**MILITARY AND MARINE STRENGTH.]** The number of land forces in the United Provinces, in time of peace, commonly amounts to about forty-thousand: twenty-five thousand of whom serve in garrisons; many of them are Scots and Swifs; and in time of war they hire whole regiments of Germans. The chief command of the army was vested in the stadtholder, under whom was the field-marshal general. The marine force of the United Provinces used to be very great, and they formerly fitted-out very formidable fleets: but their navy has for many years been much neglected. Their late war with Great Britain obliged them to increase it; and they have great resources for that purpose. At present it must be in a very feeble and shattered state, in consequence of the surrender of admiral Lucas's Squadron at the Cape of Good Hope, the victory gained by admiral Duncan, and especially the surrender of the fleet in the Texel to admiral Mitchel; since which, however, a statement has been published, which makes their naval force amount to fifteen ships of the line and seven or eight frigates.

**ORDER OF TEUTONIC KNIGHTS.]** This was one of the most powerful as well as ancient orders in Europe, now divided into two branches; one for papists, and the other for protestants. This branch has a house at Utrecht, where they transact their business. The nobles of Holland, if they propose a son to be a knight, enter his name in the register, and pay a large sum of money to the use of the poor maintained by the order; and the candidate succeeds in rotation, if he brings with him proof of his nobility for four generations on the father's and mother's side. The ensign is a cross pattie, enamelled white, surmounted with another black; above the cross is a ball twisted, white and black; it is worn pendent to a broad black watered ribband, which is worn about the neck. The same cross is embroidered on the left breast of the upper garment of each knight.

**ARMS.]** The ensigns armorial of the Seven United Provinces, or the States of Holland, are, *Or*, a lion, gules, holding with one paw a cutlass,

and with the other a bu-

and with the other a bundle of seven arrows close bound together, in allusion to the seven confederate provinces, with the following motto; *Concordia res parva crescant.*

**HISTORY.]** See the Austrian Netherlands.

William V. prince of Orange and Nassau, hereditary stadtholder, captain-general and admiral of the Seven United Provinces, and knight of the garter, was born March 19, 1748; married, in 1767, the princess Frederica-Sophia-Wilhelmina, of Prussia, born in 1751; by whom he has issue:

1. Frederica-Louisa-Wilhelmina, born Nov. 28, 1770; married to the hereditary prince of Brunswick.
  2. William-Frederic, hereditary prince, born Aug. 2, 1772; married, Oct. 1, 1791, to princess Frederica-Sophia-Wilhelmina, of Prussia.
  3. William-George-Frederic, born Feb. 15, 1774.
- The stadtholder has one sister, Wilhelmina-Carolina, born 1743, and married to the prince of Nassau Weilbur.

**AIR, SOIL, AND PRODUCE.]** The air of Brabant, and upon the coast of Flanders, is bad; that in the interior parts is more healthful, and the seasons more settled, both in winter and summer, than they are in England. The soil and its produce are rich, especially in corn and fruits. They have abundance of pasture; and Flanders itself has been reckoned the granary of France and Germany, and sometimes of England. The most barren parts for corn rear far more profitable crops of flax, which is here cultivated to great perfection. Upon the whole, the late Austrian Netherlands, by the culture, commerce, and industry of the inhabitants, was formerly the richest and most beautiful spot in Europe, whether we regard the variety of its manufactures, the magnificence and riches of its cities, the pleasantness of its roads and villages, or the fertility of its land. If it has fallen off in latter times, it is owing partly to the neglect of its government, but chiefly to its vicinity to England and Holland; but it is still a most desirable and agreeable country. There are few or no mountains in the Netherlands: Flanders is a flat country, with scarcely a single hill in it: Brabant, and the rest of the provinces, consist of little hills and valleys, woods, inclosed grounds, and champaign fields.

**RIVERS AND CANALS.]** The chief rivers are the Maese, Sambre, Demer, Dyle, Néthe, Geet, Sanne, Ruppel, Scheldt, Lis, Scarpe, Deule, and Dender. The principal canals are those of Brussels, Ghent, and Ostend.

**METALS AND MINERALS.]** Mines of iron, copper, lead, and brimstone, are found in Luxemburg and Limburg, as are some marble quarries; and in the province of Namur there are coal-pits, and a species of bituminous fat earth proper for fuel, with great plenty of fossile nitre.

**INHABITANTS, POPULATION, MANNERS, CUSTOMS, AND DIVERSIONS.]** The Flemings (for so the inhabitants of Flanders and the Low Countries are generally called) are thought to be a heavy, blunt,

honest people; but their manners are somewhat indelicate. Formerly they were known to fight desperately in defence of their country; at present they make no great figure. The late Austrian Netherlands are extremely populous; but authors differ as to their numbers. Perhaps we may fix them, at a medium, at a million and a half. They are ignorant, and fond of religious exhibitions and pageants. Their other diversions are the same with those of the peasants of the neighbouring countries.

**DRESS AND LANGUAGE.]** The inhabitants of French Flanders are mere French men and women in both of these particulars. The Flemings on the frontiers of Holland dress like the Dutch boors, and their language is the same; but the better sort of the people speak French, and dress in the same taste.

**RELIGION.]** Before the conquest of this country by the French, the established religion was the Roman catholic; but protestants, and other sects, were not molested.

**ARCHBISHOPRICS AND BISHOPRICS.]** The archbishoprics were Cambrai, Malines or Mechlin: the bishoprics, Ghent, Bruges, Antwerp, Arras, Ypres, Tournay, St. Omers, Namur, and Ruremonde.

**LEARNING, LEARNED MEN, AND ARTISTS.** } The societies of Jesuits formerly produced the most learned men in the Austrian Low Countries, in which they had many eligible settlements. Works of theology, and the civil and canon law, Latin poems and plays, were their chief productions. Strada is an elegant historian and poet. The Flemish painters and sculptors have great merit, and form a school by themselves. The works of Rubens and Vandyke cannot be sufficiently admired. The models for heads of Flamingo, or the Fleming, particularly those of children, have never yet been equalled; and the Flemings formerly engrossed tapestry-weaving to themselves.

**UNIVERSITIES.]** Louvain, Douay, Tournay, and St. Omers. The first was founded in 1426, by John IV. duke of Brabant, and enjoys great privileges. By a grant of pope Sixtus IV. this university had the privilege of presenting to all the livings in the Netherlands, except in Holland.

**ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICIAL.** } Some Roman monuments of temples and other buildings are to be found in these provinces. Many curious bells, churches, and the like, ancient and modern, are also found here; and the magnificent old edifices of every kind, in all their cities, give evidence of their former grandeur. In 1607, some labourers found 1600 gold coins, and ancient medals, of Antoninus Pius, Aurelius, and Lucius Verus.

**CITIES.]** This article has employed several large volumes, published by different authors, but in times when the Austrian Netherlands were far more flourishing than at present. The walls of Ghent, formerly the capital of Flanders, and celebrated for its linen and woollen manufactures, contain the circuit of ten miles; but now unoccupied, and great part of it in a manner a void. Bruges, formerly so noted for its trade and manufactures, but above all for its fine canals, is now dwindled to an inconsiderable place. Ostend is a tolerably convenient harbour for traders; and soon after the rupture between Great Britain and Holland, during the American war, became more opulent and populous. In 1781, it was visited by the emperor, who granted to it many privileges and franchises, and the free exercise of the protestant religion. As to Ypres, it is only a strong garrison town. The same may be said of Charleroi and Namur.

Louvain, the capital manufactures and plains and harbours. Brussels having been the resid Netherlands, is a pop of the European conti lace shop, with the ho joining. One of the off the Spanish yoke, by sinking vessels, loa shutting up the entranc was the more cruel, as and fellow-sufferers in prosperity of their own

**ARMS.]** The arm HISTORY.] The which lies west of th About a century bef Hesse to the marshy They gave the name brave, the Batavians ing exempted from t only to perform mili the Goths, and oth provinces first, as th and other parts of th to small governmen

Louvain, the capital of the Austrian Brabant, instead of its flourishing manufactures and places of trade, now contains pretty gardens, walks, and arbours. Brussels retains somewhat of its ancient manufactures; and having been the residence of the governor or viceroy of the Austrian Netherlands, is a populous, lively place. Antwerp, once the emporium of the European continent, is now reduced to be a tapestry and thread-lace shop, with the houses of some bankers, jewellers, and painters adjoining. One of the first exploits of the Dutch, soon after they threw off the Spanish yoke, was to ruin at once the commerce of Antwerp, by sinking vessels, loaded with stone, in the mouth of the Scheldt; thus shutting up the entrance of that river to ships of large burthen. This was the more cruel, as the people of Antwerp had been their friends and fellow-sufferers in the cause of liberty; but they foresaw that the prosperity of their own commerce was at stake.

It may be observed here, that every gentleman's house is a castle or *château*; and that there are more strong towns in the Netherlands than in all the rest of Europe; but since the decline of their trade by the rise of the English and Dutch, these towns are considerably diminished in size, and whole streets, particularly in Antwerp, are in appearance uninhabited. In the Netherlands, provisions are extremely good and cheap. Travelling is safe, reasonable, and delightful, in this luxurious country. The roads are generally broad causeways, and run for some miles in a straight line, till they terminate with the view of some noble buildings. At Cassel, in the French Netherlands, may be seen thirty-two towns, itself being on a hill.

COMMERCE AND MANUFACTURES.] The chief manufactures of the Netherlands are their beautiful linens and laces; in which, notwithstanding the boasted improvements of their neighbours, they are yet unrivalled; particularly in that species called cambrics, from Cambrai, the chief place of its manufacture. These manufactures form the principal article of their commerce.

CONSTITUTION AND GOVERNMENT.] The Austrian Netherlands were considered as a circle of the empire, of which the archducal house, as being sovereign of the whole, was the sole director and summoning prince. This circle contributed its share to the imposts of the empire, and sent an envoy to the diet, but was not subject to the judicatories of the empire. At present they must be considered as annexed to France, and under the same constitution and government.

REVENUES.] These arose from the demesne lands and customs: but so much was the trade of Austrian Flanders reduced, that they are said not to have defrayed the expence of their government. The French Netherlands brought in a considerable revenue to the nation.

ARMS.] The arms of Flanders are, *Or*, a lion sable, langued gules.

HISTORY.] The seventeen provinces, and that part of Germany which lies west of the Rhine, was called Gallia Belgica, by the Romans. About a century before the Christian æra, the Batavæ removed from Hesse to the marshy country bounded by the Rhine and the Maese. They gave the name of Batavia to their new country. Generous and brave, the Batavians were treated by the Romans with great respect, being exempted from tribute, governed by their own laws, and obliged only to perform military services. Upon the decline of that empire, the Goths, and other northern people, possessed themselves of these provinces first, as they passed through them in their way to France, and other parts of the Roman empire; and afterwards being erected into small governments, the heads of which were despotic within their

own dominions, Batavia and Holland became independent of Germany, to which it had been united under one of the grandsons of Charlemagne, in the beginning of the 10th century, when the supreme authority was lodged in the three united powers, of a Count, the Nobles, and the Towns. At last, they were swallowed up by the House of Burgundy, anno 1433.

The emperor Charles V. the heir of that family, transferred them, in the year 1477, to the House of Austria, and ranked them as part of the empire, under the title of the Circle of Burgundy. The tyranny of his son, Philip II, who succeeded to the throne of Spain, made the inhabitants attempt to throw off his yoke, which occasioned a general insurrection, the counts Hoorn and Egmont, and the prince of Orange, appearing at the head of it; and Luther's reformation gaining ground about the same time in the Netherlands, his disciples were forced by persecution to join the malcontents. Whereupon king Philip introduced a kind of inquisition, which, from the inhumanity of its proceedings, was called the "Council of Blood," in order to suppress them; and many thousands were put to death by that court, besides those that perished by the sword. Count Hoorn and count Egmont were taken and beheaded; but the prince of Orange, whom they elected to be their stadtholder, retiring into Holland, that and the adjacent provinces entered into a treaty for their mutual defence, at Utrecht, in the year 1579. And though these revolters at first were thought so despicable as to be termed *Beggars* by their tyrants, their perseverance and courage were such, under the prince of Orange, and with the assistance afforded them by queen Elizabeth, both in troops and money, that they forced the crown of Spain to declare them a free people, in the year 1609; and afterwards they were acknowledged by all Europe to be an independent state, under the title of **THE UNITED PROVINCES**. By their sea-wars with England, under the Commonwealth, Cromwell, and Charles II. they justly acquired the reputation of a formidable naval power. When the House of Austria, which for some ages ruled over Germany, Spain, and part of Italy, with which they afterwards continued to carry on bloody wars, was become no longer formidable; and when the public jealousy was directed against that of Bourbon, which was favoured by the government of Holland, who had dispossessed the prince of Orange of the stadtholdership; the spirit of the people was such, that they revived it in the person of the prince, who was afterwards William III. king of Great Britain; and during his reign, and that of queen Anne, they were principals in the grand confederacy against Lewis XIV. king of France.

Their conduct towards England in the wars of 1742 and 1756 has been discussed in the history of that country, as also the occurrences which led to a rupture between them and the English in the year 1780. As it was urged that they refused to fulfil the treaties which subsisted between them and Great Britain, so all the treaties which bound Great Britain to them were declared null and void, as if none had ever existed. By the war, their trade suffered considerably; but Negapatnam, in the East Indies, is the only place not restored to them by the late peace.

Probably, to their separation from Great Britain, may be attributed the recent differences between the States-General and the emperor Joseph II. who, from the exhausted state of several of the European powers, seemed to have a favourable opportunity of accomplishing his ambitious designs. In the year 1781, he had been allowed to demolish the

Dutch barrier in his dominions for which they had contended so desperately in the time of queen Anne, and he now seemed willing to encroach upon their territories. A conference concerning the boundaries of their respective nations was proposed to the states; but before this could take place, he began to commit some acts of hostility, and extended his dominions a little by way of preliminary. Two small forts, St. Donat, and St. Paul, were seized upon, as well as some part of the marshes in the neighbourhood of Sluys. As a prelude to the negotiations, he also demanded that the Dutch guard-ship should be removed from before Lillo, in acknowledgment that one of the prerogatives of his Imperial majesty was the free navigation of the Scheldt. This being complied with, the negotiations were opened at Brussels, on the 24th of April, 1784, when several other demands of small portions of territory and little sums of money were made; the most material requisition being the town of Maestricht, and its territory. For some time the conferences were carried on in that dry and tedious manner which generally marks the proceedings of the Dutch; but the emperor urged on his demands with great vigour, and matters seemed fast tending towards an open rupture. On the 23d of August, he delivered in his *ultimatum* to the commissioners at Brussels, in which he offered to give up his demand on Maestricht, in consideration of having the free and unlimited navigation of the Scheldt, in both its branches, to the sea; and, in token of his confidence of the good intentions of the states, he determined to consider the river as open from the date of that paper. Any insult on his flags, in the execution of these purposes, he would conclude to be a direct act of hostility, and a formal declaration of war on the part of the republic. To prevent all injuries contrary to the incontestable rights of his Imperial majesty, and to leave no doubt of his unalterable resolution to adhere to the propositions contained in the *ultimatum*, his majesty could not forbear determining to send to sea, from Antwerp, a ship under his flag, after having declared long enough before in what manner he should consider all violent opposition that might be made to the free passage of the said ship.

The ship was stopped in its passage, as was another, ordered to sail from Ostend up the Scheldt to Antwerp. But the Dutch offered to dismiss the vessels, if the captains would engage to return to their respective places, and not continue their voyage on the river; which they refused to do. This the emperor called insulting his flag, and declared to all foreign courts, he could not look on this fact but as "an effective declaration of war on the part of the republic." In answer to their conduct in stopping the Imperial ships, which the emperor styled an insult to his flag, and by which he declared them to have begun hostilities, the Dutch ministers at Brussels, in a paper delivered to that court, protested "that as their sole aim was to support their uncontrovertible right, they could not, with any appearance of justice, be considered as guilty of a hostile aggression."

Great preparations were made for immediate hostilities against the Dutch; and several hundred of the Imperialists, with some field-pieces, advancing towards the counter-carpe of Lillo, the commanding officer of that place ordered the sluices to be opened, November 7, 1784, which effected an inundation that laid under water many miles of flat country around the forts on the Scheldt, to preserve them from an attack. Both parties exerted themselves, in case they should be called forth to open a campaign in the next spring; but France and Prussia interposed as negotiators and mediators, and succeeded in bringing

about a reconciliation. However, from the conduct of the emperor in the partition of Poland, and in demolishing the fortifications of the barrier places in the Netherlands, and demanding a free navigation of the Scheldt, and to the East Indies—advancing from one pretension to another, it is apparent that the most solemn treaties will be no longer observed by some courts and statesmen, than till they have an opportunity, with ability, to break them.

During the progress of their contentions with the emperor, this country was greatly distressed by the most unhappy animosities within themselves, which it may be proper in this place briefly to state. The continued series of losses which they had sustained in the late war with Great Britain was peculiarly disgraceful to the republic. All their settlements in the West Indies fell into the hands of the British, without resistance; their ships were captured, and trade ruined; while the disasters of the war excited the animosity of the two factions against each other to the highest degree. The patriots, or aristocratic party, attributed these defeats to the stadtholder, who had openly expressed his predilection for the English, at the beginning of the American quarrel. To this conduct the patriots now very artfully reverted. They accused him of having advised the aggression of the English, and of contributing to their success by treachery. The evident inequality of the struggle, the notorious deficiency of all warlike articles in the dock-yards and arsenals of the republic, the frequent and public reclamations made by the prince and by the council of state on the subject of that deficiency, were forgotten; and the wilful misconduct of the stadtholder was boldly alleged by the patriots as the sole cause of that miserable succession of defeat and disgrace, which immediately followed the commencement of hostilities. Whilst these were the recriminations of the patriots, the monarchical, or Orange party, accused their antagonists of having involved the country in a dangerous war, at a time when it was entirely unprepared for it.

This produced various accusations and vindications between the two parties, until at last, in the month of May, 1786, the stadtholder gave orders to seize on Vreeswick, a post of importance to the city of Utrecht, on account of its situation on the canal between that city and the territories of South Holland; containing also the sluices, by which both these provinces might be overflowed. This brought on a skirmish between the troops of the stadtholder and the burghers of Utrecht, in which the latter proved victorious. Some other unimportant hostilities took place; but while the military operations were carried on in such a languid manner, a violent tumult happened at Amsterdam, in which several persons were killed. This was followed by a revolt of most of the regular troops of Holland, who went over to the stadtholder; but notwithstanding this apparent advantage, and some others which afterwards took place, the disputes still continued with extreme violence, insomuch that the princess of Orange herself was seized, and detained prisoner a night by the patriots.

These most turbulent commotions were, however, at last settled by the king of Prussia, who, for this purpose, marched an army into the territories of the United States, and took possession of the city of Rotterdam, and some other places, without resistance. This too much overawed both parties, that they quickly came to an accommodation, and a treaty was concluded between that monarch and the states of Holland. By this, the two contending parties were formally reconciled, and the courts of London and Berlin guaranteed the stadtholdership, as well as

the hereditary government of each province, in the House of Orange, with all the rights and prerogatives settled in the years 1747 and 1743; by which all attempts to disturb the domestic tranquillity of the republic, by means of any foreign interference, appeared to be effectually guarded against by the close union that subsisted between those two important powers.

The late revolution in Holland, in consequence of the irruption of the French, and the expulsion of the stadtholder from that country, has already been briefly narrated in our history of France, to which we must refer the reader.

AFTER the independency of the Seven United Provinces was acknowledged, the Spaniards remained possessed of the other ten provinces, or, as they are termed, the Low COUNTRIES, until the duke of Marlborough, a general of the allies, gained the memorable victory of Ramillies, in the year 1706; after which, Brussels, the capital, and great part of these provinces, acknowledged Charles VI. afterwards emperor of Germany, for their sovereign; and his daughter, the late empress-queen, remained possessed of them until the war of 1741, when the French reduced them, except part of the province of Luxemburg; and would have possessed them from that time, but for the exertions of the Dutch, and chiefly of the English, in favour of the House of Austria. The places retained by the French, by the peace of Aix-la-Chapelle in the year 1748, may be seen in the preceding general table of divisions.

It was not long after the settlement of the disturbances in Holland, that the provinces of the Netherlands belonging to the emperor determined to assert their liberty. The quarrel originated, like those in other countries, about the prerogatives assumed by the emperor, and which were more extensive than his subjects wished to allow; and the emperor making use of force to assert his claims, the territories of the United States became a refuge for the discontented Brabanters.

On the part of his Imperial majesty, the insurgents were not treated with lenity. A proclamation was issued by count Trautmanndorff, governor of Brussels, intimating, that no quarter should be given them, and that the villages in which they concealed themselves should be set on fire. General Dalton marched with 7000 men to retake the forts, proclaiming that he meant to become master of them by assault, and would put every soul he found in them to the sword.

In opposition to this sanguinary proclamation, the patriots issued a manifesto, in which they declared the emperor to have forfeited his authority, by his various oppressions and cruelties, his annulling his oath, and infringing the constitution. Banishment was threatened to such as took part with him; and all were exhorted to take up arms in defence of their country, though strict orders were given that no crowds or mobs should be allowed to pillage; and whoever was found doing so, should be treated as an enemy to his country.

This was dated at Hoogstraten, in Brabant, October the 24th, 1789. Almost every town in Austrian Flanders showed its determination to oppose the emperor, and the most enthusiastic attachment to military affairs displayed itself in all ranks of men. Even the ecclesiastics manifested their valour on this occasion; which perhaps was naturally to be expected, as the emperor had been very active in depriving them of their revenues. A formidable army was soon raised, which, after some successful skirmishes, made themselves masters of Ghent, Bruges, Tournay, Malines, and Ostend; so that general Dalton was obliged to retire to Brussels. A battle was fought before the city of Ghent, in which

the patriots were victorious, though with the loss of 1000 men, besides women and children. It reflects indelible disgrace on the Imperial character, as well as on the commanders of the troops, that they committed the most dreadful acts of cruelty on the unhappy objects who fell into their hands. Orders were given to plunder and destroy wherever they could obtain any booty; while the merciless savages not only destroyed the men, but killed women and sucking infants. Some of them plunged their bayonets into the bodies of children in the cradle, or pinned them against the walls of the houses. By these monstrous cruelties, they insured success to their adversaries; for the whole countries of Brabant, Flanders, and Maes, almost instantly declared in their favour. They published a memorial for their justification, in which they gave, as reasons for their conduct, the many oppressive edicts with which they had been harassed since the death of the empress-queen; the unwarrantable extension of the Imperial prerogatives, contrary to his coronation-oath, and which could not be done without perjury on his part; the violence committed on his subjects, by forcibly entering their houses at midnight, and sending them prisoners to Vienna, to perish in a dungeon, or on the banks of the Danube. Not content with this, he had openly massacred his subjects; he had consigned towns and villages to the flames, and entered into a design of exterminating people who contended only for their rights. These things, they owned, might be terrible at the time, and easily impose upon weak minds, but "the natural courage of a nation, roused by repeated injuries, and animated by despair, would rise superior to those last efforts of vindictive tyranny, and render them as impotent and abortive, as they were wicked and unexampled." For all which reasons they declared themselves **INDEPENDENT**, and for ever released from the House of AUSTRIA.

The emperor, now perceiving the bad effects of his cruelty, published proclamations of indemnity, &c. but they were treated with the utmost contempt. The patriots made the most rapid conquests; inasmuch, that before the end of the year they were masters of every place in the Netherlands, except Antwerp and Luxemburg.

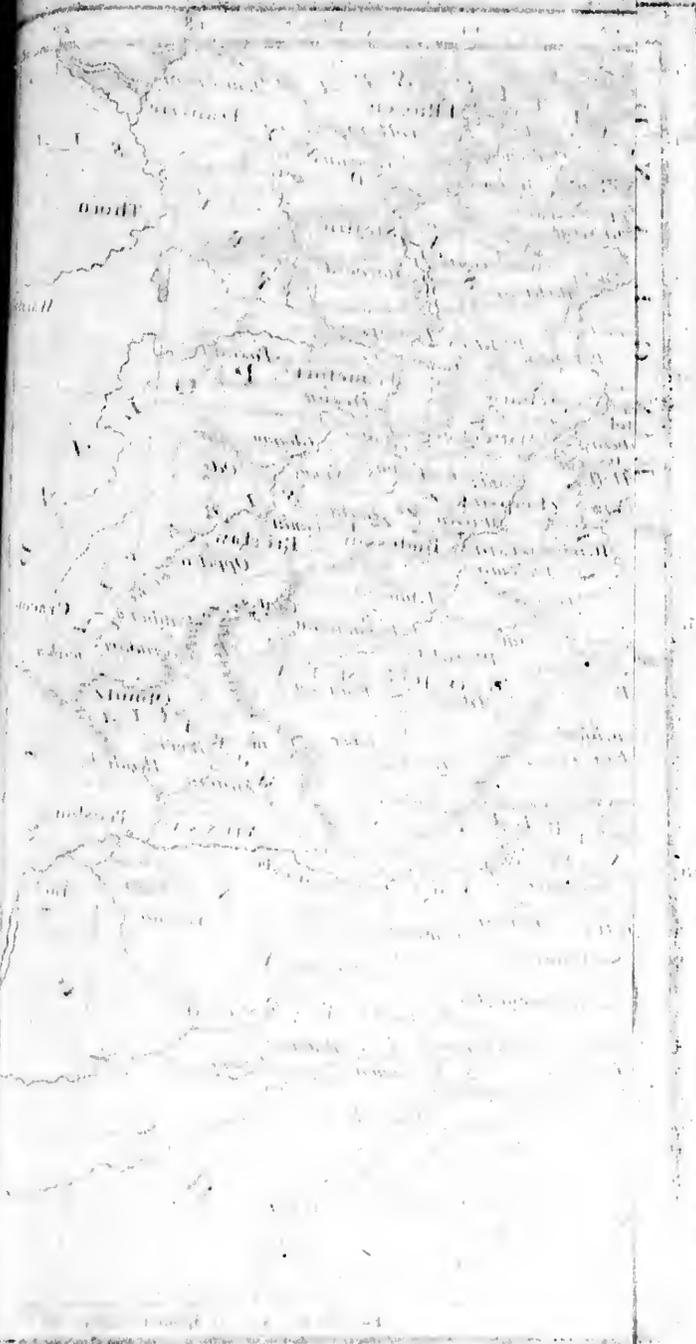

Notwithstanding they thus appeared for ever separated from the House of Austria, yet the death of Joseph, happening soon after, produced such a change in the conduct of government, as gave a very unexpected turn to the situation of affairs; and the mild and pacific disposition of Leopold, who succeeded his brother, the conciliatory measures he adopted, together with the mediation of Great Britain, Prussia, and Holland, made a material alteration in the affairs of these provinces; and a convention, which was signed at Reichenbach, on the 27th of July, 1790, by the above-mentioned high contracting powers, had for its object the re-establishment of peace and good order in the Belgic provinces of his Imperial majesty.

Their majesties of Great Britain and Prussia, and the states-general of Holland, became, in the most solemn manner, guarantees to the emperor and his successors for the sovereignty of the Belgic provinces, now reunited under his dominion.

The ratification of this convention was exchanged between the contracting parties within two months from the date of signing, which was executed at the Hague, on the 10th of December, 1790.

The incursion of the French into these provinces, their complete conquest, and the final cession of them to France by the treaty of Campo Formio, have already been related in our history of the late transactions of that people, which will supersede the necessity of any repetition of it in this place.

## SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 663 } Breadth 520 }	between { 5 and 19 East long. } { 45 and 55 North lat. }	181,631.

GERMANY and BOHEMIA contain 191,573 square miles, with 135 inhabitants to each.

**BOUNDARIES.]** THE empire of Germany, properly so called, is bounded by the German Ocean, Denmark, and the Baltic, on the North; by Poland and Hungary, including Bohemia, on the East; by Switzerland and the Alps, which divide it from Italy, on the South; and by the dominions of France and the Low Countries, on the West, from which it is separated by the Rhine, Moselle, and the Maese.

**GRAND DIVISIONS.]** The divisions of Germany, as laid down even by modern writers, are various and uncertain. We shall therefore adhere to those that are most generally received. Germany formerly was divided into the Upper, or Southern, and the Lower, or Northern. The emperor Maximilian, predecessor and grandfather to the emperor Charles V. divided it into ten great circles; and the division was confirmed in the diet of Nuremberg, in 1552; but the circle of Burgundy, or the seventeen provinces of the Low Countries, being now detached from the empire, we are to confine ourselves to nine of those divisions, as they now subsist.

Of these, three are in the north, three in the middle, and three in the south.

	</		

settled weather is found in the middle of the country, at an equal distance from the sea and the Alps. In the north it is sharp; towards the south it is more temperate.

The soil of Germany is not improved to the full by culture; and therefore in many places it is bare and sterile, though in others it is surprisingly fruitful. Agriculture, however, is daily improving; which must necessarily change the most barren parts of Germany greatly to their advantage. The seasons vary as much as the soil. In the south and western parts, they are more regular than those that lie near the sea, or that abound with lakes and rivers. The northern and eastern winds are unfavourable to vegetation. Upon the whole, there is no great difference between the seasons of Germany and those of Great Britain.

**MOUNTAINS.]** The chief mountains of Germany are the Alps, which divide it from Italy, and those which separate Saxony, Bavaria, and Moravia, from Bohemia. But many other large tracts of mountains are found in different parts of the empire.

**FORESTS.]** The great passion which the Germans have for hunting the wild boar is the reason why, perhaps, there are more woods and chafes yet standing in Germany than in many other countries. The Hercynian forest, which in Cæsar's time was nine days' journey in length, and six in breadth, is now cut down in many places, or parcelled out into woods, which go by particular names. Most of the woods are pine, fir, oak, and beech. There is a vast number of forests of less note in every part of this country; almost every count, baron, or gentleman, having a chase or park, adorned with pleasure-houses, and well stocked with game, viz. deer, of which there are seven or eight sorts, as roebucks, stags, &c. of all sizes and colours, and many of a vast growth; plenty of hares, conies, foxes, and boars. They abound so much also with wild fowl, that in many places the peasants have them, as well as venison, for their ordinary food.

**RIVERS AND LAKES.]** No country can boast a greater variety of noble large rivers than Germany. At their head stands the Danube or Donau, so called from the swiftness of the current, and which some pretend to be, naturally, the finest river in the world. From Vienna to Belgrade in Hungary, it is so broad, that, in the wars between the Turks and Christians, ships of war have been engaged on it; and its conveniency for carriage to all the countries through which it passes is inconceivable. The Danube, however, contains a vast number of cataracts and whirlpools; its stream is rapid, and its course, without reckoning turnings and windings, is computed to be 1620 miles. The other principal rivers are the Rhine, Elbe, Oder, Weser, and Moselle.

The chief lakes of Germany, not to mention many inferior ones, are those of Constance and Bregentz. Besides these, are the Chiem-see, or the Lake of Bavaria; and the Zirnitzer-see, in the duchy of Carniola, whose waters often run off, and return again, in an extraordinary manner.

Besides these lakes and rivers, in some of which are found pearls, Germany contains large noxious bodies of standing water, which are next to pestilential, and afflict the neighbouring natives with many deplorable disorders.

**MINERAL WATERS AND BATHS.]** Germany is said to contain more of these than all Europe besides. The Spa waters, and those of Seltzer and Pymont, are well known. Those of Aix-la-Chapelle are still more noted. They are divided into the Emperor's Bath, and the Little

Bath; and the springs of both are so hot, that they let them cool ten or twelve hours before they use them. Each of these, and many other waters, have their partisans in the medicinal faculty; and if we believe them, cure diseases internal and cutaneous, either by drinking or bathing. The baths and medicinal water of Embs, Witbaden, Schwalbach, and Wildungen, are likewise reported to perform wonders in almost all diseases. The mineral springs at the last mentioned place are said to intoxicate as soon as wine, and therefore they are inclosed. Carlsbad and Baden baths have been described and recommended by many great physicians, and used with great success by many royal personages. It is, however, not improbable, that great part of the salutary virtues ascribed to these waters is owing to the exercises and amusements of the patients, and numbers of the company which crowd to them from all parts of the world; many of whom do not repair thither for health, but for amusement and conversation.

[METALS AND MINERALS.] Germany abounds in both. Many places in the circle of Austria, and other parts of Germany, contain mines of silver, quicksilver, copper, tin, iron, lead, sulphur, nitre, and vitriol. Salt-petre, salt-mines, and salt-pits, are found in Austria, Bavaria, Silesia, and the Lower Saxony; as are carbuncles, amethysts, jasper, sapphire, agate, alabaster, several sorts of pearl, turquois stones, and the finest of rubies, which adorn the cabinets of the greatest princes and virtuosi. In Bavaria, Tyrol, and Liege, are quarries of curious marble, slate, chalk, ochre, red lead, alum, and bitumen; besides other fossils. In several places are dug up stones, which to a strong fancy represent different animals, and sometimes trees, or the human form. Many of the German circles furnish coal-pits: and the *terra sigillata* of Mentz, with white, yellow, and red veins, is thought to be an antidote against poison.

[VEGETABLE AND ANIMAL PRODUCTIONS.] These differ in Germany very little, if at all, from the countries already described; but naturalists are of opinion, that, had the Germans, even before the middle of this century, been acquainted with agriculture, their country would have been the most fruitful of any in Europe. Even in its present, what we may call rude state, provisions are more cheap and plentiful in Germany than in any other country perhaps in the world; witness the prodigious armies which the most uncultivated part of it maintained during the late war, while many of the richest and most fertile provinces remained untouched.

The Rhenish and Moselle wines differ from those of other countries in a peculiar lightness, and detergent qualities, more sovereign in some diseases than any medicine.

The German wild boar differs in colour from our common hogs, and is four times as large. Their flesh, and the hams made of it, are preferred by many even to those of Westmoreland, for flavour and grain. The *glutton* of Germany is said to be the most voracious of all animals. Its prey is almost every thing that has life, which it can manage, especially birds, hares, rabbits, goats, and fawns; whom they surprise artfully and devour greedily. On these the glutton feeds so ravenously, that it falls into a kind of a torpid state, and, not being able to move, he is killed by the huntsmen; but though both boars and wolves will kill him in that condition, they will not eat him. His colour is a beautiful brown, with a faint tinge of red.

Germany yields abundance of excellent heavy horses; but their horses, oxen, and sheep, are not comparable to those of England, probably owing their want of skill in feeding and rearing them. Some parts of Ger-

This calculation extends only to the principal parts of Germany; and when the inferior parts are added, the number in all, including the Kingdom of Bohemia, is now computed at twenty-six millions; and when the landholders become better acquainted with agriculture and cultivation, population must naturally increase among them.

The Germans in their persons are tall, fair, and strong built. The ladies have generally fine complexions; and some of them, especially in Saxony, have all the delicacy of features and shape that are to be-  
 witching in some other countries.

Both men and women affect rich dresses, which in fashion are the same as in France and England: but the better sort of men are excessively fond of gold and silver lace, especially if they are in the army. The ladies at the principal courts differ not much in their dress from the French and English, only they are not so excessively fond of paint as the former. At some courts they appear in rich furs; and all of them are loaded with jewels, if they can obtain them. The female part of the burghers' families, in many of the German towns, dress in a very different manner, and some of them inconceivably fantastic; but in this respect they are gradually reforming, and many of them make quite a different appearance in their dresses from what they did thirty or forty years ago. As to the peasantry and labourers, they dress, as in other parts of Europe, according to their employments, convenience, and circumstances. The stoves made use of in Germany are the same with those already mentioned in our account of other northern nations, and are sometimes made portable, so that the ladies carry them to church. In Westphalia, and many other parts of Germany, they sleep between two feather-beds, with sheets fitted to them, which, by use, becomes a very comfortable practice. The most unhappy part of the Germans are the tenants of little needy princes, who squeeze them to keep up their own grandeur; but, in general, the circumstances of the common people are more comfortable than those of their neighbours.

The Germans are naturally a frank, honest, hospitable people, free from artifice and disguise. The higher orders are ridiculously proud of titles, ancestry, and show. The Germans in general are thought to want animation, as their persons promise more vigour and activity than they commonly exert, even in the field of battle. But when commanded by able generals, especially the Italians, such as Montecuculi and Prince Eugene, they have done great things both against the Turks and the French. The Imperial arms have seldom made any remarkable figure against either of those two nations, or against the Swedes or Spaniards, when commanded by German generals. This possibly might be owing to the arbitrary obstinacy of the court of Vienna; for in the two last wars the Austrians exhibited prodigies of military valour and genius.

Industry, application, and perseverance, are the great characteristics of the German nation, especially the mechanical part of it. Their works of art would be incredible, were they not well-known, especially in watch and clock making, jewellery, turnery, sculpture, drawing, painting, and certain kinds of architecture, some of which we shall have occasion to mention. The Germans have been charged with intemperance in eating and drinking, and perhaps not unjustly, owing to the vast plenty of their country in wine and provisions of every kind; but such excesses are now less common. At the greatest tables, though the guests drink pretty freely at dinner, yet the repast is commonly finished by coffee, after three or four public toasts have been given. But no people have more feasting at marriages, funerals, and on birth-days.

The German nobility are generally men of so much honour, that a sharper, in other countries, especially in England, meets with more credit if he pretends to be a German, rather than any other nation. All the sons of noblemen inherit their fathers' titles, which greatly perplexes the heralds and genealogists of that country. The German husbands are not quite so complaisant as those of some other countries to their ladies, who are not entitled to any pre-eminence at the table; nor indeed do

they seem to affect it, being far from either ambition or loquacity, though they are said to be somewhat too fond of gaming. Many of the German nobility, having no other hereditary estate than a high-sounding title, easily enter into their armies, and those of other sovereigns. Their fondness for title is attended with many other inconveniences,—their gentlemen of property think the cultivation of their lands, though it might treble their revenue, below their attention, and that they should degrade themselves by being concerned in the improvement of their grounds.

The domestic diversions of the Germans are the same as in England; billiards, cards, dice, fencing, dancing, and the like. In summer, people of fashion repair to places of public resort, and drink the waters. As to their field diversions, besides their favourite one of hunting, they have bull and bear-baiting, and the like. The inhabitants of Vienna live luxuriously, a great part of their time being spent in feasting and carousing; and in winter, when the several branches of the Danube are frozen over, and the ground covered with snow, the ladies take their recreation in sledges of different shapes, such as griffins, tigers, swans, scallop-shells, &c. Here the lady sits, dressed in velvet lined with rich furs, and adorned with laces and jewels, having on her head a velvet cap; and the sledge is drawn by one horse, stag, or other creature, set off with plumes of feathers, ribbands, and bells. As this diversion is taken chiefly in the night-time, servants ride before the sledges with torches; and a gentleman, standing on the sledge behind, guides the horse.

RELIGION.] Before the reformation introduced by Luther, the German bishops were possessed (as indeed many of them are at this day) of prodigious power and revenues, and were the tyrants of the emperors as well as of the people. Their ignorance was only equalled by their superstition. The Bohemians were the first who had an idea of reformation, and made so glorious a stand, for many years, against the errors of Rome, that they were indulged in the liberty of taking the sacrament in both kinds, and other freedoms not tolerated in the Romish church. This was in a great measure owing to the celebrated Englishman, John Wickliffe, who went much farther in reforming the real errors of popery than Luther himself, though he lived about a century and a half before him. Wickliffe was seconded by John Hus and Jerome of Prague, who, notwithstanding the emperor's safe-conduct, were infamously burnt at the council of Constance.

The reformation introduced afterwards by Luther\*, of which we have spoken in the Introduction, though it struck at the chief abuses in the church of Rome, was thought in some points (particularly that of consubstantiation, by which the real body of Christ, as well as the elements of bread and wine, is supposed to be taken in the sacrament) to be imperfect. Calvinism †, therefore, or the religion of Geneva (as now practised in the church of Scotland), was introduced into Germany, and is the religion professed in the territories of the king of Prussia, the

\* Born in Saxony, in the year 1483, began to dispute the doctrines of the Romish church 1517, and died, 1546, in the 63d year of his age.

† John Calvin was born in the province of Picardy, in the north of France, anno 1506. Being obliged to fly from that kingdom, he settled at Geneva, in 1539, where he established a new form of church discipline, which was soon after embraced by several nations and states, who are now denominated presbyterians, and, from their doctrinal articles, Calvinists. He died at Geneva, in the year 1564; and his writings make nine volumes in folio.

landgrave of Hesse, and some other princes, who maintain a parity of orders in the church. Some even assert, that the numbers of protestants and papists in the empire are now almost equal. Germany, particularly Moravia, and the Palatinate, as also Bohemia, is over-run with sectaries of all kinds; and Jews abound in the empire. At present, the modes of worship and forms of church government are, by the protestant German princes, considered in a civil rather than a religious light. The protestant clergy are learned and exemplary in their deportment, but the popish ignorant and libertine.

ARCHBISHOP AND BISHOP SEES.] These are differently represented by authors: some of whom represent Vienna as being a suffragan to the archiepiscopal see of Saltzburg; and others, as being an archbishopric, but depending immediately upon the pope. The others are the archbishop of Mentz, who has under him twelve suffragans; but one of them, the bishop of Bamberg, is said to be exempted from his jurisdiction:—Triers has three suffragans;—Cologne has four;—Magdeburg has five;—Saltzburg has nine, besides Vienna;—and Bremen three.

At different periods since the Reformation, it has been found expedient, to satisfy the claims of temporal princes, to secularise the following bishop-sees, Bremen, Verden, Magdeburg, Halberstadt, Minden, Lubeck, and Osnaburg, which last goes alternately to the houses of Bavaria and Hanover, and is at present held by his Britannic majesty's second son. Such of those sees as were archbishoprics are now considered as duchies, and the bishoprics as principalities.

LANGUAGE.] The Teutonic part of the German tongue is an original language, and has no relation to the Celtic. It is called High Dutch, and is the mother tongue of all Germany; but varies much in its dialect in different provinces. Latin and French are the most useful languages in Germany, when a traveller is ignorant of High Dutch.

The German Pater-noster is as follows: *Unser Vater, der du bist im himmel, geheiligt werde dein name. Zukomme dein reich. Dein wille geschehe, wie im himmel also auch auf erden. Unser täglich brodt gib uns heute. Und vergib uns unsere schulden, als wir vergeben unsern schuldigern. Und führe uns nicht in versuchung. Sondern erlöse uns von dem bösen. Den dein ist das reich, und die kraft, und die herrlichkeit, in ewigkeit. Amen.*

LEARNING, LEARNED MEN, } No country has produced a greater  
AND UNIVERSITIES. } variety of authors than Germany, and there is no where a more general taste for reading, especially in the protestant countries. Printing is encouraged to a fault; almost every man of letters is an author; they multiply books without number; thousands of theses and disputations are annually published; for no man can be a graduate in their universities who has not published one dissertation at least. In this country there are 36 universities, of which 17 are protestant, 17 Roman-catholic, and two mixed; besides a vast number of colleges, gymnasia, pedagogies, and Latin schools. There are also many academies and societies for promoting the study of natural philosophy, the belles-lettres, antiquities, painting, sculpture, architecture, &c. as the Imperial Leopoldine academy of the *Natura Curiosi*: the academy of Sciences at Vienna, at Berlin, at Gottingen, at Erfurth, at Leipzig, at Duisburg, at Gießen, and at Hamburg. At Dresden and Nuremberg are academies for printing: at Berlin a royal military academy; and at Augtburg is the Imperial Franciscan academy of fine art; to which we may add the Latin society at Iena. ries the most celebrated are those of Vienna, Berlin, Halle, Wolfenbuttle, Hanover, Gottingen, Weymar, and Leipzig.

Many of the Germans have greatly distinguished themselves in various branches of learning and science. They have written largely upon the Roman and canon laws. Stahl, Van Swieten, Stork, Hoffinan, and Haller, have contributed greatly to the improvement of physic; Ruvinus and Dillenius, of botany; Heister, of anatomy and surgery; and Newman, Zimmermann, Pott, and Margtaff, of chemistry. In astronomy, Kepler deservedly obtained a great reputation; and Puffendorf is one of the first writers on the law of nature and nations, and has also merit as an historian. But at the end of the last century, and the beginning of the present, Germany, by her divines, and by her religious sects, was so much involved in disputes about systematic theology, that few comparatively paid any attention to other parts of learning, or to polite literature. The language also, and the style of writing in German books, which at the time of the Reformation was pure and original, became ridiculous, by a continual intermixture of Latin and French words; which, though they were not understood by the people in general, were thought to give an air of superiority to the writers, and therefore much affected: for an opinion prevailed among the learned in Germany, and many have not yet divested themselves of it, that compiling huge volumes, and larding them with numberless quotations from all sorts of authors, and from all languages, was the true test of great erudition. Their productions, therefore, became heavy and pedantic, and were, in consequence, disregarded by other nations.

It was about the year 1730, that the prospects of literature in Germany began to brighten. Leibnitz and Wolfius opened the way to a better philosophy than had hitherto prevailed. Gottsched, an author and professor at Leipzig, who was greatly honoured by Frederic II. king of Prussia, introduced a better taste of writing, by publishing a German grammar, and by instituting a literary society for polishing and restoring to its purity the Germany language, and by promoting the study of the belles-lettres. We may consider this as the epocha from which the Germans began to write with elegance in their own language upon learned subjects, and to free themselves, in a considerable degree, from that verbosity and pedantry by which they had been characterised. About this time, several young men in the university of Leipzig, and other parts of Lower Germany, united in publishing some periodical works, calculated for the general entertainment of persons of literary taste. Some of these gentlemen afterwards became eminent authors; and their works are held in Germany in high estimation.

The style of preaching among the German divines also now underwent a considerable change. They began to translate the best English and French sermons, particularly those of Tillotson, Sherlock, Saurin, Bourdaloue, and others. They improved by these models; and Mosheim, Spalding, Zollikofer, and others, have published sermons which would do credit to any country; although they still retain too much of that prolixity for which German divines and commentators have been so much censured. Nor can it be denied, that great numbers of the German preachers, even in large and opulent towns, are still too much distinguished by vulgar language, absurd opinions, and an inattention to the dictates of reason and good sense.

Some of the English periodical writings, such as the Spectator, Tatler, and Guardian, being translated into the German language, excited great emulation among the writers of that country, and a number of pe-

wrote in Holland, was soon after greatly improved in Germany. The Germans are generally allowed to be the first inventors of great guns, as also of gunpowder, in Europe, about the year 1320. Germany has likewise produced some excellent musicians,—Handel, Bach, Haffé, and Haydn, of whom Handel stands at the head, having arrived at the sublimity of music.

CITIES, TOWNS, FORTS, AND OTHER EDIFICES, PUBLIC AND PRIVATE; with occasional estimates of REVENUES AND POPULATION. } This is a copious head in all countries, but more particularly so in Germany, on account of the numerous independent states it contains.

Though Berlin is accounted the capital of all his Prussian majesty's dominions, and exhibits, perhaps, the most illustrious example of sudden improvement that this age can boast of, yet, during the seven years' war, it was found a place of no strength, and fell twice, almost without resistance, into the hands of the Austrians, who, had it not been for the politeness of their generals, and their love of the fine arts, which always preserves mankind from barbarity and inhumanity, would have levelled it to the ground.

Berlin lies on the river Spree, and, besides the royal palace, has many other superb edifices; it contains fourteen Lutheran, and eleven Calvinist churches, besides a catholic one. Its streets and squares are spacious, and built in a very regular manner; but the houses, though neat without, are ill finished, and ill furnished within, and very indifferently provided with inhabitants. The king's palace here, and that of prince Henry, are very magnificent buildings. The opera-house is also a beautiful structure: and the arsenal, which is handsomely built, in the form of a square, contains arms for 200,000 men. There are sundry manufactures in Berlin, and several schools, libraries, and charitable foundations. The number of its inhabitants, according to Busching, in 1755, was 126,661, including the garrison. In the same year, and according to the same author, there were no fewer than 443 silk looms, 149 of half silks, 2858 for woollen stuffs, 453 for cotton, 248 for linen, 454 for lace-work, 39 frames for silk stockings, and 310 for worsted ones. In the year 1774, the number of inhabitants was 104,874, of whom 5381 were French, 1162 Bohemians, and 3958: the garrison, reckoning their attendants, amounted to 29,540 souls, which may be added to the number of the inhabitants. They have here manufactures of tapestry, gold and silver lace, and mirrors.

The electorate of Saxony is by nature the richest country in Germany, if not in Europe; it contains 210 walled towns, 61 market-towns, and about 3000 villages, according to the latest accounts of the Germans themselves (to which, however, we are not to give an implicit belief); and the revenue, estimating each rix-dollar at four shillings and six-pence, amounts to 1,350,000*l*. This sum is so moderate, when compared to the richness of the soil (which, if we are to believe Dr. Busching, produces even diamonds, and almost all the precious stones to be found in the East Indies and elsewhere, and the variety of splendid manufactures), that the Saxon princes appear to have been the most moderate and patriotic of any in Germany.

Dresden, the elector of Saxony's capital, is remarkable for its fortifications, palaces, public buildings, churches, and charitable foundations; it is beautifully situated on both sides the Elbe, and is the school of Germany for statuary, painting, enamelling, and carving; not to mention its mirrors, and founderies for bells and cannon, and its foreign

commerce, carried on by means of the Elbe. The inhabitants of Dresden, by the latest accounts, amount to 110,000.

The city of Leipzig in Upper Saxony, 46 miles distant from Dresden, is situated in a pleasant and fertile plain on the Pleisse, and the inhabitants are said to amount to about 40,000. There are also large and well-built suburbs, with handsome gardens. Between these suburbs and the town is a fine walk of lime-trees, which was laid out in the year 1702, and encompasses the city. Mulberry-trees are also planted in the town-ditches: but the fortifications seem rather calculated for the use of the inhabitants to walk on, than for defence. The streets are clean, commodious and agreeable, and are lighted in the night with seven hundred lamps. They reckon 436 merchant-houses, and 192 manufactories of different articles, as brocades, paper, cards, &c. Leipzig has long been distinguished for the liberty of conscience allowed here to persons of different sentiments in religion. Here is an university, which is still very considerable, with six churches for the Lutherans (theirs being the established religion, one for the Calvinists, and a chapel in the castle for those of the Romish church. The university-library consists of about 26,000 volumes, 6000 of which are folios. Here is also a library for the magistrates, which consists of about 36,000 volumes and near 2000 manuscripts, and contains cabinets of urns, antiques, and medals, with many curiosities of art and nature. The exchange is an elegant building.

The city of Hanover, the capital of that electorate, stands on the river Leine, and is a neat, thriving, and agreeable city. It contains about twelve hundred houses, among which there is an electoral palace. It carries on some manufactures; and in its neighbourhood are the palace and elegant gardens of Herrenhausen. The dominions of the electorate of Hanover contain about seven hundred and fifty thousand people, who live in fifty-eight cities, and sixty market-towns, besides villages. The city and suburbs of Bremen, belonging, by purchase, to the said elector, contain about fifty thousand inhabitants, who have a considerable trade by the Weser. The other towns belonging to this electorate have trade and manufactures; but, in general, it must be remarked, that the electorate has suffered greatly by the accession of the Hanover family to the crown of Great-Britain. It may be proper to mention, on account of its relation to our royal family, the secularised bishopric of Osnaburg, lying between the rivers Weser and Ems. The chief city, Osnaburg, has been long famous all over Europe for the manufacture known by the name of the duchy, and for the manufacture of the best Westphalia hams. The whole revenue of the bishopric amounts to about 30,000*l*.

Breslau, the capital of Silesia, which formerly belonged to the kingdom of Bohemia, lies on the river Oder, and is a fine city, where all sects of Christians and Jews are tolerated; but the magistracy is Lutheran. Since Silesia fell under the Prussian dominion, its trade is greatly improved, being very inconsiderable before. The manufactures of Silesia, which principally centre at Breslau, are numerous. The revenue of the whole is, by some, said to bring his Prussian majesty in near a million sterling; but this sum seems to be exaggerated; if, as other authors of note write, it never brought in to the House of Austria above 500,000*l*. yearly.

Frankfort on the Maine, so called to distinguish it from another of the same name on the Oder, is situated in a healthful, fertile, and delightful country on the river just mentioned, by which it is divided in-

NATUR

to two parts, distinguished by the names of Frankfort and Saxenhausen. The former of these, being the largest, is divided into twelve wards, and the latter into two; and both are computed to contain about three thousand houses. The fortifications, which are both regular and solid, form a decagon, or figure consisting of ten bastions, faced with hewn stone; the ditches are deep, and filled with fresh water; and all the out-works are placed before the gates. Frankfort is the usual place of the election and coronation of the kings of the Romans, and is also a free and imperial city. It is of a circular form, without any suburbs; but the streets are generally narrow, and the houses are mostly built of timber and platter, and covered with slate; though there are some handsome private structures, of a kind of red marble, that deserve the name of palaces; as the buildings called the Compestel and Fronhof, the Trierhof, the Cullenhof, the German-house, an august edifice, situated near the bridge over the Maine, the Hesse Darmstadthof, the palace of the prince de la Tour, and the houses of the counts of Solms, Schauenburg, and Schönborn. There are likewise three principal squares.

Vienna is the capital of the circle of Austria, and, being the residence of the emperor, is supposed to be the capital of Germany. It is a noble and a strong city, and the princes of the House of Austria have omitted nothing that could contribute to its grandeur and riches. Vienna contains an excellent university, a bank, which is in the management of its own magistrates, and a court of commerce, immediately subject to the aulic council. Its religious buildings, with the walks and gardens, occupy a sixth part of the town; but the suburbs are larger than the city. It would be endless to enumerate the many palaces of this capital, two of which are imperial; its squares, academies, and libraries; and, among others, the fine one of prince Eugene, with his and the imperial cabinets of curiosities. Among its rich convents, is one of the Scotch nation, built in honour of their countryman St. Colman, the patron of Austria; and one of the six gates of this city is called the Scots' gate, in remembrance of some notable exploit performed there by the troops of that nation. The inhabitants of Vienna, including the suburbs, are computed at about three hundred thousand; and the encouragement given them by their sovereigns has rendered this city the rendez-vous of foreigners.

The streets, except those in the suburbs, are narrow and dirty. The houses of this city are generally of stone, five or six stories high, and flat roofed. They have three or four cellars under one another, with an open space in the middle of each arched roof, for the communication of air; and from the lowermost of all, there is a tube to the top, to let in air from the street. The winds often blow so strong, that it is troublesome to walk the streets. A remarkable prerogative of the sovereign here, is, that the second floor of every house belongs to him, and is assigned to whomsoever he thinks proper: and hence there is no part of Germany where lodging is so dear as at Vienna. An odd custom prevails here of putting iron bars to all the windows, up to the very tops of the houses; which makes them all look like so many prisons. The houses and furniture of the citizens are greatly disproportioned to the magnificence of the palaces, squares, and other public buildings; but the excessive imposts laid by the House of Austria upon every commodity in its dominions must always keep the manufacturing part of its subjects poor.

ANTIQUITIES AND CURIOSITIES, } In describing the mineral and  
NATURAL AND ARTIFICIAL. } other springs, a great part of this

article, which is of itself very copious, has been already anticipated. Every court of Germany produces a cabinet of curiosities, artificial and natural, ancient and modern. The tun at Heidelberg holds 800 hogs-heads, and is generally full of the best Rhenish wine, from which strangers are seldom suffered to retire sober. Vienna itself is a curiosity; for here you see the greatest variety of inhabitants that is to be met with any-where, as Greeks, Transylvanians, Sclavonians, Turks, Tartars, Hungarians, Croats, Germans, Poles, Spaniards, French, and Italians, in their proper habits. The imperial library at Vienna is a great literary rarity, on account of its ancient manuscripts. It contains upwards of 80,000 volumes, among which are many valuable manuscripts in Hebrew, Syriac, Arabic, Turkish, Armenian, Coptic, and Chinese; but the antiquity of some of them is questionable, particularly a New Testament in Greek, said to have been written 1500 years ago, in gold letters, upon purple. Here are likewise many thousand Greek, Roman, and Gothic coins and medals; with a vast collection of other curiosities of art and nature. The vast Gothic palaces, cathedrals, castles, and, above all, town-houses in Germany, are very curious, and impress the beholder with their rude magnificence: many castles have the same appearance, probably, as they had 400 years ago; and their fortifications generally consist of a brick wall, trenches filled with water, and bastions or half-moons.

Next to the lakes and waters, the caves and rocks are the chief natural curiosities of Germany. There is said to be a cave, near Blackenburg, in Hartz-forest, of which no person has yet found the end, though many have advanced into it for twenty miles. But the most remarkable curiosity of that kind is near Hamelen, about thirty miles from Hanover, where, at the mouth of a cave, stands a monument which commemorates the loss of 130 children, who were there swallowed up in 1284. This fact, however, though it is very strongly attested, has been disputed by some critics. Frequent mention is made of two rocks near Blackenburg, exactly representing two monks in their proper habits; and of many stones which seem to be petrifications of fishes, frogs, trees, and leaves.

COMMERCE AND MANUFACTURES.] Germany has vast advantages in point of commerce, from its situation in the heart of Europe, and being intersected, as it were, with great rivers. Its native materials for commerce, besides mines and minerals, are hemp, hops, flax, anise, cumin, tobacco, saffron, madder, truffles, variety of excellent roots and pot-herbs, and fine fruits, equal to those of France and Italy. Germany exports to other countries, corn, tobacco, horses, lean cattle, butter, cheese, honey, wax, wines, linen and woollen yarn, ribbands, silk and cotton stuffs, toys, turnery-wares in wood, metals, and ivory, goat-skins, wool, timber both for ship-building and houses, cannon and bullets, bombs and bomb-shells, iron plates and stoves, tinned plates, steel work, copper, brass-wire, porcelain, the finest upon earth, earthen-ware, glasses, mirrors, hogs' bristles, mum, beer, tartar, snalts, zaffer, Prussian blue, printers' ink, and many other articles.

The revocation of the edict of Nantes by Lewis XIV. which obliged the French protestants to settle in different parts of Europe, was of infinite service to the German manufactures. They now make velvets, silks, stuffs of all kinds, fine and coarse linen and thread, and every thing necessary for wear, to great perfection. The porcelain of Meissen, in the electorate of Saxony, and its paintings, have been long in great repute.

TRADING COMPANIES.] The Asiatic company of Embden, established by Frederic II. king of Prussia, was, exclusive of the Hanseatic league, the only commercial company in Germany; but no ships have been sent out since the year 1760. The heavy taxes imposed on the company have been the cause of its total annihilation. In the great cities of Germany, very large and extensive partnerships in trade subsist.

CONSTITUTION AND GOVERNMENT.] Almost every prince in Germany (and there are about 300 of them) is arbitrary with regard to the government of his own estates; but the whole of them form a great confederacy, governed by political laws, at the head of which is the emperor, and whose power in the collective body, or the diet, is not directorial, but executive; but even that gives him vast influence. The supreme power in Germany is the diet, which is composed of the emperor, or, in his absence, of his commissary, and of the three colleges of the empire. The first of these is the electoral college; the second is the college of princes; and the third, the college of imperial towns.

The empire was hereditary under the race of Charlemagne, but, after that, became elective; and in the beginning, all the princes, nobility, and deputies, of cities, enjoyed the privilege of voting. In the reign of Henry V. the chief officers of the empire altered the mode of election in their own favour. In the year 1239, the number of electors was reduced to seven. One elector was added in 1649, and another in 1692.

The dignity of the empire, though elective, has for some centuries belonged to the House of Austria, as being the most powerful of the German princes; but, by French management, upon the death of Charles VI. grandfather, by the mother's side, to the emperor Joseph II. the elector of Bavaria, was chosen to that dignity, and died, as it is supposed, heart-broken, after a short uncomfortable reign. The power of the emperor is regulated by the capitulation he signs at his election; and the person, who in his life-time is chosen king of the Romans, succeeds, without a new election, to the empire. He can confer titles and enfranchisements upon cities and towns; but, as emperor, he can levy no taxes, nor make war or peace, without the consent of the diet. When that consent is obtained, every prince must contribute his *quota* of men and money, as valued in the matriculation roll, though perhaps, as an elector or prince, he may espouse a different side from that of the diet. This forms the intricacy of the German constitution; for George II. of England, as elector of Hanover, was obliged to furnish his *quota* against the House of Austria, and also against the king of Prussia, while he was fighting for them both. The emperor claims a precedency for his ambassadors in all Christian courts.

The nine electors of the empire have each a particular office in the imperial court, and they have the sole election of the emperor. They are in order,

First, The archbishop of Mentz, who is high-chancellor of the empire when in Germany.

Second, The archbishop of Triers, who is high-chancellor of France and Arrelat, which, since the separation of France from the empire, is merely nominal.

Third, The archbishop of Cologne, who is the same in Italy, a mere title also.

The king, or rather elector of Bohemia, who is cup-bearer.

The elector of Bavaria, who is grand sewer, or officer who serves out the feasts.

The elector of Saxony, who is great marshal of the empire.

The elector of Brandenburg (now king of Prussia), who is great chamberlain.

The elector Palatine, who is great steward; and,

The elector of Hanover (king of Great Britain), who claims the post of arch-treasurer.

It is necessary for the emperor, before he calls a diet, to have the advice of those members; and during the vacancy of the imperial throne, the electors of Saxony and Bavaria have jurisdictions, the former over the northern, and the latter over the southern circles.

The ecclesiastical princes are as absolute as the temporal ones in their several dominions. The chief of these, besides the three ecclesiastical electors already mentioned, are the archbishop of Saltzburg, the bishops of Liege, Munster, Spire, Worms, Wurtzburg, Strasburg, Osnaburg, Bamberg, and Paderborn. Besides these, there are many other ecclesiastical princes. Germany abounds with many abbots and abbees, whose jurisdictions are likewise absolute, and some of them very considerable; and all of them are chosen by their several chapters. The chief of the secular princes are the landgrave of Hesse, the dukes of Brunswic, Wolfenbuttle, Wurtemberg, Mecklenburg, Saxe-Gotha, the marquises of Baden and Culmbach; with the princes of Nassau, Anhalt, Furstenburg, and many others, who have all high titles, and are sovereigns in their own dominions. The free cities are likewise sovereign states: those which are imperial, or compose part of the diet, bear the imperial eagle in their arms; those which are Hanse towns, of which we have spoken in the Introduction, have still great privileges and immunities, but they subsist no longer as a political body.

The imperial chamber, and that of Vienna, which is better known by the name of the aulic council, are the two supreme courts for determining the great causes of the empire, arising between its respective members. The imperial council consists of fifty judges or assessors. The president, and four of them, are appointed by the emperor, and each of the electors chooses one, and the other princes and states the rest. This court is at present held at Wetzlar, but formerly resided at Spire: and causes may be brought before it by appeal. The aulic council was originally no better than a revenue court of the dominions of the House of Austria. As that family's power increased, the jurisdiction of the aulic council was extended upon the powers of the imperial chamber, and even of the diet. It consists of a president, a vice-chancellor, a vice-president, and a certain number of aulic counsellors, of whom six are protestants, besides other officers; but the emperor, in fact, is master of the court. These courts follow the ancient laws of the empire for their guides, the golden bull, the pacification of Passau, and the civil law.

Besides these courts of justice, each of the nine circles has a director to take care of the peace and order of the circle. These directors are commonly as follow: for Westphalia, the bishop of Munster, or duke of Neuburg; for Lower Saxony, the elector of Hanover or Brandenburg. For Upper Saxony, the elector of Saxony. For the Lower Rhine, the archbishop of Mentz. For the Upper Rhine, the elector Palatine, or bishop of Worms. For Franconia, the bishop of Bamberg, or marquis of Culmbach. For Swabia, the duke of Wurtemberg, or bishop of Constance. For Bavaria, the elector of Bavaria, or archbishop of Saltzburg; and for Austria, the archduke of Austria, his imperial majesty.

Upon any great emergency, after the votes of the diet are collected, and sentence pronounced, the emperor, by his prerogative, commits the

execution of it to a particular prince or princess, whose troops live at free quarter upon the estates of the delinquent, and he is obliged to make good all expenses.

The constitution of the Germanic body is a study of no small difficulty. However plausibly invented the several checks upon the imperial power may be, it is certain that the House of Austria has more than once endangered the liberties of the empire, and that they have been saved by France. The House of Austria, indeed, met with a powerful opposition from the House of Brandenburg, in consequence of the activity and abilities of the king of Prussia. It may here be proper to inform the reader of the meaning of a term which frequently appears in the German history,—that of the *Pragmatic Sanction*. This is no other than a provision made by the emperor Charles VI. for preserving the indivisibility of the Austrian dominions in the person of the next descendant of the last possessor, whether male or female. This provision has been often disputed by other branches of the House of Austria, who have been occasionally supported by France from political views, though the pragmatic sanction is strongly guaranteed by almost all the powers of Europe. The late emperor, elector of Bavaria, and the late king of Poland, attempted to overthrow it, as being descended from the daughters of the emperor Joseph, elder brother to Charles VI. It has likewise been repeatedly opposed by the court of Spain.

Few of the territories of the German princes are so large as to be assigned to viceroys, to be oppressed and fleeced at pleasure; nor are they entirely without redress when they suffer any grievance; as they may appeal to the general diet, or great council of the empire, for relief. The subjects of the petty princes in Germany are generally the most unhappy; for these princes, affecting the grandeur and splendor of the more powerful, in the number and appearance of their officers and domestics, in their palaces, gardens, pictures, curiosities, guards, bands of music, tables, dress, and furniture, are obliged to support all this vain pomp and parade at the expense of their vassals and dependants. With respect to the burghers and peasants of Germany, the former in many places enjoy great privileges: the latter also, in some parts, as in Franconia, Swabia, and on the Rhine, are generally a free people, or perform only certain services to their superiors, and pay the taxes: whereas, in the marquisate of Brandenburg, Pomerania, Lusatia, Moravia, Bohemia, Austria, &c. their condition is various, indeed, but universally very servile.

**REVENUES.]** The only revenue falling under this head is that of the emperor, who, as such, has an annual income of about 5000 or 6000l. sterling, arising from some inconsiderable fiefs in the Black Forest. The Austrian revenues are immense, and are thought to amount to 7,000,000l. sterling in Germany and Italy, a sum that goes far in those countries. Frederic-William I. of Prussia, whose revenues were not near so extensive as those of his son, Frederic II. the uncle of the late king of Prussia, though he maintained a large army, was so good an economist, that he left 7,00,000l. sterling in his coffers; and Silesia alone yields above half a million sterling annually. From the magnificence of many of the German courts, a stranger is apt to conceive very high ideas of the incomes of their princes; which is owing to the scarcity of money in that country, and, consequently, the low price of provisions and manufactures.

**MILITARY STRENGTH.]** During the two last wars, very little regard was paid, in carrying them on, to the ancient German constitutions; the

whole management being engrossed by the head of the House of Austria. The elector of Mentz keeps what is called a matriculation book, or register, which, among other matters, contains the assessment of men and money, which every prince and state, who are members of the empire, is to advance when the army of the empire takes the field. The contributions in money are called Roman months, on account of the monthly assessments, paid to the emperors when they visited Rome. Those assessments, however, are subject to great mutability. It is sufficient here to say, that, upon a moderate computation, the secular princes of the empire can bring to the field 379,000 men, and the ecclesiastical 74,500, in all 453,500; of those the emperor, as head of the House of Austria, is supposed to furnish 90,000.

By this computation, which is far from being exaggerated, it appears that the emperor and empire form the most powerful government in Europe; and if the whole force was united, and properly directed, Germany would have nothing to fear from any of its ambitious neighbours.

But the different interests pursued by the several princes of Germany render the power of the emperor of little consequence, except with regard to his own forces, which are indeed very formidable. The imperial army was computed, in 1775, to amount to two hundred thousand; and, in the present war, the emperor has brought about the same number into the field.

IMPERIAL, ROYAL, AND OTHER } The emperor of Germany pre-  
TITLES, ARMS, AND ORDERS. } tends to be successor to the emperors of Rome, and has long, on that account, been admitted to a tacit precedency on all public occasions among the powers of Europe. Austria is but an archdukedom; nor has he, as the head of that House, a vote in the election of emperor; which is limited to Bohemia. Innumerable are the titles of principalities, dukedoms, baronies, and the like, with which he is vested as archduke. The arms of the empire are a black eagle with two heads, hovering with expanded wings, in a field of gold; and over the heads of the eagle is seen the imperial crown. On the breast of the eagle is an escutcheon quarterly of eight, for Hungary, Naples, Jerusalem, Arragon, Anjou, Guelders, Brabant, and Barr. It would be as useless as difficult to enumerate all the different quarterings and armorial bearings of the archducal family. Every elector, and indeed every independent prince of any importance in Germany, claims a right of instituting orders; but the emperors pretend that they are not admissible unless confirmed by them. The emperors of Germany, as well as the kings of Spain, confer the order of the Golden Fleece, as descended from the House of Burgundy. The empress dowager Eleonora, in 1662 and 1666, created two orders of ladies, or female knights; and the late empress-queen instituted the order of St. Theresa.

The "*Order of the Golden Fleece*" was instituted at Bruges, in Flanders, on the 10th of January, 1429, by Philip, duke of Burgundy, on the day of his marriage with his third wife. It is supposed that he chose the badge, it being the chief of the staple manufactures of his country. It at first consisted of thirty knights, including the sovereign, who were of the first families in the Low Countries; and it still continues to be classed with the most illustrious orders of knighthood in Europe. At present there are two branches of it; of the one, the emperor is sovereign, and the king of Spain of the other; all must prove their noble descent from the twelfth century. The motto of the order is "*Pretium non vile laborum.*" The "*Teutonic Order*" owed its origin to some religious Germans in Jerusalem during the crusades, who assumed the title of "*Teutonic knights, or brethren of the hospital of our Lady of the Germans at Jerusalem.*" Courade, duke of Swabia, invited them into Prussia, about the year 1230; soon after, they conquered Prussia for themselves, and became one of the most powerful orders in Europe. By their internal quarrels, they afterwards lost their power and possessions: and Albert, marquis of Brandenburg, grand-master of the order, on his abjuring popery, abdicated the grand-mastership, subdued Prussia, and expelled all the papists who would not follow his example. The order is now divided into two branches: the protestant branch, which has a house at Utrecht, has been noticed in our account of orders in the Netherlands:—that for papists has a house at Mergentheim, in Germany, and the members must take the oath of celibacy. The ensign worn by this branch is worn round the neck, pendent to a gold chain.

The time of the institution of the "*Order of the Red Eagle*" is uncertain. The margrave of Bareith is sovereign of it, and it is generally bestowed on military officers. In the year 1690, John-George, elector of

Saxony, and Frederic III. elector of Brandenburg, on terminating their disputes, established the "*Order of Sincerity*," as a confirmation and security hereafter of their amity. The knights of this order wear a bracelet of gold; on one side are the names of the two princes, with this device, "*Amitié sincère*;" on the other side are two armed hands, joined together, and placed on two swords, with two palm-branches crossed, with this motto, "*Unis pour jamais*."

John-George, duke of Saxe Weiffenfels, instituted the "*Order of the Noble Passion*," in the year 1704, of which the duke is the sovereign. Each knight of the order is to contribute to the maintenance of the maimed or decayed soldiers in the service of the sovereign. In the year 1709, Louisa-Elizabeth, widow of Philip, duke of Saxe Meriburg, revived the "*Order of the Death's Head*," first instituted in 1652, by her father, the duke of Wurtemberg. A princess of that house alone can be sovereign of it, and none but women of virtue and merit (birth and fortune not regarded) be received into it. They are to avoid gaming, theatrical amusements, and luxuries of all kinds. The badge of the order is a death's head enamelled white, surmounted with a cross pattée, black; above the cross pattée, another cross composed of five jewels, by which it hangs to a black ribband edged with white, and on the ribband these words, "*Memento mori*," worn at the breast.

The great order of Wurtemberg is that "*of the Chase*," instituted in the year 1702, by the then duke, and improved in the year 1719. On the left side of the coat is a silver star embroidered, of the same figure as the badge, in the middle of a green circle, with the motto "*Amicitia Virtutisque Fœdus*." The festival of this order is on St. Hubert's day, he being the patron of sportsmen.

In the year 1709, the elector Palatine revived the "*Order of St. Hubert*," first instituted by a duke of Juliers and Cleves, in memory of a victory gained by him on St. Hubert's day, in 1447. All the knights have either military employments or pensions. The archbishop of Saltzburg, in 1701, instituted the "*Order of St. Rupert*," in honour of the founder and patron of the see he held, and as the apostle of his country. As the archbishop is the richest and most powerful prince of Bavaria, next to the elector, his order is in good esteem. In the year 1729, Albert, elector of Bavaria, instituted the "*Order of St. George, the Defender of the Immaculate Conception*," the knights of which are obliged to prove their nobility by father and mother for five generations.

The "*Order of the Golden Lion*," instituted by the present landgrave of Hesse-Cassel, is equally a military and civil order, but mostly conferred on general officers. The present landgrave has also instituted the military "*Order of Merit*," the badge of which is a gold cross, of eight points, enamelled white, and in the centre this motto, "*Pro Virtute et Fidelitate*:" it is worn at the coat button-hole, pendent to a blue ribband edged with silver.

[HISTORY.] The manners of the ancient Germans are well described by the elegant and manly pencil of Tacitus, the Roman historian. They were a brave and independent race of men, and peculiarly distinguished by their love of liberty and arms. They opposed the force of the Roman empire, not in its origin or in its decline, but after it had arrived at maturity, and still continued in its full vigour. The country was divided into a number of principalities, independent of each other, though occasionally connected by a military union for defending themselves against such enemies as threatened the liberties of them all. At length, the Roman power, supported by art and policy, prevailed

over a great part of Germany, and it was reduced to the condition of a province. When the Roman empire was shattered by the northern barbarians, Germany was over-run by the Franks, about the year 480, and a considerable part of it long remained in subjection to earls and marquises of that nation. In this situation Germany continued, notwithstanding the efforts of particular chieftains or princes to reduce the rest into subjection, until the beginning of the ninth century; then it was that Charlemagne, one of those eccentric and superior geniuses who sometimes start up in a barbarous age, first extended his military power, and afterwards his civil authority, over the whole of this empire. The posterity of Charlemagne inherited the empire of Germany until the death of Lewis III. in the year 911, at which time the different princes, assuming their original independence, rejected the Carlovinian line, and placed Conrade, duke of Franconia, on the throne. Since this time, Germany has ever been considered as an elective monarchy. Princes of different families, according to the prevalence of their interest and arms, have mounted the throne. Of these, the most considerable, until the Austrian line acquired the imperial power, were the Houses of Saxony, Franconia, and Swabia. The reigns of these emperors contain nothing more remarkable than the contests between them and the popes. From these, in the beginning of the thirteenth century, arose the factions of the Guelphs and Gibbelines, of which the former was attached to the pope, and the latter to the emperor; and both, by their violence and inveteracy, tended to disquiet the empire for several ages. The emperors too were often at war with the Turks, and sometimes the German princes, as happens in all elective kingdoms, with one another about the succession. But what more deserves the attention of a judicious reader than all those noisy but uninteresting disputes, is the progress of government in Germany, which was in some measure opposite to that of the other kingdoms of Europe. When the empire reigned by Charlemagne fell asunder, all the different independent princes assumed the right of election; and those now distinguished by the name of electors had no peculiar or legal influence in appointing a successor to the imperial throne; they were only the officers of the king's household, his secretary, his steward, chaplain, marshal, or master of his horse, &c. By degrees, as they lived near the king's person, and, like all other princes, had independent territories belonging to them, they increased their influence and authority; and in the reign of Otho III. of the House of Saxony, in the year 984, acquired the sole right of electing the emperor\*. Thus, while, in other kingdoms of Europe, the dignity of the great lords, who were all originally allodial or independent barons, was diminished by the power of the king, as in France, and by the influence of the people, as in Great Britain—in Germany, on the other hand, the power of the electors was raised upon the ruins of the emperor's supremacy, and of the people's jurisdiction. Otho I. having, in the year 962, united Italy to the empire of Germany, procured a decree from the clergy, that he and his successors should have the power of nominating the pope, and of granting investitures to bishops. Henry V. a weak and wicked prince, in the year 1122, surrendered up the right of investiture and other powers, to the disgrace of the imperial dignity; but pope Benedict XII. refusing absolution to Louis V. of Bavaria, in 1338, it was declared in the diet of the empire, that the majority of

\* Wiquesfort says, that nothing was settled as to the number of electors, or the electoral dignity, till Charles IV. who was chosen emperor in 1347, and made that famous constitution for the election of emperors, called the *Golden Bull*,

fruffrags of the electoral college should confer the empire without the consent of the pope, and that he had no superiority over the emperor, nor any right to reject or to approve of elections. In 1438, Albert II, archduke of Austria, was elected emperor, and the imperial dignity continued in the male line of that family for three hundred years. One of his successors, Maximilian, married the heiress of Charles, duke of Burgundy, and the seventeen provinces of the Netherlands, were annexed to the House of Austria. Charles V, grandson of Maximilian, and heir to the kingdom of Spain in right of his mother, was elected emperor in the year 1519. Under him Mexico and Peru were conquered by the Spaniards, and in his reign happened the reformation of religion in several parts of Germany, which, however, was not confirmed by public authority till the year 1648, by the treaty of Westphalia, and in the reign of Ferdinand III. The reign of Charles V. was continually disturbed by his wars with the German princes, and the French king, Francis I. Though successful in the beginning of his reign, his good fortune toward the conclusion of it began to forsake him; which, with other reasons, occasioned his abdication of the crown.

His brother, Ferdinand I. who, in 1558, succeeded to the throne, proved a moderate prince with regard to religion. He had the address to procure his son Maximilian to be declared king of the Romans, in his own life-time, and died in 1564. By his last will he ordered, that if either his own male issue, or that of his brother Charles, should fail, his Austrian estates should revert to his second daughter Anne, wife to the elector of Bavaria, and her issue.

This destination is noticed as it gave rise to the late opposition made by the House of Bavaria to the pragmatic sanction in favour of the late empress-queen of Hungary, on the death of her father Charles VI. The reign of Maximilian II. was disturbed with internal commotions, and an invasion from the Turks; but he died in peace, in 1576. He was succeeded by his son Rodolph, who was involved in wars with the Hungarians, and in differences with his brother Matthias, to whom he ceded Hungary and Austria in his life-time. To him succeeded in the empire, Matthias, under whom the reformers, who went by the names of Lutherans and Calvinists, were so much divided among themselves, as to threaten the empire with a civil war. The ambition of Matthias at last reconciled them; but the Bohemians revolted, and threw the imperial commissaries out of a window, at Prague. This gave rise to a ruinous war, which lasted thirty years. Matthias thought to have exterminated both parties; but they formed a confederacy, called the *Evangelic League*, which was counterbalanced by a *Catholic League*.

Matthias dying in 1618, was succeeded by his cousin, Ferdinand II, but the Bohemians offered their crown to Frederic, the elector palatine, the most powerful protestant prince in Germany, and son-in-law to his Britannic majesty, James I. That prince was incautious enough to accept of the crown; but he lost it, being entirely defeated by the duke of Bavaria and the imperial generals, at the battle of Prague: and he was also deprived of his own electorate, the best part of which was given to the duke of Bavaria. The protestant princes of Germany, however, had among them at this time many able commanders, who were at the head of armies, and continued the war with great firmness and intrepidity; among them were the margrave of Baden Dourlach, Christian duke of Brunswic, and count Mansfield; the last was one of the best generals of the age. Christian IV. king of Denmark, declared

for them; and Richelieu, the French minister, did not wish to see the House of Austria aggrandised. The emperor, on the other hand, had excellent generals; and Christian having put himself at the head of the evangelic league, was defeated by Tilly, an imperialist of great reputation in war. Ferdinand so grossly abused the advantages obtained over the protestants, that they formed a fresh confederacy at Leipsic, of which the celebrated Gustavus Adolphus, king of Sweden, was the head. His victories and progress, till he was killed at the battle of Lutzen, in 1632, have already been related. But the protestant cause did not die with him. He had brought up a set of heroes, such as the duke of Saxe Wiemar, Torstenson, Banier, and others, who shook the Austrian power, till, under the mediation of Sweden, a general peace was concluded among all the powers at war, at Munster, in the year 1648; which forms the basis of the present political system of Europe.

Ferdinand II. died in 1637, and was succeeded by his son, Ferdinand III. who died in 1657, and was succeeded by the emperor Leopold, a severe, unamiable, and not very fortunate prince. He had two great powers to contend with; France on the one side, and the Turks on the other; and was a loser in his war with both. France took from him Alsace, and many other frontier places of the empire; and the Turks would have taken Vienna, had not the siege been raised by John Sobieski, king of Poland. Prince Eugene, of Savoy, was a young adventurer in arms, about the year 1697; and being one of the imperial generals, gave the Turks the first checks they received in Hungary; and by the peace of Carlowitz, in 1699, Transylvania was ceded to the emperor. The empire, however, could not have withstood the power of France, had not the prince of Orange, afterwards king William III. of England, laid the foundation of the grand confederacy against the French power, the consequences of which have been already described. The Hungarians, secretly encouraged by the French, and exasperated by the unfeeling tyranny of Leopold, were still in arms, under the protection of the Porte, when that prince died, in 1705.

He was succeeded by his son, Joseph, who put the electors of Cologne and Bavaria to the ban of the empire; but being very ill served by prince Lewis of Baden, the general of the empire, the French partly recovered their affairs, notwithstanding their repeated defeats. The duke of Marlborough, though he obtained very splendid victories, had not all the success he expected or deserved. Joseph himself was suspected of a design to subvert the Germanic liberties; and it was evident, by his conduct, that he expected England should take the principal part in the war, which was chiefly carried on for his benefit. The English were disgusted at his slowness and selfishness; but he died in 1711, before he had reduced the Hungarians; and leaving no male issue, was succeeded in the empire by his brother, Charles VI. whom the allies were endeavouring to place on the throne of Spain, in opposition to Philip, duke of Anjou, grandson to Lewis XIV.

When the peace of Utrecht took place, in 1713, Charles at first made a show as if he would continue the war; but found himself unable, now that he was forsaken by the English. He therefore was obliged to conclude a peace with France, at Baden, in 1714, that he might oppose the progress of the Turks in Hungary, where they received a total defeat from prince Eugene, at the battle of Peterwaradin. They received another, of equal importance, from the same general, in 1717, before Belgrade, which fell into the hands of the imperialists; and the following year the peace of Passarowitz, between them and the Turks, was concluded. Charles was

continually employed in making arrangements for increasing and preserving his hereditary dominions in Italy and the Mediterranean. Happily for him, the crown of Britain devolved to the House of Hanover; an event which gave him a very decisive weight in Europe, by the connections of George I. and II. with the empire. Charles was sensible of this, and carried matters with so high a hand, that, about the years 1724 and 1725, a breach ensued between him and George I. and so unsteady was the system of affairs all over Europe at that time, that the capital powers often changed their old alliances, and concluded new ones, contrary to their interest. Without entering into particulars, it is sufficient to observe, that the safety of Hanover, and its aggrandisement, was the main object of the British court; as that of the emperor was the establishment of the pragmatic sanction, in favour of his daughter, the late empress-queen, he having no male issue. Mutual concessions upon those great points restored a good understanding between George II. and the emperor Charles; and the elector of Saxony being prevailed upon by the prospect of gaining the throne of Poland, relinquished the claims he had upon the Austrian succession.

The emperor, after this, had very ill success in a war he entered into with the Turks, which he had undertaken chiefly to indemnify himself for the great sacrifices he had made in Italy to the princes of the House of Bourbon: Prince Eugene was then dead, and he had no general to supply his place. The system of France, under cardinal Fleury, happened at that time to be pacific, and she obtained for him, from the Turks, a better peace than he had reason to expect. Charles, to pacify the German and other European powers, had, before his death, given his eldest daughter, the late empress-queen, in marriage to the duke of Lorraine, a prince who could bring no accession of power to the Austrian family. Charles died in 1740.

He was no sooner in the grave, than all he had so long laboured for must have been overthrown, had it not been for the firmness of George II. The pragmatic sanction was attacked on all sides. The young king of Prussia, with a powerful army, entered and conquered Silesia, which he said had been wrongfully dismembered from his family. The king of Spain and the elector of Bavaria set up claims directly incompatible with the pragmatic sanction; and in this they were joined by France; though all those powers had solemnly guaranteed it. The imperial throne, after a considerable vacancy, was filled up by the elector of Bavaria, who took the title of Charles VII. in January, 1742. The French poured their armies into Bohemia, where they took Prague: and the queen of Hungary, to take off the weight of Prussia, was forced to cede to that prince the most valuable part of the duchy of Silesia, by a formal treaty.

Her youth, her beauty, and sufferings, and the noble fortitude with which she bore them, touched the hearts of the Hungarians, under whose protection she threw herself and her infant son; and though they had always been remarkable for their disaffection to the House of Austria, they declared unanimously in her favour. Her generals drove the French out of Bohemia; and George II. at the head of an English and Hanoverian army, gained the battle of Dettingen, in 1743. Charles VII. was at this time dressed on the imperial throne, and driven out of his electoral dominions, as had been his ancestor, in queen Anne's reign, for siding with France, and would have given the queen of Hungary almost her own terms; but she haughtily and impolitely rejected all accommodation, though advised to it by his Britannic majesty, her best, and indeed

only friend. To invade Bohemia, though he took, he was not supposed to be the conqueror, and the queen of Prussia, that she the beginning of the grand-duke of mounting some Francis I.

The bad success of the Low Countries, nations of the emperor's brother, the Prussians, was such, that the possession of Silesia, which he justly pretended to have been entered into by the king of Poland, and to divide the king of Poland, took possession of the mediation acknowledged for emperor. disadvantage, finished by the Silesia was once before that moment, the press of Russia, king of Poland, schemes, a free king of Prussia, many, and his two principles gotten, and 670,000. to flames of which

His Prussian imperial general down their a elector of Saxony, his Prussian poured, by Germany. To be parallel conceivable general Bro the tide of t most tremor his troops w general Dan The operat

only friend. This obstinacy gave a colour for the king of Prussia to invade Bohemia, under pretence of supporting the imperial dignity; but though he took Prague, and subdued the greatest part of the kingdom, he was not supported by the French; upon which he abandoned all his conquests, and retired to Silesia. This event confirmed the obstinacy of the queen of Hungary, who came to an accommodation with the emperor, that she might recover Silesia. Soon after, his imperial majesty, in the beginning of the year 1745, died; and the duke of Lorraine, then grand-duke of Tuscany, consented to her Hungarian majesty, after surmounting some difficulties, was chosen emperor, by the title of Francis I.

The bad success of the allies against the French and Bavarians in the Low Countries, and the loss of the battle of Fontenoy, retarded the operations of the empress-queen against his Prussian majesty. The latter beat the emperor's brother, prince Charles of Lorraine, who had before driven the Prussians out of Bohemia; and the conduct of the empress-queen was such, that his Britannic majesty thought proper to guarantee to him the possession of Silesia, as ceded by treaty. Soon after, his Prussian majesty pretended that he had discovered a secret convention which had been entered into between the empress-queen, the empress of Russia, and the king of Poland, as elector of Saxony, to strip him of his dominions, and to divide them among themselves. Upon this he suddenly attacked the king of Poland, drove him out of Saxony, defeated his troops, and took possession of Dresden, which he held till a treaty was made under the mediation of his Britannic majesty, by which the king of Prussia acknowledged the duke of Lorraine, now become great-duke of Tuscany, for emperor. The war continued in the Low Countries, not only to the disadvantage, but to the discredit of the Austrians and Dutch, till it was finished by the treaty of Aix-la-Chapelle, in April, 1748. By that treaty, Silesia was once more guaranteed to the king of Prussia. It was not long before that monarch's jealousies were renewed and verified; and the empress of Russia's views falling in with those of the empress-queen and the king of Poland, who were unnaturally supported by France in their new schemes, a fresh war was kindled in the empire, in the year 1756. The king of Prussia declared against the admission of the Russians into Germany, and his Britannic majesty against that of the French. Upon those two principles, all former differences between these monarchs were forgotten, and the British parliament agreed to pay an annual subsidy of 670,000*l.* to his Prussian majesty during the continuance of the war, the flames of which were now rekindled with more fury than ever.

His Prussian majesty once more broke into Saxony, defeated the imperial general Brown, at the battle of Lowositz, forced the Saxons to lay down their arms, though almost impregnablely fortified at Pirna; and the elector of Saxony again fled to his regal dominions in Poland. After this, his Prussian majesty was put to the ban of the empire; and the French poured, by one quarter, their armies, as the Russians did by another, into Germany. The conduct of his Prussian majesty on this occasion is scarcely to be paralleled in history. He broke once more into Bohemia with inconceivable rapidity, and defeated an army of 100,000 Austrians, under general Brown, who was killed, as the brave marshal Schwerin was on the side of the Prussians. He then besieged Prague, and plied it with a most tremendous artillery; but, just as he was beginning to imagine that his troops were invincible, they were defeated at Colin, by the Austrian general Daun, obliged to raise the siege, and to fall back upon Eifenach. The operations of the war now multiplied every day. The imperialists,

under count Daun, were formed into excellent troops; but they were beaten at the battle of Lissa, and the Prussians took Breslau, and obtained many other great advantages. The Russians, after entering Germany, gave a new turn to the aspect of the war; and the cautious, yet enterprising genius of count Daun, laid his Prussian majesty under infinite difficulties, notwithstanding all his amazing victories. At first he defeated the Russians at Zorndorf; but an attack made upon his army, in the night-time, by count Daun at Hochkirchen, had nearly proved fatal to his affairs, though he retrieved them with admirable presence of mind. He was obliged, however, to sacrifice Saxony, for the safety of Silesia; and it has been observed, that few periods of history afford such room for reflection as this campaign did; six sieges were raised almost at the same time; that of Colberg by the Russians; that of Leipsic, by the duke of Deux Ponts, who commanded the army of the empire; that of Dresden, by count Daun; and those of Neiss, Cosel, and Torgau, also by the Austrians.

Many important events which passed at the same time in Germany, between the French, who were driven out of Hanover, and the English, or their allies, must be omitted on account of the brevity necessary to be observed in this compendium. The operations on both sides are of little importance to history, because nothing was done that was decisive, though the war was extremely burdensome and bloody to Great Britain. Great was the ingratitude of the empress-queen to his Britannic majesty and his allies, who were now daily threatened with the ban of the empire. The Russians had taken possession of the kingdom of Prussia, and laid siege to Colberg, the only port of his Prussian majesty in the Baltic. Till then, he had entertained too mean an opinion of the Russians; but he soon found them by far the most formidable enemies he had. They advanced under count Soltikoff, in a body of 100,000 men, to Silesia. In this distress he acted with a courage and resolution that bordered upon despair; but was, at last, totally defeated by the Russians, with the loss of 20,000 of his best men, in a battle near Frankfort. He became now the tennis-ball of fortune. Succeeding defeats seemed to announce his ruin, and all avenues towards peace were shut up. He had lost, since the first of October, 1756, the brave marshal Keith, and forty brave generals, besides those who were wounded and made prisoners. At Landschut, the imperial general Laudohn defeated his army under Fottquet, on which he had great dependence, and thereby opened to the Austrians an easy passage into Silesia. None but his Prussian majesty would have thought of continuing the war under such repeated losses; but every defeat he received seemed to give him fresh spirits. It is not, perhaps, very easy to account for the inactivity of his enemies after his defeat near Frankfort, but by the jealousy which the imperial generals entertained of their Russian allies. They had taken Berlin, and laid the inhabitants under pecuniary contributions; but towards the end of the campaign, he defeated the imperialists in the battle of Torgau, in which count Daun was wounded. This was the best fought action the king of Prussia had ever been engaged in; but it cost him 10,000 of his best troops, and was attended with no great consequences in his favour. New re-inforcements which arrived every day from Russia, the taking of Colberg by the Russians, and of Schweidnitz by the Austrians, seemed almost to have completed his ruin, when his most formidable enemy, the empress of Russia, died, January 5, 1762. George II. had died on the 25th of October, 1760.

The deaths of those illustrious personages were followed by great consequences. The British ministry of George III. were solicitous to put an

end to the war, and the new emperor of Russia recalled his armies. His Prussian majesty was, notwithstanding, so very much reduced by his losses, that the empress-queen, probably, would have completed his destruction, had it not been for the prudent reluctance of the other German princes to annihilate the House of Brandenburg. At first the empress-queen rejected all terms proposed to her, and ordered 30,000 men to be added to her armies. The visible unwillingness of her generals to execute her orders, and the successes obtained by his Prussian majesty, at last prevailed upon her to agree to an armistice, which was soon followed by the treaty of Hubertsburg, February 15, 1763, which again secured to his Prussian majesty the possession of Silesia.

Upon the death of the emperor, her husband, in 1765, her son Joseph, who had been crowned king of the Romans in 1764, succeeded him in the empire. Soon after his accession, he discovered great activity and ambition. He joined in the dismemberment of Poland, with Russia and Prussia. He paid a visit incognito, and with moderate attendants, to Rome, and the principal courts of Italy; and had a personal interview with his Prussian majesty, though this did not prevent hostilities from being commenced between Austria and Prussia, on account of the succession to the electorate of Bavaria. The Austrian claims on this occasion were very unjust; but, in the support of them, while the contest continued, the emperor displayed great military skill. Though vast armies were brought into the field on both sides, no action happened of much importance, and an accommodation at length took place. The emperor afterwards demanded of the Dutch the free navigation of the Scheldt, but in this he likewise failed. He endeavoured, however, to promote the happiness of his subjects, granted a most liberal religious toleration, and suppressed most of the religious orders of both sexes, as being utterly useless, and even pernicious to society; and in 1783, by an edict, abolished the remains of servitude and villanage, and fixed also the fees of the lawyers at a moderate amount, granting them a pension in lieu. He also abolished the use of torture in his hereditary dominions, and removed many of the grievances under which the peasants and common people laboured. He was a prince that mixed with his subjects with an ease and affability that are very uncommon in persons of his rank. He loved the conversation of ingenious men, and appeared solicitous to cultivate knowledge.

Peter-Leopold, grand-duke of Tuscany, succeeded his brother Joseph II. and engaged the public praise by repeated instances of moderation and solid principles. His former management of his Italian sovereignty, which was prudent and beneficent, showed that he aspired to truer reputation than can be acquired by the mere splendors of royalty. One of the bishops of Hungary having refused his licence to a catholic subject to marry a protestant woman, the emperor dismissed him from his see; but pardoned him afterwards upon concession, and desired the bishop to exhort his brethren to comply with the imperial ordonnances, else no favour should be shown.

The French revolution now attracted the attention of the powers of Europe. A conference was held at Pilnitz, between the emperor, the king of Prussia, and the elector of Saxony, at which the plan of attacking France was proposed and discussed. Leopold for some time was very irresolute, but at last seemed to be resolved on war, when he died of a pleuritic fever, on the first of March, 1792, after an illness of four days.

His son Francis was raised to the imperial throne in the middle of July following. He embraced the politics of his predecessor, and em-

barked with zeal in the political crusade against France. The disastrous consequences of this war to the House of Austria, the disgraceful treaty by which it was for a short time intermitted, its re-commencement, and the recent successes of the imperial arms, have been related in our account of the affairs of France.

Francis-Joseph-Charles, emperor of Germany, and grand-duke of Tuscany. He was born Feb. 3, 1768; married, Jan. 6, 1788, Elizabeth, princess of Wurtemberg, who died 1790. He married 2dly, Sept. 1790, Maria Theresa, of Naples, his cousin.

On the death of his father Peter-Leopold, late emperor, March 1st, 1792, he succeeded to the crown of Hungary and Bohemia; and July 14, 1792, was elected emperor of Germany.

He had no issue by his first marriage. By the latter he has a daughter, Maria-Theresa, born Dec. 12, 1791.

The late emperor Peter-Leopold had 15 children, the eldest of whom is the present emperor; the others are,

Ferdinand-Joseph, born May 5, 1769; married, Sept. 17, 1790, Maria-Amelia of Naples.

Charles-Lewis, born Sept. 3, 1771.

Alexander-Leopold-Joseph, born Aug. 1, 1772.

Maximilian, born Dec. 23, 1774; died May 9, 1778.

Joseph-Antony, born May 9, 1776.

Antony-Victor, born Aug. 31, 1779.

A son, born Jan. 20, 1782.

Regnier-Jeroni, born Sept. 30, 1783.

Theresa-Josepha-Charlotta-Jane, born Jan. 14, 1767.

Maria, born Jan. 14, 1767; married, Oct. 18, 1787, Antony, brother to the elector of Saxony,

Mary-Ann-Ferdinanda Josepha, born April 21, 1770.

Mary-Clementina-Josepha, born April 24, 1777; married, Sept. 1790, Francis-Januarius, prince-royal of Naples.

Maria Josepha-Theresa, born Oct. 15, 1780.

A princess, born Oct. 22, 1784.

Maria-Antionetta, born and died in 1786.

The late emperor has, living, two sisters, and one brother *unmarried*.

Those *married* are,

Maria-Christiana-Josepha, born May 13, 1742; married, April 8, 1766, to prince Albert of Saxony.

Maria-Amelia-Josepha, born Feb. 26, 1746; married to the reigning duke of Parma, June 27, 1769.

Ferdinand-Charles-Antoine, born June 1, 1754; married to the princess Maria-Beatrice of Modena, and has issue.

Mary-Caroline-Louisa, born Aug. 13, 1752; married, April 7, 1768, to the king of the Two Sicilies.

ELECTORS.] Three ecclesiastical electors, called Electoral Highnesses; and five secular ones, Most Serene Electoral Highnesses.

ECCLESIASTICAL ELECTORS.] 1. Frederic-Charles-Joseph, baron of Erthal, archbishop and elector of Mentz, born July 8, 1774.

2. Prince Clement of Saxony (son of Augustus III. king of Poland), born Sept. 28, 1739; archbishop and elector of Treves, Feb. 10, 1768; also bishop of Treisingen and Augtburg, by dispensation from the pope.

3. Maximilian-Francis, brother to the late emperor, grand-master of the Teutonic order, archbishop and elector of Cologne, and bishop of Munster, born Dec. 8, 1756.

SECULAR ELECTORS.] 1. Francis-Joseph-Charles, emperor of Germany, king of Hungary, Bohemia, &c. born Feb. 3, 1768.

2. Frederic-Augustus IV. elector and duke of Saxony, born Dec. 23, 1730; married, Jan. 17, 1769, to the princess Amelia-Augusta of Deux Ponts.

3. Charles-Frederic, elector and marquis of Brandenburg.

4. The prince of Deux Ponts, elector Palatine, &c.

5. George III. king of Great Britain, elector of Hanover, &c.

SAXE-GOTHA.] Ernest Lewis, duke of, nephew to the late princess dowager of Wales, born Jan. 30, 1745; married, May 21, 1769, to Maria-Charlotte of Saxe-Meningen, by whom he has,

1. Ernest, born Feb. 27, 1770.

2. Emilius-Leopold, born Nov. 24, 1772.

3. His brother Augustus, born Aug. 14, 1747.

MECKLENBURG.] The house of Mecklenburg is divided into two branches, viz.

I. Mecklenburg Schwerin.—Frederic, reigning duke, born Nov. 9, 1717; married, in 1746, Louisa-Frederica, daughter of Frederic-Louis, hereditary prince of Wurtemberg Stutgard, born Feb. 3, 1722; they have no issue.—Issue of the late prince Louis, by the princess Charlotte-Sophia, of Saxe-Coburg-Staelfeld.

Frederic-Francis, born Dec. 10, 1757.

Princess Ulrica-Sophia, sister to the reigning duke, born July 1, 1723, governess of the convent of Ruhne.

II. Mecklenburg Strelitz.—Adolphus-Frederic, reigning duke (knight of the garter), born May 5, 1738.—His brothers and sisters are,

1. Charles-Louis-Frederic, a lieutenant-general in the Hanoverian service, born Oct. 10, 1741; married, Sept. 18, 1768, to Frederica-Charlotte-Louisa, of Hesse Darmstadt, by whom he had issue,

1. Carolina-Georgina Louisa-Frederica, born Nov. 17, 1769.

2. Theresia-Matilda-Amelia, born April 5, 1778.

Ernest-Gotlob-Albert, major-general in the Hanoverian service, and governor of Zell, born Aug. 7, 1742.

4. Christiana-Sophia-Albertina, born Dec. 6, 1735.

5. Charlotte, queen consort of Great-Britain, born May 19, 1744; married Sept. 8, 1761; crowned Sept. 22, 1761.

## THE KINGDOM OF PRUSSIA, FORMERLY DUCAL PRUSSIA.

Lat. 52° 40'—to 55° 50' N.

Long. 10° 00'—to 23° 23' E.

Containing 22,144 square miles, with 67 inhabitants in each.—The whole dominions 60,000 square miles, with 104 inhabitants to each.

SITUATION, BOUNDARIES, } THIS country is bounded to the  
AND EXTENT. } North by part of Samogitia; to the  
South, by Poland Proper, and Masovia; to the East, by part of Lithuania; and to the West, by Polish Prussia and the Baltic. Its greatest length is about 160 miles, and breadth about 112.

NAME, AIR, SOIL, PRODUCE, } The name of Prussia is probably de-  
AND RIVERS. } rived from the Boruss, the ancient  
inhabitants of the country. The air, upon the whole, is wholesome,  
and the soil fruitful in corn and other commodities, and affords plenty  
of pit-coal and fuel. Its animal productions are horses, sheep, deer and  
game, wild bears, and foxes. Its rivers and lakes are well stored with  
fish; and amber, which is thought to be formed of an oil coagulated  
with vitriol, is found on its coasts towards the Baltic. The woods fur-  
nish the inhabitants with wax, honey, and pitch, besides quantities of  
pot-ashes. The rivers here sometimes do damage by inundations; and  
the principal are, the Vistula, The Pregel, the Memel or Mammel, the  
Passarge, and the Elbe.

POPULATION, INHABITANTS, MANNERS, } As Prussia, since the  
CUSTOMS AND DIVERSIONS. } beginning of the present  
century, has become a most respectable power upon the continent of  
Europe, it may be proper to deviate from the usual plan, and bring be-  
fore the reader's eye the whole of his Prussian majesty's territories, which  
lie scattered in other divisions of Germany, Poland, Switzerland, and  
the northern kingdoms, with their names; all which will be found in  
the following table:

Protestants.		Square Miles.	Length.	Breadth.	CHIEF CITIES.
COUNTRIES' NAMES.

Total		52,450			

Besides a great part of Silesia, which Frederic II. under various pretences, wrested from Austria; availing himself also of the internal troubles in Poland, he, by virtue of no other right than that which a powerful army confers on every tyrant, seized upon Thorn, with the countries on the Vistula and the Neiser, and other territories contiguous to his own dominions, close to the walls of Danzic. These acquisitions may be traced in the map. To these must also be added the additional part of Poland acquired by the final partition of that country.

We shall here confine ourselves to Prussia as a kingdom, because his Prussian majesty's other dominions fall under the description of the countries where they lie.

The inhabi-  
tants are

REVENUE

of his coun

The inhabitants of this kingdom alone were, by Dr. Busching, computed to amount to 635,998 persons capable of bearing arms. Since the year 1719, it is computed that about 34,000 colonists have removed thither from France, Switzerland, and Germany; of which number 17,000 were Saltzburgers. These emigrants have built 400 small villages, 11 towns, 86 seats, and 50 new churches; and have founded 1000 village schools, chiefly in that part of the country named Little Lithuania.

The manners of the inhabitants differ but little from those of the other inhabitants of Germany. The same may be said of their customs and diversions.

RELIGION, SCHOOLS, } The religion of Prussia is very tolerant.  
AND ACADEMIES. } The established religions are those of the Lutherans and Calvinists, but chiefly the former; but papists, antipædobaptists, and almost all other sects, are here tolerated. The country, as well as the towns, abounds in schools. An university was founded at Königsberg in 1544; but we know of no very remarkable learned men that it has produced.

CITIES.] The kingdom of Prussia is divided into the German and Lithuanian departments; the former of which contains 280 parishes, and the latter 105.

Königsberg, the capital of the whole kingdom, seated on the river Pregel, over which it has seven bridges, is about 84 miles from Dantzic. According to Dr. Busching, this city is seven miles in circumference, and contains 3800 houses, and about 60,000 inhabitants. This computation is perhaps a little exaggerated, because it supposes, at an average, near sixteen persons in every house. Königsberg has ever made a considerable figure in commerce and shipping, its river being navigable for ships; of which 493 foreign ones arrived here in the year 1752, besides 298 coasters; and 373 floats of timber were, in the course of that year, brought down the Pregel. This city, besides its college or university, which contains 38 professors, has magnificent palaces, a town-house, and exchange; not to mention gardens and other embellishments. It has a good harbour and a citadel, which is called Fredericsburg, and is a regular square.

ANTIQUITIES AND CURIOSITIES, } See Germany.  
NATURAL AND ARTIFICIAL. }

COMMERCE AND MANUFACTURES.] The Prussian manufactures are not inconsiderable; they consist of glass, iron-work, paper, gunpowder, copper, and brass mills; manufactures of cloth, camlet, linen, silk stockings, and other articles. The inhabitants export variety of naval stores, amber, linseed, and hempseed, oatmeal, fish, mead, tallow, and caviar: and it is said that 500 ships are loaded every year with those commodities chiefly from Königsberg.

CONSTITUTION AND GOVERNMENT.] His Prussian majesty is absolute through all his dominions, and he avails himself to the full of his power. The government of this kingdom is by a regency of four chancellors of state; viz. 1. The great master; 2. The great burgrave; 3. The great chancellor; and, 4. The great marthal. There are also some other councils, and 37 bailiwicks. The states consist, 1. Of counsellors of state; 2. Of deputies from the nobility; and, 3. From the commons. Besides these institutions, Frederic II. erected a board for commerce and navigation.

REVENUES.] His Prussian majesty, by means of the happy situation of his country, its inland navigation, and judicious political regulations;

probably de-  
the ancient

the coun-

derives an amazing revenue from this country, which, about a century and a half ago, was the seat of boors and barbarism. It is said that amber alone brings him in 26,000 dollars annually. His other revenues arise from his demesnes, his duties of customs and tolls, and the subsidies yearly granted by the several states; but the exact sum is not known; though we may conclude it is very considerable from the immense charges of the seven years' war. The revenue which the king draws from Silesia amounts annually to 5,854,632 rix-dollars; and after deducting the expenses of the military establishment, and all others, there is a net revenue of 1,554,632 rix-dollars. His revenues now, since the accession of Polish or Royal Prussia, must be greatly increased: exclusive of its fertility, commerce, and population, its local situation was of vast importance, as it lay between his German dominions and his kingdom of Prussia. By this acquisition, his dominions are compact, and his troops may march from Berlin to Königsberg without interruption.

[MILITARY STRENGTH.] The Prussian army, even in time of peace, consists of about 180,000 of the best disciplined troops in the world; and, during the seven years' war, that force was augmented to 300,000 men. But this great military force, however it may aggrandise the power of the king, is utterly inconsistent with the interests of the people. The army is chiefly composed of provincial regiments, the whole Prussian dominions being divided into circles or cantons; in each of which, one or more regiments, in proportion to the size and populousness of the divisions, have been originally raised, and from it the recruits continue to be taken: and each particular regiment is always quartered, in time of peace, near the canton from which its recruits are drawn. Whatever number of sons a peasant may have, they are all liable to be taken into the service except one, who is left to assist in the management of the farm. The rest wear badges from their childhood, to mark that they are destined to be soldiers, and obliged to enter into the service whenever they are called upon. But the maintaining so large an army, in a country naturally so little equal to it, has occasioned such a drain from population, and such a withdrawing of strength from the labours of the earth, that the late king endeavoured in some degree to save his own peasantry, by drawing as many recruits as he could from other countries. These foreign recruits remain continually with the regiments in which they are placed; but the native Prussians have every year some months of furlough, during which they return to the houses of their fathers or brothers, and work at the business of the farm, or in any other way they please.

[ARMS AND ORDERS OF KNIGHTHOOD.] The royal arms of Prussia are, argent, an eagle displayed sable, crowned, or, for Prussia. Azure, the imperial sceptre, or, for Courland. Argent, an eagle displayed, gules, with semicircular wreaths, for the marquisate of Brandenburg. To these are added the respective arms of the several provinces subject to the Prussian crown.

There are four orders of knighthood, the "*Order of Concord*," instituted by Christian Ernest, margrave of Brandenburg, in the year 1660, to distinguish the part he had acted in restoring peace to many of the princes of Europe. Frederic III. elector of Brandenburg, and afterwards king of Prussia, instituted, in 1685, the "*Order of Generosity*." The knights wear a cross of eight points, enamelled blue, having in the centre this motto, "*La Générosité*," pendent to a blue ribbon. The same prince instituted the "*Order of the Black Eagle*," on the day of his coronation

at Königsberg, in the year 1700: the sovereign is always grand-master; and the number of knights, exclusive of the royal family, is limited to thirty, who must also be admitted into the "Order of Generosity," previous to their receiving this, unless they be sovereign princes. The "Order of Merit" was instituted by the late king, in the year 1740, to reward the merit of persons either in arms or arts, without distinction of birth, religion, or country; the king is sovereign, and the number of knights unlimited.

HISTORY.] The ancient history of Prussia, like that of other kingdoms, is lost in the clouds of fiction and romance. The early inhabitants, a brave and warlike people, descended from the Sclavonians, refused to submit to the neighbouring princes, who, on pretence of converting them to Christianity, endeavoured to subject them to slavery. They made a noble stand against the kings of Poland; one of whom, Boleslaus IV. was by them defeated and killed in 1163. They continued independent, and pagans, till the time of the crusades, when the German knights of the Teutonic order, about the year 1227, undertook their conversion by the edge of the sword, but upon condition of having, as a reward, the property of the country when conquered. A long series of wars followed, in which the inhabitants of Prussia were almost extirpated by the religious knights, who, in the thirteenth century, after committing the most incredible barbarities, peopled the country with Germans. After a vast waste of blood, in 1406, a peace was concluded between the knights of the Teutonic order, and Casimir IV. king of Poland, who had undertaken the cause of the oppressed people; by which it was agreed, that the part now called Polish Prussia should continue a free province, under the king's protection; and that the knights and the grand-master should possess the other part, acknowledging themselves vassals of Poland. This gave rise to fresh wars, in which the knights endeavoured, but unsuccessfully, to throw off their vassalage to Poland. In 1525, Albert, margrave of Brandenburg, and the last grand-master of the Teutonic order, laid aside the habit of his order, embraced Lutheranism, and concluded a peace at Cracow, by which the margrave was acknowledged duke of the east part of Prussia (formerly called, for that reason, Ducal Prussia), but to be held as a fief of Poland, and to descend to his male heirs; and upon failure of his male issue, to his brother, and his male heirs. Thus ended the sovereignty of the Teutonic order in Prussia, after it had subsisted near 300 years. In 1657, the elector Frederic-William of Brandenburg, deservedly called the Great, had Ducal Prussia confirmed to him; and by the conventions of Welau and Bromberg, it was freed by John Casimir, king of Poland, from vassalage; and he and his descendants were declared independent and sovereign lords of this part of Prussia.

As the protestant religion had been introduced into this country by the margrave Albert, and the electors of Brandenburg were now of that persuasion, the protestant interest favoured them so much, that Frederic, the son of Frederic-William the Great, was raised to the dignity of king of Prussia, in a solemn assembly of the states, proclaimed January 18, 1701, and soon after acknowledged as such by all the powers of Christendom. His grandson, Frederic II. in the memoirs of his family, gives us no high idea of this first king's talents for government, but expatiates on those of his own father, Frederic-William, who succeeded in 1713. He certainly was a prince of strong natural abilities, and considerably increased the revenues of his country, but too often at the expense of humanity. At his death, which happened in 1740, he is said to have left seven millions sterling in his treasury, which enabled his son, by his wonderful victories,

and the more wonderful resources by which he repaired his defeats, to become the admiration of the age. He improved the arts of peace as well as of war, and distinguished himself as a poet, philosopher, and legislator. Some of the principal transactions of his reign have already been related in our account of the history of Germany. In the year 1783, he published a rescript, signifying his pleasure that no kneeling in future should be practised in honour of his person, assigning for his reason, that this act of humiliation was not due but to the Divinity; and near 2,000,000 of crowns were expended by him, in draining marshes, establishing factories, settling colonies, relieving distress, and in other purposes of philanthropy and policy.

The late king of Prussia, who succeeded his uncle, August 17, 1786, made many salutary regulations for his subjects, and established a court of honour to prevent the diabolical practice of duelling in his dominions.

The exertions of Prussia against France, till the treaty of peace concluded between those two powers, on the 5th of April, 1795, have been already related in our account of France.

The conduct of Prussia with regard to Poland is difficult to explain; and it would apparently have been more for the interest of the former to have erected the latter as a formidable independent barrier against Russia and Austria, than to have exposed itself to the enormous and increased power of Russia.

Frederic-William II. \* died at Berlin, of a dropsy, November 16, 1797, and was succeeded by his son, Frederic-William III.

Frederic-William II. king of Prussia, and elector of Brandenburg, born September 23, 1744; married, July 14, 1765, to the princess Elizabeth-Christiana-Ulrica, of Brunswick Wolfenbuttle. 2dly, On July 14, 1769, to Frederica-Louisa, of Hesse Darmstadt.

Issue by the first marriage:

Frederica-Charlotta-Ulrica-Catharine, born May 7, 1767; married, September 29, 1791, to the duke of York, the second son of his Britannic majesty.

Issue by the latter marriage:

1. Frederic-William, the present king, born August 3, 1770.
2. Frederic-Louis-Charles, born August 3, 1773.
3. Frederica-Sophia-Wilhelmina, born November 18, 1774; married, October 1, 1791, to the hereditary prince of Orange.
4. Frederic-Christian-Augustus, born May 1, 1780.
5. Another prince, born December 20, 1781.
6. Another prince, born July, 1783.

Queen dowager, Elizabeth-Christina, of Brunswick Wolfenbuttle, born November 8, 1715.

Brother and sister to the late king:

1. Frederic-Charles-Henry, born December 30, 1747.
2. Frederica-Sophia-Wilhelmina, born in 1751; and married in 1767, to the present prince of Orange.

\* In enumerating the kings of Prussia, we have thought it most proper to follow the method used in Prussia, and throughout Germany, where the *Frederics* are distinguished from the *Frederic-Williams*; thus the uncle of the late king, and the late king, frequently here styled Frederic III. and Frederic IV. are always called, on the continent, Frederic II. and Frederic-William II. the father of the former not being styled Frederic II. but Frederic-William I.

**SOIL AND AIR.]** The air of Bohemia Proper is not thought so wholesome as that of the rest of Germany, though its soil and produce are pretty much the same.

**MOUNTAINS AND RIVERS.]** Bohemia, though almost surrounded with mountains, contains none of note or distinction: its woods are many, and the chief rivers are the Elbe, Muldau, and Eger.

**METALS AND MINERALS.]** This kingdom contains rich mines of silver, quicksilver, copper, iron, lead, sulphur, and saltpetre: its chief manufactures are linen, copper, iron, and glass.

**POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.** } About 150 years ago, Bohemia was computed to contain near 3,000,000 of inhabitants; but at present they are thought not to exceed 2,100,000. The Bohemians, in their persons, habits, and manners, resemble the Germans. There is among them no middle state of people; for every lord is a sovereign, and every tenant a slave. But the emperor Joseph II. generously discharged the Bohemian peasants, on the

imperial demerits, from the state of villanage in which they have been so long and so unjustly retained; and it will be happy if his example should be followed by the Bohemian nobility, and they be thereby induced no longer to deprive their vassals of the rights of human nature. Although the Bohemians, at present, are not remarkable either for arts or arms, yet they formerly distinguished themselves as the most intrepid assertors of civil and religious liberty in Europe; witness the early introduction of the reformed religion into their country, when it was scarcely known in any other; the many glorious defeats they gave to the Austrian power, and their generous struggles for independency. Their virtues may be considered as the causes of their decay, as no means were left unemployed by their despotic masters for breaking their spirit: though it is certain their internal jealousies and dissensions greatly contributed to their subjection. Their customs and diversions are the same as Germany.

**RELIGION.]** Though popery is the established religion of Bohemia, yet there are many protestants among the inhabitants, who are now tolerated in the free exercise of their religion: and some of the Moravians have embraced a visionary unintelligible protestantism, if it deserves that name, which they have propagated, by their zealous missionaries, in several parts of the globe. They have a meeting-house in London, and obtained an act of parliament for a settlement in the plantations.

**ARCHBISHOPRIC AND BISHOPRICS.]** Prague is the only Bohemian archbishopric. The bishoprics are Königgratz, Breslau, and Olmutz.

**LANGUAGE.]** The proper language of the Bohemians is a dialect of the Slavonian, but they generally speak German and High Dutch.

**UNIVERSITY.]** The only university in Bohemia is that of Prague.

**CITIES AND TOWNS.]** Prague, the capital of Bohemia, is one of the finest and most magnificent cities in Europe, and famous for its noble bridge. Its circumference is so large, that the grand Prussian army, in its last siege, never could completely invest it. For this reason it is able to make a vigorous defence in case of a regular siege. The inhabitants are thought not to be proportioned to its capaciousness, being computed not to exceed 70,000 Christians, and about 13,000 Jews. It contains ninety-two churches and chapels, and forty cloisters. It is a place of little or no trade, and therefore the middling inhabitants are not wealthy; but the Jews are said to carry on a large commerce in jewels. Bohemia contains many other towns, some of which are fortified; but they are neither remarkable for strength or manufactures. Olmutz is the capital of Moravia; it is well fortified, and has manufactures of woollen, iron, glass, paper, and gunpowder. Breslau, the capital of Silesia, has been already described.

**COMMERCE AND MANUFACTURES.]** See Germany.

**CONSTITUTION AND GOVERNMENT.]** The forms, and only the forms, of the old Bohemian constitution still subsist; but the government under the emperor is despotic. Their states are composed of the clergy, nobility, gentry, and representatives of towns. Their sovereigns of late have not been fond of provoking them by ill usage, as they have a general aversion towards the Austrians. This kingdom is frequently described as part of Germany, but with little reason, for it is not in any of the nine circles, nor does it contribute any thing towards the forces or revenues of the empire, nor is it subject to any of its laws. What gives some colour to this mistake, is, that the king of Bohemia is the first secular elector of the empire, and their kings have been elected emperors of Germany for many years.

**REVENUES.]** The revenues of Bohemia are whatever the sovereign

is pleased to ex-  
nually assemble  
a year.

is pleased to exact from the states of the kingdom, when they are annually assembled at Prague. They may perhaps amount to 500,000l. a year.

**ARMS.]** The arms of Bohemia are, argent, a lion gules, the tail moved, and passed in saltire, crowned, langued, and armed. Or.

**HISTORY.]** The Bohemian nobility used to elect their own princes, though the emperors of Germany sometimes imposed a king upon them, and at length usurped that throne themselves. In the year 1438, Albert II. of Austria, received three crowns, Hungary, the empire, and Bohemia.

In 1414, John Hus, and Jerome of Prague, two of the first reformers, and Bohemians, were burnt at the council of Constance, though the emperor of Germany had given them his protection. This occasioned an insurrection in Bohemia: the people of Prague threw the emperor's officers out of the windows of the council-chamber; and the famous Zisca, assembling an army of 40,000 Bohemians, defeated the emperor's forces in several engagements, and drove the imperialists out of the kingdom. The divisions of the Hussites among themselves enabled the emperor to regain and keep possession of Bohemia, though an attempt was made to throw off the imperial yoke, by electing, in the year 1618, a protestant king in the person of the prince palatine, son-in-law to James I. of England. The misfortunes of this prince are well known. He was driven from Bohemia by the emperor's generals, and, being stripped of his other dominions, was forced to depend on the court of England for a subsistence. Since the war of thirty years, which desolated the whole empire, the Bohemians have remained subject to the House of Austria.

HUNGARY.

EXTENT AND SITUATION.

To which may be added Temeswar, which has been considered as distinct from Hungary, because it was formerly governed by an independent king; and it has several times been in possession of the Turks; but the Austrians gaining possession of it, it was incorporated into the kingdom of Hungary in 1778. The province of Temeswar is ninety-four miles long, and sixty-seven broad, containing about 3850 miles: it has been divided into four districts, Cſadat, Temeswar, Werschez, and Lugos. Temeswar, the principal town, is situated E. lon. 22-15. N. lat. 45-54.

**AIR, SOIL, AND PRODUCE.]** The air, and consequently the climate, of the southern parts of Hungary, is found to be unhealthful, owing to its numerous lakes, stagnated waters, and marshes; but the northern part being mountainous and barren, the air is sweet and wholesome. No country in the world can boast a richer soil than that plain which extends 300 miles, from Presburg to Belgrade, and produces corn, grass, esculent plants, tobacco, saffron, asparagus, melons, hops, pulse, millet, buck-wheat, delicious wine, fruits of various kinds, peaches, mulberry-trees, chestnuts, and wood: corn is in such plenty, that it sells for one-sixth part of its price in England.

**RIVERS.]** These are the Danube, Drave, Save, Teyſſe, Meriſh, and the Temes.

**WATER.]** Hungary contains several lakes, particularly four among the Carpathian mountains, of considerable extent, and abounding with fish. The Hungarian baths and mineral waters are esteemed the most sovereign of any in Europe; but their magnificent buildings, raised by the Turks when in possession of the country, particularly those of Buda, are suffered to go to decay.

**MOUNTAINS.]** The Carpathian mountains, which divide Hungary from Poland on the north, are the chief in Hungary; though many detached mountains are found in the country. Their tops are generally covered with wood, and on their sides grow the richest grapes in the world.

**METALS AND MINERALS.]** Hungary is remarkably well stocked with both. It abounds not only with gold and silver mines, but with plenty of excellent copper, vitriol, iron, orpiment, quicksilver, chryſocolia, and terra-ſigillata. Before Hungary became the seat of destructive wars between Turks and Christians, or fell under the power of the House of Austria, those mines were furnished with proper works and workmen, and produced vast revenues to the native princes. The Hungarian gold and silver employed mint-houses, not only in Hungary, but in Germany, and the continent of Europe; but all those mines are now greatly diminished in their value, their works being destroyed or demolished: some of them, however, still subsist, to the great emolument of the natives.

VEGETABLE AND ANIMAL PRODUCTIONS.] Hungary is remarkable for a fine breed of horses, generally mouse-coloured, and highly esteemed by military officers, so that great numbers of them are exported. There is a remarkable breed of large rams in the neighbourhood of Presburg. In general its other vegetable and animal productions are the same with those of Germany and the neighbouring countries. The Hungarian wines, however, particularly Tokay, are preferable to those of any other country, at least in Europe.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. } It was late before the northern barbarians drove the Romans out of Hungary; and some of the descendants of their legionary forces are still to be distinguished in the inland parts, by their speaking Latin. Before the Turks obtained possession of Constantinople, Hungary was one of the most populous and flourishing kingdoms in Europe; and if the House of Austria should give the proper encouragement to the inhabitants to repair their works, and clear their fens, it might become so again. The population of Hungary, exclusive of Transylvania, Sclavonia, and Dalmatia, was estimated, in 1776, by the celebrated Buschin, to be 3,170,000; and Mr. Windish, an Hungarian, in his Geography of Hungary, published in 1780, says, "the population, according to a new accurate examination, is 3,170,000, excluding Transylvania, Sclavonia, and Dalmatia." But the committee appointed by the diet of 1791, to inquire into things of this nature, "some of whose notes," says Mr. Townson, a late intelligent traveller in this country, "I have had in my hands, estimate the population of Hungary, in its greatest extent, but always excluding Transylvania, at about 8,000,000, which, they add, is 1777 souls per square mile. In N<sup>o</sup> 61 of Mr. Slotzer's *Staats Anzeigen*, there is a detailed account, which makes the total population 7,417,415."

The Hungarians are a brave, generous, and hardy race of men; their manners are peculiar to themselves; and they pique themselves on being descended from those heroes who formed the bulwark of Christendom against the infidels. In their persons they are well made. Their fur-caps, their close-bodied coats, girded by a sash, and their cloak or mantle, which is so contrived as to buckle under the arm, so that the right-hand may be always at liberty, gives them an air of military dignity. The men shave their beards, but preserve their whiskers on their upper lips. Their usual arms are the broad-sword, and a kind of pole-axe, besides their fire-arms. The ladies are reckoned handsomer than those of Austria; and their sable dress, with sleeves strait to their arms, and their stays fastened before with gold, pearl, or diamond little buttons, are well known to the French and English ladies. Both men and women, in what they call the mine towns, wear fur and even sheep-skin dresses. The inns upon the roads are most miserable hovels, and even those seldom to be met with. The hogs, which yield the chief animal food for the peasants, and their poultry, live in the same apartment with their owners. The gout and fever, owing to the unwholesomeness of the air, are the predominant diseases in Hungary. The natives in general are indolent, and leave trade and manufactures to the Greeks and other strangers settled in their country, the flatness of which renders travelling commodious, either by land or water. The diversions of the inhabitants are of the warlike and athletic kind. They are in general a brave and magnanimous people. Their ancestors, even since the beginning of the present century, were so jealous of their liberties, that, rather than be tyrannised over by the House of Austria, they often put themselves under the protection of the Ottoman court; but their fidelity to the late em-

press-queen, notwithstanding the provocations they received from her house, will be always remembered to their honour.

The inhabitants of Temeswar, a province lately incorporated into the kingdom of Hungary, are computed at 450,000. There are in this country many sarsons, or gypsies, supposed to be real descendants of the ancient Egyptians. They are said to resemble the ancient Egyptians in their features, in their propensity to melancholy, and in many of their manners and customs; and it is asserted, that the lascivious dances of Isis, the worship of onions, many famous Egyptian superstitions and specifics, and the Egyptian method of hatching eggs by means of dung, are still in use among the female gypsies in Temeswar.

RELIGION.] The established religion of the Hungarians is the Roman-catholic, though the major part of the inhabitants are protestants, or Greeks; and they now enjoy the full exercise of their religious liberties.

ARCHBISHOPRICS AND BISHOPRICS.] The archbishoprics are Presburg, Gran, and Colocza. The bishoprics are Great Waradin, Agria, Velpin, Raab, and Five Churches.

LANGUAGE.] As the Hungarians are mixed with Germans, Slavonians, and Walachians, they have a variety of dialects, and one of them is said to resemble the Hebrew. The better and the middlemost ranks speak German; and almost all, even of the common people, speak Latin, either pure or barbarous, so that the Latin may be said to be here still a living language.

UNIVERSITIES.] In the universities (if they can be properly so called) of Firan, Buda, Raab, and Caschaw, are professors of the several arts and sciences, who used generally to be Jesuits; so that the Lutherans and Calvinists, who are more numerous than the Roman-catholics in Hungary, go to the German and other universities.

ANTIQUITIES AND CURIOSITIES. } The artificial curiosities of this  
NATURAL AND ARTIFICIAL. } country consist of its bridges,  
baths, and mines. The bridge of Esseck, built over the Danube and Drave, is, properly speaking, a continuation of bridges, five miles in length, fortified with towers at certain distances. It was an important pass during the wars between the Turks and Hungarians. A bridge of boats runs over the Danube, half a mile long, between Buda and Pest; and about twenty Hungarian miles distant from Belgrade are the remains of a bridge erected by the Romans, judged to be the most magnificent of any in the world. The baths and mines here have nothing to distinguish them from the like works in other countries.

One of the most remarkable natural curiosities of Hungary is a cavern, in a mountain near Szelitze; the aperture of this cavern, which fronts the south, is eighteen fathoms high, and eight broad: its subterraneous passages consist entirely of solid rock, stretching away farther south than has yet been discovered: as far as it is practicable to go, the height is found to be fifty fathoms, and the breadth twenty-six. Many wonderful particulars are related of this cavern. Astonishing rocks are common in Hungary, and some of its churches are of admirable architecture.

CITIES, TOWNS, FORTS, AND OTHER } These are generally decay-  
EDIFICES, PUBLIC AND PRIVATE. } ed from their ancient magnificence; but many of the fortifications are still very strong, and kept in good order. Presburg is fortified. In it the Hungarian regalia are kept. The crown, in the year 1784, was removed to Vienna by order of the emperor Joseph II. But this measure gave so great offence, and excited such violent discontents, that it was sent back to Buda in 1790, where it was received with the most extravagant testimonies of joy, the

whole city and suburbs being illuminated. This crown was sent, in the year 1000, by pope Sylvester II. to Stephen, king of Hungary, and was made after that of the Greek emperors: it is of solid gold, weighing nine marks and three ounces, ornamented with fifty-three sapphires, fifty rubies, one large emerald, and three hundred and thirty-eight pearls. Besides these stones, are the images of the apostles and the patriarchs. The pope added to this crown a silver patriarchal cross, which was afterwards inserted in the arms of Hungary. At the ceremony of the coronation, a bishop carries it before the king. From the cross is derived the title of apostolic king; the use of which was renewed under the reign of the empress-queen Maria-Theresa. The sceptre and the globe of the kingdom are of Arabian gold; the mantle, which is of fine linen, is said to be the work of Gisele, spouse of St. Stephen, who, they say, embroidered in gold the image of Jesus Christ crucified, and many other images of the patriarchs and apostles, with a number of inscriptions. The sword is two-edged, and rounded at the point. Buda, formerly the capital of Hungary, retains little of its ancient magnificence, but its strength and fortifications; and the same may be said of Pest, which lies on the opposite side of the Danube. Raab is likewise a strong city, as are Gran and Comorra. Tokay has been already mentioned for the excellency of its wines.

COMMERCE AND MANUFACTURES.] After having mentioned the natural produce of the country, it is sufficient to say, that the chief manufactures and exports of the natives consist of metals, drugs, and salt.

CONSTITUTION AND GOVERNMENT.] The Hungarians dislike the term of queen, and even called the late empress-queen, king Theresa. Their government preserves the remains of many checks upon the regal power. They have a diet or parliament, which assembly consists of tables or houses; the first composed of magnates, or the great officers of the crown, princes, counts, barons, and archbishops; and the second of the abbots, prelates, and deputies from the chapters and each of the two and fifty counties, into which the kingdom is divided. These houses, however, form but one body, as their votes are taken together. The diet, besides being convened on all great national events, should meet at stated times. Under Matthias Corvinus, and Ferdinand I. it was decreed they should be annual; and, under Leopold I. that they should be triennial; which was confirmed by Charles VI. and is still considered as the constitutional period. But sovereigns and their ministers often wish to get rid of these incumbrances; and lately, from 1764 to 1790, no diet was held; though many important affairs had happened within this period. It ought not to sit more than two months. There is likewise a Hungary-office, which resembles our chancery, and which resides at Vienna; as the stadtholder's council, which comes pretty near the British privy-council, but has a municipal jurisdiction, does at Presburg. Every royal town has its senate; and the Gespanschafts resemble our justices of the peace. Besides this, they have an exchequer and nine chambers, and other subordinate courts.

MILITARY STRENGTH.] The emperor can bring into the field, at any time, 50,000 Hungarians in their own country, but seldom draws out of it above 10,000; these are generally light-horse, and well known in modern times by the name of Hussars. They are not near so large as the German horse; and therefore the hussars stand up on their short stirrups when they strike. Their expedition and alertness have been found so serviceable in war, that the greatest powers in Europe have troops that go by the same name. Their foot are called Heydukes, and wear feathers

in their caps, according to the number of enemies they pretend to have killed: both horse and foot are an excellent militia, very good at a pursuit, or ravaging and plundering a country, but not equal to regular troops in a pitched battle. The sovereign may summon the Hungarian nobility to take the field and defend their country. This service is called an *insurrectio*, and from it the high clergy are not exempt. In the frequent wars in which Hungary was formerly engaged, principally against the Turks, this service was a rather severe obligation. The number of combatants each brought into the field was in proportion to his estate. The archbishop of Gran, and the bishop of Erlau, brought each two stands of colours, and under each stand a thousand men; the archbishop of Colocza, and several bishops, a thousand each. In the fatal battle of Mohatch, seven bishops were left on the field. A general *insurrection* of this kind was summoned by the emperor in the present war; but the treaty of Campo Formio having been concluded before the troops so raised began to act, they returned home.

COINS.] Hungary was formerly remarkable for its coinage; and there are still extant, in the cabinets of the curious, a complete series of coins of their former kings. More Greek and Roman medals have been discovered in this country than perhaps in any other in Europe.

ARMS.] The emperor, as king of Hungary, for armorial ensigns, bears quarterly, barwise, argent and gules, of eight pieces.

HISTORY.] The Huns, after subduing this country in the middle of the third century, communicated their name to it, being then part of the ancient Pannonia. They were succeeded by the furious Goths; the Goths were expelled by the Lombards; they by the Avari; who were followed by the Sclavi in the beginning of the 9th century. At the close of it, the Anigours emigrated from the banks of the Volga, and took possession of the country. Hungary was formerly an assemblage of different states; and the first who assumed the title of king was Stephen, in the year 997, when he embraced Christianity. In his reign, the form of government was established, and the crown rendered elective. About the year 1310, king Charles Robert ascended the throne, and subdued Bulgaria, Servia, Croatia, Dalmatia, Slavonia, and many other provinces; but many of those conquests were afterwards reduced by the Venetians, Turks, and other powers. In the 15th century, Huniades, who was guardian to the infant king Ladislaus, bravely repulsed the Turks when they invaded Hungary; and upon the death of Ladislaus, the Hungarians, in 1438, raised Matthias Corvinus, son of Huniades, to their throne. Lewis, king of Hungary, in 1526, was killed in a battle, fighting against Solymán, emperor of the Turks. This battle almost proved fatal to Hungary: but the archduke Ferdinand, brother to the emperor Charles V. having married the sister of Lewis, he claimed the title of Hungary, in which he succeeded, with some difficulty; and that kingdom has ever since belonged to the House of Austria, though by its constitution its crown ought to be elective.—For the rest of the Hungarian history, see Germany.

## TRANSYLVANIA, SCLAVONIA, CROATIA, AND HUNGARIAN DALMATIA.

THESE countries appear under one division, for several reasons, and particularly because we have no account sufficiently exact of their extent and boundaries. The most authentic is as follows:—TRANSYLVANIA belongs to the House of Austria, and is bounded on the North by the Carpathian mountains, which divide it from Poland; on the East by Moldavia and Walachia; on the South by Walachia; and on the West by Upper and Lower Hungary. It lies between twenty-two and twenty-six degrees of East longitude, and forty-five and forty-eight of North latitude. Its length is about 180, and its breadth 120 miles; and contains nearly 14,400 square miles, surrounded on all sides by high mountains. Its produce, vegetables, and animals, are almost the same with those of Hungary. The air is wholesome and temperate; but the wine of this country, though good, is not equal to the Hungarian. Its chief city is Hermanstadt, and its interior government still partakes greatly of the ancient feudal system, being composed of many independent states and princes, who are little more than nominally subject to the Austrians. Papists, Lutherans, Calvinists, Socinians, Arians, Greeks, Mahometans, and other sectaries, here enjoy their several religions. Transylvania is thought to add but little to the Austrian revenue, though it exports some metals and salt to Hungary. The other large places are Segeswar, Millenback, and Newmark. All sorts of provisions are very cheap, and excellent in their kinds. Hermanstadt is a large, strong, and well-built city, as are Clausenburg and Weissenburg. The seat of government is at Hermanstadt, and the governor is assisted by a council made up of Roman-catholics, Calvinists, and Lutherans. The diet, or parliament, meets by summons, and receives the commands of the sovereign, to whom of late they have been more devoted than formerly. They have a liberty of making remonstrances and representations in case of grievances.

Transylvania is part of ancient Dacia, the inhabitants of which long employed the Roman arms before they could be subdued. It was overrun by the Goths on the decline of the Roman empire, and then by the Huns. Their descendants retain the same military character. The population of the country is not ascertained; but if the Transylvanians can bring into the field, as has been asserted, 30,000 troops, the whole number of inhabitants must be considerable. At present, their military force is reduced to six regiments of 1500 each; but it is well known, that, during the last two wars in which the House of Austria was engaged, the Transylvanians did great services. Hermanstadt is its only bishopric; and the Transylvanians at present seem to trouble themselves little either about learning or religion, though the Roman-catholic is the established church. Stephen I. king of Hungary, introduced Christianity there about the year 1000; and it was afterwards governed by an Hungarian vaivod or viceroy. The various revolutions in their government prove their impatience under slavery; and though the treaty of Carlowitz, in 1699, gave the sovereignty of Transylvania, as also of Sclavonia, to the House of Austria, yet the natives enjoy what we may call a loyal aristocracy, which their sovereigns do not think proper to invade. In October, 1784, on account of the real or feigned oppressions of the nobility, near 16,000 assembled, and committed great

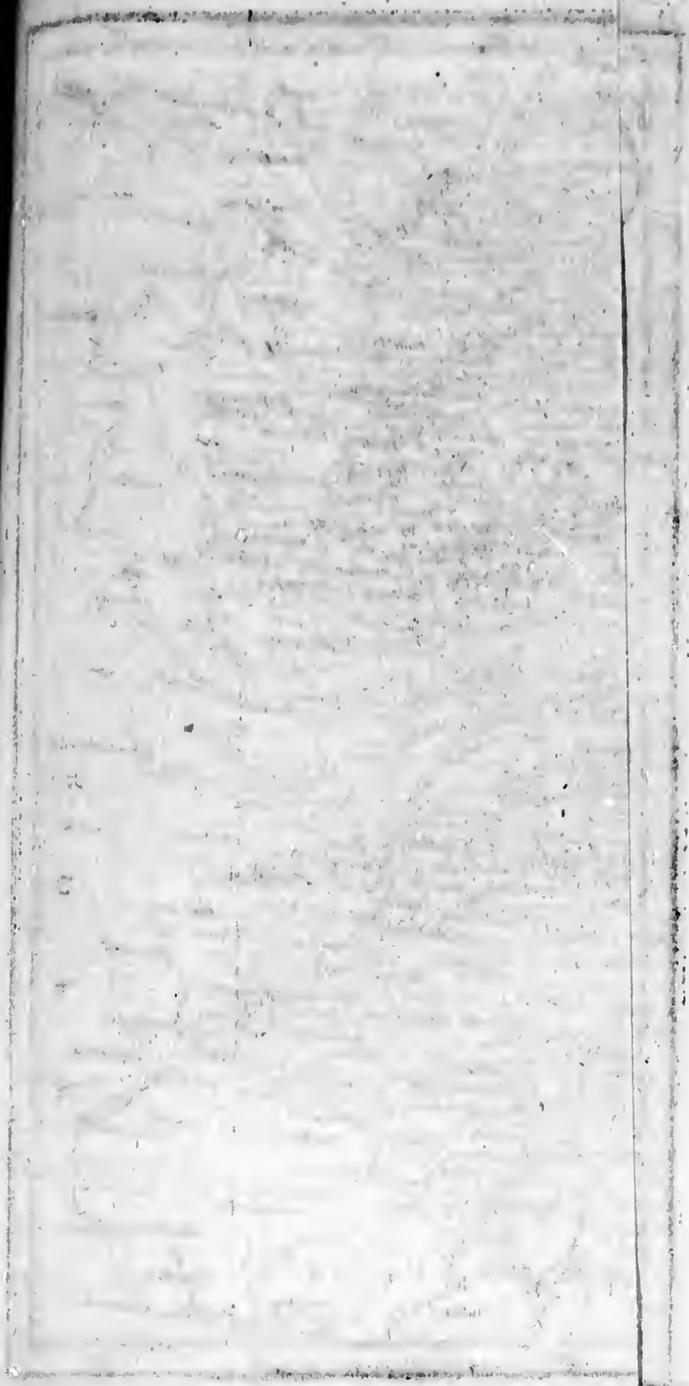

depredations on those whose conduct had been obnoxious to them. Several had their palaces burnt, and were glad to escape with their lives. The revolters were disappointed in their attempt on Claufenburg; and afterwards offered to separate, and go home in peace, on the terms of a general pardon, better treatment from the nobility, and a freedom from vassalage. Lenient terms were granted to them; and, with the punishment of a few, the insurrection was suppressed.

SCLAVONIA lies between the 17th and 21st degrees of East longitude, and the 55th and 46th of North latitude. It is thought to be about 200 miles in length, and 60 in breadth, and contains about 10,000 square miles. It is bounded by the Drave on the North, by the Danube on the East, by the Save on the South, and by Stiria in Austria on the West. The reason why Hungary, Transylvania, Sclavonia, and the other nations, subject to the House of Austria in those parts, contain a surprising variety of people, differing in name, language, and manners, is because liberty here made its last stand against the Roman arms, which by degrees forced the remains of the different nations they had conquered into those quarters. The thickness of the woods, the rapidity of the rivers, and the strength of the country, favoured their resistance; and their descendants, notwithstanding the power of the Turks, the Austrians, the Hungarians, and the Poles, still retain the same spirit of independency. Without regarding the arrangements made by the sovereigns of Europe, they are quite under the government that leaves them most at liberty. That they are generous as well as brave, appears from their attachment to the House of Austria, which, till the last two wars, never was sensible of their value and valour; inasmuch, that it is well known, that they preserved the pragmatic sanction, and kept the imperial crown in that family. The Sclavonians formerly so much employed the Roman arms, that it is thought the word *slave* took its original from them, on account of the great numbers of them who were carried into bondage, so late as the reign of Charlemagne. Though Sclavonia yields neither in beauty nor fertility to Hungary and Transylvania, yet the ravages of war are still visible in the face of the country, which lies in a great measure unimproved. The Sclavonians are zealous Roman-catholics, though Greeks and Jews are tolerated. Here we meet with two bishoprics; that of Posega, which is the capital of the country, and Zagrab, which lies on the Drave; but we know of no universities. Effeck is a large and strong town, remarkable, as before noticed, for a wooden bridge over the Drave, and, adjoining marshes, five miles long and fifteen pieces broad, built by the Turks. Waradin and Peterwaradin are places noted in the wars between the Austrians and Turks. The inhabitants are composed of Servians, Radzians, Croats, Wallachians, Germans, Hungarians, and a vast number of other people, whose names were never known even to the Austrians themselves, but from the military muster-rolls, when they poured their troops into the field during the last two wars. In 1746, Sclavonia was united to Hungary, and the states send representatives to the diet of Hungary.

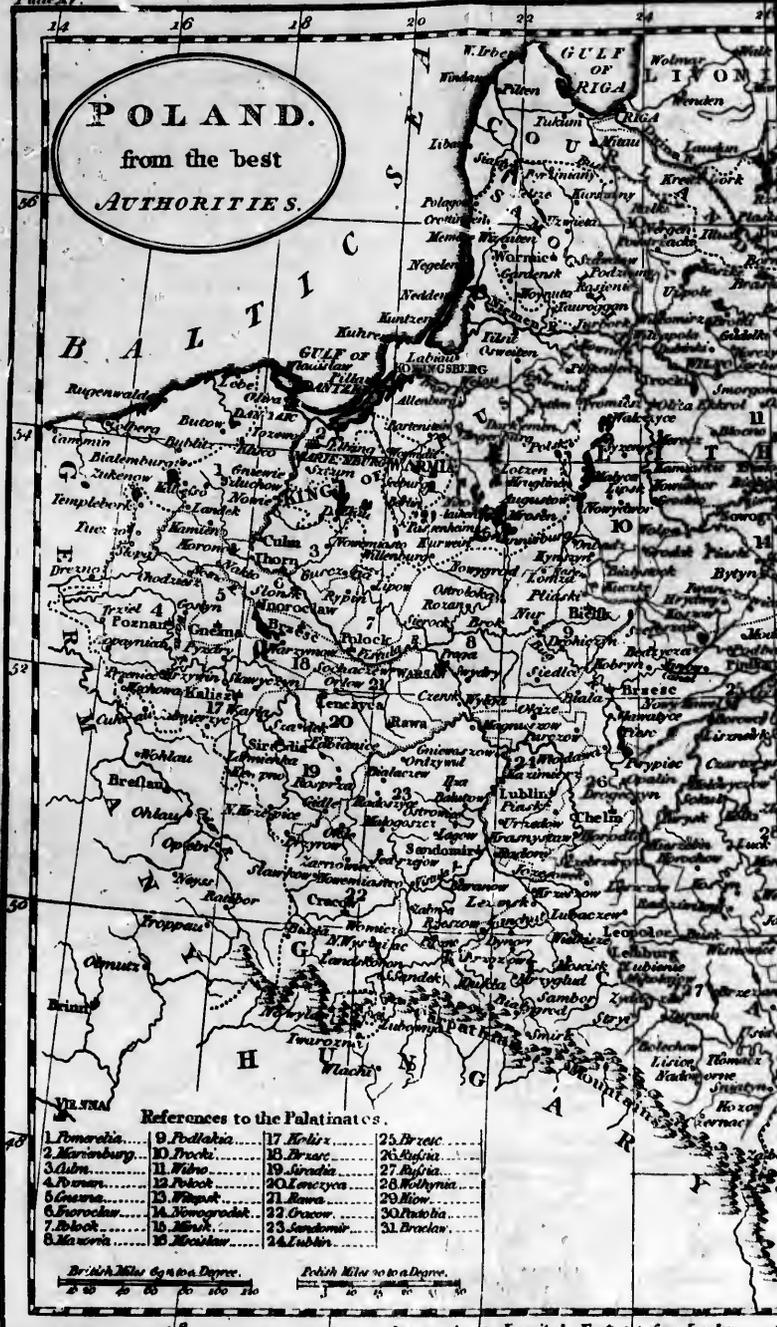

CROATS lies between the 15th and 17th degrees of east longitude, and the 45th and 47th of north latitude. It is eighty miles in length, and seventy in breadth, and contains about 2,500 square miles. The manners, government, religion, language, and customs of the Croats, are similar to those of the Sclavonians and Transylvanians, who are their neighbours. They are excellent irregular troops, and, as such, are famed in modern history, under the name of Pandours, and various other designations.

ful kingdoms in Eu

nations. The truth is, the House of Austria finds its interest in suffering them and the neighbouring nations to live in their own manner. The towns are blended with each other, there scarcely being any distinction of boundaries. Carolsstadt is a place of some note, but Zagrab (already mentioned) is the capital of Croatia. All the sovereignty exercised over them by the Austrians seems to consist in the military arrangements for bringing them occasionally into the field. A viceroy presides over Croatia, jointly with Slavonia, and

Hungarian DALMATIA. This lies in the upper part of the Adriatic Sea, and consists of five districts, in which the most remarkable places are the two following: Segna, which is a royal free town, fortified both by nature and art, and situated near the sea, in a bleak, mountainous, and barren soil. The bishop of this place is a suffragan to the archbishop of Spalatro. Here are twelve churches, and two convents. The governor resides in the old palace, called the Royal Castle. 2. Ottofschatz, a frontier fortification on the river Gatzka. That part of the fortress where the governor and the greatest part of the garrison reside is surrounded with a wall and some towers: but the rest of the buildings, which are mean, are erected on piles in the water: so that one neighbour cannot visit another without a boat.

Near Segna dwell the Uscocs, a people, who, being galled by oppression, escaped out of Dalmatia; from whence they obtained the name of Uscocs, from the word Scoco, which signifies a *deserter*. They are also called springers, or leapers, from the agility with which they leap, rather than walk, along this rugged and mountainous country. Some of them live in scattered houses, and others in large villages. They are a rough, savage people, large-bodied, courageous, and given to rapine; but their visible employment is grazing. They use the Walachian language, and in their religious sentiments and mode of worship approach nearest to the Greek church; but some of them are Roman-catholics.

A part of Walachia belongs also to the emperor as well as to the Turks. It lies to the east of Transylvania, and its principal towns are Tregohitz, Bucharest, and Severin.

**BOUNDARIES.]** BEFORE the late extraordinary partition of this country, the kingdom of Poland, with the great duchy of Lithuania annexed (anciently called Sarmatia), was bounded on the North by Livonia, Muscovy, and the Baltic Sea; on the East by Muscovy; on the South by Hungary, Turkey, and Little Tartary; on the West by Germany; and, had the form of its government been as perfect as its situation was compact, it might have been one of the most powerful kingdoms in Europe. Its grand divisions were,

	Dantzic, Thorn, and Elbing, in Prussia Royal, are styled free cities, and were under the protection of Poland, but were seized by the late king of Prussia.			

After the final dismemberment in 1793, Poland was distributed among the partitioning powers as follows:

Austria	{ Little Poland Red Russia A part of Podolia Great Poland Polish Prussia	} Now Galicia and Lodomeria.
Prussia	{ A small part of Lithuania Masovia Polachia. Samogitia	
Russia	{ Remainder of Lithuania Polesia Volhinia Podolia.	

**NAMES.]** It is generally thought that Poland takes its name from Polu, or Pole, a Slavonian word signifying a country fit for hunting; for which none was formerly more proper, on account of its plains, woods, wild beasts, and game of every kind.

**CLIMATE.]** The air of Poland is such as may be expected from so extensive but level a climate. In the north parts, it is cold, but healthy. The Carpathian mountains, which separate Poland from Hungary, are covered with everlasting snow, which has been known to fall in the midst of summer. Upon the whole, however, the climate of Poland is temperate, and far from being so unsettled, either in winter or summer, as might be supposed from so northerly a situation; but the air is rather insalubrious on account of the numerous woods and morasses.

**SOIL, PRODUCE, AND WATERS.]** Poland is, in general, a level country, and the soil is fertile in corn, as appears from the vast quantities that

are sent from thence down the Vistula to Dantzic, and which are bought up by the Dutch, and other nations. The pastures of Poland, especially in Podolia, are extremely rich. Here are mines of silver, copper, iron, salt, and coals; Lithuania abounds in iron, ochre, black agate, several species of copper and iron pyrites, and red and grey granite; false precious stones, and marine petrifications. The interior parts of Poland contain forests, which furnish timber in such great quantities, that it is employed in house-building, instead of bricks, stones, and tiles. Various kinds of fruits and herbs, and some grapes, are produced in Poland, and are excellent when they meet with culture; but their wine seldom or never comes to perfection. Poland produces various kinds of clay fit for pipes and earthen-ware. The water of many springs is boiled into salt. The virtues of a spring in the palatinate of Cracow, which increases and decreases with the moon, are said to be wonderful for the preservation of life; and it is reported, that the neighbouring inhabitants commonly live to 100, and some of them to 150 years of age. This spring is inflammable, and, by applying a torch to it, it flames like the subtlest spirit of wine. The flame, however, dances on the surface without heating the water; and if neglected to be extinguished, which it may easily be, it communicates itself, by subterraneous conduits, to the roots of trees in a neighbouring wood, which it consumes; and about thirty-five years ago the flames are said to have lasted for three years before they could be entirely extinguished.

RIVERS.] The chief rivers of Poland are, the Vistula or Weyfel, the Neister, Neiper or Boristhenes, the Bog, and the Dwina.

LAKES.] The chief of the few lakes contained in Poland is Gopto, in the palatinate of Byzesty; and Birals, or the White Lake, which is said to dye those who wash in it of a swarthy complexion.

VEGETABLE AND ANIMAL PRODUCTIONS. } The vegetable productions of Poland have been already mentioned under the article of SOIL, though some are peculiar to itself, particularly a kind of manna (if it can be called a vegetable), which in May and June the inhabitants sweep into sieves with the dew, and it serves for food, dressed various ways. A great quantity of yellow amber is frequently dug up in Lithuania, in pieces as large as a man's fist, supposed to be the production of a resinous pine.

The forests of Warsovia or Masovia contain great numbers of ur, or buffaloes, whose flesh the Poles powder, and esteem it an excellent dish. Horses, wolves, boars, the glutton, lynx, elks, and deer, all of them wild, are common in the Polish forests; and there is a species of wild horses and asses, and wild oxen, that the nobility of the Ukraine, as well as natives, are fond of. A kind of wolf, resembling a hart, with spots on his belly and legs, is found here, and affords the best fur in the country; but the elk, which is common in Poland, as well as in some other northern countries, is a very extraordinary animal. The flesh of the Polish elk forms the most delicious part of their greatest feasts. His body is of the deer make, but much thicker and longer; the legs high, the feet broad, like a wild goat's. Naturalists have observed, that, upon dissecting an elk, there was found in his head some large flies, with its brain almost eaten away; and it is an observation sufficiently attested, that, in the large woods and wildernesses of the north, this poor animal is attacked, towards the winter chiefly by a larger sort of flies, that, through its ears, attempt to take up their winter-quarters in its head. This persecution is thought to affect the elk with

the falling sickness, by which means it is frequently taken more easily than it would be otherwise.

Poland produces a creature called *bohac*: it resembles a guinea-pig, but seems to be of the beaver kind. They are noted for digging holes in the ground, which they enter in October, and do not come out, except occasionally for food, till April: they have separate apartments for their provisions, lodgings, and their dead; they live together by ten or twelve in a herd. We do not perceive that Poland contains any species of birds peculiar to itself; only we are told that the quails there have green legs, and their flesh is reckoned to be unwholesome. Lithuania abounds in birds; among those of prey are the eagle and vulture. The *remiz*, or little species of mouton, is frequently found in these parts: it is remarkable for the wondrous structure of its pendent nest, formed in the shape of a long purse, with amazing art.

POPULATION, INHABITANTS, MANNERS, } Some authors have supposed Poland and Lithuania to contain 14,000,000 of inhabitants; and when we consider that the Poles have no colonies, and sometimes have enjoyed peace for many years together, and that no fewer than 2,000,000 of Jews are said to inhabit there, perhaps this calculation has not been exaggerated. But since the partition and dismemberment of the kingdom, the number is only 9,000,000, of which 600,000 are Jews. The provinces taken by Russia are the largest; by Austria the most populous; and by Prussia the most commercial.

The Poles, in their persons, make a noble appearance; their complexion is fair, and their shapes are well proportioned. They are brave, honest, and hospitable; and their women sprightly, yet modest, and submissive to their husbands. Their mode of salute is to incline their heads, and to strike their breasts with one of their hands, while they stretch the other towards the ground; but when a common person meets a superior, he bows his head near to the earth, and with his head touches the leg near to the heel of the person to whom he pays obedience. Their diversions are warlike and manly: vaulting, dancing, and riding the great horse, hunting, skating, bull and bear baiting. They usually travel on horseback; a Polish gentleman will not travel a stone's throw without his horse; and they are so hardy, that they will sleep upon the ground, without any bed or covering, in frost and snow. The Poles never live above stairs, and their apartments are not united: the kitchen is on one side, the stable on another, the dwelling house on the third, and the gate in the front. They content themselves with a few small beds; and if any lodge at their houses, they must carry their bedding with them. When they sit down to dinner, or supper, they have their trumpets and other music playing, and a number of gentlemen to wait on them at table, all serving with the most profound respect; for the nobles who are poor frequently find themselves under the necessity of serving those that are rich; but their patron usually treats them with civility, and permits the eldest to eat with him at his table, with his cap off; and every one of them has his peasant-boy to wait on him, maintained by the master of the family. At an entertainment, the Poles lay neither knives, forks, nor spoons, but every guest brings them with him; and they no sooner sit down to table, than all the doors are shut, and not opened till the company return home. It is usual for a nobleman to give his servant part of his meat, which he eats as he stands behind him, and to let him drink out of the same cup with himself; but

this is the less esteemed his equals. Russia; nor will they would exceed the boquirages of the Polish idea of all that is faine to have any conception of their attendance, w not unusual to see them with a great number an old gentlewoman up her train; and if number of flambeaux.

The Poles are distinguished by the peasants; the peasant and those belonging counts, and barons, a level, except the joy. Hence all who do not value titles highest appellation titles; and, indeed them alone, partly rally from ancient constitution, before the life and death over ject to none but the king; and none but could purchase land enjoying many other lated state; but if These great privileges have large territories they call their subjects and furniture. Un to death with impunity himself as the hei scribed a fine for t of his decease with other regulations the nobles; and w estates from five to reigns of cities, nobles sometimes could raise 8 or 10 asylum for person fame to take the foot guards, which and in their ante abroad. They n diet, some of them in the senate were had suits at law ecution of the se of the kingdom

this is the less extraordinary, if it be considered that these servants are esteemed his equals. Bumpers are much in fashion, both here and in Russia; nor will they easily excuse any person from pledging them. It would exceed the bounds of this work to describe the grandeur and equipages of the Polish nobility; and the reader must figure to himself an idea of all that is fastidious, ceremonious, expensive, and showy in life, to have any conception of their way of living. They carry the pomp of their attendance, when they appear abroad, even to ridicule; for it is not unusual to see the lady of a Polish grandee, besides a coach and six, with a great number of servants, attended by an old gentleman-usher, an old gentlewoman for her *gouvernante*, and a dwarf of each sex to hold up her train; and if it be night, her coach is surrounded by a great number of flambeaux.

The Poles are divided into nobles, clergy, citizens or burghers, and peasants; the peasants are divided into two sorts—those of the crown, and those belonging to individuals. Though Poland has its princes, counts, and barons, yet the whole body of the nobility are naturally on a level, except the difference that arises from the public posts they enjoy. Hence all who are of noble birth call one another *brothers*. They do not value titles of honour, but think a *gentleman of Poland* is the highest appellation they can enjoy. They have many considerable privileges; and, indeed, the boasted Polish liberty was properly limited to them alone, partly by the indulgence of former kings, but more generally from ancient custom and prescription. Under their ancient constitution, before the last partition of the country, they had a power of life and death over their tenants and vassals; paid no taxes; were subject to none but the king; might choose whom they would for their king; and none but they, and the burghers of some particular towns, could purchase lands. In short, they were almost entirely independent, enjoying many other privileges entirely incompatible with a well-regulated state; but if they engage in trade, they forfeit their nobility. These great privileges make the Polish gentry powerful; many of them have large territories, with a despotic power over their tenants, whom they call their subjects, and transfer or assign over with the lands, cattle, and furniture. Until Casimir the Great, the lord could put his peasant to death with impunity; and, when the latter had no children, considered himself as the heir, and seized all his effects. In 1347, Casimir prescribed a fine for the murder of a peasant; and enacted, that, in case of his decease without issue, his next heir should inherit. But these and other regulations proved ineffectual against the power and tyranny of the nobles, and were either abrogated or eluded. Some of them had estates from five to thirty leagues in extent, and were also hereditary sovereigns of cities, with which the king had no concern. One of their nobles sometimes possessed above 4000 towns and villages. Some of them could raise 8 or 10,000 men. The house of a nobleman was a secure asylum for persons who had committed any crime; for none might presume to take them from thence by force. They had their horse and foot guards, which were upon duty day and night before their palaces and in their ante-chambers, and marched before them when they went abroad. They made an extraordinary figure when they came to the diet, some of them having 5000 guards and attendants; and their debates in the senate were often determined by the sword. When great men had suits at law, the diet or other tribunals decided them; yet the execution of the sentence must be left to the longest sword; for the justice of the kingdom was commonly too weak for the grandees. Sometimes

they would raise 6000 men of a side, plunder and burn one another's cities, and besiege castles and forts; for they thought it below them to submit to the sentence of judges, without a field-battle. As to the peasants, they are born slaves, and have no idea of liberty. If one lord kills the peasant of another, he is not capitally convicted, but only obliged to make reparation by another peasant equal in value. A nobleman who is desirous of cultivating a piece of land, builds a little wooden house, in which he settles a peasant and his family, giving him a cow, two horses, a certain number of geese, hens, &c. and as much corn as is sufficient to maintain him the first year, and to improve for his own future subsistence and the advantage of his lord.

The clergy have many immunities; they are all free men, and, in some instances, have their own courts of justice, in which the canon law is practised. A bishop is entitled to all the privileges of a senator; was usually appointed by the king, and confirmed by the pope, but afterwards nominated by the king out of three candidates chosen by the permanent council. The archbishop of Gnesna is primate. The burghers still enjoy some freedom and privileges; they chuse their own burgomaster and council, regulate their interior police, and have their own criminal courts of justice.

The peasants are at the absolute disposal of their master, and all their acquisitions serve only to enrich him. They are indispensably obliged to cultivate the earth; they are incapable of entering upon any condition of life that might procure them freedom, without the permission of their lords; and they are exposed to the dismal, and frequently fatal effects of the caprice, cruelty, and barbarity of their tyrannical masters, who oppress them with impunity; and having the power of life and property in their hands, too often abuse it in the most gross and wanton manner, their wives and daughters being exposed to the most brutal treatment. One blessing, however, attends the wretched situation of the Polish peasants, which is their insensibility. Born slaves, and accustomed from their infancy to hardships and severe labour, the generality of them scarcely entertain an idea of better circumstances and more liberty. They regard their masters as a superior order of beings, and hardly ever repine at their severe lot. Cheerful, and contented with their condition, they are ready upon every occasion to sacrifice themselves and their families for their master, especially if the latter takes care to feed them well. Most of them seem to think that a man can never be very wretched while he has any thing to eat. There are some styled German peasants, whose ancestors were indulged, on settling in Poland, in the use of the German laws, who enjoyed several privileges not possessed by the generality of the Polish peasants: their villages are better built, they possess more cattle, pay their quit-rents better, and are cleaner and neater in their persons. We have been the more circumstantial in describing the manners and present state of the Poles, as they bear a near resemblance, in many particulars, to those of Europe in general during the feudal ages; but their tyranny over their tenants and vassals seems to be carried to a much greater height. Lately, indeed, a few nobles of enlightened understandings have ventured to give liberty to their vassals. The first who granted this freedom was Zemoiski, formerly great chancellor, who, in 1760, enfranchised six villages in the palatinate of Masovia, and afterwards on all his estates. The events has shown the project to be no less judicious than humane—friendly to the nobles' own interests as well as the happiness of the peasants; for it appears, that in the districts in which the new arrangement has been introduced, the po-

ulation of the village  
their estates augmented  
of the late king of

population of the villages is considerably increased, and the revenues of their estates augmented in a triple proportion. Prince Stanislaus, nephew of the late king of Poland, likewise enfranchised four villages near Warsaw; and not only emancipated his peasants from slavery, but condescended to direct their affairs. So that better times in that distressed country may be expected.

Torture was abolished in Poland in 1770, by an edict of the diet, under the influence of the king. Atrocious crimes, such as murder, &c. are punished by beheading or hanging; lesser delinquencies by whipping, imprisonment, and hard labour: the nobles never suffer any corporal punishment, but are liable only to imprisonment and death.

The inns in this country are long stables, built with boards, and covered with straw, without furniture or windows; there are chambers at one end; but none can lodge there, because of flies and other vermin; so that strangers generally choose rather to lodge among the horses. Travellers are obliged to carry provision with them; and when foreigners want a supply, they apply to the lord of the village, who forthwith provides them with necessaries.

**DRESS.]** The dress of the Poles is rather singular. They shave their heads, leaving only a circle of hair upon the crown, and men of all ranks generally wear large whiskers. They wear a vest which reaches down to the middle of the leg, and a kind of gown over it lined with fur, and girded with a sash, but the sleeves fit as close to their arms as a waistcoat. Their breeches are wide, and make but one piece with their stockings. They wear a fur cap or bonnet; their shirts are without collar or wristbands, and they wear neither stock nor neckcloth. Instead of shoes, they wear Turkey leather boots, with thin soles, and deep iron heels bent like a half moon. They carry a pole-ax, and a sabre, or cutlass, by their sides. When they appear on horseback, they wear over all a short cloak, which is commonly covered with furs both within and without. The people of the best quality wear fables, and others the skins of tigers, leopards, &c. Some of them have fifty suits of clothes, all as rich as possible, and which descend from father to son. Were it not for our own partiality to short dresses, we must acknowledge that of the Poles to be picturesque and majestic. Charles II. of England, thought of introducing the Polish dress into his court, and, after his restoration, wore it for two years, chiefly for the encouragement of the English broad-cloth; but discontinued it through his connections with the French.

The habit of the women very much resembles that of the men; a simple Polonaise, or long robe edged with fur; but some people of fashion, of both sexes, affect the French or English modes. As to the peasants, in winter they wear a sheep's-kin, with the wool inwards, and in summer a thick coarse cloth; but as to linen, they wear none. Their boots are the rinds of trees wrapped about their legs, with the thicker parts to guard the sole of their feet. The women have a watchful eye over their daughters, and, in the district of Samogitia particularly, make them wear little bells before and behind, to give notice where they are, and what they are doing.

**RELIGION.]** The number of protestants, consisting of Lutherans and Calvinists, in the republic of Poland, is very considerable; and when these are joined to the Greek church, the whole are called **DISSIDENTS**. At the same time, the Polish nobility and the bulk of the nation are tenacious of the Roman-catholic religion. The treaty of Oliva, concluded in 1660, tolerated the dissidents, and was guaranteed by the

principal powers in Europe; but was so disregarded by the Poles, that, in the year 1724, they made a public massacre of the protestants at Thorn. Numerous provisions were made for the protection of the protestants who were persecuted, when Jews, Turks, and infidels of every kind, have been tolerated and encouraged. The monasteries in Poland are, by some writers, said to be 576, and the nunneries 117, besides 246 seminaries or colleges, and 31 abbeys. The clergy are possessed of a very large proportion of the lands and revenues of the kingdom; but in general are illiterate bigots, and the monks are some of the most profligate of mankind, without apprehending any disgrace to their order, or dreading the censure of their superiors, who require equal indulgence. The popish clergy have had great influence in Poland, at different periods, notwithstanding the treaties and capitulations which have been made in favour of the protestants and the members of the Greek church. Indeed it has been chiefly owing to the influence and conduct of the popish clergy that the peasants in Poland have been reduced to such a state of wretched slavery.

The principles of Socinianism made a very early and considerable progress in Poland. A translation of the Bible into the Polish language was published in 1572; and two years after, under the direction of the same persons, the catechism, or confession, of the Unitarians, was published at Cracow. The abilities and writings of Socinus greatly contributed to the extensive propagation of his opinions; but though the Socinians in Poland have been very numerous, they have at different times been greatly persecuted. However, it was lately resolved between the republic and partitioning powers, that all dissidents should henceforth enjoy the free exercise of their religion, though to continue excluded from the diet, the senate, and the permanent council. They are to have churches, but without bells; also schools and seminaries of their own; they are capable of sitting in the inferior courts of justice, and three of their communion are admitted as assessors in the tribunal to receive appeals in religion.

[ARCHBISHOPRICS AND BISHOPRICS.] Poland contains two archbishoprics; Gnesna and Lemburg. The archbishop of Gnesna, besides being primate, is always a cardinal. The other bishops, particularly of Cracow, enjoy great privileges and immunities.

[LANGUAGE.] The Polish language is a dialect of Slavonic, and is both harsh and unharmonious, on account of the vast number of consonants it employs. The Lithuanians and Livonians have a language full of corrupted Latin words: but the Russian and German tongues are understood in the provinces bordering on those countries.

[LEARNING AND LEARNED MEN.] Though Copernicus, the great restorer of the true astronomical system, Vorsius, and some other learned men, were natives of Poland, yet many circumstances in this country are far from being favourable to learning. Latin is spoken, though incorrectly, by the common people in some provinces. But the contempt which the nobility, who place their chief importance in the privileges of their rank, have ever shown for learning; the servitude of the lower people; and the universal superstition among all ranks of them, have wonderfully retarded, and, notwithstanding the liberal efforts of his late majesty, still continue to retard, the progress of letters in this kingdom. However, of late, a taste for science has spread itself among the nobles, and begins to be regarded as an accomplishment.

[UNIVERSITIES.] The universities of Poland are those of Cracow, Wilna, and Posna or Posen. The first consists of eleven colleges, and

has the supervisory

Wilna was under the superintendance of the Jesuits; but after their suppression the king established a committee of education, who appoint professors, and direct their salaries and studies: that of Posna was rather a Jesuits' college than an university.

ANTIQUITIES AND CURIOSITIES, } The frequent incursions of the  
NATURAL AND ARTIFICIAL. } Tartars, and other barbarous na-  
tions, into Poland, probably forced the women sometimes to leave their  
children exposed in the woods; where we must suppose they were nursed  
by bears and other wild beasts; otherwise it is difficult to account for  
their subsistence. It is certain that such beings have been found in the  
woods both of Poland and Germany, divested of almost all the proper-  
ties of humanity but the form. When taken, they generally went on  
all fours; but it is said that some of them have, by proper management,  
attained to the use of speech.

The salt-mines in Poland consist of wonderful caverns, several hundred yards deep, at the bottom of which are many intricate windings and labyrinths. Out of these are dug four different kinds of salts; one extremely hard, like crystal; another softer, but clearer; a third white, but brittle; these are all blackish, but the fourth is somewhat fresher. These four kinds are dug in different mines, near the city of Cracow; on one side of them is a stream of salt water, and on the other one of fresh. The revenue arising from these, and other salt mines, is very considerable, and formed part of the royal revenue, before seized by Austria: the annual average profit of those of Wiolitzka, eight miles from Cracow, was about 98,000*l.* sterling. Out of some mines at Itza, about 70 miles north-east of Cracow, are dug several kinds of earth, which are excellently adapted to the potter's use, and supply all Poland with earthen-ware. Under the mountains adjoining to Kiow, in the deserts of Podolia, are several grottos, where a great number of human bodies are preserved, though buried a vast number of years since, being neither so hard nor so black as the Egyptian mummies. Among them are two princes, in the habits they used to wear. It is thought that this preserving quality is owing to the nature of the soil, which is dry and sandy. The artificial rarities of Poland are but few, the chief being the gold, silver, and enamelled vessels presented by the kings and prelates of Poland, and preserved in the cathedral of Gnesna.

CITIES, TOWNS, FORTS, AND OTHER } Warsaw lies on the Vistula,  
EDIFICES, PUBLIC AND PRIVATE. } and almost in the centre of  
Poland. It was the royal residence, and contains many magnificent  
palaces and other buildings, besides churches and convents. It is now  
subject to Prussia, having been allotted to that power by the last parti-  
tion. It is said to contain near 70,000 inhabitants; but a great number  
are foreigners. The streets are spacious, but ill paved, and the greatest  
part of the houses, particularly in the suburbs, are mean wooden hovels.  
The city exhibits a strong contrast of wealth and poverty, as does every  
part of this unhappy country. It has little or no commerce. The same may  
be said of Cracow, the ancient capital; for we are told, that notwithstanding  
it lies in the neighbourhood of the rich salt-mines, and is said to contain  
fifty churches and convents, its commerce is inconsiderable. The city  
stands in an extensive plain watered by the Vistula, and, with the sub-  
urbs, occupies a vast space of ground; but both together scarcely contain  
16,000 souls. It is surrounded with high brick walls, strengthened  
with round and square towers in the ancient style of fortification.

Grodno, though not the capital, is the principal town in Lithuania, but a large and straggling place, containing ruined palaces, falling houses, and wretched hovels, with about 7000 inhabitants,—1000 of whom are Jews, and 3000 employed in new manufactures of cloths, camlets, linen, cotton, silk, stuffs, &c. established there by the king in 1776. He likewise established in this place an academy of physic for Lithuania, in which ten students are instructed for physic, and twenty for surgery, who were all taught and maintained at his own expense.

Dantzic is the capital of Polish Prussia, and is famous in history on many accounts, particularly for being formerly at the head of the Hanseatic association, commonly called the Hanse-towns. It is situated on the Vistula, near five miles from the Baltic, and is a large, beautiful, populous city: its houses generally are five stories high; and many of its streets are planted with chestnut-trees. It has a fine harbour, and is still a most eminent commercial city, although it seems to be somewhat past its meridian glory, which was probably about the time that the president De Thou wrote his much esteemed *Historia sui Temporis*, in which, under the year 1607, he so highly celebrates its commerce and grandeur. It is a republic, claiming a small adjacent territory about forty miles round it, which were under the protection of the king and the republic of Poland. Its magistracy, and the majority of its inhabitants, are Lutherans; although the Romanists and Calvinists be equally tolerated in it. It is rich, and has 26 parishes, with many convents and hospitals. The inhabitants have been computed to amount to 200,000; but Dr. Busching tells us, that, in the year 1752, there died but 1846 persons. Its own shipping is numerous; but the foreign ships constantly resorting to it are more so, of which 1014 arrived there in the year 1752; in which year also 1288 Polish vessels came down the Vistula, chiefly laden with corn, for its matchless granaries; whence that grain is distributed to many foreign nations; besides which, Dantzic exports great quantities of naval stores, and vast variety of other articles. Dr. Busching affirms, that it appears from ancient records, as early as the year 997, that Dantzic was a large commercial city, and not a village or inconsiderable town, as some pretend.

The inhabitants of Dantzic have often changed their masters, and have sometimes been under the protection of the English and Dutch; but generally have shown a great predilection for the kingdom and republic of Poland, as being less likely to rival them in their trade, or abridge them in their immunities, which extend even to the privilege of coining money. Though strongly fortified, and possessed of 150 large brass cannon, it could not, through its situation, stand a regular siege, being surrounded with eminences. In 1734, the inhabitants discovered a remarkable attachment and fidelity towards Stanislaus, king of Poland, not only when his enemies, the Russians, were at their gates, but even in possession of the city. The reason why Dantzic, Thorn, and Elbing, have enjoyed privileges, both civil and religious, very different from those of the rest of Poland, is because, not being able to endure the tyranny of the Teutonic knights, they put themselves under the protection of Poland, reserving to themselves large and ample privileges. This city, as well as that of Thorn, were exempted by the king of Prussia (Frederic II.) from those claims which he made on the neighbouring countries; notwithstanding which, he soon after thought proper to seize on the territories belonging to Dantzic, under pretence of their having been formerly part of Polish Prussia. He then proceeded to possess himself of the port-duties belonging to that city, and erected a custom-house in the harbour, where he laid arbitrary and in-

supportable duties upon goods exported or imported. To complete the system of oppression, custom-houses were erected at the very gates of Dantzic, so that no person could go in or out of the town without being searched in the strictest manner. Such is the treatment which the city of Dantzic received from the king of Prussia, though few cities have ever existed which have been comprehended in so many general and particular treaties, and whose rights and liberties have been so frequently secured, and guaranteed by so many great powers, and by such a long and regular succession of public acts, as that of Dantzic has been. In the year 1794, it was blockaded by his troops, on various pretences: by the interposition of the empress of Russia, and of the king of Poland, they were withdrawn, and a negotiation carried on by deputies at Warsaw; which was concluded on the 7th of September; by which, as now acceded to by the citizens, the trade of the city was to be restored to its former stability. Notwithstanding this, however, in the year 1793, the Prussian troops took possession of Dantzic; the burgo-master and council of the city having, on the 2d of April, assembled at the town-house, at the request of the late king of Prussia, by public declaration ordered every person to follow his trade and business as usual, and remain peaceably in his house, when the Prussians should enter that city. The city of Thorn was also treated by the king of Prussia in the same unjust and oppressive manner with that of Dantzic, and is now added to his dominions.

