State prisoners here are, in general, privately seized, partially adjudged, and fecretly dispatched, or fent into banishment to Siberia, of which the following is a singular incident, as related by a character of eminence, who refided many years in Ruffia. " I was not long in Riga (fays that person) when I received the following intelligence from good authority. One Dr. Fonderholft, a German, was, a few years before my arrival, phylician to the army. He was faid to be a man of learning but of no great forefight. Happening to receive an affront from one of the great men of the court, who was in favour with the empress, the doctor retorted feverely, and rendered him very ridiculous. courtier had the address to get the doctor sent to Siberia in the following manner. One day, as the doctor was attending the field marshal, who was fick, a captain of the guards arrived with expresses from St. Peterfburg, and demanded immediate audience. He was introduced, and whispered something in the field marshal's ear, who defired the doctor to amuse himself in the great hall till he had finished some business with the officer. When that was done, the doctor was again called upon; and when he had given the field marihal his advice about fome diforder which he at that time laboured under, and was going to retire, the count defired him to come to dinner, as he might need his far-ther affiftance; and, at the fame time, invited the cap-tain of the guards to dine, telling him he was not able to fit at the table himself; but the vice-governor, prince Dolgoruki, who was present, would bear him company. This was agreed to. At dinner the captain told the vice-governor, that a relation of his, in his way to the army, was suddenly taken ill, and obliged to remain in a house distant three or four versts from the city; and that therefore he defired him to appoint an able phyfician to attend him, for which he would be amply rewarded. The deputy governor pointed to Dr. Fonderholft, as physician to the army, and one of the ablest professors in Riga; and, at the same time, politely defired the doctor to visit the officer. Dr. Fonderholft agreed, and was given directions to his fervants to get his coach ready, when the prince told him that that was needless, as his coach was large enough to carry them all such an inconsiderable distance. After dinner, when they had arrived at the house were the pretended the patient was supposed to be, and had taken a few glasses of wine, the doctor defired to fee him, but was answered, that he was a flate prisoner by order of the cabinet; and therefore they advised him to make no refistance, but get into a travelling waggon ready at the door; telling him, at the same time, that if he offered the least refistance, he would be bound fast with ropes, and might be very cruelly treated, on the way, by the foldiers who were appointed to convey him to the place of destination. Thus this man was conveyed to Siberia, and there long immured, or kept in a hole in the wall, with only a fmall flit through which he received his provisions. It feems he had fome money about him when he was arrefted; but the captain took nothing from him except his fword. The foldiers on the way, robbed him of his watch; but he concealed what little money he had from them. Forefeeing that his money could not maintain him long, and perfuaded that he could not long long fublift upon the poor provisions allowed to such prisoners, he affected to be a fortune-teller, and apprized the foldiers, who kept guard upon him, of his defign, offering them the half of what he got by his The foldiers, being acquainted with many of the fuperstitious inhabitants, told the doctor every thing concerning them before they came to him, which he repeated to them, whereby his fame, as a wife man, fpread far, and he acquired the means of support. Having neither books or company to amuse him in this miserable situation, he got a few hens, and diverted himself with feeding them. He gave their eggs a black colour; and wrote upon them with a pin, Den ungelucklick Doctor Fonderholft. Ungelucklick fignifies unfortunate. These eggs he fold to the inhabitants as charms. They knew not the meaning of the writing, but thought it rendered the eggs more valuable. After he had been many months thus confined, it happened that the governor's lady fet up in this village, in her way from Russia to Siberia, and wanted eggs, among other things, for dinner. The hostes told her that there was, in the place, a prisoner, a very wife man, who fold extraordinary eggs. She defired to fee them; and, as the understood the German language, was furprized to fee written upon them the name of the very physician who, a few years before, had recovered her from a very dangerous fever. She went to the hole, fpoke to the doctor; then applied to her husband, and caufed his fituation to be made much eafier; and, as the was a great favourite with the Empres, wrote, to her Majesty, and represented his undeserved misfortune so pathetically, that the governor received orders to liberate him, and send him, at her expence, to Moscow.

The executive part of the government of Ruffia is vefted in the fovereign council of chancery, which is chiefly composed of the third class of the nobility, and divided into fix departments, in which are separately confidered, foreign affairs, war, finances, public accounts, civil processes brought by appeal, and criminal

causes brought by appeal.

The determination of the two last mentioned, formerly depended upon the equity of the judge. In 1647 a code, or body of laws, was ordered to be compiled by the wifeft men in the empire, which was accordingly done, in one volume in folio, intitled, Sabrona Ulofienia, that is to fay, Univerfal and General Right; and by this the judges were to regulare their fentences. There is this great and fingular advantage in the courts of judicature of this country, that they are neither expensive or tedious; for a law-fuit is begun and determined in the space of fix or seven weeks.

Nevertheless they are extremely venal.

All the peafants and husbandmen are slaves, either directly to the fovereign, to the boyars or lords, to monafteries, or to fome of the gentry; and the greater number any of them hath, as before observed, the richer he is efteemed. These are employed by them in whatever work or bufiness they think fit; and this is one reason why they affect to appear more dull and untractable than they, perhaps, naturally are; because, if any of them betrays a greater vivacity or dexterity than the rest, he is fure to have more business and trouble upon his hands, without any proportionable reward or encouragement. It is usual for the fovereigns to reward some of the services done to them by any nobles or officers with a number of those villages; and as there is an account of their number in all provinces, in forty days two or three hundred thousand of them may be raifed, by fummoning each mafter to furnish fuch a quota.

In Russia no person can be convicted of a capital crime but by confession. However, the most inhuman tortures are used. The ordinary punishments are the batoags and the knout The former is used in families, for the correction of children and flaves, and also in the army. The person to undergo this, after pulling off his clothes to his drawers, is laid flat on his belly on

the ground. One fits across his head, another upon his feet, each furnished with a good switch, with which they foundly tickle his back.

If a man kills his wife or flave, he is only whipped with the knout, which is thus performed. A lufty fellow takes him upon his back, and another ties his feet with a cord, which comes through between the legs of the person who carries him. In this posture he is held fo fast that he cannot stir, and being stripped to the middle, the executioner, with the knout, which is a ftrap of dried elk skin, untanned, fastened to a stick, which he applies to the back fo dexteroufly, that every lash brings the blood, or leaves a very thick whale. This is called the moderate; but when fentenced to be more fevere, the executioner, advancing three or four fleps, till he is within reach of the offender, gives the first ftroke on the middle of the back, recreating at every ftroke; and is fo expert that he never hits twice in a place; each stroke bringing the flesh with it. When the punishment is ordered in the extreme, he firikes the flanks, and often cuts into the bowels, which few furvive. It is a general remark, that lean people turn fat after the knout; and that it is an infallible cure for those who are hide-bound.

A late traveller relates, that he faw three women buried alive for drowning their husbands. They had, it feems, croffed the Mosco in a boat, all three together, in fearch of their hulbands, whom they found all drunk in a public-house, and endeavouring to perfuade them to go home, were feverely beaten by them. However, by the affiftance of fome other people, they got them at last into the boar, where they fell asleep .-The wives to be revenged on the hulbands for beating them, when the boat had reached the middle of the river, threw them in one after another; and, after drowning them, came on shore very unconcerned. The matter immediately came to light. They were feized, tried, condemned, and ordered to be put alive into the ground up to their necks, and there to remain till they died. Two of them lived ten, and the other eleven days. They spoke the first three days, complaining of great pain, but not after that. They certainly must have got some sustenance in the night time, or they could not have existed so long. The eldest was not

above twenty years of age. The traveller last cited, gives the following account of the whimfical manner in which libeliers are punished in Ruffia: " While I refided at Mofcow, there was a gentleman who thought fit to publish a quarto volume, in vindication of the liberties of the fubject, grofsly reflecting upon the unlimited power of the Czar, and censuring the legislature of that empire. The offender was immediately feized by virtue of a warrant, figned by one of the principal officers of the state. He was tried in a fummary way; his book determined to be a libel; and the author condemned to eat his own words, This fentence was literally carried into execution on the following day. A fcaffold was erected in the most populous part of the town: the imperial provoit was the executioner; and all the magistrates attended at the ceremony. This book was severed from the binding, the margins cut off, and every leaf rolled up, as near as I can recollect, in the form of a lottery ticket, when it is taken out of the wheel at Guidhall by the bluecoat-boy. The author of the libel was then ferved with them feparately by the provoft, who put them . into his mouth, to the no small diversion of the specta-The offender had received a complete mouthful before he began to chew; but he was obliged, upon pain of the feverest baltinado, to swallow as many of the leaves as the Czar's ferjeant-furgeon and phyfician thought possible for him to do without immediate hazard of his life. As foon as they were pleafed to determine that it would be dangerous to proceed, the remainder of the fentence was suspended for that time, and refumed again the next day, at the fame place and hour, and firitly conformable to the fame ceremony. I remember it was three days before this execution was

was over; but I attended it conflantly, and was convinced that he had actually swallowed every leaf of the book. Thus I think he may be very justly faid to have eat his own words."

Traitors, after having undergone a variety of tor-tures, are banished to Siberia; but sometimes not till they have been deprived of their eyes or ears. Coiners are obliged to fwallow the melted metal of the coin which they counterfeited. Those who are hanged are obliged to put the noose about their own necks, and to fling themselves off the ladder, when commanded by the executioner.

The fyftem of civil laws in Ruffia is very imperfect. The present Empress, however, has made some attempts to reform them. The courts of justice were, in general, corrupt; those by whom it was administered, ignorant: but the empress has made some judicious regulations, and fixed a certain falary to the office of judge, which before depended on the contributions of the unhappy clients; and thus the poor were without hope or remedy. The office of an executioner was formerly efteemed honourable; but it is now held infamous; nor is the executioner permitted to fell his office; for it must continue in his family; on failure of which, the brothers are obliged to choose one out of

their body. The coin of Russia, till the reign of Peter I. confifted chiefly in copecks, or filver pence, except that which was brought thither from foreign parts; for merchants were obliged to pay the government in rix-dol-lars: but after the lofs of the battle of Narva, that monarch was fo straightened for want of money, that an expedient was tried, of recalling all the copecks, and coining new ones of the fame weight and value, though alloyed with two fifths of a baser metal. This induced the people to hoard up their old money, inflead of bringing it to the mint: upon which another expedient was thought of, and a new order issued, whereby 10 per cent. was given, in new money, to every one that should bring the old: and larger pieces were ordered to be coined, fuch as rubles, half and quarter rubles, and pieces of ten, five, and three copecks value; on which account, a rixdollar, which, during the currency of the old coin, was valued at but 55 copecks, being now re-coined, and mixed with fome alloy, made a ruble, or 100 copecks. This greatly diffressed commerce in general, caused the exchange to fall between 30 and 40 per cent. and was attended with other inconveniences to the fubjects. But the Czar, who was a venences to the Judgetts. But the Czar, who was a prodigious gainer by it, and did not want his coin to go out of his dominions, but to make the foreign ones flow into them, was deaf to every thing that was faid against it. At present the Russians have gold ducats; rubles; half rubles; quarter tibles; griveners, or 10 copecks; copecks of filver; five copecks; two copecks; and half and quarter ditto. The ducat is worth two rubles, and the ruble is, in value, about 4s. 6d. fterling. The half and quarter rubles are expressive of their own value. A grivener is the tenth part of a ruble, and a copeck is an hundreth part of the fame,

The Russian pound in weight, is exactly the same as our pound.

With respect to the liquid measures, eight cruskas make one vedro, one half vedro one stackan, two stackans one anchor, and fix anchors one hog, which is exactly the same as an English hogshead.

The principal measure of extension is the verst, which is 3200 feet English; and 104 versts make a degree. The Russians reckon distances by versts, as the English do by miles.

SECTION V.

Population, Commerce, and Military and Naval Armament of Ruffia.

THE Ruffian empire, though of fuch an amazing extent, is well known to be badly peopled. The best writers inform us that it contains between feven-

teen and eighteen millions of inhabitants, and one million in the conquered provinces; but, according to the best accounts; the number at present is much in-creased. Almost from the moment that the present Empress began to reign, fie has increased the number of her subjects by many ways, principally by a general and very active encouragement of all arts, of agriculture, mining, manufactures, and commerce, and this with fuch effect, that all of them are more flourishing, at this time, by many degrees than they were formerly. Another means which she has taken to increase her people, has been by inviting foreigners of all denominations; and this fhe has done in a greater degree than any of her predeceffors. Almost from her accession to the empire, she has brought continued bodies of Germans, Poles, and Greeks from Turkey, to fet-tle in her dominions, and these not sew in numbers. From the coasts of Germany ship loads; but from Poland and Turkey, whole towns, villages, and diftricts, have left their habitations, and fettled in Ruffia. Nor has it been certain times, but regular emigrations, in consequence of her continued encouragement.

This encouragement, which the Empress has conftantly granted, confifts in feveral very important articles. All the expences of the journey, or voyage, from their native country, are borne by her. She feeds and supports them by the way. Upon their arrival at the territory appointed them to cultivate (which has always been part of the crown lands) every family has a cottage erected at her expence, to which they contribute labour. They then are furnished with implements necessary for cultivation, and one year's pro-visions for the whole family. A further advantage is an exemption from all taxes during five years. All which is a system of such admirable policy, and carried into execution with fuch unufual fpirit, even while the finances of the empire have been much diffressed by expensive wars, that there scarcely is an instance in history superior to it. Nor can there be a doubt but that confiderable advantages must arise from such a fyftem, not only in point of population, but also to the revenues of the empire.

Ruffia, upon the whole, is well fituated for commerce; and her exports are iron, hemp, wood, hides, grain, pot-ash, wax, cordage, copper, flax, furs, linseed, fish, leather, tallow, materials for ship-building, &c. The imports are fugar, beaver-skins, tin, dye-woods, shal-loons, Norwich stuffs, lead, cloths, slannels, Manchester velvets, brass wire, spirituous liquors, silk, spices, indigo, English beer, wines, fruits, china, paper, &c.

The commerce is with England, Holland, France, Germany, Poland, Turkey, Persia, China, &c. Here it is to be observed, that, as the annual exports of Ruffia greatly exceed the imports, the balance of trade must be greatly in her favour. The foreign commerce of the empire, under the present Empress, is much increased in consequence of her conquests from Sweden, and fince the establishment of her new emporium of Petersburg, whereby her naval intercourse with Europe is rendered much more short and easy.

The revenues of the Russian empire are great, conof disquistions, ought ever to be considered, though it rarely is so. The Empress is, in many articles, the sole merchant in her dominions. The whole trade by land to China is on her account. This is not, indeed, confiderable; for a caravan rarely goes now. Rhubarb, pot-ashes, and spices, are branches in which she, and no body elfe, trades. Salt is an article that brings her in an immense revenue. Very large quantities of the best hemp of Ukraina are bought and fold on her account; much iron, the same; and even beer and brandy are her's. Befides these articles she has customs, tolls, and a poll-tax. Also the crown-lands, which are prodigiously extensive, and added to the general amount, proves that, as the resources are large, the revenue must be considerable.

The regular troops of Russia, exclusive of the Cosfacks and Tartars, are computed at about 350,000 mea: "But fuch (fays a modern traveller) is the great extent of their territories, and the number of fortreffes which they have to support, from Petersburg to the borders. of China, that it takes much time before they can bring more than half that number into the field, to act offenfively against an enemy. The common Russian soldiers, are taught to despite life; and by this means they are brought to stand their ground, and keep their ranks,

perhaps, equal to any troops in the world."

The Ruffian marine, established by the wife regulations of Peter the Great, afterwards declined; but was again rendered respectable under the auspices of the present Empress, who invited to her assistance, a num-ber of British sea officers and artificers, by whose means she accomplished a very important design. The Rusfians have now a confiderable naval armament, con-fifting of ships of the line, frigates, sloops, row-gal-

lies, &c.

Many thousands of failors are kept in constant pay,
and in service, either on board the ships, or in the dock
yards. The harbour is at Cronstadt, seven leagues yards. The harbour is at Cromtacts, teven leagues from Petersburg. It is strongly defended; and the canal, and large basion, will contain between 5 and 600 fail of ships. Upon the whole, Russia is now a formidable power, both by sea and land.

HISTORY OF RUSSIA.

WITH respect to the origin of the Russians, it appears from the concurring and pears from the concurring testimony of historians, that they are descended from the ancient Scythians; and this account is confirmed by the very import of the term Russia, which fignifies a wanderer, as all the Scythian, or northern nations, were formerly. The annals of Russia cannot be deduced, with authenticity, from a period more remote than the ninth century; though a tradition prevails, that Kioff, or Kiow, and Novogorod, were founded in the year 430. For a number of years, Russia was under the government of divers petty fovereigns usually stiled dukes, who were, in general, fubject to the Tartars, till they were at length conquered in the year 1450, by John or Ivan Calilowitz, who subdued several of their territories, and annexed them to the Russian dominions. His grandson, John Basilowitz, added divers provinces to the Russian dominions in 1540, at which time the Ruffian fovereigns affumed the title of Czar. In his reign the English arrived at Archangel, and began to trade with Russia, which, till then, had never been visited by the ships of any na-

From the death of John Basilowitz, Russia was under the government of feveral fovereigns in fuccession, of whom the only memorable circumttances recorded, are, that they were, in general, weak and cruel princes,

and that their territories were rent by civil wars.

In the year 1695 the Czar, 10 well known in history by the diffinguishing title of Peter the Great, ascended the throne of Russia. For a summary detail of his tranfactions, that would exceed the limits to which we are under a necessity of confining ourselves in this depart-ment of our work, we must refer the reader to the histories of the northern nations, (some of which we have already presented, as we intend to do the rest) and give only a general account of his vast power, and the eminent pitch of renown to which he raifed his do-

The czar Peter was the son of the czar Alexis Michaelowitz, He reigned conjunctively with John, his half-brother, from 1082 till 1695, when he became fole fovereign of Ruffia. Determining, the year following, to build a fleet, for the purpose of naviga-tion and traffic, he formed a delign of visiting the maritime countries of Europe, to obtain the necessary instructions. He also proposed to encourage arts and iciences in general, and invite learned men, and ingenious artificers, to return with him to Russia, by offering

them great rewards. For the profecution of this plan, Peter began his travels. He first visited Holland, then England; and, by diligent and frequent attendance and observations in the dock-yard at Deptford, acquired fuch a competent knowledge of thip-building, as enabled him, in process of time, to subdue his enemies, and extend his conquests. Through the bent of his genius, and the affiduity with which he prosecuted his plans, he rose gradually through every rank and fervice both by fea and land. The feveral defeats he fultained, and especially that at Narva, from Charles XII. of Sweden, (which we have recounted in our history of that kingdom,) instead of checking, enlarged his ambition, and tended eventually to render him conqueror, through military experience and tried valour.

The generous friendship he manifested to Augustus, king of Poland, previous and subsequent to his being dethroned by Charles XII. does him infinite honour. Nor does his last marriage with Catharine, though a young Luthianian woman of inferior rank, tarnish his character; on the contrary, it evinces his difcernment of merit; for the afterwards appeared to have possessed a foul capable of conceiving the fublimest ideas, and executing the most important designs.

The defeat of the king of Sweden, at the battle of Pultowa, was attended with a succession of triumphs that added renown to his reign; but it derived its most effulgent glories from his cultivation of commerce, arts, and sciences, which tends, in the most ex-

alted degree to aggrandize a nation.

In the year 1717, he made another journey to Holland, not incognito, as before, but as a fovereign prince, and was received with all the honours due to his rank. From thence he visited France, and made himself ac-quainted with every thing he thought worthy his attention: but his principal view being to improve his own people, he engaged artists in all professions in his fervice, and, by the falaries and rewards he offered them, prevailed with many of them to return with him to Russia. Before he arrived at Petel burg he received advice, that a conspiracy had been formed to depose him, and fer his only fon, the czarowitz, upon the throne; to which that prince, it is faid, was privy.

Many of the conspirators were put to death, on the zar's return: and the czarowitz fled to the court of Vienna to avoid his father's refentment; and, as his confort was fifter to the then empress of Germany, it was given out that the court of Vienna had obtained his pardon; but however that might be, when the composite returned to Russa, he was apprehended and imprisoned; and being tried by a court of officers of his father's appointing condemned to die. The fentence, indeed, was not executed, the prince dying a natural death in prison.

After this event Peter caused the Czarina Catharine to be proclaimed his fucceffor, and crowned; and the nobility and officers of state took the oaths of allegiance to her: foon after which he died in the gad year of his age. Upon this, the senate proclaimed the Czarina Ca-tharine Empress of all the Russias, and renewed their oaths of allegiance to her, who was about 35 years of

age at her accession. The Czarina applied herfelf immediately to perfect what the late Czar had begun; encouraging all arts and sciences, and inviting learned foreigners and artificers, by offering them large revenues, to fettle in the Ruffian dominions; and obliging her fubjects to fend

their fons and dependants abroad, to qualify themselves in every science.

Catharine died, after a glorious reign, in 1727, in the 30th year of her age, having appointed prince Peter, fon of the czarowitz, to fucceed her? Peter II. at his accession, was in the 12th year of his age. In his proclamation it was shewn, that he had a right to the Russian throne by hereditary descent, as well as by the appointment of the late emperor and empress. appointment of the ante competer II. was the princess mother of the emperor Peter II. was the princess Charlotta

The princess harlotta

Charlotta Christiana Sophia, of Brunswick Wolfenbuttle, fister to the confort of the emperor of Germany, Charles VI. It was by the particular direction of Peter the Great, that the late czarina appointed Peter to succeed her; for otherwise she would have transferred the empire to one of the princesses her daughters, of whom the left two, Anna Petrowna, then 19 years of age, married to Charles Frederick, duke of Holstein Gottorp, and Elizabeth Petrowna, 13 years of age, unmarried.

Prince Menzikof, who was prime minister of Russia at the death of the empress, and esteemed the richest subject in Europe', attempted to prevail on the young Emperor to espouse his eldest daughter; at which the nobility of Russia were so incensed, that they resolved on rusining him, and caused him to be brought to trial, wherein he was charged with being accessary to the death of the late czarowitz, his imperial majesty's father; with causing the first consort of Peter the Great to be continued in prison; with embezzling the public revenues; with causing several great men to be deprived of their honours and estates; and with a boundless ambition, as appeared in his design of marrying his daughter to the Emperor; for all which he was sentenced to be banished to Siberia, and his great estate consistent.

The relations of the young Emperor next proceeded to give the late czarina, the first consort of the emperor Peter the Great, her liberty, and reverse the sentence of her divorce. They also repealed a law made by Peter the Great, which subverted the right of primogeniture, and the natural order of succession in the imperial family, and the rest of the Russian samilies; made void the process against the late czarowitz, the reigning Emperor's father; restored the noblemen who had been banissed to Siberia under the administration of prince Menzikos; and having concluded a peace both with Sweden and Denmark, they proceeded to the coronation of the Czar at Moscow, on the 7th of March,

Prince Dolgoruki, who fucceeded Menzikof in the post of prime minister, appeared to have no less ambition than his predecessor, contriving to get his eldest daughter espossed to the reigning Emperor. He was congratulated thereupon, and their nuptials appointed to be celebrated; but the Czar died of the small-pox, on the 29th of January, 1729-30, three days before the marriage was to have been solemnized; whereupon the senate and great officers of the crown, caused the princess Anne, duchess dowager of Courland, to be proclaimed Empress. She was the second daughter of the late czar John, elder brother of Peter the Grant; Catharine, her eldest sitter, having been married to Charles, duke of Mecklenburg.

The court residing at Molcow on the death of the Czar, prince Dolgoruki, and three others were appointed to attend the empress Anne, and convoy her to Moscow. These noblemen arriving at Mittau, the capital of Courland, congratulated her on her succession; but insisted on limiting the prerogatives of the crown, and vesting part of the legislative authority in the states, which she consented to, and signed the capitulation they had provided for her; the principal arricles of which were, that she should not make peace or war, or raise taxes, without the concurrence of the states; and that she should not marry, appoint a successor, or dispose of any considerable office, without the like affent. But the Czarina appearing to have many friends on her arrival at Moscow, the articles she had signed were cancelled; and both the clergy and latty took the oaths to her majesty in as absolute terms as they had done to Peter the Great, without reserve or limitation.

The ambitious Dolgoruki, his fon, and feveral of their relations and friends, were foon after banithed, and their estates conficated, being principally concerned, it is supposed, in putting limitations on the prerogative, as mentioned above; but the declaration No. 63.

published on this occasion, charged Dolgoruki, and his fon, with behaving infulently to the late Czar Peter II. endeavouring to marry him to Dolgoruki's daughter, and embezzling the public treasure.

The empress Anne died in October, 1740, having

The empress Anne died in October, 1740, having nominated for her fuccessor prince John, an infant, six months old, son of Anthony Ulrick, duke of Brunsswick Wolfenbuttle, and of Anne his wife; daughter of Charles, duke of Mecklenburg, and of the princess Catharine, eldest daughter of the late exar John. During the minority of the infant Emperor, the appointed her favourite, count Biron, duke of Courlands to the regent: but the mother of the young Emperor, the princess Anne of Mecklenburg, deeming herself much better entitled to the regency, and even to the throne itself, as her son could have no right to the Russian throne but by her, she ordered count Munich to take the duke of Courland prisoner, and causing him to the tried for high-treason, he was condemned to die; but his sentence was afterwards changed to banishment into Siberia.

Through some disgust or other, the princes Anne of Mecklenburg, caused count Munich to be removed from all his posts, a circumstance that tended eventually to her own ruin. While the foldery were under his command, the had not much to fear from them a but he was no fooner displaced; than they began to cabal in favour of the princes Elizabeth, other youngest daughter of Peter the Great, by his last confort, the empress Catharine; and on the 5th of December, 1741, all the avenues to the palace, and the chief posts in the city, were seized by the guards, who, with the friends of the princess, affembling in the palace, proclaimed her Empress of Russia. The late regent, and her confort, the duke of Brunswick, and their infant son, were made prisoners, as were also counts Munich and Osterman, the chancellor. The Dolgorukis, the duke of Courland, and other state prisoners, were recalled from Siberia, and their fentence revoked. In the mean time, counts Ofterman, Munich, and feveral more, that were not thought well affected to the present government, were tried for high treason, and condemned to die; but when they had been brought to the foaffold, and prepared for the execution, it was declared, that the reigning Empress had changed their fentence into that of

The empress Elizabeth, having waged a successful war with Sweden, and thereby greatly enhanced her power, replaced the national order of succession to the throne of Russia in her own family, by adopting the duke of Holstein Gottorp, declaring him to be her heir, and giving him the title of grand duke of Russia. He was married to the princess Catharina Alexowna, the daughter of Christian Augustus, prince of Anhalt-Zerbst, who bore him a son that was christeaed by the name of Peter, and asterwards became the unfortunate Peter III.

The reign of this Empress may, in divers instances, be said to have been truly glorious. She obtained a complete victory over the Swedes; and such was her importance in the political scale of Europe, that the court of Great Britain deemed it expedient, in 1747) to court her alliance at the expence of a very confiderable subsidy. A treaty was accordingly entered into, and articles signed by the plenipotentiaries of the respective monarchs. She was induced, from political, as well as private reasons, to espouse the cause of the house of Austria against the king of Prussia, in 1756; and, notwithstanding the superior talents that monarch displayed, both in the cabinet and field, her conquests were of such importance, as threatened the destruction of the Prussian power, which, however, was prevented by her critical death, which supperied on January 5, 1762.

Elizabeth was fucceeded by Peter III. grand prince of Ruffia, and duke of Holftein Gottorp. He poffessed the warmest attachment to the king of Prussia, from his political and personal character; and seemed to have

adopted his principles and practices, as the governing maxims of his own conduct. From these motives he is supposed to have introduced some peculiarities and innovations into the empire, which were extremely digusting to his subjects. However that may be, a conspiracy was formed against him, which was carried on in such a manner, that this unfortunate prince knew but a short interval between the loss of his crown and his death, which happened in July, 1762. He was fucceeded by his confort Catharine the II. the first remarkable occurrence in whose reign was the death of prince Ivan, fon of the princess of Mecklenburg, who fell a victim to an ill concerted conspiracy, formed by a party to raise him to the imperial throne, to which, it is univerfally admitted, he had no legal pretence.

The transactions and event of the war between Ruffia and the Ottoman Porte, which commenced in 1768, and terminated in 1774, are well known from chifforical record. We have recounted the particulars of the same in our hiftory of Turkey, in the first divition of our work, under the article of Afia, for which the reader is referred to page 206. The part the Empress took in the dismemberment of Poland, will be

fhewn in our hiftory of that kingdom,

as Manich and Offer-describe, the dake of

nors, were strailed from

It will be necessary to relate, that a short time before the conclusion of the war with the Turks, a rebellion broke out in Ruffia, which greatly alarmed the court of Petersburg, a pretender appearing in the perfon of a Coffac, called Pugaticheff; and affurning the name and character of the late unfortunate emperor Peter III. by his ability and address, drew after him numerous followers, which increased to such a degree, that they stood feveral engagements with-able Russian generals, and committed great ravages in the country. They were at length, however, totally defeated; and the pretender being taken prisoner, was conducted to Moscow, in an iron cage, and there beheaded, January 21, 177

In justice to the present Empress, it must be acknowledged, that the has filled the throne with diftinguished luftre. She has promoted frience, extended commerce, and introduced many falutary reformations in the interior police of her empire, than which nothing can more effectually tend to aggrandize herfelf, as well as her subjects. We shall only add, that one transaction of her reign particularly redounds to her honour; this is the ettablishment of an armed neutrality, for the protection of the commerce of the nations not at war, from any attacks or infults from belligerent powers. This armed neutrality was acceeded to in 1780, by the kings of Sweden and Denmark, and by the States General.

The flames of war are again burft out between Ruffia and the Porte, and the emperor of Germany has inter-posed in favour of the former. Time alone can decide the event. However, our readers may be affured, that whatever transactions may occur from the commencement of the fame to the close of this work, shall be minutely and faithfully inferted by way of supplement, as we have already announced with respect to events

in general.

CHA

L

SECTION I.

Origin of the Name, Extent, Situation, Boundaries, Cli-mate, Soil, Productions, Rivers, &c.

T is the general opinion that Poland takes its name from Polu, a Sclavonian word, fignifying a country fit for hunting, on account of its plains, woods, wild beafts, and every kind of game.

Before the excraordinary partition of this country, the kingdom of Poland was very confiderable, extending about 700 miles in length, and 680 in breadth; the situation being between 46 and 57 deg. north lat. and 16 and 34 deg. east long, and the boundaries, Livonia, part of Russia, and the Baltic Sea, to the north; another part of Ruffia to the east; Hungary, Turkey, and Little Tartary, to the fouth; and Germany to the west.

From its fituation, the climate of this country is rather temperate, and the air not excessive cold; yet fometimes the lakes and rivers are fo frozen, that carriages pass over them for five or six months together. The foil also is generally fertile, fit for tillage and pasture, and produces a vast quantity of corn and cattle, even enough to supply the populous nation of Holland, who yearly fend vast fleets to Dantzick, to buy the corn and oxen fent down thither from the feveral parts of Poland, It also produces honey, wax, hemp, flax, leather, pot-ashes, falt, wood, falt-petre, vitriol, and quickfilver. With these staple commodities the inhabitants purchase those of other nations, as wines, cloths, ftuffs, wrought fiks, tapeftry, jewels, fables, martens, tin, fteel, iron ware, brandy, and fpices.

This country product also all kinds of fruits and herbs, and a good breed of horses. There are vines

in many places, the grapes of which are grateful to the tafte, especially if the summer and harvest be favourable; but the wine is generally very tharp when drawn off. In the mountains there are mines of lead, filver, copper,

VII. show the or bolled or best feet

have with Sweder and D. Quelt, total Norveded in Control of the Co

and iron; but the most considerable of all are the faltmines in Lesser Poland, which are the chief riches of the country, and bring most money into the exchequer. They work in those mines as colliers do in our coal-pits. The falt is generally of a blueish colour, but some of it is white and transparent. They have also some veins of sal-gemmas. The woods are well stored with hares, of lal-gemma. The woods are well tored with lares, rabbits, fquirrels, deer, foxes, bears, wolves, and boars. The Malovian forefts have plenty of elks, wild affes, wild oxen, called uri, and buffaloes, whose flesh, when salted, the Poles esteem a great dainty. In the Ukraine there are wild horses also, whose flesh is equally esteemated. The wolf, resembling a hart, or the European collect these converses, and by the natives resemble. lynx, called lupus cervarius, and by the natives ris, with spots on its belly and legs, affords the best furs in Poland. The quails in Podolia have green legs. It is faid their flesh is unwholesome, and, if immoderately eaten, causes the cramp.

Poland is a plain flat country, rather inclining to marsh lands, so that no considerable woods or mountains are found here, except those that form the frontier tains are tound nere, except their that for a the nonner to Hungary, which is a craggy ridge of 300 miles in leagth, and called the Crapach, or Carpathan mountains. The eaftern part of the country, indeed, is full of woods, forefts, lakes, marshes, and rivers, which afford a delightful prospect to that part of it which is

The most considerable rivers are the Vistula, the Niemen or Cronus, the Nieper or Boristhenes, the Niester or Tyras, and the Bog or Vegus; and the only lake worthy of observation is the great lake Gopto, or the White Lake, which, it is affirmed, will dye those who bathe in it of a swarthy complexion.

. One of the most fingular productions of Poland is manna, of which it may not be improper here to give an account. According to natural historians it is a kind of gum, which flows spontaneously from several forts of trees, and afterwards congeals into grumes in

the form of an effential falt. It not only proceeds from the ash and quicken-tree, but also from the larix, pine, fir, oak, juniper, maple, olive, fig-tree, &c. It flows in July and August, from about the nervous fibres of the leaves, which, being dried in the air, concrete into whitish grains of the fize of wheat; infomuch, that, in August, the greater leaves of the ash-tree look white, as if they were covered with fnow. However, it is very fearce, on account of the difficulty of gathering The virtues of manna are well known, it being a mild laxative purge, and thought to diffolve gross humours, and abate their acrimony; whence it is good in catarrhs and coughs, proceeding from an acrid phlegm. It is also good in disorders of the breast and lungs, when stuffed with clammy humours. It is used in the pleurity, inflammation of the lungs, and tenfion of the belly, from a thick hot bile.

SECTION II.

Description of the several Provinces and principal Places of Poland.

IN treating of this country, confidered in its utmost ex-tent, prior to its difmemberment, we shall divide it into the twelve following provinces and attend to each in due order. These are Poland, properly so called; Polish Prussia, Lithuania, Samogitia, Courland, War-sovia, Polachia, Polesia, Red Russia, Podolia, Volhinia, and Ukrania. Most of these provinces are divided into diffricts called palatinates; and the latter are again fubdivided into starosties, or bailiwicks,
POLAND, properly so called, is divided in Upper, or

Little Poland; and Lower, or Great Poland.

Upper, or Little Poland, contains many woods, but is fertile in some places, and in general well watered. There is but one mountain in Little Poland, called Mons Calvus, or Bald Mountain.

Little Poland is divided into the palatinates of Cracow, Sendomir, and Lublin. These three palatinates form together the diocese of Cracow, which contains

1018 churches, including 11 which are collegiate.
Cracow, the metropolis of the palatinate of that name, and of the kingdom of Poland, is feated on a rocky bank of the river Vistula, about the middle of the palatinate. It is very populous, and the largest and best built of any town in Poland, the houses being of free-stone, four or five stories high, and covered with boards in the form of tiles. The public buildings are magnificent; among which are the cathedral of St. Stanislaus; the church of St. Mary, in the grand place, furrounded with four rows of very fine buildings; with 50 other churches; and 17 religious houses in the castle, city and suburbs; together with the noble, well-built monasteries of the Jesuits and Dominicans. The only remaining places of worship, differing from the state, are two Greek churches, and a Jewish synagogue. There is an university here which contains 11 colleges, where all kinds of sciences are taught. This university was begun by Casimir the Great, finished by Uladiflaus Jagello, and had its privileges confirmed by pope Urban. Though the court generally refides at Warfaw, as being more in the heart of the kingdom, Cracow is a noble, large, populous city, full of gentry and clergy, and honoured with the fellion of the fupreme court of judicature, the keeping of the royal enfigns or regalia, and the place of the king's coronation. The king's apartments are adorned with very curious paintings and statues. Within the castle stands the cathedral, where the kings of Poland are crowned and interred. Here likewife the relics of St. Staniflaus, the ancient bishop and patron of the nation, are carefully kept, and highly venerated.

Near this city are fome admirable falt mines, which were discovered in 1548. They produce a great annual revenue to the crown; and the proprietors are likewise obliged to make a yearly present to every city in Poland. The falt is of four kinds; and on one fide

of the mines runs a stream of brackish water, as a fine fresh one does on the other side.

The other towns of this palatinate are Zator, Siveria, Biecz, Sandrecz, Lelow, Czentochow, Slacovia, and Velisca. In some of these are mines of silver and lead: in others collegiate churches and monasteries.

Czentochow, on the river Warta, near the confines of Silesia, in particular, is celebrated for remarkable good beer. Without the walls there is a monastery of hermits, where a picture of the Virgin Mary is deposited, and which those hermits affirm to have been painted by St. Luke himself. This hath drawn a great concourse of pilgrims hither, who have made rich fents to the hermits; yet these treasures are not lodged in the monastery, but in a small fortress.

The fenators of this palatinate are the bishop, palatine, and castellan of Cracow, with four other inferior castellans.

The jurisdiction of this palatine is very large, and extends feveral ways, not only over the citizens and countrymen. but also the nobility and gentry. The prætor, or mayor of Cracow, is named by the king; but the castle is principally under the command of the palatine, who has ten deputies, or burgraves, by whom, in times of peace and war, a strict guard is kept, both night and day; and they must always be chosen out of

the gentry.

The palatinate of Sendomir, or Sandomir, abounds with mines of gold, filver, copper, iron, lead, ficel, and marble; and has its name from its capital.

Sendomir is pleafant, and defended by a firong caftle on the fouth fide of the town, on a fteep rock, befides walls and outworks built by Casimir the Great, who died here of a furfeit by eating too much fruit, which, about this spot, is reckoned the best in Poland. The most remarkable structures in the town are the Dominican monastery, a collegiate church which is very rich, a school where the Jesuits teach, and other religious houses. The chief court of judicature for the palatinate is kept here. The inhabitants are reckoned very polite. Here are two churches, much frequented by pilgrims, both which ftand in the midft of a forest. The towns are Cunow, Schydlowiecz, Viasden, Op-

tatow, Radom, Ilza, Solecia, Bozentin, Kielcz, Chencin, Racow, Lagovia, Corzin, and Vizicca. can be faid worthy of mention concerning these several places is, that they produce the respective articles of timber, iron, steel, earthen ware, fish, &c. which tend to the advantage of the inhabitants.

The palatinate of Lublin contains many noblemen and gentlemens feats. It is governed by four principal

persons, the palatine, the castellan, and two senators.

The city of Lublin, from whence the palatinate receives its name, is a fmall town, but has very great trade, and is particularly celebrated for four great annual fairs or marts, which continue a month each, and are reforted to by merchants from many parts, both of Europe and Asia. It is a bishopric, suffragan to the archbishop of Cracow. The Jews synagogue here is the finest in the whole kingdom; and the city besides contains feveral churches, convents, a college, and the chief tribunal for Little Poland. It is a healthy place, though furrounded by moraffes, which are, indeed, its chief defence; though Calimir the Great walled it, and furrounded it with a ditch. It hath likewife the fecurity of a citadel, which communicates to the town by a bridge.

Casimir is built of timber among the rocks near the Weissel. It is a large city, with a beautiful palace, and extensive gardens, belonging to the archbishop of Gnefa. This is the town where Charles XII. king of Sweden, caused general Patkul to be broke alive upon the wheel.

There are three other towns in this palatinate, but of no note.

LOWER OF GREAT POLAND; though so called, is rather smaller than Little Poland; for it did not receive its appellation of Great from its extent, but from hav-

to give it is a

feveral mes in

the

The palatinate of Polnania is fituated to the east-

ward of Silefia and Brandenburg.

The fenators of this palatinate are the archbifhop of The fenators of this palatinate are the archbiflop of Goefia; the bifflop, palatine, and caffellan of Polnania; and fix other caffellans. There are feveral other officers in this palatinate, both civil and military. The Staroffas, or governors of cities, have fome of them jurisdiction, others none, as it is likewise all over the kingdom. Some of its towns are walled; but the houses, in general, are of timber, except the public edifices, which are of stone or brick.

Pofnania, the capital, is thought to be inferior to no city of Poland, except Cracow. It is the fee of a bi-fhop, fuffragan of Gnefna; and it is defended by a good caftle, a double wall, and a deep ditch. It is famed for its trade, well built, and has a cathedral. The bifnop's palace, and an univerfity, are in its fuburbs, encompaffed by a morals and a deep lake, but incommoded fometimes by the overflowings of the river. There is a fine college and monastery in the city, in the former of which they have many fcholars. The inhabitants make as handsome a figure in their houses and dress as any in Poland: and their Starosta, or chief magiffrate, who is chofen annually out of the Echevins, or aldermen, is dignified with the tittle of general of Great Poland. Most of them are Papills; but here are many Jews, who have greater privileges than the citizens. The public buildings are generally of free-stone, of which the most considerable is the caltle. There are three famous fairs kept in this city, much referred to by the German traders. In St. Mag-dalen's, which is the principal church of the city, is fhewn the tomb of the duke Miccessaus, who intro-duced Christianity into Poland. Here are several other churches, besides monasteries. The streets are spacious, and the town-house a piece of sine architecture.

Besides the capital, the only place of note in this palatinate is Fravenstadt, which is remarkable for the victory obtained near it over the Saxons by the Swedes, which proved fo fatal to king Augustus, that it permitted Charles XII. to enter Saxony, and left Poland and Lithuania to the mercy of that con-

The palatinate of Kalisch hath five senators, viz. the palatine, the castellan of Kalisch, Land, Naklo, and

Kamin.

palatine, the castellan of Kalisch, Land, Naklo, and Kamin.

Kalisch, the city from whence the palatinate hath its name, lies among marshes, and is fortified only with a brick wall, and low towers. Here are the ruins of a strong castle, which was destroyed by the Tuetonic knights. It has a magnificent college of Jesuits, and some religious houses. It was taken by the Swedes during the wars of the last century. The Saxons and Poles descated the Swedes near this place, in October 1706, just as a treaty had been figned, where king Augustus renounced the crown to king Stantslaus, his electorate of Saxony being then over-run by the Swedes, and no other way lest to relieve it.

Gnesna, or, as the Germans term it, Gnssen, is now deemed the capital of Great Poland, and was formerly the metropolis of the whole kingdom, and the residence of the king. It was built, as is generally reported, by king Lechus, I. sounder of the monarchy, and called Gnesna, from an eagle's nelt found there, which, in the Polish language, is called Genesiad. The kings of Poland were crowned, and the regalia kept here, till 1320, when they were removed to Cracow. It suffered very much by a dreadful fire in 1613, and has been declining ever since; so that it is now only considerable for being the see of an archbishop, who is primate of clining ever fince; so that it is now only confiderable for being the see of an archbishop, who is primate of all Poland, legate of the Holy See, and, in case of the

king's death, regent till a new king be chosen, whom also he claims the right of declaring and crowning. He can reverse all proceedings in any of the bishops courts; and it is death to draw a sword in his presence. A golden crofs is carried before him when he goes to the diet, or to the king; and when he fits, his chaplain holds it behind his chair. His marshal, who is a senator, carries a ftaff before his coach, and falutes none with it but the king. He visits no ambassadors, though they vifit him. During the inter-regnum, he may com money in his own name; the revenues of the crown then belonging to him, and he having the fame officers with the king: but at all times he has drums beating, and trumpets founding, within and without, before he fits down to table; and he may vifit the king when he pleafes. The canons must all be of noble birth.

There is lodged in the cathedral a great treafure of gold, filver, and curious enamelled veffels, bequeathed to it by Sigismund III. and some other kings. tomb of one of the archbishops is cased with filver,

and the pillars are of Corinthian brafs.

The palatinate of Siradia is fituated to the north and

fouth of the Warta, and contains Siradia, the capital town, which is fmall, but popu-lous, and has a caftle to defend it.

Wielun, which is the feat of the Starosta, castellan,

and provincial diet. And
Petricow, a tolerable well-built near town, about 80 miles from Cracow. One of the great tribunals of the kingdom, for determining differences among the nobility, and appeals from inferior courts, fits in this town; as does also a provincial court, and the synod of

the clergy.

The palatinate of Lencicia hath five fenators, viz.
the palatine and caftellan of Lencicia, and three other
castellans.

The principal town, called Lencicia. has a great an-nual fair, and is the feat of one of the little diets.

Piontkum is celebrated for a fine monastery, and

good beer.

The palatinate of Rava lies east from that of Lencicia, and hath four fenators, viz. the castellans of Sochaezow, Goftinin, and Rava, and the palatine of

Rava, the capital, is fituated in the midft of a plain, built of wood, tolerably populous, and defended by a

Louitz is a small neat town, hath a castle surrounded by the river, is adorned with a flately church, and the palace of the archbishop of Gnesna.

Volhora is a populous town, where the bishop of Cu-javia has a noble palace.

The palatinate of Brezeltry is fertile, and fends five members to the diet.

In the fuburbs of Crefwick stands the church of St. Peter, built with free-stone, together with a college of

Uladiflaw is a palatinate, the capital city of which, of the fame name, is the fee of a bishop. The cathedral is an ancient Gothic structure, but rich in plate, ornaments, and relics; and encompassed with the houses of the canons and prebendaries, and a large free-school. The chief ornament of the place is the bishop's stately palace. Though the adjacent foil is marshy, and to scarce of fuel, that the inhabitants suffer very much for want of it, yet it is fruitful in corn, and fends great quantities to Dantzick.

The palarinate of Inowlocz, or Inowladiflaw, is di-vided into three territories, and fends four castellans to

the diet, besides the palatine.

The chief town of the same name, is small, but defended by a strong castle.

Bydgost is noted for a great trade in salmon.

Dobrin abounds with fruit and fish of all forts; and was formerly the occasion of many quarrels between

the Tuetonic knights, Pruffia and Poland.

Ploezko, or Plofkow, is divided into four diffricts.

Plofkow, its chief town, has been a bilhop's, fee a long

time, is very populous, has a good trade, and is defended by a castle. It has a cathedral, with other churches and monasteries, well endowed, especially that of the Benedictines, in the suburbs, where, among other relies, they keep the head of St. Sigismund in a golden

hrine, given by king Sigifmund III.

Polish Prussia hath been ufually particularized by the appellation of Royal Pruffia, on account of its belonging to the crown of Poland, and to diftinguish it from Ducal Pruffia, which belonged to the house of Brandenburg; but hath, for some time past been erected into a kingdom. The modern distinction, therefore, is into Polish Pruffia, and the kingdom of Pruffia; as his late Pruffian majesty, in the dismemberment of Poland, seized upon the opulent, commercial, and fine cities of Dantzick, Thorn, and Elbing, which are all in Polish Pruffia, but annexed to the dominions of Pruffia.

Polish Prussia was formerly a diffinct political state from Poland itself, and no farther connected than by a perpetual alliance. In the year 1466, however, the inhabitants put themselves under the protection of Casimir IV. when it was expressly stipulated, that Polish Prussia should have nothing to do with the kingdom of Poland, though it had with its fovereign; and that the king should personally, and alone, come among them, hold diets, give orders, and determine all matters relative to Polish Prussia. Some of the cities and towns of this province, and particularly Dantzick, hadformerly very peculiar privileges.

The fouthern parts of this division, excepting in the neighbourhood of Dantzick, are barren, but level and open; but the other parts are over-run with mountains, lakes, and woods. The lakes yield plenty of excellent fish; and the woods afford wild boars, roe-bucks, game, wax, honey, and timber. This province is divided into four palatinates, viz. Pomerellia Culm, Marienburg, and Warmia.

The inhabitants of Polish Prussia have a distich which characterizes fix of their principal cities and towns, and which may be thus translated,

Dantzick the rich, Culm the delightful, and Ploczko the long;

Marienburg the handsome, Thorn the devout, and Elbing the strong.

The Palatinate of Pomerellia had formerly princes of its own. It has now a palatine, and four provincial judges; lies in the diocefe of Cujovia, and contains the following places.

The city of Dantzick, which is not only the capital of the palatinate, but the metropolis of Polish Prussia, is situated on a branch of the river Vistula.

The inhabitants of Dantzick have frequently changed their mafters, and have fometimes been under the protection of the English and Dutch; but they have shewn a greater attachment to Poland, as being less likely to rival them in their trade.

The city of Dantzick is large, populous and rich, carries on a vaft trade, and hath long been confidered not only as the chief mart and magazine of Poland, but as one of the greatest granaries in the world; therefore, London and Amsterdam excepted, it is reputed to excel, in opulence and commerce, any other city in Europe.

This city is divided into three parts, which are governed by three diffinct fenators, viz. Voorstadt, or Fore City; the Altstadt, or Old City; and the Rechtestadt, or the Emperor's City; all encompassed with high walls, so broad that coaches easily go round upon them. The scrifications are of vast extent; but being commanded by two hills, on the south-west, they cannot stand a siege. A canal goes through the city, which is generally covered with merchant ships. It is watered by the rivers Motlaw and Rodaun, on which are several mills. One, on the Rodaun, yields the state a great revenue, besides what it brings the proprietors. The No. 64.

houses are partly stone, and partly brick, and generally The public buildings are fix or feven stories high. very fair. St. Mary's church is a stately fabric, with 48 alters, 3722 windows, and a front, made at Antwerp, that cost 5000l. Here is a magnificent town house Here's a magnificent town house with a very lofty fpire. The arfenal, and exchange, the square of St. Dominic, and the college, are noble structures. There are 20 parishes in the city and fuburbs; three magazines, well furnished with ammunition and other stores; and many granaries of seven and nine stories high, with funnels to let the corn down from one to the other, which faves a great deal of labour and charge. They are encompassed with water, fo that ships lie close to them to take in their landing; and no houses are suffered to be near them for fear of fire. The chief export of this place is in corn brought from other parts, of which an incredible quantity is shipped from hence every year. The citizens have the fole privilege of buying up the corn as foon as it enters the harbour. The magistrates set a price upon it; but that the country people, who are the sellers, may not be imposed upon, and delayed, the citizens are obliged to buy up the whole quantity which the boats bring in, let it be what it will. Though this city takes off a great quantity of the woollen manufactures of Great Britain, yet the Dutch, fending fo many thips for corn to Dantzick, which must go empty away if they have no goods to carry, and the freight coffing them nothing, chief market to which the Dutch, and also the Scots, fend their pickled herrings, which are a most profit-able merchandize in Poland. The Dutch fend juniper fpirits hither, together with falt, fulphur whale-fins, and train-oil. Befides corn, of which there is not fuch a quantity exported any where as here, the Dantzickers export pot-ashes, sturgeon, Polish linen, fail-cloth, and great quantities of spruce canvas, which is used for fails for small shipping in England, and in Spain and Italy. The Dutch fetch great quantities of Polish sheeps' wool from hence, which is the best in all the northern world, the English and Irish only excepted, and which they employ in their cloth manufacture. The French also bring some of it away. The Polish wool is exported likewife to Germany and Sweden. The Dantzickers have a wine of that fort they call Tokay, but it is no other than the Polish wines of the mountains of Cracow and Podolia: and they import great quantities of Hollands gin, which is much drank in Poland. Some of the best oaken plank, for building ships, is brought from this city. The Dutch cargoes, besides those already mentioned, generally consist of English woollen manufactures, the fugars of the English colonies, American tobaccoes, with French filks, wines, and brandy. One half of the port customs belonging to the king of Poland fince the reign of Sigifmund Augustus, till his late Prussian majesty converted all of them to his own emolument. The harbour of Dantzick is not deep, fo that very large ships cannot come up to One of the suburbs of Dantzick is called Scotland; and the Scotch had great privileges allowed them, in confideration of their gallant defence of the town under one of the family of Douglas, when it was befieged by the Poles. It is faid there have been usually upwards of 30,000 Scorch pedlars at a time in Poland, fome travelling on foot, fome on horfeback, &co Indeed, in the time of king Charles II. they amounted to 53,000, when Sir John Denham, and Mr. Killigrew, were fent to number and tax them by the poll, which they did by particular licences from the king of Poland, bringing home 10,000!. fterling, befides defray-

ing the expenses of the journey and commission.

In the great church here is a vast pillar, hollowed, which, it is pretended, was anciently used to immure ecclesiastics guilty of heinous crimes. As liberty of religion is publicly allowed in Dantzick, there are churches of all kinds, Lutheran, Calvinist, and Catholie, There are besides convents for the religious of both sexes.

The environs of this city are uncommonly beautiful.

8 O

defore

, but de-

between

r diffricts. fee a long time.

Before the difmemberment, though this town was under the protection of Poland, yet it was governed by its own magistrates in form of a republic. They had four proconfuls or burgomafters, out of whom the king named a burgrave to represent him in the senate, and fign fentences of death. The fenators continued for life; and four of them were Calvinists. There were 100 burghers chosen to inspect the conduct of the fenates, and join with them in chufing the ministers. The magistrates determined all criminal causes without appeal, and all civil causes not exceeding 1000 The 100 burghers, who joined with the fenate in imposing taxes, represented the grievances of the people, and maintained their privileges. When the king came hither, he was only allowed to bring a few guards, and was treated by the city for three days. They had a fecretary always at court to take care of their interests, and the right of coinage. Their money, which they could coin without the king's leave, had the king's effigy on one fide, and the city arms on the other.

Here is a college, with professors in all faculties; but they do not give the degree of doctor. The jurif-diction of this city is above 40 miles round. The established religion has been Lutheranism since 1525. The Calvinists are numerous, and are allowed the freedom of their worship; as are all sects in general. This city is noted for having been the birth-place of that

eminent geographer Philip Cluverius.

There is an inland fea or bay here, called the Frischaff, famous for sturgeon, a vast quantity of which is taken here, cured at Koningsberg and Dantzick, and fent to all the trading ports of Europe, especially England and Holland. Peter the Great, ezar of Muscovy, having brought a fine yacht hither from Holland, took great delight in working it in this bay; and, in order to acquire the mariner's art, did every part himself; being sometimes at the helm, sometimes before the mast, and sometimes at the top-mast head, &c.

Oliva, a small sea-port, five miles north-west of Dantzick, is samed for a benedictine abbey, where a peace was concluded in 1660, betwixt the emperor, the king of Poland, and the elector of Brandenburgh, on one part; and the king of Sweden on the other.

The abbot's palace and gardens are very elegant; but his revenues, which amounted to 10,000 ducats) or near 5000l.) per annum, and the lands of the convent which, he enjoyed in full fovereignty, were all feized by the late king of Pruffia.

In this palatinate are five other towns, b t neither

of them merit attention.

The palatinate of Culm has four fenators, viz. the bifhops of Culm and Wormia, the palatine and castellan. The city of this name was built and well fortified by

the Teutonic knights. It is pleafantly fituated, but is

much decayed fince the Swedish wars.

The city of Thorn, the most ancient of any in Polish Prussia, is likewise the handsomest and best built. The streets are broader, and the houses moree legant, than those of Dantzick. The name is derived from the German word Thor, which signifies a door or gate, because the Teutonic knights, by building it, opened to themselves a door into Prussia; and the device on the city seal is a gate thrown open.

In the year 1454 this city, in conjunction with the reft of Polish Prussia, threw off the oppressive yoke of the Teutonic knights, and put itself under the protection of Poland, on condition that it should enjoy its ancient rights and privileges, which were equal to those

of Dantzick.

It had heretofore the right of coining money, chusing its own magistrates, determining civil and criminal causes, sending representatives to the several diets, purchasing siefs and estates, &c. But its rights and privileges now depend entirely upon the will of the Prussian monarch.

The German and Polish languages are spoken here in the utmost purity. The territory appertaining to

the city is of confiderable extent; and at a village about fix miles from the city, all persons, who resort thither, may drink as much beer as they please gratis. The town is defended by a double wall and mooat. The wooden bridge over the Vistula is the longest in Europe, as half an hour is required to walk over it at a tolerable pace; and at the fame time it is the most expensive, as one third of it is fure to be annually carried away by the floods. In fact it confifts, properly speaking, of two bridges, as the island Bazar divides it in the middle. The Stadthouse hath none in Europe which excels it, except that of Amsterdam. Great quantities of soap and gingerbread are made here and exported. The asparagus, that grows wild in the neighbourhood, is not inferior to what is cultivated in other places. In this city the celebrated aftronomer Copernicus was born in the year 1472.

The Lutheran college hath five profesfors, with a teacher of the Polish language, a fine library, and a

printing-house.

The bishop of Culm, whose diocese and spiritual jurisdiction extends to this city, having, towards the end of the last century, established an annual procession with the host on Corpus-Christi day, the year 1724 will fcarce ever be forgot by the citizens of Thorn, for the execution of a terrible decree that year from the chancery at Warfaw, at the instigation of the Jesuits, and the false depositions of their partizans; by which feveral Protestant magistrates, and others of note, were not only put to death, and others fined, whipped, and imprisoned, on account of a tumult, because some of the citizens children did not kneel down at the proceffion, but St. Mary's church was taken from the Protestants, and given to the Papists; their schools destroyed; the form of the city government utterly subverted; the burghers forced to submit to a new set of magistrates, who were all Roman Catholics; and, in a word, the inhabitants were stripped of all their privileges that had been fo dearly purchased, and after-wards confirmed by the peace of Oliva. During this many of the inhabitants fled to Dantzick for refuge, but thought fit to retire from thence elsewhere, lest the Poles should oblige the magistrates of that city to deliver them up. The Jesuits college having been broke open and plundered in the tumult, they demanded 20,000 florins of the city, which paid down one half in hand, and mortgaged the city lands for the other; though the damage they fustained did not exceed 1000 florins, and their whole college was not worth the fum total of their demand. Mean time the commission for the execution of the horrid fentence, which even the reigning pope thought too cruel, flaid about a fortnight, and coft the city 40,000 florins. Five or fix foldiers were quartered upon every Protestant burgher, who was obliged to maintain them in luxury, on pain of being treated with inhumanity; fo that the milery and calamity upon this occasion in Thorn is almost inex-

The leaning tower in this town is much admired; for though the outfide is built obliquely from the ground, so that it feems ready to fall, yet the floor and ceilings within are perfectly horizontal, and the walls perpendicular to the horizon. In the university library two of Cicero's epistles are preserved on wax.

and greatly admired by the literati.

Having described all the places worthy of note in this palatinate, we pass to that of Marienburgh, which is an open, level, populous, and fruitful country, producing corn, cattle, grafs, &cc. in abundance. The air is good. The fuel generally used is either turf, straw, or stubble; and the few woods harbour very sierce wolves. The inhabitants are principally Lutherans, or Roman Catholics; and the palatinate has only two fenators, viz. the palatine and the castellan of Marienburgh.

The city of Marienburgh was founded by the Teutonic knights. The caffle, which was erected in 1281, is a brick structure, fortified on one side with a treble

the Teud in 1281, h a treble ditch, ditch, defended on the other by strong stone walls, and secured by high towers at the banks. It has undergone several revolutions, and been subject to different powers.

Here is a magnificent church, dedicated to the Virgin Mary; but the town is meanly built, most of its houses being of wood, and the inhabitants poor. The adjacent foil is fruitful, and well cultivated, as is the neighbouring island of the same name, formed by the river; but the dykes, to preserve it from inundations, are very expensive. The best mead in Polish Prussia is made here.

Elbing is the metropolis of the palatinate, and the only port, except Dantzick, in all Polish Prussia. It was built in 1239, by the burghers of Lubeck; had the same laws, privileges, and arms, as their city; and was one of the Hans-Towns, as well as a free and imperial city; and one of the most considerable on the Baltic. This city also has undergone various revolutions. The last was in the dismemberment of Poland, by which it was subjected to the many calamities incidental on that event.

The city of Elbing is divided into the Old and New Towns, or rather the Upper and Lower Towns, which are both fortified, and, with Thorn and Dantzick, form a repository for the archives and treasures of Polish Prussia. Its streets are broad and strait, and the fortifications very regular. Its principal commerce is in sturgeon, butter, cheese, mead, and corn. The Catholic and Lutheran are the two religions of the place. It is situated in a level country, like Holland, and is as struitful and populous as any part of that province, Amsterdam excepted. The boors in the neighbourhood have as good houses and apparel almost as the noblemen in Courland; so that a boor is hardly to be distinguished, by his habit, from a burgher.

The architecture of the houses in this city is most grotesque and singular. They terminate in a point; and almost all the upper stories are untenantable, being designed for granaries, and not for residence. It was formerly fortissed in the Gothic taste, and surrounded by a trench. But even these feeble ramparts are, in a great measure demolished, since it hath become subject

to its new mafter.

Chriftburg is a confiderable town, with an old caffle, on the river Sergamen, which discharges itself into the

Drausen, opposite Elbing.

Stum is a small town with a castle, where the diet of the palatinate, and a court of judicature is held.

The fourth palatinate of this country is Warmia, a bishopric, the people of which are exempted from the royal jurisdiction, and governed by the laws of Prussia under their bishop, who is a prince of the empire, the chief of the Prussian senators, and has his seat at Heilfberg, a strong place, built in 1240, on the river Aller, north-east from Elbing, and 32 miles south of Koningsberg. His cathedral is at Frawenburg, on the Frischaff, where it receives the river Schon, and has a good harbour, 10 miles north east from Elbing and Pillau. The famous Copernicus was a canon of this cathedral.

The chief town of this palatinate is Braunfberg, or Braunflaw, a populous place, much frequented, famed for a good trade, and an univerfity, or rather a college, built by cardinal Hofius. The town has been mortgaged fince 1667 to the electoral family of Brandenburg; but his late Pruffian Majefty took poffession of the whole.

Pruffia may, in this manner, from a finall state, become an extensive and mighty empire, till, perhaps, it grows too unweildy to support itself, when, like many other states, it may decline as rapidly as it rose.

When empire in its childhood first appears, A watchful fate o'ersees its tender years; Till grown more strong, it thrusts and stretches out, And elbows all the kingdoms round about. The place thus made for its first breathing free, It moves again for ease and luxury; Till, fwelling by degrees, it has posses of The greater space, and now crowds up the rest; When from behind there starts some petty state, And pushes on its now unwieldy sate: Then down the precipice of time it goes, And sinks in minutes what in ages rose.

The extensive country of LITHUANIA, which the natives themselves call Letwa, was united to Poland in 1501. It is, in length, about 360 miles, and 340 in breadth, where broadest. It was formerly almost filled with woods, and still contains many considerable forests. It abounds in honey, wax, timber, bufsaloes, wild horses, wild asses, pitch, tar, boars, elks, uris, woodcocks, &c.

The numerous lakes likewise produce great quantities of fish; but the great numbers of lakes and forests occasion the air to be thick and foggy. Here are many flocks and herds; and buck wheat, as well as other grain, is pleatiful; fo that provisions are cheap, though agriculture is greatly neglected: but money is very scarce.

The nobility affect great pomp and fplendor, and are exceedingly fond of retaining a numerous train of dometics. The Roman Catholic is the established religion; but Lutherans, Calvinists, Jews, Turks, Greeks, &c., are tolerated.

Lithuania was governed by its own duke, till it was united to Poland by the marriage of its great duke Jagello to Hedwig, the dowager of Lewis, king of Poland and Hungary; but each country still retained its own laws, customs, privileges, dialect, &c. In a dict held at Lublin, in the year 1569, it was more firmly compacted with Poland than before; and a decree was made, that both countries should form but one state under the same prince.

In their courts of justice, the tenth part of what is adjudged in all real actions goes to the judge's bar, and is immediately paid into court. The judge claims half the damages given in personal actions. The common people, the Germans, and burghers in the royal towns excepted, are slaves; and so exceedingly illiterate, that some of them even retain many of their ancient idol-

atrous fuperstitions.

The poor people here have only Monday to themfelves, and fometimes their lords even deprive them of that. They wear a coarse ash-coloured habit; and, for their legs, they have buskins of bark; and generally speak the Sclavonic, which is the language used in all their courts of judicature. They have a great mixture of Polish, and also of the Latin, which last is as common here as in Poland, and spoke by people of all ranks, infomuch, that Michalon, one of their authors, makes no doubt of their being descended from the old Romans; and the rather, because the Lithuanians had, not long since, the same customs and superstitions, as

burning the dead, divining by augurs, &c.

The bread they cummonly eat is a coarse black fort, made of rye, the sooty wheat, unwinnowed, and barleyears, all ground together. They have sleeh, fish, and sowl; and what cattle or poultry they think they shall not be able to keep in the winter, they usually kill in autumn, and preserve in falt.

In every house in the country they have four or five hand-mills to grind their corn. While they are at work they have a constant song. They have also a fort of very long wooden trumpet, which, when they found,

almost deafens bye-standers.

Their peafants have waggons or carts, all of wood, and made very fight, by interweaving boughs with each other; and their coverings are commonly the fame, not much unlike the colliers or lime-burners carts in England. The wheels are of one flat and entire piece of wood; and, as the axle-trees are never greafed, a number of them together make an intolerable fqueaking noife.

Their

Their houses are built round, and therefore they call them towers. They are narrow, and open at top, to let out the smoke and stench; and generally covered with boards, ftraw, or bark of trees. In these the people and their cattle live together, by which both often re-

One of the employments of the men, in the winter, is to fluff beds with chopt feathers, and flalks that grow in the marshes; and part of the womens business, within doors, is to weave coarse cloth. For fear of the incurfions of the Tartars, the Lithuanians fecure all their corn, straw, falt meat, and, in short, all their provisions, in caves, which they dig in the forests, and hide the entrance with the bark and branches of trees.

The first palatinate of Lithuania is Vilna, which

comprehends three large diffricts, and is divided into two equal parts by the river Wilia. It has only three fenators, viz. the bishop, palatine, and castellan; and its name is derived from the capital, not only of this

palatinate, but of Lithuania, viz.

Vilna, which the inhabitants call Vilenski, and the Germans Wilde. It stands at the conflux of the Vilia and Wiln, and is a large populous town, with a good trade, but chiefly carried on by foreigners, the natives being poor and lazy. The houses are so smoaky, and the inhabitants, who are slaves to their noblemen and their bellies, eat fo much garlic and onions, that half of them are blind before they grow old. They are much given to quarrels, fo that murders fometimes en-fue. The ftreets are badly paved, dirty, and fwarm with beggars; for here is no hospital. Most of the houses are low, mean, and built of wood, except those of fome foreign merchants, the great duke's palace, the cathedral and churches, which are all built of stone; as are also the Bernardine monastery, the university, and the Russian company's warehouse, where they keep their ermines, fables, &c.

As it is the most considerable staple for trade, so it

is the feat of the chief court of judicature for Lithuania, which fits yearly at this place and at Minisk, by turns. All the inhabitants, except the members of the tribunal, are under the jurisdiction of the palatine, who is gover-

nor of the city.

Here is a ruinous old castle upon a hill; and another much more beautiful, of a modern firucture, at the lower part of the town. In the duke's palace there is a well-furnished arienal, or armory, and a good li-The cathedral, dedicated to St. Stanislaus, stands in the lower castle. It has a large silver tomb of St. Cafimir, who was canonized by pope beo. X. revenues are confiderable; and though the archbishop is a Roman Catholic, he challenges jurifdiction over all the bishops of Polish Prussia, who are of the Greek religion; which is, however, disputed by the bishop of Kiow. Here is a great bell that requires 24 men to ring it, which was given by king Sigifmund III, who also gave the filver tomb, and an altar of the same me-The college here was founded in 1579, by king Stephen, with professors of divinity, law, philofophy, the Hebrew language, and philology; and honoured with the title of an university by pope Gregory The town is noted for making very good guns, and other instruments of war, chiefly by German arti-

The fuburbs are as large as the town, and full of the like timber cottages, which have not partitions, but confift only of one room, common to the family and their cattle. Both the castles are built of bricks, and slanked with towers. The fortifications are but indifferent, and its gates are only thut in time of war. The Protestants had a church and college here formerly, but where deprived of both by a decree of the diet of Poland, which, nevertheless, left the Greeks in posleffion of their monasteries, churches, and the free exercife of their religion. The town is inhabited by Poles, Russians, Germans, Tartars, and other nations, as well as by the Lithuanians. The Tartars, who lie along the banks of the river Vaca, which does not run far

from Vilna, have waggons for the fervice of travellers. They live according to their own laws, without giving cause of complaint, and own the king of Poland for their Great numbers of them refide in the villages of a valley three miles from hence, in the way to Koningsberg. Foreign merchants seldom come hither but in the winter, when the marshes are frozen, Foreign merchants feldom come and they can bring their goods on fledges over the fnow. There was fo great a famine in these parts in 1571, that in Vilna alone there died of it no less than 25000. Here was a great tumult in 1581, on account of the bishop's zeal, in burning the books of the Lutherans, Calvinists, and Russians. In 1610 the Rusfians, to be revenged for the mischief done by the Poles at Smolensko, took this place, and set fire to it, by which 4700 houses were reduced to ashes, together with seven Catholic, and three other churches; so that the queen of Poland had but just time to escape, with her attendants, in boats; of which some, nevertheless, were drown-In 1644 the scholars raised a great tumult, which could not be appealed till major Oginiki came with 400 foldiers, of whom feveral, together with the major himself, were killed in the skirmish.

Grodno, in the palatinate of Troki, the largest town in Lithuania next to Vilna, is fituated on the river Niemen. Here is a fine palace, a castle, a college, a Jews fynagogue, a Carmelite nunnery, three Greek and nine Roman Catholic churches. Besides these here are two other palaces, the one belonging to prince Radzivil, and the other to the Sapietian family. Very few of the ftreets of this city are paved; and a great part of this town was confumed by fire in the year 1753. is a place of good trade, has a provincial diet, and a court of judicature. In the first division of Lithuania are feveral small towns, but on no confideration remark-

able.

The fecond division of Lithuania, or Lithuanian Ruffia, contains White Ruffia, and is about 340 miles in length, from east to west, and 240 in breadth, from north to fouth. It includes Black Russia, or the palatinate of Novogrodeck, and contains feven towns, of which we can only mention one that deferves attention. This is Novogrodeck, a confiderable town, 68 miles fouth of Vilna, fituated on a hill. Here are a provincial diet, a high court of judicature, an inferior court, a college, Roman Catholic and Greek convents, and feveral churches.

The palatinate of Minski has two senators, viz. the

palatine and castellan of the town of Minski.

Minski, the capital, is a large, well built town, defended by a deep ditch, a strong castle, and other fortifications. It was once a dictine town, but its confequence is now much declined.

Boriffaw is built of timber, has a strong castle, and is regularly fortified. As is also Brodzieck, 40 miles

to the fouth of Borislaw.

Rochaczow is a large and populous town, fituated on the banks of the Nieper.

The palatinate of Miscislaw, or Mislaw, is, for the most part, over-run with woods, or over-flowed with water; but what plain land it has, is generally fruitful. It likewise abounds with cattle of all forts, and excellent fowl; is divided into two large diffricts, which are those of Miscislaw and Modzeria; and has two senators, viz. the palatine and castellan.

Its capital, of the fame name, is a fmall timber-built town on the river Sos. The Russians received a great defeat near it in 1514; but in 1660 they took it, and

maffacred all the inhabitants.

Mohilow is a large, well built, populous town, fituated on the river Nieper. It is a great mart for furs, reckoned one of the strongest towns of Lithuania, and contains a very fine college.

The palatinate of Witepik has two fenators, the pala-

tine and castellan.

The city of Witepsk, the capital, sicuated near the conflux of the Witzhu and Dwina, is defended both by art and nature; has two ftrong caftles; is large and by pa is waf Th into t castel Pol and is caftles covy, It rer 1579, built Jefuit Th and f kingo

populous, but built with timber. Commerce is carried on from hence to the city of Riga, by means of the Dwina.

Orfka, or Orfa, is a large timber built city, at the conflux of a river of its own name with the Nieper; is defended on one fide by the Nieper, and on the other by pallifadoes, and a ftrong caftle built of flone, which is washed by the river Orfa.

The palatinate of Poloczk, or Poloczko, is divided into two districts, and has two fenators, the palatine and castellan of

Poloczk, the capital, which flands on the river Dwina, and is a large and populous town, defended by two castles. In 1562 John Basilowitz, great duke of Moscovy, took it, and carried away most of its inhabitants. It remained in the hands of the Russians till the year 1579, when it was recovered by Stephen Bathori, who built and endowed a very fair foundation here for the Lussian.

The province of Samogicia is of a triangular form, and fituated between Courland, Semigallia, and the kingdom of Pruffia. The length, from eaft to weft, is near 190 miles; and the greatest breadth, from north to fouth, about 90. The foil is marshy, as the name itself, in the language of the country, implies. It contains many rivers and lakes, and has some good pasture and corn lands. Some parts are mountainous; and the woods contain prodigious swarms of bees. The honey is excellent, and the wax remarkable for its purity and whiteness.

There is a breed of horses here which are small, but sprightly, swift, and hardy. Though the arable soil is very stiff, the inhabitants are so dull and stupid, that they use none but wooden plough-shares; because, when one of their starostas, or governors of bailiwicks, thought to introduce iron shares, in a season which happened not so kindly as usual, they imputed the cause of it solely to the change of this good tool; so that he was forced to let them have their wooden shares again, for sear of an insurrection.

In 1404 Vitoldus, duke of Lithuania, gave this country to the Teutonic knights; but, in 1408, it was taken from them by Uladiflaus Jagello, king of Poland; after whose death, in 1446, by a treaty with Poland, they were again put in possession of the duchy: In 1525, when Albert of Brandenburg was made hereditary duke of Prussia, it sell to the crown of Poland; but it was almost ruined in the Swedish wars.

The ordinary people here live in cottages, which stand, for the most part, near lakes and rivers, and are covered either with thatch or boards. They are low, and built longways, with the hearth in the middle. They have but mean furniture, and but one room for The better fort drink out of themselves and cattle. horn cups, and eat off of wooden platters. Most of the inhabitants differ little in manners, habit, or language, from the Lithuanians. Though Christianity, which was first preached here in 1200, prevails in many places, yet fome of them still retain part of the old Pagan idolatry, the most ridiculous of any in Europe, especially in the deserts, where they worship a four-footed serpent, by the name of Givosit. About the end of October, men, women, children, and fervants, meet at a place appointed, where a cloth being spread upon straw, several loaves are set in due order, and between every two a large pot of beer: then beafts of divers kinds, both male and female, are brought in, and facrificed; after which they cut off a bit from every part, which they featter about the room, and then eat and drink heartily. The peasants of this country differ but little from those of Lithuania. However, they have the following peculiarities worthy of remark. They are not fo laborious as the Lithuanians, and consequently have not such plenty of provisions, &c. therefore, instead of bread, they use green turnips, as large as a man's head, which grow wild without sow-They have a peculiar way of making mead, metheglin, and beer, by quenching feveral red-hot stones in them successively, after it has been boiled a whole night, in order to make their bellies soluble. This drink they put into vessels made of the bark of trees. They reward those that drink hard with presents of a frock, shirt, handkerchies, &c. They live to so extraordinary an age, that it is no rarity to see persons here 100 or 120 years old. They are, generally speaking, more robust, bold, and nimble, than the Lithuanians; and they plow, sow, and harrow, all at the same time; so that the ground, having been once improved by burning, will bear crops seven or eight years together, without dunging. When they burn the woods on the lands, if they meet with high trees, they do not cut them down, but only prune off their side branches, to let in the rays of the sun upon the ground, which they perform with great dexterity.

In the time of war they bury their corn underground, in repolitories made for that purpole; previous to which they fmoak it, which makes the corn keep feveral years.

This province has three fenators, viz. the bishop, castellan, and starost.

Rozion, the capital of this province, is but an inconfiderable, fmall, and ill built town.

Midnick is rather a better built town than Rozion, and is the fee of a bishop, suffragan to the archbishop of Gnesna.

That fmall part of this province, called Polifh Livonia, is of very little importance, and contains only one place that deferves the name of a town, viz. Duneburg, which is a ftrong, well fortified place, fituated on the Dwina.

The duchy of COURLAND, called by the inhabitants Kur-Semmer, is a large track of land projecting into the fea. The length is 200, and the greateft breadth 80 miles. Many parts of the country are woody, and fome fwampy; but when those fwamps are drained, the foil is remarkably fertile, and yields grain, flax; pasture, &c. in abundance. This duchy is likewise well supplied with fish, and abounds in iron ore, minerals, quarries of stone, chalk, stucco, timber, amber, &c. with which the inhabitants trade to Riga, Libaw, Windaw, Memel, &c.

Horses and cattle are very plentiful here: and one of their modes of agriculture is to let the water remain upon the low ground for two or three years; and then drain it, when the soil is found to be exceedingly enriched.

The established religion in Courland is the Lutheran. Other sects, in general, are tolerated, but excluded from holding public employments.

The nobility are diffinguished by the appellations of old and new. The former only are permitted to enjoy offices of state; but neither are admitted to fit in the diet of Poland. Both, however, have an unlimited power over their wretched tenants and vaffals which The duke is the paextends even to life and death. tron of fome of the churches, and the nobility of When state necessity requires the nobility are obliged to appear on horseback properly armed; but they are not under any necessity to march beyond the The duke is permitted to appear in all the frontiers. regalia allowed to fovereign princes in Germany, to coin money in his own name, &c. but, in extraordinary cases, the nobility may appeal to the Russian court; this country being now subject to Russia. He keeps a court with all the proper officers of state, and is able, with the affishance of his nobility, to raife a very considerable

In the year 1558 Ketler, the last great master of the Teutonic knights, was, by the king of Poland, made hereditary duke of Courland, on condition of his quitting Riga and Livonia, and holding the duchy as a siet of that crown. His descendants continued in possession of Courland till 1737, when the family being extinct, by the death of Ferdinand, the last of the Ketlers, the Courlanders chose for their duke, Ernest Courl Biron, a native, and chamberlain to the Czarina, Anna

No. 64

built great, and town, rt for lania, pala-

ulous

by his fon.

The judges here are four captains or fuperintendants, viz. two for Courland, properly to called, and two for Semigallia; but from these an appeal lies to the high council, in which the duke in person presides; and even from this council a fecond appeal may be made to the government of Russia, if the case is sufficiently important; and disputes, between the duke and his nobles, are decided only by the empress of Russia in

Every two years a diet is held at Mittaw, to which

representatives are fent from every parish.

This duchy is divided into Courland Proper, on the west side, and Semigallia on the east side of the river Mussa; and each of these into two captainships

The first captainship of Courland Proper is Goldingen, fo named from its chief town, which was formerly one of the Hanse. It stands on the river Wetaw, which falls into the Baltie 40 miles off, and is 70 fouth-west from Riga. It is not confiderable at prefent, but for its large jurifdiction, though it is adorned with a very fine castle.

Windaw, called by the inhabitants Kiefc, hath an harbour near the mouth of the Baltic. It is reckoned the capital city of a palatinate of the same name, has a castle, formerly the residence of the Livonian knights, and the place where the states of Courland held their affemblies, which made it populous; but it is now much decayed, being only supported by building ships for the duke, and by its trade in pitch, tar, wax, &c. exported from it.

Libaw has a good road and harbour, where fome of the duke of Courland's ships are also built, and possesses the greatest trade of any of his towns.

Piltyn, or Pilten, is a palatinate, as well as the feat of a bishop of Courland, whose gentry, being protestants, put themselves formerly under the king of Poland's protection; but on his endeavouring to force a Popul bishop upon them, they submitted to the duke of Courland, and are the richest gentry in his domi-

The captainthip of Tuckum is fo called from its chief town, which is about 50 miles east of Goldingen.

Semigallia is the eastern division of Courland. Mittaw, on the river Mussa, 52 miles fouth of Riga, is the capital of this divition, and, indeed, of the whole duchy, as well as the feat and burial place of its dukes, who have a magnificent castle, which is fortified by two bastions, encompassed by marshes, and has always a strong garrison. The town is also well fortified, though meanly built, the houses being partly of brick, partly of timber, and some of mixed materials. It is large, and the seat of the diets of the duchy. It was feveral times taken by the Swedes, particularly by Gustavus Adolphus, in 1621, and again in 1701, and also by the Russians in 1705, but as often recovered. The Aa river, on which the castle stands, passes by this city to the Dwina, with a deep channel, which might be navigable, if the people of Riga had not, for their own interest, choaked up the mouth of it.

The rown of Mittaw is not very ancient, being founded by a private gentleman of Courland, in the year 1426. It occupies at least as much ground as Riga, but, as the firects are more spacious, and the buildings more scattered, it cannot properly be regarded as equal in fize. Most of the houses are of wood, and very mean in their appearance. It is badly paved; and, which is very fingular, the nobleffe have opposed and prevented the duke's intention to repair this defect, from motives

of caprice and obstinacy.

Bauske is another strong town on the river Mussa, or Plussa, with a castle built on a rock, which has a large garrison. It was taken by the Swedes in 1701, with the King of Poland's magazines, valued at 300,000 crowns; and he demanded 60,000 from the duchy, befides vast quantities of provisions. In 1705 the Czar furprized this town by ftratagem, and forced the Swedish garrison in the castle to surrender, just after a victory he had obtained over them near Muhrendorf, in this du-The Swedes repoffessed it, but quitted it, with the whole duchy, in 1709, after levying great sums from the inhabitants.

This duchy was an exact refemblance of Poland in miniature; the fame aristocrary, the fame turbulence, the same political evils existed in both. Poland was first difmembered and divided, Courland afterwards invested on one side by Prussia, between which and the empire of Russia, this little province shared the fate of its feudal parent, from the ambition and avidity of afpiring monarchs. The rights of humanity, of justice, and of liberty, have been fo trampled on and despised in the partition of Poland, that no future action, of a fimilar nature, can furprize, in the prefent age. The duke is a lover of letters, and has nobly founded an academy in Mittaw, which is now compleated, and where profeffors are entertained, at his own expence, for the instruction of the young nobility and persons of condition in the duchy. This is a very laudable foundation, and does him great honour.

The province of WARSOVIA, or the duchy of WARsaw, is the most considerable part of the king of Poland's dominions, being the regal refidence, and the part where the most considerable of the nobility refide. It is about 120 miles in length, from fouth-west to north-east, and about 90 in breadth. It has the benefit of feveral navigable rivers, especially the Weissel, which runs through the fouth part; and the Bog, which passes quite across from east to west. The country is plain and fruitful, yielding plenty of corn, cattle, fish, and fowl. It was formerly governed by princes of its own, but, in 1526, fell to the king of Poland. It is divided into three palatinates, of which Masovia Proper is subject to the bishop of Posen, and has eight senators.

The capital of Masovia is Warsaw, which is a large, handfome, populous, trading city, defended by a double wall and ditch. The kings of Poland ufually keep their court here, in a noble large square palace, built by Sigismund III. and beautified by his successors; and the grand diets of the kingdom have their fessions here. The city is divided into four parts, viz. the old and new towns, the fuburbs of Cracow, and the Brag. The chief church, dedicated to St. John the Baprift, is very fine; as are the arfenal, the caffle, the market place, and other public buildings. There is a wooden bridge of excellent workmanship over the river; and beyond it the king's palace, called Viafdow, where the general diet meets. It was built by Uladislaus VII. and stands amidst delicate gardens and groves and not far from it, in the fuburb called Cracow, there is a small chapel, erected by the king of Poland, in token of a victory gained over the Moscovites; wherein is a fepulchral monument of Demetrius Suifcious, great duke of Mofcovy, who, being taken prisoner, died a captive in Poland.

Goods are brought to this city by the neighbouring rivers, and fent from hence to Dantzick. The king of Sweden took possession of this city in 1704, put a garrison into the castle next year, when he demanded 2400 florins a week for their fubfiltence: but, in 1506, king Augustus recovered both the town and castle. The town Augustus recovered both the town and castle. paid him 50,000 rixdollars to be exempted from plunder. In 1705 the Swedes defeated the Saxon and Lithuanians near this city, when the Saxon general Patkul was taken prisoner; and next year Stanislaus, king Augustus's rival, was crowned here with his queen. In 1707 the Moscovites plundered the palaces and gardens of tues, &cc that car which co the who turned h ledged h forcified Swedes, A Fre

dens of the king and nobility here, and fent the statues, &c. to Moscow. Next year a plague raged here, that carried off vast numbers; and a fire broke out, which continued burning nine days, and almost reduced the whole city to ashes. In 1712 king Augustus returned hither, and held a general diet, which re-acknowledged his title; and in 1715 he ordered this city to be forested with intrenchments, to prevent surprize by the Swedes, and their consederates.

A French writer fays, he observed the same politeness here as at Paris: that the king maintains a set of French comedians, and frequently gives balls and concerts, with noble feasts, for the entertainment of the nobility: and that the ladies, especially, are passionately fond of music and plays; are very amiable, witty, and sprightly; and have a most delicate taste for every thing that passes under the name of diversion.

About half a league from this city, near the village of Wola, there is a plain, where the nobles meet, and encamp in tents, for the election of a king: and about a league from the city there is another palace, that was built by king John Sobiefki, with the name of Villa Nová.

Czerfko, or Czeftochow, is a fmall city, the capital of its palatinate, and deemed the ftrongest city in this part of the country, it having a fortress, wherein is kept that rich treasure called the Virgin's; and the nobility send their best effects hither in time of war. It was besieged, in vain, by Charles Gustavus, king of Sweden.

There are three other towns in this palatinate; one of which only deferves notice, viz. Pultovia, being the refidence of the bifhop of Poloczko. The town is walled and well built, with flately public edifices, and a flrong callle.

The chief places in the province of Polachia, are Augustaw, a handsome town on a lake, founded and named, from king Sigismund, Augustine.

Bielez, a large town on the river Biela, where the Jews carry on a great trade.

Bialystock, a small town, of which great part was destroyed by fire in the year 1753. In the neighbourhood is a very fine seat and gardens, belonging to the Bonicki family.

Tykocin is a confiderable town, with a handfome castle, on the river Narew. In 1705, in this town, Augustus II. king of Poland, instituted the order of the White Eagle.

The palatinate of Polesia is overgrown with woods, and has many lakes and pools. It has two fenators, the palatine and castellan.

Briefcia, the capital, is fortified with a caftle, built on a rock, and wathed by the river Muchavecz. Here is an academy, the moltanous in Europe for Jews, who frequent it from Italy, Germany, Moravia, Silefia, &c. and take degrees. Without the city there is a royal palace of modern architecture, with variety of pleafant gardens.

Pinfko is a pretty large town. The inhabitants are very industrious, make several trading journies into Russia and Germany, and are generally of the Greek persuasion, there being a bishop of that sect resident among them. This town has suffered much by the ravages of the Cossacks.

Biala is famed for a palace belonging to prince Radxivil, which is now a Gymnafium, or college for the influction of youth.

RED RUSSIA is near 180 miles in length, and upwards of 100 in breadth, fertile in fome parts, but mountainous in others, and, in general, well watered through the whole.

Red Ruffia is divided into three palatinates, viz. Lemberg, Chelm, and Belz.

The palatinate of Lemberg has nine fenators.

Lemberg, or Leopold, the capital, is a large opulent city, fituated among hills on the river Peltew. It is the fee of an archbifhop, who is deemed both a fpiritual and temporal lord. This city is large, well built and fortified,

having two castles, one within the walls, and one with out, on a rifing ground, that commands the town; both which, together with the city, were founded by Leo, duke of Ruffia, about anno 1289. The churches are generally fair and well built, and abound with cost-Here is an academy, fupplied by proly ornaments. fessors from that of Cracow, where learned men are much encouraged. The Armenian Catholics here are wholly governed by their own prelate. enjoy great privileges, on account of the confiderable commerce they maintain with the Persians and other eastern nations. They are not only provided with fish for their own confumption, from the many ports belonging to it, and from the neighbouring rivers, but falt great quantities for exportation. Barbels are taken in great numbers in Roxolania. Here is kept a very famous winter fair, to which the Hungarian, Moldavian, and Turkish merchants refort in great numbers.

Javarow is famous for a natural bath, whose virtues are described by a Polish physician, named Sixtus Leo.

Premislaw is a populous, pleasant, trading, well built city, and an episcopal see, on the river Saa, 53 miles west from Lemberg. The Russians have a bishop here, and the Jesuts had a college. The city is defended by good strong walls, and a casse built on a rock on the other side of the river. It has several samous yearly fairs. The king has a very spacious park near it, full of all kinds of wild beasts, and strongly walled in, that they may do no mischief. The country abounds with casses, to keep off the Turks and Tartars, the chief of which is said to be that called Crassici, built on the river Saa.

Jaroslaw is defended by a castle, and famed for a fair on Lady-day the most famous in Poland, frequented by merchants, with their goods, from Persia, Constantinople, Venice, Russia, and Holland. There are usually brought hither at that time, 400,000 black cattle, and 200,000 horses. There is a college here, and without the town a stately numery.

Refovia has a strong castle, an annual fair, and a linen manufactory, carried on by the descendants of the Germans, whom Casimir the Great took prisoners, and settled here to manage it.

Lencut has a strong castle, and several magnificent

The fouth-east part of Red Russia is called Pocutia or the district of Halicz.

Halicz was once the metropolis of a kingdom, then the capital of a duke, and afterwards the fee of an archbithop. Now it is greatly fallen from its ancient fplendor, though it is ftill a large town. The cattle is frong, the houses are of wood, and the inhabitants are remarkably clownish.

Coloni is a town on the river Prut, much frequented on account of the fine falt, with which it furnishes all the rest of Red Russia and Lithuania, there being many springs here, and none at all in these provinces, except only in the district of Premislaw.

Crofna is the ftaple of Hungary, whose wines, and other merchandize, are brought hither, and disposed of at these fairs, which are more frequented than those of their neighbourhood.

Sniatyn had formerly fairs, but has fince much declined.

The palatinate of Chelm contains the town of Chelm, from which it receives its name. It is the fee of a bishop, though not the refidence.

Krasnostow has a court of judicature, and is the residence of the bishop of Chelm, and of a starosta.

The palatinate of Belz contains Horoda, where a

The palatinate of Belz contains Horodla, where a provincial diet and court of judicature are held, and a starosta resides.

Rava is a small town, where king Augustus entertained the czar Peter the Great, in the year 1698, for three days successively.

Belzel is a confiderable town, from which the palatinate receives its name. Here a palatine, castellan,

and starosta reside; and a provincial diet and a court of

judicature are held.

Zamoski is a town strongly fortified, has many confiderable privileges, contains a charitable foundation called Mons-Pietatis, and feveral churches, and was originally founded by the celebrated Zamoski, great chancellor of Poland, in a very pleafant plain on the banks of the Veine.

The principal places of the province of Podolia are

the following:
The city of Caminiec Podolski, the capital, is a populous, well built city, furrounded with high rocks, befides being fortified with walls, a deep, broad, and fteep ditch, filled with water by the river which furrounds it, and by a very ftrong castle; so that it is the ftrongest place on this fide, and used to be reckoned one of the keys of Poland. In the reign of king Sigifmund lH. it was taken by the Coffacks. It has been attacked feveral times by the Walachians, Turks, and Tartars. In 1669 it suffered much by fire; and in 1672 was taken by the Turks, who kept possession of it, and thereby often made inroads into Poland, and carried away vast numbers of captives, till it was agreed to be furrendered by the peace at Carlowitz, in the year 1699, and evacuated next fpring to the Poles, when the diet resolved, that this town and Podolia should be free from taxes for 10 years. It is the see of two bishops, one a Papist, the other an Armenian, The Greeks of Podolia pleaded to be restored to their churches, but were denied.

The Lower Podolia, which is the east part, and also called the palatinate of Braclaw, from its chief town on the river Bog, was taken by the Turks in 1672, but restored by the treaty above mentioned in 1699.

Winnicza has a court of justice and a college. Human was besieged and taken in 1675, by the Turks, who committed great barbarities here, contrary to the capitulation, ravished the fair fex, murdered the old people and young children, and carried into flavery all that were able to walk.

The province of VOLAINIA is divided into the Up-

per and Lower Palatinates.

The Upper, which is also called the palatinate of Lufuc, or Lucko, from its chief town, is a plentiful country, near 200 miles in length, and 100 in breadth. Its chief town stands on the river Ster, now a lake, which encompasses part of the castle, 90 miles north-east from Lemberg. It is a large city, and the see of a bishop, fuffragan to the archbishop of Gnesna; but is chiefly inhabited by Jews, Armenians, and other eastern people, who traffic in these countries. The cathedral and chapter-house are in one of the castles, there being two built on hills near this city. Here also resides a Ruffian bishop.

Pilaveze is a small city on the river Bog, two leagues

from Chmielnich.

Krzemence, the capital of the district of Cremen, is a fmall city on a hill, near the river Icua, with a wooden caftle, founded on a rock, and mud walls. It has been often plundered by the Tartars.
Ulodimer, or Woldximiers, is the refidence of a

Russian bishop, with a considerable jurisdiction.

Brodi is a town with strong fortifications, has a col-

legiate church, and a public academy.

Olika is a town, with the title of a duchy, belonging to the family of Radzivil, adorned with a fine cathedral, and an academy for all forts of art and sciences

Conftantinow, adorned and defended by a well fortified castle, stands near the source of the river Slucz, 75

miles north from Caminiec.

The Lower Volhinia commonly called the palatinate of Kiow, together with Lower Podolia, comprehended in the Ukraine, lies east from the Upper Volhinia; and the river Boristhenes, or the Nieper, passes through the middle of it, from north-west to south-east, dividing it into two parts, of which only the western is now subject to Poland; the eastern being under the Russians. The former is fruitful; but the latter, which, however, abounds with falt-petre, is a mere defert, by reason of the neighbourhood of the Tartars.

UKRANIA is a large country, bounded on the north by part of Poland and Ruffia, on the fouth by Little Tartary, on the east by the Ockzakow-Tartars, and on the west by Moldavia. The name Ukrain is Sclavonie, and fignifies a frontier, which it really is against the Turks and Tartars. This is the country of the Coffacks, who have their name from Kofa, a fcythe, their usual weapon; or Cosa, which, in the Russian language, fignifies free-booter, or plunderer. were originally a crew of diffolute rovers, that affembled together, from the frontiers of Ruffia, Volhinia, and Podolia, to a practife piracy on the Black Sea. Their chief habitation was betwixt the rivers Niester and Nieper; but they extended themselves a great way east from the latter. The Coffack language is a dialect of the Polish. They are vigorous, hardy, brave, and very jealous of their liberty; fickle and wavering; but focial, chearful, and sprightly. Their forces consist entirely of cavalry; and they are, in fhort, a powerful people. Their common people are of the Greek church; but the better fort are generally Romans, or Their first considerable appearance, as Protestants. an united body, was in 1548, in the reign of Sigif-mund I, king of Poland; when they called themselves volunteers, and assembled to the number of 6000, for defence of the country against the Turks and Tartars, whom they frequently intercepted at the passes of the Nieper, when returning with their prey. Being foon joined by multitudes to share their booty, they could, Being foon with snallow boats, pass those rocks in the mouth of the Boristhenes, that hinder the navigation from the Ukrain to the Black Sea; and, during the fummer, they roved over the fea, and its coasts, making descents upon Natolia, and pillaging and fpoiling wherever they came, even to the walls of Constantinople. Stephen Bathori, king of Poland, formed them into an orderly militia; and, intending to use them against the Tartars, gave them the town and territory of Trethimirow in this palatinate, which they made their magazine; appointed a general over them, and gave them many privileges; and for some time they did the Poles great fervice, by opposing the Tartars: yet being sensible of their strength, they began to fet up for themselves; and in the year 1589, rebelled; but their general being taken and executed, it was for a time quieted. About the year 1600 they were fo powerful, that the Poles were forced to raife a large army against them, who often worsted them, and took their generals; but ftill they continued mutinous; wherefore their privileges were taken away; and they continued in a flate of enmity till about the year 1640, when king Uladislaus VI. making war upon the Tartars, collected them together, and fet over them for a general Chmielniski, who was afterwards a better and formidable enemy to Poland; for the Coffacks being oppressed by the Popish nobility, their landlords, and on complaint, receiving no redrefs, affembled in vaft numbers; and, calling in the Tartars, furioufly attacked the Poles: but king John. Casimir made such a stand against them, that, in 1649, the Tartars accepted a peace. Chmielniki, having obliged the prince of Moldavia to join him, it produced another war in 1651, wherein the Tartars and Costacks were worsted; and since that time they have not been so confiderable.

In 1677 this country was refigned by the Poles to the Turks, with liberty to the Coffacks of this part to chuse their own general, or prince, dependent on the fultan, who kept possession of it till the year 1699, when, by the peace of Carlowits, it was restored to the The only towns of note, on the west side of the Nieper, are,

Trethimirow, or the Nieper, a strong place, and defended by a caftle.

Ozykaffy, which used to be the chief retreat of the Coffacks, stands near the same river. It was burnt by the Poles in 1636, but has been fince repaired.

SECTION. III.

Persons, Dispositions, Ranks, Dress, Diet, Howses, Religion, Deseases; Geremonies baptismal and matrimonial; Customs, Bull and Bear benting, &c.

HE Poles, in their persons in general, are tall, well proportioned, and comely. Their complexion is fair, and their hair commonly of a pale yellow. They enjoy good constitutions, and have a healthful look. They are characterised, upon the whole, as brave, honest, and hospitable; but the common people are yery illiterate and bigottech

With respect to the superior people of Poland, like those of Russia, they are rather satisfied with a trisling and supersicial knowledge of things, than to carry their literary pursuits to any great height.

The Poles, like most of the northern nations, and like all governments where the feudal laws, or at least their remains, prevail, are divided into four distinct classes, viz. nobles; clergymen and law ers; merchants and burghers; farmers, labourers, foldiers, &c.

Though Poland has its princes, counts, and barons, yet the whole body of the nobility are on a level, excepting the difference that arifes from the public pofts they enjoy. Here all who are of noble extraction callone another brothers. They have many confiderable privileges, power of life and death over their peafants and vaffals, pay no taxes, are fubject to none but the king, may chufe whom they pleafe for their king, and in a word, lay their king under what reftraint they pleafe. In fhort, they are almost independent: but if they engage in trade, they forseit their nobility.

The Polish clergy, in general, are illiterate and bigotted; and fome of the monks profligate to a degree. The Polish clergy have vast sway; and it has been chiefly owing to their influence and conduct, that the peasants here have been reduced to such a state of wretched slavery.

The only traders of Poland, who have any skill in mercantile affairs, are the citizens of Dantzick, and the Jews who are feattered throughout the kingdom. The Polish mechanics are very aukward; and the artifans, in general, are but little acquainted with modern improvements. A recent writer favs, there are undoubtedly men of good natural talents among the citizens and trading part of the Polith nation; but, in the first place, they are kept very poor by the Jews, who, being protected by the nobility, carry on almost all the inland trade of the kingdom: fecondly, they are not properly instructed in their respective trades; and, thirdly, they are kept in a state of oppression; and are, in many respects, denied the common rights of mankind. The farmers and labourers, who form the bulk of the people, are in a most deplorable and wretched situation. The situation of the negroes, in many of our West-India plantations, is superior to theirs. They have no other ideas but those of tyranny and slavery. The wretchedness of their situation makes them indolent and careless abo t life, as they have reflection enough to perceive, that coarse food and raiment are all they can expect: but those among them, to whom nature has given any talents, have fenfibility enough, at times, to feel the weight of their oppression, which destroys all kind of emulation, and, through refentment, prevents them from doing any more for their oppressors, than they are forced to do by acts of violence.

The Poles cut the hair of their heads short, and shave their beards, leaving only large whiskers. They wear a vest, which reaches down to the middle of the leg, and a kind of gown over it, lined with fur, and girded with a sash; but the sleeves sit close to their arms. They have fur caps; but neither stocks or neckeloths; and their shirts are without collars or wristbands. Their breeches are wide, and make but one piece with their stockings. They have no shoes; in No. 65.

lieu of which they wear Turkey leather boots, with their foles, and deep iron heels, bent like a half-moon. They carry a pole-axe, and a fabre or cutlafs by their fide. On horfeback they wear a fhort cloak, covered with furs, both within and without. Perfons of rank wear fables, and athe fikins of tygers, leopards, &c. The peafants commonly wear a fheep fkin, with the wool on, in winter; and, in fummer, a thick coarfe cloth, inflead of boots, bufkins, and shoes, made of the bark of trees. The habit of the women much refembles that of the men, being a simple Polonaife, or long robe, edged with fur. But some perfons of quality, of both sexes, affect the French or English modes of dress.

Their diet is generally fresh meat, fowl, and in: and they drink the strongest of Rhenish, French, Spanish, Italian and Hungarian wines; brandy, aniseedwater, and other spirits. Their fauces, &c. are fo enriched with spices, that some of the nobility spend great fums in that commodity: and their usual breakfast is a hot pot of beer, with eggs, fugar and ginger. They hang the carcafes of elks at their gates till they stink, then dress and eat them, as a great curiofity, to be met with no where but at the tables of their chief nobility; yet their butcher's meat is delicious, and they have plenty of good fish. When they are invited to another's table, they must carry their spoons, knives, &c. with them; and their linen too, if they would be cleanly: for they have no napkins, but a broad piece of starched linen, fewed round the table-cloth, that their fervants may not fleal it. The ladies carry napkins with them, and put up as much sweetmeats and dried fruits as they please. The masters reach meat from the table to the fervants, who eat it as they stand by the chairs: and the mafter of the feaft is reckoned a niggard, if he does not make his guests drunk.

It is the custom for the master of the house, and his intimates, to drink the best wine; while the other guests, that are invited, are obliged to put up with the common fort.

Bumpers are much in fashion here; nor will they easily excuse any person from pledging them.

The houses are generally low, for they seldom lie above stairs. Some of them are of brick and stone, but the greatest part of wood. The kitchen is of one side of the court, the stable on another, the dyelling house is on a third, and the gate in the front. The richer fort having hangings of tapestry, or arras, and beds with tastata curtains; but seldom any accommodation to lodge strangers.

The inhabitants of Poland were converted from Paganifm to Christianity, by Aldebert, archbishop of Gnesna, about the year 964, and ever since the religion of the church of Rome hath been predominant here, except in Red Russia, where many of the people adhere to the Greek church. Some of the Greek church submit to that of Rome, but have their worship in Greek. They have also Arminians, who comply with the church of Rome, but have their worship in their own language.

The king, though a Papift, was obliged by his coronation oath, to tolerate Lutheranism in Polish Prussia, where there are whole cities of Lutherans, as Dantzick, Elbing, Thorn, and Marienburg; and fome Calvenists; especially in the Ducal Prussia. Faustus Socinus was of this nation; and his followers, from him called Socinians, grew very numerous in the last century: but king John Casimir made an edict against them, which was enforced by his fucceffor, king John Sobieski, who drove them quite out of the kingdom. The generality of the Papists here are great bigots, and their interest is strengthened by the presidencies of their bishops in the grand and petty diets. The inferior elergy have a place also in all courts of judicature; and the great fecretary of the kingdom is always a churchman. The regular clergy, as they call the monks, are more efterned than the fecular; and the mendicant friars have the privilege to enter the private room of any house without knocking at the door. The fecular clergy are generally rich, but dissolute. The inferior clergy feldom attend their office in the church, but give poor scholars two-pence a day to officiate for them; nor do the bishops correct the inferior clergy for their misbehaviour.

The common people may be guilty of inebrity, without rebuke, on their faft days, provided they abflain from fleth, &c. and they will not eat butter and cheefe on fuch days, though the Pope gives them a difpensation. At the elevation of the host the people knock their heads against the pavement, or benches, hard enough to be heard at a distance. Their churches are fine, and well adorned; and the priests affect rich vestments. The priests at Leopold have a cape they wear at mass, embroidered so thick with pearls and jewels, that it is a perfect burden. In winter the women of rank, and some of the men, have surred bags in the churches, that they may preserve their feet from the excessive cold.

The language of the Poles is a dialect of the Sclavonic, and is both harfh and inharmonious, from the vaft number of confonants in it. The Lithuanians, and Livonians, have a language full of corrupted Latin words: but the Ruffian and German tongues are underflood in the provinces bordering on those countries.

Most of the diseases of the Poles proceed from their drunkenness, to which they are so addicted, that they have a proverb, fignifying, "That a man may as well drink water as wine, if he does not feel the effects of drinking." The distemper peculiar to the Poles, is that called the Plica; in which the hair of the head is. matted together and entangled in one night's time, in spite of all care to prevent it. If it be cut off, it occafions a dimness of fight, if not a total loss of it, together with an eruption of puffules all over the body, and pains in the head and limbs; yet foreigners, who have been infected with it, fay, they have cut off their hair without any bad consequence. The Poles are not much troubled with other difeafes; and fcurvy, malignant fevers, and pleurifies, are feldom of fuch ill confequence here as in other countries.

The baptifmal and matrimonial ceremonies in Poland, are the fame as in other Roman Catholic countries; but the funerals of the people of quality are fo pompous and magnificent, that they look more like triumphs. The corpfe is carried in a hearfe or chariot, drawn by fix horses all covered with black. The coffin has a large black velvet pall over it, with a crofs of red fattin in the middle, and fix long black filk taffels, supported by fix of the deceased's domestics in close mourning. Several priefts, monks and others, walk before the hearfe with wax tapers; and immediately before it comes three men on horseback, who carry the arms of the deceased; one his fword, another his lance, and the third his dart. As foon as the funeral fervice is over, they ride furiously into the church, break the arms of the deceased upon the costin, and the body is interred; after which there is a feast, where both clergy and laity drink to excefs. When women of quality mourn, they wear coarfe black fluff; and their linen is not much better than canvas; and the greater the quality, the coarfer are the mourning weeds. When the king dies, he is laid on a bed of flate, and a certain number of fenators, ecclefiaftical and temporal, are appointed to attend his corpfe. The public defrays the funeral expences out of the revenue of the crown. The queen has the same honours paid her, when she dies, as the king; and all the fenators, deputies, &c. that repair to the diet for the election of a king, must be in black.

By the laws of Poland, the effate of the father is equally divided among the children, except any of them go into a monaftery, in which case their parts are divided amongst the rest; and the younger children here, as in other Popish countries, are encouraged by their parents to take the vow upon them, that their estates may be preserved entirely to the eldest son.

The method of hunting bulls and bears in Poland is They furround the wild bulls with a great number of horfemen, of whom every one rides up and darts an arrow at him, upon which the creature purfues him, during which another darts him behind; whereupon he faces about to purfue the latter; and thus by turns they fo harrafs him, that the beaft, being quite tired with purfuing fo many affailants, falls down, and is easily taken. Another way of taking them, is by felling a great number of trees, and thereby enclosing them, when each hunter, having his posts, darts at him; and as the bull runs towards his enemy, the hunter from behind gives him his death-wound; but if he breaks through the enclosure, the next hunter holds out a piece of red cloth, against which the beast having an antipathy, he forthwith leaves that person, and runs at another, who, being provided for him, commonly kills him. When they hunt for bears, they take those of the big-gest fize with nets; and, when they have hampered him, all the hunters ride about him, and having pinned down his head and feet with great wooden forks they fo bind him about with strong hempen cords, that he is not able to ftir; then they roll him into a great wooden cheft. The knots of the cords are fo contrived, that with one pull they may be untied. The bear is kept thus till they have a mind to hunt him, and then they let him out of a trap door made for the purpofe.

SECTION IV.

Government of Poland, Power of the Superior Class, bonorary Institutions, &c.

S the partitioning powers, at the difinemberment of the provinces of Poland, proceeded to change the conflitution and government, under pretence of amending them, the general forms cannot be afcertained. We can, therefore, only relate that mode which, in fome degree, fublifts in those parts which may now be termed the dominions of the king of Poland.

The government of Poland, in fact, differs little from an ariftocracy. The king is elected by the nobility and clergy; immediately after which he figns the pacta corventa of the kingdom, by which he engages to introduce no foreigners into the army or government; fo that as his power is cfreumferibed within very narrow bounds, he is, in effect, no more than the prince or chief regent in a free commonwealth; fince he can do nothing without the bounds of that authority which the laws of the land have given him, and the nobles take care to maintain.

For the administration of justice, civil and criminal, feveral courts are held in Poland; but the most considerable are the parliaments, composed of a certain number of gentlemen, clergy, and laity, who are chosen in each palatinate; the lay members once in four years, and the ecclesiastical once in two years. Of these parliaments there are two for the kingdom, and one for the duchy. Those for the kingdom fit at Lublin, in Upper, and Petricow in Lower Poland; and that for the duchy is held one year at Vilna, and the other year at Minski, or Novogrodeck, by turns. These courts receive appeals from inserior courts, and from them lies no appeal, except to the king and senate.

A king of Poland can neither marry, nor divorce a wife, without the confent of the republic. If he marries after his coronation, the queen cannot be crowned without his afking their confent; nor even then, unlefs fhe be a Roman Catholic. When she is to be crowned, the king must conduct her to the church, and present her to the archbishop of Gresna, or the bishop who anoints her with the confecrated oil, and puts the crown upon her head, and the sceptre into her right hand, and the globe of gold into her left. The queens of Poland have no officers but a marshal and a chancellor, neither of whom are senators, but only judges of the differences that happen among her domestics. They answer the addresses that are made to the queen when

an ambassador makes her a compliment in his master's name, or when a present is made to her at the marriage of a maid of honour. The king furnishes the queen with money to defray the charge of her household; but, after his death, she must maintain herself, and all her retinue, with the revenue which the king bestows upon her, with the consent of the republic, both for her dowry, and for her marriage present. These revenues are called the Reformation, and consist of the reversion of a certain number of starosties, which she cannot enjoy till they become vacant by the death of the present possession; and sometimes those who possess the starosties that are in her reformation, outlive her: but if the king dies before the queen's reformation be settled upon her, the republic allows her a yearly pension out of the crown lands.

The titles of the king are, king of Poland, great duke of Lithuania, duke of Russia, Prussia, Massovia, Samogitia, Kiovia, Volhinia Podolia, Polachia, Livonia,

Smoleníko, Severia, and Czernichovia.

All his revenue is clear to himfelf; for he pays no troops, nor even his own guards; all the public expences being provided for by the fenate: and all the officers of the household are Polish gentlemen, who ferve without falary, in expectation of some office.

A king of Poland may remit fines and capital punishments; and, upon invasions or rebellions, can summon the nobility to his standard. He can engage mercenary troops, disband armies, and punish those who transgress their duty. The king may nominate the great officers of state, make ecclesiastical, military, and civil promotions; but all are accountable for their conduct to the senate; neither can the king displace them when once appointed. All the laws, leagues, negociations, and embassies, must be in his name, and pass under his

feal; as do all letters patent, &c.

The fenate confifts of 16 bishops, besides the primate, who is chief, and about 130 laymen named by the king, and are for life; viz. the ten great officers of state of the kingdom of Poland and duchy of Lithuania; to whom are added, the palatines and the leffer fenators, who are the castellans and lieutenants of the palatinates, and the deputies of the nobility. They are created by the king, after they have taken an oath to preferve the liberties of the republic, by virtue whereof they controul the king, when he invades their privileges: and as this court is looked upon to be the bulwark of the commonwealth, against the attempts of the king, therefore four of the fenators are always about his person, on pretence of being his counfellors; though, in truth, they are but spics on him. None of the senators can go out of the kingdom without leave of the resublic. In the general diets they fit on the right and left hand of the king, according to their dignity, and not according to the feniority of their rece, tion; and it is they who, without the king, approve and ratify all the constitutions which the nobility propose to them by their deputies: fo that the fenators are, as it were, mediators between the king and the nobility, to preferve and defend the authority of the republic.

The chief fecular fenators are, in number, 36, viz. 32 palatines, who are, properly, governors of provinces; three caffellans, viz. of Cracow, Vilna, and Troki; and the flaroft of Samogitia. It is observed, that tho the quality of caffellan and flarofta is inferior to that of palatine, these four last mentioned possess almost the first rank among the lay senators. The office of a palatine is to lead the troops of his palatinate to the army, to preside in the affemblies of the nobility in his province, to set a price upon goods and merchandize, to set that the weights and measures be not altered, and to judge and defend the Jews. He has a vice-palatine under him, who must take an oath to him, and who ought to have an estate in the land, which they call

Possessionatus.

The caffellans are the next in dignity to the palatines; and there are two forts of them in the kingdom, who are usually distinguished by the title of great castellans, and petty or sub-castellans. They are all senators, lieutenants, or deputies of the palatines, and heads of the nobility, in their respective jurisdictions.

The Polith diets are of two kinds, vizi either ordinary or extraordinary. The ordinary diets meet every fecond year; but the extraordinary diets only upon particular occasions, when summoned by the king; but one diffenting voice renders all their deliberations ineffectual.

Every gentleman is a fovereign prince in his own estate, and has power of life and death over his tenants, who are perfect flaves, without laws or privileges to protect them. They dare not leave their mafter's lands to go to another's, unless he violates their wives or daughters; fo that they are often glad of that plea. If a gentleman actually kills one of his own flaves, he only pays 15 livres; and if he kills another's, he is only obliged to furnish another, or as much money as will buy one, and to maintain the deceased's family. If one gentleman kills another, he cannot be executed without the king's confent; fo that they frequently escape. No foldiers can be quartered upon the gentry; and if any officer does it, he is fentenced to die, or elfe declared infa-mous by the diet: nor can the king himfelf lodge at a nobleman's house without asking his leave. Mean time their houses are such sanctuaries for delinquents, that, though they may be arrefted there, they cannot be taken from thence without the mafter's leave. By the conflitution of Poland, the gentry cannot be arrefted till convicted by juffice; fo that he must be first summoned to the tribunal, where he is to be tried. If he does not appear, he is declared contumacious; and if he does appear, and is convicted, he is then arrefted, and imprisoned, in order to be afterwards sentenced, according to the laws and the nature of his crime. If a foreigner dies without iffue, his effate falls not to the king, but to the lord of the manor. The product of the lands of the gentry may be exported without paying custom; and a certificate, upon oath, exempts the purchaser from paying it. Neither the king or the republic confers the title of prince on any but the fons of the royal family; and though five or fix of the chief families have, perhaps, the title of princes of the empire, it gives them no fort of precedency. When their gentry travel into France or Germany, they assume the title of counts and barons, that they may have the easier access to persons of quality; especially in Germany, where they fearee think any one a gentle-man under a baron, and confequently, not worthy of their conversation.

They never had any order of knighthood before that of the immaculate Conception, erected by Sigifmund III. with fome privileges above the reft of the gentry, who fo much defpifed it, that the order foon came to nothing. King Augustus, in 1705, created that called the order of the White Eagle, in remembrance of his happily meeting the diet of Lithuania, when the Swedes and Stanislaus thought to have intercepted him. The badge is a white eagle, crowned with diamonds. He conferred it on feveral lords: but the senators are diftinguished by wearing a golden cross, with a badge in

the middle of it.

The king inflituted the order of Stanislaus in 1765. The badge is a gold crofs enamelled red; and on the centre of it is a medallion, with the image of St. Stanislaus, enamelled in proper colours. Many of the grandees have fuch large territories, that they can raise from 5000 to 10,000 men apiece, and maintain them, which makes them fo proud, that when great mens law fuits are decided by the diet, or other tribunals, the execution of the fentence must be left to the longest sword; for the grandees sometimes raise sive or fix hundred men of a fide, plunder and burn one another's towns, besides castles, and fight it out, rather than submit to the sentence of a bench of judges. They efteem themselves, especially the senators, above any German prince, want nothing of fovereign power but the liberty of coining money, which is referved to the

EUROP

republic; and fome of them we hereditary fovereigns of cities with which the king has nothing to do.

SECTION V.

Commerce, Trade, Manufaelures, Coin, Revenues, Refources, and Armam nt of Poland.

THE commerce and trade of Poland, generally confidered, are neither various in articles, or extensive in degree. In the interior parts some sinen and woollen cloths, and hard wares, are manufactured; but commerce is confined to the city of Dantzick, and a few other towns on the Vistula and Baltic. Dantzick, in particular, is an excellent port; and there is a navigation by the Vistula from thence to the interior parts of the kingdom, whereby all kinds of merchandize may be imported and exported with great facility.

The coins of Poland are the gold ducat, which is

The coins of Poland are the gold ducat, which is worth about 4s. 3d. the filver dollar of Dantzick, which is worth about 4s. 6d. the rix-dollar of Thorn, which is worth about 4s. 5d. and the rix-dollar of Sigifmund HI. and Uladiflaus IV. which is worth about 4s. 6d.

Notwithstanding the circumscribed power of the king of Peland, with respect to his political prerogative, the revenues of his dominions are adequate to a splendid maintenance; since, as before observed, he pays no troops, or officers of state. By the dismemberment, Poland, indeed, lost near half her annual income. To supply this deficiency, however, it was found necessary to new model and increase the taxes, not only to make up the king's revenue, but to keep up a standing army, for the desence of those parts of the kingdom which the partitioning powers suffered the

king to retain. By the ancient laws of Poland, the nobility, upon all great occasions, were to take the field on horseback, together with their adherents; and when this rule was properly carried into execution, a body of 100,000 men might be raifed. This army was always called Pospolite; but, from a variety of causes, it usually moved with great difficulty, and was generally without discipline, subordination, or experience. The Polish army, however, of late years, hath not been fo numerous; yet, previous to the late difmemberment, the peace establishment was 36,000 men; that is, 24,000 for Poland, and 12,000 for Lithuania, two-thirds of which were cavalry. The two bodies of troops that form the Polish army are commanded by two generals, who are independent of each other: and though they are named by the king, they are not obliged to give are named by the King, they are not one gublic, and an account of their operations but to the republic, and have an absolute authority over the troops. colonels are likewise absolute masters of their regiments; and it is their bufiness to find subfiftence for them, and to pay them as well as they can; but being rarely paid themfelves, they destroy the country, and ruin the farmers, to fatisfy their avarice, and that of their troops. The Polish nobility appear with more magnificence in the fields than in their towns; their tents being more elegantly ornamented than their houses. The cavalry, which is the greatest part of the army, chiefly composed of gentlemen. They have fine horses and their faddles, bridles, &c. are richly ornamented. The very contrast to their cavalry is their infantry; for as much as the former is magnificently ornamented, the latter is badly cloathed, badly armed, and often without uniforms. The corps is recruited from among the meanest of the people, and they resemble an army of vagabond Tartars. The Polish troops have but very little discipline a nong them. They attack with great fury; but if they are repulsed, they immediately retire with great precipitation, and there is the greatest dis-

ficulty in rallying them.

The martial, as well as the commercial, fpirit of the Polith nation, has, doubtlefs, been greatly checked by its respective invaders, who find it expedient to keep up such armies as shall not only overawe the people

they have subjected, but totally discourage them from attempting to introduce any reformation among them, either civil or military. Hence the very languid state of what is called the kingdom of Poland.

HISTORY OF POLAND.

HE origin of the Poles, like that of many other nations, is enveloped in obscurity. The ancient Poles are represented by Tacitus, the Roman historian, who gives a fhort account of them, as a rude and barbarous people, living by robbery and plunder, and rambling from place to place, almost in a state of nature, wholly negligent of cultivation in every fenfe and de-The first person we read of that maintained any superiority over them, was Lechus, who assumed the title of duke about the year 550. From that period they were under divers petty chiefs, till the year 700, when they gave the fovereign command to Cracus, the founder of the city of Cracow. On failure of iffue in his line, (the last of which was Casimir I.) the Poles elected to the supreme command, in 830, a peasant, named Piastus, who, living to a great age, and ruling with honour to himfelf, and advantage to the people, every native of Poland, who has, from his time, been elected king, is called, in commemoration of him, a Piast. The title of Duke was retained from the last mentioned period till the year 999, when Boleslaus affumed the title of king, conquered Moravia, Pruffia, and Bohemia, and rendered them tributary to Poland. Boleslaus II. marrying the heiress of Red Russia, annexed that province to Poland in 1059.

The kings of Poland, among whom was Cafimir III. were abfolute fovereigns, until the reign of Lewis anno 1370, when the Poles infifted on limiting the prerogative; probably becaufe Lewis was king alfo of Hungary, and they fufpected he would favour his native country to their prejudice. Lewis being fucceeded by his daughter and heirefs, Hedwigis, anno 1382, the married Uladiflaus V. great duke of Lithuania, on condition he should become a Christian, and their issue should succeed both to the crown of Poland and to the duchy of Lithuania, which have been united ever

Uladiflaus, their fon, succeeded them, and was also king of Hungary. This prince was killed in a battle with Amurath, the Turkith emperor, and leaving no iffue, was fucceeded by his brother Casimir IV. between whom and the knights of the Teutonic order, who had been placed in Prusia by the Pope, there were continual wars; until it was agreed, that the knights should remain possessed of Eastern or Ducal Pruffia, the grand mafter taking an oath of fealty to the king of Poland. In this reign the reprefentatives of the feveral palatinates, or provinces, were first summoned to fit in the diet, or affembly of the states; the great officers of the crown and dignified clergy only enjoying that privilege till then. In this reign also the learning of Latin was fo much encouraged, that it became the language of the common people. Sigifmund succeeded to the crown, anno 1507, in whose reign auther's doctrine was received at Dantzick, and some other towns in the north of Poland.

In the reign of Sigifmund II. the Russians invaded Livonia, then possessed by the Teutonic knights, who called in the Poles to their affistance. Other Provinces called in the Swedes; and these three powers contended for the dominion of Livonia many years.

Henry of Valois, duke of Anjou, was elected king of Poland in 1574; but his brother Charles, the French king dying, he quitted Poland, and fucceeded to the crown of France anno 1577.

Stephen Bathori, prince of Transilvania, was elected

Stephen Bathori, prince of Transilvania, was elected king of Poland on the abdication of Henry. In his reign the supreme courts of justice were first erected; before which time the king and council were the last resort in cases of appeal.

The Free interest, he requiring t all foreigne tended to report of Saxo throne by a mate was a with a pow pelled his he escaped,

The king Bavaria, Pi Austria, in the heredita VI. in whice ed fides, an queen agai capital of Sigiffmund III. fon of John, king of Sweden, was elected king on his renouncing Lutheranism, anno

Uladiflaus, his fon, fucceeded him, anno 1632; and invading Ruffia, took the capital city of Mofcow; and, on a treaty that enfued, he obliged the Ruffians to confirm the provinces of Smolentko and Zermigof to Poland.

Uladiflaus leaving no iffue, was fucceeded by his brother, John Cafimir, anno 1648, though he was then a cardinal. In this reign the old Coffacks being difobliged, renounced their allegiance to the Poles, and became fubjects to the Ruffians and Turks.

Charles Guffavus, king of Sweden, conquered Poland, but loft it again in fix months; after which John Cafimir introduced an army of 30,000 Germans to defend the kingdom against the Swedes; but the Poles suffecting he intended to render himself absolute, deposed him; whereupon he retired into France, and was made abbot of the abby of St. Germains.

Michael Wilnoweifki being elected anno 1670, the Turks conquered Podolia in his reign; but were defeated by John Sobiefki, who was elected on the death of Wilnoweifki. This prince raifed the fiege of Vienna anno 1683, and, after, a glorious reign, died in 1696.

Upon the death of Sobiefki, there appeared a great many candidates for the throne; but the prince of Conti had the greatest number of electors for him, and was declared king by the primate. The rest of the candidates, however, joining Augustus, elector of Saxony, and making his part; much superior to that of the French, the elector was proclaimed king, anno 1697, and the prince of Conti obliged to return to France.

We have already related, in our history of Sweden, the manner in which Augustus was driven from the throne of Poland, by the celebrated Charles XII. (who procured the advancement of Stanislaus,) and afterwards restored by the czar Peter the Great; and shall therefore, proceed to observe, that Augustus was not fully confirmed on the throne, which he held upon procarious terms, till the year 1712. The Poles, naturally attached to Stanislaus, were perpetually forming conspiracies and plots against Augustus, who was obliged to maintain his authority by means of his Saxon guards.

In 1725 his natural fon, prince Maurice, afterwards the famous count Saxe, was chosen duke of Courland; but Augustus was not able to maintain him in that dignity, against the power of Russia, and the

jealoufy of the Poles.

In 1733, Augustus III. died; and his death having been expected some time, the emissiaries of France had bribed several of the leading men in savour of Stanis-Jaus, whose daughter the French king had married. On the other hand, the emperor and Russia made interest to advance Augustus, the son of the late king, to the threne, who was the only legitimate issue of his late.

Polith majefty.

The French having gained over the primate to their intereft, he fent circular letters to the feveral palatines, requiring them to take fuch measures as might exclude all foreigners from the Polish throne; by which he intended to recommend Stanillaus, and exclude the elector of Saxony. Stanislaus was actually re-elected to the throne by a considerable party, of which the prince primate was at the head; but Augustus, entering Poland with a powerful army of Saxons and Russians, compelled his rival to retreat into Dantzick, from whence he escaped, with great difficulty, into France.

The king of Poland entered into a confederacy with Bavaria, Pruflia, and the French, against the house of Austria, in 1740, in hopes of coming in for a share of the hereditary dominions of the late emperor Charles VI. in which he did not succeed. He afterwards changed sides, and entered into an alliance with the empress queen against Pruflia, in which he was deseated, the capital of his German dominions plundered, and he

was forced to fly into Bohemia. But in this great diftrefs he appears to have been so little in favour with his subjects the Poles, that they gave him no manner of affishance or countenance, but left him to make the best peace he could with Prussia.

Augustus III. died at Dresden in 1763, when count Stanislaus Poniatowski was unanimously chosen king, by the name of Stanislaus Augustus. He was born in 1732, and crowned king of Poland in 1764. private nobleman, he refided fome time in London, and was chosen a member of the royal fociety. As he was peculiarly favoured by the empress of Russia, and some Protestant powers, the papers which he signed at the time of his election, were deemed too favourable to the Protestants in general, and the Greeks in particu-Hence the army, which the empress of Russia had in Poland, furnished a pretence for various confederacies to be formed against the king by the Roman Catholics; and the confpiring nobles, at length, were induced to throw off all allegiance to the fovereign, and put themselves under the protection of the Grand Seignior. This step occasioned the Ottoman Porte to declare war against Russia, and invade Poland with a powerful army. Hurried on by blind zeal, the confederates precipitated the ruin of their devoted country; and some of the neighbouring powers, invited by their incautious enthusiasm, took an advantage of this civil war, and difmembered this once powerful kingdom. So far was diffimulation used in the difmemberment, or partitioning of Poland, (as the powers concerned think proper to term it,) that they all exprefsly deny having had the least intention to scize any of the Polish provinces, or in any wife to divide that country. In the act of renunciation, transmitted to the court of Warfaw in the year 1764, and fealed with the seal of the Russian empire, the empress of Russia fays, " She did by no means arrogate, either to her-felf, her heirs and fucceffors, or to her empire, any right or claim to the diffricts or territories which were actually in poffession, or subject to the authority of the kingdom of Poland, or great dutchy of Lithuania; but that, on the contrary, her faid majesty would guarantee to the faid kingdom of Poland, and dutchy of Lithuania, all the immunities, land, territories, and districts, which the faid kingdom and dutchy ought by right to poffefs, or did now actually poffefs; and would at all times, and for ever, maintain them in the full and free enjoyment thereof, against the attempts of all and every perfon or perfons who should at any time, or on any pretext, endeavour to disposes them of the fame."

The king of Prussia, in the same year, signed an act, in which he declared, "That he had no claims, formed no pretensions on Poland, or any part thereof; and that he renounced all claims on that kingdom, either as king of Prussia, elector of Brandenburg, or duke of Pomerania." In the same instrument he guarantees the rights and territories of Poland against every other power whatever. The empress queen of Hungary likewise, in the year, 1765, wrote a letter, with her own hand, to the king of Poland, in which she gave him the strongest assurances, "That her friendship for him and the republic was firm and unalterable; that the motion of her troops ought not to alarm him; that she had never entertained a thought of seizing any part of his dominions, nor would even suffer any other power to do it."

Since these illusive declarations were made, and fallacious protestations given, the partitioning powers published each a manifesto, in which they respectively laid claim to certain of the Polish territories. In these pretensions the king of Prussia-shewed himself a deep politician, by contriving to lay claim to the most valuable share, and thereby obtaining the richest, most populous, and most commercial parts. In the year 1770 the respective powers threw off the mask, and began to avow their intentions. The Prussian consul, having received his instructions, took occasion to quarrel 8 R with

with the magistrates of Dantzick, and having been palpably the aggressor, was, according to those instructions, the first to complain. The king of Prussia pretended to be highly offended; but, instead of coming to an explanation, or hearing both parties, he suddenly surprised the city with a strong body of troops, fined the magistrates 100,000 ducats for what he termed their insolence, seized upon 1000 men to recruit his army, and having thus executed his intentions first, he began very calmly to argue the matter with the magistrates afterwards; and having coolly remonstrated with them on their imprudence, as he called it, told them to do so no more, and he would freely forgive them.

This, however, was a trifling prelude to what was to follow; for, the enfuing year, the Prussian troops entered Great Poland, and carried off from that province and its neighbourhood above 12,000 families. About the latter end of the same year his Prussian majesty published an edict, commanding, under the most fevere penalties, that all perfons should take in payment for forage, provifions, corn, horfes, &c. the money offered by his troops and commiffaries. This money was either filver bearing the impression of Poland, and worth only one third of its nominal value, or ducats flruck in imitation of Dutch ducats, but above 17 per cent. inferior in value to the real ducats of Holland. With this very base money he bought up a sufficient quantity of forage and provisions to stock his magazines, and fupply his army for two years; and the poor inhabitants, after having been thus obliged to part from their property much below its value, were, through necessity, compelled to come to re-purchase corn from those magazines, and to pay good substantial money for it; for the Prussian commissiones absolutely refused to receive again the same coin which they had paid. From this curious, though not very honest manœuvre, the king of Prussia cleared 7,000,000 dollars. The country being thus ftripped of money and provisions, the next plan of his Prussian majesty was to clear it of its inhabitants. To increase the population of his own dominions, at the expence of Poland, had long been his aim. To this end he enacted, that every city, town, village, &c. in the places which his troops pof-fessed, should furnish a certain number of marriageable young women; and the parents were ordered to give as a portion, a feather-bed, four pillows, a cow, two hogs, and three ducats in gold. This cruel order was rigorously executed. The parents were stripped to supply extorted portions for the children ravified from their arms. The young women were inhumanly dragged from their parents, their friends, and their connections; and being bound hand and foot like criminals, were carried off, in fpite of the lamentations of themselves and relations, in carts, waggons, &c. After this cruel exertion of arbitrary power, the exactions from the abbies, convents, cathedrals, nobles, &c. were fo great and unreasonable that the nobles fled from their estates, and retired into foreign countries, and the priests abandoned their churches. At length the treaty of partition was declared, and poffession taken, by the respective powers, of the provinces usurped; when Polish Prussia, and some districts bordering upon Brandenburg, were allotted to the king of Prussia: almost all the south-eastern parts of the kingdom, with the rich saltworks of the crown, fell to the empress queen of Hungary; and the empress of Russia took possession of a large territory about Mohilow. This violent dismemberment and partition of Poland, has justly been confidered as the first great breach in the modern political fystem of Europe.

C H A P. VIII.

KINGDOM OF PRUSSIA.

A S Pruffia, fo called from the Boruffi, the ancient inhabitants of the country, has, from the commencement of the prefent century, become a formidable power upon the continent of Europe, we shall, for the information of our readers, prefent, in one point of view, all the territories under the dominion of the Pruffian monarch, arranging them, with respect to name and situation, in the following order, and describing them as they progressively occur. The divisions and situations are as follow.

PRUSSIA, formerly termed DUCAL, but now REGAL PRUSSIA, is bounded on the north by part of Samogitia, on the fouth by Mafovia and Poland Proper, on the eaft by part of Lithuania, and on the weft by Polifia Pruffia and the Baltic; the length being about 160, and the breadth about 112 miles.

Autumn, in this country, is ufually wet, and winter fevere; yet the air is, in general, wholefome, being purified by high winds.

The chief productions of Pruffia are corn, flax, hemp, fruit, hops, pafturage, game, foxes, cattle, horfes, fheep, deer, bears, wolves, lynxes, wild boars, &c.

The Baltic, with the rivers and lakes, plentifully supply the inhabitants with fish; and, on the shore of the former, great quantities of amber are found, enclosed in which are often seen spiders, siles, gnats, minerals, leaves, fishes, frogs, ants, drops of water, pieces of wood, &c. Pope thus comments on this wonderful peculiarity.

Pretty in amber to observe the forms Of hair, of straws, of dirt, of grubs, of worms. The things, we know, are neither rich or rare; But wonder how the devil they got there.

This very remarkable fubflance is defcribed by an eminent natural historian in the following words.

"Amber is a hard bituminous fubstance, brittle, fomewhat transparent, and of a yellow, or citrine colour; though fometimes it is whitish, and sometimes brown. The taste is somewhat acrid, and bituminous, with a little aftringency. The smell, when warm, is fragrant and bituminous; and, when rubbed, it will at-

will attract

tract straws and bits of sticks by its electrical virtue. It is found in large quantities in Prussia, which is the country where it is chiefly got, particularly in the Baltic Sea, near the fhore of Sodavia, where it is found fwimming upon the water, and is taken in nets. However, this bitumen is not a production of the fea; for its water only ferves to wash it off from the bowels of the earth, and remove it to places near the shore. The veins of this bitumen have been found, by the order of the King of Pruffia. In digging for them, they first met with fand, which, being taken away, a stratum of clay appeared; and still deeper there was the mineral of vitriol, which being exposed to the open air, it was covered with an efflorescence of green vitriol. Still deeper there was a fandy mineral, out of which, with proper instruments, they got amber in various places. By this means, in the Marche, near Kustrin, as also in the Track of Stolpen and Dantzick, it was met with among fand, and found collected in heaps; whence it appears they were greatly mistaken, who took it for the rosin of trees, that dropped from them into the sea. It feems to proceed from a bituminous fossile wood, by the affiftance of the fubterranean heat; which, at first, is probably like petroleum, and, after passing through the mineral of vitriol, by the mixing therewith, becomes coagulated into a hard body. no doubt that it has been liquid, because it is often found in a round form, containing feveral forts of infects: befides, the oil which is obtained from amber is, for virtue and fmell, like petroleum. Charlton, who was a very great naturalist, has sometimes found real petroleum included in pieces of amber, which is a farther reason to prove what is afferted. The greatest plenty of this bitumen is found near the shore of Sudavia, aftera violent north wind, attended with a tempest. Sometimes amber is fo transparent, as to ferve to make burning glasses, one of which is kept in the cabinet of the Landgrave of Heffe Caffel. Amber, properly prepared, becomes a medicine for opening the obstructions of the bowels, and promoting all forts of excretions; and confequently is a very ufeful remedy in chronical difeafes. It is likewife faid to be very efficacious in curing cold diforders of the brain, and particularly in pains of the head, fleepy and convulfive difeafes, as well as in hyfteric and hypochondriac fits. The dofe is from a scruple to a dram in a poached egg, or any other proper vehicle. The volatile falt of amber is diuretic, and accounted a specific in hysteric and convulsive diseases. The dose is from 30 grains to 10. The oil is recommended in nervous diforders, particularly in the gout, palfy, and catarrhs, by anointing the parts therewith. It is given inwardly from two to twenty drops.

A kind of manna is likewife found here; and an infect, of whose eggs that beautiful red colour called St. John's blood is made. Wood, pit-coal, wax, honey, pitch, &cc. abounds; and of the athes of some kinds of wood glass is made. Independent of lakes and canals, several sine rivers water the country, which afford good inland navigation. Great damages, however, are some-

times done by their inundations.
Previous to the year 1719, the inhabitants of Pruffia (Ducal Pruffia only) capable of bearing arms, amounted to 635,998 perfons. Since that period, 17,000 Saltzburghers, and the fame number of German, Swifs, and French colonifts, have fettled in this country; and these emigrants have, subsequent to their coming into this kingdom, erected and founded 11 towns, 400 villages, 50 churches, 86 seats, and 1000 schools: hence the number of inhabitants at the present time must be deemed very considerable.

Most religions are tolerated: the Luthcrans and Calvinists, however, prevail. In the 13th century the German knights of the Teutonic order made a conquest of the whole country, in which they committed the most inhuman barbarities; for, instead of converting, which they pretended was their view, they extirpated the natives, and put the Germans in their place.

In 1454, one half of Prussia revolted from the knights, and put itself under the protection of Poland: This occasioned an almost continual war betwixt that country and the order, till the year 1525, when, by a treaty concluded at Cracow, it was agreed that Albert, Margrave of Brandenburg, the 34th and last master of the Teutonic order, should have the eastern part, under the title of a dutchy, and that it should descend to his and his brother's male heirs as a fief of Poland; but in 1657, the elector Frederick William had the fovereignty confirmed to him and his heirs, on condition of its returning to the Poles in case of the failure of heirs male. In 1701, Ducal Prussia was raised to a kingdom by the elector Frederick, who was, in a short time after, univerfally acknowledged as king of Prussia. At the time of his coronation at Koningsberg, he instituted the order of the Black Eagle. The enfign is a gold cross like that of Malta, enamelled with blue, and worn at the end of a broad orange-coloured ribbon, The fovereign is which passes over the left shoulder. grand mafter; and the number of knights are always thirty.

Another order is that of Merit, founded by his late Prussian Majesty, in the year 1740. The mark is a golden cross, with eight points, enamelled with azure, and on the uppermost point is the letter F crowned; on the three lowermost points this motto, For Merit; and on the four other points, which form a St. Andrew's cross, are so many spread eagles in gold. This star is fixed to a black ribbon, which they put about their necks, and it hangs down their breasts.

The late king of Pruffia brought the trade of this country into a very flourishing fituation, by the institution of an excellent police. The imports are trivial, and the exports many, consequently the balance is greatly in favour of the country. The manufactures, exports, &c. being iron work, paper, copper, brafs, linen, gold lace, filver ditto, naval stores, fish, oatmeal, tallow, glass, gunpowder, cloth, camblet, filk, stockings, amber, linseed, hempseed, mead; caviar, &c.

This country alone brings his Pruffian majefty a very confiderable revenue, the fingle article of amber producing 26,000 dollars annually. The other revenues arife from the crown demefines, duties, cuffoms, tolls, fubfidies, &c. The king of Pruffia is abfolute in this as well as in all his other dominions, in political, civil, ecclefiaftical, and feudal matters.

The country is governed by a regency, confifting of four great officers of flate, viz. the great mafter, burgrave, chancellor and marshal. These are affisted by counsellors of state, deputies from the nobles, and deputies from the commons. Here are likewise a board of commerce, a board of navigation, a college of war, a demesse chamber, and several tribunals of justice.

The military establishment here, as in all other parts of his Prussian majesty's dominions, is very considerable. Each regiment is quartered upon a particular district; and all the young men of that district being registered, they are obliged to join the regiment whenever commanded so to do.

This country is now divided into the provinces of Smaland, Nantangan, Oberland, and Little Lithuania.

The province or circle of Smaland lies near the gulph of Courland, and is celebrated for the vaft quantities of amber which are found upon the coast. The principal places of this province or circle are,

Konigsberg, or Koningsberg, the capital not only of this province, but of the whole kingdom of Prussia; and is situated on the river Pregel, in 54 deg, 42 min. north lat. and 21 deg. 35 min. east long. It is well fortified, has seven bridges over the Pregel, and was sounded by Offocartus, or Premissaus I. king of Bohemia, in the year 1255, when that king came to the affistance of the Teutonic knights against the Pagan Smalanders. It consists properly of three towns, formed by so many branch s of the river, with the respective

fuburbs to each. It is a spacious city, very populous, and contains a great number of streets and houses; but the former are laid out without elegance, and the latter erected without tafte. Here is an academy founded by one of the first dukes of Frussia. There is nothing worth observation in it, except the original safeconduct (pass-port) given by Charles V. to Martin Luther, when he attended the dict of Worms in 1521, and figned by the emperor's hand. This merits prefervation. Koningsberg has a confiderable trade in hemp and flax; but it is feven German, or 35 English miles from Pillaw, the fea-port at the mouth of the river Pregel, fo that only very finall veffels can come up to the town. In the city and fuburbs are many gardens, public and private, which are great embellishments to it. The citadel, called Frederictburg, erected in 1657, is a regular fortification, of a square form, This city was and furrounded by broad ditches. formerly a Hans Town, and its trade is still confiderable; and near the palace is the Collegium Fredericianum. Befides the feveral hospitals and almshouses, here is a charitable fund, from which above 800 perfons receive weekly pentions.

Pillaw is a well fortified town, with an excellent harbour, fituated at the mouth of the bay or lake called the Fresche-Hoff, 30 miles to the west of Koningsberg. The larger veffels, configned to Koningsberg, deliver and take in their cargoes here, as the Fresche-Hoff hath not a fufficient depth of water to carry them up to Koningsberg; hence Pillaw is a place of confiderable trade; and the town and harbour are defended by a strong fort, well planted with cannon. The peninfula in which Pillaw is fituated, is, from its fertility and pleafantness, termed the Paradise of Prussia.

Wogram is a fmall village in the neighbourhood of Pillaw, where flurgeons are boiled and packed up, and caviare is made of their roes; the greatest part being

exported to England.

The Curische Nerung, or peninsula Curonensis, a narrow flip of land, which feparates the Baltic Sea from the bay called Curifche-Hoff, is a barren, narrow, fandy track, of which a late traveller thus makes mention. "The road lies over a fpit of fand about 83 miles in length, and not more than a fingle one in breadth in many places; and in none does it exceed three. This extraordinary bank of fand terminates a little to the northward of the town (Koningtberg) from which it is separated by a haven of near half a mile in breadth. When the weather is fine, and the fea fmooth, one may drive along with great pleafure, as the fands, close to the margin of the water, are hard and firm. Unhappily for me, it not only blew very hard, but the wind being westerly, drove the waves a long way higher on the beach than usual. I landed-on the fand about two in the afternoon, and reached the first post-house, as night closed in. A more terrible one I hardly ever remember: it not only rained without intermission, but the wind, which had increased the whole day, blew a hurricane. The sea being driven by its sury a long way beyond the ufual bounds, compelled the postillions to drive through the very furf, which many times completely covered the fore wheels of the carriage, and roared like thunder in my ears. In fuch a fituation I could not take much repole, and more than once apprehended I thould have been inevitably overturned into the fea; the fides of the little fand hills, which bound the thore, being to fliclving and fleep, that it was with the utmost precaution and care the carriage was prevented from turning over. Morning came most welcome after such a night; and about eight o'clock I got to a miferable naity hovel called an inn, where I found the poor inhabitants employed in boiling pumpkins, which appeared to be one chief article of their food. The women looked more like witches than ruman creatures, without any fort of head-drefs except their hair, and were fearcely covered to the knees. Here, among horfes, in a large stable, I took my breakfast very composedly. I reached the southern

termination of the Sound, where it joins the continent, about noon, and gladly found myfelf once more on firm ground, after having driven two and twenty hours along the shore of the Baltic, and often amidst its very wayts.'

Great and Little Frederick's canals, fituated near Walau, at the conflux of the Pregel and Alle, much facilitate the inland navigation of the kingdom. They belonged to the Waldenburg family till the year 1713, when the king of Pruffia purchased the property of the

canals, and their respective tolls.

The province, or circle of Nantangan, adjoins to Smaland, is fertile and populous, and contains the fol-

lowing places:

Angerburg, which is furrounded by palifadoes, and defended by a ftrong castle, situated on a lake, where the river Angerhap has its fource, is celebrated only for its church, which is capacious, beautiful, and well

Raftenburg, a handfome town, with a caftle on the river Guleer, is enclosed with a wall and rampart.

Gardawen, on the river Omet, has two caftles to defend it, and an elegant palace with fine gardens. It was founded in 1325; and in its vicinity is a lake, which contained a floating island that once afforded pasturage for an hundred head of cattle; but now it is feparated, and the respective parts daily diminish by the washing of the waters. As the neighbouring people pretended to prognosticate the nature of approaching weather from the motions of this island, it was termed the Gardawen Almanac.

The province, or circle of Oberland, is fertile, but less populous than it has been. It contains the follow-

ing places:

Ofterode, remarkable only for its falt-works. Holland is a well fortified, handfome town, near the river Weefke. It is defended by a castle, and has a free fishery on the Drausen lake; contains some excellent falt-works, a magazine for corn, forage, &c. and has feveral fine feats in its neighbourhood.

Mohrungen is a well fortified town.

Marienwarden is a confiderable town, neatly built, and pleafantly tituated near the Viftula, and on the borders of Pomerania. The cathedral is a stately Gothic structure, and the palace not much inferior. The trade is confiderable, and the falt-works important; and for corn and forage there is a great magazine. The czar Peter the Great had an interview with Frederick I. king of Prussia, at this place, in the year

The province of Little Lithuania is 144 miles in length, and, in general, about 50 in breadth. It is very woody, and was almost depopulated by the peftilence in 1710; but king Frederick William restored it, by encouraging a great number of foreigners to fettle in it, fince when it has been extremely well cultivated, and abounds with all the necessaries of life.

Memel is a well fortified town, on the lake Curifche-Hoff, about 80 miles from Koningsberg. The trade, which is confiderable, confifts chiefly in flax, linfeed, thread, and hemp. Here are likewise a brewery, and a foap manufactory, with a falt factory, royal magazine, and a strong citadel to defend the whole.

Tilset is famed for the cattle fed, and the excellent butter made in its neighbourhood. This town contains a falt factory, and is defended by a castle.

Infterburg is a town fituated at the conflux of the Infter, with the Angerhap, is defended by a castle, contains a grainery, falt factory, and high court, and has a considerable trade for beer and corn.

Stallupehenen is a fmall new built town, with a charter granted in the year 1722. The inhabitants carry on a great trade in cattle; but wood is fcarce, and fresh water scarcer still.

Ragnit is a fmall town, furrounded by pallifadoes, and defended by a strong castle.

the electorate of Saxony, on the fouth. Its length is [] 200 miles, and its greatest breadth about 100. In winter the climate is exceedingly cold, and the foil in general not fruitful, as it is, in a great measure, fandy; though under the late reigns a variety of methods have been taken to improve it. The chief productions are buck-wheat, millet, flax, woad, tobacco, herbs, allum, falt-petre, amber, iron, ftone, &c. Abundance of cattle and fheep are bred here; and the woods not only fupply the inhabitants with fuel, but with timber, charcoal, tar, and wood-afhes, not only for domestic uses. The filk manufactory is likewife but exportation. carried on here with great fuccefs.

The principal rivers of Brandenburg are the Elbe,

Warta, Order, Havel, and Spree.

The rivers and lakes abound with fifh, and are united by canals.

His late Pruffian Majesty greatly increased not only the manufactures, but the number of people, villages, and even towns in his dominions, and more particularly in the Brandenburg territories.

The electorate of Brandenburg is divided into three parts, viz. The New Marck, The Middle Marck, and

the Alt or Old Marck.

The climate is very cold, and the winter sharp for feven or eight months; but they have plenty of firing. It is not very fruitful, by reason of its cold and watry foil; but it has large forests abounding with deer. The Old Marck has plenty of herbs and fruits; and the New Marck fome corn and pasture, wherein are fed great flocks of theep, and fome black cattle. They boatt, indeed, in some parts, of their wine; but the Saxons despise it to a proverb. The country people are generally poor. They are much given to drinking and feaffing, yet they are univerfally acknowledged to be very brave. The commodities are chiefly exported by the Elbe and the Oder, betwixt which there is a communication by a canal, which faves their pay-ing toll in the Sound. The country is watered by feveral good rivers; and has many lakes, the chief of which is the Ukerzee, and are the best stocked with fish of any in Germany.

The New Marck is about 100 miles in compass. It belonged to the knights of the Teutonic order till the 13th century, when it was purchased by the Brandenburg family; but they had not peaceable possession of it till the 16th. This division of the Prussian dominions abounds more than any of the others in corn and pasture, and has vineyards on the banks of the Oder, but they are of no great account. Sometimes the boors find here quantities of old coin, and pre-

cious ftones, which they fell for trifles.

The principal places in the New Marck are Custrin, or Kustrim, its capital. It was but a fishing village till 1537, when it was walled with stone, and otherwise fortified, and is accounted the key of the New Marck. Gustavus Adolphus besieged it in vain in 1631. It is strong both by art and nature, being situated in a marsh, at the constux of the Oder and Warta. It has an arfenal well furnished, and a very strong citadel. The burghers have neat houses, well furnished; and the market-place is the best in all the marquifate. Befides the town-council there is a council of the regency, and a court of bailiwick.

Falkenburg is only noted for its ftrong caftle. Diesen is another town with a strong fortress, near the Polish frontier, at the conflux of the rivers Netze and Trage. On the Polish fide it is defended by a large marsh, which reaches almost a musquet-shot from the The fortification is a regular pentagon, with The Swedes took it by the treachery of one town. ditches. of the inhabitants in 1639, but restored it by the peace

Landsperg, on the river Warta, is very conveniently fituated, having a manufacture, which confifts much in

cafting of iron ordnance.

Sunneberg, or Sonneberg, was the refidence of the bailiffs of the order of Malta, till the elector feized it No. 65.

in the 16th century, and assumed the power to present their bailiffs, and dispose of their officers of power.

Schwedt, upon the Oder, is the appendage of one of the fors of the family, who has a pleafant garden and palace here; and from hence Philip, great uncle to the late king of Prussia, was denominated prince of Brandenburg Schwedt.

The Middle Marck lies in the middle of the margifate, and is the largest of the three divisions, containing about 100 miles from the banks of the Elbe to the

Oder The chief towns are

Lebus, on the Oder, which was formerly a bishopric, founded by Miceslaus, the first Christian prince of Poland, about the year 965. It embraced the reformation in 1555; and in 1628, it was united to the dominions of Brandenburg, by the elector, who was its bishop, and, as such, chancellor of the university of Franckfort. The fee, which has fince been fecularized, was fuffragan to the archbishop of Gnesna, in Poland. The town stands between two hills, on one of which are the ruins of the old castle of the bishop, which was burnt.

Franckfort, on the Oder, is about 253 miles northwest of Vienna. The Oder, over which there is a large timber bridge, divides it into two parts. In 1379 the elector Sigismund gave it great privileges, upon its entering into the league of the Hans Towns: and Joachim I. founded an university here in 1506, fupplying it with learned profesfors from Leipsic; fince which time it has bred many learned men. The Protestant religion was established here in 1538. It was once a free and imperial city; but now exempt, and not so important as formerly. Nevertheless it has a confiderable trade, chiefly in linen, cloth and felts, by the Oder, and the canal betwixt that river and the Elbe; and has three great fairs a year. The streets are wide, the houses well built, and the market-place fpacious and ftately. This city has ftood the flock of various revolutions. It was put under the ban of the empire by the emperor Charles IV. and, to pacify him, the inhabitants were forced to pay him down 12,000 marks of filver. In 1631 the Swedes took it by ftorm, when they put all the inhabitants to the fword, to revenge the maffacre of 2000 Swedes, whom the emperor's general, count Tilly, had inhumanly put to death. However, it was reftored to the elector by the peace of Westphalia. Without the gates there are the ruins of an ancient Carthufian monastery, of which Johannes ab Indagine, who is faid to have wrote 300 tracts on various fubjects, was prior.

Munchenburg is a fmall town, inhabited chiefly by the defeendants of those French Protestants who left their country on the repeal of the edict of Nantz.

Furstenwald contains an electoral palace, and is the

feat of a bailiwick.

Berlin is not only the capital of the electorate of Brandenburg, but of the whole Pruffian dominions, and may, with justice, be deemed one of the finest and largest cities of Germany. It is the royal residence, confifts of five towns united together, and has received aftonishing improvements of late years. The ffreets are handsome, long, and capacious. Here are fome very elegant fquares, and many fine palaces. One of the principal public edifices is the royal palace, a predigious pile, but irregular, as it was erected at different times, and by various architects. corated with admirable paintings, and beautiful tapeftry, and furnished with a greater quantity of plate than any other court in Europe. It contains likewise a fine cabinet of rarities, natural and artificial, an excellent collection of medals, a difpenfary, and one of the finest libraries in Europe. Among the other principal structures are the council-house, Calvinist gymnasium, great garrifon church, provincial council-house, Jews fynagogue, and royal magazine. In the last mentioned place a great quantity of rough wool is kept, to be regularly delivered out to poor manufacturers, that it

may be foun and wove, and afterwards dyed and fold by the managers of the Orphan-house at Potzdam, to which charity the profits are appropriated. In Berlin is a fine hospital, in which above 800 children are educated gratis. The Lutheran gymnafium, or School of Athletic Exercises, is situated in the Grey Cloister; and at the King's Gate is the court of cadets, in which young noblemen and gentlemen are instructed in all the exercises necessary to qualify them for a military life. All the above, except the royal palace, are in Berlin, properly fo called. The palace itself is in the quarter called Old Coln; and in the suburbs are the magnificent garden of count Reuffen, the beautiful house and garden called Monbijou, and the house and garden of Belvidere. The hospital of invalids is a stately and magnificent building, and above 1000 perfons are maintained in it, confifting of others and foldiers, with their wives and children; and thefe, befides lodging and fuel, have a certain weekly allowance of money, bread, &c. There are feveral bridges over the river Spree, and, in particular, one which is elegant and magnificent: it confifts of five arches, and has a fine metal statue on it of the great elector Frederick In the magnificent and noble Calvinist church of Old Coln, is the burial-place of the royal family, near which are the riding academy, the royal stables, a school of exercises, and many other buildings, public and private. In the fugar-houses of Berlin as much fugar is refined as ferves the whole Pruffian dominions. Many other manufactures are carried on here, particularly one of porcelain, inferior in no refpect to that of Meissen, except in the paintings. The great population and improvement of this city, as well as other parts of the Prussian dominions, have been ascribed to the emigration and influence of the French refugees, who introduced a variety of arts, manufac-tures, &c. before unknown in the Prussian territories. The canals cut to Berlin from the Havel, the Oder, and the Elbe greatly promote the trade of the city, and fupply the inhabitants with plenty of fish; and as the late king of Pruffia always made a point of embellishing and aggrandizing this metropolis, it is no wonder that it should be the admiration of all who visit it. The following institutions add to the beauty of the capital, as well as to the benefit of the inhabitants, viz. the academy of fciences, the academy of belles lettres, the college of physic annd furgery, the anatomical theatre, the tapestry manufactory, the opera-house, the arfenal, feveral well regulated hospitals, and many Lutheran, Calvinist, and two Roman Catholic churches.

Independent of these there are a variety of pleasant

gardens, walks, &c.

The police of Berlin is well regulated, and the inhabitants more fecure from the depredations of robbers than in most other cities. Round the environs are many pleafant villages, canals, pleafure houses, gardens, &c. Among the palaces in the vicinity, belonging to the fovereign, are those of Schoenhausen and Charlottenburg. The first is about the distance of two miles from Berlin, situated on the river Panka, which

waters its fine gardens.

Charlottenburg stands on the Spree, so that one may go to it in a boat; though the common way is through the park, at the end of the great walk from the new town. When the king is here, all the road hither from Berlin is lighted with lamps on both fides. It was formerly called Lutzenburg, and but a finall village, till the electress wife to Frederick I. charmed with the fituation of it, began to build here; and after her death the works were carried on by the elector, who caufed the place to be called Charlottenburg, in remembrance of his confort, whose name was Sophia Charlotte. This castle, or palace, is one of the most considerable structures in Germany, the apartments being grand and splendid, and the furniture very rich. There is one closet furnished with the choicest porcelain, and another with luftres, a tea table, and all its equipage, of folid gold. It has a fumptuous chapel, adorned on every

fide with gold and painting; and a most beautiful garden next to the river, with one of the most magnificent orangeries in Europe; not only for the number and disposition of its trees, but the greatness of the build-

ing, where they are kept all the winter.

Oranjeburg, so called by its founder Frederick I. n honour of his mother, who was born princefs of Orange, is delightfully fituated near the Spree, about 16 miles north-west of Berlin. The apartments of this palace are grand. The rich furniture has been removed to Berlin; and its fine percelain, which was not to be matched in Europe, passed into the hands of the elector of Saxony. The miles from hence to Berlin, and from thence to Potzdam, are distinguished by mile-stones. Near this seat lies a small city of the same name, furrounded by beautiful meadows, watered and divided by many canals drawn out of the Havel, and bounded by woods, across which are cut several long

Spandaw is of no more note than from being used as

prifon for state criminals.

Brandenburg is a very ancient city, and gave name to, and was formerly the metropolis of the Marquifate. It flands on the banks of the Havel, which divides it into the Old or Upper Town, and that called the New. In the great church are many monuments of princes. The streets of the Upper Town are built cross-ways, and centre in a fine market-place, where is a Statua Rolandina, which was an image fet up in many German cities, as a testimonial of the great privileges granted them by the emperors. This town is well fupplied with fish from a neighbouring lake 10 miles long. It lies in the road from Berlin to Magdeburg; has a confiderable trade, and a garrifon confifting of a battalion of grenadiers. Though it has no fortification except a few round towers along the walls of the New Town, et it is strong by its situation among marshes; and has a hill on one fide covered with vineyards, on the top of which is St. Mary's, an handsome church, formerly one of the richest abbies, and best built churches of Germany. It has two high fquare towers, which are feen a great way off. Though the walls are very ancient, the streets are, for the most part, handsome and regular. The Havel brings great boats hither from the Elbe, with all forts of merchandize, from the towns on that river.

The Alt, or Old Marck, called, by fome authors, The Galilee of Germany, because it abounds in fruits and herbs, is divided into four petty provinces, called Offland on the east, Zurmunland on the west, Angerland on the fouth, and Zenland on the north. Elbe feparates it on the east from Preignitz. The chief

places are

Stendal, or Stendel, a Hans Town, well built, and ftrongly fortified. The courts of civil judicature for the Old Marck are held here. The inhabitants have a pretty good trade in corn and linen cloth, and make a good profit by travellers, it being in the road from Magdeburg and Erfurt, to Hamburg and Lubeck.

Soltwedel is a large town on the west side of Jetze, a little below its conflux with the Dune. This city, and the neighbouring territory, had formerly princes of their own, who did great things against the Huns. It is divided into the old and new Towns. Their chief trade is in beer, which they export. It was an-giently known by the name of Heliopolis.

Gardeleben, or Gardelegen, in Latin Gardelegin, which name fome derive from the pleafent gardens in the neighbourhood, where there is an old fort, called in

their language Iron Jaws.

Tangermund, or Angermund, on the Elbe, at the mouth of the Anger, was first a castle built by the emperor Charles IV. who bought this Marck, and refided here. It fell fometime after into the hands of the dukes of Pomerania, from whom the elector Frederick I. took it in 1420. It is a place of pretty good trade in corn and other commodities, conveyed to Hamburg, and other places, by the Elbe.

Ofterburg is noted for a good corn market.

Werben, in 1631, was taken by the Swedes; after which Gustavus Adolphus ordered the castle, which commands the town, to be built, thinking it might be made one of the strongest places in Germany. In 1636 it was taken by the Imperialists and Saxons, who were forced that same year to surrender it again to the Swedes. Next year the Imperialists retook it; but in 1640, the Brandenburghers got possession of their fort; and, upon a suspension of arms next year, between them and the Swedes, wherein it was agreed that it should be demolished, the elector's peasants pulled it down.

Havelburg, in 946, was made a bishopric, suffragan to Magdeburg, and its bishop resided ar Witstock, a town of Preignitz, but abolished at the reformation; since which the religion here has been Lutheran.

Potzdam is a large town, fituated on an island about four miles to the fouth-west of Berlin. The castle built here first rendered it considerable, fince which the town has continually increased, and received a variety of embellishments. It contains many strait ftreets, with canals in the middle, and trees on each fide. The palace is magnificent, and the houses in the vicinity very beautiful. Before the castle is a square adorned with Roman columns, which hath a very fine garden. The garrifon is exercised in the æra in the front, and near it a large forest paled in for hunting. The forest itself contains a royal feat, with vistas in form of a star. About the town are also many vineyards; and the market-place contains a stately obelifk of variegated Silefian marble, with a pedeftal of white marble, and marble bufts of the kings on each fide. Two thoufand foldiers children are maintained, cloathed, and educated, in the orphan-house. Here is a foundery, manufactories for velvet, filk, gold and filver lace, &c. Several elegant churches, one of which contains a fine fet of chimes; and stables for the horse-guards, of which, with the foot guards, and other battalions, the garrifon confifts.

Not far from Potzdam is the palace of Sans-Souci, on the top of a mountain, from whence there is a delightful landfcape, comprizing a view of the town, neighbouring country, rivers, lakes, woods, viñeyards, groves, &c. The palace, though not very capacious, is magnificent; and the furniture, though not fuperb, elegant. The paintings, flatues, gardens, &c. contribute to make the whole a most delightful place. The small but excellent library is kept in an apartment wainfcoted with codar, and adorned with foliage of gold; and the elevated spot on which the palace is situated, has plantations of vineyards, and is cut into terraces.

Exclusive of the above principal divisions, Brandenburg contains some other inferior districts, circles, and towns, besides several villages, hamlets, &c. All that can be faid, in general, of these is, that some of them have nunneries for ladies of the Protestant profession, and others carry on considerable traffic.

PRUSSIAN POMERANIA is above 200 miles in length, and from 50 to 80 in breadth. The foil, in many parts, is fandy and barren; and the arable lands, near the shore, are frequently overwhelmed with fand; yet, in other parts, there is corn enough both for confumption and export; besides good pastures filled with cattle; and many large woods and forests, which abound with deer, wild boars, hares, foxes, wolves, wild horfes, wild bulls, &c. and fowls of all forts. Here are also beavers; and such plenty of water fowl, that they reckon 20 forts of ducks. They have great plenty of falt and fresh water fish, particularly salmon, and very large lampreys, especially in the bay of Stetin, and lake of Laffen. About Grypfwald and Rugen, they have good herring fishing; and, in the lake Madduje, near Colbatz, there is a large broad fish called Muscum, found no where else in Germany. There are many fair and fertile meadows betwixt the branches of the Oder, and great quantities of fruit of all kinds. They have no wine of their own growth, but excellent mum, and beer of feveral forts, particu-

larly the bitter beer of Stetin, the mum of Grypfwald; and the flout of Wollin, which mariners transport : and as there are scarce any mountains in the country, it has no mines, but some sew of iron in the Upper Pomerania. It abounds with amber, especially on the coasts of Brandenburg Pomerania, where it is not only thrown up by the sea, and found among the sea-weeds and fands, but also dug out of the rocks and mines. There is a particular lake in this country, that communicates with the fea, where they gather it in nets when the sea begins to flow, and sometimes draw up pieces a big as a man's fist. At first taking up it is foft, but foon hardens, by the air, into a ftony fubstance. It is of several colours, white, yellow, black, The fort found in Pomerania is a dark yellow. It is supposed to be an oil distilled from rocks, like petroleum; and that the infects which are fometimes found enclosed in it, are entangled there while it is liquid; and that which is taken in the fea, and in the adjoining lakes and rivers, is broke off from fome rock or vein under ground, by floods and tempests. In fome places it is found in a matrix of wood, which the skilful know at first fight.

The people are reckoned as frout and nimble as any in Germany; but charged, on the other hand, with being intemperate, credulous, and prodigal. The character is given of the ancient inhabitants, that they were ftrangers to deceit or robbery, locked up nothing, were hospitable to all strangers, and so kind to one another, that there were no beggars among them.

that there were no beggars among them.

The nobles of this duchy, as well as the feveral towns, had formerly very particular privileges, which his late Pruflian majefty greatly abridged. The inhabitants are principally of German and Sclavonian defcent, a dialect of the latter being the language of the country. Lutheranism is the established religion; but Calvinists and Roman Catholics are tolerated.

The duchy contains an univerfity, feveral colleges, grammar fchools, &c. Here are feveral manufactories; and great commerce is carried on by means of the Baltic and feveral navigable rivers. It was formerly confidered as divided into Anterior and Hinder Pomerania; but it is most suitable to confider the whole under the distinct heads of Prussian Pomerania, and what hath been usually called Swedish Pomerania; tho all the former, and the greatest part of the latter, belong to the king of Prussia.

In Prussian Pomerania the principal places are as follow:

Stetin, or Old Stetin, a capacious and handfome town, and very strongly fortified, contains many manufactories, hath great trade, and exports prodigious quantities of corn, timber, linen, and naval stores

The profpect of the river, and the islands formed by it, is very agreeable; and the neighbouring hills have a very romantic appearance. The principal buildings are the colleges foreducation, college of physicians, tribunals of justice, board of health, chamber of commerce, court of admiralty, royal gymnatium, or school of exercise, supperintendency, arsenal, castle, free-school, and dock.

Though this town is fituated 40 miles from the fea, fhips of confiderable burden come up to it; and fmaller veffels may go much higher.

The inhabitants are remarkable for their courteous behaviour, and have been celebrated for the valiant defence of their city against the Imperialists, who belieged it four months, in 1659, in vain; and again in 1677, when it held out five months, from July to December, against Frederick William the Great, then elector of Brandenburg; who, after one of the most remarkable sieges that had been known in Europe, whereby most of the city was burnt to the ground, at the expense of an immense quantity of warlike ammunition, and the garrison reduced from 3000 men to 700, was obliged to grant it very honourable terms of capitulation.

The burghers were even more refolute, if poffible, in the defence of the town, than the Swedish gar-

rifon :

nburg, erburg rison: for, on the 15th of August, when most of their ships in the river had been funk and shattered, and the cathedral, with many of the houses, burnt, the elector offered them honourable terms, which they refused. On the 22d, when the town had suffered much more, he took pity of the inhabitants, and made them another offer; but they were obstinate, made it death for any totalk of a furrender, fecured their wives and children in places prepared for them under-ground, and made vigorous fallies, but were repulfed. The 6th of September he fent a trumpeter to forwarn them of their danger, and to offer them larger privileges than they had; but they still refused. He summoned them again on the 22d, after being joined by 8000 Danes, but to no purpose. The elector, having un-dermined their wall, filled the ditch, &c. summoned them again on the 1st of November, and threatened their ruin if they refused his new offers; but they replied they would hold out to the end of the year, and hoped to have the fame terms then: and though the town was in ruins, and 1400 citizens killed, besides soldiers, they continued resolute, and made vigorous sallies. On the 20th, and also on the 30th of that month, there were quarrels betwixt the garrison, which was for capitulating, and the burghers, that opposed it; in which several sell on both sides. The king of Sweden having fent the town a new charter, the elector fummoned them again, December 19, and offered to confirm their new privileges, with an exemption from taxes for many years; but still they refused, and made feveral fallies; but next day, finding no hopes of relief, they proposed an honourable capitulation, which, if not granted, they declared they would die fword in hand, and be buried in the ruins of the city. The elector generously complied, and ratified all the privileges granted them by their new charter: but the burghers, infifting on too high terms for the garrison, hostilities were renewed with vigour on both sides, till the 26th, when they accepted the elector's terms, who, on the 6th of January following, entered the town in triumph. He continued their magistrates, who, with the judges and ministers, swore fealty to him; and, of his own accord, exempted their fifthery from taxes for eight years, on condition that they should rebuild their churches; and he promifed to rebuild the great one himself. He also continued the university, the schools, and religion, as they were. The befieged had a fine train of artillery, but wanted powder, falt, and wood.

Politz is remarkable only for its hop trade.

Anklam, or Anclam, was formerly called Tanglim. Some authors will have it to be the feat of the Angli, mentioned by Tacitus, who advanced from hence to the Elbe, and from thence to the ifland of Great-Britain. It made a good figure once among the Hans Towns. It is advantageoufly fituated amidft good arable lands, and excellent pafture, with the conveniency of fifling, and of exporting their commodities abroad-by the river Pene. It has four parish churches, and a yearly fair on the fecond Sunday after the birth of our lady. It fuffered by feveral fires in the 14th century, when its churches, with a monaftery and a town-houfe, were burnt; but the town was rebuilt with more beauty.

Paffewalck has two parochial, and two other churches. There is an excellent, fort of beer brewed here. It is a provoftfhip, with fpiritual jurifdiction over 10 parifhes. When Pomerania and the Marquifate were under different fovereigns, this place, being on the confines of both, was frequently a bone of

contention.

Gartz, one of the passes of the Order, was walled in 1258, by Barnimus I. duke of Pomerania. It has eight parishes under its jurisdiction, and several yearly tairs. It was a great sufferer during the long wars in Germany; for its situation rendered it always a place of importance to the possessor.

Ukermunde stands where the Uker river falls into

Gross Haff. It was walled in 1190; and Bogislaus III; duke of Pomerania, caused a castle to be built here. In 1469 it was besieged by the elector of Brandenburg, affisted by the Mecklenburgers, but they were obliged to abandon it. There is a fine walk of fair trees from hence through the middle of a great forest, which goes almost 20 miles, and within a league of Stetin.

Dermin has a tolerable trade by means of some neigh-

bouring lakes.

Trepts has three annual fairs, and is defended by a

strong castle.

Stolpe is a fortified town, with an ancient eaftle. Its agreeable fituation, in a valley on a river of the fame name, tempted the dukes of Pomerania to build a caftle here; and therefore some of them are, in several histories, stilled dukes of Stolpe.

At Verchen, on the lake of Cummerio, is a convent

of ladies.

Penkum is a remarkable pleafant town.

Griffenhagen, on the Oder, is pleafantly fituated, and gives name to a circle.

Dam fome time fince fell to decay; but a fteel manufactory, after being established, has, in some mea-

fure, revived it.

The ifle of Usedom is about fix miles in length, abounds with wild boars, deer, and hares, and was the park where the dukes of Pomerania kept their game. In 1630 the Swedes, to the number of 3000, landed here, and took it without refishance; but, in 1637, 2000 Imperialists came upon it by surprize, and put them to the swed; and finding their countrymen were preparing to re-take it with veng ance, they consumed all the provisions that were in the island, and then abandoned it.

The isle of Wollin is 25 miles long, 15 where broadest, and is divided by the Swin from Usedom. The town was built out of the ruins of Julinum, formerly one of the largest cities in Europe, next to Constantinople, being inhabited by Danes, Swedes, Ruisians, Jews, and merchants of all nations, who had their separate streets, and houses of exchange; and faid to have been so powerful, as singly to maintain a war against Denmark, and to have taken its king Suinorte prisoner three several times: but, having been partly destroyed by lightning, and partly by the arms of Woldemar, king of Denmark, it was, in 1170 totally demolithed, and has been but an inconsiderable town ever since, its commerce having been transferred to Lubeck and Dantzick.

Stargard, on the Ihna, is a capacious, handfome town, containing feveral churches, in one of which the Calyinifts are allowed the exercife of their religion. Here are, befides a college, a free-fchool, a houfe of correction, various manufactures, and a confiderable trade. The flreets of this town are crowded with foldiery, and nothing is feen but regiments. The poftilions, the friffeurs, and the very peafants, are all mili-

Camin is a confiderable town, has a foundation for ladies, a provofthip, and three yearly fairs, by which, with its commerce and fisheries, it is likely to become opulent.

Belgarden, or Belgart, is a little town, with a good trade. In fome public acts, it is called Belgrad, and Belgradia. It is a very ancient town, of which we find no certain account till the preaching of the gospel in these parts, which was about the 11th century. It was

heretofore very confiderable, both for the number and valour of its inhabitants; but has greatly fuffered by wars and conflagrations. Near the above-mentioned are feveral towns, or their remains; but none of them

deserve particular description.

Cosin is a very pleasant town, with a good air, and the usual residence of the bishop of Camin. It being but a league from the Baltic, the inhabitants can easily export their corn, and import what commodities they want from abroad. The Frische Hosse lake is a treafure to them; for they often, in the winter, bring up

1000 weight of fish there, at one draught of the net. | It is not only furrounded with the tides at high water, but has a stream called Nesenbach, which turns mills for feveral uses. The adjacent country is fruitful, and interspersed with feveral little hills, on which stood formerly Popish chapels, much frequented by pilgrims. In 1480 it was roughly treated by Bogislaus X. duke of Pomerania, for a mutiny of the inhabitants. Here are a parish church, and two others, one of which, near the caftle, was heretofore a nunnery. There is also a college, which has fent forth some eminent professors. On St. Simon and St. Jude's day, in 1504, the town was burnt down, but foon rebuilt; and in 1535 it fuffered very much by pestilence. Here are three annual

Corlin is the capital of a bailiwick near Belgard, and has a very good castle on the river Persant. At the entrance of the town there is a wooden bridge over a river, formed by the conflux of three smaller ones. is a very pleafant place, and has belonged to the bishops of Camin ever fince 1240. It has two annual In 1643 it held out against a fiege by the 1mfairs. perialifts.

Colberg, or Colburg, is the capital of that part called the duchy of Caffubia, and stands at the mouth of the Perfant, near the Baltic shore. Salt is made here, of which great quantities are fent abroad, to the great emolument of the town, and increase of the revenue of the Prussian monarch, to whom the town came by the treaty of Munster. Its harbour is defended by a strong castle. It hath some trade; contains four churches, one of which is collegiate; has a foundation for ladies, and a grammar school.

Near the above are Frederickfburg, a market-town, which gives name to a bailiwick; Gulzo, a markettown, which gives name to a diffrict; and Naugarten, a fmall town, fituated on a lake, from which a lordship receives its appellation.

SWEDISH POMERANIA comprehends the island of Rugen, which has already been described in our account of Sweden; the island of Hiddensee, which is remarkable only for a light-house; a few smaller islands, of too little importance to merit mention; and fome places on the continent, the principal of which are as

Stralfund, the largest and richest town in Swedish Pomerania, the fixth in rank of the Hans Towns, and a free imperial city, flands near the banks of the fea, over against the island of Rugen. The most authentic account of it is, that being for the most part destroyed, it was magnificently rebuilt, enlarged, and peopled with Germans, by Jaromar, the prince of Rugen, about 1209; and that most of it being afterwards burnt by the Danes, the fituation was altered by his fon about 1230, when it was rebuilt, foon grew populous, and was fortified. In the civil wars of Germany, count Wallenstein, the imperial general, befieged it in vain; not long after which, the citizens put themselves under the protection of Gustavus Adolphus, king of Sweden. The elector of Brandenburg took it in 1678, after deftroying 1500 houses, by bombs, in one night's time. In 1711 the kings of Poland and Denmark besieged it in vain. In 1715 the king of Sweden, Charles XII. arrived here from his long confinement in Turkey, after his defeat at Pultowa, animated the garrifon to hold out a vigorous fiege against the kings of Denmark and Prussia, affisted by the Russians and Saxons; but, not-

linquished again to the Swedes. It enjoys great privileges, the chief of which are, that the magistrates are empowered to determine all causes among themselves without an appeal; to coin money, and raise troops for sea and land service; to make leagues and confederacies for advancing their trade; to chuse what prince of the empire they please for their

withflanding his continually fupplying them with men and provisions from the ifle of Rugen, the town was

forced to furrender on terms, after four months fiege.

It was, however, by the treaty of peace in 1720, re-

protector; and, in case of a naval war by the empire, they are not obliged to venture their ships any farther than is confiftent with the fafety of the city; nor are they obliged to give more than they please in the contributions which the other towns in the duchy are taxed at. It suffered much by a fire in 1680, as well as by fieges, but is now a flourishing city. It lies in a fort of peninfulat formed by the fea and the lake Francken. The fea, from hence to Rugen, is about a mile over; and there are fix gates, with as many bridges, leading to them from the city, to which the merchant ships in the harbour are fastened. On the land side it is regularly fortified with bulwarks and fish-ponds, two musquet-shots in breadth, besides large ditches, and natural marshes, only passable by four causeways and bridges, leading from four gates, and all fortified; which make approaches to it very difficult. It has an excellent haven, where ships come up into the very town; and is so well fituated for trade, that it has a very great and advantageous commerce both by sea and land: for it is to be observed, that here begins the export of those staple commodities which all Europe sends for to the Baltic, as corn, and naval flores, viz. hemp, flax, &c. but especially corn, of which great quantities are exported, this being the first city in the Baltic, to which the Dutch trade for it. Here are also great quantities of honey, wax, tar, pitch, rofin, hides, tallow, and linen, especially carryas, of which a good fort is made here. The streets are broad, and the buildings beautiful, the private houses being of stone, and uniform.

Barth stands on a small bay, 10 miles from Stralfund. It gives name to a fmall principality, and is celebrated for an excellent kind of beer. It is defended by a ftrong caftle; and has a foundation for ladies, first began in

Kenz, a small village in the neighbourhood of Barth, is much frequented for its mineral waters.

Trebesis is an old but important frontier town, with a castle and bailiwick. About the close of the 12th century, Ratibor, duke of Pomerania, took it from the people of Rugen, and converted them to Christianity.

Grieffswalde is fituated at the bottom of a gulph opposite to the isle of Rugen. It is considerable, handformly built, strongly fortified, possesses a good trade, as great privileges, and produces a large revenue. Here are an university, a grammar school, and German feminary; and the three pastors of the town are theological profesfors. In the neighbourhood are falt springs, which are not of any utility for want of fuel. town has a good harbour, with many ships belonging Here are two annual fairs.

Wolgast, a town near the river Pene, has a pretty good trade. It gives name to a county and lordship, as it did anciently to a duchy; and feveral of the dukes of Pomerania are interred in its parochial church.

Grotskow is a town on the river Pene, and a capital of a county of the fame name. Upon the death of its last count without issue, the dukes of Pomerania, to whom it devolved, feized it, and had the investiture thereof by the emperor; but it afterwards belonged to the Swedes, though now to the king of Pruffia.

This town was the first in these parts that received Christianity, upon its being preached by Orton, bishop of Bamberg, called the apostle of Pomerania, who built a church here in the room of its Pagan temple; and it was then a town of some eminence; but it was taken and plundered by the Danes, and the people of Rugen, in 1357; and, after the demolition of its castle, by the inhabitants of Stralfund and Gripfwald, in 1368, it greatly dwindled. Here was once also a collegiate church, on whole fynod feveral parishes depended, as to spiritual jurisdiction, which are now shared between Wolgast and Gripswald; and Grotskow itself depends now on the fynod of Gripfwald.

Loytz stands on the Pene river, between Grotskow and Demain. The Pomeranians took it first from the counts of Grotskow, and afterwards from the princes of Mecklenburg. It has four annual fairs.

In Swedish Pomerania, as in the divisions of the Pruffian dominions in general, are many towns and villages, too inconfiderable to merit infertion.

MAGDEBURG is a level country, watered by the Elbe; in fome places woody, in others marshy or fandy; but, in most parts, so exceedingly rich in falt, as to be capable of fupplying all Germany with that commodity. It was formerly an archbishopric, erected at the request of the emperor Otho I. with subjection to none in spirituals but the pope; and its prelate was primate of all Germany till the reformation, when the canons, having embraced Luther's doctrine, chose the elector of Brandenburg's fon administrator of the archbishopric; after which it remained in the administration of a fecular prince till 1648, when it was established by the treaty of Munster, that, after the death of the then adminiftrator, the whole country should devolve on the elector of Brandenburg as a fecular eftate, and a dukedom. It is accordingly now subject to that elector.

Magdeburg, the capital, stands on the Elbe. It is as ancient a city as most in Germany. The name fignifies Maiden Town, which some ascribe to the worthip paid in it to Venus, till her image and temple were destroyed by order of Charlemagne, who, charmed with its fituation, built St. Stephen's church there, with its treafure, together with a fort, to awe the Saxons. The town was first built about the year 940, by Otho I. who made it imperial, and was enlarged by his empress Edgitha, daughter to our Saxon king Edmund, who, some say, founded it; but others, with more probability, that the received it from him as a part of her dowry in mar-The first tournaments in Germany were appointed here by the emperor Henry the Fowler, to which none were admitted but those of noble extraction,

and unblemished reputation. The fituation of this city is very fine, having an outlet on all fides to spacious plain, that are very fruitful in corn, as well as an inlet of riches by the river Elbe: but there are few towns in Germany that have suffered fo much as this, by war, fieges, ravages, and fire. It was the greatest sufferer in that called the thirty years war; because, for so long a time, Germany was ravaged on all fides: for, in 1631, the emperor's general, count Tilly, took it by ftorm, after a long fiege, maffacred the inhabitants in a most barbarous manner, and burnt and destroyed the whole town, except the cathedral, and a few inconfiderable houses, or rather cottages, of fishermen; fo that 16 churches and chapels, many of them covered with lead, and one with copper, were reduced to ashes; and of 40,000 burghers, not above 400 escaped, and these had no support, the general having ordered his foldiers to spare neither age or fex.

The electors of Brandenburg have fince repaired its fortifications, which having been carried on many years, are very strong. They have also rebuilt one stately church. The Jesuits have also a very sine church; the three religions being tolerated here, according to the treaty of Westphalia; and the town is populous, extensive, and has a flourishing trade. The cathedral, a magnificent structure, built after the English model, was founded in 1210, by Archbishop Albert I. and dedicated (as the former that was burnt) to St Maurice. Here is that called Otho's chapel, where he is represented in Basso Relievo over the altar, with his empress Edgitha, and the figures of 19 casks of gold, which had been ipent by them upon the former cathedral. This church has 49 alters; and the high alter in the choir is of one stone of divers colours, curiously wrought, nine Hamburg ells long, four broad, and one thick. Behind the high altar are the tombs of the emperor Otho, and the empress Edgitha, whose bones were removed hither from the ruins of the old cathedral. In the front of the choir there is a fine marble statue of St. Maurice, the patron of the church, having a shield in one hand, with the Imperial eagle; and, in the other, the standard with which the citizens march to the field in time of war. Among other ornaments are the statues of the five wife virgins smiling, and the five foolish ones lamenting; both well executed. In the ruins of the cloyster of the Augustin friars, in which order Martin Luther was one, there are a chamber, bedstead, and table, which appear, by an infcription over the door, in German verle, to have belonged to that reformer. The elector Frederic I. built a house in this city, which faces the great fquare before the cathedral, and is opposite to the citadel he built, which

is divided from it by the Elbe.

This river brings up a great many merchant thips from Holland, Hamburg, &c. to the quay of Mag-deburg, and forms an island before the town, which has fome works of earth cast up, with several houses, and large wharehouses of fir timber for building ships, that is carried to Hamburg, and there bought up by divers merchants. The ifland is joined both to the country and the town, by two bridges. Over against the town house there is enclosed, in a fort of cage, an equestrian statue, erected by the city in honour of Otho, accompanied with the statues of his two wives, Edgitha and Adelais; and several figures of armed men, holding the arms of his chief hereditary domains. In the great market-place there is the statue of Roland, of the same nature with those Charlemagne caused to be fet up in all the towns which he either founded or repaired. An academy of cadets is erected in this, as well as Berlin, and other towns, where young gentlemen are inftructed in the rudiments of war. The great fquare before the elector's palace, has few equal to it for extent, and fine houses that encompass it, which are all uniform, and three stories high. There is an arfenal full of cannon and small arms; and though not so magnificent as that of Berlin, may be ranked among the chief eliewhere. The chapter of Magdeburg meets in the cathedral, is on the fame footing as before the reformation; and the canons must all prove their nobility; though this is a punctilio with which the elector, who confers all its dignities, sometimes dispenses.

Halle, a large town, received its name from the falt-pits, discovered here previous to the birth of our Saviour, which were bestowed by the emperor Otho the Great, on the archbishopric of Magdeburg. His son, named likewife Otho, gave the place a charter, called it Halle, and made it an imperial city. The town contains four falt springs, many boiling houses, &c. The toll of the falt brings a very confiderable revenue to the king of Prussia. The renters of the boiling houses; are called plarmers, and must be freemen of the city; but the workmen are termed hallers; and these still retain the Sclavonic drefs, cuftoms, manners, language, &c. The principal part of the falt made here is conveyed by the Elbeto Brandenburg, Pomerania, Silefia, Pruffia, Franconia, &c. where it is disposed of by the king's factors. These falt springs, and the university, have rendered Halle a flourishing place. The university was founded in 1694, by Frederic I. king of Pruffia. From that period to the present, the increase of the ftudents has been amazing. They have not only been eminent in point of dignity, but their proficiency in the various departments of the belles lettres.

This univerfity is superior to that of Leipsic, with respect to the abilities of the professors, the discipline of the students, and the cheapness of living. In the tower of Halle are a library, consisting of above 10,000 volumes, a Lutheran and Calvinist gymnasium, a free secular Calvinist nunnery, three Lutheran churches, many Calvinist churches, a Popish chapel, a Jews synagogue, several chapels, hospitals, &c.

The magistrates have large estates, an extensive jurisdiction, great power, and many privileges. The orphan house is a laudible inflitution, and the correction and workhouse are of infinite utility. The inhabitants carry on various manufactories for gloves, ftuffs, fustians, flannel, porcelain, gold, ribbons, metal buttons, filk stockings, woollen stockings, cloths, linen, tobacco pipes, filver, ftarch, red and yellow leather. &c.

In the environs of the town are many plantations of mulberry-trees, for the purpose of feeding filk-worms, and the improvement of the filk manufactory. German language is spoken here in its utmost purity, and the manners of the inhabitants are courteous and

Glauche, near Halle, is in the fame bailiwick, is celebrated for an orphan-house, in which 200 orphans are conftantly maintained and educated, and many other perfons occasionally relieved. In the school are taught Hebrew, Greek, Latin, French, theology, logic, mathematics, phyfic, geography, history, writing, arithmetic, finging, and epistolary correspondence. Here are two finging, and epiftolary correspondence. inspectors, 50 preceptors, a dispensary, laboratory, mu-feum, printing-presses, &c. Exclusive of the preceptors, officers, and orphans, on the foundation, above an hundred other students, and poor scholars, are allowed their dinner and fupper, infomuch that with perfons occasionally admitted, near 700 persons eat together in one large hall. Independent of the above, here are four German schools, under the direction of two inspectors, and 110 preceptors. Near the orphan house is an academy, where young gentlemen are taught at their own expence, every polite and useful branch of erudition.