COMMERCE AND MANUFACTURES.] The chief exports of Poland are all species of grain, hemp, flax, cattle, masts, planks, pitch and tar, honey, wax, pot-ash and tallow: its imports are foreign wines, cloths, stuffs, manufactured silks and cotton, fine linen, hardware, tin, copper, silver, and gold, glass-ware, furs, &c. Some linen and woollen cloths, silks, stuffs, camlets, lace, and hardwares, are manufactured in the interior parts of Poland and Lithuania; but commerce is chiefly confined to the city of Dantzic, and the other towns on the Vistula and the Baltic.

CONSTITUTION AND GOVERNMENT.] Whole volumes have been written upon the old constitution of Poland. It differed little from aristocracy: hence Poland has been called a kingdom and commonwealth. The king was head of the republic, and was elected by the nobility and clergy in the plains of Warsaw. They elected him on horseback; and in case there should be a refractory minority, the majority had no controul over them, but to cut them in pieces with their sabres; but if the minority were sufficiently strong, a civil war ensued. Immediately after his election, he signed the *pacta conventa* of the kingdom, by which he engaged that the crown should be elective—that his successor should be appointed during his life—that the diets should be assembled every two years—that every noble or gentleman in the realm should have a vote in the diet of election, and that in case the king should infringe the laws and privileges of the nation, his subjects should be absolved from their allegiance.—In fact, the king was no more than president of the senate, which was composed of the primate, the archbishop of Lemberg, fifteen bishops, and 130 laymen, consisting of the great officers of state, the palatines, and castellans. The palatines were the governors of the provinces, who held their offices for life.—The castellans' offices in time of peace were almost nominal; but when the military or feudal services were required, they were the lieutenants of the palatines, and commanded the troops of their several districts.

The diets of Poland were ordinary and extraordinary: the former met once in two, and sometimes three years; the latter was summoned by the

king, upon critical emergencies, and continued no longer than a fortnight; but one dissenting voice rendered all their deliberations ineffectual. Previous to a general diet, either ordinary or extraordinary, which could sit but six weeks, there were dietines, or provincial diets, held in different districts. The king, with the advice of the permanent council, sent them letters, containing the heads of the business that was to be treated of in the general diet. The gentry of each palatinate might sit in the dietine, and choose nuncios or deputies, to carry their resolutions to the grand diet. The great diet consisted of the king, senators, and deputies from provinces and towns, viz. 178 for Poland and Lithuania, and 70 for Prussia: it met twice at Warsaw, and once at Grodno, by turns, for the conveniency of the Lithuanians, who made it one of the articles of their union with Poland; but since the present reign, they have been always summoned to Warsaw.

The partitioning powers, at the time of their first dismemberment of Poland, proceeded to change and fix the constitution and government, under pretence of amending it; confirming all its defects, and endeavouring to perpetuate the principles of anarchy and confusion. The executive power, which was entrusted to the king and senate, was vested in the permanent council, composed of the king, senate, and the equestrian order. The king, as president, the primate, and three bishops, nine lay senators, four from the ministry of the republic, the marshal, with 17 counsellors of the equestrian order,—in all 36. Of the 18 senators, six from each province of Great Poland, Little Poland, and Lithuania. They insisted upon four cardinal laws to be ratified, which was at last obtained. By the *first*, "that the crown of Poland shall be for ever elective, and all order of succession proscribed;" thus the exclusion of a king's son and grandson removed the prospect of an hereditary sovereignty, and entailed upon the kingdom all the evils inseparable from an elective monarchy. By the *second*, "that foreign candidates to the throne shall be excluded, and no person can be chosen king of Poland, excepting a native Pole, of noble origin, and possessing land in the kingdom," the House of Saxony, and all foreign princes who might be likely to give weight to Poland by their hereditary dominions, and restore its provinces and liberties, were set aside. By the *third*, "the government of Poland shall be for ever free, independent, and of a republican form;" the *liberum veto*, and all the exorbitant privileges of the equestrian order, were confirmed in their utmost latitude. And by the *fourth*, "a permanent council shall be established, in which the executive power shall be vested; and in this council the equestrian order, hitherto excluded from the administration of affairs in the interval of diets, shall be admitted;" so that the prerogatives of the crown were still farther diminished; but this change of the constitution was intended by the partitioning powers to serve their own purposes, and give a large scope to influence and faction over that part of the kingdom they had not as yet seized.

**REVENUES.]** The income of the kings of Poland generally amounted to 140,000*l.* sterling. The public revenues arose chiefly from the crown-lands, the salt mines in the palatinate of Cracow, now in Austrian Poland, which alone amounted to nearly 100,000*l.* sterling; ancient tolls and customs, particularly those of Elbing and Dantzic, the rents of Marienburg, Dirishan, and Rogenhus, of the government of Cracow and district of Niepolomniez.—Of the revenues received from Poland by the powers among whom it has been divided, nothing can, at present, be affirmed with certainty.

**MILITARY STRENGTH.]** The pride of the Polish nobility is such, that

they always appear in the field on horseback; and it is said that Poland could raise with ease 100,000, and Lithuania 70,000 cavalry; but it must be understood that servants are included. As to the ordinary army of the Poles, it consisted, in 1778, of 12,310 men in Poland, and 7,465 in Lithuania, cantoned into crown-lands.—The Polish hussars are the finest and most showy body of cavalry in Europe; next to them are the panzerers; and both those bodies wear defensive armour of coats of mail and iron caps. The rest of their cavalry are armed with muskets and heavy scymetars. Yet the Polish cavalry are extremely inefficient in the field; for though the men are brave, and their horses excellent, they are strangers to all discipline. It is certain, notwithstanding, that the Poles may be rendered excellent troops by discipline, and that, on various occasions, particularly under John Sobieski, they made as great a figure in arms as any people in Europe, and proved the bulwark of Christendom against the infidels.

ORDERS.] The "*Order of the White Eagle*" was first instituted by Vladislaus, in the year 1325, but revived by Augustus I. in the year 1705, to attract to him some of the Polish nobles, who, he feared, were inclined to Stanislaus, his competitor: it was conferred also on the czar Peter the Great, of Russia. The late king instituted the "*Order of St. Stanislaus*," soon after his election to the crown in 1765. The badge is a gold cross enamelled red, and on the centre of it is a medallion, with the image of St. Stanislaus, enamelled in proper colours. It is worn pendent to a red ribband edged with white. The star of the order is silver, and in the centre is a cypher of S.A.R. (Stanislaus Augustus Rex), encircled with the motto "*Præmiando incitat.*"

HISTORY.] Poland, of old, was possessed by the Vandals, who were afterwards partly expelled by the Rus's and Tartars. It was divided into many small states or principalities, each almost independent of another, though they generally had some prince who was paramount over the rest. In the year 700, the people, through the oppression of their petty chiefs, gave the supreme command, under the title of duke, to Cracus, the founder of the city of Cracow. His posterity failing, in the year 830, a peasant, named Piastus, was elected to the ducal dignity. He lived to the age of 120 years, and his reign was so long and auspicious, that every native Pole who has since been elected king is called a Piast. From this period till the accession of Micislaus II. 904, we have no very certain records of the history of Poland. The title of duke was retained till the year 999, when Boleslaus assumed the title of king, and conquered Moravia, Prussia, and Bohemia, making them tributary to Poland. Boleslaus II. added Red Russia to Poland, by marrying the heiress of that duchy, anno 1059. Jagello, who, in 1384, mounted the throne, was grand duke of Lithuania, and a pagan; but on his being elected king of Poland, he not only became a Christian, but was at pains to bring over his subjects to that religion. He united his hereditary dominions to those of Poland; which gave such influence to his posterity over the hearts of the Poles, that the crown was preserved in his family, until the male line became extinct in Sigismund Augustus, in 1572, who admitted the reformed, with Greeks and all other sects, to a seat in the diet, and to all the honours and privileges before confined to the catholics. He gave such evident marks of favour to the protestant confession, that he was suspected of being inclined to change his religion. At this time two powerful competitors appeared for the crown of Poland: these were, Henry duke of Anjou, brother to Charles IX. king of France, and Maximilian of Austria. The French interest prevailed, by private bribes to the nobles, and a stipula-

tion to pay an annual pension to the republic from the revenues of France; but Henry had not been four months on the throne of Poland when his brother died, and he returned privately to France, which kingdom he governed by the name of Henry III. The party who had espoused Maximilian's interest, endeavoured once more to revive his pretensions; but the majority of the Poles being desirous to choose a prince who might reside among them, made choice of Stephen Batori, prince of Transylvania, who, in the beginning of his reign, meeting with some opposition from the Austrian faction, took the wisest method to establish himself on the throne, by marrying Anne, the sister of Sigismund Augustus, and of the royal house of the Jagellons. Stephen produced a great change in the military affairs of the Poles; by establishing a new militia, composed of Cossacs, a rough and barbarous race of men, on whom he bestowed the Ukraine, or frontiers of his kingdom. Upon his death, in 1586, the Poles chose Sigismund, son of John, king of Sweden, by Catharine, sister of Sigismund II. for their king.

Sigismund was crowned king of Sweden after his father's death; but being expelled, as we have seen in the history of Sweden, by the Swedes, a long war ensued between them and the Poles, but terminated in favour of the latter. Sigismund being secured in the throne of Poland, aspired to that of Russia as well as Sweden; but after long wars, he was defeated in both views. He was afterwards engaged in a variety of unsuccessful wars with the Turks and Swedes. At last a truce was concluded under the mediation of France and England: but the Poles were forced to agree that the Swedes should keep Elbing, Memel, Branusberg, and Pillau, together with all they had taken in Livonia. In 1623, Sigismund died, and Uladislaus, his son, succeeded. This prince was successful both against the Turks and the Russians, and obliged the Swedes to restore all the Polish dominions they had taken in Prussia. His reign, however, was unfortunate, by his being instigated, through the avarice of his great men, to encroach upon the privileges of the Cossacs in the Ukraine. As the war which followed was carried on against the Cossacs upon ambitious and perfidious principles, the Cossacs, naturally a brave people, became desperate; and on the succession of John II. brother to Uladislaus, the Cossac general Schmielinski defeated the Poles in two great battles, and forced them to a dishonourable peace. It appears that, during the course of this war, the Polish nobility behaved as the worst of Russians, and their conduct was highly condemned by John; while his nobility disapproved of the peace he had concluded with them. As the jealousy hereby occasioned continued, the Russians came to a rupture with the Poles; and being joined by many of the Cossacs, they, in 1654, took Smolensko. This was followed by the taking of Wilna, and other places; and they committed most horrid ravages in Lithuania. Next year Charles X. of Sweden, after over-running Great and Little Poland, entered into Polish Prussia, all the towns of which received him, except Dantzic. The resistance made by that city gave the Poles time to re-assemble; and their king, John Casimir, who had fled into Silesia, was joined by the Tartars as well as the Poles: so that the Swedes, who were dispersed through the country, were every where cut in pieces. The Lithuanians, at the same time, disowned the allegiance they had been forced to pay to Charles, who returned to Sweden with no more than a handful of his army. It was during this expedition, that the Dutch and English protected Dantzic, and the elector of Brandenburg acquired the sovereignty of Ducal Prussia, which had submitted to Charles. Thus the latter lost Poland, of which he had made an almost complete conquest. The treaty of Oliva

was begun after the Swedes had been driven out of Cracow and Thorn, by which Royal Prussia was restored to the Poles. They were, however, forced to quit all pretensions to Livonia, and to cede Smolentko, Kiow, and the duchy of Siveria, to the Russians.

During these transactions, the Polish nobility grew dissatisfied with the concessions their king had made to the Cossacs, many of whom had thrown off the Polish yoke; others taxed him with want of capacity; and some, with an intention to rule by a mercenary army of Germans. Casimir, who very possibly had no such intentions, and was fond of retirement and study, finding that cabals and factions increased every day, and that he himself might fall a sacrifice to the public discontent, abdicated his throne, and died abbot of St. Germain in France, employing the remainder of his days in Latin poetical compositions, which are far from being despicable.

The most remote descendants of the ancient kings ending in John Casimir, many foreign candidates presented themselves for the crown of Poland; but the Poles chose for their king a private gentleman, of little interest, and less capacity, one Michael Wiefnowilki, because he was descended from a Piast. His reign was disgraceful to Poland. Large bodies of Cossacs had put themselves under the protection of the Turks, who conquered all the provinces of Podolia, and took Kamienieck, till then thought impregnable. The greatest part of Poland was then ravaged, and the Poles were obliged to pay an annual tribute to the Sultan. Notwithstanding those disgraceful events, the credit of the Polish arms was in some measure maintained by John Sobieski, the crown-general, a brave and active commander, who had given the Turks several defeats. Michael dying in 1673, Sobieski was chosen king; and in 1676 he was so successful against the infidels, that he forced them to remit the tribute they had imposed upon Poland; but they kept possession of Kamienieck. In 1683, Sobieski, though he had not been well treated by the House of Austria, was so public-spirited as to enter into the league that was formed for the defence of Christendom against the infidels, and acquired immortal honour, by obliging the Turks to raise the siege of Vienna, and making a terrible slaughter of the enemy; for all which glorious services, and driving the Turks out of Hungary, he was ungratefully requited by the emperor Leopold.

Sobieski returning to Poland, continued the war against the Turks, but unfortunately quarrelled with the senate, who suspected that he wanted to make the crown hereditary in his family. He died, after a glorious reign, in 1696.

Poland fell into great distractions upon Sobieski's death. Many confederacies were formed, but all parties seemed inclined to exclude the Sobieski family. In the mean time, Poland was insulted by the Tartars, and the crown in a manner put up to sale. The prince of Conti, of the blood royal of France, was the most liberal bidder; but while he thought the election almost sure, he was disappointed by the intrigues of the queen-dowager, in favour of her younger son, prince Alexander Sobieski, for which she was driven from Warsaw to Dantzie. Suddenly Augustus, elector of Saxony, started up as a candidate, and after a sham election, being proclaimed by the bishop of Cujavia, he took possession of Cracow with a Saxon army, and actually was crowned in that city in 1697. The prince of Conti made several unsuccessful efforts to re-establish his interest, and pretended that he had been actually chosen; but he was afterwards obliged to return to France, and the other powers of Europe seemed to acquiesce in the election of Augustus. The manner in which

he was driven from the throne, by Charles XII. of Sweden, (who procured the advancement of Stanislaus), and afterwards restored by the czar, Peter the Great, has been already related in the history of Sweden. It was not till the year 1712 that Augustus was fully confirmed on the throne, which he held upon precarious and disagreeable terms. The Poles were naturally attached to Stanislaus, and were perpetually forming conspiracies and plots against Augustus, who was obliged to maintain his authority by means of his Saxon guards and regiments. In 1723, his natural son, prince Maurice, afterwards the famous count Saxe, was chosen duke of Courland; but Augustus was not able to maintain him in that dignity against the power of Russia and the jealousy of the Poles. Augustus died, after an unquiet reign, in 1733, having done all he could to insure the succession of Poland to his son Augustus II. (or, as he is called by some, III.) This occasioned a war, in which the French king maintained the interest of his father-in-law, Stanislaus, who was actually re-elected to the throne by a considerable party, of which the prince-primate was the head. But Augustus, entering Poland with a powerful army of Saxons and Russians, compelled his rival to retreat to Dantzic, whence he escaped with great difficulty into France. In the history of Germany, the war between Augustus II. as elector of Saxony, or rather as the ally of Russia and Austria, and Frederic II. king of Prussia, has been already noticed. It is sufficient to say, that though Augustus was a mild and moderate prince, and did every thing to satisfy the Poles, he never could gain their hearts; and all he obtained from them was merely shelter, when the king of Prussia drove him from his capital and electorate. Augustus died at Dresden, in 1763, upon which count Stanislaus Poniatowski was chosen king, by the name of Stanislaus Augustus; though it is said that the election was conducted irregularly, and that he obtained the crown chiefly through the influence of the empress of Russia. He was a man of abilities and address; but, from various concurring causes, he had the unhappiness to see Poland, during his reign, a scene of desolation and calamity. In 1786, two Polish gentlemen presented a petition to the king, in the name of all the protestant nobility, and in behalf also of the members of the Greek church, wherein they demanded to be re-instated in their ancient rights and privileges, and to be placed upon the same footing in every respect as the Roman-catholic subjects of the kingdom. "The difference of sentiments upon some points of religion among Christians," said they, in their petition, "ought not to enter into any consideration with regard to the employments of the state. The different sects of Christians, although they differ in opinion among themselves with respect to some points of doctrine, agree all in one point, that of being faithful to their sovereign, and obedient to his orders: all the Christian courts are convinced of this truth; and therefore, having always this principle in view, and without having any regard to the religion they profess, Christian princes ought only to seek after those whose merit and talents make them capable of serving their country properly." The king gave no answer to the petition of the dissenters; but the matter was referred to the diet, which was held the following year, when the ministers of the courts of Russia, London, Berlin, and Copenhagen, supported their pretensions. The diet appeared to receive the complaints of the dissenters with great moderation, as to the free exercise of their worship, which gave some flattering expectations that the affair would be happily terminated. But the intrigues of the king of Prussia appear to have prevented this: for, though he openly professed to be a zealous defender of the cause of the dissenters, it was manifest, from the event, that

his great aim was to promote the views of his own ambition. The intervention of the Russians in the affairs of Poland also gave great disgust to all parties in the kingdom. The whole nation ran into confederacies formed in distinct provinces; the popish clergy were active in opposing the cause of the dissidents; and this unfortunate country became the theatre of the most cruel and complicated of all wars, partly civil, partly religious, and partly foreign. The confusion, devastation, and civil war, continued in Poland during the years 1769, 1770, and 1771, whereby the whole face of the country was almost destroyed; many of the principal popish families retired into foreign states with their effects; and had it not been for a body of Russian troops, which acted as guards to the king at Warsaw, that city had likewise exhibited a scene of plunder and massacre. To these complicated evils were added, in the year 1770, that most dreadful scourge, the pestilence, which spread from the frontiers of Turkey to the adjoining provinces of Podolia, Volhinia, and the Ukraine; and in these provinces, it is said, swept off 250,000 people. Meanwhile some of the Polish confederates interceded with the Turks to assist them against their powerful oppressors; and a war ensued between the Russians and the Turks on account of Poland. The conduct of the grand signior, and of the Ottoman Porte, towards the distressed Poles, was just and honourable, and the very reverse of that of their Christian, catholic, and apostolic neighbours\*.

On September 3, 1771, an attempt was made by Koziniki, an officer among the Polish confederates, and several others, to assassinate the king of Poland, in the streets of Warsaw. His majesty received two wounds on the head, one from a ball, and the other from a sabre; notwithstanding which, he had the good fortune to escape with life, by Koziniki's relenting; for which his life was saved, and he was suffered to retire to the papal territories, with an annual pension from the king.

The following year, 1772, it appeared that the king of Prussia, the emperor and empress-queen, and empress of Russia, had entered into an alliance to divide and dismember the kingdom of Poland: though Prussia was formerly in a state of vassalage to Poland, and the title of king of Prussia was never acknowledged by the Poles till 1764. Russia also, in

\* In 1764, the empress of Russia transmitted to the court of Warsaw an act of renunciation, signed with her own hand, and sealed with the seal of the empire; in which she declares, "That she did by no means arrogate either to herself, her heirs, and successors, or to her empire, any right or claim to the districts or territories which are actually in possession, or subject to the authority, of the kingdom of Poland, or great duchy of Lithuania; but that, on the contrary, her said majesty would guarantee to the said kingdom of Poland and duchy of Lithuania all the immunities, lands, territories, and districts, which the said kingdom and duchy ought by right to possess, or did now actually possess; and would at all times, and for ever, maintain them in the full and free enjoyment thereof, against the attempts of all and every one who should, at any time, or on any pretext, endeavour to dispossess them of the same."—In the same year did the king of Prussia sign, with his own hand, an act, wherein he declared, "That he had no claims, formed no pretensions on Poland, or any part thereof: that he renounced all claims on that kingdom, either as king of Prussia, elector of Brandenburg, or duke of Pomerania." In the same instrument he guarantees, in the most solemn manner, the territories and rights of Poland against every power whatever.—The empress-queen of Hungary, so late as the month of January, 1771, wrote a letter with her own hand to the king of Poland, in which she gave him the strongest assurances, "That her friendship for him and the republic was firm and unalterable; that the motions of her troops ought not to alarm him; that she had never entertained a thought of seizing any part of his dominions, nor would even suffer any other power to do it." From which, according to the political creed of princes, we may infer, that to guarantee the rights, liberties, and revenues of a state, means to annihilate those liberties, seize upon those rights, and appropriate those revenues to their own use.—Such is the faith of princes!

the beginning of the 17th century, saw its capital and throne possessed by the Poles; while Austria, in 1683, was indebted to a king of Poland for the preservation of its metropolis, and almost for its very existence. These three allied powers, acting in concert, set up their formal pretensions to the respective districts which they had allotted for and guaranteed to each other;—Polish or Western Prussia, and some districts bordering upon Brandenburg, for the king of Prussia; almost all the south-east parts of the kingdom bordering upon Hungary, together with the rich salt-works of the crown, for the empress-queen of Hungary and Bohemia\*; and a large district of country about Mohilow, upon the banks of the Dnieper, for the empress of Russia†. But though each of these powers pretended to have a legal title to the territories which were allotted them respectively, and published manifestoes in justification of the measures which they had taken, yet as they were conscious that the fallacies by which they supported their pretensions were too gross to impose upon mankind, they forced the Poles to call a new diet, and threatened them, that if they did not consent unanimously to sign a treaty for the ceding of those provinces to them respectively, the whole kingdom would be laid under a military execution, and treated as a conquered state. In this extremity of distress, several of the Polish nobility protested against this violent act of tyranny, and retired into foreign states, choosing rather to live in exile, and to have all their landed property confiscated, than to be instruments of bringing their country to utter ruin; but the king, under the threatening of deposition and imprisonment, was prevailed upon to sign this act, and his example was followed by many of his subjects.

The king of Prussia's conduct in Poland was the most tyrannical that can be conceived. In the year 1771, his troops entered into Great Poland, and carried off from that province and its neighbourhood, at a moderate computation, 12,000 families. On the 29th of October, in the same year, he published an edict, commanding every person, under the severest penalties, and even corporeal punishment, to take in payment, for forage, provisions, corn, horses, &c. the money offered by his troops and commissaries. This money was either silver, bearing the impression of Poland, and exactly worth one third of its nominal value, or ducats struck in imitation of Dutch ducats, seventeen per cent. inferior to the real ducats of Holland. With this base money he bought up corn and forage enough, not only to supply his army for two whole years, but to stock magazines in the country itself, where the inhabitants were forced to come and re-purchase corn for their daily subsistence, at an advanced price, and with good money, his commissaries refusing to take the same coin they had paid. At the lowest calculation, he gained, by this *bonapart* manoeuvre, seven millions of dollars. Having stripped the country of money and provisions, his next attempt was to thin it still more of its in-

\* The district claimed by Austria was "all that tract of land lying on the right side of the Viñda, from Silesia above Sandonir, to the mouth of the San, and from thence by Francopol, Zamoise, and Rubicoff, to the Bog; from the Bog along the frontiers of Red Russia to Zabras, on the border of Volhania and Podolia, and from Zabras in a straight line to the Nieper, where it receives the Shutz, taking in a part of Podolia, and then along the boundaries separating Podolia and Moldavia." This country is now incorporated with Austria, under the appellation of the kingdoms of Galicia and Lodomeria.

† The Russian claims comprise Polish Livonia, that part of the palatinate of Polotsk to the east of the Duna—the palatinates of Vitepsk, Mielaw, and the portions of the palatinate of Minsk. This tract of land (Polish Livonia excepted) is situated in White Russia, and includes full one third of Lithuania. It is now divided into the two governments of Polotsk and Mohilef.

habitants. To people his own dominions at the expense of Poland had been his great aim: for this purpose, he devised a new contribution; every town and village was obliged to furnish a certain number of marriageable girls; the parents to give, as a portion, a feather-bed, four pillows, a cow, two hogs, and three ducats in gold. Some were bound hand and foot, and carried off as criminals. His exactions from the abbeyes, convents, cathedrals, and nobles, were so heavy, and exceeded at last their abilities so much, that the priests abandoned their churches, and the nobles their lands. These exactions continued with unabated rigour, from the year 1771, to the time the treaty of partition was declared, and possession taken of the provinces usurped. From these proceedings, it would appear that his Prussian majesty knew of no rights but his own; no pretensions but those of the House of Brandenburg; no other rule of justice but his own pride and ambition.

The violent dismemberment and partition of Poland has justly been considered as the first great breach in the modern political system of Europe. The surprise of a town, the invasion of an insignificant province, or the election of a prince who had neither abilities to be feared nor virtues to be loved, would some years ago have armed one half of Europe, and called forth all the attention of the other. But the destruction of a great kingdom, with the consequent disarrangement of power, dominion, and commerce, has been beheld by the other nations of Europe with the most astonishing indifference and unconcern. The courts of London, Paris, Stockholm, and Copenhagen, remonstrated against the usurpations; but that was all. Poland was forced to submit, and the partition was ratified by their diet, held under the bribes and threats of the three powers. In the senate there was a majority of six, but in the lower house, or assembly of nuncios, there was but one in favour of the measure, fifty-four against fifty-three. This is a very alarming circumstance, and shows that a most important though not happy change has taken place in that general system of policy, and arrangement of power and dominion, which had been for some ages an object of unremitting attention with most of the states of Europe. Our ancestors might perhaps, on some occasions, discover rather more anxiety about preserving the balance of power in Europe than was necessary: but it has been well remarked, that the idea of considering Europe as a vast commonwealth, of the several parts being distinct and separate, though politically and commercially united, of keeping them independent, though unequal in power, and of preventing any one, by any means, from becoming too powerful for the rest, was great and liberal, and, though the result to barbarism, was founded upon the most enlarged principles of the wisest policy. It appears to be owing to this system, that this small part of the western world has acquired so astonishing a superiority over the rest of the globe. The fortune and glory of Greece proceeded from a similar system of policy, though formed upon a smaller scale. Both her fortune and glory expired with that system.

The revolution which happened in this country on the third of May, 1791, deservedly engaged much of the public attention. The evils of elective monarchy were indeed the chief cause that Poland had almost ceased to be considered as a nation. The dynasty of future kings of Poland was to commence in Frederic Augustus, elector of Saxony, with the right of inheritance to his male descendants: in case the present elector should have no male issue, a husband chosen by him for his daughter, with the consent of the Polish representatives, shall begin the dynasty. But after this boasted change, Poland would only have ad-

vanced to that degree of civilisation which other European countries enjoyed in the thirteenth century. Her hundreds of citizens would have been free, her millions of peasants would have still continued slaves; at the utmost, not above five hundred thousand out of fifteen millions would have been free.

After a short and unequal struggle with Russia, this unhappy country was forced to abandon the new constitution. The manifesto of the Russian empress, replete with sentiments disgraceful to humanity, was followed by some skirmishes; but it is said that a letter, written with her own hand to the Polish king, in which she declared her resolution to double or triple her troops, rather than abandon her pretensions, induced that benignant monarch to prevent the farther effusion of blood.

On the 6th of January, 1793, the king of Prussia issued a declaration respecting the march of his troops into Poland, in which he mentions the friendly interference of her imperial majesty, the empress of Russia, in the affairs of Poland. In the same strain his majesty adds, that he had entertained hopes that the troubles in that country would have subsided without his own interference, especially as he was so deeply occupied in another quarter. He laments that he has been disappointed, and that the propagation of French democracy, by means of clubs and jacobin emissaries, especially in Great Poland, had already risen to such a height as to require his most serious attention: his majesty, however, observes, that he has determined to anticipate their designs, by sending a sufficient body of troops into the territories of the republic, after having concerted proper measures with the friendly courts of Peterburg and Vienna, who were equally interested with himself in the welfare of the republic.

The protest published at Grodno, in the sitting of the general confederation, the 3d of February, against this violent invasion, sufficiently evinces the detestation which the Poles themselves entertain of the measures of their pretended friend. They assure his majesty that a continued correspondence between the military commanders and the civil magistrates had enabled the confederation to declare, that perfect tranquillity prevailed from one end of the kingdom to the other; that they were "astonished at the assertions of his majesty" in his last declaration; and conclude by entreating that his majesty would revoke the orders which he had given for troops to enter the republic. Notwithstanding, however, these solemn assurances—notwithstanding the evidence and the facts which were alledged in support of them, the Prussian army advanced, and one of its detachments appeared under the walls of Thorn. The inhabitants refusing entrance to the troops, the gates were forced, the municipal guard dislodged from their post, and the Prussian regiments entered the defenceless city, as if it had been a place taken by assault. At the same time different Polish detachments, dispersed throughout Great Poland, were attacked and driven from their posts by superior force.

In March, the manifesto of her imperial majesty appeared, relative to the partition. Religion was, as usual, called in to sanction this atrocious act of rapine and injustice, and the empress humanely lamented the sufferings of the people of Poland, among whom it had been, for thirty years, her incessant endeavour to maintain tranquillity; and her grief was increased by considering them as descended from the same race and professing the holy Christian religion, which would be violated by the introduction of such dreadful doctrines as were propagated by some unworthy Poles, who adopted the detestable and destructive plans of the

rebels of France. As an indemnification, therefore, for her losses, to provide for the future safety of her empire, and the Polish dominions, and to prevent all future changes of government, she graciously made known her intention to take for ever under the sceptre of Russia those tracts of land, with their inhabitants, which lie between Druy on the river Dwina, to Neroch and Dubrova, and, following the border of the vauodship of Vilna, to Stolpfa, to Nesvig, and then to Pinsk: thence passing Krenish, between Vitkero and Novogreble, near the frontier of Galicia, to the river Dniester, and terminating in the old border of Russia and Poland, at Jegertie. In this partition, the increase of the happiness of the inhabitants was avowed to be the *sole object* of her imperial majesty.

The declaration of the Prussian monarch, which was dated March 25, echoed many of the sentiments contained in the Russian manifesto, and avowed, that, in order to preserve the republic of Poland from the dreadful effects of its internal divisions, and to rescue it from utter ruin, no means remained but to incorporate her frontier provinces into the states of Prussia, which, therefore, had determined to take immediate possession of the cities of Dantzic and Thorn, and the vauodships of Posen, Gnesen, Kalish, and Siradia, the city and monastery of Czentochowa, the province of Wielun, the vauodship of Lentfchitz, the province of Cujavia and of Dobrzym, the vauodships of Rawa and Plotzk, &c.

On the 2d of April the Prussian troops took possession of Dantzic; and, about the same time, the empress of Russia commanded the king of Poland to remove to Grodno, under the escort of Russian troops, for the express purpose of sanctioning the alienation and partition of his kingdom.

The means employed to affect the mock ratification of the partition of this unfortunate country were entirely characteristic of the baseness of the cause. The diet, in the month of September, was assailed for three successive days with official notes from the Russian ambassador and the Prussian minister, full of threats, pressing the signature of the treaty. The states, however, persisted in their refusal. At last M. de Sievers, the Russian ambassador, sent his ultimatum in a note, which ended with the following remarkable expressions; "The underwritten must besides inform the states of the republic assembled in the confederate diet, that he thought it of absolute necessity, in order to prevent every disorder, to order *two battalions of grenadiers*, with four pieces of canon, to surround the castle, to secure the tranquillity of their deliberations. The underwritten expects that the sitting will not terminate, until the demanded signature of the treaty is decided." Conformably to this threat, the Russian soldiers so closely surrounded the castle, that no person was suffered to go out: some of the officers took their station in the senate, pretending to guard his majesty's person against conspirators. The king, on the contrary, sent a delegation to the Russian ambassador, declaring that he would not open the session in the presence of the Russian officers. In consequence, they were ordered to retire, except the general, who declared publicly, that no member should be permitted to quit the senate before the consent to the treaty was given. The debates were long and violent; and it was not until three o'clock the next morning, after three successive divisions, that the diet came to a resolution, in which they declare, before all Europe, to whom they had frequently appealed, that, "Contrary to the faith of treaties most sacredly observed on their part, as well as to that of the treaty recently entered into with his ma-

jesty, the king of Prussia, and at his own desire, in the year 1790, whereby the independence and the integrity of Poland were guaranteed in the most solemn manner; that, being deprived of free-will, surrounded at the moment of the present act by an armed foreign force, and threatened with a further invasion of the Prussian troops, they are forced to commission and authorise a deputation appointed to treat with the said king, to sign the treaty, such as it was planned and amended under the mediation of the Russian ambassador."

Depressed and despairing, the Polish nation, supposing its political existence to depend on a seasonable alliance with a powerful neighbour, put itself under the protection of Russia, which, in the treaty of alliance with Poland, had expressly stipulated that no change or infringement should take place in the form of government to be established without the consent of the empress or her successors: so that Russia, without engaging for the perpetuity of the new form, became completely mistress of whatever government should be established in Poland.

On the 7th of February, 1794, the baron d'Ingelstrom, who had succeeded the count de Sievers as ambassador at Warsaw, demanded a public annulling of the acts of the diets of 1788 and 1791, together with the form of the constitution then established, and the surrender of every paper, whether in public records or private cabinets, respecting that transaction. The court of Russia soon afterwards issued its mandate for the reduction of the military force to 16,000 men. This was opposed by several regiments, particularly in South Prussia, where the insurgents, headed by the gallant Madaliniki, a Polish nobleman, and brigadier of the national troops, peremptorily refused to disband. The spirit of resistance was widely diffused, and the capital assumed a military aspect. In this situation fifteen thousand Russian troops were sent into Poland, the ambassador was instructed to deliver to the permanent council an official document representing the danger that threatened the king, and requesting the commissioners of war to dispatch an army to oppose Madaliniki; and the permanent council was desired to take into custody every suspected person. Both these requisitions were, however, refused; and it was pointedly replied to the latter, that, according to the laws of the republic, no Polish nobleman could be arrested, without being legally convicted.

The imperious conduct of the Russians, during their struggle for power, continued to harass the oppressed Poles, and to drive them to desperation. The peasants were compelled to lodge and board the Russian soldiers, and transport them from place to place, without receiving the least remuneration, or any other reward than brutality and insolence. It could not be expected that a gallant and high-spirited people would long tamely submit to such insult and injury. Their patriotic spirit, though latent, was not extinguished. It was roused into action by incessant sufferings, and by the continued efforts of the intrepid Kosciutko, who, early in February, appeared at the head of a considerable body of Polish insurgents, attacked the Prussians who had taken possession of their country, forced them to retreat, and pursued them to a considerable distance. The Russian troops having evacuated Cracow on the 23d of March, Kosciutko entered that town on the night of the 24th, and next morning ordered the gates to be shut, and declared himself commander in chief of all the Polish forces. He then imposed an oath of fidelity on all the military in the city, took possession of the public treasure, and proceeded to measures of military sequestration. On the day on which he entered Cracow, he issued a pro-

clamation, c

clamation, couched in the most energetic terms, inviting the nation to shake off their disgraceful fetters, and to unite in forming a new confederation. The proclamation was received with unanimous applause; and "Long live Kosciusko!" resounded from every quarter. He was conducted to the town-house and presented to the principal nobility, who had assembled there to receive him; and by them he was formally invested with the title of general. Every article for the support of his army was abundantly supplied. On the 26th, a revolutionary tribunal was established, and every fifth house was required to furnish one man armed and equipped for the defence of the constitution against the usurping powers. The different corporations then assembled under their respective banners before the town-house, whence the magistrates led them in procession to the church of the Holy Virgin, where the constitution of the 3d of May, 1791, was publicly read with great solemnity, and an oath taken to defend it.

In the mean time Warsaw was in a state of the highest fermentation. In that city and its vicinity there were not less than fifteen thousand Russian mercenaries, some of whom were quartered, to the amount of a hundred in a body, in several of the palaces. The most vigorous measures were adopted by the permanent council; a decree passed, declaring the insurgents rebels, and subjecting them to the most arbitrary punishments; and the police were charged to seize every person suspected of being inimical to the existing government, with the promise of military assistance. The unpopularity of his Polish majesty daily increased, and a guard of Russians was appointed for his preservation. About this time, the unhappy monarch issued a proclamation, exhorting his subjects to a peaceable acquiescence, and urging the danger and destruction which attended their resistance.

The Polish nobles had no sooner taken the oaths in the presence of Kosciusko, than they departed for their respective estates, in order to arm and assemble their vassals. Baron d'Ingelstrophm, about the same time, surrounded the diet at Warsaw with a military force, and demanded the surrender of the arsenal. This demand was spiritedly resisted; and notice of it having been sent to Kosciusko, he, about the end of March, took the route to Warsaw with his army, and a reinforcement of 4000 peasants armed with pikes, &c.—On the 4th of April he was met by a detachment of 6000 Russians, with a park of heavy artillery, on their march to reduce Cracow. A fierce encounter ensued. The Polish peasants being driven to desperation, made a dreadful slaughter of the Russian plunderers. General Woronzow was taken prisoner, and above 1000 Russians killed on the spot; while the Poles lost only sixty men, and took eleven pieces of cannon and all the ammunition. After the battle, Kosciusko fell back with his army towards Cracow, where he was joined by a very considerable body of disaffected Polish troops.

On the 16th of April, baron d'Ingelstrophm demanded the surrender of the arsenal, the disarming of the military, and that twenty persons of the first consequence should be arrested, and, if found guilty, punished with death. This occasioned a general commotion, in which the citizens, having procured arms from the arsenal, after an incessant combat of thirty-six hours, drove the Russians out of the city with great slaughter. A deputation had been sent to inform the king of the attempt of the Russians to seize the arsenal; when the monarch had replied, "Go, and defend your honour." The situation of the king after the contest became very critical, and the people were extremely jealous of every movement he made. They compelled him to promise repeatedly that

\* An English traveller, speaking of a religious procession some years ago at Florence, in Italy, describes it as follows: "I had occasion," says he, "to see a procession where all the noblesse of the city attended in their coaches. It was the anniversary of a charitable institution in favour of poor maidens, a certain number of whom are portioned every year. About two hundred of these virgins walked in procession, two and two together. They were preceded and followed by an irregular mob of penitents, in sack-cloth, with lighted tapers, and monks carrying crucifixes, bawling and bellowing the litanies; but the greatest object was the figure of the Virgin Mary, as big as the life, standing within a gilt frame, dressed in a gold stuff, with a large hoop, a great quantity of false jewels, her face painted and patched, and her hair frizzled and curled in the very extremity of the fashion. Very little regard had been paid to the image of our Saviour on the cross; but when the Lady Mother appeared on the shoulders of three or four lusty friars, the whole populace fell upon their knees in the dirt."

LEARNING AND LEARNED MEN, PAINTERS, STATUARIES, ARCHITECTS, AND ARTISTS. } In the introduction we have particularized some of the great men which ancient Italy has produced.

In modern times, that is, since the revival of learning, some Italians have shone in controversial learning, but they are chiefly celebrated by bigots of their own persuasion. The mathematics and natural philosophy owe much to Galileo Torricelli Malacampi Bonelli and

or towns. Its capital, Cagliari, is a university, an archbishopric, and the seat of the viceroy, containing about 15,000 inhabitants. It is thought that his Sardinian majesty's revenues, from this island, do not exceed 5000l. sterling a year, though it yields plenty of corn and wine, and has a coral fishery. Its air is bad, from its marshes and high mountains on the north, and therefore was a place of exile for the Romans. It was formerly annexed to the crown of Spain, but at the peace of

Utrecht, that prince having married a princess of Portugal, prevailed with the crown of Spain to give up all pretensions to that kingdom.

which was erected by Vespasian, and finished by Domitian, called the Coliseum. Twelve thousand Jewish captives were employed by Vespasian in this building; and it is said to have been capable of containing eighty-seven thousand spectators seated, and twenty thousand standing. The architecture of this amphitheatre is perfectly light, and its proportions are so just, that it does not appear near so large as it really is. But it has been stripped of all its magnificent pillars and ornaments, at vari-

not discovered till near forty years after the discovery of Herculaneum. One street, and a few detached buildings of this town, have been cleared; the street is well paved with the same kind of stone of which the ancient roads are made, and narrow causeways are raised a foot and a half on each side for conveniency of foot passengers. Dr. Moore observes, that the street itself is not so broad as the narrowest part of the Strand,

riofities, and with a great number of medals and paintings. In the cabinets of Erasimus and Amerbach, which also belong to this university, there are no less than twenty original pieces of Holbein; for one of which, representing a dead Christ, a thousand ducats have been offered. The other universities, which indeed are commonly only styled colleges, are those of Berns, Lausanne, and Zurich.

**ANTIQUITIES AND CURIOSITIES.** Every district of a canton in NATURAL AND ARTIFICIAL. } this mountainous country; presents the traveller with a natural curiosity: sometimes in the shape of wild but beautiful prospects, interspersed with lofty buildings, and wonderful hermitages, especially one, two leagues from Friburg. This was formed by the hands of a single hermit, who laboured on it for twenty-five years, and was living in 1707. It is the greatest curiosity of the kind perhaps in the world, as it contains a chapel, a parlour twenty-eight paces in length, twelve in breadth, and twenty feet in height, a cabinet, a kitchen, a cellar, and other apartments, with the altar, benches, flooring, ceiling; all cut out of the rock.

At Schaffhausen was a very extraordinary bridge over the Rhine, justly admired for the singularity of its architecture. The river is extremely rapid, and had already destroyed several stone bridges of the strongest construction, when a carpenter of Appenzel offered to throw a wooden bridge, of a single arch across the river, which is near 400 feet wide. The magistrates, however, required that it should consist of two arches, and that he should, for that purpose, employ the middle pier of the old bridge. Accordingly the architect was obliged to obey; but he contrived to leave it a matter of doubt, whether the bridge was supported by the middle pier, and whether it would not have been equally as safe if formed solely of one arch. The sides and top were covered, and the road, which was almost level, was not carried as usual over the top of the arch, but, if the expression may be allowed, let into the middle of it, and therefore suspended. A man of the slightest weight felt it tremble under him; though waggons heavily laden might pass over without danger. Considering the boldness of the plan and construction, it must appear extraordinary that the architect was only, as was said before, a carpenter, without the least tincture of literature, totally ignorant of mathematics, and not versed in the theory of mechanics. His name was Ulric Grubenman. The bridge was finished in less than three years, and cost about 8000l. sterling. It was burnt by the French when they evacuated Schaffhausen, after being defeated by the Austrians, April 13th, 1799.

At the famous pass of *Pierré Pertuis*, the road is carried through a solid rock near fifty feet thick, the height of the arch twenty-six, and its breadth twenty-five. The marcasites, false diamonds, and other stones found in those mountains, are justly ranked among the natural curiosities of the country. The ruins of Cæsar's wall, which extended eighteen miles in length, from Mount Jura to the banks of Lake Lemman, are still discernible. Many monuments of antiquity have been discovered near the baths of Baden, which were known to the Romans in the time of Tacitus. Switzerland boasts of many noble religious buildings, particularly a college of Jesuits; and many cabinets of valuable manuscripts, antiques, and curiosities of all kinds. At Lucerne (says Mr. Coxe) is to be seen a topographical representation of the most mountainous parts of Switzerland, by general Pfiffer, a native of this town, and an officer in the French service. It is a model in relief, and well deserves the attention of the curious traveller. What was finished

in 1776, comprised cerise, Zug, Berne, was twelve feet long, principally a mastic-coat of wax; and is least damage. The ing the objects as the servation, that not are distinguished, but ed, each being shaped calcareous stone, or nal mountains. \* Count Stolberg, which is vast, contain

in 1776, comprised about sixty square leagues, in the cantons of Lucerne, Zug, Berne, Uri, Schweitz, and Underwalden\*. The model was twelve feet long, and nine and a half broad. The composition is principally a mastic of charcoal, lime, clay, a little pitch, with a thin coat of wax; and is so hard as to be trod upon without receiving the least damage. The whole is painted with different colours, representing the objects as they appear in nature. It is worthy of particular observation, that not only the woods of oak, beech, pine, and other trees, are distinguished, but also that the strata of the several rocks are marked, each being shaped upon the spot, and formed with granite, gravel, calcareous stone, or such other natural substances as compose the original mountains. The plan is indeed so minutely exact, that it comprises not only all the mountains, lakes, towns, villages, and forests, but every cottage, every torrent, every road, and even every path, is distinctly and accurately represented. The general takes his elevations from the level of the lake of Lucerne, which, according to M. de Saussure, is about fourteen hundred and eighty feet above the Mediterranean. This model, exhibiting the most mountainous parts of Switzerland, conveys a sublime picture of immense alps piled one upon another; as if the story of the Titans were realised, and they had succeeded (at least in one spot of the globe) in heaping Ossa upon Pelion, and Olympus upon Ossa. From the account of this officer, it appears, that there are continued chains of mountains of the same elevation, rising in progression to the highest range, and from thence gradually descending in the same proportion to Italy. Near Rosinière is a famous spring, which rises in the midst of a natural basin of twelve square feet; the force that acts upon it must be prodigious; after a great shower of rain, it carries up a column of water as thick as a man's thigh, nearly a foot above its surface. Its temperature never varies, its surface is clear as crystal, and its depth unfathomable,—probably the end of some subterraneous lake, that has here found an issue for its waters.

[CIRRAS.] Of these the most considerable is the city of Berne, standing on the river Aar. This city and canton, it is said, form almost a third of the Helvetic confederacy, and can, upon occasion, fit out 100,000 armed men. All the other cities in Switzerland are excellently well provided with arsenals, bridges, and public edifices, Basil is accounted by some the capital of all Switzerland. It is situated in a fertile and delightful country, on the banks of the Rhine, and the confines of Alsace and the empire. It contains two hundred and twenty streets, and six market-places. The town-house, which stands on the river Birsée, is supported by very large pillars, and its great hall is finely painted by the celebrated Hans Holbein, who was a native of this city. The situation of Basil is pleasing: the Rhine divides it into the upper and lower town, and it is considered as one of the keys of Switzerland. Baden is famous for its antiquity and baths. Zurich is far less considerable than Berne; but in the arsenal is shown the bow of the famous William Tell, and in the library is a manuscript of excellent letters, written by the unfortunate lady Jane Grey to the judicious reformer Bullinger, in elegant Latin and German.

The city of Geneva, which is an associate of Switzerland, and under the protection of the Helvetic body, but within itself an independent state and republic, is well built, and well fortified; and contains 24,000

\* Count Stolberg, who saw this model in 1791, says of it: "This model, the size of which is vast, contains 220 square leagues."

inhabitants, most of whom are Calvinists. It is situated upon the afflux of the Rhône from the large fine lake of Geneva. It is celebrated for the learning of the professors of its university, and the good government of its colleges, the purity of its air, and the politeness of its inhabitants. By its situation it is a thoroughfare from Germany, France, and Italy. It contains a number of fine manufactures and artists; so that the protestants, especially such as are of a liberal turn, esteem it a most delightful place. But the fermentation of their politics, and particularly the usurpation of the senate, has divided the citizens into parties, and the late struggle of patricians and plebeians had nearly ruined all. Many of the citizens have accordingly left the place, and sought refuge and protection in other countries.

**COMMERCE AND MANUFACTURES.]** The productions of the loom, linen, dimity, lace, stockings, handkerchiefs, ribbands, silk, and painted cottons, and gloves, are common in Switzerland; and the inhabitants are now beginning, notwithstanding their sumptuary laws, to fabricate silks, velvets, and woollen manufactures. Their great progress in those manufactures and in agriculture gives them a prospect of being able soon to make considerable exports.

**CONSTITUTION AND GOVERNMENT.]** The old constitution and government of Switzerland, which, if they are not to be considered as entirely subverted, are, for the present at least, suspended by the incursions and influence of the French, are very complicated, from the cantons, though belonging to the same body, being partly aristocratical, and partly democratical. Every canton is absolute in its own jurisdiction; but those of Berne, Zurich, and Lucerne, with other dependencies, are aristocratical, with a certain mixture of democracy, Berne excepted. Those of Uri, Schweitz, Underwald, Zug, Glaris, and Appenzel, are democratical. Basil, though it has the appearance of an aristocracy, rather inclines to a democracy. But even these aristocracies and democracies differ in their particular modes of government. However, in all of them the real interests of the people appear to be much attended to, and they enjoy a degree of happiness not to be expected in despotic governments. Each canton has prudently reconciled itself to the errors of its neighbour, and cemented, on the basis of affection, a system of mutual defence.

The confederacy, considered as a republic, comprehends three divisions. The first are the Swisses, properly so called. The second are the Grisons, or the states confederated with the Swisses, for their common protection. The third are those prefectures, which, though subject to the other two, by purchase or otherwise, preserve each its own particular magistrates. Every canton forms within itself a little republic; but when any controversy arises that may affect the whole confederacy, it is referred to the general diet, which sits at Baden, where, each canton having a vote, every question is decided by the majority. The general diet consists of two deputies from each canton, besides a deputy from the abbot of St. Gall, and the cities of St. Gall and Bienne. It is observed by Mr. Coxe, to whom the public have been indebted for the best account of Switzerland that has appeared, that there is no country in which happiness and content more universally prevail among the people. For whether the government be aristocratical, democratical, or mixed, a general spirit of liberty pervades and actuates the several constitutions; so that even the oligarchical states (which, of all others, are usually the most tyrannical) are here peculiarly mild; and the property of the subject is securely guarded against every kind of violation. subjection to the  
when the emper

maintained by the concurrence of their mutual felicity; and their sumptuary laws, and equal division of their fortunes among their children, seem to insure its continuance. There is no part of Europe which contains, within the same extent of region, so many independent commonwealths, and such a variety of different governments, as are collected together in this remarkable and delightful country; and yet, with such wisdom was the Helvetic union composed, and so little have the Swiss, of late years, been actuated by the spirit of conquest, that, since the firm and complete establishment of their general confederacy, and till the unprovoked invasion of their country by the French, they have scarcely ever had occasion to employ their arms against a foreign enemy; and have had no hostile commotions among themselves, that were not very soon happily terminated.

At present Switzerland, under the power and influence of the French, is styled the Helvetic republic, and has its councils and directory. But it appears unnecessary to enter into a minute detail of this constitution, as, even though the old Helvetic confederacy and forms of government should not be restored, it will probably undergo great alterations in consequence of the late revolution in France.

**REVENUES AND TAXES.]** The variety of cantons that constitute the Swiss confederacy renders it difficult to give a precise account of their revenues. Those of the canton of Berne are said to amount annually to 300,000 crowns, and those of Zurich to 150,000; the other cantons in proportion to their produce and manufactures. Whatever is saved, after defraying the necessary expenses of government, is laid up as a common stock; and it has been said, that the Swisses are possessed of 500,000l. sterling in the English funds, besides their property in other banks.

The revenues arise, 1. From the profits of the demesne land; 2. The tenth of the produce of all the lands in the country; 3. Customs and duties on merchandise; 4. The revenues arising from the sale of salt, and some casual taxes.

**MILITARY STRENGTH.]** The internal strength of the Swiss cantons, independent of the militia, consists of 13,400 men, raised according to the population and abilities of each. The œconomy and wisdom with which this force is raised and employed are truly admirable, as are the arrangements which are made by the general diet, for keeping up that great body of militia, from which foreign states and princes are supplied, so as to benefit the state, without any prejudice to its population. Every burgher, peasant, and subject, is obliged to exercise himself in the use of arms; appear on the stated days for shooting at the mark; furnish himself with proper clothing, accoutrements, powder and ball; and to be always ready for the defence of his country. The Swiss engage in the service of foreign princes and states, either merely as guards, or as marching regiments: in the latter case the government permits the enlisting volunteers, though only for such states as they are in alliance with, or with whom they have entered into a previous agreement on that article. But no subject is to be forced into foreign service, or even to be enlisted without the concurrence of the magistracy.

**HISTORY.]** The present Swisses and Grisons, as has been already mentioned, are the descendants of the ancient Helvetii, subdued by Julius Cæsar. Their mountainous uninviting situation formed a better security for their liberties than their forts or armies; and the same is the case at present. They continued long under little more than a nominal subjection to the Burgundians and Germans, till about the year 1300, when the emperor, Albert I. treated them with so much rigour, that

they petitioned him against the cruelty of their governors. This served only to double the hardships of the people; and one of Albert's Austrian governors, Gressler, in the wantonness of tyranny, set up a hat upon a pole, to which he ordered the natives to pay as much respect as to himself. The famous William Tell being observed to pass frequently without taking notice of the hat, and being an excellent marksman, the tyrant condemned him to be hanged, unless he cleft an apple upon his son's head, at a certain distance, with an arrow. Tell cleft the apple; and Gressler asking him the meaning of another arrow he saw stuck in his belt, he bluntly answered, that it was intended for his (Gressler's) heart, if he had killed his son. Tell was condemned to prison upon this; but making his escape, he watched his opportunity, and shot the tyrant, and thereby laid the foundation of the Helvetic liberty.

It appears, however, that, before this event, the revolt of the Swisses from the Austrian tyranny had been planned by some noble patriots among them. Their measures were so just, and their course so intrepid, that they soon effected a union of several cantons.

Zurich, driven by oppression, sought first an alliance with Lucerne, Uri, Schwitz, and Underwald, on the principles of mutual defence; and the frequent successes of their arms against Albert, duke of Austria, insensibly formed the grand Helvetic union. They first conquered Glaris and Zug, and admitted them to an equal participation of their rights. Berne united itself in 1353; Friburg and Soleure 130 years after; Basle and Schaffhausen in 1015; and Appenzel, in 1513, completed the confederacy, which repeatedly defeated the united powers of France and Germany; till, by the treaty of Westphalia, in 1648, their confederacy was declared to be a free and independent state.

Neuchâtel, since the year 1707, has been under the dominion of the king of Prussia; but the inhabitants are free to serve any prince whatever, and by no means bound to take an active part in his wars. The king has the power of recruiting among them, and of naming a governor; but the revenue he derives is not above 5000*l.* yearly, great part of which is laid out on the roads and other public works of the country.

Towards the close of the year 1797, Switzerland fell a prey to the rapacity and ambition of France; the emissaries and partisans of which republic had prepared the way for the subjugation of the country, by exciting among the people a spirit of discontent against the government, especially in the aristocratic republics. That the aristocracies of Switzerland were not entirely blameless, either in their conduct towards their subjects or towards the French, may, perhaps, be true: but if the power of the state, and its very moderate emoluments, were in some, or perhaps the majority, of the cantons, monopolised by a few families, it must still be remembered that their authority was exercised with the utmost moderation, and that the people were contented and happy. The real views of the French directory, in their attack on Switzerland, however they might endeavour to colour them by pretending that they were invited by the people, and that their sole aim was to assert the cause of general liberty, no doubt were to give employment to, and procure pay and plunder for their armies; as also to secure the command of a country, the possession of the important posts of which, in case of a renewal of hostilities with the empire, would both secure their frontier, and enable them to attack with much greater advantage.

The first act of hostility on the part of the French was the seizing of the Helvetic part of the bishopric of Basle, of which they took possession under some frivolous pretext, and contrary to an express treaty concluded

The French gene was confusion both had mutinied, deser The Swiss army wa

with the Swiss in the year 1792. The Helvetic body, knowing they were too weak to resist, submitted patiently to this usurpation; but soon after an insurrection which took place in the Pays de Vaud, and which, it is not improbable, was produced by the instigation of the agents of France, afforded an opportunity for an interference which soon terminated in the subjection of almost the whole of Switzerland to the French yoke, and almost the entire overthrow of its form of government. In the month of December, the French directory took upon them to demand of the government of Berne, what they termed the restoration of the rights of that people, and the assembling the states of the Pays-de-Vaud. This demand they immediately prepared to enforce by arms, and general Meynard was ordered to march with a body of 15,000 men, to support the claims of the discontented in that country. The supreme council of Berne, fearful of entering into a contest with the powerful armies of France, on the 5th of January, 1799, issued a proclamation enjoining the citizens of the Pays-de-Vaud to assemble in arms, to renew the oath of allegiance, to proceed to reform the abuses of the government, and to assert and re-establish all their ancient rights. The malcontents, however, encouraged by the protection of the French army, proceeded to open hostilities, and seized on the castle of Chignon. The government of Berne now had recourse to arms, and ordered a body of 20,000 troops, under the command of colonel Weiss, to disperse the insurgents. But the contest was soon decided by the French army under general Meynard, which immediately advanced while the Swiss retreated, and, by the beginning of February, had taken possession of the whole of the Pays-de-Vaud.

The council of Berne still attempted to negotiate with the French directory; but at the same time assembled an army of about 20,000 men, the command of which they gave to M. d'Erlach, formerly a field-marshal in the service of France. This force was joined by the quotas of the other Swiss cantons, amounting to about 5,500 men. The directory, however, required that the ancient magistrates of Berne should be dismissed from their offices, and the constitution of the state changed to one more agreeable to democratic principles and the new system of liberty and equality. These conditions the government of Berne absolutely refused to submit to, and sent off orders to break off all further negotiations. The directory alarmed at this appearance of firmness and resistance, and fearing they were not sufficiently prepared, sent general Brune to take the command of their army in the Pays-de-Vaud, with orders to conclude an armistice until he should receive a sufficient reinforcement. Brune, immediately upon his arrival, announced to the senate of Berne, that he came prepared to adjust all differences amicably, and requested that they would send commissioners to treat with him. These were accordingly sent, and an armistice concluded for eight days. But on the 2d of March, two days, it is affirmed, before the truce agreed on had expired, the castle of Domach, at the northern extremity of the canton of Soleure, was attacked and carried by the French; and, at the same time, 13,000 men were marched under the walls of Soleure, which capitulated to general Schawembourg on the first summons. Friburg was immediately after reduced by general Brune, and the Swiss army was forced to retreat.

The French generals immediately advanced towards Berne, where all was confusion both in the city and in the army, the left division of which had mutinied, deserted their posts, and put to death some of their officers. The Swiss army was reduced by desertion to 14,000 men, exclusive of a

rabble of undisciplined peasants, raised by the *landssturm*, or levy of the country *en masse*. About 8,000 of the regular forces were stationed at Neweneg, and 6,400 held the position of Frauenbrun, against which general Schawenbourg advanced from Soleure, at the head of 18,000 men. On the morning of the 5th of March both posts were attacked by the French. The troops of Neweneg repulsed the enemy, but those at Frauenbrun, after a vigorous resistance, were compelled to retreat. M. d'Erlach rallied his men at Uteren, where a second engagement took place, but with no better success on the part of the Swiss. They afterwards, however, made a stand at Grauholtz, about a league and a half from Berne; but were thence driven to the gates of the capital, where, after another severe battle, they were entirely defeated; and on the evening of the 5th general Brune entered the city of Berne by capitulation. The divisions of the Swiss army stationed at Neweneg and Guminen retreated, and the soldiers of the latter column, in a fit of rage and despair, murdered their officers, and among others their unfortunate general D'Erlach.

The defeat of the Bernese was followed by the submission of nearly the whole of Switzerland; though the democratic republics still made a stand, defeated general Schawenbourg, and forced him to retire with the loss of 3,000 men, after he had consented to a treaty by which he engaged not to enter the smaller cantons.

After this revolution the Swiss confederacy changed its constitution, and even its name. Provincial governments, under the direction of the French generals, were established in the different districts; and the whole assumed the name of the Helvetic republic. Contributions and requisitions were levied, as usual, by the French commissioners, and the most shocking enormities perpetrated. During the campaign of 1799, the northern part of Switzerland became the seat of war between the Austrians and French, and the cantons of Schaffhausen and Zurich, especially the latter, suffered the severest distress from the ravages of the contending armies. What will be the future state of Switzerland it is not easy to say. Should the allies be so successful as to force the French to evacuate the country, renounce their influence over it, and leave it entirely to itself, its ancient constitution and government will probably be restored; but it must no doubt be long before it will be able to regain its former tranquillity and happiness.

The town and fortrefs of Gibraltar, subject to Great Britain.

ANCIENT NAMES AND DIVISIONS.] Spain formerly included Portugal, and was known to the ancients by the name of Iberia, and Hesperia, as well as Hispania. It was, about the time of the Punic wars, divided into Citerior and Ulterior: the Citerior contained the provinces lying north of the river Ebro; and the Ulterior, which was the largest part, comprehended all that lay beyond that river. Innumerable are the internal changes that it afterwards underwent; but they are less accurately known than those of any other European country.

CLIMATE, SOIL, AND WATER.] Except during the equinoctial rains, the air of Spain is dry and serene, but excessively hot in the southern provinces in June, July, and August. The vast mountains that run through Spain, are, however, very beneficial to the inhabitants, by the refreshing breezes that come from them in the southernmost parts; though those towards the north and north-east are in the winter very cold.

Such is the moisture of the hills, bounded on the north by the Bay of Biscay, and to the south by snowy mountains, that the utmost care is not sufficient to preserve their fruits, their grain, their instruments of iron, from mould, from rot, and from rust. Both the acetous and the putrid fermentation here make a rapid progress. Besides the relaxing humidity of the climate, the common food of the inhabitants contributes much to the prevalence of most diseases which infect the principality of Asturia. Yet, although subject to such a variety of endemical diseases, few countries can produce more instances of longevity; many live to the age of a hundred, some to a hundred and ten, and others much longer. The same observation may be extended to Galicia, where, in the parish of St. Juan de Poyo, A. D. 1724, the curate administered the sacrament

to thirteen persons whose ages together made one thousand four hundred and ninety-nine, the youngest of these being one hundred and ten, and the oldest one hundred and twenty-seven. But in Villa de Fofnanes, one Juan de Outeyro, a poor labourer, died in the year 1726, aged more than one hundred and forty-six years.

The soil of Spain was formerly very fruitful in corn; but the natives have lately found some scarcity of it, by their disuse of tillage, through their indolence; the causes of which will be afterwards explained. It produces in many places, almost spontaneously, the richest and most delicious fruits that are to be found in France and Italy; oranges, lemons, prunes, citrons, almonds, raisins, and figs. The wines of Spain, especially sack and sherry, are in high request among foreigners. There are, in the district of Malaga (according to Mr. Townshend), fourteen thousand wine presses, chiefly employed in making the rich wine, which, if white, from the nature of the country, is called *Mountain*; if red, from the colour, *vino tinto*, known in England by the name of *Tent*. Good mountain is sold from thirteen to sixteen pounds the butt, of one hundred and thirty-five gallons, according to quality and age. It is reckoned that from eight hundred to a thousand vessels enter this port every year, of which about one-tenth are Spanish, and the exports in wine, fruit, oil, and fish, are computed at about 375,000*l.* per annum; but it has been considerably more.

Spain indeed offers to the traveller large tracts of unpromising, because uncultivated, ground; but no country perhaps maintains such a number of inhabitants who neither toil nor work for their food; such are the generous qualities of the soil. Even sugar-canes thrive in Spain; and it yields saffron, honey, and silk, in great abundance. A late writer, Ustariz, a Spaniard, computes the number of shepherds in Spain to be 40,000; and has given us a most curious detail of their œconomy, their changes of pasture at certain times of the year, and many other particulars unknown till lately to the public. Those sheep-walks afford the finest of wool, and are a treasure in themselves. Some of the mountains in Spain are clothed with rich trees, fruits, and herbage, to the tops; and Seville oranges are noted all over the world. No country produces a greater variety of aromatic herbs, which render the taste of their kids and sheep so exquisitely delicious. The kingdom of Murcia abounds to much with mulberry-trees, that the product of its silk amounts to 200 000*l.* a year. Upon the whole, few countries in the world owe more than Spain does to nature, and less to industry.

The medicinal waters of Spain are little known; but many salutiferous springs are found in Grenada, Seville, and Cordova. All over Spain the waters are found to have such healing qualities, that they are excelled by those of no country in Europe; and they are continually more and more resorted to, especially at Alhamar, in Grenada.

**MOUNTAINS.]** It is next to impossible to specify these, they are so numerous; the chief, and the highest, are the Pyrénées, near 200 miles in length, which extend from the bay of Biscay to the Mediterranean, and divide Spain from France. Over these mountains there are only five narrow passages to France; and the road over, the pass that separates Roussillon from Catalonia reflects great honour on the engineer who planned it. It formerly required the strength of 30 men to support, and nearly as many oxen to drag up a carriage, which four horses now do with ease. The Cantabrian mountains (as they are called) are a kind of continuation of the Pyrénées, and reach to the Atlantic Ocean, south

of Cape Finisterre, Mount Calpe, near one of the Pillars of Africa.

of Cape Finisterre. No Englishman ought to be unacquainted with Mount Calpe, now called the Hill of Gibraltar, and, in former times, one of the Pillars of Hercules; the other, Mount Abyla, lying opposite to it in Africa.

Among the mountains of Spain, Montserrat is particularly worthy the attention of the curious traveller; one of the most singular in the world, for situation, shape, and composition. It stands in a vast plain, about thirty miles from Barcelona, and nearly in the centre of the principality of Catalonia. It is called by the Catalonians Monte serrado, or the sawed mountain; and is so named from its singular and extraordinary form; for it is broken and divided, and crowned with an infinite number of spiring cones, or pine heads, so that it has the appearance, when seen at a distance, of the work of man; but, upon nearer approach, is seen to be evidently the production of nature. It is a spot so admirably adapted for retirement and contemplation, that it has, for many ages, been inhabited only by monks and hermits, whose first vow is never to forsake it. When the mountain is first perceived at a distance, it has the appearance of an infinite number of rocks cut into conical forms, and built one upon another to a prodigious height, and seems like a pile of grotto work, or Gothic spires. Upon a nearer view, each cone appears of itself a mountain: and the whole composes an enormous mass about 14 miles in circumference. The Spaniards compute it to be two leagues in height\*. As it is like no other mountain, so it stands quite unconnected with any, though not far distant from some that are very lofty. A convent is erected on the mountain, dedicated to our Lady of Montserrat, to which pilgrims resort from the farthest parts of Europe. All the poor who come here are fed gratis for three days, and all the sick received into the hospital. Sometimes, on particular festivals, seven thousand persons arrive in one day; but people of condition pay a reasonable price for what they eat. On different parts of the mountain are a number of hermitages, all of which have their little chapels, ornaments for saying mass, water cisterns, and most of them little gardens. The inhabitant of one of these hermitages, which is dedicated to St. Benito, has the privilege of making an annual entertainment on a certain day, on which day all the other hermits are invited, when they receive the sacrament from the hands of the mountain vicar, and, after divine service, dine together. They meet also at this hermitage on the days of the saints to whom their several hermitages are dedicated, to say mass, and commune with each other. But at other times they live in a very solitary and reclusive manner, perform various penances, and adhere to very rigid rules of abstinence. They never eat flesh; nor are they allowed to keep within their walls either dog, cat, bird, or any living thing, lest their attention should be withdrawn from heavenly to earthly affections. The number of professed monks there is 76, of lay brothers 28, and of singing boys 25; besides physician, surgeon, and servants. Mr. Thicknesse, who has published a very particular description of this extraordinary mountain, was informed by one of the hermits, that he often saw from his habitation the islands of Minorca, Majorca, and Yvica, and the kingdoms of Valencia and Murcia.

RIVERS AND LAKES.] The principal rivers of Spain are the Douro, formerly Durus, which falls into the Atlantic Ocean, below Oporto in Portugal; the Tajo or Tagus, which falls into the Atlantic Ocean

\* Mr. Swinburne estimates its height at only 3,300 feet; and observes, that the arms of the convent are, the Virgin Mary sitting at the foot of a rock half cut through by a saw.

below Lisbon: the Guadiana, which falls into the same ocean near Cape Finisterre; as does the Guadalquivir at St. Lucar; and the Ebro, the ancient Iberus, which falls into the Mediterranean sea below Tortosa.

The river Tinto, the qualities of which are very extraordinary, rises in Sierra Morena, and empties itself into the Mediterranean, near Huelva. The name of Tinto has been given it from the tinge of its waters, which are as yellow as a topaz, hardening the sand, and petrifying it in a most surprising manner. If a stone happens to fall in, and rest upon another, they both become, in a year's time, perfectly united and conglutinated.—This river withers all the plants on its banks, as well as the roots of trees, which it dyes of the same hue as its waters. No kind of verdure will come up where it reaches, nor any fish live in its stream. It kills worms in cattle when given them to drink; but in general no animals will drink out of this river, excepting goats, whose flesh nevertheless has an excellent flavour. These singular properties continue till other rivulets run into it and alter its nature; for when it passes by Niebla, it is not different from other rivers. It falls into the Mediterranean sea, six leagues lower down.

Several lakes in Spain, particularly that of Beneventa, abound with fish, particularly excellent trout. The water of a lake near Antiquera is made into salt by the heat of the sun.

**BAYS.]** The chief bays are those of Biscay, Ferrol, Corunna (commonly called the Groyne), Vigo, Cadiz, Gibraltar, Carthagen, Alicant, Altea, Valencia, Roses, Majorca in that island, and the harbour of Port-Mahon in the island of Minorca. The Strait of Gibraltar divides Europe from Africa.

**METALS AND MINERALS.]** Spain abounds in both, and in as great variety, and of the same kinds, as the other countries of Europe. Cornelian, agate, loadstones, jacinths, turquois stones, quicksilver, copper, lead, sulphur, alum, calamine, crystal, marbles of several kinds, porphyry, the finest jasper, and even diamonds, emeralds, and amethysts, are found here. The Spanish iron, next to that of Damascus, furnishes the best arms in the world, and, in former times, brought in a vast revenue to the crown; the art of working it being here brought to great perfection.—Spanish gun barrels, and swords of Toledo, are still highly valued. Among the ancients, Spain was celebrated for gold and silver mines; and silver was in such plenty, that Strabo, who was contemporary with Augustus Cæsar, informs us, that when the Carthaginians took possession of Spain, their domestic and agricultural utensils were of that metal. These mines have now disappeared; but whether by their being exhausted, or through the indolence of the inhabitants in not working them, we cannot say; though the latter cause seems to be the most probable.

**ANIMAL PRODUCTIONS, } BY SEA AND LAND. }** The Spanish horses, especially those of Andalusia, are thought to be the handsomest of any in Europe, and at the same time very swift and serviceable. The king does all he can to monopolise the finest breeds for his own stables and service. Spain furnishes likewise mules and black cattle; and the wild bulls have so much ferocity, that the bull-fights were the most magnificent spectacle the court of Spain could exhibit; nor are they yet disused. Wolves are the chief beasts of prey in Spain, which is well stored with all the game and wild-fowl that are to be found in the neighbouring countries already described. The Spanish seas afford excellent fish of all kinds, especially anchovies, which are here cured in great perfection. This country is much infested with

locusts; and Mr. [unclear] ed with them, an of Andalusia, Mu in the air in such of Spain has been dura been render sente of smelling garden at a consid instant. Mr. Dil attention and obs insects, and there

By the best an the Spaniards in British subjects by supplying th the most hospita

locusts; and Mr. Dillon observes, that, in 1754, La Mancha was covered with them, and the horrors of famine assailed the fruitful provinces of Andalusia, Murcia, and Valencia. They have sometimes appeared in the air in such numbers as to darken the sky; the clear atmosphere of Spain has become gloomy, and the finest summer day in Estremadura been rendered more dismal than the winter of Holland. Their sense of smell is so delicate, that they can discover a corn field or a garden at a considerable distance; which they will ravage almost in an instant. Mr. Dillon is of opinion, that the country people, by timely attention and observation, might destroy the eggs of these formidable insects, and thereby totally extirpate them.

POPULATION, INHABITANTS, MANNERS, } Spain, formerly the  
CUSTOMS, DIVERSIONS, AND DRESS. } most populous kingdom  
in Europe, is now but thinly inhabited. This is owing partly to the great drains of people sent to America, and partly to the indolence of the natives, who will not labour to raise food for their families. Another cause may be assigned, and that is, the vast numbers of ecclesiastics, of both sexes, who lead a life of celibacy. Some writers have assigned several other causes, such as their wars with the Moors, and the final expulsion of that people. The present inhabitants of this kingdom have been computed, by Feyjoo, a Spanish writer, to amount to 9,250,000; so that England is three times as populous as Spain, considering its extent.

The persons of the Spaniards are generally tall, especially the Castilians; their hair and complexions swarthy, but their countenances are very expressive. The court of Madrid has of late been at great pains to clear their upper lips of mustachoes, and to introduce among them the French dress, instead of their black cloaks, their short jerkins, strait breeches, and long Toledo swords, which dress is now chiefly confined to the lower ranks. The Spaniards, before the accession of the House of Bourbon to their throne, affected that antiquated dress, in hatred and contempt of the French; and the government probably will find some difficulty in abolishing it entirely, as the same spirit is far from being extinguished. An old Castilian, or Spaniard, who sees none above him, thinks himself the most important being in nature; and the same pride is commonly communicated to his descendants. This is the true reason why many of them are so fond of removing to America, where they can retain all their native importance, without the danger of seeing a superior.

Ridiculous, however, as this pride is, it is productive of the most exalted qualities. It inspires the nation with generous, humane, and virtuous sentiments; it being seldom found that a Spanish nobleman, gentleman, or even trader, is guilty of a mean action. During the most embittered wars they have had with England, for near 100 years past, we know of no instance of their taking advantage (as they might easily have done) of confiscating the British property on board their galleons and Plate fleet, which was equally secure in time of war as peace. This is the more surprising, as Philip V. was often needy, and his ministers were far from being scrupulous of breaking their good faith with Great Britain.

By the best and most credible accounts of the late wars, it appears, that the Spaniards in America gave the most humane and noble relief to all British subjects who were in distress and fell into their hands, not only by supplying them with necessaries, but money; and treating them in the most hospitable manner while they remained among them.

Having said thus much, we are carefully to distinguish the Spanish nobility, gentry, and traders, from the lower ranks of Spaniards, who are as mean and rapacious as those of any other country. The kings of Spain, of the House of Bourbon, have seldom ventured to employ native Spaniards of great families, as their ministers. These are generally French or Italians, but most commonly the latter, who rise into power by the most infamous arts, and of late times from the most abject stations.—Hence it is, that the French kings of Spain, since their accession to that monarchy, have been but very indifferently served in the cabinet. Alberoni, who had the greatest genius among them, embroiled his master with all Europe, till he was driven into exile and disgrace; and Grimaldi, the last of their Italian ministers, hazarded a rebellion in the capital, by his oppressive and unpopular measures.

The common people who live on the coasts partake of all the bad qualities that are to be found in other nations. They are an assemblage of Jews, French, Russians, Irish adventurers, and English smugglers, who, being unable to live in their own country, mingle with the Spaniards.—In time of war, they follow privateering with great success; and when peace returns, they engage in all illicit practices, and often enter into the Irish and Walloon guards in the Spanish service. There are about 40,000 gypsies, who, besides their trade of fortune-telling, are inn-keepers in the small towns and villages. The character of the Spaniards is thus drawn by Mr. Swinburne. “The Catalans appear to be the most active stirring set of men, the best calculated for business, travelling, and manufactures. The Valencians are a more sullen sedate race, better adapted to the occupations of husbandmen, less eager to change place, and of a much more timid, suspicious cast of mind than the former. The Andalusians seem to be the greatest talkers and rhodomontaders of Spain. The Castilians have a manly frankness, and less appearance of cunning and deceit. The New Castilians are, perhaps, the least industrious of the whole nation; the Old Castilians are laborious, and retain more of the ancient simplicity of manners;—both are of a firm determined spirit. The Arragonese are a mixture of the Castilian and Catalan, rather inclining to the former. The Biscayners are acute and diligent, fiery and impatient of controul, more resembling a colony of republicans than a province of an absolute monarchy; and the Galicians are a plodding pains-taking race of mortals, that roam over Spain in search of a hardly-earned subsistence.”

The beauty of the Spanish ladies reigns mostly in their novels and romances; for though it must be acknowledged that Spain produces as fine women as any country in the world, yet beauty is far from forming their general character. In their persons, they are generally small and slender; but they are said to employ great art in supplying the defects of nature.—If we were to hazard a conjecture, we might reasonably suppose that those artifices rather diminish than increase beauty, especially when they are turned of 25. Their indiscriminate use of paint, not only upon their faces, but their necks, arms, and hands, undoubtedly disfigures their complexions and shrivels their skin. It is at the same time universally allowed, that they have great wit and vivacity.

Among the many good qualities possessed by the Spaniards, their frugality in eating and drinking is remarkable. They frequently breakfast, as well as sup, in bed. Their breakfast is usually chocolate, tea being very seldom drank. Their dinner is generally beef, mutton,

veal, pork, and but-

veal, pork, and bacon, greens, &c. all boiled together. They live much upon garlic, chives, sallad, and radishes; which, according to one of their proverbs, are food for a gentleman. The men drink very little wine; and the women use water or chocolate. Both sexes usually sleep after dinner, and take the air in the cool of the evening. This is the common practice in warm countries, such as Italy, Spain, and Portugal, where, generally speaking, the weather is clear, and the inhabitants are mostly in the habit of rising much earlier than in England. The human body cannot furnish spirits sufficient to resist the effects of the violent heat, through the whole day, without some such refreshment: it is, therefore, the universal practice to go to sleep for some hours after dinner, which in those countries is over early; and this time of repose, which lasts for two or three hours, is in Spain called *the Siesta*, and in Portugal *the Sesta*. Dancing is so much their favourite entertainment, that you may see a grandmother, mother, and daughter, all in the same country-dance. Many of their theatrical exhibitions are insipid and ridiculous bombast. The prompter's head sometimes appears through a trap-door, above the level of the stage, and he reads the play loud enough to be heard by the audience. Gallantry is a ruling passion in Spain. Jealousy, since the accession of the House of Bourbon, has slept in peace. The nightly musical serenades of mistresses by their lovers are still in use. The fights of the cavaliers, or bull-fights, are almost peculiar to this country, and make a capital figure in painting the genius and manners of the Spaniards. On these occasions, young gentlemen have an opportunity of showing their courage and activity before their mistresses; and the valour of the cavalier is proclaimed, honoured, and rewarded, according to the number and fierceness of the bulls he has killed in these encounters. Great pains are used in settling the form and weapons of the combat, so as to give a relief to the gallantry of the cavalier. The diversion itself, which is attended with circumstances of great barbarity, is undoubtedly of Moorish original, and was adopted by the Spaniards when upon good terms with that nation, partly through complaisance, and partly through rivalry.

There is not a town in Spain but what has a large square for the purpose of exhibiting bull-fights; and it is said, that even the poorest inhabitants of the smallest villages will often club together, in order to procure a cow or an ox, and fight them, riding upon asses for want of horses.

RELIGION.] The Romish religion is the only one tolerated in Spain. The inquisition is a tribunal disgraceful to human-nature; but though disused, it is not yet abrogated; but the ecclesiastics and their officers can carry no sentence into execution without the royal authority. The Spaniards embrace and practise the Roman-catholic religion with all its absurdities; and in this they have been so steady, that their king is distinguished by the epithet of *Most Catholic*. It appears, however, that the burning zeal which distinguished their ancestors above the rest of the catholic world has lost much of its activity, and seems nearly extinguished; and the power of the clergy has been much reduced of late years. A royal edict has also been issued, to prevent the admission of novices into the different convents, without special permission; which has a great tendency to reduce the monastic orders. It is computed that there are now, in the kingdom of Spain, 54,000 friars, 34,000 nuns, and 20,000 secular clergy, but as little true moral religion as in any country under heaven.

In Catalonia, the confidence of the people in the intercession of saints

has at all periods been a source of consolation to them, but upon some occasions has betrayed them into mischief. Every company of artificers, and every ship that sails, is under the immediate protection of some patron. Besides folio volumes, which testify the innumerable miracles performed by our Lady in Montserrat, every subordinate shrine is loaded with votive tablets. This has been the parent of presumption, and among the merchants has brought many families to want. The companies of insurance, in the last war, having each of them its favourite saint, such as San Ramon de Penaforte, la Virgen de la Merced, and others, associated in form by the articles of partnership, and named in every policy of insurance; and having with the most scrupulous exactness allotted to them their correspondent dividend, the same as to any other partner, they concluded that with such powerful associates it was not possible for them to suffer loss. Under this persuasion, they ventured, about the year 1779, to insure the French West Indiamen at fifty per cent. when the English and Dutch had refused to do it at any premium, and indeed when most of the ships were already in the English ports. By this fatal stroke, all the insuring companies, except two, were ruined.

[ARCHBISHOPRICS AND BISHOPRICS.] In Spain there are eight archbishoprics, and forty-six bishoprics. The archbishop of Toledo is styled the primate of Spain; he is great chancellor of Castile, and has a revenue of 100,000*l.* sterling per annum; but the Spanish court has now many ways of lessening the revenues of the church, as by pensions, donations to hospitals, &c. and premiums to the societies of agriculture. This archbishopric pays annually 15,000 ducats to the monks of the Escorial, besides other pensions; and it is asserted that there is not a bishopric in Spain but has somebody or other quartered upon it; and the second-rate benefices are believed to be in the same predicament. Out of the rich canonries and prebends, are taken the pensions of the new order of knights of Carlos Tercero. The riches of the Spanish churches and convents are the unvarying objects of admiration to all travellers as well as natives; but there is a sameness in them all, excepting that they differ in the degrees of treasure and jewels they contain.

[LANGUAGE.] The Spanish language, like the Italian, is derived from the Latin; and it might properly be called a bastard Latin, were it not for the terminations, and the exotic words introduced into it by the Moors and Goths, especially the former. It is a majestic and expressive language: and it is remarkable, that foreigners who understand it best, prize it most. It makes but a poor figure even in the best translations; and Cervantes speaks almost as awkward English, as Shakspeare does French. It may, however, be considered as a standard tongue, having nearly retained its purity for upwards of 200 years. Their Paternoster runs thus: *Padre nuestro, que estas en el cielo, santificado se el tu nombre; venga a nos el tu reyno; bagase tu voluntad, assi en la tierra como en el cielo; el pan nuestro de cada dia da nos de oy; y perdona nos nuestras deudas assi como nos otros perdonamos a nuestros deudores; no nos dexes cair en la tentacion, mas libra nos de mal; porque tao es el reyno, y la potencia, y la gloria, per li. Aglos. Amen.*

[LEARNING AND LEARNED MEN.] Spain has not produced learned men in proportion to the excellent capacities of its natives. This defect may, in some measure, be owing to the indolence and bigotry of the Spaniards, which prevents them from making that progress in the polite arts which they otherwise would: but the greatest impediment to

literature in Spain of the ancient father much to Isidore, but likewise produced the Austrian government that the inimitable Madrid in 1549, his soldier, and died near the battle of Lepanto, knight-errantry, in vice to his country, does honour to his head of moral and

literature in Spain is the despotic nature of its government. Several of the ancient fathers of the church were Spaniards; and learning owes much to Isidore, bishop of Seville, and cardinal Ximenes. Spain has likewise produced some excellent physicians. Such was the gloom of the Austrian government that took place with the emperor Charles V. that the inimitable Cervantes, the author of *Don Quixote*, born at Madrid in 1549, lifted in a station little superior to that of a common soldier, and died neglected, after fighting bravely for his country at the battle of Lepanto, in which he lost his left hand. His satire upon knight-errantry, in his adventures of *Don Quixote*, did as much service to his country; by curing them of that ridiculous spirit, as it now does honour to his own memory. He was in prison for debt when he composed the first part of his history, and is perhaps to be placed at the head of moral and humorous satirists.

The Visions of Quevedo, and some other of his humorous and satirical pieces, having been translated into the English language, have rendered that author well known in this country. He was born at Madrid in the year 1570, and was one of the best writers of his age, excelling equally in verse and in prose. Besides his merit as a poet, he was well versed in the oriental languages, and possessed great erudition. His works are comprised in three volumes 4to, two of which consist of poetry, and the third of pieces in prose. As a poet, he excelled both in the serious and burlesque style, and was happy in a turn of humour similar to that which we admire in Butler and Swift.

Poetry was cultivated in Spain at an early period. The most distinguished dramatic poet of this nation was Lopez de Vega, who was contemporary with our Shakspeare. He possessed an imagination astonishingly fertile, and wrote with great facility; but in his dramatic works he disregarded the unities, and adapted his works more to the taste of the age, than to the rules of criticism. His lyric compositions, and fugitive pieces, with his prose essays, form a collection of fifty volumes, besides his dramatic works, which make twenty-six volumes more; exclusive of four hundred scriptural dramatic pieces, called in Spain *Autos Sacramentales*. Calderon was also a dramatic writer of considerable note, but many of his plays are very licentious in their tendency.

Tostatus, a divine, the most voluminous perhaps that ever wrote, was a Spaniard; but his works have been long distinguished only by their bulk. Herrera, and some other historians, particularly De Solis, have shown great abilities in history, by investigating the antiquities of America, and writing the history of its conquest by their countrymen.— Among the writers who have lately appeared in Spain, Father Feyjoo has been one of the most distinguished. His performances display great ingenuity, very extensive reading, and uncommon liberality of sentiment, especially when his situation and country are considered. Many of his pieces have been translated into English, and published in four volumes 8vo. Don Francisco Perez Bayer, archdeacon of Valencia, and author of a Dissertation on the Phœnician Language, may be placed in the first line of Spanish literati. Spain has likewise produced many travellers and voyagers to both the Indies, who are equally amusing and instructive.

Some of the Spaniards have distinguished themselves in the polite arts; and not only the cities, but the palaces, especially the Escorial, discover many striking specimens of their abilities as sculptors and architects; Palomino, in an elaborate treatise on the art of painting, in two volumes folio, has inserted the lives of two hundred and thirty three

painters and sculptors, who flourished in Spain from the time of Ferdinand the catholic, to the conclusion of the reign of Philip IV. Amongst the most eminent Spanish painters, were, Velasques; Murillo, who is commonly called the Spanish Vandyke; Ribeira; and Claudio Coello, whose style of painting was very similar to that of Paul Veronese.

UNIVERSITIES.] In Spain are reckoned 24 universities, the chief of which is Salamanca, founded by Alphonfus, ninth king of Leon, in the year 1200. It contains 21 colleges, some of which are very magnificent. Most of the nobility of Spain send their sons to be educated here. The others are, Seville, Grenada, Compostella, Toledo, Valladolid, Alcalá, Sigüenza, Valencia, Lerida, Huesca, Saragossa, Tortosa, Offuna, Onata, Candia, Barcelona, Murcia, Taragona, Baeza, Avila, Oriuela, Oviedo, and Palencia.

ANTIQUITIES AND CURIOSITIES, } The former of these consist  
ARTIFICIAL AND NATURAL. } chiefly of Roman and Moorish  
antiquities. Near Segovia, a grand aqueduct, erected by Trajan, extends over a deep valley between two hills, and is supported by a double row of 159 arches. Other Roman aqueducts, theatres, and circi, are to be found at Terrago, and different parts of Spain. A ruinous watch-tower, near Cadiz, is vulgarly, but erroneously, thought to be one of the pillars of Hercules. Near the city of Salamanca are the remains of a Roman way, paved with large flat stones; it was continued to Merida, and from thence to Seville. At Toledo are the remains of an old Roman theatre, which is now converted into a church, said to be one of the most curious remains of antiquity. It is 600 feet in length, 500 in breadth, and of a proportionable height; the roof, which is amazingly bold and lofty, is supported by 350 pillars of fine marble, in ten rows, forming eleven aisles, in which are 366 altars, and 24 gates; every part being enriched and adorned with the most noble and costly ornaments. At Martorel, a large town, where much black lace is manufactured, is a very high bridge, built, in 1768, out of the ruins of a decayed one that had existed 1985 years from its erection by Hannibal. At the north end is a triumphal arch or gateway, said to have been raised by that general in honour of his father Hamilcar. It is almost entire, well proportioned and simple, without any kind of ornament, except a rim or two of hewn stone. Near Mulviedro (once the faithful Saguntum destroyed by Hannibal) are some Roman remains--as the ruins of the theatre, an exact semicircle about 82 yards diameter; some of the galleries are cut out of the rock, and 9000 persons might attend the exhibitions without inconvenience.

The Moorish antiquities are rich and magnificent. Among the most distinguished of these is the royal palace of the Alhambra, at Grenada, which is one of the most entire as well as the most stately of any of the edifices which the Moors erected in Spain. It was built in 1280, by the second Moorish king of Grenada; and, in 1492, in the reign of their eighteenth king, was taken by the Spaniards. It is situated on a hill, which is ascended by a road bordered with hedges of double or imperial myrtles, and rows of elms. On this hill, within the walls of the Alhambra, the emperor Charles V. began a new palace in 1568, which was never finished, though the shell of it remains. It is built of yellow stone: the outside forms a square of one hundred and ninety feet. The inside is a grand circular court, with a portico of the Tuscan, and a gallery of the Doric order, each supported by thirty-two columns, made of as many single pieces of marble. The grand entrance is orna-

mented with columnations of battles, in mass of many house-stones of different dit and ceilings, some c with various Arabic floors, and ceilings o with orange and lem of the gardens is an elevated station than is one of the finest p Grenada. bounded b regret the loss of Gre very of the city. CHIEF CITIES, & rounded by a nu 300,000 inhabitant summits are freq lighted, and some houses of Madrid

mented with columns of jasper, on the pedestals of which are representations of battles, in marble basso-relievo. The Alhambra itself is a mass of many houses and towers, walled round, and built of large stones of different dimensions. Almost all the rooms have stucco walls and ceilings, some carved, some painted, and some gilt, and covered with various Arabic sentences. Here are several baths, the walls, floors, and ceilings of which are of white marble. The gardens above with orange and lemon trees, pomegranates, and myrtles. At the end of the gardens is another palace called Ginaraliph, situated on a more elevated station than the Alhambra. From the balconies of this palace is one of the finest prospects in Europe, over the whole fertile plain of Grenada, bounded by the snowy mountains. The Moors to this day regret the loss of Grenada, and still offer up prayers to God for the recovery of the city. Many other noble monuments, erected in the Moorish times, remain in Spain; some of them in tolerable preservation, and others exhibiting superb ruins.

Among the natural curiosities, the medicinal springs, and some noisy lakes, form a principal part; but we must not forget the river Guadiana, which, like the Mole in England, runs under ground, and then rises again. The royal cabinet of natural history, at Madrid, was opened to the public, by his majesty's orders, in 1775. Every thing in this collection is ranged with neatness and elegance, and the apartments are opened twice a week for the public, besides being shown privately to strangers of rank. The mineral part of the cabinet, containing precious stones, marbles, ores, &c. is very perfect: but the collection of birds and beasts at present is not large, though it may be expected to improve rapidly, if care be taken to obtain the productions of the Spanish American colonies. Here is also a curious collection of vases, basons, ewers, cups, plates, and ornamental pieces, of the finest agates, amethysts, rock crystals, &c. mounted in gold and enamel. set with cameos, intaglios, &c. in elegant taste, and of very fine workmanship, said to have been brought from France by Philip V. The cabinet also contains specimens of Mexican and Peruvian vases and utensils.

In blowing up the rock of Gibraltar, many pieces of bones and teeth have been found incorporated with the stone, some of which have been brought to England, and deposited in the British Museum. On the west side of the mountain, is the cave called St. Michael's, eleven hundred and ten feet above the horizon. Many pillars, of various sizes, some of them two feet in diameter, have been formed in it by the droppings of water, which have petrified in falling. The water perpetually drips from the roof, and forms an infinite number of stalactites, of a whitish colour, composed of several coats or crusts, and which, as well as the pillars, continually increase in bulk, and may probably in time fill the whole cavern. From the summit of the rock, in clear weather, not only the town of Gibraltar may be seen, but the bay, the straits, the towns of St. Roque and Algeiras, and the Alpuxara mountains; mount Abyla, on the African shore, with its snowy top, the cities of Ceuta, Tangier, and great part of the Barbary coast.

CHIEF CITIES, &c.] Madrid, though unfortified, it being only surrounded by a mud wall, is the capital of Spain, and contains about 300,000 inhabitants. It is surrounded with very lofty mountains, whose summits are frequently covered with snow. It is well paved and lighted, and some of the streets are spacious and handsome. The houses of Madrid are of brick, and are laid out chiefly for show, con-

venience being little considered: thus you will usually pass through two or three large apartments of no use, in order to come at a small room at the end where the family sit. The houses in general look more like prisons than the habitations of people at their liberty, the windows, besides having a balcony, being grated with iron-bars, particularly the lower range, and sometimes all the rest. Separate families generally inhabit the same house, as in Paris and Edinburgh. Foreigners are very much distressed for lodgings at Madrid, as the Spaniards are not fond of taking strangers into their houses, especially if they are not catholics. Its greatest excellency is the cheapness of its provisions; but neither tavern, coffee-house, nor newspaper, excepting the Madrid Gazette, are to be found in the whole city. The royal palace stands on an eminence, on the west side of the city; it is a spacious magnificent structure, consisting of three courts, and commands a very fine prospect. Each of the fronts is 470 feet in length, and 100 high, and there is no palace in Europe fitted up with greater magnificence; the great audience-chamber especially, which is 120 feet long, and hung with crimson velvet richly embroidered with gold. It is ornamented also with 12 looking glasses made at St. Ildefonso, each ten feet high, and with 12 tables of the finest Spanish marble. The other royal palaces round it are designed for hunting seats, or houses of retirement for their kings. Some of them contain fine paintings and good statues. The chief of those palaces are the Buen Retiro (now stripped of all its best pictures and furniture), Casa del Campo, Aranjuez, and St. Ildefonso.

A late traveller has represented the palace of Aranjuez, and its gardens, as extremely delightful. Here is also a park many leagues round, cut across, in different parts, by alleys of two, three, and even four miles extent. Each of those alleys is formed by two double rows of elm-trees; one double row on the right, and one on the left, which renders the shade thicker. The alleys are wide enough to admit four coaches abreast, and betwixt each double row there is a narrow channel, through which runs a stream of water. Between those alleys there are thick groves of smaller trees of various kinds; and thousands of deer and wild-boars wander there at large, besides numberless hares, rabbits, pheasants, partridges, and several other kinds of birds. The river Tagus runs through this place, and divides it into two unequal parts. The central point of this great park is the king's palace, which is partly surrounded by the garden, and is exceedingly pleasant, adorned with fountains and statues; and it also contains a vast variety of the most beautiful flowers, both American and European. As to the palace of Aranjuez itself, it is rather an elegant than a magnificent building.

The palace of St. Ildefonso is built of brick, plastered and painted, but no part of the architecture is agreeable. It is two stories high, and the garden-front has thirty-one windows, and twelve rooms in a suite. The gardens are on a slope, on the top of which is a great reservoir of water, called here *El Mar* (the sea), which supplies the fountains; this reservoir is furnished from the torrents which pour down the mountains. The water-works are excellent, and far surpass those at Versailles. The great entry of the palace is somewhat similar to that of Versailles, and with a large iron palisade. In the gardens are twenty-seven fountains; the basins are of white marble, and the statues, many of which are excellent, are of lead, bronzed and gilt. These gardens are in the formal French style, but ornamented with sixty-one very fine marble statues,

as large as the life, vases gilt. The upper rooms, and the lower

The pride of Spain perhaps with justice, other palace in Europe quarto volume; appended upon it six of windows, 200 ornaments are decorated with tapestry, ornaments of curious stones. The large, and richly ornamented, and a library, is more particularly with which it is embellished by Bartholomew Caracciolo, or profane history, below present to be presented above the medals, at the siege of thematics; and the works relative to the stance in this library which is, that, on the contrary way, so that their titles written Montanus, a learned man had served as a forerunner placed and inscribed to be the most correct introduced his own for the sake of usefulness books afterwards a collection of artists and mechanics, beautified with live in the conversion of 12,000. The map of Spain, is called that temple at Rome model of St. Peter's marbles.

Allowing to the bestowed on this palace, and the like beautiful, yet weavers a bad taste form of a gridiron was broiled on fire its principal ornaments sacerdotal habits, less bigot, such as tory he obtained forces) at St. Qu apartment where

as large as the life, with twenty-eight marble vases, and twenty leaden vases gilt. The upper part of the palace contains many valuable paintings, and the lower part antique statues, busts, and basso-relievos.

The pride of Spain, however, is the Escorial; and the natives say, perhaps with justice, that the building of it cost more than that of any other palace in Europe. The description of this palace forms a sizable quarto volume; and it is said that Philip II. who was its founder, expended upon it six millions of ducats. It contains a prodigious number of windows, 200 in the west front, and in the east 366; and the apartments are decorated with an astonishing variety of paintings, sculpture, tapestry, ornaments of gold and silver, marble, jasper, gems, and other curious stones. This building, besides its palace, contains a church, large, and richly ornamented, a mausoleum, cloisters, a convent, a college, and a library, containing about thirty thousand volumes; but it is more particularly valuable for the Arabic and Greek manuscripts with which it is enriched. Above the shelves are paintings in fresco, by Bartheloni Carducho, the subjects of which are taken from sacred or profane history, or have relation to the sciences of which the shelves below present to us the elements. Thus, the council of Nice is represented above the books which treat of theology; the death of Archimedes, at the siege of Syracuse, indicates those which relate to the mathematics; and Cicero pronouncing his oration in favour of Rabirius, the works relative to eloquence and the bar. A very singular circumstance in this library may be agreeable to the curious reader to know, which is, that, on viewing the books, he will find them placed the contrary way, so that the edges of the leaves are outwards, and contain their titles written on them. The reason for this custom is, that Arius Montanus, a learned Spaniard of the sixteenth century, whose library had served as a foundation for that of the Escorial, had all his books placed and inscribed in that manner, which no doubt appeared to him to be the most commodious method of arranging them; that he had introduced his own method into the Escorial; and since his time, and for the sake of uniformity, it had been followed with respect to the books afterwards added. Here are also large apartments for all kinds of artists and mechanics; noble walks, with extensive parks and gardens, beautified with fountains and costly ornaments. The fathers that live in the convent are 200, and they have an annual revenue of 12,000*l*. The mausoleum, or burying-place of the kings and queens of Spain, is called the Pantheon, because it is built upon the plan of that temple at Rome, as the church to which it belongs is upon the model of St. Peter's. It is thirty-six feet in diameter, incrusted with fine marbles.

Allowing to the Spaniards their full estimate of the incredible sums bestowed on this palace, and on its furniture, statues, paintings, columns, vases, and the like decorations, which are most amazingly rich and beautiful, yet we hazard nothing in saying, that the fabric itself discovers a bad taste upon the whole. The conceit of building it in the form of a gridiron, because St. Laurence, to whom it is dedicated, was broiled on such an utensil, and multiplying the same figure through its principal ornaments upon the doors, windows, altars, rituals, and sacerdotal habits, could have been formed only in the brain of a tasteless bigot, such as Philip II. who erected it to commemorate the victory he obtained over the French (but by the assistance of the English forces) at St. Quentin, on St. Laurence's day, in the year 1557. The apartment where the king resides forms the handle of the gridiron. The

army, when deserted both by England and the emperor, for whom they had taken up arms. The number of inhabitants is supposed to be nearly 150,000, and they supply Spain with most of the clothing and arms for the troops. A singular custom prevails among them; on the 1st of November, the eve of All Souls, they run about from house to house to eat chestnuts, believing that for every chestnut they swallow, with proper faith and unctiōn, they shall deliver a soul out of purgatory.

Valencia is a large and almost circular city, with lofty walls. The streets are crooked and narrow, and not paved; the houses ill built and filthy, and most of the churches tawdry. Priests, nuns, and friars, of every dress, swarm in this city, whose inhabitants are computed at 30,000. Its archbishopric is one of the best in Spain, to the amount of 40,000*l.* sterling a year.

Carthagena is a large city, but has very few good streets, and fewer remarkable buildings. The port is very complete, formed by nature in the figure of a heart, and the arsenal is a spacious square south-west of the town, with 40 pieces of cannon to defend it towards the sea. When Mr. Swinburne visited it, in 1775, there were 800 Spanish criminals, and 600 Barbary slaves, working at the pumps, to keep the docks dry, &c. and treated with great inhumanity. The crimes for which the Spaniards were sent there deserved indeed exemplary punishment.

Grenada stands on two hills, and the ancient palace of the Alhambra crowns the double summit between two rivers, the Douro, and the Xenil. The former glories of this city are passed away with its old inhabitants; the streets are now filthy, the aqueducts crumbled to dust, and its trade lost. Of 50 000 inhabitants, only 18,000 are reckoned useful; the surplus is made up of clergy, lawyers, children, and beggars. The amphitheatre for bull-feasts is built of stone, and one of the best in Spain. The environs of the city are still pleasing and healthful.

Bilboa is situated on the banks of the river Ybaizabal, and is about two leagues from the sea. It contains about eight hundred houses, with a large square by the water side, well shaded with pleasant walks, which extend to the outlets on the banks of the river, where there are great numbers of houses and gardens, which form a most pleasing prospect, particularly in sailing up the river; for, besides the beautiful verdure, numerous objects open gradually to the eye, and the town appears as an amphitheatre, which enlivens the landscape, and completes the scenery. The houses are solid and lofty, the streets well paved and level, and the water is so conveyed into the streets, that they may be washed at pleasure; which renders Bilboa one of the neatest towns in Europe.

Malaga is an ancient city, and not less remarkable for its opulence and extensive commerce than for the luxuriance of its soil, yielding in great abundance the most delicious fruits; whilst its rugged mountains afford those luscious grapes which give such reputation to the Malaga wine, known in England by the name of Mountain. The city is large and populous, and of a circular form, surrounded with a double wall, strengthened by stately towers, and has nine gates. A Moorish castle on the point of a rock commands every part of it. The streets are narrow, and the most remarkable building in it is a stupendous cathedral, begun by Philip II. said to be as large as that of St. Paul's in London. The bishop's income is 16,000*l.* sterling.

The city of Salamanca is of a circular form, built on three hills and two valleys, and on every side surrounded with prospects of fine houses, noble seats, gardens, orchards, fields, and distant villages; and is ancient, large, rich, and populous. There are ten gates to this city, and it contains twenty-five churches, twenty-five convents of friars, and the same number of nunneries. The most beautiful part of this city is the great square, built about forty years ago. The houses are of three stories, and all of equal height and exact symmetry, with iron balconies, and a stone balustrade on the top of them: the lower part is arched, which forms a piazza all round the square, which extends two hundred and ninety-three feet on each side. Over some of the arches are medallions, with busts of the king of Spain, and of several eminent men, in stone bas-relievo, among which are those of Ferdinando Cortez, Francis Pizarro, Davila, and Cid Ruy. In this square the bull-fights are exhibited, for three days only, in the month of June. The river Tormes runs by this city, and has a bridge over it of twenty-five arches, built by the Romans, and yet entire.

Toledo is one of the most ancient cities in Spain, and during several centuries it held the rank of its metropolis. But the neighbourhood of Madrid has by degrees stripped it of its numerous inhabitants, and it would have been almost entirely deserted but for its cathedral, the income of which being in great part spent here, contributes chiefly to the maintenance of the few thousands that are left, and artists, in some degree, those small manufactures of sword-blades and silk-stuffs that are established in this city. It is now exceedingly ill built, poor, and mean.

Burgos was the ancient capital of the kingdom of Castile, but now in obscurity. The cathedral is one of the most magnificent structures, of the Gothic kind, now in Europe. Its form is exactly the same as that of York-minster, and on the east end is an octagon building, exactly like the chapter-house at York.

Gibraltar, once a celebrated town and fortress of Andalusia, is at present in possession of Great Britain. Till the arrival of the Saracens in Spain, which took place in the year 711, or 712, the rock of Gibraltar went by the name of *Mons Calpe*. On their arrival, a fortress was built upon it, and it obtained the name of *Gibet Tarif*, or Mount Tarif, from the name of their general, and thence Gibraltar. It was in the possession of the Spaniards and Moors by turns, till it was taken from the former by a combined fleet of English and Dutch ships, under the command of Sir George Rooke, in 1704; and this rather through accident than any thing else. The prince of Hesse, with 1800 men, landed on the isthmus; but an attack on that side was found to be impracticable, on account of the steepness of the rock. The fleet fired 15 000 shot, without making any impression on the works; so that the fortress seems to be equally impregnable both to the British and Spaniards, except by famine. At last, a party of sailors, having got merry with grog, rowed close under the New Mole in their boats; and as they saw that the garrison, which consisted only of 100 men, did not mind them, they were encouraged to attempt a landing; and having mounted the mole, hoisted a red jacket as a signal of possession. This being immediately observed from the fleet, more boats and sailors were sent out, who, in like manner, having ascended the works, got possession of a battery, and soon obliged the town to surrender. After many fruitless attempts to recover it, it was confirmed to the English, by the treaty of Utrecht, in 1713. Repeated attempts have been since made to wrest

it from England, famous than ever, forces of Spain and ed by general Elliot the assailants; though impregnable. Nevertheless chiefly brass, which have been raised, is a commodious passage of the Straits, near and Levant nor storms: the Straits are 24 miles from the Atlantic of it, a brisk gale in the last but on account of is always furnished harbour is formed guns. Gibraltar is between the rock art and nature, and accessible. It has sea. Across this chiefly with a view any intercourse with they carry on a the Spaniards are fined within very any thing, all the from Ceuta, or was entirely under those abuses which proper to erect it lodged in its magazines.

The chief islands, jorca, and Yvica. under general Star Utrecht, 1713, was 15, 1782, and is 27,000 inhabitants. COMMERCE AND themselves, make ports and imports export it to other this commerce. merce) other European in Spanish phrase has it, collected foreign nations consuls of those said to have the city in Europe; treasures of Spain ported from Cad

it from England, but without success; the last war has made it more famous than ever, when it underwent a long siege against the united forces of Spain and France, by land and sea, and was gallantly defended by general Elliot and his garrison, to the great loss and disgrace of the assailants; though it must be granted, the place is by nature almost impregnable. Near 300 pieces of cannon, of different bores, and chiefly brass, which were sunk before the port in the floating batteries, have been raised, and sold, to be distributed among the garrison. It is a commodious port, and formed naturally for commanding the passage of the Straits, or, in other words, the entrance into the Mediterranean and Levant seas. But the road is neither safe against an enemy nor storms: the bay is about twenty leagues in circumference. The straits are 24 miles long, and 15 broad; through which sets a current from the Atlantic ocean into the Mediterranean; and for the stemming of it, a brisk gale is required. The town was neither large nor beautiful, and in the last siege was totally destroyed by the enemies' bombs, but on account of its fortifications is esteemed the key of Spain, and is always furnished with a garrison well provided for its defence. The harbour is formed by a mole, which is well fortified and planted with guns. Gibraltar is accessible on the land side only by a narrow passage between the rock and the sea; but that is walled and fortified both by art and nature, and so inclosed by high steep hills, as to be almost inaccessible. It has but two gates on that side, and as many towards the sea. Across this isthmus the Spaniards have drawn a fortified line, chiefly with a view to hinder the garrison of Gibraltar from having any intercourse with the country behind them; notwithstanding which they carry on a clandestine trade, particularly in tobacco, of which the Spaniards are exceedingly fond. The garrison is, however, confined within very narrow limits; and, as the ground produces scarcely any thing, all their provisions are brought them either from England or from Ceuta, on the opposite coast of Barbary. Formerly, Gibraltar was entirely under military government; but that power producing those abuses which are naturally attendant on it, the parliament thought proper to erect it into a body corporate, and the civil power is now lodged in its magistrates.

The chief islands belonging to Spain in Europe, are Minorca, Majorca, and Yvica. Minorca, which was taken by the English, in 1708, under general Stanhope, and confirmed to Great Britain by the treaty of Utrecht, 1713, was re-taken by the Spaniards in the last war, February 15, 1782, and is now become a Spanish island again; containing about 27,000 inhabitants.

COMMERCE AND MANUFACTURES.] The Spaniards, unhappily for themselves, make gold and silver the chief branches both of their exports and imports. They import it from America, from whence they export it to other countries of Europe. Cadiz is the chief emporium of this commerce. "Hither (says Mr. Anderson, in his History of Commerce) other European nations send their merchandise to be shipped off in Spanish bottoms for America, sheltered (or, as our old English phrase has it, coloured) under the names of the Spanish factors. Those foreign nations have here their agents and correspondents; and the consuls of those nations make a considerable figure. Cadiz has been said to have the finest storehouses and magazines for commerce of any city in Europe; and to it the flota and galleons regularly import the treasures of Spanish America. The proper Spanish merchandises exported from Cadiz to America are of no great value; but the duty on

the foreign merchandize sent thither would yield a great revenue (and consequently the profits of merchants and their agents would sink) were it not for the many fraudulent practices for eluding those duties."

At St Ildefonso the glass manufacture is carried on to a degree of perfection unknown in England. The largest mirrors are made in a brass frame, 162 inches long, 93 wide, and six deep, weighing near nine tons. These are designed wholly for the royal palaces, and for presents from the king. Yet even for such purposes it is ill placed, and proves a devouring monster in a country where provisions are dear, fuel scarce, and carriage exceedingly expensive. Here is also a royal manufacture of linen, employing about 15 looms; by which it is said the king is a considerable loser.

In the city of Valencia there is a very respectable silk manufacture, in which five thousand looms, and three hundred stocking frames, give employment to upwards of 20,000 of the inhabitants, without enumerating those who exercise professions relative to the manufacture, such as persons who prepare the wood and iron work of so great a number of machines, or spin, wind, or die the silk. At Alcora, in the neighbourhood of Valencia, a manufacture of porcelain has been successfully established; and they very much excel in painted tiles. In Valencia, their best apartments are floored with these, and are remarkable for neatness, for coyness, and for elegance. They are stronger and much more beautiful than those of Holland.

At Carthagena they make great quantities of the *esparto* ropes and cables, some of them spun like hemp, and others plaited. Both operations are performed with singular rapidity. These cables are excellent, because they float on the surface of the water, and are not therefore liable to be cut by the rocks on a foul coast. The *esparto* rush makes good mats for houses, *alpargates*, or short trowsers and buskins for peasants, and latterly it has been spun into fine thread for the purpose of making cloth. If properly encouraged, there is no doubt that the manufacture may be brought to such perfection, as to make this once useless rush a source of abundant wealth to the southern provinces of Spain, for it is the peculiar and natural production of all the high and uncultivated mountains of the south.

As to the hempen cordage which is made in Spain for the use of the royal navy, M. de Bourgoanne observes that it is better and more durable than that of the principal dock-yards and magazines in Europe; because, in combing the hemp, all the towy part we leave in it is taken out, and made use of in caulking, whence results the double advantage of more solid cordage, and the better caulking of vessels. Another custom in our rope-yards, which the Spaniards have avoided adopting, is the tarring the cordage and keeping it a long time piled up. In this state the tar ferments, and eats the hemp, and the cordage is extremely apt to break after being used but a short space of time.

The Spaniards formerly obtained their hemp from the north; at present they are able to do without the assistance, in this article, of any other nation. The kingdom of Grenada already furnishes them with the greatest part of the hemp they use; and, in case of need, they may have recourse to Arragon and Navarre. All the sail-cloth and cordage in the magazines at Cadiz are made with Spanish hemp; the texture of which is even, close, and solid.

The most important production of this country, and the most valuable article of commerce, is *barilla*, a species of pot-ash, procured by burning a great variety of plants almost peculiar to the kingdoms of Va-

lencia and Murcia, such as *soza*, *algarul*, *suzon*, *fyenns*, *salicornia*, with *barilla*. It is used for making soap, for bleaching, and for glass. All the nations in Europe, by the combustion of various vegetable substances, make some kind of pot-ash; but the superior excellence of the barilla has hitherto secured the preference. The country producing it is about sixty leagues in length, and eight in breadth, on the borders of the Mediterranean. The quantity exported annually from Spain (according to the testimonies of both Mr. Townsend and M. de Bourgoanne) is about a hundred and fifty quintals, most of which are sent to France and England, and a small quantity to Genoa and Venice.

Spain is one of the richest countries in Europe in salt-petre, a most important article of commerce. The account of this surprising manufacture we shall abridge from Mr. Townsend. "I observed," says he, "a large enclosure, with a number of mounds of about twenty feet high, at regular distances from each other. These were collected from the rubbish of the city of Madrid, and the scrapings of the highways. They had remained all the winter piled up in the manner in which I found them. At this time men were employed in wheeling them away, and spreading abroad the earth to the thickness of about one foot, whilst others were turning what had been previously exposed to the influence of the sun and air. The preceding summer these heaps had been washed, and being thus exposed, would yield the same quantity of salt again; and, as far as appears, the produce would never fail; but, after having been washed, no salt-petre can be obtained without a subsequent exposure. Some of this earth they can lixiviate once a year, some they have washed twenty times in the last seven years, and some they have subjected to this operation fifteen times in one year, judging always by their eye when they may wash it to advantage, and by their taste if it has yielded a lixivium of a proper strength; from which, by evaporating the water in boiling, they obtain the salt-petre."

The other manufactures of Spain are chiefly of wool, copper, and hardware. Great efforts have been made by the government, to prevent the other European nations from reaping the chief advantage of the American commerce; but these never can be successful, till a spirit of industry is awakened among the natives, so as to enable them to supply their American possessions with their own commodities and merchandise. Meanwhile, the good faith and facility with which the English, French, Dutch, and other nations, carry on this contraband trade, render them greater gainers by it than the Spaniards themselves are, the clear profits seldom amounting to less than twenty per cent. This evidently makes it an important concern, that those immense riches should belong to the Spaniards, rather than any active European nation: but of this subject there will be occasion to speak in the account of America.

CONSTITUTION AND GOVERNMENT.] Spain, from being the most free, is now the most despotic kingdom in Europe; and the poverty which is so visible in most parts of the country is in a great degree the result of its government, in the administration of which no proper attention is paid to the interests and welfare of the people. The monarchy is hereditary, and females are capable of succession. It has even been questioned, whether his catholic majesty may not bequeath his crown, upon his demise, to any branch of the royal family he pleases. It is at least certain, that the House of Bourbon mounted the throne of Spain in virtue of the last will of Charles II.

The cortes, or parliaments of the kingdom, which formerly, especially in Castile, had greater power and privileges than those of England, are now abolished; but some faint remains of their constitution are still discernible in the government, though all of them are ineffectual, and under the controul of the king.

The privy council, which is composed of a number of noblemen, or grandees, nominated by the king, sits only to prepare matters, and to digest papers for the cabinet council, or *junto*, which consists of the first secretary of state, and three or four more named by the king, and in them resides the direction of all the executive part of government. The council of war takes cognisance of military affairs only. The council of Castile is the highest law tribunal of the kingdom. The several courts of the royal audiences are those of Galicia, Seville, Majorca, the Canaries, Saragoſſa, Valencia, and Barcelona. These judge primarily in all causes within fifteen miles of their respective cities or capitals, and receive appeals from inferior jurisdictions. Besides these there are many subordinate tribunals, for the police, the finances, and other branches of business.

The government of Spanish America forms a system of itself, and is delegated to viceroys, and other magistrates, who are in their respective districts almost absolute. A council for the Indies is established in Old Spain, and consists of a governor, four secretaries, and twenty two counsellors, besides officers. Their decision is final in matters relating to America. The members are generally chosen from the viceroys and magistrates who have served in that country. The two great viceroyalties of Peru and Mexico are so considerable, that they are seldom trusted to one person for more than three years; and their emoluments are sufficient to make his fortune in that time.

The foreign possessions of the crown of Spain, besides those in America, are the towns of Ceuta, Oran, and Masulquiver, on the coast of Barbary, in Africa; and the islands of St. Lazaro, the Philippines, and Ladrones, in Asia.

**REVENUES.]** The revenues arising to the king from Old Spain, yearly, amount to 5,000,000. sterling, though some say eight; and they form the surest support of his government. His American income, it is true, is immense, but it is generally, in a manner, embezzled or anticipated before it arrives in Old Spain. The king has a fifth of all the silver mines that are worked, but little of it comes into his coffers. He falls upon means, however, in case of a war, or public emergency, to sequester into his own hands great part of the American treasures belonging to his subjects, who never complain because they are always punctually repaid with interest. The finances of his present catholic majesty are in excellent order, and on a better footing, both for himself and his people, than those of any of his predecessors.

As to the taxes whence the internal revenues arise, they are various, arbitrary, and so much suited to conveniency, that we cannot fix them at any certainty. They fall upon all kinds of goods, houses, lands, timber, and provisions; the clergy and military orders are likewise taxed.

**MILITARY AND MARINE STRENGTH.]** The land forces of the crown of Spain, in time of peace, are never fewer than 70,000; but in case of war, they amount, without prejudice to the kingdom, to 110,000. The great dependence of the king, however, is upon his Walloon or foreign guards. His present catholic majesty has been at great care and expence to raise a powerful marine; and his fleet in Europe and America at pre-

ROYAL ARMS, TITLES, NO- } Spain formerly comprehended twelve  
BILITY, AND ORDERS. } kingdoms; all of which, with several others, were, by name, entered into the royal titles, so that they amounted in all to about thirty-two. This absurd custom is still occasionally continued, but the king is now generally contented with the title of his Catholic Majesty. The kings of Spain are inaugurated by the delivery of a sword, without being crowned. Their signature never mentions their name, but, I THE KING. Their eldest son is called prince of Asturias, and their younger children of both sexes, are, by way of distinction, call *infants* or *infantas*, that is, children.

The armorial bearing of the kings of Spain, like their title, is loaded with the arms of all their kingdoms. It is now a shield, divided into four quarters, of which the uppermost on the right hand and the lowest on the left contain a castle, or, with three towers, for Castile; and in the uppermost on the left, and the lowest on the right, are three lions, gules, for Leon; with three lilies in the centre for Anjou.

The general name for those Spanish nobility and gentry who are unmixed with the Moorish blood, is Hidalgo. They are divided into princes, dukes, marquises, counts, viscounts, and other inferior titles. Such as are created grandees, may stand covered before the king, and are treated with princely distinctions. A grandee cannot be apprehended without the king's order; and cardinals, archbishops, ambassadors, knights of the Golden Fleece, and certain other great dignitaries, both in church and state, have the privilege, as well as the grandees, to appear covered before the king.

The "Order of the *Golden Fleece*," particularly described before in the orders of Germany, is generally conferred on princes and sovereign dukes; but the Spanish branch of it has many French and Italian nobility; there are no commanderies or revenues annexed to it.

The "Order of *St. James*," or *St. Jago de Compostella*, is the richest of all orders of Spain. It was divided into two branches, each under a grand-master; but the office of both was given, by pope Alexander VI. to the kings of Spain and Portugal, as grand-masters in their respective dominions. The order is highly esteemed in Spain, and only conferred on persons of noble families. The same may be said of the "Order of *Calatrava*," first instituted by Sanchio, king of Toledo: it took its name from the castle of Calatrava, which was taken from the Moors, and here began the order, which became very powerful. Their number, influence, and possessions, were so considerable as to excite the jealousy of the crown, to which, at length, their revenues, and the office of grand-master, were annexed, by pope Innocent VIII. The celebrated "Order of *Alcantara*" derived its origin from the order of St. Julian, or of the Pear-tree; but after Alcantara was taken from the Moors, and made the chief seat of the order, they assumed the name of knights of the order of Alcantara, and laid aside the old device of a pear-tree. This order is highly esteemed, and conferred only on persons of ancient and illustrious families. The "Order of the *Lady of Mercy*" is said to have been instituted by James I. king of Arragon, about the year 1218, on account of a vow made by him to the Virgin Mary, during his captivity in France, and was designed for the redemption of captives from the Moors, in which were expended large sums of money.

It was first confined to men, but a lady of Barcelona afterwards got women included in it. This order possesses considerable revenues in Spain. The "Order of *Montesa*" was instituted at Valencia, at the close of the thirteenth century, in the place of the Templars, and enjoyed their possessions. Their chief seat being the town of Montesa, the order from thence derived its name, and chose St. George for their patron. In the year 1771, the late king instituted after his own name, the "Order of *Charles III.*" in commemoration of the birth of the infant. The badge is a star of eight points, enamelled white, and edged with gold: in the centre of the cross is the image of the Virgin Mary, vestments white and blue. On the reverse the letters C. C. with the number III. in the centre, and this motto, *Virtuti et Merito*. None but persons of noble descent can belong to this order.

HISTORY OF SPAIN.] Spain was probably first peopled by the Celts, from Gaul, to which it lies contiguous; or from Africa, from which it is only separated by the narrow strait of Gibraltar. The Phœnicians sent colonies thither, and built Cadiz and Malaga. Afterwards, upon the rise of Rome and Carthage, the possession of this kingdom became an object of contention between those powerful republics; but at length the Roman arms prevailed, and Spain remained in their possession until the fall of that empire, when it became a prey to the Goths. In the beginning of the sixth century, the Suevi, the Vandals, and the Alani, divided this kingdom among them; but in the year 584, the Goths again became its masters.

These, in their turn, were invaded by the Saracens, who, about the end of the seventh century, had possessed themselves of the finest kingdoms of Asia and Africa; and, not content with the immense regions that formerly composed great part of the Assyrian, Greek, and Roman empires, crossed the Mediterranean, ravaged Spain, and established themselves in the southerly provinces of that kingdom.

Don Pelago is mentioned as the first Old Spanish prince who distinguished himself against these infidels (who were afterwards known by the name of Moors, the greater part of them having come from Mauritania); and he took the title of king of Asturia about the year 720. His successes animated other Christian princes to take arms likewise, and the two kingdoms of Spain and Portugal for many ages were perpetually embroiled in bloody wars.

The Moors in Spain were superior to all their contemporaries in arts and arms, and the Abdoulrahman line retained possession of the throne near three hundred years. Learning flourish'd in Spain, while the rest of Europe was buried in ignorance and barbarity. But the Moorish princes by degrees became weak and effeminate, and their chief ministers proud and insolent. A series of civil wars ensued, which at last overturned the throne of Cordova, and the race of Abdoulrahman. Several petty principalities were formed on the ruins of this empire, and many cities of Spain had each an independent sovereign. Every adventurer was then entitled to the conquests he made from the Moors, till Spain at last was divided into twelve or thirteen kingdoms; and about the year 1095, Henry of Burgundy was declared, by the king of Leon, count of Portugal; but his son, Alphonso, threw off his dependence on Leon, and declared himself king. A series of brave princes gave the Moors repeated overthrows in Spain, till about the year 1492, when all the kingdoms in Spain, Portugal excepted, were united by the marriage of Ferdinand, king of Arragon, and Isabella, the heirs and afterwards queen of Castile, who took Grenada, and expelled out of Spain

the Moors and Jews who would not be converts to the Christian faith, to the number of 170,000 families.

The expulsion of the Moors and Jews in a manner depopulated Spain of artists, labourers, and manufacturers; and the discovery of America not only added to that calamity; but rendered the remaining Spaniards most deplorably indolent. To complete their misfortunes, Ferdinand and Isabella introduced the popish inquisition, with all its horrors, into their dominions, as a safeguard against the return of the Moors and Jews.

Charles V. of the house of Austria, and emperor of Germany, succeeded to the throne of Spain, in right of his mother, who was the daughter of Ferdinand and Isabella, in the year 1516. The extensive possessions of the house of Austria in Europe, Africa, and, above all, America, from whence it drew immense treasures, began to alarm the jealousy of neighbouring princes, but could not satisfy the ambition of Charles; and we find him constantly engaged in foreign wars, or with his own protestant subjects, whom he in vain attempted to bring back to the catholic church. He also reduced the power of the nobles in Spain, abridged the privileges of the commons, and greatly extended the regal prerogative. At last, after a long and turbulent reign, he came to a resolution that filled all Europe with astonishment, withdrawing himself entirely from any concern in the affairs of this world, in order that he might spend the remainder of his days in retirement and solitude\*.

\* Charles, of all his vast possessions, reserved nothing for himself but an annual pension of 100,000 crowns; and chose, for the place of his retreat, a vale in Spain, of no great extent, watered by a small brook, and surrounded by rising grounds, covered with lofty trees. He gave strict orders that the style of the building which he erected there should be such as suited his present situation, rather than his former dignity. It consisted only of six rooms; four of them in the form of friars' cells, with naked walls; and the other two, each twenty feet square, were hung with brown cloth, and furnished in the most simple manner: they were all level with the ground, with a door on one side into a garden, of which Charles himself had given the plan, and had filled it with various plants, which he proposed to cultivate with his own hands. After spending some time in the city of Ghent, in Flanders, the place of his nativity, he set out for Zealand, in Holland, where he prepared to embark for Spain, accompanied by his son, and a numerous retinue of princes and nobility; and taking an affectionate and last farewell of Philip and his attendants, he set out, on the 17th of September, 1556, under a convoy of a large fleet of Spanish, Flemish, and English ships. As soon as he landed in Spain, he fell prostrate on the ground; and considering himself now as dead to the world, he kissed the earth and said, "Naked came I out of my mother's womb, and naked I now return to thee, thou common mother of mankind." Some of the Spanish nobility paid their court to him as he passed along to the place of his retreat; but they were so few in number, and their attendance was so negligent, that Charles observed it, and felt, for the first time, that he was no longer a monarch. But he was more deeply affected with his son's ingratitude; who forgetting already how much he owed to his father's bounty, obliged him to remain some weeks on the road, before he paid him the first moiety of that small portion, which was all that he had reserved of so many kingdoms. At last the money was paid; and Charles, having dismissed a great number of his domestics, whose attendance he thought would be superfluous, entered into his humble retreat with twelve domestics only. Here he buried in solitude and silence his grandeur, his ambition, together with all those vast projects which, during half a century, had alarmed and agitated Europe, filling every kingdom in it, by turns, with the terror of his arms, and the dread of being subjected to his power. Here he enjoyed, perhaps, more complete satisfaction than all his grandeur had ever yielded him. Far from taking any part in the political transactions of the princes of Europe, he restrained his curiosity even from any inquiry concerning them; and he seemed to view the busy scene which he had abandoned, with all the contempt and indifference arising from his thorough experience of its vanity, as well as from the pleasing reflection of having disengaged himself from its cares.

Agreeably to this determination he resigned Spain and the Netherlands, with great formality, in the presence of his principal nobility, to his son, Philip II. but could not prevail on the princes of Germany to elect him emperor, which dignity they conferred on Ferdinand, Charles's brother, thereby dividing the dangerous power of the house of Austria into two branches: Spain, with all its possessions in Africa and the New World, the Netherlands, and some Italian states, remained with the elder branch, whilst the empire, Hungary, and Bohemia, fell to the lot of the younger, which they still possess.

Philip II. inherited all his father's vices, with few of his good qualities. He was austere, haughty, immoderately ambitious, and, through his whole life, a cruel bigot in the cause of popery. His marriage with queen Mary, of England, an unfeeling bigot like himself, his unsuccessful addresses to her sister Elizabeth, his resentment and unsuccessful wars with that princess, his tyranny and persecutions in the Low Countries, the revolt and loss of the United Provinces, with other particulars of his reign, have been already mentioned in the history of those countries.

In Portugal he was more successful. That kingdom, after being governed by a race of wise and brave princes, fell to Sebastian, about the year 1557. Sebastian lost his life and a fine army, in a headstrong, unjust, and ill-concerted expedition against the Moors, in Africa; and in the year 1580, Philip united Portugal to his own dominions, though the Braganza family, of Portugal, asserted a prior right. By this acquisition, Spain became possessed of the Portuguese settlements in India, some of which she still holds.

The descendants of Philip proved to be very weak princes; but Philip and his father had so totally ruined the ancient liberties of Spain, that they reigned almost unmolested in their own dominions. Their vices, however, were at once so tyrannical and insolent over the Portuguese, that, in the reign of Philip IV. in the year 1640, the nobility of that nation, by a well-conducted conspiracy, expelled their tyrants, and placed the duke of Braganza, by the title of John IV. upon their throne; and ever since, Portugal has been a distinct kingdom from Spain.

The kings of Spain, of the Austrian line, failing in the person of Charles II. who left no issue, Philip, duke of Anjou, second son to the dauphin of France, and grandson to Lewis XIV. mounted that throne, in virtue of his predecessor's will, by the name of Philip V. anno 1701. After a long and bloody struggle with the German branch of the house of Austria, supported by England, he was confirmed in his dignity, at the conclusion of the war, by the shameful peace of Utrecht, in 1713. And

New amusements and new objects now occupied his mind; sometimes he cultivated the plants in his garden with his own hands; sometimes he rode out to the neighbouring wood on a little horse, the only one that he kept, attended by a single servant on foot. When his infirmities confined him to his apartment, he either admitted a few gentlemen who resided in the neighbourhood, and entertained them familiarly at his table; or he employed himself in studying the principles, and in forming curious works of mechanism, of which he had always been remarkably fond. He was particularly curious with regard to the construction of clocks and watches; and having found, after repeated trials, that he could not bring any two of them to go exactly alike, he reflected, it is said, with a mixture of surprise and regret, on his own folly, in having bestowed so much time and labour on the more vain attempt of bringing mankind to a precise uniformity of sentiment concerning the intricate and mysterious doctrines of religion. And here, after two years' retirement, he was seized with a fever which carried him off, in the 59th year of his age.

thus Lewis XIV. thro support. his grandson accomplished his fav with all its rich poss Austria, to that of h Naples, and got thadily acknowledging the imperialists.

After a long and of his wife, Elizabeth by his son Ferdinand many abuses, and e of his kingdom. In the loss of his wife III. then king of N wife, the prince's o

The irresist rison was foot ceived to issue morning fever

thus Lewis XIV. through a masterly train of politics (for, in his wars to support his grandson, as we have already observed, he was almost ruined) accomplished his favourite project of transferring the kingdom of Spain, with all its rich possessions in America and the Indies, from the house of Austria, to that of his own family of Bourbon. In 1734, Philip invaded Naples, and got that kingdom for his son Don Carlos, the Sicilians readily acknowledging him for their sovereign, through the oppression of the imperialists.

After a long and turbulent reign, which was disturbed by the ambition of his wife, Elizabeth of Parma, Philip died in 1746. and was succeeded by his son Ferdinand VI. a mild and peaceable prince, who reformed many abuses, and endeavoured to promote the commerce and prosperity of his kingdom. In 1759, he died without issue, through melancholy for the loss of his wife. Ferdinand was succeeded by his brother, Charles III. then king of Naples and the Two Sicilies, son to Philip V. by his wife, the princess of Parma.

He was so warmly attached to the family compact of the house of Bourbon, that, two years after his accession, he even hazarded his American dominions to support it. War being declared between him and England, the latter took from him the famous port and city of Havana, in the island of Cuba, and thereby rendered herself entirely mistress of the navigation of the Spanish plate-fleets. Notwithstanding the success of the English, their ministry thought proper, hastily, to conclude a peace, in consequence of which Havana was restored to Spain. In 1775, an expedition was concerted against Algiers by the Spanish ministry, which had a most unsuccessful termination. The troops, which amounted to upwards of 24,000, and who were commanded by lieutenant-general comde de O'Reilly, landed about a league and a half to the eastward of the city of Algiers; but were disgracefully beaten back, and obliged to take shelter on board their ships, having 27 officers killed, and 191 wounded; and 501 rank and file killed, and 2088 wounded. In the years 1783 and 1784, they also renewed their attacks against Algiers by sea, but after spending much ammunition, and losing many lives, were forced to retire without doing much injury.

When the war with Great Britain and her American colonies had subsisted for some time, and France had taken part with the latter, the court of Spain was also prevailed upon to commence hostilities against Great Britain. The Spaniards closely besieged Gibraltar, both by sea and land; it having been always a great mortification to them, that this fortress should be possessed by the English. The grand attack was on the 13th of September, 1782, under the command of the duke de Crillon, by ten battering ships, from 600 to 1400 tons burden, carrying in all 212 brass guns, entirely new, and discharging shot of 26 pounds weight. The showers of shot and shells which were directed from them, from their land-batteries, and on the other hand from the various works of the garrison, exhibited a scene, of which perhaps neither the pen nor the pencil can furnish a competent idea. It is sufficient to say, that *four hundred pieces* of the heaviest artillery were playing at the same moment: an instance which has scarcely occurred in any siege since the invention of those wonderful engines of destruction.

The irresistible impression of the numerous red-hot balls from the garrison was soon conspicuous; for in the afternoon, smoke was perceived to issue from the admiral's ship and another, and by one in the morning several were in flames, and numbers of rockets were thrown

up from each of their ships as signals of distress; and thus ended all the hopes of the Spaniards of reducing the fortress of Gibraltar. Some trifling operations continued on the side of the Spaniards till the restoration of peace in 1783.

In other enterprises, however, the Spaniards proved more successful. The island of Minorca was surrendered to them on the 6th of February, 1782, after having been besieged for 171 days. The garrison consisted of no more than 2692 men, while the forces of the enemy amounted to 16,000, under the command of the duke de Crillon. The Spanish commander at first attempted to corrupt the governor (general Murray); but this being rejected with indignation, the siege was commenced in form; and the garrison would have showed themselves equally invincible with those of Gibraltar, had it been possible to relieve them in the same manner. The scurvy soon made its appearance, and reduced them to such a deplorable situation, that they were at last obliged to surrender in spite of every effort of human fortitude or skill; and so sensible were both parties that this was the true cause, that the Spanish general allowed them to march out with their arms shouldered, drums beating, and colours flying, while the disconsolate British soldiers protested that they surrendered their arms to God, and not to the Spaniards.

His late catholic majesty did all he could to oblige his subjects to desist from their ancient dress and manners, and carried his endeavours so far, that it occasioned such a dangerous insurrection at Madrid, as obliged him to part with his minister, the marquis of Squillace; thereby affording an instance of the necessity that even despotic princes are under, of paying some attention to the inclinations of their subjects.

The government of Spain testified much uneasiness at the French revolution, and watched narrowly those who spoke in favour of its principles. The circulation of all public papers and political pamphlets from France was severely prohibited. The proclamation against tinkers and knife-grinders introducing seditious papers into the kingdom, and the rescript concerning strangers, show all the deformity, but, at the same time, the old age of despotism. If dotage be a sign of decay, these symptoms are very apparent in this government; and a temperate revolution in Spain would be a matter of far more exultation to the philosopher, than that of France: for its miseries are far greater. Liberty, science, and true religion, were confined in France; but in Spain they are trampled under the brutal feet of monks and bigots.

A short war arose between the Spaniards and the emperor of Morocco. The emperor besieged Ceuta, but peace is since restored. It was unjustly surmised that this war was entered into, in order to divert the attention of the people, who might be impressed with the affairs of France; but the reign of ignorance and bigotry is so firmly established in Spain, that many years may elapse before any idea of freedom is formed in that unhappy kingdom. In France the crisis was prepared by innumerable writings; but it is believed that not even a pamphlet exists in the Spanish language, which displays any just or liberal notions of government.

The sudden dismissal of count Florida Blanca from the office of prime minister originated in causes not disclosed. It is imagined that the court found this step necessary, to appease the public murmurs at some late measures, particularly the edict concerning strangers, which contributed to impose farther fetters upon commerce, and which has since been repealed. On the 28th of February, 1792, the minister was re-

moved, and count d'Aranda, an old statesman, a warm friend of the queen and nobility of France, succeeded to his employments, till some other arrangement could be formed. It is said, he abolished the superintendent tribunal of police, a kind of civil inquisition; and in other liberal measures appeared to see the real interest of monarchs, which is certainly to concede with grace, in order to prevent the despair of the people from recurring to force. His influence, however, was but short; and has been succeeded by that of the duke d'Alcudia.

The irregularities committed in France, the indecent reception of the humane interference of the court of Spain in favour of the king, and the industry of the confederate foreigners, induced the court of Spain to declare war against France, on the 23d of March 1793. The issue of this war, the treaty of peace concluded by Spain with the French republic on the 23d of July 1795, and the subsequent hostilities with England, have already been mentioned in our historical accounts of those countries.

Charles IV. king of Spain, born Nov. 11, 1748, ascended the throne Dec. 13, 1788 (upon the death of his father, Charles III.) and was married to Louisa-Maria-Theresa, princess of Parma, Sept. 4, 1765, by whom he has issue,

1. Charlotte, born April 25, 1775.
2. Mary-Louisa, born July 9, 1777.
3. Philip, born Aug. 10, 1783.
4. Ferdinand, born Oct. 14, 1784.
5. Maria-Isabella, born July 6, 1789.

Brothers to the king:

1. Ferdinand, the present king of the Two Sicilies, born in 1751, married, in 1768, to the arch-duchess Mary-Caroline-Louisa, sister to Joseph II. late emperor of Germany.

2. Anthony-Pascal, born Dec. 31, 1755.

Containing 32,000 square miles, with 72 inhabitants to each.

BOUNDARIES.] IT is bounded by Spain on the North and East, and on the South and West by the Atlantic Ocean, being the most westerly kingdom on the continent of Europe.

ANCIENT NAMES AND DIVISIONS. } This kingdom was, in the time of the Romans, called Lusitania. The etymology of the modern name is uncertain. It most probably is derived from some noted harbour or port, to which the Gauls (for so strangers are called in the Celtic) resorted. By the form of the country, it is naturally divided into three parts; the northern, middle, and southern provinces. The provinces are six in number.

	Provinces.	Chief Towns.	Sq. M.

**SOIL, AIR, AND PRODUCTIONS.]** The soil of Portugal is not in general equal to that of Spain for fertility, especially in corn, which they import from other countries. Their fruits are the same as in Spain, but not so highly flavoured. The Portuguese wines, when old and genuine, are esteemed to be very friendly to the human constitution, and safe to drink\*.

Portugal contains mines, but they are not worked; variety of gem., marbles, and mill-stones, and a fine mine of salt-petre near Lisbon. The cattle and poultry are but indifferent eating. The air, especially about Lisbon, is reckoned soft and beneficial to consumptive patients; it is not so scorching as that of Spain, being refreshed from the sea-breezes.

**MOUNTAINS.]** The face of Portugal is mountainous, or rather rocky, for the mountains are generally barren: the chief are those which divide Algarve from Alentejo; those of Tras os Montes; Arrabida and Montejunto in Estremadura; Estrella in Beira; Ossa in Alentejo; and Cintra, about five leagues south-west of Lisbon, well-known to navigators as being the most westerly part of all Europe. The cape contiguous to it, at the mouth of the Tajo, is called the rock of Cintra, or the rock of Lisbon.

**WATER AND RIVERS.]** Though every brook in Portugal is reckoned a river, yet the chief Portuguese rivers are mentioned in Spain, all of them falling into the Atlantic Ocean. The Tagus or Tajo was celebrated for its golden sand. The Minho and Douro are the boundaries of the province Entre Douro e Minho. Portugal contains several roaring lakes and springs; some of them are absorbent even of the lightest substances, such as wood, cork, and feathers; some, particularly one about 45 miles from Lisbon, are medicinal and sanative; and some hot baths are found in the little kingdom, or rather province, of Algarve.

**PROMONTORIES AND BAYS.]** The promontories or capes of Portugal are Cape Mondego, near the mouth of the river Mondego; Cape Roxo, at the north entrance of the river Tajo; Cape Epithel, at the south entrance of the river Tajo; and cape St. Vincent, on the south-west point of Algarve. The bays are those of Cadoan, or St. Ubes, south of Lisbon, and Lagos Bay in Algarve.

**ANIMALS.]** The sea-fish, on the coast of Portugal, are reckoned excellent; on the land, the hogs and kids are tolerable eating. Their mules

\* The Port-wines are made in the districts round Oporto, which does not produce one-half the quantity that is consumed, under that name, in the British dominions only. The merchants in this city have very spacious wine-vaults, capable of holding 6 or 7000 pipes, and it is said that 20,000 are yearly exported from Oporto.

are sure, and serve for horses, though slight POPULATION, IN 1732, there were two millions, or two of Portuguese in a mated at about nine persons (which is above 300,000 ecc

The modern Portuguese are to the is evidently owing them inactive, for that inactivity has Treachery has been above all, an intense more superstitious state, than the Spanish is commonly practised their dealings, especially what alteration men expulsion of the Jews them; but above commercial affairs of their gratitude much encouraged

are sure, and serviceable both for draught and carriage; and their horses, though slight, are lively.

POPULATION, INHABITANTS, MAN- } According to the best calcula-  
NERS, AND CUSTOMS. } tion, Portugal contains about  
two millions, or two millions and a half of inhabitants. The number  
of Portuguese in all the colonies appertaining to the crown are esti-  
mated at about nine hundred thousand. By a survey made in the year  
1732, there were in that kingdom 3,344 parishes, and 1,742,230 lay  
persons (which is but 522 laity to each parish on a medjum) besides  
above 300,000 ecclesiastics of both sexes.

The modern Portuguese retain nothing of that adventurous enterpris-  
ing spirit that rendered their forefathers so illustrious 300 years ago.  
They have, ever since the house of Braganza mounted the throne, de-  
generated in all their virtues; though some noble exceptions are still  
remaining among them, and no people are so little obliged as the Por-  
tuguese are to the reports of historians and travellers. Their degeneracy  
is evidently owing to the weakness of their monarchy, which renders  
them inactive, for fear of disobliging their powerful neighbours; and  
that inactivity has proved the source of pride, and other unmanly vices.  
Treachery has been laid to their charge, as well as ingratitude, and  
above all, an intemperate passion for revenge. They are, if possible,  
more superstitious, and, both in high and common life, affect more  
state, than the Spaniards themselves. Among the lower people, thieving  
is commonly practised; and all ranks are accused of being unfair in  
their dealings, especially with strangers. It is hard, however, to say  
what alteration may be made in the character of the Portuguese, by the  
expulsion of the Jesuits, and diminution of the papal influence among  
them; but above all, by that spirit of independency, with regard to  
commercial affairs, upon Great Britain, which, not much to the honour  
of their gratitude, though to the interest of their own country, is now so  
much encouraged by their court and ministry.

The Portuguese are neither so tall nor so well made as the Spaniards,  
whose habits and customs they imitate; only the quality affect to be  
more gaily and richly dressed. The Portuguese ladies are thin, and small  
of stature: Their complexion is olive, their eyes black and expressive,  
and their features generally regular. They are esteemed to be generous,  
modest, and witty. They dress like the Spanish ladies, with much auk-  
wardness, and affected gravity, but in general more magnificently; and  
they are taught by their husbands to exact from their servants a ho-  
mage, that in other countries is paid only to royal personages. The fur-  
niture of the houses, especially of the grandees, is rich and superb to  
excess; and they maintain an incredible number of domestics, as they  
never discharge any who survive after serving their ancestors. The  
poorer sort have scarcely any furniture at all, for they, in imitation of  
the Moors, sit always cross-legged on the ground. The Portuguese pea-  
sant has never reaped any advantage from the benefits of foreign trade,  
and of the fine and vast countries the kings of Portugal possessed in  
Africa or in the East; or of those still remaining to them in South Ame-  
rica. The only foreign luxury he is yet acquainted with is tobacco;  
and when his feeble purse can reach it, he purchases a dried Newfound-  
land cod-fish; but this is a regale he dares seldom aspire to. A piece of  
bread made of Indian corn, and a salted pilchard, or a head of garlic,  
to give that bread a flavour, compose his standing dish; and if he can  
get a bit of the hog, the ox, or the calf, he himself fattens, to regale  
his wretched family at Christmas or Easter, he has reached the pinnacle

of happiness in this world; and indeed whatever he possessed beyond this habitual penury, according to the present state and exertions of his intellects, would quickly be taken from him, or rather he would willingly part with it, being taught by his numberless ghostly comforters, with which his country swarms, to look forward for ease and happiness to another state of existence, to which they are themselves the infallible guides and conductors.

To these remarks, we shall subjoin those of Mr. Murphy, a late traveller in Portugal:—"The common people of Lisbon and its environs are a laborious and hardy race. It is painful to see the trouble they are obliged to take for want of proper implements to carry on their work. Their cars have the rude appearance of the earliest ages; these vehicles are slowly drawn by two stout oxen. The corn is shelled by the treading of the same animals. They have many other customs which to us appear very singular; for example, women sit with the left side towards the horse's head when they ride. A postillion rides on the left horse. A tailor sits at his work like a shoemaker. A hair-dresser appears on Sundays with a sword, a cockade, and two watches, at least two watch-chains. A tavern is known by a vine bush, a house to be let by a piece of blank paper, the door of an accoucheur by a white cross, and a Jew by his extra-catholic devotion.—A Portuguese peasant will not walk with a superior, an aged person, or a stranger, without giving him the right hand side, as a mark of respect. He never passes by a human being without taking off his hat, and saluting him in these words, *the Lord preserve you for many years*. In speaking of an absent friend he always says—'I die with impatience to see him.'—They all imagine their country is the blessed Elysium, and that Lisbon is the greatest city in the world."

**RELIGION.]** The established religion of Portugal is popery, in the strictest sense. The Portuguese have a patriarch; but formerly he depended entirely upon the pope, unless when a quarrel subsisted between the courts of Rome and Lisbon. The power of his holiness in Portugal has been of late so much curtailed, that it is difficult to describe the religious state of that country: all we know is, that the royal revenues are greatly increased, at the expense of the religious institutions in the kingdom. The power of the inquisition is now taken out of the hands of the ecclesiastics, and converted to a state-trap for the benefit of the crown.

**ARCHBISHOPRICS AND BISHOPRICS.]** The archbishoprics are those of Braga, Evora, and Lisbon. The first of these has ten suffragan bishops; the second, two; and the last, ten, including those of the Portuguese settlements abroad. The patriarch of Lisbon is generally a cardinal, and a person of the highest birth.

**LANGUAGE.]** The Portuguese language differs but little from that of Spain, and that provincially. Their Paternoster runs thus: *Padre nosso que estas nos ceos, sanctificado seio o tu nome; venha a nos tuo reyno. seia feita a tua vontade, assi nos ceos, como na terra. O pao nosso de codidia, dano lo oei nestro dia. E perdoa nos as nossas devidas, assi como nos perdoamos a os nossos devedores. E nao nos dexes cahir om tentacao, mas libra nos do mal. Amen.*

**LEARNING AND LEARNED MEN.]** These are so few, that they are mentioned with indignation, even by those of the Portuguese themselves who have the smallest tincture of literature. Some efforts, though very weak, have of late been made by a few, to draw their countrymen from this deplorable state of ignorance. It is universally allowed, that the

defect is not owing to the ancestors of the true knowledge, with than perhaps any other century, and for some adventurer and voyager genius.

**UNIVERSITIES.]** There is; and which had some new regulations; the nobles at Lisbon branch of polite learning to the banished library. The English is also a military and cated in the science of

The fatal effects e parts of the city, an remembrance of tha there were not less t ever, availed thems after the destructive

defect is not owing to the want of genius, but of a proper education. The ancestors of the present Portuguese were certainly possessed of more true knowledge, with regard to astronomy, geography, and navigation, than perhaps any other European nation, about the middle of the 16th century, and for some time after. Camoens, who himself was a great adventurer and voyager, was possessed of a true, but neglected, poetical genius.

**UNIVERSITIES.]** These are Coimbra, founded in 1291, by king Denis; and which had fifty professors: but it has lately been put under some new regulations; Evora, founded in 1559; and the college of the nobles at Lisbon, where the young nobility are educated in every branch of polite learning and the sciences. All the books that did belong to the banished Jesuits are kept here, which compose a very large library. The English language is likewise taught in this college. Here is also a military and marine academy, where young gentlemen are educated in the science of engineering and naval tactics.

**CURIOSITIES.]** The lakes and fountains which have been already mentioned, form the chief of these. The remains of some castles in the Moorish taste are still standing. The Roman bridge and aqueduct at Coimbra are almost entire, and deservedly admired. The walls of Santarem are said to be of Roman work likewise. The church and monastery near Lisbon, where the kings of Portugal are buried, are inexpressibly magnificent, and several monasteries in Portugal are dug out of the hard rock. The chapel of St. Roch is probably one of the finest and richest in the world; the paintings are mosaic work, so curiously wrought with stones of all colours, as to astonish the beholders. To these curiosities we may add, that the king is possessed of the largest, though not the most valuable, diamond in the world. It was found in Brazil.

**CHIEF CITIES.]** Lisbon is the capital of Portugal. Of the population of this city (says Mr. Murphy) no exact account has been recently published, and the rapid increase of its inhabitants of late years must render any calculation of that kind very uncertain. In the year 1774, the forty parishes into which Lisbon is divided were found to contain 33,764 houses; and in the year 1790, they amounted to 38,102. Hence it appears to have increased 4,338 houses, in the course of these ten years. Now if we estimate each house on an average at six persons, which, perhaps is within the truth, the population in the year 1790 was 228,612. To these are to be added the religious of both sexes, with their attendants, who dwell in convents and monasteries, the soldiery, the professors and students of seminaries of education, and such of the Galician labourers as have no fixed dwelling; their aggregate amount, if my information be correct, is not very short of 12,000. According to this statement, therefore, the population of Lisbon exceeds 240,000. From the magnitude of the city, indeed, we should be induced to suppose that its population was considerably more than above stated; for it is computed to be four miles long, by one and a half broad; but many of the houses have large gardens; and such as have not, are, in general, laid out upon a large scale, on account of the heat of the climate.

The fatal effects of the earthquake in 1755, are still visible in many parts of the city, and never fail to impress every spectator with an awful remembrance of that disaster; according to the most accurate accounts, there were not less than 24,000 victims to it. The Portuguese have, however, availed themselves of this misfortune, and, like the English, after the destructive fire of 1666, have turned the temporal evil into a

permanent good. All the new streets erected in Lisbon, in the place of the old, are capacious, regular, and well paved, with convenient foot-paths for passengers, as in the streets of London. In point of cleanliness, Lisbon is no longer so much a subject of animadversion to strangers as formerly; but all is not yet done, as it still wants common sewers, pipe-water and privies. Lisbon is deservedly accounted the greatest port in Europe, next to London and Amsterdam. The harbour is spacious and secure, and the city itself is guarded from any sudden attack towards the sea by forts, though they would make but a poor defence against ships of war. The second city in this kingdom is Oporto, which is computed to contain 30,000 inhabitants. The chief article of commerce in this city is wine; and the inhabitants of half the shops in the city are coopers. The merchants assemble daily in the chief street, to transact business; and are protected from the sun by sail-cloths hung across from the opposite houses. About thirty English families reside here, who are chiefly concerned in the wine trade.

**COMMERCE AND MANUFACTURES.]** These, within these few years, have taken a surprising turn in Portugal. The ministry have projected many new companies and regulations, which have been again and again complained of as unjust and oppressive, and inconsistent with the privileges which the British merchants formerly enjoyed by the most solemn treaties.

The Portuguese exchange their wine, salt, and fruit, and most of their own materials, for foreign manufactures. They make a little linen, and some coarse silk and woollen, with a variety of straw-work, and are excellent in preserving and candying fruit. The commerce of Portugal, though seemingly extensive, proves of little solid benefit to her, as the European nations trading with her, engross all the productions of her colonies, as well as her own native commodities, as her gold, diamonds, pearls, sugars, cocoa-nuts, fine red wood, tobacco, hides, and the drugs of Brasil, her ivory, ebony, spices, and drugs of Africa and East India, in exchange for the almost numberless manufactures, and the vast quantity of corn and salt-fish, supplied by those European nations, and by the English North American colonies.

The Portuguese foreign settlements are, however, not only of immense value, but vastly improvable. These are Brasil, the Isles of Cape Verd, Madeira, and the Azores. They bring gold from their plantations on the east and west coast of Africa, and likewise slaves for manufacturing their sugars and tobacco in Brasil, and their South American settlements.

What the value of these latter may be, is unknown perhaps to themselves; but they certainly abound in all the precious stones, and rich mines of gold and silver, and other commodities that are produced in the Spanish dominions there. It is computed that the king's fifth of gold sent from Brasil amounts annually to 300,000*l.* sterling, notwithstanding the vast contraband trade. The little shipping the Portuguese have, is chiefly employed in carrying on the slave-trade, and a correspondence with Goa, their chief settlement in the East Indies, and their other possessions there, as Diu, Daman, Macao, &c.

**CONSTITUTION AND GOVERNMENT.]** The crown of Portugal is absolute; but the nation still preserves an appearance of its ancient free constitution, in the meeting of the cortes, or states, consisting, like our parliaments, of clergy, nobility, and commons. They pretend to a right of being consulted upon the imposition of new taxes; but the only real power they have, is, that their assent is necessary in every new regu-

lation with regard to

lation with regard to the succession. In this they are indulged, to prevent all future disputes on that account.

This government may be fairly pronounced the most despotic in Europe. The established law is generally a dead letter, excepting where its decrees are carried into execution by the supplementary mandates of the sovereign, which are generally employed in defeating the purposes of safety and protection; which law is calculated to extend equally over all the subjects.

The people here have no more share in the direction of government, in enacting of laws, and in the regulating of agriculture and commerce, than they have in the government of Russia, or China. The far greater part know nothing of what is done in that respect. Every man has no other alternative but to yield a blind and ready obedience, in whatever concerns himself, to the decrees and laws of the despot, as promulgated from time to time by his secretaries of state. How would an Englishman, alive to all the feelings of civil liberty, tremble at reading the preamble of every new law published here! and which runs thus: "*I, the king, in virtue of my own certain knowledge, of my royal will and pleasure, and of my full, supreme, and arbitrary power, which I hold only of God, and for which I am accountable to no man on earth, I do, in consequence, order and command, &c. &c.*"

All great preferments, both spiritual and temporal, are disposed of in the council of state, which is composed of an equal number of the clergy and nobility, with the secretary of state. A council of war regulates all military affairs, as the treasury courts do the finances. The council of the palace is the highest tribunal that can receive appeals, but the Casa da Supplicação is a tribunal from which no appeal can be brought. The laws of Portugal are contained in three duodecimo volumes, and have the civil law for their foundation.

**REVENUES AND TAXES.]** The revenues of the crown amount to above 3,000,000 and a half sterling, annually. The customs and duties on goods exported and imported are excessive, and farmed out; but if the Portuguese ministry should succeed in all their projects, and in establishing exclusive companies, to the prejudice of the British trade, the inhabitants will be able to bear these taxes without murmuring. Foreign merchandise pays twenty-three per cent. on importation, and fish from Newfoundland twenty-five per cent. Fish taken in the neighbouring seas and rivers pays twenty-seven per cent. and the tax upon lands, and cattle that are sold, is ten per cent. The king derives a considerable revenue from the several orders of knighthood, of which he is grand-master. The pope, in consideration of the large sums he draws out of Portugal, gives the king the money arising from indulgences, and licences to eat flesh at times prohibited, &c. The king's revenue is now greatly increased by the suppression of the Jesuits, and other religious orders and institutions.

**MILITARY AND MARINE STRENGTH.]** The Portuguese government used to depend chiefly for protection on England; and therefore, for many years, they greatly neglected their army and fleet; but the same friendly connection between Great Britain and Portugal does not at present subsist. In the late reign, though they received the most effectual assistance from England, when invaded by the French and Spaniards, his Most Faithful Majesty judged it expedient to raise a considerable body of troops, who were chiefly disciplined by foreign officers; but since that period, the army has been again neglected, no proper encouragement being given to foreign officers, and little attention paid to

the discipline of the troops, so that the military force of Portugal is now again inconsiderable, amounting, it is said, to 25,000 men. The naval force of this kingdom is computed at thirteen sail of the line and fifteen frigates.

**ROYAL TITLES AND ARMS.]** The king's titles are, King of Portugal and the Algarves, on this and on the other side of the sea in Africa, Lord of Guinea, and of the conquest, navigation, and commerce of Ethiopia, Arabia, Persia, and Brasil. John V. was complimented, by the pope, with the title of his Most Faithful Majesty. The title of the heir apparent is Prince of Brazil; and that of his eldest son Prince of Beira. The rest of the princes of the blood royal are called Infante.

The arms of Portugal are, argent, five escutcheons, azure, placed cross-wise, each charged with as many besants as the first, placed saltier-wise, and pointed, sable, for Portugal. The shield bordered, gules, charged with seven towers, or, three in chief, and two in each flanch. —The supporters are two winged dragons, and the crest a dragon, or, under the two flanches, and the base of the shield appears at the end of it; two crosses, the first fleur-de-lis, vert, which is for the order of Aviez, and the second patee, gules, for the order of Christ; the motto is changeable, each king assuming a new one; but it is frequently these words, *pro Rege et Grege*, "For the King and the People."

**NOBILITY AND ORDERS.]** The titles and distinctions of their nobility are much the same as those of Spain. Their orders of knighthood are three; 1. That of *Avis* or *Aviez*, first instituted by Alphonfus Henriquez, king of Portugal, in the year 1147, as a military and religious order, on account of his taking Evora from the Moors. In 1213, it was subject to the order of Calatrava, in Spain; but when Don John of Portugal seized the crown, he made it again independent. 2. The "Order of St. James," instituted by Dennis I. king of Portugal, in the year 1310, supposing that under that saint's protection he became victorious over the Moors; and he endowed it with great privileges. The knights profess chastity, hospitality, and obedience, and none are admitted till they prove the gentility of their blood: Their ensign is a red sword, the habit white, and their principal convent is at Dalmela. 3. The "Order of Christ" was instituted in the year 1317, by Dennis I. of Portugal, to engage the nobility to assist him more powerfully against the Moors. The knights obtained great possessions, and elected their grand-master, till 1522, when pope Adrian VI. conferred that office on John III. and his successors to the crown of Portugal. These orders have small commanderies and revenues annexed to them, but are in small esteem. The "Order of Malta" has likewise twenty-two commanderies in Portugal.

**HISTORY OF PORTUGAL.]** This kingdom comprehends the greatest part of the ancient Lusitania, and shared the same fate with the other Spanish provinces, in the contests between the Carthaginians and Romans, and in the decline and fall of the Roman empire, and was successively in subjection to the Suevi, Alans, Visigoths, and Moors. In the eleventh century, Alphonfus VI. king of Castile and Leon, rewarded Henry, grandson of Robert, king of France, for his bravery and assistance against the Moors, with his daughter, and that part of Portugal then in the hands of the Christians. Henry was succeeded by his son Alphonfus Henry, in the year 1095, who gained a decisive victory over five Moorish kings, in July, 1139. This victory proved the origin of the monarchy of Portugal, for Alphonfus was then proclaimed king by his soldiers. He reigned forty-six years, and was esteemed for his courage

and love of learning throne for some centuries, and minions for coward

Dennis I. or Dionysius, rebuilt forty-four years of Christy-six years.—Under his reign earthquakes at Lisbon many lives. John I. conquered in Africa and the Canaries; he died in the year 1419. Portuguese discoverer, John II. the kingdom of Mononguea, and the East Indies in 1495, and fleets for new discoveries on the coast of Africa in the year 1500, Alvarez

John III. succeeded in settlements, made by Xavier as a missionary, blished that infernal against the entreaties grandson, succeeded in Moors in Africa. In Morocco, on the banks slain or drowned. Sebastian, being the king, in the year 1580: king, by the states been observed in our belonged to him, be nuel, and sent the country, and pro September, 1580.

The viceroys under Philip IV. behaved with lence. The Spanish their repeated acts of courage of the Portugal, December, 1640. legitimate heir to the throne by the title of John II. tlements also acknowledged for many years the Spaniards to be included in February, and independent.

The Portuguese revolt from Spain, had England and Holland, England, that prince with the crown of

and love of learning.—His descendents maintained themselves on the throne for some centuries; indeed Sancho II. was expelled from his dominions for cowardice, in the year 1240.

Dennis I. or Dionysius, was called the *Father of his country*: he built and rebuilt forty-four cities and towns in Portugal, founded the military order of Christ, and was a very fortunate prince. He reigned forty-six years.—Under his successor, Alphonfus IV. happened several earthquakes at Lisbon, which threw down part of the city, and destroyed many lives. John I. was illustrious for his courage, prudence, and conquests in Africa; under him Madeira was first discovered, in 1420, and the Canaries; he took Ceuta, and, after a reign of forty-nine years, died in the year 1433. In the reign of Alphonso V. about 1480, the Portuguese discovered the coast of Guinea; and in the reign of his successor, John II. they discovered the Cape of Good Hope, and the kingdom of Moni-Congo, settled colonies, and built forts in Africa, Guinea, and the East Indies. Emanuel, surnamed the Great, succeeded him in 1495, and adopted the plan of his predecessors, fitting out fleets for new discoveries. Vasco de Gama, under him, cruised along the coast of Africa and Ethiopia, and landed in Hindoostan: and in the year 1500, Alvarez discovered Brasil.

John III. succeeded in 1521, and while he lost some of his African settlements, made new acquisitions in the Indies. He sent the famous Xavier as a missionary to Japan, and, in the height of his zeal, established that infernal tribunal, the inquisition, in Portugal, anno 1526, against the entreaties and remonstrances of his people. Sebastian, his grandson, succeeded him in 1557, and undertook a crusade against the Moors in Africa. In 1578, in a battle with the king of Fez and Morocco, on the banks of the river Lucco, he was defeated, and either slain or drowned. Henry, a cardinal, and uncle to the unfortunate Sebastian, being the son of Emanuel, succeeded, but died without issue, in the year 1580: on which, Antony, prior of Crato, was chosen king, by the states of the kingdom; but Philip II. of Spain, as has been observed in our history of that country, pretended that the crown belonged to him, because his mother was the eldest daughter of Emanuel, and sent the duke of Alva with a powerful force, who subdued the country, and proclaimed his master king of Portugal the 12th of September, 1580.

The viceroys under Philip and his two successors, Philip III. and Philip IV. behaved towards the Portuguese with great rapacity and violence. The Spanish ministers treated them as vassals of Spain, and, by their repeated acts of oppression and tyranny, so excited the hatred and courage of the Portuguese, as to produce a revolt at Lisbon, the first of December, 1640. The people obliged John, duke of Braganza, the legitimate heir to the crown, to accept it, and he succeeded to the throne by the title of John IV. almost without bloodshed; and the foreign settlements also acknowledged him as their sovereign. A fierce war subsisted for many years between the two kingdoms, and all the efforts of the Spaniards to re-unite them proved vain, so that a treaty was concluded in February, 1668, by which Portugal was declared to be free and independent.

The Portuguese could not have supported themselves under their revolt from Spain, had not the latter power been engaged in wars with England and Holland; and, upon the restoration of Charles II. of England, that prince having married a princess of Portugal, prevailed with the crown of Spain to give up all pretensions to that kingdom.

Alphonso, son to John IV. was then king of Portugal. He had the misfortune to disagree at once with his wife and his brother Peter; and they, uniting their interests, not only forced Alphonso to resign his crown, but obtained a dispensation from the pope for their marriage, which was actually consummated. They had a daughter; but Peter, by a second marriage, had sons, the eldest of whom was John, his successor, and father to the late king of Portugal. John, like his father, joined the grand confederacy formed by king William; but neither of them were of much service in humbling the power of France. On the contrary, he almost ruined the allies, by occasioning the loss of the battle of Almanza, in 1707.—John died in 1750, and was succeeded by his son Joseph, whose reign was neither happy to himself, nor fortunate for his people. The fatal earthquake, in 1755, overwhelmed his capital, and shook his kingdom to the centre. His succeeding administration was not distinguished by the affection that it acquired at home, or the reputation which it sustained abroad. It was deeply stained with domestic blood, and rendered odious by excessive and horrible cruelty. In September, 1758, the king was attacked by assassins, and narrowly escaped with his life, in a solitary place near his country palace of Belem. The families of Aveira and Tavora were destroyed by torture, in consequence of an accusation being exhibited against them: of having conspired against the king's life. But they were condemned without proper evidence, and their innocence has been since authentically declared. From this supposed conspiracy is dated the expulsion of the Jesuits (who were conjectured to have been at the bottom of the plot) from all parts of the Portuguese dominions. The marquis de Pombal, who was at this time the prime minister of Portugal, governed the kingdom for many years with a most unbounded authority, and which appears to have been sometimes directed to the most cruel and arbitrary purposes.

In 1762, when a war broke out between Spain and England, the Spaniards, and their allies, the French, attempted to force his Faithful Majesty into their alliance, and offered to garrison his sea-towns against the English, with their troops. The king of Portugal rejected this proposal, and declared war against the Spaniards, who, without resistance, entered Portugal with a considerable army, while a body of French threatened it from another quarter. Some have doubted whether any of these courts were in earnest upon this occasion, and whether the whole of the pretended war was not concerted to force England into a peace with France and Spain, in consideration of the apparent danger of Portugal. It is certain, that both the French and Spaniards carried on the war in a very dilatory manner, and that, had they been in earnest, they might have been masters of Lisbon, long before the arrival of the English troops to the assistance of the Portuguese. However, a few English battalions put an effectual stop, by their courage and conduct to the progress of the invasion. Portugal was saved, and a peace was concluded at Fontainebleau, in 1763. Notwithstanding this eminent service performed by the English to the Portuguese, who often had been saved before in the like manner, the latter, ever since that period, cannot be said to have beheld their deliverers with a friendly eye. The most captious distinctions and frivolous pretences have been invented by the Portuguese ministers, for cramping the English trade, and depriving them of their privileges.

His Portuguese majesty having no son, his eldest daughter was married, by dispensation from the pope, to don Pedro, her own uncle, to

prevent the crown died on the 24th of ter, the present queen the removal from excited general joy pected from the arb though it has been a lle measures which tugal.

to her nephew, the

prevent the crown from falling into a foreign family. The late king died on the 24th of February, 1777, and was succeeded by his daughter, the present queen. One of the first acts of her majesty's reign was the removal from power of the marquis de Pombal; an event which excited general joy throughout the kingdom, as might naturally be expected from the arbitrary and oppressive nature of his administration; though it has been alleged in his favour, that he adopted sundry public measures which were calculated to promote the real interests of Portugal.

On the 10th of March, 1792, the prince of Brasil, as presumptive heir to the crown, published an edict, declaring, that as his mother, from her unhappy situation, was incapable of managing the affairs of government, he would place his signature to public papers, till the return of her health; and that no other change should be made in the forms.

Portugal, as the ally of England, has taken a feeble part in the war against France; but her exertions were confined to furnishing Spain with a few auxiliary troops, and sending a small squadron to join the English fleet. In August 1797, however, a negotiation for a treaty of peace between France and Portugal was entered into, and the treaty actually concluded; but the French directory refused to ratify it, alleging that the queen of Portugal, so far from showing a disposition to abide by its articles, had put her forts and principal ports into the possession of the English. Since the failure of this attempt at negotiation, Portugal has continued a member of the alliance against France; though her aid has been very unimportant, consisting only of a small squadron, which has cruised in the Mediterranean, and assisted in the blockade of Malta.

The queen is disordered by religious melancholy; Dr. Willis, at the request of the prince, some time since, made a voyage to Lisbon to attempt her cure; but her recovery remaining hopeless, the government of the country rests with the prince of Brasil.

Maria-Frances-Isabella, queen of Portugal, born December 17, 1734; married, June 6, 1760, to her uncle, don Pedro Clement, F. R. S. born July 5, 1717, who died May 25, 1786; began to reign February 24, 1777.

Their issue.

John-Maria-Joseph-Louis, born May 13, 1767; married, March 20, 1785, Maria-Louisa, of Spain, born July 9, 1777.

The issue by the late king:

1. Her present majesty.
2. Anna-Frances-Antoinetta, born October 8, 1736.
3. Maria-Francisca-Benedicta, born July 24, 1746; married, in 1776, to her nephew, the prince of Brasil, who died September 11, 1789.

## ITALY.

## SITUATION AND EXTENT.

Miles.                      Degrees.  
 Length 600 } between { 38 and 47 North latitude.  
 Breadth 400 }            { 7 and 19 East longitude.  
 Containing 116,967 square miles, with 170 inhabitants in each.

THE form of Italy renders it very difficult to ascertain its extent and dimensions; for, according to some accounts, it is, from the frontiers of Switzerland, to the extremity of the kingdom of Naples, about 750 miles in length; and from the frontiers of the duchy of Savoy, to those of the dominions of the states of Venice, which is its greatest breadth, about 400 miles, though in some parts it is scarcely 100.

BOUNDARIES.] Nature has fixed the boundaries of Italy; for towards the East it is bounded by the Gulf of Venice, or Adriatic Sea; on the South and West by the Mediterranean Sea; and on the North, by the lofty mountains of the Alps, which divide it from France and Switzerland.

The whole of the Italian dominions, comprehending Corfica, Sardinia, the Venetian and other islands, are divided and exhibited in the following table:

**SOIL AND AIR.]** The happy soil of Italy produces the comforts and luxuries of life in great abundance; each district has its peculiar excellency and commodity; wines, the most delicious fruits, and oil, are the most general productions. As much corn grows here as serves the inhabitants; and, were the ground properly cultivated, the Italians might export it to their neighbours. The Italian cheeses, particularly those called Parmesans, and their native silk, form a principal part of their commerce. There is here a great variety of air: and some parts of Italy bear melancholy proofs of the alterations that accidental causes make on the face of nature; for the Campagna di Roma, where the ancient Romans enjoyed the most salubrious air of any place perhaps on the globe, is now almost pestilential, through the decrease of inhabitants, which has occasioned a stagnation of waters, and putrid exhalations. The air of the northern parts, which lie among the Alps, or in their neighbourhood, is keen and piercing, the ground being in many places covered with snow in winter. The Apennines, which are a ridge of mountains that longitudinally almost divide Italy, have great effects on its climate: the countries on the south being warm, those on the north mild and temperate. The sea breezes refresh the kingdom of Naples so much, that no remarkable inconveniency of air is found there, notwithstanding its southern situation. In general, the air of Italy may be said to be dry and pure.

**MOUNTAINS.]** We have already mentioned the Alps and Apennines, which form the chief mountains of Italy. The famous volcano of Mount Vesuvius lies in the neighbourhood of Naples.

**RIVERS AND LAKES.]** The rivers of Italy are the Po, the Var, the Adige, the Trebia, the Arno, and the Tiber, which runs through the city of Rome. The famous Rubicon forms the southern boundary between Italy and the ancient Cisalpine Gaul.

The lakes of Italy are the Maggiore, Lugano, Como, Isco, and Garda, in the north; the Perugia, or Thrasimene, Bracciana, Terni, and Celano, in the middle.

**SEAS, GULFS, OR BAYS, CAPES, } Without a knowledge of these,  
PROMONTORIES, AND STRAITS. }** neither the ancient Roman authors, nor the history or geography of Italy, can be understood. The seas of Italy are the gulf of Venice, or the Adriatic sea; the seas of Naples, Tuscany, and Genoa; the bays or harbours of Nice, Villa Franca, Oneglia, Finale, Savona, Vado, Spezzia, Lucca, Pisa, Leghorn, Piombino, Civita Vecchia, Gaeta, Naples, Salerno, Policastro, Reggio, Squillace, Tarento, Manfredonia, Ravenna, Venice, Trieste, Istria, and Fiume; Cape Spartavento, del Alice, Otranto, and Ancona; the strait of Messina, between Italy and Sicily.

The gulfs and bays in the Italian islands are those of Fiorenzo, Bastia, Talada, Porto Novo, Cape Corso, Bonifacio, and Ferro, in Corsica; and the strait of Bonifacio, between Corsica and Sardinia. The bays of Cagliari and Oristagni; Cape de Sardis, Cavello, Monte Santo, and Polo, in Sardinia. The gulfs of Messina, Melazzo, Palmiero, Mazara, Syracuse, and Catania; Cape Faro, Melazzo, Orlando, Gallo, Trapano, Pafaro, and Alessia, in Sicily; and the bays of Porto Feraio, and Porto Longone, in the island of Elba.

**METALS AND MINERALS.]** Many places of Italy abound with mineral springs; some hot, some warm, and many of sulphureous, chalybeate, and medicinal qualities. Many of its mountains abound in mines that produce great quantities of emeralds, jasper, agate, porphyry, lapis lazuli, and other valuable stones. Iron and copper-mines are found in a few

places; and a mill for forging and fabricating these metals is erected near Tivoli, in Naples. Sardinia is said to contain mines of gold, silver, lead, iron, sulphur, and alum, though they are now neglected; and curious crystals and coral are found on the coast of Corsica. Beautiful marble of all kinds is one of the chief productions of Italy.

VEGETABLE AND ANIMAL PRO- } Besides the rich vegetable pro-  
DUCTIONS, BY SEA AND LAND. } ductions mentioned under the ar-  
ticle of soil, Italy produces citrons, and such quantities of chestnuts, cherries, plums, and other fruits, that they are of little value to the proprietors.

There is little difference between the animal productions of Italy, either by land or sea, and those of France and Germany already mentioned.

POPULATION, INHABITANTS, MAN- } Authors are greatly divided  
NERS, CUSTOMS, AND DIVERSIONS. } on the head of Italian popula-  
tion. This may be owing, in a great measure, to the partiality which every Italian has for the honour of his own province. The number of the king of Sardinia's subjects in Italy is about 2,300,000. The city of Milan itself, by the best accounts, contains 300,000, and the duchy is proportionably populous. As to the other provinces of Italy, geographers and travellers have paid very little attention to the numbers of natives that live in the country, and inform us by conjecture only of those who inhabit the great cities. Some doubts have arisen whether Italy is as populous now as it was in the time of Pliny, when it contained 14,000,000 of inhabitants. It seems probable that the present inhabitants exceed that number. The Campagna di Roma, and some other of the most beautiful parts of Italy, are at present in a manner desolate; but we are to consider that the princes and states of Italy now encourage agriculture and manufactures of all kinds; which undoubtedly promotes population; so that it may not, perhaps, be extravagant, if we assign to Italy 20,000,000 of inhabitants; but some calculations greatly exceed that number\*. The Italians are generally well-proportioned, and have such meaning in their looks, that they have greatly assisted the ideas of their painters. The women are well-shaped, and very amorous. The marriage-ties, especially of the better sort, are said to be of very little value in Italy. Every wife has been represented to have her gallant or cicisbeo, with whom she keeps company, and sometimes cohabits, with very little ceremony, and no offence on either side. But this practice is chiefly remarkable at Venice; and indeed the representations which have been made of this kind by travellers, appear to have been much exaggerated. With regard to the modes of life, the best quality of a modern Italian is sobriety, and they submit very patiently to the public government. With great taciturnity, they discover but little reflection. They are rather vindictive than brave, and more superstitious than devout. The middling ranks are attached to their native customs, and seem to have no ideas of improvement. Their fondness for greens, fruits, and vegetables of all kinds, contributes to their contentment and satisfaction; and an Italian gentleman or peasant can be luxurious at a very small expense. Though perhaps all Italy does not contain many descendants of the ancient Romans, yet the present inhabitants speak of themselves as successors of the conquerors of the world, and look upon the rest of mankind with contempt.