There are other towns in the duchy of Magdeburg; fome of which have falt fprings, fome coal and copper mines, and others carry on trade and manufactures; but they are, in general, too inconsiderable to merit

particular description. HALBERSTADT is a small province, 30 miles in length, and 35 in breadth, has a good foil, yields plenty of corn, and the forests have store of venison. The largest park is the Hackel, in the middle of the country. The north-west part is full of fens and marshes, through which dykes and roads are cast up towards

Brunswic, Helmstadt, &c. D Halberstadt, its principal town, which gives name to the country, was heretofore an imperial city. It stands on the river Hotheim, or Hotteim, 25 miles fouth-west of Magdeburg. It was made a bishopric by Charlemagne in 780, when the see was transferred hither from Osterwick. Historians give an account of 48 of their bishops, most of them as being of the house of Brunswic, and more remarkable for being soldiers than scholars. Their 15th bishop, Ramhard, defeated the emperor Henry V. in the woods of Welfo. Their 18th, Utric, was routed by Henry the Lion, duke of Brunswic, who took and burnt the town, with the citizens and clergy that fled to the cathedral. Their 29th, Albert of Brunfwic, fought 20 battles, and gained most of them, over his rivals, who were fet up against him by the popes. The 31st was Albert, a great philosopher, who being defeated by Gerard the Eloquent, bishop of Hildesheim, it occasioned a jest here, that rhetoric was too hard for logic. Their 44th, Henry Julius, of Brunswic, was chosen when but two years old, on condition, that the dean and chapter should have the government for 12 years, and pay their infant-bifhop an annuity. In 1591 he introduced Luther's reformation. He was succeeded by his three sons, one after the other; the last of whom, Christian, took part with the Protestants in the civil wars of Germany, and was a great, but unfortunate warrior. Their 48th, and last bishop, was Leopold William, of Austria, who being put in by the Imperialists, restored Popery: but the Swedes, retaking the town, restored Lutheranism, and kept possession of both city and diocese, till the bishopric was fecularized, and given to the elector of Brandenburg by the treaty of Weftphalia; and now it bears

the title of a principality. The town is well built, the streets strait and uniform, and many of the buildings compact and stately: but the most remarkable is an inn, called the Commis, or factory, reckoned the largest in Europe, and to have the best accommodations for strangers; so that in the time of the civil war, Wallenstein, the emperor's general, kept his court in it for some months, and found lodg-

ings in it for all his attendants and guards. The trade here is inconfiderable, by reason of the smallness of the river; but as it is the feat of the regency of the principality, and of the courts of justice, it is much frequented. Its cathedral, which is a free-stone pile, adorned with remarkable statues, belongs to a chapter, wherein the Catholics and Protestants are equally admitted, and both are allowed their public worship. Behind its choir there is an image of the Virgin Mary, with 72 titles of honour. The Catholics have feveral convents in the town, of which that of the Recollects is the most beautiful, and their church is very fine. Upon the whole, it is a ftrong and populous city, has fix gates and a town house. The houses which are on the hill, or about it, are called the town; those below it, the suburbs. On the top of an hill, in an esplanade, stand two churches, with the canons houses.

Gruningen is a fmall town with a large castle, formerly the residence of the bishops of Halberstadt. Here is a curious chapel, gilt all over the infide, with fineg leries, &c. This town gives name to a bailiwick, as does Aschersleben, a town on the Bode, containing a Bene dictine nunnery, and a convent of Augustine monks.

Aschersleben, on the Erne, is the second town in the province, and contains three churches, one of which is common both to Lutherans and Calvinifts.

Weferlingen, on the Aller, is a market town, and contains a Lutheran abbey.

Ermfleben, on the Selke, gives name to a circle and bailiwick. Dardeffen is a walled town on a hill. Zilly is a fmall town which gives name to a bailiwick. Horenburg, on the Iffe, does the fame, and is likewise celebrated for its hop trade. Ofterwick, on the Ilfe, has feveral woollen manufactories: and Reinstein, formerly a

strong castle, gives name to a county and circle.

GLATZ has for its boundaries Silesia, Moravia, and Bohemia, and is separated from them all by mountains almost inacceffible, so that it is a country very difficult to be entered. Its length is about 30 miles, and its breadth 20, beautifully diversified with villages, hills, dales, meadows, fields, ftreams, &c. and produces wheat, pasture, woods quarry-stones, jasper, cornelians, game, fish, pit-coal, marble, topazes, mineral waters, &c. It is watered by feveral streams, particularly the Neyfz; and is, upon the whole, an exceeding fertile and plentiful country.

Since Glatz became subject to Prussia, the diets have been discontinued. It was not conquered by the Prussian monarch, but ceded to him in the year 1742, by the queen of Hungary. For the government of Glatz there is a regency; but an appeal, in either civil or ecclesiastical matters, lies to the courts at Berlin; and the offices are subordinate to the war and domain chambers at Breslaw. The language is German. The principal manufactures are thread and cotton; but the fayourite employments of the inhabitants are tillage and The people, in general, were Roman Catholics, till the country came into the possession of the king of Prussia; since which Lutheranism has been esta-The principal places are the following:

Glatz, the capital, is fituated near the Neyfz, on the declivity of a kill. It is well fortified; contains an old castle, which has been much improved by the Pruffians; and a new one, which they have lately erected. The latter is admirably situated on a hill, opposite to the former, with a river between them. Here are commodious barracks for the garrison; and the adjacent country may be laid under water by means of fluices. The town contains a college, two conveats, feveral churches, and enjoys a tolerable trade. From the fummit of the old citadel the country may be feen, which, as well as the town, has been greatly improved fince the Prussians became possessed of it.

Laudec, on the Biela, contains fome warm baths.

Habelschwerdt is a walled town on the Neysz. Remerz is an open town, remarkable for a mineral fpring, and its manufactures of cloth, plush, and paper.

In this province there is a high mountain, which ferves as a weather-glass to the whole country:

For by the clouds that on its head appear, The wifer swains predict when storms are near; And, from th' appearance of its top, explain When fnows will fall, or tell th' approach of rain.

MINDEN, which was given to the elector of Brandenburg at the treaty of Munster, lies betwixt Osnaburg and Schaumburg, and is 20 miles from east to west, and 25 from north to fouth. The fouthern parts abound with corn, of which they export a great quantity; but the northern are full of woods and hills, and

have plenty of ame.

The capital, of the fame name, is a neat, well fortified town, on the west side of the Weser, 30 miles east of Osnaburg. It was made a bishopric by Charlemagne, and continued to as fuffragan to the archbishop of Cologne, till 1638, when it was fecularized by the treaty In Charlemagne's time a castle was built of Munster. at the foot of its bridge over the Weser, of which some remains, with other antiquities, are yet visible. In 1529 the reformation took place here with fuch vehemence that the chapter was obliged to leave the city; for which the inhabitants were, in 1538, put under the ban of the empire; and in 1547, they were, in confequence, obliged to furrender their town to Charles V. They were almost ever afterwards in continual troubles and revolutions, on the score of religion, during the wars in Germany. The city was taken by the Imperialists under count Tilly, in 1628; and by the duke of Brunswic Lunenburg, in 1634. It was taken the first time by storm, when Tilly put near 3000 men, foldiers and inhabitants, to the sword. In 1636 the Swedes undertook to protect the Protestant inhabitants against the persecution of the chapter, and kept poffestion of it on that account till 1650; when, in pursuance of the treaties of Westphalia, this once imperial city, and one of the Hans Towns also, was delivered to the elector of Brandenburg, who keeps a garrifon here. The majority of the inhabitants are Protestants; but the cathedral, a noble and large, though dark structure, which is faid to have been king Wittikind's palace, who, on his conversion, turned it into a church, is in the possession of the Roman Catholics; as are likewise the churches of St. John and St. Simeon, with a large monastery adjoining to the latter. This place is noted for a particular fort of pale beer, much efteemed in Germany, fomewhat like oat-ale. It is a walled town, defended by fome half-moons, but commanded by a neighbouring hill. It has two chapters, one of canons, and the other of canoneffes, into which the ladies must make proof of their nobility to be ad-

Minden has fuffered greatly by war, and has feveral times been besieged and taken. Upon the plain in its vicinity, a memorable battle was fought between the French, and the confederate army, under prince Ferdinand of Brunfwick, on the 1st of August, 1759. The allies on that day advanced towards the centre of the French army, which was composed almost wholly of horfe; but it was the flower of their cavalry, who anticipated the shock of the allies by beginning the engagement. The brunt of the battle was almost whosly fuftained by the English infantry and some corps of Hanoverians, which stood the reiterated charges of so many bodies of horfe, the strength and glory of the French armies, with a refolution, steadiness, and expertness in their manœuvres, which were never exceeded, or, perhaps, never equalled. They cut to pieces, or entirely routed, these bodies. Two brigades of foot attempted to support them, but they vanished before the English infantry. Waldegrave's and Kingf-

ley's regiments diftinguished themselves in a particular manner this day; nor were their commanders less distinguished. The enemy's horse, which composed their centre, being entirely discomfited, and their right having made no fort of impression, they thought of nothing but a retreat. At this point of time the prince fent orders to lord George Sackville, who commanded the whole British, and several brigades of German cavalry, to advance. But the orders were not fufficiently precise, or they were not sufficiently understood by the English commander; so that during the delay occasioned in waiting for explanations, the critical minute paffed away. The British cavalry lost their share in the glory of the action, and the victory was lefs decifive than it would otherwise have been. The loss of the French, in this action, amounted to about 7000 men, killed, wounded, and taken; among whom were feveral officers of confiderable rank. The lofs of the allies did not exceed 2000, about 1200 of which were English; for as the English had the greatest glory in the action, so they were the greatest sufferers.

Peterihagen was a small village till 1722, when it ob-

tained the privileges of a town. It has a Lutheran church, a brewery, distillery, and is defended by a

Hansberg gives name to a district; has a brewery, diftillery, three vaffals feats, royal farm, and castle. In 1722 it was made a city and magistracy.

Lubeck is a fortified town, inhabited by Lutherans; the magistrates having both civil and criminal jurisdiction within the district. Here are a school, alms-house, fugar-house, chapter-house, &c. The trade consists of cattle, yarn, woollen, linen, beer, and spirits.

RAVENSBURG lies fouth from Ofnaburg and Minden, north-west from Lippe, and north from Rheda, is 38 miles long, and 40 broad. It belongs to the king of Prussia; is mostly rocky and mountainous, and has its name from its capital, which is fituated, together with its ftrong fort, on a hill near the River Heffel, 18 miles fouth of Oinaburg. Here it may be proper to observe, that most of the ancient seats of the German princes and nobility are thus fituated upon hills, which is the reason that fo many counties and lordships of Germany terminate in berg, i. e. a hill; as the reason why so many of its towns end in burg, or borch, is, because both these monofyllables fignify a town. The other towns in this province are

Bielvelt, or Bielseidt, formerly a Hans Town, 10 miles fouth east of Ravensburg, at the bottom of a great hill and defended by the impregnable fort of Sparen-burg. It made a brave refiftance against the French, when they attacked it from a neighbouring hill with granades and fire-balls; for the burghers covered their houses with webs of linen (their chief manufacture) dipped in milk, which prevented their doing much damage. Their linen is bleached on the adjacent hills, where it is watched by boys, who, on the approach of travellers in the night-time, make a hideous howl. The town lies in the road from Minden to Munster.

Hervoden, or Herfurt, is a pleafantly fituated town, and famed for the manufacture of linen, 22 miles foutheast from Osnaburg. It is a pretty large place, and divided into three parts, called the Old Town, the New Town, and Radewich, by the rivers Elfa, Aa, and Werne. It was formerly an imperial city; but it is ill built, and chiefly noted for a famous nunnery founded in 832, the abbefs of which formerly held this city in fubjection, till Anne, countefs of Limburg, and abbeis of this nunnery, gave up the city to William, duke of Juliers, in the year 1547. The estate belonging to it was formerly a county, and converted in the year 790, to the use of a friars convent, where this abbey now stands. It embraced the reformation about two centuries ago; and is, perhaps, the only one of its kind in Europe; because the abbess and all the nuns are Calvinists. One abbess was the learned princess Elizabeth, of the Palatine family, fifter to the princess Sophia of Hanover, whose literary correspondence

with M. Descartes, that great man has published in his works, which thew that the was the miracle of her fex. Confiderable effates, in the neighbourhood of this city, belong to it. There is also another nunnery on a hill, near the town, which is a fort of nursery to the abbey, and where the young ladies are taught needle-work, &c. It was founded in the year 1101, and is under the immediate direction of a deaconess, with a treasuress, and all the officers that belong to collegiate churches; but otherwise subject to the abbess of Hervoden, who, as princess of the empire, has all the hereditary offices common to electors. She has her feat at the diet among the prelates of the Rhine; and the has princes, or counts, for vaffals, who pay her homage, by kneeling at the foot of her throne, in prefenting her with gold and filver. The revenue of this abbey is worth about 3000l. a year. There are no vows, or unreasonable restraints, imposed on the nuns, who commonly are ladies of the first quality. The king of Pruffia, as count of Ravensburg, is protector of the abbey. He has also a garrison in the town.

Engeren, thought to have been the capital of the Angrivari, was the refidence of king Wittikind, who founded the collegiate church of St. Denys, and was buried in it.

Ulotowe, on the Wefer, is the capital of an ancient barony, with a caftle, which was formerly count Waldeck's, and lies convenient for trade.

Schidesche is a small hamlet, with a foundation for 17 Roman Catholic, Lutheran, and Calvinist ladies. Versmold is a small town, where a considerable linen

trade is carried on; and Bunde is another final town, famed likewife for its linen manufactory, and also for a mineral spring.

LINGEN is fituated between the bishoprics of Munfter and Ofnaburg, has a fertile foil, and produces plenty of pit-coal and stone. Calvinism is the established religion; but there are many Lutherans and Roman Catholics. On the death of William III. king of England, the whole country was feized by the king of Prussia, and incorporated with Tecklenburg.

The principal places are Lingen, the metropolis, which flands on the river Ems. It came to William, prince of Orange, by his lady the heirefs. The Ems here is very broad, and bears large veffels, that get into the fea near Embden. It once had a caftle, and other fortifications; but the former was blown up many years ago by the magazine's taking fire; and of the latter there only remain its ditch, and a draw-bridge at each gate. The fands about this place keep the air dry, and free from fogs. King William erected an academy here; befides which he founded five places in a Latin school for poor scholars, and did every thing he could to promote the Protestant religion in this country, which was at that time entirely Popish; but the protestors of it were obliged to have their marriages and baptisms in the Protestant church; and a priest could not lie here one night without leave from the magistrates, as a punishment for the revolt whereto they excited the people about the year 1674, which was suppressed by the prince of Orange in person. There is a good library at the academy, together with a pripting-house.

Rheda is a small town, with a castle, near the Ems: and Ibbenbukren is an inconsiderable town; but near it are quarries of stone, and several coal-pits.

The duchy of CLEVES is, in general, fertile, pleafant, and well watered by the Rhine, Roer, Empfer, Lippe, Islel, &c. Dykes are cut as a fecurity against inundations; and the country abounds in corn, fruits, black cattle, game, fish, and horses.

The inhabitants are fond of trade; and the rivers and lakes afford them many commercial opportunities. The most remarkable places are

Cleves, the metropolis, which has its name from its fituation, being, for the most part, among cliffs, and on the declivity of a hill, between the Rhine and the Maese, in one of the finest countries of Germany. It

is thought, by Cluverius, and others, to have been the ancient Colonia Ulpia Trajana: and over the fouth gate of the town there is an infcription, denoting, that Julius Cæfar founded a castle here; that Augustus garrifoned it; that Ulpius Trajanus made it a colony; and Ælius Adrianus a city. It is now fmall, but pleafant, well built, and well peopled, having feveral fine houses belonging to perfons of quality; but those of the ordinary burghers are mean. The castle is large, delightfully feated on the top of a hill, but irregular, and not very flrong to From an ancient Gothic flructure, called the Swan Tover, there is a noble prospect of the neighbouring country, and, in particular, of the Rhine, which lies three miles from it to the north, and there divides itself into two branches, both commanded by the fort Schenk. There are stately apartments in the castle, which was the palace of their ancient dukes, and where the king of Prussia resides when he comes to the city, which fubfifts chiefly by the refidence of his deputies, who govern the duchy, and by the meeting of the states, who affemble in the castle. The governors of the country, and the magistrates of the city, are Calvinists, and have a large handsome church, besides the chapel of the castle: but the public churches here, and in most parts of the duchy, are in the possession of the Papists, by virtue of an agreement with the dukes of Newburg and Juliers, who was thereupon obliged to allow the Protestants a liberty in their dominions. The river Hel, which runs by the foot of the caftle, is navi-gable, by fmall veffels, to the Rhine. On the weft fide of the city are those called prince Maurice of Naffau's parks, with many pleafant canals, fine water works, grottos, &cc. Above them lies the high hill of Sternerg, from whence may be feen Utrecht, though 50 miles off, with near 40 other cities and great towns, 12 of which are feen through fo many walks cut in the woods. The prince's house stands in a wood on the eaft fide; and, among other rarities, has a noble collection of old Roman urns, and divers other monuments of antiquity. Befides the great church, a monaftery of Capuchins, and another of Franciscans, are the only public buildings in the city. On the road, two leagues from this city, there is the palace of Moiland, where the late king of Pruffia refided in 1734, as he returned from the Imperial army on the Rhine; and from hence to Santen, which is five leagues, there is one continued range of walks.

Emmerick, or Embrick, is a large, rich, beautiful

town, pleafantly fituated on the east fide of the Rhine, four miles east of Cleves; it is very ancient, one of the Hans Towns, and has a pretty good trade. It was formerly possessed by the Dutch; but, on the emperor's perfuation, they refigned it to the duke of Cleves in 600, on condition that the Spaniards should restore Rhinberg to the elector of Cologne; which they not performing, the Dutch repoffessed it, and fortified this, and feveral other towns of the duchy, as a frontier against the Spaniards: but they afterwards restored them to the elector of Brandenburg. It was taken by the French in 1672; but restored, in 1674, to the elector, who had mortgaged it to the Dutch. Over against it, in the Rhine, there is a large ifland, at the corner of which, next to the town, there was a fort, which commanded the river. The governor and magistrates, and many of the burghers, are Calvinists, and have a church here; but the rest are possessed by the Papists according to agreement.

Rees, nine miles higher, on the fame fide of the Rhine, was a fortified town, and taken and reftored by the French in the fame manner as Emmerick, but lately diffmantled. The Protestants have a church here,

where they have preferved an excellent fculpture in gilt

wood, containing the hiltory of the life of Christ.

Santen, 9 miles west of Wesel, and 13 from Cleves, in a valley between hills, half a league from the Rhine, is a large town, so ancient, that Cluverius supposed it to be the Vetera Castra of Tacitus, which was for some time the residence of Julius Cæsar. The place is much

decayed; but has a great church, like a cathedral, with 30 fine altars, and the goldel hiftory carved exquifitely in timber; fine altars, abundance of reliques, and, as the priefts fay, a MS. by \$t. Paul's own hand. The town is walled, but has no fortifications. This was the for the partition of the fuccession of Juliers, Berg, and Cleves, between the families of Brandenburg and

Newburg.

Calcar, on the river Men, between Santen and Cleves, was built and fortified by the dukes of Cleves, for a defence against any sudden invasion from Cologne or Gelderland. It foon grew populous and rich, by a trade in linen: but fince one of its dukes built a vast granary here, for the boors to bring their corn to, it has been more confiderable for making malt and beer. Its most stately buildings are the town house, St. Nicholas's church, and a monastery of Dominicans; the latter of which has a good library. It has a strong castle, and a fine market-place; but the streets are narrow; and it is surrounded with water and morasses. The road from hence to Cleves is through a barren country, in which are fome castles.

Between this town and Santen flands Marienboom, a rich monastery, with a Latin inscription on the wall next the road, expressing their gratitude to Frederick William, elector of Brandenburg, for accepting their great collection of MSS. in 1650, instead of turning them out, and fecularizing their revenues.

Wefel, called Nether Wefel, to diftinguish it from Upper Wesel, in the electorate of Treves, stands on the east fide of the Rhine, near the mouth of the river Lippe, 10 miles east of Santen, and 18 south-east of Cleves. It was formerly a Hans Town, and also im-perial, but exempted, by the dukes of Cleves, from the contributions paid by those towns to the military cheft of the empire, according to the Matricula. It is populous, and well feated for trade. It grew rich by the concourfe of merchants who fled hither from the perfecution in the Spanish Netherlands, and was garrifoned by the Dutch, to whom it was mortgaged by the elector of Brandenburg? but taken and plundered by the French in 1672, when they also exacted heavy contributions from the inhabitants, which forced many of them to retire; but it was reftored, in 1674, to the elector, after the French had difmantled it. the place submits to the king of Prussia as its sovereign, it is governed by its own laws. Both the town, and its two fuburbs, are full of foldiers, and well fortified, after the modern way. As the place has been fortifying during a long space of time, it may well be reckoned one of the strongest towns in Europe. It has a good citadel towards the Rhine; a small harbour for vessels that trade on that river; an arfenal, well flored with al! necessaries for defence or destruction; and feveral churches and monasteries. The porch of the great church is remarkable for the birth of Peregrine Bertie (afterwards earl of Lindsey) whose mother, the duchess dowager of Suffolk, and Mr. Bertie, her hufband, being forced to fly beyond fea, from queen Mary's perfecution, were reduced to fuch difficulties here, because they durft not make themselves known, that they could not get any better accommodation. There is an hofpital in this town, founded, and richly endowed, by a chancellor of this duchy and his fon, for the aged and decrepid. The country from hence to Duisburg is a plain, and a gravelly foil.

Duifburg was formerly an Imperial city, and one of the Hans Towns; has a Protestant university, a commandry of the Teutonic order, two monasteries, a nunnery, and two parish churches, and is well fortified. The other towns in this duchy are inconfiderable.

MEURS is a little principality, watered by the Rhine, and yields plenty of corn, cattle, and venifon. On the death of the last count, and his daughter, Walpurgis, it came to the house of Nassau; and, on the death of William III. king of Great Britain, to the electoral house of Brandenburg. As prince of Meurs, the king of Pruffia has a feat and voice in the college of the princes of the empire, and the diets of the circle. The revenue is confiderable; and the only places of the least note are,

Meurs, or Mors, a compact, fmall, well fortified town, where the provincial colleges hold their meetings. Here is a castle, a Calvinist church, and a Latin

Crefeld is a finall town, defended by a citadel, and contains manufactures of filk, linen, velvet, &c.

MARK is reckoned the largest county in Westphalia, being 40 miles both ways. It is fituated between the Lippe and the Roer, divided into 15 bailiwicks, and fubject to the king of Prussia. It is thought to have its name from being the ancient boundary between Germany and Gallia Belgica. It lies west from the duchy of Westphalia, north from that of Berg, and fouth-east from Clever.

This county in itself is fertile and rich, and yields grain, pulse, fruit, coals, lead, filver, falt, game, flax, hemp, wood, iron, copper, stone, cattle, fish, &c.

The principal manufactures are in iron and fteel. People of all perfuations are tolerated here; and the government is invested in the same colleges as that of Cleves. The principal places are as follow:

Hamm was anciently one of the Hans Towns: but though the adjacent country abounds with corn, hemp, and flax, it is a poor place, that fubfifts chiefly by lodging travellers between Brandenburg, &c. and the Netherlands. It was taken by the French in 1673. but restored next year to the elector of Brandenburg.

Soeft, or Souft, is a populous city, feated in the neck of this county, which shoots into Westphalia; of which circle some reckon it the largest city, except Munster. It is fortified with a double wall, whereon are 30 watch towers, and a large deep ditch. It has 14 parithes, and many churches, befides chapels; one of which is collegiate, and under the jurisdiction of the archbishop of Cologne. It has many privileges, particularly the liberty of hunting and killing venifon in any of the neighbouring counties. It has also a court of judicature within itself, from which there lies no appeal, except to the chamber of Wetzlar. It has as many gates as parishes; but is in so ruinous a state, that very few of the streets are paved. It was taken and plundered in 1622, by Christian, duke of Brunswic; and has fuffered much, at fundry times, by war and fire. Here are feveral convents; and a famous nunnery, in particular, called Paradife. The Lutherans possess two of the parish churches, and a nunnery, which, like other Protestant nunneries in Germany, is a fort of free boarding school, raised on the ancient Popish establishments, where young ladies, generally of the best fa-milies, are educated. Some then their lives in them, but take neither the vow or habit; nor are they tied down to many rules.

Hoerde, on the Empfer, is defended by an old castle, and contains a Lutheran and Calvinist church. The inhabitants are chiefly employed in nail making: and near the town there is a free fecular foundation for an abbefs, and 15 other ladies, partly Protestant, and

partly Roman Catholic. Hagen, on the Volme, is a fmall town, contains a Lutheran, Calvinit, and Roman Catholic church, and a manufacture of Noth. The inhabitants likewise make fword-blades, paper, knives, hammers, charcoal, &c. In the diffrict are found two forts of alabafter, viz. white with red veins, and black with white veins.

Dortmund was one of the Hans Towns, and reckoned the capital of the county of Mark, as it was of its bailiwick, which the lords of it fold to the inhabitants; whereupon, with the emperor's confent, they took the title of an imperial city, which the elector of Brandenburg took away. The religious establishment here is Lutheran. Though it is a small place, it is rich and populous, having a pretty good trade, and communication with the Rhine, by its river Empfer, almost in the middle, between the rivers Lippe and Roer,

Roer, scarce fix miles from both. It has an university, [which was erected in 1543.

Of the other towns in the county of Mark, it may fuffice to observe, that they are small; and their principal trade and manufacture confifts in brafs, iron, and wool.

EAST FRIESLAND, otherwise called the earldom of EMBDEN, was formerly under the protection of the United Provinces of Holland; but they disposed of their right to the late king of Prussia, to whom, and his fucceffor, it has fince that time been subject.

The air of this province is thick and moift, the country low and marfly, and the inundations frequent and dangerous; but the pastures are rich and fertile. Here are abundance of horfes, sheep, horned cattle, &c. The great number of dykes are highly ferviceable to the country, which, however, produces but little corn: but, besides the articles already mentioned, here is plenty of venison, fish, wild and tame fowl, herbs, &c. and the inhabitants are well provided with turf for fuel. The chief river is the Eons. The languages spoken by the people of East Friesland, are High and Low Dutch. The prevailing religion is the Lutheran. The trade is very confiderable in horses, horned cattle, butter, cheese, linen, rape-seed, barley, and wool.

The principal places of this province are the fol-

Embden, fituated on the north fide of the Ems, and on the bay called Dollart, is a rich, large, and populous city, fortified towards the land by a double ditch, regular bulwarks, and baftions; and on the fouth by a ftrong wall, and the river. The ifland Neffa, which lies in the Dollart bay, over against this city, makes the harbour as large and convenient as any on the German coaft. They have also artificial canals, by which they can bring large vessels into the heart of the town; and, by opening their fluices, lay the neighbouring country under water, and render the town inaccessible. Their houses are, in general, neat and high. The town-hall is magnificent. The inhabitants are very industrious, much disposed to trade, zealous afferters of their liberties, and excellent foldiers. They make good provision for their poor, and allow freedom of worship to all but Papists. In 1750 the late king of Prussia established an East-India company here. divided into three parts, the Old Town, the Faldern, The most remarkable buildings are and the Suburbs. the town-house, library, and cathedral.

Norden, fituated about 15 miles diffant from Embden, is a pleafant, well built, and populous town, but not walled in; nor is the harbour deep enough to re-

ceive ships of any great burthen.

Aurich, about ten miles from Embden, is defended by a ftrong caftle, the refidence of the count or prince of East Friefland. This is the place where the supreme court of judicature for this county is held. It is the capital of a little diffrict called Auricherland, which is marshy and full of woods.

Jemgum is an opulent borough, with an harbour on the Ems; Leer, a large, well inhabited town, on the Leda, with a confiderable linen manufactory; and Gretfyhl is a borough town, fituated on the German Ocean, with a strong castle to defend it.

Witmund was formerly a place of good trade, but

is now much decayed.

LIPPE is a county, in general, mountainous and healthy, but has fome arable land. The inhabitants are Calvinifts. Lipstadt, the capital, is a considerable town, which was formerly free and imperial, but now partly fubject to its own counts, and partly to the elector of Brandenburg. The principal places are as follow:

Lemgan, formerly a Hans Town, contains a Lutheran academy, one Calvinist and two Lutheran churches, a palace called Lippehoff, and a foundation for ladies, the abbets of which is always a counters of the house of Lippe.

Detmold, on the Warra, has a ftrong castle; Horn contains a palace; Sabz-Ufflen is celebrated for a faltfpring; Barndorf is a borough, and has a palace Swalenberg has a castle; and Lipperod gives name to

GULICK lies between the Maese and the Rhine, abounds with corn, pafture ground, and cattle, and has an excellent breed of horses. The foil also produces woad, or wad, for dying.

Juliers, or Gulick, the capital, is a fortified town. defended by a caftle, in which was the palace of the

ancient dukes.

The other towns, or rather villages, are not worthy of mention.

TACKLENBURG, in 1560, fell to the counts of Bentheim, and fince to the king of Pruffia. Its capital of the fame name, has a strong castle and a fort.

Before we proceed to describe that part of Gelder-

land in the Netherlands, (which is called Upper Gelderland, and introduced here as belonging to the king of Prussia,) it is necessary to observe, that it is entirely divided from that part which is called Dutch Gelderland; and also confidered as a distinct territory.

Upper Gelderland continued in the possession of the Spaniards after the common-wealth of the United Provinces was fettled; but was conquered by the allies, during the war occasioned by the death of king Charles II. of Spain, about his succession. The king of Prusfia laid claim to it: and, by the treaty of Utrecht, it was agreed, that he should keep the city of Gelder, the prefectorships, towns, boroughs, fiefs, lands, quit and other rents, in that part of the high quarter of Gelderland, which he was actually in poffession of, which was yielded to him, his heirs, and fucceffors, for ever; together with the county of Keffel, and the bailiwick of Krickenbeck. By the barrier treaty, concluded at Antwerp in 1715, the emperor gave up to the States-General for ever, the city of Venlo, with its diffrict, fort St. Michael, fort Stevenswert, with its territories and diffrict, and so much ground as was neceffary to enlarge its fortifications on the other fide of the Maefe. The principal places of Upper Gelderland are the following :

Gelder, 20 miles diftant from Cleves, stands in a plain, on the river Niers, which, dividing itself here into two branches, forms an ifland in which this city is fituated. It receives the Niers into its trenches, lies in the midst of marshes, and is so well fortified in other respects, that it is reckoned one of the strongest places in the Netherlands. It has an ancient castle, formerly the feat of its governors, and is supposed to have been built by Wichard, the first lord of this county, who erected it into a principality, after the death of Charles the Bald. The heirers being afterwards married to Otho, of Nassau, who was created count by the emperor Henry IV. about the year 1069, one of his defcendants was made duke by the emperor Lewis, of Bavaria, in 1339; but his posterity failing, it came to the count of Egmont, who fold it to Charles, duke of Burgundy, by whole daughter it came to the house of Austria. It was taken by the confederates in the beginning of the war in the Low Countries, but betrayed to the Spaniards in 1587. The Dutch belieged it in 1637, 1639, and 1640, but without fuccess. The French feized it in the beginning of the war occasioned by the death of Charles II. of Spain, as before mentioned; but it was retaken by the Pruffians, after a blockade of 15 months and 14 days bombardment. By the treaty of Utrecht, it was yielded to the king of Prussia, in exchange for the principality of Orange, to which he had a right, as heir to king William III. and which the French king had seized upon.

Keffel, a large borough, with a fine caftle, is the capital of a county, or district, which was yielded to the king of Prussia by the same treaty. This borough lies on the Maele, about 13 miles distant from Gelder

to the fouth.

Stralen, about four miles diftant from Gelder, was formerly fortified; but the French having taken it in 1672, demolithed its fortifications. It belongs now

is it was of the inhabinfent, they e elector of tablishment place, it is trade, and ver Empfer, Lippe and Roer,

to the king of Pruffia, and is the capital of a small territory.

Wachtendonck stands on the little river Niers, five miles above Gelder. It is well fortified, but its chief ftrength confifts in the marihes that furround it, and in its ditches, filled with the waters of the Niers. In the beginning of the wars in the Low Countries, it was taken by Lewis, count of Naffau, brother to the prince of Orange, in an hard winter, by marching fome troops over the ice, which the garrison had neglected to break. In 1588 it was furioufly battered by count Mansfield, general of the Spaniards; and it is observed, that bombs were used, for the first time, at this siege: notwithstanding which, the besieged defended themfelves so bravely, that the Spaniards were going to retire, after a three months fiege, when the town was betrayed to them by the governor, just as it was upon the point of being relieved.

The principality of Neurchatel, though a part of Switzerland, belongs to Prussia; and is bounded by the bishopric of Basil, and the territory of Biel, towards the north; by the lake Neuschatel towards the east; by the canton of Bern on the south; and by Franche Compte, or Burgundy, on the west; being about twelve leagues in length, from north to south, and six in breadth, from east to west. The air of this country, near the lake, is temperate, but very sharp in the mountainous parts of it. The soil is stony, but produces the best wine in Switzerland; by the sale whereof to foreigners, the natives make great advantages.

The language is French; and the inhabitants refemble that nation more in their manners and customs than the Germans. They are, in a manner, a free independent people, notwithstanding they have always had a prince for their head; for nothing is determined but by the concurrence of the three estates. They have also the privilege of chusing their own magistrates and standard-bearer, and are subject to no taxes but what they lay upon themselves; and the whole country is of the reformed religion, except the two villages of Crefier and Landeron, the inhabitants of which are Roman Catholics. Upon the death of the duchefs of Nemours, the last countess of Neuschatel, as heiress of the house of Longueville, the states of the county were inclined to fubmit themselves to the father of the late king of Pruffia, as heir, by his mother, to the house of Orange, which derived its title to Neufchatel from the marriage of one of its princes with the heirefs of the house of Chalons, the direct sovereign of these two counties. Several competitors also arose at the fame time, who claimed as heirs, in blood, to the house of Longueville; but the states rejected their claim, and adjudged it to the heirs of the house of Chalons, and the king of Prusha accordingly took posfession of it. The chief towns in the county of, Neufchatel, are Neufchatel, the capital, and Landeron.

Neufchatel, called by the Germans Newburg, is fituated at the north-east end of the lake to which it communicates its name, about 20 miles north-west of Bern, and 15 north-west of Friburg. The town is well built, and adorned with several handsome fountains. It is governed by a council of 60 burghers, and enjoys large privileges, among which the most considerable is, that they are comburghers, or fellow-citizens, with the canton of Bern, which is not only their protector, but umpire of all the differences between them and their fovereign; and this canton supported them in their religious and civil rights, while they were under the dominion of Popish princes. The counts of Neufchatel were formerly allied to the cantons of Bern, Lucern, Soleure, and Friburg; but fince the investiture of the king of Prussia, the Popish states do not feem disposed to renew the alliance, and they may be looked upon now as allied only to Bern.

Landeron, fituated near the lake of Biel, is remarkable for the strength of its fituation, and a noble castle, the residence of the prince.

Some parts of SILESIA having been ceded to the late king of Pruffia, and others feized upon by him

at various times, and under different pretences; it may, therefore, upon the whole, with great propriety, be deemed a Pruffian province, and as such described in this place.

Silefia extends, on both fides of the Oder, from the Carpathian mountains, where it rifes, to the borders of Brandenburg. It is separated from Bohemia and Moravia, on the south-west and south, by the mountains called Riffenbergen; and bounded by Poland on the east; Lusatia and part of Bohemia on the west; Brandenburg on the north; and Hungary on the south.

From north-west to south east it is about 225 miles, and about 100 where broadest; but it is much contracted at both ends.

On the fide next to Bohemia there are many barren mountains; but the rest of the country is a good soil, abounding with corn, wine, sweet cane, or galengal, madder, and flax: and on the mountains which divide it from Moravia, are mines of silver, the richest in Germany, which were mortgaged by the emperor Charles VI. upon the advance of money from Great Britain, &c. by the title of the Silesian loans, at five and seven per cent. There are others of copper, lead, iron, quicksilver, salt, salt-petre, and chalk.

quickfilver, falt, falt-petre, and chalk.

The chief mountains are Jottenberg, or the Silefian Weathercock, so called because the neighbouring people prognosticate what weather will ensue from the appearance of its summit. Here are the ruins of an old castle, demolished by the citizens of Breslaw, because it was a shelter for robbers. From this hill they dig a fine dark greenish marble. Gratzberg or Gradisberg, on which duke Frederick built a castle, now a watchtower. Spitsberb, with a beacon, near the former. Georgenberg, in the duchy of Schweidnitz, famous for the Terra Sigillata, first discovered by Montanus, an eminent physician and chymist, who wrote a Latin treatise on its virtues.

The chief river is the Oder, which rifes near a town of that name on the borders of Morayia, and traverses the country from south to north-west. Many smaller rivers rise here, and fall into the Oder, increating it to a large navigable ftream before it patles into Brandenburg. The rivers abound with fresh water fish, as do also the ponds and lakes, especially lampreys, which are taken in vast quantities in the Neiffish lake, &c. The meadows also have cattle, the forests venison, with all the wild and tame beasts and fowl that are in any part of Germany. The number of inhabitants are computed at a million and half. being a mixture of Germans, Moravians, Poles, &c. The language is in some places German, and in others Sclavonic. Since the country fell under the dominion of the Pruffians, no diets have been held; but all the other privileges of the inhabitants have been confirmed to them. The established religion is the Protestant; but Roman Catholics, Jews, Greeks, &c. are tolerated. The principal manufactures are woollens, linens, cottons, thread, hats, glass, gunpowder, and iron

Christianity was planted here, as in Poland, about the end of the 9th, or beginning of the 10th century: but at first the Christians worshipped in private, for fear of their magistrates, till about 965, that the court itself turned to Christianity, when no less than nine bishoprics were erected in this country. Soon after Luther's appearance they embraced the Augiburg confeffion, for which they had a charter granted them by the emperor Rodolph II. in 1609: but Ferdinand II. repealed their charter, and very much restrained the exercife of their religion, which, though reftored by the treaty of Westphalia, was again invaded by the Auftrian family; till Charles XII. king of Sweden, obliged the emperor Joseph to allow it them again, with fresh concessions. Thefe, however, have been virtually revoked, at fome periods subsequent to that time; but now, being under the dominion of a Protestant power, they are fully confirmed in the free exercise of the Protestant religion.

The excise revenue here is only levied in walled towns, and fluctuates; but, in the reft of the duchy, the contributions are fixed, and the same both in peace and war. The whole revenue from Silesia, and the country of Glatz, is very considerable, and managed by the domain offices of Breslaw and Glogaw.

Many Silefians, of the higher rank, have diffinguished themselves for their political and military talents, learning, wit, &c. but the lower class of people are, in general, rather dull. "They have (says a pertinent observer) more of Mars than Mercury in their composition, and their parts are more solid than shining."

Silefia is divided into Upper and Lower, and these are again subdivided into principalities and lordships. Both the property and jurisdiction of some of these belong immediately to the king, and others to his subjects and vassals.

LOWER SILESIA is divided into thirteen principalities, and three lordships, to which we shall attend in due order.

The principality of Breslaw is a pleasant and fruitful country, in the middle of Silesia, lying on both sides of the Oder. Its first duke was Boleslaus, a Polish prince, so created by the emperor Frederick I. in 1163; but the following princes not being able to defend themselves against the Tartars and Poles, were forced to put themselves under the protection of the king of Bohemia, to whom, Buno says, the emperor Frederick II, gave it as a sief of the empire; but it was subject to the house of Austria before its cession to the king of Prussia.

Breflaw, the capital of all Silefia, is fituated at the conflux of the Oder and Olaw, at the diffance of 150 miles north-east of Berlin, and 147 north of Vienna. It is a rich, populous town, and, including the suburbs, of great extent. It contains many large uniform fquares, capacious ftreets, flately public edifices, handsome private houses, &c. The fortifications are of no great importance. Breflaw contains feveral Roman Catholic and Lutheran churches, one for the use of the Calvinists, and another for the Greeks; two fynagogues for the Jews, a college, a palace for the bithop, two Lutheran gymnafiums, or schools of exercise, a noble university, and a magnificent exchange. This city is next in dignity to Berlin and Koningfburg, being the third in rank in all the Pruffian dominions. The magistracy is Lutheran, the trade and manufactures confiderable, and the monasteries and nunneries magnificent and well endowed. Here are likewife feveral good public libraries, two armories, a college of physicians, a mint, &c. Many yearly fairs, excellent markets, and other advantages which it enjoys, induce various foreign merchants to refort hither. The abundance of water is a great convenience to this city. The houles are all built with stone: and there are two islands near it formed by the river Oder, in one of which is a church, the tower of which was burnt by lightning in 1730; and in the other island, called Thinn, the cathedral is fituated. This city was taken by the king of Pruffia in 1741, and retaken by the Austrians in 1757; but they did not keep it long; for the king of Prussia made himself master of it again the same year, and hath retained it ever fince.

he this principality are many other towns and villages, but none deferving of mention, except the village of Leuthen, where, in 1757, the Prussians obtained a fignal victory over the Austrians.

a fignal victory over the Auftrians.

The principality of Brieg is one of the largest and most fruitful in all oblesia. It is watered by the Oder and Olaw, and produces corn, pasture, tobacco, beech, madder, oak ping, from Sc.

and Olaw, and produces corn, pafture, tobacco, beech, madder, oak, ping, flone, &c.

Brieg, between mainy fmall towns, villages, hamlets, &c. contains the fix following places, which give name to as many offices.

Brieg, the capital, which stands on the Oder, is one of the handsomest towns in Silesia, well-fortified, and has a college, where the professors are Lutherans; and

an academy, where the nobility are trained to the liberal arts. The ftreets are uniform, the houses generally of stone; and St. Nicolas's church is a high, stately, old fabric, with two towers. Most of it, except the public buildings, was burnt, by the Hustites, in 1428; and, in 1740, the Prussians obtained a victory over the Austrians, at a little village called Molwitz, near this place.

Olaw, fituated on a river fo called, is defended by a caftle, contains a copper flatting-mill, and is celebrated for the quantity of tobacco raifed in its neighbourhood.

Strehlen has large fuburbs, a manufactory of cloth, and in its neighbourhood a quarry of green marble.

Reichenstein and Silberberg are mine towns, and produce gold, filver, and lead ore.

Creutzburg is defended by a ftrong caftle.

Nimptch, a town, with a castle, on the Lohe, is situated in a commandry belonging to the knights of St. John.

The principality of Schweidnitz has a capital of the same name, on the river Weistritz. It derives its name from the great herds of swine kept here before the forest was cut down in 1070, and has a wild boar for its arms. It is situated on a rising ground, with a view over a delightful and fruitful country. Its walls, which seem to be very ancient, are built of brick, and fortified with ramparts on round towers. Here are a castle, a fine square, and a college of Jesuits, who have a church, one of the largest and finest in Silesia, with a very high tower, and a clock that is heard at a great distance, with chimes that strike the hours. It is beautissed with many other elegant structures, besides its churches; and has an armoury, wherein there is a piece of ordnance of excessive weight.

Striga, one of the towns of this principality, flands on the river Polinitz, and is noted for excellent beer, and that remarkable mineral called Terra Sigillata.

Landshut is a considerable town at the conflux of the Bober and Zeider, having a flourishing linen trade, and giving name to a circle, in which is situated the Cistertian abbey of Grissau, richly endowed. The abbot is vicar-general of Silesia, and wears a mitre.

Reichenbach, on the Peil, is a fmall town, with manufactures of fuftian, canvas, and linen; a commandry of the order of St. John, and a priory dedicated to St. Barbara.

The principality of Jawer, or Jauer, is watered by the river Bober, which rifes in it, and runs through it from north to fouth.

Jawer, its capital, is fituated in a pleafant valley, and a good air, near the rocky mountains which divide Silefia from Bohemia. It is not fo large as Schweidnitz but has ftrong walls with high ramparts, and deep ditches. It has a confiderable church, with a convent of Bernardines, and a great citadel, in which refides the bailiff, or lieutenant, of both the duchies of Jawer and Schweidnitz. There is a fine town-house in the middle of a large square of houses, built with galleries for people to walk under. This capital suffered much by the civil wars in 1648, when the church was burnt down, but has been since rebuilt in a more stately manner.

Bunzlaw, a finall town on the Bober, is noted for a beautiful brown earthen ware, and an excellent quick fpring of a mineral nature.

Lawenberg, on the Bober, contains a Franciscan convent, with a commandry of the order of St. J. hn, and a Lutheran oratory. A darkish kind of amber is found here; and within its circle is a linen manufactory.

Hirochberg is one of the handfomest, largest, and most thriving towns in Silesia, situated at the conflux of the Bober and Zaken. It has a large trade, a great bleachery, and a capital linen manufactory; and in the circle, to which the town gives name, are mines of iron and copper, warm baths, manufactures of linen, glass, silk damasks, &c.

The principality of Lignitz is capacious, fertile, and well watered by feveral rivers, the chief of which is

the Katzbach. It contains many large woods, and is celebrated for producing a fine breed of horses, and

plenty of madder.

Lignitz, the capital, is fituated on the Katzbach, a rivulet, two German miles north from Jawer, and fix west from Breslaw. It was walled round, made a city, and adorned by Boleflaus, the first duke, who resided here about 1170, when it was the chief city of Silefia, next to Breslaw. It was farther beautified and fortified by Boleslaus the Bald. Frederick II. another of its dukes, encompassed it with a ditch in 1532, to secure it against the frequent incursions of the Turks; and Henry XI. augmented the ditch, and made new works to strengthen it. It is, in short, a large town, has a noble caftle, a flately town-house and hospital, and is famous for a victory obtained near it, over the Imperialits, in 1635. In 1741 the Pruffians took it without opposition. It contains several churches, Roman Catholic, Lutheran, &c. a college, a military academy, and the palace of the ancient princes, with the chapel in which they were buried. Here are many meal, fawing, tan, paper, and powder mills, and a confiderable trade in linen and madder.

Goldberg, on the Katzbach, is a confiderable town, which took its name from a gold mine that was formerly worked here, and contains a Franciscan convent, with a commandry of the order of St. John. In the neighbourhood is a hill called Spitzbergen, or the tharp-pointed hill, which, at a diffance, refembles a

pyramid, and is of a green colour.

Luben gives name to a circle, and has a cloth manu-Parchwitz, a fmall town on the Katzbach, has also a manufactory of cloth, and gives name to a

The principality of Wolaw is, in general, woody and marshy, yet has a few corn lands. The rivers are the Katzbach and Oder; and the circles are fix in number, to which the following towns give name.

Wolaw, the capital, containing a Carmelite con-

vent and church, the Ciftertian abbey of Leubus, a palace, and a Lutheran church and school.

Winziz is a fmall town, containing a Roman Catho-

lic church and a school.

Rautden, a fmall open town; Steinau, on the Oder, remarkable for its cloth manufactory; Ratzen, on the Bartich, celebrated for its two mineral fprings; and Herrenstadt, on the same river, which had a Roman Catholic and Lutheran church till 1739, when the whole was burnt down by the Austrians.

The principality of Glogaw is the largest in Lower It is watered by the Oder, Bartich, and Bober; yields abundance of corn, wine, and wood; has several woollen manufactories; and is divided into fix circles, to which the following towns give name.

Glogaw, the capital, has the epithet of Great, to diftinguish it from another town of the same name in Upper Sileiia. It is the feat of feveral courts, offices, &c. has a college, a Lutheran, a Calvinift, and feveral Roman Catholic churches and convents; and is strongly fortified, and well garrifoned. It was taken in 1741 by the Prussians, and its fortifications considerably augmented; and in its circle is a lake, the fishery of which is farmed out, and brings a confiderable fum

Gurau, which, in 1759, was burnt by the Ruffians; Sprottau, at the conflux of the Sprotte and Bober, is remarkable for its iron works; Grunberg, famous for its vineyards; Schuibus, on the Schwemme, important on account of its cloth manufactory and firong castle; and Treystadt, remarkable for a castle, a convent, a Lutheran and Roman Catholic church, a cloth manufactory, and a mill-stone quarry, which belongs folely to the king.

The principality of Neyfz is remarkable for its northern diffricts being more fertile than the fouthern. In some parts of it tobacco is cultivated; and it is watered by the Olaw, the Neyfz, the Billaw, and the Oppa. The principal places are

Ottmachaw, on the Neyfz, where the bishop has a

palace, and a court of regency.

Neyfz flands on the river of its own name, and is noted for a great trade in bed ticking. It is watered also by the river Bielan, and is the ordinary residence of the bishop of Breslaw. It is as large as Lignitz or Brieg, and much more magnificent, with spacious suburbs. Most of the houses are high, and built of free-ftone, forming fine streets and public squares. It is encompassed by a good wall, and a ditch full of water: has feveral churches and convents; is commanded by a fort on a neighbouring hill, erected in 1743, by order of the late king of Prussia, and defended by a strong garrison.

Grotkaw is but a fmall town, and the houses mostly built of timber; but the bishop's palace, the church, and town-hall, are of stone. It has good gates and walls, with a triple ditch. It stands in a fine plain, near a forest, in a good air, and a fruitful soil, between Brieg on the north, and Munfterburg on the fouth-west. It has a large parish church. This town, and west. It has a large parish church. This town, and its principality, were fold, in 1341, by the dukes of Lignitz and Brieg, to the bishop of Breslaw. It has been subject to divers accidents. In 1400, and 1549, it was burnt down; the last time by lightning; so that only the parish church, and a few houses, escaped. In 1438 it was plundered by the Poles. Duke William, of Tropp:u, took it in 1445; and it fuffered very much

in the Swedish war with the empire.

The principality of Oels is fandy and barren, divided into four circles, and has four towns of no importance. The principality of Sagan abounds with wood and iron, and contains but one place of any note, viz.

Sagan, near the frontiers of Lufatia, remarkable for an abbey, a ducal palace, a Lutheran church, a Roman Catholic church, a college, and feveral iron and copper mills.

The principality of Munsterburg is very mountainous; notwithstanding which it yields abundance of grain, flax, hemp, wood, hops, cattle, fleep, &c. It is watered by the Neyíz and Olaw, and contains

Munsterburg, the capital, which stands in a fruitful plain, at the head of the river Olaw, and takes its name from a monaftery built here by the emperor Henry I. who founded the city; but has nothing remarkable, except its old castle, which is a strong fortress, the school, and a handsome town-house.

Henrichau, only remarkable for a Ciftertian abbey; Frankenstein, on the Pauso, which contains a palace, a convent, two churches, a Ciftertian abbey, feveral offices, courts, &c. and Wartha, a little town on the Neyfz, which has a well endowed priory.

The two last principalities are those of Tranchenberg and Carolath, each of which contains two incon-

fiderable towns.

The lordship of Wartenberg contains only Wartenberg, a small town, with a palace, a Roman Catholie, Lutheran, and Calvinist church.

The lordship of Militsh is only remarkable for its large forests, which are the property of the king; and for one town of the same name, which is situated on the Bartich, and contains a Lutheran and a Roman Catholic church.

The lordship of Goschutz is surrounded by the principality of Oels, and contains only two inconfiderable towns.

UPPER SILESIA is divided into fix principalities and one lordship, which are as follow:

The principality of Oppelen is very barren, and full of lakes. The only town of any note is

Oppelen, on the north bank of the Oder. It is the capital of the principality, and contains a college, and feveral convents. In the circle to which it gives name, there is a royal foundery for casting bombs.

The principality of Troppau, watered by the Oppa, is very fertile, and contains

Troppau, on the Oppa, the capital of Upper Silefia. It is a walled town, and contains feveral churches, con-

vents, a college, a palace, &c. and Hildschin, a small | Prussia is generally computed at 120,000. He has a town, walled and fortified.

The principality of Jagerndorf, is likewise fertile, and contains feveral mineral fprings. The principal town is

Jagerndorf, which takes its name from the great number of huntimen that formerly lived in it, there being plenty of game in the neighbouring woods. It is called, by Latin authors, Cornovientis, from its arms, which are a pair of horns betwixt two stones; and were given by Lewis, king of Hungary and Bohemia, to George, marquis of Brandenburg, who built a caftle, and other fortifications, to defend the town; and though dispossessed of it by the civil wars in Germany, kept up his claim to it till the emperor gave him the circle of Schwibus, in Lower Silesia, for an equivalent. From hence the king of Pruffia formed that claim which was a pretence for his invading Silefia.

The principality of Ratibor has a foil tolerably fertile in corn and pasture, and abounds in lakes, ponds, streams, &c. It forms a circle, the inhabitants of which are Poles, or descendants of Poles; and the only place worth naming is Ratisbor on the Oder, which contains feveral convents, a palace, a bridge

over the river, &c. The principality of Teschen is full of lakes, moors, mountains, &c. The only place worth naming is Teschen, a walled town, with a palace, a Lutheran and Roman Catholic church, a college, and two con-

The principality of Bilitz is tolerably fertile, but contains no place worthy of observation.

The lordship of Pless contains only

Pless, a small city, near the river Weissel, with the title of a barony. It is well defended by its rivers and marshes, and has a large castle, which is said to have as many windows as there are days in the year, and flands in a great fquare, encompaffed by handsome houses, inhabited by merchants. The Roman Catholics have a church here, and the Lutherans, who are the majority, another.

That part of Poland which, in the partition, was allotted to the monarch of Prussia, has been already defcribed in our account of the former unhappy kingdom, under the title of Polish Prussia.

Descent, Manusactures, Titular Dignities of the King, Military Forces, Revenues, &c. of Prussia.

THE nobility are, in general, descended from the ancient Germans; but the peafantry are of a mixed breed, and either vaffals to the king or nobles. The manufactures of Pruffia are daily advancing and

improving, particularly those of filk, linen, cloth, camblets, glass, iron, copper, paper, gunpowder,

brafs, &cc.

The king of Pruffia's title runs thus: Frederick William, king of Pruffia, margrave of Brandenburg, of the Holy Roman empire; arch-chamberlain and elector, fovereign and supreme duke of Silesia; sovereign prince of Orange, Neufchatel, and Valengin, of the county of Glatz, Gelder, Magdeburg, Cleves, Juliers, Berg, Stetin, Pomerania, the Caffubi, and Wends, Mecklenburg, and Crossen; duke burgrave of Nuremburg; prince of Halberstadt, Minden, Camin, Wenden, Shwerin, Ratzeburg, East Friesland, and Meurs; count of Hohenstein, Tecklenburg, Lingen, Buren, and Leerdarn; lord of Ravenstein, &c. &c. As an elector he possesses the seventh place; as archchamberlain carries the scepter before the emperor at his coronation; and possesses five voices in the college of princes of the empire.

The royal arms are argent, an eagle displayed sable, crowned, Or, for Pruffia. Azure, the imperial sceptre, Or, for Courland. To these are added the respective arms of the feveral provinces subject to the Prussian

crown.

The number of troops in the pay of the king of

body of 80 squadrons of hustars, each of 130 men, youthful, comely, and well proportioned, collected by emissaries dispersed throughout Europe, and at any ex-

The arms of the huffars are a light mufket and fabre, both which are kept in admirable order. Their cloath. ing is of coarse red cloth, made close to their bodies, and strengthened at the elbows by leather in the shape of a heart. Their breeches are of well dreffed sheepskins; their boots short and light, but the soles of them durable; and their caps are firengthened in the ordinary, fo as to fland a cut. They are the only denomination of foldiers in the Pruffian fervice who have no chaplain. Besides the hussars, the king has a small body of men whom they call hunters, who are reputed the most faithful couriers in the army, and oftentimes have been promoted for their fidelity in hazardous enterprizes. When these hunters are taken prisoners, no quarter is granted on either fide.

The Prussian soldiers, in general, are remarkable for their very short cloathing, which is obviously calcu-

lated for many wife ends.

The king's guards, and fome few other regiments, are cloathed annually; but, in general, the army has new regimentals twice in three years only. Frederick II. required the foldiery to wear white spatterdashes, winter and summer; but his successor, the late king, observing the inconvenience, as well as inclegance, of it, gave his men black for the winter, made of fustian, or a thick kind of linen cloth. The foldiers have also breeches of woollen cloth in this season; whereas in fummer they are of white dimity or linen, which are very light and clean. They observe an uniformity about their heads, by wearing pig-tails, which are eafily kept in repair; and are generally powdered, but always fo when on duty.

Their arms are reputed the largest and most weighty of any in Europe; though some of the fuzileers, who are finaller bodied men, have their arms proportioned. Notwithstanding the great weight of their arms, the tactic art is carried here to the highest persection; and nothing can give more pleasure to those who have any idea of harmony of this fort of motion, than the exercife of the Pruffian foldiers which they go through twice a day. When the weather is bad it is performed under cover, for which proper places are appointed. The least motion of the head, not according to art, is corrected; so that a soldier in this service must apply diligently to his duty or he will pass his time very ill.

Two thirds of the army, according to their establishment, should be composed of foreigners; and this rea-fon, as well as the small number of inhabitants in the Prussian dominions, renders it obvious how difficult it must be to recruit an army: so that however formidable the monarch may appear, if we confider his country as little plentiful in refources of wealth as of inhabitants, that strength must be deemed artificial, in some meafure, which has so great a connection with foreign dependencies.

The pay of a common Prussian soldier is eight groch (fourteen-pence) a week, and of this three-pence is supposed to go in washing and materials for cleaning their arms, for which they are so much distinguished;

but they are allowed bread.

The royal revenue ariles from the produce of the excise, customs, services, and various taxes, which, in Prussia, are numerous and heavy. The dominions are well fituated by nature for trade; and the acquifition of the maritime territories, obtained by the late king, must have greatly increased the revenue, and added to the dignity of the crown of Prussia.

HISTORY OF PRUSSIA.

THE ancient Hiftory of Pruffia, like that of other kingdoms, is enveloped in the mazes of conjecture and fiction. The name of Pruffian was unknown till

the tenth century, and its etymology is very uncertain. The original inhabitants are supposed to have been defcended from the Sclavonians, and appear to have been a brave and warlike people, as they refused to submit to the neighbouring princes, who, on various pretences, attempted to reduce them to flavery. In particular, they made a noble stand against the kings of Poland; and, in the year 1163, the Polish monarch, Boleslaus IV. was by them defeated and flain.

They remained Pagans in opinion, and independent in circumstances, till the time of the crusades, when the German knights of the Teutonic order, about the year 1230, attempted to convert them by force of arms. Several bloody wars enfued, in which the inhabitants of Prussia were almost extirpated by the zealous fury of the Teutonic knights; and the latter having ravaged the country with incredible barbarity, at-

tempted to re-people it with Germans.

In 1466 a treaty was entered into between Casimir IV. king of Poland, and the Teutonic knights, in which it was agreed, that the country now called Polish Prussia, should continue a free province under the protection of the king, and that the knights should possess the remaining part, on condition of acknowledging themselves vassals to Poland. This treaty was, however, foon broken. Another series of bloody wars enfued, and the knights attempted to become independent of the Poles, but their attempts proved abortive.

In 1525 Albert, margrave of Brandenburg, and the last grand master of the Teutonic order, laid aside the habit of his order, embraced Lutheranism, and concluded a peace, and entered into a treaty at Cracow, in which it was stipulated that the margrave should be ac-knowledged duke of the east part of Prussia (which on that account was formerly called Ducal Pruffia) but ftill it was to remain as a fief of Poland. In this manner the fovereignty of the Teutonic order ended in Pruffia, after it had subsisted near 300 years

In the year 1657, the elector Frederick William, of Brandenburg, furnamed the Great, had Ducal Pruffia confirmed to him; and, by the conventions of Welau and Bromberg, it was freed from its vaffalage to Poland; and Cafimir, king of Poland, acknowledged its independency. The late king of Pruffia, in his memoirs of the house of Brandenburg, says, that this Frederick William began hisreign under the most desperate circumstances. "He was (says he) a prince without territories, an elector without power, a fucceffor without inheritance, and just in the flower of his youth, an age which, exposed to the vivacity of passions, renders mankind almost incapable of direction; yet he gave marks of the most confummate wisdom, and of every virtue that could render him worthy of command. This great prince died April 29, 1688, of the dropfy.

Frederick William the Great was fucceeded by his fon Frederick, who was afterwards the first king of Prussia. This great titular alteration was chiefly owing to the influence of the Protestant powers; for as the reformed religion had been introduced into this country by the margrave Albert, and the electors were of that perfuasion, the Protestant interest was made use of to raife Frederick to the dignity of a king, which was effected in 1701; and he was accordingly foon acknowledged as such, not only by the empire of Germany, but by all the other powers of Europe. His grandfon, Frederick III. late king of Pruffia, in the memoirs of his family, gives no very favourable picture of the vir-tues, or high opinion of the abilities, of this prince. He, however, fpeaks warmly in praise of his own fa-ther, Frederick William, who succeeded Frederick 1. king of Prussia, in the year 1713. This prince certainly had great talents, and uncommon courage; but he too frequently exerted both at the expence of that magnanimity and humanity which ever ought to adorn a monarch. He amatled fo much money during his reign, that, at his death, which happened in 1740, he is faid to have left behind him the enormous fum of 7,000,000l. fterling, a treasure which enabled his late fon and fucceffor to purfue the most important plans; and which, joined to his fagacity, courage, and great military talents, raifed him to the utmost consequence in the political scale of Europe.

Frederick III. began his reign January 31, in the year 1740. Nothing remarkable of his early years has been transmitted to us, except that he had then a tafte for literature and the polite arts, and shewed a particular passion for fine breeding and delicacy of manners, in opposition to the inelegant customs that prevailed in his father's court. In particu'ar, his father was fond of drinking to excess, a vice which the fon abominated. This, and other correspondent circumstances, at length determined him to leave his father in a fecret manner, and, as it is generally believed, to retire to the court of England, where he proposed to live under the protection of his uncle (king George II.) till either the death of his father, or fome other occurrence, should remove the difficulties to his return. Whatever the defign was, it is certain that he had concerted it with a young officer of the gens d'armes, named Katte, and two others. The fecret, however, was discovered; and the prince, Katte, and one of the officers were feized; but the other fortunately made his escape. A council of war was appointed to enquire into the conduct of these officers, which affembled at Koppenich. One of them was cathiered, and condemned to three years imprisonment; another, having retired to a foreign country, was outlawed; but with regard to young Katte, the votes were equally divided; one half of his judges were for finding him guilty of death, and the other half were for acquitting him; fo that they were obliged to leave the decision of it to the king. The affair being at this crifis, young Katte wrote a pathetic epiftle to the king, imploring his clemency, but in vain; for the king ordered him to be beheaded. Several perions of diffunction interested themselves in his fate, and tried to fave him. The king, however, remained inexorable, and the unhappy Katte was beheaded. The prince, who had been fecured, was foon afterwards fet at liberty; but, that he might feel the power of a king and father in its utmost rigour, he was, against his will, married to the princes Elizabeth Christina, of Brunfwick Wolfenbuttle. He did not, indeed, oppose the commands of his father, but submissively married the princels, but without professing either esteem or affection for her; and confidering the claim of parental affection as fully fatisfied by the external ceremony, he abstained, during the life of his father, from her bed. Thus feeluded from public bufiness, in contention with his father, in alienation from his wife, his whole time was spent in literary acquisitions and useful speculations. After the death of his father he did an act of justice to his princess, by receiving her as his wife, and acknowledging her as his queen before his whole court. With respect to the wars in which he has been engaged, they are so connected with the political affairs of other countries, that we thall defer a narrative of them till we proceed to our general history of Germany.

This renowned monarch improved the arts of peace, as well as those of war, and diffinguished himself as a poet, philosopher, and legislator. In 1782 he expended an immense sum in establishing factories, settling colonies, relieving diffress, and other laudable purposes, which evinced confummate philanthropy, as well as found policy. He paid the debt of nature, August 17th, 1786, in the 75th year of his age; and was iucceeded on the throne by his nephew, Frederick William, (fon of his deceased brother, William Augustus,) a prince who feems to have imbibed the political tenets, and to inherit the martial prowefs of his celebrated predecessor, the latter of which was conspicuous in his strenuous exertion to vindicate the injured dignity of his royal fifter during the late commotions in Holland. From this and other confiderations, there is reason to anticipate the glories of his reign, which promifes well to his subjects in particular, as well as

the political fystem of Europe in general.

GERMAN EMPIRE.

SECTION I.

Name, Boundaries, Situation, Extent, Soil, Climate; Productions, Vegetable, Animal, and Mineral; Rivers, &c.

THE ancient Germans went under different appellations, as Allemanni, Teytones, &c. which last is said to have been their most antique designation. The Germans, themselves, call their country Teutchland. Great part of modern Germany lay in ancient Gaul; and the word Germany is of itself but modern. The most probable opinion respecting the derivation of it is, that it is compounded of Ger, or Gar, and Man, which, in the ancient Celtic, signifies a warlike man.

This extensive empire is bounded by the German Ocean, and the Baltic, on the north; by Switzerland, and the Alps, on the fouth; by Poland, and Bohemia, on the east; and by France, and the Low Countries, or Netherlands, on the west. It lies between 45 and 55 degrees of north latitude, and 5 and 19 degrees of east longitude. Its length is 600, and breadth 500 miles.

The foil of this country is exceeding fruitful, particularly on the banks of the Rhine and the Danube, where the air is temperate; but in the northern parts it is cold, and the ground lefs fruitful. In those provinces that lie next the sea, and that abound with lakes and rivers, there is plenty of rain. In other parts, where the surface of the earth is drier, there are temperature constitutes and rivers in the same transfer. fometimes confiderable droughts. The north winds from the Baltic, and the bleak mountains of Sweden, bring frosts and fnow: The eastern blasts coming over a vast continent of three or four thousand miles, from China and Japan, bring dry and unwholefome weather: the fouth, in the fummer, brings refreshing breezes from the Alps: but the fourh-west wind, as with us, is both the most frequers and wholesome that blows in Germany. In general, this country, and Poland, are fo like Great Britain, both in climate and foil, that no countries in Europe agree better with Enghish constitutions. Besides great plenty of corn, cattle, fheep, wool, cloth, horfes, fish, &c. the earth affords mines of divers forts of metals and minerals, as iron, bitumen, nitre, ocre, copper, tin, lead, and even filver in some parts; allum, vitriol, quickfilver, falt, coal, &c. In general the furface is even, and though, in fome parts, it is hilly, it is no where mountainous except towards the fouth and fouth-west, where the Alps, and a few mountains in Alface, ferve as boundaries and bulwarks against Italy and France.

Their forests and wastes afford many things, both for the fultenance of the poor, and the luxury of the rich. They yield plenty of wood for fuel and building, and abound with variety of wild fowl, and all forts of venifon. They also feed vast numbers of hogs; and some of them, as the forest of Ardenne, good mutton. The rivers and lakes abound with fish in the utmost variety and perfection. The orchards are full of fruit-trees; and, in the fouthern provinces, there is plenty of the more delicate fort, as peaches, apricots, figs, olives, &c. in perfection. They have rich wines, of which the Rhenish and Moselle, in particular, are exported in vast quantities to foreign nations; and not only equal, but preferable, to some of the wines of Italy. The very mountains of the Alps, on the German fide, are in some places cultivated to the top; and the vallies abound with pastures and vines. In short, no country, perhaps, in the world produces fo great a variety of every thing conducing to the comforts of life as this; though others may exceed it in the goodness of fome particular articles; nevertheless, even of these

No. 67.

they have enough of every fort; and they might still have them in greater perfection, were the inhabitants industrious; or rather did the landed men give encouragement to husbandry and industry. For want of this, the people neither understand, nor take care to manure the foil, or to improve the native treasure of the country; and to this general neglect it is owing, that the sovereign princes in Germany are sufferers, as well as the subjects; and the landlord becomes bankrupt with his tenant: for to this ignorance and discouragement of husbandry, on the one hand, and to the excessive vanity and passion of their great men for foreign luxuries on the other, it may in a great measure be attributed, that Germany exports less, and imports more, than any country, perhaps, in the commercial world.

There is a fort of earth found in Germany called Terra Sigillata, which fome call Terra Lemnia, because it is also brought from the Isle of Lemnos: it is a hard earth, with white, yellow, and red veins, and faid to be an antidote against all kinds of poisons. There are good quarries of marble in Bavaria, Tirol, Liege, and other provinces; and for precious stones, as diamonds, agates, chryftals, jaspers of several colours, fine alabaster, several forts of pearls, turquois, rubies, &c. this country furpaffes most others in Europe, there being vast collections of them in the cabinets of the emperor, the electors of Bavaria, Brandenburg, Hanover, Saxony, and other princes, and of many private men, as well as those which are the ornaments of churches and images. They are dug for the most part out of the mines, and frequently found in the rivers. A remarkable natural curiofity peculiar to Germany, is the Schiefferstein, a blackish, glittering kind of stone or falt, which melted, yields much copper, and some filver. In one part of Saxony these ftones are dug up in the fields. They exhibit a lively representation, by fair copper strokes, of fishes of divers forts, frogs, and other animals, that abound in a neighbouring lake.

The principal rivers of this country are the fol-

lowing:

The Danube, or Donaw, fo called from the Swiftness of the current, rises in the Black Forest in Swa-bia; runs through Swabia and Bavaria to Ratisbon, and thence to Vienna. After dividing Hungary into two parts, it continues its course to Belgrade in Servia, and then proceeding to Turkey, falls into the Black Sea by feveral channels. It is very broad, and has three great cataracts. The Saw Ruffel, or Swine's Snout, near Linitz; fo called from a pointed rock hanging over, which has under it a dangerons whichpool. The Der Strudel, near Greinon, in Austria, where the falling of the water makes a horrid noise. And the Der Wurbel, another very dangerous whirlpool, about a furlong from Der Strudel. The watermen of these parts have a method of passing them without much danger. As foon as this cataract is passed, a man comes on board from a chapel dedicated to St. Nicolas, on the bank of the river, with the faint's picture, and an alms-box for the passengers to throw in something, as an offering to that faint for their deliverance.

This river carries market-boats, &c. of 10 or 15 tons, every week from Ulm to Vienna, which, with the turnings and windings, is a course of about 400 miles. It receives ten other rivers before it comes to Belgrade. It enters Hungary 35 miles beyond Vienna; and, before it leaves Germany, runs about 500 miles; and about 1000 more through Hungary and Turkey in Europe, before it salls into the Black Sea. Its whole course thither, from its sountain, is about 27

and Sile Franconi of confi places.

degrees; which, reckoning 60 miles to a degree, is 1620 miles, without including its turnings and windings, which must make it at least one third more; so that it may well be affirmed to be longer than the Nile, in Egypt, which, in many particulars, it refembles. It has three heads; but which is the true one the German geographers themselves are not agreed. Cluverius, whose authority seems the best in matters of this nature, places it in the Black Forest, at the foot of a little hill, and fays, the fountain is walled in. The waters of this river are always muddy, and whitish; and the channel is kept almost as full in the summer, by the melted fnow from the hills, as by the floods in the winter. Its waters have been found by repeated experiments, to be medicinal, though not to the fame degree as mineral fprings; and, it is faid, that in those places where there are no natural baths, the people bathe with the water of this river warmed. These, with its other virtues, are ascribed to its washing so many mines, and to its faline tinctures, which are so strong, that a fort of falt has been actually made of the water, which has supplied the want of better; yet it is fresh enough for drinking, after it has flood fome hours to fettle.

The Danube abounds with all those fish that are to be found either in our running or standing rivers; and they are generally much larger, but not for sweet as ours. There are feveral fifb in it not common elsewhere, which feem to be of the falt-water kind, and are supposed to come from the Euxine. Of these the most remarkable is the Hanson, a grisly fish, somewhat like our sturgeon, almost as large as a crocodile, some being 18 or 20 feet long. Shoals of them come about the fishermens boats at the found of a trumpet or horn. It is deemed a dainty by the Austrians and Hungarians, and is only to be met with at noblemens tables

The Rhine rifes from two springs in the Alps, which unite eight miles from the city of Coire. foon after dilates itself into a large lake, called the Boden Sea, or lake of Constance; whence, passing westward to Basil, it turns to the north, and runs between Swabia and Alface into the Palatinate, receiving the Neckar at Manheim, and the Maine at Mentz; then it runs to Coblentz, where it receives the Mofelle. It afterwards waters Cologne, and passes on through the duchy of Cleves, receiving the Roer and the Lippe, and other smaller rivers, by the way; and passes into the Netherlands at Schenchenschans, five miles below Cleves, where it is very broad, and its course very fwift: but the navigation of it is interrupted by nine cataracts, the most dangerous whereof are two in Switzerland, one near Schaffhuysen (where the whole river falls 75 feet) and the other near Lauffenburg. Here the watermen either haul their boats ashore, and launch them on the other fide, or else let them down by ropes. The direct course of this river is about 400 miles, and, including turnings, 600.

The Elbe rifes in the mountains near Hirchburg, in Silefia, upon the confines of Bohemia, through which it runs in eleven feveral fprings; which, being united, pass northward, between Milnia and Lusatia, into Saxony. A little below Gluckstadt it divides into two branches, which fall into the German Ocean 60 miles below Hamburg. It is very large and deep at that city; fo that ships of four or five hundred tons ride at anchor in it. The course of this river, which is very winding, is as long as that of the Rhine. It runs above 500 miles through the north of Germany; as the Rhine does through the west, and the Danube through the middle and foutherly parts. The tide runs about 10 miles above Hamburg; and the river is navigable, by fmail veffels, a great way up into Germany; which very much promotes the trade of the country, especially by its communication with the Spree, in the marquifate of Brandenburg, and the Moldaw in Bohemia. As the course of it is very flow, it abounds with such fish as are common in ftanding waters.

The Oder rifes in Moravia; and, after a long cur-

rent through Silefia and Brandenburg, falls into the

Baltic Sea. It runs in a pretty strait course through the north-east part of Germany. It is navigable for fmall veffels a great way above Stetin. Canals are cut betwist this river and the Euce, which had been been mote the trade of the electorate of Brandenburg. Bemote the trade of the electorate of Brandenburg. This river, and the adjoining lakes, are full of fish; the bare customs on the salmon and lampreys, some of which are of a vaft bulk, amounting to a confiderable

The Wefer rifes in the mountains of Thuringeri, runs through Hesse and Westphalia, and empties itielf into the ocean 40 miles below Bremen, within 20 miles of the mouth of the Elbe. It is fo full of fish of feveral forts, that here are some in season for every month.

The Aller runs through the country of Lunenburg, and falls into the Wefer below Verden.

The Maine rifes near the borders of Bohemia, paffes through Franconia, the electorate of Mentz, the fouth part of the principality of Nassau, washes the walls of Frankfort, and other confiderable cities, and falls into the Rhine at Menitz. It is not over-stocked with fish, perhaps on account of its clearness, occasioned by the mines of gold and filver through which it passes, some degree of mud being necessary for the nourishment of all forts of sish.

The Ion is a large river that rifes on the frontiers of Switzerland, runs through Tirol and Bavaria, and falls into the Danube at Paffau. Its course being among the Alps, it cannot be very navigable; and, as it washes several falt-pits and minerals, it cannot abound with fifb.

The vast passion which the Germans have for hunting the wild boar, is affigned as the cause why there are more woods and chases yet standing in Germany than in most other countries. The Hyrcanian forest, which, in Cæsar's time, was nine days journey in length, and fix in breadth, is now cut down in many places, or parcelled out into woods, which go by particular names. Most of the wood are pine, fir, oak, and beech. There is a vast number of forests of less note in every part of this country; almost every count, baron, or gentleman, having a chafe, or park, adorned with pleafurehouses, and stocked with deer, of which there are seven or eight forts, as roebucks, stags, &c. of all sizes and colours, and many of them of a vast growth; plenty of hares, rabbits, foxes, bears, wolves, boars, &c. The forests also abound with wild fowl.

SECTION II.

Grand Divisions of the German empire. Particular Description of the several Circles.

ERMANY was formerly divided into ten great circles; but the circle of Burgundy, or the provinces of the Low Countries, being now detached from the empire, we shall, in describing Germany, confine ourselves to the nine circles as they now subsist, viz.

> Upper Saxony, Lower Saxony, In the north. Weftphalia, Upper Rhine, In the middle. Lower Rhine, Franconia, Auftria, Bavaria, In the fouth. Swabia,

These we shall describe in their respective order, beginning with

THE CIRCLE OF UPPER SAXONY.

THE circle of Upper Saxony is bounded on the west by those of the Upper Rhine and Lower Saxony; on the east by Prossa, and part of Poland ugh for

and Silesia; on the south by Bavaria, Bohemia, and Franconia; and on the north by the Baltic. It is of considerable extent, and contains the following places.

The ELECTORATE of SAXONY.

Saxony, in general, is one of the most fertile countries in all Germany. It yields a righ increase of all kinds of grain and fruits. Hops, flax, tobacco, anile, and woad, are cultivated here. The minerals are of great importance. The porcelain earth is excellent; and the Terra Sigillata (already described) extremely good. The country produces various kinds of marble, and the distinct pieces of precious stones. Vitriol and allum are prepared here. Coal is stug: and the mines of silver, copper, tin, iron, and lead, are very valuable. It likewise abounds in horses, cattle, sheep, venifon, &c. &c.

The principal rivers are the Elbe, Mulde, Pleisse, Schwarze-Elster, Sala, and White-Elster. These rivers, as well as the lakes and rivusets, produce great quantities of fish; and the White-Elster yields abundance of beautiful pearls.

This electorate is, in general, well cultivated and populous. The provincial diets are held every fix years, and the felect diets convened every two years. Lutheranifm is the established religion; though the different branches of the electoral family have usually been Roman Catholics. With regard to ecclesiatical matters, the countries is divided into parishes, subordinate to spiritual inspectors, which latter are all accountable to the ecclesiastical council and upper consistory of Dresden. Roman Catholics and Calvinitis are tolerated in most parts of the electorate. Learning flourishes here, commerce is encouraged, and manufactures in the various branches are arrived at great persection.

Among the electors of the empire the elector of Saxony is the fixth in dignity, and great marshal of the empire. His revenues are very considerable. The whole is divided into circles, which are as follow;

The electoral circle, or duchy of Saxony, is very near 40 miles in length, and almost as many in breadth. The foil is fandy; and it contains the following places.

Wirtemberg, the capital, on the east fide of the Elbe, 55 miles north-west from Dresden. It is the seat of an aulic judicatory, a consistory, a spiritual inspection, and a general superintendency. It is well fortified, and contains an university and a Latin school. Martin Luther first preached here against the Pope's indulgencies; and in the cathedral of All Saints he was buried. The library appertaining to the university, is very valuable; but the Prussians taking the place in 1756, did great damage to the fortifications.

Kemberg is a small town, whose inhabitants are noted for the cultivation of hops. Zahna has a seat and voice in the diets. Schmiedeberg is surrounded, in a romantic manner, by mountains: And Remhards contains a curious laboratory for making mechanical and optical machines, in particular the camera obscura.

By means of which, woods, hills, and dales, appear; Flocks graze the plains, birds wing the filent air. In darken'd rooms, where light can only pass Thro' the small circle of a convex glass, On the white sheet the moving figures rise: The forest waves; clouds float along the skies.

Barby, on the Elbe, is defended by a cattle; Gommern has a cattle and superintendency; Annaburg is a borough town on a little island; Herberg has a woollen and a salt-petre manufactory; and Lichtenburg has an electoral palace with pleasure gardens.

Here e'en rough rocks with tender myrtles bloom, And trodden weeds fend out a rich perfume: Here western gales eternally reside, And all the seasons lavish all their pride; Blossoms, fruits, and flow'rs, together rise, And the whole year in gay consusion lies.

There are many inconfiderable towns in this circle, of which nothing more can be faid, than that they have all a feat and voice in the diets of the empire.

The circle of Thuringia is very fertile, abounding in corn, cattle, sheep, hories, timber, &c. It contains the following places:

Tenftad, which gives name to a bailiwick. Pforte contains a school, where 150 scholars are maintained, and taught gratis; Frawenpriesnitz, a market town; and Treffurt, a town on a hill, near the Werra.

Weisenfels is a handsome town on the Saal. Above the town is a white rock, at the summit of which a fine castle is erected, called Augustusburg. This town likewise contains manusactories of filk and velvet, a Latin school, and a gymnassum, or school of exercise.

The wife, for health, on exercise depend: God never made his works for man to mend.

Rosback is a village, celebrated for the deseat of a formidable army of French and Austrians, in the year 1757, by the late king of Prussia, in its neighbourhood. The other towns and villages of this circle are so very inconsiderable, that they merit not enumerating

The margravate or circle of Meissen is a plentiful country, and its fields are fertile in grain. Its forests furnish plenty of venison, its rivers are full of fish, and its hills abound with minerals. It contains likewise many considerable vineyards, but the wine is not generally admired. Upon the whole, however, it is allowed to be one of the most fruitful and populous districts in Germany; and its inhabitants have universally the character of being the most lively and polished people in the whole empire. The principal places are

the following. Dresden, the capital, not only of Meissen, but of all Saxony, is fituated 67 miles north of Prague, and 210 north-west of Vienna. The name is derived from three lakes in the neighbourhood, which, in the country language, are called Drysen-seen. This city is one of the finest in Germany, with respect to the pleasant-ness of its situation, the beauty of its structures, and the number and magnificence of its embellishments. It was originally fortified by Charlemagne; and, fince his time, the works have been fo greatly augmented and improved by its dukes and electors, that it is now a place of great strength and importance. Many of its parts are defended by a double ditch, and the baltions have flone facings. The houses, which are built of free stone, are lofty and substantial; and the streets are ftrait, spacious, elegantly paved, and well lighted. The cathedral church is a noble structure; and several large squares give the whole city an uncommon air of magnificence. The stone bridge over the Elbe, which divides the city intothe Old and New Town, and confifts of 17 arches, is one of the noblest structures in the universe. At the entrance of New Dresden is a noble building, called the Palace of the Indies: it confifts of three stories, all the apartments of which are filled with the most curious Japan and China wares. All the household goods are Indian; and there is one fet of furniture scarce to be paralleled, which confifts of feathers of various colours, all natural, but in-laid with fo much art, that it might be taken for a fine flowered fattin. A very pleasant garden belongs to this magnificent palace, which runs down to the Elbe, and is adorned with statues of white marble, that were purchased for the late elector at Rome, of the cardinals Annibal and Alexander Albani, nephews to pope Clement XI. besides two noble obelisks, and two very fine fountains. Near the Palace of the Indies stands a magnificent

feat of th

nificent structure, built by the estates of Saxony, for maintaining two companies of cadets, all gentlemen of the country, who are here instructed in the several fciences. In the fame street there is an amphitheatre, or area, for the battles of wild beafts, fuch as lions, tigers, bears, and, in short, all the fiercest animals from the four quarters of the world; of which great numbers are kept for the purpose. Here is a huntinghouse, where bears are kept; with fountains and ponds, in which they wash; and ragged posts round them, by which they climb up to scaffolds on the top, where they dry themselves. Here is a place called the Horn Gallery, which has feveral apartments, painted, with a reprefentation of hunting wild beafts and fowls. In the old town there is a large castle; and some of the fortifications still to be seen, which were made by Charlemagne. In this quarter flands also that called the Prince's Palace, which was formerly a very fine building; but all of it has been confumed by fire, except one part, containing very fine apartments, superbly furnished, and accommodated by the elector to the modern tafte; but they belong only to the elector and electress; for the electoral prince and princess live in a separate palace, which communicates with it by galleries, where the rooms are perfectly well disposed, and adorned with fine paintings.

The elector's palace, or castle, joins to the bridge at the entrance of the New Town. It is an ancient structure, and makes but a mean appearance. The infide, however, far furpaffes the outlide; the apartments being noble, and iplendidly furnished. There is a great gallery, which contains antique bufts, veffels, pictures, and feveral other curiofities: a spacious hall, adorned with fine drawings of cities, pictures of giants, the ha-bits of many nations; and divers large chambers, full of a furprifing collection of rarities, and the greatest curiofities, both of art and nature, especially pictures, of a very great value, and wonderful performances in clock-work. In this palace are two chapels, one for the Roman Catholics, the other for the Lutherans. The first was herecofore a theatre for the operas; but one of the electors turned it into a chapel, on account of the marriage of his only fon with the eldest daughter of the emperor Joseph. The second, which was always the chapel of the Protestant electors of Saxony, he left for the use of his wife, who constantly adhered to that religion. The treasure of it is extremely rich, confifting of veffels, and other moveables, of gold and filver, heretofore confecrated and given to this chapel by the electors. In this palace is the regal treasury, commonly called the Grune Gewolbe, or the Green Vault, composed of three arched rooms, which contain prodigious riches, and shine all over with gold and precious stones; so that it is one of the finest places in the world. Here are feveral fets of brilliant diamonds, rubies, emeralds, pearls, fapphires, and other precious stones; every set is complete, and consists of buttons, buckles, loops for hats, &c. fwords, hangers, fwordbelts, canes, muffs, fnuff-boxes, watches, tweezer-cafes, pocket-books, in short all the jewels that can possibly be imagined, even to the furniture of a horse; and they are ranged with admirable nicety, in cases of crystal.

Near this palace there is a very fine garden, called the Zwinger-Garten, which is Reckoned the Thuilleries of Drefden, though not large enough to deferve the name. It is femicircled, in the shape of a horse-shoe, with magnificent buildings of free-ftone, that form arches; over which there runs an open gallery, that unites three large pavilions, and has balustrades adorned with statues. In the middlemost there is a fine grotto, and green-houses for orange-trees, and the most delicious fruits. The upper story contains a very beautiful faloon, faced with marble and gilded ornaments. The ceiling is magnificent, the windows are of large plate-glass; and the rest of the building, which joins this garden, is of the same magnificence; but seems a little too much encumbered with carved work, which has more of the Gothic than the modern tafte.

In the elector's ftables, and the riding-house, is a great number of exceeding fine horses; and some of all forts of the rarest breed, which have iron racks and copper mangers. There is a curious fountain and pond near them, furrounded with baluftrades, for the horses to water and wash in: and before the stables there is a long arched walk, painted with curious horses; over which there is a gallery, with the pictures of all the dukes and electors of Saxony, in their robes and military habits; particularly the two generals, Hengist and Horfa, under whom the Saxons invaded England, are depicted here, after the romantic manner they are described by our monkish historians. In the chambers over the stables are kept the rich harnesses, and other fumptuous equipages, many of which are the Turkish mode, plated with maffy filver, and adorned with precious stones. Here are a great many curiofities, particularly a gun, which discharges 40 times successively, without intermission; and a filver equestrian statue, which, moved by a fpring carries a cup of wine.

They boast of an arsenal here, with great quantities of all forts of arms, feveral fuits of armour, and coats of mail, in filver and fteel, that have been used by the electors in their wars; and reprefentations of Turkish and Hungarian parties of horfe and foot, wish their commanders at their head, fo contrived as to turn round: but this was stripped by the Prussians in the year 1756. There are five or fix houses here called hotels, which, in Italy, would pass for palaces; but that called the Hotel de Hoym, which is in the occupation of a tamily of that name, is efteemed the most considerable

of them all.

The fuburbs of this city are very extensive, but have no building of confequence, except the palace in the elector's great garden, called the Turkish palace, from

being furnished entirely after the Turkish manner.

The electors have other seats, viz. Pilnitz, Moritzburg, Augustusburg (which lies in the circle of the mountains) and Anneburg.

Within three miles of the city there is a bed or quarry of stones, which according to description, somewhat refembles the Giants Causeway in Ireland. The stones rise about 17 ells above ground, represent columns with feveral corners, and are joined as if done by art. They have from four to feven columns apiece, are smooth on the outlide, look as if they were mixed with iron,

are very weighty, and hard as adamant.

The people of Dressen contend with those of Halle for speaking the best high Dutch. It has been observed of them in general, that there are none more devoted to pleasures; such as plays, masquerades, balls, feasts, running at the ring, races on fledges, tournaments, hunting-matches, &c. of all which they have abundance; and plays and masquerades are free for all people of fashion. The citizens wives are more fociable here than in any town of Germany, and fondly give themselves the air of quality, especially in the article of dress, a luxury which has infected the wives of the mechanics, and even the fervants.

Keffeldorf is a fmall village, near which, in 1745, a bloody engagement was fought between the Saxons and Pruffians, in which the former were defeated with great flaughter.

Still preffing forward to the fight, they broke Thro' flames of fulphur, and a night of fmoke, Till flaughter'd legions fill'd the trench below, And bore their fierce avengers to the foe. High on the works the mingling hofts engage, The battle kindling into tenfold rage; With show'rs of bullets, and with storms of fire. Bombs in full fury, heaps on heaps expire. The western sun now shot a feeble ray, And faintly featter'd the remains of day: Evining approach'd; but, oh! what hofts of foes Were never to behold that ev'ning close.

Dipoldifwalda, Rabenau, Dohna, Gottleuli, and Berggieszhubel, have each a seat and voice in the diets; d

and the latter has a mine office, an acid fpring, and a cold bath.

Liebstadt and Barenstein are both defended by castles; and in the neighbourhood of the latter is a tin mine; New Geyiznig contains a mine office; Hohenstein is a Bohemian fiel; and Neustadt has a linen and stocking manufactory.

Meissen, from whence the marquifate is denominated, was formerly its capital, but is now inconfiderable. It flands 12 miles north-west of Dresden, on a river of its own name, on the left fide of the Elbe, over which it had the best wooden bridge in the empire, till destroyed in the German wars. It was made a bishopric about the middle of the 10th century, but fecularized after the reformation, and subject to the elector ever fince 1581. It lies partly in a valley, and partly on the fide of a hill, on the top of which are the palace, a venerable old pile, in form of a castle, and the cathedral, in which are the tombs of many princes and noblemen. Here was a monastery formerly, which has been converted into a public school, and the revenues applied to the maintenance of the students. In Meissen is an admirable porcelain manufactory, which produces goods esteemed by many to be superior to those brought from India.

Schandau, on the Elbe, has a great trade in timber and corn; Beschosswerda, on the Wesenitz, in white yarn; Stolpen, on the same river, had its castle demolished by the Prussians in 1756; and, in the same year, at the village of Ebenheit, the capitulation was drawn up for the furrender of the Saxon army to the Pruffians.

Hayn, or Haya, on the river Reder, was plundered and burnt, by the Hussites, in 1429, and again burnt in 1538, It was formerly a flourishing town, and the feat of the margraves of Misnia, the remains of whose palace are still to be seen; and before the long wars in Germany, here was a great manufacture of woollen cloth.

Torgaw has a bridge, with stone pillars, on the Elbe. It was built by John Frederick, the elector, in 1535, and beautified with a stately castle. It once had a very flourishing trade, and the electors of Saxony held their diets here; but it was so often harrassed and oppressed by the Swedes in the German wars, that the face of this once fair city is quite changed. The castle, which is adorned with a beautiful church, has feveral very large and noble apartments. There is a fpacious hall, adorned with the pictures of feveral emperors, kings, electors, and other princes: and in another room there are the pictures of their fools, or jefters. In a gallery of this castle there is the genealogy of the Saxon family, with the pictures, arms, and abstract of the lives of its princes.

Mulberg, on the Elbe, is famous for the victory won by Charles V. over the Protestants in 1547, when Frederick, duke of Saxony, was taken by the duke of Alva, who commanded the Spanish auxiliaries. It is the capital of a bailiwick near the forest of Rederwack. Here is an ancient castle, which was a few years ago This was yielded to the elector by the bishop of Meisson, at the same time with the castle of Dreskau, a little below it. Near this place, in 1730, the elector made a grand encampment for a month, which was 12 miles in compass, formed of 28,000 men, and visited by the king of Prussia, and several other princes, besides many other persons of distinction.

Frederickstal has a looking glass manufactory; and Seinstenburg gives name to a bailiwick.

Zeithayn is a village celebrated for having been the feat of the pleasure camp formed by Augustus II. at the expense of 5,000,000 of dollars. On the spot where the camp stood are six large pyramids, erected to commemorate the circumstance.

Konigstein, on the Elbe, has a fustian manufactory, and is defended by an impregnable fortress on the top of a rock. On the fide towards Drefden there are ftrong works, and a triple battery of cannon. castle can neither be undermined, or racked with shot from the adjacent eminences; and, as it contains a well, magazines of all kinds of provisions, pasture and arable land, gardens, &c. &c. it would be impossible to reduce it by blockade. It is the repolitory of the archives, and the place of retreat of the electoral family in times of danger; and, besides, commands the navigation of the Elbe.

As there are, in this circle, as well as throughout the empire, a number of places, so inconsiderable as to afford no one object worthy of note, we pass them over

without mention.

Leipfic stands in a charming fruitful plain, between the rivers Saal and Mudle, abounding with all the necessaries and luxuries of life, particularly large and rich meadows, mowed constantly twice, and sometimes thrice a year; besides pleasant woods, and many fine orchards, with all forts of fruits, there being neither orchards nor gardens within the walls of the city. It is situated at the conflux of three other lesser rivers, the Elster, Pleissa, and Pardo, or Barde, 28 miles northwest of Meissen, 41 west of Dresden, and 238 northwest of Vienna. It is supposed to have been built by the Vandals, about anno 700, and to have derived its name from Lipzk, a lime-tree, with which the country once abounded. It was in this city that, in 1520, Luther disputed with Eckius against the pope's supremacy, and the people soon after adopted reformation priceicles.

tion principles.

This part of the country having been the chief theatre of the long German war, this city was, in two years, taken five feveral times, and last by the Imperialists in 1623, but restored by the treaty of Prague in 1635. It is remarkable for three fignal victories obtained near it by the Swedes over the Imperialists, viz. in 1631, when Gustavus deseated Tilly; in 1641, and in 1642, when the archduke Leopold, and gene ral Picolomini, were defeated by the Swedish admiral Torstenson, who afterwards obliged the town to sur-It is famous also for an university, which was founded in 1409, by Frederick and William, dukes of Saxony, out of a detachment of the scholars from Prague, of whom there came hither not less than 2000 in one day, by reason of the quarrel between the Husfites and Papifts. It has 24 professors in four colleges, wherein the nations are diffinguished by several classes. It has bred many learned men, and been honoured with the dukes of Sleswic and Holstein, Stetin, Pomerania, and Mecklenburg, and other fovereign princes, for its rectors. It is not subject to the elector, but to the town. The library has abundance of MSS. that belonged to the monafteries demolished at the time of the reformation, of which the most valuable, because it is a rarity, perhaps not to be met with elsewhere, is Tretzer's Greek commentary on Homer's Iliad, in excellent preservation. There is a monthly book published here, being a fort of Journal des Scavans, or Memoirs of Literature, containing an account of re-markable pieces in all parts of learning, intituled, Acta Eruditorum Lipsiæ; which shews that physic, anatomy, and the mathematics, are very much cul-tivated, though divinity is their chief study.

The city is the feat of a high court of judicature, where the elector himself is obliged to appear, when summoned. It was first opened about the year 1520, when Augustus, the then elector, established the college, to confilt of a prefident, and fix affesfors; of whom three are civilians, and the other three of the city

council, with a registering clerk.

Some call this city the jewel of the electorate of Saxony, not only for its fine structures, but for the confiderable revenue it yields to its fovereign. The town itself is not large, but populous, with regular streets and stately houses, generally five or six stories, but, about the market-place, eight or nine stories high, substantially built of free-stone, adorned with fine win-dows. The town-house is a noble structure. St. Nicholas's church is the best adorned within of any Lutheran church in Germany. The ground-floors of most of the houses are warehouses, where the merchants store their

No. 67.

their goods for the fairs at New-Year's-Tide, Easter, and Michaelmas, which a vast concourse of merchants attend from the most noted places in Europe, who are exempted from tolls. So many rich curiofities are then brought hither, and there is fo great a vent for them, that an immense fum accrues to the revenue. The German tongue is spoken here with great purity.

The town is fortified with ramparts and a ditch; but they are not of fo much importance as its strong castle of Pleissenburg, on the river Plesse, which, however, when Charles XII, of Sweden, marched into Saxony, in 1706, the elector did not think tenable, and ordered the governor to furrender it, without hazarding

a fiege. The suburbs are very large. The city has four magnificent free-stone gates, at each of which is set up a post, after the manner of the Romans; which kind of polts are at the gates of all the towns, and even of the villages, of the electorate; and from hence they count the leagues, which are divided at the end of every quarter of a mile by other posts, not so large, upon all the great roads, shewing the distances. The gardeners of Leipsic are esteemed the best in Germany, and value themselves upon forcing the products of na-ture more early than others. Their asparagus is delicious, and extraordinary large. This place is par-ticularly remarked for its larks, which are fent all over Germany, Poland, Holland, and Denmark. In the woods are abundance of nightingales, of which great numbers are taken, and kept in cages. There are tolerable good ordinaries here as well as at Drefden: but the provision at the towns and villages in the road betwixt those cities, though so much frequented, is illdreffed, and the houses nasty. There is a remarkable wood in this neighbourhood called Rosendahl, which, in the language of the country, fignifies the Vale of Roses, and consists of 14 walks, all agreeably diversified, with a great meadow in the middle, each walk having

a noble point of view.

Old Ranstadt is the village where the peace was concluded between Augustus, king of Poland, and Charles XI. king of Sweden. Delitzsh is noted for its stocking

manufactory.

Grimmia, on the Mulde, has a school for 100 students, and a superintendency. It gives name to a district, and is noted for manufactories of thread and flannel.

Leisznig is remarkable for its salmon fishery; Dobeln is a manufacturing town; and Rochlitz has a feat and voice in the diets, several manufactories, a ftrong castle, and a superintendency.

The circle of Erzgeburg receives its name from its

mountains, which are rich in mineral ores. The most

confiderable places in it are the following:

Freyberg, the principal mine town on a branch of the Mulde, 13 miles to the fouth-west of Dresden, is strongly fortified. Near the principal church is a chapel, in which many of the electors have been buried; and the town is so pleasantly situated, that there is a Saxon proverb, which may be thus rendered into English;

Did Leipsic's wealth on me depend, My fortune I'd at Freyberg spend.

It is the feat of feveral mine offices, a court of justice, superintendency, &c. In the neighbourhood are several valuable mines of filver, copper, tin, lead, fulphur, vitriol, &c. The wood for the mines is brought down the Mulde from Bohemia. Here is likewife a brewery, a lace and thread manufactory, a bell foundery, a cannon foundery, a gymnasium, and a public library.

Brand is inhabited with miners; Grimthal is the place where the filver is separated from the copper; and

Schopa contains a fmelting-house.

Oedern is a manufacturing town; Chemnitz was once an imperial city, and is now a large town wth a fuperintendency; Fromkenberg has a stuff manufactory,

and gives name to a district; and Mulde gives name to a bailiwick, has manufactories of cloth and leather, and is defended by a castle.

Granaten is a borough town near the wood of Tharaud; Travenstein is a small town with a castle; Rechenberg has a caftle; and Altenberg has a lace manufactory, a tin mine, and a cement spring. It gives name to a bailiwick, in which are several tin, filver, and iron mines, mills, finelting-houses, &c. with an electoral forest and hunting feat.

Soon as Aurora draws away the night, And edges eaftern clouds with rofy light, The healthy huntfman, with a chearful horn, Summons the dogs, and greets the dappled morn; The jocund thunder wakes th' enliven'd hounds; They rouse from sleep, and answer sounds for sounds.

Zoblitz has an iron foundery in its vicinity; and is celebrated for the great quantities of asbestos of divers colours, granites, &c. found in its neighbourhood, which likewife abounds with the ferpent from. This stone is of various colours: the red being the most valuable is claimed by the electors; but all the feveral kinds are worked into various trinkets and utenfils, by the inhabitants.

Wolkenstein, on the Zschopa, contains several small towns, the inhabitants of all which are either em-Wolkenstein, ployed in the lace manufactory, or in mining, as this bailiwick produces great quantities of minerals, of which we shall describe the following.

Alum is either native or factitious. The former fort is, at present, very little known. The latter is usually diffinguished by the name of the country from whence it comes. It is of a very binding nature, and has always been looked upon as a great flyptic. of the ancients had a fmell like aqua-fortis; but the factitious has none at all; and, when placed over the fire in an iron pan, it bubbles up and melts like water. When alum is fet to crystallize, it concretes into a figure with eight fides, which looks like a triangular pyramid, with the angles cut off; infomuch that it is composed of four hexagon surfaces, and four that are triangular. From a chymical analysis it appears, that alum consists of an acid vitriolic salt, and an astringent earth or bole intimately united. Alum is recommended for swellings of the gums, and against fluxions upon the tonsils. When burnt, it will take down proud flesh in wounds and ulcers. It is of no

own proud heir in wounds and dieters. It is of no use internally; only it is fometimes given, with a large portion of nutmeg, for the cure of the ague.

Cobalt is a fossil body, which is heavy, hard, and almost black, not very unlike antimony. It has a sulphureous, nauseous smell, when kindled in the fire; and is commonly mixed with a portion of brafs, and

fometimes of a little filver.

Vitriol is either native or factitious, and, with regard to the colour, is diftinguished into white, blue, and green. White vitriol is made into large lumps, which looks almost like loaf-fugar, and has a sweetish tafte. It is found in mines, where it springs forth from the fides, under the appearance of a woolly substance, which being diffolved in water, must be boiled to a due thickness; and, at last, it will turn into a white mass like fugar. Sometimes there are found in the fame mines pieces of vitriol, which are already crystallized, and appear transparent.

Blue vitriol is dry to the touch, and is formed into blue cryftals, like fapphires, of a rhomboidal form, but flat, and with ten fides. It obtains its fine colour from

copper, and has a pungent tafte.

Green vitrirol is of an herbaceous colour, and has various names, according to the different places from whence it is got. It abounds with iron, from whence it has its colour; and is either in large crystals, of a rhomboidal form, or in pieces composed of crystalline grains, united together, which feel a little oily to the touch. It has a sharp taste. Common

Common fulphur, or brimftone, is either native or factitious, or rather depurated. Native fulphur, commonly called fulphur vivum, is either transparent or The transparent appears like a gem of a gold colour; though fome is met with that is yellowish or greenish. The opaque is usually met with in hard, fold maffes, of a greenish shining colour, or under the form of an ath-colouring clayey glebe, inclining to

Factitious fulphur is prepared feveral ways; for in fome places it is boiled in water; but, in the hot baths, fulphur is raifed in vapours from the water, and fticks to the cover of the spring in hardish lumps, that have the appearance of flour or fulphur; and a great quantity of this is gathered every year. Sometimes it is extracted from a whitish clayey earth; and is as often obtained from the stone called the pyrites.

Arfenic, properly to called, is extracted from the mineral called cobalt. If this be mixed with calcined flints and pot ashes, the mixture, in a very strong fire, will turn into a glass of a blueish colour, that, when reduced to power, is called finalt. In the preparation of this glass a copious smoak is exaled, or rather flowers, which, sticking to the sides of the furnace, and collected together, appear in the form of a white powder, which, put into a crucible, and melted in an exceeding strong fire, turns into a white, heavy, hard, glaffy mass; and this is named white arienic, which is a most dangerous poison. But when to ten parts of the former powder one of fulphur is added, and melted as before, then yellow arfnic will be produced. Again, if two parts of the fulphur are added to ten of the powder, and melted as before, it will turn to a reddiff. mass, which goes by the name of red arsenic.

Stolberg has a cloth manufactory; and Grunhayn gives name to a bailiwick, which contains Enterlein, Zwonitz, and Scholottan, all of them mining towns. The miners here are remarkably civil, and exceedingly fond of shewing the subterraneous wonders of the mines to strangers.

Now those profounder regions they explore, Where metals ripen in vaft cakes of ore. Here, fullen to the fight, at large is spread The dull unweildy mass of lumpish lead: There, glimm'ring in their dawning beds, are feen The more aspiring seeds of sprightly tin.
The copper sparkles next in ruddy streaks, And, in the gloom, betrays its glowing cheeks. The filver then, with bright and burnish'd grace, Youth and a blooming luftre in its face. To th' arms of those more yielding metals flies, And in the folds of their embraces lies. So close they cling, so slubbornly retire, Their love's more vi'lent than the chymist's fire.

Schwargenberg is an ancient town, defended by a caftle, and inhabited by miners and artificers in iron.

Schneeberg, on the Mulde, has a confiderable trade in gold and filver lace, thread, filk, fmalt, &c. Newfladt is a small mine town in its neighbourhood; and Lybenstock is a mine town. The mines not only produce metals, but various kinds of jewels.

Joharm Georgenstadt is a town famous for the mines in its neighbourhood, for a lace manufactory, and for a great quantity of emery made by its inhabitants.

Korchberg has a cloth manufactory; Zíchorlaw a foundery and fmalt mill; Westlau a stuff manufactory; and Criminichau, on the Plessa, a linen and stuff manufactory, with feveral dyers and callico printers.

Zwickau, on the Mulde, has a free school, library, and cattle, called Ofterstein. It was formerly an Imperial city, and had a mint, which was afterwards removed to Dresden. It carries on a great trade in divers valuable articles.

The circle of Vogtland contains the following places:

Oelfnitz, on the Elfter, remarkable for a pearl fifhery. Mark-Neukerchen is inhabited by some of the best mufical instrument-makers in Germany; and Schoneck

Charles IV. in the year 1376.

Plauen, on the Elster, 68 miles from Dresden, is the capital of this circle, and the seat of a superintendency, and defended by an old caftle. This place is fo pleasant, that many persons of opulence retire hither to pass their time in a kind of rural leisure, or to divert that leifure by various innocent amusements.

Keichenback is celebrated for its excellent scarlet

In the circle of Neuftadt is the town of Neuftadt, on the Orra, which has a castle, mine office, and seat of superintendency.

The circle or foundation of Merfeburg lies betwixt Saxe-Hall and Naumberg. It was formerly a bishopric (suffragan to Magdeburg) but secularized by the treaty of Pasaw, in favour of the house of Saxony. One of the dukes, who was administrator of it, having introduced Lutheranism here about 1562, it has been fince applied as a portion for one of the younger fons, to whom it gives the title of duke, who, with the revenues of other bailiwicks, as well as of this once noble bishopric, is enabled to keep a splendid court.

Merseberg, where the duke resides, is a city in a charming fituation, amidst gardens and meadows, on the banks of the Sala or Saal. The emperor Otho I. who founded its fee in 952, made it also an Imperial city. It is a large populous town, and thought to derive its name from Mars, whom the Pagan Saxons worthipped here by the name of Irmanfeul. The great church, which was the cathedral, founded by the emperor Henry II. a Gothic building, is remarkable for the magnificent tomb of the emperor Rodolph, who died, after the loss of a hand, in battle with his competitor Henry IV. and near it is a library of very ancient MSS. It may be observed here, that part of the revenues of this, and the other bishoprics, sevularized in favour of the Saxon and Brandenburg families, is appropriated towards the maintenance of a number of canons belonging to each cathedral, and the reft to the administrators of the respective princes. The city is well built, though not in the modern taste. Its walls, and its seven towers, are of free-stone. The wars in the last century did great damage to this place, which was fuccessively the prey of the contending armies. Count Tilly took it in 1631, as the Swedes did after-wards; and the Imperialists and Saxons also mastered it in their turn. It had formerly a very flourishing trade, and a very famous yearly fair, from the year 1047 to 1200, when it was almost burnt down, and the merchants removed, with their effects, elsewhere.

Lauchstadt is celebrated for a medicinal spring; as is Lutzen for a famous battle fought near it, between the Imperialists and the Swedes, in which the former were defeated: but the celebrated Gustavus Adolphus loft his life.

Hark! the shrill trumpet fends a mortal found, And prancing horses shake the solid ground; The furly drums refounding from afar With all the dreadful music of the war. From the drawn fwords effulgent flames arise, Flash o'er the plains, and lighten to the skies. The heav'ns above, the fields and floods beneath, Glare formidably bright, and thine with death. In fiery ftorms descends a murd'rous show'r: Thick flash the lightnings, fierce the thunders roar, As when, in wrathful mood almighty Jove Arms his fire-bolts, red hiffing from above; Through the fing'd air, with unrefifted fway, The forky vengeance rends its flaming way; And, while the firmament with thunder roars, From their foundations hurls imperial tow'rs. So rush the globes with many a fiery round, The shape of man half buried in the wound;

EURO

And, lo! while in the shock of war they close, While fwords meet fwords, and foes encounter foes, The treach'rous earth beneath their footstep cleaves, Her entrails tremble, and her bosom heaves; Sudden in bursts of fire eruptions rise, And whirl the torn battalions to the skies. Thus earthquakes, rumbling with a thund'ring found,

Shake the wide world's firm base, and rend the ground; Rocks, hills, and groves are toft into the fky, And in one mighty ruin nations die.

The foundation or bishopric of Naumberg lies betwixt Saxe-Altenburg, on the north eaft, and Saxe-Gotha on the west, and was seized by the elector of Saxony in 1718, on the death of the last duke of Saxe-Zeits.

The city of the like name, which was once a bishop's see, under the archbishop of Magdeburg, and an imperial town, flands on the river Sala, or Saal. This town is famous for its fairs, which are the most confiderable in Saxony, next to those in Leipsic. An historian of credit says, that, in 1714, it was burnt down upon its fair day, which is June 29; and that here is a large castle, built by one of the landgraves of Thuringia. Its ancient cathedral is yet flanding; and the Lutherans have a chapter of canons, who must prove their nobility by 16 descents, both by the fathers and mothers side. The suburbs of this city are almost all vineyards, but the wine is bad. The bishopric was founded by the emperor Otho I. in 951, at Zeits, and transplanted hither in 932. Lutheranism was introduced here in the beginning of the 16th century, by its bishop, after whose death the elector took the administration. It was ceded to him by the treaty of Passaw in 1552; and it gave a title to the branch of its family, which was called administrator: but the last prelate turned Papift in 1717, by which he was rendered in-capable of enjoying the Protestant bishopric.

For a description of the electorate of Brandenburg, the reader is referred to our account of the Prussian dominions, in which it is included.

The Principality of WEIMER lies between the river Saal and the county of Schwartzburg, and contains the bailiwicks of Bercka, Jena, Orlamund, Dornsberg, and Tondorf, with several forests and towns. Besides that which is properly the duchy of Weimar, the duke's other estates in Upper Saxony are those of the branch of Saxe-Jena, of which this prince is joint-fovereign with the duke of Saxe-Eisenach, with whom he enjoys many other things in common, such as the reversion of several estates, archives, tolls, and mines. His revenues are computed at about 80,000l. a year, with which he maintains 1000 regular troops in the finest order, and keeps a tolerable court. The chief places in this principality are the following:

Magdela, a market-town; Butstoff, on the Losse. confiderable for a beaft fair; and Salza, on the Ilm,

famous for a falt-work.

The Principality of EISENACH lies on the Frontiers of Hesse. It is mountainous, and the surface barren; but the hills are replete with mines of iron, copper, allum, vitriol, faline fprings, &c. Lutheranism is the established religion, and the principal places are,

Eisenach, which gave name to the principality, and is its capital. It is fituated on the Nesse, and contains a gymnasium, a ducal palace, a feat of colleges, and a superintendency. In a castle, on a neighbouring mountain, Martin Luther fuffered 11 months impri-

Allstert, a town of great antiquity, is defended by a castle, and gives name to a superintendency and baili-The emperor Otho had a palace in this town, and held a diet here in 974. Many of his medals have been found in digging about the town and its environs.

The medal, faithful to its charge of fame, Thro' climes and ages bears each form and name:

In one short view, subjected to our eye, Gods, emp'rors, heroes, fages, beauties lie. With sharpened fight pale antiquaries pore, Th' inscription value, but the rust adore: This the blue varish, that the green endears, The facred ruft of twice ten hundred years! Oh! when shall Britain, conscious of her claim, Stand emulous of Greek and Roman fame; In living medals fee her wars enroll'd, And vanquish'd realms supply recording gold.

Jana, on the Saal, 14 miles east of Weimar, is a well-fortified town, pleasantly situated amidst vine-yards. Here is an university, with a library, observatory, physic-garden, &c. a consistory, Latin and German fociety, free-school, and ducal palace. Both the town and university have fine gardens.

The Duchy of COBURG is fituated in the circle of the Upper Saxony, though the inhabitants call themfelves Franconians. It belonged formerly to the counts of Henneberg, but has been possessed by the dukes of

Saxe Gotha ever fince 1674.

Its capital, of the fame name, is one of the most ancient towns in Germany, pretty large, well built, and defended by the duke of Saxe-Gotha's ftrong caftle, on a neighbouring hill, where Luther, who resided here for the most part during the diet of Augsburg, in 1530, to be at hand to inftruct his adherents, was feveral times imprisoned, and where he composed several hymns and epistles. Here is a college, with 11 professors of several faculties, called Casimir college, because sounded in 100 pt. Icho Casimir college, because sounded in 100 pt. I cause founded in 1602, by John Casimir, elector of Saxony, who had, in 1597, also built the house for the courts of justice. The court, or palace, where the dukes refided, is in the town itself, very near the great church. The Augsburg confession is the religion professed in this duchy. In the citadel are old archives, wherein are preferved many important instructions relating to the history of the reformation.

The duchy of Coburg belongs, in part, to the duke of Hildburgbausen, or Hilpershausen, which is the name of a town, with a fine castle, where he resides. It is a grand building, of free-stone, according to the modern tafte. To him also belongs Holburg, another town, with a fine castle, and several others of lesser

Steinhead is a small town, and was anciently a gold

Senneburg gives name to a bailiwick, in which are two market towns, named Indenbach and Murschnitz: Eiszfeld, on the Werra, contains a ducal palace, a Latin school, glass-house, vitriol manufactory, powder blue manufactory, has a superintendency, and gives name to a bailiwick.

Koningsberg is situated on a hill, and defended by an ancient castle. It contains a superintendency, and gives name to a bailiwick. In Ummerstadt town, on the river Rodach, are a hunting palace and a

falt work.

The Principality of SAXE-GOTHA is bounded by Naumberg on the east; the landgraviate of Hesse and Saxe-Eilenach on the west; the county of Eufurt and Halle on the north and north-eaft; and Franconia on the fouth. Its dukes are defeended from the elector John Frederick the Magnanimous, who was deposed by the emperor Charles V. in 1574, fince which the youngest branch has enjoyed the electorate.

The estates of its sovereign are (besides the duchy of Gotha, including the lordships of Tenna, Wachsenburg, and Ichtershausen) the bailiwick of Kranichfeld, the monastery of Volkenroda, and, in the country of Altenburg, the towns of Altenburg, Orlamunda, Kala, Leuchtenburg, Schmoelle, Sichweighoff, &c. His titles are the fame as those of the duke of Saxe-Eysenach, with the addition only of the lordship of Tonna, and they differ but little from those of the elector of Saxony: and as of all the Saxon princes of the Ernestine branch, this duke is the most powerful,

fo of all the courts of Saxony, next to that of Drefden, his is the most numerous and magnificent. He has all the officers of state that are common to fovereign princes. By the prudent management of his public finances, his subjects are the least burdened with taxes of any state in Germany. His guards are well cloathed, his liveries rich, and his tables served with more elegance than posusion.

Gotha, the capital city, is a large walled town on the river Leina. It is fituated in a fine corn country, about two days journey fouth of Hanover. Its chief trade is in dyers woad, of which they have three crops, the third growing wild. This herb is esteemed such a sovereign balfamic, as to cure wounds almost with a touch, if taken in time. It refembles plantain, but has a longer leaf. The roots fatten barren ground exceedingly; and, being brought over to England, thrive well in leveral places. Here are two churches and an hospital.

John Frederick, elector of Saxony, being taken prifoner by Charles V. the old caftle of Gotha was, by his order, demolished. When the elector was set at liberty in 1552, he rebuilt it, and made it larger. being again taken in 1567, was demolished a second time, after a long and expensive siege; but duke Erneft, furnamed the Pious, rebuilt it, caused both that and the town to be encompassed with ditches and ramparts, and gave it the name of Friedenstein, or the Castle of Peace, in opposition to its ancient name of Grimmerstein, or the Castle of Furies. It stands by itself on a hill, from whence there is a vast prospect over a fertile plain. It contains a library, a cabinet of curiofities, a chapel, a mint, an armoury, a theatre, and a laboratory; and is embelished with fine gardens, as is Frederickshal, another ducal palace in the fuburbs. Here are feveral churches, a military and other hospitals, an academy for cadets, various schools, a college foundry, riding-house, green-house, water-works, porcelain, and other manufactories.

The Principality of ALTENBURG is well watered, has a fruitful foil, and rich mines. The inhabitants are Lutherans, and have five superintendants: and the

principal places are as follow:

Carnburg, on the Saal, which was formerly the capital; Sulzia, on the Ilm, remarkable for its falt works; Roda, on the Roda, a market town, containing a cloth and flocking manufactory; and Orlamunda, on the Saal, a town much decayed from its priftine grandeur.

Ronneburg has manufactories of woollen cloth,

earthen wares, &cc.

Altenburg, on the Pleffe, 37 miles west of Drefden, is the feat of the chief offices for the diffricts of the principality. The town, which is large, and was once an Imperial city, contains a foundation for the education of young ladies of decayed families, a house belonging to the Teutonic order, an orphan house, a house of correction, a college, library, and muleum. It gives name to a diffrict, which contains Lucca, Schmollen, Gofznitz, and Mufelwitz.

The most confiderable places in the small principa-

lity of SAXE-COBURG-SAALFELD, are

Saalfeld, a handsome town on the Saal, which contains the mint for the circle of Upper Saxony, a ducal palace, a grammar-school, vitriol-house, smeltinghouse, several churches, manufactories of cloth, gold and filk stuffs, &c. Saalfeld-abbey, a Benedictine monastery, once stood on an eminence near this town, the abbot of which was always a prince of the empire, and had a feat and voice in the diets.

Posneck is a small but populous town, full of potters, clothiers, and curriers; Lehsten is a town celebrated for having a quarry of excellent flate in the neighbourhood; and Grafenthal is a finall town near the river Zepten, in which are some iron and copper

works, with a glass-house.

The territories belonging to the house of Hatzfield contain only Blanckenhayn, a fmall town, and Wandesleben, a market-town, on the Apfelstet. No. 67.

The little Principality of QUERFURT contains the

following places:

Querfurt, from which the principality receives its name, is a confiderable town, including the fuburbs, with a castle, on a hill, in the vicinity. It is the seat of a fuperintendency, and has a great annual fair on the Wednelday in the Easter week.

Dahrne is the feat of a superintendency, and has a

ducal palace in the neighbourhood.

Juterback, on the Angerback, is a small town, near which, in 1644, a battle was fought between the Swedes and Imperialists, in which the former were victorious.

The Principality of ANHALT, fituated between the rivers Elbe and Saal, is divided into the four branches of Desfau, Bernberg, Zerbst, and Cothen. When the dominions were thus divided, it was agreed to fubmit to the eldest of the family, who has the supreme government, and the only power to affemble the rest upon matters of consequence. They have all but one vote in the diet, in which they generally depute one of their number to represent them. The right of seniority has been established for some years in the branches of Bernberg and Zerbst, which are the most numerous. It appears, from history, that this family has been productive of mighty warriors, and many other famous men; and that they have matched into the greatest fa-

milies of the empire.

The estates of the prince of Anhalt-Dessau are the principality of Deffau, with the town of that name; Worlitz, upon the Elbe; Rudegast, Sundersleben; Oranienbaum, a feat on the confines of the electorate of Saxony; Ragun, Jesnitz, &c. The prince of Anhalt-Bernburg possesses the lordship of Bernburg, on the Saal, and Bellenstadt; Old Anhalt, from whence the family is denominated; Hartzgerode; Little Zeitz, where he refides; and the abbey of Gernrode, for ladies; of which laft the princes of Anhalt have the advowson. The prince of Anhalt-Cothen has the town and territory of that name, between the Saal and Mulda, with Plotzkow; the bailiwick of Nienburg, on the Saal, heretofore an abbey; Wolfen, the upper country of Worenfdorf, and Guften. The prince of Anhalt-Zerbst posiesses the town of that name, with the bailiwicks of Lindau, Coswitz, Roswick, Rosla, Muhligen of Magdeburg, Water-Nienburg, Domburg, Meckern, and the lordships of Javern, or Yevern, in Olderburg. He has also the reversion of the territory of Kniphausen. It is computed, that the revenue of each is about 7000l. a year. There is no university in this country; but prince Lewis of Gothen founded a learned fociety, the members of which have been chiefly employed in translations of ancient Greek and Latin authors, and the improvement of the German language. He was the first president; and, in a fhort time, above 20 princes, and 600 noblemen, entered into the fociety, which is called the Fructifying Society, and has very much advanced the learning, and improved the language of the Germans. The people of Desfau, according to the Present State of Germany, are Calvinists, and the others Lutherans; but, in the town of Zerbst, there are both Calvinists and Lutherans. It is a good corn country, watered by the Saal and the Mulda, and its principal trade is in beer.

The chief towns are

9 A

Desiau, on the Elbe, at the influx of the Mulda 8 miles fouth of Zerbst, and 20 east of Bernberg. It lies in a pleafant fruitful country, is well fortified, and adorned with the prince's palace. In one of the chapels there is the tomb of one Rehebeck, an old miller, who, having followed Waldemar, marquis of Brandenburg, to the wars, where the latter was flain, the former perfonated him to artfully, that he was respected as the marquis himfelf. The trade of this town is in excellent beer, which is transported all over the country. It had a fine bridge over the Elbe, which the Imperialifts burnt in 1631.

Zerbst stands a little east of the Elbe, 10 miles north of Dessau, and 46 north of Leipsic. It is very ancient, and well fortified, according to the import of the name which, in the Wendish dialect, fignifies Fort. It is remarkable for little now but being the feat of its prince, and a brewery, productive of fuch excellent malt liquor, that in Franconia it sells dearer than wine.

Bernburg is a fortified town, in a fruitful territory, on the banks of the Saal, 8 miles from the Elbe, 18 eaft of Deffau, and 20 fouth of Magdeburg. The prince has a palace here, separated from the town by the river. This place was taken in 1636, by the troops of the elector of Saxony, when they put the Swedish garrison

to the fword, and plundered the town.

Barbi belongs to a prince of the Weissenstels branch of Saxony, who has erected a noble castle in it, with commodious apartments, and crimson velvet furniture, embroidered with gold. Here is a superb saloon, which, with the closet and ceiling, is finely painted. It has gardens delightfully situated by the side of the Elbe. The duke of Barbi is the only calvinit prince of the Saxon Family. The town stands near the influx of the Saal into the Elbe, betwixt Anhalt and Magdeburg.

Quedlinburg is a little state in this circle, betwixt the principalities of Anhalt and Halberstadt, which has the title of an abbacy, from an abbey of great note, that was founded here by Henry I. who was buried in it in 936; and, because he spent much of his time here in taking birds, was furnamed the Fowler. After he had defeated 40,000 Huns near Mursburg, he began to build the church, to sulfil a vow which he had made for the prosperity of his arms; but, dying soon after he had dedicated the church to St. Servetus, his widow Matilda carried it on, his fon the emperor Otho completed and richly endowed it, and his daughter Matilda was the first abbess. Succeeding emperors were also very bountiful to it, and declared themselves its protectors; but, on the exftinction of the then Imperial family, the protectorship passed into that of Anhalt, and thence into that of Saxony, in which it continued till the close of the last century, when the late elector fold the protection-fee of the abbey, and of the city of Northausen, to the elector of Brandenburg, who garrifoned the town, and established several courts in it. The abbess being a princess of the empire, and the first of those princesses who derive their title solely from their abbeys, complained of this to the diet, wherein she has her deputy among the prelates of the Rhine, but without effect; fo that now she has little more than the shadow of power in the city, and the abbey itself has loft much of its ancient fplendor: for the abbeffes have not, as formerly, their hereditary officers, &c. The chapter has four dignitaries, viz. the abbess, the priorefs, the deanefs, and the canonesses, or nuns. All these ladies must be at least baronesses, and prove their noble extraction for eight descents. The abbesses have commonly been of the Imperial or electoral families. Those of Brandenburg, Brunswic, and Anhalt, possess fiefs, which they hold of the abbey. No abbess can be chosen without the consent of its hereditary protector; and the emperor's confirmation is sufficient to render his election valid, without any from Rome; for that court has nothing to do with the abbey fince 1539, when Lutheranism was brought in by its abbess, the countess of Stolberg. Here are no vows made; the canonesses, who receive and return visits, know no restraints; both the abbess and her nuns may leave the abbey and marry; and fince the reformation feveral of the abbeffes have been widows. The revenue of this Lutheran abbey does not exceed 5000l. a year; its estate, besides the little city of Quedlinburg, being only the villages of Ditfurt and Suderole; which last is claimed by the elector of Brandenburg, as belonging to his fecularized bishopric of Halberstadt. The abbey has more the air of a little court than of a religious house. The abbess gives audiences with all the affected pomp of fecular princes, and is feated under a canopy, furrounded by her chaplains and officers.

Quedlinburg, her place of refidence, is a little city en the river Bode, that was formerly a Hans Town, and afterwards fubject 'to the abbey; but the citizens rebelling against their abbess in 1745, they were made subject to the elector of Saxony, though now it is in other hands. It had formerly a castle on the top of a neighbouring hill, since demolished. A famous council was held here in 1085. This town is so very near the frontier of Lower Saxony, that some geographers have placed it in that circle.

The free Imperial abbey of Walkenried belongs to the family of Brunfwic Wolfenbuttle, who poffers it as a bailiwick; but, on its account, pay an affeffment to the empire, and to the chamber of Wetzlar. The only places of the leaft importance, in the whole bailiwick, are the town of Walkenried, on the Zorge, and the town of Zorge, which contains iron manufactories.

The fouth part of the principality of Schwarzburg, which is feparated from the north, is furrounded by Coburg, Altenburg, Eifenach, and Erfurt; and the north part is encompassed by Thuringia, the electorate of Saxony, the counties of Stolberg, Hohenstein, Eichsfelde, and the territory of the imperial town of Mulhausen. In this principality are many fertile spots, yielding all kinds of grain, roots, fruits, &c. The country likewise produces wine, game, filver, falt, timber, venison, copper, and alabaster.

The rivers are the Schwarze, Saal, Helme, Wep-

per, Ilm, Gera, Zorgange, and Elbe.

The inhabitants amount to about 100,000. Lutheranism is the religion professed, and the principal places

are the following:

Sonderhausen, on the Wepper, has a palace near it, the apartments of which are fine, and the gardens elegant. In the armoury is an image of Puftrich, a Wandish idol, in shining black metal. Its head, on which the right hand rests, is large and disproportionate, with a hole in the top of it; and its belly is prominent and hollow. In lieu of a mouth a round hole is substituted. The legs are both mutilated, and the right is bent in a particular manner. The middle of the less arm, which rests on the lap, is broken off. This town gives name to a bailiwick, and is the seat of the public offices.

Arnstadt, on the Gera, has a handsome stone bridge of fix arches. On the same river are brass and iron works, with several mills, and a salt-petre house near the town, in which are two palaces belonging to the prince, several churches, and a public school.

In Augustenburg is a fine palace, and a garden. Geren is a market-town, with iron works, and a faw-mill; Langewiesen, on the Ilm, is a fief of Mentz; and Breituback, on the same river, contains a

The principal places in the territories of RUDOL-STADT, are Rudolstadt on the Saal, with a castle on an eminence in the neighbourhood, several colleges and courts, a Latin school, and superintendency: and in the bailiwick to which Rudolstadt gives name, there is a small town called Teichel.

Blanckenburg on the Rhine, has some paper-mills and copper-mines; Konitz is remarkable only for its silver mines; Leutenberg has silver and copper mines, a copper mill, smelting-house, &c. Ehrenstein is defended by a castle; and Ilm is a small town, on a river of the same name.

Frankenhausen is environed on all sides by hills, and gives name to a bailiwick: Arnsburg is an ancient castle; at Stransberg there are the ruins of another castle; Hermingea, on the Helme, is very pleasantly structured; Scholetheim is a market-town, belonging to the Hopsgarten family; and Kalbra is surrounded by the plentiful district called the Golden Plain.

STOLBERG county, which lies north of the lower county of Schwartzburg, east of Hohenstein, and west of Mansseld, is about 20 miles long, and 10 broad; and gives name to counts of an ancient, and once a very powerful family, whose domains lie dispersed; but most of them are in the circle of the Upper Rhine; and they have right to the succession of the counts of Schwartzburg.

They are divided into the two chief branches of Isenberg and Gudern, and the latter into those of Stolberg and Ortenberg. They are sovereign counts, of the Lutheran religion; and, besides their large bailwicks in the circle above mentioned, they have the county of Weringerode, in the principality of Halberstadt, near the borders of which, among the mountains, stands the castle of Stolberg, which, it is faid, was built by Otho Colonna, a Roman gentleman, to whom the emperor Justin gave this part of the Hyrcanian Forest, in reward for his services; and who gave it this name from the iron mines he met with in the foundation of it, which, in the German tongue, are called Sthalgrub.

Mansfeld is one of the four Hyrcanian counties, the other three being Stolberg Hohenstein, and Regenstein. It is about 30 miles from east to west, and 18 from north to fouth. It abounds in feveral forts of minerals, very profitable to the inhabitants; parti-cularly that called the Scheifferstein, peculiar to the and the neighbouring provinces. It is a blackish glittering kind of flate, which, melted and bruifed, yields much copper and filver. An authentic writer fays, there is scarce the like in the world; that out of it the inhabitants melt copper, each hundred weight of which contains 10 or 12 ounces of pure filver; and that this ftone is very common here. He adds, that in these

stones are lively representations, in fair copper strokes, of fishes of feveral forts, frogs, water-rats, and other animals, that abound in a neighbouring lake.

The pedigree of the counts of Mansfeld is supposed to be derived from Burchard V. count of Quernfurt, to whom the emperor Frederick Barbaroffa gave this county, for his fervice in the Holy Land; and his fucceffors have enjoyed it ever fince, but pay homage to the elector of Saxony. There have been feveral great men of this family, fome of whom have been privy-counfellors to the emperors of Germany, and deputy-governors of Saxony; and the names of several of them shine in the annals of Germany and the Netherlands; but it is now divided into four or five branches, which makes them less considerable than formerly. Some of the young counts, in the 16th century, opposed several of the Lutheran doctrines, which gave rife to a feet called Mansfeldians. The two chief branches left are those of Bornstet and Eisleben. The latter refides in the town of that name, and has nothing to depend on but the hunting, fishery, and patronage of the churches; the family being so deeply in debt, that the greater part of the estates, which formerly belonged to it, were feized by the creditors; and the remainder was fequestered to the elector of Saxony, who mortgaged his part, in 1715, to George I. king of Great-Britain; fo that all the prefent count is possessed of, is only Bornstet, with its district, two estates in Bohemia, and the finall principality of Fondi, in the kingdom of Naples.

The prince of this country being an hereditary count of the German empire, we shall here give some account of that dignity. These counts have a voice in the Imperial diet, may purchase estates in any part of the emperor's dominions, may lift volunteers, and cannot be fued by the emperor but only in the Imperial chamber. But that which properly relates to counts of territories, fuch as those of Mansfeld, is, that they were anciently created and invested by the delivery of one or more banners for feifin of their territories, as dukes were invefted; and the furrender of them was made by the

re-delivery of those banners to the emperor.

None of the town or villages in this county are worthy of description, except Eisleben, the capital of the county, which is divided into Old and New, and celebrated for the birth and death of the great reformer Martin Luther. It is populous, a great thorough-fare, contains many breweries, and has a castle to de-

The county of WERNIGERODE, fituated on the borders of the principality of Halberstadt, is 12 miles

long, 9 broad, partly level, and partly mountainous. The Blockberg mountain here is reckoned the highest in Germany, and the fnow generally covers it all the year round. The level parts of this country are fertile in grain, pulse, flax, fruit, herbs, timber, &c. And the whole abounds in horses, game, chalk, lime-stone, marle, lead, cattle, falt-petre, cobalt, freestone, clay, and iron.

The established religion is Lutheranism; and the

principal places are,

Wernigerode, which gives name to the county, and is defended by a stately castle, adorned with admirable gardens, and containing a fine library, and many valuable archives.

The town consists of three parts; the Old Town, the New Town, and the Suburb of Noschonsade. It may be laid under water by means of the Zillicher Rivulet. The corporation has a property in some large woods, from which the burghers are allowed timber for building, and a certain quantity for fuel. The inhabitants are employed in breweries, diffilling, and cloth and woollen manufactories. Along the Zillicher River are feveral oil, fulling, copper, meal, fawing, and other

Drubeck, a large village, has a foundation for fix Protestant ladies; and Ilsenburg is defended by a strong castle. In the neighbourhood of the latter there are various mills; and in the bailiwick of Hafferode, is a

colour mill and a lead mine.

The Lordships of REUSSEN are furrounded by Erzgeberg, Vogtland, Neustadt, Culmback, Bamberg, Saalfeld, Leutenberg, Altenberg, and the bailiwick of Zeits. The plains are fruitful, the hills rich in minerals, and the rivers abound in fish. The people, who are Lutherans, employ themselves in woollen and iron manufactories.

The principal places are, Greitz, on the Elster, a town encompassed with woods and mountains. It contains a handsome church, Latin fchool, orphan-house, and some woollen manufactories, Zeulenroda has a manufactory of stuffs, stockings,

&c. an allum mine, and an annual fair.

Trawrenth is a market-town, celebrated for its iron works; and Moschlitz is a market town, which has an alum mine work.

Gerad is a handsome little town, situated in a pleasant vale near the Elfter, and contains a gymnafium and woollen manufactory.

Schlewitz has a woollen manufactory, and gives name to a lordship, which contains three market towns, viz. Tanna, Gorgwitz, and Market Hohen-

The great industry of the inhabitants of these lordships renders them very rich; for the people feem to make business their pleasure, and to consider labour an

The greatest part of the inhabitants of the lordship SCHONBURG are Lutherans, very industrious, and have feveral flourishing manufactories. The counts of Schonburg have a feat in the diet of the empire, and in that of the circle.

The principal places are,

Waldenburg, on the Mulda, famous for its brown and earthen wares. Losnitz has a cloth manufactory; Wechfelbur, on the Mulda, contains a noble feat; and Burgstadt has a stuff manufactory. The people of these lordships are particularly attentive to their religious duties, and feem to be unaffectedly pious in their demeanors.

Hail! heav'nly piety, fupremely fair! Whose smiles can calm the horrors of despair, Bid in each breaft unufual transports flow, And wipe the tears that strain the cheek of woe How bleft the man who leaves each meaner scene, Like thee, exalted, fmiling, and ferene! Whose rising soul purious a novel. Whose bosom melts with more refin'd delight;
Whose

BRUNSWIC LUNENBURG.

Whose thoughts, elate with transports all sublime, Can foar at once beyond the views of time; Till loos'd from earth, as angels unconfin'd, He flies aerial on the darting wind; Free as the keen-ey'd eagle, bears away, And mounts the regions of eternal day.

The county of HOUSTERN, though rather hilly, abounds in corn, grafs, cattle, deer, game, timber, iron, alabafter, and jafper, which latter it may not be

improper here to describe.

The jusper differs little from an agate, only it is fofter, and will not bear fo fine a polifh, because it consists of groffer particles; besides, it is not fo transparent, and is most commonly green; and the nearer it comes to an emerald, the higher is the value. However, it is of other colours, and, on that account, is divided into different species, among which are included the ne-

phritic stones.

The white nephritic flone has a very fine, compact, firm texture, with a fmooth gloffy furface, and is of various fizes; but the common fort is two inches in diameter. The fhape is very irregular, like a common flint; and it is naturally of a fine white, with great brightness and transparency. It has sometimes a blueish tinge, which makes it appear of a deep pearl colour, and, upon that account, is more valued by fome; but when it is yellowlish, it is not in great efteem. It looks pretty much like marble, but breaks into fine gloffy bits, and is heavy, as well as very hard. It is often cut into fmall cups and other toys, which are extremely bright.

The green jasper is a bright semi-transparent stone and of a close, hard, irregular texture. It has been found in maffes of many feet in diameter, and fometimes no larger than a horse-bean. It is of a deep beautiful green, and almost always of the same colour throughout, though it has been fometimes found clouded with white. It is externally bright and gloffy, and breaks into fmooth pieces, apparently of a texture between flint and marble. Its very great hardness renders it capable of a fine

polish.

The foft dufky green jasper is not so heavy or valuable as the former, and is generally found in stones of a flat fhape, from two to five inches in diameter. The furface is pretty full of superficial cracks, and the colour always dull, with fometimes a blueish and fometimes a brownish cast. The most remarkable places in

this county are,

Haustern, which gives name to the county, and to a bailiwick; Ilfeld, a village on the Behr, that belongs to the elector of Brunfwic-Lunenburg, and contains a imall college; and Bleikrade, a fmail town in the lordship of Lora, which, with the town of Kaettenberg, is now incorporated with the principality of Halberstadt.

Ebrich, on the Zorge, has feveral manufactories, and is the feat of a superintendency; Sachsa is a small town with a ruined caffie, a flatting mill, a paper mill, and a gunpowder mill; Benneckstein is a famous for its iron mills; and Great Bodungen is a market-town on the Bode.

THE CIRCLE OF LOWER SAXONY.

THIS circle is bounded, on the north, by the duchy of Slefwic and the Baltic; on the fouth by the circle of Upper-Saxony, and a part of that of the Upper &Rhine; on the west by the circle of Westphalia and the North Sea; and on the east by part of the circle of Upper Saxony. In some parts it is woody, fandy, and marshy; but, in general, it may be deemed a very fruitful country.

Having already described those parts of this circle which are included in the dominions of Denmark and Pruffia, we proceed to those which have not been no-

ticed, and are an fellow:

Though many places in this country are heathy, marfhy, fandy, and barren, yet feveral diffricts are fruitful in grain of all the various kinds, as well as many valuable roots. Here are likewise great quantities of timber, honey, wax, pitch, fish, falt fprings, cattle, game, minerals, turf, &c.

Their territories have many manufactories of woollen cloths, fluffs, linen, thread, lace, cotton, carpets, gold twift, galoons, fringe, fword-knots, taffels, halberts, embroidery, tobacco-pipes, falt, fire-arms, co-

lours, paper, gunpowder, hats, fkins, &c.

Lutheranism is the established religion; but Roman Catholics are tolerated in some places, particularly at Hanover and Gottingen. Calvinifts and Jews are tolerated throughout all the electoral territories.

With respect to the ancestors of this illustrious house, we observe, that the house of Brunswic being united in the two fons of Henry, duke of Zell, in 1546, the branch of Brunfwic Wolfenbuttle and Beveren, defeended from Henry, the eldeft of those fons; and the electoral branch of Brunswie-Lunenburg, from William, the youngest son; and that the ancestress of both branches was Margaret, queen of Scotland, wise of king Malcolm III. and fifter to Edgar Atheling, the Saxon, who was the true lineal heir of the crown of England, both of the Danish and Saxon race; which Edgar dying without iffue, the right of fuccession fell to queen Margaret's posterity, in whom centered at once the hereditary titles of the Scottish, Pictish, British, Danish, and Saxon royal families. It appears that his Britannic Majesty is descended from the Scottish, Norman, and Welch royal families, after the conquest, and particularly from the Plantagenet family; from Margaret, queen of Scotland, daughter to our king Henry VII. from the house of Lancaster; from the Scots royal family of Baliol and Bruce; and, laftly, from king James, the first monarch of Great Britain; fo that his majefty participates the blood of all the royal families that ever reigned in this island. It might be demonstrated, that this family is one of the most ancient and illustrious in Europe; that it descended from, and has intermarried with, most, if not all, the sovereign families in Christendom; that there have been two emperors of Germany, and an empress of Conflantinople, of this family; not to mention the share which queen Caroline, confort of George II. might have had in the Imperial throne of Germany, had it not been for her inflexible attachment to the Protestant religion; and that from this family are descended the kings of Sweden, Denmark, Poland, and Pruffia; the electors of Bavaria and the Palatinate; the families of Heffe, Baden, Mecklenburg, and feveral princes of the house of Saxony; to whom we might also add feveral mitred prelates, there having been 18 archbishops and bishops of this family, all princes of the empire, befides one cardinal.

The creation of the electorate, which is attached to the duchies of Hanover and Zell, was concerted at the congress at the Hague in 1692, in the reign of king William III. of glorious memory, and happily effected by his influence, in conjunction with most of the Protestant princes of the empire, in order to counterbalance the accession of the Popish branch of the Palatine family to the electorate of the Pelime. It was opposed by several German princes, and particularly by the duke of Brunswic Wolfenbuttle, from a principle of envy; but the then emperor Leopold, in order to testify his gratitude to the Protestants for their assistance in the war against France, and, considering not only the personal merit of duke Ernest, but the great dignity of the Brunswic family, who had the first feat in the college of princes at the diet, and was one of the most confiderable in the empire for antiquity, wealth, and power, ordered it to be put to the question in the college of electors at Ratifbon, wherein it was refolved,

the 17th of October, 1692, that the electoral dignity should be conferred on the said prince Ernest and his heirs. The college of princes immediately entered their protest against this resolution, as contrary to the laws of the empire, because entered into without their consent. Nevertheless, in December following, the emperor gave prince Ernest the investiture, by delivering the electoral cap to his plenipotentiaries, and declaring him elector.

The extent of the particular dominions of the elector is as follows;

				Miles	long.	Miles	bros
 	42.	00	•				

The principality of Grubenhagen	40	40
The duchy of Hanover, or Calenburg	40	12
The duchy of Lunenburg	80	50
The duchy of Saxe-Lawenburg	30	15
The duchy of Bremen, including Verder	n 60	40
The county of Hoya	30	15
The county of Diepholt	30	10

The elector's revenues arise from the falt-pits, or springs, within the walls of Lunenburg: from taxes on land, cattle, merchandize, public-houses, and inns; but principally from the rich mines of filver, iron, and copper. The mines of Claufthall, with those of St. Andrew and Altena, yield near 200,000l. a year. Upon the whole, this elector's annual revenue is calculated to amount to at least 400,000l. In the year 1692, he had near 14,000 regular troops on foot. Now that the estates of the electorate are larger above one-half, by the addition of Lunenburg and Bremen, he may raife an army of betwixt 30 and 40,000 men, without greatly burthening his subjects. In the year 1729, he reviewed a body of 19,890 men; and in September, .1735, that number was augmented to 22,000 regular troops. In 1687 there was an hereditary and perpetual union made between this electoral family and that of Saxony; which was renewed in 1731 and 1736, for the mutual guarantee of the peaceable poffession of their estates against all invaders.

The Duchy of BREMEN has the Weser on the west; the Elbe, and part of Lunenburg, on the east; the German Sea on the north; and part of Verden and Oldenburg on the fouth. It is divided into the land of Bremen, properly fo called, which lies fome miles round the city; Wursterland, along the coast, from the Weser to the mouth of the Elbe; Hadeland, the north part of the duchy, at the mouth of the Elbe, where the people are deemed ignorant, but fo fond of gay cloaths, that their neighbours have a proverb, that "There are no peafants in Hadeland." Part of it belongs to Hamburg, and part to Saxe-Lawenburg. Kedingerland, in which lies Stadt; and Altland, a pleafant fruitful track, of about 14 miles in length. Betwixt Bremen and Stade the country is defert; but the other parts, towards the rivers, are very pleafant, and abound with fields, meadows and orchards. The inhabitants, who formerly relied fo much on their valour, that they fcorned to build forts, are still esteemed as good foldiers as any in Germany; and it is faid of the Wurstlanders, in particular, that they will fight The fituaand drink with the best men in Germany. tion of the country between two fuch navigable rivers, has disposed the people in general to trade.

The emperor Ludovicus Plus gave this country to Anfgarius, the first archbishop of Bremen and Hamburg; whom he had made metropolitan of Denmark, and all the known countries to the north. He died in 865; and his death is annually observed by the common people here with great folemnity. Denmark and Sweden were no longer dependent on this fee, when Lunden was crected into an archbishopric: but this country continued subject to its archbishops, till, by the treaty of Westphalia, the archbishopric was secularized, converted into a duchy, and given to the Swedes for restoring the peace of the empire, and giving up other places which they had taken during the war. As their ancestors had frequent wars with their archbishop in defence of their liberties, they pleaded for the fame

No. 68.

exemptions when made subject to the Swedes, who continued their mafters till 1712, when this country and Verden were conquered by the king of Denmark. This prince mortgaged it foon to the elector, who, in This prince mortgaged it took to the parliament, 1715, had 250,000l. granted him by his parliament, There was to enable him to make the purchase of it. an opposition, indeed, made to it, in both houses, and a clamour raifed against it without doors; but, however convenient it might be for the elector of Hanover, whose family was possessed of Bremen once before, and to whose dominions it lay contiguous, the legislature wifely judged it might be of the most dangerous consequence to the crown of Great Britain, that any foreign prince, especially a maritime power, should hold the key, which the king of Denmark then had, of the Elbe and the Wefer. On furveying the maps of this part of the empire, it appears that, whilst that king was in possession of the duchies of Bremen and Verden, he was master of the sea-coast from Denmark almost to the Seven Provinces. The maps thew, that the Elbe runs for about 500 miles, through Bohemia, Saxony, Brandenburg, and the rest of Germany; and that the Wefer passes, for about 250 miles, through Hessia, Westphalia, Oldenburg, and fome other countries of the empire. The vaft importance of those rivers to our trade will be manifest from considering that all our woollen, and other English manufactures, and almost all our commodities, both domestic and foreign, to the value of many hundred thousands a year, are by those streams conveyed to innumerable markets; and that by the fame navigation a great part of our riches flows continually home to us; a trade too precious to have lain at the mercy of any foreigner, either to lock it up from us, or to lay what impositions he pleased on it, as might have been the case, if the king of Denmark had not been dispossessed of Bremen and Verden. In 1717 this country fuffered very much by inundations from the Elbe, the banks of which are in some places very low, and would be frequently overflown, were it not for the dykes. In 1720 the crown of Sweden confented in form to the difmemberment of this duchy from its other dominions, and confirmed it to the house of Brunswic.

The common dialect of this, and a very large part of the lower circles of Germany, is a fort of Lower Saxon, neither Dutch or High German, but partaking of both, or rather the root of both; for it feems to have retained more of the ancient Anglo-Saxon than of the Dutch or High-German: yet every one understands High-German; and it is the language of their printed books, fermons, and written letters.

This duchy is watered by many rivers. The Tech, the Umme, and the Hamma, join together, and fall into the Wefer; as do the Brept, the Lun, the Stotel, and feveral others. The Effa, the Schwingel, and the Ofte, fall into the Elbe. The most remarkable places

Boxtehude, fituated on the Effa, or Eft, 15 miles west of Hamburg, and 48 north east of Bremen, in a pleafant country, to fruitful as to be reckoned one of the granaries of Hamburg. It is a pretty large town, with broad streets, and is surrounded with a ditch and wall, upon which there are old ruinous towers. Its river, which comes out of Lunenburg, and is navigable for boats up to the town, falls into the Elbe at Crantz, about four miles off, where the latter is about a mile over; and from hence there is a fine prospect of Ham-The town, which first had its rife from a nunnery of ladies of a family of that name, was of fuch note formerly, as to be admitted into the Hanseatic League, and still retains the privileges of a city, with burgomasters and senators. One of the dukes of Brunswic attempted, in vain, to reduce this place in 1424, as did, in 1552, one of the counts of Mansfeld, because he could not take it, set fire to the neighbouring nunnery. During the civil wars of Germany, it was feveral times taken from, and re-taken by, the Swedes; who, being at length restored to it in 1679, 9 B kept

From

The n

Both th

kept it, with the rest of the duchy of Bremen, till the whole country was conquered by the Danes, and then

made over to the elector of Hanover.

Stade has a good trade, and a healthy air. 'It is fituated on the river Zwinga, or Schwingel, which falls into the Elbe 2 miles below it, 27 miles west of Hamburg, and 44 north of Bremen. This place, befides having been a free imperial city, and one of the Hans Towns, was formerly endowed with great privileges; particularly that of being an afylum or fanctuary for all offenders, with a right of toll for thips paffing up the Elbe; but became to poor, by Hamburg outstripping it, that it was put under the protection of the archbishop of Bremen. After its decay, the English merchants, upon some difgust taken at Hamburg, removing hither, revived its trade; fo that it became rich and populous, and is still in good condition; though the English merchants returned to Hamburg. The town is well built; and its town-hall, market-place, and churches, are handsome.

Bremerfurd, or Breme-Verden, is a walled town, with a good caftle, that commands the neighbouring plains; and a palace, which was formerly the arfibbifhop of Bremen's, on the river Ofte, that runs into the Elbe. It is fifteen miles fouth from Stade, and 28 north of Bremen; and the chief trade of if is by paffengers betwixt those towns. The chancery of the duchy is kept at this

Ritzbuttle is a bailiwick, confifting of a caftle, with 14 villages, belonging to the Hamburghers, and fituated on the coast, where the Eibe falls into the North Sea, not 10 miles from the utmost point of land of this country, and 32 north-west of Stade. Here the Hamburghers have a harbour, called Cuxhaven, which is of great benefit to hips coming on the Elbe in winter, when the river is full of ice. Here likewife their ships often stop, on their arrival from long voyages, for orders and news. Here are privileged pilots, who, by the flatutes, are obliged to have a yacht always at fea, near the outermost buoy, ready to put a pilot or two, as occasion shall require, on board of every ship coming into the Elbe. But, notwithstanding this is one of the most dangerous rivers in Europe to enter, as all ships coming to Hamburg are obliged to pay half pilotage, whether they have pilots on board or not, they are feldom at fea, but in good weather, when they are leaft wanted, which has occasioned the loss of many rich thips. The Hamburghers have another fort in this neighbourhood, called New-wreck, or Nieu-wark, which ferves for strengthening the former, on the landfide, against the country.

Adjoining to the bailiwick of Ritzbuttle is the little. diffrict of Hadeln, or Hadeland, (the most northern part of this duchy,) which, with its capital, Ottendorff, on the river Medame, and the town of Hadeln, came, in the 16th century, from the archbishops of Bremen, to the house of Saxe-Lawenburg: but the male line of that house becoming extinct in the year 1689, and a diffute arifing about the inheritance, between the fe-male heirs and the king of Sweden, the emperor caufed it to be taken into fequestration, under which it still remains. The caftle of Ottendorff, which belongs to Saxe-Lawenburg, commands most of the district.

Carelfladt is rather a fortrefs than a town, on the river Geefte; which, having filled its ditches, falls into the Wefer, 31 miles north-west of Bremen. It was founded by Charles X. of Sweden; taken by the dukes of Brunfwick in 1676, and reftored, by the treaty of Fontainbleau, in 1679. Charles XII. in 1698, granted liberty of confcience, with 30 years exemption from taxes, to all Protestants that would fettle here: but the inhabitants are few.

Bremen, the capital of the duchy, flands in a fruitful plain, 23 miles east of Oldenburg, and about 460 north-west of Vienna. It is an ancient, large, populous, flourishing, free, imperial city, and the third in rank among the Hans, which are Hamburg, Lubec, and Bremen. The latter, though it is reckoned the

least considerable, is certainly much the oldest, being noted for shipping when the monks, fent by the pope to convert the Saxons, embarked here for England, which was 200 years before Hamburg was built, and above 500 before the building of Lubec. An archbishopric was founded here by Charles the Great, who made it the metropolis of the north. Henry V. granted the citizens great privileges, as a reward for their valiant performances in the holy wars. It had feveral privileges also granted it by the emperor Wenceslaus, for clearing the coast from pirates, and protecting the merchants trading on the Weser; and no goods were allowed to go down the river, and pass this city, with-out being first landed here. The inhabitants have their privilege also of fishing from the bridge of Hoya, four German miles above Bremen, down to the fea; as likewise in the rivers Hunte, Ochtum, Wemme, and Leefum, which flow into the Wefer. The city is well fupplied with fish, both from its rivers and the sea; and they have every month feveral forts in feafon. Among others they catch great quantities of falmon and lampreys; the former of which, being dried and smoaked, and the latter pickled, are in great effeem throughout all Germany. Rodolph II. endowed them with the privilege that neither their persons or goods should be liable to arrest, attachment, or other impofition, throughout the empire; and Charles V. gave them the right of coinage: but, on its receiving the reformation in 1552, and zealously defending it against one of their archbishops, that emperor ordered the city to be befieged by the duke of Brunswick; against whom it made to gallant a defence, that, after almost a year's continuance, he was forced to raife it. The archbishops did not embrace the reformation till 1585. This city claimed a right of vote and fession in the diet ever fince Charlemagne, which was confirmed to them (though the archbishop opposed it) by the emperor Ferdinand III. in 1641. Afterwards on the fe-cularization of the archbifhopric, in the reign of queen Christina, of Sweden, new disputes arose, which came to a rupture in 1654; and though they were composed under Charles Gustavus, in 1658, they broke out again under Charles XI. who claimed the fovereignty of the city, as well as that of the duchy, which had been yielded to the Swedes by treaty: but the fenate totally difclaimed it, on the basis of the 10th article of the treaty of Ofnaburg, whereby it was declared a free imperial city; though the archbishopric, with all the rights belonging to it, was annexed, by the emperor and empres, to the crown of Sweden. The Swedes, nevertheless, not being fatisfied, befieged it above fix weeks, but raifed the fiege, at the interposition of the neighbouring princes; and then followed the treaty of Hahenhausen, in 1666, by which the city was obliged to part with fome of its ancient privileges, and to wave its pretentions to the right of fitting and voting in the diet. It is governed by a fenate, composed of 4 burgomafters, or confuls, and 24 fenators, or commoncouncilmen, confifting of four divisions, viz. one burgomafter, and fix fenators, to each of the four wards. They are chosen out of the chief citizens, fo that the government is a kind of ariftocracy. This fenate decides all causes, ecclefiastical, criminal, and civil; and from it there lies no appeal, except in the latter, where the fum litigated exceeds 600 Rhenish guilders of gold, about 210l. flerling; in which case there may lie an appeal to the imperial chamber of Wetzlar. If any of the members die, or become incapable, they must chuse another in 24 hours; for which end, one elector is chosen out of each class by lot, and then thut up in a room without feeing any one till the election is over. They have their own flatute-laws, which were enacted in 1281, but have been fince amended. It has a jurifdiction of about 10 miles round, abounding with paftures well flocked with cattle, and is bordered with territories belonging to his Britannic majesty. The river Wefer, which is navigable about 30 miles from the fea, runs through it, and divides the old city from the new;

but there is a communication by a bridge of boats, and feveral wooden bridges. The river is not navigable for thips of burden farther than Fegefack, fix miles below the town, where there is a custom-house, and where all fhips load and unload: fo that all goods are brought up from thence in flat-bottomed veffels. It has a confiderable trade to England, especially with all forts of Westphalia linens, and sends several ships, particularly to London, every year; there being a great confumption of the English woollen manufactures, which they receive not only directly from England, but by way of Hamburg and Holland, and disperse them again through the whole circle of Westphalia. It likewise fends ships to France, Spain, Portugal, and Italy, and a great number to Davis's Streights. It has also a confiderable inland trade, particularly to the great fairs and marts in Germany, to which, among other goods, it fends large quantities of calicoes and fugar, printed and refined here, though not to that perfection as at Ham burg. Its beer is very much efteemed in Germany, and therefore exported in large quantities. The other commodities are minerals, timber, corn, cattle, and leather; in dreffing of which, and cloth, they are very expert; fo that both are fent hither, for that purpose, from other countries. The duties upon importation and exportation are very low, which is a great encouragement to trade, and gives the inhabitants an advantage over the Dutch in the countries betwixt this city and their republic. Bremen is deemed the next port to Hamburg, in the whole empire, for commerce: and, in time of war, it fits out thips of force to convoy their merchantmen. It generally fends 20 or 30 thips a year to the whale-fifthery in Greenland; and their harpooners, being esteemed the most expert in all the country, are frequently hired both by the Dutch and English.

Both the old and new towns are fortified with high walls, a broad ditch, and a counterfcarp. The former has feveral towers on the walls, after the old manner; but the walls of the new town have eight fine bulwarks. It is, however, ftronger by nature than art. Here is a garrifon of 600 men, befides the guard kept day and night, at the town-houfe, by 200 of the citizens. On the city wall, or ramparts, which are planted with rows of trees, there is a road for coaches, as well as footpaffengers, and a most agreeable prospect of the river, and adjacent country.

The new town has a grand arienal, well flored with artillery, finall arms, and other utenfils and tools of war, both ancient and modern. There is a leffer, which is a fort of armoury for the burghers, being a fpacious hall, where their council of trade meets, the walls of which are adorned with finall arms. At the entrance there is the figure of a warrior in complete armour, who, by fome mechanism under the steps, as foon as you tread on them, lifts up the beaver of his helmet with his truncheon to falute you.

From the gallery of the grand arienal, which contains the greater part of the small arms, ranged in a very beautiful manner, there is a passage to the gymnasium, or academy, built after the reformation, which was at first only a free school, but afterwards advanced to the title of an university; which, by the muniscence of several worthy citizens, makes as good a figure as some of the best in Germany, and has produced many great men.

The senate, council, or town-house, is a large Gothic structure, built in 1405, and adorned on the outside, with several statues of the emperors and electors, besides those of Plato, Aristotle, Cicero, and other ancients; and a picture of the old and new towns. The council-chamber has the picture of 12 German emperors, down to Leopold. The courts of justice, and other apartments, are plainer than suits with the dignity of the offices they are put to; and the lower part, or hall, in which there are doors that lead to the courts of justice is filled with toy and print shops, and others for stationary and haberdashery wares.

At one end of this building, but separated by a street, there is a public structure, with a piazza and shops under it, which serves for an exchange; but is not near so much frequented as those of London and Amsterdam, and only resorted to by the merchants on post days.

Here are feveral hospitals, particularly one for superannuated or disabled mariners; and another for the sick, lame, decrepid, and old, of both sexes. It is a plain but commodious structure, with a very handsome chapel. Adjoining to it is a house of correction for vagabonds and criminals, where lunatics are also kept, and such as happen to kill a person inadvertently, the plea of chance-medley not being admitted in this country. Such strict discipline is kept here, that it is observed, though there are at least 100 profligate persons in it, not an indecent word is heard out of their mouths, being almost continually obliged to accompany the task-master in singing psalms and hymns.

The new town, on the fouth fide of the Wefer, in which stands the university and arienal, confists chiefly of gardens, and little pleasure houses, belonging to the principal merchants, and other inhabitants, of the old city; has larger and much more regular streets than the latter; and they are most of them planted with rows of limes and wild chefnuts.

The streets of the old town, on the north side of the river, in which are the cathedral and the fenate house. center in the market-place, wherein stands an old gigantic image, one of those erected in many of the German cities, by order of Charles the Great, by the name of Statua Rolandina; on which is an ancient inscription, denoting it to be a testimonial of the liberty granted by Charles the Great to this city. On the opposite fide of the market is a public-house, which, at the fame time, ferves as a fort of common-hall for the feveral colleges, or affemblies of the burghers, and the council of trade. This old town is faid to have been walled 800 years ago. On the largest of its wooden bridges, there is an engine that raifes water, and disperses it all over the city; and there is a fort at the head of it, which is well guarded.

Under the fenate house is a spacious wine cellar, wherein are five huge vessels, each of which holds much above 100 hogsheads, whereof four are always kept full of Rhenish wine, and the fifth is left empty, with a small door at the head of it, to gratify such as have the curiosity to enter. There is one vault of choice old hock, the key of which is kept by the presiding burgomaster, and only a number of bottles left in the hands of the master of the cellar, to be fold at about a dollar, or 4s. 6d. a bottle. The city coins a little piece of money of its own, called a groat, which is worth about a halfpenny: 103 of their yards make 100 English. The custom, which afterwards became general in the other Hans Towns, of swearing new comers by bread and falt, and making them free, on paying a fine of good liquor to the company, is said to have been instituted, here.

Otterfburg, a little fortified town, 14 miles northeast of Bremen, with a strong cattle, or pass, on the borders of the bishopric, was tormerly the bishop's feat. It was taken twice by the Imperialifts, and once by the Swedes, in the German civil wars. It is a pretty large borough, on the river Wemme, from whence the road towards Bremen is very bad, fandy, and full of the branches of the river, in the middle of which is a fort, with four baftions, that commands a long dyke, or caufeway, with feveral cuts in it, over which are bridges. On the other fide of the town, 12 miles from it, flood the monaftery of Clofterzeven, charmingly fituated, which is now a confiderable borough, adorned with many fine gardens, and a handsome church. This is the place where, in 1757, the convention was con-cluded between the duke of Cumberland and the duke de Richlieu, through the mediation of count Lynel, the Danish governor.

Schamfbeck

Schamsbeck is a large village, which gives name to a district, and has a woollen manufactory; Stoel does the same; Bardel is a village, where the nobility hold a meeting twice a year; and Neuenwalde is a village, where there is a foundation for an abbes and 12 other ladies.

The bailiwick of Wildeshausen, on the Hemte, has but a very indifferent soil. In 1700 the crown of Sweden mortgaged this bailiwick to the electoral house of Brunswic Lunenburg; and, in 1720, at the peace of Stockholm, made over all right and claim thereto, as well as to Bremen and Verden. The only place worth mentioning in this bailiwick is the town of Wildeshausen, from which the whole receives its name. It is situated on the Hemte, contains about 300 dwelling houses, a few churches, and some other public buildings. About half the inhabitants are Roman Catholics, who are not allowed the use of bells, church music, or processions: nor are they permitted to be baptized, married, or buried by their own priefts, but must have those ceremonies performed by a Lutheran minister. Here are still to be seen the vestiges of an ancient abbey, and the ruins of an old castle.

The principality of LUNENBURG-ZELL is bounded, on the north, by the duchy of Lawenburg, or Lauenburg, and the Eibe, on the fouth by Calenburg, Hildelheim, and part of Brunswic; on the east by another part of Brunswic, and the duchy of Mecklenburg; and to the west by Bremen, Verden, and Hoya. In many parts the soil is sandy, heathy, and marshy. The banks of the Eibe, Aller, and Jetze, are, however, fertile, and abound in grain, roots, trees, and fruits of

various kinds.

Here are likewise plenty of cattle, bees, venison, falt-springs, and lime-stone. The rivers Elbe, Aller, and Ilmenau, produce great quantities of sish; and being all navigable, are of great advantage to the country in a commercial point of view. The whole principality contains about 200 Lutheran churches, which are under the direction of two generals, and 15 subordinate superintendants. The manufactures are linen, ribbons, hats, bleached wax, gold wires, filver ditto, cottons, stockings, starch, refined sugars, wooden wares, barges ready built, with boats and some small ships.

On account of this principality the king of Great Britain has a feat and voice, both in the college of the princes of the empire, and the circle of Lower Saxony. The revenues arifefrom the demefnes, tolk on the Elbe, contributions, duties on cattle, beer, wine, brandy, and other commodities; and the principal places are

the following:

Lunenburg, the metropolis of the principality, is a large city, fituated on the river Elmen, or Ilmenau, which is navigable from hence to the Elbe. It is 27 miles from Hamburg, and 68 from Hamover. It was formerly an Hans town, and an Imperial city. The name has been derived by fome from Lina, the ancient name of the Ilmenau; and by others from Luna, the moon, an image of which was worshipped here, by the inhabitants, in the times of Paganism. Here was formerly several convents, out of the revenues of one of which, the Benedictine, an academy for martial exercises was founded, where the youth of the principality are taught, gratis, dancing, fencing, riding, and the French language.

Out of the same revenues a Latin school, confisting of sour classes, was likewise founded, and well endowed. The superintendency of these, and the estate appropriated to their support, are invested in a landschaft-director, and an austreiter, who are both selected from the Luncpburg nobility. The first of these officers is the head of the states of the principality, and the president of the provincial college. He assumes the title of excellency, and in public writings stiles himself, By the grace of God, Landschaft-Director, and Lord of the Mansson of St. Michael in Luneaburg. The public edifices are three parish churches, three hospi-

tals, a falt magazine, an anatomical theatre, the ducal palace, the town-house, the academy, the barracks for the garrison, and the conventical church of St. Michael, in which the ancient dukes lie interred, and where the celebrated table, taken from the Saracens by the emperor Otho, is deposited. It is eight feet long, and four broad, was plated over with chased gold, and had a rim richly embellished with precious stones of immense value; but, in 1608, a gang of robbers broke into the church, and stripped this magnificent table of a large diamond, 200 emeralds and rubies, and most of the gold. Here are many rich falt-springs, a fifth of the product of which belongs to the king of Great Britain. The falt is the best in Germany. The other articles in which the commercial part of the inhabitants deal, are wool, honey, wax, lime-stone, flax, linen, beer, &c. and warehouses are erected along the borders of the Ilmenau, for the reception of goods from all parts of Germany, to be forwarded to Hamburg and Lubec.

Ahlden, on the Old Leine, has a palace, in which Sophia Dorothea, confort of his Britannic majefly George Leffieded after their feparation till her death, in 1726. It is the feat of aspailiwick, and has a great

trade in horses and timber.

Ultzen, a compact town, at the conflux of the Wiper, and two other rivulets, which form the river Ilmenau, was formerly called Lawenwald, i. e. Lion Forest, and had its present name from the neighbouring monastery of Oldenstadt, formerly called Old Ulsen. It is said, that the first English Saxons came to Britain from this place; and that those who returned, hung up a tin gilt ship in the market-place, as a memorial of their success, which continued there till 1646, when most of the town was burnt down, and never wholly rebuilt: but the streets are larger, and the houses more splendid and regular, than before.

Effel, on the Aller, gives name to a diffrict, wherein the noble family of Bothmar have three manors and a village, from which they take their name, with a church of their own, to which they appoint a minister.

Soltau, at the conflux of the Soltau and Bohme, gives name to a bailiwick, which abounds with wood, and contains manufactories of canvas, plush, lindseywoolsey, woollen cloths, baize, stuffs, &c.

Hitzacker is a fmall town in a little island in the Jetze. The castle was formerly the residence of some of the dukes. Here is a great annual fair; and the bailswick to which the town gives name, contains the forest of Ghorde, which is about 16 miles in compass: it abounds with a kind of feathered game, deer, wild boars, &c. and on its east side stands a royal hunting

Zell is feated on a fandy plain, near the conflux of the Aller and the Fuhre, 24 miles north of Hanover, and 47 fouth of Harburg. The town is ancient, having a charter, dated in 1203, wherein it is called Tielle. It confifts of three streets, that run parallel, is well fortified, the ramparts being broad and high, and well mounted with cannon, but not regular. Here are held the chief courts of judicature for this duchy; and, in 1485, its duke (Henry) built a palace near that called the Hanover Gate, which is a fquare building, with four platforms at the four corners, moated round. Several coaches may go in front on the terrace round the town, which is adorned with trees planted all along; and the adjacent fine gardens, orchards, and grottos, form a very agreeable landicape. There is but one church in the town, and that without a stemple. The French refugees have their church in the fuburbs, which are very large. Here are still many French Catholics, as well as Protestants, and the former have a chapel. All the buildings are of timber, except the churches, the castle, and the house of correction, which are of brick. The elector has a regency here, which judges all causes without any appeal, but to the council of state at Hanover. Betwist this fown and Harburg it is a fandy road, with scarce any thing but heath. post-stages,

The

tages,

post-stages, which are of four miles, are very ill served, and the times the worst in Germany. Though there is much heath betwixt this town and Hanover, yet the country is well cultivated; for the inhabitants not only make turf of the heath for fuel, but it also serves for pasturage and manure. There is a trade from hence to Bremen, by the river Aller.

In the neighbourhood of this town there is the caftle of Ahlen, where the heires of Lunenburg-Zell, who was married to the late elector, and afterwards divorced, died, after 30 years refidence. It was rather a voluntary retirement, than confinement; as the had the best of usage, and full liberty to go whither she pleased. Here also the late queen of Denmark retired, after the fevere treatment the met with as before-

mentioned.

During the war in the year 1757, a most barbarous and inhuman transaction reduced the inhabitants of Zell to great diffress; for the duke of Richlieu ordered not only the suburbs of Zell to be burnt, but even the orphan-house, which contained a great number of children, to be fet fire to, when the whole was reduced to athes, together with the poor innocent infants. An instance of cruelty scarcely to be parallelled in history!

Bardewic, on the Luke, four miles from Lunenburg, though now only a straggling village, was formerly a strong, populous city. It had nine churches, of which only the cathedral is left, wherein there is still a college of eight refidentiary canons, and a few Acars: but the bishopric was transferred to Verden; and the district about the church transformed into kitchen gardens. Over the gate there are some barbarous Latin veries, in an old Gothic character, which shew that the town was built 235 years before Rome, and destroyed by Henry the Lion, in 1189. They write, that he took this revenge on the city because it refused to acknowledge him, after he was profcribed by the emperor Frederick I.

Dannebeug stands in the most eastern part of this duchy, on the river Jetze, fix miles from its influx into the Elbe, and 33 fouth-east of Lunenburg. It is the chief town of the rich and fruitful county of this name, which was given by its count, in 1462, to Otho, duke of Brunfwic-Wolfenbuttle, and yielded by the latter to the house of Lunenburg-Zell. The Germans write it Daunenburg, confiftent with the etymology of its name, which fignifies a Mountain of Fir-trees. This county lies along the Elbe, having Mecklenburg on the north, the marquifate of Brandenburg on the eaft and fouth, and the duchy of Lunenburg on the west.

Snackanburg, is a large trading town, at the conflux of the Elbe and the Weckt, or Beffe.

Harburg, on the Seeve, 50 miles from Zell, is a trading town, with a good harbour. It is well fortified, populous, has a caftle, garrifon, armoury, magazine, and barracks. and barracks.

Lune is a village with a Lutheran convent, and a medicinal fpring. Medingen, on the Ilmenau, has likewife a Lutheran convent, which was formerly a Ciftertian monaftery.

Winfen-an-der-Luke is a city on the Luke, over which it has two stone bridges. It contains a Lutheray abbey, has a voice and feat in the diets, is a great thorough are, and gives name to a bailiwick.

Ebstorf is a town pleasantly situated, and containing a convent, which was formerly a Benedictine nunnery; but confifts now of a Lutheran abbeis, a prioreis, and 14 other ladies. The religious reftrictions here are not very great; but love ulually fills the convent, as it is celebrated for being the retreat of ladies who have been disappointed in their affections; and it is supposed that some of the beautiful recluses have, with the Fair Penitent, faid,

With melancholy, speechless faints to dwell; But bless the day I to that refuge ran, Free from the marriage-chain, and from that tyrant man!

Wienhausen is a village on the Aller, with a Lutheran convent, confifting of an abbefs, a priorefs, and 23 other ladies.

Isenhagen, on the Ise, contains also a Lutheran convent; but the nuns here, contrary to the other institu-

tions, may be of plebeian extraction.

Nor think it hard within a lonely cell,

Walittode, i. e. Walo's Cross, on the river Bohme, 25 miles north-west of Zell, and 40 fouth-west of Lainenburg, is not far from the confines of the duchy of Verden. It was at first only a monastery, built by one Walo, but is now a Lutheran convent, confifting of an abbey, a priorefs, and nine other ladies. It is likewife the feat of a bailiwick and superintendancy.

Some parts of the Principality of GRUBENHAGEN are very tertile, producing variety of grain, pulfe, marble, and minerals; the mines and quarries being chiefly in the mountain and forest called the Hartz. The rivers are the Leine, the Oder, and the Ocker. The states are composed of the abbey of St. Alexander, and that of the Blessed Virgin, at Einbeck; the noble proprictaries of nine manors; and the cities of Einbeck and Ofterode, at which the diets are alternately held once a year. Lutheranism is the established religion; and the manufactures and commodities of the country are flax, linen, fand-stone, marble, copper, falt, ful-phur, zink, starch, printed cottons, thread, timber, flate, iron, lead, vitriol, lapis calaminaris, powder blue, woollen goods, and fire-arms.

On account of this principality the electors have a vote in the college of princes, both in the diet of the empire, and in that of the circle of Lower Saxony. The fovereign's revenues arise from the produce of the demesnes, and of the mines; and appeals lie from the courts here to the chancery of Hanover. The prin-

cipal places are the following:

Embeck, the capital of the principality, is fituated at the conflux of the Ilme and the Leine, about 42 miles from Hanover. It is well fortified by towers, bulwarks, ramparts, a double ditch, and outworks; and furrounded by a fine country, very ferrile, particularly in corn. It was formerly a free Imperial town, and its magistrates still possess some valuable privileges. It is large and populous, divided into three parts, called the Munster, the Newstadt, and the Markt; and has a tolerable trade, particularly in beer, woollen manufactures, and printed cottons. Formerly it was a bishop's fee, the cathedral and chapter of which still remain. The latter confifts of a Lutheran fenior, nine canons, one vicar, and four vicars in ordinary, who, together, fend a deputy to the diet. The revenues of the ancient abbey of the Bleffed Virgin are now enjoyed by a fenior and nine canons, who have likewife a representative at the diets. A large district belongs to, and is subject to, the jurisdiction of Einbeck, which was a town to early as the year 1256, and formerly coined gold, filver, and copper money.

Wildeman is a mine town, furrounded, on all fides, by lofty, rugged mountains: Lautenthal and Schulenberg, are finall towns, containing fmelting-houses; and Cellerfeld is an open mine town, with a mint for coin-

St. Andreasburg is a mine town, with a manufactory of powder blue, and a filver fmelting-house: and near it is a refervoir, from whence, by a canal, water is conveyed to all the mine works. This town is fo pleafantly fituated, that a person, with a philosophical turn of mind, might retire hither, and, with propriety, exclaim,

Hail, ye foft feats by e limpid fprings and floods, Ye flow'ry meads, Ye vales and mazy woods! Ye limpid floods, that ever murn'ring flow! Ye verdant meads, where flow'rs eternal blow!

Oh! thut me in a cloifter; there, well pleas'd, Religious hardthips I will learn to bear: To fast and freeze at midnight hours of pray'r, No. 68.

Ye shady vales, where zephyrs ever play!
Ye woods, where little warblers tune their lay!
Here grant me, heav'n, to end my peaceful days,
And steal myself from life by slow decays;
With age, unknown to pain or forrow, blest,
To the dark grave retiring as to rest;
While gently, with one figh this mortal frame,
Dissolving, turns to ashes, whence it came;
While my freed soul departs without a groan,
And joyful wings her slight to worlds unknown.

Altenau is a fmall mine town, in a valley, furrounded by high rugged rocks. It contains a filver finelting-house, the aqua fortis from which runs into the river Ocker.

Claufthall is a large open mine town, in which are a filver fmelting house, and a mint. The place is defended by a garrison, and contains two churches, an orphan-house, a grammar-school, a mine-office, and a forest bailiwick-office. Though the rest of the country is so pleasant, the air of the Hartz Forest, almost the whole year round, is so cold, and rain, hail, snow, sogs, and storms, are so frequent, that the cultivation of the land cannot be pursued with any degree of success. The mountain, which part of the forest covers, consists of oaks, ash, alder, pines, beech, aspin, birch, and firs. This amazing plenty of wood is of the utmost importance, as, without such a profusion of timber, the mining works could not be carried on. That part of the forest called Brunswick-Lunenburg-Hartz, is divided into Upper and Lower, and again subdivided into mine and forest bailiwicks, part of which belong to the king of Great Britain, and part to the prince of Brunswic.

Ofterode, a town fituated not far from the Hartz, is divided into Old and New Town. It contains a large granary, three parish churches, and a grammar school; has a manufactory of woollen cloths; and is defended by a castle, in which several dukes of Brunswick and Lunenburg have formerly resided,

On an eninence not far from the above town, formerly flood the caftle of Grubenhagen, which, as well as the principality itself, took its name from the noble family of Gruben, every branch of which is now ex-

Salzder Helden, on the Leine, contains fome falt wyrks, as does the small neighbouring village of Salbeck, which is romantically fituated, and surrounded by a very pleasant country:

Where on the trees fweet honeyfuckles blow, And ruddy daizies paint the ground below; Where the fhrill linnet charms the folemn fhade, And zephyrs pant along the cooler glade; Or fhake the bull-rush by a river-fide, While the gay fun-beams sparkle on the tide. Oh! for some grot, whose rustic fides declare Ease, and not splendor, was be builder's care; Where roses feed their unaffected charms, And the curl'd vine extends her clasping arms; Where happy silence lulls the quiet soul, And makes it calm as summer waters roll. Here man may learn to check each growing ill, And bring to reason dissobedient will; To watch his incoherent breast, and find What fav'rite passions rule the giddy mind,

Herburg has a caftle, linen manufactory, and iron works.

Scharzfels is defended by a castle situated on a high rock. It contains a small garrison, and is sometimes used as a state prison. The castle give name to a bailwick, which contains stone quarries, iron works, plenty of flax, chalk-pits, copper mines, and a linen manufactory

In the neighbourhood are fine caverns, called the Scharzfel Caves, where the ebur foffile and drop-stone are found.

Lautenbury, on the Oder, is a fief of the abbey of Quedlinburg; has mines of copper and iron in its neighbourhood, and is inhabited by miners.

Elbingerode is a finall town, which gives name to a bailiwick, that abounds in warm baths, pine, flate, marble, iron ore, jafper, &c.

At the village of Lucashof is a mill for sawing marble: at those of Lucashof, and New Hutte, are stating-mills; and at Koningshof stood anciently the palace of Konigsburg, where the emperors and princes of the Saxon race used anciently to reside, when they came to this part to partake of the diversion of staghunting. This diversion, however, is on the decline in Germany, and a fondness for music prevails in almost all their courts; so that the German sovereigns seem to have facrificed huntsmen to musicians, and to have exchanged horns for violins: so capricious are the inclinations of man, and so ssuccessful states.

Thro' his young wood how pleas'd Sabinus ftray'd Or fat delighted in the thick'ning shade; With annual joys the red'ning shoots to greet, Or fee the stretching branches long to meet. His fon's fine tafte an op'ner vifta loves; Foe to the dryads of his father's groves; One boundless green, or flourish'd carpet views, And all the faded family of yews, The thriving plants ignoble broomfticks made, Now fweep those alleys they were born to shade. But not our paffions only difagree: In tafte is found as great variety. Sylvius is ravish'd when he hears a hound; His lady hates to death the odious found: Yet both love music, tho' in different ways: He in a kennel, the at operas. A florift shall, perhaps, not grudge some hours, To view the colours in a bed of flowers; Yet fhew him Titian's workmanship divine, He passes on, and only cries, 'tis fine.

The principality of CALENBURG is 35 miles in length, and 18 in breadth. A confiderable part of it is mountainous and barren; but other diffricts are rich and fertile, and abound in corn, pulie, timber, cattle, falt, and medicinal fprings, ftones, minerals, &c. The rivulets abound with all kinds of fifth. In the principality are three Protestant abbies, and fix convents, of which three are inhabited by men, and fix by women. Lutheranism is the established religion, but Calvinists and Roman Catholics are tolerated. The commodities and manusactures of the country are wool, cotton, tobacco, flass, filk, iron, copper, glass, galoons, spunges, tassels, gunpowder, linen, brais, leather, gold lace, filver ditto, embroideries, stone wares, carpets, &c.

In the year 1757 the French over-ran this principality, and did great damage, though they were foon disposses of it. The proprietor of it is intitled to a vote in the college of princes at the diet of the empire, and that of the circle. To the supreme tribunal of Hanover it nominates two affesfors, and two to the high court of appeal at Zell. The revenues arise from demesses, excile, a military tax, stamp-duty, card ditto, duty on corn, cattle, theep, magazines, &c. The principal places are the following:

Hanover, the metropolis, and feat of the elector, as it always was of the dukes, after the removal of their court hither from Calenburg. In the death of George the laft duke of Brunfwick Calenburg. It is pleafantly fituated in a fandy foil, on the river Leine, which is navigable here for small boats. It is 26 miles fouthwest from Zell, 27 from Brunfwick, and 365 east from London. It was anciently called Lawenroda, from London is prefent name in Henry the Lion's time, because of a ferry here; Hanover, in the old Saxon dialect, signifying the same as Have-over in English. It is divided by the river into the New and Old Towns.

Towns. Moft Most of the houses are of timber and clay, but there are many of brick and stone. The streets are regular, broad, and well furnished with lamps. It is regularly fortified, and the ravelins before the gates are well mounted with cannon. Here was once a monastery, fince metamorphofed into a palace, at one end of the city, near the ramparts, though they fcarce deferve that name. It has a large structure of free stone, with feveral fquare courts, and a fine stair-case; but the whole is rather commodious than magnificent. This is, however, adorned with fine tapeftry and paintings, and very richly furnished. Here is a cabinet of curiofities, with a noble collection of medals, ancient and modern; and a very fine chapel. When the court is here, there are frequent concerts, balls, and affemblies; and a French comedy used to be acted three times a week, at a theatre in the palace, where all people were admitted gratis, the expence being defrayed by the elector. Here is also an opera-house, visited by all foreigners. The most remarkable of the churches are St. James's, in which there are two crucifixes, with fine pictures of the apostles, and many faints; though the Lutherans pay no adoration to them. That of the Holy Crofs is much finer and neater than the other, having a double row of galleries round it from the altar; and, upon the first, the history of the gospel, in 53 parts, painted by the ablest masters. Besides these, there are St. George's and St. Giles's churches. Here are four fairs a year, much frequented by foreigners. It was once a free Imperial city, and a Hans Town, when it had a flourishing commerce; but its chief trade now is in that fweet, but muddy liquor, called Brewhan, which they fend in great quantities to the neighbouring towns and villages. This liquor had its name from a famous brewer, one Conrade Brewhan, of this neighbourhood, who, having ferved his time at Hamburg, came and fet up here in 1526. The Roman Catholic church here was granted to those of that communion by Erneft, the first elector, as one of the conditions demanded by the emperor Leopold, who invested him, and also engaged him to admit of an apostolical vicar in his dominions, and to permit him to refide at Han-There is a confiderable number of Roman Catholics: but the nobility and gentry are almost all Lutherans, The princess Sophia caused a new church to be built here for the French refugees, to which our king William III. was also a benefactor. Besides a house for orphans, there is one hospital within the town, and another without. This city has acquired new lustre since the accession of the illustrious house of Hanover to the electoral college in the diet of the empire; but more especially since its advancement to the throne of Great Britain; and is of particular note for the famous treaty concluded here in 1725, to counterbalance that of Vienna.

In the environs are feveral rural feats, particularly one called the Fancy, or Whim: and another Montbrillant, or Mount Pleafant, which were built by two fisters-in-law, Madame de Kilmansec (late countels of Arlingten) and the counters of Platen. There lead to the pleatant palace of Herenhaufen (i. e. the house of the lord of the manor) a castle built on the river Leine, by order of the prince, who was the first elector, about the same distance north from Hanover as the palace of Kenfington is from that of St. James's. A strait walk leads up to the house, which is adorned with charming gardens: a wilderness of evergreens; one of the largest and noblest orangeries in Europe; a perfect theatre cut out into green feats, with arbors and fummer houses on both sides of it, for the actors to dress in, the whole fet off with fine statues, many of them gilt: and, above all, here are noble fountains, with very large basons, beautiful cascades, and water-works, that throw the water up much higher than the famous fountain at St Cloud in France, which was always looked upon as the most considerable of the kind, till this was fet up, by the direction of a very capital English artificer, under the patronage of the elector in 1716.

Rehburg is the feat of a bailiwick, which yields grain, flax, hops, oak, beech, coals, &c. and has a medicinal fipring; and Ricklingen is a parochial village, near which there is a ftone monument, erected to the memory of duke Albert of Saxony, who, in 1385, in befieging the castle, had his leg shattered in such a manner as to occasion his death.

Newstadtam Rubenberge, on the Leine, over which there are two stone bridges, has likewise a fluice in the same river, gives name to a bailiwick and superintendency, and was formerly defended by a castle.

Calenburg is an ancient ducal palace, from which the principality took its name; and Barfinghausen contains a Lutheran convent for ladies, and has a feat and voice in the diets.

Marientee, Wennigfen, Marienwarder, and Wulfinghaufen, have each Lutheran convents for ladies, and fend reprefentatives to the affemblies of the states.

Marienrode contains a convent of Roman Catholic monks; Munder is a town on the Hamel, with faltworks; Lockum is a village, with a Lutheran abbey; and Pattenfen has still the remains of its ancient moat, walls, ramparts, &c.

Wunftorf is the feat of a fuperintendency, and of a Lutheran abbey, to which belong an abbefs and four conventualifts, who must all be of noble birth, together with several canons, the senior of whom is superintendant. The abbey has a seat and voice in the diets of the principality, and was sounded in 870, by a bishop of Minden.

Hamelen is a very ancient city, fituated in a fine country on the river Hamel, from which it has its name. The Hamel difembogues itself into the Weser, on which an admirable sluice was finished in 1734, at a great expence. Over the Weser there is likewise a bridge of nine wooden arches. The other public edifices are an abbey, two Lutheran churches, a Calvinist ditto, an hospital, a town-house, a free-school, a poor-house, and barracks.

There are woollen, filk, linen, and leather manufactories. The magistrates are allowed to coin money, and have very extensive privileges, and civil and criminal jurisdiction, within their liberties, which contain many villages, forests, a ferry, &c. The abbot of Fulda, who was formerly fovereign of the town, having fold it to the bishops of Minden, when the latter came to take possession of it, the citizens opposed him, but were deteated, with great slaughter, near Sedemunde. This event is supposed to have given rise to a story, which, though ridiculous, and bordering on the marvellous, we present, as it may afford some entertainment to the

reader. " There came into the town of Hamelen a very fingular character, who being by profession a piper, and affecting a fantaftical drefs of various colours, was called the Pied Piper. This man, for a ftipulated fum, undertook to exterminate all the rats in the town, which had long been annoyed by those vermin. To effect this the Piper went throughout the town with his instrument, producing the shrillest tones, which bringing forth all the rats, he led them to the river Weser, and drowned them therein. Having accomplified his un-dertaking, he demanded his reward; but the inhabitants receding from their contract, and offering bim much less than the sum stipulated, he threatened them with revenge, and refuming his pipe, went through the streets as before, followed by a number of boys, out at one of the gates of the city. Coming to a hill, there opened in the fide a wide hole, into which the Piper, and all the boys, except one, entered, and the hole closed up again. The parents deplored the loss of their children, and men were fent out in quest of them, but no other intelligence than the boy's could be obtained. To perpetuate the memory of an event fo extraordinary, it was, by a flatute, ordained that from thenceforth, no drum, pipe, or other inftrument, be founded in the ftreet leading to the gate through which they passed. It was also established,

that, from that time forward, in all public writings that should be made in that town, after the date therein set down of the year of our Lord, the date of the year of the going forth of their children should be added; which they have accordingly ever fince continued. This

great wonder happened on the 22d of July, 1376." Bodenwerder is fituated on the Wefer, over one branch of which there is a bridge, and over another a ferry. It has fome trade, particularly in coarse linens, and is subject to inundations.

Lauenau, a market-town, gives name to a bailiwick; and Reher contains a brais foundery, and a powder-

Sprunge, a small town, with a great beer trade, gives name to a bailiwick, which contains some falt springs, woods, pit coal, manufactories of glass, linen, earthen-ware, &c.

Lauenflein is the capital of a bailiwick, in which are falt fprings, a coal-mine, a linen manufactory, and a glafs-house. The town was formerly walled; and glass-house. near it stood a castle, the remains of which are still to be feen.

Hemmendorf, on the Saal, was the rendezvous of the states before they agreed to meet at Hanover; Dorpe is famous for its manufactory of earthen-ware, and black furniture for stoves; Salz-Hemmendorf is a borough with three falt-fprings, and twelve boilinghouses; Dumgen has a manufactory of stone ware; Grohnde has a ferry and toll; and Polle, on the Wefer, is the feat of a bailiwick, in which thread flockings are knit, lime made, veffels for the Wefer built, and from whence large quantities of timber are carried

Gottingen is fituated on the New Leine, which is a canal drawn from the Old Leine, and about 50 miles from Hanover. It is ftrong, well built, and well paved. The ancient gymnalium was, in 1734, converted by his Britannic majetty, George II, into an university. Its library is the best in Germany. Here is also a fine observatory, an anatomical theatre, a physic garden, aschool for teaching midwifery, an academy of sciences and Belles Lettres, and a German society, which are all included under, and belong to, the univerfity. The Latin school has eight masters, and is under very good regulations. There are also an armoury, fix Lutheran churches, one Calvinist church, an alms-house with a church belonging to it, and an orphan-house. On a hill, in the territory belonging to the town, anciently ftood an imperial berg and palatine town, called Grone, which was the principal refidence of the Saxon emperors after Otho the Great. The town's effate and juridiction are very confiderable, confifting of feveral villages, woods, meadows, and paftures. Formerly it was one of the Hans, and had a mint for coining. In the campaigns of 1757 and 1758, it was, for fometime, in the hands of the French.

Hedemunden, on the Werra, contains a linen manufactory; Sichelstein, in English, Sickle-stone, formerly had a castle, opposite which was another fortress, called Senfenstein, or Scythe-stone. Bursfeld was anciently one of the most celebrated convents of Benedictine monks in Germany; and had the permission of holding a market, the power of coining, and the privilege of electing its own abbot.

Northeim contains some manufactories, a parish church, a free-school, and anciently had a Benedictine convent for both fexes, founded in 1051, by Otho, duke

Hardegien, on the Espoide, has a cassle, and is the feat of a superintendency and bailiwick; and Uslar is divided into Old and New, the former of which is walled.

Munden is fituated in a vale on the Fulda, which, a little below, joins the Werra, and then the united ftreams take the name of the Wefer. These rivers with the islands they form, and the neighbouring gardens, hills, woods, &c. afford a most enchanting profess. pect. The public buildings are two Lutheranchurches,

one Calvinist church, a bridge over the Werra, a freeschool, and barracks for a regiment of soldiers.

The gardens within and around the town are very numerous. The manufactures are of filk, flax, and tobacco. This being the commercial center for Heffe, Thuringia, Nuremburg, Franckfort, Franconia, Bavaria, and all parts of Saxony, a number of factors refide here; and none, who are not freemen of Munden, are allowed to trade beyond this town; but must confign their goods to factors here; and whatever is brought in any vettel, must, according to the staple weight, be unladen here. On stated days a vessel goes up the Fulda from hence to Capel, which none but freemen of Munden have a right to navigate.

The principality of WOLFENBUTTLE, which is part of the duchy of Brunswic, is divided into two parts, by the diocese of Hildesheim, and the principality of Halberstadt. The northern part is rather level, and produces confiderable quantities of grain, flax, hemp, pulfe, fruits, cattle, filk, &c. The fouthern parts contain feveral mines and falt-works. The rivers are the Wefer, Leine, Ocker, Schimter, and Aller. The states depute representatives to the diets, which are held at Brunswic four times a year. Lutheranism is the established religion. The chief manufactures are flax, wool, filk, tobacco, glass, lead, iron, steel, porcelain, wax, blacking, &c. The high colleges for this principality are the privy council, convent office, chancery, treafury, high court of justice, and confistory.

Brunswic, the metropolis of the county, is 61 miles west from Magdeburg. It had its name from its founder, Burno, duke of Saxony, who creeted it in the year 861. It was once a Hans Town, and an Imperial free city. Though it is much decayed from its priftine fplendor, it is still rich and populous, contains handfome houses, is well paved, and strongly fortified. It is about two miles in circumference, and divided into the Old and New Town. The principal trade is in leather, butter, hops and mum.

The chief buildings are the ducal palace, which is capacious, magnificent, splendidly furnished, and contains many fine paintings, an excellent library, and a cabinet of curiofities; an armoury, an academy for martial exercises, a college, a theatre, a custom-house, a house of correction, a council-house in the Old and lew Town, a mint, an orphan house, two gymnasiums, a college of physic, an anatomy and furgery school, a lazaretto, a caitle, St. Leonard's hospital; a kind of college, called the Templehof, which formerly belonged to the knights templers; and the following churches; one for the Calvinists, one for the Roman Catholics, and ten for the Lutherans; among which is the cathedral, dedicated to St. Blasius, which contains the ducal burying place, the records of the electoral family, and two large monuments of duke Henry the Lion, and his fecond confort. The chapter of this cathedral confifts of a provoit, a dean, a fenfor, ten canons, and feveral inferior prebends and vicars: the dean is the first member of the states. The Lutheran foundation of St. Eyriac confifts of a dean, who is one of the states, a great committee, and five canons. The convent of Riddaghaufen is about two miles from Brunfwic. The ramparts of the city are planted with mulberry-trees; and the gardens belonging to the ducal palace are laid out in exquifite taite. Spinning was invented here in the year 1530, by one Jurgen, a statuary and stonecutter. This was the first capital place that embraced the reformation. The road from hence to Wolfenbuttle is paved, and lined on each fide with trees. The French got possession of this city during the war in Germany, in the year 1757, but evacuated it in 1758. The Lutheran convent of the Holy Cross has a church of its own, and is fituated without St. Peter's gate.

Lucklum is a village, where there is a commander of the Teutonic order; and Scheppenstadt, on the Altenau, is the feat of a fuperintendency.

Salzdalum is a village which gives name to a bailiwick, and takes its own from a confiderable falt-work in the nei fine large pictures, wife a fn paintings of exqui enamels of The grea high; an the latter for turio chapel, 8 palace is diets: w duchess. voft, a de

in the neighbourhood. The ducal palace here has a fine large gallery, which contains above a thousand pictures, by the most eminent masters. Here is likewife a fmall gallery, embellished with many beautiful paintings. In the china cabinet are above 8000 pieces of exquifite beauty: and in another above 1000 enamels of Raphael de Urbino, admirably executed. The great gallery is 200 feet long, 50 broad, and 40 high; and the leffer one 160 long, and 20 broad. In the latter, befides the above cabinet, are fix fmall ones, for curiofities of art and nature. The garden, the chapel, &c. are extremely grand. Adjoining to the palace is a convent, which fends reprefentatives to the diets; was founded by duke Anthony Ulrich and his duchess, dedicated to the Virgin Mary, and has a provost, a domino, and 15 fifters of noble families.

Wolfenbuttle, from whence the duchy is denominated, flands on the river Ocker, feven miles foutheast of Brunswic. It is the ancient feat of the dukes; and so well fortified, that it is deemed one of the ftrongest towns in Germany. Here is an arsenal also, well furnished. Wollen is divided into two parts, one ealled Arx Guelphica, which is the ducal palace, fo named from duke Ecbert, of the family of the Guelphs; the other Henrickstadt, from the founder, duke Henry, The palace, which is the strongest and most stately that belongs to the duke's family, has noble apartments, rich furniture, costly paintings, and a library reckoned one of the best in Europe, which was founded by the learned duke Augustus. The librarian's catalogue, published in 1604, numbered the volumes at 124,000; another in 1660, mentioned only 27,666 volumes, and 115,504 tracts, by 56,393 authors. There are 2000 MSS. particularly 438 folios of French embaffies, transcribed from the French king's library; 41 volumes written by the founder himself, 12 of which are on music; besides a very learned tract on the antiquity and mystery of the game of chess.

The new church is an admirable piece of architecture; and many dukes and ducheffes are interred under it. Here is also an academy, and a museum. The town is not half fo large as Brunswic, and the houses are of timber; but there are feveral pretty feats near it, in the road to Brunswic. There is another palace of the duke's at Saltzdahl (about a league from the town, and from Brunswic) the road to which is lined with a very fine row of trees. The castle, built by duke Anthony Ulrich, is a very magnificent structure. Besides its immenfely rich furniture, there is a numerous, but choice collection of pictures, in a great gallery, which is one of the finest rooms in all Germany. There are two *cabinets, one full of the finest porcelain; the other of vales and urns, painted by Raphael.

Helmftadt, which has its name from the elms about it, flands 20 miles east of Brunswic and Wolfenbuttle, and near the frontier of Magdeburg. It was built by Charles the Great, anno 782, and is chiefly noted for the Academia Julia, or university, founded and richly endowed, about 1576, by duke Julius, and his for Henry Julius, who also furnished it with a good li-It has very confiderable privileges, particularly one granted by the emperor Maximilian II. that its rector is for ever to have the title and dignity of count palatine. The elector of Hanover, and the duke of Wolfenbuttle, are joint fovereigns, and have the direction of it alternately. No univerfity in Germany has made a better figure, or had more learned Lutheran professors, than this. The three faculties in which it confers degrees, are divinity, law, and physic. Among the manufcripts in its library, there is an ancient Hebrew pentateuch, in two volumes, for which fome I Jewish Rabbies offered a great sum. The faculty of divines here was charged with giving their opinion in the case of the marriage of the princess of Brunswic-Wolfenbuttle, with the emperor Charles VI. that a Protestant princes might, with a safe conscience, embrace the Romish religion; but they refuted it in 1708, by a public declaration, as a Popith forgery. The No. 69.

town is encompaffed with walls, ditches, and ramparts, and has three churches, and a fine fuburb, called Oftendorff.

Gandersheim is an abbey on the borders of the bishopric of Hildesheim, 18 miles south-west of Goslar, which was founded by a duke of Saxony, in the ninth century, for ladies of noble families; and its first abbeffes were fucceffively the founder's three daughters. As confiderable as it was formerly, it is now greatly reduced, and depends on the duke of Brunswic-Wolfenbuttle, who maintains an abbeis, four canoneffes, and eight canons. Though this abbey is in Lower Saxony, the abbess takes her feat among the prelates of the Rhine. It embraced the reformation in the 16th century, fo that the abbefs and nuns are Lutherans. There is a castle in its bailiwick, which is watered by the river Ganda, that runs into the Leine. The bailiwick is about two miles in compass, and contains about 20

Scheningen is a fmall town, with a fuperintendency and a Latin school; and near it is a falt-work and a

Konigflutter is a town standing on the rivulet of Lutter, celebrated for a peculiar kind of beer, called Duckstein. Here was anciently a Benedictine monaftery, which at present consists of a Lutheran abbot, a prior, and four conventuals. In its church lie buried the emperor Lotharius, His empress Richenza, and duke Henry the Magnanimous. It takes precedence of all the other convents in the principality, and fends a representative to the diet and the grand committee.

Supplengenbury is a commandery of the order of St. John; Calvorde, on the Ohre, has an old caftle; Vorsfeld, a market-town, on the Aller, is the feat of a bailiwick and fuperintendency; Heffen has a ducal palace; Marienburg contains a Lutheran nunnery; and Marienthal has a Lutheran monastery, and a free-

Seefen, the feat of a superintendency and bailiwick, receives its name from an adjacent lake; Gittel is a fmall town with an iron foundery; and Julius Halle is a falt-work in the bailiwick of Hartzburg.

Between the Weier and the Leine are Holzmunden, which has a toll, and fome iron and fteel-works; Amelunxborn, which contains a Lutheran convent; and Turstenberg, which has a manufactory of porcelain, and is defended by a strong old castle on a

The Duchy of MECKLENBURG is bounded by Pomerania on the east; by the bishopric of Lubec, and the territories of Brunswic and Lunenburg, on the west; by the Baltic on the north; and by the electorate of Brandenburg on the fouth. It is fituated between 53 deg. 10 min. and 54 deg. 40 min. north lat. and between 31 and 34 deg. 35 min. west lon. from the island of Ferro, being 135 miles in length, and about 90 at its greatest breadth. It is well watered by several fine rivers and lakes, and well supplied with fish. It is likewife extremely fertile, and yields plenty of corn, hemp, timber, pafture, sheep, butter, cheese, flax, fruit, game, cattle, wool, &c.

The peafants here are in a state of villainage; but the nobility enjoy confiderable privileges. The flates are composed of the nobility, with the diets, that are fummoned annually, which are held alternately at Sternburg and Malchin. The inhabitants of this country are mostly Lutherans, under the direction of their superintendants. There are also some Calvinists and Roman Catholics. The whole duchy is divided into three circles, which are those of Mecklenburg, Wenden, and Stargard. The principal places in which are as follow:

In the circle of Mecklenburg are Schwerin, the capital of the duchy, a compact town, on a great lake of that name. It was the fee of a bifhop, translated hither from Mecklenburg in 1062, and suffragan to the archbishop of Bremen; but converted into a secular principality by the treaty of Olnaburg, and granted

It is lenburg

to Adolphus Frederick, duke of Mecklenburg, as an equivalent for Wifmar, which was to remain in the pofferfion of the Swedes. Henry the Lion, duke of Saxony, who fortified the town, built and endowed a cathedral here, and drove the Pagan Mecklenburghers, by thousands, into a part of the lake of Schwerin, where the then bishop baptized them; from whence that part of the lake is still called the Font. The duke of Mecklenburg has his refidence here at a caftle, in which were imprisoned the burgomafters of Rostock, in 1716; but, after fix months confinement, they were fet at liberty, on renouncing their immunities and privileges.

Parchin is fituated on the Elbe, which divides it into the Old and New Towns. It had once a caftle and

a mint, and has ftfil two churches.

Domitz, 43 miles east of Lunenburg, stands in an island made by the conflux of the Elbe and Elda, with a caftle on the former, where the duke of Mecklenburg Schwerin obliges thips to pay toll. This fort, which is faid to be the strongest, if not the only one, in the duchy, is accessible but by a timber bridge. In 1328 the elector Lewis of Brandenburg, alienated this town to the count of Schwerin, with the customs, and all the country on both fides the Elbe, for 7500 marks of Brandenburg coin. Great part of the country, however, returned back to the Brandenburg family by marriage; but the castle remained in the hands of the dukes of Mecklenburg, who are still possessed of it, together with the customs, which amount to a confiderable fum. In 1627 the Imperial general, count Tilly, took this town; but, in 1631, it was retaken by the Swedes. In 1637 the Imperialifts and Saxons re-took it. The Swedish general, Bannier, attempted to recover it in 1639, and blocked it up part of the following year, but did not mafter it till 1643. Those prisoners who are intended for a long confinement, are generally fent hither.

Gadebush is remarkable for a great victory obtained near it, in 1712, by the Swedes over the Danes.

Mecklenburg, which gives name to the duchy, and title to the dukes, though formerly a large town, is now but an indifferent village. It formerly had three convents, and was the fee of a bithop, but gradually declined as Wifmar rofe.

Eldena, on the Elda, has a hill containing allum, a falt work, and gives name to a bailiwick.

Dobberan, which was anciently a Ciftertian monaf-tery, is now only a hunting feat. In the church many great personages have been formerly interred.

In the circle of WARDEN are Gustrow, a well fortified town, 17 miles fouth of Rostock, and 37 from Schwerin. It has a castle, which was the residence of the dukes of Gustrow; after the extinction of which branch, the emperor adjudged this city, and its dependencies, in 1691, to the late duke of Mecklenburg-Schwerin, who reinforced the garrifon; but the troops of Sweden and Lower Saxony refused to quit the place. The duke, however, continued there till April, when 3000 of the troops of the directors of the circle attacked and obliged, him to furrender, and compelled the duke and the Imperial minister to quit the place, into which they put a garrison, and defired the emperor to name commissioners to take the administration upon them till the fuccession was settled, which was in 1701. Its cattle, a grand edifice, with four fronts, faid to be the finest in all the country, is adorned with a most elegant garden.

Roftock, a free Imperial city, and one of the Hans-Towns, flands on the river Warna, which falls eight miles below it into the Baltic Sea. It is an ancient city, walled in 1160, by Burevinus, king of the Heruli, and, as appears by its charter, dated in 1218, mo-delled by the laws of Lubec. This town being, with the duchy, feized by the Imperialists in 1629, was retaken by the Swedes in 1631, who, after the treaty of Munster, built a fort here, and, by their garrifon, de-manded a toll of all ships, which very much lessened the trade of the town. Most of the town was burnt in 1677, but it was fince rebuilt, with more magnificence. In 1712 it was feized by the Swedes, on pretence of its having furnished their enemies with provisions; and, in 1715, the duke of Mecklenburg, not being powerful enough to defend it against the Danes, agreed that they should have a garriton and magazine here, but no concern with the civil government.

The university, one of the best and largest in Germany, was founded in 1419. The city, being at half the charges with the duke, chuses nine of the eighteen professors; and out of them their Rector Magnificus, who appoints their meetings, and superintends their treasury. For these two last centuries this has been one of the most flourishing universities in Germany. The bishop of Schwerin was, by charter, made perpetual chancellor, who deputed one of the eldest pro-tesfors vice-chancellor. The city is divided into the Old, New, and Middle Towns, confifting of 14 wide long streets, besides smaller, and many thousand stately houses. It boatts of seven remarkable things, each seven in number: seven doors in St. Mary's church, feven large streets centering in the great market-place, feven gates, feven bridges over the Warna, towers on the town-hall, feven great bells belonging to the town-clocks, which chime at certain hours, and feven vast lime trees in their common garden. The chief commodity is beer, the fame as formerly called Lubec beer, which they export in great quantities; for tome years ago they had 250 privileged brewers, who brewed, it is faid, as many thousand tons a year, belides what particular perfons brewed for their own use; so that the duke of Mecklenburg's revenue, from the excite on beer, must be greater than from all other articles together. The river Warna is navigable to the very walls; but large ships come no farther than Warnemunder, a little town, seven miles lower, where the Swedes built their fort. The city of Rostock is governed by 24 aldermen, chosen from the nobility, univerfity, and merchants. Four are burgomafters, two chamberlains, and two flewards, or bailiffs, for the river, to cleanse and take care of the haven at Warnemunder. There are two judges to determine all causes civil or criminal. The 24 aldermen are called the upper house, determine all causes finally, coin money, and chuse officers; but, on matters extraordinary, a lower-house, of 100 common-councilmen, chosen out of the different trades, is summoned to give their opinion.

Sulte is famous for its falt fprings and boiling-houses; Ribnitz is fituated on a lake, and has a nunnery for ladies, of the order of St. Clare; Schwan, on the Warna, has feveral capital brick-works; and Dargem

contains a ducal palace.

The Circle of STARGARD contains New Branden burg, the capital, fituated on a lake. It fends a deputy to the leffer committee of the states, has a grammar-school, two curches, a superintendant, and is noted for its hop trade. The neighbourhood is singularly pleasant; and the inhabitants are all remarkably healthy, that a ftranger might be induced to think they had unanimously pursued, with great strictness, the advice given in the following expressive lines:

Toil and be ftrong; by toil the flaccid nerves Grow firm, and gain a more compacted tone. The greener juices are by toil fubdu'd, Mellow'd, and subtiliz'd; the vapid cold Expell'd, and all the rancour of the blood. Come, my companions, ye who feel the charms Of nature and the year, come, let us ftray Where chance or fancy leads our roving walk; Come, while the foft voluptuous breezes fan The fleecy heavens, enwrap the limbs in balm, And shed a charming languor o'er the foul. Nor when bright winter fows with prickly frost The vigorous æther, in unmanly warmth Indulge at home, nor e'en when Eurus blafts This way and that, convolve the lab'ring woods. in

My liberal walks, fave when the fkies in rain Or fogs relent, no feafon thould confine, Or to the cloifter'd gallery, or arcade. Go climb the mountain; from the ætherial fource Imbibe the recent gale: the chearful morn Beams o'er the hills; go mount th' exulting fteed: Already, fee, the deep-mouth'd beagles catch The tainted mazes; and, on eager foort Intent, with emulous impatience try Each doubtful trace. Or if a nobler prey Delight you more, go chafe the defp'rate deer, And thro' its deepeft folitudes awake The vocal foreft with the joyial horn.

Wesenburg is the principal place in a fertile territory, called Pomel, the inhabitants of which are some of the most humane and benevolent of human beings, and practice charity without oftentation.

Charity, decent, modest, easy, kind,
Softens the high, and rears the abject mind;
Knows with just reins and gentle hand to guide,
Betwixt vile shame and arbitrary pride.
Nor soon provok'd, she easily forgives;
And much the suffers, as the much believes;
Soft peace she brings, wherever she arrives;
She buildsour quiet, as the forms our lives;
Laws the rough paths of peevish nature even,
And opens in each heart a little heaven.

Each other gift which God on man beflows,
His proper bound, and due reftriction knows;
To one fixt purpose dedicates its power,
And, finishing its acts, exists no more.
Thus, in obedience to what heaven decrees,
Knowledge shall fail, and prophecy shall cease;
But lasting charity's more ample sway,
Nor bound by time, nor subject to decay,
An happy triumph shall for ever live,
And endless good diffuse, and endless praise receive.

Strelitz gives name to a branch of the ducal family, and is fituated among marthes. It confifts of Old and New, which fland at a fmall diffance from each other. The prince's palace, which is at the latter, is adorned with pleafant gardens, and has a very elegant appearance.

Nemaro was anciently a commandery of the order of St. John, but is now a bailiwick; and Miro contains a ducal feat.

Wifmar stands among fens on a bay of the Baltic, between Rostock and Lubec, 25 miles west of the for-mer, and east of the latter, and 55 west of Strassund. It is supposed to have been built in the 13th century, out of the ruins of Mecklenburg; for being of timber, it was burnt in 1262, and rebuilt handfomely of stone; and its government modelled in 1626, upon the plan of Lubec; to that it foon became one of the chief Hans-Towns, ftrongly fortified, and the harbour for their men of war. It was taken by the Imperialifts during the civil war in 1629; but retaken by the duke of Mecklenburg, and the Swedes, in 1632, and by the treaty of Munster given to the latter. It has been feveral times taken by the Danes, but again reftored to the Swedes. Its magazines were blown up by lightning in 1690, most of the new city destroyed, with one of the new gates; the arfenal, churches, and houses damaged; and many people killed and wounded. It was, in 1711, befieged by the Danes; and, in 1716, furrendered to the allies, Danes, Brandenburgers, Hanoverians, Saxons, and Ruffians, who found in it 300 pieces of cannon, a vast quantity of bombs, grenadoes, and ammunition. But it was, by treaty in 1720, reflored to the Swedes, on condition that the walls and fortifications should be demolished; and in such state it now remains.

It is here proper to observe, that the house of Mecklenburg is divided into two branches, Schwerin and

Strelitz. The latter commenced with duke Adolphus Frederick II. younger brother of the duke of Schwerin, and grandfather of the present duke of Strelitz, Frederick IV. who was born May the 5th, 1738, and succeeded to the government Dec. 11, 1752. He was made a knight of the garter in 1764; and has three brothers and two fifters; the younger of the latter being our gracious sovereign Sophia Charlotte, who was born May 19, 1744; and married the 8th of September, 1761, to his present majesty, George III. king of Great Britain, &c. As her majesty's shining virtues have endeared her to the British nation, we think it necessary here to give a small specimen of her literary accomplishments, for which the is as remarkable as for her other amiable qualities. The following elegant epiftle was written by her to the late king of Pruffia, during the war in Germany, and has been equally admired for the humanity of the fentiments, and elegance of the diction.

" May it please your Majesty.

"I AM at a lofs, whether I should congratulate, or condole with you, on your late victory; since the same success, which hath covered you with laurels, has over-pread the country of Mecklenburg with defolation. I know, Sire, that it seems unbecoming my fex, in this age of vicious refinement, to seel for one's country, to lament the horrors of war, or wish for the return of peace. I know you may think it more properly my province to study the arts of pleasing, or to inspect judices of a more domestic nature. But however unbecoming it may be in me, I cannot resist the desire of interceding for this unhappy people.

"It was but a few years ago, that this territory wore the most pleasing appearance; the country was cultivated, the peasant looked chearful, and the towns abounded with riches and seftivity. What an alteration, at present, from so charming a scene! I am not expert at description, nor can my fancy add any horrors to the picture; but surely even conquerors themselves would weep at the hideous prospects now before

" The whole country (my dear country!) lies one frightful wafte, prefenting only objects to excite terror, pity, and defpair. The bufiness of the husbandman and the shepherd are quite discontinued. bandman and the shepherd are become foldiers themfelves, and help to ravage the foil they formerly culti-vated. The towns are inhabited only by old men, women, and children; perhaps here and there a warrior, by wounds or loss of limbs rendered unfit for fervice, left at his door: his little children hang around, ask an history of every wound, and grow themselves foldiers before they find strength for the field. But this were nothing, did we not feel the alternate infolence of either army, as it happens to advance or retreat in purfuing the operations of the campaigns. It is impossible to express the confusion which even those who call themselves our friends create. Even those from whom we might expect redrefs, opprefs us with new calamities. From your justice, therefore, it is that we expect relief. To you even women and children may complain, whose humanity stoops to the meanest petition, and whose power is capable of repressing the greatest injustice."

As the above epiftle has been elegantly paraphrafed, we subjoin some of the principal lines of the poetical version:

WHILE conqueft feats you on the throne of fame, And martial deeds immortalize your name; On burnish'd arms, which glory brightly beams, And deeds victorious fill the foldier's dreams; Trembling I view, from whence the glory springs, Of king-like heroes or of hero-kings: Shock'd I behold the source whence dart those rays, Which shine on victors, and round conq'rors blaze.

Hence I'm in doubt, while prompted to express My weak ideas on your late success. Whether congratulations to bestow, Or melt to tears, and swell the stream of woe: For all those laurels which your brows entwine, Crown your success, and bid your conquests shine, Meant as immortal trophies to adorn, Were from my country's bleeding bowels torn; While, in what's truly brave, and greatly bold, You outstrip heroes dignify'd of old, My native Mecklenburg, a prey to arms, Is desolated of her fertile charms:

No more her plains their plenteous verdure yield, No longer Ceres decks the happy field;
Nothing is seen, or heard, where'er ye go, But seenes of hostor, and ther signs of wee.

But scenes of horror, and the figns of woe. I know, great Sire, a patriotic theme, In my weak fex may unbecoming feem: For, in an age fo viciously refin'd, By folly led, and to caprice refign'd, Perhaps you deem the very name of arms, The thoughts of rapine, and of wars alarms; Of flaughter, by contending armies made, Or burnish'd fwords for mortal ends display'd; Of mourning widows, and of bleeding fwains; Of burning towns, and defolated plains: Perhaps you deem fuch thoughts unfit for those, Who shou'd their minds to softer themes compose; Who ought to fludy only how to pleafe, And court the prospect of domestic ease; T' inspect with care the finer art to charm, And point the light'ning, when their eyes they arm; To practife finiles, by art to look ferene; Catch the free air, and dignity of mien; To lose themselves in all that's idly vain, The approbation of the world to gain. If thele, my Liege, are arts for females fit, Who shou'd no other fentiments admit, I must for once transgress, and, unconfin'd, Obey the dictates of a feeling mind: I must, by fost humanity inspir'd, Express the thoughts from shocking scenes acquir'd. With truth, great Sire, permit me to unfold What I've beheld ---- ah! -- what I yet behold; And while the natives of my country bleed, For the unhappy let me intercede. A few years fince, in Mecklenburg's domain, Fair plenty imil'd on ev'ry fertile plain; The placid years ferenely fled away, The fields were fruitful, and the groves were gay: Now my dear country, (here the tear will flow,) Now my dear country is a wafte of woe: Depopulation makes a frightful void; The peafant flies, or flaying, is deftroy'd. Turn to what part I will my aching eyes, And all the horrors of the war arile; The devaftations of the martial train, With streaming gore empurples ev'ry plain; With native blood the filent rivers flow, And on their bosoms streaming purple show; While into camps the fertile fields are made, And gloomy woods can scarce from danger shade; Wood's where sequester'd families abide, And die each moment while from death they hide; Who watch thro' fear, or thro' reflection weep, And from exhausted spirits borrow sleep; Whose sweetest rest is but a troubled doze; Who thank fatigue for ev'ry finall repofe. A famish'd babe, perhaps, lifts up its eyes, And for affiftance to the mother cries; The fainting mother, ready to expire, Replies with tears, and supplicates the fire: The fire, unable to relieve their woe, Can only answer with a briny flow; And while his filent forrows grief express, Increase his own, by tharing their diffress. Thus wing'd by fear, no hufbandman remains, By cultivation to reftore the plains;

No gentle shepherd tends his fleecy care; Both join the war, and in the horrors share; And foldiers grown, a ftrange reverse of fate, Deftroy those fields they us'd to cultivate. With anguish'd age, the women fit and wail, As fears for hufbands or for fons prevail. Perhaps a warrior here and there is found, Debarr'd the field by many a rankling wound; Or, by the lofs of limbs, not want of will, Deny'd the use of sanguinary skill. Round him the curious pratting children fwarm, Hang on his tongue, and, as he fpeaks, grow warm; Demand the hist ry of each aching wound; Devour each word, and catch the martial found; And while the foldier eagerly recites The rage of battle, and the blood of fights; The steeds loud neighing, and the clank of arms; The rumbling drum, that beats to war's alarms; The clang'ring trumpet, and the cannon's roar; The dying groans, and fields of streaming gore; The little auditors erect their crefts, While a new ardour fires their youthful breafts. To you, great Sire, we therefore make appeal, Whose justice only can our suff'rings heal From you alone, great Sire, we hope relief; 'Tis your compatition must assuage our grief: To you e'en helples females may complain, Nor thed their tears, nor plead their cause in vain; And trembling babes, with tender looks, implore The royal hand to open mercy's door.

To you, whose kind humanity stoops down, To shield the peasant underneath the crown; To guard the meanest, who for justice prefs, And give the humblest supplicant redress; To you affliction speeds with tearful eye, Whose power relieves, and bids injustice fly.

HAMBURG, an imperial city, the greatest emporium of Germany, and the fecond of the Hans Towns, stands on the north fide of the Elbe, 27 miles north-west of Lunenburg, and 416 north-west of Vienna; east long. 10 deg. 11 min. lat. 53 deg. 41 min. It owes its origin to Charlemagne, who, to stop the progress of the northern Sclavonians, built two forts on the Elbe, one of them at this place, and erected a church, the only one in Hamburg, for above 350 years. It was first declared a free and independent city in 1220. The emperor Maximilian, in the diet of Augsburg, in 1510, declared it free and imperial. Since that time it has been invested with fovereign power within its own jurifdiction. In 1641 it was summoned to the diet of the empire; though, as both Denmark and Holstein protested against it, the Hamburghers have not yet enjoyed the right of fitting and voting there. Great pri-vileges have, however, been granted them by feveral emperors; and, for their keeping a light-house at Helgoland, four German miles within the fea, they are excused from paying toll at Stade, to our king, as elector of Hanover; yet the kings of Denmark have fince compelled them feveral times to pay tolls at Gluckstadt.

The continual jealousies between Sweden and Denmark used to be the chief security of the Hamburghers; but, in 1712, on occasion of the northern war, the Danes, Muscovites, and Saxons, having their armies in the neighbourhood, made their separate demands, with threats in case of refusal; and they were obliged to compound with them for very large sums of money. Denmark has extorted money from it six times since 1645. After this the czar of Muscovy got large sums on some other pretensions. In 1713 the city was visited by a plague.

It is feated with all possible advantage for trade, foreign and domestic, having such a port and river as nothing in Europe excels, except the Thames. Besides the Elbe, which enters the German Ocean here, the inhabitants have a channel opened to the Trave, for the sake of a communication with Lubec and the Baltic,

without being at the trouble and hazard of going about by the East Sea, round the coast of Jutland and the Scaw; and without the obstructions of the toll, and other difficulties of the Sound; so that vessels in the Trave are within 40 miles of the Baltic, whereas it is

400 miles and more round Jutland.

The trade of Hamburg exceeds that of any city which has no kingdom or republic annexed to it; and the exports and imports of it fingly, exceed those of many great kingdoms even in Germany. The Elbe, and many great navigable rivers that fall into it, after a course through some of the largest, richest, and most trading parts of Germany, furnish it with all the products and manufactures of Austria; Bohemia, and Upper and Lower Saxony. By the Havel and Spree it has trade with the Brandenburg electorate; and, by a canal from the Spree to the Oder, its commerce extends into Silefia, Moravia, Poland, and almost to Hungary: fo that it has more manufactures for exportation than most cities in the world. The chief exports (chiefly to Great Britain) are of various linens of feveral countries; particularly Silefia diapers, and the lawns of Misnia and Lusatia; Germany linen from Ofnaburg, Lunenburg, &c. Hamburg dowlas, and other ftrong linens, from Lower Saxony; coarle linen, barras, crocus, hinderlands, and many other forts from Lower Germany; linen-yarn from the fame countries; tin-plates, brafs, iron and fteel wire, chiefly from Upper Saxony; clap-boards, pipe and hogshead staves, wainfcot boards, oak plank and timber, kid-skins, from Brandenburg; corn from many provinces, chiefly Brandenburg and Saxony. Of the number of articles which they import from abroad, the chief are the woollen manufacture of England. The value of fuch from Yorkshire only is said to be above 100,000l. The article of English Stockings comes to above 20,000l. per annum. The whole of the English manufactures vended here, amount to feveral hundred thousand pounds annually. The English merchants, having great privileges, make an extraordinary figure here. They appear as a body, hold a court, with particular jurifdiction and powers among themselves; and as they are called in London the Hamburg Company, fo are they here called the English Hans or Society. have a church and minister of their own. The English are numerous, this place being really still the staple of the English trade. They have the same privilege to import herrings allowed the Dutch. The Ham burgers drive great trade to Ruffia and Livonia; and for goods fent to the north of the empire and to Poland, they have great returns, not only in linen-yarn and fine flax, but in honey, wax, annifeed, linfeed, drugs, &c. all by the Oder into the Spree, and fo into the Elbe, in the marquifate of Brandenburg; therefore the Danes cannot interrupt this trade, nor obtain any part of it. About 200 English ships come into this harbour in a year, though mostly from Spain, Portugal, and Italy; from and to which the Hamburg merchants pay them double the freight they do for their own thips; because the English being free from the Turks by their Mediterranean paffes, they fave more than that in infurance. Indeed they, in 1751, aimed at taking much of this trade into their own hands, on their own bottome, &c. but happily the king of Spain fo deeply refented their treaty with the piratical states of Barbary, and furnishing them especially with warlike stores, &c. that he not only inhibited commerce with Hamburg, but laid an embargo on their goods in Spain. The difference, however, was reconciled, and matters accommodated, on condition of not having any more fuch trade with the Barbarians.

This city has great part in the Greenland whale fishery; and the fins and whalebone is a manufacture managed by its inhabitants. It commonly sends 50 or 60 ships annually in this trade; so that they export great quantities of oil and fins; though they buy from the Dutch more than their own ships supply. In war it sits out ships of force to convoy the merchantmen, and

may be faid to be ftrong both at land and fea, being able to arm 12 or 14,000 men, and having a constant garrifon of near 2000. It exports great quantities of beer, brewed here; and has feveral manufactures, as weaving of damasks, brocades, velvets, the richest filks, and fugar-baking, there being as good loaf fugar made in Hamburg as in London; though, indeed, they are forced to buy their Muscavado sugars chiefly from Great Britain. Callico printing employs numbers of people; and of late they have begun to print linens alfo. In short, Hamburg is become a rich and powerful city, and, without dispute, drives the greatest inland trade, at this time, of any city in Europe, London and Amsterdam excepted. It has an undoubted right to a place in the diet of the empire. It has pretenfions also to being so free a city, as not to be subject to the empire, as other Imperial cities are, and, on that account, always refuses to pay contributions to the military cheft in time of war: but then the Hamburgers; under colour of a particular treaty with the emperor. wifely avoiding to embarrals themselves, in case of a war in Germany, do the fame thing in effect.

The government here is vested in the senate and three colleges of burghers, and is a mixture of the aristocratical and democratical. Of the latter, because all their taxes and imposts are granted by the burghers, without whose consent the senate cannot raise one penny, and because the management of the finances is in 10 of the burghers. Of the former, because they have a senate chosen out of the principal persons of the republic, who alone have the power of assembling and dissolving the convention of the burghers; to whom the burghers, that are managers of the sinances, are accountable; who treat with foreign princes, without the intervention of the burghers; and who are vested with almost every act of sovereignty, but that of lay-

ing taxes and managing the finances.

The government thus conflituted, is under the protection of the emperor, for which the Hamburghers pay him 80,000 crowns a year. But how little this has availed them is too well known; and the protection they have from England, for the fake of trade, is certainly their greatest security. The senate confists of 4 burgomafters, of whom there are 3 lawyers and one merchant (2 of whom prefide alternately for a year;) 24 fenators, viz. 11 lawyers and 13 merchants; 4 fyndies, who are all lawyers, and give their opinions as our judges do in the house of lords, but have no vote; and 4 fecretaries, of whom the principal is called prothonotary. All thefe are, upon every vacancy, chofen out of their own bodies. Here is also a court of admiralty, confifting of a burgomafter, four fenators, 6 merchants, and 2 mafters of thips, affifted by a fecretary, and a water-bailiff.

Their law is the civil, or Justinian: and, in criminal causes, the statutes of the emperor Charles IV. with which they have likewife their own flatutes, but both puzzled and obscured by numberless comments, and contradictory precedents. The first or chief of three colleges is that of the Ober-Alten (or principal Elders) which confifts of 3 members, chosen out of each of the five wards of the city; has great power, like that of the tribunes at Rome; can demand of the fenate to call a convention of the burghers, and even impeach a fenator, and require a conference with the fenate, on that or other occasions. When the three colleges, confifting in the whole of 180 members, are affembled, and the fenate at the fame time, which is in all extraordinary cases, particularly for laying taxes, the gates of the city are thut, a ftrong guard is drawn up before the fenate house, and fentinels posted at all its avenues. Each ward debates and votes by itself; and, when the question is put by the senate, the majority of the 5 determines it. Their ecclefiaftical government, of which the senate is the head, is managed by a confiftory, or convocation of the paftors, archdeacons, and deacons, (29 in all,) of the 5 principal, and 7 fmaller, churches or chapels.

In general the religion is Lutheran, and the Calvinishs were obliged to go to worship at Altena till within these few years past, that they have been allowed or 2 churches within the walls of this city; but this is a favour not granted to the Roman Catholics; against whom they were to exasperated in 1719, upon a public attempt of their priefts to make profelytes in the city, that a mob ftripped and demolished a chapel that was building here by the Imperial refident, together with the faid minister's house; for which the Hamburghers being threatened by the emperor Charles VI, with military execution, they were forced to find another house and chapel at their own expence, and to make good all the other lofs and damage, befides paying a fine, and fending two members of the fenate, and two of the burghers, to Vienna, to beg the emperor's par-don; after which, he took the citizens into his special protection, and espoused their cause warmly, against the antiquated pretentions of the Danes. obliged, however, to allow the Roman Catholics their worthip in the ambaffadors houses. They have here what they call a private confession, previous to the holy communion; though it differs in nothing from ours that is general, and the absolution the same; but even the poorest of the people here are forced to give a fee to the prieft for fuch confession; a custom not being known in any other Protestant city, is reckoned the more inexcufable in this; because its churches are immenfely rich, and have great fums of money at usury, out of which they might afford the clergy a competent maintenance. But the fame of Hamburg is justly great for its care of the poor; here being more hospitals, in proportion to its fize, than in any other Protestant city in Europe; one in particular for orphans, like our Blue-Coat Hospital in London, the yearly revenue of which amounts to betwixt 50 and 60,000l. Sometimes they have above 300 infants abroad at nurse, who, when able to dress themselves, are taken into the house. The boys that are qualified, are put out and maintained at the university; the rest are put to trades; and the girls, after they can read, fpin, knit, &c. are fent to fervice. The building is decent, but not very coftly, and borders on one of the canals. There is a large fumptuous hospital for receiving poor travellers that fall fick; and another for the relief of maimed, ancient, and decayed feamen; where also care is taken of the widows, as well as children, of those who lofe their lives in the fervice of the public. In that called the oldeft hospital, 114 poor, old, blind, and lame people, are maintained. There is St. Job's for those poor that have the French disease; and a pesthouse for those that have the plague, or other infectious distempers; to which even people of the best rank come for cure, but pay for it to the house. There are many leffer hospitals, besides these, for poor widowers, widows, orphans, &c. and great numbers of free-schools; belides two work-houses, or houses of correction, where they manufacture rugs, and coarfe kerfeys, with which those confined there are clothed, and where they also spin. Here are also societies for making good loffes and damage by fire.

The houses in Hamburg are about 30,000. The churches are ancient, large, and handsome tabrics, but open thoroughfares all day long; and in some there are bookfellers shops. Here are fix lofty steeples, some of them covered with copper, which make a grand appearance, though the frames are only of timber. The great spire of St. Peter's is the highest in the city. That of St. Nicholas is supported by large gilt globes. St. Michael's steeple is 400 feet high. St. Catherine's has a stayely front, with abundance of statues in niches; and the steeple is formed of fundry lantsons, diminishing gradually to the last, which supports a spire, like St. Bride's in Fleet-street, but much tallex. Round the middle of its steeple is a crown richly gilt. Its pulpit is of white marble, curiously carved, and adorned with figures, and other ornaments of gold; and its organ, reckoned one of the best in Europe, has 6000

pipes. That called the thum, or dome, was the ca-thedral while the town remained an archbishopric, and was built about the year \$30. The fpire, and tower that supports it, are near 360 feet high. There still belong a dean and chapter to it, though fecularized, from whose court there lies no appeal, but to the imperial chamber at Wetzlar. Many of the counts of Schawenburg and Holftein are buried here, whose names are written in a fair catalogue, with their other benefactors, and hung up in the body of the church. This cathedral, with the chapter, and a large number of houses belonging to it, are under the immediate protection of his Britannic majesty, as bishop of Bremen, and independent of the city jurisdiction. There are five other very large churches here, and eight leffer churches, or chapels of ease. There is a Schola Illustris, or univerfity here, well endowed, and furnished with 6 able professors, of whom were lately the learned Fabricius, and M. Hubner, the geographer. The fenate-house and town-hall is an ancient, large, and noble structure, adorned with the statues of emperors, and the 9 worthies; and a building is lately added for their new bank. Their exchange is fine, but inferior to that in London; and is opposite to the senate-house. One part of the square is planted with large trees; and the other covered with a hall, where the elders or council of commerce meet. At the other end of it is the pub-lic crane. On the street before the town-house the lawyers have a fort of exchange, as the public minifters have at an eminent toy-shop in the same neighbourhood. The emperor, and feveral princes of Germany, have their own post-houses here, managed by persons of their own appointment; but the post-house for England and Holland is the only one that can properly be faid to belong to the public. The British resident and company have a stately hall built by themselves; and the refident has a power of judging fuits and differences that arife among his countrymen. There is an opera or play-house here, chiefly for the entertainment of the relidents and other foreign gentry, of whom here are fome from most trading kingdoms in Europe.

This city, which is almost of a circular form, and about fix miles in compass, is naturally ftrong, a great part of it lying upon iflands. The walls and fortifications, that lie open to view, are covered with grafs, and planted with rows of trees, fo high, that none of the houses are to be feen without that fide of the walls which is next to Altena. It has fix gates, and three entrances by water; two from the Elbe, and one from the Alfter. It is divided into the Old and New City by a canal, and furrounded by a fine high wall, with 2 3 bulwarks, belides other out works and fortifications, in the modern way, and a very deep ditch. There is also a noble line, or out-work, with other works, from the largest bason of the Alster to the Elbe, about half a mile above the town; and on the other fide of that bason, about the midway betwixt that and the Elbe, below the town, there is a very fine fortification, called the Star-Sconce, to ftrong, that the king of Denmark, with all his army, could not take it in 1686, after fix weeks fiege. In the New Town, towards Altena, there are large fireets of poor houses, chiefly inhabited by

The two channels, called the North and South Elbe, into which that river is feparated, two or three miles above this city, having, with fome finaller ones, formed divers beautiful islands towards Harburg, that belong to his Britannic majefty; re-unite in one channel, about fix miles below the city. Towards the east it is washed by the little river Bille; and towards the north by another little river, called the Alfter, which forms a very large basion just without the town; and another, though not so large as that, yet of at least 1000 feet square, within the walls of it; after which it drives the public mills, and, passing by several suices and canals, through the whole city, falls into the Elbe. Here are 84 bridges, 34 water mills, (besides 6 windmills,) and 6 sluices; and it has sikewise 6 large mar-

kets. A chief ftre 22 from damaged have bee inflances fo comm fhips cor fize anch unload i crooked. high and usually r make 4s. citizen d and forei to trade.

kets. As the tide flows in canals through most of the chief streets, and runs 4 leagues above the city, i.e. 22 from the river's mouth, the town is frequently damaged by fpring-tides; and houses and families have been ruined by tempests. There were two fad instances in 1651 and 1719. Though the harbour is fo commodious, and river so deep, that large merchantfhips come up to the walls, yet those of extraordinary fize anchor at the new mills, 4 miles below, where they unload into finaller veffels. The streets are generally crooked, but pretty wide, and outstrip all Germany for high and stately houses, which are mostly of brick. They usually reckon here by ftivers and lubs, of which 48 make 4s. 6d. (or a dollar.) It is the custom, when a citizen dies, to leave the tenth of his estate to the city; and foreigners, not naturalized, pay annually for liberty to trade.

Hamburg has a diftrict for 12 miles round, abounding with excellent pastures, with confiderable villages, and noble feats. It comprizes the bailiwicks of Rutzenbuttle, Bilwerder, Ochsenwerder, and Eppendorf. Alte-game, New-game, Kirchwerder, and Roflacke bailiwicks, are enjoyed by the Hamburghers, in common with the citizens of Lubec, as are a castle, and the little town and bailiwick of Bergedorf. The merchants here are affable, but too nice in punctilio and ceremony; very frugal in their families, but as liberal in treating strangers. They much affect gardens at the city gates, in the tafte of Holland. Scarce a merchant or confiderable shopkeeper but has his coach. The common carts are only a long pully laid on an axle-tree between two wheels, and drawn by men, of whom 12 or more are fometimes linked to those machines, drawing 2 tons weight. Graduates at law are very numerous, though hardly a tenth of them employed in it. Every artificer, who can perform a piece of work beyond his brother artifts, is made free of his company; a benefit not otherwise to be attained, but by servitude, marrying a freeman's widow or daughter, or at a very great expence. By the vigilance of the magistrates and their beadles, few or no beggars are to be feen in the streets; which may be ascribed also to the manufacture of knitflockings, which is fufficiently extensive to employ all the poor. Officers are employed to carry wool to be carded, fpun, &c. by the poor at their own habitations, and then fetch the work, paying them due wages. The ladies are generally attended to the church by a fervant maid with a book, hanging by a filver chain on one arm; and, if it be cold weather, with a brafs flove on the other. The hangman's house is the common prison for malefactors. After sentence (which is always pronounced on Fridays, as execution is done the following Monday) malefactors are carried to a handfome upper room, where they are allowed a good bed, and all reasonable comforts suiting their condition, and are confrantly attended by fome clergyman in rotation. As no criminal is punishable without pleading guilty, they have five degrees of tortures to extort fuch confestion, in proportion to the strength of evidence to fupport accutation. The judges are always prefent, with a clerk to write down the confession, at a table with a curtain drawn round it; so that they can hear and fpeak to the tortured criminal, without being eye-witneffes of the cruelty.

A walk runs by the great bason of the Alster from the play-house to the heart of the city, called the Maidens Walk, 1000 feet long, and 20 broad, railed and bordered by trees on each fide. On one fide is the water with feveral stairs, on the other a row of noble houses. Many convents, &cc. still remain; but, being fecularized, are now Lutherans. The tenure of one of them is still continued by offering a glass of wine to every malefactor carried by to execution. People of the best fashion regale in a cave, an odd kind of tavern, which has a prodigious stock and vent of old hock, &cc. which is well regulated by a deputy of the magistrates, and brings in a confiderable revenue. Corn is meafured by the schepel, of which 83 make 10 quarters English; and 100 Hamburg ells make but 48 and a half in London. Hamburg and Lincoln are in the same latitude; but it is considerably colder in winter, and hotter in fummer, at the former.

The Diocese of HILDESHEIM is situated between the rivers Lerne and Ocker. The bailiwick of Hunderfuch lies separate from it, being enclosed by the principalities of Calenburg and Grubenhagen. This diocese is 40 miles long and 30 broad; and the foil is fertile in grain, hops, oak, ash, flax, pulse, beech, and birch. It is likewise productive of salt, stone, iron ore, black cattle, hogs, horses, sheep, game, &c.

The inhabitants derive plenty of fish, of various kinds, from the rivulets which water this country. The states consist of clergy, nobility, and burgesses.

The religion is Lutheraniim; the manufactures are cloth, porcelain, flockings, iron ware, &c.

The principal places are as follow: Hildesheim, on the Innerste, the capital of the

diocese, situated 15 miles from Hanover, is an oldfashioned, large, irregular town. The magistracy and burghers are, in general, Lutherans. The principal buildings are the cathedral, several monasteries and nunneries, many churches, the chancery, the nobility's hall, where the diets are held, the Jefuits college, the Jews fynagogue, the gymnafium, and the Latin school of St. Lambert. The magistrates possess civil and criminal jurisdiction, impose and collect duties, and apply them to public uses. The town was antiently one of the Hans, and the capital of Henry the Lion; and in the neighbourhood there are two rich abbies.

Peina, on the Fuse, has a garrison, an episcopal palace, a capuchin convent, and a Lutheran church.

Weddingen is a commandery of the Teutonic order; Salz-Detfurt a market town, with falt-works; Mark Olderdorf a market town on the Ilme; and Salzliebendall a market town, which contains falt-works, and feveral convents.

Lamipringe is a town on the Lannue, where there is an English Benedictine feminary, whose abbot is poffeffed of the lower jurifdiction of the town, and is also patron of the Lutheran church.

Gronau, on the Leine, contains a Dominican convent, and gives name to a bailiwick; Bekenem is a town whole benefice is in the gift of the elector of Brunswic; Elze, on the Saal, is possessed of a high and low jurisdiction; and Alfeld, on the Leine, has fimilar privileges.

GOSLAR, though an Imperial city, and independent of the Brunswic family, is usually described in this country, because it is surrounded with their dominions. It is a large ancient city, 22 miles fouth-east of Hildetheim, 25 fouth of Brunswic, and 26 west of Halber-It was built in 1201, by the emperor Henry I. who had a palace here, and also fortified it. It stands on the fouth fide of the Gofe, which rifes to the fouthcast of Cellerfeld, and falls into the Ocker near the confines of Hildesheim. Goslar enjoys the same privileges as other free Imperial cities, besides an exemption from tolls in all markets of the empire but three. In all Imperial writs it is called Nobile Membrum Imperii. The houses are covered with flate. It is fituated in a valley, furrounded with mountains, in which are mines both of iron and filver, viz. those of Steinberg, Hertzberg, Ramelfberg, Klockenberg, &c. The inhabitants are employed either in digging them, or cleanfing, tempering, and vending the metals and minerals, of all forts, that are dug out of them. It has been the refidence of the emperors, for the take, it is supposed, of hunting; and because they have often attembled the states here, it has been called a palatinate city.

The emperor Frederick II. anno 1235, with confent of the states of the empire, granted to Otho I. duke of Brunswic, the tenth of its mines. The house of Brunswic has pretentions to this city; and several of its princes have endeavoured to establish them by force of arms, but hitherto in vain. The protectorship of

it is in the king of Great Britain, as elector of Hanover, alternately with the duke of Brunfwic-Wolfenbuttle. There is no religion tolerated here but the Lutheran. It was in this city that Barthold Schwartz, the Benedictine monk, is faid to have found out the

art of making gun-powder.

The Imperial Lordship of Schauen is situated between the principality of Halberstadt, and the county of Wernigerode. It belonged formerly to the abbey of Walkenreid, but now belongs to the duk? of Brunf-

The Imperial City of NORDHAUSEN is fituated on the Zorge, about 21 miles fouth-east from Gossar. It was formerly one of the Hans-Towns, is celebrated for its curious works in alabafter and marble, and carries on a great trade in the distillery branches. The inhabitants and magistracy are Lutherans; to the latter of whom the elector of Brandenburg, in 1717, transferred all his rights and prerogatives to this city. in confideration of being paid a flipulated fum. In the diet of the empire it has the tenth feat on the Rhenish bench of Imperial cities, and the fourth among those of Lower Saxony.

The Imperial City of MUHLHAUSEN is fituated on the Unftrut, 40 miles eaft of Caffel. It contains 2 Lutheran churches, with a Roman Catholic foundation for Augustine nuns. In the 14th century this city purchased, of the emperor Lewis, the office of Imperial judge within the city and its precincts. It poffeffes the ninth place on the bench of Imperial cities in the diets of the empire, and the third in those of Lower Saxony. It was formerly one of the Hans-Towns, and has at prefent a tolerable trade.

BLANKENBURG and REINSTEIN, though two counties, are usually confidered together as one chief town. These counties, together with Quedlinburg, Hohenftein, Stolberg, and Schwarztburg, in Upper Saxony, already described, were formerly one province, and then called Hartzingow, i. e. the Hyrcanian County, having been a part of the ancient Hyrcanian Forest, now called Hartz, of which there ftill remain great woods and parks, that abound with game. They are fituated fouth from Brunswic, fouth-west from Magdeburg, west from Halberstadt, north from Thuringia, and east from Hildesheim. It is so cold a country that the fnow lies on its mountains till Midfummer, and affords little corn; but the vallies are filled with cattle. The inhabitants are ftrong and vigorous, and many of them live to a very great age. There are iron mines in their mountains, one of which, called Brocken, or Brocksberg, the Bructerus of the Latins, is reckoned the highest in Germany.

Betwixt Blankenburg and Elbingerode is a remarkable cave, called Buman's Hole, (from its difcoverer, Buman,) which has a narrow entrance; but none ever found the end of it; though some of the miners have affirmed they have gone as far in it as Goflar, which is 20 miles. Large bones of ftrange creatures have been often found in it, which the neighbouring gentry keep for rarities; and, among others, the skeleton of a giant. There are two great rocks near the convent of Michaelstein, and not far from Blankenburg, which reprefent two monks in their proper habits, as nicely as if they were carved out, and therefore are called the Monks Craigs. Many castles are found in these counties on the tops of inacceffible rocks, and fome actually hewn out of the rocks; but they are not regarded. The most remarkable of them is that near Brocksberg, which, the inhabitants fay, was built 300 years before Christ, by the Chauci, a branch of the Saxons, who had an idol and temple of Saturn here, which were destroyed by Charlemagne, who called the place Hartzburg. A falt-fpring being discovered at the bottom of this hill, in the time of Julius, duke of Brunfwic, he built a small town for the workmen, called Julius Hall, which is now grown rich and large, by the trade in falt, copper kettles and pots, wire, &c.

The people of this country are represented as the dulleft in all Germany, and mere bigots to the institutions and cuftoms of their ancestors. This perty county was left by the late duke Anthony-Ulrich, of Wolfenbuttle, to his fecond and favourite fon, prince Lewis, to make him fome compensation for the right of primogeniture, which he had newly introduced into his family, to that fon's prejudice: for the Brunswicprinces had been long used to a partition of lands in their families, till that cuftom, fo pernicious to great ones, was first abolished by the Hanover branch. As this county neither gives its pofferfor the rank of a fovereign prince, or admittance into the college of princes at the diet of the empire, the then duke of Blankenburg, in order to procure himself both these privileges, made a treaty with the elector of Hanover, whereby the latter yielded him the vote and feat which he enjoyed in the diet for his duchy of Grubenhagen; and the duke engaged never to vote at the diet but in conformity to the fentiments of the elector; but after his decease, the vote and session for Grubenhagen reverted to the elector.

The town of Blankenburg is fituated 8 miles west of Quedlinburg, and 40 fouth of Wolfenbuttle, on the frontier of the principality of Anhalt. It is but fmall, and the houses are ill-built and inconvenient. One of the dukes, who had a castle here, offered the inhabitants materials for building gratis, and did all in his power to inspire them with taste, and the arts, but

without fuccef.

The County of RANZAU is about to miles long, and fix broad, and has a foil tolerably fertile. It was formerly called the bailiwick of Barmftedt, afterwards erected into a county of the empire, by the emperor Ferdinand III. Barmftedt, a market town on the Acce, and Elmshorn, another market town on the same river, are the only places of any confideration in the whole county. 1 15

The principality of RATZEBURG belongs to the Strelitz family, but does not contain any place worthy of notice, except the town of Ratzeburg, where the regency, treasury, and consistory are held, but which belongs to the duchy of Saxe Lawenburg; and the town of Sconberg, which gives name to a bailiwick, and formerly contained an epifcopal palace.

The principality of SCHWERIN is furrounded by the duchy of the fame name, and the lordships of Wismar and Roftock. It is 20 miles long, fix broad, and was formerly a bishopric, but fecularized at the peace of Weitphalia. The only places worthy of notice are

Butzo, a town where the bishops formerly resided: and Rhun, which gives name to a bailiwick, and contains a convent for ladies who are nobly born.

The county of HALDEN lies along the Elbe, is 8 miles in length, the tame in breadth, and borders on the territory of Hamburg. It is very fertile, abounds in grain, fruit, cattle, and fish; has its own courts, ecclefiaftical and civil; and was ceded, in 1731, to the elector of Bruniwic. The inhabitants are Lutherans; and the only town is Offerndorff, on the river Meden.

The Duchy of SAXE-LAWENBURG is the fartheft province of his Britannic majefty's German dominions. It is watered by the Elbe, which divides it; and is bounded by Holftein on the west and north, by Lunenburg on the fouth, and Mecklenburg on the caft.

This county is not very fertile in grain, but abounds in flax, pafturage, wood, cattle, fifh, &c.

It is about 80 miles in length; and its greatest breadth is near 26 miles. The manors, entitling to a vote and feat in the diets, are 23 in number; and the ftates are composed of the nobility and burghers. Lutheranism is the established religion; and the clergy, in general, of this duchy, may be placed as patterns for those of most other countries; for their attention to their holy function, their humility, humanity, zeal, and benevolence, are fuch, that they feem to merit, individually,

the following character which Dryden gives of the good priest:

The tythes his parish freely paid he took, But never fu'd or curs'd with bell and book; With patience bearing wrong, but off'ring none, Since every man is free to lote his own. Yet of his little he had fome to spare, To feed the famish'd, and to clothe the bare : For mortify'd he was to that degree, A poorer than himfelf he could not fee. True priefts, he faid, and preachers of the word, Were only flewards of their fov'reign lord: Nothing was their's, but all the public ftore, Entrusted riches to relieve the poor; Who, should they steal for want of his relief, He judg'd himfelf accomplice with the thief. And still he was at hand, without request, To ferve the fick, to fuccour the diffres'd. He duly watch'd his flock by night and day, And from the prowling wolf redeem'd the prey, But hungry fent the wily fox away. The proud he tam'd, the penitent he chear'd, Nor to reprove the rich offender fear'd. His preaching much, but more his practice wrought, (A living fermon of the truth he taught:) For this by rules fevere his life he fquar'd, That all might see the doctrine which they heard : For priefts, he faid, are patterns for the reft, The gold of heav'n, who bear the God imprest; But, when the precious coin is kept unclean, The fov'reign's image is no longer feen. If they be toul on whom the people truft, Well may the bafer brafs contract-a ruft. With what he begg'd, his brethren he reliev'd, And gave the charities himself receiv'd; Gave while he taught, and edify'd the more, Because he shew'd, by proof, 'twas easy to be poor.

Both the nobility and commons derive their privileges from an act called the Lawenburg Act, which was granted by George I. king of Great Britain, and confirmed in all its articles by his fucceffors. The Lutheran fuperintendant, appointed by the king of Great Britain, is obliged to visit the feveral parishes annually.

Here are but few manufactures; but many commodities are transported from hence to other countries, particularly rye, cheefe, timber, butter, wool, wood, &c.

Here is a regency fubordinate to that of Hanover, and a high tribunal, the members of which are appointed partly by the king, and partly by the states; but an appeal lies to Zell. The duchy has a contistory of its own; and the colleges meet at Ratzeburg. The principal places are

Ratzeburg, 12 miles fouth of Lubec, fituated on an iffund in a lake of the fang name. It is the feat of a regency, confifory, and chief court of juffice; has a fine bridge, a beautiful walk planted with limes, a cathedral, a caftle, and a ftrong garrifon.

Lawenberg, on a hill near the Elbe, has a confidera-

Lawenberg, on a hill near the Elbe, has a confiderable trade, particularly in corn and wood. It is 35 miles eaft of Hamburg, has a toll, and contains the veftiges of a ducal palace.

Mollen, a finall town, 16 miles from Lubec, is almost furrounded by lakes; Grunau is a market-town; Buchen, a village, where diets are held; and Schwarzenbach gives name to a bailiwick, which contains two copper mills and a paper mill.

THE CIRCLE OF WESTPHALIA.

SOME derive the name of this country from Weiffenphalen, i. e. a white horse, the arms of its ancient dukes; but others more probably from Westfield, or Westvelden, the country of its ancient inhabitants the West Saxons, on the west side of the Weser, betwixt that and the Rhine; as the country on the other side was called Oostvelden, or Eastsield. It stretches No. 69.

along the west side of the Weser, from the German Ocean on the north, to Hessia on the south; and between Lower Saxony on the east, and the Netherlands on the west. The greatest extent, from south to north, is about 200 miles, and 150 from east to west. The air, especially in the northern part, is very cold; and great part of the soil is marshy and barren. However, it has plenty of corn and pasture; but the fruit is very ordinary, and serves chiesly to feed the swine, of which this country has good store of an excellent kind; so that the bacon, and particularly the hams, they send abroad, are very much esteemed. The chief rivers are the Weser, the Embs, the Lippe, the Roer, the Aa, &c. The accommodations a traveller may meet with here, are humourously expressed in a distich, very common in Germany, which, in English, runs thus:

Four things here will drive a traveller mad; Long miles, small beer, coarse bread, and lodgings bad.

Westphalia, indeed, is confessed to be the most wretched part of all Germany; and some writers are of opinion, that the temper of the people is, in a great measure, influenced by the climate. They are good soldiers upon the whole, but have not talents in common with the other Germans; for they apply themselves much more to the breeding of cattle, than the cultivation of arts and sciences. The greater part of this circle is a prey to the tyranny and avarice of certain petty princes, both spiritual and temporal, who, having great vanity, and small revenues to support it, are thereby induced to plunder, rather than protect, their subjects. The nobility boast of the antiquity of their pedigree, but display neither elegance in their manner of living, or the least degree of hospitality in their disposition. There are, in this country, almost as many different religions as princes, such as Jews, Roman Catholics, and Protestants, with their various subdivisions; but the major part of the latter are Calvinists.

When Charles the Great had conquered the Saxons, and planted Christianity among them, he erected several bishoprics here, to which he gave lands for their support. In the circle of Westphalia are three very considerable ones, who had sovereign princes, and increased their dominions at the general partition that was made of the great dukedom of Saxony, after the proscription of Henry the Lion; and then it was that the bishop of Munster enlarged his country, and that the archbishop of Cologne obtained that part of Westphalia which he still holds, and by that tenure stilles himself duke of Westphalia. The elector palatine, as duke of Juliers, and the king of Prussia, as duke of Cleves, are alternately condirectors of this circle, with the bishop of Munster.

The territories contained in this circle are the follow-

The bishopric of PADERBORN, which is surrounded by the dominions of Hanover, Hesse, and Munster, has the county of Lippe on the north and west; Hesse-Cassel, and Waldeck, on the fouth; and Munster, and the duchy of Westphalia, on the west. It is 40 miles from east to west, and, in some places, 30 from north to fouth. It is not very fruitful in corn; but abounds to much in cattle, that drovers come hither from the neighbouring countries to buy at their fairs: and they have rich falt springs, and some iron mines, with plenty of deer and other game. It is fo populous as to contain 25 market-towns, 54 parifhes, 16 monafteries, and 20 gentlemens feats, all fubject to the bishop, who is a prince of the empire, and whose see is one of the most considerable in Germany. The chapter is composed of 24 capitular canons, who are all obliged to fludy in some French or Italian university, must be 21 years old, and prove their noble extraction by four degrees. The revenues of this fee, which is a fuffragan of Mentz, and now enjoyed by the elector of Cologne, are

very confiderable; and the bishop is able to raise a body of 3000 men. In this bishopric is the famous field of battle, where Quintilius Varus, with the Roman army under his command, was routed by the Germans under Arminius, and the latter thereby freed from the

Roman yoke.

In the transactions of the Royal Society, published in December 1665, there is an account of a fpring in this territory, which lofes itself twice in 24 hours; but returns with a great noise, and such force, as to turnthree mills not far from its fource; for which reason it is called Bolder Born, i. e. Boifterous Spring. There is another remarkable fountain, called Methorn, two miles from Paderborn, which is a terrible fpring; two parts of which, not a foot and an half from each other, have very different qualities; the one limpid, blueish, lukewarm, and containing fal-armoniac, ochre, iron, vitriol, allum, fulphur, nitre, and orpiment; the other cold as ice, turbid, and whitish, with much the same contents, but stronger in taste, and heavier than the before-mentioned. It is faid to be a perfect cure for the worms. All fowls that drink it are immediately thrown into convulfions, but foon recovered by an infusion of common falt and vinegar. The third spring, which is about twenty paces from the other two, is of a greenish colour, but very clear, tastes both four and Iweet, and is supposed to be a mixture of the other two.

The city of Paderborn, which is one of the Hans Towns, is a large, well built, fortified, and populous city, 20 miles east of Lippe, and about 60 fouth-west of Hanover. This city was imperial till 1604, when Theodore, its bishop, became both its spiritual and temporal sovereign. Some of its churches are magnitemporal fovereign. ficent. Its cathedral is a grand fabric, inferior to few in the empire. Otho II. gave a golden crucifix to it of 60 pounds weight, to the value of 60,000 guilders, or about 8000! fterling. The bishop's palace is a de-cent structure; but the bishops, when they vouchsafe to visit this small benefice, which is not very often, refide feven miles off, at Nienhus, a castle built in 1590. An univerfity was founded here in 1592, by the bishop of Furstenburg; and though this city stands not far from the Lippe, which joins with the Ulme, near Nienhus, yet it has its name from the Pader, a rivulet which has its rife just under the high altar of its cathedral, and

Born, i. e. a fpring.

In 777 Charlemagne held a general convention here of the Franks and Saxons, where a great number, both of Saxons and Westphalians, were haptized. He built a church here that was destroyed by the Saxons, but rebuilt, in 795, by Wittekind, the great duke of the Saxons, who then, it is faid, translated the fee hither from Heristell, five German miles off, where it had been first planted by Charlemagne. In 999 the cathedral, with its library, &c. and the best part of the city, was destroyed by fire; and it had the like mi fortune in the years 1058, 1133, 1165, and 1340. This city was first walled round by its bishop, in the beginning of the 11th century. In 1530 the inhabitants attempted to introduce Lutheranism; but the bishop executed 16 of the principal citizens who had embraced it, and forced the rest to abjuse it. In 1622 the bishop of Halberftadt, who was duke Christian of Brunswic, made a confiderable booty here, and fent the gold and filver images of the faints to the mint. In 1633 it was taken by William, landgrave of Heffe; but delivered up to the emperor in 1636. In 1646 it furrendered to the Swedes and Heffians; but the latter were foon drove out of it by Francis William, bishop of Osnaburg.

Neuhaus is a borough with a caftle; Altenbecken is a village with a remarkable fpring; Salzkotten has its name from its falt fprings, and is the feat of the land diets; Lichtenau has the fame privileges; Wunnenburg takes its name from a victory obtained here by Charlemagne over the Saxons, and Buren, on the

Alure, has a college.

Lippespring derives its name from the Lippe, near the mouth of which it is fituated. It is customary for the Popish inhabitants of these parts to assemble once a year, each with a lighted taper, and, headed by their priefts, to repair to the woods and groves, to visit images and relics placed there in little chapels, which, except upon these occasions, are never opened.

Warburg, formerly an Imperial city, and one of the Hans, is the fecond city in rank in the bifhopric, and the feat of a diet. In the neighbourhood are mines of iron and lead; and a ftrong palatable beer is brewed by

the inhabitants.

Brakel, on the Bruckt, was formerly an Imperial city, but is now greatly decayed; and Drinkenburg has a citadel, and is a feat of the land diets.

Beverungen, near the conflux of the Bever with the Wefer, is famous for its falt-fprings, and has fome trade; and Oldenburg, on the Houta, has a good trade by barges; and the neighbouring farmers breed great quantities of cattle.

The Bithopric of MUNSTER has the county of Mark, and duchy of Westphalia, on the fouth; Embden and Oldenburg, on the north; the county of Bentheim, and the United Provinces, on the west; and Ofnaburg, Paderborn, and Ravensburg, on the east.

This is the most extensive of all the bithoprics in Westphalia, being 80 miles in length, and about 60 in breadth. It has some fruitful plains, a few woods, and many quarries of ftone; but is, in general, a fterile country. The principal rivers (which abound in fish) are the Embs, Vecht, Lippe, and Berkel. Great numbers of black cattle are bred here.

The provincial diets, which confift of the clergy. nobles, and town deputies, are held at Munster; and the greatest part of the inhabitants are Roman Catholics. The bithop of Munster, who is also utually elector of Cologne, has a very confiderable revenue, can maintain 8000 men, and is heir to all strangers who die in his territories without children. The chapter of Munster, besides the bishop, consists of 40 canons, who must be all of noble deicent. The principal places

in the bishopric are the following:

Munster, the capital of the bishopric, and of the circle, derives its name from a monaftery erected here by Charlemagne. It is fituated at the conflux of the river Aa, with the Embs, or Enns, 37 miles fouth-west from Olnaburg, and 450 north-west from Vienna. It s capacious, ftrongly fortified both by art and nature, and of a circular form. Here is a noble city, called the Brille, which was erected by the celebrated bishop Bernard Van Galen, to be a check upon the burghers. The cathedral is also a superb and noble edifice. Befides thefe there are feveral fine convents, and other beautiful buildings, furrounded by very pleafant gar-The bishop was formerly nominated by the emperor; but fince the beginning of the 13th century, the privilege of nomination is in the dean and chapter. This city is celebrated for three famous transactions: First, the revolution in 1533, occasioned by a number of enthufiafts, who being headed by a taylor, denominated John of Leyden, from the place of his birth, difpoffested the magistrates, took possession of the city, turned out the burghers, and perpetrated the most horrid cruelties. At length, in 1536, after a long fiege, the place was taken, and John of Leyden, who had affumed the title of king, with feveral of his adherents, were executed, and their bones hung up in iron baskets on the top of the highest steeple in the city. Second, the treaty concluded here in 1648, which terminated a 30 years war. Third, the noble efforts it made in defence of its liberties, against the tyranny and usurpation of the bishop Bernard Van Galen.

Beckhem and Ahlen, on the Weser; Telget, on the Einbs; and Warendoff, on the same river, have all feats in the land diets. The latter has a capital linen

manufactory.

Coesfeld is the largest town in the bishopric next to Munster; Coppenburg is independent of the bishop; Werne, near the Lippe, sends deputies to the diets; Bocholt, on the Aa, has a confiderable iron work; and Memmem

Be-

Memmem is a town and fort, at the conflux of the | Hafe and Ems.

At Weerdt, on the Isfel, the Protestants are tolerated; Vechla is a town and fort on the river of the fame name; and Cloppenburg is a fmall town, 22 miles north-east of Meppen.

The bishopric of LIEGE is bounded, on the north, by Brabant; on the fouth by Luxemburg and Champagne; on the west by Namur and Hainault; and on the east by Limburg and Juliers. It is about 90 miles long, but very unequal in the breadth. The foil is fruitful, the air temperate, and the earth rich in mines of iron, lead, and pit coal. The rivers are the Maeie and Sambre.

The manufactures of Liege are beer, ferge, leather, arms, nails, marble, &c.

The flates are composed of three bodies, the chapter of Liege, the nobility of the country, and the deputies of the capital.

The bishop is both temporal and spiritual lord of the country; but, in the latter capacity, fuffragan to the archbishop of Cologne. The chapter consists of 60 persons, who must prove their descent to be noble for four generations, from both parents, or have diplomas from fome celebrated university. The most considerable places are the following:

Liege, the ancient Leodium, called Luyck by the prefent inhabitants, (the capital,) is fituated on the river Maeie, 12 miles fouth of Maestricht, 30 miles north-east of Namur, and 50 miles fouth-east of Bruffels, in 5 degrees, 36 min. eaft long, and 50 deg. ference. It is a populous wealthy city; two branches of the river Macie, and other rivulets or canals, running through feveral of the streets, and forming little islands. No city in Germany can equal it in fine churches or convents. There are not less than 100 churches, and a very numerous clergy belonging to the churches and monafteries, which are most pleasantly situated, and have ample endowments. Among other religious houses, here is one of English nuns, and an university of great fame.

The fortifications of the town, which are not very ftrong, are commanded by the neighbouring hills; but the citadel is capable of making a good defence. Its bishop, who was elector of Cologne, put it into the hands of the French, at the beginning of queen Anne's war; but the duke of Marlborough took it from them, anno 1702: and the French belieging it again, anno 1705, they were obliged to raise the siege by the same general, on his return from the Mofelle.

The magistrates of Liege pretend that it is an imperial city, or fovereign ftate: but they have fuffered very feverely for disputing the authority of their bishop, who is, in fact, absolute sovereign of the city, as well as the bithopric. He is chosen by the 60 major canons, who are, most of them, of noble extraction. This bishop is one of the most considerable ecclesiastical princes in Germany, having within his diocefe 52 baronies, 18 walled towns, and 400 villages, full of people, with a revenue of 300,000 ducats per annum, and is able to maintain a body of 8000 men, without oppreffing his fubjects, who are generally Roman Catholics.

The trade of the inhabitants is most considerable with Holland. Great quantities of iron, stone, chalk, &c. are every day carried down thither by the Maese; and herrings, cheefe, butter, and all kinds of grocery, are brought back in return.

There is a proverbial faying prevails here, to the following tenor; That this city is the women's hell, the men's purgatory, and priefts paradife. The women are compleat flaves; as they draw their boats up the river instead of horses; dig, saw, and carry all kinds of heavy burthens. The priefts have truly their paridife here; for the greatest princes of Europe make interest to be of this chapter, because the revenues and power of it are greater than any other can boast of. As to the

poor laity, if to have no money in their pockets, and their consciences at the absolute will and disposal of the priests, may be called a purgatory, we shall not find this proverb to fall very short of the truth.

Tongres, or Tungri, a very ancient town, fituated on the river Jecker, 10 miles north-west of Liege, and 10 west of Maestricht, was of great same in the time of the Romans. When Atilla, the Hun, took it, he destroyed 100 churches; for it was very early made a bishopric: but the see, upon its decline, was removed to Maestricht, and from thence to Liege.

Huy, or Hugum, fituated on the east fide of the Maele, formerly called Benefactum, a town of great note antiently, is at present a strong fortress, 15 miles south-west of Liege; and was frequently besieged during the wars in the Netherlands.

Dinant, fituated on the river Maese, 12 miles fouth of Namur, was taken by the French, but restored to the bishop of Liege by the peace of Ryswick, anno 1697.

Bouillon, fituated on the river Semoy, 30 miles fouth of Dinant, and about 10 miles from the frontiers of Champaign, is a fortified town, and, with a fmall territory annexed to it, gives the title of duke to the bishop of Liege. Of this place the famous Godfrey was duke, who, for his conduct and courage in fubduing Jerusalem, and taking it from the Saracens, in the 11th century, was made the first Christian king of

St. Tren is famous for its Benedictine abbey, the abbot of which names one half of the magistrates of the place, and the bishop the other; and for several convents of nuns and friars.

Tranchimon, fix miles from Liege, gives name to a marquifate; Verviers, on the Weze, has a confiderable woollen manufactory; Cuivin, fituated on a hill, is only noted for the ruins of an old castle; Thuin, on the Sambre, has a collegiate church, and some convents; Haffelt, on the Damer, is a small pretty town; and Lobbes, a Benedictine abbey, is immediately fubject to the fee of Rome.

Spa, or Spaw, is a small but celebrated town, on the little river Weze, 20 miles distance from Liege towards the fouth-east, and 7 from Linsburg towards the southwest. The avenues to it are exceeding stony and difficult; and it is fo furrounded by mountains that you cannot fee it till you approach very near to it. In traveiling to Spa, either by Liege or Aix-la-Chapelle, the way lies chiefly through uncultivated defert, and those almost rocky. There are nothing but mountains on every fide, which fucceed one another, and over which travellers have made fome imperfect traces of a road. The rains and tempelts, which are frequent there, even make the paffage fometimes dangerous, by rolling down great stones from the precipices. The coachmen of the country are themselves often at a loss, because the tracks are defaced between feafon and feafon. The town confifts of 4 streets, in the form of a cross, and may contain about 400 houses, for the convenience of those that come to drink the waters. It was formerly a mere village; but, through the fame of its mineral fprings, has been enlarged, and erected into a bo-

Here are five principal wells, which go down with fteps, like that at Tunbridge. The chief well, called Pouxhon, or Pahon, in the market-place, is the most reforted to, and has this inscription upon it, which expreffes the qualities of the waters:

Sanitati sacrum:

Obstructum reserat, durum terit, bumida siccat, Debile fortificat; fi tamen arte bibas.

That is to fay, " Sacred to health, these waters open obstructions, concoct crudities, dry up excessive moisture, and ftrengthen what is weak, provided you take them with precaution." It is from this fpring they draw

that prodigious quantity of water which is transported into foreign countries, and especially into England and Holland, sealed up in bottles, with the town feal.

Next to the well of Pouxhon, there is a fountain of fresh water, which has its spring in a meadow, half a mile diffant from the town. The bottom of it is of blue stone and the top of bras: it spouts its water out of the mouths of three frogs, whence the people

call it the Toad's Fountain.

The well called Geronsterre, or Geronstar, is in a wood, about two miles diffant from Spa, towards the fouth-west. It is covered with a dome of blue-stone, fupported by four pillars of red and white marble. It is confiderably less plentiful of water than the former, and yet the most frequented. The three other wells, called the Saviniere, the Watroz, and the Tannelet, or little Tun, are not much used. The deafons for drinking these waters are in the hot months of June, July, and August. These waters have been known many ages ago.

The Capuchins have a very fine monastery at Spa, adorned with large gardens, where all the company walk who drink the waters. The inn, called the Court of London, is very large, and the best and most fre-

quented.

Several princes, who have been here, have left proofs of their liberality; particularly Margaret de Valois, queen of France, daughter to Henry II. fifter to Henry III. and wife to Henry IV. who was here in the year 1577. Henry III. king of Poland and France, who was here in 1585. The famous Alexander Farnese, duke of Parma, in 1591: And, at one time, king Charles II. of England, the king of Denmark, and the Great Duke of Tuscany: And, in 1717, Peter the Great, czar of Muscovy, drank the waters here during feveral weeks.

The people are good-natured, and speak the same Walloon, or barbarous French, as at Liege. They are governed by a mayor, two burgomafters, feven Echevins, and a recorder, named by the prince of Liege, and changed by him every year. The people employ themselves in making boxes for ladies toilets, fouff and other boxes varnished after the manner of China-wares, which they fell to the company as they go

from the wells.

This town, being reforted to by people from all parts of Europe, on account of its waters, has been always allowed a neutrality during the hotteft wars.

The country round it is not very fruitful in corn. being chiefly woods, mountains, and heaths; but it abounds with fprings of mineral and fweet water, and in feveral forts of game; and the little rivers, which flow from the mountains, produce plenty of trout, and other kinds of fish.

The czar, Peter the Great, erected a monument here, in commemoration of the benefit he received from drinking their waters; the infcription upon which is as follows:

PETER THE FIRST, by the grace of God, emperor of the RUSSIANS,

Religious, happy; invincible Restorer of military discipline, And first planter of all sciences and arts among his people; Who having, by his own industry, Built a most powerful fleet of ships; Having infinitely augmented his armies, And having fecurely fettled, in the very blaze of war,

His realms, as well hereditary as acquired, Went abroad;

And having fearched into the manners Of the feveral nations in Europe Came through France to Namur and Liege, To these waters at SPA, As to the haven of health;

And having happily drank of those most healthful springs, Particularly that of GERONSTERRE,

Was restored to his former strength, And his defired health, In the year 1717, 22d of July; Thence returning through Holland To his hereditary dominions,

Ordered this eternal monument of his gratitude to be erected, 1718.

The bishopric of OSNABURG is fituated between the Wefer and the Ems; being bounded by Minden on the east, Munster on the west, Diepholt on the north-east, and Ravensburg on the fouth-west. It is about 45 miles long, and 25 broad, and produces rye, pasturage, cattle, turf, coals, marble, &c.

The inhabitants, who are partly Protestants and partly Roman Catholics, cure great quantities of, and

deal confiderably in, hams, bacon, &c.

By a treaty concluded here in 1648, this bishopric was to be an alternative between the Roman Catholics and Protestants; and the Protestant bishop was always to be a younger prince of the house of Brunswic-Lunenburg, or, in case of failure thereof, of Brunswic-Wolfenbustle. In confequence of this flipulation, his prefent Britannic majesty's second son, Frederick, born August 16, 1763, is now bishop of Ofnaburg. But though this bithopric is thus alternatively hereditary in this Protestant family, it is not so with regard to its Roman Catholic bishops; for they are chosen out of different families, by a chapter of 25 canons, of whose prebends the revenues of 18 are enjoyed by the Romish ecclesiastics; those of four are appropriated to the support of a college; and the other three by the Lutheran canons, who are capable of electing, but not of being elected, bishops, as the Roman Catholics are. When they have a Popish bishop, he is suffragan to the archbishop of Cologne: but the Protestant bishop, who is a temporal prince, indeed, has little to demonstrate him an ecclesiastic, but the title; and it was agreed, by the treaty aforefaid, that when there is a Protestant bishop, the archbishop of Cologne should suspend the exercise of his metropolitan jurisdiction, with regard to the Protestants. Since the reformation, introduced here in 1634, the bishop, whether Papist or Protestant, has little more than the name; the Lutherans not allowing the exercife of episcopal jurisdiction, and the Papists not being firong enough to obtain it for the bishop of their own opinion. It is observed by historians, that Charles the Great, who founded this fee, and dedicated the cathedral to St. Peter, and the two martyrs Crifpin and Critpinian, exempted its bifhop from all manner of homage and fervice, except in an embaffy, at the emperor's charge, to negotiate any march that should be proposed betwixt the families of the caftern and western emperors.

The revenue of this bithopric amounts to upwards of 30,000l, and the bishop is able to raise 2500 men; though he has only one hereditary officer, a grand maitre, or fleward. The manufactures are coarle linen, woollen and yarn. The diets are held at Ofnaburg; and the principal places are the following.

Oinabrig, or Oinabrig, the capital, was formerly an imperial city, and one of the Hant, but is now subject to the bishop. It has its name from a bridge over the Ose, which divides it into the Old and New Town; and is fituated 67 miles west of Hanover, in the midst of a fine plain. It is a neat, well-built city, and adorned with feveral handsome public structures. It is encompassed with walls and ditches; but commanded by a mountain within cannon that; upon which there is an abbey, or facred retirement, for men of quality. The bithop's palace, called Petersburg, or St. Peter's caftle, is well fortified, and separated from the town by a bridge. It is an hexagon, with a court in the middle, and at each corner a turret. In one of the apartments of this palace George I, expired, the 11th of June, 1727, in the arms of his brother, prince Ernest, and, as some say, in the very room wherein he was born.

born. The

It is

The Papifts hold the cathedral church, and the church and monaftery of the Dominicans in the Old City, and the collegiate church of St. John in the New. The Lutherans have the great parochial church of St. Mary in the Old City, and a voice in chufing the magistrates of both: therefore the government of the city is mixed. Here are three convents for monks, and five for nuns. The inhabitants, who are very industrious, not only breed abundance of swine, and other cattle, but carry on a considerable trade in making linen; in brewing a palatable, though thick fort of beer, called Buse; and in making the best white bread in all Westphalia.

In the cathedral are still seen some ornaments of Charles the Great, among which are his crown of silver gilt, his comb, battoon face. As the exercise of both religions is equally freel neither Papists or Protestants are molested during the government of a bishop of the opposite persualibn. The Brunswie samily having considered this city and bishopric as part of their territories, it is observed, that when the possession of it comes to their turn, they are more than ordinarily careful of it, and less exacting on their subjects, than where the incumbents possession on their subjects, and chuse to make the best of their possession, without regard to the benefit of their fuccess.

Iburg, or Iborg, about 10 miles fouth of this city, is only noted for a commodious cattle, in which its biftop formerly refided. It was taken and plundered by Philip the Great, of Brunfuic, in 1972.

the Great, of Brunswic, in 1553.

Furstenau gives name to a district, which contains 15 parishes, and formerly had a palace, where the bishops resided. In one of the parishes round Borstel, is a noble foundation for Lutheran ladies.

Widenburg, on the Ems, is a fmall town, with a collegiate church, two nunneries, and a magistracy of its own.

Melle is a borough, containing a Roman Catholic and a Lutheran church, and having a council and burgomafter of its own.

Vorden has the fame privileges as Melle, and contains a church, common to both Lutherans and Roman Catholics.

Quackenburg, on the Hofe, is a little town, with a Lutheran and Popith church; and the revenues of the college of canons is divided between both religions; but one of the Lutheran canons of Ofnaburg is always provoft of Quackenburg.

The county of Hove, one of the elector of Hanover's domains, has Bremen on the north, Minden on the fouth, I unenburg on the caft, and Diepholt on the weft. It formerly belonged to counts of an ancient Saxon family, to whom it was given by the emperor Lotharius; but after the death of the laft, in 1582, it was divided between the families of Brunfwic and Heffe. Hoye and Nyenburg, Liebenaw and Bruckhaufen, became fubject to the duke of Lunenburg; the forts of Seltzenaw, Ezenburg, and five more towns, to the house of Brunfwic; and Freudenburg and Ucht to the landgrave of Heffe; the latter of which gave their fbare to the counts of Bentheim: fo that now it belongs almost wholly to his Britannic maieffy.

its chief town, of the same name, stands on the east fide of the Weser. It is small, but well fortified, having one of the strongest castles in Westphalia.

Nyenburg, on the east bank also of the Weser, 10 miles south of Hoye, is another well-fortisted town, which sustained several sieges during the wars of Germany. It was formerly the residence of the counts of Hoye; and its territory abounds with all forts of grain, fruits, pasture, and cattle. It has a castle on the west side of it, with broad deep ditches, and a good rampart, which commands the Weser, and great part of the town, which has strong walls, with a double ditch, and other works, that almost surround it. It had a fine bridge over the Weser, which, being ruined, is supplied by serry-boats, to preserve the commerce between No. 70.

the two circles of Westphalia and Lower axony, which consists chiefly of corn, wool, flax, honey, wax, and cattle. Nyenburg has also a fine parts church, with all the ornaments that architecture can give it; in which are the monuments of many of the counts of Hoye.

Old Bruckhausen is a borough, with a castle and manor belonging to the sovereign; Liebenaw contains manufactories of lace and scythes; Drakenburg is a borough on the Weser; and Harpstadt is a borough on the Delme, with a territorial jurisdiction.

Baffum is a borough belonging to the landgrave of Heffe; but it contains a noble foundation for ladies, of which the king of Great Britain is the fuperior; Kellingerode has a fimilar foundation; and Suhlingen, the refidence of a fuperintendant, has four confiderable yearly fairs.

The country of Vernenburg appertains partly to the archbishop of Treves, and partly to the count of Lowenstein-Wertheim, both of whom it entitles to a seat and voice in the Westphalian college, and also in the diets of the circle. It is almost furrounded by the archbishopric of Treves, and contains only one place worth notice, viz. the borough town of Vernenburg, which is defended by a citadel.

The county of STEINFURT, which is 15 miles long, 10 broad, and furrounded by the bishopric of Munster, belongs partly to the empire, and partly to the primate of Munster; is watered by the Aa, and gives to its count a seat and voice in the Westphalian college, and in the diets of the circle. The only place worth notice is the town of Steinsfurt, which stands on the Aa, and contains a Calvinist and Roman Catholic church, a commandery of St. John, and a college for the study of the liberal arts.

The Duchy of Verden, which is, in length, 22 miles, and in breadth 18, is bounded by Hoye on the fouth, Bremen on the north, Lunenburg on the east, and the Weser on the west. It is well watered, but the soil is poor. The inhabitants are Lutherans; and the whole belongs to the king of Great Britain, who, on account of this duchy, has a seat among the princes at the diets of the empire, and those of the circle. The only places worthy of observation are,

Verden, on the Aller, the capital, 50 miles fouthwest from Hamburg, which was once an imperial city, strong and populous, is now decayed; but, however, still contains a cathedral, three other churches, and a Latin school.

Rotenburg, on the Wumme, 15 miles from Verden, has fome trade, is populous, and formerly contained a bifhop's palace.

The small district called the Abbey of Corver, is tolerably fertile, watered by the Weser, and has a Benedictine abbey, founded by the emperor Lewis I. The first monks having been taken from Corbie in Picardy it is called Corbie, or Corvey Abbey, which abbey is the only place deserving of notice in the district, the abbot being a prince of the empire, and having a feat in the college of princes, and at the diets of the circle and the empire.

Malmed is a small town, situated amongst high hills, on the little river Lecht, 25 miles distant from Liege to the south-east, and nine from Limburg to the south. They reckon here about 400 houses, most of them inhabited by leather-dressers, or woollen-drapers. Here are several springs of mineral waters, which some physicians say are as wholesome and strong as those of Spa. This city, though within the territory of the prince of Liege, is, nevertheless, in spiritual matters, under the juristiction of the archbishop of Cologno. The parochial church is dedicated to St. Gereon the Martyr; and here is a convent of Capuchins, and another of nuns of St. Sepulchre. But it is chiefly remarkable for its abbey of Benedictine monks, under the same abbot with that of Stavelo.

STAVELO (erroneously called Stablo by some) stands on the little river Ambleve, which falls into the Recht.

It is about 6 miles distant from Malmedi to the east, and 9 from Limburg towards the fouth. There are here about 400 houles; and the inhabitants carry on a pretty good trade; tho' this town being quite open, has suffered very much during the wars. Here is a famous abbey of Benedictine monks, founded in the year 657, at the sametime with that of Malmedi, with which it is united under the fame abbot. But the jealoufy between these two religious houses is the reason why they can never agree in choice of a regular abbot from amongst themselves; fo that ever since the year 1576 they have always chofen commendatory abbots.

The abbey church, which is at the same time parochial, is a flately building, after the modern tafte. Under it there is a Crypta, or fubterraneous church, with five altars. The abbot of Stavelo, who is ftiled a prince of the empire, is spiritual and temporal lord of this town, and of its territory, which is very large, in-cluding the town of Malmedi; and his yearly income

amounts to about 12,000 crowns.

The trade of this town confifts in woollen cloth, and other stuffs, and chiefly in a great quantity of leather curried here. There are also some mineral springs, faid

to be very wholesome.

The district belonging to the Abbey of Werden is fituated in the county of Mark. St. Ludger, whole effate it was, in 778 founded the abbey for monks of the order of St. Benedict. The revenue is about 20,000 rix dollars. The king of Pruffia claims the right of fovereignty here; and the only remarkable place is Werden, a little walled town on the Roer, which, befides the abbey, contains a Lattheran church.

The diffrict, or territory, of the Abbey of Sr. Con-NELIS MUNSTER is furrounded by those of Juliers, Limburg, and Aix-la-Chapelle. The abbot has a feat at the diets of the empire, on the Rhenish bench of prelates; but at those of the circle he fits among the

The Abbey of Effen, and its territory, is furrounded by Berg, Cleves, Werden, and the county of Mark. The abbey was founded by Alfred, biflop of Hildescheim, in the year 877. The king of Pruffia is hereditary protector. The abbefs files herfelf princefs of the holy Roman empire. The chapter confifts of none but noble ladies, and the abbey has a featin the diets of the empire and circle. The hereditary officers are the marshal, steward sewer, and chamberlain.

Effenwick, the only place of any confideration in the territory, is fubject to the abbefs as its fovereign, but has very extensive privileges. It is large, has some trade, a cloth manufactory, an academy, a gymnafium, a commandery of the Teutonic order, and feveral Ro-

man Catholic and Protestant churches,

The Abbey of THORN is fituated in the bishopric of Liege, and county of Hoarn. It is an Imperial free fecular foundation; was erected in the year 1000; has a feat at the diets of the empire and circle; and a chapter, which confifts of princesses and countesses, of the order of St. Benedict

The Abbey of HERFORD, fituated in Ravensburg, was crected in the eighth century, has a feat at the diets of the empire and circle, gives title of princefs and prelatefs of the holy Roman empire to its abbefs, contains none but noble canoneffes, and is a Lutheran foundation. The number of ladies is indeterminate. The abbess is superior of the collegiate church of St. Mary of the opposite mountains, and the prebends are in her gift. The canoneffes wear a fearlet ribbon, with a filver border hanging from the right fhoulder, having a cross at the end, with the figures of our Saviour and the Virgin Mary; and on the left breaft is a star, with the same figures.

The Duchy of BERG is 50 miles long, 20 broad, and takes its name from being mountainous. It is bounded on the west, by the Rhine; on the east by Westphalia; on the north by the county of Mark; and on the fouth by the electorate of Cologne. Though mountainous, in many places, in some parts it produces corn, pasturage, fruit, vines, wood, and herbs; is rich in coals, iron, &c. The manufactures are cloth, iron and steel. The fame regency and diet serves for this duchy and that of Juliers. The most considerable

places in Berg are the following:

Duffeldorp, at the conflux of the Duffel with the Rhine, is 20 miles from Cologne, and 57 from Mun-It stands in the midst of a fine fruitful plain. The Rhine runs against it with such violence, that they have been obliged to make great works to break the current. It was an Imperial city, and had a good trade before the removal of its fairs to Frankfort. It is large, pleafant, well built, and defended by a citadel, which is separated from it by a small harbour, formed by the Rhine, and confifts of two royal baftions faced with brick; and in the other parts it is fortified by five baf-tions. The public buildings, towards the river, make a fine appearance; particularly its flately palace, an old Gothic building, (with paintings by Van Dyke, Raphael, Paul Veronefe, Rubens, Julio Romano, Titian, &c. brafs antiques, flatues of marble, portable cabinets, &c.) which was the elector palatine's chief refidence during the devastations of the palatinate by the French towards the end of the last century. In the market-place, over a ainst the palace, is an equestrian flatue in brass, on a pedeflal of grey marble, of the elector John William, in armour, with the electoral bonnet on his head. Here are three weekly markets for corn, which is imported hither from the low countries, and exported in great quantities to Cologne, and other parts of Germany. The elector's refidence being fixed at Manheim, a regency is established here, for the countries of Berg, and Juliers, which bring in a great revenue to the elector, are governed by flates, without whose consent he can lay no taxes. All religions are here tolerated; but the Catholics alone are admitted to civil employments. Though the pofferfion be the elector's, yet the title is disputed by those of Saxony and Brandenburgh.

Ratingen has a feat and voice at the diets; Solingen is famous for its (word-blade manufactory , Neffelrode gives name to an ancient and noble family; Lennest has the first place and voice at the diets, and a cloth manufactory; Elverfeld has a manufactory of thimbles; and Kornberg is defended by a strong castle.

Bensberg has a strong fort and monastery, of the order of the Holy Cross, which was built in 1298, and is the first of its kind in the empire. The castle, or palace, here, was built in a forest, on a hill, by the elector John William, and is worthy of notice. It stands three leagues from the Rhine, between Cologne and Duitz. It is built of a very hard stone; and the ornaments, particularly the pillars that support the gallery in the front, are a kind of grey marble, dug out of the neighbouring quarries. The apartments are large, well decorated with the finest paintings; and they have an extensive prospect of the city of Cologne, the Rhine, and all the flat country; containing a great variety of beautiful fcenes and enchanting landscapes.

Principalities of NASSAU-SIGEN, OF SIEGEN, NASSAU-DILLEMBERG, &c.

Sigen, or Siegen, near which is an iron mine, stands on the river Siega, 15 miles from Dillemberg, and 30 north-east from Nassau, on the top of a rocky hill, defended by a strong wall, and regular fortification; and gives names to a county, of which it is the capital, as well as title to another branch of the Naffau family. In 1559 the prince of Naffau-Siegen's Pædagogium was brought hither from Herborn, and foon became fo fa-mous, that it was frequented by fludents from Germany, Poland, Livonia, Denmark, &c. to which an academy was added for training up youth in martial exercises. There is a castle here, in which the elector of Cologne keeps a garrifon as director of the circle; and not far from hece is a very good iron mine.

Dillemberg stands on the river Dilla, 16 miles west from Marpurg, and 32 north-east from Nassau, and gives name to a county. It has a good trade in cattle and woollen goods, and two yearly saits. The counts of that branch, called Naffau-Dillemburg, had their feat in a fine strong castle, that stands on the top of a neighbouring hill, where is a large arfenal, furnished with arms and ammunition for several thousand horse and foot; and the jaw-bone of a monstrous whale caught near Catwick in 1598, which is worth fee-ing. The castle is surrounded by the town, which is built in a femicircle to the west, north, and east; and there is a fine church, where the counts of this branch The court guard is on the fouth fide of are interred. the caffle, and adorned with pavilions, walks, and other embellith ments.

Beilstein, or Beilinstein, 15 miles north-east from Naffau, gives name to a county which was the inheritance of the Hadamars, a younger branch of the family of Nassau, and was the capital of it. It is an old town among rocky hills; but has a castle, and a church, worthy a traveller's view. It lies in the midway betwixt Coblentz on the west, and Marpurg on the

Hadamar is the capital of a territory on the confines of the electorate of Treves, which had the title of a principality before the extinction of that branch of the Naffau family. It stands on the Lohn, 20 miles north of Mentz, and is defended by a good caftle.

The County of SAYN belongs respectively to the margrave of Brandenburg Anfpach, the burgrave of Kirchburg, the counts of Witgenshein and Hornburg,

and the Elector of Treves.

The two first have a voice in the college, but all together have only one voice in the diet of the circle. Lutherans, Calvinifts, and Roman Catholics, have equally the free exercise of their religions. The only places worth mentioning are,

Altenkirchen, the capital, and feat of a regency, which contains a Lutheran and Calvinist church, and is

defended by a caftle.

Freufburg, on the Sieg, is defended by a fortrefs, as is the neighbouring town of Triedwald; and Hachen-

burg, which has a strong castle.

The County of WIED is divided into two parts, New-Wied, or Lower County, and Wied Runkel, or Upper County. The only places here are Runkel, on the Lohn, a small town, containing about 120 houses, and a castle; Dierdorf, which is defended by a fortrefs; and New-Wied, a fmall but regular town on the

The County of SHAUENBURG is watered by the Wefer, and furrounded by Calenburg, Minden, Lippe, and Raventburg. It produces corn, pasture, falt, allum, cryftals, with gold, filver, wood, fheep, free-stone, limeftone, pit-coal, gipfum, copper, iron pyrites, cattle,

It is 30 miles long, 20 broad, and the inhabitants are mostly Lutherans. The county belongs partly to the king of Great Britain, the landgrave of Hesse, and the count of Shauenburg Lippe.

The two first have a diffine voice in the diets of the

circle, and a joint voice in the college of the Westphalian counts of the empire. The principal places are,

Hagenburg, with a castle, post-house, and manufactories of linen and buckram; Steinhude, on the Steinhuder lake, with the fame manufactories as the former, and a fifnery; and Sadthagen, which is well fortified, has a caffle, orphan house, a stately mausoleum, and a

celebrated mineral fpring.

Shauenburg, from which the county derives its name, at prefent exhibits only the ruins of an old castle; Visbeck, on the Weser, has a Lutheran foundation for an abbefs and 12 ladies; and Mollenbeck is the vestige of an ancient cloister in a neighbouring

Buckburg is remarkable for fix things, a strong castle, a beautiful church, a well endowed orphan house, an elegant town school, a large Calvinist church, and an ad-

mirable fountain in the market-place.

Rinteln, a fortified town between the Weser and Exter, has an university, the professors of which are partly Lutherans, and partly Calvinifts. Here is a regency, confiftory, and fuperintendancy; and fome trade is carried on by means of the Weser. To the university of Town belong the revenues of Egestors, formerly a Benedictine nunnery.

Soltorf is famous for its fine white falt; Obernkirchen for a noble foundation for Lutheran ladies; and Ro-

denberg for its castle and medicinal spring.

The County of DELMENHORST, which is tolerably fertile, is furrounded by the Weser, Oldenburg, Diepholt, and Wildhausen. The government is vested in the regency of Oldenburg; and the only place of any confideration in it is Delmenhorst, from which it takes its name. This town is fituated on the river Delme, and has a strong castle to defend it.

The County of OLDENBURG is 40 miles long, 30 broad, and bounded by East Friesland on the west; Delmenhorst, and the Weser, on the east; Jover and Jode on the north; and Munster on the fouth. fecured by dykes against inundations, and produces pasturage, cattle, and turf. It is noted for its horses.

The king of Denmark, to whom this county be-

longs, is entitled in right thereof to a feat and voice both in the Westphalian college of counts of the empire, and in the diets of the circle. The administration is vefted in a regency, fubordinate judicatories, a royal confiftory, and a fuperintendance. The princi-pal places in this county are,

Oldenburg, a town regularly fortified, and fituated at the conflux of the Hunte and the Haare. It has a caffle, which is now the refidence of the regency; and a church, which was formerly the burial place of the counts of Oldenburg. The celebrated horn, called the horn of Oldenburg, was once kept in the castle, but it is at present in the museum at Copenhagen.

Varel, fituated in a wood, called The Bufh of Varel, was formerly the capital of a feigniory, and had a wing

of its fine castle burnt down in 1751.

The County of BENTHEIM is 40 miles long, 15 broad, furrounded by Munster and the United Provinces, and abounds in wood, stone quarries, grain, pafturage, honey, venifon, game, cattle, fruit, and fifh. It has linen and woollen manufactories. The count has a feat and voice in the college, and in the diets of the circle. The inhabitants are Lutherans, The principal Calvinifts, and Roman Catholics.

Bentheim, from which the county takes its name, a large borough town, 30 miles north-west from Munster. It is defended by an old caftle, where the counts refide, is fituated in a wood, and has a Roman Catholic

and a Calvinist church.

Wietmarfen has a noble foundation for ladies, and a feat and voice at the land diets; Schuttorf, on the Vechte, is the oldest town in the county; North-horn, furrounded by the Vechte, has a tolerable trade; and Frenswegen, a cloister of regular canons of the order of St. Augustine, has a feat and voice at the land diets, and was formerly the burial place of the counts.

DORTMUND is an Imperial city, has a feat and voice at the diets of the circle, and also at those of the empire. It was formerly one of the Hans-Towns, has four Lutheran churches, two monasteries, and one nunnery. It is populous and rich, has a communica-tion with the Rhine by means of the Empfer, and car-

ries on a tolerable trade.

The Imperial City of AIX-LA-CHAPELLE is 15 miles north-east from Limburg, 13 fouth-west from Juliers, and 23 north-east of Spa. It lies in a valley, furrounded with mountains and woods; yet it enjoys a very wholesome air; and the hills are covered with vines. Its Latin name, Aquifgrafium, is supposed to be derived from Serenius Granus, lieutenant-general of Gallia Belgica, who, having discovered the springs

here, anno 53, adorned them like the Roman baths. and built a palace near them: in confirmation whereof the natives still shew, at the end of the town house, a piece of ancient architecture, which they call Granus's Tower, and fay it was a part of his palace; though the building does not appear fo ancient. According to Charlemagne's Pragmatic Sanction, this Granus was brother to Nero and Agrippa; and the Chronicle of Utrecht fays, he was banished hither by Nero. Artila, the Hun, having plundered and destroyed this city, it lay in ruins till the time of Charlemagne, who, hunting in the neighbouring woods, his horse happened to strike his hoof into one of the springs. The emperor observing this, and finding, by the ruins of feveral great buildings, that this must have been the old Aquis, ordered the baths to be searched out, and rebuilt; founded and endowed the collegiate church of St. Mary, in which he employed a great quantity of marble, that he fent for from Rome and Ravenna; and was fo charmed with the fituation of the place, that he built a palace here, together with all that part of the city which is enclosed by the old wall; and made it the feat of his empire on this fide the Alps; ordaining, that the future kings of the Romans should be crowned here with an iron crown, as at Milan with one of filver, and at Rome with one of gold; which, though observed for a while, has been long since

Both the palace and town were burnt in \$82, by the Normans; but the church, having fo much marble, flood its ground. After the town was rebuilt, it fuffered much by other fires, in 1146, 1172, 1224, 1236; and particularly in 1656, when 20 churches and chapels, and 5000 houses, were burnt; but soon after re-built. In 1688 the samous treaty was made here between France and Spain. This town is called, by the French, Aix-la-Chapelle, from a chapel in the great church, where are abundance of reliques. It is noted for feveral councils, in the time of Charlemagne, and Lewis the Pious, concerning the procession of the Holy Ghoft, reformation of manners, the regulation of monafteries, and fuch as had feized the patrimonies of the church. It fuffered much during the civil wars of Germany, when most of the citizens were Protestants: but the marquis de Spinola took the town in 1614, and re-established Popery : so that the Protestants have not fince been allowed any place of worship here, but go to church about two miles off, in that part of Lim-

burgh which is subject to the Dutch.

Succeeding emperors continued to honour this city with their presence, and to enlarge its privileges; so that it was made free and imperial. They were crowned here for 500 years after Charlemagne, as is expressly ordained by the golden Bull of Charles IV. but ever fince Maximilian I. when 37 emperors had been crowned here fucceflively, that ceremony has been performed at Frankfort, which, being in the centre of the empire, is more convenient for the princes; but particularly for the spiritual electors, and for the elector palatine, who may fend for their equipages, and return them back by the navigable rivers, the Rhine, Maine, &c. Nevertheless, the emperors, when crowned at Frankfort, protest, it shall be without prejudice to the privileges of this city: for Charlemagne having himfelf been a canon of its cathedral, and ordered his fucceffors to be fo, they take an oath as fuch, when crowned; at which time the magistrates fend Charlemagne's fword, shoulder-belt, and the works of the four Evangelists, in golden letters, to the elector of Mentz, who gives fecurity for refloring them to this city when the coronation is over.

This city recovered its loffes in the above-mentioned fires, by the bounty of feveral emperors, and the great concourse of people to its baths. Frederick I. built the outer walls, towers, and ditches, in 1172. The circuit of the whole city is a league and a half, and the inner town three quarters. The inner wall has 10 gates, and the outer 11. The town-house, or senate-

house, which was built in 1553, and fince repaired by the citizens, in hopes of having the congress there, and not at Soissons, is a noble structure of free-stone, and one of the finest in Germany. It is adorned with the statues of all the emperors fince Charlemagne, and with curious history-paintings; particularly those by Amissaga, highly valued; among which are that of the refurrection, and that of Charlemagne's giving the city their charter. The uppermost story of it is one hall, 162 feet by 60; in which the emperors, who formerly received their first crown of iron here, used to entertain the electors, and other princes, who affifted at the coronation. In the market-place, over against the town-house, there is a large stately fountain, with four forings, that run, from above, into a copper ciftern 30 feet in diameter, and weighing 12,000 pounds. Round the edges of it there is a Latin infeription, importing the discovery of the hot spring by Granus; as well as the renewing of the baths by Charlemagne; as that the cold fountain did formerly run into the baths; and that the fenate adorned it, with this ciffern, in 1620. From this the water runs, by fix pipes, into a stone cistern below, and from thence it is conveyed through the city. On the top of the fountain there is a large brafs statue of Charlemagne in armour, richly gilt, with his face towards Germany. As the city lies in a valley forrounded with mountains and woods, there are 20 other public fountains of good and clear water, befides many private ones. Here are ten hot mineral fountains, and fome cold ones, without St. James's Gate, befides feveral in the adjacent fields; and the ftreams that run through the town keep it very clean, and drive feveral mills.

Here are 30 parochial or collegiate churches, be-fides the cathedral, a large old-fathioned Gothic pile, which was confecrated by pope Leo III. in presence of the emperor Charlemagne, and 365 bishops. The steeple, at the west end, is adorned with several pyramids; and on the top there is a large globe and crofs. From this tower, which is much higher than the body of the church, runs a gallery, supported by a long arch, to a cupola near the middle of the fabric. The infide is beautified with a vaft number of pillars of marble and brafs, gilt statues, brafs doors and partitions, and a great deal of Mofaic work. Over the place where Charlemagne was first interred hangs a large crown of filver and brafs gilt, adorned with 16 fmall towers, furrounded with 48 statues, each a foot high; and 32 leffer flatues, all of filver; among which are commonly placed a 8 candlefficks; and, at certain grand feftivals, no lefs than 450 tapers. This crown was the gift of the emperor Frederick I. who, removing Charlemagne's body, interred it in a filver coffin, under the altar of the choir, and covered it with the white marble tomb-flone it had before, with the buft of Proferpine upon it, supposed to have been taken from the tomb of Julius Cæfar. Out of this tomb were taken a great many rarities and reliques, which the faid emperor had got from Aaron, king of Perfia, the Patriarchs of Jerufalem, Conftantinople, &c. Here is also the monument of the emperor Otho I. in black marble.

The four chief reliques shewn to pilgrims here, at the jubilee, once in feven years, are thefe: (1.) What they call the gown, faid to be worn by the Virgin Mary at the birth of Our Saviour, made of a fort of flax, that feems to be neither linen or callico; and being only exposed from the top of a high tower, it is not easy to determine what part of apparel it is. (2.) A coarfe linen cloth, faid to have been girt about Our Saviour on the crofs. (3.) A piece of the cord he was bound with. (4.) Some of the blood of the protomartyr St. Stephen, richly inchafed in gold and precious stones, on which the emperors are fworn at their inauguration. Here is the picture of the Virgin Mary, with Our Saviour in her arms, emboffed on a jasper, about two inertes broad, found in the emperor Charle-magne's tough, and laid to be the work of St. Luke; also a MS, copy of the gospels, in a cover of filver-

filvergilt,

gilt, found in the same tomb; and Charlemagne's fword, put on by his fuccessors at their coronation, and used in the dubbing of knights, and conferring other honours. At the east end of the cathedral Our Saviour is represented sitting in state, with a long robe, on a throne, round which are the four animals reprefented in Ezekiel's vision. Over his head is a circle of golden stars; and underneath is a symbol of the crofs, which appeared to Constantine when he defeated Maxentius. Here is also a representation of the 24 elders, mentioned in the Revelations, rising from the seats, laying aside their crowns, and falling down before the throne. The windows are curioufly gilt, and the pavement is of chequered marble. an immense treasure here, consisting of vessels of gold, and silver-gilt, copes embroidered with pearl, and other rich veitments. Over the chief altar there is a cheft of filver and gold, of antique workmanship, and curiously engraved, in which are kept the four reliques above mentioned. At the entrance of the choir there is a pulpit, covered with plates of gold and filver, and adorned with precious stones, especially a very large agate, the gift of the emperor Henry II. The altar of the choir is covered with plates of gold alfo, reprefenting Our Saviour's paffion, which, it is faid, was found in Charlemagne's fepulchre. In the upper part of the church, over-against the prince's altar, between two pillars, is a throne, or chair, of white marble, supposed to have been placed there by the emperor Charlemagne, in which the emperors used to fit when consecrated, and receive the first obesidance of the electors and the chapter of the cathedral, in quality of king of the Romans. It is not polifhed, because it was formerly covered with plates of gold, though they are not now to be seen.

The emperor, as duke of Brabant, and the elector palatine, as duke of Juliers, are protectors of this city. The latter names the mayor, or conful, who is for life; and affifted in the government by 2 burgomasters, or joint confuls; 14 eschevins, or aldermen, who are also for life, and act as judges; and 120 common-council, that are elected, as are likewife the burgomafters, by 15 trading companies of the burghers, and continue in

their office two years.

The baths of this city are well known, and much frequented by the English, and most other Europeans. There are three within the inner walls of the Old Town, viz. the Emperor's, the Little Bath, and St. Quirinus's. Charlemagne was fo much delighted by the first, that he often invited his fons, and his nobles, to bathe and fwim there with him; for it was the cuftom anciently to bathe there, an hundred, perhaps, together; but it is now divided into five bathing-rooms. The Little Bath joins to it; and the fprings of both rife fo hot, that they let them cool 10 or 12 hours before they use them. They are impregnated with nitre and fulphur; and fometimes cakes of brimftone and falt-petre, of a confiderable thickness, are taken out of them. They are unpleafant to the tafte at first, and fmell like a rotten egg.

Near these baths there is a fountain of warm water, much reforted to in fummer mornings, and drank for chronical difeases. Those in the New Town, which are the Rose Bath, the Poors Bath, and St. Corneille's, are not fo hot and clear as the former, and their smell is somewhat offensive. Near the hot springs lie many cold ones, by which their heat might be tem-pered; and, with a little charge, they might be made the most delightful baths in the world. A physician of eminence fays, that bathing in these waters is good against all nervous diforders; fuch as convulsions, palfies, numbrefs, trembling, fciatica, gout, fwellings, diffempers of the bowels, vertigoes, tingling of the ears, nephritic diffempers, moist and cold affections of the womb, barrennefs, abortion, scabs, and the dregs of mercury. Though they are properest for bathing, they are also drank, in several cases, with success, against hot distenspers of the liver, splcen, reins, and bowels; obstructions of the mesentery, pancreas, liver, No. 70.

fpleen, and reins. They cure the yellow jaundice and its effects, a cachexy and dropfy. They are good against inveterate and stubborn fevers, tertian and quartan agues, and bleeding at the nofe. They produce good effects in the fcurvy, rheumatifm, and other diffempers, proceeding from too much ferum in the blood. They kill worms, dry over-moist parts, and help conception. They purge the urinary vessels of all impurities, cure stranguries and stoppages, and some-times dissolve and expel the stone and gravel. They are excellent against asthmas, and the most inveterate cholics, fcirrhous swellings, fcrophulous distempers, imposthumes of the mesentery, diarrhαas, ulcers of the mouth, and distempers of the gums and teeth. The drinking of these waters is relief also in melancholy and hypochondriacal distempers. They recover lost appetites, strengthen weak and slatulent stomachs, and quench immoderate thirst. From these virtues may be feen the agreement between the waters of this place and those of the English baths. In fine, all those baths, efpecially fome that are very lately repaired, are neat and commodious, the accommodations and provisions good and reasonable, and they are frequented

by the best company.

About a furlong out of the fouth gate lies the charming village of Borcet, or Porcet, which had its name from the wild hogs that abounded formerly in the neighbouring woods. Here are also many hot fprings on both fides of a fmall cool rivulet, which runs They are conveyed by pipes and through the town. conduits into 14 houses, in which are formed 28 baths. Some of them are much hotter than those in the town, and must be cooled 18 hours before they can be used. Their water is clear and pleafant, without any difagreeable smell. They are, for the most part, five or fix yards square. There is one quite open to the air, called the Poor Man's Bath, which has a spring so hot, There is one quite open to the air, callthat the people feald pigs, and boil eggs with it; but it is observed, that they only harden the yolks, and not the whites. These baths are not so strong as those in the city, and, of confequence, the better for weak people; and those of all ages and conditions bathe in them for their diversion, without any danger. They are good against the same distempers as the others, and particularly against defluxions of the head and breast, moift and fqueamish stomachs, dropsies, foft swellings, &c. and may be drank, as well as those of the city; but the latter are more solutive, and those of the village more strengthening. The fountains are, in both places, fo plentiful, that they are capable of filling, several times in a day, above 50 baths, of 60 or 70 tuns each; and most of them, but those for the poor, are so contrived, that the old water is drawn off by subterraneous conduits, and the baths cleanfed from all impurities. It is computed, that, from the baths in the city, and in this village, there flow 6000 tons of water per day, which carry as many pounds weight of falt. The first feason for these baths is about the 18th of May, the second about the 18th of August, and continues each time fix weeks.

The village of Borcet is well built, has four handfome churches, and a nunnery of Bernardines, whose abbefs is a princefs of the empire; but there lies an appeal from her court to the eschevins of the city.

The adjacent country abounds with corn, fruit, and pasturage. The woods furnish the inhabitants with materials for fire and building, as the quarries do with flone. They have also rich coal mines, besides others of iron, lead, vitriol, fulphur, und lapis calaminaris; and are well fupplied with necessaries by the Rhine and Maefe. The territories of the city are large, and contain near 200 villages, enclosed on all fides with mountains.

Befides the places already described, the circle of Westphalia contains the following less considerable counties, feigniories, &c.

The County of DIEPHOLT lies fouth of Delmenhorst, is 12 miles long, 5 broad, and contains a lake c alled Dummersce, Dummerfee, which abounds with fifth and wild ducks. The foil is sterile; and the inhabitants profess Lutheranism. Their trade is in coarse linen and woollen, which they manufacture, and also in black cattle. Diepholt, the only town, is a borough, fituated on the

PYRMONT, famous for its mineral waters, lies on the borders of Hanover, near Ludge, 38 miles fouthwest of Hanover, and 20 east of Lemgow. It is the capital of a county, with a very flrong fort, formerly fubject to its own lords, and now belongs to the prince of Waldeck. There is a great refort of German and other nobility hither to drink the waters, which are preferred even to those of Spa, and exported abroad from Bremen, to which they are carried by the Weser. In the neighbourhood are one or two falt-pits; and the king's iron and filver mines are not far off.

The county of Spiegelburg is held by the prince of Orange of the elector of Hanover; hence the civil and ecclefiaftical judicatories are subordinate to those of Brunfwic-Lunenburg; and the elector has a feat in the college, and at the diets. The only place in this county worthy of observation is Spiegelberg, an ancient cassle on a mountain, in the vicinity of which there is an hospital for old women, and a castle to which

pilgrimages are made.

The county of Rittburg is furrounded by Ravenf-

The county of Rittburg is furrounded by Ravenfburg, Lippe, Paderborn, and Ofnaburg. Its length is 17 miles, its breadth 6. Its count enjoys a feat and voice in the college, and in the diets of the circle; and its only town, called Rittburg, is fituated on the Ems.

The little diffrict of Gronsfeld was erected into a county by the emperor Rodolph II. and entitles its count to a feat in the college, and in the diets of the circle; as does the county of Reckum, which is feparated by the Maese from the duchy of Limburg.

The seigniory of Anhalt belongs to the prince of

The feigniory of Anhalt belongs to the prince of Salm, who, on its account, enjoys a feat and voice in the college, and in the diets of the circle; as does the count Metteruich, for the feigniories of Wrurienburg

The county of Holzapfel belongs to the prince of Anhalt-Bernburg-Hoym. The feigniories of Wittem, Eyfs, and Schlenacken, belong to the count of Platterburg; and both entitle their proprietors to a feat in

the college, and in the diets of the circle.

The counties of Blankenheim and Gerolftein, the feigniories of Gehmen, Gimborn, and Neufladt, Wickerhad, Mylendonk, Reichenstein, Kerpen, and Lommerfum, Schleinden, and the county of Hallermund, all entitle their respective proprietors to a seat and voice in the college, and in the diets of the circle.

THE CIRCLE OF THE UPPER RHINE.

THIS circle is bounded by the Lower Rhine, which almost interfects it, and by Westphalia, Franconia, Swabia, Upper Saxony, Lower Saxony, Alface, and Lorrain. It was anciently much larger, than it is at present, as a great portion hath been dismembered from it by France. The diets are held at Frankfort, the archives are kept at Worms, and it prefents two affeffors to the chamber of Wetzlar. Its divisions and fubdivisions are the following:

The Bishopric of Worms is about 12 miles in length. and 8 in breadth where broadest. It is intersected by the Rhine, and furrounded by the lower palatinate. In general it is barren, mountainous, and woody; though fome few parts are fruitful in corn and wine. The Protestants here are uniferably oppressed. The chapter chuses the bishop, whose revenue does not exceed 2,500l and who, in spirituals, is subject to the arch-

bishop of Menta

Worms, the capital city, is fituated on the west fide of the Khine, at the distance of 26 miles fouth of Frankfort on the Maine. While the Imperial chamber was kept here, it was one of the most considerable cities in the whole empire. It is celebrated for the great diet held here in the year 1521, to which Luther came according to his fummons; though his friends would fain have diffuaded him, by reminding him of John Huss, who was burnt by a decree of the council of Conflance, notwithflanding the paffport granted him by the emperor Sigifmund; but Luther, far from being terrified, faid, " That though he was fure to be engaged with as many devils as there were tiles upon the houses of Worms, he was resolved to go." He came hither accordingly; and made fuch a defence of his doctrine, that he was profcribed, and obliged to abfcond; during which time he wrote that book called his Works from the Defart. The Lutherans have only one church for their use; and the Papists have all the rest of the churches. The Calvanists have one at Newhausel, half a league out of the city, where the Lutherans fometimes feruple not to have their children baptizd, contrary to the cuftom of Frankfort. The town has no other fortification than a double wall; and is as large as Frankfort, ill-peopled, and poor. It was often taken and retaken during the civil wars in Germany; but fuffered most by the French, who, in 1689, laid in ashes, in a few hours, what had been the work of

In 1698 the Popish clergy, who had not been allowed to make any procession, except on the day after Faster, nor to carry the host in public, determining to carry it in procession through the streets on Christmas day, the magistrates sent a notary to forbid it; but the prieft, at the head of the proceffion, firuck him over the head with a cenfor that he carried in his hand. Most of the burghers, being Protestants, ran to affift the notary; but a great number of Popish peasants; brought in for the purpose, fired upon them, which so incensed the Protestants, that they drove the procession back to the church from whence it came, and wounded feveral of the Papifts, particularly the in-folent prieft. The Papifts complained of this as a breach of the treaty of Ryfwick, betwixt France and the empire, which reflored Worms, and its dependencies, to the bishop. The Protestants pleaded the treaty of Westphalia in their own defence. Some of the principal authors of the tumult were feized, and a Palatine regiment quartered in the city to prevent difturbances. At the fame time the elector enclosed it

The city is subject to the bishop, but under the protection of the elector palatine. The Papists, who are very numerous here, have the cathedral; but the ma-There is fo much vacant ground in the town as, being planted with vines, yields annually 1500 fodders of wine; each containing 250 English gallons. This wine is fo much effectively, that the magistrates make presents of it, with some fish, to princes, and other

travellers of quality. The prefent of the fish is to denote their right of fishery on the Rhine.

The churches of St. Paul and St. John are very ancient. The latter is built of vast square stones, in an irregular manner, with narrow windows, and galleries round the outfide, just under the roof; and the walls are above 12 feet thick; so that it seems to have been defigned for a fort rather than a church. The cathedral is a long, high, and ftrong fructure, with a tower at each of the four corners. The ornaments are Gothic; and over one of the gates there is an hieroglyphic, being a figure of the fize of an als, with four heads, viz, those of a man, an ox, an eagle, and a lion. The two first are looking upwards, and the two other downwards. It is supposed to be a representation of the four beafts in Ezekiel's vision; or, as some think, of the hieroglyphics of the four evangelifts. A woman fits on its back, which they fay represents the gospel.

There are two public halls here, in one of which the

magistrates affemble twice a week for matters of state, and in the other for the administration of justice. It was in the former that Luther, being heated with the debate, and the fire that was near him, called for a

glass of wine; which, being brought, he was so eager in his discourse, that he forgot to drink it, and soon after it broke to pieces on the bench, without any body's touching, or being near it; whence the Lutherans concluded that there was poison mixed with the wine; whereupon they broke the bench, and still kept the pieces as a memorial of his deliverance. A sine church was built here for the Lutherans not many years are was built here for the Lutherans not many years ago, in which the hiftory of that great man is well painted.

There is a mint here, which is a noble fructure.

with a spacious portico, where a vast number of bones and horns hang between the arches; the former of which, they fay, are those of giants that lived among the ancient Vangiones; and the latter, the horns of oxen that drew the slones which built the cathedral. The outfide of the house is adorned with many pictures,

particularly fome of those giants in armour.

Since this city was laid in ashes by the French, in 1693, it is little more than the shadow of its former beauty. The richest traders, considering how much both they and their ancestors had suffered by reason of their lying fo open to France, retired to Frankfort and Holland; fo that its chief support now is from the bishop and chapter; the first of whom, however, being always a pluralift, and often an ecclefiaftical elector, very feldom refides here. The citizens, as are, in-deed, those of most other Imperial towns, are very complaifant to firangers. There is a fenate, or fupreme council, here, composed of 25 members, whereof 13 are for life. There is the finest country in the world, from this city to Oppenheim and Fendale. fine fpacious plain in which it stands abounds with corn, vineyards, and fruit-trees. A wine is produced here, which is called Lieben-Frauen-Milch, i. c. Our Lady's Milk. The Rhine is about 3 or 400 paces from the town; but it is faid it formely ran close by its walls. Which way foever one approaches the town, the four towers of the cathedral are feen, which are all built of red free-stone. In the campaign of 1743 king George II. took up his quarters in this city, and lodged in the bishop's palace, after the battle of Dettingen.

Stein, though only a fortress on the river Weschnitz, gives name to a bailiwick; and Leiningen is a town on a mountain, the citadel of which was destroyed by the

Neuhaufen, Turkeim, Rhein, Hockheim, and Dirm-flein, are all boroughs, with Protestant churches; in which, however, the Roman Catholics are allowed to perform their religious duties.

The Bishopric of Spire is intersected by the Rhine. The other parts are furrounded by the territories of the elector palatine, and the margrave of Baden Durlach. Some parts are mountainous and woody, and others level and fertile, in corn, almonds, vines, and chefnuts. It extends 32 miles in length, and 12 in breadth. The bishop, though suffragan to the archbishop of Mentz, as a prince of the empire, has a feat and voice in the diets thereof, and of the circle.

The Imperial city of Spire is fituated on a delightful plain, on the eaft fide of the Rhine, 12 miles fouthwest from Heidelburg. It was erected before the time of Our Saviour, and the fee was founded in the fourth century. The magistrates, and many of the inhabitants, are Lutherans; but the Roman Catholics have many churches, convents, &c. It has a feat, and votes in the diets of the empire, and those of the circle, paying an affeffment to the empire, and the chamber of Wetzlar. The French, who burnt this city in the year 1689 murdered, indifcriminately, men, women, and children; deftroyed feveral valuable marble monuments of emperors and empresses; even ransacked the graves, and feattered about the bones of the venerable dead. Previous to this devastation it was the feat of the Imperial chamber. Since that time it has been built with additional beauty; but the Imperial chamber has been removed, At the diet held here in 1529, the word Protestant took its rife; fince which

time persons of the reformed religion have been diftinguished by that appellation. It is fingular, that the bithop is not permitted to refide in this city; and when he is chosen, before he is suffered to enter it, he must redress all complaints. Then, fitting on horseback, between the two outermost gates, with one hand on his left breast, he must give it his benediction. He then makes his public entry, and the citizens pay him ho-This city is under the protection of the elecmage. tor palatine. The fortifications are but very indif-

Philipfburg, eight miles to the fouth of Spire, was at first but a little town. Afterwards it was encompassed by a wall, and at length erected into a city in 1443. It is conveniently fituated for commanding the adjacent country, and was therefore fortified with feven adjacent country, and was therefore fortified with teven royal baftions, by Philip, bishop of Spire, (who was also bishop of Tiers,) in 1629, before the civil wars in Germany, and called by his own name. The elector palatine, Frederic V. under whose sovereignty and protection it was, suspicious of the bishop's designs in fortifying this place during a peace, ordered him to defift; but he refused, alledging, that he had the emperor's placart for his warrant. Upon this the elector raised troops, and demolished the fortifications; for which the emperor fummoned him and his confederates before the chamber of Spire, and defigned to proceed against them with the utmost severity, which was one of the causes of the civil wars in Germany. It has fuffered feveral memorable fieges, in the space of 100 years. Spinola, the Spanish general, repaired the for-tifications, and made it almost impregnable, in 1633-It was taken the year after by the Swedes, who gave it to Lewis XIII. and was retaken by the Imperialists in 1635. It was taken from them in 1644 by the French, under the prince of Condé, who joined the German Protestants. The French kept it till 1676, by virtue of the treaty of Munster; and Lewis XIV. added so greatly to the fortifications, that they extended to the Rhine, which lies a quarter of a league from the town; and over the great gate put a Latin infeription; thus, rendered into English:

" Lewis XIV. the most Christian king of France and Navarre, having finished the wars in both Ger-manies, and restored peace every where, caused this fortress to be strengthened with these ramparts and walls at his own royal charge, as a monument of his own valour, and of the recovery of the German liberty. He compleated it in 1666, for the terror of his enemies, the fupport of his allies, and a fecurity to the French; it being the fecond bulwark of France on this fide of the Rhine and a key into Company the law. fide of the Rhine, and a key into Germany; the lowest in fituation, but not in strength.

"What he shuts, no man opens; and what he opens, no man fhuts."

In 1676 the Imperialists retook it: and the emperor ordered the faid Latin inscription to be erased, and another put up in its stead. In English it runs thus:

" Leopold, the emperor, pious, fuccefsful, and august conqueror, having undertaken a neceffary war for affifting his confederates, defending his subjects, curbing his enemies, and reftoring peace every where, took this fortrefs by fiege, that it might be a monument to posterity of his breaking off the yoke of flavery from the neck of common liberty; and restoring it to Germany, from which it had been unjustly taken.

" In the year of our falvation 1676.

" For the terror of his enemies, the defence of his fubjects, and the fecurity of Germany, he shut against the French, and opened to the Germans, this fecond bulwark of France on this fide of the Rhine, and key to Germany, as a happy omen of his like fuccess in re-"What the French shut, the Germans open."

The Germans having regained it, after a fiege of four months, it was granted to them by the peace of Nimeguen. In 1688 the French took it again; but it was restored to the empire by the treaty of Ryswick in 1697, with the fortifications on the right fide; but those on the left were demolished. It was again taken by the French in 1734, after a long and bloody fiege, in which the famous duke of Berwick (natural fon of king James II.) was killed by a cannon ball, betwixt his two grandsons, as he went to take a view of the trenches; but they restored it upon the peace that followed, at the beginning of the year 1736.

The bishop of Spire resides in the castle, a noble

pile, founded in 1513, in a plain furrounded with marshes, by George, count palatine of the Rhine, and bishop of Spire; and repaired, in 1570, by bishop Marquard de Hatstein. The emperor has the right of garrifoning it; but the bishop has also some fort of ju-risdiction in it.

Bruxhall, or Bruchfal, is a large open town in this bishopric, on the river Saltza, with a castle, which is the ordinary refidence of the bishop, nine miles fouth-east of Philipfburg, and 12 north-east of Durlach. Here prince Eugene kept his head-quarters during the fiege

of Philipfburg by the French, 1734.

Altrip, in the fame diocefe, though but a village, was formerly fortified, because it commands a passage of the Rhine a little above Manheim. In the Notitia of the empire it is called de Alta Ripa, because the bank of the Rhine is here very high. It was a place of fuch importance to the Romans, that they kept a garrison in it.

Eidesteim, Weibstat, and Rottenburg, are small towns. The first is situated on the Hart, the banks of which yield good wing, and the latter is defended by

a caftle.

The rich Provostinip of Weissenburg was originally an abbey of Benedictines, fituated in the ancient imperial city of Weissenburg, in the Lower Alface; but, in 1546, it was converted into a temporal provostship, and annexed to the bishopric of Spire, on which account the bishop has a seat and voice in the

diets of the empire and ofrele.

It is necessary here to observe, concerning the bi-shopric of Strasburg, or Strasburg, the cathedral and chapter of which are in the city of Strasburg, in Alface, which is under the dominion of France; that, therefore, in respect to that part of his diocese, the bishop is subject to France; but, on account of his bailiwick on the other fide the Rhine, he retains the title and flate of a prince of the German empire, and has accordingly a feat and voice in the diets of the empire, and of this circle. But, in spirituals, he is subject to the archbishop of Mentz.

The Bithopric of BASIL is extensive; but the fituation is in different dominions, as part of it lies in Switzerland, and part in this circle. The inhabitants are partly of the Roman Catholic, and partly of the Proteftant perfuation; and the flates confift of the clergy and nobility, with the towns and bailiwicks. bishop, whose cathedral stands in the city of Basil, is a prince of the empire; having, as fuch, a feat and vote in the diet of the empire, and of the circle. He is likewise an ally of the Swiss. The only places in his

dominions, which belong to this circle, are,
Bellelay, and abbey, whose abbot is mitred; Sechos, under the protection of the Canton of Bern; St. Urifitz, on the Daux, which contains a provoftship; Bamtrut, on the Allen, containing a bishop's palace, with a college and a Capuchin cloufter; Arlesheim, on the same river, is the refidence of the chapter; and Schelingen a market-town on the Rhine.

The territory of the abbey of the town of Fulda, called Buchen, by the Germans, was, by the Latins, called Fagonia, because it was anciently a wilderness of beech-trees; but it is now improved to a rich foil, fruitful in every thing, particularly good wines. It lies fouth of Heffe, and north of Hanau, Reineck, &c. and

is about 25 miles in length, and 12 in breadth, It be-longs to the circle of the Upper Rhine, and is divided into 13 fmall bailiwicks. Some reckon it a part of Heffe, others of Wetteravia; and fome again make it independent; because its abbot, who is elected by friars, that must be all of rank, by 16 descents, is lord of the town and country, and primate of all the abbots in Germany and Gaul; is a prince of the empire; fits at the foot of the emperor's throne in all general diets; and depends immediately on the pope, to whom he pays 400 florins, or 401, on his installation. But the country bordering on several Protestant states, as Saxe-Gotha, &c. as well as Hesse-Cassel, there are several here of that religion. The abbot is, moreover, perpetual chancelor to the empres, and puts the crown upon her head at her coronation. The revenue of this country is betwixt 20 and 30,000l. a year. The abbot is able to raise 4 or 5000 men. His chapter consists of eight provosts. He has all the four great officers, rich equipages and livery, and a magnificent houshold; and there is always a company of horse-guards, and a regiment of foot-guards, well cloathed and mounted, to at-

Fulda, which is the capital of the county, flands on a riser of the fame name. It is contiguous to the abbey, which is of the Benedictine order, and one of the noblest in all Europe. It was founded, anno 744, by St. Boniface, and endowed with great privileges by feveral emperors. The great church, dedicated to that faint, is a flately free-stone pile of ancient architecture. The monks have two MSS, one of the New Testament complete, and the four Evangelifts diffinct; all faid to be written by St. Boniface, in a character much different from any now in use. It is an open town, but dirty, and not very well built. The palace is a stately pile of free-stone, with apartments richly furnished, and, together with the abbey, may be reckoned among the no-bleft buildings in Germany. A traveller of rank fays, he was glad when he got out of this country, because here he met with very hard drinkers, bad roads, and

city, till it became subject to the abbot.

Hirchfeld, on the same river, 20 miles north from Fulda, and 30 south-east of Cassel, is a small but neat city, noted for another abbey, which is of as noble a structure as any in the empire, being built upon an arch supported by 16 pillars, of one entire stone each. It was founded by Pepin; endowed by Charles the Great; and one of its first abbots was Alcuinus, or Albinus, his preceptor, who lies buried in it. Since 1606, when its last abbot died, the revenues have been kept by a branch of the family of Heffe, as administrator, and it was fecularized by the treaty of Munster. Its district, which has the title of a principality, is about 12 miles long, and the fame in breadth, and lies on the east

difmal lodging. It was formerly a free and imperial

fide of Heffe, towards Thuringia.

The Mastership of St. John confists only of the town of Hestersheim, and a few villages belonging to the order of St. John. The Grand Master is a prince of the empire, and has a feat and vote among the princes in the diet of the empire and circle. Heirefham is a market-town, and the residence of the Grand Master.

The Abbey of PRUM is fituated in the forest of Ardemes: was founded, in the eighth century, by Pepin, king of the Franks; and, in 1570, incorporated with the archbishopric of Triers. Hence the archbishops became in a business. bishops became its administrators, and, as such, have a feat and vote in the diets. Prum, from which the abbey takes its name, is an inconfiderable town on a fmall rivulet.

The duchy of SUINNERN was long possessed by a collateral branch of the palatine family; but that fail-ing, it devolved to the electors, who, on that account, fit and vote in the college of princes, and, joined with the bithop of Worms, are fummoning princes for the circle. Suinnern, the principal town, which takes its appellation from a river of the fame name, is 30 miles

west of Mentz, and has several churches. The duchy contains, besides Suinnern, several small and inconsi-

The little Duchy of LAUTEREN, in the last century, reverted to the electoral house, which is thereby entitled to a feat and voige in the diets: as did the bailiwicks of Lauteren and Veldenz, bestowing, at the same time, fimilar privileges. Veldenz is fituated on the Moselle,

and Lauteran on the Glan.

The Imperial and free City of Frankfort on the Maine was anciently called Francofordia, that is, The Ford of the Franks; for the Franks used to cross the river here, in order to make their incursions upon the Saxons; on which account the latter at length built this city to restrain their ravages. It is now called Frankfort on the Maine, not only on account of its Frankfort on the Name, not only on account of its being fituated on that river, but to diftinguish it from Frankfort on the Oder. It is 18 miles east of Mentz, and 20 from the Rhine. It is spacious, populous, and opulent; one of the Hans-Towns, and the feat of the Imperial diet. The river interfects and divides it into two parts, which have a communication by means of an elegant stone bridge, consisting of 14 arches, with a tower at each end 400 paces afunder; but the whole is under the jurisdiction of the same magistrates. The river is about half as broad as the Thames at London. The town is furrounded by walls, encompassed with deep ditches of running water, and fortified with 11 baltions, fuitable counterfearps, outworks, &c. The Maine, Rhine, &c. render its fituation admirable for trade, particularly for bringing great quantities of corn and wine from Franconia, and the Palatinate. It has two annual fairs, which are frequented by merchants with various commodities, particularly books from most parts of Europe, of which they distribute printed catalogues; fo that there is greater choice here than in any town in Christendom, during the mart, which lasts three weeks; but at other times the bookfellers have fcarce any bufinefs. There are three marts every year; and the names of the foreign merchants are written over the arch, before the doors of their shops, which, when the marts are ended, are shut up. Most of the ffreets are large, except two or three, which are full of traders mops. Some of the houses are built of red marble, or timber plaistered, and painted or covered with flates.

On the north fide of the city there is a spacious horsefair, or market, where a valt number of good horses are fold to the French king, and the neighbouring princes. The Jews are the chief jockies. The city is round, and has no fuburbs; but is much larger,

richer, and more populous than Mentz.

The chief structures are the following: St. Bartholomews's cathedral, which, though too dark a pile within, is a stately venerable piece of architecture, built by Pepin, father to Charlemagne. In a long narrow part of this church, called the conclave, they used to chuse the emperor. It has a very mean altar and benches for so celebrated a place. The other part, in which he was crowned, being a cloifter of iron, fastened to the balustrades of the choir, looks like a great birdeage, having no ornament but an ordinary crucifix of brafs. A French writer takes notice of a curiofity here of another fort, the tomb and white marble flatue (standing in a niche of black marble) of John Charles, bishop of Worms, who, as the inscription says, was descended from the barons of Frankenstein, who trace their genealogy from father to fon, for more than 1000

The town-house, where the emperor and electors meet in council after the election is over, besides the throne, has only fome benches, covered with green cloth, and some pictures. The great hall, where the Imperial feaft is kept on the coronation day, is not very regular, though large. The floor is covered with black and yellow cloth, the livery of the house of Auftria. On the ceiling is painted the story of Ganymede carried away by Jupiter's eagle; and of a raven tearing out the eyes of a person who had fallely accused another of murder. Before the house is a great square, where, at this solemnity, an ox is roasted, stuffed with venison, wild-sowl, and sucking pigs; and thither one of the electors comes in person for a slice of beef, which he carries to the emperor; and, after he has dined on it, it is abandoned to the populace. Another of the electors carries him a glass of wine, which, on that occafion, runs from a fountain in the middle of the fquare. A third carries him a measure of oats from thence: and in this square, after the coronation, another distributes the medals, &c. struck upon the occasion. Here is a vestry, where the electors are shut up during the election: at which time the marshal of the empire stands before the door with his fword drawn, to prevent the princes from coming out till it is over.

Braunfeld, which was formerly the emperor's palace, is now the manfion-house of the Teutonic knights, where debtors have a fanctuary for 14 days, after which

they may be taken up.

There is a port, or harbour; and The citadel or fortress of Saxenhausen. There are also several noble fountains in the city, and particularly three in the great market-place; and divers mineral

fprings and baths belonging to the city.

This city is governed by a prætor, 12 burgomafters, 14 eschevins, or aldermen, one of which is always a burgomaster, and 42 common-council. The senate, which chuses two burgomasters annually out of their own number, is divided into three benches: the first is that of the eschevins; the second is that of the literati, or learned, out of which the first bench is supplied in case of a vacancy; and the third is that of tradesmen, who never rise higher. The grand bailist, who is always president of the council, is chose out of the esche-vins; and his office is for life, as well as the eschevins. Besides these, there are syndics, whose power is much limited.

The magistrates are chosen from among the nobility, but named by all the corporations of tradefinen, except the taylors, because one of them was chief in a revolt against the magistrates. The government here is milder than in most of the Imperial towns; and their liberties, which they boast of holding originally from

Charlemagne, feem better established.

The magistrates, and most of the inhabitants, are Lutherans, and have five churches, in one of which is much painting and sculpture, an altar of black marble, a marble pulpit, and reading-defk; the figure of our Saviour, with a globe, and a crucifix, both of alabaster, &c. The altar-piece is a representation of our Saviour's paffion in the garden; and the cieling, and the fronts of the galleries, are painted with feripture hifto-The Roman Catholics are permitted to perform their religious duties in the cathedral, and have feveral chapels, and two convents; but they are not suffered to make public processions. The Calvinists have two churches about a league from the city, one for German and the other for French refugees; but the ceremonies of baptism and marriage, must be performed in the Lu-theran churches. In the council held here in 794, three hundred bishops affisted against the Nestorian heresy, This city was one of the first that had spirit enough to demand the free exercise of the Lutheran religion, which, being refused by their magistrates, 1522, they deposed them, and chose others; and, in 1530, the Augsburg consession was established here.

This city was belieged twice in 1552, by Maurice, elector of Saxony, and by Albert, margrave of Brandenburg, who took it; but it foon recovered its liberty, and has flourished ever fince. On the wall of the great bridge of Saxenhausen, is an indifferent, though much celebrated, picture, reprefenting a dead infant befmeared with blood, and an infeription beneath, denoting, that, on Palm Sunday, 19475, a child, of two years and a half of age, called Simon; was murdered by the Jews. Under the child a Jew is exhibited in a black cloak, with a ruff, ftriding on a

9 I

No. 70.

hog, with his face towards its tail, which he holds in his hand instead of a bridle. A monstrous figure follows, and fpits in his face; and a mob of women and fiends furrounds him, infulting both him and his companion, whom another fiend carries on his shoulders. The populace firmly believe this flory; yet it is well known to the learned, and more fensible part of the inhabitants of Frankfort, to be an absolute fiction, designed merely to prejudice the people against the Jews. fect have a fynagogue here; but the walls are as black and fmoaky as those of a kitchen; and they are confined all night to their particular quarter, which is in a street about a mile in tength, but very narrow and dirty, with a gate at each end of it, that is flut every evening, and the keys carried to the magistrates. Their houses are generally of timber, plastered, and four, five, or fix stories high, but as nasty as a hog-stye: yet, in this little quarter, it is faid, there are 3 Their chief trade is buying and felling or 4000 fouls. old wares, hawking toys at the inns, and changing fuch money as is not current here; but none of this can they do on Saturday, which is their fabbath; nor on Sunday, which is ours; for if they were to appear in the streets upon the latter, they would certainly be pelted by the mob; so much are they hated by the German populace; who, in 1614, role against their ancestors, and pillaged them cruelly upon this account. The citizens of Frankfort quarrelled with their magiffrates to fuch a degree, that the mob befet the ancient fenators in the council-chamber for four days together, and thereby forced them to quit the place, as well as their offices; and they could not be restored, notwithstanding two mandates came from the emperor to that purpose. During this, on St. Bartholomew's day, a great mob vented their fury also on the lews, who barricadoed the gates of their street, made the best defence they could, and killed and wounded some This fo exasperated the rest, that of the ring-leaders. they broke upon their quarter, and forced them to their burying-place, and to abandon all that they could not carry thither to the ravage of the plunderers. They were, however, flopt in their riot early next morning, by the majority of the citizens, foot and horse, well armed, who seized the plunderers, secured the effects they had taken from the right owners, and so put an end to the infurrection. The Jews, however, who had intrenched themselves in their burial-place, fearing the populace might rife again, and force them out of it, begged and obtained leave to retire out of town, with their families, and fuch effects as were faved or recovered from the plunderers.

This fatal day they afterwards called the Day of their Tribulation, as they had called their quarter Little Jerusalem, and, it is observed, that the day they were obliged to fly from Frankfort was a folemn fast, which they had been used to keep in memory of the destruction of the ancient Jerusalem by Nebuchadnezzar, and by Titus Vespasian. Mean time the remains of these poor Israelites, at Frankfort, are obliged, under severe penalties, to fetch water, when any fire breaks out in the city, be it ever so distant from their quarter. In recompence, the magistracy permits them to chuse 12 judges, out of their own body, to decide their own differences, who are called bawmeesters; and those who will not submit to their decisions, are allowed to appeal to the Lutheran tribunals. They are obliged to wear a piece of yellow cloth, that they may be known from the other inhabitants: though their habit is very diftinguishing; for themen generally wear coarse thread-bare cloaks, flat-brimmed hats, old greafy ruffles, and thick pointed beards. The women wear over their clothes fhort cloaks of black crape, bound about their necks by clasps of gilt copper; and round their shoulders a sparkling border of tinsel, a foot in breadth. their head-dress, it is only a course wrapper, ending at their forehead in two large horns, about four fingers broad, one of which is covered with black gauze, and the other with a bit of lawndyed blue. The Jewishgirls are distinguished from the married women by their headdress, which is nothing but a piece of red taffeta bordered with a gold gauze, with which their hair is gathered and tied. A great number of the Jewesses here wear earrings, which represent the figns of their houses or shops, be they cat, dog, or any other animal. By their fynagogue they have their hot and cold baths. former are in two little rooms, where there are cauldrons to heat the water. The cold are in a fubterraneous place, 30 feet deep, furrounded by an iron rail, where the women peep over, to fee that she who bathes plunges over head and ears into the water, according to their old law, which ordains, that every hair be purified. There is a place with ovens, for baking their victuals on their fabbath-day, to which each family carries their pot, or pan, on the eve, and it is taken home next day, when the fervice is over. Their timber houses being so close, and apt to catch fire, their quarter has been twice burnt down.

At feveral houses in Frankfort there are pine-trees planted by the doors, denoting they are taverns; and cyphers painted on the door-posts, marking the different prices of the wines.

Saxenhausen formerly belonged to the elector of Mentz, but was bartered for the town of Hochst, which depended on Frankfort; and fince this change one of the city council must reside at Saxenhausen.

As to the three originals of the famous Golden Bull of which two are preserved at Prague and Nuremberg, the third is kept in an apartment of the town-house of Frankfort; but is never shewn to strangers, except in presence of two of the council, and the secretary. It is a fmall manuscript, in quarto, confisting of 42 leaves of parchment, with a gold feal of 3 inches diameter, weighing 20 ducats, appended to it by a cord of yellow filk. It is written in Latin and Gothic characters, without diphthongs; and kept in a black-box, together with two written copies of a translation of it into the German language. This Bull, which they likewife call the Caroline Law, contains the rules and ceremonies to be observed in the choice of the emperor; fettles the power and authority of all ranks of the nobility; and fo binds the emperor and the princes to one another by oath, that neither may, with impunity, instigate or attempt anything to the detriment or danger of the commonwealth, the country, the empire, or its neighbours; and, amongst other conditions for which the author of it is especially commended, it decrees, " That whofoever hereafter had a view to the Imperial dignity, should be well acquainted with the languages, particularly the Latin, Italian, French, Tuscan and German; that, when he was emperor, he might be able to answer his subjects in the several languages, without an interpreter.'

An ingenious writer thus characterizes this famous city, and the inhabitants of it." There are, (fays he) few places, upon the whole, more difagreeable, and few towns in Germany where the common people are more unpolified. The burghers are not to be matched for affectation. As most of the electors and princes of the empire have their agents here, to whom they give the title of residents, they are for the greatest part, merchants of this city, who folicit the title, in order to be exempt from the authority of the senate, and from the payment of the customs, and to qualify themselves to place over their doors the arms of the princes to whom they send the newspapers."

While the empire was in the hands of the French the princes were all obliged to appear in person, unless they were excused by the emperor and electors; but now most of them send their deputies to save charges, which much retards their proceedings; because their deputies are often obliged to send for their instructions. To such abbots and bishops who are not deputies, the emperor does not write, but only to their directors, that they may give them notice. Though, since Maximilian's time, many of the princes have sorborne to send deputies, yet they are as much

obliged to submit to the resolves of the dist as if they did. Sometimes, in cases of great importance, the emperor not only fends letters, but ambaffadors, to require their presence; and, in urgent affairs, those who do not fend, make their ambaffadors plenipotentiaries. All the princes bear their own charge, or that of their deputies. When they arrive, they give notice to the hereditary marshal of the empire, under the elector of Saxony, who affigns them apartments according to their quality. If the emperor be present, they beg audience of him, shew their summons, thank him for calling the diet, and promife concurrence for the good of the empire. If he be absent, the princes fend officers, to notify their arrival to the director of Mentz; but if they are deputies, they fend their fecretaries with their full powers, as do also the deputies of the towns. When they are all come, the marshal of the empire acquaints them when and where the emperor, or his commissary, is to tell them what he has to propose. There is no upper and lower house, but all affemble in one room: The emperor goes in his robes to the throne, which he afcends by three fteps. The electors fit on a bench, which they afcend by two steps; and the princes on other benches, not raifed fo high. If the emperor is present, the first thing they do is to attend him to church, where prayers are put up for a bleffing on their consultations. When they are returned, the elector of Treves, in the nameof the states, thanks the emperor for calling a diet; and the fecretary of the empire, receiving the pro-pofals from the vice-chancellor, reads them. After this, the colleges retire to their feveral apartments; when they have confidered them, agree upon a day for meeting and imparting their thoughts to one another, which, when paffed into a refolve, they fend to the emperor; and, if approved by him, it becomes a law or constitution of the empire. The princes are divided into benches, called the spiritual and the se-

The archduke of Austria, and the duke of Burgundy, though fecular princes, fat formerly on the ecclefiaflical bench, because they were princes of extraordinary eminence; and the master of the Teutonic order does the fame. The Lutheran princes were formerly excluded from the diet, till, by the treaty of Westphalia, they were allowed a place by themselves, between the ecclefiaftical and fecular princes. All the ecclefiaftical and fecular members have not equal votes; for fuch of both as have princely dignities, are allowed fingle votes; but those who have not, give their votes by companies, as the deputies of the towns of the bench of the Rhine, or of Suabia. The towns of Franconia and Suabia, which include those of Saxony, are also allowed two benches, and two votes. The deputies of the Imperial towns make up the third rank of members. The deputies of the city where the diet is held, fit at a table by themselves, and take an account of the voices of the other delegates, which are brought to them, and registered by the two registers of Ulm and Spire; the former representing the cities in the circle of the Rhine, and the latter those of Suabia. All the votes in this august assembly are said not to exceed 250.

The emperor's throne is covered with cloth of gold; and the chairs and benches of the other princes and states, with cloth of filver, velvet, fatin, filk, &c. according to their rank and quality. The elector of Treves sits at the foot of the throne, as director of the electoral college. The electors of Cologne, Bohemia, Palatine, and Brandenburg, sit on the right; and those of Mentz, Saxony, Bavaria, and Hanover, on the lest. The ecclesiastical princes sit under the electors on the right, and the secular princes under the electors on the lest. The deputies of the towns, and of the bench of the Rhine, sit under the ecclesiastical; and the deputies of the towns, and the bench of Suabia, sit under the secular princes. The deputies of Lubec and Osnaburg sit at the cross bench before the elector

of Treves; and the marshal of the empire sits at a table, in the middle of the hall, before the cross bench. The directoral table, with the officers attending it, is on one side, before the secular princes. Those princes only have a right to sit in the college of princes, and to have a deliberative and decisive voice, who contribute to the support of the empire, according to the Matricula. The directors of this college are the archbishop of Saltzburg, and the archduke of Austria, who preside alternately, as fresh matters come upon the tapis. The votes of the secular and ecclesiastical bench, which are taken alternately, are collected by the marshal; after which, the archbishop of Saltzburg, and the archduke, draw the result, and report it to the diet. Such princes as possess several dominions, have a vote for each. The magistrates of the city where the diet is held, are directors of the college of the towns. The abbesses, who are princesses, fend deputies.

Though the point of precedency, among the electors, has been long fince fettled by the Golden Bull, yet the other princes, and the representatives of the cities, have not agreed on the matter to this day; insomuch, that it occasions perpetual quarrels: and the diet would fometimes break up in consustion, if some of them did not, for peace sake, yield to the rest; entering a protest only, that such an instance should not be made a precedent. One fourth of a session is said to be generally spent in disputes on this subject; a second in drinking matches; a third in disputes with the emperor about their privileges; and scarce a fourth upon the business proposed to them from the throne; the emperor alone having the power of proposing what is to be debated in the diet.

There is another affembly of the empire, called the affembly of deputations; where the deputies, chosen for that purpose, determine things that have been referred to them by a diet; or when the elector of Mentz, in the emperor's name, summons the deputies, at the request of the directors or capatins of one or more circles, to take orders about their affairs, or to settle controversial points, which they are not able to decide themselves.

The Lordship of Ollbruck belongs to the Wald bott-Bassenheim family; that of Dochstul belongs t the family of Oettingen-Baldern, and gives the proprietor a seat and voice in the diet of the circle: the Lordship of Britzenheim, on the banks of the Nahe, belongs to the elector of Cologne, who, in consequence of possessing it, enjoys a seat and voice at the diet of the circle; and the counts of Wurtemburg, for the little county of the same name, have a seat and vote in the diets of the Upper Rhine, and in those of the empire.

The Imperial city of Wetzlar, or Westlar, on the borders of the county of Solms, has nothing in it worth notice, but the great church. However, it is, at present, the seat of the Imperial chamber, which was removed hither from Spire in the year 1689, when that city was taken and destroyed by the French. The provostship of the town belongs to the prince of Hessenth arms. It stands on the confluence of the rivers Lohn and Dillen.

The Imperial City of FRIEDBURG is feated at the foot of a ridge of hills called De Hohe, and enjoys large privileges, granted by the emperor Frederick II. The mart now held at Frankfort was kept here till the year 1340, when it was removed thither at the defire of the merchants; and, in lieu of it, this city has four annual fairs; one of which is held on the first Sunday after Trinity, in remembrance of the dedication of their church on that day, which brought pedlars thither with toys, and at length caused the establishment of a substantial trade. Some of the emperors refided here formerly, certain months in the year. This town has fuffered by terrible fires, particularly in 1383, when 900 houses were burnt; and in 1447, when 700 more shared the same sate. The last fire was and in 1447. faid to be owing to a quarrel between two of the towns.

men, one of whom fired the other's house, to be revenged on him. It was attended with fuch a loss to the citizens, that they were forced to fell or mortgage the villages in their territory, to defray the expence of rebuilding their houses. Friedburg is noted for the depth of its cellars, there being, in some houses, two

or three one under another.

The Duchy of DEUX-PONTS gave title to its dukes, a branch of the palatine family, one of whom was Charles Gustavus, king of Sweden; but it became extinct in 1732, in the person of Gustavus Leopold. Since that time it has been in fequestration; the landgrave of Hesse-Darmstadt, and the about of Fulda, both Roman Catholics, being administrators. The elector palatine, as duke of Newburg, claimed this succession, as does also the prince of Birckenselds, who is a Protestant, and next claimant to the electoral dignity after the house of Sultzbach. The duchy, which is supposed to have been an ancient fief of the bishopric of Mentz, is divided into five bailiwicks; one of which, called Bischweiler, lies in Lower Alface, where there are other lands belonging to the family. It is, upon the whole, a mountainous, barren country, but has fome fertile vallies. It has two fmall rivers that join near the capital, from whence it has its name, and run fouth to the Saare. Calvinism was generally professed in this duchy, till the Swedes became posfessed of it, when Lutheranism began to slourish, the king of Sweden giving fome of the best livings and preferments to the Lutheran clergy, which created great animolities between the two opinions: but the late king of Sweden dying without iffue, and the duchy devolving on, or at least being claimed by, a Popish family, the Protestant subjects thought fit to unite, lest their common enemy, the Papists, should take advantage of their quarrels.

The city of Deux-Ponts, which, in the German language, is called Zweybruggen, and, in the Latin, Bipontium, from its two bridges over the small rivers of Blife and Schwolb, whereon it flands, is fmall, but neat, and was once defended by a good caftle, fince demolished. It suffered much during the civil wars in Germany; and also in those between France and the empire, when it was taken in 1676, by the French; but restored to the king of Sweden hy the treaty of

Ryfwick.

The Landgravate of Hesse is fituated on the north fide of the river Maine. The whole country is bounded on the north by Westphalia; on the west by the duchy of Berg, and electorate of Triers; on the fouth by the electorate of Mentz and Franconia; and on the east by the duchy of Weimar and Thuringia. Its utmost extent, from north to fouth, is about 100 miles, and the same from east to west.

The air is cold, but healthful; the water wholesome, and the foil fruitful, producing much corn; and, towards the banks of the Rhine and Lohn, grapes. Here are large forests, with abundance of deer, and game in general. In the mountains are fome mines of copper

and lead.

The house of Hesse, which is one of the most ancient in Germany, is divided into two principal branches, Caffel and Darmstadt. The former comprifes Heffe-Caffel and Heffe-Rhinfels; the latter Heffe-

Darinstadt and Hesse-Homburg.

The rights and prerogatives of the fovereign princes of this house are great, they having three votes at the diet of the empire. They belong to the circle of the Upper Rhine; but Hesse-Cassel has a voice among the counts of the bench of Westphalia, for the county of Schaumburg. Causes, not exceeding 1000 florins, are determined by the courts of the county without appeal. These princes have several privileges in common, such as the right of protection and Imperial prefecture of the city of Wetzlar, which is at present ex-ercised by Darmstadt alone. The princes of Hesse-Cassel are not deemed of age till they are 25; but those of Darmfladt are at 18.

The effates of the landgrave of Heffe-Caffel are Lower Heffe, in which are the counties of Pless, Cafsel, and Zigenheim; Marpurg, in Upper Hesse, and Frankenburg; the principality of Hershfeld, a secularized abbey on the Fulda; the lower county of Catzenellebogen; the county of Schaumburg, except Buckeburg, which belongs to the county of Lippe; and Smalwald, in the county of Henneburg; the bailiwicks

of Rottenburg and Saxenhagen.
The landgrave of Heffe-Darmstadt, who is little inferior to the former, either in dominion or wealth, pof-fesses the greatest part of the upper landgravate, in which there are Giessen, Butzbach, Aendorf, Battenberg, Berg, &c. the county of Nidda, which confifts of feveral bailiwicks; the lordship of ltter; the upper county of Catzenellebogen, in which lies Darmstadt city; the land of Epstein, Braubach in Lower Catzenellebogen, and Kirnbach in Suabia. The fuccession also of the county of Hanau was, in 1736, upon the death of its count, awarded to the prince of Hesse-Darmstadt, as next heir, on condition of his paying a stipulated sum, by way of compensation, to the house of Cassel. The king of Poland, as elector of Saxony, ought to have had his share in the succession; but his majesty gave up his rights to the landgrave of Hesse-Cassel by a treaty.

The branch of Rhinfels possesses the greatest part of the lower county of Catzenellebogen, viz. Rhinfel, St. Goar, fort Catz, Schwalbach, and Gevernhausen; the bailiwicks of Richenburg, Florenstein, and Brau; Rot-tenburg, and its district; Wanfried, Eschweiga, and

Sontra in Lower Heffe.

The branch of Homburg possesses Homburg and its territory: Bingheim; and Wevelinghen and Helim-fladt, with its dependencies. The prince of Homburg has moreover an appendage of about 1000l, a-year from

Heffe-Caffel, and 2000l. from Darmfladt.

The branches of Caffel and Homburg are Calvinists; the branch of Darmstadt Lutheran; and Rhinfels professes the Roman Catholic religion, which is, however, not tolerated in the dominions of the other three princes, except in the fmall principality of Hershfeld. In these counties are several universities and academics. The fituation of the country betwixt Upper and Lower Saxony, and the neigbourhood of Westphalia, occasions the language of the people to be a mixture of High and Low Dutch. The laws most in force here are, the Roman or Civil, to which they join municipal laws of their own. The people are numerous and warlike, being raifed and disciplined by the younger fons of the nobility, who are made licutenants and captains in feveral districts, and receive pay of the regent. In the prince of Heffe-Caffel's military fervice are a general, two lieutenantgenerals, a major-general, a colonel of the artillery, two commissaries-general of war, and one chief paymafter; two troops of life-guards, one of white, and the other of black-horfes; three other regiments of horse, three of dragoons, and five of foot; one of which is guards; besides the militia commanded by a lieutenant-general. The landgrave has a privy-couneil, or court, for the game and forests; a chancery, or fecretary's office; a treafury and confiftory, for ecclefiastical affairs: and another court, called the French commission, relating particularly to the French in his dominions. All the privy counsellors are members of the confiftory, to whom are added a superintendant, a metropolitan, one of the court preachers, and a fyndic.

The principal places in the landgravate of Heffe are

the following:

Cassel, the capital city of the Lower Hesse, situated in a rich pleasant plain on the river Fulda, near the confines of the duchy of Brunswic, 40 miles fouth east from Paderborn, and 98 north-east from Mentz, is a place of good trade for wool and other merchandize; and fortified to the west with walls, ditches and a strong citadel. It is the feat of the landgrave, whose

palace stands without the town, furrounded by bulwarks, with apartments contrived in the very ramparts, to lodge his family during a fiege, out of the reach of bombs. The palace is of free-stone, magnificent, both within and without, and adorned with curious gardens and fountains. It is observed as a reproach to the inhabitants, that for want of industry, they fuffer other nations to run away with the profit of manufacturing their wool. There is a gymnafium, or academy, here, which has been much eclipfed by the univerfity of Marpurg. Here is a great arfenal of freeflone, with arms for 25,000 men; and in the room under it are 200 pieces of cannon, some 64 pounders. From the palace there is a prospect of no less than 60 towns, the leaft of which contains 300 houses. The ftreets of this city are spacious, full of shops, and contain feveral fine markets, with good provisions of all forts. The landgrave has a library well furnished with books and curiofities. In the great church are the monuments of the landgraves, in brafs, copper, and marble, of very good workmanship. The cathedral, dedicated to St. Martin, is very spacious. There are four other churches, which have two ministers each, befides the foldiers church, which has but one. There is a church likewise in the palace, for the worthip of the court. A fine stone bridge over the river divides the city into two parts, of which that called the New Town is well built, with uniform houses; and the streets are pretty even and spacious. The landgrave, the founder of it, has also made one of the finest aqueducts in the whole country.

Wetter formerly contained an abbey, the revenues of which were allotted by Philip the Magnanimous, to portion out the daughters of ancient noble families. Louisendorf, in the bailiwick of Geismar, is inha-

bited chiefly by French refugees.

Hania, on the Wohra, contains one of the four high hospitals of Heffe, in which 400 poor and fick are carefully attended and maintained, out of the revenues of the Ciffertian convent. The governors of each of these hospitals are nobles, alternately nominated by the two princes of Hetfe.

Rodemburg, a town on the river Fulda, is pleafantly feated, and has a collegiate church, with a dean and 20 canons, well endowed. This place flands in a valley between two hills in Upper Hesse, and gives title to a branch of the Heffian family. It is divided into the Old and New Towns. In the Old there is a castle, which was demolished in the year 1212, by the Imperialifts, but rebuilt by William IV. landgrave of H. ffe, who, in 1574, adorned it with a fine garden, and a church, built throughout with white marble, dug out of a quarry at Morssen, a village just below the town, on the fame river.

Homburg, a town with a castle, in the Upper Hesse, is the refidence of the branch of the family, from thence called Heffe-Homburg, which has the bailiwick, of which this is the head town, for its appendage

Ziegenhein, on the river Schwalm, in the lower landgravate, is a small but neat city, and gives name to a county, of which it is the capital; and was united by Lewis the Pacific, the landgrave, to his domain, in 1543. The fuccession to this estate was formerly disputed by the counts De Hohenloe; but their claim being referred to the diet at Worms, it was adjudged in favour of the landgraves of Heffe, who have enjoyed it ever fince.

Geyfmer, 12 miles north from Cassel, is the capital

of a bailiwick in Lower Heffe.

Eschwege, 24 miles from Cassel, is a walled town, built by Charles the Great, destroyed by the Huns, and rebuilt by Henry II. It ftands on the bank of the river Werra, by which wood and coals, the principal commodities of these parts, are conveyed down to the Weler, and from thence to the neighbouring counties. It is fituated in the Lower Heffe, near the confines of Thuringia; and has belonged, with its territory, to No. 71.

the landgrave of Heffe-Rhinfels fince 1387, when it was taken from the elector of Mentz.

Smalcald, a town on a rivulet of the same name, has a good trade for iron ware, many mines of the neighbourhood furnishing the inhabitants with plenty of that metal, which they work, and fend to foreign parts. They also make and temper steel, from whence a village near it is called Stahlburg. This place was famous for the affemblies of the Protestant princes in 1530, 1531, 1535, and 1537, in order to make a league for the defence of the Augsburg confession against the emperor Charles V. and the Popish princes of Germany, which league grew fo powerful, that they forced the emperor to a treaty, held in 1557, at Paffaw, by which Lutheranism was established in several parts of the empire.

Marpurg, which ftands in a pleafant country, on the river Lohn, was once a free and Imperial city, afterwards subject to its own lords, and is the chief town of the Upper Hesse, and the seat of the supreme court of judicature, to which appeals are brought both from Caffel and Darmstadt. It has a strong castle on a hill, and is otherwise well fortified. The great church is a stately building, and has many noble monuments. The university here, founded in 1526, is one of the most considerable in Germany. The professors are Calvinifts. The town is large and well built, with spacious freets. It has a very large square, adorned with a town-house of curious architecture. The castle is feparated from the town by the river. In the other part is a flately building, the house of the commander of the Teutonic knights. The palace of the landgrave, stands on a rising ground, from whence there is a view over large plains and vallies, watered with rivulets; befides hills and vineyards, of which there is a fine prospect also, from its free-stone bridge over the river.

Connefeld is a village, with a fine white alabafter rock near it; Melfungen contains a feat belonging to the prince; Friedwald contains another princely feat; and Vach, on the Werra, which gives name to a bailiwick, is a much frequented thoroughfare, between

Leipfic and Frankfort on the Maine.

Waldkappel and Allendorf both give name to bailiwicks; the former having fome coal-pits, and the latter containing feveral falt-works.

Grebenstein, on the Esse, gives name to a bailiwick, and is famous for its bridge, where, in the open air, a court of judicature is held called the Bridge Court, in which every defendant is obliged to deposit a fine; but on acquittal it is returned him, and the plaintiff immerfed in double the fum.

Felfburg contains a palace belonging to the landgrave, and is defended by a castle; Gudenburg is remarkably fertile, and contains Nidenstein, a very ancient town, and Merxhausen, one of the four high hof-

pitals of Heffe.

Frankenburg, a large town, faid to be built by Theodorick, king of France, in 520, stands 15 miles southeast of Waldeck, in the westernmost bounds of the landgravate of Upper Hesse, towards Westphalia. In 1590 fome mines of filver and copper were discovered here, but they turned to little or no account. About fix miles west is Sachsenburg, where are the ruins of an old fort, built by the ancient Saxons, to secure their frontier from any incursion by the French garrison at

Alsfeld, 19 miles east from Marpurg, is one of the ancient towns of Hefle, and had formerly very great privileges, even power over life; but it loft its charter in an accidental fire many years fince; fo that now the inhabitants have only a memorial of it, by the chief magistrate's having a sword carried before him. The town-house is an handsome building; and over the door is a monument in remembrance of the fire, with a Latin inscription, denoting "That when things are irrecoverably lost, it is the best way to forget them."
This was the first town in Hesse that embraced Luther's reformation.

Gieffen

Gieffen, a town in Upper Heffe, is defended by a ftrong wall, and regular fortifications, and has a well flored arfenal. Its trade is dreffing and felling of cloth. It has four gates, and as many spacious streets, with a fquare or market-place in the centre. The compass of its ditch is about an hour's walk. It has one great church dedicated to St. Pancras; and is governed by a council and a magistrate, besides the officers of the landgrave. It has a fair between Eafter and Ascension day, which lasts a week. Round the neighbourhood are feveral castles, as Solms, Konigsburg, Fetzburg, Gleiber, &c., It once had an university, which began to flourish upon the desertion of Lutheranism by the professors at Marpurg, and their adhering to Calvinism: but, in 1625, the landgrave Lewis, who was a Calvinift, suppressed this university, and recalled the students to Marpurg.

St. Goar, the capital of the lower county, is fituated on the west side the Rhine, where a toll is paid, the produce of which belongs in common to the two sovereign branches of the house of Hesse. On a high rock, in the vicinity, is the strong fortress of Rhinfels.

Goarshausen is a small town, on the east side of the Rhine, opposite to St. Goar; Rechenburg is a castle on a high rock, with a mineral spring; Granan is an hospital for women, and one of the sour called the high hospitals of Hesse; and Langenschwalback is a large village in the bailiwick of Hohenstein, famous for its mineral waters; in which bailiwick there is likewise Harsthalerlead, a celebrated medicinal bath.

Upper Rosbach, a small town, will be ever famous for the great victory obtained here over the French, by the king of Prusia, on the 5th of November,

Philipsec is a palace, which was erected by the landgrave Philip III. Bredencap is famous for its iron works, foundery, and a filver mine; and Thal-Itter for a copper mine.

Freyfladt, on the Rhine, was erected in the year 1745, by the landgrave Lewis, and contains an asylum for debtors.

Hofheim, one of the four high hospitals of Heffe, is fituated in the bailiwick of Domburg.

Zwingenberg is fituated on the Berge-Strafze, or Hill-street, a road so called, which extends 40 miles over the mountains from Darmstadt to Heidelberg.

Branbach, on the Rhine, is defended by two callies, and celebrated for its mineral fprings, and copper and filver mines.

Ems is a large village, famous for its baths; and Old-Catzenellebogen has a caftle, and fome iron mines.

Darmstadt, situated on a river of the same name, at the distance of 12 miles south from Frankfort on the Maine, is enclosed by palifadoes, and defended by a strong castle, which is the landgrave's palace. For the better fecurity of the county, there are two forts; one on the Rhine, named Markburg, or Marienburg; and another on the Maine, called Ruffelheim. palace is a stately structure, and, had it been finished according to its model, would have been one of the largest and most magnificent in Europe, fit for lodging the emperor and all the nine electors; but the magnificent works that were intended, have been quite laid afide. However, the parts that are finished make a grand appearance, and are beautified with a spacious garden, abounding with all forts of fruits, and yielding annually great quantities of rich wines. The emperor has, besides, two fine pleasure-houses, two miles from hence, Kranchstein and Sensfeld. Though the town is not large, it makes a good appearance, most of the houses being built of free-stone, and very high. Though well fortified, it has feveral times been furprised and taken. In this town the Germans first gave over tilts; because in 1403, the Franconians and Hesfians having challenged one another to this exercise, several of the Franconian nobility, and nine of the Heffians, were killed on the spot.

The deer come fometimes close to the palifadoes of

the town; there being no province in Germany more proper for hunting, nor in Europe where there are more deer; the great plenty of which is very troublefome to the poor peafants, who are abroad day and night to watch their fields, and guard them from their encroachments. It is a flat even country, with a gravelly foil, which produces excellent pulse, and is interspersed with woods, through which are cut excellent roads.

The County of SPONHEIM was anciently divided into hither and farther, the former of which is now commonly called the county of Sponheim, and the other that of Starkenburg. It is fituated between the Rhine and the Mofelle.

In the hither county, of which three-fifths belong to the elector Palatine, and the remaining two-fifths to the prince of Baden-Baden, the principal place is

Kreutznach, or Creutznach, the capital, a well-built town, divided by the river Nahe into the Old and New Towns. The first emperors of the Franks had a palace here, in which they sometimes resided. Near the town is a castle, and, at no great distance up the river, two salt-works.

In the farther county, of which one half belongs to the duke of Deux-Ponts-Birkenfeld, and the other to the prince of Baden-Baden, are,

Birkenfeld, which once gave the title of duke to a branch of the family of Deux-Ponts. This branch afterwards fucceeding to the duchy of Deux-Ponts, added Birkenfeld in their title to Deux-Ponts.

Trarbach, or Tranerbach, is a town lying on the Mofelle, and containing a church common to the Roman Catholics and Lutherans, with a Lutheran gymnafium. In the neighbourhood are many vineyards. The town was once very ftrong, but the fortifications, have been demolified.

Starkenburg is a caftle on the Mofelle, by the name of which this county is now generally diffinguished, the counts having refided in it frequently.

The Principality and County of Solm is fituated between Lorrain and Lower Alface; and, to diffinguish it from the County of the fame name in the duchy of Luxemburg, it is called the Upper county, and the other the Lower. The princes of Solm are now divided into two branches, Hoogstrat, or Solm-Zusalm; and Leutz-Loes, or Solm-Kirburg; each of which possesses are qual share of the citates belonging to the former

counts, and vote alternately at the diets. The Principality of NASSAU lies mostly in the Wetterau. The length of it is computed at about 50 miles, and the breadth at about 30. Though it is, in general, woody and mountainous, there are fome fine pastures and corn-lands in it, besides excellent baths and mineral waters, and feveral mines of iron, lead, copper, and other metals. Most of the princes and inhabitants are Calvinists. The principality is divided inhabitants are Calvinists. The principality is divided into several counties, belonging to the different branches of the family, which is one of the most ancient and illustrious of Europe, having produced, befides many other great heroes, Adolphus, emperor of Germany, and king William III. of Great Britain. The elder line, or that of Walram, confifts, at prefent, of the branches of Naffau-Saarbruck-Ufingen, Naffau-Saarbruck Saarbruck, and Naffau-Weilburg. The representative of the last of these married the late prince of Orange's only fifter. The other line, or that of Otho, which confifted formerly of the feveral branches of Naffau-Siegen, which was Popish, Naffau-Dillemberg, Dietz, and Hadamar, is now reduced to that of Naffau-Dietz, the representative of which, William, prince of Orange, enjoys all the territories that belonged to the other branches; and, on account of them, has feveral votes in the diet of the empire, and those of this circle and Westphalia. All the branches pay a matricular and chamber taxation; but those of the elder line have no feat, or votes, in the college of the princes of the empire, being only members of that of the Imperial Wetterau counts. The chief places in this principality are

Dietz another prince of on the rifouth-eafine caft town. In nicates w fubject t mation, fity of I is about neral, f fheep; I for the i

The

Dietz

oil,

Dietz, the capital of another county, belonging to another branch of the Nassau family, of which the prince of Orange is the head. It is pleasantly fituated on the river Lohn, 9 miles east from Nassau, and 19 fouth-east from Coblentz. It is walled, and has two fine caftles, or towers, standing upon two hills in the town. It has a bridge over the river, which communicates with Fregen-Dietz. It had a collegiate church, fubject to the electors of Treves; but fince the reformation, the revenues have been applied to the univerfity of Herborn. The county in which this town lies is about 14 miles long, and 10 broad. It is, in general, stony and hilly; has plenty of venison and sheep; but in the vallies there is corn and wine enough for the inhabitants.

Naffau is a small town on the Lohn, near which formerly flood Naffau-berg, a very ancient cattle, which was the original feat of the family. From this castle the principality, family, town, and bailiwick, took their name. The caftle, according to some, derived its own name from Nasgau, the original name of the county, fignifying, in the German, a marshy track, fuch as it antiently was; but, according to others, from Nasua, a famous German commander. Of the bailiwick, named from the town, a part belongs to Naffau-Dietz, another to Naffau-Weilburg, and another to Nassau-Usingen; and of that of Camberg adjoining, Nassau-Dietz, and the elector of Triers,

are joint proprietors.

Weilburg is a handsome town on the river Lohn, which gives name to a county, and title to the prince thereof, who has a fine palace and gardens in the town. Over the river is a stone bridge; and in the neighbourhood of the town are a large menageric and pleafure-house.

Weilmunster contains some filver and sopper mines,

and a great deal of iron ore.

Withbaden is a handfome, populous town, fituated on the Rhine, and noted for its warm baths.

Bibarich, a village on the Rhine, contains a palace; Schierstein is celebrated for its wine; Lohn, on the Schutter, gives name to a lordship; Otiweilar contains a Lutheran and Roman Catholick church; and Saarbruck, on the Saar, takes its name from a bridge over a river of the same name.

Homburg, a town fituated on the Wefgau, belongs to Naffau-Saarbruck-Saarbruck. The fame prince has a fhare of some other districts in this part of the prin-

cipality of Naffau.

The County of WALDECK terminates fouthward on Heffe, northward on the diocefe of Paderborn, weft-ward on the duchy of Weftphalia, and eaftward on Heffe, and the bailiwick of Fritzlar, in the electorate of Mentz. Its length is computed at about 24, and its breadth at 20 miles. It yields iron, lead, copper, marble, flate, mineral springs, and abounds in grain, wood, and cattle. Gold is fometimes found in the river Eder. The inhabitants, in general, are Lutherans. There are some woollen manufactories, besides those of iron and paper, in the county. The title of the family of Waldeck runs thus: "Waldeck, prince of the facred Roman empire, count of Pyrmont and Rap-polften, lord of Hoheneck and Gerolfeck, &c." The fernales, notwithflanding, are only counteffes. The prince has not yet obtained a feat and voice among the princes in the diet of the empire, but in that of this circle he has. To the empire, his affediment for Waldeck is 4 horse, and 18 foot, or 120 florins, monthly, in lieu of them; and to the chamber of Wetzlar 6; rix-dollars, 74 kruitzers. The county is a fief of Heffe-Caffel; the fuccession to which was first settled on the eldest son, and his issue, in the year 1697. Here are the usual high courts and colleges, for the government of the county, and the administration of justice. The revenue of the county is pretty confiderable; and the prince generally maintains five companies of foot. The chief places here are

Corbach, the capital, divided into the Old and New Towns, which contains a gymnafium, with two churches; in one of which is a stately monument of marble and alabafter, erected by the states of the United Provinces to the prince of Waldeck, who was field-marshal of their forces.

Lower Weldungen is a pretty large well built town, having the epithet of Lower, to diftinguish it from Old Weldungen, a small town, with a castle, called Frederichstein. In the choir of the church belonging to the former of these towns, is a monument of alabafter, erected by the republic of Venice, to a prince of Waldeck, who was commander of their forces. In its neighbourhood also are some mineral springs.

In Rhoden is a feat belonging to the prince. Near Waldeck stands an old castle, which gives name to the county, and title to the prince.

Arolfen is a regular well built town, standing not far from the river Aars, and containing a palace, which is the usual residence of the prince, and a church for each of the three religions. Here is also the seat of the high colleges.

Adorf is a village in the bailiwick of Eisenburg, in which are iron works, with two copper mines, and a Lutheran foundation for ladies. There are copper works in fome of the other bailiwicks; and at Kleinern, a village in the bailiwick of Waldeck, are two chalybeate springs.

The County of HANAU-MUNZENBURG is fertile in corn, wood, wine, and fruit. It produces likewife falt, cobalt, filver, and copper.

The rivers are the Maine, Kinzeg, and Nidda. The

established religion is Calvinism; but Lutherans and Roman Catholics are tolerated. It is a populous manufactoral and commercial county, and the chief places are the following:

Hanau, its capital, is fituated on the river Kinzeg, which divides it into the Old and New Towns, both of which are fortified. The New Town, which was built at first by Flemish and French refugees, who had great privileges granted to them, is regular and handsome. The castle, in which the counts used to reside, and which stands in the Old Town, is fortified, and has a fine flower-garden, with commodious aparments. The Jews are tolerated here, and dwell in a particular quarter. The Magistracy of the New Town, and the dis-posal of all offices in it, belong to the French and Dutch congregations. Here are an univerfity, with feveral manufactories, particularly that of roll tobacco, and a very confiderable traffic. A canal runs from the town to the Maine, on which river, near the town, is Philipfrue, i. e. Philip's Repose, a pretty villa, built by one of the counts of the name of Philip.

Bergen, a small town, yields excellent wine; Bieber is a thriving town, with filver, copper, iron, and cobalt mines and works; and Glenhausen, on the Kinzeg, 16 miles north-east from Hanau, was formerly an Imperial city, but now belongs entirely to the landgrave of Heffe-Caffel.

In Nauheim, a imall town, is a falt-work of confiderable value.

Territories belonging to the Princes of SOLMS.

The house of Solms is divided into many branches, of which those of Solms-Laubach-Baruth, with their collateral branches, have their estates in Lusatia, and the electorate of Saxony. The matricular affestment of those of this circle is 252 florins; and, to the chamber of Wetzlar, about 130 rix-dollars. In the diet of the empire, and the college of the Imperial counts of the Wetterau, they have four votes, and the like number in the diets of this circle. The lines of Braunfels and Hoen-Solms are Calvinifts, that of Sonnenwald Catholic, and all the refl Lutherans. In the territory of Solms-Braunfels are

Braunfels, a town fituated on a high hill. Near it is a palace, strongly fortified in the ancient manner, and

EUROI

giving name to a bailiwick, which, with the town and caftle, belong to the Braunfels branch; and contains, befides other places, Altenburg, a Promonstratensian convent for ladies; near which the highest court of the county is held annually in the open air, unless in stormy weather; and Burg-Solms, a village, in which stood formerly the ancient samily seat of the counts of Solms. The bailiwick has also several iron mines and woods in it, and abounds in grain and cattle.

Hungen is a small town seated on the Horloss, in that part of the lordship of Munzenburg which belongs to this samily. In the town is a palace of the counts, and without it a park for deer. In the same part of the above lordship stands also Arensburg, a rich abbey of Bernardines, subject to the archbishop of Mentz, the revenue of which is said to amount to about 30,000

florins.

Wolfesheim, Gambach, and Hoen-Solms, all give names to bailiwicks, and the latter contains a palace. Laubach, on the Wetter, gives name to a bailiwick, and title to a prince. In the neighbourhood of the latter town excellent fuller's earth is found in great abundance.

In the territory of Solms-Rodelheim are

Rodelheim, a large county town on the Nidda, containing the count's palace, and giving name to a bailiwick, the greater part of which belongs also to a count; and Affenheim, a small town, situated at the conflux of the Nidda and Wetter, and giving name to a bailiwick, of the greater part of which the count is also proprietor.

The County of Konicstein lies in the Wetterau, along a ridge of mountains called the Hoe. The elector of Mentz at prefent possessing the whole of the county, a small part only being held by the counts of Stolberg, who, however, have, at various times, pretended to have a right, and laid claim, to the whole. In the mean time both these princes continue to vote, on account of it, in the diet of the Upper Rhine, and both are members of the college of the Imperial Wetterau counts. Of the matricular assessing the Mentz pays 80 florins, and Stolberg 20. The places in this country are

Konigstein, which gives name to it, and contains a castle on a high rock; Soden, a free Imperial village, in which there are some salt-pans and a medicinal bath; Ranstall, a small town belonging to the same count;

and Ordenburg, defended by a castle.

The County of UPPER-ISENBURG, fo called to diftinguish it from Lower-Isenburg, on the Lower Rhine, was made a county in 1442, having been only a lordship before. It contains wood, corn, and wine; is well watered; and belongs partly to the house of Isenburg, partly to that of Hesse-Darmstadt, and partly to the counts of Stolberg. The house of Isenburg, on account of its portion of this county, has a seat in the diets of this circle, and also among the Wetterau counts. The principal places in it are as follow:

Birstein, famous for its iron mines; Langen-Diebach, and Offenbach, on the Maine, belonging to the

prince of Itenburg Birstein.

Hayn-zur-Dreyeichen, in the Imperial forest of Dreyeichen; and New Isenburg, a regular built town,

belonging to the above-mentioned prince.

Budingen, though a fmall town, is the capital of the whole county, and gives name to a diffrict, which, with two others, belongs to the count of lienburg-Budingen, who has a spalace in the town. In its neighbourhood is a park for deer, with fome falt works and vineyards.

Wachterfbach is a small town, giving name to a district, which, with the town, and two other districts, belong to the counts of Jsenburg-Wachtersbach, who

reside in the town.

Meerholz is a village on the river Kenzig, in which the counts of Isenburg-Meerholz reside, and which gives name to a district belonging, with some others, to the same counts. Of the WILD and RHINE-GRAVES, and their Territories.

The Wild, or Wald, or Rau-Graves, in Latin, Comites falutarii, forestarii filvestres, & birsuti, were so called from the rough and woody territories, which, as well as those of the Rhine-Graves, lay dispersed about the Rhine, between Basil and Bonn. In the 12th century the territories of the former sell to the latter, from whom are descended the counts of Salm, the counts of Grumbach, the Rhine-Graves of Stein, and Wild-Graves of Daun and Kirburg. Each reigning house sits and votes in the diets of this circle, and in those of the empire, in the college of the Imperial counts of the Wetterau, paying each a matricular assessment, and also to the chamber at Wetzlar. The Wild and Rhine Grave lands are mostly siefs.

In the territory of the counts of Grumbach are Grumbach, a town which gives name to a lordship, or bailiwick, lying on the river Glan, and affording amethysts, cornelians, agates, mochas, &c. Tronchen, on the Tron, gives name to a lordship,

Tronchen, on the Tron, gives name to a lordship, which contains Talfang, a market town, and 14 little villages.

The territories of the Rhine-Grave of Stein contain only Rhingrafenstin and Wildenburg, which have both castles; Grehweiler, which has a palace; and the large village of Worstall.

The Wild-Gravate of Daun contains Daun, an elegant feat on a hill, near the Suinnern; Kirn, a town on the Nahe; Diemringen, a market town, which gives name to a bailiwick; and Putlingen, from which a lord-

thip receives its appellation.

Leiningen, or Linage, the capital of its county, flands eight miles fouth-west of Worms, and northwest from Spire. This county, which borders upon Frankendale, is shared among four branches of the family, who take their name of diffinction from the feveral parts of it in their possession. The county of Linage, properly fo called, is a fief of the bishop of Mentz, and therefore was united to France in 1681; but, by the treaty of Ryfwick, those counts were reestablished in their ancient state, and they are therein expressly stiled the counts of Leiningen. The principal places in it are New-Leiningen, Turcheim, Grunfladt, and Lansheim. The other branches of these counts, who are all Lutherans, are in possession of Hartenberg, in the middle of the Palatinate, not far from Worms; Broich cattle, on the Rhine, near Duifburg; Dachfburg, in the Westreich, in Alface; and Westerburg, in Wasteravia.

The Lordship of Reipoltzkirchen belongs to the count of Hillesheim, on which account he has a feat and voice in the diets of the circle; as hath the count of Wied Runkiel for the lordship of Kirchingen.

The county of Falkenstein belongs entirely to the emperor; but contains only Falkenstein, a small town, defended by a castle; and Winweiler, which gives name to a bailiwick, and has a fortress.

The County of WITGERSTEIN, which is about 18 miles in length, and 14 in breadth, is environed by the territories of Heffe-Darmfladt, Naffau-Dillemberg, and the Duchy of Weftphalia. It produces little grain, but good pafture, and plenty of wood; with mines of filver, copper, and iron; and is watered by the rivers Lohn and Eder. The counts, who are of the fame family as those of Sayn, are divided into the two branches of Sayn-Witgenstein, of Witgenstein, and Sayn-Witgenstein of Berleburg. The county entitles both branches to a vote in the college of the Wetterau counts, both at the diet of the empire, and those of this circle. The revenue of the county of Witgenstein, including that of the lordship of Homburg, which lies between the duchy of Berg and county of Mark, and belongs to the counts of Witgenstein, is considerable. In this county are

The

Witgenftein; and Berleburg, a small town, on the little river Berlen, containing a fine palace, belonging, with the town, to the county of Sayn-Witgenftein-Berleburg.