\* Mr. Swinburne says, that in 1779, the number of inhabitants in the kingdom of Naples amounted to 4,249,430, exclusive of the army and naval establishments.

The dress of the Italians is little different from that of the neighbouring countries, and they affect a medium between the French volatility and the solemnity of the Spaniards. The Neapolitans are commonly dressed in black, in compliment to the Spaniards. It cannot be denied that the Italians excel in the fine arts: though they make at present but a very inconsiderable figure in the sciences. They cultivate and enjoy vocal music at a very dear rate, by emasculating their males when young: to which their mercenary parents agree without remorse.

The Italians, the Venetians especially, have very little or no notion of the impropriety of many customs that are considered as criminal in other countries. Parents, rather than their sons should throw themselves away by unsuitable marriages, or contract diseases by promiscuous amours, hire mistresses for them, for a month, or a year, or some determined time; and concubinage, in many places of Italy, is an avowed licensed trade. The Italian courtesans, or *bona-robas*, as they are called, make a kind of profession in all their cities. Masquerading and gaming, horse-races without riders, and conversations or assemblies, are the chief diversions of the Italians, excepting religious exhibitions, in which they are pompous beyond all other nations.

A modern writer, describing his journey through Italy, gives us a very unfavourable picture of the Italians and their manner of living. Give what scope you please to your fancy, says he, you will never imagine half the disagreeableness that Italian beds, Italian cooks, and Italian nastiness, offer to an Englishman. At Turin, Milan, Venice, Rome, and perhaps two or three other towns, you meet with good accommodations; but no words can express the wretchedness of the other inns. No other beds than those of straw, with a mattress of straw and next to that a dirty sheet, sprinkled with water, and consequently damp: for a covering, you have another sheet as coarse as the first, like one of our kitchen jack-towels, with a dirty coverlet. The bedstead consists of four wooden forms or benches. An English peer and peers must lie in this manner, unless they carry an upholsterer's shop with them. There are, by the bye, no such things as curtains; and in all their inns the walls are bare, and the floor has never yet been washed since it was first laid. One of the most indelicate customs here, is that men, and not women, make the ladies' beds, and would do every office of a maid-servant, if suffered. They never scour their pewter; their knives are of the same colour. In these inns they make you pay largely, and send you ten times as much as you can eat. The soup, like wash, with pieces of liver swimming in it; a plate full of brains fried in the shape of fritters; a dish of livers and gizzards; a couple of fowls (always killed after your arrival) boiled to rags, without any the least kind of sauce or herbage: another fowl, just killed, stewed as they call it; then two more fowls, or a turkey, roasted to rags. All over Italy, on the roads, the chickens and fowls are so stringy, you may divide the breast into as many filaments as you can a halfpenny-worth of thread. Now and then we get a little piece of mutton or veal; and generally speaking, it is the only eatable morsel that falls in our way. The bread all the way is exceedingly bad; and the butter so rancid, that it cannot be touched, or even borne within the reach of your smell. But what is a greater evil to travellers than any of the above recited, are the infinite numbers of gnats, bugs, fleas, and lice, which infest us by day and night.

RELIGION ] The religion of the Italians is Roman catholic. The inquisition here is little more than a sound; and persons of all religions live unmolested in Italy, provided no gross insult is offered to their wor-

ship. In the Introduction, we have given an account of the rise and establishment of popery in Italy, from whence it spread over all Europe; likewise of the causes and symptoms of its decline. The ecclesiastical government of the papacy has employed many volumes in describing it. The cardinals, who are next in dignity to his holiness, are seventy; but that number is seldom or never complete: they are appointed by the pope, who takes care to have a majority of Italian cardinals, that the chair may not be removed from Rome, as it was once to Avignon in France, the then pope being a Frenchman. In promoting foreign prelates to the cardinalship, the pope regulates himself according to the nomination of the princes who profess that religion. His chief minister is the cardinal patron, generally his nephew, or near relation, who improves the time of the pope's reign by amassing what he can. When met in a consistory, the cardinals pretend to controul the pope, in matters both spiritual and temporal, and have been sometimes known to prevail. The reign of a pope is seldom of long duration, being generally old men at the time of their election. The conclave is a scene where the cardinals principally endeavour to display their abilities, and where many transactions pass very inconsistent with their pretended inspiration by the Holy Ghost. During the election of a pope, in 1721, the animosities ran so high, that they came to blows with both their hands and feet, and threw the ink-standishes at each other. We shall here give an extract from the creed of pope Pius IV. 1560, before his elevation to the chair, which contains the principal points wherein the church of Rome differs from the protestant churches. After declaring his belief in one God, and other heads wherein Christians in general are agreed, he proceeds as follows:

" I most firmly admit and embrace the apostolical and ecclesiastical traditions, and all other constitutions of the church of Rome.

" I do admit the holy scriptures in the same sense that holy mother-church doth, whose business it is to judge of the true sense and interpretation of them; and I will interpret them according to the unanimous consent of the fathers.

" I do profess and believe that there are seven sacraments of the law, truly and properly so called, instituted by Jesus Christ our Lord, and necessary to the salvation of mankind, though not all of them to every one; namely, baptism, confirmation, eucharist, penance, extreme unction, orders, and marriage, and that they do confer grace; and that of these, baptism, confirmation, and orders, may not be repeated without sacrilege. I do also receive and admit the received and approved rites of the catholic church in her solemn administration of the abovesaid sacraments.

" I do embrace and receive all and every thing that hath been defined and declared by the holy council of Trent\* concerning original sin and justification.

" I do also profess that in the mass there is offered unto God a true, proper and propitiatory sacrifice for the quick and the dead; and that in the most holy sacrament of the eucharist there is truly, really, and substantially, the body and blood, together with the soul and divinity, of our Lord Jesus Christ; and that there is a conversion made of the whole sub-

stance of the bread into the body, and of the whole substance of the wine into the blood; which conversion the catholic church calls Transubstantiation. I confess that under one kind only, whole and entire, Christ and a true sacrament is taken and received.

"I do firmly believe that there is a purgatory; and that the souls kept prisoners there do receive help by the suffrages of the faithful.

"I do likewise believe that the saints reigning together with Christ are to be worshipped and prayed unto: and that they do offer up prayers unto God for us, and that their relics are to be had in veneration.

"I do most firmly assert that the images of Christ, of the blessed Virgin the mother of God, and of other saints, ought to be had and retained, and that due honour and veneration ought to be given unto them\*.

"I do likewise affirm, that the power of indulgences was left by Christ to the church, and that the use of them is very beneficial to Christian people.

"I do acknowledge the holy catholic and apostolical Roman church to be the mother and mistress of all churches: and I do promise and swear true obedience to the bishop of Rome, the successor of St. Peter, the prince of the apostles, and vicar of Jesus Christ.

"I do undoubtedly receive and profess all other things which have been delivered, defined, and declared by the sacred cantons and œcumenical councils, and especially by the holy synod of Trent. And all other things contrary thereto, and all heresies condemned, rejected, and anathematized by the church, I do likewise condemn, reject, and anathematize."

ARCHBISHOPRICS.] There are thirty-eight archbishoprics in Italy, but the suffragans annexed to them are too indefinite and arbitrary for the reader to depend upon; the pope creating or suppressing them as he pleases.

LANGUAGE.] The Italian language is remarkable for its smoothness, and the facility with which it enters into musical compositions. The ground-work of it is Latin, and it is easily mastered by a good classical scholar. Almost every state in Italy has a different dialect; and the prodigious pains taken by the literary societies there, may at last fix the Italian into a standard language. At present, the Tuscan style and writing is most in request.

The Lord's prayer runs thus: *Padre nostro che sei nel cielo, sia santificato il tuo nome; il tuo regno venga; la tua volontà sia fatta siccome in cielo così anche in terra: dacci oggi il nostro pane cotidiano; e rimettici i nostri debiti, siccome noi ancora rimettiamo a' nostri debitori; e non inducici in tentazione, ma liberaci dal maligno; perciocché tuo è il regno, e la potenza, e la gloria in sempiterno. Amen.*

\* An English traveller, speaking of a religious procession some years ago at Florence, in Italy, describes it as follows: "I had occasion," says he, "to see a procession where all the noblesse of the city attended in their coaches. It was the anniversary of a charitable institution in favour of poor maidens, a certain number of whom are portioned every year. About two hundred of these virgins walked in procession, two and two together. They were preceded and followed by an irregular mob of penitents, in sack-cloth, with lighted tapers, and monks carrying crucifixes, bawling and bellowing the litanies; but the greatest object was the figure of the Virgin Mary, as big as the life, standing within a gilt frame, dressed in a gold stuff, with a large hoop, a great quantity of false jewels, her face painted and patched, and her hair frizzled and curled in the very extremity of the fashion. Very little regard had been paid to the image of our Saviour on the cross; but when the Lady Mother appeared on the shoulders of three or four luty friars, the whole populace fell upon their knees in the dirt."

**LEARNING AND LEARNED MEN, PAINTERS, } In the introduction  
STATUARIES, ARCHITECTS, AND ARTISTS. }** we have particularised some of the great men which ancient Italy has produced. In modern times, that is, since the revival of learning, some Italians have shone in controversial learning, but they are chiefly celebrated by bigots of their own persuasion. The mathematics and natural philosophy owe much to Galileo, Torricelli, Malpighi, Borelli, and several other Italians. Strada is an excellent historian; and the history of the council of Trent, by the celebrated father Paul, is a standard work. Guicciardini, Bentivoglio, and Davila, have been much commended as historians by their several admirers. Machiavel is equally famous as an historian, and as a political writer. His comedies have much merit: and the liberality of his sentiments, for the age in which he lived, is amazing. Among the prose writers in the Italian language, Boccace has been thought one of the most pure and correct in point of style: he was a very natural painter of life and manners, but his productions are too licentious. Petrarch, who wrote both in Latin and Italian, revived among the moderns the spirit and genius of ancient literature: but among the Italian poets, Dante, Ariosto, and Tasso, are the most distinguished. There are said to be upwards of a thousand comedies in the Italian language, though not many that are excellent: but Metastasio has acquired a great reputation by writing dramatic pieces set to music. Sannazarius, Fracastorius, Bembo, Vida, and other natives of Italy, have distinguished themselves by the elegance, correctness, and spirit of their Latin poetry, many of their compositions not yielding to the classics themselves. Socinus, who was so much distinguished by his opposition to the doctrine of the Trinity, was a native of Italy.

The Italian painters, sculptors, architects, and musicians, are unrivalled, not only in their numbers, but their excellencies. The revival of learning, after the sack of Constantinople by the Turks, revived taste likewise, and gave mankind a relish for truth and beauty in design and colouring. Raphael from his own ideas, assisted by the ancients, struck out a new creation with his pencil, and still stands at the head of the art of painting. Michael Angelo Buonarrotti united in his own person painting, sculpture, and architecture. The colouring of Titian has perhaps never yet been equalled. Bramante, Bernini, and many other Italians, carried sculpture and architecture to an amazing height. Julio Romano, Correggio, Caraccio, Veronese, and others, are, as painters, unequalled in their several manners. The same may be said of Corelli, and other Italians, in music. At present Italy cannot justly boast of any extraordinary genius in the fine arts.

**UNIVERSITIES.]** Those of Italy are, Rome, Venice, Florence, Mantua, Padua, Parma, Verona, Milan, Pavia, Bologna, Ferrara, Pisa\*, Naples, Salerno, and Perugia.

**ANTIQUITIES AND CURIOSITIES, }** Italy is the native country of all **NATURAL AND ARTIFICIAL. }** that is stupendous, great, or beautiful, either in ancient or modern times. A library may be filled by descriptions and delineations of all that is rare and curious in the arts; nor do the bounds of this work admit only of a very brief account of those objects that are most distinguished either for antiquity or excellence.

which was erected by Vespasian, and finished by Domitian, called the Coliseum. Twelve thousand Jewish captives were employed by Vespasian in this building; and it is said to have been capable of containing eighty-seven thousand spectators seated, and twenty thousand standing. The architecture of this amphitheatre is perfectly light, and its proportions are so just, that it does not appear near so large, as it really is. But it has been stripped of all its magnificent pillars and ornaments, at various times, and by various enemies. The Goths, and other barbarians, began its destruction, and popes and cardinals have endeavoured to complete its ruin. Cardinal Farnese, in particular, robbed it of some fine remains of its marble cornices, friezes, &c. and with infinite pains and labour, got away what was practicable of the outside casing of marble, which he employed in building the palace of Farnese. The amphitheatre of Verona, erected by the consul Flaminius, is thought to be the most entire of any in Italy. There are forty-five rows of steps carried all round, formed of fine blocks of marble about a foot and a half high each, and above two feet broad. Twenty-two thousand persons may be seated here at their ease, allowing one foot and a half for each person. This amphitheatre is quite perfect, and has been lately repaired with the greatest care, at the expense of the inhabitants. They frequently give public spectacles in it, such as horse-races, combats of wild beasts, &c. The ruins of theatres and amphitheatres are likewise visible in other places. The triumphal arches of Vespasian, Septimius Severus, and Constantine the Great, are still standing, though decayed. The ruins of the baths, palaces, and temples, answer all the ideas we can form of the Roman grandeur. The Pantheon, which is at present converted into a modern church, and which from its circular figure is commonly called the Rotunda, is more entire than any other Roman temple which is now remaining. There are still left several of the niches which anciently contained the statues of the heathen deities. The outside of the building is of Tivoli free-stone, and within it is incrusted with marble. The roof of the Pantheon is a round dome, without pillars, the diameter of which is a hundred and forty-four feet; and though it has no windows, but only a round aperture in the centre of this dome, it is very light in every part. The pavement consists of large square stones and porphyry, sloping round towards the centre, where the rain-water, falling down through the aperture on the top of the dome, is conveyed away by a proper drain covered with a stone full of holes. The colonnade in the front, which consists of sixteen columns of granite, thirty-seven feet high, exclusive of the pedestals and capitals, each cut out of a single block, and which are of the Corinthian order, can hardly be viewed without astonishment. The entrance of the church is adorned with columns forty-eight feet high, and the architrave is formed of a single piece of granite. On the left hand, on entering the portico, is a large antique vase of Numidian marble; and in the area before the church is a fountain with an antique of porphyry. The pillars of Trajan and Antonine, the former 175 feet high, and the latter covered with instructive sculptures, are still remaining. A traveller forgets the devastations of the northern barbarians, when he sees the rostrated column erected by Duillius in commemoration of the first naval victory the Romans gained over the Carthaginians; the statue of the wolf giving suck to Romulus and Remus, with visible marks of the strokes of lightning, mentioned by Cicero; the original brass plates containing the laws of the twelve tables; and a thousand other identical antiquities, some of them transmitted unhurt to the present times; not to mention

medals, and the infinite variety of seals and engraved stones which abound in the cabinets of the curious. Many palaces, all over Italy, are furnished with busts and statues fabricated in the times of the republic and the higher empire.

The Appian, Flaminian, and Æmilian roads, the first 200 miles, the second 130, and the third 50 miles in length, are in many places still entire; and magnificent ruins of villas, reservoirs, bridges, and the like, present themselves all over Italy.

The subterraneous constructions of Italy are as stupendous as those above ground: such are the cloacæ, and the catacombs, or repositories for dead bodies, in the neighbourhood of Rome and Naples. It is not above 50 years since a painter's apprentice discovered the ancient city of Pæstum or Posidonia, in the kingdom of Naples, still standing; for so indifferent are the country people of Italy about objects of antiquity, that it was a new discovery to the learned. An inexhaustible mine of curiosities exists in the ruins of Herculaneum, a city lying between Naples and Vesuvius, which in the reign of Nero was almost destroyed by an earthquake, and afterwards, in the first year of the reign of Titus, overwhelmed by a stream of the lava of Vesuvius. The melted lava in its course filled up the streets and houses in some places to the height of sixty-eight feet above the tops of the latter, and in others one hundred and ten feet. This lava is now of a consistency which renders it extremely difficult to be removed or cleared away: it is composed of bituminous particles, mixed with cinders, minerals, metallic, and vitrified sandy substances, which altogether form a close and heavy mass. In the revolution of so many ages, the spot it stood upon was entirely forgotten; but in the year 1713, upon digging into these parts, some remains of this unfortunate city were discovered, and many antiquities were dug out: but the search was afterwards discontinued, till the year 1736, when the king of Naples employed men to dig perpendicularly eighty feet deep, whereupon not only the city made its appearance, but also the bed of the river which ran through it. The temple of Jupiter was then discovered, and the whole of the theatre. In the temple was found a statue of gold, and the inscription that decorated the great doors of entrance. In the theatre the fragments of a gilt chariot of bronze, with horses of the same metal, likewise gilt: this had been placed over the principal door of entrance. There were likewise found among the ruins of this city multitudes of statues, busts, pillars, paintings, manuscripts, furniture, and various utensils. The streets of the town appear to have been quite straight and regular, the houses well built, and much alike; some of the rooms paved with mosaic, others with fine marbles, others again with bricks, three feet long and six inches thick. It appears that the town was not filled up so unexpectedly with the melted lava, as to prevent the greatest part of the inhabitants from escaping with many of the richest effects: for when the excavations were made, there was not more than a dozen skeletons found, and but little gold, silver, or precious stones.

The town of Pompeii was destroyed by the same eruption of Mount Vesuvius, which occasioned the destruction of Herculaneum; but it was not discovered till near forty years after the discovery of Herculaneum. One street, and a few detached buildings of this town, have been cleared; the street is well paved with the same kind of stone of which the ancient roads are made, and narrow causeways are raised a foot and a half on each side for conveniency of foot passengers. Dr. Moore observes, that the street itself is not so broad as the narrowest part of the Strand,

and is supposed to be of wheels of carriages small, but give an idea walls is smooth and bare are ornamented with animal. They are taken on them, the colours are on the same plan, and conjectured to have a place which seems to be of greatest advantage. ing, with a colonnade Royal Exchange at from this, is a temple brick, stuccoed like magnificent in the hitherto found at Pompeii out of the walls, and the streets of this town one apartment (says wretches, who were other bodies were found show that they were them.

The natural curiosities are numerous as its artificial distant from the city remarkable for their towards the sea, is it is equally fertile to a delightful prospect and west sides of the top, covered with Vesuvius has been sea. It has been an An animated description younger Pliny, who the year 1631, its ever, it broke out In 1694, was a great burning matter was at thirty miles distant a river for three miles in its way. In 17 of cinders and ash noon-day. In 17

and is supposed to have been inhabited by trades-people. The traces of wheels of carriages are to be seen on the pavement. The houses are small, but give an idea of neatness and conveniency. The stucco on the walls is smooth and beautiful, and as hard as marble. Some of the rooms are ornamented with paintings, mostly single figures, representing some animal. They are tolerably well executed, and a little water being thrown on them, the colours appear surprisngly fresh. Most of the houses are built on the same plan, and have one small room from the passage, which is conjectured to have been the shop, with a window to the street, and a place which seems to have been contrived for showing the goods to the greatest advantage. In another part of the town is a rectangular building, with a colonnade towards the court, something in the style of the Royal Exchange at London, but smaller. At a considerable distance from this, is a temple of the goddess Isis, the pillars of which are of brick, stuccoed like those of the guard-room; but there is nothing very magnificent in the appearance of this edifice. The best paintings hitherto found at Pompeii, are those of this temple; they have been cut out of the walls, and removed to Portici. Few skeletons were found in the streets of this town, but a considerable number in the houses. In one apartment (says Mr. Sutherland), we saw the skeletons of 17 poor wretches, who were confined by the ancles in an iron machine. Many other bodies were found, some of them in circumstances which plainly show that they were endeavouring to escape when the eruption overtook them.

With regard to modern curiosities in Italy, they are as numerous as the remains of antiquity. Rome itself contains 300 churches, filled with all that is rare in architecture, painting, and sculpture. Each city and town of Italy contains a proportionable number. The church of St. Peter at Rome is the most astonishing, bold, and regular fabric, that ever perhaps existed; and when examined by the rules of art, it may be termed faultless. The house and chapel of Loretto is rich beyond imagination, notwithstanding the ridiculous romance that composes its history.

The natural curiosities of Italy, though remarkable, are not so numerous as its artificial. Mount Vesuvius, which is five Italian miles distant from the city of Naples, and Mount *Ætna*, in Sicily, are remarkable for their fiery eruptions. The declivity of Mount Vesuvius towards the sea, is every-where planted with vines and fruit-trees, and it is equally fertile towards the bottom. The circumjacent plain affords a delightful prospect, and the air is clear and wholesome. The south and west sides of the mountain form very different views, being, like the top, covered with black cinders and stones. The height of Mount Vesuvius has been computed to be 3,900 feet above the surface of the sea. It has been a volcano, beyond the reach of history or tradition. An animated description of its ravages in the year 79, is given by the younger Pliny, who was a witness to what he wrote. From that time to the year 1631, its eruptions were but small and moderate; then, however, it broke out with accumulated fury, and desolated miles around. In 1694, was a great eruption, which continued near a month, when burning matter was thrown out with so much force, that some of it fell at thirty miles distance, and a vast quantity of liquid lava ran down like a river for three miles distance, carrying every thing before it which lay in its way. In 1707, when there was another eruption, such quantities of cinders and ashes were thrown out, that it was dark at Naples at noon-day. In 1767, a violent eruption happened, which is reckoned

- to be the 27th from that which destroyed Herculaneum, in the time of Titus. In this eruption, the ashes, or rather small cinders, showered down so fast at Naples, that the people in the streets were obliged to use umbrellas, or adopt some other expedient, to guard themselves against them. The tops of the houses and the balconies were covered with these cinders; and ships at sea, twenty leagues from Naples, were covered with them, to the great astonishment of the sailors. An eruption happened also in 1766, another in 1779, which have been particularly described by Sir William Hamilton in the Philosophical Transactions; and another in June 1794, which laid waste a considerable tract of country, and destroyed several villages, and a great number of habitations. It has been observed by a modern traveller, that though Mount Vesuvius often fills the neighbouring country with terror, yet, as few things in nature are so absolutely noxious as not to produce some good, even this raging volcano, by its sulphureous and nitrous manure, and the heat of its subterraneous fires, contributes not a little to the uncommon fertility of the country about it, and to the profusion of fruits and herbage with which it is every where covered. Besides, it is supposed that, while open and active, the mount is less hostile to Naples, than it would be, if its eruptions were to cease, and its struggles confined to its own bowels, for then might ensue the most fatal shocks to the unstable foundation of the whole district of Terra di Lavoro\*.

Mount *Ætna* is 10,954 feet in height, and has been computed to be 60 miles in circumference. It stands separate from all other mountains, its figure is circular, and it terminates in a cone. The lower parts of it are very fruitful in corn and sugar-canes; the middle abounds with woods, olive-trees and vines; and the upper part is almost the whole year covered with snow. Its fiery eruptions have always rendered it famous: in one of these, which happened in 1669, fourteen towns and villages were destroyed, and there have been several terrible eruptions since that time. There is generally an earthquake before any great eruption. In 1693, the port-town of Catania was overturned, and 18,000 people perished.

Near the lake Agnano and Pozzuolo, there is a valley called *Solfatara*, because vast quantities of sulphur are continually forced out of the clefts by subterranean fires. The grotto del Cane is remarkable for its poisonous steams, and is so called from its killing dogs that enter it, if forced to remain there. Scorpions, vipers, and serpents, are said to be common in Apulia.

Among the natural curiosities of Italy, those vast bodies of snow and ice, which are called the glaciers of Savoy, deserve to be particularly mentioned. There are five glaciers which extend almost to the plain of the vale of Chamouny, and are separated by wild forests, corn-fields, and rich meadows; so that immense tracts of ice are blended with the

\* Sir William Hamilton, in his account of the earthquakes in Calabria Ulteriore, and Sicily, from February 5th, to May, 1783, gives several reasons for believing that they were occasioned by the operation of a volcano, the seat of which lay deeper either under the bottom of the sea, between Stromboli, and the coast of Calabria, or under the parts of the plain towards Oppido and Terra Nuova. He plainly observed a gradation in the damage done to the buildings, as also in the degree of mortality, in proportion as the countries were more or less distant from this supposed centre of the evil. One circumstance he particularly remarked: If two towns were situated at an equal distance from this centre, the one on a hill, the other on the plain or in the bottom, the latter had always suffered greatly more by the shocks of the earthquakes than the former; sufficient proof to him of the cause coming from beneath, as this must naturally have been productive of such an effect.

highest cultivation, and singular and striking variety chiefly in the hollow length, unite together in Europe, and probability of M. de Luc, the sea, is 2391½ French toises, says Mr. Cox, "from the mountains around being seen at a great mountain in Switzerland Blanc, the highest ground

highest cultivation, and perpetually succeed to each other, in the most singular and striking vicissitudes. All these several valleys of ice, which lie chiefly in the hollows of the mountains, and are some leagues in length, unite together at the foot of Mont Blanc; the highest mountain in Europe, and probably of the ancient world. According to the calculations of M. de Luc, the height of this mountain above the level of the sea, is 2391½ French toises, or 15,303 English feet. "I am convinced," says Mr. Cox, "from the situation of Mont Blanc, from the height of the mountains around it, from its superior elevation above them, and its being seen at a great distance from all sides, that it is higher than any mountain in Switzerland; which, beyond a doubt, is, next to Mont Blanc, the highest ground in Europe."

STATES OF ITALY, CONSTITUTION AND CHIEF CITIES. } Thus far, of Italy in general; but as the Italian states are not, like the republics of Holland, Switzerland, or the empire of Germany, cemented by a political confederacy, to which every member is accountable (for every Italian state has a distinct form of government, trade, and interests), it will be necessary to take a separate view of each, to assist the reader in forming an idea of the whole.

The duke of SAVOY, or king of SARDINIA, taking his royal title from that island, is a powerful prince in Italy, of which he is called the Janus, or keeper, against the French; though in the late irruption of the republicans, his guardianship has proved of little avail. His capital, Turin, is strongly fortified, and one of the finest cities in Europe; but the country of Savoy is mountainous and barren, and its natives are forced to seek their bread all over the world. They are esteemed a simple, but very honest people. The king is so absolute, that his revenues consist of what he pleases to raise upon his subjects. His ordinary income, besides his own family provinces, cannot be less than 500,000 sterling, out of which he maintains 15,000 men in time of peace. During a war, when assisted by foreign subsidies, he can bring to the field 40,000 men. The aggrandisement of his present Sardinian majesty was chiefly owing to England, to whom, by his situation, he was esteemed a natural ally, for the preservation of the balance of power in Europe.

The MILANESE, belonging to the house of Austria, was a most formidable state, and formerly gave law to all Italy, when under the government of its own dukes. The fertility and beauty of the country are almost incredible. Milan, the capital, and its citadel, is very strong, and furnished with a magnificent cathedral, in the Gothic taste, which contains a very rich treasury, consisting chiefly of ecclesiastical furniture, composed of gold, silver, and precious stones. The revenue of the duchy was above 300,000l. annually, which was supposed might maintain an army of 30,000 men. The French, in the year 1796, over-ran this province, and erected what was called the Cisalpine republic; but on the recommencement of hostilities in 1799, the Austrians, within a few months, regained the whole.

The republic of GENOA is greatly degenerated from its ancient power and opulence, though the spirit of trade still continues among its nobility and citizens. Genoa is a most superb city, and contains some very magnificent places, particularly those of Doria\*, and Durazzo. The

\* Andrew Doria, the head of this family, famous for his military exploits, and the deliverer of Genoa, was born in the territory of Genoa, in the year 1468; he was offered the sovereignty of the state, but refused it, and gave to the people that republican form of government which still subsists; he lived to the age of 93, the refuge and friend of the unfortunate.

inhabitants of distinction dress in black, in a plain if not an uncoouth manner, perhaps to save expences. Their chief manufactures are velvets, damasks, gold and silver tissues, and paper. The city of Genoa contains about 150,000 inhabitants (but some writers greatly diminish that number), among whom are many rich trading individuals. Its maritime power is dwindled down to six galleys. The common people are wretched beyond expression, as is the soil of its territory. Near the sea some parts are tolerably well cultivated. The old government of Genoa was aristocratical, being vested in the nobility; the chief person was called the doge, or duke; to which dignity no person was promoted till he was fifty years of age. Every two years a new doge was chosen, and the former became incapable, during five years, of holding the same post again. The doge gave audience to ambassadors, all orders of government were issued in his name, and he was allowed a body-guard of two hundred Germans.

This government has been abolished, by a revolution, under the direction of the French; and the republic of Genoa is now called the LIGURIAN republic. It is governed by a directory, and legislative body consisting of two councils, one of juniors and one of ancients, the members of which are elected by the fifteen departments into which the territory of the new republic is divided. The total population of these departments is estimated at about 600,000 souls.

VENICE, now a part of the Austrian territory, was one of the most celebrated republics in the world, on account both of its constitution and former power. It is composed of several fine provinces on the continent of Italy, some islands in the Adriatic, and part of Dalmatia. The city of Venice is seated on 72 islands at the bottom of the north end of the Adriatic sea, and is separated from the continent by a marshy lake of five Italian miles in breadth, too shallow for large ships to navigate, which forms its principal strength. Venice preserves the vestiges of its ancient magnificence, but is in every respect degenerated, except in the passion which its inhabitants still retain for music and mummery during their carnivals. They seem to have lost their ancient taste for painting and architecture, and to be returning to Gothicism. They had, however, lately some spirited differences with the court of Rome, and seemed to be disposed to throw off their obedience to its head. As to the constitution of the late republic, it was originally democratical, the magistrates being chosen by a general assembly of the people, and so continued for one hundred and fifty years; but various changes afterwards took place: doges, or dukes, were appointed, who were invested with great power, which they often grossly abused, and some of them were assassinated by the people. By degrees a body of hereditary nobility was formed; continued and progressive encroachments were made on the rights of the people, and a complete aristocracy was at length established upon the ruins of the ancient popular government. The nobility were divided into six classes, amounting in the whole to 2,500, each of whom, when twenty-five years of age, had a right to be a member of the grand council. Before the late revolution, these elected a doge, or chief magistrate, in a peculiar manner by ballot, which was managed by gold and silver balls. The doge was invested with great state, and with emblems of supreme authority, but had very little power, and was not permitted to stir from the city without the permission of the grand council. The government and laws were managed by different councils of the nobles.

The college, otherwise called the signory, was the supreme cabinet

council of the state, court gave audience to foreign ambassadors to the generals of armies on state affairs, business to be discussed of state crimes examining them in private evidence against the fitted only of three in its manner appeal, on the lives the highest of the nobles. To these three inconsidering secret intelligence or actions they might and ordering them to had keys to every act they pleased, penetrated cabinet, and examined to the house of ever only one year, but when they were in authority by this government, intercourse with foreign and were even cautious.

All the orders of wigs, and caps which doge's marrying the from his bucentaur, lity, was intermitted day, 1797, and the by the French. The grandeur and laces, the treasury, several canals of Venice which are stone. cloth, gold and silver which bring in a considerable annually, is said to valued at twenty-pence expences of the state peace, consisted of reign general) and curbing the insolence have, however, prevailed likewise carried a from the arsenal.

The Venetians those of the *Stola* referred only on the which in the proper

In ecclesiastical authority of one read much power; and

council of the state, and also the representative of the republic. This court gave audience, and delivered answers, in the name of the republic, to foreign ambassadors, to the deputies of towns and provinces, and to the generals of the army. It also received all requests and memorials on state affairs, summoned the senate at pleasure, and arranged the business to be discussed in that assembly. The council often took cognizance of state crimes, and had the power of seizing accused persons, examining them in prison, and taking their answers in writing, with the evidence against them. But the tribunal of state inquisitors, which consisted only of three members, and which was in the highest degree despotic in its manner of proceeding, had the power of deciding, without appeal, on the lives of every citizen belonging to the Venetian state; the highest of the nobility, even the doge himself, not being excepted. To these three inquisitors, was given the right of employing spies, considering secret intelligence, issuing orders to seize all persons whose words or actions they might think reprehensible, and afterwards try them, and ordering them to be executed, when they thought proper. They had keys to every apartment of the ducal palace, and could, whenever they pleased, penetrate into the very bed-chamber of the doge, open his cabinet, and examine his papers: and, of course, might command access to the house of every individual in the state. They continued in office only one year, but were not responsible afterwards for their conduct whilst they were in authority. So much distrust and jealousy were displayed by this government, that the noble Venetians were afraid of having any intercourse with foreign ambassadors, or with foreigners of any kind, and were even cautious of visiting at each other's houses.

All the orders of Venetian nobility are dressed in black gowns, large wigs, and caps which they hold in their hands. The ceremony of the doge's marrying the Adriatic once a year, by dropping into it a ring from his bucentaur, or stage barge, attended by those of all the nobility, was intermitted for the first time for several centuries, on Ascension day, 1797, and the bucentaur has since been carried away from Venice by the French. The inhabitants of Venice are said to amount to 200,000. The grandeur and convenience of the city, particularly the public palaces, the treasury, and the arsenal, are beyond expression. Over the several canals of Venice, are laid near 500 bridges, the greatest part of which are stone. The Venetians still have some manufactures in scarlet cloth, gold and silver stuffs, and, above all, fine looking-glasses, all which bring in a considerable revenue to the owners; that of the state, annually, is said to have amounted to 8,000,000 of Italian ducats, each valued at twenty-pence of our money. Out of this were defrayed the expenses of the state, and the pay of the army, which, in the time of peace, consisted of 16,000 regular troops (always commanded by a foreign general) and 10,000 militia. They kept up a small fleet for curbing the insolencies of the piratical states of Barbary. The French have, however, pressed into their service the ships they found there; and likewise carried away immense quantities of arms and military stores from the arsenal.

The Venetians have some orders of knighthood, the chief of which are those of the *Stola d'oro*; so called from the robe they wear, which is conferred only on the first quality; and the military order of St. Mark; of which in the proper place.

In ecclesiastical matters, the Venetians have two patriarchs; the authority of one reaches over all the provinces, but neither of them have much power; and both of them are chosen by the senate; and all reli-

gious sects, even the Mahometan and pagan, excepting protestants, are here tolerated in the free exercise of their religion.

The Venetians are a lively, ingenious people, extravagantly fond of public amusements, with an uncommon relish for humour. They are in general tall and well made; and many fine manly countenances are met with in the streets of Venice, resembling those transmitted to us by the pencils of Paul Veronese and Titian. The women are of a fine style of countenance, with expressive features, and are of an easy address. The common people are remarkably sober, obliging to strangers, and gentle in their intercourse with each other. As it is very much the custom to go about in masks at Venice, and great liberties are taken during the time of the carnival, an idea has prevailed, that there is much more licentiousness of manners here than in other places: but this opinion seems to have been carried too far. Great numbers of strangers visit Venice during the time of the carnival, and there are eight or nine theatres here, including the opera-houses.

The dominions of Venice, before the government of the republic was subverted by the French, consisted of a considerable part of Dalmatia and Istria, the islands of Corfu, Pachfu, Antipachfu, Santa Maura, Curzolari, Val di Compare, Cephalonia, and Zante. The Venetian territories in Italy contain the duchy of Venice, the Paduanese, the peninsula of Rovigo, the Veronese, the territories of Vicenza and Brescia, the districts of Bergamo, Cremafco, and the Marca Trevigiana, with part of the country of Friuli. Of these Dalmatia, Istria, and a great part of the Venetian Terra Firma, were ceded by the French to the emperor, by the late treaty of Campo Formio: the islands they retained possession of themselves; but several of them have since been taken by the Turkish and Russian fleet.

The principal city of TUSCANY is Florence, which is now possessed by a younger branch of the house of Austria, after being long held by the illustrious house of Medici, who made their capital the cabinet of all that is valuable, rich, and masterly, in architecture, literature, and the arts, especially those of painting and sculpture. It is thought to contain above 70,000 inhabitants. The beauties and riches of the grand duke's palaces have been often described; but all description falls short of their contents, so that, in every respect, it is reckoned, after Rome, the second city in Italy. The celebrated Venus of Medici, which, take it all in all, is thought to be the standard of taste in female beauty and proportion, stands in a room called the Tribunal. The inscription of its base mentions its being made by Cleomenes, an Athenian, the son of Apollodorus. It is of white marble, and surrounded by other masterpieces of sculpture, some of which are said to be the works of Praxiteles, and other Greek masters. Every corner of this beautiful city, which stands between mountains covered with olive-trees, vineyards, and delightful villas, and divided by the Arno, is full of wonders, in the arts of painting, statuary, and architecture. It is a place of some strength, and contains an archbishop's see, and an university. The inhabitants boast of the improvements they have made in the Italian tongue, by means of their Accademia della Crusca; and several other academies are now established at Florence. Though the Florentines affect great state, yet their nobility and gentry carry on a retail trade in wine, which they sell from their cellar windows, and sometimes they even hang out a broken flask, as a sign where it may be bought. They deal, besides wine and fruits, in gold and silver stuffs.—Upon the accession of the archduke Peter Leopold, afterwards emperor of Germany, to this duchy, a great refor-

mation was introduced for the great benefit of the Tuscan people, and that its revenues are much decayed; but modern taste, and with the market-place. Besides the citadel, the sea, and of many the Mahometans, has inhabitants is computed Jews, who live in a pogogue, and, though in a condition, the greatest part hands.

The inhabitants of Tuscany are very numerous, and very industrious of the Italians. The garden, so that, the revenue amounts to 800,000, and contains about 40,000, and fruits, especially cany keeps the people preferve their freedom and harmony can alone their darling Liberty image is not only in all their public buildings this little republic, of cheerfulness and neighbouring countries.

The republic of Tuscany is very curious. Its territory is very fertile, and has served their liberties, and protection of the people, whose number is not less than 1,000,000.

The duchy and county of Guastalla, formerly the richest fruits and silk. It is the seat of a magnificent church, and of a great duke. \* Pa the late Don Philip Parma and Placer catholic majesty, and carried with him his nobilities. The duke and it is said that

\* Ferdinand, duke of Parma and Placer, and his wife Maria-Amelia-Josephina, were the founders of the present dynasty.

nation was introduced, both into the government and manufactures, to the great benefit of the finances. It is thought that the great duchy of Tuscany could bring into the field, upon occasion, 30,000 fighting men, and that its revenues were above 500,000*l.* a year. The other principal towns of Tuscany are Pisa, Leghorn, and Sienna: the first and last are much decayed; but Leghorn is a very handsome city, built in the modern taste, and with such regularity, that both gates are seen from the market-place. It is well fortified, having two forts towards the sea, besides the citadel. The ramparts afford a very agreeable prospect of the sea, and of many villas on the land side. Here all nations, and even the Mahometans, have free access, and many settle. The number of inhabitants is computed at 40,000, among whom are said to be 20,000 Jews, who live in a particular quarter of the city, have a handsome synagogue, and, though subject to very heavy imposts, are in a thriving condition, the greatest part of the commerce of this city going through their hands.

The inhabitants of LUCCA, which is a small free commonwealth, lying on the Tuscan sea, in a most delightful plain, are the most industrious of the Italians. They have improved their country into a beautiful garden, so that, though they do not exceed 120,000, their annual revenue amounts to 80,000*l.* sterling. Their capital is Lucca, which contains about 40,000 inhabitants, who deal in mercery goods, wines, and fruits, especially olives. The vicinity of the grand duchy of Tuscany keeps the people of Lucca constantly on their guard, in order to preserve their freedom; for in such a situation, a universal concord and harmony can alone enable them to transmit to posterity the blessings of their darling Liberty, whose name they bear on their arms, and whose image is not only impressed on their coin, but also on the city gates, and all their public buildings. It is also observable, that the inhabitants of this little republic, being in possession of freedom, appear with an air of cheerfulness and plenty, seldom to be found among those of the neighbouring countries.

The republic of St. MARINO is here mentioned as a geographical curiosity. Its territories consist of a high, craggy mountain, with a few eminences at the bottom, and the inhabitants boast of having preserved their liberties, as a republic, for 1300 years. It is under the protection of the pope; and the inoffensive manners of the inhabitants, whose number is not more than 5,000, with the small value of their territory, have preserved its constitution.

The duchy and city of PARMa, together with the duchies of Placentia and Guastalla, form one of the most flourishing states in Italy, of its extent. The soils of Parma and Placentia are fertile, and produce the richest fruits and pasturages, and contain considerable manufactures of silk. It is the seat of a bishop's see and a university; and some of its magnificent churches are painted by the famous Correggio. The present duke of \* Parma is a prince of the house of Bourbon, and son to the late Don Philip, the king of Spain's younger brother. The cities of Parma and Placentia are enriched with magnificent buildings; but his catholic majesty, on his accession to the throne of Naples, is said to have carried with him thither the most remarkable pictures and movable curiosities. The duke's court is thought to be the politest of any in Italy; and it is said that his revenues exceed 100,000*l.* sterling a year, a sum

\* Ferdinand, duke of Parma, born Jan. 20, 1751; married to the archduchess Maria-Amelia-Josepha, June 27, 1769. Their issue are, a prince and two princesses.

rather exaggerated. The city of Parma is supposed to contain 50,000 inhabitants.

**MANTUA**, formerly a rich duchy, bringing to its own dukes 500,000 crowns a year, is now much decayed. The capital is one of the strongest fortresses in Europe, and contains about 16,000 inhabitants, who boast that Virgil was a native of their country. By an order of the emperor, in 1785, this duchy was incorporated with that of Milan into one province, called Austrian Lombardy. Mantua was taken by the French after a long siege, on the 2d of February 1797, and, by the treaty of Campo Formio, given up to the Cisalpine republic, the emperor receiving as an equivalent the city and territory of Venice; but, on the renewal of hostilities in 1799, it was retaken by the Austrians, on the 30th of July.

The duchy of **MODENA** (formerly *Matina*), before the late revolutions excited by the French in Italy, was governed by its own duke\*, the head of the house of Este, from whom the family of Brunswick descended. The duke was absolute within his own dominions, which are fruitful. He was under the protection of the house of Austria, and a vassal of the empire.

The **ECCLESIASTICAL STATE**, which contains Rome, formerly the capital of the world, is situated about the middle of Italy. The ill effects of popish tyranny, superstition, and oppression, are here seen in the highest perfection. Those spots, which under the masters of the world were formed into so many terrestrial paradises, surrounding their magnificent villas, and enriched with all the luxuries that art and nature could produce, are now converted into noxious pestilential marshes and quagmires; and the Campagna di Roma, that formerly contained a million of inhabitants, would afford, at present, of itself, but a miserable subsistence to about five hundred. Notwithstanding this, the pope † is a considerable temporal prince: and some suppose that his annual revenue amounts to above a million sterling: other authors calculate it to be much higher. When we speak comparatively, the sum of a million sterling is too high a revenue to arise from his territorial possessions: his accidental income, which formerly far exceeded that sum, is now diminished, by the suppression of the order of the Jesuits, from whom he drew vast supplies, and the measures taken by the popish powers for preventing the great ecclesiastical issues of money to Rome. According to the best and latest accounts, the taxes upon the provisions and lodgings furnished to foreigners, who spend immense sums in visiting his dominions, form now the greatest part of his accidental revenues. Some late popes have aimed at the improvement of their territories, but their labours have had no great effect.

Modern Rome, which stands on Campus Martius, &c. is thirteen miles; and was supposed in 1787 to contain (according to Mr. Watkins) 160,000 inhabitants. Within its circuit there is a vast number of gardens and vineyards. It stands upon the Tiber, an inconsiderable river when compared to the Thames, and navigated by small boats, barges, and lighters. The castle of St. Angelo, though its chief fortress, would be

\* Hercules-Renaud, duke of Modena, born Nov. 22, 1727; married, April 16, 1741, to the princess of Massa Carara. Their issue, Mary-Beatrix, born April 29, 1750; married to Ferdinand, archduke of Austria, 1771.

† Pope Pius VI. (formerly count Braschi) was born at Cesena, Dec. 27, 1717; created a cardinal in 1773, elected pope Feb. 15, 1775; dethroned by the French Feb. 15, 1798; and died Aug. 19, 1799. Cardinal Chiaramonte, has lately been elected pope at Venice, and taken the title of Pius VII.

found to be of small strength, were it regularly besieged. The city standing upon the ruins of ancient Rome, lies much higher, so that it is difficult to distinguish the seven hills on which it was originally built. When we consider Rome as it now stands, there is the strongest reason to believe that it exceeds ancient Rome itself in the magnificence of its structure: nothing in the old city, when mistress of the world, could come in competition with St. Peter's church; and perhaps many other churches in Rome exceed, in beauty of architecture, and value of materials, utensils, and furniture, her ancient temples; though it must be acknowledged that the Pantheon must have been an amazing structure. No city, however, in its general appearance, can unite more magnificence and poverty than this, as adjoining the most superb palaces we see the meanest habitations; and temples, the boasted ornaments of antiquity, choked up by sheds and cottages. From the drawings of this city Mr. Watkins expected to see the streets at least as broad as in London, but was disappointed. Il Corso, the principal and most admired, is but little wider than St. Martin's-lane; but this mode of building their streets so narrow, is done with a view of intercepting, as much as possible, the sun's heat. The inhabitants of Rome, in 1714, amounted to 143,000. If we consider that the spirit of travelling is much increased since that time, we cannot reasonably suppose them to be diminished at present.

There is nothing very particular in the pope's temporal government at Rome. Like other princes, he has guards, or sbirri, who take care of the peace of the city, under proper magistrates, both ecclesiastical and civil. The Campagna di Roma, which contains Rome, is under the inspection of his holiness. In the other provinces he governs by legates and vice-legates. He monopolises all the corn in his territories, and has always a sufficient number of troops on foot, under proper officers, to keep the provinces in awe.

Next to Rome, Bologna, the capital of the Bolognese, was the most considerable city in the ecclesiastical state, and an exception to the indolence of its other inhabitants. The government was under a legate *a latere*, who was always a cardinal, and changed every three years. It is now annexed to the Cisalpine republic. The rest of the ecclesiastical state contains many towns celebrated in ancient history, and even now exhibiting the most striking vestiges of their flourishing state about the beginning of the 16th century; but they are at present little better than desolate, though here and there a luxurious magnificent church and convent may be found, which is supported by the toil and sweat of the neighbouring peasants.

The grandeur of FERRARA, RAVENNA, RIMINI, URBINO (the native city of the celebrated painter Raphael), ANCONA, and many other states and cities illustrious in former times, are now to be seen only in their ruins and ancient history. LORETTO, on the other hand, an obscure spot never thought or heard of in times of antiquity, became the admiration of the world, for the riches it contained, and the prodigious resort to it of pilgrims, and other devotees, from a notion industriously propagated by the Romish clergy, that the house in which the Virgin Mary is said to have dwelt at Nazareth, was carried thither through the air by angels, attended with many other miraculous circumstances, such as that all the trees, on the arrival of the sacred mansion, bowed with the profoundest reverence; and great care is taken to prevent any bits of the materials of this house from being carried to other places, and exposed as relics, to the prejudice of Loretto. The image of the Virgin Mary, and of the divine infant, are of cedar, placed in a small apartment, fe-

parated from the others by a silver balustrade, which has a gate of the same metal. It is impossible to describe the gold chains, the rings and jewels, emeralds, pearls, and rubies, wherewith this image is or was loaded; and the angels of solid gold, who are here placed on every side, were equally enriched with the most precious diamonds. To the superstition of Roman catholic princes Loretto is indebted for this mass of treasure. It has been a matter of surprize, that no attempt has been made by the Turks or Barbary states upon Loretto, especially as it is badly fortified, and stands near the sea; but it is now generally supposed, that the real treasure is withdrawn, and metals and stones of less value substituted in its place.

The king of NAPLES and SICILY, or, as he is more properly called, the king of the Two Sicilies (the name of Sicily being common to both), is possessed of the largest dominions of any prince in Italy, as they comprehend the ancient countries of Samnium, Campania, Apulia, Magna-Græcia, and the island of Sicily, containing in all about 32,000 square miles. They are bounded on all sides by the Mediterranean and the Adriatic, except on the north-east, where Naples terminates on the ecclesiastical state. The Apennine runs through it from north to south; and its surface is estimated at 3,500 square leagues. The air is hot, and the soil fruitful of every thing produced in Italy. The wines called *Vino Greco*, and *Lacrymæ Christi*, are excellent. The city of Naples, its capital, which is extremely superb, and adorned with all the profusion of art and riches, and its neighbourhood, would be one of the most delightful places in Europe to live in, were it not for their vicinity to the volcano of Vesuvius, which sometimes threatens the city with destruction, and the soil being pestered with insects and reptiles, some of which are venomous. The houses in Naples are inadequate to the population, but in general are five or six stories in height, and flat at the top; on which are placed numbers of flower vases, or fruit trees in boxes of earth, producing a very gay and agreeable effect. Some of the streets are very handsome: no street in Rome equals in beauty the *Strada di Toledo*, at Naples; and still less can any of them be compared with those beautiful streets that lie open to the bay. The richest and most commodious convents in Europe, both for male and female votaries, are in this city; the most fertile and beautiful hills of the environs are covered with them: and a small part of their revenue is spent in feeding the poor, the monks distributing bread and soup to a certain number every day before the doors of the convents.

Though above two-thirds of the property of the kingdom are in the hands of the ecclesiastics, the protestants live here with great freedom; and though his Neapolitan majesty presents to his holiness every year a palfrey, as an acknowledgment that his kingdom is a fief of the pontificate, yet no inquisition is established in Naples. The present revenues of that king amount to above 750,000*l.* sterling a year. The exports of the kingdom are legumes, hemp, aniseeds, wool, oil, wine, cheese, fish, honey, wax, manna, saffron, gums, capers, macaroni, salt, pot-ash, flax, cotton, silk, and divers manufactures. The king has a numerous but generally poor nobility, consisting of princes, dukes, marquises, and other high-sounding titles; and his capital, by far the most populous in Italy, contains at least 350,000 inhabitants. Among these there are 30,000 *lazaroni*, or black-guards, the greater part of which have no dwelling-houses, but sleep every night in summer under porticos, piazzas, or any kind of shelter they can find, and in the winter or rainy time of the year, which lasts several weeks, the rain falling by pailfuls, they

resort to the caverns under Capo di Monte, where they sleep in crowds like sheep in a penfold. Those of them who have wives and children, live in the suburbs of Naples, near Posilipo, in huts, or in caverns, or chambers dug out of that mountain. Some gain a livelihood by fishing, others by carrying burthens to and from the shipping; many walk about the streets ready to run on errands, or to perform any labour in their power for a very small recompense. As they do not meet with constant employment, their wages are not sufficient for their maintenance: but the deficiency is in some degree supplied by the soup and bread which are distributed at the doors of the convents.

But though there is so much poverty among the lower people, there is a great appearance of wealth among some of the great. The Neapolitan nobility are excessively fond of show and splendour. This appears in the brilliancy of their equipages, the number of their attendants, the richness of their dress, and the grandeur of their titles. According to a late traveller (Mr. Swinburne) luxury of late hath advanced with gigantic strides in Naples. Forty years ago, the Neapolitan ladies wore nets and ribbands on their heads, as the Spanish women do to this day, and not twenty of them were possessed of a cap: but hair plainly drest is a mode now confined to the lowest order of inhabitants, and all distinction of dress between the wife of a nobleman and that of a citizen is entirely laid aside. Expense and extravagance are here in the extreme.

Through every spot of the kingdom of Naples, the traveller may be said to tread on classic ground, and no country presents the eye with more beautiful prospects. There are still traces of the memorable town of Cannæ, as fragments of altars, cornices, gates, walls, vaults, and underground granaries; and the scene of action between Hannibal and the Romans is still marked out to posterity, by the name of *pezzo di sangue*, "field of blood." Taranto, a city that was once the rival of Rome, is now remarkable for little else than its fisheries. Sorrento is a city placed on the brink of steep rocks, that overhang the bay, and, of all the places in the kingdom, has the most delightful climate. Noia, once famous for its amphitheatre, and as the place where Augustus Cæsar died, is now hardly worth observation.

Brundisium, now Brindisi, was the great supplier of oysters for the Roman tables. It has a fine port, but the buildings are poor and ruinous; and the fall of the Grecian empire under the Turks reduced it to a state of inactivity and poverty, from which it has not yet emerged. Except Rome, no city can boast of so many remains of ancient sculpture as Benevento: here the arch of Trajan, one of the most magnificent remains of Roman grandeur, out of Rome, erected in the year 114, is still in tolerable preservation. Reggio contains nothing remarkable but a Gothic cathedral. It was destroyed by an earthquake before the Marston war, and rebuilt by Julius Cæsar; part of the wall still remains, and was much damaged by the earthquake in 1783, but not destroyed: only 126 persons lost their lives out of 16,000 inhabitants. The ancient city of Oppido was entirely ruined by the earthquake of the 5th of February, the greatest force of which seems to have been exerted near that spot, and at Casal Nuova, and Terra Nuova. From Trupezia to Squillace, most of the towns and villages were either totally or in part overthrown, and many of the inhabitants buried in the ruins. To ascertain the extent of the ravages, Sir William Hamilton, who surveyed it, gives the following description: "If on a map of Italy, and with your compasses on the scale of Italian miles,

or towns. Its capital, Cagliari, is a university, an archbishopric, and the seat of the viceroy, containing about 15,000 inhabitants. It is thought that his Sardinian majesty's revenues, from this island, do not exceed 5000*l*. sterling a year, though it yields plenty of corn and wine, and has a coral fishery. Its air is bad, from its marshes and high mountains on the north, and therefore was a place of exile for the Romans. It was formerly annexed to the crown of Spain, but at the peace of Utrecht was given to the emperor, and in 1719 to the house of Savoy.

The island of **CORSICA** lies opposite to the Genoese continent between the gulf of Genoa and the island of Sardinia, and is better known by the noble star which the inhabitants made for their liberty against their Genoese tyrants, and afterwards against the base and ungenerous efforts of the French to enslave them, than from any advantages they enjoyed from nature or situation. Though mountainous and woody, it produces corn, wine, figs, almonds, chestnuts, olives, and other fruits. It has also some cattle and horses, and is plentifully supplied, both by sea and rivers, with fish. The inhabitants are said to amount to 120,000. Bastia, the capital, is a place of some strength; though other towns of the island that were in possession of the malcontents, appear to have been but poorly fortified.

In the year 1794 it was taken by the English, and annexed to the crown of England. A constitution was framed for it, a viceroy appointed, and a parliament assembled. But it has since been retaken by, and still remains in the possession of, the French.

**CAPRI**, the ancient **CAPREA**, is an island to which Augustus Cæsar often came for his health and recreation, and which Tiberius made a scene of the most infamous pleasures. It lies three Italian miles from that part of the main land which projects farthest into the sea. It extends four miles in length from East to West, and about one in breadth. The western part is, for about two miles, a continued rock, vastly high, and inaccessible next the sea; yet Anacapri, the largest town of the island, is situated here; and in this part are several places covered with a very fruitful soil. The eastern end of the island also rises up in precipices that are nearly as high, though not quite so long, as the western. Between the rocky mountains, at each end, is a slip of lower ground that runs across the island, and is one of the pleasiest spots that can easily be conceived. It is covered with myrtles, olives, almonds, oranges, figs, vineyards, and corn-fields, which look extremely fresh and beautiful, and afford a most delightful little landscape, when viewed from the tops of the neighbouring mountains. Here is situated the town of Caprea, two or three convents, and the bishop's palace. In the midst of this fertile tract rises a hill, which in the reign of Tiberius was probably covered with buildings, some remains of which are still to be seen. But the most considerable ruins are at the very extremity of the eastern promontory.

From this place there is a very noble prospect; on one side of it the sea extends farther than the eye can reach; just opposite is the green promontory of Sarentum, and on the other side the bay of Naples.

**ISCHIA**, and some other islands on the coasts of Naples and Italy, having nothing to distinguish them but the ruins of their antiquities, and their being now beautiful summer retreats for their owners. Elba has been renowned for its mines from a period beyond the reach of history. Virgil and Aristotle mention it. Its situation is about ten miles south-west from Tuscan, and it is 80 miles in circumference, containing near 7000 inhabitants. It is divided between the king of Naples, to whom Porto Longone belongs, the great duke of Tuscan, who is

master of Porto Ferrajo, and the prince of Piombino. The fruits and wine of the island are very good, and the tannery, fisheries, and salt, produced a good revenue.

**LIPARI ISLANDS.** These islands lie to the north of Sicily, and were anciently called the *Æolian islands*. They are twelve in number, viz. Lipari, Stromboli, Vulcano, Saline, Felicuda, Alicuda, Panaria, Vulcanello, Basiluzzo, Lisca Bianca, Dattolo, and Fila Navi. They are subject to the king of Naples, and produce great quantities of alum, sulphur, nitre, cinnabar, and most kinds of fruits, particularly raisins, currants, and figs, in great perfection. Some of their wines are much esteemed, especially the *Malvasia* or *Malmsey*. Great quantities of pumice are exported from Lipari. All these islands are of volcanic origin, and Stromboli has a considerable volcano, which is remarkable for being continually in a state of eruption. The number of inhabitants in Lipari amount to between 9 and 10,000, and those of Stromboli to about 1000; but Vulcano is uninhabited, and several of the other islands are little more than barren rocks.

We shall here mention the isle of **MALTA**, though it is not properly ranked with the Italian islands. It was formerly called *Melita*, and is situated in 15 degrees E. long. and 36 degrees N. lat. 60 miles south of Cape Passaro in Sicily. It is of an oval figure, 20 miles long, and 12 broad. The air is clear, but excessively hot: the whole island seems to be a white rock, covered with a thin surface of earth, which is however amazingly productive of excellent fruits and vegetables. This island, or rather rock, was given to the knights of St. John of Jerusalem in 1530, by the emperor Charles V. when the Turks drove them out of Rhodes, under the tender of one falcon, yearly to the viceroy of Sicily, and to acknowledge the kings of Spain and Sicily for their protectors: they are now known by the distinction of the knights of Malta. They are under vows of celibacy and chastity; but they keep the former much better than the latter. They have considerable possessions in the Roman catholic countries on the continent, and are under the government of a grand-master, who is elected for life. The lord prior of the order was formerly accounted the prime baron in England. The knights are in number 1000: 500 are to reside on the island, the remainder are in their seminaries in other countries, but at any summons are to make a personal appearance. They had a seminary in England, till it was suppressed by Henry VIII. but they now give to one the title of grand prior of England. They were considered as the bulwark of Christendom against the Turks on that side. They wear the badge of the order, a gold cross of eight points enamelled white, pendant to a black-watered ribband at the breast, and the badge is decorated so as to distinguish the country of the knight. They are generally of noble families, or such as can prove their gentility for six descents, and are ranked according to their nations. There are sixteen called the great-crosses, out of whom the officers of the order, as the marshal, admiral, chancellor, &c. are chosen. When the great-master dies, they suffer no vessel to go out of the island till another is chosen, to prevent the pope from interfering in the election. Out of the sixteen great-crosses the great-master is elected, whose title is, "The most illustrious, and most reverend prince, the lord friar A. B. great-master of the hospital of St. John of Jerusalem, prince of Malta and Gaza." All the knights are sworn to defend the church, to obey their superiors, and to live on the revenues of their order only. Not only

their chief town Valletta, or Malta, and its harbour, but the whole island, is so well fortified as to be deemed impregnable. On the 18th of September there is an annual procession at Malta in memory of the Turks raising the siege on that day, 1563, after four months assault, leaving their artillery, &c. behind.

In the beginning of June, 1798, the island of Malta was surrendered to the French under Buonaparte, who landed there a body of troops from the fleet then on its passage for Egypt.

ARMS AND ORDERS.] The chief armorial bearings in Italy are as follow: The pope, as sovereign prince over the land of the church, bears for his escutcheon, gules, consisting of a long headcape, or, surmounted with a cross, pearled and garnished with three royal crowns, together with the two keys of St. Peter, placed in saltier. The arms of Tuscany, or, five roundles, gules, two, two, and one, and one in chief, azure, charged with three fleurs-de-lis, or. Those of Venice, azure, a lion winged, sejant, or, holding under one of his paws a book covered, argent. Those of Genoa, argent, a cross, gules, with a crown closed for the island of Corsica; and for supporters two griffins, or. The arms of Naples are, azure, semée of fleur-de-lis, or, with a label of five points, gules.

The "order of St. Januarius" was instituted by the late king of Spain, when king of Naples, in July 1738. The number of knights is limited to thirty, and after the present sovereign, that office of the order is to be possessed by the kings of Naples. All the knights must prove the nobility of their descent for four centuries, and are to be addressed by the title of excellency. St. Januarius, the celebrated patron of Naples, is the patron of this order. The "order of Annunciation" was instituted in the year 1355, by Amadeus V. count of Savoy, in memory of Amadeus I. who bravely defended Rhodes against the Turks, and won those arms which are now borne by the dukes of Savoy: "gules, a cross argent." It is counted among the most respectable orders in Europe: the knight must be of a noble family, but also a papist. In the year 1572, Emanuel Philibert, duke of Savoy, instituted the "order of St. Lazarus," and revived and united to it the obsolete order of St. Maurice; which was confirmed by the pope, on the condition of maintaining two galleys against the Turks.

In the year 828 it is pretended that the body of St. Mark was removed from Alexandria, in Egypt, to Venice. Accordingly, this saint hath been taken for their tutelar saint and guardian, and his picture was formerly painted on their ensigns and banners. When the "order of St. Mark" was first instituted is uncertain, but it was an honour conferred by the doge or duke of Venice and the senate, on persons of eminent quality, or who had done some signal service to the republic. The knights, when made, if present, were dubbed with a sword on their shoulders, the duke saying "*Esto miles fidelis*" (be a faithful soldier). Absent persons were invested by letters patent; but their title, "*Knights of St. Mark*," is merely honorary: they have no revenue, nor are they under any obligation by vows as other orders. About the year 1460, Frederic III. emperor of Germany, instituted the "order of St. George," and dedicated it to St. George, tutelar saint and patron of Genoa. The doge is perpetual grand-master. The badge, a plain cross enamelled, gules, pendant to a gold chain, and worn about their necks. The cross is also embroidered on their cloaks. In the year 1561, Casimir of Medicis, first grand-duke of Tuscany, instituted the "order of St. Stephen," in memory of a victory which secured to him the sovereignty of that pro-

vince. He and his successors were to be the grand-masters. The knights are allowed to marry, and their two principal conventual houses are at Pisa. It is a religious as well as military order, but the knights of justice and the ecclesiastics are obliged to make proof of nobility of four descents. They wear a red cross with right angles, crled or, on the left side of their habit, and on their mantle.

The "order of the *Holy Ghost*" was founded with their chief seat, the hospital of that name in Rome, by pope Innocent III. about the year 1198. They have a grand-master, and profess obedience, chastity, and poverty. Their revenue is estimated at 24,000 ducats daily, with which they entertain strangers, relieve the poor, train up deserted children, &c. Their ensign is a white patriarchal cross with twelve points, sewed on their breast on the left side of a black mantle. The "order of *Jesus Christ*," instituted by pope John XXII. was reformed and improved by pope Paul V. The reigning pope was to be always sovereign of it, and it was designed as a mark of distinction for the pope's Italian nobility, but on account of its frequent prostitution, it has fallen into discredit. The "order of the *Golden Spur*" is said to have been instituted by pope Pius IV. 1559, and to have been connected with the "order of Pius," instituted a year afterwards; but the badges were different. The knights of Pius are suppressed, and all that the knights of the Golden Spur have preserved to themselves, is the title of counts of the sacred palace of the Lateran. The badge is a star of eight points, white, and between the two bottom points, a spur, gold.

**HISTORY.** Italy was probably first peopled from Greece, as we have mentioned in the introduction, to which we refer the reader for the ancient history of this country, which, for many ages, gave law to the then known world, under the Romans.

The empire of Charlemagne, who died in 814, soon experienced the same fate with that of Alexander. Under his successors it was in a short time entirely dismembered. His son, Louis the Debonair, succeeded to his dominions in France and Germany, while Bernard, the grandson of Charlemagne reigned over Italy and the adjacent islands. But, Bernard having lost his life by the cruelty of his uncle, against whom he had levied war, and Louis himself dying in 840, his dominions were divided among his sons Lothario, Louis, and Charles. Lothario, with the title of emperor, retained Italy, Provence, and the fertile countries situated between the Saone and the Rhine; Louis had Germany; and France fell to the share of Charles, the youngest of the three brothers. Shortly after this, Italy was ravaged by different contending tyrants; but in 964, Otho the Great re-united Italy to the imperial dominions. Italy afterwards suffered much by the contests between the popes and the emperors; it was harassed by wars and internal divisions; and at length various principalities and states were erected under different heads.

Savoy and Piedmont, in time, fell to the lot of the counts of Maurienne, the ancestors of his present Sardinian majesty, whose father became king of Sardinia, in virtue of the quadruple alliance concluded in 1718\*.

The great duchy of Tuscany belonged to the emperor of Germany, who governed it by deputies to the year 1240, when the famous distinctions of the Guelphs, who were the partisans of the pope, and the Gibellines, who were in the emperor's interest, took place. The popes then persuaded the imperial governors in Tuscany to put themselves under the protection of the church; but the Florentines in a short time formed themselves into a free commonwealth, and bravely defended their liberties against both parties by turns. Faction at last shook their freedom; and the family of Medici, long before they were declared either princes or dukes, in fact governed Florence, though the rights and privileges of the people seemed still to exist. The Medici, particularly Cosmo, who was deservedly called the Father of his Country, being in the secret, shared with the Venetians in the immense profits of the East-India trade, before the discoveries made by the Portuguese. His revenue in ready money, which exceeded that of any sovereign prince in Europe, enabled his successors to rise to sovereign power; and pope Pius V. gave one of his descendants (Cosmo, the great patron of the arts) the title of great-duke of Tuscany in 1570, which continued in his family to the death of Gaston de Medicis in 1737, without issue. The great-duchy was then claimed by the emperor Charles VI. as a fief of the empire, and given to his son-in-law, the duke of Lorraine (afterwards emperor, and father of Joseph II.) in lieu of the duchy of Lorraine, which was ceded to France by treaty. Leopold, his second son (brother and successor to the emperor Joseph II.) upon the death of his father, became grand-duke. When he succeeded to the imperial crown, his son Ferdinand entered upon the sovereignty of the grand-duchy of Tuscany, who has now succeeded his father in the empire of Germany. Leghorn, which belongs to him, carries on a great trade: and several ships of very considerable force are now stationed on the Tuscan coasts to prevent the depredations of the infidels.

No country has undergone greater vicissitudes of government than Naples or Sicily, chiefly owing to the inconstancy of the natives, which seems to be incorporated with their air. Christians and Saracens by turns conquered it. The Normans under Tancred drove out the Saracens, and by their connections with the Greeks, established there, while the rest of Europe was plunged in monkish ignorance, a most respectable monarchy flourishing in arts and arms. About the year 1166, the popes being then all-powerful in Europe, their intrigues broke into the succession of Tancred's line, and Naples and Sicily at last came into the possession of the French; and the house of Anjou, with some interruptions and tragical revolutions, held it till the Spaniards drove them out in 1501, and it was then annexed to the crown of Spain.

The government of the Spaniards under the Austrian line was so oppressive, that it gave rise to the famous revolt, headed by Massaniello, a young fisherman, without shoes or stockings, in the year 1647. His success was so surprising, that he obliged the haughty Spaniards to abolish the oppressive taxes, and to confirm the liberties of the people. Before these could be re-established perfectly, he turned delirious, through his continual agitations of body and mind, and he was put to death at

4. Victor-Emanuel-Cajetan, duc d'Aoste, born July 24, 1759; married, April 25, 1789, Maria-Theresa, niece to the present emperor.

5. Maurice-Joseph-Maria, duc de Montferriat, born September 12, 1762.

6. Maria-Charlotta, born January 17, 1764.

7. Charles-Joseph, duc de Genevois, born April 6, 1765.

8. Joseph-Benedict, comte de Maurienne, born October 5, 1766.

the head of his own mob. Naples and Sicily continued with the Spaniards till the year 1700, when the extinction of the Austrian line opened a new scene of litigation. In 1706, the archduke Charles, afterwards emperor, took possession of the kingdom. By virtue of various treaties, which had introduced Don Carlos, the king of Spain's son, to the possession of Parma and Placentia, a new war broke out in 1733, between the houses of Austria and Bourbon, about the possession of Naples; and Don Carlos was received into the capital, where he was proclaimed king of both Sicilies: this was followed by a very bloody campaign, but the farther effusion of blood was stopt by a peace between France and the emperor, to which the courts of Madrid and Naples at first demurred, but afterwards acceded in 1736, and Don Carlos remained king of Naples. Upon his accession to the throne of Spain, in 1759, it being found, by the inspection of physicians, and other trials, that his eldest son was by nature incapacitated for reigning, and his second being heir-apparent to the Spanish monarchy, he resigned the crown of Naples to his third son, Ferdinand IV. who married an archduchess of Austria\*.

The Milanese, the fairest portion of Italy, went through several hands; the Vicentis were succeeded by the Galezzos and the Sforzas; but fell at last into the hands of the emperor Charles V. about the year 1525, who gave it to his son, Philip II. king of Spain. It remained with that crown till the French were driven out of Italy, in 1703, by the imperialists. They were dispossessed of it in 1745; but by the emperor's cession of Naples and Sicily to the present king of Spain, it returned to the house of Austria, who governed it by a viceroy, till the late conquest of it by the French, and the establishment of the new Cisalpine republic, of which it forms the principal part.

The duchy of Mantua was formerly governed by the family of Gonzaga, who, adhering to France, the territory was forfeited, as a fief of the empire to the house of Austria. Guastalla was separated from it in 1748, and made part of the duchy of Parma.

The first duke of Parma was natural son to pope Paul III. the duchy having been annexed to the holy see in 1545, by pope Julius II. The descendants of the house of Farnese terminated in the late queen-dowager of Spain, whose son, his present catholic majesty, obtained the duchy, and his nephew now holds it, with the duchy of Placentia.

The Venetians were formerly the most formidable maritime power in Europe. In 1194, they conquered Constantinople itself, and held it for some time, together with great part of the continent of Europe and Asia. They were more than once brought to the brink of destruction, by the confederacies formed against them among the other powers of Europe, especially by the league of Cambray, in 1509, but were as often saved by the disunion of the confederates. The discovery of a passage to India, by the Cape of Good Hope, gave the first blow to their greatness, as it lost them the Indian trade. By degrees the Turks took from them their most valuable possessions on the continent; and so late as the year 1715

\* Ferdinand IV. king of the Two Sicilies, third son of his late catholic majesty, the king of Spain, born Jan. 12, 1751, ascended the throne October 5, 1759; and married, April 7, 1768, to the archduchess Maria-Carolina-Louisa, sister to the late emperor, by whom he has had issue 15 children, 10 of whom are living: among whom are,

1. Maria-Theresa, present empress of Germany, born June 6, 1771.
2. Theresa-Clementina, born November 23, 1775; married, September 17, 1790, the archduke Ferdinand.
3. Francis-Januarius, prince-royal, born August 17, 1777; married Maria-Clementina, the archduchess, September, 1790.

they lost the Morea. The Genoeze for so long a time, with the Venetians, were the only powers who were not subjected, by the French, to be crowned by what title. The victorious Austrians, after the peace of 1763, and the history of the present government establish. The history of the famous Matilda, part of Italy, who became famous pope Gregory XIII. well known by the name of Gregory XIII. to enter into a detail of that reformation. Even such, that the pope's public affairs, chief princes.

The papal power in present times, when it strides, the pope was more ceremony than a temporal principality. considerable caution powers against France incursion into his territory compelled him to submit to dictate. He paid a sum that such of the missionaries appointed away, and conveyed 1797, a riot happened that city, entered 1798, the tree of liberty and the Roman entered on the right the Roman republic published, and the posing a director in chief, in France, and 7

The pope renounced himself to be in his own rooms, and in a few days the morning of the

they lost the Morea. In 1797 the French seized upon the city of Venice, abolished its government, and soon after ceded it by treaty to the emperor, with a considerable part of its continental territory.

The Genoese for some time disputed the empire of the Mediterranean sea with the Venetians, but were seldom or never able to maintain their own independency by land, being generally protected, and sometimes subjected, by the French and imperialists. Their doge, or first magistrate, used to be crowned king of Corsica, though it does not clearly appear by what title. The successful effort they made in driving the victorious Austrians out of their capital, during the war, which was terminated by the peace of Aix-la-Chapelle, in 1748, has few parallels in history, and serves to show the effect of despair under oppression. Genoa has lately been revolutionised by France, and a new form of republican government established there.

The history of the papacy is connected with that of Christendom itself. The most solid foundations for its temporal power were laid by the famous Matilda, countess of Tuscany, and heiress to the greatest part of Italy, who bequeathed a large portion of her dominions to the famous pope Gregory VII. (who, before his accession in 1073, was so well known by the name of Hildebrand). It would be too tedious here to enter into a detail of the ignorance of the laity, and the other causes that operated to the aggrandisement of the papacy, previous to the reformation. Even since that æra, the state of Europe has been such, that the popes have had more than once great weight in its public affairs, chiefly through the weakness and bigotry of temporal princes.

The papal power is evidently now nearly extinct. Even before the present times, when innovation and revolution have made such rapid strides, the pope was treated by Roman-catholic princes with very little more ceremony than is due to him as bishop of Rome, and possessed of a temporal principality. In the present war, though he acted with considerable caution and moderation, he co-operated with the allied powers against France: in consequence of which, the French made an incursion into his territories, where they met with little resistance, and compelled him to sign a peace on such terms as they thought proper to dictate. He paid a considerable contribution in money; and consented that such of the most valuable statues and pictures in Rome, as commissioners appointed for that purpose should select, should be carried away, and conveyed to Paris. But about the latter end of December, 1797, a riot happening at Rome, in which the French general Duphot was killed, the French army, under general Berthier, marched against that city, entered it without resistance, and, on the 15th of February, 1798, the tree of liberty was planted, the papal government abolished, and the Roman people declared by the French commander to have entered on the rights of sovereignty, and to constitute what was termed the Roman republic. On the 20th of March the new constitution was published, and the government declared to be vested in five consuls, composing a directory under the direction of the French general as commander in chief, 32 senators, corresponding to the council of ancients in France, and 72 tribunes, called the representatives of the people.

The pope remained in Rome when the French entered it, and suffered himself to be made a prisoner by them. They confined him to his own rooms, and put the seal of confiscation on every thing he had; but in a few days they resolved that he should be sent from Rome, and on the morning of the 20th of February he left that city, accompanied by

a body of French cavalry, who escorted him to Sienna in Tuscany; whence, on the 26th of May, he was removed to a Carthusian convent within two miles of Florence; from which, after the recommencement of hostilities with the allies, he was again removed to Grenoble and Valence in France, at which latter town he died on the 19th of August, 1799. In the beginning of December a conclave was held at Venice, and, on the 13th of March following, cardinal Chiaramonti was elected to the papal chair.

In November, 1798, the king of Naples commenced hostilities against the French, attacked the new Roman republic, and entered Rome in triumph. But this success was quickly followed by a fatal reverse. The French, collecting their forces, not only soon regained Rome, but totally defeated the Neapolitan army, made themselves masters of the city of Naples, and compelled its sovereign to take refuge in the island of Sicily. The successes which attended the arms of the Austrians and Russians in the campaign of 1799, aided by the powerful co-operation of the English fleet under lord Nelson, have, however, again expelled the French both from Naples and Rome, though the king of the Two Sicilies has not yet thought it expedient to return to his capital.

The late pope, John Angelo Braschi, who took upon him the name of Pius VI. was born at Cesena, December 27, 1717; elected pope February 15, 1775; dethroned by the French, February 15, 1798; and died at Valence, August 19, 1799.

Gregory Barnabas Chiaramonti, the present pope, who has assumed the name of Pius VII. was born at Cesena, August 14, 1742, and elected pope, at Venice, March 13, 1800.

**SOIL, AIR, SEASONS, AND WATER.]** Nature has lavished upon the inhabitants of Turkey all her blessings in those four particulars. The soil, though unimproved, is luxuriant beyond description. The air is salubrious, and friendly to the imagination, unless when it is corrupted from the neighbouring countries, or through the indolence and uncleanness of the Turkish manner of living. The seasons are here regular and pleasant, and have been celebrated from the remotest times of antiquity. The Turks are invited to frequent bathings, by the purity and wholesomeness of the water all over their dominions.

**MOUNTAINS.]** These are the most celebrated of any in the world, and, at the same time, often the most fruitful. Mount Athos stands on a peninsula, running into the Ægean Sea; the mounts Pindus and Olympus, celebrated in Grecian fables, separate Thessaly from Epirus. Parnassus, in Achaia, so famous for being consecrated to the Muses, is well-known. Mount Hæmus is likewise often mentioned by the poets; but most of the other mountains have changed their names; witness the

after the model of that of Venice. The government is in the hands of the nobility and the chief of the republic, who is styled rector, is changed every month, and elected by scrutiny or lot. During his short administration, he lives in the palace and wears a ducal habit. As the Ragusans are unable to protect themselves, they make use of their wealth to procure them protectors, the chief of whom, for many years, was the grand signor. They endeavour also to keep upon good terms with the Venetians, and other neighbouring states. But in the year 1783, a dispute arose between them and the king of Naples, respecting a claim of right to his appointing a commander of the Ragusan troops. It was terminated by the republic's putting itself under that king's protection. The city of Ragusa is not above two miles in circumference, but it is well built, and contains some handsome edifices. The ancient Epidaurus was situated not far from this city. The Ragusans profess the Romish religion, but Greeks, Armenians, and Turks, are tolerated. Almost all the citizens are traders, and they keep so watchful an eye over their freedom, that the gates of the city of Ragusa are allowed to be open only a few hours in the day. The language chiefly in use among the Ragusans is the Slavonian, but the greatest part of them speak the Italian. They have many trading vessels, and are great carriers in the Mediterranean, like the Dutch, being constantly at peace with the piratical states of Barbary. The cities of Gravosa and Stagno, 50 miles N.E. of Ragusa, are within the territories of this republic, and there are also five small islands belonging to it, the principal of which is Melida.

mountains Shua, Witofka, Staras, Plamina, and many others. Even the most celebrated mountains above mentioned, have modern names imposed upon them by the Turks, their new masters, and others in their neighbourhood.

SEAS.] The Euxine, or Black Sea; the Palus Mæotis, or Sea of Asoph; the Sea of Marmora, which separates Europe from Asia; the Archipelago; the Ionian Sea, and the Levant, are so many evidences that Turkey in Europe, particularly that part of it where Constantinople stands, of all other countries, had the best claim to be mistress of the world.

STRAITS.] Those of the Hellespont and Bosphorus are joined to the Sea of Marmora, and are remarkable in modern as well as in ancient history. The former, viz. the Hellespont, or Dardanelles, is only two miles and a half in breadth, and is famous for the passage of Xerxes over it, when about to invade Greece, and of Alexander in his expedition against Asia. The former, for the more easy transportation of his numerous forces, laid a bridge of boats over it. It is also celebrated by the poets in the story of two lovers, Hero and Leander, of whom, the latter swam across it to his mistress, but one night was unhappily drowned. The Bosphorus is about the same breadth, but has not been so much celebrated by historians and poets.

RIVERS.] The Danube, the Save, the Neister, the Dneiper, and the Don, are the best known rivers in this country; though many others have been celebrated by poets and historians.

LAKES.] These are not extremely remarkable, nor are they mentioned with any great applause, either by the ancients or moderns. The Lago di Scutari lies in Albania. It communicates with the Lago di Plave, and the Lago di Holti. The Stymphalus, so famous for its harpies and ravenous birds, lies in the Morea; and the Peneus, from its qualities, is thought to be the lake from which the Styx issues, conceived by the ancients to be the passage into hell.

METALS AND MINERALS.] Turkey in Europe contains a variety of all sorts of mines; and its marbles are esteemed the finest in the world.

VEGETABLE PRODUCTIONS.] These are excellent all over the European Turkey, especially when assisted by the smallest degree of industry. Besides pot and garden herbs of almost every kind, this country produces, in great abundance and perfection, oranges, lemons, citrons, pomegranates, grapes of an uncommon sweetness, excellent figs, almonds, olives, and cotton. Besides these, many drugs, not common in other parts in Europe, are produced here.

ANIMALS.] The Thessalian or Turkish horses are excellent both for their beauty and service. The black cattle are large, especially in Greece. The goats are a most valuable part of the animal creation to the inhabitants, for the nutrition they afford, both of milk and flesh. The large eagles which abound in the neighbourhood of Badadagi furnish the best feathers for arrows for the Turkish archers, and they sell at an uncommon price. Partridges are very plentiful in Greece; as are all other kinds of fowls and quadrupeds all over Turkey in Europe: but the Turks and Mahometans in general are not very fond of animal food.

ANTIQUITIES AND CURIOSITIES, } Almost every spot of ground,  
NATURAL AND ARTIFICIAL. } every river, and every fountain  
in Greece, presents the traveller with the ruins of a celebrated antiquity. On the isthmus of Corinth, the ruins of Neptune's temple, and the theatre where the Isthmian games were celebrated, are still visible. Athens, which contains at present above 10,000 inhabitants, is a fruitful

source of the most magnificent and celebrated antiquities in the world; a minute account of which would exceed the limits of this work; but it will be proper to mention some of the most considerable. Among the antiquities of this once superb city, are the remains of the temple of Minerva, built of white marble, and encompassed with forty-six fluted columns of the Doric order, forty-two feet high, and seven feet and a half in circumference: the architrave is adorned with basso relievos, admirably executed, representing the wars of the Athenians. To the south-east of the Acropolis, a citadel which defends the town, are seventeen beautiful columns of the Corinthian order, thought to be the remains of the emperor Adrian's palace. They are of fine white marble, about fifty feet high, including the capitals and bases. Just without the city stands the temple of Theseus, surrounded with fluted columns of the Doric order: the portico at the west end is adorned with the battle of the Centaurs, in basso-relievo; that at the east end appears to be a continuation of the same history: and on the outside of the porticos, in the spaces between the triglyphs, are represented the exploits of Theseus. On the south-west of Athens is a beautiful structure, commonly called the Lantern of Demosthenes: this is a small round edifice of white marble, the roof of which is supported by six fluted columns of the Corinthian order, nine feet and a half high; in the space between the columns are pannels of marble; and the whole is covered with a cupola, carved with the resemblance of scales: and on the frieze are beautifully represented, in relievo, the labours of Hercules. Here are also to be seen the temple of the Winds, the remains of the theatre of Bacchus, of the magnificent aqueduct of the emperor Adrian, and of the temples of Jupiter Olympius and Augustus. The remains of the temple of the oracle of Apollo are still visible at Castri, on the south side of Mount Parnassus, and the marble steps that descend to a pleasing running water, supposed to be the renowned Castalian spring, with the niches for statues in the rock, are still discernible. The famous cave of Trophonius is still a natural curiosity in Livadia, the old Bœotia.

Mount Athos, which has been already mentioned, and which is commonly called Monte Santo, lies on a peninsula which extends into the Ægean Sea, and is indeed a chain of mountains, reaching the whole length of the peninsula, seven Turkish miles in length, and three in breadth; but it is only a single mountain that is properly called Athos. This is so lofty, that on the top, as the ancients relate, the sun-rising was beheld four hours sooner than by the inhabitants of the coast: and, at the solstice, its shade reached into the Agora or market-place of Myrina, a town in Lemnos, which island was distant eighty-seven miles eastward. There are twenty-two convents on Mount Athos, besides a great number of cells and grottos, with the habitations of no less than six thousand monks and hermits; though the proper hermits, who live in grottos, are not above twenty: the other monks are anchorites, or such as live in cells. These Greek monks, who call themselves the inhabitants of the holy mountains, are so far from being a set of slothful people, that, besides their daily offices of religion, they cultivate the olive and vineyards, are carpenters, masons, stone-cutters, cloth-workers, tailors, &c. They also live a very austere life; their usual food, instead of flesh, being vegetables, dried olives, figs, and other fruit; onions, cheese, and, on certain days, Lent excepted, fish. Their fasts are many and severe; which, with the healthfulness of the air, renders longevity so common there, that many of them live above a hundred years. It appears from Ælian, that anciently the mountain in general, and particularly the

summit, was accustomed whence the inhabitants farther informed of philosophers upon the plation of the head doubtless built the

CITIES.] Constantinople on the European side of the ancient Byzantium, came afterwards to be the destructive rage as the most beautiful Gothic ages, in which emperors, it was in manners and a East Indies. summit, was accounted very healthy, and conducive to long life; whence the inhabitants were called Macrobii, or long-lived. We are farther informed by Philostratus, in the life of Apollonius, that numbers of philosophers used to retire to this mountain, for the better contemplation of the heavens and of nature; and after their example the monks doubtless built their cells.

CITIES.] Constantinople, the capital of this great empire, is situated on the European side of the Bosphorus. It was built upon the ruins of the ancient Byzantium, by the Roman emperor Constantine the Great; as a more inviting situation than Rome, for the seat of empire. It became afterwards the capital of the Greek empire; and having escaped the destructive rage of the barbarous nations, it was the greatest as well as the most beautiful city in Europe, and the only one, during the Gothic ages, in which there remained any image of the ancient elegance in manners and arts. While it remained in the possession of the Greek emperors, it was the only mart in Europe for the commodities of the East Indies. It derived great advantages from its being the rendezvous of the crusaders; and being then in the meridian of its glory, the European writers, in the ages of the crusades, speak of it with astonishment. Constantinople is at this day one of the finest cities in the world by its situation and its port. The prospect from it is noble. The most regular part is the Beseftin, inclosed with walls and gates, where the merchants have their shops excellently ranged. In another part of the city is the Hippodrome, an oblong square of 400 paces by 100, where they exercise on horseback. The Meidan, or parade, is a large spacious square, the general resort of all ranks. On the opposite side of the port are four towns, but considered as a part of the suburbs, their distance being so small a person may easily be heard on the other side. They are named Pera, Galata, Pacha, and Tophana. In Pera the foreign ambassadors and all the Franks or strangers reside, not being permitted to live in the city. Galata also is mostly inhabited by Franks or Jews, and is a place of great trade. The city abounds with antiquities. The tomb of Constantine the Great is still preserved. The mosque of St. Sophia, once a Christian church, is thought in some respects to exceed, in grandeur and architecture, St. Peter's at Rome. The city is built in a triangular form, with the seraglio standing on a point of one of the angles, from whence there is a prospect of the delightful coast of the Lesser Asia, which is not to be equalled. When we speak of the seraglio, we do not mean the apartments in which the grand signor's women are confined, as is commonly imagined, but the whole inclosure of the Ottoman palace, which might well suffice for a moderate town. The wall which surrounds the seraglio is thirty feet high, having battlements, embrasures, and towers, in the style of ancient fortifications. There are in it nine gates, but only two of them magnificent; and from one of these the Ottoman court takes the name of the *Porte*, or the *Sublime Porte*, in all public transactions and records. Both the magnitude and population of Constantinople have been greatly exaggerated by credulous travellers. It is surrounded by a high and thick wall, with battlements after the Oriental manner, and towers, defended by a lined but shallow ditch, the works of which are double on the land side. Some authors have estimated it to contain above 800,000 inhabitants, and others 600,000, but, according to Mr. Dallaway, do not exceed 400,000, including the suburbs of Galata, Pera, Tophana, and Scutari. Of these 200,000 are Turks, 100,000 Greeks, and the remainder Jews, Armenians, and Franks of all the European nations. The city has frequently suffered

great damage by fires, either owing to the narrowness of the streets and the structure of the houses, or the practices of the janisaries, who, it is said, fire the city as often as they are discontented with the government. In August, 1784, a fire broke out in the quarter situated towards the harbour, and spread into other quarters, and about 10,000 houses (most of which had been rebuilt since the fire in 1782) were consumed.

Opposite to the seraglio, on the Asiatic side, and about a mile and a half distant, across the water, is Scutari, adorned with a royal mosque, and a pleasant house of the grand signor. On the brow of an adjacent hill is a grand prospect, embracing in one view the city of Constantinople, the suburbs Galata and Pera, the small seas of the Bosphorus and Propontis, with the adjacent countries on each shore.

As to the population, manners, religion, government, revenues, learning, military strength, commerce, and manufactures of the Turks, these depending on the same principles all over the empire, shall be mentioned under Turkey in Asia.

**CRIM-TARTARY, or the CRIMEA,** is the ancient Taurica Chersonesus, and is a peninsula, lying on the Euxine, or Black Sea, by which it is bounded on the west and south, and on the east and north-east by that of Afoph. It is between forty-four and forty-six degrees north latitude, and thirty-four and thirty-seven degrees of east longitude.

This peninsula was esteemed a part of Turkey in Europe, until it was ceded to Russia, in consequence of the peace in 1784. Many cities were built on it by the Greeks, particularly those of Cherson, Theodosia, Panticapeum, and some others, which carried on a great trade with the Scythians, as well as with the Greek cities on the continent.

The most considerable rivers in the Crimea are those of Karasu and Salagir, both of which take an easterly course.

Of the towns in this part of the world we have but very slight descriptions; and indeed where the country has been so often the seat of war, and the inhabitants are still so rude, very little can be expected from their buildings. Lady Craven, now the margravine of Anspach, who, without doubt, had access to the best lodgings in the country, informs us, that "a Tartar's house is a very slight building, of only one story, without any chair, table, or piece of wooden furniture. Large cushions are ranged round the room for seats; and, what is extremely convenient, there is more than double the space of the room behind the wainscot, which draws back in most places; so that in a place where the room appears to be exceedingly small and confined, there is yet every conveniency to be met with."

Among the curiosities in this country, we may reckon the source of the river Karusa; which is situated among the rocks, in a very romantic manner, and rises in a considerable stream. It was visited by lady Craven in 1786. No less wonderful are those lakes which receive the rivulets without any visible outlet. This celebrated female traveller mentions a house near Sebastopol, situated in a very romantic manner at the foot of some rocks, from which issue many clear springs that amply supply the houses and baths with water. On the summit of these rocks there are places through which immense cables have certainly passed and been tied. The Tartars insist that the sea was once close to the foot of them, and ships were fastened there. Near Bachiserai there is a mine of earth, exactly like soap, which is reckoned very good for the skin, and vast quantities of it are consumed by the women at Constantinople. Lady Craven bestows the greatest encomium on the sheep, which in this peninsula are innumerable, and afford the most beautiful and costly fleeces.

The sheep are all spotted; the lambkins very beautiful, and they kill the ewes to have them before birth, when their skins have small spots, and are smooth like the finest and lightest fattins. Coats lined with these skins are called pelisses; and as a great number of these small animals must be killed to make the lining of one coat, this is one of the finest presents the empress can make to an ambassador.

The peninsula of the Crimea has a considerable trade in what is called Morocco leather, of various colours, which is to be had very cheap, and like satin. At Bachiserai there is a great trade of sword-blades, knives, and hangers, many of which are not to be distinguished from such as are made at Damascus.

### ISLANDS belonging to TURKEY in EUROPE, being part of Ancient GREECE.

WE shall mention these islands chiefly for the use of such readers as are conversant with ancient history, of which they make so distinguished a part.

NEGROPONT, the ancient Eubœa, stretches from the south-east to the north-west, and on the eastern coast of Achaia or Livadia. It is ninety miles long and twenty-five broad, and contains about 1300 square miles. Here the Turkish galleys lie. The tides on its coasts are irregular; and the island itself is very fertile, producing corn, wine, fruit, and cattle, in such abundance, that all kinds of provisions are extremely cheap. The chief towns in the island are, Negropont, called by the Greeks Egripos, situated on the south-west coast of the island, on the narrowest part of the strait; and Castel Rosso, the ancient Carystus.

LEMNOS, or STALIMENE, lies on the north part of the Ægean Sea or Archipelago, and is almost a square of twenty-five miles in length and breadth. Though it produces corn and wine, yet its principal riches arise from its mineral earth, much used in medicine, sometimes called *terra Lemnia*, or *terra sigillata*, because it is sealed up by the Turks, who receive from it a considerable revenue.

TENEDOS is remarkable only for its lying opposite to old Troy, and being mentioned by Virgil as the place to which the Greeks retired, and left the Trojans in a fatal security. It has a town of the same name.

SCYROS is about sixty miles in circumference, and is remarkable chiefly for the remains of antiquity which it contains: about three hundred Greek families inhabit it.

LESBOS, or MITYLENE, is about sixty miles long, and is famous for the number of philosphers and poets it produced. The inhabitants were formerly noted for their prodigality.

SCIO, or CHIOS, lies about eighty miles west of Smyrna, and is about one hundred miles in circumference. This island, though rocky and mountainous, produces excellent wine, but no corn. It is inhabited by 100,000 Greeks, 10,000 Turks, and about 3,000 Latins. It has 300 churches, besides chapels and monasteries; and a Turkish garrison of 1400 men. The inhabitants have manufactures of silk, velvet, gold and silver stuffs. The island likewise produces oil and silk, and the *Jentisk-tree*, or mastic, from which the government draws its chief revenue. The women of this, and almost all the other Greek islands, have in all ages been celebrated for their beauty, and their persons have been the most perfect models of symmetry to painters and statuaries. A late

learned traveller, Dr. Richard Chandler, says, "The beautiful Greek girls are the most striking ornaments of Sclo. Many of these were sitting at the doors and windows, twisting cotton or silk, or employed in spinning and needle-work, and accosted us with familiarity, bidding us welcome as we passed. The streets on Sundays and holidays are filled with them in groups. They wear short petticoats, reaching only to their knees, with white silk or cotton hose. Their head-dress, which is peculiar to the island, is a kind of turban; the linen so white and thin, it seemed snow. Their slippers are chiefly yellow, with a knot of red fringe at the heel. Some wore them fastened with a thong. Their garments were silk of various colours; and their whole appearance so fantastic and lively as to afford us much entertainment. The Turks inhabit a separate quarter, and their women are concealed." Among the poets and historians said to be born here, the inhabitants reckon Homer, and show a little square house, which they call Homer's school.

SAMOS lies opposite to Ephesus, on the coast of Lesser Asia, about seven miles from the continent. It is thirty miles long, and fifteen broad. This island gave birth to Pythagoras, and is inhabited by Greek Christians, who are well treated by the Turks, their masters. The muscadine Samian wine is in high request; and the island also produces wool, which they sell to the French; oil, pomegranates, and silk. This island is supposed to have been the native country of Juno; and some travellers think that the ruins of her temple, and of the ancient city Samos, are the finest remains of antiquity in the Levant.

To the south of Samos lies PATMOS, about twenty miles in circumference, but so barren and dreary, that it may be called a rock rather than an island. It has, however, a convenient haven; and the few Greek monks who are upon the island show a cave where St. John is supposed to have written the Apocalypse.

THE CYCLADES islands lie like a circle round Delos, now called Dilli, the chief of them, which is south of the islands Mycone and Tirse, and almost mid-way between the continents of Asia and Europe. Though Delos is not above six miles in circumference, it is one of the most celebrated of all the Grecian islands, as being the birth-place of Apollo and Diana, the magnificent ruins of whose temples are still visible. This island is almost destitute of inhabitants.

PAROS lies between the islands of Luxia and Melos. Like all the other Greek islands, it contains the most striking and magnificent ruins of antiquity; but is chiefly renowned for the beauty and whiteness of its marble.

CÉRIGÓ, or CYTHERA, lies south-east of the Morea, and is about fifty miles in circumference, but rocky and mountainous, and chiefly remarkable for being the favourite residence of Venus.

SANTORIN is one of the southernmost islands in the Archipelago, and was formerly called Calista, and afterwards Thera. Though seemingly covered with pumice-stones, yet, through the industry of the inhabitants, who are about 10,000, it produces barley and wine, with some wheat. One-third of the people are of the Latin church, and subject to a popish bishop. Near this island another arose of the same name, from the bottom of the sea, in 1707. At the time of its birth there was an earthquake, attended with most dreadful lightnings and thunders, and boilings of the sea for several days, so that, when it arose out of the sea, it was a mere volcano; but the burning soon ceased. It is about 200 feet above the sea; and at the time of its first emerging, it was about a mile broad, and five miles in circumference, but it has since increased. Se-

veral other islands original; but the fathomed.

The famous island of east longitude about twenty miles about sixty miles and pleasant, and but the inhabitants. The chief town, side of a hill from the island, is scattered with gardens. Rhodes is the greatest island in the world, is esteemed among the ancients as a colossus of brass, was fifty fathoms deep, and is the largest island in the world: one of the most fertile in the direction of marriage, whom this imagination. The inhabitants of Rhodesian law were knights of St. John, from the Turks, fence, and after

CANDIA, the largest island in Greece, and more than thirty-five miles long, and as wide as Africa, and stands in the middle of the Mediterranean and Lethe, the most fertile of this island, excellent in their modern times, The Turks invaded the island, till the latter emigration. The population. The island is 80,000.

CYPRUS lies between the coasts of Syria and Egypt, is seventy miles broad, and as high as Africa. It was formerly the seat of a goddess; and, in the kingdom, inhabited at the bottom of the island, and the richest capital, in the world, indeed, most fertile, its ancient capital, and is so rich, that its ancient consuls were well populated and

veral other islands of the Archipelago appear to have had the like original; but the sea in their neighbourhood is so deep as not to be fathomed.

The famous island of RHODES is situated in the twenty-eighth degree of east longitude, and thirty-six degrees thirty minutes north latitude, about twenty miles south-west of the continent of Lesser Asia, being about sixty miles long, and twenty-five broad. This island is healthful and pleasant, and abounds in wine, and many of the necessaries of life; but the inhabitants import their corn from the neighbouring country. The chief town, which also bears the name of Rhodes, is situated on the side of a hill fronting the sea, and is three miles in circumference, interspersed with gardens, minarets, churches, and towers. The harbour of Rhodes is the grand signor's principal arsenal for shipping, and the place is esteemed among the strongest fortresses belonging to the Turks. The colossus of brass, which anciently stood at the mouth of the harbour, and was fifty fathoms wide, was deservedly accounted one of the wonders of the world: one foot being placed on each side of the harbour, ships passed between its legs; and it held in one hand a light-house for the direction of mariners. The face of the colossus represented the sun, to whom this image was dedicated; and its height was about 135 feet. The inhabitants of this island were formerly masters of the sea; and the Rhodian law was the directory of the Romans in maritime affairs. The knights of St. John of Jerusalem, after losing Palestine, took this island from the Turks in 1308, but lost it to them in 1522, after a brave defence, and afterwards retired to Malta.

CANDIA, the ancient Crete, is still renowned for its hundred cities, for its being the birth-place of Jupiter, the seat of legislature to all Greece, and many other historical and political distinctions. It lies between thirty-five and thirty-six degrees of north latitude, being 200 miles long, and sixty broad, almost equally distant from Europe, Asia, and Africa, and contains 3,220 square miles. The famous Mount Ida stands in the middle of the island, and is no better than a barren rock; and Lethe, the river of oblivion, is a torpid stream. Some of the valleys of this island produce wine, fruits, and corn; all of them remarkably excellent in their kind. The siege of Candia, the capital of the island, in modern times, was far more wonderful and bloody than that of Troy. The Turks invested it in the beginning of the year 1645; and its Venetian garrison, after bravely defending itself against fifty-six assaults, till the latter end of September 1669, made, at last, an honourable capitulation. The siege cost the Turks 180,000 men, and the Venetians 80,000.

CYPRUS lies in the Levant Sea, about thirty miles distant from the coasts of Syria and Palestine. It is one hundred and fifty miles long, and seventy broad, and lies at almost an equal distance from Europe and Africa. It was formerly famous for the worship of Venus, the Cyprian goddess; and, during the time of the crusades, was a rich flourishing kingdom, inhabited by Christians. Its wine, especially that which grows at the bottom of the celebrated Mount Olympus, is the most palatable and the richest of all that grows in the Greek islands. Nicosia is the capital, in the midst of the country, and the see of a Greek archbishop; indeed, most part of the inhabitants of the island are Greeks. Famagusta, its ancient capital, has a good harbour; and the natural produce of the island is so rich, that many European nations find their account in keeping consuls residing upon it; but the oppressions of the Turks have depopulated and impoverished it to a surprising degree, so that the revenue

they get from it does not exceed 1250l. year. The island produces great quantities of grapes, from which excellent wine is made; and also cotton of a very fine quality is here cultivated, and oil, silk, and turpentine. Its female inhabitants do not degenerate from their ancestors as devotees to Venus; and Paphos, that ancient seat of pleasure and corruption, is one of the divisions of the island. Richard I. king of England, subdued Cyprus, on account of its king's treachery; and its royal title was transferred to Guy Lusignan, king of Jerusalem, from whence it passed to the Venetians, who still hold that empty honour.

The islands in the Æonian sea are, SAPIENZA, STIVALI, ZANTE, CEPHALONIA, SANTAMAURA, CORFU, FANNU, and others of smaller note, particularly the Isola del Compare, which would not deserve mention, had it not been the ancient Ithaca, the birth-place and kingdom of Ulysses. These islands, in general, are fruitful, and belonged to the Venetians; but, after the late revolution at Venice, passed into the possession of the French republic.

ZANTE has a populous capital of the same name, and is a place of considerable trade, especially in currants, grapes, and wine. The citadel is erected on the top of a large hill, strong by nature, but now little better than a heap of ruins. Here is a garrison of 500 men, but their chief dependence is on their fleet, and the island of Corfu. The inhabitants of Zante are about 30,000, mostly Greeks, and friendly to strangers. Corfu, which is the capital of that island, and the residence of the governor-general over all the other islands, is a place of great strength, and its circumference about four miles. The Venetians are said to have concerned themselves very little about the welfare or government of these islands, so that the inhabitants, who are generally Greeks, bear a very indifferent character. Their number at Corfu is estimated at 50,000, and their manners more severe than at Zante.

## A S I A.

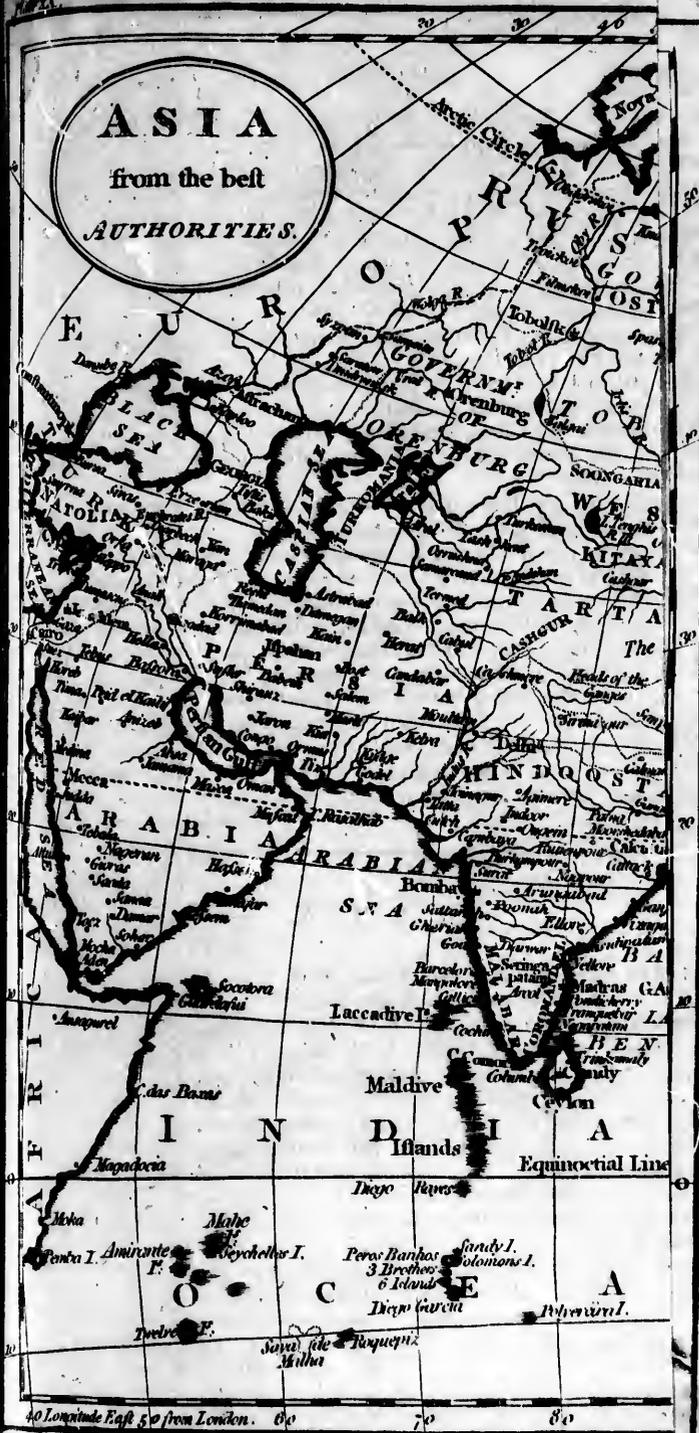

AS Asia exceeds Europe and Africa in the extent of its territories, it is also superior to them in the serenity of its air, the fertility of its soil, the deliciousness of its fruits, the fragrant and balsamic qualities of its plants, spices, and gums; the salubrity of its drugs; the quantity, variety, beauty, and value of its gems; the richness of its metals, and the fineness of its silks and cottons. It was in Asia, according to the sacred records, that the all-wise Creator planted the garden of Eden, in which he formed the first man and first woman, from whom the race of mankind was to spring. Asia became again the nursery of the world after the deluge, whence the descendants of Noah dispersed their various colonies into all the other parts of the globe. It was in Asia that God placed his once favourite people, the Hebrews, whom he enlightened by revelations delivered by the prophets, and to whom he gave the Oracles of Truth. It was here that the great and merciful work of our redemption was accomplished by his divine Son; and it was from hence that the light of his glorious gospel was carried, with amazing rapidity, into all the known nations by his disciples and followers. Here the first Christian churches were founded, and the Christian faith miraculously propagated, and cherished, even with the blood of innumerable martyrs. It was in Asia that the first edifices were reared, and the first empires founded,

while the other parts of the globe were inhabited only by wild animals. On all these accounts, this quarter claims a superiority over the rest; but it must be owned that a great change hath happened in that part of it called Turkey, which has lost much of its ancient splendour; and from the most populous and best cultivated spot in Asia, is become a wild and uncultivated desert. The other parts of Asia continue much in their former condition, the soil being as remarkable for its fertility as most of the inhabitants for their indolence, effeminacy, and luxury. This effeminacy is chiefly owing to the warmth of the climate, though in some measure heightened by custom and education: and the symptoms of it are more or less visible, as the several nations are seated nearer or farther from the north. Hence the Tartars, who live near the same latitudes with us, are as brave, hardy, strong, and vigorous, as any European nation. What is wanting in the robust frame of their bodies, among the Chinese, Mogul-Indians, and all the inhabitants of the most southern regions, is in a great measure made up to them by the vivacity of their minds, and ingenuity in various kinds of workmanship, which our most skilful mechanics have in vain endeavoured to imitate.

This vast extent of territory was successively governed, in past times, by the Assyrians, the Medes, the Persians, and the Greeks; but the immense regions of India and China were little known to Alexander, or the conquerors of the ancient world. Upon the decline of those empires, great part of Asia submitted to the Roman arms; and afterwards, in the middle ages, the successors of Mahomet, or, as they were usually called, Saracens, founded in Asia, in Africa, and in Europe, a more extensive empire than that of Cyrus, Alexander, or even the Roman, when in its height of power. The Saracen greatness ended with the death of Tamerlane; and the Turks, conquerors on every side, took possession of the middle regions of Asia, which they still enjoy. Besides the countries possessed by the Turks and Russians, Asia contains, at present, three large empires, the Chinese, the Mogul, and the Persian, upon which the lesser kingdoms and sovereignties of Asia generally depend. The prevailing form of government, in this division of the globe, is absolute monarchy. If any of its inhabitants can be said to enjoy some share of liberty, it is the wandering tribes, as the Tartars and Arabs. Many of the Asiatic nations, when the Dutch first came among them, could not conceive how it was possible for any people to live under any other form of government than that of a despotic monarchy. Turkey, Arabia, Persia, part of Tartary, and part of India, profess Mahometanism. The Persian and Indian Mahometans are of the sect of Ali, and the others of that of Omar; but both own Mahomet for their lawgiver, and the Koran for their rule of faith and life. In the other parts of Tartary, India, China, Japan, and the Asiatic islands, they are generally heathens and idolaters. Jews are to be found every where in Asia. Christianity, though planted here with wonderful rapidity, by the apostles and primitive fathers, suffered an almost total eclipse by the conquests of the Saracens, and afterwards of the Turks; incredible indeed have been the hazards, perils, and sufferings of the catholic missionaries, to propagate their doctrines in the most distant regions, and among the grossest idolaters; but their labours have hitherto failed of success, owing in a great measure to the avarice, cruelty, and injustice, of the Europeans, who resort thither in search of wealth and dominion.

The principal languages spoken in Asia are, the modern Greek, the Turkish, the Russian, the Tartarian, the Persian, the Arabic, the Malayan, the Chinese, and the Japanese. The European languages are also spoken upon the coasts of India and China.

The continent of Asia is situated between twenty-five and 180 degrees of east longitude, and between the equator and eighty degrees of north latitude. It is about 4740 miles in length from the Dardanelles on the west, to the eastern shore of Tartary; and about 4380 miles in breadth, from the most southern part of Malacca, to the most northern cape of Nova Zembla. It is bounded by the Frozen Ocean on the north; on the west it is separated from Africa by the Red Sea, and from Europe by the Levant or Mediterranean, the Archipelago, the Hellespont, the Sea of Marmora, the Bosphorus, the Black Sea, the river Don, and a line drawn from it to the river Tobol, and from thence to the river Oby, which falls into the Frozen Ocean. On the east, it is bounded by the Pacific Ocean, or South Sea, which separates it from America; and on the south, by the Indian Ocean; so that it is almost surrounded by the sea. The principal regions which divide this country are as follow:

	Nations.	Length.	Breadth.	Square Miles.	Chief Cities.	Dist. and bearing from Lond.	Dist. or time from London.	Religion.

**MOUNTAINS.]** These are famous in sacred as well as profane writings. - The most remarkable are, Olympus, Taurus, and Anti-taurus; Caucasus and Ararat; Lebanon and Hermon.

**RIVERS.]** The same may be observed of the rivers, which are the Euphrates, Tigris, Orontes, Mæander, Sarabat, Kara, and Jordan.

**AIR AND CLIMATE.]** Though both are delightful in the utmost degree, and naturally salubrious to the human constitution, yet such is the equality with which the Author of Nature has dispensed his benefits, that Turkey, both in Europe and Asia, is often visited by the plague; a frightful scourge to mankind whenever it takes place, but here doubly destructive, from the native indolence of the Turks, and their superstitious belief in a predestination, which prevents them from using the proper precautions to defend themselves against this calamity.

**SOIL AND PRODUCE.]** As this country contains the most fertile provinces of Asia, it is scarcely necessary to inform the reader that it produces all the luxuries of life in the utmost abundance, notwithstanding the indolence of its owners. Raw silk, corn, wine, oil, honey, fruit of every species, coffee, myrrh, frankincense, and odoriferous plants and drugs, are natives here almost without culture, which is practised chiefly by Greek and Armenian Christians. The olives, citrons, lemons, oranges, figs, and dates, produced in these provinces, are highly delicious, and in such plenty, that they cost the inhabitants a mere trifle, and, it is said, in some places nothing. Their asparagus is often as large as a man's leg, and their grapes far exceed those of other countries in largeness. In short, nature has brought all her productions here to the highest perfection.

**ANIMAL PRODUCTIONS BY SEA AND LAND. }** The same may be said of their animals. The breed of the Turkish and Arabian horses, the latter especially, are valuable beyond any in the world, and have considerably improved that of the English. We know of no quadrupeds that are peculiar to these countries, but they contain all that are necessary for the use of mankind. Camels are here in much request, from their strength, their agility, and, above all, their moderation in eating and drinking, which is greater than that of any other known animal. Their manufacture, known by the name of camlets, was originally made by a mixture of camel's hair and silk, though it is now often made with wool and silk. Their kids and sheep are exquisite eating, and are said to surpass, in flavour and taste, those of Europe; but their butchers' meat in general, beef particularly, is not so fine.

As to birds, they have wild fowl in great perfection: their ostriches are well known by their tallness, swiftness in running, and stupidity. The Roman epicures prized no fish, except lampreys, mullets, and oysters, but those that were found in Asia.

**METALS AND MINERALS.]** This country contains all the metals that are to be found in the richest kingdoms and provinces in Europe; and its medicinal springs and baths exceed those of any in the known world.

---

## OF THE TURKS IN EUROPE AND ASIA.

**POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. }** THE population of this great country is by no means equal, either in its extent or fertility, nor have the best geographers been able to ascertain it, because of the uncertainty of its

limits. It certainly even under the all, to the tyrant which is undoubtedly from many reasons, among which than the Turks, are kept by the The Turkish European princes.

As to the inhabitants in youth, their hair and eyes are commonly handsome, their demeanour, though passive; but when big with dissimulation: in many. Though the even humanity, them in religious affections for the good; and where guinity, or friendship, morals of the Asiatics.

They are hospitable reign chiefly amenable to one another public spirit is more of entertainment, refreshment of pleasure they search out to are a luxury to which not only at their confined, seldom they sit conversing or chewing opium of their own or a is turned out, otherwise there will be a of the disgrace of and agreeable could read any other than negotiated in Turkey be bought and sold.

The Turks die in the winter, and Among the great they have neither religion to use glorified. Rice is boiled up with game fowl boiled to raise seasoned, and prepared and the only d

limits. It certainly is not so great as it was before the Christian æra, or even under the Roman emperors; owing to various causes, and, above all, to the tyranny under which the natives live, and their polygamy, which is undoubtedly very unfavourable to population, as may be evinced from many reasons; and particularly, because the Greeks and Armenians, among whom it is not practised, are incomparably more prolific than the Turks, notwithstanding the rigid subjection in which they are kept by the latter. The plague is another cause of depopulation. The Turkish emperor, however, has more subjects than any two European princes.

As to the inhabitants, they are generally well made and robust men: in youth, their complexions are fair, and their faces handsome; their hair and eyes are black or dark brown. The women, when young, are commonly handsome, but they generally look old at thirty. In their demeanour, the Turks are rather hypochondriac, grave, sedate, and passive; but when agitated by passion, furious, raging, ungovernable; big with distimulation, jealous, suspicious, and vindictive beyond conception: in matters of religion, tenacious, superstitious, and morose. Though the generality seem hardly capable of much benevolence, or even humanity, with regard to Jews, Christians, or any who differ from them in religious matters, yet they are far from being devoid of social affections for those of their own religion. But interest is their supreme good; and when that comes in competition, all ties of religion, consanguinity, or friendship, are with the generality, speedily dissolved. The morals of the Asiatic Turks are far preferable to those of the European. They are hospitable to strangers, and the vices of avarice and humanity reign chiefly among their great men. They are likewise said to be charitable to one another, and punctual in their dealings. Their charity and public spirit is most conspicuous in their building caravanseras, or places of entertainment, on roads that are destitute of accommodations, for the refreshment of poor pilgrims or travellers. With the same laudable view they search out the best springs, and dig wells, which in those countries are a luxury to weary travellers. The Turks sit cross-legged upon mats, not only at their meals, but in company. Their ideas are simple and confined, seldom reaching without the walls of their own houses, where they sit conversing with their women, drinking coffee, smoking tobacco, or chewing opium. They have little curiosity to be informed of the state of their own or any other country. If a visiter, bashaw, or other officer, is turned out, or strangled, they say no more on the occasion than that there will be a new visiter or governor, seldom inquiring into the reason of the disgrace of the former minister. They are perfect strangers to wit and agreeable conversation. They have few printed books, and seldom read any other than the Koran, and the comments upon it. Nothing is negotiated in Turkey without presents; and here justice may commonly be bought and sold.

The Turks dine about eleven o'clock in the forenoon, and sup at five in the winter, and six in the summer, and this is their principal meal. Among the great people, their dishes are served up one by one; but they have neither knife nor fork, and they are not permitted by their religion to use gold or silver spoons. Their victuals are always high seasoned. Rice is the common food of the lower sort, and sometimes it is boiled up with gravy; but their chief dish is pilau, which is mutton and fowl boiled to rags; and the rice being boiled quite dry, the soup is high seasoned, and poured upon it. They drink water, sherbet, and coffee; and the only debauch they know is in opium, which gives them sensa-

tions resembling those of intoxication. Guests of high rank sometimes have their beards perfumed by a female slave of the family. They are temperate and sober from a principle of their religion, which forbids them the use of wine; though in private many of them indulge themselves in strong liquors. Their common salutation is by an inclination of the head; and laying their right hand on their breast. They sleep in linen waistcoats and drawers, upon mattresses, and cover themselves with a quilt. Few or none of the considerable inhabitants of this vast empire have any notion of walking or riding either for health or diversion. The most religious among them find, however, sufficient exercise when they conform themselves to the frequent ablutions, prayers, and rites prescribed them by Mahomet.

Their active diversions consist in shooting at a mark, or tilting it with darts, at which they are very expert. Some of their great men are fond of hunting, and take the field with numerous equipages, which are joined by their inferiors; but this is often done for political purposes, that they may know the strength of their dependents. Within doors, the chess or draught-board are their usual amusements; and if they play at chance games, they never bet money, that being prohibited by the Koran.

**DRESS.]** The men shave their heads, leaving a lock on the crown, and wear their beards long. They cover their heads with a turban, and never put it off but when they sleep. Their shirts are without collar, or wristband, and over them they throw a long vest, which they tie with a sash, and over the vest they wear a loose gown somewhat shorter. Their breeches, or drawers, are of a-piece with their stockings; and instead of shoes they wear slippers, which they put off when they enter a temple or house. They suffer no Christians, or other people, to wear white turbans. The dress of the women differs little from that of the men, only they wear stiffened caps upon their heads, with horns something like a mitre, and wear their hair down. When they appear abroad, they are so muffled up as not to be known by their nearest relation. Such of the women as are virtuous, make no use of paint to heighten their beauty, or to disguise their complexion; but they often tinge their hands and feet with *benna*, which gives them a deep yellow. The men make use of the same expedient to colour their beards.

**MARRIAGES.]** Marriages in this country are chiefly negotiated by the ladies. When the terms are agreed upon, the bridegroom pays down a sum of money, a license is taken out from the *cadi*, or proper magistrate, and the parties are married. The bargain is celebrated, as in other nations, with mirth and jollity; and the money is generally employed in furnishing the house of the young couple. They are not allowed by their law more than four wives, but they may have as many concubines as they can maintain. The wealthy Turks, therefore, besides their wives, keep a number of women in their harems, or, as they are improperly called in Europe, their seraglios. But all these indulgences are sometimes insufficient to restrain their unnatural desires.

**FUNERALS.]** The burial of the Turks are decent. The corpse is attended by the relations, chanting passages from the Koran; and after being deposited in a mosque (for so they call their temples), they are buried in a field by the *iman* or priest, who pronounces a funeral sermon at the time of the interment. The male relations express their sorrow by alms and prayers; the women, by decking the tomb on certain days with flowers and green leaves; and, in mourning for a husband, they wear a particular head-dress, and leave off all finery for twelve months.

**RELIGION.]** The established religion is the Mahometan, so called from Mahomet, the author of it, some account of whom the reader will find in the following history of Arabia, the native country of that impostor. The Turks profess to be of the sect of Omar; but these are split into as many sectaries as their neighbours the Christians. There is no ordination among their clergy; any person may be a priest that pleases to take the habit, and perform the functions of his order, and may lay down his office when he pleases. Their chief priest, or mufti, seems to have great power in the state.

**ECCLESIASTICAL INSTITUTIONS, } The Turkish government hav-**  
**AND RESTRICTIONS OF CHRISTIANS. } ing formed these into part of its**  
 finances, they are tolerated where they are most profitable; but the hardships imposed upon the Greek church are such as must always dispose that people to favour any revolution of government. Constantinople, Jerusalem, Alexandria, and Antioch, are patriarchates; and their heads are indulged, according as they pay for their privilege, with a civil as well as an ecclesiastical authority over their votaries. The same may be said of the Nestorian and Armenian patriarchs; and every great city that can pay for the privilege, has its archbishop or bishop. All male Christians pay also a capitation tax from seventeen years old to sixty, according to their stations.

The insulting distinction of Christian and Mahometan (says Mr. Eton), is carried to great a length, that even the minutæ of dress are rendered subjects of restriction. A Christian must wear only clothes and head-dresses of dark colours, and such as Turks never wear, with slippers of black leather, and must paint his house black, or dark brown. The least violation of these frivolous and disgusting regulations is punished with death. Nor is it at all uncommon for a Christian to have his head struck off in the street, for indulging in a little more foppery of dress than the sultan or visier, whom he may meet incognito, approves. If a Christian strikes a Mahometan, he is most commonly put to death on the spot, or at least ruined by fines and severely bastinadoed; and if he strikes, though by accident, a sheriff, or descendant of Mahomet, who wears the green turban, of whom there are thousands in some cities, it is death without remission.

The Turkish language is derived from the Zagutai, a dialect of the Tartarian. It is the easiest of any we are acquainted with, because it is the most regular. It has only one conjugation of verbs, one declension of nouns, and no gender. There is no exception nor any irregular verb or noun in the language. It is not very copious, yet it is manly, energetic, and sonorous. To supply the want of words, their writers frequently mix with it the Arabic and Persian. The Greeks speak a modernised Greek, and in the Asiatic provinces the Arabic and a dialect of the Syriac is spoken. A specimen of the modern Greek follows in their paternoster:

*Pater bemas, opios isf ees tos ouranon: bagiasbbito to onoma sou: na erti ke basilia sou: to thelema sou na genetex itxon eu to ge, os is ton ouranon: to pifomi bemas doxe bemas semoren: ka sicborase bemos ta crimata bemon itxon, ke bemas sicborasomen ekinous opou bemas adikoun: ke meu ternes bemas is to pifasmo, alla sefson bemas apo to kaxo. Amen.*

**LEARNING AND LEARNED MEN.]** The Turks till of late professed a sovereign contempt for our learning. Greece, which was the native country of genius, arts, and sciences, produces at present, besides Turks, numerous bands of Christian bishops, priests, and monks, who in general are as ignorant as the Turks themselves, and are divided into various

absurd sects of what they call Christianity. The education of the Turks seldom extends farther than reading the Turkish language, and the Koran, and writing a common letter. Their jurisprudence and theology consist only of commentaries on the Koran; their astronomy is astrology, and their chemistry alchemy; of the history and geography of other countries they are perfectly ignorant. Some of them understand astronomy, so far as to calculate the time of an eclipse; but the number of these being very small, they are looked upon as extraordinary persons.

ANTIQUITIES AND CURIOSITIES, } These are so various, that they  
NATURAL AND ARTIFICIAL. } have furnished matter for many voluminous publications. These countries contained all that was rich and magnificent, in architecture and sculpture; and neither the barbarity of the Turks, nor the depredations they have suffered from the Europeans, seem to have diminished their number. They are more or less perfect, according to the air, soil, or climate, in which they stand, and all of them bear deplorable marks of neglect. Many of the finest temples are converted into Turkish mosques, or Greek churches, and are more disfigured than those which remain in ruins. Amidst such a vast variety of curiosities, we shall select some of the most striking.

Balbec is situated on a rising plain, between Tripoli, in Syria, and Damascus, at the foot of Mount Libanus, and is the Heliopolis of Cælo-Syria. Its remains of antiquity display, according to the best judges, the boldest plan that ever was attempted in architecture. The portico of the temple of Heliopolis is inexpressibly superb, though disfigured by two Turkish towers. The hexagonal court behind it is now known only by the magnificence of its ruins. The walls were adorned with Corinthian pilasters and statues, and it opens into a quadrangular court of the same taste and grandeur. The great temple to which this leads is now so ruined, that it is known only by an entablature, supported by nine lofty columns, each consisting of three pieces, joined together by iron pins, without cement. Some of those pins are a foot long, and a foot in diameter; and the fordid Turks are daily at work to destroy the columns for the sake of the iron. A small temple is still standing, with a pedestal of eight columns in front, and fifteen in flank, and every-where richly ornamented with figures in alto-relievo, and the heads of gods, heroes, and emperors. To the west of this temple is another, of a circular form, of the Corinthian and Ionic order, but disfigured with Turkish mosques and houses. The other parts of this ancient city are proportionably beautiful and stupendous.

Various have been the conjectures concerning the founders of these immense buildings. The inhabitants of Asia ascribe them to Solomon, but some make them so modern as the time of Antoninus Pius. Perhaps they are of different æras; and though that prince and his successors may have rebuilt some part of them, yet the boldness of their architecture, the beauty of their ornaments, and the stupendous execution of the whole, seem to fix their foundation to a period before the Christian æra, though we cannot refer them to the ancient times of the Jews, or Phœnicians, who probably knew little of the Greek style in building and ornamenting. Balbec is at present a little city encompassed with a wall. The inhabitants, who are about 5000 in number, chiefly Greeks, live in or near the circular temple, in houses built out of the ancient ruins. A free-stone quarry in the neighbourhood furnished the stones for the body of the temple; and one of the stones, not quite detached from the bottom of the quarry, is 70 feet long, 14 broad,

and 14 feet five inches square, of white marble quarried at Palmyra.

Palmyra, or, as it is situated in the wilderness, 200 miles to the south of the row plain, lined all at once, the eye can be found in the way to it is through white marble, the plates of it, who, with his fragments, some remembrance from them, are especially as he can find relation. Superb in length, temple, intercolumniades, and finished but so dispersed as to give an idea of the whole by the miserable

Nothing but a city, formerly the most magnificent, what now are traces of more certain than the grandeur, that it was and that its merchandise for the merchant altered situation, which have turned Asiatics think of Solomon; and in the story. In profane history, Antony; and in the empire, about the year 217, Palmyra, was high. His widow, Zenobia, the celebrated Roman tyrant, who took her principal nobles towards destroying large sums of money, the majesty of the Palmyrene empire can be no doubt emperor Justianus, but with wretched state, and the property of those of Balbec. Nothing but a Greek and a

and 14 feet five inches deep: its weight must be 1135 tons. A coarse white marble quarry, at a greater distance, furnished the ornamental parts.

Palmyra, or, as it was called by the ancients, Tadmor in the desert, is situated in the wilds of Arabia Petraea, in about 33 deg. of N. lat. and 200 miles to the south-east of Aleppo. It is approached through a narrow plain, lined as it were with the remains of antiquity; and opening all at once, the eye is presented with the most striking objects that are to be found in the world. The temple of the Sun lies in ruins; but the access to it is through a vast number of beautiful Corinthian columns of white marble, the grandeur and beauty of which can only be known by the plates of it, which have been drawn and published by Mr. Wood, who, with his friends, visited it some years ago, purposely to preserve some remembrance of such a curiosity. As those drawings, or copies from them, are now common, we must refer the reader to them, especially as he can form no very adequate ideas of the ruins from a printed relation. Superb arches, amazing columns, a colonnade extending 4000 feet in length, terminated by a noble mausoleum, temples, fine porticos, peristyles, intercolumniations, and entablatures, all of them in the highest style, and finished with the most beautiful materials, appear on all hands; but so dispersed and disjointed, that it is impossible from them to form an idea of the whole when perfect. These striking ruins are contrasted by the miserable huts of the wild Arabs, who reside in or near them.

Nothing but ocular proof could convince any man, that so superb a city, formerly ten miles in circumference, could exist in the midst of what now are tracts of barren uninhabitable sands. Nothing however is more certain than that Palmyra was formerly the capital of a great kingdom, that it was the pride as well as the emporium of the eastern world, and that its merchants dealt with the Romans and the western nations, for the merchandises and luxuries of India and Arabia. Its present altered situation, therefore, can be accounted for only by natural causes, which have turned the most fertile tracts into barren deserts. The Asiatics think that Palmyra, as well as Balbec, owes its original to Solomon; and in this they receive some countenance from sacred history. In profane history it is not mentioned before the time of Mare Antony; and its most superb buildings are thought to be of the lower empire, about the time of Gallienus: Odenathus, the last king of Palmyra, was highly carested by that emperor, and even declared Augustus. His widow, Zenobia, reigned in great glory for some time; and Longinus, the celebrated critic, was her secretary. Unwilling to submit to the Roman tyranny, she declared war against the emperor Aurelian, who took her prisoner, led her in triumph to Rome, and butchered her principal nobility, and, among others, the excellent Longinus. He afterwards destroyed her city, and massacred its inhabitants, but expended large sums out of Zenobia's treasures in repairing the temple of the Sun, the majestic ruins of which have been mentioned. None of the Palmyrene inscriptions reach above the Christian æra, though there can be no doubt that the city itself is of much higher antiquity. The emperor Justinian made some efforts to restore it to its ancient splendor, but without effect, for it dwindled, by degrees, to its present wretched state. It has been observed, very justly, that its architecture, and the proportions of its columns, are by no means equal in purity to those of Balbec.

Nothing can be more futile than the boasted antiquities shown by the Greek and Armenian priests in and near Jerusalem, which is well known

to have been so often rased to the ground, and re-built anew, that no scene of our Saviour's life and sufferings can be ascertained; and yet those ecclesiastics subsist by their forgeries; and pretending to guide travellers to every spot mentioned in the Old and New Testament. They are, it is true, under severe contributions to the Turks, but the trade still goes on, though much diminished in its profits. The church of the Holy Sepulchre, as it is called, said to be built by Helena, mother to Constantine the Great, is still standing, and of tolerable good architecture; but its different divisions, and the dispositions made round it, are chiefly calculated to support the forgeries of its keepers. Other churches built by the same lady are found in Palestine; but the country is so altered in its appearance and qualities, that it is one of the most despicable of any in Asia, and it is in vain for a modern traveller to attempt to trace in it any vestiges of the kingdom of David and Solomon. But the most fertile country, abandoned to tyranny and wild Arabs, must in time become a desert. Thus oppression soon thinned the delicious plains of Italy; and the noted countries of Greece and Asia the Less, once the glory of the world, are now nearly destitute of learning, arts, and people.

Mecca and Medina are curiosities only through the superstition of the Mahometans. Their buildings are mean, when compared to European houses or churches; and even the temple of Mecca, in point of architecture, makes but a mean appearance, though erected on the spot where the great prophet is said to have been born. The same may be said of the mosque at Medina, where that impostor was buried; so that the vast sums spent yearly by Mahometan pilgrims, in visiting those places, are undoubtedly converted to temporal uses. Between the rivers Euphrates and Tigris, where some superstitious and visionary people have sought the situation of Paradise, there are some tracts which undoubtedly deserve that name. The different ruins, some of them inexcessibly magnificent, that are to be found in those immense regions, cannot be appropriated with any certainty to their original founders; so great is the ignorance in which they have been buried for these thousand years past. It is, indeed, easy to pronounce whether the style of their buildings be Greek, Roman, or Saracen: but all other information must come from their inscriptions.

The neighbourhood of Smyrna (now called Ismir) contains many valuable antiquities. The same may be said of Aleppo, and a number of other places, celebrated in antiquity. The site of old Troy cannot be distinguished by the smallest vestige, and is known only by its being opposite to the isle of Tenedos, and the name of a brook which the poets magnified into a wonderful river. A temple of marble, built in honour of Augustus Cæsar, at Milasso, in Caria, and a few structures of the same kind in the neighbourhood, are among the antiquities that are still entire. Three theatres of white marble, and a noble circus near Laodicea, now Latakia, have suffered very little from time or barbarism; and some travellers think they discern the ruins of the celebrated temple of Diana, near Ephesus.

CHIEF CITIES, MOSQUES, AND } These are very numerous, and, at  
OTHER BUILDINGS. } the same time, very insignificant, because they have little or no trade, and are greatly decayed from their ancient grandeur. Scanderoon stands upon the site of Old Alexandria, but it is now almost depopulated. Superb remains of antiquity are found in its neighbourhood. Aleppo, however, preserves a respectable rank among the cities of the Asiatic Turkey. It is still the capital of Syria,

and is superior in its buildings and conveniences to most of the Turkish cities. The houses, as usual in the east, consist of a large court, with a dead wall to the street, an arcade or piazza running round it, paved with marble, and an elegant fountain of the same in the middle. Aleppo, and its suburbs, are seven miles in compass, standing on eight small hills, on the highest of which the citadel, or castle, is erected, but of no great strength. An old wall, and a broad ditch, now in many places turned into gardens, surround the city, which was estimated by the late Dr. Ruffel to contain 230,000 inhabitants, of whom 30,000 were Christians and 5,000 Jews; but at present, according to Mr. Eton, it does not contain more than 50,000, which depopulation has chiefly taken place since 1770. Whole streets are uninhabited, and bazars abandoned. It is furnished with most of the conveniences of life, excepting good water, within the walls, and even that is supplied with an aqueduct, distant about four miles, said to have been erected by the empress Helena. The streets are narrow, but well paved with large square stones, and are kept very clean. Their gardens are pleasant, being laid out in vineyards, olive, fig, and pistachio trees: but the country round is rough and barren. Foreign merchants are numerous here, and transact their business in caravaneras, or large square buildings, containing their warehouses, lodging-rooms, and counting-houses. This city abounds in neat, and some of them magnificent mosques, public bagnios, which are very refreshing, and bazars or market-places, which are formed into long, narrow, arched, or covered streets, with little shops, as in other parts of the east. Their coffee is excellent, and considered by the Turks as a high luxury; and their sweetmeats and fruits are delicious. European merchants live here in greater splendor and safety than in any other city of the Turkish empire, in consequence of particular capitulations with the Porte. Coaches or carriages are not used here, but persons of quality ride on horseback, with a number of servants before them, according to their rank. The English, French, and Dutch, have consuls, who are much respected, and appear abroad, the English especially, with marks of distinction.

Bagdad, built upon the Tigris, not far, it is supposed, from the site of ancient Babylon, is the capital of the ancient Chaldea, and was the metropolis of the caliphate, under the Saracens, in the twelfth century. This city retains but few marks of its ancient grandeur. It is in the form of an irregular square, and rudely fortified; but the convenience of its situation renders it one of the seats of the Turkish government, and it has still a considerable trade, being annually visited by the Smyrna, Aleppo, and western caravans. The houses of Bagdad are generally large, built of brick and cement, and arched over to admit the free circulation of the air; many of their windows are made of elegant Venetian glass, and the ceilings ornamented with chequered work. Most of the houses have also a court-yard before them, in the middle of which is a small plantation of orange-trees. The number of houses is computed at 80,000, each of which pays an annual tribute to the bashaw, which is calculated to produce 300,000*l.* sterling. Their bazars, in which their tradesmen have their shops, are tolerably handsome, large, and extensive, filled with shops of all kinds of merchandise, to the number of 12,000. These were erected by the Persians, when they were in possession of the place, as were also their bagnios, and almost every thing here worthy the notice of a traveller. The population of Bagdad has, however, greatly declined within these few years. The plague of 1773 carried off two-thirds of the inhabitants, who now scarcely amount to 20,000; for here, as at Aleppo, whole streets and bazars are desolate. In this city are

five mosques, two of which are well built, and have handsome domes, covered with varnished tiles of several colours. Two chapels are permitted for those of the Romish and Greek persuasions. On the north-west corner of the city stands the castle, which is of white stone, and commands the river; consisting of curtains and bastions, on which some large cannon are mounted, with two mortars in each bastion; but in the year 1779 they were so honey-combed and bad, as to be supposed not to support one firing. Below the castle, by the water-side, is the palace of the Turkish governor; and there are several summer-houses in the river, which make a fine appearance. The Arabians who inhabited this city under the caliphs were remarkable for the purity and elegance of their dialect.

Ancient Assyria is now called the Turkish Kurdistan, though part of it is subject to the Persians. The capital is Kurdistan, the ancient Nineveh being now a heap of ruins. Kurdistan is said to be for the most part cut out of a mountain, and is the residence of a viceroy, or beglerbeg. Orfar, formerly Edessa, is the capital of the fine province of Mesopotamia. It is now a mean place, and chiefly supported by a manufacture of Turkey leather. Mosul is also in the same province, a large place, situated on the west shore of the Tigris, opposite where Nineveh formerly stood.

Georgia, or Gurgistan, now no longer subject to the Turks, is chiefly peopled by Christians. The natives of this country are a brave warlike race of men. Their capital, Teflis, is a handsome city, and makes a fine appearance; all the houses are of stone, neat and clean, with flat roofs, which serve as walks for the women, but the streets are dirty and narrow; its inhabitants being about 30,000. It is situated at the foot of a mountain, by the side of the river Kur, and is surrounded by strong walls, except on the side of the river. It has a large fortress on the declivity of the mountain, which is a place of refuge for criminals and debtors, and the garrison consists of native Persians. There are thirteen Greek churches in Teflis, seven Armenian, and one Roman-catholic church; the Mahometans who are here have no mosques. In the neighbourhood of the city are many pleasant houses, and fine gardens. The Georgians, in general, are, by some travellers, said to be the handsomest people in the world; and some think that they early received the practice of inoculation for the small-pox. They make no scruple of selling and drinking wines in their capital, and other towns; and their valour has procured them many distinguishing liberties and privileges. Lately they have formed an alliance with Russia, under the brave prince Heraclius; as has the czar or prince Solomon, sovereign of Immeretta, a district between the Caspian and Black Seas, who is distinguished from his subjects (all of the Greek religion) by riding on an ass, and wearing boots.

The ancient cities of Damascus, Tyre, and Sidon, still retain part of their former trade. Damascus is called Sham, and the approach to it by the river is inexpressibly beautiful. It contains a fine mosque, which was formerly a Christian church. It still is famous for its steel works, such as sword-blades, knives, and the like, the excellent temper of which is said to be owing to a quality in the water. The inhabitants manufacture also those beautiful silks, called damasks, from their city, and carry on a considerable traffic in raw and worked silk, rose-water, extracted from the famous damask roses, fruits, and wine. The neighbourhood of this city is still beautiful, especially to the Turks, who delight in verdure and gardens. Sidon, now Said, which likewise lies within the ancient Phœnicia, has still some trade, and a tolerable harbour.

Tyre, now called Tyros, was formerly famous for its purple, but is now a few miserable fishermen. There are several high, and several low, mountains, more than a mile and a half from the city, and a number of about 100,000, still visible. The author observes that upon which the city stands, who deserves much notice, came to be a mountain. Tyre, Queen of the Tyrians, on \* Two were over their occupation, the expense of their might be caught, ple fish. I did not the old fishers had been only a conceit depended upon to nothing else but of cloth in a year.

Natolia, or Asia Minor, Pamphylia, Phœnicia, and Amasia; all of the ruins, are now, thro' or a theatre of ruin, so luxurious is nature over her forlorn than maintains the circuit of the lers, upon an attempt has been said by fertility, and population at present of their own soil.

‡ The late reverend author examined that courtly foundest philosophy as well cultivated of Syria and Phœnicia considered, yields larg others complain, do from the want of possess it, and the this fine country. the earth. "In sowing, accompan And, after all, wh

Tyre, now called Sur, about twenty miles distant from Sidon, so famous formerly for its rich dye, is now inhabited by scarcely any but a few miserable fishermen, who live among the ruins of its ancient grandeur. There are strong walls on the land side, of stone, eighteen feet high, and seven broad. The circumference of the place is not more than a mile and a half, and Christians and Mahometans make up the number of about five hundred. Some of the ruins of ancient Tyre are still visible. The pavements of the old city, Mr. Bruce tells us, he saw, and observes that they were seven feet and a half lower than the ground upon which the present city stands. Passing by Tyre (says our author, who deserves much praise for some happy elucidations of scripture), I came to be a mournful witness of the truth of that prophecy, 'That Tyre, Queen of Nations, should be a rock for fishers to dry their nets on \*.' Two wretched fishermen, with miserable nets, having just given over their occupation, with very little success, I engaged them, at the expense of their nets, to drag in those places where they said shell-fish might be caught, in hopes to have brought out one of the famous purple fish. I did not succeed; but in this I was, I believe, as lucky as the old fishers had ever been. The purple fish at Tyre seems to have been only a concealment of their knowledge of cochineal, as, had they depended upon the fish for their dye, if the whole city of Tyre applied to nothing else but fishing, they would not have coloured twenty yards of cloth in a year †.

Natolia, or Asia Minor, comprehending the ancient provinces of Lydia, Pamphylia, Pisidia, Lycaonia, Cilicia, Cappadocia, and Pontus, or Amasia; all of them territories celebrated in the Greek and Roman history, are now, through the Turkish indolence and tyranny, either forsaken, or a theatre of ruins. The sites of ancient cities are still discernible; and so luxurious is nature in those countries, that in many places she triumphs over her forlorn condition. The selfish Turks cultivate no more land than maintains themselves, and their gardens and summer-houses fill up the circuit of their most flourishing cities. The most judicious travellers, upon an attentive survey of those countries, fully vindicate all that has been said by sacred and profane writers of their beauty, strength, fertility, and population. Even Palestine and Judæa, the most despicable at present of all those countries, lie buried within the luxuries of their own soil. The Turks seem particularly fond of representing it in the most gloomy colours, and have formed a thousand falsehoods concerning it, which, being artfully propagated by some among ourselves, have imposed upon weak Christians ‡.

COMMERCE AND MANUFACTURES.] These objects are little attended to in the Turkish dominions. The nature of the government destroys

\* Ezek. chap. xxvi. 5.

† Bruce's Travels, vol. I. Introduction, p. lix.

‡ The late reverend Dr. Shaw, professor of Greek at Oxford, who seems to have examined that country with an uncommon degree of accuracy, and was qualified by the soundest philosophy to make the most just observations, says, that, were the Holy Land as well cultivated as in former times, it would be more fertile than the very best parts of Syria and Phœnicia, because the soil is generally much richer, and, every thing considered, yields larger crops. Therefore the barrenness, (says he,) of which some authors complain, does not proceed from the natural unfruitfulness of the country, but from the want of the inhabitants, the indolence which prevails among the few who possess it, and the perpetual discords and depredations of the petty princes, who share this fine country. Indeed, the inhabitants can have but little inclination to cultivate the earth. "In Palestine," says Mr. Wood, "we have often seen the husbandman sowing, accompanied by an armed friend, to prevent his being robbed of the seed." And, after all, whoever sows is uncertain whether he shall ever reap the harvest.

that happy security which is the mother of arts, industry, and commerce; and such is the debasement of the human mind, when borne down by tyranny and oppression, that all the great advantages of commerce, which nature has, as it were, thrown under the feet of the inhabitants by their situation, are here totally neglected. The advantages of Tyre, Sidon, Alexandria, and all those countries which carried on the commerce of the ancient world, are overlooked. The Turks command the navigation of the Red Sea, which opens a communication to the southern ocean, and presents them with all the riches of the Indies. Whoever looks on a map of Turkey, must admire the situation of their capital, upon a narrow strait that separates Europe from Asia, and communicates on the south with the Mediterranean Sea, thereby opening a passage to all the European nations, as well as the coast of Africa. The same strait, communicating northwards with the Black Sea, opens a passage, by means of the Danube and other great rivers, into the interior parts of Germany, Poland, and Russia.

In this extensive empire, where all the commodities necessary for the largest plan of industry and commerce are produced, the Turks content themselves with manufacturing cottons, carpets, leather, and soap. The most valuable of their commodities, such as silk, a variety of drugs, and dyeing stuffs, they generally export without giving them much additional value for their own labour. The internal commerce of the empire is extremely small, and managed entirely by Jews and Armenians. In their traffic with Europe, the Turks are altogether passive. The English, French, Dutch, and other Europeans, resort hither with their commodities, and bring back those of Turkey in the same bottoms. They seldom attempt any distant voyages, and are possessed of only a few coasting vessels in the Asiatic Turkey, their chief royal navy lying on the side of Europe. The inattention of the Turks to objects of commerce is perhaps the best security to their government. The balance of power established among the princes of Europe, and their jealousies of one another, secure to the Turks the possession of countries which, in the hands of the Russians, or any active state, might endanger the commerce of their neighbours, especially their trade with India.

CONSTITUTION AND GOVERNMENT.] The Turkish government is commonly exhibited as a picture of all that is shocking and unnatural in arbitrary power. But from the accounts of Sir James Porter, who resided at the Porte, in quality of ambassador from his Britannic majesty, it appears that the rigours of that despotic government are considerably moderated by the power of religion. For though in this empire there is no hereditary succession to property, the rights of individuals may be rendered fixed and secure, by being annexed to the church, which is done at an inconsiderable expense. Even Jews and Christians may in this manner secure the enjoyment of their lands to the latest posterity; and so sacred and inviolable has this law been held, that there is no instance of an attempt on the side of the prince to trespass or reverse it. Neither does the observance of this institution altogether depend on the superstition of the sultan; he knows that any attempt to violate it would shake the foundations of his throne, which is solely supported by the laws of religion. Were he to transgress these laws, he would become an infidel, and cease to be the lawful sovereign. The same observation extends to all the rules laid down in the Koran, which was designed by Mahomet both as a political code and as a religious system. The laws there enacted, having all the force of religious prejudices to support them, are inviolable; and by them the civil rights of the Maha-

metans are regulated by the law where it is left imperfect, and the transgressions of the prophet can transgress the limit.

The Asiatic Turkey hold their possessions serving in the field while they perform who seldom call immediate servants Turkish government state, and whose officers in Turkey second in power the aga of the jan the musti, or his civil judges, and tion and assiduity children of Tart school of adversity difficulties and abilities as deficient, intrigue, and corruption; and they have they are uncertainly they have attainedly corrupt over the of the judges, and ed upon very equ

REVENUES.] empire must be a variety of taxes subjects, not of the thirty shillings a ers six shillings a venue arises from tious bordering laws. These for millions and a compared with the and officers of the demnify themselves of oppression that the vitals of the frequently give and the whole devoted victim is the names of his nity of making a cree, to take off highest respect, "The will of God" tifying his entire

metans are regulated. Even the comments on this book, which explain the law where it is obscure, or extend and complete what Mahomet had left imperfect, are conceived to be of equal validity with the first institutions of the prophet: and no member of the society, however powerful, can transgress them without censure, or violate them without punishment.

The Asiatic Turks, or rather subjects of the Turkish empire, who hold their possessions by a kind of military tenure, on condition of their serving in the field with a particular number of men, think themselves, while they perform that agreement, almost independent of the emperor, who seldom calls for the head or the estate of a subject who is not an immediate servant of the court. The most unhappy subjects of the Turkish government are those who approach the highest dignities of state, and whose fortunes are constantly exposed to sudden alterations, and depend on the breath of their master. There is a gradation of great officers in Turkey, of whom the visier, or prime minister; the kiaja, second in power to the visier; the reis-effendi, or secretary of state; and the aga of the janisaries, are the most considerable. These, as well as the musti, or high priest, the pashas, or governors of provinces, the civil judges, and many others, are commonly raised, by their application and assiduity, from the meanest stations in life, and are often the children of Tartar or Christian slaves taken in war. Tutored in the school of adversity, and arriving at pre-eminence through a thousand difficulties and dangers, these men are generally as distinguished for abilities as deficient in virtue. They possess all the dissimulation, intrigue, and corruption, which often accompanies ambition in a humble rank; and they have a farther reason for plundering the people, because they are uncertain how long they may possess the dignities to which they have attained. The administration of justice, therefore, is extremely corrupt over the whole empire; but this proceeds from the manners of the judges, and not from the laws of the kingdom, which are founded upon very equitable principles.

REVENUES.] The riches drawn from the various provinces of this empire must be immense. The revenues arise from the customs, and a variety of taxes which fall chiefly on the Christians, and other subjects, not of the Mahometan religion. The rich pay a capitation tax of thirty shillings a year; tradesmen fifteen shillings, and common labourers six shillings and ten-pence halfpenny. Another branch of the revenue arises from the annual tribute paid by the Tartars, and other nations bordering upon Turkey, but governed by their own princes and laws. These form what are called the *miri*, and amount to about four millions and a half sterling. All these, however, are trifling, when compared with the vast sums extorted from the governors of provinces, and officers of state, under the name of *resents*. These harpies, to indemnify themselves, as we have already observed, exercise every species of oppression that their avarice can suggest, till, becoming wealthy from the vitals of the countries and people they are sent to govern, their riches frequently give rise to a pretended suspicion of disloyalty or misconduct, and the whole fortune of the offender devolves to the crown. The devoted victim is seldom acquainted with the nature of the offence, or the names of his accusers; but, without giving him the least opportunity of making a defence, an officer is dispatched, with an imperial decree, to take off his head. The unhappy pasha receives it with the highest respect, putting it on his head, and after he has read it, says, "The will of God and the emperor be done," or some such expression, testifying his entire resignation to the will of his prince. Then he takes

the silken cord, which the officer has ready in his bosom, and having tied it round his own neck, and said a short prayer, the officer's servants throw him on the floor, and drawing the cord tight, soon dispatch him; after which his head is cut off, and carried to court.

**FORCES.]** The militia of the Turkish empire is of two sorts: the first have certain lands appointed for their maintenance, and the other is paid out of the treasury. Those that have certain lands amount to about 268,000 effective men. Besides these, there are also certain auxiliary forces raised by the tributary countries of this empire; as the Tartars, Walachians, Moldavians, and, till of late, the Georgians, who are commanded by their respective princes. The khan of the Crim Tartars, before his country was subjected to Russia, was obliged to furnish 100,000 men, and to serve in person, when the grand-signor took the field. In every war, besides the above forces, there are great numbers of volunteers, who live at their own charge, in expectation of succeeding the officers. These adventurers do not only promise themselves an estate if they survive, but are taught, that if they die in war against the Christians, they shall go immediately to Paradise. The forces which receive their pay from the treasury are called the spahis; or horse-guards, and are in number about 12,000; and the janisaries, or foot-guards, who are esteemed the best soldiers in the Turkish armies, and on whom they principally depend in an engagement. These amount to about 25,000 men, who are quartered in and near Constantinople. They frequently grow mutinous, and have proceeded so far sometimes as to depose the sultan. They are educated in the seraglio, and trained up to the exercise of arms from their infancy; and there are not less than 100,000 foot soldiers scattered over every province of the empire, who procure themselves to be registered in this body, to enjoy the privileges of janisaries, which are very great, being subject to no jurisdiction but that of their aga, or chief commander. Mr. Eton states the number of janisaries at 113,400, the whole of the Turkish infantry at 207,400, and the cavalry at 181,000; making a total of 388,000. But, deducting from these the leventis, who belong to the fleet, and can only be employed near the coast where the fleet is; the garrisons of Constantinople, and the fortresses and frontiers in Europe and Asia; the bostanges, who only march when the grand-signor takes the field; the miklagis, and such as serve the visier, the beglerbegs, and paschas, and never go into the battle; the remainder of effective men will amount only to 186,400. Yet the Porte, (adds he,) has often found it difficult to assemble 100,000 men; and, in 1774, with its utmost efforts, could only bring into the field 142,000.

**ARMS AND TITLES.]** The emperor's titles are swelled with all the pomp of eastern magnificence. He is styled by his subjects, *the Shadow of God, a God on earth, Brother to the Sun and Moon, Disposer of all earthly Crowns, &c.* The grand-signor's arms are, vert, a crescent, argent, crested with a turban, charged with three black plumes of heron's quills, with this motto, *Donec totum impleat orbem.*

**COURT AND SERAGLIO.]** Great care is taken in the education of the youths who are designed for the state, the army, or the navy: but they are seldom preferred till about forty years of age, and they rise by their merit. They are generally the children of Christian parents, either taken in war, purchased, or presents from the viceroys and governors of distant provinces, the most beautiful, well-made, and sprightly children that can be met with, and are always reviewed and approved of by the grand-signor, before they are sent to the colleges or seminaries, where they are educated for employments according to their genius or abilities.

The ladies of the court are chiefly sent as presents to the children of some years since the conquest, which George the first, king of Great Britain, sent to Sultan Selim had the present sultan permitted to the court dancing, and other pleasures, and ornate clothes and ornaments every fifth there is a *kiaya*, or governess among them, for the last that is sent ladies are scarcely the signor removes from the conveyance them to curtains; and when signals are made at the roads through are a number of men; and some majesty.

**ORIGIN AND PROGRESS.]** The Turks are more southern and conquered by that country known to the moderns by that name, or Turcomans, who under various leaders from the Caspian to the Straits, the capacity of body-guards, the doctrine of Mahomet, armies of contend, neighbourhood of Moulta, Major, and after he they seized that kingdom, all over the neighbourhood converts to Mahometanism, ravaging and sometimes commanding the caliphate or empire of Palestine; and part of the Christian Saracens, the Turkish contributions, and excise of the counts mentioned more fully.

It unfortunately more jealous of the throne, though, after occupied at Jerusalem, and were possessed of the year 1229, had

The ladies of the seraglio are a collection of beautiful young women, chiefly sent as presents from the provinces and the Greek islands, most of them the children of Christian parents. The brave prince Heraclius, some years since, abolished the infamous tribute of children of both sexes, which Georgia formerly paid every year to the Porte. The number of women in the haram depends on the taste of the reigning monarch. Sultan Selim had two thousand; Achmet had but three hundred; and the present sultan has nearly 1600. On their admission, they are committed to the care of old ladies, taught to sew and embroider, music, dancing, and other accomplishments, and furnished with the richest clothes and ornaments. They all sleep in separate beds, and between every fifth there is a preceptress. Their chief governess is called *katon kija*, or governess of the noble young ladies. There is not one servant among them, for they are obliged to wait on one another by rotation: the last that is entered serves her who preceded her, and herself. These ladies are scarcely ever suffered to go abroad, except when the grand-signor removes from one place to another, when a troop of black eunuchs conveys them to the boats, which are inclosed with lattices and linen curtains; and when they go by land, they are put into close chariots, and signals are made at certain distances, to give notice that none approach the roads through which they march. Among the emperor's attendants are a number of mutes, who act and converse by signs with great quickness; and some dwarfs, who are exhibited for the diversion of his majesty.

[ORIGIN AND PROGRESS OF THE TURKS.] It has been the fate of the more southern and fertile parts of Asia, at different periods, to be conquered by that warlike and hardy race of men, who inhabit the vast country known to the ancients by the name of Scythia, and among the moderns by that of Tartary. One tribe of these people, called Turks or Turcomans, which name signifies *wanderers*, extended its conquests under various leaders, and during several centuries, from the shore of the Caspian to the Straits of the Dardanellés. Being long resident, in the capacity of body-guards, about the courts of the Saracens, they embraced the doctrine of Mahomet, and acted for a long time as mercenaries in the armies of contending princes. Their chief residence was in the neighbourhood of Mount Caucasus, from whence they removed to Armenia Major, and after being employed as mercenaries by the sultans of Persia, they seized that kingdom about the year 1037, and spread their ravages all over the neighbouring countries. Bound by their religion to make converts to Mahometanism, they never were without a pretence for invading and ravaging the dominions of the Greek emperors, and were sometimes commanded by very able generals. Upon the declension of the caliphate or empire of the Saracens, they made themselves masters of Palestine; and the visiting of the holy city of Jerusalem being then part of the Christian exercises, in which they had been tolerated by the Saracens, the Turks laid the European pilgrims under such heavy contributions, and exercised such horrible cruelties upon the Christian inhabitants of the country, as gave rise to the famous crusades, which we have mentioned more fully in the introduction.

It unfortunately happened, that the Greek emperors were generally more jealous of the progress of the Christians than the Turks; and though, after oceans of blood were spilt, a Christian kingdom was erected at Jerusalem, under Godfrey of Boulogne, neither he nor his successors were possessed of any real power of maintaining it. The Turks, about the year 1229, had extended their dominions on every side, and possessed

themselves, under Othman, of some of the finest provinces in Asia, of Nice, and Prusa in Bithynia, which Othman made his capital, and, as it were, first embodied them into a nation; hence they took the name of Othmans from that leader; the appellation of Turks, as it signifies in the original, *wanderers* or *banished men*, being considered by them as a term of reproach. Othman is to be styled the founder of the Turkish empire, and was succeeded by a race of the most warlike princes that are mentioned in history. About the year 1357, they passed the Hellespont, and got a footing in Europe, and Amurath settled the seat of his empire at Adrianople, which he took in the year 1360: under him the order of janifaries was established. Such were their conquests, that Bajazet I. after conquering Bulgaria, and defeating the Greek emperor Sigmund, laid siege to Constantinople, in hopes of subjecting all the Greek empire. His greatness and insolence provoked Tamerlane, a Tartarian prince, who was just then returned from his eastern conquests, to declare war against him. A decisive battle was fought between those rival conquerors, in Natolia, in the plain where Pompey defeated Mithridates, when Bajazet's army was cut in pieces, and he himself taken prisoner, and shut up in an iron cage, where he ended his life.

The successors of Tamerlane, by declaring war against one another, left the Turks more powerful than ever; and though their career was checked by the valour of the Venetians, Hungarians, and the famous Scanderbeg, a prince of Epirus, they gradually reduced the dominions of the Greek emperors; and, after a long siege, Mahomet II. took Constantinople, in 1453. Thus, after an existence of ten centuries, from its first commencement under Constantine the Great, ended the Greek empire: an event which had been long foreseen, and was owing to many causes; the chief was the total degeneracy of the Greek emperors themselves, their courts and families, and the dislike their subjects had to the popes and the western church,—one of the patriarchs declaring publicly to a Romish legate, "that he would rather see a turban than the pope's tiara upon the great altar of Constantinople." But as the Turks, when they extended their conquests, did not exterminate, but reduced the nations to subjection, the remains of the ancient Greeks still exist, as we have already observed, particularly in Constantinople and the neighbouring islands, where, though under grievous oppressions, they profess Christianity under their own patriarchs of Constantinople, Alexandria, Antioch, and Jerusalem; and the Armenians have three patriarchs, who are richer than those of the Greek church, on account of their people being richer and more conversant in trade. It is said that the modern Greeks, though pining under the tyrannical yoke of the Turkish government, still preserve somewhat of the exterior appearance, though nothing of the internal principles, which distinguished their ancestors.

The conquest of Constantinople was followed by the submission of all Greece: and from this time the Turks have been looked upon as an European power.

Mahomet died in 1481, and was succeeded by Bajazet II. who carried on war against the Hungarians and Venetians, as well as Persia and Egypt. Bajazet falling ill of the gout, became indolent, was harassed by family differences, and at last, by order of his second son, Selim, was poisoned by a Jew physician. Selim afterwards ordered his eldest brother, Achmet, to be strangled, with many other princes of the Othman race. He defeated the Persians and the prince of Mount Taurus; but being unable to penetrate into Persia, he turned his arms against

Egypt, which, after some time, in the year 1517, he took, and made Cairo his capital.

He was succeeded by Soliman I. who, taking advantage of the weakness of the Christian powers, made conquests to Malta, which he took in the reign of Soliman, and gave the powers, and general government of the metropolis of Constantinople, to near 200,000 captives, who he sent into Austria, and Charles V. He made Malta his capital. This Soliman filled the throne of

He was succeeded by Selim II. Turkish marine retook the battle of Lepanto, and the Turkish power, had the Spaniards. Selim II. Tunis in Africa from his son, Amurath III. many other cities, and the treasures of Raab, in Hungary, in 1541. Mahomet III. The metropolis in 1565. nineteen of his brothers, who were slain. He was often afflicted with the plague in 1604. He was often unsuccessful against the Persians, yet he forced that he should keep the throne. prince of great spirit, successful against the Persian power he intended to take Bagdad from the Persians in 1640; a worthwhile conquest in 1648. His successor, Ibrahim, grand vizier, Cupe, had been besieged by the Persians and their allies, so that a bloody war succeeded. The latter were so successful that the Persians were forced (as has been said) to be expelled from the country. John Sobieski, king of Poland, was, in 1687, shut out of Constantinople by his brother, Soliman I.

The Turks continued to grow in power, that of his brother, Selim III. mounted the throne in 1789. Some British campaigns of Carlowitz, between 1699 and 1700. Soon after his death, and his brother, Ahmed III. who gave shelter to the Persians, and a war with the Russian

Egypt, which, after many bloody battles, he annexed to his own dominions, in the year 1517, as he did Aleppo, Antioch, Tripoli, Damascus, Gaza, and many other towns.

He was succeeded in 1520 by his son Soliman the Magnificent, who, taking advantage of the differences which prevailed among the Christian powers, took Rhodes, and drove the knights from that island to Malta, which was given them by the emperor, Charles V. The reign of Soliman, after this, was a continual war with the Christian powers, and generally successful, both by sea and land. He took Buda, the metropolis of Hungary at that time, and Belgrade, and carried off near 200,000 captives, A. D. 1526, and two years afterwards advanced into Austria, and besieged Vienna, but retired on the approach of Charles V. He miscarried also in an attempt he made to take the isle of Malta. This Soliman is looked upon as the greatest prince that ever filled the throne of Othman.

He was succeeded, in 1566, by his son Selim II. In his reign, the Turkish marine received an irrecoverable blow from the Christians, in the battle of Lepanto. This defeat might have proved fatal to the Turkish power, had the blow been pursued by the Christians, especially the Spaniards. Selim, however, took Cyprus from the Venetians, and Tunis in Africa from the Moors; he was succeeded, in 1575, by his son, Amurath III. who forced the Persians to cede Tauris, Teflis, and many other cities, to the Turks. He likewise took the important fortresses of Raab, in Hungary; and in 1593, he was succeeded by Mahomet III. The memory of this prince is distinguished by his ordering nineteen of his brothers to be strangled, and ten of his father's concubines, who were supposed to be pregnant, to be thrown into the sea. He was often unsuccessful in his wars with the Christians, and died of the plague in 1604. Though his successor Achmet was beaten by the Persians, yet he forced the Austrians to a treaty in 1606, and to consent that he should keep what he was possessed of in Hungary. Osman, a prince of great spirit, but no more than sixteen years of age, being unsuccessful against the Poles, was put to death by the janifaries, whose power he intended to have reduced. Morad IV. succeeded in 1623; and took Bagdad from the Persians. His brother, Ibrahim, succeeded him in 1640; a worthless inactive prince, and strangled by the janifaries in 1648. His successor, Mahomet IV. was excellently well served by his grand visier, Cuperli. He took Candia from the Venetians, after it had been besieged for thirty years. This conquest cost the Venetians, and their allies, 80,000 men, and the Turks, it is said, 180,000. A bloody war succeeded between the Imperialists and the Turks, in which the latter were so successful, that they laid siege to Vienna, but were forced (as has been already mentioned) to raise it with great loss, by John Sobieski, king of Poland, and other Christian generals. Mahomet was, in 1687, shut up in prison by his subjects, and succeeded by his brother, Soliman II.

The Turks continued unsuccessful in their wars during his reign, and that of his brother and successor, Achmet I.—but Mustapha II. who mounted the throne in 1694, headed his armies in person. After some brisk campaigns, he was defeated by prince Eugene; and the peace of Carlowitz, between the Imperialists and Turks, was concluded in 1699. Soon after, Mustapha was deposed, his musti was beheaded, and his brother, Achmet III. mounted the throne. He was the prince who gave shelter, at Bender, to Charles XII. of Sweden; and ended a war with the Russians, by a peace concluded at Pruth. When the Rus-

sian army was surrounded without hopes of escape, the czarina inclined the grand visier to the peace, by a present of all the money, plate, and jewels, that were in the army: but the Russians delivered up to the Turks Afoph, Kamnieck, and Taiganrog, and agreed to evacuate Poland. He had afterwards a war with the Venetians, which alarmed all the Christian powers. The scene of action was transferred to Hungary, where the Imperial general, prince Eugene, gave so many repeated defeats to the infidels, that they were forced to conclude a disgraceful peace at Passarowitz, in 1718. An unfortunate war with the Persians, under Kouli Khan, succeeding, the populace demanded the heads of the visier, the chief admiral, and secretary, which were accordingly struck off; but the sultan also was deposed, and Mahomet V. advanced to the throne. He was unsuccessful in his wars with Kouli Khan, and at last obliged to recognise that usurper as king of Persia. He was, after that, engaged in a war with the Imperialists and Russians; against the former he was victorious; but the successes of the latter, which threatened Constantinople itself, forced him to agree to a hasty treaty with the emperor, and, after that, another with the Russians, which was greatly to his advantage. Mahomet died 1754.

He was succeeded by his brother, Osman III. who died in 1757, and was succeeded by his brother Mustapha III. who died on the 21st of January, 1774, whilst engaged in an unsuccessful war with the Russians, of which some account has been already given in the history of that country. In the course of this war, a considerable Russian fleet was fitted out, which set sail from the Baltic, with a view of attacking the remote parts of the Archipelago. This fleet having arrived at Minorca, departed from thence in the beginning of February, 1770, and shaped its course for the Morea. Count Orlov having debarked such land forces as he had with him at Maina, which lies a little to the westward of Cape Metapan, and about fifty miles to the south-west of Mistra, the ancient Sparta, the Mainotes, the descendants of the Lacedæmonians, and who still possessed the country of their ancestors, under subjection to the grand-signor, immediately flew to their arms in every quarter, and joined the Russians by thousands, from their aversion to the tyranny of the Turks. The other Greeks immediately followed their example, or rather only waited to hear of the arrival of the Russians, to do what they had long intended; and the whole Morea seemed every where in motion. The open country was quickly over-run, and Mistra, Arcadia, and several other places, as speedily taken, while the Russian ships, that had been separated, or that put into Italy, arrived successively, and landed their men in different quarters, where every small detachment soon swelled into a little army, and the Turks were every where attacked or intercepted. In the mean time, the Greeks gave the utmost loose to their revenge, and every where slaughtered the Turks without mercy; and the rage and fury with which the inhabitants of the continent were seized extended itself to the islands, where also the Turks were massacred in great numbers. They were, indeed, unable to make head against the Russians and Greeks in the field; their only protection was found within the fortresses. The malcontents had so much increased since the first debarkation of the Russians, that they invested Napoli di Romania, Corinth, and the castle of Patras, with several other places of less note. But whilst they were employed in these enterprises, an army of thirty thousand men, composed chiefly of Albanians, and Epirotes, entered the Morea, commanded by the seraskier, pasha of Bosnia. of the peninsula as soon as he appeared in it; and all the Greeks that were found in arms, or out of their villages, were instantly put to death. The Russians were now driven back to their ships; but about the same time, another Russian squadron, commanded by admiral Elphinstone, arrived from England to re-inforce count Orlov's armament. The Turkish fleet also appeared, and an obstinate engagement was fought in the channel of Scio, which divides that island from Natolia, or the Lesser Asia. The Turkish fleet was considerably superior in force, consisting of fifteen ships of the line, from sixty to ninety guns, besides a number of chebeques and galleys, amounting in the whole to near thirty sail; the Russians had only ten ships of the line, and five frigates. Some of the ships engaged with great resolution, while others on both sides found various causes for not approaching sufficiently near. But Spiritoz, a Russian admiral, encountered the captain pacha, in the Sultana, of ninety guns, yard-arm and yard-arm; they fought with the greatest fury, and at length ran so close, that they locked themselves together, with grappling-irons, and other tackling. In this situation, the Russians, by throwing hand-grenades from the tops, set the Turkish ship on fire, and as they could not now be disentangled, both ships were in a little time equally in flames. Thus dreadfully circumstanced, without a possibility of succour, they both at length blew up with a most terrible explosion. The commanders and principal officers on both sides were mostly saved; but the crews were almost totally lost. The dreadful fate of those ships, as well as the danger to those that were near them, produced a kind of pause on both sides; after which the action was renewed, and continued till night without any material advantage on either side. When it became dark, the Turkish fleet cut their cables, and ran into a bay on the coast of Natolia; the Russians surrounded them thus closely pent up, and in the night some fire-ships were successfully conveyed among the Turkish fleet, by the intrepid behaviour of lieutenant Dugdale, an Englishman in the Russian service, who, though abandoned by his crew, himself directed the operations of the fire-ships. The fire took place so effectually, that in five hours the whole fleet, except one man of war and a few galleys, that were towed off by the Russians, was totally destroyed; after which they entered the harbour, and bombarded and cannonaded the town, and a castle that protected it, with such success, that a shot having blown up the powder-magazine in the latter, both were reduced to a heap of rubbish. Thus was there scarcely a vestige left, at nine o'clock, of a town, a castle, and a fine fleet, which had been all in existence at one the same morning.

Some of the principal military transactions by land, in the war between Russia and Turkey, having been already noticed in our account of the former empire, we shall here only add, that, after a most unfortunate war on the side of the Turks, peace was at length concluded between them and the Russians, on the 21st of July, 1774, a few months after the accession of Achmet IV. The emperor, Mustapha III. left a son, then only in his 13th year; but as he was too young to manage the reins of government in the then critical situation of the Turkish affairs, Mustapha appointed his brother, the late emperor, to succeed him in the throne; and to this prince, under the strongest terms of recommendation, he confided the care of his infant son.

The perseverance of the Turks, supplied by their numerous Asiatic armies, and their implicit submission to their officers, rather than an excellency in military discipline or courage in war, have been the great

springs of those successes which have rendered their empire so formidable. The extension, as well as duration of their empire, may indeed be in some measure owing to the military institution of the janisaries, a corps originally composed of children of such Christian parents as could not pay their taxes. These being collected together, were formed to the exercise of arms under the eyes of their officers in the seraglio. They were generally in number about 40,000; and so excellent was their discipline, that they were deemed to be invincible; and they still continue the flower of the Turkish armies: but the Ottoman power is in a declining state. The political state of Europe, and the jealousies that subsist among its princes, is now the surest basis of this empire, and the principal reason why the finest provinces in the world are suffered to remain any longer in the possession of these haughty infidels.

Notwithstanding the peace which was established in 1774, between Russia and the Porte, various sources of discord having been left open, very little tranquillity could subsist between them. For an account of these we refer our readers to our historical narrative of the former empire. Towards the latter end of the year 1786, the Turks seem to have adopted a regular system of indirect hostility against Russia, who was continually making such encroachments, as made the Turks resolve to tempt again the fortune of war. Scarcely had the empress returned from the splendid journey which she made to Cherson, before a declaration of Turkish hostilities was announced at Petersburg. What part the emperor of Germany would take in this war was not at first known. The capriciousness of his character kept the spirit of curiosity in suspense for some little time; but he soon declared himself determined to support all the claims which Russia had upon the Porte.

Instead of being disheartened at the formidableness of the confederacy that had broken out against them, the Turks applied themselves with redoubled ardour to prepare for resistance. But an event that seems greatly to have contributed to the bad success experienced by the crescent in the year 1789, was the death of Achmet the Fourth, grand-signor, on the 7th of April.

This prince, if we make suitable allowances for the disadvantages under which he laboured as a despotic monarch, and the prejudices of his country, may be allowed to possess some claim to our esteem. He filled the throne of Constantinople without reflecting disgrace upon human nature. His temper appears to have been mild and humane. He not only permitted Selim, his nephew, son of the late emperor, to live, but even publicly acknowledged him for his successor. His reign was not stained with so many arbitrary murders as those of his predecessors; nor did he think it at all necessary that a disgraced minister should part at once with his office and his life. He suffered his countrymen to improve by the arts and military discipline of Europe. Yussuf, his prime minister, during the last three years of his life, though by no means consistently great, must be allowed to deserve our applause, and will be better known to posterity as the patron of the Turkish translation of the Encyclopédie, than as the victorious and skilful rival of the Austrian arms in the Bannat of Transylvania.

Achmet died at the unenterprising age of sixty-four, and Selim the Third succeeded, at twenty-eight. In the vigour of youth, he thought it necessary to distinguish himself by something extraordinary; and at first purposed to put himself at the head of his forces. He was easily, as might be expected from his effeminate education, dissuaded from this

rash and ridiculous project. But he conceived that at least it became him to discountenance the ministers of his predecessor, to confound their pains, and reverse all their proceedings. These ministers had acquired in some degree the confidence of those who acted under their command; and it appeared in the sequel that the fantastic splendour of a new and juvenile sovereign could not compensate for the capricious and arbitrary changes with which his accession was accompanied.

In the year 1788 Choczim and Oczakow surrendered to the arms of Russia, as will be found in the history of that country; and on the 12th of September, 1789, the Austrian forces sat down before Belgrade, and with that good fortune which seemed almost constantly to attend their commander, marshal Laudohn. The place, together with its numerous garrison, surrendered, after a vigorous resistance, on the 8th of October. The rest of the campaign was little else than a succession of the most important successes; and a circumstance that did not a little contribute to this, was the system adopted by the Austrians and Russians, of suffering the Turkish troops to march out of the several places they garrisoned without molestation. Bucharest, the capital of Walachia, fell without opposition into the hands of prince Cobourg; while Akerman, on the Black Sea, was reduced by the Russians; and Bender surrendered to prince Po'emkin, not without suspicion of sinister practices, on the 15th of November. One only check presented itself to the allied arms. The garrison of Orsova displayed the most inflexible constancy, and marshal Laudohn was obliged to raise the siege of this place in the middle of December, after having sat down before it for a period of six weeks. In a short time after, the siege was renewed, and Orsova was reduced the 16th of April, 1790.

After the reduction of Orsova, the war was carried on with languor on the part of Austria; and in the month of June a conference was agreed upon at Reichenbach, at which the ministers of Prussia, Austria, England, and the United Provinces assisted, and at which also an envoy from Poland was occasionally present. After a negotiation, which continued till the 17th of August, it was agreed that a peace should be concluded between the king of Hungary and the Ottoman Porte; that the basis of this treaty should be a general surrender of all the conquests made by the former, retaining only Choczim as a security till the Porte should accede to the terms of the agreement, when it was also to be restored. On the other hand, the king of Prussia gave up the Belgic provinces, and even promised his assistance in reducing them to the Austrian dominions.