THE CIRCLE OF THE LOWER-RHINE.

THIS circle is bounded on the east by Franconia, and the lower part of the circle of the Upper Rhine; on the west by the upper part of the circle of the Upper Rhine, Lorrain and Luxemburg; on the north by the circle of Westphalia; and on the south by that of Swabia. It contains, exclusive of the Palatinate, &c. the three archbishopries and electorates of Mentz, Triers, or Treves, and Cologne.

The diets of this circle are held at Frankfort on the Maine; and the elector of Mentz is the fummoning prince and director of it. It is one of those called the anterior circles; and its contribution to the empire has generally been equal to that of the Upper Rhine.

In describing this circle we shall observe the following

The Archbishopric and Electorate of Mentz lies on the banks of the Maine, between the electorate of Triers on the west, the Palatinate on the fouth, Franconia on the east, and the Wetterau on the north. It is about 60 miles in length, and 50 in breadth. Besides the Main, it is watered by three other principal rivers, the Rhine, the Jaxt, and the Lohn. It is, in general, exceeding fertile, and produces great plenty of corn, cattle, wines, fruit, salt, slax, tobacco, and timber. It has several kinds of manufactures, particu-

chefinuts, flax, and tobacco, a confiderable trade is carried on with the adjacent countries.

As the electorate of Mentz is under the dominion of an ecclefiaftic, almost the whole property of it belongs

larly those of woollen and linen cloth, glass mirrors,

and porcelain, in which, as well as in wine, almonds,

to priests, monks, and nuns; and all places and offices are possessed by the clergy. The predominant religion of the electorate is the Roman Catholic; but, in seve-

ral places, there are many Protestants.

The elector is chosen by the chapter, which consists of 42 canons, 24 of whom are capitulars. He is not only the first archbishop, but also elector of Germany, in consequence of his being arch-chancellor of the empire; and he always sits on the right hand of the emperor in all public conventions. He is visitor of all the courts of the empire, director of its posts, and guardian of the archives and matricula. He crowns the emperor, nominates a vice-chancellor of the empire, and holds a chancery at the Imperial court. To him also all foreign princes and states direct what propositions they make to the empire, as well as apply for the redress of grievances. In spirituals he stands immediately under the see of Rome. The bishoprics subject to this jurisdiction are those of Worms, Spire, Strasburg, Constance, Augsburg, Coire, Wurtsburg,

Eichstadt, Paderborn, Hildesheim, and Fulda.

For the government of the country, and the administration of justice, the chief colleges are the privy conference, the privy chancery, the Aulic council, and the reversion judicatory; to the last of which appeals

lie from the inferior judicatories.

The revenues of the elector are supposed to amount annually to about 100,000l arising chiefly from the tolls on the Rhine and Maine, the tax on wine, and that paid by the Jews, the latter of which is very confiderable. He is able to maintain 5 or 6000 men at all times; but, to save unnecessary expence, seldom keeps above half that number of regular troops; for his income, when he is only archbishop of Mentz, without commandams, (which is seldom the case,) will not allow of any greater state or expences; and his houshold is suited rather to his facred than his temporal character.

The most considerable places in this electorate are the following:

No. 71.

Mentz, which stands on the Rhine, near where the Maine falls into it, is the capital of the archbishopric and electorate. It is called, in Latin, Moguntia, Moguntiarum; and, in French, Mayence. It is fituated 15 miles west from Frankfort, 20 north from Worms, 48 from Heidelberg, 45 from Spire, 186 from Strafburg, 60 from Triers, and 74 from Cologne. It is a large and populous city; but most of the streets are narrow, and the common buildings very plain and irregular. The elector has feveral palaces in and about the city, most of which are ornamented with beautiful and extensive gardens. It was made an archbishopric in 729, by Pepin and pope Gregory III. The cathedral is a lofty vaulted building; and in it are some fine monuments, erected to the memory of deceased electors. The vestments in which the electors say mass are extremely rich; and the canopy under which the host is carried in procession is entirely covered with pearl. The elector's chief palace is built of reddish marble stone, embellished with ornaments, and is regular and magnificent, though but two stories high, and built after the old German manner. On the windows of this building, as well as on those of the cathedral, are painted a wheel, which is a part of the elec-tor's coat of arms. Befides the cathedral, here are many collegiate and other churches, with feveral mo-nafteries, nunneries, and hospitals. Here are likewise an university, founded in the year 1482, by the elector Diether; a bridge of boats over the Rhine; manufactories of stockings and stuffs; and two yearly fairs. But the most considerable building in this city is the charter-house, which, for elegance and extent, is one of the finest in Europe. It has apartments large and commodious enough to lodge a fovereign and his retinue, and is beautifully fituated on an eminence fronting the Rhine. At the foot of this house stands the Favorita, a small but elegant electoral palace, with most delightful gardens.

Mentz has a flourishing trade, especially in Rhenish wines, of which the vineyards in this neighbourhood yield the best, particularly those of Hockham, from whence the finest fort of Rhenish wine has obtained the name of Old Hock. The city of Mentz claims the invention of the art of printing, which, if not invented, was at least much improved, by John Fust, or, as others say, by John Guttenburg, about the year

Alchaffenburg is fituated on the conflux of the rivulet Aschaff and the Maine. Here is a fine castle, in which the elector frequently resides during the season for hunting in the Spassart, together with a collegiate church, a college, and a large cloister. The town gives name to a bailiwick, in which are also Seligenstadt, a town situated on the Maine, with a Benedictine cloister; the abbot of which stiles himself lord of Geisalbach, Omersbach, and Hostsdaen; together with Obernburg, a small town, and Dettingen, a village on the Maine, remarkable for a battle fought near it in 1743, between the English and French, in which the latter were repulsed.

Bingen is a pleafant town, fituated on the west side of the Rhine. It had a fort in the time of the Romans; and has a castle at this day, which stands on a hill, and overlooks the town. It is 15 miles west from Mentz, and was formerly an Imperial city; but it is now subject to the dean and chapter of Mentz. has a handsome stone bridge over the river Nahe, which runs through the town, and empties itself into the Rhine. A toll is levied here for whatever paffes up or down the Rhine, which is twice as broad at this place as the Thames at London. Not far from the town is the celebrated Bingerloch, where the Rhine is confined between two high rocks, which, with the waterfall, occasioned by the river Nahe's emptying itself there into the Rhine, renders the passage very danger-ous. At a small distance from hence, in an island or rock on the Rhine, is the famous Mousethurm, that is, the Mice or Rats Tower, so called, as the people

here will have it, from the following circumstance. An archbishop, who had a great antipathy to beggars, and used to call them the rats that eat up the corn, was, by the just vengeance of heaven, so pestered with rats and mice, that though he fled to this tower to avoid them, yet they purfued him across the river, and at length devoured him. Others reject this flory as fabulous; and think the tower was fo called, from the Germans giving the name of rats to the officers that were placed in it to levy the tolls, old buildings being generally called rats nefts.

Cronberg is a small town situated on a mountain, the inhabitants of which are partly Protestants and partly Roman Catholics. It once belonged to the landgrave of Hesse. The district, which it gives name to, contains some fine woods, with great numbers of

chefnut and other fruit trees.

Eltvil, or Elfeld, a small town, five miles west from Mentz, has a strong castle, and is the capital of the Rhinegau, a tracklying along the Rhine, and very fruitful, especially in excellent vines. There are several other small towns and cloifters in the Rhinegau.

Miltenburg, on the Maine, contains a castle, a Fran-

cifcan cloifter, and a gymnafium.

Fritzlar, a pretty strong town on the river Edos, contains two collegiate churches, with an Ursuline nunnery. It gives name to a territory which lies betwixt Lower Heffe and the county of Waldeck, and has another small town in it, called Naumburg, or Num-

Besides those already mentioned, there are several

other inconfiderable towns in this electorate.

The Archbishopric and Electorate of TRIERS, or TREVES, lies between Cologne, Berg, and Juliers, on the north; Lorrain and the Palatinate on the fouth; Luxemburg on the west; and Wetterau on the east. Its extent, from north to fouth, is about 80 miles; and its breadth, from east to west, about 60. watered not only by the rivers Rhine and Mofelle, but also by the Saar and Kyll. On the banks of the two former the country is populous, and fruitful in corn and wine, but elfewhere mountainous and woody, yet abounding in game and acid fprings, as also in

metals and minerals of various kinds.

The states confist of the prelates or abbots, with the representatives of the clergy, and of certain towns. The inhabitants are all Papifts, except in such places as the elector possesses in common with other princes, where there are some Protestants. Under the archbishop are 5 archdeacons, and, subordinate to those, 20 provincial deans. The ancient Treveri, from whom the city of Triers and the electorate take their name, were a very warlike people. Their general, Ambiorix, cut off a whole Roman army. They worshipped Mars, and Apollo, till Conftantine established Christianity among them: but at what time the bishopric and archbishopric were created is uncertain. The thurch of Treves, however, is commonly accounted the most ancient in Germany. The chapter, which elects the archbishop from among themselves, and make him fwear to a capitulation, confifts of 16 capitulary canons, all of whom are of noble descent. At every new election the pope receives large fums for confirmation, the pallium, and for annats, or first fruits. The archiepiscopal title is, "By the grace of God, archbithop of Treves, of the Holy Roman Empire, throughout Gaul and the kingdom of Arles, arch-chancellor and elector, and also administrator of Prum." He is the fecond elector in rank, and at the election of an emperor has the first voice. The tolls on the Moselle and Rhine, his demesnes, and his office of noble guardian of the Minors, with the taxes he lays on his fubjects, are supposed to bring him in about 70,000l. per annum. For the government of this electorate, and the administration of justice, besides the regency and revision court, there are the two aulic judicatories, to which appeals lie from the inferior courts. There are also two spiritual high courts. The hereditary officers are the marshal, the chamberlain, the sewer, and cupbearer. Among other prerogatives, this elector has power to banish excommunicated persons out of the empire, if they do not reconcile themselves to the church within a year; and to take possession of the estates of minors, till they are of age. He has also a right to re-unite all the fir fs of his diocefe, upon failure of heirs, to the domains of his church. His subjects may appeal to the chamber of the empire, in all causes above 1000 florins. The regular troops he maintains, besides a militia, amount to between 11 and 1200; befides a life-guard of 40 men.

The chief places in this electorate are the follow-

Triers, or Treves, the capital of the archbishopric, is fituated on the Mofelle, over which it has a handfome stone bridge. It is 60 miles west of Mentz, 52 fouth of Cologne, and 82 north of Strafburg. city vies with most in Europe for antiquity, having been a large and noted town before Augustus settled a colony in it. It was free and imperial till the year 1560, when it was furprized, and subjected, by its archbishop, James III. The private buildings are very mean; and the city is neither well fortified or well inhabited. Near the cathedral, a large Gothic edifice, is the elector's palace, which was a few years ago rebuilt, and is a tolerable handsome building. Here are 3 collegiate and 5 parith churches, 13 monasteries and nunneries, an university founded in 1472, a house of the Teutonic order, and another of that of Malta, with some remains of the ancient Roman theatre.

Near Triers is a small town on the Moselle, called Psabzel, where, in the time of the Romans, stood a palatium. It gives name to a diffrict, in which is Conz, a borough on the Saar, over which there is a

bridge here, called Confarbruck.

Coblentz is a large town, fituated near the conflux of the Mofelle and Rhine, 35 miles north-west from Mentz, 40 fouth-east from Cologne, and 52 north-east from Triers. It is well built, and strongly fortified; has a bridge of boats over the Rhine, and another of stone, consisting of 14 arches, over the Moselle. Here are feveral collegiate and other churches, befides monasteries and nunneries, a gymnasium, an archiepisco-pal seminary, and a castle. The Romans had a fort at this town; and the first kings of the Franks frequently refided in it.

On the other fide of the Rhine, nearly opposite to Coblentz, is Hermanstein, or Ebrenbreitstein castle, an impregnable fort, well defended by out-works, on the fummit of a fleep rocky hill, which commands the city and the two rivers. It is eftermed one of the strongest citadels in Germany; and the ascent to it is by a winding road cut out of the rock, in the courfe of which are four handsome gates. On the outermost gate there is a statue of brafs, above 15 feet high, reprefenting the Virgin Mary, with the infant Jesus in her arms, and a lily in one hand. In the middle of the citadel is a fquare, on one fide of which is the governor's house. The other three are occupied by magazines and barracks. Among other curiofities here is a prodigious cannon, 18 feet and a half long, a foot and an half diameter in the bore, and 3 feet 4 inches in the breech. The ball made for it to carry weighs 180 pounds, and its charge of powder is 94 pounds. According to the inscription on it, it was made in 1529, by one Simon. In another square is a very fine fountain, being a large bason of stone, in the centre of which stands a marble pillar on a brass pedestal, with the elector's arms, furrounded with four dolphins of the fame metal. On the top of this column is a statue of the Virgin Mary, bruifing the head of the ferpent, which is also of brafs, about 12 feet in height. There is a well here, dug out of the rock, 280 feet deep, the water of which is clear, and exceedingly wholesome. At the foot of the castle is an electoral palace, enclosed on one side by the Rhine, and on the other by a rock. It is but an indifferent building; and the apartments are low, incom-

modious, and much exposed to the sun; but they are adorned with beautiful tapestries and paintings; and the chapel is very elegant. The garden, though fmall, is embellished with statues, water-works, a charming orangery, and a bower, more than 300 feet in length, by the fide of the Rhine, from whence, through the openings, which are well contrived for the purpose, are seen the Rhine, the Moselle, the city of Coblentz, the bridge across the Moselle, the charterhouse, and a very fine country to the distance of three or four leagues. The way to the charter-house, which is a handsome building, beautifully situated about two miles from the castle, is full of chapels, in the manner of oratories, adorned with statues, representing the principal actions of Our Saviour, from his birth to his refurrection.

Oberwesel is situated on the west side of the Rhine, at the foot of a hill, 21 miles fouth from Coblentz, and 18 west from Mentz. It was once an Imperial and free city, but has been fubject to the archbishop of Triers ever fince the year 1312. It has four churches,

and a very large castle.

Limburg, a town on the river Lohn, over which it has a stone bridge, contains a collegiate church with three cloifters, and gives name to a bailiwick, in which alfo is Lower Brechen, a small town, and Lower Salters, a village on the Emfbach. Near the last is the celebrated mineral fpring, the waters of which are fo much used and exported, that, in 1755, 18,000 rix-dollars per annum were offered for a lease of it. In this bailiwick also filver has been found.

Berncastle, on the Moselle, contains a strong castle and a Capuchin cloifter, and gives name to a bailiwick, in which is a copper mine; and a place called Novio-magum, on the Mofelle, where Constantine the Great

had a camp.

Wittlich, on the river Lefer, contains a Franciscan cloifter, and a castle, called Ottenstein; and gives name to a bailiwick, in which is a college of canons regular, where adoration is paid to a celebrated image of the Virgin, and whither many pilgrimages are made. In this diffrict the French were defeated by the Imperialists in 1735.

Welschbillig is a small town, near which is a cloister

of the Brother of the Cross.

St. Maximin is one of the oldest and richest abbies in Germany. The abbot is the first among the provincial states here, as well as in the duchy of Luxem-The yearly revenues of the abbey are estimated at 6000 ducats. Befides the bailiwick of St. Maximin, with the jurisdiction and regalia therein, to the abbey belong also the feigniory and burgravate of Freudenburg on the Saar, and other estates, with the superiority, jurisdiction, and right of taxation in them.

Werheim is a borough, in which, and the bailiwick werneim is a bolougi, in amount to the elector of Triers and the prince of Naffau-Ufingen, both the Roman Catholic and Protestant religion are tolerated.

Munster-Meinfeld, a small town, gives name to a bailiwick, which yields fome copper and gold, and contains Carden, a very ancient borough on the Moselle, with a collegiate church, and a Franciscan cloister.

Mayen, a small town on the Nette, contains a castle, and gives name to a bailiwick; in which also is Montreal, a strong little town, on the Elz; together with Kayferfesch, a small town, and the Benedictine abbey of Lock.

Boppard, a town and castle on the Rhine, where a toll is levied, contains three cloifters, and gives name

to a bailiwick.

Engers has a strong castle on the Rhine, between Coblentz and Andernach, which gives name to a neighbouring territory. Here is a noble bridge, founded by Cuno, archbishop of Triers, who died in 1388.

The greater part of the Archbishopric and Electorate of COLOGNE lies on the western bank of the Rhine, where it runs near 100 miles in length; but the breadth is hardly any where more than feven or eight. It is

bounded by the duchy of Cleves on the north, and the electorate of Triers on the fouth; the duchy of Juliers on the west, and that of Berg on the east. It is a pleafant and fruitful country, (especially that part situated on the Rhine,) and produces excellent wine, corn, and most of the necessaries of life. The archbishop is the supreme lord of it, as also of a pretty large track in Westphalia; and is richer and more potent than either of the other two ecclesiastical electors. His dominions contain 52 towns, and about 17 boroughs. He has the second suffrage in the electoral college; and crowns the emperor, when the ceremony is performed in his own diocele, or those of his suffragans. His fee was raised from a bishopric to an archbishopric in the eighth century. His fuffragans, at prefent, are the bishops of Liege, Munster, and Ofnaburg; as were formerly also those of Utrecht and Minden; but he has no authority in spirituals over the Protestants of the bishopric of Olnaburg. His title is, " By the grace of God archbishop of Cologne, and arch-chancellor of the holy Roman empire throughout Italy; as also elector and legatus-natus of the holy apostolic see, duke of Engern and Westphalia, &c." The right of electing the emperor, exclusive of the other princes, devolved on him, and the other arch-officers of the empire, about the end of the 13th century. The great chapter of Cologne is one of the nobleft in Europe, confifting of 40 canons, who are generally princes or counts of the empire. Of these 25 chuse the archbishop, and may advance one of their own body to that high dignity, if they are so inclined. The revenues arising from the archbishopric amount to about 130,000l. sterling; but the elector is generally possessed of several other great benefices. He has his hereditary officers and his lifeguards, confifting of halberdiers and yeomen, befides a regiment of foot-guards, which make a handsome appearance.
The chief cities and towns in this electorate are as

follow:

Cologne, the capital, which gives name to the electorate, is feated on the Rhine, 20 miles fouth-east from Duffeldorp, 16 east of Juliers, 40 north from Coblentz, 60 east from Maestricht, 68 north of Triers, 70 south of Munster, 82 north-west of Mentz and Nimeguen, 100 from Bruffels and Antwerp, and 120 from Amsterdam. It is one of the largest cities of Germany, and very confiderable on account of its buildings, number of inhabitants, and great trade in Rhenish wine, and other commodities of Germany, which, by means of the Rhine, are brought hither, and transported to Holland. It is a free city, being governed by its own fenate, who order and judge all civil matters and causes: but criminal causes are judged by the elector. It is called, by fome, Second Rome, because of its senate, buildings, and extent; and, by others, the Holy City, because of the many churches and religious houses in it; here being, befides the cathedral, which is a very magnificent, though unfinished, pile, ten collegiate and 19 parochial churches, also 37 monasteries, and great numbers of chapels and hospitals. The walls of the city are flanked with 83 towers, and encompassed with three deep ditches, beautified with fine rows of trees; and all the churches and houses are covered with flates. The government of this city is in fix burgomafters, feven eschevins or aldermen, and 150 common-council, who hold their offices during life. Only two of the burgomafters are regents, . during a year, by turns. The eschevins are chosen by the archbishop, and the council by the companies of the There are only 50 of the council in power for a year, fo that it returns to the same perfons once in three years. When a burgomafter dies the council have power to chuse another. Most of the inhabitants are Papists; but there are many Protestants, who are their chief traders. The Lutherans have a church in this city; and the Calvinifts one on the other fide of the Rhine, at Maltheim. Most of the houses of the canons and pretends have large gardens and vineyards. In St. Greon's

and students, many of whom beg alms with a fong; and nothing to be heard but the tolling of bells." He fays also, "That there are as many churches and chapels in it as days in the year; that there are very few families of quality; that the vulgar are extremely clownish; and that the noblemen of the chapter stay no longer in town than their duty obliges them." As a free Imperial city it has a feat and voice at the diets of the empire and circle; in the former of which it has the first place on the Rhenish bench. On the other fide of the Rhine, directly opposite Cologne, is a village called Deutz, inhabited chiefly by Jews tolerated by the elector; but they are not fuffered to enter the city without a guard, nor to lie one night in it; and they pay a florin of gold for every hour they stay. The Jews in Deutz live by fattening herds of swine for the Christians; so that more beasts than men are feen in the streets, which are extremely filthy and ill-paved; and the houses are built with pieces of timber intermixed with clay. The principal buildings belonging to this village are a Benedictine convent, and a parochial church on the brink of

the river.

Bonne, the usual place of residence of the elector, is fituated on the western side of the Rhine, 15 miles fouth of Cologne, 28 north-west from Coblentz, 21 fouth-east from Juliers, 57 north-east from Treves, and 62 north-west from Mentz, in a fruitful country, which produces very good wine. The woods abound with variety of game, as does a ridge of mountains on both fides of the Rhine, from hence as far as Bingen. It is a fmall city, but well inhabited. The elector's palace, fituated in the castle, is a very elegant and spacious building. The churches are flately, especially the colle-giate, dedicated to the martys Cassius, Florentius, and Malufius, whose bodies, with several others of the fa-mous Theban legion, are said to be buried in it, being brought hither by St. Helena, who founded this church to their honour. The town-house is well-built, and adorned with fine paintings. This was formerly an Imperial city, but is now subject to the elector. In the bailiwick, to which the town gives name, are feveral electoral pleafure-houses; and a small town, called

Heymertien, on the Erfft. Andermach is a town on the Rhine, fituated about 20 miles fouth-east of Bonne, upon the confines of the electorate of Triers, and the duchy of Juliers. was formerly a free and Imperial city, but is now fubject to the elector of Cologne. After it had lain a long time in ruins, it was rebuilt in 1520. It is fortified with a wall, castle, and bulwarks; is the boundary betwixt this archbishopric and that of Treves; and has a cultom-house belonging to Cologne; but its principal trade is by lodging paffengers. In 1702 it was taken by the prince of Heffe-Caffel, the more to streighten Bonne, which was then blocked up by the confederates. This is mentioned as one of the fortrefles which Drusus built to awe the Germans; and it is believed, that Caligula, his fon, was born here. It is the handsomest and largest of all the towns from Bonne to Triers. It has three confiderable monasteries in it, and several churches, the chief of which has two twin steeples, not unlike the towers of Notre-Dame at Paris. Two companies of foldiers are kept here by the chapter of Cologne. In the bailiwick, to which the town gives name, is an abbey called St. Thomas; and Rens, or Rees, a fmall town on the Rhine, near which is a remarkable piece of antiquity, called the Konigstulh, a large round building, of free-stone, resting on nine pillars, the ascent to which is by 28 steps. In this building the electors formerly met to consult about the choice of an emperor, and other weighty matters; and fome emperors have actually been elected here.

Zulpich, or Zulch, a fmall town, gives name to a bailiwick entirely furrounded by the duchy of Juliers. Konigsfeld, a borough and citadel, gives name to a diffrict, in which is a Carmelite cloifter, and a famous mineral fpring.

church they pretend to shew 1000 heads of martyrs, who fuffered in the reign of Maximinianus. Some of the heads of the pretended virgin martyrs, most noted for miracles, are kept, in cases of filver, in the church dedicated to St. Urfula: others covered with stuffs of gold; and some have caps of cloth of gold and velvet. Here is also a shrine, with a glass door, through which they shew several facred relics. The whole revenue of this church, which must be considerable (exclusive of the offerings and gifts made by pilgrims and other devotees) belongs to an abbess and fix canonesses, who must be all countesses, to do honour to St. Urfula. In the church of the Carmelites, the only one in the city whose altar is placed to the east, is a pulpit, the most magnificent in Cologne. In the Cordelier's church is the tomb of the famous Duns Scotus, furnamed the Subtle Doctor, on which is engraved this epitapth: Scotus me genuit; Anglia me suscepit; Gallia me docuit; Colonia me tenet. 'Among other curiofities in the cathedral, they shew the tombs of the three wife men that came to worship our Saviour, called from hence the three kings of Cologne. They lie in a large purple shrine, spangled with gold, fet up on a pedestal of brass, in the middle of a square mausoleum, faced within and without with marble and jasper. It is opened every morning at nine o'clock, if two of the canons of the cathedral are present, where these kings are feen lying at full length, with their heads bedecked with a crown of gold, garnished with precious stones. Their names, which are Gasper, Melchoir, and Balthasar, are in purple characters, upon a little grate of the fame metal with that before the shrine, which is adorned with an infinite number of large rich pearls and precious ftones, particularly an oriental topaz, as big as a pigeon's egg, valued at above 30,000 crowns. Over-against them are fix large branches of filver, with wax candles, which burn night and day. It is faid, the bones of these men were brought to Constantinople by Helena, the mother of Constantine; from thence to Milan, by Eutorpius, bishop of that see; and afterwards to this place, by

by Urban VI. in 1388. The town-house is a vast fabric, after the Gothic manner, where are feveral rooms adorned with noble paintings; and others full of bows, arrows, bucklers, and all forts of antique arms; particularly a cross bow of whalebone, 12 feet long, 8 inches broad, and 4 inches thick. From the tower of this house there is a beautiful prospect of the city and country. On the front of it is the figure of a man in Baffo Relievo, engaged with a lion, reprefenting one of their burgomafters, who, having exasperated their clergy, they put in a lion upon him, which he flew on the fpot. In the grand hall are five pictures with infcriptions, to perpetuate the memory of the battle of Hochstet. Several ecclesiastical councils have been held here; the first in the year 346. Another was held by Charlemagne's order, in the eighth century; and feveral in the ninth, for reformation of manners, against incestuous marriages, and oppression of the poor. The pope generally has a nuncio here, to take care of his interests with the Popish electors. Though the elector, by his officers, administers justice in all criminal causes; yet so jealous are the citizens of him, that they will not permit him, in person, to reside above three days at a time in the city, nor to come into it with a great train; for which reason he generally refides at Bonne. Cologne was made an archbithopric in 755, and, in 1260, entered into the Hanseatic league. It has the precedence of all the Imperial

nperors,

Nuys, a fortified town, near the conflux of the Rhine and Erfft, has a brifk trade, and contains a college of canons regular of St. Augustine. It held out a fiege for a whole year, against Charles the Bold duke of Burgundy; for which great privileges were granted to it by the emperor Frederick IV.

Zons, a fmall town, with a castle, on the Rhine, which gives name to a bailiwick, contains another small town, called Wering, or Weringan, and a pre-

monstratensian abbey.

Rufferschied, a small town, contains a castle, and gives name to a county which belongs to a branch of the house of Salm.

Ahrweiler, a small town on the Ahr, is noted for

producing excellent wine.

The district called the Palatinate of the RHINE is divided, by the Rhine, into two parts, the Upper and Lower Palatinate. The former lies in the circle of Bavaria, and belongs to the elector thereof; but the latter(in the circle we are now treating of) belongs to the elector palatine. The Lower Palatinate is bounded on the east by the county of Catzenellebogen, the archbishopric of Mentz, the bishopric of Worms, and part of the territory of the Teutonic order in Franconia; on the west by Alface, the duchy of Deux-Ponts, the county of Spanheim, the duchy of Simmern, and certain districts of the electorate of Mentz; on the north by part of the archbishopric of Mentz, and the county of Catzenellebogen; and on the fouth by the duchy of Wertemburg, and the bishopric of Spire. It contains 41 towns, befides feveral boroughs; and its greatest extent is about 80 miles. The air is healthful, and the foil fruitful in corn, pasturage, wine, tobacco, and all forts of pulse and fruits, particularly walnuts, chefnuts, and almonds. This country also breeds abundance of cattle, and is well watered by the Neckar, the Nahe, and the Rhine. In the last of thefe, near Germersheim and Sebz, is found gold, the exclusive right of fearching for which is farmed out by

The state of religion has varied greatly here fince the reformation, Lutheranism and Calvinism having been uppermost by turns, till the electorate devolved to the Popish branches of the family, when Popery, with all its fuperstition, was established anew; fo that the Protestant religion is now on a very precarious footing in the Palatinate; though most of the natives are still of that persuasion. The two sects of Protestants, the Lutherans, and Calvinists, have, indeed, greatly contributed to their own ruin, by their mutual jealoufy and animofity; being no less rancorous against one another, than against their common adversaries the Papifts. The Lutherans reckon themselves 50,000 strong, and are possessed of about 85 churches; but not one half of their preachers and schoolmasters have a competent maintenance. The number of Calvinist clergy here is estimated at 500, and that of the Roman Catholics at 400. Besides schools and Jesuits colleges in this country, there is one university, namely, that of Heidelberg; but there is very little trade in it except in wine. Authors are divided about the origin of the name Palatines, or Pfalzgraves, as the Germans call them; but it feems most likely to be derived from the palatia, or palaces, which the old Frankish and German kings, and Roman emperors, were possessed of in different parts of the country, and over which they appointed fupreme flewards or judges, who were called Palatines, or Pfalzgraves. The countries where these Palatines kept their courts were, from them, called Palatinates, which name came at last to be appropriated, by way of eminence, to this country, as being the most confiderable of them. The ancient electoral line failing in 1685, the electorate devolved to Philip William, duke of Neuburg; and upon the death of his fecond fon, Charles Philip, to the prince of Sultzbach. elector has the title of arch-treasurer of the empire, as well as the elector of Brunswic-Lunenburg, and is the fifth in rank among the secular electors. He is also one No. 71.

of the vicars of the empire, alternately with the elector of Bavaria, and enjoys many other prerogatives. In his own dominions he disposes of all vacant benefices; but allows the ecclefialtical council, composed of two clergymen and two laymen, to prefent two candidates, of which he chuses one. He is also master of all the tythes in his dominions; but he either grants them to the clergy or falaries in lieu of them, out of the revenues of the church. His title is, "Pfalzgrave of the Rhine, arch treasurer and elector of the holy Roman empire; duke of Bavaria, Juliers, Cleves, and Berg; prince of Mors; marquis of Bergen-op-Zoom; count of Veldens, Spanheim, the Mark, and Ravensburg, and lord of Ravenstein." In this country is an order of knighthoood called St. Hubert, the badge of which is a quadrangle cross pendant to a red ribbon, with a ftar on the breaft. The whole of the elector's revenue arifing from the Palatinate, the duchies of Berg and Juliers, the feigniory of Ravenstein, and the duchies of Neuburg, and Sultzbach, hath been estimated at about 300,000l, per annum. The military establishment consists of several regiments of horse and foot, besides the horse and Swiss life-guards. All the different courts and councils, usual in other countries for the different departments of government, are also to be found here.

The most remarkable towns and places in this Pala-

tinate are as follows:

Heidelberg, the capital of the Palatinate, to miles from Manheim, 12 from Spire, 38 from Frankfort, and 35 from Mentz, is fituated near the river Neckar, in a good air, and encompaffed on all fides, except to the west, with hills covered with wines. It takes its name from Heidel, which fignifies a myrtle, and Berg, a mountain; there being, or having been, plenty of those trees on the mountains in the neighbourhood. It is an ancient city, and has been frequently befieged and taken, plundered and destroyed. Though it is at present small, it is neat, and well built. The electoral palace is an antique building, but, standing on a hill, commands a fine prospect. As to the famous library here, many valuable books and manuscripts were taken from it in 1622, (when general Tilly made himself master of the town,) and sent to Rome, Vienna, and Munich. The professors of the university here are partly Calvinists, and partly Roman Catholics. Calvinists have also a gymnasium. Of the churches, some belong to the Calvinists, some to the Lutherans, and some to the Roman Catholics. In a college called the Sapience, which belongs to the Calvinists, 12 poor thudents are provided with lodging and board.

Opposite to Heidelberg is a high mountain, on which the Romans had a castle, and which, by some, is thought to be the Mons Pyrus, mentioned by Aminianus Marcellinus. It is now called the Holy Mountain, from a cloifter erected on it in 1023, to which frequent pilgrimages are made. The famous tun here, which stood in a cellar under one of the towers of the electoral palace, and contained 600 hogsheads of wine, was destroyed by the French in 1688; but the elector Charles Lewis caused a new one to be made, which is much more

confiderable.

Eight miles west of Heidelberg, on the east side of the Rhine, stands Manheim, the place where the elector usually resides. It is one of the finest towns in Germany, and strongly fortified; but it labours under two capital disadvantages, the want of good water and wholesome air. The electoral palace is one of the most magnificent in Europe, and contains a grand collection of paintings, brought hither from Dosseldorp, besides antiquities and curiosities, among which is the crown of the unhappy Frederick V. king of Bohemia. The three religions tolerated in the empire have churches in this city. Here is also a Jewish synagogue, with a Capuchin and Carmelite cloister. Some manufactures, and a considerable trade, are carried on in this town; the latter chiefly by the Jews, some of whom are very rich.

Bacharach is a town on the Rhine, the name of which, as some imagine, is a corruption of Bacchi Ara, i. e. the Altar of Bacchus; there being a stone opposite to it, on the Rhine, shaped like an altar, and called, by the inhabitants, the altar-stone, upon which, it is thought, victims were frequently offered to Bacchus, the neighbouring country yielding Muscadine wine. The inhabitants here, as in all other towns of the Palatinate, are a medley of Catholics, Lutherans, and Calvinists. The town contains a cloister; and on a mountain near it stands the castle of Staleck.

Oppenheim stands on a hill near the Rhine, and was once an Imperial free city. In 1688 and 1689 it was laid waste by the French, as were the principal towns of the Palatinate; but it has fince recovered itself. All

the three religions have churches here.

Ingleheim is a borough on the Selz, in which Sebaftian Munster, the geographer, and, as some think,

Charlemagne, the emperor, were born,

Frankenthal, a confiderable town, was formerly fortified, but afterwards laid waste, and dismantled by the French. In 1750 great privileges were promised to all Protestants and Roman Catholics who should come and settle in it.

Alzey, on the river Selz, contains a castle, with a church for each of the three religions, and gives name to a bailiwick. In the neighbourhood of this town is a stone monument, erected in memory of a dangerous leap, which the elector Frederick IV. made over a very broad ditch, on horseback.

Neuftadt, on the Hart, has a college, a gymnafium, and gives name to a bailiwick, which yields an excellent wine, and contains feveral fmall towns. Near

Neuftadt is a castle.

Germersheim is a large town, with a castle, fituated on the Rhine, where it is joined by the Queick, and where is a profitable fishery and a gold wash. The emperor Rodolph I. of Hapsburg, died in this town, which is supposed to be the Vicus Julianus of the Romans, and gives name to a bailiwick, containing also a commandery of the order of St. John, together with several small towns on the Rhine. At Selz is a gold wash; and at the same place was anciently a noble provostship, the revenues of which are now enjoyed by the Roman Catholies.

Mosbach contains a castle, with churches belonging to the three religions, and has a manufactory of cloth. It gives name to a bailiwick in which are several towns, particularly Sinzheim, where there is a large cloister

belonging to the Franciscans.

Ladenberg, is an ancient town on the Neckar, 16 miles from Heidelberg, of which one half formerly belonged to the elector, and the other to the bithop of Worms; but now the whole is the elector's. In the time of the Romans it was named Lupodunum. Here are churches of three religions.

Bretten is noted for being the birth-place of Philip Melancthon. It also gives name to a bailiwick.

Weinheim is a town fituated in the finest part of the Bergstraz. The neighbourhood produces good wine,

and contains a castle on a mountain.

The City of ERFURT is the capital of Thuringia, and was made a bishopric by St. Boniface, in the eighth century. Both the city and its territory, which is of considerable extent, are subject to the electorate of Mentz; but the inhabitants of both, or at least the greatest part of them, are Protestants, and entitled, by express stipulations, to the free exercise and enjoyment of their religion. The civil and criminal courts consist of an equal number of Roman Catholic and Lutheran affessor; and the members of the town-council are partly Catholics, and partly Protestants; the last having likewise a consistory of their own persuasion. The city of Ersurt is large and well fortissed, but not very populous; and the buildings are mostly old fashioned. The territory is pleasant and fruitful, both in corn and wine. The garrison consists of two battalions of imperial and electoral troops. There is a bell here, called

Susanna, which is said to be the largest in Germany, weighing above 12 tons. Here also are two citadels, with many churches; some collegiate, some Roman Catholic, and some Lutheran; together with a rich Benedictine monastery; seven cloisters, of which one is the Scottish; a Lutheran gymnasium; an university of five colleges, the professors of which are partly Lutherans, and partly Roman Catholics; the Imperial academy of natural curiofities; a riding academy; a botanic garden; an astronomical observatory; an anatomical theatre; feveral good libraries; and an academy of the useful sciences. Several diets of the empire have been held here. In 1664 the city was befieged and taken by the elector of Mentz, with the help of the French and Lorrain troops: but, by stipulations with the elector and princes of Saxony, who were its protectors, its privileges were, in a great mea-fure, secured. The territory belonging to the city contains 2 fmall towns and 73 villages, among which are 5 called the Kitchen Villages, as being obliged to perform certain fervices to the archbifhop's kitchen.

That part of the Lower Rhine, called the EICHSFELD, is furrounded by Heffe, Thuringia, and the principalities of Grubenhagen and Calenburg. It extends about 30 miles in length, and 20 in breadth, and is divided into the Upper and Lower Eichsfeld. The former is mountainous, but healthy and populous; the latter, though not enjoying, perhaps, fo pure an air, is more level, warm, and fruitful, abounding in corn, cattle, flax, and tobacco. Great quantities of linen and ferge are made in the upper; in which the rivers Leine, Lutter, Unstrut, Wipper, and Rume, have their The Thuringian language is spoken in the upper, but in the under the lower Saxon. In both are 4 cities, 3 boroughs, and 150 villages. The diets, which confift of the representatives of the abbies, nunneries, and certain towns, with the nobility, are held, if the weather will permit, in the open air, at a place called Jagebanks-Warte; if not, in the council-house at Heilingenstadt. There are a few Protestants in the Eichsfeld; but the prevailing religion is the Roman Catholic. With regard to ecclefiaftical matters, the country is divided into 10 provincial deaneries, and 81 parishes, in which are 2 collegiate foundations, 2 abbies, and 6 nunneries. The right of patronage, in some places, belongs to the archbishop; in others to the cloifters and foundations; and in others to the nobility. At Heilingenstadt are held the supreme temporal courts; and there also refides the lieutenant, or administrator; but the seat of the archiepiscopal commissary which has the spiritual jurisdiction over the whole Eichsfeld, is at Duderstadt.

The only places of note, in this part of the country,

are the two following:

Heilingenstadt, fituated on the river Leine, in the upper district. Here is a fine castle, a collegiate church dedicated to St. Martin, with three other churches, and a school; and a town on the Hahle, in the lower district, containing an Ursuline nunnery, the superior of which is stilled Worthy Mother, and is changed every three years. The inhabitants, many of whom are Lutherans, subssit chiefly by brewing of beer, and cultivating tobacco.

The Duchy of Westphalia, which is about 40 miles in length, and 30 in breadth, is bounded on the east by the bishopric of Paderbon, and the territories of Waldeck and Hesse; on the north by the bishopric of Munster, and the county of Lippe; and on the fouth by the counties of Witgenstein and Nassau, and the duchy of Berg. The lower division of it is tolerable fertile in corn and cattle; and in some parts of it are salt springs. The higher part produces iron ore, calamy, lead, copper, sine woods, corn, cattle, game, sish, and some gold and silver.

The rivers, that either pass through the duchy, or along its borders, are the Rhur, the Lenna, the Bigga, the Dimel, and the Lippe. There are 28 towns in it, besides boroughs and closters. The provincial diets

are held at Aremberg. In the year 1180 the emperor Frederick I. made a donation of this duchy to the archbishopric of Cologne, which was confirmed by fucceeding emperors; and, in 1368, the last duke of Arensburg ceded to it also the county of Arensburg. The duchy is now governed by a bailiff, under the archbishop, and is divided into the Hellwege, the Haarstrank, and the Surland; or otherwise into the Ruden, the Werl, the Bilstein, and the Brilon quarters.

In the Ruden quarter, besides the town which gives name to it, fituated on the river Mons, and containing a Capuchin monastery and nunnery, is

Geseke, a small town, in which is a foundation for ladies, and a cloifter of Observantines.

In the Werl quarter, besides Arensburg, the capital of a county, and a handsome town, situated on the Rhur, or Roer, 47 miles north-east from Cologne, are the small towns of Werl and Beelike; the first containing a Capuchin cloifter, and the other a Benedictine

The fame quarter contains also several abbies, nunneries and caftles, a mineral fpring, a commandery of the Teutonic order, with a ftud, and hunting-feat of

In the Bilftein quarter are the towns of Fredeburg, Drolfhagen, Olpe, and Attondorn, with feveral cloifters and castles.

In the Brilon quarter are nine small towns, with several caftles and cloifters.

The County of RECKLINGHAUSEN is bounded by the bishopric of Munster, the duchy of Cleves, and the county of Mark, lying on the east fide of the Rhine, and extending about 20 miles from east to west, and ro from north to fouth. It belongs to the fee of Cologne, and is governed by a lieutenant. It contains only one place that merits any attention, namely,

Recklinghausen, a town, giving name to the county, and containing a strong castle, with a nunnery, the abbefs whereof hath power of punishing capitally. She alone is obliged to make a vow of chaftity; for the nuns, after having been a certain number of years in the house, may marry

The County of LOWER-ISENBURG lies near that of Wied, in the circle of Westphalia. The greater part of it is possessed by the elector of Triers, who has a feat and voice on account of it at the diets of this circle. The rest of it belongs to the counts of Wied-Runkel, and the barons of Walderdorf. In that part of the county belonging to the elector is a small town, called Herfbach.

The Burgravate of REINECK lies on the Rhine, between the duchy of Juliers and the archbishopric of Cologne. It had formerly burgraves of its own; but now belongs to the counts of Zinzendorf, of the Ernest-Brunn line, who, on account of it, have a feat and a voice in the diets of this circle. The only town in it is Reineck, from which it takes its name.

The principality of AREMBERG is furrounded by the archbishopric of Cologne, the duchy of Juliers, and the county of Blankenheim. The dukes of Aremberg and Arfchot are a branch of the house of Ligne. Till 1576 they were only counts, but were then made princes of the empire; and, in 1644, dukes. They have a feat and voice both at the diets of the empire and circles, and in the college of princes. They take their title from Aremberg, which, though a small town, has a castle, and is the capital of the principality.

The princes of Thurn, or Tour, and Taxis, though they have no immediate estate in this circle, yet have a feat and voice in its diets, as also in those of the empire. The first they obtained in consequence of advancing to the circle, in the year 1724, by way of purchase, 80,000 rix-dollars; and the other in consequence of an Imperial decree, founded upon their having had the office of post-master of the empire erected in their favour into a free estate. They took their seat among

the princes in the diet of the empire, for the first time,

in 1754.

The Teutonic order of knights are possessed of a bailiwick in this circle, named from the town of CoB-LENTZ, which entitles them to a feat and voice among the prelates of the empire, and also in the diets of the circle. To this bailiwick, which has its feat at Cologne, belong feven commanderies, or commendams.

THE CIRCLE OF FRANCONIA.

RANCONIA is bounded by the circle of the Upper and Lower Rhine, Bavaria, Swabia, Upper Saxony, and Bohemia. The bishop of Bamberg, and the margraves of Brandenburg-Bareith and Anipach, are fummoning princes for the circle; but the bishop is fole director. The diets are held at Nuremburg, the archives are kept at Bamberg; and the inhabitants are a mixture of Roman Catholics, Lutherans, and Cal-

The Imperial City of NUREMBERG, which is fituated 35 miles to the fouth of Bamberg, was made Imperial by the emperor Frederick Barbaroffa. It is one of the largest, finest, and richest cities in the empire; and confidering its great distance from the sea, the wonder of Europe for trade, and number of people.

Nuremburg, in general, furpaffes all other cities in Germany, except Berlin, in the stateliness of its buildings; but exceeds that, as it does all the others, in the wealth, ingenuity, and industry of the inhabitants. It is eight miles round; defended with large ditches faced with stone, and high triple stone walls, with 365 towers on them, of which 183 are of free-stone, mounted with 300 pieces of cannon. Here are 550 ftreets and alleys; and most of the houses being uniform, are of free-stone, 6 or 7 stories high, painted on the out-fide, and adorned at the top with gilded balls. The streets are large, very commodious, open, and well paved; and next to those of Hanau, the neatest in Germany; but they are not very strait, neither are they on a level. Here are 10 market places, regularly built, 13 public baths, 12 conduits, and 118 wells. Their chief fountain is adorned with many brass statues; one of Neptune on the top, three yards and an half high; and above 2200 weight; and others of nymphs and seahorfes larger than the life. This fountain will throw out 200 hogheads in an hour, and coft near 3500 crowns. The river Pegnitz is let in by 12 large arches under the walls; and, after running through the middle of the city, is let out by 12 other arches.) It forms several pleasant islands, wherein are most agreeable walks and meadows, where they whiten linen; and also supplies the ditches and town with water. Upon the stream there is a great number of mills for tanners and braziers, as well as for corn, paper, iron, and making fword-blades, knives, and other iron-wares. There are 60 mills within the walls, many of them for grinding corn; and 7 wooden and 11 stone bridges over this river. One of these bridges has one arch only, of 97 feet from one base to the other, like the Rialto at Venice, though not fo high or fo long, and is accounted a wonder in architecture. At one end of it there is a large market, built of hewn stone, on the gate of which the butchers have placed a vast ox of stone, lying on his belly, with gilded horns and hoofs.

The inhabitants are about 60,000; yet have but 2 parish churches properly so called. The first is as stately as any one of its kind in the empire, viz. that built by St. Sebald, a Danish prince of the blood royal, by whom this country was converted. It is a large Gothic pile, has 7 gates, an immense bell, and a brass monument erected to his memory, with noble antique The fextons have a rare collection of relics, which they shew only to travellers of quality. fecond is St. Laurence's church, another Gothic fabric, which is chiefly frequented by the Lutheran nobility and gentry. It has eight gates, two fteeples in the front, and is the largest in the city. Here the chief of the citizens have their tombs and escutcheons; and

bisho on the pastu are no by no their are do their fort, the locour cour of V fides Net

athere is a register of all that have been buried here for 500 years, specifying the time and manner of their death. Besides these, there are the churches of the Virgin Mary, St. Giles, the Holy Ghoft, and the hospital of St. James, in which are the monuments of many princes and counts of the empire. Near St. Laurence's church are three fountains, one of them an octagon bason, with a large brass pillar in the middle, from whose chapiters project six muzzles of Lions, fpurting water out of each by a twifted pipe. On the cornice are the fix cardinal virtues, fpurting water from their breasts. On this pillar stands a less one fluted, on which are fix infants, every one of them leaning on an escutcheon, bearing the arms of the empire, those of Nuremberg, &c. and they all have trumpets, out of which jets plenty of water; as it does likewife from the breafts of a fine statue of Justice, on the top of this fecond pillar, and from a large oftrich which fupports it. The whole is of brafs, enclosed by an iron grate, carved and gilt.

The caftle, where the emperor refides when here, is well fortified, and stands on a high hill, or rock, from whence there is a fine prospect of the city. It has many curious pictures. Within the first gate is a small antique chapel, which was formerly a chapel dedicated to Credo and Hirmensul, two divinities worshipped by the ancient Germans, whose stone statues are against the wall on the outside. Here is a well in the rock 1600 feet deep; and the chain of the bucket is 300 weight. The cicling is supported by sour Corinthian pillars, each 45 feet high. In the emperor's apartment there is the picture of the homage paid by the magistrates to the emperor Matthias in 1612. This castle has four towers, two of which look towards the town, and the two others to the east and

north.

The stadthouse is a stately beautiful fabric of hewn ftone, 100 paces in breadth, and much larger than that of Augsburg. It has three great points, marble pillars. The front is very fine, having a no-It has three great porticos, with There are two other very grand gates to it, at equal diffances, which are no less splendidly ornamented. There is a long gallery, on the cieling of which a famous tournament, that was held here above 300 years ago, is represented in relievo. The council-chamber, dining-room, and other apartments, are well painted and gilt, filled with the arms of all nations, and adorned with curious pictures, medals, excellent works, both antique and modern, idols, shells, plants, minerals, and other natural productions. council-chamber is small, and not suitable to the dignity and power of the senate. The floor of the senatehouse is paved with gilt stones, intermixed with others of different colours; so that it exceeds that of Amsterdam: and in one of the chambers is a large picture, that quite covers one fide of the wall, representing the entertainment which the emperor Ferdinand III. gave in the grand hall here, to the plenipotentiaries, at the treaty of Munster. Here are the pictures also of all the princes, and most other great personages in Germany, who have been entertained here. The deputies of the circle of Franconia meet every day. Those of the bishop of Bamberg, and the marquis of Brandenburg-Bareith, prefide at it; but the deputies of the ecclefiaftical princes have the right hand. These deputies are, in all, 18, and are attended by nine fecretaries, who fit at another table to write their resolu-Within this chamber, over the door, is a picture of three brothers, princes of Saxony, viz. John George, Frederick, and John Christian, who supported Luther in his reformation. The fecond of thefe holds the Imperial crown, which he would not accept The tapeftry of this chamber contains the hiftory of Nebuchadnezzar.

The arfenal, which has arms for 10,000 men, is one of the finest, and best furnished, in Germany. Here are good ramparts, and a numerous garrison. The

city has fix gates, each defended by a large tower. The public library was composed, at the beginning of the reformation, of all the books belonging to the convents of this city and its neighbourhood. It confifts of four galleries, and 26,000 volumes; particularly a Greek MS of the Gospels, and some of St. Paul's Epistles, above 1000 years old; with the prayers and hymns formerly used in the Greek church. The characters are very different from those now in use. Here are a letter, of Luther's hand-writing, to the magistrates of this city; a pocket-book of John Frederick, elector of Saxony, being scraps of fermons he heard him preach; and a figure of Moses, which, though but a foot high, has a great part of the Pentateuch written upon it.

This city, among many other privileges, has the custody of most of the Imperial ornaments made use of at the emperor's coronation; fuch as Charlemagne's crown, about which there is a mitre enriched with a vast number of diamonds, rubies, emeralds, and pearls; and, on the front, a cross of diamonds of great value. His Dalmatic robe, or mantle, embroidered with large pearls; the golden apple, or globe; his fword; his golden fceptre; the Imperial cloak, embroidered with eagles, and bordered with large emeralds, diamonds, fapphires, and chrysolites; the buskins, covered with plates of gold; the gloves, embroidered with curious ftones. These are kept in the church of the hospital, and were all brought from Prague by the emperor Sigifmund, on account of the troubles that were in Bohemia in his time. Here is also a large cheft, suspended in the air by iron chains fastened to the cieling, in which are a vast many facred relics; but they are never shewn, except to sovereign princes, and their attendants.

The council is composed of 42 persons, whereof 28 are selected from the ancient patrician families, and the rest from among the burghers; so that there are 13 eschevins, or aldermen; as many counsellors, or common councilmen; 8 other senators, who are all patricians; and 8 other counsellors, elected out of the corporations of trades and crafts, who are consequently, plebeians; but these acquiesce so implicitly in the decision of the patricians, that they may be said to have no vote. There are two burgomasters, one chosen out of the eschevins, the other out of the council, who have the superiority, the one of the military, the other of the civil government, and are changed every month.

The raifing of troops, taxes, and other matters of great moment, are referred to a felect committee of feven, named the Septemvirate, who call in three or four civilians for advice. They have falaries for their attendance on fuch occasions. But no lawyers are allowed any vote, or share in the administration. In extraordinary cases there is a great council of 400, chosen out of all the callings and trades in the city; and they annually chuse the members of the other courts. The magistrates never allow mechanics to meet publicly, except at worship, weddings, and sunerals, for fear of tumults; and the senators are, in general, so very circumspect, that "as prudent as a Nuremburg senator," is become in the country, a common proverb.

No Papift is allowed the freedom of the city, there being but few here; and these are obliged to worship in a chapel, or small church, in the house of the Teutonic order. The Calvinits were formerly obliged to go a league out of town to a church, in the marquilate of Anspach; and the Lutheran ministers, in the town, baptized their children; but the father of the late king of Prussa, whom the Nutemberghers seared much more than they loved, having demanded that they should be allowed a place for worship nearer the city, they now meet two/or three musquet-shot without the gates, in a long hall, which holds about 500 persons.

The Jews, who live in a village without the city, where they have a lynagogue, are not allowed to lodge here, or to come into it, without paying a florin for every hour they flay, as at Cologne, and that on the

fame pretext, a defign to poison the wells and fountains. The religion, as well as quality, of every person here, may be known by their habits; which regulation was made by the magistrates, both of this city and Augsburg, to restrain the luxury of the meaner fort in clothes, and to detect rioters, who are but too common in all free cities.

No city in the world has a greater number of curious workmen, in metal of all forts, ivory, wood, &cc. or affords artificial commodities cheaper. They are particularly famous for clockwork. There was a coach made here, for the king of Denmark, with fprings, fo as to go forward or backward, or turn about, and travel a league on ftones, without horfes, and only managed by two boys within. The fame workman made, for the Dauphin of France, a reprefentation of a fquadron of horfe, engaged with a battalion of foot, both of them marching, and firing, by fpring-work. The Nuremberg brafs is faid to be the most ductile, the brightest, and the least subject to flaws, of any in Europe; and is made, chiefly, out of the Tirol copper.

The Imperial city of Weissenburg, which is 28 miles fouth of Nuremberg, and fituated on the Norgau, has a feat and voice both in the diet of the circle and of the empire. Its territory is very finall, and contains but one inconfiderable village.

The Imperial city of SCHWEINFURT stands on the Maine, has a good bridge, and a gymnasium. The territory is small, but celebrated for its excellent wine; and the inhabitants are Protestants.

The Imperial city of Windsheim, 27 miles from Nuremberg, stands on the Aifch, and is very ancient. It has a feat and voice at the diets of the empire and circle, is a finall territory; and the inhabitants are Lutherine.

The Imperial city of ROTHENBERG is fituated near the Tauber. The inhabitants are Lutherans. It has a feat and voice in the diets of the circle and empire, a confiderable territory, and contains feveral churches,

a gymnafium, Teutonic house, &c.

The seigniories of Seinsheim, Reichelsberg, and Wiesentheid, entitle their lords to a seat and voice in the diets of the empire and circle: but the seigniories of Welzheim and Hansen have not those privileges.

The combined feigniories of LIMBURG and SPICK-FELD, entitle its proprietors to two voices at the diet of the empire, and in the college of Franconian

The county of Erbach, on the fouth fide of the Maine, is 27 miles long, 20 broad, tolerably fertile, and inhabited by Lutherans. It gives a feat and voice in the college of Franconian counts, and at the diets of the circle and empire; and contains Erbach, a town on the Mumling, with a caftle; and Michelstadt, the feat of a regency and fuperintendency. In this county the estates of all who die unmarried after the age of 25, are forseited.

The County of Wertheim lies on both fides the Maine, between the archbishopric of Mentz and the bishopric of Wurtzburg, a part of it terminating also on the county of Erbach. It abounds in corn, wine, pasturage, wild fowl, and venison. The inhabitants are mostly Protestants. A part of the county came by marriage to the family of Lowenstein, who derive their pedigree from that of the elector Palatine, and are divided into the two branches of Lowenstein-Wertheim-Virnenburg, and Lowenstein-Wertheim-Rochefort, the former of which are Protestants and counts; the latter Roman Catholics and princes, or princely counts. They take the title of Lowenstein from the county of that name, under the jurisdiction of the duke of Wirtemburg, of which they are proprietors; besides other seigniories in the empire, Bohemia, and the Netherlands. They have two voices in the Franconian college of counts of the empire, and have also

a feat and voice among the counts in the diets of the circle. The reft of this county, besides what is possessed by the counts of Lowenstein, belongs to the bishop of Wurtzburg, and the counts of Castle. The chief in it are

Wertheim, which gives name to it, and is its capital; lying at the conflux of the Maine and Tauber. Here each of the above-mentioned branches of the Lowenstein family have a palace. The inhabitants are partly Protestants and partly Papists; but the magistracy is wholly Protestant.

Brenberg, a ftrong castle on a mountain, gives name to a seigniory, which had anciently lords of its own. Little Heuback, a market town on the Maine, contains a castle, and gives name to a bailiwick.

tains a castle, and gives name to a bailiwick.

The county of Rieneck gives its possession a seat and voice in the diets of the empire and circle, and in the college of Franconian counts; but contains only Rieneck, a small town, with a castle.

The County of CASTELL lies between that of Schwartzenburg, and the bithopric of Wurtzburg, and west from Bamberg. It is about 27 miles long, and 8 where broadest; and belongs to its own counts, divided into two principal lines, Remlingen and Rudenhausen, descended from the ancient dukes of Franconia. This county is a fief of Wurtzburg, to which the counts are hereditary cup-bearers. They have two voices in the college of the Imperial counts of Franconia, both at the diets of the empire, and those of the circle. The oldest of the reigning counts is always administrator of the seudal segmiories of the whole house, and cup-bearer to the bishop of Wurtzburg. The chief places are

Caftell, a village, containing a fine palace, in which one of the collateral lines of the principal Remlingen line refides, and giving name to a bailiwick belonging to the fame line. Near the village formerly ftood a caftle, that gave name to the county, and was the refidence of the counts.

Remlingen is a market town, from which one of the principal lines takes its title.

Rudenhausen is a village, which gives title to the other capital line, and contains a paiace belonging to them.

The Bishopric of BAMBERG is bounded on the north by the principality of Coburg and the Voghtland; on the fouth by the principality of Brandenburg-Bareith, the territory of Nuremberg, and the principality of Schwartzenburg; on the west by the bushopric of Wurtzburg; and on the east by the territory of Nuremberg and Brandenburg-Bareith. The length of it is about 60 miles, and the breadth 40. The foil is very fertile in corn, wine, faffron, and liquorice; yielding alfo, in fome places, laurel, fig, lemon, and orangetrees, with woods of forest-trees, and some metals. The county abounds likewife in cattle, and is well watered by the Maine, and feveral other rivers and brooks that fall into it. The inhabitants are all zealous Roman Catholics. Here are no effates. Before the year 1006 this county was called the county of Babenberg, and had counts of its own; but was then allotted for a bishopric by the emperor Henry II. which pope Benedict VIII. exempted from all archiepiscopal jurisdiction. The bishop's privileges and prerogatives are very great. He is the only one in Germany who has the privilege of wearing a cardinal's hat, together with the pillium; and there lies no appeal from his decisions, in secular matters, to the courts of the empire. The king of Bohemia is his cup-bearer, the elector palatine his fteward, and the elector of Brandenburg his great chamberlain. These, or their proxies, if fummoned, must attend, and do the duties of their offices on the day of his installation. He is able to bring into the field 4000 men. The revenue arifing from his bishopric, besides his bailiwicks in Carinthia, amounts to above 50,000l. The chapter, by whom the bifhop is elected, confifts of 20 capitular canons, and 15 domicelli all of noble birth. All his effates, 9 N

excepting those in Carinthia, are held immediately of the empire. At the diet thereof he has the fourth place on the spiritual bench in the college of princes, and is a summoning prince and director of this circle. Here are all the usual courts, councils, and offices, for the different departments of government, as war, foreign affairs, and the finances. The following are the chief places in the bishopric:

Bamberg, its capital, pleafantly fituated near the river Rednitz, is about 34 miles north of Nuremberg, and in the center of Germany. It is furrounded with walls and a ditch; and is, in general, well built and populous. Here are two episcopal palaces, or castles; one called Petersburg, and the other Gayerswerth; an univerfity, founded in 1648; feveral monasteries, nunneries, and churches; besides the cathedral of St George, in which is the monument of Henry II. who founded the bishopric, and his confort Cunigunda, with a treasure of jewels and relics. Several diets, both of the empire and circle, have been held here. Not far from the town stands the bishop's summer palace, called Marquardfburg. Among other curiofities in the treasury of the church of St. George, is a folio manuscript of the four Gospels, in Latin, upon fine vellum, in a neat Roman character, with some Gothic letters intermixed; and most beautiful miniatures to be feen every where. The binding is wood, covered with curious (culptures, in ivory, of Our Saviour's passion; and bordered with a gold edging, on which are the heads of Our Lord and his Apoltles, as are those of the four Evangelists at the four corners. The whole is enamelled; and the intervals between the figures are garnished with pearls and precious stones. There is another Latin manuscript in folio of the four Gospels, with a commentary by St. Jerom, and fine miniatures, but not comparable to the former. There is a third in Gothic letters, the corners of which are also enriched with pearls and precious stones, much in the same manner with the first, with a square of ivory in the middle, reprefenting St. John baptizing Our Saviour. The faid emperor also gave a fine large shrine of gold for relics, which is also set with precious stones. In short, it would be tedious to mention the vaft number of antipendiums of altars, which are extremely rich; the candlefticks, luftres, lamps, cenfors of gold and filver, and other rich articles of this treasury.

Here is an ancient church, whole front is adorned with the statues of several saints in niches; but the infide is very indifferent. The Dominicans have another, with an altar. The Augustine friars have a monastery, dedicated to St. Stephen; and the Benedictines an abbey, dedicated to St. Michael, and standing on an eminence of the same name. One of its abbots, who was a great botanist, caused the church to be painted, within and without, with all forts of known plants and simples. A council was held at this city in 1011, to put an end to the difference among the German bishops; and, in the time of Henry IV. its bishop, Otho, converted the Pomeranians to Christianity. An university was founded here in 1653, by Melchoir Otto, one of its bishops. There are several public fountains in the town, but no fortifications more than its walls; so that in time of war, the bishop resides, and has commonly a very strong garrison, at Forcheim.

Forcheim, 10 miles fouth-east from Bamberg, the Lacoritum of the ancients, is strongly and regularly fortified, having walls of free-stone on the confluence of the Wisent and the Rednitz: yet duke Bernard, of Weymar, the Swedish general, took it in 1633, at the first onset. The buildings are generally old, and out of repair. Baudrand gives it the Latin name of Forchænum. There is a popular tradition here, that this was the country of Pontius Pilate. The parish church of St. Martin was made collegiate in 1354.

The neighbourhood of Bamberg is very agreeable; but as one comes to it from Nuremberg, through a forest of fir-trees, there is an avenue to it for a quarter of a

league in length, formed of wheels and gibbets, on which are exposed the bodies of malefactors, by which this road has been infested from all quarters; for this bishopric being contiguous to seven or eight different states, the city lies in the greatest road of all Germany. This city had formerly a wall; but the inhabitants, for their rudeness to the bishop in 1435, were condemned, at the council of Basil, to raze the walls, and never to rebuild them. In 1609 the Popish boors here attempted to plunder the Jews, and the neighbouring Protestants; but were soon suppressed, and their leaders punished.

The Bishopric of WURTZBURG extends 80 miles in length, and 60 in breadth, is well watered, and fertile in corn, fruit, herbs, wine, plants, pastures, &c.

The established religion is the Roman Catholic; yet there are a few much oppressed and persecuted Protestants in the country. Christianity was first introduced here by St. Kilian, a Scotchman, about the end of the feventh century: and St. Burchard, the first bishop, was appointed and confecrated by St. Boniface, who is also faid to have been a Scotchman, and was the chief apostle of the Germans, and first archbishop of Mentz, to which fee the bishop of Wurtzburg is suffragan. The bishop's title runs thus: "Prince of the holy Roman empire, bishop of Wurtzburg, and duke of east Frankenland." His revenue amounts to about 60,000l. a year, with which he maintains a confiderable body of troops, even in time of peace, with a splendid court and houshold, horse and foot guards, &c. being absolute in temporals, and living in all the ftate of a fovereign temporal prince, but in spirituals an appeal lies against him to his metropolitan, or the Pope's nuncio. His chapter consists of 22 capitular canons, and 30 who are domiciled. must all be of noble birth, and each has an income of 3000 German crowns per annum. The bifhop has the honour of the pall and crofs, with a feat and voice in the diets of the empire and circle.

Wurtzburg, the name of the capital, fignifies a town of herbs, a great variety of which is found about it. It stands in the very center of Franconia, on the banks of the Maine, 40 miles west of Bamberg, and is well fortified. There is also a strong fort near the town, containing an episcopal palace, magazine, and a church; but the palace, in which the bishop usually resides, stands in the town, and is a noble structure, the first stone of which was laid in the year 1720. The cathedral, together with a feminary, is dedicated to St. Kilian, the patron of Wurtzburg and Franconia. As this city is under the dominion of an ecclefiaftical prince, it contains a great number of churches, monafteries, nunneries, and other religious foundations. Here also is an university, founded in 1403; a house of the Teutonic order, and another of the order of St. John; a foundry for cannon and bells, a handsome college, and several hospitals At the entrance of the bridge, over the Maine, is a triumphal arch of hewn stone. Of the abbies, one, large and magnificent, belongs to the Scots Benedictines. The cathedral, an ancient Gothic structure, is richly adorned within with flatues, altars, pillars of marble and filver, finely executed; besides paintings, culptures, gilding, and veffels of gold and filver. fuch as the pulpit, the organs, the benches for the ca-nons, and the altars. Most of the statues are also gilt. The great hospital of St. Julian here, is one of the richeft and most magnificent in Europe, having a greater estate and income than the bishop himself. In the castle is a fine train of artillery, with all the implements neces-fary for gunners, and vast quantities of ammunition in

general.

The foil of the Franconian Principalities of the Margraves of Brandenburg is, upon the whole, fertile; and the mountains abound with copper, lead, fulphur, marble, fine clay, gold, iron, vitriol, antimony, cryftal, terra figillata, filver, &c.

The country contains many woods, is well watered, and abounds in fish. The established religion is Lutheranism; but Calvinists and Roman Catholics are tole-

rated. The manufactures are of ftockings, porcelain, woollen cloth, hats, white and brown earthen ware, &c.

The principal places are the following:

Bareith, the capital, which contains a magnificent palace, erected fubiquent to the year 1753, two Lutheran and one Calvinist church, a mint, a Roman Catholic chapel, &c. The seat of the high colleges is here; and in the neighbourhood, in a wood, is a neat house, called the Hermitage.

St. Gorgen-am-fee, a town on a lake, contains a noble palace, fine gardens, a porcelain and marble manufactory, &c.

Streitburg, a market town, has a castle, and is famous for the yellow marble dug in its environs.

Hof, on the Saale, contains four churches, a woollen manufactory, and a gymnasium; Neila is famous for its copper and iron mines, and quarries of green marble; and Winsiedel is a considerable town on the Roszlau.

Cullembach stands on the Maine, not far from Fichtelberg, nor from the source of the Red Maine, one of the rivulets that forms the Maine. Some take this to be the very center of Germany. In 1430 it was plundered by the Hussites. In 1553, upon the approach of the inhabitants of Nuremberg, with the princes their allies, the citizens, finding they were not able to sustain a siege, set fire to the town, and retired, with their best effects, to the neighbouring castle of Blassenburg, or Plassenburg. Their enemies, however, advanced to the town, extinguished the slames, made a great booty, took the castle, after a long siege, and demolished it: but the Nurembergers were afterwards obliged to rebuild it; and it is well fortissed. In it are kept the ancient records of the family of Brandenburg, consisting of title-deeds, Imperial diplomas, acts, and other important and fundamental pieces.

Near Weiffenstadt, an old town on the Eger, were formerly mines of tin and crystal. A large lake takes its name from it, abounding with delicious carp and perch.

Lechtenberg is a market town, giving name to a bailwick, in which are a copper and iron mine; besides several sorts of marble and medicinal springs.

Golderonach is a town on the river Cronach, where was formerly a gold mine. Marble of various kinds is found hereabouts.

Erlang is one of the fix head-towns (as they are called) of the principality, fituated at the conflux of the Rednitz with the Schwabach, and diftinguished into the Old and New. The latter, which is also called Christian Erlang, having been begun by the margrave Christian Ernest, in 1686, is one of the finest towns in Germany. It lies close to Old Erlang, being almost environed with a wall of free-stone, and containing a margravial palace, with a fine garden, an university, and several churches. Some manufactures are also carried on here, especially those of hats and stockings.

Neuftadt, on the Aisch, one of the head-towns of the principality, contains a margravial palace, and gives name to a bailiwick. Besides this principality, the margraves are possessed of considerable sies in the arch-

duchy of Austria. The Bishopric of Eighstert is bounded by the Upper Palatinate, Upper Bavaria, the duchy of Neuburg, the county of Papenheim, and the principality of Anspach. It is a fruitful country, about 40 miles in length; but the breadth is small in comparison, and very unequal. The bishop is a prince of the empire, but fuffragan of Mentz, and has a revenue of between 9 and 10,000l. The chapter confifts of 14 capitulars, and 14 domiciled, who must all be noblemen by 16 descents. There are few landed estates here; and the inhabitants are all Roman Catholics. The bishopric was founded by St. Boniface, who made his fifter's fon, Wilibald, afterwards canonized by pope Benedict XIII. first bishop thereof, in the year 745. Here are the

usual hereditary offices, and high colleges. The bishop is perpetual chancellor of the university of Ingolstadt, and lord of several fiefs possessed by princes and counts. The only considerable place in the bishopric is

Eichstett, or Aichstadt, i. e. the Town or City of Oaks, fo called from the huge oaks that formerly grew near it. Here, besides an episcopal palace, and a cathedral, dedicated to our Lady, are several cloisters and churches, with a large college. In St. Werburg's church is a rock, or altar, as it is stiled, containing the breaft bones of the faint, from which, what they call an oil, but which, in reality, is only a vapour, (for it neither burns nor fwims upon the furface of water,) is faid to flow, and force itself through the stone twice a year. This holy oil is put up in small phials for the use of pilgrims, and other devotees, who are affured of its miraculous virtues, and for that reason refort hither in great numbers to purchase some of it, and pay their devotions to the bones of the faint. It has a curious cathedral, to which one of their bishops presented a fine pixis for the host, which is of pure gold, in form of a fun, of great weight, sumptuously adorned with diamonds, fine pearls, rubies, and feveral other precious stones. In 1704 this town was taken by a French detachment. It lies in a valley; but the bishop resides, for most part, at the fortress of Willibaldsberg, commonly called Walpersberg, which is about two miles off, upon a hill. The archives are kept here; and it likewife contains an arfenal and library.

The Principality of Anspace has Wurtzburg on the west, Bamberg on the north and east, and Swabia on the south. It yields grain, wine, iron, timber, fruits, tobacco, marble, medicinal springs, &c.

Some parts are mountainous; yet the others produce good patture, in which abundance of cattle are both bred and fed. The woods are well stored with game; and the rivers with fish. The chief of the latter are the Rednitz, the Altmuhl, the Jaxt, the Wornetz, and the Tauber. This principality, exclusive of that of Bareith, brings a confiderable revenue to its fovereign. The predominant religion is Lutheranism; but at Schwabach the Calvinists have the free exercise of theirs. At Anspach is a military academy. The principal manufactures of the country are tapestry, stockings, cloth, stuffs, gold and filver lace, wire, needles, porcelain, leather, and mirrors. The reigning margrave has a feat and voice in the college of princes, and at the diets of the empire and circle. His military establishment is a life-guard of horse, and one regi-ment of soot. The principal places in the principality are,

Anspach, the capital, which stands on the Under-Retzat, and contains a palace, in which the margraves commonly reside. Here the chief courts, councils, and offices are held. There is also a public library here, with a collection of medals, a mint, a gymnafium, a porcelain manusactory, barracks for some companies of foot, besides two gardens, with a fine orangery and green-house, belonging to the prince, and several churches. The town is small, but well built, and surrounded with walls.

Bruckberg is a beautiful pleafure-house belonging to the margrave, ftanding on an eminence.

Schwaback, on a river of the fame name, is populous, and carries on great trade in gold, iron, brass, cloths, tapestry, stockings, filver, steel, hardwares, stuffs, lace, and tobacco.

The TEUTONIC ORDER of KNIGHTS was founded in the year 1190, in Palestine; and were, at first, called Knights of the Virgin Mary, or Brothers of the Teutonic House of our Lady of Jerusalem. They must be all Germans, and of ancient nobility. They are to bind themselves by vows to defend the Christian religion, and the Holy Land, and to protect and affist the poor and the sick. In the years 1226 and 1228, after they had been obliged to quit Palestine, they obtained a grant of all the lands they should conquer from

the Pagan Pruffians; whereupon they fubdued all Pruffia, Courland, Semigallia, and Livonia; but after-wards loft them all. The fuperior of this spiritual order is stiled the Grand and Teutonic Master, Administrator of the Grand Masterdom in Prussia, Master of the Teutonic Order in Germany and Italy, and Lord of Freudenthal and Eulenberg. He is a prince of the empire, and, as such, has a feat and vote in the diets of the empire, and of this circle. Both Roman Catholics and Protestants may be invested with the order; and the Protestant knights are permitted to marry. The estates, which they are possessed of in Germany, were obtained partly by purchase, and partly by donation, and consist of what is properly called the masterdom of Mergentheim, and twelve bailiwicks. Grand-Mafter is chosen by the chapter, confifting of the counfellors and commanders, or commenders; the latter of whom are administrators and judges of the bailiwicks and commenderies; but, in weighty matters, an appeal lies from them to the Grand-Master. The counsellors also, and the commenders, are chosen by the chapter; the latter out of the former, and confirmed by the Grand-Mafter.

The County of HENNEBERG is about 24 miles in length, and nearly as much in breadth. Befides confiderable quantities of grain, it yields also tobacco, medicinal and falt-fprings, with mines of filver, copper, and iron. The chief river is the Werra, into which several smaller streams fall. The inhabitants are all Lutherans, except at Schmalkalden, where the Calvinists have a church. The chief manufactures of the county are those of arms, hard-ware, and sustains. The proprietors of it are the elector of Saxony, the dukes of Saxe-Weimar, Meinungen, Gotha, Coburg-Saalfield, Hilburghausen, and the landgrave of Hesse-Cassel. Some of these princes are entitled by it to voices in the diets of the empire and circle; and all of them contribute to the payment of its assessment to the empire and chamber-court. The principal places in

the county are,
Schlenfingen, lying on the little river Schlenz, and
belonging, with its bailiwick, and feveral others, to
the elector of Saxony. Here is a caftle, in which the
princes of Henneberg used sometimes to reside. The
town is not large, but has a gymnasium in it, belonging in common to all the dukes of Saxony, who have
a share in the county, and a commandery of the order
of St. John. Not far from it is a medicinal spring,
called Wilhelmshrun.

Ilmenau is a fmall town on the Ilm, belonging to Saxe-Weimar, and containing a mine-office, on account of the copper and filver mines in the neighbourhood, which were formerly more confiderable than at prefent.

Meinungen is a town fituated on the river Werra, and giving title to a branch of the house of Saxe-Gotha, who have a palace in it, with a library and cabinet of medals. In this palace also are kept the Henneberg archives, belonging in common to the princes of Saxony. In the neighbourhood of this town tobacco is much cultivated.

Salzungen is a finall town on the Werra, taking its name from its falt fprings, and belonging to Saxe-Meinungen. Near it also is a medicinal spring.

Schmalkalden is a large, populous, thriving town, having falt fprings, and a citadel near it called Wilhelmfburg. A great trade is carried on here in iron and fteel wares, there being mines of iron in the neighbourhood, and forges in the town, which is famous in hiftory, on account of the meetings held in it by the Protestant princes, concerning the reformation, and the league concluded by them in 1531. This town, together with several bailiwicks and districts, belongs to the landgrave of Hesse-Cassel.

The County of SCHWARTZENBURG is about 16 miles in length, but very narrow in proportion. Some of the inhabitants are Roman Catholics, and fome Lutherans. The prince has a feat and voice in the col-

lege of princes in the diets of the empire and circle; and is possessed of other estates in the empire besides this county.

The County of HOHENLOHE is 20 miles long, and nearly as many broad, tolerably fertile, and well watered; and the only confiderable place is

Ochrengen, the capital, fituated on the Ochren, containing two palaces, a gymnafium, and feveral churches.

THE CIRCLE OF AUSTRIA.

THE circle of Austria is bounded on the north by Moravia, Bohemia, and the circle of Bavaria; on the south by the Adriatic Sea, and the territory of Venice; on the east by Hungary; and on the west by Switzerland. It is the largest circle, and the first in rank, in Germany; and the inhabitants, in general, are Roman Catholics. The principal part of it belongs to the illustrious house which bears its name, and which hath been upwards of 300 years in possession of the Imperial dignity.

The Archduchy of AUSTRIA is divided in Upper and Lower; the former being fituated westward, and the latter eastward. It is bounded by Bohemia on the north, Stiria on the fouth, Bavaria on the west, and Hungary on the east. It extends near 70 miles from north to fouth, on both fides the Danube. It is, in general, level, fertile, and well watered. The diets confift of princes, counts, provofts, barons, knights, bishops, abbots, and town representatives; and in them they treat of contributions, taxes, military affairs, &c. The diets of Lower Austria is held at Vienna, and that of Upper Austria at Lentz. The Protestant refigion, for fome time subsequent to the reformation, made a very confiderable progress; but at length was profcribed, and, in a manner, suppressed. The archbishop of Vienna is a prince of the holy Roman em-pire, and bears the pall and cross. The manufactures are filks, cloth, ftockings, mirrors, plate, hard-wares, gold and filver lace, ftuffs, linen, porcelain, braís, gunpowder, &c. Great quantities of allum, faffron, wine, &c. are exported; but few commodities are permitted to be imported; and those which are allowed are loaded with so many imposts and duties, as to amount almost to a prohibition. At Vienna there is a chamber of commerce, an exchange, and a loan bank, which was established in the year 1704.

LOWER AUSTRIA was divided into four circles in the year 1753. Two of these are situated on the south, and two on the north, side of the Danube. Those to the southward are called the circles below and above the forest of Vienna; and those to the northward, the circles below and above the mountain of Manhartsberg. The principal places in Lower Austria are the following:

Vienna, not only the capital of the circle of Lower Austria, but the metropolis of the whole German empire, and the residence of the emperor, is situated in 48 deg. 14 min. north lat. and 16 deg. 57 min. east long. This city, which is watered by the Danube, is, by the Turks, called Beez; by the natives Wien; and, by the Poles, Wieden. The Danube is here very wide, and forms several beautiful islands, which are well stocked with wood. This city was famous in the time of the Romans; but since that period we have but very little account of it till the year 1158, when Henry I. of Austria, rebuilt it. In 1192 it was enlarged, beautified, and surrounded by a wall, with the money paid for the ransom of Richard I. king of England. This ransom was 140,000 marks of silver, in Cologne weight; so prodigious a sum for those times, that the English were forced to sell their church-plate to raise it. It was made an Imperial city by Frederick II. in 1236; but sour years after it became subject to the house of Austria. Æneas Sylvius, who wrote at least 250 years ago, says, this city abounded with palaces sit for kings, and churches which vied with

the fol-

those of Italy; a character which it deserves much better now, even though it has fultained divers memorable fieges; particularly by Matthias Corvin, king of Hungary, who took it in 1490, and died here in 1495. By the grand feignior, Soliman the Magnificent, in 1529, when he made 20 attacks upon it with 300,000 men; but Philip, elector palatine, bravely defended it; and the emperor, Charles V. coming to its relief with 90,000 men, obliged the Turks to rafe the fiege on the 14th of October following. By the Turks in 1532 and 1543; and again in 1683, when Kara Muftapha, grand vizir, befieged it with 100,000 men, who cannonaded it from the 24th of July to the beginning of September, and laid part of the Imperial palace, as well as feveral other grand structures, in ashes: but count Staremberg, though reduced to great straits, gal-lantly held it out till relieved by John Sobieski, king of Poland, who came up with his army; and, being joined by the Imperialifts, under the electors of Saxony, Bavaria, and Hanover, Charles, late duke of Lorrain, and the brave prince Eugene, attacked the besiegers on the 12th of September, N. S. and totally routed them; fo that they not only quitted their camp, but their cannon and baggage; and the vizir, who left his tent for the king of Poland to fleep in, was, by the grand feignior's order, strangled, on his return to Belgrade.

On the 19th of April, 1725, a treaty of peace was concluded here between the emperor and Spain, after four years had been spent, in little but ceremony, at the congress of Cambray. On the 16th of March, 1731, that called the second Vienna treaty of peace and alliance was concluded here, between the emperor and Great Britain, whereby the latter guaranteed the Pragmatic Sanction; and the former confented to the inmatic Sanction; and the former contented to the introduction of the 6000 Spaniards into Italy; and foon after agreed to the fame with the king of Spain himfelf, by that called the third treaty of Vienna, concluded the 22d of July following, between the em-

peror, Great Britain, and Spain.

Befides the old inner wall, which was built with the ranfom-money of our king Richard I. this city is well fortified, after the modern manner, with large broad bastions, faced with brick, and edged with free-stone, viz. two towards the river; ten towards the land; and a very deep ditch, into which they can let the river, but generally keep it dry, for the fake of their cellars. Including the fuburbs, it is of large circuit; but the city itself is not above three miles round. It is very populous, and never without ftrangers, in the habits of most of the European nations; here being generally not less than 30 ambassadors, and other ministers, at a time, from foreign princes and states, and from the princes and states of the empire, besides vast numbers of quality of the hereditary dominions, who are often at court. But no Turkish ambassador is ever permitted to lodge in the city. It contains about 600,000 fouls. Some of the houles are well-built of stone, fix flories high, with flat roofs, after the Italian manner; but those which are otherwise, are generally contemptible, being covered with pieces of timber, in the shape of tiles. The streets are of a middling size; and many of the houses have four cellars, one under another, with an open space in the middle of each arched roof, for a communication of air; and from the lowermost of all there is a tube to the top, to let in the air from the streets. The malignity of the air, which might be more unwholesome were it not for the winds, is generally ascribed to the loads of mud and dirt in the streets, owing to the neglect of the scavengers. Between the city and suburbs, all round the wall, there is an empty space of about 600 paces in breadth, in which none are permitted to build. The city contains above 1500 houses, 29 churches, and 8 chapels.

This city was at first a bishopric, but is now the see of an archbishop. Its cathedral, dedicated to St. Stephen, founded by Henry I. of Austria, and finished by Henry II. is a flately fabric; but the windows are darkened by its painted glass. The steeple and spire are No. 72

the finest in Germany. It is 480 feet high; and under the cross, on the top; there were formerly the Turkish arms, a half-moon and star, set up by the citizens; because, when Soliman the Magnificent befieged the city, he would on no other conditions spare the steeple: and though he was obliged to raife the fiege, and march off, yet the arms continued there till the Turks befieged it again in 1683; after which, because they fired at the steeple, they were taken down. This spire has large crochets, above a yard long, adorned with foliagework; and there is a most noble prospect from it of the city and adjacent country, and of the course of the Danube through most of Austria, and almost to Presburg in Hungary. In the tower there hangs a case of wooden hammers, with which they call the people to church, from Good Friday to easter day; because they will not fuffer the bells to ring out during the time that Our Saviour is supposed to have lain in the grave. At the entrance of this church there is a stone placed in the wall, which they fancy to be one of those wherewith St. Stephen was stoned to death. It looks like a pebble and is worn very fmooth by the fuperstitious people, who think they gain some merit by touching In this church are many fumptuous monuments of princes and other great persons; but the princes of the Austrian family, who have been fo long in possession of this empire, have chosen to be buried in the chancel of the Capuchins church, without any pomp, or leaving any memory of their names or actions, on their The Aulic church, where the most immonuments. portant ceremonies are performed, is not the court church; though it is fo near it, that there is a paffage to it, from the palace, by a long gallery.

Here are many other noble churches, and rich convents; particularly for Scotchmen, in honour of their countryman St. Colman, who was reckoned the patron of Austria; and whose body, long kept here, had miraculous cures ascribed to it; but it was afterwards carried to Alba Regalis. The church of the Austin friars, which is very large, has a chancel refembling that called the Santa Cafa, or the Virgin's House, at Loretto in Italy, on the top of which are many columns, ftandards, and other trophies, taken from the Turks and Tartars. Here are likewife two elegant and spa-cious colleges. Before that which faces the piazza there is a column of copper, in the center of the mar-ket-place, on a pedeftal of white ftone, bearing the statue of the Virgin Mary, with the serpent at her feet, and four angels round her, with infcriptions, recommending Austria to her patronage. St. Peter's church is much efteemed for its antiquity, being the oldeft in the city, and built in the fame place where formerly ftood the Ara Flaviana, dedicated to St. Domitian.

Here is a noble university, founded by the emperor Frederic II. who endowed it with great revenues and privileges. It was afterwards enlarged by Ottacar, king of Bohemia, and compleated by Albert III. of Austria, who divided it into four classes, with their peculiar rules and immunities. I. The Austrian class, which takes in the students of Austria, Italy, and other provinces beyond the mountains. 2. That of the Rhine, which takes in the west part of the empire, France, Spain, and the Netherlands. 3. The Hungarian includes Hungary, Bohemia; and 4. That of the Saxons, takes in Saxony, the north of Germany, all the northern kings on the continent, Great Britain, Ireland, &c. The chancellor and the mafter have Ireland, &c. The chancellor and the mafter have power of life and death over the students. In 1706 the emperor Joseph erected an academy for painting, sculpture, and architecture. The public library contains chiefly classical and civil law-books. Protestants are not tolerated publicly to exercise their religion, except in the chapels of ambaffadors. The Jews were once permitted to refide in a fuburb beyond the river called Judenstadt; but being suspected of secretly carrying on a correspondence with the Turks, they have fince been entirely banished from Austria. Imperial palace is mean, low, dark, and badly fur-

nished; though the library, which consists of eight rooms, is well stocked with manuscripts and printed books; and the museum contains many admirable rarities both of art and nature. The theatre is fuperb; and the stables are capacious buildings, of a vast length, but no taste, being divided into seven pavilions, which appear, at first fight, to be so many different houses; but the inner rooms are ill contrived; and the long one, for the houses, is so narrow, that they stand all in one row. Indeed, a bad taste here is too prevalent in the buildings in general. There are, it must be admitted, fome hotels, and even palaces, wherein the rules of architecture have been preferved; but then they are ever charged with fculpture, which derogates from the ancient architecture. Here is, however, the best arfenal in the empire; where is shewn, to strangers, the head of the grand vizir, who was ftrangled at Belgrade, after he had miscarried in the fiege of Vienna. The German foldiers, when they took Belgrade, in a former war with the Turks, opened his tomb there, in hopes of treasure, but found nothing, except the body in its shirt: and the governor, remembering that this same grand vizir, when he laid siege to Raab, (which he was also obliged to raise,) threatened that, if he mastered the town, the head of its bishop, then count Collonitz, should be cut off, because he took the money out of the convents to encourage the garrison, fent the vizir's corpfe to the count, who gave it to this arfenal.

In one of the bastions there is a great magazine of naval ftores for the emperor's gallies, &c. on the The feven channels, into which the Danube Danube. is here divided, contain feveral iflands, communicating together by feven bridges made of timber. The high bridge is formed by the interfection of two streets by equal angles; the foundation of one being as high as the tops of the houses; and, in the other, an arch is built in the lowermost street, to let the uppermost pass over it. Here are two remarkable columns, of which one is called the Conception of the Immaculate Virgin, and the other St. Trinity. The various fuburbs of the city almost embrace it like a bow, and appear like so many different towns; the principal being called Leopoldstadt, and abounding with handsome houses of the nobles and gentry. The Prat, a wood in an island formed by the Danube, is much frequented in In its vicinity is a walk, called the Emperor's Garden; and the ruins of a palace, which was destroyed by the Turks. Another island, named St. Peter's, is capable of encamping a large army.

At the cabinet council the emperor prefides; and next to him fits the king of the Romans: and, in the privy-council, the prime minister is president These have 10 secretaries, the principal of whom signs the emperor's letters. The council of war has two generals as prefidents, and feven majors-general as members, with proper fecretaries, &c. The Aulic council confifts of an equal number of Roman Catholics and Lutherans, nominated by the emperor. It is equal in power to the imperial chamber of Wetzlar, as there is no appeal from either. The court of chancery, for all the business transacted at the Imperial court, whereof the elector of Mentz is always chancellor; but the vice-chancellor prefides in his absence, and has an affistant, an affestor, two secretaries, and a referendary. The writs are either in the German or Latin tongues. Here is a council of finances, and an Imperial council, where is also a prefident, confifting of many lords and gentlemen; among whom are the governors of the Hungarian cities where the mines lie, with the chief officers for the civil affairs of Hungary, Bohemia, Moravia, Silefia, &c. who fend directions from hence to the respective governments of those countries.

Though other chief courts may exceed the Imperial in pomp, yet, for real grandeur, this outfirips them all. Most of the officers of state, and of the houshold, are princes or counts, as are also the captains of the horse

tlemen of the bed-chamber, with golden keys at their breafts, who are all counts and barons; of which quality are also 60 pages; yet ceremonies and the etiquette a name by which they call ancient usages, give this court an air of constraint that is to be seen no where else; and though it is universally exclaimed against, it is as punctually observed as if it was an article of religion. They are very fond, in the city, as well as at court, of the days of gala, which is the name they give to those of festival and ceremony, when there are commonly operas and comedies. There are three commonly operas and comedies. There are three claffes of them; the court gala, which is univerfal, both for the Imperial family, and for the nobles and plebians; at which time, especially on the birth-days of the emperor and empress, the court is extremely gay, and glittering with gold and diamonds. On these days the archducheties (because it is the custom at Vienna for fifters to dress alike) must be dressed all in their hair, as well as their maids of honour; and they wear robes much like childrens vests, with great trains. The grand gala, which are kept in the city, is for the feftival of fome minister. The little gala is when the ladies are let blood: for if any lady of distinction does but fend for a furgeon to open a vein, it is enough to put the whole city in gala: nay, the husband makes a gala here for his wife, the wife for her husband, the children for their parents, and brothers and fifters for one another; fo that for this cause two-thirds of Vienna are always in gala. It is a fingular cuftom at this court, that the empress-dowager can never quit mourning; for though their officers and other domestics wear coloured clothes, their apartments and coaches must always be hung in black: neither must they be present at play, ball, or concert; fo that by lofing their hufbands, they lose the pleasures of life. The emperor's pleafure-houses are no better than his palace in the city. The castle of the Favorita, which is in the suburb of Leopoldstadt, is a great irregular Gothic building, full of turnings and windings, like the flreet it looks into, and appears more like a great convent of Capuchins, than the manfion of an emperor. dens are pretty large, but otherwise mean.

Luxemburg, though a neat convenient box, is even much inferior to the Favorita: but the court only resides there a month or fix weeks, during the season for heron-hunting. The ministers, who attend the emperor there, have houses, which, though not grand, are commodious; but any other perfon who goes thither to pay a vifit, must return to Vienna for a bed. The court used to spend a great part of the summer at the palace of New Favorita, which gives name to one of the fuburbs; but the princes of Mansfeld have built one there which is much more magnificent. The emperor Joseph, indeed, began a fine house at Schonborn, or Schonbrun, about a league from this city, which, if finished according to its plan, might have been another Verfailles; but his empress-dowager, to whom he left it, fuffered the works to run to ruin.

The palace of the great prince Eugene, of Savoy, is very flately, but fituated in a narrow flreet, with a very little court before it. Here is a spacious saloon, adorned with large pictures, representing the chief victories of the prince over the French and the Turks; and in two rooms next to this, a fuit of rich tapeftry, made by the famous Devos, at Bruffels. In the bed-chamber beyond these, there is a lustre of rock crystal, faid to have cost 400,000 florins; and rich tapestry, rolled up in pilasters of green velvet, embroidered with gold, and adorned with figures of needle-work fo fine, that they feem to be miniatures; and the closet next to it is gilt all over.

The palace of Lichtenstein, which is larger, and full as magnificent, is worth feeing, were it only for its paintings. The palaces of the suburbs, in general, are infinitely more grand than those of the city, and they have both court-yards and gardens. Prince Eugene had princes or counts, as are also the captains of the horse one here too, where he used to pass the fine season and foot guards: and there are not less than 100 gen- It is a superb structure, with magnificent gardens, in

The civil government of this city is administered by a stadtholder, who must always be a person of noble extraction, and an officer of the army. The governor has feldom any other title than colonel of the city; and he has a lieutenant-colonel to command in his abfence, who has the direction of the fortifications, the arfenal, and the garrison, which never ftirs from Vienna, and confifts of veteran foldiers, or the burghers and artificers of the city. The employments in this corps are very lucrative; but not being on the road to honour, not much folicited by persons of extraction. It is maintained at the charge of the city, and used to mount guard at the emperor's palace, as he has no other foot-guards. Vienna abounds with coffee-houses, where the news-writers are not less free with the characters of their generals, statesimen, &c. than they are at Lon-There being no hospital of invalids here, the church doors are always plied with begging foldiers that have been disabled in the fervice. All round, upon the city walls, are barracks, or huts, for the garrion, which are very well built, but not all of them occupied by the foldiers, fome being tippling-houses, and others for common women.

Klofter-Neuburg is a rich foundation for Augustine canons; Baden is famous for its hot baths; and Neu-

fladt contains a military academy.

Molk is a market town on the Danube, near which is an exempted cloifter of Benedictines, the greatest and richest foundation of the kind in all Austria. The abbot is primate of the lower estates of this circle, and prefident of the feat of prelates. The abbey is dedi-cated to St. Colman, whose tomb it contains. This St. cated to St. Colman, whole tomb it contains. Colman was the apoftle of Austria, and of the blood royal of Scotland; but his fate was fomewhat fingular; for, in paffing through this country in the habit of a pilgrim, he was taken up and hanged as a spy.

UPPER AUSTRIA is divided into four quarters, Hauf-

truck, Traun, Michel, and Black.

The principal places in the Haustruck quarter are, Linz, the capital of Upper Austria, standing on the Danube. Here is a wooden bridge over the Danube; and on a hill in the neighbourhood is a citadel, which is formetimes the refidence of the emperor. The town is well built of white free-stone, and populous, containing feveral handfome churches, cloifters, fquares, and fountains, and is much reforted to by the nobility, who have villas in the neighbourhood. It is also the feat of feveral counts and colleges for Upper Austria; carries on a confiderable trade in gun-barrels and linen cloth; and has handsome suburbs, with two great yearly fairs, at Easter and Bartholomew-tide. In the neighbourhood likewife are plantations of hops.

Wels is a well built town, on the river Traun, faid to have been founded by the emperor Valerian, after his expedition against the Scythians in Pannonia. Here is a castle, in which the emperor Maximilian I. died. From this town also the neighbouring extensive barren

heath of Welfar takes its name.

Gmunden is a town fituated on the lake of Gmund, or Traun, which abounds with fish. It has a confiderable trade in falt, made at Halftadt, in the neighbourhood, brought hither by the lake, and exported as far as Vienna. The falt-pits were first discovered in 1303, by Elizabeth, confort of Albrecht I. On an island in the lake is a royal citadel, called Ort.

Focklabruck, or Voklabruck, is a well-built town on the river Vokl, which enjoys the privilege of granting protection to all flaves, whose burghers and merchants, with their wares, are toll-free, throughout all the Austrian dominions. Near it, in 1626, the rebel

Bavarians were defeated.

Frankenburg, a town standing on the borders of Bavaria, and containing a citadel, which, together

with the country denominated from them, and the incorporated feigniories, is the property of count Khevenhuller.

Kainmer is a citadel in the Atterfee, which is the largest lake in the whole country, and abounds in exquifite fish, of which it yields a new species every

Schaumberg is a citadel, which gives name to a county, now belonging to the family of Stahrenberg, but formerly an immediate county of the empire.

The county of Neuburg also was formerly an immediate county of the empire, but now belongs to the bishop of Passau. Though this county is a part of Auftria, it is furrounded on all fides by Bavaria, and has feveral citadels in it:

The most remarkable places in the Traun quarter

Ens, in Latin Anisia, Anasum, or Anassanum, a ftrong, well-built town, fituated on the river of the same name. It was built in the year 990, on the scite of Lauriacum, a Roman colony, destroyed by the Huns, about the year 450, and the seat of some Roman emperors. Ens was formerly subject to its own count, till the emperor Rodolph purchased it, and annexed it to the dominions of Austria. The river Ens falls into the Danube two miles below the town.

Stever is a confiderable town, fituated at the conflux of the two little rivers Steyer and Ens, and inhabited chiefly by fmiths, cutlers, and other artificers, who, by means of the Danube, transport their workmanship to

In Michel quarter are Schlog, a cloifter on the river; and the Millack-Bad, a celebrated medicinal bath near the Danube.

In Black quarter are Freystadt, a strong, well-built, royal town, on the north fide of the Danube; and Grein, which contains a Franciscan cloister, a Loretto chapel, a mount calvary, and an hermitage.

The Duchy of STIRIA is divided into Upper and Under Stiria; and bounded to the north by Auftria, properly fo called; to the fouth by Caricola; to the west by Saltzburg and Carinthia; and to the east by Hungary. The air is unwholesome; and the inhabitants are greatly troubled with fevers and swelled throats, which latter complaint is owing to the great quantity of fnow-water which they drink. Upper Stiria is very mountainous, and exceedingly cold, but yet tolerably fertile. The mountains contain filver, lead, copper, and iron; and the fummits are covered with forests, which fupply wood for fmelting these metals. The fteel of this country is reckoned the best in Europe.

In the whole duchy are 20 botoughs, near 100-mar ket towns, and about 500 citacels. The common people generally speak Wendish, or a very harsh dialect of the German; and the better fort are masters not only of these, but also of the Italian and French. land estates of this duchy consists, as in Authria, of the prelates, lords, knights, and royal towns; and their affemblies are held at Gratz. The Roman Campolic is the only religion tolerated in Stiria. Seckau is the fee of a bishop, subject to the archbishop of Saltzsburg, whose vicar he is in most parts of Stiria. At Gratz is an university; and in some other places are gymnasia, and several good colleges. The principal manufactures of the country are iron and fteel works, of which there is a confiderable exportation. Stiria continued a marquifate, till the emperor Frederick Barbaroffa erected it into a duchy. It has been conftantly subject to the house of Austria, fince Rodolph I. and to this day retains peculiar immunities. The counts of Trautmansdorf are supreme hereditary stewards, the counts of Wildenstein chamberlains, the counts of Saurau marshals the counts of Wendish Gratz masters of the horfe, &c.

The principal places are the following:

Gratz, or Gracz, the metropolis, lies on the river Muhr, 20 miles from the Drave, and 74 fouth of Vienna, and is a neat, well-built city, in a pleafant, fruitful

country, and defended by a wall, ramparts, and caftle, on a rocky hill, and other fortifications, that render it almost impregnable. The castle is on a high hill, that commands a neighbouring country, where is the archduke's palace, which is finely furnished, and has a good library and museum. Here is a large college, well endowed, which has the privilege of conferring degrees; fo that it is ranked among the universities of Germany, and is well filled with students. This town is the refidence of the governor of Stiria, as it was formerly of the archdukes of Austria, particularly Ferdinand II. afterwards emperor, who called themselves by its name. Its suburbs, which are large, are washed by a rivulet of its own name; and its territory is very

Marburg, celebrated for its Roman monuments, is

also remarkable for its manufactures.

Raskeburg, or Rakelsburg, situated on the river Muhr, is one of the strongest towns in Stiria. The neighbouring country produces plenty of grapes, and other fruits. The burghers have the fole privilege to buy all the new wines during a stated time, after which the peafants may fell to whom they pleafe.

Leutenburg, a market town, is noted for the best

wine in these parts.

Cilli, or Zilli, was formerly the capital of an independent county, which the emperor Frederick III. took poffession of in 1457, when the last dount was killed, leaving no heirs, and incorporated it with Stiria. In this county flands the high mountain Bacher, or Pacher, rich in all forts of ores, as the mineral waters The highway bethat iffue from it evidently shew. tween Cilli and Pettau was originally a Roman causeway; and feveral Roman mile-stones, and other monu-ments, have been found near it. The inhabitants of the county are all Sclavonians, otherwise called Wends, or Winds. The town, stiled, in Latin authors, Cilia, Celia, Celeia, and Zelia, is very ancient; and, by many Roman coins, and other monuments, discovered in and about it, appears to have been anciently a place of great confideration.

Gunnawitz is a market town, near which is a remarkable fpring, being warm in winter, and cold in

fummer.

Studenitz has a noble female foundation, or priory, belonging to the order of Dominicans.

In Upper Stiria are the following places:

Judenburg, the capital, fituated on the banks of the Muhr, in a plain, furrounded with high mountains, continually covered with fnow, contains a royal fort, two cloifters, and a college Here also are two great

Leuben, a neat pleasant town, standing upon the fame river, was once the capital of a county. Here is a college, two cloifters, and a great trade in iron.

Near it is the rich nunnery of Gols.

Seckau is a confiderable town, and an episcopal fee, under the archbishop of Saltzburg, by whom the bishop is elected and invefted.

Bruck, on the Muhr, is noted for a great cattle fair,

a fine public fquare, and two monasteries

Eisenartz is a confiderable town, and famous for its mines and forges of iron, whence it has its name. It fupplies all Germany with fteel, and many places with iron; vast quantities of both being disposed of at the great yearly fair, and at other times.

A part of the Duchy of CARINTHIA was anciently called Carnia, and the inhabitants Carni; but the former afterwards Carinthia, and the latter Carantani, and Carinthi. The county of Carinthia is bounded to the fouth by the territories of Venice and Carniola; to the north by Stiria, and the archbishopric of Saltzburg; to the west by Tirol, or Tyrol; and to the east by Stiria. The air is cold, the soil barren; the rivers, brooks, &c. abound with fish; and the mountains yield many minerals. The principal places are as follow: Clagenfurt, the capital of the whole duchy, standing

140 miles fouth-west of Vienna, (being anciently called

Claudia, and the feat of the dukes) is well built and fortified, and contains feveral churches and convents, with a large college, a gymnafium, and a provincial house, in which the states assemble. Here is also an equestrian statue of the emperor Theobald. Æneas Sylvius fays, " That in his time, if a man was ftrongly fuspected of theft, they used first to hang him, and then try him three days after. If he was found guilty, they let his body hang till it rotted; if innocent, they took him down, buried him at the public charge, and prayed for his foul." Between this town and St. Veit are fome remains of an ancient town, supposed to be Tiburnia, where Roman coins have been found, and other antiquities. The Lutheran religion was suppressed here anno 1600.

Villach, near the Drave, over which there is a bridge, is a populous town, a great thoroughfare, and famous for its mineral waters. The fituation of this town is among hills, and the churches are noted for their fine paintings. The governor is nominated annually, the emperor naming him two fuccessive years,

and the bishop of Bamberg a third.

The Duchy of CARNIOLA is bounded by the Gulph of Venice to the west, by Sclavonia and Croatia to the eafl, by Carinthia and Stiria to the north, and by the Adriatic Sea to the fouth. It is 110 miles long, 50 broad, rather cold, but, at the fame time, tolerably The lower class of people speak the Sclavonian, or Wendish language; the better fort the German; or Wendish language; the better for the German; but both with a very indifferent dialect. The peafants are a very hardy set of people, going barefoot in the midst of winter, never covering their breasts from the inclemency of the weather, and sleeping on a hard bench, without bed or bolster. In the Upper and Lower Krain the people wear long beards; and fuch as live by exporting the commodities of the country on pack-horses are called Samers, or, more properly, Saumers. The states of Carniola consist of the ciergy, the nobility, knights, and royal towns. Christianity was first planted in this county about the middle of the eighth century; and, in the fixteenth, Lutheranism made a confiderable progress in it, but, excepting the Walachians, or Ufkokes, who are of the Greek church, and stile themselves Staraverzi, i. e. Old Believers, all the inhabitants at prefent are Roman Catholics. In the whole duchy are 3 bishoprics, 24 cloifters, 4 commanderies, and 134 parishes; but to the bishopric of Leybach belong also many parishes in Stiria and Carinthia. The principal commodities exported from hence are iron, fleel, quick-filver, white and red wine, oil of olives, cattle, theep, cheefe, linen, a kind of woollen stuff called Mahalan, Spanish leather, honey, walnuts, timber, together with all manner of wood work, as boxes, difhes, trenchers, fpoons, fieves, &c. Carniola was long a marquifate or margravate; but, in the year 1231, was erected into a duchy. On the extinction of the margraves, the inhabitants made choice of Frederick II. duke of Austria and Servia, for their fovereign. The arms of Carniola are an eagle crowned, on whose breast and expanded wings is to be seen a diced crescent. The counts of Thurn are supreme hereditary stewards in Carniola and the Wendish Mark, the house of Aversberg chamberlains and marshals, the prince of Lamberg mafter of the horfe, the count of Cobenzel cup-bearer, the barons of Eck and Hohenwart fewers, the count of Gallenberg ranger, the count of Katzenstein keeper of the jewels, the baron of Eck staff-bearer, count Sauer of Ankenstein carver, and the count of Lanihieri falconer. The principal officers for the government of the county are the land captain, or the governor in chief, the burgrave of Laubach, land lieutenant, and land vicar.

This duchy has feveral immaterial fubdivisions, fuch as Upper, Lower, Middle, Inner, &c. but the principal places are the following:

Laubach, the capital, stands on a small river of the fame name, which falls into the Save 10 miles below it. The air here is not reckoned wholesome; yet it is a populous,

it is a

a populous, well built city, which the emperor Frederick III. made the fee of a bishop, formerly under uilt and onvents, the jurisdiction of the patriarch of Aquileia, but now rovincial dependent on the pope. It has a cathedral, and a large alfo an caftle; but it is commanded by a hill; and the town Æncas is not very strong, especially towards the river. Howftrongly eyer, it held out a fiege in 1440, till the emperor Frederick III. came to its relief. The princes of the nd then ty, they house of Austria have the right of appointing the preiey took lates and the chapter here, which only confifts of fix canons, of whom, indeed, the bishop nominates one. 1 prayed ire fome Here is a fine house, where the states of the duchy meet; iburnia, and the prince de Aversberg has also a palace in it. There are several convents for both sexes; and the ier antied here river is noted for breeding the largest cray-fish in

Crainberg, or Krainberg, on the banks of the Save, over which it has a bridge, stands on the top of a hill, and is fortisted with a strong castle. It has three churches; and in its suburbs, a monastery of Capuchins. It once gave title to a marquis of the ancient Bavarian family. Supposed to have been a Roman colony; because coins and medals, with other Roman monuments, are frequently dug up in and about the

Ratimondorf, in this neighbourhood, on the north fide of the Save, has also many Roman antiquities, and gives title to a Roman family in Stiria.

Lack, or Bishopslack, is a city, which was plundered and burnt in 1451; but is handsomely rebuilt and fortified, and is subject to the bishop of Freysing, to whom the emperor Henry III. gave it; and the governor of it is his lieutenant.

That part of Istria which belongs to Austria is very fertile; and divided into the county of Metterberg, and lordship of Castua. The chief places are Metterberg, which gives name to the county, and is its capital. It is without walls or ramparts, but has a castle to defend it. Antiguana, a large town; Biben the see of a bishop; Bercketz, a town with an harbour, on the Adriatic; and Castua, which gives name to a lordship.

St. Viet, fituated on a bay of the Adriatic, has a strong castle, is otherwise well fortisted, and possess a good trade on account of its excellent harbour, by which large quantities of goods are exported and imported. The neighbouring territories yield abundance of wine and fruits, particularly sigs. The governor of the town is stiled captain, and resides in the castle. On the opposite side of the river there is a chapel, dedicated to St. Mary of Loretto. The neighbouring gulph abounds in fish; among which is a species called gatta, the skin of which, forming a kind of shagreen, is used for the cases of watches, caskets, telescopes, &c. This town was formerly incorporated with the duchy of Carniola, and bore a share in its taxes; but, at present, it is neither reckoned a part of its territory, nor is it subject to its imposts.

Kirknitz, or Czirnitz, is remarkable for its famous lake, called the Czirnitzer Lake, or Sea, which is 10 miles long, and 8 broad, encompassed with mountains and forests at some distance, and on the east side with a forest of pear-trees. The water finks under ground every year in June, through many large holes in the bottom, leaving it quite dry till September, when it returns spouting out of those holes, with such violence, that it foon rifes to the height of a pike, and covers all the ground again, making that space a sea, which was before fields of corn, palture, and hunting: for, after the retreat of the water, the people fow corn here, which ripens for the fickle before September: and the grafs grows here fo quick, that it affords pasture for the cattle and deer that are turned into it from the neighbouring hills and forests, which are taken off be-fore the springs rise again. The fish that abound here are carp, eels, tench, &c. which none must catch without license from the Prince Eckenburgh, who is lord of the manor, till the water retires; and then the peafants catch great numbers, by laying their nets over the holes. The adjacent inhabitants fay, the lake conflantly observes this course, but can give no reason for this strange phænomenon.

Laas lies near this lake, with a castle, on the river Boick, that runs into it 20 miles south-east from Czirnitz, and is noted for a breed of well-shaped horses, though not so good for service as those bred in Karstia.

Upper Laubach, on the fame river, is confiderable for being a mart for Italian goods, which are brought hither in great quantities over the mountains from Gortz, and fent to all parts of Germany.

The province of Windischmark, in Latin Vindorum Marchia, lies in the fouth-east corner of this duchy. Some reckon it a Sclavonian principality, and subject to the emperor, and not a part of Carniola, to which it adjoins. Though it is a mountainous barren country, especially towards the south, it produces corn and excellent white wine. Its inhabitants are thought to be a branch of the Venedi. Their language is a mixture of the Sclavonic and German, and their religion Roman Catholic.

Metling, or Motling, the chief town of the Windischmark, stands in a pleasant fruitful country, on the river Culp, and the frontier of Croatia. The chief trade of its inhabitants is fattening swine, in two neighbouring woods of chesnuts and oaks. This town lies full in the road from Laubach to Croatia. The wood through which it leads is rough and stony, but the rest of the country is pleasant and fruitful. In the year 1431 this town was suprised by the Turks, and most of the inhabitants massacred; and in 1578 it was again stormed and plundered by those insidels. There is a house here of the Teutonic order.

Rudolphfworth, Rudelfwerd, or Newstadt, which stands on the river Gurck, it is said to have been a Roman colony, but subdued by the Goths, whose king, Dieterich, resided here. It is a well-fortissed town, and samous for the best wine in those parts. About 1435 it was besieged by Albert of Austria, and Ulrich, count of Cilli; but the troops of the emperor Sigisfmund obliged them to raise the siege; and he granted the town great privileges for its brave opposition. It has an abbey, a convent of Recollects, and hot baths, at four miles distance, much frequented by foreigners. Newstadt is the name commonly given to the town, and Rudolphsworth to the abbey.

Gortz, or Goritz, is an ancient town on the river Lozono, in Goritia, fituated in the middle of a wood, and by fome thought to have been the ancient Noricia, or Noreia, near which Dieterich, king of the Goths, defeated Odoacer, king of the Heruli. The Old, or Upper Town, was taken in 1507, by the Venetians, who fortified it, but regained by the emperor Maximilian I. two years after; and in 1616, they again attempted to furprize it, but were forced to retreat.

The Sclavonian tongue, which is spoken in these provinces, reaches no farther west than this town, where the common people speak a corrupt Latin, more like French than Italian; but, in the courts of judicature, they speak High Dutch, as do also the gentry. It is the residence of the governor, and other persons of quality. The inhabitants pretend it is a distinct province, and that their ancestors were a colony of Germans brought hither from Swabia. However, it is deemed a part of Carniola. The river on which the town stands falls into the Gulph of Venice. The lower part of it is quite open, and has a college, a convent of Franciscans, another of Capuchins, and some very sine houses. The town-house, where the states of the county meet, is not large, but well built. In the Upper Town, which is called the Fortress, there is a good guard. Appeals are made from the courts here to the regency of Austria. The road from hence to Laubach is very stony. The county or district of Goricia, of which this town is the capital, is 35 miles long, and 15 broad, and has sine vineyards. It had formerly its par-

ticular counts, the branch of which being extinct, the emperor Frederick IV. took possession of it in 1473; fo that it belongs to the house of Austria.

Seissenburg is a market town of note, on the banks of the Gurck, which supplies it with plenty of fish, particularly the best cray fish in the country. It is subject

to the counts of Aversperg.

Landstraffe is a strong town, almost encompassed by the Gurck. It has jurisdiction over the neighbouring hills and vallies, which were formerly a wilderness for feveral leagues, but of late ages well inhabited; the vallies having been converted into meadows and pafturage, by a company of Walachians, that fettled here by the name of Ufloken, who are of the Greek church, pay the emperor no tribute, but own him for fovereign, and, upon occasion, furnish him with men in proportion to their numbers.

Reifnitz is a noted town on the borders of Carniola, near the Zirnicker See, being the chief of a barony of the same name belonging to the family of Trigler, and the place where the Imperial trained bands of this county muster. The Turks burnt most of it down in

The province of Karstia is reckoned a part of the duchy of Carniola, though it formerly belonged to Fri-uli, betwixt which and Istria it lies. It is a peninfula, almost encompassed with the rivers Alben and Lifonzo, about 36 miles long, and 20 broad, and remarkable for a breed of good horfes, which are bought up by most of the Italian nobility. It was diffmembered from of the Italian nobility. It was diffmembered from Friuli in 1500, and is divided into Upper and Lower Karftia Karitia.

In this province is the famous river Timavus, mentioned by Virgil, in the first Æneid. It is called at first Recea; and, after running under ground for above 40 miles, Timavus, as soon as it breaks out again, and falls into the Gulph of Trieste by 12 small

channels.

Triefte, the chief town of this province, stands on the Adriatic Sea, at the bottom of a bay, to which it gives name. It was a Roman colony, and built from the ruins of the ancient Tergestum of the Carnians, the ruins of which are still to be seen on on a neighbouring mountain. It is a small but strong and populous place, with a large harbour, the only one the house of Austria has in this country. It is also a bishop's see, under the patriarch of Aquileia. The Venetians feized it in the beginning of the 13th century, on ac-count of the piracy of the inhabitants; but Maximilian I. took it from the Venetians, A. D. 1507, and his faccessors have been in possession of it ever since. Great quantities of falt are made here and exported; and the neighbouring country produces good wine. There is a fine town-house in the middle of a large fquare, near the port, where are two beautiful stone pillars; one with the image of the Virgin Mary upon it, and the other with that of the emperor. Here are a cathedral, a college, and a church. The town is well built; and the rocks run into the fea here in the form of moles, which break the waves, and render it fafe riding, even for ships of burden, when in port; but it is only frequented by fmall veffels, just to cross over to Venice: though the emperor Charles VI. who had no other fea port in his hereditary dominions before the treaty of peace at Rastadt, which threw Italy, Sicily, and the Spanish Netherlands, into his hands, made this a free port, and gave great encouragement to the ships and merchants of all nations to come to it, defigning to make it the center of the Austrian commerce in this part of the world: but the merchants of Triefle not having a flock, the Venetians themselves came among them, and carried on that very trade for them, by which they were so sanguine at one time, as to think of supplanting even Venice itself: for from this port the Venetian merchants struck into a new commerce, by the river Save to Belgrade, and from thence to Sinope in the Black Sea; and likewise to Constantinople. The most the Germans have yet done

here, has been to fend fome ships among the Archipelago iflands, from whence they bring back wines, cotton-yarn, fruits, and fome filk, grogram-yarn, camels hair, &c. But the chief misfortune which the Austrians laboured under in carrying on the great trade proposed from this port, was, that they had no fund of goods for exportation, either for their produce or manufactures; the only article they could export, of any value, being the wrought iron made in Carinthia, Stiria, and the adjacent countries; which, indeed, is of great service to the Venetians, because they have no iron works near them. The Venetians have a navigation also through Stiria by the river Muhr, to the Danube, and fo to Vienna; and they have the like in Carniola, by the great river Save, which runs into Croatia and Hungary. From these Countries the Venetians receive a great quantity of large black cattle, which are bought lean, from Croatia, and then brought down to the falt marshes of Venice, and fed there till they are fat. Some also are bought at the several fairs on the frontiers of Carinthia; and they afford the best beef, when fed in the rich lands of Lombardy, that is to be found in that part of the world.

The Idrian bottom is fituated between Carniola and the county of Gortz. The name is derived from Idria, a royal market town, which is immediately subject to the Auftrian aulic-chamber Gratz, and lies in a deep valley, amidst high mountains, on the small river Idria. This town is defended by a castle, and celebrated for its quickfilver mines. The common fort of quickfilver is extracted from the ore by means of fire; but the virgin quickfilver is found in numerous fmall drops, or trickles through the veins of the mountains. Malefactors are condemned to these mines to work for life, as this kind of labour is the most unwholsome that can be.

As we cannot prefent the reader with a more accurate description of these mines, or a more pathetic display of the miferies of those who are doomed to toil in them, than what are contained in two letters, written by a learned and ingenious traveller, of the name of Everard, we infert them without farther apology.

LETTER I.

"AFTER passing through several parts of the Alps, and having vifited Germany, I thought I could not return home without vifiting the quick@lver mines at Idria, and feeing those dreadful subterraneous caverns, where thousands are condemned to refide, thut out from all hopes of ever feeing the chearful light of the fun, and obliged to toil out a miferable life under the whips of imperious talk-masters. Imagine to yourself a hole in the fide of a mountain, about five yards over: down this you are let, in a kind of bucket, more than 100 fathom, the prospect growing still more gloomy, yet still widening as you descend. At length, after swinging in terrible suspense for some time in this precarious fituation, you then reach the bottom, and tread on the ground, which, by its hollowed found under your feet, and the reverberations of the echo, feems thundering at every step you take. In this gloomy and frightful folitude, you are enlightened by the feeble gleam of lamps, here and there difperfed, so as that the wretched inhabitants of these mansions can go from one place to another without a guide; and yet let me affure you, that though they, by custom, could see objects very distinctly by these lights, I could scarce discern, for fome time, any thing, not even the person who came with me to shew me these scenes of horror.

"From this description, I suppose, you have but a disagreeable idea of the place; yet let me assure you that it is a palace, if we compare the habitation with the inhabitants: fuch wretches my eyes never yet beheld. The blackness of their visages only serves to cover an horrid paleness, caused by the noxious qualities of the mineral they are employed in procuring. As they in general confift of malefactors condemned for life to this task, they are fed at the public expence;

" In this horrid mansion I walked after my guide for fome time, pondering on the strange tyranny and avarice of mankind, when I was accosted by a voice behind me, calling me by my name, and enquiring after my health with the most cordial affection. turned, and faw a creature all black and hideous, who approached me, and with a piteous accent demanding, Ah, Everard, do you not know me?" Good God! what was my furprise, when through the veil of this wretchedness, I discovered the features of a dear and old friend. I flew to him with affection; and after a tear of condolence, asked how he came there. To this he replied, that having fought a duel with an officer of the Austrian infantry, against the emperor's command, and having left him for dead, he was obliged to fly into the forests of Istria, where he was first taken, and afterwards sheltered by some banditti, who had long insested that quarter. With these he lived nine months, till, by a close investiture of the place, in which they were concealed; and after a very obstinate refistance, in which the greater part of them were killed, he was taken and carried to Vienna, in order to be broken alive upon the wheel. However, upon arriving at the capital, he was quickly known; and feveral of the affociates of his accufation and danger witneshing his innocence, his punishment of the rack was changed into that of perpetual banishment and labour in the mines of Idria -- a fentence, in my opinion, a thousand times worse than death.

" As my old friend was giving me this account, a young woman came up to him, who at once I perceived to be born for better fortune: the dreadful fituation of this place was not able to destroy her beauty; and even in this scene of wretchedness, she feemed to have charms sufficient to grace the most brilliant assembly. This lady, was, in fact, daughter to one of the first families in Germany; and having tried every means to procure her husband's pardon without effect, was at last refolved to share his miseries, as she could not relieve them. With him the accordingly defeended into thefe manfions, from whence few of the living return; and with him the is contented to live, forgetting the gaieties of life, and with him to toil, despising the splendor of opulence, and contented with the consciousness of

her own constancy.

LETTER II.

MY last to you was expressive, and, perhaps, too much so, of the gloomy stuation of my mind. I own, the deplorable fituation of the worthy man described in it, was enough to add double feverity to the hideous mansion. At present, however, I have the happiness of informing you, that I was a spectator of the most affecting scenes I ever yet beheld. Nine days after I had written my last, a person came post from Vienna, to the little village near to the mouth of the great shaft. He was foon after followed by a fecond, and he by a third. The first enquiry was after my unfortunate friend; and I happening to overhear the demand, gave them the first intelligence: Two of these were the brother and cousin of the lady: the third was an intimate friend and fellow-foldier to my friend. They came with his pardon, which had been procured by the general, with whom the duel had been fought, and who was perfectly cured of his wounds. I led him, with all the expedition of joy, down to this dreary abode, presented to him his friends, and informed him of the happy change of his circumstances. It would be impossible to describe the joy that brightened upon his grief-worn countenance; nor was the young lady's emotions less vivid at seeing her friends, and hearing of her hufband's liberty.

"Some hours were employed in mending the appearance of this faithful couple; nor could I, without

a tear, behold my friend taking leave of the former wretched companions of his toil. To one he left his mattock, to another his working-clothes, to a third his houshold utenfils, fuch as were necessary for him in that fituation. We foon emerged from the mine, where he once again revisited the light of the sun, that he had totally despaired of ever seeing again. A postchaife and four were ready the next morning to take them to Vienna, where, I am fince informed by a letter from himself, they are returned. The emperor has again taken him into favour, his fortune and rank are restored, and he and his fair partner have now the pleasing satisfaction of feeling happiness with double relish, as they once knew what it was to be miserable.'

The county of Tirol is partly level and partly mountainous: the places of the former are fertile, and those of the latter covered with woods, abounding in game, and rich in mines. The men are robust, the women fair; and both, in their characters, have a mixture of

the German and Italian.

A particular kind of falutation is used all over Tirol. When a person comes into a house, he says, "Hail! Jesus Christ." The answer is, "May Christ be praised, and the Holy Virgin his mother." Then the master of the house takes the visitor by the hand. This falutation is fixed up in print at all the doors, with an advertisement tacked to it, importing, that pope Clement XI. granted 100 days indulgence, and a plenary absolution to those who should pronounce the salutation and answer.

The emperor has forts and citadels fo advantageously fituated on rocks and mountains all over the county, that they command all the vallies, avenues, and paffes that lead into it. The inhabitants, however, (to keep them in good humour) are more gently treated, and not fo highly taxed, as those of the other hereditary countries. As to the states, they are much the same in this county as in the other Austrian territories, except that the peasants here send deputies to the diets. Tirol came to the house of Austria in the year 1363, when Margaret, countess thereof, bequeathed it to her un-cless the dukes of Austria. The arms of Tirol are an eagle gules, in a field argent. Besides the governor, here are three fovereign colleges, fubordinate to the court at Vienna, which fit at Juspruck on the Inn, the capital of the county, fituated 225 miles west of Vienna. The city is small but elegant; the suburbs are large, and the whole is pleasant. It contains several hand fome churches, convents, market-places, fountains, and palaces, is the refidence of the governor, and feat of the colleges. The castle is large, but not regular; convenient, but not beautiful. It is adorned with many fine paintings, a cabinet of curiofities, groves, gardens, and walks that lead from it to five different churches. Adjoining to it is a wooden palace, whither the court used to retire when an earthquake happened, to which the city, by being thut up among fo many mountains, is frequently subject.

The fortifications are not extraordinary; but, about a mile off, is the strong castle of Amras, or Ambras, which commands the town. In the Franciscan church is a noble monument, crected by Ferdinand I. to his grand-father Maximilian; and a chancel, called the filver chancel, because there is an image of the Virgin of folid filver, as large as the life, in the middle of the altar, together with many other images of faints, all of the fame metal. In this city Christina, queen of Sweden, first abjured the Protestant religion in 1655; and, in 1719, the princess Sobieski was detained here by the emperor's orders, when she was going to Italy to be married to the Pretender. However, the foon made

her escape, and was married to him.

Hall, which stands a league north-east of Inspruck, on the Inn, and is reckoned the fecond city in Tirol, is famous for its falt-works, there being, in this neighbourhood, a falt-mine, out of which large blocks of falt are dug, and thrown into pits filled with fresh water; from whence the falt, when melted, is conveyed by wooden troughs to Hall, and there boiled in huge pans or cifterns. A great number of peafants are continually employed in felling trees in the woods of fir, with which the double range of mountains along the Inn are covered. These being rolled down from the mountains into the river, are conveyed by it to Inspruck and Hall. Here is a mint, which, with the falt-works, mines, &c. render this a very flourishing

place.

Ambras, or Amras, a strong castle, lies about one mile and a half east of the city. The name was derived from the design of it, which was a shady summerhouse. It is pleasantly situated at the end of a fine park, over-looking the river Inn; but would hardly be vifited by travellers, were it not for its curiofities; the apartments containing little more than the bare walls; though they were fumptuously fitted up formerly for the archdukes of Austria, who used to spend their fummers here, as they did their winters at Inspruck. Ambras is adorned with fuch a number of statues, and fuch an infinite quantity of medals, &c. that, in 1601, a large book was printed with an account of them. Besides the immense treasure in gold and precious ftones, the feveral princes, ranged on horseback in all their rich old tilting accoutrements, and a thoufand other remarkable things, here are the armour of Charles XI. king of France, and the statue of Francis I. on horseback, in plaister-work, exactly representing him in his armour, and his horse in his trappings, just as he was taken at the battle of Pavia. Here is likewise the armour of feveral emperors, kings, and princes; with the picture of each prince, drawn to the life, just by it. In fhort, here are abundance of spoils and trophies taken in some of the most important victories obtained by the house of Austria for 3 or 400 years past; par-ticularly the effigies of two Turkish bashaws on horseback, with the costly habits and harnesses in which they were taken, embellished with gold, filver, and precious stones. One very extraordinary phænomenon among the collection of rarities, is the trunk of an oak enclosing the entire body of a deer, which philosophers fuppose to have perished in the snow; and that, being brought down, upon a thaw, by a torrent from the neighbouring hills, and covered with mud, it was there first enclosed by the roots, which, as the tree grew, forced it by degrees up into the trunk. Noah's rain-bow is so admirably painted on one of the cielings, that the great duke of Tuscany offered 100,000 crowns for it. Here is also a good library, and a gallery full of busts. The chatellan, or keeper of this castle, who is generally fome invalid, comes purposely from Inspruck to shew the apartments to strangers; and when he does it, is always attended with a strong guard, and expects a fuitable reward for his trouble.

At a little distance from the town, on the south side, is the famous monastery of Wiltheim, where the monks pretend to have the body of their founder Haymon, a gigantic prince, 12 feet and a half high, who, they say, killed a monstrous dragon, which threw down as much of his monastery by night as his men built by day. There is a pillar before its gates, with an inscription, importing, that the road from Italy towards Augsburg lay across the field where this monastery stands; and that it was repaired for near 100 miles together, in the

time of the emperor Septimius Severus.

Tirol, from whence this country has its denomination, is only remarkable for its fituation in a pleafant valley, and its ancient caftle.

The margravate of Burgau, between the Danube and Lech, with the city of the fame name, and land-gravate of Nellenberg, and the county of Hohenberg,

all belong to the house of Austria.

The territory of Brifgaw, which came to the house of Austria by purchase, in 1367, contains

Friburg, on the Treisam, which was formerly very strong, and had stood many sieges; but its fortifications were demolished by the French in 1745. The town is large, populous, and wealthy, having an university,

a college, and feveral cloifters. The lapidaries here are famous for polifhing the granites, jaspers, and other precious stones, that are found in Lorrain and the neighbouring countries. The tower of the great church is so high, and so curiously carved and constructed, that there is nothing of that kind in Germany to be compared to it, except that of Strasburgh.

Brifack, called Old Brifack, to distinguish it from the New, (which was built and strongly fortified by the French, on the other side the Rhine, in Alface,) came to the house of Austria by mortgage, and was once an Imperial city. It was reckoned very strong until 1741, when its fortifications were razed by order of the queen of Hungary.

Neuberg, on the Rhine, was formerly an imperial town, but in the 14th century, fell under the dominion

of the house of Austria.

The abbey of St. Blase, whose abbot, in 1747, was made a prince of the empire, is also hereditary archaulic-chaplain of the house of Austria, in the interior Austrian countries; but subject, in spirituals, to the

bishop of Constance.

The four forest towns are Rheinselden, Seckingen, Lausenburg, and Waldshut. The first is the capital of a county, and was once a free Imperial city; but was mortgaged, in 1410, by the emperor Lewis of Bavaria, to the dukes of Austria. Hard by is the village of Kaisars-Augst, on the Rhine, where anciently stood the Augusta Rauracorum. The second is a small town, and held in see of its abbess. The third is the capital of an ancient county, well fortissed, and seated on both sides the Rhine. It is held as a sief of the foundation of Seckingen, and came to the house of Austria in 1409, when the line of the counts of Habsburg-Lausenburg became extinct. The fourth is a small but strong town, being, as its German name imports, a key to the Black Forest. It was built and fortissed in 1249, by Albert, count of Habsburg, who granted it several privileges.

The landgravate of Ortenau belongs partly to the house of Austria, and partly to the immediate Imperial.

knighthood of the circuit of the Ortenau.

The bishopric of Brixen is 45 miles long, 30 broad, and, though situated among the Alps, is fruitful. The wine here is excellent. The bishop is a prince of the empire, and the chapter consists of 18 canons, of which nine are noble.

Brixen, the capital, is only a post stage from the territories of Venice. It contains an episcopal palace, a castle, two convents, a cathedral, two other churches, several squares, many handsome houses, painted on the outside, &c. Mount Brinner, in the vicinity, is cultivated to the very top, where there is a post-house,

tavern and chapel.

The bishopric of Trent lies among the Alps, fouth, from Tirol, north and west from the dominions of Venice, and east from those of the Grisons. It is near 60 miles from east to west, and 40, where broadest from fouth to north. Some make it a part of Italy; but the bishop of Trent, having been a prince of the empire fince Ferdinand II. the Germans reckon it in the circle of Austria. The river Adige runs through it from north to fouth, receiving feveral small rivers, that rife in the mountains on each fide of it. Its foil produces a good pale red wine, oil, fruit, and pasture; but not much corn. The ancient inhabitants were the Tridentini of The common languages of the present are the German and Italian. Though the house of Austria were the temporal fovereigns and owners of the county, yet they provided handsomely for the bishop, who has a confiderable revenue, not only from the city of Trent, but Riva, Bolzano, Roveredo, &c. He is suffragan to the archbishop of Saltzburg; but, before the treaty of Munster, he was suffragan to the patriarch of Aquiteia, whose bishop, Hermagoras, was the founder of the fee, A. D. 50. When the bishop dies, the emperor fends a governor, who prefides till another is chosen by the chapter, which is composed of 18 canons, who always chuse the bishop out of their body. This

diocefe was much enlarged by the emperor Conrade II. and confirmed by his fucceffors, who made the count of Tirol protector of the bishop, and obliged him, in case of an invasion, to affish him. Several princes, both of Germany and Italy, pay homage to him for part of the estates which they hold of this see, particularly the duke of Mantua; and the emperors, as counts of Tirol, pay him quit-rents, as do many earls and barons.

Trent, the capital, receives its name from three mountains, or peaks, which hang over it, and is fituated on the river Adige, at the diffance of 255 miles fourhwest from Vienna. The high mountains about it render the air excessive cold in winter, and extremely hot in summer, as well as expose the town to frequent innundations. The city is small, but populous, surrounded by a wall, defended by a castle, and contains several palaces, churches, convents, &c. The cathedral is magnificent, the episcopal palace large, and adorned with fine paintings. The church of St. Mary has an organ of a prodigious fize, that imitates various musical inftruments, the singing of many forts of birds, the cries of several different kinds of wild beastls, the sounds of drums, trumpets, &c. The famous council, called the Council of Trent, was held here.

Reif, or Reva, on the lake De Garda, is famous for

Reif, or Reva, on the lake De Garda, is famous for the excellent oranges and lemons which grow in the neighbourhood, for a celebrated image of the Virgin, and for a confiderable trade.

The bishopric of Chur, or Choire, is governed by a bishop, who stiles hunfelf a prince of the empire; and, as a bishop, is under the archbishop of Mentz. he is himfelf a Roman Catholic, most of the inhabitants of the lands, fubject to his temporal jurisdiction, are Protestants. His chapter consists of 24 canons, of whom fome are nobles. Both he and they refide on an eminence near the town of Chur, called Hoff, where is a spacious and well-built castle. He has the right of coinage; and is poilefied of feveral fine estates and fiels, not only among the Grifons, but in fome foreign countries, as Tirol and Alface. Before the reformation, he had also some jurisdiction over the city of Coire. title runs thus: " By the grace of God, elected bishop of Chur, or Coire, prince of the holy Roman empire, lord of Furstenburg, Furstenan, &c." The see is very ancient, and its power, both temporal and spiritual, before the reformation, was very great. At prefent its episcopal, or spiritual jurisdiction, extends partly into the hereditary countries of the house of Austria, and partly into Switzerland.

The Teutonic order has two bailiwicks in the circle of Austria, on account of which it is reckoned a state thereof, namely, one in the archduchy of Austria, and another on the Etsch, and the Gebirge in Tirol.

The little feigniory of Trasp, belonging to the prince of Dietrichstein, lies on the borders of Tirol, in the valley of Engedein. The emperor Leopold made a present of it, together with the supreme jurisdiction, to prince Ferdinand Joseph of Dietrichstein, who, on that account, in 1688, obtained a seat and voice in the college of princes at the diet of the empire.

THE CIRCLE OF BAVARIA.

THIS circle is bounded by the circles of Austria, Swabia, Franconia, and the kingdom of Bohemia. It receives its name from the duchy of Bavaria, which conflitutes the greatest part of it, is 190 miles long, and 115 broad where widest. The diets are usually held at Ratisbon; and the elector of Bavaria, and bishop of Saltzburg, are joint summoning princes. The elector of Bavaria is likewise hereditary commander of the circular forces. The inhabitants are of various religious persuasions. The air is wholesome, the country mountainous; and the principal rivers are the Danube, Lech, Inn, Ifer, Amber, and Salza.

The Archbishopric of SALTZBURG is near 100 miles in length, and 60 in breadth. It is, in general, mountainous; but many places contain fine pastures, where No. 73.

excellent cattle and horses are bred. It abounds in falt, copper, filver, lead, iron, lapis calaminaris, marble, mineral waters, &c. The lands belong to the clergy, as here are not any nobles; but the peasants are, in general, trained to arms. The Romith is the established religion; and the oppressions of the Protestants have been such, that they have continually emigrated from hence: in particular, in 1732, above 30,000 quitted the place, and dispersed themselves into divers parts of Europe and America.

The archbishop, who is one of the richest prelates in Germany, is prince of the empire, perpetual legate to the fee of Rome in Germany ever fince 1073, and primate of Germany by the treaty of Munitedin 1648. He fits in the diet on the first bench next to the elec-tors; and, in the college of princes, he and the archduke of Austria prefide by turns. When the emperor writes to him, he gives him the title of Your Friendship; whereas the other prelates have only the title of Your Devotion, or Your Piety. He has, moreover, the first voice in the diet of any of the ecclesiastical princes, after the electors. His spiritual prerogatives are very great. There lies no appeal from this archbishop to the nuncios at Vienna, Lucern, and Cologne, as there does from the other bishops of the empire. He moreover nominates to the canonicates vacant in the months of the pope, in which months the pope has a right of nomination, by virtue of the German concordat. He may, as well as the archbishop of Cologne, drefs in the habit of a cardinal. He has the disposal of the four bishopries of Gurck, Cheimsee, Lavant, and Seggau, or Seccau. Only the nomination of the bishopric of Gurck is alternative, between this prelate and the archduke of Austria. His suffragans are the bishops of Ratisbon, Freisingen, Passaw, and Brixen. His revenue amounts to near 80,000l. The very falt, which is carried into Bavaria and Swabia, brings him in 30,000 crowns per annum. He has better than 6000l. a year for his private purse; and, for officiating at three folemn fervices, he is paid near 2000l. for each; but, as he is abfolute, he is matter of all the revenues of the country, and by no means accountable for what he lays out. Besides he commonly holds the deanery in commendam, which brings him in an additional fum of 2000l. He is able to raife 8000 men; and, under the archiepiscopal mitre, he bears, in his arms, the fword on the right, and the crofter on the left, denoting both the temporal and spiritual power. His chapter is composed of 24 canons, who must be all nobles by eight defcents, and are only obliged to four months refidence in the year. They admit of no princes to be members, that they may have a plea for refuling those of Bavaria, of whose power they are jealous; though they are obliged to them for most of their wealth. These canons have no vote, or revenue, till they have been ordained priest. They have each a house, and some of them palaces. Though they do not fing in the choir of the cathedral, they lofe a perquifite if they are not present: and though they have eight months vacation in the year, to go where they please, yet they are so strictly tied down to one year's constant residence in the city, that if they happen to lie abroad but one night, they must begin the term de novo. Both the provost and dean have the crosser and mitre; as have also the provost and dean of Passaw. At his coming to this fee, he must pay 100,000 crowns to Rome for the pall: but the country generally raises it for him; besides making him a free gift of the like fum at the same time. This prince has a great number of officers and attendants, befides a numerous and fplendid retinue. He also confers the order of St. Rupert, (whose knights wear a medal with that faint's effigy, and the red cross of the order on the reverse,) which was inflituted in 1702, by the archbishop John Ernest, who has thereto annexed fix commanderies, or prebends, of a confiderable revenue. He has two villas, Gleisheim, and Heilbron, or Hellenbron, which are both magnificent and beautiful. The latter espe-

cially, not above a mile from the city of Saltzburg, is worth visiting on account of its fine waters and cascades, rich statues, &c. and the various prospects both of the city and country, from two fine fummer-houses at the farther end of its gardens.

Saltzburg, the capital of the archbishopric, takes its name from the river Salza, on which it is fituated, and over which it has a bridge. It is well fortified, and the refidence of the archbishop. The castle here is very ftrong, and as ftrongly garrifoned, and well provided with provisions and warlike stores. The archbishop's palace is magnificent; and in the area before it is a fountain, esteemed the largest and grandest in Germany. The city, of which one part stands on a steep rock, is well built; but the streets are narrow, and badly paved. Besides the above mentioned, there are two other stately palaces belonging to the archbishop, one of which is called the Neuebau, and the other Mir rabella. The latter of these has a very beautiful garden, and most extensive orangery. The river Salza runs close by the walls of this garden. There are many other fine structures in the city, public and private, fuch as palaces, monafteries, hospitals, and churches. In the cathedral, dedicated to St. Rupert, the apostle of Bavaria, all the altars are of marble of different kinds. The winter and fummer riding-schools here are noble ftructures. The university was founded in 1620, and committed to the care of the Benedictines. Befides it, there are two colleges, in which young noblemen are educated.

Gaftein is a town remarkable for its gold, filver, and

lead mines, and for a warm bath.

Hallein stands in a valley crossed by three rivers, formed by torrents from the mountains, which bring down a vast deal of floating wood that is stopped here by the piles, which either crofs or shut up the rivers. This wood they lay up in store for the falt works. Its falt is carried in great quantities through Bavaria, and a corner of Tirol into Switzerland, where it is paid for in French money, which is one reason that there is scarce any coin current in Bavaria but that of France. There is a great high mountain on the west side of the town, the earth of which being mixed with a fort of allum, or falt-petre, they throw it into large trenches, which they fill with fresh water, and let it stand three or four weeks, till the earthy part is funk to the bottom: then they let it out, and boil the faline part in iron pans three feet deep, and 10 or 12 in diameter; and when the water is evaporated from the falt, which it leaves at the bottom, they take it up, and put it to dry and harden in deal casks, without head or bottom. This mountain is pierced in a thousand places, like that of Poton in Peru: therefore, those who go out of curiofity to fee the works in it, have need of very good guides, for fear of being loft in the infinite variety of tracts, or crushed by the fall of the earth.

There is no feeing these works without much ceremony. Before they enter, they generally repair to a church on the top to perform their devotions. done, they take a hearty breakfast at a public-house near the church; and being accommodated with some bottles of Rofa folis, they are accounted with a furtout of coarfe linen cloth, with leathers over their right arm and back, the better to enable them to make their way through the timber-works. They put great bonnets on their heads, so that but little of the face is feen, to keep out the cold. Being thus fitted out, every man enters with a lighted candle or torch in his left hand. A great number of guides and others go before and behind the fpectators, left they should be frightened in the dismal caverns. The candles sometimes go our, by reason of the prodigious rapidity with which they descend from one beam to another; but if none should happen to be left burning to light the rest, the guides quickly strike fire, and re-kindle them. After having vifited all the fubterranean curiofities, which takes up five or fix hours, they give money to the guides, and then go to the town to regale. Boats are continually going up and down the river, with the falt made here, for Saltzburg; from whence it is carried elsewhere. On the opposite fide of the river there are forges, where they melt the copper that is dug out of the mines of this archbi-

The Electorate of BAVARIA is about 100 miles in length, and 60 in breadth. Those parts near the Alps are mountainous, cold and barren; but produce wood, game, wild-fowl, cattle, falt, mineral waters, filver, lead, iron, copper, &c. The parts that are fituated towards the Danube are much more level and fertile, yielding grain, fruits, pasturage, &c. The many rivers which water this country, and the various lakes which it contains, abundantly supply the inhabitants with fish. A committee of the states, confiding of prelates, nobles and knights, affemble at Munick, whenever emergencies require. The only religion tolerated is the Roman Catholic. The convents are numerous, and the clergy rich; but the peafants are milerably poor. The manufactures are filk and woollen ftuffs, clocks and watches, coarse cloth, velvet, tapestry and

stockings.

The title of the elector is, " By the grace of God, duke of Upper and Lower Bavaria, as also of the Upper Palatinate; pfalzgrave of the Rhine, arch-fteward of the Holy Roman empire, and landgrave of Leuchtenberg." He has five hereditary officers, a mafter of the houshold, a steward, marshal, cup-bearer, and huntiman. In 1729 the order of St. George was revived by the elector Albert, the enfign of which is a cross enamelled blue, and worn pendant to a broad skyblue ribbon, with a black and white border. The elector has the fifth feat in the electoral college, and several votes at the diets both of the empire and circle, in the colleges of the princes and counts. His ordinary revenues, arifing chiefly from the monopoly of corn, falt, beer, and tobacco, tolls, mines and contributions, amount to between 6 and 700,000l. per annum. With respect to his military establishment, he maintains, in time of peace, about 12,000 regulars, exclufive of 10,000 militia. His court, for magnificence and fplendor, is exceeded by none in Germany. During an inter-regnum he is vicar of the empire, alternately with the elector Palatine, in all places belonging to the vicariate of the count Palatine of the Rhine. Bavaria is divided into Upper and Lower. The principal places in the former are as follow:

Munich, the capital of all Bavaria, and the refidence of the elector, fituated on the Ifer, at the distance of 214 miles west of Vienna, is one of the most po-pulous and agreeable cities in Germany. It was originally erected on a spot of ground belonging to a conand had from thence the name of Munchen, which fignifies Monk's Town, and which fince has been corrupted into the word Munich. The elector's palace is a most magnificent structure. It was built by Maximilian the elector, at a most enormous expence. The infide is far more beautiful than the outfide; the architecture of which is not very regular, because it was built at different periods. It contains 11 courts, 20 great halls, 19 galleries, 2600 large crofs windows, 6 chapels, 16 great kitchens, 12 large cellars, 40 vaft apartments, all on a floor, in which are 300 great rooms, richly painted, furnished, &c. and there is hardly a cornice, niche, or grate, but has a buft or relievos of marbles, which are also the ornaments of almost every chimney-piece. The particulars most remarkable are the long gallery, adorned with pictures of 100 illustrious persons, by the greatest masters; and another gallery, the cieling of which represents the principal towns, rivers, and castles of Bavaria. In the former are the effigies and names of 36 princes, the predecef-fors of the two last electors. The Antiquarium, or Statuarium, containing a vast number of old and new pieces, in marble, stone, wood, &c. The great hall, called the emperor's, a beautiful apartment, 118 feet long, and 52 broad, which Gustavus Adolphus said he was forry he could not get transported to Stockholm.

The staircase leading to it is, from the bottom to the top, marble and gold. This noble room is adorned with curious pictures of facred history on one fide, and profane on the other, with a Latin distich under each. Beyond this there is a fine hall, where the electors give audience to the foreign ministers. Here are in eight great compartments, shewing the different manlps od. ner in which foreign princes give audience to ambaffadors, befides other pictures, accompanied with hiero-glyphics, &c. The hall, filled with antiquities brought er, ted from Rome, exceeds all the rest; here being 354 busts ile, of jasper, porphyry, brass, and marble, representing any Grecian captains, Roman emperors, generals, &c. be-fides numbers of idols, and veffels of the Pagans; kes ints valuable for workmanship, as well as antiquity. orelibrary, wherein, befides a vast collection of printed enbooks, in most languages, ancient and modern, there are a great many valuable MSS. particularly a Latin ited ous, treatise in folio, in an old square character, said to be ably written by pope Clement I. to St. James the Apostle; uffs. and the New Testament, in the Indian, Arminian, and Wendish tongues. A chamber of rarities, containing, befides the figures of Parnassus and the nine Rod, Muses, with landscapes, &c. in coral, and the Pagan deities, a neat perspective globe, in the circumference of pper 1 of which there is the whole hiftory of Our Saviour's paffion, uchwhich being inverted, thews the elevation of the ferpent r of and in the wilderness on one side, and Our Saviour's crucifixion on the other. Here are flowers and plants cast in regold, feveral drawers full of ancient and modern coins is a and medals, and a remarkable picture of Christopher fky-Freschammer, a most notorious assassin. A little cha-The pel belonging to the electress's apartment, where scarce and any thing is to be feen but gold and filver, pearls and ircle, The very organs are of filver in relievo; and gems. ordithe cabinets of rock chrystal, worked in figures. oly of furniture, in short, of the whole palace, is rich beribuyond imagination. In the treasury there are whole num. fervices of gold, and many other coftly veffels, vaft mainnumber of pearls, diamonds, rubies, and other pre-cious stones; rare pictures, curious works, medals, xclucence &c. and, among the rest, a cherry-stone with 140 heads Durdiffinctly engraved upon it; and a boat, of palm tree alterwood, petrified. There is a vaft quantity of marble nging in this palace, which is artificial, but fo well hardened thine. and polished, that it looks like natural: and there is prina prospect, through little galleries, to all the churches and convents in the city. In the beginning of the year dence 1730 this new apartment was burnt down by a fire nce of which broke out in the night-time, fo that scarce any R poof the fine furniture was faved; and the elector and is orielectress were in imminent danger of being burnt in a contheir bed. The nearest church to this palace is that ichen. of the Theatins, which, together with their monastery, s been was built by the wife of Ferdinand-Mary, elector. palace The friars, who are 27, must be all men of quality. Maxi-They dare not ask alms, though they may receive them; The and when they have suffered extreme want, at any time, he arfor three days together, they are allowed to ring a bell, it was as a token of their diffres: but the electors feldom let ts. 20 them want. Round one half of the garden there is a ndows, grand piazza, adorned with pictures, reprefenting the feveral histories of the princes of the Bavarian family, to vaft rooms, At the end of this piazza there is a very fine building, irdly a the lower part of which is an orangery, and the upper evos of part a fummer house, where in that season, the elect every tor has a drawing-room. Near this there is a kind of ple ard menagerie, in which lions, and other wild beafts, are o illuf-The piazza leads to one of the finest ridinganother houses that is to be seen. It is 366 feet long, and 76 rincipal broad; has 80 great windows; and all round within there runs a fine corridor, or gallery, for the spectators, former edecefwhen there are caroufals, or tournaments. Here is a ium, or grand box for the elector, richly carved, large enough nd new to contain all the electoral family. Here is also a magat hall, nificent opera-room, with a stage suitable to it, and 118 feet superb decorations to each. Upon festival days, or

others, when there is an opera here, it is remarked, as

faid he

ckholm.

The

a very unaccountable custom, that just as they begin to play the overture, a luffre of extraordinary grandeur and structure comes down unexpectedly through the cieling, from the top of the stage; and as foon as the

first act is over it is drawn up again.

The manufactures of Munich are those of filk, velvet, woollen cloths, and tapeftry; and it has two annual fairs, at which great quantities of falt, wine, &c. are The streets are broad and regular, and most of the houses well built, and painted on the out-side. The market-place is extremely beautiful. The fervant maids at the great inns here, on holidays, wear a filver chain round their necks, confifting of three rows. Their breafts are likewife laced with two other chains of the fame metal. It was formerly a general custom to place a green garland, on a bundle of straw, before every house containing the corpse of an unmarried person. The common falutation here, and in the other Catholic countries of Germany, is, "Praifed be Jefus Christ;" and the answer returned, "For ever, Amen." Two popes having granted an indulgence of 100 days each time to all that use it. Not far from Munich are four other palaces, with fine gardens, belonging to the elector, viz. those of Sleisheim, Nymphenburg, Dachau, and Stahrenberg. The first and last are about three leagues from the capital; the second about half a league; and the third about two, at a market-town of the fame name.

Ingoldstadt, a fortified town on the Danube, 45 miles north of Munich, contains several convents and churches, a college, an excellent arfenal, and an univerfity, which boafts of having produced the learned Bellarmine. This univerfity is accomodated with an admirable library, and a cabinet of curiofities. The castle where the governor refides is exceeding strong. Over the Danube there is an elegant bridge. In the great church there is an image of the Holy Virgin of great value.

Rain is a well-fortified town, where the celebrated

count Tilly received his mortal wound.

Reichenhall, on the Tala, is famous for an excellent falt-spring, some of the waters of which are conveyed above 12 miles over mountains to Traunstein, and fome are boiled on the fpot. A furprifing aqueduct, about a mile and a half in length, and 12 fathoms beneath the furface of the earth, passes under the town. Boats may pass through it in about a quarter of an hour: but the whole was confiructed in order to carry off the

fuperfluous waters of the falt-fpring.

Donawert has its name from the Danube, on the north fide of which it stands, near the conflux of the Wernitz, within 10 English miles north-east of Hochstet. Though the town is small and ill-built, yet, being near the road from Augsburg, it is pretty much frequented by travellers. All that go up and down the Danube are obliged to land here, and pay a finall toll, which brings the town a great deal of money; as does also the passage of their bridge over that river, (where it receives the Wernitz,) because of the many great towns in its neighbourhood. It is a strong place, which, revolting from the duke of Bavaria in 1420, was made imperial by the emperor Sigismund, and so continued till 1607; when it was put under the ban by the emperor Rodolph II. for embracing the Protestant religion, and afterwards obliged to submit to the duke of Bavaria, who invefted it with a numerous army, took it by capitulation, but, contrary to the terms of it, difarmed the citizens, and put the Jefuits in possedion of the chief Protestant church. The Swedes took it twice in the civil wars of Germany; and by the Munster treaty it was reinstated in its privileges, to the great joy of the Protestant princes and states; though it was restored to Bavaria, by the treaty of Munster; in 1648. It recovered its liberty by the profeription of its elector Maximilian, when he took part with France; but it was restored to him again by the treaty of Rastadt. The river Wernitz, which falls into the Danube here, after receiving the Eger, rifes near a town of the fame name in Franconia.

Schellemberg is famous for the defeat of the French and Bavarians in 1704, when the confederates, chiefly the English and Scots soldiers, forced the trenches, and next day made themselves masters of Donawert. There is a very agreeable prospect from hence, of the towns of Donawert, Hochstet, Newburgh, and Ingolstadt, together with several hamlets and villages, and a fine country on both sides of the Danube.

Lower Bavaria contains Landshut, a town fituated 33 miles north-east of Munich, on the river Ifer. It is well fortified, and had the name, which fignifies the Bulwark of the Country, from Otho of Bavaria; who, when Ratifbon threw off its yoke, and was made a free Imperial city, built a palace here, which his fon enlarged, and, about 1204, added a castle to it. It flands in the richest and pleasantest part of all Bavaria, and is the feat of the elector's deputy, or lieutenant of Lower Bavaria, who has a court here, and feveral officers for the government of the country, which confifts of 6 bailiwicks, 32 market-towns, 14 monasteries, and 74 noblemen's feats, with their dependencies. town is, in general, well built, being formerly much frequented by the nobility, who attended the court, as it is now by the elector's officers. Its principal church, St. Martin's, has a tower which is reckoned the highest in the empire, having a prospect of almost all Bavaria; and therefore it is called Landshut, i. e. the Hat of the Country. The new buildings in the duke's palace are of neat architecture in the Italian tafte. Here is a bridge over the Ifer, and a fuburb on the other fide, called Saldental.

Stadtamhof is exactly opposite to Ratisbon, on the other side of the Danube, both places having a com-

munication by means of a bridge.

Abach, a market town on the Danube, is celebrated for an excellent mineral fpring, the tafte of which is very difagreeable, but the virtues very

great.

The UPPER PALATINATE is fo called to diftinguish it from the Lower, belonging to the elector Pala-tine, to whom this also belonged until about the year 1620, when the elector, affuming the title of king of Bohemia, in opposition to the emperor, it was transferred to the duke of Bavaria, Maximilian I. with the title of elector; both which were confirmed to his family by the treaty of Munster; but on condition, that in case of the failure thereof, they should revert to the Palatine branch. Since this country came to the house of Bavaria the diets have been discontinued. This Palatinate is bounded by a part of Franconia and Swabia on the west, Saxony on the north, and part of Bohemia and the Danube on the fouth, excepting a fmall part of it, which lies on the other fide of that river, being about 60 miles in length, and 40 in breadth, but interfected by the territory of Sulzbach, and the diffrict of Villeck, belonging to Bamberg. Though it is not unfruitful in grain, its chief riches arife from its mines of filver, copper, and iron. The places of note in it are the following:

Amberg, the capital, flanding on the river Vils, 28 miles north of Ratifbon, is the refidence of the governor and regency, contains an electoral palace, with a college, and is well fortified. In its neighbourhood

is an iron mine.

Treswitz, on the Preimb, has a castle, where Frederick, duke of Austria, was confined, when he was taken prisoner by the elector.

Waldfaffen is an abbey of Ciftertian monks, the abbots of which were princes of the empire in former

The bishopric of Treysingen is surrounded by the circle of Bavaria, and its bishop is a prince of the empire. Treysing, on the Iser, is the principal town, containing several convents and churches, a cathedral, a gymnasium, a bishop's palace, &c.

The seigniory of Ehrensels belongs to the elector pa-

The feigniory of Ehrenfels belongs to the elector palatine, who, on its account, has a feat and voice among the counts of the empire and circle; but the elector of Bavaria possesses the same privileges for each of the three Protestant seigniories of Sulzburgh, Pyrbaum, and Breileneck, and the Roman Catholic seigniory of Hoen Waldeck.

The little Protestant county and town of Ortenberg jointly belongs to their own counts; the county of Haog belongs to the elector; the provost of Berchtologaden is a prince of the empire; and the county of Sternstein

belongs to the Lobkowitz family.

The bishopric of Passaw, or Passaw, stands on both sides of the Danube, where it receives the Inn on the one side, and the Iltz on the other. The three rivers above-mentioned divide it into three parts, viz. Passaw itself, on the south side of the Danube, and the west side of the Inn; Instat, on the east side of the Inn, and the south side of the Danube; and Ilstat, on the north side of the Danube, and the banks of the Iltz.

This bishopric was founded in the year 634, by Theodore III. duke of Bavaria; and its diocese extends 20 miles on the north side of the Danube, bordering on Austria and Bohemia. It was commonly given to a younger son of the house of Austria, before the late vast aggrandisement of that house, and yielded near 15,000l. a year before the erection of the bishopric of Vienna. In 1729 the pope made the bishop independent of the metropolis of Saltzburg, and allowed him the pall, to indemnify him, in some fort, for the loss of 69 parishes, 2 abbies, a provossible, and a priory, which were dissumer the properties of Vienna. The chapter consists of 24 canons, who are all of rank.

Paffaw, the capital of the bifhopric, is noted for many meetings and confultations of the German princes, and particularly for the treaty made in it anno 1552, for quieting the troubles of Germany, in the contention between the emperor Charles V. and the proteftant princes; whereby the Lutherans, who were only tolerated before, were now established in the free exercise of their religion. It is a rich, populous, trading city, and naturally ftrong, being fenced on all fides with rocks and rivers; and fo pent in by a mountain, that it runs in a narrow flip at the bottom of it, from east to west, above a mile in length. It is an Imperial free city, but under the pr tection of its archbishop, who is a prince of the empire. The private buildings here are of wood, for which reason it suffered much by a fire in 1661; but it has been rebuilt in the Italian tafte; and the churches are flately, especially the cathedral, which is full of fine tombs, and other monuments, and dedicated to St. Stephen. The bifhop's palace, the chapter-court near it, and the castle on St. Gregory's Hill, near that part of this town called llzstadt, are handsome buildings. The other part, called Inftat, is supposed to have been the Boiodorum of the ancients; and, indeed, the buildings have more of the air of antiquity than those of Passaw. Here are, befides the cathedral, three other chuches, a monaftery, and a handsome college. Without the town there is another church and monastery. The castle was erected in 1219. There is another fort at the bottom of the hill; and they both belong to the bishop. The duke of Bavaria took it in 1704, but foon furrendered it to the Imperialists; and in 1741, it was surprised by the late elector. This is reckoned one of the ten principal cities on the Danube: and the river lkz produces pearls, that belong to the emperor and the elector of Bavaria, each of whom has an officer here to take care of his interests. People here dress in a very brilliant and fumptuous manner.

The landgravate of Leuchtenberg belongs to the elector of Bavaria, who, on account of it, has a feat and voice in the diets of the empire and circle. Leuchtenberg itself is a market town, has a castle defended by a fortress, and gives name to a bailiwick.

The Principalities of Neuburg and Sulzbach lie mostly in the Upper Palatinate. The former princes thereof were branches of the Palatine family. Of the Neuburg branch Philip William became elector; but both

both his fons dying without male iffue, the other branch fucceeded to the palatinate, the duchy of Neuburg, and electoral dignity. Each has a regency of its own, and the inhabitants of both are a mixture of Roman Catholics and Lutherans. In the duchy of Neuberg, the principal places are,

Neuberg, which gives name to it, and is its capital,

Neuberg, which gives name to it, and is its capital, flanding on the Danube, 40 miles north of Munich, and weft of Ratifbon. It is well built and fortified, contains an electroal palace, with a college, and is the feat of the regency.

Hochftadt is a finall town on the Danube, near which, at the village of Blenheim, the duke of Marlborough, and prince Eugene, obtained a fignal victory over the French and Bavarians.

This famous battle is thus elegantly described by the celebrated Addison:

Behold, in awful march, and dread array,
The long extended fquadrons shape their way.
Death, in approaching terrible, imparts
An anxious horror to the bravest hearts;
Yet do their beating breasts demand the strife,
And thirst of glory quells the love of life.
No vulgar fears can British minds controul:
Heat of revenge, and noble pride of foul,
O'erlook the soe, advantag'd by his post,
Lessen his numbers, and contract his host.
Tho' fens and floods posses the middle space,
That, unprovok'd, they would have fear'd to pass,
Nor fens, nor sloods, can stop Britannia's bands,
When her proud foe rang'd on the borders stands.

But oh! my Muse, what numbers wilt thou find, To fing the furious troops in battle join'd? Methinks I hear the drum's tumultuous found The victor's shouts and dying groans confound; The dreadful burst of cannon rend the skies, And all the thunders of the battle rife.
'Twas then great Marlbro's mighty foul was prov'd; That, in the shock of charging hosts, unmov'd Amidst confusion, horror, and despair, Examin'd all the dreadful fcenes of war; In peaceful thought the field of death furvey'd, To fainting fquadrons fent the timely aid; Infpir'd repuls'd battalions to engage, And taught the doubtful battle were to rage. So when an angel, by divine command, With rifing tempefts shakes a guilty land, (Such as of late o'er pale Britannia pass'd,) Calm and ferene, he drives the furious blaft, And, pleas'd th' Almighty's orders to perform, Rides in the whirlwind, and enjoys the storm.

But fee the haughty houthold troops advance, The dread of Europe, and the pride of France: The war's whole are each private foldier knows, And with a gen'rat's love of conquest glows: Proudly he marches on, and, void of fear, Laughs at the shaking of the British spear. Vain insolence! with native freedom brave, The meanest Briton scorns the highest slave; Contempt and sury fire their souls by turns, Each nation's glory in each warrior burns; Each fight, as in his arm the important slay, And all the sate of his great monarch lay. A thousand glorious actions, that might claim Triumphant laurels, and immortal same, Confus d in crowds of glorious actions lie, And troops of heroes undistinguish'd die.

The bishopric of Ratisbon contains 1383 parishes. The chapter consists of 24 canons; and the bishop is a prince of the empire, but suffragan to Saltzburg.

The Imperial city of Ratisbon, 60 miles to the north

The Imperial city of Ratifbon, 60 miles to the north of Munich, is large, populous, and well fortified. The magifracy and burghers are Lutherans; but the greatest part of the inhabitants are Catholics, and have many churches and convents belonging to them. The abbot of St. Emerau, and the abbesses of Upper and Lower No. 73.

Munster, have feats and votes in the diets of the empire and circle, and are affeffed in the matriculas. In the first of these abbies are two curious manuscripts of the gospel, written in the eighth and ninth centuries. In the fame abbey Apollonius, fo diftinguished for his skill in the Greek tongue, was educated? The abbot is exempted from the jurifdiction of the bishop, and stands immediately under the pope. In the female foundations, the lady-abbeffes are elected by the two chapters of ladies, who must be all of noble birth; and though the abbeffes make vows of celibacy, &c. the other ladies may marry. There are two islands in the Danube, near this city, called Oberwerth and Underwerth, i. e. the Upper and Lower Island, which are inhabited by millers, boatmen, and fishermen. Befides the abbies mentioned above, among other reli-gious houses, here is a cloifter for Scotchmen of the Roman Catholic Religion. The city drives a great trade, exporting, by the Danube, Nab, and Regen, large quantities of falt, corn, wood, and provisions of all forts. Over the first of these rivers is a bridge of 15 arches. The diets of the empire have been held in the council-court of this city, almost without interruption, fince the year 1662.

THE CIRCLE OF SWABIA

I S bounded by Switzerland and Tirol to the fouth; by the Palatine and Franconia to the north; by Bavaria to the east; and by Alface to the west. From the two last it is separated by the rivers Rhine and Lech, and by the great lake of Constance from Switzerland. It was once called Allemania, which is now the name of all Germany. The Germans call it Schwaben, and the French Souabe. It had the Latin name Suevia from fome tribes of the Suevi, the best warriors in Germany, that came from the north parts of it: and the greatest part of Germany was called Swabia by the Romans, because the Suevi were the most considerable people they knew, and extended their dominions farthest in that country; but it was afterwards appropriated to the Hermunduri, the most considerable branch of them, who inhabited that part now called Swabia, where they established a powerful state in length of time, which contained all the country betwixt the Rhine, the Alps, and the Elbe; and they called their governors kings; but Clovis, king of France, deprived them of that title; and its governors had afterwards the title of dukes.

The modern Swabians retain the courage of their ancestors the Suevi, and are capable of all the fatigues of war; but both fexes are addicted to fenfuality. Many of them are grossly superstitious; for though the religion, which they profess in general, is Lutheran, yet here are Papists, Calvinists, and Jews; a diversity of religious being almost unavoidable under such a diverfity of fovereigns. In this country, particularly in the duchy of Wurtemburgh, the executioner, or hangman, instead of being deemed infamous, eats, drinks, and traffics with every body, and is company for the beft; and fo far is a man from being abhorred for it, that every fresh execution gives him a title of honour; and when he has performed a certain number, he is complimented with the degree of doctor of physic. At the fame time it is observed, that that very profession which is reckoned the most noble, the most ancient, and the most innocent, the pastoral life, so celebrated by the ancients, and the most ingenious of the European moderns, is not only deficitly derns, is not only despised, but abhorred, by the Swabians; the meanest peasants excluding shepherds from their company. This circle is 130 miles in length, from east to west, and 110 in breadth, from north to The air is healthy, and the foil generally fruitful: for though fome parts are mountainous and woody, yet the hills afford mines of filver, copper, and other metals; and the forests much pine and fir-timber, befides great store of game, and good breeds of horses, black cattle, and sheep. The other parts of the coun-

try yield great store of corn, wine and flax. The inhabitants are chiefly employed in making linen cloth, of which they vend great quantities to other nations. Its chief rivers are the Danube and the Neckar; the former of which rifes in the principality of Furstenberg, and the latter not far from it; but great part of it is also watered by the Rhine.

This country was formerly governed by dukes; but the emperor Henry IV. conferred it on his fon-in-law, Frederick of Hohenstaufen, in whose family it continued till its extinction in 1268. After this period the flewards appointed by the emperor, their deputies, &c. became masters of different parts of it, at various times, and under various pretences. The summoning princes are the bishop of Constance and the duke of Wurtemburg: the latter being, however, fole director, the diets are held twice a year at Ulm; and the states are divided into five benches, viz. ecclefiaftical princes and abbots, temporal princes and abbots, prelates, counts and barons, and free Imperial cities.

The religion is mixed, and, on that account, it nominates two affesfors to the imperial chamber, the one a Lutheran, and the other a Roman Catholic. Danube, Neckar, and Rhine, are the principal rivers; and the different counties and states contained in this

circle are as follow:

That part of the Bishopric of Augsburg which lies towards Tirol, is mountainous and barren; but the parts on the banks of the Lech are fertile in corn and pasture. The bishop himself is a prince of the empire, and fuffragan to the archbishop of Mentz. The principal places in the bishopric are the following:

The imperial city of Augsburg, peopled by a colony planted here by Augustus Cæsar, is fituated near the conflux of the Lech and Wertach, in a pleafant fertile country, at the distance of 25 miles from the Danube. It is well fortified, and has four large and fix small gates. The cathedral is a magnificent pile; befides which there are many other elegant churches, as also several monafteries and nunneries. Of the churches many be-long to the Roman Catholics, and feveral to the Lutherans; for both religions are tolerated, and have a share in the government of the city. In the year 1518 Luther appeared before the diet in this city concerning his doctrine; and, about 12 years subsequent to this affair, Luther and Melancthon drew up and presented their confession of faith to the emperor Charles V. whence the Lutherans are faid to be of the Augsburg confession, though their present creed differs widely from it. Besides the above-mentioned public buildings, here are the finelt town-house in all Germany; many hospitals, well endowed; a Lutheran gymna-fium; an academy for arts and sciences, founded in the year 1755, and called the Imperial Franciscan academy; two well furnished armouries, a house of correction, and a work-house; with several beautiful fountains and refervoirs, whence the city is well supplied with water, brought by aqueducts from the Lech to five towers, and from thence, by means of curious water-works, distributed throughout it. There are several corn, fawing, flatting, and finelting mills on the aqueducts. The palaces of the counts of Fuggar are magnificent. To these counts belong a great number of small houses in the suburbs, called the Fuggery, which are let, at very low rents, to poor burghers, and others. The trade of the city, though ftill confiderable, is far fhort of what it was formerly. At present, exclusive of the bank commerce, and the Tirol wines, with which it supplies almost all Germany, it confifts chiefly in gold and filver-fmiths wares, and those of tin and ivory, clocks and toys. The government of the city is almost entirely in the hands of the patricians. The bishop however, has certain powers and prerogatives in it. The revenue of the city is very confiderable, and its garrifon confifts of 300 In the council-house are some very noble halls, which, with the other apartments, are adorned with fine pictures, sculptures, statues, gilding, &c. Of

the fountains, the most beautiful are those of Augustus and Hercules. Betwixt the gates of Gogging and Klenker, is a very curious wicket for admitting proper persons in the night-time. In the cathedral are several chancels; and the arms of all the countries possessed by Charles V. who here laid up his sword, ftandard, fceptre, and crown, when he bid adieu to this world, and retired to a convent. In the library belonging to the gymnafium are fome curious books and manufcripts. The abbot of the Benedictine abbey of St. Ulrich and Afra, in this city, has a feat among the prelates of the Rhine, and pays the usual taxes to the empire. The revenue of the abbey is very confiderable. This abbey is a privileged place for debtors and criminals for three days, but no longer, without the abbot's permission. In the convent of the Carmelites is a remarkable fun-dial, being a Madona, whose hands holds a sceptre, marking the hours; and whose head is enriched with rays, stars, and all the figns of the zodiac. The public granaries contain great quantities of corn. In one of the arfenals is an old battering-ram of brass, still preserved entire. All orders and degrees of persons here are distinguished by their proper dreffes, fome of which are very odd and uncommon. Prints of them all, done on pasteboard, are fold in the town. The hospital of the Holy Ghost is a very noble one, and patients of both religions are admitted into it. The inn, called the Three Kings, is very commodious. Neither Jews or Calvinists have a toleration for their worship here. As an Imperial city, Augsburg has a feat and vote in the diets of the empire and circle.

The Bishopric of Constance takes its name from the city of Constance; though the bishop himself resides usually on the other fide of the lake, at Marsburgh. The chapter confifts of 20 canons, and four expectants; but the Protestant religion prevails in most parts of the

diocefe.

The city of Constance, situated on a celebrated lake of the same name, was formerly Imperial; but in the year 1549, Ferdinand I. annexed it to the territories of the house of Austria. It is well fortified, the see of a bishop, and has been the feat of several diets. The famous affembly, known by the name of the Council of Constance, was held here by order of the emperor Sigifmund, at a time the empire was distracted by religious disputes, and by the feuds raised by three popes, all then living, viz. one fet up by Italy, another by France, and a third by Spain. But this council deposed them all, and elected Martin V. in their stead. likewife condemned the doctrines of Wickliff, John Huss, and Jerom of Prague; ordering the sepulchre of the first to be despoiled, and the two latter to be burnt alive. This council continued sitting four years, during which time a vast number of foreigners resided in and near Constance. A considerable trade is carried on here by means of the lake, and the Rhine which runs from it; but the chief tribunal is held at Altorf, a neighbouring market-town.

The other places are Mariburgh, a pretty town; Ochumgen, containing an opulent abbey; and Reichenau, a Benedictine abbey, on an island of the same

name, in the Zellerzee.

The priory of Ewangen, on the borders of Franconia, gives its prior the title of prince of the empire; and the town of the same name is the place of residence of the prior and chapter.

Kempton is an imperial town, containing an abbey, the abbot of which is a prince of the empire; and the abbey lands contain a market-town, called Gronenbach.

The Duchy of WURTEMBURG is the principal dominion of the circle of Swahia, and is nearly fquare, being upwards of 60 miles each way. One divition of it is into the Unter, or Under-land, the Middle-land, and the Upper-land; the last of which makes a part of the mountainous track called the Alb, and Black Forest. It is also divided into the land above and below the Steig, which is the name of a ridge of

mountains near Stutgard. This duchy not only abounds in grain of most forts, but also in slaw, hemp, and good wine, commonly called Neckar wine, and fruit, especially pears and apples; insomuch, that cyder and perry are the common drink of the peafants, when wine happens to be dear. In this country are also mines of filver, copper, and iron; woods of fir, oak, beech, birch, and pine; fome falt fprings; abundance of sheep, game, and cattle; coal, turf, cobalt, fulphur, terra figillata, fine clays for porcelain and earthen ware, feveral forts of marble, black amber, alabafter, mill-ftones, mineral fprings and baths. Silk is also cultivated in it. It is well watered by the Neckar, the Ens, Nagold, Fils, and Rems. The inhabitants are very numerous. On important occafions, diets are called and held at Stutgard, confifting of the Lutheran prelates and abbots, and the repre-The established religion fentatives of the towns. is Lutheranism. Before the reformation there was about twelve very rich convents in this country, whose revenues are now chiefly applied to the maintenance of churches, schools and the clergy. Besides Lutherans, here are some Calvinists, Waldenses, and Jews. The Waldenses are allowed the public exercise of their religion; but the others only in private. The principal manufactures of the country are porcelain, earthenware, linens, woollens, printed cottons, glass, paper, hats, stockings, filks, &c.

The princes of Wurtemburgh had long only the title of counts, the dignity of duke having been first conferred upon Eberhard I. in the year 1495, by the emperor Maximilian; and the right of primogeniture was eftablished in the family in the year 1473. There is a branch of it fettled in Silefia, which, from the duchy of Oels, has the title of duke of Wurtemburg Oels. The duke's title is, "Duke of Wurtemburg and Teck, count of Mompelgard, lord of Heydenheim and Jut-tingen." He is hereditary standard-bearer of the empire, and grand-huntfman; in allufion to the last of which, the order of hunting was founded here in 1702. The enfign of that order is a gold cross, enamelled red, appended to a broad watered fearlet ribbon, paffing from the left shoulder to the right side. On the left breast of the coat is a filver star embroidered. Their grand festival is on St. Hubert's day. As a prince of the empire, the duke has a feat and voice in the college of princes at the diets, paying the usual affeffments to the empire and Imperial chamber, and is summoning prince and director of this circle. Causes are determined here in the last refort, no appeal lying from the court-judicature to the aulic council, or any foreign tribunal. The revenues of the duchy are very large, The duke has a great number of hunting feats. So numerous are the deer and wild boars, that a writer of credit fays, " Above 20,000 head perished in the winters of 1731 and 1732, by the feverity of the weather." is no wonder they multiply fast, as no person, on pain of death, dare offer to wound or kill them, unless at the duke's hunting matches; fo that the poor peafants, near the forests, are obliged, in summer, to keep a conflant look out, and to be continually watching their flocks and corn fields. A very ancient custom prevails through the whole duchy, of adorning their apartments with deer's horns.

Stutgard, the capital of the duchy, is 38 miles east of Baden. Some derive the name from its being anciently a flud for breeding horses; and the arms of the city are a colt. It stands in a fruitful plain, has several fine gardens and vineyards about it, and is encompassed with very high hitls and vallies. It has three fuburbs, five gates, three churches, and is divided into two parts by the Neckar, over which it has a bridge. It is pretty large; but most of the houses are low, and ill-built. The streets are broad and lightsome, but dirty; yet the town is gay, being much frequented on ac-count of its natural hot baths, which are good for many difeases. The duke's castle, or palace, is a noble freestone fabric, well fortified, composed of four piles of

buildings, flanked at each angle by a tower, and adorned with elegant groves and gardens, an orangery which is fcarce to be paralleled, curious labyrinths, grottos, and water works, and a stately pleasure-house; but the walls of the castle are washed by ditches, which give it the air of a prison. There are, however, several grand rooms in it; one, particularly, where the duke's gentlemen dine, and where tables are fometimes fpread for 2 or 300 foreigners. There is a bridge over its moat to the duke's gardens; and near it an aviary, with all manner of birds. In the moat is not only plenty of fish, but fwans, and other water-fowl; and that part of it which is dry, facing the gardens, harbours feveral deer. Near the gardens is a theatre; and beyond that a large court covered with fand, for tilting on horseback, and running of the ring. fore the entrance to the castle there is a grand building, which is the duke's chancery, or fecretary's office. The duke has a tolerable collection of antiques, bufts, and baffo-relievos: but the piece that most deserves attention is the Jupiter Dolichenus, brought hither from Marfeilles by the celebrated antiquary Patin; it being a representation of that deity in armour, standing on the crupper of an ox, just in the same attitude as he is copied from this original in the antiquities of Montfaucon. Here are abundance of urns, lamps, little lares or househould gods, and ancient coins, both of filver and gold, with shells, petrifactions, fossils, the caprices of nature, both in wood and stone, exotic plants, monstrous productions, the exuviæ of animals, &c. besides the dresses and weapons used in the most remote countries. The hall is a most spacious room, finely adorned, in fresco, with representations of vari-ous huntings; in each of which pieces the duke of Wurtemburg may be distinguished, with the princes and princesses of his family, in whose time they were performed. There is an arienal, in which appears a feries of the dukes of Wurtemburg on barbed horses, richly armed, and accoutred after the fashion of the age they lived in, as large as the life, and the name and eulogium of every one fet forth on the opposite wall: which is graced also with standards, and other trophies, gained by the dukes in their feveral actions; particularly the fkin of a favourite horse, killed under that duke who commanded under prince Eugene and the duke of Marlborough, at the battle of Hochflet. On the cieling of this arfenal are fome noble reprefentations of battles wherein fome of the ancient dukes of Wurtemburg loft their lives in the fervice of their country, under the emperors of the Saxon and Swabian race.

Ludwigfburg, about three miles from Stutgard, is the feat of a palace built by the duke Eberhard-Lewis, in a place remote from any river, great roads, or forefts. It is fo ill contrived, that it looks more like an orangery than the palace of a fovereign, the apartments being too fmall and inconvenient, as well as irregular; yet no cost has been spared to adorn them with carving, gliding and painting; though with more profusion than judgment. The furniture also is rich, but as ab-surd as the fabric. The best thing in the whole palace is the chapel, a fine noble structure. In the gardens there are feveral terraces, which, rifing one above another, entirely bound the prospect of the palace, which is encompassed by buttresses that also cramp the apart-The town is as irregular as the palace, and in no respect agreeable; for the situation of it is upon uneven ground; and most of the houses are of timber, and flightly built, having been run up out of necessity.

Tubingen lies on the Neckar, and has a castle near it on a hill. Here is held the high court, in which all causes are finally determined. At this place are an university, a seminary of divines, with a collegium illustre, the students of which must be all princes or counts, a Latin school, and a woollen manufactory. In the neighbourhood is a medicinal bath.

Canstadt, on the Neckar, has, in its neighbourhood, an excellent mineral, and feveral falt-springs. In the

elector o

town is a cotton printing-house; and, in an adjacent village, a filk manufactory. At no great distance is the ancient family seat of Wurtemburg, which gave name to the duchy; and in its vicinity the ancient counts held

their courts in the open air.

Urach, a little town on the Alb, near the river Erms, contains a ducal feat, with a linen manufactory. In the neighbourhood are mills for lead, iron, and copper; and in the diffrict to which it gives name, fome fine fluds of horfes; a beautiful white earth; and that called the Holzrutfehe, which is a large iron pipe, into which the wood, felled on the Alb, being put, is conveyed, in an inflant, from the top of a mountain into the river Erms, and by that into the Neckar, which brings it to Berg near Stutgard.

The Lordship of New Ravensburgh, on the Argen, belongs to the abbey of St. Gall, in Switzerland, though it pays taxes to the circle.

it pays taxes to the circle.

The Benedictine Abbey of Ottobeuren is the richest

in all Swabia.

The Roman Catholic Imperial towns of Offenburg, on the river Kenzing, of Gengenbach, on the fame river, and of Zell-Am-Hammersbach, about four miles from the latter, are in league with each other mutually, to support their common privileges.

The following imperial towns all pay taxes to the empire; but the religion of the inhabitants is different,

as may be feen by the following table:

Name.	Religion.	Situated on
Buchau	Mixed	The Federfee River
Bopfingen	Lutheran	Eger
Aalen	Calvinist	Kocher

The Imperial town of Minmingen stands on the Aach, a small river, betwixt the Her and the Danube, 20 miles north of Kempten. The Magistracy is Lutheran; but the inhabitants are partly Lutherans, and partly Roman Catholics. Here are feveral religious houses. Mimmingen was an Imperial city so early as the days of Frederick I. and now enjoys great privileges; in particular, an exemption from the jurisdiction of the tribunal of Rothweil. A good trade is carried on by it with Switzerland, Italy, and other countries adjacent, in hops, Bavarian falt, grain, cotton-stuffs, and paper. The town is pretty well fortified, and almost as large as Ulm, but not fo populous or well built. In its diffrict, which is confiderable, are manufactories of brass, pewter, wire, and porcelain, together with a warm bath, a chalybeate spring, and a free huntingground, in which the feveral neighbouring lordships enjoy an unlimited privilege of hunting; but the jurifdiction belongs to the town of Mimmingen. In the same district is found terra figillata.

Gemund, on the frontiers of the county of Hohenrechberg, is the capital of the county of Rechberg. It has its name from the conflux of a great many brooks here into the river Rems; and the neighbour-

hood is called Remsthal, or the Valley of Rems. This river falls into the Neckar five miles below Stutgard, The town was of note formerly for tournaments held here by the nobility of Swabia, and was subject to its dukes, one of whom caused it to be encompassed with a wall. Frederick I. made it Imperial in 1186; and the emperors Cornrade III. and Frederick Barbarossa, enlarged and granted it many privileges. M. Villars encamped here with the French army in 1707, and raised contributions far and near. It is a Roman Catholic town, with five churches, two chapels, and several convents; and the principal trade is in its beads, which the inhabitants send abroad. It was formerly governed by persons of quality, but now the power is in the burghers.

Halle stands among steep rocks and mountains, on the river Kocher, in the county of Oetingen, and on the frontiers of Franconia. It depended formerly on the dukes of Wurtemburg, but was made Imperial by Charles IV. in 1360. This town has plenty of fresh water; but it owes its rife to its spring of salt, which, though not so white or piquant as other salt, is carried to Nuremberg. There is a bridge here over the

river to its fuburb.

Rothweil is a fmall Imperial city, 20 miles fouth from Tubingen. It is the feat of a chamber, or court of justice, for the whole duchy, first erected, anno 1147, by Conrade III. duke of Swapia, who made it a free city. It was taken by the French in 1643, when they were in alliance with the Protestants of the empire, but restored at the treaty of Munster. It was again seized by the French, under M. Villars, in 1703, after he had paffed the Black Forest, at the end of which it stands; but they were foon obliged to quit it. It is in the territory of Hegow, and the head of a county called Hohenberg, under the protection of the house of Auftria; but it is in league with the Switzers, it being but five miles from Schaffhausen, and not far from the Da-It is fortified after the ancient manner, and encompassed with broad deep ditch's. In 1338 this town was almost burnt down by lightening.

The counties and lordships of the noble family of the Truches, the lordship of Tetnaug, the commanderies belonging to the Teutonic order, the abbies of Baindt, Gutenzell, Rothmunster, Heggbach, Gengenbach, Zwisalten, Marchthall, Peterhausen, and the priory of Wettenhausen, all give their proprietors voices and seats in the diets of the empire, circle, &c.

Ulm, a name thought to be derived from the groves of elms near it, and fupposed to be the Alcimenis of Ptolemy, is an imperial city, 17 miles west of Burgaw, and South of Wurtzburgh. It stands on the west side of the Danube, which here begins to be navigable, after having received the united streams of the Lauter and Blaw, opposite to the mouth of the Iler, and forms feveral little islands before the town. In Charlemagne's time it was but a little village, of which he made a grant to the abbey of Richenaw, near Constance. It was ruined by the emperor Lotharius II. during his war with his rivals for the empire, because it refused to open its gates to him, though he had granted many privileges; but it was rebuilt, and encompassed with walls, about the year 1300; and its inhabitants enriching themfelves by trade, it grew to be a handsome large town. In 1346 the emperor Frederick II. granted it many privileges. The inhabitants having purchased their freedom from the abbey of Richenaw, the emperor Lewis of Bavaria made their city Imperial. They are governed by 41 eschevins, most of whom are of the nobleffe, and the rest tradefmen; and they chuse two bailiffs annually out of the former, who prefide in Here are four burgomafters, who enter their council. on the offices every year alternately. Seven of the oldest members make the secret council, and execute the laws. All the magistrates, as well as most of the inhabitants, are Lutherans; the Protestant having been the prevailing religion here ever fince 1531. The Roman Catholics have 2 churches, and are excluded from

the public offices, as well as their privy council. The elector of Bavaria basely surprised this city for the French in 1702; and they kept it till after the battle of Hochster, when it surrendered to the Imperialists. It was a very necessary place for him to secure his do-minions on that side, and to facilitate the passage of the French to join his army. It is a great and po lous city, with regular fortifications, and wide deep ditches, filled by the waters of the Danube and the Blaw; but it is fo fituated that it would not be able to fustain a long fiege. It has a bridge of stone, of four arches, over the Danube, the entrance of which is defended by fortifications; and there is a little fuburb of pleafure-houses, and large gardens. There are in the city two fquares, in the largest of which is the townhouse, a stately building, where the fenate meets. At one end of the town there is an arfenal, from which the French carried off all the arms, &c. that were in it, before the battle of Hochstet. The river Blaw turns mills for feveral occupations; there being a great number of hands employed in the manufactories of stuffs, linen, cotton, and fustians; in dreffing leather; and in the iron, and other manufactories, as well as clockwork; by which this is become one of the richest cities in Germany.

The cathedral of Our Lady, now belonging to the Lutherans, which is 365 feet in length, is reckoned the longest, highest, and best built in the country; and, by some, the finest in the empire. This church has 5 stately spires; one of them 102 feet high, supported by 36 handsome pillars. It has a large square tower, with a watch always at the top of it, to give notice to the city of any approaching danger from the country. The organ is a finished piece of art, of extraordinary height, weight, and dimensions. The tabernacle is a very fine, though Gothic piece of work, of a fingular kind of marble, and ornamented with abundance of statues. They keep, to this day, the picture of the Last Supper, which was put up above the great altar before the reformation. The benches in the choir are adorned with historical passages of the Bible in sculpture, Befides this, the Lutherans have two other churches. This place may boast of giving birth to Freinsheim, so much respected for his great learning by the whole world; and particularly by Christina, queen of Sweden, who made him her librarian and historiographer. Its territory is near as large as that of Nuremburg, being fix German leagues in length, and four in breadth. It is almost environed by the duchy of Wurtemburg, except on the fouth and east sides, where it is bounded by the Danube; and is divided into 40 bailiwicks and lordships, of which that of Geislingen comprehends the greatest part of the county of Helsenstein, which, with other counties and towns, were purchased by this city foon after it was made Imperial. The garrifon lives here in little houses fet apart for it. In time of war it is maintained by the empire; and this city furnishes a quota equal to that of Augsburg. There was a great Franciscan monastery here, the revenues of which were appropriated, at the reformation, to a college, where they have professors in all arts and

Olm is fituated in one of the most fertile plains in Swabia; though it has been almost ruined by the feveral wars in this country. This city, before those wars, was fo rich, that it passed for one of the wealthieft in the empire; and the Germans had a proverb, that "The ready cash of Ulm, the neatness of Augsburg, the industry of Nuremburg, and the arfenal of Strafburg, were the four wonders of Germany." archives of all the free cities of the circle of Swabia are kept at Ulm, where their meetings are also held by turns with the city of Spires. Though all the country from hence to Augsburg is even, yet it is tiresome to travellers, because of the pavement of the causeways.

The Imperial Abbies of Schuffenried, Weiffenau, Roth, Raggerburg, Kayfersheim, Ursperg, Yrsee, Elchingen, Ochsenhausen, and Salmanswell, entitle No. 74 their abbots, or proprietors, to voices and feats in the diets; as do the Principality of Lichenstein, and

princely Landgravate of Kletgau.