The king of Prussia was less successful in his mediation with Russia. Catharine had not, like Leopold, an imperial crown at stake, which, unsubstantial as it is, has always its charms with those who are educated in the habitual adoration of rank and dignities. Her conquests also, on the side of Turkey, were too important to be easily relinquished; and she considered her dignity attacked by the insolent style of Prussian mediation. The substance of her answer to the Prussian memorial was therefore, "That the empress of Russia would make peace and war with whom she pleased, without the interference of any foreign power."

The campaign of 1791 opened, on the part of Russia, with the taking of Maczin, on the 4th of April, by prince Gallitzin; and in a subsequent victory, on the 12th, by the same general, in the neighbourhood of Brailow, the Turks lost not less than 4000 men, and upwards of 100 officers, besides many pieces of cannon. On the 14th the Russian arms

experienced a check, by which they lost about 700 men, and were obliged to relinquish their intention of besieging Brailow. After reinforcing this place, the visier proceeded to the banks of the Danube, near Silistria; and by means of a bridge which he threw across the river, his advanced posts were enabled to make incursions on the opposite side. The ability of the visier, and the valour of the Turks, were however exerted in vain against the discipline and experience of European armies. In the month of June 15,000 Turks were defeated by a party of cavalry under general Kutusow. On the 3d of July, the fortrets of Anape was taken by general Gudowitsch; and the garrison, to the amount of 6,000 men, made prisoners. This event was followed, on the 9th of the same month, by a signal victory which prince Reppin obtained near Maczin over a body of 70,000 men, the flower of the Turkish army. The Ottomans left upwards of 4000 dead upon the field of battle, and lost their entire camp-equipage, colours, and 30 pieces of cannon. The Russians are said to have lost only 150 men killed, and between 200 and 300 wounded.

While the war was thus vigorously carried on, the mediating powers were not inactive. Great Britain and Prussia, in particular, declared themselves determined to support the balance of Europe, and to force the empress to peace upon the basis of a *status quo*. Of the interference of Britain in this dispute, we have treated more largely in another place. To the first applications of the English minister, the empress answered in nearly the same terms in which she had before replied to the memorial of Prussia—"That the British court would not be permitted to dictate the terms of peace." In the course of the negotiation, however, her demands became more moderate: and as the northern powers, and particularly Denmark, began to exert themselves for the prevention of hostilities, she confined her views to the possession of Oczakow, with the district extending from the Bog to the Neister, and even then providing for the free navigation of the latter river. The negotiation was protracted to the 11th of August, when at length peace was concluded between the czarina and the Porte, nearly upon these terms—terms which, considering the ill success of the war, cannot be accounted very disadvantageous to the Turks, who have lost a fortret more useful for the purpose of annoying Russia, than for defending their own territories; but certainly of considerable importance to Russia, which, by this cession, has secured the peaceable possession of the Crimea.

It is computed that in this war Turkey lost 200,000 soldiers; Russia, 100,000; the Austrians, who fell in battle, or in the unhealthy marshes, are supposed to exceed 130,000.

The treacherous and wanton invasion of Egypt by the French, in 1798, without even the pretence that the Porte had given them any cause of offence, justly provoked the Turks to declare war against France; but as the hostilities which have hitherto taken place between these powers have been almost entirely confined to the attack on Egypt and some towns in Syria, of which an account is given elsewhere, it is unnecessary to repeat it here.

Selim III. grand-signor, born in 1761, succeeded to the throne of Turkey on the death of his uncle, the late sultan, April 7, 1789.

### SITUATION AND EXTENT.

Miles.		Degrees.
Length 4000 } Breadth 2400 }	between	{ 50 and 150 East longitude. 30 and 72 North latitude.

**BOUNDARIES.]** It would be deceiving the reader to desire him to depend upon the accounts given us by geographers, of the extent, limits, and situation of these vast regions. Even the emperors of Russia and her ministry are ignorant of her precise limits with the Chinese, the Persians, and other nations. Tartary, taken in its fullest extent, is bounded by the Frozen Ocean on the North; by the Pacific Ocean on the East; by China, India, Persia, and the Caspian Sea, on the South; and by Muscovy on the West.

Kamtschatka is a great peninsula, which extends from north to south about seven degrees thirty minutes. It is divided into four districts, Bolchereck, Tigiltkaja Krepost, Verchnei or Upper Kamtschatkoi Ostrog, and Nishnei or Lower Kamtschatkoi Ostrog.

**MOUNTAINS.]** The principal mountains are Caucasus in Circassia, and the mountains of Taurus and Ararat, so contiguous to it, that they appear like a continuation of the same mountain, which crosses all Asia from Mongolia to the Indies; and the mountains of Stolp, in the North.

**SEAS.]** These are the Frozen Ocean, the Pacific Ocean, and the Caspian Sea.

**RIVERS.]** The principal rivers are, the Wolga, which runs a course of two thousand miles; the Oby, which divides Asia from Europe; the Tabol, Irtis, Genesa or Jenka; the Barrumpooter; the Lena, and the Argun, which divides the Russian and Chinese empires.

**AIR, CLIMATE, SOIL, AND PRODUCE.]** The air of this country is very different, by reason of its vast extent from North to South; the northern parts reaching beyond the arctic polar circle, and the southern being in the same latitude with Spain, France, Italy, and part of Turkey.

Nova Zembla and Russian Lapland are most uncomfortable regions; the earth, which is covered with snow nine months in the year, being extremely barren, and every where incumbered with unwholesome marshes, uninhabited mountains, and impenetrable thickesses. The climate of Siberia is cold, but the air is pure and wholesome; and Mr. Tooke observes, that its inhabitants, in all probability, would live to an extreme old age, if they were not so much addicted to an immoderate use of intoxicating liquors. Siberia produces rye, oats, and barley, almost to the 60th degree of northern latitude. Cabbages, radishes, turneps, and cucumbers, thrive here tolerably well; but scarcely any other greens. All experiments to bring fruit-trees to bear have hitherto been in vain: but there is reason to believe that industry and patience may at length overcome the rudeness of the climate. Currants and strawberries of several sorts are said to grow here in as great perfection as in the English gardens. Herbs, as well medicinal as common, together with various edible roots, are found very generally here: but there are no bees in all Siberia. Astracan, and the southern parts of Tartary, are extremely fertile, owing more to nature than industry. The parts that are cultivated produce excellent fruits of almost all the kinds known in Europe, especially grapes, which are reckoned the largest and finest in the world. The summers are very dry, and from the end of July to the beginning of October the air is pestered, and the soil sometimes ruined, by incredible quantities of locusts. Mr. Bell, who travelled with the Russian ambassador to China, represents some parts of Tartary as desirable and fertile countries, the grass growing spontaneously to an amazing height. The country of Thibet is the highest in Asia, and is a part of that elevated tract which gives rise to the rivers of India and China, and those of Siberia, and other parts of Tartary.

**METALS AND MINERALS.]** It is said that Siberia contains mines of gold, silver, copper, iron, jasper, lapis lazuli, and loadstones: a sort of large teeth found here have occasioned dispute among naturalists, whether they belong to elephants or fishes.

**ANIMALS.]** These are camels, dromedaries, bears, wolves, and all the other land and amphibious animals that are common in the northern parts of Europe. Their horses are of a good size for the saddle, and very hardy: as they run wild till they are five or six years old, they are generally headstrong. Near Astracan, there is a bird, called by the Russians baba, of a grey colour, and something larger than a swan: he has a broad bill, under which hangs a bag that may contain a quart, or more; he wades near the edge of a river, and on seeing a shoal or fry of small fishes, spreads his wings and drives them to a shallow, where he gobbles as many of them as he can into his bag, and then going ashore, eats them, or carries them to his young. Some travellers take this bird to be the pelican.

The forests of Siberia are well stocked with a variety of animals, some of which are not to be found in other countries. These supply the inhabitants with food and clothes; and, at the same time, furnish them with commodities for an advantageous trade. Siberia may be considered as the native country of black foxes, sables, and ermines, the skins of which are here superior to those of any part of the world. Horses and cattle are in great plenty, and sold at low prices. The bos grunniens of Linnaeus, or grunting ox, which inhabits Tartary and Thibet, has a tail of uncommon beauty, full and flowing, of a glossy and silky texture. These tails are a considerable article of exportation

POPULATION, INHABITANTS, MANNERS, CUSTOMS, DIVERSIONS, AND DRESS. } We can form no probable conjecture as to the number of the inhabitants in Tartary; but, from many circumstances, we must conclude, that they are far from being proportioned to the extent of their country. They are in general strong-made stout men; their faces broad, their noses flattish, their eyes small and black, but very quick; their beards are scarcely visible, as they continually thin them by pulling up the hairs by the roots. The beauty of the Circassian women is a kind of staple commodity in that country; for parents there make no scruple of selling their daughters to recruit the seraglios of the great men of Turkey and Persia. They are purchased, when young, by merchants, and taught such accomplishments as suit their capacities, to render them more valuable against the day of sale. The Tartars are, in general, a wandering sort of people. In their peregrinations they set out in the spring, their number in one body being frequently an 10,000, preceded by their flocks and herds. When they come to an inviting spot, they live upon it till all its grass and verdure is eaten up. They have little money, except what they get from their neighbours the Russians, Persians, or Turks, in exchange for cattle; with this they purchase cloth, silks, stuffs, and other apparel for their women. They have few mechanics, except those who make arms. They avoid all labour, as the greatest slavery; their only employment is tending their flocks, hunting, and managing their horses. If they are angry with a person, they wish he may live in one fixed place, and work like a Russian. Among themselves, they are very hospitable, and wonderfully so to the strangers and travellers who confidentially put themselves under their protection. They are naturally of an easy, cheerful temper, always disposed to laughter, and seldom depressed by care or melancholy. There is a strong resemblance between the northern and independent Tartars, and some nations of Canada, in North America; particularly, when any of their people are infirm through great age, or seized with distempers reckoned incurable, they make a small hut for the patient near some river, in which they leave him with some provisions, and seldom or never return to visit him. On such occasions, they say they do their parents a good office in sending them to a better world: Notwithstanding this behaviour, many nations of the Tartars, especially towards the south, are tractable, humane, and are susceptible of pious and virtuous sentiments. Their affection for their fathers, and their submission to their authority, cannot be exceeded; and this noble quality of filial love has distinguished them in all ages. History tells us, that Darius, king of Persia, having invaded them with all the forces of his empire, and the Scythians retiring by little and little, Darius sent an ambassador to demand where it was they proposed to conclude their retreat, and when they intended to begin fighting. They returned for answer, with a spirit so peculiar to that people, "That they had no cities or cultivated fields, for the defence of which they should give him battle: but when once he was come to the place of their fathers' monuments, he should then understand in what manner the Scythians used to fight.

The Tartars are inured to horsemanship from their infancy; they seldom appear on foot. They are dexterous in shooting at a mark, info-

much that a Tartar, while at full gallop, will split a pole with an arrow, though at a considerable distance. The dress of the men is very simple, and fit for action; it generally consists of a short jacket, with narrow sleeves, made of deer's skin, having the fur outward; trousers and hose of the same kind of skin, both of one piece, and tight to the limbs. The Tartars live in huts half sunk under ground; they have a fire in the middle, with a hole in the top to let out the smoke, and benches round the fire to sit or lie upon. This seems to be the common method of living among all the northern nations, from Lapland eastward, to the Japanese Ocean. In the extreme northern provinces, during the winter, every family burrows itself, as it were, under ground; and we are told, that so sociable are they in their dispositions, that they make subterraneous communications with each other, so that they may be said to live in an invisible city. The Tartars are immoderately fond of horse-flesh, especially if it be young, and a little tainted; which makes their cabbins extremely nauseous. Though horse-flesh be preferred raw by some northern tribes, the general way of eating it is after it has been smoked and dried. The Tartars purchase their wives with cattle. In their marriages they are not very delicate. Little or no difference is made between the child of a concubine or slave, and that of the wife; but among the heads of tribes, the wife's son is always preferred to the succession. After a wife is turned of forty, she is employed in menial duties, as another servant, and as such must attend the young wives who succeed to her place; nor is it uncommon, in some of the more barbarous tribes, for a father to marry his own daughter.

The descendants of the old inhabitants of Siberia are still most of them idolaters. They consist of many nations, entirely different from each other in their manner of living, religion, language, and countenances. But in this they agree, that none of them follow agriculture, which is carried on by some Tartars, and such as are converted to Christianity. A few of them breed cattle, and others follow hunting. The population of Siberia has been much increased since it became a Russian province; for the Russians have founded there a number of towns, fortresses, and villages. Notwithstanding which, it presents but a void and desert view; since, by its extent, it is capable of supporting several millions more than it at present contains. For the manners and customs of the other Tartars belonging to the Russian empire, we refer to our account of that country.

[RELIGION.] The religion of the Tartars somewhat resembles their civil government, and is commonly accommodated to that of their neighbours; for it partakes of the Mahometan, the Gentoo, the Greek, and even popish religions. Some of them are the grossest idolaters, and worship little rude images, dressed up in rags. Each has his own deity, with whom they make very free in case of disappointment in any pursuit.

But the religion and government of the kingdom of Thibet and Lassa, a large tract of Tartary, bordering upon China, are the most remarkable, and the most worthy of attention. The Thibetians are governed by the Grand Lama, or Dalai Lama, who is not only submitted to, and adored by them, but is also the great object of adoration among the various tribes of heathen Tartars, who roam through the vast tract of continent which stretches from the banks of the Wolga, to Corea, on the Sea of Japan. He is not only the sovereign pontiff, the viceroy of the Deity on earth; but, as superstition is ever the strongest

LEARNING.] account of the T Zingis Khan and

where it is most removed from its object, the more remote Tartars absolutely regard him as the Deity himself. They believe him to be immortal, and endowed with all knowledge and virtue. Every year they come up from different parts, to worship and make rich offerings at his shrine: even the emperor of China, who is a Manchou Tartar, does not fail in acknowledgments to him in his religious capacity, though the Lama is tributary to him, and actually entertains, at a great expence, in the palace of Peking, an inferior Lama, deputed, as his nuncio, from Thibet. The opinion of those who are reputed the most orthodox among the Thibetians is, that when the Grand Lama seems to die either of old age or of infirmity, his soul in fact only quits a crazy habitation to look for another younger or better, and it is discovered again in the body of some child, by certain tokens, known only to the lamas or priests, in which order he always appears. In 1774, the Grand Lama was an infant, which had been discovered some time before by the Tayhoo Lama, who, in authority and sanctity of character, is next to the Grand Lama, and, during his minority, acts as chief. The lamas, who form the most numerous, as well as the most powerful body in the state, have the priesthood entirely in their hands; and, besides, fill up many monastic orders, which are held in great veneration among them. The residence of the Grand Lama is at Patoli, a vast palace on a mountain near the banks of the Burrumpooter, about seven miles from Labassa. The English East-India company made a treaty with the Lama in 1774. The religion of Thibet, though in many respects it differs from that of the Indian Bramins, yet in others it has a great affinity to it. The Thibetians have a great veneration for the cow, and also highly respect the waters of the Ganges, the source of which they believe to be in heaven. The Sunniasses, or Indian pilgrims, often visit Thibet as a holy place, and the Lama always entertains a body of two or three hundred in his pay. Besides his religious influence and authority, the Grand Lama is possessed of unlimited power throughout his dominions, which are very extensive, and border on Bengal.

Another religion, which is very prevalent among the Tartars, is that of Schamanism. The professors of this religious sect believe in one Supreme God, the creator of all things. They believe that he loves his creation, and all his creatures; that he knows every thing, and is all-powerful; but that he pays no attention to the particular actions of men, being too great for them to be able to offend him, or to do any thing that can be meritorious in his sight. But they also maintain that the Supreme Being has divided the government of the world, and the destiny of men, among a great number of subaltern divinities, under his command and controul, but who, nevertheless, generally act according to their own fancies; and therefore mankind cannot dispense with using all the means in their power for obtaining their favour. They likewise suppose, that, for the most part, these inferior deities abominate and punish premeditated villany, fraud, and cruelty. They are all firmly persuaded of a future existence; but they have many superstitious notions and practices. Among all the Schamanes, women are considered as being vastly inferior to men, and are thought to have been created only for their sensual pleasure, to people the world, and to look after household affairs; and, in consequence of these principles, they are treated with much severity and contempt.

LEARNING.] The reader may be surpris'd to find this article in an account of the Tartars; yet nothing is more certain, than that under Zingis Khan and Tamerlane, and their early descendents, Afracan and

the neighbouring countries were the seats of learning and politeness, as well as empire and magnificence. Modern luxury, be it ever so splendid, falls short of that of those princes; and some remains of their taste in architecture are still extant, but in spots so desolate, that they are almost inaccessible. The encouragement of learning was the first care of the prince, and it was generally cultivated by his own relations or principal grandees. They wrote in the Persian and Arabic tongues; and their histories, many of which are still extant in manuscript, carry with them the strongest marks of authenticity.

**CURIOSITIES.]** These are comprehended in the remains of the buildings, left by the above-mentioned great conquerors and their successors. Remains of ditches and ramparts are frequently met with, which heretofore either surrounded small towns, now quite demolished, or were designed for the defence of camps, forts, or castles, the vestiges of which are often to be discovered. Many of them are still in tolerable preservation. The Slabode, or Tartarian suburb of Kasimof, on the Oha, seems to have been the residence of some khan. In the midst of the ruins of that city, is a round and elevated tower, called, in their language, *Misquir*, a sort of temple, or building, dedicated to devotion. Here are also the remains of the walls of a palace: and in one of the mausoleums, or burial-places, is a very considerable mausoleum: all which edifices are built of hewn stone and bricks. From an Arabic inscription we learn, that the khan of Schagali was buried there in the 962d year of the Hegira, or the 1520th of the Christian era. Near Mount Caucasus are still very considerable remains of Madfchar, a celebrated city of former times. Near Derbent are numerous tombs covered with cylindrical stones, exceeding the usual stature of men, with Arabic inscriptions. In the environs of Astracan the ruins of ancient Astracan are very visible; and the rubbish and ramparts of another respectable town still exist near Tzaritzin, on the left shore of the Wolga. A little below the mouth of Kama, which empties itself into the above-mentioned river, are many superb monuments of the ancient city Bulgari, consisting of towers, mosques, houses, and sepulchres, all built of stone or brick. The oldest epitaphs have been there more than eleven centuries, and the most modern at least four hundred years. Not far from hence, on the Tschereutscham, a little river that runs into the Wolga, are found ruins somewhat more injured by the depredations of time: they are those of Bouimer, an ancient and very considerable city of the Bulgarians. The Tartars have erected upon its ruins the small town of Bilyairk. In the fortress of Kasan is a monument of the ancient Tartarian kingdom of that name. Its lofty walls are so broad, that they serve at present for ramparts; the turrets of which, as well as the old palace of the khan, are built of hewn stone. Ascending the river Kasanha, we meet with epitaphs; and the strong ramparts of the old Kasan. Near the Oufa are cemeteries full of innumerable inscriptions, and several sepulchral vaults. The ramparts of Sibir, the ancient capital of Tartary, are still seen about Tobolsk upon the Irtysh. The lofty walls of Tontoura appear yet in the Baraba, a little gulf in the river Om; and near the mouth of the Oural are the ditches of the city Saratschik. There are a great number of other ruins in Siberia; and the desert of Kirguis abounds in the relics of opulent cities. Some gold and silver coins have likewise been found, with several manuscripts neatly written, which have been carried to Peterburg. In 1720, there were found in Calmuc Tartary a subterraneous house of stone, some urns, lamps, and ear-rings; an equestrian statue; an image

of an oriental throne; and to the Academy of Siberia, an shape of serpents animals, Tart places were m sition prevail kind of life th prince, they f arms and othe

of an oriental prince with a diadem on his head; two women seated on thrones; and a roll of manuscripts, which was sent by Peter the Great to the Academy of Inscriptions at Paris, and proved to be in the language of Thibet. The quantity of gold ornaments found in the tombs of Siberia, and of elegant workmanship, as bracelets, collars in the shape of serpents, vases, crowns, rings, bucklers, sabres, figures of animals, Tartar idols, &c. is surprising. It is supposed that these burial-places were made about the time of Zingis Khan, and that the superstition prevailed in those parts of departed souls following the same kind of life they did in this world, and therefore, on the death of a prince, they sacrificed his favourite wife, &c. and buried with him his arms and other valuable things.

[CITIES AND TOWNS.] Of these we know little but the names, and that they are in general no better than fixed hordes. They may be said to be places of abode, rather than towns or cities, for we do not find that they are under any regular government, or that they can make a defence against an enemy. The few places, however, that are mentioned in the preceding divisions of this country, merit notice. Tobolsk and Astracan are considerable cities, the first containing 15,000, and the latter 70,000 inhabitants. Forts, villages, and towns, have also lately been erected in different parts of Siberia, for civilising the inhabitants, and rendering them obedient to the Russian government.

[COMMERCE AND MANUFACTURES.] This head makes no figure in the history of Tartary, their chief traffic consisting in cattle, fine ox-tails, skins, beavers, rhubarb, musk, and fish. The Astracans, notwithstanding their interruptions by the wild Tartars, carry on a considerable traffic into Persia, to which they export red leather, woollen and linen cloth, and some European manufactures. The Bucharians also are a very commercial people: their caravans travel through a great part of Asia, and traffic with Thibet, China, India, Persia, and Russia. Their principal marts are Tomsk and Orenburg. Gold-dust is often found in the sand of the rivers of Bucharia.

[HISTORY.] Though it is certain that Tartary, formerly known by the name of Scythia, peopled the northern parts of Europe, and furnished those amazing numbers, who, under various names, destroyed the Roman empire, yet it is now but very thinly inhabited; and those fine provinces, where learning and the arts resided, are now scenes of horror and barbarity. This must have been owing to the dreadful massacres made among the nations by the two above-mentioned conquerors and their descendants; for nothing is more common in their histories, than their putting to the sword three or four hundred thousand people in a few days.

The country of Usbec-Tartary was once the seat of a more powerful empire than that of Rome or Greece. It was not only the native country, but the favourite residence of Zingis or Jenghis Khan, and Tamerlane, who enriched it with the spoils of India and the eastern world.

The former, about the year 1200, made himself master of those regions which form at this day the Asiatic part of the Russian empire; and his son, Batou Sagin, conquered Southern Russia and peopled it with Tartar colonies, which are now confounded or blended with the Russians. It was not until the time of Ivan III. who ascended the Russian throne in 1462, that the Russians were able to throw off the galling yoke of the Tartars. Ivan repeatedly defeated them, subdued

the kingdom of Kafan, and other provinces, and made his name respected through all the neighbouring countries.

The fame of Tamerlane has been more permanent than that of Zingis Khan: his defeat of the Turkish emperor Bajazet has been noticed in the history of that nation. The honour of being descended from him is claimed not only by all the khans and petty princes of Tartary, but by the emperor of Hindooftan himself. The capital of this country is Bokharia, which was known to the ancients by the name of Bucharia; situated in the latitude of 32 degrees 15 minutes, and 13 miles distant from the once-famous city of Samarcand, the birth-place of Tamerlane the Great.

The present inhabitants of this immense common compose innumerable tribes, who range at pleasure with their flocks and their herds, in the old patriarchal manner. Their tribes are commanded by separate khans, or leaders, who, upon particular emergencies, elect a great khan, or leader, who, upon particular emergencies, elect a great khan, who claims a paramount power over strangers as well as natives, and who can frequently bring into the field 100,000 horsemen. His chief residence is a kind of military station, which is moved and shifted according to the chance of war and other occasions. When the vast dominions of Zingis Khan fell to pieces, under his successors in the 16th century, the Mogul and Tartar hordes, who had formed one empire, again separated, and have since continued distinct. They are bounded on every side by the Russian, the Chinese, the Mogul, the Persian or the Turkish empires, each of whom are pushing on their conquests in this extensive, and, in some places, fertile country. The khans pay a tribute, or acknowledgement of their dependency upon one or other of their powerful neighbours, who treat them with caution and lenity; as the friendship of these barbarians is of the utmost consequence to the powers with whom they are allied. Some tribes, however, affect independency: and when united, they form a powerful body, and of late have been very formidable to their neighbours, particularly to the Chinese.

The method of carrying on war, by wasting the country, is very ancient among the Tartars, and practised by all of them from the Danube eastward. This circumstance renders them a dreadful enemy to regular troops, who must thereby be deprived of all subsistence; while the Tartars, having always many spare horses to kill and eat, are at no loss for provisions.

## THE EMPIRE OF CHINA.

Chinese Tartary is bounded on the north by Siberia; on the east by the Gulf of Kamtschatka and the Eastern Sea; on the south by China; and on the west by the country of the Calmouks, who are established between the Caspian Sea and Casgar.

Eastern Tartary extends north and south from the 41st to the 55th degree of north latitude. and east and west from about the 137th degree of longitude to the Eastern Sea. It is bounded on the north by Siberia; on the south by the Gulf of Lea-tong and Corea; on the east by the Eastern Sea; and on the west by the country of the Moguls. The country is divided into three grand departments, the provinces of Chen-yang, Kirin, and Tritcear; of which the chief towns are Mougdon, Kirin, and Tritcear.

[DIVISION AND POPULATION.] The empire of China is divided into fifteen provinces, each of which might, for its extent, fertility, populousness, and opulence, rank as a distinct kingdom. The following statement of the division, population, and extent of China Proper, was delivered to Lord Macartney, at his request, by Chow-ta-Zhin, a Chinese mandarin, and is founded on authentic documents, taken from one of the public offices in Pekin.

Provinces.	Population	Sq. Miles.	Acres.
Pe-che-lee	38,000,000	58,949	37,727,260
Kiang-nan	32,000,000	92,961	59,495,040
2 provinces			
Kiang-see	19,000,000	72,176	46,192,640
Tehe-kiang	21,000,000	59,450	25,056,000
Fo-chen	15,000,000	53,480	34,227,200
Hou-pe	14,000,000	144,770	92,652,800
Hou-nan			
Ho-nan	25,000,000	65,104	41,666,560

Kan-fore			
Se-chueen	27,000,000	166,800	106,752,000
Canton	21,000,000	79,156	50,851,840
Quang-see	10,000,000	73,250	50,080,000
Yu-nan	8,000,000	107,969	69,100,160
Koel-cheou	9,000,000	64,554	41,314,560
Total	333,000,000	1,297,999	830,719,560

With respect to this statement, Sir George Staunton, who compiled the judicious and authentic account of the late English embassy to China, observes, that "the extent of the provinces is ascertained by astronomical observations, as well as by admeasurement. The number of individuals is regularly taken in each division of a district by a tything-man, or every tenth master of a family. Those returns are collected by officers resident so near as to be capable of correcting any gross mistake: and all the returns are lodged in the great register at Pekin. Though the general statement is strictly the result of those returns added to each other, which seem little liable to error, or, taken separately, to doubt, yet the amount of the whole is so prodigious as to stagger belief. It must, however, be recollected, that population in China is

not subject to be materially diminished by war. No private soldiers, and a few officers only, natives of the ancient provinces of China, were engaged in the conquest of Western Tartary, or in the Thibet war. Celibacy is rare, even in the military profession, among the Chinese. The number of manufacturers, whose occupations are not always favourable to health, whose constant confinement to particular spots, and sometimes in a close or tainted atmosphere, must be injurious, and whose residence in towns exposes them to irregularities, bears but a very small proportion to that of husbandmen in China. In general there seem to be no other bounds to Chinese populousness, than those which the necessity of subsistence may put to it. These boundaries are certainly more enlarged than in other countries. The whole surface of the empire is, with trifling exceptions, dedicated to the production of food for man alone. There is no meadow, and very little pasture, nor are fields cultivated in oats, beans, or turneps, for the support of cattle of any kind. Few parks or pleasure-grounds are seen, excepting those belonging to the emperor. Little land is taken up for roads, the chief communication being by water. There are no commons or lands suffered to lie waste by the neglect, or the caprice, or for the sport, of great proprietors. No arable land lies fallow. The soil under a hot and fertilising sun yields double crops, in consequence of adapting the culture to the soil, and supplying its defects by mixture with other earths, by manure, watering, and careful and useful industry of every kind. The labour of man is little diverted from that industry, to minister to the luxuries of the opulent and powerful, or in employments of no real use. Even the soldiers of the Chinese army, except during the short intervals of the guards which they are called to mount, or the exercises or other occasional services which they perform, are mostly employed in agriculture. The quantity of subsistence is increased also by converting more species of animals and vegetables to that purpose than is usual in other countries. From a consideration of the influence of all these causes, the great population of China, asserted in this statement, will not, perhaps, appear surprising, though it appears from it that every square mile in that vast empire contains, upon an average, about one-third more inhabitants, being upwards of three hundred, than are found upon an equal quantity of land, also upon an average, in the most populous country in Europe."

**NAME.]** It is probably derived from a Chinese word, signifying middle, from a notion the natives have, that their country lies in the middle of the world.

**MOUNTAINS.]** China, excepting to the north, is a plain country, and contains no remarkable mountains.

**RIVERS AND WATER.]** The chief are the Yamour and the Argun, which are the boundary between the Russian and Chinese Tartary; the Croccus, or Whambo, or the Yellow River; the Kiam, or the Blue River; and the Tay. Common water in China is very indifferent, and is in some places boiled to make it fit for use.

**BAYS.]** The chief are those of Nankin and Canton.

**CANALS.]** These are sufficient to entitle the ancient Chinese to the character of a most wise and industrious people. The commodiousness and length of their canals are incredible. The chief of them are lined with hewn stone on the sides, and they are so deep, that they carry large vessels, and sometimes extend above 1000 miles in length. Those vessels are fitted up for all the conveniences of life; and it has been thought by some, that in China the water contains as many inhabitants as the

land. They are full of an amazing quantity, sometimes drawn formed by art or canal is crossed by dams. These canals render China desirable places that are no

**FORESTS.]** Scarcely lumbered with timber, but for ornament the trees, when cut

**AIR, SOIL, AND CLIMATE.]** The situation of the climate mild, and in fruitful of every tree or luxuries of life which the bulk of most beyond desire either ornamental are to be found in

The tallow-tree has red leaves, shaped like a cherry-tree. The smell strong, nor is it some which yield pepper. The gum is in the world. A beautiful and useful tree so wedded to the soil, meliorated by cultivation, which, in general, and indeed of America, grafting or inoculation gardening.

It would be unprofitable to plant in rows of hilly land (says S. the province of convenience of cultivation afterwards branches spring from the trunk. It is both bear some resemblance concerning the tree, leaves were plucked them afterward esteemed, and they are often exposed, containing that kind of plants, but which

land. They are furnished with stone quays, and sometimes with bridges of an amazing construction. The navigation is slow, and the vessels sometimes drawn by men. No precautions are wanting, that could be formed by art or perseverance, for the safety of the passengers, in case a canal is crossed by a rapid river, or exposed to torrents from the mountains. These canals, and the variety that is seen upon their borders, render China delightful in a very high degree, as well as fertile, in places that are not so by nature.

FORESTS.] Such is the industry of the Chinese, that they are not encumbered with forests or woods, though no country is better fitted for producing timber of all kinds. They suffer, however, none to grow but for ornament and use, or on the sides of mountains, from whence the trees, when cut down, can be conveyed to any place by water.

AIR, SOIL, AND PRODUCE.] The air of this empire is according to the situation of the places. Towards the north it is sharp, in the middle mild, and in the south hot. The soil is, either by nature or art, fruitful of every thing that can minister to the necessities, conveniences, or luxuries of life. The culture of the cotton, and the rice fields, from which the bulk of the inhabitants are clothed and fed, is ingenious almost beyond description. The rare trees, and aromatic productions, either ornamental or medicinal, that abound in other parts of the world, are to be found in China, and some are peculiar to itself.

The tallow-tree has a short trunk, a smooth bark, crooked branches, red leaves, shaped like a heart, and is about the height of a common cherry-tree. The fruit it produces has all the qualities of our tallow, and when manufactured with oil serves the natives as candles; but they smell strong, nor is their light clear. Of the other trees peculiar to China, are some which yield a kind of flour; some partake of the nature of pepper. The gum of some is poisonous, but affords the finest varnish in the world. After all that can be said of these, and many other beautiful and useful trees, the Chinese, notwithstanding their industry, are so wedded to their ancient customs, that they are very little, if at all meliorated by cultivation. The same may be said of their richest fruits, which, in general, are far from being so delicious as those of Europe, and indeed of America. This is owing to the Chinese never practising grafting or inoculation of trees, and knowing nothing of experimental gardening.

It would be unpardonable here not to mention the raw silk, which so much abounds in China; and, above all, the *tea-plant*, or shrub. It is planted in rows, and pruned to prevent luxuriance. "Vast tracts of hilly land (says Sir George Staunton) are planted with it, particularly in the province of Fochien. Its perpendicular growth is impeded for the convenience of collecting its leaves, which is done first in spring, and twice afterwards in the course of the summer. Its long and tender branches spring up almost from the root without any intervening naked trunk. It is bushy like a rose-tree, and the expanded petals of the flower bear some resemblance to that of the rose. Every information received concerning the tea-plant concurred in affirming that its qualities depended both upon the soil in which it grew, and the age at which the leaves were plucked off the tree, as well as upon the management of them afterwards. The largest and oldest leaves, which are the least esteemed, and destined for the use of the lowest classes of the people, are often exposed to sale with little previous manipulation, and still retaining that kind of vegetable taste which is common to most fresh plants, but which vanishes in a little time, whilst the more essential fla-

your, characteristic of each particular vegetable, remains long without diminution. The young leaves undergo no inconsiderable preparation before they are delivered to the purchaser. Every leaf passes through the fingers of a female, who rolls it up almost to the form it had assumed before it became expanded in the progress of its growth. It is afterwards placed upon thin plates of earthen-ware or iron, made much thinner than can be executed by artists out of China. It is confidently said, in the country, that no plates of copper are ever employed for that purpose. Indeed, scarcely any utensil used in China is of that metal, the chief application of which is for coin. The earthen or iron plates are placed over a charcoal fire, which draws all remaining moisture from the leaves, rendering them dry and crisp. The colour and astringency of green tea is thought to be derived from the early period at which the leaves are plucked, and which, like unripe fruit, are generally green and acrid."

The Portuguese had the use of tea long before the English; but it was introduced among the latter before the Restoration, as mention is made of it in the first act of parliament that settled the excise on the king for life, in 1660. Catharine, of Lisbon, wife to Charles II. rendered the use of it common at his court. The *ginseng*, so famous among the Chinese as the universal remedy, and monopolized even by their emperors, is now found to be but a common root, and is plentiful in North America. When brought to Europe, it is little distinguished for its healing qualities; and this influence alone ought to teach us with what caution the former accounts of China are to be read. The *ginseng*, however, is a native of the Chinese Tartary.

[METALS AND MINERALS.] China (if we are to believe some naturalists) produces all metals and minerals that are known in the world. White copper is peculiar to itself, but we know of no extraordinary quality it possesses. One of the fundamental maxims of the Chinese government is that of not introducing a superabundance of gold and silver, for fear of hurting industry. Their gold mines, therefore, are but slightly worked, and the currency of that metal is supplied by the grains the people pick up in the sand of rivers and mountains. The silver specie is furnished from the mines of Honan.

Iron, lead, and tin mines, must be very common, since these metals are sold at a low rate throughout the empire; and it appears, from very authentic documents, that the use of iron in particular was very ancient there: quarries and coal-mines abound in almost every province. Coals are found in great plenty in the mountains of the provinces of Shen-see, Shan-see, and Pe-che-lee: they are used by workmen in their furnaces, in all kitchens, and in the stoves with which the Chinese warm their apartments during the winter.

[PERSONS, MANNERS, AND CHARACTER.] Parents who cannot support their female children are allowed to cast them into the river; but they fasten a gourd to the child, that it may float on the water; and there are often compassionate people of fortune, who are moved by the cries of the children to save them from death. The Chinese, in their persons, are middle-sized, their faces broad, their eyes black and small, their noses blunt, and turned upwards: they have high cheek-bones, and large lips. The Chinese have particular ideas of beauty. They pluck up the hairs of the lower part of their faces by the roots with tweezers, leaving a few straggling ones by way of beard. Their Tartar princes compel them to cut off the hair of their heads, and, like Mahometans, to wear only a lock on the crown. Their complexion, towards the

North, is fair, but a beauty in a man who aim at preface and learning, who are plexioned; and they grow to an enormous manual labour.

The women have features, and a their feet is reckoned is omitted, when that when they grow "Of most of the the middle and in other truncated. accidentally cut or daged like the feet much torment, and of ladies of high stature the growth of and leaving the ground others, and retaining if buried in the soil that this practice lower sort in the

"The exterior is very ceremonious inclinations of the king or disengaging of good-breeding part in such difficulties. When, however, former of them strangers, they are selves with an easy superiors, and as deficient or inaccurate.

The Chinese, low, thieving set to improve the art Europeans, whom but they observe are fond of law dcriy is without b the most avowed ment. It should counts of China ed with any parts probably met wit not just to attempt this kind, though quainted with the of the manners are missionaries, the later writers too p

North, is fair, but towards the south swarthy: corpulence is esteemed a beauty in a man, but considered as a palpable blemish in the fair sex, who aim at preserving a slimmess and delicacy of shape. Men of quality and learning, who are not much exposed to the sun, are delicately complexioned; and they who are bred to letters let the nails of their fingers grow to an enormous length, to show that they are not employed in manual labour.

The women have little eyes, plump, rosy lips, black hair, regular features, and a delicate, though florid complexion. The smallness of their feet is reckoned a principal part of their beauty, and no swathing is omitted, when they are young, to give them that accomplishment; so that when they grow up, they may be said to totter rather than to walk. "Of most of the women we saw (says Sir George Staunton), even in the middle and inferior classes, the feet were unnaturally small, or rather truncated. They appeared as if the fore-part of the foot had been accidentally cut off, leaving the remainder of the usual size, and bandaged like the stump of an amputated limb. They undergo, indeed, much torment, and cripple themselves in a great measure, in imitation of ladies of higher rank, among whom it is the custom to stop by pressure the growth of the ankle as well as foot from the earliest infancy; and leaving the great toe in its natural position, forcibly to bend the others, and retain them under the foot, till at length they adhere to, as if buried in the sole, and can no more be separated. It is said, indeed, that this practice is now less frequent than formerly, at least among the lower sort in the northern provinces."

"The exterior demeanour of the Chinese (observes the same writer) is very ceremonious. It consists of various evolutions of the body, and inclinations of the head, in bending or stiffening the knee, and in joining or disengaging the hands; all which are considered as the perfection of good-breeding and deportment; while the nations who are not expert in such discipline are thought to be little better than barbarians. When, however, those Chinese ceremonies are once shown off, the performers of them relapse into ease and familiarity. In their address to strangers, they are not restrained by any bashfulness; but present themselves with an easy confident air, as if they considered themselves as the superiors, and as if nothing in their manners or appearance could be deficient or inaccurate."

The Chinese, in general, have been represented as the most dishonest, low, thieving set in the world; employing their natural quickness only to improve the arts of cheating the nations they deal with, especially the Europeans, whom they cheat with great ease, particularly the English; but they observe that none but a Chinese can cheat a Chinese. They are fond of law disputes beyond any people in the world. Their hypocrisy is without bounds; and the men of property among them practise the most avowed bribery, and the lowest meannesses, to obtain preferment. It should, however, be remembered, that some of the late accounts of China have been drawn up by those who were little acquainted with any parts of that empire, but the sea-port towns; in which they probably met with many knavish and designing people. But it seems not just to attempt to characterise a great nation by a few instances of this kind, though well attested; and we appear not to be sufficiently acquainted with the interior parts of China to form an accurate judgment of the manners and character of the inhabitants. By some of the Jesuit missionaries, the Chinese seem to have been too much extolled, and by later writers too much degraded.

**DRESS.]** This varies according to the distinction of ranks, and is entirely under the regulation of the law, which has even fixed the colours that distinguish the different conditions. The emperor, and princes of the blood, have alone a right to wear yellow; certain mandarins are entitled to wear satin of a red ground, but only upon days of ceremony; in general they are clothed in black, blue, or violet. White is only worn for mourning, and cannot be too much soiled for the occasion, to avoid every appearance of personal care and ornament. The colour to which the common people are confined, is blue or black; and their dress is always composed of plain cotton cloth. The men wear caps on their heads, of the fashion of a bell; those of quality are ornamented with jewels. The rest of their dress is easy and loose, consisting of a vest and sash, a coat or gown thrown over them, silk boots quilted with cotton, and a pair of drawers. Dress is seldom altered in China from fancy or fashion. Even among the ladies there is little variety in their dresses, except, perhaps, in the disposition of the flowers or other ornaments of the head. They generally wear over a silk netting, which is in lieu of linen, a waistcoat and drawers of silk, trimmed or lined in cold weather with furs. Above this is worn a long satin robe, which is gracefully gathered round the waist, and confined with a sash. These different parts of their apparel are usually each of a different colour, in the selection and contrast of which the wearers chiefly display their taste. They suffer their nails to grow, but reduce their eye-brows to an arched line.

**MARRIAGES.]** The parties never see each other, in China, till the bargain is concluded by the parents, and that is generally when the parties are perfect children. When the nuptials are celebrated, the lady is carried (as yet unseen by the bridegroom) in a gilt and gaudy chair, hung round with festoons of artificial flowers, and followed by relations, attendants, and servants, bearing the paraphernalia, being the only portion given with a daughter in marriage by her parents. Next to being barren, the greatest scandal is to bring females into the world; and if a woman of poor family happens to have three or four girls successively, it not unfrequently happens that she will expose them on the high roads, or cast them into a river.

**FUNERALS.]** The Chinese, among other superstitions, are particularly scrupulous about the time and place of burying their dead. The delay occasioned before these difficult points are ascertained has often long detained the coffins of the rich from their last repository; many are seen in houses and gardens under temporary roofs, to preserve them in the mean time from the weather; but necessity forces the poor to overcome many of their scruples in this respect, and to deposit at once, and with little ceremony, the remains of their relations in their final abode.

The following is the description of a Chinese funeral procession, observed by Sir George Staunton, passing out of one of the gates of Pekin: "The procession was preceded by several performers on solemn music; then followed a variety of insignia, some of silken colours, and painted boards with devices and characters, displaying the rank and office of him who was no more. Immediately before the corpse the male relations walked, each supported by friends, occupied in preventing them from giving way to the excesses and extravagance of grief, to which the appearance of their countenance implied that they were prone. Over the mourners were carried umbrellas with deep curtains hanging from the edges. Several persons were employed to burn circular pieces of

paper, covered chiefly with tin-foil, as they passed by burying-grounds and temples. These pieces, in the popular opinion, like the coin to Charon for being conveyed to the Elysian fields, are understood to be convertible, in the next stage of existence, into the means of providing the necessaries of life."

The public burying-grounds are extremely extensive, owing to that respect paid to the dead by the Chinese, which prevents them from opening a new grave upon any spot where the traces of a former one remain upon the surface.

Every Chinese keeps in his house a table, upon which are written the names of his father, grandfather, and great grandfather, before which they frequently burn incense, and prostrate themselves; and when the father of a family dies, the name of the great grandfather is taken away, and that of the deceased is added.

LANGUAGE.] The Chinese language contains only three hundred and thirty words, all of one syllable; but then each word is pronounced with such various modulations, and each with a different meaning, that it becomes more copious than could be easily imagined. The missionaries, who adapt the European characters as well as they can to the expression of Chinese words, have devised eleven different, and some of them very compounded, marks and aspirations, to signify the various modulations, elevations, and depressions of the voice, which distinguish the several meanings of the same monosyllable. The Chinese oral language being thus barren and contracted, is unfit for literature; and, therefore, their literature is all comprised in arbitrary characters, which are amazingly complicated and numerous, amounting to about eighty thousand. This language being wholly addressed to the eye, and having no affinity with their tongue, as spoken, the latter has still continued in its original, rude, uncultivated state, while the former has received all possible improvement.

GENIUS AND LEARNING.] The genius of the Chinese is peculiar to themselves: they have no conception of what is beautiful in writing, regular in architecture, or natural in painting; and yet, in their gardening and planning their grounds, they exhibit the true sublime and beautiful. They perform all the operations of arithmetic with prodigious quickness, but differently from the Europeans. Till the latter came among them, they were ignorant of mathematical learning and all its depending arts. They had no proper apparatus for astronomical observations; and the metaphysical learning which existed among them was only known to their philosophers; but even the arts introduced by the Jesuits were of very short duration among them, and lasted very little longer than the reign of Canghi, who was contemporary with our Charles II. nor is it very propable they will ever be revived. It has been generally said, that they understood printing before the Europeans; but that can only be applied to block-printing; for the fusile and moveable types were undoubtedly Dutch or German inventions. The Chinese, however, had almanacks, which were stamped from plates or blocks, many hundred years before printing was discovered in Europe.

The difficulty of mastering and retaining such a number of arbitrary marks and characters as there are in what may be called the Chinese written language greatly retards the progress of their erudition. But there is no part of the globe, where learning is attended with such honours and rewards, and where there are more powerful inducements to cultivate and pursue it. The literati are revered as another species, and are the only nobility known in China. If their birth be ever so

mean and low, they become mandarins of the highest rank, in proportion to the extent of their learning. On the other hand, however exalted their birth may be, they quickly sink into poverty and obscurity, if they neglect those studies which raised their fathers. It has been observed, that there is no nation in the world where the first honours of the state lies so open to the lowest of the people, and where there is less of hereditary greatness. The Chinese range all their works of literature into four classes. The first is the class of *King*, or the sacred books, which contain the principles of the Chinese religion, morality and government, and several curious and obscure records, relative to these important subjects. History forms a separate class: yet, in this first class, there are placed some historical monuments on account of their relation to religion and government, and among others the *Tekun tseou*, a work of Confucius, which contains the annals of twelve kings of Low, the native country of that illustrious sage. The second class is that of the *Su*, or *Che*, that is, of history and the historians. The third class, called *Tsu*, or *Tse*, comprehends philosophy and the philosophers, and contains all the works of the Chinese literati, the productions also of foreign sects and religions, which the Chinese consider only in the light of philosophical opinions, and all books relative to mathematics, astronomy, physic, military science, the art of divination, agriculture, and the arts and sciences in general. The fourth is called *Tsie* or *Miscellanies*, and contains all the poetical books of the Chinese, their pieces of eloquence, their songs, romances, tragedies, and comedies. The Chinese literati, in all the periods of their monarchy, have applied themselves less to the study of nature, and to the researches of natural philosophy, than to moral inquiries, the practical science of life, and internal polity and manners. It is said that it was not before the dynasty of the Song in the 10th and 11th centuries after Christ, that the Chinese philosophers formed hypotheses concerning the system of the universe, and entered into discussions of a scholastic kind, in consequence, perhaps, of the intercourse they had long maintained with the Arabians, who studied with ardour the works of Aristotle. And, since the Chinese have begun to pay some attention to natural philosophy, their progress in it has been much inferior to that of the Europeans.

The invention of gunpowder is justly claimed by the Chinese, who made use of it against Zingis Khan and Tamerlane. They seem to have known nothing of small fire-arms, and to have been acquainted only with cannon, which they call the fire-pan. Their industry in their manufactures of stuffs, porcelain, japanning, and the like sedentary trades, is amazing, and can be equalled only by their labours in the field, in making canals, levelling mountains, raising gardens, and navigating their junks and boats.

**ANTIQUITIES AND CURIOSITIES.]** Few natural curiosities present themselves in China, that have not been comprehended under preceding articles. Some volcanoes, and rivers and lakes of particular qualities, are to be found in different parts of the empire. The Volcano of Linefung is said sometimes to make so furious a discharge of fire and ashes, as to occasion a tempest in the air: and some of their lakes are said to petrify fishes when put into them. The great wall separating China from Tartary, to prevent the incursions of the Tartars, is supposed to extend from 1200 to 1500 miles. It is carried over mountains and valleys, and reaches from the province of Shensee to the Whang-Hay, or Yellow Sea. It is in most places built of brick and mortar, which is so well tempered, that though it has stood more than 2000

years, it is but a bulwark of stone east of Peking, and of the capital city cased with bricks, and the other stretched a line of distant points were enough for five d

years, it is but little decayed. The beginning of this wall is a large bulwark of stone raised in the sea, in the province of Petchelee, to the east of Peking, and almost in the same latitude: it is built like the walls of the capital city of the empire, but much wider, being terraced and cased with bricks, and is from twenty to twenty-five feet high. P. Regis, and the other gentlemen who took a map of these provinces, often stretched a line on the top, to measure the bases of triangles, and to take distant points with an instrument. They always found it paved wide enough for five or six horsemen to travel abreast with ease.

The artificial mountains present, on their tops, temples, monasteries, and other edifices. The Chinese bridges cannot be sufficiently admired. They are built sometimes upon barges strongly chained together, yet so as to be parted, and to let the vessels pass that sail up and down the river. Some of them run from mountain to mountain, and consist only of one arch; that over the river Safrany is 400 cubits long and 500 high, though a single arch, and joins two mountains; and some in the interior parts of the empire are said to be still more stupendous. The triumphal arches of this country form the next species of artificial curiosities. Though they are not built in the Greek or Roman style of architecture, yet they are superb and beautiful, and erected to the memory of their great men, with vast labour and expense. They are said in the whole to be eleven hundred, two hundred of which are particularly magnificent. Their sepulchral monuments make likewise a great figure. Their towers, the models of which are now so common in Europe, under the name of pagodas, are vast embellishments to the face of their country. They seem to be constructed by a regular order, and all of them are finished with exquisite carvings and gildings, and other ornaments. That at Nanking, which is 200 feet high, and 40 in diameter, is the most admired. It is called the Porcelain Tower, because it is lined with Chinese tiles. Their temples are chiefly remarkable for the fanciful taste in which they are built, for their capaciousness, their whimsical ornaments, and the ugliness of the idols they contain. The Chinese are remarkably fond of bells, which give name to one of their principal festivals. A bell of Peking weighs 120,000 pounds, but its sound is said to be disagreeable. Their buildings, except the pagodas, being confined to no order, and susceptible of all kinds of ornaments, have a wild variety, and a pleasing elegance, not void of magnificence, agreeable to the eye and the imagination, and present a diversity of objects not to be found in European architecture.

CHIEF CITIES.] The empire is said to contain 4400 walled cities; the chief of which are Peking, Nanking, and Canton. Peking, the capital of the whole empire of China, and the ordinary residence of the emperors, is situated in a very fertile plain twenty leagues distant from the great wall. It is an oblong square, and is divided into two cities: that which contains the emperor's palace is called the Tartar city, because the houses were given to the Tartars when the present family came to the throne; and they refusing to suffer the Chinese to inhabit it, forced them to live without the walls, where they in a short time built a new city; which, by being joined to the other, renders the whole of an irregular form, six leagues in compass. The walls and gates of Peking are of the surprising height of fifty cubits, so that they hide the whole city; and are so broad, that centinels are placed upon them on horseback; for there are slopes within the city of considerable length, by which horsemen may ascend the walls; and in several places there are houses built for the guards. The gates, which are nine in number, are neither em-

bellished with statues, nor other carving, all their beauty consisting in their prodigious height, which at a distance gives them a noble appearance. The arches of the gates are built of marble, and the rest with large bricks, cemented with excellent mortar. Most of the streets are built in a direct line; the largest are about 120 feet broad, and a league in length. The shops where they sell silks and China-ware generally take up the whole street, and afford a very agreeable prospect. Each shop-keeper places before his shop, on a small kind of pedestal, a board about twenty feet high, painted, varnished, and often gilt, on which are written, in large characters, the names of the several commodities he sells. These being placed on each side of the street, at nearly an equal distance from each other, have a very pretty appearance; but the houses are poorly built in front, and very low, most of them having only a ground floor, and none exceeding one story above it. Of all the buildings in this great city, the most remarkable is the imperial palace, the grandeur of which does not consist so much in the nobleness and elegance of the architecture, as the multitude of its buildings, courts, and gardens, all regularly disposed; for within the walls are not only the emperor's house, but a little town, inhabited by the officers of the court, and a multitude of artificers employed and kept by the emperor; but the houses of the courtiers and artificers are low and ill contrived. F. Artier, a French Jesuit, who was indulged with a sight of the palace and gardens, says, that the palace is more than three miles in circumference, and that the front of the building shines with gilding, paint, and varnish, while the inside is set off and furnished with every thing that is most beautiful and precious in China, the Indies, and Europe. The gardens of this palace are large tracts of ground, in which are raised, at proper distances, artificial mountains, from twenty to sixty feet high, which form a number of small valleys, plentifully watered by canals, which uniting, form lakes and meres. Beautiful and magnificent barks sail on these pieces of water, and the banks are ornamented with ranges of buildings, not any two of which are said to have any resemblance to each other: which diversity produces a very pleasing effect. Every valley has its house of pleasure, large enough to lodge one of our greatest lords in Europe, with all his retinue: many of these houses are built with cedar, brought, at a vast expense, the distance of 500 leagues. Of these palaces, or houses of pleasure, there are more than 200 in this vast inclosure. In the middle of a lake, which is near half a league in diameter every way, is a rocky island, on which is built a palace, containing more than a hundred apartments. It has four fronts, and is a very elegant and magnificent structure. The mountains and hills are covered with trees, particularly such as produce beautiful and aromatic flowers; and the canals are edged with rustic pieces of rock, disposed with such art, as exactly to resemble the wildness of nature.

The estimated population of Peking was carried in the last century, by the Jesuit Grimaldi, as quoted by Gimelli Carreri, to sixteen millions. Another missionary reduces at least that of the Tartar city to one million and a quarter. According to the best information given to the late English embassy, the whole was about three millions. The low houses of Peking seem scarcely sufficient for so vast a population; but very little room is occupied by a Chinese family, at least in the middling and lower classes of life. A Chinese dwelling is generally surrounded by a wall six or seven feet high. Within this inclosure a whole family of three generations, with all their respective wives and children, will frequently be found. One small room is made to serve for the indivi-

duals of each branch only by mats hanging.

Nanking is said but Canton is the much frequented circumference, with some adjacent hills of the country. In the valleys all great men, which branches from the failing different city is entered by guard-house. The narrow, paved with images. To walk in them less by chance of market-places provisions, which houses, which lies chiefly in the warehouses. \* The English as appears from of Europe; encouragement

duals of each branch of the family, sleeping in different beds, divided only by mats hanging from the ceiling. One common room is used for eating.

Nanking is said to be still more extensive and populous than Peking; but Canton is the greatest port in China, and the only port that has been much frequented by Europeans. The city wall is above five miles in circumference, with very pleasant walks around it. From the top of some adjacent hills, on which forts are built, you have a fine prospect of the country. It is beautifully interspersed with mountains, little hills, and valleys all green; and these again pleasantly diversified with small towns, villages, high towers, temples, the seats of mandarins and other great men, which are watered with delightful lakes, canals, and small branches from the river Ta; on which are numberless boats and junks, sailing different ways through the most fertile parts of the country. The city is entered by several iron gates, and within side of each there is a guard-house. The streets of Canton are very straight, but generally narrow, paved with flag-stones. There are many pretty buildings in this city, great numbers of triumphal arches, and temples well stocked with images. The streets of Canton are so crowded, that it is difficult to walk in them; yet a woman of any fashion is seldom to be seen, unless by chance when coming out of her chair. There are great numbers of market-places for fish, flesh, poultry, vegetables, and all kinds of provisions, which are sold very cheap. There are many private walks about the skirts of the town, where those of the better sort have their houses, which are very little frequented by Europeans, whose business lies chiefly in the trading part of the city, where there are only shops and warehouses. Few of the Chinese traders of any substance keep their families in houses where they do business, but either in the city, in the more remote suburbs, or farther up in the country. They have all such a regard to privacy, that no windows are made towards the streets, but in shops and places of public business, nor do any of their windows look towards those of their neighbours. The shops of those that deal in silk are very neat, make a fine show, and are all in one place; for tradesmen or dealers in one kind of goods herd together in the same street. It is computed that there is in this city, and its suburbs, 1,200,000 people; and there are often 5000 trading vessels lying before the city.

[TRADE AND MANUFACTURES.] China is so happily situated, and produces such a variety of materials for manufactures, that it may be said to be the native land of industry; but it is an industry without taste or elegance, though carried on with great art and neatness. They make paper of the bark of bamboo and other trees, as well as of cotton, but not comparable, for records or printing, to the European. Their ink for the use of drawing is well known in England, and is said to be made of oil and lampblack. The antiquity of their printing, which they still perform by cutting their characters on blocks of wood, has already been mentioned. The manufacture of that earthen-ware generally known by the name of China was long a secret in Europe, and brought immense sums to that country. Though the Chinese affect to keep that manufacture still a secret, yet it is well known that the principal material is a prepared pulverised earth, and that several European countries far exceed the Chinese in manufacturing this commodity\*.

\* The English, in particular, have carried this branch to a high degree of perfection, as appears from the commissions which have been received of late from several princes of Europe; and we hope that a manufacture so generally useful will meet with encouragement from every true patriot among ourselves.

The Chinese silks are generally plain and flowered gauzes, and they are said to have been originally fabricated in that country, where the art of rearing silk-worms was first discovered. They manufacture silks likewise of a more durable kind; and their cotton and other cloths are famous for furnishing a light warm wear.

Their trade, it is well known, is open to all European nations, with whom they deal for ready money; for such is the pride and avarice of the Chinese, that they think no manufactures equal to their own. But it is certain, that, since the discovery of the porcelain manufacture, and the vast improvements the Europeans have made in the weaving branches, the Chinese commerce has been on the decline.

CONSTITUTION AND GOVERNMENT.] The original plan of the Chinese government was patriarchal, almost in the strictest sense of the word. Duty and obedience to the father of each family was recommended and enforced in the most rigorous manner; but, at the same time, the emperor was considered as the father of the whole. His mandarins, or great officers of state, were looked upon as his substitutes, and the degrees of submission which were due from the inferior ranks to the superior were settled and observed with the most scrupulous precision, and in a manner that to us seems highly ridiculous. This simple claim of obedience required great address and knowledge of human nature to render it effectual; and the Chinese legislators, Confucius particularly, appeared to have been men of wonderful abilities. They enveloped their dictates in a number of mystical appearances, so as to strike the people with awe and veneration. The mandarins had peculiar modes of speaking and writing, and the people were taught to believe that the princes partook of divinity; so that they were seldom seen, and more seldom approached. "In the great palace of Peking (says Sir George Staunton) all the mandarins resident in the capital, assembled, about noon, on his imperial majesty's birth-day, and, dressed in their robes of ceremony, made the usual prostrations before the throne; incense of sandal and rose woods burning upon it at the same time, and offerings being made of viands and liquors, as if, though absent, he were capable of enjoying them. Mr. Barrow (a gentleman of the embassy) was present while the same ceremonies were observed at Yuen-min-yuen, and he was informed that they likewise took place on that day in every part of the empire, the prostrators being every where attentive to turn their faces towards the capital. On all the days of new and full moon, similar incense is burnt, and offerings are made before the throne by the officers of the household in the several palaces of the emperor."

Though this system preserved the public tranquillity for an incredible number of years, yet it had a fundamental defect, that often convulsed and at last proved fatal to the state, because the same attention was not paid to the military as the civil duties. The Chinese had passions like other men; and sometimes a weak or wicked administration drove them to arms, and a revolution easily succeeded, which they justified by saying that their sovereign had ceased to be their father. During these commotions, one of the parties naturally invited their neighbours, the Tartars, to their assistance, who, possessing great sagacity, became acquainted with the weak side of their constitution, and availed themselves accordingly, by invading and conquering the empire, and conforming to the Chinese institutions.

Besides the great doctrine of patriarchal obedience, the Chinese had sumptuary laws and regulations for the expenses of all degrees of

year 213 before the subjects, which was preventing the the mandarius in a virtuous manner, and a virtuous prince tary effects. No strates for the dis China; but they the execution. T nor of the Earth,

year 213 before the Christian æra, ordered all the historical books and re-subjects, which were very useful in preserving the public tranquillity, and preventing the effects of ambition. By their institutions, likewise, the mandarins might remonstrate to the emperor, but in the most submissive manner, upon the errors of his government; and, when he was a virtuous prince, this freedom was often attended with the most salutary effects. No country in the world is so well provided with magistrates for the discharge of justice, both in civil and criminal matters, as China; but they are often ineffectual, through want of public virtue, in the execution. The emperor is styled "*Holy Son of Heaven, Sole Governor of the Earth, Great Father of his People.*"

RELIGION.] There is in China no state religion. None is paid, preferred, or encouraged by it. The Chinese have no Sunday, nor even such a division as a week; the temples are, however, open every day for the visits of devotees. Persons of that description have, from time to time, made grants, though to no great amount, for the maintenance of their clergy, but no lands are subject to ecclesiastical tithes. The emperor is of one faith; many of the mandarins of another; and the majority of the common people of a third, which is that of Fo. No people are, in fact, more superstitious than the common Chinese. Beside the habitual offices of devotion on the part of the priests and females, the temples are particularly frequented by the disciples of Fo, previously to any undertaking of importance; whether to marry, or go a journey, or conclude a bargain, or change situation, or any other material event in life, it is necessary first to consult the superintendent deity. This is performed by various methods. Some place a parcel of consecrated sticks, differently marked and numbered, which the consultant, kneeling before the altar, shakes in a hollow bamboo, until one of them falls on the ground; its mark is examined, and referred to a correspondent mark in a book which the priest holds open, and sometimes even it is written upon a piece of paper pasted upon the inside of the temple. Polygonal pieces of wood are by others thrown into the air. Each side has its particular mark: the side that is uppermost, when fallen on the floor, is in like manner referred to its correspondent mark in the book or sheet of fate. If the first throw be favourable, the person who made it prostrates himself in gratitude, and undertakes afterwards with confidence the business in agitation. But if the throw should be adverse, he tries a second time, and the third throw determines, at any rate, the question. In other respects the people of the present time seem to pay little attention to their priests. The temples are, however, always open for such as choose to consult the decrees of heaven. They return thanks when the oracle proves propitious to their wishes. Yet they often cast lots to know the issue of a projected enterprise, then supplicate for its being favourable, and their worship consists more in thanksgiving than in prayer.

The temples of Fo abound with more images than are found in most Christian churches, some of which, as one of the missionaries has observed, exhibit so strong a likeness to those in churches of the Roman faith, that a Chinese conveyed into one of the latter might imagine the votaries he saw were adoring the deities of his own country. On the altar of a Chinese temple, behind a screen, is frequently a representation which might answer for that of the Virgin Mary, in the person of *Sbin-moo*, or the sacred mother, sitting in an alcove with a child in her arms, and rays proceeding from a circle, which are called a glory, round her head, with tapers burning constantly before her. The re-

semblance of the worship of the Chinese to the forms of the catholic church, in some other particulars, has been, indeed, thought so striking, that some of the missionaries have conjectured that the Chinese had formerly received a glimpse of Christianity from the Nestorians, by the way of Tartary; others that St. Thomas the apostle had been among them: but the missionary Premare could account for it no otherwise than by supposing it to have been a trick of the devil to mortify the Jesuits.

There are other images, however, in these temples, which bear a greater analogy to the ancient than to the present worship of the Romans. A figure, representing a female, appears to be something similar to Lucina, and is particularly addressed by unmarried women wanting husbands, and married women wanting children. The doctrine of Fo, admitting of a subordinate deity particularly propitious to every wish which can be formed in the human mind, could scarcely fail to spread among those classes of the people who are not satisfied with their prospects as resulting from the natural causes of events. Its progress is not obstructed by any measures of the government of the country, which does not interfere with mere opinions. It prohibits no belief, which is not supposed to affect the tranquillity of society.

The temples of Peking are not very sumptuous. The religion of the emperor is new in China, and its worship is performed with most magnificence in Tartary. The mandarins, the men of letters, from whom are selected the magistrates who govern the empire, and possess the upper ranks of life, venerate rather than adore Confucius, and meet to honour and celebrate his memory in halls of a simple but neat construction. The numerous and lower classes of the people are less able than inclined to contribute much towards the erection of large and costly edifices for public worship. Their religious attention is much engaged besides with their household gods. Every house has its altar and its deities. The books of their mythology contain representations of those who preside over their persons and properties, as well as over exterior objects likely to affect them. Few of the Chinese, however, carry the objects to be obtained by their devotion beyond the benefits of this life. Yet the religion of Fo professes the doctrine of the transmigration of souls, and promises happiness to the people on conditions, which were, no doubt, originally intended to consist in the performance of moral duties; but, in lieu of which, are too frequently substituted those of contributions towards the erection or repair of temples, the maintenance of priests, and a strict attention to particular observances. The neglect of these is announced as punishable by the souls of the defaulters passing into the bodies of the meanest animals, in which the sufferings are to be proportioned to the transgression committed in the human form.

**PUBLIC ROADS.]** The security of travellers, and an easy mode of conveyance for passengers and merchandise of every kind, are objects to which particular attention seems to have been paid by administration in China. The manner in which the public roads are managed greatly contributed to the former.

These roads are paved in all the southern provinces, and some of the northern. Valleys have been filled up, and passages have been cut through rocks and mountains, in order to make commodious highways, and to preserve them as nearly as possible on a level. They are generally bordered with very lofty trees, and sometimes with walls eight or ten feet in height, to prevent travellers from entering into the fields,

Openings are left into cross roads to roads, covered so may shelter himself from the heats of the sun.

There is no wall to cross roads. They are paved with gravel, or to sleep on a path, to give lodgings.

We meet with erected at certain which is hoisted soldiers, who running letters which one another, and remarkable events in the most excellent manner of the parts of the empire.

#### REVENUES.]

are said to be little which may be estimated about four times France before the revolution, all the civil and ordinary charges, and the respective provinces, the remainder is remitted, amounted in the statement furnished of silver, or 12 million to the reign of the poll tax. Most impost being added to the tax from it by the collection from one province may be compared to the production of so much to supply the demand, a considerable sum, and presents from the confiscations of opium, revenues of the provinces in kind. The principal classes of the people is wheat, to which

**MILITARY AND** more powerful emperor Tartars, in 1644, the first Tartar subjects to conquer the Chinese to which thereby incorporated the empire.

Openings are left in them at certain intervals, which give a passage into cross roads that conduct to different villages. On all the great roads, covered seats are erected at proper distances, where the traveller may shelter himself from the inclemency of the winter, or the excessive heats of the summer.

There is no want of inns on the principal highways, and even on the cross roads. The former are very spacious, but they are badly supplied with provisions. People are even obliged to carry beds with them, or to sleep on a plain mat. Government requires of those who inhabit them, to give lodging only to those who ask and pay for it.

We meet with many turrets (says Mr. Bell) called post-houses, erected at certain distances one from another, with a flag-staff, on which is hoisted the imperial pendant. These places are guarded by soldiers, who run from one post to another with great speed, carrying letters which concern the emperor. The turrets are in sight of one another, and by signals they can convey intelligence of any remarkable event. By these means the court is informed in the speediest manner of whatever disturbance may happen in the most remote parts of the empire.

**REVENUES.]** The public revenues of China proper (says Staunton) are said to be little less than two hundred millions of ounces of silver, which may be equal to about sixty-six millions of pounds sterling, or about four times those of Great Britain, and three times those of France before the late subversion. From the produce of the taxes, all the civil and military expenses, and the incidental and extraordinary charges, are first paid upon the spot, out of the treasuries of the respective provinces where such expenses are incurred; and the remainder is remitted to the imperial treasury at Peking. This surplus amounted in the year 1792, according to an account taken from a statement furnished by Chow-ta-Zhin, to the sum of 36,614,328 ounces of silver, or 12,204,776*l*. A land tax was substituted in the last reign to the poll tax, as better proportioned to the faculties of individuals. Most imports, and all luxuries, are likewise taxed; but the duty being added to the original price of the article, is seldom distinguished from it by the consumer. A transit duty is laid likewise on goods passing from one province to another. Each province in China, which may be compared to an European kingdom, is noted chiefly for the production of some particular article, the conveyance of which, to supply the demand for it in the others, raises this duty to a considerable sum, and forms the great internal commerce of the empire. Presents from the tributaries and subjects of the emperor, and the confiscations of opulent criminals, are not overlooked in enumerating the revenues of the public treasury. Taxes, such as upon rice, are received in kind. The several species of grain, on which many of the poorer classes of the people principally subsist, are exempted from taxation: so is wheat, to which rice is always preferred by the Chinese.

**MILITARY AND MARINE STRENGTH.]** China is at this time a far more powerful empire than it was before its conquest by the eastern Tartars, in 1644. This is owing to the consummate policy of Chuntchi, the first Tartarian emperor of China, who obliged his hereditary subjects to conform themselves to the Chinese manners and policy, and the Chinese to wear the Tartar dress and arms. The two nations were thereby incorporated. The Chinese were appointed to all the civil offices of the empire. The emperor made Peking the seat of his govern-

ment, and the Tartars quietly submitted to a change of their country and condition, which was so much in their favour.

According to the information given to the gentlemen of the English embassy by Van-ta-Zhin, who was himself a distinguished officer, and appeared to give his account with candour, though not always, perhaps, with sufficient care and accuracy, the total of the army in the pay of China, including Tartars, amounted to one million infantry, and eight hundred thousand cavalry. From the observation made by the embassy, in the course of their travels through the empire, of the garrisons in the cities of the several orders, and of the military posts at small distances from each other, there appeared nothing improbable in the calculation of the infantry: but they met few cavalry. If the number mentioned really do exist, a great proportion of them must be in Tartary, or on some service distant from the route of the embassy. As to the marine force, it is composed chiefly of the junks we have already mentioned, and other small ships that trade coast-ways, or to the neighbouring countries, or to prevent sudden descents.

A treatise on the military art, translated from the Chinese into the French language, was published at Paris, in 1772, from which it appears that the Chinese are well versed in the theory of the art of war; but caution, and care, and circumspection, are much recommended to their generals; and one of their maxims is, never to fight with enemies either more numerous or better armed than themselves.

**HISTORY.]** The Chinese pretend, as a nation, to an antiquity beyond all measure of credibility, and their annals have been carried beyond the period to which the Scripture chronology assigns the creation of the world. Poan Kou is said by them to have been the first man, and the interval of time betwixt him and the death of their celebrated Confucius, which was in the year before Christ 479, has been reckoned from 276,000 to 96,961,740 years. But, upon an accurate investigation of this subject, it appears, that all the Chinese historical relations of events prior to the reign of the emperor Yao, who lived 2057 years before Christ, are entirely fabulous, composed in modern times, unsupported by authentic records, and full of contradictions. It appears also, that the origin of the Chinese empire cannot be placed higher than two or three generations before Yao. But even this is carrying the empire of China to a very high antiquity, and it is certain that the materials for the Chinese history are extremely ample. The grand annals of the empire of China are comprehended in 668 volumes, and consist of the pieces that have been composed by the tribunal or department of history, established in China, for transmitting to posterity the public events of the empire, and the lives, characters, and transactions of its sovereigns. It is said, that all the facts which concern the monarchy, since its foundation, have been deposited in this department, and from age to age have been arranged according to the order of times under the inspection of government, and with all the precautions against illusion or partiality that could be suggested. These precautions have been carried so far, that the history of the reign of each imperial family has only been published after the extinction of that family, and was kept a profound secret during the dynasty, that neither fear nor flattery might adulterate the truth. It is asserted, that many of the Chinese historians exposed themselves to exile, and even to death, rather than disguise the defects and vices of the sovereign. But the emperor Chi-hoang-ti, at whose command the great wall was built, in the

ords, which contained the fundamental laws and principles of the ancient government, to be burnt, that they might not be employed by the learned to oppose his authority, and the changes he proposed to introduce into the monarchy. Four hundred literati were burnt, with their books; yet this barbarous edict had not its full effect; several books were concealed, and escaped the general ruin. After this period, strict search was made for the ancient books and records that yet remained; but, though much industry was employed for this purpose, it appears that the authentic historical sources of the Chinese, for the times anterior to the year 200 before Christ, are very few, and that they are still in smaller numbers for more remote periods. But, notwithstanding the depredations that have been made upon the Chinese history, it is still immensely voluminous, and has been judged by some writers superior to that of all other nations. Of the grand annals before mentioned, which amount to 608 volumes, a copy is preserved in the library of the French nation. A chronological abridgment of this great work, in 100 volumes, was published in the 42d year of the reign of Kang-hi; that is, in the year 1703. This work is generally called *Kam-ino*, or the abridgement. From these materials the abbé Grosier proposed to publish at Paris, in the French language, a General History of China, in 12 volumes 4to. some of which have been printed; and a smaller work in 12 volumes 8vo. by the late Father de Mailla, missionary at Peking, has lately been published.

But the limits to which our work is confined will not permit us to enlarge upon so copious a subject as that of the Chinese history; and which, indeed, would be very uninteresting to the generality of European readers. A succession of excellent princes, and a duration of domestic tranquillity, united legislation with philosophy, and produced their *Fo-hi*, whose history is enveloped in myteries, their *Li-Laokum*, and, above all, their Confucius, at once the Solon and the Socrates of China. After all, the internal revolutions of the empire, though rare, produced the most dreadful effects, in proportion as its constitution was pacific, and they were attended with the most bloody exterminations in some provinces: so that, though the Chinese empire is hereditary, the imperial succession was more than once broken into, and altered. Upwards of twenty dynasties, or different tribes and families of succession, are enumerated in their annals.

Neither the great Zingis Khan, nor Tamerlane, though they often defeated the Chinese, could subdue their empire, and neither of them could keep the conquests they made there. Their celebrated wall proved but a feeble barrier against the arms of those famous Tartars. After their invasions were over, the Chinese went to war with the Manchew Tartars, while an indolent worthless emperor, *T'iong-tching*, was upon the throne. In the mean while, a bold rebel, named *Li-cong-t'ic*, in the province of *Se-tchuen*, dethroned the emperor, who hanged himself, as did most of his courtiers and women. *Ou-fan-quey*, the Chinese general, on the frontiers of Tartary, refused to recognise the usurper, and made a peace with *T'iongate*, or *Chun-tehi*, the Manchew prince, who drove the usurper from the throne, and took possession of it himself, about the year 1644. The Tartar maintained himself in his authority, and, as has been already mentioned, wisely incorporated his hereditary subjects with the Chinese, so that in effect Tartary became an acquisition to China. He was succeeded by a prince of great natural and acquired abilities, who was the patron of the Jesuits, but knew how to check them when he found them intermeddling with the affairs of his government. About the year 1661, the Chinese, under this Tartar family, drove the Dutch out of the island of *Formosa*, which the latter had taken from the Portuguese.

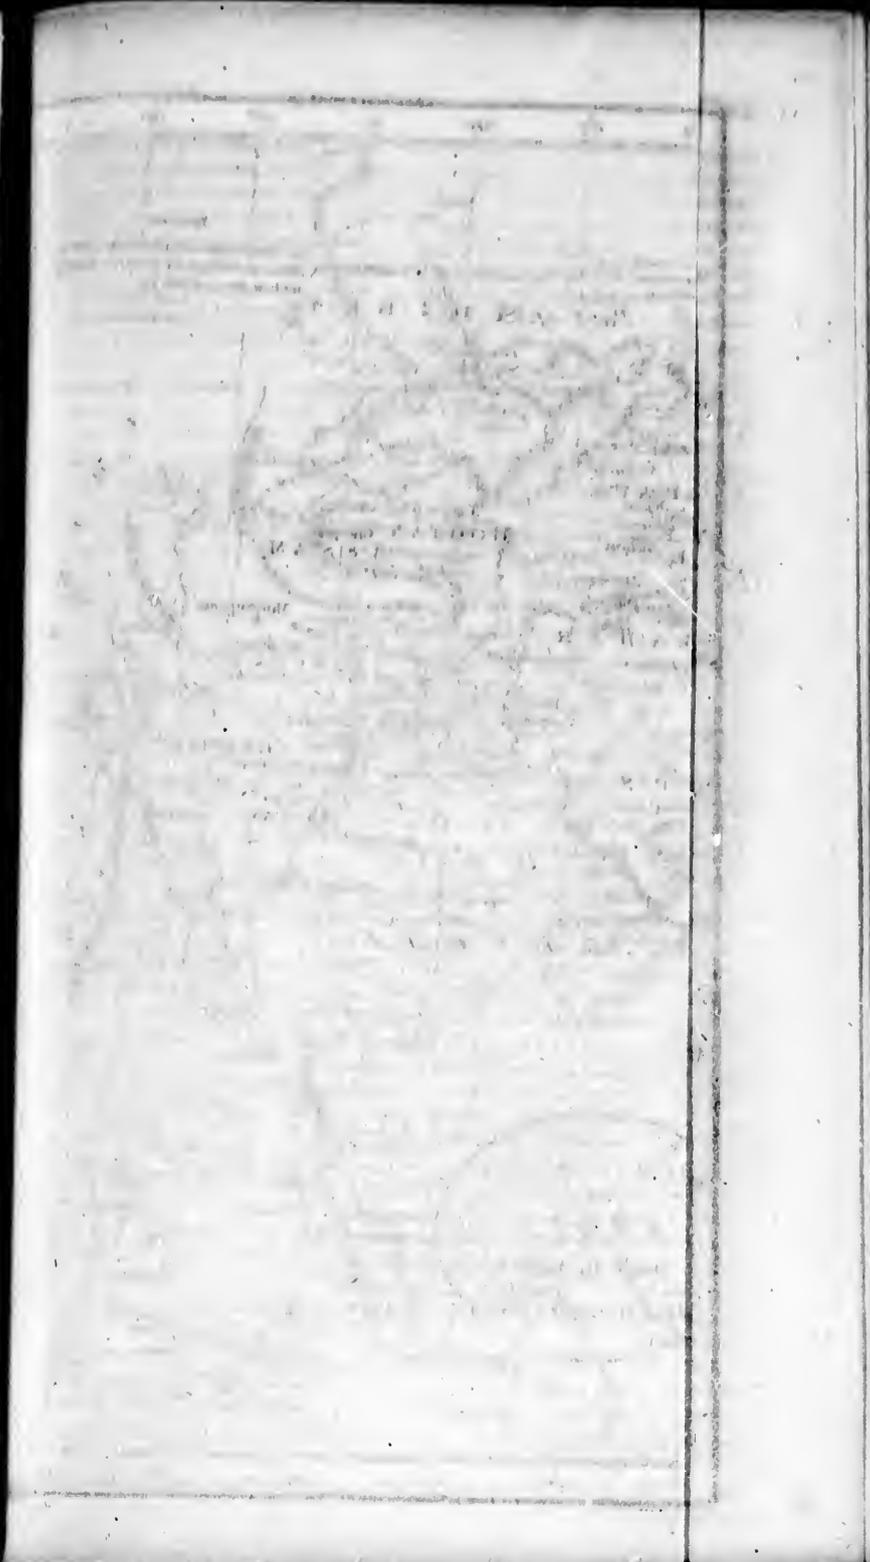

In the year 1771, all the Tartars which composed the nation of the Tourgouths, left the settlements which they had under the Russian government on the banks of the Wolga, and the Jaick, at a small distance from the Caspian Sea, and, in a vast body of fifty thousand families, passed through the country of the Hacks; after a march of eight months, in which they surmounted innumerable difficulties and dangers, they arrived in the plains that lie on the frontiers of Carapen, not far from the banks of the river Ily, and offered themselves as subjects to Kien-Lung, emperor of China, who was then in the thirty-sixth year of his reign. He received them graciously, furnished them with provisions, clothes, and money, and allotted to each family a portion of land for agriculture and pasturage. The year following there was a second emigration of about thirty thousand other Tartar families, who also quitted the settlements which they enjoyed under the Russian government, and submitted to the Chinese sceptre. The emperor caused the history of these emigrations to be engraven upon stone in four different languages.

The hopes which were lately indulged of the great and manifold advantages to be derived from the embassy of lord Macartney to the court of Peking have ended in disappointment. Never, perhaps, was there a character better qualified for the management of an embassy of such delicacy and importance than lord Macartney: but, notwithstanding his lordship's adroitness, he found it utterly impossible to obtain permission for the residence of an Englishman at the capital of China, as ambassador, consul, or in any other character, or any exclusive settlement for the English within the Chinese dominions, even on a temporary grant, and solely for the purposes of trade. According to a fundamental principle in Chinese politics, innovation, of whatever kind, is held to be inevitably pregnant with ruin; and on this principle the emperor declined to admit a foreign resident at the court of Peking, or to expand the principles on which our commercial intercourse with this country are at present regulated and confined.

The embassy arrived in the river Pei-ho, in the Gulf of Peking, the beginning of August 1793, and on the 21st of the same month reached the city of Peking. They remained here till the beginning of September, when they were conducted to Zhe-hol, or Jehol, one of the emperor's country residences in Tartary, distant about forty or fifty leagues from Peking. Here they had their audience of the emperor, who accepted the presents they had brought in the most gracious manner, and returned others of great value, of which two are so singular as to claim particular notice. The one is a poem addressed to his Britannic majesty, the composition of the emperor himself, and his own hand-writing: it is lodged in a black, wooden, carved box, of no great value, but as an antique, to which character it has a just claim, having been two thousand years in the possession of the imperial family of China. The other present is a mass of costly agate, of unequalled size and beauty. It has always been the practice with the emperor to hold this agate in his hand, and to fix his eyes upon it, whenever he spoke to a mandarin, or any of his ministers; as to look upon a subject is considered as not only derogatory to the imperial dignity, but to confer too much honour on the individual addressed.

Kien-Lung, the late emperor of China, appeared, at the time he gave audience to the embassy, to be perfectly unreserved, cheerful, and unaffected; his eyes were full and clear, and his countenance open. He was clad in plain dark silk, with a velvet bonnet, in form not much different from the bonnet of Scotch Highlanders; on the front of it was placed a large pearl, which was the only jewel or ornament he appeared to have about him.

Kien-Lung, the late emperor of China, was only the fourth sovereign of the Tartar dynasty which took possession of the throne of that country about the year 1644. He ascended the throne of China in 1736, and died February 11, 1799. He was succeeded by Ka-Hing, the present emperor, who, immediately on his accession to the throne, degraded and imprisoned Ho-choong-taung, the prime minister of his predecessor. This minister was in power at the time of lord Macartney's embassy, and was supposed to be very hostile to the object of it: his disgrace has given hopes that such another attempt might now prove successful.

## INDIA IN GENERAL.

SITUATION AND } THIS vast country is situated between the 66th  
BOUNDARIES. } and 109th degrees of East longitude, and be-  
tween 1 and 40 of North latitude. It is bounded on the North by the  
countries of Ufbec Tartary and Thibet; on the South, by the Indian  
Ocean; on the East, by China and the Chinese Sea; and, on the West,  
by Persia and the Indian Sea.

DIVISIONS.] We shall divide, as others have done, India at large, into  
three greater parts: first, the Peninsula of India beyond the Ganges,  
called the Farther Peninsula; secondly, the Main Land of Hindoostan,  
or the Mogul's empire; thirdly, the Peninsula within, or on this side the  
Ganges; all of them vast, populous, and extended empires. But it is  
necessary, in order to save many repetitions, to premise an account of  
some particulars that are in common to those numerous nations, which  
shall be extracted from the most enlightened of our modern writers, who  
have visited the country in the service of the East-India company.

POPULATION, INHABITANTS, RE- } The Mahometans, or, as they are  
LIGION, AND GOVERNMENT. } called Moors, of Hindoostan, are  
computed, according to Mr. Orme, an excellent and authentic historian, to  
be about ten millions, and the Indians about a hundred millions. Above half  
the empire is subject to rajahs or kings, who derive their descent from the  
old princes of India, and exercise all rights of sovereignty, only paying a  
tribute to the Great Mogul, and observing the treaties by which their an-  
cestors recognised his superiority. In other respects, the government of  
Hindoostan is full of wise checks upon the overgrowing greatness of any  
subject; but (as all precautions of that kind depend upon the adminis-  
tration) the indolence and barbarity of the Moguls or emperors, and their  
great viceroys, have rendered them fruitless.

The original inhabitants of India are called Gentoos; or, as others  
call them, Hindoos, and the country Hindoostan. They pretend that  
Brumma, who was their legislator both in politics and religion, was in-  
ferior only to God, and that he existed many thousand years before our  
account of the creation. This Brumma, probably, was some great and  
good man, whose beneficence, like that of the pagan legislators, led his  
people and their posterity to pay him divine honours. The Brahmins,  
or Gentoopriests, pretend, that he bequeathed to them a book called the  
Vedam, containing his doctrines and institutions; and that, though the  
original is lost, they are still possessed of a commentary upon it, called  
the Shahitah, which is wrote in the Shanscrit, now a dead language, and  
known only to the Brahmins.

The foundation of Brumma's doctrine consisted in the belief of a Su-  
preme Being, who has created a regular gradation of beings, some supe-

to equal the exquisite execution of their workmanship. While this high improvement of their more curious manufactures excited the admiration, and attracted the commerce of other nations, the separation of professions in India, and the early distribution of the people into classes attached to particular kinds of labour, secured such abundance of the more common and useful commodities, as not only supplied their own wants, but ministered to those of the countries around them.

To this early division of the people into casts, we must likewise ascribe a striking peculiarity in the state of India; the permanence of its institutions, and the immutability in the manners of its inhabitants. What now is in India, always was there, and is still likely to continue; neither the ferocious violence and illiberal fanaticism of its Mahomedan conquerors, nor the power of its European masters, have effected any considerable alterations. The same distinctions of condition take place, the same arrangements in civil and domestic society remain, the same maxims of religion are held in veneration, and the same sciences and arts are cultivated. Hence, in all ages, the trade with India has been the same; gold and silver have uniformly been carried thither in order to purchase the same commodities with which it now supplies all nations; and, from the age of Pliny to the present times, it has always been considered and execrated as a gulf which swallows up the wealth of every other country, that flows incessantly towards it, and from which it never returns\*.

All these casts acknowledge the Brahmins for their priests, and from them derive their belief of the transmigration; which leads many of them to afflict themselves even at the death of a fly, although occasioned by inadvertence. But the greater number of casts are less scrupulous, and eat, although very sparingly, both of fish and flesh; but, like the Jews, not of all kinds indifferently. Their diet is chiefly rice and vegetables, dressed with ginger, turmeric, and other hotter spices, which grow almost spontaneously in their gardens. They esteem milk the purest of foods, because they think it partakes of some of the properties of the nectar of their gods, and because they esteem the cow itself almost like a divinity.

Their manners are gentle; their happiness consists in the solaces of a domestic life; and they are taught by their religion, that matrimony is an indispensable duty in every man, who does not entirely separate himself from the world from a principle of devotion. Their religion also permits them to have several wives; but they seldom have more than one; and it has been observed, that their wives are distinguished by a decency of demeanour, a solicitude in their families, and a fidelity to their vows, which might do honour to human nature in the most civilised countries. The amusements of the Hindoos consist in going to their pagodas, in assisting at religious shows, and in fulfilling a variety of ceremonies prescribed to them by the Brahmins. Their religion forbids them to quit their own shores †; nor do they want any thing from abroad. They

\* Dr. Robertson's Historical Disquisition concerning India, Appendix, p. 261, 262.

† The Gentooes are persuaded, that the waters of the three great rivers, Ganges, Kistna, and Indus, have the sacred virtue of purifying those who bathe in them from all pollutions and sins. This religious idea seems to be founded on a principle of policy, and intended to restrain the natives from migrating into distant countries: for it is remarkable, that the sacred rivers are so situated, that there is not any part of India where the inhabitants may not have an opportunity of washing away their sins. The Ganges, which rises in the mountains of Thibet, with its different branches, runs through the kingdoms of Bengal, Bahar, and Orixa, and the upper provinces of Oude, Rohilcunde, Agra, Delhi, and Lahore. The Kistna divides the Carnatic from Golconda, and runs through the Visapore into the interior parts of the Deccan. And the Indus; bounding the Guzurat provinces, separates Hindoostan from the dominions of Persia.

might, therefore, have lived in much tranquillity and happiness, if others had looked on them with the same indifference with which they regard the rest of the world.

The soldiers are commonly called rajah-poots, or persons descended from rajahs, and reside chiefly in the northern provinces, and are generally more fair-complexioned than the people of the southern provinces, who are quite black. These rajah-poots are a robust, brave, faithful people, and enter into the service of those who will pay them; but when their leader falls in battle, they think that their engagements to him are finished, and they run off the field without any stain upon their reputation.

The custom of women burning themselves upon the death of their husbands still continues to be practised, though much less frequently than formerly. The Gentoos are as careful of the cultivation of their lands, and their public works and conveniences, as the Chinese; and there scarcely is an instance of a robbery in all Hindoostan, though the diamond merchants travel without defensive weapons.

**RELIGION.]** The institutions of religion, publicly established in all the extensive countries stretching from the banks of the Indus to Cape Comorin, present to view an aspect nearly similar. They form a regular and complete system of superstition, strengthened and upheld by every thing which can excite the reverence and secure the attachment of the people. The temples consecrated to their deities are magnificent, and adorned not only with rich offerings, but with the most exquisite works in painting and sculpture, which the artists highest in estimation among them were capable of executing. The rites and ceremonies of their worship are pompous and splendid, and the performance of them not only mingles in all the transactions of common life, but constitutes an essential part of them. The Brahmins, who, as ministers of religion, preside in all its functions, are elevated above every other order of men, by an origin deemed not only more noble, but acknowledged to be sacred. They have established among themselves a regular hierarchy and gradation of ranks, which, by securing subordination in their own order, adds weight to their authority, and gives them a more absolute dominion in the minds of the people. This dominion they support by the command of the immense revenues with which the liberality of princes, and the zeal of pilgrims and devotees, have enriched their pagodas.

The temples or pagodas of the Gentoos are stupendous, but disgusting stone buildings, erected in every capital, and under the direction of the Brahmins. To this, however, there are some exceptions; for, in proportion to the progress of the different countries of India in opulence and refinement, the structure of their temples gradually improved. From plain buildings they became highly ornamented fabrics, and, both by their extent and magnificence, are monuments of the power and taste of the people by whom they were erected. In this highly-finished style there are pagodas of great antiquity in different parts of Hindoostan, particularly in the southern provinces, which are not exposed to the destructive violence of Mahomedan zeal. In order to assist our readers in forming a proper idea of these buildings, we shall briefly describe two, of which we have the most accurate accounts. The entry to the pagoda of Chillambrum, near Porto Novo, on the Coromandel coast, held in high veneration on account of its antiquity, is by a stately gate, under a pyramid, a hundred and twenty-two feet in height, built with large stones above forty feet long, and more than five feet square, and covered with plates of copper, adorned with an immense variety of figures, neatly

executed. The and thirty-two another. Some entitled to adm

executed. The whole structure extends one thousand three hundred and thirty-two feet in one direction, and nine hundred and thirty-six in another. Some of the ornamental parts are finished with an elegance entitled to admiration.

The pagoda of Seringham, superior in sanctity to that of Chillingham, surpasses it as much in grandeur. This pagoda is situated about a mile from the western extremity of the island of Seringham, formed by the division of the great river Caveri into two channels. "It is composed of seven square inclosures, one within the other, the walls of which are twenty-five feet high, and four thick. These inclosures are three hundred and fifty feet distant from one another, and each has four large gates with a square tower, which are placed, one in the middle of each side of the inclosures, and opposite to the four cardinal points.—The outward wall is near four miles in circumference, and its gateway to the south is ornamented with pillars, several of which are single stones thirty-three feet long, and nearly five in diameter; and those which form the roof are still larger: in the inmost inclosures are the chapels. Here, as in all the other great pagodas of India, the Brahmins live in a subordination which knows no resistance, and slumber in a voluptuousness which knows no wants\*."

If the Brahmins are masters of any uncommon art or science, they frequently turn it to the purposes of profit from their ignorant votaries. Mr. Scrafton says, that they know how to calculate eclipses; and that judicial astrology is so prevalent among them, that half the year is taken up with unlucky days; the head astrologer being always consulted in their councils. The Mahomedans likewise encourage those superstitions, and look upon all the fruits of the Gentoo industry as belonging to themselves. Though the Gentoos are entirely passive, under all their oppressions, and, by their state of existence, the practice of their religion, and the scantiness of their food, have nothing of that resentment in their nature that animates the rest of mankind; yet they are susceptible of avarice, and sometimes bury their money, and, rather than discover it, put themselves to death by poison or otherwise. This practice, which it seems is not uncommon, accounts for the vast scarcity of silver that, till of late, prevailed in Hindoostan.

The reasons above mentioned account likewise for their being less under the influence of their passions than the inhabitants of other countries. The perpetual use of rice, their chief food, gives them but little nourishment; and their marrying early, the males before fourteen, and their women at ten or eleven years of age, keeps them low and feeble in their persons. A man is in the decline of life at thirty, and the beauty of their women is on decay at eighteen: at twenty-five they have all the marks of old age. We are, therefore, not to wonder at their being soon strangers to all personal exertion and vigour of mind; and it is with them a frequent saying, that it is better to sit than to walk; to lie down than to sit, to sleep than to wake, and death is the best of all.

The Mahometans, who, in Hindoostan, are called Moors, are of Persian, Turkish, Arabic, and other extractions. They early began, in the reigns of the caliphs of Bagdad, to invade Hindoostan. They penetrated as far as Delhi, which they made their capital. They settled colonies in several places, whose descendants are called Tytans; but their empire was overthrown by Tamerlane, who founded the Mogul govern-

ment, which still subsists. Those princes being strict Mahomedans, received under their protection all that professed the same religion, and who being a brave active people, counterbalanced the numbers of the natives. They are said to have introduced the division of provinces, over which they appointed soubahs; and those provinces, each of which may be styled an empire, were subdivided into nabobships; each nabob being immediately accountable to his soubah, who, in process of time, became almost independent on the emperor, or, as he is called, the Great Mogul, upon their paying him an annual tribute. The vast resort of Persian and Tartar tribes has likewise strengthened the Mahomedan government; but it is observable, that in two or three generations, the progress of all those adventurers, who brought nothing with them but their horses and their swords, degenerated into eastern indolence and hospitality.

Of all those tribes, the Mahrattas at present make the greatest figure. They are a kind of mercenaries, who live on the mountains between Hindoostan and Persia. They commonly serve on horseback, and, when well commanded, they have been known to give law even to the court of Delhi. Though they are originally Gentoos, yet they are of bold active spirits, and pay no great respect to the principles of their religion. Mr. Scrafton says, that the Mahomedans, or Moors, are void of every principle, even of their own religion; and if they have a virtue, it is an appearance of hospitality, but it is an appearance only; for while they are drinking with, and embracing a friend, they will stab him to the heart. But it is probable that these representations of their moral depravity are carried beyond the bounds of truth.

The people of Hindoostan are governed by no written laws; nor is there a lawyer in their whole empire; and their courts of justice are directed by precedents. The Mahomedan institutes prevail only in their great towns and their neighbourhood. The empire is hereditary, and the emperor is heir only to his own officers. All lands go in the hereditary line, and continue in that state even down to the subtenants, while the lord can pay his taxes, and the latter their rent, both which are immutably fixed in the public books of each district. The imperial demesne lands are those of the great rajah families, which fell to Tamerlane and his successors. Certain portions of them are called jaghire lands, and are bestowed by the crown on the great lords or omrahs, and, upon their death, revert to the emperor; but the rights of the subtenants, even of those lands, are indefeasible.

Such are the outlines of the government by which this great empire long subsisted, without almost the semblance of virtue among its great officers, either civil or military. It was shaken, however, after the invasion of Mahomed Shah, by Kouli Khan, which was attended by so great a diminution of the imperial authority, that the soubahs and nabobs became absolute in their own governments. Though they could not alter the fundamental laws of property, yet they invented new taxes, which beggared the people, to pay their armies, and support their power; so that many of the people, a few years ago, after being unmercifully plundered by collectors and tax-masters, were left to perish through want. To sum up the misery of the inhabitants, those soubahs and nabobs, and other Mahomedan governors, employ the Gentoos themselves, and some even of the Brahmins, as the ministers of their rapaciousness and cruelties. Upon the whole, ever since the invasion of Kouli Khan, Hindoostan, from being a well-regulated government, is become a scene of mere anarchy or stratocracy; every great man pro-

fects himself in his tyranny by his soldiers, whose pay far exceeds the natural riches of his government. As private assassinations and other murders are here committed with impunity, the people, who know they can be in no worse state, concern themselves very little in the revolutions of government. To the above causes are owing the late successes of the English in Hindoostan.

The complexion of the Gentoos is black, their hair long, and the features of both sexes regular. At court, however, the great families are ambitious of intermarrying with Persians and Tartars, on account of the fairness of their complexion, resembling that of their conqueror Tamerlane, and his great generals.

BOUNDARIES.] THIS peninsula is bounded by Thibet and China on the North; by China and the Chinese Sea on the East; by the same sea and the Straits of Malacca on the South; and by the Bay of Bengal and the Hither India on the West. The space between Bengal and China is now called the province of Mecklus, and other districts subject to the king of Ava, or Burmah.

NAME.] The name of India is taken from the river Indus, which, of all others, was the best known to the Persians. The whole of this peninsula was unknown to the ancients, and is partly so to the moderns.

AIR AND CLIMATE.] The air of the southern parts of this country is hot and dry, but in some places moist, and consequently unhealthy. The climate is subject to hurricanes, lightnings, and inundations, so

that the people build their houses upon high pillars, to defend them from floods; and they have no other idea of seasons, but wet and dry. Easterly and westerly *monsoons*, or trade winds, prevail in this country.

**MOUNTAINS.]** These run from north to south almost the whole length of the country; but the lands near the sea are low, and annually overflowed in the rainy season.

**RIVERS.]** The chief are the Sampoo or Burrampooter, Domea, Meccon, Menan, and Ava, or the great river *Nou Kian*.

Of these, the Burrampooter, called Sampoo, in the upper part of its course, is by far the most considerable. This rival sister of the Ganges issues from the same mountains that give birth to that river; but taking a contrary, i. e. an easterly direction, through Thibet, winds to the south-west through Assam; and, entering Hindoostan, flows to the south, assumes the name of Megna, and joins the western branch of the Ganges with an immense body of water, equal, if not superior, to the Ganges itself.

These two noble rivers, when they approach the sea, divide into such a multitude of channels, and receive such a number of navigable streams, that a tract of country, nearly equal to Great Britain in extent, enjoys by their means the finest inland navigation that can be conceived, and which gives constant employment to 30,000 boatmen. These channels are so numerous, that very few places in this tract are, even in the dry season, 25 miles from a navigable stream; and in the season of the periodical rains, they overflow their banks to the depth of 30 feet, and form an inundation that fertilises the soil to the extent of more than 100 miles\*.

**BAYS AND STRAITS.]** The bays of Bengal, Siam, and Cochin-China, The straits of Malacca and Sincapora. The promontories of Siam, Romana, and Banfac.

**SOIL, AND PRODUCT OF THE } The soil of this peninsula is fruitful**  
**DIFFERENT NATIONS. } in general, and produces all the de-**  
lightful fruits that are found in other countries contiguous to the Ganges, as well as roots and vegetables; also saltpetre, and the best teek timber, or Indian oak, which for ship-building in warm climates is superior to any European oak. It abounds likewise in silks, elephants, and quadrupeds, both domestic and wild, that are common in the southern kingdoms of Asia. The natives carry on a great trade in gold, diamonds, rubies, topazes, amethysts, and other precious stones. Tonquin produces little or no corn or wine; but is the most healthful country of all the peninsula. In some places, especially towards the north, the inhabitants have swellings in their throats, said to be owing to the badness of their water.

**INHABITANTS, CUSTOMS, } The Tonquinese are excellent me-**  
**AND DIVERSIONS. } chanics, and fair traders; but greatly**  
oppressed by their king and great lords. The king engrosses the trade, and his factors sell by retail to the Dutch and other nations. The Tonquinese are fond of lacker houses, which are unwholesome and poisonous. The people in the south are a savage race, and go almost naked, with large silver and gold ear-rings, and coral, amber, or shell bracelets. In Tonquin and Cochin-China, the two sexes are scarcely distinguishable by their dress, which resembles that of the Persians. The people of quality are fond of English broad-cloth, red or green; and others wear a dark-coloured cotton cloth. In Azem, which is thought one of the

The poetry of diction of their l ner of eastern co are many things of literary men. language of the philosophy, and hundred volum history. The f

best countries in Asia, the inhabitants prefer dog's flesh to all other animal food. The people of that kingdom pay no taxes, because the king is sole proprietor of all the gold and silver and other metals found in his kingdom. They live, however, easily and comfortably. Almost every housekeeper has an elephant for the conveniency of his wives and women,—polygamy being practised all over India.

It is unquestionable, that those Indians, as well as the Chinese, had the use of gunpowder before it was known in Europe; and the invention is generally ascribed to the Azimete. The inhabitants of the southern division of this peninsula go under the name of Malayans, from the neighbouring country of Malacca.

Though the religious superstitions that prevail in this peninsula are extremely gross, yet the people believe in a future state; and when their kings are interred, a number of animals are buried with them, and such vessels of gold and silver as they think can be of use to them in their future life. The people of this peninsula are commonly very fond of show, and often make an appearance beyond their circumstances. They are delicate in no part of their dress but in their hair, which they buckle up in a very agreeable manner. In their food they are loathsome; for, besides dogs, they eat rats, mice, serpents, and stinking fish. The people of Aracan are equally indelicate in their amours, for they hire Dutch and other foreigners to consummate the nuptials with their virgins, and value their women most when in a state of pregnancy. Their treatment of the sick is ridiculous, beyond belief; and in many places, when a patient is judged to be incurable, he is exposed on the bank of some river, where he is either drowned, or devoured by birds or beasts of prey.

The diversions common in this country are fishing and hunting, the celebrating of festivals, and acting comedies, by torch-light, from evening to morning.

LANGUAGE.] The language of the court of Delhi is Persian, but in this peninsula it is chiefly Malayan, as we have already observed, interspersed with other dialects.

LEARNING AND LEARNED MEN.] The Brahmins, who are the tribe of the priesthood, descend from those Brachmans who are mentioned to us with so much reverence by antiquity; and although much inferior, either as philosophers or men of learning, to the reputation of their ancestors, as priests, their religious doctrines are still implicitly followed by the whole nation; and as preceptors, they are the source of all the knowledge which exists in Hindoostan. But the utmost stretch of their mathematical knowledge seems to be the calculation of eclipses. They have a good idea of logic; but it does not appear that they have any treatises on rhetoric; their ideas of music, if we may judge from their practice, are barbarous; and in medicine, they derive no assistance from the knowledge of anatomy, since dissections are repugnant to their religion.

The poetry of the Asiatics is too turgid, and full of conceits, and the diction of their historians very diffuse and verbose; but, though the manner of eastern compositions differs from the correct taste of Europe, there are many things in the writings of Asiatic authors worthy the attention of literary men. Mr. Dow observes, that in the Sanscrit, or learned language of the Brahmins, which is the grand repository of the religion, philosophy, and history of the Hindoos, there are in particular many hundred volumes in prose, which treat of the ancient Indians and their history. The same writer also remarks, that the Sanscrit records con-

tain accounts of the affairs of the Western Asia, very different from what any tribe of the Arabians have transmitted to posterity; and that it is more than probable, that, upon examination, the former will appear to bear the marks of more authenticity, and of greater antiquity, than the latter. The Arabian writers have been generally so much prejudiced against the Hindoos, that their accounts of them are by no means to be implicitly relied on.

Mr. Dow observes, that the small progress which correctness and elegance of sentiment and diction have made in the East did not proceed from a want of encouragement to literature. On the contrary, it appears, that no princes in the world patronised men of letters with more generosity and respect than the Mahomedan emperors of Hindoostan. A literary genius was not only the certain means to acquire a degree of wealth, which must astonish Europeans, but an infallible road for rising to the first offices of the state. The character of the learned was at the same time so sacred, that tyrants, who made a pastime of imbruing their hands in the blood of their other subjects, not only abstained from offering violence to men of genius, but stood in fear of their pens.

**MANUFACTURES AND COMMERCE.]** These vary in the different countries of this peninsula; but the chief branches have been already mentioned. The inhabitants, in some parts, are obliged to manufacture their salt out of ashes. In all handicraft trades that they understand, the people are more industrious, and better workmen, than most of the Europeans; and in weaving, sewing, embroidering, and some other manufactures, it is said, that the Indians do as much work with their feet as their hands. Their painting, though they are ignorant of drawing, is amazingly vivid in its colours. The fineness of their linen, and their fillagree work in gold and silver, are beyond any thing of those kinds to be found in other parts of the world. The commerce of India, in short, is courted by all trading nations in the world, and probably has been so from the earliest ages: it was not unknown even in Solomon's time: and the Greeks and Romans drew from thence their highest materials of luxury. The greatest share of it, through events foreign to this part of our work, is now centred in England, though that of the Dutch is still considerable; that of the French has for some time declined; nor is that of the Swedes and Danes of much importance.

**CONSTITUTION, GOVERNMENT, } This article is so extensive, that**  
**RARITIES, AND CITIES. } it requires a slight review of the**  
kingdoms that form this peninsula. In Azem, it has been already observed, the king is proprietor of all the gold and silver; he pays little or nothing to the Great Mogul; his capital is Ghergong, or Kirganu. We know very little of the kingdom of Tipra, but that it was anciently subject to the kings of Aracan; and that they send to the Chinese gold and silk, for which they receive silver in return.

Aracan lies to the south of Tipra, and was formerly governed by twelve princes, subject to the chief king, who resided in his capital.—His palace was very large; and contained, as we are told, seven idols cast in gold, of two inches thick, each of a man's height, and covered with diamonds and other precious stones. At present Aracan makes a part of the empire of Ava, having been conquered by Minderagee, the present sovereign of that country, in 1783. Pegu is about 350 English miles in length, and almost the same in breadth. Its capital, Pegu, on a river of the same name, was, about the year 1600, one of the largest,

and most splendid country was since the beginning of the reign of Ava or Birmah, when the Peguerna kingdom of Ava, who became the

and most splendid, and populous cities in all Asia. The emperor of this country was anciently a very rich and powerful monarch; but about the beginning of the seventeenth century, Pegu was conquered by the king of Ava or Birmah, and the kingdoms united; till about the year 1740, when the Peguers rebelled, and in a few years subdued, in their turn, the kingdom of Ava. In 1754, however, the Birmans, under Alompra, who became their sovereign, shook off the yoke, and again subdued Pegu, which now forms a part of the Birman empire.

Ava, Birmah, or, as it is called by the natives, Miama, is bounded on the west by a ridge of lofty mountains which divide it from Aracan; on the north-east and east by China and Siam; and on the south by Pegu. The Birman empire consists of Ava, Pegu, and Aracan, which are now all subject to one sovereign. It is difficult to ascertain the exact limits of this empire; but according to major Symes, in his account of an embassy to Ava, in the year 1793, it appears to include the space between the 9th and 26th degrees of north latitude, and between the 92d and 107th degree of longitude east of Greenwich; being about 1050 geographical miles in length, and 600 in breadth. The number of cities, towns, and villages, in the Birman dominions, major Symes was assured by a person who might be supposed to know, amounts to 8000; from which the population of the whole empire, including Aracan, may be supposed to be not less than seventeen millions.

The climate of Ava is extremely salubrious; the seasons are regular, and the extremes of heat and cold seldom experienced; at least the duration of the intense heat, which immediately precedes the commencement of the rainy season, is very short. The soil is remarkably fertile, and produces as luxuriant crops of rice as are to be found in the finest parts of Bengal. Sugar-canes, tobacco of a superior quality, indigo, cotton, and the different tropical fruits, in perfection, are all indigenous products of this fertile country. The kingdom of Ava abounds in minerals: it contains mines of gold, silver, rubies, and sapphires; it also affords amethysts, garnets, very beautiful chrysolites, jasper, loadstone, and marble. An extensive trade is carried on between the capital of the Birman dominions and Yunan in China. The principal article of export from Ava is cotton. Amber, ivory, precious stones, beetle-nut, and the edible nests brought from the eastern archipelago, are also articles of commerce.

The general disposition of the Birmans is strikingly contrasted with that of the natives of Hindoostan, from whom they are separated only by a narrow ridge of mountains, in many places admitting of an easy intercourse. Notwithstanding the small extent of this barrier, the physical difference between the nations could scarcely be greater, had they been situated at the opposite extremities of the globe. The Birmans are a lively inquisitive race, active, irascible, and impatient; the character of their Bengal neighbours it is well known is the reverse.—The unworthy passion of jealousy, which prompts most nations of the East to immure their women within the walls of a haram, and surround them with guards, seems to have scarcely any influence over the minds of this extraordinary and more liberal people. The wives and daughters of the Birmans are not concealed from the sight of men, and are suffered to have as free intercourse with each other as the rules of European society admit. The Birmans are extremely fond both of poetry and music. Their religion is, in fact, that of the Hindoos, though they are not votaries of Brama, but sectaries of Boodh.

The emperor of Ava; like the other sovereigns of the East, is a def-

otic monarch. The prevailing characteristic of the Birman court is pride. Like the sovereign of China, his majesty of Ava acknowledges no equal. There are no hereditary dignities or employments in the Birman government. All honours and offices, on the demise of the possessor, revert to the crown. The titles the monarch assumes in his public acts are the "Lord of earth and air; the monarch of extensive countries; the proprietor of all kinds of precious stores; the king who performs the ten duties incumbent on all kings; the master of the white, red, and mottled elephants, whose praises are repeated far as the influence of the sun and moon extends."

Alompra, who, as mentioned above, in 1754 recovered the independence of his country, and subdued the Peguers, was a Birman originally, of low extraction, who collected a band of resolute adventurers, defeated the Peguers, and rendered himself sovereign of Ava. He died in 1760, and was succeeded by Namdogee Praw, who died in 1764, leaving the throne to his brother Shembuan. The present sovereign is named Shembuan Minderagee Praw. He is the fourth son of Alompra, and ascended the throne in 1782.

The kingdom of Laos or Lahos formerly included that of Jangoma, or Jangomay; but that is now subject to Ava: we know few particulars of it that can be depended upon. It is said to be immensely populous, to abound in all the rich commodities, as well as (the gross superstitions of the East, and to be divided into a number of petty kingdoms, all of them holding of one sovereign, who, like his oriental brethren, is absolutely despotic, and lives in inexpressible pomp and magnificence; but is of the Lama religion, and often the slave of his priests and ministers.

The kingdom of Siam is rich and flourishing, and approaches, in its government, policy, and the quickness and acuteness of its inhabitants, very near to the Chinese. It is surrounded by high mountains, which, on the east side, separate it from the kingdoms of Camboja and Laos: on the west from Pegu: and on the north from Ava, or more properly from Jangoma; on the south it is washed by the river Siam, and joins the peninsula of Malacca, the north-west part of which is under its dominion. The extent of the country, however, is very uncertain, and it is but indifferently peopled. The inhabitants of both sexes are more modest than any found in the rest of this peninsula. Great care is taken of the education of their children. Their marriages are simple, and performed by their talapoins, or priests, sprinkling holy water upon the couple, and repeating some prayers. The government is despotic; servants must appear before their masters in a kneeling posture; and the mandarins are prostrate before the king. Siam, the capital, is represented as a large city, but scarcely one-sixth part of it is inhabited; and the palace is about a mile and a half in circuit. Bangkok, which stands about 18 leagues to the south of Siam, and 12 miles from the sea, is the only place towards the coast that is fortified with walls, batteries, and brass cannon; and the Dutch have a factory at Ligor, which stands on the east side of the peninsula of Malacca, but belonging to Siam.

The peninsula of Malacca is a large country, and contains several kingdoms or provinces. The Dutch, however, are said to be real masters and sovereigns of the whole peninsula, being in possession of the capital (Malacca). The inhabitants differ but little from brutes in their manner of living; and yet the Malayan language is reckoned the purest of any spoken in all the Indies. We are told by the latest travellers, that its chief produce is tin, pepper, elephants' teeth, canes, and gums.

Some missionaries pretend that it is the Golden Chersonesus, or peninsula of the ancients, and that the inhabitants used to measure their riches by bars of gold. The truth is, that the excellent situation of this country admits of trade with India; so that when it was first discovered by the Portuguese, who were afterwards expelled by the Dutch, Malacca was the richest city in the East, next to Goa and Ormus, being the key of the China, the Japan, the Moluccas, and the Sunda trade. The country, however, at present is chiefly valuable for its trade with the Chinese. This degeneracy of the Malayans, who were formerly an industrious ingenious people, is easily accounted for, by the tyranny of the Dutch, whose interest it is that they should never recover from their present state of ignorance and slavery.

The English carry on a smuggling kind of trade in their country ships, from the coast of Coromandel and the Bay of Bengal, to Malacca. This commerce is connived at by the Dutch governor and council, who little regard the orders of their superiors, provided they can enrich themselves.

Cambodia, or Camboja, is a country little known to the Europeans; but, according to the best information, its greatest length, from north to south, is about 520 English miles: and its greatest breadth, from west to east, about 398 miles. This kingdom has a spacious river running through it, the banks of which are the only habitable parts of the country, on account of its sultry air, and the pestiferous gnats, serpents, and other animals bred in the woods. Its soil, commodities, trade, animals, and products by sea and land, are much the same with the other kingdoms of this vast peninsula. The betel, a creeping plant of a particular flavour, and, as they say, an excellent remedy for all those diseases that are common to the inhabitants of the East Indies, is the highest luxury of the Cambodians, from the king to the peasant; but it is very unpalatable and disagreeable to the Europeans. The same barbarous magnificence, despotism of the king, and ignorance of the people, prevail here as throughout the rest of the peninsula. Between Cambodia and Cochin-China lies the little kingdom of Chiampa, the inhabitants of which trade with the Chinese, and seem therefore to be somewhat more civilized than their neighbours.

Cochin-China, or the western China, is situated under the torrid zone, and extends, according to some authors, about 500 miles in length; but it is much less extensive in its breadth from east to west. Laos, Cambodia, and Chiampa, as well as some other smaller kingdoms, are said to be tributary to Cochin-China. The manners and religion of the people seem to be originally Chinese; and they are much given to trade. Their king is said to be immensely rich, and his kingdom enjoys all the advantages of commerce that are found in the other parts of the East Indies; but this mighty prince, as well as the kings of Tonquin, are subject to the Chinese emperor.

The government of Tonquin is particular. The Tonquinese had revolted from the Chinese, which was attended by a civil war. A compromise at last took place between the chief of the revolt and the representative of the ancient kings, by which the former was to have all the executive powers of the government, under the name of Chouah; while the Bua, or real king, should retain the royal titles, and be permitted some inconsiderable civil prerogatives within his palace, from which neither he nor any of his family can stir without permission of the chouah.

The chouah resides generally in the capital, Cachao, which is situated near the centre of the kingdom. The bua's palace is a vast structure,

and has a fine arsenal. The English have a very flourishing factory on the north side of the city.

The British nation possess, in full sovereignty, the whole Soubah of Bengal, and the greatest part of Bahar; in Orissa, or Orixa, only the district of Midnapour. The whole of the British possessions in this part of Hindoostan contain about 15,000 square British miles of land; to which if we add the district of Benares, the whole will be 162,000, that is 30,000 more than are contained in Great Britain and Ireland; and near eleven millions of inhabitants. The total net revenue, including Benares, is about 287 lacks of Sicca rupees, which may be reckoned equal to 3,050,000<sup>l</sup> \*. With their allies and tributaries, they now occupy the whole navigable course of the Ganges from its entry on the plains to the sea, which, by the winding course, is more than 1350 miles.

**AIR AND SEASONS.]** The winds in this climate generally blow for six months from the south, and six from the north. April, May, and the beginning of June, are excessively hot, but refreshed by sea breezes; and in some dry seasons, the hurricanes, which tear up the sands, and let them fall in dry showers, are excessively disagreeable. The English, and consequently the Europeans in general, who arrive at Hindoostan, are commonly seized with some illness, such as flux, or fever, in their different appearances; but when properly treated, especially if the patients are abstemious, they recover, and afterwards prove healthy.

**MOUNTAINS.]** The most remarkable mountains are those of Caucasus and Naugracut, which divide India from Persia, Usbec Tartary, and Thibet; and are inhabited by Mahrattas, Afghans, or Patans, and other people more warlike than the Gentoos. The mountains of Balagant, which run almost the whole length of India from north to south, are so high as to stop the western monsoon, the rains beginning sooner on the Malabar than they do on the Coromandel coast.

**RIVERS.]** These are the Indus, called by the natives Sinda and Sinduh; and the Ganges, both of them known to the ancients, and held in the highest esteem, and even veneration, by the modern inhabitants. Besides those rivers, many others water this country.

**SEAS, BAYS, AND CAPES.]** These are the Indian Ocean; the Bay of Bengal; the Gulf of Cambaya; the Straits of Ramanakool; Cape Comorin, and Diu.

**INHABITANTS.]** To what has been said of their religions and sects, in the general review of this great empire, it may be added, that the fakirs are a kind of Mahomedan mendicants or beggars, who travel about, practising the greatest austerities; but many of them are impostors. Their number is said to be 800,000. Another set of mendicants are the joghis, who are idolaters, and much more numerous, but most of them are vagabonds and impostors, who live by amusing the credulous Gentoos with foolish fictions. The Banians, who are so called from their affected innocence of life, serve as brokers, and profess the Gentoos religion.

The Persees, or Parses of Hindoostan, are originally the Gaurs, described in Persia, but are a most industrious people, particularly in weaving, and architecture of every kind. They pretend to be possessed of the works of Zoroaster, whom they call by various names. They are known as paying divine adoration to fire, but it is said only as an emblem of the divinity.

The nobility and people of rank delight in hunting with the bow as

\* A considerable addition both to the territory and revenue of the East-India company was obtained by the cessions in the late treaty of peace with Tippoo Sultan, to the amount of 15,374 square miles, affording a revenue of 1,316,765 Coontearry pagodas, equal to 411,450<sup>l</sup>.

RENNELL.

Another considerable addition has since been made by the late conquest and partition of the whole of the Mysore country.

well as the gun, and often train the leopards to the sports of the field. They affect shady walks and cool fountains, like other people in hot countries. They are fond of tumblers, mountebanks, and jugglers; of barbarous music, both in wind and string instruments, and play at cards in their private parties. Their houses make no appearance and those of the commonalty are poor and mean, and generally thatched, which renders them subject to fire; but the manufacturers choose to work in the open air; and the insides of houses belonging to principal persons are commonly neat, commodious, and pleasant, and many of them magnificent.

**COMMERCE OF HINDOOSTAN.]** The commerce and manufactures of India have already been mentioned; but the Mahomedan merchants here carry on a trade that has not been described, which is that with Mecca, in Arabia, from the western parts of this empire, up the Red Sea. This trade is carried on in a particular species of vessels called junks, the largest of which, we are told, besides the cargoes, will carry 1700 Mahomedan pilgrims to visit the tomb of their prophet. At Mecca they meet with Abyssinian, Egyptian, and other traders, to whom they dispose of their cargoes for gold and silver; so that a Mahomedan junk returning from this voyage is often worth 200,000*l*.

**PROVINCES, CITIES, AND OTHER BUILDINGS, PUBLIC AND PRIVATE.** } The province of Agra is the largest in all Hindoostan, containing 40 large towns and 340 villages. Agra is the greatest city, and its castle the largest fortification, in all the Indies. The Dutch have a factory there, but the English have not.

The city of Delhi, which is the capital of that province, is likewise the capital of Hindoostan. It is described as being a fine city, and containing the imperial palace, which is adorned with the usual magnificence of the East. Its stables formerly contained 12,000 horses, brought from Arabia, Persia, and Tartary; and 500 elephants. When the forage is burnt up by the heats of the season, as is often the case, these horses are said to be fed in the morning with bread, butter, and sugar, and in the evening with rice-milk properly prepared.

Tatta, the capital of Sindia, is a large city; and it is said that a plague, which happened there in 1699, carried off above 80,000 of its manufactures in silk and cotton. It is still famous for its manufacture of palanquins, which are a kind of canopied couches, on which the great men all over India, Europeans as well as natives, repose when they appear abroad. They are carried by four men, who will trot along, morning and evening, forty miles a day; ten being usually hired, who carry the palanquin by turns, four at a time. Though a palanquin is dear at first cost, yet the porters may be hired for nine or ten shillings a month each, out of which they maintain themselves. The Indus, at Tatta, is about a mile broad, and famous for its fine carp.

Though the province of Moultan is not very fruitful, it yields excellent iron and canes; and the inhabitants, by their situation, are enabled to deal with the Persians and Tartars yearly for above 60,000 horses.

The province of Cassimere being surrounded with mountains, is difficult of access; but when entered, it appears to be the paradise of the Indies. It is said to contain 100,000 villages, to be stored with cattle and game, without any beasts of prey. The capital (Cassimere) stands by a large lake; and both sexes, the women especially, are almost as fair as the Europeans, and are said to be witty, dexterous, and ingenious.

The province and city of Lahor formerly made a great figure in the Indian history, and is still one of the largest and finest provinces in the Indies, producing the best sugars of any in Hindoostan. Its capital was

once about nine miles long, but is now much decayed. We know little of the province of Ayud, Varad, Beker, Haliabas, that is not in common with the other provinces of Hindoostan, excepting that they are inhabited by a hardy race of men, who seem never to have been conquered, and though they submit to the Moguls, live in an easy, independent state. In some of those provinces many of the European fruits, plants, and flowers, thrive as in their native soil.

Bengal, of all the Indian provinces, is perhaps the most interesting to an English reader. It is esteemed the storehouse of the East Indies. Its fertility exceeds that of Egypt after being overflowed by the Nile: and the produce of its soil consists of rice, sugar-canes, corn, sesamum, small mulberry and other trees. Its calicoes, silks, salt-petre, lakka, opium, wax, and civet, go all over the world: and provisions here are in vast plenty, and incredibly cheap, especially pullets, ducks, and geese. The country is intersected by canals cut out of the Ganges for the benefit of commerce, and extends near 100 leagues on both sides the Ganges, full of cities, towns, castles, and villages.

In Bengal, the worship of the Gentoos is practised in its greatest purity, and their sacred river (Ganges) is in a manner lined with their magnificent pagodas or temples. The women, notwithstanding their religion, are said by some to be lascivious and enticing.

The principal English factory in Bengal is at Calcutta, and is called Fort William: it is situated on the river Hoogley, the most westerly branch of the Ganges. It is about 100 miles from the sea: and the river is navigable up to the town, for the largest ships that visit India. The fort itself is said to be irregular, and untenable against disciplined troops; but the servants of the company have provided themselves with an excellent house, and most convenient apartments for their own accommodation. As the town itself has been in fact for some time in possession of the company, an English civil government, by a mayor and aldermen was introduced into it. This was immediately under the authority of the company. But, in 1773, an act of parliament was passed to regulate the affairs of the East-India company, as well in India as in Europe. By this act, a governor-general and four counsellors were appointed, and chosen by the parliament, with whom was vested the whole civil and military government of the presidency of Fort William; and the ordering, management, and government of all the territorial acquisitions and revenues in the kingdom of Bengal, Bahar, and Orissa, so long as the company should remain possessed of them. The governor-general and council so appointed are invested with the power of superintending and controlling the government and management of the presidencies of Madras, Bombay, and Bencoolen. The governor-general and council to pay obedience to the orders of the court of directors, and to correspond with them. The governor-general and counsellors are likewise empowered to establish a court of judicature at Fort William: to consist of a chief justice and three other judges, to be named from time to time by his majesty; they are to exercise all criminal, admiralty, and ecclesiastical jurisdiction: to be a court of record, and a court of oyer and terminer for the town of Calcutta, and factory at Fort William and its limits; and the factories subordinate thereto. But the establishment of this supreme court does not appear to have promoted either the interests of the East-India company, or the felicity of the people of the country. No proper attention has been paid to the manners and customs of the natives: acts of great oppression and injustice have been committed; and the supreme court has been a source of great dis-

satisfaction, disorder, and confusion. For the subsequent regulations of the East-India territories and company, we refer to our account in the History of England.

In 1756, an unhappy event took place at Calcutta, which is too remarkable to be omitted. The Indian nabob, or viceroy, quarrelled with the company, and invested Calcutta with a large body of black troops. The governor and some of the principal persons of the place threw themselves, with their chief effects, on board the ships in the river; they who remained, for some hours bravely defended the place: but their ammunition being expended, they surrendered upon terms. The soubah, a capricious unfeeling tyrant, instead of observing the capitulation, forced Mr. Holwel, the governor's chief servant, and 145 British subjects, into a little but secure prison, called the Black-Hole, a place about eighteen feet square, and shut up from almost all communication of free air. Their miseries during the night were inexpressible, and before morning no more than twenty-three were found alive, the rest dying of suffocation, which was generally attended with a horrible phrensy. Among those saved was Mr. Holwel himself, who has written a most affecting account of the catastrophe. The insensible nabob returned to his capital, after plundering the place, imagining he had routed the English out of his dominions; but the seasonable arrival of admiral Watson, and colonel (afterwards lord) Clive, put them once more, with some difficulty, in possession of Calcutta; and the war was concluded by the battle of Plassey, gained by the colonel, and the death of the tyrant Surajah Dowla, in whose place Mhir Jaffier, one of his generals, who had previously signed a secret treaty with Clive to desert his master, and amply reward the English, was advanced, of course, to the soubahship.

The capital of Bengal, where the nabob keeps his court, is Patna, or Moorshedabad; and Benares, lying in the same province, is the Gentoo university, and celebrated for its sanctity.

Chandenagore is the principal place possessed by the French in Bengal: it lies higher up the river than Calcutta. But though strongly fortified, furnished with a garrison of 500 Europeans, and 1200 Indians, and defended by 123 pieces of cannon and three mortars, it was taken by the English admirals Watson and Pococke, and colonel Clive; and also was taken the last war, but restored by the peace. Hoogley, which lies fifty miles to the north of Calcutta, upon the Ganges, is a place of prodigious trade for the richest of all Indian commodities. The Dutch have here a well-fortified factory. The search for diamonds is carried on by about 10,000 people, from Saumelpour, which lies thirty leagues to the north of Hoogley, for about fifty miles farther. Decca is said to be the largest city of Bengal, and the tide comes up to its walls. It contains an English and a Dutch factory. The other chief towns are Casumbazar, Chinchura, Barnagua, and Maldo; besides a number of other places of less note, but all of them rich in the Indian manufactures.

We know little concerning the province or soubah of Malva, which lies to the west of Bengal, but that it is as fertile as the other provinces, and that its chief cities are Ratifpor, Ougein, and Indoor. The province of Candish includes that of Berar and part of Orixia, and its capital is Brampur, or Burhampoor, a flourishing city, which carries on a vast trade in chintzes, calicoes, and embroidered stuffs. Cattac is the capital of Orixia.

The above are the provinces belonging to the Mogul's empire, to the north of what is properly called the peninsula within the Ganges. Those that lie to the southward fall into the description of the peninsula itself.

**HISTORY J.** The first invader of this country, India, whose expedition is authentically recorded, was the famous Alexander of Macedon. Zingis Khan also directed his force thither in the year 1221, and made the emperor forsake his capital; he is said to have given the name of Mogul to India. Long before Tamerlane, descended in the female line from that conqueror, Mahomedan princes had entered, made conquests, and established themselves in India. Walid, the sixth of the caliphs, named Omniades, who ascended the throne in the 708th year of the Christian æra, and in the 90th of the Hegira, made conquests in India; so that the Koran was introduced very early into this country. Mahmoud, son of Sebegetchin, prince of Gazna, the capital of a province separated by mountains from the north-west parts of India, and situated near Kandahar, carried the Koran with the sword into Hindoostan, in the year 1000 or 1002 of the Christian æra. He treated the Indians with all the rigour of a conqueror, and all the fury of a zealot, plundering treasures, demolishing temples, and murdering idolaters throughout his route. The wealth found by him in Hindoostan is represented to be immense. The successors of this Mahmoud are called the dynasty of the Gaznavides, and maintained themselves in a great part of the countries which he had conquered in India until the year 1155, or 1157, when Kofron Shah, the 13th and last prince of the Gaznavide race, was deposed by Kuffain Gauri, who founded the dynasty of the Gaurides, which furnished five princes, who possessed nearly the same dominions as their predecessors the Gaznavides. Scheabbedin, the fourth of the Gauride emperors, during the life of his brother and predecessor, Gaiativeddin, conquered the kingdoms of Moultan and Delhi, and drew from thence prodigious treasures. But an Indian, who had been rendered desperate by the pollutions and insults to which he saw his gods and temples exposed, made a vow to assassinate Scheabbedin, and executed it. The race of Gaurides finished in the year 1212, in the person of Mahmood, successor and nephew to Scheabbedin, who was also cut off by the swords of assassins. Several revolutions followed till the time of Tamerlane, who entered India at the end of the year 1398, descending more terrible than all its former inundations, from the centre of the northern part of the Indian Caucasus. This invincible barbarian met with no resistance sufficient to justify, even by the military maxims of Tartars, the cruelties with which he marked his way. But, after an immense slaughter of human creatures, he at length rendered himself lord of an empire which extended from Smyrna to the banks of the Ganges. The history of the successors of Tamerlane, who reigned over Hindoostan with little interruption more than 350 years, has been variously represented; but all writers agree, that they were magnificent and despotic princes; that they committed their provinces, as has been already observed, to rapacious governors, or to their own sons, by which their empire was often miserably torn in pieces. At length, the famous Akengzebe, in the year 1607, though the youngest among many sons of the reigning emperor, after defeating or murdering all his brethren, mounted the throne of Hindoostan, and may be considered as the real founder and legislator of the empire. He was a great and a politic prince, and the first who extended his dominion, though it was little better than nominal, over the peninsula within the Ganges, which is at present so well known to the English. He lived so late as the year 1707, and it is said that some of his great officers of state were alive in the year 1730.

In 1713, four of his grandsons disputed the empire, which, after a bloody struggle, fell to the eldest, Mauzoldin, who took the name of Jehander Shah. This prince was a slave to his pleasures, and was governed by his mistress so absolutely, that his great omrahs conspired against him, and raised to the throne one of his nephews, who struck off his uncle's head. The new emperor, whose name was Furrukhîr, was governed and at last enslaved by two brothers of the name of Seyd, who abused his power so grossly, that being afraid to punish them publicly, he ordered them both to be privately assassinated. They discovered his intention; and dethroned the emperor, in whose place they raised a grandson of Aurengzebe, by his daughter, a youth of seventeen years of age, after imprisoning and strangling Furrukhîr. The young emperor proved disagreeable to the brothers, and, being soon poisoned, they raised to the throne his elder brother, who took the title of Shah Jehan. The rajahs of Hindoostan, whose ancestors had entered into stipulations, or what may be called *paktu conventa*, when they admitted the Mogul family, took the field against the two brothers, but the latter were victorious, and Shah Jehan was put in tranquil possession of the empire, but died in 1719. He was succeeded by another prince of the Mogul race, who took the name of Mahommed Shah, and entered into private measures with his great rajahs for destroying the Seyds, who were declared enemies to Nizam al Muluck, one of Aurengzebe's favourite generals. Nizam, it is said, was privately encouraged by the emperor to declare himself against the brothers, and to proclaim himself soubah of Deccan, which belonged to one of the Seyds, who was assassinated by the emperor's order, and who immediately advanced to Delhi to destroy the other brother; but he no sooner understood what had happened, than he proclaimed the sultan Ibrahim, another of the Mogul princes, emperor. A battle ensued in 1720, in which the emperor was victorious. He is said to have used his conquest with great moderation, for he remitted Ibrahim to the prison from whence he had been taken; and Seyd, being likewise a prisoner, was condemned to perpetual confinement, but the emperor took possession of his vast riches. Seyd did not long survive his confinement; and, upon his death, the emperor abandoned himself to the same course of pleasures that had been so fatal to his predecessors. As to Nizam, he became now the great imperial general, and was often employed against the Mahrattas, whom he defeated, when they had almost made themselves masters of Agra and Delhi. He was confirmed in his soubahship, and was considered as the first subject in the empire. Authors, however, are divided as to his motives for inviting Nadir Shah, otherwise Kouli Khan, the Persian monarch, to invade Hindoostan. It is thought, that he had intelligence of a strong party formed against him at court; but the truth perhaps is, that Nizam did not think that Nadir Shah could have success, and at first wanted to make himself useful by opposing him. The success of Nadir Shah is well known, and the immense treasure which he carried from Hindoostan in 1739. Besides those treasures, he obliged the Mogul to surrender to him all the lands to the west of the rivers Attock and Sind, comprehending the provinces of Peyshor, Cabul, and Gagna, with many other rich and populous principalities, the whole of them almost equal in value to the crown of Persia itself.

This invasion cost the Gentoos 200,000 lives. As to the plunder made by Nadir Shah, some accounts, and those too strongly authenticated, make it amount to the incredible sum of two hundred and thirty-

one millions of times. The increase was considerably above Nadir Shah's, the Mogul empire he had raised a Mahommed Shah. A general willing to yield it. The province Nadir Shah, was treasurer, an unmeans, in the carry off three enabled to put hi with fifty thousand made the mean occasioned. the army of My

\* Jaghire means at pleasure; but gen

one millions sterling, as mentioned by the London Gazette of those times. The most moderate say that Nadir's own share amounted to considerably above seventy millions. Be that as it may, the invasion of Nadir Shah may be considered as putting a period to the greatness of the Mogul empire in the house of Tamerlane. Nadir, however, when he had raised all the money he could in Delhi, re-inflated the Mogul, Mahommed Shah, in the sovereignty, and returned into his own country. A general defection of the provinces soon after ensued; none being willing to yield obedience to a prince deprived of the power to enforce it. The provinces to the north-west of the Indus had been ceded to Nadir Shah, who being assassinated in 1747, Achmet Abdallah, his treasurer, an unprincipled man, but possessed of great intrepidity, found means, in the general confusion occasioned by the tyrant's death, to carry off three hundred camels loaded with wealth, whereby he was enabled to put himself at the head of an army, and march against Delhi with fifty thousand horse. Thus was the wealth drawn from Delhi made the means of continuing those miseries of war which it had at first occasioned. Prince Achmet Shah, the Mogul's eldest son, and the visier, with other leading men, in this extremity, took the field with eighty thousand horse, to oppose the invader. The war was carried on with various success, and Mahommed Shah died before its termination. His son, Achmet Shah, then mounted the imperial throne at Delhi; but the empire fell every day more into decay. Abdallah erected an independent kingdom, of which the Indus is the general boundary.

The Mahrattas, a warlike nation, possessing the south-western peninsula of India, had, before the invasion of Nadir Shah, exacted a chout or tribute from the empire, arising out of the revenues of the province of Bengal, which being withheld in consequence of the enfeebled state of the empire, the Mahrattas became clamorous. The empire began to totter to its foundation; every petty chief, by counterfeiting grants from Delhi, laying claim to jaghires\* and to districts. The country was torn to pieces by civil wars, and groaned under every species of domestic misery. Achmet Shah reigned only seven years, after which much disorder and confusion prevailed in Hindoostan, and the people suffered great calamities. At present, the imperial dignity of Hindoostan is vested in Shah Allum Zadab, who is universally acknowledged to be the true heir of the Tamerlane race; but his power is feeble: the city of Delhi, and a small territory round it, is all that is left remaining of the house and heir of Tamerlane, who depends upon the protection of the English, and whose interest it is to support him, as his authority is the best legal guarantee of their possessions.

We shall now conclude the history of Hindoostan with some account of the British transactions in that part of the world, since 1765, when they were quietly settled in the possession of the provinces of Bengal, Bahar, and Orissa, not indeed as absolute sovereigns, but as tributaries to the emperor. This state of tranquillity, however, did not long continue, for, in 1767, they found themselves engaged in a very dangerous war with Hyder Ally, the sovereign of Mysore. This man had originally been a military adventurer, who learned the rudiments of the art of war in the French camp; and in the year 1753 had distinguished himself in their service. In 1763, having been advanced to the command of the army of Mysore, he deposed his sovereign, and usurped the supreme

\* Jaghire means a grant of land from a sovereign to a subject, revokeable indeed at pleasure; but generally held for life.

authority, under the title of regent. In a short time he extended his dominions on all sides, except the Carnatic, until at last his dominions equalled the island of Great Britain in extent, with a revenue of not less than four millions sterling annually. The discords which took place in various parts of Hindoostan, particularly among the Mahrattas, enabled him to aggrandise himself in such a manner, that his power soon became formidable to his neighbours; and in 1767, he found himself in danger of being attacked on one side by the Mahrattas, and on the other by the British. The former were bought off with a sum of money, and the latter were in consequence obliged to retire. Having soon, however, assembled all their forces, several obstinate engagements took place; and the British now, for the first time, found a steady opposition from an Indian prince. The war continued with various success during the years 1767, 1768, and part of 1769, when Hyder, with a strong detachment of his army, passing by that of the British, advanced within a little distance of Madras, where he intimidated the government into a peace upon his own terms. The advantages gained by this peace, however, were quickly lost by an unfortunate war with the Mahrattas, from whom, in the year 1771, he received a most dreadful defeat, almost his whole army being killed or taken. Hyder was now reduced to the necessity of allowing his enemies to desolate the country, till they retired of their own accord; after which he retrieved his affairs with incredible perseverance and diligence, so that in a few years he became more formidable than ever. In 1772, the Mahrattas made some attempts to get possession of the provinces of Corah, and some others, but were opposed by the British, who, next year, defeated and drove them across the river Ganges, when they had invaded the country of the Rohillas. On this occasion the latter had acted only as the allies of Sujah Dowla, to whom the Rohilla chiefs had promised to pay forty lacks of rupees for the protection afforded them; but when the money came to be paid, it was, under various pretences, refused; the consequence of which was, that the Rohilla country was next year (1774) invaded and conquered by the British, as well as several other large tracts of territory; by which means the boundary of Oude was advanced, to the westward, within twenty-five miles of Agra; north-westward, to the upper part of the navigable course of the Ganges; and south-westward to the Jumna river.

In 1778, a new war commenced with the Mahrattas; on which occasion a brigade, consisting of 7000 Indian troops, commanded by British officers, traversed the whole empire of the Mahrattas, from the river Jumna to the Western Ocean. About this time the war with France broke out, and Hyder Ally, probably expecting assistance from the French, made a dreadful irruption into the Carnatic, at the head of 100,000 men. For some time he carried every thing before him; and having the good fortune to defeat, or rather destroy, a detachment of the British army, under colonel Baillie, it was generally imagined that the power of Britain in that part of the world would have soon been annihilated. By the happy exertions of Sir Eyre Coote, however, to whom the management of affairs was now committed, the progress of this formidable adversary was stopped, and he soon became weary of a war, which was attended with incredible expence to himself, without any reasonable prospect of success. By the year 1782, therefore, Hyder Ally was sincerely desirous of peace, but died before it could be brought to a conclusion; and his rival, Sir Eyre Coote, did not survive him above five months: a very remarkable circumstance, that the com-

manders in chief of two armies, opposed to each other, should both die natural deaths within so short a space of time.

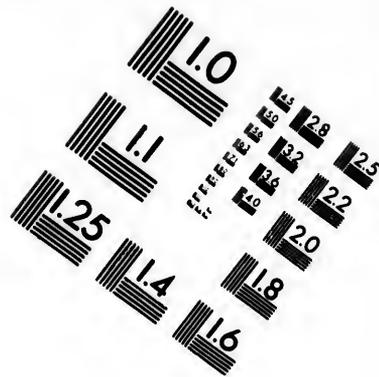

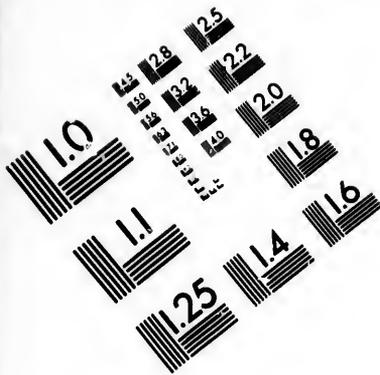

To Hyder Ally succeeded his son, Tippoo Sultan, whose military prowess is well known. Of all the native princes of India, Tippoo was the most formidable to the British government, and the most hostile to its authority. The peace of Mangalore, in 1784, had, it was supposed, secured his fidelity by very feeble ties; and the splendid embassy which, not long after that event, he dispatched to France, afforded much reason to apprehend that some plan was concerted between the old government of that country and the tyrant of Mysore, for the annoyance of Great Britain in its Indian possessions; but this plan was happily defeated by the French revolution.

The increasing power of Tippoo was not less formidable to the Dutch, than to the English; and the vicinity of Cochin, their most flourishing settlement on the continent of India, to the territories of that aspiring monarch, made them tremble for its safety. That sagacious people, however, have seldom been without their resources. Besides Cochin, the Dutch were possessed of two other forts, which were situated between Mysore and their favourite settlement; and one of them, Cranganore, had been taken by Hyder Ally in 1779, or 1780. When the war broke out in 1780 between Hyder and the English, he was obliged to evacuate his garrisons on the Malabar coast, to employ his force in the Carnatic; and Holland and France being soon after united with Hyder against the English, the Dutch embraced the opportunity of clandestinely taking possession, and re-garrisoning the fort; a measure which greatly offended Hyder, and of which he loudly complained. By the mediation, however, of France, a compromise took place, but upon what terms is uncertain.

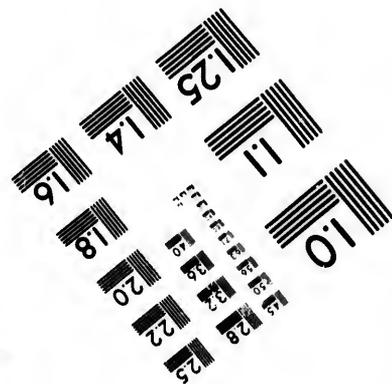

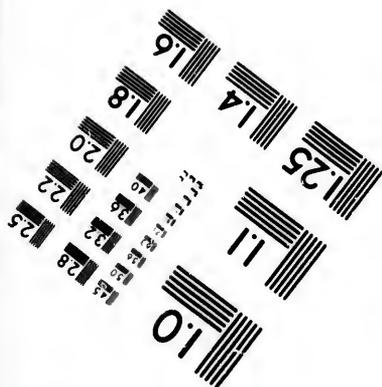

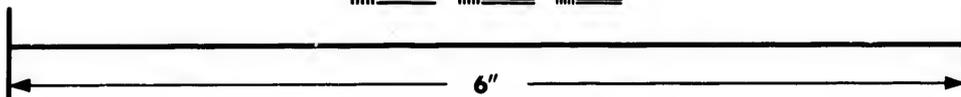

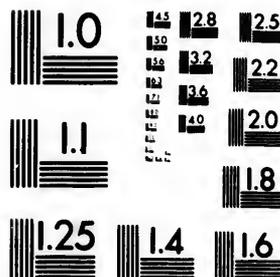

From the vicinity of Cranganore and Accottah to his boundary, and their situation within the territory of an acknowledged tributary to Mysore (the rajah of Cochin), the possession of them was a most desirable object with Tippoo. In the month of June, 1789, he marched a formidable force towards Cranganore, with a professed intention of making himself master of it, upon a claim chiefly founded upon the transactions we have just related. Unable therefore to retain the possession of the forts themselves, and fearing for a settlement of much superior value, the Dutch readily entered into a negotiation with the rajah of Travancore for the purchase of them. That politic people easily saw, that, by placing them in his hands, they erected a most powerful barrier, no less than the whole force of Great Britain (who was bound by treaty to assist him), against the encroachments of their ambitious neighbour upon their settlement at Cochin. The imprudence of the rajah, in entering upon such a purchase while the title was disputed, drew down upon him the heaviest censures from the government at Madras; and he was repeatedly cautioned both by Sir Archibald Campbell, and Mr. Holland, his successor in the government, not to proceed in the negotiation. Such, however, was the ardour and temerity of the rajah in making this acquisition, that he not only concluded the purchase with the Dutch, but even treated with the rajah of Cochin, without the privity of Tippoo, though he was the acknowledged tributary of that prince, for some adjacent territory. The bargain was concluded in July, 1789, though it was not till the 4th of August that the rajah informed the Madras government, through their resident Mr. Powney, that he was on the point of making the purchase.

It was not probable that Tippoo would remain an indifferent specta-

tor of these transactions. He insisted on the claim which he retained over these forts, in consequence of their being conquered by his father, and in consequence of the subsequent compromise. He asserted, that according to the feudal laws, no transfer of them could take place without his consent, as sovereign of Mysore; and on the 29th of December, he made, with a considerable force, a direct attack upon the lines of Travancore. On receiving a remonstrance from the British government of Fort St. George, he desisted, and even apologized. From the 29th of December to the 1st of March, Tippoo Sultan remained perfectly quiet, still asserting his claims to the feudal sovereignty of the forts; but, it is confidently affirmed, offering to submit the dispute to an impartial arbitration.

On the first of March, 1790, the rajah's troops made an offensive attack upon Tippoo, who had continued quiet within his lines from the 29th of December. An engagement took place; and the British government conceived themselves bound to take an active part. No period appeared more favourable to humble Tippoo, if that was the object of the British administration. With all the other powers of India we were not only at peace, but treaties of alliance existed between Great Britain and the two most powerful states of India, the Nizam and the Mahrattas; and both declared themselves in perfect readiness to exert their utmost force to crush the rising power of Mysore.

We shall here present the reader with a brief account of the progress and termination of this war, by which the British power was more than ever established on the continent of Asia, from a narrative drawn up by major Dirom, from journals and authentic documents.

It should be remembered, that the campaign here recorded was the third of our war with Tippoo Sultan. The *first* commenced in June, 1790, and concluded with that year. It was confined below the Ghauts. The *second campaign* contained the capture of Bangalore, which fixed the seat of war in the enemy's country, and concluded with the retreat of lord Cornwallis from Seringapatam, towards the end of May 1791. The *third* commences almost from that point, and terminates in March 1792. Observing, however, as the author very properly states, that, in the fine climate of Mysore, campaigns are regulated rather by plans of operations, than by seasons.

The narrative commences with unfavourable circumstances; the retreat of the two armies under general Abercromby and lord Cornwallis; the loss of cannon in both; an epidemic distemper among the cattle; and a dreadful scarcity of grain. These evils, however, vanished by degrees; the junction of the Mahrattas afforded a supply of necessaries, and arrangements were made for obtaining in future the most ample and regular provisions of bullocks and grain, and for replacing the battering guns. On the return of the army to the vicinity of Bangalore, the operations began, which were to secure the communication with the Carnatic, and reduce the power of the enemy in those parts. The British force was immediately and successfully employed to reduce Outloor, Rayacotta, and the other hill forts commanding the Policode pass. The next object was the forts to the north-east of Bangalore, which interrupted the communication with the Nizam's army, and with the Carnatic, by that route. These being soon reduced, Nundydroog, built on the summit of a mountain, about one thousand seven hundred feet in height, a place of greater magnitude and strength, was attacked, and after being besieged from September 22, was carried by assault on the 18th of

October, in spite of obstacles which might reasonably have been deemed insurmountable.

By means of dispositions made for that purpose, supplies of all kinds now came in from the Carnatic. Penagra was taken at the end of October; and Kistdagheri attacked on the 7th of November; this was almost the only enterprise that was not completely successful; the lower fort and pettah were taken; but the upper fort maintained its defence, and the attack was relinquished. It seems that it could only have been carried by a *coup de main*, which unluckily failed. On the 2d of the same month, another instance of ill success happened to us; the relief of Coimbatore having been prevented, that garrison was obliged to capitulate to Kummer-ud deen Kahn, on terms which Tippoo did not afterwards fulfil.

Savendroog, or the Rock of Death, bore witness, in the month of December, to the ardour and perseverance of the British troops. This fortress, standing in the way between Bangalore and Seringapatam, is thus described: It is "a vast mountain of rock, and is reckoned to rise above half a mile in perpendicular height, from a base of eight or ten miles in circumference. Embraced by walls on every side, and defended by cross walls and barriers, wherever it was deemed accessible,—this huge mountain had the farther advantage of being divided above by a chasm which separates the upper part into two hills, which, having each their defences, from two citadels capable of being maintained, independent of the lower works; and, affording a secure retreat, should encourage the garrison to hold out to the last extremity," p. 67. It is no less famed for its noxious atmosphere, occasioned by the surrounding hills and woods, than for its wonderful size and strength. Hence it derives its formidable name.

The sultan is said to have flattered himself that before this place "half the Europeans would die of sickness, the other half be killed in the attack;" he was, however, mistaken. The garrison, fortunately for us, trusted more to the strength of the place than to their own exertions, and, on the 21st of December, only the 11th day of the siege, this fortress, hitherto deemed impregnable, was taken by assault in less than an hour, in open day, without the loss of a man, only one private soldier having been wounded.

Outredroog, and other forts, fell successively after this brilliant success. The forces of the allies were not equally fortunate during the same interval. The army of the Nizam, after a long siege of Gurrampcondah, drew off to join our forces, and only left the place blockaded. To make amends for this failure, the Mahratta army, under Purseram Bhow, assisted by our engineers, took Hooly Onore, Bankapoor, Simoga, and other places. By the latter end of January, 1792, the whole allied forces, excepting the Bombay army, was assembled in the vicinity of Hooleadroog.

We come now to the operations against Seringapatam. On the first of February, 1792, the allies began their march, and by two o'clock on the 5th we encamped across the valley of Milgotah, only six miles from the position of Tippoo before Seringapatam. It could not well be expected by the sultan that he should receive so early an attack as Lord Cornwallis destined for him. His camp was strongly situated and fortified by a bound hedge, and several redoubts. Nevertheless, after causing his position to be reconnoitred in the morning of the 6th, the commander in chief issued orders for the attack that very evening. The army was to march at night in three divisions, and without cannon.

"The plan of attack," says major Dirom, "was indeed bold beyond the expectation of our army; but, like a discovery in science, which excites admiration when disclosed, it had only to be known, to meet with general applause." The outlines of this great enterprise are generally known; and the particulars cannot be detailed in this place, but are related with great clearness by the historian, and so illustrated by the attendant plans, that the circumstances cannot be mistaken.

The result of this operation was, that Tippoo was driven from his camp into Seringapatam, all his redoubts taken, and a lodgement established on the island, in a strong position, where lieut. Stuart remained posted. All possible preparations were made, from this time, for taking the capital by assault: and they were such as probably would have been crowned with full success. On the 16th of February, the Bombay army, under general Abercromby, after overcoming various obstacles, joined the main army, and remained posted to the north-west of the city.

On the 19th it was stationed on the south side of the Caveri, in a situation that seemed to give the sultan much uneasiness. However, after attacking the advanced post of this army on the night of the 21st, Tippoo made no farther effort; and on the 24th, when the preparations for the general assault were in great forwardness, it was announced that preliminaries of peace were settled. The conferences for this purpose had begun on the 15th; but the operations on both sides continued till the 24th. After the cessation of arms, which then took place, the conduct of Tippoo Sultan was so equivocal and suspicious, as to make it necessary on our part to renew the preparations for the siege. Overawed, at length, by the firmness and decision of lord Cornwallis, and probably alarmed by the discontent of his own people, the reluctant sultan submitted to all the terms proposed; and on the 19th of March, the copies of the definitive treaty were delivered in form, by his sons, to lord Cornwallis, and the agents of the allied princes. The Nizam's son, prince Secunder Jah, and the Mahratta plenipotentiary, Hurry Punt, thought it beneath their dignity to be present on this occasion in person, and were represented by their vakeels.

The substance of the treaty was: 1st. That Tippoo was to cede one-half of his dominions to the allied powers. 2d. That he was to pay three crores and thirty lacks of rupees. 3d. That all prisoners were to be restored. 4th. That two of the sultan's three eldest sons were to become hostages for the due performance of the treaty.

Tippoo is said to have been prevailed upon with infinite difficulty to subscribe to the terms of peace; and now that all was settled, the uneasiness in the seraglio became extreme in parting with the boys, who were to be sent out as hostages. The sultan was again entreated to request they might be allowed to stay another day, in order to make suitable preparations for their departure; and lord Cornwallis, who had dispensed with their coming at the time the treaty was sent, had again the goodness to grant his request.

When the princes left the fort, which appeared to be manned as they went out, and every where crowded with people, who, from curiosity or affection, had come to see them depart, the sultan himself was on the rampart above the gateway. They were saluted by the fort on leaving it, and with twenty-one guns from the park as they approached our camp, where the part of the line they passed was turned out to meet them. The vakeels conducted them to the tents, which had been sent from the fort for their accommodation, where they were met by Sir John

Kennaway, the Mahratta and Nizam's vakeels, and from thence accompanied by them to head-quarters.

The princes were each mounted on an elephant richly caparisoned, and seated in a silver howder [a canopied seat], and were attended by their father's vakeels, and the persons already mentioned, also on elephants. The procession was led by several camel haccarras [messengers] and seven standard-bearers, carrying small green flags, suspended from rockets\*, followed by one hundred pikemen, with spears inlaid with silver. Their guard of two hundred sepoy and a party of horse brought up the rear. In this order they approached head quarters, where the battalion of Bengal sepoy, commanded by captain Welch, appointed for their guard, formed a street to receive them.

Lord Cornwallis, attended by his staff, and some of the principal officers of the army, met the princes at the door of his large tent, as they dismounted from the elephants; and, after embracing them, led them in, one in each hand, to the tent; the eldest, Abdul Kalick, was about ten, the youngest, Mooza-ud-Deen, about eight years of age. When they were seated on each side of lord Cornwallis, Gullam Ally, the head vakeel, addressed his lordship as follows: "These children were this morning the sons of the sultan, my master; their situation is now changed, and they must look up to your lordship as their father."

Lord Cornwallis, who had received the boys as if they had been his own sons, anxiously assured the vakeel and the young princes themselves, that every attention possible would be shown to them, and the greatest care taken of their persons. Their little faces brightened up; the scene became highly interesting; and not only their attendants, but all the spectators, were delighted to see that any fears they might have harboured were removed, and that they would soon be reconciled to their change of situation, and to their new friends.

The princes were dressed in long white muslin gowns and red turbans. They had several rows of large pearls round their necks, from which was suspended an ornament consisting of a ruby and an emerald of considerable size, surrounded by large brilliants; and in their turbans each had a sprig of rich pearls. Bred up from their infancy with infinite care, and instructed in their manners to imitate the reserve and politeness of age, it astonished all present to see the correctness and propriety of their conduct.

This ended a war in which the advantages gained by us may be briefly stated thus:—1. Our most formidable enemy was so reduced by it, as to render our possessions in India both profitable and secure. 2. Madras was secured from invasion by possession of the passes, and covered by a territory defended by strong forts. 3. The value of Bombay was greatly enhanced by possessions gained on the Malabar coast, protected by Poligatcherry and the frontier of the Coorga Rajah. These advantages, it may be presumed, far overbalanced the expenses of the war. By a statement of major Dirom, it appears that Tippoo lost in this war sixty-seven forts, 801 cannons, and 49,340 men.

It is utterly impossible, says major Rennell, in the present imperfect state of our knowledge of the geography of the northern part of the peninsula (notwithstanding the present improvements), to describe, with any degree of accuracy, the boundaries of the cessions now made to the Mahrattas and Nizam; or even the positions of all the principal places

\* Rocket is a missile weapon, consisting of an iron tube of about a foot long, and an inch in diameter, fixed to a bamboo rod of ten or twelve feet long.

situated within them. A very good *general idea* may, however, be collected from the map, on which the countries ceded are particularly marked.

The ambition of Tippoo Sultan was for a time repressed by the victories which had forced him to sign the treaty above-mentioned; and his power diminished by the cessions he had been compelled to make: still, however, he retained the same enmity to the British government, and the desire of revenge, should any events afford him encouragement and an opportunity again to resume his arms. The war which took place between England and France, in consequence of the French revolution, seemed to present such an opportunity, and Tippoo willingly listened to the suggestions of French emissaries, that, by entering into an alliance with that republic, he might receive from it such aid and support as should not only enable him to regain the territory he had lost, but entirely to drive the English out of Asia, and share the dominions they had there acquired with the French.

In the month of February, 1798, a proclamation was issued by the governor-general of the Isle of France, importing that an embassy had arrived at the Isle of France with letters from Tippoo Sultan, addressed not only to the governor of that island, but to the executive directory of France, proposing to conclude an offensive and defensive alliance with the French; to subsidize and to supply whatever troops the French might furnish to the sultan; and to commence against the British power in India a war of aggression, for which the sultan declared himself to be fully prepared. The proclamation concluded by offering encouragement to the subjects of France to enter into the service of Tippoo Sultan, on terms to be fixed with his ambassadors then on the spot. The circumstances attending this proclamation, on inquiry, established the fact that Tippoo had actually concluded such an alliance as was mentioned in it with the French; and it also appeared that he had dispatched an embassy to Zemaun Shah, the sultan of the Abdalli, the object of which could be no other than to encourage that prince in the prosecution of his long-intended invasion of Hindoostan. The French expedition to Egypt, likewise, in the summer of the same year, appeared to have for its ultimate object the execution of a plan of invasion of the British settlements in India, in conjunction with Tippoo.

In consequence of these transactions, which so evidently menaced hostility, lord Mornington, the present governor-general of Bengal, addressed a letter to Tippoo Sultan, in which he expressed his surprise and concern at the intercourse he maintained, and the alliance he had formed, with the French, proposing to send to him major Doveton, who might more fully and particularly explain the sole means which appeared effectual for removing all distrust and suspicion, and establishing peace and good understanding on the most durable foundations. His lordship, at the same time, expecting but little satisfaction from the negotiation he had thus offered to open, determined to assemble without delay the armies on the coast of Coromandel and Malabar; and directed all his attention to strengthen and improve the defensive alliance concluded with the Nizam and the Paishwa of the Mahrattas. He gave peremptory orders to the government of Fort St. George to complete the equipment of their battering train, and to advance it with all practicable dispatch to the most eligible station on the frontier of the Carnatic, with a view of proceeding towards Seringapatam at the earliest possible period, if such a movement into Mysore should become necessary.

The letter of vague professions, however, declined more effectual cooperation, entered into, to gnomony, or promote

The letter of his lordship to Tippoo produced no other answer than vague professions of a wish to maintain peace and amity. The sultan, however, declined receiving major Doveton; alleging that no means more effectual could be devised than the treaties and engagements already entered into, to give stability to the foundations of friendship and harmony, or promote the states and the welfare and advantage of all parties.

As it was evident that Tippoo meant only to gain time and increase his strength, lord Mornington determined to avail himself of the superiority of his force, and commence hostilities immediately. He accordingly, on the 3d of February, 1799, directed lieutenant-general Harris to enter the territory of the Mysore with the army assembled under his command; and on the same day issued orders to lieutenant-general Stuart to be prepared to co-operate from Malabar: and signified to rear-admiral Rainier, and to the several allies of the company, that he now considered the British government in India to be at war with Tippoo Sultan.

The army of Bombay, under the command of lieutenant-general Stuart, marched from Cananore on the 21st of February, arrived at the head of the Poodicherrum ghaut on the 25th of the same month, and took post at Seedapoor and Seedafere on the 2d of March. The army of Madras, under lieutenant-general Harris, entered the territory of Mysore on the 5th of March, and commenced its operations by the reduction of several forts upon the frontier. On the 6th of March Tippoo Sultan passed his own frontier, and attacked a detachment of the army of Bombay, under lieutenant-general Stuart,—the total strength of whose entire army did not amount to six thousand fighting men. The attack of the sultan's force was sustained by a body not exceeding two thousand men, and the sultan's army was finally defeated and completely dispersed before general Stuart could collect the whole of his divided force.

After this signal defeat, Tippoo retreated precipitately to his camp at Periapatam, and remained there until the 11th of March without making any farther attempt to molest the army. He then returned to Seringapatam, whence in a few days he moved to meet lieutenant-general Harris and the army of Madras, between which and the army of Tippoo an engagement took place on the 27th of March, in which the sultan was completely defeated, and driven from every post which he attempted to maintain. General Harris then proceeded on his march without the least interruption, till, on the 30th, he crossed the Caveri, with his whole army, and, on the 5th of April, encamped two miles south-west of Seringapatam, the siege of which he immediately prepared to commence.

In the afternoon of the 14th of April, the army of Bombay joined the army before Seringapatam. A large body of the cavalry of the enemy, under the command of Kummeer-ud-Jeen Khan, had attended them closely during their march from Periapatam, but without having been able to make the slightest impression upon them. On the night of the 20th general Harris received a letter from Tippoo Sultan, expressive of a desire to open a negotiation for peace. To this overture the general answered by transmitting a draft of preliminaries, founded on instructions with which he had been furnished by the governor-general; and which were, in substance, that Tippoo should deliver all Frenchmen, or natives of the island of Mauritius or Bourbon, or of any other countries now subject to France, as also all Europeans, natives or subjects of countries at war with Great Britain, to be treated as prisoners of war; that he

should renounce all connection with the French nation; that he should cede one-half of the dominions of which he was in possession before the war, to the allies; that he should pay two crores of rupees (above two millions sterling); and that he should send as hostages four of his sons, and four of his principal officers, together with half the required treasure, within forty-eight hours, to the camp of the allies. To these propositions the sultan replied, that they were weighty, and could not be brought to a conclusion without the intervention of embassadors. General Harris, considering this as evidently intended to gain time, refused to admit any vakeels or embassadors, unless accompanied by the hostages and specie required.

On the 30th of April the batteries began to batter in breach, and on the evening of the 3d of May had so much destroyed the walls, that the arrangement was made for assaulting the place on the following day, when the breach was reported practicable. The troops intended to be employed were stationed in the trenches early in the morning of the 4th, that no extraordinary movement might lead the enemy to expect the assault, which it was determined to make in the heat of the day, as the time best calculated to insure success, since the troops of the sultan would then be least prepared to oppose the attack. Agreeable to this disposition, at one o'clock the troops began to move from the trenches, crossed the rocky bed of the Caveri, and mounted to the assault, in despite of every obstacle which the difficulty of the passage and the resistance of the enemy could oppose. Their impetuous attack was completely successful. Resistance, however, continued to be made from the palace of Tippoo for some time after all firing had ceased from the works. Two of his sons were there, who, on assurance of safety, surrendered to the troops surrounding them; and guards were placed for the protection of the family, most of whom were in the palace. It was soon after reported, that Tippoo Sultan had fallen: Syed Saheb, Meer Saduc, Syed Gofar, and many other of his chiefs, were also slain. Measures were immediately adopted to stop the confusion, at first unavoidable in a city strongly garrisoned, crowded with inhabitants, with their property in ruins from the fire of a numerous artillery, and taken by assault. The princes were removed to the camp.

As it appeared important to ascertain the fate of the sultan, immediate search was made for his body, which, after much difficulty, was found, late in the evening, in one of the gates, under a heap of slain. He had been shot through the head, and bayoneted in three parts of his body, as he attempted to make his escape. The corpse was the next day recognised by the family, and interred with the honours due to his rank in the mausoleum of his father.

The treasure found in the place was immense; a prodigious quantity of grain, and military stores of all kinds, were likewise taken.

Thus ended the power and life of, perhaps, the most inveterate and formidable enemy the British government ever had in Hindoostan. His death has given a security to their possessions in that country, which they never could have had during his life. His territories have been divided between the British, the Nizam, and the Pashwa of the Mahrattas, except certain districts of Myfore, which have been assigned to Maha Rajah, a descendant of the ancient rajahs of Myfore, who is to pay an annual subsidy to the British government of seven lacks of pagodas (or 70,000l. sterling) for the defence of his country. The British are to possess the fortrefs, city, and island of Seringapatam.

Tippoo Sultan about five feet in eyes, and his countenance he was naturally a statesman, nor for he possessed a commanding either in ill-concerted schemes.

Grand divisions.

The south-east coast of India, situate on the bay of Bengal, usually called the coast of Coromandel.

Tippoo Sultan was, when he fell, about fifty years of age. He was about five feet nine inches high; his face was round, with large full eyes, and his countenance full of fire and animation. In his disposition he was naturally cruel, passionate, and revengeful. It is probable that his abilities have been over-rated, and that he was neither so wife a statesman, nor so able a general, as he has been represented. Though he possessed a considerable share of prudence, and was not, in general, wanting either in promptitude or judgment, he at last fell a victim to ill-concerted schemes, dictated by his ambition and thirst of revenge.

As to the government and constitution of Hindoostan, we must refer to what we have already observed. The emperor of Hindoostan, or Great Mogul (so called from being descended from Tamerlane, the Mongul or Mogul Tartar), on his advancement to the throne, assumes some grand title; as, "*The Conqueror of the World, the Ornament of the Throne,*" &c. but he is never crowned.

RIVERS.] The Cattack or Mahanada, the Soane and Nerbudda, the Pudder, and the famous Kistna.

CLIMATE, SEASONS, AND PRODUCE.] The chain of mountains already mentioned, running from north to south, render it winter on one side of this peninsula while it is summer on the other. About the end of June, a south-west wind begins to blow from the sea, on the coast of Malabar, which, with continual rains, lasts four months, during which time all is serene upon the coast of Coromandel (the western and eastern coasts being so denominated). Towards the end of October, the rainy season and the change of the monsoons begin on the Coromandel coast, which, being destitute of good harbours, renders it extremely dangerous for ships to remain there during that time; and to this is owing the periodical returns of English shipping to Bombay, upon the Malabar coast. The air is naturally hot upon this peninsula, but it is refreshed by breezes, the wind altering every twelve hours; that is, from midnight to noon it blows off the land, when it is tolerably hot, and during the other twelve hours from the sea, which last proves a great refreshment to the inhabitants of the coast. The produce of the soil is the same with that of the other part of the East Indies. The like may be said of their quadrupeds, fish, fowl, and noxious creatures and insects.

INHABITANTS.] The inhabitants of this part are more black in complexion than those of the other peninsula of India, though lying nearer to the equator, which makes some suspect them to be the descendants of an ancient colony from Ethiopia. The greatest part of them have but

a faint notion of any allegiance they owe to the emperor of Hindoostan, whose tribute from thence has been, ever since the invasion of Srah Nadir, intercepted by their soubahs and nabobs, who now exercise an independent power in the government; but besides those soubahs and other imperial viceroys, many estates in this peninsula belong to rajahs, or lords, who are descendants of their old princes, and look upon themselves as being independent of the Mogul and his authority.

PROVINCES, CITIES, AND OTHER BUILDINGS, PUBLIC AND PRIVATE. } From what has been said above, this peninsula is rather to be divided into great governments or soubahships, than into provinces. One soubah often engrosses several provinces, and fixes the seat of his government according to his own conveniency. We shall speak of those provinces belonging to the Malabar and Coromandel coast, the two great objects of English commerce in that country; and first of the eastern, or Coromandel coast.

Madura begins at Cape Comorin, the southernmost point of the peninsula. It is about the bigness of the kingdom of Portugal, and is said to have been governed by a sovereign king, who had under him seventy tributary princes, each of them independent in his own dominions, but paying him a tax. At present the prince is scarcely able to protect himself and his people from the depredations of his neighbours, but by a tribute to buy them off; the capital is Trichinopoly. The chief value of this kingdom seems to consist in a pearl-fishery upon its coast. Tanjore is a little kingdom, lying to the east of Madura. The soil is fertile, and its prince was rich, till plundered by the nabob of Arcot, and some British subjects connected with him. Within it lies the Danish East-India settlement of Tranquebar, and the fortress of Negapatam, which was taken from the Dutch during the last war, and confirmed to the English by the treaty of peace: the capital city is Tanjore.

The Carnatic, as it is now called, is well known to the English. It is bounded on the east by the Bay of Bengal; on the north by the river Kistna, which divides it from Golconda; on the west by Visapour; and on the south by the kingdoms of Messaur and Tanjore; being in length, from south to north, about 345 miles, and 276 in breadth from east to west. The capital of the Carnatic is Binnagar, belonging to the nabob of Arcot. The country in general is esteemed healthful, fertile, and populous. Within this country, upon the Coromandel coast, lies Fort St. David, or Cuddalore, belonging to the English, with a district round it. The fort is strong, and of great importance to our trade. Five leagues to the north lies Pondicherry, once the emporium of the French in the East Indies, but which has been repeatedly taken by the English, and as often restored by the treaties of peace.

Fort St. George, better known by the name of Madras, is the capital of the English East-India company's dominions in that part of the East Indies, and is distant eastward from London about 4,800 miles. Great complaints have been made of the situation of this fort; but no pains have been spared by the company in rendering it impregnable to any force that can be brought against it by the natives. It protects two towns, called, from the complexion of their several inhabitants, the White and the Black. The White Town is fortified, and contains an English corporation of a mayor and aldermen. Nothing has been omitted to amend the natural badness of its situation, which seems originally to be owing to the neighbourhood of the diamond mines, which are but a week's journey distant. These mines are under the direction of a Mogul officer, who lets them out by admeasurement, and inclosing

the contents by palifadoes; all diamonds above a certain weight originally belonged to the emperor. The district belonging to Madras, extending about 40 miles round, is of little value for its product; 80,000 inhabitants of various nations are said to be dependent upon Madras; but its safety consists in the superiority of the English by sea. It carries on a considerable trade with China, Persia, and Mocha.

Pellicate, lying to the north of Madras, belongs to the Dutch. The kingdom of Golconda, which, besides its diamonds, is famous for the cheapness of its provisions, and for making white wine of grapes that are ripe in January, has already been mentioned. Golconda is subject to a prince called the Nizam, or soubah of the Deccan, who is rich, and can raise 100,000 men. The capital of his dominions is called Bagnagur, or Hyderabad, but the kingdom takes its name from the city of Golconda. East-south-east of Golconda lies Masulipatam, where the English and Dutch have factories. The English have also factories at Ganjam and Vizigapatam, on this coast; and the Dutch at Narisipore. The province of Orissa, from whence the English company draw some part of their revenues, lies to the north of Golconda, extending in length from east to west about 550 miles, and in breadth about 240. It is governed chiefly by Moodajee Booslah and his brother, allies to the Maharrattas. In this province stands the temple of Jagernaut, which they say is attended by 500 priests. The idol is an irregular pyramidal black stone of about 4 or 500lbs. weight, with two rich diamonds near the top, to represent the eyes, and the nose and mouth painted with vermilion.

The country of Deccan \* comprehends several large provinces, and some kingdoms; particularly those of Baglagna, Balagate, Telenga, and the kingdom of Visiapour. The names, dependencies, and government of those provinces are extremely unsettled, they having been reduced by Aurengzebe, or his father, and subject to almost annual revolutions and alterations. Their principal towns are Aurengabad, and Doltabad, or Dowlet-abad; and the latter is the strongest place in all Hindoostan. Near it is the famous pagoda of Elora, in a plain about two leagues square. The tombs, chapels, temples, pillars, and many thousand figures that surround it, are cut out of the natural rock. Telenga lies on the east of Golconda; and its capital, Beder, contains a garrison of 3000 men. The inhabitants of this province speak a language peculiar to themselves.

Baglagna lies to the west of Telenga, and forms the smallest province of the empire; its capital is Mouler. The Portuguese territory begins here at the port of Daman, twenty-one leagues south of Surat, and extends almost twenty leagues to the north of Goa. Visiapour is a large province: the western part is called Konkan, which is intermingled with the Portuguese possessions. The rajah of Visiapour is said to have had a yearly revenue of six millions sterling, and to bring to the field 150,000 soldiers. The capital is of the same name, and the country very fruitful. The principal places on this coast are, Daman, Bassaim Trapar, or Tarapar, Chawl, Dandi-Rajahpur, Dabul-Rajapur, Ghi-

\* This name DECCAN signifies the SOUTH, and, in its most extensive signification, includes the whole peninsula south of Hindoostan Proper. However, in its ordinary signification, it means only the countries situated between Hindoostan Proper, the Carnatic, and Orissa; that is, the provinces of Candesh, Amednagur, Visiapour, and Orissa.

ria, and Vingorla. The Portuguese have lost several valuable possessions on this coast, and those which remain are on the decline.

Guzerat is a maritime province on the Gulf of Cambaya, and one of the finest in India, but inhabited by a fierce rapacious people. It is said to contain 35 cities. Ahmed-abad is the capital of the province, where there is an English factory, and is said, in wealth, to vie with the richest towns in Europe. About 43 French leagues distant stands Surat, where the English have a flourishing factory.

Among the islands lying upon the same coast, is that of Bombay, belonging to the English East-India company. Its harbour can conveniently contain 1000 ships at anchor. The island itself is about seven miles in length, and twenty in circumference; but its situation and harbour are its chief recommendations, being destitute of almost all the conveniences of life. The town is about a mile long, and poorly built; and the climate was fatal to English constitutions, till experience, caution, and temperance, taught them preservatives against its unwholesomeness. The best water there is preserved in tanks, which receive it in the rainy seasons. The fort is a regular quadrangle, and well built of stone. Many black merchants reside here. This island was part of the portion paid with the Infanta of Portugal to Charles II. who gave it to the East-India company; and the island is still divided into three Roman-catholic parishes, inhabited by Portuguese, and what are called popish Mestizos and Canarines; the former being a mixed breed of the natives and Portuguese, and the other the aborigines of the country. The English have found methods to render this island and town, under all their disadvantages, a safe, if not an agreeable residence. The reader scarcely needs to be informed, that the governor and council of Bombay have lucrative posts, as well as the officers under them. The troops on the island are commanded by English officers; and the natives, when formed into regular companies, and disciplined, are here, and all over the East Indies, called Sepoys. The inhabitants of the island amount to near 60,000, of different nations; each of whom enjoys the practice of his religion unmolested.