Bakben, or Baden, fituated along the castern banks of the Rhine, is divided between two princes of the same family, who receive title from their respective capitals; the one being styled the Margrave of Baaden-Balden, and the other of Baaden-Durlach. The share of the former, as lying fouth of the other, is distinguished by the name of the Upper; and that of the latter by the name of the Lower Margravate, or Marchifate. The right of primogenitureship hath been long introduced into both these branches. The whole county is near 60 miles long, and 20 broad, and lies betwen the duchy of Wurtemburg and Brifgau. It is fruitful in corn, wine, hemp, flax, and wood; abounding, in particular, with chefnut-trees. There are also many quarries of marble and free-stone in it; large herds of fwine; plenty of fifh, fowl and venifon; and the baths and mineral fprings are fo common, that the chief towns of both marquilates have their names from them. Both princes exercise an absolute authority in their dominions, excepting so far as it is limited by the laws of the empire, and lay taxes on their subjects without assembling any states. The Upper Margravate, or that of Baaden Basten, is bounded by the Rhine, the Lower Margravate, the duchy of Wurtemburg, the county of Eberstein, and the Ortenau. Other estates belonging to the margrave are the lordthip of Mahlberg, lying between the Ortenau and Britgau; the county of Eberstein; a confiderable part of the county of Sponheim; two manors in the lordship of Graffenstein, and one in the duchy of Luxem-burg, with several baronies in Bohemia. The mar-The margrave votes in the college of princes both in the diets of the empire and circle. His annual revenue amounts to about four hundred thousand florins. As to religion, both the margrave and his fubjects are Roman Catholics. The following are the principal places in the country.

Rastadt, where the princes reside in a magnificent castle, in which were settled the preliminaries of the beace concluded at Baden betwixt the emperor and France, in 1714. The town, which is not large, and belonged formerly to the counts of Eberstein, stands in a fine plain on the river Murg, which a little below falls into the Rhine. Not far from it is a palace of the margrave's, called the Favourita.

Baaden derives its name from its hot baths, impregnated with falt, allum, and fulphur, and which give relief in the cramp, gout, and other nervous diftempers. The town is pleafantly fituated among vineyards, and contains a palace of the margrave's.

Stolhoffen, fituate not far from the Rhine, five miles fouth-west of Baaden, is famous for the lines cast up here in the war for the Spanish succession, to guard the empire against the French, who were repulsed when they attacked them in 1703; but, in 1707, they forced them, and raifed vast contributions in the adjacent country. Near the town is a Benedictine abbey.

Kehl gives name to a district, containing the noted fortress called, from the village, fort Kehl. The fort, fo called, first stood at the east end of the bridge over the Rhine, at Strafburg; but was afterwards built at the conflux of the Kenzig and Rhine, and is now in a ruinous condition.

The lower marquifate of Baden, fo called with regard to the course of the Rhine, viz. that of Baden-Durlach, or Deurlach, is contiguous to the marquifate of Baden on the north-east; and has the duchy of Wurtemburg on the eaft; the Rhine, which separates it from Alface, on the west; and part of the Lower Palatinate, and the bishopric of Spire, on the north. The places of note here are Durlach, its capital, a pretty large town, which lies on the banks of the Pfintz, or Phints, at the foot of a mountain, on the top of which there is a strong tower, with a constant guard. The marquis has a magnificent palace here, far exceeding that of Baaden, a good library, and a fine collection of ancient

coins and medals. The streets are strait, and the houses stately and uniform. Here is also a gymnasium, with professors of the several faculties. The town and palace suffered much in the different wars with the French, who, in 1689, burnt them; fo that the Protestant cantons thought, fit to affift its prince, who was a Lutheran, with contributions for repairing the Protestant churches, which the French ruined in this country; and he himself gave large immunities to such foreign Pro-

testants as would settle in this capital.

Carlfrube has a castle and palace, both built by the marquis Charles-William, who gave it the name, signifying Charles's Rest. It is thus described by an eminent traveller: "Imagine the margrave's house (fays he) to be at the entrance of a great forest, in the centre of a flar, formed by 32 walks, the chief of which, behind the palace, is three German leagues in length. Two large wings advance from the main body of the house, which deviating from each other in proportion as they lengthen, the whole, together, looks like a theatre. Behind the principal building is a very high octagon tower, which commands all the walks. the court, between the two wings, are the gardens and parterres; at the end of which there is a femicircle of houses of an equal height, built archways, between which there run five streets, the middlemost whereof fronts the palace. At the end of the three chief streets, opposite to the palace, are three churches, one belonging to the Lutherans, another to the Calvinists, and a third to the Roman Catholics; to which three prevailing religions of the empire the late margrave gave equal liberty of conscience when he founded the new

town.
"The pheafant-walk, which joins to the caftle, is a very large enclosure, disposed in various walks, and a great bason in the centre, always full of wild ducks, which is encompassed with four pavilions, made in the form of Turkish tents. Two of them are aviaries, and the other two fummer-houses, with fofas and couches in them after the manner of the eaftern countries. The late margrave used to divert himself by playing in concerts with fome young ladies, whom he taught music. He had no less than 60 waiting-women to attend him, though but 8 waited upon one day; and these, when he went abroad, attended him on horse-back, dressed like hussars. The generality of these damsels, who had all lodgings in the palace, understood both music and dancing; and not only performed operas at the theatre of the palace, but were muficians of the chapel.'

The territories of the prince of Hohenzollorn are 34 miles long, 10 broad, and tolerably fertile, being watered by the Danube, Eyach, Starzell, &cc. They do not contain any remarkable town; but the prince is hereditary chamberlain of the holy Roman empire.

The abbess of Lindau, and the abbess of Buchau, have both feats and voices in the diets of the empire and

circle, as hath the prince of Theugen.

The county of OETTINGEN lies east of the duchy of Wurtemburg, in the north-east corner of the circle, and extends about 18 miles in length, and 12 in breadth. The principal river in it is the Wernitz. The lords of this county are divided into three lines, viz. that of the Oettingen-Spielberg, who are princes of the empire, but have no feat or vote in the college of princes thereof; and those of Oettingen-Wallerstein, and Oettingen-Katzenstein-Baldern. In the diet of the empire they belong to the college of Swabian counts; but in that of the circle the princely line has a feat and vote on the bench of lay princes; and the others on the bench of counts and barons. The subjects of these princes are partly Roman-Catholics and partly Lutherans; but the princes themselves are all Roman-Catholics. The only place in the county worth mentioning is Oettingen, a town on the Wernitz, whence the county takes its name, and wherethe prince of Oettingen-Spielberg refides. Here is also a commandery of the

Teutonic order, a large college, and a fociety for the improvement of arts and sciences. The bailiwick, to which the town gives name, with four others, belong to the same prince.

SECTION III.

Perfons, Dispositions, Population, Subordination, and Diversions of the Germans in general.

OTWITHSTANDING we have been unavoidably led, in our deforiories ably led, in our description of the respective states of which this extensive empire is composed, to introduce feveral particulars relative to the manners, customs, &c. of the various inhabitants, we deem it necessary to bring the whole into one point of view, or, in other words to characterize the Germans in general. The Germans are of a good stature, with fair complexions and agreeable features; but neither their shape or mien are to be admired, any more than the brightness of their parts, which are not at all improved by their regimen or way of life; for no people eat and drink to greater excess. Germany, however, has produced great men; a circumstance which may proceed from their unwearied application to whatever they undertake, and their travelling to other countries: and it is no wonder it produces great generals, being perpe-tually engaged in wars, either with the Christian princes, their neighbours, or the Turks. The Germans are, upon the whole, an honest, hospitable people, free from artifice and difguife. A modern author, in his character of the Germans, fays, " That they want spirit to actuate their large bodies, and heat to concoct their phlegmatic humour: that their courage appears from the many victories they have gained over the Infidels: that they are free from malice and diffimulation, much addicted to gluttony and drunkenness, but not over amorous: that the common people are laborious and honest, but flow and heavy: that the merchants and tradefinen are very fair in their dealings, hospitable, and complaifant: that the nobility are men of great honour, and commonly scholars: that they value themselves much upon their birth and family: that most of the princes being poor, their younger fons generally engage in the fervice of the emperor, the electors, or some foreign state; or procure themselves some of the rich ecclefiaftical preferments, which are fo numerous in the Roman Catholic states: that the Protestant clergy are learned, and exemplary in their deportment; but the Popish ignorant and libertine; and no people have more feating at marriages, funerals, and birthdays: that the Germans have excellent mechanic geniuses, &c."

The number of the inhabitants of Germany can only be determined with probability. It is, in general, populous; and, in that respect, has rather the superiority over France; for which it would be more than a match, if it was united under one head. The inhabitants are computed at about 24 millions; and if they do not make fo great a figure abroad as the French, they are probably more happy at home, as they have more liberty, and live in greater plenty. Few of the territo-ries of the German princes are so large as to be affigned to viceroys, who might oppress and fleece the people at pleasure; nor are they without redress. When they fuffer any grievance, they may appeal to the general diet, or great councils of the empire, for relief; whereas, in France, the lives and fortunes of the fubects are entirely at the disposal of the Grand Monarch. The subjects of the petty princes in Germany are generally the most unhappy; for these princes, affecting the grandeur and splendor of the more powerful, in the number and appearance of their officers and domestics, in their palaces, gardens, pictures, curiofities, guards, furniture, drefs, mufic, &c. &c. fleece their tenants, vasfals, and dependants, in order to support all this parade. In fome places, however, the burghers and peafants enjoy very, confiderable privileges.

The principal divertions of the Germans, in general, but more particularly those of Vienna, are feathing, dancing, fencing, gaming, and musical entertainments; for the latter of which they preserve an immoderate paffion. In the winter feafon, when the ground is covered with fnow, and the waters are frozen over, the ladies take their recreation in fledges, of various shapes and devices, such as swans, scollop-shells, tigers, griffins, &c. In one of those a lady fits, richly dreffed in velvet, laced with gold or filver, lined with furs, adorned with jewels, &c. A gentleman shews his gallantry by driving her; and the horse that draws the fledge is decorated with plumes of feathers, ribbons, bells, &c. When this amusement is taken at night, a fervant rides before the fledge with a lighted torch in his hand. Hunting of game, bull-hunting, and boarhunting, are favourite diversions.

The diversions for the common people are such as feem hardly fit for a civilized and polished nation to allow; particularly the combats, as they are called, or baiting of wild beasts, which is much more savage and

ferocious than our bull-baiting.

The most exact description we can give of these di-

versions, will be literally to translate a hand-bill, as distributed through the streets on Sundays and festivals.—
It runs thus.—

"This day, by Imperial licence, in the great amphitheatre, at five o'clock, will begin the following diversions:

"1ft. A wild Hungarian ox, in full fire, (that is, with fire under his tail, and crackers fastened to his ears and horns, and to other parts of his body,) will be fet upon by dogs.

"2d. A wild boar will, in the fame manner, be baited by dogs.

" 3d. A great bear will, immediately after, be torn by dogs.

"4th. A wolf will be hunted by dogs of the fleet-

" 5th. A very furious and enraged wild bull from Hungary will be attacked by fierce and hungry dogs.
" 6th. A fresh bear will be attacked by hounds,

"7th. A fierce wild boar, just caught, will be baited, for the first time, by dogs, defended with iron armour.

" 8th. A beautiful African tiger.

" oth. This will be changed for a bear.

" toth. A fresh and fierce Hungarian ox.

"11th. And lastly, a furious and hungry bear, which has had no food for eight days, will attack a young wild bull, and eat him alive upon the spot; and if he is unable to complete the business, a wolf will be ready to help him."

These barbarous spectacles are usually attended by two or three thousand people, among whom are a great

number of ladies!

SECTION IV.

Commerce, Exports, Imports, Mechanism, Privilege of Coining, Standard of the Coin, and Language.

THIS very extensive country being bordered by the German Ocean, Baltic, Gulph of Venice, &c. and intersected by many navigable rivers, is admirably fituated for commerce. The exports are corn, horses, cattle, tobacco, butter, cheese, honey, syrup, wine, linen, woollen-stuffs, yarn, ribbons, silk and cotton stuffs, Nuremburg wares, goat-skins, wool, all forts of wood, particularly for ship-building, iron plates and stoves, cannon, ball, bombs, granadoes, tin plates, steel work, copper, brass wire, porcelain, earthen ware, mirrors, glasses, beer, Brunswic mum, tartar, smalt, zaffer, Prussian blue, hogs-bristles, printers ink, and many other commodities. The French buy up great numbers of horses in Germany to remount their cavalry. Towards the middle of the 13th century, several towns

upon the German Ocean and the Baltic entered into a league for the security and promotion of their trade and navigation, and were therefore called Hans-Towns. Though this league hath long fince ceased to operate in regard to several of these towns, in consequence of the decay of their trade, yet Hamburg, Lubeck, and Bremen, are still called the Hans-Towns; and a league actually subsists between them, under the name of which they conclude treaties of commerce with foreign powers. Hamburg is the chief town of trade in Germany; and next to it are Frankfort on the Maine, Nuremburg, Augsburg, Vienna, Fiume, and Trieste: which last is a free port. There are great annual fairs at some towns in the empire, as at Frankfort on the Maine, at Leipfic, at Brunswic, Frankfort on the Oder. Naumberg, and Mentz. A new trading company to Asia was established at Embden, by the late king of Prussia, in 1750. The imports of the Germans consist of a great variety of articles. In particular from England they import woollen manufactures, tobacco, fugar, ginger, East-India goods, tin, and lead: but several of the German princes having prohibited some particular forts, and others all our woollen manufactures, the balance of trade is much against us with Germany.

The genius of the Germans hath appeared in the invention and improvement of many mechanical arts, especially clock work. They have exceeded all the world in the contrivance of a variety of motions, to shew not only the course of the hours and minutes, but even of the sun, moon, and stars; whereof the clocks at Strasburg, Prague, and many other places all over Germany, are sufficient instances. The emperor Charles V. had a watch in the jewel of his ring; and in the elector of Saxony's stable is to be seen a clock in the pomel of his faddle.

The Germans claim the invention of the art of printing. The Dutch fay, indeed, that Laurence Coster, of Haarlem, found out the art by accident, and had brought it to some perfection, but was robbed of his materials by a servant, who sted with them to Germany: but the Germans alledge, that John Gottenburg, an alderman of Strasburg, sirft invented it in the year 1440, removed with it to Mentz, and printed several books, in which he made use of cast letters of metal, in the same manner as is now used.

The invention of guns is also said to be theirs, which was likewise produced by an accident, in this manner: one Barthold Schwartz, a friar, making chymical experiments, mixed fome falt-petre and brimftone, with other ingredients, and fet them upon the fire in a crucible; but a spark getting in, the pot suddenly broke with great violence and noise; which unexpected effect surprised him at first; but he repeated the experiment, and finding the effect constant, set himself at work to improve it. To this purpose he caused an iron pipe to be made, with a small hole at the lower end to fire it at, and putting in fome of his new ingredients, together with some small stones, set fireto it, and found it answered his expectation, in penetrating all before it. This happened about the year 1330, and was foon improved to the making of great ordnance, &c. But a celebrated writer, in his Natural History of Oxfordshire, is of opinion, that it was invented 100 years before, by Roger Bacon, a Franciscan friar, who was fellow of Merton college in Oxford; and an eminent professor, in his notes on that friar's epistle Ad Pari-fiensem, is of the same opinion.

To these inventions of the Germans we may add their improvement of the art of chymistry; which, being brought hither by Albertus Magnus, was very much studied by the Monks, and much time lost by them, in the search of the philosopher's stone, and the study of the Rosicrucian philosophy.

The emperor, electors, many princes and prelates of the empire, and of the Imperial cities, several towns, some of the gentry who are favoured by the emperor, and all such as have gold and silver mines, enjoy

the privilege of coining money as far as the quantity they yield. Some, however, have the privilege of coining only fmall money; but others a larger species, either of filver or gold. But there are only three or four mints allowed in each circle, unless an estate of the empire has mines of its own, and wants to erect a mint near it. By the laws of the empire the coin of each circle ought to be examined yearly, and all the money of the empire ought to be according to one and the same flandard, which at prefent is that of Leipsic. The money of most nations in Europe goes here near its value. The most common German silver coin is a rix-dollar, which is worth about 4s. 6d. but in some places only 3s. 6d. A German florin, or guilder, is worth generally about half a crown; and a gold ducat about 9s. A crown, in specie, is equal to an English crown; but a crown current only to 3s. 6d. The German coin, in general, is neither true sterling or due weight; being more clipt, it is thought, than any other coin in Europe. This, with the great variety of money that is current here, is no small disadvantage to trade, and finks also the value of estates. A German mark is 1s. 6d.

The language of the Germans is High Dutch, of which there are so many dialects, that the people of one province scarce understand those of another. Latin and French are the most useful languages for a foreigner travelling in Germany, every servant almost in their inns understanding something either of the one or other of them. High and Low Dutch are disagreeable and harsh to the ear; and both are but dialects of the Old Teutonic.

SECTION V.

Religion, Learning, and Political Government of Germany.

THE inhabitants of the empire are pretty equally divided between Roman Catholics and Protestants, the latter being of two classes, viz. Lutherans and Calvinifts. In the dark ages the popes got into their hands almost the whole management of every thing relating to the church and eccletiaftics, both fecular and regular : nay, they even claimed a power not only to controul, but to depose princes, to absolve their fubjects from their allegiance, and dispose of their do-minions as they thought fit. The tyranny and usurpations of the popes, and the monstrous corruptions and abuses that had crept, or been introduced, from worldly views of power and grandeur, into the ancient doctrine and discipline of the church, caused all, that were capable of any reflection among the laity, and every honest man among the clergy, earnestly to wish for a reformation, which was at last boldly attempted by a native of this country, Dr. Martin Luther, in the The states of the empire, that embraced 16th century. the reformation, from their protesting, in 1529, against the conclusion of the diet at Spire, by which all innova-tions in religion, till the decree of a future council could be obtained, were declared unlawful, obtained the name of Protestants. A religious war foon after broke out, which was extinguished, in some measure, in 1552, by the peace of Paffaw, and more compleatly by that ratified at Augsburg in 1555, by which a full toleration and liberty was granted to the Protestants. This was farther confirmed and explained by the treaty of Westphalia, in 1648. By virtue of these conventions, no other religion but the Roman Catholic, Lutheran, and Reformed, was to be introduced into, or tolerated in the holy Roman empire. Some other fects, notwithstanding, in some places, actually enjoy the free exercise of their religion. Such of the above persuafions as existed in any state in the year 1624, are still to be allowed; but it lies in the breast of the respective fovereigns, whether they will tolerate any that had neither public or private exercise in the country in the year abovementioned. The power of the Protestant states over their Catholic subjects, in regard to religion, is the same as that which the Catholic states have over their Protestant subjects. Each party is obliged to allow the other the free exercise of their religion in their dominions, provided they were in possession of it in the year 1624. In the Roman Catholic countries here, as well as elsewhere, the clergy are, in a great measure, independent of the civil power; but in the Protestant states the supremacy is vested in the sovereign. The Protestant, or evangelic body, have mutually agreed, that whenever, for the future, a Lutheran lord of a county shall turn to the reformed church, or obtain a county of that persuasion, or vice versa, that in that case he shall leave his subjects the free exercise of their religion, with their whole form of church and school-discipline, and all other privileges whatsoever.

With respect to the learning of the Germans, there is no where a more general taste for reading, especially in the Protestant counties, nor are more books any where written and printed, than among the Germans. No people apply themselves more closely to their studies; and the Hebrew is in no country so generally learnt, or better understood. Printing is highly encouraged. Every man of letters is an author. They multiply books without number. Great numbers of thesses and disputations are annually published; for no man can be a graduate in their universities, who has

not produced at least one controversial publication. Soon after the diffolution of the western empire, the Franks subdued all Germany and Gaul, which were, about the year 800, erected into an empire by Charlemagne: but 80 years afterwards the French race were discarded, and a new emperor from among the Germans elected. The race of the house of Austria began with Rodolph of Hapfburg, who was elected emperor in the year 1273. Charles IV. at the diet of Nuremburg, in 1356, formed the wholefome regulations for the election of an emperor, which are to this day known and observed, under the name of the Golden Bull. in the year 1448 the celebrated Concordat, between the emperor Frederick III. and certain spiritual and temporal estates of the empire, and Pope Nicholas V. were fettled. This emperor was duke of Austria; and his posterity, notwithstanding the empire is elective, have had the address to continue it in their family for 300 years, namely, to the year 1740, when they loft it only for want of an heir male in the family; but the Austrian family are now again in possession of it. In the reign of the emperor Frederick III, the court, now called the Chamber of Wetzlar, was established, and the empire was divided into 10 circles. His fucceffor, Charles V. first swore to a capitulation. In his time Mexico and Peru were conquered, whereby he became possessed of much larger territories, and more riches, than any prince before him ever enjoyed. His brother Ferdinand established the Aulic Council. It was inferted, for the first time, in the capitulation of the emperor Matthias, grandfon of Ferdinand, that the electors, for the future, should be entitled to elect a king of the Romans, with or without the confent of the emperor. In the reign of Ferdinand III. an end was put to the religious wars that began in the reign of Charles V. in consequence of the reformation, by the treaty of Westphalia. In the reign of his fon Leopold, the diet of the empire was opened at Ratifbon, in the year 1663, where it still continues; and the Imperial chamber of justice was removed from Spire to Wetz-This emperor conferred on Erneft-Augustus, of Brunswic Lunenburg, the ninth electoral dignity.

The empire of Germany is elective; and the laws of the empire do not require that the emperor should be of any particular age, nation, or religion; but as the Popish are more in number than the Protestant electors, a Roman Catholic is always elected to the Imperial dignity. The emperors used formerly to be crowned by the popes, till the reign of Charles V. but from that time the papal coronation has been dispensed with. However, immediately upon his entering upon

The

the government, he testifies his veneration to the pope by an embaffy. The title of the emperor runs thus: " N. by the grace of God, elected Roman emperor; at all times augmenter of the empire in, or of, Germany, king." Then follow the titles of the hereditary Imperial dominions. The states of the empire give the emperor the title of Most Illustrious, Most Powerful, and Most Invincible Roman emperor; the last of which is omitted by the electors. The emperor is looked upon, by all other crowned heads and states in Europe, as the first European potentate, and as such precedence is given him and his ambaffadors. He is the supreme head of the German empire; but his power in the administration thereof is very limited. With refpect to ecclefialtical matters, his prerogative confifts principally in the right of the first petition, by virtue of which, in all foundations and cloisters of the empire, he may, once during his administration, confer a benefice on any person qualified for it by the statutes; and on that of a panis brief to each foundation or cloifter in the empire, by virtue of which, fuch foundation is obliged to admit into it the person who has obtained the emperor's brief, and there provide him, during life, with all necessaries. With respect to temporal matters, he can create princes, dukes, marquisses, counts, barons, knights, &c. raife countries and territories to a higher rank; bestow arms; and grant letters of respite and protection, fecuring a debtor against his creditor; establish universities, fares, and markets; empower any person to adopt another, and to assume a title from his estate; erect any place into a sanctuary; confer majority on minors; legitimate children born out of wedlock; confirm the contracts and stipulations of the members of the empire; remit oaths extorted from them; invest such as possels siefs of the empire, and decide in feudal matters relative thereto, &c. but he cannot grant to any person privileges for printing particular books, for new invented machines, &c. He appoints most of the officers, civil and military, of the empire, except fuch as are hereditary, as the great chancellor, treasurer, &c. but these are only honorary. In ancient times the emperor had confiderable domains in the empire; but almost all these have been succesfively mortgaged and alienated, fo that at present the certain revenues of the emperor cannot be afcertained; but as he has the disposal of most offices, the creation of princes and noblemen, is entitled to all confifcations and forfeitures, and invests the feveral princes in their estates, besides those that hold fiefs of the empire in Italy, the profits of these articles must amount to a large fum. He has also some offerings from the Jews, and the free-gifts of the order of knights of the empire. A fucceffor to the empire is frequently chosen by the electors during the life of the emperor, who is fliled king of the Romans. He is elected and crowned in the fame manner as the emperor, has the title of majesty, and takes precedence of all other kings in Christendom.

The diet of the empire confifts of the emperor, nine electors, composed of ecclefiastical and secular princes,

and deputies of Imperial cities.

The electors are divided into spiritual and temporal. The spiritual electors are the archbishops of Triers, Cologne, and Mentz. The temporal electors are those of Bavaria, Hanover, Saxony, Brandenburg, Bohemia, and the elector Palatine. The elector of Mentz is archchancellor of the holy Roman empire in Germany, and director of the electoral college.

The elector of Treves is arch-chancellor of the holy

Roman empire in France.

The elector of Cologne is arch-chancellor of the holy Roman empire in Italy

The king and elector of Bohemia, is arch-cup-bearer of the holy Roman empire, and precedes all the other electors.

The elector of Bavaria is arch fewer of the holy Roman empire, the elector of Saxony is arch-marshal, and the elector of Brandenburg is arch-chamberlain. No. 74.

The elector Palatine was originally arch-fewer; and fince the treaty of Westphalia arch-treasurer. when the elector of Bayaria, was put under the ban of the empire in the year 1706, the elector Palatine recovered the office of arch-fewer, and the elector of Hanover obtained the office of arch-treasurer, by which he still stiles himself, till another suitable arch office can be conferred upon him. Next to the electors are the princes of the empire, who are partly spiritual, and partly temporal. The spiritual are archbishops, bishops, abbots, provosts, abbesses, the masters of the

Teutonic order of St. John, &cc.

Not only all those princes who have feats and voices in the diet, but many others, are vested with great powers in the respective territories; but they are still subject to the general laws of the empire, and sworn not to engage in any wars or alliances to the prejudice of the emperor. The Franks, in imitation of the Romans, reduced all Germany into provinces, over which they placed governors with different titles. They were generally of noble families; and, if there was no material objection against it, their sons were appointed to succeed them; from whence these governors came at length to infift on a right of fucceeding their ancestors, and refused to pay homage to the German emperors, every one taking upon him to exercise legal power in his province; from whence have fprung up fo many petty fovereigns in the empire. The third college of the diet is that of the free or imperial cities, i. e. fuch as are governed by magistrates of their own, and stands immediately under the emperor and empire. Some of these are wholly Catholic, others entirely Lutheran, and others again of a mixed religion. Within their territory they exercise supreme power, and are divided into two benches, the Rhenish and Swabian. As the princes of the empire took advantage of the necessities or indulgence of the German emperors, to erect the governments they held, in capacity of vicerovs or governors, into independent principalities and states, so did the cities now called free and imperial. The emperors, frequently wanting supplies of money to carry on wars, or for other occasions, borrowed large fums of the wealthy trading towns, and paid them again in munificent grants and privileges, making them free states, and independent of the governors of the provinces where they flood. Accordingly, these cities, like the princes, exercife all kinds of fovereign power that are confiftent with the general laws of the empire. They make laws, constitute courts of justice, coin money, raife forces, and enter into alliances and confederacies; only acknowledging the emperor for their supreme lord, and contributing their share towards the common defence of the empire. The diet meets at Ratifbon on the emperor's fummons; and any of the princes may fend their deputies thither in their flead. The diet makes laws, raifes taxes, determines differences between the feveral princes and states, and can relieve subjects from the oppressions of their sovereign. There are two fupreme councils, called the Aulic Council, and the Chamber of Wetzler. It was fettled by the emperor Charles V. that every circle, and every prince and member of each circle, should contribute towards the ordinary and extraordinary taxes of the empire. This contribution was entered into a book called a matriculation book, which is kept by the elector of Mentz. By the matricula twelve florins were to be paid monthly in lieu of every horfeman, and four for every foot foldier. Afterwards it was enacted that 60 florins should be advanced in lieu of every trooper, and 12 for every foot foldier.

Roman empire at the height of its grandeur. The country was divided into a number of principalities, independent of each other; though, occasionally, connected by a military union, for defending themselves against such enemies as threatened the liberty of them all. At length, however, the Roman power prevailed over a great part of Germany, and it was reduced to the condition of a province. When the northern barthe condition of a province. When the northern bar-barians broke through the Roman barrier, Germany was overrun by the Franks about the year 480, and a confiderable part of it long remained in subjection to the chief of that nation. In this fituation it continued from the abovementioned period to the year 800, when Charlemagne, or Charles the Great of France, was advanced to the Imperial throne on Christmas-day, He was the fon of king Pepin, and fucceeded him in the kingdom of France in the year 768, when Defiderius, king of Lombardy, possessed that throne, who, having infulted the pope and clergy of Rome, and compelled them to part with a great deal of that power they had usurped, Charles invaded Lombardy, defeated and deposed Defiderius; and going afterwards to Rome, the pope, who looked upon him as his de-liverer, declared him a patrician, a title equal almost to that of emperor; investing him with authority to confirm future popes, and grant the Italian bishops the investitures of their sees; after which the pope swore allegiance to him upon St. Peter's tomb. Charles, in return, gave the pope a power of constituting exarchs, or governors over the provinces of Ancona, Bologna, Mantua, Modena, Parma, Ferrara, &c.

King Charles afterwards made a conquest of part of Spain, of the north of Germany, then denominated Saxony; and pope Adrian dying, Leo III. being elected pope, was confirmed in the chair by Charles the Great, as patrician of Reme; and, on Christmas-day, 800, (as before observed,) the pope and senate of Rome conferred the title of Roman emperor on king Charles, and crowned him in the church of St. Peter, the people faluting him emperor at the same time.

Statues of the emperor were fet up in most of the public places in Rome; but he chose, however, to reside in Germany, and left the pope, in a manner, governor of Italy; of which the emperor had the title of king, as well as that of Roman emperor. He enjoyed these honours 14 years, dying anno 814, at Aix-la-Chapelle, and was buried there in a church he had founded having designed to make that city the capital of his empire.

He was succeeded by his son Lodowic, or Lewis, king of Aquitain, surnamed the Godly, who ordered the Bible to be translated into the Saxon language, and to be dispersed among the common people. He was an unfortunate prince, all his three sons rebelling against him; and having taken him prisoner, thut him up in a monastery, from whence his subjects rescued him; but while he was upon the march against Lotharius, the eldest, he died; and Lotharius succeeded him, who, after he had reigned 15 years, abdicated his throne, and resided in a monastery till he died, and was succeeded by his son Lodowic, or Lewis II. It was in this reign that the court of Rome sirst assumed the power of electing the pope without the leave or concurrence of the sovereign. Adrian II. was the first that was chosen without the emperor's licence.

In the reign of Lewis III. called the Grofs, from his corpulency, the Normans invading France, and penetrating as far as Paris, which they befieged, they compelled him to confirm the duchy of Normandy to them, which they had possessed themselves of; and having done some other unpopular acts, he was deposed by his subjects, who placed Arnolph upon the throne, the natural son of the duke of Bavaria; so that the empire can no longer be esteemed hereditary in the line of Charlemagne, who was the sounder of it. Arnolph being opposed by Guido and Berengarius, to whom the city of Rome adhered, he deseated them, and took Rome by storm. Lewis IV. the son of Ar-

nolph, fucceeded him: but the pope fetting up another Lewis against him in Italy, created him a great deal of disturbance in his reign. However, his son Henry succeeded, by his own appointment in his last will.

Conrade, duke of Franconia, was next advanced to the Imperial throne by the German nobility. He opposed the encroachments of the pope, defended the empire against the invasions of the Hungarians, died after a prosperous reign of 17 years, and was succeeded by his son Otho, who obliged the king of Denmark to acknowledge his dependence on the empire, and admit Christianity into his kingdom. He subdued the king of Bohemia also, and planted Christianity in that kingdom. On the other hand, he deposed pope John XII. advanced Leo VIII. to the papal chair, and decreed that suture popes should be appointed only by the emperor.

Otho III. according to fome writers, first reduced the number of electors to seven. He reigned 18 years, when he was possened by a pair of gloves, his concubine gave him for refusing to marry her, as he had promised. Henry, duke of Bavaria, who was chosen emperor by the electors, anno 1002, defeated the Saracens in Italy, and drove them out of Apulia and Calabria.

Henry III. defended the empire against the Bohemians and Hungarians; after which he went into Italy to pacify the disturbances at Rome, occasioned by the setting up three popes at once. He deposed them all, and advanced Clement II. to the papal chair, reviving the decree, "That every pope should be appointed by the emperor."

Henry V. on the other hand, was compelled by the pope to acknowledge his supremacy, and renounce his right to the investiture of bishopries.

Frederic Barbarolla was so diffressed by the pope, that he submitted to let his holiness tread upon his neck.

Frederick II. was excommunicated by three popes; but at length deposed Gregory IV. and during these contests between the popes and emperors, arose those two famous factions of Guelphs and Gibellines, under the one or the other of which all the princes of Europe were engaged; the first adhering to the popes, and the other to the emperor.

After the death of Frederic there was an inter-regnum of 20 years, fix great princes contending for the empire; among whom was Richard, earl of Cornwall, brother to Henry III. King of England; and Rodolph, earl of Hapfburg, who, at length, obtained the Imperial dignity, by the confert of all the electors, and was confirmed by the pope. He first occasioned the advancement of the Austrian family, by creating his fon Albert archduke of Austria, who fucceeded to the empire after Rodolph, but was deposed, it is said, for submitting to serve with his troops, as mercenaries, under Edward I. king of England, against France.

Albert, fon of Rodolph being crowned emperor, and confirmed by the pope, made his fon king of Bohemia.

Henry, earl of Luxemburg, was next elected, but poisoned by a monk.

Charles IV. in 1347, first instituted the Golden Bull, containing the rites and ceremonies to be observed at the election of an emperor.

Sigilinond, king of Hungary and Bohemia, was unanimously elected emperor; in whose reign John Huss, and Jerome of Prague, disputing the pope's authority, and being summoned to appear at the Council of Constance, were burnt for heretics there, notwithstanding they had the emperor's safe conduct for their return.

Frederick IV. duke of Austria, being unanimously elected, married Leonora, daughter of Alphonso, king of Portugal. He reigned 53 years, being longer than any emperor had reigned before him.

Maximilian, his fon, fucceeded him, having been elected king of the Romans anno 1489; and married Mary,

Mary the daughter and heiress of Charles, duke of Burgundy, whereby he became entitled to all the do-

minions of that house.

Charles V. his grandfon, was elected emperor anno 1519, after an inter-regnum of fix months, having been opposed by Francis I. king of France, his competitor. He caused Luther's doctrine to be condemned by the diet of the empire, which the Lutherans protefting against, obtained the denomination of Protestants. This prince was victorious in more than 30 battles in person. The pope and French king were his prisoners at the same time. He subdued the Protestant princes, who had formed the Smalcaldic league against him, took the elector of Saxony and the prince of Heffe prifoners, defeated the Turks and raifed the fiege of Vienna: and in his reign great part of South America was fubdued. He was fovereign of the Philippine Islands in Afia, of part of the coast of Barbary in Africa, of Spain, Germany, and the greatest part of Italy and the Netherlands; and after a reign of 38 years, refigned the empire, and his hereditary dominions on the fide of Germany, to his brother Ferdinand; and Spain, Italy, the Netherlands, America, the Philippines, and the rest of his territories belonging to the crown of Spain, to his fon Philip II. after which he retired into a convent in Spain, where he died about two years after.

Ferdinand I. was unanimously elected emperor on the relignation of his brother Charles. He reigned in peace till his death, which happened in the year 1564.

His fon Maximilian fucceeded him. Both these last emperors were remarkable for their indulgence to the Protestants.

Rodolph succeeded his father Maximilian, and was

a very learned prince.

He was succeeded in the empire by Matthias, under whom the reformers, called Lutherans and Calvinifts, were fo much divided among themselves, as to threaten the empire with a civil war. Matthias dying in 1618, was fucceeded by his coufin Ferdinand II. but the Bohemians offered their crown to Frederick, the elector Palatine, the most powerful Protestant prince in Germany, and fon-in-law to his Britannic majefty, James I. This prince was fo incautious as to accept the crown; but he loft it, being entirely defeated by the duke of Bavaria, and the Imperial generals, at the battle of Prague; and he was also deprived of his own electorate. Ferdinand made fuch use of his advantages obtained over the Protestants, that they formed a fresh confederacy at Leipfic, of which the celebrated Gustavus Adolphus was at the head. Ferdinand II. died in 1637, and was succeeded by his fon Ferdinand III. who died in 1657, and was fucceeded by the emperor Leopold, a rigid and not very fortunate prince. He had two great powers to contend with, France on the one fide, and the Turks on the other, and was a lofer in his war with both. France took from him Alface; and the Turks would have taken Vienna, had not the fiege been raifed by John Sobieski, king of Poland. Prince Eugene, of Savoy, was a young adventurer in arms about the year 1697, and being one of the Imperial generals, gave the Turks the first check in Hungary; and, by the peace of Carlowitz, Transylvania was ceded to the emperor. Leopold, however, could not have withftood the power of France, had not the prince of Orange, afterwards king William III. of England, laid the foundation of the grand confederacy against the French power, which overturned all their machinations, The Hungarians, fecretly encouraged by the French, and exasperated by the tyranny of Leopold, were itill in arms under the protection of the Turks, when that prince died in 1705.

This emperor being very ill ferved by prince Lewis of Baden, the general of the empire, the French partly recovered their affairs, notwithstanding their repeated defeats. The duke of Marlborough, though he obtained very splendid victories, had not all the success he expected, or deferved. Joseph himself was sufpected of a defign to subvert the liberties of Germany; and it was evident from his conduct, that he expected the English should take the labouring oar in the war which was carried on chiefly on his account. He died of the finall-pox in 1711, before he had reduced the Hungarians, and was fucceeded by Charles, king of Spain, who leaving that kingdom, and arriving at Frankfort, was elected on the 12th of October, 1711.

When the peace of Utrecht took place in 1713, Charles at first indicated a design to continue the war; but soon finding himself unable, now he was forsaken by the English, concluded a peace with France at Baden, in 1714, that he might attend the progress of the Turks in Hungary, where they received a total defeat from prince Eugene, at the battle of Peterwaraden. They received another of equal importance from the fame general, in 1717, before Belgrade, which fell. into the hands of the Imperialifts; and next year the peace of Passarowitz, between them and the Turks, was concluded.

The emperor being now at peace both with Christians and Turks, prevailed on the states of the kingdom of Hungary to pass an act for settling the succession of that crown upon his female iffue, according to their feniority, which was done on the 22d of June, 1722. This is what has frequently been termed in the German history the "Pragmatic Sanction," and has given rise to several disputes and contentions. His next care was to promote the trade of his subjects. He incorporated a company of merchants, therefore, at Oftend, to trade to the East and West Indies, and Africa, which the Dutch pretended to be much alarmed at, and prefented feveral memorials to the emperor on this fubject, declaring it to be a breach of the treaty of Munfter, and other treaties for the inhabitants of the Spanish Netherlands (now Austrian) to trade to the East-Indies; charging the emperor with ingratitude in encroaching on their trade, when they had, at a vast expence, conquered fo many confiderable countries for him in the late war, with which the emperor was rather provoked than moved to alter his conduct, feveral thips being fitted out by the Oftenders for the Eaft-India trade.

There having been a congress at Cambray to compole the remaining differences between the princes of Europe, the emperor and Spain, wearied with the delays of the French, who took upon them the office of mediators and femed to take a pride in carrying the ministers of the contending powers from place to place, as that court removed, thought fit to accommodate matters themselves, without communicating the terms to any foreign power. By this treaty, figned on the 30th of April, 1725, the emperor acknowledged Philip, duke of Anjou, king of all the Spanish dominions in his potention, confirmed Sardinia to the duke of Savoy, and ceded the reversion of the duchies of Tufcany, Parma, and Placentia, to Don Carlos, prince of Spain, after the death of the reigning princes; but it was expressly provided, that no forces (hould be fent thither during the lives of the reigning princes.

King Philip, on the other hand, ceded to his fon-Don Carlos, his territories on the coaft of Tufcany and agreed that none of the Italian dominions should ever be possessed by any prince who should succeed to the crown of Spain: and king Philip renounced, in fa-vour of his Imperial majesty, all rights and pretentions to the Spanish dominions in Italy, Sicily, Flanders, or elfewhere, in the poffession of his Imperial majesty; and both Charles and Philip were to ftile themselves kings of Spain during their respective lives. This was called the Vienna Treaty. A treaty of commerce also was concluded between the fame parties, May 1, 1725, in which Spain agreed that the emperor's subjects should enjoy the same privileges in Spain as the most favoured nations, and particularly that they might difto of the East-India merchandize, which should be brought over by the Oftend East-India company, in Spain. The emperor also entered into alliances, of fentive

ing been married Mary,

The maritime powers, especially the Dutch, appre-hending there were some secret articles in the Vienna treaty, that would be prejudicial to their commerce in other parts of the world, as well as in the Eaft-Indies, concluded a treaty with France and Pruffia, September 3, 1725, whereby they guaranteed each others dominions, and their respective rights and privileges in trade, and agreed, that if any encroachments were made upon them, they would affift each other with their forces, to obtain fatisfaction of the parties to the Vienna treaty; and this alliance being concluded at Han-over, obtained the name of the Hanover treaty. The kings of Great Britain and Prussia further agreed, that in case of an offensive war, they would not furnish their complement of troops to the empire against France; and if they should be compelled to it, they would furnish as many forces to affist France, as their comple-

ment amounted to.

The court of Vienna being acquainted with this treaty, made many severe reflections upon it; and it was reported, at the fame court, that the British ambaffador, at Constantinople, endeavoured to excite the Turks to invade the empire. To discover the truth whereof, orders were sent to all the Imperial generals and officers on the frontiers of Turkey, to let nobody pass without giving notice thereof to the court of Vienna; and a British courier being stopped in pursuance of those orders, king George complained of it as a breach of the law of nations; though the courier was released on discovering the badge of an English mesfenger, and delivering a letter from the Imperial refident at the Porte, by whom he was fo stiled; and the Imperialifts infifted that they had much more reason to complain that fuch negociations were carrying on to difturb their peace, than the king of Great Britain had

for apprehending his meffenger.

Whatever truth there might be in these suggestions, the Germans were so much out of temper with the court of Great Britain at this time, that an Imperial edict paffed, to prohibit the importation of English manufactures, or East-India goods, from England; and the Spaniards, who were now become the allies of Vienna, about the fame time laid fiege to Gibraltar, to which they were provoked by the court of Great Britain's fending a fquadron of men of war, under the command of admiral Hofier, to block up Porto-Bello, and prevent the Spanish galleons coming to Europe. However, a treaty of pacification being fet on foot between the allies of Vienna, and those of Hanover, the following year, it was agreed, that the fiege of Gibraltar should be raifed, the Ostend trade to India should be fulpended, and the British squadrons be withdrawn from Porto-Bello, and the coasts of Old Spain; which By a subsequent treaty, made at Seville, anno 1728,

between Great Britain and Spain, the former agreed to affift in transporting 6000 Spaniards to Tuscany, to fecure the eventual fuccession of Don Carlos to that ducy and Parma; to which treaty both the French and

Dutch acceded.

The article for introducing Spanish forces into Italy, during the lives of the duke of Tufcany and Parma, alarming the emperor, he protested against it, and ordered a great body of his forces to march into Italy in the year 1729, to prevent its being put in execution, which occasioned the transportation of those forces to be put off for the present; but Sir Charles Wager, with a British squadron, joining the Spanish sleet, anno 1731, convoyed 6000 Spanish forces to Leghorn, compelling the then reigning duke, and the emperor, to fubmit to that article: though the emperor reprefented, that the introducing these Spanish forces would endanger the loss of all his Italian dominions. However, both the English and Dutch guaranteeing the possession of all his Italian dominions to him, he acquiefced in what he could not well avoid : nor was he much mistaken in his conjectures, for the French, under pretence that the emperor had affifted in advancing the elector of Saxony to the throne of Poland, to the prejudice of king Stanislaus, his father-in-law, entered into a confederacy with the kings of Spain and Sardinia, and at once invaded both his Italian and German dominions. They made themselves masters of fort Kheil, opposite to Strafburg, and befieged Philipfburg, before which town the duke of Berwick, general of the French, was killed in the trenches. However, the Austrians not being able to relieve it, the place furrendered.

The armies of the Spaniards, and their allies, met with still greater success in Italy; for the maritime powers, who had guaranteed the emperor's hereditary dominions in Italy to him, refufing to fend him any affiftance, his forces were driven out of Naples, Sicily, the Milanele, and all the rest of his Italian dominions, except the city of Mantua; whereupon he formed a peace with the allies on the best terms he could.

The British court were much reflected on, for suffering the emperor's territories in Italy to be thus torn from him, which they had guaranteed; but the Dutch, who had done the fame, confenting to a neutrality in Flanders, it would have been highly impolitic, after that, for the English to have taken the whole burthen of that war upon themselves. These terms were agreed on by way of preliminaries, in the year 1735; and, in the year 1737, the emperor found himself obliged to engage in another war against the Turks, in which the Ruffians bore a confiderable part and were fuccefsful, for fome time, on their fide. The Imperialifts also, commanded by count Seckendorf, took the city of Nissa, in Servia; but this was soon retaken by the Turks; and afterwards Media and Orfovo; which the court of Vienna ascribing to the ill-conduct or cowardice of their generals and officers, count Seckendorf was imprisoned, the governor of Nissa, general Donat, lost his head, and the duke of Lorrain took upon him the command of the Imperial army; but foon after returned to court, being taken ill of a fever.

The year following the Turks invested Belgrade; and the emperor at this time, entertained fuch a confidence in the friendship of the grand monarch, that he trusted him to negociate a peace for him with the grand feignior; by which treaty it was agreed, that the em-peror should yield up all Servia, with the capital city of Belgrade, to the Turks, the fortifications being first demolished; and the Save and the Danube made the boundary of the Austrian dominions on the fouth; the river Alauta, and the Iron-Gate mountains on the east;

and the river Unna, in Bosnia, on the west.

Soon after the demise of the emperor Charles VI. in 1740, the king of Prussia, with a powerful army, entered and conquered Silena, which he alledged had been wrongfully difmembered from his family. The king of Spain, and the elector of Bayaria, preferred their respective claims to that country, and in this they were joined by France, though directly in-

compatible with a former agreement.

After a confiderable time had elapfed, the Imperial throne was filled up by the elector of Bavaria, who affumed the title of Charles VII. in January, 1742. The French poured their armies into Bohemia, where they took Prague; and the queen of Hungary, from politic views, ceded to the Pruffian monarch the most valuable part of the duchy of Silefia by a formal treaty. Embarraffed on all fides, the unfortunate queen, as the last resource, threw herself into the arms of the Hungarians, who though not well affected to the house of Auftria, declared unanimoufly in her favour. Success crowned her arms; the French were driven out of Bohemia; and his Britannic majefty, George II. at the head of an English and Hanoverian army, gained the battle of Dettingen in 1743.

The

that he was disposed to an accommodation with the queen of Hungary almost upon her own terms: but the would not liften to any propofals, though confonant to the advice and opinion of his Britannic majefty, her only faithful ally. This perverse conduct in the queen afforded the king of Prussia a pretence for invading Bohemia, upon the principle of fupporting the Imperial dignity; but his efforts not being attended with the fuccels expected, he abandoned fome parts of the kingdom which he had taken, and retired to Silefia. Soon after this the emperor Charles VII. paid the debt of nature, in the year 1745; and the duke of Lorrain, then grand-duke of Tulcany, confort to her Hungarian majesty, after surmounting some difficulties, ascended the Imperial throne, according to the usual mode of election, under the title of Francis 1.

The defigns of the empress-queen against the king of Pruffia were frustrated by the ill-success of the allied army, and particularly the loss of the battle of Fontenoy. A feries of events followed respecting the operations of the contending powers of Europe; and it may be faid, upon a review of the whole, that the war continued in the Low countries with various fortune, though chiefly to the difadvantage of the Austrians and Dutch, till terminated by the treaty figned at Aix-la-Chapelle, in April, 1748. By this treaty the king of Prussia once

more obtained possession of Silesia.

In the year 1756 a fresh war was kindled in the empire. The king of Prussia, suspecting a design formed between the empress-queen, the empress of Rusha, and the king of Poland, as elector of Saxonv, unnaturally abetted by France, to strip him of his dominions, the former monarch, in confequence, declared against the admission of the Russians into Germany, as did his Britannic majefty against that of the French. Upon this principle an entire reconciliation was effected between those monarchs, who prosecuted, in conjunction, a war more furious than ever. The Pruffian hero atchieved prodigies of valour, though fometimes most vigorously pressed by the enemy. Many capital encounters took place in Germany, between the French, who were driven out of Hanover, and the English, or their allies. The atchievements were valiant, but not of great importance, because they were not decisive, though attended with great loss of blood and treasure to Great Britain. The king of Prussia, notwithstanding his great military skill and unparallelled fortitude, was, at length, nearly overpowered by the Ruffians, who had taken Berlin, and were receiving daily fuch reinforcements as threatened the completion of his ruin, when the empress of Russia, his most formidable enemy, paid the debt of nature, the 5th of January, 1762.

George II. having refigned his life and crown on the 25th of October, 1760, the ministry of his successor, George III. were disposed to put an end to the war; and the new emperor of Ruffia recalled his armies. Matters were at length finally fettled by the treaty of. Hubertsburg, in 1763, by which the possession of Silefia was again fecured to the king of Prussia.

On the demise of the emperor Francis I. in 1765. his fon Joseph succeeded to the Imperial throne. He evinced, foon after his accession, great talents for go-vernment, and joined in the dismemberment of Poland with Ruffia and Pruffia. Hostilities afterwards commenced between Austria and Prussia, on account of the fuccession to the electorate of Bavaria. Great armaments were brought into the field, but nothing of importance was done, as an accommodation took place.

The emperor then turned his thoughts to the promotion of the happiness of his subjects; in order to effect which he granted a most liberal religious toleration; and abolished, by edict, in 1783, the remains of servitude and villanage, as also the use of torture, as well as removed many grievances under which the common people laboured. He is a lover of literature, a patronizer of learned men, and appears to poffels a

foul worthy of his very elevated station.

As the flames of war are unhappily broke out between the Turks, Russians and Imperialists, and as there is cause to apprehend, from the great hostile preparations, a bloody campaign will follow, the reader will be prefented, at the close of this work, by way of supplement, with a detail of every important event that may take place concerning it, as they will also with every material incident that may occur, with respect to political affairs, in other parts of the world; so that in conformity to our plan, we shall not only present the public with a Complete System of Geography, but also a concise History of the most distinguished kingdoms in the known world, to the latest period of our work.

M H E

HIS country, called, in German, Boiheim, and corruptedly Bohmen, obtained its name from the Boii, its ancient inhabitants, who were a tribe of the Celtæ, that retired into the Hyrcanian Forest (which runs through this country) in order to avoid the perfecutions of the Romans. It is bounded on the east by Poland; on the west by the palatinate of Bavaria, with part of Saxony; on the north by Lufatia; and on the fouth by Austria. It is about 300 miles in length, from north to fouth, and 250 from east to west. It is divided into two parts, Bohemia Proper, and the Marquifate of Moravia. As each of these divisions has fomething peculiar, either in the produce of the country, or the nature of the inhabitants, we shall describe them feparately.

SECTION I.

BOHEMIA PROPER.

BOHEMIA Proper is bounded on the east by Moravia and Silesia, on the west by Bavaria, on the north by Lufatia, and on the fouth by Austria. It is about 170 miles in length, from east to west, and 140 No. 74.

in breadth, from north to fouth. It is almost furrounded with mountains and woods; in the former of which are mines of gold, filver, copper, tin, iron, lead, fulphur, and nitre. Here are likewife abundance of fulphur, and nitre. Here are likewife abundance of carbuncles, emeralds, amethysts, jaspers, sapphires, crystals, and other precious stones, most of which are purchased by the Jews, and exported into foreign

The climate of Bohemia is rather unwholesome, owing, as it is supposed, chiefly to the large thick woods with which it abounds. The foil is, in general, tolerably fertile, being well watered with rivers, particularly the Elbe, the Moldaw, or Muldaw, the Egra, Oder, Vistula, Teyn, and Igla. It produces great plenty of corn and millet; as also abundance of hops, affron, ginger, red wines, flax, wood, and timber. The inhabitants have excellent pasturage; and, besides cattle and sheep, breed great numbers of fine horses, which are chiefly purchased for the use of the French. The woods abound with various kinds of game, as also feveral forts of wild beafts, the most remarkable of which are bears, lynxes, wolves, foxes, martens, badgers, beavers, and otters.

This country also produces terra figillata, or fealed earth, Moscovy-glass, stone, pit-coal, allum, vitriolic water, marble, mineral waters, and hot baths. The rivers produce various kinds of excellent fish; and in fome of them are found gold duft. Here were formerly great numbers of falt pits: but the working of them not answering the expence, they have been some time laid afide; and the country is supplied with that article from Mifnia, and other places.

Bohemia Proper is divided into 12 circles, or provinces, exclusive of Prague, and the territory of Egra, or Eger. Before we take notice of the towns in the other circles, we shall describe the city of Prague, which is not only the principal place in this divition, but also the capital of the whole kingdom of Bohemia.

The city of Prague is fituated in 14 deg. 40 min. ft long, and 50 deg. 5 min. north lat. When the eaft long, and 50 deg. 5 min. north lat. When the Bohemians first settled here they called it Bohoheim, as being the capital of the kingdom. It was afterwards called, by the Sclavonians, Prague, which name it has ever fince preferved. It is fituated in a pleafant and fruitful country, in the midft of gardens and fine fields, and is furrounded with magnificent palaces belonging to the nobility and gentry. It is about 12 miles in circumference; and is watered by the river Moldaw, which runs through the principal part of the city. The houses are chiefly built of stone, and confist, for the most part, of three stories. Here are near 100 churches and chapels, and about 40 cloifters, besides 9 fynagogues for the Jews. The Christian inhabitants are computed to be 70,000, and the Jews about 12,000.

Prague comprehends three towns, the Old, the New, and the Leffer Town. The Old Town, which is as large as the other two, is very populous, the houses uniformly built, and well inhabited. Here is an university (the only one in Bohemia) which was founded by the emperor Charles IV. in the year 1358. It has still a great number of students, tho' very inferior to what it formerly contained. Here are also several monasteries and colleges; of the latter of which there is a very magnificent one near the bridge, that formerly belonged to the sesuits, and was founded by the emperor Ferdinand for an hundred of that order. Great numbers of Jews live in this quarter, from whence it is called by fome Judenstant, or Jews Town, These people have almost the whole trade of the city in their own hands. They deal in every kind of commodity, especially the precious stones found in the Bohemian mines.

The New Town is by far the best built of the three and the streets longer and much more spacious, Here are the ruins of the palace of their ancient kings; likewise a very handsome college that formerly belonged to the jefuits, over the entrance of which are 13 statues of men, as large as life; and are made of stone, whose quality is such as to resemble brass. A fmall fortress was some years ago built for the security of this part of the city. It is a neat building, and has

ramparts well provided with cannon.

The Leffer Town is pleafantly fituated on the western fide of the Moldaw, and communicates with the Old Town by means of a bridge, which is one of the largest and most substantial in Europe. It consists of 24 arches, is 1700 feet in length, and 35 in breadth. It has a magnificent gate at each end, and the fides of it are decorated with feveral statues of faints. Part of this town lies on a rifing ground, the fummit of which is called Ratschin-Hill; and the streets and buildings that furround it form another part, which is diftinguished by the name of Upper Prague. On this fpot are many elegant buildings belonging to the nobility; and here the emperor has a magnificent palace, with a fummer-house, which affords one of the most beautiful prospects in the universe. The halls, galleries, and other apartments, are adorned with a prodigious number of paintings, executed by the best masters. The great hall where the coronation feast is kept, is deemed, exclusive of that at Westminster, the largest in Europe. In this part of the city is a very handfome and spacious cathedral, called St. Vest, which contains many ancient monuments and magnificent tombs, erected to the memories of some of the most distinguithed personages of this kingdom. The original edifice was destroyed by the Swedes in 1648. Among the remains of great men interred in this cathedral are two faints, St. Wenceslaus (the founder of the cathedral, who was king of Bohemia) and his wife's confessor, St. John of Nepomuck, who, because he would not discover her confessions to her jealous hufband, was, by his order, thrown from the bridge into the Moldaw. He was afterwards canonized at Rome by pope Benedict XIII. in the year 1721, at the request and expence of the empress, and of the states of the kingdom. Great numbers of people, from all parts, refort to the shrine of this faint; and his tomb, which is adorned with a rich canopy, is loaded with the most valuable presents. This faint is at present held in fuch veneration in Bohemia, that there is no church where he has not a chapel, no public building without his effigy, and scarce any person to be seen who has not his picture hanging before them, like the badge of an order, to a straw-coloured ribbon. The statue of him in brafs, as large as the life, is erected on the bridge near the fpot from whence he was thrown into the river.

At some distance from the cathedral are two sumptuous palaces, both of which have elegant and extensive gardens. One of them belongs to the family of count Coloredo, and the other to that of count Wallenstein. The latter is the largest and most magnificent. The hall is lofty and spacious, and the gardens large and beautiful. On one fide of them is an aviary enclosed with trees; and on the other are large stables of curious architecture. The racks are made of fteel, and the mangers of marble, with a marble pillar between each stall; and over every manger is the picture of the horse

it belongs to, as large as the life.

The town-house, which is a very beautiful structure, is fituated in a spacious square, and has a noble clock, with a great variety of motions. It is a uniform build-ing; and the principal room, which is elegantly finithed, is ornamented with the pictures of the emperors of

Germany, and the kings of Bohemia.

The market-place confifts of one large and spacious street, where a market, or rather fair, is kept every day in the week. In one part of it is a large stone column, on the top of which is the statue of the Virgin Mary in gilt brass; and at the corners are four angels, each of which holds the figure of a devil in chains. this column is an antique fountain of curious workmanthip, having 12 fronts. The bason is of red marble; and in the centre is a figure on a pedestal, round which are engraven the 12 figns of the zodiac.

The castle stands on Ratschin-Hill, otherwise called the White Mountain. It is a regular fortrefs, and always provided with a strong garrison. On the same mountain stands also the archiepiscopal palace.

The inhabitants of Prague are, in general, poor, and their shops meanly turnished; notwithstanding which, there are few cities where the nobility and genwhich, there are few cities where the nobility and gentry are more wealthy, and live in greater flate. Here are much gaming, malquerading, feafling, and very fplendid balls, with an Italian opera.

The principal traffic of this city confifts in luftres and drinking-glaffes, which are made of Bohemian cryftal, and to generally effected, that they are exported to more covered to the configuration.

ed to most parts of Europe. These crystals are also polished by the Jews, who turn them to good account by fetting them in rings, car-pendants, and shirt-

The tribunals of the regency meet at the emperor's palace to execute all public bufiness relative to the kingdom. The chief of these tribunals confists of 12 stadtholders, at the head of whom is the great burgrave, governor of the kingdom and cities, (who is immedimia. ately under the emperor,) and the chancery of Bohe-

The inhabitants of Prague enjoy many ancient privileges. Among the charters by which these are held, there is a remarkable one preserved in one of the churches. It was granted by Alexander the Great: and as it is one of the oldest records in Europe, and consequently a great curiosity, we shall, for the entertainment of the reader, preferve a translation of it. It is as follows: "We, Alexander the Great, on of king Philip, founder of the Grecian empire, governor of the Persians, Medes, &c. and of the whole world from east to west, and from north to fouth, son of great Jupiter, by, &cc. fo called, to you, the noble flock of Sclavonians, and to your lineage, because you have been unto us a help, true in faith, valiant in war, we confirm all that track of earth from the north to the fouth of Italy, from us, and our fucceffors, to you and your posterity for ever; and if any other nation be found there, let them be your flaves. Dated at Alexandria the 12th of the goddess Minerva. Witness Ethra and the eleven princes, whom we appoint our fucceffors."

The city of Prague has fuftained great injuries, at different periods, fince the commencement of the last century, having been feveral times befieged, taken and plundered. It was first attacked by the archduke Leopold, bithop of Paffaw, who plundered the Leffer Town, as he would have done the whole, had it not been timely relieved by the emperor Matthias, king of Hungary. Nine years after this it was again plundered by the Imperialifts, who entered the city, and carried off an ineftimable booty. This depredation was made foon after the famous battle of Weiffinberg, or the White Hill, on the 8th of November, 1620, when Frederick V. elector Palatine, was totally defeated by the forces of the emperor Ferdinand, under Maximilian, duke of Bavaria, and thereby loft the Bohemian crown, and his German electorate. It fhared the like fate in 1631, when it was taken by the elector of Saxony, after he had made himfelf mafter of Bohemia; but the following year the great Wolftein, who recovered the country from the Saxons, took this city by ftorm. In 1641 the Swedish general Koningfmark furprifed and plundered that part of it called the Leffer Town, with only 3000 foldiers; but the inhabitants of the Old Town, affifted by the scholars of the university, repulsed him, and that part of the city escaped being plundered. On the 26th of November, 1741, the French and Saxons, after a very short fiege, stormed and took it; and the next month the elector of Bavaria was there proclaimed and crowned king of Bohemia. But, in 1742, the Austrians having for fome months blockaded and befieged it, the marshal Bellisse collected all the provisions, &c. that he could carry with him, marched out of the city in the beginning of December, with feveral thousand foot and horse, to Egra; and the same month the rest of the garrison capitulated to the Austrian general, prince Lobkowitz, and marched out: not long after which the queen of Hungary was crowned queen of Bohemia. In 1744 the king of Prussia invested it with a confiderable army, which having, with its bombs, &c. de-ftroyed great part of the Old and New Towns, the Austrian garrison, after the trenches had been opened fix days, furrendered themselves prisoners of war. But the city was foon again in the hands of its fovereign; for, in November the same year, on the approach of prince Charles with the Austrian army, the Prussian garrison evacuated the town. His Prussian majesty made another attempt on this city in 1757, but was repulsed, and all his efforts rendered totally abortive.

The territory of EGRA, or EGER, receives its name from its capital, which is fituated 90 miles west of Prague, and is the only place of any note throughout the whole district. It is built on the declivity of a rock, at the foot of the mountains which enclose Bohemia on the west, and near the Eger, from whence both it and the territory have their names. The city is well fortified with a double wall next the river, and in other parts with a triple one; besides which it hath a very strong castle. Frederick I. made it an imperial city in 1179, for its fidelity to him against the duke of Bavaria. In confequence of this it has the privilege of coining money; and from the judicial fentences of its council there lies no appeal but to the fovereign.

In this city are feveral ancient and elegant buildings; among which are three cloifters, and a handsome college that formerly belonged to the jesuits. Here are likewise several churches, with courts of judicature, hospitals, baths, and store-houses for corn. At a finall diffance from the city is an acid fpring, the waters of which are purgative, and remarkable for removing diforders in the eyes, ears, and other parts of the head. In its neighbourhood are also mines of filver and gold; but they have not been wrought for feveral years paft.

The river Eger is very broad, and fo deep as to admit veffels of very confiderable burthen, which is of the utmost utility to the inhabitants of the city, who are also plentifully sopplied from it with a great variety of excellent fish.

The twelve circles, or provinces, of Bohemia Proper, exclusive of Prague, and the territory of Egra, are as follow:

Beraun-Podbrad, Rakownitz, Leutmeritz, Saaz, Pil-fen, Prachin, Bechin Kaurzim, Tschaflau, Chrudim, Konigingratz, and Bunflaw. But as the kingdom of Bohemia has been greatly defolated by war and perfecution, though there are many towns in these circles, there are sew worthy of notice. The principal, however, are the following:

Leutmeritz, which gives name to a circle, is fituated on the Elbe, thirty-five miles north-west of Prague. It is a rich, well-built, populous town, a royal borough, and bishop's see, the prelate of which is a suffragan to the archbishop of Prague. Here is a handsome college, which formerly belonged to the jefuits.

In the town of Krupka, or Krauppen, is an image of the Virgin Mary, to which pilgrimages are made from various parts of the kingdom. In the neighbourhood of this town are tin-works, and a college that formerly belonged to the jefuits.

Loworice is a fmall town, near which, in 1756, was fought a warm battle between the Pruffians and Auftrians.

Toplvi is a finall but pleafant town, and remarkable for containing feven warm baths.

Elnbogen, or Loget, the capital of a territory, which was annexed to the circle of Saaz in the year 1714, is feated on a high fleep rock, near the river Eger, 72 miles from Prague; and, being a frontier town, and strongly fortified, it is called the Bohemian key to the German dominions. The inhabitants speak the German lan-

Wary, or Carlibad, that is, Charles's Bath, is a royal borough, and celebrated for its baths and medi-cinal waters. These baths are of two forts, differing both in heat and ftrength; the one being boiling hot, and the other little more than luke-warm. The fource of them is in the middle of a river, formed by torrents from the neighbouring mountains, whose waters are exceeding cold; notwithstanding which those of the mineral fprings, especially of the hottest, are feen to smoke in the river. These waters are beneficial in the smoke in the river. cure of various diforders, particularly the gravel; and their virtues have been particularly described by Hostman, and other physicians.

Pillen, which gives name to a circle, is a large, wellbuilt town, fituated about '44 miles fouth-west of Prague. It has two large churches; and near the centre of it is a spacious market-place, well supplied with most kinds of provisions. The west and south sides of it are defended by a bulwark and a large disch, within which are strong walls, with towers and bastions. This city hath fuffered greatly in the respective wars of

Bohemia, having been taken, retaken, and burnt feveral times.

Nepomuck is a small town, and noted for giving birth to the faint of that name, who is so much venerated by the Bohemians. The principal buildings are a small

castle with a closter of Circassians.

"Budweis, a royal borough, fituated on the river Moldaw, is a finall but neat town, well-built, and ftrongly fortified. The chief building in it is a cloiffer belonging to the order of Dominicans. All falt brought out of the Auftrian dominions must be first exposed to sale here, and pay toll.

Kuttenberg, a royal borough, about 30 miles foutheast of Prague, is noted for its filver mines, and others which yield copper, and were formerly very profitable.

Kongingratz, which gives name to a circle, is a royaljointure town and bifhop's fee, fituated 45 miles northeaft of Prague, at the conflux of the rivers Elbe and Erlitz. Here is a commandery of the Teutonic order, and a fine college, that formerly belonged to the jefuits.

Benatky, a fmall town on the river Ifer, is remarkable for having been the refidence of Tycho Brahe, the

celebrated aftronomer.

Persons, Manners, Language, Religion, &c. &c. of the Inhabitants of Bohemid Proper.

THE Bohemians are a mixture of Sclavonians and Germans; the former of whom live in villages, and are flaves. The inhabitants of the towns are neither fond of arms, arts, or trade, but prefer an idle, indolent life. They are, in general, well made, ftrong, and fubject to few difeafes. In their difpolitions they are fubtle, but courageous, and always make a point of fulfilling their engagements. The gentry, and middling fort of people, are open and agreeable in their convertation; but the boors, or peafants, are fly and morofe, and greatly addicted to theft. The people, in general, are illiterate, notwithstanding there are many feminaries of learning in different parts of the country. This is owing to the negligence of the parents, whose natural indolence renders them strangers to the spirit of literary emulation.

The language of the Bohemians is a dialect of the Sclavonic, but fomewhat harfher than that of their neighbours, who fpeak the fame language, as the latter change the confonants more into vowels. Most people of fashion, however, through their intercourse with the court of Vienna, fpeak High Dutch, or German, with which the language of the common people

is also intermixed.

The religion of the Bohemians was that of the Greek church, till Boleflaus, furnamed the Good, introduced Popery among them. John Huís, and Jeromoi Prague, were burnt at the Council of Constance, in the 15th century, for endeavouring to bring about a reformation in religion. This occasioned a bloody war, which continued for many years; but the Huslites were worsted; and, in 1547, the greater part of them were obliged to quit their country; upon which they withdrew to the neighbouring dominions, especially Poland and Pruffia. However, when Luther appeared, great numbers of the Bohemians embraced his doctrine, and thefe at first had toleracion; but afterwards, being persecuted, they took up arms, and, in 1618, chose Frederick V elector Palatine, for their king; but the war ended unfortunately both for the king and the Protestant Bohemians; the former being taken prifoner, and the latter perfecuted with the most unremitting severity. In 1627 the remaining Protestants were deprived of all their rights and privileges; and fuch as would not fubmit to the Roman Catholic church were compelled to quit the country.

Since the above period Popery has been the established religion in this country. There are, however, a few Lutherans in some parts of it; but they are obliged to be on their guard, and to conceal themselves as much

as possible. The Jews are more indulged, having an ample toleration for the exercise of their religion.

The archbishop of Prague is always legate of the holy apostolic see of Rome; and it is peculiar to his office to crown the kings of Bohemia. He is also a prince of the holy Roman empire, (though he has no seat in the diets,) primate of the kingdom, and perpetual chancellor of the university of Prague. His suffragans are the bishops of Leutmeritz and Konigingratz. The government of the church and clergy is vested in the archiepiscopal consistory, from which an appeal lies either to the sovereign or pope.

Constitution, Manufattures, Revenues, &c. of Bobemia Proper.

BOHEMIA, for a confiderable time, was governed by dukes, and afterwards by kings, who were limited in their power, and elected by the states; though they usually kept to the family of the deceased monarch. A ter the battle of the White Mountain, in 1620, the crown was made hereditary in the Austrian family; fo that, from that time, the states have had nothing more to do with respect to the right of succession. The states, indeed, are summoned every year, by imperial command, and meet at Prague; but it is only for form's fake. They confitt of the clergy, nobility, gentry, and representatives of the towns. Here a commissioner from the sovereign lays before them the necessity or granting such supplies as the court demands, which usually amount to a very great sum; and these are granted without hesitation or examination. The peafants here are bondmen to their lords; and to the hard yoke which galls them is doubtless owing in a great measure, both their perverse obstinate dispofition, and their indolence; the latter of which, among other things, is evident from the wretched condition of the villages; which, though wood is to be found here in great plenty, and building is far from being expensive, are very mean and despicable. The clergy are composed of the archbishop of Prague, several bishops, provosts, and abbots, besides those of inferior rank. The nobility are divided into princes, counts, and barons; and the next degrees to their are knights, burghers, husbandmen, and peasants. Each circle has two headmen, or captains; one out of the flate of lords, and one out of the flate of knights. Bohemia is generally considered as a part of Germany, but with very little reason, for it is not in any of the nine circles, neither doth it contribute any thing towards the forces or revenues of the empire, or is fubject to any of its laws.

The chief manufacture of Bohemia is linen, of which they export great quantities, together with corn, malt, hops, and mineral waters. They have also considerable manufactories of copper, iron, glass, earthen-ware,

and paper, of which also a part is exported.

The revenues of Bohemia are raised by the states of the kingdom, who are assembled annually at Prague, to provide such sums as the empress demands of them, over and above the customs and duties to which she is entitled by her prerogative. The revenue is supposed to amount to near 100,000l. sterling a year. The standing militia of the Austrian hereditary countries is 24,000 men, towards which Bohemia surnishes 9,000. In times of war these serve to fill up the marching regiments.

SECTION II.

THE MARQUISATE OF MORAVIA.

THIS marquifate is about 120 miles in length, and 100 in breadth. It is bounded on the east by Silesia and Hungary, on the west by Bohemia Proper, and on the south by Austria. A great part of it is overrun with woods and mountains, where the air is very cold, but much wholsomer than in the low grounds,

which a general fertile, wine, fi in horfe and abovenifon beaft of having on its p produc iron, fu neral w Its rive are the cularly

ing to-

Prague, f them, h the is ipposed. The atries is 9,000. ning re-

gth, and east by Proper. is overis very grounds, which which are full of bogs and lakes. The mountains, in general, are barren; but the more level parts tolerably fertile, yielding corn, hemp, flax, faffron, pafturage, wine, fruits, and garden ituff. Moravia also abounds in horses, black cattle, sheep, and goats. In the woods, and about the lakes, are plenty of wild fowl, game, venifon, bees, hares, foxes, wolves, beavers, and a beaft of prey called Ryfowe, about the fize of a dog, having its belly and feet spotted, and leaping suddenly on its prey, from rocks or trees. This country likewise produces marble, baftard diamonds, amethyfts, allum, iron, fulphur, falt-petre, and vitriol, with wholefomemineral waters and warm fprings; but falt is imported. Its rivers, of which the March, Morawa, or Morau, are the chief, abound with great variety of fifh, particularly trout, cray-fish, barbel, eels, jack, and perch.

The inhabitants of Moravia are, in general, liberal, not eafy to be provoked or pacified, obedient to their masters, and true to their promises; but credulous of old prophecies, and much addicted to drinking. Their language is a dialect of the Sclavonic, differing little from that of Bohemia; but the nobility and citizens

fpeak German and French.

The states of this country confist of the clergy, lords, knights, and burgesses; and the diets, when summoned by the regency, are held at Brunn. The marquisate is divided into fix circles, each of which has its captain, and contributes to its fovereign about one-third of what is exacted from Bohemia. Seven regiments of foot, one of cuiraffiers, and one of dragoons, are usually quar-

Christianity was planted in this country in the ninth century; and the inhabitants continued attached to the church of Rome till the 15th, when they espouled the doctrine of John Huss, and threw off Popery; but after the defeat of the elector Palatine, whom they had chosen king, as well as the Bohemians, the emperor Ferdinand II. re-established Popery. However, there are still some Protestants in Moravia; and some years rince a fet of enthusialts, called Hernhutters, or Mora-vian Brethren, headed by one of the counts of Zinzen-dorf, appeared among them, who, at first, met with great encouragement in England; but afterwards, when their tenets and practices came to be better known, fell into contempt; though they have ftill fome followers among the lower fort. The bishop of Olmutz, who stands immediately under the pope, is at the head of the ecclesiastics; and the supreme ecclefiastical jurisdiction, under the bishop, is vested in a confiftory.

The commerce of this country is inconsiderable. Of what they have, Brunn enjoys the principal part. At Iglau and Trebitz are manufactories of cloth, paper, gunpowder, &c. In some parts of the country are also iron-works and glass-houses.

The chief places in the marquifate of Moravia are

the following:

Holomauc, or Olmutz, the capital, is a fmall, but neat, well-built, and populous city, fituated on the river Morawa, 80 miles north of Vienna. It is divided into the Old and New Town, in which are some spacious, regular streets, with fine houses, all painted on the outfide, two great fquares, a cathedral dedicated to St. Wenzel, feveral hospitals and cloifters of monks and nuns, an university, riding academy, learned society, and 26 churches. It is a royal borough, and the fee of a bishop; and, by means of its river, carries on a confiderable trade with Bohemia, Hungary, Poland, Silefia, and Austria. In the neighbourhood is a cloister of canons regular of the order of Præmonstatenses, whose abbot is mitred.

Brunn, or Brinn, is well built, fortified, and inhabited; and a place of the greatest trade in Moravia. Here are held the courts of judicature and the diets. are fix cloifters, a collegiate church, the bishop's palace, and a large college, with an hospital of the knights of Malta in the suburbs. The cloifter of Augustine hermits is famous for an image of the Virgin Mary, made,

No. 75.

as they pretend, by St. Luke, and a foundation for young ladies. The citadel is called Spielberg, or Spilmberg, and stands on a mountain close to the

Gihlawa, or Iglau, a ftrong, well-built, populous town, and royal borough, on the river Ighlawa, was the first town of Moravia that received the Augsburg confession. The principle buildings in it are a large college and gymnasium, with two monasteries, one of Dominicans, and another of Franciscans. The trade of the town is chiefly in beer, and a coarse woollen cloth. It is much frequented by travellers, being fituated on the borders of Bohemia, and in the high road to Hungary

Hradisch is a strong royal town on the March, containing a large college, and a cloifter of Franciscans. About a mile from the town stands the Cistertian cloister of Welehrad, whose abbot is the first of the regular

prelates at the diet.

Kromerziz, or Kremfier, is a well-built town on the river March, or Morave, belonging to the bishop of Olmutz, whose large and beautiful palace here was destroyed by fire in 1752, together with the archives, the fuburbs, and 55 burghers houses. Here is also a collegiate church, several cloisters, and a mint.

LUSATIA.

USATIA has Silesia on the east, Misnia on the west, Bohemia on the south, and Brandenburg on It is divided into the Upper and Lower Marquifate. The air of the former, which is a hilly country, is more falubrious than that of the latter, the fituation of which is low and fenny. The mountainfituation of which is low and fenny. ous tracks are barren, but the vallies are fertile; and both of the marquifates produce wood, turf, wheat, rye, oats, millet, beans, peas, buck-wheat, lentils, flax, hops, tobacco, manna, wine, &c. Here are likewise medicinal fprings, quarries of stone, earths and clays for tobacco pipes and earthen-wares, bastard diamonds, agates and jaspers, allum, vitriol, &c. Cattle, venison, and fish are plenty. The country is well watered. The language of the people is very inarticulate, guttural, and barbarous; and their drefs, at once, fingular and mean. Both marquifates were anciently subject to the king of Bohemia, the arch-dukes of Austria, or the electors of Brandenburg; but, in the year 1636, they were ceded to the elector of Saxony. Christianity was established here in the seventh century, and at present the reformed is the stablished religion. The manufactures are woollen and linen stuffs, caps, gloves, stockings, spatterdashes, hats, leather, paper, iron, glass, gunpowder, bleached wax, &c. many of which the in-habitants export. The imports are filk, yarn, wool, fpices, wine, corn, hops, garden-fluff, fruit, &c. The states of Upper Lusatia confist of state lords,

prelates, gentry, and commonalty. Without the concurrence of these nothing of importance can be transacted. The diets are either ordinary or extraordinary. The former met once in three years, the latter upon

particular emergencies.

Upper Lufatia is divided into two circles, called

Budiffen and Gorlitz.

The circle of Budiffen receives its name from the capital of the marquifate. The town of Budiffen is the feat of the same diets, and of the chief officers and tribunals. It is fituated on the Spree, 20 miles northwest from Gorlitz. It is pretty large, handsomely built, strongly fortified, and well inhabited. Its castle is fituated on a high rock within the town walls. The Lutherans and Roman Catholics perform divine service in different parts of the cathedral. Here are several other churches, a council-house, library, orphan-house, fpinning-house, house of correction, two diet houses, three hospitals, a gymnasium, &c. The trade of this place is in hats, stockings, gloves, linen, glazed leather, The trade of this cloth, fustian, Turkey manufactures, &c. to a very large amount.

9 X

Carmenz, on the Elster, contains eight churches, three hospitals, a manufactory of linen, another of

woollen cloths, and a Latin school.

Lobau has a mineral spring; Marklissa a Latin school; Uhyst a castle; and Baruth, a small town, with a citadel, is fituated fo pleafantly, that the meadow in which it is erected is called the Golden Au.

Gorlitz, the capital of the circle of the fame name, is 20 miles to the east of Budissen. It was erected in 1139 by Boleslaus, king of Poland; but soon after burnt, from whence arises its name; for Gorlitz, in the Sclavonic tongue, implies Burnt Town. It is the feat of juffice for this part, and the refidence of the gover-nor, has feveral neat churches, and many stately houses, built of stone. The chief trade is in beer, and in dres fing and dying woollen and linen cloth. It is well fortified, and the approach to it difficult, because it stands in a moras, on the west-side of the Neisse, which rises on the borders of this country, and runs through it into the Oder. Its great church, formerly called St. Peter and Paul, is magnificent. Near a fmall church, on a mount without the city, there is a model of the holy fepulchre at Jerufalem, built 200 years ago, by the direction of a citizen who had been there feveral

Muska has a great allum work; Great Radmeritz contains a noble temporal foundation for 12 ladies; and Hertenhuth is a small place belonging to count Zinzendorf. It was founded in 1722 by some Mora-vian brethren; and is now the chief nursery and seat of that sect called Hernhutters.

Laubans, upon the river Queis, and the confines of Silefia, is well fortified, and has a great linen manu-

factory.

Zittau, on the river Neisse, is a fine city, near the borders of Bohemia, 8 miles fouth of Leibau, and 28 east of Dresden. Wenceslaus, king of Bohemia, cncompassed it with walls in 1255. It is well fortified, and the houses are built in the newest stile. It has a good trade in beer, a great manufactory of cloth, an hospital, which was once a Franciscan monastery, and

large populous suburbs.

The land estates of Lower Lusatia are similar to those of the Upper. Spiritual matters belong to a consistory crected in 1668; the chief officers of which are the prefident of the upper office, the land captain, and the land judge. The tribunals are the Upper Office and the Land Court; and the whole is divided into five little circles, which contain nothing worthy of notice.

CHAP. XI.

HOLLAND, or the UNITED PROVINCES.

THE feventeen provinces, which are known by the general name of the Netherlands, and include the Seven United States denominated Holland, were formerly part of Gallia Belgica, or Belgic Gaul. They derived the appellations of Netherlands, Pais-Bas, or Low Countries, from their low fituation. They are fituated between 50 and 53 degrees of north lat. and between 2 and 7 degrees of east long. comprehending in length 350 miles, and in breadth 300. bounded by the German Sca on the north, by the circle of Westphalia and other parts of Germany on the east, by France on the fouth, and by the British Channel on the west. The Seven United Provinces, of which we are here to treat, form only the northern part of this track, and comprise Holland, Friesland, Overyssel, Zealand, Groningen, Gelderland, and Utrecht. These seven provinces are situated between 3 deg. 20 min. and 7 deg. 50 min. eaft long. and be-tween 51 deg. 35 min. and 53 deg. 40 min. north lat. They are about 150 miles in length, and much the fame in breadth.

SECTION I.

Climate, Productions, Rivers, and general Observations concerning Holland, or the United Provinces.

A^S this country is low and fwampy, partly fur-rounded by the fea, and abounding in bogs and marshes, the air is too moist, and consequently unwholesome. Rains and fogs are frequent; and the gout, scurvy, rheumatism, &c. are common and inveterate. Holland would be overwhelmed by the fea, were it not for the dykes and dams, which exhibit aftonishing proofs of human industry, and are stupendous works, defigned to repress the inundations of the fea, and drain the waters from the land. The marshes are very fertile, and feed abundance of cattle. milk being exceeding rich, great quantities of butter and cheefe are made, not only for home confumption, but for exportation. The breed of theep is good, and produces excellent wool. The other natural productions of the country are tobacco, madder, turf, fruit, iron, &c. All the provinces either lie upon, or communicate with, the North Sea, by means of the Zuyder Sea. This Zuyder Sea, or South Sea, was formed originally by a branch of the Rhine, increased afterwards by a stream of the Vecht, and at length rendered very capacious by an inundation of the fea, which happened in the 13th century. The principal rivers are the Rhine, Maes, Scheld, and Vecht.

There are many fmaller rivers that join these, and a vast number of canals; yet there are few good har-bours in the provinces. The best are those of Rotterdam, Helvoetluys, and Flushing. As to the harbour of Amsterdam, it is, indeed, one of the largest and safest in Europe; but there is a bar at the entrance of it, over which large veffels cannot pass, without being lightened, or unloaded. There are no mountains in these provinces; and the only lake, properly so called, is that of Haaerlem. The provinces are well cultivated, and very populous, especially that of Holland, which, in this respect, perhaps, has not its equal in the universe. The towns are very agreeable, being kept exceedingly clean; and having canals in the middle of the ftreets, planted with trees. The number of inhabitants is computed at about two millions. The animals here are much the same as in England; but their horses and horned cattle are of a larger fize. Storks build and hatch on the chimnies; but, being birds of paffage, they leave the country about the middle of August, with their young, and return the February following. It is faid there are some wild boars and wolves here; and that neither oysters or herrings are to be found upon the coaft; but of other fifth they have the feveral forts, both in their feas and rivers.

Though the quantity of grain produced here is not fufficient for home confumption; though woods are unknown; and, in fine, though the Hollanders have very few staple commodities, such is their mercantile turn, and fuch their general industry, as to furnish them in an ample degree with all the comforts of life.

SECTION II.

Particular Description of the several United Provinces.

A^S this country enjoys as great a foreign trade as any in the universe, and is of great importance in the scale of affairs in Europe, we shall treat of the particular provinces in the following distinct order.

HOLLAND.

HOLLAND, by far the most considerable, and giving name to the whole of the United Provinces, is fituated about 100 miles to the east of England, being bounded to the north and west by the German Ocean, to the east by the Zuyder Sea, and to the fouth by Zealand and Utrecht. It is about 100 miles long, rather less than 30 broad, and divided into north and south. Some few places of this province are fruitful in corn. but the greatest part consists of very rich pasture lands, where confiderable herds of kine are bred. The multiplicity of rivers and canals that interfect the whole country, and form a communication between almost every village and town, are of infinite fervice to the inland commerce of the country, though they are of great disadvantage to the climate. The province of Holland is fo populous, that the number of inhabitants is computed at one million two hundred thoufand. In point of cleanliness, no country surpasses, and few equal it, especially north Holland, and that even in the villages. From the counts of Holland this province devolved, in 1436, to the dukes of Burgundy, and from them to the house of Auttria, along with the other provinces. The states for Holland and West Friesland are composed of the nobility and de-puties of the towns. Of the latter there are eighteen that fend deputies to the affembly of the states, which is held at the Hague. The grand penfionary is a person of great dignity and weight in this assembly, and his office requires extraordinary abilities. There are also two councils composed of deputies, one for South and another for North Holland, who have the cognizance of the revenue and military affairs. The whole province fends one deputy from among the nobleffe to the states-general, who takes precedence of all others, together with three or four more. are two supreme courts of judicature for Holland and Zealand, viz. the great council of Holland and Zealand, and the hof, or court of Holland. To these appeals lie from the towns; but the causes of noblemen come before them in the first instance. With refpect to the ecclefiaftical government, there is a fynod held annually both in South and North Holland, of which the former contains eleven classes, and the latter fix.

South Holland contains the following towns: Dort is fituated 34 miles from Amsterdam, on an island that was formed, in 1421, by the overflowing of the Maes and Merwe. It is so very strong, from its natural advantages, that few artificial fortifications feem requifite. It contains the mint for South Holland, a gymnasium, and a commodious harbour. town is large and populous, the streets broad and well paved, and the houses high, and built with brick. It is admirably calculated, by its fituation, for commerce; particularly in grain, linen, thread, timber, and Rhenish wine, the two latter articles of which are brought down the river from Germany. Strangers usually go to view an apartment in the Guildhall, where the celebrated fynod was held in 1619, for terminating the religious differences between the Arminians and Go-Dort is famous for its falmon fishery.

Haarlem is a city of great confideration, as well as antiquity, fituated on the river Speren, 10 miles west of Amsterdam. It has eight gates, is surrounded by a wall, and contains a great number of inhabitants. It is very large, but not firong. During the holy

wars; when the Christians designed to besiege Damietta in Egypt, a prodigious iron chain obstructed the paffage into the harbour. This chain the ships of Haarlem undertook to break, and fucceeded in the hazardous attempt, which facilitated the capture of the place. As a memorial of this transaction, the arms of the city are a fword, between four stars, and a cross over the point, with this motto, Vires vincit virtus; or, Valour vanquishes violence.

The Roman Catholics are more numerous than the Protestants. A most extravagant taste, with regard to flowers, once prevailed here; where feveral kinds, particularly tulips, were bought and fold at an enormous price. Great quantities of linen, thread, &c. are bleached here, as the waters of the place are peculiarly excellent for such purposes. The buildings here are all of brick, and the streets strait, and embellished with canals. The great church is one of the finest structures in the Netherlands, and contains, among other things, two filver bells. The Hadt-house is a magnificent building, adorned with very fine paintings. Here are 4 Dutch, 1 French, 1 Lutheran, 1 Arminian, and 5 Anabaptist churches, with many Roman Catholic chapels.

Haarlem is the fecond in order among the voting cities in Holland, and its government confifts of four burgomasters, seven eschevins, one scout, and thirty-two senators. The manufactures are linen cloth, ribbons, tape, thread, filk, velvet, &c. Good beer is brewed here, great quantities of which are exported, This city claims the honour of having given birth to Laurence Coster, the pretended inventor of printing, and the first book he printed is kept in the stadt-house; as is the statue of Laurence Coster in the town house. There is a communication with the lake, and with Amsterdam and Leyden, by means of feveral canals. Schemes have been often formed for draining the lake, but never put in execution. To the fouth of the town lies a wood, cut into delightful walks and viftas. When the Spaniards laid fiege to this place, in 1573, for the space of ten months, the inhabitants sustained innumerable hardships. In the year 1752 an academy of fciences was founded here, which has fince produced fome eminent men.

Delft, four miles fouth-east from the Hague, is reforted to on account of its pleafant fituation, by rich people who have retired from bufiness. In the great church is a magnificent mausoleum, erected in 1609, at the expence of the states-general, to the memory of William I. prince of Orange, who was basely affasfinated by an emiffary of Philip II. king of Spain. At the feet of the Prince's statue lies a dog, who is faid to have died of grief when his mafter was murdered. Among other flately monuments in the old church is that of the renowned admiral Van Tromp. Delft is famous for its fine earthen-ware, made in imitation of china, and known by the name of Delft ware. The town-house is adorned with several statues, as those of Justice, Prudence, Mercy; and over the gate is a diftich, which may be thus translated :

This house loves peace, and honours virtue's cause; Checks crimes-hates vices-and preferves good laws.

The arfenal for the province of Holland, two powder magazines for the province, and two for the generalite, are kept here, as are likewife the deputies yachts, which are very beautifully decorated. This city is two miles in circumference, of an oblong figure, furrounded by an old wall and ditch, and defended against inundations by three dams and dykes. Here, as in most other provinces, are chimes extremely harmonious; they play one tune at the first quarter after every hour, two at the next, three at the next, and four before the hour strikes.

Leyden is one of the largest, pleasantest, and most magnificent cities in Holland. It is fituated fix miles east from the ocean, and 19 fouth of Amsterdam. It was erected on the ancient channel of the Rhine, which paffes through, interfects, and divides it into feveral islands, that meet again about the white Gate. It has 8 gates, 24 wards, subdivided into 90 leffer parts, 50 islands, of which 31 may be failed round by boats, 180 ffreets, 145 bridges, and 42 towers on the walls. The ditches are broad, deep, and circumferibed by a quick-fet hedge. The esplanade is adorned with rows of trees, and has the rampart on one fide, and gardens or meadows on the other. The houses are magnificent and neat, the streets broad and clean, and the canals regular and agreeable. In the middle of the town is a round strong tower, called the Burgh, which measures 610 feet in circumference, and has an afcent of 50 fleps, and a fine prospect from its summit. The burgrave of Leyden take their appellation from the burg, or tower. The great church is a noble struc-ture, with a lofty roof, large windows, and three rows of elegant pillars on each fide of the choir. This, as well as the other churches, contain feveral remarkable monuments, and other curiofities. Among the rest, in the church of Notre Dame, is the monument of the celebrated Joseph Scaliger. Here are many hofpitals, which are kept with that remarkable neatnefs peculiar to the Dutch. The orphan-house only, maintains 900 children. The stadt-house is a capacious building, with a handsome stone front. In the burgomaster's chamber is a fine piece of painting, by Luke of Leyden, representing the Last Day of judgment. The waters in some of the canals, in hot weather, used to grow stagnant; on which account two large canals, a lew years fince, were made, on one of which two mills were fo contrived as to force water into the town, and on the other two mills of a different construction were formed to draw it from thence, which has, in fome measure, remedied the great inconvenience complained of. The university belonging to this city is its greatest glory. It was founded, A. D. 1573, by the states-general, as some recompence to the inhabitants for the great hardships they had undergone; and losses they had fustained, when they were befieged by the Spaniards. The school is a capacious pile of building, three stories high; in the uppermost stories of which the celebrated Elzevir had his printing office. This univerfity has produced many learned professors, in particular Lipsius, Scaliger, Salmasius, Henisius, and Boerhaave. Physic and law are the predominant studies; and the number of students have sometimes amounted to 2000: but only two of the colleges are endowed, fo that the students who do not belong to them are obliged to board themselves in the town. When matriculated, the scholars have great privileges, and even before matriculation are fo far from being obliged to conform to an academic drefs, that they are even permitted to wear fwords. The university is governed by three curators. The rector is elected annually, and has his own affeffors. Near the school is a physic-garden, where the botanical professor reads his lectures; and the Indian cabinet contains a great number of turiofities. The anatomy hall is an octagon building, the walls of which are adorned with pilatters and cornices; and the library, founded by William I. is well furnished with books. The cloth manufactory here is much decayed, which formerly flourished to a great degree. This city is famous for the long and fevere liege it maintained in 1573 against the Spaniards. We cannot help mentioning the reply of that illustrious magistrate, Adrian de Vers, when the citizens represented to him the havock made by the famine during the fiege, and infified upon his furrendering: "Friends, (faid he,) here is my body, divide it among you, to fatisfy your hunger, but banish all thoughts of furrendering to the cruel and perfidious Spaniard." They took his advice, in regard to their not furrendering, and never would liften to any overtures; but told the Spaniards, they would hold out as long as they had an arm to ear, and another to fight.

Amsterdam is the capital not only of the province

of Holland, but of all the United Netherlands. Its fituation is on the river Amftel, and an arm of the sea called Wye. It is in 52 deg. 20 min. north lat. and 4 deg. 30 min. east long, and erected in a morass, on strong and extensive piles, in the form of a crescent. The stadt-house alone hath upwards of 130,000 strong piles of wood for its foundation. This city is supposed to have derived its name from the river Amstel, or from a fortress on the Amstel of the same application. However, it is most probable, that it received its name from the river, which is formed by the confluence of several streams about six miles above the city, and a dam which is designed to prevent this river from overflowing the country; these joined together make Amstel-Dam, which hath been corrupted to Amsterdam.

It was founded towards the latter end of the 12th century, and rofe gradually from being only a fmall fifting village to its present state of opulence and im-portance. The Amstel divides it into two grand divifions, and having filled all its canals there, again fubdivides it into various fmall islands. A communication, however, is maintained by a great number of bridges; and the masts of the multitude of ships, rows of trees, &c. give an idea to the beholder of a forest in a town. plantagie is a place laid out in beautiful walks, and planted with trees; and on the Wye is a delightful walk, which commands an admirable prospect. The city of Amsterdam, next to London, is thought to be the most extensive city in Christendom. It is, without any manner of doubt, one of the greatest trading ports, and not perhaps inferior to any city for riches. It is furrounded with brick walls, and a large ditch, and the gates are built with free-stone. The walls are high, kept in good repair, and slanked with 26 bastions. The harbour is shut up with large stakes of piles drove perpendicularly into the bottom of the water, and joined together on the ton by steams bearing. ter, and joined together on the top by ftrong beams placed horizontally; with openings between them for fhips to go in and out; but these openings are every night shut up by booms, laid across and locked, after ringing of a bell, to give notice to those who would go out or come in to make haste. Beyond the ditch that furrounds the walls there is a dyke to receive the water of the canals, which would overflow the neighbouring meadows, that are a great deal lower than the water in the canals. On each fide of the baffions there is a windmill to grind corn; and round the whole city is a great number of mills for fawing boards, preparing tobacco, making gunpowder, and many other uses. The gates are very fine, particularly that of Haaerlem, which is a noble piece of architecture: it is all of freestone, and adorned on each side with large columns, with a lion's head on the top of each. This gate is 24 feet high, and the arch of it 19. In the middle is placed the new coat of arms of the city, viz. Gules, a pale fable and three foltiers with creft and Imperial crown, supported by two lions. The bridge over the Amstel, which joins one side of the rampart to the other, is one of the finest structures of that kind in the whole country. The three principal canals, which run through the city, in the form of femicircles, are the Heere-Gragt, the Keyfers-Gragt, and the Prince-Gragt; that is to fay, the canals of the Lords, the Emperor, and the Prince. The quays of them are all of free-stone, and adorned on both sides with noble houses, and fine rows of losty trees. Most of the houses upon those canals have very pleasant gardens

The houses of Amsterdam, in general, are handsomely built, either with brick or stone. The streets are spacious, well paved, embellished with trees, and have canals passing through them. Here are eleven Dutch Calvinists, one high Dutch, two French, and three English churches; but only the Calvinists have the privilege of using bells. The Roman Catholics have twenty seven chapels, and a kind of cloister, the nuns of which, however, are allowed to go abroad, and to marry if they please. The Jews, Arminians, Anabap-

tifls, &c. are likewise places of worship; but all who are not of the established religion must not marry in their own mode without the peculiar permission of the magistracy. In a court yard belonging to one of the Jews synagogues are schools where children are instructed in the principles of the Jewish religion and taught Hebrew.

What they term the Lombard is a corporation, empowered by authority to lend money upon pledges at a moderate interest. The bank here was founded in at a moderate interest. The bank here was founded in 1609. All payments, exceeding the fum of three hundred guilders, must be made in bank. Bank money is generally about five per cent. better than current, and the difference is termed the agio. Instead of drawing an interest, every proprietor pays considerably for keeping his money in the bank, the credit of which is very great, as depending not fo much upon the treafure actually deposited there, as upon the security of the city, and even of the republic. It is under the care and inspection of the burgomasters, city has a great share not only of the trade carried on in Europe, but in all the rest of the world; and in particular, it is in possession of one half of that vast commerce carried on by the Dutch to the East Indies, and governs the whole.

The industry of the inhabitants of Amsterdam is amazing; all are employed in fome trade, manufactures, or business, and none are idle, but such as either want hands, or strength to use them. The number of inhabitants, is computed at about two hundred thoufand, of which a great part are Papifts and Jews. The greatest disadvantages this city labours under are the want of good air and water. At the mouth of the harbour is a bar, which cannot be paffed by large ships,

till they are lightened.

This city cannot properly be faid to be adorned with any squares: the principal place so called is the dam, which is very irregular, and has no capital building but the stadt-house, which is a noble oblong edifice of free-stone, 282 feet in length, 235 in breadth, and 116 in height. The architecture of the new stadt-house is admired by most. At the entrance on the right hand is the hall of justice, and below stairs is the office of the bank, and the prisons both for debtors and criminals, and a guard-chamber. There are eight large cisterns of water on the summit of the whole fabric, to There are eight large be conveyed by pipes to every room in the building in case of fire; and the very chimnies, by way of precaution, are lined with copper. The cupola affords an agreeable and extensive prospect, and has a round tower, rifing 50 feet above the roof, supported by pillars, adorned with statues. It is furnished with a good chime of bells. This noble edifice is unfurnished, and likely to remain fo, through a superstitious motive; as the Dutch pretend that their destruction depends on its completion, and produce, to vindicate this notion, an old prophecy, which implies,

When men a finished piece the stadt-house call, The Seven United Provinces shall fall.

The new church of St. Catherine is a magnificent edifice, and contains many entious pieces of feulpture,

painted windows, &c.

The admiralty house is an old building, having been formerly a nunnery. The arfenal is a fine structure, 200 feet long and 22 broad. Near the arsenal is the dock, which is 508 feet in length, and has the storehouses, ship carpenters houses, &c. contiguous. The East India House is a very large building, and contains a prodigious quantity of various articles. The India company hath likewife a magazine or arfenal independent of that just mentioned.

Amsterdam contains many hospitals, which together maintain and relieve great numbers of both sexes. Besides these, here are many places where people may have diet and lodging for life, on advancing a certain fum of money, which is not very confiderable. At No. 75.

many parts of the city poor boxes hang on chains, being locked up and fecured by the overfeers of the poor, who every quarter go round the city, open the boxes, and diffribute the money. The play-houses pay half their profits to the use of the poor. All who entertain people at fairs are obliged to contribute a third of their profit; and all who pass through pay a penny for the same purpose.

The exchange is another ornament of Amsterdam, It is built over three arches, under which runs part of the waters of the Amstel, thro' a canal called Rockin, into another named Dam-Rack. Formerly boats were suffered to pass under those arches; but they are now locked up with wooden rails, fince it was discovered that some traitors attempted to hide under them a boat laden with gunpowder, in order to blow the exchange up, at the time the merchants were met there. At a quarter after twelve the gates are shut, and those who come after that time must pay a penny for the use of the poor. Above stairs, over the gallery, there is a fencing school, the master of which is appointed by the magistrates; and a hall, where they fell all forts of woollen cloth. The chief post-offices are all in the

neighbourhood of the exchange. The public houses of correction are worth a stranger's view; as the Rasp-house, where rogues are impri-foned, and kept at hard labour; especially rasping or fawing Brafil wood, for three, four, feven, ten years, or for life, according to the nature of their crime. When they are incorrigible they are often put in a dungeon where the water comes in; fo that they must be continually labouring at the pump to avoid being drowned. The fpin-house is a place where profitutes, or disorderly women, are locked up, and obliged to fpin or sew with great diligence; but if they can be at the charge of it, they may have chambers by them-

In the illustrious school, or academy, public lectures are read on the oriental and other tongues, divinity, philosophy, history, &c. The lawyers and physicians have likewise their colleges; and here are several high towers with a clock on each, fo distributed, that the hours may be heard to strike in any part of the city. The library, near the fouth church, is a fine building,

well furnished with books.

The fluices are works of prodigious expence and art, and worth a traveller's notice. Formerly the city was frequently damaged by the overflowing of the water, which, upon the blowing of the north-east wind, was driven out of the Zuyder Sea and the Wye, with such violence, into the canals in the streets, that the water overflowing, not only run into their cellars, but even rose to the first floor of their houses that stood in the lower parts of the town: to prevent which the magistrates caused these sluices to be made at the mouth of every one of the four canals that open to the Wye. These are strong solid brick-works, 10 or 12 feet thick, raifed from the bottom of the river, or rather gulph; to the furface of the ground, and built across the canals, leaving only convenient places for the passage of ships; which openings are again shut up with very strong shoot-gates, able at all times to resist the force of the water, and fecure the inhabitants from its rage.

There is a fettled custom in the Netherlands not unworthy of notice, which is, that the cities and most of the villages have a house for rhetoricians, or rather for poets; for here, under the denomination of rhethoricians, are understood those that delight in poetry. As their inclination to verse is very strong, it engages the Dutch poets to creet public schools every where, in order to exercife themselves, and to acquire some repu-tation by their performances. The spiel, or musichouses, are a kind of taverns, where young people of the lower class meet two or three times a week, to enterrain themselves with music, dancing, &c. The pesthouse was built in 1630, and has 360 windows.

Amsterdam has two suburbs, one at the gate of the regulars, and the other extending to the village of Over-9 Y

ton, where boats that come from Leyden are rolled over land upon wooden rollers. The city is governed by a fenate of 36; and when a vacancy happens by death, the fenators chuse whom they think proper to fill the place, without any reference to the people. The principal civil officers in Amsterdam are the treasurers, who manage the public revenue; the foot, whole office at once refembles that of a magistrate of the police, and that of a sheriff; and the pensioner, who acts as recorder of the city.

The militia confifts of 60 companies of foot, of at least 200 men each; so that the whole number is always from 12,000 to 15,000. The Jews and Anabaptifts not being admitted to bear arms, are obliged to main-

tain 1400 foldiers, who act as the city guard. Navigation and general commerce, from this city, to France and England, are not very great; but the corrrespondence between the bankers of Amsterdam, and those of London and Paris, and the bufiness of exchange, and that fort of traffic that depends upon banking, is highly confiderable. In fhort, Amfterdam has her share in all the business that is done in Europe, and in most of the trading world.

To this prodigious extent of foreign commerce we must add the manufactures, which, though carried on in other towns of Holland, are also more or less practifed in this powerful and opulent city, with exception only to Delf ware. There are refiners for fugar, falt, cin-

namon, camphire, borax, fulphur, yellow wax, &c.
This city was lately befieged by the troops of the king of Pruffia. Commotions had been excited in some of the slates, which seemed resolved to deprive the fladtholder of feveral rights he possessed as devolving from his predecessors. Amidst the general tumult his royal consort, sister to the king of Prussia, had been treated, at the instance of certain persons high in power, in a manner derogatory to her dignity. Incenfed at this the Prussian monarch commenced hostilities against the malcontents, invested the capital of Amsterdam, caused the insurgents to surrender, and brought them to terms of accommodation with the stadtholder; who, being reinvested with his rights, and peace and good order restored throughout the provinces of Holland, his troops evacuated the city of Amsterdam.

Gouda, Gauda, or Ter-gow, is feated on the small river Gow, from which it has its name, and the Yffel, which, about five miles lower, falls into the Maes. It is almost of a round figure, and enjoys a pretty healthful air, though feated in a marshy ground; and by their fluices the inhabitants can drown all the adjacent country, which makes it inaccessible, except by two banks, on each fide the Yffel, which are fo well fortified, that no enemy can come that way; and the town is likewise encompassed with a good wall, and a broad and deep ditch. The market-place is reckoned the largest in Holland, the town-house stands in the middle, and near it the great church, the paintings on the windows of which are extraordinary fine. are the works of two brothers, natives of Gouda, named Theodore and Walter Crabeth, the most eminent painters on glass that ever were. The buildings here are, for the most part, more neat than stately; and the city is kept very clean, by a multitude of canals, and fmall currents, that are cleanfed by the tide. The chief manufactures of the inhabitants are of cordage, and particularly of pipes, which are neat, and of which they have a very extensive trade. They make alfo, in the neighbourhood of this city, a vast quantity of bricks and tiles. It is encompaffed, like most other cities in Holland, with multitudes of pretty gar-dens, adorned with neat fummer-houses. Goudefluys, which takes its name from this city, lies near the old channel of the Rhine, between Badegrave and Leyden.

Rotterdam is fituated at the conflux of the Maes and Rotter, from the latter of which, and Dam, its name is formed. It is 12 miles from the Hague, and 28 from Amsterdam. The streets are spacious, adorned with lofty trees and beautiful canals; by some of the

last of which ships of the greatest burden are brought into the very heart of the city. Over the Maes, which is very broad, is a bridge, on which is placed a brass statue of Erasmus. The Haaring-Vliet, and the statue of Erasmus. The Haaring-Viiet, and the Boom Quay, are noble streets; the latter lies along the Maes; and on one fide has a magnificent row of trees and houses, or rather palaces, extending above half a mile; and on the other the river, where ships are continually failing up and down, or at anchor. The principal buildings in the town are the exchange, the East and West-India houses, the bank, the arsenal, and the great church, or that of St. Laurence.

There are three high tribunals in this city, viz. that of the admiralty of the Maes; of the high-bailiff, or dyke-graaf of Schieland; and that of the judges of Schieland. On the east and west sides of the city are docks, where they are continually building, repairing, or launching veffels; but the largest ships belonging to the admiralty of Rotterdam lie at Helvoetfluys; and, as there is not a fufficient depth of water at the mouth of the Maes for ships that draw above 15 feet, they are obliged to come hither by the way of Helvoetsluys, and the Haaring-Vliet. The glass-house here produces abundance-of glass toys, and enamelled bowls, which are fent to India, and exchanged for China ware, and other oriental commodities.

Gorcum is a neat well-built city, ftrongly fortified hy art and nature, and is, as well as Worcum and Loevenstein, one of the keys of Holland. They have a daily market for corn, butter, cheefe, fowls, wild-ducks, and other provisions. Their lords formerly named their fenate, but in 1652 the states gave them power to appoint their own magistrates. Over the water-gate there is this inscription: " A city happy in the loyalty of its inhabitants, bleffed in peace, and unconquered in war."

Afperen, a small walled town, belonging to the family of the Boetselaars, is noted for giving birth to At Leerdam, a fmall city feveral eminent divines. belonging to the family of Orange, the celebrated Cornelius Jansenius was born.

Schiedam, on the river Schie, is celebrated for the number of juniper-trees which grow in the neighbour-hood. The inhabitants are, in general, fishermen and net-makers.

Schaonhoven, fituated at the conflux of the Lech and Vliet, at the distance of 11 miles from Rotterdam, is well fortified, and has a good harbour and trade, espe-

cially in falmon, herrings, paper, &c.
Birel, in the ifle of Voorn, near the mouth of the Maes, has a good harbour and trade, pleafant walks of trees on the ramparts, and is ftrongly fortified. The celebrated admiral Van Tromp was born here. island on which this town stands is 20 miles long and fix broad; the air is thick, and the foil fruitful. Briel was the first town that the malcontents, under the command of the earl of March, took from the Spaniards in the year 1572, which occasioned the revolt becoming general, and laid the foundation of the Republic of the United Provinces. It was likewife one of the cautionary towns; which was mortgaged to queen Elizabeth, for repaying the expences the had been at in supporting them against the crown of Spain.

The Hague, or Gravenhage, is tituated two miles east of the sea, nine north-west of Rotterdam, and nine south-west of Leyden. The name implies Earl's-Grave, as formerly the earls of Holland had a villa Since the commencement of the Republic in 1579 it hath become a very important place, though it is called only a village, because it is not walled, and does not fend deputies to the states. It, however, furpaffes many cities in most respects, and, with regard to extent, opulence, number of people, &cc. is equal-It contains above 5000 houses, about ed by few. 50,000 inhabitants, is fituated on an elevated ground, in the centre of many cities, towns, villages, &c. is furrounded by a fine canal, and commands the most beautiful prospects that imagination can conceive.

am, and es Earl's-1 a villa public in though illed, and however, th regard is equals, about d ground, &cc. is the most eive. The

The buildings, in general, are grand, the compeople politer than in any other part of the Netherlands. The palace; or inner court, is moated about on three fides, and on the fourth is washed by the Vyver, or Dish-Pond. There are three entrances into it, over fo many draw-bridges, which might be drawn up in case of a tumult. The court is large, and almost square; and in it, before the guard-room, stands a very large tree, which was planted by one of the princes of Orange. The buildings are old, irregular, and not very magnificent. The ftadtholders relide here; and the states-general, the states of the province of Holland, the council of flate, the council of the nobility, and the fovereign courts of justice, hold their affemblies here in different apartments. A great hall, of gross Gothic architecture is the most conspi-cuous building of the place, but with no happy effect. The walls are hung with colours, drums, and other trophies of victory, taken from the Spaniards, French, and other enemies of the commonwealth. The names of the battles are written underneath them, as Hochster, Ramilies, Malplaquet, &c. In the mid-dle of the hall is a scaffold, or wooden structure, where the state lotteries are drawn by hospital boys, as in London: there are also several booksellers, stationers,

and other shops in it. The chamber, where the states-general assemble, is partly adorned with fine tapestry, and embellished with elegant paintings of the princes of Orange. The chamber of truce, from the fize and number of the windows, is very luminous; and in it the ambaffadors have their public audiences. Near it is the chamber of private conference, a plain apartment, but containing 12 fine pictures of Hans Holbein. The outward court is much larger, and more open, than the inner. The horse-guards draw up here, as the foot do in the inner court. The former do no duty, except when the states are sitting: they are cloathed in blue, faced with red, very finely mounted, and make a good appearance. At the gate through which is the paffage from the outer court into the Plaats, stands the prison for state criminals, where the unfortunate de Wits met their fate; this place is always shewn to strangers. De Plaats is an open airy place, almost in the form of a triangle: it has no trees, but is adorned with neat and beautiful houses. Criminals of any eminence are executed here, on a scaffold erected for that purpose.

The Plaats opens to the Vyverberg, which is the most agreeable part of the Hague; is is called Berg, or Hill, because it is an eminence made with the earth dug out of the Vyver, or large bason of water at the bottom of it. It consists of several fine shady walks, with feats in them; and has on one fide a row of hand-fome buildings, and on the other the Vyver, which affords a very grateful prospect on a summer's day. The Vyver is handsomely faced with stone, 200 paces long, and near 100 broad: it washes the back part of the court, and of prince Maurice's house. There is a pretty island in the middle of it planted with a tust of trees. One of the most remarkable buildings on the Vyverberg is the Hof, or Palace of Friefeland, which belongs to the prince of Orange. It was built by one of his ancestors, and is dark and decayed for which reason his highness, when he comes to the Hague, does not live in it, but in an hired house in the plain. A little beyond that palace is the Logement van Dort, or the house where the deputies of the city refide, when they are at the Hague,

The Vyverburg terminates in a very spacious opening, which takes in part of the Voorhout, and is full of regular plantations and gardens.

The Voorhout is fo called because it was formerly the entrance into the wood, Voor fignifying before, and Hout, a wood, or grove. It is the most celebrated part of the Hague, and confifts of the mall, and three ways for coaches on each fide, planted with trees; beyond which are two parallel rows of magnifi-

centhouses, chiefly occupied by the foreign ministers, and persons of the first quality, at the Hague. The most remarkable buildings here are at the upper end of the mall. The palace of Opdam, or Waffanaar, is a neat elegant flructure. The Little Voorhout is railed round, and adorned with high trees like the other. The houses about it are elegant and pleasant. The Jews tynagogue is very neat, and particularly ele-gant within. The Little Voorhout opens to the New Princels Graft, one of the most elegant parts of the The magazine, or military store-house, is a Hague. lofty building, principally defigned for founding can-non. The French play-house, in Casnari-street, is a very indifferent building: and the Plain, in Dutch Het Pleyn, into which one enters from the outercourt, is a beautiful grove, laid out in feveral cross walks, and furrounded with stately houses; here the foot-guards draw up every afternoon. The deputies of the city of Amiterdam have their houses here, which are magnificent, and worthy the representatives of so great a city, and the prince of Orange has also a fine house here.

The Noord-eynde, or North-end, is a long strait firect, in the midale of which is the Oude Hoff, or Old Court, a noble palace, belonging formerly to king William III! It is a large modern building, with two advanced wings, supported by high arches, from the angles of which runs a noble baluftrade; in the midft of it is the principal gate; and at each end are two leffer ones : this baluftrade, which is of iron gilt,

separates the court from the street.

Near the great market stands the Stathuys, or Town-House; it was formerly but an ordinary building, but is now rebuilt in a moderntafte; it fronts the great church, and the space between them is used for public execu-tions. A scaffold is erected, on such occasions, before the windows of the town-house, where the magistrates fit, and see the sentence executed. The town-house is a plain and handtome building, but differs in nothing from a private house, only in the front of it there is this good motto, in large gilt capitals: Ne Jupiter quidem omnibus motto, in large git capitals: No jupiter quidem omnious placet; that is to fay, "Jupiter himself cannot please every one;" alluding to the difficulty of pleasing universally in the administration of justice. The bench on which the judges fit is finely gilt and carved; and over it is a niythological painting, on the administration of juffice, exquifitely well done.

The great church, over against the town-house, is very large: the choir, which is separated from the body of the church by a brass balustrade, is darkened by the

great number of escutcheons affixed to it.

Near this church is the anatomical hall, belonging to the furgeons of the Hague; they are upon the same footing as those in France, form a company, and have a proteflor of anatomy, who diffects publicly, reads lectures to them, and is paid by the magistrates.

In the street, called the Hooge West-eynde, or High West-end, is the hotel of Spain: it belongs to the crown of Spain, whose arms are affixed to the wall, and whose ambassador always resides in it. This is the only crown that has an hotel, or house, at the Hague, for its

minister.

Near this hotel is an house where ladies, whose fortunes are not equal to their birth, are maintained. It was founded by our excellent queen. Mary, confort of William III. for a certain number of French Protestant gentlewomen, who, having made a facrifice of their estates in France to their religion, and not being capable of getting a livelihood, would have been reduced to the utmost distress, had they not met with such a feasonable relief.

In this part of the Hague is alfothe Prince-graft, one of the most beautiful and magnificent freets in Europe : it is near half a mile in length, proportionably broad, and as strait as a line. A fine canal, adorned on both sides with shady trees, runs through the midst of it. The bridges over it are of hewn stone, with iron rails upon the fides of them. The buildings, especially those lately

erected on one fide of the street, resemble palaces more than private houses, and are inhabited by persons of

the first rank.

Near the farther end of this fireet flands t'Hofje van Nicoop, i. e. Nicoop's Hospital, or seat for poor people. It is one of the most beautiful hospitals of that kind, and was built by one Newport, a Roman Catholic merchant, for 60 poor widows of his religion; but the magistrates obliged him to allow the Protestants an equal share in his charity. The contrivance of the building is admirably adapted to the use it was intended for.

The environs of the Hague are exceeding pleafant. Among other agreeable objects are the wood, with the palace of Orange at the extremity of it, called the House in the Wood; the village of Scheveling; and the sand-hills along the North Sea; with the village of Voorburg, and the charming feats and fine gardens round it. Two miles from the Hague is Ryswick, a village; and a quarter of a mile from that a noble paround it. lace belonging to the prince of Orange, famous for the treaty of peace concluded there in 1697. Five miles beyond Loofduynen, and not far from the beautiful village of Gravelande, is Honflardyck, another palace belonging to the prince of Orange, and one of the finest structures in the Low Countries.

Naorden, a town on the Zuyder-Sea, is ftrongly fortified, and a kind of barrier to Amsterdam. are some woollen and velvet manufactories.

Muyden is a well-fortified town at the mouth of the Vecht, on the Zuyder Sea. Great quantities of falt are made here; and the adjacent country, in case of need may be laid under water.

The principal places in North-Holland are as

follow:

Alkmaar, 23 miles north of Amsterdam, is a beautiful and pleasant town, surrounded with gardens, walks, and meadows. The road and canal from hence to Bemfted are very agreeable, as are the walks upon the ramparts. The inhabitants are principally Roman Catholics, and the greatest trade is in butter and cheese.

Edam, near the Zuyder-Sea, has a confiderable trade

in timber, train oil, falt, fhip building, &c.

Monikendam, Monikedam, or Munikedam, lies on
the Zuyder-Sea, about eight miles diffant from Amfterdam to the north-east, and as many from Muyden to the north. It has its name from the small river Monick. which runs through it. It is an ancient city, mentioned in the Dutch annals of 1236, well fortified with ramparts and walls, and has a monk for its arms. The inhabitants of this city contributed very much to the victory gained by the Dutch near Hoorn, in 1573, over the Spanish fleet, commanded by the admiral count Buffu; and they still keep in the town-house the collar of the order of the Golden Fleece, which was taken from that admiral by Cornelius Direzen, a native of Monikendam, who was admiral of the Dutch fleet.

Hoorn is situated on a bay of the Zuyder-Sea, 12 miles from Alcmaer to the east, and 17 from Amsterdam to the north. It is a pleafant, rich, and large town, en-compassed with fo many dykes and canals, that it is reckoned impregnable. The inhabitants are also famed for courage. Some derive its name from its crooked harbour. Hoorn, in Dutch, fignifying a horn. On the land fide are rich pastures, fine gardens, and plea-fant walks. The trade of this city confists chiefly in butter and cheefe, whereof they export vast quantities into Spain, Portugal, and other parts, especially at their annual fair in the month of May. They have a considerable trade in Danish cattle, which being brought lean into this place are fattened in the adjacent pastures and then drove to the other places in Holland. They also build ships, and have a share in the whale-sishery. Here is one of the fix chambers of the Dutch Fast-India company. The chamber of North-Holland, for the West-India company, is settled here: and one of the five colleges of the admiralty resides alternately at Hoorn and Enchuysen. Hoorn has given birth to several learned men, and particularly to Peter Junius,

the celebrated historian; and to William Scouten, who, failing beyond the Straits of Magellan, discovered, in

1616, the paffage called the Strait of Le Maire. Enchuyen, or Enchusia, stands on the Zuyder-Sea, It miles distant from Hoorn. It is very strong by its situation and by art. The harbour is one of the best in this country; but as there lies a bank of sand before it, it is liable to be choaked up, and made impracticable for large vessels. They build many ships here, drive a great trade in herring sishing, and send out large sleets into the Baltic, and other places, by which, as well as by their refining falt from Brittany, in France, the city is in a flourithing condition. This is the first town that revolted from Spain, after the taking of the Briel by the confederates.

Medinblick, on the Zuyder-Sea, feven miles diftant from Enchuysen, is reckoned the most ancient city in North-Holland, and was formerly its capital, and the feat of the Frison kings. The town is small, but has a noble harbour. The banks, or dykes here, are stronger, broader, and higher than any in the country. The chief trade of the inhabitants confifts in timber, which they fetch from Norway, and other places in the Baltic. They were the first who, in 1593, failed to Guinea, from whence they returned to Amfterdam richly loaded. The neighbouring country abounds in excellent pastures, where are bred a prodigious number of cattle.

Fourteen miles to the west of Medinblick lies Sohaagen, a rich village: the adjacent country is reckoned the richest foil in Europe.

Egmond, a well built village, which gave title to the counts of Egmond, lies in this country.

Seven miles farther to the fouth lies Beverwick, anciently noted for pilgrimages to it. It has pleafant enclosures, a good harbour on the mouth of the Wickermeer, and a lake which communicates with the Wye.

The drained lands in North-Holland are the Zype, the Beemster, the Purmer, the Woormeer, and Scher-meer. The Zype was first drained and encompassed with banks by William, lord of Schaagen, and sccured by strong fences in 1552, but the fea broke them down in 1570: after which it was drained again, and fecured by a mole of prodigious height and bulk, proof againft all attacks of the fea; and it is now a very fruitful foil. The noise made by the waves which break upon it founds like the barking of a pack of hounds, from whence it is called the Hounds Wood. It is supported by large beams of timber, firmly placed in the ground, and strongly fastened together, the distances between them being filled with large stones, that resemble rocks; and the mole is frengthened by a vast bank cast up against it. There were no less than 30 mills made use of to drain the Beemster, which is encompaffed by a channel from four to eight rods broad, and is joined to Purmer-end, by a bridge at the fouth

Across the mouth of the Zuyder-Sea lies a row of islands; the first of which, named the Texel, is disjoined from the north cape of North Holland, by a very narrow channel; nor are the diffances between the reit much larger. The three, named Texel, Flie-land, and Schelling, are reckoned part of North-

Holland.

The Texel is about eight miles long, and five broad; it is defended from the fea by fand-hills, and ftrong banks. Most of the foil is applied to feed sheep, of which they have great flocks; and the cheese made of their milk vies with the Parmefan. This island contains feveral fine villages, and a large town on the east fide, called Burch, which enjoys the privileges of a city. The inhabitants apply themselves to agriculture and herring-fishing; and the states, because of the importance of this place, which lies at the mouth of the Zuyder-Sea, have built a strong fortress here, where they keep always a good garrison.
Flieland, or Vlieland, lies towards the north-east of

the Texel, and is about nine miles long, and but two

abroad; it has only two fmall villages, and is chiefly remarkable for the great quantity of muscles found here.

Schelling, or Der Schelling, lies' to the north-east of Flieland, and is about 10 miles long, and three broad. It has two villages with churches, and three without. The chief of them, containing above 1000 houses, was burnt, with 100 merchants ships, by Sir Robert Holmes, with an English squadron, in 1666. Some reckon this island to belong to the province of Friescland. These islands lying along the mouth of the Zuyder-Sea, by means of several large banks of sand, break the rage of the ocean, and form two good harbours at the Texel and Viie: the first being a noted station for ships bound to the south, and the other for those bound to the north.

The Wierengen, thus called from the great quantity of fee-weed, named Wier, is a number of little islands, which lie more to the fouth, on the coast of North-Holland; the chief of them is five miles long, and two broad, has feveral good villages, a rich foil, and large flocks of sheep.

ZEALAND.

ZEALAND has Flanders to the fouth, the province of Holland to the north, Brabant to the east, and the German Ocean to the west. It consists of islands, is guarded against the sea by dykes, has a fruitful soil, but is without such, except what England and Scotland supply. Sheep are numerous, and the wool sine, and sish may be had in great plenty. The province is populous and wealthy, but the air is not wholesome. The affembly of the states consists of seven members, is held at Middleburg, and has the prince of Orange for its president. To the affembly of the states general Zealands sends sour deputies, who hold their office for life. Two high courts of justice, a college of admiralty, and a chamber of accompts, are the principal tribunals. The clergy are divided into four classes.

The principal places in Zealand are, Middleburg, the capital, fituated 50 miles fouth-west of Rotterdam, and takes its name from its fituation, in the middle of the island of Walcheren. It has the first feat in the affembly of the states of Zealand, and is extensive, handsome, and populous. The form is oval. the public buildings, magnificent, and the streets broad and well paved. The whole is environed by a fine capacious canal well flored with fifth, and the neighbouring profects are very beautiful. The gates are eight in number; the harbour and city are flrongly fortified, and the latter contains 33 parishes, about 4000 houses, and near 26,000 inhabitants. Here are one English, one French, one Lutheran, and fix Dutch churches, a Roman Catholic chapel, a Jews fynagogue, &c. The fladt-house is a fine building, situated in the marketplace, adorned with 25 statues of the counts and counteffes of Holland, a statue of the emperor Charles V. and a handsome tower. The chamber of the affembly of the states is an old building, but is finely hung with tapeftry. The bank is a neat edifice, containing feveral apartments; the commissioners make up their accounts three times in a year, and the city is fecurity for the bank. Here are two prisons, very strong, a commodious Latin school, a horse-guard house, an East-India house, a large market-place where the annual fair is kept, a fish-market. a market for vegetables, an exchange, a mad-house, an orphan-house, and an hospital for the aged and decrepid. The burgers weefhuys was built in 1718, for the maintenance of decayed burghers children; the money for founding it was left by a lady. Here is a pond, which, being filled every fpring-tide, and emptying itself again, makes a continued ffream through all the canals, and prevents the water from stagnating. city is the staple for French and Spanish wines, and its trade in other articles is very considerable. The inhabitants burn coals, which they procure from .No. 75.

Scotland, or Holland turf, not having any fuel of their

Flufhing, fituated in the island of Walcheren, five miles from Middleburg, is strongly fortified, has an excellent harbour, great trade, and contains several fine structures. It shock off the Spanish yoke in 1572, and voluntarily submitted to the states. In 1585 is was mortgaged to queen Elizabeth, but reflored by James I. Sir Philp Sidney was governor of it while in the hands of the English. Loaded vessels come up to the very doors of the merchants. The samous admiral de Ruyter, who rose, from a common seaman and pilot, to be admiral of the United Provinces, was born here in 1607. The prince of Orange, as marquis of Flushing and Veer, or Teer-Veer, is first nobleman of the province, and president in the assembly of the states.

Rammekins is a firong fort, built by Mary, queen of Hungary, and governess of the Low Countries, for Charles V. It stands pleasantly, being encompassed with villages, meadows, and fields; and on one side it has a creek, which is a safe harbour for ships. It was one of the cautionary towns given to queen Elizabeth, West-Cappelle on the western coast of the island, has a commodious harbour, and is samous for the maritime laws used in the Seven Provinces, and called by its name. The palace of the abbots of Middleburg, called Westhove, is pleasantly situated amongst woods, near Domburg, which is now reduced to a village, being ruined by inundations.

Veer, or Teer-Veer, four miles from Middleburg, is well fortified, and has a good trade, especially to Scotland, the natives of which enjoy particular privileges here. The arsenal is the best furnished in the province, and the harbour a very good one. The Calvinists alone are allowed the public exercise of their religion in the town; whence the Veres, anciently carls of Oxford, have derived both their origin and name.

The island of South-Beveland is the pleasantest of all the Zealand islands, and contains the town of Ter-Goes, on the northern part of the island, not far from East-Schelde. It is small, but nearly built, strongly fortified, and carries on a good trade; besides, it is the only town on the island that sends deputies to the states.

Schowen isle is 17 miles long, about eight broad, tolerably fertile, has many rich farms and gentlemens' feats, and contains the town of Zirksee, 13 miles from Middleburg, which sends deputies to the states.

The island of Duiveland took its name from the great number of duives, or pigeons, which formerly abounded in it, and contains only a few villages.

Tholen ifle is eight miles long, and four broad, but does not contain any place worth naming, except. Tholen, which stands on the Earidracht, is well fortified fords deputies to the states, and has a roll house.

fied, fends deputies to the states, and has a toll-house. Sr. Philip's island contains only one village of the same name.

FRIESELAND.

RIESELAND is bounded by the Flie to the west, by Groningen and Overyssel to the east, by the German Ocean to the north, and by the Zuyder Sea to the south. It is 32 miles long, 27 broad, has a soil and air resembling those of Holland, rich passures, that seed large quantities of cattle, sheep, horses, &c. and in the higher grounds good corn lands. It produces turf and wood, has many lakes, and is guarded from the sea by onsiderable dykes. Here are many canals, which facil at commerce. The inhabitants are chiefly Anabaptists. The language approaches the nearest to the Old English of any other in Europe. The linen manufactured here is the finest perhaps in the universe, and the woollens are much esteemed. The affembly of the states here consists of about 82 persons, who send sive deputies to the affembly of the states general. Several courts and chambers belong to this province; and the

化图图图

Calvinist ministers are divided into fix classes which hold

fynods annually and alternately.

Leuwarden, the capital of this province, is 60 miles from Amsterdam to the north-east, and 7 from the German Ocean to the fouth. It is the largest, richest, best built, and most populous town of the province, the seat of the provincial states and the sovereign council, and the residence of the stadtholder. The streets are clean, the houses splendid, the bridges well paved, and the gardens pleasant. The churches, the governor's palace, that where the flates meet, and the houses of the noblemen, are fine structures. The form of the city is an oblong square, encompassed with strong ramparts, a broad deep ditch, and five bulwarks of earth, with a ditch to each. It stands in a fruitful foil; and, by its navigable canals, the largest of which runs to the ocean, they have a good trade with Hamburg, Bremen, Embden, and Holland; and are plentifully supplied with necessaries from the neighbouring countries. One of their canals to the westward is secured by strong fluices. Here were formerly four monasteries, now turned to other uses. They have two hospitals, one of them nobly endowed for 100 poor persons of both sexes, with accommodations for the aged, sick, and lunatic; and for entertaining poor strangers two nights at a time. They have several good laws for regulating their government, into which they admit no military men, nor any but those of the established religion, and of competent estates. The magistracy is composed of three burgomasters, and nine scheepens, or aldermen; one of the former, and two of the latter, are changed annually on New Year's day. This city and Francker are the only two in the province that chuse their own magistrates; those of the other towns are appointed by the stadtholder, from a double nomination presented to him.

Francker, a town about 10 miles from Leuwarden, and four from the Zuyder-Sea, has an university, and a physic-garden. The falaries of the professors are paid out of the revenues of the old monasteries; and the students, neither in this or the other universities of the provinces, pay any tax for their wine and beer. Fine blue glazed tiles and bricks are made here in large

quantities.

Sneek is fituated on a lake of the same name, which fupplies it with plenty of fish, both for consumption

and fale; but otherwise of no note.

Dokkum stands in a fruitful country, abounding with corn, pasture, villages, and gentlemens seats.

great deal of falt is also made at it.

Harlingen stands on the coast of the Zuyder-Sea, at the mouth of a large canal. The admiralty college of Frieseland has its seat here. Its manufactures are falt, bricks, and tiles.

Workum is famous for the quantities of lime made there from mufcle shells; Ylst fends deputies to the flates; and Makkum has many falt-houses and brick-

Hinlopeu has a harbour on the Zuyder-Sea; the inhabitants are employed in fifthing, or fhip-building, and differ from the other Frielfians in dialect and ap-

parel.

Molkweren is a village fituated in a marshy ground. They fpeak here a particular language, which none of the other inhabitants of the country are able to understand. It is a remainder, or dialect, of the ancient Saxon; fo that the people of that village, and the English, understand each other pretty well. The houses here are all separated from one another, and placed so irregularly, that when a stranger comes into this village, he must have a guide to help him out of that labyrinth.

At Wykeb village, in the quarter of the Seven Forests, are interred the remains of the celebrated general Coehorn; and on the coast of Frieseland are two little islands, viz. Ameland and Schiermonnigkoog, the former of which belongs to the prince of Orange, as

a free independent lordship.

GRONINGEN.

GRONINGEN is bounded on the west by Frieseland, on the east by Munster, on the south by Darenthe, and on the north by the German Ocean. It is 47 miles long, and the greatest breadth is about 33 miles. The air and foil are fimilar to those of Frieseland. The number of canals and dykes are very confiderable, and the principal river is the Hunfe. The states consist of the deputies of the town of Groningen, and of the neighbouring country thereof; and the colleges are much the same as in the other provinces. Six deputies are fent to the states-general. The number of established clergy are 160 ministers, divided into 7 classes; and the principal places are

Groningen, the capital, fituated at the conflux of feveral rivulets, which form the Hunfe and Fivel-Ships of confiderable burthen can come up to the city, in consequence of which it enjoys a good trade. The university is well endowed out of the revenues of the ancient monasteries. The town, which was formerly one of the Hans, and has still great privileges, is large and populous, being the feat of the high colleges, and containing 3 fpacious market-places and streets, in which are many fine houses, besides churches, and other public structures. By the river Fivel, and the Eems, it has a communication with Westphalia. In 1672 it made a gallant refiftance against the bishop of Munster. Rodolphus Agricola, and Veselius, two of the most learned men of the age in which they lived, were born here. Under the jurisdiction of this city is a considerable district, called the Gorecht.

Dam, or Damme, stands on the river, or channel, called Damsterdiep. The Imperialists took this city by ftorm in 1536, when those of Gelderland were lords of it; and it was then agreed, that the walls should never be rebuilt, nor the town fortified. Though this is an open place, yet it has all the privileges of a city, and fends deputies to the states of the province. It has fuffered very much of late by inundations.

Delfzyl has a very good harbour, which, for fitua-tion, and other advantages, exceeds that of Embden. It is a strong place, surrounded with good ramparts, and seven bastions; and defended by a citadel, encompaffed by broad and deep ditches. In 1672 the Dutch East-India fleet, confisting of 14 ships, the cargoes of which were valued at 16 millions sterling, escaped into this harbour from the English fleet, which pursued them very close.

Winschoten is a strong fortress, but was taken and plundered by the troops of Munster in 1674. It is chiefly remarkable for the first battle fought against the Spaniards in 1568, by the Dutch, in defence of their liberty; when count Lewis of Nassau, brother to prince William I. defeated the Spanish general Arenberg, who was killed in the action, after himfelf had killed, with his own hand, count Adolphus of Nassau, another brother of prince William I. The Spaniards lost in the battle 1200 men, all their baggage, and fix

OVER-YSSEL.

VER-YSSEL is bounded on the fouth by Zutphen: on the north by Friescland and Drenthe; to the past by the county of Bentheim, and the bishopric of Munster; and to the west by the Zuyder-Sea. It has the name of Over-Yffel from its fituation in respect of Holland. Utrecht, and part of Gelderland. With respect to the foil, it is, in general, far inferior to the other provinces, being full of fands, heaths, and marshes; yet, in fome places, they have good corn land and pasture. The states consist of the nobility, and the towns of Deventer, Kampen, and Zwol, in which their annual affem-blies are alternately held. The province was long fubject to the bishops of Utrecht, till bishop Henry, of Bavaria, transferred it to Charles V. and, in 1580, it

acceded t bunals an provinces hence to clergy of four claffe chief tow

acceded to the union of Utrecht. Here are high tribunals and colleges, answering to those of the other provinces; and five deputies are commonly sent from hence to the assembly of the states-general. The clergy of the established religion, who are divided in the four classes, hold their annual synods alternately in the chief towns. The most remarkable places in the province are the following:

Deventer, in the quarter of Salland, on the Yffel, is a neat, populous, well-built, and well-fortified city, containing feveral churches belonging to different feets, a gymnalium illustre, a mint, and an iron foundery; and five annual fairs are held here. They brew also a pleasant fort of beer, and have a good trade. Along the river side is a sine quay, adorned with rows of

Kampen, on the Yffel, is strong from its situation, and may be easily laid under water. The wooden bridge is a curious structure, standing upon vast piles. This place was once a free Imperial city, and has still a mint, but its trade is greatly decayed.

Hoffelt is a fortified town on the Blackwater; Genemunden is remarkable for the mats made there; Amels is famed for its manufactures of fine linen; and Woolenhoven, on the Zuyder-Sea, is a commercial

Zwol is the handsomest and most wealthy town in the province. It is strongly fortified, contains several churches and hospitals, an arsenal, a college, and a granary. The provincial states meet here, at Deventer, and Kampen alternately: and the celebrated Thomasa-Kempis was prior of a monastery near this town.

GELDERLA'ND.

THIS province is usually called North-Gelderland, to diffinguish it from Upper Gelderland, or Gelders, which belongs to the king of Prussia, and which we have already described in that monarch's dominions. North Gelderland is bounded on the east by Munster and Cleves; on the west by Utrecht and Holland; on the north by Over-Yffel and the Zuyder-Sea; and on the fouth by the Maes, which separates it from Brabant. It is 47 miles from north to fouth, and upwards of 40 from eaft to west. The land lies higher, and the air is much clearer, than in the maritime provinces, and the foil in most parts are fruitful. Gelderland is watered by the Rhine, and its three branches, the Yssel, Leck, and Waal, several canals, &c. divided into three districts, viz. Nimeguen, Zutphen, and Arnheim, each of which has its diets and flates. Those for the province are held twice a year, and the deputies sent to the flates-general are 19. Here are upwards of 200 Calvinift minifters, 4 Lutheran, 14 Roman Catholic, and 3 Anabaptift congregations. The principal places in the diffrict of Nimeguen are as follow :

Nimeguen flands on the Waal, and is the capital of the quarter to which it gives name. It is a large ancient city, flrongly fortified, and pleafantly fituated, where the Oppidum Batavorum is fupposed by some to have flood. The provincial states, and those of the district, assemble in the stadt-house. This city is famous for the peace concluded here in 1678, between the French and the confederates. It carries on a good trade with the duchy of Cleves, and makes great profit by its white beer, which is much esteemed throughout the provinces. In the town-house is kept the sword with which the counts Egmont and Hoorn were beheaded by the duke of Alva's order. The burgrave, who resides in the castle, is one of the chief nobles of the province, and presides in its diets. In the higher part of the city are three large ponds, fed from hidden springs; and through the whole there are many deep wells, which are observed to rise and fall as does the Maes, though six miles distant from this city, whereas the Waal runs close by it, but in

a valley, towards which the descent is considerable. Upon the gate to the north-west of the castle are these inscriptions: Pes imperii. Huc usque jus Stavira. Melior est bellicosa libertas quam servitus pacifica. That is to say, "This is the border of the empire. So far reaches the right of Stavira. It is better to have liberty with war, than slavery with peace." The reason of these inscriptions is supposed to be, that this was the limit of the Roman empire on this side; and that the impost, or tax, called Stavira, reached not them, because they were exempted from this city to Arnheim, across the Betuwe, about seven miles long, at the charge of these two cities.

Tiel, on the Waal, 17 miles west of Nimeguen, though much decayed from its pristine splendor, is still

populous, and has a tolerable trade.

Bommel, the capital, and only confiderable place of an island of the same name, otherwise called Bemmelwaert, stands on the river Waal. It is a pleasant walled city, with broad and regular streets. It is very strong, being fortisted with good curtains, bastions, and towers, a double wall, and double ditches. It stands low, in a marshy ground, which can be overslowed from the Waal and the Maes. It surrendered to the French in 1672, who spent 14 days in destroying its sortistications, carried off the artillery and ammunition, and obliged the town to pay 36,000 guilders to prevent its being burnt. It was afterwards strongly fortisted when recovered by the states. The town chuses their own magistrates, under whose jurisdiction is the whole island of Bommel, in which are many good villages, and which is about 13 miles long, and 4 broad, be-

tween that and the Maes.

Batenburg is the chief place of a little diffrict, called Maes and Waal, because it lies between those two rivers, near their conflux. The town has the title of a barony; and two brothers, lords of Batenburg, were beheaded at Brussels, in the year 1569, by the duke of Alva's orders. The counts of Hoorn were also de-

fcended from that family.

Panderen is a village in the bailiage of Upper Betuwe, where begins the new canal, through which the Rhine at present passes. In the same bailiage stood formerly the Schenken-Schanze, a very strong and spacious fort, built in 1586 by general Martin Schenk; and the Tolhaus, a castle where the dukes of Gelderland frequently resided, and where vessels fill pay toll, as they did formerly. The Betuwe is that track of land lying between the Rhine and the Waal. It is divided into two bailiages, called the Upper and Lower, or Eastern and Western Betuwe.

Zutphen, a town on the right bank of the Yffel, is large and ftrongly fortified, and has a bridge of boats over the Yffel, which divides the town into two parts. The whole neighbouring country may be laid under water by means of the Borkel, a river which here joins the Yffel. There are feveral churches here belonging to different fects, with hospitals for the aged, fick, orphans, and strangers, and a gymnasium. There are pleasant walks about it, especially on the ramparts. The citizens are noted for their courtesy and politeness, to which the many gentlemen who live here greatly contribute. The great Sir Philip Sydney died here of the wounds he received at the siege of this city; and Gerard Van Zutphen, master to the samous Thomas-a-Kempis, was born here.

Arnheim, the third diffrict, contains a town of the fame name, which is not only the capital of this diftrict, but of the whole province. It flands on the Rhine, at the foot of the Veluwe hills, 6 miles from Nimeguen, and 48 from Amfterdam, and is ftrongly fortified. It has also a commodious harbour, and is the seat of the supreme council of Gelderland, and the chamber of accounts. Here is an articient palace, in which the dukes of Gelderland, and after them the fladtholders of the province, used to keep their court. The walls, being delightly planted with lime-trees, render the walks pleasant. In the great church are the

monument of feveral counts and dukes of Gelderland; and near the city is the village of Oofterbeck, where the emperor Henry III. was born in 1027

At Harderwyk, fituated on the Zuyder-Sea, is an univerfity, which, till 1641, was only a Schola Illuftris.

The trade of the town is confiderable, especially in fish, of which its red herrings are much admired. The steeple of St. Mary's church, a stately structure, is fo high that it ferves for a land-mark, being feen at a great diffance, both by fea and land. Prodigious quantities of blue-berries are gathered in the neighbouring woods, and carried to Amsterdam, and other towns. The provincial mint is in this city, the fortifications of which The famous lawyer are in the ancient manner. Gerardus Voetius is faid to have been a native of this place.

In the neighbourhood of Wageningen, a fmall town on the Rhine, with a commodious harbour, tobacco is

much cultivated.

Elburg is a fmall town on the Zuyder-Sea, whose ramparts, planted with lime-trees, form a delightful walk. Its inhabitants subfift chiefly by fishing and carching wild ducks.

In that track of land called the Veluwe is the lordthip of Loo, belonging, with a beautiful feat on it, to the prince of Orange.

UTRECHT.

THE province of Utrecht is furrounded by Holland and Gelderland, a fmall part which borders on the Zuyder Sea excepted. The length is about 32 miles, the breadth about 20. The air is falubrious, and the foil fruitful. The rivers are the Rhine, Leck, Vecht, and fome smaller streams. The provincial states are composed of 12 members, and three deputies are sent to the affembly of the States General. The established clergy are divided into three classes, and hold an annual fynod

at Utrecht.

Utrecht, the capital of this province, and feat of the states, is so called from its ancient ferry or passage over the Rhine. It is a large and populous city, fituated 19 miles from Amsterdam and Rotterdam. were feveral large and rich monasteries, and other religious houses here, before the reformation. The churches are magnificent, especially that of St. Martin, formerly the cathedral, and builty called the dome. Over that of St. Salvador, or the old minster, where the English have a place of worship, is a museum of all forts of antiques and rarities. The only defence of the city is a wall on the canal. Here is a stately town-house, with a commandery of the Teutonic order, and a celebrated university, which was founded in 1636, since which it bath flourished greatly, though it has not all the privileges of most other universities, being wholly subject to the magistrates of the city. The mall, without the town, having five rows of lofty limes on each fide, is very pleafant; and the physic garden, belonging to the university, is extremely curious. There are five churches here that have chapters; but the members of those purchase their places, of which some cost 6 or 7000 guilders. The streams which run through several of the streets contribute much to the beauty and cleanliness of the town; and the canal that is cut from the Leck, and passes through it to Amsterdam, will carry ships of any Pope Adrian VI. was a native of this city. His epitaph is worth inferting : Adrianus Sextus bic fitus eft, qui nibil sibi in vita infesicius duxit, quam quod im-peraret, i. c. "Adrian VI. lies here, who reckoned it his greatest missortune that he stould ever have been called to government." Here, in 1579, the memo-rable union was formed between the feven provinces; and, in 1713, the celebrated peace concluded between France on the one part, and the allies on the other. The Papifts have a nominal archbishop of the city; and there is a filk manufactory carried on in it, which employs a number of hands.

Amersfoort is fituated on the little river Eem, which runs by its walls, and falls into the Zuyder-Sea. It took its name from a ford on this river: it is fix miles diffant from that fea to the fouth, and 17 from Utrecht towards the north-east. It is an ancient town, and was the usual retreat of the bishops of Utrecht, when drove out by the citizens; and the inhabitants of this place frequently helped to restore them. This town was anciently but fmall, as appears from the remains of its old fortifications. It is now much larger, and will take near an hour to walk round it. It is of no great frength, being commanded by a neighbouring hill. The buildings, efpecially those of the Old Town, are very neat. They have three churches here, one of which is a large and stately fabric. Their hospitals are equal to those of the greater cities; and they have a public school, where se-veral eminent persons have had their education. It suffered much formerly by the Geldrians, who took it in 1543. It was also taken by the Spaniards in 1629, but afterwards quitted by them, and better fortified by the flates. Their government is much like that of Utrecht, and they enjoy almost the same privileges. They had and they enjoy almost the same privileges. formerly a great trade in brewing beer; but now they fubfift chiefly by feeding cattle, and by husbandry, there being good arable and pasture ground on the east and fouth; but on the west and north there is nothing but a barren heath. It is called Amersforder-Berg, or the hill of Amersford; and is fix miles long, and almost as many broad. They have planted upon it two rows of trees from Amersford till within fix miles of Utrecht.

Juft upon the edge of this hill flands Soetfyke, a

pleafant palace, adorned with fine gardens, curious fountains, delightful walks, shaded with lofty trees, pleafant parks filled with deer, a large aviary, exceed-

ing fine flables, &c.

Rhenen is situated on the Rhine, about 7 miles above Wyck-te-Overstede to the east, 19 from Utrecht towards the fouth-east, and 13 from Amersford to the fouth. It is an ancient town, thought to be the Grinnes, mentioned by Tacitus, and is furrounded with walls and bastions. On the steeple of the church is a very fine clock, with a most harmonious chime of bells. In the fields between the town and Utrecht are dug most of the turfs that serve the neighbouring country with

Montfort, the chief place of a little diffrict, is fituated on the little Yssel, near the borders of the province of Holland, 10 miles above Gauda to the east, fix from Utrecht towards the fouth-west, and but three from Oudewater to the south-east. It is not a large town, but is fine, near, and pretty strong: it was built by a bishop of Utrecht in 1159, as a bulwark against the incursions of the Hollanders.

SECTION III.

Classes, Persons, Dispositions, Dress, Customs, Manners, &c. of the People of the United Provinces in general.

THE people of the United Provinces may be di-vided into five feparate claffes. First, the nobles; fecond, the opulent merchants retired from bufiness; third, the merchants and traders; fourth, the feamen; and fifth, the boors, or country farmers. Of the first there are but few in Holland and Zealand, having almost become extinct during the long wars with Spain; but in the other provinces they are numerous. They pride themselves upon their rank, and imitate the manners and dress of the French. Economy and moderation once characterised the second class, the opulent merchants; but of late they have been tainted with the profusion and luxury of their neighbours of France and Great Britain. The merchants and tradefinen are tolerably acute, and, in general, intent on the accumulation of wealth. The mariners are plain, furly, and ill mannered. The boors are mostly industrious and diligent but not some laboratory. diligent, but not very laborious: they are, upon the whole, honest and frugal.

about

All appetites and paffions run lower and cooler here than in any other countries, avarice excepted. When they attempt to revenge an injury, their refentment is ufually unmanly and favage, agreeable to the opinion which the great Dryden entertained of them, who fays,

With an ill grace the Dutch their mischief do; They've both ill-nature, and ill-manners too.

The drefs of the common people is plain, and they change fashions as rarely as the Spaniards. The drefs of both fexes is inelegant; that of the men confists of coats without shape or plaits, with long pockets placed as high as the ribs. The drefs of the women is still more singular, for their coats reach only to the middle of their legs, and in North-Holland no lower than their legs.

These people are patient, steady, wary, covetous, calm, and feldom have any difference with each other; but when they are irritated, as before observed, they grow brutish. Many of the lower class carry knives grow brutish. Many of the lower class carry knives about them, with which they stab their antagonists, notwithstanding the fevere laws against this practice. They are, however, very indulgent to their children, They are addicted to drinking, and when they treat their friends they do it fumptuoully. They are neat to excess in their houses and furniture, and the streets themselves are kept amazingly clean. The women, however, have but an indifferent character; and there is a proverbial faying, "That the dittieft thing in a Dutchman's house is his wife;" but this character is not universal. The pavement of the chambers is generally of marble. Their general mode of living is pulled frugal. The poorer people live upon four milk, pulled frugal. and herbs. It is uncommon for any of them to be really in love, or even to pretend to it; nor do the women feem to care whether they are or not. People converfe pretty much upon a level here; nor is it easy to diffinguish the man from the master, or the maid from the mistress. The principal enjoyment of the from the mistress. The principal enjoyment of the Dutch is eating and drinking, for they have no idea of pleafure unconnected with feafting and caroufing. The humidity of the air doubtless inclines them to the cuftom of drinking and fmoaking tobacco, which are in general usage throughout the country. One of their general usage throughout the country. rinter amusements is skaiting, in which they excel; fo that in a hard frost it is assomishing to see the crowds of both fexes that pass from place to place upon the ice,

and dart along with amazing velocity.

Many of the Dutch excel in pairting and engraving, fome have been good flatuaries, and a few have been remarkable for their wit and ingenuity, as Erasmus, Grotius, &c. The common mode of travelling in the United Provinces, and, indeed, throughout the Auftrian and French Netherlands, is in trackfcoots, or draw-boats, which are large covered boats, drawn by a horfe, at the rate of three miles an hour, the fare of which does not amount to more than a penny a mile. The rate of these boats, and also of the post waggons, is fixed, and you are permitted to carry a portmanteau and provisions, so that you are not under the necessity of expending any thing at public houses. The carriage of the baggage is not settled by law, therefore an agreement ought to be made, otherwife the driver will charge not what in equity he thould, but according to the dictates of his avarice, and the money must be paid him if a previous bargain is not made. At the inns and public houses on the road a person is sure to meet with clean linen and soft beds; but their bedsteads, or rather calcins, in the fides of the walls, are placed fo high, that a man may break his necke if he happens to fall out of them. Befides, a traveller must be content to lie with half a dozen people or more in the same room, and be disturbed all night long by somebody or other, if a churlish landlord pleases to have it so. There is no disputing with a Dutch inn-keeper, either about the reckoning or any other particular.

No. 76.

SECTION IV.

Religion, Language, Constitution, Military and Neval Armament, Commerce, Coin, &c.

THE prevailing religion of the United Provinces is Calvinism, which is embraced by the bulk of the people. All other sects, however, of the reformed religion, are tolerated and protected here. The Jews have likewise their synagogues in Amsterdam and Rotterdam. The Roman Catholic religion was excepted at the first establishment of this government; but the States, at length, desirous of giving all men liberty in this point, now suffer the public exercise of that religion. Indeed, their great care has long been to savour no particular inquisition into the faith or religious principles of any peaceable, good subject, who live under the protection of their laws, and to suffer no violence or oppression to be offered to any man's conscience, when his opinion or actions did not interfere with, or were of ill consequence to, the civil government of the state.

The Calvinift clergy are, in general, throughout this country, attached to the family of the prince of Orange. The church government amongst that prevailing feet is according to the discipline citablished by the grand synod held at Dort in 1618. The ecclesiaftical affemblies are composed of different classes, laity as well as clergy, to whom all are aliotted their respective functions.

The only fubordination among the clergy in Holland is, that the confifteries are fubordinated to the claffes, and thefe to the provincial fynod; for as to national fynods, there have been none fince that of Dort, mentioned above.

The Dutch language is a dialect of the German, and has a harsh found; but the better fort of people speak French.

The cities and towns of the United Provinces are little republics of themselves, whose deputies, with the nob lity, compose the states thereof; and the deputies of the provinces, in a fimilar manner, compole the flates general. Every town, or province, may fend as many members as they please to the slates-general; but all belonging to one town, or province, have but one voice; and no refolution taken by the flates-general is of any force till ratified by the feveral provinces. In the cities and towns the legislative power is vested in the fenates, and the executive in the burgo-masters, The states of the provinces, except tiled noble and mighty tords. Those at fyndics, &c. The states of the province Holland, are stiled noble and mighty tords. Holland are called noble and most mighty lords; and the title of the states-general is bigb and mighty lords, or their bigb mightineffes. Befides the states general, there is also a council of state, confishing of deputies from the feveral provinces. They are twelve in number, whereof Holland fends three, Gelderland two, Zealand two, Utrecht two, Friefland one, Groningen one, and Over-Yffel one. Their bufiness is to prepare effimates, and ways and means for raifing the revenue, as well as other matters that are laid before the flatesgeneral. In this council every deputy prefides a week by turns; and the fladtholder has a decifive voice when the votes happen to be equal. The principal affairs that come under their deliberation are those relating to the army and finances. The ftadtholder is also prefident of the states in every province, but has no feat in the states-general. One differting voice in the provincial flates prevents their coming to any refolution. From the death of William III. prince of Orange, and king of England, there had been no fladtholder, at least for the provinces of Holland, Zealand, and West Friesland; but these also, in 1747, upon the French breaking into Dutch Flanders, made choice of William-Charles-Henry-Friso, prince of Orange, and father of the present stadsholder, William V. The stadsholdership was at the same time made hereditary to his heirs male

and female, provided the latter did not marry the fon of a king, or a papift. The stadtholder's powers and prerogatives are very confiderable: in particular, he feems directly, or by his influence, to have the nomination of the magistrates, deputies, and most of the of-ficers, civil and military. In short, though he has not ficers, civil and military. In short, though he has not the title, he has more real power and authority than many kings; for, befides the influence and revenue he derives from the fladtholdership, he has several principalities and large estates of his own. With respect to the administration of justice in this country, every province has its tribunal, to which, except in criminal causes, appeals lie from the petty and country courts; and it is faid, that justice is no where distributed with more impartiality.

The taxes in these provinces, especially in Holland, e many and heavy. The ordinary revenues of the are many and heavy. republic are computed at between two and three millions fterling annually. Out of 100 guilders the province of Holland contributes 58, and confequently above one half of the whole public expences. For the encouragement of trade, the duties on goods and merchandize are very low. Not withstanding the number and great-ness of the taxes, every province is said to labour un-der very heavy debts, especially Holland.

With respect to their land forces, in time of peace they feldom exceed 40,000, and very often fall short of that number. They employ a great many foreigners, especially Swifs and Scots, in their service; and, in time of war, hire whole regiments of Germans. The chief command of the army is vefted in the stadtholder, under whom is the field-marshal-general. No nation can fit out a more formidable fleet than the Dutch, having always vast quantities of timber prepared for building fhips, and great numbers of fhip-carpenters and mariners: however, in times of peace, they usually have no more than 30 in commission, for the protection of their trade in the Mediterranean, and to convoy their homeward-bound Indiamen, &c.

The Dutch East-India company have had the mono-poly of the spice trade considerably more than a century; hence it is one of the most opulent trading com-panies in the universe. Though the United Provinces of themselves produce very few things, yet all the commodities and products of the globe may be procured here. The Dutch likewise acquire great riches by their herring, cod, and whale fisheries; by their manufactures of linen, paper, earthen-ware, &c. and by shipbuilding. Every province has the right of coinage, but all the pieces must be of a similar intrinsic value. The following table exhibits, at one point of view, the value, in English money, of the Dutch gold and silver

Name	Value.	Name.	Value.
Ryder - Half-ryder Doubl e d uca Ducat	0 12 9	Three guilder piece Rix-dollar Dollar Twenty-eight fliver piece Six fliver piece - Pieces of five fliver and a half Two fliver pieces, eleven of which make Stiverpieces, eleven of which make	s. d. 5 5 5 1 4 6 1 2 8 2 2 6 0 6 1 0 6 1 0 0 6

SECTION. V.

Description of the County of Drenthe, or Drent, the Generalité Lands, &c. included under the title of Dutch Flanders.

HE county of Drethe is bounded on the fouth by Bentheim, and Over-Yffel; on the north by Groningen; on the wost by Frieseland; and on the east by Munfter. It is tolerably fertile; the states confist of the nobles and freeholders; the affembly is annually held at Affen, but no deputies are fent from thence to the states-general. Affen, the capital, is small, well built, and the feat of the high colleges; and Koevorden, though a fmall town, is ftrongly fortified.

The Generalité Lands are those parts of the Netherlands that appertain to the United Provinces in general. The hereditary stadtholder is governor of them all. The high tribunals are held at the Hague, Middleburg, and Veulo; and the established religion is Calvinism. These lands confift of part of the duchies of Brabant and Limburg, of the upper quarter of Gelderland, and part of Flanders. The principal places in Brabant, belong-

ing to the states, are the following:

Bois le Duc on the Dieft, 20 miles from Breda, is ftrong by nature and art. The majority of the inhabitants are Roman Catholics. The town contains feveral churches, mass-houses, a citadel, gymnasium, &c. The manufactures are linen, woollen, cutlery wares, needles, &c. It was once a bishopric; and the cathedral, which is now in the hands of the Protestants, is one of the most magnificent in the Netherlands. Before the Reformation there were 16 monasteries of both fexes here. In the district to which the town gives name are the towns of Ofterwyk, Tilborg, Boxtel, Einhoven, Grifchot, Helmond, Os, Grave, and Rave-ftein. The Grave is frongly fortified, and belongs to the prince of Orange, who is also proprietor of the barony of Kuik, and other estates in the district. Ravestein, with the lordship to which it gives name, are held as fiels of the states-general, by the elector palatine; and Helmond is the property of the house of Aremberg. In the same district is also a lordship belonging to the Teutonic order, and two rich convents, which, by the indulgence of the states, are suffered to remain and enjoy their ancient revenues.

Breda, fituated at the conflux of the Merk and the Aa, which, after their junction, are navigable from hence to the German Ocean, 14 miles from Dort to the fouth, 20 miles from Bois le Duc to the west, and 25 from Antwerp to the north-east, is pretty well built and fortified, and a part of the adjacent country may be laid under water. Here are feveral fquares, one of which is delightfully planted with trees, and adorned with a moated caftle, and feveral churches, but the trade and manufactures of the town are greatly declined. The states have been possessed of it ever since the year 1637. Here king Charles II. resided a short time before he fet out, when invited by his fubjects to take possession of his kingdoms, and from hence was dated his famous declaration. Here also, in 1669, the famous treaty of peace was concluded between the faid king Charles, Lewis XIV. of France, and the statesgeneral, under the mediation of the king of Sweden. The neighbourhood of the town is very pleafant; among other agreeable objects are feveral woods, of which one is cut out into beautiful walks and viftas. The town gives name to a barony, which contains 18 little towns and villages, the principal of which are Williamstadt and Steenbergen, which are both well fortified and garrifoned.

Bergen-op-Zoom is not fo called from its being fituated on the river Zoom, as there is no fuch river. Those who have been of that opinion have taken for a river a canal that runs through this city, and was made for the conveniency of bringing into the town boats laden with turfs, which ferve for fuel to the inhabitants. pitants. But But Zoom, in Dutch, fignifies a feam, an hem, or a border, and was given to the country where this city flands, because it borders upon the sea: and the city being built on an hill, called, in Dutch, Berge, or Bergen, it was from thence called Bergen-op-Zoom, i. e. "The Hill on the Border." It is 19 miles diffant from Antwerp to the north, and 17 from Breda towards the west. It is one of the strongest places belonging to the Dutch, who fortified it fo strongly in the year 1629, that it was reckoned almost impregnable. On the fide towards Antwerp they have built a large half-moon, which extends as far as the fort called Kyk-in-de-Pot, i. e. "Look into the pot." That fort is defended by four redoubts, with batteries planted with great guns on every fide. There is a canal from the fea to this city, by which fupplies of men and ammunition can be brought in, without being prevented by the befiegers. From this city to the sea there are eleven forts well planted with cannon, and many redoubts and palifadoes along the dyke or caufeway. Towards Steenbergen there are also several fortifications, with many redoubts and intrenchments; and as the country about it is marshy, and often overflowed, the approaches to it are very difficult. It is reckoned a fea-port town, because it is pretty near the fea, with which it has a communication by means of the river Scheld. Its harbour is very fine, and defended on both fides by ftrong forts. The houses here are well built, and the fquare large and beau-The church of St. Gertrude is a noble piece of architecture; its roof being but one fingle arch vaulted over. The palace of the marquis is also worth

Maestricht, on the Maes, is one of the strongest fortreffes belonging to the republic, flanding 12 miles from Liege, and 48 from Bruffels. The flates-general, to whom it was yielded up by the treaty of Munto whom it was yielded up by the treaty of Mun-fler, are fovereigns of it, jointly with the bishop of Liege, as having succeeded to the rights of the dukes of Brabant. There are many popish convents in it, and churches belonging to different sects; and a strong garrison is maintained by the states. The magistracy consists partly of Calvinishs and partly of Roman Catholics, and the latter must be natives of the bishopric of Liege. In a hill in the neighbourhood is a horizontal quarry full of long winding paffages, in which, in time of war, the country people fecure their cattle and valuable effects; 40,000 men might lodge in it with great convenience. The town contains about 3000 houses, and 13,000 inhabitants, besides the gar-rison. There is a Calvinist gymnasium and grammarschool here, the masters and professors of which are paid by the flates; a large college, a commandery of the Teutonic order, a flately town-house, and governor's houses, with other public buildings.

In the part of the duchy of Linfburg, belonging to

the states-general, are,

Valkenburg, the Falcon's Mountain, or Caftle, which flands on the river Geul, and, though but a small open place, is the capital of a county. By a particular privilege it is exempted from all taxes.

In the upper part of Gelderland, belonging to the

flates-general, are the following places: Venlo has its name from its fituation among low meadows, which is the meaning of its name in Dutch. It flands on the right bank of the Maes, feven miles diftant from Gelder to the fouth, and 17 from Ruremonde to the north. This city is of a fquare form, and pretty large, having two fquares; the town-house stands in

one, where they also keep a market three times a week; the other is the parade, and place of arms. Here are between 8 and 900 houses, and about 4000 inhabitants, most of whom are Roman Catholics, who enjoy the free exercise of their religion. They have but one parochial church, and several convents. The Dutch Protestants have a pretty church here; and this is the only frontier town where there is no French mi-

The houses are very indifferent, and the inhabitants generally fo poor, that they let their houses fall to ruin. The magistracy is composed of a schout, a burgomaster, seven scheepens, three counsellors, and two fecretaries. The burgomafter is changed annually by the states-general, and chosen among the scheepens, from a nomination of three prefented to them by the

counfellors

Stevensweert is a strong fortress with seven bastions.

It stands in an island of the Maes, near the borders of the duchy of Cleves, and the bishopric of Liege, three miles below Maesyck, and nine above Ruremonde. In the year 1633, after the death of the infanta Ifabella, the marquis of Aitove, whom Philip IV. king of Spain had appointed governor of the Low Countries, till he could pitch upon a more proper person, caused this fortress to be built; and in order to obstruct the trade of the Dutch up and down the Maes, he caused a bridge of boats to be made here, the head of which

The principal places belonging to the states-general in Flanders are the following:

Sluys, on the German Ocean, the harbour of which snys, on the German Ocean, the harbour of which is now almost choaked up. The fortifications are remarkably strong, but the air is so bad that the garrison must be changed every year. All the other Dutch governors in Flanders are subordinate to the governor of this town.

Hulft is a ftrong fortified town, fituated in a fruitful plain, which may be laid under water. The commodity it chiefly deals in is corn, having a canal, or harbour, which communicates with the West-Scheld. The forts and lines by which it is furrounded render the approaches to it very difficult; but the air is but indifferent, and most of the inhabitants are Papists. It gives name to a bailiage, which is of confiderable

Sas van Ghent is a fmall but ftrong town, on a bay of the West-Scheld. Its name fignifies the Sluice of Ghent; for the inhabitants having dug a canal from hence to that city erected a fluice here for keeping up the waters. About a mile from the town is a fort called St. Anthony's, which was built for the defence of the

Philippine is a fmall but well fortified town, on the western arm of the Scheld, called Brackman-water. had its name from Philip II. king of Spain, who caused

it to be built.

In this part of Flanders is the island of Kadsand, or Catsand, which, as well as many other places whose names begin with Cat, is supposed to have been so called from the Catti, who formerly inhabited part of the Netherlands. It lies over-against Sluys, and is very fertile. To defend it against the sea, to which it is much extended. posed in stormy weather, strong dykes have beenerected, and are kept in repair at a vast expence.

The hiftory of the United Provinces will be included

in that of the Netherlands in general.

CH XII.

AUSTRIAN FLANDERS, or the AUSTRIAN NETHERLA

THIS province of the Netherlands, bounded on the north by the United Province, on the east by Germany, on the fouth by feveral parts of France, and on the west by the German ocean, is 60 miles long and 50 broad.

The feveral diftinct diftricts are as follow:

BRABANT is bounded on the north by the United Provinces; on the fouth by Hennegan and Namur; on the west by Flanders, properly so called; and on the east by Liege. The air is good, and the foil fruitful. It is watered by feveral rivers, the chief of which is the Demer, or Rupel. There are two fine canals in it, one of which joins the Senne and the Rupel; the other runs from Louvain to the Rupel. Between Louvain and Bruffels is a fine stone causeway, and another reaching from Louvain to Thienen and Liege. The fouthern part, called Walloon-Brabant, is mountainous, but not unfruitful. In Auffrian Brabant are reckoned 19 walled towns, besides a great many boroughs and villages. The flates of the province confift of the clergy, nobility, and representatives of the chief towns. These states meet four times a year at Bruffels, In them, and the viceroy, the legislative power, and that of levying money, is vested; but the whole assembly must be unanimous in passing an act. They appoint a kind of committee, of two clergymen and two noble-men, to meet daily during their recess. There are four hereditary officers of flate for this province, viz. the feneichal, the chamberlain, the marthal, and the guidon: besides which there are also a great huntsman, a great falconer, a great forester, a chief justice in eyre, and a mafter of the wolf-hunters. The high council of Brabant, which is divided into two chambers, or courts, is chiefly held at Mechlin, where most of the provincial causes are tried. The Roman Catholic is the only religion of this country; and the number and opulence of the eccleliastics is very great. At Mechlin is the see of an archbishop, to whom are subject the prelates of Antwerp, Ghent, Bois le Duc, Bruges, Ypres, and Ruremonde. In the archbishop are 14 collegiate churches, and 203 cloifters. This, with many other countries, came to the house of Austria by the marriage of Maria, daughter of Charles the Bold, duke of Burgundy, with Maximilian, archduke of Austria. The principal manufactures are lawns, cambrics, and tapeftry.

The Walloon language, which is spoken here, is a mixture of German, French, and Spanish. The arms of the duchy are a Lion, Or; in a Field, Sable. Aufirian Brabant is divided into feveral quarters. quarter of Louvain the principal places are,

Louvain on the Dyle, 13 miles east of Bruffels, formerly the capital of the duchy; but at prefent Bruffels is confidered as fuch. Louvain is a place of great antiquity, having been founded by the emperor Afnul-phus as a check against the Normans. The emperor phus as a check against the Normans. The emperor Charles V. was educated in the castle, which long continued the relidence of the dukes of Brabant. Many affemblies of the states have been kept in it. The churches and cloifters are very numerous and fine, both within and without the town, which is very large, but not populous; for there are many meadows, vineyards, gardens, and orchards, within the walls. The fladt-house and the church of St. Peter are very beautiful. In the 14th century the manufacture of woollen cloths was fo great here, that there were vast numbers of woollendrapers, and many thousand of weavers, in the city. When they went from their work, a great bell was rung to give notice to the mothers to keep their children within doors, left they should be trampled under feet by that crowd of workmen; but, in process of time, the journeymen weavers, and other tradesmen, revolted, took up arms, threw feveral of their migifirates out of the windows of the town house, and laid waste all Brabant: at last, however, they were subdued, some of their ringleaders executed, and most of the others banished. Of these, many retired to England, and were kindly received. The trade of Louvain has ever fince been upon the decline, and at prefent is inconfiderable, contifting chiefly in the excellent beer which is brewed there, of which great quantities are fent to the neighbouring cities, especially to Bruffels. With a view to reffore this city to its former luftre, an univerwas founded in it in 1426, by John IV. dake of Brabant, which enjoys great privileges, granted to it both by the popes and dukes. There are above 40 colleges; and in the hall, where the public exercises are performed, are three spacious rooms, where lectures are read every morning in divinity, law, and physic, to which the scholars, in every college, may refort. The Hollanders have a college here for their Roman Catholic, the English one of Augustine monks, and the Irish one of Dominicans, and another of itecollects. To give encouragement to learning, pope Sixtus IV. granted to the university, A. D. 1483, the privilege of presentation to all the livings in the Nether-Thechurch, which belonged to the jefuit's convent, is admired for the elegance of its artichecture. The convent for English ladies is very capacious and elegant, and more richly endowed than any other in the Low Countries. The burghers of Louvain boaft that their city was never taken by force. In 1710, indeed, the French entered it by ftratagem, but were foon repulfed with great loss by the citizens. To reward their fidelity and bravery, Charles, then ftyled king of Spain, and afterwards emperor, prefented them with a golden key, which is still kept in the townhouse.

Tienen, on the Ghete, seven miles east of Louvain, was formerly a very confiderable city, but is now greatly decayed. Here are two collegiate churches, the canons of one of which are permitted to marry, but if they become widowers they are not allowed to wed a fecond time, unless they refign their prebends. No layman has been able to afcertain the amount of their revenues, as they are bound by oath not to reveal it. They must be all natives of the place, and the prebends are in their own gift, fo that upon the whole they are very opulent. Befides the above, here are eight nunneries and fix monasteries.

Helerve is a town with a strong castle, belonging to the duke of Aremburgh and Arichot; and Limale is a

fine borough town.

Gemblours flands upon a fleep hill, encompaffed on all fides with precipices, except towards the east, where a little hill hangs over it. It is confiderable only for its abbey of St. Hubert, of the Benedictine order. The abbot is the first nobleman of Brabant, has the title of earl of Gemblours, of which he is a temporal lord, and has, as fuch, the first voice in the affembly of the states This abbey has produced feveral learned of Brabani. men; and, amongst others, the celebrated monk Sige. bertus, author of the Chronicon Gemblacenfe, well known by the learned : he died here in the year 1112, and his chronicle was continued by abbot Anfelmus till the year 1137, when he died. Gemblours is famous in history for the victory which don John of Austria gained near it on the 31st of January, 1578, over the army of the flates-general, commanded by Antony de Coignies, who loft all his cannon, and was himfelf EUROP taken pr of the c

taken prisoner. This defeat was imputed to the absence of the chief officers of the flates, who were then at Bruffels, and to the jealoufy form others had conceived against the prince of Orange. In the abbey of this town king William took up his head quarters during a great part of his wars with France.

Diest is a little city upon the river Demer, noted for

its woollen cloths, hofe, and other manufactures; as alfo for the excellent beer brewed here, which is fold in all the neighbouring towns. They keep, on every Ath-Wednesday, a famous fair for horses. This city, with its territory, has the sittle of a barony, which belonged to king William, and is claimed at present by several

of his heirs. There are at Dieft two collegiate churches, and feveral convents of friars and nuns.

The French lines in Brabam running along by this place, it furrendered to the duke of Marlborough, when he had forced the end of the same dampaign the French re-took it, and difmantled it. However, at last, the allies again got possession of it, and it was ceded to the house of Austria

by the peace of Utrecht.

Montaigne, in Flemish Scherpen-Heuvel, that is to fay, Sharp-Mount, and, in Latin, Mons Acutus, which fignifies the fame, is thus called from its fituation on the top of an hill: it stands between Diest and Sichem; and, though fmall, is very regularly built, and of an heptagon figure. It is famous for an image of the Holy Virgin, which stood formerly in a little nich against a tree; but, in the year 1609, the archdukes of Austria built here a chapel, or small church, which is become very rich by the offerings of the devotees to that image.

Ramilies is a fmall village, near 11 miles from Namur, where, in the year 1706, the duke of Marlborough defeated the French, and obtained a fignal

victory.

Lecuwe, on the Ghete, a strong town, seven miles from Tienen, is in a marthy fituation, which renders it almost inaccessible. The air is extremely bad, on which account the fovereigns of the county used for-

merly to banish delinquents hither.

Landen is famous for the desperate battle fought near it in the year 1693, between the confederates, under the command of king William and the elector of Bavaria, and the French, commanded by the dukes of Luxemburg, Villeroy, and Berwick, in which the former were defeated.

In the Bruffels quarter of Brabant the principal

places are,

Bruffels, which gives name to the territory, and is, though but second in rank, not only the capital of Brabant, but of the Netherlands in general. It is 13 miles west of Louvain, situated on the brow of a hill, and watered by the little river Senne, lat. 50 deg. 51 min. north; long. 2 deg. 30 min. west. The prospect of it at a distance is admirable, but, upon entering it, its irregularity is rather difgufful to a ftranger. It is feven miles in circumference, (and confequently too large to hold out a long flege,) has feven frong gates, and is furrounded by a double brick wall, and deep ditches. It is populous, and the houses are handsome. Here are feven beautiful fquares; in particular, the great fquare, or market-place, is one of the most noble in Europe: around it are the halls of the different trading companies, and the town-house. The latter oc-cupies one quarter; and the fronts of the whole are embellished with sculptures, gilding, Latin inscriptions, &c. The town-house, which is an elegant structure, contains the apartments for the affembly of the states of Brabant. They are spacious and superb, finely adorned with tapestry in gilt frames, and many original paintings. On the top of the steeple is the statue of St. Michael killing the dragon, of gilt copper, 17 feet high, which ferves for a weather-cock. The public high, which ferves for a weather-cock. buildings in general, particularly the palaces and courts of the feveral princes, counts, and other persons of diftinction, together with the churches and cloifters, are No. 76.

large and magnificent. Behind the Imperial palace, that flood in the highest part of the city, but was burnt down not many years ago, is a park well stocked with deer, and planted with trees, like that of St. James's at London, for the inhabitants to walk in. At the farther end of it is a fine pleasure house, built by the emperor Charles V. after his abdication. Of the other palaces, those of the prince de la Tour and Taxis, and of the English earl of Aylesbury, are very fine; and of the gardens, those of the Duke of Bournonville are the most delightful. In all the palaces are collections of original paintings, by the most eminent masters, both Italian and Flemish. The arfenal is well worth seeing, on account of the curious antique arms. The operahouse is very spacious and magnificent, built after the Italian manner, with rows of lodges, or closets, in most of which are chimnics. Four fine pictures of the markets of Bruffals, by Rubens and Snyder, which coft the dukes of St. Pierre 40,000 florins, and for which the French king, Lewis XIV. offered great fums, are

now in the possession of the Orford family.

This city is well provided with water, having 20 public fountains, adorned with statues at the corners of the most public streets. The lower part of the city is called the Rivage, and is cut into canals, which communicate with the great canal, extending from Bruffels to the Scheld, 15 miles. By this canal, which was finished in 1561, and cost the city an immense sum, a person may sail from Brussels to the North Sea; and large covered boats, called treck-schoots, actually go twice a day to Antwerp and back again. Each boat is drawn by one horfe only, which goes a gentle pace at the rate of three miles an hour, and the fare is about two-pence farthing for every hour. Along the canals, both within and without the city, are fine walks planted with trees, as in Holland, and also on the walls. Of the churches, the most remarkable is that of St. Gudula, which is an old gothic building on the outfide, but finely adorned within. In the choir are several fine monuments of illustrious princes: and all around it are many pretty chapels, in one of which they worship three hofts, which, they fay, were stabbed in the year 1369, by a Jew, and bled. These are exposed every festival, in a chalice, richly set with diamonds; and on the Sunday after the 13th of July there is a yearly pro-cession, in memory of this stabbing, when the hosts are carried round the city, decorated with a great number of precious ftones, and attended by all the clergy, fecular and regular, the magistrates, courts of justice, and the governor of the province. The chapel where and the governor of the province. The chapel where they are kept is all of marble, and the altar of folid filver. Among the cloifters of all orders here are two English, one of which is of Dominican ladies, founded by cardinal Howard in the reign of Charles II. of which a lady of the house of Norfolk was always to be abbefs, and the other is of nuns of the Benedictine or-der. The beguinage here is like a little town, fur-rounded by a wall and deep ditch, and fubdivided into various small streets and lanes. The number of beguines, who have all feparate apartments, amount to above 800: they are governed by four matrons, whom they chuse out of their own body: their church is very elegant; and they have a confessor appointed by the bishop of Antwerp. Here is a pawnbroker general, or public office, for lending money upon pledges at a moderate interest. It is called the Mamit of Piety, and was established by the archbishop Albert and his Several private confort Isabella, in the year 1617. paffages lead to it, fo that any person may enter it without being seen going in from the public streets. The inhabitants of Brussels seem to have had a great predilection for the number feven, as

In this city we find fome footfleps of the ancient fancy for that number; for there are feven principal ftreets that enter into the great market; feven stately houses in the market, let out by the senate for the use of the corporation; seven parish churches; seven noble families, eminent for their antiquity and great privi-

leges; feven midwives, licenfed and fworn by the fenate, to vifit the poor, as well as the rich, when called; and feven public gates of Doric work, remarkable for leading to fo many places of pleafure, or different exercise; one to fowling, a fecond to fishing, a third to hunting, a fourth to pleafant fields, a fifth to pasture grounds, a fixth to springs and vineyards, and a feventh to

gardens.

The city entertained at one time feven crowned heads, besides the dukes of Savoy and Lorrain, with 9000 horse belonging to their retinues. The inns, or eating-houses here, are equal to any in the world; a stranger may dine at any time betwixt twelve and three, on feven or eight dishes of meat, at a most moderate The wines also are very good and cheap; and for a meer trifle by the hour you may have a coach to carry you wherever you please. At the gate of Bruffels begins the famous wood of Sogne, of great extent, out of which the inhabitants are allowed to cut a great quantity of wood for fuel every year; and as fast as the trees are cut down fresh ones are planted in their room, by which means the forest will continue for ever for the benefit of the poor. This city is the feat of the council of state, the privy-council, the council of finances, the war council, and the chamber of accompts of the chancery and fœdal court of Brabant, the court of the grand forester, and a particular chamber of accompts for the province of Brabant. The trade confifts in camblets, laces, and tapeffries, manufactured here, and fent all over Europe. In the year 1695 it fuffered much by a French bombardment: in 1706 the allies made themselves masters of it; and the French in 1746, but it was restored by the treaty of Aix-la-Chapelle. Here is a statue of gilt marble, erected by the company of brewers to prince Charles of Lorrain, governor-general of the Austrian Nether-

At Vilverden, a fmall town, seven miles from Bruffels, stands, on the canal of Bruffels, the famous William Tindal, who first translated the New Testament into English, and suffered martyrdom contrary to the law of

nations, he being a subject of England.

Nivelle is 15 miles distant from Brussels. It is a pretty considerable city, since, besides two collegiate churches, there are five parochial ones, and several convents, one of which is for polite learning. There are also several nunneries, and a chapter of canonesses, who must all be the daughters of princes, or at least of noblemen of four descents. The abbess is stilled princess of Nivelle, and is appointed by the sovereign, who must chuse one out of three canonesses named to him by the chapter. The abbess is spiritual and temporal lady of the city, and of its district. There are 17 villages within the district of this city. The town enjoys large privileges; and a great quantity of fine linen is made here equal to that of Cambray.

About five miles to the fouth of this city stands the village of Senes, famous for a battle fought near it in 1674, between the Dutch, under the prince of Orange, and the French, commanded by the prince of Condé. They fought with great fury on both sides eight hours during day-light, and two by moon-light; but the moon setting obliged them to give over. The French pretended they had carried the day, because they took more prisoners than the Dutch; but the latter remained masters of the field of battle. There were about 14,000 men killed on both sides; but the French lost more from than the Dutch, and had a great many officers of

diffinction killed.

In the Brabant quarter of Antwerp are,

Antwerp, which gives name to the marquifate of the Holy Roman empire, or of Antwerp. This city is fituated on the Scheld, 25 miles north of Bruffels. It is the third in rank in Brabant, extensive and elegantly built. The houses are lofty, built of free-stone, and have courts before, and gardens behind them. At one end of a noble street, called Mere-street, there is a brazen crucifix, 33 feet in height. The cathedral, de-

dicated to the Virgin Mary, and the stadt-house, are very magnificent structures. The exchange for merchants is the first that was built in Europe, and from which Sir Thomas Gresham took his model of that at London, as did also those at Amsterdam. It has four spacious gates, opposite one another, which are always open; and the walks on each fide are supported by 43 pillars of blue marble, all engraved, but not two of them alike. The length of this exchange is 180 feet, and the breadth 140. Underneath are vaults and magazines for merchants goods; and above is an academy for painting, feulpture, architecture, and mathematics. This city was once the emporium for trade on this fide of Europe, being fituated on the banks of the river Scheld, where thips of the greatest burthen came up to her quays, as upon the river Thames at London. But when the Seven United Provinces were declared a free state, and the navigation of the Scheld was yielded to them by Spain, they built a fort, called Lillo, feven miles below this city, on the narrowest part of the river, to hinder all shipping from coming up, except what paid custom to them: and as Flushing, in Zealand, is at the mouth of the river Scheld, they took effectual care to render the navigation that way impracticable: fo that trade took wing from Antwerp to Amsterdam, a town formerly not very confiderable, but now one of the most flourishing in Europe. This drove the merchants of Antwerp to turn their heads to jewelling, painting, and banking, which they have continued to this day to the greatest perfection. Here is likewise an excellent manufactory of tapestry and lace; and, for the promotion of trade, an infurance company has been erected. This city is the fee of a bishop, who, as abbot of St. Barnard, is the fecond prelate in Brabant. The bithopric is of great extent, and the cathedral a most noble pile, with one of the finest steeples in the world. The emeror Charles V. when he made his entry into Antwerp, faid it ought to be put in a cafe, and shewed only once a year for a rarity. The house of the Hans-Towns, built when the city was in its flourishing condition, is a flately building, with magazines above for dry goods, and cellars below for wet, and in the middle flory were 300 lodging rooms for merchants; but now it is turned to a horse barrack. There is a market here called the Friday's market, because it is held every Friday, where all forts of household goods, pictures, and jewels, are fold by auction. No city in the Netherlands has so many and fuch fine churches as this. Many of them particularly the cathedral and jefuits church, are adorned with paintings, by Sir Peter Paul Rubens, who was a native of this city; and by Quintin Maffeys, who is faid to have been a blackfmith, but that having fallen in love with a painter's daughter, and been told by her father, when he afked her of him in marriage, that he would have none but a painter for his fon-inlaw, he went to Italy to fludy painting, and, in a few years, returned fo eminent in his new profession, that he found no difficulty in obtaining the father's confent. He is interred at the entry of the cathedral, where his effigy is put up, with an infcription fignifying, That conjugal love made an Appelles of a blackfmith. before mentioned church is extremely magnificent, and the chapel of the Virgin, joining to it, still more fo. Among the cloifters, the most remarkable are the noble and rich abbey of St. Michael, on the banks of the Scheld, the apartments of which are truly royal, and in which all fovereign princes that pass this way actually lodge; and the English nunnery, of the order of St. Terefa, the nuns of which never wear linen, or eat, flesh, and lie upon straw. The grates of the convent are so dismal that it looks like a prison. As to the fortifications of the city, it is environed

As to the fortifications of the city, it is environed with a fine wall, planted with rows of trees on each fide, with walks between, broad enough for two coaches to go a-breaft; being also defended by a very strong, large, regular citadel, in form of a pentagon, erected by the duke of Alva in 1568, which commands the town and neighbouring country. The magistracy

of this city is chosen only out of the feven patrician families, and confift of two burgomafters, and 18 eschevins, besides inferior magistrates. Among the privileges granted to it by its princes there is one by which every person born in it is a citizen, though both his father and mother were foreigners. When the duke of Alençon, brother to the French king Henry III. whom the states-general had appointed governor of the Netherlands, made an attempt, in 1582, to furprize this city, the citizens defended themselves so bravely that they drove the French out of the town, killed 1500 of them, of which 300 were noblemen, and took ing, by this step, lost the confidence of the states, re-2000, with the lofs of only 80 men: the duke havtired to France, where he foon died of grief. fiege which this city held out in 1585 against the duke of Parma, governor of the Netherlands, is one of the most renowned in history. The fiege lasted a twelvemonth; and he never could have fucceeded, had it not been for the stupendous bridge he laid over the Scheld to carry on his attack. Here the celebrated geographer Abraham Ortelius was born. In the noble steeple of the cathedral, mentioned above, are 33 bells, and two chimes, a clock with a diameter of 30 feet,

and a crofs at top, which is 15 feet in height.

Lier, on the conflux of the Greater and Leffer, Nethe, is a final town, but strong both by art and nature. A paved road leads from hence to Antwerp. Here is a fpacious market-place, where once every week, from St. John's day to St. Martin's, they keep a famous market for black cattle. They brew an excellent fort of white beer, called Caveffe, which is very much efteemed all over the Netherlands: they also make lace, which is reckoned equal to that of Mechlin. The chief church, which is a collegiate one, is a fine building, adorned with an harmonious chime of bells. There are feveral convents and nunneries here: among the latter is that of English barefooted Carmelite nuns. The Carthufians have a mo-naftery, the largest in the Netherlands: the circumference of the walls that enclose the cells and kitchengarden, is a full English mile, and the monks have a greater privilege granted them by the pope than the other monafteries of that order; for they are allowed to dine together in the refectory every Wednesday; and althothey ear nothing but fish, they have each a bottle of wine at dinner, and have the liberty, fix weeks in fummer, to go abroad in coaches to take the air, and to flay out from feven of the clock in the morning till five at night. The monaftery is very large, and the

Turnhout, a fmall city, with the title of a lordship, was built by Henry IV. duke of Brabant, about the year 1212. Here is a collegiate church dedicated to St. Peter, the chapter of which is composed of a dean and 12 canons. The regular canons of the priory of Consenbonk have here a college, where they teach polite literature. In the year 1545 the emperor Charles V. gave this city and lordship to his sister Mary, queen of Hungary, to enjoy it during her life. In 1648, after the conclusion of the treaty of Munster, Philip IV. king of Spain, gave it to the princess Amelia of Solms, the widow of prince Frederick Henry of Naffau; by which means this lordship came to the house of Orange. King William III. dying without issue, the lordship of Turnhout was adjudged, by a decree of the sovereign sedal court of Brabant, issued the 26th of May, 1708, to the king of Prussia, agreeable to the princess Amelia's last will; but on condition that the king should pay a stipulated sum to John William Frisco, prince of Orange.

The lordship of MECHLIN is no more than eight miles in length, and about five in breadth.

Mechlin, fituated on the Demer, 15 miles from Antwerp, is the capital. The archbishop takes the title of primate of the Netherlands, and abbot of Affligem, one half of the revenues of the abbey being appropriated to his see. His suffragans are the bishops of

Antwerp, Ghent, Ypres, Bruges, and Ruremonde; and, within his archiepifcopal jurifdiction, are 17 cities, and 455 villages. The cathedral is a large and magand 455 villages. The cathedral is a large and mag-nificent structure. The clock upon the 4 sides of the tower or fleeple is 144 feet in circumference, each figure being above a yard long; and yet so high is the fleeple, that, from the market place, it feems but an ordinary clock. Besides a great number of convents of men and maidens, there is in this city a large beguinage, containing generally 700 beguines, and fometimes more, who make fome of the finest Mechlin lace. St. Rombant, who was an Irishman, and bishop of Dublin, is patron of this city. Mechlin is the feat of a governor, a provincial court, and also a parliament or fovereign council, to which appeals lie from most of the courts of justice in the Austrian Netherlands; but from it lies no appeal, except in the causes of the knights of the Golden Fleece, to the fovereign of the order. The city is pretty large and well built, with broad clean ftreets, driving a confiderable trade in corn, blankets, and thread; but their chief manufacture is of those fine laces famous throughout all Europe. Here is a flately arfenal, and a noble hospital for wounded or superannuated foldiers.