Near Bombay are several other islands, one of which, called Elephanta, contains the most inexplicable antiquity perhaps in the world. A figure of an elephant, of the natural size, cut coarsely in stone, presents itself on the landing-place, near the bottom of a mountain. An easy slope then leads to a stupendous temple, hewn out of the solid rock, eighty or ninety feet long, and forty broad. The roof, which is cut flat, is supported by regular rows of pillars, about ten feet high, with capitals, resembling round cushions, as if pressed by the weight of the incumbent mountain. At the farther end are three gigantic figures, which have been mutilated by the blind zeal of the Portuguese. Besides the temple are various images, and groupes on each hand, cut in the stone—one of the latter bearing a rude resemblance of the judgment of Solomon; also a colonnade, with a door of regular architecture; but the whole bears no manner of resemblance to any of the Gentoo works.

The island and city of Goa, the capital of the Portuguese settlements in the East Indies, lies about thirty miles south of Vingorla. The island is about twenty-seven miles in compass. It is one of the finest and best fortified ports in the Indies. This was formerly a most superb settlement, and was surpassed either in bulk or beauty by few of the European cities. It is said that the revenues of the Jesuits upon this island equalled those of the crown of Portugal. Goa, as well as the rest of the Portuguese possessions of this coast, are under the power, who

still keeps up the remains of the ancient splendor of the government. The rich peninsula of Salfette is dependent on Goa. Sunda lies south of the Portuguese territories, and is governed by a rajah, tributary to the Mogul. The English factory of Corwar is one of the most pleasant and healthy of any upon the Malabar coast. Canara lies about forty miles to the south of Goa, and reaches to Calicut. Its soil is famous for producing rice, that supplies many parts of Europe, and some of the Indies. The Canarines are said generally to be governed by a lady, whose son has the title of Rajah; and her subjects are accounted the bravest and most civilised of any in that peninsula, and remarkably given to commerce.

Though Malabar gives name to the whole south-west coast of the peninsula, yet it is confined at present to the country so called, lying on the west of Cape Comorin, and called the Dominions of the Samorin. The Malabar language, however, is common in the Carnatic, and the country itself is rich and fertile, but infested with green adders, whose poison is incurable. It was formerly a large kingdom of itself. The most remarkable places in Malabar are Cranganore, containing a Dutch factory and fort; Tellicherry, where the English have a small settlement, keeping a constant garrison of thirty or forty soldiers. Calicut, where the French and Portuguese have small factories, besides various other distinct territories and cities. Cape Comorin, which is the southernmost part of this peninsula, though not above three leagues in extent, is famous for uniting in the same garden the two seasons of the year; the trees being loaded with blossoms and fruit on the one side, while on the other they are stripped of all their leaves. This surprising phenomenon is owing to the ridge of mountains so often mentioned, which traverse the whole peninsula from south to north. On the opposite sides of the Cape, the winds are continually at variance; blowing from the west on the west side, and from the east on the eastern side.

In the district of Cochin, within Malabar, are to be found some thousands of Jews, who pretend to be of the tribe of Manasseh, and to have records engraven on copper-plates in Hebrew characters. They are said to be so poor, that many of them embrace the Gentoo religion. The like discoveries of the Jews and their records have, it is said, been made in China, and other places of Asia, which have occasioned various speculations among the learned.

Before we close our account of Hindoostan, it may be proper to describe its present division according to the different powers among whom it is shared; and this is the more necessary, as it may serve to give the reader a clearer idea of these extensive regions, and at the same time show him how very considerable a portion belongs to the British and their allies.

The celebrated Persian usurper, Thamas Kouli Khan, having in the year 1738 defeated the emperor Mahommed Shah, plundered Delhi, and pillaged the empire of treasure to the amount of more than 70 millions sterling, restored the unhappy prince his dominions, but annexed to Persia all the countries westward of the Indus.

This dreadful incursion so weakened the authority of the emperor, that the viceroys of the different provinces either threw off their allegiance, or acknowledged a very precarious dependence; and, engaging in wars with each other, called in as allies the East-India companies of France and England, who had been originally permitted, as traders, to form establishments on the coasts. These, from the great superiority

of European discipline in an obstinate contest, French from Hindoostan acquired, partly by conquest, territories of vast population, to most of the

These extraordinary under the following account great empire absolute history.

## PRESENT

Such is the intemperance of Shah Allum, the deposed prince, of no importance to reside at Delhi, remains to him of the more than 350 years.

The principal division with Tippoo in 1792, in alliance with Britain their tributaries; the dominions of Tippoo

The British possess (which is 90,327 more and about ten millions territories, viz.

\* The character of the but little understood in fine of it. His military to merit of every kind; e

of European discipline, from allies, became in a short time principals in an obstinate contest, that at length terminated in the expulsion of the French from Hindoostan; and thus a company of British merchants have acquired, partly by cessions from the country powers, and partly by conquest, territories equal in extent, and superior in wealth and population, to most of the kingdoms of Europe.

The Mahrattas originally possessed several provinces of Hindoostan, from whence they were driven by the arms of the Mogul conquerors; they were never wholly subjected, but, retiring to the northern part of the Ghauts, made frequent incursions from these inaccessible mountains: taking advantage of the anarchy of the empire, they have extended their frontiers, and are at present possessed of a tract of country 1000 British miles long, by 700 wide; besides the territory they acquired by the partition treaty, signed by Tippoo Sultan in March 1792.

Hyder Ally\*, a soldier of fortune, who had learned the art of war from the Europeans, having possessed himself of that part of the ancient Carnatic called the kingdom of Mysore, within a few years acquired, by continual conquests, a considerable portion of the southern part of the peninsula. This able and active prince, the most formidable enemy that the English ever experienced in Hindoostan, dying in 1783, left to his son Tippoo Saib the peaceful possession of his dominions, superior in extent to the kingdom of England.

Tippoo engaged in two wars with the English, in the former of which he lost a considerable part of his territories, and in the latter his life, and the remainder of his dominions, which were divided between the British, the Nizam, and the Mahrattas, as also the territory appropriated by the company, in the final division of the Mysore country, after the taking of Seringapatam and the death of Tippoo Sultan.

These extraordinary revolutions, with others of less importance, render the following account of the present division of property in this great empire absolutely necessary, in order to understand its modern history.

#### PRESENT DIVISION OF HINDOOSTAN.

Such is the instability of human greatness, that the present Mogul, Shah Allum, the descendant of the great Tamerlane, is merely a nominal prince, of no importance in the politics of Hindoostan: he is permitted to reside at Delhi, which, with a small adjacent territory, is all that remains to him of that vast empire, which his ancestors governed for more than 350 years.

The principal divisions of this country, as they stood at the peace with Tippoo in 1792, were as follows, viz: The British possessions; States in alliance with Britain; Tippoo Saib's territories; Mahratta states, and their tributaries; the territories of the Soubah of the Deccan; and the dominions of Tippoo Sultan.

#### BRITISH POSSESSIONS.

The British possessions contain about 197,496 square British miles, (which is 90,327 more than is contained by Great Britain and Ireland) and about ten millions of inhabitants. They consist of three distinct governments, viz:

\* The character of the late Hyder Ally appearing to me (says Major Rennell) to be but little understood in this part of the world, I have ventured to attempt an outline of it. His military success, founded on the improvement of discipline: attention to merit of every kind; conciliation of the different tribes that served under his ban-

the bar at the mouth of that branch of the Caveri called Coleroon, which falls into the sea at Devicotta. The capital and seat of government is MADRAS in the Jaghire, called also Fort St. George. It is ill situated, without a harbour, and badly fortified, yet contains upwards of 200,000 inhabitants.—Fort St. DAVID, in the territory of Cuddalore, is rich, flourishing, and contains 60,000 inhabitants.—MASULIPATAM, in the northern Circars, at one of the mouths of the Kistna, was formerly the most flourishing and commercial city on this coast, and though much declined, is still considerable.

The northern Circars, which are denominated from the towns of Cicacole, Rajamundry, Elore, and Condapily, are defended inland by a strong barrier of mountains and extensive forests, beyond which the country is totally unknown for a considerable space.

GOVERNMENT OF BOMBAY.] This government is watered by the Tapee and Nerbudda. Its capital and seat of government is BOMBAY, in a small island, and an unhealthy situation, but it is well fortified, and has a fine harbour.—SURAT on the Tapee, which forms an indifferent port, is one of the most rich and commercial cities in Hindoostan.—TELLICHERRY, on the Malabar coast, is dependent on Bombay.

ALLIES OF THE BRITISH.

Dominions of the nabob of Oude,

Fyzabad.  
Lucknow.

Arcot, on the Paliar, is the capital, though the nabob usually resides at Madras.

Gingee, the strongest Indian fortrefs in the Carnatic.

Tritchinpoly, near the Caveri, well fortified in the Indian manner, was rich and populous, containing near 400,000 inhabitants, now almost ruined by the numerous sieges it has sustained.

Dominions of the nabob of Arcot, comprehending the eastern part only of the ancient Carnatic,

Seeringham Pagoda, in an island of the Caveri, is famous throughout Hindoostan for its sanctity, and has no less than 40,000 priests, who constantly reside here in voluptuous indolence.

Chandegeri, the ancient capital of the empire of Narzzingua, formerly rich, powerful, and populous; near it is the famous pagoda of Tripetti, the Loretto of Hindoostan. The offerings of the numerous pilgrims who resort hither, bring in an immense revenue.

Tanjore, Madura, and Tinivelly, are the capitals of small states of the same name, which, with Marawar, are dependent on the nabob of Arcot.

Territory of Futty Sing Guicker in the ioubah of Guzeret.

Amedabad.  
Cambay.

Territory of the rajah of Ghod.

Gwalior, a celebrated fortrefs.

**MAHRATTA STATES, in Alliance with the BRITISH, and their TRIBUTARIES.**

This extensive country is divided among a number of chiefs or princes, who have one common head, called the Paishwa or Nana; to whom, however, their obedience is merely nominal, as they often go to war against each other, and are seldom confederated, except for mutual defence.

Southern Poonah Mah-rattas, or the territories of the Paishwa, are naturally strong, being inter-fected by the various branches of the Ghauts. } Satara, the nominal capital of the Mah-ratta states; the Paishwa, at present, re-sides at Poonah. }  
Aurangabad, Amednagur, and Visapour, are in his territories, }

The Concan, or tract between the Ghauts and the sea, is sometimes called the Pirate coast, as it was subject to the celebrated pirate Angria, and his successors, whose capital was the strong fortress of Gheria, taken by the English and Mahrattas in 1755: by the acquisition of this coast the Mahrattas have become a maritime power.

By the treaty of peace, Tippoo Sultan ceded to the Mahrattas:

In the Doobab, being the circar of Bancapoor, with part of Moodgul, &c. affording a revenue of	} 1,306,666
In Gooty, the district of Sundoor,	
	10,000
	1,316,666

To these are to be added the territory assigned to the Paishwa of the Mahrattas by the final division of the dominions of Tippoo Sultan, after the defeat and death of that prince.

Harpoonelly, Soonda (above the Ghauts) } 263,957  
in Chittledroog, and in Bednore, }

**TERRITORY of the NIZAM, an Ally to the BRITISH.**

The possessions of the Nizam or Soubah of the Deccan (a younger son of the famous Nizam-al-Muluck) comprise the province of Golconda, that is the ancient province of Tellingana, or Tilling, situated between the lower parts of the Kistna and Godavery rivers, and the principal part of Dowlatabad; together with the western part of Berar, subject to a tribute of a chout, or fourth part of its net revenue, to the Berar Mahratta. The Nizam has the Paishwa, or Poonah Mahratta on the west and north-west; the Berar Mahratta on the north; the northern circars on the east; and the Carnatic, and Mysore on the south. I am not perfectly clear, says Major Rennell, in my idea of his western boundary, which, during his wars with the Mahrattas, was subject to continual fluctuation; but I understand generally, that it extends more than 40 miles beyond the city of Aurungabad, westwards, and comes within 80 miles of the city of Poonah. His capital is Hydrabad, or Bagnagur, situated on the Moulli river, near the famous fortress of Golconda.

The districts of Adoni and Rachore, which were in the hands of Bazalet Jung (brother to the Nizam) during his life-time, are now in the hands of the Nizam. The Sourapour, or Sallapoor rajah, on the west of the Beemah river, together with some other rajahs, are his tributaries. The Guntoor circar also belongs to him. Probably, says the

major, these dominions are no less than 430 miles. To the above, we add to him in the treaty

Keryah (or Cuddalore) Canoul, affording a revenue of 10,000. In Gooty, in Adoni (Moolah) In the Doobab, be

**BERAR MAHRATTAS.**

This country is very little known to Europeans. { Nagpour is the capital. Balafore has considerable trade. Cuttack, on the Mahanada, an important post which renders this nation a formidable enemy to the British, as it cuts off the communication between the governments of Bengal and Madras.

**NORTHERN POONAH MAHRATTAS.**

They are governed at { Ougein, the residence of Sindia, present by Sindia, Holkar, and some other less considerable princes. { Indoor, the residence of Holkar. Calpy, the residence of Gungdar Punt. Sagur, the residence of Ballagee.

**TERRITORY OF THE RAJAH OF MYSORE.**

On the defeat and death of Tippoo Sultan, Maha Rajah, a descendant of the ancient Rajahs of Myfore, was made sovereign of a part of the territory of Myfore, consisting of certain talooks or districts of Seringapatam, Bednore, and Chittledroog, affording a revenue of 1,374,076 Koontearly pagodas. Chitteldroog, Harponelly, Roydroog, &c. are the capitals of territories of the same name.

Country of the Abdalli.—The Abdalli are properly a sect or tribe of Afghans, but the name seems to be applied to the Afghans in general. They inhabit a country stretching from the mountains of Tartary to the Arabian Sea, and from the Indus to the confines of Persia. They are a robust hardy race of men; and, being generally addicted to a state of predatory warfare, their manners largely partake of a barbarous insolence, and they avow a fixed contempt for the occupations of civil life. The principal cities of Afghanistan are Candahar and Cabul, the former of which was the capital; but the late and present sultans have kept their court at Cabul. About the year 1720 an army of Afghans invaded Persia, took Ispahan, and made the Shah Hussein prisoner. They kept possession of Ispahan and the southern provinces for ten years, when

Caspian Sea and the frontiers of Turkey in Asia, contains the provinces of Aderbeitzen, the ancient Media; Gangea and Daghistan, part of the ancient Iberia and Colchis; Ghilan, part of the ancient Hyrcania; Shirvan and Mazanderan.

NAME.] Persia, according to the poets, derived its name from Perseus, the son of Jupiter and Danaë. Less fabulous authors supposed it derived from Paras, which signifies a horseman,—the Persians, or Parthians, being always celebrated for their skill in horsemanship.

AIR.] Those parts which border upon Caucasus and Daghistan, and the mountains near the Caspian Sea, are cold, as lying in the neighbourhood of these mountains which are commonly covered with snow. The air in the midland provinces of Persia is serene, pure, and exhilarating; but in the southern provinces it is hot, and sometimes communicates noxious blasts to the midland parts, which are so often mortal, that the inhabitants fortify their heads with very thick turbans.

SOIL, VEGETABLE AND ANIMAL PRODUCTIONS.] The soil is far from being luxuriant towards Tartary and the Caspian Sea, but with cultivation it might produce abundance of corn and fruits. South of Mount Taurus, the country abounds in corn, fruits, wine, and the other luxuries of life. It produces wine and oil in plenty, senna, rhubarb, and the finest drugs. The fruits are delicious, especially the dates, oranges, pistachio nuts, melons, cucumbers, and garden stuff. Great quantities of excellent silk are likewise produced in this country, and the Gulf of Bassorah formerly furnished great part of Europe and Asia with very fine pearls. Some parts, near Isfahan especially, produce almost all the flowers that are valued in Europe; and from some of them, particularly roses, they extract waters of a salubrious and odorific kind, which form a gainful commodity in trade. In short, the fruits, vegetables, and flowers of Persia, are of a most exalted flavour; and had the natives the art of horiculture to as great perfection as some nations in Europe, by transplanting, engrafting, and other meliorations, they would add greatly to the natural riches of the country. The Persian assa-fœtida flows from a plant called hiltot, and turns into a gum. Some of it is white, and some black; but the former is so much valued, that the natives make very rich sauces of it, and sometimes eat it as a rarity.

No place in the world produces the necessaries of life in greater abundance and perfection than Shirauz; nor is there a more delightful spot in nature to be conceived, than the vale in which it is situated, either for the salubrity of the air, or for the profusion of every thing necessary to render life comfortable and agreeable. The fields yield plenty of rice, wheat, and barley, which they generally begin to reap in the month of May, and by the middle of July the harvest is completed. Most of the European fruits are produced here, and many of them are superior in size and flavour to what can be raised in Europe, particularly the apricot and grape. Of the grape of Shirauz there are several sorts, all of them very good, but two or three more particularly so than the rest; one is the large white grape, which is extremely luscious and agreeable to the taste; the small white grape as sweet as sugar; and the black grape, of which the celebrated wine of Shirauz is made, which is really delicious, and well deserving of praise. It is pressed by the Armenians and Jews, in the months of October and November, and a great quantity is exported annually to Abu Shehr, and other parts in the Persian Gulf, for supply in the Indian market. The pomegranate is good to a proverb; the Persians call it the fruit of Paradise.

The breed of horses in the province of Fars is at present very indif-

ferent, owing to the ruinous state of the country; but in the province of Dushistan, lying to the south-west, it is remarkably good. The sheep are of a superior flavour, owing to the excellence of the pasturage in the neighbourhood of Shirauz, and are also celebrated for the fineness of their fleece; "they have tails of an extraordinary size, some of which I have seen weigh," says Mr. Francklin, "upwards of thirty pounds; but those which are sold in the markets do not weigh above six or seven. Their oxen are large and strong, but their flesh is seldom eaten by the natives, who confine themselves chiefly to that of sheep and fowls."

Provisions of all kinds are very cheap; and the neighbouring mountains affording an ample supply of snow throughout the year, the meanest artificer of Shirauz may have his water and fruits cooled without any expence worthy consideration. This snow being gathered on the tops of the mountains, and brought in carts to the city, is sold in the markets. The price of provisions is regulated in Shirauz, with the greatest exactness, by the daroga, or judge of the police, who sets a fixed price upon every article, and no shop-keeper dares to demand more, under the severe penalty of losing his nose and ears.

**MOUNTAINS.]** These are Caucasus and Ararat, which are called the mountains of Daghistan; and the vast chain of mountains called Taurus, and their divisions, run through the middle of the country from Natolia to India.

**RIVERS.]** It has been observed, that no country, of so great an extent, has so few navigable rivers as Persia. The most considerable are the Kur, anciently Cyrus; and Aras, anciently Araxes, which rise in or near the mountains of Ararat, and, joining their streams, fall into the Caspian Sea. Some small rivulets falling from the mountains water the country; but their streams are so inconsiderable, that few or none of them can be navigated even by boats. The Oxus can scarcely be called a Persian river, though it divides Persia from Usbec Tartary. Persia has the river Indus on the east, and the Euphrates and Tigris on the west.

**WATER.]** The want of rivers, in Persia, occasions a scarcity of water; but the defect, where it prevails, is admirably well supplied by means of reservoirs, aqueducts, canals, and other ingenious methods.

**METALS AND MINERALS.]** Persia contains mines of iron, copper, lead, and, above all, turquoise-stones, which are found in Chorasan. Sulphur, salt-petre, and antimony, are found in the mountains. Quarries of red, white, and black marble, have also been discovered near Tauris.

**POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.** } It is impossible to speak with any certainty concerning the population of a country so little known as that of Persia. If we are to judge by the vast armies, in modern as well as in ancient times, raised there, the numbers it contains must be very great. The Persians of both sexes are generally handsome; the men being fond of marrying Georgian and Circassian women. Their complexions towards the south are somewhat swarthy. The men shave their heads, but the young men suffer a lock of hair to grow on each side, and the beard of their chin to reach up to their temples; and religious people wear long beards. Men of rank and quality wear very magnificent turbans; many of them cost twenty-five pounds, and few under nine or ten. They have a maxim to keep their heads very warm, so that they never pull off their caps or their turbans out of respect even to the king. Their dress is very simple. Next to their skin they wear calico

shirts, over them a vest, which reaches below the knee, girt with a sash, and over that a loose garment somewhat shorter. The materials of their clothes, however, are commonly very expensive, consisting of the richest furs, silks, muslins, cottons, and the like valuable stuffs, richly embroidered with gold and silver. They wear a kind of loose boots on their legs, and slippers on their feet. They are fond of riding; and very expensive in their equipages. They wear at all times a dagger in their sash, and linen trowsers. The collars of their shirts and clothes are open; so that their dress upon the whole is far better adapted for the purpose both of health and activity than the long flowing robes of the Turks. The dress of the women, as well as that of the men, is very costly; and they are at great pains to heighten their beauty by art, colours, and washes.

The Persians accustom themselves to frequent ablutions, which are the more necessary, as they seldom change their linen. In the morning early they drink coffee, about eleven go to dinner, upon fruits, sweetmeats, and milk. Their chief meal is at night. They eat at their repasts cakes of rice, and others of wheat-flour; and as they esteem it an abomination to cut either bread, or any kind of meat after it is dressed, these cakes are made thin, that they may be easily broken with the hand; and their meat, which is generally mutton or fowls, is so prepared, that they divide it with their fingers. When every thing is set in order before them, they eat fast, and without any ceremony. But it is observed by a late traveller, that when the oldest man in the company speaks, though he be poor, and sit at the lower end of the room, they all give a strict attention to his words. They are temperate, but use opium, though not in such abundance as the Turks; nor are they very delicate in their entertainments of eating and drinking. They use great ceremony towards their superiors, and politely accommodate Europeans who visit them, with stools, that they may not be forced to sit cross-legged. They are so immoderately fond of tobacco, which they smoke through a tube fixed in water, so as to be cool in the mouth, that when it has been prohibited by their princes, they have been known to leave their country rather than be debarred from that enjoyment. The Persians are naturally fond of poetry, moral sentences, and hyperbole. Their long wars, and the national revolutions, have mingled the native Persians with barbarous nations, and are said to have taught them dissimulation; but they are still pleasing and plausible in their behaviour, and in all ages have been remarkable for hospitality.

The Persians write like the Hebrews, from the right to the left; are neat in their seals and materials for writing, and wonderfully expeditious in the art. The number of people employed on their manuscripts (for no printing is allowed there) is incredible. Their great soible seems to be ostentation in their equipage and dresses; nor are they less jealous of their women than the Turks and other eastern nations. They are fond of music, and take a pleasure in conversing in large companies; but their chief diversions are those of the field, hunting, hawking, horsemanship, and the exercise of arms, in all which they are very dextrous. They excel, as their ancestors the Parthians did, in archery. They are fond of rope-dancers, jugglers, and fighting of wild beasts; and privately play at games of chance.

There are places in Shirauz (Mr. Francklin observes) distinguished by the name of Zoor Khana, the house of strength, or exercise, to which the Persians resort for the sake of exercising themselves.

In their conversation the Persians aim much at elegance, and are perpetually repeating verses and passages from the works of their most favourite poets, Hafez, Sadi, and Jami; a practice universally prevalent from the highest to the lowest; because those who have not the advantages of reading and writing, or the other benefits arising from education, by the help of their memories, which are very retentive of whatever they have heard, are always ready to bear their part in conversation. They also delight much in jokes and quaint expressions, and are fond of playing upon each other; which they sometimes do with great elegance and irony. There is one thing much to be admired in their conversations, which is the strict attention they always pay to the person speaking, whom they never interrupt on any account. They are in general a personable, and in many respects a handsome people; their complexions, except those who are exposed to the inclemencies of the weather, are as fair as Europeans.

The bright and sparkling eyes of the women, which is a very striking beauty, is in a great measure owing to art, as they rub their eye-brows and eye-lids with the black powder of antimony (called surma) which adds an incomparable brilliancy to their natural lustre.

MARRIAGES.] When the parents of a young man have determined upon marrying him, they look out amongst their kindred and acquaintance for a suitable match; they then go to the house where the female they intend to demand lives. If the father of the woman approves, he immediately orders sweetmeats to be brought in, which is taken as a direct sign of compliance. After this the usual presents on the part of the bridegroom are made, which, if the person be in middling circumstances, generally consist of two complete suits of apparel, of the best sort, a ring, a looking-glass, and a small sum in ready money, of about ten or twelve toman, which is to provide for the wife in case of a divorce. There is also provided a quantity of household stuff of all sorts, such as carpets, mats, bedding, utensils for dressing victuals, &c. The contract is witnessed by the *cadi*, or magistrate. The wedding-night being come, the bride is brought forth, covered from head to foot in a veil of red silk, or painted muslin; a horse is then presented for her to mount, which is sent expressly by the bridegroom; and when she is mounted, a large looking-glass is held before her by one of the bridesmaids, all the way to the house of her husband, as an admonition to her, that it is the last time she will look into the glass as a virgin, being now about to enter into the cares of the married state. The procession then sets forward in the following order;—first, the music and dancing girls, after which the presents in trays borne upon men's shoulders; next come the relations and friends of the bridegroom, all shouting, and making a great noise; who are followed by the bride herself, surrounded by all her female friends and relations, one of whom leads the horse by the bridle, and several others on horseback close the procession. Rejoicings upon this occasion generally continue eight or ten days. Men may marry for life, or for any determined time in Persia, as well as through all Tartary; and all travellers or merchants, who intend to stay some time in any city, commonly apply to the *cadi*, or judge, for a wife during the time he proposes to stay. The *cadi*, for a stated gratuity, produces a number of girls, whom he declares to be honest, and free from diseases; and he becomes surety for them. A gentleman, who lately attended the Russian embassy to Persia, declares, that amongst thousands, there has not been one instance of their dishonesty during the time agreed upon.

**FUNERALS.]** The funerals of the Persians are conducted in a manner similar to those in other Mahomedan countries. On the death of a Mussulman, the relations and friends of the deceased being assembled, make loud lamentations over the corpse; after which it is washed and laid out on a bier, and carried to the place of interment without the city-walls, attended by a Mullah, or priest, who chaunts passages from the Koran all the way to the grave. If any Mussulman should chance to meet the corpse during the procession, he is obliged, by the precepts of his religion, to run up to the bier, and offer his assistance in carrying it to the grave, crying out at the same time, *Lab Illab, Ill Lillab!* There is no God, but God. After interment, the relations of the deceased return home, and the women of the family make a mixture of wheat, honey, and spices, which they eat in memory of the deceased; sending a part of it to their friends and acquaintance, that they may also pay him a like honour. This custom seems to be derived from very great antiquity, as we read in Homer of sacrifices and libations being frequently made to the memory of departed souls.

**RELIGION.]** The Persians are Mahomedans of the sect of Ali; for which reason the Turks, who follow the succession of Omar and Abu Bekr, call them heretics. Their religion is, if possible, in some things more fantastical and sensual than that of the Turks; but in many points it is mingled with some Brahmin superstitions. A comparison may be made between the Brahmins and the Persian *Guebres* or *Gaurs*, who pretend to be the disciples and successors of the ancient Magi, the followers of Zoroaster. That both of them held originally pure and simple ideas of a Supreme Being, may be easily proved; but the Indian Brahmins and Perses accuse the Gaurs, who still worship the fire, of having sensualized those ideas; and of introducing an evil principle into the government of the world. A combustible ground, about ten miles distant from Baku, a city in the north of Persia, is the scene of the devotions of the Guebres. This ground is impregnated with inflammatory substances, and contains several old little temples; in one of which the Guebres pretend to preserve the sacred flame of the universal fire, which rises from the end of a large hollow cane stuck into the ground, resembling a lamp burning with very pure spirits. The Mahomedans are the declared enemies of the Gaurs, who were banished out of Persia by Shah Abbas. Their sect, however, is said to be numerous, though tolerated in very few places.

The long wars between the Persians and the Romans seem early to have driven the ancient Christians into Persia, and the neighbouring countries. Even to this day, many sects are found that evidently have Christianity for the ground-work of their religion. Some of them, called *Souffees*, who are a kind of quietists, sacrifice their passions to God, and profess the moral duties. The *Sabeans* Christians have, in their religion, a mixture of Judaism and Mahomedanism; and are numerous towards the Persian Gulf. The *Armenian* and *Georgian* Christians are very numerous in Persia.

The Persians observe the fast during the month of Ramazan (the 9th month of the Mahomedan year) with great strictness and severity. About an hour before day-light, they eat a meal which is called *Shere*, and from that time until the next evening at sun-set they neither eat nor drink of any thing whatever. If, in the course of the day, the smoke of a calean, or the smallest drop of water should reach their lips, the fast is in consequence deemed broken, and of no avail. From sun-set until the next morning they are allowed to refresh themselves. This

fast, when the motions must do (the especially to those during the day-time several nights during prayer. The Persians which their property the hands of an n Ramazan; the day. The other is the was brought down delivered to their Night of Power.

**LANGUAGES.]** The dialects of the Caspian introduced into Persia those countries. Arabic, and people we do the French parts, on the coast provinces speak a languages. Their *kib der ofmani*; *pa* *iste tu ben-jundaur* *roux mara*; *ward* *ormán mara*; *roaa* *chérir*. Amen.

fast, when the month Ramazan falls in the middle of summer, as it sometimes must do (the Mahomedan year being lunar), is extremely severe, especially to those who are obliged by their occupations to go about during the day-time; and is still rendered more so, as there are also several nights during its continuance, which they are enjoined to spend in prayer. The Persians particularly observe two; the one being that in which their prophet Ali died, from a wound which he received from the hands of an assassin; three days before; which night is the 21st of Ramazan; the day of which is called by the natives the Day of Murder. The other is the night of the 23d, in which they affirm that the Koran was brought down from heaven by the hands of the angel Gabriel, and delivered to their prophet Mahomed: wherefore it is denominated the Night of Power.

[LANGUAGE.] The common people, especially towards the southern coasts of the Caspian Sea, speak Turkish; and the Arabic probably was introduced into Persia under the caliphate, when learning flourished in those countries. Many of the learned Persians have written in the Arabic, and people of quality have adopted it as a modish language, as we do the French. The pure Persic is said to be spoken in the southern parts, on the coast of the Persian Gulf, and in Ispahan; but many of the provinces speak a barbarous mixture of the Turkish, Russian, and other languages. Their Pater-noster is of the following tenor: "*Ei Padera ma kib der ofmoni; pae hasbed nam tu; hay ayed padeshabi tu; sibwad chwawiste tu ben-junkankib der ofmon niz derzemin; beb mara jurouz nan kefaf rouz mara; wadar gnasir mara konaban ma zjunankibma niz mig surim urdan mara; wador omajisb minedazzmara; likin ebalas kun mara ez ebbirir.* Amen.

[LEARNING AND LEARNED MEN.] The Persians, in ancient times, were famous for both, and their poets renowned all over the east. There is a manuscript at Oxford, containing the lives of a hundred and thirty-five of the finest Persian poets. Ferdusi and Sadi were among the most celebrated. The former comprised the history of Persia in a series of epic poems, which employed him for near thirty years, and which are said by Mr. Jones to be "a glorious monument of eastern genius and learning." Sadi was a native of Shirauz, and flourished in the thirteenth century, and wrote many elegant pieces both in prose and in verse. Shemseddin was one of the most eminent lyric poets that Asia has produced; and Nakhsheb wrote in Persian a book called the Tales of a Parrot, not unlike the Decameron of Boccace. Jami was a most animated and elegant poet, who flourished in the middle of the fifteenth century, and whose beautiful compositions, on a great variety of subjects, are preserved at Oxford in twenty-two volumes. Hariri composed, in a rich, elegant, and flowery style, a moral work, in fifty dissertations, on the changes of fortune, and the various conditions of human life, interspersed with a number of agreeable adventures, and several fine pieces of poetry.

Of the sprightly and voluptuous bard of Shirauz, the name and character are sufficiently known to orientalists. It may, however, excite the curiosity of the English reader, that the poet Hafez, here introduced to his notice, conciliated the favour of an offended emperor, by the delicacy of his wit, and the elegance of his verses; that the most powerful monarchs of the East sought in vain to draw him from the enjoyment of literary retirement, and to purchase the praises of his Muse by all the honours and splendour of a court: and that his works were not only the admiration of the jovial and the gay, but the manual of

mystic piety to the superstitious Mahomedan; the oracle which, like the *Sortes Virgilianæ*, determined the councils of the wise, and prognosticated the fate of armies and of states. Seventeen odes have already been translated into English by Mr. Not, with which he has published the originals, for the purpose of promoting the study of the Persian language. The 21st ode has also appeared in an English dress, by the elegant pen of Sir William Jones.

The tomb of this celebrated and deservedly admired poet stands about two miles distant from the walls of the city of Shirauz, on the north-east side. It is placed in a large garden, and under the shade of some cypresses trees of extraordinary size and beauty; it is composed of fine white marble from Tauris, eight feet in length and four in breadth. This was built by Kerim Khan, and covers the original one. On the top and sides of the tomb are select pieces from the poet's own works, most beautifully cut in the Persian Nustaleck character. During the spring and summer season, the inhabitants visit here, and amuse themselves with smoking, playing at chess, and other games, reading also the works of Hafez, who is in greater esteem with them than any other of their poets, and they venerate him almost to adoration, never speaking of him but in the highest terms of rapture and enthusiasm. A most elegant copy of his works is kept upon the tomb, for the purpose, and the inspection of all who go there. The principal youth of the city assemble here; and show every possible mark of respect for their favourite poet, making plentiful libations of the delicious wine of Shirauz to his memory. Close by the garden runs the stream of Roknabad, so celebrated in the works of Hafez, and, within a small distance, the sweet bower of Mofellay.

At present learning is at a very low ebb among the Persians. Their boasted skill in astronomy is now reduced to a mere smattering in that science, and terminates in judicial astrology, so that no people in the world are more superstitious than the Persians. The learned profession in greatest esteem among them is that of medicine; which is at perpetual variance with astrology, because every dose must be in the lucky hour fixed by the astrologer, which often defeats the ends of the prescriptions. It is said, however, that the Persian physicians are acute and sagacious. Their drugs are excellent, and they are no strangers to the practices of Galen and Avicenna. The plague is but little known in this country; and almost equally rare are many other diseases that are fatal in other places; such as the gout, the stone, the small-pox, consumptions, and apoplexies. The Persian practice of physic is therefore pretty much circumscribed, and they are very ignorant in surgery, which is exercised by barbers, whose chief knowledge of it is in letting blood; for they trust the healing of green wounds to the excellency of the air, and the good habit of the patient's body.

ANTIQUITIES AND CURIOSITIES, }  
 NATURAL AND ARTIFICIAL. } The monuments of antiquity in Persia are more celebrated for their magnificence and expense, than their beauty or taste. No more than nineteen columns, which formerly belonged to the famous palace of Persepolis, are now remaining. Each is about fifteen feet high, and composed of excellent Parian marble. The ruins of other ancient buildings are found in many parts of Persia, but void of that elegance and beauty which are displayed in the Greek architecture. The tombs of the kings of Persia are stupendous works; being cut out of a rock, and highly ornamented with sculptures. The chief of the modern edifices is a pillar to be seen at Ispahan, sixty feet high, consisting of the

skulls of beasts, erected by Shah Abbas, after the suppression of a rebellion. Abbas had vowed to erect such a column of human skulls; but, upon the submission of the rebels, he performed his vow by substituting those of brutes, each of the rebels furnishing one.

The baths near Gaombron are medicinal, and esteemed among the natural curiosities of Persia. The springs of the famous Naptha, near Baku, are mentioned often in natural history for their surprising qualities; but the chief of the natural curiosities in this country is the burning phenomenon, and its inflammatory neighbourhood, already mentioned under the article of Religion.

HOUSES, CITIES, AND PUBLIC EDIFICES.] The houses of men of quality in Persia are in the same taste with those of the Asiatic Turks already described. They are seldom above one story high, built of bricks, with flat roofs for walking on, and thick walls. The hall is arched, the doors are clumsy and narrow, and the rooms have no communication but with the hall; the kitchens and office-houses being built apart. Few of them have chimneys, but a round hole in the middle of the room. Their furniture chiefly consists of carpets, and their beds are two thick cotton quilts, which serve them likewise as coverlets, with carpets under them.

Ispahan or Spahawn, the capital of Persia, is seated on a fine plain, within a mile of the river Zenderhend, which supplies it with water. It is said to be twelve miles in circumference. The streets are narrow and crooked, and the chief amusement of the inhabitants is on the flat roofs of their houses, where they spend their summer evenings; and different families associate together. The royal square is a third of a mile in length, and about half as much in breadth; and we are told, that the royal palace, with the buildings and gardens belonging to it, is three miles in circumference. There are in Ispahan 100 mosques, 1800 caravanferais, 260 public baths, a prodigious number of fine squares, streets, and palaces, in which are canals, and trees planted to shade and better accommodate the people. This capital is said formerly to have contained 650,000 inhabitants; but was often depopulated by Kouli Khan during his wars; so that we may easily suppose, that it has lost great part of its ancient magnificence. In 1744, when Mr. Hanway was there, it was thought that not above 5000 of its houses were inhabited.

Shiraz lies about 225 miles to the south-east of Ispahan. It is an open town, but its neighbourhood is inexpressibly rich and beautiful, being laid out for many miles in gardens, the flowers and fruits of which are incomparable. The wines of Shiraz are reckoned the best of any in Persia. This town is the capital of Farsistan, or Persia Proper, and has a college for the study of eastern learning. It contains an uncommon number of mosques, and is adorned by many noble buildings, but its streets are narrow and inconvenient, and not above 4000 of its houses are inhabited. Shiraz has many good bazars and caravanferais; that distinguished by the appellation of the Vakeel's bazar (so called from its being built by Kherim Khan) is by far the handsomest. It is a long street, extending about a quarter of a mile, built entirely of brick, and roofed something in the style of the piazzas in Covent-garden; it is lofty and well made; on each side are the shops of the tradesmen, merchants, and others, in which are exposed for sale a variety of goods of all kinds; these shops are the property of the khan, and are rented to the merchants at a very easy monthly rate. Leading out of this bazar is a spacious caravanferai, of an octagon form, built of brick;

the entrance through a handsome arched gate-way; in the centre is a place for the baggage and merchandise, and on the sides, above and below, commodious apartments for the merchants and travellers; these are also rented at a moderate monthly sum. About the centre of the above-mentioned bazar, is another spacious caravanferai of a square form; the front of which is ornamented with a blue and white enamelled work, in order to represent China-ware, and has a pleasing effect to the eye.

The cities of Ormus and Gombroon, on the narrow part of the Persian Gulf, were formerly places of great commerce and importance. The English, and other Europeans, have factories at Gombroon, where they trade with the Persians, Arabians, Banyans, Armenians, Turks, and Tartars, who come hither with the caravans which set out from various inland cities of Asia, under the convoy of guards.

**MOSQUES AND BAGNIOS.]** It has been thought proper to place them here under a general head, as their form of building is pretty much the same all over the Mahomedan countries.

Mosques are religious buildings, square, and generally of stone: before the chief gate there is a square court, paved with white marble, and low galleries round it, whose roof is supported by marble pillars. Those galleries serve for places of ablution before the Mahomedans go into the mosque. About every mosque there are six high towers, called minarets, each of which has three little open galleries, one above another. These towers, as well as the mosques, are covered with lead, and adorned with gilding and other ornaments; and from thence, instead of a bell, the people are called to prayer by certain officers appointed for that purpose. No woman is allowed to enter the mosque; nor can a man with his shoes or stockings on. Near most mosques is a place of entertainment for strangers during three days; and the tomb of the founder, with conveniences for reading the Koran and praying.

The city of Shirauz is adorned (according to Mr. Francklin) with many fine mosques, particularly that built by the late Kherim Khan, which is a noble one. Being very well disguised, says our traveller, in my Persian dress, I had an opportunity of entering the building unobserved. It is of a square form; in the centre is a stone reservoir of water, made for performing the necessary ablutions, previous to prayer; on the four sides of the building are arched apartments allotted for devotion, some of the fronts of which are covered with China tiles; but Kherim Khan dying before the work was completed, the remainder has been made up with a blue and white enamelled work. Within the apartments, on the walls on each side, are engraven various sentences from the Koran, in the Nushki character; and at the upper end of the square is a large dome, with a cupola at top, which is the particular place appropriated for the devotion of the vakeel; or for the sovereign: this is lined throughout with white marble, ornamented with the curious blue and gold artificial lapis lazuli, and has three large silver lamps suspended from the roof of the dome. In the centre of the city is another mosque, which the Persians call the Musjidi Noó, or the New Mosque, but its date is nearly coeval with the city itself; at least, since it has been inhabited by Mahomedans; it is a square building, of a noble size, and has apartments for prayer on each side; in them are many inscriptions in the old Cufic character, which of themselves denote the antiquity of the place.

The bagnios in the Mahomedan countries are wonderfully well-con-

structed for the oftener circular, bagnio contains the second contains the with black and various, but wholeful. The waiter stretches his limbs all which exercise to health. In part the afternoon; will proceed, and when

structed for the purpose of bathing. Sometimes they are square, but oftener circular, built of white well-polished stone or marble. Each bagnio contains three rooms; the first for dressing and undressing; the second contains the water, and the third the bath; all of them paved with black and white marble. The operation of the bath is very curious, but wholesome; though to those not accustomed to it, it is painful. The waiter rubs the patient with great vigour, then handles and stretches his limbs as if he were dislocating every bone in the body; all which exercises are, in those inert warm countries, very conducive to health. In public bagnios, the men bathe from morning to four in the afternoon; when all male attendants being removed, the ladies succeed, and when coming out of the bath display their finest clothes.

**POLICE.]** The police in Shirauz, as well as all over Persia, is very strict. At sun-set, the gates of the city are shut; no person whatever is permitted either to come in or go out during the night; the keys of the different gates being always sent to the hakim or governor, and remaining with him until morning. During the night, three tablas, or drums are beaten at three different times; the first at eight o'clock, the second at nine, and the third at half past ten. After the third tabla has sounded, all persons whatsoever found in the streets by the daroga, or judge of the police, or by any of his people, are instantly taken up, and conveyed to a place of confinement, where they are detained until next morning, when they are carried before the hakim; and if they cannot give a very good account of themselves, are punished, either by the bastinado or a fine.

Civil matters are all determined by the cazi, and ecclesiastical ones (particularly divorces) by the sheick al fellaum, or head of the faith, an office answering to that of Mufti in Turkey. Justice is administered in Persia in a very summary manner; the sentence, whatever it may be, being always put into execution on the spot. Theft is generally punished with the loss of nose and ears; robbing on the road, by ripping up the belly of the criminal, in which situation he is exposed upon a gibbet in one of the most public parts of the city, and there left until he expires in torment: a dreadful punishment, but it renders robberies in Persia very uncommon. The punishments in this country are so varied and cruel, that humanity shudders at them.

**MANUFACTURES AND COMMERCE.]** The Persians equal, if not exceed, all the manufacturers in the world in silk, woollen, mohair, carpets, and leather. Their works in these join fancy, taste, and elegance, to richness, neatness, and show; and yet they are ignorant of painting, and their drawings are very rude. Their dyeing excels that of Europe. Their silver and gold laces, and threads, are admirable for preserving their lustre. Their embroideries and hortic-furniture are not to be equalled; nor are they ignorant of the pottery and window-glass manufactures. On the other hand, their carpenters are very indifferent artificers, which is said to be owing to the scarcity of timber all over Persia. Their jewellers and goldsmiths are clumsy workmen; and they are ignorant of lock-making, and the manufacture of looking-glasses. Upon the whole, they lie under inexpressible disadvantages from the form of their government, which renders them slaves to their kings, who often engross either their labour or their profits.

The trade of the Persians, who have little or no shipping of their own, is carried on in foreign bottoms. That with the English and other nations, by the Gulf of Ormus at Gombroon, was the most gainful they

had; but the perpetual wars they have been engaged in have ruined their commerce. The great scheme of the English in trading with the Persians through Russia, promised vast advantages to both nations, but it has hitherto answered the expectations of neither. Perhaps the court of Petersburg is not fond of suffering the English to establish themselves upon the Caspian Sea, the navigation of which is now possessed by the Russians. The Caspian Sea is about 680 miles long, and 260 broad in the widest part: it has no tide, but is navigable by vessels drawing from 9 to 10 feet water, with several good ports. The Russian ports are Kislar and Curief. Derbent and Niezabad belong to Persia, as also Einzellee and Astrabad, with Baku, the most commodious haven in this sea, and which has a fortress surrounded with high walls. As the manufactures and silk of Ghilan are esteemed the best in Persia, Reschd on the Caspian is one of the first commercial towns in this part of Asia, and supplies the bordering provinces with European merchandise.

**CONSTITUTION AND GOVERNMENT.]** Both these are extremely precarious, as resting in the breast of a despotic, and often capricious monarch. The Persians, however, had some fundamental rules of government. They excluded from their throne females, but not their male progeny. Blindness likewise was a disqualification for the royal succession. In other respects the king's will was a law for the people. The instances that have been given of the cruelties and inhumanities practised by the Mahomedan kings of Persia are almost incredible, especially during the last two centuries. The reason given to the Christian ambassadors, by Shah Abbas, one of their most celebrated princes, was, that the Persians were such brutes, and so insensible by nature, that they could not be governed without the exercise of exemplary cruelties. But this was only a wretched and ill-grounded apology for his own barbarity. The favourites of the prince, female as well as male, are his only counsellors, and the smallest disobedience to their will is attended with immediate death. The Persians have no degrees of nobility, so that the respect due to every man, on account of his high station, expires with himself. The king has been known to prefer a younger son to his throne, by putting out the eyes of the elder brother.

**REVENUES.]** The king claims one-third of the cattle, corn, and fruits of his subjects, and likewise a third of silk and cotton. No rank or condition of Persians is exempted from severe taxations and services. The governors of provinces have particular lands assigned to them for maintaining their retinues and troops; and the crown lands defray the expenses of the court, king's household, and great officers of state. The water that is let into fields and gardens is subject to a tax; and foreigners, who are not Mahomedans, pay each a ducat a head.

**MILITARY STRENGTH.]** This consisted formerly of cavalry, and it is now thought to exceed that of the Turks. Since the beginning of this century, however, their kings have raised bodies of infantry. The regular troops of both brought to the field, even under Kouli Khan, did not exceed 60,000; but, according to the modern histories of Persia, they are easily recruited in case of a defeat. The Persians have few fortified towns; nor had they any ships of war, until Kouli Khan built a royal navy; but since his death we hear no more of their fleet.

**ARMS AND TITLES.]** The arms of the Persian monarch are a lion couchant, looking at the rising sun. His title is Shah, or Sovereign;

Khan, and Sultan, acts of state the Persian monarch runs in this universe obeys."

**HISTORY.]** The Persian. Cyrus laid the Israelites in the Persian years before Christ. The general officers, who were conquered by the Persians; and the monarch Artaxerxes, who was the successor of those who were subdued by the Persians, were supplanted by a family, and who were the successors, from whom were valiant and prudent, by their cruelty into such a disorder. Hantlein, a prince, was killed by Mahmud, for himself was by the throne. Prince T. escaped from the throne. Nadir Shah, who was the Persian monarch, was killed by Tartars during the reign of Nadir. Nadir broke out, pretending that he was against his sovereign to death.

This usurper of the throne of Nadir. His expedition made there, have been remarkable for plunder from India, rajas and accidents not so successful as to be inaccessible. but was unable to ment was to strike nations. His conduct to change the religion of the chief priests who were chief officers and upon his death, the chronology and the history is very difficult through the whole of Kerim Khan's reign. During his reign he was rent by civil kingdome struggling

Khan, and Sultan, which he assumes likewise, are Tartar titles. To acts of state the Persian monarch does not subscribe his name; but the grant runs in this manner: "This act is given by him-whom the universe obeys."

**HISTORY.]** The Persian empire succeeded the Assyrian or Babylonian. Cyrus laid its foundation about 556 years before Christ, and restored the Israelites, who had been captive at Babylon, to liberty. It ended in the person of Darius, who was conquered by Alexander 329 years before Christ. Alexander's empire was divided among his great general officers, whose descendants, in less than three centuries, were conquered by the Romans. The latter, however, never fully subdued Persia; and the natives had princes of their own, from Artaces called Artacides, who more than once defeated the Roman legions. The successors of those princes survived the Roman empire itself, but were subdued by the famous Timur-Leng, or Tamerlane, whose posterity were supplanted by a doctor of law, the ancestor of the Sefi or Sophi family, and who pretended to be descended from Mahomed himself. His successors, from him sometimes called Sophis, though some of them were valiant and politic, proved in general to be a disgrace to humanity, by their cruelty, ignorance, and indolence, which brought them into such a disrepute with their subjects, barbarous as they were, that Hussein, a prince of the Sefi race, who succeeded in 1694, was murdered by Mahoud, son and successor to the famous Miriweis; as Mahmud himself was by Efref, one of his general officers, who usurped the throne. Prince Thamas, the representative of the Sefi family, had escaped from the rebels, and assembling an army, took into his service Nadir Shah, who defeated and killed Efref, and re-annexed to the Persian monarchy all the places dismembered from it by the Turks and Tartars during their late rebellions. At last the secret ambition of Nadir broke out, and after assuming the name of Thamas Kouli Khan, pretending that his services were not sufficiently rewarded, he rebelled against his sovereign, made him a prisoner, and, it is supposed, put him to death.

This usurper afterwards mounted the throne, under the title of Shah Nadir. His expedition into Hindoostan, and the amazing booty he made there, have been mentioned in the description of that country. It has been remarked, that he brought back an inconsiderable part of his plunder from India, losing great part of it upon his return by the Maharrattas and accidents. He next conquered Usbec Tartary; but was not so successful against the Daghistan Tartars, whose country he found to be inaccessible. He vanquished the Turks in several engagements, but was unable to take Bagdad. The great principle of his government was to strike terror into all his subjects by the most cruel executions. His conduct became so intolerable, and particularly his attempt to change the religion of Persia to that of Omar, and strangling the chief priests who resisted, that it was thought his brain was disordered; and he was assassinated in his own tent, partly in self-defence, by his chief officers and his relations, in the year 1747. Many pretenders, upon his death, started up; and it may naturally be supposed, that a chronological and accurate account of these various and rapid revolutions is very difficult to be obtained. The confusion which prevailed through the whole country, from the death of Nadir, until the settlement of Kerim Khan, prevented all attempts of literature, arts, and sciences. During this interval, the whole empire of Persia was in arms, and rent by commotions; different parties in different provinces of the kingdom struggling for power, and each endeavouring to render him-

self independent of the other, torrents of blood were shed, and the most shocking crimes were committed with impunity. The whole face of the country, from Gombroon to Russia, presents to the view thousands of instances of the misery and devastation which has been occasioned by these commotions.

From the accounts we have been able to collect, the number of pretenders to the throne of Persia, from the death of Nadir Shah, until the final establishment of Kerim Khan's government, was no less than nine, including himself. Kerim Khan Zund was a most favourite officer of Nadir Shah, and at the time of his death was in the southern provinces. Shirauz and other places had declared for him. He found means, at last, after various encounters with doubtful success, completely to subdue all his rivals; and finally to establish himself as ruler of all Persia. He was in power about thirty years, the latter part of which he governed Persia under the appellation of Vakeel, or regent; for he never would receive the title of Shah. He made Shirauz the chief city of his residence, in gratitude for the assistance he had received from its inhabitants, and those of the southern provinces. He died in the year 1779, in the eightieth year of his age, regretted by all his subjects, who esteemed and honoured him as the glory of Persia. His character is most deservedly celebrated for the public buildings which he erected, and the excellent police which he maintained; so that, during his whole reign, there was not in Shirauz a single riot productive of bloodshed: besides these merits, his aversion to severe punishments, his liberality and kindness to the poor, his toleration of people of different persuasions, his partiality for Europeans, and his encouragement of trade, together with his great military abilities, and personal courage, rendered him not only beloved by his own subjects, but greatly respected by foreign powers.

From the death of Kerim Khan, to the present time, a variety of competitors have been desirous of filling the throne of Persia. Of these we shall only mention the two principal. Akau Mahomed Khan keeps possession of the provinces of Mazanderan and Ghilan, as well as the cities of Ispahan, Hamadad, and Tauris, where he is acknowledged as sovereign. Jaaffar Khan has possession of the city of Shirauz, and the provinces of Beaboon and Shuster: he also receives an annual present from the province of Carmania, and another from the city of Yezd: Abu Shehr and Iar also send him tribute. The southern provinces are in general more fruitful than those to the northward, they not having been so frequently the scenes of action during the late revolutions.

Jaaffar Khan is a middle-aged man, very corpulent, and has a cast in his right eye: in the places where he is acknowledged, he is well beloved and respected. He is very mild in his disposition, and just. In Shirauz he keeps up a most excellent police, and good government. He is very kind and obliging to strangers in general, and to the English in particular. Of the two competitors who at present contend for the government of Persia, he is the most likely, in case of success against his opponent, to restore the country to a happy and reputable state; but it will require a long space of time, to recover it from the calamities into which the different revolutions have brought it:—a country, if an oriental metaphor may be allowed, once blooming as the garden of Eden, fair and flourishing to the eye;—now, sad reverse! despoiled and leafless, by the cruel ravages of war and desolating contention.

Intelligence was received at Constantinople, in December 1793, that Jaaffar Khan had been dethroned by his brother Mahomed Khan, who entered into the possession of his dominions.

**NAME.]** It is remarkable that this country has always preserved its ancient name. The word *Arab*, it is generally said, signifies a robber, or freebooter. The word *Saracen*, by which one tribe is called, is said to signify both a thief and an inhabitant of the desert. These names justly belong to the Arabians, for they seldom let any merchandize pass through the country without extorting something from the owners, if they do not rob them.

**MOUNTAINS.]** The mountains of Sinai and Horeb, lying in Arabia Petraea, east of the Red Sea, and those called Gabel el Ared, in Arabia Felix, are the most noted.

**RIVERS, SEAS, GULFS, AND CAPES.]** There are few mountains, springs, or rivers in this country, except the Euphrates, which washes the north-east limits of it. It is almost surrounded with seas; as the Indian Ocean, the Red Sea, the gulfs of Persia and Ormus. The chief capes or promontories are those of Rosalgate and Musledon.

**CLIMATE, AIR, SOIL, AND PRODUCE.]** As a considerable part of this country lies under the torrid zone, and the tropic of Cancer passes over Arabia Felix, the air is excessively dry and hot, and the country is subject to hot poisonous winds, like those on the opposite shores of Persia, which often prove fatal, especially to strangers. The soil, in some

parts, is nothing more than immense sands, which, when agitated by the winds, roll like the troubled ocean, and sometimes form mountains by which whole caravans have been buried or lost. In these deserts, the caravans, having no tracks, are guided, as at sea, by a compass, or by the stars, for they travel chiefly in the night. Here, says Dr. Shaw, are no pastures clothed with flocks, nor valleys standing thick with corn; here are no vineyards or olive-yards; but the whole is a lonesome desolate wilderness, no other ways diversified than by plains covered with sand, and mountains that are made up of naked rocks and precipices. Neither is this country ever, unless sometimes at the equinoxes, refreshed with rain; and the intenseness of the cold in the night is almost equal to that of the heat in the day-time. But the southern part of Arabia, deservedly called the Happy, is blessed with an excellent soil, and, in general, is very fertile. There the cultivated lands, which are chiefly about the towns near the sea-coast, produce balm of Gilead, manna, myrrh, cassia, aloes, frankincense, spikenard, and other valuable gums; cinnamon, pepper, cardamom, oranges, lemons, pomegranates, figs, and other fruits; honey and wax in plenty, with a small quantity of corn and wine. This country is famous for its coffee and its dates, which last are found scarcely any where in such perfection as here and in Persia. There are few trees fit for timber in Arabia, and little wood of any kind.

**ANIMALS.]** The most useful animals in Arabia are camels and dromedaries; they are amazingly fitted by Providence for traversing the dry and parched deserts of this country; for they are so formed that they can throw up the liquor from their stomach into their throats, by which means they can travel six or eight days without water. The camels usually carry 800lbs. weight upon their backs, which is not taken off during the whole journey, for they naturally kneel down to rest, and in due time rise with their load. The dromedary is a small camel, with two bunches on its back, and remarkably swift. It is an observation among the Arabs, that wherever there are trees, the water is not far off; and when they draw near a pool, their camels will smell at a distance, and set up their great trot till they come to it. The Arabian horses are well known in Europe, and have contributed to improve the breed of those in England. They are only fit for the saddle, and are admired for their make as much as for their swiftness and high mettle. The finest breed is in the kingdom of Sunnaa, in which Mocha is situated.

**INHABITANTS, MANNERS, } The Arabians, like most of the nations  
CUSTOMS, AND DRESS. }** of Asia, are of a middle stature, thin, and of a swarthy complexion, with black hair and black eyes. They are swift of foot, excellent horsemen, and are said to be, in general, a martial brave people, expert at the bow and lance, and, since they became acquainted with fire-arms, good marksmen. The inhabitants of the inland country live in tents, and remove from place to place with their flocks and herds.

The Arabians, in general, are such thieves, that travellers and pilgrims are struck with terror on approaching the deserts. These robbers, headed by a captain, traverse the country in considerable troops on horseback, and assault and plunder the caravans; and we are told, that so late as the year 1750, a body of 50,000 Arabians attacked a caravan of merchants and pilgrims returning from Mecca, killed about 60,000 persons, and plundered it of every thing valuable, though escorted by a Turkish army. On the sea-coast they are mere pirates, and make prize of every vessel they can master, of whatever nation.

The habit of the roving Arabs is a kind of blue shirt, tied about them with a white sash or girdle; and some of them have a vest of furs or sheep-skins over it; they also wear drawers, and sometimes slippers, but no stockings; and have a cap or turban on their head. Many of them go almost naked; but, as in the eastern countries, the women are so wrapped up, that nothing can be discerned but their eyes. Like other Mahomedans; the Arabs eat all manner of flesh, except that of hogs; and prefer the flesh of camels, as we prefer venison to other meat. They take care to drain the blood from the flesh, as the Jews do, and like them refuse such fish as have no scales. Coffee, and tea, water, and sherbet made of oranges, water, and sugar, is their usual drink: they have no strong liquors.

[RELIGION.] Of this the reader will find an account in the following history of Mahomed their countryman. Many of the wild Arabs are still pagans; but the people in general profess Mahomedanism.

[LEARNING AND LANGUAGE.] Though the Arabians in former ages were famous for their learning and skill in all the liberal arts, there is scarcely a country at present where the people are so universally ignorant. The vulgar language used in the three Arabias, is the Arabeik, or corrupt Arabian, which is likewise spoken, with some variation of dialect, over great part of the East, from Egypt to the court of the Great Mogul. The pure old grammatical Arabic, which is said to be a dialect of the Hebrew, and by the people of the East accounted the richest, most energetic, and copious language in the world, is taught in their schools, as Greek and Latin are amongst Europeans, and used by Mahomedans in their worship: for as the Koran was written in this language, they will not suffer it to be read in any other; they look upon it to have been the language of Paradise, and think no man can be a master of it without a miracle, as consisting of several millions of words. The books which treat of it say they have no fewer than a thousand terms to express the word *camel*, and five hundred for that of a *lion*. The Pater-noster in Arabic is as follows:

*Abuna elladbi fi-samwat; jetkaddas esmde; tati malacutac: taouri nas-  
biatic, cama fi-sfama; kedbalec ala lardb aating chobzena kefatna iaum

dina; wala tadalebulna fibajarib; laken mejjina me nnef:berir. Amen.*

CHIEF CITIES, CURIOSITIES,  
AND ARTS.

What is called the Desert of Sinai } is a beautiful plain near nine miles long, and above three in breadth; it lies open to the north-east, but to the southward is closed by some of the lower eminences of Mount Sinai; and other parts of that mountain make such encroachments upon the plain as to divide it into two parts, each so capacious as to be sufficient to receive the whole camp of the Israelites.

From Mount Sinai may be seen Mount Horeb, where Moses kept the flocks of Jethro, his father-in-law, when he saw the burning bush. On those mountains are many chapels and cells, possessed by the Greek and Latin monks, who, like the religious at Jerusalem, pretend to show the very spot where every miracle or transaction recorded in Scripture happened.

The chief cities in Arabia are Mocha, Aden, Muscat, Suez, and Judah, where most of the trade of this country is carried on.

Mocha is well-built, the houses very lofty, and are, with the walls and forts, covered with a chinam or stucco, that gives a dazzling whiteness to them. The harbour is semicircular, the circuit of the wall is two miles, and there are several handsome mosques in the city. Suez,

the Arsinoë of the ancients, is surrounded by the Desert, and is but a mean, ill-built place. The ships are forced to anchor a league from the town, to which the leading channel has only about nine feet water. Juddab is the place of the greatest trade in the Red Sea, for there the commerce between Arabia and Europe meets, and is interchanged, the former sending her gums, drugs, coffee, &c. and from Europe come cloths, iron, furs, and other articles, by the way of Cairo. The revenues of these, with the profits of the port, are shared by the grand-signor and the sheriff of Mecca, to whom jointly this place belongs.

Mecca, the capital of all Arabia, and Medina, deserve particular notice. At Mecca, the birth-place of Mahomed, is a mosque, the most magnificent of any in the Turkish dominions; its lofty roof being raised in fashion of a dome, and covered with gold, with two beautiful towers at the end, of extraordinary height and architecture, which make a delightful appearance, and are conspicuous at a great distance. The mosque has a hundred gates, with a window over each; and the whole building within is decorated with the finest gildings and tapestry. The number of pilgrims who yearly visit this place is almost incredible, every Mussulman being required, by his religion, to come hither once in his life-time, or send a deputy. At Medina, about fifty miles from the Red Sea, the way to which Mahomed fled when he was driven out of Mecca, and the place where he was buried, is a stately mosque supported by 400 pillars, and furnished with 300 silver lamps, which are continually burning. It is called the "*Most Holy*," by the Turks, because in it is placed the coffin of their prophet Mahomed, covered with cloth of gold, under a canopy of silver tissue, which the bashaw of Egypt, by order of the grand-signor, renews every year. The camel which carries it derives a sort of sanctity from it, and is never to be used in any drudgery afterwards. Over the foot of the coffin is a rich golden crescent, curiously wrought, and adorned with precious stones. Thither the pilgrims resort, as to Mecca, but not in such numbers.

GOVERNMENT.] The inland country of Arabia is under the government of many petty princes, who are styled xeriffs and imans, both of them including the offices of king and priest, in the same manner as the caliphs of the Saracens, the successors of Mahomed. These monarchs appear to be absolute, both in spirituals and temporals; the succession is hereditary, and they have no other laws than those found in the Koran, and the comments upon it. The northern Arabs owe subjection to the Turks, and are governed by bashaws residing among them; but receive large gratuities from the grand-signor, for protecting the pilgrims that pass through their country, from the robberies of their countrymen. The Arabians have no standing regular militia, but their emirs command both the persons and the purses of their subjects, as the necessity of affairs requires.

HISTORY.] The history of this country in some measure differs from that of all others; for as the slavery and subjection of other nations make a great part of their history, that of the Arabs is entirely composed of their conquests or independence. The Arabs are descended from Ishmael, of whose posterity it was foretold, that they should be invincible, "have their hands against every man, and every man's hands against theirs." They are at present, and have remained from the remotest ages, during the various conquests of the Greeks, Romans, and Tartars, a convincing proof of the divinity of this prediction. Towards the north, and the sea-coasts of Arabia, the inhabitants are, indeed, kept in awe by the Turks; but the wandering tribes in the

southern and inland parts acknowledge themselves the subjects of no foreign power, and do not fail to harass and annoy all strangers who come into their country. The conquests of the Arabs make as wonderful a part of their history, as the independence and freedom which they have ever continued to enjoy. These, as well as their religion, began with one man, whose character forms a very singular phenomenon in the history of mankind. This was the famous Mahomed, a native of Mecca, a city of that division of Arabia, which, from the luxuriancy of its soil, and happy temperature of its climate, has ever been esteemed the loveliest and sweetest region of the world, and distinguished by the epithet of the Happy.

Mahomed was born in the sixth century, in the year 569, in the reign of Justinian II. emperor of Constantinople. Though descended of mean parentage, illiterate and poor, he was endued with a subtile genius, like those of the same country, and possessed a degree of enterprise and ambition peculiar to himself, and much beyond his condition. He had been employed in the early part of his life, by an uncle, Abuteleb, as a factor, and had occasion, in this capacity, to travel into Syria, Palestine, and Egypt. He was afterwards taken into the service of a rich merchant, upon whose death he married his widow, Khadija, and by her means came to be possessed of great wealth and of a numerous family. During his peregrinations into Egypt and the East, he had observed the vast variety of sects in religion, whose hatred against each other was strong and inveterate, while, at the same time, there were many particulars in which the greater part of them were agreed. He carefully took advantage of these, by means of which, and by addressing himself to the love of power, riches, and pleasure, passions universal among men, he expected to raise a new system of religion, more general than any which hitherto had been established. In this design he was assisted by Sergius, a monk, whose libertine disposition had made him forsake his cloister and profession, and engage in the service of Khadija, with whom he remained as a domestic when Mahomed was taken to her bed. This monk was perfectly qualified, by his great learning, for supplying the defects which his master, for want of a liberal education, laboured under, and which, in all probability, must have obstructed the execution of his design. It was necessary, however, that the religion they proposed to establish should have a divine sanction; and for this purpose Mahomed turned a calamity, with which he was afflicted, to his advantage. He was often subject to fits of the epilepsy, a disease which those whom it afflicts are desirous to conceal. Mahomed gave out, therefore, that these fits were trances into which he was miraculously thrown by God Almighty, during which he was instructed in his will, which he was commanded to publish to the world. By this strange story, and by leading a retired, abstemious, and austere life, he easily acquired a character for superior sanctity among his acquaintance and neighbours. When he thought himself sufficiently fortified by the numbers and the enthusiasm of his followers, he boldly declared himself a prophet sent by God into the world, not only to teach his will, but to compel mankind to obey it.

As we have already mentioned, he did not lay the foundation of his system so narrow as only to comprehend the natives of his own country. His mind, though rude and enthusiastic, was enlarged by travelling into distant lands, whose manners and religion he had made a peculiar study. He proposed that the system he established should extend over all the neighbouring nations; to whose doctrines and prejudices he had taken

care to adapt it. Many of the inhabitants of the east, in these countries were at this time much addicted to the opinions of the heathens, so denied that Jesus Christ was co-equal with God the Father, as is declared in the Athanasian creed. Egypt and Arabia were filled with Jews, who had fled into these corners of the world from the persecution of the emperor Adrian, who threatened the total extinction of that people. The other inhabitants of these countries were pagans. These, however, had little attachment to their decayed and derided idolatry; and, like men whose religious principle is weak, had given themselves over to pleasure and sensuality, or to the acquisition of riches, to be the better able to indulge in the gratifications of sense, which, together with the doctrine of predestination, composed the sole principles of their religion and philosophy. Mahomed's system was exactly suited to these three kinds of men. To gratify the two former, he declared that there was one God, who created the world and governed all things in it; that he had sent various prophets into the world to teach his will to mankind, among whom Moses and Jesus Christ were the most eminent; but the endeavours of these had proved ineffectual, and God had therefore now sent his last and greatest prophet, with a commission more ample than what Moses or Christ had been entrusted with. He had commanded him not only to publish his laws, but to subdue those who were unwilling to believe or obey them; and for this end, to establish a kingdom upon earth, which should propagate the divine law throughout the world; that God had designed utter ruin and destruction to those who should refuse to submit to him; but to his faithful followers, he had given the spoils and possessions of all the earth, as a reward in this life, and had provided for them hereafter a paradise of all sensual enjoyments, especially those of love; that the pleasures of such as died in propagating the faith, would be peculiarly intense, and vastly transcend those of the rest. These, together with the prohibition of drinking strong liquors (a restraint not very severe in warm climates), and the doctrine of predestination, were the capital articles of Mahomed's creed. They were no sooner published, than a great number of his countrymen embraced them with implicit faith. They were written by the priest before-mentioned, and compose a book called the Koran, or Alkoran, by way of eminence, as we say the Bible, which means the Book. The person of Mahomed, however, was familiar to the inhabitants of Mecca; so that the greater part of them were sufficiently convinced of the deceit. The more enlightened and leading men entered into a design to cut him off; but Mahomed getting notice of their intention, fled from his native city to Medina Tahmachi, or the City of the Prophet. The fame of his miracles and doctrine was, according to custom, greatest at a distance, and the inhabitants of Medina received him with open arms. From this flight, which happened in the 622nd year of Christ, the fifty-fourth year of Mahomed's age, and the tenth of his ministry, his followers, the Mahomedans, compute their time; and the era is called, in Arabic, Hegira, i. e. the Flight.

Mahomed, by the assistance of the inhabitants of Medina, and of others whom his insinuation and address daily attached to him, brought over all his countrymen to a belief, or at least to an acquiescence, in his doctrines. The speedy propagation of his system among the Arabians was a new argument in its behalf among the inhabitants of Egypt and the East, who were previously disposed to it. Arians, Jews, and Gentiles, all so took their ancient faith, and became Mahomedans. In a word, the contagion spread over Arabia, Syria, Egypt, and Persia; and

Mahomed, from a deceitful hypocrite, became a powerful monarch. He was proclaimed king at Medina, in the year 627; and after subduing part of Arabia and Syria, died in 632, leaving two branches of his race, both esteemed divine among their subjects. These were the caliphs of Persia and of Egypt, under the last of which Arabia was included. The former of these turned their arms to the East, and made conquests of many countries. The caliphs of Egypt and Arabia directed their ravages towards Europe, and, under the name of Saracens or Moors, (which they obtained because they entered Europe from Mauritania, in Africa, the country of the Moors) reduced the greater part of Spain, France, Italy, and the islands in the Mediterranean.

In this manner did the successors of that impostor spread their religion and conquests over the greatest part of Asia, Africa, and Europe; and they still give law to a very considerable portion of mankind.

## THE INDIAN AND ORIENTAL ISLANDS.

**THE JAPAN ISLANDS**, Japan or Nippon, Bongo, Tonfa, and Dezima, form together what has been called the empire of JAPAN. They are situated about 150 miles east of China, and extend from the 30th to the 41st degree of north latitude, and from the 130th to the 147th of east longitude. Their chief town is Jeddo, in the 141st degree of east longitude, and the 36th of north latitude.

The islands of Japan are governed by a despotic sovereign, called the *Kubo*, besides whom there is a spiritual or ecclesiastical emperor, entitled the *Dairi*. The veneration entertained for the latter is little short of the honours paid to their gods. He seldom goes out of his palace, his person being considered as too sacred to be exposed to the air, the rays of the sun, or the view of the common people. He is brought into the world, lives, and dies, within the precincts of his court, the boundaries of which he never once exceeds during his whole life. His hair, nails, and beard, are accounted so sacred, that they are never suffered to be cleaned or cut by day-light; but this must be done by stealth, during the night, while he is asleep. His holiness never eats twice off the same plate, nor uses any vessel for his meals a second time; they are immediately broken to pieces after they are used, to prevent their falling into unhallowed hands. He has twelve wives, only one of whom, however, is styled empress. He confers all titles of honour; but the real power of government is exercised by the *kubo*.

The soil and productions of the country are pretty much the same with those of China; and the inhabitants are famous for their lacquer ware, known by the name of Japan. The Japanese are gross idolaters, and so irreconcilable to Christianity, that it is commonly said the Dutch, who are the only European people with whom they now trade, pretend themselves to be no Christians, and humour the Japanese in the most absurd superstitions. Notwithstanding all this compliance, the natives are very shy and rigorous in all their dealings with the Dutch; and Nagasaki, in the island of Dezima, is the only place where they are suffered to trade. The complexions of the Japanese are in general yellowish, although some few, chiefly women, are almost white. Their narrow eyes and high eye-brows are like those of the Chinese and Tartars; and their noses are short and thick. Their hair is universally black.

The dress of the Japanese may with more propriety be termed national, than that of any other part of the world, as it not only differs from that of every other nation, but is uniform from the monarch down to the most inferior subject, similar in both sexes, and (which almost surpasses belief) has been unchanged for the space of 2500 years. It consists of one or more loose gowns, tied about the middle with a sash. People of rank have them made of silk, but the lower class of cotton stuffs. Women generally wear a greater number of them than men, and much longer, and have them more ornamented, often with gold or silver flowers woven into the stuff. Their houses are built with upright posts, crossed and wattled with bamboo, plastered both without and within, and white-washed. They generally have two stories; but the uppermost is low, and seldom inhabited. The roofs are covered with pantiles, large and heavy, but neatly made. The floors are elevated two feet from the ground, and covered with planks, on which mats are laid. The public buildings, such as temples and palaces, are larger, it is true, and more conspicuous, but in the same style of architecture; and the roofs, which are decorated with several towers of a singular appearance, are their greatest ornament.

The towns are sometimes of a considerable size, always secured with gates, and frequently surrounded with walls and fosses, and adorned with towers, especially if a prince or governor of a province keeps his court there. The town of Jeddo is said to be twenty-one hours' walk in circumference, or about twenty-one French leagues, and may vie in size with Pekin. The streets are straight and wide, and at certain distances divided by gates; and at each gate there is a very high ladder, from the top of which any fire that breaks out may be discovered, an accident that not unfrequently happens there several times in the week.

The furniture in Japan is as simple as the style of building. Neither cupboards, bureaux, sofas, beds, tables, chairs, watches, looking-glasses, nor any thing else of the kind, are to be found in the apartments. To the greater part of these the Japanese are utter strangers. Their soft floor-mats serve them for chairs and tables. A small board, about twelve inches square, and four in height, is set down before each person in company at every meal, which is served up one dish only at a time. Mirrors they have, but never fix them up in their houses as ornamental furniture; they are made of a compound metal, and used only at their toilets. Notwithstanding the severity of their winters, which obliges them to warm their houses from November to March, they have neither fire-places nor stoves; instead of these they use large copper pots standing upon legs. These are lined on the inside with loam, on which ashes are laid to some depth, and charcoal lighted upon them, which seems to be prepared in some manner which renders the fumes of it not at all dangerous. The first compliment offered to a stranger, in their houses, is a dish of tea, and a pipe of tobacco. Fans are used by both sexes equally; and are, within or without doors, their inseparable companions. The whole nation are naturally cleanly; every house, whether public or private, has a bath, of which constant and daily use is made by the whole family. Obedience to parents, and respect to superiors, are the characteristics of this nation. Their salutations and conversations between equals abound also with civility and politeness; to this children are early accustomed by the example of their parents. Their penal laws are very severe; but punishments are seldom inflicted. Perhaps there is no country where fewer crimes against society are committed. Commerce and manufactures flourish here; though as these

people have few wants, they are not carried to the extent which we see in Europe. Agriculture is so well understood, that the whole country, even to the tops of the hills, is cultivated. They trade with no foreigners but the Dutch and Chinese, and, in both cases, with companies of privileged merchants. Besides the sugars, spices, and manufactured goods, which the Dutch send to Japan, they carry thither annually upwards of 200,000 deer-skins, and more than 100,000 hides, the greatest part of which they get from Siam, where they pay for them in money. The merchandise they export from these islands, both for Bengal and Europe, consists in 9000 chests of copper, each weighing 120 pounds, and from 25,000 to 30,000 weight of camphor. Their profits on imports and exports are valued at 40 or 45 per cent. As the Dutch company do not pay duty in Japan, either on their exports or imports, they send an annual present to the emperor, consisting of cloth, chintz, succotas, cottons, stuffs, and trinkets.

The LADRONE ISLANDS, of which the chief is said to be Guam (east longitude 140, north latitude 14), are about twelve in number. The people took their name from their pilfering. We know nothing of them worth particular mention, excepting that lord Anson lauded upon one of them (Tinian), where he found great refreshment for himself and his crew.

FORMOSA is likewise an oriental island. It is situated to the east of China, near the province of Fo-kien, and is divided into two parts by a chain of mountains which runs through the middle, beginning at the south coast, and ending at the north. This is a very fine island, and abounds with all the necessaries of life. That part of the island which lies to the west of the mountains belongs to the Chinese, who consider the inhabitants of the eastern parts as savages, though they are said to be a very inoffensive people. The inhabitants of the cultivated parts are the same with the Chinese already described. The Chinese have likewise made themselves masters of several other islands in these seas, of which we scarcely know the names; that of Ainan is between sixty and seventy leagues long, and between fifty and sixty in breadth, and but twelve miles from the province of Canton. The original inhabitants are a shy, cowardly people, and live in the most unwholesome part of the island; the coast, and cultivated parts, which are very valuable, being possessed by the Chinese.

The PHILIPPINES are said to be 1100 in number, lying in the Chinese Sea (part of the Pacific Ocean) 300 miles south-east of China, of which Manilla, or Luconia, the chief, is 400 miles long and 200 broad. The inhabitants consist of Chinese, Ethiopians, Malays, Spaniards, Portuguese, Pintadoes, or painted people, and Mestres, a mixture of all these. The property of the islands belongs to the king of Spain, they having been discovered by Magellan, and afterwards conquered by the Spaniards, in the reign of Philip II. from whom they take their name. Their situation is such, between the eastern and western continents, that the inhabitants trade with Mexico and Peru, as well as with all the islands and places of the East Indies. Two ships from Acapulco, in Mexico, carry on this commerce for the Spaniards, who make 400 per cent profit. The country is fruitful in all the necessaries of life, and beautiful to the eye. Venison of all kinds, buffaloes, hogs, sheep, goats, and a particular large species of monkeys, are found here in great plenty. The nest of the bird saligan affords that dissolving jelly which is so voluptuous a rarity at European tables. Many European fruits and flowers thrive surprisingly in these islands. If a sprig of an

orange or lemon-tree is planted here, it becomes within the year a fruit-bearing tree; so that the verdure and luxuriancy of the soil are almost incredible. The tree amēt supplies the natives with water; and there is also a kind of cane, which, if cut, yields fair water enough for a draught; this abounds in the mountains, where water is most wanted.

The city of Manilla contains about 3000 inhabitants; its port is Cavite, lying at the distance of three leagues, and defended by the castle of St. Philip. In the year 1762, Manilla was reduced by the English under general Draper and admiral Cornish, who took it by storm, and humanely suffered the archbishop, who was the Spanish viceroy at the same time, to ransom the place for about a million sterling. The bargain, however, was ungenerously disowned by him and the court of Spain, so that great part of the ransom never was paid. The Spanish government is settled there, but the Indian inhabitants pay a capitation tax. The other islands, particularly Mindanao, the largest next to Manilla, are governed by petty princes of their own, whom they call sultans. The sultan of Mindanao is a Mahomedan.

Upon the whole, though these islands are enriched with all the profusion of nature, yet they are subject to most dreadful earthquakes, thunder, rains, and lightning; and the soil is pestered with many noxious and venomous creatures, and even herbs and flowers, whose poisons kill almost instantaneously. Some of their mountains are volcanoes.

The **MOLUCCAS**, commonly called the **SPICE** or **CLOVE ISLANDS**. These are not out of sight of each other, and lie all within the compass of twenty-five leagues to the south of the Philippines, in 125 degrees of east longitude, and between one degree south, and two north latitude. They are in number five, viz. Bachian, Machian, Motyr, Ternate, and Tydore. The islands produce neither corn nor rice, so that the inhabitants live upon bread made of sago. Their chief produce consists of cloves, mace, and nutmegs, in vast quantities; which are monopolised by the Dutch with so much jealousy, that they destroy the plants, lest the natives should sell the supernumerary spices to other nations. These islands, after being subject to various powers, are now governed by three kings, subordinate to the Dutch. Ternate is the largest of them, though not more than thirty miles in circumference. The Dutch have here a fort called Victoria; and another called Fort Orange, in Machian.

The **BANDA**, or **NUTMEG ISLANDS**, are situated between 127 and 128 degrees east longitude, and between four and five south latitude, comprehending the islands of Lantor, the chief towns of which are Lantor, Polerong, Rosinging, Pooloway, and Gonapi. The chief forts belonging to the Dutch on the islands are those of Revenge and Naisau. The nutmeg, covered with mace, grows on these islands only, and they are entirely subject to the Dutch. The great nutmeg harvest is in June and August.

**AMBOYNA**. This island, taken in a large sense, is one of the most considerable of the Moluccas, which, in fact, it commands. It is situated in the Archipelago of St. Lazarus, between the third and fourth degrees of south latitude, and 120 leagues to the eastward of Batavia. Amboyna is about seventy miles in circumference, and defended by a Dutch garrison of 7 or 800 men, besides small forts, which protect their clove plantations. It is well known, that when the Portuguese were driven off this island, the trade of it was carried on by the English and Dutch; and the barbarities of the latter, in first torturing and then murdering the English, and thereby engrossing the whole trade, and

that of Banda, can never be forgotten; but will be transmitted as a memorial of Dutch infamy at that period, to all posterity. This tragical event happened in 1622.

The island of CELEBES, or MACASSAR, is situated under the equator, between the island of Borneo and the Spice Islands, at the distance of 160 leagues from Batavia, and is 500 miles long, and 200 broad. This island, notwithstanding its heat, is rendered habitable by breezes from the north, and periodical rains. Its chief productions are pepper and opium; and the natives are expert in the study of poisons, with a variety of which nature has furnished them. The Dutch have a fortification on this island; but the internal part of it is governed by three kings, the chief of whom resides in the town of Macassar. In this, and indeed in almost all the oriental islands, the inhabitants live in houses built on large posts, which are accessible only by ladders, which they pull up in the night-time, for their security against venomous animals. They are said to be hospitable and faithful, if not provoked. They carry on a large trade with the Chinese. Their port of Jampoden is the most capacious of any in that part of the world.

The Dutch have likewise fortified GILOLO and CERAM, two other Spice Islands lying under the equator, and will sink any ship that attempts to traffic in those seas.

The SUNDA ISLANDS. These are situated in the Indian Ocean, between 93 and 120 degrees of east longitude, and between eight degrees north, and eight degrees south latitude, comprehending the islands of Borneo, Sumatra, Java, Bally, Lamboe, Banca, &c. The three first, from their great extent and importance, require to be separately described.

BORNEO is said to be 800 miles long, and 700 broad, and till New-Holland was discovered to be an island, was considered to be the largest island in the world. The inland part of the country is marshy and unhealthy; and the inhabitants live in towns built upon floats in the middle of the rivers. The soil produces rice, cotton, canes, pepper, camphor, the tropical fruits, gold, and excellent diamonds. The famous ouran-outang is a native of this country, and is thought, of all irrational beings, to resemble a man the most. The original inhabitants live in the mountains, and make use of poisoned darts; but the sea-coast is governed by Mahomedan princes; the chief port of this island is Benjar-Masseu, and carries on a commerce with all trading nations.

SUMATRA has Malacca on the north, Borneo on the east, and Java on the south-east, from which it is separated by the straits of Sunda; it is divided into two equal parts by the equator, extending five degrees and upwards, north-west of it, and five on the south-east: and is 1000 miles long, and 100 broad. This island produces so much gold, that it has been thought to be the Ophir\* mentioned in the scriptures; but Mr. Marsten, in his late history of the island, thinks it was unknown to the ancients.—Its chief trade with the Europeans is in pepper. The English East-India company have two settlements here, Bencoolen and Fort Marlborough; from whence they bring their chief cargoes of pepper. The king of Achen is the chief of the Mahomedan princes who possess the sea-coasts. The interior parts are governed by pagan princes; and the natural products of Sumatra are pretty much the same with those of the adjacent islands.

\* There is a mountain in the island which is called Ophir by the Europeans, whose summit, above the level of the sea, is 13,842 feet, exceeding in height the Peak of Teacuse by 577 feet.

Rain is very frequent here; sometimes very heavy, and almost always attended with thunder and lightning. Earthquakes are not uncommon, and there are several volcanoes on the island. The people who inhabit the coast are Malays, who came hither from the peninsula of Malacca; but the interior parts are inhabited by a very different people, and who have hitherto had no connection with the Europeans. Their language and character differ much from those of the Malays; the latter using the Arabic character. The people between the districts of the English company and those of the Dutch at Palimban, on the other side of the island, write on long narrow slips of the bark of a tree, with a piece of bamboo. They begin at the bottom, and write from the left hand to the right, contrary to the custom of other eastern nations. These inhabitants of the interior parts of Sumatra are a free people, and live in small villages called Doofans, independent of each other, and governed each by its own chief. All of them have laws, some written ones, by which they punish offenders, and terminate disputes. They have almost all of them, and particularly the women, large swellings in the throat, some nearly as big as a man's head, but in general as big as an ostrich's egg; like the goitres of the Alps. That part of this island which is called the Cassia country, is well inhabited by a people called Battas, who differ from all the other inhabitants of Sumatra in language, manners, and customs. They have no king, but live in villages independently of each other, and generally at variance with one another. They fortify their villages very strongly with double fences of camphor-plank, pointed, and placed with their points projecting outwards; and between these fences they place pieces of bamboo, hardened by fire, and likewise pointed, which are concealed by the grass, but which will run quite through a man's foot. Such of their enemies whom they take prisoners they put to death and eat; and their skulls they hang up as trophies in the houses where the unmarried men and boys eat and sleep. They allow of polygamy: a man may purchase as many wives as he pleases; but their number seldom exceeds eight. All their wives live in the same house with the husband, and the houses have no partition; but each wife has her separate fire-place. It is from this country that most of the cassia sent to Europe is produced. The cassia-tree grows to fifty or sixty feet, with a stem of about two feet in diameter, and a beautiful and regular spreading head. Within about ninety miles of Sumatra is the island of **ENGANHO**, which is very little known, on account of the terrible rocks and breakers which entirely surround it. It is inhabited by naked savages, who are tall and well made, and who generally appear armed with lances and clubs, and speak a different language from the inhabitants of any of the neighbouring islands.

The greatest part of **JAVA** belongs to the Dutch, who have here erected a kind of commercial monarchy, the capital of which is Batavia, a noble and populous city, lying in the latitude of six degrees south, at the mouth of the river Jucata, and furnished with one of the finest harbours in the world. The town itself is built in the manner of those in Holland, and is about a league and a half in circumference, with five gates, and surrounded with regular fortifications; but its suburbs are said to be ten times more populous than itself. The government here is a mixture of eastern magnificence and European police, and held by the Dutch governor-general of the Indies. When he appears abroad, he is attended by his guards and officers, and with a splendor superior to that of any European potentate, except upon some solemn occasions. This city is as beautiful as it is strong; and its fine canals, bridges, and avenues,

render it a most magnificent, and public where the government which are inhabited by Chinese residing 30,000 of that nation, who have never provoked and detest the governor arrived but he never has constantly resides the island and the

It may be here a native of this island, cinnamon; the trunk the body of the tree, and other uses, this delicious island expelled, and had in January 1782, taken by the English, 1

render it a most agreeable residence. The description of it, its government, and public edifices, have employed whole volumes. The citadel, where the governor has his palace, commands the town and the suburbs, which are inhabited by natives of almost every nation in the world; the Chinese residing in this island are computed at 100,000; but about 30,000 of that nation were barbarously massacred, without the smallest offence ever proved upon them, in 1740. This massacre was too unprovoked and detestable to be defended even by the Dutch, who, when the governor arrived in Europe, sent him back to be tried at Batavia; but he never has been heard of since. A Dutch garrison of 3000 men constantly resides at Batavia, and about 15,000 troops are quartered in the island and the neighbourhood of the city.

The **ANDAMAN** and **NICOBAR** islands. These islands lie at the entrance of the bay of Bengal, and furnish provisions, consisting of tropical fruits and other necessaries, for the ships that touch there. They are otherwise too inconsiderable to be mentioned. They are inhabited by a harmless inoffensive people.

**CEYLON.** This island, though not the largest, is thought to be, by nature, the richest and finest island in the world. It is situated in the Indian Ocean near Cape Comorin; the southern extremity of the Hither Peninsula of India being separated from the coast of Coromandel by a narrow strait; and is 250 miles long, and 200 broad. The natives call it, with some show of reason, the terrestrial paradise; and it produces, besides excellent fruits of all kinds, long pepper, fine cotton, ivory, silk, tobacco, ebony, musk, crystal, saltpetre, sulphur, lead, iron, steel, copper; besides cinnamon, gold and silver, and all kinds of precious stones except diamonds. All kinds of fowl and fish abound here. Every part of the island is well wooded and watered; and besides some curious animals peculiar to itself, it has plenty of cows, buffaloes, goats, hogs, deer, hares, dogs, and other quadrupeds. The Ceylon elephant is preferred to all others, especially if spotted: but several noxious animals, such as serpents and ants, are likewise found here. The chief commodity of the island is its cinnamon, which is by far the best in all Asia. Though its trees grow in great profusion, yet the best is found in the neighbourhood of Columbo, the chief settlement of the Dutch and Negambo. The middle part of the country is mountainous and woody, so that the rich and beautiful valleys are left in the possession of the Dutch, who have in a manner shut up the king in his capital city, Candy, which stands on a mountain in the middle of the island, so that he has scarcely any communication with other nations, or any property in the riches of his own dominions. The descendants of the ancient inhabitants are called Cinglasses, who, though idolaters, value themselves upon maintaining their ancient laws and customs. They are, in general, a sober, inoffensive people, and are mingled with Moors, Malabars, Portuguese, and Dutch.

It may be here proper to observe, that the cinnamon-tree, which is a native of this island, has two, if not three barks, which form the true cinnamon; the trees of a middling growth and age afford the best; and the body of the tree, which, when stripped, is white, serves for building and other uses. In 1656, the Dutch were invited by the natives of this delicious island to defend them against the Portuguese, whom they expelled, and have monopolised it ever since to themselves. Indeed, in January 1782, Trincomale, the chief sea-port of the island, was taken by the English, but soon afterwards retaken by the French, and restored

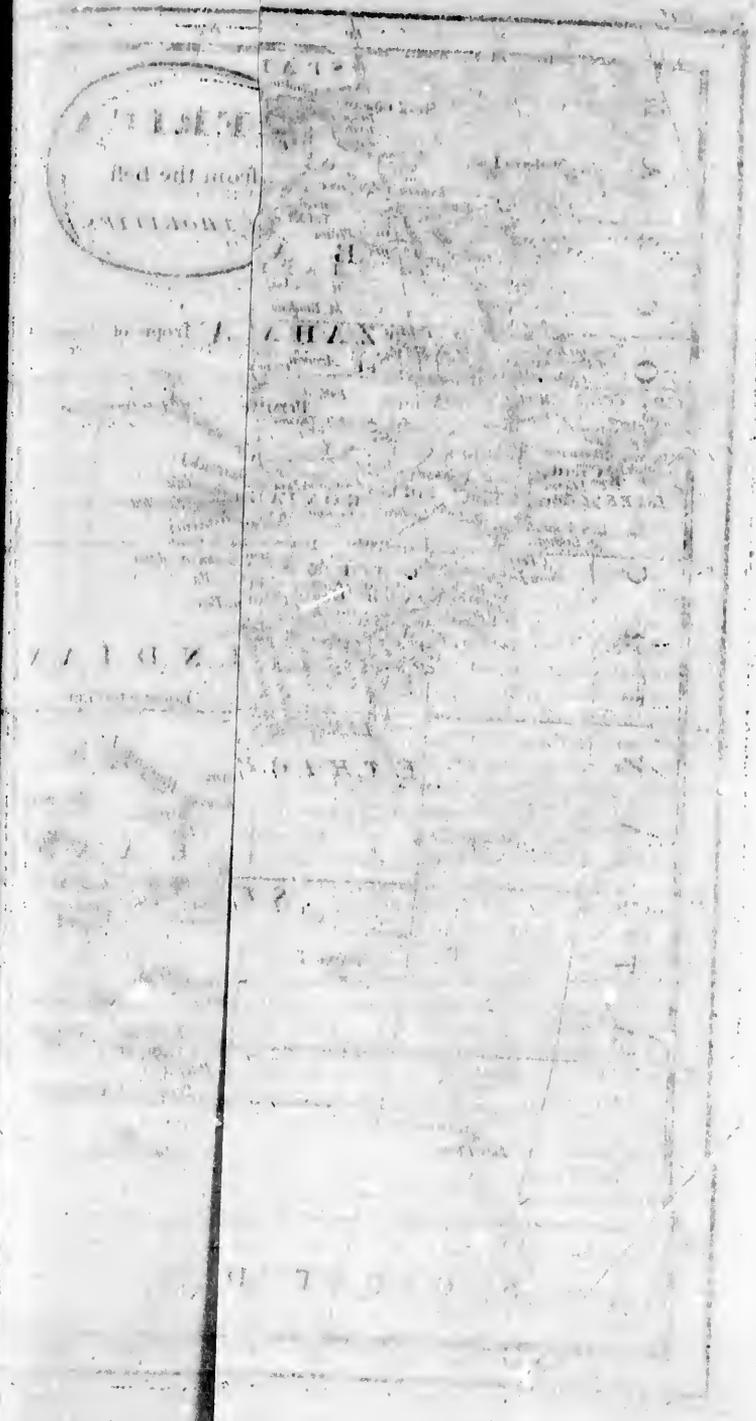

to the Dutch by the last treaty of peace. In August, 1795, it was again taken by the English, in whose possession it still remains.

The MALDIVES. These are a vast cluster of small islands or little rocks just above the water, lying between the equator and eight degrees north latitude, near Cape Comorin. They are chiefly resorted to by the Dutch, who carry on a profitable trade with the natives for couries, a kind of small shells, which go, or rather formerly went, for money upon the coasts of Guinea and other parts of Africa. The cocoa of the Maldives is an excellent commodity in a medical capacity. "Of this tree (says a well-informed author) they build vessels twenty or thirty tons; their hulls, masts, sails, rigging, anchors, cables, provisions, and firing, are all from this useful tree."

We have already mentioned BOMBAY, on the Malabar coast, in speaking of India. With regard to the language of all the Oriental islands, nothing certain can be said. Each island has a particular tongue; but the Malayan, Chinese, Portuguese, Dutch, and Indian words, are so frequent among them, that it is difficult for an European, who is not very expert in those matters, to know the radical language. The same may be almost said of their religion; for though its original is certainly pagan, yet it is intermixed with many Mahomedan, Jewish, Christian, and other foreign superstitions.

The sea which separates the southern point of the Peninsula of Kamtschatka from Japan, contains a number of islands in a position from north north-east to south-south-west, which are called the KURILE ISLANDS. They are upwards of twenty in number, are all mountainous, and in several of them are volcanoes and hot springs. The principal of these islands are inhabited: but some of the little ones are entirely desert and unpeopled. They differ much from each other, in respect both to their situation and natural constitution. The forests in the more northern ones are composed of laryx and pines; those in the southern produce canes, bamboos, vines, &c. In some of them are bears and foxes. The sea-otter appears on the coasts of all these islands, as well as whales, sea-horses, seals, and other amphibious animals. Some of the inhabitants of these islands have a great likeness to the Japanese, in their manners, language, and personal appearance; others very much resemble the Kamtschadales. The northern islands acknowledge the sovereignty of the empire of Russia; but those of the south pay homage to Japan. The Kurilians discover much humanity and probity in their conduct, and are courteous and hospitable; but adversity renders them timid, and prompts them to suicide. They have a particular veneration for old age. They reverence an old man wherever he be, but have an especial affection for those of their respective families. Their language is agreeable to the ear, and they speak and pronounce it slowly. The men are employed in hunting, fishing for sea animals and whales, and catching fowl. Their canoes are made of the wood that their forests produce, or that the sea casts upon their shores. The women have charge of the kitchen, and make clothes. In the northern isles they sew, and make different cloths of the thread of nettles. The southern islanders are more refined and polished than the northern, and carry on a sort of commerce with Japan, whither they export whale-oil, furs, and eagles' feathers to fledge arrows with. In return, they bring Japanese utensils of metal and varnished wood, skillets, sabres, different stuffs, ornaments of luxury and parade, tobacco, all sorts of trinkets, and small wares.

## AFRICA.

AFRICA, the third grand division of the globe, in shape bears some resemblance to the form of a pyramid, the base being the northern part of it, which runs along the shores of the Mediterranean; and the point or top of the pyramid, the Cape of Good Hope. Africa is a peninsula of a prodigious extent, joined to Asia only by a neck of land, about sixty miles over, between the Red Sea and the Mediterranean, usually called the Isthmus of Suez; and its utmost length from north to south, from Cape Bona in the Mediterranean, in 37 degrees north, to the Cape of Good Hope in 34-7 south latitude, is 4,300 miles; and the broadest part from Cape Verd, in 17-20 degrees west longitude to Cape Guardafui, near the straits of Babel-Mandel, in 51-20 east longitude, is 3,500 miles from east to west. It is bounded on the north by the Mediterranean Sea, which separates it from Europe; on the east by the Isthmus of Suez, the Red Sea, and the Indian Ocean, which divides it from Asia; on the south by the Southern Ocean; and on the west by the great Atlantic Ocean, which separates it from America. As the equator divides this extensive country almost in the middle, and the far greater part of it is within the tropics, the heat is in many places almost insupportable to an European; it being there increased by the rays of the sun, from vast deserts of burning sands. The coasts, however, and banks of rivers, such as the Nile, are generally fertile; and most parts of this region are inhabited, though it is far from being so populous as Europe and Asia. From what has been said, the reader cannot expect to find here a variety of climates. In many parts of Africa, snow seldom falls in the plains; and it is generally never found but on the tops of the highest mountains. The natives in these scorching regions would as soon expect that marble should melt, and flow in liquid streams, as that water by freezing should lose its fluidity, be arrested by the cold, and, ceasing to flow, become like the solid rock.

The most considerable rivers in Africa, are the Gambia, which falls into the Atlantic or Western Ocean, at Cape St. Mary, and is navigable for ships of 150 tons burthen, five hundred miles from its source; the Senegal, which rises about a hundred miles east of the Gambia, and falls, likewise, into the Atlantic Ocean, about eighty miles north of Cape Verd, after running a much longer course. The Niger, which rises about ninety miles to the east of the head of the Senegal, and runs *eastward* \* by Tombuctoo, Houssa,

\* This river has long been an object of research and dispute with respect to its origin and course. According to Mr. Lucas's communications to the African Association, "the rise and the termination of the Niger are unknown, but the course is from east to west." He adds, "so great is its rapidity, that no vessel can ascend its stream; and such is the want of skill, or such the absence of commercial inducements among the nations which inhabit its borders, that, even with the current, neither vessels nor boats are seen to navigate. That the people who live in the neighbourhood of the Niger should refuse to profit by its navigation, may justly surprise the traveller; but much greater is his astonishment, when he finds that even the food which the bounty of the stream would give, is uselessly offered to their acceptance; for such is the want of skill, or such the settled dislike of the people to this sort of provision, that the fish, with which the river abounds, are left in undisturbed possession of the waters." Proceedings of the African Association, p. 183-189.) It was also generally believed, that the Gambia and Senegal were branches of the Niger. All these reports are, however, fully disproved by the late discoveries of Mr. Park, who reached the banks of the Niger, or, as it is called by the natives, the Joliba, at Segou, the capital of Bam-

and Cashna, terminating, as is supposed, in some lakes farther to the eastward; and the Nile, which dividing Egypt into two parts, discharges itself into the Mediterranean, after a prodigious course from its source in Abyssinia. The most considerable mountains in Africa are the Atlas, a ridge extending from the Western Ocean, to which it gives the name of Atlantic Ocean, as far as Egypt. It had its name from a king of Mauritania, a great lover of astronomy, who used to observe the stars from its summit; on which account the poets represent him as bearing the heavens on his shoulders. The mountains of the Moon, extending themselves between Abyssinia and Moumotapa, and which are still higher than those of Atlas. Those of Sierra Leone, or the Mountain of the Lions, which divide Nigritia from Guinea, and extend as far as Ethiopia. These were styled by the ancients the Mountains of God, on account of their being subject to thunder and lightning. The Peak of Teneriffe, which the Dutch make their first meridian, is about two miles high, in the form of a sugar loaf, and is situated on an island of the same name near the coast. The most noted capes or promontories in this country, are Cape Verd, so called because the land is always covered with green trees and mossy ground. It is the most westerly point of the continent of Africa. The Cape of Good Hope, so denominated by the Portuguese, when they first went round it in 1489, and discovered the passage to Asia. It is the southern extremity of Africa, in the country of the Hottentots; and the general rendezvous of ships of every nation who trade to India, being about half way from Europe. It is at present in the possession of the English, who took it from the Dutch in September 1795. There is but one strait in Africa, which is called Babel Mandel, and joins the Red Sea with the Indian Ocean.

The situation of Africa for commerce is extremely favourable, standing as it were in the centre of the globe, and having thereby a much nearer communication with Europe, Asia, and America, than any of the other quarters has with the rest. That it abounds with gold, we have not only the testimony of the Portuguese, the Dutch, the English, and the French, who have settlements on the coast of Africa, but that of the most authentic historians. It is, however, the misfortune of Africa, that, though it has 10,000 miles of sea-coast, with noble, large, deep rivers, it should have no navigation, nor receive any benefit from them; and that it should be inhabited by an innumerable people, ignorant of commerce, and of each other. At the mouths of these rivers are the most excellent harbours, deep, safe, calm, sheltered from the wind, and capable of being made perfectly secure by fortifications; but quite destitute of shipping, trade, and merchants, even where there is plenty of merchandize. In short, Africa, though a full quarter of the globe, stored with an inexhaustible treasure, and capable, under proper improvements, of producing so many things delightful, as well as convenient, within itself, seems to be almost entirely neglected, not only by the natives, who are quite unsolicitous of reaping the be-

barra, where he saw it, "flowing slowly to the eastward." On the river were numerous canoes; and, proceeding farther, he tells us, that he "passed a great many villages, inhabited chiefly by fishermen, who caught great plenty of fish, by means of long cotton nets, which they make themselves, and use nearly in the same manner as nets are used in Europe." Those who would see more concerning this celebrated river, and the different opinions and notices of ancient and modern geographers and travellers, relative to its rise, course, and termination, may consult the ample and ingenious disquisition on that subject, in Major Rennell's *Geographical Illustration of Africa*, subjoined to Mr. Park's *Travels*,

nefits which nature has provided for them, but also by the more civilised Europeans who are settled in it, particularly the Portuguese.

Africa once contained several kingdoms and states, eminent for the liberal arts, for wealth and power, and the most extensive commerce. The kingdoms of Egypt and Ethiopia, in particular, were much celebrated; and the rich and powerful state of Carthage, that once formidable rival to Rome itself, extended her commerce to every part of the then known world; even the British shores were visited by her fleets, till Juba, who was king of Mauritania, but tributary to the republic of Carthage, unhappily called in the Romans, who, with the assistance of the Mauritanians, subdued Carthage, and, by degrees, all the neighbouring kingdoms and states. After this the natives, constantly plundered, and consequently impoverished, by the governors sent from Rome, neglected their trade, and cultivated no more of their lands than might serve for their subsistence. Upon the decline of the Roman empire, in the fifth century, the north of Africa was over-run by the Vandals, who contributed still more to the destruction of arts and sciences; and, to add to this country's calamity, the Saracens made a sudden conquest of all the coasts of Egypt and Barbary, in the seventh century. These were succeeded by the Turks; and both being of the Mahomedan religion, whose professors carried desolation with them wherever they came, the ruin of that once flourishing part of the world was thereby completed.

The inhabitants of this continent, with respect to religion, may be divided into three sorts; namely, Pagans, Mahomedans, and Christians. The first are the more numerous, possessing the greatest part of the country, from the tropic of Cancer to the Cape of Good Hope; and these are generally black. The Mahomedans, who are of a tawny complexion, possess Egypt, and almost all the northern shores of Africa, or what is called the Barbary coast. The people of Abyssinia, or the Upper Ethiopia, are denominated Christians, but retain many Pagan and Jewish rites. There are also some Jews in the north of Africa, who manage all the little trade that part of the country is possessed of.

There are scarcely any two nations, or indeed any two of the learned, who agree in the modern divisions of Africa: and for this very reason, that scarcely any traveller has penetrated into the heart of the country; and consequently we must acknowledge our ignorance of the bounds, and even the names of several of the inland nations, which may be still reckoned among the unknown and undiscovered parts of the world; but, according to the best accounts and conjectures, Africa may be divided according to the following table:

	NATIONS.	Length.	Breadth.	Square Miles.	Chief Cities.	Dist. and bearing fr. Lond.	Diff. of time from London.	Religion.
Barbary.	Morocco, Taflet, &c.	500	480	219,400	Fez	1080 S.	0 24 aft.	Mahom.

AIR.] It is obſerved by M. Volney, that during eight months in the year (from March to November) the heat is almoſt inſupportable by an

European. "During the whole of this season, the air is inflamed, the sky sparkling, and the heat oppressive to all unaccustomed to it."—The other months are more temperate. The southerly winds which sometimes blow in Egypt, are by the natives called *poisonous* winds or the *hot winds of the Desert*. They are of such extreme heat and aridity, that no animated body exposed to them can withstand their fatal influence. During the three days which it generally lasts, the streets are deserted; and woe to the traveller whom this wind surprises remote from shelter; when it exceeds three days, it is insupportable. Very frequently the inhabitants are almost blinded with drifts of sand. These evils are remedied by the rising and overflowing of the Nile.

SOIL AND PRODUCE.] Whoever is in the least acquainted with literature, knows that the vast fertility of Egypt is not owing to rain (little falling in that country), but to the annual overflowing of the Nile. It begins to rise when the sun is vertical in Ethiopia; and the annual rains fall there, viz. from the latter end of May to September, and sometimes October. At the height of its flood in the Lower Egypt nothing is to be seen in the plains but the tops of forests and fruit-trees, their towns and villages being built upon eminences either natural or artificial. When the river is at its proper height, the inhabitants celebrate a kind of jubilee, with all sorts of festivities. The banks, or moulds, which confine it, are cut by the Turkish basha, attended by his grandees; but according to captain Norden, who was present on the occasion, the spectacle is not very magnificent. When the banks are cut, the water is led into what they call the Chalige, or grand canal, which runs through Cairo, from whence it is distributed into cuts, for supplying their fields and gardens. This being done, and the waters beginning to retire, such is the fertility of the soil, that the labour of the husbandman is next to nothing. He throws his wheat and barley into the ground in October and May. He turns his cattle out to graze in November, and, in about six weeks, nothing can be more charming than the prospect which the face of the country presents, in rising corn, vegetables, and verdure of every sort. Oranges, lemons, and fruits perfume the air. The culture of pulse, melons, sugar canes, and other plants which require moisture, is supplied by small but regular cuts from cisterns and reservoirs. Dates, plantains, grapes, figs, and palm-trees, from which wine is made, are here plentiful. March and April are the harvest-months, and they produce three crops; one of lettuces and of cucumbers the latter being the chief food of the inhabitants), one of corn, and one of melons. The Egyptian pasturage is equally prolific, most of the quadrupeds producing two at a time, and the sheep four lambs a year.

ANIMALS.] Egypt abounds in black cattle; and it is said, that the inhabitants employ every day 200,000 oxen in raising water for their grounds. They have a fine large breed of asses, upon which the Christians ride, those people not being suffered by the Turks to ride on any other beast. The Egyptian horses are very fine; they never trot, but walk well, and gallop with great speed, turn short, stop in a moment, and are extremely tractable. The hippopotamus, or river-horse, an amphibious animal, resembling an ox in its hinder parts, with the head like a horse, is found in Upper Egypt. Tigers, hyænas, camels, antelopes, apes, with the head like a dog, and the rat called ichneumon, are natives of Egypt. The cameleon, a little animal something resembling a lizard, that changes colour as you stand to look upon him, is found here, as well as in other countries. The crocodile was for-

merly thought any material d rica. They a grow till they with large fee kind of imper prey in the fe much resembl way traveller

merly thought peculiar to this country; but there does not seem to be any material difference between it and the alligators of India and America. They are both amphibious animals, in the form of a lizard, and grow till they are about twenty feet in length, and have four short legs, with large feet, armed with claws, and their backs are covered with a kind of impenetrable scales, like armour. The crocodile waits for his prey in the sedge, and other cover, on the sides of rivers; and, pretty much resembling the trunk of an old tree, sometimes surprises the unwary traveller with his fore paws, or beats him down with his tail.

This country produces, likewise, great numbers of eagles, hawks, pelicans, and water-fowls of all kinds. The ibis, a creature (according to Mr. Norden) somewhat resembling a duck, was deified by the ancient Egyptians for its destroying serpents and pestiferous insects.— They were thought to be peculiar to Egypt, but a species of them is said to have been lately discovered in other parts of Africa. Ostriches are common here, and are so strong, that the Arabs sometimes ride upon their backs.

The cerasfes, or horned viper, inhabits the greater part of the eastern continent, especially the desert sandy parts of it. It abounds in Syria, in the three Arabias, and in Africa: this is supposed to be the asp which Cleopatra employed to procure her death. Alexandria, plentifully supplied by water, must then have had fruit of all kinds in its gardens. The baskets of figs must have come from thence, and the aspic, or cerasfes, that was hid in them, from the adjoining desert, where there are plenty to this day.

POPULATION, MANNERS, CUSTOMS, AND DIVERSIONS. } As the population of Egypt is almost confined to the banks of the Nile, and the rest of the country inhabited by Arabs and other nations, we can say little upon this head with precision. Mr. Browne, a late traveller, who was in Egypt in 1792, estimates its whole population at two millions and a half. It seems, however, to be certain, that Egypt is at present not near so populous as formerly, and that its depopulation is owing to the inhabitants being slaves to the Turks.— They are, however, still very numerous; but what has been said of the populousness of Cairo, as if it contained two millions, is a mere fiction.

The descendants of the original Egyptians are an ill-looking, slovenly people, immersed in indolence, and are distinguished by the name of Copts: in their complexions they are rather sun-burnt, than swarthy or black. Their ancestors were once Christians, and, in general, they still pretend to be of that religion; but Mahomedanism is the prevailing worship among the natives. Those who inhabit the villages and fields, at any considerable distance from the Nile, consist of Arabs, or their descendants, who are of a deep swarthy complexion, and they are represented, by the best authorities, as retaining the patriarchal custom of tending their flocks, and many of them have no fixed place of abode. The Turks, who reside in Egypt, retain all their Ottoman pride and insolence, and the Turkish habit, to distinguish themselves from the Arabs and Copts, who dress very plain, their chief finery being an upper garment of white linen, and linen drawers; but their ordinary dress is of blue linen, with a long cloth coat, either over or under it. The Christians and Arabs of the meaner kind content themselves with a linen or woollen wrapper, which they fold, blanket-like, round their body. The Jews wear blue leather slippers; the other natives of the country wear red, and the foreign Christians yellow. The dress of the women is

tawdry and unbecoming; but their clothes are silk, when they can afford it; and such of them as are not exposed to the sun, have delicate complexions and features. The women are not admitted into the society of men, even at table. When the rich are desirous of dining with one of their wives, they give her previous notice, when she accordingly prepares the most delicate dishes, and receives her lord with the greatest attention and respect. The women of the lower class usually remain standing, or seated in a corner of the room, while their husband is at dinner, and present him with water to wash, and help him at the table. The Copts are an acute and ingenious people; they are generally excellent accountants, and many of them live by teaching the other natives to read and write. Their exercises and diversions are much the same as those made use of in Persia and other Asiatic dominions. All Egypt is over-run with jugglers, fortune-tellers, mountebanks, and travelling slight-of-hand men.

[RELIGION.] To what has been already said concerning the religion of Egypt, it is proper to add, that the bulk of the Mahomedans are enthusiasts, and have among them their *santos*, or fellows who pretend to a superior degree of holiness, and, without any ceremony, intrude into the best houses, where it would be dangerous to turn them out. The Egyptian Turks mind religious affairs very little. The Copts profess themselves to be Christians of the Greek church, but they embrace transubstantiation; in which, and other points, the catholics of Cairo think they approach their faith nearer than the Greeks. They have, however, adopted, from the Mahomedans, the custom of frequent prostrations during divine service, ablutions, and other ceremonies. In religious, and indeed many civil matters, they are under the jurisdiction of the patriarch of Alexandria, who, by the dint of money, generally purchases a protection at the Ottoman court.

[LANGUAGE.] The Coptic is the ancient language of Egypt. This was succeeded by the Greek, about the time of Alexander the Great; and that by the Arabic, upon the commencement of the caliphate, when the Arabs dispossessed the Greeks of Egypt. The Arabic, or Arabesque, as it is called, is the current language; the Coptic (says Mr. Browne) may be considered as extinct: numerous and minute researches have enabled me to ascertain this fact. In Upper Egypt, however, they unknowingly retain some Coptic words.

[LEARNING AND LEARNED MEN.] Though it is past dispute that the Greeks derived all their knowledge from the ancient Egyptians, yet scarcely a vestige of it remains among their descendants. This is owing to the bigotry and ignorance of their Mahomedan masters; but here it is proper to make one observation, which is of general use. The Caliphs, or Saracens, who subdued Egypt, were of three kinds. The first, who were the immediate successors of Mahomed, made war, from conscience and principle, upon all kinds of literature, excepting the Koran; and hence it was, that when they took possession of Alexandria, which contained the most magnificent library the world ever beheld, its valuable manuscripts were applied for some months in cooking their victuals, and warming their baths. The same fate attended the other magnificent Egyptian libraries. The caliphs of the second race were men of taste and learning, but of a peculiar character. They bought up all the manuscripts that survived the general conflagration, relating to astronomy, medicine, and some useless parts of philosophy; but they had no taste for the Greek arts of architecture, sculpture, painting, or poetry, and learning was confined to their own courts and colleges,

without ever especially the human nature ignorance wh

without ever finding its way back to Egypt. The lower race of caliphs, especially those who called themselves caliphs of Egypt, disgraced human nature; and the Turks have riveted the chains of barbarous ignorance which they imposed.

All the learning, therefore, possessed by the modern Egyptians consists in arithmetical calculation for the dispatch of business, the jargon of astrology, a few nostrums in medicine, and some knowledge of Arabesque, or the Mahomedan religion.

**CURIOSITIES AND ANTIQUITIES.]** Egypt abounds more with these than perhaps any other part of the world. Its pyramids have been often described. Their antiquity is beyond the researches of history itself, and their original uses are still unknown. The bases of the largest covers eleven acres of ground, and its perpendicular height is 500 feet, but if measured obliquely to the terminating point, 700 feet. It contains a room thirty-four feet long, and seventeen broad, in which is a marble chest, but without either cover or contents, supposed to have been designed for the tomb of the founder. In short, the pyramids of Egypt are the most stupendous, and, to appearance, the most useless structures that ever were raised by the hands of men.

The mummy-pits, so called from their containing the mummies, or embalmed bodies of the ancient Egyptians, are subterraneous vaults of a prodigious extent; but the art of preparing the mummies is now lost. It is said, that most of the bodies thus embalmed are perfect and distinct at this day, though buried 3000 years ago. The labyrinth in Upper Egypt is a curiosity, thought to be more wonderful than the pyramids themselves. It is partly under ground, and cut out of a marble rock, consisting of twelve palaces, and 1000 houses, the intricacies of which occasion its name. The lake Mœris was dug by the order of an Egyptian king, to correct the irregularities of the Nile, and to communicate with that river, by canals and ditches, which still subsist, and are evidences of the utility as well as grandeur of the work. Wonderful grottos and excavations, mostly artificial, abound in Egypt. The whole country towards Grand Cairo is a continued scene of antiquities, of which the oldest are the most stupendous, but the more modern the most beautiful. Cleopatra's needle, and its sculptures, are admirable. Pompey's pillar is a fine regular column of the Corinthian order, the shaft of which is one stone, being eighty eight feet nine inches in height, or ten diameters of the column; the whole height is 114 feet, including the capital and the pedestal. The Sphinx, as it is called, is no more than the head and part of the shoulders of a woman, hewn out of the rock, and about thirty feet high, near one of the pyramids.

The papyrus is one of the natural curiosities of Egypt, and served the ancients to write upon, but we know not the manner of preparing it. The pith of it is a nourishing food. The manner of hatching chickens in ovens is common in Egypt, and now practised in some parts of Europe. The construction of the oven is very curious.

**OASES.]** At the distance of about a hundred miles or more from the Nile, are small fertile spots of cultivated land, situated like islands in the midst of an ocean of sand: they are called *Oases*, the name by which they were known to the ancient Greeks, and by the Arabs *Elwah*. Those with which we are now acquainted are in number three; the Great Oasis, in lat. 26 deg. 30 min. N.; the Lesser Oasis, about forty miles to the north of the former; and the Oasis of Siwa, in lat. 29 deg. 12 min. N. lon. 44 deg. 54 min. East. The Great Oasis is said to be twenty-

five leagues in length, and four or five in breadth. That of Siwa was visited by Mr. Browne: it is about six miles long, and four and a half or five wide. A large proportion of this space is filled with date trees; but there are also pomegranates, figs, olives, apricots, and plantains, and the gardens are remarkably flourishing. A considerable quantity of rice is cultivated here. This has been supposed to be the Oasis where the famous temple of Ammon anciently stood; but though Mr. Browne found here the ruins of an edifice which appeared to be the work of the ancient Egyptians, as the figures of Isis and Anubis were conspicuous among the sculptures, he discovered nothing which could induce him to believe this to be the real Oasis of Ammon.

CITIES, TOWNS, AND } Even a slight review of these would amount  
PUBLIC EDIFICES, } to a large volume. In many places, not only  
temples, but the walls of cities, built before the time of Alexander the Great, are still entire, and many of their ornaments, particularly the colours of their paintings, are as fresh and vivid as when first laid on.

Alexandria, which lies on the Levant coast, was once the emporium of the world; and, by means of the Red Sea, furnished Europe and great part of Asia, with the riches of India. It owes its name to its founder, Alexander the Great. It stands forty miles west from the Nile, and a hundred and twenty north-west of Cairo. It rose upon the ruins of Tyre and Carthage, and is famous for the light-house erected on the opposite island of Pharos, for the direction of mariners, deservedly esteemed one of the wonders of the world. All the other parts of the city were magnificent in proportion, as appears from their ruins, particularly the cisterns and aqueducts. Many of the materials of the old city, however, have been employed in building New Alexandria, which at present is a very ordinary sea-port, known by the name of Scanderoon. Notwithstanding the poverty, ignorance, and indolence of the inhabitants, their mosques, bagnios, and the like buildings, erected within these ruins, preserve an inexpressible air of majesty. Some think that Old Alexandria was built from the materials of the ancient Memphis.

Rosetta, or Raichid, stands twenty-five miles to the north-west of Alexandria, and is recommended for its beautiful situation, and delightful prospects which command the fine country, or island of Delta, formed by the Nile, near its mouth. It is likewise a place of great trade.

Cairo, Kahira, or, as it is called by the Arabs, Mafir, the present capital of Egypt, is a large and populous, but a disagreeable residence, on account of its pestilential air, and narrow streets. It cannot, according to Mr. Browne, be estimated to contain less than 300,000 inhabitants. It is divided into two towns, the Old and the New, and defended by an old castle, the works of which are said to be three miles in circumference. This castle is said to have been built by Saladin: at the west end are the remains of very noble apartments, some of which are covered with domes, and adorned with pictures in mosaic work; but these apartments are now only used for weaving embroidery, and preparing the hangings and coverings annually sent to Mecca. The well, called Joseph's well, is a curious piece of mechanism, about 300 feet deep. The memory of that patriarch is still revered in Egypt, where they show granaries, and many other works of public utility, that go under his name. They are certainly of vast antiquity; but it is very questionable whether they were erected by him. One of his granaries is shown in old Cairo; but captain Norden suspects it is a Saracen work,

nor does he give us any high idea of the building of the city itself. On the banks of the Nile, facing Cairo, lies the village of Gize, which is thought to be the ancient Memphis. Two miles west, is Bulac, called the port of Cairo. The Christians of Cairo practise a holy cheat, during the Easter holidays, by pretending that the limbs and bodies of the dead arise from their graves, to which they return peaceably. The streets of Cairo are pestered with the jugglers and fortune-tellers already mentioned. One of their favourite exhibitions is their dancing-camels, which, when young, they place upon a large heated floor; the intense heat makes the poor creatures caper, and being plied all the time with the sound of drums, the noise of that instrument sets them a dancing whenever they hear it.

The other towns of note in Egypt are, Damietta, supposed to be the ancient Pelusium; Seyd, on the west bank of the Nile, 200 miles south of Cairo, said to be the ancient Egyptian Thebes; by the few who have visited it, it is reported to be the most capital antique curiosity that is now extant; and Cosfire, on the west coast of the Red Sea. The general practice of strangers who visit those places, is to hire a janissary, whose authority commonly protects them from the insults of the other natives. Suez, formerly a place of great trade, is now a small city, and gives name to the isthmus that joins Africa with Asia.

**MANUFACTURES AND COMMERCE.]** The Egyptians export great quantities of manufactured as well as prepared flax, thread, cotton, and leather of all sorts, calicoes, yellow wax, sal ammoniac, saffron, sugar, senna, and cassia. They trade with the Arabs for coffee, drugs, spices, calicoes, and other merchandises, which are landed at Suez, from whence they send them to Europe. Several European states have consuls resident in Egypt, but the customs of the Turkish government are managed by Jews. A number of English vessels arrive yearly at Alexandria; some of which are laden on account of the owners, but most of them are hired and employed as carriers to the Jews, Armenians, and Mahomedan traders.

**CONSTITUTION AND GOVERNMENT.]** The government of Egypt is both monarchical and republican. The monarchical is executed by the pasha, and the republican by the Mamalukes or sangiacks. The pasha is appointed by the grand-signor, as his viceroy. The republican, or rather the aristocratical part of the government of Egypt, consists of a divan, composed of twenty-four sangiacks, beys, or lords. The head of them is called the sheik-bellet, who is chosen by the divan, and confirmed by the pasha. Every one of these sangiacks is arbitrary in his own territory, and exerts sovereign power: the major part of them reside at Cairo. If the grand-signor's pasha acts in opposition to the sense of the divan, or attempts to violate their privileges, they will not suffer him to continue in his post; and they have an authentic grant of privileges, dated in the year 1517, in which year sultan Selim conquered Egypt from the Mamalukes.

**REVENUES.]** These are very inconsiderable, when compared to the natural riches of the country, and the despotism of the government. Some say that they amount to a million sterling, but that two-thirds of the whole is spent in the country.

**MILITARY STRENGTH.]** This consists in the Mamalukes, some bodies of whom are cantoned in the villages, to exact tribute, and support authority. The greater part are assembled at Cairo. They amount to about 8,000 men, attached to the different beys, whom they enable to contend with each other, and to set the Turks at defiance.

**HISTORY.]** It is generally agreed, that the princes of the line of the Pharaohs sat on the throne of Egypt, in an uninterrupted succession, till Cambyse II. king of Persia, conquered the Egyptians, 520 years before the birth of Christ; and that in the reign of these princes, those wonderful structures, the pyramids, were raised, which cannot be viewed without astonishment. Egypt continued a part of the Persian empire, till Alexander the Great vanquished Darius, when it fell under the dominion of that prince, who soon after built the celebrated city of Alexandria. The conquest of Alexander, who died in the prime of life, being seized upon by his generals, the province of Egypt fell to the share of Ptolemy, by some supposed to have been a half-brother of Alexander, when it again became an independent kingdom, about 300 years before Christ. His successors, who sometimes extended their dominion over great part of Syria, even after retained the name of Ptolemies, and in that line Egypt continued between two and three hundred years, till the famous Cleopatra, the wife and sister of Ptolemy Dionysius, the last king, ascended the throne. After the death of Cleopatra, who had been mistress successively to Julius Cæsar and Marc Antony, Egypt became a Roman province, and thus remained till the reign of Omar, the second caliph of the successors of Mahomed, who expelled the Romans after it had been in their hands 700 years. The famous library of Alexandria, said to consist of 700,000 volumes, was collected by Ptolemy Philadelphus, son of the first Ptolemy; and the same prince caused the Old Testament to be translated into Greek; which translation is known by the name of the Septuagint. About the time of the crusades, between the year 1150 and 1190, Egypt was governed by Nouredin, whose son, the famous Saladin, proved so formidable to the Christian adventurers, and retook from them Jerusalem. He instituted the military corps of Mamalukes, who, about the year 1242, advanced one of their own officers to the throne, and ever after chose their prince out of their own body. Egypt, for some time, flourished under those illustrious usurpers, and made a noble stand against the prevailing power of the Turks, till the time of Selim, who, about the year 1517, after giving the Mamalukes several bloody defeats, reduced Egypt to its present state of subjection.

While Selim was settling the government of Egypt, great numbers of the ancient inhabitants withdrew into the deserts and plains, under one Zinganeus, from whence they attacked the cities and villages of the Nile, and plundered whatever fell in their way. Selim and his officers, perceiving that it would be very difficult to extirpate those marauders, left them at liberty to quit the country, which they did in great numbers, and their posterity is known all over Europe and Asia by the name of Gypsies.

An attempt was made a few years since, to deprive the Ottoman Porte of its authority over Egypt, by Ali Bey, whose father was a priest of the Greek church. Ali having turned Mahomedan, and being a man of abilities and address, rendered himself extremely popular in Egypt. A false accusation having been made against him to the grand signor, his head was ordered to be sent to Constantinople; but, being apprised of the design, he seized and put to death the messengers who brought this order, and soon found means to put himself at the head of an army. Being also assisted by the dangerous situation to which the Turkish empire was reduced, in consequence of the war with Russia, he boldly mounted the throne of the ancient sultans of Egypt. But not content with the kingdom of Egypt, he also laid claim to Syria, Palestine, and

that part of Arabia which had belonged to the ancient Sultans. He marched at the head of his troops to support these pretensions, and actually subdued some of the neighbouring provinces, both of Arabia and Syria. At the same time that he was engaged in these great enterprises, he was not less attentive to the establishing of a regular form of government, and the introducing of order into a country that had been long the seat of anarchy and confusion. His views were equally extended to commerce; for which purpose he gave great encouragement to the Christian traders, and took off some shameful restraints and indignities to which they were subjected in that barbarous country. He also wrote a letter to the republic of Venice, with the greatest assurances of his friendship, and that their merchants should meet with the utmost protection and safety. His great design was said to be, to make himself master of the Red Sea: to open the port of Suez to all nations, but particularly to the Europeans, and to make Egypt once more the great centre of commerce. The conduct and views of Ali Bey showed an extent of thought and ability that indicated nothing of the barbarian, and bespoke a mind equal to the founding of an empire. He assumed the titles and state of the ancient sultans of Egypt, and was ably supported by Sheik Daher, and some other Arabian princes, who warmly espoused his interests. He also succeeded in almost all his enterprises against the neighbouring Asiatic governors and bashaws, whom he repeatedly defeated: but he was afterwards deprived of the kingdom of Egypt, by the base and ungrateful conduct of his brother-in-law, Mahomed Bey Abudahab; his troops being totally defeated on the 7th of March, 1773. He was also himself wounded and taken prisoner; and, dying of his wounds, was buried honourably at Grand Cairo. Abudahab afterwards governed Egypt, as Sheik Bellet, and marched into Palestine to subdue Sheik Daher. After behaving with great cruelty to the inhabitants of the places he took, he was found dead in his bed one morning at Acre, supposed to be strangled. Sheik Daher accepted the Porte's full amnesty; and, trusting to their assurances, embraced the captain pacha's invitation to dine on board his ship; when the captain produced his orders, and the brave Daher, Ali Bey's ally, had his head cut off in the 85th year of his age.

A civil war now commenced between the adherents of Ali, and other beys or princes who rose on his ruins. Of these the principal were Murad and Ibrahim, who, having driven their enemies into banishment, began to quarrel among themselves; till, at length, after having alternately expelled each other from Cairo, they agreed to a kind of compromise in March 1785.

From this time nothing of importance occurred till the invasion of Egypt by the French, of which some account has already been given in our summary of the affairs of France. The French made themselves masters of Cairo and the whole of the Delta, forcing Murad Bey and the Mamelukes to take refuge in Upper Egypt; but, after the departure of Buonaparte, general Kleber, who was left at the head of the army, concluded a treaty with the grand vizier, who had been sent against him with a powerful army; by which the French troops were to be permitted to evacuate Egypt without molestation. But the British government having, at the same time, sent orders to the English admirals in the Mediterranean to prevent the return of the French to Europe, general Kleber, having received notice of these orders, immediately attacked the Turks, and defeated them with great slaughter. Negotiations, it is said, however, have been since recommenced for the departure of the

French from Egypt; but, of the issue of these, no certain accounts have yet been received.

## THE STATES OF BARBARY.

**U**NDER this head are included the countries of, 1. Morocco and Fez; 2. Algiers; 3. Tunis; 4. Tripoli and Barca.

The empire of Morocco, including Fez, is bounded on the north by the Mediterranean Sea; on the south, by Tafilet; and on the east, by Segelmessa and the kingdom of Algiers; being 500 miles in length, and 480 in breadth.

Fez, which is now united to Morocco, is about 125 miles in length, and much the same in breadth. It lies between the kingdom of Algiers to the east, and Morocco on the south, and is surrounded on other parts by the sea.

Algiers, formerly a kingdom, is bounded on the east by the kingdom of Tunis, on the north by the Mediterranean, on the south by Mount Atlas, and on the west by the kingdoms of Morocco and Tafilet. According to Dr. Shaw, this country extends in length 480 miles along the coast of the Mediterranean, and is between 40 and 100 miles in breadth.

Tunis is bounded by the Mediterranean on the north and east; by the kingdom of Algiers on the west; and by Tripoli, with part of Biledulgerid, on the south; being 220 miles in length from north to south, and 170 in breadth from east to west.

Tripoli, including Barca, is bounded on the north by the Mediterranean Sea; on the south, by the country of the Beriberies; on the west, by the kingdom of Tunis, Biledulgerid, and the territory of the Gadamis; and on the east by Egypt; extending about 1100 miles along the sea-coast; and the breadth is from 1 to 300 miles.

Each capital bears the name of the state or kingdom to which it belongs.

The Barbary states form a great political confederacy, however independent each may be as to the exercise of its internal polity; nor is there a greater difference than happens in different provinces of the same kingdom, in the customs and manners of the inhabitants.

**AIR AND SEASONS.]** The air of Morocco is mild, as is that of Algiers, and indeed all the other states, except in the months of July and August.

**SOIL, VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.** } These states, under the Roman empire, were justly denominated the garden of the world; and to have a residence there was considered as the highest state of luxury. The produce of their soil formed those magazines which furnished all Italy, and great part of the Roman empire, with corn, wine, and oil. Though the lands are now uncultivated, through the oppression and barbarity of their government, yet they are still fertile; not only in the above-mentioned commodities, but in dates, figs, raisins, almonds, apples, pears, cherries, plums, citrons, lemons, oranges, pomegranates, with plenty of roots and herbs in their kitchen-gardens. Excellent hemp and flax grow on their plains; and, by the report of the Europeans who have lived there for some time, the country abounds with all that can add to the pleasures of

life; for the Mahon their own great quantities several places

The city Jews, and 2

life; for the great people find means to evade the sobriety prescribed by the Mahomedan law, and make free with excellent wines and spirits of their own growth and manufacture. Algiers produces salt-petre, and great quantities of excellent salt; and lead and iron have been found in several places of Barbary.

Neither the elephant nor the rhinoceros are to be found in the states of Barbary; but their deserts abound with lions, tigers, leopards, hyenas, and monitrous serpents. The Barbary horses were formerly very valuable, and thought equal to the Arabian. Though their breed is now said to be decayed, yet some very fine ones are occasionally imported into England. Dromedaries, asses, mules, and kumrahs, a most serviceable creature, begot by an ass upon a cow, are their beasts of burden.

But from the services of the camel they derive the greatest advantages. This useful quadruped enables the African to perform his long and toilsome journeys across the continent. The camel is, therefore, (says Mr. Bruce) emphatically called the *Ship of the Desert*. He seems to have been created for this very trade, endued with parts and qualities adapted to the office he is employed to discharge. The driest thistle, and the barest thorn, is all the food this useful animal requires; and even these, to save time, he eats while advancing on his journey, without stopping, or occasioning a moment of delay. As it is his lot to cross immense deserts, where no water is found, and countries not even moistened by the dew of heaven, he is endued with the power, at one watering-place, to lay in a store with which he supplies himself for thirty days to come. To contain this enormous quantity of fluid, nature has formed large cisterns within him, from which, once filled, he draws at pleasure the quantity he wants, and pours it into his stomach with the same effect as if he then drew it from a spring; and with this he travels, patiently and vigorously, all day long, carrying a prodigious load upon him, through countries infected with poisonous winds, and glowing with parching and never-cooling sands.

Their cows are but small, and barren of milk. Their sheep yield indifferent fleeces, but are very large, as are their goats. Bears, porcupines, foxes, apes, hares, rabbits, ferrets, weasels, moles, cameleons, and all kinds of reptiles, are found here. Besides vermin, says Dr. Shaw (speaking of his travels through Barbary), the apprehensions we are under, in some parts at least of this country, of being bitten or stung by the scorpion, the viper, or the venomous spider, rarely failed to interrupt our repose; a refreshment so very grateful, and so highly necessary to a weary traveller. Partridges, quails, eagles, hawks, and all kinds of wild-fowl, are found on this coast; and of the smaller birds, the capsparrow is remarkable for its beauty, and the sweetness of its note, which is thought to exceed that of any other bird; but it cannot live out of its own climate. The seas and bays of Barbary abound with the finest and most delicious fish of every kind, and were preferred by the ancients to those of Europe.

POPULATION, INHABITANTS, MAN-<sup>4</sup> } Morocco was certainly formerly far more populous than  
 NERS, CUSTOMS, AND DIVERSIONS. } it is now, if, as travellers say, its capital contained 100,000 houses, whereas at present it is thought not to contain above 25,000 inhabitants; nor can we think that the other parts of the country are more populous, if it is true, that their king or emperor has 80,000 horse and foot, of foreign negroes in his armies.

The city of Algiers is said to contain 100,000 Mahomedans, 15,000 Jews, and 2000 Christian slaves; but no estimate can be formed as to

the populousness of its territory. Some travellers report that it is inhabited by a friendly hospitable people, who are very different in their manners and character from those of the metropolis.

Tunis is the most polished republic of all the Barbary states. The capital contains 10,000 families and above 3000 tradesmen's shops; and its suburbs consist of 1000 houses. The Tunisians are indeed exceptions to the other states of Barbary; for even the most civilised of the European governments might improve from their manners. Their distinctions are well kept up, and proper respect is paid to the military, mercantile, and learned professions. They cultivate friendship with the European states; arts and manufactures have been lately introduced among them; and the inhabitants are said at present to be well acquainted with the various labours of the loom. The women are handsome in their persons; and though the men are sun-burnt, the complexion of the ladies is very delicate; nor are they less neat and elegant in their dress; but they improve the beauty of their eyes by art, particularly the powder of lead-ore, the same pigment, according to the opinion of the learned Dr. Shaw, that Jezebel made use of when she is said (2 Kings, chap. ix. verse 30) to have painted her face; the words of the original being, that she set off her eyes with the powder of lead-ore. The gentlemen in general are sober, orderly, and clean in their persons, their behaviour complaisant, and a wonderful regularity reigns through all the city.

Tripoli was once the richest, most populous, and opulent of all the states on the coast; but it is now much reduced, and the inhabitants, who are said to amount to between 400,000 or 500,000, have all the vices of the Algerines.

Their manners are much the same with those of the Egyptians already described. The subjects of the Barbary states, in general subsisting by piracy, are allowed to be bold intrepid mariners, and will fight desperately when they meet with a prize at sea; they are, notwithstanding, far inferior to the English and other European states, both in the construction and management of their vessels. They are, if we except the Tunisians, void of all arts and literature. The misery and poverty of the inhabitants of Morocco, who are not immediately in the emperor's service, are beyond all description; but those who inhabit the inland parts of the country are an hospitable inoffensive people; and indeed it is a general observation, that the more distant the inhabitants of those states are from the seats of their government, their manners are the more pure. Notwithstanding their poverty, they have a liveliness about them, especially those who are of Arabic descent, that gives them an air of contentment; and, having nothing to lose, they are peaceable among themselves. The Moors are supposed to be the original inhabitants, but are now blended with the Arabs, and both are cruelly oppressed by a handful of insolent domineering Turks, the refuse of the streets of Constantinople.

**DRESS.]** The dress of these people is a linen shirt, over which they use a silk or cloth vestment with a sash, and over that a loose coat. Their drawers are made of linen. The arms and legs of the wearer are bare, but they have slippers on their feet; and persons of condition sometimes wear butkins. They never move their turbans, but pull off their slippers when they attend religious duties, or the person of their sovereign. They are fond of striped and fancied silks. The dress of the women is not very different from that of the men, but their drawers are longer, and they wear a sort of cawl on their heads instead of a turban. The chief

**CITIES AND**  
of Morocco, th

furniture of their houses consists of carpets and mattresses, on which they sit and lie. In eating, their slovenliness is disgusting. They are prohibited gold and silver vessels; and their meat, which they swallow by handfuls, is boiled or roasted to rags.

**RELIGION.]** The inhabitants of these states are Mahomedans; but many subjects of Morocco follow the tenets of one Hamed, a modern sectarist, and an enemy to the ancient doctrine of the Caliphs. All of them have much respect for idiots; and, in some cases, their protection screens offenders from punishment for the most notorious crimes. The Moors of Barbary, as the inhabitants of these states are now promiscuously called (because the Saracens first entered Europe from Mauritania, the country of the Moors), have in general adopted the very worst parts of the Mahomedan religion, and seem to have retained only as much of it as countenances their vices. Adultery in the women is punished with death; but though the men are indulged with a plurality of wives and concubines, they commit the most unnatural crimes with impunity. All foreigners are allowed the open profession of their religion.

**LANGUAGE.]** As the states of Barbary possess those countries that formerly went by the name of Mauritania and Numidia, the ancient African language is still spoken in some of the inland countries, and even by some inhabitants of the city of Morocco. In the sea-port towns, and maritime countries, a bastard kind of Arabic is spoken; and seafaring people are no strangers to that medley of living and dead languages, Italian, French, Spanish, &c. that is so well known, in all the ports of the Mediterranean, by the name of *Lingua Franca*.

**ANTIQUITIES AND CURIOSITIES, } This article is well worth the**  
**NATURAL AND ARTIFICIAL. } study of an antiquary, but the**  
 subjects of it are difficult of access. The reader can scarcely doubt that the countries which contained Carthage, and the pride of the Phœnician, Greek, and Roman works, are replete with the most curious remains of antiquity: but they lie scattered amidst ignorant, barbarous inhabitants. Some memorials of the Mauritanian and Numidian greatness are still to be met with, and many ruins which bear evidence of their ancient grandeur and populousness. These point out the old Julia Cæsarea of the Romans, which was little inferior in magnificence to Carthage itself. A few of the aqueducts of Carthage are still remaining, particularly at Manuba, a country-house of the Bey, four miles from Tunis; but no vestige of its walls. The same is the fate of Utica, famous for the retreat and death of Cato; and many other renowned cities of antiquity; and so over-run is the country with barbarism, that their very sites are not known, even by their ruins, amphitheatres, and other public buildings, which remain still in tolerable preservation. Besides those of classical antiquity, many Saracen monuments, of the most stupendous magnificence, are likewise found in this vast tract: these were erected under the caliphs of Bagdad, and the ancient kings of the country, before it was subdued by the Turks, or reduced to its present form of government. Their walls form the principal fortifications in the country, both inland and maritime. We know of few or no natural curiosities belonging to this country, excepting its salt pits, which in some places take up an area of six miles. Dr. Shaw mentions springs found here, that are so hot as to boil a large piece of mutton very tender in a quarter of an hour.

**CITIES AND PUBLIC BUILDINGS.]** Mention has already been made of Morocco, the capital of that kingdom, but now almost in ruins, the

court having removed to Mequinez, a city of Fez. Incredible things are recorded of the magnificent palaces in both cities; but by the best accounts the common people live in a very slovenly manner.

The city of Algiers is not above a mile and a half in circuit, though it is computed to contain near 120,000 inhabitants, 15,000 houses, and 107 mosques. The public baths are large, and handsomely paved with marble. The prospect of the country and sea from Algiers is very beautiful, the city being built on the declivity of a mountain; but, though for several ages it has braved some of the greatest powers in Christendom, it could make but a faint defence against a regular siege; and it is said that three English fifty-gun ships might batter it about the ears of its inhabitants from the harbour. The Spaniards, however, attacked it, in 1775, by land and by sea, but were repulsed with great loss, though they had near 20,000 foot and 2000 horse, and 47 king's ships, of different rates, and 346 transports. In the years 1783 and 1784, they also renewed their attacks by sea to destroy the city and galleys; but after spending a quantity of ammunition, bombs, &c. were forced to retire without either its capture or destruction. The mole of the harbour is 500 paces in length, extending from the continent to a small island where there is a castle and large battery.

The kingdom of Tunis, which is naturally the finest of all these states, contains the remains of many noble cities, some of them still in good condition. Tunis, built near the original site of Carthage, has a wall and fortifications, and is about three miles in circumference. The houses are not magnificent, but neat and commodious; as is the public exchange for merchants and their goods: but, like Algiers, it is distressed for want of fresh water; that of rain, preserved in cisterns, is chiefly used by the inhabitants.

The city of Tripoli consists of an old and new town the latter being the most flourishing; but great inconveniences attend its situation, particularly the want of sweet water. The city of Oran, lying upon this coast, is about a mile in circumference, and is fortified both by art and nature. It was a place of considerable trade, and the object of many bloody disputes between the Spaniards and the Moors. Constantina was the ancient Cirta, and one of the strongest cities of Numidia, being inaccessible on all sides, excepting the south-west.

Besides the above towns and cities, many others, formerly of great renown, lie scattered up and down this immense tract of country. The city of Fez, at present the capital of the kingdom so called, is said to contain near 300,000 inhabitants, besides merchants and foreigners. Its mosques amount to 500; one of them magnificent beyond description, and about a mile and a half in circumference. Mequinez is esteemed the great emporium of all Barbary. Sallee was formerly famous for the piracies of its inhabitants. Tangier, situated about two miles within the straits of Gibraltar, was given by the crown of Portugal as part of the dowry of queen Catharine, consort to Charles II. of England. It was intended to be to the English what Gibraltar is now; and it must have been a most noble acquisition, had not the misunderstandings between the king and his parliament occasioned him to blow up its fortifications and demolish its harbour; so that, from being one of the finest cities in Africa, it is now little better than a fishing-town. Ceuta, upon the same strait, almost opposite to Gibraltar, is still in the hands of the Spaniards, but often, if not always, besieged or blocked up by the Moors. Tetuan, which lies within twenty miles of Ceuta, is now but an ordinary town, containing about 800 houses: but the

inhabitants are said to be rich, and tolerably civilised in their manners.

The provinces of Suz, Tafilet, and Gefula, form no part of the states of Barbary, though the king of Morocco pretends to be their sovereign; nor do they contain any thing that is particularly curious. Zaara is a desert country, thinly peopled, and almost destitute both of water and provisions.

**MANUFACTURES AND COMMERCE.]** The lower subjects of these states know very few imaginary wants, and depend partly upon their piracies to be supplied with necessary utensils and manufactures; so that their exports consist chiefly of leather, fine mats, embroidered handkerchiefs, sword-knots, and carpets, which are cheaper and softer than those of Turkey, though not so good in other respects. As they leave almost all their commercial affairs to the Jews and Christians settled among them, the latter have established silk and lincn works, which supply the higher ranks of their own subjects. They have no ships, that, properly speaking, are employed in commerce; so that the French and English carry on the greatest part of their trade. Their exports, besides those already mentioned, consist in elephants' teeth, ostrich feathers, copper, tin, wool, hides, honey, wax, dates, raisins, olives, almonds, gum arabic and sandarach. The inhabitants of Morocco are likewise said to carry on a considerable trade by caravans to Mecca, Medina, and some inland parts of Africa, from whence they bring back vast numbers of negroes, who serve in their armies, and are slaves in their houses and fields.

In return for their exports, the Europeans furnish them with timber, artillery of all kinds, gunpowder, and whatever they want, either in their public or private capacities. The duties paid by the English in the ports of Morocco, are but half of those paid by other Europeans. It is a general observation, that no nation is fond of trading with these states, not only on account of their capricious despotism, but the villany of their individuals, both natives and Jews, many of whom take all opportunities of cheating, and, when detected, are seldom punished.

It has been often thought surprising, that the Christian powers should suffer their marine to be insulted by these barbarians, who take the ships of all nations with whom they are at peace, or rather, who do not pay them a subsidy either in money or commodities. We cannot account for this forbearance otherwise than by supposing, first, that a breach with them might provoke the Porte, who pretends to be the lord paramount; secondly, that no Christian power would be fond of seeing Algiers, and the rest of that coast, in possession of another; and, thirdly, that nothing could be got by a bombardment of any of their towns, as the inhabitants would instantly carry their effects into the deserts and mountains, so that the benefit resulting from the conquest must be tedious and precarious.—Indeed, expeditions against Algiers have been undertaken by the Spaniards, but they were ill-conducted and unsuccessful, as before noticed.

**CONSTITUTION AND GOVERNMENT.]** In Morocco, government cannot be said to exist. The emperors have for some ages been parties, judges, and even executioners with their own hands, in all criminal matters: nor is their brutality more incredible than the submission with which their subjects bear it. In the absence of the emperor, every military officer has the power of life and death in his hand, and it is seldom that they regard the form of a judicial proceeding. Some vestiges,

however, of the caliphate government still continue; for in places where no military officer resides, the mufti or high-priest is the fountain of all justice, and under him the cadis, or civil officers, who act as our justices of the peace. Though the emperor of Morocco is not immediately subject to the Porte, yet he acknowledges the Grand-signor to be his superior, and he pays him a distant allegiance as the chief representative of Mahomed. What has been said of Morocco is applicable to Fez, both kingdoms being now under one emperor.

Though Algiers, Tunis, and Tripoli have each of them a Turkish pasha or dey, who governs in the name of the Grand-signor, yet very little regard is paid by his ferocious subjects to his authority. He cannot even be said to be nominated by the Porte. When a vacancy of the government happens, which it commonly does by murder, every soldier in the army has a vote in choosing the succeeding dey; and though the election is often attended with bloodshed, yet it is no sooner fixed than he is cheerfully recognised and obeyed. It is true, he must be confirmed by the Porte; but that is seldom refused, as the divan is no stranger to the dispositions of the people. The power of the dey is despotic; and the income of the dey of Algiers amounts to about 150,000*l.* a year, without greatly oppressing his subjects, who are very tenacious of their property. These deys pay slight annual tributes to the Porte. When the Grand-signor is at war with a Christian power, he requires their assistance, as he does that of the king of Morocco; but he is obeyed only as they think proper. Subordinate to the deys are officers, both military and civil; and in all matters of importance the dey is expected to take the advice of a common council which consists of thirty pashas. These pashas seldom fail of forming parties amongst the soldiers, against the reigning dey, whom they make no scruple of assassinating, even in council; and the strongest candidate then fills the place. Sometimes he is deposed; sometimes, though but very seldom, he resigns his authority to save his life, and it is seldom he dies a natural death upon the throne. The authority of the dey is unlimited; but an unsuccessful expedition, or too pacific a conduct, seldom fails to put an end to his life and government.

**REVENUES.]** Those of Algiers have been already mentioned, but they are now said to be exceeded by those of Tunis. They consist of a certain proportion of the prizes taken from Christians, a small capitation tax, and the customs paid by the English, French, and other nations, who are suffered to trade with those states. As to the king of Morocco, we can form no idea of his revenues, because none of his subjects can be said to possess any property. From the manner of his living, his attendance, and appearance, we may conclude he does not abound in riches. The ransom of Christian slaves are his perquisites. He sometimes shares in the vessels of the other states, which entitles him to part of their prizes. He claims a tenth of the goods of his Mahomedan subjects, and six crowns a year from every Jew merchant. He has likewise considerable profits in the Negroland and other caravans, especially the slave-trade towards the south. It is thought that the whole of his ordinary revenue, in money, does not exceed 165,000*l.* a year. A detachment of the army of these states is annually sent into each province to collect the tribute from the Moors and Arabs; and the prizes they take at sea sometimes equal the taxes laid upon the natives.

mounted by his negro slaves. Those wretches are brought young to Morocco, know no other state but servitude, and no other master but that king, and prove the firmest support of his tyranny. About the year 1727, all the naval force of Morocco consisted only of three small ships, which lay at Sallee, and, being full of men, sometimes brought in prizes. The Algerines maintain about 6500 foot, consisting of Turks and collegies, or the sons of soldiers. Part of them serve as marines on board their vessels. About 1000 of them do garrison duty, and part are employed in fomenting differences among the neighbouring Arab princes. Besides these, the dey can bring 2000 Moorish horse into the field; but, as they are enemies to the Turks, they are little trusted. Those troops are under excellent discipline, and the deys of all the other Barbary states maintain a force in proportion to their abilities; so that a few years ago they refused to send any tribute to the Turkish emperor, who seems to be satisfied with the shadow of obedience which they pay him.

It is very remarkable, that though the Carthaginians, who inhabited this very country of Barbary, had greater fleets and more extensive commerce than any other nation, or than all the people upon the face of the earth, when that state flourished, the present inhabitants have scarcely any merchant ships belonging to them, nor indeed any other than what Sallee, Algiers, Tunis, and Tripoli fit out for piracy; which, though increased since the last attack of the Spaniards, are now but few and small, and some years ago did not exceed six ships, from thirty six to fifty guns. The admiral's ship belongs to the government; the other captains are appointed by private owners, but subject to military law. With such a contemptible fleet, these infidels not only harass the nations of Europe, but oblige them to pay a kind of tribute by way of presents.

**HISTORY.]** Under the Roman emperors, the states of Barbary formed the fairest jewels in the imperial diadem. It was not till the seventh century that, after these states had been by turns in possession of the Vandals and the Greek emperors, the caliphs or Saracens of Bagdad conquered them, and from thence became masters of almost all Spain, from whence their posterity was totally driven about the year 1492, when the exiles settled among their friends and countrymen on the Barbary coast. This naturally begot a perpetual war between them and the Spaniards, who pressed them so hard, that they called to their assistance the two famous brothers Barbarossa, who were admirals of the Turkish fleet, and who, after breaking the Spanish yoke, imposed upon the inhabitants of all those states (excepting Morocco) their own. Some attempts were made by the emperor Charles V. to reduce Algiers and Tunis, but they were unsuccessful; and, as observed, the inhabitants have in fact shaken off the Turkish yoke likewise.

The emperors or kings of Morocco are the successors of those sovereigns of that country who were called xeriffs, and whose powers resembled that of the caliphate of the Saracens. They have been, in general, a set of bloody tyrants; though they have had among them some able princes, particularly Mul-y Mqluc, who defeated and killed Don Sebastian, king of Portugal. They have lived in almost a continual state of warfare with the kings of Spain and other Christian princes ever since: nor does the crown of Great Britain sometimes disdain, as in the year 1769, to purchase their friendship with presents.

## ABYSSINIA.

### SITUATION AND EXTENT.

Miles.	}	between	}	Degrees.	}	Sq. Miles.
Length 920	}	}	}	6 and 20 North latitude.	}	378,000
Breadth 900	}	}	}	26 and 44 East longitude.	}	

**BOUNDARIES.]** IT is bounded on the North by the kingdom of Sennaar, or Nubia; on the East partly by the Red Sea, and partly by Duncala; on the West, by Gorham; and on the South, by the kingdom of Gingiro, and Alaba.

It contains (according to Mr. Bruce, from whom the following account is chiefly taken) the following provinces, viz.

1. Mafuah; 2. Tigre; 3. Samen; 4. Begemder; 5. Amhara; 6. Wailaka; 7. Gojam; 8. Damot; 9. Maifha; 10. Dembea; 11. Kuara; 12. Nara.

**AIR AND SEASONS.]** The rainy season continues for six months of the year, from April to September, which is succeeded, without interval, by a cloudless sky and vertical sun; and cold nights, which immediately follow these scorching days. The earth, notwithstanding the heat of these days, is yet perpetually cold, so as to feel disagreeably to the soles of the feet; partly owing to the six months' rain, when no sun appears, and partly to the perpetual equality of nights and days.

**QUADRUPEDS.]** There is no country in the world which produces a greater number or variety of quadrupeds, whether tame or wild, than Abyssinia: Of the tame or cow-kind, great abundance present themselves every where, differing in size, some having horns of various dimensions, some without horns at all; differing also in the colour and length of their hair.

Among the wild animals are prodigious numbers of the gazel or antelope kind; the bohur, fassa, feeho, and madequa, and many others. The hyæna is still more numerous. There are few varieties of the dog or fox kind. Of these the most numerous is the deep, or, as he is called, the jackal; this is precisely the same in all respects as the deep of Barbary and Syria, who are heard hunting in great numbers, and howling in the evening and morning. The wild boar, smaller and smoother in the hair than that of Barbary or Europe, but differing in nothing else, is met frequently in swamps or banks of rivers covered with wood.

The elephant, rhinoceros, giraffa, or camelopardalis, are inhabitants of the low hot country; nor is the lion, leopard, or saadh, which is the panther, seen in the high and cultivated country. The hippopotamus and crocodile abound in all the rivers, not only of Abyssinia, but as low down as Nubia and Egypt. There are many of the ass kind in the low country towards the frontiers of Abarah, but no zebras; these are the inhabitants of Fazuelo and Narea.

But of all the other quadrupeds, there is none exceeds the hyæna for its merciless ferocity. They were a plague, says our author, speaking of these animals, in Abyssinia, in every situation, both in the city and the field, and I think surpassed the sheep in number. Gondar was full of them from the time it turned dark to the dawn of day, seeking the different pieces of slaughtered carcasses which this cruel and unclean people expose in the streets without burial.

It is a constant observation in Numidia, that the lion avoids and flies from the face of man, till by some accident they have been brought to

engage, and the beast has prevailed against him; then that feeling of superiority imprinted by the Creator in the heart of all animals for man's preservation, seems to forsake him. The lion, having once tasted human blood, relinquishes the pursuit after the flock. He repairs to some highway or frequented path, and has been known, in the kingdom of Tunis, to interrupt the road to a market for several weeks; and in this he persists till hunters or soldiers are sent out to destroy him.

**BIRDS.]** The number of birds in Abyssinia exceeds that of other animals beyond proportion. The high and low countries are equally stored with them: the first kind are the carnivorous birds. Many species of the eagle and hawk, many more still of the vulture kind, as it were, over-stock all parts of the country. That species of glede called had-daya, so frequent in Egypt, comes very punctually into Ethiopia, at the return of the sun, after the tropical rains. The nissar, or golden eagle, is not only the largest of the eagle kind, but one of the largest birds that flies. From wing to wing he is eight feet four inches. The black eagle rachamah, erkoom, moroc, theregrig, and waalia, are particularly described by the historian of Abyssinia, to whose celebrated work we refer the reader who is desirous of information concerning them.

There is no great plenty of water-fowl in Abyssinia, especially of the web-footed kind. Vast variety of storks cover the plains in May, when the rains become constant. All the deep and grassy bogs have snipes in them; and there are swallows of many kinds unknown in Europe; those that are common in Europe appear in passage at the very season when they take their flight from thence. There are few owls in Abyssinia; but those are of an immense size and beauty. There are no geese, wild or tame, excepting what is called the Golden Goose, Goose of the Nile, or Goose of the Cape, common in all the South of Africa: these build their nests upon trees, and, when not in water, generally sit upon them.

**INSECTS.]** From the class of insects, we shall select the most remarkable, viz. the tsaltsalya, or fly, which is an insect that furnishes a striking proof how fallacious it is to judge by appearances. If we consider its small size, its weakness, want of variety or beauty, nothing in the creation is more contemptible or insignificant. Yet passing from these to his history, and to the account of his powers, we must confess the very great injustice we do him from want of consideration. We are obliged, with the greatest surprise, to acknowledge, that those huge animals, the elephant, the rhinoceros, the lion, and tiger, inhabiting the same woods, are still vastly his inferiors, and that the appearance of this small insect, nay, his very sound, though he is not seen, occasions more trepidation, movement, and disorder, both in the human and brute creation, than would whole herds of these monstrous animals collected together, though their number was in a ten-fold proportion greater than it really is.

This insect has not been described by any naturalist. It is in size very little larger than a bee, of a thicker proportion. As soon as this plague appears, and their buzzing is heard, all the cattle forsake their food, and run wildly about the plain, till they die, worn out with fatigue, fright, and hunger. No remedy remains but to leave the black earth, and hasten down to the far's of Atbara; and there they remain while the rains last, this cruel enemy never daring to pursue them farther. Though the size of the camel is immense, his strength vast, and his body covered with a thick skin, defended with strong hair, yet still he is not capable to sustain the violent punctures the fly makes with his

pointed proboscis. He must lose no time in removing to the sands of Atbara; for, when once attacked by this fly, his body, head, and legs break out into large bosses, which swell, break, and putrify, to the certain destruction of the creature.

**VEGETABLE PRODUCTIONS.]** The *Papyrus*, which is a plant well known in Egypt, appears to have been early brought thither from Ethiopia. It is also found in Abyssinia. *Baleffar*, *Balm*, or *Balsam*, is also a native of Abyssinia. The great value set upon this drug in the East, remounts to very early ages. We know from Scripture, the oldest history extant, as well as the most infallible, that the Ishmaelites, or Arabian carriers and merchants; trafficking with the India commodities, into Egypt, brought with them balm as a part of the cargo.—The *Ensete* is an herbaceous plant, which grows and comes to great perfection at Gondar, but it mostly abounds in that part of Maitsha and Gousto west of the Nile, where there are large plantations of it, and is there, almost exclusive of every thing else, the food of the Galla inhabiting that province. When soft, like the turnep well-boiled, if eaten with milk or butter, it is the best of food, wholesome, nourishing, and easily digested. The *Teff* is a grain commonly sown all over Abyssinia, where it seems to thrive equally on all sorts of ground; from it is made the bread which is commonly used throughout this country. The Abyssinians indeed have plenty of wheat, and some of it of an excellent quality. They likewise make as fine wheat-bread as any in the world, both for colour and taste; but the use of wheat-bread is chiefly confined to people of the first rank. The acacia tree is very common in Abyssinia, as are several other curious productions of the vegetable world.

**LAKES.]** The lake of Tzana (not to mention those of Gooderoo, and Court Ohha) is by much the largest expanse of water known in this country. Its extent, however, has been greatly exaggerated. Its greatest breadth is thirty-five miles, and its extent in length is forty-nine. The Nile, by a current always visible, crosses the end of it. In the dry months, from October to March, the lake shrinks greatly in size; but after that all those rivers are full which are on every side of it, and fall into the lake, like radii drawn to a centre; it then swells, and extends itself into the plain country, and has, of course, a much larger surface.

There are about eleven inhabited islands in the lake. All these islands were formerly used as prisons for the great people, or for a voluntary retreat on account of some disgust or great misfortune, or as places of security to deposit their valuable effects during troublesome times.

**CATARACTS OF THE NILE.]** Omitting those of inferior note, we shall here give the reader some account of the great cataract of Alata, which was the most magnificent sight that Mr. Bruce ever beheld. The height has been rather exaggerated. The missionaries say the fall is about sixteen ells or fifty feet. The measuring is, indeed, very difficult; but by the position of long sticks, and poles of different lengths, at different heights of the rock, from the water's edge, Mr. Bruce thinks he may venture to say that it is nearer forty feet than any other measure. The river had been considerably increased by rains, and fell in one sheet of water, without any interval, above half an English mile in breadth, with a force and a noise that was truly terrible, and which stunned, and made him for a time perfectly dizzy. A thick fume or haze covered the fall all round, and hung over the course of the stream, both above and below, marking its track, though the water is not seen. The river, though swelled with rain, preserved its natural clearness, and fell, as far as he could discern, into a deep pool, or basin, in the solid rock,

which was full, and in twenty different eddies to the very foot of the precipice; the stream, when it fell, seeming part of it to run back with great fury upon the rock, as well as forward in the line of its course, raising a wave, or violent ebullition, by chasing against each other.

SOURCES OF THE NILE.] The Agows of Damot pay divine honours to the Nile; they worship the river, and thousands of cattle have been offered, and still are offered, to the spirit supposed to reside at the sources. The village of Geesh, though not farther distant than 600 yards, is not in sight of the sources of the Nile. In the middle of a marsh near the bottom of the mountain of Geeth, arises a hillock of a circular form, about three feet from the surface of the marsh itself, though apparently founded much deeper in it. The diameter of this is something short of twelve feet; it is surrounded by a shallow trench, which collects the water, and voids it eastward; it is firmly built with sod or earthen turf, brought from the sides, and constantly kept in repair, and this is the altar upon which all their religious ceremonies are performed. In the middle of this altar is a hole, obviously made, or at least enlarged, by the hand of man. It is kept clear of grafs or other aquatic plants, and the water in it is perfectly clear and limpid, but has no ebullition or motion of any kind discernible upon its surface. This mouth or opening of the source is some parts of an inch less than three feet in diameter, and the water stood about two inches from the lip or brim. The spring is about six feet six inches deep.

Ten feet distant from the first of these springs, is the sacred fountain, about eleven inches in diameter; but this is eight feet three inches deep. And about twenty feet distant from the first, is the third source, its mouth being something more than two feet large, and it is five feet eight inches deep. With a brass quadrant of three feet radius, he found the exact latitude of the principal fountain of the Nile to be  $10^{\circ} 59' 25''$ , though the Jesuits have supposed it  $12^{\circ}$  N. by a random guess. The longitude he ascertained to be  $36^{\circ} 55' 30''$  East of the meridian of Greenwich\*.

CAUSES OF THE INUNDATIONS OF THE NILE.] The sun being nearly stationary for some days in the tropic of Capricorn, the air there becomes so much rarefied, that the heavier winds, charged with watery particles, rush in upon it from the Atlantic on the west, and from the Indian Ocean on the east. Having thus gathered such a quantity of vapours as it were to a focus, the sun now puts them in motion, and drawing them after it in its rapid progress northward, on the 7th of January, for two years together, seemed to have extended its power to the atmosphere of Gondar, when, for the first time, there appeared in the sky, white, dappled, thin clouds, the sun being then distant  $34^{\circ}$  from the zenith, without any one cloudy or dark speck having been seen for several months before. Advancing to the line with increased velocity, and describing larger spirals, the sun brings on a few drops of rain at Gondar the 1st of March, being then distant  $5^{\circ}$  from the zenith; these are greedily absorbed by the thirsty soil; and this seems to be the far-

\* There is another branch of the Nile, called the *Bahr el abiad*, or White River; the sources of which, according to Mr. Browne, lie about ten days' journey south of the country of Dar-Fâr. The place is called Donga, and is the residence of a chief or king of an idolatrous nation. The country there is very mountainous, and in the spot where the river rises are said to be forty distinct hills; these are called Kumri. From them a great number of springs issue, which, uniting into one great channel, form the Bahr el abiad. The people are quite naked, black, and idolaters. The place is said to be twenty days removed from the confines of Bornou. All the road thither is mountainous. It lies in about 7 deg. north lat. and 25 deg. east lon.

theft extent of the fun's influence capable of caufing rain, which then only falls in large drops, and lafts but a few minutes: the rainy feafon, however, begins moft ferioufly upon its arrival at the zenith of every place, and thefe rains continue conftant and increafing after he has paffed it, in his progrefs north ward.

In April, all the rivers in Amhara, Begemder, and Lafta, are firft difcoloured, and then beginning to fwell, join the Nile, in the feveral parts of its courfe neareft them; the river then, from the height of its angle of inclination, forces itfelf through the ftagnant lake without mixing with it. In the beginning of May, hundreds of ftreams pour themfelves from Gojam, Damot, Maittha, and Dembea, into the lake Tzana, which had become low by intenfè evaporation, but now begins to fill infenfibly, and contributes a large quantity of water to the Nile, before it falls down the cataract of Alata. In the beginning of June, the fun having now paffed all Abyffinia, the rivers there are all full; and then is the time of the greateft rains in Abyffinia, while it is for fome days, as it were, ftationary in the tropic of Cancer.

Immediately after the fun has paffed the line, he begins the rainy feafon to the fouthward, ftill as he approaches the zenith of each place: but the fttuation and neceffities of this country being varied, the manner of promoting the inundation is changed. A high chain of mountains runs from above 6° fouth all along the middle of the continent towards the Cape of Good Hope, and interfefts the fouthern parts of the peninfula, nearly in the fame manner that the river Nile does the northern. A ftrohg wind from the fouth, ftopping the progrefs of the condenfed vapours, dafhes them againft the cold fummits of this ridge of mountains, and forms many rivers which efcape in the direftion either eaft or weft as the level prefents itfelf. If this is towards the weft, they fall down the fides of the mountains, into the Atlantic, and if on the eaft, into the Indian Ocean.

**CITIES AND TOWNS.] GONDAR**, the metropolis of Abyffinia, is ftuated upon a hill of confiderable height, the top of it nearly plain, on which the town is placed. It confifts of about ten thoufand families in time of peace; the houfes are chiefly of clay, the roofs thatched in the form of cones, which is always the conftruction within the tropical rains. On the weft of the town is the king's houfe, formerly a ftructure of confiderable confequence. It was a fquare building flanked with fquare towers. It was formerly four ftories high, and from the top of it had a magnificent view of all the country fouthward to the lake Tzana. Great part of this houfe is now in ruins, having been burnt at different times; but there is ftill ample lodging in the two loweft floors of it, the audience-chamber being above one hundred and twenty feet long.

The palace and all its contiguous buildings are furrounded by a fubftantial ftone wall thirty feet high, with battlements upon the outer-wall, and a parapet roof between the outer and inner, by which you can go along the whole, and look into the ftreets. There appear to have been never any embrafures for cannon, and the four fides of the walls are above an Englifh mile and a half in length. Gondar, by a number of obfervations of the fun and ftars made by day and night, in the courfe of three years, with an aftronomical quadrant of three feet radius, and two excellent telefcopes, and by a mean of all their fmall differences, is in N. lat. 12° 34' 30": and by many obfervations of the fatellites of Jupiter, efpecially the firft, both in their immerfions and emerfions

RELIGION. that in the tin

during that period, its longitude was found to be  $37^{\circ} 33' 0''$  east from the meridian of Greenwich.

DIXAN is the first town in Abyssinia, on the side of Taranta. Dixan is built on the top of a hill perfectly in form of a sugar-loaf; a deep valley surrounds it every where like a trench, and the road winds spirally up the hill till it ends among the houses. It is true of Dixan, as of most frontier towns, that the bad people of both contiguous countries resort thither. The town consists of Moors and Christians, and is very well peopled; yet the only trade of either of these sects is a very extraordinary one, that of selling children. The Christians bring such as they have stolen in Abyssinia to Dixan as to a sure deposit; and the Moors receive them there, and carry them to a certain market at Masuah, whence they are sent over to Arabia or India. The priests of the province of Tigré, especially those near the rock Damo, are openly concerned in this infamous practice. Dixan is in lat.  $14^{\circ} 57' 55''$  north, and long.  $40^{\circ} 7' 30''$  east of the meridian of Greenwich.

AXUM is supposed to have been once the capital of Abyssinia, and its ruins are now very extensive; but, like the cities of ancient times, consist altogether of public buildings. In one square, which seems to have been the centre of the town, there are forty obelisks, none of which have any hieroglyphics upon them. They are all of one piece of granite, and, on the top of that which is standing, there is a *patera*, exceedingly well carved, in the Greek taste. Axum is watered by a small stream, which flows all the year from a mountain in the narrow valley where stand the rows of obelisks. The spring is received into a magnificent basin 150 feet square, and thence it is carried at pleasure, to water the neighbouring gardens, where there is little fruit excepting pomegranates, neither are these very excellent. The latitude of this town is  $14^{\circ} 6' 36''$  north.

MASUAH. The houses of this town, which is situated upon an island bearing the same name, on the Abyssinian shore of the Red Sea, are in general built of poles and bent grass, as in the towns of Arabia; but besides these, there are about twenty of stone, six or eight of which are two stories each. N. lat.  $15^{\circ} 35' 5''$  E. long.  $39^{\circ} 36' 30''$ .

TRADE AND COMMERCE.] There is a considerable deal of trade carried on at Masuah, narrow and confined as the island is, and violent and unjust as is the government. But it is all done in a slovenly manner, and for articles where a small capital is invested. Property here is too precarious to risk a venture in valuable commodities, where the hand of power enters into every transaction.

Gondar, and all the neighbouring country, depend for the necessaries of life, cattle, honey, butter, wheat, hides, wax, and a number of such articles, upon the Agows, who inhabit a province in which the sources of the Nile are found, and which province is no where sixty miles in length, nor half that in breadth. These Agows come constantly in succession, a thousand or fifteen hundred at a time, loaded with these commodities to the capital.

It may naturally occur, that, in a long carriage, such as that of a hundred miles in such a climate, butter must melt, and be in a state of fusion, consequently very near putrefaction: this is prevented by the root of an herb, called Moc-moco, yellow in colour, and in shape nearly resembling a carrot; this they bruise and mix with their butter, and a very small quantity preserves it fresh for a considerable time.

RELIGION.] Mr. Bruce informs us, from the Annals of Abyssinia, that in the time of Solomon all this country was converted to Judaism,

and the government of the church and state modelled according to what was then in use at Jerufalem.

Some ecclesiastical writers, rather from attachment to particular systems, than from any conviction that the opinion they espouse is truth, would persuade us, that the conversion of Abyssinia to Christianity happened in the days of the apostles; but it appears that this was effected by the labours of Frumentius (the apostle of the Abyssinians) in the year of Christ 333, according to our account.

Their first bishop, Frumentius being ordained about the year 333, and instructed in the religion of the Greeks of the church of Alexandria, by St. Athanasius, then sitting in the chair of St. Mark; it follows that the true religion of the Abyssinians, which they received on their conversion to Christianity, is that of the Greek church. They receive the holy sacrament in both kinds, in unleavened bread, and in the grape bruised with the husk together as it grows, so that it is a kind of marmalade, and is given in a flat spoon. They observe also circumcision.

**HISTORY.]** As the accounts of kings and princes of remote ages are not always entertaining, and as the history of so barbarous and uncivilised a people will, we presume, afford but small amusement to our readers, whatever satisfaction they may have received from surveying the manners and customs of the people, and the natural history of the country; we shall therefore make no farther apology for omitting the account of the annals of Abyssinia, but refer those who have any desire of information upon this subject, to the second volume of the Travels of our adventurous author, where they will find a very ample detail through more than 700 pages of a ponderous quarto.

## INTERIOR COUNTRIES OF AFRICA;

FEZZAN, BORNOU, CASHNA, TOMBUCTOO, HOUSSA,  
DAR-FUR, &c.

**IT** having been long a subject of complaint that Europeans know very little, if any thing, of the *interior districts* of Africa, a number of learned and opulent individuals formed themselves into a society for the purpose of exploring them. The association was formed on the 9th of June, in the year 1788; and on the same day a committee of its members, viz. *Lord Rawdon, the bishop of Llandaff, Sir Joseph Banks, Mr. Beaufoy, and Mr. Stuart,* were invested with the direction of its funds, the management of the correspondence, and the choice of the persons to whom the geographical mission was to be assigned. Persuaded of the importance of the object which the association had in view, their committee lost no time in executing the plan which it had formed. Two gentlemen were recommended to them; and, appearing to be eminently qualified for making the projected researches, they were chosen. One was *Mr. Ledyard*; the other a *Mr. Lucas*.

Such a person as *Mr. Ledyard* was formed by nature for the object in contemplation: and, were we unacquainted with the sequel, we should congratulate the Society on being so fortunate as to find such a man for

It describes th

one of their missionaries : but the reader will soon be acquainted with the melancholy circumstance to which we allude.

\* From two such geographical missionaries (observes a very respectable literary journalist\*) much information was no doubt expected; and though the views of the society were not yet fully answered, the communications which it has received are of a nature which will excite, though not fully gratify, the curiosity of geographers.

\* Mr. Ledyard undertook, at his own desire, the difficult and perilous task of traversing from east to west, in the latitude attributed to the Niger, the widest part of the continent of Africa. On this bold adventure he left London, June 30, 1788, and arrived at Cairo on the 19th of August.

\* Hence he transmitted such accounts to his employers as manifest him to have been a traveller who observed, reflected, and compared; and such was the information which he collected here from the travelling slave-merchants, and from others, respecting the interior districts of Africa, that he was impatient to explore them. He wrote to the committee, that his next communication would be from Sennaar (600 miles to the south of Cairo): but death, attributed to various causes, arrested him at the commencement of his researches, and disappointed the hopes which were entertained of his projected journey.

\* Endowed with a soul for discovery, and formed by nature for achievements of hardihood and peril, the death of Mr. Ledyard must be considered as a public misfortune.

\* With a mixture of regret and disappointment, we turn from poor Ledyard, to notice Mr. Lucas's communications, which occupy the greatest part of the volume published by the association. He embarked for Tripoli, October 18, 1788, with instructions to proceed over the Desert of Zahara to Fezzan, to collect, and to transmit by way of Tripoli, whatever intelligence the people of Fezzan, or the traders thither, might be able to afford respecting the interior of the continent; and to return by the way of Gambia, or the coast of Guinea.

\* Instructions to undertake great enterprises are more easily given than executed. So Mr. Lucas found; and so the reader, to his disappointment, will find likewise. Only a part of the plan was this geographical missionary able to carry into execution. He sets out, indeed, mounted on a handsome mule, presented to him by the bey, the bathaw's eldest son, in company with sheerefs, for the kingdom of Fezzan: resolved, we will suppose, to penetrate from Tripoli even unto Gambia: but his peregrinations, which began Feb. 1, 1798, terminated at Mesurata on Feb. 7:

\* Deprived of visiting Fezzan, and the other inland districts of Africa, Mr. Lucas solicits the information of his fellow travellers, and transmits to the society the result of his conferences. A memoir compiled in this way, from the reports of a thereof Imhammed, will not be deemed very satisfactory; and yet it certainly merits consideration, as it is in part corroborated by other testimonies.\*

Having no other sources of information, however, we must, for the present, content ourselves with these communications. From the various conferences of Mr. Lucas with the thereof Imhammed, the following narrative is composed:

\* It describes the kingdom of Fezzan to be a small circular domain,

\* Monthly Review, new Series, vol. ii. p. 63.

placed in a vast wilderness, as an island in the midst of the ocean, containing near a hundred towns and villages, of which Mourzook is the capital, distant, south from Mesurata, about 390 miles. In this kingdom are to be seen some venerable remains of ancient magnificence, some districts of remarkable fertility, and numerous smoking lakes, producing a species of fossil alkali called *irona*. Agriculture and pasturage are the principal occupations of the Fezzaners; they do not appear to have any coin; their medium of commerce is gold-dust; their houses, or rather huts, are built of clay, and are covered with branches of trees, on which earth is laid. As rain never falls at Fezzan, this covering is a sufficient protection. Their dress resembles that of the Moors of Barbary: but, during the heats of summer, which are intense, they only wear drawers, and a cap to protect their heads from the immediate action of the sun. To these, many particulars are added of their persons, diseases, and mode of cure; of their religion, government, taxes, animal and vegetable productions. Their sovereign, who is a tributary of the bashaw of Tripoli, administers impartial justice.