The Duchy of LINSBURG is furrounded by Inliers, Luxemburg, and Liege. The country is pleafant, populous, and fruitful; abounds in cattle, mines of iron, lead and calamy, and is well watered. The flates confift of the nobility, clergy, and commons; and the principal places are,

Linfburg, which stands on an eminence, is well fortified, has one large street, two strong gates, and a capacious suburb called Dahlem.

At about a mike distance from the city of Roleduc stands the samous abbey of Roleduc, of the order of St. Augustin; it is called Cloosterrode by the people of that country. The abbot is temporal lord of the villages of Marckstein, Kerkenrode, and other places; and is the first member of the states of the province of Linsburg, and perpetual commissary or deputy of the clergy, alternately with the abbot of Valdieu: he is also patron of the parochial church of Roleduc, which he generally bestows on one of the monks of his abbet.

The Duchy of Luxemburg is bounded by Liege to the north, by Lorrain to the fouth, by Treves to the eaft, and by Champagne to the west. It is nearly square, and extends about 80 miles each way. The air is pure, the land well watered, the soil fruitful, and the country populous. The states consist of the clergy, nobles and deputies; and the religion is Roman Catholic. Three different languages are spoken in this duchy, viz. German, French and Walloon. It lies in the center of the forest of Ardenne, and contains the following places:

Luxemburg, the capital of the province, is divided into Upper or Old Town, and Lower or New Town. The former is furrounded by rocks; and the latter contains two suburbs. Here is a strong castle and regular fortifications.

The city is governed by a richter, or judge, and feven eschevins, or aldermen, who judge both in civil and criminal matters. The richter is chosen every year, on the eve of St. Andrew stestival; that office is held alternately by a citizen, and by one of the aldermen.

The chief church here is that of St. Nicholas, a parochial one, but not very confiderable; fo that when there is any public act of devotion to be performed, it is always done either in the church which formerly belonged to the jefuits, or in that of the recollects. There are three other parifles in this city; one of which belongs to the abbey of Munster, of the Benedictine order, founded by Conrade I. count of Luxemburg, in the year 1083: besides which there are three convents of men, and as many of maidens.

Arlon was so named from an altar sacred to the moon, which the ancient inhabitants worshipped as a deity. It lies on an eminence, 12 miles from Luxemburg to the

north-west, and was formerly a considerable place, well peopled and fortified, but hath fince fuffered by wars,

and been difmantled.

Bastogne, situated in the county of Chiny, near the forest of Ardenne, is so well peopled, has such a good trade, and is fo well built, that the people of that country call it Paris in Ardenne. There are in this city two convents of men, and one of maidens. It is the seat of a provostship, containing 145 villages or hamlets within its district. In this city was born John Beck, a man of mean extraction, who, from being a meffenger, raifed himfelf, by his merit and courage, to the post of quarter-master-general of his Catholic majefty's armies, and was madegovernor and captain-general of the duchy of Luxemburg: he was killed at the

battle of Lens, in the year 1648.

Marche, or Mache-en-Famene, is a fmall ity, fituated on the little river Marfette, on the borders of the county of Namur. It is called Marche-en-Fa-mene, because it is the chief place of a district called Famene; it is also the feat of a provoltship, which has 19 villages under its jurifdiction. The parochial church, dedicated to St. Remoalus, is a fine building. is a convent of Carmelite monks, and another of nuns, of the fame order, and a beautiful college, where they teach polite literature. They keep yearly two free fairs, one the Wednesday after Easter, and the other the 11th of September: this privilege was granted to that city in 1712, by Maximilian Emanuel, duke of Bavaria, whilft he was in possession of the duchy of Luxemburg.

Roche, or Roche-en-Ardenne, fituated in that forest, is one of the strongest and best fortified towns in the whole province, being furrounded with strong bulwarks, and broad ditches full of water, that comes from the river Ourte, which runs across this city: it is also defended by a castle built on rocks, which com-

mands the town.

In the marquifate of Le Pont D'Oye are several small

inconsiderable towns.

The Austrian part of the duchy of Gelders contains only the little cities of Elmpt and Swalm, with their villages and feigniories, and the strong town of

Rwremond, fituated at the conflux of the Roer with the Macs, 25 miles from Maestricht. It is the largest town in Gelders, and subject to the archbishop of Mechlin. A toll is levied here; and in the town are

many convents, and a charter house.

FLANDERS, properly fo called, is bounded on the east by Brabant, on the north by the Ocean, on the west by Artois, and on the fouth by Hennegau and Artois. It is 75 miles long, 55 broad, has a good air, and perhaps the most fruitful foil in Europe. The population is fuch that it looks like one continued city. The principal rivers are the Scheld, Lys, Scharp, and Dender. The states consist of the nobles, clergy, and commons. The first class consists of certain families, who have hereditary offices, or baronies; the fecond includes the bishops and abbots; and the third is formed of the deputies of cities and districts, the burgomafters, and penfioners. Most of the Flander-kins are fat, clumfy, and dull, but industrious, honest, and great lovers of liberty. The women, in general, are fair and virtuous, but not remarkable for wit, or the affectation of it. Both fexes, however, are fond of public diversions; and every city, town, or village, almost, has a kermisse, or fair, in which public shews are exhibited. The manufactures consist of silk, woollen, tapestry, lace, cotton, brocades, camblets, and

This country had counts of its own, from the 9th century to 1369, when it went, by marriage, to the dukes of Burgundy; and afterwards from them, by a Subsequent marriage, to the house of Austria. France feized some of the southern parts in 1667; and the states-general, in 1715, obtained some part of the northern districts. The arms of this country are, A Lion, bable, in a Field, Or. As we have already described those parts of Flanders which belong to the Dutch and shall referve such as appertain to France for the ensuing chapter, we have only here to investigate those which own the sovereignty of the house or Austria,

which are as follow:

Ghent, the capital of Flanders, is feven miles in circumference within the walls, (though not above half that space is built upon,) is 28 miles north-west of Bruffels, and 33 east from Oftend. This city is watered by the rivers Scheld, Lys, Lieve, and Moere; and these, together with their branches and canals cut from them, divide the whole into 26 islands, which have a communication with each other by means of 26 large and 72 finall bridges. Ghent is ftrongly forti-fied both by art and nature: it is at once fecured and commanded by an important caftle; and the inhabitants can, by shutting up the sluices, lay the country, for a mile round, under water. It was once so opulent, powerful, and populous, as to be able to raife confiderable armies, declare war, and oppose its fovereign. In this city the famous emperor Charles V. was born, A. D. 1500; and its first bishop was the celebrated Jansenius, from whom the Jansenists take their name. From the tower of Belfort, in the centre of the town, there is a most delightful prospect over the whole, as well as part of the adjacent country. Here are many churches, hospitals, monasteries, and market-places, The market-place, called the Friday's market, is very large, and adorned with a statue of the emperor Charles V. in his imperial robes. The stadthouse is a noble structure; and the cathedral, which is very superb, has, beneath it, a fine crypta, or fubterraneous church. Here are 50 companies of tradefmen, and very curious manufactories of cloths, stuffs, and filks. The chief magifrates are the high bailiffs, under whom are bur-gomafters, efchevins, and counfellors. Here are feveral canals; in particular one which the states of Flanders caused to be begun in 1613, which leads to Bruges; and another, which was begun in 1554, and finished in 1561, which leads to Sas-Van-Ghent, and from thence to the fea.

The inhabitants of this city are exceedingly fond of chimes, or carillons, as are, indeed, the people of the Low Countries in general. Of these carillons, an ingenious writer, eminent for his mulical talents, gives us the following description, in the account of his

travels:

" I determined to inform myfelf, in a particular manner, concerning the earillon fcience. For this purpose I mounted the town belfrey, from whence I had a full view not only of the city of Ghent, which is reckoned one of the largest in Europe, but could examine the mechanism of the chimes, as far as they are played by clock-work, and likewise see the carilloneur perform with a kind of keys communicating with bells, as those of the harpsicord organ do with strings

and pipes.

"I foon found that the chimes in these countries had
the largest peal a greater number of bells than those of the largest peal in England; but, when I mounted the belfrey, I was aftonished at the great quantity of bells I faw. In short, there is a complete feries or feale of flones and femiftones, like those on the harpsichord, or organ, carilloneur was literally at work, and hard work, indeed, it must be: he was in his shirt with the collar unbut-toned, and in a violent sweat. There are pedals communicating with the great bells, upon which, with his feet, he played the bass to several sprightly, and rather difficult airs, performed with two hands upon the up-per species of keys. These keys are projecting sticks, wide enough afunder to be ftruck with violence and velocity by either of the two hands edgeways, without the danger of hitting the neighbouring keys. player has a thick leather covering for the little finger of each hand, otherwise it would be impossible for him to fupport the pain which the violence of the ftroke necessary to be given to each key, in order to its being distinctly heard shroughout a very large town, requires.

" The this counti greatest pe and perhap the English The carill very dexte treble with the bass w

"The carillons are faid to be originally of Aloft, in this country, and are still here, and in Holland, in their greatest perfection. It is certainly a Gothic invention, and perhaps a barbarous tafte, which neither the French, the English, or the Italians, have imitated or encouraged. The carilloneur, at my request, played several pieces very dexteroufly, in three parts, the first and second treble with the two hands on the upper fet of keys, and the bass with the feet on the pedals.

"The carilloneur plays four times a week, viz. Sunday, Monday, Wednesday, and Friday, from half an hour past eleven till twelve o'clock. It is constant employment for a watch or clock-maker to attend the works of the common chimes: he has an apartment under the belfrey, and it is by him that the caril-loneur is played. This place and Antwerp are, according to the inhabitants, the most celebrated cities in the Netherlands, and perhaps in the world, for ca-

rillons and chimes.

"The great convenience of this kind of mufic is, that it entertains the inhabitants of a whole town, without giving them the trouble of going to any particular spot to hear it; but the want of fomething to stop the vibration of each bell, at the pleasure of the player, like the valves of an organ, and the red cloth in the jacks of a harpfichord, is an intolerable defect to a cultivated ear: for by the notes of one paffage perpetually running into another, every thing is rendered to inarticulate and confused, as to occasion a very disagreeable jargon. As to the clock-work chimes, or those worked by a barrel, nothing, in my opinion, can be more tirefome; for, night and day, to hear the fame tune played every hour, during fix months, in fuch a stiff and unalterable manner, requires that kind of patience which nothing but a total absence of taste can produce.

Aloft is the capital of what is called Imperial Flanders, because it was formerly a free and Imperial city; for which reason the earls of Flanders stiled themselves, anciently, princes of the holy empire. This country, which is the most eastward of Flanders, lies between the Dender, the Scheld, and the province of Hainault. It was formerly of a larger extent, fince it contained the best part of what is now called Dutch Flanders.

Here are feveral convents of friars and nuns, and a college where they teach polite literature. The greatest curiofity is the tomb of Thierry, or Theory Martin, who brought the art of printing hither from Germany: it stands in the church of the convent of the Gulilelmite monks. He was an intimate friend of Erafmus, who wrote his epitaph, which is engraved on his tomb.

Oudenarde, or Audenarde, a town, interfected and furrounded by the Scheld, is famous for the fine tapeftries wove in it. It contains many convents, and will ever be memorable in history for the celebrated battle fought near it by the allies, commanded by the duke of Marlborough and prince Eugene, and the French, commanded by the duke of Burgundy and the duke of Vendome, in which the former obtained a compleat victory.

Ruplemonde, at the conflux of the Ruple with the Scheld, is famous for having given birth to Gerard

Mercator, a celebrated mathematician.

Courtray, a fmall city, fituated on the Lys, was difmantled by the French in 1744. The manufactures are of woollen cloths and table-linen. Thielt has a linen manufactory; and Menin was a barrier town, ceded to the Dutch in 1715; but, in 1744, the French feized and difmantled it.

In Bornhem are an ancient priory of Benedictine monks, and a convent of English Dominican friars. The latter was founded in 1670, by the reverend father Thomas Howard, duke of Norfolk, who was of that fame order, and afterwards created a cardinal.

Dendermonde, fo called from its fituation on the mouth of the river Dender, and from Monde, which, in the Flemish language, signifies Mouth, is strong both by art and nature. On the conslux of the Dender and the Scheld stands a little fort, built about the year No. 77.

1585, by the prince of Parma, governor of the Netherlands. The fituation is pleasant, being furrounded with beautiful meadows, watered by those two rivers, which render the whole country round about very fruitful, and contribute, at the fame time, to the strength of the city, which is very well fortified; for by means of fluices all the neighbouring country can be laid under water. It has 4 gates, 26 bridges, 16 of which are of stone, and the others of timber, and o large market-places, or public squares. The houses are large, beautiful, and convenient; most of them having a canal before, and fine gardens behind. The town drives a pretty good trade, and the merchants and tradefmen enjoy great privileges.

There are here two parochial churches, three abbies of maidens, and feveral other religious houses, with an

Dendermonde, and its territory, which contains fix-

teen fine villages, are now governed by an high bailiff. In the year 1607 a countryman found a treasure between Dendermonde and Aloft, near the village of Mefpelaer. Digging one morning in his garden, his spade hit against a little pot, high, but narrow, in which he found 1600 gold pieces, all very old and black, and each of them about the value of a guinea. They were ancient medals, amongst which were fome of Antoninus Pius, Marcus Aurelius, and Lucius Verus, which he

fold to the curious; and, amongst others, to the archduke Albert, who bought a great many of them to enrich his cabinet.

Bruges, 24 miles from Ghent, and 46 from Antwerp, takes its appellation from a chapel, which anciently flood here near a bridge. Here are several fine canals: the waters, however, are stagnant, but may always be put in motion by the fluices of the city; yet they are not fit to drink, or to be used for culinary purposes. The only waters here proper for domestic uses are such as are brought by pipes from the Lys and Scheld, for which every house pays a proportionate tax.

Bruges was anciently an opulent and important city, and bath still the remains of 17 palaces, where for-merly fo many confuls from different nations resided, each of which had diffinct houses magnificently built with warehouses, for the merchandizes they exported or imported. The citizens were fo powerful, indeed, that they imprisoned their sovereign the archduke Maximilian. This city, however, hath been for many years upon the decline; yet feveral rich merchants still refide here, who meet daily in the great market-place, which ferves them in lieu of an exchange. It is the fee of a bifhop, fuffragan to the archbifhop of Machlin; and the diocefe contains fix cities, viz. Bruges, Sluys, Oftend, Damme, Middleburg, and Oudenberch, and 133 boroughs, villages, and hamlets. The cathedral was erected in 865, and is a fine Gothic building. The church, dedicated to the Virgin Mary, is an elegant structure, and has a steeple of such an height, that it is seen at sea off Ostend. It contains two remarkable monuments of gilt copper, the one of Charles the Hardy, duke of Burgundy, and the other of Mary his daughter. Among the numerous curiofities in the treatury of this church are the rich vestments of Thomas-a-Becket, archbishop of Canterbury: they are finely adorned with diamonds, and other precious stones; and were purchased and presenced to this church at the time of the Reformation, by Mary, fifter to the emperor Charles V. Bruges contains four abbies, and a great number of nunneries, convents, &c. Dominicans convent is a very curious pulpit; the wood which supports the top is cut in the manner of ropes, and used as such. The Carthusian monastery is a mile in circuit; and in the church belonging to the Carmelites is a beautiful monument to the memory of Henry Jermyn, earl of Dover. But the most noble monaftery in the city is the Dunes, of the order of St. Bernard. It confifts of two cloifters, as large as those of Hampton-Court, with great gardens behind. The abbot's apartment is very magnificent, and those of the

monks, in the cloifters, very neat: they keep a fumptuous table; and have country feats depending on the abbey, where they go to amule themselves.

Of the many nunneries here are two English; one of Augustines, who are all English ladies of quality, whose fuperior, in 1724, was lady Lucy Herbert, fifter to the duke of Powis. The nuns entertain ftrangers at the grate with fweetmeats and wine. The other English nunnery, called the Pelicans, is of a stricter order,

and coarfer drefs.

There are few cities where the poor and orphans are fo well taken care of as in this; for here are feveral hospitals, and other houses, for their mainte-Amongst these there is one called the school of the Boogaards, (i. e. of the Orchards,) founded, in the year 1411, in which 130 orphan boys are educated, and brought up either to learning or to some trade, according to their genius or inclination. They are dreffed in cloth coats, half of which is brown, and the other half red; and they wear flat caps. This school has produced feveral bithops, abbots, and other learned clergymen, who have taken a pride in thewing their gratitude, by fending their pictures to adorn that fehool.

The ftreets of Bruges are large and strait, and there are feveral fine fquares, one of which is called the Friday's market-place, where fix great streets begin that lead in a strait line to the fix principal gates of the city. At one end of this fquare stands a fine steeple, 533 fteps high, with a curious chime of bells. The fquare is adorned with feveral rows of trees, which afford pleafant walks to the inhabitants. The iquare called the Burg, from the caftle of that name, is furrounded with many fine buildings. 'Several courts of justice are here held, as that of the magistrates for the city, that of the liberty of Bruges, that of the provostship and chapter, and the fædal court. The manufactures are woollen and cotton stuffs, filk, tapestries, linen, and lace. In January, 1430, Philip the Good inflituted the order of the Golden Fleece.

Upres, on the Iperlee, is a barrier town, fituated in a fruitful country, handsomely built, and the see of a bishop, suffragan to the archbishop of Mechlin. convents, churches, and hospitals are numerous, and

the manufactures are of filk and wool.

Newport, a strong sea-port town on the Iperlee, is one mile from the fea, and nine from Oftend. Its harbour is tolerably good, and its strength consists in its fluices, by which all the country round may be laid under water. It contains feveral convents and monafteries, particularly one of English Carthusian friars. In the neighbourhood a famous battle was fought in 1600, between the army of the states-general and the Spaniards, in which the latter were defeated. The chief bufiness of the inhabitants is rope-making, net-

making, and fishing.

Oftend, or Ooftende, a fea-port town in the liberty of Bruges, is well fortified, and fituated in a marshy foil, by the canals through which fhips of confiderable burden may approach the city. Many strongs forts furround the city; and the harbour is of that nature that it can never be entirely blocked up. This city held out against the Spaniards from July 5, 1601, to September 22, 1604, during which time they loft 80,000 men; and in the city 50,000 perished; and 300,000 cannon balls, of 30 lb. wt. each, were fired against it. The greatest inconvenience attending this town is not having fresh water, that necessary article being brought in boats from Bruges.

Tournay is a large trading place, and famous for feveral manufactories, particularly for admirable stock-The cathedral church, and the abbey of St. Martin, are very magnificent structures. Tournay was taken by the allies in 1709, but ceded to the House of Austria by the treaty of Utrecht; though the Dutch put in a garrison as being one of the barrier towns; but, in 1745, the French demolithed the fortifica-

tions.

AUSTRIAN HAINAULT, OF HENNEGAU, has Flanders to the north, Champagne and Picardy to the fouth, Brabant to the cast, and Namur and Liege to the west. It is 48 miles long, 45 broad, fruitful in pasturage and corn, breeds abundance of black cattle and theep, is well watered with many rivers and lakes, and abounds with timber, coals, iron, lead, marble, flate, &c. In spirituals it is subject to the archbishop of Cambray, and the bishops of Liege and Arras. The flates conflit of the clergy, nobility, and commons. The arms are Four Lions in a Field, Or. The principal places are,

Mons, the capital, which stands on the river Trouille, and is large and well fortified. The public structures are noble, the buildings in general handforne, and the ftreets spacious. This place has some trade, particularly in woollen ftuffs, of which here are manufac-tories. Polite literature is taught in two colleges; befides which here are feveral convents and nunneries, and an abbey. St. Wandrau, fifter to the celebrated St. Aldegonide, founded a chapter of cannoneffes here. They are 13 in number, must prove their nobility by 16 descents, and are in the nomination of the sovereign. In the morning they must attend divine service in their canonicals, but during the reft of the day they are allowed to drefs as they pleafe, and amufe themfelves as they think proper.

Malplaquet is a village about eight miles from this city, where, in 1709, the French army, commanded by the marthals Villars and Boufflers, were attacked in their triple intrenchments, and entirely defeated with

great flaughter.

Rœux stands in a fruitful foil, is well fortified, has feveral villages within its jurifdiction, and bestows on

the house of Croi the title of earl.

Near Soignies, a fmall city, fituated on the river onnegue, is the little wood called the Wood of Sonnegue, Soignies, which must not be mistaken for the wood of Sogne, which is much larger, and flands in Brabant, near Bruffels and Hall. There are in this city a convent, a nunnery, an hospital, and an house of the fathers of the oratory, established in 1629, in which they began to teach polite literature in 1709.

St. Ghiflain, or St. Guiflain, is pretty ffrong by its fituation on the banks of the river Hains, and by the marthes that furround it. The king of Spain caufed feveral fortifications to be raifed about it. The French, having made themselves masters of it in 1678, reftored it to the Spaniards, by the treaty of Nimeguen, on condition that it should be diffmantled; and its fortifications were demolished accordingly. The French feized it again, after the death-of Charles II. king of Spain; and towards the latter end of the year 1703 the governor of Ath, on the part of the allies, took it with a detachment from his garrifon; but the French re-took it a few days after. September the toth, 1709, the allies took it again, fince which time the house of Austria has continued uninterruptedly in possession.

This city is famous for an abbey of Benedictine monks, founded here in the year 651, by St. Guislain, a native of Greece, who is faid to have been a bishop. The emperor Charles the Great enlarged the revenue of this abbey, and cauted a magnificent church to be built there: he gave at the same time the spiritual and temporal lordship of the city to the abbot, who is also ftiled primate of Hainault.

Leffines flands in a beautiful plain, on the little river Dender, near the borders of Flanders. There are in this city one parish church, an hospital, a convent of Dominican friars, and a nunnery. It is famous for its manufactory of linen.

Chievres, a fmall city, about nine miles diffant from Mons, being an open place, has fuffered very much

during the wars.

Hall, or Halle, on the Senne, feven miles from Bruffels, is famous for an image of the Virgin Mary, enthrined in gold, with a crown of the fame on the head. In the other Binch, 1 pleafant ci in all fort The Fren the fecon after which tifications: and the for Spaniards

Binch, fituated on the river Haine, is an ancient and pleafant city, built in a fruitful country, which abounds in all forts of game, and the air is very wholeforme. The French became mafters of this city in 1668, by the fecond article of the treaty of Aix-la-Chapelle; after which they repaired it, and added some new fortifications; but it was ruined again in the subsequent wars, and the fortifications demolished. It was restored to the Spaniards by the peace of Nimeguen, fince which time it has continued in the possession of the house of Austria.

At a mile and a half diftance from Binch ftands the abbey of Bonne Esperance, or Good Hope: it is inhabited by monks of the order of Præmonstratenses: and in this neighbourhood there is also an abbey of Ciftertian nuns, called the abbey of de l'Olve, or, of the Olive.

Brain-le-Comte, fo called to diftinguish it from Braine-Lalgu, and Wauter-Braine, two boroughs in Brabant, is fituated on the paved road which was made in 1705, and is 12 miles diftant from Mons to the north-east, and 16 from Bruffels to the fouth-west. In 1652 the king of Spain gave this city to the house of Aremberg, in exchange for the manor of Sevenbergen; to that the duke of Aremberg is now lord of it, and of the castle ward, which contains 11 villages.

Anguien, or Enghein, which stands in a valley, 14 miles diftant from Mons, with its territory, or bailiwick, was formerly the first barony in the county of Hainault; it came to the house of Bourbon, with several other lordships, by means of Mary of Luxemburg, countefs of St. Paul, and lady of Anguien. The title of count of Anguien a long time belonged to a branch of the house of Bourbon, and was at last raifed to that of a duke, and annexed to the city of Nogent-le-Rotrou, in the province of Perche in France. It was afterwards transferred to the barony of Isloudun, in Berry. The eldest fon of the prince of Condé is now always stiled duke of Anguien.

Braine-le-Chateau is a village which, in 1681, was raifed to a principality, under the name of Tour and Taxis; and Ligne is a confiderable village, which gives name to a principality.

Fontenoy is a village on the Scheld, where the French, under marshal Saxe, gained a victory over the allies in 1745.

Between Anguien and Hall stands the village of Steenkirk, or Steenkerken, famous for the battle fought here August 3, 1692, between the army of the allies, commanded by king William, and by Maximilian Emanuel, elector of Bavaria, governor of the Netherlands, and the French, under the command of the duke of Luxemburg.

Namur is furrounded on all fides by Brabant and Liege, except towards the west, where it is partly bounded by Hainault. It is 30 miles long, 28 broad. well watered, and very fertile. The flates confift of the clergy, nobles, and deputies of the town; but an appeal lies from the council of the province to the grand council of Mechlin. The arms are a Lion Sable, in a Field Or, with a dexter Feffe drawn over the whole Shield. The principal places are as follow:

Namur, the capital, at the conflux of the Maes and Sambre, over which there is a bridge, is fituated 30 miles from Bruffels. It is one of the ftrongefl towns in Europe, defended by a formidable caftle, more than a dozen forts, and other important fortifications. It is the fee of a bishop, suffragan to the archbishop of Mechlin. The diocefe contains 8 cities, 300 villages, and innumerable abbies, charches, religious houses, &c. Befides the provincial council and town magistracy, a feudal court, called Bailiage, is held here, from which an appeal lies to the grand council at Mechlin.

Charleroy, a finall but strong city and fortress, stands on a hill, near the conflux of the Sambre and

1668, by the treaty of Aix-la-Chapelle, and reftored to the Spaniards by the peace of Nimeguen, in 1678. In 1692 the French bombarded this place; and the next year they fat down before it with a numerous army the marquis de Villeroy carrying on the fiege, whilit the marshal of Luxemburg covered it; fo that king William, and the elector of Bavaria, not being ftrong enough to attack them, they carried the town by fur render, after a gallant defence by the marquis de Caftillio, governor of the place, who held out against them 27 days open trenches, and capitulated, on honourable terms, October 1. It was restored to the Spaniards, by the treaty of Ryswick, in 1697; but after the death of king Charles H. the French feized it again, and kept it till the peace of Utrecht, when they were obliged to evacuate it to the emperor. It is a place of very great importance, being fituated near the borders of Hainault.

In the neighbourhood of this city ftands the abbey of Soleilmont, confifting of nuns of the Ciftertian order, founded in the year 1088, by Philip, count of

Charlemont stands on the top of a mountain, at the foot of which runs the river Maes. The ground on which it is built-belonged formerly to the country of Liege; but the bishop granted it to the emperor Charles V. who built there a castle with a small city, which he annexed to the earldom of Namur in 1555.

Bouvines is a small city on the left bank of the river Maes. The mayor has a right to fit in the affembly of the states of the province. In the year 1554 the French took it by affault, and facked it. It was defended only by the inhabitants of whom the French made a prodigious flaughter. Part of them were drowned in the river, and those who were taken were hanged; because, though they were not in a condition to defend the town, they were so obstinate as not to surrender till a breach was made in the walls. This place is confiderable only for being a pass between the provinces of Namur and Luxemburg.

Near Bouvines are to be feen the ruins of an ancient city called Chevremont, which was very strong, the inhabitants of which were notorious for their robberies. They defended themselves very courageously against king Charles the Simple in 922 against king Otho in 9:9, and against the archbishop of Cologne in 990, but at laft their city was taken, and levelled with the ground, in 992, by Norger, bishop of Liege.

Fleur, about fix miles diftant from Charleroy, is famous for two battles fought in its neighbourhood. The first happened August 30, 1622, between Don Gonzales de Cordoua, general of the Spanith army, and Erneft, count of Mansfeld, and Christian duke of Brunfwic, bifhop of Halberstadt. The latter were beaten and loft their cannon and all their baggage. The duke of Saxe-Weimar was killed in the battle, and the duke of Brunswic had an arm cut off. However, the count of Mansfeld, after a retreat, which proved more glorious to him than a victory would-have been, marched through Brabant with 4000 horfe, and 3000 foot, and joined the prince of Orange, who, by that means, was able to force the marquis of Spinalo to raife the fiege of Bargen-op-zoom. The tecond battle was fought July 1, 1690, between the confederate army, commanded by prince Walderk, and the French, under the command of Marshal de Luxemburg. The confederates were routed, had 5000 killed, 4000 taken priioners, and loft 49 great guns, &c. but the French fuffered also very much, fince, notwithflanding the great advantage they had gained, they were not able to undertake any thing during the remainder of the campaign.

CONCISE HISTORY OF THE NETHERLANDS IN GENERAL.

THE Seventeen Provinces, and that part of Germany which lies to should many which lies to the west of the Rhine, was the little river Pieton. It was yielded to the French in Il called Belgica Gallia by the Romans. Upon the de\$40

cline of that empire, the Goths, and other northern people, poffeffed themselves of these provinces, and aserected themselves into small governments, the heads of which were despotic within their own dominions. At length they came into the fole possession of the house of Burgundy in the year 1433. The emperor Charles V. the heir of that family, transferred them, in the year 1477, to the house of Austria, and ranked them as part of the empire, under the title of the Circle of Burgundy. The tyranny of his fon Philip, who fucceeded to the throne of Spain, made the inhabitants attempt to throw off his yoke, which occasioned a general infurrection. The counts Hoorn and Eg-mont, and the prince of Orange, appearing at the head of it, and Luther's reformation at the tame time gaining ground in the Netherlands, his disciples were forced perfecution to join the malecontents. Upon this king Philip introduced a kind of inquisition, in order to fuppress them, and many thousands were put to death by that court, besides those that perished by the sword. The counts of Hoorn and Egmont were taken and beheaded; but the prince of Orange, whom they elected to be their fladtholder, retiring into Holland, that and the adjacent provinces entered into a treaty for their Their mutual defence at Utrecht, in the year 1579.

perseverance and courage were such under the prince of Orange, that, together with the affiftance afforded them by queen Elizabeth, both in troops and money, they forced the crown of Spain to declare them a free people in the year 1609, and afterwards they were acknowledged by all Europe to be an independent frate, under the title of the United Provinces.

After the independency of the Seven United Provinces was acknowledged, the Spaniards remained poffeffed of the other ten provinces, or, as they were termed, the Low Countries, until the duke of Mariborough, general of the allies, gained the memorable victory of Ramilies, in the year 1706; after which, Bruffels, the capital, and great part of these provinces, acknowledged Charles VI. afterwards emperor of Germany, for their fovereign; and his daughter, the late empress queen, remained possessed of them until the war of 1741, when the French reduced them, except part of the province of Luxemburg, and would ftill have peffeffed them, but for the exertion of the Dutch, and chiefly of the English, in favour of the house of Austria. The places in the postession of France, distinguished by the appellation of French Flanders, will be enumerated and described after our description of

France in the following chapter.

XIII. E. R

N giving a geographical description of this country, we hardly know what fyftem to lay down on which to purfue our history. At the time of the publication of the first Edition of this Work, France was a kingdom, under an abfolute monarch, who had in himfelf the power of making laws, of imposing taxes, imprison-ment, and even of life. A revolution however has taken place, fo wonderful and extensive in its effects, that not a vellige of monarchy remains; the feodal fystem is totally extirpated; nobility and all hereditary diffinctions are abolished; the treasures and revenues of the churches, abbeys, and monasteries, have been appropriated to the fervice of the state; and in civil fociety they have declared all men to be equal. A deputation of persons from all parts of the republic, elected by general fuffrage, forms now the fupreme power of the land, under the name of "the Convention. obtain as equal a representation as possible, the geo graphical divisions of the country are changed; and France is now divided into 84 departments, each department including a diffrict of about 18 leagues fquare. The prefent unfettled ftate of this country, fubject as it is to various new arrangements, as the governing power fees expedient, inclines us however for the prefent to continue the old division of the country, introducing only the following table of the departments, accompanied with a reference to the province or provinces in which the department lies. The departments in fome inftances include more than one of the former provinces, and in others one province forms feveral departments.

SECTION I.

Name, Extent, Boundaries, Climate, Soil, Rivers, Mountains, Minerals, Vegetable and Animal Productions, &c.

NRANCE derived its name from the Francs, or Freemen, a German nation, reftless and enterprizing, ho conquered the Gauls, the ancient inhabitants; and the Roman force not being able to repress them, they were permitted to fettle in the country by treaty.

This extensive and populous country is 600 miles in length, and 500 in breadth; being bounded on the west by the bay of Biscay; on the east by Germany, Switzerland, and Italy; on the north by the English Channel and the Netherlands; and on the fouth by the Mediterranean and Pyrenean Mountains, which di-

vide it from Spain.

The air of this country is, in most parts, mild, temperate, and wholefome, but not fo particularly falubrious as has been afferted. It must be acknowledged, indeed, that the French have been but too fuccelsful in giving the inhabitants of Great Britain falle prepoffessions in favour of their own country. It must also be confessed that the weather is more equal than in England, but at the fame time the winters, particularly in the northern provinces, are much colder; and what is worfe, the inhabitants are not fo well supplied with fuel.

The foil, in many places, is admirable, and produces not only the conveniencies, but most of the luxuries of life. In general the fruits are much finer, and higher flavoured, than those of England; but the pasturage and tiliage are not equal to ours. In several diffricts the foil is burnt by the heat; and the people hitherto have not attended to cultivation as they do in England. The French however have endeavoured to ftimulate the peafants to greater industry, by instituting academies of agriculture, and proposing premiums for us improvement, as in England.

The fprings and running streams of this country produce excellent water, which, by means of engines, and a variety of hydraulic inventions, are rendered fubfervient to all the purposes of domestic and public utility.

The principal rivers are the following:

The Loire, which takes its course north and northwest, extending, in all its windings, 500 miles, till it discharges itself into the lea at Nantes.

The Garonne, which rifes in the Pyrenean Mountains, takes its course at first north-east, and has a communication with the Mediterranean Sea, by means of a canal, the work of Louis XIV.

The Seine runs north-westward, waters in its course Troyes, Paris, and Rouen, and then discharges itself into the British Channel at Havre de Grace.

The Soane falls into the Rhone at Lyons. The Charante discharges itself into the Bay of Biscay at Roch-The Rhine rifes in Switzerland, is the eaftern boundary between France and Germany, and receives the Motelle and Sette in its paffage. The Somme runs north-west through Picardy, and falls into the English Channel through Abbeville. The Varre rifes in the

No. 77.

Alps, runs fouth, divides France from Italy, and falls into the Mediterranean west of Nice. The Adour runs from east to west through Gascoigne, and falls into the Bay of Bifcay through Bayonne; and the Rhone, which rifes in Switzerland, flows on fouth-west to Lyons, and then runs on due fouth till it falls into the Mediterranean below Arles.

In the Rhone grows the Vallifneria, a plant confifting of a finall root, with a few long leaves rifing from it, and, in the midft of them, a stalk of two or three feet in length, but so weak, that it is not able to support itself erect. On the top of each stalk is one fingle flower, in fome degree refembling a fingle flower from a bunch of jeffamine. It appears to be abfolutely necessary to the well-being of the plant, that every part of it should be immersed in water, except just the flower at the top of each stalk. And the heat of the fun is requifite to opening the feeds contained in the cup of the base of them: now the Rhone, wherein this plant grows in great abundance, is a river of uncertain depth, and that in places very near one ano-The Rhone is also, of all rivers, the most apt ther. to be swelled by fudden floods. In this case how is the plant, that was just flowering in its proper manner, at four feet depth, to be kept in the necessary state of having that flower above water when the depth is increafed to fix? Or how is it to be kept from falling on the furface of the water, and rotting, when the depth decreases, and leaves a foot or two of a naked stalk; which is unable to support itself? All this is provided for by the great Author of Nature; for the stalks are not strait, but twisted in a spiral form, in the manner of a cork-fcrew, or rather in the manner of those springs of wire, which we fee made by wrapping the wire round a fmall stick. By this formation the stalks of this plant have a power of extending and contracting themselves in length, and this so suddenly, that let the rife or fall of the water be ever fo quick; the lengthening or shortening of the stalks accompany it, and the flower of the Vallisheria is kept just at the surface of the water: by this means the fun has power to ripen the flower till the feeds are feattered on the furface of the water in perfect ripenels, where they float a little while, but, when thoroughly wetted, fink, and take root at the bottom. To prove to ocular demonstration what is faid of this plant, feveral of them have been put into veffels of water, fome of them with ftalks to long, that one half of them was above the furface of the water; others with them fo thort, that they were immerfed feveral inches under it; but in a few hours they had each adapted the length of their ftalks to the depth, and the flower of every one was floating just on the furface.

The great advantages which France derives from her rivers are much augmented by artificial canals. Here are but few lakes: one at the top of a hill near Alegre is supposed to be bottomless; and another at La Basse causes a noise like thunder when a stone is thrown into it. The chief mountains in France, or its borders, are the Alps, which divide France from Italy; the Pyrenees, which divide France from Spain; Vaugue, which separates Lorraine from Burgundy and Alface; Mount Jura, which divides Franche Compte from Switzerland; the Cevannes in the province of Languedoc, and Mount Dor in the province of Au-

The waters of Bareges, which lie near the borders of Spain, under the Pyrenean Mountains, are admirable in their effects. The Sulteybach waters, in Alface, cure the stone, palty, and weak nerves. At Bagueiis, not far from Bareges, are some excellent mineral springs and baths. The waters of St. Amaud are efficacious the gravel and obstructions: and at Aigne, in Auvergne, is a fpring which boils up violently, and is of fo poilonous a quality that birds and beafts who drink of it die almost instantly.

France abounds in marble and free-flone. In Languedoc, there are veins of gold and filver, as well as 10 D

turquoifes, the only gem this kingdom produces; Alface contains filver and copper; Brittany has mines of iron, tin, lead, and copper; and in other parts are found alabafter, jafper, coal, chalk, oker, &c.

The roots, herbs, and other vegetable productions of France, are much finer than those of England, and confequently their foups, fallads, &c. are fuperior to ours. The principal objects of cultivation among the French are their vines, and the excellency of the wines they produce is univerfally acknowledged; in particular, the wines of Champagne, Burgundy, Bourdeaux, Gascony, and those called Hermitage, Frontiniac, and Pontacke, are much admired, not only for their pleasant taste, but falubrious qualities.

Elm, ash, and oak, are produced in France, but the latter is not so good as that which grows in England. At Rhee, Rochfort, and their vicinity, great quantities of falt are made. The herb falled kali, which grows in Languedoc, furnishes abundance of pot-ashes; and prunes and capers are produced near Bourdeaux

and Toulon.

The horses, black cattle, and sheep of France, are far inferior to those of England; and the wool is not so fine; but the hair and fkin of the shamon, or mountain goat, are superior to ours. There are few other animals, either wild or tame, in France, but what are common to England, wolves excepted. These ferocious creatures do much mischief, and are greatly dreaded by those perfons who refide near woods or forests. The wolf is the largest and fiercest animal of the dog species, and partakes fomewhat of the nature of a dog. He has a wild look, thining eyes, tharp teeth, thort neck, and a blackith colour. He bears hunger long, has a howling voice, oblong blunt muzzle, thort ears, and a thick

SECTION II.

Particular Description of the several Provinces or Go-vernments into which France was divided before the Revolution.

N the government of Paris there are several very conspicuous places, of which we shall treat in their

order, beginning with the capital.

Paris, the metropolis of France, is fituated on the river Seine in the Isle of France, being one of the largest and finest cities in Europe. It derives its name from the ancient Parifin, and had formerly, as it is imagined, the Latin name of Lutetia, from the word lutum, which implies mud, as it was originally founded on a marthy foil. Paris has been the relidence of the French monarchs for upwards of 800 years, that is, ever fince the reign of Hugh Caput. The form is circular, and, with the suburbs included, it is about 16 miles in circumference. The computed number of inhabitants is about 500,000; and it contains, exclufive of public ftructures, upwards of 20,000 houses, and 912 streets. The greatest inconvenience of Paris is the almost general want of good water, that of the Seine being deteftable. The only water proper to drink is conveyed to Paris from the neighbouring village of Arcueil. Many of the streets are tolerably well paved and lighted. The whole that goes under the denomination of Paris contains a prodigious affemblage of palaces, castles, superb hotels, academies, libraries, gates, bridges, market places, fountains, hofpitals, convents, churches, the univerfity, &c.

But to defcend to particulars: that part of Paris called La Cité contains three islands, which are formed by the branching of the Seine, and are thus named, L'Isle de Palais, L'Isle de Notre Dame, and L'Isle Louviers. This division is the principal part of Paris, and contains the following structures. Several bridges fome being of wood, and others of stone; but most of them have a row of houses on each fide. The principal of these are Pont-Neuf, Pont-Royal, fince the revolution called Pont de la Nation, and Pont de la Liberté. Pont-Neuf confifts of 12 arches, and has a catriage way in the middle 30 feet broad, and foot that it should never be alienated. However, Lewis

walks on each fide raifed two feet high. In the center was formerly a brafs flatue of Henry IV. on horfeback, but in the time of the revolution it was thrown down and a guard-house is erected on the spot. A building, called LaSamaritaine, is likewise crected on this bridge. It is fo named from a group of figures upon it, reprefenting Our Saviour and the Samaritan woman flanding near Jacob's well. Here is a pump to raife the water, which, by means of pipes, fupplies the quarter of the Louvre, and fome other parts of the town.

Pont-Royal, or Pont de la Nation, croffing the Seine to the Thuilleries, was built of stone by order of king Lewis XIV, in the room of a wooden bridge that was carried away by the violence of the current, February 20, 1684. The foundations of this bridge were laid October 25, 1685, and it was finished in a little time, at a moderate expence, though it is one of the strongest in the country. A Dominican friar,

named Romain, had the direction of it. The Pont de la Liberte was begun in the year 1787, under the reign of Lewis XVI, and was then intended to be named Pont de Louis Serze. It croffes the Seine

at the foot of the Palais Bourbon.

Paris is an archbishop's see; and, according to the new constitution, is the capital of the department of

the fame name.

The cathedral church, stiled L'Eglise de Notre Dame, i. e. Our Lady's Church, because it is dedicated to the Holy Virgin, is an ancient Gothic building, compleated at feveral times, but more ftrong than noble. In this church, before the revolution, there were a great many fine paintings, rich tapeftry, and a vaft quantity of filver and gold plate for the use of their altars.

In the church of St. Genevieve the great philosopher Des Cartes has a tomb, with infcriptions upon it in Latin and French. Here is a library, with a curious collection of coins, medals, antiquities, and other rarities belonging to this convent. The collection of minerals and fossils is very considerable. Amongst the rarities there is the skeleton of a man dried in the fands of Africa, with all the mufcles complete, and exactly preserved: there is likewife a good portrait picture of stone in exceeding small tesserse of Mosaic work. In a cabinet of coins there are fome extraordinary relics of antiquity; a Roman affis, and a fquare brafs plate of the weight of four affis, with the figure of an ox upon it. In some of the divisions of this repository are a multitude of dies of freel, made at Padua, for the firiking of counterfeit Roman coins. In the muleum of St. Genevieve are many curiofities befides thole already mentioned, particularly the head of Cartouche, the highwayman, exactly taken in plaister of Paris, the most politic and adventrous captain of banditti that ever the world produced; but all his adventures and escapes at length ended upon the wheel. At one time this famous robber was concealed at an inn in France, to which a party of dragoons came in quest of him. He put on the drefs of a prieft, introduced himfelf into their company, dined and drank with them, and talked upon the affair of Cartouche; but before they role from table, he took an opportunity to flip into the stables, and throw off his habit; then cutting the girths of all the other horses, he mounted himself upon the best of them, and as he rode off gave an alarm of The dragoons ran out to take horfe; but Cartouche. when they had put their feet into the stirrups their faddles turned round; and the delay and confusion that interfered before they could enter upon the purfuit gave him an opportunity of escaping for that time. ciety of St. Genevieve is one of the richest in France.

Near the church of Notre Dame is the palace of the archbithop, in which the library of the advocates is kept. Le Palais Royal, or the royal palace, was called at first Le Palais Cardinal, because cardinal de Richlieu built it, in the year 1636. As foon as it was finished, ing, lge. preling uer, the

XIV. gave first the use, and afterwards the property, of it to his only brother Philip, duke of Orlean. It confists of several sets of buildings separated by large courts, and is adorned with sine gardens. Several new apartments have been added to it since the cardinal's time. The whole court was lodged in it during the regency of queen Anne of Austria, mother to Lewis XIV. whence it had the name of the Royal Palace. Since the revolution le Palais Royal has been named

le Jardin de la Revolution. The palace, where the parliament of Paris used to meet, was anciently the relidence of the kings, but was given to the officers of justice by Philip the Fair, who fixed the parliament at Paris. The great hall was built according to the plan of another very ancient one that was here, round which flood the flatues of the kings. This was the place where thefe princes gave audience to the ambaffadors. The grand chamber is contiguous to the great hall. It was built in the reign of St. Lewis, who used to give audience there publicly, and labour himself to make up the differences and difputes which arofe among his fubjects. Lewis XII. repaired this chamber, as it is at prefent; but the other chambers are much finer than this, the roofs of fonce being gilt and painted very beautifully. The court of aids had a jurifdiction diffinct from that of the parliament, and held its meetings in three particular cham-bers adorned with fine ceilings. The chancery was kept in that part of this palace called the gallery of the prisoners; for in this palace was the royal prison or goal

belonging to the parliament, called, la Conciergerie. The Hotel Dieu is the most capacious as well as the most ancient hospital in Paris; and here 8000 site and instrument people are taken care of, and properly attended by the nuns of the order of St. Augustine.

The observatory is a building composed of stones exactly square, and uncommonly massy. By the flatness of the roof, which is paved with bricks, the wet has penetrated, and, by wathing the mortar from the joints of the stone, has hurt the whole structure. From the northern window there is a delightful prospect of the city of Paris. The domes that arife in different quarters, the palaces, monasteries, churches, and public buildings, every where distributed, and the rural verdure of gardens and public walks, intermixing itself with the whole, form as rich a view as can well be prefented to the eye; and the perfect clearness of the air, in which no smoke is visible, permits the spectator to take in every part of it without interruption. Through the center of the whole building of the observatory there is a circular well, which is continued as far under the ground as the building itself is raised above it, and at this depth, which you defeend by a winding flair-cafe of stone of 170 steps, there are subterraneous passages or narrow alleys, with from walls on each fide, which feem more extensive than the building itself, and branch out into many directions. They conduct you to a cave or grotto, from the roof of which the water, having penetrated all the way from the top of the obfervatory, diffils conftantly to the floor, and there forms a petrefied cruft. This edifice was crected in the reign of Lewis XIV, when all the arts and fciences as the French used to express themselves, ran at his command. On the floor of the upper flory is a line of brafs upon the pavement which is the meridian that was afterwards continued to the fouth of France, by a fuccession of trigonometrical operations, and even into Spain itfelf.

The Louvre is reckoned the chief ornament of the city of Paris; and was built of repaired under the reign of Philip Augustus, in the year 1214. It was a castle that stood without the city. Near it, on the banks of the river Seine, they built a large tower, called the Tower of the Louvre. It defended the river, together with another tower, that stood over against it, named the Tower of Nesle. In this tower were sometimes kept the treasures of the French kings. It was pulled down when the foundations of what is called the Old

Louvre were laid, under Francis I. His fon Henry II. employed the most eminent and relebrated archetects of his time to render this building as regular and magnificent as could be. What is called the Old Louvre confifts of two fets of buildings, that form an interior angle, the fronts of which are adorned with very fine pieces of architecture. The whole building is three flories high. The first is of the Corinthian order, the fecond of the Composite, and the third of the Attic. The fore or outward courts are adorned with chamfered columns, and the other with pilasters of the fame order with those columns. What is chiefly admired is the proportion of the windows of the fecond flory, the cases of which are adorned with a pediment alternately triangular and circular. The third flory, of the Attic order, has also its particular ornaments, confisting in trophies of arms, in basso-relievo fixed to the window cases, with other ornaments in the entablatures. In the hall of the hundred Switzers is a kind of gallery supported by four gigantic figures. This hall was formerly used for great entertainments; and queen Catharine de Medicis caufed plays and interludes to be acted here for the diversion of the court. Henry IV. built a gallery along the river fide, quite to the Thuilleries, which is very long, and efteemed the finest in Europe: under it is the printing-house, and the lodgings of many curious artists in painting. Lewis XIII. finished the front to the west, and built a large pavilion, in the form of a dome, in the middle, over the gate, which is supported by two rows of very large pillars of the lonic order, and also adorned the architrave of the front to the court with fine fculptures. Lewis XIV. bestowed great costs upon the east front, in the middle whereof is the east gate of the palace: here are forty columns of the Corinthian order, which support a large terrace, that is railed with a flately balluitrade. The court, which is in the middle of that large building, is very near twenty-three perches square; the four fides of it are composed of eight pavilhons, and eight fets of buildings, which furround that great court: there are yet but about three parts of it built. The architecture, after the manner it is begun, is to confift three orders of columns, with their pedeftals; the first of the Corinthian, and the two others of the Composite order.

Lewis XIV. who declared himself the protector of the French academy, gave that illustrious body an partment in the Louvre to hold their affemblies in; as also to the academy of medals and inscriptions, and to the academy of sciences. The academy of architecture and painting meet in the old Louvre. In the gallery of the Louvre is the printing house, established by

cardinal de Richlieu.

In the wardrobe of this palace is a prodigious quantity of rich tapeftry hangings, both ancient and modern, the finest of which were made in the reign of Francis I. Amongst them are the battles of Scipio, and the triumphs of the same general; the bistry of Joshua, made after the designs of the samous Raphael; the history of Psyche; the acts of the apostles; the history of St. Paul, &c. Lewis XIV. caused several tapestries with gold and silver to be made, after the designs of Le Brun. There were also here, in several rooms, a large quantity of ancient arms; amongst which were those which Francis I. wore at the samous of the blows he received before he surrendered to the Spaniards.

In the hospital dedicated to St. Catherine poor women and maidens are allowed to fojourn, and are entertained three days, being attended by the nuns of St. Augustine. In the grand chatelet the fessions were held by the inferior courts of justice. Fort L'Eveque contained a mint and a prison, and is close to the spot where Henry IV. was stabled by Ravilliac. St. German l'Auxerrais was termed the parish church royal, because the Louvre and Thuilleries are situated in its parish.

The Thuilleries is joined to the Louvre by a gallery which

cuted with great accuracy.

The Thuilleries, or Tuleries, stands in a place where formerly they made tiles, called Tuiles in French, from whence that palace has its name. It is one range of building, with a pavilion at each end, and a dome in the middle: before it is an handsome large space divided into three courts; the whole adorned with columns, pilafters, and other ornaments. Behind this palace are gardens, adorned with fine walks, planted with ever-greens, and other trees, and fine parterres; where were to be feen, the year round, all the flowers that are in scason. It has also three fine fountains, with their basons, and a large octagonal canal, To wards the river is a fine terrace planted with three rows of trees. From this terrace is a most beautiful prospect over part of the city, and over the adjacent country. A beautiful walk opens on the banks of the river beyond the Thuilleries, which is composed of four rows of fine elms, that form three avenues, being together 120 feet broad. In the centre is a ring with trees planted round it in a circular manner, and at each end are iron gates. The National Convention meet here.

The Baftille, which was deftroyed at the beginning of the revolution, was a kind of fortrefs, confifting of eight large roundtowers, joined together by other ftrong buildings. In the year 1634 it was furrounded with ditches and baftions. It was a prifon for flate criminals and for fuch as were taken up by lettres-de-cachet, that is to fay, by warrants figned by the king, and fealed. In it the king kept a governor, a lieutenant, and an independent company of foldiers.

The National Library, under the reign of Lewis XIV. was a flately palace, built by cardinal Mazarine, the infide of which has been altered, and confifts now of feveral large and lofty rooms, in which the numerous books are ranged in very good order. Here is the fhield of Scipio Africanus, which was found in the Rhone about 600 years fince. In the library are a pair

of globes 20 feet in diameter.

La Place des Victories, or Victory Place, is a kind of circus, in which flood a noble flatue of Lewis XIV. erected to his honour by the duke de Fuillade. The king's statue was of massy brass, 30 feet high, clad in his robes, with a Victory behind him, of the fame bulk and metal, putting a crown on his head, and poifed with her foot on a globe. Under her feet was a three headed Cerberus, to reprefent Lewis XIV. triumphing over the triple alliance, and this infcription under it, Viro immortali, " To the immortal man." The whole mould was caft at once, and weighed above 30,000 pounds. The pedeftal was 22 feet high, which, with the maffy piece of mold the flatue flands upon, made the whole near 40 feet high. Upon the pedeftal were four flaves of brafs, with baffo relievos of the king's battles and conquefts. Under the pedeftal was a pavement of marble enclosed within flately iron grates. There were feveral infcriptions upon the pedeftal alluding to the king's great actions. This flatue was thrown down at the revolution.

In the church of St. Roche the celebrated poet Corneille is interred; Moliere is buried in the church-yard of St. Joseph; and the famous statesman Colbert has a fine monument in the church of St. Eustace. The gates of St. Denis and St. Martin were both erected in the form of triumphal arches, in compli-

ment to Lewis XIV.

La Greve is an open place, appropriated at once to joy and tribulation; for malefactors are formetimes executed here, and at other times public rejoicings are celebrated on the fame tpot. The Hotel de Ville as a large but whimfical building, as the main part is of Gothic architecture, and the columns are of the Corinthian order. The arienal contains many spacious buildings, particularly a soundery and falt-petre house. Here is likewise a musquetoon of two barrels, the balls of which will, pierce a thick board at the distance of

fix miles; and for difcerning an object at that diftance, there is a telescope fixed to the barrel. The Temple, till the time of the revolution, was a commandery of the knights of Malta. Here Lewis XVI. and his family were confined after monarchy was abolished. Its precinct was a privileged place for debtors. In the church belonging to the house, which was formerly called La Mation Professe des Jesuites, the hearts of Lewis XIII. and Lewis XIV. were preserved in caskets of gold, and supported each by two angels of massy filter as large as the life, represented as hovering with expanded wings.

Of the public spectacles the Comedie Françoise is the chief. This theatre is spacious, and, when filled,

has a splendid appearance.

The theatre of the Comedie Italienne is built on the fame plan as that of Comedie Françoife. It fometimes confifts of a farrago of French and Italian, and of comedy, farce, and pantomime.

The opera is the most superb spectacle of Paris, and excellent in its decorations, scenery, and dancing. The house is spacious, and, in general, well filled.

Amongst the diversions of the metropolis of France, a British traveller gives the following account of that of bull baiting. "The place appointed for this diverfion is a small amphitheatre built of wood. Around the arena, in the ancient manner, are the caves and dens for the beafts of combat; and over these are the boxes and galleries for the spectators. It began with various combats of wolves, bears, and wild boars, with mastiffs; but the bull was referved as a finishing stroke to fatiate the cruelty of the spectators. It was not long before my curiofity was fufficiently gratified. The bull, in springing to the first dog that entered, broke off his horn, close to his head, against the wall. He was then defenceless; but they continued to fend in mastiffs to the number of 14, that were suffered to hang about him till he fell to the ground. This I did not fee, for I could not flay the conclusion; but I heard from my fervant, whom I left there, he was devouring alive for more than two hours, and that his nofe, tong e, eyes, and throat, were eaten, before he expired. Join with me here in retorting back on the French the appellation, they bestow on us of peuple barbare,

The palace of Luxemburg was built by Mary de dicis on the ruins of the old hotel or house of Luxemburghein ame it kept. It was finished in five or fix years, time, under the direction of James de Brosse; and is one of the most perfect and regular pieces of architecture in France. In this palace is a gallery of painting, done by the famous Rubens, who spent two whole years on that work. The whole history of Mary de Medicis's life is here represented allegorically, in 24 large pictures, nine feet broad, and ten feet high, placed in the piers between the windows.

The quarter called the University stands in the south of the islands of the palace, and of our lady. It was formerly enclosed by a wall, and surrounded with ditches; but under the reign of Lewis XIV, the wall was pulled down, and the ditches filled, to make it configuous to the neighbouring suburbs. That of St. Germain is the most considerable, and is alone larger than the whole quarter called the University; but it is not so populous, because of the great number of hospitals, large houses or hotels, and gardens that take up a great part of it. Adjoining to this suburb are that of St. Michael, which is but small; that of St. James, which is pretty large; and that of St. Marceau, which is larger still: the last of all, which is the nearest to the river on the east, is that of St. Victor, which is very large, but not built all over.

The university was founded by Charles the Great, and is appropriated to the cultivation of the arts, sciences, &c. in general, and physic, law, and divinity in particular. It contains above 40 colleges, the principal of which are, the colleges of Sorbonne, Navarre, the Four Nations, and Physicians.

Public lectures are read only in the four principal. The rector, who is the head of theuniversity, is chosen every three months; the professors have settled falaries.

The Gobelins is a house so called from one Gobelin, an eminent dyer, who removed from Rheims to Paris, under the reign of Francis I. and bought that He found out the fecret of dying in that beautiful fearlet colour called, from his name, the fearlet of the Gobelins. Lewis XIV. bought that and fome others, where he established a manufactory of the finest tapeffries; and fettled a number of gold and filver fmiths, embroiderers, painters, carvers, and other artificers in every branch that relates to fplendor and magnificence. Here are many things of most curious

workmanthip.

The general hospital is a very humane and noble foundation for the poor of the female fex, great numbers of whom are here provided for: those who are well are compelled to work, but the fick are tenderly nurfed, and carefully supplied with every necessary. Different wards are respectively assigned for foundlings, sempftreffes, idiots, proftitutes, &c. As this general hofpital is appropriated to females only, the castle of Bicetre is a kind of counterpart, and appointed for the relief of fimilar necessities in the male fex; and likewife for another purpose, viz. the punishment of children who lead diffolute lives, or are undutiful to their

The physic garden was first founded in the year 1626, by order of Lewis XIII. and finished in 1634. There were at first four professors of botany, in the room of whom the king established, in 1671, two demonstrators of the plants, one of whom is obliged to make the analysis, or chemical demonstration of them. There is also a laboratory where they read lectures of chemistry, and a particular hall for anatomical demonfirations; and in the year 1712 there was another demonstrator added, whose office is to read lectures upon

the Materia Medica.

St. Victor's abbey contained an excellent library of curious manuscripts, as well as printed books, and many admirable maps, prints, &c. To the college of phyticians belong five professors. The academy of furgery was instituted in 1731. The convent of Franciscans was the richest in France. The convent of Carthufians contained many fine paintings; and, in the fame quarter, are fome remains of the palace of Julian the apostate. In the hotel des Ambassadeurs ambassadors extraordinary are entertained for the space of three days, and those from remote countries during their refidence at Paris.

The abbey of St. Germain de Prez contained a cabinet of curiofities, a valuable library of printed books, and a great number of manufcript volumes. The hotel des Invalides, for difabled foldiers, was erected by Lewis XIV. for the maintenance of lame and fuperannuated officers and foldiers; the buildings being fo enormoutly extensive as to cover 17 acres of ground, and the chapel is magnificent. Near the hospital of invalids is a military academy for the instruction of 500 young gentlemen in every thing relative to the art of war.

The feveral academies in Paris that deferve to be

particularly mentioned are the following. 1. The Academie Françoife, or French Academy, founded by cardinal Richlieu for the improvement of the French language, in such a degree as to reduce it to a determinate standard. It confifts of forty members, who meet at flated times to superintend the institution, and promote the same by every probable means.

2. The Academy of Inscriptions and Belles Lettres, inflituted for the advancement of polite literature. In this academy ancient monuments are explained, and public transactions perpetuated by medals, infcriptions,

&cc.

No. 77

3. The Academy of Sciences, inflituted in 1666, has its honorary members, penfioners, affociates, and fludents. These apply themselves to the different branches of the mathematics and natural philotophy.

4. The Academy of Painting and Sculpture, founded in 1643. The mafter-pieces of the painters and feulptors admitted into this academy are disposed in different halls, and marked with the names of the feveral artifts.

5. The Academy of Architecture was founded in 1671, but not authorized by letters patent before the year 1717. It is divided into two classes; the first is composed of 10 architects, a professor, and a secretary, and the fecond of 12 other architects. The professor, whose post, as well as the secretary's, is for life, is obliged to read public lectures on flated days.

All these establishments relate to arts and sciences, There are others defigned for the improvement of virtue, and promoting religion. Before the revolution there were 10 of these seminaries at Paris, among which was one for English, and another for Irish priests; and most of the bishops had such seminaries in their

Comparisons have been and are frequently drawn between this metropolis and that of England. The natives of the respective nations have, doubtless, been influenced by that patriotic attachment almost inseparable from human nature, and mifreprefentations have been the unavoidable confequence. We shall not therefore pronounce decifively on the matter; but having thus given the most accurate account of the metropolis we could procure, fubmit it to the candid and intelligent reader; though we frankly confess a bias of opinion in favour of London, and we prefume we thall be justified therein by impartial travellers.

The neighbourhood of Paris is very pleasant, and

contains a great number of towns, villages, &c. and fome fine feats. Among the last in this government are the palace of Meudon; another at St. Maur des Boffex; the palace called Conflans, near the conflux of the Seine and Marne; one at Iffy, which belonged to the prince of Conde; another at Rambouillet; and

those called Maifons and Colaguy.

In the government of the Isle of France is included a part also of Perche, Picardy, Brie, Gatinois, Beauce, and all Le Vexin François. It is fruitful in grain, fruits, and wine, and contains the following remarkable places:

St. Denis, commonly called St. Denis en France, which lies about two leagues from Paris to the north. Here is an abbey of great antiquity, dedicated to St. Denis, the patron, or tutelar faint of France. It has an elegant garden, and before the revolution contained a rich treasure, in which were also kept the crown ewels. In its church are the fepulchres of the French kings, the princes and princeffes of the blood, and other great personages, particularly that of marshal Turenne. The convent, which was of the benedictine order, and, with its precincts, was immediately fubject to the pope, had a confiderable income, together with the ordthip of the town. This town is noted for its fairs.

Vincennes, a palace hard by Paris, standing in a fine park, or wood, called Le Bois de Vincennes, which appertained to the king, together with the palace. The park is very large. The caftle was used as a state prifon, and the avenue leading to it is planted with four beautiful rows of elms.

Montmorency, an ancient but fmall town, contained The ancient dukes of Montmoa convent of monks. rency took their title from this town, and in the church their tombs are yet to be feen.

Corbel, fituated at the conflux of the Efforne and Seine, had feveral convents, churches, two bridges, and an hospital, and the chief trade is in skins.

Charenton, on the Maine, was formerly celebrated for the refort of Hugonots; but the revocation of the edict of Nantz drove them from thence :

For perfecution no excuse admits: Men must believe whate'er the bigot fits.

Public

tained one convent and two churches, and belongs to the Orleans family.

Senlis, on the Nenette, is upwards of 20 miles north of Paris. The air is remarkably good, on which account many of the royal children of France have been nurfed in the caftle. It was a bilhop's fee till the time

of the revolution.

Chantilly is a fmall town. It has a fine feat, which was the property of the princes of Condé, and its fituation is uncommonly preafant. Here is a cabinet filled up in the palace for the reception of a choice collection of fossils. Almost every beauty of the mineral kingdom is here displayed in great abundance, with all its exquifite diverfity of colours, spars, and precious stones, studded by chance in lumps of rich ore, so as to have as fine an effect as the hand of art is capable

Compeigne, on the Oife, 13 leagues north-west of Paris, is the place where the Maid of Orleans was taken prisoner by the English in 1430. Here is a palace, which was repaired by Lewis XIV. and the gardens finely laid out; with a Benedictine abbey dedicated to St. Cornelius. The trade of this place principally con-

fifts of corn, wood, and wool.

At Villers Corteretz, a little town five leagues from Compeigne to the fourh east, at the fide of the forest of Retz, is a fine palace belonging to the family of Or-leans, and an abbey. To this place the late duke was banished by Lewis XVI. for protesting against the proceedings of the king in registering an edict in parliament.

Soitions, a bishop's see. It is an ancient city, and is fituated feven leagues from Paris to the north-east, in a pleasant valley on the banks of the river Aifne, over which there is a stone bridge. town is pretty large and well built. The bishop had the right to anoint the French kings during the vacancy of the archiepifcopal fee of Rheims, or in the archbishop's absence. It drives a great trade in corn. Here is an old castle, and an academy, whose object is the same as that of the French academy at Paris.

Noyon, on the Vorfe, is a place of antiquity, capacious, and handfomely built on the declivity of a hill. It contains several churches, fountains, 2 hospitals, and the same number of public gardens. It has great trade in wheat and oats, many manufactories, gives name to a territory called Le Nayonnois, and was the place of nativity of the celebrated John Calvin. It was the fee

of a bilhop till the revolution.

Laon, 22 leagues north-east of Paris, is a handsome town, which enjoys a very fine air. It contains feveral churches, has a caftle, cathedral, and college, and was the fee of a bishop till the revolution.

Gerbori is a small town, about five leagues from Beauvais, near which, in 1435, the English, under the command of the earl of Arundel, were totally defeated.

Beauvais, the capital of the province of Beauvaisis, is 14 leagues north west of Paris. A bishop's see. This city contains, befides feveral churches, convents, and courts of justice, manufactories of woollen, linen, terge, tapeftry, &c. In the new division of France, Beauvais is the capital of the department of Oile.

Pontoile, on the Oife, the capital of Vexin-Francoite, is five leagues north-west of Paris, and contained two convents and several courts. Over the river it has a good bridge, from which it receives its name. The parliament of Paris was banished hither in 1720 and

Dreux, a very ancient town, fituated on the little river Blaife, about 13 or 14 leagues from Paris to the west, is supposed either to have given name to the Druids, or to have borrowed its name from them. Here is a woollen manufactory. A great battle was fought near this town in 1562, between the Roman Catholics and the Hugonots, in which the latter were defeated.

St. Cloud is fituated on the Seine, two leagues below The family of Orleans has a palace here, with very fine gardens.

Verfailles is a bifhop's fee, and is fituated four leagues from Paris. Lewis XIV. built a most magnificent palace here, and adorned it with noble gardens: it stands on a rifing ground in the middle of a valley furrounded with hills, having, on the fide towards Paris, a fine avenue leading to it through the town, which it divides into the Old and New. Prior to the deposition of Louis XVI. the apartments of the palace abounded with innumerable paintings, flatues, antiques, &c. all of which have been removed, and the palace is now uninhabited. The chapel, built in 1699, is a most finished piece of architecture, sculpture, and painting. Veriailles, under the new conftitution, is the capital of the department of Seine and Oile.

Every room in this noble palace had a particular name, taken from the chief fubject painted on the ceiling. As for instance, the hall or chamber of plenty, La Sale d'Abondance, because plenty and liberality were painted on the ceiling. Here were feveral pictures, as, the Holy Virgin on a column of jafper, holding the infant Jefus in her arms, and furrounded below with feveral pilgrims, done by Pouffin; the Virgin Mary and St. Joseph flying into Egypt, by Guido; the woman cured of a bloody-flux by Our Saviour, done by Paul Veronese, &c. The hall of Venus has that goddess painted on the ceiling, fitting in a chariot drawn by doves, the gods and heroes, celebrated by the ancients, adorning her triumph. Here were the pictures of Nebuchadnezzar, ordering the forming of the gardens of Babylon; of Augustus exhibiting a race of chariots in the Circus; of Alexander marrying Rox-

ana; and of Cyrus reviewing his army.

As the hall of war was dedicated to Bellona, the frize is adorned with trophies, bucklers, and thunderbolts. Over the doors were trophies of gilt metal, under which were represented the four feasons, by proper figures and festoons, fignifying that Lewis XIV. was a conqueror in all the feafons of the year. The ceiling of this hall is adorned with five pictures: the largest, in the middle, reprefenting France holding a thunderbolt in one hand, and a buckler in the other; the four others are in the fides. In the first is Bellona in a violent passion, The fecond represents Germany doing her best but fruitless endeavours to defend the Imperial crown. In the third Spain feems to threaten France; but her foldiers are put to flight. The fourth shews Holland thrown back upon her lion. This room was also adorned with fix heads of porphyry, representing as many Roman emperors; they were in bufts, with a drapery of gilt bra's, and supported on pedestals of oriental alabaster.

The room formerly called the king's bed-chamber was the most sumptuous of all. The carvings were all gilt, on a white ground. The bed was placed in a kind of alcove, where were two figures of Fame, represented fitting : on the cupola, over the bolfter, was France fitting, and feeming to watch for the prefervation of the king. There were several other pictures in this chamber, and particularly one of Hagar in the defert, with her fon, and an angel. The furniture of the bed was of crimfon velvet, embroidered with gold, and otherwife

beautifully ornamented.

The gardens were not less magnificent than the palace. In defeending from the terrace you meet with two bafons, where there are feveral water-spouts; and in the middle of each a collection of fpouts in the form of a wheat-sheaf, which rises 29 feet high. The borders of these basons were adorned each with 8 groups of brazen figures, reprefenting rivers and nymphs; and four others of the fame metal, reprefenting cupids, little nymphs, and genii. In two angles of the parterre are two other basons of marble. The water-spouts that come from them form two theets of water exceedingly fine; and on the border of each of these basons were two groups of figures of animals, made of brafs. From this parterre you fee, in a kind of half-moon that is below it, the bason of Latona, round which were reprefented, in a group of three figures, Latona, Apollo, and Diana. Latona feemed to complain to Jupiter of the

cruelty of the peafants of Lycia, who were here reprefented metamorphofed into frogs, which threw a vaft

quantity of water upon the group.

There are feveral other basons, with water-spouts, and other curious water-works, all of which, before the revolution, were adorned with groups of feveral kinds, which it would be too long to give a particular description of; we shall therefore confine ourselves to the famous canal. At one end of it is a bason of an octagonal figure, and 420 feet diameter; four of its fides are circular, three in strait lines, and the other joins with the canal; in two of the angles of this bason are two sea-horses, each of which carries a Triton on his back. The great canal is 32 fathoms broad, and 800 long, including the basons at each end. In the middle it is croffed by another canal, about 520 fathoms long. At the other end of the large canal is also a bason 200 fathoms long, and 100 broad. Upon this canal the court sometimes diverted themselves in yachts and gallies.

The orangery, or green-house, was a matter-piece in its kind. It is exposed to the fouth, and contains first a large gallery, which is innermost, 408 feet long, and 32 feet broad, with 12 arched windows in the tront; on each fide of this gallery are two others, each 360 feet long. These galleries are adorned without with fine rows of columns; the innermost gallery has eight double columns of the Tufcan order, the two others have four columns each of four feet diameter. At the gate of the porch are two other columns of the fame order, but much thinner. Before this greenhouse is a beautiful parterre, with a fine bason in the middle, where the water fpouts out 40 feet high. It is adorned with four rows of columns, of the Tuscan order, groups of stone figures beautifully carved, vafes, flatues of white marble, &c. In the fummer time this parterre feemed to be a forest of orange and lemon trees,

myrtles, laurels, &c.

The labyrinth or maze is a fine grove, the feveral walks of which are to interwoven with each other, that it is a difficult matter to find the way out of it. At the entrance you meet with two flatues, the one of Æfop, and the other of Cupid, holding a clue of thread in his hand. At every turning of the avenues you meet with a beautiful fountain, adorned with a bason of fine shell-work, where they have represented, in the most natural manner, one of Æsop's fables; the subject of which is expressed in four lines, engraved in gold letters on a thin brafs plate with a black ground. In the garden are statues, canals, groves, grottos, fountains, and every thing that can render it delightful and elegant. The cabinet contained many fine medals, coins, paintings, &c. In the park stands the beautiful palace of Trianon, the outfide of which confifts wholly of variegated marble, of exquisite workmanship. The gardens are large, and abound in statues and water-works.

In a park contiguous to Verfailles is a once royal feat called Marly, with beautiful gardens. The engine here for raifing water from the Seine, to supply the refervoirs and water-works, is equally grand and ingenious, and, with the other water works, coft immense fums; the water being conveyed over feveral hills to the great refervoir here, and from thence to Verfailles.

St. Germain en Laye, a town in the forest of Laye, is chiefly remarkable for two caftles, or palaces. forest and park, contiguous to the castles, are very beautiful.

The convent of St. Cyr, for nuns of the order of St. Augustine, was founded, in 1686, by M. Maintenon, miftres of Lewis XIV. is a very spacious and splendid structure, and before the revolution it contained fifty ladies of quality, and two hundred and fifty pupils or young ladies; for inftructing of whom, in every branch of education becoming their rank and fex, there were thirty-fix lay-fifters. The young ladies continued until they were twenty, when they either took the veil, married, or returned to their relations. If they married they had a portion of four hundred pistoles.

Meudon, two leagues from Paris, contains a fine

palace, which was the favourite habitation of Lewis XIV.

Fontainbleau is fituated in the middle of a forest of the same name, eleven leagues south of Paris, and about one from the Seine. Its spacious castle or palace hath chiefly contributed to its fame. Here are neat gardens, laid out with a very good tafte; and befides the great fountain are many others, which greatly adorn this charming feat. All the halls or rooms of this palace are adorned with very fine paintings and carvings. The greatest room, of all is that where plays were acted when the court was here. There is in that room a fine chimney, built by Henry IV. in 1599; it is twenty-three feet high, and twenty wide, and is adorned with four large Corinthian columns of spotted marble, with bases and chapiters of white marble.

The room where the kings dined in public is adorned with a very fine ceiling, and noble paintings, reprefenting fortitude, temperance, justice, and prudence,

with feveral other fubjects.

In the gallery of Diana is the picture of Henry the Great in a hunter's drefs; and the different kinds of hunting he delighted in are drawn in feven pictures, each twelve feet high, and twenty feet broad.

The gardens are answerable to the magnificence of the palace, and are all adorned with statues and foun-

The town of Fontainbleau was confiderably increafed under the reigns of Henry IV. and Lewis XIII. The latter built the parochial church, which is adorned with fine paintings: on each fide of the great altar is a Corinthian column twenty feet high, and over it is a picture of Our Saviour curing the man fick of the pally, exquifitely done by Varin.

Nemours, a little town, fituated between the forests of Fontainbleau and Montargis. Its trade confifts in corn, wine, flour, and cheefe, which they fell in the

adjacent villages, or fend to Paris by the Seine.

Courtnay is a finall town, fituated fixteen leagues from Paris to the fouth, and gave name to the illuitrious house of Courtnay, a branch of which came into England with William the Conqueror, and founded the family of that name, which still subsists here.

Estampes, a town on the river Juine, contains seve-

ral churches, with a granary for falt.

The diffriers which form the Government of ARTOIS and Picardy produce wine, grain, fruits, pafturage, and turf. Picardy, the name of which is thought to be derived from Picard, fignifying a paffionate wranger, is bounded on the east by Champagne; on the fouth by the life of France; on the north by the Pas de Calais, Artois, and Hainault; and on the west by Normandy and the channel. Its rivers are the Somme, which rifes in the Vermandois, and falls into the channel; the Oife, in Latin Ifara, which rifes in Picardy, and at Conflans falls into the Seine; and the Canche, which rifes in Artois, and falls into the fea at Staples. The other fmaller rivers are the Lauthie, the La Lis, the Aa, the Scarpe, and the Deule. This province, in confequence of its flourishing manufactures, its fituation upon the lea, and its fitheries, is the feat of a very extensive trade. Like most of the other provinces, it had formerly its petty princes, dependent, however, on the crown of France

Guile, the capital of the diffrict of Thierache, has a strong castle, and gave name to a duchy and peerage belonging to the house of Bourbon-Condé. The town, being fituated on the frontiers of the Low Countries, is regarded as one of the bulwarks of France, and con-

fequently ftrongly fortified.

La Fere, a little town near the conflux of the Saar and Oife, contains a powder mill, arfenal, falt office, foundery, and caffic; two churches, and feveral glafs-

St. Quinten, or St. Quentin, on the Somme, is fa-ous for a lawn manufactory. The collegiate church, mous for a lawn manufactory. which is one of the finest in France, takes its name from St. Quentin. In the year 1557 a battle was fought here betwixt the French and Spaniards, called the battle of St. Quentin, in which the French were totally defeated.

Peronne, on the Somme, is the capital of a diffrict called Santerre, and famous for a linen manufactory. On account of its having been often befreged, but never taken, the French term it la Pucelle, or the Maiden.

Amiens, the capital of Picardy, was anciently called Somarobriva, or Briga, that is, the Bridge over the Somme. It is fituated two leagues from Paris to the north, and was the capital of the district called Amienois. It is a place of great antiquity, well fortified, and the fee of a bishop. Here are three bridges over as many channels of the Somme, many churches, befides the cathedral, feveral hospitals and manufactories, with an academy of the arts, and sciences. Voiture, Rohault, and many other eminent men, were natives of this town. The ramparts make a fine walk, being planted with a double row of trees. In the new divifion of France, Amiens is the chief city of the department of Somme.

Conti is a fmall town about five leagues from Amiens, which gave the title of prince to a branch of the house

of Bourbon.

Abbeville, the capital of the diffrict of Ponthieu, is fituated about five leagues from the British Channel, 13 from Boulogne, and 7 from Amiens, on the Somme, in which the tide rifes here to the height of fix feet. There are a great many churches in the town, and it has a very flourithing trade, and a variety of manufactories. The profpect of this town, at the diffance of a quarter of a mile, is remarkably beautiful.

Creffy, a small place on the river Authie, is noted for the battle betwixt the English and French, anno 1346, in which the latter were totally defeated, and the king of Bohemia taken prisoner; whose motto, ich dien, was afterwards put in the prince's arms.

Montreuil, on the Couche, 3 leagues on the British Channel, contains about 5000 inhabitants, and has a

pretty brisk trade.

The peafants round this fpot are very poor. It is remarked by travellers, that no fooner does a chaife ftop, than the cottages pour forth swarms to crave charity : young and old all join in the chorus, Charité pour l'amour de Dieu.

St. Valery, or Galerici, is a fea-port town, fituated at the mouth of the Somme, four leagues below Abbeville. The entrance into the Somme is very dangerous, because of the shelves and quick-fands which move from place to place with the wind and tide, fo that no ships dare venture to enter it without the affiftance of the best pilots of the country; however, there is great trade here, because all forts of merchandizes are eafily conveyed from hence to Amiens, and thence into Artois, Champagne, and to Paris. Here they import spices from Holland, as also pot-ashes for making of foap; cod fish, herrings, cheese, and many other commodities from feveral countries; they also export into Spain and Portugal the manufactures of Picardy.

Agincourt, or Azincourt, near the river Brefle, is famous in hiftory for a glorious victory which the English, commanded by Henry V. gained here over the French, the 25th of October, 1415. The English loft but 1600 men, and the French 6000. Among the flain were the count of Nevers, and Anthony, duke of Brabant, brothers to the duke of Burgundy, the duke of Alençon, the constable of Albret, the duke of Bar, the marthal of Boucicaut, admiral Dampietre, the archbishop of Sens, the viscount of Laonnois, and many others of the nobility. The dukes of Orleans and Bourbon, the counts of Vendosme and Richemont, and a great number of principal officers were taken prisoners.

Boulogne, on the mouth of the Lane, is only eight leagues from the nearest coast of England. It was the capital of a diffrict called the Boulonois, which enjoyed

peculiar privileges of exemption from feveral taxes; and had a governor independent of the governor-general of Picardy. The harbour cannot be entered but at high water, and is defended by a fort. The town is divided into Upper and Lower. Near the citadel is a mineral fpring, called La Fontaine de Fer, that is, the Iron Spring. It was the fee of a bishop till the revolution.

Ambleteufe, a small town on the channel, two leagues from Boulogne, is well fortified, and has a good harbour. Here king James AI. landed, when he fled to

France, after his abdication.

Near Andres, a fortified town, three leagues from Calais to the fouth, Francis I. and Henry VIII. of England, had an interview: their retinue was fo richly dreffed, that the place where they met has ever fince been called Le Champ de drap d'Or. " The Field of

the Cloth of Gold."

Arras is the capital of the diffrict named Artois, which is one of the most fertile districts in all France. It is 24 leagues long, and 12 broad, being bounded on the east by Hainault, on the north by Flanders, and on the west and south by Picardy. A considerable trade is carried on in the province in grain, flax, hops, wool, linen, &c.

Arras, fituated on the river Scarpe, 10 leagues from Amiens to the north, is a very ancient and large city, and is divided into two parts: the one, called the City, is the ancient; and the other, named the Town, is the new. They are each furrounded with old wails, where there remain still several round towers, built after the ancient manner, and a gate, over which was this inscription: Quand les François prendront Arras, les fouris mangerent les chats ; i. e. " When the French shall take Arras, the mice shall eat the cats." In the new division of France, Arras is the chief town

in the department of the Pas de Calais.

Marshal de Vauban repaired those old walls, and added feveral baftions, and many new works to them in the ditch, which is large and very deep. There are to be observed in it, among other things, lunettes, built after Vauban's manner: they are the first works of that kind, which were invented by that excellent engineer. They confift of a triangular half-moon, covered with two half envelopes, feparated from each other by a ditch.

The citadel is fomewhat higher towards the country. It is not very large, but deemed one of the strongest in France. The ditch is dry towards the country. The greatest part of the ground about this city is low, and proper to be laid under water. This town is inhabited by wealthy traders and artificers, who make fails and tapeftry-hangings, especially the latter, which art was invented here; therefore those tapestries take their name from that of the city.

Aire is a fortified town, fituated on the river Lis. 22 miles from Arras to the north-west, and contains two hospitals. At a little distance from the town stands

fort St. Francis.

St. Venant is a little but well fortified town, fituated on the bank of the river Lis, fix leagues from Aire to the east, taking its name from the martyr St. Venant. The country about it may be laid under water.

Calais, a town fituated on the narrowest part of the channel opposite to Dover, from which it is distant about seven leagues, was the capital of the Pais Reconquis, or Recovered Country. It is pretty large, and well fortified, but the harbour is of very difficult and dangerous access. Here are a fine arienal, and a citadel, which commands the town, the harbour, and all the adjacent country. All the country about the town may be laid under water in 24 hours. By the canal of Calais the inhabitants have an easy communication with Dunkirk, St. Omer, Graveline, Ypres, &c. and in time of peace a packet-boat paffes regularly twice a week between England and Calais. There are two inconveniences which they who pass from Dover to Calais would always wish to avoid: the first is that of losing the tide, and being obl harbour; thut out o of the hou lais makes ter than th come visit has two p are both o able walk of the day quented this pier a of accomr fengers at with their nations.

The town of Calais makes a much handsomer appearance from the water than the town of Dover; its towers begin to become visible on reaching the middle of the straits. It has two piers of great length, which run parallel, and are both of timber. One of them affords a very agreeable walk over a boarded floor, which, at feveral times of the day, but especially in a summer evening, is frequented by many genteel people of the place. On this pier a troop of fervants, from the feveral houses of accommodation, fland ready to receive the paffengers at their landing, and conduct them, together with their baggage, according to their feveral desti-

The only remaining place worthy of notice in this diffrict is St. Omer, on the river Aa. This city is defended not only by a caftle, but also by large bastions. There are in this city feveral fine streets, and a large fquare, built round with noble houses, among which is the Town-House or Guild-hall. The cathedral church, dedicated to St. Omer, is a noble building remarkable chiefly for its chapels, enriched with fine marble, and beautiful paintings. Befides the cathedral, there are here fix parochial churches, and an abbey, which, before the revolution, was extremely rich, and belonged to the order of St. Benedict. There are also two hospitals for maidens, a general one for the fick, an orphan-house for boys, and another for girls, an house for twelve poor men, in memory of the twelve apostles, and feveral foundations; the yearly income of which is employed in maintaining a certain number of boys at school, in giving a sum of money in marriage to fome poor girls, and in clothing fome others. Here is also an English seminary. The people have some trade, several small vessels coming up here from the fea through Gravelines, by the river Aa. For the go vernment of the city there is a mayor, who is changed every year, 12 aldermen or eschevins, and several other officers. The fuburb called Haut-Pont, or High-Bridge, contains many houses inhabited by Flemish families, who have settled here many years ago: they have kept their ancient language, which has not undergone the fame alterations with the common Flemish. They adhere most ferupulously to the ancient fimplicity of their nation; and that they may not alter or corrupt it, they never marry but among themselves. St. Omer is the see of a bishop.

On the east of this suburb, which is situated along the banks of the river Aa, and on the north-east of St. Omer, there is a marsh, or a kind of lake, in which are the famous floating-islands. They do not rest on the bottom of the lake, but go backwards and forwards, according to the motion that is given them. They are made to move like boats, by means either of poles or ropes. There is always grafs growing on these islands; and people draw them near the shore, to drive their cattle on them. There are also some trees, but they take care to keep them very low, for fear the wind should have too much hold of them, and make the islands move with violence.

The Government of CHAMPAGNE has Hainault and Liege on the north, Burgundy on the fouth, Luxemburg and Lorrain on the east, and the Isle of France and Picardy on the west. It is 160 miles long, in some places exceeds 140 in breadth, and is watered by the Seine, Maine, Aube, Aifne, and Maes. The air is pure, and the foil fertile. The few hills abound with mines, the vallies with mineral waters, and the forests with game. The province itselt receives its name from its extensive plains. The trade consists in corn, wine,

Troyes, the capital of the province, is feated on the river Seine, 26 leagues from Paris to the fouth-east. No. 78.

flourishing as formerly. Its trade is confiderable, and feveral manufactures are carried on in it. The neighbouring country is pleasant, and fruitful in wine, grain, and pasture. It is a bishop's see, and, in the new division of France, Troyer is the chief city in the department of Aube.

Pont-sur-Seine, a town, as the name shews, fituated on the Seine, has a magnificent feat, with fine gardens belonging to it.

Espernay is a small town on the Maine. The country

about it produces excellent wine.

Chalons, or Chalon-fur-Maine, a large city, fituated on the Maine. Chalons has a flourishing manufactory of shalloons, which take their name from the town, and of other woollen stuffs.

Clermont, before the revolution, was the capital of an earldom, belonging to the prince of Condé; St. Differ, on the Maine, is famous for its iron forges; and Vaffy, on the Blate, is remarkable for being the scene of a horrid maffacre of the Protestants in 1562.

Joinville, on the Maine, was, before the revolution, the capital of a principality belonging to the family of

Langres is a fortified town, and has a manufactory of tools and knives. It was a bishop's fee till the revolution.

Chaumont is well fortified, and, in the new division of France, is the chief town in the department of Upper Marne.

Clervaux is a town on the Aube, near which is an abbey. In it is the famous cask of St. Bernard, which holds 800 tons.

Dom Remi, furnamed la Pucelle, is the birth-place of the celebrated Joan d'Arc, or the Maid of Orleans.

Sens is the capital of the diffrict called from it Senonos. It is large, and the see of a bishop. The principal church is a fine monument of Gothic architecture. The inhabitants tradero Paris, by means of the Yonne, in wine, wood, coals, oats, hay, &c. In the new division of France, Sens is the capital of the department of Yonne.

Vitry le François is small, but well built, strongly

fortified, populous, and rich. * Rheims is one of the most ancient, celebrated, and largest cities of France. It is the see of an archbishop. The cathedral is a fine Gothic structure, and has a stately and superb gate and portico. The university was founded in the 16th century, by Charles, archbi-shop of Rheims, and cardinal of Lorrain. In the new division of France, Rheims is the chief town in the

department of Marne.

In this city are feveral remains of antiquity. Three of its gates retain the names of heathen deities, viz. of the Sun, of Mars, and of Ceres. There is a triumphal arch, which was covered with earth, and is composed of three arches of the Corinthian order, with columns, and baffo-relievos in the vaults. In the middle arch is the figure of a woman in fresco, holding two cornucopias in her arms, which feem to denote the fruitfulness of the country: four children, that are near her, express the four feasons of the year; and the . 12 months are repretented by 12 proper figures. The two other arches are each 30 feet high, and 8 broad. That on the right hand has the figures of Romulus and Remus tucking a she-wolf: on their sides are the shepherd Faustulus, and the shepherdess Acca Laurentia. In the third arch are to be seen a Leda embracing Jupiter transformed into a wwan, with a Cupid who lights them with his flambeau. There are the remains of another triumphal arch in this city, and also of several roads made by the Romans in the neighbourhood of Rheims. The chief trade here is that of wine. Several kinds of thin woollen stuffs, mixed with filk, are manufactured in this city.

The principal places of Brie, belonging to this government, are

Meaux, on the Maine, a very ancient city, and the It is pretty large, but far from being so populous and lifee of a bithop. Here is a falt granary. The trade

confifts chiefly in grain, wool, and cheefe. In the new division of France, Meaux is in the department of Seine and Marne.

Provins, a town on the little river Vousie, fends confiderable quantities of corn to Paris by the Seine, from

which it is only three leagues diffant.

Sedan, near the borders of Luxemburg, being one of the keys of France, is ftrongly fortified. In the new division of France, it is the see of a bishop, and in the department of Ardennes. Here is a fine castle, and a manufactory of cloth and ferge.

The Government of BURGUNDY has Champagne on the north, Lyonnois, on the fouth, Franche Comté on the east, and Nivernois and Bourbonnois on the west. Its length, from north to fouth, is about 45 leagues; and its breadth, from east to west, about 30. It is very fertile in corn, wine, fruit, and tobacco; being watered by the Seine, the Dehume, which falls into the Soane, the Brebince, or Bourbince, the Armançon, the Ouche, and the Tille. There are fome noted mineral fprings in it, with fubt-rraneous lakes, and plenty of ochre. For a long time it had dukes of its own, fubordinate to the crown of France; but Lewis XI. at last, upon the failure of heirs male, seized upon it, and annexed it to his crown. The principal places in the feveral parts of Burgundy are the following:

Dijon, the capital, is a large fortified town. It is the see of a bishop, and, in the new division of France, the capital of the department of Cote d'Or. Contains an academy of sciences, a college of law, a stately castle, and feveral hospitals. Fontaine de Dijon, a village near it, was the birth-place of St. Bernard.

Avalon, on the Coufin, has an hospital. Samur, on the Armançon, has two fine bridges, a granary of falt,

a castle, and a cloth-manufactory.

Chatillon-fur-Seine, contains two hospitals, in one of which poor travellers are maintained for three days.

Auxerre, on the Yonne, is the capital of the diffrict called Auxerrois, and, in the new division of France, is the chief town in the department of Yonne. formerly a bishop's see, contains several hospitals, and a grand palace.

Aulim, on the Aroux, the capital of Autunois, and

is defended by a citadel.

Maçon, on the Soane, in the new division of France, is the capital of the department of Soane and Loire, and was formerly a bishop's fee. In a council held here in 585, it was enacted that if a layman on horseback should meet a prios on foot, the former should descend

to do reverence to the prieft.

Chalon, on the Soane, was a bishop's see till the revolution. It is defended by a citadel.

Bourbon L'Ancy is celebrated for its warm fprings, and contains some remains of the ancient Roman baths.

Bourg, the capital of the diffrict called La Breffe, flands on the Refousse, almost in the centre of the country. The fairs here are chiefly for horses, cattle, and fkins.

Belley, the capital of the country called Le Bugey. In the new division of France, Belley is the fee of a bithop, in the department of Ain.

Gex, at the foot of mount St. Claude, near the lake of Geneva, gives name to a diffrict, extending from fort d'Ecluse to the village of Crossay. It be-longed to the prince of Condé.

The principality of Dombes, which lies contiguous to the government of Burgundy, but is independent of it, extends nine leagues in length, almost as many in breadth, and is a very pleasant fruitful country.

Trevoux, lying on the Soane, is the capital of the principality of Dombes.

The Government of DAUPHINE is bounded on the fouth by Provence, on the north by Breffe and the Rhone, on the east by the Alps and Savoy, and on the west by the Rhone, which separates it from the Lyonnois and Languedoc. It had long princes of its own, | tiful it is.

who were stiled dauphins du Viennois. At last Dauphin Humbert, having no children, made it over to Philip VI. of France, on condition that the inhabitants should still retain their privileges, that the province should be for ever incorporated with the crown of France, and that the king's eldest fon should enjoy it, with the arms and title of Dauphin. In the year 1349 this agreement was fully executed. Near two thirds of the province are very barren and mountainous; but the mountains contain a variety of minerals, and, in fome places, are covered with larch trees, which are very valuable, as they not only yield a very durable wood, but also manna, benzoin, and agaric, the last of which is used in physic and dying scarlet. level and fruitful part of the province is called Lower Dauphiné. On the mountains are also found several forts of wild animals, as bears, marmots, chamois-goats, and other species of goats, called, by the French, bouquettons, or chevrels, together with white hares, partridges, eagles, hawks, &c.

Dauphiné had a governor and parliament, and con-

Grenoble, fituated on the conflux of the Isere and Drac, in a plain at the foot of the mountains. It received its name from the emperor Gratian, fon of Valentinian I. from whence it is called, in Latin, Gratianapolis. It is, however, much more ancient; was before called Cularo, and belonged to the Allobroges. It has been a bishop's see ever fince the fourth century. Delphinal council, established here in 1340, by Humbert II. Dauphin of Viennois, was erected into a parliament in 1453, by king Lewis XI. This city is well peopled, and commanded by a fort called la Baftille. The Ifere divides the city into two unequal parts. Here are no fine buildings, except the bithop's palace, which owes its beauty to cardinal le Camus, bishop of Grenoble; and is adorned by excellent paintings, representing Our Saviour's life and passion, and by the picture of the bishop. The town was fortified by the chevalier de Ville. The skins and gloves of Grenoble are very much esteemed; but the woollen stuffs are but coarse. There was not, even before the revolution, one abbey of men in this whole diocefe, and but one of maidens, viz. that of Haves, of the Ciffertian order. In the new division of France, Grenoble is the chief town in the department of Here.

Near this town was the famous monastery and hermitage of the Carthufian monks, called in French, la Grande Chartreufe, or the Great Charter-house, because it was the first of that order, founded by St. Bruno. It is fituated on high mountains, covered with thick woods; but the place is very pleafant. Each monk had a garden annexed to his cell, which he cultivated with his own hands. About three leagues from Grenoble is a piece of ground that emits fmoke, and fometimes fmall flame; and at the diftance of one league are the caves of Saffage, and a grotto, in which is a

water-fall.

Here also, among the gravel in the springs, are found a fort of sprecious stones, some white, some of a dark grey colour, very fmooth, and of a fine luftre. Those of the fize and shape of a lin-feed are not only the best, but being dropt into the eye, they expel all impurities, without injuring it in the leaft. About five leagues from Grenoble is the mineral fpring of la Mothe, the waters of which are pretty hot, and highly efteemed, being a certain remedy for all diforders of the ftomach. fluxes, and even lamenefs.

St. Bonnet, a fmall place, but the capital of the country of Champfaur, belonged formerly to the family of

Villeroi.

Briançon, at the conflux of the Dure and Ancea, is the capital of the diffrict, called from it Brianconnois; and has a castle situated on a steep rock. On the leaves of the larch trees hereabouts is gathered a manna, which falls in the night, and melts as foon as the fun thines upon it. The hotter the feafon the more plen-

onetier

Monetier is a town in the diffrict of Briançon, where is a fpring that fpouts out water, now and then fix feet high, and fometimes more.

Ashbrum, or Embrum, the capital of the maritime Alps, and the territory called, from the town. Ambrunois, stands on a steep rock, at the foot of which runs the Durance. It was, before the revolution, the see of an archbishop, who stilled himself prince and count of Ambrum.

Gap is the capital of the territory, called from it Gapençois, and was the fee of a bilhop. At St. Peter D'Argenfon is a mineral water; and in the lake of Pelhotiers is a floating meadow confifting of grafs and rulhes.

Vienne, on the Rhone, 13 leagues from Grenoble, was once a Roman colony, and afterwards the kingdom of Burgundy. It is large, and contains feveral remains of Roman buildings, a manufactory of hardware, and another of paper. Some mineral fprings are found in its diffrict, which is called Viennois.

Tain is famous for its hermitage wine. St. Anthoine contained the abbey of St. Anthony, which was the only one of that order.

Valence, the capital of the Valentinois, a place of antiquity, flands on the Rhone, contains an university, and is large, well fortified, and the see of a bishop. In the new division of France, Valence is the chief town in the department of Drome.

Die, on the Dromme, over which it has a bridge, is the capital of a district, famous for its mineral springs, and for a steep rock in the neighbourhood, called the Innaccessible Mountain, and, till the revolution, was the see of a bishop.

The principality of Orange is about four French leagues in length, and two in breadth, and had formerly counts and princes of its own; but, in the year 1531, it came to the house of Naslau, in which it continued till the death of William Henry, prince of Orange, stadtholder of Holland, and king of Great Britain. In the year 1713 Frederick William, king of Prussia, and one of king William's heirs, ceded it to France; and, in 1722, Lewis XV. gave it to the prince of Conti. Aiterwards it was annexed to the government of Dauphiné. The only place in it worth mentioning is that from which it takes its name, viz.

Orange, in Latin Araufio, fituated on the little river Maine, in a beautiful plain about a league from the Rhone, and five from Avignon. It was, until the revolution, the fee of a bishop. Here are feveral remains of Roman magnificence, particularly a fine triumphal arch, and an amphitheatre.

The Government of PROVENCE derives its name from the Latin Provincia; and is bounded to the fouth by the Mediterranean; to the north by Dauphine; to the west by the Rhone, which separates it from Languedoc; and to the east by the Alps and the Var, which feparate it from the dominions of the king of Sardinia. It is divided into the Upper and Lower, its length being about 42 French leagues, and its breadth about 30. The air and foil differ widely in the two divisions; for in the former the air is temperate, but in the latter extremely hot. The former yields good corn, apples, and pears, and abounds in cattle, but has little wine. On the contrary, the latter has plenty of wine, with orange, lemon, pomegranate, fig, palm, cyprefs, olive, mastic, medlar, and sea-cherry trees; but does not produce half the quantity of corn necessary for the inhabitants. This province yields also a kind of box, the fruit of which proceeds from the middle of the leaf, and continues all the year round. Of their wines, the Muscadel is the best. In the road and harbour of Toulon is caught a fish, enclosed in a stone, which must be broke before the fish can be come at, and called a date from its refemblance to that fruit. The taste of it is very agreeable: but, in general, the fish of the Mediterranean are inferior to those of the

Ocean. There is also a small bird in this province, called becca-figo, that feeds only upon grapes and figs, and is delicate eating. Iron, black agate, copper, and lead, are found here. There are no considerable rivers in the province: the chief are the Durance, the Sourge, the Largens, (so called from the transparency of its water,) the Lare, the Verdon, and the Var; the last of which divides France from Italy. The woods are numerous, and afford a great deal of timber for shipbuilding, and other uses. Almost the whole trade from France to Italy, the Levant, and the greater part of Spain, is carried on from this province.

Aix, the capital, fo called from its baths, is fix leagues from Marfeilles, the fee of an archbishop, has a stately cathedral, a public library, an university, two colleges, an academy of fine arts, fountains, a most beautiful walk called Le Conor de Orbitesle, a town-house, and sine palace. It is situated in a fertile valley, particularly famous for its olives, which yield excellent oil. In the new division of France, Aix is the chief town in the department of Bouches du Rhone.

Bugs and beetles are so plentiful here as to be of the greatest annoyance to the inhabitants. The inconvenience arifing from these vermin is thus represented by a late traveller. "I think (fays he) we are now in the region of flies, bugs, and beetles; as every place fwarms with these disagreeable, troublesome vermin. Not a night has there been, fince we left Paris, that one or both of us have not flept on the floor, for fear of being attacked by those legions that lie in ambush amidst the crevices of the beds, and only wait for our fleep to make their attack. Our custom is to draw off the upper mattrass with the sheet and bolster on it, into the middle of the room; and by this means we often escape the annoyance, except it be from a straggler who has rambled from the main body. It is a strange custom which they have in these parts, where the heat is often very troubletome, to hang their rooms with a kind of dark rug, or as they may call it, ta-peftry; for it has a dirty look, and only ferves to increase the warmth of them, and to furnish hives and nurferies for those detestable vermin that have put us in such terrors. in fuch terrors.

Salon is fix leagues west of Aix. Here the famous pretended prophet Nostrodamus died in 1566.

St. Remy is a confiderable town, and formerly belonged to the prince of Monaco. It is fituated near the lake of Glaciers: Le Baufe, in the bailiwick of Arles, likewife belonged to the prince of Monaco.

Arles, on the Rhone, formerly a Roman colony,

Artes, on the Rhone, formerly a Roman colony, contains many antique curiofities, such as Roman tombs, startes, an amphitheatre, an obelish, &c.

This city was formerly the capital of the kingdom of Burgundy, and, until the revolution, was dignified with a metropolitan fee, and an academy, known by the name of The Royal Academy of Sciences and Languages. It was raifed in 1668, by the king's letters patent; by which it was ordered, that the number of members should not exceed 20% who were all to be noble by birth. There were afterwards 10 other members added to it by new letters patent.

Tarafçon is a large ancient town on the Rhone, having a handsome castle. The inhabitants of this place have a very peculiar method of threshing their corn, which, with fome other particulars, we shall relate as given by a celebrated writer, in a letter to his friend. The corn (fays he) is threshed out almost as soon as cut; and for this purpose they make a temporary threshing-floor on some part of the field where they reap. This threshing floor is prepared by moistening a piece of ground of about 20 or 30 feet square, and afterwards beating it with an instrument that takes off all inequalities, and makes it look as if it had been plaistered with a mason's trowel. The fun soon hardens this fpot; and it is then strewed with several bundles of corn as high as the knees of a man. The manner of threshing them when they are thus strewed, is what I never faw before. A woman (for I have feen

more women employed this way then men) flands in the midft, and has around her half a dozen or more horfes, with a bridle or halter to each. She holds all thefe bridles by their extremities in one of her hands, and whips the horfes with the other; fo that they dance in a circle around, the bridles forming the radii, of which her hand is the centre, and trample the corn out of the ear with their feet. Whether this method answers fo well as that of the flail I cannot pretend to determine: it may be more expeditious, but certainly makes great wafte.

"They feem to make little use of the straw or reed but in manure, and therefore take but little trouble to bundle it up. In many fields the ears are only plucked off, and it is suffered to rot in the ground;

whilft in others it is afterwards moved.

Women here are reapers; and it is not uncommon to fee five females to one man employed in this kind of labour. Scarce any of them have shoes or stockings, and few a hat, or any other covering for the head, to defend them from the heat of the fun. Perhaps to this it may be owing that, among the lower class of people, handsome women are exceeding rare; all of them having coarfe, ordinary fun-burnt faces. However, though the country is deficient in this refpect, it has a juster claim itself to be called beautiful than any other part of France I have yet feen. The fields have more the appearance of cultivation, and there are fewer of those barren naked rocks to which the country in general is subject. Hedges are not uncommon; and you may fometimes fee fome ftraggling trees and coppices; but these are forlorn, and have not those inhabitants that should enliven them. I know not what makes the little feathered fongsters for lake these parts, excepting it be that they cannot find shelter in a country so naked of woods; but I am fure you may travel for days together and not be able to fee one.

"It is not often that oxen are employed in ploughing: those which I observed were yoked by the horns, as being the part where it is imagined they can exert the greatest strength. In general you see alman working with a single horse or als, without a boy or any other to guide it. Their ploughs are lighter than those commonly used in England, but nearly of the same construction, and seem to turn the surrows with great

facility and expedition.'

Marfeilles is a very ancient, large, rich, and populous city, fituated on the coaft of the Mediterranean fea, where it has a fafe and spacious harbour, above 7 leagues from Aix to the fouth, and 14 from Arles to the fouth-east. All the trade which is carried on from the fouth of France in a manner centers here. It was till the revolution the sec of a bishop. Here the gallies of France are laid up. Here also is a fine arsenal, a dock for building the gallies, an observatory, an academy of the fine arrs, and several churches. The harbour runs up far into the city, and is well secured and fortified. The city is divided into the Old and New; the former of which is but meanly built; but the latter is very handsome, and contains a fine walk. Opposite to the harbour are three small islands. Great quantities of tar and pitch are made in this neighbourhood.

Marfeilles, in beauty, has little to boast; but much in respect to its situation for commerce, and the antiquity of its soundation, which is said to have been laid in the time of Tarquinius Priscus. As you approach it, the Bastides, which are behind, have an uncommon appearance, and look like another city built of straggling houses. These Bastides are little pleasure-boxes, which cover the country for some miles square. Every citizen, almost to the lowest rank, has a bastide, where, after the labours of the day, he retires and spends the evening with his family. The space that each of these little retirements takes up is very consined. A little house, with a garden of about 30 yards square, filled with sig-trees, olives and wines, is their common extent. Behind the walls of one garden begins another, which

belongs to another citizen; and is continued on, in every plat of the compass just mentioned; fo that the Bastides may be said to be rus in urbe, and urbs in rure.

The streets here are crowded with people of different nations, a most extensive trade being carried on with the Levant, and with most countries of the world. Since the plague, which swept away such a multitude of the inhabitants of this town, in the year 1720, the Marseillois are very cautious of admitting any vessel from the Levant, without a strict quarantine; and every letter is dipped in, or sprinkled with, vinc-

gar, before delivered.

The manufactures of this town are various and flourishing, of which those of sap and wax-candles are the chief: though the others, such as of stuffs in imitation of those that come from the Indies, of silk stockings, porcelain, tapestry, hats, &c. are far from being inconsiderable objects of trade. Those employ a prodigious number of workmen: and owe not a little of their success to the clearness of the atmosphere around, which permits the exposition of such things as want drying and bleaching. The designs for the tapestry, linen, and Indian manufactures, are furnished by the artists belonging to the academy of paining at Marfeilles, and must be consequently superior to those of other places, where they come from the untutored genius of the workmen themselves.

The Hotel de Ville is a handsome building, and has several pictures worthy the attention of an artist. Among these are two painted by Serre, that represent

the plague.

The church of St. Victor contains a great number of antiquities. Among its curiofities they number St. Andrew's Crofs, which is almost entire, and preferved

with a religious veneration.

The Marseillois are very fond of pageantry and proceffions of all kinds, and, before the revolution, had two which were remarkably curious; one was the procession of an Ox at the Fete de Dieu, and the other that of the Voituriers and Coachmen to the church of the Grand Augustins. Whether these are still continued, we cannot at this period determine; but shall quote the description thereof from the former edition of this work. "The ceremony of the ox is performed in this manner. During the three days preceding the feast, the company of butchers are employed in driving an ox through all the streets of the town, followed by a great concourfe of people. On the back of this beaft they place a little boy dreffed in a sheep's fkin, who holds a streamer in his left hand, and keeps the fore-finger of his right hand pointed to the sky. On the eve of the feast the ox is guided to the place where the temple dedicated to Diana once stood. There the boy is taken off, and the butchers, after they have stripped themselves of their fantastic garments, provoke and drive the beaft with flicks out of the city, amidst the cries and shouts of the populace, whose minds have interwoven this chace with the duties of religion. On the next, which is the grand day, he is led back, ornamented, after the ancient manner of adorning victims, with ribbons and flowers, accompanied by the butchers dreffed in pontifical robes, with drums and flutes playing before them. Then follow the priefts, friars, and the religieux of all the orders. They drive the animal out of the gates of the city to show that they joyfully consent to banish Paganism from among them. The ox is afterwards killed and given to the poor.

"On the feaft of St. Eloi all the voituriers, coachmen, possilions, &c. affemble before the church of the Grand Augustins, mounted on their horses, mules, and affes, bearing the slags and colours of their company. As they make their procession before the grand entrance, a priest sprinkles every one of the riders and the beasts with holy water. After having received this, they proceed in files, and march to the sound of drums and fifes through most of the great streets of the town, the prizes to be run for by the different animals

being borne before them, fixed to the end of a long pole. These prizes are generally compleat sets of harnesses, ornamen ed in a better manner than those that are commonly purchased. In the evening they make three parades on the Promenade de Cours; and then proceed to the plain of St. Michael, which is the place appointed for the races. The horses enter the lists first, next the mules, and then the affes. Such are the races of Marfeilles, which are frequented as much as any in England by people of the highest rank in the neigh-

Barjols, or Barjoux, is a handsome town in the bailiwick of Brignoles.

Toulon is a large city, fituated on the Mediterranean, with a fine port, 10 leagues east from Marfeilles, and about 125 from Paris. Both the town and harbour are strongly fortified. On two sides of the former are high hills at a very small distance, of which that of St. Anne, on the north-east, perfectly commands it. The entrance of the port is so narrow that two ships can-not go into it a-breast. This place contains several courts, particularly an admiralty office, an arfenal well furnished, a foundery, magazine, manufactory of woollen cloth, &c. In the new division of France, Toulon is the chief town in the department of Var.

In the diffrict of Toulon is Ollioules, a fmall town: and five leagues eaft of Toulon is Hieres, famous for the best salt and the finest fruit in France: it contains fome churches, and gives name to three islands in the neighbouring sea.

Dragingnau, 12 leagues north-east of Hieres, is one

of the largest towns in the province.

Frejus, on the Argent, 20 leagues east of Aix, and half a league from the fea, contains many remains of antiquity, particularly an aqueduct and an amphitheatre. The town is well fortified, has a court of admiralty, and is a bishop's see. In the new division of France, Frejus is in the department of Var.

Graffe stands in a fruitful foil, and contains Reveral churches; it was the fee of a bishop till the revolution. At Antibes are a good harbour and caftle, with some

Roman antiquities. The fish, called fardines, are well

cured here.

Vence, an ancient city, fituated two leagues from the Var, was the fee of a bithop till the revolution, and at that time the civil government of the city, and lordthip of the manor, were divided between the bishop and the baron of Vence, of the house of Villeneuve. The above places are all in Lower Proyence.

Digne, on the Bleone, is celebrated for its hot wells, and is the see of a bishop. In the new division of France, Digne is the chief town in the department of

the Lower Alps.

Sifteron, on the Durance, has a good trade, and is defended by a fortress. Castellan, on the Verden, gives name to a bailiwick, and Riez, nine leagues north west of Aix, was a bishop's see till the revolution.

Manofque is one of the most populous cities in the whole province. Here is a castle, with several foun-tains; and in the neighbourhood a mineral spring. The knights of Malta were proprietors of it until the revolution.

Peyruis is a small place in the district of Forcalquier, where fome fay the celebrated Petronius was born; and that it was anciently, on that account, called Vicus Petronii.

Apt is a fmall city, at the conflux of the Durance and Calavon, eight leagues from Aix to the north. Julius Cæfar enlarged it, and made it a colony; and, to this day, there are several noble remains of antiquity about it. It was the fee of a bishop till the revolution.

The city and district of Avignon, and the county of Venaissin, belonged to the pope at the time of the revolution; but fome of the leading characters in those districts refused submission to his holiness, and folicited a junction with the French nation. By a vote of the affembly they were incorporated with France, and now form the department of Vaucluse.

No. 78.

Avignon, with its diffrict, anciently belonged to the counts of Thoulouse and Provence. Afterwards they fell to the dukes of Burgundy. Then they were pof-feffed by the kings of Sicily, who were also counts of Provence, until the year 1348, that Johanna, queen of Sicily, and counters of Provence, disposed of the town, and its district, to pope Clement VI. for 80,000 florins. The diffrict is very fruitful, and abounds in corn, wine, and faffron. As for the county of Venaissin, it was held either by the counts of Thoulouse, its own counts, or the emperors, until the year 1273; fince which it hath been poffessed by the popes, and governed, under them, by officers called rectores till September, 1791, when it was annexed to France as before mentioned. It is very fruitful. The only place worth, mentioning in the diffrict of Avignon is that which gives name to it, viz.

Avignon, a large and beautiful city, fituated at the conflux of the Rhone and Sorgue, 7 miles from Arles to the north, and 15 from Aix to the north-west. Here is a stone bridge over the Rhone; a very handfome college; and an university, founded in the year 1303. No less than seven popes resided here succesfively, from the year 1307 to 1377. In the church of the Franciscans is the tomb of the beautiful and learned Laura, fo much admired and celebrated by the im-mortal Petrarch. The grave having been opened in the time of Francis I. a leaden box was found in it, containing a medal, with a copy of verses written on parchment by Petrarch, in praise of his mistress.

In the county of Venaissin the principal places are Lifle, on an ifland in the Sorgue, the finest town in the county. Carpentras, on the Rousse, four miles northeast from Avignon. Vaisson, on the Orwesse, eight leagues from Avignon, is a small town, with a castle; and Cavaillon is a mean place, on an island in the river Durance.

The Government of LANGUEDOC is bounded to the fouth by the Mediterranean and Rousfillon; to the north by Auvergne, Lyonnois, and Guienne; to the east by the Rhone; and to the west by Gascony. It is 70 leagues in length, and, where widest, 32 in breadth.

The principal rivers are the Rhone, Garonne, Aude, Tarne, Allier, and Loire. The royal canal of Languedoc is upwards of 100 miles in length, fix feet deep every where, and the breadth about 20 fathoms. fome places it is carried under mountains, and in others over vallies, having all along fluices, dams, refervoirs, water-couries, and draw-bridges. Several remarkable winds are observed in this province. That called the cers blows generally from the west along the southern coasts and is very refreshing in summer: another, called autan, blows generally from the opposite quarter, and is hot and unwholesome: and a third, called bife, or the black, blows frequently in the valley through which the Rhone runs, very strong and cold. When the wind in this valley blows from the fouth, unattended with rain, it is no 1 is unwholesome than the autan. From the coasts of Leucate to the Rhone, in the heat of fummer, a fea breeze fets in, from ten in the forenoon to five in the afternoon, which cools the air, that would be otherwise almost insupportable. In a valley, at the foot of the Pyrenees, there is a sharp west or north-west wind, called the le vent de pas, which blows only in the night, and generally, in the fummer, through the openings of the mountains; hence the people of the valley are obliged to winnow their

corn in the night. A very remarkable custom prevails in this province, which is that of treading out their corn by hories or mules, according to the Eastern custom, frequently alluded to in the scriptures.

The coasts of Languedoc are not only dangerous, but destitute of safe and good harbours. . The exports confift chiefly of wine, oil, dried chefnuts, raifins, woollen cloth, stuffs, filk, and corn. The common divition

Thoulouse, the capital of the whole province, fituated on the Garonne, over which it has a stately bridge, is one of the largest and most ancient cities in France; yet, having little trade, it is neither populous or rich. It is the see of an archbishop. Here also are an univerfity, an academy of fciences and liberal arts, feveral monuments of antiquity, and many cliurches, befides the cathedral. In that of the Jacobins is the shrine of Thomas Aquinas. The manufactures are filks, stuffs, and carpets. This city gives name to a diffrict called Thouloufain, which contains a finall town on the Garonne, called Castle Sarazin. In the new division of France, Thoulouse is the chief town in the department of Upper Garonne.

Alby, near the Tarne, 10 leagues north-east of Thoulouse, is the see of a bishop, contains several courts, a magnificent cathedral, a beautiful palace, and an agreeable walk, denominated La Lice.

Gaillac, on the Tarne, four leagues from Alby, has a good trade in wine, which is fent down the Tarne to Bourdeaux; and Rabastein maintains a similar commerce by means of the fame river.

Caftres was a bifhop's fee before the revolution.
Turquoifes are found in the neighbourhood of this

Mirepoix, a town on the Lez, was the fee of a bishop before the revolution.

Carlat de Roguefort is a small village, where the famous Monf. Bayle was born: and Belleftat is famous for a mineral spring.

In the Lower Languedoc the chief places are the following:

Alet, on the Aude, at the foot of the Pyrenean mountains, is famous for a hot fpring. Lurioux, on the Aude, one league from Alet, has

fome iron works, and a clock manufactory.

Carcaffionne, on the Aude, feven miles east of Thouloufe, is the fee of a bithop. It is the most regular built town in Languedoc, very populous, has a good trade, there being a manufactory of fine cloth carried on in the town, and a quarry of white and flesh coloured marble in the neighbourhood, and is defended by a castle. In the new division of France, Carcasfionne is the chief town in the department of Aude.

Narbonne is a well fortified city, fituated 25 leagues from Thoulouse to the east, on a canal, which, by means of the river Aude, and lake Robine, had a communication with the fea; but such is the shallowness of the water upon the coast, that ships cannot get near it. It was the fee of an archbithop before the revolution, in whose garden is a beautiful Roman sepulchre of white marble, in the form of an altar. The city has feveral churches besides the cathedral. Great quantities of falt are made, in the neighbourhood, which is fruitful in corn and oil, but yields little wine.

St. Pons de Tomieres is a finall city on the river Jaur. In the neighbouring mountains are quarries of

beautiful marble.

Beziers is an ancient city, fituated four leagues from Narbonne. It covers all the fides of a very freep and lofty hill, on the highest point of which is built the cathedral.

Montpelier, fituated on an eminence, near the river Lez, is the largest city in the province next to Thouloufe, and the fee of a bishop. It contains a citadel, university, physic garden, and an academy of sciences: of the 15 ordinary fellows of the latter, three apply themselves to the mathematics, three to anatomy, three to chemistry, three to botany, and three to natural philosophy. The air of this city is deemed remarkably falubrious: the houses are handsome, but the streets narrow; and here is a good trade in filks, woollens, wine, ftrong waters, verdigreafe, &c.

Montpelier is pleafantly fituated, and commands many beautiful prospects. On the Pierou there is a fountain, which, for fimplicity and beauty, excels

most others. The water is brought from a mountain five miles diftant. The environs of this city are planted with vines, olive, fig, and mulberry-trees; the latter to nourish the filk-worms, which form the most confiderable object of trade. Another thing that brings in a confiderable revenue to this city is the distillation of waters of all forts, of liqueurs, and fyrups, that are famous all over Europe.

This place is much reforted to by those of the English who labour under disorders of the lungs; whom the reputed clearness of its atmosphere, and fame of its phyficians, have lured in hopes of a cure.

Montpelier, befides its univerfity, and schools of medicine, boafts an academy of sciences, which is composed of fix honorary members, three physicians, three astronomers, three mathematicians, three chemists, and three botanists. Rabelais is said to have been of this university; and his gown and cap are still preferved, with a kind of religious veneration, and used in the ceremony of conferring the degree of doctor. In the new division of France, Montpelier is the chief town in the department of Herault.

Balaruc, on the Thau, not far from Montpelier, has fome warm baths, the waters of which will retain

their heat at least eight hours.

Nifmes contains many monuments of antiquity, of which the principal are the amphitheatre, called Les Arenes; the temple of Diana; the quadrangular house supposed to have been erected by Adrian, and used formerly as a temple; and the octangular tower. Nifmes is a bishop's see. The delightful walk, called the Esplanade, is without the city. Here are several manufactories, a confiderable trade in cloth and filk, an academy of Belles Lettres, and a citadel of four baftions. A great part of the inhabitants are Protestants. The hills in the neighbourhood are covered with vines. In the new division of France, Nisines is the chief town in the department of Gar.

Beaucaire, a town fituated on the Rhone, is noted for its fair, in which raw-filk, and other goods, are

bought and fold to a confiderable amount.

Quiffac is a small place on the Vidourle, betwixt which and Sauxes is a mineral periodical spring, which runs leven, and intermits five hours. At Le Grand Galargues, not far from hence, a fine blue and red dye is made out of the night-shade, called, in French, morelle.

Uzez was the see of a bishop before the revolution. Between Uzez and Nifmes is that noble piece of Roman antiquity called the Pont du Garde, being part of an aqueduct by which water is conveyed from a fpring at Uzez to Nilmes, near 30 miles. It confifts of three ranges of arches across the river Gardon.

In the neighbourhood of Uzez are fome excellent mineral fprings, particularly at the village of Youfet.

Alais was the fee of a bishop till the revolution. The Protestants are numerous hereabouts. This city belonged to the prince of Conti, has a caftle, and is noted for the culture of filk.

Marvejolshas fix yearly fairs, and drives a good trade. Pui, the capital of the county of Velay, near the Loire, is a pretty large city, and was the fee of a bithop before the revolution. Here are feveral churches.

The government of Foix is bounded on the west by Gascoigne, on the east and north by Languedoc, and to the fouth by Rouffillon and the Pyrenean Mountains. It is divided into Upper and Lower. The former is mountainous, but abounds in wood, iron, caverns, and mineral waters; and the latter is fruitful in corn, wine, &c. The principal places in Upper Foix are

Foix, the capital, fituated at the foot of the Pyrenean Mountains. It is defended by a castle.

Tarafcon has many iron forges; and Acqs, at the foot of the Pyrenees, receives its denomination from its hot waters.

In

In Lower Foix are

Pamiers, on the Auriege, the fee of a bifhop. In the new division of France, Pamiers is the chief town in the department of Auriege.

Saverdun is a finall town, on the Auriege; Mazeres, formerly was the refidence of the counts of Foix; the diffrict of Donnezau, contains the town of Guerizu; and the diffrict of Andorre, has no place remarkable but the village of Ourdines.

The government of Roussillon is bounded on the north by the Leffer Pyrenees, on the fouth by the Greater Pyrenees, on the weft by Cerdagne, and on the eaft by the Mediterranean Sea. It is 20 leagues long, and 12 broad, and received its name from a Roman colony, called Rufcino. The heat here, in fummer, is intenfe; but the foil is fruitful in corn, wine, oil, millet, oranges, &c. Sheep, quails, partridges, and pidgeons abound; but cows and oxen are fcarce. The ground is ploughed by mules; and a great deal of oil, with fome corn, millet, and wool, are exported from the county. It is watered by the Tet, the Tec, and the Agly, which are, properly speaking, only torrents, produced by the melting of the snow on the mountains. It belonged formerly to Spain, but was yielded to France by the treaty of the Pyrenees in 1659. Besides Rouffillon, this government includes a part of Cerdagne. The principal places in Rouffillon are

Perpignan, the capital, fituated on the river Tet, a league from the Mediterrinean, which, though not large, is populous, well beilt, and ftrongly fortified. It is the fee of a bifhop. Here are an univerfity, feveral alms-houses, hospitals, and churches, and a noble cannon foundery. The remains of the old town of Rousilloln lie on the river Tet, not far from hence. In the new division of France, Perpignan is the chief town in the department of the Eastern Pyrenecs.

St. Nazire, Vernet, and Bains, are three villages in the diffrict of Perpignan; at the first of which salt is made of the sea-water; the two last are noted for their

warm baths.

Billegarde is a fortress, built for the defence of a pass leading from Catalonia to Roussillon; Prades is a handfome little town on the Tet; Mount-Lanis, the principal place in the territory of Cerdagne, is a well fortified town; and Ville Franche, on the Tet, has a strong fort near it.

The boundaries of the Government of NAVARRE and BEARN are Labourd on the west, Bigorre on the east, Gascoigne on the north, and the Pyrenean Mountains on the south. Navarre, included in this government, is but a small portion of the ancient kingdom of Navarre, which, having been seized upon by Ferdinand, king of Arragon and Castile, this part alone was restored, and became annexed to the crown of France. It is only eight leagues in length, and five in breadth. Navarre is barren and mountainous, and contains only one place worth notice, viz. St. Jean-Piéde-Port, which is situated on the Nice, a league from the borders of Spain, and-eight from Bayonne. It is well fortisted, and has a castle, commanding the pass of the mountains. The French king took the title of king of Navarre from hence.

The principality of Bearn lies at the foot of the Pyrenean Mountains, being about 16 leagues in length, and 12 in breadth. In general it is but a barren country; yet the plains yield confiderable quantities of flax, and a kind of Indian corn, called mailloc. These mountains are rich in mines of iron, copper, and lead. Some of them also are covered with vines, and others with pine-trees; and they give rise to several mineral springs, and two considerable rivers; the one called the Gave of Oleron, and the other the Gave of Bearn. Some wine is exported from this country; and the Spaniards buy up great numbers of horses and cattle, together with most of their linen, of which there is a considerable manufactory.

Pau, the place of most note in this principality, is a small but well-built town on the Gave of Bearn. Here are two hospitals, a manufactory of cloth, an academy of arts and sciences, and a palace, in which Henry IV. was born. In the new division of France, Pau is the chief town in the department of the Lower Pyrenees.

The Government of GUYENNE and GASCONY, which is the largest in France, being 65 leagues in length, from east to west, and 56 in breadth, from north to fouth, is bounded on the fouth by the Pyrenean Mountains; on the north by Limoufin, Angournois, and Saintonge; on the east by Languedoc and Auvergne; and on the west by the Ocean. This government is fruitful in corn, wine, fruits, hemp, tobacco, brandy. prunes, and many other commodities. They have also medicinal fprings, with copper, coal, and other mines, and quarries of marble of all colours. The chief rivers are the Garonne and Adour, both which discharge themselves into the Ocean. Guyenne, properly so called, is bounded on the north by Saintonge, on the east by Perigord and Agenois, on the fouth by Bzadois and Gascony, and on the west by the Ocean; and contains the following places of note, viz.

Bourdeaux, the capital of the whole government. The neighbouring diffrict, called Bourdelois, is very fruitful, particularly in vines, chefnuts, and fig-trees. The city flands on the banks of the Garonne, about 20 leagues from its mouth, and is one of the most ancient in France. It carries on a great trade with most parts of Europe, the tide rifing to high in the river, that ships of great burden can come up to the quay. The city and harbour are defended by three forts. The finest parts of the former are the palace near the harbour, and the fuburb of Chartron. It is the fee of an archbishop. Here are an university, an academy of sciences and fine arts, a large Gothic cathedral dedicated to St. Andrew, feveral other churches, three feminaries, feveral public fountains, an exchange, fome remains of antiquity, and a manufactory of lace. About fix leagues below the city is a watch-tower, or ight-house, called La Tour de Cordonan. Foreign Protestant merchants, even before the revolution, were indulged here in the private exercise of their religion. Richard II. king of England, was born here in 1367. An ingenious writer comments on this city in the following picturesque manner. " The favourable impression which Bourdeaux cannot fail to make on a ftranger at his arrival is well confirmed by a refidence in it. Pleafure feems to have as many votaries here as commerce; luxury and industry reigning within the fame walls, and that in the most extended degree. Commercial cities are usually marked by referved manners, and the love of gain. Avarice, powerful in its influence over the human heart, fwallows up and absorbs the more fost and melting passions. Here, however, these rules are entirely controverted. Diffipation and debauchery are more openly patronized, and have made a more univertal and apparent conquest than in half the capitals of Europe.

Blaye, on the Garonne, has a citadel, where all fhips bound to Bourdeaux must leave their cannon and arms till they return. Near it, on an island, is a fort that commands the river.

Dibourne, at the conflux of the rivers Isle and Dordogne, drives a confiderable trade in falt.

Perigneux, the capital of the county, called Perigord, which contains fome mines of iron and mineral waters, stands on the river lsle, has fome remains of Roman antiquities. It is a bishop's see. In the new division of France, Perigneux is the chief town in the department of Dordogne.

Rodez, the capital of the country of Rouergue, which abounds in eattle, iron, copper, vitriol, and fulphur, flands on the river Aveyron, contains feveral churches, and is the fee of a bifliop. In the new division of France, Rodez is the chief town in the department of Aveyron.

At Milan, or Milhaud, a town on the river Tarne, in Rouergue, before the revolution, there were five convents, and a commandery of the knights of Malta.

Pont de Camerares is celebrated for its mineral

Aiguillon, on the Garonne, has a confiderable trade in hemp, tobacco, grain, wine, and brandy, and is defended by a caftle.

Montaubon, on the Tarne, is a handfome well built town, eight leagues from Thoulouse. It was a bishop's fee before the revolution. Here are an academy of Belles Lettres, and a manufactory of woollen stuffs.

This town fustained confiderable damage by a dreadful inundation of the river Tarne, which began on the 14th of November, 1766, and laid 1200 houses in ruins. The particulars of this melancholy difaster are The fall of the houses began in the futhus related. burb of Sapiac. The noile occasioned by their tumbling was heard in the neighbouring fuburb, with the cries of feveral persons who called out for help; but as the water furrounded entirely the fuburb of Sapiac, it was very difficult going to the affiftance of the un-happy inhabitants. The river, which was prodigiously happy inhabitants. fwoln and rapid, was laden with a number of trees of an enormous fize, that had been torn up by the roots, and carried down along with it; a circumstance which joined with the darkness of the night, rendered the paffage of boats very dangerous. These obstacles, however, did not intimidate a mariner, who, in fpite of the intreaties and tears of his wife and children, ventured to cross the river, in order to save such as were on the point of perishing. His courage roused several of his fellow boatmen to imitate him; and by means of their help no one perished.

The floods continued to increase, and redouble their alarms. The inhabitants of the city, separated from the suburb by a bridge, ran to the Ville Bourbonne. At seven o'clock of the morning of Tuesday, November 18, the floods began to abate, and their decrease continued till noon. Hope immediately began to spring up in every bosom, but was soon stissed by the fill of the greatest part of the suburb of Gasseras, adjoining to that of Ville Bourbonne; and it was perceived that all the houses, even those that were yet at a distance from the waters, were tottering, and rested only on a loose earth, which the waters had already un-

dermined.

At noon the swell began again, and was continually augmenting. The consternation was then universal. Orders were given to move off all the effects. Persons of all ranks were desired to affish in the removal; and all the carriages were engaged to make the removal the more speedy. The tribunals of justice opened their halls, the monks their convents and clossers: the churches were also offered as repositories for the effects of the people. The inhabitants of Ville Bourbonne abandoned successively their houses, and the inhabitants of the city, with an earnestness which did honour to humanity, received their unhappy neighbours, and with marks of true tenderness, endeavoured to affuage a grief which had no bounds.

The inundation increased during the whole day, and continued still augmenting till seven in the morning of November 19, when the waters were thirty-two feet above the common water level. Such an extraordinary inundation occasioned fundry neighbouring villages to be entirely overflowed, and produced the greatest ravages. In the plains the buildings were overwhelmed, the grain washed away, the cattle drowned, and the greatest part of the inhabitants found their only safety in sudden slight, or in climbing high trees, where the horrors of samine were joined to the dreadful spectacle of beholding their dwellings destroyed, and

their effects carried away by the flood.

Agen is a large and populous city, and the fee of a bishop. It is fituated on the river Garonne; and had the honour to be the native place of that prodigy of learning, Joseph Scaliger. In the new division of France,

Agen is the chief town in the department of Lot and Garonne.

of the Lower Marché of Rouergue, on the river Aveyrou. Here are a chapter, a college, and a manufactory of hempen cloth.

Cranfac, a little place in the Lower Marché of Rouergue, is noted for its excellent fulphurous mineral

waters and coal-pits.

Gascoigne, which constitutes the south part of this government, is separated from Guyenne, on the north, by the Garonne. The inhabitants are remarkable for a vicious pronunciation of the French tongue, for being great boasters, and much given to blundering. Hence the phrase Gasconade.

The principal places are the following: Bafas, on the Lavafanne, ten leagues fouth of Bourdeaux.

Condorn, on the Baile, contains feveral convents, gives name to a fertile diffrict called Condomois, and before the revolution was the fee of a bifhop.

Aire, on the Adour, is the capital of the district of Tursan, and before the revolution was the see of a bishop. The kings of the Visigoths formerly kept their court here; and the ruins of the palace of Alaric are still to be seen on the banks of the river.

Acqs, on the fame river, had its name from its hot baths, which were celebrated in the Roman times. It was a bishop's see before the revolution, and has a

good trade.

Bayonne, the capital of the district of Labourd, which produces some fruits, is a pretty large city near the sea, five leagues on the borders of Spain to the north, and 120 from Paris. Being one of the keys of the kingdom on the Spanish side, it is strongly fortified.

Here are a citadel, with two forts, and other works. It was, before the revolution, the fee of a bithop, and had a revenue of 19,000 livres, out of which his taxation to Rome was only 100 florins. Bayonne is most agreeably fituated at the conflux of two rivers, the Adour and the Nive. The first is scarce less considerable than the Thames opposite Lambeth: and across it is a wooden bridge, which joins the place to a fuburb, called Le Fauxburg du St. Esprit. The Nive, which is small, and rifes in the Pyrenees, interfects the centre of the city, and refembles one of the canals in Holland. The entrance into the Adour, which is about four miles below the town, is rendered both difficult and hazardous, from the fands, which have collected and form a bar towards the mouth. It is, notwithstanding, a very agreeable place of refidence, and furnishes, in profusion, all the requisites of life. Bayonets for guns were invented here, and from hence is derived the name.

St. Jean de Luz is a fmall town, fituated three leagues from Bayonne, over which is a bridge, joining it to the village of Sibour, with a harbour for fifthing-boats, belonging to both these places. The peace of the Pyrenees, as it was called, was concluded in 1659, in an ifle near this town, formed by the river Bidaffoa, which is the boundary betwixt France and Spain, and

called the Isle of Pheafants.

Mauleon, the capital of the county of Soule, which lies betwixt Lower Navarre and Bearn, at the foot of the Pyrenean Mountains, contains about 70 parithes, and abounds with woods; but is without any navigable river for transporting its timber to the fea. The town stands on the Gavesten leagues from Pau to the west, and has a castle.

Auch, the capital not only of the county of Armagnac, but of all Gascoigny, stands on the river Gees. Here is a magnificent cathedral, the city being the see of a bishop. In the new division of France, Auch is the chief town in the department of Gers.

St. Bertrand, a fmall city, but the capital of the county of Comminges, and the fee of a bithop before the revolution. It was built by St. Bertrand, and therefore called by his name.

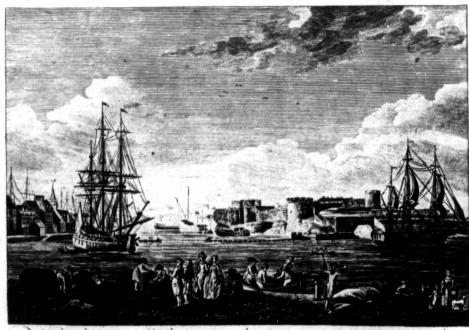

St. Beat is a strong town on the Garonne, two leagues from St. Bertrand to the south. The houses are

Tarbe, a finall city, but the capital of Bigorre, and the fee of a bishop, stands on the banks of the Adour. In the new division of France, Tarbe is the capital of the department of Upper Pyrenees.

Bagneres, a town on the fame river, is famous for

its mineral waters and warm baths.

At Baredge, a village fituated at the foot of the Pyrenees, are four baths of different degrees of hear, which are deemed efficacious in the rheumatism, and other diftempers.

The Government of SAINTONGE and AGOUMOIS, or Augumots, is 25 leagues long, 12 broad, and bounded on the east by Agoumois and Perigord, on the west by the Ocean, on the north by Poitou and Aunis, and on the fouth by the Garronne and Burdelois. The rivers are the Charente and Butonne; and the country abounds in grain, wine, faffron, fruit, falt, and mineral fprings. The principal places are the following:

Saintes, the capital, fituated on the Charente, is the fee of a bishop. Some remains of Roman works are still to be seen in it, and the bridge is said to have been built by the emperor Julian. In the new division of France, Saintes is the chief town in the department

of Lower Charente.

Pons is a handsome town on the Little Seine, over which there are feveral bridges, whence the town had its name. Here also is a mineral spring, with churches, and alms houses.

St. Jean de Angeli, a town on the river Butonne,

is noted for its brandy, and woollen stuffs.

Angoumois was a duchy, and is watered by the rivers Charente and Touvres, and yields grain, wine, faffron, all forts of fruits, and iron. The places of most note in it are

Anguleme, the capital of the province, in the center of which it stands, near the Charente, is the see of a bishop, and contains a manufactory of paper, a general hospital, several churches, &c. In the new division of France, Angulême is the capital of the de partment of Charente.

Cognac, on the Charente, is fituated in a most delightful country, and celebrated for the admirable brandy made here, as also for an old castle, in which

Francis I, was born.

Rochefaucault is a little town, which gave title to a duke eminent in the literary world.

The Government of Aunois is bounded on the fouth and east by Saintonge, on the north by Poitou, and on the west by the Ocean. It is only 10 leagues long, and about as many broad, being the smallest province in France; but is fertile in grain, patturage, vines, &c. It has a good harbour, and great quantities of falt. The principal places which it contains are as follow:

Rochefort is a handsome maritime town, on the Charente, five leagues from its mouth, and about feven from Rochelle. It was erected by order of Lewis XIV. in a very ftrong manner; and furnished with abundance of necessary store-houses, stores, magazines, a capacious and excellent dock, a victualling office, an hofpital for fick and wounded feamen, a manufactory of fail cloth, a foundery, &c. The river is broad, deep, and well guarded by forts to its mouth. The harbour is convenient and large; and the marine academy contains 300 young men, who are instructed in every thing requifite to qualify them for naval fervice.

As the most minute particulars which concern the fea-ports of France are of great importance to be known to the subjects of Great Britain, we shall sub-

join the following pertinent remarks.

The distance, from La Rochelle to Rocheshes fort is feven leagues. The first four are exceeding pleasant, the road lying along the sea-shore, and in view of the islands Oleron and Aix, which appear at a small distance. The city is built in the midst of marshes, No. 78.

which were drained for that purpose. Colbert, who was then prime minister, used to call it La Ville D'Or. (Gold-Town,) from the prodigious fums his master had expended in its crection. Time has, however, given the fanction of utility to the project, and rendered this port as necessary and important to France as either Brest or Toulon. It is situate on the Charente, about five leagues from its mouth. Every thing appears to be under an admirable regulation; and the feveral branches of naval equipment are carried on with vigour and dispatch. The armoury, the rope-walks, and ftore houses of every kind, are all in the best order. and kept with prodigious neatness. Lewis XIV. fortified the city at the time he erected it; but its fituation, at fo confiderable a distance from the sea, renders it sufficiently secure from any attack. It is laid out with beauty and elegance. The ftreets are broad and strait, traversing the whole place from side to side : but the buildings do not correspond with them in this respect, as they are mostly sow and irregular.

Rochelle, or La Rochelle, the capital of this go-

vernment, fituated on the fea-coast, two leagues from the isle of Rhé, and four from Oleron, is a handsome town, with a fine port of a circular form, and strong fortifications. Here also are an academy of Belles Lettres, a fugar refinery, and a medical, botanical, and anatomical school. Before the revolution, it was the see of a bishop, suffragan to Bourdeaux. The salt

marshes affect the air of this place greatly.

This city, being the chief seat of the reformed in France, suffered very much during the civil wars, and was often valiantly defended, and long possessed by that party, till at length Lewis XIII. after a long and famous fiege, made himfelf mafter of it in the year 1628, chiefly by the means of an admirable rampart, or bank of earth, which cardinal de Richlieu caused to be raifed against it on the fide of the Ocean. After it was taken the king caused the walls and fortifications to be demolished, except only two towers, which defend the port: but Lewis XIV. caused new and strong fortifications to be raifed about it.

There are two iflands on the coast belonging to this province and government, Oleron and Rhé, the former of which is five leagues long, two broad, and about three from the main land, having a town, castle, and a light-house on it. The inhabitants were anciently famed for their skill in navigation, and are still good feamen. The other ifle is about four miles in length, two broad, and betwixt two and three from the conrinent. It is populous, abounds in wine and falt, and has feveral forts on it, with a little fortified town, called

St. Martin.

The Government of Poitou is bounded on the north by Touraine and Anjou; on the fouth by Aunois, Saintonge, and Angoumois; on the east by La Marche and part of Berry; and on the west by the Ocean. It is 48 leagues long, and 22 broad. It belonged formerly to the kings of England; but being loft by Henry VI. was re-united to France. The rivers are the Sevre Niortoife, Vienne, and Clain. The produce and commodities are corn, cattle, and woollen stuffs.

Poitiers, the capital of the whole province, fituated on the river Clain, is large, and contains many churches, fome remains of Roman antiquities, an university, and manufactories of woollen caps, flockings, gloves, and combs. It is the fee of a bishop. The country round is noted for vipers, which are in such great numbers that vast quantities of them are transported to Venice to make treacle. In the year 1356 the French were defeated by the English, under Edward the Black Prince, near this town, and John, their king, taken prisoner, and carried to England, where he continued four years. In the new division of France, Poitiers is the capital of the department of Vienne.

Niort is a confiderable town, fituated on the Sevre-Niortoife. Here are a castle, two parish churches, a general hospital, with manufactories of shamoy leather and woollen stuffs, in which, as well as cattle, the in-

habitants carry on a confiderable trade.

Richlieu, a handfome town, nine leagues from Poitiers, gave the title of duke and peer to the head of the family of Richlieu, having been founded by the cardinal of that name, who was born in this place, then only a village.

Loudun, 10 leagues north of Poitiers, has a castle. Les Sables D'Olow has a harbour, and a castle. Foutenay-le-Comte, on the Vendec, has a trade in cloth

and woollen fluff.

St. Maixant is a town on the river Seure, or Sevre, in Upper Poitou. It is the fee of a bifhop. Here are fome woollen manufactories, in which, as well as corn and cattle, the inhabitants deal pretty largely.

The Government of BRITTANY is a peninfula, which borders on Normandy, Maine, Anjou, and Poitou, towards the eath only, all the other parts being bounded by the fea. It is 60 leagues long, 45 broad, and had its name from the Britons, who fled hither from the Saxons in the 10th century. It is watered by the Loire and Villaine, and abounds in lead, pit-coal, wood, falt, butter, cattle, &c. has many good harbours on the coaft, and contains abundance of feamen, fifthermen, &c. The air is but indifferent. The people fpeak a jargon fomewhat refembling the Welch.

Rennes, the capital, ficuated at the conflux of the Isle and the Villaine, about 14 leagues from the sea, is pretty large and populous. It is the fee of an archbishop. Here are a number of churches besides the cathedral. Several of the principal streets are handfome, as the conflagration in the year 1720, which almost reduced the whole place to ashes, obliged the inhabitants to rebuild them. In one of the squares was a fine statue, in bronze, of Lewis XV. It was erected by the province in 1744, foon after his recovery from that dangerous illness in Flanders, when he obtained the title of "Bien Aimé." Beneath the prince on one fide, was Hegeya, the godders of health, with her ferpent and patera; and on the other the genius of Bretagne kneeling on one knee, and in her countenance exultation and reverence finely marked. At the foot of the pedestal was an inscription in Latin. At the revolution in the zeal of the people against monarchy, this statue was thrown down and the metal converted to the service of the state. In the new division of France, Rennes is the chief town in the department of Isle and Villaine.

Vitrei, a fmall town on the Villaine, has a manufactory of flockings, gloves, thread, and coarfe cloth.

Painbeauf, on the Loire, is a market-town between the fea and Nantes, where the cargoes of the larger ships are put into smaller vessels to be sent to the latter

place.

Nantes is fituated on the Loire, about 8 leagues from the fea, and 18, from Rennes to the fouth. Here are many churches and an university. This town carries on a great trade; though thips of burthen cannot come up to it. It is the fee of a bishop. It is famous for the edict iffued here, in 1594, by Henry IV. in favor of the Protestants, which was revoked in 1685 by Lewis XIV. An excellent fort of brandy is exported hence into foreign countries. There is a kind or partnership or league betwixt the merchants of this city and those of Bilboa in Spain. Exactly opposite to the spot on which stands the town, the Loire is divided into feveral channels by a number of fmall iflands, most of which are covered with elegant houses. The great quay is more than a mile in length, and the buildings are fuperb. In the new division of France, Nantes is the capital of the department of Lower Loire.

Dol, before the revolution, was the fee of a biftop. The diocefe was the finalleit in Brittany; but the biftop had the title of count, and was lord of the city.

Dinan, near the Rance, 14 leagues fouth of St. lends a number of flips to the cal fiftery; and, in Malo, is flrong both by nature and art, and admits of large veffels to come up to it. The walls are fo thick

that coaches may run on the top of them. Here are mineral fprings.

Concale is a port which gives name to a cape noted

for fine oysters.

St. Brieu, nine leagues west of St. Malo, is situated among mountains. It is the see of a bishop, and contains a college. In the new division of France, Sr. Brieu, is the chief town in the department of the North Coast.

Treguier is a fea-port. Here is a fmall harbour, with fome trade in horses, corn, hemp, and flax, and a

manufactory of paper.

Vannes, the capital of Lower Brittany, is fittuited 20 leagues north-weft of Nantes, on a bay of the sea, and takes its name from the ancient Veneti. Here are several churches, and it is the see of a bishop. In the new division of France, Vannes is the capital of the department of Morbihan.

Port Louis, fince the revolution called Port de Revolutionnaire, a town at the mouth of the river Blaver. It has a citadel, and an harbour, which is very good and fafe; yet there is little trade, except in faidines

and eels.

L'Orient, or Port L'Orient, is a town fituated in the bay of Port Louis, at the mouth of the river Scorf, where the French Eaft-India company load and unload their thips, and have their chief warehouses and magazines.

Hennelond is a fmall town on the river Blaver, two leagues from its mouth, having a harbour and

good trade.

Bille-Ifle, or Beautiful Ifland, about fix leagues long, and two broad, lies fix leagues from the continent, and is almost entirely turrounded with rocks. The chief place on it is Palais, which is fortified with

a caftle, and has a good road.

In the year 1,759 Admiral Hawke, with a fquadron of Englith thips, off the fouth coaft of this ifland, burnt, funk, and destroyed most of the French sleet from Brest, under M. Conslans. In April, 1761, this island was attacked by an English sleet, under the command of commodore Keppel, and a body of land forces, under general Hodgion. No action of greater sprit and gallantry had been displayed during that whole war. The garrison at length capitulated, and marched out with the honours of war. The island was restored to France by the peace of 1763.

Quimper, or Quimper Corentin, a town on the river Oder, is large and populous, has a good trade, barks bringing up goods at high-water to the very town. It is also the see of a bishop. In the new division of France, Quimper is the chief town in the de-

partment of Finistre.

Chateaufin, a market-town on the river Aufun, has iron and copper mines in its neighbourhood, and a great trade in falmon and flate.

St. Pol de Leon, or fimply Leon, is a town on the northern coast of Brittany. Here is a safe harbour, defended by a fort. Before the revolution it was the

fee of a bithop.

Morlaix, a well built, populous, walled town, is fituated on a river of the tame name, about two leagues from the fea. The harbour is defended by fort Taureau, which flands upon an ifland; and the trade is very confiderable in flax, canvas, paper, linen cloth, thread, &c.

St. Malo is a finall but populous city, fituated on a little ifland, (which is joined to the continent by a mole or cauteway, at the head of which is a ftrong fort,) on the northern coaft of Brittany. Here are feveral fine church is, and a large harbour, but of difficult access. For the diffence of the town and harbour there are feveral forts, and other works, with a good garrifon. Before the revolution it was the fee of a bifhop. The tacle of the town is very confiderable; in particular it fends a number of thips to the cod fifthery; and, in time of war, lits out many private is. The callle was built by the celebrated Afine of Britishes, who annexed

the duchy to the crown of France, by her marriage with Charles VIII. Being asked by the engineer, who constructed it, what plan she would choose as its model, she replied, "My coach." It is so in effect. A large square area within constitutes the body; two small stowers, in the fore part, answer to the fore wheels of a carriage; as two others of superior fize do to the hinder ones; a projection in front forms the pole; and an arched nich behind corresponds to the place where the laquais stand. The streets are very narrow, and the

houses high. Breft is a famous fea-port town, feated on the north fide of a large commodious bay or harbour, which opens to the Ocean in the most extreme western part of the continent of France. It is 12 leagues diftant from St. Pol de Leon to the fouth-west, and 5 from the point or promontory of Conquet. The city is small, and the streets narrow. It is defended by a castle, which flands on a rock, very fleep towards the fea, and which, on the land fide is furrounded with a broad ditch, and fome other fortifications. The harbour lies between the city and the fuburb called Recouvrance, which is as large as half the city. There is over against the caftle a tower, which defends the entrance into the port on that fide. The harbour is encompafied with very fine quays, on which are built feveral warehouses, filled with all forts of naval stores. The road is extremely spacious; but the entrance of it, called the Goulet, or Gullet by reason of its narrowness, is exceeding difficult, because of certain rocks, known by the names of Minons, Filets, and Mingant, that lie under water at high-tide. This part, therefore, is the more fecure retreat for the French thips of war, for which it is the only port on this fide the Mediterranean: fo that the town is one of the grand magazines of the admiralty of France, Toulon, in the Mediterranean, being the other; and in this harbour the greatest number of the French navy, as in that the ships of the greatest burden, winter and are fitted out. Naval stores and provisions for seventy fail of men of war are sometimes laid up at Brest; and ships of 80 and 90 guns are built here, which makes it a populous and rich place. There is always a strong garrison in the castle. Lewis XIV. caused an arfenal to be built here, and established a maritime academy,

The Government of MAINE, PERCHE, and the County of LAVAL, are comprized in one. Maine is bounded by Perche on the east, by Brittany and Anjou towards the west, by Touraine and Vendomois towards the south, and by Normandy to the north. It is 30 leagues long, 20 broad, fruitful in corn, wine, wood, pasture, &c. and contains some iron works, slate, free-stone, quarries of marble, mineral waters, &c. Its rivers are the Loire, Sarte, Haine, and Maienne.

Mans, the capital of the whole province, fituated on the river Sarte, is a very ancient city. There are many churches here, and also a college. Before the revolution, Mans was the see of a bishop; and here were several convents and an inferior court of judicature.

Maienne, a town on a river of the fame name, was, before the revolution, a duchy and perage belonging to the duke of Mazarine. It has feveral churches, with a granary of falt.

La Ferté Bernard, a fmall town on the Huisne, contains a castle, and belonged to the duke of Richlieu before the revolution.

Chateau de Loire, on the Loire, is famed in history for holding out against Herbert Canute, of Mans, a seven years siege.

That part of this government called Perche is bounded on the east by Chartrain and Timerais, on the west and north by Normandy, and on the south by Maienne, being 15 leagues in length, and 12 in breadth. The country abounds in cattle, sheep, corn, slax, hay, mineral waters, iron mines, and cyder.

Mortagne, fituated near the borders of Normandy, at the spring of the little river Huisne, is the largest

and most populous city in this country. There are two parochial churches, and a collegiate one. There is here a granary for falt, a manufactory of very coarse linen cloth, proper only to make sacks, which they fend to Paris.

Bellefme, 4 leagues fouth of Mortagne, is famous for a mineral fpring in its vicinity; and Nogene-le-Rotrou, on the Heime, 11 leagues north-west of Chartres, has several manufactories, particularly of serges, knives, and linen cloths.

At la Trappe was a celebrated abbey of Ciftertian monks, who were remarkable for the aufterity of their manners. It flands between the cities of Séez, Montagne, Verneuil, and Laigle, in a large vale furrounded with hillsand forefts, which feem defigned to hide it from the reft of the world. It was founded in the year 1140 by a count of Perche. But the monks having, in process of time, fallen into a great remifness of manners and discipline, a very strict reformation was introduced in this abbey in the year 1662, by Armand John Bouthilier de Rancé, the commandatory abbot. Some particulars of their manner of living, and of the austerities which they practifed, are thus poetically described.

" Here flocks the train to whom indulgent heav'n The precious gift of penitence has given; Who, cloyfter'd here, feel heav'ns infpiring breath, Nor fear to triumph o'er eternal death. For this we strive; long e'er morn appears We rife, we pray, we bathe the ground with tears; Then hafte to labour, drain the putrid fen, Or break th' ungrateful grounds of other men. The unheeded roots we gather yield us bread, The spring our beverage, and the earth our bed. When midnight hour to new devotion calls, We rife with awe, and blefs those rev'rend walls, Where faints and martyrs kifs'd the chaft'ning rod, Despis'd the world, and rested on their God. Let pride unlock ambition's fanguine springs, And waited nations curse despotic kings; No ftrong alarms this lone retreat infefts: We live in peace, and peaceful fink to reft. Here pure religion tolls our only bell; Here true devotion warms each humble cell: Here contemplation clears the clouded eye, Expands the foul, and lifts it to the fky. Mean while, dear friend, my simple shroud I spread, And now prepare my last and welcome bed. Here, here, my friend, my plain rough coffin stands, Prepar'd and wrought by thefe laborious hands. It calms my spirits, drives vain thoughts away, And reconciles me to my kindred clay.'

The Government of Normandy extends from east to west 60 leagues, and from north to south about 30. It is bounded on the south by Maine, Perche, and Beauce; on the north by the British Channel; on the west by Brittany; and on the east by the Isle of France and Picardy. It is truitful in corn, slax, hemp, fruit, and pasturage; and abounds in wood, coals, cattle, madder, woad, mineral waters, iron, copper, &c. The rivers are the Seine, Eure, Andelle, Rille, Dive, Lezon, Carentone, Aure, Antes, Arne, Drome, &c. It is divided into Upper and Lower, in which the principal places are as follow:

Rouen, the capital of the province, stands on the north bank of the Seine, in a valley, almost surrounded with hills, 22 leagues from Paris to the north-west. Rouen is the see of an archbishop. The great hall of the palace, the old castle, and the principal church are noble buildings. In one of the towers of the latter is a bell of an enormous size, called George Amboise. The bridge of boats over the Seine is a great curiosity, being paved like a street, and rising and falling with the tide. Besides other tombs of great persons in the cathedral, is that of John duke of Bedford, who was regent of France under our king Henry VI. The trade of this city is very considerable, the tide of flood rising

fo high, that veffels of above 200 tons can come up to it, though it is twelve leagues from the mouth of the river. In the place Aux Veaux is a statue of the Maid of Orleans, kneeling before Charles VII. She was burnt to death here by the English in 1431. William I. furnamed the Conqueror, died here. In one of the fuburbs are feveral mineral springs. Here are manufactures of cloth, and oil of vitriol. In the new division In one of the of France, Rouen is the capital of the department of Lower Seine.

Caudebec is a small but populous town on the Seine, feven leagues below Rouen. Here is a pretty good

trade by fea, and a manufactory of hats.

At St. Valeri, a fea-port town on the channel, the inhabitants manufacture some woollen and linen stuffs, trade along the coast, and send ships to the herring and cod fisheries.

Aumale has a manufactory of ferges and coarse wool-

len fluffs.

Dieppe is a noted fea-port town on the shore of the British Sea, at the distance of 10 leagues from Rouen to the north, and 14 from Havre-de-Grace to the northeast. It is situated on an even ground between two mountains or rocks, at the mouth of the river Betune, called, at Dieppe, the river of Argues, because it waters the ruins of that city. This river, falling into the fea, makes the harbour. It is fortified with bulwarks to the fea, with a fortrefs at the fuburb called Pollet, and a castle, which, together with the craggy mountains that lie on the fouth, render it a place of itrength; and as fuch it was chosen by king Henry IV. for his headquarters, when he was opposed by the league at his acceffion to the crown. The town is well built, and inhabited by fea-faring men; mechanics, that make curious works in ivory; and merchants who drive a confiderable trade to foreign parts. The haven is narrow, but very long, and can receive ships of great burthen; but, by reason of its narrowness, of difficult access. This town has been often taken and retaken in the wars between the English and the French. In the year 1694it was almost totally destroyed by bombs that were shot into it from the English fleet, commanded by the lord Berkeley; but they have repaired it fince. The chief trade here confifts in herrings, whitings, mackerel, and oysters, which they sell in the neighbouring provinces, together with ivory works, and laces made here. There is also a manufactory where they make tobacco-rolls. The packet boats from Brighthelmston fail to this port.

Forges, near Andelse, is famous for its mineral wa-

Evreux is an ancient city and has a confiderable trade in linen, woollen, ferge, and corn. It is the fee of a bishop. Here is the superb castle of Navarre. In the new division of France, Evreux is the chief town in the department of Eure.

Elbeuf, a little town, fituated on the Seine, is noted

for a manufactory of fine cloth and carpets.

At Lifieux, a town on the conflux of the Orbec and Gaffey, are feveral manufactories of linen and woollen stuffs. Before the revolution it was the fee of a bishop, who was fliled count of Lifieux.

Honfleur is a populous town at the mouth of the Seine. They make here a great quantity of lace; and fend ships to Newfoundland, and the French colonies in America. The harbour is well defended, and will

admit ships of three or four hundred tons. Caen is fituated at the conflux of the Orne and

Odon. Here are a castle, an university, an academy of fciences, and many churches. In the new division of France, Caen is the chief town in the department of Calvados. It is a place of good trade. William the Conqueror was interred in the abbey of St. Stephen in this city, which he had founded.

Bayeux, an ancient city, fituated on the river Aure, is the see of a bishop, and contains several churches. It is a neat town of good trade, and has a castle.

Coutances, two leagues from the sea, is the capital of a territory called Le Coutantin, and the see of a bishop. Here is a college, some Roman remains, aqueducts, &c. The houses here bear all the marks of antiquity in their structure and taste, which is rude to a great degree. On the fummit of the hill, in the centre of the town, stands the cathedral. There is a grotefque appearance fpread over the whole; and the fantastic ornaments of Gothic building are mingled with a wondrous delicacy and elegance in many of its parts. From Cherburg to Volognes is mountainous and heathy; but in general the country is inferior to no part of the north of Europe. Fine acclivities, clothed with wood, and rich vallies, covered with harvests, form a most pleafing fcene. In the new division of France, Coutances is the chief town in the department of La Manche.

Cherburg, 14 leagues north of Coutances, has a fmall commodious harbour, and, by the flowing of the waves, is every tide almost furrounded by the fea. This town was taken by the English in 1758, and the fortifications demolished; and one of the articles at the conclusion of the war stipulated that the fortifications should not be carried on. Lewis XVI. however, during the American war, again carried on the fortifications, and was at an immense expence in erecting piers, and constructing a noble bason for receiving thips of war. Near here is a famous glass manufac-

Mortain is a little town on the river Lances. Stephen, king of England, was first earl of Mortain, and afterwards of Boulogne, by marriage.

At Alençon a town on the Sarte, are manufactories of vellums and linen-cloths, with a fair, and a bridge over the Sarte.

Falaise is a small town on the Ante, in which, and adjacent villages, are manufactories of linen, laces, and woollen stuffs.

In Argentan, a town on the Oron, are feveral churches, and manufactories of fine linen and stuffs.

Carentan, fix leagues north-east of Coutances, and three from the fea, is fituated on a rivulet, by which fmall veffels can come up at high water. The town is small, but the ruins of the castle are beautiful. It was celebrated in the civil wars under Charles IX. and in those of the league, which followed in the reigns of Henry III. and IV. The architecture of the great church is elegant, it having been erected in the 15th century, when the Gothic structures had almost attained to their highest point of beauty and perfection. There is nothing in the infide which merits attention, except an altar, and a painting dedicated to St. Cecilia. The faint appears to be playing on a fort of harpficord, her fingers finking negligently into the keys. A blue mantle, loofely buckled over her shoulder, exposes part of her neck to view, and her fair hair floats down her back. The pupils of her eyes are thrown up to heaven in a fine phrenzy of mutical enthulialm.

Mont St. Michael is a little town, with a castle, built on a rock in the midst of a fandy shore, which, at high-water, is overflowed. Here is an abbey which was formerly much reforted to by pilgrims. As this place is of a fingular nature, we shall give the following ample and entertaining description of it, in the words of an ingenious traveller, who wrote prior to the French

revolution.

" This extraordinary rock (for it is no more) rifes in the middle of the bay of Avranches. Nature has completely fortified one fide by its craggy and almost perpendicular descent, which renders it impracticable for courage or address, however consummate, to scale or mount it. The other parts are furrounded by walls; fenced with femilunar towers in the Gothic manner; but fufficiently ftrong, fuperadded to the advantages of its fituation, to despite all attacks. At the foot of the mountain begins a street or town, which winds round its base to a considerable height. Above are chambers where prisoners of state are kept, and other buildings intended for refidence; and on the fummit is erected the abbey itself, occupying a prodigious space

of ground, and of a ftrength and folidity equal to its enormous fize; fince it has flood all florms, in this elevated and exposed fituation, during many centuries. I fpent the whole afternoon in the different parts of this edifice; and as the Swifs, who conducted me through them, found he could not gratify my curiofity too minutely, he left no apartment or chamber unform

"The Sale de Chevalerie, or Knights Hall, reminded me of that at Marienbourg, in Polith Pruffia. It is equally spacious, but more barbarous and rude, because some hundred years prior in its erection. Here the knights of St. Michael used to meet in solemn convocation on important occasions. They were the defenders and guardians of the mountain and abbey, as those of the temple, and of St. John of Jerusalem, were to the holy sepulchre. At one end is a painting of the archangel, the patron of their order: and in this hall Lewis XI. first instituted, and invested with the infignia of knighthood, the chevaliers of the cross of St. Michael

"We passed on through several leffer rooms into a long passage, on one side of which the Swiss opened a door, and through a narrow entrance, perfectly dark, he led me, by a second door, into an apartment, or dungeon, (for it rather merited the latter than the former appellation,) in the middle of which stood a cage, It was composed of prodigious wooden bars; and the wicket, which admitted into it, was ten or twelve inches thick. I went into the inside. The space it comprised was about twelve or source feet square; and it might be nearly twenty in height. This was the abode of many eminent victims in former ages, whose names and

miseries are now obliterated and forgotten.

" There was (faid my conductor) towards the latter end of the last century, a certain news-writer in Holland, who had prefumed to print fome very fevere farcastic reflections on Madame de Maintenon, and Lewis XIV. Some months after he was induced, by a person sent expressly for that purpose, to make a tour into French Flanders. The inftant he had quitted the Dutch territories he was put under arrest, and immediately, by his majesty's express command, conducted to this place. They shut him up in this cage. Here he lived upwards of 23 years; and here he, at length, expired. During the long nights of winter (continued the man) no candle or fire was allowed him. He was not-permitted to have any book. He saw no human face except the jailor, who came once every day to present him, through a hole in the wicket, his little portion of bread and wine. No instrument was given him with which he could destroy himself; but he found means at length to draw out a nail from the wood, with which he cut or engraved, on the bars of his cage, certain fleurs-de-lis, and armorial bearings, which formed his only employment and recreation. These I faw, and they are, indeed, very curiously performed with fo rude a tool.

"It is now fifteen years (faid the Swifs) fince a gentleman terminated his days in that cage. It was before I came to refide here. But there is one inftance within my own memory. Monfieur de F—, a perfon of rank, was conducted here by command of the king. He remained three years thut up in it. I fed him myfelf every day; but he was allowed books and candle to alleviate his mifery; and at length the abbot, touched with his deplorable calamities, requefted and obtained the royal pardon. He was fet free accordingly.

"The fubterranean chambers (added he) in this mountain are fo numerous, that we know them not ourselves. There are certain dungeons, called Oubliettes, into which they were accustomed anciently to let down malesactors guilty of very heinous crimes. They provided them with a loaf of bread and a bottle of wine, and then they were totally forgotten, and left to perish by hunger in the dark vaults of the rock. This punishment has not, however, been inflicted by any king in the last or present century.

No. 79.

"We continued our progress through the abbey. He led me into a chamber, in one corner of which was a kind of window. Between this and the wall of the building was a very deep space, or hollow, of near an hundred feet perpendicular; and at bottom was another window opening to the sea. It is called the Hole of Montgomeri. The history of it is this. In the year 1559 Henry II. king of France, was unfortunately killed at a tournament by the count de Montgomeria It was not intended on that nobleman's part; and he was forced, contrary to his inclination, to push the lance against his sovereign, by his express command. He was a Hugonot; and having escaped the massacre of Paris and Coligno, made head against the royal forces in Normandy, supported by our Elizabeth with arms and money. Being driven from his fortresses in those parts, he retired to a rock, called the Tombelaine. This is another similar to the "Mont St. Michael," only three quarters of a league diftant from it, and of nearly equal dimensions. At that time there was a castle on it, afterwards demolished, and of which scarce any vestiges now remain. From this fastness, only acceffible at low tides, he continually made excursions and annoyed the enemy, who never dared to attack him. He coined money, laid all the adjacent country under contribution, and rendered himfelf univerfally dreaded. Defirous, however, to furprize the " Mont St. Michael," he found means to engage one of the monks resident in the abbey, who promited to give him the fignal for his enterprize, by displaying a handkerchief. The treacherous monk having made the fignal, betrayed him, and armed all his affociates, who waited Montgomeri's arrival. The chieftan came, attended by fifty chosen soldiers, desperate, and capable of any attempt. They croffed the fand, and having placed their scaling ladders, mounted one by one: as they came to the top, they were dispatched each in turn, without noise. Montgomeri, who followed last, at length discovered the perfidy, and escaped with only two of his men, with whom he regained the " Tombelaine." They preferve, with great care, the ladders and grappling irons used on this occasion. The count himself was at last besieged, and taken prisoner, by the Mareschal de Matignon, in 1574, at Domfront, in Normandy; and Catherine of Medicis, who detested him for his having been, though innocently, the caufe of her husband's death, ordered him to be immediately executed.

" The church itself detained me a long time, and is matter of high curiofity. It refts on nine pillars of most enormous dimensions, which stand upon the solid rock. I did not measure them; but as far as the gloominess of the place would admit, I apprehend that each of them must be five-and-twenty feet in circumference. Befides these there are two others, of much inferior fize, which support the center of the church, over which is the tower. If the prodigious incumbent weight be confidered, and the nature of its fituation, nothing less mastly could fustain the edifice. They feem as if defigned to outlive the ravages of time, and the convulsions of nature. The building was begun in 966, when Richard, the fecond duke of Normandy, began to erect the abbey. It was compleated about the year 1070, under William the Conqueror; though many other additions were made by fucceeding abbots.

"The treasury is crowded with relics innumerable, among which some few have a real and intrinsic value. There is a fine head of Charles VI. of France, cut in crystal, which drew my attention. They have got (I know not by what means) an arm of Edward the Confessor; and they shewed me another of "St. Richard, king of England." Who this saint and prince was, I confess, is beyond my comprehension. I am sure they could not term Richard I. so, unless his cruelty against Saladine wiped out all his sins, and canonized him. Richard II. has no better pretensions to sanctity. I do not mention him who sell at Bosworth; so that who this royal saint was I must leave you to

d

" When

divine. As to the monks, they know nothing about it; but they were positive he was a king of England. An enormous golden cockle-shell, weighing many pounds, given to Richard, the fecond duke of Normandy, when he founded the abbey, is worthy remark.

The refectory, cloifters, and cells of the monks, have been magnificent and spacious; but a vast sum of money is wanted to put the whole in repair, and re-inftate what the lapfe of ages has defaced and deformed."

The Government of HAVRE-DE-GRACE, constitutes part of Upper Normandy.

Havre-de-Grace, a strong sea-port town at the mouth of the Scine, 12 leagues west of Rouen, is well built, strongly fortified, has an excellent harbour, and

a good trade.

Harfleur, on the Lizard, eight leagues from Havrede-Grace, has fome concern in the cod and herring fisheries, by means of a small harbour; is defended by a castle, and contains manufactories of tanned leather, hats, laces, ferges, linens, woollen cloths, &c.

The Government of ORLEANOIS confifts of feveral diffricts, and is bounded on the north by Normandy, on the east by Champagne and Burgundy, on the fouth by Nivernois and Berry, and on the west by Touraine and Maine; including Orleanois Proper, Chartrain, or Beauce Proper, Vendemois, Blaifois, Solagne, Demois, Perche Gouet, and Gationis Orleanois.

Orleanois Proper abounds in cattle, game, and fish; yields grain, wine, fruit, and wood; and contains the

following places:

Orleans, the capital, not only of Orleanois Proper, but of the whole government, stands on the northern bank of the Loire, 20 leagues fouth of Paris. Over the river is a fine stone bridge, leading into a suburb on the south side of the river. It is one of the largest cities in the republic, and was formerly the capital of France. It contains a univerfity, a public library, a stately Gothic cathedral, and a great number of other churches, a public walk, planted with feveral rows of trees, fome fugar-houses, a manufactory of stockings and sheep-skins, and a seminary. It carries on a great trade in brandy, wine, fpices, and feveral manufactures, which, with many other commodities, are conveyed from hence to Paris, and other places, by means of the Loire, and the canal, which takes its name from the city.

The duties paid by vessels going up and down the canal amounts, in fome years, to 150,000 livres. It is a bishop's see. On the 8th of May, 1429, Orleans, then closely befieged by the English, was relieved by Joan of Arc, commonly called the Maid of Orleans; and the anniversary of that deliverance is still kept here. To perpetuate the memory of it a monument of brass was erected on the bridge. In the Hotel de Ville is a portrait of the same extraordinary woman. It was done in the year 1581, and is the oldest extant. The painter feems to have drawn a flattering refemblance, and to have decorated her with imaginary charms. Her face, though long, is of exceeding beauty, heightened by an expression of intelligence and grandeur rarely united. Her hair falls loofely down her back. She wears a fort of bonnet enriched with pearls, and shaded with white plumes, tied under her chin with a fillet. About her neck is a little band; and lower down on her bosom a necklace, composed of fmall links. Her habit fits close to the body, and is cut or flashed at the arms or elbows. Round her waist is an embroidered girdle; and in her right hand she wields the fword with which the expelled the enemies of her country. In the new divition of France, Orleans is the chief town in the department of Loiret.

To the north of this city is a forest, the largest in all France, which, at the time of the revolution, belonged to the family of Orleans, having been given by Lewis XIV. to his brother Philip. Gangs of robbers

taken, were broke upon the wheel. The new code of judicial proceedings, established by the Convention, have fet aside these executions. The following account of a remarkable one at Orleans (as related by an ingenious traveller) may ferve as a specimen of those

dreadful spectacles in general.

"When we came to Orleans, we learnt that a criminal was to be broke alive at eleven o'clock that evening; and, in our rambles through the streets, faw the fcaffold, wheel, and preparations for the execution. The papers of the condemnation were fold as last dying fpeeches are about the streets of London. By one of thefe I learnt, that the poor wretch was convicted of belonging to a troop of thieves that infefted the forest of Orleans; and of conveying them provisions, arms, and necessaries. It was in this deputation of providing for his companions that he was surprized and taken. He had entered the city difguifed as a peafant, and, after he had executed his commission, might have rejoined them in fafety, had he not taken it into his head to brave the police by committing a daring robbery, and increasing the stores he meant to convey to them. But his unlucky star was in the zenith; for, after having robbed a house, and bound every person in it, he was feized as he was decamping with his booty. His fentence was to have the question ordinary and extraordinary, in order to oblige him to discover the haunts of his comrades; and afterwards to have, as the fentence ran, 'His arms, legs, thighs, and reins broke alive upon a scaffold, to be erected for that purpose, at the place of execution belonging to this city, and to remain on a wheel, with his face turned towards the heavens, till he expires."

"When the time drew near for his tremendous fentence to be executed, I walked out with a gentleman, to fee the proceffion of the criminal, intending to return as foon as the borreau (or executioner) was about to begin his office. My friend's imagination had already presented a picture to him sufficiently horrid: and as he had no inclination to heighten it with the reality, he staid at the aubérge. The place du Martroi is a large square, capable of holding a vast concourse of people. However, I found it filled, though not thronged, with males and females, not only of the vulgar class, but some in embroidery and filks. They were walking in parties, as though they only came to enjoy the benefit of air and exercise. I was quite surprized to fee a multitude of young girls, whose delicate nerves, I should have imagined, would have been agitated at even the recital of human mifery, flocking to see the exposition of it, as if they expected a few

d'artifice.

" The scaffold was about 20 feet square, and raised 5 feet above the ground. The stake, that supported one corner of it, appeared three feet above the boards, and had a common wheel of four feet diameter, fixed by the nave on it, as on its axis. We were examining this, when the borreau brought fome ropes, and a triangular bar of iron, the instrument of terror. As soon as his torch was feen on the scaffold, the houses around were crowded at the windows, with spectators of all ranks and denominations. Soon after came the guards on horseback, with the criminal in a cart. He was lifted out by the borreau, having nothing on but his thirt, and was attended by two monks, with torches flaming in their hands. I then attempted to retire, but crowds were preffing on me behind, and I found it impossible, without danger of being trodden to death. The poor wretch who was to fuffer I judged to be about 28 or 30 years of age. He did not wring his hands. or shew any marks of terror and contrition in tears or cries; but looked round on the spectators, in a manner that has often, I am persuaded, been falsely attributed to unconcern, and a hardened heart. But if I might judge by his countenance, though he looked round, he looked at nothing: his thoughts were harrowed up; and that vacant horror which appeared in his eyes, infested the forest in the former periods, who, when I feemed to shew that the faculties of the soul stood

aloof from the body, even before the moment of their

"When the executioner had brought him to the middle of the scaffold, he proceeded to strip his shirt from his arms down to his waift, and then to bind him to a crois, as it appeared to me. It was plain what effect the torture of the question extraordinary had, as every joint was covered with blood, and he was incapable of walking. The question is not always the same; but by this I imagine that he had been stretched on a bed, till some of his veins and ligaments had burst. The monks now began to talk to him, and to repeat fome prayers; and foon after turning from him began to fing, I suppose, a hymn. All this time I found myself violently agitated; how, I cannot describe: my fensations were such as I never felt before. I a cused myfelf of cruel curiofity, and whilft he was binding made another attempt to get at a diftance, as I was close to the scaffold; but my companion told me I could not passthehorse, and gave me a phial of liquor todrink which he had taken the precaution to put in his pocket. Immediately as the monks turned their backs, the borreau caught up the bar and finished his dreadful office of breaking the limbs, in less than a minute, without a fingle shrick from the poor criminal. The blows were as rapid as he could strike them, one op each leg, and each thigh, two on each arm, and two on the ribs. He then laid the mangled carcafe on the wheel, which he brought forwards, and placed on the corner ftake, which I mentioned as placed above the scaffold. Here, with his affiftants, he folded each limb, fo that every fracture appeared; and bound him in the manner in which he was to be exposed. The monks, after this, began to talk to him again; and what furprized me was, that he turned his head, and feemed able to attend, and to answer. In this situation I thought, according to his fentence, he was to be left to linger till he expired from the anguish of his broken limbs; but the borreau had not yet shewn the compassionate part of his office; for foon after he brought a rope over the criminal's breaft, and straining it, put, in a minute, a period to his life and mifery.

"The morning we left Orleans we faw him exposed on the wheel, at the entrance of the forest, with seven or eight-and-twenty others, who had undergone the same punishment. This is an execution of which I never was before, nor ever will be again, a spectator."

Beaugency is a town, fituated on the Loire, over which is a ftone bridge, about four leagues below Orleans. The council who divorced Lewis XI. from Eleanor heirefs of Guienne, who was afterwards married to Henry II. of England, fat in this town; in which there is now a manufactory of ferges, and other woellen ftuffs.

In the diffrict called Sologne are

Romorentin, the capital, eight leagues from Blois to the fouth. Here is a manufactory of ferges and woollen cloth.

Aubigny, a little town on the Nerres.

Sully, a small town on the Loire.

In Chartrain, or Beauce Proper, which is 14 leagues long, and 11 broad, the only place of note is Chartres, 14 leagues from Paris to the south-west, and 13 from Orleans to the north-west. It stands on the Eure; and contains several churches, besides the cathedral, which has a very high and handsome steeple. It is a bishop's see. The chief trade of this town is in corn. The grove of druids, mentioned by Julius Caesar, was on a hill near this town; and there is shewn, in the cathedral, a well, into which a great many Christians were thrown by order of the Proconful Querimus. In the new division of France, Chartrain is the chief town in the department of Eure and Loire.

The other towns of this district are Bonneval, Nogent le Roi Gallardon, and Maintenon; which last gave the title of Marchioness to Madame Frances d'Aubigny, mistress of Lewis XIV. and widow of the celebrated French poet Scarron.

Dunois is bounded on the east by Orleanois, on the fouth by Blasois, on the west by Vendomois, and on the north by the Lesser Perche. It is about 10 leagues in length, and seven or eight in breadth.

This county is watered by four rivers, the Loire, the Convoy, the Egre, and the Hurre.

Chateau Dun is the capital of the county of Dunois, between Orleans, Chartres, Blois, and Vendome; nine leagues diffant from the three first, and teven from the last. It is an ancient city, in which there is a castle built by the counts of Dunois, dukes of Longueville. In the castle is a chapel, in which are the tombs of the princes of the house of Longueville. There are, in the town, several churches; besides four in the suburbs, which are larger than the city. This district produces wine, corn, and fruit. They also make cycler here; and in some parts of this district are manufactories of woollen stuffs, which they sell at Tours, Orleans, and Paris.

Marchenoir is a small city between the Loir and the Loire. Near this city is a church, dedicated to St. Leonard.

Vendomois, contains no place worth mentioning but Vendome, on the Loire, 12 leagues west of Orleans, which has an abbey, a college, an hospital, and a falt

In Persia Good, are the finall villages of Brou, La Basoche, Montmirail, Auton, and Hailuye, which gave name to as many baronies, before the revolution.

Blatois is divided into Upper and Lower, and is bounded on the fouth by Berry, on the north by Beauce, on the east by Orleanois, properly so called, and on the west by Touraine. The only town of note is

Blois, the capital, whence the country derives its name. A fine, ancient, and commercial city. It stands on the Loire, over which it has a stone bridge. Blois is 12 leagues from Orleans to the fouth-west. Here are several churches, and a celebrated castle. It is the see of a bishop. The inhabitants are said to fpeak the French language in great purity. In the caftle are shewn the chambers where the duke of Guise, and his brother, the cardinal, were murdered, in 1588. The counts of Blois were anciently the most powerful lords in France. Four leagues from the town, to the north-east, is the once royal palace of Chambord, on the little river Casson, in the middle of a spacious park, well stocked with deer. Its palace is reckoned the finest piece of Gothic architecture in France, and was built by Francis I. Here Stanislaus, the dethroned king of Poland, refided fome years; and here marshal Saxe, on whom the king had conferred the palace, died in 1750; as did his heir the count de Friese, in 1755. In the new division of France, Blois is the chief town in the department of Loir and Cher.

There are feveral other palaces in this district, and also several small towns. Montargis, before the revolution was a dukedom, belonging to the duke of Orleans; Chatillong; Chateau Regnard, on the Ouaine, containing a manufactory of coarse woollen cloth; St. Fargeau; and Cosne, on the Loire, which has some iron works in the neighbourhood.

The Government of NIVERNOIS, is bounded on the fouth by Bourbonnois, on the north by Gatinois and Aurenois, on the west by Berry, and on the east by Burgundy, being about 20 leagues in extent both ways, as it is nearly of a circular form; and yielding com, wine, fruit, wood, pit-coal, iron-ore, and mineral springs. The mest barren and mountainous part of it is the district of Morvant. It is watered by several rivers, of which three are navigable, viz. the Loire, the Allier, and the Yonne.

Nevers is the capital of the province, and takes its name from the rivulet Nievre, in Latin Niveris, which, with the Allier, falls near the town, into the Loire. Here are feveral churches, with manufactories of glass, white-iron, and earthen-ware; and a stately stone bridge over the Loire. It is the see of a bishop.

Abou

About two leagues from hence, at the village of Pouges, in the road to Paris, is a noted mineral spring. In the new division of France, Nevers is the chief town in the department of Nievre.

On the other fide of the Yonne is Pantenor, a borough or fuburb of Clamecy, where, before the revolution, was the fee of a bithop, filled bithop of Bethlehem; because Runier, bishop of Bethlehem, in Palettine, being obliged to quit that country in 1180, followed Guy, count of Nevers, into France, and had

a fmall bishopric assigned him here.

La Charité took its name from the great liberality exercifed here formerly towards poor people and pilgrims by the monks of Cluny, who had here a rich priory. It is fituated on the declivity of an hill, which by an easy descent, advances to the river Loire, over which there is here a fine stone bridge. It has a large market-place, and several churches.

The Government of BOURBONNOIS is bounded on the fouth by Auvergne, on the north by Berry and Nivernois, on the east by Burgundy and Forez, and on the west by Upper Marche. It is 30 leagues long, 20 broad, fruitful in corn, wine and pasturage; and is watered by the Loire, Allier, and Cher. From its ancient dukes, Louis XVI. the last king of France,

was descended.

Moulins, the capital, on the Allier, received its name from the numerous mills in its vicinity. It contains seleveral churches, is the fee of a bishop, and has manufactories of hardware, iron, steel, &c. and is, upon the whole, a handsome populous town. In one of the churches is the magnificent tomb of duke Henry II. of Montmorenci, who fell a facrifice to the resentment of cardinal Richlieu; and near the town there is an admirable mineral spring. In the new division of France, Moulins is the capital of the department of Allier.

Bourbon le Archambaud, five leagues west of Mouline, is remarkable for its mineral waters, hot and cold, and for stones resembling diamonds, which will cut glass, which are found in the rocks near the town.

Mont Luçan, near the Cher, with a flone bridge over that river, has feveral churches, and an hofpital; and a neighbouring market town, named Neris, has fome excellent hot baths.

The Government of Lionnois contains the provinces of Lionnois, Forez, and Beaujolois; and is bounded to the north by Maconnois and Burgundy; to the fouth by Vivarais and Velais; to the eaft the Soane and the Rhone part it from Breffe and Dauphiné; and to the west it terminates on Auvergne. It produces corn, wine, and fruits, particularly excellent chesnuts, with pit-coal and mineral springs; and about four leagues from Lyons is a mine of copper and vitriol. The principal rivers of the province are the Rhone, the Soane, and the Loire.

Lionnois, properly so called, is twelve leagues long, and seven broad. Anciently it was subject either to counts, or to the archbishop and chapter of Lyons; but in the year 1563, the jurisdiction devolved to the crown. The only place in it worth describing is

Lyons, from which it takes its name, and which is one of the finest and most considerable cities in Europe. It was founded about 42 years before Christ, soon after the affallination of Julius Cælar. Here are four gates leading to the four great roads traced by Agrippa. It hands at the conflux of the Rhone and Soane, and had the Latin name of Lugdunum, from a place of the Gauls that stood upon a hill hereabouts, and was called Lugdun, i. e. the Hill of Ravens. There are still some remains of the stately buildings with which the Romans adorned this city, now the second of France, having two sine squares: in one of which was an equestrian statue of brats of Lewis XIV. Here are a town-house, a noble stone bridge over the Rhone, with two of wood and one of stone, over the Soane, a great number of churches, besides the cathedral, sour

fuburbs, fix gates, an exchange, an observatory, a public library, three hospitals, an arfenal well furnished with military stores, and having three forts. It is noted for manufactories of gold and filver fluffs, gold and filver laces, and filks of all forts. The archbishop of Lyons, before the revolution, had feveral other archbishops and bishops immediately subordinate to him. He fuled himself count of Lyons. By the constitution formed in 1793, Lyons is an archbishopric, and Clermont, St. Flour, Le Puy, Viviers, Grenoble, Belley, and Autun are suffragants. The environs of this city are very pleafant; and it is advantageoufly fituated for trade for an inland town, but its streets are narrow. In the town-house is an ancient plate of brass, on which is engraved the oration which the emperor Claudius, when he was cenfor, delivered before the Roman fenate in behalf of the citizens of Lyons. In the new division of France, Lyons is the chief town in the department of Rhone and Loire.

Forez is divided into Upper and Lower, and had formerly counts of its own; but in the year 1532, Francis I. annexed it to the crown. It is a large fruitful valley, watered by the Loire, and feveral other fmaller rivers, and took its name from the town anciently called Forum Segusianorum, and now Feurs, or Fors, a small place which stands on the Loire, and has a sulphurous spring near it. The other towns of this

county are

St. Etience de Furans, a populous town on the river Furans, where is a confiderable trade, and a manufactory of fire arms, and other works of iron and fteel.

Roanne, on the Loire. From this place the merchants of Lyons convey their goods to feveral parts

of France.

Beaujolois is a district near the Soane, ten leagues in length, and eight in breadth, and is fertile. Its capital, Ville Franche, is fituated on the Moran, and contains a granary of falt, and an academy of polite literature.

The Government of AUVERGNE, is bounded on the fouth by the Cevennes, on the north by Bourbonnois, on the eaft by Forez, and on the weft by Limofin, Quercy, and La Marche. It is 40 leagues long, 30 broad, and divided into Upper and Lower. The rivers are the Allier, the Dargogne, and the Alagnon; the manufactures filks, stuffs, cloths, laces, ironworks, paper; and the produce corn, wine, cattle, cheefe, coals, &c. In Upper Auvergne are

St. Flour, the capital, which is fituated at the foot of Mount Cantal, one of the highest in Auvergne. It took its name from that of a bishop, who having come hither from Languedoc to preach the gospel towards the end of the fourth century, died, and was buried here. It is the see of a bishop. Here is a considerable traffick in rye and mules, as well as in knives, carpets, and cloths. In the new division of France, St. Flour, is the chief town in the department of Cantal.

Aurillac contains manufactories of tapelity and lace, a caftle, &c.

In Lower Auvergne are

Clermont, the capital of the whole province, fituated near the mountain called Pui de Domme, 14 leagues from St. Flour to the north, betwixt the rivers Artier and Bedat. It was built by the emperor Augustus, and thence was anciently called Augustonemetum, or Augustonemosum. Here are several churches, besides the cathedral. It is the fee of a bithop. In the neighbourhood of the town are feveral petrifying fprings; one of which, in the fuburb of St. Allire, has formed a folid rock, and a kind of bridge, under which the rivulet of Firidaine passes. Of this natural curiofity, and of the town itself, we have the following accurate and authentic account from an ingenious traveller. " The fituation of Clermont is agreeable, on a little eminence, to which the access is gradual and easy. The place itielf feems to have been built in an age the most

The ge the most barbarous barbarous. The streets are so narrow and winding that no carriage can enter them, and the buildings correfoond to the other parts; but, to compensate for the inconvenience, the fuburbs are charming, and the houses modern and elegant. I visited, this morning, the petrifying fpring which Charles IX. is faid to have furveyed with to much wonder and pleasure. It is only a quarter of a mile from the town. In the course of ages it has formed a ridge of stone, or incrustation, not less than 16 feet in height, above 100 feet long, and, in some parts, near 10 in thickness. As it impeded, and, at length, totally stopped the current of a little rivulet which interfected its course, the inhabitants were obliged to dig a passage through it. The stream is now directed into another channel, and has begun to form a new bridge across the rivulet into which it falls." the year 1095 pope Urban held a council here, when the first crusade was resolved on. It was composed of 600,000 men; their chief was Godfroi of Bouillon. In the new division of France, Clermont is the chieftown in the department of Puy de Dome.

Riom, two leagues from Clermont to the north, is the place where the ancient dukes of Auvergne used to keep their court. At prefent here are feveral churches with a college; and the neighbouring country is fo pleafant, that it is called the garden of Auvergne.

Near Aigue-Perfe, a fmall town, the capital of the duchy of Montpenfier, is a fpring, which boils violently, and makes a noise like water thrown upon lime; and yet is cold, and without any remarkable tafte.

Thiers, or Thiern, has the greatest variety of manufactures, and the most trade, of any town in Au-

At Brioude, a very ancient town on the Allier, is a very extraordinary bridge, fupposed to be a work of the Romans, being very long and lofty, but of only one arch, which refts on two high mountains. The town took its name from the bridge; Briva, in the language of the Gauls, fignifying a Bridge. To diftinguish this from another small town in the neighbourhood, of the same name, it is called Veille Brioude, i. e. Old Brioude.

Near the fmall towns of Vic-le-Comté and Artonne, in Lower Auvergne, are mineral waters; as there are alfo at Mont d'Or, or the Golden Mountain, which is the highest in Auvergne. At Vic-le-Comté is a chapel, and a fine palace built by the duke of Albany, who was of the royal family of Scotland, and viceroy of that kingdom during the minority of James V.

The Government of LIMOSIN is bounded on the east by Auvergne, on the west by Angoumois and Peingord, on the fouth by Quercy, and on the north by Poitou, and La Merche. It is 25 leagues long, and near as many broad; the whole being divided into Upper and Lower. The Upper parts are cold and mountainous, the Lower warm and fruitful; the produce being rye, barley, buck-wheat, chefnuts, oxen, cows, horfes, &c. also lead, tin, copper, iron, and steel. The rivers are the Vienne, the Vizere, and the Dordogne.