The narrative proceeds to state, that south-east of Mourzook, at the distance of 150 miles, is a sandy desert, 200 miles wide; beyond which are the mountains of Tibessi, inhabited by ferocious savages, tributary to Fezzan. The valleys between the mountains are said to be fertilised by innumerable springs, to abound with corn, and to be celebrated for their breed of camels. The tribute of the Tibellins to the king of Fezzan is twenty camel-loads of senna.

This kingdom is inconsiderable, when compared with the two great empires of Bornou and Cashna, or Kassina, which lie south of Fezzan, occupying that vast region which spreads itself from the river of the Antelopes for 1200 miles westward, and includes a great part of the Niger's course. Cashna, or Kassina, we are informed, contains a thousand towns and villages; and in Bornou, which is still more considerable, thirty languages are said to be spoken. The latter is represented as a fertile and beautiful country; its capital being situated within a day's journey of the river *Wod-el-Gazel*, which is lost in the sandy wastes of the vast desert of Bilma, and is inhabited by herdsmen, dwelling, like the old patriarchs, in tents, and whose wealth consists in their cattle\*. (Bornou, or Bernoa, is a word signifying the land of Noah; for the Arabs conceive, that, on the retiring of the deluge, its mountains received the ark.) Though they cultivate various sorts of grain, the use of the plough is unknown; and the hoe is the only instrument of husbandry. Here grapes, apricots, and pomegranates, together with limes and lemons, and two species of melons, the water and the nut, are produced in large abundance; but one of the most valuable of its vegetables is a tree called kedeyna, which in form and height resembles the olive, is like the lemon in its leaf, and bears a nut, of which the kernel and the shell are both in great estimation, the first as a fruit, the last on account of the oil which it furnishes when bruised, and which supplies the lamps of the people of Bornou with a substitute for the oil of olives, p. 139. Bees, it is added, are so numerous, that the wax is often thrown away as an article of no value in the market. Many other particulars are added, for which we must refer to the work. The population is described by the expression, *a countless multitude*. We shall pass over the nature of their religion, which is Mohammedan; of their

the kingdoms o

government, which is an elective monarchy; and the singular mode of their electing a new king from among the children of the deceased sovereign: but the account of the present sultan, his wives, and his children (p. 227) is too curious not to be exhibited.

The present sultan, whose name is Ali, is a man of an unostentatious, plain appearance; for he seldom wears any other dress than the common blue shirt of cotton or silk, and the silk or muslin turban, which form the usual dress of the country. Such, however, is the magnificence of his seraglio, that the ladies who inhabit it are said to be 500 in number, and he himself is described as the reputed father of 350 children, of whom 300 are males; a disproportion which naturally suggests the idea that the mother, preferring to the gratification of natural affection the joy of seeing herself the supposed parent of a future candidate for the empire, sometimes exchanges her female child for the male offspring of a stranger.

We are told that fire-arms, though not unknown to the people of Bornou, are not possessed by them.

South-east from Bornou, lies the extensive kingdom of begarmee; and, beyond this kingdom, are said to be several tribes of negroes, idolaters, and feeders on human flesh. These, we are told, are annually invaded by the Begarmee; and when they have taken as many prisoners as their purpose may require, they drive the captives, like cattle, to Begarmee. It is farther said, that if any of them, exhausted by fatigue, happen to linger in their pace, one of the horsemen seizes on the oldest, and, cutting off his arm, uses it as a club to drive on the rest.

We are not much disposed to give credit to this relation. That the negroes, who are sold for slaves, are different from the other Africans, is not probable; and that they should be driven along with the mangled limbs of their associates, utterly exceeds belief.

The empire of Cashna bears a great resemblance to that of Bornou.

After perusing what is here related of the extent, population, fertility, manufactures, and commerce of these regions, we may be permitted to wonder at their having remained altogether unknown to Europeans. We cannot but suspect considerable exaggerations. That the interior parts of Africa are peopled, the caravans which go from Cairo and Tripoli, and which are often absent three years, sufficiently evince: but that they are divided into regular and civilised states, may be a question. *A thousand towns and villages* in one empire, and *thirty different languages* spoken in the other, manifest a disposition in the sheeref Imhammed to enlargement, or, at least, to retail loose reports. That they should be acquainted with, yet not possess fire-arms, nor make any attempt to navigate the Niger, nor even to take the fish that abound in its waters, but little accords with the history of their commerce, and of their progress in manufactures.

Under the patronage of the same society for making discoveries in the interior countries of Africa, Mr. Mungo Park has since performed a journey eastward, from the mouth of the Gambia to Silla, on the river Niger, above a thousand miles from the Atlantic; and, to use the words of major Rennell, brought to our knowledge more important facts respecting the geography of western Africa, both moral and physical, than have been collected by any former traveller.

Mr. Park set out from Pisania (a British factory on the banks of the Gambia) on the 2d of December 1795, and took his route through the kingdoms of Woolli, Bondou, Kajaaga, Kassou, Kaarta, and Lu-

damar, to Bambarra. The country of Woolli, he tells us, every where rises into gentle acclivities, which are generally covered with extensive woods, and the towns are situated in the intermediate valleys; the chief productions are cotton, tobacco, and different kinds of corn. Medina, the capital of this kingdom, is a place of considerable extent, and may contain from eight hundred to a thousand houses. The country of Bondou, like that of Woolli, is very generally covered with woods; but in native fertility, in the opinion of our traveller, is not surpassed by any part of Africa. The name of the capital of this country is Fatteconda. The inhabitants are of the tribe of the Foulahs, who are in general of a tawny complexion, with small features, and soft silky hair. The Foulahs of Bondou are naturally of a mild and gentle disposition; but they evidently consider all the negro natives as their inferiors; and, when talking of different nations, always rank themselves among the white people. In Kayaaga, the next kingdom, the air and climate are more pure and salubrious than at any of the settlements towards the coast; the face of the country is every where interspersed with a pleasing variety of hills and valleys; and the windings of the Senegal river, which descends from the rocky hills of the interior, make the scenery on its banks very picturesque and beautiful. The inhabitants are called Serawoolies, or, as the French write it, Seracolets. Their complexion is a jet black; their government is a despotic monarchy; and they are habitually a trading people. In the kingdom of Kasson, of which Kooniakarry is the capital, from the top of a high hill Mr. Park had an enchanting prospect of the country. The number of towns and villages, and the extensive cultivation around them, surpassed every thing he had yet seen in Africa. A gross calculation may be formed of the number of inhabitants in this delightful plain, from the fact, that the king of Kasson can raise four thousand fighting men by the sound of his war-drum. At Kemmoo, the capital of Kaarta, Mr. Park had an audience of the king, who advised him to return to Kasson; telling him it was not in his power at present to afford him much assistance, for that all kind of communication between Kaarta and Bambarra had been interrupted for some time past, in consequence of a war between the two kingdoms. Our traveller, however, resolved to continue his journey, and proceeded to Jarra, a town in the kingdom of Ludamar, whence he sent presents to Ali, the sovereign, then encamped at Benowm, requesting permission to pass through his territories. Several days afterwards, one of Ali's slaves arrived with instructions, as he pretended, to conduct him as far as Goomba, on the farther frontier; but, before he arrived there, he was seized by a party of Moors, who conveyed him to Ali at Benowm, who detained him a prisoner more than three months. He, however, at length found means to make his escape, in the confusion which ensued, in consequence of the success of the army of the king of Kaarta, who had invaded the country. His joy at his escape, he tells us, it is impossible to describe; but he soon found that his real situation was distressful in the extreme. He was in the midst of a barren wilderness; and, after travelling a long time, exposed to the burning heat of the sun, reflected with double violence from the hot sand, his suffering from thirst became so intolerable, that he fainted on the sand, and expected the immediate approach of death. Nature, however, at length resumed its functions; and, on recovering his senses, he found the sun just sinking behind the trees, and the evening become somewhat cool. It soon after rained plentifully for more than an hour, and he quenched his thirst by wringing and sucking his clothes, by

which he was sufficiently relieved to enable him to pursue his journey; and, after travelling several days more, he at length came in sight of one of the principal objects pointed out for his research,—the river Niger. “I saw,” says he, “with infinite pleasure, the great object of my mission—the long-sought-for majestic Niger, glittering to the morning sun, as broad as the Thames at Westminster, and flowing slowly to the eastward. I hastened to the brink, and, having drank of the water, lifted up my fervent thanks in prayer to the Great Ruler of all things, for having thus far crowned my endeavours with success.”

He had now reached Sego, the capital of Bambarra, which he thus describes:—“Sego, properly speaking, consists of four distinct towns; two on the northern bank of the Niger, and two on the southern. They are all surrounded with high mud walls: the houses are built of clay, of a square form, with flat roofs; some of them have two stories, and many of them are white-washed. Besides these buildings, Moorish mosques are seen in every quarter; and the streets, though narrow, are broad enough for every useful purpose, in a country where wheel-carriages are entirely unknown. From the best inquiries I could make, I have reason to believe that Sego contains, altogether, about thirty thousand inhabitants. The view of this extensive city, the numerous canoes upon the river, the crowded population, and the cultivated state of the surrounding country, formed altogether a prospect of civilization and magnificence which I little expected to find in the bosom of Africa.—Sego is situate, as nearly as can be ascertained, in north lat. 14. deg. 10 min: west lon. 2 deg. 26 min.”

From Sego, Mr. Park continued his journey along the banks of the Niger to Silla, a large town about eighty miles to the east of Sego; and here, the tropical rains being set in, his finances expended, and various other difficulties concurring to render his farther progress extremely dangerous if not impracticable, he terminated his travels to the eastward “at a point (says major Rennell) somewhat more than sixteen degrees east of Cape Verd, and precisely in the same parallel. The line of distance arising from this difference of longitude is about 941 geographical miles, or 1090 British, within the western extremity of Africa; a point which, although short by 200 miles of the desired station Tombuctoo, the attainment of which would unquestionably have been attended with great *eclat*, was yet far beyond what any other European, whose travels have been communicated to the European world, had ever reached.”

Mr. Park gives the following account of Tombuctoo and Houssa, from the information he was able to collect concerning those cities, at Sego, and in the course of his journey.

“To the north-east of Masina (a kingdom on the northern bank of the Niger, at a short distance from Silla) is situated the kingdom of Tombuctoo, the great object of European research; the capital of this kingdom being one of the principal marts for that extensive commerce which the Moors carry on with the Negroes. The hopes of acquiring wealth in this pursuit, and zeal for propagating their religion, have filled this extensive city with Moors and Mahomedan converts; the king himself and all the chief officers of state are Moors; and they are said to be more severe and intolerant in their principles than any other of the Moorish tribes in this part of Africa. I was informed by a venerable old negro, that when he first visited Tombuctoo, he took up his lodging at a sort of public inn, the landlord of which, when he conducted him into his hut, spread a mat on the floor, and laid a rope upon it, saying: ‘If you

are a Mussulman, you are my friend; sit down: but if you are a Kafir (infidel), you are my slave, and with this rope I will lead you to market.' The present king of Tombuctoo is named Abu Ahrâhima. He is reported to possess immense riches. His wives and concubines are said to be clothed in silk, and the chief officers of state live in considerable splendor. The whole expence of his government is defrayed, as I was told, by a tax upon merchandise, which is collected at the gates of the city.

"The city of Houffa (the capital of a large kingdom to the eastward of Tombuctoo) is another great mart for Moorish commerce. I conversed with many merchants who had visited that city; and they all agreed that it is larger and more populous than Tombuctoo. The trade, police, and government, are nearly the same in both; but, in Houffa, the Negroes are in greater proportion to the Moors, and have some share in the government."

Mr. Park was likewise told by a sheeref who resided at Walet, the capital of the kingdom of Beeroo, to the northward of Sego, and who had visited Houffa, and lived some years at Tombuctoo, "that Houffa was the largest town he had ever seen: that Walet was larger than Tombuctoo; but being remote from the Niger, and its trade consisting chiefly of salt, it was not so much resorted to by strangers: that between Benown and Walet was ten days journey, but the road did not lead through any remarkable towns, and travellers supported themselves by purchasing milk from the Arabs, who keep their herds by the watering places: two of the days' journey was over a sandy country without water. From Walet to Tombuctoo was eleven days more; but water was more plentiful, and the journey was usually performed upon bullocks. He said there were many Jews at Tombuctoo but they all spoke Arabic, and used the same prayers as the Moors."

The city of Tombuctoo is placed by major Rennell, from a comparison of all the accounts received of it, in north latitude  $16^{\circ} 30'$ ; east longitude  $1^{\circ} 33'$ .

We shall here add a short account of the country of Dar-Fûr, another kingdom of the interior of Africa lately visited by Mr. Browne. "Dar-Fûr, or the country of Fûr, is situated to the south of Egypt and Nubia, and to the west of Abyssinia. Cobbé, its capital, stands, according to Mr. Browne, in north latitude  $14^{\circ} 11'$ ; east longitude  $28^{\circ} 8'$ . In Dar-Fûr wood is found in great quantity, except where the rocky nature of the soil absolutely impedes vegetation; nor are the natives assiduous completely to clear the ground, even where it is designed for the cultivation of grain. The perennial rains, which fall here from the middle of June till the middle of September in greater or less quantity, but generally both frequent and violent, suddenly invest the face of the country, till then dry and sterile, with a delightful verdure. The tame animals in Dar-Fûr are camels, horses, sheep, oxen, and dogs; the wild ones, lions, leopards, lyenas, wolves, jackals, and elephants, which in the places they frequent, go, according to report, in large herds of four or five hundred; it is even said that two thousand are sometimes found together. The antelope and ostrich are also extremely common. The population of the country Mr. Browne estimates at 200,000 souls: Cobbé, the capital, he thinks does not contain more than 6,000 inhabitants. This town is more than two miles in length, but very narrow; and the houses, each of which occupies within its inclosure a large portion of ground, are divided by considerable waste. The walls of the houses are of clay, and the people of higher rank cover them with a kind of plaster, and

colour them white, red, and black. The disposition of the people of Dar-Fûr is more cheerful than that of the Egyptians. Dancing is practised by the men as well as the women, and they often dance promiscuously. But the vices of thieving, lying and cheating in bargains, are here almost universal. No property, whether considerable or trifling, is safe out of the sight of the owner. Their religion is the Mahomedan, but they allow polygamy without limitation; and they are little addicted to jealousy. To the women are assigned the most laborious employments: they till the ground, gather in the corn, make the bread, and even build the houses. The government is despotic; though the monarch can do nothing contrary to the koran. He speaks of the soil and productions as his personal property, and of the people as his slaves. His revenues arise from the tenth of all merchandize imported; the tribute of the Arabs who breed oxen, horses, camels, and sheep; and some other duties: the sultan is besides the chief merchant in the country, and dispatches with every caravan to Egypt a great quantity of his own merchandize. The name of the present sultan is Abd-el-rachman. When Mr. Browne was in the country, he was admitted to a great public audience given by the sultan. He found him seated on his throne, under a lofty canopy, attended by his guards. The space in front was filled with suitors and spectators to the number of more than fifteen hundred. A kind of hired encomiast stood on the monarch's left hand, crying out, with all his strength, during the whole ceremony—"See the buffaloe, the offspring of a buffaloe, a bull of bulls, the elephant of superior strength, the powerful sultan, Abd-el-rachman-el-rashid!—May God prolong thy life!—O Master!—May God assist thee and render thee victorious!"—Abd-el-rachman usurped the throne from his nephew, whom he conquered in battle, in the year 1787."

---

### WESTERN AND EASTERN COAST OF AFRICA.

ON the Western coast of Africa, proceeding southwards from the empire of Morocco, we pass the country of Zahara, inhabited by Moorish and Arab tribes, called the Monselemines, Mongearts, Wadelims, and Trasarts, who extend nearly to the mouth of the river Senegal, where the French had a fort and factory, and were entire masters of the gum-trade. It is called Fort Louis, was taken by the English in 1758, and confirmed to them by the peace of 1763; but in 1783, it was restored to France. Near Cape Verd is the island of Goree, considered as one of the safest, pleasantest, and most important settlements in all Africa. It was subject to France, but has been lately taken by the English. To the southward of Cape Verd, in latitude 8 deg. 12 min. north, and about 12 deg. lon. west, is the settlement of Sierra Leone, formed from the purest motives of humanity, under the patronage of a very respectable society of gentlemen in London, in the year 1791. The benevolent purposes for which it was intended are to introduce the light of knowledge and the comforts of civilisation into Africa, and to cement and perpetuate the most confidential union between the European colony and the natives of that country.

A settlement of a similar nature was formed upon the island of Bulam, on the same coast, to the eastward of the island of Bisgos. But this is now

entirely relinquished. A great part of the colonists were massacred by the natives of the shore at the mouth of the river Gambia, who were accustomed to make annual plantations of rice in Bulam. The surviving colonists took refuge among their countrymen at Sierra Leone.

In the latter end of September 1794, a French squadron attacked this settlement, carried off or destroyed all the stores and whatever they could find belonging to the company, and burned all the public buildings and houses of the Europeans, and several likewise (as they said, by mistake,) of those of the negro colonists. The colony, however, has not been abandoned, but the directors have taken such measures as have repaired their losses, and will no doubt tend still more to increase the trade and cultivation of the settlement. The colonists are on the happiest terms of friendship with the natives, and make great progress in clearing and improving the lands allotted them.

The country or coast of Guinea (or Upper Guinea) extends from 12 deg. west lon. to 8 deg. east, nearly in the parallel of 6 deg. north lat. It comprehends the grain coast, the tooth coast, the gold coast, the slave coast, (which includes Whidah and Ardrah, now subject to Dahomy,) and Benin. The principal kingdom on these coasts is Dahomy, the monarch of which subdued and annexed to his dominions Whidah and Ardrah between the years 1724 and 1727. The country of Dahomy, as known at present, (according to the history of it by Mr. Dalzel, governor of Cape Coast Castle,) is supposed to reach from the sea-coast about 150 or 200 miles inland, though no European has penetrated above half that distance; the capital, Abomey, lies in about 8 deg. north lat. and 3 deg. 20 min. east lon. The soil is a deep rich clay of a reddish colour, with a little sand on the surface. In some places it is a little light and gravelly, but there is not a stone so big as an egg in the whole country, so far as it has been visited by the Europeans. It plentifully produces, according to the quantity of culture, maize and millet, or Guinea corn of different sorts, a kind of beans, or rather kidney-beans, called callavances, and also a species of beans called ground-beans. The Dahomians likewise cultivate yams, potatoes of two sorts, the cassada or manioka; the plantain and the banana, pine-apples, melons, oranges, limes, guavas, and other tropical fruits also abound in this fertile country. Nor is it destitute of productions adapted for commerce and manufactures; such as indigo, cotton, the sugar cane, tobacco, palm-oil, together with a variety of spices, particularly a species of pepper very similar in flavour, and indeed scarcely distinguishable from the black pepper of the East Indies. Dahomy abounds with buffaloes, deer, sheep, goats, hogs both wild and domestic, poultry of various kinds, particularly pintadas, or Guinea hens, and Muscovy ducks. The elephant, though its flesh be coarse, is made use of as food by the natives; and dogs are reared for the same purpose. The dress of the men in Dahomy consists of a pair of striped or white cotton drawers of the manufacture of the country, over which they wear a large square cloth of the same, or of European manufacture. This cloth is about the size of a common counterpane for the middling class, but much larger for the grandees. It is wrapped about the loins, and tied on the left side by two of the corners, the other hanging down and sometimes trailing on the ground. A piece of silk or velvet of sixteen or eighteen yards makes a cloth for a grandee. The head is usually covered with a beaver or felt hat, according to the quality of the wearer. The king, as well as some of his ministers, often wears a gold and silver-

laced hat and feather. The arms and upper part of the body are usually naked: and the feet are always bare, none but the sovereign being permitted to wear sandals. The dress of the women, though simple, consists of a greater number of articles than that of the men. They use several cloths and handkerchiefs; some to wrap round the loins, and others to cover occasionally the breasts and upper part of the body. They adorn the neck, arms, and ancles with beads and cowries, and wear rings of silver or baser metals on their fingers; girls, before the age of puberty, wear nothing but a string of beads or shells round their loins, and young women usually expose the breasts to view. The general character of the Dahomans is marked by a mixture of ferocity and politeness. The former appears in the treatment of their enemies: the latter they possess far above the African nations with whom we have hitherto had any intercourse; this being the country where strangers are least exposed to insults, and where it is easy to reside in security and tranquillity. The language is that which the Portuguese call *Lingua Geral*, or General Tongue, and is spoken not only in Dahomy proper, but in Whidah, and the other dependent states; and likewise in Mahee, and several neighbouring places. With respect to the Dahoman religion, it consists of a jumble of superstitious ceremonies, of which it is impossible to convey any satisfactory idea. The government is, perhaps, the most perfect despotism on the earth; the policy of the country admits of no intermediate degree of subordination between king and slave, at least in the royal presence, where the prime minister is obliged to prostrate himself with as much abject submission as the meanest subject. A minister of state, on his entrance, crawls towards the apartment of audience on his hands and knees, till he arrives in the royal presence, where he lays himself flat on his belly, rubbing his head in the dust, and uttering the most humiliating expressions. Being desired to advance, he receives the king's commands, or communicates any particular business. Still continuing prostrate; for no person is permitted to sit, even on the floor, in the royal presence, except the women, and even they must kiss the ground when they receive or deliver the king's message. The king of Dahomy maintains a considerable standing army, commanded by an agaow or general, with several other subordinate military officers, who must hold themselves in readiness to take the field upon all occasions, at the command of the sovereign. The payment of these troops chiefly depends on the success of the expeditions in which they are engaged. On extraordinary occasions, all the males able to bear arms are obliged to repair to the general's standard; every caboocer, or grandee, marching at the head of his own people. Sometimes the king takes the field at the head of his troops; and, on very great emergencies, at the head of his women. Within the walls of the different royal palaces in Dahomy are innured not less than three thousand women, several hundreds of whom are trained to arms under a female general and subordinate officers appointed by the king, in the same manner as those under the agaow. These warriors are regularly exercised, and go through their evolutions with as much expertness as the male soldiers. They have their large umbrellas, their flags, their drums, trumpets, flutes, and other musical instruments. The singularity of this institution never fails to attract particularly the attention of Europeans, when among other uncommon exhibitions they are presented with the unusual spectacle of a review of female troops.

Benin is a country to the east of Dahomy, and extending from about 9 deg. north latitude to 1 deg. south. The climate is said to be extremely unwholesome and noxious. The animals are elephants, tygers, leopards,

apes, and ostriches, and in the rivers are a great number of crocodiles. The dress of the natives is neat and ornamental. The rich wear white calico or cotton petticoats, but the upper part of the body is commonly naked. The women use great art in dressing their hair, which they adjust in a variety of forms. Polygamy is common, and the king is said to have six hundred wives. Though jealous of each other, they are not so of Europeans, as they think it impossible that the taste of the women can be so depraved as to grant any liberties to a white man. Their religion is paganism. The king exercises an absolute authority: three great officers, distinguished by a string of coral, continually attend upon him to consult, instruct, and decide in his name. He can bring into the field an army of 100,000 men. Benin, the capital, situated on the river Benin or Formosa, was formerly a very closely built and populous city. In the streets, which are long and broad, are many shops filled with European merchandize, as well as with the commodities of the country. A principal part of the town is occupied by the royal palace, which is of vast extent, but neither elegant nor commodious.

To the south of Benin is the country of Loango, which is about 250 miles in length, and 180 in breadth. The climate of this kingdom is nearly as hot as any under the torrid zone, and much hotter than those of Congo and Angola. Loango was formerly subject to, and made a part of the kingdom of Congo.

Congo (or Lower Guinea) is the name frequently given to the whole tract of country on the coast from the equator to 18 degrees of south latitude, including the kingdoms of Loango, Congo, Angola, and Benguela; but Congo Proper is only 150 miles broad along the coast, though it extends it is said 370 inland. It is bounded on the north by Loango, on the south by Angola, and on the east by an unknown country, the name of which is said to be Metamba. The climate is extremely hot in summer; but the winters are as mild as the finest springs of Italy. The animals it produces are elephants of a monstrous size, lions, leopards, tigers, wolves, zebras, buffaloes, &c. The country is likewise infested with a vast variety of serpents, some of them of a monstrous length and thickness; rattlesnakes, vipers, scorpions, and venomous insects of various kinds, both flying and reptile; the most pernicious and dangerous of which is the ant or pismire, which will not only destroy the fruits of the earth, but in the night surround even beasts and men in prodigious swarms, and devour them in a few hours, leaving only the bones. The character, manners, religion, and government of the natives of Congo, nearly resemble those of the negro kingdoms on this coast. The Portuguese have several settlements in this country.

To the south of Congo is the country of Angola, which is said to be divided among a number of petty princes. The Portuguese have several settlements on the coast; but the English and Dutch traffic with the natives, and purchase a great number of slaves.

Between Angola and the country of the Hottentots are the countries of Benguela and Mataman; but these are very little known to Europeans, and the latter is almost entirely desert.

On the Eastern coast of Africa, proceeding northwards from the Cape of Good-Hope, we find the country of Sofala, where the Portuguese have a settlement of great importance for their trade to the East-Indies, which is protected by a fort built on a small island near the mouth of a river. The natives of Sofala are for the most part black, with short curled hair, there being but very few tawny or brown among

them. The original Sofala, according to gold mines.

To the 15th and the cultivation of ostriches habitants admit of a thousand of the king The Portuguese dered or f

them. Those on the coast speak the Arabic language, for they are not the original natives, but descendants of Arabs who settled on this coast. Sofala, according to the report of the Portuguese settlers, contains some gold mines of considerable value.

To the northward of Sofala is Monomotapa, a country lying between the 15th and 20th degrees of south latitude. The climate is temperate, and the soil fertile in rice and sugar-canes, which last grow without cultivation. There are here vast herds of elephants, and great numbers of ostriches. This country possesses mines of gold and silver. The inhabitants are negroes. Like most of the other nations of Africa, they admit of unlimited polygamy; and the king is said to have above a thousand wives, most of them the daughters of petty chiefs. The army of the king consists only of foot, for there are no horses in the country. The Portuguese had a settlement here in 1560, but they were all murdered or forced away.

Beyond Monomotapa, still proceeding northward, stretches the extensive country of Zanguebar, containing the kingdoms of Mosambique, Melinda, and several others. Mosambique consists of three islands, on the west side of a channel of the same name. The principal, which is not more than three miles in length, and half as much in breadth, is about two miles from the continent. It was seized by the Portuguese in 1497, and they have kept possession of it ever since.— The capital of this island, named likewise Mosambique, is large and well fortified, having a strong citadel to defend the harbour. The Portuguese generally keep a strong garrison here; and trade with the natives for gold, elephants' teeth, and slaves. They have built several churches and monasteries, and a large hospital for sick sailors. Their ships always call here in going to the East Indies, and the harbour is so commodious that whole fleets may anchor and provide themselves with all necessaries. Mosambique is situated in lat. 15 deg. 5 min. south, lon. 40 deg. 10 min. east.

The kingdom of Melinda produces gold, elephants' teeth, ostrich feathers, wax, aloes, senna, and other drugs; also plenty of rice, sugar, cocoa-nuts, and other tropical fruits. The natives are some of them black, and some tawny: the women are mostly of an olive complexion. Their dress, among the higher classes, is remarkably elegant; for they never appear abroad but in fine silks girt with rich gold or silver girdles, collars and bracelets of the same, or something more valuable, and their heads covered with veils. The men wear a kind of turban; in other respects their dress consists of a piece of cotton wrapped about the middle, and descending a little below the knees; their legs, feet, and the rest of the body, are quite bare. The meaner sort, and those who live farther from the coast, wear little else than a piece of cloth round the middle, if we except their shield and weapons, which are the bow and arrows, the scymetar and javelin. Their government is monarchical; and in such veneration is the king held by his subjects, that, whenever he stirs out from his palace, he is carried in a sedan on the shoulders of four or more of the greatest nobles of the kingdom; and incense and other perfumes are burned before him, as he goes through the streets of any city, by a great number of ladies, who sing songs in his praise, accompanied by various kinds of musical instruments. The population of the kingdom is estimated at about 200,000 persons. With respect to religion, the generality are Pagans, some are Mahomedans, and some Christians, converted by the Portuguese, who have in the capital (likewise named Melinda) seventeen churches, nine

convents, and warehouses well provided with European goods. The city is surrounded by fine gardens, and has a good harbour defended by a fort; but the entrance is dangerous, on account of the great number of shoals and rocks under water.

The country of Ajan is the boundary of Zanguebar towards the north. It lies between lat. 2 deg. and 12 deg. north, extending from the river Magadoxo to Cape Gardafui, and contains several states or kingdoms; the principal of which are Adel or Zeila, and Magadoxo, the inhabitants of both which are Mahomedans. All the eastern coast of Ajan is said to be sandy and barren, but to the north the country is more fertile. The kings of Ajan are frequently at war with the emperor of Abyssinia, and sell the prisoners which they take: they trade likewise in ivory, gold, and horses of an excellent breed.

### COUNTRY OF THE HOTTENTOTS.

THE country of the Hottentots is a large region in the Southern extremity of Africa, extending North by West from the Cape of Good Hope, beyond the mouth of Orange-river, and from that Cape in an East North East direction to the mouth of the Great Fish-river.

“ During the thirty-six hours which I spent (says Monsieur Vaillant) with the Gonaqua Hottentots, I had time to make several observations concerning them. I remarked that they made a clapping noise with their tongue, like the rest of the Hottentots. When they accost any one, they stretch forth the hand, saying, *Tabc!* I salute you. This word and ceremony, which are employed by the Caffrees, are not used by the Hottentots properly so called.

“ This affinity of customs, manners, and even conformation; their being so near Great Caffraria, and the accounts I afterwards received, convinced me that these *bordes* of Gonaquas, who equally resemble the Caffrees and the Hottentots, must be a mixed breed produced by these two nations. The dress of the men, arranged with more symmetry, has the same shape as that of the Hottentots; but as the Gonaquas are a little taller, they make their mantles of calves' instead of sheep's skins; they are both called *krofs*. Several of them wear, hanging from their necks, a bit of ivory, or very white sheep bone; and this contrast of the two colours produces a good effect, and is very becoming.

“ When the weather is excessively hot, the men lay aside every part of their dress that is superfluous, and retain only what they name their *jackals*. This is a piece of skin of the animal so called, with which they cover what nature bids them conceal, and which is fastened to their girdle. This veil, however, negligently arranged, may be considered as an useless appendage, and is of very little service to their modesty; the women, much sonder of dress than the men, employing more care in adorning their persons. They wear a *krofs* like the latter, but the apron which conceals their sex is larger than those of the Hottentots. During the great heats they retain only this apron, with a skin which descends behind from their girdle to the calf of the leg: young girls below the age of nine years go perfectly naked; when they attain to that age, they wear nothing but a small apron.

“ Whatever may be the extent of the deserts of Africa, we must not form any calculation respecting its population from those innumerable swarms of blacks which are found on the west, and which border all the

coast of the ocean from the Canary isles to the environs of the Cape of Good Hope. There is certainly no proportion to enable us to hazard even a conjecture; since by a trade approved by a few, and held in detestation by the greater number, the barbarous navigators of Europe have induced these negroes, by the most villainous attractions, to give up their prisoners, or those who are inferior to them in strength. As their wants increased, they have become inhuman and perfidious beings: the prince has sold his subjects; the mother has sold her son; and nature, as an accomplice, has rendered her prolific.

"This disgusting and execrable traffic is, however, still unknown in the interior parts of the continent. The desert is really a desert; and it is only at certain distances that one meets with a few *bordes*, that are not numerous, and who live on the fruits of the earth, and the produce of their cattle. After finding one horde, one must travel a great way to find another. The heat of the climate, the dryness of the sands, the barrenness of the earth, a scarcity of water, rugged and rocky mountains, ferocious animals; and, besides these, the humour of the Hottentots, a little phlegmatic, and their cold temperament—are all obstacles to propagation. When a father has six children, it is accounted a phenomenon.

"The country of the Gonaquas, into which I penetrated, did not therefore contain three thousand people in an extent of thirty or forty leagues. These people did not resemble those degenerated and miserable Hottentots, who pine in the heart of the Dutch colonies, contemptible and despised inhabitants, who bear no marks of their ancient origin but an empty name; and who enjoy, at the expense of their liberty, only a little peace, purchased at a dear rate, by the excessive labour to which they are subjected on the plantations, and by the despotism of their chiefs, who are always sold to government. I had here (continues M. Vaillant) an opportunity of admiring a free and brave people, valuing nothing but independence, and never obeying any impulsive foreign to nature.

"Their huts, constructed like those of the Hottentots in the colonies, were eight or nine feet in diameter, and were covered with ox or sheep-skins, but more commonly with mats. They had only one opening, very narrow and low; and it was in the middle of their hut that the family kindled their fire. The thick smoke with which these kennels were filled, and which had no other vent but the door, added to the stench which they always retain, would have stifled any European who might have had the courage to remain in them two minutes; custom, however, renders all this supportable to these savages.

"The two colours for which they shew the greatest fondness are red and black. The first is composed of a kind of ochry earth, which is found in several places of the country, and which they mix and dilute with grease; this earth has a great resemblance to brick-dust, or tiles reduced to powder. Their black is nothing else than soot, or the charcoal of tender wood. Some women, indeed, are contented with painting only the prominence of the cheeks; but in general they daub over their whole body, in compartments, varied with a certain degree of symmetry: and this part of their dress requires no small length of time. These two colours, so much admired by the Hottentots, are always perfumed with the powder of the *boughou*, which is not very agreeable to the smell of an European. A Hottentot would, perhaps, find our odours and essences no less insupportable; but the *boughou* has over our rouge and pastes the advantage of not being pernicious to the skin,

of not attacking and injuring the lungs; and the female Hottentot, who is acquainted with neither amber, musk, nor benzoin, never knows what it is to be oppressed by vapours, spasms, and the head-ach. The men never paint their faces, but they use a preparation made of both colours mixed to paint the upper lip as far as the nostrils; by which they enjoy the advantage of continually inhaling the odour of the substance employed for this purpose. Young girls sometimes favour their lovers so far as to apply this paint for them under the nose; and on this point they show a kind of coquetry, which has a very powerful influence over the heart of a Hottentot novice. The reader, however, must not infer that the Hottentot women pay so much attention to dress as to neglect those daily and useful occupations to which nature and their usages call them. Separated from Europe by an immensity of sea, and from the Dutch colonies by desert mountains and impassable rocks, too much communication with these people has not yet led them to the excesses of our depravation. On the contrary, when they have the happiness of becoming mothers, Nature addresses them in a different language; they assume, more than in any other country, a spirit suitable to their state, and readily give themselves up to those cares which she imperiously requires of them.

They are remarkably fond of hunting, and in this exercise they display great dexterity. Besides gins and snares, which they place at convenient spots to catch large animals, they lie in wait for them also, attack them as soon as they appear, and kill them with their poisoned arrows, or their allagays, which are a kind of lances. On the first view of their arrows, one would not suspect how destructive weapons they are: their smallness renders them so much the more dangerous, as it is impossible to perceive and follow them with the eye, and consequently to avoid them. The slightest wound which they make always proves mortal, if the poison reaches the blood, and if the flesh be torn. The surest remedy is to amputate the wounded part, if it be a limb; but if the wound be in the body, death is unavoidable. The allagay is generally a very feeble weapon in the hands of a Hottentot; but, besides this, its length renders it not dangerous, for, as it may be seen cleaving the air, it is not difficult to avoid it.

The Hottentots have not the least notion of the elements of agriculture; they neither sow nor plant, nor do they even reap any crop. When they choose to give themselves the trouble, they make an intoxicating liquor composed of honey and a certain root, which they suffer to ferment in a sufficient quantity of water. This liquor, which is a kind of hydromel, is not their usual beverage, nor do they ever keep a stock of it by them. Whatever they have, they drink all at once, and frequently regale themselves in this manner at certain periods. They smoke the leaves of a plant which they name *dagba*, and not *daka*, as some authors have written. This plant is not indigenous: it is the hemp of Europe. There are some of the savages who prefer these leaves to tobacco; but the greatest part of them are fond of mixing both together. They set less value on the pipes brought from Europe, than on those which they fabricate themselves; the former appear to them to be too small.

Though they rear abundance of sheep and oxen, they seldom kill the latter, unless some accident happens to them, or old age has rendered them unfit for service. Their principal nourishment, therefore, is the milk of their ewes and cows, besides which they have the produce of their hunting excursions, and from time to time they kill a sheep. To

fatten their animals, they employ a process, which, though not practised in Europe, is no less efficacious, and has this peculiar advantage, that it requires no care. They bruise, between two flat stones, those parts which we deprive them of by the knife; and when thus compressed, they acquire in time a prodigious bulk, and become a most delicate morsel, when they have resolved to sacrifice the animal.

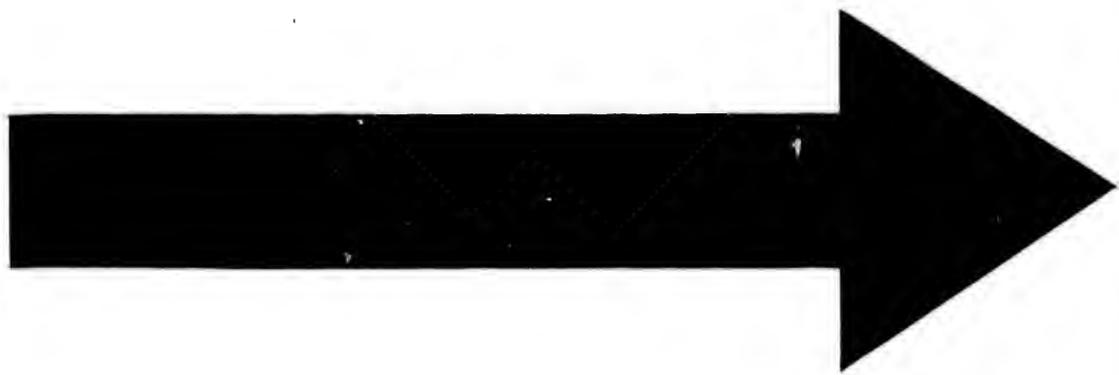

“Those oxen which they intend for carrying burdens must be broke and trained very early to the service, otherwise they would become absolutely untractable. On this account, when the animal is still young, they pierce the cartilage which separates the nostrils, and thrust through the hole a piece of stick about eight or ten inches in length, and almost an inch in diameter. The task of milking the cows and the ewes belongs to the women: and, as they never beat or torment them, they are surprisingly tractable.

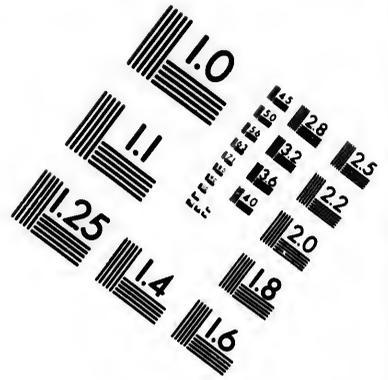

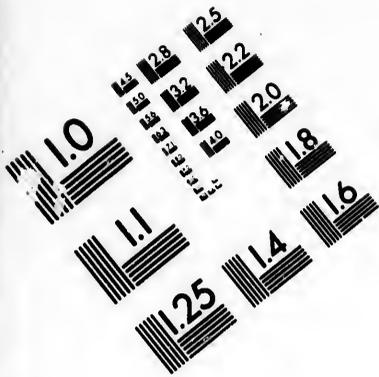

“Of their sheep and kine each village has one common herd; every inhabitant taking it in his turn to be herdsman. This charge requires many precautions very different from those which are taken by our herdsmen, beasts of prey being much more numerous and fierce in the southern parts of Africa than in Europe. Lions, indeed, are not very common; but there are elephants, rhinoceroses, leopards, tigers, hyænas, and several kinds of wolves more destructive than ours, together with many other furious animals that abound in the forests, and occasionally make excursions towards the Cape, and destroy the tame cattle. To prevent these misfortunes, it is the business of the herdsman to go or send every day round his district, in order to discover if any beast of prey be lurking in that quarter. In which case he assembles the whole village together, and makes his report; when a party of the stoutest among them arm themselves with javelins and poisoned arrows, and follow the person who may have discovered the beast, to the cave or covert where he is lodged. Here they arrange themselves in two lines; the herdsman entering the cave, and endeavouring to provoke the beast to follow him out, when he is inevitably destroyed.

“These savages measure the year by the seasons of drought and rainy weather. This division is common to all the inhabitants of the tropical regions, and it is subdivided into moons; but they never count the days if they exceed ten, that is to say, the number of their fingers. Beyond that, they mark the day or the time by some remarkable occurrence: for example, an extraordinary storm, an elephant killed, an infectious disorder among the cattle, an emigration, &c. The different parts of the day they distinguish by the course of the sun; and they will tell you, pointing with their finger, he was *there* when I departed, and *here* when I arrived.

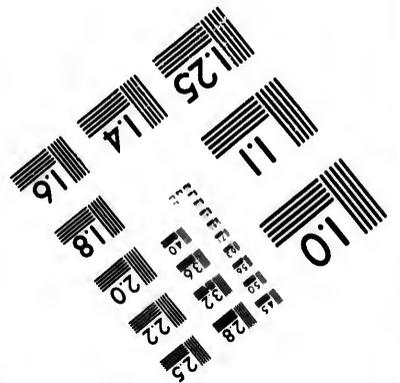

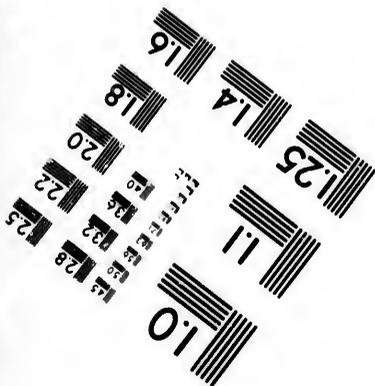

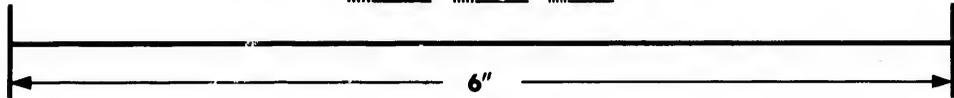

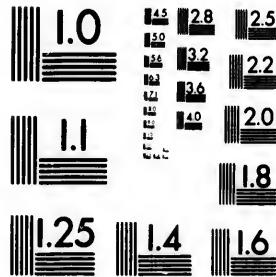

“A sense of delicacy induces the Hottentots to keep themselves separate from others when they are sick. They are then seldom seen, and it would appear that they are ashamed of having lost their health.

“When a Hottentot dies, he is buried in his worst kros, and the limbs are disposed in such a manner that the whole body is covered. The relations then carry it to a certain distance from the horde, and disposing it in a pit dug for this purpose, and which is never deep, cover it with earth, and then with stones, if any are to be found in the neighbourhood. Such a mausoleum proves but a very weak defence against the attacks of the jackal and the hyæna: the body indeed is soon dug up and devoured. However badly this last duty may be discharged, the Hottentots are not much to be blamed, when we call to mind the funeral ceremonies of the ancient and celebrated Persis, still attached

to the custom of exposing their dead on the tops of high towers, or in open cemeteries, in order that the crows and the vultures may feed upon them and carry them away in morsels. The children, and, failing them, the nearest relations of the deceased, take possession of whatever is left; but the quality of a chief is not hereditary. He is always appointed by the horde, and his power is limited. In their councils his advice prevails, if it be judged good; if not, no regard is paid to it. When they are about to go to war, they know neither rank nor divisions; each attacks or defends after his own manner; the most intrepid march in the van; and when victory declares itself, they do not bestow upon one man the honour of an action which has proved successful by the courage of all: it is the whole nation that triumphs.

"Of all the people whom I ever saw (observes our author,) the Gonaquas are the only nation that can be considered as free; but they will perhaps be soon obliged to remove to a greater distance, or receive laws from the Dutch government. All the land to the east being in general good, the planters endeavour to extend their possessions in that quarter as much as they can, and their avarice doubtless will some day succeed. Misery must then be the portion of these happy and peaceable people; and every trace of their liberty will be destroyed by massacres and invasions. Thus have all those hordes mentioned by old authors been treated; and, by being often dismembered and weakened, they are now reduced to a state of absolute dependence on the Dutch. The existence of the Hottentots, their names, and their history, will therefore in time be accounted fabulous; unless some traveller, who may possess curiosity enough to induce him to discover their remains, should have the courage to penetrate into the remote deserts inhabited by the great Nimiquas, where rocks more and more hardened by time, and old and barren mountains, do not produce a single plant worthy to engage the attention of the speculative botanist.

"It is necessary in this narration to take notice of that disgusting apron of the Hottentot women, which has long made a figure in history. It is still fashionable among a certain horde: I say it is fashionable (observes our author); for, instead of being the gift of nature, it ought to be considered as one of the most monstrous refinements ever invented by I know not what coquetry, altogether peculiar to a certain small corner of the world. This singularity is nothing else but a prolongation of the nymphæ, occasioned by weights suspended from them. They may hang down about nine inches, more or less, according to the age of the person, or the assiduous care which is bestowed on this singular decoration.

"A physiognomist, or, if the reader pleases, a modern wit, would entertain his company by assigning to the Hottentot, in the scale of beings, a place between a man and the ouran-outang. I cannot, however, consent to this systematic arrangement; the qualities which I esteem in him will never suffer him to be degraded so far; and I have found his figure sufficiently beautiful, because I experienced the goodness of his heart. It must indeed be allowed, that there is something peculiar in his features, which in a certain degree separates him from the generality of mankind. His cheek-bones are exceedingly prominent; so that his face being very broad in that part, and the jaw-bones, on the contrary, extremely narrow, his visage continues still decreasing even to the point of the chin. This configuration gives him an air of lankness, which makes his head appear very much disproportioned, and too small for his full and plump body. His flat nose rises scarcely half an inch at

its greatest elevation, exceed in height with small teeth beautiful and open Chinese: and to it is very short, and has very little hair part of what he loses from this trouble upper lip, below fails to pluck it out look; which, joined that commanding more delicacy of figure: they are have a most beautiful are small, and they wear sandals. Tring through the they employ a great to their arms.

THE country kn very extensive Abyssinia; on the

its greatest elevation; and his nostrils, which are excessively wide, often exceed in height the ridge of his nose. His mouth is large, and furnished with small teeth well enamelled and perfectly white: his eyes, very beautiful and open, incline a little towards the nose, like those of the Chinese: and to the sight and touch his hair has the resemblance of wool; it is very short, curls naturally, and in colour is as black as ebony. He has very little hair, yet he employs no small care to pull out by the roots part of what he has; but the natural thinness of his eye-brows saves him from this trouble in that part. Though he has no beard but upon the upper lip, below the nose, and at the extremity of the chin, he never fails to pluck it out as soon as it appears. This gives him an effeminate look; which, joined to the natural mildness of his character, destroys that commanding fierceness usual among savages. The women, with more delicacy of features, exhibit the same characteristic marks in their figure: they are equally well made. Their breasts, admirably placed, have a most beautiful form while in the bloom of youth: and their hands are small, and their feet exceedingly well shaped, though they never wear sandals. The sound of their voice is soft; and their idiom, passing through the throat, is not destitute of harmony. When they speak, they employ a great many gestures, which give power and gracefulness to their arms.

The Hottentots are naturally timid; their phlegmatic coolness, and their serious looks, give them an air of reserve, which they never lay aside, even at the most joyful moments; while, on the contrary, all other black or tawny nations give themselves up to pleasure with the liveliest joy, and without any restraint.

A profound indifference to the affairs of life inclines them very much to inactivity and indolence: the keeping of their flocks, and the care of procuring a subsistence, are the only objects that occupy their thoughts. They never follow hunting as sportsmen, but like people oppressed and tormented by hunger. In short, forgetting the past, and being under no uneasiness for the future, they are struck only with the present; and it is that which alone engages their attention.

They are, however, (observes M. Vaillant) the best, the kindest, and the most hospitable of people. Whoever travels among them may be assured of finding food and lodging; and though they will receive presents, yet they never ask for any thing. If the traveller has a long journey to accomplish; and if they learn from the information he requires that there are no hopes of his soon meeting with other hordes, that which he is going to quit supply him with provisions as far as their circumstances will allow, and with every thing else necessary for his continuing his journey, and reaching the place of his destination. Such are these people, or at least such did they appear to me, in all the innocence of manners and of a pastoral life. They excite the idea of mankind in a state of infancy.

---

## C A F F R A R I A.

THE country known by the general denomination of Caffraria is a very extensive region, bounded on the north by Negroland and Abyssinia; on the west by part of Guinea, Congo, and the sea; on the

south by the Cape of Good Hope; and on the east by the sea. It is divided into several territories and kingdoms, of which little is known, and is computed to be 700 miles long, and 600 broad.

We shall give a more particular description of the people from two modern writers; the first celebrated for his botanical knowledge; the other for his taste in natural history; but more especially for his very entertaining and interesting travels into the interior parts of Africa, which, it is hoped, will not prove unacceptable to the reader.

The men among the Caffrees, says lieutenant Paterfon, are from five feet ten inches to six feet high, and well proportioned, and in general evince great courage in attacking lions or any beasts of prey.

The colour of the Caffrees is a jet black, their teeth white as ivory, and their eyes large. The clothing of both sexes is nearly the same, consisting entirely of the hides of oxen, which are as pliant as cloth. The men wear tails of different animals tied round their thighs; pieces of brass in their hair, and large ivory rings on their arms: they are also adorned with the hair of lions, and feathers fastened on their heads, with many other fantastical ornaments.

They are extremely fond of dogs, which they exchange for cattle; and to such a height do they carry this passion, that, if one particularly pleases them, they will give two bullocks in exchange for it. Their whole exercise through the day is hunting, fighting, or dancing. They are expert in throwing their lances; and in time of war use shields made of the hides of oxen.

The women are employed in the cultivation of their gardens and corn. They cultivate several vegetables, which are not indigenous to their country; such as tobacco, water-melons, a sort of kidney-beans, and hemp. The women also make baskets, and the mats which they sleep on. The men have great pride in their cattle; they cut their horns in such a way as to be able to turn them into any shape they please; and they teach them to answer a whistle. When they with their cattle to return home, they go a little way from the house, and blow this small instrument, which is made of ivory or bone, and so constructed as to be heard at a great distance, and in this manner bring all their cattle home without any difficulty.

The soil of this country is a blackish loamy ground, and so extremely fertile, that every vegetable substance, whether sown or planted, grows here with great luxuriance. There are great variations in the climate; but I had no thermometer to observe the degrees of heat. It seldom rains except in the summer season, when it is accompanied with thunder and lightning. The country, however, is extremely well supplied with water, not only from the high land towards the north, which furnishes abundance throughout the year, but from many fountains of excellent water, which are found in the woods. From what I observed in this country, I am induced to believe, that it is greatly superior to any other known part of Africa. The woods produce a variety of arboreous plants, and some of a great size; they are inhabited by elephants, buffaloes, &c. There were also varieties of beautiful birds and butterflies; but they were so shy, that I was able only to preserve two birds of that country.

To judge of the Caffrees by those I had seen, says M. Vaillant, they are taller than the Hottentots of the colonies, or even than the Gonaquas, though they greatly resemble the latter, but are more robust, and possess a greater degree of pride and courage. The features of the Caffrees are likewise more agreeable, none of their faces contracting to-

wards the bottom uncouth manner, and thick lips likewise well formed compressive: so that there are many by the side of an daubing their eye toed, particularly

wards the bottom, nor do the cheek-bones of these people project in the uncouth manner of the Hottentots; neither have they large flat faces and thick lips like their neighbours, the negroes of Mosambique, but a well formed contour, an agreeable nose, with eyes sparkling and expressive: so that, setting aside our prejudice with regard to colour, there are many women among them who might be thought handsome by the side of an European lady. They do not disfigure themselves by daubing their eye-brows, like the Hottentots, but are very much tattooed, particularly about the face.

The hair of the Caffrees, which is strong and curling, is never greased, but they anoint the rest of their bodies, with a view of making themselves active and strong. The men are more particular in decorations than the women, being very fond of beads and brass rings. They are seldom seen without bracelets on their legs and arms, made of the tusks of an elephant, which they saw to a convenient thickness, and then polish and round. As these rings cannot be opened, it is necessary to make them big enough to pass the hand through, so that they fall or rise according to the motion of the arm: sometimes they place small rings on the arms of their children, whose growth soon fills up the space, and fixes the ornament; a circumstance which is particularly pleasing to them.

They likewise make necklaces of the bones of animals, which they polish and whiten in the most perfect manner. Some content themselves with the leg-bone of a sheep hanging on the breast. In the warm season the Caffrees only wear their ornaments; when the weather is cold they make use of kroffes made of the skins of calves or oxen, which reach to the feet. One particularity which deserves attention, and does not exist elsewhere, is, that the Caffree women care little for ornaments. Indeed, they are well made, and pretty, when compared to other savages; and never use the uncouth profusion of Hottentot coquetry, not even wearing copper bracelets. Their aprons, like those of the Gonaquas, are bordered with small rows of beads; which is the only vanity they exhibit.

The skin that the female Hottentot ties about the loins, the Caffree woman wears as high as her shoulders, tying it over the bosom, which it covers. They have, like the men, a kroff, or cloak, of calf or ox skin, divested of the hair; but it is only in the cold or rainy season that either sex wear it. These skins are as soft and pliant as the finest stuffs. Let the weather or season prove ever so bad, neither men nor women cover their heads. Sometimes, indeed, I have seen the head of a Caffree adorned with a feather stuck in the hair; but this sight is by no means common.

One part of the daily occupation of the women is making earthenware, which they fashion as dexterously as their husbands; they likewise make a curious kind of baskets, of a texture so compact as to contain milk; and they also prepare the fields for seed, scratching the earth, rather than digging it, with wooden pick-axes.

The huts of the Caffrees are higher and more commodious than those of the Hottentots; they form perfect hemispheres, and are composed of wooden work, very strong and compact, covered both within and without of a mixture of earth, clay, and cow-dung. The opening, or door-way, is so low, that to enter the dwelling you must crawl on your hands and knees; which makes it easier to defend themselves against animals, or the sudden attacks of an enemy. The hearth, or fire-place, is in the centre, surrounded by a circular rim which rises two or three inches.

low his courage, the envenomed dart, so much in use among his neighbours; seeking his enemy face to face, and never throwing his lance but openly. In war he carries a shield, of about three feet in height, made of the thickest part of the hide of a buffalo; this defends him from the arrow, or assagay, but is not proof against a musquet-ball. The Caffree also manages with great skill a club of about two feet and a half long, made of a solid piece of wood, three or four inches thick in the largest part, and gradually diminishing towards one of the ends. When in a close engagement, they strike with this weapon, or frequently throw it to the distance of fifteen or twenty paces; in which case it seldom fails of the intended effect.

The sovereignty here is hereditary, the eldest son ever succeeding. In default of male heirs, it is not the king's brother that succeeds, but the eldest nephew; and in case the king should have neither children nor nephews, the chiefs of the different hordes elect a king. Upon these occasions a spirit of party sometimes prevails, which gives rise to factions and intrigues that generally end in bloodshed.

Polygamy is customary among the Caffrees; their marriages are even more simple than those of the Hottentots, the parents of the bridegroom being always content with his choice; the friends of the bride are rather more difficult, but seldom refuse their consent; after which they rejoice, drink, and dance, for weeks together, according to the wealth of the families; but these feasts are never held but on the first espousals. They have no musical instruments, but such as are used by the Hottentots. As for their dances, the step is not unlike the English.

At the death of the father, the sons and the mother divide the property he has left between them. The daughters, claiming nothing, remain at home with their mother or brother, unless it pleases some man to take them; and if this circumstance takes place during the life of the parents, they receive cattle in proportion to the wealth of their father. The dead are seldom buried, but carried away from the kraal, by their family, and deposited in a deep trench common to the whole horde on such occasions, where the wild beasts repair at leisure; which preserves the air from those noxious vapours which otherwise the putrefaction would occasion. The honours of burial are due only to the king or chief of a horde; they cover these bodies with piles of stones in the form of a dome.

I am unacquainted with the disposition of the Caffrees respecting love and jealousy, but believe that they only feel the latter sensation in regard to their countrymen; voluntarily giving up their women, for a small consideration, to the first white man that expresses an inclination for them.

[HISTORY OF AFRICA IN GENERAL.] The history of the continent of Africa is little known, and probably affords no materials which deserve to render it more so. We know from the ancients, who sailed a considerable way round the coasts, that the inhabitants were in the same rude state near 2000 years ago in which they are at present: that is, they had little of humanity about them but the form. This may either be accounted for by supposing that nature has placed some insuperable barrier between the natives of this division of Africa and the inhabitants of Europe, or that the former, being so long accustomed to a savage manner of life, and degenerating from one age to another, at length became hardly capable of making any progress in civilisation or science. It is very certain, that all the attempts of Europeans, particularly of the

Dutch at the Cape of Good Hope, have been hitherto ineffectual for making the least impression on these savage mortals, or giving them the least inclination for, or even idea of, the European manner of living.

The Portuguese are sovereigns of the greatest part of the coast, and have a number of black princes their tributaries. There are some independent princes who have extensive dominions, particularly the kings of Dahomy and Widah, the most noted of any for the infamous slave-trade. Upwards of 200 years have the European nations traded with Africa in human flesh, and encouraged, in the negro countries, wars, rapine, desolation, and murder, that the West India islands might be supplied with that commodity. The annual exportation of poor creatures from Africa has exceeded 100,000, many of whom are driven a thousand miles to the sea-coast, their villages having been surrounded in the night by an armed force, and the inhabitants dragged into perpetual captivity.

A sea officer lately visited all the chiefs of the negroes in our settlements, from Santa Apollonia to Athera, an extent of more than 250 miles, and found the police and punishment of all crimes regulated by the slave-trade. Those who commit crimes or trespasses against their laws, are, at the decision of twelve elders, sold for slaves for the use of their government and the support of their chiefs. Theft, adultery, and murder, are the highest crimes, and, whenever they are detected, subject the whole family to slavery. But any individual, condemned to slavery for the crime of his relation, may redeem his own person by furnishing two slaves in his room. Or when a man commits one of the above cardinal crimes, all the male part of his family are forfeited to slavery; if a woman, the female part is sold. "This traffic in crimes makes the chiefs vigilant. Nor do our planters, who purchase them, use any pains to instruct them in religion, to make them amends for the oppression thus exercised on them. I am sorry to say, they are un-naturally averse to every thing that tends to it; yet the Portuguese, French, and Spaniards, in their settlements, succeed in their attempts to instruct them, as much to the advantage of commerce as of religion. It is for the sake of Christianity, and the advantages accompanying it, that English slaves embrace every occasion of deserting to the settlements of those nations."

It is high time for the legislature to interfere and put an end to this most infamous of all trades, so disgraceful to the Christian name, and so repugnant to the principles of our constitution. Let the negroes already in our islands be properly treated, made free, and encouragement given to their population; measures that would be attended with no less profit than honour.

## AFRICAN ISLANDS.

OF the African islands, some lie in the Eastern, or Indian Ocean, and some in the Western, or Atlantic. We shall begin with those in the Indian Ocean; the chief of which are, Zocotra, Babelmandel, Madagascar, the Comora islands, Bourbon, and Mauritius. See the Map.

**ZOCOTRA.** This island is situated in east long. 55; north lat. 12. thirty leagues east of Cape Guardafui, on the continent of Africa: it is eighty miles long, and fifty-four broad, and has two good harbours, where the European ships used formerly to put in when they lost their

passage to India. It is a populous plentiful country, yielding most of the fruits and plants that are usually found within the tropics, together with frankincense, gum-tragacanth, and aloes. The inhabitants are Mahomedans of Arab extraction, and are under the government of a prince, or sheik, who is probably tributary to the Porte.

**BABELMANDEL.** The island of Babelmandel gives name to the strait at the entrance of the Red Sea, where it is situated in east long. 44. 30. north lat. 12; about four miles both from the Arabian and Abyssinian shores. The Abyssinians, or Ethiopians, and the Arabians, formerly contended with great fury for the possession of this island, as it commands the entrance into the Red Sea, and preserves a communication with the ocean. This strait was formerly the only passage through which the commodities of India found their way to Europe; but since the discovery of the Cape of Good Hope, the trade by the Red Sea is of little importance. The island is of little value, being a barren sandy spot of earth not five miles round.

**COMORA.** These islands are five; Joanna, Mayotta, Mohilla, Angazei, and Comora, situated between 41 and 46 east long. and between 10 and 14 south lat. at an equal distance from Madagascar and the continent of Africa. Joanna, or Hinzuan, the chief, and which exacts tribute from the others, is about thirty miles long and fifteen broad, and affords plenty of provisions, and such fruits as are produced between the tropics. East India ships, bound to Bombay, usually touch here for refreshments. The inhabitants are negroes, of the Mahomedan persuasion, and entertain our seamen with great humanity.

**MADAGASCAR.** This is the largest of the African islands, and is situated between 43 and 51 deg. east long. and between 10 and 26 south lat. 300 miles south-east of the continent of Africa; it being near 1000 miles in length from north to south, and generally between 200 and 300 miles broad. The sea rolls with great rapidity, and extremely rough, between this island and the continent of the Cape of Good Hope, forming a channel or passage, through which all European ships in their voyage to and from India generally sail, unless prevented by storms.

Madagascar is a pleasant, desirable, and fertile country, abounding in sugar, honey, vines, fruit-trees, vegetables, valuable gums, corn, cattle, fowls, precious stones, iron, some silver, copper, steel, and tin. It affords an agreeable variety of hills, valleys, woods, and champaign; watered with numerous rivers, and well stored with fish. The air is generally temperate, and said to be very healthy, though in a hot climate. The inhabitants are of different complexions and religions; some white, some negroes, some Mahomedans, some Pagans. The whites and those of a tawny complexion, who inhabit the coasts, are descended from the Arabs, as is evident from their language and their religious rites; but here are no mosques, temples, nor any stated worship, except that they offer sacrifices of beasts on particular occasions; as when sick, when they plant yams, or rice, when they hold their assemblies, circumcise their children, declare war, enter into new-built houses, or bury their dead. Many of them observe the Jewish sabbath, and give some account of the sacred history, the creation and fall of man, as also of Noah, Abraham, Moses, and David; from whence it is conjectured they are descended from Jews who formerly settled here, though none knows how, or when. This island was discovered by the Portuguese, and the French took possession of it in 1641; but the people disliking their government, they were driven out in 1652; since which the na-

tives have had the sole possession of the island, under a number of petty princes, who make war upon one another for slaves and plunder.

**MAURITIUS**, or Maurice, was so called by the Dutch, who first touched here in 1598, in honour of prince Maurice their stadtholder. It is situated in east long. 36, south lat. 20, about 400 miles east of Madagascar. It is of an oval form, about 150 miles in circumference, with a fine harbour, capable of holding fifty large ships, secure against any wind that blows, and 100 fathoms deep at the entrance. The climate is extremely healthy and pleasant. The mountains, of which there are many, and some so high that their tops are covered with snow, produce the best ebony in the world, besides various other kinds of valuable wood, two of which greatly resemble ebony in quality; one red, the other yellow as wax. The island is watered with several pleasant rivers well stocked with fish, and, though the soil is none of the most fruitful, yields plenty of tobacco, rice, fruit, and feeds a great number of cattle, deer, goats, and sheep. It was formerly subject to the Dutch, but is now in the possession of the French.

**BOURBON**. The isle of Bourbon is situated in east long. 54, south lat. 21, about 300 miles east of Madagascar, and is about ninety miles round. There are many good roads for shipping round Bourbon, particularly on the north and south sides; but hardly a single harbour where ships can ride secure against those hurricanes which blow during the monsoons. Indeed the coast is so surrounded with blind rocks, sunk a few feet below the water, that coasting along shore is at all times dangerous. On the southern extremity is a volcano, which continually throws out flames and smoke, with a hideous roaring noise. The climate here, though extremely hot, is healthy, being refreshed with cooling gales, that blow morning and evening from the sea and land: sometimes, however, terrible hurricanes shake the whole island almost to its foundation; but generally without any other bad consequence than frightening the inhabitants. The island abounds in brooks and springs, and in fruits, grass, and cattle, with excellent tobacco (which the French have planted there), aloes, white pepper, ebony, palm, and other kinds of wood and fruit-trees. Many of the trees yield odoriferous gums and resins, particularly benzoin of an excellent sort, in great plenty. The rivers are well stocked with fish, the coast with land and sea tortoises, and every part of the country with horned cattle, as well as hogs and goats. Ambergris, coral, and the most beautiful shells, are found upon the shore. The woods are full of turtle-doves, parquets, pigeons, and a great variety of other birds, beautiful to the eye and pleasant to the palate. The French first settled here in the year 1672, after they were driven from the island of Madagascar. They have now some considerable towns in the island, with a governor: and here their East India ships touch and take in refreshments.

There are a great many more small islands about Madagascar and on the eastern coast of Africa, laid down in maps, but no where described.

Leaving therefore the eastern world and the Indies, we now turn round the Cape of Good Hope, which opens to our view the Atlantic, an immense ocean lying between the two grand divisions of the globe, having Europe, Asia, and Africa, or the old world, on the east; and America, or the new world, on the west; towards which division we now steer our course, touching in our way at the following islands upon the African coast, that have not yet been described, viz. **St. HELENA.** The first island on this side the Cape is St. Helena, situated in west long. 5° 49', south lat. 15° 53', being 1200 miles west of the continent of Africa, and 1800 east of South America. The island is a rock, about twenty-one miles in circumference, very high and very steep, and only accessible at the landing-place, in a small valley at the east end of it, which is defended by batteries of guns planted level with the water; and as the waves are perpetually dashing on the shore, it is generally difficult landing even there. There is no other anchorage about the island but at Chapel Valley Bay; and as the wind always blows from the south-east, if a ship overshoots the island ever so little, she cannot recover it again. The English plantations here afford potatoes and yams, with figs, plantains, bananas, grapes, kidney-beans, and Indian corn: of the last, however, most part is devoured by rats, which harbour in the rocks, and cannot be destroyed; so that the flour they use, is almost wholly imported from England; and in times of scarcity they generally eat yams and potatoes instead of bread. Though the island appears on every side a hard barren rock, yet it is agreeably diversified with hills and plains, adorned with plantations of fruit-trees and garden-stuff. They have great plenty of hogs, bullocks, poultry, ducks, geese, and turkeys, with which they supply the sailors, taking in exchange shirts, drawers, or any light cloths, pieces of calico, silks, muslin, arrack, sugar, &c.

St. Helena is said to have been first discovered by the Portuguese in 1502 on the festival of the empress Helena, mother of the emperor Constantine the Great, whose name it still bears. It does not appear that the Portuguese ever planted a colony here: and the English East India Company took possession of it in 1600, and held it without interruption till the year 1673, when the Dutch took it by surprise. However, the English, under the command of captain Munden, recovered it again within the space of a year, and at the same time took three Dutch East India ships that lay in the road. There are about 200 families in the island, most of them descended from English parents. The East India ships take in water and fresh provisions here in their way home; but the island is so small, and the wind so much against them, outward-bound, that they then very seldom see it.

The company's affairs are here managed by a governor, deputy-governor, and store-keeper, who have standing salaries allowed by the company, besides a public table, well furnished, to which all commanders, masters of ships, and principal passengers, are welcome.

**ASCENSION.** This island is situated in 7 deg. 40 min. south lat. and 14 deg. 18 min. west long. 600 miles north-west of St. Helena: it received its name from its being discovered by the Portuguese on Ascension-day; and is a mountainous barren island, about twenty miles round, and uninhabited; but it has a safe convenient harbour, where the East India ships generally touch to furnish themselves with turtle, or tortoises, which are very plentiful here, and vastly large, some of them weighing above 100 pounds each. The sailors going ashore in the night-time frequently turn two or three hundred of them on their backs before morning; and are sometimes so cruel as to turn many more than they use, leaving them to die on the shore.

**St. MATTHEW.** This is a small island lying in 6-1 west long. and 1-30 south lat. 300 miles to the north-east of Ascension, and was also discovered by the Portuguese; who planted and kept possession of it for

some time, but afterwards deserted it. This island now remains uninhabited, having little to invite other nations to settle there, except a small lake of fresh water.

The four following islands, viz. St. THOMAS, ANABOA, PRINCES ISLAND, and FERNANDOPO, are situated in the gulf of Guinea, between Congo and Benin: all of them were first discovered by the Portuguese, and are still in the possession of that nation, and furnish shipping with fresh water and provisions as they pass by.

**CAPE VERD ISLANDS.** These islands are so called from a cape of that name on the African coast, near the river Gambia, over against which they lie, at the distance of 300 miles, between 23 and 26 deg. west long. and 14 and 18 deg. north lat. They were discovered in the year 1400, by the Portuguese, and are about twenty in number; but some of them, being only barren uninhabited rocks, are not worth notice. St. Jago, Bravo, Fogo, Mayo, Bonavista, Sal, St. Nicholas, St. Lucia, St. Vincent, Santa Cruz, and St. Antonio, are the most considerable, and are subject to the Portuguese. The air, generally speaking, is very hot, and in some of them very unwholesome. They are inhabited by Europeans, or the descendants of Europeans, and negroes.

St. Jago, where the Portuguese viceroy resides, is the most fruitful, best inhabited, and largest of them all, being 150 miles in circumference; yet it is mountainous, and has much barren land in it. Its produce is sugar, cotton, some wine, Indian corn, cocoa-nuts, oranges, and other tropical fruits, plenty of roots, and garden-stuff; but the plant of most consequence to them is the madder, which grows in abundance among the cliffs. Here is also plenty of hogs and poultry, and some of the prettiest green monkeys, with black faces, that are to be met with any where. Baya, or Praya (famous for an action between an English and French Squadron), is situated on the east side, has a good port, and is seldom without ships; those outward-bound to Guinea or the East Indies, from England, Holland, and France, often touching here for water and refreshments.

In the island of MAYO, or MAY, immense quantities of salt are made by the heat of the sun from the sea-water, which at spring-tides is received into a sort of pan formed by a sand-bank, which runs along the coast for two or three miles. Here the English drive a considerable trade for salt, and have commonly a man of war to guard the vessels that come to load with it, which in some years amount to a hundred or more. The salt costs nothing, except for raking it together, wheeling it out of the pond, and carrying it on asses to the boats, which is done at a very cheap rate. Several of our ships come hither for a freight of asses, which they carry to Barbadoes and other British plantations. The inhabitants of this island, even the governor and priests, are all negroes, and speak the Portuguese language. The negro governor expects a small present from every commander that loads salt, and is pleased to be invited aboard their ships. The sea-water is so clear on this coast, that an English sailor who dropped his watch perceived it at the bottom, though many fathoms deep, and had it brought up by one of the natives, who are in general expert at diving.

The island of FOGO is remarkable for being a volcano, continually sending up sulphureous exhalations; and sometimes the flame breaks forth like *Ætna*, in a terrible manner, throwing out pumice-stones that annoy all the adjacent parts.

GOREE is situated within cannon-shot of Cape Verd, N. lat. 14-43. W. long. 17-20, and was so called by the Dutch from an island and

town of the far two miles in circuit for trade so near attention between from whom, in retaken by the possession it retained where triumphed at the treaty of war, but given

**MADEIRAS** according to the north lat. and from the Canaries, and from which the its being formerly long, sixty broad continued hill c

town of the same name in Holland. It is a small spot not exceeding two miles in circumference; but its importance arises from its situation for trade so near Cape Verd, and has been therefore an object of contention between European nations. It was first possessed by the Dutch, from whom, in 1663, it was taken by the English; but in 1665 it was retaken by the Dutch, and in 1667 subdued by the French, in whose possession it remained till the year 1759, when the British arms, every where triumphant, again reduced it; but it was restored to the French at the treaty of peace in 1763. It was retaken by the English the last war, but given up again by the peace of 1783.

**CANARIES.** The Canaries, anciently called the Fortunate Islands, are seven in number, and situated between 12 and 19 deg. west long. and between 27 and 29 deg. north lat. about 150 miles south-west of Morocco. Their particular names are Palma, Hiero, Gomera, Teneriffe, Grand Canaria, Fuerteventura, and Langarote. These islands enjoy a pure temperate air, and abound in the most delicious fruits, especially grapes, which produce those rich wines that obtain the name of Canary, of which the greatest part is exported to England, to the amount, it is computed, in time of peace, of 10,000 hogsheds annually. The Canaries abound with those little beautiful birds that bear their name, and are now so common and so much admired in Europe; but their wild notes in their native land far excel those in a cage or foreign clime.

Grand Canary, which communicates its name to the whole, is about 150 miles in circumference, and so extremely fertile as to produce two harvests in a year. Teneriffe, the largest of these islands next to that of the Grand Canary, is about 120 miles round: a fertile country abounding in corn, wine, and oil, though it is pretty much encumbered with mountains, particularly the Peak. Captain Glass observes, that in coming in with this island, in clear weather, the Peak may be easily discerned at 120 miles distance, and in sailing from it at 150. The peak is an ascent in the form of a sugar-loaf, about fifteen miles in circumference, and, according to the account of Sprat, bishop of Rochester, published in the Philosophical Transactions, nearly three miles perpendicular; but lately ascertained to be only 13,265 feet. This mountain is a volcano, and sometimes throws out such quantities of sulphur and melted ore, as to convert the richest lands into barren deserts. These islands were first discovered and planted by the Carthaginians; but the Romans destroying that state, put a stop to the navigation on the west coast of Africa, and the Canaries lay concealed from the rest of the world, until they were again discovered by the Spaniards in the year 1495, to whom they still belong. It is remarkable, that though the natives resemble the Africans in their stature and complexion, when the Spaniards first came among them, their language was different from that spoken on the continent; they retained none of their customs, were masters of no science, and did not know there was any country in the world besides their own.

**MADEIRAS.** The three islands called the Madeiras are situated, according to the author of Anson's voyage, in a fine climate, in 32-27 north lat. and from 18-30 to 19-30 west long. about 100 miles north of the Canaries, and as many west of Sallee, in Morocco. The largest, from which the rest derive the general name of Madeiras, on account of its being formerly almost covered with wood, is about seventy-five miles long, sixty broad, and 180 in circumference. It is composed of one continued hill of a considerable height, extending from east to west;

the declivity of which, on the south side, is cultivated, and interspersed with vineyards; and in the midst of this slope the merchants have fixed their country-seats, which form a very agreeable prospect. There is but one considerable town in the whole island, which is named Funchal, seated on the south part of the island, at the bottom of a large bay: towards the sea it is defended by a high wall, with a battery of cannon, and is the only place where it is possible for a boat to land; and even here the beach is covered with large stones, and a violent surf continually beats upon it.

Though this island seems to have been known to the ancients, yet it lay concealed for many generations, and was at length discovered by the Portuguese in 1519; but others assert that it was first discovered by an Englishman in the year 1344. Be that as it may, the Portuguese took possession of it, and are still almost the only people who inhabit it. The Portuguese, at their first landing, finding it little better than a thick forest, rendered the ground capable of cultivation, by setting fire to this wood; and it is now very fertile, producing, in great abundance, the richest wine, sugar, the most delicious fruits, especially oranges, lemons, and pomegranates; together with corn, honey, and wax: it abounds also with boars and other wild beasts, and with all sorts of fowls, besides numerous groves of cedar trees, and those that yield dragon's blood, mastic, and other gums. The inhabitants of this isle make the best sweetmeats in the world, and succeed wonderfully in preserving citrons and oranges, and in making marmalade and perfumed pastes, which exceed those of Genoa. The sugar they make is extremely beautiful, and smells naturally of violets. This indeed is said to be the first place in the west where that manufacture was set on foot, and from thence was carried to the Brasils in America. The Portuguese, not finding it so profitable as at first, have pulled up the greatest part of their sugar-canes, and planted vineyards in their stead, which produce several sorts of excellent wine, particularly that which bears the name of the island, Malmsey, and Tent; of all which the inhabitants make and sell prodigious quantities. Not less than 20,000 hogshheads of Madeira, it is said, are yearly exported, the greatest part to the West Indies, especially to Barbadoes: the Madeira wine not only enduring a hot climate better than any other, but even being improved when exposed to the sun in barrels after the bung is taken out. It is said no venomous animal can live here. Of the two other islands, one called Porto Santo, which lies at a small distance from Madeira, is about eight miles in compass, and extremely fertile. It has very good harbours, where ships may ride with safety against all winds except the south-west, and is frequented by Indianmen outward and homeward-bound. The other island is an inconsiderable barren rock.

**AZORES.** Leaving the Madeiras, with which we close the account of Africa, we continue our course westward, through this immense ocean, which brings us to the Azores, or, as they are called, the Western Islands, situated between 25 and 32 deg. west long. and between 37 and 40 north lat. 900 miles west of Portugal, and as many east of Newfoundland, lying almost in the mid-way between Europe and America. They are nine in number, and are named Santa Maria, St. Miguel or St. Michael, Tercera, St. George, Graciosa, Fayal, Pico, Flores, and Corvo. They were discovered in the middle of the fifteenth century, by Joshua Vander Berg a merchant of Bruges in Flanders, who, in a voyage to Lisbon, was, by stress of weather, driven to these islands, which he found destitute of inhabitants, and called them the Flemish

islands. On his arrival at Lisbon, he boasted of this discovery; on which the Portuguese set sail immediately and took possession of them, which they still retain. They were called in general the Azores, from the great number of hawks and falcons found among them. All these islands enjoy a very clear and serene sky, with a salubrious air, but are exposed to violent earthquakes, from which they have frequently suffered; and also by inundations of the surrounding waves. They are, however, extremely fertile in corn, wine, and a variety of fruits, also cattle, fowl, and fish. It is said that no poisonous or noxious animal breeds on the Azores, and that, if carried thither, they will expire in a few hours.

St. Michael, which is the largest, being near 100 miles in circumference, and containing 50,000 inhabitants, was twice invaded and plundered by the English in the reign of queen Elizabeth. Tercera is the most important of these islands, on account of its harbour, which is spacious and has good anchorage; but it is exposed to the south-east winds. Its capital town, Angra, contains a cathedral and five churches, and is the residence of the governor of these islands, as well as of the bishop.

## A M E R I C A.

### ITS DISCOVERY AND CONQUEST.

**WE** are now to treat of a country of vast extent and fertility, and which, though little cultivated by the hand of art, owes its many respects more to that of nature than any other division of the globe. The particular circumstances of this country require that we should in some measure vary our plan, and, before describing its present state, afford such information with regard to its discovery as is most necessary for satisfying our readers.

Towards the close of the 15th century, Venice and Genoa were the only powers in Europe who owed their support to commerce. An interference of interests inspired a mutual rivalry; but in traffic Venice was much superior. She engrossed the whole commerce of India, then, and indeed always, the most valuable in the world, but hitherto entirely carried on through the inland parts of Asia, or by the way of Egypt and the Red Sea. In this state of affairs, Columbus, a native of Genoa, whose knowledge of the true figure of the earth, however attained, was much superior to the general notions of the age in which he lived, conceived a project of sailing to the Indies by a bold and unknown route, and of opening to his country a new source of opulence and power. But this proposal of sailing westward to the Indies was rejected by the Genoese as chimerical, and the principles on which it was founded were condemned as absurd. Stung with disappointment and indignation, Columbus retired from his country, and laid his schemes before the court of France; where his reception was still more mortifying, and where, according to the practice of that people, he was laughed at and ridiculed. Henry VII. of England was his next resort; but the cautious politics of that prince were the most opposite imaginable to a great but uncertain design. In Portugal, where the spirit of adventure and discovery about this time began to operate, he had reason to expect better success. But the Portuguese contented themselves with creep-

ing along the coast of Africa, and discovering one cape after another; they had no notion of venturing boldly into the open sea. Such repeated disappointments would have broken the spirit of any man but Columbus. The expedition required expense, and he had nothing to defray it. His mind, however, still remained firm; he became the more intent on his design, the more difficulty he found in accomplishing it, and was inspired with that noble enthusiasm which always animates an adventurous and original genius. Spain was now his only resource; and there, after eight years' attendance, he succeeded, and chiefly through the interest of queen Isabella. Columbus now set sail, anno 1492, with a fleet of three ships, upon the most adventurous attempt ever undertaken by man, and in the fate of which the inhabitants of two worlds were interested. In this voyage he had a thousand difficulties to contend with; the most striking was the variation of the compass, then first observed, and which seemed to threaten that the laws of nature were altered in an unknown ocean, and that the only guide he had left was ready to forsake him. His sailors, always discontented, now broke out into open mutiny, threatening to throw him overboard, and insisted on their return. But the firmness of the commander, and much more the discovery of land after a voyage of 33 days, put an end to the commotion. Columbus first landed on one of the Bahama islands; but here, to his surprize and sorrow, discovered, from the poverty of the inhabitants, that these could not be the Indies he was in quest of. In steering southward, however, he found the island called Hispaniola, abounding in all the necessaries of life, inhabited by a humane and hospitable people, and, what was of still greater consequence, as it insured his favourable reception at home, promising, from some samples he received, considerable quantities of gold. This island therefore he proposed to make the centre of his discoveries; and, having left upon it a few of his companions, as the ground-work of a colony, returned to Spain to procure the necessary reinforcements.

The court was then at Barcelona: Columbus travelled thither from Seville, amidst the acclamations of the people, attended by some of the inhabitants, the gold, the arms, the utensils, and ornaments, of the country he had discovered. This entry into Barcelona was a species of triumph more glorious than that of conquerors, more uncommon, and more innocent. In this voyage he had acquired a general knowledge of all the islands in the great sea which divides North and South America; but he had no idea that there was an ocean between him and China. The countries which he had discovered were considered as a part of India. Even after the error which gave rise to this opinion was detected, and the true position of the new world was ascertained, the name has remained, and the appellation of the *West Indies* is given by all the people of Europe to the country, and that of *Indians* to its inhabitants. Thus were the West Indies discovered by seeking a passage to the East; and, even after the discovery, still conceived to be a part of the Eastern hemisphere. The present success of Columbus, his former disappointments, and the glory attending to unexpected a discovery, rendered the court of Spain as eager to forward his designs now, as it had been dilatory before. A fleet of seventeen sail was immediately prepared: all the necessaries for conquest or discovery were embarked; 1500 men, among whom were several of high rank and fortune, prepared to accompany Columbus, now appointed governor with the most ample authority. It is impossible to determine whether the genius of this great man, in first conceiving the idea of these discoveries, or

his sagacity serves our attention among such a field of new objects the advantage than to acquire of unknown pleasure of establishing grounds for a considerable colony, with further, he discovers, and from them. citizens, fear part of some gain this point the southern islands, of which were well in him an opposite world expected *la Reina*, or who was always maica was proposed, on a he returned with regard

his sagacity in the execution of the plan he had conceived, most deserves our admiration. Instead of hurrying from sea to sea, and from one island to another, which, considering the ordinary motives to action among mankind, was naturally to be expected, Columbus, with such a field before him, unable to turn on either hand without finding new objects of his curiosity and his pride, determined rather to turn to the advantage of the court of Spain the discoveries he had already made, than to acquire for himself the unavailing applause of visiting a number of unknown countries, from which he reaped no other benefit but the pleasure of seeing them. With this view he made for Hispaniola, where he established a colony, and erected forts in the most advantageous grounds for securing the dependence of the natives. Having spent a considerable time in this employment, and laboured for establishing this colony, with as much zeal and assiduity as if his views had extended no further, he next proceeded to ascertain the importance of his other discoveries, and to examine what advantages were most likely to be derived from them. He had already touched at Cuba, which, from some specimens, seemed a rich discovery; but whether it was an island, or a part of some great continent, he was altogether uncertain. To ascertain this point was the present object of his attention. In coasting along the southern shore of Cuba, Columbus was entangled in a multitude of islands, of which he reckoned 160 in one day. These islands, which were well inhabited, and abounding in all the necessaries of life, gave him an opportunity of reflecting on this fertility of nature where the world expected nothing but the barren ocean; he called them *Jardín de la Reina*, or the Queen's Garden, in gratitude to his royal benefactress, who was always uppermost in his memory. In the same voyage, Jamaica was discovered. But to so many difficulties, was Columbus exposed, on an unknown sea, among rocks, shelves, and sands, that he returned to Hispaniola without learning any thing more certain with regard to Cuba, the main object of this enterprise.

By the first success of this great man, the public diffidence was turned into admiration; but, by a continuance of the same success, admiration degenerated into envy. His enemies in Spain set every spring in motion against him; and there is no difficulty in finding specious grounds of accusation against such as are employed in the execution of an extensive and complicated plan. An officer was dispatched from Spain, fitted by his character to act the part of a spy and informer, and whose presence plainly demonstrated to Columbus the necessity of returning to Europe, in order to obviate the objections or calumny of his enemies.

It was not without great difficulty that he was enabled to set out on a third expedition, still more famous than any he had hitherto undertaken. He designed to stand to the southward of the Canaries until he came under the equinoctial line, and then to proceed directly westward, that he might discover what opening that might afford to India, or what new islands, or what continent, might reward his labour. In this navigation, after being long buried in a thick fog, and suffering numberless inconveniences from the excessive heats and rains between the tropics, they were at length favoured with a smart gale, and went before it seventeen days to the westward. At the end of this time, a seaman saw land, which was an island, on the coast of Guiana, now called Trinidad. Having passed this island, and two others which lie in the mouth of the great river Orinoco, the admiral was surprised with an appearance he had never seen before: this was the frightful tumult

of the waves, occasioned by a conflict between the tide of the sea and the rapid current of the immense river Oronoco. But sailing forward, he plainly discovered that they were in fresh water; and judging rightly that it was improbable any island should supply so vast a river, he began to suspect he had discovered the continent; but when he left the river, and found that the land continued on the westward for a great way, he was convinced of it. Satisfied with this discovery, he yielded to the uneasiness and distresses of his crew, and bore away for Hispaniola. In the course of this discovery, Columbus landed at several places, where in a friendly manner he traded with the inhabitants, and found gold and pearl in tolerable plenty.

About this time the spirit of discovery spread itself widely, and many adventurers all over Europe wished to acquire the reputation of Columbus, without possessing his abilities. The Portuguese discovered Brasil, which makes at present the most valuable part of their possessions: Cabot, a native of Bristol, discovered the north-east coasts, which afterwards composed the British empire in North America: and Amerigo Vespuccio, a merchant of Florence, sailed to the southern continent of America, and, being a man of address, had the honour of giving his name to half the globe. But no one is now imposed on by the name; all the world knows that Columbus was the first discoverer. The being deprived of the honour of giving name to the new world, was one of the smallest mortifications to which this great man was compelled to submit. For, such were the clamours of his enemies, and the ingratitude of the court of Spain, that, after discovering the continent, and making settlements in the islands of America, he was treated like a traitor, and carried over to Europe in irons. He enjoyed, however, the glory of rendering the one-half of the world known to the other; a glory so much the more precious, as it was untainted by cruelty or plunder, which disfigured all the exploits of those who came after him and accomplished the execution of his plan. He fully vindicated himself at court, was restored to favour, and undertook another voyage in which he suffered great fatigues. He returned to Spain, and died at Valladolid, in 1506, in the 59th year of his age. The succeeding governors of Cuba and Hispaniola endeavoured to purchase the same advantages by the blood of the natives, which Columbus had obtained by his good sense and humanity. These islands contained mines of gold. The Indians only knew where they were situated; and the extreme avarice of the Spaniards, too furious to work by the gentle means of persuasion, hurried them to acts of the most shocking violence and cruelty against those unhappy men, who, they believed, concealed from them part of their treasure. The slaughter once begun, they set no bounds to their fury; in a few years they depopulated Hispaniola, which contained three millions of inhabitants; and Cuba, that had about 600,000. Bartholomew de las Casas, a witness of those barbarous depopulations, says, that the Spaniards went out with their dogs to hunt after men. The unhappy savages, almost naked and unarmed, were pursued like deer into the forests, devoured by dogs, killed with gun-shot, or surprised and burnt in their habitations.

The Spaniards had hitherto only visited the continent: from what they saw with their eyes, or learned by report, they conjectured that this part of the new world would afford a still more valuable conquest. Fernando Cortez was dispatched from Cuba with 600 men, 18 horses, and a small number of field-pieces. With this inconsiderable force, he proposed to subdue the most powerful state on the continent of America;

this was the millions of Inca, whose Never history, of this war: ants; it is said a polished and old, whose wisdom fitted nearly object of administration, four seemed to bid pire, situated in ment of America immense cause was admired in places, the showous palaces of containing what grandeur of this tez, in his march the coast of Mexico warlike animals: ficial thunder which had wasted them which they did Spaniards march fame. this was the empire of Mexico, rich, powerful, and inhabited by millions of Indians passionately fond of war, and then headed by Montezuma, whose fame in arms struck terror into the neighbouring nations. Never history, to be true, was more improbable and romantic than that of this war: The empire of Mexico had subsisted for ages; its inhabitants, it is said, were not rude and barbarous; every thing announced a polished and intelligent people. They knew, like the Egyptians of old, whose wisdom is still admired in this particular, that the year consisted nearly of 365 days. Their superiority in military affairs was the object of admiration and terror over all the continent; and their government, founded on the sure basis of laws combined with religion, seemed to bid defiance to time itself. Mexico, the capital of the empire, situated in the middle of a spacious lake, was the noblest monument of American industry. It communicated with the continent by immense causeways, which were carried through the lake. The city was admired for its buildings, all of stone, its squares and market-places, the shops which glittered with gold and silver, and the sumptuous palaces of Montezuma, some erected on columns of jasper, and containing whatever was most rare, curious, or useful. But all the grandeur of this empire could not defend it against the Spaniards. Cortez, in his march, met with a feeble opposition from the nations along the coast of Mexico, who were terrified at their first appearance: the warlike animals on which the Spanish officers were mounted, the artificial thunder which issued from their hands, the wooden castles which had wasted them over the ocean, struck a panic into the natives, from which they did not recover until it was too late. Wherever the Spaniards marched, they spared neither age nor sex, nothing sacred or profane. At last, the inhabitants of Tlascala, and some other states upon the coast, despairing of being able to oppose them, entered into their alliance, and joined arms with those terrible, and, as they believed, invincible conquerors. Cortez, thus reinforced, marched onward to Mexico; and, in his progress, discovered a volcano of sulphur and salt-petre, whence he could supply himself with powder. Montezuma heard of his progress without daring to oppose it. This sovereign is reported, by the boasting Spaniards, to have commanded thirty vassals, of whom each could appear at the head of 100,000 combatants armed with bows and arrows; and yet he dared not resist a handful of Spaniards, aided by a few Americans whose allegiance would be shaken by the first reverse of fortune. Such was the difference between the inhabitants of the two worlds, and the fame of the Spanish victories, which always marched before them.

By sending a rich present of gold, which only excited the Spanish avarice, Montezuma hastened the approach of the enemy. No opposition was made to their entry into his capital. A palace was set apart for Cortez and his companions, who were already treated as the masters of the new world. He had good reason, however, to distrust the affected politeness of this emperor, under which he suspected some plot for his destruction to be concealed: but he had no pretence for violence; Montezuma loaded him with kindness, and with gold in greater quantities than he demanded, and his palace was surrounded with artillery, the most terrible of all engines to the Americans. At last, a circumstance took place which afforded Cortez a pretext for beginning hostilities. In order to secure a communication by sea to receive the necessary reinforcements, he erected a fort, and left a small garrison behind him, at Vera Cruz, which has since become an emporium

of commerce between Europe and America. He understood that the Americans in the neighbourhood had attacked this garrison in his absence, and that a Spaniard was killed in the action; that Montezuma himself was privy to this violence, and had issued orders that the head of the slain Spaniard should be carried through his provinces; to destroy a belief, which then prevailed among them, that the Europeans were immortal. Upon receiving this intelligence, Cortez went in person to the emperor, attended by a few of his most experienced officers. Montezuma pleaded innocence, in which Cortez seemed extremely ready to believe him, though, at the same time, he alleged that the Spaniards in general would never be persuaded of it, unless he returned along with them to their residence; which would remove all jealousy between the two nations. The success of this interview showed the superiority of European address. A powerful monarch, in the middle of his own palace, and surrounded by his guards, gave himself up a prisoner, to be disposed of according to the inclination of a few strangers who came to demand him. Cortez had now got into his hands an engine by which every thing might be accomplished. The Americans had the highest respect, or rather superstitious veneration, for their emperor. Cortez, therefore, by keeping him in his power, allowing him to enjoy every mark of royalty but his freedom, and, at the same time, from a thorough knowledge of his character, being able to flatter all his tastes and passions, maintained the easy sovereignty of Mexico by governing its prince. Did the Mexicans, grown familiar with the Spaniards, begin to abate of their respect, Montezuma was the first to teach them more politeness. Was there a tumult excited through the cruelty or avarice of the Spaniards, Montezuma ascended the battlements of his prison, and harangued his Mexicans into order and submission. This farce continued a long time; but on one of these occasions, when Montezuma was shamefully disgracing his character, by justifying the enemies of his country, a stone, from an unknown hand, struck him on the temple, which, in a few days, occasioned his death. The Mexicans, now delivered from this emperor, who cooperated so strongly with the Spaniards, elected a new prince, the famous Guatimozin, who, from the beginning, discovered an implacable animosity against the Spanish name. Under his conduct, the unhappy Mexicans rushed against those very men, whom a little before they had offered to worship. The Spaniards, however, by the dexterous management of Cortez, were too firmly established to be expelled from Mexico.

The immense tribute which the grandees of this country had agreed to pay to the crown of Spain, amounted to 600,000 marks of pure gold, besides an amazing quantity of precious stones, a fifth part of which, distributed among his soldiers, stimulated their avarice and their courage, and made them willing to perish rather than part with so precious a booty. The Mexicans, however, made no small efforts for independence; but all their valour, and despair itself, gave way before what they called the Spanish thunder. Guatimozin and the empress were taken prisoners. This was the prince who, when he lay stretched on burning coals, by order of one of the receivers of the king of Spain's exchequer, who insisted the torture to make him discover into what part of the lake he had thrown his riches, said to his high-priest condemned to the same punishment, and who loudly expressed his sense of the pains that he endured, "Do you imagine I lie on a bed of roses?" The high-priest remained silent, and died in an act of obedi-

ence to his sovereign. Cortez, by getting a second emperor into his hands, made a complete conquest of Mexico; with which the golden Castile, Darien, and other provinces, fell into the hands of the Spaniards.

While Cortez and his soldiers were employed in reducing Mexico, they obtained intelligence of another great empire, situated towards the equinoctial line, and the tropic of Capricorn, which was said to abound in gold and silver, and precious stones; and to be governed by a prince more magnificent than Montezuma. This was the empire of Peru, which extended in length near 30 degrees, and was the only other country in America that deserved the name of a civilised kingdom. Whether it happened, that the Spanish government had not received certain intelligence concerning Peru, or that, being engaged in a multiplicity of other concerns, it did not choose to adventure on new enterprises, certain it is, that this extensive country, more important than Mexico itself, was reduced by the endeavours and at the expence of three private persons. The names of these were, Francis Pizarro, Almagro, and Lucques, a priest, but a man of considerable fortune. The two former were natives of Panama, men of doubtful birth, and of low education. Pizarro, the soul of the enterprise, could neither read nor write. They sailed over into Spain, and, without difficulty, obtained a grant of what they should conquer. Pizarro then set out for the conquest of Peru, with 250 foot, 60 horse, and 12 small pieces of cannon, drawn by slaves from the conquered countries. If we reflect that the Peruvians naturally entertained the same prejudices with the Mexicans, in favour of the Spanish nation, and were, beside, of a character still more soft and unwarlike, it need not surprize us, after what has been said of the conquest of Mexico, that, with this inconsiderable force, Pizarro should make a deep impression on the Peruvian empire. There were particular circumstances likewise which conspired to assist him, and which, as they discover somewhat of the history, religion, and state of the human mind, in this immense continent, it may not be improper to relate.

Mango Capac was the founder of the Peruvian empire. He was one of those uncommon men, who, calm and dispassionate themselves, can observe the passions of their fellow-creatures, and turn them to their own profit or glory. He observed that the people of Peru were naturally superstitious, and had a particular veneration for the Sun. He pretended therefore to be descended from that luminary, whose worship he was sent to establish, and whose authority he was entitled to bear. By this story, romantic as it appears, he easily deceived a credulous people, and brought a large extent of territory under his jurisdiction; a larger still he subdued by his arms; but both the force and the deceit he employed for the most laudable purposes. He united and civilised the dispersed barbarous people; he subjected them to laws, and trained them to arms; he softened them by the institution of a benevolent religion: in short, there was no part of America where agriculture and the arts were so assiduously cultivated, and where the people were of such mild and ingenuous manners. A race of princes succeeded Mango, distinguished by the title of Yncas, and revered by the people as descendants of their great god, the Sun. The twelfth of these was now on the throne, and named Atabalipa. His father, Guiana Capac, had conquered the province of Quito, which now makes a part of Spanish Peru. To secure himself in the possession, he had married the daughter of the natural prince of that country, and of this

marriage was sprung Atabalipa. His elder brother, named Huefcar, of a different mother, had claimed the succession to the whole of his father's dominions, not excepting Quito, which devolved on the younger by a double connection. A civil war had been kindled on this account, which, after various turns of fortune, and greatly weakening the kingdom, ended in favour of Atabalipa, who detained Huefcar, as a prisoner, in the tower of Cusco, the capital of the Peruvian empire. In this feeble and disjointed state was the kingdom of Peru when Pizarro advanced to attack it. The ominous predictions of religion, too, as in most other cases, joined their force to human calamities. Prophecies were recorded, dreams were recollected, which foretold the subjection of the empire by unknown persons, whose description exactly corresponded to the appearance of the Spaniards. In these circumstances, Atabalipa, instead of opposing the Spaniards, set himself to procure their favour. Pizarro, however, whose temper partook of the meanness of his education, had no conception of dealing gently with those he called barbarians, but who, however, though less acquainted with the cruel art of destroying their fellow-creatures, were more civilised than himself. While he was engaged in conference, therefore, with Atabalipa, his men, as they had been previously instructed, furiously attacked the guards of that prince, and, having butchered 5000 of them, as they were pressing forward, without regard to their particular safety, to defend the sacred person of their monarch, seized Atabalipa himself, whom they carried off to the Spanish quarters. Pizarro, with the sovereign in his hands, might already be deemed the master of Peru; for the inhabitants of this country were as strongly attached to their emperor as were the Mexicans. Atabalipa was not long in their hands before he began to treat for his ransom. On this occasion the ancient ornaments, amassed by a long line of magnificent kings, the hallowed treasures of the most sumptuous temples, were brought out to save him, who was the support of the kingdom, and of the religion. While Pizarro was engaged in this negotiation, by which he proposed, without releasing the emperor, to get into his possession an immense quantity of his beloved gold, the arrival of Almagro caused some embarrassment in his affairs. The friendship, or rather the external show of friendship, between these men, was solely founded on the principle of avarice, and a bold enterprising spirit, to which nothing appeared too dangerous that might gratify their ruling passion. When their interests, therefore, happened to interfere, it was not to be thought that any measures could be kept between them. Pizarro expected to enjoy the most considerable share of the treasure arising from the emperor's ransom, because he had the chief hand in acquiring it. Almagro insisted on being upon an equal footing; and at length, lest the common cause should suffer by any rupture between them, this disposition was agreed to. The ransom was paid without delay, a sum exceeding their conception, but not capable to gratify their avarice. It amounted to 1,500,000*l.* sterling, and, considering the value of money at that time, was prodigious: on the dividend, after deducting a fifth for the king of Spain, and the shares of the chief commanders and other officers, each private soldier had above 2000*l.* English money. With such fortunes it was not to be expected that a mercenary army would incline to be subjected to the rigours of military discipline. They insisted on being disbanded, that they might enjoy the fruits of their labour in quiet. Pizarro complied with this demand, sensible that avarice would still detain a num-

ber in his army, and that those who returned with such magnificent fortunes, would induce new adventurers to pursue the same plan for acquiring gold. These wise reflections were abundantly verified; it was impossible to send out better recruiting officers than those who had themselves so much profited by the field; new soldiers constantly arrived, and the American armies never wanted reinforcements.

This immense ransom was only a further reason for detaining Atabalipa in confinement, until they discovered whether he had another treasure to gratify their avarice. But whether they believed he had no more to give, and were unwilling to employ their troops in guarding a prince from whom they expected no further advantage; or that Pizarro had conceived an aversion against the Peruvian emperor, on account of some instances of craft and duplicity which he observed in his character, and which he conceived might prove dangerous to his affairs; it is certain, that, by his command, Atabalipa was put to death. To justify this cruel proceeding, a pretended charge was exhibited against the unhappy prince, in which he was accused of idolatry, of having many concubines, and other circumstances of equal impertinence. The only just ground of accusation against him was, that his brother, Huefcar, had been put to death by his command; and even this was considerably palliated, because Huefcar had been plotting his destruction, that he might establish himself on the throne. Upon the death of the Ynca, a number of candidates appeared for the throne. The principal nobility set up the full brother of Huefcar; Pizarro set up a son of Atabalipa; and two generals of the Peruvians endeavoured to establish themselves by the assistance of the army. These distractions, which in another empire would have been extremely hurtful, and even here at another time, were at present rather advantageous to the Peruvian affairs. The candidates fought against one another: their battles accustomed these harmless people to blood; and such is the preference of a spirit of any kind raised in a nation to a total lethargy, that, in the course of those quarrels among themselves, the inhabitants of Peru assumed some courage against the Spaniards, whom they regarded as the ultimate cause of all their calamities. The losses which the Spaniards met with in these quarrels, though inconsiderable in themselves, were rendered dangerous, by lessening the opinion of their invincibility, which they were careful to preserve among the inhabitants of the new world. This consideration engaged Pizarro to conclude a truce; and the interval he employed in laying the foundations of the famous city of Lima, and in settling the Spaniards in the country. But as soon as a favourable opportunity offered, he renewed the war against the Indians, and, after many difficulties, made himself master of Cusco, the capital of the empire. While he was engaged in these conquests, new grants and supplies arrived from Spain. Pizarro obtained 200 leagues along the sea-coast, to the southward of what had been before granted, and Almagro 200 leagues to the southward of Pizarro's government. This division occasioned a warm dispute between them, each reckoning Cusco within his own district; but the dexterity of Pizarro brought about a reconciliation. He persuaded his rival, that the country which really belonged to him lay to the southward of Cusco, and that it was no way inferior in riches, and might be as easily conquered as Peru. He offered him his assistance in the expedition, the success of which he did not even call in question.

Almagro, that he might have the honour of subduing a kingdom

for himself, listened to his advice; and, joining as many of Pizarro's troops to his own as he judged necessary, he penetrated, with great danger and difficulty, into Chili; losing many of his men as he passed over mountains of an immense height, and always covered with snow. He reduced, however, a very considerable part of this country. But the Peruvians were now become too much acquainted with war, not to take advantage of the division of the Spanish troops. They made an effort for regaining their capital, in which, Pizarro being indisposed, and Almagro removed at a distance, they were very nearly successful. The latter, however, no sooner got notice of the siege of Cusco, than, relinquishing all views of distant conquests, he returned to secure the grand objects of their former labours. He raised the siege, with infinite slaughter of the assailants; but, having obtained possession of the city, he was unwilling to give it up to Pizarro, who now approached with an army, and knew of no other enemy but the Peruvians. This dispute occasioned a long and bloody struggle between them, in which the turns of fortune were various, and the resentment fierce on both sides, because the fate of the vanquished was certain death. This was the lot of Almagro, who, in an advanced age, fell a victim to the security of a rival, in whose dangers and triumphs he had long shared, and with whom, from the beginning of the enterprise, he had been intimately connected. During the course of this civil war, many Peruvians served in the Spanish armies, and learned, from the practice of Christians, to butcher one another. That blinded nation, however, at length opened their eyes, and took a very remarkable resolution. They saw the ferocity of the Europeans, their unextinguishable resentment and avarice, and they conjectured that these passions would never permit their contests to subside. Let us retire, said they, from among them; let us fly to our mountains; they will speedily destroy one another, and then we may return in peace to our former habitations. This resolution was instantly put in practice; the Peruvians dispersed, and left the Spaniards in their capital. Had the force on each side been exactly equal, this singular policy of the natives of Peru might have been attended with success: but the victory of Pizarro put an end to Almagro's life, and to the hopes of the Peruvians, who have never since ventured to make head against the Spaniards.

Pizarro, now sole master of the field, and of the richest empire in the world, was still urged on by his ambition to undertake new enterprises. The southern countries of America, into which he had some time before dispatched Almagro, offered the richest conquest. Towards this quarter, the mountains of Potosi, composed of entire silver, had been discovered, the shell of which only remains at present. He therefore followed the track of Almagro into Chili, and reduced another part of that country. Orellana, one of his commanders, passed the Andes, and sailed down to the mouth of the river of Amazons: an immense navigation, which discovered a rich and delightful country; but as it is mostly flat, and therefore not abounding in minerals, the Spaniards then, and ever since, neglected it. Pizarro meeting with repeated success, and having no superior to control, no rival to keep him within bounds, now gave loose reins to the natural ferocity of his temper, and behaved with the basest tyranny and cruelty against all who had not concurred in his designs. This conduct raised a conspiracy against him, to which he fell a sacrifice in his own palace, and in the city of Lima, which he himself had founded. The partisans of

old Almagro

old Almagro now declared his son, of the same name, their viceroy. But the greater part of the nation, though extremely well satisfied with the fate of Pizarro, did not concur with this declaration. They waited the orders of the emperor Charles V. then king of Spain, who sent over Vaca di Castro to be their governor. This man, by his integrity and wisdom, was admirably well fitted to heal the wounds of the colony, and to place every thing on the most advantageous footing, both for it and for the mother-country. By his prudent management, the mines of la Plata and Potosi, which were formerly private plunder, became an object of public utility to the court of Spain. The parties were silenced or crushed; young Almagro, who would hearken to no terms of accommodation, was put to death; and a tranquillity, since the arrival of the Spaniards unknown, was restored to Peru. It seems, however, that Castro had not been sufficiently skilled in gaining the favour of the Spanish ministry by proper bribes or promises, which a ministry would always expect from the governor of so rich a country. By their advice a council was sent over to control Castro, and the colony was again unsettled. The party-spirit, but just extinguished, began to blaze anew; and Gonzalo, the brother of the famous Pizarro, set himself at the head of his brother's partisans, with whom many new malcontents had united. It was now no longer a dispute between governors about the bounds of their jurisdiction. Gonzalo Pizarro only paid a nominal submission to the king. He strengthened daily, and even went so far as to behead a governor who was sent over to curb him. He gained the confidence of the admiral of the Spanish fleet in the South Seas, by whose means he proposed to hinder the landing of any troops from Spain, and he had a view of uniting the inhabitants of Mexico in his revolt.

Such was the situation of affairs, when the court of Spain, sensible of their mistake in not sending into America men whose character and virtue only, and not opportunity and cabal, pleaded in their behalf, dispatched, with unlimited powers, Peter de la Gasca, a man differing from Castro only by being of a more mild and insinuating behaviour, but with the same love of justice, the same greatness of soul, and the same disinterested spirit. All those who had not joined in Pizarro's revolt flocked to his standard; many of his friends, charmed with the behaviour of Gasca, forsook their old connections; the admiral was gained over by insinuation to return to his duty; and Pizarro himself offered a full indemnity, provided he would return to the allegiance of the Spanish crown. But so intoxicating are the ideas of royalty, that Pizarro was inclined to run every hazard, rather than submit to any officer of Spain. With those of his partisans, therefore, who still continued to adhere to his interest, he determined to venture a battle, in which he was conquered, and taken prisoner. His execution followed soon after; and thus the brother of him who conquered Peru for the crown of Spain, fell a sacrifice for the security of the Spanish dominion over that country.

The conquest of the great empires of Mexico and Peru is the only part of the American history which deserves to be treated under the present head. What relates to the reduction of the other parts of the continent or of the islands, if it contains either instruction or entertainment, shall be recorded under these particular countries. We now proceed to treat of the manners, government, religion, and whatever composes the character of the natives of America; and as these are extremely similar all over this part of the globe, we shall speak of them

in general, in order to save continual repetitions, noticing at the same time, when we enter upon the description of the particular countries, whatever is peculiar or remarkable in the inhabitants of each.

### Of the Original Inhabitants of AMERICA.

THE discovery of America has not only opened a new source of wealth to the busy and commercial part of Europe, but an extensive field of speculation to the philosopher who would trace the character of man under various degrees of refinement, and observe the movements of the human heart, or the operations of the human understanding; when untutored by science, or untainted by corruption. So striking seemed the disparity between the inhabitants of Europe and the natives of America; that some speculative men have ventured to affirm, that it is impossible they should be of the same species, or derived from one common source. This conclusion, however, is extremely ill founded. The characters of mankind may be infinitely varied according to the different degrees of improvement at which they are arrived, the manner in which they acquire the necessaries of life, the force of custom and habit, and a multiplicity of other circumstances too particular to be mentioned, and too various to be reduced under any general head. But the great outlines of humanity are to be discovered among them all, notwithstanding the various shades which characterise nations, and distinguish them from each other.

When the thirst of gold carried the inhabitants of Europe beyond the Atlantic, they found the inhabitants of the new world immersed in what they called barbarism, but which, however, was a state of honest independence, and noble simplicity. Except the inhabitants of the great empires of Peru and Mexico, who, comparatively speaking, were refined nations, the natives of America were unacquainted with almost every European art; even agriculture itself, the most useful of them all, was hardly known, or cultivated very sparingly. The only method on which they depended for acquiring the necessaries of life, was by hunting the wild animals, which their mountains and forests supplied in great abundance. This exercise, which among them is a most serious occupation, gives a strength and agility to their limbs, unknown among other nations. The same cause, perhaps, renders their bodies, in general, where the rays of the sun are not too violent, uncommonly straight and well-proportioned. Their muscles are firm and strong; their bodies and heads flatish, which is the effect of art; their features are regular, but their countenances fierce; their hair long, black, lank, and as strong as that of a horse. The colour of their skin is a reddish-brown, admired among them, and heightened by the constant use of war's fat and paint. The character of the Indians is altogether founded upon their circumstances and way of life. A people who are constantly employed in procuring the means of a precarious subsistence, who live by hunting the wild animals, and who are generally engaged in war with their neighbours, cannot be supposed to enjoy much gaiety of temper, or high flow of spirits. The Indians, therefore, are, in general, grave even to sadness; they have nothing of that giddy vivacity peculiar to some nations in Europe, and they despise it. Their behaviour to those about them is regular, modest, and respectful. Ignorant of the arts of amuse-

ment, of which considerable, they observe; and a some meaning. continually engage. Their subsistence hands; and they may be lost by. As they have no another, they greatest abundance; they have reason, extreme industry, arts, individuals, who. These small tribes desert frontier, less forests.

There is often which over the riation; because of life are near the great instruction has no method companions, but. But as nature has all enjoy the same main so. Liberty and their government secured than but however, from a voice of wisdom enlist under the dress they have therefore, there elders: and according to the other, it monarchy. Among of the chief is military leader with exigencies of time and even to enforce coercive: he is. He has no gradual judged violence other form of have no more hereditary nobility, more consideration the imagination that of their feelings natives of America for acquiring experience, and barbarous people

ment, of which that of saying trifles agreeably is one of the most considerable, they never speak but when they have something important to observe; and all their actions, words, and even looks, are attended with some meaning. This is extremely natural to men who are almost continually engaged in pursuits which to them are of the highest importance. Their subsistence depends entirely on what they procure with their hands; and their lives, their honour, and every thing dear to them, may be lost by the smallest inattention to the designs of their enemies. As they have no particular object to attach them to one place rather than another, they fly wherever they expect to find the necessaries of life in greatest abundance. Cities, which are the effects of agriculture and arts, they have none. The different tribes or nations are, for the same reason, extremely small, when compared with civilised societies, in which industry, arts, agriculture, and commerce, have united a vast number of individuals, whom a complicated luxury renders useful to one another. These small tribes live at an immense distance; they are separated by a desert frontier, and hid in the bosom of impenetrable and almost boundless forests.

There is established in each society a certain species of government, which over the whole continent of America prevails with very little variation; because over the whole of this continent the manners and way of life are nearly similar and uniform. Without arts, riches, or luxury, the great instruments of subjection in polished societies, an American has no method by which he can render himself considerable among his companions, but by a superiority in personal qualities of body or mind. But as nature has not been very lavish in her personal distinctions, where all enjoy the same education, all are nearly equal, and will desire to remain so. Liberty, therefore, is the prevailing passion of the Americans, and their government, under the influence of this sentiment, is better secured than by the wisest political regulations. They are very far, however, from despising all sorts of authority; they are attentive to the voice of wisdom, which experience has conferred on the aged; and they enlist under the banners of the chief, in whose valour and military address they have learned to repose their confidence. In every society, therefore, there is to be considered the power of the chief and of the elders: and according as the government inclines more to the one or to the other, it may be regarded as monarchical, or as a species of aristocracy. Among those tribes which are most engaged in war, the power of the chief is naturally predominant, because the idea of having a military leader was the first source of his superiority, and, the continual exigencies of the state requiring such a leader, will continue to support and even to enhance it. His power, however, is rather persuasive than coercive: he is revered as a father, rather than feared as a monarch. He has no guards, no prisons, no officers of justice; and one act of ill-judged violence would deprive him of the throne. The elders, in the other form of government, which may be considered as an aristocracy, have no more power. In some tribes, indeed, there are a kind of hereditary nobility, whose influence being constantly augmented by time is more considerable. But this source of power, which depends chiefly on the imagination, by which we annex to the merit of our contemporaries that of their forefathers, is too refined to be very common among the natives of America. In most countries, therefore, age alone is sufficient for acquiring respect, influence, and authority. It is age which teaches experience, and experience is the only source of knowledge among a barbarous people. Among the Indians, business is conducted with the

utmost simplicity, and such as may recall to those who are acquainted with antiquity a picture of the most early ages. The heads of families meet together in a house or cabin appointed for the purpose. Here the business is discussed, and here those of the nation distinguished for their eloquence or wisdom have an opportunity of displaying those talents. Their orators, like those of Homer, express themselves in a bold figurative style, stronger than refined or rather softened nations can well bear, and with gestures equally violent, but often extremely natural and expressive. When the business is over, and they happen to be well provided in food, they appoint a feast upon the occasion, of which almost the whole nation partakes. The feast is accompanied with a song, in which the real or fabulous exploits of their forefathers are celebrated. They have dances too, though, like those of the Greeks and Romans, chiefly of the military kind; and their music and dancing accompany every feast.

It often happens, that those different tribes or nations, scattered as they are at an immense distance from one another, meet in their excursions after prey. If there subsists no animosity between them, which seldom is the case, they behave in the most friendly and courteous manner. But if they happen to be in a state of war, or if there has been no previous intercourse between them, all who are not friends being deemed enemies, they fight with the most savage fury.

War, if we except hunting, is the only employment of the men; as to every other concern, and even the little agriculture they use, it is left to the women. Their most common motive for entering into a war, when it does not arise from an accidental rencounter or interference, is either to revenge themselves for the death of some lost friend, or to acquire prisoners, who may assist them in their hunting, and whom they adopt into their society. These wars are either undertaken by some private adventurers, or at the instance of the whole community. In the latter case, all the young men who are disposed to go out to battle, for no one is compelled contrary to his inclination, give a piece of wood to the chief, as a token of their design to accompany him: for every thing among these people is transacted with a great deal of ceremony and many forms. The chief who is to conduct them fasts several days, during which he converses with no one, and is particularly careful to observe his dreams, which the presumption natural to savages generally renders as favourable as he could desire. A variety of other superstitions and ceremonies are observed. One of the most hideous is setting the war-kettle on the fire, as an emblem that they are going out to devour their enemies; which among some nations must formerly have been the case, since they still continue to express it in clear terms, and use an emblem significant of the ancient usage. Then they dispatch a porcelaine, or large shell, to their allies, inviting them to come along and drink the blood of their enemies. For with the Americans, as with the Greeks of old,

“A generous friendship no cold medium knows,  
“Burns with one love, with one resentment glows.”

They think that those in their alliance must not only adopt their enmities, but have their resentment wound up to the same pitch with themselves. And, indeed, no people carry their friendships or their resentments so far as they do: and this is what should be expected from their peculiar circumstances; that principle in human nature, which is the

spring of the social affections, acts with so much the greater force the more it is restrained. The Americans, who live in small societies, who see few objects and few persons, become wonderfully attached to these objects and persons, and cannot be deprived of them without feeling themselves miserable. Their ideas are too confined, their breasts are too narrow to entertain the sentiment of general benevolence, or even of ordinary humanity. But this very circumstance, while it makes them cruel to an incredible degree towards those with whom they are at war, adds a new force to their particular friendships, and to the common tie which unites the members of the same tribe, or those different tribes which are in alliance with one another. Without attending to this reflection, some facts we are going to relate would excite our wonder, without informing our reason, and we should be bewildered in a number of particulars seemingly opposite to one another, without being sensible of the general cause from which they proceed.

Having finished all the ceremonies previous to the war, they issue forth, with their faces blackened with charcoal, intermixed with streaks of vermilion, which give them a most horrid appearance. Then they exchange their clothes with their friends, and dispose of all their finery to the women, who accompany them a considerable distance, to receive those last tokens of eternal friendship.

The great qualities in an Indian warrior are vigilance and attention, to give and to avoid a surprize; and indeed in these they are superior to all nations in the world. Accustomed to continual wandering in the forests, having their perceptions sharpened by keen necessity, and living in every respect according to nature, their external senses have a degree of acuteness which at first appears incredible. They can trace out their enemies, at an immense distance, by the smoke of their fires, which they smell, and by the tracks of their feet on the ground, imperceptible to an European eye, but which they can count and distinguish with the utmost facility. They even distinguish the different nations with whom they are acquainted, and can determine the precise time when they passed, where an European could not, with all his glasses, distinguish footsteps at all. These circumstances, however, give them no superiority, because their enemies are equally skilful. When they go out, therefore, they take care to avoid making use of any thing by which they might run the danger of a discovery. They light no fire to warm themselves, or to prepare their victuals; they lie close to the ground all day, and travel only in the night; and marching along in files, he that closes the rear diligently covers with leaves the tracks of his own feet, and of theirs who preceded him. When they halt to refresh themselves, scouts are sent out to reconnoitre the country, and beat up every place where they suspect an enemy may lie concealed. In this manner they enter unawares the villages of their foes; and, while the flower of the nation are engaged in hunting, massacre all the children, women, and helpless old men, or make prisoners of as many as they can manage, or have strength enough to be useful to their nation. But when the enemy is apprised of their design, and coming on in arms against them, they throw themselves flat on the ground among the withered herbs and leaves, which their faces are painted to resemble. Then they allow a part to pass unmolested; when all at once, with a tremendous shout, rising up from their ambush, they pour a storm of musquet-bullets on their foes. The party attacked returns the same cry. Every one shelters himself with a tree, and returns the fire of the adverse party, as soon as they raise themselves from the ground to give a second fire. Thus

does the battle continue until the one party is so much weakened as to be incapable of further resistance. But if the force on each side continues nearly equal, the fierce spirit of the savages, inflamed by the loss of their friends, can no longer be restrained. They abandon their distant war, they rush upon one another with clubs and hatchets in their hands, magnifying their own courage, and insulting their enemies with the bitterest reproaches. A cruel combat ensues: death appears in a thousand hideous forms, which would congeal the blood of civilised nations to behold, but which rouse the fury of savages. They trample, they insult over the dead bodies, tearing the scalp from the head, wallowing in their blood like wild beasts, and sometimes devouring their flesh. The flame rages on till it meets with no resistance; then the prisoners are secured, those unhappy men, whose fate is a thousand times more dreadful than theirs who have died in the field. The conquerors set up a hideous howling to lament the friends they have lost. They approach, in a melancholy and severe gloom, to their own village; a messenger is sent to announce their arrival; and the women, with frightful shrieks, come out to mourn their dead brothers, or their husbands. When they are arrived, the chief relates in a low voice, to the elders, a circumstantial account of every particular of the expedition. The orator proclaims aloud this account to the people; and, as he mentions the names of those who have fallen, the shrieks of the women are redoubled. The men too join in these cries, according as each is most connected with the deceased by blood or friendship. The last ceremony is the proclamation of the victory; each individual then forgets his private misfortunes, and joins in the triumph of his nation; all tears are wiped from their eyes, and, by an unaccountable transition, they pass in a moment from the bitterness of sorrow to an extravagance of joy. But the treatment of the prisoners, whose fate all this time remains undecided, is what chiefly characterises the savages.

We have already mentioned the strength of their affections or resentments. United as they are in small societies, connected within themselves by the firmest ties, their friendly affections, which glow with the most intense warmth within the walls of their own village, seldom extend beyond them. They feel nothing for the enemies of their nation; and their resentment is easily extended from the individual who has injured them to all others of the same tribe. The prisoners, who have themselves the same feelings, know the intentions of their conquerors, and are prepared for them. The person who has taken the captive attends him to the cottage, where, according to the distribution made by the elders, he is to be delivered to supply the loss of a citizen. If those who receive him have their family weakened by war or other accidents, they adopt the captive into the family, of which he becomes a member. But if they have no occasion for him, or their resentment for the loss of their friends be too high to endure the sight of any connected with those who were concerned in it, they sentence him to death. All those who have met with the same severe sentence being collected, the whole nation is assembled at the execution, as for some great solemnity. A scaffold is erected, and the prisoners are tied to the stake, where they commence their death-song, and prepare for the ensuing scene of cruelty with the most undaunted courage. Their enemies, on the other side, are determined to put it to the proof, by the most refined and exquisite tortures. They begin at the extremity of his body, and gradually approach the more vital parts. One plucks out his nails by the roots, one by one; another takes a finger into his mouth, and tears off the flesh

with his teeth; a third thrusts the finger, mangled as it is, into the bowl of a pipe, made red hot, which he smokes like tobacco; then they pound the toes and fingers to pieces between two stones; they pull off the flesh from the teeth, and cut circles about his joints, and gashes in the fleshy parts of his limbs, which they fear immediately with red-hot irons, cutting, burning, and pinching them alternately: they pull off this flesh, thus mangled and roasted, bit by bit, devouring it with greediness, and smearing their faces with the blood in an enthusiasm of horror and fury. When they have thus torn off the flesh, they twist the bare nerves and tendons about an iron, tearing and snapping them, whilst others are employed in pulling and extending their limbs in every way that can increase the torment. This continues often five or six hours; and sometimes, such is the strength of the savages, days together. Then they frequently unbind him, to give a breathing to their fury, to think what new torments they shall inflict, and to refresh the strength of the sufferer, who, wearied out with such a variety of unheard-of torments, often falls into so profound a sleep, that they are obliged to apply the fire to awake him, and renew his sufferings. He is again fastened to the stake, and again they renew their cruelty; they stick him all over with small matches of wood, that easily takes fire, but burns slowly; they continually run sharp reeds into every part of his body; they drag out his teeth with pincers, and thrust out his eyes; and lastly, after having burned his flesh from the bones with slow fires; after having so mangled the body that it is all but one wound; after having mutilated his face in such a manner as to carry nothing human in it; after having peeled the skin from the head, and poured a heap of red-hot coals or boiling water on the naked skull, they once more unbind the wretch, who, blind and staggering with pain and weakness, assaulted and pelted upon every side with clubs and stones, now up, now down, falling into their fires at every step, runs hither and thither, until one of the chiefs, whether out of compassion, or weary of cruelty, puts an end to his life with a club or a dagger. The body is then put into the kettle, and this barbarous employment is succeeded by a feast as barbarous.

The women, forgetting the human as well as the female nature, and transformed into something worse than Furies, even outdo the men in this scene of horror; while the principal persons of the country sit round the stake, smoking, and looking on without the least emotion. What is most extraordinary, the sufferer himself, in the little intervals of his torments, smokes too, appears unconcerned, and converses with his torturers about indifferent matters. Indeed, during the whole time of his execution, there seems a contest, which shall exceed, they in inflicting the most horrid pains, or he in enduring them with a firmness and constancy almost above human: not a groan, not a sigh, not a distortion of countenance escapes him; he possesses his mind entirely in the midst of his torments; he recounts his own exploits; he informs them what cruelties he has inflicted upon their countrymen, and threatens them with the revenge that will attend his death; and, though his reproaches exasperate them to a perfect madness of rage and fury, he continues his insults even of their ignorance of the art of tormenting, pointing out more exquisite methods, and more sensible parts of the body to be afflicted. The women have this part of courage as well as the men; and it is as rare for any Indian to behave otherwise, as it would be for any European to suffer as an Indian. Such is the wonderful power of an early institution, and a ferocious thirst of glory. *I am brave and intrepid*, exclaims the savage in the faces of his tormentors.

*I do not fear death, nor any kind of tortures; those who fear them are cowards; they are less than women; life is nothing to those that have courage; may my enemies be confounded with despair and rage! Oh! that I could devour them, and drink their blood to the last drop!*

Nothing in the history of mankind forms a stronger contrast than this cruelty of the savages towards those with whom they are at war, and the warmth of their affection towards their friends, who consist of all those who live in the same village, or are in alliance with it; among these all things are common; and this, though it may in part arise from their not possessing very distinct notions of separate property, is chiefly to be attributed to the strength of their attachment; because in every thing else, with their lives as well as their fortunes, they are ready to serve their friends. Their houses, their provisions, even their young women, are not enough to oblige a guest. Has any one of these succeeded ill in his hunting—has his harvest failed—or is his house burned,—he feels no other effect of his misfortune, than that it gives him an opportunity to experience the benevolence and regard of his fellow-citizens; but to the enemies of his country, or to those who have privately offended him, the American is implacable. He conceals his sentiments, he appears reconciled, until, by some treachery or surprize, he has an opportunity of executing a horrible revenge. No length of time is sufficient to allay his resentment; no distance of place great enough to protect the object: he crosses the steepest mountains, he pierces the most impracticable forests, and traverses the most hideous bogs and deserts for several hundreds of miles; bearing the inclemency of the seasons, the fatigue of the expedition, the extremes of hunger and thirst, with patience and cheerfulness, in hopes of surprising his enemy, on whom he exercises the most shocking barbarities, even to the eating of his flesh. To such extremes do the Indians push their friendship or their enmity; and such indeed, in general, is the character of all strong and uncultivated minds.

But what we have said respecting the Indians would be a faint picture, did we omit observing the force of their friendship, which principally appears by the treatment of the dead. When any one of the society is cut off, he is lamented by the whole; on this occasion a thousand ceremonies are practised, denoting the most lively sorrow. Of these, the most remarkable, as it discovers both the height and continuance of their grief, is what they call the feast of the dead, or the feast of souls. The day of this ceremony is appointed by public order: and nothing is omitted, that it may be celebrated with the utmost pomp and magnificence. The neighbouring tribes are invited to be present and to join in the solemnity. At this time, all who have died since the last solemn occasion (which is renewed every ten years among some tribes, and every eight among others) are taken out of their graves: those who have been interred at the greatest distance from the villages are diligently sought for, and brought to this great rendezvous of carcases.

It is not difficult to conceive the horror of this general disinterment. I cannot describe it in a more lively manner than it is done by Lafitau, to whom we are indebted for the most authentic account of these nations.

Without question, says he, the opening of these tombs displays one of the most striking scenes that can be conceived; this humbling portrait of human misery, in death, which appears in a thousand various shapes of horror in the several carcases, according to the degree in which corruption has prevailed over them, or the manner in which it has attacked

them. Some ment upon the without any a the point of p drowned in e horror of so t poor people t miration mor discharge thi fully even the are with eve carrying them al days, wit and without t for having lo lamented in t

them. Some appear dry and withered; others have a sort of parch-ment upon their bones; some look as if they were baked and smoked, without any appearance of rottenness; some are just turning towards the point of putrefaction; while others are all swarming with worms and drowned in corruption. I know not which ought to strike us most, the horror of so shocking a sight, or the tender piety and affection of these poor people towards their departed friends; for nothing deserves our admiration more, than that eager diligence and attention with which they discharge this melancholy duty of their tenderness, gathering up carefully even the smallest bones; handling the carcasses, disgusting as they are with every thing loathsome, cleansing them from the worms, and carrying them upon their shoulders, through tiresome journeys of several days, without being discouraged from the offensiveness of the smell, and without suffering any other emotions to arise than those of regret for having lost persons who were so dear to them in their lives, and so lamented in their death.

They bring them into their cottages, where they prepare a feast in honour of the dead; during which their great actions are celebrated, and all the tender intercourses which took place between them and their friends are piously called to mind. The strangers, who have come sometimes many hundred miles to be present on the occasion, join in the tender condolence; and the women, by frightful shrieks, demonstrate that they are pierced with the sharpest sorrow. The dead bodies are carried from the cabins for the general re-interment. A great pit is dug in the ground; and thither, at a certain time, each person, attended by his family and friends, marches in solemn silence, bearing the dead body of a son, a father, or a brother. When they are all convened, the dead bodies, or dust of those which were quite corrupted, are deposited in the pit; when the torrent of grief breaks out anew. Whatever they possess most valuable is interred with the dead. The strangers are not wanting in their generosity, and confer those presents which they have brought along with them for the purpose. Then all present go down into the pit, and every one takes a little of the earth, which they afterwards preserve with the most religious care. The bodies, ranged in order, are covered with entire new furs, and, over these, with bark, on which they throw stones, wood, and earth. Then taking the last farewell, they return each to his own cabin.

We have mentioned that in this ceremony the savages offer, as presents to the dead, whatever they value most highly. This custom, which is universal among them, arises from a rude notion of the immortality of the soul. They believe this doctrine most firmly, and it is the principal tenet of their religion. When the soul is separated from the body of their friends, they conceive that it still continues to hover around it, and to require, and take delight in, the same things with which it formerly was pleased. After a certain time, however, it forsakes this dreary mansion, and departs far westward into the land of spirits. They have even gone so far as to make a distinction between the inhabitants of the other world; some, they imagine, particularly those who in their life-time have been fortunate in war, possess a high degree of happiness, have a place for hunting and fishing, which never fails, and enjoy all sensual delights, without labouring hard in order to procure them. The souls of those, on the contrary, who happen to be conquered or slain in war, are extremely miserable after death.

Their taste for war, which forms the chief ingredient in their character, gives a strong bias to their religion. Arelkoui, or the god of bat-

tle, is revered as the great god of the Indians. Him they invoke before they go into the field; and, according as his disposition is more or less favourable to them, they conclude they shall be more or less successful. Some nations worship the sun or moon; among others there are a number of traditions, relative to the creation of the world, and the history of the gods; traditions which resemble the Grecian fables, but which are still more absurd and inconsistent. But religion is not the prevailing character of the Indians; and, except when they have some immediate occasion for the assistance of their gods, they pay them no sort of worship. Like all rude nations, however, they are strongly addicted to superstition. They believe in the existence of a number of good and bad genii, spirits who interfere in the affairs of mortals, and produce all our happiness or misery. It is from the evil genii, in particular, that our diseases proceed; and it is to the good genii we are indebted for a cure. The ministers of the genii are the jugglers, who are also the only physicians among the savages. These jugglers are supposed to be inspired by the good genii, most commonly in their dreams, with the knowledge of future events; they are called in to the assistance of the sick, and are supposed to be informed by the genii whether their patients will recover, and in what manner they must be treated. But these spirits are extremely simple in their system of physic, and in almost every disease direct the juggler to the same remedy. The patient is enclosed in a narrow cabin, in the midst of which is a stone red hot; on this they throw water, until he is well soaked with the warm vapour and his own sweat. Then they hurry him from the bagnio, and plunge him suddenly into the next river. This coarse method, which costs many their lives, often performs very extraordinary cures. The jugglers have likewise the use of some specifics, of wonderful efficacy; and all the savages are dexterous in curing wounds by the application of herbs. But the power of these remedies is always attributed to the magical ceremonies with which they are administered.

It should be observed by the reader, that the particulars which have just been mentioned concerning the manners of the Americans, chiefly relate to the inhabitants of North America. The manners and general characteristics of great part of the original inhabitants of South America were very different. On the first appearance of the inhabitants of the New World, their discoverers found them to be in many particulars very unlike the generality of the people of the ancient hemisphere. They were different in their features and complexions; they were not only averse to toil, but seemed incapable of it; and when roused by force from their native indolence, and compelled to work, they sunk under tasks which the inhabitants of the other continent would have performed with ease. This feebleness of constitution seemed almost universal among the inhabitants of South America. The Spaniards were also struck with the smallness of their appetite for food. The constitutional temperance of the natives far exceeded, in their opinion, the abstinence of the most mortified hermits; while, on the other hand, the appetite of the Spaniards appeared to the Americans insatiably voracious; and they affirmed that one Spaniard devoured more food in a day than was sufficient for ten Americans. But though the demands of the native Americans for food were very sparing, so limited was their agriculture, that they hardly raised what was sufficient for their own consumption. Many of the inhabitants of South America confined their industry to rearing a few plants, which, in a rich and warm climate, were easily trained to maturity; but if a few Spaniards settled in any district,

such a small and scanty stores, and America, compared feeble in their frigate but dastardly indolence.

## A GEN

THIS great world,

WORLD, extends to the south latitude; a 136th degree of longitude, and 9000 miles in circumference. It is divided into two hemispheres, has a variety of climates, and is bounded by great oceans. It is separated from Europe and Asia by the Mediterranean Sea, by which it is carried on a direct course. It is composed of two continents, which are joined by an isthmus 1500 miles long, and very narrow, as to make the passage means difficult, being formed between the two continents. It lies a multitude of islands and deaominated islands of Asia and the East Indies.

Before we proceed to describe the proper to take, as it were, to be extended over a general, be not a matter of the world. In South America, the north to south along the length any chain of mountains, being from the Isthmus of Darien to the whole southern part of the continent. Their height is as regular as the torrid zone, the highest of the mountains, the summit are also the French astronomer, America, which is known of no country, and that long ridge separating them from the Indian or Allegany

such a small addition of supernumerary mouths soon exhausted their scanty stores, and brought on a famine. The inhabitants of South America, compared with those of North America, are generally more feeble in their frame, less vigorous in the efforts of their minds, of a gentle but dastardly spirit, more enlaved by pleasure, and sunk in indolence.

### A GENERAL DESCRIPTION OF AMERICA.

THIS great western continent, frequently denominated the **NEW WORLD**, extends from the 80th degree north, to the 56th degree south latitude; and, where its breadth is known, from the 35th to the 136th degree of west longitude from London; stretching between 8 and 9000 miles in length, and its greatest breadth 3690. It lies in both hemispheres, has two summers, and a double winter, and enjoys all the variety of climates which the earth affords. It is washed by the two great oceans. To the eastward it has the Atlantic, which divides it from Europe and Africa; and to the west the Pacific, or Great South Sea, by which it is separated from Asia. By these seas it may, and does, carry on a direct commerce with the other three parts of the world. It is composed of two great continents, one on the north, the other on the south, which are joined by the kingdom of Mexico, which forms a kind of isthmus 1500 miles long, and in one part, at Darien, so extremely narrow, as to make the communication between the two oceans by no means difficult, being only sixty miles over. In the great gulf which is formed between the isthmus and the northern and southern continents, lie a multitude of islands, many of them large, most of them fertile, and denominated the West Indies, in contradistinction to the countries and islands of Asia beyond the Cape of Good Hope, which are called the East Indies.

Before we proceed to treat of separate countries in their order, it will be proper to take notice of those mountains and rivers which disdain, as it were, to be confined within the limits of particular provinces, and extend over a great part of the continent. For, though America, in general, be not a mountainous country, it has the greatest mountains in the world. In South America, the Andes, or Cordilleras, run from north to south along the coast of the Pacific Ocean. They exceed in length any chain of mountains in the other parts of the globe: extending from the Isthmus of Darien to the Straits of Magellan, they divide the whole southern parts of America, and run a length of 4300 miles. Their height is as remarkable as their length; for, though in part within the torrid zone, they are constantly covered with snow. Chimborazo, the highest of the Andes, is 20,608 feet; of this about 2400 feet from the summit are always covered with snow. Carazon was ascended by the French astronomers, and is said to be 15,800 feet high. In North America, which is chiefly composed of gentle ascents or level plains, we know of no considerable mountains, except those towards the pole, and that long ridge which lies on the back of the American States, separating them from Canada and Louisiana, which we call the Apalachian or Allegany mountains; if that may be considered as a mountain,

which upon one side is extremely lofty, but upon the other is nearly on a level with the rest of the country.

America is, without question, that part of the globe which is best watered; and that not only for the support of life, and all the purposes of fertility, but for the convenience of trade, and the intercourse of each part with the others. In North America, those vast tracts of country situated beyond the Apalachian mountains, at an immense and unknown distance from the ocean, are watered by inland seas, called the Lakes of Canada; which not only communicate with each other, but give rise to several great rivers, particularly the Mississippi, running from north to south till it falls into the Gulf of Mexico, after a course, including its turnings, of 4500 miles, and receiving in its progress the vast tribute of the Illinois, the Missouri, the Ohio, and other great rivers, scarcely inferior to the Rhine or the Danube; and on the north, the river St. Laurence, running a contrary course from the Mississippi, till it empties itself into the ocean near Newfoundland: all of them being almost navigable to their heads, lay open the inmost recesses of this great continent, and afford such an inlet for commerce, as must produce the greatest advantage, whenever the country adjacent shall come to be fully inhabited by an industrious and civilised people. The eastern side of North America, besides the noble rivers Hudson, Delaware, Susquehanna, and Potowmack, supplies several others of great depth, length, and commodious navigation: hence many parts of the settlements are so advantageously intersected with navigable rivers and creeks, that the planters, without exaggeration, may be said to have each a harbour at his door.

South America is, if possible, in this respect even more fortunate. It supplies much the two largest rivers in the world, the river of Amazons, and the Rio de la Plata, or Plate River. The first, rising in Peru not far from the South Sea, passes from west to east, and falls into the ocean between Brasil and Guiana, after a course of more than 3000 miles, in which it receives a prodigious number of great and navigable rivers. The Rio de la Plata rises in the heart of the country, and, having its strength gradually augmented by an accession of many powerful streams, discharges itself with such vehemence into the sea, as to make its taste fresh for many leagues from land. Besides these, there are other rivers in South America, of which the Oronoko is the most considerable.

A country of such vast extent on each side of the equator must necessarily have a variety of soils as well as climates. It is a treasury of nature, producing most of the metals, minerals, plants, fruits, trees, and wood, to be met with in the other parts of the world, and many of them in greater quantities and higher perfection. The gold and silver of America have supplied Europe with such immense quantities of those valuable metals, that they are become vastly more common; so that the gold and silver of Europe now bear little proportion to the high price set upon them before the discovery of America.

This country also produces diamonds, pearls, emeralds, amethysts, and other valuable stones, which, by being brought into Europe, have contributed likewise to lower their value. To these, which are chiefly the production of Spanish America, may be added a great number of other commodities, which, though of less price, are of much greater use, and many of them make the ornament and wealth of the British empire in this part of the world. Of these are the plentiful supplies of cochile

This continent has also a variety of excellent fruits, which here grow wild to great perfection; as pine-apples, pomegranates, citrons, lemons, oranges, malicats, cherries, pears, apples, figs, grapes; great numbers of culinary, medicinal, and other herbs, roots, and plants: and so fertile is the soil, that many exotic productions are nourished in as great perfection as in their native ground.

Though the Indians still live in the quiet possession of many large tracts, America, so far as known, is chiefly claimed, and divided into colonies, by three European nations, the Spanish, English, and Portuguese. The Spaniards, as they first discovered it, have the largest and richest portions, extending from New Mexico and Louisiana, in North America, to the Straits of Magellan, in the South Sea, excepting the large province of Brasil, which belongs to Portugal; for, though the French and Dutch have some forts upon Surinam and Guiana, they scarcely deserve to be considered as proprietors of any part of the southern continent.

Next to Spain, the most considerable proprietor of America was Great Britain, who derived her claim to North America from the first discovery of that continent by Sebastian Cabot, in the name of Henry VII. anno 1497, about six years after the discovery of South America by Columbus, in the name of the king of Spain. This country was in general called Newfoundland, a name which is now appropriated solely to an island upon its coast. It was a long time before we made an attempt to settle in this country. Sir Walter Raleigh, an uncommon genius, and a brave commander, first showed the way, by planting a colony in the southern part, which he called Virginia, in honour of his mistress, queen Elizabeth.

The French, from this period until the conclusion of the war in 1763, laid a claim to, and actually possessed, Canada and Louisiana, comprehending all that extensive inland country, reaching from Hudson's Bay on the north, to Mexico, and the gulf of the same name, on the south; regions which all Europe could not people in the course of many ages. The multitude of islands, which lie between the two continents of North and South America, are divided amongst the Spaniards, English, and French. The Dutch indeed possess three or four small islands, which in any other hands would be of no consequence; and the Danes have one or two, but they hardly deserve to be named among the proprietors of America. We shall now proceed to the particular provinces, beginning, according to our method, with the north; but Labrador, or New Britain, and the country round Hudson's Bay, with those vast regions towards the pole, are little known.

A summary View of the first Settlements of NORTH AMERICA.

<i>Names of Places.</i>	<i>When settled.</i>	<i>By whom.</i>
Quebec .....	1608	By the French.
Virginia June 10, ..	1609	By Lord de la War.
Newfoundland June	1610	By Governor John Guy.
New York } New Jersey }	about 1614	By the Dutch.
Plymouth .....	1620	By part of Mr. Robinson's congregation By a small English colony, near the mouth of Piscataqua river.
New Hampshire ...	1623	
Delaware } Pennsylvania }	.. 1627	By the Swedes and Fins.
Massachusetts Bay ..	1628	By Capt. John Endicot and Company.
Maryland .....	1633	By Lord Baltimore, with a colony of Roman-catholics.
Connecticut .....	1635	By Mr. Fenwick, at Saybrook, near the mouth of Connecticut river.
Rhode Island .....	1635	By Mr. Roger Williams, and his persecuted brethren.
New Jersey .....	1664	Granted to the Duke of York by Charles II, and made a distinct government and settled some time before this by the English.
South Carolina ....	1669	
Pennsylvania .....	1682	By Governor Sale. By William Penn, with a colony of Quakers.
North Carolina, about	1728	Erected into a separate government, settled before by the English.
Georgia .....	1732	By General Oglethorpe.
Kentucky .....	1773	By Col. Daniel Boone.
Vermont .....	1777	By emigrants from Connecticut, and other parts of New England.

**NEW BRITAIN,** or the country lying round Hudson's Bay, and commonly called the country of the Esquimaux, comprehending Labrador, now North and South Wales, is bounded by unknown lands and frozen seas, about the pole, on the North; by the Atlantic ocean on the East; by the bay and river of St. Laurence and Canada on the South; and by unknown lands on the West.

**MOUNTAINS.]** The tremendous high mountains in this country towards the North, their being covered with eternal snow, and the winds blowing from thence three quarters of the year, occasion a degree of cold in the winter over all this country, which is not experienced in any other part of the world in the same latitude.

**RIVERS, BAYS, STRAITS, } AND CAPES.** These are numerous, and take their names generally from the English navigators and commanders by whom they were first discovered. The principal bay is that of Hudson, and the principal straits are those of Hudson, Davis, and Belleisle; and the chief rivers are the Moose, Severn, Rupert, Nelson, and Black River.

**SOIL AND PRODUCE.]** This country is extremely barren. To the southward of Hudson's Bay, even the hardy pine-tree is seen no longer, and the cold womb of the earth has been supposed incapable of any better production than some miserable shrubs. Every kind of European seed committed to the earth in this inhospitable climate has hitherto perished; but perhaps the seed of corn from the northern parts of Sweden and Norway would be more suitable to the soil. All this severity, and long continuance of winter, and the barrenness of the earth which comes from thence, is experienced in the latitude of fifty-two; in the temperate latitude of Cambridge.

**ANIMALS.]** These are the moose-deer, stags, rein-deer, bears, tigers, buffaloes, wolves, foxes, beavers, otters, lynxes, martins, squirrels, ermines, wild cats, and hares. Of the feathered kind, they have geese, bustards, ducks, partridges, and all manner of wild fowls. Of fish, there are whales, morfes, seals, cod-fish, and a white fish preferable to herrings; and in their rivers and fresh waters, pike, perch, carp, and trout. There have been taken at Port Nelson, in one season, ninety thousand partridges, which are here as large as hens, and twenty-five thousand hares.

All the animals of these countries are clothed with a close, soft, warm fur. In summer there is here, as in other places, a variety in the colours of the several animals. When that season is over, which holds only

for three months, they all assume the livery of winter, and every sort of beasts, and most of their fowls, are of the colour of the snow: every thing animate and inanimate is white. This is a surprising phenomenon; but it is yet more surprising, that the dogs and cats from England, that have been carried into Hudson's Bay, on the approach of winter have entirely changed their appearance, and acquired a much longer, softer, and thicker coat of hair than they had originally.

Before we advance further in the description of America, it may be proper to observe in general, that all the quadrupeds of this new world are less than those of the old; even such as are carried from hence to breed there, are often found to degenerate, but are never seen to improve. If, with respect to size, we should compare the animals of the new and the old world, we shall find the one bear no manner of proportion to the other. The Asiatic elephant, for instance, often grows to above fifteen feet high, while the tapuretee, which is the largest native of America, is not bigger than a calf of a year old. The lama, which some also call the American camel, is still less. Their beasts of prey are quite divested of that courage which is so often fatal to man in Africa or Asia. They have no lions, nor, properly speaking, either leopard or tiger. Travellers, however, have affixed those names to such ravenous animals as are there found most to resemble those of the ancient continent. The congar, the taquar, and the taquaretti among them are despicable, in comparison of the tiger, the leopard, and the panther of Asia. The tiger of Bengal has been known to measure six feet in length without including the tail; while the congar, or American tiger, as some affect to call it, seldom exceeds three. All the animals therefore, in the southern parts of America, are different from those of the southern parts of the ancient continent; nor does there appear to be any common to both, but those which, being able to bear the colds of the north, have travelled from one continent to the other. Thus the bear, the wolf, the rein-deer, the stag, and the beaver, are known as well by the inhabitants of New Britain and Canada as Russia; while the lion, the leopard, and the tiger, which are natives of the south with us, are utterly unknown in southern America. But if the quadrupeds of America be smaller than those of the ancient continent, they are in much greater abundance; for it is a rule that obtains through nature, and evidently points out the wisdom of the author of it, that the smallest animals multiply in the greatest proportion. The goat, exported from Europe to Southern America, in a few generations becomes much less; but then it also becomes more prolific; and, instead of one kid at a time, or two at the most, generally produces five, six, and sometimes more. The wisdom of Providence in making formidable animals unprolific is obvious: had the elephant, the rhinoceros, and the lion, the same degree of fecundity with the rabbit, or the rat, all the arts of man would soon be unequal to the contest, and we should soon perceive them to become the tyrants of those who call themselves the masters of the creation.

**PERSONS AND HABITS.]** The men of this country show great ingenuity in their manner of kindling a fire, in clothing themselves, and in preserving their eyes from the ill effects of that glaring white which every-where surrounds them for the greatest part of the year: in other respects they are very savage. In their shapes and faces they do not resemble the Americans who live to the southward: they are much more like the Laplanders and the Samoeids of Europe already described.

seas and countries was owing to a project started in England for the discovery of a north-west passage to China and the East Indies, as early as the year 1576. Since then it has been frequently dropped, and as often revived, but never yet completed; and from the late voyages of discovery it seems manifest, that no practicable passage ever can be found. Frobisher only discovered the main of New Britain, or Terra de Labrador, and those straits to which he has given his name. In 1585, John Davis sailed from Portsmouth, and viewed that and the more northerly coasts, but he seems never to have entered the bay. Hudson made three voyages on the same adventure; the first in 1607; the second in 1608; and the third and last in 1610. This bold and judicious navigator entered the straits that lead into this new Mediterranean, the bay known by his name, coasted a great part of it, and penetrated to eighty degrees and a half into the heart of the frozen zone. His ardour for the discovery not being abated by the difficulties he struggled with in this empire of winter, and world of frost and snow, he staid here until the ensuing spring, and prepared, in the beginning of 1611, to pursue his discoveries; but his crew, who suffered equal hardships without the same spirit to support them, mutinied, seized upon him, and seven of those who were most faithful to him, and committed them to the fury of the icy seas in an open boat. Hudson and his companions were either swallowed up by the waves, or, gaining the inhospitable coast, were destroyed by the savages; but the ship and the rest of the men returned home.

Another attempt towards a discovery was made in 1746, by captain Ellis, who wintered as far north as fifty-seven degrees and a half; but though the adventurers failed in the original purpose for which they navigated this bay, their project, even in its failure, has been of great advantage to this country. The vast countries which surround Hudson's Bay, as we have already observed, abound with animals whose fur and skins are excellent. In 1670, a charter was granted to a company, which does not consist of above nine or ten persons, for the exclusive trade to this bay; and they have acted under it ever since, with great benefit to the private men who compose the company, though comparatively with little advantage to Great Britain. The fur and peltry trade might be carried on to a much greater extent, were it not entirely in the hands of this exclusive company, whose interested spirit has been the subject of long and just complaint. The company employ but four ships and 130 seamen. They have several forts; viz. Prince of Wales, Churchill, Nelson, New Severn, and Albany, which stand on the west side of the bay, and are garrisoned by 180 men. The French attacked, took, and made some depredations on them the last war, it was said, to the amount of 400,000*l.* They export commodities to the value of 16,000*l.* and bring home returns to the value of 29,340*l.* which yield to the revenue 3,734*l.* This includes the fishery in Hudson's Bay. This commerce, small as it is, affords immense profits to the company, and even some advantages to Great Britain in general; for the commodities we exchange with the Indians for their skins and furs are all manufactured in Britain; and as the Indians are not very nice in their choice, such things are sent of which we have the greatest plenty, and which, in the mercantile phrase, are drugs with us. Though the workmanship may happen to be in many respects so deficient, that no civilised people would take it off our hands, it may be admired among the Indians. On the other hand, the skins and furs we bring from Hudson's Bay enter largely into our manufactures; and afford us materials for trading with many nations of Europe to great advantage.

Breadth 200 }	{ 45 and 52 North latitude.	

**BOUNDARIES.]** BOUNDED by New Britain and Hudson's Bay, on the North and East; by Nova Scotia, New England, and New York, on the South; and by unknown lands on the West.

**AIR AND CLIMATE.]** The climate of this province is not very different from the colonies mentioned above; but as it is much further from the sea, and more northerly than a great part of these provinces, it has a much severer winter; though the air is generally clear; but, like most of those American tracts that do not lie too far to the northward, the summers are very hot, and exceedingly pleasant.

**SOIL AND PRODUCE.]** Though the climate be cold, and the winter long and tedious, the soil is in general very good, and in many parts both pleasant and fertile, producing wheat, barley, rye, with many other sorts of grains, fruits, and vegetables; tobacco in particular thrives well, and is much cultivated. The isle of Orléans, near Quebec, and the lands upon the river St. Laurence, and other rivers, are remarkable for the richness of their soil. The meadow grounds in Canada, which are well watered, yield excellent grass, and breed vast numbers of great and small cattle. As we are now entering upon the cultivated provinces of British America, and as Canada is upon the back of the United States, and contains almost all the different species of wood and animals that are found in these provinces, we shall, to avoid repetitions, speak of them here at some length.

**TIMBER AND PLANTS.]** The uncultivated parts of North America contain the greatest forests in the world. They are a continued wood, not planted by the hands of men, and in its appearance as old as the world itself. Nothing is more magnificent to the sight; the trees lose themselves in the clouds; and there is such a prodigious variety of species, that even among those persons who have taken most pains to describe them, there is not one perhaps that knows half the number. The province we are describing produces, amongst others, two sorts of pines, the white and the red; four sorts of firs; two sorts of cedar and oak, the white and the red; the male and the female maple; three sorts of ash trees, the free, the mungrel, and the ballard; three sorts of walnut-trees, the hard, the soft, and the smooth; vast numbers of beech trees and white wood; white and red elms, and poplars. The Indians hollow the red elms into canoes, some of which, made out of one piece, will contain twenty persons; others are made of the bark, the different pieces of which they sew together with the inner rind, and daub over the seams with pitch, or rather a bituminous matter resembling pitch, to prevent their leaking; and the ribs of these canoes are made of boughs of trees. About November the bears and wild cats take up their habitations in the hollow elms, and remain there till April. Here are also found cherry-trees, plum-trees, the vinegar-tree, the fruit of which, infused in water, produces vinegar; an aquatic plant, called alaco, the fruit of which may be made into a confection; the white thorn; the cotton-tree, on the top of which grow several tufts of

flowers, which produce honey; the pod contains sembles a Turkey corn plant.

**METALS.]** Some of the metals are found in this province also about the mountains.

**RIVERS.]** Numerous, and the Outtaouai they are all taken from the Lake St. Pierre, where it continues the line continued into the ocean, where the current forms a variety of rapids, and extractions.

**LAKES.]**

French (now but if we look and those vast countries envy of sweet water the Lake Ontario, Erie, or Oswego. That of the not less than is rather long contains several are navigable other, except by a stupendous. The water here is not in a direct to the perpendicular rather violent from which white as snow agitations. ten miles, a fall may some or pillar of the sun and the here lose their rapids above

flowers, which, when shaken in the morning before the dew falls off, produce honey, that may be boiled up into sugar, the seed being a pod containing a very fine kind of cotton; the sun-plant, which resembles a marigold, and grows to the height of seven or eight feet; Turkey corn; French beans; gourds, melons, capillaire, and the hop plant.

**METALS AND MINERALS.]** Near Quebec is a fine lead mine, and in some of the mountains, we are told, silver has been found. This country also abounds with coals.

**RIVERS.]** The rivers branching through this country are very numerous, and many of them large, bold, and deep. The principal are, the Outtauais, St. John, Seguinay, Despraires, and Trois Rivières, but they are all swallowed up by the river St. Laurence. This river issues from the Lake Ontario, and, taking its course north-east, washes Montreal, where it receives the Outtauais, and forms many fertile islands. It continues the same course, and meets the tide upwards of 400 miles from the sea, where it is navigable for large vessels; and below Quebec, 320 miles from the sea, it becomes broad, and so deep, that ships of the line contributed, in the war before the last, to reduce that capital. After receiving in its progress innumerable streams, this great river falls into the ocean at Cape Rosières, where it is ninety miles broad, and where the cold is intense, and the sea boisterous. In its progress it forms a variety of bays, harbours, and islands; many of them are fruitful, and extremely pleasant.

**LAKES.]** The great river St. Laurence is that only upon which the French (now subjects of Great Britain) have settlements of any note; but if we look forward into futurity, it is not improbable that Canada, and those vast regions to the west, will be enabled of themselves to carry on a considerable trade upon the great lakes of fresh water which these countries environ. Here are five lakes, the smallest of which is a piece of sweet water, greater than any in the other parts of the world; this is the Lake Ontario, which is not less than 200 leagues in circumference. Erie, or Oswego, longer, but not so broad, is about the same extent. That of the Huron spreads greatly in width, and is in circumference not less than 300, as is that of Michigan, though, like Lake Erie, it is rather long, and comparatively narrow. But the Lake Superior, which contains several large islands, is 500 leagues in the circuit. All of these are navigable by any vessels, and they all communicate with one another, except that the passage between Erie and Ontario is interrupted by a stupendous fall or cataract, which is called the Falls of Niagara. The water here is about half a mile wide, where the rock crosses it, not in a direct line, but in the form of a half moon. When it comes to the perpendicular fall, which is 150 feet, no words can express the consternation of travellers at seeing so great a body of water falling, or rather violently thrown, from so great a height, upon the rocks below; from which it again rebounds to a very great height, appearing as white as snow, being all converted into foam, through those violent agitations. The noise of this fall is often heard at the distance of fifteen miles, and sometimes much further. The vapour arising from the fall may sometimes be seen at a great distance, appearing like a cloud, or pillar of smoke, and in the appearance of a rainbow, whenever the sun and the position of the traveller favour. Many beasts and fowls here lose their lives, by attempting to swim, or cross the stream in the rapids above the fall, and are found dashed in pieces below; and some-

times the Indians, through carelessness or drunkenness, have met with the same fate; and perhaps no place in the world is frequented by such a number of eagles as are invited hither by the carnage of deer, elks, bears, &c. on which they feed. The river St. Laurence, as we have already observed, is the outlet of these lakes, by which they discharge themselves into the ocean. The French, when in possession of the province, built forts at the several fraits by which these lakes communicate with each other, as well as where the last of them communicates with the river. By these they effectually secured to themselves the trade of the lakes, and an influence over all the nations of America which lay near them.

**ANIMALS.]** These make the most curious, and hitherto the most interesting part of the natural history of Canada. It is to the spoils of these that we owe the materials of many of our manufactures, and most of the commerce as yet carried on between us and the country we have been describing. The animals that find shelter and nourishment in the immense forests of Canada, and which indeed traverse the uncultivated parts of all this continent, are stags, elks, deer, bears, foxes, martins, wild cats, ferrets, weasels, squirrels of a large size and grayish hue, hares, and rabbits. The southern parts in particular breed great numbers of wild bulls, deer of a small size, divers sorts of roebucks, goats, wolves, &c. The marshes, lakes, and pools, which in this country are very numerous, swarm with otters, beavers, or castors, of which the white are highly valued, being scarce, as well as the right black kind. The American beaver, though resembling the creature known in Europe by that name, has many particulars which render it the most curious animal we are acquainted with. It is near four feet in length, and weighs sixty or seventy pounds: they live from fifteen to twenty years, and the females generally bring forth four young ones at a time. It is an amphibious quadruped, that continues not long at a time in the water, but yet cannot live without frequently bathing in it. The savages, who wage a continual war with this animal, believe it to be a rational creature, that it lived in society, and was governed by a leader resembling their own sachem, or prince.—It must indeed be allowed, that the curious accounts given of this animal by ingenious travellers, the manner in which it contrives its habitation provides food to serve during the winter, and always in proportion to the continuance and severity of it, are sufficient to show the near approaches of instinct to reason, and even in some instances the superiority of the former. Their colours are different; black, brown, white, yellow, and straw colour: but it is observed, that the lighter their colour, the less quantity of fur they are clothed with, and live in warmer climates. The furs of the beaver are of two kinds, the dry and the green; the dry fur is the skin before it is applied to any use; the green are the furs that are worn, after being sewed to one another, by the Indians, who besmear them with unctuous substances, which not only render them more pliable, but give the fine down that is manufactured into hats that oily quality which renders it proper to be worked up with the dry fur. Both the Dutch and English have of late found the secret of making excellent cloths, gloves, and stockings, as well as hats, from the beaver fur. Besides the fur, this useful animal produces the true castoreum, which is contained in bags in the lower part of the belly, different from the testicles: the value of this drug is well known. The flesh of the beaver is a most delicious food, but when boiled it has a disagreeable relish.

Of the feat

The musk rat is a diminutive kind of beaver (weighing about five or six pounds), which it resembles in every thing but its tail; and affords a very strong musk.

The elk is of the size of a horse or mule. Its flesh is very agreeable and nourishing, and its colour a mixture of light gray and dark red. They love the cold countries; and when the winter affords them no grass, they gnaw the bark of trees. It is dangerous to approach very near this animal when he is hunted, as he sometimes springs furiously on his pursuers, and tramples them to pieces. To prevent this, the hunter throws his clothes to him; and while the deluded animal spends his fury on these, he takes proper measures to dispatch him.

There is a carnivorous animal here, called the carcajou, of the feline or cat kind, with a tail so long, that Charlevoix says he twisted it several times round his body. Its body is about two feet in length, from the end of the snout to the tail. It is said that this animal, winding himself about a tree, will dart from thence upon the elk, twist his strong tail round his body, and tear his throat open in a moment.

The buffalo is a kind of wild ox, of much the same appearance with those of Europe: his body is covered with a black wool, which is highly esteemed. The flesh of the female is very good; and the buffalo hides are as soft and pliable as chamois leather, but so very strong, that the bucklers which the Indians make of them are hardly penetrable by a musquet-ball. The Canadian roebuck is a domestic animal, but differs in no other respect from those of Europe. Wolves are scarce in Canada, but they afford the finest furs in all the country. Their flesh is white, and good to eat; they pursue their prey to the tops of the tallest trees. The black foxes are greatly esteemed, and very scarce; but those of other colours are more common: and some on the Upper Mississippi are of a silver colour, and very beautiful. They live upon water-fowls, which they decoy within their clutches by a thousand antic tricks, and then spring up and devour them. The Canadian pole-cat has a most beautiful white fur, except the tip of his tail, which is as black as jet. Nature has given this animal no defence but its urine, the smell of which is nauseous and intolerable; this, when attacked, it sprinkles plentifully on its tail, and throws it on the assailant. The Canadian wood-rat is of a beautiful silver colour, with a bushy tail, and twice as big as the European; the female carries under her belly a bag, which she opens and shuts at pleasure; and in that she places her young when pursued. Here are three sorts of squirrels; that called the flying squirrel will leap forty paces and more, from one tree to another. This little animal is easily tamed, and is very lively. The Canadian porcupine is less than a middling dog; when roasted, he eats full as well as a sucking pig. The hares and rabbits differ little from those in Europe, only they turn gray in winter. There are two sorts of bears here, one of a reddish, and the other of a black colour; but the former is the most dangerous. The bear is not naturally fierce, unless when wounded or oppressed with hunger. They run themselves very poor in the month of July, when it is somewhat dangerous to meet them: during the winter they remain in a kind of torpid state. Scarcely any thing among the Indians is undertaken with greater solemnity than hunting the bear; and an alliance with a noted bear-hunter, who has killed several in one day, is more eagerly sought after than that of one who has rendered himself famous in war. The reason is, because the chase supplies the family with both food and raiment.

Of the feathered creation, they have eagles, falcons, gothawks, ter-

cols, partridges, gray, red, and black, with long tails, which they spread out as a fan, and make a very beautiful appearance. Woodcocks are scarce in Canada, but snipes, and other water game, are plentiful. A Canadian raven is said by some writers to eat as well as a pullet, and an owl better. Here are black-birds, swallows, and larks; no less than twenty-two different species of ducks, and a great number of swans, turkeys, geese, bustards, teal, water-hens, cranes, and other large water-fowl; but always at a distance from houses. The Canadian wood-pecker is a beautiful bird. Thrushes and goldfinches are found here; but the chief Canadian bird of melody is the white bird, which is a kind of ortolan, very showy, and remarkable for announcing the return of spring. The fly-bird, or humming-bird, is thought to be the most beautiful of any in nature; with all his plumage, he is no bigger than a cock-chaffer, and he makes a noise with his wings like the humming of a large fly.

Among the reptiles of this country, the rattle-snake chiefly deserves attention. Some of these are as big as a man's leg, and they are long in proportion. What is most remarkable in this animal is the tail, which is scaly like a coat of mail, and on which it is said there grows every year one ring or row of scales; so that its age may be known by its tail, as we know that of a horse by its teeth. In moving, it makes a rattling noise, from which it takes its name. The bite of this serpent is mortal, if a remedy is not applied immediately. In all places where this dangerous reptile is bred, there grows a plant, which is called rattle-snake herb, the root of which (such is the goodness of Providence) is a certain antidote against the venom of this serpent, and that with the most simple preparation; for it requires only to be pounded or chewed, and applied like a plaster to the wound. The rattle-snake seldom bites passengers, unless it is provoked; and never darts itself at any person without first rattling three times with its tail. When pursued, if it has but a little time to recover, it folds itself round, with the head in the middle, and then darts itself with great fury and violence against its pursuers; nevertheless, the savages chase it, and find its flesh very good: it also possesses medicinal qualities.

Some writers are of opinion, that the fisheries in Canada, if properly improved, would be more likely to enrich that country than even the fur trade. The river St. Laurence contains perhaps the greatest variety of fish of any in the world, and these in the greatest plenty and of the best sorts.

Besides a great variety of other fish in the rivers and lakes, are sea-wolves, sea-cows, porpoises, the leincornet, the goberque, the sea-plaife; salmon, trout, turtle, lobsters, the chaourafon, iturgeon, the achigan; the gilthead, tunny, shad, lamprey, smelts, conger-eels, mackarel, soals, herrings, anchovies, and pilchards. The sea-wolf, so called from its howling, is an amphibious creature; the largest is said to weigh two thousand pounds; their flesh is good eating; but the profit of it lies in the oil, which is proper for burning and currying of leather; their skins make excellent coverings for trunks, and, though not so fine as Morocco leather, they preserve their freshness better, and are less liable to cracks. The shoes and boots made of those skins let in no water, and, when properly tanned, make excellent and lasting covering for seats. The Canadian sea-cow is larger than the sea wolf, but resembles it in figure: it hath two teeth of the thickness and length of a man's arm, that, when grown, look like horns, and are very fine ivory, as well as its other teeth. Some of the porpoises of the river St. Laurence

are said to yield a made, which are a kind of cuttle fish of them, which die and others but a fish torch; they are ex of a small cod. The poles armed with iron five feet long, and covered with scales silver gray; and the ragged at the edges fortified is a ravage few instances of fish does, however causes and reeds, in his weapon, which of the water; the pon to be only a wild alighted, than the tious to seize his prey habitant of the lake taken on the coast of long, and proportion the flesh of which the gilthead, are fish rivers breed a kind Nile.

\* In 1784, general F when they amounted to settled in the upper part

are said to yield a hoghead of oil; and of their skins walfcoats are made, which are excessively strong, and musket proof. The lencornet is a kind of cuttle fish, quite round, or rather oval: there are three sorts of them, which differ only in size; some being as large as a hoghead, and others but a foot long; they catch only the last, and that with a torch; they are excellent eating. The goberque has the taste and smell of a small cod. The sea-plaife is good eating; they are taken with long poles armed with iron hooks. The chaourafon is an armed fish, about five feet long, and as thick as a man's thigh, resembling a pike; it is covered with scales that are proof against a dagger; its colour is a silver gray; and there grows under its mouth a long bony substance, ragged at the edges. One may easily conceive, that an animal so well fortified is a ravager among the inhabitants of the water; but we have few instances of fish making prey of the feathered creation, which this fish does, however, with much art. He conceals himself among the canes and reeds, in such a manner that nothing is to be seen besides his weapon, which he holds raised perpendicularly above the surface of the water; the fowls which come to take rest, imagining the weapon to be only a withered reed, perch upon it; but they are no sooner alighted, than the fish opens its throat, and makes such a sudden motion to seize his prey, that it seldom escapes him. This fish is an inhabitant of the lakes. The sturgeon is both a fresh and salt-water fish, taken on the coast of Canada and the lakes, from eight to twelve feet long, and proportionably thick. There is a small kind of sturgeon, the flesh of which is very tender and delicate. The achigau, and the gilthead, are fish peculiar to the river St. Laurence. Some of the rivers breed a kind of crocodile, that differs but little from those of the Nile.

[INHABITANTS AND PRINCIPAL TOWNS.] Before the late war, the banks of the river St. Laurence, above Quebec, were vastly populous: but we cannot precisely determine the number of French and English settled in this province, who are undoubtedly upon the increase. In the year 1783, Canada and Labrador were supposed to contain about 130,000 inhabitants\*. The different tribes of Indians in Canada are almost innumerable; but these people are observed to decrease in population where the Europeans are most numerous, owing chiefly to the immoderate use of spirituous liquors, of which they are excessively fond. But as liberty is the ruling passion of the Indians, we may naturally suppose, that, as the Europeans advance, the former will retreat to more distant regions.

Quebec, the capital, not only of this province, but of all Canada, is situated at the confluence of the rivers St. Laurence and St. Charles, or the Little River, about 320 miles from the sea. It is built on a rock, partly of marble and partly of slate. The town is divided into an upper and a lower; the houses in both are of stone, and built in a tolerable manner. The fortifications are strong, though not regular. The town is defended by a regular and beautiful citadel, in which the governor resides. The number of inhabitants have been computed at 12 or 15,000. The river, which from the sea hither is four or five leagues broad, narrows all on a sudden to about a mile wide. The haven, which lies opposite the town, is safe and commodious, and about five fathoms deep. The harbour is flanked by two bastions, that are raised

\* In 1784, general Haldimand ordered a census of the inhabitants to be taken, when they amounted to 115,012 English and French, exclusive of 10,000 loyalists, settled in the upper parts of the province.

appoint others to succeed them. And this council, so appointed and nominated, or the majority of them, are vested with power and authority to make ordinances for the peace, welfare, and good government of the province, with the consent of the governor, or, in his absence, of the lieutenant-governor, or commander in chief for the time being. The council, however, are not empowered to lay taxes, except for the purpose of making roads, reparation of public buildings, or such local conveniences. By this act, all matters of controversy relative to property and civil rights are to be determined by the French laws of Canada; but the criminal law of England is to be continued in the province. The inhabitants of Canada are also allowed by this act not only to profess the Roman religion, but the popish clergy are invested with a right to claim and obtain their accustomed dues from those of the same religion.

**TRADE AND COMMERCE.]** The nature of the climate, severely cold in winter, and the people manufacturing nothing, shows what Canada principally wants from Europe: wine, or rather rum, cloths, chiefly coarse linen, and wrought iron. The Indian trade requires rum, tobacco, a sort of duffil blankets, guns, powder, balls, and flints, kettles, hatchets, toys, and trinkets of all kinds.

While this country was possessed by the French, the Indians supplied them with peltry; and the French had traders, who, in the manner of the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the remotest parts of America, and amongst nations entirely unknown to us. These again brought the market home to them, as the Indians were thereby habituated to trade with them. For this purpose, people from all parts, even from the distance of 1000 miles, came to the French fair at Montréal, which began in June, and sometimes lasted three months. On this occasion, many solemnities were observed, guards were placed, and the governors assisted, to preserve order, in such a concourse, and so great a variety of savage nations. But sometimes great disorder and tumults happened; and the Indians, being so fond of brandy, frequently gave for a dram all that they were possessed of. It is remarkable that many of these nations actually passed by our settlement of Albany, in New York, and travelled 250 miles farther, to Montréal, though they might have purchased the goods cheaper at the former. So much did the French exceed us in the arts of winning the affections of these savages.

Since we became possessed of Canada, our trade with that country has been computed to employ about 60 ships and 1000 seamen. Their exports, at an average of three years, in skins, furs, ginseng, snake-root, capillaire, and wheat, amount to 105,500*l*. Their imports from Great Britain, in a variety of articles, are computed at nearly the same sum. It is unnecessary to make any remarks on the value and importance of this trade, which not only supplies us with unmanufactured materials, indispensably necessary in many articles of our commerce, but also takes in exchange the manufactures of our own country, or the productions of our other settlements in the East and West Indies\*.

But whatever attention be paid to the trade and peopling of Canada, it will be hardly possible to overcome certain inconveniences, proceeding from natural causes; principally the severity of the winter, which

\* The amount of the exports from this province in the year 1786 was *£*.343,263. Amount of imports the same year was *£*.325,116.

is so excessive from December to April, that the greatest rivers are frozen over; and the snow lies commonly from four to six feet deep on the ground, even in those parts of the country which lie three degrees south of London, and in the temperate latitude of Paris. Another inconvenience arises from the falls in the river St. Laurence, below Montréal, which render it difficult for very large ships to penetrate to that emporium of inland commerce; but vessels from 300 to 400 tons are not prevented by these falls from going there annually.

**HISTORY.]** See the general account of America.

### SITUATION AND EXTENT.

	Miles.		Degrees.		Sq. Miles.
Length	350	} between	{ 43 and 49 North latitude	}	57,000
Breadth	250				

**BOUNDARIES.]** BOUNDED by the river St. Laurence on the North; by the Gulf of St. Laurence and the Atlantic Ocean, East; by the same ocean, South; and by Canada and New England, West. In the year 1784, this province was divided into two governments: the province and government now styled New Brunswick is bounded on the westward of the river Ste. Croix, by the said river to its source, and by a line drawn due north from thence to the southern boundary of the province of Quebec; to the northward by the same boundary as far as the western extremity of the Bay de Chaleurs, to the Eastward by the said bay to the Gulf of St. Laurence to the bay called Bay Verte; to the south by a line in the centre of the Bay of Fundy, from the river Ste. Croix aforesaid, to the mouth of the Musquat River; by the said river to its source, and from thence by a due line across the isthmus into the Bay Verte, to join the eastern lot above described, including all islands within six leagues of the coast.

**RIVERS.]** The river of St. Laurence forms the northern boundary. The rivers Rivgouche and Nipisguit run from West to East, and fall into the Bay of St. Laurence. The rivers of St. John, Passamagadi, Penobscot, and Ste. Croix, which run from North to South, fall into Fundy Bay, or the sea a little to the eastward of it.

**SEAS, BAYS, AND CAPES.]** The seas adjoining to it are, the Atlantic Ocean, Fundy Bay, and the Gulf of St. Laurence. The lesser bays are Chenigto and Green Bay upon the isthmus, which join the north part of Nova Scotia to the south, and the bay of Chaleurs on the north-east; the bay of Chedibucto on the south-east; the bay of the islands, the ports of Bart, Chebucto, Prosper, St. Margaret, La Heve, port Maltois, port Rossignol, port Vert, and port Joly, on the south; port La Tour, on the south-east; port St. Mary, Annapolis, and Minas, on the south side of Fundy Bay; and port Roseway, now the most populous of all.