In Upper Limofin are Limoges, on the Vienne, 65 leagues fouth of Paris, the capital of the whole government, and the fee of a bishop. It is a large and ancient city. The streets are narrow and the houses mean, but there are several fine fquares and fountains. The people in general are very poor. Here are manufactures of paper, leather, and woollen cloths; four aqueducts, constructed by the Romans, and other remains of antiquity. In the new division of France, Limoges is the capital of the department of Upper Vienne.

St. Leonard, on the Vienne, contains a chapter, and manufactories of paper and cloth; and St. Iriez, on the Isle, hath likewise a chapter and some considerable iron mines in the neighbourhood.

Chalus, a town and cattle fituated at the fpring of the Tardouere, one of the rivers that fall into the No. 79

Charente, is fix leagues distant from Limoges to the north-west. This little city has the title of a county or earldom, and belonged formerly to the viscounts of Limoges. It happened that a gentleman of Limofin found upon his eftate a treasure, which had been buri-ed there many ages before. It consisted of the statues of an emperor and his confort, fitting round a table with their children, the whole being of folid gold. Richard I. king of England, who was then mafter of Limofin, pretended that the treasure belonged to him as fovereign lord of the country where it was found. The gentleman was willing to give him part of it; but seeing that the king claimed the whole, he implored the protection of the viscount of Limosin, who gave him leave to take fanctuary in his castle of Chalus. Richard going to befiege the place, was wounded with an arrow fhot by a crofs-bow-man, and died of the wound April 6, 1199. There is a famous horse fair kept here every year on St. George's day.

In Lower Limofin are

Tulle the capital, at the conflux of the Correze and Solan. It is the fee of a bishop, and is surrounded by mountains. In the new division of France, Tulle is the chief town in the department of Correze.

Brive had its name from its bridge; and Turetle, four leagues from Tulle, was the capital of a viscounty, and belonged to the family of the duke of Bouillon.

The Government of LA MARCHE is bounded on the fouth by Limofin, on the north by Berry, on the west by Poitou, and on the east by Auvergne; being about 22 leagues from east to west, and 8 or 10 from north to fouth. It is watered by the Vienne, the Cher, the Creuse, and the Gartempe; and is not only fruitful in corn, but produces wihe.

Gueret, the capital of the province, is fituated in the Upper Marche, on the river Gartempe. It is a bishop's fee. Here is an hospital. Anthony Varitlas, the historian, was born, and founded a convent, here. In the new division of France, Gueret is the chief town

in the department of Creufe.

Aubuffon, on the river Creufe, has a manufactory of tapestry.

The Government of BERRY is bounded on the fouth by Bourbonnois and Marche, on the north by Orleanois, and on the west by Nivernois; its greatest length being about 35 leagues, and its breadth about 28. Its name, and that of its capital, Bourges, are derived from the ancient Bituriges, furnamed Cubi, to dif-tinguish them from the other Bituriges, called Vibici, who were those of Bourdeaux. The air of this pro-vince is temperate, and the foil fruitful, producing wheat, rye, wine, good fruit, a great deal of flax and hemp, and fine pasture, both for sheep and black cat-Near Vierzon is a mine of ochre, and near Bourges are quarries of stone. Here are several rivers, the chief of which are the Loire, the Creuse, the Cher, the Large and Leffer Saudre, the Indre, the Orron, the Aurette, the Moulon, and the Evre. There is also a lake, called the lake of Villiers, which is pretty large. This province had formerly counts and vifcounts of its own; but, in the reign of Philip I. it was united to the crown. The principal places in it are

Bourges, anciently Bituriges, and Bituricæ, and alfo Avaricum, the capital of the whole province, fituated at the conflux of the Evre with the Avron, and other rivulets, 18 miles from Orleans to the fouth. It is of large extent. The country round is very boggy. Here are a cathedral, feveral churches, an elegant chapel, called Holy Chapel, a very ancient university, and a palace, built by John, duke of Berry. A few handfome squares, and a stately town-house, embellish the city. A fine palace belongs to the archbishop. In the new division of France Bourges is the chief town in

the department of Cher.

Iffoudim, on the Theols, fix leagues west of Bourges, has several churches, two hospitals, and a castle. The

town has feveral manufactories, and fome trade in

Dun-le-Roi, on the Auron; and Chateauneuf, are towns of little note; Mehun, on the Evre, has a castle built by Charles VII. in which he starved himself to death, for fear of being poisoned; and Virzon, on the Evre and Cher, contains several convents, with an abbey and a college.

Aubigny, on the Nevre, 11 leagues fouth of Bourges, is well fortified, and has a castle. This town, until the revolution, gave the title of duke and peer of France to the family of Lenox duke of Richmond in England. The title was given by Lewis XIV, to one of king Charles's mistresses who was the mother of the first duke of Richmond. The present duke, a few years since, attended personally in the parliament of Paris, and registered his title.

Henrichment, five leagues north of Bourges, contains a castle. Sancerre, on the Loire, was the property of the house of Bourbon Condé. La Chatree, on the Indre, appertained to the prince of Condé; as did Chateau-Roux, 15 leagues north of Bourges.

At Argenton, a town on the Creufe, 18 leagues from Bourges, is a college for polite literature, with a church.

The Government of TOURAINE is bounded to the fouth by Berry and Poitou, to the north by the river Maine, to the west by Aojou, and to the east by Orleanois; its greatest breadth being about 22 leagues, and its length 24. It is watered by several rivers, the chief of which are the Loire, the Cher, the Creuse, and the Vienne. The climate is very mild, and the soil in general, sertile. In the country of Noyers are mines of iron and copper. This province had formerly counts of its own; but, in 1202, was united with the crown; and, in 1356, was raised to a dukedom and

Tours, the capital of the province, which also takes its name from it, is fituated on the Loire, over which there is a fine bridge. Here are feveral churches, an academy, and it is the fee of a billion. It is a large and ancient city, and has a public walk in the center of the town a mile in length. Tours is the birth place of Rapin the celebrated historian. The cathedral is a fine building, containing a library, in which are some ancient manuscripts. In 737 Charles Martel defeated the Saracens near this place with a very great slaughter. Here is a silk and cloth manuscripty. In the new division of France, Tours is the chief town in the department of Indre and Loire.

At Amboife, a town fituated at the conflux of the Amasse and Loire, Charles VIII. was born and died. The name of Hugonot had its rise in this town, wherein also the civil war broke out in 1561. Here are an hospital, and two churches.

At Loches, fituated on the river Indre, feven leagues from Amboife, is a ftrong caftle, in one of the fub-terraneous paffages of which Lewis Sforza, duke of Milan, was kept prifoner ten years. In one of the two cages alto, which are kept in this caftle, cardinal Balve, bishop of Algiers, was confined by Lewis XII.

Chinon, on the Vienne, has four churches. The celebrated Rabelats was a native of this town; and, A. D. 1189, Henry II. king of England, died in the castle here. Ten leagues south of Tours is La Hayne, the birth-place of the great philosopher Des Cartes.

The Government of Anjou, which is 26 leagues long, and 24 broad, is bounded by Poitou to the fouth, by Maine to the north, by Touraine to the eaft, and by Bretagne to the west. It is fruitful, pleasant, and well watered.

Angers, the capital, fituated on the Maienne, is a large city, and the see of a bishop. It contains, besides the cathedral, many churches, and a strong castle. Here are a seminary, an academy, an university, three hospitals, an iron cage called the queen of Sicily's cage,

and fome remains of Roman antiquities. The first walls of the city were built by John, king of England, and duke of Anjou. The houses are all covered with state; on which account Angers is frequently called the Black Town. The castle is stanked with 18 large round towers. The inhabitants are employed chiefly in bleaching wax and linen, refining sugar and making camblets, serges, and sine woollen stuffs, striped with silk and gold. It is proverbially said of Angers, that "It stands low, has high steeples, rich whores, and poor scholars." In the new division of France, Angers is the chief town in the department of Main and Loire.

At Chateau-Gontier, on the river Maienne, are a castle and several churches, with manufactories of linea cloth, and serges, and mineral springs.

Saumur is a town on the fouth bank of the river Loire, over which it has a ftone bridge, fix leagues from Angers to the fouth. Here are a cacle, feveral churches, an university, and some trade in salt-petre, sugar, steel, iron-works, medals, rings, chaplets, and strings of beads. It was one of the cautionary towns given to the Protestants; and during the time of its being in their hands, the celebrated John Cameron, a Scotch divine, was for some time professor of Divinity in the university. The district is called Saumurois; and the governor of that, as well as the town and castle, was before the revolution independent of the governor of the province. While the town was in the hands of the Protestants it was opulent, but has declined since its being re-possessor.

At Doe, three leagues west of Saumur, is a fountain in the form of a horse-shoe, which is one of the greatest curiosities in France.

SECTION III.

Persons, Dispositions, Customs, Manners, Learning, Religion, &c. of the French.

HE French, in their persons, are generally flender, well proportioned, and active. Their hair and eyes are, for the most part, black, and their complexions brown, which is the supposed cause of the prevailing custom of painting amongst the females, and even some of the other sex. The semales of the better fort are more celebrated for their fprightly wit than personal beauty. The peasantry are ordinary in general. A national vanity is the predominant character of the French. It supports them under misfortunes, and frequently impels them to actions to which other nations are inspired by true courage. This natural vanity, from which the country, in many inflances, derives great utility, and which before the revolution was conspicuous only in the higher and middling ranks, where it produced excellent officers, now pervades the whole nation. The means which have been purfued by the present government there to stimulate the people to refift the armies of the allied powers, have roused the foldiers to acts of heroilm and intrepidity which aftonish Europe. In former wars it was a general observation respecting the French and English, that the French officers will lead if their foldiers will follow, and the English foldiers will follow if their officers will lead; but with a steady perseverance, the French soldiers, in the war of the revolution, advanced to close combat, and took many pieces of the artillery of the allies with the point of the bayonet.

The French are diftinguished by their politeness and good manners, which may be traced, though in different proportions, through every rank, even to the lowest mechanic; and it has been remarked by intelligent travellers, as very singular, that politeness, which, in every other country, is consined to people of a certain rank in life, should here pervade every situation and profession. These people, from that universal politeness which characterizes their nation, have been much censured for infincerity; but this charge has often

been carried nerally owing be confessed, dour. It m many of the lities; and the fity and diffine The Frence

oliteness and gh in differven to the ed by intelpoliteness, to people of every fituathat univern, have been ge has often been

been carried too far; and the imputation has been generally owing to their excess of civility, which, it must be confessed, throws a suspicious light upon their candour. It must, upon the whole, be admitted, that many of the French, in private life, have amiable qualities; and that a great number of instances of genero-fity and difinterestedness may be found amongst them.

The French affect freedom and wit. Attention to the fair degenerates into gross soppery in the men, and the ladies are charged with admitting indecent freedoms; but the feeming levities of both fexes are rarely attended with that criminality which, to people not used to their manners, they feem to indicate; nor are the husbands so indifferent, as strangers are apt to imagine, about the conduct of their wives. The French are very credulous and litigious, but bear advertity, and reduction of circumstances, with peculiar spirit; though, in prosperity, like their fellow mortals, they are apt to be intolent, arbitrary, and imperious. An intelligent traveller remarks, that an old French officer is an entertaining and instructive companion, and, indeed, the most rational species of all the French gentry.

Under the reign of their kings the French exhibited many striking peculiarities of character not to be found under the republican government. The following is an extract from a writer eminent for his proficiency in polite literature, published prior to the revolution.

"The natural levity of the French (fays he) is reinforced by the most preposterous education, and the example of a giddy people engaged in the most frivolous pursuits. A Frenchman is, by some priest or monk, taught to read his mother tongue, and to say his prayers in a language he does not understand. He learns to dance and fence by the masters of those sciences. He becomes a complete connoiffeur in dreffing hair, and in adorning his own person, under the hands and instructions of his barber and valet de chambre. If he learns to play upon the flute or fiddle, he is altogether irrefiftible: but he piques himself upon being polished above the natives of any other country, by his conversation with the fair fex. In the course of his communication, with which he is indulged from his tender years, he learns, like a parrot, by rote, the whole circle of French compliments, which are a fet of phrases ridiculous even to a proverb, and these he throws out indifcriminately to all women without diftinction, in the exercise of that kind of address, which is here diffinguished by the name of gallantry. It is an exercise by the repetition of which he becomes very pert, very familiar, and very impertinent. A Frenchman, in consequence of his mingling with the females from his infancy, not only becomes acquainted with all their customs and humours, but grows wonderfully alert in performing a thousand little offices, which are overlooked by others, whose time hath been spent in making more valuable acquifitions. He enters, without ceremony, a lady's dreffing-room, while she is at her toilette, reaches her whatever she may want, regulates the distribution of her patches, and advises where to lay on paint. If he vifits her when she is dreffed, and perceives the least impropriety in her coiffure, he infifts upon adjusting it with his own hands. If he fees a curl, or even a fingle hair amifs, he produces his comb, his sciffars, and pomatum, and sets it to rights, with the dexterity of a professed frizeur. He accompanies her to every place the vifits, either on bufiness or pleasure, and, by dedicating his whole time to her, renders himself necessary to her occasions. In short, of all the coxcombs upon the face of the earth, a French petit maitre is the most impertinent; and they are all petit maitres, from the marquis, who glitters in lace and embroidery, to the garçon barbiere (barber's boy) covered with meal, who struts with his hair in a long queue, and his hat under his arm. A Frenchman will fooner part with his religion than his hair. The foldiers in France wear a very long queue; and this ridiculous foppery has descended to the lowest class of the people. The boy, who cleans shoes at the corner of a

ftreet, has a tail of this kind hanging down to his rump; and the beggar, who drives an als through the streets of Paris, to pick up a miserable livelihood, wears his hair en queue though, perhaps, he has no shirt.

When a stranger first arrives at Paris, he finds it

necessary to send for the taylor, peruquier, hatter, shoemaker, and every other tradesman concerned in the equipment of dress. He must even change his buckles, and the form of his ruffles; and, though at the risk of his life, fuit his clothes to the mode of the feafon. For example, though the weather should be ever so cold, he must wear his babit d'eté [summer fuit] or demi saison [mid feason] without presuming to put on a warm dress before the day which fashion has fixed for that purpose; and neither old age or infirmity will excuse a man for wearing his hat upon his head, either at home or abroad. Females are, if possible, still more subject to the caprices of fashion. All their dreffes and habits must be altered and new trimmed. They must have new caps, new laces, new shoes, and their hair new cut. They must have their tassaties for the summer, their slowered filks for the spring and autumn, and their fattins and damasks for winter. The men too must provide themselves with a camblet suit, trimmed with filver, for fpring and autumn, with filk clothes for fummer, and cloth laced with gold or velvet for winter; and they must wear their bags a la pigeon. This variety of dress is absolutely inditpenfible, for all those who pretend to any rank above the vulgar. All ranks use powder; and even the rabble, according to their abilities, imitate their superiors in the fopperies of fashion. The common people of the country, however, still retain, without any material deviation, the old fashioned modes of drefs, the large bat, and most enormous jack-boots, with suitable spurs; and this contrast is even perceivable a few miles from Paris. In large cities the clergy, lawyers, phyficians, and merchants, generally dress in black; and it has been observed that the French, in their modes of dress, are, in some measure, governed by commercial circumstances.'

The diversions of the French are much the same as those of the English, but they carry their gallantry to a much greater excess. The people of fashion accomplith themselves in the academical exercises of dancing, fencing, and riding, in the practice of which they excel all their neighbours in skill and gracefulness; and indeed, few of the common people are without some knowledge of those embellishments, They are fond of hunting; and the gentry have now left off their heavy jack-boots, their huge war-faddle, and monstrous curb-bridle, in that exercise, and accommodate themtelves to the English manner."

The late celebrated Dr. Goldsmith has beautifully depicted the French nation in the following lines:

To kinder skies, where gentler manners reign, I turn, and France displays hot bright domain. Gay sprightly land, of mirth and social ease, Pleas'd with thyfelf, whom all the world can please: How often have I led thy fportive choir, With tuneless pipe, beside the murmuring Loire, Where shading elms along the margin grew, And freshen'd from the wave the zephyr flew; And haply, tho' my harth touch falt'ring still, But mock'd all tune, and marr'd the dancer's skill, Yet wou'd the village praise my wond'rous power, And dance, forgetful of the noon-tide hour. Alike all ages: dames of ancient days Have led their children thro' the mirthful maze; And the gay grandfire, skill'd in gestic lore, Has frisk'd beneath the burden of threescore

So bless'd a life those thoughtless realms ditplay; Thus idly bufy rolls their world away. Theirs are those arts that mind to mind endear; For honour forms the focial temper here. Honour, that praise which real merit gains, Or e'en imaginary worth obtains,

Here passes current; paid from hand to hand, It shifts in splendid traffic round the land. From courts to camps, to cottages it strays, And all are taught an avarice of praise. They please, are pleas'd; they give to get esteem,

Till, feeming blefs'd, they grow to what they feem.

But while this fofter art their blifs fupplies, It gives their follies also room to rife; For praife too dearly lov'd, or warmly fought, Enfeebles all internal strength of thought; And the weak foul, within itself unbleft, Leans for all pleasure on another's breast. Hence oftentation here, with tawdry art, Pants for the vulgar praise which fools impart. Here vanity assumes her pert grimace, And trims her coat of frize with copper lace. Here beggar pride defrauds her daily cheer, To boast one splendid banquet once a year. The mind still turns where thisting fathion draws, Nor weighs the folid worth of felf-applaufe.

Such is the character of the French people prior to the revolution. With the change in the government however there has been no finall change in their cuftoms and dispositions. The difficulties which appeared before them, the heavy weight of national debt, and the unfriendly conduct of neighbouring powers, have given a new turn to their purfuits. All the zeal which Frenchmen formerly exerted for their king, appears now to press forward for the destruction of monarchy. There is a tincture of ferocity in their character very opposite to that we have been delineating in the preceding part of this section. From frivolity and trifling all ranks appear to be engaged in the cause of the day. Encompassed as they were with enemies, every nerve was exerted, and the following decree was passed by the convention to rouze every one to activity. "The young men shall march to battle; the married men shall forge arms, and transport provisions; the women shall make tents and cloaths, and wait in the hospitals; the children shall make lint of old linen; the old men shall cause themselves to be carried to the public squares, to excite the courage of the warriors, to preach hatred against kings, and the unity of the republic."

Their stile of living at this period may appear in the character of le Peletier, one of the members of the convention, who was murdered by a woman of the name of Corday for having voted for the death of Lewis XVI. He was a gentleman of confiderable fortune; but, in the spirit of the times, he dwelt in lodgings in Paris, for the purpose of not being at the expence of supporting a houfhold, which would have been necessary had

he refided in his own mansion. The native character of the people indeed appears to be activity. Under the reign of an absolute monarch this disposition discovered itself in the character of a galant; the share they now have in the government has diverted it to other objects. In both characters perhaps they have been in the extreme; and a future period may exhibit them not so full of frivolity as at one time nor fo fevere as at another.

With all their defects, the French have many good qualities, and are very respectable for the great attention they pay to strangers, and the general taste for literature which prevails amongst those of the higher class. The French literati have great influence even in the gay and diffipated city of Paris. Their opinions determine the merit of works of tafte and science.

France has produced many men who stand in the highest estimation in the several departments of litera-ture; such as Racine, Corneille, Moliere, Boileau, Pascal, the archbithop of Cambray, Montesquieu, D'Argen, Voltaire, and others; not to omit the celebrated Madame Dacier. Descartes was the greatest philosopher of his time. D'Alembert stands eminent for mathematical knowledge; as does Buffon for that of natural hiftory.

The French language is chiefly composed of words

radically derived from the Latin, with fome derived from the German, as introduced by the Franks. Lewis XIV. who liberally patronized every plan that tended to its advancement and perfection, fucceeded fo happily as to render it the most universal of all the living tongues; a circumstance which equally promoted his greatness and glory; for his court and nation thereby became the school of arts, sciences, and politeness. With respect to the properties of the French anguage, they are certainly inferior to the English; but they are well adapted to subjects void of elevation or passion, and admirably accommodated to dalliance, compliment, and common convertation. It is generally understood throughout Europe; and persons in the higher classes of life are deemed deficient in polite accomplishments without a tolerable knowledge of it. This is best to be acquired by frequent conversation with French people of all classes upon their own spot.

The prevailing religion of France is the Roman Catholic, but toleration is now given to all religions by the national convention. Before the revolution there were 200,000 ecclefiaftics, with 18 archbifhops and 118 bishops, who possessed a revenue of 6,000,000 There were also 80,000 nuns. In November, 1789, the national affembly declared all ecclefiaftical property was at the disposal of the nation, subject to the charge of providing, in a proper manner, for the expence of divine worthip, the support of the ministers of the church, and the relief of the poor. There is now only one bishop to each department, and a great reduction of the other clergy. Monasteries, &c. are abolished; monks, friars, and nuns, are liberated from their vows; and fuch as have no other refource, have a finall stipend settled by the government.

SECTION IV.

Manufactures, Trade, Commerce, Coin, Government, Revenue, Taxes, &c. of France.

HE French have, within the last century, been very affiduous to improve their manufactures. The most admirable works in tapestry, filligree, and sculpture, are executed at the Gobelins in Paris. filk manufacture was carried to great perfection during the reign of Lewis XIV. and at this time the city of Lyons excels in producing the fineft filks. The woollen manufactures at Abbeville are little inferior to the English. The manufactories of soap, thread, lace, linen, paper, glass, porcelain, cambrics, lawns, arms, artillery, falt-petre, brandy, &c. are very confiderable; but in those of hard-ware, toys, gold and silver lace, &c. the French artizans are out-done by the English.

Before the revolution the trade and commerce of France laboured under great disadvantages, inasmuch as merchants and traders were not held in fo honourable a light as they are in England; hence the poorer part of the French nobility and nobleffe fought employments in the army, church, and law. The state of the country, involved as it now is in war with the powers allied to restore the antient government, has afforded no opportunity to ascertain the spirit and disposition of the people with respect to trade.

Many of the cities of France, before the revolution, had the liberty of coinage, each having peculiar marks to diftinguish their respective pieces; these mints were under the inspection of the Cours de Monnoies, or mint courts of Paris, Lyons, and Pau. Since the revolution the mints have been suppressed in every city

Accounts are kept in livres, fous, and deniers. Twelve deniers are equal to a fol or fou, or a halfpenny English; and 20 sous make a livre. The denier is a fmall copper piece; but fols and livres are only imaginary coins. The liard is another copper coin, equal to three deniers. An ecu is worth 2s 6d. a loins blanc 5s. a piftole 8s 4d. and a louis d'or 1l. fter-

France was in the king.

The kingdom was divided into a number of provinces, over each of which was appointed a king's lieutenantgeneral, and a superintendant, who, in some respects, resembled the lords-lieutenant of the counties in England; but their powers were far more extensive. Diftributive justice was administered by parliaments, chambers of accounts, courts of aid, prefidial courts, generalities, elections, and other courts. The courts of parliament were twelve, viz. those of Paris, Thoulouse, Rouen, Grenoble, Bourdeaux, Dijon, Aix, Rennes, Pau, Metz, Befançon, and Douay. Besides these there were fuperior councils kept at Colmer, Perpignan, and in the province of Artois. These courts consisted of a certain number of prefidents and inferior judges, who purchased their places. The parliament of Paris was the most considerable; for hither the king frequently came in person, and here his royal edicts were recorded and promulged, till when they had not the force of laws. It was composed of peers of the realm, and was the only parliament that had any jurisdiction over them. The kingdom was divided into generalities, or diffricts, in each of which commonly was an office of the treafurers, and the king's commissary or intendant. The generalities were fubdivided into elections fubordinate to the generalities, and which computed the proportion which every parish in their division should raise of the fum demanded by the generality, and fent out their orders accordingly. For administering justice, and punithing criminals, there were magistrates in every confiderable town, who were commonly lawyers, appointed by the king, called differently in divers places; in some bailiffs, in others provofts, in others fenefchals; but their power and duty were much the fame.

In the year 1789, the resistance which first the par-liament, afterwards the notables, and lastly the general affembly of the states, made against registering an edict for raising money was the means of changing the government of France into a limited monarchy. In 1792 the king was dethroned, and France became a republic; the fupreme power refting in the convention or national affembly, who are elected annually by general fuffrage of the people, who have been fix months refi-dent in one house at the time of election. The proportion of members elected is one in about 40,000 citizens, and in case two candidates should have an equal number of fuffrages, the eldeft is returned. The executive council has the administrative part of the government, and confifts of 24 persons chosen by the convention from a body formed by the return of one member in each department. In establishing the new fystem of government and civil jurisprudence, the asfembly have fet afide partial privileges and antient cuftoms, and laid down one general tystem of civil and criminal law for the whole nation, in which one of the leading features is the trial by jury as in England. For the more ready administration of justice the nation is divided into departments, diffricts, and municipali-

The taxes paid by the common people during the monarchy, besides the extraordinary ones in time of war, were fix forts. 1. The taille, a fum paid yearly by every house-holder, according to his substance and family; from which the nobility, clergy, and crown-officers were exempt. 2. The taillion, paid by the same persons as the taille, amounting to about one third of that, 3. Subfiftence money, for subfiftence of the foldiers in winter, by which the subject was excused from free quarters; paid by the fame persons, and in the same manner, as the two former. 4. Customs on imports and exports. 5. The gabelle, a duty on falt, which the king alone had a right to fell. Every family was obliged to take a certain quantity yearly, and pay the duty, whether they could confume it or not. Small excises upon all necessaries of life, farms, and other demelnes of the crown. Other taxes were the capitation or poll tax; the 10ths of all estates, offices, and employments; the 50th penny, from which neither nobility or clergy were exempted; and the 10ths or No. 79.

free-gifts of the clergy. Vast sums were also sometimes raised by raising and lowering the coin at pleasure, by compounding debentures and government bills, and other oppressive means. The whole kingdom, in short, was but one great farm to the crown. At the revolution all taxes were repealed; and the prefent resources of the government arise from the seizure of the riches of the church, and of the church lands; from the confiscation of the effects of those who are disaffected to the government; and by a tax on property, every individual being obliged, under pain of death, to give a true statement of his wealth.

During the monarchy the nobility confifted of four classes, viz. princes of the blood, high nobility, ordinary nobility, and modern nobility. He who was nearest to the crown, after the king's children, was the first prince of the blood. Among the higher nobility the dukes and counts, peers of France, had the precedence: they affifted at the unction of a king, attended when he held a lit de justice, or bed of justice, and enjoyed a feat in the parliament of Paris. In this class were likewise included the knights of the Holy Ghoft, the governors of provinces, and lieutenantgenerals, with fome other dukes, counts, and marquiffes. The ordinary nobility were divided into no-bleffe de race and nobleffe de naifance. The modern or new nobility were fuch as the king granted letters of nobility to, or conferred fome places upon, by which they became ennobled. The orders of knighthood were those of St. Michael, instituted in 1469; the order of the Holy Ghost, founded in 1578; and the order of St. Lewis, which was inflituted by Lewis XIV. The first consisted of 100 knights; the second of the same number, with the sovereign at the head; and the third was a military order, for the encourage-ment of officers of merit. One of the first effects of the revolution was the fetting afide all the above dif-tinctions; even the general and familiar address of Monfieur has been involved in this change, and all men are accosted with the appellation of Citizen.

The late kings titles were Lewis XVI. by the grace of God king of France and Navarre. His subjects, in writing or speaking called him Sire; foreigners called him the Most Christian; and the pope gave him the appellation of The Eldest Son of the Church. The fon of the king of France, and heir to the crown, was fliled Dauphin. The prefent government does not

take any honorary appellation.

SECTION V.

CONCISE HISTORY OF FRANCE.

RANCE was anciently inhabited by a people called Celtæ, on whom the Romans first conferred the name of Gauls, when Julius Cæiar reduced their coun-

try into a Roman province.

Gaul continued in possession of the Romans till the subversion of the empire in the fifth century, when it became a prey to the Goths, the Burgundians, and the Franks, who fubdued, but did not extirpate, the ancient natives. The Franks, who gave it the name of Frankenland, or France, were a collection of feveral people inhabiting Germany, but more particularly of the Salii, who lived on the banks of the river Sale, and were more polished than their neighbours. The Salii had a law that they held in particular veneration, which was to exclude all females from regal power, or the inheritance of fovereignty. This law was preferved by the French, and known by the name of the Salic or Salique Law.

The Franks and Burgundians parcelled out the lands to their feveral leaders, who, at length, affumed independency, but still acknowledged the king as their nominal head. Hence arose those numerous principalities and states into which France was anciently divided; and from this fource originated those several parlia-

ments mentioned in the preceding fection.

Clovis.

Clovis, who began his reign A. D. 468, was the first Christian monarch of the Franks. From this period the French history becomes important; civil feuds; foreign wars, great enterprizes, and political events, fill the pages.

Prior to Charlemagne, the first race of the French kings had many bloody wars with the Saracens, who retaliated upon the posterity of the Goths and Vandals the barbarities used by those people to their predeces-

fors.

A. D. 800 Charlemagne, king of France, the glory of the age in which he lived, made himself master of Germany, Spain, and part of Italy; was crowned king of the Romans by the pope, and thus became emperor of the west.

Charlemagne, at his death, left his empire divided among his children, which proved fatal to his posterity. Soon after this the Normans, a fierce warlike people from Norway and Denmark, ravaged the kingdom of France; and, about the year 900, obliged the French to yield up Normandy and Bretagne to Rollo their leader, who professed himself a Christian, and married the king's daughter. This began the Norman power in France, which afterwards became a great misfortune to that nation; as from the Norman, William, who conquered England, the animosities between England and France had their origin, and the contests in general proved inglorious to the latter.

Paffing over the dark ages of the crufades, and their relative circumflances, we thall proceed to that period when Francebegan to extend its influence over Europe, which was in the reign of Francis I. cotemporary with

Henry VIII. of England.

This prince was a candidate for the empire of Germany, but loft the Imperial crown; Charles V. of the house of Austria, and king of Spain, being chosen in his stead.

Francis made feveral capital expeditions into Spain; but in one, which he undertook against Italy, he was defeated at the battle of Pavia, taken prisoner, and obliged to agree to the most humiliating terms, in order to obtain his release. His breach of the terms by which he procured his enlargement, occasioned continual wars against the emperor, till the death of Francis,

which happened in 1547.

At this period, however, France was rather in a flourishing condition; and Henry II. fon and successor of Francis I. was, in general, a very fortunate prince; for though he lost the battle of St. Quintin, against the English and Spaniards, yet he retook Calais from the former, who never after had any footing in France. In 1559 he was killed at a tilting match by the count of Montgomery. He was succeeded by his son Francis II. in whose reign the religious disputes began to break out in France. The Protestants were perfected under Charles IX. his brother and successor. These disputes occasioned two civil wars; after the conclusion of which, on St. Bartholomew's day, 1572, was perpetrated the horrid massiacre of the Protestants at Paris, which lest an indelible stain on the history of France. Upon this a confederacy, called the Holy League, was entered into by the Papists of France and Spain, for the extirpation of the Protestants.

On the demise of Charles IX. Henry III. king of Poland, succeeded to the kingdom of France in 1574, and taking the part of the Protestants against the leaguers, was affassinated by one Clement, a triar.

Henry, king of Navarre, of the house of Bourbon, succeeding, the Protestants obtained an edict, called the Edict of Nantz, 1589, in their savour, from Henry IV. whereby they were tolerated in the free exercise of their religion, in all parts of the kingdom except Paris; but still, the king observing a great majority of his kingdom zealous Catholics, found himself under a necessity of declaring himself of that religion; nor could this preserve him from the malice of the monks; for Ravillac, a friar, stabbed him to the heart in his coach, in the streets of Paris, the 14th of May, on

prefumption that he was still a Protestant. Lewis XIII. was but nine years of age at the time of his father's death. When he grew up he discarded his mother and her favourites, and chose for his minister the famous cardinal Richlieu, who, by his resolute and bloody measures, put a period to the remaining liberties of France, and to the religious establishment of the Protestants there, by taking from them Rochelle, in 1658. This put an end to the civil wars on account of religion in France, which had been attended with immense expence of blood and treasure, and caused conflagrations most direful in their consequences.

Richlieu, after having quelled, by a mafterly train of politics, all the confpiracies which were formed against him, died some months before Lewis XIII. who, in 1643, left his son, afterwards the samous Lewis

XIV. to inherit his kingdom.

During the minority of this prince the kingdom was rent by the factions of the great, and the divisions between the court and parliament. It was involved at once in foreign and dometic wars; but the queen-mother, Anne of Austria, having made cardinal Mazarine her first minister, he found means to turn the arnise even of Cromwell against the Spaniards, and to divide the dometic enemies of the court so effectually among themselves, that, when Lewis, on the death of that minister, in 1661, assumed the reins, he found himself the most absolute monarch that had ever fat upon the throne of France.

On the death of Mazarine he had the good fortune to put the domestic affairs of his administration into the hands of Colbert, who formed new fystems for the glory, commerce, and manufactures of France, all which were carried into execution with great affiduity. As an author of eminence very justly observes, to write the history of his reign would be to write that of all Europe. Ignorance and ambition were the only enemies of Lewis. Through the former he was blind to every patriotic duty as a king, and promoted the interests of his subjects, only that they might the better answer the purposes of his greatness: by the latter he embroiled himself with all his neighbours, and wantonly rendered Germany a difmal scene of devastation. He made and broke treaties for his convenience; and, at length, raifed a confederacy against himself of almost all the other princes of Europe, at the head of which was William III. king of England. This alliance he opposed for some years, till having provoked the English by his repeated infidelities, their arms, under the duke of Marlborough, and those of the Austrians, under prince Eugene, fullied all the renown he had obtained. His reign, which began splendid, ended miserably; and he died on the first of September, 1715, being fucceeded by his grandfon, Lewis XV.

This monarch, in the course of his reign, was stilled the Well Beloved, which he lost some years before he died. He was detested and despised by his subjects, for his shameful and licentious attachments, and illiberal treatment of some of the worthiest men of the kingdom. He died in the 64th year of his age, and 59th of his reign, A. D. 1774; and was succeeded by his grandson, Lewis XVI. who was born in 1754; and, in 1770, married Maria Antonietta, fifter to the empe-

ror of Germany.

This monarch began his reign with much popularity. In 1778, in order to affift the Americans in emancipating themselves from the government of the mother country, he commenced hostilities against Great Britain. In Holland he supported what was called the patriotic party against the stadtholder. In the war with Great Britain orders were given to all his ships not to molest Captain Cook, our celebrated navigator, who was on a voyage round the world.

This war, however, helped to derange the national finances; and in 1783 the difficulties were encreased by the Caiffe d'Escompte (a kind of national bank) stopping payment. Various means were devised by the minister of finance, (Calonne), to raise the money he-

the national encreased by bank) ftopifed by the money neceffary

ceffary for the exigencies of the state. The parliament of Paris (memorable for its patriotism on former occafions) refused to register the edicts for laying taxes on the people; and which, according to the conftitution of France, was necessary to render them effectual. Defeated by the steadiness of the parliament, the minister had recourse to another affembly called the Notables, who were convened, and met in February, 1787, but were as little subservient to his wishes as the parliament had been, and Calonne refigned. Necker succeeded him, and advised the calling the Tiers Etat, or three estates, (nobles, clergy, and commons) who had not met fince the year 1614. On the affembling of this body, after much contention about forms, the commons, joined by a few of the clergy and nobles, proceeded to public business. Their first act went to declare that the different taxes collected throughout the kingdom were illegal, because not voted by the people. The king observed their proceedings with aftonishment; and those about him advised him to refift these encroachments on his prerogative. Louis was, by nature, mild, gentle, and bene-volent. Stimulated by his advifers, he exerted his authority to suppress such proceedings: but the resolution and spirit of the affembly were superior to his own, and were accompanied with the plaudits of the people.

In July, 1789, M. Necker, from whose abilities the public expected the restoration of the national credit, received the royal orders to quit the kingdom. As foon as this was known, the capital was in confu-fion, the populace were filled with furious zeal; the French guards, when called forth to repel them, ranged themselves on their fide, feveral houses and public buildings were pillaged and destroyed, and among others the bastille, the mob killing all who refifted.

The confequence of these proceedings was the re-trenchment of the power of the king. The national affembly paffed refolutions limiting and defining the royal power, and the king, with apparent good will, acquiefced in their proceedings. In October following the foldiers on duty at Verfailles gave an entertainment to a corps who had lately arrived. In the course of the evening, warmed probably with liquor, it is faid, fongs were fung which had a tendency to rouze the foldiers to a love of the old government, and many of them took the national cockade out of their hats. News of this foon reached Paris. A mob of 30,000 or 40,000 foon collected, most of whom, it is faid, were women, and feizing arms wherever they could find them, they marched to Verfailles, addressed the assembly on the subject, and in the end affailed the palace, killed many of the guards, and the queen narrowly escaped the same fate.

The king the next day removed to Paris, and was conducted to the palace of the Thuilleries. In July, 1790, he took the oath appointed by the new constitution; and in this his conduct appears most deferving cenfure; for in June following, though guards furrounded the palace, he made his escape from Paris, accompanied by the queen and his two children, and fled towards the Netherlands; but they were stopped at Varennes, on the borders of France, by a post-master who recognized his person.

In April, 1792, in consequence of the warlike pre-parations and conduct of the emperor, who had perfonally met the king of Pruffia at Pilnitz, and it was faid had entered into a private league (in which other powers also were included) to invade France, war was declared against him. The queen was the fister of the emperor: the people suspected her to have influence over the king, and they believed, or professed to believe, that he used his authority contrary to the interest of the state and in conformity to the views of the emperor. Under these sentiments, in August following, M. Petion, the mayor of Paris, at the head of the fections of the capital, demanded the deposition of the king; and Louis, his queen, and two children, in the department of the North,

were placed as prisoners in the Temple. The nation was immediately declared a republic.

In the autumn of 1793, the duke of Brunswick, at the head of an army of 90,000 Pruffians, Heffians, and other German troops, entered France, having first published a manifesto declaring that he purposed marching to Paris to restore the ancient government. The eyes of all Europe were fixed on this army, and great events were expected from it: but after marching 100 miles into France, without being joined by the peafants as he had been given to expect, the duke found a retreat necessary, from the want of provisions, and with some difficulty he returned into Germany.

This unfuccessful attempt inspired the French with more fortitude, and towards the end of the fame year under General Dumourier, they invaded the Auftrian Netherlands. After a battle near the village of Jemappe, they entered Bruffels, took Antwerp, and were every where victorious. On the 20th of Ianuary, 1793, the king, after a public trial before the national affembly, which had been re-elected, and now took the name of the Convention, was fentenced to fuffer death, and on the following day was beheaded. On the 2d of October following the queen met the fame fate.

To describe the number of affassinations, murders, and executions, which have happened fince July, 1789, would be beyond the limits prescribed to this work, Many members of the affembly, and thousands of other individuals, have met the fate of their sovereign, and France has exhibited to Europe scenes which human wifdom could not forefee, and which appear too great for human reliftance.

In Feb. 1793, the French declared war against the King of England" and the "Stadtholder of Holland." In confequence the Duke of York, with a body of forces, was fent to the affiftance of Holland, which was invaded by the French forces; and they were foon compelled by the allied powers to evacuate all they had taken in the Austrian Netherlands. The campaign of 1793 was afterwards purfued with various fuccefs. In 1794, the internal commotions of France, having greatly subsided, they were enabled to bring into the field a body of forces which rendered them victorious by land over all their enemies, and Bruffels again fubmitted to them. The English fleet, however, under Lord Howe, gained a complete victory over the fleet of France on the 1st of June, after three successivo days engagement.

SECTION VI.

Containing a Geographical Description of FRENCH FLANDERS.

RENCH Flanders is bounded on the north by the Seine and German Ocean, and on the west by the latter. On the east it is bounded by the Austrian Netherlands, and on the fouth by Artois. It abounds in grain, vegetables, flax, cattle, &c.

Lifle, on the Deule, the capital of the French Netherlands, is strong and beautiful, and has one of the finest citadels in Europe. It contains likewise an hospital, an handfome exchange, a number of churches, and a confiderable manufactory of camblets, cloths, and other stuffs. There is always a strong garrison kept up in this town. The houses are of hewn stone and well built. The ftreets are ftraight, and crofs each other at right angles. In the year 1792 the Austrians besieged this town, and most of the houses were destroyed; but on the retreat of the Pruffians out of France they raifed the fiege.

Douay is a well fortified town, with a citadel, fituated on the river Scarpe, and the borders of Artois. It is of an oval form. By means of fluices the whole country round may be laid under water. Here are several churches, and a famous feminary and univerfity, In the new division of France, Douay is the chief town

Gravelines,

Gravelines, a fmall but strong town on the river Aa, about nine miles from Dunkirk, is well fortified, and has a harbour at the mouth of the river.

The Province of CAMBRESIS is about ten leagues long, and from five to fix where broadest. It is very

fruitful and populous.

Cambray, the capital of the province, is feated on the Scheld, 13 miles from Douay; it was taken by Lewis XIV. in 1677, and next year was yielded to him by the treaty of Nimeguen, together with the whole Cambresis. It is the see of a bishop. Before the revolution it was the see of an archbishop. The city is not only well fortified, but also defended by a citadel and fort. There is still a manufactory here of fine lawn, which takes its name from the city, and for which it has been long famous. The inhabitants are faid to be very lively and industrious, and to have a genius for the sciences.

Chateau-Cambresis is a small town, situated 14 miles from Cambray. It was formerly a fortified town, but now lies quite open.

FRENCH HAINAULT, 50 miles long, and 12 broad,

contains the following places:

Valenciennes, a large and populous town, on the Scheld, which runs through the town, with a good citadel, and other fortifications, 15 miles from Cambray. The manufactures are woollen stuffs, camblets, barracans, and a fort of fine lawns, called batifte, in

Condé, on the conflux of the Haine and Scheld, is strongly fortified. Quesnoy contains some manufactories of linen and stuff; Bava is famous for some Roman causeways; Maubeuge, on the Sambre, is well fortified; and Landrecy, on the Sombre, was yielded to Lewis XIV. by the treaty of the Pyrenees.

Charlemont is a little fortified town, which had its name from its fituation on a steep rock near the Maes,

and its founder Charles V.

Dunkirk is the most easterly harbour on that side of France which is next to Great Britain. It was originally a mean hamlet, confifting only of a few fisher-mens huts; but a church being built there, it was, from that, and its situation, which is a sandy eminence, called Dunkirk; Dun fignifying, in the old Gallic language, a hill; and Kirk being the old Flemish name for church. This place underwent a variety of repairs and demolitions from the year 960 to 1634, being then in the possession of the Spaniards, and the best harbour in Flanders. The French, entering into a treaty with England in 1655, assisted by Cromwell, attacked and took it; and it was put into the hands of the English, in consequence of a treaty between them and the French.
To the English it was of very great importance. They therefore improved the fortifications, and built a citadel; yet they kept it only four years; for, in 1662, two years after the restoration, Charles II. sold this valuable acquisition to France. After this it was fortified by Vauban in a very extraordinary manner, and at an immense expense to Lewis XIV. Being a place where the French privateers were stationed in time of war, the fortifications were demolished in consequence of the treaty of Utrecht in 1713.

In the year 1720, during a great storm, the sea broke up the bar, or dam, and restored to the Dunkirkers the ule of the harbour in a very confiderable degree. In the year 1740, when Great-Britain was engaged in war with Spain, Lewis XV. fet about improving the advantage which Dunkirk had derived from the storm in 1720, by restoring the works, and repairing the harbour. He erected new forts in the place of those which had been destroyed; and soon espoused the cause of Spain, and became a principal in the war against us. At the peace of Aix-la-Chapelle, in 1748, it was stipulated, that all the works towards the fea should be destroyed a second time; notwithstanding which, beforethe declaration of the war in 1756, the place was in as good a state of defence towards the sea, as it had been at any time during the war which was concluded

by the treaty of Aix-la-Chapelle. Thus the French always endeavoured to elude the demolition of this fortification. In the year 1793, the Duke of York, at the head of the British and Austrian forces, attempted to take it, but was obliged to make a precipitate retreat, with the loss of his artillery and a part of his army.

Mardyke, a village about three miles to the west'of Dunkirk, is celebrated on account of the noble canal erected there, with its fluice and basons, by order of Lewis XIV. after the peace of Utrecht: but, by virtue of an article of the treaty concluded at the Hague, in 1717, this canal hath been rendered, in a great meafure, useless.

The Government of METZ confifts of Meszin, French Barras, La Saare, and French Luxemburg. By the first of these is meant the territory round the city of Metz, in Lorrain, which was yielded for ever to the French by the treaty of Westphalia; together with other districts in the bishoprics of Metz, in which the only place worth mentioning is

Metz, fituated at the conflux of the Mofelle and Seille. It is the see of a bishop. Here are many churches, three citadels, and a Jewish synagogue, of

which people there are faid to be 3000.

The city is divided into the Old and New, both of which are large and handsome; but the latter excels the former, at least in respect to beauty. are confined to a particular quarter, and diftinguished from others by wearing yellow caps. In the new divifion of France, Metz is the chief town in the department of Mozelle.

French Barras is a part of the duchy of Bar, which has been long in the poffession of the French. It contains feveral small towns, of which Longwi and Jametz are the chief.

The French part of the duchy of Luxemburg was

acquired by the peace of the Pyrenees.

Thionville, the capital, is a fortified town, on the western bank of the Moselle, over which it has a beautiful bridge.

Carignanes is a town fituated on the Chier, fix miles

from Sedan to the west, and formerly called Ivoy. When Lewis XIV. conferred it on the count of Soiffons, of the house of Savoy, its name was changed to Carignan, after that of a town in Piedmont, of which the count's father was lord.

Saar-Louis, on the Saar, is one of the French bul-warks towards Germany. The peninfula on which it flands can be laid under water, and the ramparts are planted with three rows of trees.

The Government of LORRAIN is 100 miles long, near as many broad, mountainous in some places, but

in general fertile.

Nancy, the capital, fituated on the river Meurte, is divided into the Old and New Town, of which the latter is the largest and most beautiful. Here are several churches, an academy of sciences, a public li-brary, and an hospital. In the church of St. George is the monument of Charles the Bold, duke of Burgundy, who was killed while he was befieging this city in the year 1476. It is a bishop's see. In the new division of France Nancy is the chief town in the department of Meur. The other towns in this duchy are of no consequence.

The duchy of Bar is fruitful and well watered. It is included in one government with Lorrain.

Bar-le-Duc, the capital, is divided into the Upper and Lower, and contains several churches and an hofpital. It is a neat town, has a castle, and is noted for wines. In the new division of France Bar-le-Duc is the chief town in the department of Meuse.

Pont à Moufson is a confiderable town on the Mofelle, over which it has a bridge, about 15 miles from Metz and Nancy. The river divides the town into two parts. It contains feveral churches, with a feminary and an university.

Clermont

Clermont en Argonne, so called to diftinguish it from other cities of the same name, is the chief place of an earldom and bailiwick, which Charles III. yielded to Lewis XIII. king of France; and Lewis XIV. gave, in full property, to the prince of Condé.

Betwixt the Maes and Mofelle lie feveral lordships,

which take their names from their capitals, and are in-

dependent of both duchies.

In the Government of VERDUN, the only place worth noticing is Verdun, on the Maes, a large populous city, defended by a fine citadel, and otherwise well fortified. It is the fee of a bishop, and has many

The small Government of Tour, which is quite hemmed in by Lorrain, contains only one town, viz.

Toul on the Moselle, over which it has a fine bridge. Here are feveral churches, two hospitals, and a seminary, and the town, which was a bishop's see before the revolution, is well fortified.

The Government of ALSACE is bounded to the west by Burgundy and Lorrain, to the east by the Ortenau and Brifgau, to the fouth by Switzerland and Eligau, and to the north by the Palatinate. The foil is good, yielding grain, flax, fruit, tobacco, wood, wine, pafture, saffron, hemp, Turkish corn, oats, rye, barley, This country is separated from Lorrain by the lofty Wasgau mountains, upon which grow feveral kinds of large trees, and various species of thrubs, plants, &c. Game likewise abounds upon them; and their bowels contain filver, copper, lead, iron, antimony, cobalt, fulphur, coal, mineral waters, &c. The rivers which fall from these mountains, are the Leber, Cher, Andlace, Ergers, Sorr, Breuich, Motter, Seltz-back, Lauter, Queech, Ber, and Ill. Besides these, Alface contains several lakes, and is watered by the Rhine, which feparates it from Germany. The inhabitants are either Roman Catholics or Lutherans, and they speak the German language.

At the peace of Munster the emperor yielded up to France the town of Brifac, the landgravate of Upper and Lower Alface, the Sundgau, and the diffrict of the ten Imperial cities in Alface, with the fovereignty thereof; and, at the peace of Ryswick, in 1697, the emperor and empire ceded to France the perpetual fovereignty of Strafburg, and its dependencies, on the left fide of

the Rhine.

Strafburg, the capital of the whole country, and formerly a free imperial city, fituated on the rivers Ill and Breusch, about a quarter of a league from the Rhine, took the name of Strafburg from its standing near a highway, called, by the Latin writers of the middle age, Strata. It is a large and ancient city. The bridge over the Rhine is near an English mile long. Though the city may be laid under water, it is well fortified, and has a regular citadel. The cathedral is the principal structure in Strasburg that merits observation. The ornaments presented to this church, by Lewis XIV. cost an immense sum. Its steeple is justly reckoned one of the highest in Europe. The great bell in it weighs above ten tons; and another, called the filver bell, as being mostly of that metal, two tons, and 600 weight, which is rung only twice a year. In this church is likewife a large clock, which exhibits the various motions of the planets.

The other public buildings of any note are the epilcopal palace, the arfenal, the theatre, and the hospitals. They have a fine physic-garden, and an anatomical the-

There are also here, a Lutheran university and gymnafium; a royal fociety, founded chiefly for the natural history of Alface; and many churches. Of the members of the city council, one half are Lutherans, and the rest Roman Catholics. In the new division of Frame, Strafburg is the chief town in the department of Bas Rhin or Lower Rhine.

Hagenau, is fituated on the Motter; Weiffenburg, on the Lauter, contained, before the revolution, an abbey of Benedictines; Landau, on the Queech, is strongly fortified; Fort Louis, on an island in the Rhine. is a handsome little town; Andlau is fituated on a river of the same name; and Zabern, another town, is situated on the Sor.

Colmar, on the Ill, the capital of Upper Alface, formerly one of the ten Imperial cities in Alface, is strongly fortified. It is inhabited principally by Lutherans. It is a bishop's see, and, in the new division of France, Colmar is the chief town in the department of Haut Rhin or Upper Rhine.

New-Brifac, a finall town, built by Lewis XIV. after the peace of Ryswick, about half a league from the Rhine, opposite to Old-Brifac, is strongly fortified, and so regular, that the four gates of the town may be

feen from the great market-place.

The government of Alface comprehends also the Sundgau, i. e. the fouthern district, fo called in oppofition to the Nordgau, or northern district. This territory is about 12 leagues in length, and near as much in breadth. Most of the inhabitants speak German, and are Papists. This country, though mountainous, produces a great deal of corn and wine, and is watered by the Ill or Ell. At the peace of Munster, in 1648, it was ceded, by the emperor and empire, to France: There are no places in it worth mentioning.

The Government of FRANCHE COMTE is bounded to the fouth and west by Champagne and Burgundy, to the north by Lorrain, and to the east by Switzerland and Mumpelgard, being 30 leagues long, and 20 broad. It is in some parts flat; in others hilly; produces grain, wine, hemp, and pasture; and abounds in cattle, copper, iron, lead, filver ore, stone quarries, mineral waters, falt springs, &c.

Befançon, the capital, is feated on the Doux, which divides it into the Upper and Lower Town. Here are feveral hospitals, palaces, fountains, an archbishopric, and an university. The university has professors of divinity, law, physic, and the languages. The city is well fortified, and defended by two citadels. In the new division of France, Befançon is the chief town in

the department of Doubs. Dola is a town on the river Doux, about eight leagues fouth-west from Besançon. There are several fine streets here; but it was more considerable before the taking of Befançon, when it was the capital of the country. In the new division of France, Dola is the

chief town in the department of Jura. Salins, in Latin Saline, is a pretty large town, which takes its name from its falt fprings, and stands fix leagues fouth from Befançon, and as many east from Dola. The falt fprings here are in vast caves under ground; whence the water is raifed by cranes, pumps, and other engines, conveyed into refervoirs, and from thence into iron kettles, where it is boiled into falt. The waters are supposed to acquire their saltness by running through mines of falt, and not to come from the sea. A great deal of this falt is fent into Switzerland in casks; and the rest, by means of wooden moulds, is made into cakes and loaves of three or four pounds weight, and laid up in the warehouses, suntil they are fold. Vast quantities of wood and coals are required for making the falt, and the falt kettles. In the neighbourhood are several forts, and quarries of marble, alabaster, jasper, &c.

C H A P. XIV.

S P A I N.

SECTION I.

Ancient Names, Situation, Extent, Boundaries, Climate, Soil, Mountains, Rivers, Vegetable and Animal Productions, &c. &c.

PAIN formerly included Portugal, and was known to the ancients by the names of Iberia and Hefperia, as well as Hifpania. It is fituated between 36 and 44 degrees of north latitude, and between 3 and 10 degrees west longitude; being 700 miles in length, and 500 in breadth.

The air of Spain, excepting during the equinoctial rains, is dry and ferene; but it is exceffively hot in the fouthern provinces, in June, July, and August. The vast mountains that run through the country for very beneficial to the inhabitants, by the refreshing breezes that come from them in the fouthernmost parts; tho' those towards the north and north-east are, in the winter, very cold, and, in the night time, make a traveller shiver.

The foil of Spain is, in general, good and fertile. If it is not fo fruitful in corn as might be expected, it is owing to the indolence of the inhabitants in the neglect of tillage.

In this kingdom the mountains are remarkable for their numbers and height. The chief and highest are the Pyrenees, being near 200 miles in length, extending from the Mediterranean to the Atlantic Ocean, and dividing Spain from France. Near Gibraltar stands the celebrated Mount Calpe, now called the Hill of Gibraltar, and, in former times, one of the pillars of Hercules. Montserrat is worthy the attention of the curious traveller, as one of the most singular in the world, for situation, shape, and composition. As it is like no other mountain, so it stands quite unconnected with any; though not far distant from some that are very losty. There is a samous monastery and chapel on this mountain, dedicated to the Virgin Mary, and resorted to by a great number of pilgrims. It is inhabited by monks of several nations, who entertain all that come hither, out of devotion or curiosity, for three days, gratis.

The principal rivers of this kingdom are the Duero, the Tagus, the Guadiana, the Guadalquiver, or Surio, and the Ebro.

Many parts of Spain produce, almost spontaneously, the richest and most delicious fruits; as oranges, lemons, prunes, citrons, almonds, raisins, figs, peaches, pomegranates, &c. The wines are in high request among foreigners. The sides of the mountains are cloathed with rich trees, fruits, and herbage, to the tops; and Seville oranges are noted every where. No country produces a greater variety of aromatic herbs, which renders the taste of their kids and sheep so exquisitely delicious. The kingdom of Murcia abounds so much with mulberry-trees, that the produce of its soil sometimes amounts to 200,000l in the course of a year. It may be justly observed, upon the whole, that sew countries in the world owe more than Spain does to nature, and less to industry.

The Spanish horses are generally black, or of a chefnut colour; their ears are well set, their manes long and flowing, their eyes full of sire; and they possess activity and spirit. Those bred in Andalusa are esteemed the finest; and, indeed, they are preferable for war, show, and the menage. The mules of Andalusa are much esteemed. The Spaniards, in general, make use of mules, riding or travelling. They eat little, and are sure footed. Sheep abound; and goats

are numerous, particularly the Chamois, or Shamoy goats. The wild bulls have much ferocity. Wolves are the chief beafts of prey that pefter Spain, which is well flored with all the game and wild fowl that are to be found in the neighbouring countries already defcribed. The Spanish feas afford excellent fish of all kinds, especially anchovies, which are here cured in great perfection. Honey, falt, filk, cotton, and wool in particular, abound here; and some parts of the country produce rice and sugar canes. Spain is much infested with locusts.

There are falutiferous springs in some parts, and waters possessed of extraordinary healing qualities.

SECTION II.

Grand Divisions of the Kingdom of Spain, with ar particular Description of each Division.

SPAIN is divided into 14 grand divisions or provinces, which we shall describe in the following order.

Galicia, which was anciently a kingdom, has the Ocean on the west, Asturias and Leon on the east, Portugal on the south, and the Bay of Biscay on the north. It is of a square figure, 120 miles each way, and very mountainous. Compostella, or St. Jago de Compostella, the capital, an archbishop's see, is situated betwixt the rivers Tambra and Ulla, having a strong castle and walls, and containing several good streets, squares, monasteries, hospitals, colleges, and churches. The cathedral is a most magnificent structure, and contains the body of the apostle James the younger, the teutelary saint and patron of Spain. There is a prodigious concourse of pilgrims always at this place, to pay their devotions to the shrine of the saint. Here are all o an university, a court of inquisition, a sovereign court, two annual fairs, and a market every week. The chief of the hospitals is that for the reception of pilgrims.

Lugo, anciently called Lucus Augusti, is the see of a bishop, suffragan to St. Jago. Here are many warm baths, some of which are only lukewarm, and others boiling hot.

Corunna, a fea-port town on the Bay of Biscay, called by our feamen the Groyne, is a place of confiderable trade, having a spacious harbour, with walls and forts, several convents, chapels, churches, and hospitals. In its neighbourhood is a quarry of jasper.

Orense is an episcopal city, on the Minho. The boiling springs of this place are salutary in several dis-

Mondonnedo, 16 leagues from the sea-coast, is the see of a bishop; Betanzos, on the Mandeo, has a good harbour. Finisterre is an inconsiderable town near the cape of that name; and Montsorte, on the Lemos is a town belonging to the count of Lemos, who has a stately palace here. On the top of a neighbouring mountain is a spring that ebbs and shows as the sea does, and is alternately hot and cold.

Vigo is a town on a small bay, where, in 1702, the English and Dutch burnt the Spanish plate sleet; and Ferrol, two leagues from Corunna, is an agreeable town, with a fine harbour, where several Spanish men of war are usually at anchor.

The province of ASTURIAS, which is a principality, and gives title to the hereditary prince of Spain, his Galicia on the west, the Bay of Biscay on the east, the sea on the north, and Old Castile and Leon on the south.

Cafcar Quelles, fouth. It is 110 miles long, and 54 broad; fertile, but thinly inhabited.

Oviedo, the capital, fituated 20 miles from the Bay of Biscay, is the see of a bishop. Here are an university, several convents, chapels, churches, and hospitals; and here Pelayo, and the first Christian kings, after the conquest of Spain by the Moors, resided.

The other places in this province are inconfiderable.

The Lordship of BISCAY has the Bay of the same name on the north, Old Castile on the fouth, the Afturias on the west, and Navarre on the east. mous for its oranges, lemons, and apples, of which good cyder is made. The people, who are the best foldiers and failors in Spain, derive their origin from the Celts, whose language, now called the Biscayan, they speak, and which nearly resembles the Welch. This province is divided into three parts, viz. Bifcay Proper, Guipuscoa, and Alaba. In Biscay Proper the principal places are

Bilbao, vulgarly called Bilboa, the capital of the province. It is large and populous, and pleafantly fi-tuated on the river Ybaicabal, where it has a good port, and a great trade in iron, wrought and unwrought

wool, faffron, and chefnuts.

Duraugo, 15 miles fouth-east of Bilbon, has a great iron manufactory.

In Guipuscoa are

San Sebastian, a town, and noted port on the Bay of Biscay. It is handsome, well fortified, and has a good harbour and citadel; carrying on also a confiderable trade in iron, steel, and wool; and enjoying a pleasant prospect of the sea on one side, and the Pyrenean Mountains on the other. Here is a company which trades to the Caraccas.

Fuentarabia, a little town on the utmost borders of Spain, next to France, has a pretty good harbour, and is fortified both by nature and art. The Island of Pheafants, in the river Bidaffoa, nine miles from Fuentarabia, was famous for the peace of the Pyrences, concluded in 1659, between Maria Therefa, Infanta of Spain, and Lewis XIV.

Mendragon is celebrated for its mineral fprings; Solmas for its falt springs; and the Sierra de Adrian in this district, is the highest mountain among the Py-

The diffrict of Alaba contains no place worthy of mention but Vitoria, which is furrounded by a wall, contains many magnificent monasteries, particularly that of St. Francis, and has a great trade in iron, steel, wool, wine, and fword-blades.

The Province of UPPER NAVARRE, fo called to diftinguish it from Lower Navarre, which belongs to France, has Arragon on the fouth, the Pyrenean Mountains on the north and cast, and Old Castile and Bilcay to the west; being 80 miles long, and 75 broad. It abounds with cattle, game, honey, oil, wine, some grain, a few medicinal waters, and some minerals.

Pampelona, the capital, situated at the foot of the

Pyrenees, and walled, is the fee of a bishop, subject to the archbishop of Burgos. Here are an university, founded in 1608, two castles, several churches, and many convents. Two high roads lead from this city, ever the Pyrenees, to France: one to Bayonne, through the valley of Batan; and the other, which is the best, to St. Jean pie de Port, by the way of Taraffa.

Tafalla, on the Cadaço, is a large city, containing an university, and defended by a castle.

Tudela, a city pleasantly situated on the banks of the Ebro, is walled, and has feveral churches and convents, with a stately bridge over the river.

Estella is a handsome town on the river Ega. name fignifies a star, having been built to guide, like a ftar, the weary pilgrims, passing through these wild mountains in their way to Compostella.

Cascantei is a small city on the banks of the river Quelles, in the district of Tudela. Its Roman name was Cascantum; and some coins of Tiberius are still extant, inscribed Muiceps Cascantum.

ARRAGON, which was anciently a kingdom, has the Pyrenees on the north, Valentia on the fouth, Catalonia on the east, and Castile and Navarre on the west; being 170 miles long, and 110 broad.

Saragoffa, the capital, fituated on the banks of the Ebro, almost in the heart of the province, is a large, populous city, standing in a pleafant fertile plain, watered by four rivers, and containing many convents and churches; but the cathedral is an old irregular build-The archbishop has a considerable revenue. The university here was founded in 1744. A great many persons of quality reside in this city, which is the seat of the court of royal audience for Arragon, and of the governor and captain-general. Of the churches, that of Our Lady of the Pillar, and of the convents, that of St. Francis, are the most remarkable. Here are two ftately bridges over the Ebro; and the walls of the city, though old, are ftrong and lofty.

An ingenious, as well as facetious traveller, who made the tour of Spain, a short time since, declares, that though Saragoffa is represented, by some people, as a trading city, he faw no appearance of any, fuch thing. On the contrary, the people were all lounging about with their arms across, the warehouses empty, and not a fingle skiff to be seen on the Ebro.

The palace of the inquisition is in the center of the

city. The walls, which are of a deep yellow, thick, and flanked with towers, appear to be an hundred feet

The city gates are shut as soon as it is dark; but, for the value of fixpence, they fly open at any hour.

To judge of the people of the higher class in the province of Arragon, by the first interview, they appear humble, are obsequious, inquisitive, and fond of garlic; conversant with heraldry, vain of their family arms, and eager to shew them.

There are two manufactories here; one of brandy,

the other of hats, which are excellent.

The monks of St. Bernard retail Muscadel wines. Their gardens are well furnished with tables, surrounded by Bacchanalians.

Daroca, a confiderable town, 48 miles from Saragoffa. is walled, and fituated on an eminence, amidst a fertile and delicious plain. Here are feveral convents, chapels, squares, and fountains; and in the neighbourood is a large cave, of which they tell many wonders.

Near Tarazona, a confiderable town on the little river Queiles, is Mon Cayo, anciently Mons Caci, which name the Spaniards pretend it had from the tyrant Cacus, who was killed by Hercules. The town is well built and walled, drives a good trade, and is the fee of a bishop, suffragan to Saragossa.

Boria, a fmall but pleafant city, near Mon Cayo, is walled, and has a castle, with several convents.

Xaca, at the foot of the Pyrences, a well built walled town, has a strong castle, and is the see of a bishop. Calatayud, 45 miles fouth-west of Saragossa, is pleafantly fituated, has a good air, ftrong walls, many convents, and is celebrated for its fine tempered fteel.

Barbaftio is fituated on the Vero, over which it has a ftately bridge. It stands in a sertile plain, is surrounded by a wall, contains several convents, and is the see of a bishop.

CATALONIA has the Mediterranean fouth and eaft, the Pyrenees north, and Arragon and Valencia west. It is 150 miles long, 120 broad, is well watered, has a fertile foil, and a temperate air. The principal places are the following:

Barcelona, the capital, a well fortified city, is fituated on the Mediterranean, between the rivers Llobregat and Befos, at the foot of the mountain Monjouy, on which are feveral forts, commanding the town and harbour. The latter of these rivers is spacious, deep, and fafe; and the trade carried on by it confiderable, Here

are many good streets, houses, churches, colleges, hospitals, fountains, gardens, and convents, with an univerfity, an academy of arts and sciences, a court of inquisition, the court of royal audience for Catalonia. in which the governor and captain-general prefide, and the fee of an archbishop. The cathedral is large and magnificent; and there are feveral antiquities about the city. Near the cathedral is a church, where provisions are distributed every day to a certain number of poor. The territory round it is extremely fertile and delightful.

Tarragona, anciently called Tarcon and Tarraco, stands near the sea, 50 miles from Barcelona to the fouth-west, at the mouth of the little river Francoli, where it has a fafe and convenient harbour for small ships, and a good trade. Here are an university without the town, and the see of an archbishop. One of the chief divisions of Spain was anciently called, from this city, Tarraconensis. The climate here is so temperate, and the foil fo rich and warm, that the trees bear fruit, and bloffom, in the middle of winter.

Lerida, on the Segre, an ancient and strong city, contains several convents and monasteries, an univerfity, a court of inquisition, and is a bishop's see.

Tortofa, on the Ebro, is an ancient walled city near the sea, and has a bridge of boats over the river, with a strong castle and other fortifications, an university, and several churches and convents. It is the see of a bishop, gives the title of marquis, and carries on a good trade in filk and earthen-ware.

Terrofis, near Lerida, has an air which is remark-ably falubrious, and particularly in cases of infanity; fo that it is common, all over Catalonia, to fay to a paffionate person, "You must be sent to Terrosis for a cure.

Cardona, a handsome town near the river Cardonera, is well fortified; and near it is a mountain of falt, which yields a great revenue to the duke, who takes his title from the town, of which he is lord, and one of the richest grandees of Spain.

Balamos, a little town on a bay of the fea, near Cape Palafugel, with a good harbour, is fortified, has

a citadel, and gives the title of count.

Girona, anciently Gerunda, a confiderable town in the east part of the province, stands near the conflux of the Ter and Onhar; has ftrong old walls, and other fortifications; with many convents, and an university; being also the see of a bishop, suffragan to the arch-bishop of Tarragona. The neighbouring country is reckoned the most fertile in Catalonia. The town carries on a good trade, and gives the title of count.

Roles, a strong town, with a good harbour, on a bay of the fea, owes its name and origin to the ancient town of Rhoda, which flood a little way off, near Cape

Cruz.

Peucerda, a large town, and the capital of the earldom of Cerdagne, is fortified in the modern manner, and stands betwixt the rivers Carol and Segre, at the foot of the Pyrenees.

Urgel, originally Orgia and Orgelium, an ancient city, earldom, and bishopric, not far from the Pyrenees, is well walled, has an ancient castle, and several convents, and its territory is extremely fertile.

LEON has the Asturias on the north, Estremadura onthe fouth, Galicia and Portugal on the west, and Old Castile on the east. It is 180 miles long, and upwards of 80 broad; has a fruitful foil, abounds in cattle and game, and contains several quarries of stone and mines of jewels. The dukes of Negera are hereditary governors, and the chief places are the following:

Leon, the capital of the province, fituated 165 miles north-west from Madrid, at the soot of the Alturian mountains. It stands in a pleasant country, is well built, and contains many convents and chapels, with feveral hospitals, and one of the finest cathedrals in Spain, of which the king is always a canon, as well as the marquis of Aftorga. The bishop is immediately subject to the pope. This city was the first of any note that was re-taken from the Moors.

Salamanca is an ancient, large, rich, and populous city on the river Tormes. Here is an university, the greatest in Spain; likewise many palaces, squares, convents, churches, colleges, chapels, and hospitals, The bishop of this city is suffragan to the archbishop of Compostella. A Roman way leads from hence to Merida and Seville; and there is an old Roman bridge of stone over the Tormes. Of the colleges in the university, four are appropriated to young men of quality; and near it is an infirmary for poor fick fcholars. The students are dressed in black, and have their crowns shorn. The most beautiful part of this city is the great square. The houses are three stories, all of equal height, and exact fymmetry, with iron balconies, and a stone balustrade on the top of them. The lower part is arched, which forms a piazza all round the square of 293 feet on each side. Over some of the arches are medallions, with bufts of the kings of Spain, and of feveral eminent men, in stone basso-relievo; among which are those of Ferdinand Cortez, Francis Pizarro, Davila, and Cid Ruy. In this fquare the bull-fights are exhibited for three days only, in the month of June. The river Tormes runs by this city, and has a bridge over it.

Ciudad, or Cividad-Rodrigo, a city on the Aquada, had its name from Don Rodrigo Gonzales Giron, who rebuilt it about the year 1202. It is the fee of a bishop, suffragan to the archbishop of Compostella, has a fine Gothic cathedral, and contains many inns, which are better than any in Portugal, and superior to most

in Spain.

Zamoro, on the Douro, is fituated in a fertile country, well fortified, has a noble bridge, is the fee of a bishop, and contains many churches, convents, and

Astorga, on the Astura, has good fortifications, is

the fee of a bishop, and gives title to a marquis.

Torto, on the Douro, is pleasantly fituated. There are a stately stone bridge here over the river, many convents, feveral chapels, churches, and hospitals. Here the famous leges taurice were confirmed, in a diet held by Ferdinand and Isabella.

Parencia, pleafantly fituated on the river Carrion, was destroyed by the Romans; but rebuilt by Sancho the Great. Here are many convents, churches, and chapels, and the fee of a bishop, fuffragan to the arch-

bishop of Compostella.

Medina del Rio Secco, or the city of the Dry River, so called to distinguish it from Medina del Campo, in the same province, is a flourishing town, fituated in a spacious fruitful plain, and contains a strong castle, with several churches, chapels, and hospitals; and is a

duchy belonging to the admiral of Caffile.

Medina del Campo contains many convents and churches, with feveral hospitals, carries on a good trade,

and has peculiar privileges.

Estremadura has Portugal to the west, New Castile to the east, Andalusia to the fouth, and Leon to the north. It is 130 miles long, 110 broad, well watered, and the foil to remarkably luxuriant, that it is justly deemed one of the most fruitful places in Europe. It contains the following places:

Merida, which was built originally by Cæsar Augustus, and is situated on the Anas, over which it has a bridge, is small, but well fortified, and still retains

some fragments of its ancient splendor.

Badajoz is the largest city in the province, and well fortified. Here are a fine old Roman bridge of stone, fome handsome streets, churches, monasteries, and two modern castles, with the see of a bishop, suffragan to the archbishop of Compostella.

Plazencia, a beautiful well built city, and bishop's fee, on the banks of the little river Exerte, takes its name from the delightfulness of its situation, in the

midft of that most delicious spot called La Vera de Plazencia, or the Orchard of Plazencia, which is diversified with beautiful feats, villages, gardens, and groves of the finest citron, lemon, orange, and fig-trees. Here the emperor Charles V. having refigned all his dominions, retired into the famous monastery of St. Justus, where, after living two years a recluse, he ended his days.

The city is well built, handsome, defended by

strong walls, and has a castle.

Alcantara is a strong town, situated on the Tagus, over which it hath a magnificent bridge, built in the days of the emperor Trajan, and belonging to the knights who take their name from it.

Truxillo is detended by a ftrong citadel, and celebrated for being the native place of Francis Pizarro, the

famous conqueror of Peru.

OLD-CASTILE, formerly a kingdom, was fo called, because it was recovered from the Moors sooner than New-Caftile, which bounds it on the fouth, as Afturia and Bifcay do to the north, Leon to the west, and Navarre and Arragon to the east. It is 120 miles long, about 100 broad in its greatest extent, has some mountains, but, in general, is very fertile. It is well watered, and contains,

Burgos, the capital of the province, which has fome handsome squares, public buildings, and palaces. The cathedral here is one of the noblest and richest in Spain. There are many elegant fountains to supply the city with water, the inhabitants of which are faid to be more industrious, and to carry on a greater number of trades and manufactures, than is common in other great cities of Spain. The walls are ancient but ftrong. Among the hospitals is one for pilgrims. On the north fide, on an almost inaccessible rock, stands the citadel. The city, which was built in the ninth or tenth century, on the ruins of Auca, claims the precedence of all others in the cortes or parliament of

Valadolid is a large populous, walled city, pleafantly fituated on the banks of the river Pifuerga. Here are a great number of convents, hospitals, squares, colleges, and churches, with an university, the next in dignity to that of Salamanca, and the fee of a bishop, suffragan to the archbishop of Toledo. Here are also a fine royal palace, an academy, a court of inquifition, a high court of justice, several manufactories, and a considerable trade.

Monasterio de las Rodillas is famous for its admirable Castilian cheefe.

Avila is a confiderable city, having an univerfity, and being the see of a bishop, suffragan to the archbishop of St. Jago. It is particularly famous for having given

birth to St. Therefa. Calahorra, or Calaguris, on the Ebro, is the fee of a bishop. This place is famous in history for the fiege it formerly fustained against one of Pompey's generals, till the brave citizens were forced to eat each other; whence the proverbial expressions, Famines Calagurina

or the Famine of Calaguris.

No. 80.

Segovia is a very ancient, large, opulent, populous, and handfome city, on the river Atyada. Its wealth arises not only from the great number of noble families who make it their chief refidence, but much more from its large commerce and manufactures, especially those of cloth and paper. A great deal of wool is also exported from hence. Here is the principal mint of Spain, a royal palace, with an univerfity and a bishopric. The Roman aqueduct here is a most amazing fabric. It was built by the emperor Trajan, and confilts of two rows of lofty arches, carried from one mountain to another, and conveys water all over the city. Notwithstanding it has stood so many centuries, it still retains its strength and beauty: so great were the art and skill of the Romans in building, beyond what the following ages could boaft of. The royal palace is mounted with cannon, and has a garrison.

province contains the following places: Madrid, the capital of the whole monarchy of Spain, and the refidence of the court, flands in the center of a large plain, furrounded with mountains, and in the

NEW-CASTILE, which was formerly a kingdom, has

Old-Castile on the north, from which it is parted by

ridges of mountains; Estramadura on the west; An-

dalufia on the fouth; and Valencia and Arragon on

the east. It is 200 miles long, and, in the widest place,

190 broad, well watered, fertile, and has a good air.

The inhabitants speak the purest Spanish; and the

very heart of Spain, on the banks of the little river Manzanares, which is always very low and shallow, except when it is swelled by the melting of the fnow on the mountains. The streets here are wide, strait, and handsome, and adorned with several fine fountains: the houses lofty, but built of brick, with lattice windows, excepting those of the rich, who have glass in their windows; only during the fummer heats they use gauze, or some such thin stuff, instead of it, to let in the fresh air. There are two stately bridges here over the Manzanares, feveral beautiful squares, many magnificent churches, convents, palaces, and hospitals. Among the last is one for all nations and distempers, with a large revenue. Around the placa-mayor, or grand square, are piazzas, with houses all uniform, and a continued line of balconies, for viewing the bullfights, and other public shews exhibited in it. The royal palace which flands on the west side of the town, on an eminence, is spacious and magnificent, confifting of three courts, and commanding a fine prospect. The compass of the whole town is computed at about nine miles, and the number of its inhabitants at about 150,000. It is well supplied with provisions of all kinds at reasonable rates; and the court, with the refort and refidence of the quality, and the high colleges and offices that are kept here, occasion a brisk trade and circulation of money. There are three royal academies here; one for the improvement of the Spanish language, another for history, and another for

We have been favoured with the following remark by a correspondent who made the tour of Spain within

thefe two years.

Madrid is built upon a fandy foil. The dust flies in fuch clouds, that, unless fome friendly showers fall, travellers, on their arrival, are almost smothered with duft, and can hardly fee to diftinguish their horses. Through a long spacious street, parrots and monkies are to be seen at almost every window. The ringing of bells, the immense variety of steeples and spires, houses seven or eight stories high, and the beautiful gate called Alcala, give an air of dignity and confequence to the entrance into Madrid.

The environs of the capital are very pleafant, and contain feveral royal feats, among which are the fol-

lowing:

Ever fince the kings of Spain have deferted Buen-Retiro, the houses have been falling to decay, the springs dried up, the fountains choaked with rubbish, and nothing grows in the gardens. The grottos, clumps, and arbours, are all destroyed. One statue is remaining, which is that of Philip II. admirably executed; though it ferves only to perpetuate the memory of a deteftable

The palace of Florida is enlivened by the paintings of fome eminent masters. The edifice is rather heavy and confined. The gardens are laid out in the form of an amphitheatre, and encircled by the springs of the river Manzanares, and the hills that rife in clufters over the grounds, round Madrid, Florida is remark. able for its cascades, formed by the springs and melted fnows that flow from mountains. The air here is cold and piercing. Fruits do not ripen; roses are without odour; the trees are flunted; pinks and carnations scarcely blow, or come to any colour, even so late as the close of August. The lands round this palace are uncultivated, yet they are in full heart, and, to become

Though the king is fond of hunting, he feldom lies These apartments, that were recesses of galat Pardo. lantry to former princes, are now converted into a chapel.

The park and gardens of the Escurial are of immen's extent. The pantheon is a subterraneous chapel, where the kings, queens, and royal offspring of Spain, are interred. By the light of a lamp, that burns continually, and blackens every thing, may be feen the tombs and baffo-relievos. No perfon of ordinary rank is allowed to moulder in this vault; it is the fepulchre of royalty. This celebrated place cost Philip II. upwards of two millions and an half alone.

The village, whence the Escurial takes its name, is called *Escorial*, a word derived from *Escoria*, fignifying "Dross of metal," because formerly iron mines were, wrought at this place. In the church are several admirable paintings. The water of the Escurial is esteemed excellent. It has neither tafte or fmell, is foft and limpid, quickly hot and cold again. The meat and vegetables boiled in it are foon foftened; and the linen washed

in it acquires a better colour.

In the Cafa de Campo is an equestrian statue of Philip IV. much admired. A glorious tree is preserved here. Never was one more beautiful, or that formed a richer or more extensive shade. It is ascended by a ftaircafe and much reforted to by the youth of both fexes on holidays.

The palace of Sarfuela might be rendered an enchanting fpot; but the park, gardens, and buildings are fuffered to run to decay. The cause affigned is,

the place is supposed to be haunted.

La Grange, otherwife called St. Idelphonfus, coft Philip IV. immense sums in building and beautifying; but is now falling to decay. Excellent knives and razors may be had here. Fine looking-glaffes are made also in this place. The manufacture was established by an Irishman, who invented a machine to polish 48 plates together. He was imprisoned some years, instead of

being rewarded for his ingenuity.

The climate of Madrid is one of the finest in the world. In almost every month of the year the people may eat strawberries, fit under verdant shades, and gather rofes. Sometimes, indeed, there are tharp north winds, that chill the air, ftrip the trees of their foliage, featter the flowers, and blow down the fruits: but, in return, these winds break and disperse the clouds, clear up the horizon, brighten the day, and redouble the splendor of the sun. Nothing surpasses the beauty of the night at Madrid. The sweetest slowers diffuse their fragrance. The whole atmosphere is perfumed. In all the squares under every balcony, an singing, and playing on the guittar or flute.

The beauties of prospect, and delicious fruits, constitute the whole merit of Aranjuez. Here is a fine statue of Venus. The attitude, animated looks, and beautiful form, bear the strongest resemblance to life.

Toledo, on the Tagus, 36 miles fouth of Madrid, is an ancient, large, well fortified city. The alcazor, or royal palace, built by Charles V. is fituated on a steep hill near 500 feet above the Tagus, and commands a very fine prospect over the city and all round the country. A manufactory of fword-blades is carried on here on the king's account only, in which all the fword, hanger, and dagger blades for the army are made. Toledo is fituated in a ferene air. The churches, convents, and hospitals are numerous. The bridges are three; and here are a court of inquisition, and an university. Toledo is one of the richest bishoprics in Spain.

Alcala de Henares is a town on the river Henares, belonging to the archbishop of Toledo, and containing an univerfity, in the church of which cardinal Ximenes lies interred. Here the first Polyglot Bible was begun, compleated, and printed under the patronage and direction, as well as at the charge, of the prelate abovementioned.

Guadalaxara, a town on the Henares, has a manufacture of cloth.

Talavera la Reyna, a handsome town on the Tagus, used to be a part of the dowry of the queens of Spain, whence it acquired the epithet of La Reyna. is a manufacture of earthen-ware at this place.

VALENTIA, which was anciently confidered as a kingdom, has, to the fouth and eaft, the Mediterranean Sea; Arragon and Catalonia to the north; and Murcia and New Castile to the west. It is 200 miles long, 80 broad, well watered, has a temperate ferene air, a foil remarkably fruitful, and contains the following places:

Valentia, 180 miles fouth east from Madrid, is fituated on, and has 5 bridges over, the river Guadalquiver. It is a large, populous, trading city, and has a port within two miles of it. It is the fee of an archbishop, and contains a tribunal or inquisition, a fovereign court of judicature, an univerfity, and a woollen manufactory. Almost every house has a deep well; and here is a grand common sewer, by which the filth of every house is carried off under ground.

Segorve, or Segorbe, an ancient and pleafantly fituated city, on the banks of the Morviedro, gives the title of duke, and is the fee of a bishop, fuffragan to

the archbishop of Valentia.

Alicant, a famous city and fea-port on the Mediterranean, has a commodious harbour, from whence a great quantity of delicious fruits, with excellent red and white wine, foap, and anife, is exported. It has alfo, for its defence, ftrong walls, baftions, and a caftle.

Denia has a convenient harbour, with a castle and

watch-tower. It is also well fortified.

La Mata contains a confiderable falt-work.

Morviedro is a finall town, fituated on the fame fpot where the ancient Saguntum flood. The remains of a Roman amphitheatre are still to be seen here.

ANDALUSIA comprizes the three ancient districts of Seville, Cordova, and Jaen. It is bounded by Eftremadura and New Castile on the north; by the Mediterranean Sea, and Straits of Gibraltar, on the fouth; by Portugal on the weft; and by Granada and Murcia on the east. It is 240 miles long, 130 broad, well watered, populous, opulent, and fertile; but the heat in fummer is excellive. That part called the kingdom of

Seville contains the following places:

Seville, the capital, fituated on the river Guadalquiver, 200 miles fouth-west from Madrid, was anciently the capital of Bætia; and from Julius Cæfar, who beautified and enlarged it, was called Julia Romula; but fubfequent to this, it was the refidence of feveral Gothic and Moorish kings. There is a bridge of boats here over the river Guadalquiver, which is navigable for large veffels 40 miles from its mouth. The compass of the city walls is eight miles, and the number of its inhabitants is computed at about 120,000. It contains a great number of convents, churches, fquares, hofpitals, a mint, an exchange, a cuftom-house, an university, and a cathedral, the largest and finest in Spain. The archbishop has a very large income. Here are many fecular and ecclefiaftical courts, particularly a court of inquisition. This city parries on a great trade, and has various manufactories. Along the river are a great many commodious quays; near which is also a stately tower, called the Golden Tower, which entirely commands the river, city, and fuburbs. The court for the regulation of ever thing relating to the West-India trade and company is held here. The adjacent country is very fruitful and pleafant, and particularly noted for fine oranges. The greatest inconvenience to which the city is exposed is the overflowing of the river, which fometimes makes dreadful havock. There is a Moorish aqueduct in the neighbourhood worth feeing.

Cadix, one of the most ancient and celebrated cities in Spain, stands on an island, which is separated from the continent by a narrow canal or arm of the fea, over which there is a bridge, well fortified, on the Atlantic Ocean, being about 300 miles to the fouth-west of EUROPE.

Madrid, 80 from Seville to the fouth-west, and 58 from, [] Gibraltar. The island is about 16 or 17 miles long and about 6 in breadth, producing little grain, but fome good wine and pafture. The city is fortified after the modern manner, and its spacious harbour and bay are defended by several forts. The number of inhabitants is computed at 40,000. It is the see of a bishop, fuffragan to the archbishop of Seville. Many of the houses are stately; and a few of the streets broad, strait, and well paved. Provisions and house-rent are rather dear. A great deal of falt is made in, and fish caught about, the island. This city is the center of the Spanish American commerce; all the goods from Holland, England, Italy, France, and Spain, being shipped off from hence in Spanish bottoms, and under the name of Spanish factors. What are called the Pillars of Hercules are only two inconfiderable round towers. Here are a Spanish theatre, which is but mean; a French theatre, which is more elegant; and a de-When the dramatic diversions cent opera-house. conclude, which is usually about half past eleven, it is customary to walk in the Alameda, or Mall, till midnight. The royal observatory is well supplied with philosophical and mathematical instruments. Cadiz is difficult to approach on account of rocks and fands. In its vicinity is a fmall ifland, now called St. Pedro, but anciently Herculeum, from the famous temple of Hercules which it contained. The celebrated town and fortress of Gibraltar was

The celebrated town and fortrels of Gibraltar was taken from the Spaniards by a combined fleet of English and Dutch ships, under Sir George Rooke, in 1704; and, after many fruitless attempts to recover it, confirmed to the English by the treaty of Utrecht, in 1713. Repeated attempts have been made to take it from England, but without success. The last war established its same, when it sustained a long slege against the united forces of Spain and France, by land and sea, and was gallantly defended by its garrison, under the command of general Elliot, to the great loss and disgrace of the affailants.

It is a commodious port, and naturally formed for commanding the passage of the straits; or, in other words, the entrance into the Mediterranean and Levant feas. But the road is neither fafe against an enemy or ftorms. Gibraltar Bay is about 20 leagues in circumference. The ftraits are 24 miles long and 15 broad, through which a current runs from the Atlantic Ocean into the Mediterranean. The town was never large or beautiful, and, in the last fiege, was nearly destroyed by the enemies bombs; but, on account of its fortifications, is esteemed the key of Spain, and therefore always furnished with a garrison, well provided for its defence. The harbour is formed by a mole, which is planted with guns. Gibraltar can only be approached by a very narrow paffage, between the mountain and the fea, across which the Spaniards have drawn a line, and fortified it, to prevent the garrison from having any communication with the country. As they are thus cooped up they have no provisions but what are brought from England and Barbary. Formerly this place was under military government; but, on account of divers abuses, has fince been erected into a body corporate, and the civil power is now lodged in the magistrates.

Thole who have courage enough to climb to the top of the rock, will find a plain from whence they may have a prospect of the sea on each side the strait, and the kingdoms of Barbary, Fez and Morocco; besides Seville and Granada in Spain.

Alcantara, between Seville and St. Lucar, has a fine Roman bridge over the moraffes, which is a great antique curiofity.

San Lucar de Barameda is a handfome town and harbour at the mouth of the river Guadalquiver, 45 miles below Seville. It has been upon the decline fince the Spanish West-India sleets were allowed to set out from and return to Cadiz. Its principal trade is in falt.

Port St. Mary's, at the mouth of the river Guadelete,

is walled round, has a small castle, a good harbour, and makes and exports great quantities of falt.

Palos is a little town, with a tolerable harbour, at the mouth of the Trino, from whence Christopher Columbus, in the year 1492, fet out on the discovery of America.

Xeres de la Frontera is a large town on the little river Guadaletta; near which was fought, in the year 714, the famous battle between the Goths and Moors, that occasioned the loss of Spain to the former.

The fecond district, anciently called the kingdom of Cordova, contains only the following place of note: Cordova, anciently an opulent Roman colony, fituated on the river Guadalquiver, is celebrated for being the birth-place of the poet Lucan, the two famed Senecas, Averroes, and the learned physician Hesius. The city has a considerable trade, particularly in silk, wool, and gilt leather. The stone walls are strong and lofty, the suburbs extensive, and the environs fruitful and pleasant. Cordova is the greatest market for horses in all Spain.

In the district of Jaen, the only places worth men-

tioning are

Jaen, the capital, supposed to be the Giennium, or Gienna, of the Romans, and stands in a rich soil, and wholesome air. It is the see of a bishop, suffragan to Toledo; and contains many convents, churches, and hospitals, some of which are very fine, and is defended by a castle. St. Veronica is the great object of devotion here.

Ubeda, the Ubea, or Vetala, of the Romans, has a castle and walls, stands in a fruitful country, and en-

joys some particular privileges.

Baeza, anciently Vatia, Beathia, and Beatia; a confiderable city, three miles from the river Guadal-quiver, is noted for dying the finest scarlet, making the richest taffatas, and has an university, founded in 1533.

Murcia, which was anciently a kingdom, has New Castile on the north, Andalusia on the west, Valentia on the north-east, Granada on the south-west, and the Mediterranean on the fouth. It is 100 miles long, 90 broad where widest, well watered, tolerably fertile, and contains the following places:

Murcia, from which the province takes its name, is fituated in a spacious and delightful plain, on the river Segura. This city is large and populous, having many convents, churches, squares, and gates, with a good wall, a court of inquisition, a stately palace, and a castle. The adjacent country abounds in mulberry-trees, olives, sugar-canes, and fine fruits. The city hath often suffered by the inundations of the Segura.

Carthagena, a noted fea-port on the Mediterranean, was built by Afdrubal, the Carthaginian general, and called Carthago-Nova, or New Carthage. The air here is temperate in fummer, and remarkably mild in winter. Under the Romans and Carthaginians this was one of the most flourishing cities in all Spain; for from hence they shipped off those vast quantities of gold and filver which they dug in the Pyrenees and other mountains. Both city and harbour are well fortified. The bay on which it stands abounds in fish, especially mackarel; and the neighbouring country affords diamonds, rubies, amathysts, garnets, agates, and mines of allum. The city is pretty large, and its harbour one of the best in Spain. The bishop is suffragan to the archbishop of Toledo.

Almacaron, a little sea-port at the mouth of the ri-

Almacaron, a little fea-port at the mouth of the river Guadalantin, is celebrated for the mines of allum in its neighbourhood.

GRANADA, which is fometimes called Upper Andalusia, is bounded on the south and east by the Mediterranean; on the west and north by Lower Andalusia; and on the north-east by Murcia. Its extent, from west to east, is 210 miles; but its greatest breadth exceeds not 80. The air here is temperate and healthy;

and though there are many mountains in the province, and fome of them very high, yet they are almost every where covered with vines and fruit trees, together with laurel, myrtle, fweet-bafil, thyme, lavender, marjoram, and other aromatic herbs, which give an exquifite tafte to the flesh of their sheep and cattle. The vallies are extremely beautiful, and the whole is well watered. This was the last of the Spanish kingdoms possessed by the Moors, not being reduced till the year 1492. The

principal places are the following: Granada, the capital, flands in the midft of a fruitful country, has a fine air, and is capacious and populous, being one of the largest cities in Spain. It is of a circular form; and the snowy tops of the Sierra Nevada Mountains, which are feen at the distance of three leagues, greatly diverfify and add beauty to the ver-dure of the circumjacent fcene. Granada is divided into four quarters, and has twelve gates. It is an archbishopric, an university, and a royal chancery. It contains 24 parish churches, 29 convents, 11 hospitals, and four colleges. The marbles, which are dug out of the quarries in this province, are the most beautiful in Spain. There is one street in Granada confisting entirely of shops, wherein marble, fnuff, tobacco-boxes, flabs, globes, ftones for ear-rings, bracelets, necklaces, and other toys, are exposed to fale. The royal palace of the Alhambra is one of the most magnificent edifices which the Moors erected in Spain. It is fituated on a hill, which is afcended by a road, bordered with edges of double or imperial myrtles, and rows of elms. In Granada are likewise a theatre, a circular amphitheatre for bull fights, a court of inquifition, and a royal tribunal. The filk manufactory is confiderable, and the arfenal the best surnished of any in Spain. Without the city is a large plain, called La Vega de Granada, which is full of hamlets, villages, &c.

Malaga is an ancient, large, well fortified, and populous city, with a fine harbour, on the Mediterranean, encompaffed with a double wall, and defended by two caftles. The exportation of wines, raifins, almonds, figs, lemons, oranges, and other fruits, from hence, befides wool and oil, produces immente duties to the

king

Almeria, a small city on the Mediterranean, with a fafe and commodious harbour, is the fee of a bishop,

fuffragan to Granada.

Antiquera is a handfome town, with a caftle, 70 miles fouth-west from Granada. Near it is a famed salt-pit, which fupplies the whole territory with that commo-

SECTION III.

Population, Persons, Drefs, Houses, Manner of Living, Dances, Theatrical Exhibitions, Bull-fights, Language, Learning, Religion, &c. of the Spaniards.

CPAIN, at present, is but thinly inhabited. This is owing partly to the great drains of people fent to America, and partly to the indolence of the natives, who are at little or no pains to raile food for their families. Another cause assigned is the vast number of ecclefiaftics of both fexes, who lead a life

The Spaniards are generally tall and well made, more particularly the Castilians. They have usually black hair, and very fwarthy complexions; but their countenances are animated and expressive. The beauty of the Spanish ladies reigns mostly in their novels and romances; for though it must be acknowledged that Spain produces as fine women as any country in the world, yet beauty is far from forming their general character. In their persons they are commonly small and flender; but they employ much art in fupplying the defects of nature.

The habits of the Spanish gentry of both fexes are entirely in the French fashion. When women have occasion to walk the streets in Spain, they are covered with a black filk veil, and then are stiled Topados, that is,

flut up. The short cloak, formerly worn by the Spaniards, is now disused; as are rusts, spectacles, long fwords, mustachios, &c. The only mark of their former gravity confifts in the deep brown colour of the habits of the people in general. The Spaniards, before the accession of the house of Bourbon to their throne, affeeted that antiquated drefs in hatred or contempt of the French; and the government will probably find fome difficulty in abolithing it, as the fpirit of fingularity is far from being extinguished. An old Castilian thinks himself the most important being in nature, and the fame pride is commonly communicated to his descendants. This is the true reason why so many of them are fond of removing to America, where they can retain all their native importance, without the danger of feeing a fuperior. Ridiculous as this pride may appear, it infpires the poffesfors with generous sentiments; it being feldom found that a Spanish nobleman, gentleman, or even trader, is guilty of a mean action.

The houses of the Spanish nobility are immensely large, and the apartments extremely spacious. stair-case and hall, especially the latter, are the finest part of the house. The falle, or parlour, is surnished with images, looking-glaffes, framed chairs, and others very low. The reft of the house is indifferently furnished. The number of servants kept by the grandees is immoderate, some of them having two or three hundred domestics.

The Spaniards are remarkably temperate in their manner of living. Their breakfaft is ufually chocolate, tea being vely feldom drank. Their dinner is ufually a pochero; or beef, mutton, veal, pork, and greens, all boiled together. They live much upon carlie, fellad, radiflere see, and are also found of garlic, fallad, radifhes, &cc. and are also fond of muthrooms, honey, fnails, and fried eggs. The men drink but little wine; and the women mostly use

water.

From time immemorial the Siefta, or afternoon's nap, has been customary in Spain. From one to about three in the afternoon, all the streets of Madrid are as solitary as a defert. The tradesmen shut their shops, the mechanics quit their work, and every body lies down to fleep.

Dancing is a favourite diversion with the Spaniards. The grand dance is the Fandango, of which there are two kinds, though they are danced to the fame tune. The one is the decent dance; the other is gallant and

full of animating expressions.

The Fandango is described by an eminent writer as a kind of very lively dance, which the Spaniards have learned from the Indians: but the foundation for this

affertion is much doubted.

The theatrical representations of Spain are very trivial. Except some pieces of Lopez, with a few tragedies of Racine, they have nothing but farces exhibited. The play usually lasts three hours, in the course of which many ludicrous pranks are exhibited; and scenes introduced repugnant to common sense, as well as common decency. The actreffes are, in general, handsome; but, as well as the actors, diffort their countenances, and shew most horrid aspects, especially when they laugh or weep. There are feat in the pit, where people converse as they do in the street. Pricits, friars, and nuns, go to plays; and fometimes may be feen in the fame box, cockades, cowles, a veil, nuns ruffs, plumes of feathers, round hats, those worn under the arm, and others dreffed with flowers. There is no preservation of manners, no characteristic dress whatever. The players often appear on the ftage as they do at home. The actrefles are very fine. Men, in common, play the womens parts; and the company is often obliged to wait an hour before the curtain is drawn up, because the heroine, duenna, queen, or chambermaid, has not vet done shaving.

The Spanish tragedies are barbarous, and the catastrophe generally shocking; actors and actresses all die, and die before the spectators. The pit and boxes are

inexorable,

the catafles all die, boxes are nexorable, inexorable, and nothing can be heard for their hiffing. The guards in vain threaten and florm: fometimes they are tired with bawling, and join in their hiffes. Neither youth or beauty can difarm party.

How people can find any charms or magnificence in those horrid combats called bull-fights must be the wonder and aftonishment of all civilized nations. They are peculiar to this country, and make a capital figure in painting the genius and manners of the Spaniards. On these occasions young cavaliers have an opportunity of shewing their courage and activity before their mistresses; and the valour of the cavalier is proclaimed, honoured, and rewarded, according to the number and sierceness of the bulls he has killed in these encounters.

The bull-fighters raise horror, and the bulls excite pity. A man must be as unfeeling as a stone not to be softened into tears at the sight of a number of barbarians, killing, without any emotion or concern, a poor animal, gagged and mussled in such a manner as to deprive him of the means of defending himself, or even seeing his murderers.

The atrocity of this contest is further aggravated by the transports and acclamations of an immense body of people; by the clapping of, perhaps, twenty thoughand pair of hands, and the beating of as many pair of heels, at the very moment when the bull, mortally wounded, nearly suffocated with rage, is tottering, falling, bellowing out his last groans; stretching, struggling, and making efforts to rise; finking again, frothing at the mouth with anguish, bleeding and gasping upon the ground, where savage bull-slayers are contending for the honour of giving him the last pang.

To heighten the fcene of barbarity, the tender fex, who tremble at the fall of a leaf, fix their eyes on a poor animal in torture, bleeding, panting, and expiring at their feet; feem to count his wounds, his groans, and drops of blood, and to regret, when he dies, that his fruggles and fufferings are over.

All the bulls used at these shows are brought from the mountains and woods of Andalusia.

Such are the fights fo much talked of; fights that feveral popes and fovereigns have so often attempted, in vain, to abolish; but the populace, on every occasion, affembled tumultuously, threatening destruction; and, in order to appease them, it has often been found necessary to facrifice a great number of bulls. This barbarous diversion is, by most writers, supposed to be of Moorish original, and to have been adopted by the Spaniards when upon good terms with that nation, partly through complaisance, and partly through rivalship.

fhip.

The ground-work of the Spanish language, like that of the Italian, is Latin. The Spanish, indeed, might be called a bastard Latin, were it not for the terminations and exotic words introduced into it by the Moors and Goths. It is, at prefent, a majestic and expressive language; and what is remarkable, foreigners who understand it the least, prize it the most. Of all the Spanish dialects, that of Castile is the most figurative and emphatic.

Though many of the Spaniards are men of genius, and they have a number of univerfities and academies amongst them, they are forestricted in their disquisitions, that little progress can be expected from them in the several branches of literature. They have cultivated history with the greatest success. There is an academy for this branch established at Madrid, and translated in insellinations the caracter of Smith and the server in the caracter of the server of

employed in inveftigating the annals of Spain.

The most distinguished dramatic poet of this nation was Lopez de Vega, who was cotemporary with our Shakespeare. The most celebrated writers of humour, in prose, are Cervantes, author of that admirable piece of fatire, called the History of the Renowned Don Quixote de la Mancha; and Guevara, who produced the famous work, called El Diablo Caxuelo, which Le Sage modernized into a romance, known in English by the title of "The Devil upon two Sticks." The

No. 81.

Visions of Quevedo, and some other of his humorous and satirical pieces, having been translated into the English language, have rendered that author well known in this country. Spain has likewise produced many travellers and voyagers equally amusing and instructing. It appears, upon the whole, that if the Spaniards could disengage themselves from their abstracted turn of thinking, and their tyrannical form of government, they would make a capital figure in the literary world.

The Spaniards embrace and practife the Romish religion in all its forms and ceremonies. In this they have been fo fleady, that their king is diffinguished by the epithet of Most Catholic. The horrors of that religion are, however, at present greatly lessened in this country, by moderating the penalties of the inquisition, and disqualifying the ecclesiastics, and their officers, from carrying into execution any fentence without the royal authority. It appears, upon the whole, that the fiery zeal, which formerly diffinguished the Spaniards from the rest of the Roman Catholic world, is much abated; and that the power of the clergy has, of late years, been much reduced. A royal edict has also been iffued, to prevent the admission of noviciates into the different convents, without special permission, which has a great tendency to reduce the monastic orders. The riches of the Spanish churches and convents are objects of admiration to all travellers, as well as natives: but it is a just remark, that there is a fameness in them all, excepting that they differ in the degrees of treasure and jewels they contain.

SECTION IV.

Commerce, Manufactures, (particularly Wool.) Coin, Government, Modes of Punishment, Ranks and Orders, Revenues, &c.

THOUGH Spain is well fituated for trade and navigation, the natives, through their natural indolence, neglect this advantage, and leave it to the other maritime nations. Gold and filver are the chief branches both of their exports and imports. They import them from America, and export them to other countries of Europe. Cadiz is the chief emporium of this commerce.

The manufactures of Spain are chiefly filk, wool, copper, and hardware. Of all the wool used in manufactures, that of this country is certainly the best. It is finer, more filky, and unites better in fulling than any other wool in Europe. But all the wool of Spain is not equally fine. Several forts are distinguished, which differ from each other as to quality, number of piles, and the names of those to whom it belongs. The first pile are those of Segovia. It is computed that there are fold annually about 95,000 arobs of this wool. An arob weighs 20 pounds. These piles are designed for the finest woollen stuffs, &cc. and are used in manufacturing the best cloths. The next fort are called Cavaliers. There are various other forts of piles of midling quality in Spain.

The kingdoms and provinces in which the finest forts of wool are to be found, are Arragon, the kingdom of Valencia, Upper and Lower Andalusia, Castile, and Navarre: An old prejudice prevails, that it is the climate which occasions the fineness and whiteness so much admired in Spanish wool; whereas the manner in which the Spaniards rear their flocks is the real cause of the perfection of their wool. Other nations have successfully cultivated all arts and sciences, except the shepherd's art; the Spaniards, on the contrary, have neglected all but this; and we still find in Spania some traces of that pastoral life, which, in the early ages of the world, procured honour and happiness to those who devoted themselves to it.

Many efforts have been made by the Spanish government to prevent the other Europeans nations from reaping the chief advantage of the American com-

merce; but these can never be successful, till a spirit of industry is awakened among the natives, so as to enable them to supply their American possessions with

their own commodities of merchandize.

Accounts, in Spain, are kept in reals and maravidies de plata, or filver, which are imaginary coins; 34 maravidies making a real, equal to five-pence haltpenny fixaglish. The gold coins are pistoles, or doubloons, value 175. double, quadruple, half and quarter pistoles. The filver coins are reals de plata, or filver, worth somewhat above fix-pence of our money; piasters, or pieces of eight, worth about 4s. 6d. half and quarter pieces of eight, but these are rare. They have also small brass money, called quartos and octavos, like our halfpence and farthings. The Spanish escudos, or crowns, and ducats, are imaginary coins, and both of the value of about 6s. of our money. There are also imaginary piasters and pistoles.

In Spain a most despotic government prevails; and the distres, so visible in most parts of the country, is, in a great measure, the result of that government, in the administration of which no proper attention is paid to the interests and welfare of the people. The monarchy is hereditary, and semales are capable of succession. The kings of Spain are inaugurated without being crowned, by the delivery of a sword. Their signature never mentions their names but "I the King." The heir apparent is called prince of Assuring and the other children, of both sexes, by way of distinction, in-

fantas; that is, children.

For the administration of the government, and of justice, here are several councils and tribunals; as the junta, or cabinet-council, the privy-council, the council of Castile, the council of the inquisition, the council of the Indies, the seven courts of royal audiences, &c. Since the beginning of the 17th century, and the reign of Philip III. the cortes, or parliaments of this kingdom, have been discontinued.

Befides those above mentioned, are many subordinate tribunals for the police, the finances, and other

branches of bufinefs.

Every quarter of Madrid is subjected to the inspection of a commissary; a justice, who decides, without appeal, all the quarrels and disputes among the common people. Quarrels are unfrequent here. A Spaniard is, in general, not only sober, but peaceful even in inebriation. When he drinks to excess, he goes to sleep. The police has its spies; but these spies are always from the dregs of the people, as they are every where else. The safety of the highways is entrusted to miquelets, a fort of runners, whose business it is to seize robbers, carry them to prison, escort them to the gallows, and conduct the executioner back to his house. In Spain all executioners wear a particular uniform.

In Spain all executioners wear a particular uniform.

A great number of villains are fuffered to live in Spain, that would be put to death elfewhere. If they are young, they are fent to work at Oran, a city of Africa, on the Coast of Barbary, or Porto Rico, one of the Antilles, in North America. If Old, they are

left to rot in prison.

If the atrocity of the crime should oblige the judges to pass sentence of death, the offender is hanged. Criminals semetimes have their brains knocked out; and this punishment, which shocks the imagination, and makes the hair stand on end, is the least painful kind of death. The executioner, armed with a club and a knife, strikes the criminal on the temple, lays him dead, bleeds, tramples upon him, quarters him, and hangs the different parts on hooks, and throws them into a fire prepared for the purpose. At the fight of this butchering work, which lasts a few seconds, all the spectators turn pale, and shudder with horror; the children shriek, the women swoon with terror; though the sufferings of the malesactor have been long over.

Procureffes are stripped, anointed with honey, whipped, branded, and feathered; and in this condition led by the executioner through different parts of the

Excepting the prison for the nobility, all the reft in Madrid are charnel-houses. No distinction is made between guilt and missortune. The incorrigible villain, the noviciate in knavery, and the debtor, are frequently stretched upon the same wad of straw.

The carcan, or pillory, the brand, and the gallies, are the punishments for trivial crimes. Officers of all forts, even king's officers, are fent to the gallies. Whilft they are employed in rowing or failing, their time of flavery is going on. When they are discharged they returne their rank. Every thing depends on the terms of compact.

The Spanish courts of justice, so lenient with respect to some particular crimes, shew no mercy to those who rob a church. The king, indeed, through regard for the party, sometimes changes the punishment of death

into perpetual imprisonment.

The general name for those Spanish nobility and gentry who are unmixed with the Moorish blood, is Hidaigo. They are divided into princes, dukes, marquises, counts, viscounts, and other inserior titles. Such as are created grandees may stand covered before the king, and are treated with princely distinctions. A grandee cannot be apprehended without the king's order; and cardinals, archbishops, ambassadors, knights of the golden sleece, and certain other great dignities, both in church and state, have the privileges, as well as the grandees, to appear covered before the king.

Of the orders of knighthood in Spain, that of the Golden Fleece is the principal, which was inflituted in 1430, by Philip the Good, duke of Burgundy, and is common now to the kings of Spain and the house of Austria. The order of St. Jago de Compostella was instituted in the year 1175, by Ferdinand II. king of Leon. The order of Calatrava was founded by San-cho III. of Castile. The order of Alcantara owes its institution to Ferdinand II. king of Leon. The three last orders have large commanderies, or estates, annexed to them. The masters of them were once so powerful, that they disputed the king's authority over them; whereupon the king procured those masterships to be conferred on himself by the pope, that they might no longer affume the independency of the state, Befides these are the orders of Santiago, the order of Montefa, and the order of Charles III. which latter was inflituted September 19, 1771, in honour of the birth of his majesty's grandion. None but persons of noble descent can belong to this order.

The revenues arifing to the king, from Old Spain, are computed at 5,000,000l. His American income, it is true, is immense; but it is generally in a manner embezzled or anticipated before it arrives in Old Spain. The finances of his present Catholic Majesty are on a better footing, both for himself and people, than those of any of his predecessors. The taxes from whence the internal revenues arise are so various and arbitrary that they cannot be ascertained. They fall upon all kinds of goods, houses, lands, timber, and provisions. The clerical and military orders are likewise

taxed.

The land forces of the king of Spain, in time of peace, generally amount to between 70 and 80,000. In time of war they are proportioned to the exigencies of the flate. The king has great dependence on his Walloon or foreign guards. He has taken care to raise a powerful marine, and render his fleet very confiderable. The coast of Spain is well secured and watched; so that the whole kingdom may be soon alarmed in case of an invasion,

We shall treat of the islands belonging to Spain in our general description of European islands. As the history of Spain is intimately connected with that of Portugal, we shall introduce them together, at the close of our account of the latter in the following chapter.

C H A P. XV.

PORTUGAL.

SECTION I.

Boundaries, Situation, Extent, Climate, Soil; Vegetable, Animal, and Mineral Productions; Rivers, Mountains, &c.

THIS kingdom, which is the most western in Europe, is bounded by Spain on the north and east, and by the Atlantic Ocean on the south and west. It is situated between 37 and 42 degrees of north latitude, and 7 and 10 degrees of west longitude; being about 300 miles in length, and 100 in breadth.

Though Spain and Portugal are in the fame climate, yet the air of the latter is much more temperate than that of the former, on account of the proximity of the fea. Lifbon hath been much reforted to by valetudinarians, and confumptive persons, on account of its air. The foil is very fruitful in wine, oil, lemons, oranges, pomegranates, figs, raifins, almonds, chefnuts, and other fine fruits; but there is a want of corn, owing, in a great measure, to the neglect of agricul-There is plenty of excellent honey here, and also of sea and river fish, and sea-salt. The horses in Portugal are brifk, lively animals, as they are in Spain, but of a flight make; but mules, being furer-footed, are more used for carriage and draught. By reason of the fcarcity of pasture, there are not many herds of cattle or flocks of fheep; and what they have are fmall and lean, though the flesh is tolerably good. Their best meat is that of hogs and kids. The country in many parts is mountainous; and the mountains contain all kinds of ores, particularly of filver, copper, tin, and iron, with a variety of gems, beautifully variegated marble, mill-stones, and many curious fossils of the lapidious kind. The principal rivers are the Minho, in Latin Minius; the Lima, anciently the famed Lethe; the Cavado; the Douro; the Guadiana, anciently Anas; and the Tago, or Tagus, which is the largest river in the kingdom, carrying some gold in its fands, and falling into the sea a little below Lisbon. There are several mineral springs in the kingdom, both hot and cold, which are much frequented. The mountains of Sierras de Estrella are always covered with fnow.

SECTION II.

Grand Divisions of Portugal, with a particular Description of each Division.

THE province of ENTRE-DOURGE-MINHO derives its name from its fituation, which is between the rivers Dourge and Minho; having Galicia on the north, Beira on the fouth, the Ocean on the weft, and a ridge of mountains on the east. It is 70 miles long, 50 broad where widest, remarkable for its fertility, and contains the following places:

contains the following places:

Braga, between the rivers Cavaco and Defte, is the fee of an archbishop, who is primate of Portugal, and spiritual and temporal lord of the city and neighbouring country. Here are a stately ancient cathedral and archiepiscopal palace, many convents, several parish churches, an hospital, a large college, and a house of mercy, which is a charitable foundation for the relief of persons of good families fallen to decay, and for marrying of young maidens, and putting boys to employments.

Porto, or Oporto, on the river Douro, has a commodious harbour, much frequented by the English: but the bar at the entrance into it is somewhat dange-

rous. Next to Lifbon, it is a city of the greatest optilence, beauty, and trade, in the kingdom. At the mouth of the river is a castle to guard it, called St. John's. Here are several hospitals and parish churches, besides the cathedral, many convents, a mint, several courts of justice, and the sec of a bishop. Here is an English factory, concerned in the wine trade, which is very considerable, insomuch that all red wines, that come from Spain or Portugal, are called port wines. The church Dos Clerigos, which is situated on the highest part of the city, serves as a land-mark to sailors.

Guimaranes, a fmall but ancient town, is encompassed with a good wall, contains several convents, hospitals, and courts of justice. It has manufactures of linen and fine thread, and is desended by an old cable.

Caminha is a fortified town at the mouth of the Minho; Valenca is a ftrong town on the fame river; Villa de Conde is a fea-port at the mouth of the Ave, with a ftrong caftle; and Barcellos, on the Cavado, is fortified with a wall and towers.

Villa Nova de Carveira, on the Minho, is well fortified, and Point de Lima is an handsome town,

Viana de Fez de Lima is pleafantly fituated near the mouth of the Lima. It contains feveral courts of juftice, churches, convents, and a confiderable magazine; is large, well built, and strong, and has a good harbour, with a confiderable trade.

The Province of Tra-los-Montes has Galicia north, Beira fouth, Leon east, and some mountains west. It is 120 miles long, 80 broad, abounds in game and fruits, produces but little corn, is watered by the Douro, and contains

Braganza, a city near the river Fervença, at the extremity of the province, and near the borders of Leon and Galicia, contains feveral convents, a good castle, has a variety of filk manufactories, and is well fortified. The ancestors of the present royal family were dukes of Braganza, before they were advanced to the throne, in the person of John, the eighth duke. This town is supposed to have been the ancient Cælia Briga, Brigantia, or Brigantium.

Chaves, a strong town on the river Tamega, was built by the emperor Flavius Vespasian, and called Aquæ Flaviæ. There is still a Roman bridge of stone over the Tamega, with other marks of antient grandeur.

Villa-Real stands between the river Corgo and Ribira. It is the best and largest town of the province, and belongs to the infanta. That called the Old Town is furrounded by a wall.

Miranda de Douro, a fortified town on the frontiers of Spain, fo called from its pleafant fituation on the north fide of the Douro, is the fee of a bishop, and belongs to the king.

Beera has Spanish Estramadura east, Portuguese Estramadura south, the Ocean west, and Entre-Douroe-Minho and Tra-los-Montes north. It is about 140 miles each way, well watered, and naturally fertile. The most considerable places are

Coimbra, on the Munda, over which it hath a flately bridge. It was anciently a Roman colony. Here are now many convents, colleges, and churches, befides the cathedral, feveral courts of juftice, an university, and the fee of a bishop, who is count of Arganil.

Lamego, a city near the Douro, is furrounded with mountains, contains feveral convents, courts of justice, and is the fee of a bishop.

Vifeu is a city on a fmall river, which falls into the Mondego. Here are several convents, churches, and

courts of justice. The bishop of this place is suffra-

gan to the archbishop of Braga.

Castello Branco is a town with a castle, containing a stately palace of the bishop of Guarda; Almeida is a sortified town, near the river Coa; Penamacor is a strong town on the Spanish frontiers; and Averio has a good harbour, and a great salt trade.

The Province of ALENTEJO is 120 miles long, nearly the same broad, has a very fertile foil, and contains

Evora, acity in which are feveral churches, hospitals, courts of justice, convents, a cathedral, and university. It is a see of an archbishop, defended by a fort and other works, and is samed for the institution of the order of Avis, answering to that of Calatrava in Spain.

Portalegre is a fortified city, about 10 miles from the Spanish frontier. Here are several courts of justice, fountains, convents, and churches, besides the cathedral, a manufactory of coarse woollen cloth, and

the fee of a bishop.

Elvas, a city with a caftle, and other fortifications, is the fee of a bishop. The neighbouring country is pleasant, and fruitful in wine and oil.

Beja is a dukedom, and contains feveral churches,

courts of justice, and convents.

Villa-Vicosa, i. e. the Delightful Town, so called from its beauty, and that of the adjacent country, contains several convents, a stately royal palace, embellished with a fine park, and a strong castle.

Avis belongs to an order which takes its name from it; Campo-Mayor is well fortified; Olivença has a strong castle; and Moura is a fortified town, near the

Guadiana.

Eftremaz contains feveral churches and convents, and is ftrongly fortified.

The Province of ALGARVE is bounded to the fouth and west by the Ocean; to the east by the Gaadiana, which parts it from Andalusia; and to the north by the mountains, called Serra de Algarve, or Caldeirao, and Serra de Monachique, which divide it from Alentejo; its greatest length being about 100 miles, but its breadth only about 28. Its name is of Moorish extraction. Though mountainous, it is very fertile in corn, wine, oil, and all forts of fruits. The principal places are the following:

Lagos is a town with a harbour, on a large bay, about 110 miles fouth from Lifbon. Here are feveral convents

and courts of justice, and two forts.

Tavira, a city fituated on a bay, at the mouth of the river Sequa, has a castle for its desence, several convents, and a harbour guarded by two forts. Faro, a city situated on a bay, and well fortised,

with an harbour and castle, contains several convents,

and is the fee of a bishop.

Villa Nova de Portimao flands on a river, in the diffrict of Lagos, where it has a fpacious harbour, defended by two forts.

The Province of ESTRAMADURA is bounded on the west by the sea, on the north and east by Beira, and on the south by Alentejo. It is 120 miles long, 60 broad, well watered, and fertile, producing corn, wing, oil, millet, pusses, and fruits of all forts, especially citrons, lemons, oranges, pomegranates, figs, dates, and almonds.

Lifbon, flanding near the mouth of the river Tagus, first became considerable in the reign of king Emanuel. From that time it has been the capital of the kingdom, the residence of its monarchs, the seat of the chief tribunals and offices, of the metropolitan, a noble university, and the receptacle of the richest merchandize of the East and West Indies. Its air is excellent, being refreshed by the delightful sea-breezes, and those of the Tagus. Like old Rome it stands on seven hills. Great part of it was ruined by an earthquake, on November 1, 1755. It still contains magnificent palaces,

churches, and public buildings. Its fituation (rifing from the Tagus in the form of a crefcent) renders its appearance at once delightful and fuperb; and it is defervedly accounted the greatest port in Europe, next to London and Amsterdam. The harbour is spacious and secure; and the city itself is guarded from any sudden attack towards the sea by forts; though they would make but a poor desence against ships of war. All that part of the city that was demolished by the earthquake is planned out in a regular form. Some squares and many streets are built. The houses are lofty, elegant, and uniform, and make a beautiful appearance. Lisbon is supplied with almost all the water which is used by the inhabitants by means of an aqueduct, in the valley of Alcantara.

Liston was divided, about he year 1716, into two patts, under the names of the Oriental part, and Occidental part. This division was made on occasion of the creation of the patriarch, whose diocese confists of the Occidental part, and the archbishop has retained the Oriental. Since this partition the inhabitants are obliged, under pain of nullity, to express, in all arrets, the part of the town in which they have passed exact. Merchants also distinguish it in their Bills of exchange

and letters.

We shall conclude our description of Lisbon with the following remarks on the dreadful earthquake before alluded to. "As far as I can judge (fays the writer) after having walked the whole morning, and the whole afternoon, about these ruins, so much of Lisbon has been destroyed, as would make a town more than twice as great as Turin. In fuch a space nothing is to be seen but vast heaps of rubbish, out of which arise, in numberless places, the miserable remains of shattered walls, and broken pillars. Along a street, which is full four miles in length, fearcely a building flood the shock; and I see, by the materials in the rubbish, that many of the houses along that street must have been large and stately, and intermixed with noble churches, and other public edifices; nay, by the quantities of marble feattered on every fide, it plainly appears that onefourth, at least, of that street was entirely built of marble. The rage of the earthquake feems to have turned chiefly against that long street, as almost every edifice, on either fide, is, in a manner, levelled with the ground; whereas, in other parts of the town, many houses, churches, and other buildings, are left flanding; though all fo shattered, as not to be repaired without great expence: nor is there, throughout the whole town, a fingle building of any kind, but what wears visible marks of the horrible concussion."

Leira is a populous city, at the conflux of the Lis and Lana; Setuval is a ftrong, well fortified town, 20 miles fouth of Lifbon; Santerem, on the Tagus, is a place of good trade; and Sintra, fituated by the cape that bears the fame name, is supposed to have the most

falubrious air of any place in Portugal.

SECTION III.

Charaster, Persons, Dress, Honorary Titles, Religion, Manusastures, &c.

THE Protuguese are inferior to the Spaniards both in person and genius; and though formerly some of them have shewn themselves brave and war-like, upon certain occasions, yet their natural characteristics are craft, treachery, malice, haughtiness, cruelty, avarice, and a disposition totally vindictive. They have usually dark hair, black sparkling eyes, and olive complexions. The dress of the men, among the common people, is a large cloak and slouched hat. Beneath the cloak they usually carry a dagger, though the use of that treacherous weapon is prohibited. The women dress their heads in a net-work silk purse, in lieu of a cap, with a tassal behind, and a ribbon tied with a bow knot over the forchead. They likewise wear large sleeves, heavy pendants in their cars, and

enormous nofegays. But it is to be observed, that the nobility and gentry, of both fexes, incline to an imitation of the French fashions.

The king's titles are "King of Portugal and the Algarves, on this fide and the other fide the fea of Africa; lord of Guinea, and of the navigation, conquests, and commerce, in Ethiopia, Arabia, Persia, India, &c." The king's eldest fon is stiled prince of Brazil. In the year 1749 pope Benedict XIV. dignified the king with the title of his Most Faithful Majesty.

The established religion of Portugal is Popery in the strictest fense. The Portuguese have a patriarch; but formerly he depended on the pope entirely, unless when a quarrel subsisted between the courts of Rome and Lifbon. The power of his holiness in Portugal is now fo much curtailed, that it is difficult to describe the religious flate of that country. The power of the inquifition is taken out of the hands of the ecclefiaftics, and appropriated to flate commerce. The patriarch of Lifbon is generally a cardinal, and a person of the highest birth.

Coarfe filks, woollen cloths, and linen, are the principal manufactures of Portugal; but the commerce, particularly with England, in wine, fruit, and falt, is very confiderable.

As to the constitution of Portugal, it is an absolute hereditary monarchy. Both here and in Spain there were anciently cortes, states, or parliaments; but they have long fince entirely loft their share in the legislature. For the administration of the civil government there is a council of state, and several secretaries; for military affairs a council of war; for the finances a treasury-court; and for the distribution of justice several high tribunals, with others fubordinate to them, in the feveral diffricts into which the kingdom is divided. The cities have their particular magistracy. The proceedings of the courts are regulated by the Roman law, the royal edicts, the canon law, and the pope's mandates.

The revenues of the crown, fince the discovery of the Brazil mines, are very confiderable; but the real amount can only be gueffed at. Befides the royal demefnes, the hereditary estates of the house of Braganza, the monopoly of Brazil fnuff, the coinage, the fifth of the gold brought from Brazil, the farm of the Brazil diamonds, the masterships of the orders of knighthood, and other fources, yield very large furns.

SECTION IV.

HISTORY OF SPAIN AND PORTUGAL.

T is generally supposed that Spain was first peopled from Gaul, to which it is contiguous; or from Africa, from which it is only feparated by the narrow Strait of Gibraltar. The Phoenicians fent colonies thither, and built Cadiz and Malaga. Afterwards, upon the rife of Rome and Carthage, the possession of this kingdom became an object of contention between those powerful republics; but at length the Roman arms prevailed, and Spain remained in their possession until the fall of that empire, when it became a prey to the Goths. These, in their turn, were invaded by the Saracens, who, about the 7th century, had poffeffed themselves of the finest kingdoms of Asia and Africa; and not content with the immense regions that formerly composed great part of the Assyrian, Greek, and Roman empires, they croffed the Mediterranean, ravaged Spain, and established themselves in the southerly provinces of the kingdom.

The first Spanish prince, mentioned in the history of this country, was Don Pelago, who diftinguished himself against these insidels (afterwards known by the name of Moors) and, about the year 720, took upon himself the title of king of Austria. His succeffes animated other Christian princes to take arms likewife; and the two kingdoms of Spain and Portu-

No. 81.

gal, for many ages, were perpetually embroiled in bloody wars. In the mean time every adventurer was entitled to the conquests he made upon the Moors, till Spain was at last divided into twelve kingdoms; and, about the year 1095, Henry of Burgundy was declared, by the king of Leon, count of Portugal; but his fon Alphonfo threw off his dependence on Leon, and declared himself king. A series of brave princes gave the Moors repeated overthrows in Spain till about the year 1475, when all the Spanith kingdoms, Portugal excepted, were united by the marriage of Ferdinand, king of Arragon, and Ifabella, the heircfs, and afterwards queen, of Caftile, who took Granada, and expelled the Moors and Jews out of Spain. This expulsion greatly depopulated the country of artists, labourers, and manufacturers; and the discovery of America (which happened a few years after) not only added to that calamity, but rendered the remaining Spaniards most deplorably indolent. To complete their misfortunes, Ferdinand and Isabella introduced the popifh inquifition, with all its horrors, into their dominions, as a fafeguard against the return

of the Moors and Jews.

Ferdinand was fucceeded by his grandfon Charles V. of the house of Austria, afterwards emperor of Ger-The extensive possessions of the house of Auftria, in Europe, Africa, and above all, America, from whence he drew immense treasures, began to alarm the jealoufy of neighbouring princes, but could not fatisfy the ambition of Charles. He was almost constantly engaged in foreign wars, or with his Protestant subjects in Germany, whom he in vain attempted to bring back to the Catholic church. At length, after a long and turbulent reign, he refolved to withdraw himself entirely from any concern in worldly affairs, in order that he might fpend the remainder of his days in retirement and folitude. In confequence of this refolution, he refigned Spain and the Netherlands to his fon Philip II. but could not prevail on the princes of Germany to elect him emperor, which honour they conferred on Ferdinand, Charles's brother, dividing the dangerous power of the house of Austria with two branches. Spain, with all its poffessions in Africa and the New World, also the Netherlands, and fome Italian states, remained with the elder branch; whilst the empire, Hungary, and Bohemia, fell to the lot of the younger.

Philip II. inherited all his father's vices, but poffeffed few of his good qualities. He was auftere, haughty, immoderately ambitious, and through his whole life a cruel bigot in the cause of popery. Mary, queen of England, an unfeeling bigot like himfelf; and after her death, he paid his addresses to her fister Elizabeth, but without success. His resentment, on this account, produced very disadvantageous wars with that princess, which occasioned the revolt and lofs of the United Provinces. But in Portugal he was more fuccessful. That kingdom, after being governed by a race of wife and brave princes, fell to Sebastian about the year 1557. Sebastian lost his life, and a fine army, in a headstrong, unjust, and ill-concerted expedition against the Moors in Africa; and soon after Phillip united Portugal to his own dominions, though the Branganza family of Portugal pretended to a prior right. By this acquifition Spain became poffeffed of the Portuguese settlements in India, some of which she

still retains.

The descendants of Philip proved to be very weak princes; but Philip, and his father, had so totally ruined the ancient liberties of Spain, that they reigned almost unmolested in their own dominions. Their viceroys, however, were at once fo tyrannical and infolent over the Portuguese, that in the year 1640, the nobility of that nation, by a well-conducted conspiracy, expelled their tyrants, and placed the duke of Braganza on the throne, by the title of John IV. ever fince which Portugal has been a diffinct kingdom from Spain.

10 P

The

The kings of Spain, of the Austrian line, failing in the person of Charles II. who left no iffue, Philip, duke of Anjou, second son to the dauphin of France, and grandson to Lewis XIV. mounted the throne, by virtue of his predecessor's will, in the name of Philip V. anno 1701. After a long and bloody struggle with the German branch of the house of Austria, supported by England, he was confirmed in his dignity at the conclusion of the peace of Utrecht, in the year 1713; and thus Lewis XIV. through a masterly train of politics, accomplished his savourite project of transferring the kingdom of Spain, with all its rich possessing in America and the East Indies, from the house of Austria to that of his own family of Bourbon; an event which has proved very prejudicial to the commerce of Great Britain, especially in the Spanish American settlements.

Philip, after a long and turbulent reign, died in 1746, and was fucceeded by his fon Ferdinand VI. who died in 1759 without iffue. Ferdinand was fucceeded by his brother Charles III. the prefent reigning

monarch of Spain.

The Portuguese could not have supported themfelves under their revolt from Spain, had not the latter power been engaged in wars with England and Holland; and, upon the restoration of Charles II. king of England, that prince having married a princes of Portugal, prevailed with the crown of Spain, in 1668, to give up all pretensions to that kingdom. Alphonso, son to John IV. was then king of Portugal. He had the missortune to disagree with his wife and his brother Peter, and they uniting their interests, not only forced Alphonso to resign his crown, but obtained a dispensation from the pope for their marriage, which was actually consummated. They had a daughter; but Peter, by a second marriage, had

fons, the eldeft of whom was John, his fucceffor, and father to his late Portuguese majesty. John, like his sather, joined the grand confederacy formed by king William; but neither of them were of much service in humbling the power of France. On the contrary, they had almost ruined the allies, by occasioning the loss of the great battle of Almanza, in 1707.

John died in 1750, and was succeeded by his son Joseph, who, in 1760, was attacked by affassins, and narrowly escaped with his life. From this conspiracy is dated the expulsion of the jesuits (who were supposed to have been at the bottom of it) from all parts of the Portuguese dominions. Joseph having no son, his eldest daughter was married, by dispensation from the pope, to Don Pedro, her own uncle, to prevent the crown falling into a foreign family; and the next year, 1761, she was brought to bed of a son, called

the prince of Beira.

When the war broke out between England and Spain, in 1762, the Spaniards, and their allies the French, pretended to force Joseph into their alliance, and to garrison his sea-towns against the English with their troops. The king of Portugal rejected this proposal, and declared war against the Spaniards, who, without resistance centered Portugal with a considerable army, while a whole body of French threatened another quarter. But, by the assistance of the English, an effectual-stop was put to the invasion; and a general peace was concluded, at Fontainbleau, in the year 1763.

Joseph died on the 23d of February, 1777, and was succeeded by his daughter, Mary Frances Isabella, princess of Brazil. She was born in 1734, and married her uncle Don Pedro in 1760; and these two are now the joint sovereigns of the Portuguese

dominions.

C H A P. XVI.

SWITZERLAND, OR SWISSERLAND.

SECTION I.

Boundaries, Extent, Climate, Soil, Rivers, Lakes, Vegetable and Animal Productions, &c.

THIS country (the Helvetia of the ancients) is bounded on the north by Swabia, in Germany; on the fouth by feveral territories in Italy; on the east by Tyrol and Austria; and on the west by Burgundy, and other parts of France.

Here it is to be observed, that modern geographers give the name of Switzerland to all the countries fituated between France, Germany, and Italy, and inhabited not only by the Swifs, properly so called, or the Thirteen Cantons, but other states, allies, or sub-

jects, of the Grand Helvetic Body.

Switzerland being a mountainous country, lying upon the Alps, the frosts are consequently bitter in the winter, the hills being covered with snow sometimes all the year long. In summer the inequality of the foil renders the same province very unequal in its seasons. On one side of the mountains the inhabitants are often reaping, while they are sowing on another. The vallies, however, are warm, fruitful, and well cultivated. The country is subject to rains and tempests, for which reason public granaries are every where erected to supply the failure of their crops.

The principal rivers are the Rhine, the Rufz, the

Tefin, and the Rhone.

The vegetable productions of Switzerland, in the enclosures and open fields, are vines, wheat, rye, barley, oats, buck-wheat, beans, millet, lentil, hemp,

flax. potatoes, turnips, kidney beans, poppies, clover, &c.: The animal are cattle, fish and fowl. The Boquetin and the Chamois are animals of amazing activity. The blood of them is of fo hot a nature, that fome of the mountaineers, who are much subject to plurifies, take a few drops of it, mixed with water, as a remedy for that disorder. The flesh of the Chamois is esteemed very delicious. Here are also mineral productions.

SECTION II.

Divisions of Switzerland. Particular Description of the Cantons and their Dependencies.

THE Thirteen Cantons of Switzerland are the following, viz. Zurich, Berne, Lucerne, Uri, Schweitz, Underwald, Zug, Glaris, Bafil, Friburg, Solothurn, Schaffhausen, and Appenzel. Of these in their respective order.

ZURICH is 60 miles in length, and 48 in breadth. It abounds in corn, wine, and excellent pastures, and

is very populous.

Zurich, the capital of the Cantons, is one of the most considerable cities in Switzerland, for its antiquity, credit, and rank. It is pleasantly situated at the extremity of a fine lake, where the river Limmat divides it into two parts, and has two bridges over it.

The lake of Zurich is about ten leagues in length; but no part exceeds a league in breadth: its figure is nearly of a bow. On the west side of the lake is mount Albis, which is pretty high; and on the east a

chain o vated. In Z The in without of Swit

In Zurich are many persons of learning and merit. The inhabitants, in general, possess piety and virtue, without pride and oftentation. This was the first city of Switzerland that embraced the reformation. It was begun by Zuinglius in 1517, and established in 1524.

Berne, though it holds the fecond rank, may be deemed, in power and extent, the first Canton of Switzerland, as it comprehends about a third of the country, and its population is a fourth of the whole. It is 60 leagues in length. The reformation was introduced here in 1528.

The city of Berne, which gives name to the whole canton, and is the capital, is almost surrounded by the river Aar. The houses are mostly built of white free-stone, and, in the principal streets, have piazzas, or arches, under them, for the convenience of walking dry in wet weather. Here are a college, public library, museum, granary, guildhall, arsenal, several hospitals, a handsome stone bridge, and a platform with a fine prospect.

The city of Berne is fovereign of the whole canton, and the fovereignty rests intirely in the great council, composed of 200 counsellors, and 99 affestors. The sonale, or little council composed of 27 members, have the executive power.

In Berne, as, indeed, throughout Switzerland, they are rigidly fevere in the execution of the penal laws, not only in capital crimes, but leffer offences. For petty larceny matters the culprit is generally fentenced to the pillory. The pillory here differs from ours, being conftructed in the form of a long cage, fo that the offender can neither fit or kneel, but is under the necessity of continuing the whole time of the punishment in an exact posture.

Female profitutes, when become notorious, are apprehended, and fentenced to cleanse the public streets. Four, and sometimes fix, are harnessed or linked to the scavenger's cart, which, on pain of the lash, they are compelled to drag step by step through the streets; while others sweep, gather up the soil, and shoot it into the cart. An officer, something like one of our parish beadles, superintends the execution of this punishment; and if any relations or friends of the delinquents presume to afford them assistance, or even grumble at their sentence, they are immediately put in their places, to undergo the same disgrace of drudgery.

Halzli is a village, giving name to a territory or valley of confiderable extent, in which are fine woods of beech and pine, excellent roots, wild fowl of most kinds, chamois, and other mountain animals, together with mines, particularly of lead and iron, and fine crystals. This village forms the eastern extremity of the canton of Berne.

The Pais de Vaud, which submitted to the canton of Berne in 1536, and at the same time embraced the reformation, is a fine country, abounding with vineyards, corn-fields, and pastures.

Laufanne, the capital of the Pais de Vaud, and the fecond city of the whole canton, flands one mile and a half from the lake of Geneva. It gives name to a bailiwick, the bailiff of which refides in the caftle, which was formerly the bifthop's palace, and has fome jurisdiction in the town. In the college here Theodore Beza translated the Psalms into French verse.

LUCERNE, the most powerful of the Catholic cantons, is about 40 miles long, and 32 broad. The mountainous parts abound with sheep and cattle, and the level districts are fruitful in corn. The government is aristocratical, and the chief revenue arises from the estates of the extinct nobility.

Lucerne, from which the canton has its name, standing on a branch of the lake of Lucerne, where the Rusz issues from it, is a considerable thoroughsare to

Italy, by mount St. Gothard, and contains an arfenal, a magnificent college and town-house, several convents, with a cathedral or collegiate church.

The town forms a fine object at one extremity. Mount Pilat, and the Rugi, are noble mountains.

The lake of Lucerne exhibits greater variety, and more picturesque scenery, than any other of the Swiss lakes.

URI, which is 60 miles long, and 20 broad, abounds with mountains, the chief of which, called St. Gothard, is the highest in Switzerland. Over it is carried a fine road, in one continued afcent of eight hours, to the very fummit. This road deferves particular notice, being, in most parts, fix feet wide, and every where well paved during its whole ascent. The Rusz runs by its fide; over which are feveral handsome bridges. This road, in fummer, is perfectly fafe, not only for horses, but even for carriages; though, in winter, the fall of maffes of fnow have proved fatal to many travellers. It lies between very high mountains, the lower parts of which are covered with thick woods, but above are quite bare. Several parts exhibit the most beautiful cataracts, either from the Rusz, or other fmaller streams; while many of them, by reason of the rocks which obstruct their passage, are thrown into a mist, which, by the refracting rays of the fun, form a variety of rainbows, and at the fame time both charm and cool the traveller. But as he advances he is terrified at the view of frightful rocks hanging over the road, and so worn out underneath, that they appear as if they were just going to fall and crush him to atoms. On the other hand, when he finds himself shut in, on all fides, by fuch flupendous mountains, of vaftly different aspects, some quite bare, and others tusted with trees, and abounding with various forts of medicinal herbs, he has reason to admire the wonderful works of the Creator, and to extol the industry and ingenuity of the inhabitants, who, at an immense hazard, toil, and expence, keep these roads open. For this purpose they join rocks together by arched bridges, cut away through feveral rocks; and when the road feems ready to fink, support it by stout walls and buttreffes, with great posts, which they drive deep into the earth, and stones, which they fasten to one another by iron

At about two hours distance above the village of Gestinen lies the largest bridge over the Rusz. It is of flone, and of a furprizing height, with only one arch, which is an exact femicircle, the piers of which rest upon two rocks of vast height; and here the noise of the rapid torrent adds to the terrors of the scene. It is 50 feet over, and its height above the water about 70. It can scarcely be imagined how it was possible to erect a bridge there: and the inhabitants, thinking it beyond the power of man to accomplish it, therefore call it Teuffelsbruck, or The Devil's Bridge. In one part of this mountain, near the highway, is a Capuchin convent, in which two fathers constantly attend, and, for a fmall confideration, accommodate travellers with whatever is wanted. Many thousand head of cattle graze on this, and the other mountains here, in fummer; and great quantities of cheese are made on them. The vales between these mountains are exceeding hot in fummer, and yield the most luxuriant crops of grafs. Most beautiful crystals also are often found among them.

The inhabitants are a hardy, vigorous, and brave people. They have no wine, little corn, and few or no manufactures; but plenty of wood, fish, black cattle, butter, and cheese, with which they purchase what necessaries they want. They are reckoned about 20,000 in number, of which those of better sashion live by the flocks and herds they keep in their grounds; and the meaner fort by attending these herds, or hawking and peddling German and Italian wares. The government is democratical, and divided into ten districts. The scenery of that part which is called the lake of Uri is particularly

particularly fublime. It is narrow, and edged, on both fides, with the most wild and romantic rocks, with woods of beech and pine down to the very water's

edge.

But this fine lake is particularly interesting for having been the theatre whereon the independency of Swifferland was originally planned. Here is the chapel of William Tell, on a rock, jutting out into the lake, under a hanging wood; and the village of Brunnen, where the treaty of 1315 was figned between Uri, Schweitz, and Underwalden.

The only remarkable places in this canton are the

two following:

Altorf, i. e. the Old Village, a well built town, being the feat of government, and the place where most of the gentry reside, contains an arsenal, a granary, a handsome town-house, with a house for cutting and polishing crystal, three churches, and two convents.

Urferenthal, or Urferen Valley, is about nine miles in length, one in breadth, and yields good pafturage. The inhabitants area free people, and rather allies than fubjects of the canton of Uri. In ecclefiaftical matters they are subject to the bishop of Coire.

Schweitz is about 30 miles in length, and 20 in breadth. The land, for the most part, is pasture ground, yielding little corn, and no wine; but they have plenty of fish from their lakes and rivers, with black cattle, game, butter, and cheese. With respect to its government and religion, they are much the same as those of Uri; and its inhabitants too, like those of that canton, are hardy, bold, and vigorous.

Schweitz, which gives name to it, is its capital, and the feat of regency, is fituated 10 miles from Lucerne, in a pleafant valley, and contains, befides a parish church, three convents, a town house, a mint, an hospital, an arsenal, and several handsome private

houses.

At Einfidlen, a fmall town near the river Meuse, to miles north-east from Schweitz, is a rich benedictine abbey, the abbot of which has the title of prince, and is lord of the town and its territory, under the sovereignty, or rather the protection, of the canton. The abbey is a large edifice, containing magnificent apartments for the abbot, with a library, and convenient rooms for the recluses, and the entertainment of strangers. The church of Our Lady is embellished with masterly paintings, rich gildings, and most delicate slucco-work. In the district belonging to the abbey is also a nunnery, which, as well as the abbey, contains a treasure of great value.

Underwald is divided by a forest into two parts, distinguished by the names of Ober and Underwald, i. e. above and below the forest; but the canton bears only the name of the latter. It reaches about 18 miles from north to south, and 15 from east to west. Here are fine fruits, passures, woods, and cattle, with lakes, mineral springs, and quarries of marble. The two parts make two communities, which have each their respective chief, diet, council, seal, banner, and officers; but as they both constitute only one canton, they have also a common-council. Both are of the Popish religion. Though each sends a representative to the general diet of the cantons, yet they have but one voice. The capital of the vale above the forest is Sarnen, on the river Aar, and of that below, Stanz.

Zug is a fmall canton, reaching above 12 miles either way; but very populous and fruitful, yielding wines, wheat, chefnuts, and other fruits; and its mountains produce excellent pafture. The government is democratical. The inhabitants are Roman Catholics. There are two lakes in it abounding with fifth; and the woods produce great plenty of game. The only place in the canton worth mentioning is

Zug, which is delightfully fituated on a beautiful

lake, in a fertile valley. The lake is three leagues long, and one broad.

GLARIS is furrounded on all fides, except towards the north, with lofty mountains, one of which, called Todiberg, is almost impassable. The principal valley extends from north to fouth above 20 miles, and is fubject to earthquakes. The other vales yield good pasturage, but little corn or pulse. Vast numbers of horses, black cattle, goats, and sheep, graze both on the mountains and in the vallies; and great quantities of butter and cheese are made in each. The mountains yield wood, flate, crystal, mineral waters, and baths; and the rivers and lakes abound with fish. The government is democratical, and the fenate is composed of 62 persons, over which the landaman and proconful refide, who are never of the same religon; for the inhabitants are partly Papifts, and partly Protestants; but they live very peaceably together. Here, as in other democratical cantons, besides the diets, is a council of regency, with feveral courts of justice, for civil, criminal, and ecclefiaftical affairs. Therespective towns in this canton are fo trifling as not to merit any particular description.

Basil, which is 20 miles in length, and about 18 in breadth, contains 27 parifhes, and 7 bailiwicks; and its inhabitants are Protestants. The lower parts of it are fruitful in passure, corn and wine; but the mountains are barren. There are many medicinal springs and baths in it, and the air his wholesome and temperate. Both men and women, for the most part, wear the French dress; but the language commonly spoken is High Dutch; though the French also is much used. Its government is aristocratical. The only

place worthy of notice in this canton is

Basil, Basle, or Bale, its capital, the largest city in Switzerland. Its environs are beautiful, confifting of a fine level track of fields and meadows. divided into two parts by the Rhine, over which there is a handsome bridge. It is fortified with walls, moats, towers, and baftions, and contains feveral churches, besides the cathedral, which is an elegant Gothic structure; a commandery of the order of St. John, and another of the Teutonic order; a public granary, an arfenal, a stately town-house, an university, a gymnafium, a flately palace belonging to the margrave of Baden-Dourlach, befides a chamber of curiofities, feveral hospitals, &c. In the arfenal is shewn the armour in which Charles the Bold loft his life, with the furniture of his horfe, and the kettle-drums and trumpets of his army. On the stair-case of the council-house is a picture of the Last Judgment. Over-against the French church, on a long covered wall, is painted the dance of Death. St Peter's Square, planted with clm and lime trees, forms a pleafant work; but a fpot regularly planted with trees, close by the river, and near the minfter, makes a finer, as commanding a most beautiful and extensive prospect. The celebrated Erasmus died here in 1536, in the 70th year of his age, and was buried in the great church. Some of the merchants here are opulent; but the fumptuary laws are friet, and a fimplicity of manners still prevails at Basil. A strange custom prevails here, that the town clocks are always an hour too fast; so that when it is really noon it is one o'clock at Bafil, and fo on. Several reafons are affigned for this fingularity; which the magistrate cannot yet perfuade the common people to alter. Trade flourishes here, especially in filk, ribbons, and wines; and the police is under excellent regulations. The two Buxtorffs, father and fon, and the famous painter Holbein, were natives of this place.

FRIBURG, which is near 40 miles in length, and 20 in breadth, is partly mountainous, and partly champaign; and, befides fome wine, yields plenty of pafturage, grain, fruit, cattle, and cheefe. It is divided into three inner bailiwicks, and 16 outer, befides the territory of the city. The inhabitants are Papifts.

One part of them speak a corrupt French, the other The only place of note in it is

a baftard German. The only place of note in it is Friburg, which gives name to it, and stands among rocks, in a valley, on the river Soane, fix leagues fouth-west from Berne. Here are several churches, convents, and hospitals, with a handsome college, a mint, a granary, an arfenal, a commandery of St. John, and a council-house, which stands on a rock, and commands a great prospect. The government is much the fame as that of Berne, except that here it is confined to 70 families of patricians, exclusive of all others. The town is tolerably well fortified. At the distance of a league from Friburg, in a wilderness of woods and rocks, is a remarkable hermitage, called la Madelaine, confifting of a church and steeple, with an oratory, a hall, refectory, kitchen, feveral chambers, stairs, a cellar, well, and other conveniencies, all hewn out of a rock. This great work was performed by an hermit, named John de Pre, having had no fort of affiftance from any person but his servant, in the course of twenty-five vears.

SOLOTHURN, Or SOLEURE, is about 12 miles long, and 10 broad, and is fituated on the river Aar. It is tolerably fertile, yielding corn, wine, fine woods, fruits, and pastures. The religion protessed in it is the Roman Catholic, except in one bailiwick; and the government is ariffocratical. The principal place in it is

Solothurn, or Soleure, which gives name to it, and is fituated in a pleasant, fertile country. Here is a collegiate church, a large college, a well furnished arfenal, and two convents. The government is much the fame as that of Berne and Friburg, and the language chiefly fpoken is French. In 1777 an alliance was concluded here between the king of France, and the Thirteen Cantons and their allies, for fifty years.

SCHAFFHAUSEN is the most fouthern of all the Swifs Cantons, and lies entirely on the German fide of the Rhine. It is about 20 miles long, and 12 broad; and is, in general, fertile, yielding corn, fruit, pafture, plenty of fifth, mineral fprings, and good red wine. The inhabitants are Protestants, and the government aristocratical. The only town in it worth notice is

Schaffhaufen, which is pleafantly fituated in a plain on the Rhine, and is very handsome, the streets being broad and the houses magnificent. Here are several handsome churches, an arfenal, an academy, a noble cabinet of rarities, and a good fortress. The city carries on a confiderable trade by the Rhine, over which it has a bridge built entirely of timber, by a common carpenter, and effeemed a very curious work. As its name, in German, fignifies a fheepfold, fo it has a fheep for its coat-of arms, as also upon its coin. In the suburbs of the city is a spring of water in a cellar, fo plentiful, that it supplies above 100 pipes; and in the neighbourhood is a fine free-flone quarry.

In order to view the famous cafcade of the Rhine, you must either go to Lauffen, which is a league from Schaffhaufen, or to Neuhaufen, which is only half a league, and where the fall is feen to better advantage; but at the latter you must cross the river, to which some persons have an objection. Hence you have first a back view of the cafcade; and when you have walked down the hill, it plays upon you in all forms as you go to the ferry, from a profile to a front view. As you cross the river you enjoy it in full front all the way, and diftinguish the three sheets of water rolling down in all their majefty. You fee also that towards the oppolite fide, part of it is dashed back, and broken into fpray. The whole is white with foam, except here and there fome green tints, especially when the fun thines upon it. Having croffed the river, you mount the hill to a little platform, built on purpose to bring you close to the cascade; and there you see it foaming with the greatest fury, whilst you are safe even from the spray, unless the wind happens to set toward you. If the view of this object be truly picturefque from the No. 81.

other fide, from hence it is grand and majestic. By ascending a little higher to the castle of Laussen, you have a fourth view, wherein you look down upon the falling river, and also trace its progress. In order to fee the rainbow formed by the spray, you must be on the spot before nine o'clock in the morning. Accounts vary much as to the height of the cataract; but this is chiefly owing to the different feafon at which travellers have viewed it. After all, it is not the height of the fall, but the immensity of the body of water, broken in a most picturesque manner by the rocks, that constitutes the beauty of the cascade of Lauffen.

APPENZEL, the last of the Thirteen Cantons, is about 30 miles long, and 20 broad. It yields good pasturage, and consequently is not destitute of cattle, milk, butter, or cheefe. Confiderable quantities also of wheat, rye, barley, oats, beans, peas, flax, and wine, are produced in it; befides a great deal of fruit, wood and turf, with mineral waters, and warm baths. There are many mountains in the canton, the highest of which is that called the Hohefantis, or the Hohe-Meszmer, which commands a prospect of a prodigious extent. There are also several lakes and rivers. The inhabitants sublist chiefly by their manufactures of linen, crape, fustian, and thread, or by bleaching, and the fale of their cattle, butter, cheefe, horses, wool, and coal. Appenzel is the capital of this canton, and divided into twelve communities; fix, called the in-terior, are Roman Catholics; the other fix, called the exterior, are Protestants.

We shall now proceed to the feweral bailiwicks that

belong, in common, to certain cantons. And first The Bailiwick of Thurgau, which takes its name from the river Thur, that traverses it, is very large and populous, and though formewhat mountainous, in general tolerably fertile. About one third of its inhabitants are Papists, and the rest Protestants. The chief places in it are

Frauenfeld, the capital, which stands on the river Murk. Here the Diet of the Swiss is held. In 1771 the greater part of this town was burnt, but it has been

almost wholly rebuilt. Diffenhosen, a considerable town on the Rhine, over which it has a bridge, enjoys great privileges. magistracy is composed partly of Papists, and partly of Protestants.

The Bailiwick of the RHEINTHAL is about 20 miles long, and 5 where broadest, and is fruitful both in corn and wine, especially the latter. There is a crystal pit in it, in which a vast deal of yellow, brown, and white transparent crystal is found. Most of the inhabitants are Protestants. The fovereignty of it belongs to nine cantons, viz. Berne, Zurich, Lucerne, Schweitz, Glaris, Uri, Underwald, Zug, and Appenzel, who alternately appoint a bailiff every two years: but the abbot of St. Gall has not only a share of the jurisdiction, but a great revenue from it.

The Bailiwick of SARGANS is about 24 miles in length, and 5 or 6 in breadth. Its mountains feed great numbers of cattle, and its vallies produce corn and fruit. The inhabitants are partly Papists and partly Protestants. It is divided into the Upper and Lower Sargans; but neither of them contain any thing remarkable, except

Pfeffers, a rich Benedictine abbey, whose abbot is a prince of the empire. About a mile and a half from the convent is a famous hot bath belonging to the abbey, the water of which is good for many diffempers, being impregnated with spirit of fulphur, nitre, vitriol, and various metals.

The bailiwick of GASTER is chiefly mountainous, notwithstanding which it is far from being unfruitful. The inhabitants are Papists. This district has a dict held every two years, and a council, with two courts of justice, one for civil and another for criminal causes, in all which the bailiff prefides. The only place worth mentioning here is

Schanis, in which there is an abbey for ladies. The abbefs is a princefs of the empire, and obliged to lead a fingle life; though her nuns may marry.

The Bailiwick of UTZNACH was purchased by the cantons of Schweitz and Glaris, by whom a bailiff is appointed alternately every two years: but when it is the turn of the latter, he is nominated by the Papifts alone, the inhabitants being mostly of that persuasion.

The Bailiwick of GAMBS is subject to the same cantons as the former, and enjoys much the fame pri-

The Town of RAPPERSCHWEIL, with its District, lies 13 miles fouth-west of Zurich, on the lake. is a good town, and well fortified. The wooden bridge, which extends from hence to a point of land in the lake, is near two miles in length, yet it is remarkable that it is entirely open, there not being any rails on either fide. The inhabitants, who are Roman Catholics, enjoy their ancient privileges, under the fovereignty of Zurich and Berne.

The County and Bailiwick of BADEN is about feven leagues in length, and three in breadth; is watered by three navigable rivers; and is subject to Berne, Zurich, and Glaris, who fend a bailiff in turn. The religion is mixed, but the Catholic predominates.

Baden, the Aque Helvetice of the Romans, is fituated on the river Limmatt, in a narrow plain, between two hills. Its baths were famous under Augustus, or very foon after; and abundance of antiquities have been found here.

The hot baths are at a little distance from the town, below it, and on the banks of the Limmatt. The great baths are on the left bank. There are fixty of them, large and commodious, in the hotels and lodginghouses: and in the middle of the town are public open baths for the use of the poor. They are all/supplied by feven fprings.

The Free Amts, or Provinces, are divided into Upper and Lower, in both of which the foil is very fruitful. The inhabitants are Roman Catholics. The only place in them worth mentioning is Muri, an opulent and celebrated Benedictine abbey, on the river Bunz, the abbot of which is a prince of the empire, and im-

mediately under the pope.

Under the joint fovereignty of Zurich, Berne and Glaris, are the towns of Bremgorten and Mellingou; the former of which carries on a good trade, especially in the manufacture of paper; but the latter is inconfiderable.

Of the common bailiwicks in Switzerland, the remaining four, viz. Schwarzenburg, Morat, Grandfon, and Eschalons, are under the joint sovereignty of Berne and Friburg. The inhabitants of the three first are Protestants; but those of the last are partly Protestants and partly Papists.

The ITALIAN BAILIWICKS lie in Italy at the foot of the Alps. They are feven in number, namely, Bellenz, Riviera or Polefe, Valle di Bregno, Lauis, Lugganes, Meyathal or Val Maggia, and Mendin. They are all mountainous, but tolerably fertile. The inhabitants all Papifts, and speak the Italian language.

Under the protection of Lucerne, Uri, Schweitz, · and Underwalden, are Emgelberg Abbey, and the Borough & Gersau.

OF THE ALLIES OF THE CANTONS.

THE Swifs allies are those who are united to the cantons by a folemn league, in confequence of which they have a vote in their affemblies. They are as follow:

The Abbey of St. GALL, whose abbot is fovereign of that called the Patrimony of St. Gall, is fituated between Zurich and the lake of Constance. The abbey, which is of the Benedictine order, is very spacious, and contains a palace, a conventual church, and a library. The number of monks is 60, by and from among whom the abbot is chosen, who is immediately subject to the pope, and a prince of the empire. As an ally

of the cantons, his deputies have a feat and voice in the general diets and meetings of the confederacy. He has the disposal of all benefices in his territories, and the nomination of all judges and officers.

The Town of St. GALL is fituated in the Upper Thurgua, near the river Steinach. It is very large and populous, and its inhabitants are mostly Protestants, which occasions disputes between them and the abbot about religion. Here are feveral churches, a gymnafium, a town-house, an alms-house, and an arfenal. The town was formerly subject to the abbot; but it is now a republic, and fends deputies to the general diet. The government is ariffocratical. The inhabitants of St. Gall are uncommonly industrious, and have an extensive commerce in the manufactures of linen, muslin, and embroidery. The arts and sciences are cultivated, and literature is in great esteem. Their library is ample, and well arranged.

The Bishopric of BASLE is situated on the lake to which it gives name. At the famous pass of the rock, called Pierre Pertuis, the road is carried through a folid rock near 50 feet thick. The height of the arch is 26, and its breadth 25. The rock itself, and fpois

adjacent, afford a very romantic prospect.

The Country of the Grissons is divided into three parts, called Leagues, and diftinguished by the several denominations of the Griffon or Grey League, the League of the House of God, and the League of the Ten Jurisdictions. The length of the whole is about 70 miles, and the breadth 60. It is, in general, a mountainous country, but produces most of the necesfaries of life. - The inhabitants are partly Papifts, and partly Protestants. Each of the Leagues is subdivided into feveral leffer communities, which are fo many democracies, every male above 16 having a share in the government of the community, and a vote in the election of magistrates. Deputies from the several communities constitute the general diet of the Griffon Leagues, which meets annually, and alternately, at the capital of each League; but they can conclude nothing without the confent of their constituents.

The Griffon, or Grey League, is divided into eight diffricts, which contain feveral small villages; but nei-

ther of them merit particular notice.

The League of the House of God is the most confiderable of the three, and contains some very high mountains. The chief of it has the title of Prefident, and is elected annually. It is divided into two great communities, and those again into smaller, called Jurisdictions. The principal place of note in it is

Coire, or Chur, the capital not only of the League, but of the whole republic. It is large and populous, and its neighbourhood beautifully diversified with hills, plains, vineyards, corn-fields, and orchards. Here are feveral churches, an arfenal, a college, a grammarfchool, a granary, and a town-house, in which is held, once in three years, the general diet, and also the ex-

traordinary diets, and the congresses.

The League of the Ten Jurisdictions is the smallest of the three, and divided into feven communities, out of which the chief is annually chosen by turns. The country confifts, for the most part, of rugged mountains, yielding neither corn or fruit, except on the banks of the Rhine, and a few other places; but abounding in horses, cattle, fish, milk, butter, and cheese, of all which there is a considerable exportation. The language spoken in general is the German.

The countries or territories subject to the Griffon Leagues lie at the foot of the Alps, near the entrance of Italy, and confifts of the Valteline, and the counties of Bormio and Chiavenna, all of which are very fertile, but do not contain any thing remarkable. language is a corrupt Italian, and the religion Popery.

The Barony of HALDENSTEIN is under the protection of the Griffon Leagues, and takes its name from the village of Haldenstein, which has a palace in it, and a small castle. The inhabitants of this barony are Protestants.

The country called the VALAIS, in alliance or confederacy with the Swifs Cantons, is one large vale, bounded by very high mountains. It is divided into Upper and Lower. The foil is fertile in corn, wine, and various forts of fruits.

In the Upper Valais are the famous hot baths called

the baths of Leuck.

In the diffrict of Rarogne, belonging also to the Upper Valais, are the ruins of the castle of Chatillon, or Chillon, built upon a rock, with a very narrow road between the castle and the mountain. It has galleries, battlements, &c. and was very fliong before the invention of artillery; but is entirely commanded by the mountain.

Rarogne, from whence the district derives its name, with the ruins of the castle, of the same name, together with the adjacent fpot, exhibit, among other antiquities, a melancholy proof of the impairing effects of time, while they present a view at once dreary and

romantic.

In the Lower Valais is the famous mountain of St. Bernard, which has on its top a convent, where the friars maintain all travellers for three days gratis, whe-

ther Papists or Protestants.

The inhabitants are of short stature, tawny complexions, and vacant countenances. It is uncommon to find either a man or woman without large fwellings in the throat. The people exhibited to the public of this metropolis some time ago, called " Monstrous Craws," were no doubt natives of this country; though credulity caught the bait held forth by impostors to Those who speak German resemble the Swiss; the rest are like the Savoyards. They are, in general,

The town of MUHLHAUSEN is large, well built, populous, and adorned with feveral churches, and other good structures. The inhabitants are Protef-Though this town is in alliance with the Protestant cantons, yet it sends no deputy to the general

The Republic of GENEVA is on the confines of Savoy, France, and Switzerland, in 46 degrees 12 minutes north latitude. It is pleafantly fituated on the banks of the river Rhone, just where it emerges from the lake. The streets are, in general, wide, clean, and well paved. The houses are mostly built of freestone, with lime-stone basements. The Maison de Ville, or town house, is a large plain, ancient building, with great rooms for the councils to affemble in, and for public entertainments. In one of them there is a weekly concert by fubscription during the winter feafon. There are five churches here, besides French, Italian, and German chapels. The academy has about 600 scholars, and 11 professors. Small medals are annually diffributed to those who have diffinguished themselves in each class. The public library has near 40,000 volumes of printed books, besides a good collection of manuscripts. The citizens have the liberty both of reforting here, and borrowing books. The arfenal is in good order, and furnished with arms for artenal is in good order, and tarinine and according to the public fountains are fupplied by an hydrau-lic engine. The fortifications are in the modern fille on the fide of Sayoy, but are commanded by fome of the neighbouring ground. On the fide of France, they are old fashioned. They are calculated rather to prevent a furprise, than to fustain a regular siege. They have three gates towards France, Savoy, and Switzerland. All access by the lake is barred by a Switzerland. All access by the lake is barred by a double jetty and chain. The garrison confifts of 720 men, Swifs or Germans.

The fovereign power refides in the general affembly of citizens and burgeffes, who have attained the age of 25 years. The executive power, and administration of justice, are intrusted, 1, to the council of 25, called the fenate, or little council. 2. The council of 60. 3. The council of 200, comprehending the other two, and confifting now of 250 members. The fu-

preme magistrates are four syndics, elected annually by the general affembly. Other officers are, 1. The lieutenant, chosen also annually. 2. The treasurer, elected for three years. 3. The procurator-general, also for three years. Inferior departments of government and police are managed by committees, called Chambers.

The ecclefiaftical constitution is purely Presbyterian, and the most tolerating of all the reformed states.

The revenues of government are about 500,000 French livres, or little more than 20,000 pounds fter-

The law of the state is the Roman law, with some modifications. They have no titles of nobility or hereditary dignities.

Their arts and manufactures are watch-making, jewellery, printed cottons and linens, printed books, dreffed leather, and some other smaller articles.

Since the late troubles a theatre has been built within the city. The only public diversions besides this are two concerts. Private balls are not unfrequent; and plays are fometimes performed by gentlemen and The chief amusement is cards, at which the women constantly play in their focieties, tea-drinkings, and affemblies. Most of the men meet daily in their circles or clubs. The 12th of December is a kind of state holiday, kept in memory of the duke of Savoy's attempt upon the city; and called the day of the Escalade. In fine weather there is a great resort to the Treille, and other public walks.

The territory of Geneva contains about feven fquare leagues, and is divided into nine parishes. The country round the city is fo varied, that every village and campagne prefents fresh beauties, arising from the different points of view in which the lake, mountains,

and the country present themselves.

The lake of Geneva is chiefly a dependent of the canton of Berne. The form of it is that of a crefcent, with the horns blunted. The length, from Geneva to Villeneuve, is eighteen French leagues and three quarters. The greatest breadth is three leagues and a quarter. It is very shallow near Geneva, but off Meillerie is found to be 950 French feet in depth. This lake owes the chief part of its waters to the Rhone, which enters it near Villeneuve, and goes out of it again at Geneva. There are, however, no less than thirty-one rivers or torrents, and nine brooks, befides the Rhone, that furnish their respective little quotas. The great melting of ice and fnow in the mountains occasions the lake to be five or fix feet higher in fummer than in winter; at which feafon it never freezes. Its extent, the clearness of its waters, and the variety and beauty of the country on its banks, make it deservedly esteemed one of the finest lakes in

Strangers are no where provided with a greater variety of coin than at Geneva, the money of almost' every country in Europe being current here. They have also different ways of reckoning, by livres, and livres current. The different coins are as follow:

The pistole of gold, worth ten livres of Geneva, is rarely feen. The ecu of filver. Pieces of 21 fols. and 101 fols, both filver. The livre is nominal, and worth two florins. The florin is worth 10 fols of France, or 12 of Geneva. Pieces of 6 and 3 fols, $1\frac{1}{2}$ fol, $\frac{3}{4}$ fol, and $\frac{1}{2}$ fol. This laft is worth 6 deniers of France, or 2 gros of this country. These are all copper washed. The Louis d'or is worth 14 livres 10 fols of Geneva. The French ecu is worth 3 livres 121 fols of Geneva. Three livres current of Geneva are worth from 521 to 56 pence English, according to the course

The dress of the men at Geneva is chiefly broad cloth, without lace or trimmings, except frogs. of the women is filk in winter, and printed cottons,

which they call Indiennes, in fummer.

The fituation of Geneva being extremely healthy and delightful, and fociety of all forts good, it cannot but be a defirable place of refidence for a stranger. The French language is well spoken here; and there is also the most perfect liberty, both civil and religious.

At Ferney, in the vicinity of Geneva, is the tomb

of the celebrated Voltaire.

SECTION III.

Character of the Swifs. Wholesome Laws and Probibitions. Mechanical Genius. Admirable Effects of the Helvetic Union.

THE inhabitants of Switzerland are univerfally acknowledged to be a brave, hardy, and industrious people; remarkable for their fidelity and zealous attachment to the liberties of their country. Like the Romans of old, they are equally inured to arms and to agriculture. They are, in general, an enlightened people, a taste for literature being universally prevalent among them; and a genuine and unartful good breeding is conspicuous in their gentry.

Sumptuary laws are in force in most parts of Switzerland; and no dancing is allowed but upon particular occasions. Silk, lace, and several other articles of luxury, are totally prohibited in some of the cantons; and even the head dresses of the ladies are regarded. All games of hazard are also strictly prohibited; and as their diversions are chiefly of the active and warlike kind, and their time is not wasted in games of chance, many of them employ part of their leisure in reading, to the great improvement of their understanding.

The youth are diligently trained in all the martial exercifes.

The mechanical genius of the Swiss is wonderful; and their progress in all the numerous branches of watch-making almost incredible. The first watch seen in these parts was brought from London in 1679, which excited one of the inhabitants to make one. He accomplished his purpose unaffisted. A late intelligent traveller observes, that it is a great singularity to see the mechanical arts flourishing amidst rocks; and such an amazing exportation of watches from spots which not many years since was one continued forest.

Amongst the chief of the literati of this country we mention Calvin, who instituted laws for the city of Geneva, which are held in esteem by the most learned of that country: Rouffeau, who gave a force to the French language, which it was thought incapable of receiving; together with M. Bonnet; and

Meff. de Sauffure and De Luc.

We observe lastly, that there is no part of Europe which contains, within the same extent of regions, so many independent commonwealths, and such a variety of different governments, as are collected together in this remarkable country; and yet with such wisdom was the Helvetic Union composed, and so little have the Swifs of late years been actuated by the spirit of conquest, that since the establishment of their general confederacy, they have scarcely had occasion to employ their arms against a foreign enemy, and have had no hostile commotions that were not soon happily terminated.

C H A P. XVII.

I T A L Y.

SECTION I.

Situation, Extent, Boundaries, Mountains, Rivers, Climate, Soil, Productions, &c.

THIS country, celebrated for having been once the feat of the Roman empire, of the muses, of arms, and of arts, but now considerable so far only as the vestiges of its former greatness can be traced, is situated between 37 and 46 degrees of north lat. and between 7 and 10 degrees of east long. Its length is about 600 miles, and its utmost breadth about 400. Its boundaries are France, Switzerland, and Germany, on the north; the Adriatic on the east; and the Mediterranean on the south and west. Its figure is generally compared to that of a boot.

The chief mountains of Italy are the Appenines and the Alps:, the former run the whole length of the country, from north-west to south-east; the latter extend from the river Var, near Nice, to the Adriatic. The principal rivers are the Po, Adiga, Arno, Adda, &c. Besides these, and some other rivers, a great number of lakes are spread throughout the whole

country.

The air of Italy is very different, according to the different fituations of the feveral countries contained in it. In those on the north of the Appenines it is more temperate, but in those on the fouth generally very warm. The air of the Campania of Rome, and of the Ferrarese, is unhealthful, which is owing to the lands not being duly cultivated, nor the marshes drained. That of the other parts is generally pure, dry, and healthy. In summer the heat is very great in the kingdom of Naples, and would be almost intolerable, if it was not somewhat alleviated by the sea-breezes. The foil of Italy, in general, is very sertile, being watered by a great number of rivers. It produces a variety of

wines, and the best oil in Europe, excellent filk in abundance, corn of all forts, but not in fuch plenty as in fome other countries; oranges, lemons, citrons, pomegranates, almonds, raifins, fugar, mulberry-trees without number, figs, peaches, nectarines, apricots, pears, apples, filberds, chefnuts, &c. Most of these fruits were at first imported by the Romans from Asia Minor, Greece, Africa, and Syria, and were not the natural products of the soil. The tender plants are covered in winter on the north-fide of the Appenines, but on the fouth-fide they have no need of it. This country also yields good pasture, and abounds with cattle, theep, goats, buffalos, wild boars, mules, and horfes. The forefts are well flored with game; and the mountains yield not only mines of iron, lead, allum, fulphur, marble of all forts, alabaster, jasper, porphyry, &c. but also gold and filver, with a great variety of aromatic herbs, trees, shrubs, and ever-greens, as thyme, lavender, laurel, and bays, wild olive-trees, tamarinds, juniper, oaks, pines, &c.

SECTION II.

Divisions of the Continental Parts of Italy. Particular Description of the several Ports.

WE shall arrange our description of the continental parts of this country under the following heads, viz. The Ecclefiastical States, or Pope's Dominions; the kingdom of Naples; Piedmont; Montferrat, or Montferrat; Milan; Parma and Piacenza; Modena, Mantua, Venice, Genoa, and Tuscany.

The ECCLESIASTICAL STATE, which is fituated in the middle of Italy, is 240 miles long, but its breadth greatly varies. The foil, in general, is excellent, but badly cultivated, the people being remarkably idle, and grofly fuperfittious. The reformation gave a great

duchy wa

still possesses his temporal dominions.

The Campania of Rome is under the pope's immediate government; but the other provinces are governed by legates and vice-legates. The pope holds a confiftory of cardinals on ecclefiaftical affairs; but the cardinals do not meddle with his civil government. The pope's chief minister is the cardinal-patron, who amasses an immense estate, if the reign be of any long duration. The cardinal who is chosen pope must be an Italian, and at least 55 years of age.

The spiritual power of the pope, though far short

of what it formerly was, is still confiderable. The popes's revenue, as a temporal prince, is estimated at 1,000,000l. arifing principally from the monopoly of corn and duties on wine; but, independent of this, he receives confiderable fums for indulgencies, difpenfations, canonizations, &c. He has a considerable body of regular troops, tolerably well clothed and paid.

The territory of Bologna, which was once a republic, and afterwards annexed to the papal dominions, contains only one place worthy of mention, viz.

Bologna, a large, rich, and populous city, furrounded only by a wall, without baftions, ditch or They have very little good architecture or sculpture in Bologna; but, next to Rome, it boasts the most capital paintings in the world.

The number of churches is upwards of two hundred, fome of them well built, and richly decorated, but few

without good pictures.

Bologna has been famous for cultivating the sciences ever fince the reftoration of learning. It contains an

ample library.

The academy of sciences and belles lettres, confisting of twenty-four members, meet here every Thursday; and from these the professors of chemistry, military architecture, physics, natural history, geography, and aftronomy, are taken, who give public lectures in the Institute.

The botanic garden is a dependance upon the In-

With fuch encouragements and opportunities, it is no wonder that Bologna has always men of learn-

It furnishes also musicians and singers for many of the Italian theatres.

The principal palaces of the nobility are the Aldrovandi, Bovi, Magnani, Ramuzzi, Sampieri, Tanari, and Zambeccari. In all these are fine collections of pictures.

The Afinelli tower, built in 1109, is 327 English feet and a quarter in height. The Garifenda tower, which was built the year following, is only 153 feet in

The Bolognese put themselves voluntarily under the protection of the pope in the year 1506, on condition of being governed by their fenate; of nominating an auditor of the Rota; and having an ambaffador at Rome. A cardinal legate constantly resides here, and has for his guards a company of Swifs halberdiers, and another of light horfe.

Citizens wear a cloak when they walk abroad. Women wear a kind of close gown buttoned, with fleeves down to their wrists; when they go out they

cover themselves with the zendado.

The manufactures are damasks, fattins, taffaties, velvets, crapes, gauzes, and paper. They export hemp, flax, wax, and honey. Their macaroni, tohemp, flax, wax, and honey. bacco, and fnuff, are highly esteemed; and their breed of lap-dogs has been long and generally known. The markets are plentifully supplied with provisions, good in their kind: hog-meat is particularly excellent; and their hams and faufages are generally in repute. They also excel in soap, perfumes, and artificial flowers. They have abundance of walnuts; and their quinces, grapes, melons, and truffles, are remarkably fine.

The principal place in the duchy of Ferrara (which duchy was annexed to the ecclefiaftical state in 1597) is

blow to the spiritual power of the pope. He, however, | Ferrara, once a magnificent city, but now greatly fallen to decay.

Romagna, which was given to the fee of Rome by Pepin, king of France, is a fertile province. The

chief places are

Rovena, now a decayed city, but formerly the most celebrated of all the Roman fea-ports. In the large market-place are two lofty pillars of granate, on which are the statues of St. Victor and St. Apollinaris; and also a brass statue of Pope Alexander VII. sitting, the usual attitude of the pope in all statues and public monuments. The cathedral is a flately old

Rimini, the ancient Ariminum, on the Adriatic, is now greatly declined, though fome remains of its ancient fplendor are still to be seen. Behind the Ca-puchins convent are some remains of an amphitheatre; and over the Marecchia is a stately bridge of marble, built or repaired by Augustus and Tiberius. In the middle of the area, before the council-house, is an elegant fountain. The splendid library of count Gabalonga is well worth a traveller's notice.

The duchy of Urbino is one of the least fertile in Italy, and does not contain any remarkable place but Urbino, celebrated for having given birth to Polydore Virgil, the historian, and Raphael, the painter.

The marquifate of Ancona, on the Adriatic, has a

fertile foil, and contains

Ancona, a beautiful and convenient harbour; and being a free port, and the only confiderable one which the pope has in the Adriatic, there is a flourishing trade here. The chief exportation is of grain, wool, and filk. Ancona appears well from the fea, but is a most wretched town within, full of trade and stench. In the chief street there is room but for one carriage to pals. The mole is a very fine work, adorned with an antique triumphal arch, of white marble, of good proportions, and well preferved, eracted in honour of Trajan. There is also a modern arch, in honour of pope Benedict XIV. by Vanvielli.

Loretto, a small city, 15 miles from Ancona, is the fee of a bishop. The circumstance which renders this city the most particularly famous, is the Santa Casa, the Holy House or Chapel of Our Lady. The walls of the Holy House (as may be easily seen on the inside) are of brick, with some flat bits of stone intermixed. Towards the eaft end there is a feparation made by a grate-work of filver: this they call the fanctuary; and here stands the image of the Virgin in filver, in a nich made, as they pretend, of cedar of Lebanon, and carved by St. Luke. She has a triple crown on her head, and holds the image of Our Saviour covered with diamonds. In her left hand the carries a golden globe; and two fingers of her right are held up, as in the act of bleffing. The fanctuary is crowded with fixty-two great lamps, of gold and filver. One of the golden ones, which was prefented by the republic of Venice, weighs thirty-feven pounds. There are also angels attending; one of massive gold, and two of filver; and the walls are covered with plates of filver. All who enter the chapel armed are excommunicated. Poor wretches are continually crawling round it on their knees. If the treasure within the holy walls be furprifing, the poverty without is no less so. Such shoals of beggars, and so excessively importunate!

The country is delightful and well cultivated, washed by two rivers, and distributed into hills and vallies,

bounded by mountains.

The territory of Perugia contains the lake near which Hannibal defeated the Romans under the conful Flaminius; and the town of Perugia is only noted for having been once taken by the Goths after a feven years fiege.

The territory of Orvieto contains a town of the same name, which is supplied with water from a well cut

into a rock 250 cubits deep.

The duchy of Spoleto is tolerably fertile, and con-

No. 82.

Spoleto, anciently one of the most celebrated municipal towns in Italy, and even now the capital of the duchy. It has a celebrated aqueduct, by which water is conveyed from mount St. Francis over a valley to the city and castle.

Terni is a well built and well inhabited town, and the fee of a bifhop. The ruins of an ancient theatre are flill vifible: and not far from hence is the famous cascade formed by the fall of the river Velino, which rushes down a precipice an hundred yards high.

The principal place in the patrimony of St. Peter is Viterbo, the capital, a pretty town, fituated in a plain, at the foot of the mountain. Several fiquare lofty towers produce an agreeable effect at a diffance. It is well built; the houses are in a good taste. There are some pretty fountains, and some fronts of churches, in a good stile of architecture. The streets are paved wholly with lava, in pieces from sour to eight feet in length. Over a river, called Nera, in this part of Italy, are to be seen the remains of the bridge of Augustus. According to the account of Mr. Addison, it is one of the stateliest ruins in Italy; for though it has no cement, it looks as firm as one entire stone. One of the arches remains unbroken.

The Campagna de Roma, anciently Latium, has many lakes, and a rich cultivated foil, and contains

the following places:

Rome, the capital and feat of the Roman empire, and now the head of the Roman Catholic religion.

Nothing can be more magnificent than the entrance into Rome by the Porta del Popolo. The road is fine, the approach beautiful, and the gate handfome. The traveller immediately enters a large area, from the farther fide of which he fees the three principal ftreets of the city diverging, and flanked by the fronts of two handfome churches. In the middle is a noble Egyptian obelifk, and a fountain.

Rome is about thirteen miles in circuit, measuring round the wall, which is fingle, and without any ditch, defended only by fome towers and bastions. The ancient wall of Aurelian yet in great part remains. The city, therefore, is still of the same extent, though the present population is only about 160,000.

The feven hills are the Aventine, Capitoline, Celian, Esquiline, Palatine, Quirinal, and Viminal; and, befides these, there are Monte Celiolo and Citoria, the Janiculum and Vatican, the Pincian, and the Monte Testaccio.

The inhabitants of modern Rome have, in a manner, left the feven hills to villas, convents, gardens, and vineyards, in order to inhabit the lower parts; and the Campus Martius is become one of the most populous quarters of the city. These hills are much less confiderable than they were anciently, fince the vallies have been filled up with enormous quantities of rubbish.

It would be difficult to convey any idea of the fmaller and lefs regular streets. In general, however, we cannot avoid observing the strange-mixture of interesting and magnificent with common and beggarly objects: palaces, churches, fountains, and the finest remains of

antiquity, with rags, poverty, and filth.

There are many Piazze, or Places, as the French call them. The principal ornaments of these Piazze, or open areas of Rome, are the sountains. That in the Piazza Navona is the most magnificent in the whole world. It is a vast rock, pierced through and through, so as to be divided into four parts, which unite at the top, where the obelisk is placed. Towards the bottom of each part of the rock is seated a colossal figure, representing the principal rivers with their attributes.

The abundance of fountains in Rome gives an air of coolness, life, and motion, to the whole city: but it is a great mistake to conclude from thence, as many have done, that it is plentifully supplied with good water; for the reverse is really the case.

The river Tibe divides the city, properly so called, from the Translevere, or quarter wherein is the church of S. Peter, and the palace of the Vatican. This river is about 315 feet wide, at the bridge of S. Angelo, and is navigable for great barques. The water is yellow and turbid.

There are now three bridges at Rome, viz. that of S. Angelo, anciently Pons Aelius, leading to the caftle; Ponte Ceftio, or of S. Bartolomeo, anciently Pons Fabricius; and Ponte Sifto, anciently Pons Janicus

lensis. Rome formerly had six bridges.

Of the antiquities of Rome the amphitheatre claims the first rank. There are considerable remains of that which was begun by Vespasian, and finished by Domitian, called the Colifaeum. Twelve thousand Jewish captives were employed by Vespasian in this building, which is said to have been capable of containing upwards of 60,000 spectators. It has been stripped of all its magnificent pillars and ornaments at various times, and by various enemies. There are the arches of Constantine, Titus, and Septimus Severus. In the Campo Vaccino are the venerable remains of several stately buildings.

The baths of Titus, Caracalla, and Dioclefian, retain fome veftiges of their ancient grandeur. Thefe edifices were not merely defigned for bathing, but for academies, and the gymnaftic exercises; and also contained libraries and cabinets of curiofities.

There were feveral spacious circuses at Rome. The two noble columns of Trajan and Antoninus are well known; as are the Roman, and several other Forums in the city. The Mausoleum of Augustus, and that of Adrian, claim the notice of travellers; as do nine Egyptian obelisks set up, and three on the ground.

Egyptian obelifks fet up, and three on the ground.

Of the temples, and, indeed, of all the buildings which ancient Rome has left us, the pantheon is certainly the most noble and perfect. The portico has eight pillars in front, and three pillars, with one pillaster, on the sides, all of granite, with Corinthian capitals and basements; but none of them exactly of the same fize. The inscription is on the frieze. The outside of the whole building was encrusted with marble. The portico and body of the edifice were probably built at different times. The dome is very plain, but in its glory was probably covered with plates of silver. The inside is handsomely fitted up. Opposite to the door is the great altar; and on each side of that four other altars. It is at present converted into a modern church, which, from its circular figure, is commonly called Rotunda. Here are also the ruins of several temples, theatres, and palaces. The catacombs, or repositories for dead bodies, in the neighbourhood of Rome, are curious.

With regard to the modern curiofities of Rome, they are as various and fingular as the remains of antiquity. It contains 300 churches, filled with all that is rare in architecture, painting, and feulpture. The church of St. Peter, at Rome, is the most aftonithing, bold, and regular fabric, that perhaps ever existed; and when examined by the rules of art, the best judges

aver it may be termed faultless.

The Vatican is a vast palace, but very irregular, having been built at many different times. It is adorned with the most masterly productions of the pencil; contains a library, composed of the choicest books and manuscripts, together with a cabinet replete with all that can gratify the virtuoso. The pope's fummer palace is on Monte Cavallo, on the Quirinal Hill. The garden is almost a mile round. There are some statues in it, a grotto, and a cassino, called the coffee-house. There are several other palaces, magnificently built, and superbly ornamented.

For the promotion of literature, there are three colleges, and many public libraries, in Rome.

Rome is not a place of amusement for the gay and distipated; no public spectacles being allowed, except during the time of the carnival, which lasts from the seventh of January to Ash-wednesday. Then, indeed, they are attended with an ardour unknown in capitals where the inhabitants are under no such restraint. Seven or eight theatres are open; the prin-

The Is Italy. It Pharo of feffes Sici air is hot fects, rep der the c

cipal of which are the Argentina, Aliberti, Tordinone, and Capranica. The two first are appropriated to serious operas, the third to plays, and the last to burlettas. No women are permitted to appear upon the stage, but castrati play the semale parts. During the carnival there are also sessions or balls, masquerades, and horse races.

But though public diversions are not usually allowed, except in carnival time, yet the frequency and pomp of religious functions, in some degree, make a stronger amends.

The common people are in a ferment during all the time of the lottery, which is drawn eight times a year. Such is the rage for it, that the quantity of bread baked in the city is at these feasons considerably lefs than usual. In short, it is the locust which consumes what the caternillar had left.

Rome has fome manufactures of filk, but the material is bad, and, when wrought, it is neither fightly nor ferviceable. The only articles of exportation are vitriol, mufical ftrings, beads, artificial flowers, perfumed powders, pomatums, effences, gloves, combs, fans, and fuch trifles. Medals, flatues, bufts, paintings, and fladii of marbles, make an article of commerce.

Provisions are plentiful and good. Their vitella mongana is particularly excellent, as is also their swine's fleth. The worst meat is mutton. They have capretti, or kid; and the venison of wild deer, or capreole, but very lean. Porcupine is also softeneitines sold in the markets. Poultry and wild sown are fine and plentiful. They eat all forts of small birds, down to the wren; and several birds which we never touch; as hawks, jays, magpies, and woodpeckers. They have a good variety of fish, both of the fresh water and of the sea.

The air of Rome is reckoned good for afthmatic people in winter. The climate is mild, the trofts flight, and the fnow generally melting as it falls. The are fometimes thick, flinking fogs, but they are not very frequent, and generally disperse before noon. In summer some parts of the city are supposed to be unwhole-some; nor will the most indigent person sleep on a ground floor during this season. The country about Rome is mostly flat, and burnt, being covered with volcanic assess, and the hills are calcareous.

Tivoli is about 18 miles from Rome. The fituation is high; but the town itself is a wretched place, made more disagreeable by a number of forges. The cathedral is built upon the ruins of a temple of Hercules. The ancient name of the place was Tibur. The principal beauty of Tivoli arifes from the river Anio, now called the Teverone, which, falling headlong about 50 feet down the rock, forms a noble cascade, and several leffer ones, called le Cascadelle. The latter are extremely picturefque; as is also a deep ravine in the hill, called la Grotta di Nettuno, into which the great catcade falls. To enrich the view here are fome fine remains of ancient buildings, as the villa of Mecænas; and particularly the little round temple of the Sibyl, as it is commonly called, but rather of Vesta, one of the most elegant remains of Grecian architecture.

The naturalist will here take pleasure in observing the continual formation of new Tiburtine stone from the deposite of water descending from the calcareous Apennines.

The little republic of St. Marino confilts only of a mountain, which yields good wine; but the inhabitants have no other than rain or fnow water. In the whole territory are only three castles, three convents, and five churches. The largest of the churches is dedicated to the faint, and contains his ashes and his statue.

The Kingdom of Naples is the largest state of Italy. It was called formerly Sicily on this side the Pharo of Messina, whence the king, who likewise possesses side in the state of the Two Sicilies. The air is hot, and the soil sertile; but the number of infects, reptiles, &c. and the frequent earthquakes, render the country, in general, unpleasant.

One of the infects almost peculiar to the kingdom of Naples is the tarantula, a kind of spider, with which it abounds. The persons bit by this insect are called by the Italians tarantolati. Few of fuch unhappy persons can bear the fight of black or blue; but seem delighted with red and green objects. They are also feized with an aversion to eating fruit or vegetables. A melancholy filence, and a fixed eye, are the first fymptoms by which the bite of the tarantula difcovers itself. and the music is immediately called in to rouze the patient to a violent motion, and by that means to promote perspiration and a copious sweat. The instruments chiefly used are the guittar, hautboy, trumpet, violin, and Sicilan kettle drum. The country people, who are more or less skilled in all these instruments, enforce the operation of their mufic by grimaces and odd gesticulations. The tarantolati, on their fide, vigoroufly exert themselves, regulating their motions according to the mufic, till the venom is quite expelled. This exercise and cure sometimes takes up five or fix days; not that they are kept continually dancing allthat time, but, when nature feems to be exhaufted, the music is suspended, and the patient put to bed, well covered, and a fudorific cordial administered. It is remarkablé, that the patient, on recovery, remembers nothing of what paffed during the prevalence of the diforder; and that if the cure be not perfectly effected, and the poilon entirely expelled, the fame fymptoms return the fucceeding year, especially during the fummer heats; and some have laboured under this terrible diforder, at intervals, for ten, twenty, or thirty

The king of Naples, or of the Two Sicilies, is an hereditary monarch. The high colleges are the council of flate, the privy-council, the treasury, the Sicily council, the council of war, &c. The title of the king's eldest fon is prince of Calabria.

The city of Naples is one of the most agreeable places in the world to reside in. The climate is mild, the situation admirable, the city gay and populous, and the environs beautiful and interesting. It is about nine English miles in circuit. The principal street (Strada Toledo) is about 1170 yards long, wide, straight, and well built. In the heart of the city the streets are narrow, and, because the houses are high, they are gloomy and close. The pavement of all is a dark lava. The squares are generally small and irregular. The sountains are in the same bad taste.