The chief capes are, Cape Portage, Ecoumenac, Tonrrentin, Cape Port, and Epis, on the East; Cape Forgeri, and Cape Canceau, on the south-east; Cape Blanco, Cape Vert, Cape Theodore, Cape Dore, Cape

La Heve, and Cap on the south-west LAKES.] The particular names.

La Heve, and Cape Negro, on the south; Cape Sable and Cape Fourche on the south-west.

**LAKES.]** The lakes are very numerous, but have not yet received particular names.

**CLIMATE.]** The climate of this country, though within the temperate zone, has been found rather unfavourable to European constitutions. They are wrapped up in the gloom of a fog during great part of the year, and for four or five months it is intensely cold; but though the cold in winter and the heat in summer are great, they come on gradually, so as to prepare the body for enduring both.

**SOIL AND PRODUCE.]** From such an unfavourable climate little can be expected. Nova Scotia, or New Scotland, till lately, was almost a continued forest; and agriculture, though attempted by the English settlers, made little progress. In most parts, the soil is thin and barren, the corn it produces is of a shrivelled kind, like rye, and the grass intermixed with a cold spongy moss. However, it is not uniformly bad; there are tracts in the peninsula, to the southward, which do not yield to the best land in New England, and, by the industry and exertions of the loyalists from the other provinces, are now cultivated, and likely to be fertile and flourishing. In general, the soil is adapted to the produce of hemp and flax. The timber is extremely proper for ship-building, and produces pitch and tar. Flattering accounts have been given of the improvements making in the new settlements and Bay of Fundy. A great quantity of land has been cleared, which abounds in timber; and ship-loads of good masts and spars have been shipped from thence already.

**ANIMALS.]** This country is not deficient in the animal productions of the neighbouring provinces, particularly deer, beavers, and otters. Wild fowl and all manner of game, and many kinds of European fowls and quadrupeds, have, from time to time, been brought into it, and thrive well. At the close of March, the fish begin to spawn, when they enter the rivers in such shoals as are incredible. Herrings come up in April, and the sturgeon and salmon in May. But the most valuable appendage of New Scotland is the Cape Sable coast, along which is one continued range of cod-fishing banks, navigable rivers, basins, and excellent harbours.

**HISTORY, SETTLEMENT, CHIEF TOWNS, AND COMMERCE.]** Notwithstanding the forbidding appearance of this country, it was here that some of the first European settlements were made. The first grant of lands in it was given by James I. to his secretary, Sir William Alexander, from whom it had the name of Nova Scotia, or New Scotland. Since then, it has frequently changed hands, from one private proprietor to another, and from the French to the English nation, backward and forward. It was not confirmed to the English till the peace of Utrecht; and their design in acquiring it does not seem to have so much arisen from any prospect of direct profit to be obtained by it, as from an apprehension that the French, by possessing this province, might have had it in their power to annoy our other settlements. Upon this principle, 3000 families were transported, in 1749, at the charge of the government, into this country. The town they erected is called Halifax, from the earl of that name, to whose wisdom and care we owe this settlement. The town of Halifax stands upon Chebucto Bay, very commodiously situated for the fishery, and has a communication with most parts of the province; either by land-carriage, the sea, or navigable rivers, with a fine harbour, where a small squadron of ships of war

lies during the winter, and in summer puts to sea, under the command of a commodore, for the protection of the fishery. The town has an entrenchment, and is strengthened with forts of timber. The other towns of less note are Annapolis Royal, which stands on the east side of the Bay of Fundy, and though but a small place, was formerly the capital of the province. It has one of the finest harbours in America, capable of containing a thousand vessels at anchor, in the utmost security. St. John's is a new settlement at the mouth of the river of that name, that falls into the Bay of Fundy, on the west side.

Since the conclusion of the American war, the emigration of loyalists to this province from the United States has been very great: by them new towns have been raised; as Shelburne, which extends two miles on the water-side, and is said to contain already 9000 inhabitants. Of the old settlements, the most flourishing and populous are Halifax, and the townships of Windsor, Norton, and Cornwallis, between Halifax and Annapolis. Of the new settlements, the most important are Shelburne, Parr-town, Digby, and New Edinburgh. Large tracts of land have been lately cultivated, and the province is now likely to advance in population and fertility.

## UNITED STATES OF AMERICA.

OF the rise, progress, and most remarkable events of that war, between Great Britain and her American colonies, which at length terminated in the establishment of the United States of America, we have already given an account in our view of the principal transactions in the history of Great Britain. It was on the fourth of July, 1776, that the congress published a solemn declaration, in which they assigned their reasons for withdrawing their allegiance from the king of Great Britain. In the name and by the authority of the inhabitants of the United Colonies of New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia, they declared that they then were, and of right ought to be, free and independent states; and that, as such, they had full power to levy war, conclude peace, contract alliances, establish commerce, and do all other acts and things which independent states may of right do. They also published articles of confederation and perpetual union between the united colonies, in which they assumed the title of "The United States of America;" and by which each of the colonies contracted a reciprocal treaty of alliance and friendship, for their common defence, for the maintenance of their liberties, and for their general and mutual advantage; obliging themselves to assist each other against all violence that might threaten all or any one of them, and to repel in common all the attacks that might be levelled against all or any one of them, on account of religion, sovereignty, commerce, or under any other pretext whatsoever. Each of the colonies reserved to themselves alone the exclusive right of regulating their internal government; and of framing laws in all matters not included in the articles of confederation. But for the more convenient management of the general interest of the United States, it was determined that delegates should be annually appointed, in such manner as the legislature of each

state should direct

state should direct, to meet in congress on the first Monday in November of every year, with a power reserved to each state to recall its delegates, or any of them, at any time within the year, and to send others in their stead for the remainder of the year. No state was to be represented in congress by less than two, nor more than seven members; and no person was capable of being a delegate for more than three years, in any term of six years; nor was any person, being a delegate, capable of holding any office under the United States, for which he, or any other for his benefit, should receive any salary, fees, or emolument of any kind. In determining questions in the United States, in congress assembled, each state was to have one vote, and to abide by the determination of the United States in congress assembled, on all questions submitted to them by the confederation. The articles of the confederation were to be inviolably observed by every state, and the union to be perpetual; nor was any alteration thenceforth to be made in any of them, unless previously agreed to in a congress of the United States, and afterwards confirmed by the legislature of that state. It was on the 30th of January, 1778, that the French king concluded a treaty of amity and commerce with the Thirteen United Colonies of America, as independent states. Holland acknowledged them as such April 19, 1782; and, on the 30th of November, 1782, provisional articles were signed at Paris, by the British and American commissioners, in which his Britannic majesty acknowledged the Thirteen Colonies to be free, sovereign, and independent states; and these articles were afterwards ratified by a definitive treaty. Sweden acknowledged them as such February 5, 1783; Denmark the 25th of February; Spain in March, and Russia in July, 1783.

*The following Calculations were made from actual Measurement of the best Maps, by THOMAS HUTCHINS, Esq. Geographer to the United States.*

The territory of the United States contains,		
by computation, a million square miles, in		
which are	- - - - -	640,000,000 of acres,
Deduct for water	- - - - -	51,000,000
Acres of land in the United States		589,000,000

That part of the United States comprehended between the west temporary line of Pennsylvania on the east, the boundary line between Britain and the United States, extending from the river Ste. Croix to the north-west extremity of the Lake of the Woods, on the north, the river Mississippi to the mouth of the Ohio on the west, and the river Ohio on the south, to the aforementioned bounds of Pennsylvania, contains, by computation, about four hundred and eleven thousand square miles; in which are,

	- - - - -	263,040,000 of acres.
Deduct for water	- - - - -	43,040,000
To be disposed of by order of congress	- - - - -	220,000,000

The whole of this immense extent of unappropriated western territory, containing, as above stated, 220,000,000 of acres, has been, by the cession of some of the original thirteen states, and by the treaty of peace transferred to the federal government, and is pledged as a fund

for sinking the continental debt. It is in contemplation to divide it into new states, with republican constitutions, similar to the old states near the Atlantic Ocean.

	43,040,000

*Estimate of the Number of Acres of Water within the Thirteen United States.*

	Acres.
In Lake Erie, westward of the line extended from the north-west corner of Pennsylvania, due north, to the boundary between the British territory and the United States	410,000
In Lake Ontario	2,390,000
Lake Champlain	500,000
Chesapeake Bay	1,700,000
Albemarle Bay	330,000
Delaware Bay	630,000
All the rivers within the Thirteen States, including the Ohio,	2,000,000
	7,960,000
Total	51,000,000

The territory of the United States is in length 1,250 miles, and in breadth 1,040; lying between 31 and 46 degrees of north latitude, and between 64 and 96 degrees of west longitude. They consist at present of sixteen separate independent states, having governors, constitutions, and laws of their own, united under a general federal constitution, administered by an elective head, and by a proportionate number of representatives of the people from all the states. They are classed in three grand divisions, as follows:

- I. The NEW ENGLAND, OR EASTERN, OR NORTHERN STATES.**  
 Vermont  
 New Hampshire  
 Massachusetts, including the District of Maine  
 Rhode Island and Connecticut.

- II. The MIDDLE STATES.**  
 New York  
 New Jersey  
 Pennsylvania  
 Delaware.

Maryland  
 Virginia  
 Kentucky  
 North Carolina

Besides which, mentioned above, which population shall be sufficient to be taken by order of the United States, none of the inhabitants but a part of them. These added with 3,950,000 \* at the present supposition that in twenty years, has 4,550,000 souls in the PRESENT AND CONSTITUTION together with a present senate and house of senators from each of the representatives of one hundred and thirty-three thousand, exceeded one hundred and thirty-three thousand representative for every one hundred and twenty amounts to two hundred and twenty between the people of the Congress, that there are more than one hundred is the ultimate limit of the constitution of the The seat of Congress moved to the new city called by the State called the Territory years building, for Eastern Branch, tract of territory beauty, by none north to south, in principal streets a feet wide. III. The SOUTHERN STATES.

Maryland  
Virginia  
Kentucky  
North Carolina

South Carolina  
Georgia  
Tennessee.

Besides which, there is the extensive North-western territory mentioned above, which is gradually settling, and is hereafter, when its population shall be sufficiently increased, to be divided into new states.

POPULATION OF THE UNITED STATES.] According to the census taken by order of congress, in 1790, the number of the inhabitants of the United States of America was 3,930,000 nearly. In this number none of the inhabitants of the territory N. W. of the river Ohio, and but a part of the inhabitants south of the river Ohio, are included. These added would undoubtedly have increased the number to 3,950,000 \* at the period the census was taken. The increase since, on supposition that the inhabitants of the United States double once in twenty years, has been about 600,000; so that now there are probably 4,550,000 souls in the American United States.

PRESENT AND FUTURE CONSTITUTION OF CONGRESS. } Such are the extensive dominions dependent on congress, which, together with a president chosen for four years, consists, since 1789, of a senate and house of representatives. The senate is composed of two senators from each state, elected for six years; and the house of representatives of one representative, chosen every second year, for every thirty-three thousand inhabitants in each state, until the number has exceeded one hundred; since which there is not to be less than one representative for every forty thousand, until the number of representatives amounts to two hundred. When this takes place, the proportion between the people and their representatives is to be so regulated by congress, that there shall not be less than two hundred representatives, nor more than one representative for every fifty thousand persons. This is the ultimate limit to which the Americans as yet look forward, in the constitution of the general government of their Union.

The seat of congress and government, after the year 1800, is to be removed to the new City of Washington, now building on a tract of land ceded by the States of Virginia and Maryland to the United States, and called the Territory of Columbia. This city, which has been several years building, stands at the junction of the river Patowmack and the Eastern Branch, extending nearly four miles up each, and including a tract of territory exceeded, in point of convenience, salubrity, and beauty, by none in America. It is laid out in straight streets from north to south, intersected by others running due east and west. The principal streets are from 130 to 160, and the others from 90 to 110 feet wide. The capital or state-house is situated on a most beautiful eminence, commanding a complete view of every part of the city, and of a considerable part of the country round. It is 42 miles south-west of Baltimore, and 144 in the same direction from Philadelphia; in north lat. 29-53; west long. 77-43.

\* Morse's American Geography, Vol. i. p. 207.

## NEW ENGLAND.

## SITUATION AND EXTENT.

Miles.		Degrees.	Sq. Miles.
Length 350	} between	{ 41 and 46 North latitude	} 87,000
Breadth 140		{ 67 and 74 West longitude	

**BOUNDARIES.]** BOUNDED on the North by Canada; on the East by New Brunswick and the Atlantic Ocean; on the South by the Atlantic and Long-Island Sound; and on the West by New York \*. It comprehends the States of Vermont, New Hampshire, Massachusetts, Rhode Island, and Connecticut.

**FACE OF THE COUNTRY, } MOUNTAINS, &c. }** New England is a high, hilly, and in some parts a mountainous country. The mountains are comparatively small, running nearly north and south, in ridges parallel to each other. Between these ridges flow the great rivers in majestic meanders, receiving the innumerable rivulets and larger streams which proceed from the mountains on each side. To a spectator on the top of a neighbouring mountain, the vales between the ridges, while in a state of nature, exhibit a romantic appearance. They seem an ocean of woods, swelled and depressed in its surface, like that of the great ocean itself.

There are four principal ranges of mountains, passing nearly from north-east to south-west, through New England. They consist of a multitude of parallel ridges, each having many spurs, deviating from the course of the general range; which spurs are again broken into irregular hilly land. The main ridges terminate, sometimes in high bluff heads, near the sea-coast; and sometimes by a gradual descent in the interior parts of the country. These ranges of mountains are full of lakes, ponds, and springs of water, that give rise to numberless streams of various sizes. No country on the globe is better watered than New England †.

**RIVERS.]** The rivers are, 1. Connecticut; 2. Thames; 3. Patuxent; 4. Merimac; 5. Piscataway; 6. Saco; 7. Casco; 8. Kennebeque; and, 9. Penobscot, or Pentagonet.

**BAYS AND CAPES.]** The most remarkable bays and harbours are those formed by Plymouth, Rhode Island, and Providence Plantations; Monument Bay; West Harbour, formed by the bending of Cape Cod; Boston Harbour; Piscataway; and Casco Bay.

The chief capes are, Cape Cod, Marble Head, Cape Ann, Cape Netic, Cape Porpus, Cape Elizabeth, and Cape Small Point.

**AIR AND CLIMATE.]** New England, though situated almost ten degrees nearer the sun than the mother country, has an earlier winter, which continues longer, and is more severe than with us. The summer is extremely hot, and much beyond any thing known in Europe, in the same latitude. The clear and serene temperature of the sky, however, makes amends for the extremity of heat and cold, and renders the climate of this country so healthy, that it is reported to agree better with British constitutions than any other of the American provinces. The

\* Morse's American Geography,

† Morse.

winds are very boisterous at the early approach, and the large fresh-water lakes being frozen over several months, prove so fatal to man and beast. The sun rises at Boston at four in the morning, and sets at four in the evening; and on the 21st of the month, the sun is in the morning at seven in the morning, and at nine in the afternoon: thus their day is about nine.

**SOIL AND PRODUCE.]** The soil on the eastern shore is very fertile, but farther back than the north-east, the land is various, but best adapted to the culture of the Bay the soil is very fertile, but here the first planters are less fruitful, being generally of a clayey nature. The European grain, particularly wheat, is subject to the rust, and the cats are lean and chafed, and makes the malt, and the beer is likewise malted. However, the country is made of the tops of the hills, and the quantity of melasses. The quantity of hemp and flax. The peaches may be found in seven barrels of cider.

But New England is rich in its timber, as oak, chestnut, hazel, sassafras, and are used in tanning leather, and are said to be inferior to the European in bulk, and former in their trade.

**METALS.]** Rich in metals, and have been discovered, and become very beneficial.

**ANIMALS.]** The animals of New England commerce multiply exceedingly, some, and serviceable to the Welch. They have been sufficiently long, is not only the elk, deer, hares, martens, racoons, dogs, foxes, ounces,

winds are very boisterous in the winter season, and naturalists ascribe the early approach, and the length and severity of the winter, to the large fresh-water lakes lying to the north-west of New England, which, being frozen over several months, occasion those piercing winds which prove so fatal to mariners on this coast.

The sun rises at Boston, on the longest day, at twenty-six minutes after four in the morning, and sets at thirty-four minutes after seven in the evening; and on the shortest day, it rises at thirty-five minutes after seven in the morning, sets at twenty-seven minutes after four in the afternoon: thus their longest day is about fifteen hours, and the shortest about nine.

**SOIL AND PRODUCE.]** We have already observed, that the lands lying on the eastern shore of America are low, and in some parts swampy, but farther back they rise into hills. In New England, towards the north-east, the lands become rocky and mountainous. The soil here is various, but best as you approach the southward. Round Massachusetts Bay the soil is black, and rich as in any part of England; and here the first planters found the grass above a yard high. The uplands are less fruitful, being for the most part a mixture of sand and gravel, inclining to clay. The low grounds abound in meadows and pasture-land. The European grains have not been cultivated here with much success; the wheat is subject to be blasted; the barley is a hungry grain, and the oats are lean and chaffy. But the Indian corn flourishes in high perfection, and makes the general food of the lower sort of the people. They have likewise malt, and brew it into a beer, which is not contemptible. However, the common table drink is cider and spruce-beer: the latter is made of the tops of the spruce fir, with the addition of a small quantity of melasses. They likewise raise in New England a large quantity of hemp and flax. The fruits of Old England come to great perfection here, particularly peaches and apples. Seven or eight hundred fine peaches may be found on one tree, and a single apple-tree has produced seven barrels of cider in one season.

But New England is chiefly distinguished for the variety and value of its timber, as oak, ash, pine, fir, cedar, elm, cypress, beech, walnut, chestnut, hazel, sassafras, sumach, and other woods used in dyeing or tanning leather, carpenter's work, and ship-building. The oaks here are said to be inferior to those of England; but the firs are of an amazing bulk, and formerly furnished the royal navy of England with masts and yards. They draw from their trees considerable quantities of pitch, tar, resin, turpentine, gums, and balm; and the soil produces hemp and flax. A ship may here be built and rigged out with the produce of their forests, and indeed ship-building forms a considerable branch of their trade.

**METALS.]** Rich mines of iron, of a most excellent kind and temper, have been discovered in New England, which, if improved, may become very beneficial to the inhabitants.

**ANIMALS.]** The animals of this country furnish many articles of New England commerce. All kinds of European cattle thrive here, and multiply exceedingly; the horses of New England are hardy, mettlesome, and serviceable, but smaller than ours, though larger than the Welch. They have few sheep; and the wool, though of a staple sufficiently long, is not nearly so fine as that of England. Here are also elk, deer, hares, rabbits, squirrels, beavers, otters, monkeys, minxes, martens, racoons, fables, bears, wolves, which are only a kind of wild dogs, foxes, ounces, and a variety of other tame and wild quadrupeds.

But one of the most singular animals, of this and the neighbouring countries, is the moose and moose-deer, of which there are two sorts; the common light gray moose, which resembles the ordinary deer; these herd sometimes thirty together; and the larger black moose, whose body is about the size of a bull; his neck resembles a stag's, and his flesh is extremely grateful. The horns, when full-grown, are about four or five feet from the head to the tip, and have shoots or branches to each horn, which generally spread about six feet. When this animal goes through a thicket, or under the boughs of a tree, he lays his horns back on his neck, to place them out of his way; and these prodigious horns are shed every year. This animal does not spring or rise in going, like a deer; but a large one, in his common walk, has been seen to step over a gate five feet high. When unharboured, he will run a course of twenty or thirty miles before he takes to bay; but when chased, he generally takes to the water.

There is hardly any where greater plenty of fowls, turkeys, geese, partridges, ducks, widgeons, dappers, swans, heath-cocks, herons, storks, black-birds, all sorts of barn-door fowl, vast flights of pigeons, which come and go at certain seasons of the year, cormorants, ravens, crows, &c. The reptiles are rattle-snakes, frogs, and toads, which swarm in the uncleared parts of these countries, where, with the owls, they make a most hideous noise in the summer evenings.

The seas round New England, as well as its rivers, abound with fish, and even whales of different kinds, such as the whalebone whale, the spermaceti whale, which yields ambergris, the fin-backed whale, the frag whale, and the bunch whale, of which they take great numbers, and send besides some ships every year to fish for whales in Greenland, and as far as Falkland islands. A terrible creature, called the whale-killer, from twenty to thirty feet long, with strong teeth and jaws, persecutes the whale in these seas: but, afraid of his monstrous strength, they seldom attack a full-grown whale, or indeed a young one, but in companies of ten or twelve. At the mouth of the river Penobscot, there is a mackarel fishery; they likewise fish for cod in the winter, which they dry in the frost.

POPULATION, INHABITANTS, AND } There is not one of the colo-  
FACE OF THE COUNTRY. } nies which can be compared, in

the abundance of the people, the number of considerable and trading towns, and the manufactures that are carried on in them, to New England. The most populous and flourishing parts of the mother country hardly make a better appearance than the cultivated parts of this province, which reach about 60 miles back. There are here many gentlemen of considerable landed estates; but the great body of the people are landholders and cultivators of the soil. The former attaches them to their country; the latter, by making them strong and healthy, enables them to defend it\*. These freeholds generally pass to their children in the way of gavelkind; which keeps them from being hardly ever able to emerge out of their original happy mediocrity. In no part of the world are the ordinary sort so independent, or possess more of the conveniences of life; they are used from their infancy to the exercise of arms; and before the contest with the mother country, they had a militia which was by no means contemptible; but their military strength is now much more considerable.

The inhabitants of New England are almost universally of English descent; and it is owing to this circumstance, and to the great and gene-

province, 84 Baptist, an

ral attention that has been paid to education, that the English language has been preserved among them so free of corruption. It is true, that from laziness, inattention, and want of acquaintance with mankind, many of the people in the country have accustomed themselves to use some peculiar phrases, and to pronounce certain words in a flat, drawling manner. Hence foreigners pretend they know a New Englandman from his manner of speaking. But the same may be said with regard to a Pennsylvanian, a Virginian, a Carolinian; for all have some phrases and modes of pronunciation peculiar to themselves, which distinguish them from their neighbours.

The New Englanders are generally tall, stout, and well-built. They glory, and perhaps with justice, in possessing that spirit of freedom, which induced their ancestors to leave their native country, and to brave the dangers of the ocean, and the hardships of settling in a wilderness. Their education, laws, and situation, serve to inspire them with high notions of liberty.—In New England, learning is more generally diffused among all ranks of people than in any other part of the globe; arising from the excellent establishment of schools in every township. A person of mature age, who cannot both read and write, is rarely to be found. By means of this general establishment of schools, the extensive circulation of newspapers (of which not less than 30,000 are printed every week in New England, and sent to almost every town and village in the country), and the consequent spread of learning, every township, throughout this country, is furnished with men capable of conducting the affairs of their town with judgment and discretion\*.

New England contains, according to the census of 1790, 1,009,522 souls, and, should any great and sudden emergency require it, could furnish an army of 164,600 men †.

RELIGION.] Calvinism, from the principles of the first settlers, has been very prevalent in New England: many of the inhabitants also formerly observed the sabbath with a kind of Jewish rigour; but this hath of late been much diminished. There is at present no established religion in New England; but every sect of Christians is allowed the free exercise of his religion, and is equally under the protection of the law. They annually celebrate fasts and thanksgivings. In the spring, the several governors issue their proclamations, appointing a day to be religiously observed in fasting, humiliation, and prayer, throughout their respective states, in which the predominating vices, that particularly call for humiliation, are enumerated. In autumn, after harvest, that glad some era of the husbandman's life, a day of public thanksgiving is appointed, enumerating the public blessings received in the course of the year. This pious custom originates with their venerable ancestors, the first settlers. The custom so rational, and so well calculated to cherish in the minds of the people a sense of their dependence on the GREAT BENEFACITOR of the world for all their blessings, it is hoped, will ever be sacredly preserved ||. The Connecticut province has lately provided a bishop for the episcopalians among them, by sending one of their number to Scotland to be ordained by the nonjuring bishops of the episcopal church in that kingdom.

HISTORY.] As early as 1609, King James I. had, by letters patent, erected two companies, with a power to send colonies into those parts,

\* Morse's American Geography. † Morse.

† By a late account, there are 400 Independent and Presbyterian churches in this province, 84 Baptist, and 31 of other denominations.

|| Morse's American Geography.

then comprehended under the general name of Virginia, as all the north-east coast of America was sometimes called. No settlements, however, were made in New England by virtue of this authority. The companies contented themselves with sending out a ship or two, to trade with the Indians for their furs, and to fish upon their coast. This continued to be the only sort of correspondence between Great Britain and this part of America, till the year 1620. By this time the religious dissensions, by which England was torn to pieces, had become warm and furious. Archbishop Laud persecuted all sorts of non-conformists with an unrelenting severity. Those men, on the other hand, were ready to submit to all the rigour of persecution rather than give up their religious opinions, and conform to the ceremonies of the church of England, which they considered as abuses of the most dangerous tendency. There was no part of the world into which they would not fly, in order to obtain liberty of conscience. America opened an extensive field. Thither they might transport themselves, and establish whatever sort of religious polity they were inclined to. With this view, having purchased the territory, which was within the jurisdiction of the Plymouth company, and having obtained from the king the privilege of settling it in whatever way they chose, 150 persons embarked for New England, and built a city, which, because they had sailed from Plymouth, they called by that name. Notwithstanding the severity of the climate, the unwholesomeness of the air, and the diseases to which, after a long sea-voyage, and in a country which was new to them, they were exposed; notwithstanding the want of all sorts of conveniences, and even of many of the necessaries of life, those who had constitutions fit to endure such hardships, not dispirited or broken by the death of their companions, and supported by the vigour then peculiar to Englishmen, and the satisfaction of finding themselves beyond the reach of the spiritual arm, set themselves to cultivate this country, and to take the best steps for the advancement of their infant colony. New adventurers, encouraged by their example, and finding themselves, for the same reasons, uneasy at home, passed over into this land of religious and civil liberty. By the close of the year 1630, they had built four towns, Salem, Dorchester, Charles-town, and Boston; which last became the capital of New England. But as necessity is the natural source of that active and frugal industry which produces every thing great among mankind, so an uninterrupted flow of prosperity and success occasions those dissensions which are the bane of human affairs, and often subvert the best-founded establishments.

The inhabitants of New England, who had fled from persecution, became in a short time strongly tainted with this illiberal vice, and were eager to introduce an uniformity in religion among all who entered their territories. The minds of men were not in that age superior to many prejudices; they had not that open and generous way of thinking which at present distinguishes the natives of Great Britain; and the doctrine of universal toleration, which, to the honour of the first settlers in America, began to appear among them, had few abettors, and many opponents. Many of them were bigoted Calvinists; and though they had felt the weight of persecution themselves, they had no charity for those who professed sentiments different from their own. It was not the general idea of the age, that men might live comfortably together in the same society, without maintaining the same religious opinions; and wherever these were at variance, the members of different sects kept at a distance from each other, and established separate governments. Hence several

ships, torn from the original government of New England by religious violence, planted themselves in a new soil, and spread over the country. Such was that of New Hampshire, which continues to this day a separate jurisdiction; such too was that of Rhode Island, whose inhabitants were driven out from the Massachusetts colony (for that is the name by which the government first erected in New England was distinguished) for supporting the freedom of religious sentiments, and maintaining that the civil magistrate had no right over the speculative opinions of mankind. These liberal men founded a city, called Providence, which they governed by their own principles; and, such is the connection between justness of sentiment and external prosperity, that the government of Rhode Island, though small, became extremely populous and flourishing. Another colony, driven out by the same persecuting spirit, settled on the river Connecticut, and received frequent reinforcements from England, of such as were dissatisfied either with the religious or civil government of that country.

America, indeed, was now become the main resource of all discontented and enterprising spirits; and such were the numbers which embarked for it from England, that, in 1637, a proclamation was published, prohibiting any person from sailing thither, without an express licence from the government. For want of this licence, it is said, that Oliver Cromwell, Mr. Hampden, and others of the party, were detained from going into New England, after being on ship-board for that purpose.

These four provinces, though always confederates for their mutual defence, were at first, and still continue, under separate jurisdictions. They were all of them, by their charters, originally free, and in a great measure independent of Great Britain. The inhabitants had the choice of their own magistrates, the governor, the council, the assembly, and the power of making such laws as they thought proper, without sending them to Great Britain for the approbation of the crown. Their laws, however, were not to be opposite to those of Great Britain. Towards the latter end of the reign of Charles II. when he and his ministers wanted to destroy all charters and liberties, the Massachusetts' colony was accused of violating their charter, in like manner as the city of London, and, by a judgment in the King's Bench of England, was deprived of it. From that time to the revolution, they remained without any charter. Soon after that period, they received a new one, which, though very favourable, was much inferior to the extensive privileges of the former. The appointment of a governor, lieutenant-governor, secretary, and all the officers of the admiralty, was vested in the crown; the power of the militia was wholly in the hands of the governor, as captain-general; all judges, justices, and sheriffs, to whom the execution of the law was entrusted, were nominated by the governor, with the advice of the council: the governor had a negative on the choice of counsellors, peremptory and unlimited; and he was not obliged to give a reason for what he did in this particular, or restrained to any number; authentic copies of the several acts passed by this colony, as well as others, were to be transmitted to the court of England, for the royal approbation; but if the laws of this colony were not repealed within three years after they were presented, they were not repealable by the crown after that time; no laws, ordinances, election of magistrates, or acts of government whatsoever, were valid without the governor's consent in writing; and appeals for sums above 300*l.* were admitted to the king and council. Notwithstanding these restraints,

the people had still a great share of power in this colony; for they not only chose the assembly, but this assembly, with the governor's concurrence, chose the council, resembling our house of lords; and the governor depended upon the assembly for his annual support.

We shall now proceed to give an account of each state separately.

## V E R M O N T .

### SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 157 } Breadth 65 }	between { 42 and 45 North latitude. { 72 and 73-30 West longitude. }	} 10,000

**BOUNDARIES AND DIVISIONS.]** BOUNDED on the North by Lower Canada; on the East, by Connecticut river, which divides it from New Hampshire; on the South, by Massachusetts; and on the West, by New York. It is naturally divided by the Green Mountain, which runs from south to north, and divides the state nearly in the middle. Its civil division is into eleven counties as follow :

	<i>Counties.</i>	<i>Towns.</i>
West of the Mountain	Bennington Rutland Addison Chilteadon Franklin Orleans	Bennington Rutland Addison Colchester
East of the Mountain	Orange Windfor Windham Caledonia Essex	Newbury Windfor Newfane and Putney

**RIVERS AND LAKES.]** The principal rivers in this state are Michifcoui, Lamoille, Onion, and Otter creek rivers, which run from east to west into Lake Champlain, West, Sexton's Block, Waterquechee, White, Ompompanoosuck, Weld's, Wait's, Passumpsick, and several smaller rivers, which run, from west to east, into Connecticut river. Over the river Lamoille is a natural stone-bridge, seven or eight rods in length. Otter creek is navigable for boats fifty miles. Its banks are excellent land, being annually overflowed and enriched. Memphremagog is the largest lake in this state. It is the reservoir of three considerable streams, Black, Barton, and Clyde rivers. One of these rises in Willoughby Lake, and forms a communication between it and Lake St. Peter's, in the river St. Laurence.

**SOIL AND PRODUCTIONS.]** This state, generally speaking, is hilly, but not rocky. West of the mountain, from the county of Rutland, northward to the Canada line, is a flat country, well adapted for tillage. The state at large is well watered, and affords the best of pasturage for cattle. Some of the finest beef-cattle in the world are driven from this state: horses also are raised for exportation. Back from the rivers, the

land is thickly timbered with white oak of an extraordinary size, rye, barley, oats, flax,

**TRADE AND MANUFACTURES.]** principally with Boston. The exports are pot and pearl ashes, a most important manufacture, by a competent family back of Connecticut, but ordinary advantage to imported brown sugar, being no more than for the year 1791.

**POPULATION AND EMIGRANTS.]** When taken, this state of emigrants from Connecticut. Two townships in Orange, the body of the people are presbyterians, baptists,

**CHIEF TOWNS.]** towns are not to be excepted corner of the state, inhabitants, a number of houses, and gaol.

Windfor and Rutland to be the seat of government, Connecticut river, and upon Otter creek, and flourishing towns.

**HISTORY.]** The town, was claimed both interfering claims had. They were not finally commenced between this district, considering in the jurisdiction either and formed a constitution have continued to exist have prospered. On the 6th of December 1791, States, and constitutes the largest of the American Union.

**CONSTITUTION.]** tives, and a council of officers, and the lieutenant-governor meet annually in the town, and other magistrates twenty-one years old, asking the oath of fidelity county courts, sheriffs, by joint ballot of the bills, other than money as they disapprove; but

land is thickly timbered with birch, sugar-maple, ash, butter-nut, and white oak of an excellent quality. The soil is well fitted for wheat, rye, barley, oats, flax, hemp, &c.

**TRADE AND MANUFACTURES.]** The inhabitants of this state trade principally with Boston, New York, and Hartford. The articles of export are pot and pearl ashes; beef, which is the principal article; horses, grain, some butter and cheese, lumber, &c. Vast quantities of pot and pearl ashes are made in every part of this state: but one of its most important manufactures is that of maple-sugar. It has been estimated, by a competent judge, that the average quantity made for every family back of Connecticut river, is 200lb. a year. One man, with but ordinary advantages, in one month, made 550lb. of a quality equal to imported brown sugar. In two towns in Orange county, containing no more than forty families, 13,000lb. of sugar were made in the year 1791.

**POPULATION AND RELIGION.]** In 1790, according to the census then taken, this state contained 85,530 inhabitants, consisting chiefly of emigrants from Connecticut and Massachusetts, and their descendants. Two townships in Orange county are settled principally by Scotch. The body of the people are congregationalists; the other denominations are presbyterians, baptists, and episcopalian's. This state is rapidly peopling.

**CHIEF TOWNS.]** In a new and interior country, large populous towns are not to be expected. Bennington, situated near the south-west corner of the state, is one of the largest. It contains about 2400 inhabitants, a number of handsome houses, a congregational church, a court-house, and gaol.

Windsor and Rutland, by a late act of the legislature, are alternately to be the seat of government for eight years. The former is situated on Connecticut river, and contains about 1600 inhabitants; the latter lies upon Otter creek, and contains upwards of 1400 inhabitants. Both are flourishing towns.

**HISTORY.]** The tract of country called Vermont, before the late war, was claimed both by New York and New Hampshire; and these interfering claims have been the occasion of much warm altercation. They were not finally adjusted till since the peace. When hostilities commenced between Great Britain and the colonies, the inhabitants of this district, considering themselves as in a state of nature, and not within the jurisdiction either of New York or New Hampshire, associated, and formed a constitution for themselves. Under this constitution they have continued to exercise all the powers of an independent state, and have prospered. On the 4th of March, 1791, agreeably to act of congress of December 6th, 1790, this state became one of the United States, and constitutes the fourteenth, and not the least respectable pillar of the American Union.

**CONSTITUTION.]** The legislature consists of a house of representatives, and a council of twelve, besides the governor, who is president, and the lieutenant-governor, who is officially a member. The freemen meet annually in their several towns to choose the governor, counselors, and other magistrates; and to the privilege of voting, all males, twenty-one years old, and of peaceable dispositions, are entitled, after taking the oath of fidelity to the state. The judges of the supreme and county courts, sheriffs, and justices of the peace, are appointed annually, by joint ballot of the council and house. The council may originate bills, other than money-bills, and suspend till the next session such bills as they disapprove; but have not a final negative.

NEW HAMPSHIRE.

SITUATION AND EXTENT.

Miles.		Degrees.	Sq. Miles.
Length 168	} between	{ 42-41 and 45-11 North latitude 70-40 and 72-28 West longitude	} 9,500
Breadth from 90 to 19			

**BOUNDARIES.]** NEW Hampshire is bounded by Lower Canada on the North; by the district of Maine on the East; by Massachusetts on the South; and by Connecticut river, which separates it from Vermont, on the West.

It is divided into five counties as follows:

Counties.	Chief Towns.
Rockingham .....	Portsmouth and Concord
Strafford .....	Dover and Durham
Cheshire .....	Charles-town and Keene
Hillsborough .....	Amherst
Grafton .....	Plymouth.

**RIVERS AND LAKES.]** The most considerable rivers of this state are the Connecticut, Merrimack, Piscataqua, Saco, Androscoggin, Upper and Lower Ammonoosuck, besides many other smaller streams. The chief lakes are Winnipicogee, Umbagog, Sunopee, Squam, and Great Ossipee.

**MOUNTAINS.]** New Hampshire is intersected with several ridges of mountains, among which are the Blue Hills, and the lofty ridge which divides the Connecticut and Merrimack rivers, denominated the *Height of Land*. But the White Mountains, which run through this state, are undoubtedly the highest in all New England. Their height above an adjacent meadow is 3500 feet, and the meadow is 2500 above the level of the sea. They are almost continually covered with snow and ice, whence they have received the name of White Mountains. Though they are seventy miles inland, they are visible many leagues off at sea. One of their loftiest summits, which makes a majestic appearance along the shore of Massachusetts, has lately been distinguished by the name of Mount Washington.

**AIR, SOIL, AND PRODUCE.]** The air of New Hampshire is healthful, and the weather is commonly serene, and not so subject to variation as in the more southern states. From the vicinity of the White Mountains, which, as has been said, are almost always covered with snow and ice, this country is extremely cold in winter. In summer the heat is great, but of short duration. The shore is mostly a sandy beach, adjoining to which are salt-marshes, intersected by creeks, which produce good pasture for cattle and sheep. The interval lands on the margin of great rivers are the most valuable, because they are overflowed and enriched by the water from the uplands, which brings a fat slime or sediment. On Connecticut river these lands are from a quarter of a mile to a mile and a half on each side, and produce grass, corn, and grain, especially wheat, in greater abundance and perfection than the same kind of soil does in the higher lands. The wide-spreading hills are esteemed as warm and rich; rocky moist land is accounted good for pasture; drained swamps have a deep mellow soil, and the valleys between the hills are generally very productive. Agriculture is the chief occupation of the inhabitants. Wheat, rye, Indian corn, barley, pulse,

butter, cheese, hops raised in immense quantities, produces great plenty. Apples and peaches are the most common fruit of first quality cannot be particular attention. Forests of pine, fir, &c. Several kinds of cedar, red and yellow ochre, a kind of talc, common stone, iron ore, and lead, have been seen; but iron is not in great advantage.

**POPULATION AND HISTORY.]** NEW Hampshire, according to the census of 1790, was 141,885. In 1763, of this state is considered a great commercial state, whale-oil, flax-seed, madder, &c. In 1790, 100,000 tons, and 50 under the ton, were exported in 1793 amounting to 1,793,000, assembled the stock-holders, and 100,000 dollars in interest.

**COLLEGES AND ACADEMIES.]** Dartmouth College, Hanover, called Dartmouth College, and is in a flourishing state, those of Exeter, New Hampshire.

**CHIEF TOWNS.]** Portsmouth, the largest city in New Hampshire, having a sufficient defence, so well defended against the sea, there in any season of war, pleasantly situated on the shore, commonly held their annual fairs, a thriving back country government.

**HISTORY AND GOVERNMENT.]** NEW Hampshire, about the year 1629, a colony was established, year 1679, but seems to have been united with Massachusetts; but a council against the joint government of the two colonies, and, on the 1st of March, 1740, was appointed in 1740, legislative power, as in the house of representative court, and the supreme council, the latter consisting of seven members.

butter, cheese, hops, esculent roots and plants, flax and hemp, are raised in immense quantities in New Hampshire; which likewise produces great plenty of beef, pork, mutton, and poultry. Apples and pears are the most common fruits in this state; but tree-fruit of the first quality cannot be raised in such a northern climate as this without particular attention. The uncultivated lands are covered with extensive forests of pine, fir, cedar, oak, walnut, &c.

Several kinds of earths and clays are found in this state. It produces red and yellow ochres, steatites or soap-rock, the best lapis specularis, a kind of talc, commonly called isinglass; crystals, alum, vitriol, free-stone, iron ore, and black lead. Some lead and copper ore have been seen; but iron is the only metal which has been wrought to any advantage.

**POPULATION AND COMMERCE.]** The number of inhabitants in New Hampshire, according to the census taken by order of congress in 1790, was 141,885. In 1767, the number was estimated at 52,700. The trade of this state is considerable; though it is not to be ranked among the great commercial states. Its exports consist of lumber, ship-timber, whale-oil, flax-seed, live-stock, beef, pork, Indian corn, pot and pearl-shes, &c. In 1790, there belonged to Piscataqua 33 vessels above 100 tons, and 50 under that burden. The value of the exports from that port in 1793 amounted to 198,197 dollars. The bank of Hampshire was established in 1792, with a capital of 60,000 dollars: by an act of assembly the stock-holders can increase it to 200,000 dollars in specie, and 100,000 dollars in any other estate.

**COLLEGES AND ACADEMIES.]** The only college in this state is at Hanover, called Dartmouth college, which is amply endowed with lands, and is in a flourishing situation. The principal academies are those of Exeter, New Ipswich, Atkinson, and Amherst.

**CHIEF TOWNS.]** Portsmouth is the metropolis, and the largest town in New Hampshire. Its harbour is one of the finest on the continent, having a sufficient depth of water for vessels of any burden, and being so well defended against storms by the land that ships may securely ride there in any season of the year. Concord is a very flourishing town, pleasantly situated on the Merrimack river. The legislature of late have commonly held their sessions here; and, from its central situation and a thriving back country, it will probably become the permanent seat of government.

**HISTORY AND GOVERNMENT.]** This state first began to be settled about the year 1629, and was erected into a separate government in the year 1679, but seems afterwards to have been under the same governor with Massachusetts; because New Hampshire complained to the king in council against the joint-governor, relative to the boundaries between the two colonies, and, on hearing the complaint, a separate government was appointed in 1740. According to its present constitution, the legislative power, as in the other United States, resides in a senate and house of representatives, which together are here styled the general court, and the supreme executive authority is vested in a governor and council, the latter consisting of five members.

MASSACHUSETTS, INCLUDING THE DISTRICT OF MAINE.

SITUATION AND EXTENT.

	Miles.	Degrees.	Sq. Miles.
Length	150	between { 64-57 and 73-38 west longitude 41-13 and 48-15 north latitude	} 48,000
Breadth	60		

BOUNDARIES.] MASSACHUSETTS, which, with the district of Maine, constitutes one of the United States of America, is bounded on the North by Vermont and New Hampshire; on the East, by the Atlantic Ocean; on the South, by the Atlantic, Rhode Island, and Connecticut; and on the West, by New York.

This state is divided into seventeen counties.

Counties.

Suffolk	BOSTON	} Chief Towns. 42-23 N. lat. 70-59 W. long.
Norfolk	Dedham	
Essex	Salem	
Middlesex	Charles-town	
Hampshire	Northampton	
Worcester	Worcester	
Plymouth	Plymouth	
Barnstable	Barnstable	
Duke's county	Edgarton	
Nantucket	Nantucket	
Bristol	Taunton	
Berkshire	Stockbridge.	

District of MAINE:

York	York
Cumberland	Portland
Lincoln	Pownalborough
Hancock	Hancock
Washington	Machias.

RIVERS, BAYS, CAPES, AND ISLANDS.] The country is well watered by a number of small rivers, of which the principal are Mystic and Charles rivers. The chief bays are Massachusetts, Ipswich, Boston, Plymouth, and Barnstable; the most remarkable capes, Ann, Cod, Malabar, Poge, and Gay Head; the principal islands Plumb island, Nantucket, Martha's Vineyard, Elizabeth islands, and numerous small isles in Boston Bay.

CLIMATE, SOIL, AND PRODUCE.] The climate is similar to that of the other northern states. In the district of Maine the heat in summer is intense, and the cold in winter extremely severe. In Massachusetts are to be found all the varieties of soil from very good to very bad; and capable of yielding in abundance all the different productions common to the climate: such as Indian corn, rye, wheat, barley, oats, hemp, flax, hops, potatoes, field-beans and peas, apples, pears, peaches, plums, cherries, &c.

Iron ore, in immense quantities, is found in various parts of this state; as likewise copper ore, black lead, pipe-maker's clay, yellow and red

ochre, alum and slate. Several mineral springs have been found in different parts of the country.

POPULATION, COMMERCE, AND MANUFACTURES.] The number of inhabitants in Massachusetts was in 1790, 378,787. This is the only state in the union in which there are no slaves: slavery was abolished by the legislature some years ago. This state, including the district of Maine, owns more than three times as many tons of shipping as any other of the states; and more than one-third part of the whole that belongs to the United States. Upwards of 29,000 tons are employed in carrying on the fisheries, 46,000 in the coasting business, and 96,500 in trading with almost all parts of the world. Pot and pearl-ashes, flaves, flax-seed, and bees-wax, are carried chiefly to Great Britain, in remittance for their manufactures; masts and provisions to the East Indies; fish, oil, beef, pork, lumber, and candles, are carried to the West Indies for their produce; and the two first articles, fish and oil, to France, Spain, and Portugal; roots, vegetables, and fruits to Nova Scotia and New Brunswick; hats, saddlery, cabinet-work, men's and women's shoes, nails, tow-cloth, barley, hops, butter, and cheese, to the southern states. The value of exports in the year 1791 was 2,445,975 dollars, and in 1794, 5,380,703 dollars. Great quantities of nails are made in this state. The machine invented by Caleb Leach, of Plymouth, will cut and head 5000 nails in a day, under the direction of a youth of either sex. There is also a machine for cutting nails at Newbury port, invented by Mr. Jacob Perkins, which will turn out *two hundred thousand* nails in a day. The nails are said to have a decided superiority over those of English manufacture, and are sold 20 per cent. cheaper. There are in this state upwards of twenty paper-mills, which make more than 70,000 reams of writing, printing, and wrapping-paper, annually. There were, in 1792, 62 distilleries, which distilled in one year from foreign materials 1,900,000 gallons. There are several saws, oil, chocolate, and powder-mills; there are indeed few articles which are essentially necessary, and minister to the comfort and convenience of life, that are not manufactured in this state.

RELIGION AND LEARNING.] There is no established religion in Massachusetts, but every sect of Christians is allowed the free exercise of its religion, and is equally under the protection of the laws.

In May 1780, the council and house of representatives of Massachusetts passed an act for incorporating and establishing a society for the cultivation and promotion of the arts and sciences. It is entitled the American Academy of Arts and Sciences. The first members were named in the act, and never were to be more than two hundred, nor less than forty. There is likewise a university at Cambridge, four miles west of Boston, the college buildings of which are four in number, and named Harvard, Hollis, and Massachusetts Halls, and Holden Chapel. This university generally has from 140 to 200 students; and as to its library, philosophical apparatus, and professorships, is at present the first literary institution on this continent. It takes its date from the year 1638, seven years after the first settlement in the township, then called Newtown.

CHIEF TOWNS.] Boston is the capital of this state, the largest town in New England, and the third in size and rank in the United States. It is built on a peninsula of irregular form, at the bottom of Massachusetts Bay, and is joined to the main-land by an isthmus at the south end of the town. It is two miles long, but of unequal breadth; the broadest part is 726 yards. In 1790, it contained 2376 dwelling-houses, and

18,038 inhabitants; but the increase has been very considerable since. It contains nineteen edifices for public worship, of which nine are for congregationalists, three for episcopalians, and two for baptists: the friends, Roman-catholics, methodists, sandemonians, and universalians, have one each. There are also seven free-schools, besides a great number of private schools. The harbour is capacious enough for 500 vessels to ride at anchor in good depth of water, while the entrance is so narrow as scarcely to admit two ships abreast. The wharfs and quays in Boston are about eighty in number, and very convenient for vessels. Long Wharf, or Boston Pier, in particular, extends from the bottom of State-street 1743 feet into the harbour in a straight line. The breadth is 104 feet. At the end are 17 feet of water at ebb-tide. Long Wharf is covered on the north side with large and commodious warehouses, and in every respect exceeds any thing of the kind in the United States. Charles river and West Boston bridges are highly useful and ornamental to Boston, and both are on Charles river, which mingles its waters with those of Mystic river, in Boston harbour. Charles river bridge connects Boston with Charles-town, in Middlesex county, and is 1503 feet long, 42 feet broad, and stands on 75 piers. West Boston is 3483 feet long, stands on 180 piers, and exceeds the other as much in elegance as in length. The view of the town, as it is approached from the sea, is truly beautiful and picturesque. It lies in a circular and pleasingly irregular form round the harbour, and is ornamented with spires, above which the monument of Beacon Hill rises pre-eminent: on its top is a gilt eagle, bearing the arms of the Union, and on the base of the column are inscriptions commemorating some of the most remarkable events of the late war. The town is governed by nine select men, chosen at an annual meeting in March, when twelve overseers, twelve constables, and some other officers, are chosen. Attempts have been made to change the government of the town from its present form to that of a city; but this measure, not according with the democratic spirit of the people, has as yet failed.

Salem is the second town in this state. It contained, in 1790, 928 houses, and 7921 inhabitants. It is a very commercial place, and is connected with Beverly by Essex bridge, upwards of 1500 feet in length; erected in 1789. The harbour is defended by a fort.

Plymouth was the first town built in New England, and peopled principally by the descendants of the first settlers. The rock on which their forefathers landed was conveyed in 1774 from the shore to a square in the centre of the town, where it remains as a monument. The situation of the town is pleasant and healthful.

Portland is the capital of the district of Maine. It has a most excellent, safe, and capacious harbour, and is one of the most thriving commercial towns in the commonwealth of Massachusetts. In 1795 a fort, a citadel, and a battery of ten pieces of cannon, were erected for its defence.

**HISTORY AND GOVERNMENT.]** An account of the first settlement and early history of Massachusetts has already been given under the general head of New England. In consequence of the revolt of the American colonies from the authority of Great Britain, (of the origin and progress of which an account has been given in another place,) on the 25th of July, 1776, by an order from the council at Boston, the declaration of the American Congress, absolving the United Colonies from their allegiance to the British crown, and declaring them free and independent, was publicly proclaimed from the balcony of the state-house in that town.

A constitution, Massachusetts, incorporated, established by the charter of 1780. In the institution, maintained the existence of individuals who could not enjoy tranquillity, their rights whenever they were sought to alter the government, for the prosperity and happiness of the Legislature of the state, of his providence, to prevent fraud, violence, or any other solemn compact with the civil government for that it was the right, and at stated intervals, the subject should be held in estate, for worship to the dictates of his sentiments: provide for others in their religion.

It was also enacted that no other bodies politic, or exclusive right of any kind, should be granted without their consent, by the subject to the teachers, should, if the report of the public teachers, nomination, provided, tended; otherwise it should be the duty of teachers of the parishes, or raised. That every peaceably, and as equally under the protection of any sect or denomination, by law.

It was likewise declared that the people, and was derived from government vested in the judicial, are the most countable to them. The right of his property or privilege of the land. The subject should not be subjected to any tax, or accepting for the government, or jury. That the liberty of a state; and that commonwealth, arms, for the common good, dangerous to liberty, or the consent of the legislature, should be held in exact subordination.

The legislature of

A constitution, or form of government, for the commonwealth of Massachusetts, including a declaration of rights, was agreed to, and established by the inhabitants of that province, and took place in October 1780. In the preamble to this it was declared, that the end of the institution, maintenance, and administration of government, is to secure the existence of the body politic; to protect it, and to furnish the individuals who compose it, with the power of enjoying, in safety and tranquillity, their natural rights, and the blessings of life; and that, whenever these great objects are not obtained, the people have a right to alter the government, and to take measures necessary for their prosperity and happiness. They expressed their gratitude to the Great Legislator of the universe, for having afforded them, in the course of his providence, an opportunity, deliberately and peaceably, without fraud, violence, or surprise, of entering into an original, explicit, and solemn compact with each other; and of forming a new constitution of civil government for themselves and their posterity. They declared that it was the right, as well as the duty, of all men in society, publicly, and at stated seasons, to worship the Supreme Being; and that no subject should be hurt, molested, or restrained in his person, liberty, or estate, for worshipping God in the manner and season most agreeable to the dictates of his own conscience; or for his religious profession or sentiments: provided he did not disturb the public peace, or obstruct others in their religious worship.

It was also enacted, that the several towns, parishes, precincts, and other bodies politic, or religious societies, should, at all times, have the exclusive right of electing their public teachers, and of contracting with them for their support and maintenance. That all moneys paid by the subject to the support of public worship, and of the public teachers, should, if he required it, be uniformly applied to the support of the public teacher or teachers of his own religious sect or denomination, provided there were any on whose instructions he attended; otherwise it might be paid towards the support of the teacher or teachers of the parish or precinct in which the said moneys should be raised. That every denomination of Christians, demeaning themselves peaceably, and as good subjects of the commonwealth, should be equally under the protection of the law; and that no subordination of any sect or denomination to another should ever be established by law.

It was likewise declared, that as all power resided originally in the people, and was derived from them, the several magistrates and officers of government vested with authority, whether legislative, executive, or judicial, are their substitutes and agents, and are at all times accountable to them. That no subject should be arrested, or deprived of his property or privileges, but by the judgment of his peers, or the law of the land. That the legislature should not make any law that should subject any person to a capital or infamous punishment, excepting for the government of the army or navy, without trial by jury. That the liberty of the press is essential to the security of freedom in a state; and that it ought not, therefore, to be restrained in that commonwealth. That the people have a right to keep and bear arms, for the common defence; but that, as in times of peace armies are dangerous to liberty, they ought not to be maintained without the consent of the legislature; and that the military power should always be held in exact subordination to the civil authority.

The legislature of Massachusetts consists of a senate, and a house of

representatives; which, together with the governor and lieutenant-governor, are elected annually by the people: electors must be twenty-one years of age, have freeholds of the annual value of three pounds, or personal estate to the value of sixty pounds. To be eligible to the office of governor or lieutenant-governor, the candidate must have resided in the state seven years, and during that time have been seized of a freehold of one thousand pounds. Senators must have resided five years in the state, and have possessed a freehold to the value of three hundred pounds, or personal property to the value of six hundred pounds. A representative must have resided one year in the town which he is chosen to represent, and have been seized therein of freehold estate to the value of one hundred pounds, or been possessed of personal property to the value of two hundred pounds. From the persons returned as senators and counsellors, being forty in all, nine are annually elected, by joint ballot of both houses, for the purpose of advising the governor in the execution of his office. All judicial officers, the attorney and solicitor-general, sheriffs, &c. are, with the advice of the council, appointed by the governor. The judges (except justices of the peace, whose commissions expire in seven years, but may be renewed) hold their offices during good behaviour.

## RHODE ISLAND.

### SITUATION AND EXTENT.

	Miles.	Degrees.	Sq. Miles.
Length	47	between { 41-26 and 42-10 north lat. } { 71-17 and 71-40 west lon. }	} 1,300
Breadth	37		

**BOUNDARIES AND DIVISIONS.]** RHODE ISLAND and Providence Plantations, which together form the smallest of the United States, are bounded on the North and East by Massachusetts; on the South, by the Atlantic Ocean; and on the West, by Connecticut. This state is divided into the five following counties:

<i>Counties.</i>	<i>Chief Towns.</i>
Newport . . . . .	Newport
Providence . . . . .	Providence
Washington . . . . .	South Kingston
Bristol . . . . .	Bristol
Kent . . . . .	

**ISLANDS, HARBOURS, AND RIVERS.]** Narraganset bay contains several fertile islands; the principal of which are, Rhode Island, Canonicut, Prudence, Patience, Hope, Dyer's and Hog Islands. Block Island is the southernmost land belonging to the state. Rhode Island, from which the state takes its name, is about fifteen miles in length, and about three and a half broad, on an average. The harbours are, Newport, Providence, Wickford, Patuxet, Warren, and Bristol. This state is intersected in all directions by rivers; the chief of which are Providence and Taunton rivers, which fall into Narraganset bay.

**CLIMATE, SOIL, AND PRODUCE.]** Rhode Island is as healthy a country as any in America. The winters, in the maritime parts of the state are milder than in the inland country: the air being softened by a sea

vapour, which especially in Rhode parts of America. This state sufficient for fruits, and cultivation: cider state are but the other parts. state; there is a with load-stone

**CHIEF TOWNS.** Providence, Newport, Narraganset bridge 160 feet containing few Newport is harbour (whi fore the town anchor in it, 1,000 houses.

vapour, which also enriches the soil. The summers are delightful, especially in Rhode Island; where the extreme heats, which prevail in other parts of America, are allayed by cool and refreshing breezes from the sea. This state produces rye, barley, oats, and, in some parts, wheat, sufficient for home consumption; and the various kinds of grasses, fruits, and culinary roots and plants, in great abundance, and in perfection: cider is made for exportation. The north-western parts of the state are but thinly inhabited, and are more rocky and barren than the other parts. Iron ore is found in great plenty in several parts of this state; there is also a copper mine, mixed with iron strongly impregnated with load-stone. Abundance of lime-stone is also found here.

POPULATION, TRADE, AND MANUFACTURES.] The state of Rhode Island, in 1790, contained 69,825 persons, of whom 948 were slaves. The town of Bristol carries on a considerable trade to Africa, the West Indies, and to different parts of the United States; but by far the greatest part of the commerce of Rhode Island is at present carried on by the inhabitants of the flourishing town of Providence, which had, in 1791, 129 sail of vessels, containing 11,942 tons. The exports from this state are, flax-seed, lumber, horses, cattle, beef, pork, fish, poultry, onions, butter, cheese, barley, grain, spirits, cotton and linen goods. The imports consist of European and West Indian goods, and log-wood from the Bay of Honduras. Upwards of 600 vessels enter and clear annually at the different ports in the state. The amount of exports from this state to foreign countries for one year, ending Sept. 30, 1791, was 470,131 dollars; and, in 1794, 954,573 dollars. The inhabitants of this state are rapidly improving in manufactures. A cotton manufactory has been erected at Providence. Jeans, fustians, denims, thicksets, velvets, &c. are here manufactured, and sent to the southern states. Large quantities of linen and tow-cloth are made in different parts of this state for exportation; but the most considerable manufactures here are those of iron; such as bar and sheet iron, steel, nail-rods, and nails, implements of husbandry, stoves, pots, and other household utensils; the iron-work of shipping, anchors, and bells.

RELIGION AND LEARNING.] Liberty of conscience has been inviolably maintained in this state, ever since its first settlement. So little has the civil authority to do with religion here, that no contract between a minister and a society (unless incorporated for that purpose) is of any force. It is probably for these reasons that so many different sects have ever been found here; and that the sabbath, and all religious institutions, have been more neglected in this than in any other of the New England states.

A college, called Rhode Island college, is established at Providence. It is a spacious edifice, and contains upwards of sixty students. It has a library, containing nearly 3000 volumes, and a valuable philosophical apparatus.

CHIEF TOWNS.] The principal towns in the state of Rhode Island are, Providence and Newport. The former is situated at the head of Narraganset bay, on both sides of Providence river, over which is a bridge 160 feet long and 22 wide. It is a large and handsome town, containing several elegant buildings, and about 6,400 inhabitants.

Newport is situated at the south-west end of Rhode Island. The harbour (which is one of the finest in the world) spreads westward before the town. The entrance is easy and safe, and a large fleet may anchor in it, and ride in perfect security. Newport contains about 1,000 houses.

**HISTORY AND GOVERNMENT.]** This state was first settled from Massachusetts. Mr. Roger Williams, a minister, who came over to New England in 1631, was charged with holding a variety of errors, and was on that account forced to leave his house, land, wife, and children, at Salem, in the dead of winter, and to seek a residence without the limits of Massachusetts. Governor Winthrop advised him to pursue his course to Nehiganset or Narraganset bay; which he did, and fixed himself at Secunk, or Seekhonk, now Rehoboth. But that place being within the bounds of the Plymouth colony, governor Winflow, in a friendly manner, advised him to remove to the other side of the river; where the lands were not covered by any patent. Accordingly, in 1636, Mr. Williams, and four others, crossed Seekhonk river, and landed among the Indians, by whom they were hospitably received; and thus laid the foundation of a town, which, from a sense of God's merciful providence to him, he called *Providence*. Here he was soon after joined by a number of others; and though they were secured from the Indians by the terror of the English, yet they, for a considerable time, suffered much from fatigue and want: but they enjoyed liberty of conscience, which is still maintained in this state.

The constitution of Rhode Island is founded on the charter granted by Charles II. in 1663; and the frame of government was not essentially altered by the revolution. The legislature of the state consists of two branches; a senate, or upper house, composed of ten members, besides the governor and deputy-governor, called in the charter *assistants*; and a house of representatives, composed of deputies from the several towns. The members of the legislature are chosen twice a year; and there are two sessions of this body annually, viz. on the first Wednesday in May, and the last Wednesday in October.

**CONNECTICUT.**

**SITUATION AND EXTENT.**

the sea-coast is indented with harbours, many of which are safe and commodious; but those of New London and New Haven are the most important.

**AIR, SOIL, AND PRODUCE.]** Connecticut, though subject to the extremes of heat and cold in their seasons, and to frequent sudden changes, is very healthful. It is generally broken land, made up of mountains, hills, and valleys; and is exceedingly well watered. Some parts of it are thin and barren. Its principal productions are Indian corn, rye, wheat in many parts of the state, oats and barley, which are heavy and good, and, of late, buck-wheat; flax in large quantities; some hemp; potatoes of several kinds, which are common to the climate. The soil is very well calculated for pasturage and mowing, which enables the farmers to feed great numbers of neat cattle and horses.

**POPULATION AND COMMERCE.]** In 1790 the population of this state amounted to 237,946 persons, of whom 2,764 were slaves. The inhabitants are almost entirely of English descent. There are no Dutch, French, or Germans, and very few Scotch or Irish people, in any part of the state.

The exports from this state consist of horses, mules, oxen, oak-staves, hoops, pine-boards, oak plank, beans, Indian corn, fish, beef, and pork. The amount of foreign exports, in the year 1794, amounted to 806,746 dollars.

**RELIGION AND LEARNING.]** All religions that are consistent with the peace of society are tolerated in Connecticut; and a spirit of liberality and catholicism is increasing. There are very few religious sects in this state. The bulk of the people are congregationalists; and there are besides episcopalians and baptists.

Yale college, at New Haven, is an eminent seminary of learning. It was founded in the year 1700. It has a public library of about 3,000 volumes, and a very complete philosophical apparatus. Academies have likewise been established at Greenfield, Plainfield, Norwich, Windham, and Pomfret, some of which are flourishing. In no part of the world is the education of all ranks of people more attended to than in Connecticut; almost every town in the state is divided into districts, and each district has a public school kept in it a greater or less part of every year. A thirst for learning prevails among all ranks of people in the state. More of the young men in Connecticut, in proportion to their numbers, receive a public education than in any of the states.

**CHIEF TOWNS.]** There are a great number of very pleasant towns, both maritime and inland, in Connecticut. It contains five cities, incorporated with extensive jurisdiction in civil causes. Two of these, Hartford and New Haven, are capitals of the state. The general assembly is holden at the former in May, and at the latter in October, annually. Hartford is regularly laid out; the streets intersecting each other at right angles. The other cities are New London, Norwich, and Middletown.

**HISTORY AND GOVERNMENT.]** The first grant of Connecticut was made by the Plymouth council to the earl of Warwick, in 1630. The year following the earl assigned this grant to lord Say and Seal, lord Brook, and nine others. Some Indian traders settled at Windsor in 1633. The same year, a little before the arrival of the English, a few Dutch traders settled at Hartford; and the remains of the settlement are still visible on the bank of Connecticut river. In 1634, lord Say and Seal, &c. sent over a small number of men, who built a fort at Saybrook, and made a treaty with the Pequot Indians for the lands on Con-

the Con-  
whole of

necticut river. Mr. Haynes and Mr. Hooker left Massachusetts bay in 1634, and settled at Hartford. The following year, Mr. Eaton and Mr. Davenport seated themselves at New Haven. In 1644 the Connecticut adventurers purchased of Mr. Fenwick, agent for Lord Say and Seal and lord Brook, their right to the colony for 1600'. Connecticut and New Haven continued two distinct governments for many years. At length, John Winthrop, esq. who had been chosen governor of Connecticut, was employed to solicit a royal charter. In 1662, Charles II. granted a charter, constituting the two colonies for ever one body corporate and politic, by the name of the governor and company of Connecticut. New Haven took the affair ill; but in 1665 all difficulties were amicably adjusted, and this charter still continues to be the basis of their government.

The supreme legislative authority of the state is vested in a governor, deputy-governor, twelve assistants or counsellors, and the representatives of the people, styled the general assembly. The governor, deputy governor, and assistants, are annually chosen by the freemen in the month of May. The representatives (their number not to exceed two from each town) are chosen by the freemen twice a year, to attend the two annual sessions, on the second Tuesdays of May and October. The general assembly is divided into two branches, called the upper and lower houses. The upper house is composed of the governor, deputy-governor, and assistants: the lower house, of the representatives of the people. No law can pass without the concurrence of both houses.

**NEW YORK:**

Onondago .....	None.

**RIVERS.]** The principal of these are Hudson's and the Mohawk : the former abounds with excellent harbours, and is well stored with great variety of fish ; on this the cities of New York and Albany are situated.

The tide flows a few miles above Albany, which is six hundred miles from New York. It is navigable, for sloops of eighty tons, to Albany, and for ships to Hudson. About sixty miles above New York the water becomes fresh. The river is stored with a variety of fish, which renders a summer passage to Albany delightful and amusing to those who are fond of angling. On the Mohawk is a large cataract, called the Cohoes, the water of which is said to fall thirty feet perpendicular ; but, including the descent above, the fall is as much as sixty or seventy feet, where the river is a quarter of a mile in breadth.

**CAVES.]** These are Cape May, on the east entrance of Delaware river ; Sandy Hook, near the entrance of Raritan river ; and Montock Point, at the east end of Long Island.

**CLIMATE, SOIL, AND PRODUCE.]** This province, lying to the south of New England, enjoys a more happy temperature of climate. The air is very healthy, and agrees well with all constitutions. The face of the country, resembling that of the other British American colonies, is low, flat, and marshy towards the sea. As you recede from the coast, the eye is entertained with the gradual swelling of hills, which become large in proportion as you advance into the country. The soil is extremely fertile, producing wheat, rye, Indian corn, oats, barley, flax, and fruits, in great abundance and perfection. The timber is much the same with that of New England. A great deal of iron is found here.

**CITIES, POPULATION, AND COMMERCE.]** The city of New York stands on the south-west end of York Island, which is twelve miles long, and near three in breadth, extremely well situated for trade, at the mouth of Hudson's river, where it is three miles broad, and proves a noble conveyance from Albany and many other inland towns towards Canada and the lakes. This city is in length above two miles, and its mean breadth about a mile. This city and harbour are defended by a fort and battery : in the fort is a spacious mansion-house, for the use of the governor. Many of the houses are very elegant ; and the city, though irregularly built, affords a fine prospect. A fourth part of the city was burnt down by some incendiaries in 1776, on the king's troops taking it. A great part of the inhabitants, reckoned in 1790 at 33,131, are descended from the Dutch families who remained here after the sur-

render of the New Netherlands to the English, and the whole province, in 1790, was numbered at 340,220, of whom 11,324 were slaves\*.

The city of Albany contains about 6000 inhabitants, collected from almost all parts of the northern world. As great a variety of languages are spoken in Albany as in any town in the United States. Adventurers in pursuit of wealth are led here by the advantages for trade which this place affords. Situated on one of the finest rivers in the world, at the head of sloop-navigation, surrounded with a rich and extensive back country, and the store-house of the trade to and from Canada and the lakes, it must flourish, and the inhabitants cannot but grow rich.

The city of Hudson, however, is their great rival, and has had the most rapid growth of any place in America, if we except Baltimore in Maryland. It is 130 miles north of New York. It was not begun till the autumn of 1783 †.

The situation of New York, with respect to foreign markets, has decidedly the preference to any of the states. It has at all seasons of the year a short and easy access to the ocean. It commands the trade of a great proportion of the best settled and best cultivated parts of the United States. It has been supposed by well-informed gentlemen, that more wealth is conveyed down Connecticut river, and through the Sound to New York, than down the Hudson. This is not improbable, as the banks of the Connecticut are more fertile and much thicker, and more extensively settled than the banks of Hudson †. The commodities in which they trade, are wheat, flour, barley, oats, beef, and other kinds of animal food. Their markets are the same with those which the New Englanders use; and they have a share in the logwood trade, and that which is carried on with the Spanish and French plantations. They used to take almost the same sort of commodities from England with the inhabitants of Boston. At an average of three years, their exports were said to amount to 526,000*l.* and their imports from Great Britain to 531,000*l.* The exports from this state in 1791 amounted to 2,505,465 dollars, and in 1795 to 10,304,580 dollars; or above two millions sterling.

AGRICULTURE AND MANUFACTURES.] New York is at least half a century behind her neighbours in New England, New Jersey, and Pennsylvania, in point of improvement in agriculture and manufactures. Among other reasons for this deficiency, that of want of enterprise in the inhabitants is not the least. Indeed, their local advantages are such, that they have grown rich without enterprise. Besides, lands have hitherto been cheap, and farms of course large; and it requires much less ingenuity to raise one thousand bushels of wheat upon sixty acres of land, than to raise the same quantity upon thirty acres. So long, therefore, as the farmer in New York can have sixty acres of land to raise one thousand bushels of wheat, he will never trouble himself to find out how he can raise the same quantity upon half the land. It is population alone that stamps a value upon lands, and lays a foundation for high improvements in agriculture. When a man is obliged to maintain a family upon a small farm, his invention is exercised to find out every improvement that may render it more productive. This appears to be the great reason why the lands on Delaware and Connecticut rivers produce to the farmer twice as much clear profit as lands in equal quantity, and of the same quality upon the Hudson. If the preceding observations be

just, improvements will keep pace with population and increasing value of lands.

Improvements in manufactures never precede, but invariably follow, improvements in agriculture. This observation applies more particularly to the country. The city of New York contains a great number of people who are employed in the various branches of manufactures, viz. wheel carriages of all kinds, loaf sugar, bread, beer, shoes and boots, saddlery, cabinet-work, cutlery, hats, clocks, watches, mathematical and musical instruments, ships, and every thing necessary for their equipment. A glass work and several iron works have been established\*.

[RELIGION AND LEARNING.] It is ordained by the constitution of New York, that the free exercise and enjoyment of religious profession and worship, without discrimination or preference, shall for ever be allowed within that state to all mankind.

A college was erected at New York, by act of parliament, about the year 1755; but, as the assembly was at that time divided into parties, it was formed on a contracted plan, and has for that reason never met with the encouragement which might naturally be expected for a public seminary in so populous a city. It is now called Columbia College. It has about one hundred and forty students in the four classes, besides medical students.

A college called Union College was established at Schenectady in 1794: which has now about forty students in the four classes. Besides these there are dispersed in different parts of the state fourteen incorporated academies, containing in the whole as many as six or seven hundred students. It is also provided that schools shall be established, one, at least, in every district of four square miles.

[HISTORY AND GOVERNMENT.] The Swedes and Dutch were the first Europeans who formed settlements on this part of the American coast. The tract claimed by the two nations extended from the 38th to the 41st degree of latitude, and was called the New Netherlands. It continued in their hands till the time of Charles II. who obtained it from them by right of conquest in 1664; and it was confirmed to the English by the treaty of Breda, 1667. The New Netherlands were not long in our possession before they were divided into different provinces. New York took that name from the king's brother, James duke of York, to whom the king granted it, with full powers of government, by letters patent dated March 20, 1664. On James's accession to the throne, the right to New York became vested in the crown, and it became a royal government. The king appointed the governor and council; and the people, once in seven years, elected their representatives to serve in general assemblies. These three branches of the legislature (answering to those of Great Britain) had power to make any laws not repugnant to those of England: but, in order to their being valid, the royal assent to them was first to be obtained.

By the constitution of the state of New York, established in 1777, the supreme legislative power is vested in two separate and distinct bodies of men; the one called "The Assembly of the State of New York," consisting of seventy members annually chosen by ballot; and the other, "The Senate of the State of New York," consisting of twenty-four, for four years, who together form the legislature, and meet once at least in every year for the dispatch of business. The supreme executive power is vested in a governor, who continues in office three years, assisted by four counsellors chosen by and from the senate. Every male in-

habitant of full age, who shall possess a freehold of the value of twenty pounds, or have rented a tenement of the yearly value of forty shillings, and been rated and have paid taxes to the state for six months preceding the day of election, is entitled to vote for members of the assembly; but those who vote for the governor, and the members of the senate, are to be possessed of freeholds of the value of one hundred pounds. The delegates to the congress, the judges, &c. are to be chosen by ballot of the senate and assembly.

**RIVERS.]** These are the Delaware, Raritan, and Passaic, on the latter of which is a remarkable cataract: the height of the rock from which the water falls is said to be about seventy feet perpendicular, and the river there eighty yards broad.

**CLIMATE, SOIL, AND PRODUCE.]** The climate is much the same with that of New York; the soil is various; at least one-fourth part of the province is barren sandy land, producing pines and cedars; the other parts in general are good, and produce wheat, barley, rye, Indian corn, &c. in great perfection. In this state are several iron mines, and in Bergen county is a very valuable copper mine.

of this province, all persons are allowed to worship God in the manner that is most agreeable to their own consciences; nor is any person obliged to pay tithes, taxes, or any other rates, for the purpose of building or repairing any church or churches, for the maintenance of any minister or ministry, contrary to what he believes to be right, or has deliberately or voluntarily engaged himself to perform. There is to be no establishment of any one religious sect in this province in preference to another: and no protestant inhabitants are to be denied the enjoyment of any civil right, merely on account of their religious principles.

A college, called Nassau Hall, was established at the town of Princeton, in this province, by governor Belcher, in 1746, which has a power of conferring the same degrees as Oxford or Cambridge. There are generally between eighty and a hundred students here, who come from all parts of the continent, some even from the extremities of it. There is another college at Brunswick, called Queen's College, founded a little before the war, and in considerable repute.

POPULATION, TRADE, MANUFACTURES.] In 1790, the number of inhabitants in New Jersey was 184,139, of whom 11,423 were slaves. The trade of this state is carried on almost solely with and from those two great commercial cities, New York on one side, and Philadelphia on the other, though it wants not good ports of its own: manufactures here have hitherto been inconsiderable, if we except the articles of iron, nails, and leather. The iron manufacture is, of all others, the greatest source of wealth to the state. In Morris county alone are no less than seven rich iron mines. In the whole state it is supposed there is yearly made about 1200 tons of bar iron, and as many of pig iron, exclusive of hollow ware and various other castings, of which vast quantities are made.

CHIEF TOWNS.] Trenton is the largest town in, and the metropolis of, this state; where the legislature stately meets, the supreme court sits, and most of the public offices are kept. It contains between two and three hundred houses, and about 2000 inhabitants.

Perth Amboy and Burlington were formerly the seats of government: the governor generally resided in the latter, which is pleasantly situated on the river Delaware, about twenty miles from Philadelphia. The former is as good a port as most on the continent, and the harbour is safe, and capacious enough to contain many large ships.

HISTORY AND GOVERNMENT.] New Jersey is part of that vast tract of land, which, we have observed, was given by king Charles II. to his brother James, duke of York; he sold it, for a valuable consideration, to lord Berkeley and Sir George Carteret (from which it received its present name, because Sir George had estates in the island of Jersey), and they again to others, who in the year 1702 made a surrender of the powers of government to queen Anne, which she accepted; after which it became a royal government.

By the new Charter of Rights, established by the provincial congress, July 2, 1776, the government of New Jersey is vested in a governor, legislative council, and general assembly. The members of the legislative council are to be freeholders, and worth at least one thousand pounds real and personal estate; and the members of the general assembly to be worth five hundred pounds. All the inhabitants worth fifty pounds are entitled to vote for representatives in council and assembly, and for all other public officers. The elections of the governor, legislative council, and general assembly, are to be annual; the governor and lieutenant-governor to be chosen out of, and by, the assembly and

council. The judges of the supreme court are chosen for seven years, and the officers of the executive power for five years.

RIVERS.] The rivers are, Delaware, which is navigable more than two hundred miles above Philadelphia. The Susquehanna and Schuylkill are also navigable a considerable way up the country. These rivers, with the numerous bays and creeks in Delaware bay, capable of containing the largest fleets, render this state admirably suited to carry on an inland and foreign trade.

from those of New York. If there be any difference, it is in favour of this province. The air is sweet and clear. The winters continue from December till March, and are so extremely cold and severe, that the river Delaware, though very broad, is often frozen over. The months of July, August, and September, are almost intolerably hot; but the country is refreshed by frequent cold breezes. It may be remarked, in general, that in all parts of the United States, from New York to the southern extremity, the woods are full of wild vines of three or four species, all different from those we have in Europe. But, whether from some fault in their nature, or in the climate, or the soil where they grow, or, what is much more probable, from a fault in the planters, they have yet produced no wine that deserves to be mentioned, though the Indians from them make a sort of wine with which they regale themselves. It may also be observed of the timber of these states, that towards the south it is not so good for shipping as that of the more northern countries. The farther southward you go, the timber becomes less compact, and rives easily; which property, as it renders it less serviceable for ships, makes it more useful for staves.

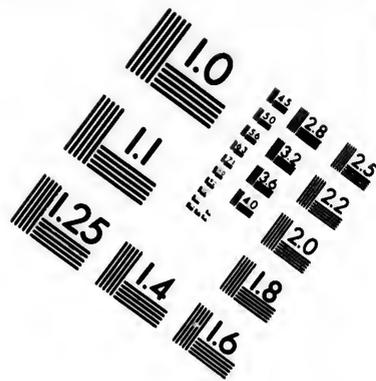

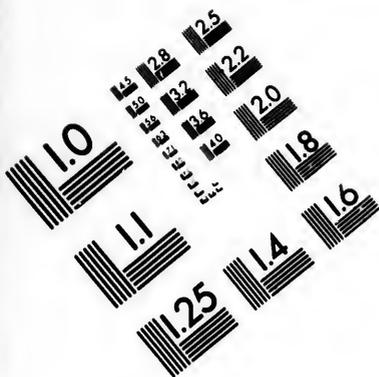

**ANIMALS.]** Deers are found in great numbers in Pennsylvania; there are also beavers, otters, racoons, and martins. Buffaloes rarely cross the Ohio, and elks seldom advance from the north. Panthers, wild cats, bears, foxes, and wolves, are not rare; the last do most mischief, especially in the winter; but the fur and skins of all are valuable. In the thick settlements, rabbits and squirrels are frequent; also musk-rats in marshes. Partridges are yet numerous, though the late hard winters have destroyed many. There are great numbers of wild turkeys in the new settlements; pheasants and grouse are become scarce. Pigeons, ducks, and wild geese, are generally found in plenty in their proper seasons. Here are a great number of singing birds, as many migrate to this state from the north and south in certain seasons.

**ORIGIN AND CHARACTER OF THE INHABITANTS.]** The inhabitants of Pennsylvania are principally the descendants of English, Irish, and Germans, with some Scotch, Welsh, Swedes, and a few Dutch. There are also many of the Irish and Germans, who emigrated when young or middle-aged. The Friends and Episcopalians are chiefly of English extraction, and compose about one-third of the inhabitants. They live chiefly in the metropolis, and in the counties of Chester, Philadelphia, Bucks, and Montgomery. The Irish are mostly Presbyterians, but some are Roman Catholics. The Germans compose about one-quarter of the inhabitants of Pennsylvania. They consist of Lutherans, who are the most numerous sect; Calvinists, or Reformed Church; Moravians, Roman Catholics, Mennonists, Tunkers, and Zwingfelters, who are a species of Quakers. These are all distinguished for their temperance, industry, and economy. The Baptists, except the Mennonists and Tunker Baptists, are chiefly descended of emigrants from Wales, and are not numerous. A proportionate assemblage of the national prejudices, the manners, customs, religions, and political sentiments of all these will form the Pennsylvanian character.

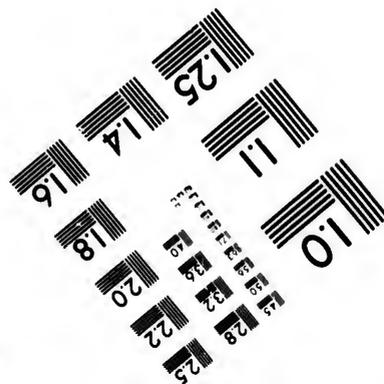

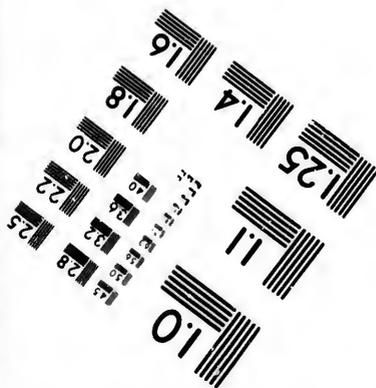

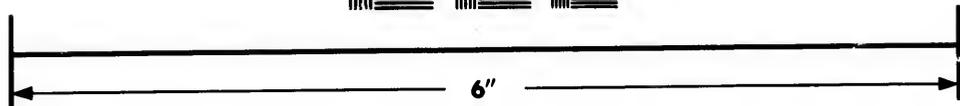

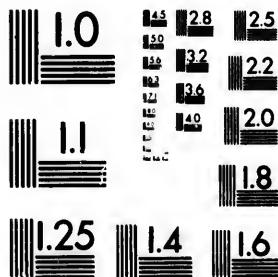

**POPULATION, COMMERCE, AND MANUFACTURES.]** The inhabitants of Pennsylvania in 1790 amounted to 434,373, including 3,737 slaves; or about ten for every square mile.

The commerce of Pennsylvania is very flourishing. It is principally carried on from Philadelphia: and there are few commercial ports in the world where ships from Philadelphia may not be found in some season

of the year. The number of vessels which entered this port in 1786 was 1910, and, in 1795, 1620. The clearances in the latter year were 1789. It is not mentioned; however, how many of these were coasting vessels. The number of vessels built in 1795 was 31, of which 23 were ships and brigs. In the year 1792, Philadelphia shipped 420,000 barrels of flour and middlings. The value of exports from the State of Pennsylvania in the year ending September 30, 1791, was 3,436,092 dollars; and, in 1795, 11,518,260 dollars. The existing war has occasioned some extraordinary articles in the exportation of late; coffee and other commodities having been carried to Philadelphia, and thence to Hamburg, as neutral ports.

The manufactures of this state are of numerous kinds. Iron-works are of long standing, and their products increase in quantity, and improve in quality. There are also improving manufactures of leather, paper, cotton, gun-powder, copper, lead, tin, and earthen-ware.

[RELIGION AND LEARNING.] Liberty of conscience is allowed in this state in its fullest extent. The proportions in which the several different sects prevail, may be estimated from the number of congregations in Pennsylvania, as given by Doctor Morfe, viz. Presbyterians, 86; German Calvinists, 84; nearly 84 of German Lutherans; Friends, or Quakers, 54; Episcopalians, 26; Baptists, 15; Roman Catholics, 11; Scotch Presbyterians, 8; Free Quakers, 1; Universalists, 1; Covenanters, 1; Methodists, 3 or 4; and a Jewish synagogue; the whole amounting to 384.

There is a university at Philadelphia, and colleges at Carlisle and Lancaster. The Episcopalians have an academy at York-town, in York county. There are also academies at German-town, at Pittsburg, at Washington, at Allen's-town, and other places: these are endowed by donations from the legislature, and by liberal contributions of individuals. The legislature have also reserved 60,000 acres of the public lands for public schools. The United Brethren, or Moravians, have academies at Bethlehem and Nazareth, on the best establishment of any schools perhaps in America. The literary, humane, and other useful societies, are more numerous and flourishing in Pennsylvania than in any of the sixteen states. Among these is one which deserves a particular notice, which is the *American Philosophical Society*, held at Philadelphia. This society was formed, January 2d, 1769, by the union of two other literary societies that had subsisted for some time, and were created one body corporate and politic, with such powers, privileges, and immunities, as are necessary for answering the valuable purpose which the society had originally in view, by a charter granted by the common-wealth of Pennsylvania on the 15th of March 1780. This society has published two very valuable volumes of their transactions; one in 1771, and the other in 1786. In 1771 it consisted of nearly 300 members, and upwards of 120 have since been added; a large proportion of whom are foreigners.

[CHIEF TOWNS.] Pennsylvania contains several very considerable towns, such as Lancaster, Carlisle, and Pittsburg. But the city of Philadelphia, which is beautiful beyond any city in America, and in regularity unequalled by any in Europe, eclipses the rest, and merits particular attention. It was built after the plan of the famous William Penn, the founder and legislator of this colony. It is situated about 120 miles from the sea, by the course of the bay and river; and 55 or 60 in the south-eastward direction. The ground-plot of the city is an oblong square, about one mile from north to south, and two from east

to west; lying in the narrowest part of the isthmus, between the Delaware and Schuylkill rivers, about five miles in a right line above their confluence, where the Delaware is a mile broad. The city is intersected by a great number of streets crossing each other at right angles. Of these there were originally nine, which extended from the Delaware to the Schuylkill, and were crossed by twenty-three others running north and south. The number of squares formed by these streets, in the original plan, was 184; but as several of them have lately been intersected by new streets, their number now amounts to 304; and several of these are again intersected by lanes and alleys. Market-street is 100 feet wide, and runs the whole length of the city, from river to river; and near the middle is intersected by Broad-street 113 feet wide, running nearly north and south. The other streets are 50 feet wide, except Arch-street, which is 65 feet. Most of the city is well paved with foot-paths of brick, furnished with common sewers and gutters, so that the streets are in general kept very clean and neat. The houses in the city and suburbs are generally of brick, three stories high, in a plain decent style, without much display of ornament. In 1794 there were 9000 houses in this city, and 400 which were building; and the present number of inhabitants may be estimated at about 55,000. Philadelphia contains 27 places of public worship, belonging to different sects. The state-house is a magnificent building, erected in 1735. In 1787 an elegant court-house, or town hall, was built on the left of the state-house, and, on the right, a philosophical hall. Here likewise is a public observatory, and several other public buildings. This city is governed by a mayor, recorder, fifteen aldermen, and thirty common council men, according to its present charter, granted in the year 1789. A malignant fever raged here in 1793, which in the course of August and three succeeding months carried off 4031 of the inhabitants; and this fatal distemper for several years returned annually.

**HISTORY AND GOVERNMENT.]** This country, under the name of the New Netherlands, was originally possessed by the Dutch and Swedes. When these nations, however, were expelled from New York by the English, admiral Penn, who, in conjunction with Venables, had conquered the island of Jamaica (under the auspices of Cromwell), being in favour with Charles II. obtained a promise of a grant of this country from that monarch. Upon the admiral's death, his son, the celebrated quaker, availed himself of this promise, and, after much court-solicitation, obtained the performance of it. Though as an author and a divine Mr. Penn be little known but to those of his own persuasion, his reputation, in a character no less respectable, is universal among all civilized nations. The circumstances of the times engaged vast numbers to follow him into his new settlement, to avoid the persecutions to which the Quakers, like other sectaries, were then exposed; but it was to his own wisdom and ability that they are indebted for that charter of privileges which placed this colony on so respectable a footing. Civil and religious liberty, in the utmost latitude, was laid down by that great man as the chief and only foundation of all his institutions. Christians of all denominations might not only live unmolested, but have a share in the government of the colony. No laws could be made but by the consent of the inhabitants. Even matters of benevolence, to which the laws of few nations have extended, were by Penn subjected to regulations. The affairs of widows and orphans were to be inquired into by

a court constituted for that purpose. The causes between man and man were not be subjected to the delay and chicanery of the law, but decided by wise and honest arbitrators. His benevolence and generosity extended also to the Indian nations: instead of taking immediate advantage of his patent, he purchased of these people the lands he had obtained by his grant, judging that the original property, and oldest right, was vested in them. William Penn, in short, had he been a native of Greece, would have had his statue placed next to those of Solon and Lycurgus. His laws, founded on the solid basis of equity, still maintain their force; and, as a proof of their effects, it is only necessary to mention, that land was lately granted at twelve pounds an hundred acres, with a quit-rent of four shillings reserved; whereas the terms on which it was formerly granted were at twenty pounds the thousand acres, with one shilling quit-rent for every hundred. Near Philadelphia, before the commencement of the war with the mother-country, land rented at twenty shillings the acre, and, even at several miles distance from that city, sold at twenty years purchase.

It was in Philadelphia that the general congress of America met in September 1774: and their meetings continued to be chiefly held there till the king's troops made themselves masters of that city, on the 26th of September 1777. But in June 1778 the British troops retreated to New York, and Philadelphia again became the residence of the congress.

In 1776 the representatives of the freemen of Pennsylvania met in a general convention at Philadelphia, and agreed upon the plan of a new constitution of government for that colony. According to the actual constitution, the legislative power is administered by a senate and house of representatives; the executive by a governor; and the judiciary by a supreme court, a court of common-pleas, and a court of quarter-sessions of the peace. The legislature and governor are elected by the freemen; the governor for three years; the representatives, and a fourth part of the senate, annually. The number of representatives must not be less than sixty, nor exceed one hundred; nor that of senators less than a fourth, nor greater than a third-part of the number of representatives. The electors of the magistrates must have attained the age of twenty-one, have resided in the state two years, and paid taxes. The representatives must have been inhabitants of the state three years, and, the last year previous to their election, have resided in the county which chooses them. The qualifications of twenty-five years of age, and of four years residence, are required in senators: and the governor must have attained the age of thirty, and have resided in the state seven years; and he is not eligible more than nine years in twelve. The senators are divided by lot into four classes; and the seats of one class vacated and re-filled yearly.

DELAWARE.

SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 92 } between { 38 29 and 39 54 north latitude	{ 75 2 and 75 48 west longitude }	} 2000
Breadth 24 }		

BOUNDARIES.] DELAWARE is bounded on the East by the river and bay of the same name, and the Atlantic Ocean; on the North, by Pennsylvania; and on the South, and West by Maryland. It is divided into the three following counties:

Counties.	Chief Towns.
Newcastle.....	Newcastle, Wilmington
Kent.....	Dover
Suffex.....	Lewes

RIVERS.] In the southern and western parts of this state, spring the head-waters of Pocomoke, Wicomico, Nanticoke, Choptank, Chester, Sassafras, and Bohemia rivers, all falling into Chesapeake bay. Some of them are navigable twenty or thirty miles into the country for vessels of fifty or sixty tons.

AIR, SOIL, AND PRODUCE.] The air is in general healthy; but in some parts, where there are large quantities of stagnant water, it is less salubrious. The soil along the Delaware river, and from eight to ten miles into the interior country, is generally a rich clay, adapted to the various purposes of agriculture. From thence to the swamps the soil is light, sandy, and of an inferior quality. Wheat grows here in such perfection, as not only to be particularly sought by the manufacturers of flour throughout the Union, but also to be distinguished and preferred for its superior qualities in foreign markets. Besides wheat, this state generally produces plentiful crops of Indian corn, barley, rye, oats, flax, buck-wheat, and potatoes. There are few minerals in this state, except iron: large quantities of bog iron ore, very fit for castings, are found in Suffex county, among the branches of Nanticoke river.

POPULATION, TRADE, AND MANUFACTURES.] The number of inhabitants in Delaware in 1790 was 59,094, of whom 887 were slaves. The staple commodity of this state is wheat, which is manufactured into flour, and exported in large quantities. Besides wheat and flour, lumber and various other articles are exported from Delaware. The amount of exports from this state, in the year 1795, was 158,041 dollars. Among other branches of industry exercised in and near Wilmington, are a cotton manufactory, and a bolting manufactory. In the county of Newcastle are several fulling-mills, two snuff-mills, one flitting-mill, four paper-mills, and sixty mills for grinding grain, all turned by water.

RELIGION AND LEARNING.] In this state there are a variety of religious denominations. Of the Presbyterian sect there are 24 churches; of the Episcopal, 14; of the Baptists, 7; of the Methodists, a considerable number. Besides these there is a Swedish church at Wilmington, which is one of the oldest churches in the United States.

There is no college in this state. There is an academy at Newark, incorporated in 1769. The legislature, in January 1796, passed an act to create a fund for the establishment of schools throughout the state.

**CHIEF TOWNS.]** Dover, being the seat of government, is considered as the metropolis, though it contains but about a hundred houses; but Wilmington is the most considerable town in the state, containing 600 houses, and 3000 inhabitants. It is regularly laid out in squares, similar to Philadelphia.

**HISTORY AND GOVERNMENT.]** Settlements were made here by the Dutch about the year 1623, and by the Swedes about the year 1627. Their settlements were comprehended in the grant to the duke of York; and William Penn united them to his government by purchase. They were afterwards separated in some measure from Pennsylvania, and denominated the *Three Lower Counties*. They had their own assemblies, but the governor of Pennsylvania used to attend, as he did in his own proper government. At the late revolution, the three counties were erected into a sovereign state, having a governor, senate, and house of representatives. The senators are nine in number, three from each county; and the representatives twenty-seven. The former must be twenty-seven years old, and the latter twenty-four; and senators must have a freehold of two hundred acres, or real and personal estate to the value of one thousand pounds. The governor is not eligible more than three years in six. In other particulars the constitution of Delaware almost exactly agrees with that of Pennsylvania.

**RIVERS.]** This country is indented with a vast number of navigable creeks and rivers. The chief are Patowmac, Pocomoke, Patuxent, Choptank, Severn, and Sassafras.

**FACE OF THE COUNTRY, AIR, SOIL, AND PRODUCE.** } In these particulars this province has nothing remarkable by which it may be distinguished from those already described. The hills in the inland country are of so easy ascent, that they rather seem an artificial than a natural production. The climate is generally mild, and agreeably suited to agricultural productions and a great variety of fruit-trees. In the interior hilly country the inhabitants are healthy; but in the flat country, in the neighbourhood of the marshes and stagnant waters, they are, as in the other southern states, subject to intermittents. The vast number of rivers diffuses fertility through the soil, which is admirably adapted to the rearing of tobacco and wheat (which are the staple commodities of that country), hemp, Indian corn, grain, &c.

**POPULATION AND COMMERCE.]** The number of inhabitants has of late years greatly increased, amounting in 1790 to 319,728, of whom 103,036 are slaves; which is nearly 34 for every square mile.

The trade of Maryland is principally carried on from Baltimore, with the other states, with the West Indies, and with some parts of Europe. To these places they send annually about 30,000 hogheads of tobacco, besides large quantities of wheat, flour, pig-iron, lumber, and corn-beans, pork, and flax-seed in small quantities: and receive in return, cloathing for themselves and negroes, and other dry goods, wines, spirits, sugars, and other West-India commodities. The balance is generally in their favour.—The total amount of exports from Baltimore in 1790 was 2,027,777 dollars, and in 1795, 5,811,379 dollars. In the year 1791 the quantity of wheat exported was 205,571 bushels.

**RELIGION AND LEARNING.]** The Roman Catholics, who were the first settlers in Maryland, are the most numerous religious sect. Besides these there are Protestants, Episcopalians, English, Scotch and Irish Presbyterians, German Calvinists, German Lutherans, Friends, Baptists, Methodists, Mennonists, Nicolites, or new Quakers; who all enjoy liberty of conscience. The seminaries of learning are as follow: Washington Academy, in Somerset county, which was instituted by law in 1779. Washington College, instituted at Chester-town in Kent county in 1782. By a law enacted in 1787, a permanent fund was granted to this institution, of 1250l. a year currency. St. John's College was instituted in 1784, to which a permanent fund is assigned of 175l. a year. This college is to be at Annapolis, where a building is now prepared for it.

Very liberal subscriptions were obtained towards founding and carrying on these seminaries. The two colleges constitute one university, by the name of "The university of Maryland," whereof the governor of the state for the time being is chancellor, and the principal of one of them vice-chancellor. The Roman-catholics have also erected a college at George town on Patowmac river for the promotion of general literature. In 1785 the Methodists instituted a college at Abington in Hartford county, by the name of Cokerbury College.

**CHIEF TOWNS.]** Annapolis, the capital of Maryland, is a small but well situated town upon the river Patuxent. It was formerly called Severn, which name, in the year 1694, was, by an act of the assembly of Maryland, changed into Annapolis. It is situated on a peninsula formed by the river, and two small creeks, and affords a beautiful prospect of Chesapeak bay, and the eastern shore beyond it. This city is of little note in the commercial world; but is the wealthiest town of its size in the United States. The houses, about three hundred in number, are spacious and elegant, and indicate great wealth. The state-house is the noblest building of the kind in the Union. It stands in the centre of the city, from which point the streets diverge in every direction like radii.

Baltimore is the largest town in the State of Maryland: in size it is the fourth and in commerce the fifth in rank in the United States. It is situated on the north side of Patapsco river, at a small distance from its junction with the Chesapeak. The town is built around what is called the basin, reckoned one of the finest harbours in America. The number of the inhabitants of the town and precincts in 1791 was 13,503, including 1255 slaves, and they must have greatly increased since.

**HISTORY AND GOVERNMENT.]** Maryland, like the provinces we have formerly described, owes its settlement to religious considerations. As they, however, were peopled by Protestants, Maryland was originally planted by Roman-catholics. This sect, towards the close of Charles the First's reign, was the object of great hatred to the bulk of the English nation; and the laws in force against the Papists were executed with great severity. This in part arose from an opinion, that the court was too favourably disposed towards this form of religion. It is certain that many marks of favour were conferred on the Roman Catholics. Lord Baltimore was one of the most eminent in great favour with the court, and on that account most odious to the generality of the English. This nobleman, in 1632, obtained a grant from Charles of that country, which formerly was considered as a part of Virginia, but was now called Maryland, in honour of queen Henrietta Mary, daughter to Henry IV. of France, and spouse to king Charles. The year following, about 200 popish families, some of considerable distinction, embarked with Lord Baltimore, to enter into possession of this new territory. These settlers, who had that liberality and good breeding which distinguish gentlemen of every religion, bought their lands at an easy price, from the native Indians; they even lived with them for some time in the same city; and the same harmony continued to subsist between the two nations, until the Indians were imposed on by the malicious insinuations of some planters in Virginia, who envied the prosperity of this popish colony, and inflamed the Indians against them, by ill grounded reports, such as were sufficient to stir up the resentment of men naturally jealous, and who from experience had reason to be so. The colony, however, was not wanting to its own safety on this occasion. Though they continued their friendly intercourse with the natives, they took care to

ereft a fort, and to use every other precaution for their defence against sudden hostilities; the defeat of this attempt gave a new spring to the activity of this plantation, which was likewise receiving frequent reinforcements from England, of those who found themselves in danger by the approaching revolution. But, during the protectorship of Cromwell, every thing was overturned in Maryland. Baltimore was deprived of his rights, and a new governor, appointed by the protector, substituted in his room. At the restoration, however, the property of this province reverted to its natural possessor. Baltimore was reinstated in his rights, and fully discovered how well he deserved to be so. He established a perfect toleration in all religious matters: the colony increased and flourished, and dissenters of all denominations, allured by the prospect of gain, flocked into Maryland. But the tyrannical government of James II. again deprived this noble family of their possession, acquired by royal bounty, and improved by much care and expense.

At the revolution, lord Baltimore was again restored to all the profits of the government, though not to the right of governing, which could not consistently be conferred on a Roman-catholic. But, after the family changed their religion, they obtained the power as well as the interest. The government of this country exactly resembled that in Virginia, except that the governor was appointed by the proprietor, and only confirmed by the crown. The government of Maryland is now vested in a governor, senate of fifteen, and house of delegates; all which are to be chosen annually. The governor is elected by ballot, by the senate and house of delegates; and cannot continue in office longer than three years successively. All freemen above twenty-one years of age, having a freehold of fifty acres, or property to the value of thirty pounds, have a right of suffrage in the election of delegates, which is  *viva voce* . All persons appointed to any office of profit and trust, are to subscribe a declaration of their belief in the Christian religion.

CAPEs, BAYs, AND RIVERs.] In sailing to Virginia or Maryland, you pass a strait between two points of land, called the Capes of Virginia, which opens a passage into the bay of Chesapeak, one of the largest and safest in the whole world; for it enters the country near 300 miles from the south to the north, is about eighteen miles broad for a considerable way, and seven where it is the narrowest, the waters in most places being nine fathoms deep. This bay, through its whole extent, receives a vast number of navigable rivers from the sides of both Maryland and Virginia. From the latter, besides others of less note, it receives James River, York River, the Rappahannoc, and the Patowmac: these are not only navigable for large ships into the heart of the country, but have so many creeks, and receive such a number of smaller navigable rivers, that Virginia is, without all manner of doubt, the country

in the world of all others of the most convenient navigation. It has been observed, and the observation is not exaggerated, that every planter has a river at his door.

**FACE OF THE COUNTRY.]** The whole face of this country is so extremely low towards the sea, that you are very near the shore before you can discover land from the mast-head. The lofty trees, which cover the soil, gradually rise as it were from the ocean, and afford an enchanting prospect. You travel 100 miles into the country without meeting with a hill, which is nothing uncommon on this extensive coast of North America.

**AIR AND CLIMATE.]** In summer the heats here are excessive, though not without refreshing breezes from the sea. The weather is changeable, and the change is sudden and violent. Their winter frosts come on without the least warning. To a warm day there sometimes succeeds such an intense cold in the evening as to freeze over the largest rivers.

The air and seasons here depend very much upon the wind, as to heat and cold, dryness and moisture. In winter, they have a fine clear air, and dry, which renders it very pleasant. Their spring is about a month earlier than in England; in April they have frequent rains; in May and June the heat increases; and the summer is much like ours, being refreshed with gentle breezes from the sea, that rise about nine o'clock, and decrease or increase as the sun rises or falls. In July and August these breezes cease, and the air becomes stagnant, and violently hot: in September the weather generally changes, when they have heavy and frequent rains, which occasion all the train of diseases incident to a moist climate, particularly agues and intermitting fevers. They have frequent thunder and lightning, but it rarely does any mischief.

**SOIL AND PRODUCE.]** Towards the sea-shore and the banks of the rivers, the soil of Virginia consists of a dark rich mould, which, without manure, returns plentifully whatever is committed to it. At a distance from the water there is a lightness and sandiness of the soil, which, however, is of a generous nature, and, aided by a kindly sun, yields corn and tobacco extremely well.

From what has been said of the soil and climate, it is easy to infer the variety and perfection of the vegetable productions of this country. The forests are covered with all sorts of lofty trees, and no underwood or bushes grow beneath; so that people travel with ease through the forests on horseback, under a fine shade to defend them from the sun: the plains are enamelled with flowers and flowering shrubs of the richest colours and most fragrant scent. Silk grows spontaneously in many places, the fibres of which are as strong as hemp. Medicinal herbs and roots, particularly the snake-root and ginseng, are here in great plenty. There is no sort of grain but might be cultivated to advantage. The inhabitants, however, are so engrossed with the culture of the tobacco plant, that they think, if corn sufficient for their support can be reared, they do enough in this way. But flax and hemp are produced, not only for their own consumption, but for exportation, though not in such quantities as might be expected from the nature of the soil, admirably fitted for producing this commodity.

**ANIMALS.]** We shall here observe, that there were neither horses, cows, sheep, nor hogs in America before they were carried thither by the Europeans; but now they are multiplied so extremely, that many of them, particularly in Virginia, and the Southern Colonies, run wild. Before the war between Great Britain and the Colonies, beef and pork were sold here from one penny to two-pence a pound; their fattest

pullets at six-pence a-piece; chickens at three or four shillings a dozen; geese at ten pence; and turkeys at eighteen-pence a-piece. But fish and wild-fowl were still cheaper in the season, and deer were sold from five to ten shillings a-piece. This estimate may serve for the other American colonies, where provisions were equally plentiful and cheap, and in some still lower. Besides the animals transported from Europe, those natural to the country are deer, of which there are great numbers, a sort of panther or tiger, bears, wolves, foxes, and racoons. Here is likewise that singular animal called the opossum, which seems to be the wood-rat mentioned by Charlevoix in his History of Canada. It is about the size of a cat; and, besides the belly, common to it with other animals, it has another peculiar to itself, and which hangs beneath the former. This belly has a large aperture towards the hinder legs, which discovers a great number of teats on the usual parts of the common belly. Upon these, when the female of this creature conceives, the young are formed, and there they hang, like fruit upon the stalk, until they grow to a certain bulk and weight; when they drop off, and are received into the false belly, from which they go out at pleasure, and in which they take refuge when any danger threatens them. In Virginia there are all sorts of tame and wild fowl. They have the nightingale, whose plumage is crimson and blue; the mocking-bird, thought to excel all others in his own note, and including that of every one; the humming-bird; the smallest of all the winged creation, and by far the most beautiful, all arrayed in scarlet, green, and gold. It sips the dew from the flowers, which is all its nourishment, and is too delicate to be brought alive into England.

**CHARACTER, MANNERS, CUSTOMS.]** Virginia has produced some of the most distinguished actors in effecting the revolution in America. Her political and military character will rank among the first in the page of history. But it is to be observed, that this character has been obtained for the Virginians by a few eminent men, who have taken the lead in all their public transactions, and who, in short, govern Virginia; for the great body of the people do not concern themselves with politics, so that their government, though nominally republican, is in fact oligarchical, or aristocratical.

Several travellers give but a very indifferent account of the generality of the people of this state. The young men, observes one, generally speaking, are gamblers, cock-fighters, and horse-jockies. The ingenuity of a Locke, or the discoveries of a Newton, are considered as infinitely inferior to the accomplishments of him who is expert in the management of a cock-fight, or dextrous in manœuvring at a horse-race. A spirit for literary enquiries, if not altogether confined to a few, is, among the body of the people, evidently subordinate to a spirit of gambling and barbarous sports. At almost every tavern or ordinary on the public road there is a billiard table, a back-gammon table, cards, and other implements for various games. To these public houses the gambling gentry in the neighbourhood resort, to *kill* time, which hangs heavily upon them; and at this business they are extremely expert, having been accustomed to it from their earliest youth. The passion for cock-fighting, a diversion not only inhumanly barbarous, but infinitely beneath the dignity of a man of sense, is so predominant, that they even advertise their matches in the public papers\*. This dissipation of manners is the consequence of indolence and luxury, which are the fruit of African slavery.

\* A traveller through Virginia observes: Three or four matches were advertised in the public prints at Williamsburg; and I was witness to five in the course of my travels from that to Port-Royal.

**POPULATION AND COMM.** The inhabitants of Virginia amounted, according to the census of 1790, to 747,610, of which 292,627 were negroes. The trade of Virginia consists principally in tobacco, and different kinds of grain. In 1790, about 40,000 hogheads of tobacco were exported; but its culture has since declined, and that of wheat taken place. The greatest quantity of tobacco ever produced in this country was 70,000 hogheads in the year 1759. The exports from this state, in the year 1792, amounted to 3,549,499 dollars, and in 1796 to 5,268,615 dollars.

**RELIGION AND COLLEGES.]** The present denominations of Christians in Virginia are, Presbyterians, who are most numerous; Episcopalians, Baptists and Methodists. The first settlers were Episcopalians. There is a college at Williamsburg, founded by King William, and called William and Mary College. That monarch gave two thousand pounds towards building it, and twenty thousand acres of land, with power to purchase and hold lands to the value of two thousand pounds a year, and a duty of a penny per pound on all tobacco exported to the other plantations. There is a president, six professors, and other officers, who are always appointed by the governors, or visitors. The academy in Prince Edward county has been erected into a college by the name of Hampden Sidney college. There are besides a number of academies in different parts of Virginia: one at Alexandria, one at Norfolk, one at Hanover, and others in other places.

**CHIEF TOWNS.]** Virginia is not divided into townships, nor are there any large towns, owing probably to the interfection of the country by navigable rivers, which bring the trade to the doors of the inhabitants, and prevent the necessity of their going in quest of it to a distance. The principal towns are, Richmond the capital, Williamsburg, and Norfolk. Richmond contains between 400 and 500 houses, and about 4000 inhabitants. Here is a large state-house, or capitol, lately erected on a hill which commands an extensive prospect of the lower part of the town, the river, and the adjacent country. Williamsburg was the seat of government till the year 1780. It contains about 100 houses, and about 1400 inhabitants. It is regularly laid out in parallel streets, with a pleasant square in the centre, of about ten acres, through which runs the principal street, about a mile in length, and more than 200 feet wide. Norfolk is the most considerable commercial town in Virginia. The harbour is safe and commodious, and large enough to contain 300 ships. In 1790 the number of inhabitants in Norfolk was 2959, including 1294 slaves.

**HISTORY AND GOVERNMENT.]** This is the first country which the English planted in America. We derived our right, not only to this, but to all our other settlements, as has been already observed, from the discovery of Sebastian Cabot, who, in 1497, first made the northern continent of America, in the service of Henry VII. of England. No attempts, however, were made to settle it till the reign of queen Elizabeth. It was then that sir Walter Raleigh applied to court, and got together a company, which was composed of several persons of distinction, and several eminent merchants, who agreed to open a trade and settle a colony in that part of the world, which, in honour of queen Elizabeth, he called Virginia. Towards the close of the sixteenth century, several attempts were made for settling this colony, before any proved successful. The three first companies who failed to Virginia perished through hunger and diseases, or were cut off by the Indians. The fourth was reduced almost to the same situation; and being dwindled to a feeble remainder, had set sail for England, in despair of

living in such an uncultivated country, inhabited by such hostile and warlike savages. But, in the mouth of Chesapeak Bay, they were met by lord Delaware, with a squadron loaded with provisions, and with every thing necessary for their relief and defence. At his persuasion they returned: by his advice, prudence, and winning behaviour, the internal government of the colony was settled within itself, and put on a respectable footing with regard to its enemies. This nobleman, who had accepted the government of the unpromising province of Virginia from the noblest motives, was compelled, by the decayed state of his health, to return to England. He left behind him, however, his son as deputy; with sir Thomas Gates, sir George Sommers, the honourable George Piercy, and Mr. Newport, for his council. By them, James Town, the first town built by the English in the New World, was erected. The colony continued to flourish, and the true sources of its wealth began to be discovered and improved. The first settlers, like those of Maryland, were generally persons of consideration and distinction. It remained a steady ally to the royal party during the troubles of Great Britain. Many of the cavaliers, in danger at home, took refuge here; and, under the government of sir William Berkeley, held out for the crown, until the parliament, rather by stratagem than force, reduced them. After the restoration there is nothing very interesting in the history of this province. Soon after this time, a young gentleman named Bacon, a lawyer, availing himself of some discontent in the colony on account of restraints in trade, became very popular, and threw every thing into confusion. His death, however, restored peace and unanimity.

The government of this province was not at first adapted to the principles of the English constitution, and to the enjoyment of that liberty to which a subject of Great Britain thinks himself entitled in every part of the globe. It was subject to a governor and council appointed by the king of Great Britain. As the inhabitants increased, the inconvenience of this form became more grievous; and a new branch was added to the constitution, by which the people, who had formerly no consideration, were allowed to elect their representatives from each county into which this country is divided, with privileges resembling those of the representatives of the commons of England. Thus two houses, the upper and lower house of assembly, were formed. The upper house, which was before called the council, remained on its former footing; its members were appointed, during pleasure, by the crown; they were styled Honourable, and answered in some measure to the house of peers in the British constitution. The lower house was the guardian of the people's liberties. And thus, with a governor representing the king, an upper and lower house of assembly, this government bore a striking resemblance to our own. When any bill had passed the two houses, it came before the governor, who gave his assent or negative as he thought proper. It now acquired the force of a law, until it was transmitted to England, and his majesty's pleasure known on that subject. The upper house of assembly acted not only as a part of the legislature, but also as privy council to the governor, without whose concurrence he could do nothing of moment: it sometimes acted as a court of chancery.

The present government of this province, as settled, in convention at Williamsburg, July 5th, 1776, is, that the legislative, executive, and judiciary departments be separate and distinct; that the house of delegates be chosen annually by the freeholders, two for each county, and for the district of West Augusta; and one representative for the city of Williamsburg and town of Norfolk. RIVERS, SOIL, PRODUCE.] The Ohio bounds Kentucky in its whole length. This state is watered by many rivers, and the greatest part of the soil is amazingly fertile, and is more temperate and healthy than any part in America. Here are buffaloes, bears, deer, elks, and many other animals common to the United States, and others entirely unknown to them. The rivers abound in the finest fish; salmon, roach, perch, eel, and all kinds of hook-fish. The paroquet is common here; as is the ivory-bill woodcock, of a whitish colour, with a white plume; the bill is pure ivory. Here is an owl like ours, but different in vociferation. It makes a surprizing noise, like a man in distress. The natural curiosities of this country are astonishing and innumerable. Caves are found amazingly large, in some of which you may travel several miles under a fine lime-stone rock, supported by curious arches and pillars. In most of them run streams of water. Near Lexington are to be seen curious sepulchres full of human skeletons. There are three springs at

ponds of bitumen near Green River, which discharge themselves into a common reservoir, and, when used in lamps, answer all the purposes of the finest oil. There are many alum banks, and different places abounding with copper, which, when refined, is equal to any in the world. At a salt spring near the Ohio river very large bones have been found, far surpassing the size of any species of animals now in America: the head appears to have been considerably above three feet long. Dr. Hunter said it could not be the elephant, and that, from the form of the teeth, it must have been carnivorous, and belonging to a race of animals now extinct. Specimens have been sent to France and England. What animal this is, and by what means its remains are found in these regions, (where none such now exist,) are very difficult questions, and variously resolved. The variety of conjectures only serves to show the futility of all.

The Mississippi and Ohio are the keys to the northern parts of the western continent. The usual route to Kentucky is from Philadelphia, or Baltimore, by the way of Pittsburg. The distance from the mouth of the Ohio to New Orleans, which does not exceed 460 miles in a straight line, is 856 by water. The mouth empties itself by several channels into the Gulf of Mexico.

POPULATION.] An idea may be formed of the astonishing emigrations to this country, from the following account taken by the adjutant of the troops stationed at Fort Harmar, at the mouth of Muskingum.

From the 10th of October 1786, to the 12th of May 1787, 177 boats, containing 2689 souls, 1353 horses, 766 cattle, 112 waggons, and two phaetons, besides a very considerable number that passed in the night unobserved.

The population of this state in 1790 was 73,677. It is asserted that upwards of 20,000 persons emigrated hither in the year 1787. These people, collected from different states, of different manners, customs, religions, and political sentiments, have not been long enough together to form a uniform national character. Among the settlers there are many gentlemen of abilities, and many genteel families from several of the states; and they are in general more regular than people who settle new countries.

CHIEF TOWNS.] Kentucky as yet contains no very large towns; the principal are Lexington, Louisville, and Washington. Lexington contains about 250 houses, and about 2000 inhabitants.

RELIGION.] The Baptists are the most numerous religious sect in Kentucky. There are several large congregations of Presbyterians, and some few of other denominations.

HISTORY AND CONSTITUTION.] The history of this State is the same with that of Virginia, of which it made a part till the year 1792, when it was erected into an independent State. By the constitution of this State, formed and adopted in 1792, the legislative power is vested in a general assembly, consisting of a senate and house of representatives; the supreme executive in a governor; the judiciary in the supreme court of appeals, and such inferior courts as the legislature may establish. The representatives are chosen annually by the people; the senators and governor are chosen for four years, by electors appointed for that purpose; the judges are appointed, during good behaviour, by the governor, with the advice of the senate. The number of representatives cannot exceed one hundred, nor be less than forty; and the senate, at first consisting of eleven, is to increase with the house of representatives, in the ratio of one to four.

day seldom passed without ten or fifteen boxing-matches, it is now a rare thing to hear of a fight.

**POPULATION AND TRADE.]** The number of inhabitants in North Carolina in 1790 was 393,751, of whom 100,571 were slaves.

A great proportion of the produce of the back country, consisting of tobacco, wheat, Indian corn, &c. is carried to market in South Carolina and Virginia. The southern interior counties carry their produce to Charles-town, and the northern to Peterburg in Virginia. The exports from the lower parts of the state are tar, pitch, turpentine, rosin, Indian corn, boards, scantling, staves, shingles, furs, tobacco, pork, lard, tallow, bees-wax, myrtle-wax, and some other articles; amounting in the year, ending September 30th, 1791, to 524,548 dollars. Their trade is chiefly with the West Indies and the northern states.

**RELIGION AND LEARNING.]** The Methodists and Baptists are numerous and increasing in North Carolina; the Moravians have several flourishing settlements in the upper part of this state; and the Friends or Quakers have a settlement in New-Garden, in Guildford county, and several congregations at Pequimins and Pasquotank.

The general assembly of North Carolina, in 1789, passed a law, incorporating forty gentlemen, five from each district, as trustees of the university of North Carolina. The general assembly, in December 1791, loaned 5,000l. to the trustees, to enable them to proceed immediately with their buildings. There is a very good academy at Warenton, another at Williamborough, in Granville, and three or four others in the state of considerable note.

**CHIEF TOWNS.]** Newbern is the largest town in North Carolina, and was formerly the residence of the governors. Edenton, Wilmington, Halifax, Hillsborough, Salisbury, and Fayetteville, have each in their turns been the seat of the general assembly. Raleigh, situated near the centre of the state, has lately been established as the metropolis.

**HISTORY AND GOVERNMENT.]** The history of North Carolina is less known than that of any other of the states. From the best accounts that history affords, the first permanent settlement in North Carolina was made about the year 1710, by a number of Palatines from Germany, who had been reduced to circumstances of great indigence by a calamitous war. The infant colony remained under the general government of South Carolina till about the year 1729, when seven of the proprietors, for a valuable consideration, vested their property and jurisdiction in the crown; and the colony was erected into a separate province, by the name of North Carolina, and its present limits established by an order of George II.

By the constitution of this state, which was ratified in December 1796, all legislative authority is vested in two distinct branches, both dependent on the people, viz. a Senate and House of Commons, which, when convened for business, are styled the General Assembly. The senate is composed of representatives, one from each county, chosen annually by ballot. The House of Commons consists of representatives chosen in the same way, two for each county, and one for each of the towns of Edenton, Newbern, Wilmington, Salisbury, Hillsborough, Halifax, and Fayetteville.

SOUTH CAROLINA.

SITUATION AND EXTENT.

Miles.		Degrees.	Square Miles.
Length 200 }	between	{ 32 and 35 North lat.	20,000
Breadth 125 }		{ 78 and 81 West long.	

**BOUNDARIES.]** BOUNDED by North Carolina on the North; by the Atlantic Ocean on the East; and on the South and South-west by the Savannah river, and a branch of its head-waters, called Tugulo river, which divides this state from Georgia. South Carolina is divided into nine districts, in which are 38 counties, as follow:

	Counties.		Counties.
<b>BEAUFORT DISTRICT,</b> on the sea-coast, between Combahee and Savannah rivers. Chief town BEAUFORT.	Hilton Lincoln Granville	<b>ORANGE DISTRICT,</b> west of Beaufort district. Chief town ORANGEBURGH.	Lewisburg Orange Lexington Winton

<b>CHERAWS DISTRICT,</b> west of George-town district. Chief towns are GRENVILLE and CHATHAM.		<b>PINCKNEY DISTRICT.</b> Chief town PINCKNEYVILLE.	York Chester Union Spartanburgh
<b>WASHINGTON DISTRICT.</b> Chief town PINCKENSVILLE.			

**RIVERS AND CANALS.]** South Carolina is watered by many navigable rivers, the principal of which are the Savannah, Edisto, Santee, Pedee, and their branches. The Santee is the largest river in the state. Those of a secondary size are the Wakkamaw, Black, Cooper, Ashpeo, and Combahee rivers. A canal of twenty-one miles in length, connecting Cooper and Santee rivers, is nearly completed, which it is estimated will cost 400,000 dollars; and another canal is soon to be begun, to unite the Edisto with the Ashley.

**SEAS AND HARBOURS.]** The only sea bordering on this is the Atlantic Ocean, which is so shallow near the coast, that a ship of any great burden cannot approach it, except in some few places. The principal harbours in South Carolina are Winyaw, or George-town, Charles-town, and Port-Royal.

**CLIMATE AND AIR.]** The climate of South Carolina agrees in general with that of North Carolina and Virginia. The weather, as in all

soil have somethin  
naturally throws  
shrubs. All the  
in which their na

this part of America, is subject to sudden transitions from heat to cold, and from cold to heat, but not to such violent extremities as Virginia. The winters are seldom severe enough to freeze any considerable water, affecting only the mornings and evenings; the frosts have never sufficient strength to revisit the noon-day sun, so that many tender plants, which do not stand the winter in Virginia, flourish in South Carolina, for they have oranges in great plenty near Charles-town, and excellent in their kinds, both sweet and sour. The salubrity of the air is different in different parts of the state. Along the sea-coast, bilious diseases, and fevers of various kinds, are prevalent between July and October; one cause of which is the low marshy country, which is overflowed for the sake of cultivating rice. The upper country, situated in the medium between extreme heat and cold, is as healthful as any part of the United States.

SOIL, PRODUCE, AND FACE } The soil of South Carolina may be divided into four kinds: first, the pine barren, which is valuable only for its timber. Interspersed among the pine barren are tracts of land free of timber, and every kind of growth, but that of grass. These tracts are called *savannas*, constituting a second kind of soil, good for grazing. The third kind is that of the swamps and low grounds on the rivers, which is a mixture of black loam and fat clay, producing, naturally, canes in great plenty, cypress bays, loblolly pines, &c. In these swamps rice is cultivated, which constitutes the staple commodity of the state. The high lands, commonly known by the name of oak and hickory lands, constitute the fourth kind of soil. The natural growth is oak, hickory, walnut, pine, and locust. On these lands, in the low country, Indian corn is principally cultivated; and in the back country, likewise, they raise tobacco in large quantities, wheat, rye, barley, oats, hemp, flax, and cotton. From experiments which have been made, it is well ascertained that olives, silk, and madder, may be as abundantly produced in South Carolina, and we may add in Georgia also, as in the south of France. There is little fruit in this state, especially in the lower parts of it. They have oranges, chiefly sour, and figs in plenty; a few limes and lemons, pomegranates, pears, and peaches; apples are scarce, and are imported from the northern states; melons, especially water-melons, are raised here in great perfection.

Except the high hills of Santee, the Ridge, and some few other hills, this country is like what is called the upper country, -- is one extensive plain, till you reach the Tryon and Hog-back mountains, 220 miles north-west of Charles-town. The elevation of these mountains above their base is 3840 feet, and above the sea-coast 4640. Their summit affords an extensive view of this state, North Carolina, and Georgia. The sea-coast is bordered with a chain of fine islands, the soil of which is generally better adapted to the culture of indigo and cotton than the main land, and less suited to rice. The whole state, to the distance of eighty or a hundred miles from the sea, is low and level, almost without a pebble, and is little better than an unhealthy salt marsh; but the country, as you advance in it, improves continually; and at 100 miles distance from Charles-town, where it begins to grow hilly, the soil is of a prodigious fertility, fitted for every purpose of human life; nor can any thing be imagined more pleasant to the eye than the variegated disposition of this back country. Here the air is pure and wholesome, and the summer heat much more temperate than on the flat sandy coast.

In South Carolina vegetation is incredibly quick. The climate and soil have something in them so kindly, that the latter, when left to itself, naturally throws out an immense quantity of flowers and flowering shrubs. All the European plants arrive at perfection here beyond that in which their native country affords them. With proper culture and

encouragement, silk, wine, and oil, might be produced in these colonies; of the first we have seen samples equal to what is brought to us from Italy. Wheat in the back parts yield a prodigious increase.

From what we have observed, it appears that the vegetable production of this state are wheat, rice, Indian corn, barley, oats, peas, beans, hemp, flax, cotton, tobacco, indigo, olives, oranges, citron, cypress, saffras, oak, walnut, caisia, and pine-trees; white mulberry-trees for feeding silk-worms; sarsaparilla, and pines, which yield turpentine, rosin, tar, and pitch. There is a kind of tree from which runs an oil of extraordinary virtue of curing wounds; and another which yields a balm thought to be little inferior to that of Mecca. There are other trees besides these, that yield gums.

South Carolina abounds with precious ores, such as gold, silver, lead, black lead, copper, and iron; but it is the misfortune of those who direct their pursuits in search of them, that they are deficient in the knowledge of chemistry, and too frequently make use of improper menstruums in extracting the respective metals. There are likewise rock-crystal, pyrites, marble beautifully variegated, abundance of chalk, crude alum, nitre, and vitriol. The Carolinas produce prodigious quantities of honey, of which they make excellent spirits, and mead as good as Malaga sack. Of all these the three great staple commodities at present are the indigo, rice, and the produce of the pine. Nothing surprises an European more at first sight than the size of the trees here, as well as in Virginia and other American countries. Their trunks are often from fifty to seventy feet high, without a branch or limb; and frequently above thirty-six feet in circumference. Of these trunks, when hollowed, the people of Charles-town, as well as the Indians, make canoes, which serve to transport provisions and other goods from place to place; and some of them are so large, that they will carry thirty or forty barrels of pitch, though formed of one piece of timber. Of these are likewise made curious pleasure boats. There are also a variety of medicinal roots; among others, the rattle snake root, so famous amongst the Indians for the cure of poison; and the venereal root, which, under a vegetable regimen, will cure a confirmed lues.

ANIMALS.] The original animals of this country do not differ much from those of Virginia; but in both the Carolinas they have a still greater variety of beautiful fowls. All the animals of Europe are here in plenty; black cattle are multiplied prodigiously; to have 200 or 300 cows is very common, but some have 1000 or upwards. These ramble all day at pleasure in the forest; but their calves being separated and kept in fenced pastures, the cows return every evening to them. The hogs range in the same manner, and return like the cows; these are very numerous, and many run quite wild, as well as horned cattle and horses, in the woods.

POPULATION AND TRADE.] The number of inhabitants in South Carolina, in 1790, was 249,073, including 107,094 slaves.

The little attention that has been paid to manufactures occasions a vast consumption of foreign imported articles; but the quantity and value of their exports generally leave a balance in favour of the state, except when there have been large importations of negroes. The principal articles exported from this state are rice, indigo, tobacco, skins of various kinds, beef, pork, cotton, pitch, tar, rosin, turpentine, myrtle-wax, lumber, naval stores, cork, leather, snake-root, and ginseng. In the most successful seasons, there have been as many as 140,000 barrels of rice; and 1,300,000 pounds of indigo; exported in a year. In 1791, the exports from this state amounted to 1,693,267 dollars, and in 1795 to 3,998,492 dollars.

RELIGION AND LEARNING.] Since the revolution, by which all denominations were put on an equal footing, there have been no dis-

putes between upper parts of methodists. The dependents are low ebb. Since are several royal on Port-Roy state. Three Charles-town other at Cam their session in practicability the different

putes between different religious sects. They all agree to differ\*. The upper parts of this state are settled chiefly by presbyterians, baptists, and methodists. There are some episcopalian, but the presbyterians and independents are most numerous. The literature of this state is but at a low ebb. Since the peace, however, it has begun to flourish. There are several respectable academies in Charles-town, one at Beaufort, on Port-Royal island, and several others in different parts of the state. Three colleges have lately been incorporated by law, one at Charles-town, one at Winnsborough, in the district of Camden, and the other at Cambridge in the district of Ninety-six. The legislature, in their session in January 1795, appointed a committee to inquire into the practicability of, and to report a plan for, the establishment of schools in the different parts of the state.

**CHIEF TOWNS.]** The principal towns of South Carolina are, Charles-town, George-town, Columbia, and Camden. Charles-town is by far the most considerable town on the sea-coast for an extent of 600 miles. It is the metropolis of South Carolina, and is admirably situated at the confluence of two navigable rivers, one of which is navigable for ships twenty miles above the town, and for boats and large canoes near forty. The harbour is good in every respect, but that of a bar, which hinders vessels of more than 200 tons burthens, loaded, from entering. The fortifications, which were strong, are now demolished; the streets are well cut; the houses are large and well built; some of them are of brick, and others of wood, but all of them handsome and elegant, and rent is extremely high. The streets are wide and straight, intersecting each other at right angles; those running east and west extend about a mile from one river to the other. In 1787, it was computed that there were 1600 houses in this city, and 15,000 inhabitants, including 5400 slaves. In 1791, there were 16,359 inhabitants, of whom 7684 were slaves. This city has often suffered much by fire: the last and most destructive happened in June 1796. The neighbourhood of Charles-town is beautiful beyond description.

Columbia is a small town in Kerhaw county, on the east side of the Congaree, just below the confluence of the Saluda and Broad rivers. It is now the seat of government; but the public offices have, in some measure, been divided, for the accommodation of the inhabitants of the lower counties, and a branch of each retained in Charles-town.

**HISTORY AND GOVERNMENT.]** The first English expeditions into Carolina were unfortunate. None of them had success till the year 1663, in the reign of Charles II. At that time several English noblemen, and others of great distinction, obtained a charter from the crown, investing them with the property and jurisdiction of this country. They parcelled out the lands to such as were willing to go over into the new settlement, and to submit to a system of laws, which they employed the famous Locke to compose for them.

They began their first settlement at a point of land towards the southward of their district, between two navigable rivers. Here they laid the foundation of a city, called Charles-town, which was designed to be, what it is now, the capital of the province. In time, however, the disputes between the church-of-England men and dissenters caused a total confusion in the colony. This was rendered still more intolerable by the incursions of the Indians, whom they had irritated by their insolence and injustice. In order to prevent the fatal consequences of these intestine divisions and foreign wars, an act of parliament was passed, which put this colony under the immediate protection of the crown. The

\* Dr. Morfe.

lords proprietors accepted a recompence of about 24,000*l*. for both the property and jurisdiction; and the constitution of this colony, in those respects in which it differed from the royal colonies, was altered. Earl Grenville, however, thought fit to retain his seventh share, which continued in the possession of his family. For the more convenient administration of affairs, Carolina was divided into two districts, and two governments. This happened in 1728, and from that time, peace being restored in the internal government, as well as with the Cherokees and other Indian tribes, these provinces began to breathe, and their trade advanced with wonderful rapidity.

The government of South Carolina is vested in a governor, senate of thirty-seven, and a house of representatives of one hundred and twenty-four members.

**R**ELIGION are presbyterian, but few regular.

The literature on a plan, which great advantage been instituted.

**ISLANDS AND RIVERS.]** The whole coast of Georgia is bordered with islands, the principal of which are Skidaway, Wallaw, Oribaw, St. Catharine's, Sapelo, Frederica, Jekyl, and Cumberland. The chief rivers of Georgia are the Savannah, which separates it from South Carolina, the Ogeechee, Alatomaha, Turtle River, Little Sitilla, Great Sitilla, St. Mary's, and Apalachicola.

**CLIMATE, SOIL, AND PRODUCE.]** The climate of Georgia is extremely temperate: the winters there are very mild and pleasant. Snow is seldom or never seen; nor is vegetation often prevented by severe frosts. The soil and its fertility are various, according to situation and different improvements. The eastern part of the state, between the mountains and the ocean, and the rivers Savannah and St. Mary's, a tract of country more than 120 miles from north to south, and from 50 to 80 east and west, is level, without a hill or stone. At the distance of about 40 or 50 miles from the sea-board or salt marsh, the lands begin to be more or less uneven, until they gradually rise to mountains. The vast chain of the Alleghany, or Apalachian mountains, which commence with Kaats Kill, near Hudson River, in the state of New York, terminate in Georgia, sixty miles south of its northern boundary. From the foot of this mountain spreads a wide extended plain of the richest soil, and in a latitude and climate well adapted to the cultivation of most of the productions of the south of Europe, and of the East Indies. Rice is at present the staple commodity of the state; tobacco, wheat, and indigo, are the other great articles of produce. Besides these, the country yields cotton, silk, Indian corn, potatoes, oranges, figs, olives, and pomegranates. Most of the tropical fruits would flourish in this state with proper attention. The south-western parts of Georgia, and the parts of East and West Florida which lie adjoining, will probably, says Dr. Morfe, become the vineyard of America. The forests consist of oak, hickory, mulberry, pine, and cedar.

**POPULATION AND TRADE.]** The number of inhabitants in Georgia, according to the census of 1790, amounted to 82,548, of whom 29,264 were slaves. The increase by emigration has been very considerable since.

The chief articles of export from Georgia are rice, tobacco, indigo, sago, timber, naval stores, leather, deer-skins, snake-root, myrtle, and bees-wax; corn, and live-stock. The planters and farmers raise large stocks of cattle, from 1000 to 1500 head, and some more. The value in sterling money of the exports of Georgia, in 1755, was 15,744*l.*—in 1772, 121,677 *l.*—in 1791 value in dollars 491,472; and 1796, 950,158 dollars. In 1790, the tonnage employed in this state was 28,540, and the number of American seamen 11,225. In return for her exports, Georgia receives West-India goods, teas, wines, cloathing, and dry goods of all kinds: from the northern states, cheese, fish, potatoes, cyder, and shoes. The imports and exports are principally to and from Savannah, which has a fine harbour, and is the place where the principal commercial business of the state is transacted.

**RELIGION AND LEARNING.]** The different religious sects in Georgia are presbyterians, episcopalian, baptists, and methodists. They have but few regular ministers among them.

The literature of this state, which is yet in its infancy, is commencing on a plan, which, if properly carried into effect, must be attended with great advantages. A college with ample and liberal endowments has been instituted at Louisville. There is also provision made for the in-

stitution of an academy in each county of the state, to be supported from the same funds, and considered as parts and members of the same institution, under the general superintendance and direction of a president and board of trustees, selected for their literary accomplishments from the different parts of the state, and invested with the customary powers of corporations. This institution is denominated *The University of Georgia*. The funds for the support of literary institutions are principally in lands, amounting in the whole to 50,000 acres, a great part of which is of the best quality, and at present very valuable; together with nearly 6,000*l.* sterling, in bonds, houses, and town lots in Augusta. Other public property, to the amount of 1,000*l.* in each county, has been set apart for the purposes of building, and furnishing their respective academies.

The rev. Mr. George Whitfield founded an orphan-house at Savannah, which, after his death, was converted into a college for the education of young men designed chiefly for the ministry. The funds for its support are chiefly in rice-plantations and negroes. On the death of the Countess of Huntingdon, to whom Mr. Whitfield bequeathed this property as trustee, the legislature, in the year 1792, passed a law vesting it in 13 commissioners, with powers to carry the original intention of Mr. Whitfield into execution; and in memory of the countess, the seminary is styled *Huntingdon College*.

**CHIEF TOWNS.]** The principal towns in Georgia, are Savannah, Augusta, and Louisville. Savannah, formerly the capital of the state, is commodiously situated both for inland and foreign trade, seventeen miles from the sea, on a noble river of the same name, which is navigable for boats upwards of 200 miles. Ships of 300 tons burthen can lie within six yards of the town, and close to a steep bank, extending near a mile along the river-side. The town is regularly built, in the form of a parallelogram, and contained, in 1787, 2,300 inhabitants. In the autumn of 1796 more than two-thirds of this town was consumed by fire.

Augusta, till lately the seat of government, is situated in a fertile plain on the south west bank of the Savannah river, at a bend of the river, where it is near 500 yards broad. In 1787, it contained about 200 houses.

Louisville, now the metropolis of the state, is situated on the river Ogeechee, seventy miles from its mouth. The convention for the revival of the constitution sat in this town in May 1795, and appointed the records to be removed, and the legislature to meet here in future.

**HISTORY AND GOVERNMENT.]** The settlement of Georgia was projected in 1732, when several public-spirited noblemen, and others, from compassion to the poor of these kingdoms, subscribed a considerable sum, which, with 10,000*l.* from the government, was given to provide necessaries for such poor persons as were willing to transport themselves into this province, and to submit to the regulations imposed on them. In process of time, new sums were raised, and new inhabitants sent over. Before the year 1752, upwards of 1000 persons were settled in this province. It was not, however, to be expected, that the inhabitants of Georgia, removed, as they were, at a great distance from their benefactors, and from the check and controul of those who had a natural influence over them, would submit to the magistrates appointed to govern them. Many of the regulations, too, by which they were bound, were very improper in themselves, and deprived the Georgians of privileges which their neighbours enjoyed, and which, as they increased in number

and opulence, these corrupt constitution of colony was or took it under and placed G

and opulence, they thought it hard they should be deprived of. From these corrupt sources arose all the bad humours which tore to pieces this constitution of government. Dissensions of all kinds sprang up, and the colony was on the brink of destruction, when, in 1752, the government took it under their immediate care, removed their particular grievances, and placed Georgia on the same footing with the Carolinas.

The government of Georgia is vested in a governor, executive council of twelve, and house of assembly of seventy-two representatives.

**BOUNDARIES AND DIVISIONS.]** BOUNDED, North, by Kentucky, and part of Virginia; East, by the Stone, Yellow, Iron, and Bald Mountains, which divide it from North Carolina; South, by South Carolina and Georgia; West, by the Mississippi\*.

This extensive territory is divided into three districts; Washington, Hamilton, and Mero; and fourteen counties as follow:

Counties.		Counties.			
Washington district	{	Washington	Mero district	{	Davidson
		Sullivan			Sumner
		Greene			Robertson
		Carter			Montgomery
		Hawkins			
Hamilton district	{	Knox			
		Jefferson			
		Sevier			
		Blount			
		Grainger			

The population, according to an estimate made in November, 1795, was 77,262.

**RIVERS AND MOUNTAINS.]** The Tennessee, called also the Cherokee, and, absurdly, the Hogohege river, is the largest branch of the Ohio. It rises in the mountains of Virginia, latitude 37°, and pursues a course of about 1000 miles south and south-west, nearly to latitude 34°, receiving from both sides a number of large tributary streams. It then wheels about to the north, in a circuitous course, and mingles with the Ohio, nearly sixty miles from its mouth.

The Cumberland mountain, in its whole extent from the great Kan-haway to the Tennessee, consists of the most stupendous piles of craggy rocks of any mountain in the western country. In several parts of it, for miles, it is inaccessible, even to the Indians on foot. In one place particularly, near the summit of the mountain, there is a most remarkable ledge of rocks, of about thirty miles in length, and 200 feet thick,

\* About seven and a half millions of acres of this tract only have been yet purchased from the Indians.

showing a perpendicular face to the south-east, more noble and grand than any artificial fortification in the known world, and apparently equal in point of regularity. Through this stupendous pile, according to a modern hypothesis, had the waters of all the upper branches of the Tennessee to force their way.

The *Enchanted Mountain*, about two miles south of Brafs-town, is famed for the curiosities on its rocks. There are, in several rocks, a number of impressions resembling the tracks of turkeys, bears, horses, and human beings, as visible and perfect as they could be made in snow or sand. The latter were remarkable for having uniformly six toes each, one only excepted, which appeared to be the print of a negro's foot. One of these tracks was very large; the length of the feet sixteen inches, the distance of the extremities of the outer toes thirteen inches. One of the horse-tracks was of an uncommon size. The transverse and conjugate diameters were eight by ten inches; perhaps the horse which the great warrior rode. What appears most in favour of their being the real tracks of the animals they represent, is the circumstance of the horses' feet having slipped several inches, and recovered again, and the figures having all the same direction, like the trail of a company on a journey. If it be a *lusus Naturee*, the old dame never sported more seriously: if the operation of chance, perhaps there was never more apparent design. If it be the work of art, it may be intended to perpetuate the remembrance of some remarkable event of war, or some battle fought there. The vast heaps of stones near the place, said to be tombs of warriors slain in battle, seem to favour the latter supposition. The texture of the rocks is soft: the part on which the sun had the greatest influence, and which was the most indurated, could easily be cut with a knife, and appeared to be of the nature of the pipe-stone. Some of the Cherokees entertain an opinion that it always rains when any person visits the place, as if sympathetic Nature wept at the recollection of the dreadful catastrophe which these figures were intended to commemorate.

**ANIMALS.]** A few years since, this country abounded with large herds of wild animals, improperly called buffaloes; but the improvident or ill-disposed among the first settlers destroyed multitudes of them out of mere wantonness. They are still to be found on some of the south branches of Cumberland river. Elk or moose are seen in many places, chiefly among the mountains. The deer are become comparatively scarce, so that no person makes a business of hunting them for their skins only. Enough of bears and wolves yet remain. Beavers and otters are caught in plenty in the upper branches of Cumberland and Kentucky rivers.

**COMMERCE.]** This country furnishes many valuable articles of export, such as fine waggon and saddle horses, beef, cattle, ginseng, deer-skins, and furs, cotton, hemp, and flax, which may be transported by land; also iron, lumber, pork, and flour, which might be exported in great quantities, if the navigation of the Mississippi were opened; but there are few of the inhabitants who understand commerce, or are possessed of proper capitals; of course, it is badly managed.

**RELIGION.]** The presbyterians are the prevailing denomination of Christians in this district. They have a presbytery, called the Abingdon presbytery, established by act of synod, which, in 1788, consisted of twenty-three large congregations.

**CHIEF TOWNS.]** Knoxville is the seat of government in Tennessee. It is regularly laid out, in a flourishing situation, and enjoys a commodi-

location with every part of the United States by post. A college has been established here by government, called Blount college. The other principal towns are Nashville and Jonesborough.

**HISTORY AND GOVERNMENT.]** The eastern parts of this district were explored by colonels Wood, Patton, Buchanan, captain Charles Campbell, and Dr. T. Walker (each of whom were concerned in large grants of land from the government), as early as between the years 1740 and 1750. In 1755, at the commencement of the French war, not more than fifty families had settled here, who were either destroyed or driven off by the Indians, before the close of the following year. It remained uninhabited till 1765, when the settlement of it recommenced; and, in 1773, the country as far west as the long island of Holstein, an extent of more than 120 miles in length, from east to west, had become tolerably well peopled.

In 1785, in conformity to the resolves of congress, of April 23, 1784, the inhabitants of this district essayed to form themselves into a body politic, by the name of the State of FRANKLAND; but differing among themselves, as to the form of government, and other matters, in the issue of which some blood was shed, and being opposed by some leading persons in the eastern parts, the scheme was given up, and the inhabitants remained in general peaceable until 1796, when a convention was held at Knoxville, and on the 6th of February the constitution of the State of Tennessee was signed by every member of it. Its principles promise to ensure the happiness and prosperity of the people.

## TERRITORY NORTH-WEST OF THE OHIO.

### SITUATION AND EXTENT.

Miles.		Degrees.		Sq. Miles.
Length 900 } Breadth 700 }	between	{ 37 and 50 North latitude { 81 and 98 West longitude	}	411,000

**BOUNDARIES AND DIVISIONS.]** THIS extensive tract of country is bounded, North, by part of the northern boundary line of the United States; East, by the lakes, and Pennsylvania; South, by the Ohio river; West, by the Mississippi. Mr. Hutchins, the late geographer of the United States, estimates that this tract contains 263,040,000 acres, of which 43,040,000 are water.

That part of this territory in which the Indian title is extinguished, by being purchased from them, and which is settling under the government of the United States, is divided into the following five counties:

Counties.	When erected.	Counties.	When erected.
Washington, . . . . .	July 26, 1788	Knox, . . . . .	June 20, 1790
Hamilton, . . . . .	Jan. 2, 1790	Wayne, . . . . .	1795
St. Clair, . . . . .	April 27, 1790		

**RIVERS.]** The Mulingum is a gentle river, confined by banks so high as to prevent its overflowing. It is 250 yards wide at its confluence with the Ohio, and navigable by large bateaux and barges to the Three Legs, and by small ones to the lake at its head. The Hockhock-

ing resembles the Muskingum, though somewhat inferior in size. The Scioto is a larger river than either of the preceding, and opens a more extensive navigation. One hundred and seventy-six miles above the Ohio, and eighteen miles above the Missouri, the Illinois empties itself into the Mississippi, from the north-east, by a mouth about 400 yards wide.

FACE OF THE COUNTRY, } The lands on the various streams  
SOIL, PRODUCTIONS, &c. } which fall into the Ohio are inter-  
spersed with all the variety of soil that conduces to pleasantness of situa-  
tion, and lays the foundation for the wealth of an agricultural and ma-  
nufacturing people.

The sugar-maple is a most valuable tree. Any number of inhabi-  
tants may be constantly supplied with a sufficiency of sugar by preserv-  
ing a few of these trees for the use of each family. One tree will yield  
about ten pounds of sugar a year, and the labour is very trifling.

Springs of excellent water abound in every part of this territory; and  
small and large streams, suitable for mills and other purposes, are inter-  
spersed, as if to prevent any deficiency of the conveniences of life.

No country is better stocked with wild game of every kind. Innu-  
merable herds of deer and wild cattle are sheltered in the groves, and  
fed in the extensive bottoms that every where abound; an unquestion-  
able proof of the great fertility of the soil. Turkeys, geese, ducks,  
swans, teal, pheasants, partridge, &c. are, from observation, believed  
to be in greater plenty here than the tame poultry are in any part of the  
old settlements in America.

The rivers are well stored with fish of various kinds, and many of  
them of an excellent quality. They are generally large, though of dif-  
ferent sizes: the cat-fish, which is the largest, and of a delicious flavour,  
weighs from six to eighty pounds.

The number of old forts found in this western country are the ad-  
miration of the curious. They are mostly of an oblong form, situated  
on strong well-chosen ground, and contiguous to water. When, by  
whom, and for what purpose, these were thrown up, is uncertain.  
They are undoubtedly very ancient, as there is not the least visible dif-  
ference in the age or size of the timber growing on or within these forts,  
and that which grows without; and the natives have lost all tradition  
respecting them.

GOVERNMENT.] By an ordinance of congress, passed the 13th of Ju-  
ly, 1787, this country, for the purposes of temporary government, was  
erected into one district, subject, however, to a division, when circum-  
stances shall make it expedient.

In the same ordinance it is provided, that congress shall appoint a  
governor, whose commission shall continue in force three years, unless  
sooner revoked.

The governor must reside in the district, and have a freehold estate  
therein of 1000 acres of land, while in the exercise of his office.

Congress, from time to time, are to appoint a secretary, to continue in  
office four years, unless sooner removed, who must reside in the district,  
and have an estate of 500 acres of land while in office.

The same ordinance of congress provides that there shall be formed  
in this territory not less than three nor more than five states; and when  
any of the said states shall have 60,000 free inhabitants therein, such  
state shall be admitted by its delegates into the congress of the United  
States, on an equal footing with the original states, and shall be at li-  
berty to form a permanent constitution and state-government, provided

Faint, mostly illegible text, possibly a legal document or official record, with some words like "whereas" and "and" visible.

the constitution and government so to be formed shall be republican, and so far as it can be consistent with the general interest of the confederacy. Such admission shall be allowed at an earlier period, and when there may be a less number of inhabitants in the state than 60,000.

The settlement of this country has been checked for several years past by the unhappy Indian war. Of this, however, an amicable termination took place on the 3d of August, 1795, when a treaty was concluded, since which a trade has been opened, by a law of congress, with the Indians, on such a liberal footing as promises to give permanency to the treaty, and security to the frontier inhabitants.

## WEST INDIES.

WE have already observed, that between the two continents of America lie a multitude of islands which we call the West Indies, and which, such as are worth cultivation, now belong to five European powers, Great Britain, Spain, France, Holland, and Denmark. As the climate and seasons of these islands differ widely from what we can form any idea of by what we perceive at home, we shall, to avoid repetitions, speak of them in general, and mention some other particulars that are peculiar to the West Indies.

The climate in all our West-India islands is nearly the same, allowing for those accidental differences which the several situations and qualities of the lands themselves produce. As they lie within the tropics, and the sun goes quite over their heads, passing beyond them to the north, and never returning farther from any of them than about thirty degrees to the south, they are continually subjected to the extreme of a heat which would be intolerable, if the trade-wind, rising gradually as the sun gathers strength, did not blow in upon them from the sea, and refresh the air in such a manner, as to enable them to attend to their concerns, even under the meridian sun. On the other hand, as the night advances, a breeze begins to be perceived, which blows smartly from the land, as it were from the centre, towards the sea, to all points of the compass at once.

In the same manner, when the sun has made a great progress towards the tropic of Cancer, and becomes in a manner vertical, he draws after him such a vast body of clouds, as shield the earth from his direct beams; and dissolving into rain, cool the air, and refresh the country, thirsty with the long drought, which commonly reigns from the beginning of January to the latter end of May.

The rains in the West Indies (and we may add in the East Indies) are by no means so moderate as with us. Our heaviest rains are but dews comparatively. They are rather floods of water, poured from the clouds with a prodigious impetuosity; the rivers rise in a moment; new rivers and lakes are formed, and in a short time all the low country is under water\*. Hence it is, the rivers which have their source within the tropics swell and overflow their banks at a certain season; but so mistaken were the ancients in their idea of the torrid zone, that they imagined it to be dried and scorched up with a continued and fer-

\* See Wafer's Journey across the Isthmus of Darien.

vent heat, and to be for that reason uninhabitable; when, in reality, some of the largest rivers of the world have their course within its limits, and the moisture is one of the greatest inconveniences of the climate in several places.

The rains make the only distinction of seasons in the West Indies; the trees are green the whole year round; they have no cold, no frosts, no snows, and but rarely some hail; the storms of hail are, however, very violent when they happen, and the hailstones very great and heavy.—Whether it be owing to this moisture, which alone does not seem to be a sufficient cause, or to a greater quantity of sulphureous acid which predominates in the air of this country, metals of all kinds, that are subject to the action of such causes, rust and canker in a very short time; and this cause, perhaps as much as the heat itself, contributes to make the climate of the West Indies unfriendly and unpleasant to a European constitution.

It is in the rainy season (principally in the month of August, more rarely in July and September) that they are assailed by hurricanes, the most terrible calamity to which they are subject (as well as the people in the East Indies) from the climate; this destroys, at a stroke, the labours of many years, and prostrates the most exalted hopes of the planter, and often just at the moment when he thinks himself out of the reach of fortune. It is a sudden and violent storm of wind, rain, thunder, and lightning, attended with a furious swelling of the seas, and sometimes with an earthquake; in short, with every circumstance which the elements can assemble, that is terrible and destructive. First, they see, as the prelude to the ensuing havoc, whole fields of sugar-canes whirled into the air, and scattered over the face of the country; the strongest trees of the forest are torn up by the roots, and driven about like stubble; their wind-mills are swept away in a moment; their utensils, the fixtures, the ponderous copper boilers, and stills of several hundred weight, are wrenched from the ground, and battered to pieces; their houses are no protection; the roofs are torn off at one blast; whilst the rain, which in an hour rises five feet, rushes in upon them with irresistible violence.

The grand staple commodity of the West Indies is sugar; this commodity was not at all known to the Greeks and Romans, though it was made in China in very early times, from whence we had the first knowledge of it; but the Portuguese were the first who cultivated it in America, and brought it into request, as one of the materials of a very universal luxury in Europe. It is not agreed whether the cane, from which this substance is extracted, be a native of America, or brought thither to their colony of Brasil, by the Portuguese, from India and the coast of Africa; but, however that may be, in the beginning they made the most as they still do the best sugars which come to market in this part of the world. The juice within the sugar-cane is the most lively, elegant, and least cloying sweet in nature, and, sucked raw, has proved extremely nutritive and wholesome. From the melasses, rum is distilled, and from the scummings of sugar a meaner spirit is procured. Rum finds its market in North America, where it is consumed by the inhabitants, or employed in the African trade, or distributed from thence to the fishery of Newfoundland, and other parts, besides what comes to Great Britain and Ireland. However, a very great quantity of melasses is taken off raw, and carried to New England to be distilled there. The tops of the canes, and the leaves which grow upon the joints, make very good provender for the cattle; and the refuse of the cane,

after grinding, without its use.

It is computed that melasses pay the gain. However we may easily see that they are very great, chargeable articles, and the houses, and the will not suffer not to mention the loss of capital of at least which great effect the earth, as it generally provides a speedier sale than p

after grinding, serves for fire; so that no part of this excellent plant is without its use.

It is computed that, when things are well managed, the rum and melasses pay the charges of the plantation, and the sugars are clear gain. However, by the particulars we have seen, and by others which we may easily imagine, the expenses of a plantation in the West Indies are very great, and the profits, at the first view, precarious: for the chargeable articles of the wind-mill, the boiling, cooling, and distilling-houses, and the buying and subsisting a suitable number of slaves and cattle, will not suffer any man to begin a sugar plantation of any consequence, not to mention the purchase of the land, which is very high, under a capital of at least 5000*l*. There are, however, no parts of the world in which great estates are made in so short a time, from the produce of the earth, as in the West Indies. The produce of a few good seasons generally provides against the ill effects of the worst, as the planter is sure of a speedy and profitable market for his produce, which has a readier sale than perhaps any other commodity in the world.

Large plantations are generally under the care of a manager, or chief overseer, who has commonly a salary of 150*l*. a year, with overseers under him in proportion to the greatness of the plantation; one to about thirty negroes, with a salary of about 40*l*. Such plantations, too, have a surgeon at a fixed salary, employed to take care of the negroes which belong to it. But the course which is the least troublesome to the owner of the estate is, to let the land, with all the works, and the stock of cattle and slaves, to a tenant, who gives security for the payment of rent, and the keeping up repairs and stock. The estate is generally estimated to such a tenant at half the net produce of the best years. Such tenants, if industrious and frugal men, soon make good estates for themselves.

The negroes in the plantations are subsisted at a very easy rate. This is generally by allotting to each family of them a small portion of land, and allowing them two days in the week, Saturday and Sunday, to cultivate it: some are subsisted in this manner, but others find their negroes a certain portion of Guinea and Indian corn, and to some a salt herring, or a small portion of bacon or salt pork, a day. All the rest of the charge consists in a cap, a shirt, a pair of breeches, and a blanket; and the profit of their labour yields 10*l*. or 12*l*. annually. The price of men negroes, upon their first arrival, is from 30 to 36*l*. women and grown boys 50*l*. less: but such negro families as are acquainted with the business of the islands generally bring above 40*l*. upon an average one with another; and there are instances of a single negro man, expert in business, bringing 150 guineas; and the wealth of a planter is generally computed from the number of slaves he possesses.

To particularise the commodities proper for the West-India market, would be to enumerate all the necessaries, conveniences, and luxuries of life; for they have nothing of their own but cotton, coffee, tropical fruits, spices, and the commodities I have already mentioned.

Traders there make a very large profit upon all they sell; but from the numerous shipping constantly arriving from Europe, and a continual succession of new adventurers, each of whom carry out more or less as a venture, the West-India market is frequently overstocked; money must be raised, and goods are sometimes sold at prime cost or under. But those who can afford to store their goods, and wait for a better market, acquire fortunes equal to any of the planters. All kinds of handicraftsmen, especially carpenters, bricklayers, braziers, and cooper,

get very great encouragement. But it is the misfortune of the West Indies, that physicians and surgeons even outdo the planter and merchant in accumulating riches.

The present state of the population in the British West Indies appears to be about 65,000 whites, and 455,000 blacks. There is likewise in each of the islands a considerable number of mixed blood, and native blacks of free condition. In Jamaica they are reckoned at 10,000; and they do not fall short of the same number in all other islands collectively taken. The whole inhabitants, therefore, may properly be divided into four great classes: 1. European whites; 2. Creole or native whites; 3. Creoles of mixed blood and free native blacks; 4. Negroes in a state of slavery.

The islands of the West Indies lie in the form of a bow, or semicircle, stretching almost from the coast of Florida north, to the river Orinoco, in the main Continent of South America. Some call them the Caribbees, from the first inhabitants; though this is a term that most geographers confine to the Leeward Islands. Sailors distinguish them into Windward and Leeward Islands, with regard to the usual courses of ships, from Old Spain, or the Canaries, to Carthage, or New Spain and Portobello.—The geographical tables and maps distinguish them into the great and little Antilles.

**JAMAICA.** This island, which is the first belonging to Great Britain, and also the most important that we arrive at after leaving Florida, lies between the 75th and 79th degrees of west longitude from London, and between 17 and 18 north latitude. From the east and west it is in length about 140 miles, and in the middle about 60 in breadth, growing less towards each end, in the form of an egg. It lies near 4500 miles south-west of England.

This island is intersected with a ridge of steep rocks, heaped by the frequent earthquakes in a stupendous manner upon one another. These rocks, though containing no soil on their surface, are covered with a great variety of beautiful trees, flourishing in a perpetual spring; they are nourished by the rains which often fall, or the mists which continually brood on the mountains, and which, their root penetrating the crannies of the rocks, industriously seek out for their own support. From the rocks issue a vast number of small rivers of pure wholesome waters, which tumble down in cataracts, and, together with the stupendous height of the mountains, and the bright verdure of the trees through which they flow, form a most delightful landscape. On each side of this chain of mountains are ridges of lower ones, which diminish as they remove from it. On these coffee grows in great plenty. The valleys or plains between those ridges are level beyond what is ordinary in most other countries, and the soil is prodigiously fertile.

The longest day in summer is about thirteen hours, and the shortest in winter about eleven; but the most usual divisions of the seasons in the West Indies are into the dry and wet seasons. The air of this island is, in most places, excessively hot, and unfavourable to European constitutions; but the cool sea-breezes, which set in every morning at ten o'clock, render the heat more tolerable: and the air upon the high grounds is temperate, pure, and cooling. It lightens almost every night, but without much thunder, which, when it happens, is very terrible, and roars with astonishing loudness; and the lightning in these violent storms frequently does great damage. In February or March they expect earthquakes, of which we shall speak hereafter. During the months of May and October, the rains are extremely violent, and continue some-

times for a fortnight; and the heat is so great, that a bath, of great service, which, except in the most terrible epidemics, is not to be used.

Sugar is the principal commodity which is raised in the West Indies. It is the most valuable article of the produce, and the most profitable. The plant is the most common, and the most easy to be raised. It is a perennial plant, and the fruit, though it is not a true fruit, is a berry, and is used for the most part as a sugar. The sugar is made by boiling the juice of the plant in a boiler, and then pouring it into a mould, where it is pressed into cakes. The sugar is then refined, and is used for the most part as a sugar. The sugar is the most valuable article of the produce, and the most profitable. The plant is the most common, and the most easy to be raised. It is a perennial plant, and the fruit, though it is not a true fruit, is a berry, and is used for the most part as a sugar. The sugar is made by boiling the juice of the plant in a boiler, and then pouring it into a mould, where it is pressed into cakes. The sugar is then refined, and is used for the most part as a sugar.

times for a fortnight together. In the plains are found several salt fountains; and in the mountains, not far from Spanish Town, is a hot bath, of great medicinal virtues. It gives relief in the dry belly-ach, which, excepting the bilious and yellow fever, is one of the most terrible endemial distempers of Jamaica.

Sugar is the greatest and most valuable production of this island. Cocoa was formerly cultivated in it to a great extent. It produces also ginger, and the pimento, or, as it is called, Jamaica pepper; the wild cinnamon-tree, whose bark is so useful in medicine; the manchineel, whose fruit, though uncommonly delightful to the eye, contains one of the worst poisons in nature; the mahogany, in such use with our cabinet-makers, and of the most valuable quality; but this wood begins to wear out, and of late is very dear. Excellent cedars, of a large size and durable; the cabbage-tree, remarkable for the hardness of its wood, which when dry is incorruptible, and hardly yields to any kind of tool; the palma, affording oil, much esteemed by the savages, both in food and medicine; the soap-tree, whose berries answer all purposes of washing; the mangrove and olive-bark, useful to tanners; the fustic and red-wood to the dyers; and lately the logwood. The indigo plant was formerly much cultivated; and the cotton-tree is still so. No sort of European grain grows here; they have only maize or Indian corn, Guinea corn, peas of various kinds, but none of them resembling ours, with variety of roots. Fruits, as has been already observed, grow in great plenty; citrons, Seville and China oranges, common and sweet lemons, limes, shadocks, pomegranates, mamees, fourfops, papas, pine-apples, custard apples, star-apples, prickly pears, allicada pears, melons, pompions, guavas, and several kinds of berries, also garden-stuffs in great plenty, and good. The cattle bred on this island are but few; their beef is tough and lean; the mutton and lamb are tolerable; they have great plenty of hogs; many plantations have hundreds of them, and their flesh is exceedingly sweet and delicate. Their horses are small, mettlesome, and hardy, and, when well made, generally sell for 30l. or 40l. sterling. Jamaica likewise supplies the apothecary with guaiacum, sarsaparilla, china, cassia, and tamarinds. Among the animals are the land and sea turtle, and the alligator. Here are all sorts of fowl, wild and tame, and in particular more parrots than in any of the other islands; besides parroquets, pelicans, snipes, teal, Guinea hens, geese, ducks, and turkeys; the humming-bird, and a great variety of others. The rivers and bays abound with fish. The mountains breed numberlessadders, and other noxious animals, as the ferns and marshes do the guana and the gallewasp; but these last are not venomous. Among the insects are the ciror, or chegoe, which eats into the nervous or membranous parts of the flesh of the negroes; and the white people are sometimes plagued with them. These insects get into any part of the body, but chiefly the legs and feet, where they breed in great numbers, and shut themselves up in a bag. As soon as the person feels them, which is not perhaps till a week after they have been in the body, they pick them out with a needle, or point of a penknife, taking care to destroy the bag entirely, that none of the breed, which are like nits, may be left behind. They sometimes get into the toes, and eat the flesh to the very bone.

This island was originally a part of the Spanish empire in America. Several descents had been made upon it by the English, prior to 1656; but it was not till this year that Jamaica was reduced under our dominion.—Cromwell had fitted out a squadron, under Pean and Venables, to reduce the Spanish island of Hispaniola, but there this squadron was

unsuccessful. The commanders, of their own accord, to atone for this misfortune, made a descent on Jamaica, and, having carried the capital, St. Jago, soon compelled the whole island to surrender. Ever since it has been subject to the English, and the government of it is one of the richest places, next to that of Ireland, in the disposal of the crown, the standing salary being 2,500*l.* per annum, and the assembly commonly voting the governor as much more; which, with the other perquisites, make it on the whole little inferior to 10,000*l.* per annum.

We have already observ'd, that the government of all the American islands is the same, namely, that kind which we have formerly described under the name of a royal government. Their religion too is universally of the church of England; though they have no bishop, the bishop of London's commissary being the chief religious magistrate in those parts.

About the beginning of this century, it was computed, that the number of whites in Jamaica amounted to 60,000, and that of the negroes to 120,000. At present the inhabitants are stated at 30,000 whites, 10,000 freed negroes and people of colour, and 250,000 negro slaves.

Indigo was once very much cultivated in Jamaica, and it enriched the island to so great a degree, that in the parish of Vere, where this drug was chiefly cultivated, they are said to have had no less than 300 gentlemen's coaches; a number perhaps even the whole island exceeds not at this day; and there is great reason to believe, that there were many more persons of property in Jamaica formerly than there are now, though perhaps they had not those vast fortunes which dazzle us in such a manner at present. However, the Jamaicans were undoubtedly very numerous, until reduced by earthquakes, and by terrible epidemical diseases, which swept away vast multitudes. The decrease of inhabitants, as well as the decline of their commerce, arises from the difficulties to which their trade is expos'd, of which they do not fail to complain to the court of Great Britain; that they are of late deprived of the most beneficial part of their trade, the carrying of negroes and dry goods to the Spanish coast; the low value of their produce, which they ascribe to the great improvements the French make in their sugar colonies, who are enabled to undersell them by the lowness of their duties; and the trade carried on from Ireland and the northern colonies to the French and Dutch islands, where they pay no duties, and are supplied with goods at an easier rate. Some of these complaints, which equally affect the other islands, have been heard, and some remedies applied; others remain unredress'd. Both the logwood trade, and this contraband, have been the subjects of much contention, and the cause of a war between Great Britain and the Spanish nation.

Port Royal was formerly the capital of Jamaica. It stood upon the point of a narrow neck of land, which, towards the sea, formed part of the border of a very fine harbour of its own name. The conveniency of this harbour, which was capable of containing a thousand sail of large ships, and of such depth as to allow them to load and unload at the greatest ease, induced the inhabitants to build their capital on this spot, though the place was a hot dry sand, and produced none of the necessaries of life, not even fresh water. But the advantage of its harbour, and the resort of pirates, made it a place of great consideration. These pirates were called Buccaneers; they fought with an inconsiderate bravery, and then spent their fortune in this capital with an inconsiderate dissipation. About the beginning of the year 1692, no place, for its size, could be compared to this town for trade, wealth, and au-

entire corruption of manners. In the month of June, in this year, an earthquake, which shook the whole island to the foundations, totally overwhelmed this city, so as to leave, in one quarter, not even the smallest vestige remaining. In two minutes, the earth opened and swallowed up nine tenths of the houses, and two thousand people. The water gushed out from the openings of the earth, and tumbled the people on heaps; but some of them had the good fortune to catch hold of beams and rafters of houses, and were afterwards saved by boats. Several ships were cast away in the harbour, and the Swan frigate, which lay in the dock to careen, was carried over the tops of sinking houses, and did not overset, but afforded a retreat to some hundreds of people, who saved their lives upon her. An officer, who was in the town at this time, says, the earth opened and shut very quick in some places, and he saw several people sink down to the middle, and others appeared with their heads just above ground, and were squeezed to death. At Savannah, above a thousand acres were sunk, with the houses and people in them; the place appearing for some time like a lake, was afterwards dried up, but no houses were seen. In some parts mountains were split; and at one place a plantation was removed to the distance of a mile. They again rebuilt the city; but it was a second time, ten years after, destroyed by a great fire. The extraordinary convenience of the harbour tempted them to build it once more; and once more, in 1722, was it laid in rubbish by a hurricane, the most terrible on record. Such repeated calamities seemed to mark out this place as a devoted spot; the inhabitants, therefore, resolved to forsake it for ever, and to reside at the opposite bay, where they built Kingston, which is lately become the capital of the island. It consists of upwards of one thousand houses, many of them handsomely built, and, in the taste of these islands, as well as the neighbouring continent, one story high, with porticoes, and every conveniency for a comfortable habitation in that climate. Not far from Kingston stands St. Jago de la Vega, a Spanish town, which, though at present inferior to Kingston, was once the capital of Jamaica, and is still the seat of government, and the place where the courts of justice are held.

On the 3d of October, 1780, was a dreadful hurricane, which almost overwhelmed the little sea port town of Savanna-la-Mar, in Jamaica, and part of the adjacent country. Very few houses were left standing, and a great number of lives were lost. Much damage was also done, and many persons perished, in other parts of the island.

The number of white inhabitants in this island in 1787 was 30,000; freed negroes 10,000; maroons 1400; and slaves 250,000; in all 304,000. The value of this island as British property is estimated as follows; 250,000 negroes, at 50l. sterling each, twelve millions and a half; the landed and personal property, and buildings to which they are appurtenant, twenty-five millions more; the houses and property in the towns, and the vessels employed in trade, one million and a half; in all thirty-nine millions. The exports of Jamaica for one year, ending the 5th of January, 1788, amounted in sterling money to £.2,136,442. 17s. 3d. In 1787, the exports to the United States amounted to £.60,095. 18s. and importations from the United States to the value of 90,000l.

The whole produce of the island may be reduced to these heads: First, sugars, of which article was exported to Great Britain in 1787, 824,706 cwt. In 1790, 1,185,519 cwt. Most of this goes to London, Bristol, and Glasgow, and some part of it to North America, in return for the beef, pork, cheese, corn, peas, staves, planks, pitch, and tar,

which they have from hence. Second, rum, of which they export about four thousand puncheons. The rum of this island is generally esteemed the best, and is the most used in Great Britain. Third, molasses, in which they make a great part of their returns for New England, where there are vast distilleries. All these are the produce of the grand staple, the sugar-cane. According to the late testimony of a respectable planter in Jamaica; that island has 280,000 acres in canes, of which 210,000 are annually cut, and make from 68 to 70,000 tons of sugar, and 4,200,000 gallons of rum. Fourth, cotton, of which they send out two thousand bags. The indigo, formerly much cultivated, is now inconsiderable; but some cocoa and coffee are exported, with a considerable quantity of pepper, ginger, drugs for dyers and apothecaries, sweet-meats, mahogany, and manchineel planks. But some of the most considerable articles of their trade are with the Spanish continent of New Spain and Terra Firma; for in the former they cut great quantities of logwood; and both in the former, and latter, they carry on a vast and profitable trade in negroes, and all kinds of European goods. And even in time of war with Spain, this trade between Jamaica and the Spanish main goes on, which it will be impossible for Spain to stop, whilst it is so profitable to the British merchant, and whilst the Spanish officers, from the highest to the lowest, show so great a respect to presents properly made. Upon the whole, many of the people of Jamaica, whilst they appear to live in such a state of luxury, as in most other places leads to beggary, acquire great fortunes, in a manner instantly. Their equipages, their clothes, their furniture, their tables, all bear the tokens of the greatest wealth and profusion imaginable. This obliges all the treasure they receive to make but a very short stay, being hardly more than sufficient to answer the calls of their necessity and luxury on Europe and North America.

On Sundays, or court time, gentlemen wear wigs, and appear very gay in coats of silk, and vests trimmed with silver. At other times they generally wear only thread stockings, linen drawers, a vest, a Holland cap, and a hat upon it. Men servants wear a coarse linen frock, with buttons at the neck and hands, long trowsers of the same, and a check shirt. The negroes, except those who attend gentlemen, who have them dressed in their own livery, have once a year Osuaburghs, and a blanket for cloathing, with a cap or handkerchief for the head. The morning habit of the ladies is a loose night-gown, carelessly wrapped about them; before dinner they put off their dressable, and appear with a good grace in all the advantage of a rich and becoming dress.

The common drink of persons in affluent circumstances is Madeira wine mixed with water. Ale and claret are extravagantly dear; and London porter sells for a shilling per bottle. But the general drink, especially among those of inferior rank, is rum punch, which they call Kill-devil, because, being frequently drank to excess, it heats the blood, and brings on fevers, which in a few hours send them to the grave, especially those who are just come to the island; which is the reason that so many die here upon their first arrival.

English money is seldom seen here, the current coin being entirely Spanish. There is no place where silver is so plentiful, or has a quicker circulation. You cannot dine for less than a piece of eight, and the common rate of boarding is three pounds per week, though in the markets, beef, pork, fowl, and fish, may be bought as cheap as in London; but mutton sells at nine-pence per pound.

well versed in literature, and who send their children to Great Britain, where they have the advantage of a polite and liberal education; but the bulk of the people take little care to improve their minds, being generally engaged in trade or riotous dissipation.

The misery and hardships of the natives are truly pitiable; and though great care is taken to make them propagate, the ill-treatment they receive so shortens their lives, that, instead of increasing by the course of nature, many thousands are annually imported to the West Indies, to supply the place of those who pine and die with the hardships they undergo. It is said, that they are stubborn and untractable for the most part, and that they must be ruled with a rod of iron; but they ought not to be crushed with it, or to be thought a sort of beasts, without souls, as some of their masters or overseers do at present, though some of these tyrants are themselves the dregs of this nation, and the refuse of the jails of Europe. Many of the negroes, however, who fall into the hands of gentlemen of humanity, find their situations easy and comfortable; and it has been observed, that in North America, where in general these poor wretches are better used, there is a less waste of negroes, they live longer, and propagate better. And it seems clear, from the whole course of history, that those nations which have behaved with the greatest humanity to their slaves were always best served, and ran the least hazard from their rebellions.—The slaves, on their first arrival from the coast of Guinea, are exposed naked to sale; they are then generally very simple and innocent creatures, but they soon become roguish enough; and, when they come to be whipped, excuse their faults by the example of the whites. They believe every negro returns to his native country after death. This thought is so agreeable, that it cheers the poor creatures, and renders the burthen of life easy, which would otherwise, to many of them, be quite intolerable.—They look on death as a blessing, and it is surprising to see with what courage and intrepidity some of them meet it; they are quite transported to think their slavery is near an end, that they shall revisit their native shore, and see their old friends and acquaintance. When a negro is about to expire, his fellow-slaves kiss him, and wish him a good journey, and send their hearty good wishes to their relations in Guinea. They make no lamentations; but with a great deal of joy enter his body, believing he is gone home and happy.

**BARBADOES.]** This island, the most easterly of all the Caribbees, is situated in fifty-nine degrees west long. and thirteen degrees north lat. It is twenty-one miles in length, and in breadth fourteen. When the English, some time after the year 1625, first landed here, they found it the most savage and desolate place they had hitherto visited. It had not the least appearance of ever having been peopled even by savages. There was no kind of beasts of pasture or of prey, no fruit, no herb, nor root, fit for supporting the life of man. Yet as the climate was so good, and the soil appeared fertile, some gentlemen of small fortunes in England resolved to become adventurers thither. The trees were so large, and of a wood so hard and stubborn, that it was with great difficulty they could clear as much ground as was necessary for their subsistence. By unremitting perseverance, however, they brought it to yield them a tolerable support; and they found that cotton and indigo agreed well with the soil, and that tobacco, which was beginning to come into repute in England, answered tolerably. These prospects, together with the disputes between the king and parliament, which were beginning to break out in England, induced many new adventurers to transport

themselves into this island. And what is extremely remarkable, so great was the increase of people, in Barbadoes, twenty-five years after its first settlement, that, in 1650 it contained more than 50,000 whites, and a much greater number of negroes and Indian slaves; the latter they acquired by means not at all to their honour; for they seized upon all those unhappy men, without any pretence, in the neighbouring islands, and carried them into slavery: a practice which has rendered the Caribbee Indians irreconcilable to us ever since. They had begun, a little before this, to cultivate sugar, which soon rendered them extremely wealthy. The number of the slaves therefore was still augmented: and in 1676, it was supposed that their number amounted to 100,000, which, together with 50,000, make 150,000 on this small spot; a degree of population unknown in Holland, in China, or any other part of the world most renowned for numbers. At this time Barbadoes employed 400 sail of ships, one with another, of 150 tons, in their trade. Their annual exports, in sugar, indigo, ginger, cotton, and citron-water, were above 350,000*l.* and their circulating cash at home was 200,000*l.* Such was the increase of population, trade, and wealth, in the course of fifty years. But since that time this island has been much on the decline; which is to be attributed partly to the growth of the French sugar colonies, and partly to our own establishments in the neighbouring isles. In 1786, the numbers were 16,167 whites; 838 free people of colour; and 62,115 negroes. Their commerce consists in the same articles as formerly, though they deal in them to less extent. The capital is Bridgetown, where the governor resides, whose employment is said to be worth 5000*l.* per annum. They have a college founded and well endowed by colonel Codrington, who was a native of this island. Barbadoes, as well as Jamaica, has suffered much by hurricanes, fires, and the plague. On the 10th of October 1780, a dreadful hurricane occasioned vast devastation in Barbadoes, great numbers of dwellings were destroyed, not one house in the island was wholly free from damage, many persons were buried in the ruins of the buildings, and many more were driven into the sea, and there perished.

**St. CHRISTOPHER'S.**] This island, commonly called by the sailors St. Kitt's, is situated in sixty-three degrees west long. and seventeen degrees north lat. about fourteen leagues from Antigua, and is twenty miles long and seven broad. It has its name from the famous Christopher Columbus, who discovered it for the Spaniards. That nation, however, abandoned it, as unworthy of their attention: and in 1626, it was settled by the French and English conjunctly; but entirely ceded to us by the peace of Utrecht. Besides cotton, ginger, and the tropical fruits, it generally produces near as much sugar as Barbadoes, and sometimes quite as much. It is computed that this island contains 6000 whites, and 36,000 negroes. In February, 1782, it was taken by the French, but was restored again to Great Britain by the late treaty of peace.

**ANTIGUA.**] Situated in sixty-one degrees west long. and 17 deg. north lat. is of a circular form, near twenty miles over every way. This island, which was formerly thought useless, has now got the start of the rest of the English harbours, being the best and safest as a dock-yard and an establishment for the royal navy; but St. John's is the port of greatest trade: and this capital, which, before the fire in 1769, was large and wealthy, is the ordinary seat of the governor of the Leeward Islands. In 1774, the white inhabitants in Antigua of all ages and sexes were 2,590, and the enslaved negroes 37,808.

**NEVIS AND MONTSERRAT.]** Two small islands, lying between St. Christopher's and Antigua, neither of them exceeding eighteen miles in circumference. In the former of these islands the present number of whites is stated not to exceed six hundred, while the negroes amount to about ten thousand; a disproportion which necessarily converts all such white men as are not exempted by age and decrepitude into a well-regulated militia, among which there is a troop consisting of fifty horse, well mounted and accoutred. English forces, on the British establishment, they have none. The inhabitants of Montserrat amount to 1,300 whites, and about 10,000 negroes. The soil in these islands is pretty much alike, light and sandy, but, notwithstanding, fertile in a high degree; and their principal exports are derived from the sugar-cane. Both were taken by the French in the year 1782, but restored at the peace.

**BARBUDA.]** Situated in eighteen degrees north lat. and sixty-two west long. thirty-five miles north of Antigua, is twenty miles in length, and twelve in breadth. It is fertile, and has an indifferent road for shipping, but no direct trade with England. The inhabitants are chiefly employed in husbandry, and raising fresh provisions for the use of the neighbouring isles. It belongs to the Codrington family, and the inhabitants amount to about 1500.

**ANGUILLA.]** Situated in nineteen deg. north lat. sixty miles north-west of St. Christopher's, is about thirty miles long and ten broad. This island is perfectly level, and the climate nearly the same with that of Jamaica.—The inhabitants, who are not numerous, apply themselves to husbandry, and feeding of cattle.

**DOMINICA.]** Situated in sixteen deg. north lat. and in sixty-two west long. lies about half way between Guadaloupe and Martinico. It is near twenty-eight miles in length, and thirteen in breadth: it got its name from being discovered by Columbus on a Sunday. The soil of this island is thin, and better adapted to the rearing of coffee than sugar; but the sides of the hills bear the finest trees in the West Indies, and the island is well supplied with rivulets of fine water. The French have always opposed our settling here, because it must cut off their communication, in time of war, between Martinico and Guadaloupe. However, by the peace of Paris, in 1763, it was ceded in express terms to the English; but we have derived little advantage from this conquest, the island being, till lately, no better than a harbour for the natives of the other Caribbees, who, being expelled their own settlements, have taken refuge here. But on account of its situation between the principal French islands, and Prince Rupert's Bay being one of the most capacious in the West Indies, it has been judged expedient to form Dominica into a government of itself, and to declare it a free port. It was taken by the French in 1778; but was restored again to Great Britain by the late peace.

**St. VINCENT.]** Situated in thirteen deg. north lat. and 61 deg. west long. fifty miles north-west of Barbadoes, thirty miles south of St. Lucia, is about twenty-four miles in length, and eighteen in breadth. It is extremely fruitful, being a black mould upon a strong loam, the most proper for the raising of sugar. Indigo thrives here remarkably well, but this article is less cultivated than formerly throughout the West Indies. Many of the inhabitants are Caribbeans, and many here are also fugitives from Barbadoes and the other islands. The Caribbeans were treated with so much injustice and barbarity, after this island came into possession of the English, to whom it was ceded by the peace

in 1763, that they greatly contributed towards enabling the French to get possession of it again in 1779; but it was restored to Great Britain by the treaty of 1783.

**GRANADA AND THE GRANADINES.]** Granada is situated in twelve deg. north lat. and sixty-two deg. west long. about thirty leagues south-west of Barbadoes, and almost the same distance north of New Andalusia, or the Spanish Main. This island is said to be thirty miles in length, and fifteen in breadth. Experience has proved, that the soil is extremely proper for producing sugar, coffee, tobacco, and indigo; and upon the whole it carries with it all the appearance of becoming as flourishing a colony as any in the West Indies of its dimensions. A lake on the top of a hill, in the middle of the island, supplies it plentifully with fine rivers, which adorn and fertilise it. Several bays and harbours lie round the island, some of which may be fortified with great advantage; which renders it very convenient for shipping; and it is not subject to hurricanes. St. George's bay has a sandy bottom, and is extremely capacious, but open. In its harbour or careening place, one hundred large vessels may be moored with perfect safety. This island was long the theatre of bloody wars between the native Indians and the French, during which these handful of Caribbees defended themselves with the most resolute bravery. In the last war but one, when Granada was attacked by the English, the French inhabitants, who were not very numerous, were so amazed at the reduction of Guadaloupe and Martinico, that they lost all spirit, and surrendered without making the least opposition; and the full property of this island, together with the small islands on the north, called the Granadines, which yield the same produce, were confirmed to the crown of Great Britain by the treaty of Paris, in 1763. But in July, 1779, the French made themselves masters of this island, though it was restored to Great Britain by the treaty of 1783.

**NEWFOUNDLAND.]** Exclusive of the West-Indian sugar islands, lying between the two continents of America, Great Britain claims several others, that are seated at the distance of some thousand miles from each other in this quarter of the globe, of which we shall speak, according to our method, beginning with the north.

Newfoundland is situated to the east of the Gulf of St. Laurence, between forty-six and fifty-two deg. north lat. and between fifty-three and fifty-nine deg. west long.—separated from Labrador, or New Britain, by the Straits of Belleisle, and from Canada by the Bay of St. Laurence, being 350 miles long, and 200 broad. The coasts are extremely subject to fogs, attended with almost continual storms of snow and sleet, the sky being usually overcast. From the soil of this island, which is rocky and barren, we are far from reaping any sudden or great advantage, for the cold is long continued and severe; and the summer heat, though violent, warms it not enough to produce any thing valuable. However, it is watered by several good rivers, and has many large and good harbours. This island, whenever the continent shall come to fail of timber convenient to navigation (which on the sea-coast perhaps is no very remote prospect), it is said, will afford a large supply of masts, yards, and all sorts of lumber for the West-India trade. But what at present it is chiefly valuable for, is the great fishery of cod, carried on upon those shoals, which are called the Banks of Newfoundland. Great Britain and North America, at the lowest computation, annually employ 3000 sail of small craft in this fishery: on board of which, and on shore to cure and pack the fish, are upwards of 10,000 hands; so that

this fishery is but a source most excellent to us for the Levant. ones, which and not only abundance, of Newfoundland; and from which or so barren make us am and no way

St. JOHN miles in length and though

this fishery is not only a very valuable branch of trade to the merchant, but a source of livelihood to so many thousands of poor people, and a most excellent nursery for the royal navy. This fishery is computed to increase the national stock 300,000*l.* a year in gold and silver, remitted to us for the cod we sell in the North, in Spain, Portugal, Italy, and the Levant. The plenty of cod both on the Great Bank and the lesser ones, which lie on the east and south-east of this island, is inconceivable; and not only cod, but several other species of fish, are caught there in abundance, all of which are nearly in an equal plenty along the shores of Newfoundland, Nova Scotia, New England, and the Isle of Cape Breton; and very profitable fisheries are carried on upon all their coasts, from which we may observe, that where our colonies are thinly peopled, or so barren as not to produce any thing from their soil, their coasts make us ample amends, and pour in upon us a wealth of another kind, and no way inferior to that arising from the most fertile soil.

This island, after various disputes about the property, was entirely ceded to England, by the treaty of Utrecht, in 1713; but the French were left at liberty to dry their nets on the northern shores of the island; and, by the treaty of 1763, they were permitted to fish in the Gulf of St. Laurence, but with this limitation, that they should not approach within three leagues of any of the coasts belonging to England. The small islands of St. Pierre and Miquelon, situated to the southward of Newfoundland, were also ceded to the French, who stipulated to erect no fortifications on these islands, nor to keep more than fifty soldiers to enforce the police. By the last treaty of peace, the French are to enjoy the fisheries on the north and west coast of the island. The chief towns in Newfoundland are Placentia, Bonavista, and St. John; but not above 1000 families remain here in the winter.

[CAPE BRETON.] This island, or rather collection of islands, called by the French *Les Isles de Madame*, which lie so contiguous that they are commonly called but one, and comprehended under the name of the island of Cape Breton, lies between forty-five and forty-seven deg. north lat. and between fifty-nine and sixty deg. west long. from London. It is about one hundred miles in length, and fifty in breadth; and is separated from Nova Scotia by a narrow strait, called the *Gut of Canso*, which is the communication between the Atlantic Ocean and the Gulf of St. Laurence. The soil is barren, but it has good harbours, particularly that of Louisbourg, which is near four leagues in circumference, and has every where six or seven fathoms water.

The French began a settlement in this island in 1714, which they continued to increase, and fortified it in 1720. They were, however, dispossessed in 1745, by the bravery of the inhabitants of New England, with little assistance from Great Britain; but it was again, by the treaty of Aix-la-Chapelle, ceded to the French, who spared no expense to fortify and strengthen it. Notwithstanding which, it was again reduced, in 1758, by the British troops, under-general Amherst and admiral Boscawen, together with a large body of New England men, who found in that place two hundred and twenty-one pieces of cannon, and eighteen mortars, together with a large quantity of ammunition and stores; and it was ceded to the crown of Great Britain by the peace of 1763, since which the fortifications have been blown up, and the town of Louisbourg dismantled.

[ST. JOHN'S.] Situated in the Gulf of St. Laurence, is about sixty miles in length, and thirty or forty broad, and has many fine rivers; and though lying near Cape Breton and Nova Scotia, has greatly the

advantage of both in pleasantness and fertility of soil. Upon the reduction of Cape Breton, the inhabitants of this island, amounting to four thousand, submitted quietly to the British arms; and, to the disgrace of the French governor there were found in his house several English scalps, which were brought there to market by the savages; this being the place where they were encouraged to carry on that barbarous and inhuman trade. This island was so well improved by the French, that it was stiled the granary of Canada, which is furnished with great plenty of corn, as well as beef and pork. It has several fine rivers, and a rich soil. Charlotte-town is its capital, and is the residence of the lieutenant-governor, who is the chief officer in the island. The inhabitants are estimated at about five thousand.

**BERMUDAS, OR SUMMER ISLANDS.**] These receive their first name from their being discovered by John Bermudas, a Spaniard; and were called the Summer Islands, from Sir George Summers, who was shipwrecked on their rocks in 1609, in his passage to Virginia. They are situated at a vast distance from any continent, in thirty-two degrees north lat. and in sixty-five degrees west long. Their distance from the Land's End is computed to be near 1500 leagues, from the Madeiras about 1200, and from Carolina 300. The Bermudas are but small, not containing in all above 20,000 acres; and are very difficult of access, being as Waller the poet, who resided some time there, expresses it, "walled with rocks." The air of these islands, which Waller celebrates in one of his poems, has been always esteemed extremely healthful; and the beauty and richness of the vegetable productions are perfectly delightful. Though the soil of these islands is admirably adapted to the cultivation of the vine, the chief and only business of the inhabitants, who consist of about 10,000, is the building and navigating of light sloops and brigantines, which they employ chiefly in the trade between North America and the West Indies. These vessels are as remarkable for their swiftness, as the cedar, of which they are built, is for its hard and durable quality.

The town of St. George, which is the capital, is seated at the bottom of a haven in the island of the same name, and is defended with seven or eight forts, and seventy pieces of cannon. It contains above 1000 houses, a handsome church, and other elegant public buildings.

**LUCAY'S, OR BAHAMA ISLANDS.**] The Bahamas are situated to the south of Carolina, between twelve and twenty-seven degrees north lat. and seventy-three and eighty-one degrees west long. They extend along the coast of Florida quite down to the Isle of Cuba; and are said to be 500 in number, some of them only mere rocks; but twelve of them are large, fertile, and in nothing different from the soil of Carolina; they are, however, almost uninhabited, except Providence, which is 200 miles east of the Floridas; though some others are larger and more fertile, on which the English have plantations. Between them and the continent of Florida is the Gulf of Bahama, or Florida, through which the Spanish galleons sail in their passage to Europe. These islands were the first fruits of Columbus's discoveries; but they were not known to the English till 1667, when captain Seyle, being driven among them in his passage to Carolina, gave his name to one of them; and being a second time driven upon it, gave it the name of Providence. The English, observing the advantageous situation of these islands for a check on the French and Spaniards, attempted to settle them in the reign of Charles II. Some unlucky incidents prevented this settlement from being of any advantage, and the Isle of Providence became a harbour for the buccaneers, or pirates, who for a long time infested the American na-

vigation. This Woodes Rogers settlement. The dependent company, these slowly. In time demised there; this labyrinth of during the last Augustine, Apr

by Georgia on the of Mexico on the RIVERS.] The world, as well as it is supposed to manner choake of any consider only twelve feet the principal en the channel is a certain season, rapid. It is, free from shoals other almost to John's rivers, a

vigation. This obliged the government, in 1718, to send out captain Woodes Rogers, with a fleet to dislodge the pirates, and for making a settlement. This the captain effected; a fort was erected, and an independent company was stationed in the island. Ever since this last settlement, these islands have been improving, though they advance but slowly. In time of war, people gain considerably by the prizes condemned there; and at all times by the wrecks, which are frequent in this labyrinth of rocks and shelves. The Spaniards captured these islands during the last war, but they were retaken by a detachment from St. Augustine, April 7, 1783.

**FALKLAND ISLANDS.]** Leaving the Bahama and West-Indian islands, we shall now proceed along the south-east coast of America, as far as the fifty-second degree of south latitude, where the reader, by looking into the map, will perceive the Falkland Islands situated near the Straits of Magellan, at the utmost extremity of South America. Falkland Islands were first discovered by Sir Richard Hawkins, in 1594, the principal of which he named Hawkins Maidenland, in honour of queen Elizabeth. The present English name, Falkland, was probably given them by captain Strong, in 1639, and, being adopted by Halley, it has from that time been received into our maps. They have occasioned some contest between Spain and Great Britain; but being of very little worth, seem to have been silently abandoned by the latter in 1774, in order to avoid giving umbrage to the Spanish court.

Length 500	} between	{	80 and 91 West longitude	100,000
Breadth 440			25 and 32 North latitude	

**BOUNDARIES.]** THIS country, which was ceded by Great Britain to Spain by the late treaty of peace, is bounded by Georgia on the North; by the Mississippi on the West; by the Gulf of Mexico on the South; and by the Bahama Straits on the East.

**RIVERS.]** There are the Mississippi, which is one of the finest in the world, as well as the largest; for, including its turnings and windings, it is supposed to run a course of 4500 miles; but its mouths are in a manner choaked up with sands and shoals, which deny access to vessels of any considerable burthen; there being, according to Mitchel's map, only twelve feet water over the bar (captain Pittman says, seventeen) at the principal entrance. Within the bar there is 100 fathom water, and the channel is every where deep, and the current gentle, except at a certain season, when, like the Nile, it overflows and becomes extremely rapid. It is, except at the entrance already mentioned, every where free from shoals and cataracts, and navigable for craft of one kind or other almost to its source. The Mobile, the Apalachicola, and St. John's rivers, are also large and noble streams.

**BAYS AND CAPES.]** The principal bays are St. Bernard's, Ascension, Mobile, Pensacola, Dauphin, Joseph, Apalaxy, Spiritu Santo, and Charles Bay.

The chief capes are Cape Blanco, Samblas, Anclote, and Cape Florida, at the extremity of the peninsula.

**AIR AND CLIMATE.]** Very various accounts have been given of these particulars in this country; but that the air of Florida is pure and wholesome, appears from the size, vigour, and longevity of the Floridian Indians, who, in these respects, far exceed their more southern neighbours, the Mexicans,

**SOIL, PRODUCTIONS, AND } East Florida, near the sea, and forty  
FACE OF THE COUNTRY. { miles back, is flat and sandy. But even  
the country round St. Augustine, in all appearance the worst in the  
province, is far from being unfruitful; it produces two crops of In-  
dian corn a-year; the garden vegetables are in great perfection; the  
orange and lemon trees grow here, without cultivation, to a large size,  
and produce better fruit than in Spain and Portugal. The inland coun-  
try, towards the hills, is extremely rich and fertile, producing sponta-  
neously the fruits, vegetables, and gums, that are common to Georgia  
and the Carolinas, and is likewise favourable to the rearing of European  
productions.**

This country also produces rice, indigo, ambergris, cochineal, amethysts, turquoises, lapis lazuli, and other precious stones; copper, quicksilver, pit-coal, and iron-ore: pearls are also found on the coast of Florida: mahogany grows on the southern parts of the peninsula, but inferior in size and quality to that of Jamaica. The animal creation are here so numerous, that you may purchase a good saddle horse in exchange for goods of five shillings value prime cost; and there are instances of horses being exchanged for a hatchet per head.

**CHIEF TOWNS.]** The chief town in West Florida is Pensacola, N. lat. 30-22, W. long. 87-20, which is situated within the bay of the same name, on a sandy shore that can only be approached by small vessels. The road is, however, one of the best in all the Gulf of Mexico, in which vessels may lie in safety against every kind of wind, being surrounded by land on every side.

St. Augustine, the capital of East Florida, N. lat. 29-45, W. long. 81-12, runs along the shore, and is of an oblong form, divided by four regular streets, crossing each other at right angles. The town is fortified with bastions, and inclosed with a ditch. It is likewise defended by a castle, which is called Fort St. John; and the whole is furnished with cannon. At the entrance into the harbour are the north and south breakers, which form two channels, whose bars, at low tides, have eight feet water.

**SOIL AND CLIMATE.]** These countries, lying for the most part within the temperate zone, have a climate in many places extremely agreeable, and a soil productive of every thing, either for profit or delight. In California, however, the heat is great in summer, particularly towards the sea-coast; but in the inland country the climate is more temperate, and in winter even cold.

**FACE AND PRODUCE OF THE COUNTRY.]** The natural history of these countries is as yet in its infancy. The Spaniards themselves know little of them, and the little they know they are unwilling to communicate. It is certain, however, that in general the provinces of New Mexico and California are extremely beautiful and pleasant; the face of the country is agreeably varied with plains, intersected by rivers, and adorned with gentle eminences covered with various kinds of trees, some producing excellent fruit. With respect to the value of the gold-mines in these countries, nothing positive can be asserted. Their natural productions are undoubtedly insufficient to render them advantageous colonies to any but the Spaniards. In California there falls in the morning a great quantity of dew, which, settling on the rose leaves, candies, and becomes hard like manna, having all the sweetness of refined sugar, without its whiteness. There is also another very singular production; in the heart of the country there are plains of salt, quite firm, and clear as chrysal, which, considering the vast quantities of fish found on its coasts, might render it an invaluable acquisition to any industrious nation.

**INHABITANTS, HISTORY, GOVERNMENT, } The Spanish settlements  
RELIGION, AND COMMERCE. } here are comparatively  
weak: though they are increasing every day, in proportion as new  
mines are discovered. The inhabitants are chiefly Indians, whom the  
Spanish missionaries have in many places brought over to Christianity,  
to a civilised life, and to raise corn and wine, which they now export  
pretty largely to Old Mexico. California was discovered by Cortez,  
the great conqueror of Mexico: our famous navigator, Sir Francis  
Drake, took possession of it in 1578, and his right was confirmed by  
the principal king or chief in the whole country. This title, however,  
the government of Great Britain have not hitherto attempted to vindicate,  
though California is admirably situated for trade, and on its coast  
has a pearl fishery of great value. The inhabitants and government  
here do not materially differ from those of Old Mexico.**

## OLD MEXICO, OR NEW SPAIN.

### SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 2000 } Breadth 600 }	between { 83 and 110 W. long. 8 and 30 N. lat. }	318,000

**BOUNDARIES.]** BOUNDED by New Mexico, or Granada, on the North; by the Gulf of Mexico, on the North-east; by Terra Firma, on the South-east; by the Pacific Ocean, on the South-west; containing three audiences, viz.

Audiences.	Chief Towns.
1. Galicia, or Guadaluja	Guadalájarra
2. Mexico Proper	} Mexico, W. long. 100. N. lat. 19-54. } Acapulco } Vera Cruz
3. Guatimala	} Guatimala *

**RAYS.]** On the North Sea are the gulfs or bays of Mexico, Campeachy, Vera Cruz, and Honduras; in the Pacific Ocean, or South Sea, are the bays of Micoya and Amapalla, Acapulco, and Salinas.

**CAVES.]** These are the Cape Sardo, Cape St. Martin, Cape Conduedo, Cape Catoche, Cape Honduras, Cape Cameron, and Cape Gracias Dios, in the North Sea.

Cape Marques, Cape Spirito Santo, Cape Corientes, Cape Gallero, Cape Blanco, Cape Burica, Cape Pructeos, and Cape Mala, in the South Sea.

**WINDS.]** In the Gulf of Mexico, and the adjacent seas, there are strong north winds from October to March, about the full and change of the moon. Trade winds prevail every where at a distance from land within the tropics. Near the coast, in the South Sea, they have periodical winds, viz. monsoons, and sea and land breezes, as in Asia.

**SOIL AND CLIMATE.]** Mexico, lying for the most part within the torrid zone, is excessively hot; and on the eastern coast, where the land is low, marshy, and constantly flooded in the rainy seasons, it is likewise extremely unwholesome. The inland country, however, assumes a better aspect, and the air is of a milder temperament; on the western side the land is not so low as on the eastern, much better in quality, and full of plantations. The soil of Mexico in general is of a good variety, and would not refuse any sort of grain, were the industry of the inhabitants to correspond with their natural advantages.

**PRODUCE.]** Mexico, like all the tropical countries, is rather more abundant in fruits than in grain. Pine-apples, pomegranates, oranges, lemons, citrons, figs, and cocoa-nuts, are here in the greatest plenty and perfection. Mexico produces also a prodigious quantity of sugar, especially towards the Gulf of Mexico, and the provinces of Guaxaca and Guatimala; so that here are more sugar-mills than in any other

\* This city was swallowed up by an earthquake on the 7th of June, 1773, when eight thousand families instantly perished. New Guatimala is built at some distance, and is well inhabited.

part of Spanish America. Cedar-trees and logwood abound about the bays of Campeachy and Honduras; the maho-tree also, which has a bark with such strong fibres that they twist and make ropes of. They have also a tree, which is called light-wood, being as light as a cork, of which they make floats to carry their merchandize on the sea-coasts. But what is considered as the chief glory of this country, and what first induced the Spaniards to form settlements upon it, are the mines of gold and silver. The chief mines of gold are in Veragua and New Granada, bordering upon Darien and Terra Firma. Those of silver, which are much more rich, as well as numerous, are found in several parts, but in none so much as in the province of Mexico. The mines of both kinds are always found in the most barren and mountainous parts of the country; nature making amends in one respect for her defects in another. The working of the gold and silver mines depends on the same principles. When the ore is dug out, compounded of several heterogeneous substances mixed with the precious metals, it is broken into small pieces by a mill, and afterwards washed, by which means it is disengaged from the earth, and other soft bodies which cling to it. Then it is mixed with mercury, which, of all substances, has the strongest attraction for gold, and likewise a stronger attraction for silver than the other substances which are united with it in the ore. By means of the mercury, therefore, the gold and silver are first separated from the heterogeneous matter, and then, by straining and evaporation, they are disunited from the mercury itself. It has been computed that the revenues of Mexico amount to twenty-four millions of our money; and it is well known that this, with the other provinces of Spanish America, supply the whole world with silver. The other articles next in importance to gold and silver are the cochineal and cocoa. The former is of the animal kind, and of the species of the gall insects. It adheres to the plant called opuntia, and sucks the juice of the fruit, which is of a crimson colour. It is from this juice that the cochineal derives its value, which consists in dyeing all sorts of the finest scarlet, crimson, and purple. It is also used in medicine as a sudorific, and as a cordial; and it is computed that the Spaniards annually export no less than nine hundred thousand pounds' weight of this commodity to answer the purposes of medicine and dyeing. The cocoa, of which chocolate is made, grows on a tree of a middling size, which bears a pod about the size and shape of a cucumber, containing the cocoa. The Spanish commerce in this article is immense; and such is the general consumption, as well as the external call for it, that a small garden of cocoa-trees is said to produce to the owner twenty thousand crowns a-year. At home it makes a principal part of their diet, and is found wholesome, nutritious, and suitable to the climate. This country likewise produces silks, but not in such quantity as to make any remarkable part of their export. Cotton is here in great abundance, and, on account of its lightness, is the common wear of the inhabitants.

POPULATION, INHABITANTS, } We have already described the  
 GOVERNMENT, AND MANNERS. } original inhabitants of Mexico, and  
 the conquest of that country by the Spaniards. The present inhabitants  
 may be divided into whites, Indians, and negroes. The whites are  
 either born in Old Spain, or they are Creoles, i. e. natives of Spanish  
 America. The former are chiefly employed in government or trade, and  
 have nearly the same character with the Spaniards in Europe; only a  
 still greater portion of pride, for they consider themselves as entitled  
 to very high distinction as natives of Europe, and look upon the other

inhabitants as many degrees beneath them. The Créoles have all the bad qualities of the Spaniards, from whom they are descended, without that courage, firmness, and patience, which constitute the praiseworthy part of the Spanish character. Naturally weak and effeminate, they dedicate the greatest part of their lives to loitering and inactive pleasures. Luxurious without variety or elegance, and expensive with great parade and little convenience, their general character is no more than a grave and spacious insignificance. From idleness and constitution their whole business is amour and intrigue; and their ladies, of consequence, are not at all distinguished for their chastity and domestic virtues. The Indians, who, notwithstanding the devastations of the first invaders, remain in great numbers, are become, by continual oppression and indignity, a dejected, timorous, and miserable race of mortals. The blacks here, like those in other parts of the world, are stubborn, hardy, and as well adapted for the gross slavery they endure as any human creatures can be.

Such is the general character of the inhabitants, not only in Mexico, but the greatest part of Spanish America. The civil government is administered by tribunals, called Audiencias, which bear a resemblance to the old parliaments in France. In these courts the viceroy of the king of Spain presides. His employment is the greatest trust and power which his catholic majesty has in his disposal, and is perhaps the richest government entrusted to any subject in the world. The greatness of the viceroy's office is diminished by the shortness of its duration. For as jealousy is the leading feature of Spanish politics in whatever regards America, no officer is allowed to retain his power for more than three years; which, no doubt, may have a good effect in securing the authority of the crown of Spain, but is attended with unhappy consequences to the miserable inhabitants, who become a prey to every new governor. The clergy are extremely numerous in Mexico, and it has been computed that priests, monks, and nuns of all orders, make upwards of a fifth of all the white inhabitants, both here and in the other parts of Spanish America. The people are superstitious, ignorant, rich, lazy, and licentious: with such materials to work upon, it is not remarkable that the church should enjoy one-fourth of the revenues of the whole kingdom.

COMMERCE, CITIES, AND SHIPPING.] The trade of Mexico consists of three great branches, which extend over the whole known world. It carries on a traffic with Europe, by La Vera Cruz, situated on the Gulf of Mexico; with the East Indies, by Acapulco on the South Sea, and with South America by the same port. These two sea-ports, Vera Cruz and Acapulco, are wonderfully well situated for the commercial purposes to which they are applied. It is by means of the former that Mexico pours her wealth over the whole world, and receives in return the numberless luxuries and necessaries which Europe affords to her, and which the indolence of her inhabitants will never permit them to acquire for themselves. To this port the fleet from Cadiz, called the Flota, consisting of three men of war as a convoy, and fourteen large merchant ships, annually arrive about the beginning of November. Its cargo consists of every commodity and manufacture of Europe, and there are few nations but have more concern in it than the Spaniards, who send out little more than wine and oil. The profit of these, with the freight and commission to the merchants, and duty to the king, are almost the only advantages which Spain derives from her American commerce. on the East  
and by the

Cruz, the fleet takes in the plate, precious stones, and other commodities for Europe. Some time in May they are ready to depart. From La Vera Cruz they sail to the Havannah, in the Isle of Cuba, which is the rendezvous where they meet the galleons, another fleet/ which carries on the trade of Terra Firma by Carthagena, and of Peru by Panama and Porto Bello. When all are collected, and provided with a convoy necessary for their safety, they steer for Old Spain.

Acapulco is the set-port by which the communication is kept up between the different parts of the Spanish empire in America and the East Indies. About the month of December the great galleon, attended by a large ship as a convoy, annually arrives here. The cargoes of these ships (for the convoy, though in an under-hand manner, likewise carries goods) consist of all the rich commodities and manufactures of the East. At the same time the annual ship from Lima, the capital of Peru, comes in, and is not computed to bring less than two millions of pieces of eight in silver, besides quicksilver, and other valuable commodities, to be laid out in the purchase of the galleon's cargoes. Several other ships, from different parts of Chili and Peru, meet upon the same occasion. A great fair, in which the commodities of all parts of the world are bartered for one another, lasts thirty days. The galleon then prepares for her voyage, loaded with silver and such European goods as have been thought necessary. The Spaniards, though this trade be carried on entirely through their hands, and in the very heart of their dominions, are comparatively but small gainers by it. For as they allow the Dutch, Great Britain, and other commercial states, to furnish the greater part of the cargo of the flota, so the Spanish inhabitants of the Philippines, tainted with the same indolence which ruined their European ancestors, permit the Chinese merchants to furnish the greater part of the cargo of the galleon. Notwithstanding what has been said of Vera Cruz, and Acapulco, the city of Mexico, the capital of the empire, ought to be considered as the centre of commerce in this part of the world; for here the principal merchants reside, and the greatest part of the business is negotiated. The East-India goods from Acapulco, and the European from Vera Cruz, all pass through this city. Hither all the gold and silver come to be coined; here the king's fifth is deposited; and here are wrought all the utensils and ornaments in plate which are every year sent to Europe. The city itself breathes the air of the highest magnificence, and, according to the best accounts, contains about 80,000 inhabitants.

## SPANISH DOMINIONS IN SOUTH AMERICA, TERRA FIRMA, OR CASTILE DEL ORO.

### SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 1400	between { 60 and 82 West long. the Equator, and 12 N. lat. }	} 700,000
Breadth 700		

BOUNDARIES.] BOUNDED by the North Sea (part of the Atlantic Ocean) on the North; by the same sea and Surinam on the East; by the country of the Amazons and Peru on the South; and by the Pacific Ocean and New Spain on the West.

Divisions.	Subdivisions.	Chief Towns.
The northern division contains the provinces of . . . .	1. Terra Firma Proper, or Darien	Porto Bello PANAMA, W. long. 80. 21. N. lat. 8-47.
	2. Carthagena	Carthagena
	3. St. Martha	St. Martha
	4. Rio de la Hacha	Rio de la Hacha
	5. Venezuela	Venezuela
	6. Comana	Comana
	7. New Andalufia, or Paria	St. Thomas
The southern division contains the provinces of . . .	1. New Granada	Santa Fé de Bogotá
	2. Popayan	Popayan

**BAYS, CAPES, &c.]** The Isthmus of Darien, or Terra Firma Proper, joins North and South America. A line drawn from Porto Bello in the North, to Panama in the South Sea, or rather a little west of these two towns, is the proper limit between North and South America; and here the isthmus or neck of land is only sixty miles over. The principal rivers are the Rio Grande, Darien, Chagre, and the Oronoque.

The principal bays in Terra Firma are, the Bay of Panama and the Bay of St. Michael's, in the South Sea; the Bay of Porto Bello, the Gulf of Darien, Sino Bay, Carthagena Bay and harbour, the Gulf of Venezuela, the Bay of Maracaibo, the Gulf of Triesto, the Bay of Guaira, the Bay of Curiaco, and the Gulf of Paria, or Andalufia, in the North Sea.

The chief capes are, Samblas Point, Point Canoa, Cape del Agua, Swart Point, Cape de Vela, Cape Conquibacoa, Cape Cabelo, Cape Blanco, Cape Galera, Cape Three Points, and Cape Nassau; all on the north shore of Terra Firma.

**CLIMATE.]** The climate here, particularly in the northern divisions, is extremely hot; and it was found by Ulloa, that the heat of the warmest day in Paris is continual in Carthagena; the excessive heats raise the vapour of the sea, which is precipitated in such rains as seem to threaten a general deluge. Great part of the country, therefore, is almost continually flooded; and this, together with the excessive heat, so impregnates the air with vapours, that in many provinces, particularly about Popayan and Porto Bello, it is extremely unwholesome.

**SOIL AND PRODUCE.]** The soil of this country, like that of the greater part of South America, is wonderfully rich and fruitful. It is impossible to view, without admiration, the perpetual verdure of the woods, the luxuriancy of the plains, and the towering height of the mountains. This, however, only applies to the inland country, for the coasts are generally barren sand, and incapable of bearing any species of grain. The trees most remarkable for their dimensions are the caobo, the cedar, the maria, and balsam-tree. The manchineel tree is particularly remarkable: it bears a fruit resembling an apple, but which, under this specious appearance, contains the most subtle poison, against which common oil is found to be the best antidote. The malignity of this tree is such, that if a person only steps under it, he finds his body swelled, and is racked with the severest tortures. The beasts, from instinct, always avoid it. fruit of a species of willow, and contains a kernel resembling an almond, but less white, and extremely bitter. This kernel is found to be an excellent and never-failing remedy for the bite of the most venomous vipers and serpents, which are very frequent all over this country. There were formerly rich mines of gold here, which are now in a great measure exhausted. The silver, iron, and copper mines, have been since opened, and the inhabitants find emeralds, sapphires, and other precious stones.

ANIMALS.] In treating of North America, we have taken notice of many of the animals that are found in the southern parts. Among those peculiar to this country, the most remarkable is the Sloth, or, as it is called by way of derision, the Swift Peter. It bears a resemblance to an ordinary monkey in shape and size, but is of a most wretched appearance, with its bare hams and feet, and its skin all over corrugated. He stands in no need of either chain or hutch, never stirring unless compelled by hunger; and he is said to be several minutes in moving one of his legs, nor will blows make him mend his pace. When he moves, every effort is attended with such a plaintive, and at the same time so disagreeable a cry, as at once produces pity and disgust. In this cry consists the whole defence of this wretched animal; for on the first hostile approach it is natural for him to be in motion, which is always accompanied with disgustful howlings, so that his pursuer flies much more speedily in his turn, to be beyond the reach of this horrid noise. When this animal finds no wild fruits on the ground, he looks out with a great deal of pains for a tree well loaded, which he ascends with a world of uneasiness, moving, and crying, and stopping by turns. At length having mounted, he plucks off all the fruit, and throws it on the ground, to save himself such another troublesome journey; and rather than be fatigued with coming down the tree, he gathers himself into a bunch, and with a shriek drops to the ground.

The monkeys in these countries are very numerous; they keep together twenty or thirty in company, rambling over the woods, leaping from tree to tree; and if they meet with a single person, he is in danger of being torn to pieces by them; at least they chatter and make a frightful noise, throwing things at him; they hang themselves by the tail, on the boughs, and seem to threaten him all the way he passes: but where two or three people are together, they usually scamper away.

NATIVES.] Besides the Indians in this country, who fall under our general description of the Americans, there is another species, of a fair complexion, delicate habit, and of a smaller stature than the ordinary Indians. Their dispositions too are more soft and effeminate; but what principally distinguishes them is their large weak blue eyes, which, unable to bear the light of the sun, see best by moonlight, and from which they are therefore called Moon-eyed Indians.

INHABITANTS, COMMERCE, } We have already mentioned how this  
AND CHIEF TOWNS. } country fell into the hands of the Spaniards. The inhabitants therefore do not materially differ from those of Mexico. To what we have observed with regard to this country, it is only necessary to add, that the original inhabitants of Spain are variously intermixed with the negroes and Indians. These intermixtures form various gradations, which are carefully distinguished from each other, because every person expects to be regarded in proportion as a greater share of the Spanish blood runs in his veins. The first di-

inction, arising from the intermarriage of the whites with the negroes, is that of the mulattoes, which is well known. Next to these are the Tercerones, produced from a white and a mulatto. From the intermarriage with these and the whites, arise the Quarterones, who, though still near the former, are disgraced with a tint of the negro blood. But the produce of these and the whites are the Quinterones, who, it is said, are not to be distinguished from the real Spaniards, but by being of a still fairer complexion. The same gradations are formed in a contrary order, by the intermixture of the mulattoes and the negroes; besides these, there are a thousand others, hardly distinguishable by the natives themselves. The commerce of this country is chiefly carried on from the ports of Panama, Carthagena, and Porto Bello, which are three of the most considerable cities in Spanish America; and each containing several thousand inhabitants. Here there are annual fairs for American, Indian, and European commodities. Among the natural merchandize of Terra Firma, the pearls found on the coast, particularly in the Bay of Panama, are not the least considerable. An immense number of negro slaves are employed in fishing for these, who have arrived at wonderful dexterity in this occupation. They are sometimes, however, devoured by fish, particularly the sharks, while they dive to the bottom, or are crushed against the shelves of the rocks. The government of Terra Firma is on the same footing with that of Mexico.

and fall into the Pacific Ocean, between the equator and eight degrees S. lat. There is said to be a river in Peru whose waters are as red as blood; but the truth of this has been doubted.

**PETRIFIED WATERS.]** There are some waters, which, in their course, cover whatever they pass over with stone; and here are fountains of liquid matter, called coppey, resembling pitch and tar, and used by seamen for the same purpose.

**SOIL AND CLIMATE.]** Though Peru lies within the torrid zone, yet having on one side the South Sea, and on the other the great ridge of the Andes, it is not so hot as other tropical countries. The sky too, which is generally cloudy, defends it from the direct rays of the sun; but what is extremely singular, it never rains in Peru. This defect, however, is sufficiently supplied by a soft kindly dew which falls gradually every night on the ground, and so refreshes the plants and grafts, as to produce in many places the greatest fertility. Along the sea-coast in Peru is generally a dry barren sand, except by the banks of rivers, where it is extremely fertile, as are all the low lands in the inland country.

**ANIMAL, VEGETABLE, AND } There are many gold mines in the  
MINERAL PRODUCTIONS. } northern part, not far from Lima.**  
Silver too is produced in great abundance in various provinces; but the old mines are constantly decaying, and new ones daily opened. The towns shift with the mines. That of Potosi, when the silver there was found at the easiest expence (for now having gone so deep it is not so easily brought up), contained 90,000 souls, Spaniards and Indians, of which the latter were six to one. The northern part of Peru produces wine in great plenty. Wool is another article of its produce, and is no less remarkable for its fineness than for the animals on which it grows; these are the lamas and vicunnas. The lama has a small head, resembling that of a horse and a sheep at the same time. It is about the size of a stag, its upper lip is cleft like that of a hare, through which, when enraged, it spits a kind of venomous juice, which inflames the part it falls on. The flesh of the lama is agreeable and salutary, and the animal is not only useful in affording wool and food, but also as a beast of burden. It can endure amazing fatigue, and will travel over the steepest mountains with a burden of sixty or seventy pounds. It feeds very sparingly, and never drinks. The vicunna is smaller and swifter than the lama, and produces wool still finer in quality. In the vicunna is found the bezoar stone, regarded as a specific against poison. The next great article in the produce and commerce of this country is the Peruvian bark, known better by the name of Jesuits' bark. The tree which produces this invaluable drug grows principally in the mountainous parts of Peru, and particularly in the province of Quito. The best bark is always produced in the high and rocky grounds; the tree which bears it is about the size of a cherry tree, and produces a kind of fruit resembling the almond: but it is only the bark which has those excellent qualities that render it so useful in terminating fevers, and other disorders to which daily experience extends the application of it. Guinea pepper, or Cayenne pepper, as we call it, is produced in the greatest abundance in the vale of Africa, a district in the southern parts of Peru, from whence they export it annually, to the value of 600,000 crowns. Peru is likewise the only part of Spanish America which produces quicksilver, an article of immense value, considering the various purposes to which it is applied, and especially the purification of gold and silver. The principal mine of this singular metal is

at a place called Guancavelica, discovered in 1567, where it is found in a whitish mass, resembling brick ill burned. The substance is volatilized by fire, and received in steam by a combination of glass vessels, where it condenses by means of a little water at the bottom of each vessel, and forms a pure heavy liquid. In Peru likewise is found the new substance called *platina*, which may be considered as an eighth metal, and, from its superior qualities, might almost vie with gold itself.

**MANUFACTURES, TRADE, AND CITIES.]** We join these articles because of their intimate connection; for, except in the cities we shall describe, there is no commerce worth mentioning. The city of Lima is the capital of Peru, and the whole Spanish empire: its situation, in the middle of a spacious and delightful valley, was fixed upon by the famous Pizarro as the most proper for a city, which he expected would preserve his memory. It is so well watered by the river Rimac, that the inhabitants, like those of London, command a stream, each of his own use. There are many very magnificent structures, particularly churches, in this city; though the houses in general are built of slight materials, the equality of the climate, and want of rain, rendering stone houses unnecessary; and, besides, it is found, that these are more apt to suffer by shocks of the earth, which are frequent and dreadful all over this province. Lima is about two leagues from the sea, extends in length two miles, and in breadth one and a quarter. It contains about 60,000 inhabitants, of whom the whites amount to a sixth part. One remarkable fact is sufficient to demonstrate the wealth of this city. When the viceroy, the duke de la Palada, made his entry into Lima in 1682, the inhabitants, to do him honour, caused the streets to be paved with ingots of silver, to the amount of seventeen millions sterling. All travellers speak with amazement of the decorations of the churches with gold, silver, and precious stones, which load and ornament even the walls. The merchants of Lima may be said to deal with all the quarters of the world, and that both on their own accounts, and as factors for others. Here all the products of the southern provinces are conveyed, in order to be exchanged at the harbour of Lima, for such articles as the inhabitants of Peru stand in need of; the fleet from Europe and the East Indies land at the same harbour, and the commodities of Asia, Europe, and America, are there bartered for each other. What there is no immediate sale for, the merchants of Lima purchase on their own accounts, and lay up in warehouses, knowing that they must soon find an outlet for them, since by one channel or other they have a communication with almost every commercial nation. But all the wealth of the inhabitants, all the beauty of the situation, and fertility of the climate of Lima, are not sufficient to compensate for one disaster, which always threatens, and has sometimes actually befallen them. In the year 1747, a most tremendous earthquake laid three-fourths of this city level with the ground, and entirely demolished Callao, the port town belonging to it. Never was any destruction more terrible or complete; not more than one of three thousand inhabitants being left to record this dreadful calamity, and he by a providence the most singular and extraordinary imaginable.—This man, who happened to be on a fort which overlooked the harbour, perceived in one minute the inhabitants running from their houses in the utmost terror and confusion; the sea, as usual on such occasions, receding to a considerable distance, returned in mountainous waves, foaming with the violence of the agitation, buried the inhabitants for

ever in its bosom, and immediately all was silent; but the same wave which destroyed the town drove a little boat by the place where the man stood, into which he threw himself, and was saved. Cusco, the ancient capital of the Peruvian empire, has already been taken notice of. As it lies in the mountainous country, and at a distance from the sea, it has been long on the decline; but it is still a very considerable place, and contains above 40,000 inhabitants, three parts Indians, and very industrious in manufacturing baize, cotton, and leather. They have also, both here and in Quito, a particular taste for painting; and their productions in this way, some of which have been admired in Italy, are dispersed all over South America. Quito is next to Lima in populousness, if not superior to it. It is, like Cusco, an inland city, and, having no mines in its neighbourhood, is chiefly famous for its manufactures of cotton, wool, and flax, which supply the consumption all over the kingdom of Peru.

**INHABITANTS, MANNERS, AND GOVERNMENT.** } It has been estimated by some writers, that in all Spanish America there are about three millions of Spaniards and Creoles of different colours; and undoubtedly the number of Indians is much greater, though neither in any respect proportionable to the wealth, fertility, and extent of the country. The manners of the inhabitants do not remarkably differ over the whole Spanish dominions. Pride and laziness are the two predominant passions. It is said, by the most authentic travellers, that the manners of Old Spain have degenerated in its colonies. The Creoles, and all the other descendants of the Spaniards, according to the above distinctions, are guilty of many mean and pilfering vices, which a true-born Castilian could not think of but with detestation. This, no doubt, in part arises from the contempt in which all but the real natives of Spain are held in the Indies, mankind generally behaving according to the treatment they meet with from others. In Lima the Spanish pride has made the greatest descents; and many of the first nobility are employed in commerce. It is in this city that the viceroy resides, whose authority extends over all Peru, except Quito, which has lately been detached from it. The viceroy is as absolute as the king of Spain; but as his territories are so extensive, it is necessary that he should part with a share of his authority to the several audiences or courts established over the kingdom. There is a treasury court established at Lima, for receiving the fifth of the produce of the mines, and certain taxes paid by the Indians, which belong to the king of Spain.

		{ Baldivia Imperial
On the east side of the Andes,	} Cuyo, or Cutio .....	{ St. John de Frontiera.

**LAKES.]** The principal lakes are those of Tagatagua near St. Jago, and that of Paren. Besides which, they have several salt-water lakes, that have a communication with the sea, part of the year. In stormy weather the sea forces a way through them, and leaves them full of fish; but in the hot season the water congeals, leaving a crust of fine white salt a foot thick.

**SEAS, RIVERS, BAYS, AND HARBOURS.]** The only sea that borders upon Chili is the Pacific Ocean on the west. The principal rivers are the Salado or Salt River, Guafo, Coquimbo, Chiapa, Bohio, and the Baldivia, all scarcely navigable but at their mouths.

The principal bays, or harbours, are Capiapo, Coquimbo, Govanadore, Valpariso, Jata, Conception, Santa Maria, La Moucha, Baldivia, Brewer's-haven, and Castro.

**CLIMATE, SOIL, AND PRODUCE.]** These are not remarkably different from the same in Peru; and if there be any difference, it is in favour of Chili. There is indeed no part of the world more favoured than this is, with respect to the gifts of nature. For here, not only the tropical fruits, but all species of grain, of which a considerable part is exported, come to great perfection. Their animal productions are the same with those of Peru; and they have gold almost in every river.

**INHABITANTS.]** This country is very thinly inhabited. The original natives are still in a greater measure unconquered and uncivilized; and leading a wandering life, attentive to no object but their preservation from the Spanish yoke, are in a very unfavourable condition with regard to population. The Spaniards do not amount to above 20,000; and the Indians, negroes, and mulattoes, are not supposed to be thrice that number. However, there have lately been some formidable insurrections against the Spaniards, by the natives of Chili, which greatly alarmed the Spanish court.

**COMMERCE.]** The foreign commerce of Chili is entirely confined

South division . . . . .	Tucuman . . . . .	St. Jago
	Rio de la Plata . . . . .	BUENOS AYRES, W. long. 57-54. S. lat. 34-35.

BAYS AND LAKES.] The principal bay is that at the mouth of the river La Plata, on which stands the capital city of Buenos Ayres; and Cape St. Antonio, at the entrance of that bay, is the only promontory. This country abounds with lakes, one of which, Cafacoroes, is 100 miles long.

RIVERS.] This country, besides an infinite number of small rivers, is watered by three principal ones, the Paragua, Uragua, and Parana, which, united near the sea, form the famous Rio de la Plata, or Plate River, and which annually overflow their banks; and, on their recess, leave them enriched with a slime that produces the greatest plenty of whatever is committed to it.

AIR, SOIL, AND PRODUCE.] This vast tract is far from being wholly subdued or planted by the Spaniards. There are many parts in a great degree unknown to them, or to any other people in Europe. The principal province of which we have any knowledge is that which is called Rio de la Plata, towards the mouth of the above-mentioned rivers. This province, with all the adjacent parts, is one continued level, not interrupted by the least hill for several hundred miles every way; extremely fertile, and producing cotton in great quantities; tobacco, and the valuable herb called Paraguay, with a variety of fruits, and prodigious rich pastures, in which are bred such herds of cattle, that it is said the hides of the beasts are all that is properly bought, the car-

cases being in a manner given into the bargain. A horse some time ago might be bought for a dollar; and the usual price for a bullock, chosen out of the herd of two or three hundred, was only four rials. But, contrary to the general nature of America, this country is destitute of woods. The air is remarkably sweet and serene, and the waters of La Plata are equally pure and wholesome.

FIRST SETTLEMENT, CHIEF CITY, AND COMMERCE. } The Spaniards first discovered this country, by sailing up the river La Plata, in 1515, and founded the town of Buenos Ayres, so called on account of the excellence of the air, on the south side of the river, 50 leagues within the mouth of it, where the river is seven leagues broad. This is one of the most considerable towns in South America, and the only place of traffic to the south ward of Brasil. Here we meet with the merchants of Europe and Peru; but no regular fleet comes here, as to the other parts of Spanish America; two, or at most three, register ships, make the whole of their regular intercourse with Europe. Their returns are very valuable, consisting chiefly of the gold and silver of Chili and Peru, sugar, and hides. Those who have now and then carried on a contraband trade to this city, have found it more advantageous than any other whatever. The benefit of this contraband is now wholly in the hands of the Portuguese, who keep magazines for that purpose, in such parts of Brasil as lie near this country. The trade of Paraguay, and the manners of the people, are so much the same with those of the rest of the Spanish colonies in South America, that nothing farther can be said on those articles.

But we cannot quit this country without saying something of that extraordinary species of commonwealth which the Jesuits erected in the interior parts, and of which these crafty priests endeavoured to keep all strangers in the dark.

About the middle of the last century, those fathers represented to the court of Spain, that their want of success in their missions was owing to the scandal which the immorality of the Spaniards never failed to give, and to the hatred which their insolent behaviour caused in the Indians, wherever they came. They insinuated, that, if it were not for that impediment, the empire of the gospel might, by their labours, have been extended into the most unknown parts of America; and that all those countries might be subdued to his Catholic majesty's obedience, without expense, and without force. This remonstrance met with success; the sphere of their labours was marked out, and uncontrouled liberty was given to the Jesuits within these limits; and the governors of the adjacent provinces had orders not to interfere, not to suffer any Spaniards to enter this pale, without licence from the fathers. They, on their part, agreed to pay a certain capitation tax, in proportion to their flock; and to send a certain number to the king's works whenever they should be demanded, and the missions should become populous enough to supply them.

On these terms the Jesuits gladly entered upon the scene of action, and opened their spiritual campaign. They began by gathering together about fifty wandering families, whom they persuaded to settle; and they united them into a little township. This was the slight foundation upon which they built a superstructure which has amazed the world, and added so much power, at the same time that it occasioned so much envy and jealousy of their society. For when they had made this beginning, they laboured with such indefatigable pains, and such masterly policy, that, by degrees, they mollified the minds of the most

savage nations, fixed the most rambling, and subdued those to their government who had long disdained to submit to the arms of the Spaniards and Portuguese. They prevailed upon thousands of various dispersed tribes to embrace their religion; and these soon induced others to follow their example, magnifying the peace and tranquillity they enjoyed under the direction of the fathers.

Our limits do not permit us to trace, with precision, all the steps which were taken in the accomplishment of so extraordinary a conquest over the bodies and minds of so many people. The Jesuits left nothing undone that could confirm their subjection, or increase their numbers; and it is said, that above 340,000 families, several years ago, were subject to the Jesuits; living in obedience, and an awe bordering upon adoration, yet procured without any violence or constraint: that the Indians were instructed in the military art with the most exact discipline, and could raise 60,000 men well armed: that they lived in towns; they were regularly clad; they laboured in agriculture; they exercised manufactures; some even aspired to the elegant arts; and that nothing could equal the obedience of the people of these missions, except their contentment under it. Some writers have treated the character of these Jesuits with great severity, accusing them of ambition, pride, and of carrying their authority to such an excess, as to cause not only persons of both sexes, but even the magistrates, who are always chosen from among the Indians, to be corrected before them with stripes, and to suffer persons of the highest distinction, within their jurisdiction, to kiss the hem of their garments, as the greatest honour. The priests themselves possessed large property; all manufactures were theirs; the natural produce of the country was brought to them; and the treasures, annually remitted to the superior of the order, seemed to evince that zeal for religion was not the only motive of their forming these missions. The fathers would not permit any of the inhabitants of Peru, whether Spaniards, Mestizos, or even Indians, to come within their missions in Paraguay. In the year 1757, when part of the territory was ceded by Spain to the court of Portugal, in exchange for Santo Sacramento, to make the Oragua the boundary of their possessions, the Jesuits refused to comply with this division, or to suffer themselves to be transferred from one hand to another, like cattle, without their own consent. And we are informed by authority of the Gazette, that the Indians actually took up arms; but notwithstanding the exactness of their discipline, they were easily, and with considerable slaughter, defeated by the European troops who were sent to quell them. And, in 1767, the Jesuits were sent out of America by royal authority, and their late subjects were put upon the same footing with the rest of the inhabitants of the country.

---

### SPANISH ISLANDS IN AMERICA.

**CUBA.]** The island of Cuba is situated between twenty and twenty-five deg. north lat. and between seventy-four and eight-five deg. west long. one hundred miles to the south of Cape Florida, and seventy-five north of Jamaica, and is near seven hundred miles in length, and generally about seventy miles in breadth. A chain of hills runs through

the middle of the island from east to west; but the land near the sea is in general level and flooded in the rainy season, when the sun is vertical. This noble island is supposed to have the best soil, for so large a country, of any in America. It produces all commodities known in the West Indies, particularly ginger, long pepper, and other spices, cassia fistula, mastic, and aloes. It also produces tobacco and sugar; but from the want of hands, and the laziness of the Spaniards, not in such quantities as might be expected. It is said that its exports do not equal in quantity those of our small island of Antigua.

The course of the rivers is too short to be of any consequence; but there are several good harbours in the island which belong to the principal towns, as that of St. Jago, facing Jamaica, strongly situated and well fortified, but neither populous nor rich. That of the Havannah, facing Florida, which is the capital city of Cuba, and a place of great strength and importance, containing about 2000 houses, with a great number of convents and churches. It was taken, however, by the courage and perseverance of the English troops in the year 1762, but restored in the subsequent treaty of peace. Besides these, there is likewise Cumberland harbour, and that of Santa Cruz, a considerable town thirty miles east of the Havannah.

**PORTO RICO.]** Situated between sixty-four and sixty-seven deg. west long. and in eighteen deg. north lat. lying between Hispaniola and St. Christopher's, is one hundred miles long and forty broad. The soil is beautifully diversified with woods, valleys, and plains; and is extremely fertile, producing the same fruits as the other islands. It is well watered with springs and rivers, but the island is unhealthy in the rainy seasons. It was on account of the gold that the Spaniards settled here; but there is no longer any considerable quantity of this metal found in it.

Porto Rico, the capital town, stands in a little island on the north-side, forming a capacious harbour, and joined to the chief island by a causeway, and defended by forts and batteries, which render the town almost inaccessible. It was, however, taken by Sir Francis Drake, and afterwards by the earl of Cumberland. It is better inhabited than most of the Spanish towns, because it is the centre of the contraband trade carried on by the English and French with the king of Spain's subjects.

**VIRGIN ISLANDS.]** Situated at the east-end of Porto Rico, are extremely small.

**TRINIDAD.]** Situated between fifty-nine and sixty-two deg. west long. and in ten deg. north lat. lies between the Island of Tobago and the Spanish Main, from which it is separated by the Straits of Paria. It is about ninety miles long, and sixty broad; and is an unhealthy but fruitful soil, producing sugar, fine tobacco, indigo, ginger, variety of fruit, and some cotton trees, and Indian corn. It was taken by Sir Walter Raleigh in 1595, and by the French in 1676, who plundered the island and extorted money from the inhabitants. It was captured by the British arms in February 1797.

**MARGARETTA.]** Situated in sixty-four deg. west long. and 11-30 north lat. separated from the northern coast of New Andalusia, in Terra Firma, by a strait of twenty-four miles, is about forty miles in length, and twenty-four in breadth; and being always verdant, affords a most agreeable prospect. The island abounds in pasture, in maize, and fruit; but there is a scarcity of wood and water. There was once a pearl-fishery on its coast, which is now discontinued.

There are many other small islands in these seas, to which the Spa-

niards have paid no attention. We shall, therefore, proceed round Cape Horn into the South Seas, where the first Spanish island of any importance is CHILOE, on the coast of Chili, which has a governor, and some harbours well fortified.

JUAN FERNANDES.] Lying in eighty-three deg. west long. and thirty-three south lat. three hundred miles west of Chili. This island is uninhabited; but having some good harbours, it is found extremely convenient for the English cruizers to touch at and water. This island is famous for having given rise to the celebrated romance of Robinson Crusoe. It seems one Alexander Selkirk, a Scotchman, was left ashore in this solitary place by his captain, where he lived some years, until he was discovered by captain Woodes Rogers in 1709. When taken up, he had forgotten his native language, and could scarcely be understood, seeming to speak his words by halves. He was dressed in goats' skin, would drink nothing but water, and it was some time before he could relish the ship's victuals. During his abode in this island he had killed 500 goats, which he caught by running them down; and he marked as many more on the ear, which he let go. Some of these were caught thirty years after by lord Anson's people; their venerable aspect, and majestic beards, discovered strong symptoms of antiquity. Selkirk, upon his return to England, was advised to publish an account of his life and adventures in his little kingdom. He is said to have put his papers into the hands of Daniel Defoe, to prepare them for publication; but that writer, by the help of these papers and a lively fancy, transformed Alexander Selkirk into Robinson Crusoe; and returned Selkirk his papers again; so that the latter derived no advantage from them. They were probably too indigested for publication, and Defoe might derive little from them but those hints which gave rise to his own celebrated performance.

The other islands that are worth mentioning are, the Gallipago Isles, situated four hundred miles west of Peru, under the equator; and those in the Bay of Panama, called the King's or Pearl Islands.

SEAS, BAYS, HARBOURS, AND CAPES. } The Atlantic Ocean washes the coast of Brasil on the north-east and east, upwards of 3000 miles, forming several fine bays and harbours: as the harbours of Pernambuco, All Saints, Porto Seguro, the port and harbour of Rio Janeiro, the port of St. Vincent, the harbour of St. Gabriel, and the port of St. Salvador, on the north shore of La Plata.

The principal capes are, Cape Roque, Cape St. Augustine, Cape Trio, and cape St. Mary, the most southerly promontory of Brasil.

FACE OF THE COUNTRY, AIR, CLIMATE, AND RIVERS. } The name of Brasil was given to this country, because it was observed to abound with a wood of that name. To the northward of Brasil, which lies almost under the equator, the climate is hot, boisterous, and unwholesome, subject to great rains and variable winds, particularly in the months of March and September, when they have such deluges of rain, with storms and tornadoes, that the country is overflowed. But to the southward, beyond the tropic of Capricorn, there is no part of the world that enjoys a more serene and wholesome air, refreshed with the soft breezes of the ocean on one hand, and the cool breath of the mountains on the other. The land near the coast is in general rather low than high, but exceedingly pleasant, it being interspersed with meadows and woods; but on the west, far within land, are mountains from whence issue many noble streams, that fall into the great rivers Amazon and La Plata; others running across the country from east to west till they fall into the Atlantic Ocean, after meliorating the lands which they annually overflow, and turning the sugar-mills belonging to the Portuguese.

[SOIL AND PRODUCE.] In general the soil is extremely fruitful, producing sugar, which, being clayed, is whiter and finer than our muscovado, as we call our unrefined sugar; also tobacco, hides, indigo, ipecacuanha, balsam of Copaiba, Brasil wood, which is of a red colour, hard and dry, and is chiefly used in dyeing, but not the red of the best kind; it has likewise some place in medicine, as a stomachic and restifergent.

The animals here are the same as in Peru and Mexico. The produce

of the soil was the mines of plantations, in consequent

of the soil was found very sufficient for subsisting the inhabitants until the mines of gold and diamonds were discovered: these, with the sugar plantations, occupy so many hands, that agriculture lies neglected, and, in consequence, Brasil depends upon Europe for its daily food.

**INHABITANTS, MANNERS, } AND CUSTOMS.** } The portrait given us of the manners and customs of the Portuguese in America, by the most judicious travellers, is very far from being favourable. They are described as a people, who, while sunk in the most effeminate luxury, practise the most desperate crimes; of a temper hypocritical and dissembling; of little sincerity in conversation, or honesty in dealing; lazy, proud, and cruel; in their diet penurious; for, like the inhabitants of most southern climates, they are much more fond of show, state and attendance, than of the pleasures of free society, and of a good table; yet their feasts, which are seldom made, are sumptuous to extravagance. When they appear abroad, they cause themselves to be carried out in a kind of cotton hammocks, called serpentine, which are borne on the negroes' shoulders, by the help of a bamboo about twelve or fourteen feet long. Most of these hammocks are blue, and adorned with fringes of the same colour: they have a velvet pillow, and above the head a kind of tester, with curtains; so that the person carried cannot be seen, unless he pleases; but may either lie down, or sit up leaning on his pillow. When he has a mind to be seen, he pulls the curtain aside, and salutes his acquaintance whom he meets in the streets; for they take a pride in complimenting each other in their hammocks, and even hold long conferences in them in the streets; but then the two slaves who carry them make use of a strong well made staff, with an iron fork at the upper end, and pointed below with iron: this they stick fast in the ground, and rest the bamboo, to which the hammock is fixed, on two of these, till their master's business or compliment is over. Scarcely any man of fashion, or any lady, will pass the streets without being carried in this manner.

**TRADE AND CHIEF TOWNS.]** The trade of Portugal is carried on upon the same exclusive plan on which the several nations of Europe trade with their colonies of America; and it more particularly resembles the Spanish method, in not sending out single ships, as the convenience of the several places, and the judgment of the European merchants, may direct; but by annual fleets, which sail at stated times from Portugal, and compose three flotas, bound to as many ports in Brasil; namely, to Pernambuco, in the northern part; to Rio Janeiro, at the southern extremity; and to the Bay of All Saints, in the middle.

In this last is the capital, which is called St. Salvador, and sometimes the city of Bahia, where all the fleets rendezvous on their return to Portugal. This city commands a noble, spacious, and commodious harbour. It is built upon a high and steep rock, having the sea upon one side, and a lake, forming a crescent, investing it almost wholly, so as nearly to join the sea, on the other. The situation makes it in a manner impregnable by nature; and they have besides added to it very strong fortifications. It is populous, magnificent, and, beyond comparison, the most gay and opulent city in all Brasil.

The trade of Brasil is very great, and increases every year; which is the less surprising, as the Portuguese have opportunities of supplying themselves with slaves for their several works at a much cheaper rate than any other European power that has settlements in America; they being the only European nation that has established colonies in Africa, whence they import between forty and fifty thousand negroes annually,

all of which go into the amount of the cargo of the Brasil fleets for Europe. Of the diamonds there is supposed to be returned to Europe to the amount of 130,000*l*. This, with the sugar, the tobacco, the hides, and the valuable drugs for medicine and manufactures, may give some idea of the importance of this trade, not only to Portugal, but to all the trading powers of Europe.

The chief commodities that European ships carry thither in return, are not the fiftieth part of the produce of Portugal; they consist of woollen goods of all kinds from England, France, and Holland; the linen and laces of Holland, France, and Germany; the silks of France and Italy; silk and thread stockings, hats, lead, tin, pewter, iron, copper, and all sorts of utensils wrought in these metals, from England; as well as salt-fish, beef, flour, and cheese; oil they have from Spain; wine, with some fruit, is nearly all they are supplied with from Portugal. England is at present most interested in the trade of Portugal, both for home consumption and what they want for the use of the Brasils.

Brasil is a very wealthy and flourishing settlement. Their export of sugar within forty years is grown much greater than it was, though anciently it made almost the whole of their exportable produce, and they were without rivals in the trade. Their tobacco is remarkably good, though not raised in such large quantities as in the United States. The northern and southern parts of Brasil abound with horned cattle; these are hunted for their hides only, of which no less than twenty thousand are sent annually to Europe.

The Portuguese had been long in possession of Brasil before they discovered the treasures of gold and diamonds which have since made it so considerable. Their fleets rendezvoits in the Bay of All Saints, to the amount of one hundred sail of large ships, in the month of May or June, and carry to Europe a cargo little inferior in value to the treasures of the Spanish flota and galleons. The gold alone, great part of which is coined in America, amounts to near four millions sterling; but part of this is brought from their colonies in Africa, together with ebony and ivory.

**HISTORY AND GOVERNMENT.]** This country was first discovered by Americus Vesputio, in 1498; but the Portuguese did not plant it till 1549, when they fixed themselves at the Bay of All Saints, and founded the city of St. Salvador. They met with some interruption at first from the court of Spain, who considered the whole continent of South America as belonging to them. However, the affair was at length made up by treaty; and it was agreed that the Portuguese should possess all the country lying between the two great rivers Amazon and Plata; which they still enjoy. The French also made some attempts to plant colonies on this coast, but were driven from thence by the Portuguese, who remained without a rival till the year 1580, when, in the very meridian of prosperity, they were struck by one of those blows which generally decide the fate of kingdoms: Don Sebastian, the king of Portugal, lost his life in an expedition against the Moors in Africa; and by that event the Portuguese lost their independence, being absorbed into the Spanish dominions.

The Dutels, soon after this, having thrown off the Spanish yoke, and being not satisfied with supporting their independence by a successful defensive war, being flushed with the juvenile ardor of a growing commonwealth, pursued the Spaniards into the remotest recesses of their extensive territories, and grew rich, powerful, and terrible, by the spoils of their former masters. They particularly attacked the posses-

sions of the Portuguese; they took almost all their fortresses in the East Indies, and then turned their arms upon Brasil, where they took seven of the captainships, or provinces; and would have subdued the whole colony, had not their career been stopped by the archbishop, at the head of his monks, and a few scattered forces. The Dutch were, about the year 1654, entirely driven out of Brasil; but their West India company still continuing their pretensions to this country, and harassing the Portuguese at sea, the latter agreed, in 1661, to pay the Dutch eight tons of gold, to relinquish their interest in that country; which was accepted: and the Portuguese have remained in peaceable possession of all Brasil from that time, till about the end of the year 1762, when the Spanish governor of Buenos Ayres, hearing of a war between Portugal and Spain, took, after a month's siege, the Portuguese frontier fortress called St. Sacramento; but, by the treaty of peace, it was restored.

### FRENCH AMERICA.

THE possessions of the French on the continent of America are at present inconsiderable. They were masters of Canada and Louisiana; but they have now lost all footing in North America; though on the southern continent they have still a settlement, which is called

#### CAYENNE, or EQUINOXIAL FRANCE.

IT is situated between the equator and fifth degree of north latitude, and between the fiftieth and fifty-fifth of west longitude. It extends two hundred and forty miles along the coast of Guiana, and near three hundred miles within land; bounded by Surinam, on the north; by the Atlantic Ocean, east; by Amazonia, south; and by Guiana, west. The chief town is Caen. All the coast is very low, but within land there are fine hills very proper for settlements: the French have, however, not yet extended them so far as they might; but they raise the same commodities which they have from the West India islands, and in no inconsiderable quantity. They have also taken possession of the island of Cayenne, on this coast, at the mouth of the river of that name, which is about forty-five miles in circumference. The island is very unhealthy; but, having some good harbours, the French have here some settlements, which raise sugar and coffee.

### FRENCH ISLANDS IN AMERICA.

THE French were among the last nations who made settlements in the West Indies; but they made ample amends by the vigour with which they pursued them, and by that chain of judicious and admirable measures which they used in drawing from them every advantage that the nature of the climate would yield; and in contending against the difficulties which it threw in their way.

[**St. DOMINGO, or HISPANIOLA.**] This island was at first pos-

possessed by the Spaniards alone; but by far the most considerable part has been long in the hands of the French, to whom the Spanish part was likewise ceded by the treaty of peace between the two nations in 1795. It must now, therefore, be considered as a French island.

It is situated between the seventeenth and twenty-first deg. north lat. and the sixty-seventh and seventy-fourth of west long. lying in the middle between Cuba and Porto Rico, and is 450 miles long, and 150 broad. When Hispaniola was first discovered by Columbus, the number of its inhabitants was computed to be at least a million. But such was the cruelty of the Spaniards, and to so infamous a height did they carry their oppression of the poor natives, that they were reduced to sixty thousand in the space of fifteen years. The face of the island presents an agreeable variety of hills, valleys, woods, and rivers; and the soil is allowed to be extremely fertile, producing sugar, cotton, indigo, tobacco, maize, and cassava root. The European cattle are so multiplied here, that they run wild in the woods, and, as in South America, are hunted for their hides and tallow only. In the most barren parts of the rocks they discovered formerly silver and gold. The mines, however, are not worked now. The north-west parts, which were in the possession of the French, consist of large fruitful plains, which produce the articles already mentioned in vast abundance. This indeed is the best and most fruitful part of the best and most fertile island in the West Indies, and perhaps in the world.

The population of this island was estimated, in 1788, at 27,717 white people; 21,809 free people of colour; and 405,528 slaves. Its trade employed 580 large ships, carrying 189,679 tons, in which the imports amounted to twelve millions of dollars, of which more than eight millions were in manufactured goods of France, and the other four millions in French produce. The Spanish ships exported, in French goods or money, 1,400,000 dollars, for mules imported by them into the colony; ninety-eight French ships, carrying 40,130 tons, imported 26,506 negroes, who sold for eight millions of dollars.

The most ancient town in this island, and in all the New World, built by Europeans, is St. Domingo. It was founded by Bartholomew Columbus, brother to the admiral, in 1504, who gave it that name in honour of his father Dominic, and by which the whole island is named, especially by the French. It is situated on a spacious harbour, and is a large well-built city, inhabited, like the other Spanish towns, by a mixture of Europeans, Creoles, Mulattoes, Mestizos, and Negroes.

The French towns are, Cape François, the capital, which is neither walled nor palled in, and is said to have only two batteries, one at the entrance of the harbour, and the other before the town. Before its destruction in 1793, it contained about eight thousand inhabitants, whites, people of colour, and slaves. It is the governor's residence in time of war, as Port-au-Prince is in time of peace. The Mole, though inferior to these in other respects, is the first port in the island for safety in time of war, being by nature and art strongly fortified. The other towns and ports of any note are, Fort Dauphin, St. Mark, Leogane, Petit Goave, Jeremie, Les Cayes, St. Louis, and Jacmel.

In the night between the 22d and 23d of August, 1791, a most alarming insurrection of the negroes began on the French plantations upon this island. A scene of the most horrid cruelties ensued. In a little time no less than one hundred thousand negroes were in rebellion, and all the manufactories and plantations of more than half the northern

province appeared as one general conflagration. The plains and the mountains were filled with carnage and deluged with blood. In this dreadful conflict, which has been of long continuance, the white colonists of St. Domingo have been extirpated or expelled, and the whole power of the island consequently vested in the mulattoes, the negroes, and the lower classes of the French inhabitants. The sovereign authority has fallen into the hands of some of the people of colour; the negroes who were slaves have been, during the greater part of the six years which have nearly elapsed since this change was effected, emancipated from their chains, and the majority of them trained to arms. In a word, it is the decided opinion of the best and most competent judges, that all the powers of Europe, combined, could not now frustrate the views of the people of colour in St. Domingo; and that a few years will present us with the new and perhaps formidable phenomenon of a black republic, constituted in the noblest island of the western ocean, in alliance with America, and only connected with that continent.

In the month of October, 1793, the English effected a landing on this island, and made themselves masters of Jeremie, Cape Tiburon, the Mole, and several other places on the coast. The troops, however, suffered greatly by the unhealthiness of the climate; several of the places they had gained possession of were soon retaken; nor could they have retained the others, had it not been for the contests and mutual jealousies of the whites and people of colour.

MARTINICO, which is situated between fourteen and fifteen degrees of north latitude, and in sixty-one degrees west longitude, lying about forty leagues north-west of Barbadoes, is about sixty miles in length, and half as much in breadth. The inland part of it is hilly, from which are poured out, on every side, a number of agreeable and useful rivers, which adorn and enrich this island in a high degree. The produce of the soil is sugar, cotton, indigo, ginger, and such fruits as are found in the neighbouring islands. But sugar is here, as in all the West India islands, the principal commodity, of which they export a considerable quantity annually. Martinico was the residence of the governor of the French islands in these seas. Its bays and harbours are numerous, safe, and commodious, and so well fortified, that they used to bid defiance to the English, who, in vain, often attempted this place. However, in the war of 1756, when the British arms were triumphant in every quarter of the globe, this island was added to the British empire; but it was given back at the treaty of peace. It was again taken by the English in 1794.

GUADALOUPE.] So called by Columbus from the resemblance of its mountains to those of that name in Spain, is situated in sixteen degrees north latitude, and in sixty-two west longitude, about thirty leagues north of Martinico, and also as much south of Antigua; being forty-five miles long, and thirty-eight broad. It is divided into two parts by a small arm of the sea, or rather a narrow channel, through which no ships can venture; but the inhabitants pass it in a ferry-boat. Its soil is equally fertile with that of Martinico, producing sugar, cotton, indigo, ginger, &c. This island is in a flourishing condition, and its exports of sugar almost incredible. Like Martinico it was formerly attacked by the English, who gave up the attempt; but in 1759 it was reduced by the British arms, and was given back at the peace of 1763. It was again reduced by the English in 1794, but evacuated a few months after.

**St. LUCIA.**] Situated in fourteen degrees north latitude, and in sixty-one degrees west longitude, eighty miles north-west of Barbadoes, is twenty-three miles in length, and twelve in breadth. It received its name from being discovered on the day dedicated to the virgin martyr St. Lucia. The English first settled on this island in 1637. From this time they met with various misfortunes from the natives and French; and at length it was agreed on between the latter and the English, that this island together with Dominica and St. Vincent, should remain neutral. But the French, before the war of 1756 broke out, began to settle these islands, by the treaty of peace, were yielded up to Great Britain, and returned to France. The soil of St. Lucia, in the valleys, is extremely rich. It produces excellent timber, and abounds in pleasant rivers and well situated harbours; and is now declared a free port under certain restrictions. The English made themselves masters of it in 1778; but it was restored again to the French in 1783. It was taken by the English in 1794, surrendered again to the French in 1795, and re-captured by Great Britain in 1796.

**TOBAGO.**] This island is situated in eleven degrees odd min. north latitude, one hundred and twenty miles south of Barbadoes, and about the same distance from the Spanish main. It is about thirty-two miles in length, and nine in breadth. The climate here is not so hot as might be expected so near the equator; and it is said that it lies out of the course of those hurricanes that have sometimes proved so fatal to the other West-India islands. It has a fruitful soil capable of producing sugar, and indeed every thing else that is raised in the West Indies, with the addition (if we may believe the Dutch) of the cinnamon, nutmeg, and gum copal. It is well watered with numerous springs; and its bays and creeks are so disposed as to be very commodious for all kinds of shipping. The value and importance of this island appear from the expensive and formidable armaments sent thither by European powers in support of their different claims. It seems to have been chiefly possessed by the Dutch, who defended their pretensions against both England and France with the most obstinate perseverance. By the treaty of Aix-la-Chapelle, in 1748, it was declared neutral; but by the treaty of peace in 1763 it was yielded up to Great Britain. In June 1781 it was taken by the French; and was ceded to them by the treaty of 1782. In 1793 it was again captured by the British arms.

**St. BARTHOLOMEW, DESEADA, AND MARIGALANTE,** are three small islands lying in the neighbourhood of Antigua and St. Christopher's, and of no great consequence to the French, except in time of war, when they give shelter to an incredible number of privateers, which greatly annoy our West-India trade. The former was given to Sweden in 1765.

The small islands of St. Pierre and Miquelon, situated near Newfoundland, have been already mentioned in our account of that island, p. 955.

## DUTCH AMERICA,

Containing SURINAM, on the Continent of SOUTH AMERICA.

AFTER the Portuguese had dispossessed the Dutch of Brasil in the manner we have seen; and after they had been entirely removed out of North America, they were obliged to console themselves with their rich possessions in the East Indies, and to sit down content in the West with Surinam; a country once in the possession of England, but of no great value whilst we had it, and which we ceded to them in exchange for New York; with two or three small and barren islands in the north sea, not far from the Spanish main.

Dutch Guiana is situated between five and seven degrees north lat. extending 100 miles along the coast from the mouth of the river Orinoco, north, to the river Maroni, or French Guiana, south. The climate of this country is generally reckoned unwholesome; and a considerable part of the coast is low, and covered with water. The settlement is at Surinam, a town built on a river of the same name; and the Dutch have extended their plantations thirty leagues above the mouth of this river. This was one of the richest and most valuable colonies belonging to the United Provinces; but it is in a less prosperous situation than it was some years since, owing, among other causes, to the wars with the fugitive negroes, whom the Dutch treated with great barbarity, and who are become so numerous, having increased from year to year, that they have formed a kind of colony in the woods, which are almost inaccessible, along the rivers of Surinam, Saramaca, and Copename, and are become very formidable enemies to their former masters. Under the command of chiefs, whom they have elected among themselves, they have cultivated lands for their subsistence, and make frequent incursions into the neighbouring plantations. The chief trade of Surinam consists in sugar, a great deal of cotton, coffee of an excellent kind, tobacco, flax, skins, and some valuable dyeing drugs. They trade with the North American colonies, who bring hither horses, live cattle, and provisions, and take home a large quantity of metals. Surinam was taken by the English in August 1709.

Connected with Surinam, we shall mention the two Dutch colonies of Demerary and Isequibo on the Spanish main, which surrendered to the English in the year 1781, and were represented as a very valuable acquisition, which would produce more revenue to the crown than all the British West-India islands united. But the report was either not believed or slighted; for the colonies were left defenceless, and soon were retaken by a French frigate. In the present war, however, they again surrendered to the British arms, April 21, 1796.

Dr. Bancroft observes, that the inhabitants of Dutch Guiana are either whites, blacks, or the reddish-brown aboriginal natives of America. The promiscuous intercourse of these different people has likewise generated several intermediate casts, whose colours immutably depend on their degree of consanguinity to either whites, Indians, or negroes. These are divided into Mulattoes, Tercerones, Quarterones, and Quinterones, with several intermediate subdivisions, proceeding from their retrograde intercourse. There are so great a number of birds, of various species, and remarkable for the beauty of their plumage, in Guiana, that several persons in this colony have employed

themselves advantageously, with their slaves and dependents, in killing and preserving birds for the cabinets of naturalists in different parts of Europe. The torporific eel is found in the rivers of Guiana, which, when touched either by the hand, or by a rod of iron, gold, silver, copper, or by a stick of some particular kinds of heavy American wood, communicates a shock perfectly resembling that of electricity. There are an immense number and variety of snakes in this country, which form one of its principal inconveniences. A snake was killed some years since, on a plantation which had belonged to Peter Aniyatt, esq. which was upwards of thirty-three feet in length, and in the largest place near the middle three feet in circumference. It had a broad head, large prominent eyes, and a very wide mouth, in which was a double row of teeth. Among the animals of Dutch Guiana is the Laubba, which is peculiar to this country. It is a small amphibious creature, about the size of a pig four months old, covered with fine short hair; and its flesh, by the Europeans who reside here, is preferred to all other kinds of meat.

### DUTCH ISLANDS IN AMERICA.

ST. EUSTATIUS, } SITUATED in 17° 29' N. lat. 63° 10' W. long.  
OR EUSTATIA, } and three leagues north-west of St. Christopher's,  
is only a mountain, about twenty-nine miles in compass, rising out of the sea like a pyramid, and almost round. But though so small, and inconveniently laid out by nature, the industry of the Dutch has made it to turn to very good account, and it is said to contain 5000 whites and 15,000 negroes. The sides of the mountain are disposed in very pretty settlements; but they have neither springs nor rivers. They raise here sugar and tobacco; and this island, as well as Curassou, is engaged in the Spanish contraband trade, for which, however, it is not so well situated; and it has drawn the same advantage from its constant neutrality. But when hostilities were commenced by Great Britain against Holland, admiral Rodney was sent with a considerable land and sea force against St. Eustatius, which, being incapable of any defence, surrendered at discretion on the 3d of February, 1781. The private property of the inhabitants was confiscated, with a degree of rigour very uncommon among civilised nations, and very inconsistent with the humanity and generosity by which the English nation were formerly characterised. The reason assigned was, that the inhabitants of St. Eustatius had assisted the revolted colonies with naval and other stores. But on the 27th of November, the same year, St. Eustatius was retaken by the French, under the command of the marquis de Bouillé, though their force consisted of only three frigates and some small craft, and about 300 men.

CURASSOU.] Situated in 12 degrees north lat. 9 or 10 leagues from the continent of Terra Firma, is 30 miles long, and 10 broad. It seems as if it were fated, that the ingenuity and patience of the Hollanders should every where, both in Europe and America, be employed in fighting against an unfriendly nature; for this island is not only barren, and dependent upon the rains for water, but the harbour is naturally one of the worst in America: yet the Dutch have entirely

remedied that defect; they have upon this harbour one of the largest, and by far one of the most elegant and cleanly towns in the West Indies. The public buildings are umerous and handsome; the private houses commodious; and the magazines large, convenient, and well filled. All kind of labour is here performed by engines; some of them so well contrived, that ships are at once lifted into the dock. Though this island is naturally barren, the industry of the Dutch has brought it to produce a considerable quantity both of tobacco and sugar: it has, besides, good salt-works, for the produce of which there is a brisk demand from the English islands, and the colonies on the continent. But what renders this island of most advantage to the Dutch is the contraband trade which is carried on between the inhabitants and the Spaniards, and their harbour being the rendezvous to all nations in time of war.

The Dutch ships from Europe touch here for intelligence, or pilots, and then proceed to the Spanish coasts for trade, which they force with a strong hand, it being very difficult for the Spanish guarda-costas to take these vessels; for they are not only stout ships, with a number of guns, but are manned with large crews of chosen seamen, deeply interested in the safety of the vessel and the success of the voyage. They have each a share in the cargo, of a value proportioned to the station of the owner, supplied by the merchants upon credit, and at prime cost. This animates them with an uncommon courage, and they fight bravely, because every man fights in defence of his own property. Besides this, there is a constant intercourse between this island and the Spanish continent.

Curassou has numerous warehouses, always full of the commodities of Europe and the East Indies. Here are all sorts of woollen and linen cloths, laces, silks, ribbands, iron utensils, naval and military stores, brandy, the spices of the Moluccas, and the calicoes of India, white and painted. Hither the Dutch West-India, which is also their African, company annually bring three or four cargoes of slaves; and to this mart the Spaniards themselves come in small vessels, and carry off not only the best of the negroes, at a very high price, but great quantities of all the above sorts of goods; and the seller has this advantage, that the refuse of warehouses and mercers' shops, with every thing that has grown unfashionable and unsaleable in Europe, goes off here extremely well; every thing being sufficiently recommended by its being European. The Spaniards pay in gold and silver, coined or in bars, cacao, vanilla, Jesuit's bark, cochineal, and other valuable commodities.

The trade of Curassou, even in times of peace, is said to be annually worth to the Dutch no less than 500,000*l.* but in the time of war the profit is still greater, for then it becomes the common emporium of the West Indies; it affords a retreat to ships of all nations, and at the same time refuses none of them arms and ammunition. The intercourse with Spain being then interrupted, the Spanish colonies have scarcely any other market from whence they can be well supplied, either with slaves or goods. The French come hither to buy the beef, pork, corn, flour, and lumber, which the English bring from the continent of North America, or which is exported from Ireland; so that, whether in peace or war, the trade of this island flourishes extremely.

The trade of all the Dutch American settlements was originally carried on by the West-India company alone: at present, such ships as go upon that trade pay two and a half per cent. for their licences; the

company, however, reserve to themselves the whole of what is carried on between Africa and the American Islands.

The other islands, Bonaire and Aruba, are inconsiderable in themselves, and should be regarded as appendages to Curacao, for which they are chiefly employed in raising cattle and other provisions.

The small islands of Saba and St. Martin's, situated at no great distance from St. Eustatia, hardly deserve to be mentioned: they were both captured by admiral Rodney and general Vaughan, at the time when St. Eustatia surrendered to the arms of Great Britain; but were afterwards retaken by the French.

DANISH ISLANDS IN AMERICA.

DANISH ISLANDS IN AMERICA.

St. THOMAS. [AN inconsiderable island of the Caribbees, is situated in 64 degrees west long. and 18 north lat. about 15 miles in circumference, and has a safe and commodious harbour.

STE. CROIX, OR SANTA CRUZ. [Another small and unhealthy island, lying about five leagues east of St. Thomas, ten or twelve leagues in length, and three or four where it is broadest. These islands, so long as they remained in the hands of the Danish West-India company, were ill managed; and of little consequence to the Danes; but that wise and benevolent prince, the late king of Denmark bought up the company's stock, and laid the trade open; and since that time the island of St. Thomas has been so greatly improved, that it is said to produce upwards of 9000 hogheads of sugar of 1000 weight each, and others of the West-India commodities in tolerable plenty. In time of war, privateers bring in their prizes here for sale; and a great many vessels trade from hence along the Spanish main, and return with money, in specie or bars, and valuable merchandise. As for Santa Cruz, from a perfect desert a few years since, it is beginning to thrive very fast; several persons from the English islands, some of them of very great wealth, have gone to settle there, and have received very great encouragement.

NEW DISCOVERIES,

OUR knowledge of the globe has been considerably augmented by the late discoveries of the Russians, and still more by those that have been made by British navigators in the present reign, which have been numerous and important; and of these discoveries we shall therefore give a compendious account.

NORTHERN ARCHIPELAGO.

THIS consists of several groups of islands, which are situated between the eastern coast of Kamtschatka and the western coast of the continent of America\*. Mr. Muller divides these islands into four principal groups, the first two of which are styled the Aleutian islands. The first group, which is called by some of the islanders *Sagihnan*, comprehends, 1. Beering's Island; 2. Copper Island; 3. Otma; 4. Samyra, or Shernyia; 5. Anukta. The second group is called *Khao*, and comprises eight islands, viz. 1. Immak; 2. Kiska; 3. Tchetchia; 4. Ava; 5. Kavia; 6. Tichangulek; 7. Ulagama; 8. Amtschidga. The third general name is *Negho*, and comprehends the islands known to the Russians under the name of *Andreanofski Ostrova*; sixteen of which are mentioned under the following names: 1. Amatkinak; 2. Ulak; 3. Unalga; 4. Navotsha; 5. Uliga; 6. Anagin; 7. Kagulak; 8. Ilak; 9. Ilak; 9. Takavanga, upon which is a volcano; 10. Kanaga, which has also a volcano; 11. Leg; 12. Sketthuna; 13. Tagaloon; 14. Gurdleoi; 15. Otehu; 16. Amla. The fourth group is called *Kavalang*, and comprehends sixteen islands; which are called by the Russians *Lysic Ostrova*, or the *For Islands*; and which are named; 1. Anuchta; 2. Tichigama; 3. Tsohegula; 4. Unifra; 5. Ulaga; 6. Tauagulasa; 7. Kagamin; 8. Kigalga; 9. Skelmaga; 10. Umnak; 11. Agun-Alashka; 12. Unimroa; 13. Uligan; 14. Anturo-Leiffume; 15. Semidit; 16. Senagak.

Some of these islands are only inhabited occasionally, and for some months in the year, and others are very thinly peopled; but others have a great number of inhabitants, who constantly reside in them. Copper Island receives its name from the copper which the sea throws up on its coasts. The inhabitants of these islands are in general of a short stature, with strong and robust limbs, but free and supple. They have lank black hair and little beard, flattish faces and fair skins. They are for the most part well made, and of strong constitutions, suitable to the boisterous climate of their isles. The inhabitants of the Aleutian isles live upon the roots which grow wild, and sea animals. They do not employ themselves in catching fish, though the rivers

\* Mr. Coxe observes, that "the first project for making discoveries in that tempestuous sea which lies between Kamtschatka and America was conceived and planned by Peter I." Voyages with that view were accordingly undertaken at the expense of the crown; but, when it was discovered that the islands of that sea abounded with valuable furs, private merchants immediately engaged with ardour in similar expeditions; and, within a period of ten years, more important discoveries were made by these individuals, at their own private cost, than had hitherto been effected by all the efforts of the crown. The investigation of useful knowledge has also been greatly encouraged by the late empress of Russia; and the most distant parts of her vast dominions, and other countries and islands, have been explored, at her expense, by persons of abilities and learning; in consequence of which, considerable discoveries have been made.

abound with all kinds of salmon, and the sea with turbot. Their clothes are made of the skins of birds, and of sea otters.

The Fox islands are so called from the great number of black, gray, and red foxes with which they abound. The dress of the inhabitants consists of a cap, and a fur coat which reaches down to the knee. Some of them wear common caps of a party-coloured bird-skin, upon which they leave part of the wings and tail. On the fore part of their hunting and fishing caps they place a small board like a screen, adorned with the jaw-bones of sea-bears, and ornamented with glass beads which they receive in barter from the Russians. At their festivals and dancing parties they use a much more showy sort of caps. They feed upon the flesh of all sorts of sea animals, and generally eat it raw. But if at any time they choose to dress their victuals, they make use of a hollow stone: having placed the fish or flesh therein, they cover it with another, and close the interstices with lime or clay. They then lay it horizontally upon two stones, and light a fire under it. The provision intended for keeping is dried without salt in the open air. Their weapons consist of bows, arrows, and darts, and for defence they use wooden shields.

The most perfect equality reigns among these islanders. They have neither chiefs nor superiors, neither laws nor punishments. They live together in families, and societies of several families united, which form what they call a race, who, in case of an attack, or defence, mutually help and support each other. The inhabitants of the same island always pretend to be of the same race; and every person looks upon his island as a possession, the property of which is common to all the individuals of the same society. Feasts are very common among them, and more particularly when the inhabitants of one island are visited by those of the others. The men of the village meet their guests beating drums, and preceded by the women, who sing and dance. At the conclusion of the dance, the hosts serve up their best provisions, and invite their guests to partake of the feast. They feed their children when very young with the coarsest flesh, and for the most part raw. If an infant cries, the mother immediately carries it to the sea side, and, whether it be summer or winter, holds it naked in the water until it is quiet. This custom is so far from doing the children any harm, that it hardens them against the cold, and they accordingly go barefooted through the winter without the least inconvenience. They seldom heat their dwellings; but, when they are desirous of warming themselves, they light a bundle of hay, and stand over it; or else they set fire to train oil, which they pour into a hollow stone. They have a good share of plain natural sense, but are rather slow of understanding. They seem cold and indifferent in most of their actions; but let an injury, or even a suspicion only, rouse them from this phlegmatic state, and they become inflexible and furious, taking the most violent revenge, without any regard to the consequences. The least affliction prompts them to suicide; the apprehension of even an uncertain evil often leads them to despair, and they put an end to their days with great apparent insensibility.

#### NORTH-WEST COAST OF AMERICA.

FROM the observations made by captain Cook on the inhabitants of the western coast of North America; in the neighbourhood of Prince William's Sound, and to the latitude of  $64^{\circ}$  north, it appeared that a

frong similarity was discernible between them and the Esquimaux on the eastern coast; whence it was conjectured by some that a communication by sea existed between the eastern and western sides of that continent. In support of this conjecture old accounts were revived of the discoveries of John de Fuca, and De Fonte or De Fuentes; the one a Greek pilot, who made his voyage in 1592, and the other a Spanish or Portuguese admiral, who sailed in 1640. John de Fuca had related that between the 47th and 48th degrees of north latitude he had entered a broad inlet which led him into a far broader sea, wherein he sailed above twenty days; and De Fonte had sailed through crooked channels in an extensive archipelago 260 leagues, and 60 leagues up a navigable river which flowed into it, in 53° of north latitude, and communicated, by other lakes and rivers, with a passage in which a ship had arrived from Boston in New England. The truth of these ancient accounts appeared to be strongly corroborated, some years since, by the discovery said to be made by one Mr. Etches, who had fitted out some ships for the fur trade, that all the western coast of America, from lat. 48° to 57° north, was no continued tract of land, but a chain of islands which had never been explored, and that these concealed the entrance to a vast inland sea, like the Baltic or Mediterranean in Europe, and which seemed likewise to be full of islands. Among these, Mr. Etches' ship, the Princess Royal, was said to have penetrated several hundred leagues, in a north-east direction, till they came within 200 leagues of Hudson's Bay; but as the intention of their voyage was merely commercial, they had not time fully to explore the archipelago just mentioned, nor did they arrive at the termination of this new mediterranean sea.

The existence of any such inland sea is, however, now, completely disproved by the voyage of the late captain Vancouver, who, during the summers of 1792, 1793, and 1794, explored and accurately surveyed the whole western coast of North America, from lat. 30° to 60°. Between the 47th and 57th degrees of north latitude there is indeed an archipelago, composed of innumerable islands and crooked channels; but he nowhere found either the inlet of John de Fuca, the river of De Fonte, or the inland sea of Mr. Etches' ship.—“The precision,” says captain Vancouver, “with which the survey of the coast of North-West America has been carried into effect, will, I trust, remove every doubt, and set aside every opinion of a north-west passage, or any water communication navigable for shipping, existing between the North Pacific and the interior of the American continent, within the limits of our researches.”

This coast, with very little deviation, has the appearance of one continued forest, being covered with pines of different species, intermixed with alder, birch, and other trees. The natives of the northern parts are in general short in stature, with faces flat and round, high cheek-bones, and flat noses. They have some very peculiar customs of mutilating or disfiguring their persons, probably by way of ornament, though to us they appear disgusting and even hideous. At Port Trinidad, in lat. 41° north, the custom, says captain Vancouver, “was particularly singular, and must be attended with much pain in the first instance, and great inconvenience ever after. All the teeth of both sexes were, by some process, ground uniformly down, horizontally to the gums; the women especially, carrying the fashion to an extreme, had their teeth reduced even below this level, and ornamented the lower lip with three perpendicular rows of punctuation, one from each corner of the mouth, and one in the middle, occupying three fifths of the lip and chin.” On other parts of this coast the women make a horizontal incision in the

under lip, extending from one corner of the mouth to the other, entirely through the flesh, which orifice is by degrees sufficiently stretched to admit an ornament made of wood, which is confined close to the gums of the lower jaw, with the external surface projecting horizontally. These wooden ornaments are oval, and resemble a small oval platter or dish made concave on both sides; they are of various sizes; some of them above three inches in length, and an inch and a half broad. The chief object of civilized nations in navigating this coast, hitherto, has been to traffic with the natives for furs, which they give in exchange for pieces of iron, nails, beads, penknives, and other trifling trinkets. These furs are carried to China, and disposed of at a great profit. The skins obtained are those of the sea-otter, racoon, pine-martin, land-beaver, and earless marmot. Ginseng, copper, oil, and some other commodities, might also be procured.

In 1788, some English merchants engaged in this trade formed a settlement in King George's Sound, since called Nootka Sound from the name by which it is called by the natives. The Spaniards, however, being jealous of the intrusion of the English into a part of the world which they long regarded as their exclusive property, sent a frigate from Mexico, which captured two English vessels, and took possession of the settlement. The British ministry, on receiving intelligence of this transaction, fitted out a powerful armament to give weight to their demand of reparation; but the affair was amicably terminated by a convention in 1790.

Nootka Sound is situated in lat.  $49^{\circ} 33'$  north, long.  $126^{\circ} 48'$  west, on an island about 300 miles in length and 80 in breadth, named by captain Vancouver, in 1792, Quadra and Vancouver's Island, in compliment to Senor Quadra, the Spanish commandant at Nootka.

### THE PELEW ISLANDS.

THE existence and situation of these islands were probably known to the Spaniards at a distant period; but from a report among the neighbouring islands, of their being inhabited by a savage race of cannibals, it appears that there never had been the least communication between them and any of the Europeans, till the Antelope packet (belonging to the East-India company) was wrecked on one of them, in August 1783. From the accounts given of these islands, by captain Wilson, who commanded the packet, it appears that they are situated between the 5th and 9th degrees north latitude, and between 130 and 136 degrees of east longitude from Greenwich, and lie in a N. E. and S. W. direction; they are long but narrow, of a moderate height, and well covered with wood; the climate temperate and agreeable; the lands produce sugar-cane, yams, coconuts, plantains, bananas, oranges, and lemons; and the surrounding seas abound with the finest and greatest variety of fish.

The natives of these islands are a stout, well-made people, above the middle stature; their complexions are of a far deeper colour than what is understood by the Indian copper, but not black. The men go entirely naked; and the women wear only two small aprons, one behind, and one before, made of the hulks of the cocoa nut, dyed with different shades of yellow.

The government is monarchical, and the king is absolute, but his power is exercised more with the mildness of a father than a sovereign. In the language of Europeans, he is the fountain of honour; he occasionally creates his nobles, called *Rupacks* or chiefs, and confers a singular honour of knighthood, called the *Order of the Bone*, the members of which are distinguished by wearing a bone on their arm.

The idea which the account published by Captain Wilson gives us of these islanders, is that of a people who, though naturally ignorant of the arts and sciences, and living in the simplest state of nature, yet possess all that genuine politeness, that delicacy, and chastity of intercourse between the sexes, that respect for personal property, that subordination to government, and those habits of industry, which are so rarely united in the more civilised societies of modern times.

It appears, that when the English were thrown on one of these islands, they were received by the natives with the greatest humanity and hospitality; and, till their departure, experienced the utmost courtesy and attention. "They felt our people were distressed, and in consequence wished they should share whatever they had to give. It was not that worldly munificence that bestows and spreads its favours with a distant eye to retribution. It was the pure emotion of native benevolence. It was the love of man to man." It was a scene that pictures human nature in triumphant colouring; and which their liberality gratified the sense, their virtue struck the heart.

### THE MARQUESAS ISLANDS.

THESE islands were first discovered by Quiros in 1595: their situation was better ascertained by captain Cook in 1774. They are five in number, and named St. Christina, Magdalena, St. Dominica, St. Pedro, and Hood. Captain Cook, in his second voyage, lay some time at the first of these, which is situated in  $9^{\circ} 55'$  south latitude, and  $139^{\circ} 9'$  west longitude. St. Dominica is the largest, about 16 leagues in circuit. The inhabitants, their language, manners, and clothing, with the vegetable productions, are nearly the same as those of the Society Isles.

### INGRAHAM'S ISLANDS.

THESE islands were discovered by captain Joseph Ingraham, of Boston, commander of the brigantine Hope, on the 19th of April, 1791. They lie N. N. W. from the Marquesas Islands, from 35 to 50 leagues distant; in about  $9^{\circ}$  of south latitude, and from 140 to 141 west longitude from London. They are seven in number, and were named by captain Ingraham, Washington, Adams, Lincoln, Federal, Franklin, Hancock, Knox. Most if not all of these islands are inhabited, and appear generally to be diversified with hills and valleys, and to be well wooded, and very pleasant. The people resemble those of the Marquesas Islands, as do their canoes, which are carved at each end. They appeared friendly.

## OTAHEITE, OR KING GEORGE'S ISLAND.

THIS island was discovered by captain Wallis, in the Dolphin \*, on the 19th of June, 1767. It is situated between the 17th degree 28 min. and the 17th degree 53 min. south latitude, and between the 140th degree 11 min. and the 149th degree 39 min. west longitude. It consists of two peninsulas, of a somewhat circular form, joined by an isthmus, and is surrounded by a reef of coral rocks, which form several excellent bays and harbours, where there is room and depth of water for almost any number of the largest ships. The face of the country is very extraordinary; for a border of low land almost entirely surrounds each peninsula, and behind this border the land rises in ridges that run up into the middle of these divisions, and these form mountains that may be seen at sixty leagues distance. The soil, except upon the very tops of the ridges, is remarkably rich and fertile, watered by a great number of rivulets, and covered with fruit-trees of various kinds, forming the most delightful groves. The border of low land that lies between the ridges and the sea is in few places more

\* The Dolphin was sent out, under the command of captain Wallis, with the Swallow, commanded by captain Carteret, at the expense of the British government, in August, 1766, in order to make discoveries in the southern hemisphere. These vessels proceeded together, till they came within sight of the South Sea at the western entrance of the Strait of Magellan, and from thence returned by different routes to England. On the 6th of June, 1767, captain Wallis discovered an island, about four miles long and three wide, to which he gave the name of *Whitson's Island*, it being discovered on Whitson-eve. Its latitude is  $19^{\circ} 26' S.$  and its longitude  $137^{\circ} 56' W.$  The next day he discovered another island, to which he gave the name of *Queen Charlotte's Island*. The inhabitants of this island, captain Wallis says, were of a middling stature, dark complexion, and long black hair, which hung loose over their shoulders. The men were well made, and the women handsome. Their clothing was a kind of coarse cloth or matting, which was fastened about their middle, and seemed capable of being brought up round their shoulders. This island is about six miles long, and one mile wide, and lies in latitude  $19^{\circ} 18' S.$  longitude  $138^{\circ} 4' W.$  In the space of a few days after, he also discovered several other small islands, to which he gave the names of *Egmont Island*, *Gloucester Island*, *Cumberland Island*, *Prince William Henry's Island*, and *Ofnaburgh Island*.

On the 19th of the same month he discovered the island of Otahete; and after he had quitted that island, he discovered, on the 28th of July, 1767, another island about six miles long, which he called *Sir Charles Saunders's Island*; and on the 30th of the same month, another about ten miles long, and four broad, which he called *Lord Howe's Island*. After having discovered some other small islands, one of which was named *Wallis's Island*, he arrived at Batavia on the 30th of November; at the Cape of Good Hope on the 4th of February, 1768; and his ship anchored safely in the Downs on the 20th of May following.

Captain Carteret, in the Swallow, after he had parted with captain Wallis in the Dolphin, having passed through the Strait of Magellan, and made some stay at the island of Mafatevero, discovered, on the 2d of July, 1767, an island about five miles in circumference, to which he gave the name of *Pitcairn's Island*. It lies in latitude  $25^{\circ} 2' S.$  longitude  $123^{\circ} 21' W.$  and about a thousand leagues to the westward of the continent of America. The 11th of the same month he discovered another small island, to which he gave the name of the *Bishop of Ofnaburgh's Island*. The next day he discovered two other small islands, which he called the *Duke of Gloucester's Islands*. The following month he discovered a cluster of small islands, to which he gave the name of *Queen Charlotte's Islands*, and also three others, which he named *Cape's Island*, *Simpson's Island*, and *Carteret's Island*. On the 24th of the same month he discovered *Sir Charles Hardy's Island*, which lies in latitude  $4^{\circ} 50' S.$  and the next day *Winchelsea's Island*, which is distant about ten leagues in the direction of S. by E. He afterwards discovered several other islands, and proceeded round the Cape of Good Hope to England, where he arrived in March 1769.

than a mile and a half broad; and this, together with some of the valleys, are the only parts that are inhabited. Captain Wallis made some stay at this island; and it was afterwards visited again by captain Cook in the Endeavour, in April, 1769. That commander was accompanied by Joseph Banks, Esq. now Sir Joseph Banks, and Dr. Solander; and those gentlemen, together with the captain, made a very accurate survey of the island.

Some parts of the island of Otaheite are very populous; and captain Cook was of opinion, that the number of inhabitants on the whole island amounted to 204,000, including women and children. They are of a clear olive complexion; the men are tall, strong, well-limbed, and finely shaped; the women are of an inferior size, but handsome, and very amorous. Their clothing consists of cloth or matting of different kinds; and the greatest part of the food eaten here is vegetable, as cocoa-nuts, bananas, bread-fruit, plantains, and a great variety of other fruit. Their houses, those which are of a middling size, are of an oblong square, about twenty-four feet long, and eleven wide, with a shelving roof supported on three rows of posts, parallel to each other, one row on each side, and one in the middle. The utmost height within is about nine feet, and the eaves on each side reach to within about three feet and a half from the ground. All the rest is open, no part being inclosed with a wall. The roof is thatched with palm leaves, and the floor covered some inches deep with soft hay, over which they lay mats; upon which they sit in the day, and sleep in the night. They have no tools among them made of metal; and those they use are made of stones, or some kind of bones. The inhabitants of Otaheite are remarkable for their cleanliness; for both men and women constantly wash their whole bodies in running water three times a day. Their language is soft and melodious, and abounds with vowels. There were no tame animals upon the island but hogs, dogs, and poultry; but the English and Spaniards have since carried thither bulls, cows, sheep, goats, a horse and mare, geese, ducks, peacocks, turkeys, and also cats. The only wild animals are tropical birds, paroquets, pigeons, ducks, and a few other birds; rats, and a very few serpents. The sea, however, supplies the inhabitants with a very great variety of the most excellent fish.

In other countries the men cut their hair short, and the women pride themselves on its length; but here the women always cut it short round their ears, and the men (except the fishers, who are almost continually in the water, suffer it to spread over their shoulders, or tie it up in a bunch on the top. They have the custom of discolouring the skin, by pricking it with a small instrument, the teeth of which are dipped into a mixture of a kind of lamp-black, and this is called tattooing. This is performed upon the youth of both sexes, when they are about twelve or fourteen years of age, on several parts of the body, and in various figures. Their principal manufacture is their cloth, of which there are three kinds, made of the bark of three different kinds of trees. The finest and whitest is made of the Chinese paper mulberry-tree; and this is chiefly worn by the principal people. Another considerable manufacture is matting, some of which is finer, and in every respect better, than any we have in Europe. The coarser sort serves them to sleep upon, and the finer to wear in wet weather. They are likewise very dextrous in making wicker-work; their baskets are of a thousand different patterns, and many of them exceedingly neat. The inhabitants of Otaheite believe in one supreme Deity, but at the same

time acknowledge a variety of subordinate Deities; they offer up their prayers without the use of idols, and believe the existence of the soul in a separate state, where there are two situations, of different degrees of happiness. Among these people a subordination is established, which somewhat resembles the early state of the European nations under the feudal system. If a general attack happens to be made upon the island, every district is obliged to furnish its proportion of soldiers for the common defence. Their weapons are slings, which they use with great dexterity, and clubs of about six or seven feet long, and made of a hard heavy wood. They have a great number of boats, many of which are constructed for warlike operations.

### THE SOCIETY ISLANDS.

OF the several islands so called, and which were discovered by captain Cook \*, in the year 1769, the principal are HUAHEINE, ULITEA, OTAHEITE, and BOLABOLA. HUAHEINE is about 31 leagues to the

\* At the close of the year 1767, it was resolved by the Royal Society, that it would be proper to send persons into some part of the South Sea, to observe a transit of the planet Venus over the Sun's disk, which, according to astronomical calculation, would happen in the year 1769; and that the islands called Marquesas de Mendoza, or those of Rotterdam or Amsterdam, were the properest places then known for making such observations. In consequence of these resolutions, it was recommended to his majesty, in a memorial from the society, dated February, 1768, that he would be pleased to order such an observation to be made; upon which his majesty signified to the Lords Commissioners of the Admiralty his pleasure that a ship should be provided to carry such observers as the society should think fit, to the South Seas; and accordingly a bark, of three hundred and seventy tons, was prepared for the purpose. It was named the Endeavour, and commanded by captain James Cook, who was soon after, by the Royal Society, appointed, with Mr. Charles Green, a gentleman who had long been assistant to Dr. Bradley at the Royal Observatory at Greenwich, to observe the transit. But while this vessel was getting ready for her expedition, captain Wallis returned; and it having been recommended to him by lord Morton, when he went out, to fix on a proper place for this astronomical observation, he, by letter, dated on board the Dolphin, the 18th of May, 1768, the day before he landed at Hastings, mentioned Port Royal harbour, in the island of Otaheite; the Royal Society; therefore, by letter, dated the beginning of June, in answer to an application from the Admiralty, to be informed whether they would have their observers sent, made choice of that place. Captain Cook set sail from Plymouth, in the Endeavour, on the 26th of August, 1768. He was accompanied in his voyage by Joseph Banks, Esq. and Dr. Solander. They made no discovery till they got within the tropic, where they fell in with Lagoon Island, Two Groups, Bird Island, and Chain Island; and they arrived at Otaheite on the 13th of April, 1769. During their stay at that island, they had the opportunity of making very accurate inquiries relative to its produce and inhabitants; and, on the 4th of June, the whole passage of the planet Venus over the Sun's disk was observed by them with great advantage. The result of their observations may be found in the Philosophical Transactions. After his departure from Otaheite, captain Cook discovered and visited the Society Islands and Oheteroa, and thence proceeded to the south till he arrived in the latitude of 40 degrees 22 minutes, longitude 147 degrees 29 minutes W. and afterwards made an accurate survey of the coast of New Zealand. In November he discovered a chain of islands, which he called *Barrier Islands*. He afterwards proceeded to New Holland, and from thence to New Guinea; and in September, 1770, arrived at the island of Savu, from whence he proceeded to Batavia, and from thence round the Cape of Good Hope to England, where he arrived on the 12th of June, 1771.

Soon after captain Cook's return home in the Endeavour, it was resolved to equip two ships, in order to make farther discoveries in the southern hemisphere. Accord-

serving the bes

north-west of Otaheite; and its productions are exactly the same, but it appears to be a month forwarder. The inhabitants seem to be larger made, and more stout than those of Otaheite. Mr. Banks measured one of the men, and found him to be six feet three inches and a half high; yet they are so indolent, that he could not persuade one of them to go up to the hills with him; for they said, if they were to attempt it, the fatigue would kill them. The women are fairer than those of Otaheite, and both sexes appear less timid and less curious; though in their dress, language, and almost every other circumstance, they are the same. Their houses are neat, and they have boat-houses that are

ingly the Resolution and the Adventure were appointed for that purpose; the first was commanded by captain Cook, and the latter by captain Tobias Furneaux. They sailed from Plymouth Sound on the 13th of July, 1772; and on the 29th of the same month arrived at the Island of Madeira. From thence they proceeded to the Cape of Good Hope; and in February, 1773, arrived at New Zealand, having sought in vain for a southern continent. In that month the Resolution and the Adventure separated, in consequence of a thick fog, but they joined company again in Queen Charlotte's Sound, on the 18th of May following. In August they arrived at Otaheite; and in September they discovered Harvey's Island. On the second of October they came to Middleburgh, one of the Friendly Islands; and about the close of that month the Resolution and the Adventure were separated, and did not join company any more. Captain Cook, however, proceeded in the Resolution, in order to make discoveries in the southern polar regions, but was stopped in his progress by the ice, in the latitude of 71 degrees 10 minutes south; longitude 100 degrees 54 minutes west. He then proceeded to Easter Island, where he arrived in March, 1774, as he did also in the same month at the Marquesas Islands. He afterwards discovered four islands, which he named Palliser's Islands; and again steered for Otaheite, where he arrived on the 22d of April, and made some stay, and also visited the neighbouring isles. In August he came to the New Hebrides, some of which were first discovered by him. After leaving these islands, he steered to the southward a few days, and discovered New Caledonia. Having surveyed the south-west coast of this island, captain Cook steered again for New Zealand, in order to refresh his crew, and put his ship into a condition to encounter the danger attending the navigation in the high southern latitudes. Directing his course to the south and east, after leaving New Zealand, till he arrived in the latitude of 35 degrees 6 minutes south, longitude 138 degrees 56 minutes west, without meeting with any continent, captain Cook gave up all hopes of discovering any in this ocean; and therefore came to a resolution to steer directly for the west entrance of the Straits of Magellan, with a view of coasting and surveying the uttermost or south side of Terra del Fuego. Keeping accordingly in about the latitude of 33 or 35, and steering nearly east, he arrived off the western mouth of the Straits of Magellan, without meeting with any thing remarkable in his new route. In January, 1775, he discovered a large and dreary island, to which he gave the name of *South Georgia*. He afterwards discovered various capes and elevated snow-clad coasts, to the most southern part of which he gave the name of the *Southern Thule*; as being the nearest land to that pole which has yet been discovered. In February he discovered *Sandwich Land*, and several islands covered with snow. He then proceeded round the Cape of Good Hope to England, where he arrived on the 30th of July, 1775. Captain Furneaux had returned to England in the Adventure a year before, having proceeded home round the Cape of Good Hope without making any remarkable discovery. Ten of his men, a boat's crew, had been murdered and eaten by some of the savages of New Zealand; so that this voyage afforded a melancholy proof that cannibals really exist; and, indeed, in the course of these voyages of discovery, other evidence appeared of this fact. As to captain Cook, in the course of his voyage in the Resolution, he had made the circuit of the southern ocean, in a high latitude, and had traversed it in such a manner, as to leave not the least room for the possibility of there being a southern continent, unless near the pole, and out of the reach of navigation. It deserves also to be remembered, in honour of that able commander, captain Cook, that, with a company of a hundred and eighteen men, he performed this voyage of three years and eighteen days, throughout all the climates, from fifty-two degrees north to seventy-one degrees south, with the loss of only one man by sickness; and this appears, in a considerable degree, to have arisen from the great humanity of the commander, and his uncommon care and attention to adopt every method for preserving the health of his men.

remarkably large. Ulitea is about seven or eight leagues to the south-westward of Huahine, and is a much larger island, but appears neither so fertile, nor so populous. The principal refreshments to be procured here are, plantains, cocoa nuts, yams, hogs, and fowls; but the two last are rather scarce. Otaha is divided from Ulitea by a strait, that in the narrowest part is not above two miles broad. This island affords two good harbours, and its produce is of the same kind as that of the other islands. About four leagues to the north-west of Otaha lies Bolabola, which is surrounded by a reef of rocks and several small islands, all of which are no more than eight leagues in compass. To these islands, and those of Marua, which lie about fourteen miles to the westward of Bolabola, containing six in all, captain Cook gave the name of Society Islands.

### OHETEROA.

THIS island is situated in the latitude of 22 deg. 27 min. south, and in the longitude of 150 deg 47 min. west from Greenwich. It is thirteen miles in circuit, and rather high than low, but neither so populous nor so fertile as some of the other islands in these seas. The inhabitants are luffy and well made, but are rather browner than those of Otaheite. Their principal weapons are long lances made of etoa wood, which is very hard, and some of them are near twenty feet long.

### THE NAVIGATORS' ISLANDS.

THESE islands, which were discovered by M. de Bougainville, and explored by the unfortunate De la Pérouse in 1787, are ten in number, and called by the natives Opoun, Leone, Fanfoe, Maouna, Oyolava, Calinaffe, Pola, Shika, Ossamo, and Ouera. Opoun, the most southerly as well as the most easterly of these islands, lies in 14° 7' south latitude, and 169° 7' west longitude. At Maouna, M. de la Pérouse, commander of the French ships the *Bouffole* and *Astrolabe*, met with his first fatal accident: M. de Langle, captain of the *Astrolabe*, and eleven officers and sailors, being massacred by the natives. Oyolava is separated from Maouna by a channel about nine leagues wide, and is at least equal to Otaheite in extent, fertility, and population. The island of Pola is somewhat smaller than that of Oyolava, but equally beautiful. The eastern islands, Opoun, Leone, and Fanfoe, are small, especially the last two, which are about five miles in circumference; but Maouna, Oyolava, and Pola, may be numbered among the largest and most beautiful islands of the South Sea. They combine the advantages of a soil fruitful without culture, and a climate that renders clothing unnecessary. They produce in abundance the bread-fruit, cocoa-

nut, the b

nut, the banana, the guava, and the orange. The inhabitants are a strong and handsome race of men. Their usual height is five feet ten or eleven inches, and six feet; but their stature is less astonishing than the colossal proportions of the different parts of their bodies. The men have the body painted or tattooed, so that any one would suppose them clothed, though they go almost naked. They have only a girdle of sea-weeds encircling their loins, which comes down to their knees; and gives them the appearance of the river gods of mythology. Their hair is very long, and they often twist it round their heads, and thus add to their native ferocity of countenance, which always expresses either surprise or anger. The stature of the women is proportional to that of the men. They are tall, slender, and not without grace, though in general disgusting from their gross effrontery and indecency. The inhabitants of these islands cultivate several arts with success. Their houses have even a kind of elegance, and they finish their work very neatly, with tools made of a very fine and compact species of basalt, in the form of an adze. They manufacture very fine mats, and some paper-stuffs. They are almost continually on the water, and do not go so much as from one village to another on foot, but perform all their journeys in canoes; on which account M. de Bougainville called these islands the *Navigators' Islands*. Their villages are all situated in creeks by the seaside, and have no paths from one to the other. In their disposition they appear to be thievish, treacherous, and ferocious.

---

### THE FRIENDLY ISLANDS.

THESE islands were so named by captain Cook, in the year 1773, on account of the friendship which appeared to subsist among the inhabitants, and from their courteous behaviour to strangers. Abel Jausen Tasman, an eminent Dutch navigator, first touched here in 1643, and gave names to the principal islands. Captain Cook laboriously explored the whole cluster, which he found to consist of more than sixty. The three islands which Tasman saw, he named New Amsterdam, Rotterdam, and Middleburgh. The first is the largest, and extends about twenty-one miles from east to west, and about thirteen from north to south. These islands are inhabited by a race of Indians, who cultivate the earth with great industry. The island of Amsterdam is intersected by straight and pleasant roads, with fruit trees on each side, which afford shade from the scorching heat of the sun.

The principal of these islands are, Tongataboo, or Amsterdam; Eaoowe, or Middleburgh; Annamooka, or Rotterdam; Hapacc, and Lefooga. The first, which is the largest, lies in 21° 9' south latitude, and 174° 46' west longitude. Eaoowe, when viewed from the ship at anchor, formed one of the most beautiful prospects in nature, and very different from the others of the Friendly Isles; which, being low and perfectly level, exhibit nothing to the eye but the trees which cover them: whereas here the land rising gently to a considerable height, presented an extensive prospect, with groves of trees interspersed at irregular distances, in beautiful disorder; the rest is covered with grass, except near the shores, which are entirely covered with fruit and other

trees; among which are the habitations of the natives. In order to have a view of, as great a part of the island as possible, captain Cook and some of his officers walked up to the highest point of it. From this place they had a view of almost the whole island, which consisted of beautiful meadows, of prodigious extent, adorned with tufts of trees, and intermixed with plantations. "While I was surveying this delightful prospect," says captain Cook; "I could not help flattering myself with the pleasing idea, that some future navigator may, from the same station, behold these meadows stocked with cattle, brought to these islands by the ships of England; and that the completion of this single benevolent purpose, independent of all other considerations, would sufficiently mark to posterity that our voyages had not been useless to the general interests of humanity."

### NEW ZEALAND.

**THIS** country was first discovered by Tasman, the Dutch navigator, in the year 1642, who gave it the name of Staten Land, though it has been generally distinguished in our maps and charts by the name of New Zealand, and was supposed to be part of a southern continent; but it is now known, from the late discoveries of captain Cook, who sailed round it, to consist of two large islands, divided from each other by a strait four or five leagues broad. They are situated between the latitudes of 34 and 48 degrees south, and between the longitudes of 66 and 180 degrees east from Greenwich. One of these islands is for the most part mountainous, rather barren, and but thinly inhabited; but the other is much more fertile, and of a better appearance. In the opinion of Sir Joseph Banks and Dr. Solander, every kind of European fruits, grain, and plants, would flourish here in the utmost luxuriance. From the vegetables found here, it is supposed that the winters are milder than those in England, and the summers not hotter, though more equally warm; so that it is imagined, that if this country was settled by people from Europe, they would, with moderate industry, be soon supplied not only with the necessaries, but the luxuries of life, in great abundance. Here are forests of vast extent, filled with very large timber trees; and near four hundred plants were found here that had not been described by naturalists. The inhabitants of New Zealand are stout and robust, and equal in stature to the largest Europeans. Their colour in general is brown, but in few deeper than that of a Spaniard who has been exposed to the sun, and in many not so deep; and both sexes have good features. Their dress is very uncouth, and they mark their bodies in a manner similar to the inhabitants of Otahite, which is called tattooing. Their principal weapons are lances, darts, and a kind of battle-axes; and they have generally shown themselves very hostile to the Europeans who have visited them.

## THE NEW HEBRIDES.

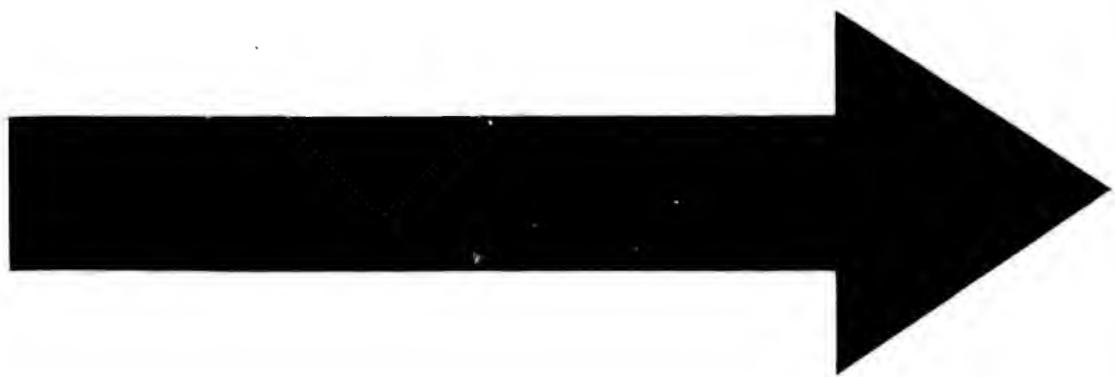

THIS name was given by captain Cook to a cluster of islands, the most northerly of which was seen by Quiros, the Spanish navigator, in 1606, and by him named Terra del Espiritu Santo. From that time till captain Cook's voyage in the Endeavour, in 1769, this land was supposed to be part of a great southern continent, called *Terra Australis Incognita*. But when captain Cook had sailed round New Zealand, and along the eastern coast of New Holland, this opinion was fully confuted. On his next voyage, in the Resolution, he resolved to explore those parts accurately; and, accordingly, in 1774, besides ascertaining the extent and situation of these islands, discovered several in the group which were before unknown. The New Hebrides are situated between the latitudes of 14 deg. 29 min. and 20 deg. 4 min. south; and between 166 deg. 41 min. and 170 deg. 21 min. east long. They consist of the following islands, some of which have received names from the different European navigators, and others retain the names which they bear among the natives, viz. Terra del Espiritu Santo, Mallicollo, St. Bartholomew, Isle of Lepers, Aurora, Whitsuntide, Ambrym, Immer, Appee, Three Hills, Sandwich, Montagu, Hinchinbrook, Shepherd, Eorromanga, Ironan, Annatom, and Tanna.

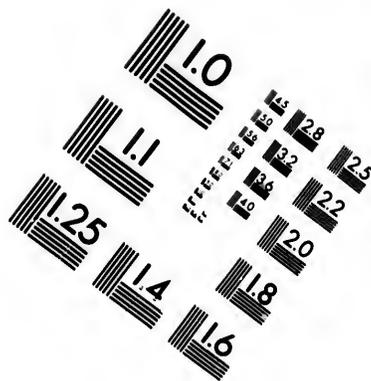

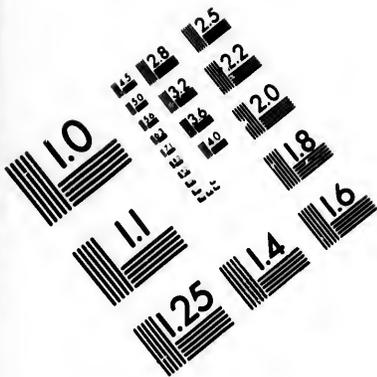

Not far distant from the New Hebrides, and south westward of them, lies NEW CALEDONIA, a very large island, first discovered by captain Cook, in 1774. It is about eighty-seven leagues long, but its breadth does not in any where exceed ten leagues. It is inhabited by a race of stout, tall, well-proportioned Indians, of a swarthy or dark chestnut brown. A few leagues distant, are two small islands, called the Island of Pines, and Botany Island.

## NEW HOLLAND,

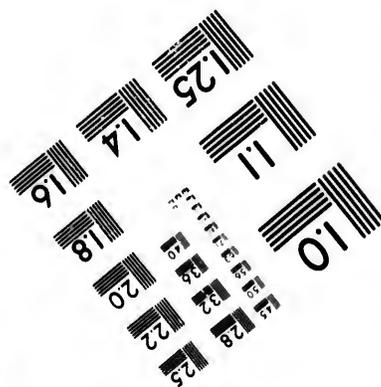

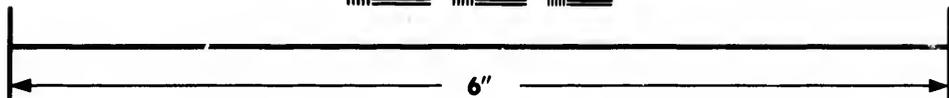

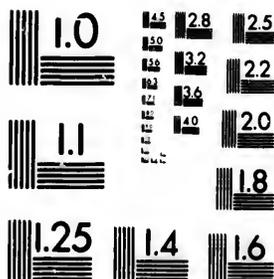

THE largest island in the world, and formerly supposed to be a part of that imaginary continent, called Terra Australis Incognita, lies between 10 deg. 30 min. and 43 deg. south latitude, and between 110 and 153 deg. 30 min. east longitude; extending in all as much as the whole continent of Europe, the eastern coast running not less than 2000 miles in length from north-east to south-west. Its dimensions from east to west have not been so exactly ascertained, as we are obliged to take our information concerning them from the accounts of navigators of different nations, who visited this part of the world at a time when the method of making observations, and finding the latitudes and longitudes of places, was less accurate than it is now. Different parts of the country have been called by the names of the discoverers, as Van Dieman's land\*, Carpentaria, &c. and though the general appellation of the

\* According to accounts lately received, governor Hunter, the present governor of New South Wales, having conceived an idea that the land called Van Dieman's Land was not a part of the coast of New Holland, but that it was probably a group of islands separated from its southern extremity by a strait, and being desirous of ascertaining the fact, fitted out a two-decked boat, of 15 tons burthen, built at Norfolk Island, and sent her to the southward, under the direction of the second lieutenant and purser of

whole was New Holland, it is now applied by geographers to the north and west parts of the country. The eastern part, called New South Wales, was taken possession of in his majesty's name by captain Cook, and now forms a part of the British dominions, a colony being very lately formed there, chiefly of the convicts sentenced to transportation. The accounts of the climate and soil of this extensive country, now become an object of importance to Great Britain, are very various: different parts have been explored at different times, and at different seasons of the year. In general, however, the relations are by no means favourable; the sea-coast, the only place on which any inhabitants have been discovered, appearing sandy and barren; and as for the inland parts, which might reasonably be supposed more fertile, they are now thought to be wholly uninhabited; but whether this proceeds from the natural sterility of the soil, or the barbarity of the inhabitants, who know not how to cultivate it, is not yet discovered.

One thing we are assured of by all who have ever visited this country, that its coast is surrounded by very dangerous shoals and rocks, so that it is by no means easy to effect a landing upon it. A shoal called Houtman's Abrolhos, or shoal, from Frederick Houtman, commander of a fleet of Dutch Indiamen, in 1618, lies on the western coast, on which commodore Pelsart, a Dutch navigator, was wrecked in 1629. When his ship, the Batavia, having on board 330 men, struck on this shoal, there was no land in sight, excepting some small rocky islands, and one considerably larger, about three leagues distant. All these were explored in search of fresh water; but none being found, they were obliged to sail in their skiff to the continent, which they soon after discovered. But, on their approach, they found the coast so excessively rocky, that it was impossible to land. Continuing their course northward for two days, they found themselves in 27 degrees of south latitude; but still the shore was so extremely steep, that there was no possibility of approaching it. It presented the same appearance as far north as 24 degrees; but the men being now resolved to get on shore at any rate, six of them, who were expert swimmers, threw themselves into the sea, and with much difficulty got to land. Here they employed themselves in searching for fresh water, but, finding none, they were obliged to swim back again to their skiff. Next day they discovered a cape, from the extreme points of which ran a ridge of rocks, for about a mile into the sea, with another behind it; but still no passage was found to the continent. Another opening appeared about noon the same day, into which they ventured, though the passage was extremely dangerous, even for a skiff, having only two feet water, with a rugged stony bottom. Here, however, they effected a landing; but though they made the most diligent search for fresh water, they could find neither rivulets, springs, nor even water that could be drunk by digging of wells. The shoal on which commodore Pelsart was wrecked is placed by Dampier in 27 degrees south latitude.

This navigator explored the coast of New Holland in 1688 and 1699. In the last of these voyages he fell in with the land in 26 degrees south latitude; but could not land on account of the steepness of the shore. In 22 deg. 22 min. he found another shoal, which was the first

the Reliance man of war. They passed through a wide and extensive strait, and completely circumnavigated Van Dieman's Land, entered two rivers in it, and went many miles up with their little sloop. The strait is, in some places, more than a degree and a half wide, but studded with a few scattered steep islands. A chart of this discovery is preparing to be sent home.

he had met with since leaving the Aboihos in 27 deg. 19. 20. deg. 21 min. he fell in with some rocky islands, which, from the nature of the tides, he supposed to extend in a range as far south as Shark's Bay, in 25 deg. and nine or ten leagues in breadth from east to west. In 18 deg. 21 min. he effected a landing; but the shore here, as in all other places visited by this navigator, was excessively rocky at low water, so that it is then impossible to land. At high water, however, the tides rise so high, that boats may get over the rocks to a sandy beach which runs all along the coast.

The southern part of this island, visited by captain Tasman, in 1642, was found less difficult of access. He pursued the coast as far south as 44 degrees, where it begins to run to the eastward; and from this time the country appears not to have been visited by any Europeans, till the year 1770, when captain Furneaux, of the Adventure, reached the point we speak of, lying in 43 deg. 17 min. south, 145 deg. 36 min. and, by account, 143 deg. 10 min. east from Greenwich. Several islands appeared to the north west, one of which was named, by captain Cook, Eddystone, from its resemblance to the light-house of that name; and he observes that nature seems to have left these two rocks for the same purpose that the Eddystone light-house was built by man, viz. to give navigators warning of their danger; for they are the conspicuous summits of a ledge of rocks under water, on which the sea in many places breaks very high. Their surface is white with the dung of sea fowls, which makes them conspicuous at a considerable distance.

This celebrated navigator, captain Cook, spent upwards of four months in surveying the the eastern coast, the extent of which, as has already been mentioned, is nearly 2000 miles. The bay in which he anchored, from the great quantity of undescribed plants found on the shore, was called BOTANY BAY, and is the place for which the convicts were originally destined; though now they are settled in another part of the island, about fifteen miles to the northward, named, by captain Cook, Port Jackson, the principal settlement being called SYDNEY COVE.

This was not visited or explored by captain Cook, it was seen at the distance of between two and three miles from the coast; but, had fortune conducted him into the harbour, he would have found it much more worthy of his attention, as a seaman, than Botany Bay, where he passed a week. From an entrance not more than two miles broad, Port Jackson gradually extends into a noble and capacious basin, having soundings sufficient for the largest vessels, and space to accommodate, in perfect security, any number that could be assembled. It runs, chiefly in a western direction, about thirteen miles into the country, and contains no less than a hundred small coves formed by narrow necks of land, whose projections afford shelter from the winds.

SYDNEY COVE lies on the south side of the harbour, between five and six miles from the entrance. The neck of land that forms this cove is mostly covered with wood, yet is so rocky, that it is not easy to comprehend how the trees could have found sufficient nourishment to bring them to so considerable a magnitude. The soil in other parts of the coast, immediately about Port Jackson, is of various qualities. This neck of land, which divides the south end of the harbour from the sea, is chiefly sand. Between Sydney Cove and Botany Bay, the first space is occupied by a wood, in some parts a mile and a half, in others three miles broad.

Beyond that, is a kind of heath, poor, sandy, and full of swamps; but as far as the eye can reach to the westward, the country is one continued wood.

The name of Cumberland county was given by the government to this part of the territory. It is about fifty miles in length, and thirty broad. The boundaries fixed for Cumberland county were, on the west, Caermarthen and Lansdown hills; on the north, the northern parts of Broken Bay; and to the southward, the southern parts of Botany Bay; thus including completely these three principal bays, and leaving the chief place of settlement, at Sydney Cove, nearly in the centre.

At the very first landing of governor Philip on the shore of Botany Bay, an interview took place with the natives. They were all armed; but on seeing the governor approach with signs of friendship, alone and unarmed, they readily returned his confidence by laying down their arms.

They were perfectly devoid of clothing, yet seemed fond of ornaments, putting the beads and red baize that were given them on their heads or necks, and appearing pleased to wear them.

The different coves of Port Jackson were examined with all expedition, and the preference was given to one which had the finest spring of water, and in which ships can anchor so close to the shore, that at a very small expense quays may be constructed, at which the largest vessels may unload.

After they had all landed at Sydney Cove, a plan was laid down for building a town, according to which were traced out the principal streets, the governor's house, main-guard, hospital, church, store-houses, and barracks. In some parts of this space, temporary barracks are erected; but no permanent buildings will be allowed, except in conformity to the plan laid down. Should the town be farther extended in future, the forms of other streets are also marked out, in such a manner as to ensure a free circulation of air. The principal streets, according to this design, will be two hundred feet wide.

The climate at Sydney Cove is considered, on the whole, as equal to the finest in Europe. The rains are never of long duration, and there are seldom any fogs. The soil, though in general light and rather sandy in this part, is full as good as usually is found so near the sea-side, All the plants and fruit-trees brought from Brasil and the Cape, which were not damaged in the passage, thrive exceedingly; and vegetables have now become plentiful, both the European sorts, and such as are peculiar to New South Wales.

The natives of New Holland, in general, seem to have no great aversion to the new settlers; the only acts of hostility they ever committed were, on account of their occupying the fishing-grounds which the New Hollanders justly supposed to belong to themselves. They appear, however, to be in too savage a state to be capable as yet of deriving any instruction from their new neighbours. They are so ignorant of agriculture, that it seems most probable they do not even know the use of corn, and therefore, perhaps more from ignorance than malice, set fire to that which the colonists had raised for their own use. To avoid such disagreeable incidents, a new settlement was begun on a small uninhabited island, named *Norfolk Island*, lying in south lat. twenty nine degrees, and east long. 108 10, at the distance of twelve hundred miles from New Holland. The party sent out to form this

settlement consisted only of twenty-six persons, who took possession on the 14th of February, 1788. This settlement was found so eligible, that, in October, 1788, another party was sent thither, so that the new colony, at the time the last advices were received, consisted of forty-four men and sixteen women; who, being supplied with eighteen months' provisions, will probably be able to cultivate the soil in such a manner, as to enable them to form a granary, which will put those who settled on New Holland entirely out of danger from their barbarous neighbours.

For a more particular account of this new settlement, we refer our readers to the Voyage of Governor Philip to Botany Bay.

## NEW GUINEA,

**T**ILL the late discoveries, was thought to be the north coast of an extensive continent, and to be joined to New Holland; but captain Cook discovered a strait between them, which runs north-east, through which he sailed. Thus it was found to be a long narrow island, extending north-east from the second degree of south latitude to the twelfth, and from one hundred and thirty-one to one hundred and fifty degrees east longitude; but in one part it does not appear to be above fifty miles broad. The country consists of a mixture of very high hills and valleys, interspersed with groves of cocoa-nut trees, plantains, bread-fruit, and most of the trees, shrubs, and plants, that are found on the other South Sea islands. It affords from the sea a variety of delightful prospects. The inhabitants make nearly the same appearance as the New Hollanders on the other side the straits.

To the north of New Guinea is **NEW BRITAIN**, which is situated in the fourth degree of south latitude, and one hundred and fifty-two degrees nineteen min. east longitude from Greenwich. It was supposed to be part of an imaginary continent, till captain Dampier found it to be an island, and sailed through a strait which divides it from New Guinea. Captain Carteret, in his voyage round the world, in 1767, found it was of much less extent than it was till then imagined to be, by sailing through another strait to the north, which separates it from a long island, to which he gave the name of New Ireland. There are many high hills in New Britain, and it abounds with large and stately trees. To the eastward of New Britain, and in both the above straits, are many islands, most of which are said to be extremely fertile, and to abound with plantains and cocoa-nut trees.

**NEW IRELAND** extends in length, from the north-east to the south-west, about two hundred and seventy miles, but is in general very narrow. It abounds with a variety of trees and plants, and with many pigeons, parrots, rooks, and other birds. The inhabitants are black and woolly-headed, like the negroes of Guinea, but have not their flat noses and thick lips. North-westward of New Ireland, a cluster of islands was seen by captain Carteret, lying very near each other, and supposed to consist of twenty or thirty in number. One of these, which is of very considerable extent, was named **NEW HANOVER**; the rest of the cluster received the name of the **ADMIRALTY ISLANDS**.

## SANDWICH ISLANDS.

**BESIDES** the voyages of discovery already mentioned, another voyage was performed by captain Cook and captain Clerke, in the Resolution and Discovery, during the years 1770, 1777, 1778, and 1779, in search of a north-west passage between the continents of Asia and America. After they had arrived at the Cape of Good Hope, they proceeded from thence to New Holland. In their course they discovered two islands which Captain Cook called Prince Edward's Isles. The largest, about fifteen leagues in circuit, is in latitude 46-53 south; long. 37-46; the other, about nine leagues in circuit, lat. 46-40, and long. 38-8, east, both barren, and almost covered with snow. From New Holland they sailed to New Zealand, and afterwards they visited the Friendly and the Society Isles. In January, 1777, they arrived at the Sandwich Isles, which are twelve in number, and are situated between twenty-two deg. fifteen min. and eighteen deg. fifty-three min. north lat. The air of these islands is in general salubrious, and many of the vegetable productions are the same with those of the Society and Friendly Isles. The inhabitants are of a middle size, stout, and well made, and their complexion in general a brown olive. On the 7th of February, being nearly in lat. 44 deg. 33 min. north, and long. 235 deg. 36 min. east, they saw part of the American continent, bearing north-east. They afterwards discovered King George's Sound, which is situated on the north-west coast of America, and is extensive: that part of it where the ships under the command of captain Cook anchored, is in lat. 49 deg. 36 min. north, and long. 233 deg. 28 min. east. The whole sound is surrounded by high land, which in some places appears very broken and rugged, and is in general covered with wood to the very top. They found the inhabitants here rather below the middle size, and their complexions approaching to a copper colour. On the 12th of May, they discovered Sandwich Sound in lat. 59 deg. 54 min. north. The harbour, in which the ships anchored, appeared to be almost surrounded with high land; which was covered with snow; and here they were visited by some of the Americans in their canoes. They afterwards proceeded to the island of Unalatchka; and after their departure from thence, still continued to trace the American coast, till they discovered the strait which separates it from the continent of Asia. Here both the hemispheres presented to the view a naked and flat country, without any defence, and the sea between them not very deep. They passed the strait, and arrived on the 20th of August, 1778, in lat. 70 deg. 54 min. long. 194 deg. 55 min. where they found themselves almost surrounded with ice, and the farther they proceeded to the eastward the closer the ice became compacted. They continued labouring among the ice till the 25th, when a storm came on, which made it dangerous for them to proceed; and a consultation was therefore held on board the Resolution, as soon as the violence of the gale abated, when it was resolved, that as this passage was impracticable for any useful purpose of navigation, which was the great object of the voyage, it should be prosecuted no farther; and especially on account of the condition the ships were in, the approach of winter, and their great distance from any known place of refreshment. The voyage, indeed, afforded sufficient evidence, that no practicable passage exists between the Atlantic and Pacific Oceans towards the north; and this voyage also ascertained the western boundaries

of the great continent of America. On their return, it unfortunately happened that the celebrated and able navigator, captain Cook, was killed in an affray with the natives on the island of O'why'hee, one of the Sandwich Isles, on the 14th of February, 1779; not so much by his own rashness, as through the inadvertence and neglect of some of his own people. His death was universally regretted, not only in Great Britain, but also in other parts of Europe, by those to whom his merits and public services were known. In his last voyage he had explored the coast of America, from 42 deg. 27 min. to 70 deg. 40 min. 57 sec. north. After the death of captain Cook, the command devolved on captain Clerke, who died at sea on his return to the southward on the 22d day of August, 1779. The two ships returned home by the Cape of Good Hope, and on the 5th of October, 1780, anchored at the Nore.

We cannot conclude this article without inserting the following character of captain Cook, to perpetuate the memory and services of so excellent a navigator.

"Perhaps no science ever received greater additions from the labours of a single man than geography has done from those of captain Cook. In his first voyage to the South Seas, he discovered the Society Islands; determined the insularity of New Zealand; discovered the straits which separate the two islands, and are called after his name; and made a complete survey of both. He afterwards explored the eastern coast of New Holland, hitherto unknown; an extent of twenty-seven degrees of latitude, or upwards of two thousand miles.

"In his second expedition, he resolved the great problem of a southern continent, having traversed that hemisphere between the latitude of forty and seventy degrees, in such a manner as not to leave a possibility of its existence, unless near the pole, and out of the reach of navigation. During this voyage he discovered New Caledonia, the largest island in the Southern Pacific Ocean, except New Zealand; the Island of Georgia; and an unknown coast, which he named Sandwich Land, the Thule of the southern hemisphere; and having twice visited the tropical seas, he settled the situations of the old, and made several new discoveries.

"But the last voyage is distinguished above all the rest, by the extent and importance of its discoveries. Besides several smaller islands in the Southern Pacific, he discovered to the north of the equinoctial line the group called the Sandwich Islands, which, from their situation and productions, bid fairer for becoming an object of consequence in the system of European navigation than any other discovery in the South Sea. He afterwards explored what had hitherto remained unknown of the western coast of America, from the latitude of forty-three to seventy degrees north, containing an extent of three thousand and five hundred miles; ascertained the proximity of the two great continents of Asia and America; passed the straits between them, and surveyed the coast on each side, to such a height of northern latitude, as to demonstrate the impracticability of a passage, in that hemisphere, from the Atlantic into the Pacific Ocean, either by an eastern or a western course. In short, if we except the Sea of Amur, and the Japanese Archipelago, which still remain imperfectly known to Europeans, he has completed the hydrography of the habitable globe.

"The method which he discovered, and so successfully pursued, of preserving the health of seamen, forms a new æra in navigation, and will transmit his name to future ages amongst the friends and benefactors of mankind.

"Those who are conversant in naval history, need not be told at how

dear a rate the advantages which have been sought through the medium of long voyages at sea have always been purchased. That dreadful disorder which is peculiar to their service, and whose ravages have marked the tracks of discoverers with circumstances almost too shocking to relate, must, without exercising an unwarrantable tyranny over the lives of our framers, have proved an insuperable obstacle to the prosecution of such enterprises. It was reserved for captain Cook to show the world, by repeated trials, that voyages might be protracted to the unusual length of three, or even four years, in unknown regions, and under every change and rigour of the climate, not only without affecting the health, but even without diminishing the probability of life, in the smallest degree.

### TERRA-INCIGNITA, or UNKNOWN COUNTRIES.

NOTWITHSTANDING the amazing discoveries of navigators, and the progress made in geography since the first voyage of Columbus, anno 1492, there still remain some countries, either absolutely unknown, or very superficially surveyed.

#### IN AFRICA.

OF this quarter of the globe, the moderns are acquainted with the sea-coasts only, and these very imperfectly: the internal parts being little known to us; nor have we any satisfactory accounts of their inhabitants, their productions, or their trade. It is well known, however, that the rivers of Africa bring down large quantities of gold, and it is equally certain that the ancients drew prodigious riches from a country blessed with a variety of climates, some of them the finest in the world.

#### IN AMERICA.

IN North America, towards the pole, Labrador, or New Britain, New North and South Wales, New Denmark, are very little known. All that vast tract on the back of the British settlements, from Canada and the Lakes to the Pacific Ocean, which washes America on the west, is likewise unknown to us, no European having ever travelled thither. From the climate and the situation of the country, it is supposed to be fruitful. It is inhabited by innumerable tribes of Indians, many of whom used to resort to the great fair of Montréal, even from the distance of one thousand miles, when that city was in the hands of the French.

In South America, the country of Guiana, extending from the equator to the eighth degree of north latitude, and bounded by the river Orinoco on the north, and the Amazons on the South, is unknown, except a slip along the coast, where the French at Cayenne, and the Dutch at Surinam, have made some settlements, which, from the unhealthfulness of the climate, almost under the equator, and other causes, can hardly be extended any considerable way back.

The count has never been European countries means of the made by the vast difficulties gold being found has hitherto

Patagonia, scribed as part European nations generally residing fifty-two degrees gellan, having on the south the breadth by Magellan sailed through from the Atlantic considered a loss to his life in Europe, the in favour of strait in his of Good Hope ward of the passage, since passage, which called double from fatal islands, by before they attained the extreme that passage which is the

The country of Amazonia, so called from the great river of that name, has never been thoroughly discovered, though it is situated between the European colonies of Peru and Brasil, and every where navigable by means of that great river and its branches. Some attempts have been made by the Spaniards and Portuguese; but being always attended with vast difficulties, so that few of the adventurers ever returned back, and no gold being found in the country, as they expected, no European nation has hitherto made any settlement there.

Patagonia, at the southern extremity of America, is sometimes described as part of Chili; but as neither the Spaniards, nor any other European nation, have any colonies here, it is almost unknown, and is generally represented as a barren, inhospitable country. And here, in fifty-two degrees and a half south lat. we fall in with the Straits of Magellan, having Patagonia on the north, and the islands of Terra del Fuego on the south. These straits extend from east to west 110 leagues, but the breadth in some places falls short of one. They were first discovered by Magellan, or Magelbaens, a Portuguese, in the service of Spain, who sailed through them in the year 1520, and thereby discovered a passage from the Atlantic to the Pacific or Southern Ocean. He has been since considered as the first navigator that sailed round the world: but having lost his life in a skirmish with some Indians before the ships returned to Europe, the honour of being the first circumnavigator has been disputed in favour of the brave Sir Francis Drake, who, in 1574, passed the same strait in his way to India, from which he returned to Europe by the Cape of Good Hope. In 1616, Le Maire, a Dutchman, keeping to the southward of these straits, discovered, in lat. fifty-four and a-half, another passage, since known by the name of the Straits of Le Maire; and this passage, which has been generally preferred by succeeding navigators, is called doubling Cape Horn. The author of Anson's Voyage, however, from fatal experience, advises mariners to keep clear of these straits and islands, by running down to sixty-one or sixty-two degrees south lat. before they attempt to set their face westward, towards the South Seas; but the extreme long nights, and the intense cold in those latitudes, render that passage practicable only in the months of January and February, which is there the middle of summer.

# MODERN UNIVERSAL TABLE,

The most **COPIOUS** and **AUTHENTIC** that ever was published, of the present State of the **REAL** and **IMAGINARY MONIES** of the **World**.

Divided into four Parts, viz.

## EUROPE, ASIA, AFRICA, AND AMERICA;

Which are subdivided into fifty-five Parts, containing the Names of the most capital places, the Species whereof are inserted, shewing how the Monies are reckoned by the respective Nations; and the Figures standing against the Denomination of each foreign Piece give the English intrinsic Value thereof, according to the best Assays made at the Mint of the **TOWER** of **LONDON**.

### EXPLANATION

By real Money is understood an effective Specie, representing in itself the Value denominated thereby, as a **GUINEA**, &c.

\* This Mark is prefixed to the imaginary Money, which is generally made use of in keeping Accounts, signifying a fictitious Piece which is not in being, or which cannot be represented but by several other Pieces, as a **Pound Sterling**, &c.

All fractions in the Value English are parts of a Penny.

= This Mark signifies, *is, make, or equal to.*

Note, for all the Spanish, Portuguese, Dutch, and Danish Dominions, either on the Continent, or in the West Indies, see the Monies of the respective Nations.

THE ERA, THE COUNTRY, AND WRITINGS OF LEARNED MEN:

The whole comprehending, in one View, the Analysis or Outlines of General History, from the Creation to the present Time.

Bef. Christ.

- 4004 THE creation of the world, and Adam and Eve.
- 4003 The birth of Cain, the first who was born of a woman.
- 3017 Enoch, for his piety, is translated to Heaven.
- 2348 The whole world is destroyed by a deluge, which continued 377 days.
- 2247 The tower of Babel is built about this time by Noah's posterity, upon which God miraculously confounds their language, and thus disperses them into different nations.  
About the same time, Noah is, with great probability, supposed to have parted from his rebellious offsprings, and to have led a colony of some of the more tractable into the East, and there either he, or one of his successors, to have founded the ancient Chinese monarchy.
- 2234 The celestial observations are begun at Babylon, the city which first gave birth to learning and the sciences.
- 2188 Misraim, the son of Ham, founds the kingdom of Egypt, which lasted 1663 years, down to its conquest by Cambyses, in 525 before Christ.
- 2039 Ninus, the son of Belus, founds the kingdom of Assyria, which lasted above 1000 years, and out of its ruins were formed the Assyrians of Babylon, those of Nineveh, and the kingdom of the Medes.
- 1921 The covenant of God made with Abram, when he leaves Haran to go into Canaan, which begins the 430 years of sojourning.
- 1897 The cities of Sodom and Gomorrah are destroyed for their wickedness, by fire from Heaven.
- 1856 The kingdom of Argos, in Greece, begins under Inachus.
- 1822 Memnon, the Egyptian, invents letters.
- 1715 Prometheus first struck fire from flint.
- 1635 Joseph dies in Egypt, which concludes the book of Genesis, containing a period of 2369 years.
- 1574 Aaron born in Egypt; 1490, appointed by God first high-priest of the Israelites.
- 1571 Moses, brother to Aaron, born in Egypt, and adopted by Pharaoh's daughter, who educates him in all the learning of the Egyptians.
- 1556 Ceresop brings a colony of Saites from Egypt into Attica, and founds the kingdom of Athens, in Greece.
- 1546 Scamauder comes from Crete into Phrygia, and founds the kingdom of Troy.
- 1493 Cadmus carried the Phœnician letters into Greece, and built the citadel of Thebes.
- 1491 Moses performs a number of miracles in Egypt, and departs from that kingdom, together with 600,000 Israelites, besides children; which completed the 430 years of sojourning. They miraculously pass through the Red Sea, and come to the Desert of Sinai, where Moses receives from God, and delivers to the people, the Ten Commandments, and the other laws, and sets up the tabernacle, and in it the ark of the covenant.

- 1485 The first ship that appeared in Greece was brought from Egypt by Danaus, who arrived at Rhodes, and brought with him his fifty daughters.
- 1459 The first Olympic games celebrated at Olympia in Greece.
- 1459 The Pentateuch, or five books of Moses, are written in the land of Moab, where he died in the year following, aged 120.
- 1451 The Israelites, after sojourning in the Wilderness forty years, are led under Joshua into the land of Canaan, where they fix themselves, after having subdued the natives; and the period of the sabbatical year commences.
- 1406 Iron is found in Greece, from the accidental burning of the woods.
- 1193 The rape of Helen by Paris, which, in 1193, gave rise to the Trojan war, and siege of Troy by the Greeks, which continued ten years, when that city was taken and burnt.
- 1048 David is sole king of Israel.
- 1004 The temple is solemnly dedicated by Solomon.
- 896 Elijah, the prophet, is translated to Heaven.
- 894 Money first made of gold and silver at Argos.
- 869 The city of Carthage, in Africa, founded by queen Dido.
- 814 The kingdom of Macedon begins.
- 776 The first Olympiad begins.
- 753 Era of the building of Rome in Italy by Romulus, first king of the Romans.
- 720 Samaria taken, after three years' siege, and the kingdom of Israel finished, by Salmanassar, king of Assyria, who carried the ten tribes into captivity.
- The first eclipse of the moon on record.
- 658 Byzantium (now Constantiaople) built by a colony of Athenians.
- 604 By order of Necho, king of Egypt, some Phenicians sailed from the Red Sea round Africa, and returned by the Mediterranean.
- 600 Thales of Miletus travels into Egypt, consults the priests of Memphis, acquires the knowledge of geometry, astronomy, and philosophy; returns to Greece, calculates eclipses, gives general notions of the universe, and maintains that one supreme intelligence regulates all its motions.
- Maps, globes, and the signs of the Zodiac, invented by Anaximander, the scholar of Thales.
- 577 Jehoiakin, king of Judah, is carried away captive, by Nebuchadnezzar, to Babylon.
- 587 The city of Jerusalem taken after a siege of 18 months.
- 562 The first comedy at Athens acted upon a moveable scaffold.
- 559 Cyrus the first king of Persia.
- 538 The kingdom of Babylon finished; that city being taken by Cyrus, who, in 536, issues an edict for the return of the Jews.
- 534 The first tragedy was acted at Athens, on a waggon, by Theopis.
- 526 Learning is greatly encouraged at Athens, and a public library first founded.
- 515 The second temple at Jerusalem is finished under Darius.
- 509 Tarquin, the seventh and last king of the Romans is expelled, and Rome is governed by two consuls, and other republican magistrates, till the battle of Pharsalia, being a space of 461 years.
- 504 Sardis taken and burnt by the Athenians, which gave occasion to the Persian invasion of Greece.
- 486 Aeschylus the Greek poet first gains the prize of tragedy.
- 481 Xerxes the Great, king of Persia, begins his expedition against Greece.
- 458 Ezra is sent from Babylon to Jerusalem, with the captive Jews and the vessels of gold and silver, &c. being seventy weeks of years, or 490 years before the crucifixion of our Saviour.
- 454 The Romans send to Athens for Solon's laws.
- 451 The Decemvirs created at Rome, and the laws of the twelve tables compiled and ratified.
- 430 The history of the Old Testament finishes about this time.
- Malachi the last of the prophets.
- 401 Retreat of 10,000 Greeks under Xenophon.
- 400 Socrates, the founder of moral philosophy among the Greeks, believes the immortality of the soul, and a state of rewards and punishments, for which, and other sublime doctrines, he is put to death by the Athenians, who soon after repent, and erect to his memory a statue of brass.
- 331 Alexander the Great, king of Macedon, conquers Darius, king of Persia, and other nations of Asia.
- 323 Dies at Babylon, and his empire is divided by his generals into four kingdoms.
- 285 Dionysius of Alexandria began his astronomical era on Monday June 26, being the first who found the exact solar year to consist of 365 days, 5 hours, and 49 minutes.

- 234 Ptolemy Philadelphus, king of Egypt, employs seventy-two interpreters to translate the Old Testament into the Greek language, which is called the Septuagint.
- 269 The first coining of silver at Rome.
- 254 The first Punic war begins, and continues 23 years. The chronology of the Arundelian marble, called the Parian chronicle, composed.
- 260 The Romans first concern themselves in naval affairs, and defeat the Carthaginians at sea.
- 237 Hamilcar, the Carthaginian, causes his son Hannibal, at nine years old, to swear eternal enmity to the Romans.
- 218 The second Punic war begins, and continues 17 years. Hannibal passes the Alps, and defeats the Romans in several battles, but does not improve his victories by the storming of Rome.
- 190 The first Roman army enters Asia, and, from the spoils of Antiochus, brings the Asiatic luxury first to Rome.
- 168 Perseus defeated by the Romans, which ends the Macedonian kingdom.
- 167 The first library erected at Rome, of books brought from Macedonia.
- 163 The government of Judæa under the Macabees begins, and continues 126 years.
- 146 Carthage, the rival of Rome, razed to the ground by the Romans.
- 135 The history of the Apocrypha ends.
- 52 Julius Cæsar makes his first expedition into Britain.
- 47 The battle of Pharsalia between Cæsar and Pompey, in which the latter is defeated.
- The Alexandrian library, consisting of 400,000 valuable books, burnt by accident.
- 45 The war of Africa, in which Cato kills himself.
- The solar year introduced by Cæsar.
- 44 Cæsar, the greatest of the Roman conquerors, after having fought fifty pitched battles, and slain 1,192,000 men, and overturned the liberties of his country, is killed in the senate-house.
- 31 The battle of Actium fought, in which Mark Antony and Cleopatra are totally defeated by Octavius; nephew to Julius Cæsar.
- 30 Alexandria, in Egypt, is taken by Octavius, upon which Antony and Cleopatra put themselves to death, and Egypt is reduced to a Roman province.
- 27 Octavius, by a decree of the senate, obtains the title of Augustus Cæsar, and an absolute exemption from the laws, and is properly the first Roman emperor.
- 8 Rome at this time is fifty miles in circumference, and contains 463,000 men fit to bear arms.
- The temple of Janus is shut by Augustus as an emblem of universal peace, and JESUS CHRIST is supposed to have been born in September, or on Monday, December 25.
- A. C.
- 12 CHRIST hears the doctors in the temple; and asks them questions.
- 27 ——— is baptized in the wilderness by John.
- 33 ——— is crucified on Friday, April 3, at 3 o'clock P. M.
- His resurrection on Sunday, April 5; his ascension, Thursday, May 14.
- 36 St. Paul converted.
- 39 St. Matthew writes his Gospel.
- Pontius Pilate kills himself.
- 40 The name of Christians first given at Antioch to the followers of Christ.
- 43 Claudius Cæsar's expedition into Britain.
- 44 St. Mark writes his Gospel.
- 49 London is founded by the Romans; 368, surrounded by ditto with a wall, some parts of which are still observable.
- 51 Caractacus, the British king, is carried in chains to Rome.
- 52 The council of the Apostles at Jerusalem.
- 55 St. Luke writes his Gospel.
- 59 The emperor Nero puts his mother and brothers to death.
- persecutes the Druids in Britain.
- 61 Boadicea, the British queen, defeats the Romans; but is conquered soon after by Suetonius governor of Britain.
- 62 St. Paul sent in bonds to Rome—writes his epistles between 51 and 66.
- 63 The Acts of the Apostles written.
- Christianity is supposed to be introduced into Britain by St. Paul, or some of his disciples, about this time.
- 64 Rome set on fire, and burned for six days; upon which began (under Nero) the first persecution against the Christians.
- 67 St. Peter and St. Paul put to death.
- 70 Whilst the factious Jews are destroying one another with mutual fury, Titus, the

- Roman general, takes Jerusalem, which is razed to the ground, and the plough made to pass over it.
- 79 Hericulanum overwhelmed by an eruption of Mount Vesuvius.
- 83 The philoſophers expelled Rome by Domitian.
- 85 Julius Agricola, governor of South Britain, to protect the civilised Britons from the incurſions of the Caledonians, builds a line of forts between the rivers Forth and Clyde; defeats the Caledonians under Calgacus, on the Grampian hills; and firſt ſails round Britain, which he diſcovers to be an iſland.
- 96 St. John the Evangelist wrote his revelation—his goſpel in 97.
- 121 The Caledonians reconquer from the Romans all the ſouthern parts of Scotland; upon which the emperor Adrian builds a wall between Newcastle and Carlisle: but this alſo proving ineffectual, Pollius Urbicus, the Roman general, about the year 144, repairs Agricola's forts, which he joins by a wall four yards thick, ſince called Antoninus's wall.
- 135 The ſecond Jewiſh war ends, when they were all baniſhed Judea.
- 139 Juſtin writes his firſt Apology for the Chriſtians.
- 141 A number of hereſes appear about this time.
- 152 The emperor Antoninus Pius ſtops the perſecution againſt the Chriſtians.
- 217 The Septuagint ſaid to be found in a caſk.
- 222 About this time the Roman empire begins to ſink under its own weight. The Barbarians begin their irruptions, and the Goths have annual tributa not to moleſt the empire.
- 260 Valerius is taken priſoner by Sapor, king of Perſia, and ſlaved alive.
- 274 Silk firſt brought from India; the manufactory of it introduced into Europe by ſome monks, 551; firſt worn by the clergy in England, 1534.
- 291 Two emperors, and two Cæſars, march to defend the four quarters of the empire.
- 306 Conſtantine the Great begins his reign.
- 308 Cardinals firſt created.
- 313 The tenth perſecution ends by an edict of Conſtantine, who favours the Chriſtians, and gives full liberty to their religion.
- 314 Three biſhops, or fathers, are ſent from Britain to aſſiſt at the council of Arles.
- 325 The firſt general council at Nice, when 318 fathers attended, againſt Arius, where was compoſed the famous Nicene creed, which we attribute to them.
- 328 Conſtantine removes the ſeat of empire from Rome to Byzantium, which is thenceforward called Conſtantinople.
- 331 ——— orders all the heathen temples to be deſtroyed.
- 363 The Roman emperor Julian, ſurnamed the apoſtate, endeavours in vain to rebuild the temple of Jeruſalem.
- 364 The Roman empire is divided into the eaſtern (Conſtantinople the capital) and weſtern (of which Rome continued to be the capital), each being now under the government of different emperors.
- 400 Bells introduced by biſhop Paulinus, of Campania.
- 404 The kingdom of Caledonia or Scotland revives under Fergus.
- 406 The Vandals, Alans, and Suevi, ſpread into France and Spain, by a conſeſſion of Honorius, emperor of the Weſt.
- 410 Rome taken and plundered by Alaric, king of the Viſi-Goths.
- 412 The Vandals begin their kingdom in Spain.
- 420 The kingdom of France begins upon the lower Rhine, under Pharamond.
- 426 The Romans, reduced to extremities at home, withdraw their troops from Britain, and never return; adviſing the Britons to arm in their own defence, and truſt to their own valour.
- 446 The Britons, now left to themſelves, are greatly haraſſed by the Scots and Picts; upon which they once more make their complaint to the Romans, but receive no aſſiſtance from that quarter.
- 447 Attila (ſurnamed the Scourge of God) with his Huns ravages the Roman empire.
- 449 Vortigern, king of the Britons, invites the Saxons into Britain, againſt the Scots and Picts.
- 455 The Saxons, having repulſed the Scots and Picts, invite over more of their countrymen, and begin to eſtabliſh themſelves in Kent, under Hengiſt.
- 476 The weſtern empire is finiſhed, 523 years after the battle of Pharfalia; upon the ruins of which ſeveral new ſtates ariſe in Italy and other parts, conſiſting of Goths, Vandals, Huns, and other barbarians, under whom literature is extinguiſhed, and the works of the learned deſtroyed.
- 496 Clovis, king of France, baptized, and Chriſtianity begins in that kingdom.
- 508 Prince Arthur begins his reign over the Britons.
- 513 Conſtantinople beſieged by Vitellianus, whoſe ſteet is burned by a ſpeculum of braſs.
- 516 The computing of time by the Chriſtian æra is introduced by Dionyſius the monk.
- 529 The code of Juſtinian, the eaſtern emperor, is publiſhed.

- 557 A terrible plague all over Europe, Asia, and Africa, which continues near 50 years.
- 581 Latin ceased to be spoken about this time in Italy.
- 596 Augustine the monk comes into England, with forty monks.
- 606 Here begins the power of the popes, by the concession of Phocas, emperor of the East.
- 622 Mahomet, a false prophet, flies from Mecca to Medina, in Arabia, in the 54th year of his age and the tenth of his ministry, when he laid the foundation of the Saracen empire, and from whom the Mahometan princes to this day claim their descent. His followers compute their time from this era, which in Arabic is called Hegira, i. e. the flight.
- 637 Jerusalem is taken by the Saracens, or followers of Mahomet.
- 640 Alexandria in Egypt is taken by ditto, and the grand library there burnt by order of Omar, their caliph or prince.
- 653 The Saracens now extend their conquests on every side, and retaliate the barbarities of the Goths and Vandals upon their posterity.
- 664 Glass introduced in England by Benalt, a monk.
- 685 The Britons, after a brave struggle of near 150 year, are totally expelled by the Saxons, and driven into Wales and Cornwall.
- 713 The Saracens conquer Spain.
- 726 The controversy about images begins, and occasions many insurrections in the eastern empire.
- 748 The computing of years from the birth of Christ began to be used in history.
- 749 The race of Abbass become caliphs of the Saracens, and encourage learning.
- 762 The city of Bagdad upon the Tigris is made the capital for the caliphs of the house of Abbas.
- 800 Charlemagne, king of France, begins the empire of Germany, afterwards called the western empire; gives the present names to the days and months; endeavours to restore learning in Europe; but mankind are not yet disposed for it, being solely engrossed in military enterprises.
- 826 Harold, king of Denmark, dethroned by his subjects for being a Christian.
- 828 Egbert, king of Wessex, unites the Heptarchy, by the name of England.
- 836 The Flemings trade to Scotland for fish.
- 838 The Scots and Picts have a decisive battle, in which the former prevail, and both kingdoms are united by Kenneth; which begins the second period of the Scottish history.
- 867 The Danes begin their ravages in England.
- 896 Alfred the Great, after subduing the Danish invaders (against whom he fought 56 battles by sea and land), composes his body of laws; divides England into counties, hundreds, tythings; erects county-courts, and founds the university of Oxford about this time.

- Armistice between Great Britain and Holland, February 10.  
 Ratification of the definitive treaty of peace between Great Britain, France, Spain, and the United States of America, September 3.
- 1784 The city of London wait on the king with an address of thanks for dismissing the coalition ministry, January 16.  
 The great seal stolen from the chancellor's house in Great Ormond-street, Mar. 24.  
 The ratification of the peace with America arrived April 7.  
 The definitive treaty of peace between Great Britain and Holland, May 24.  
 The memory of Handel commemorated by a grand jubilee, at Westminster-Abbey, May 26.  
 Proclamation for a public thanksgiving, July 2.  
 Mr. Lunardi ascended in a balloon from the Artillery-ground, Moorfields, the first attempt of the kind in England, September 15.  
 The bull seats abolished in Spain, except for pious or patriotic uses, by edict, November 14.
- 1785 Mr. Blanchard and Dr. Jefferies went from Dover to Calais in an air balloon, in about two hours, January 7.  
 A treaty of confederacy to preserve the indivisibility of the German empire, entered into by the king of Prussia, the electors of Hanover, Saxony, and Mentz, May 29.  
 M. de Rozier and M. Romain ascended at Boulogne, intending to cross the channel; in twenty minutes the balloon took fire, and the aeronauts came to the ground and were killed on the spot.  
 The toll was taken off Blackfriars bridge, June 22.  
 The preliminaries of peace were signed between the emperor and Holland, at Paris, September 20.  
 The above powers signed the definitive treaty, and a treaty of alliance between France and the Dutch, on the 16th of November.  
 Dr. Seabury, an American missionary, was constituted bishop of Connecticut, by five non-juring Scotch prelates, Nov.
- 1786 The king of Sweden prohibited the use of torture in his dominions.  
 Cardinal Turlone, high inquisitor at Rome, was publicly dragged out of his carriage by an incensed multitude for his cruelty, and hung on a gibbet fifty feet high.  
 Commercial treaty signed between England and France, September 26.  
 471,000 l. 3 per cent. stock transferred to the landgrave of Hesse, for Hessian soldiers lost in the American war, at 30l. a man, Nov. 21.  
 Mr. Adams, the American ambassador, presented Dr. White of Pennsylvania, and Dr. Provost of New York, to the archbishop of Canterbury, to be consecrated bishops for the United States. They were consecrated Feb. 4, 1787.
- 1787 Mr. Burke at the bar of the house of lords, in the name of all the commons of Great Britain, impeached Warren Hastings, late governor-general of Bengal, of high crimes and misdemeanors, May 21.  
 The king, by letters patent, erected the province of Nova Scotia into a bishop's see, and appointed Dr. Charles Inglis to be the bishop, Aug. 11.
- 1788 In the early part of October, the first symptoms appeared of a severe disorder, which afflicted our gracious sovereign. On the sixth of November they were very alarming, and on the thirteenth a form of prayer for his recovery was ordered by the privy council.
- 1789 His majesty was pronounced to be in a state of convalescence, February 17; and to be free from complaint, February 26.  
 A general thanksgiving for the king's recovery, who attended the service at St. Paul's, with a great procession, April 23.  
 Revolution in France, capture of the Bastille, execution of the governor, &c. July 14.  
 1790 Grand confederation in the champ de Mars, July 14.
- 1791 In consequence of some gentlemen meeting to commemorate the French revolution in Birmingham on the 14th of July, the mob arose and committed the most dangerous outrages for some days on the persons and properties of many of the inhabitants of the town and neighbourhood, burning and destroying meeting-houses, private dwellings, &c. Peace and security were at length restored by the interposition of the military power.
- 1792 The definitive treaty of peace was signed between the British and their allies, the Nizam and Mahrattas on one part, and Tipoo Sultan on the other, March 19th, by which he ceded one half of his territorial possessions, and delivered up two of his sons to lord Cornwallis, as hostages for the fulfilment of the treaty.  
 Gustavus III. king of Sweden, died on the 29th of March, in consequence of being assassinated by Ankerström.

- 1793 Louis XVI. after having received innumerable indignities from his people, was brought to the scaffold, January 21, and had his head severed by the guillotine, contrary to the express laws of the new constitution, which had declared the person of the king inviolable.
- On the 25th of March, lord Grenville and count Woronzow signed a convention at London on behalf of his Britannic majesty and the empress of Russia, to employ their forces, conjointly, in a war against France. Treaties were also entered into with the king of Sardinia and the prince of Hesse Cassel.
- The unfortunate queen of France, on the 16th of October, was conducted to the spot where Louis had previously met his fate, and beheaded by the guillotine in the thirty-eighth year of her age.
- 1794 On the first of June, the British fleet under the command of admiral earl Howe, obtained a signal victory over that of the French, in which two ships were sunk, one burnt, and six brought into Portsmouth harbour.
- 1795 In consequence of the rapid progress of the French arms in Holland, the princess of Orange, the hereditary princess, and her infant son, arrived at Yarmouth on the 19th of January. The Stadtholder landed at Harwich on the 20th. George prince of Wales married to the princess Caroline of Brunswic, April 8. The trial of Warren Hastings concluded on the 25th of April, when he was acquitted of the charges brought against him by the house of commons.
- 1796 Lord Malmesbury went to Paris in October, to open negotiations for a general peace; but returned Dec. 29, without having effected the object of his mission.
- 1797 A signal victory gained over the Spanish fleet by sir John Jervis, since created earl St. Vincent, February 14.
- An alarming mutiny on board the Channel fleet at Spithead, April 15.
- The nuptials of the prince of Wirtemberg and the princess royal celebrated at St. James's, May 18.
- Another alarming mutiny on board the fleet at Sheerness.
- Parker, the chief leader in this mutiny, executed on board the Sandwich at Blackfakes, June 30.
- Lord Malmesbury arrived at Lisle July 4, and opened a negotiation for a peace between England and the French republic, but again returned without effecting the object of his mission, September 19.
- A signal victory gained over the Dutch fleet by admiral Duncan, October 11.
- Peace between France and Austria definitively signed at Campo Formio, Oct. 17.
- A general thanksgiving for the late great naval victories. The king and the members of both houses of parliament attended divine service at St. Paul's in grand procession; Dec. 19.
- 1798 A dreadful rebellion in Ireland, which was quelled, after several battles with the insurgents, and much bloodshed.
- The glorious victory of admiral Nelson at Aboukir, near the mouth of the Nile, in which nine French ships of the line were taken, and two burnt; only two escaping, which were afterwards taken, August 1.
- 1799 The war against France recommenced by the emperor; and the Russian driven out of almost all their conquests in Italy, by the Austrians and Russians under Suwarrow.
- Seringapatam taken by lieutenant-general Harris, and Tippoo Sultan killed, May 4.
- The directorial government abolished in France, and a new constitution framed, according to which Buonaparte is to be first consul for ten years.
- 1800 A horrid attempt made on the life of his majesty by James Hadfield, a lunatic, who fired a pistol at him from the pit of Drury-lane theatre, May 15.
- The bill for a union with Ireland signed, July 2.

## MEN OF LEARNING AND GENIUS.

N. B. *By the Dates is implied the Time when the above Writers died; but when that Period happens not to be known, the Age in which they flourished is signified by it. The Names in Italics are those who have given the best English Translations, in-  
clusive of School Books.*

529	Procopius, of Cæsarea, the Roman historian. <i>Holcroft.</i>	171

Here ends the illustrious list of ancient, or, as they are styled, Classic authors, for whom mankind are indebted to Greece and Rome, those two great theatres of human glory; but it will ever be regretted, that a small part only of their writings have come to our hands. This was owing to the barbarous policy of those illiterate pagans, who, in the fifth century, subverted the Roman empire, and in which practices they were joined soon after by the Saracens, or followers of Mahomet. Constantinople alone had escaped the ravages of the barbarians; and to the few literati who sheltered themselves within its walls, is chiefly owing the preservation of those valuable remains of antiquity. To learning, civility, and refinement, succeeded worse than Gothic ignorance—the superstition and buffoonery of the church of Rome; Europe therefore produces few names worthy of record during the space of a thousand years; a period which historians, with great propriety, denominate the dark or Gothic ages.

The invention of printing contributed to the revival of learning in the sixteenth century, from which memorable era a race of men have sprung up in a new soil, France, Germany, and Britain; who, if they do not exceed, at least equal, the greatest geniuses of antiquity. Of these our own countrymen have the reputation of the first rank, with whose names we shall finish our list.

## A. C.

735	Bede, a priest of Northumberland; History of the Saxons, Scots, &c.	
901	King Alfred; history, philosophy, and poetry.	
1259	Matthew Paris, monk of St. Alban's; History of England.	175