To repel an enemy by fea, there is, to the west, Castel del Uovo. Towards the east are some batteries, the bastions of the arienal, and Castel Nuovo. A block-house and batteries desend the mouth of the harbour.

The clock-yard and magazines are fpacious. The harbour is rather too confined. It is entirely the work of art.

Architecture is by no means in a good tafte at Naples. Of 300 churches and upwards, there is not one, with a front or portico, which has any merit: many of them, indeed, prefent nothing but a bare wall.

The civil architecture of Naples is in no better a aftile than the ecclefialtical. Their buildings are heavy, and crowded with gigantic prominences.

and crowded with gigantic prominences.

The king's palaee has a handlome front, decorated with three orders, Doric, Ionic, and Corinthian, a magnificent staircase, and apartments suitable to the inhabitants. The pictures in it are but sew.

The palaces of the nobility are large, with long fuits of apartments, and a great gallery for the reception of company.

I Studii Publici are the buildings of the university, made from designs of Fontana. The front is adorned with antique statues, found at Cuma. Professors read lectures here in theology, medicine, politics, law, mathematics, physic, history, the humanities, and lan-

guages.

The principal libraries are the king's; that of the Seggio, or St. Angelo a Nido; S. Philippo Neri; the

prince of Tarfia; the convents of Monte Oliveto, S. Giovanni di Carbonara, &c.

There are near forty hospitals and conservatories at Naples, and yet no where more beggars and idle people in the streets. There is an annual procession at Naples, made with the double view of exhibiting figns of penitence in the proftitutes, and of collecting money for their support, or, as some are of opinion, for the emolument of the prieft who attends upon the occasion; but candour should lead us to suppose that a part only of the charitable donations are appropriated to the use of the priest.

The great theatre of St. Carlo, adjoining to the royal

palace, is vaft, noble, and elegant.

Besides the great theatre, there is Teatro de' Fiorentini, and Teatro Nuovo, less, and, notwithstanding its name, older than the last.

There are three conservatories in this city, for the education of boys in the profession of music.

The carnival begins on S. Charles's day, and continues till Lent.

The common people of Naples are very devout, or

rather superstitious.

Naples, with respect to its municipal police, is divided into fix feggii, or wards, five of which are governed by a committee of nobles. The last belongs exclusively to the plebeians, who are distributed into 29 ottine, or quarters, under the direction of an eletto, or mayor, with his affiftants.

This city has neither watchmen or lamps; but of late years darkness has been dispelled in many streets, by the piety of a Dominican, who has perfuaded the people to subscribe oil for lamps, to burn before images. He fixes them up in the most convenient places, and thus turns their devotion to public ac-

Provisions are plentiful and cheap: poultry, game, and fith, are abundant; fruits and garden-stuff are to be had all winter in fo favourable a climate. The nobility are fond of fplendor and thow. About an hundred of them have the title of prince; a ftill greater number bear that of duke,

In the midft of idleness sewer riots or outrages happen than might be expected. This is owing partly to the national character of the Italians, and partly to the common people here being univertally fober. Their great hixury is iced water; and nothing would be fo likely to raife a mutiny in Naples as a scarcity of ice. It all comes from the mountains about eighteen miles off, where pits or refervoirs are made to preferve it; and it is fent to the city only as it is wanted.

The environs of Naples are highly interesting to the claffical scholar, the naturalist, and the antiquary.

In order to furvey Mount Veluvius you go either to Portici or Refina, a little more than four miles from the extremity of Naples; and there you may hire mules, and guides. When you have rode as far as you can, you will proceed on foot, the guides affifting you in the ascent, by fastening a girdle round you, and pulling you along; unlefs you prefer trufting to your own ftrength, aided by a good ftaff, which you will find much better. The cone of the mountain is covered with loofe ashes and cinders: it is therefore very fatiguing to afcend it, for you fink up to the knees, and go two steps backwards for every three that you set. The way to get forwards is not to be in a hurry, but to go on gently, and often to take breath. After all, you will find it great labour, without much inftruction or amusement; for, in general, you will not be able to differn much of the crater. However, favourable circumstances may, perhaps, allow you a peep into the fiery gulph, or, at least, if the weather should be fine, the view of the furrounding country may pay you for your trouble. To a naturalist, a survey and scrutiny of the feveral ftreams of lava that have flowed from this volcano will be much more to the purpofe. Some of these streams are fix or seven miles in length, and have loft themselves in the sea; whilst others, arrested

in their course, have accumulated in the vallies. There are shops, both at Portici and Naples, where specimens of all the varieties of lava, and of the other jubstances. which are thrown out in the eruptions, both rough and polished, may be feen and purchased. It will take an hour and a half to go'from Portici to the foot of the cone; a little more than an hour to afcend it; and about half that time to come down again.

Vefuvius is computed to measure 24 miles round at its base, and to be 3694 feet perpendicular height above

the level of the fea.

In the road leading from the fuburbs of Chaia to the grotto del Monte di Pausilipo, are the remains of a tomb or maufoleum, supposed to be that of Virgil, but without any foundation. It was originally in the form of a pyramid, but now refembles a large oven. "It is certain (fays Mr. Addison) that Virgil was buried at Naples, but almost as certain that his tomb stood on the other fide of the town."

The cave of Paufilipo is a broad, ftrait, fubterraneous road, hewn through a mountain. At coming out the road leads to the lake Agano, which is circular, and a mile in circumference. In the midst are the fudatories of St. Germano, or stone apartments, where the hot streams which arise produce a profuse perspiration. Hence they are much frequented in various diforders. In a rock near the banks of the lake is the Dog's Grotto, fo called because a dog is always made use of to thew strangers the astonishing effects of the vapour in this cavity; for if a dog's note be held in the vapour, which floats within a foot of the furface of the grotto, the animal loofes all figns of life; but, on being taken out of the grotto, or thrown into the lake, he revives.

Puzzoli, or Puteoli, glories in being the place where the first Christian community in Italy was formed; for St. Paul, in his journey to Rome, we are told, found brethren in it. The earth of Puteoli has this peculiar property, that it hardens in the water, and, after lying in it fome time, looks more like stone than earth. In the neighbourhood is what the ancients called the Elyfian Fields, from the sweetness of the climate, the ver-

dure, and fertility of the foil, &c.

Baiæ, the celebrated winter retreat of the Old Romans, flood on a bay about two miles and a half wellnorth-west from Puzzuoli, but not the least vestige of it is now to be feen.

Salerno, the capital of the Principato Citra, or Principality on this fide the Appennines, is well fortified, has a pretty good harbour and caftle, but little trade. Here, however, is the fee of an archbishop, with an univerfity, and feveral annual fairs, which are much reforted to, and very profitable to it.

Otranto, anciently called Hydruntum, is a well fortified city, and the fee of an archbishop, on an island at the mouth of the Adriatic, which is joined by a bridge to another ifland, and that by a bridge to the

PIEDMONT, part of the ancient Lombardy, is a very fruitful country; and the Piedmontese filk is deemed the best in Italy. From the mountain Rochemelon, which takes a whole day to afcend, is a most extensive and romantic prospect. Annually, on the fifth of Auguft, vast crowds go up to hear mass said before a statue of the Virgin Mary on the summit. The inhabitants, and even the horse and dogs, are subject to the fame kind of wens in the throat as the people about the Alps.

Turin, the capital of Piedmont, and residence of the king of Sardinia, stands at the conflux of the Po and It is finall, but strong, and very populous. Within the city are 48 churches and convents, and some very fine streets, particularly Rue Neuve, and Rue de Po. Here are likewise many fine squares, several magnificent palaces, befides that of the king, a superb opera house, an arfenal, a royal printing house, an university, which is a quadrangle, and one of the finest buildings

refidence of f the Po and y populous. ts, and fome and Rue de everal maguperb opera a univerlity, ift buildings in the city. The king's palace is elegant. The apartments contain a great collection of pictures, amongst which some are excellent. From a canal cut from the river Dora, water is conveyed by an aqueduct into the city, and afterwards distributed at pleasure through every street. Here are a fine citadel, an university, library, and many charitable foundations. In the neighbourhood of Turin are many beautiful villas, convents, and other buildings.

Sufa, on the Dora, contains the remains of a triumphal arch, erected in honour of Augustus Cæsar. About a quarter of a league from it stands Fort Brunette, hewn out of a rock, with all its outworks.

Nice is a fmall fea-port on the Mediterranean, at the mouth of the Paulon. It has an indifferent harbour, is a free port, and the fee of a bishop.

Montserrat, or Montferrat, a duchy fituated west of Milan, is 62 miles long, 48 broad, and very settile. It contains a sew fortified towns, not remarkable. The principal of them, Casal, on the Po, 42 miles east of Turin, is the see of a bishop, suffragan to Milan. Alessandria has a strong citadel, and a garrison consisting of sive regiments of infantry, and a detachment of cavalry. There is an opera here during the two sairs, in April and October; but the place is neither large or remarkable. The principal building is the town-house in the great square, by the cathedral, a gothic edifice, which contains nothing to amuse a stranger.

Savoy is a duchy; the heir apparent to the crown of Sardinia always having the title of duke of Savoy, and prince of Piedmont. It is fituated between France, Piedmont, and the lake of Geneva, being near 90 miles fong, and upwards of 70 broad. It lies among the Alps, and confequently is mountainous and sterile. The roads over the Alps are difagreeable and dangerous, especially as huge masses of snow, called by the Italians avalanches, and the fragments of rocks, frequently roll down into them from the impending precipices. The way of travelling is either in fledges, chairs, or on the backs of mules. In some places the path on the brink of the precipices is fo narrow, that there is but just room for a single, person to pass. It begins to fnow on these mountains commonly about the beginning of October. In the months of July, August, and September, many of them yield very fine grafs, with a great variety of howers and herbs; and others box wood, walnuts, chelinuts, and pines. The height and different combinations of these mountains, their towering fummits rifing above one another, and covered with fnow, the many cataracts or falls of water, the noise and rapidity of the river Arc, the froth and green tincture of its water, the echoes, and the numerous freams tumbling from cliff to cliff, form altogether a yery romantic scene. The furface of the glaciers, or ice vallies, appears like a sea, or lake; and the air here, even in July and August, is exceeding cold.

The inhabitants of Savoy (the better people excepted) fpeak a corrupt French. In their dispositions, however, they resemble the Germans more than the French. Great numbers of the mountaineers, of both sexes, are deformed, and particularly disfigured with wens in the throat, which is the only inconvenience they suffer from this strange disorder, as the wens are not in the least painful.

Chambery, though the capital of Savoy, affords nothing worth feeing. The fituation, indeed, is fine, in a wide, delightful valley, where there is the greatest variety of objects that a fine country and mountains can produce: but it is a poor dirty town; the houses dark, the streets narrow, and the convents and other public buildings miserable. The remainder of the ducal palace is a castle: over the gate-way are the governor's lodgings, commanding the town and adjacent country.

MILAN, one of the finest provinces of Italy, is fi-

tuated to the north of the Appennine Mountains, being near 100 miles long, and about 100 broad. It is fertile and well watered, containing, independent of feveral rivers, fome lakes, particularly lake Lago-Maggiore, which contains the Baromean Islands, viz. Itolo Bella, and Itolo Madre, the beauty of which almost exceeds imagination. Art and nature feem to have vied with each other in embellishing them. In each of them is a palace, with beautiful gardens, belonging to the Baromean family. The water of the lake is clear, of a greenish colour, and abounds with fish. The hills, with which it is furrounded, present a most charming landscape, being planted with vines and chesnut trees, interspersed with summer-houses. This province belongs to the emperor.

Milan, the capital, is a large walled city, with a rampart and citadel. It is governed by a prefident and council. Here are many churches, palaces, convents, hospitals, &c. The cathedral is a vast pile, all of marble. The dome, by Brunellescho, is in the middle of the crofs; and immediately under it is an opening, furrounded with rails, to give light to the fubterrang-ous chapel, where repotes the body of S. Carlo Barromeo, in a case of crystal, set in silver gilt. In the Ambrofian college, founded by Frederick Baromeo, 16 profesfors teach gratis. In the same college is also an academy of painting, with a museum, and a library, containing a valt number of printed books and manuscripts; among the last of which is a translation of Josephus's History of the Jews, done by Ruffinus about 1200 years ago, and written on the bark of a tree. The feminary for sciences, the college of the nobles, the Helvetian college, and the mathematical academy, are noble foundations, and stately buildings. Of the hospitals the most remarkable are the Lazaretto, and that called the Great Hospital. In a void space in one of the streets of Milan, where stood the house of a barber, who had conspired with the commissary of health to poison his fellow-citizens, is crected a pillar, called Colonna Infame, with an infcription, to perpetu-ate the memory of the execrable defign. The environs of this city are very pleafant, being adorned with beautiful feats, gardens, orchards, &c.

Pavia, on the Teffin, over which it hath a flone bridge of fix arches, is an old, fpacious, but thinly inhabited city. Not far from the city is a magnificent Carthufian monaftery, called Certofa, founded by John Galeazzo Vifconti, who died in the year 1494, and has an elegant monument of white marble erected to his memory in the church. The park, in which the convent flands, is of great extent. There is an university

at Pavia, confiffing of feven colleges.

Cremona, on the Po, is the fee of a bifhop, and ftrongly fortified. It has a bridge of boats over the river, an university, a superb cathedral, many other churches, convents, chapels, &c.

PARMA and PIACENZA are united Duchies. Parma is about four miles in circuit, and contains 37,000 inhabitants. There is no church, palace, or convent, that is worth feeing, and no appearance of a court. The cathedral is a curious, heavy, dark, gothic building. The famous painting, by Corregio, in the dome, is much damaged. The ducal palace is now in great part pulled down. The theatre is all of wood, and, in general, finely imagined

Piacenza is about 200 yards from the Po; a town of great note and antiquity, but/of late much decayed and depopulated. It has no architecture, long ugly streets, and paltry squares. Most of the churches are embellished with paintings of the Bologna school, the Caracci and their disciples. The Palazzo Publico, or town-hall, on the piazza, is a curious building. In the same square are the equestrian statues in bronze, of Al-standro I. and his son Ranuccio Farnese, either by Giovanni Bologna, or his pupil Moca. The ducal palace is by Vignola: it is of brick, and only a third of it finished. The theatre adjoins to it.

The duchies of Parma and Piacenza have ever undergone the fame revolutions, and are now in the Spanish family, by their marrying the heires of Farnese.
Their extent is 56 English miles from east to west, and
44 from north to fouth. The soil is sertile; the pastures and cattle fine; falt-works and minerals abound; as also mines of copper and iron in the Appennines.

These duchies are noted for the number and quality of their cheefes, called Parmefan, and much

esteemed for their excellent flavour.

Modena, which is fituated eaft of Parma, abounds with all the necessaries of life, many minerals, petrefactions, &c. It is well watered, and the duke is a

vaffal of the German empire.

Modena, the capital, is large, populous, and fortified, but not handsome. It is the see of a bishop, and has a large unweildy cathedral. This city hath given birth to feveral celebrated persons, particularly Tasso, the poet; Correggio, the great painter; Sigonius, the civilian and historian; da Vignola, the architect; and Monte uculi, the Imperial general. The ducal palace is a noble edifice, in which, among the other fine pictures, the birth of Christ, by Correggio, called la Notte Felice, is much celebrated. The only manufacture for which this city is noted is that of masks, of which great numbers are exported.

Mirandola is the fee of a bithop, and the capital of the principality to which it gives name, and which, for a long time, belonged to the noble family of Pico. this family and city was the famed Picus de Mirandola, whose works are well known among the learned; and being printed in a large and small character, give name to the types which printers call double and fingle

The little principalities of Maffa and Carrara were, for a confiderable time, under the Genoese jurisdiction. Afterwards they belonged to the house of Malaspina, then to that of Cibo, the daughter and heirefs of which was married to the hereditary prince of Modena, who thereby became lord of these countries, which are contiguous to one another, and very fruitful. They both have their names from their capitals, and lie on the Tufcan Sea. Maffa, fituated on the river Frigido, about three miles from the sea, is the see of a bishop, suffragan to the archbishop of Pila, and has a ducal palace. Carrara is a fmall, neat town, on the little river Lavenza, four miles from Matta, and as many from the fea, at the foot of some high mountains, which yield a fine fort of marble, that brings in a confiderable income to the duke.

Mantua is about 60 miles long, but not above feven broad. It is well watered, fertile, and belongs

to the house of Austria.

Mantua, the capital, is very ancient, having been founded prior to Rome. It is furrounded by a morafs, formed by the overflowing of the Mincio, and can be approached only by long bridges or causeways. It is about four miles in circumserence. Some of the ftreets are wide and ftrait, with a few good houses; but they are generally unequal, and mostly indifferent.

There are 18 parish churches at Mantua; and 14 convents. The cathedral is spacious, and has five ailes. Giulio Romano was the architect, and also painted the tribuna, with a part of the cieling. In the upper facrifty is a night piece of the temptation of S. Antony, by Paolo Veronefe.

A little way from Mantua is Pietola, formerly Andes, the village where Virgil was born; and near it is a grotto, to which that great poet is faid to have often retired for fludy.

VENICE role from a very fmall beginning to great consequence That cluster of little islands, where the city of Venice now stands, was originally inhabited only by fithermen: but, when Italy was invaded first by

Alaric, the Goth, and afterwards by Attali, the Hun, great numbers of the people fled thither for flelter with all their wealth. From that time a city gradually rofe, grew powerful from its fituation, and opulent from commerce. A republic was formed; trade furnished the people with riches, riches gave birth to ambition, ambition urged them to conquest, and conquest pro-

Engrave

cured them additional territories.

The government of Venice, after many revolutions, was at last fettled in an ariftocratical form, and the fupreme authority vested in the nobles. These have the title of Excellency, and wear, as a mark of distinction, black furred gowns, reaching to their heels, with long caps and perriwigs. At the head of the government is the doge, whose office was once hereditary, and power absolute; but the former is now elective, and the latter very much circumscribed. Though the power of the doge is small, his state and retinue are splendid. His title is that of Serenity, and his office for life. He is fald to be a king with regard to his robes, a fenator in the council-house, a prisoner in the city, and a private man out of it. Though he may be deposed, he cannot refign his dignity. The inquifition is under great reftrictions here. The principal Venetian order of knighthood is that of St. Mark, the badge of which is a large gold medal pendant from the breaft. The order of Constantine knights wear a cross hanging from a gold chain.

The Venetians can equip a formidable fleet. The army confifts of between 20,000 and 30,000 men, principally Swifs and Dalmatians; and the commander in chief, stiled Capitano, is always a foreigner of distinction. The ordinary revenues of the state amount annually to about 1,200,000l. sterling, and arise chiefly from the customs, and duties on falt.

Venice, the capital, is one of the finest cities in the world; and certainly the most singular, with respect to its fituation; being built on piles, in the midft of fhal-lows, called the Lagunes. The great canal, which divides the city into two almost equal parts, in the form of an S, is generally about an hundred paces over. The famous bridge of the Rialto is nearly in the middle: it is of one arch, 89 feet wide; and a double row of thops is built upon it. They reckon 400 canals forming communications all over the city; and bridges many more in number. The main city is furrounded with a multitude of islands, many of them occupied by

The buildings, pictures, public entertainments, riches, and government of Venice, are all interesting objects to a stranger. The singular approach to this fine city must be always striking, both from its novelty and beauty. A confiderable time is required to fee all that is curious in Venice: almost all the churches and schools, and many of the palaces, have fomething to attract notice. Every body knows the rank which the Venetian schools of architecture and painting hold with persons of taste.

The churches are remarkable for pictures and good

architecture.

The palace of S. Mark, or the ducal palace, is very fpacious. Befides the apartments of the doge, there are aifo halls and chambers for the fenate, and all the different councils and tribunals. The treasury of S. Mark is very rich in jewels and relics. To have leave to fee it, you must apply to one of the procurators of S. Mark. The palaces of the nobility at Venice are in an elegant stile of architecture: the fronts are enriched with columns to each flory; the orders confequently are small, but then each story is supported in a diffinct and natural manner. One of the fingularities of this fingular city is its confervatories, and mufical schools or academies, for instructing young women in mufic: of these there are four.

The Piazza di S. Marco is the only open area in Venice large enough for a confiderable number of people to affemble in, and walk about at their eafe. This being the only place of public refort, there is a

great variety of objects affembled in it. In the evening it is crowded with all forts of people; and in fine weather numbers pass the greatest part of the night The nobles and wealthy people fometimes prefer little apartments of their own, neatly fitted up, but without magnificence, where they may receive a few friends in a more eafy manner than they could do at their palaces. These are their cassinos; where, instead of going home to a formal supper, and returning to this place of general refort, they order refreshments, and amuse themselves with cards. That these cassinos may be occasionally used for the purposes of intrigue is not improbable; but that this is the general purpose for which they are frequented is certainly falle.

There are no less than seven theatres at Venice; one for the ferious opera, two for comic operas, and four play-houses. It is the custom to go masked during the carnival, in autumn, and at the Ascension: with a mask, and a filk cloak, a man is then sufficiently dressed for any affembly in Venice. Masks in character are used only three or four weeks before Lent.

The Arfenal is on an ifland, about three miles in compass. Here are docks for the gallies and men of war, and repolitories for all forts of military and naval ftores. Here also they build their men of war under cover; cast cannon; make cables, fails, anchors, &c. The arms are arranged in the armories, as in other arfenals. The Bucentoro, or state galley of the repub-lic, is laid up here. It never goes out but when it carries the doge to the espousals of the Adriatic. When the weather is favourable, the ceremony of the espoulals is performed on Ascension-day. The solemnity is announced in the morning by ringing of bells, and firing of cannon. About noon the doge, with the pope's nuncio and the patriarch on each fide of him, attended by a numerous party of the fenate and clergy, goes on board. The veffel is rowed a little way into the fea, accompanied by the splendid yachts of the foreign ambassadors, the gondolas of the Venetian nobility, and an incredible number of small vessels of every kind, many of them covered with canopies of filk or rich fluffs, with the gondoliers in fumptuous liveries. A band of music plays, while the Bucentoro, and its train, flowly move towards the Lido. The doge drops a ring into the sea, pronouncing these words; "Desponsamus te mare in signum veri perpetuique diminii." He then returns in the same state, inviting those who accompany him in the galley to dinner. The day following the fair begins at S. Mark, which lafts ten days.

One of the great fingularities of Venice is its gondolas, or long narrow boats, which have a room in the middle, fix feet by four, covered with black cloth, and with fliding windows. Two perfons fit very commodiously at the end and two others may fit on each fide. They are rowed either by one or two gondoliers stand-These gondolas ary the only carriages at Venice, and there are flands of them every where, as there are of hackney coaches at London. The gondoliers are robust, good humoured, and lively; pique themselves upon the quickness of them repartees, and are esteemed for their fidelity and attachment.

In fine weather they frequently challenge one another to a contest. They put up a little flag, or a bough for a prize, which they difplay the greatest ardour to obtain. If any person of consequence, or a stranger, shows any defire to fee the contest, arrangements, are made for a more orderly course, and the city is amused with a regata. But, on particular occasions, a grand regata is fometimes exhibited, under the direction, and at the expence of government. On these public occasions the competitors are chosen from families of the first reputation among the gondoliers. When the day arrives their relations encourage them, by calling to mind the triumphs of their families: the women present the oar; and religion has its share in the preparations. The course is about four miles, along the great canal, and back again. The prizes are four, marked by flags of different colours. The great canal, upon these occations, is covered with barges, boats, and gondolas; and on each fide are placed bands of mufic.

One of the principal manufactories at Venice is that of glafs, on the ifland of Murano. They blow large mirrors, and make abundance of trinkets (margaritine) and flowers to decorate lustres, and for notegays to adorn the churches. They export little now but to the Levant.

Printing also still makes one of the chief branches of Few countries make better velvets or filk flock-The wax brought from Dalmatia, Greece, and all the Levant, employs feveral manufactories. Jewellery forms a confiderable branch of foreign commerce. Drugs are imported from the Levant, and are effeemed excellent: their Theriaca is in great reputation. Their marafquin, or cherry water, and their liquors, are famous. Though they have nothing within themselves, yet no city is better furnished with the necessaries and luxuries of life from the Paduan and Polefin.

The territory of Padua is 35 miles long, 28 broad,

and exceeding fertile.

Padua, the capital, is fituated on the Brenta, 34 miles east of Venice, and has many churches, hospitals, and convents; but the streets are narrow and dirty: The univertity, with the public schools, museum, &c. is one of the first objects of curiofity. The chemical laboratory, with a collection of minerals, has been lately established by the present professor of chemistry. The anatomical theatre is curioufly fitted up, to hold a multitude of spectators in a little compais; but it is fmall and dark. The muleum of natural curiofities was collected by Antonio Vallifnieri. The botanic garden is a very good one, and arranged according to the fystem of Tournefort, The economical garden, instituted for experiments in husbandry, is in very good condition, under the care of an active naturalist. Padua has always had men of learning and eminence. It was the birth place of Livy: Petrarch was a canon of the cathedral: Galileo lived here; and it lately poffeffed Tartini.

There is a cloth manufactory in the city for home confumption. But the great number of beggars with which the place fwarms is a ftrong indication that trade and manufactures are not in a flourishing condition.

In the environs of Padua the Euganean mountains will attract the notice of the naturalift : they are extinct volcanos, and full of all the productions of fubterraneous fires. A very interesting excursion also may be made to the hot baths of Abano, four or five miles from Padut; and to Petrarch's villa and monument at

Verona, on the Adige, is a large, strong, finely fituated city. Over the river are four bridges, of which that which leads to the caftle is much admired. The castles are three in number. The streets are narrow and dirty, and the houses mean. The best street in the city is that called the Corso, where horse and foot races are fometimes run. The largest square is that called Piazza d'Armi, where the annual fairs were formerly kept, in April and Autumn. The Scaliger family were formerly lords of Verona; and in the church of St. Maria Antica are some monuments of the family, with their arms. In the town-house are the statues of five celebrated persons, natives of Verona, viz. the poets Catullus and Æmilius Marcus, the historian Cornelius Nepos, Pliny the elder, and Ve-truvius the architect. Here are several academies for the improvement of music, polite exercites, &c. an elegant theatre, and a Roman amphitheatre in fine prefervation.

The Vicentine territory is well watered, fertile, and healthy, and the wine is admirable.

Vicenza, the capital, is charmingly fituated between o mountains on a large plain. Though but four two mountains on a large plain. miles round, it contains between thirty and forty thoufand fouls. It is the native place of Palladio; and the best works of this celebrated architect make the great ornament of the city.

Teatro Olympico is one of the finest specimens of modern architecture: it was begun early in 1588, the very year that Palladio died. The house in which the architect himself lived was built by him, and is no less modest than elegant.

Vicenza, though of no extraordinary extent, has above fixty churches, convents, and hospitals.

A naturalist will visit the Grotta de Cavoli, the mineral waters of Recoaro, the tepid waters of S. Pancrazio di Barbarano, the hills of Bretto, and the mountains to the north of the city, in which are abundance of shells, petrefactions, &c.

In the volcanic mountains near Vicenza are nodules of chalcedony, from the fize of a pea to the diameter of an inch, bedded in the lava: they are commonly hollow; and that hollow fometimes has water in it, and they are then called enhydri.

These Vicentine hills are calcareous, furnishing fine red, yellow, and variegated marbles; and have been

shattered by violent volcanos.

Brefciano territory, which is tolerably fertile, and well watered, contains no place worth observing, but

Brefeia, its capital, ftanding in a pleafant plain on the little river Garza. It is very populous, and drives a confiderable trade in fire-arms, fwords, knives, and other cutlery wares. They make here alfo linen cloth, and deal in many other kinds of merchandize. The caffle ftands on a rock, and commands the whole town; and the arfenal is well furnished with warlike ftores.

The diffrict of Bergamafco is, in general, barren, though well watered; and the inhabitants are subject to the same kinds of wens in the throat as the Savoyards. It only contains Bergama, a fortified town at the foot of the Alps.

Crema, in the territory of Cremano, which is fruitful and pleafant, is fituated on the Serio, strong, handfome, the see of a bishop, and famed for a linen manufactory.

Marca Trevigiana is fo fertile diffrict as to have obtained the name of a continued garden. Trevifo, the capital, is an ancient, strong, neat, but populous place.

Patria del Friuli is the northern verge of Italy, and belongs partly to the Venetians, and partly to the Auftrians. It is very fertile, but does not contain any re-

markable place, except
Udino, a confiderable city on the river or canal La
Roia. It hath a fine cattle, with feeral handfome
churches, palaces, and convents; befide a college for
law, and an academy for martial exercises.

Iftria is a fruitful peninfula on the Adriatic, belonging partly to the Venerians, and partly to the Autrians. It is fertile, though hilly; but the air is unwholefome.

Capo de Istria is a strong town on an island in the gulph, so near the continent as to be joined by a bridge. It is the see of a bishop, contains many convents, and has a considerable trade in falt.

Lucca is interefting as being the capital of a little republic, which, for its extent, is the richeft and beft peopled state of Italy. The territory is forty miles in length, and sifteen in breadth, containing about 400 tquare miles. An air of chearfulness and plenty appears among the people, and their scanty soil is improved to the utmost. The mountains are covered with vines, olives, chesnuts, and mulberries: their olives and oil are in great esteem. Towards the sea much cattle is sed in the meadows and marshes. No beggars or idle people are to be seen in this republic; nor has luxury yet corrupted their manners. The habit of ceremony is black; and the Gonfaloniere is the only person who wears lace. There are no titles, and nobody wears a sword.

The capital city has neither good freets, or handfome buildings. Round the ramparts is a pleasant walk or drive, of three miles in extent; and here the company assemble after dinner, or in the evening. The climate is temperate, and the country round delightful, ornamented with abundance of charming country houses.

Genoa is greatly degenerated from its former splendor. The government is aristocratical. The doge, or duke, is chosen only for two years. The legislative power is lodged in the great council. The administration is vested in a doge, and a proper council. The doge has the title of Serenity during his office. The great council make laws and raise money; the lesser declare war, proclaim peace, and form alliances.

The Genoese territories are 160 miles in length, but do not exceed 25 in breadth. They extend along that part of the Mediterranean called the Gulph of Genoa, and are divided into two diffricts, viz. the eastern coast and the western coast. The former contains

Genoa, the capital, which flands on the coast of the Mediterranean. As it is partly fituated on a declivity, it appears to great advantage from the fea. It is defended on the land fide by a double wall. The New and Balbi Streets confift each of a double row of magnificent palaces; the other streets are crooked and narrow; but the suburb of San Pietra d' Arena contains many noble buildings. Here are feveral palaces, churches, convents, hospitals, &c. many of which are superbly built of marble. The palace where the doge refides, and where the great and little council, and the two colleges of the procuratori and governatori affemble, is a large stone building in the centre of the city: it contains fome fine paintings in fresco, two statues of Andrew and John Doria in white marble, and an arfenal amply flored. Of the churches the finest are those of the Annunciation, St. Mary Carignan, St. Dominic, and St. Martha. In the cathedral is a dish made of a fingle emerald. All the inhabitants here except the principal ladies, who are carried in chairs, walk on foot on account of the narrowness or fleepness of the ftreets. The fortifications of the city towards the fea are remarkably strong. There are two fine stone bridges over the rivers Bonzevera and Bifagno; the first whereof washes the west, and the other the east fide of the city, within which there is also a surprising ftone bridge, joining two hills. The harbour, though large, is far from being fafe; but no care or expence have been spared to render it as sase and commodious On a rock, on the weft fide of the harbour, is the fanal, or light-house. The trade of Genoa is chiefly in velvets, damasks, plush and other filks, brocades, lace, gloves, sweetmeats, fruits, oil, anchovies, and medicinal drugs from the Levant; but the badness of the harbour, and the price of commodities, greatly check its commerce.

The western coast contains

Savona, a large town, with a firong citadel, and a harbour capable of receiving large thips, but partly choaked up.

St. Remo, a fmall town, with a good harbour, 17 miles east of Nice. Mr. Addison says, he saw several persons here, that, in the midst of December, had nothing over their shoulders but their shirts, without complaining of the cold.

Between the Genoese territories and the county of Nice is the small principality of Monaco, where the late duke of York died. The only place worth mentioning in the principality is that which gives name to it,

Monaco, a fmall town, containing about eight or nine hundred fouls, befides the garrifon, built on a rock, which projects into the fea, and making a very romantic appearance.

Tuscany is encompassed by that part of the Mediterranean called the Tuscan Sea, Modena, Lucca, and the Popedom. It is 116 miles long, 80 broad, well watered, mountainous in some parts, but fertile in others. The great duke is an absolute prince. The only order of knighthood is that of St. Stephen, infli-

tuted in 1554 the badge of a golden bore

Florence, on the Arno, the capital, is 26 miles fouth from Venice. It gives name to a populous and fertile diffrict. Here are four stone bridges over the Arno. The number of churches, palaces, hospitals, and convents, are great, but the streets are crooked and narrow. The old and new ducal palace contain rich collections of natural and artificial curiofities, both ancient and modern. The chapel for the interment of the great dukes, in the church of St. Loxenzo, is magnificent. Here is an academy for the improvement of the Tuscan language, called Della Crusca, another for agriculture, and another for riding. The principal trade, befides wine, oil, fruits, and other produce of the country, confifts in wrought filks, and gold and filver stuffs. The nobility and gentry do not think it below them to trade: though, at the fame time, they look upon it as a great disparagement to educate their children in the profession of physic. They write the Italian here very well; but their pronunciation is guttural and difagreeable. Florence is adorned with feven fountains, fix columns, two pyramids, and about 160 statues. Most of the Florentines are short-fighted, and hence the Florentini Ciechi, or Blind Florentines, has passed into a proverbial jest. As the Tuscan order, and ruftic work, owe their origin to this country, the architects take care to give them a place in all the structures they rear in this duchy. The great piazza, or fquare, is very fpacious and magnificent, with a noble fountain in the midft of it. The arienal is well worth a traveller's notice, being a flately building, and well furnished with all forts of weapons of war, kept in good order. The cathedral is a very magnificent edifice, the whole outfide being of polifhed marble, and enriched with the most exquisite architecture and feulpture; and from the ball, over the cupola, you have a delightful prospect of all the churches, palaces, monasteries, &c. within the walls, and of near 2000 villas, or country seats, without. Hard by the church flands the much celebrated Campanile, or fquare fleeple, which is 180 feet high, all of fine marble, of feveral colours, and curioufly wrought.

Pifa, on the Arno, formerly a republic, was fubdued by the Florentines in 1406, fince which it has greatly declined. The houses and streets are handsome. The university is in a flourishing condition, and the exchange is magnificent, but little frequented. The great duke's gallies are built, and commonly stationed, here. This city is also the principal residence of the order of St. Stephen, and the see of an archbishop. The cathedral, a large Gothic pile, contains a great number of excellent paintings, and other curiofities. Near the cathedral is the city burying ground, called Il Campo Santo; and in that the famous leaning tower; the inclination of which is fo great, that a plumb line let down from the top touches the ground at the diffance of near 15 feet from the bottom. The city has a moat, walls, a caftle, fort, and citadel. The Arno is of confiderable breadth, and has three bridges over it, one of them of marble. Two leagues below the town it falls into the fea. The physic garden is very fpacious, contains a great number of plants, and is decorated with water works. Over the door leading into it are thefe words; Hie Argus fed nos Briareus efto; i. e. " Employ the eyes of Argus, but not the hands of Bria-

Leghorn (Liverno) is only fourteen miles from Pifa. It is a free port, fortified on the land fide with good baftions, and wide ditches filled with water: the garrifon is 2000 men. The town is about two miles in circuit: the general form is fquare: part of it has the convenience of canals, one of which is five miles in length, and joining the Arno, merchandife and paffengers are thus conveyed to Pifa. The streets are straight; the chief street very broad: the fquares spacious and handfome, but not regular: the great church magnificent. Cosmo and his two sons fortified the city, drained the marshes, established the freedom of the port, and formed two most commodious harbours, which, however, have not depth of water fufficient for men of war. There is nothing to be feen besides these, with the mole, lazaretto, coral manufactory, and statue of Ferdinand I. with the four flaves chained to the pedeftal: the first by Giovanni dell'Opera, the flaves by Pietro Tacca Carrarefe.

The inhabitants are about 45,000, of which at least 5,000 are Jews, who have engroffed the coral manufactory, have a confiderable trade, and poffess the chief

riches of the place.

Sienna, a large ancient city, 38 miles fouth of Florence, has a fertile pleafant territory of near 65 miles fquare. The city is clean, neat and healthy, but not populous. The inhabitants are polite, and fpeak the Italian language in its utmost purity. The cathedral is a very magnificent Gothic pile. Fronting the cathedral is a spacious and well-endowed hospital, founded by a shoe-maker, who is interred in the church, and, as a reward for his liberality, hath been canonized. Over the statue erected to his memory is this apposite inscription, Suter ultra crepidam; i. e. "The shoe-maker went beyond his Last."

SECTION III.

General Observations respecting the Persons, Genius, Dispositions, Language, &c. of the Italians.

AVING taken occasion to describe the manners, customs, &c. of the inhabitants of this country as they respectively occurred, in the course of our division, we have only to add the following gene-

ral remarks.

The Italians are usually well proportioned, and have expressive countenances. As to dress, they follow the fathions of the countries on which they border, or to which they are subject, namely, those of France, Spain, and Germany. With respect to their genius and taste in architecture, painting, carving, and music, they excel most other nations of Europe. They are affable, courteous, ingenious, fober, and ready witted; but jealous, vindictive, ceremonious, and fuperstitious. In their tempers the Italians feem to be a good medium between the French and Spaniards; neither fo gay and volatile as the one, nor fo grave and folemn as the other. The women admire yellow hair, as the Roman ladies and courtezans formerly did. They also use paint and washes, both for their hands and faces. The day here is reckoned from fun-fet to fun-fet, as the Athenians did of old.

The Italian language is corrupted Latin; but fince the revival of arts in Italy, it hath been fo much re-fined, that it is now deemed elegant, fort, and imooth. The pureft Italian is spoken in Tuscany. The Roman Catholic religion here predominates. The exports are chiefly wine, oil, perfumes, truits, and filks. Travellers expend large fums of money in Italy, in purchafing pictures, curiofities, antiquities, relics, &c.

SECTION IV.

HISTORY OF ITALY.

CCORDING to the accounts of most historians Italy was first peopled from Greece. In those early ages, when the Romans first began to extend their territories, like most other countries it was parcelled out into a great number of small states, who were all gradually fubdued by the Romans. On the declenfion of the Roman empire, the Huns, Goths, Vandals, Heruli, and other northern nations, passed the Alps, and seized on the greatest part of it. After them came the Lombards, or Longbeards, and erected a kingdom in the northern part of it, which was overturned by Charlemagne, who founded a new empire in the weft.

The

great patron of the arts,) the title of great duke of Tufcany, in 1570, which continued in his family to the death of Gaston de Medicis, in 1737, who left no issue, The great duchy was then claimed by the emperor Charles VI. as a fief of the empire, and given to his

fon-in-law the duke of Lorrain, and late emperor, in lieu of the duchy of Lorrain, which was ceded to France by treaty. Leopold his fecond fon, brother to the prefent emperor, is now grand duke, and Tufcany affumes a new face. Leghorn which belongs to him, carries on a great trade; and feveral fhips of very con-

ficierable force are now stationed on the Tuscan coasts, to prevent the depredations of the Infidels.

The Milanefe went through feveral hands; but was at length poffeffed by the emperor Charles V, about the year 1525, who gave it to his fon Philip II. king of Spain. It remained with that crown till the French were driven out of Italy, by the Imperialists, in 1706. These were dispossessed of it in 1743; but, by the emperor's ceffion of Naples and Sicily to the prefent king of Spain, it returned to the House of Austria, who governs it by a vicerov.

The fucceffors of Charlemagne claimed, and for some time poffeffed, the fovereignty of Italy; but their

Savoy and Predmont, in time, fell to the lot of the

counts of Maurienne, the ancestors of his present

Sardinian majesty, whose father became king of Sardinia

by virtue of the quadruple alliance, concluded in 1718.

civil wars at home foon gave an opportunity to their governors either to affume or purchase the sovereignty

of the feveral flates over which they prefided.

The duchy of Mantua was formerly governed by the family of Gonzaga, who adhering to France, the territory was forfeited, as a fief of the empire, to the house of Austria, which now possesses it, the last duke dying without male iffue; but Guastella was separated from it in 1748, and made part of the duchy of Parma.

The first duke of Parma was natural fon to pope Paul III. the duchy having been annexed to the holy fee, in 1545, by pope Julius II. The descendants of the house of Farnese terminated in the late queen dowager of Spain, whose fon, his present Catholic majesty, obtained that duchy, and his nephew now holds it with the duchy of Piazencia.

The Venetians were formerly the most formidable maritime power in Europe. In 1193 they conquered Conftantinople itself, and held it for some time, together with great part of the continent of Europe and The discovery of a passage to India, by the Cape of Good Hope, gave the first blow to their greatnets, as it loft them the Indian trade. By degrees the Turks took from them their most valuable possessions on the continent; and fo late as the year 1715 they loft the Morea.

The Genoefe, for fome time, disputed the empire of the Mediterranean Sea with the Venetians, but were feldom or never able to maintain their own independence by land, being generally protected, and fometimes subjected, by the French and Imperialists. At prefent they are possessed of a revenue barely sufficient to preferve the appearance of a fovereign flate.

The great duchy of Tuscany belonged to the emperors of Germany, who governed it by deputies, till the year 1240, when the famous diffinction of the Guelphs, who were the partizans of the pope, and the Gibellines, who were in the emperor's interest, took place. The popes then periuaded the Imperial governments in Tulcany to put themselves under the protection of the church; but the Florentines in a thort time formed themselves into a free commonwealth, and bravely defended their liberties against both parties by turns. Faction at last shook their freedom; and the family of Medici, long before they were declared princes or dukes, in fact governed Florence, though the rights and privileges of the people seemed still to exist. The Medici, particularly Cosmo, who was deservedly called the father of his country, being in the fecret, shared with the Venetians in the immense profits of the East India trade, before the discoveries made by the Portugueie. His revenue, in ready money, which exceeded that of any fovereign prince in Europe, enabled his fucceffors to rife to fovereign power; and pope Pius V. gave one of his defcendants Coimo, (the

Few countries have undergone greater viciffitudes of government than Naples or Sicily, chiefly owing to the inconstancy of the natives. Christians and Saracens conquered it by turns. The Normans, under Tancred, drove out the Saracens, and by their connections with the Greeks, established there (while the rest of Europe was plunged in monkish ignorance) a most respectable monarchy, which flourished in arts and arms. About the year 1166, the popes being then all-powerful in Europe, their intrigues broke into the succession of Tancred's line, and Naples and Sicily at last came into the possesfion of the French; and the house of Anjou, with some interruptions and tragical revolutions, held it till the Spaniards drove them out in 1504, and it was then an-

nexed to the crown of Spain.

The government of the Spaniards was fo oppreffive, that it gave rife to the famous revolt, headed by Maffanaillo, a young fisherman, without shoes or stockings. His fuccess was so surprizing, that he obliged the haughty Spaniards to abolifh the opprefive taxes, and to confirm the liberties of the people. Before these could be reestablished perfectly, he turned delirious, through his continual agitations of body and mind, and was put to death at the head of his own mob. Naples and Sicily continued with the Spaniards till the year 1706, when the arch-duke Charles, afterwards emperor, took poifession of the kingdom. By virtue of various treaties, which had introduced Don Carlos, the king of Spain's fon, to the poffession of Parma and Piazencia, a new war broke out in 1733, between the houses of Austria and Bourbon, about the poffession of Naples, and Don Carlos was received into the capital, where he was proclaimed king of both Sicilies. This was followed by a very bloody campaign; but the farther effusion of blood was stopped by a peace between France and the emperor, to which the courts of Madrid and Naples at first demurred, but afterwards acceded in 1736, and Don Carlos remained king of Naples.

Upon his accession to the crown of Spain, in 1759, it being found that his eldeft fon was by nature incapacitated for reigning, he refigned the crown of

Naples to his third fon, Ferdinand VI.

The papal power is now evidently at a low ebb. The order of jefuits, who are not improperly called its Janissaries, has been exterminated out of France, Spain, Naples, and Portugal; and is but just tolerated in other Popills countries. The pope himself is treated by Roman Catholic princes with very little more ceremony than is due to him as bifliop of Rome, and pof-feffed of a temporal principality. This frumiliation, it is reasonable to believe, will terminate in a total separation from the holy fee of all its foreign emoluments, which even, fince the beginning of the prefent century, were immente, and to the reducing his holinefs to the exercise of his ecclesiastical functions as first bithop of Christendom.

HUNGARY, and its Incorporated PROVINCES.

UNGARY received its name from the Huns, a | H UNGARY received its name from the Huns, a Scythian nation, who possessed themselves of it in the ninth century. It lies between the 18th and 22d degree east long, and 45th and 49th deg. north lat. is 300 miles long, and 200 broad; has the Carpathian mountains north; Servia south; Moravia, Austria, and Stiria west; and Walachia and Transylvania east. The northern parts are mountainous and barren, but whole-The fouthern diffricts are level and fertile, but unwholesome. The mountains contain a great variety of minerals, and even diamonds. Corn is very plenti-ful; and the Hungarian wines, particularly Tokay, exceeds all others in Europe. Horses, cattle, fish, and all kinds of vegetables abound, as do wild beafts, and various kinds of game; and tobacco, faffron, buckwheat, millet, melons, chefnuts, &c. are cultivated with fuccefs. The principal rivers are the Danube, Drave, Save, Teyffe, Merith, and the Temes.

Hungary is divided into Upper and Lower. The former contains.

Zemplin, which gives name to a county that contains feveral inconfiderable towns, and many vineyards, that yield excellent wine, particularly that which takes

its name from Tokay.

Skepus is a caftle, which gives name to a county of great extent, abounding in some parts with fruitful corn-fields, rich paftures, pulfe, and flax, and in others with woods and mountains. No wine is made in any part of it, but it has fome iron and copper mines. Near the castle of Skepus is a cavern, in which, during the winter, the water is fluid; but in fummer large quantities of ice are brought from it for cooling their liquors. Vitriol, or copperas, not only gushes out from the mines of this county, but breaks forth alfo from the furface of the ground. The village of Vockotz is famous for its medicinal fprings.

Erlau is the capital of the county of Heves, in which

are feveral other towns.

and enjoys a good air.

Great-Varadin, or Waradin, in the county of Bihar, has a strong castle on the east side, and the epithet of Great, to diftinguish it from Little-Waradin, in the county of Chege.

Temes-Var is a strong town on the river Beg, the capital of the Bancat, or territory to which it gives name, has feveral times been in the poffession of the Turks; but the Austrians gaining possession of it, it was incorporated into the kingdom of Hungary in

In Lower Hungary the principal places are Presburg, fituated on the Danube, about 46 miles eaft from Vienna. In it the regalia were kept; but they were lately removed to Vienna; and, in the cathedral, dedicated to St. Martin, the fovereign is crowned. The town is ancient, pleafantly fituated,

Lepto-Ujvar-Hradek is a castle which gives name to a county every where full of mountains and rocks. They abound in metals, minerals, and medicinal fprings, with caverns, in which are many curious figures in

drop-stone. Gran is a royal free town on the Danube. Here are fome natural warm baths. The neighbouring country is very pleafant and fruitful, and yields excel-

There are two towns of the name of Buda, the Old and the New. Old Buda is a mean place; but the New is a royal free town, standing on the Danube, well fortified, and was the capital of the kingdom, and refidence of the king, until it was feized by the Turks in 1529, in whose hands it continued till 1689. Here are several

warm baths. The town has confiderable fuburbs. The neighbouring country yields good red wine, and excel-lent melons. A few miles below Buda is an island, called Esepel, which formerly belonged to prince Eugene, who had a feat in the neighbourhood.

Schemnitz, the principal mine town in Hungary, is chiefly inhabited by Protestants. The gold and filver mines produce a confiderable quantity of ore.

Cremnitz, the capital of the county of Beps, contains a mint; but the mines are fo exhaufted as scarce

to deferve working.

The Hungarians are fierce, cruel, proud, and revengeful; better foldiers than mechanics, and huntfmen than scholars. The men are strong and well made; they shave their beards, leave whiskers on the upper lip, wear furs on the head, a close bodied coat girt with a fash, and a short cloak buckled under the arm, in order to leave the right hand at liberty. The horse, who carry a broad fword and battle-ax, are called huffars, and the foot are named heydukes. Here are five languages spoken, viz. Hungarian, Sclavonian, lachian, German, and Latin. Though not above a fourth part of the people are Roman Catholics, yet that religion is the established one. Protestants, and particularly those of the Greek church, are tolerated; and Jews are doubly taxed.

The ordinary revenue of this kingdom is very confiderable. Hungary can eafily bring into the field a

very formidable army.

TRANSYLVANIA, anciently Dacia, had its modern name from its fituation Trans-Sylvas, that is, Beyond the Woods or Forests. It is fituated on the fouth of Hungary, being about 160 miles long, and 150 broad. Its mountains yield filver, iron, lead, copper, quick-filver, rock falt, cinnabar, fulphur, vitriol, falt-petre, antimony, red ochre, ifinglafs, and other minerals; and feveral of them are clothed with vines. Many petrifying, falt, and medicinal fprings, cold and hot, with a great variety of plants, are also found among them. The fields and valleys are rich and fertile, yielding corn, pulle, and fruits; and the forests abound with buffaloes, elks, ftags, wild goats, bears, foxes, martins, lynxes, ermines, beavers, wild-affes, wolves, bees, &c. Vast numbers also of black cattle and horses are bred here. Of the latter there is a wild fort, with manes hanging down to the ground. The principal rivers are the Szamos, the Maros, and the Aluta. The inhabitants are of feveral forts, as Hungarians, Saxons, Wa lachians, Arminians, Bulgarians, Greeks, Rascians, or Servians, and a people called Sekli. Here are also Jews and Zigduns, or Gypfies, as in Hungary. Roman Catholics, Protestants, Greeks, and Armenians, are all tolerated here. The Protestants are much more numerous than the Roman Catholics. The states, like those of Hungary, confist of the prelates or clergy, nobility, gentry, and royal towns.

SCLAVONIA extends from the Adriatic to the Black Sea. It takes its name from the Sclavi, a Scythian nation. The inhabitants are a mixture of Sclavonians, Croats, Wallachians, Germans, Venetians, Turks, Servians, or Rascians, and Hungarians. Sclavonia was long subject to the Venetians, afterwards to the Turks; but in 1746 it was united to Hungary. The flates fend reprefentatives to the diets of Hungary, and have also diets of their own. The air is pleasant and temperate; the face of the country level; and the foil fruitful in corn, wine, and pasture. The only religion, publicly tolerated, is the Roman Catholic; yet there are many of the Greek church.

CHAP.

CROATIA, fituated west of Sclavonia, is 80 miles long, and 70 broad. The Croats, or inhabitants of this country, derive their origin from the Sclavi, and speak the Sclavonian language. Both horse and foot are good foldiers, especially the former, serving for much the fame purpoles as the huffars, pandours, and other irregulars. The foil where cultivated, is fruitful in wine and oil, and many other products.

DALMATIA belongs to the Venetians, Austrians, Turks and Ragusans; that is, the former have the maritime places, and the three other powers the reft. The language is Sclavonian, the religion Romish. The mountains are clad with olives, vides, myrtles, and fheep, and lined with gold, filver, and other ores; and the plains are fertile. There is a people in this country and Carmola, called Uccocks, a rough favage race, much addicted to rapine, and noted for their agility. Their language is Wallachian, and their religion the

At Lara is a capacious harbour, and a citadel. To fupply the want of fresh water the rain is carefully preferved in cifterns. The city is ancient, and contains magnificent structures.

Ragusa is a small republic under the protection of the Turks and Venetians.

Ragufa, the capital, is a finall, but well built town, ftanding on the sea-coast, in a wholesome air, but barren foil, and having a good harbour, with feveral manufactures, and a confiderable trade.

C H XIX.

$\mathbf{R} \mathbf{K}$ \mathbf{E}

the Turkish Empire in Asia and Africa, in our account of those quarters of the globe, we have now only to treat of Turkey in Europe, which we shall do under the distinct heads of the Danubian Provinces, Little Tartary, and Greece.

DANUBIAN PROVINCES.

ROMANIA, the ancient Thrace, is about 280 miles in length, and 180 in breadth. The whole is well watered. The mountainous parts are cold; but the level parts, towards the fea, warm and fertile. This province is governed by a beglerbeg, and three fangiacs;

and contains the following places

Constantinople, the capital of the whole Ottoman empire, and the refidence of the grand feignior. This city is admirably fituated, and has not only a fine profpect, but a water communication with various parts of the empire. It was anciently called Byzantium; afterwards Conftantinople, from Conftantine the Great; and fometimes the Porte, on account of its being the finest port in Europe. It stands in 41 deg. north lat. and 24 deg. 40 min. cast long. It is separated from Asia by a canal, is of a triangular form, and, including the suburbs, covers a great deal of ground. The streets are narrow, the houses mean, and the fortifications decayed. The innumerable bagnios, bazars, seraglios, and mosques, with their miranets, make a fine appearance at a diffance. Fires are frequent; and the only method of preventing the conflagration from spreading is to blow up a number of them. The mosques, of which there are seven called royal, are handsome buildings, in detached fituations, furrounded by lofty and adorned by fountains. Near the harbour flands the feraglio, which is a collection of royal buildings, a mile and a half in circumference. Below the palace are the gardens, from whence the coast of Leffer Asia presents a fine prospect. The hall of Audrerice, for foreign ambaffadors, is amazingly magnificent, and contains a most superb throne. The most magnificent mosque is that of St. Sophia, which stands opposite to the great gate of the feraglio, upon an eminence, from whence there is a gentle descent to the sea shore. There are upwards of 100 pillars in this mosque, of the most curious marble, some of them porphyry and Egyptian granate; and the whole building is lined or wainfcoted with marble. Befides this mosque are se-veral others little inferior to it. These, and the rest, have usually hospitals, and endowed schools, belonging to each of them; but no painting or imagery are fuffered in any of them. Here are several Greek and

AVING already described the various parts of the Turkish Empire in Asia and Africa, in our church. The Atmeidan, or Hippodrome, where horse-unt of those quarters of the globe, we have now almost as it was formerly; for here the Turks throw the gerit, or dart, riding full speed at the mark. At the fouth end of the city is the castle of seven, or rather eight, towers; for an eighth hath been lately added; the whole ferving as a ftate prison.

In the markets for live cattle flaves of all ages and fexes are fold, and these are generally Christians; but where any of the girls have a good share of beauty, that may recommend them to men of figure, they are kept in handsome lodgings by their masters, and provided with good cloaths, and whatever elle may recom-

mend them to the purchafers.

The circumference of this city, including gardens, fuburbs, &c. is very great, and the inhabitants exceeding numerous, confifting not only of Turks, but a great number of Greeks and other Christians, Arminians, Jews, &c. but the plague often makes dreadful havock among them. In August, 1784, a fire broke out in the quarter situated towards the harbour, and fpreading into other quarters, about 10,000 houses were confumed. The environs are pleasant, and afford beautiful profpects.

Adrianople, the fecond city in this empire, is about eight miles in circumference. It received its name from the emperor Adrian, who rebuilt it after it had been destroyed by an earthquake. It stands on a fine plain in a fruitful country, well watered by rivers and

rivulets, the chief of which is Mariza.

Philippopoli is inhabited chiefly by Christians of the Greek communion, and is the fee of one of their arch-

Gallipoli is a fea port town, fituate on the Thracian

BULGARIA is governed by the beglerbeg of Rume-lia, with four fubordinate fangiacs. The country is, in general, mountainous, but has fome fertile spots, abounds in cattle, and contains a few iron mines, and medicinal fprings.

Scopia, a populous town on the Bojane, is the prin-

cipal place.

SERVIA has the rivers Save and Danube on the north. It is 250 miles in length, and upwards of 100 in breadth from north to fouth. The capital city is Belgrade, fituated at the confluence of the Danube and the Save. It was a very large and important place, and has been feveral times taken and retaken by the Christians and Turks. It was taken by prince Eugene in August, 1717, and kept till 1739, when it was ceded to the Turks.

Bosnia is 40 Turkish miles in length, 15 in breadth, and confifts of 3 fangiacfhips, in which are feveral inconfiderable towns.

WALLACHIA, fituated to the fouth of Moldavia, is, of a triangular form. The air is temperate, and the foil fruitful. Cattle abound, and wood is fearce. The whole is well watered. The established religion is the Greek church; and the common people are extremely ignorant. The waywode, prince, delpot, or hospodar of Wallachia, is a vaffal of the Ottoman Porte, paying a yearly tribute, and furnishing a body of troops in time of war. The principal places are Terves, the capital, on the civer Jalonitz, 60 miles north of the Danube, which has a tolerable trade, with fome fortifications; and Buckerest, a strong town, and archbishop's see, 40 miles north of the Danube, which has some trade, and is the residence of the wayworde.

MolDAVIA, fituated to the east of Transylvania, is, ! in general, a barren spot, and the inhabitants are a mixture of various neighbouring nations. The principal place is Jaffy, the capital, and refidence of the waywode; and Choczim, a strong town on the Niester, near the borders of Podolia.

LITTLE TARTARY.

THE principal parts of Tartary in Europe are the following:

BESSARABIA, which borders on the Black Sea. The inhabitants are called White Hordes: they rove from place to place, along the Niester, and live on the fight of horses, oxen, cheese, milks, particularly that of mares, &c. The chief place is Bender, which, in the Turkish language, fignifies a strong pass. It was here that Charles XII. of Sweden, resided after his deseat at

BUDZIAC TARTARY is inhabited only near the fea, and along the banks of the river. Ockzakow, the chief place, fituated at the influx of the Nieper into the Black Sea, is very strong. Notwithstanding the force of Russia has repeatedly been directed against it, the Turks still continue masters of it.

GREECE

THIS country, with respect to arms and arts, was once the most celebrated in the world. It is fituated to the north of the Mediterranean, being 400 miles in length, and 240 in breadth. The air is temperate, but fluctuating; the foil fruitful, but uncultivated; and the religion Christianity, but mixed with superstition. The provinces are

MACEDONIA, fituated to the west of the Archipelago. It has a fharp, clear, and wholesome air, and produces corn, wine, and oil. It is well watered, but mountainous. The only considerable place is the town called Karais, the residence of the Turkish aga.

Salonichi, or Theffalonica, is fituate at the bottom of a bay of the Egean Sea. Here St. Paul preached, and we have ftill two of his epifiles, written to the Theffalonians. It is a populous town, and has a good foreign trade.

ALBANIA, comprehending Illyricum and Epirus, is fituated to the east of the gulph of Venice, being 190 miles long, and 96 broad. The foil is fertile, but little cultivated; and the inhabitants robust, but ignorant. The principal places are Scutari, which carries on a confiderable trade; and Durazzo, which has a good bankour and confiderable. harbour and castle.

The district called Lower Albania, or Epirus, is fruitful, and the inhabitants are well adapted for a military life. The towns are totally decayed. No. 83.

THESSALY, now JANNA, is bounded by Macedon on the north, by the Archipelago on the east, by Achaia on the fourh, and Epirus on the west. The chief town is Larista, said to be the birth-place of Achilles. Philip, the father of Alexander the Great, refided here. It carries on a confiderable trade, and is pleafantly fituated on the river Peneus.

LIVADIA, formerly ACHAIA, is fruitful though mountainous, being well watered. The principal place, Sentines, the ancient Athens, fittiated near the bay of Engia, stands almost in the middle of a plain, being a barren, but healthful foil, the river Iliffus almost furrounding it.

Athens, once renowned as the feat of the arts and sciences, is still a source of the most magnificent and celebrated antiquities in the world. Among these are the remains of the temple of Minerva. The architrave is adorned with baffo-relievos, admirably executed, representing the wars of the Athenians. To the foutheast of the cuadel are 17 beautiful columns of the Corinthian order, thought to be the remains of the emperor Adrian's palace. Just without the city stands the temple of Theieus. On the outlide of the porticos are represented the feats of Theseus. On the south-west of Athens is a beautiful ftructure, commonly called the anthorn of Demosthenes. On the frieze are beautifully represented the Labours of Hercules. Here are also to be seen the temple of the winds, the remains of the theatre of Bacchus, of the magnificent aqueduct of the emperor Adrian, of the temples of Jupiter Olymputs and Augustus, and of several other noble structures.

Lepanto, the ancient Naupactus, is furrounded by fruitful fields and vineyards, producing corn, rice, olives, oranges, lemons, and citrons, in great plenty. The wine is efteemed the best in Greece. Near the entrance of the bay the Venetians, and their allies, commanded by Don John of Austria, natural son of Charles V. obtained a compleat naval victory over the Turks, in the year 1571.

Livadia, fituated on the gulph of Lepanto, is a populous trading town, inhabited by Turks and Greeks.

The PELOPONNESUS, or MOREA, is a large peninfula, joined to Greece by the ifthmus of Corinth. It is 120 miles long, and 155 broad, tolerably fertile, except in the mountainous parts, and, in general, well watered. The principal places are

Corinth, the modern Gerame, fituated between the bays of Lepanto and Engria, 50 miles welt of Athens. The buildings are not now contiguous, but intermixed with fields and gardens, which make it look like a village. The cattle is fituated on a high fteep rock above it, of very difficult access. The country about it abounds with corn, wine, and oil. From the callle there is one of the finest prospects in the world, having the sea in full view on the east and west, and a fine country north and fouth. The narrowest part of the isthmus is about six miles over.

Patras, eight miles west of Corinth, is the see of an

archbishop, formerly contained a temple of Diana, and is at prefent a place of some trade. Lacedemon, or Sparta, now named Mistra, is famous for a code of laws received from Lycurgus.

Napoli di Romana is a strong town, with a good harbour, and a confiderable trade.

Olympia, now Langanico, once famous for the games celebrated on the neighbouring plains, every fifth year, from whence the computation of time by Olympiads took its rife, is now an inconfiderable place.

In our furvey of Afiatic Turkey we have given an ample account of the character, customs, manners, &c. of the Turks in general; and as those of Europe dif-fer in no effential points, we have only to refer the reader to the same as contained in the first volume of our work.

XX. C H A P.

EUROPEAN ISLANDS.

ICELAND.

THIS island, which received its name from the great maffes of ice that are feen near it, is fituated in the Atlantic Ocean, between 63 and 68 deg. north lat. and between 10 and 26 deg. west long. It is about 400 miles in length, and 150 in breadth. For two months together the sun never sets; and in the winter it never rises for the same space, at least not entirely. The greater part of the island is mountainous, stoney, and barren; but in some places there are excellent pattures, and the grass has a fine scent. The ice, which gets loose from the more northern country in May, brings with it a large quantity of wood, and fe-veral animals, fuch as foxes, wolves, and bears.

The whole country is well watered with large and fmall rivers, that flow from the mountains; besides rivulets and large lakes, all of which abound with excel-lent fish. There are no forests in any part of the island; but this defect is in a great measure compen-sated by large quantities of fine timber, that come floating ashore in different parts of the sea-coast.

With respect to the natural productions of this island, such as quadrupeds, birds, infects, and fish, they are so much alike with those of Norway, Greenland, &c. that their descriptions may be sound by referring back to the natural history of those countries.

The most remarkable phænomena for which this island is famous are the mountains, several of which are exceeding lofty, and always covered with ice and fnow. In the vallies between them the inhabitants live; and in those near the coast are plains covered with verdure. But notwithstanding the amazing coldness of this island, earthquakes and volcanos have been more known here than in many countries in much warmer climates. Mount Hecla is the most noted mountain, and is a volcano, which sometimes throws out sulphurous torrents. The last eruption of this mountain happened in 1766. It began on the 5th of April, and continued to the 7th of September following. Among the curiosities of Iceland, none are more worthy of attention, than the hot footing water forings with which this island abounds. Some of these springs fpout columns of water, of feveral feet in thickness, to the height of many fathoms. These springs are of unequal degrees of heat. The cows that drink of the cooler springs yield an extraordinary quantity of milk. They are also deemed falutary to the human species.

Stones of various colours are found in this country, but no marble. It likewife produces a kind of chryftal, a large quantity of pumice-ftones, and, near the vol-canos, two forts of agate. It is rich in minerals, though there are no mines worked in the country. The prin-cipal article of this island is fulphur.

The Icelanders are, in general, well made, and pof-feis a considerable share of bodily strength; though

fefs a confiderable share of bodily strength; though they seldom live to a very old age. In general they are sober, honest, docile, and industrious; but, like all others who dwell in cold countries, they are sond of drinking spirituous liquors. They are subject to various disorders, particularly the rhumatilm, severs, asthma, and consumption; but the leprosy, or rather a kind of hereditary scurvy, is the prevailing disease. Their chief employment is sisting, to which they bring up their children as soon as they have strength enough to row a boat. The dress both of the men and enough to row a boat. The dress both of the men and women is much the same as that worn by the Norwegians. The men, in fifthing, wear a garment of theep-fkin over their cloaths, and this they frequently fosten by rubbing it over with fish liver. The houses in Iceland nearly resemble those of Norway; with this difference, that as they are not so well supplied with timber, they make more use of stones, turf, and mud-walls. The better fort possess tolerable houses, well furnished. The roofs are either boarded or thatched, and their walls are thick and

The Icelanders are remarkably ingenious and docile. The country not only affords a great number of able boat-carpenters, and handicraftimen, but has likewife produced men of some learning. As there are no public schools in the country, the children are taught to read, and instructed in the articles of religion, at home, by their parents, or by the ministers of the different parishes, in the course of their visitations. They do not reckon time by the clock or hour, but take their observations from the sun, stars, or tide, and parcel out the day into different divisions, each of which has its own appellation; fuch as midnight, twi-light, broad-day, forenoon, noon, afternoon, evening,

mid-evening, &c.

As the inhabitants of this island were originally a colony from Norway, they still speak the old Norwegian dialect. The Lutheran is the only religion here tolerated. The country is divided into two bishopries; namely, the see of Skalholt for the south, and that of Hoalum for the north. The clergy here have no tythes; but some small dues are paid to them either in merchandize or money. The churches are, in general, low, and but indifferently decorated; nevertheless they

are clean, decent, and commodious.

The Icelanders are ruled by a governor, called Staffs-The Icelanders are ruled by a governor, called Staffs-amptmand, or rather by his deputy, the Amptmand. The former is generally chosen by the king from the Danish nobility, and resides at Copenhagen; but the latter lives in Iceland, at the king's palace of Ressested, on a salary of 400 rix-dollars per annum. His majesty likewise appoints a receiver, who collects all the taxes and revenues, and transmits them to the treasury. Beand revenues, and transmiss them to the treatury. Be-fides the flewards, there are Sysselmen, who farm the king's taxes in certain districts, and act as justices of the peace, each within his own province. The king's revenues arise from taxes and dues, an annual sum payed by the company of merchants, secularized ab-bey lands, and other royal demesses farmed out to the natives.

Law fuits, in spiritual matters, or concerning free-hold property, are determined by the Norwegian laws; but in every dispute relative to meum and tunm, the old Iceland laws take place. There is no other legal method of punishing men with death than beheading, or hanging. The women, condemned to die, are sewed in a fack and drowned.

With refrest to the commerce of this island, its ex-

With respect to the commerce of this island, its exports confilt of dried fish, falt meat, butter, tallow, train-oil, coarse woollen cloth, stockings, gloves, raw wool, sheep-skins, lamb-skins, fox surs, edder-down, and feathers. The imports are timber, fishing lines and hooks, tobacco, bread, horse-shoes, brandy, wine, falt, linen, filk, and a few other necessaries, as well as superfluities for the better forc.

The whole trade of Iceland is engroffed by a mono-poly of Danes, indulged with an exclusive charter. This company maintains factories at all the harbours in the island, where they exchange the foreign goods for the merchandize of the country; and as the ba-lance is in favour of the Icelanders, they pay the overplus in Danish money, which is the only current coin in this island. The weights and measures here are nearly the same with those used in Denmark.

S

GREAT BRITAIN.

THIS island, known by the general name of Great Britain, is not only the largest in Europe, but one of the most populous, rich, and fruitful. It in-cludes England, Wales, and Scotland, the latter having been united to the former in 1707. Great Britain is fituated between 50 and 59 deg. of north lat. and between 1 deg. 42 min. and 6 deg. long. Its length is about 625 miles, and its utmost breadth 338.

We shall treat of Great Britain under two diffinct heads, South and North; the former comprehending

England and Wales, the latter Scotland.

BRITAIN. SOUTH SECTION L

ENGLAN

Boundaries, Situation, Climate, Soil, Mountains, Forefts, Rivers, Medicinal Springs, Vegetable and Animal Productions, &c.

THIS kingdom is bounded on the north by Scotland, on the east by the German Ocean, on the fouth by the English Channel, and on the west by the

England, from its fituation, is liable to great uncertainty of weather. The climate, however, is far preferable to that of any part of the continent near the fame latitude, the fummers being neither fo hot, nor the winters so cold. The air, in many places, is subject to vapours; but these vapours nourish the vegetable fystem, and, by that means, produce good effects. Upon the whole, the air is healthy, the foil fertile, the face of the country beautifully diversified, the prospects admirable, and the lands well cultivated.

England, except in a few places, exhibits to the view an enchanting variety of gently swelling hills, level plains, corn fields, meadow grounds, wood and water, intermingled in the most agreeable manner. The champain country is parcelled out into beauteous enclosures, furrounded with quick-fet hedges, intermixed with flately oaks and clms." The farm houses, scattered about in great numbers all over the face of the kingdom, appear large, neat, and convenient, in the midst of their offices or out-houses. The uncultivated part of the ground is cloathed with a perpetual verdure; and the lands, in general, display the perfection of agri-culture. The seats of noblemen and gentlemen rise like enchanted castles on every hand. Populous villages, thriving towns, and flourishing cities, abound in every part of the kingdom, which excels all the states of Europe in beauty, opulence, and cultiva-

The most noted mountains in England are, the Peak in Derbyshire, the Wreken in Shropshire, the Endle in Lancashire, the Wolds in Yorkshire, and the Cheviot Hills on the borders of Scotland.

The remarkable forefts are those of Windsor, Epping, Dean, Sherwood, and that called New Forest.

The principal rivers are the Thames, the noblest perhaps in the world; the Severn, the Medway, the Trent, the Tyne, the Avon, and the Humber, be-fides feveral others of less note. The bridges over the Thames, at Westminster and Black-friars, for commodiousness, architecture, and workmanship, stand unparalleled. The rivers, in general, not only fertilize the ground, but conduce to the improvement of com-

To enumerate the medicinal fprings would be need-lefs; fuffice it, therefore, to observe, that the principal

are those of Bath, Buxton, Cheltenham, Dulwich, Epfoin, Harrowgate, and Scarborough, each of which have been recommended by the faculty for their specific

Of minerals, England produces tin, lead, copper, and iron. The pits, in the northern parts, furnish immense quantities of coals. Other places produce much allum and falt; and there is abundance of fuller's earth, which is of the utmost importance in the cloth manufactory.

England produces corn, not only fufficient for the inhabitants, but to bring in large fums of money from the exports. Leis difficult to ascertain the quantities of barley, rye, peas, beans, vetches, oats, and other grain, that grow in the kingdom. The most uninformed reader cannot be ignorant that the most excellent fruits. as apples, pears, plumbs, cherries, peaches, apricots, nectarines, currants, goofeberries, &c. abound here, nor that great quantities of cyder and perry are made in some counties, particularly those of Devon and Hereford. Our kitchen gardens are stocked with all sorts of greens, roots, and fallads. Wood for dying is cultivated in Bucks and Bedfordshire; and in many parts is clover, cinquefoil, trefoil, and other meliorating graffes for the foil. It is the province of a botanist to recount the various kinds of useful and salutary herbs, shrubs, and roots, that grow in different parts. The spil of Kent, Essex, Surry, and Hampshire, is most favourable to the culture of hops, which is become a considerable article of trade. The timber is various and excellent.

The English oxen are large and fat, and the beef has a delicious flavor. The sheep are large, and even more valuable for their sleece than their sless, as walt numbers of fleeces are annually shorn and manufactured in the kingdom. The horses for the saddle and chace are finely proportioned, and full of mettle; those for draught are amazingly ftrong; and the war horses have the greatest spirit imaginable. Among the animals peculiar to England we must not omit mentioning the mastiffs and bull dogs, whose spirit is so great that they will fingly attack any animal whatever. But it must be remembered that this furprizing fpirit degenerates when they are transported to any other country.

Tame fowls are pretty much the same in England as in other countries, and there is plenty and variety of wild fowl. The feathered choir is also numerous; and whether we respect the gratification of the palate or the ear, each is amply provided for. We shall only add that the English game cock is remarkable for his courage, but, like the mastiff and bull dog, degene-

rates if carried to any other country.

Few countries are better supplied than England with river and sea fish. Of the former are falmon, trout, pike, perch, carp, tench, flounders, fmelts, &c. There is a delicate lake fish called char. The chief fea fish are cod, haddock, mackarel, whiting, her-rings, skaite, soles, plaife, &c. The John Dory, found towards the western coast, is reckoned a great delicacy, as is the red mullet. As to shell sish, there are lobsters, oysters, muscles, cockles, &c. The best sish that comes to the tables of the great in London is the turbot, fold to the English by the Dutch, who take them upon the English coast. Attempts have been made to carry on a fishery for that species, but they have hitherto proved abortive.

With respect to reptiles, such as adders, vipers, snakes, and worms; and insects, such as ants, gnats, wasps, and flies, England is pestered with them as well as other parts of Europe.

SECTION II.

Grand Divisions of England. Descriptions of the Counties included in each Division.

HEN the Romans added England to their other provinces, they divided it into three The Saxons afterwards erected feven kingdoms in it, under the title of the Saxon Heptarchy, viz. those of Kent, South Saxons, East Angles, West Saxons, Northumberland, East Saxons, and Mercis.

Since the Norman invalion England has been divided into counties, a certain number of which, excepting Middlefex and Cheshire, are comprehended in fix circuits, or annual progress of the judges, for administering justice to the subjects who are at a distance from the capital. They are as follow. The home circuit, the Norfolk circuit, the Oxford circuit, the midland circuit, the western circuit, and the northern circuit. Each of these comprehends a certain number of counties. The home circuits are Effex, Hertford, Kent, Surrey, and Suffex. In the Norfolk, Bucks, Bedfordshire, Huntingdonshire, Cambridgeshire, Suffolk, and Norfolk. In the Oxford, Oxon, Berks, Gloucestershire, Worcestershire, Monmouthshire, Herefordshire, Salop, and Staffordshire. In the midland, Warwickshire, Leicestershire, Derbyshire, Nottinghamfhire, Lincolnshire, Rutlandshire, and Northampton-shire. In the western, Hants, Wilts, Dorsetshire, Somerfetshire, Devonshire, and Cornwall. In the northern, Yorkshire, the bishopric of Durham, Northumberland, Lincashire, Westmorland, and Cumberland. In England we number 40 counties, containing 25 cities, 172 botoughs, and 8 cinque-ports, which are Haftings, Dover, Sandwich, Hythe, Romney, Rye, Wincheliea, and Seaford.

We shall now enter upon a description of the fituation of, and the principal places in, each county

CORNWALL is the most western county of England, and, in shape, refembles what its name implies, a horn. It abounds in tin and lead; produces mundic, which affords copper as good as the Swedish; is famous for the best kind of slate tiles; and furnishes the builder with moor stone, which, when polished, looks like Egyptian granate. It has the title of a duchy, and the king's eldeft fon is duke of Cornwall.

Launceston is a corporation town, and fends two members to parliament. It was formerly defended by

a castle, which is now in ruins.

Falmouth is the richest and best trading town in the county. The harbour is to commodious that thips of the greatest burthen come up to its quay. It is guarded by the castles of St. Mawes and Pendennis. There is a fufficient shelter in many creeks for the whole royal navy to ride here fale from any winds. The town is well built, and its trade very confiderable.

Penzance, the farthest town in the west of England, is well built and populous, and has many ships belonging to it. Veins of lead, tin, and copper, are feen here even to the utmost extent of low water mark.

DEVONSHIRE is naturally sterile, but rendered fertile, in many parts, by art, and contains the following prin-

cipal places.

Exeter, the capital of the county, and one of the principal cities of the kingdom. It is fituated on a rifing ground, watered by the river Ex, has fix gates, and, with the suburbs, is two miles in circumference. The cathedral, called St. Peter's, is a magnificent and curious fabric. This city had feveral charters, confirmed by most of our kings, many of which have honoured it with their royal presence. Its bridge over the Ex is of great length, and has houses on both sides towards the ends. It has four principal streets (the chief of which is called High-street) all centering in the middle of the city, which is well supplied with water. There is an old castle here, called Rougement, supposed to have been built by the West Saxon kings. It is now much decayed, only a part being kept up for the affizes, &c. The city is remarkable for a fair at Lammas, at which the goods fold in the woollen manufactory are numerous.

Totne's stands on the river Dart. Here are a spacious church, a town hall, and a school-house. chief trade is the woollen manufacture. There is a fine ftone bridge over the river, which abounds with delicate trout, and other good fish. It is diverting to fee them catch falmon peele here, with a spaniel trained to drive them into a shove net. Sometimes a man will take up 20 falmon at a time, from 14 to 20 inches long, for which they ask only two-pence a piece.

Plymouth, 216 miles from London, at the influx of the rivers Plymand Tamar into the channel, contains near as many inhabitants as Exeter, and is one of the chief magazines in the kingdom, owing to its port, which is one of the largest and safest in England. It confifts of two harbours, capable of containing 1000 fail of ships; and is defended by feveral forts, particularly a strong citadel, of large extent. It is the general rendezvous of thips outward bound; and is very convenient for homeward bound ships to provide themfelves with pilots up the channel.

About two miles up the mouth of the river Tamar, in an inlet of the fea, diftinguished from Cat-water by the name of Hamouze, and commanded by the caffie on St. Nicholas Island, is a royal dock for building and repairing thips. Here is a charity-school, four holpitals, and a work-house. Off the entrance of the bay lies the Edystone rock, which is covered, at high water, and on which the ingenious Mr. Winstanley built a light-house, that was blown down in that terrible hurricane in November 1703, and himfelf, with those that were in it, never more heard of.

Dartmouth stands on the fide of a craggy hill, and about a mile long. The streets are irregular, and is about a mile long. The streets are irregular, and the houses generally high. The harbour is good, and 500 fail of ships may ride safe in the bason. Here is a large quay, and a spacious street before it, where many considerable merchants live. Here are three churches, and a large meeting house. Dartmouth castle is very

DORSETSHIRE, fituated on the fouth eaft of Devonshire, is, like the two last, a maritime county. It is one of the pleasantest and most fertile in the kingdom,

abounding in corn, cattle, fheep, &c.

Dorchefter is the county town, and was the most considerable station of the Romans in those parts. They had a camp near it, with five trenches, enclofing ten acres, the vefliges of which are still visible at a place called Maiden Caftle, about a mile from the town. It is fituated on an afcent, on the banks of the river Frome. St. Peter's, Trinity, and All Saints churches, and the shire-hall, are the principal buildings in the town. The Ikenild street of the Romans is plainly traced here; and the foundations of the old Roman wall appear quite round the town, except toward the east, where the disch is filled up, a ftreet built upon it; yet the place is still called be Walls. The Romans had an amphitheatre in the neighbourhood, now called Maumbury, the terrace of the top of which is a noted place for the inhabitants to walk on, having an elegant prospect of the town and country round it.

Weymouth is a well built town, and has a good har-bour, defended by two forts. Many substantial merchants reside here, and carry on an extensive trade. It is joined to Melcomb-Regis by a wooden bridge, over the little river Wey. The united towns have a church,

and about 400 houses.

Portland is a peninfula. It is fearcely feven miles in circumference, and but thinly inhabited. The in-land parts are famous for quarries of the finest free frone, and most durable, with which St. Paul's church, Westminster-bridge, &c. were erected.

At Purbeck is found the best tobacco pipe clay in

Somensershine, lituated to the north eaft of Devonshire, is a very fertile county, and more celebrated for its mineral waters than any other county in the

Briftol, 12 miles from Bath, is the second city in the British dominions, for trade, wealth, and number of inhabitants. Though it lay in two counties, before it was made a county of itself, which was in the reign of Edward III. it was by the parliament rolls reckoned in Somerfetshire. The cathedral was formerly the collegiate church of St. Augustin's monastery, which, when diffolved by Henry VIII. and erected into the fee of a bishop, he applied its revenues to the maintenance of a bishop, dean, prebendaries, &c.

There are in this city 18 Mary Redcliff's, without thenry VI. by William city. This is a magnific city. This is a magnification. Here are a stately the Avon, a square, a c market places, besides a fi and other benevolent four change, two fine quays, ket, and three gates.

There

There are in this city 18 churches. The chief is St. Mary Redcliff's, without the walls, built in the reign of Henry VI. by William Cannings, alderman of this city. This is a magnificent structure, in the Gothic tafte. Here are a stately bridge of three arches over the Avon, a square, a custom-house, three excellent market places, besides a fish market, near 20 hospitals,

and other benevolent foundations, a guildhall, an ex-change, two fine quays, feveral docks, a corn mar-

EUROPE.1

ket, and three gates.

This city, which, with the fuburbs, lies compact, being almost as broad as long, is about fix miles in circumference on the Gloucester side, and three miles on the Somerfet fide, which, in the whole, make nine miles in circumference. The houses are close and crowded, especially towards the bridge and the heart of the city, where many of them are five or six stories high. The

afcent to St. Michael's Hill is very freep.

Bath was famous in the time of the Romans for its medicinal waters, called, by Ptolemy, the Hot Waters; by Antoninus, the Waters of the Sun; by the Britons, Caer Baden, the City of Bath; and by the Saxons, Akmanchester, or the City of Valetudinarians. The names of the feveral baths are, the King's-bath, the Queen's-bath, the Crofs-bath, and the Hot-bath. In the King's-bath is a fratue of Bladud, eighth king of the Britons, with an infcription under it, importing that he discovered the use of these baths 863 years before Christ. That this place was of old a refort of cripples and difeased persons, appears from the crutches hung up at the several baths, as the thank-offerings of those who came hither lame, and went away cured: but the city of Bath is now more frequented by the found for their pleasure, than by the fick for their health. The fprings were doubtless separated from the common springs by the Romans, and senced in with a durable wall. The company assemble in the pumproom every morning between the hours of eight and ten to drink the waters, a band of music always at-tending to entertain them. A fine marble statue of the late Richard Nash, Esq; executed at the expence of the corporation, perpetuates the memory of a man, under whose government the city of Bath rose to its pre-fent degree of splendor.

Bath has amazingly increased of late years in the ex-tent and elegance of its buildings. The first improve-ment was the erection of Queen's-square, began in 1729, in the center of which is a garden, and an obelifk 70 feet high, in honour of his late Royal Highness Frederick, Prince of Wales. When the fquare was finished, Mr. Wood (an eminent architect) planned feveral streets contigous to it; and, in 1739, began the North and South Parades, Pierrepoint-street, Dukeftreet, and others. In 1754 he planned the Circus, a beautiful circular pile of buildings, uniformly confifting of the Doric, Ionic, and Corinthian orders. Grey-ftreet, Brook-street, Bennet-street, and the Crefcent, ought not to be here omitted. The last mentioned is a most magnificent and much admired pile of buildings, in the elliptical form, confifting of one order only of Ionic pillars supporting the upper cornice, and commanding a prospect beyond all descrip-

Wells has its name from the wells and fprings about the city, which is but of small extent, though well inhabited. The buildings are neat, and the cathedral

Cheddar is famed for fine cheefe, It is common here for three or four dairies to join their milk, and to make what is called a Cheddar Cheefe.

The woollen Frome is fituated 10 miles from Bath. manufacture is reckoned more confiderable here than in

any part of England.

Bridgewater is feated on the river Parret, over which there is a stone bridge. Ships of considerable burden come up to its quay; and, from its convenient fituation for commerce, the inhabitants have a pretty good coafting trade. No. 83

Glaftonbury is famous for its abbey, some magnificent ruins of which are still remaining.

Taunton is a handsome town, and has several large

woollen manufactories.

WILTSHIRE, fituated to the north-east of Somerfetthire, is rather unfertile, but abounds in sheep. The

principal place is

Salifbury, or New Sarum, an epifcopal fee, and a large well built pleafant city, near which four rivers join their streams, and flow through every street. The cathedral is confidered as the most elegant and regular in the kingdom, particularly for its lofty stone spire. The number of windows, pillars, and doors, in this fabric, also add to its celebrity. There are three other churches besides the cathedral. The market-place, in which is a fine town house, is a square so spacious that three or four battalions of foot may be multered with-out being crowded. There are fome remarkable monuments in the cathedral and other places.

HAMPSHIRE, fituated to the north east of Dorfetthire, is famous for hogs, theep, and timber. The

principal places are

Winchester, on the Itching. It refembles an amphitheatre, and is furrounded by chalk hills. On St. Catherine's Hill, near the city, are the remains of a camp; and on the west gare was a castle, where the West Saxon kings kept their court. The cathedral is venerable and large, but not elegant. Here are fix other churches, two hospitals, a college, several public fchools, &c.

Southampton, 12 miles from Winchester, stands between two large rivers, the Itching and the Tefe, that fall here into that called Southampton Water. It has a wall almost round it, of a hard kind of stone. Henry VI. made it a county of itself, which renders it independent of the lord lieutenant. The chief street is one of the broadest and longest in England. It has one large quay, and one other called West-Quay, where the Guernsey and Jersey vessels always anchor, with which islands they carry on a confiderable trade. The approach to the town, from the London road, is extremely pleasant.

Portsmouth, the great key of England, is regularly fortified, and stands at the entrance of a creek, on the island of Portsea, It is also defended by South-Seacastle, Blockhouse-castle, and a chain that goes across the harbour from the round tower to the opposite shore. This is the narrowest point of entrance to a large and fafe harbour. The dock-yard is as convenient as can be imagined, capable of docking 25 or 30 ships in a formight. In the dock is likewife a royal academy. The Common, as it is called, is the relidence chiefly of the artificers and officers of the dock. Here is one very magnificent church, having on the top of the steeple a ship for a weather-cock.

BERKSHIRE, fituated to the north of Hampshire, has

a fertile foil, and contains

Windfor, 21 miles from London, a pleafant and ancient town on the Thames, and has a fine castle, built by William the Conqueror, Edward III. who was born here, enlarged and beautified it; built the royal palace and chapel, together with St. George's hall and its chapel, and instituted here the Order of the Garter. Queen Elizabeth added the noble terrace, faced with free-frone ramparts, like those of a fortified city, which is scarce to be equalled in Europe. King Charles II. laid out great fums in repairing, new modelling, and furnishing this palace; and there is a fine equestrian fratue of him, erected in 1680, over a great well in the inner court. St. George's hall is efteemed one of the fineft in Europe. The royal chapel is beautifully adorned with curious paintings. The round tower is built like an amphitheatre, very high, with elegant apartments. On the north fide is St. George's, or the chapel of the garter, one of the most elegant Gothic structures in the universe. In the choir are the stalls of the knights of the order, and their banners over them, with a throne for their fovereign.

10 X

Here are two parks; the little park, about three miles, and the great park 14 miles, in circumference, ftocked with all kinds of game, and lavifhly embellished by the hand of nature. In the forest, which is 30 miles round, are several seats; particularly Cranbourn Lodge, which stands on the top of a hill, and has a view not only of Windfor and its parks, but of London

and the adjacent country.

Reading, the principal town of the county, frands on the river Thames, near the influx of the Kennet, and has three parish churches, built of flint and square ftone. An hospital was founded here, and liberally endowed, by archbishop Laud. It had anciently a monaftery, equal to most in England, both for riches and beauty. The gate-house is still pretty entire; and there are fome remains of its walls eight feet thick. The most remarkable curiosity of natural history is a continued bed of oyster-shells, which, for many genera-tions, has been found near this place, extended through

the circumference of five or fix acres of ground.

Surrey, fituated to the fouth of Middlefex, is a pleafant, healthy, fertile county. The principal place (exclusive of the borough of Southwark) is

Guildford, a large well-built town, on the river Wey, which is navigable from thence to the Thames. Not far from the river are ruinous walls of an old castle, this place having, in the Saxon times, been a royal villa, where many of our kings kept their festivals. Here are three parish churches. The road to Chichefter and Portsmouth lies through this town, which has long been famous for good inns and accommodations. Here are alms-houses, liberally endowed, and the remains of a once famous manufactory of cloth. In the neighbourhood are the walls of what was formerly called St. Catherine's Chapel, built with a fort of tile, ed St. Catherine's Chaper, built with a strong, and which, when broken, has the appearance of iron, and which, when broken, has the appearance of iron, and the cement of them is in a manner impenetrable. road leading from Guildford to Farnham is remarkable for running along upon the ridge of an high chalky hill, called St. Catherine's, no wider than the road itself, from whence there is a delightful prospect.

Richmond, anciently called Shene, is remarkable for its beautiful fituation and royal palace, in which are many curious paintings by the most eminent masters. Queen Caroline took great delight here; and his prefent majefty has made great improvements in the gar-dens of this delightful place. The town runs up the hill a full mile to the park, with small gardens declining all the way to the Thames, over which has been

erected a very neat bridge.

Sussex, a maritime county, fituated to the fouth of Surrey, abounds in sheep, wool, &c. The chief

Chichester, situated on a plain near an arm of the fea. It is a very neat small city, walled about in a circular form; with four gates opening to the four principal streets, which meet in the center, where is a beautiful cross. All the space or quarter between the west and fouth gates is taken up with the cathedral, the bishop's palace, the dean's, prebendaries, and vicars houses. The church itself is not large, but very neat, with a high stone spire of an octagonal form, esteemed a complete piece of architecture.

KENT, fituated to the fouth-east of Middlefex, abounds in hops, wood, and fruit. The principal

places are

Canterbury, the chief of the county, and the metro-politan fee of all England. The cathedral is a noble pile of Gothic architecture. Seven kings have been interred in this church; and St. Augustine, with the feven archbishops that succeeded him, lie in one vault. Here was the shrine of Thomas-a-Becker, so famous for its riches offered by votaries and pilgrims from most parts of the universe. Among the ruins of the Roman and Saxon buildings, and of many religious houses, are the walls of a chapel, faid to have been a Christian temple before St. Augustine's time. Two gates of the monastery, built by Ethelbert, king of Kent, about the year 600, at the request of Austin the monk, are still remaining. Here are fix wards, denominated from its fix gates, fifteen parish churches, and seven

hospitals.

Rochester lies in a valley on the east side of the river Medway, and, except Canterbury, is the oldeft fee in England. Its cathedral is faid to have been built by Ethelbert, king of Kent. Here is a stone bridge, confifting of 25 arches, which is efteemed one of the finest in England. Rochester appears to have been a Roman station, from the Roman Watling-street running thro'

Tunbridge, or Town of Bridges, is fo called from the river Ton, and four other streams of the Medway, which rise in the Weald, runing hither, over each of which is a ftone bridge. The river Medway is made navigable up to the town. Five miles from Tunbridge town are Tunbridge Wells, much frequented on ac-

count of their mineral waters.

Margate, or St. John's, is fituated on the north fide of the Isle of Thanet, and is a member of the town and port of Dover, to which it is subject in all matters of civil jurisdiction. The principal street is near a mile in length, and built on an easy descent, by which means the upper part is clean and dry, but the lower end much otherwise. The pier is maintained and preferved by certain payments for all goods and commodities shipped or landed. The bathing-rooms are not large, convenient. There are fome of these rooms that employ feveral machines till near the time of high water, which, at the ebb of the tide, formetimes runs two or three hundred yards into the bay. The fands are fo fafe and clean, and every convenience for bathing is carried to fuch great perfection, that it is no wonder this place should be frequented by multitudes of people, who bathe in the fea either for health or pleafure

Greenwich is noted for its magnificent hospital for decayed feamen, its delightful park, and its aftronomical observatory. The hospital is thought to be one of the finest structures of the kind in the world, and its noble hall is finely painted. It was formerly noted for its palace, where Queen Elizabeth was born; but that was pulled down, and what is fo called now ferves for apartments for the governor of the hospital, and

the ranger of the park.

MIDDLESEX takes its name from its fituation between the kingdoms of the ancient East, West, and South Saxons. Amongst other places it contains London, the metropolis of Great Britain. This

city is very ancient. It is mentioned by Tacitus as a place of confiderable trade in the reign of Nero, and hence we may conclude it was founded about the time of Claudius, and the year of Christ 42.

The city of London has undergone great calamities of various kinds; but the two last were most remarkable; that is, the plague in 1665, which fwept away 68,596 perfons; and the fire in 1666, which burnt down 13,200 dwelling-houses.

London, in it's large fense, comprehending West-minster, Southwark, and part of Middlesex, is a city of furprizing extent, prodigious wealth, and most ex-tensive trade. It is delightfully and advantageously fituated on the banks of the Thames, from which it rifes with a gradual afcent. Nothing can be more beautiful than the furrounding country, confifting of rich corn fields, fertile meadows, large tracks of gar-den grounds, parks, and elegant villas, belonging to

the nobility, and persons of opulence.

The irregular form of this city renders it difficult to ascertain its extent. The best idea that can be formed of it is from the number of the people, who are computed to be near a million, and from the multiplicity of edifices devoted to the service of religion. To defcribe the various structures with which this city abounds would require a volume. The most remarkable, therefore, will only be attended to under this article.

London-bridge was first built of stone in the reign of Henry II. about the year 1163. From that time it has undergone many alt particularly fince the year taken down, and the who and beautiful.

Westminster-bridge is complete and elegant fit known world. It is bui tended over the river at a broad, which is above 300 bridge. On each fide is with places of shelter from structure was begun in 17

Westminster-bridge is reckoned one of the most complete and elegant structures of the kind in the known world. It is built entirely of stone, and extended over the river at a place where it is 1,223 feet broad, which is above 300 feet broader than at London-bridge. On each side is a sine ballustrade of stone, with places of shelter from the rain. This magnificent structure was begun in 1738, and sinished in 1750.

Blackfriars-bridge, which, in magnifience or work-manship, is allowed to fall nothing short of that of Westminster, was begun in 1760, and finished in 1770. It is situated almost at an equal distance between those of Westminster and London, commands a view of the Thames from the latter to Whitehall, and discovers the majesty of St. Paul's in a very strik-

ing manner.

The cathedral of St. Paul is one of the most capacious, magnificent, and regular Protestant churches in the world. It is built of Portland stone, according to the Greek and Roman orders, in the form of a cross, after the model of St. Peter's at Rome, to which, in some respects, it is deemed superior. This edifice is the principal work of Sir Christopher Wren, and undoubtedly the only work of the same magnitude that ever was completed by one man. He lived to a great age, and finished the building 37 years after himfelf laid the first stone. The expence of rebuilding it after the fire of London was defrayed by a duty on coals, and is computed at a million sterling.

Westminster-abbey is a venerable pile of building in the Gothic taste. It was first built by Edward the Confessor. King Henry III. rebuilt it from the ground; and Henry VII. added a fine chapel to the east end of it. This is the depository of the deceased British kings and nobility, and here are also monuments erected to perpetuate the memories of poets, philosophers, heroes,

and patriots.

The infide of the church of St. Stephen, Walbrook, is admired for its lightness and elegance. The steeples of St. Mary-le-Bow and St. Bride's are supposed to be the most complete in their kind of any in Europe. Few churches in or about London are without some beauty. Several of the new ones are built in elegant taste; and even some of the chapels have gracefulness and proportion to recommend them.

Westminster-hall, though on the outside it makes no very advantageous appearance, is a noble Gothic building, and deemed the largest room in the world, whose roof is not supported with pillars. Here are held the corronation feasts of our kings and queens: also the courts of chancery, king's bench, common pleas, and exchequer

of chancery, king's bench, common pleas, and exchequer.

That beautiful column, called the Monument, erected at the charge of the city to perpetuate the memory of the dreadful fire of London in 1666, is worthy of notice.

This monument was begun by Sir Christopher Wren in 1671, and finished by him in 1677.

The Royal Exchange is a large and noble edifice,

The Royal Exchange is a large and noble edifice, calculated for the transaction of commercial business between the merchants of London and other places.

To these may be added the Tower of London, Bank of England, Guildhall, the College of Physicians in Warwick-lane, Christ's Hospital, the College of Heralds, New Treasury, the Admiralty-office, the Horse Guards at Whitehall, the Mansion-house, or the house of the lord mayor, the Custom-house, Excise-office, Indiahouse, Inns of court, a great number of other public buildings, besides the magnificent edifices raised by the nobility and gentry.

the nobility and gentry.

In the center of the town, and upon the banks of the nobleft river in Europe, was a chain of inclegant ruinous houses, known by the names of Durham-yard, the Savoy, and Somerset-house. The first being private property, engaged the notice of an ingenious architect, who opened the way to a piece of scenery

which no city in Europe can equal. On the fite of Durham-yard was raifed upon arches the pile of the Adelphi, celebrated for its enchanting prospect, the utility of its wharfs, and its subterraneous apartments, answering a variety of purposes of general benefit.

Contiguous to the Adelphi stands the Savoy, the pro-

Contiguous to the Adelphi stands the Savoy, the property of government, hitherto a nuisance; and adjoining to the Savoy, towards the Temple, stood Somersethouse, where, being the property of government also, a new pile of buildings for public offices has been erected; and here, in a very magnificent edifice, are elegant apartments appointed for the use of the Royal Society, the Royal Academy of Painting and Sculpture, and the Society of Antiquaries.

and the Society of Antiquaries.

Among the lift of improvements worthy notice may be included the Six Clerks-Office in Chancery-lane; and that very substantial building in the Old Bailey, which does honour to a people celebrated for their cleanlines and humanity. Here the unfortunate debtor will no longer be annoyed by the dreadful rattle of chains, and by the more horrid sounds is uning from the lips of those wretched beings who set defiance to all laws, human and divine; and here also the offender, whose crime is not capital, may enjoy a free open air.

In the metropolis, and its environs, are many excellent charitable foundations; particularly St. Bartholomew's Hospital near Smithfield; the Small-pox Hospital in Coldbath-fields, and another near Battle-bridge-Wells; the Lying-in Hospital in Brownlow-street, Long-acre; another in the City Road; and a third near Westminster-bridge; St. Thomas's and Guy's hospitals in Southwark; St. George's and the Lock, near Hyde-Park-corner; the Middlesex Hospital in Tottenham-Court-Road; the London Hospital at Mile-end; the Magdalen, for the reception of female orphans, in St. George's Fields. To these must be added, Bedlam, or Bethlem Hospital, for lunatics, in Lower Moorfields; and St. Luke's, lately in Upper Moorsields, but now creeked upon a large and extensive plan in Old-street Road. The Foundling Hospital merits equal notice, as its plans and erections are equally laudable and liberal.

The new buildings in the liberty of Westminster have, within these sew years, increased to a prodigious degree. Among them are several magnificent squares, as those of Hanover, Berkeley, Grosvenor, Cavendish, Portman, and Manchester. To the east of this last is Portland Place, the buildings in which are deemed superior in grandeur to any in Europe. Besides the above squares there are St. James's, Soho, Leicester, Golden, Bloomsbury, and Bedford; to which may be added the magnificent square called Lincoln's-Inn-Fields, and several others of less note, both in the city and suburbs.

The number of parishes in London are, 97 within the walls, 16 without, 19 in the out-parishes of Middlesex, and 11 in the city and liberties of Westminster. The number of meeting-houses, for Protestant dissenters of all denominations, is very great; besides which there are three Jews Synagogues. The public schools are, that of St. Paul; Merchant-Taylors school in Susfolk-lane, near Cannon-street; the Charter-house; the Royal school in Westminster; and St. Martin's school near the King's Mews.

The very elegant method of paving and enlightening the streets is felt in the most sensible manner by all ranks and degrees of people. The roads are continued for several miles around upon the same model, and, exclusive of lamps regularly placed on each side, at short distances, are rendered more secure by watchmen stationed within call of each other. Nothing can appear more brilliant than the lights when viewed at a distance, especially when the roads run across; and even the principal streets, such as Pall-Mall, New-Bond street, Oxford street, &c. convey an idea of elegance and magnificence.

The trading part of the city of London is divided into a number of companies. Of these there are 12

principal; the mercers, grocers, drapers, fishmongers, goldsmiths, stationers, merchant-taylors, haberdashers, goldsmiths, stationers, merchant-taylors, haberdashers, ironmongers, vintners and clothworkers. The city magistrates are the lord-mayor, 26 aldermen, 236 common-councilmen, a recorder, two sheriffs, a chamberlain, a common-serieant, and town-clerk. The city and liberties of Westminster are governed by a high-steward, a head-bailiss, a high-constable and whose series.

14 burgeffes.

Learned bodies of men, besides the clergy, are, the Royal Society, the College of Physicians, and the Society of Antiquarians. The finest repository of rarities is Sir Hans Sloane's Museum, kept in Great Russel-street, Bloomfbury.

Essex, which is fituated to the eaft of Middlefex, is

extremely fertile, and abounds in cattle, faffron, &c. Colchefter, the chief town of the county, is a large populous place, on the river Coln, which passes thro' it, and is made navigable for small craft up to the Hithe, a long street, which may be called the Wapping of Colchefter, where there is a convenient quay; and at Vennoe, within three miles of it, is a good custom-This, and all the towns round it, are noted for making baize, of which great quantities are ex-ported. Colchester is also noted for excellent oysters.

Chelmsford stands in a beautiful plain, having the little river Chelmer running through it, over which there is a bridge. It is a large populous town, almost in the center of the county. Its situation renders it the most frequented; and it is called the shire town.

Harwich, a fea port town, contains one of the finest harbours in Europe. Here is also a good dock

yard, in which many thips are built.

HERTFORDSHIRE, or Hartfordshire, which received its name from the great number of harts with which it formerly abounded, is fituated westward of Essex. It is a county particularly fertile in corn and wood.

Hertford is the thire town, though inferior either to Ware or St. Alban's in opulence. It is pleafantly fituated on the river Lea, and built in the form of a Roman Y. It has two churches, All Saints and St. An-

BEDFORDSHIRE, fituated north west of Hertfordshire,

is fruitful in corn and pafture.

Bedford, the county town, is a clean, well-built, populous place. Here are five churches, of which the chief, and indeed the principal ornament of the town, is St. Paul's, which had once a college of prebendaries. The priory, now belonging to the earl of Alhburnham, was founded before the Norman conqueft, for fe-cular canons. The buildings of this town are prety good, and the ftreets broad. The north and fouth parts are joined by a flone bridge over the Oufe. A famous castle here was demolished in the reign of Henry VIII, and the fite is now a bowling green, reskoned one of the fineft in England.

BUCKINGHAMSHIRE, fouth weft of Bedfordshire, is a pleasant fruitful county, and abounds particularly in

phyfical plants.

Buckingham, the county town, stands in a low ground, encompassed on all sides, but the north, with the river Ouse. The castle, now in ruins, was built in the middle of it, and divides it into two parts. In the north part stands the town hall, a very handsome convenient structure. The town was, for many years, a staple for wool, and several of its wool halls are yet flanding; but that trade is now loft. It is populous, and has three stone bridges over the Oufe. Its church, which is in the west part of the town, is very large. The lace manufacture is the principal business here, as well as in other parts of the county. There is a road from this town leading to the Marquis of Buckingham's (late Earl Temple's) celebrated feat at Stowe. It runs in a straight line, about two miles up to the Corinthian arch, which, however, fometimes disappears, owing to the riting and falling of the ground. The temple, pavilions, pyramids, obelifks, monuments, flatues, bufts, &c. which adorn the elegant villa at Stowe, are all highly finished; and the many inscriptions are deligned for the information and instruction of the beholder.

OXFORDSHIRE, fituated to the west of Buckinghamshire, is a pleasant, healthful, and fertile county.

The city of Oxford flands on the conflux of the Charwell and Ifis. It enjoys a fweet air, in a plentiful country, on a fine plain, and has every way a delightful prospect. The private buildings are near, the public ones fumptuous; and the river navigable for barges. But that which gives it a confequence above all other places in this kingdom, is the oldest and most noble university in Europe. It is of so great antiquity as to have been an university between eight or nine hundred years. The constitution is so regular, the endowments to plentiful, the mansions to convenient for study, and every thing so agreeable to the education of youth, and the accomplishment of students, that it is no wonder fuch numbers of learned men are daily fent abroad for the fervice of the church and state. It contains 20 colleges; five halls; a stately pile, called the schools, wherein exercises for the several degrees are performed; the theatre, the most magnificent building of the kind in the world; the Clarendon printing-house, which likewise surpasses every thing of a fimilar nature in the universe; the museum, containing a chemical elaboratory; a repository of natural and artificial curiofities and antiquities; a library; a phyfic garden, &c. It is governed by a chancellor, vicechancellor, &c.

GLOUCESTERSHIRE, fituated to the westward of Oxfordshire, is tolerably pleasant, but indifferently fertile. Gloucester is a well built, clean, healthy city, se-

cured by the river on one fide, a branch of which brings up vessels of a confiderable burthen to its walls. It has a beautiful cathedral, five churches, and is well provided with hospitals. The cathedral is an antient but magnificent fabric, and has a tower, which is one of the neatest and most curious pieces of architecture in England, and a whifpering place, as in the cupola of St. Paul's. Here is an elegant stone bridge over the river, with a key, wharf, and custom-house. Abundance of croffes, and statues of the kings of England, are difperfed in different parts of the city, and large remains of monasteries. Its town-hall, for the affize, is called the Booth-hall. Under the bridge is a curious machine, which raifes water to ferve the town; though it is also supplied from Robin Hood's Well, which is a mile or two out of the city. Cheltenham is noted for its mineral waters, for which it has been much frequented, and is now more fo, having obtained the fanction of a visit from their majesties, and a part of the royal family.

Monmouthshire, which was formerly part of Wales, is the most western English county towards South Wales.

Monmouth, 12 miles from Hereford, gives name to the county, and has its own from the mouth of the river Minway, at which it is fituated. It flands pleafantly between that river and the Wye, over each of which it has a bridge. It has been a place of note ever fine the conquest; for the castle, now in ruins, was a stately edifice at that time. There are still re-maining such parts of its fortifications as shew that it was formerly very ftrong. The town is, in a manner, furrounded by water, there being another river, the Trothy, over which it has also a bridge. It has a stately church, the east end of which is curiously built. The place carries on a confiderable traffic with Briftol by means of the Wye.

HEREFORDSHIRE, north of Monmouthshire, is one of the most fertile counties in England, and particularly

celebrated for its cyder.

Hereford, the only city in this county, has a good stone bridge of eight arches over the Wye, and is encompaffed with rivers on all fides but the west. Its name fignifies the ford of an army, it having been for feveral hundred years the head quarters of the Saxons be-

fore the conquest, and of were stationed here to ke the civil wars it had fix, b The cathedral is a magn monuments of its antient the close with the digni of the vicass and chorift is a large, but not very and mean, and the street fituation.

Before the civil wars it had fix, but has now only four churches. The cathedral is a magnificent structure, and contains monuments of its antient prelates. The bishop's castle, the close with the dignitaries houses, and the college of the vicass and chorifters, are pleafantly fituated. It is a large, but not very populous city; the houses old and mean, and the streets dirty, by reason of its low firuation.

Worcestershire, north-east of Herefordshire, is a

Worcefer, on the Severn, over which it has a fine frone bridge, is the capital. The remarkable battle in 1651, when Charles II. was defeated by Cromwell, was fought near the fouth gate of the city, where bones of the flain are frequently dug up. The chief manufac-tures of the place are broad cloth, gloves, and porcelaine, which is a composition of a middle nature, between fine earth and glafs. The public buildings make a grand appearance, especially the guildhall, and the workhouse. It had formerly a castle, and walls with three gates, and five watch towers; all long fince deftroyed. The cathedral, which is exactly the model of that of Bruffels, is a large edifice, but not very elegant, except the choir of the chapel, on the fouth fide, which is of curious workmanship. A handsome library belongs to the cathedral, supported by one single pillar in the middle. Here are the monuments of king John; prince Arthur, brother to Henry VIII. the countess of Salisbury; and other illustrious persons. Besides the cathedral, there are nine parish churches. The ftreets are broad and well paved; the Foregate-ftreet is regular and beautiful. The hospitals deserve notice, especially that noble one erected by Robert Berkley, of Spetchley, who laid out 2000 l. in the building, and 4000 l. in endowing it for 12 poor men. Besides this, there are six or seven others. The Severn, though generally rapid elsewhere, glides by Worcester very gently. Here is a good water-house and quay.

WARWICKSHIRE, to the east of Worcestershire, is very fertile, and particularly famous for its iron works. Coventry is united with Litchfield in Staffordshire, as a bishopric. There are many traditional stories relating to this city, particularly that of lady Godina, who, to obtain and perpetuate fome privileges, rode naked through the ftreets; and an annual procession is ftill made through the town in commemoration of it. This city is large and populous, but the buildings are old, and some of them, which are built of timber, project out so much, that in the narrow streets the tops of the opposite houses almost touch. The chief churches are St. Michael's and Trinity. The Protestant diffenters are a confiderable body here. The town-house is worth seeing, the windows being of painted glass, representing some of the old kings, &c. who have been benefactors to this city. Its chief manufactures are tammies, and the weaving of ribbons.

Warwick, on the Avon, the county town, ftands on a fituation remarkably rocky. It is of great antiquity, and may be approached by four ways, answering to the points of the compass, and cut through rocks. These lead to four streets, which meet in the center of the town. The walls and cellars are made in the rock. It is supplied with water by pipes from springs half a mile off, and has a noble stone bridge of 12 arches over the Avon. Here is a castle, the principal ornament of the place, strong both by art and nature. The rock on which it stands is 40 feet from the river; but on the north fide it is even with the town. From its ter-Avon, there is a prospect of the river, and a beautiful country beyond it. The apartments of the castle are well contrived, and many of them adorned with origi-William the Conqueror, Near the town is Guy's Cliff, a high perpendicular rock, where Guy, earl of War-No. 83.

wick, is faid to have lived a hermit, after his defeating the Danish giant Colbrand. His sword and other ac-courrements are still shewn in the castle.

Birmingham is a very large populous town, the upper part of which stands dry on the side of a hill, but the lower is watery, and inhabited by the meaner fort of people. They are employed here in theiron works, in which they are fuch ingenious artificers, that their performances, in the small wares of iron and steel, are admired both at home and abroad. It is much improved of late years, both in public and private buildings. Near this town is a feat belonging to Sir Lister Holt, bart. but converted into public gardens, with an organ and other music, in imitation of Vauxhall, which is the name it now goes by.

NORTHAMPTONSHIRE, east of Warwickshire, has lefs wafte ground than any other county, and confequently is exceeding rich and fertile.

Northampton flands upon the Nen, over which it has two bridges. The buildings were handfome, and the town large (having feven parish churches within the walls, and two without) when it was reduced to ashes by a dreadful fire in 1675. Liberal contributions from all parts of the kingdom reflored it in a great measure to its original fize; and for neatness, beauty, and situation, sew towns equal it. It has four churches, of which the great one, viz. Allhallows, is a handsome edifice, with a flately portico of 12 lofty Ionic co-lumns, and a flatue of king Charles II. on the balu-ftrade. It ftands near the center of the town, and at the meeting of four spacious streets. The sessions and affize house is a very beautiful building of the Corinthian order. The market place is one of the finest in Europe. The horse market is thought to exceed any other of the kind in England. Its most considerable manufacture is shoes, of which great numbers are exported; the next to that ftockings. A county hof-pital is built here after the manner of the infirmaries of London, Briftol, Bath, &c. and the river Nen has lately been made navigable up to the town.

HUNTINGDONSHIRE, to the east of Northampton-

shire, is a great corn and pasture county, and abounds in fish and wild fowl.

Huntingdon, near the Ouse, over which it has a stone bridge, is the constant place for the affize, as well as the county goal, and is a populous trading town, con-fifting chiefly of one large freet, well-built, with a handiome market-place, and a good grammar school. More beautiful meadows are not to be feen any where than on the banks of the river, which, in the fummer, are covered with numerous herds of cattle, and flocks of sheep. The bridge, or rather bridges, with the causeway, are ornaments, as well as benefits to the town, CAMBRIDGESHIRE, including the Isle of Ely, is fitua-

ted to the west of Suffolk, and is in general very Cambridge is fo called from its fituation on the banks of the Cam, which forms feveral islands on the west side, and divides the town into two parts, which are joined by a large stone bridge. It is very ancient,

being well known in the time of the Romans by the name of Camboritum. William the Conqueror built a castle here, of which the gate-house is still standing, and used for the county goal. The town is divided into 10 wards, has 14 parish churches, contains up-wards of 1200 houses, for the most part irregularly built, and about 6000 inhabitants.

This univerfity contains 12 colleges and four halls, is a corporation of itself, and governed by a chancellor, high-steward, vice-chancellor, &c.

Stourbridge, a large spot of ground near Cambridge, is famous for one of the greatest annual fairs in England. The chief articles sold here consist of woollen cloth, hops, iron, wool, leather, and cheefe.

Ely, an ancient city, fituated in the fenny country, called the life of Ely, and being furrounded by the Ouse and other streams, is unhealthy, though it stands on a rising ground. It was made an episcopal see by

Henry I. The cathedral and the bishop's palace are its chief ornaments: the former has a remarkable dome

Newmarket, a handfome, well built town, confifting of one long street, the north side of which is in Suffolk, is famous for horfe-races, and much frequented by persons of all ranks. The town is not modern, as the name imports; for it was of note in Edward III's. time; but being burnt down in 1683, was afterwards rebuilt. Befides the parish church of St. Mary's, there is also a small church, All-Saints, which is, properly speaking, only a chapel of ease to Wood-Ditton, in Cambridgeshire. It is a healthy place, and on a spacious heath, which is the finest course in England. Here are several very wide, steep, and long ditches, which were cut by the East Angles, to keep out the Mercians; one of which, being a stupendous work, much superior to the rest, has obtained the name of the Devil's Ditch; which runs many miles over the heath.

Suffolk, a maritime county, fituated west of the German Ocean, has but an indifferent foil, but is well

watered.

Ipswich was once in a flourishing state, as appears from the great number of ships that belonged to it, when its harbour was more commodious; and it had 21 churches, of which now only 12 remain. The tide rifes here 12, and fometimes 14 feet. The town is populous, about a mile long, and fomething more in breadth, forming a fort of half moon on the banks of the river, over which it has a good bridge of stone. It is a corporation; and its chief manufactures are linen and woollen. Here are a convenient quay and customhouse.

NORFOLK, a maritime county, to the north of Suf-

folk, is exceedingly fruitful.

Norwich is a large city, near the conflux of the rivers Vensder and Yare. It stands on the side of a hill, and is near two miles in length, and one in breadth. The town is irregular; though the buildings, both public and private, are neat and handsome. The manufactures, for the greatest part, are crapes and stuffs, of which vast quantities are fent from Yarmouth(a neighbouring sea port) to Holland, Germany, Sweden, and other parts in the Baltic. It has 12 gates, and fix bridges over the Yare; 36 churches, besides the cathedral, and chapels and meeting-houses of all denominations. The roof of the cathedral, a large, venerable, and handsome structure, is adorned with the history of the bible. The choir is large and spacious. Here are two churches for the Dutch and French Flemings, who enjoy fingular privileges.

Yarmouth is a fea port of great firength, both from art and nature. It is esteemed the key of this coast; but though the harbour is a fine one, it is dangerous in windy weather. This place is noted for its herrings.

LINCOLNSHIRE is a large plentiful maritime county, fituated to the west of the German Ocean, and divided into three parts, viz. Holland, Kesteven, and Lind-

y. The principal place in the first is Boston, on the Witham, which is navigable to Lincoln. This town was formerly made a staple for wool, and the merchants of the Hans Towns fixed their guild here. It is a pleafant, well built town, and has a good foreign and inland trade. Its church is reckoned the largest parish church without cross ayles in all the world. Its tower, or steeple, is famous for its height and work-It has a beautiful octagon lanthorn on the top, which is feen near 40 miles every way; but efpecially on the fea, as far as the entrance of the dangerous channels called Lynn-deeps and Boston-deeps; so that it is the guide of mariners, as well as the wonder of travellers, and is a magnificent specimen of a fine Gothic tafte. The town has a commodious haven, and is plentifully supplied with fresh water by pipes from a pond, enclosed in the great common called the West Fenn.

The principal place of Kesteven is Stamford, on the Welland, which is navigable for barges. The

town is finely fituated on the declivity of a hill, has a ftone bridge of five arches, a town hall, fix parish churches, and a confiderable trade in malt, coals, and free-stone.

Grantham, an ancient town on the river Witham, has several good inns of great resort. It is well built. Here is a fine large church, with a handsome spire, which, by a deception of the fight, scems to stand awry. A good free-school was built and endowed here by Bishop Fox, where Sir Isaac Newton received his first education.

Lindsey division contains

Lincoln, built on the fide of a hill, at the bottom of which runs the river Witham in three small channels, over which are feveral bridges. The cathedral was ef-teemed the glory of Lincoln; for its magnificence and elevation is fuch, that the monks concluded it would chagrin the devil to look at it, and thence an envious look, by a proverbial expression, is compared to the devil looking over Lincoln. The city formerly abounded with monasteries and churches. In the center of the old castle, which was built by the Romans, and repaired by the Saxons, is a modern structure, where the affizes are held. The city is a county of itfelf, and has extensive power and privileges. On the down of Lincoln is fometimes feen that rare bird called the Bustard. The country hereabout is very rich and agreeable; the noble track of Lincoln Heath extending, like Salisbury Plain, above 50 miles. The cathedral was fucceffively brought to perfection by feveral of its bishops. Here is the finest and largest bell in England, called Tom of Lincoln, near five ton weight, and near 23 feet in compass.

RUTLANDSHIRE, to the fouth west of Lincolnshire, is the smallest county in England, but contains more parks than any other, and is as fertile as pleafant.

Oakham, the shire town for the affize, is situate in the little but rich vale of Catmos, and famous for its market, fairs, caltle, hospitals, and free school. This town is particularly remarkable for an ancient custom still kept up, viz. that every peer of the realm, the first time he comes through this town, shall give a horse-shoe to nail upon the castle-gate; and if he refuses, the bailiff of the manor has power to stop his coach, and take the shoe from one of his horses. This is now called the order of the horse, shoe; and it is common for the donor to have a large one made with his name flamped on it, and often gilt. One over the judges feat, in the affize hall, is of curious workmanship.

LEICESTERSIRE, fituated to the west of Rutland-

shire, is a plentiful county.

Leicester, the chief town, is the largest, best built, and most populous in the shire: it has fix parishes, and five churches. The freemen are exempt from toll in all markets in England. There is an exquisite piece of workmanship in the high street, in form of Our Saviour's cross. The hospital, built by Henry Plantagenet, duke of Lancaster, is supported by some revenues of the duchy of Lancaster, so as to be capable of maintaining an hundred aged persons decently. It was re-built in 1776, at his majesty's expence, There is an-other near the abbey for six widows. The inhabitants other near the abbey for fix widows. The inhabitants have greatly improved in their manufacture of ftockings wove in frames, and return in that article a large fum annually. Before the castle was dismantled it was a noble work. Its hall and kitchen ftill remain entire; and the former is so lofty and spacious, that it is made a court of justice at the assizes. One of the gateways of this place has an arch of curious workmanship; and in the tower, over it, is kept the magazine for the county militia. St. Margaret's church is a noble and elegant structure.

NOTTINGHAMSHIRE, to the north of Leicestershire, is fruitful towards the eastward part, but unfertile

ent of a rock parallel with made navigable gable. It has three churches; a grand town-house built on piazzas; a fine spacious markes-place, well supplied; a goal for the town and county; a manufactory for weaving frame stockings; and likewise for glass and earthen ware. The rock on which the town stands is so remarkably soft, as to be capable of being cut out into steps, and other purposes, with great ease. The cellars are very good for keeping beer; and the county abounding in barley, the malt and beer-trade are greatly followed. Here is a house built on the side of a hill, where one enters at the garret, and descends to the cellar, which is at the top of the house. As the castle has oftener been the residence of our monarchs than any place so sar from London, the town has more gentlemens house than any town of the size in Britain. In the duke of Newcastle's park there is a ledge of perpendicular rocks hewn into a church, houses, chambers, dove-houses, &c.

DERBYSHIRE, to the west of Nottinghamshire, is barren on its surface, owing to the great number of hills, mountains, &c. but rich within the bowels of those eminences. The peak, a mountainous part of this county, is much visited on account of some rarities, called the Wonders of the peak; amongst which is the fine seat of the duke of Devonshire, at Chatsworth.

Derby, the county town, so called from having been a park or shelter for deer, stands on the west side of the river Derwent, over which it has a neat stone bridge of five arches. The fouth side is watered by a little rivulet, called Mertin-brook, which has nine bridges over it. The most remarkable church in Derby is All-Saints, or Allhallows, having a beautiful Gothic square tower, 60 yards high, with 4 pinnacles. This town depends chiefly on a retail trade, also in buying and selling corn, in making malt, and brewing ale, of both which great quantities are sent to London.

YORKSHIRE, the largest county in the kingdom, contains a variety of soils, and is divided into three Ridings, viz. west, east, and north, being so distinguished on account of their situations with respect to the city of York.

York is fituated on the river Ouse, and its chief magistrate has the title of Lord Mayor. The cathedral is built in the Gothic taste. The windows are adorned with glass exquisitely painted with scripture history. The nave of this church is four feet and half wider, and 11 feet higher, than that of St. Paul's. The ascent from it, through the choir to the altar, is by six steps. The entrance of the middle nave of the church, at the west door, is under the largest Gothic arch in Europe, which binds and supports the two towers. At the south end of the cross is is a circular window, called the marigold window, from its glass being stained of that colour; and a large one at the north end, consisting of sive lights, reaching almost from bottom to top. The painting represents embroidery.

painting represents embroidery.

The city belongs to neither of the Ridings, but enjoys its own liberty, and a jurisdiction over 36 villiages and hamlets in the neighbourhood, on the west side of the Ouse. This liberty is called the Ainstey, or county,

of the city of York.
York is pleafantly fituated, and divided into four wards, containing 28 parifles, and walled, but not fortified with artillery. The river Oufe, from the north, paffes through it, and divides it into two parts, joined together by a stone bridge of five arches, of which the middlemost is reckoned, for height, breadth, and architecture, to be equal to the Rialto at Venice, though not to that at Blenheim. The great council-chamber, the exchequer, the sheriff's court, and the two city prisons, are kept upon this bridge. The river brings large vessels to the quay, though at 60 miles distance from the ocean. It has four large well built gares, and sive posterns. The other most remarkable structures are the guildhall; the statue of king Edgar, who re-built the city, and St. Anthomy's hall. The market-house, in the street called the Pavement, is a curious piece of

architecture, supported by 12 pillars of the Tuscan order; and there is another still larger in a square, called Thursday market. In this city are 17 churches

ed Thursday market. In this city are 17 churches. Hull, or Kingston upon Hull, has two churches; one called Trinity, or High Church, the other St. Mary's, or Low Church. The foriner is a spacious beautiful building, the pillars of which are remarkably small; and had, before the reformation, 12 chantries, in one of which is now a neat library. Here are several meeting-houses, an exchange, a custom house, and an engine for making salt-water fresh. Here is a free-school, with an hall over it, belonging to the merchants, who have founded an hospital, bassed Trinity-house, in which are maintained many distressed scame and their widows. The town carries on a great trade in fail making; is large, close built, and populous. The rigid discipline beggars meet with here makes Hull tremendous to them. All foreign poor are whipped out, and the poor of the town are set to work. They have a cant litany among them, viz. "From Hell, Hull, and Halifax, good Lord deliver us."

Scarborough is a large town, built in the form of a crescent, on the side of a steep hill. It has a commodious quay, but little trade. The pier is maintained by a duty upon coals; and the mariners have erected an hospital for widows and poor feamen, which is main? tained by a rate on veffels, and deductions out of seamens wages. From the middle of November herrings are taken here in great numbers. Besides herrings, they catch ling, cod-fish, haddock, and other fish in great plenty; and fometimes whiting and mackarel. spaw-well is at the foot of an exceeding high cliff, rifing perpendicular out of the earth like a boiling pot, near the level of high-water mark in fpring tides, which it is often over-flowed. It is never dry, and in an hour yields 24 gallons of water, which is purgative and diuretic. Here is good accommodation, besides affemblies and public balls. The refort of company to this place is prodigious.

DURHAM BISHOPRIC, fituated to the north of Yorkfhire, is (though not a fertile county) very rich in

Durham, fituated on a hill, has a cathedral, which is an old but magnificent pile. Befides the cathedral, here are fix parish churches. Southward of the cathedral is the college, a spacious court, the whole of which has been rebuilt, or much repaired, since the restoration. Above the college-gate is the exchequer; and at the west the guest-hall, for the entertainment of strangers. On the north side of the college school is a house for the master; and between the church-yard and castle an open area, called the Palace Green; to the west of which is the shire-hall, where the affizes and sessions are held for the county; and near it a library. On the east is an hospital, built and endowed by Bishop Cosin. On the north side is a castle, now the bishop's palace, built by William the Conqueror, the outer gate-house of which is at present the county goal. The toll-booth, near St. Nicholas's church, and the cross conduit, in the market place, with the two brigdes over the Were, are the other principal public buildings.

NORTHUMBERLAND, the mole northern county of England towards Scotland, is fertile towards the fea, and has great quantities of sheep fed in the mountainous parts; but its peculiar wealth is pit coal.

Newcastle is an antient, large, disagreeable, and dirty town, but exceedingly populous, and very rich. It is situated at the end of the antient PictsWall, on the river Tyne, over which it has a fine bridge. Hence it is called Newcastle upon Tyne. The commerce carried on in coals and salmon is amazing, and has rendered it, in a great measure, the emporium of the north. It may be said to be situated both in Northumberland and the bishopric of Durham; though that part of it which is in the latter is called Gateside, and is like Southwark to London, the liberties coming no farther than the great iron gate upon the bridge, which has the arms of the bishop of Durham carved on the south, and those

CHE

of Newcastle on the north side. The situation of the town is very uneven and unpleasant, especially that part which is most considerable for business, and which lies upon the river; for it is built on the declivity of a freep hill, which makes the streets difficult and uneasy. It is also crowded with houses, especially in that part of the town best situated for trade. The castle, though old and runous, overlooks the whole town. The exchange is a noble and magnificent building, fituated in the only broad place of that part of the town, and conti-guous both to the river and the custom-house, but too much pent up for want of room. Between the town-wall and the river is a spacious place, firmly wharfed up with a facing of free-stone, and makes a very fine quay. Befides the commerce abovementioned, here are fome glass-houses, iron manusactories, &c. Here is an hospital, built by subscription, several churches and chapels, besides St. Nicholas's church, which is a curious fabric, an exchange, mansion-house, public li-

Berwick upon Tweed is a town fortified in the modern way, but is much contracted from its antient extent; the old caftle and works now lying at some diftance beyond the present ramparts. Abundance of wool is exported from this town; also eggs, which are collected through the country, to a prodigious annual amount. It was always, before the Union, a bone of contention between the two nations. Both had an eye upon it, and therefore it was well fortified; but now the works are greatly impaired. It is a county and town of itself; and though situated on the north side of the Tweed, is included in Northumberland. It has handsome streets, a fine parish church, a town-house, an exchange, and a beautiful bridge of 16 arches over the Tweed, leading to Tweed's Mouth, a fuburb where is another large church; and betwixt the town wall and its once stately castle is a handsome suburb, called Castle-gate. Here is a noble salmon fishery, esteemed equal to any in England, and also a considerable manufacture of fine stockings.

Alnwick is a populous, well built town. It has three gates, which are almost entire; and an old stately

Gothic castle, the seat of the dukes of Northumberland, CUMBERLAND, fituated fouth-west of Northumberland, has a wholesome air, but is not very fertile.

Carlifle, fituated at the conflux of the rivers Eden, Petterill and Cauda, is a fea-port, but without ships, merchants, or trade, and has but two parish churches, St. Cuthbert's and St. Mary's. The choir of the cathedral is an exact piece of architecture. The roof is elegantly vaulted with wood, and embellished with the arms of France and England; the Percy's, Lucy's, Warren's, &c. This town is the key of England on the west sea, as Berwick upon Tweed is on the east fea. It has a bridge over the Eden, which is but a little way from Scotland, the south part of which indents into England, at least 50 miles farther than it does at Berwick.

Whitehaven is so called from the white cliffs that are near it, and shelter the harbour from tempests. It is a populous rich town, chiefly obliged to the Lowther family for its improvement, who were at a vast expence to make the harbour more commodious, and to beautify the town, the trade of which chiefly confifts of falt and coal.

WESTMORELAND, fituated to the fouth-east of Cumberland, has a healthy but sharp air, is very mountainous, and confequently includes many barrentracks.

Appleby, the county town, is neither rich or beautiful; yet the fituation of it, in the midst of pleasant fields, and on the banks of the river Eden, which almost encompass it, is very agreeable. Its name is a corruption of the Aballaba in the Notitia; and it was the station of the Mauri Aureliani, a band of Roman foldiers to called, because they were sent hither by the Emperor Aurelian. Here also is an hospital for a governess and twelve other widows, called the mo-

Kendal, 16 miles from Appleby, called also Kirkby Kandale, that is, a church by the dale upon the river Can, over which it has two bridges of stone and one of wood, and a harbour for boats. It is much superior to Appleby in trade, buildings, number and wealth of the inhabitants, and is the largest town in the

Lonsdale, or Kirby Lonsdale, is a large well built town, feated on the river Lone. It has a handsome ftone bridge, with a ftately church and a fine churchyard, from which and from the banks of the river is a fine prospect of the mountains at a great distance, and of the beautiful course of the river Lone, in a valley far beneath. This town has a good trade in cloth.

LANCASHIRE, a maritime county, fituated to the eastward of the Irish Sea, is famous for its manufactures, for the fertility of the level parts, and the treasures contained within the bowels of the mountain-

The navigation made by the Duke of Bridgewater, in this county, is highly worthy of notice. It bears vessels of 60 tons burthen, and is carried over two rivers, the Mersey and the Irwell. The adit which was necessary to be made, in order to drain the water from the coal mines, is rendered navigable for boats of fix or feven tons burthen, and forms a kind of fubterraneous river, which runs about a milevand a half under ground, and communicates with the canal. This part leads to the head of the mines, is arched over with brick, and is just wide enough for the passage of the boat. At the mouth of it are two folding doors, which are closed as foon as you enter, and you then proceed by candle-light, which casts a livid gloom, ferving only to make darkness visible.

But this difmal gloom is rendered ftill more aweful by the folemn echo of this fubterraneous water, which returns various and discordant founds. One while you are ftruck with the grating noise of engines, which by a curious contrivance let down the coals into the boats : then again you hear the shock of an explosion, occafioned by blowing up the hard rock, which will not yield to any other force than that of gun-powder: the next minute your ears are faluted by the fongs of merriment from either fex, who thus beguile their labours in the mine.

You have no fooner reached the head of the works than a new scene offers to your view. There you behold man and woman almost in the primitive state of nature, toiling in different capacities, by the glimmering of a dim taper. Some digging coal out of the bowels of the earth; fome again loading it in little waggons made for the purpose; and others drawing these waggons to the boats?

To perfect this canal without impeding the publie roads, bridges are built over it, and where the earth has been raifed to preserve the level, arches are formed under it; but what principally strikes every beholder is a work raised near Barton-bridge, to convey the canal over the Mersey. This is done by means of three ftone arches, fo spacious and lofty, as to admit veffels failing through them; and indeed nothing can be more fingular and pleafing, than to observe large veffels in full fail under the aqueduct, and at the same time the duke's veffels failing over all, near fifty feet above the navigable river.

Lancafter, the shire town, has its name from the river Lone, on the side of which it is situated near its mouth, and gives name to the whole county. Here are frequently found the coins of Roman emperors, especially where the Benedictine Friars had a cloyster, which they fay was the area of an antient city burnt to the ground in 1322 by the Scots. After this con-flagration they built nearer the river, by a green hill, upon which stands a castle, and on the top of it a handsome church. At the bottom there is a fine bridge over the Lone; and on the steepest part of it hangs a piece of very ancient Roman-wall, now called Werywall, In digging a cellar feveral cups were found alfo Kirkby on the river frone and It is much number and town in the

that had been used in facrifices. It was formerly more remarkable for agriculture than commerce; but is much improved in the latter, being, at present, a populous, thriving corporation, with a tolerable harbour and custom-house. The county affizes are held in the castle, which is one of the finest monuments of antiquity in this kingdom.

Liverpool is a neat populous town, and the most flourishing sea-port in these parts. The inhabitants drive an incredible trade, with very large stocks, to all the northern and southern parts of the world. They import almost all kinds of foreign goods, have a large inland trade, and share in that to Ireland and Wales, with Bristol. It is also the most convenient and most frequented passage to Ireland, standing at the mouth of the Mersey river, or Liverpool-water, as the sailors call it. The harbour is defended on the south side by a castle, and, on the west, by a tower on the Mersey. It has sour churches, many spacious clean freets, an elegant town house, an admirable wet dock, with iron slood gates, a stately custom-house, a neat play-house, &c.

Manchester, near the conflux of the Irk and Irwell, is a place of great trade, handsome, well built, and populous, and has a spacious market place, a college, an exchange, &c. The fustian manusacture, called Manchester cottons, has been much improved by some late inventions of dying and printing. The greatest variety of other stuffs, known by the name of Manchester goods, as ticking, tapes, filleting and linen cloth, not only enrich the town, but render the people industrious. The collegiate church is very large and beautiful, with a choir remarkable for its curious carved work, and a famous clock that shews the age of the moon. As the Hague in Holland, is deservedly called the most magnificent village in Europe, so Manchester may with equal propriety be said to be the greatest village in England; the highest magistrate being only a constable or headborough; though it is more populous than York, or many other cities in England.

Warrington, a large town on the river Merfey, has a market well fupplied with corn, cattle, and fish. Here is an academy founded upon a noble and extensive plan for educating youth in the learned professions. In this town, and the neighbouring villages, sail-cloth is made for the royal navy. Here are also copper works, sugar-houses, and glass-houses, which furnish the industrious with the means of obtaining a comfortable substitute. On the banks of the Mersey, which, by means of wears and locks, is made navigable to Manchester, are paper-mills, gun-powder mills, oil-mills, iron forges and slitting-mills.

Prefton is a fine town, feated on the river Ribble. Though it has no manufacture, it has a court of chancery and other offices of justice, for the county pattine of Lancaster. From the gentry many miles round reforting here in winter, and having assemblies, balls, &c. it is vulgarly called Proud Preston. It has a large market-place. On the neighbouring common are frequent horse races. Near it the duke of Hamilton, who came to rescue Charles I. from imprisonment, was deseated in 1648; as were also the English rebels, under general Foster, in 1715.

Wigon is inhabited by shop-keepers of almost all kinds, has a manufacture of coverlets, rugs and blankets, and is governed by a mayor, a recorder, aldermen, &c.

Near this town is a well, which at first fight does not appear to be a spring, but rather rain-water. There is nothing about it that seems extraordinary; but upon emptying it there presently breaks out a sulphurous vapour, which causes the water to bubble up as if it boiled. A candle being put to it, it presently takes fire and burns like brandy. The slame in a calm seafon will continue a whole day, by the heat of which you may boil meat, eggs, &c.

you may boil meat, eggs, &c.

Cheshire, to the fouth of Lancashire, has a serene air, and good foil, and is samous for its cheese.

No. 84.

Chefter, or as it is commonly called, West Chester, is a large well built city, full of wealthy inhabitants, who, by its neighbourhood to the Severn, and to Ireland, drive a considerable trade; as may be seen by the great fairs held here every year; to which abundance of tradesmen and merchants come from all parts, but particularly from Bristol and Dublin. The houses are, generally speaking, distinguished from all the buildings in Britain. They are, for the most part, of timber, very large and spacious, but are built with galleries, piazzas, or covered walks before them, in which the people, who walk, are so hid, that, to look up or down the streets, one sees no-body stirring, except with horses, carts, &c. and yet they may be faid to be full of people. By the same means also the shops are, as it were, hid; little or no part of them being to be seen, unless one is under those rows, or just opposite to a house.

Nantwich, or Namptwich, is a large well-built town. The inhabitants are wealthy and carry on a confiderable trade, particularly in falt and cheefe, the latter exceeding all that is made in the county, from the excellency of the foil. Here are falt fprings, which lie on the banks of a fresh water stream, of which they make great quantities of falt. The water brought from the falt springs to the wich houses, as they are called, by troughs, is received into large casks set in the ground. From hence it is put into the leads, and a fire made for keeping it warm, during which women with wooden rakes gather it as it settles to the bottom. After this it is put into salt barrows, a kind of wicker baskets, in the shape of a sugar-loaf reversed, that the water may drain from it and leave the falt dry.

STAFFORDSHIRE, to the fouth eaft of Cheshire, is a rich, though not a fertile county, the principal places being

Litchfield, a large neat town, which is, when joined to Coventry, a bishopric. The cathedral suffered much in the time of the civil wars, but was thoroughly repaired after the restoration of Charles II. and is now a noble and admirable structure. It is walled in like a castle; but stands on such an eminence that it is seen to miles round.

Stafford is the shire town where the affizes are held. It stands low, on the river Sow, over which it has a good bridge. Here are two handsome churches, a free-school, and a spacious marketsplace, in which stands the shire-hall. It is well built and paved, and much increased of late, both in wealth and inhabitants, by its manufacture of cloth. The buildings are, for the most part, of stone and slate, and some of them in the modern taste. Not only the affizes, but the quarter sessions are kept in this town.

Wolverhampton stands on a high ground, and is a populous well built town, and the streets well paved; but all the water the town is supplied with, except what falls from the skies, comes from four weak springs of different qualities which go by the name of Pudding-well, Horse-well, Washing-well, and Meal-well. From the last they fetch all the water they use for boiling or brewing, in leather buckets, laid across a horse, with a sunnel at the top, by which they fill them; and in the other wells they clean tripe, water horses, and wash linen. To the high and dry situation of the place is ascribed its healthy state.

Shroyshire, fouth of Cheshire, is tolerably fertile. Shrewsbury has two bridges over the Severn, which furrounds it, except on the north side, in the form of a horse-shoe, and renders it a peninsula. It has a free grammar school, founded and endowed by Edward VI. Queen Estzabeth rebuilt it, added a library, and endowed it more largely. Here are five churches, besides meeting houses: likewise 12 incorporated companies, who repair in their formalities, once a year, to Kingsland, on the opposite side of the Severn, where they entertain the mayor and corporation, in bowers erected for that purpose, and distinguished by mottos or devices suitable to their respective arts and trades,

The ftreets are large, and the houses well built, with hanging gardens down to the river. Charles II. would have erected this town into a city; but the townshen chose to remain a corporation; for which refusal they were afterwards called the proud Salopians. The town has been famed throughout England for cakes. Its brawn is reckoned to exceed that of Canterbury. Here is plenty of provisions, especially salmon and other good fish. Here are many Welch families; and on market days the general language spoken is Welch. One great ornament in this town is that called the quarry, now converted into one of the finest walks in England, both for beauty and extent. It takes in at least 20 acres of ground on the south and south-west

sides of the town, betwixt its walls and the Severn. It is shaded with rows of lime trees on each side, and adorned in the center with a fine double alcove, and seats on both sides, one of them facing the town, and the other the river. It is reckoned not inferior to the mall in St. James's park. Upon the Welch bridge there is a noble gate, over the arch of which is placed the statue of the great Llewellyn, the idol of the Welch, and the last Welch prince.

Many curious and necessary particulars, which previously inserted in the respective counties would have been disgusting from the frequent repetition, may be known by the following table, where they are exhibited

at one view.

A TABLE, containing the Modern and Antient Names of the Counties or Shires in England, the Titles they give, their Length, Breadth, Circumference, Cities and Towns, Diftance from London, Market Towns, the Number of Members they fend to Parliament, and the Number of Parishes and Acres contained in each.

SECTION II.

PRINCIPALITY OF WALES.

ALES was formerly of greater extent than it is at prefent, as it included the counties of Monmouth and Hereford, which have fince been annexed to England.

It is bounded on all fides by the fea and the Severn, except on the east, where it joins to the counties of Chetter, Salop, Hereford, and Monmouth; being 113 mile long and 90 broad where widest. The country, though generally mountainous, is not altogether unfruitful, as the valleys abound in corn, the feas and rivers with fish, and the hills, exclusive of the metals and minerals they contain, feed great quantities of black cattle, fheep, deer, goats, &c. This country is, at prefent, divided into eleven counties, exclusive of the isle of Anglesey; according to which we shall consider it.

RADNORSHIRE, to the fouth west of Shropshire, is tolerably fertile. The chief commodities are sheep

and horfes. The principal place is
Radnor, 157 miles from London, a very ancient
borough, chiefly confifting of thatched houses. It was
called Radnor by the English, from Rhaidr Gwy,
or the cataract of the river Wye, near the town of
Rhaidr. It stands in a fruitful valley, at the bottom

of a hill, where abundance of sheep are fed.

Brecknockshire, to the fouth of Radnorshire, has a fharp but wholesome air, is very mountainous, and abounds with black cattle, venison, goats, and wild fowls.

Brecknock, or Brecon, 159 miles from London, which is the capital, and almost the centre of the county, is a compact, well built-town, where the affizes are held. It stands at the confluence of the rivers Hondhy and Usk, over which it has a good stone bridge. It is well inhabited, and has some share in the woollen manufacture. The ruins of its caftle, built by Bernard de Newmarch, in the reign of William Rufus, reinain. Its markets are well supplied with cattle, corn, and other provisions. Brecknock Priory was founded in the reign of Henry I. by Bernard de Newmarch. It is now a collegiate church, and still a magnificent building, fituated on an eminence, and built in the form of a cross. There are two other churches.

GLAMORGANSHIRE, fituated north of the Briftol

Channel, is tolerably fertile towards the fouthern parts.
Cardiff, 161 miles from London, the capital, where
the affizes are held, has a bridge over the Taff, to
which small vessels may come up. It is a large, wellbuilt town; and though it comprehends two parishes, has but one church. It has a good trade with Bristol, and plentiful markets and fairs for corn, cattle, sheep, horses and swine.

Swanfey, 202 miles from London, is an ancient, large, well-built town, which drives the greatest trade of any in the county, especially in coals, holds a great correspondence with Bristol, and has an exceeding good harbour. The town stands on the river Twye, and its markets are well furnished with all necessaries. Here are the remains of an ancient castle, built by Henry Beaumont, earl of Warwick.

Landaff, though the see of a bishop, has not so much as a market. The cathedral is a neat, ancient build-

CARMARTHENSHIRE, fituated north-west of Glamorganshire, has a milder air, and is more fruitful than most of the Welch counties.

Caermarthen, 204 miles from London, is fituated on the river Towy, over which it has a stone bridge, and is a place venerable for its antiquity. It is a thriving and populous town of great refort, and drives a very confiderable trade. This place was anciently reckoned the capital of Wales. The Britons made it the feat of their affemblies.

PEMBROKESHIRE is encompassed around by St. George's Channel, except on the east fide, where it joins to Carmarthenshire, and on the north-east to Car-

diganshire. It is a fruitful county.

Pembroke, 234 miles from London, the county town, stands at the innermost eastern creek of Milford Haven. It has two handsome bridges over the two points of it. Here are the remains of an ancient castle on a rock, in which Henry VII. was born; and under it is a vault noted for a ftrange echo, called the Wogan. It has two parishes, a custom house, and several merchants houses, well built.

Haverford-west, 236 miles from London, stands on the fide of a hill, is a very neat, well built, ftrong, populous, and trading town, having a fine stone bridge, plentiful markets, a commodious quay for ships of burthen, and a custom-house. There are three parish churches in the town, besides one in the out parts, called Prengeft.

Milford-Haven has 16 creeks, five bays, and 13 roads in which 1000 fail of ships may ride fecurely. There is no danger in failing in or out of it with the tide. and almost any wind, by night as well as by day; and a ship in distress may run alhore on soft ooze, and there lie fate. The fpring tide rifes in the harbour 36 feet, and the neap about 26. But that which makes this the most excellent and useful harbour in this part of the world, is, that in an hour's time a fhip is out of the harbour into the fea, and in a fair way between the Lands-end and Ireland. As it lies in the mouth of the Severn, a fhip, in eight or ten hours, may be over on the coaft of Ireland.

St. David's is an epifcopal fee, which was once confiderable, but is now finall, and thinly inhabited. The cathedral is the remnant of a venerable building.

CARDIGANSHIRE, fituated north-east of St. George's Channel, is a barren county, but contains fome valuable mines.

Cardigan, 222 miles from London, is pleafantly fituated at the mouth of the Teivy, over which it has a stone bridge, leading into Pembrokeshire. It is a large, ancient, and populous borough, and carries on a confiderable trade, especially to Ireland, the tide flowing up to the town. The church is a handsome structure; but the castle is in a ruinous condition.

Aberiftwyth, though a fmall town, has a very confiderable market once a week.

MONTGOMERYSHIRE, to the east of Merionethshire, and the west of Shropshire, is in the principal parts fertile, and remarkable for the horses being larger than in the other parts of Wales.

Montgomery, 161 miles from London, is fituated in a very healthy air, on the easy ascent of a rocky hill, having beneath it a pleasant valley, through which the Severn winds its course. The town is large, but the buildings indifferent, except a few belonging to confiderable families.

Welch Pool, fix miles from Montgomery, is a large, well-built corporate town, fituated on a lake in a fruitful valley, where is a good manufacture of flannel. On the fouth fide is a red caftle, belonging to the Earl of Powis.

MERIONETHSHIRE, eaft of St. George's Channel, is a mountainous, barren, bleak, unhealthy county; and the inhabitants are more remarkable for idleness

and incontinency than any other Welch people.

Harlech, 223 miles from London, is fituated on a rock near the fea, where is an harbour for ships. It is a mean town, thinly inhabited, but has a garrison for the fecurity of the coast, and an old decayed castle, originally a strong fort of the ancient Britons. In the year 1694 the country about Harlech was annoyed above eight months with a fiery exhalation of a curd colour, which arose from the sea, and was seen only in the night. It let fire to barns, stacks of hay and corn, in its way; infected the air and blafted the grass and herbage; fo that a great mortality among the sheep, horses, and cattle, enfued.

Dolgelly,

Dolgelly, 36 miles from Welch Pool, is fituated in a woody valley by the Avon, at the foot of the great mountain Cader-Idris, which, by computation, is near three miles high, and one of the leftielt in Britain. Here are inns for travellers, and a good market for Welch cottons.

CARNARYONSHIRE fituated fouth-east of the Isle of Angleso, is very mountainous, but abounds in cat-

tle, sheep, goats, &c.

Carnarvon, 251 miles from London, is fituated on the channel that feparates this from the Isle of Anglefey, and was built by command of Edward I. out of the ruins of the city Sagontium, which stood a little below it. The town has a beautiful prospect of the Isle of Anglesey. It had a strong castle, now in ruins. The market is supplied with corn, and all sorts of provisions.

DENBIGHSHIRE, to the fouth-west of Flintshire, is, in many parts, mountainous and barren, yet contains

fome fertile fpots.

Denbigh, 210 miles from London, is a handfome, populous town, ftands on a branch of the Clwyd, has a good trade, and is by some effected the best town in North Wales. It has a good market for corn, cattle, and other provisions; and two churches. Here are the ruins of a castle dismantled in the civil wars; and also those of an abbey of monks.

Wrexham is a town well inhabited, and contains a handfome church, the fteeple of which is admired for

its curious architecture.

Ruthin, fituated in the vale of Clwyd, is a corporation town, well inhabited, and has an hospital and freeschool.

FLINTSHIRE, fituated west of Cheshire, is in many

places fertile and contains some mines.

Flint, 195 miles from London, is the county town and flands on an arm of the river Dee. It had formetly a caftle, the ruins of which are ftill remaining.

St. Afaph, 212 miles from London, is a bifhop's fee, fituated in the vale of Clwyd, at the conflux of the Elwy with the Clwyd; but the buildings are not remarkable for beauty, nor the church for elegance. The epifcopal fee was founded in the year 560, by Kentigern, bifhop of Glafgow, in Scotland, who refigned it to his disciple Afaph, from whom it has its name.

The county of Angleley, will be described in our account of Islands belonging to or surrounding Great Britain. The following table will exhibit, in one point of view, the particulars relative to the counties before mentioned:

Counties	Chief Towns.	Leng.	Bred.	Parish	Mem. of Par

SECTION III.

Persons, Dispositions, Genius, Customs, Manners, Difeases; Classes and Orders, superior and inferior; relative Connections, Sc. of the People of South Britain.

THE people of England, in general, are of a good fize, and well made. They have regular features, and commonly fair skins and florid complexions. It is, however to be presumed, that the great numbers of foreigners that are intermarried with the natives, have given a cast to their persons and complexions, different

from those of their ancestors. The women, in particular, are deemed the most beautiful in Europe. Besides many external graces, peculiar to them, they are to be esteemed for their prudent behaviour, thorough cleanliness, a tender affection for their husbands and children, and all the engaging duties of domestic life. The fashionable dress of the English is usually copied from the French; but the former generally add decency and cleanliness to the decorations of the latter. The most common personal defect is decayed teeth, from the scorbutic humour common to the country.

The nerves of the English are so delicate, that people of both sexes are sometimes forcibly, nay mortally, assected by imagination. This over sensibility has been considered as one of the sources of those singularities which so strongly characterize the English nation. They sometimes magnify the smallest appearances into real ills; and yet when real danger approaches, no people face it with greater resolution or constancy of

mind.

The manners of the English people vary in the different classes of which they are composed, according to the difference of education and intercourse. Persons of fashion, after having studied at the university, com-monly travel for improvement. They are magnificent in their drefs, equipage, dwellings, and manner of living; generally polite, hospitable, good-natured, humane, charitable, and forgiving. On the reverse of their character, we likewise observe a disposition to gaming and riot. They are in general blunt, artles, and averfe to civility and cringing. Hence arises too frequently a rudeness of behaviour, which, by foreigners, has been confidered as bordering on brutality. The English merchants are, beyond all others, famous for their honourable dealings, as well as for their knowledge of trade, and their extensive commerce. The people, in general, are mafters of the different professions they exercise. Their workmanship is neatly and elegantly finished, far above any thing of the same fort in other countries; and though they are not the most remarkable for their discoveries in the arts of handicraft, they never fail to make improvements on the inventions of their neighbours.

The English have been always equally famed for courage and ingenuity. Their foldiers are fearles in the day of battle, and have obtained a great number of fignal victories, over the most powerful and warlike nations on the continent; and their failors are confessed by superior to all the mariners upon earth, in activity.

skill, and intrepidity.

The divertions and pastimes of the English people may be divided into those of the town, and those of the country; and again subdivided into such as are peculiar to the higher ranks of life; fuch as are practifed by the lower class of people, and fuch as are common to both. The divertions of the town are ridottos, mafquerades, concerts of music, theatrical performances; and card affemblies, for persons of fashion. The pastimes of the country, peculiar to the same degree, are horse-races, stag, fox, and bare-hunting. A spirit of gaming prevails with great violence at a horse-race. Hunting is the fport of country gentlemen; and those whom the world diftinguish by the appellation of foxhunters feem to be infatuated with the diversion. The common people have likewife their town and country pastimes, which they enjoy with great eagerness. Among these we number cudgeling, wrestling, duckhunting, bowls, skittles, or nine-pins, archery, prifon bars, cricket, shovel-board, quoits, divers games of chance, and spectacles of various kinds.

Most of the houses, belonging to persons of fashion, are built of stone, large, magnificent, and well provided with offices. The apartments are spacious, adorned with carvings and paintings, and the furniture rich and splendid. The middling fort of people live in brick houses, roomy, convenient, well sinished, and neatly surnished. The habitations of the lower class are built of the same materials, though not so large and well sinished; and, perhaps, several families are crowd-

ed into one house. The English, in general, are fond of good cheer, and, perhaps, live more luxuriously

than any other people.

Diftempers arising from intemperance are rife in England, especially in the great towns; fevers of all kinds, continual, remitting, and intermitting; inflammations, malignant and eruptive; pleurises, coughs, catarrhs, diarrhæas, dysenteries, and consumptions; gout, gravel, dropsy, jaundice, and the lues venerea. But the endemial dileases of this climate are the scurvy, the hypochondriacy, and, particularly among the fair sex, hysterics.

The monarch of England is diftinguished by the titles of George III. by the grace of God, of Great Britain, France, and Ireland, King, Defender of the Faith. He ftiles himself King of France from an antient claim which his predecessors had to that kingdom. The title, Defender of the Faith, was an antient appellation given to the kings of England; but more particularly confirmed by Leo X. to Henry VIII. in consequence of a book written by this prince against Luther. The title was afterwards continued by act of parliament. The king of England is supreme head of the church, and chief magistrate of the kingdom. He has the supreme right of patronage, paramount over all the ecclesiastical benefices in England. He is the supreme civil judge, and the fountain from which all justice is derived. In point of power, pomp, dignity, and revenue, he rivals the greatest monarchs in Christendom.

The royal atchievement (arms) borne by the reigning family is thus marshalled quarterly. In the first grand quarter Mars, three lions paffant-guardant in pale, Sol, the imperial enfigns of England: these are impaled with the royal arms of Scotland, consisting of Sol, a lion rampant within a double treffure flowered and counterflowered, with fleurs de lis, Mars. The fecond quarter contains the arms of France, namely, Jupiter, three fleurs de lis, Sol. The third, for Ireland, exhibits Jupiter, an harp, Sol, ftringed Luna. In the fourth grand quarter is represented his present majesty's own coat of arms, being Mars, two lions passant-guar-dant, Sol, for Brunswick, impaled with Lunenburg, giving Sol, semeé of hearts, proper, a lion rampant, Jupiter, having for antient Saxony, Mars, an horse current, Luna, grafted in base; and in a shield surtout, Mars, the diadem, or, a crown of Charlemagne; the whole furrounded with a garter, as fovereign of that order. Above the helmet, as the emblem of fovereign jurisdiction, is an imperial crown; the creft a lion paffant-guardant crowned with the like: the supporters, a lion rampant-guardant, Sol, 'crowned as the former; and an unicorn, Luna, gorged with a crown, and chained. The royal motto, Dien et mon droit, "God and my right," is as old as the reign of king Richard I. who affumed it to shew his independence of all earthly

The eldeft fon of the king of England is born duke of Cornwall, and afterwards created prince of Wales, with letters-patent, by which the faid principality and a certain revenue are granted to him. He bears the king's arms, with the addition of a label of three points, charged with nine torteaux; his device being a coronet beautified with three offrich feathers, inscribed Ich dien, fignifying, in the German language, "I

" ferve."

The nobility of England are numerous and wealthy; and no country in Europe can produce fuch a number of noblemen living in all the pomp of affluence, and all the joys of independence. They are diffinguished by the different titles of duke, marquis, earl, viscount and baron. The sons of nobility enjoy certain titles by courtesy, according to the rank of their fathers; but the law ranks them among the commons of England. Thus the eldest son of a duke is denominated marquis or earl; and the younger sons are saluted by the appellation of My Lord. The first son of a marquis or earl is denominated lord of some barony belonging to his father; and his brothers are likewise addressed by the

title of lord. The fifters enjoy the honourable title of lady in the fame manner. But this courtefy is not extended to the younger children of vifcounts and barons.

The next class or order of persons, after the barons, are the baronets of England, so called as an inferior kind of barons. The title of baronet is conferred by patent under the great seal, and descends to heirs male. Like other knights, he is diftinguished by the appellative Sir prefixed to his christian name, in speaking and

writing.

Exclusive of baronets, there are three orders of knighthood, viz. Garter, Bath, and Thistle. The order of the Garter, dedicated to St. George, is one of the most antient and honourable orders in the universe. The seat of the order is in the castle of Windsor, consisting of the chapter-house, the hall, and chaped of St. George. A knight of this order is distinguished by a blue garter with a gold buckle, worn on the left leg, and inscribed Honi soit qui mal y pense; signifying, "Shame to him who puts a bad construction on this "order;" by an embroidered silver star on the left breast; and the picture of St. George, enamelled upon gold, and beset with diamonds, hanging at the end of a broad blue ribbon, that crosses the body from the left shoulder.

The order of the Bath was inftituted by king Henry IV. and took its denomination from their bathing on the eve of their admiffion. The order, which had grown obsolete, was revived by king George the First, in the year 1725, when 18 noblemen, and as many commoners, were installed Knights of the Bath, with great ceremony, at Westminster. They are diffunguished by a star on the breast, and a broad red ribbon, worn like a belt, over the shoulder. The motto of this order is, Tria juncta in uno.

The order of the Thiftle, peculiar to Scotland, confifts of the fovereign and 12 knights, who wear a green ribbon over the shoulder, and on the breast an embroidered star, representing St. Andrew irradiated, with this

motto, Nemo me impune lacessit.

All the gentlemen of South Britain, not distinguished by nobility or knighthood, have the general denomination of Esquires. The highest order of plebeians are freeholders or yeomen; then follow copyholders, merchants, traders, mechanics, hired servants, and day-labourers. But it is to be observed, that oppalent merchants are considered as of greater importance than the degree wherein they are placed in the above scale, and frequently, by means of large portions, wed their daughters to nobility.

A woman in England, as foon as married, is, with all her moveables, at the will and disposition of her husband; nor can she alienate any thing without his consent. Her necessary apparel is not her own property. Nay, at the death of her husband, all the perfonal chattles she possessed at marriage descend to his executor or administrator. She can make no contract without her husband's consent, nor reply without him, in matters of law. On the other hand, he must pay the debts which she contracted; and if she should injure any person by her tongue or trespass, he will be obliged to make satisfaction.

The authority of fathers is so absolute in England, that they may give away their unentailed estates from their own children, or bequeath their fortunes to any one child, in preference to all the rest. A youth of 14 may choose his guardian, and consent to marriage; at 21 he is at age to make any contract, deed, or will, and to sit in parliament. The eldest son commonly inherits the landed estate, and the younger children are por-

tioned from the goods and chattels.

With respect to the inhabitants of that part of South Britain called Wales, they are, in general, brave, hardy and hospitable; jealous of affronts, hasty, and proud. The nobility and gentry speak the English language, affect the English, fashions, and endeavour to civilize the lower orders of their countrymen. The

II A

common people (though fome of them fpeak English indifferently) commonly use the Welch, being particularly attached to their own language.

SECTION IV.

Constitution, Government, Laws, &c.

N all states there is an absolute supreme power, to which the right of legislation belongs, and which, by the singular constitution of these kingdoms, is here vested in king, lords, and commons.

The fupreme executive power of Great Britain and Ireland is vefted, by our conftitution, in a fingle perfon, king or queen. The perfon entitled to it, whether male or female, is entrufted with all the enfigns, rights, and prerogatives of fovereign power.

The grand fundamental maxim upon which the right of fuccession to the throne of these kingdoms depends, is "That the crown, by common law, and constitutional custom, is hereditary, and this in a manner peculiar to itself; but that the right of inheritance may, from time to time, be changed or limited, by act of parliament, under which limitations the crown still continues hereditary."

At the revolution in 1688 the convention of the eftates, or reprefentative body of the nation, declared, that the mifconduct of King James II. amounted to an abdication of the government, and that the throne was thereby vacant. In confequence of this vacancy, and from a regard to the antient fine, the convention appointed the next Protestant heir of the blood royal of Charles I. to fill the vacant throne, with a temporary exception, or preference, to the person of king William III.

On the impending failure of the Protestant line of king Charles I. the king and parliament extended the settlement of the crown to the Protestant line of king James I. viz. to the princes Sophia of Hanover, and the heirs of her body, being Protestants. She married the duke of Brunswick Lunenburg, by whom she had George, elector of Hanover, who alcended the throne, by an act of parliament expressly made in favour of his mother; and that princes is now the common stock from whom the heirs of the crown must descend. This appears to be the true constitutional notion of the right of succession to the imperial crown of these kingdoms.

When such an hereditary right, as our laws have created, and vested in the royal stock, is closely interwoven with those liberties, which are equally the inheritance of the subject, this union will form a constitution in theory the most beautiful, in practice the most approved, and in duration the most permanent. This constitution it is the duty of every Briton to understand, to revere, and to defend.

The house of lords is composed of all the peers of the realm, spiritual and temporal. The commons, including the Scotch members, are chosen by the counties and boroughs, and in their collective body are supposed

to represent the people of England.

It is highly necessary, for preserving the balance of the conflitution, that the executive power should be a branch, though not the whole of the legislature. The crown cannot begin of itself any alterations in the prefent established law; but it may approve or disapprove of the alterations fuggested and consented to by the two houses. The legislative, therefore, cannot abridge the executive power of any rights which it has now by law, without its own confent; fince the law must perpetually stand as it now does, unless all the powers will agree to alter it. Herein confifts the true excellence of our government, that all the parts of it form a mu-tual check upon each other. In the legislature the people are a check upon the nobility, and the nobility a check upon the people, by the mutual privilege of rejecting what the other has refolved; while the king is a check upon both, which prevents the executive power from encroachments.

The king of England, befides his high court of parliament, has fubordinate officers and ministers to affift him; and these are responsible for their advice and conduct. The peers of the realm are, by their dignity, hereditary counfellors, and may be called together at any time, to impart their advice in all matters of importance to the public weal. Another council are the judges of the courts of law. But the principal is the privy council, called, by way of eminence, "The council." Privy counfellor's are made by the king's nomination, and subject to a removal at his discretion. The power of the privy council confifts in enquiring into all offences against the government, and in committing offenders into fafe custody, in order to take their trial in some of the courts of law. But their jurisdiction does not extend to punishment; and the perfons committed by them are entitled to their habeas corpus equally with those committed by an ordinary justice of the peace. In this council the civil government is regulated, and every new measure of the administration proposed and planned.

There is a committee of the privy council, called the cabinet-council, confifting of a number of ministers and noblemen, according to the king's opinion of their integrity and abilities, or attachment to the views of the court. One of the members of the cabinet council is generally considered as first minister, though, in reality, there is no office of that kind. A responsibility for all the transactions of government, is, however, always annexed to the title, which renders it a post of great

danger and difficulty.

The great officers of the crown, who take place next to the princes of the blood, and the two primates, are nine in number, viz. the Lord High Steward, the Lord Chancellor, Lord Treafurer, Lord Prefident of the Council, the Lord Privy Seal, the Lord Chamberlain, the Lord High Contable, the Earl Marshal, and the Lord High Admiral.

The office of Lord High Steward is only exercifed occasionally, as at coronations and trials. That of Lord High Treasurer is vested in a commission of sive persons; the first of whom is supposed to posses the power of Lord High Treasurer. That of Lord High Constable is introduced at a coronation; and that of Lord High Admiral is now held by commission, and is of very great importance.

The judges of England, appointed by the king, are 12 in number, disposed in different courts of judicature, and divided into certain circuits, for the administration of justice through all parts of the realm. The tribunals held at Westminster are, the courts of King's-Bench, Common-Pleas, Chancery, Exchequer,

and the duchy chamber of Lancaster.

The punishments inflicted on civil criminals in England, are different from those adjudged in other countries. High treason, petit treason, rape, sodomy, murder, and felony, are capital crimes by the laws of this country. A traitor is first hanged up, then cut down, opened and embowelled; after which he is quartered, and his head and members exposed to the populace. But in noblemen this fentence is, by the indulgence of the crown, always changed into decapitation; and the criminal in that case is beheaded with an ax on a public scaffold. A traitor is not quit for his own life; but his conviction is attended with the ruin of his family. He forfeits all his lands and goods; his wife lofes her dowry; and his children are deprived of their nobility, and right of inheritance. Coiners, though adjudged guilty of high treason, are only hanged and drawn. Petit treason, comprehending the murder of a master or miftress by a servant, of a husband by his wife, or of a bishop by a clergyman, who owes him obedience, is punished by drawing the criminal to the gallows on a hurdle, and hanging him by the neck until he be dead, except in the cale of a female, who, for high treason, as well as petit treason, is sentenced to be drawn and burned alive. All other capital crimes are punished by hanging; and in cases of murder, the body of the criminal

SECTION V.

Religion, Language, Learning, Commerce, Coin, Weights and Measures, Military and Naval Force, &c.

HE established religion of England is a Protestant episcopal church. The king of England is acknowledged as supreme head of the church, governed by two archbishops and 24 suffragans, each of these enjoying the title of lord, on account of the barony annexed, and having precedence immediately after viscounts, in parliament as well as in other affemblies. The two archiepiscopal sees are those of Canterbury and York, to which all the other dioceses of England and Wales are subject. The archbishop of Canterbury is stilled the primate of all England; is the first peer of the kingdom; precedes all dukes and great officers of the crown, next the royal family; and performs the ceremony of the coronation. The dioceses contained in the province of Canterbury are those of London, Winchester, Ely, Lincoln, Rochester, Litchfield and Coventry, Hereford, Worcester, Bath and Wells, Salisbury, Exeter, Chichester, Norwich, Gloucester, Oxford, Peterborough, and Briftol; and in Wales, the bifhopries of St. Dayid's, Landaff, St. Afaph, and Bangor. The archbifhop of York is ftiled primate of England, and metropolitan; hath place and precedence of all dukes next to the royal family, and all great officers of state, except the lord chancellor. He enjoys many prerogatives and privileges within his own province, which comprehends the bishoprics of Durham, Carlisle, and Chefter, befides that of Sodor and Man.

The church of England is more tolerant than any other national church, with respect to its principles. Moderation being its governing character, no religious feet here is prevented from worthipping God in that manner which their confciences approve. Hence, fince the reformation, a number of feets have arifen under the feveral denominations of Prefbyterians, Independents, Baptists, Methodists, Quakers, &c.

Though unqualified men are admitted as preachers amongst some of those sects, many of the ministers of those who exclude the illiterate from their pulpits, have greatly diftinguished themselves by their learning and abilities; and some of their writings are held in high estimation by many of the clergy, and other members of the established church.

Numbers of families in England still profess the Roman Catholic religion; and its exercise is under very mild and gentle restrictions. Some writers have exclaimed with great violence against the numerous fects tolerated in this country: but let it be confidered that civil and religious liberty are closely connected, and that it by no means becomes any church, which makes no pretentions to infallibility, to let up the flandard of perfecution. Where candour and charity, flandard of perfecution. Where candour and charity, and a love of truth and liberty, unite, among those who differ in fentiment, peace, order, and harmony must ever prevail.

The English language is compounded of feveral others, but more particularly of Saxon, Celtic, French, and Latin; but the former predominates. This, inflead of rendering it defective, gives it innumerable graces; fince it has incorporated most of the beauties, and rejected the defects, of the languages of which it is composed. Hence it is more energetic than the French, more manly than the Italian, more copious than the Spanish, and more elegant than the German.

England may be deemed the feat of the muses. Alfred the Great cultivated literature at a period when all the rest of Europe was plunged into ignorance and barbarism. Since his time a continual succession of learned men have been diftinguished by their masteriv writings, and done credit to the British name; and, at present, literature in England seems to have arrived at its utmost zenith. Indeed, we have men of genius and ingenuity, who, in almost every art, science, manufactory, and profession, exceed those of any other nation.

England, being plentifully supplied with all the corveniences of life, could fubfift without the affiftance of any other country whatfoever. But as foreign commerce is advantageous, employs abundance of artists, as well as a great number of poor, and is a manifest improvement to all manufacture in general, fo it is the furest and most effectual means not only to enrich, but to strengthen the nation, and render it a terror to its enemies.

The English merchants traffic largely with Rusha, Sweden, Denmark, Norway, Hamburgh, Bremen, both fides of the Baltic, all the northern parts of Germany, Holland, Flanders, Portugal, Sicily, Italy, the Levant, the coast of Africa, and the East and Wast Indies. The commodities exported from England are comprehended in the different articles of corn, cattle, thip provition, butter, cheefe, beef, pork, biscuit, iron, lead, tin, copper, manufactured and unmanufactured leather, copperas, allum, pit-coal, faffron, hops, flax, hats, shoes, herrings, pilchards, cod, falmon, oyfters, liquorice, watches, ribbons, toys, and all the different manufactures of wool, fuch as broad cloth, bays; kerfies, rufhes, ferges, fays, frizes, ffuffs, flannels, rugs, caps, and flockings. The products of wool are the principal article of the English traffic, the exports of them exceeding two millions yearly. The fishery is very considerable, and, if properly cultivated, would equal if not excel any other branch of compares. would equal, if not excel, any other branch of commerce. It confifts of pickled herrings, cod, ling, and tufk, from Shetland, and the Scottish coast; red herrings from Yarmouth; and pilchards from the western coast of England; befides, a confiderable number of ships an-nually employed in the whale fishery of Spitzbergen: The imports from various parts of the globe are immenfe, and need not enumeration, as they confift of the produce and manufactures of most of the countries in the universe. Many branches of foreign commerce are monopolized and managed by incorporated, or chartered companies. For the still greater promotion of English trade, a council of commerce, or board of trade, is likewise held at Whitehall.

The English funds are perfectly secure, though the national debt is enormous; and the revenues are immenfe, though of fo complicated a nature as not to be easily ascertained. Accompts are kept in pounds, shillings, pence, and farthings; the former being only a nominal fum. Besides farthings, halfpence, sixpences, shillings, half-crowns, guineas, half-guineas, which are the common current coins, there are some silver pieces, fuch as pence, two-pences, three-pences, and groats; and fome gold ones, fuch as two and five guinea pieces. There are two forts of weights, troy and avoirdupois. All goods subject to waste are weighed by the latter, all others by the former. Twelve ounces of the first, and 16 of the latter, constitute a pound. Measures of length are the inch, foot, yard, fathom, perch or pole, acre, furlong, and mile. Dry measures are the pint, quart, gallon, peck, bushel, comb, quarter, last, and chaldron. Liquid measures are the gill, half-pint, pint, quart, gallon, firkin, kilderkin, barrel, hogshead, pipe, butt, and tun.

The land forces of Great Britain, in time of peace, do not exceed 40,000, viz. 12,000 in Ireland, and the rest in Great Britain, and various garrisons beyond the feas; but in time of war, during hostilities, the number is augmented, according to exigencies; and fometimes the troops in pay are very numerous. The navy of Great Britain is more powerful than that of any other country in the universe. In peaceable times a number of mariners are retained by government; but when necessity requires, the British sleet is rendered

amazingly formidable.

SECTION VI.

NORTH BRITAIN, or

SCOTLAND.

CCOTLAND, fituated to the north of England, is bounded northward by the Frozen, westward by the British Ocean, and to the fouth it joins England. The length is 250 miles; and the breadth, where wideft, The principal part of the country is mountainous and hilly; the air tharp, but wholefome; and the foil, in general, inferior to that of England. It is divided into two diffricts, viz. Highlands and Low-The people of the former are rude and uncivilized; but those of the latter imitate the English customs and manners. The whole kingdom is well watered with rivers and lakes. There are a few forests of fir. Timber, in general, however, is scarce. The quarries contain free-stone; and, indeed, Scotland, in general, in every part of its natural history, refembles England, except that most of its productions, from the more unfavourable fituation, are rather inferior to those of South Britain.

With respect to character, the Scotch are brave, passionate, and vindictive; but they are accused, particularly the Highlanders, of infincerity, rapacity, avarice, pride, and naftiness. Indeed, a celebrated Scotch author, in speaking of Scotland, acknowledges that " cleanliness is a virtue very rarely found in this part of the world;" but adds, " persons of education, fortune, and fentiment, ought to be exempted from this national reproach." They are fond of rambling in fearch of adventures and money. Hence the proverb, " In every corner of the earth you may find a Scot, a rat, and a Newcastle grindstone." Many of them attain to a degree of eminence in the various branches of literature. They are good foldiers, and obsequious servants. Their clothes are after the English fashion, except that their peasants wear blue bonnets, and the Highlanders plaids, the only remains of the ancient Roman dress. They have long visages, high cheek bones, and commonly fandy hair. They are abstemious in diet, and badly accommodated in their houses. Most of the Scotch are uncommonly fond of mufic, and their tunes are fweet, expreffive, and affecting. Their common inftrument is the bagand affecting. Their common intrument is the bag-pipe. The religion is Prefbytery: and the kirk of the kingdom is divided into 13 provincial fynods, which contain 68 prefbyteries, and 938 parithes. Sixteen peers, and 45 commoners, are tent from Scotland to the English parliament. This kingdom is divided into the following counties.

CAITHNESS, the most northern county of Scotland, is very rocky, includes many bays and promontories, abounds in cattle, sheep, goats, roe-bucks, red deer, and produces copper and iron; but the inhabitants principally live by fifthing and grazing. The principal place is Weick, a royal borough and market; though Thurso, a town on the other side of the county, is deem-

ed more populous.

SUTHERLAND, fouth-west of Caithness, is mountainous and barren, but well supplied with fifth and wild fowl, by reason that it is not only watered by several rivers, but contains above 60 lakes, including various finall islands. The principal place is the royal borough of Dornoch, which is the feat of a presbytery, contains a cathedral, and confifts of nine parithes.

Ross, which includes Tayne and Cromartie, is fituated to the fouth-west of Sutherland, and has snow on its mountains the greatest part of the year. The vallies, however, are fertile, the air good, and the hills produce forests of fir, game, &c. The chief place, Channerie, though the seat of a presbytery, is but an inconfiderable market-town.

INVERNESS, to the fouth of Rosshire, is a barren county, but produces wood, iron, and game. At the

mouth of the Aber, in the center between the West and North Highlands, stand the towns of Maryborough and Fort William, built to check the depredations of fome of the Clans. Inverness, from which the shire derives its name, is a royal borough on the river Neifs, over which there is a bridge of feven arches. It is the feat of a prefbytery, contains 13 parishes, and may be justly deemed the key and capital of the islands. In this county is the lake of Lochness, which never freezes in the feverest winter.

NAIRN, fituated to the fouth-east of Rossshire, has a falubrious and temperate air, and contains fome tolerable pasture land. The only place of note is Nairn, on a river of the same name. Though a royal borough, it is poor and mean, and the harbour is quite choak-

ELGIN, to the east of Nairn, has a tolerable air, and the low country is fertile. The town of Elgin is a royal borough, fituated in a verdant plain on the river Loffie. It is the feat of a presbytery, including 13

ARGYLESHIRE, to the fouth-west of Inverness, is a wild barren country. The town of Argyle is the feat of a Provincial Synod, confifting of five prefbyteries and 49 parishes, and gives the title of duke and earl to the noble family of Campbell, the most powerful of all the Scottish nobility. This shire is divided into feveral diffricts, viz. Kintyre, Knapdale, Korne, Argyle, properly fo, and Cowal.

PERTHSHIRE is fituated about the center of Scotland, and may be deemed one of its most fertile provinces. The people are polite and industrious, and their habitations neater than in most other parts of the kingdom. The shire is divided into several districts, viz. Menteith, Braidalbin, Athol, Stratherne,

Gowrie, Perth Proper, and Scone.

Perth, the capital of the province, is an agreeable, populous town, fituated 20 miles within land, on the fouth bank of the river Tay. It was otherwise called St. Johnston's, from a church dedicated to St. John, as the patron of the place. It is a royal borough, fecond in dignity to the metropolis, and the feat of a large

prefbytery.

Scone, or Scaan, supposed to be the center of the kin dom, is a royal palace, flanding on the north bank of the Tay, famous, in former ages, for the adjoining abbey, founded for the monks of the order of St. Augustine. Here the kings of Scotland were crowned in the fatal chair, faid to be brought by Fergus from Ireland, including in its bottom a rough marble ftone. It was removed from hence by Edward I. of England, and deposited in Westminster-abbey, where it still remains. Scone gives the title of baron to the viscount Stormont, a branch of the family of Murray. He is also hereditary keeper of this palace, which is large, spacious, and magnificent, though built in the ancient manner. Some of the pannels are adorned with paintings, performed above 200 years ago; and here is a bed of fine needle-work, fewed by the hands of Mary, queen of Scots. The house was provided with elegant gardens, a chapel, and offices; but the whole is now fallen into decay. It was in the chapel that king Charles II. took the covenant, when the Scots invited him to this kingdom. Here the Pretender refided three weeks, in all the state of a monarch; while his general, the earl of Mar, lay with his forces at Perth.

BAMFSHIRE, to the west of Aberdeenshire, is a very fertile pleafant county, inhabited chiefly by Low-

landers.

Barnff, fituated on the coast of the Murray Frith, is a royal borough, of very little confideration. It was of old fecured by a caftle, which is now in ruins.

This is likewise the case with the abbey of Deer, in the neighbourhood, which belonged to the Ciffertian

The

The capital of this county is Aberdeen, 80 miles north of Edinburgh. It stands upon the rivers Dee and Don, and is, in effect, divided into two distinct towns. Old Aberdeen, the seat of a presbytery, built at the mouth of the Don, has a church made of hewn frone, with a lofty freeple or turret, ending in an imperial crown, with a round globe of frone, and two gilded croffes. Near the church is a library, furnished with a valuable collection of books. Old Aberdeen is chiefly remarkable for the college founded by king James IV. confifting of a principal, fub-principal, regents, or professors, of divinity, civil law, physic, philosophy, and the languages. To these endowments Charles I. added eight burfers, out of the revenues of vacant bishoprics. King Charles II. bestowed upon it the benefices of vacant churches in several dioceses for seven years. From these benefactions it derived the name of the Caroline University. The town is fmall, indifferently built, and inconfiderable, though very ancient. About a mile from hence, at the mouth of the river Dee, is New Aberdeen, the county town, a neat, populous, and flourishing place, adorned with churches, hospitals, a fine wharf, a custom-house, and many stately edifices built of hewn stone. The streets are large and well paved; the private houses lofty, and well finished, provided with gardens and orchards, which appear intermingled with the buildings, and at a distance give it the air of a city.

MEARNS, or KINCARDINSHIRE, fituated fouth of Aberdeenshire, is a fertile county. The principal place is Stonehive, the feat of the county courts, a fmall town with a commodious haven, and enjoys a good falmon fishery. Kincardin, another confiderable place, falmon fishery. Kincardin, another considerable place, stands on the river Dee, and gives the title of earl to a branch of the family of Bruce. Cowy is an ancient borough, greatly decayed, and remarkable for nothing but the ruins of a castle, said to have been built by king Malcolm Kemnore; and Fourdon, or Mearns, is a small town, the seat of a presbytery, and, before the reformation, famous for the reliques of St. Palladius, who was taken to see the Scendard in the fifth carturer by who was fent over to Scotland in the fifth century by pope Celestine, to enlighten the Scots, and confute the Pelagians.

FORFARSHIRE, to the fouth-west of Kincardinshire,

produces wood, minerals, cattle, and game.

The county-town, Forfar, bestows its name upon the shire, and gave the title of earl to a branch of the noble family of Douglas, which title was extinguished at the death of the last earl, a gallant youth, who lost his life in the battle of Dumblaine. The town, though inconfiderable, is a royal borough, and feat of a prefbytery. The most flourishing town of this county is Dundee antiently called Alutum and Taodunum, the birth-place of the historian Hector Boethius. It is fiutated at the foot of a hill, on the north fide of the Tay, not far from that river's influx into the ocean-Dundee is a royal borough, and feat of a presbytery, handsomely built, and inferior to few towns in Scotland, in ftrength, fituation and commerce.

CLACKMAMAN, a very small county, is fertile, but contains only one place of note, viz. Aloa, on the Ferth or Frith, a sea-port of tolerable trade.

FIFESHIRE, a peninsula, between the Forth of Firth, and the Tay, is tolerably fertile. The principal place is Coupar of Fife, the county town, fituated on the river Eden; but the most celebrated place is the city of St. Andrew's. Hither the bones of St. Andrew are faid to have been brought from Patras, a town of Peloponnesus, in the fourth century, by Regulus, a Grecian monk, renowned for his piety and learning. St.
Andrew's was also the principal seat of the Culdees, who directed all facred institutions from the first conversion of the Picts to Christianity, and has always been

famous for its univerfity.

The island of May, about a mile and a half in circumference, lies feven miles from the coast of Fife, almost opposite to the rock of Bass. It formerly belonged to the priory of Pittenweem, and was dedicated No. 85

to St. Adrian, supposed to have been martyred in this place by the Danes; and hither, in times of Popith superstition, barren women used to come and worship at his shrine, in hopes of being cured of their sterility. Here are a tower and light house, built by a Mr. Cunningham, to whom king Charles I. granted the island in fee, with power to exact two pence per ton from every ship that passes, for the maintenance of the light-house.

STIRLINGSHIRE is a pleasant fertile county, fituated

to the fouth of Perthshire.

Stirling, the capital of the county, which derives its name from Ster, a Saxon word, fignifying hill, and Lin water, was anciently called Binobara, of the fame fignification in the Scottish language. The town stands about 30 miles from Edinburgh, on the defcent of a hill, the top of which is crowned with a stately old castle, of which the earls of Mar were formerly hereditary castellans, kept in repair, and garrisoned by the government. The town is enclosed with a wall, except towards the north, where the part of a foffe is supplied by the river Forth, over which the inhabitants have built a stone bridge, consisting of four stately arches,

DUMBARTONSHIRE, to the north of the Firth of Clyde, is a barren county. The lake called Lochlomond is a great curiofity, being supplied by subterraneous springs and rivulets, surrounded with huge mountains, extending 25 miles in length, and in some places five miles in breadth, incredibly deep in every part, interspersed with 24 verdant isles, some of which are stocked with red deer, and inhabited.

Dumbarton, the county town, which bestows its name upon the shire, is a small inconsiderable royal borough, fituated near the conflux of the Clyde and Leven; and at prefent remarkable for nothing but its caftle, which is very large, and formed on a very fingular construc-tion. It is a steep rock, rising up into two points, and every where inacceffible, except by a very narrow paffage or entry, fortified with a ftrong wall and rampart. Within this wall is the guard-house, with lodgings for the officers: and from hence a long flight of stone steps ascends to the upper part of the castle, where there are several batteries mounted with cannon.

RENFREWSHIRE, eaft of Dumbartonshire, from which it is separated by the river Clyde, is tolerably fer-tile, and hath many opulent inhabitants. The principal town is Renfrew, an inconsiderable place, which yields greatly in point of importance to the village of

LANERKSHIRE, to the fouth-west of Edinburghshire, is divided into two districts, viz. the shire of Lanerk, and the barony of Glasgow. The soil is diversified, being in some places barren, and in others sertile. The principal place is the large, elegant and populous city of Glafgow. It stands on the descent of an eminence, near the Clyde, over which it has a handfome ftone bridge of feven arches. The ftreets are regular and well paved, the houses lofty and built of ftone, the churches elegant, and the university a noble and beauti-ful foundation. The people are industrious and carry on great commerce; and the whole place has the appearance of opulence.

LINLEIGHGOWSHIRE, a small county to the fouth of Stirlingshire, is very pleasant, and tolerably fertile. Linlithgow, the chief town, is a neat place, the feat of

a presbytery, and a royal borough.

EDINBURGHSHIRE, OF WEST LOTHIAN, to the fouth of the Forth of Firth, abounds in minerals, is extremely fertile, well cultivated, and pleafant. The sheriffalty of this shire is in the gift of the crown, and Edinburgh is a county of itself. The city, which is the capital of Scotland, was formerly the regal refidence. It con-fifts principally of one street, with lanes running from it, the ground rifing gradually from Holyrood-house, to the Canongate-head, which is the fuburb; and from thence to the castle, which is the highest part of the city. The principal street besides this is called Cowgate, and is on the fouth fide of the other; and from this several lanes run up the hill towards the university and Heriot's hospital. The city is above a mile in length, but no where above half a mile in breadth. The houses are built of stone, fix or seven stories high; and near the parliament close they are 14 stories high. The whole is walled on every fide but the north, where a lake circumfcribes it. The caftle is remarkably ftrong. The council-house and sessions-house are convenient fabrics for the purposes for which they are defigned. The high church, which was the cathedral, is now divided into four churches; besides which there are seven other churches, and a chapel in the castle. The palace called Holyrood house was formerly an abbey, and is a handsome convenient structure. This city is governed by a lord provoft, four bailiff, and a common council.

Leith, fituated on the Forth, two miles north of Edinburgh, is not only the port, but may, with justice, be termed the warehouse of Edinburgh. It is a flourishing handsome town intersected by the river Leith; over which there is a stone bridge, which con-

nects the two parts.

Haddingtonshire, to the north-east of Edinburghfhire, is a very fertile, and well cultivated county. The shire town, situated on the river Tyne, over which it has a stone bridge with three arches, is a royal borough, large, well-built, and the seat of a presbytery.

Dunbar, a royal borough, at the mouth of the Firth, is the feat of a prefbytery. It is a neat fmall town, has a good market, a fecure harbour, and a confider-

able trade.

BERWICKSHIRE, adjoining to England, fituated to the fouth east of Edinburghshire, is a rough, moorish county, irregularly diversified with woods and vallies. Berwick town being now annexed to England, the principal Scotch town of this county is Duns, a large populous barony in the center of the shire, being the seat of a presbytery, and having a castle for its defence.

AIRESHIRE, to the east of the Firth of Clyde, is a level, pleasant, and tolerable fertile county. Aire, the county town, is an ancient royal borough, commodiously situated for trade, and composed of the Old and new Towns. which are joined together by a bridge of four arches.

TWEEDALESHIRE, or PEBLES, fituated to the fouth of Edinburghshire, produces some grain, is particularly fertile in pasturage, well watered with rivers, and contains several lakes. The only town worthy of notice is Pebles, a small pleasant place on the Tweed, over which it has a stone bridge of five arches.

which it has a flone bridge of five arches.

ROXBURGHSHIRE, or TIVIOTDALE, to the fouth of Berwickshire, is, though rather barren, a well inhabited county. Roxborough, the county town, was formerly a flourishing place, but is now greatly reduced, by reason that its royalty was removed to Jedburgh, situated at the confluence of the Tefy and Ted.

SELKIRKSHIRE, to the west of Roxburghshire, is a hilly country, but yields good pasture, and abounds in cattle. The chief town is Selkirk, a royal borough, on the Eltrick, famous for its manufacture of boots and

Dumpriesshire, to the fouth-west of Selkirkshire, is a hilly county, but produces cattle in abundance. Annan, a royal borough and sea-port, was once the clief town, but having gone to decay, Dumfries is at present to be considered as such. This town, which may be stilled the capital of the south-west part of Scotland, is a large flourishing royal borough, stuated at the mouth of the Nid, at the distance of 64 miles from Edinburgh. The houses are well built and com-

at the mouth of the Nid, at the distance of 64 miles from Edinburgh. The houses are well built and commodious, the streets are open and spacious. The town is adorned with mold castle in tolerable repair, four gates, a stately church, an exchange for the merchants, a tolbooth, a large market-place with a curi-

ous cross, and a noble bridge of free-stone over the river, consisting of 13 large arches, with a gate in the middle, as a boundary between the shire of Dumfries, and the stewartry of Galloway. Dumfries gives the title of earl to the chief of the family of Crichton, is the seat of a prespytery and provincial synod, and carries on a considerable share of commerce.

Wigtownshire, to the fouth of Aireshire, abounds in cattle, horses, &c. The capital of the shire is Wigtown, which bestows the title of earl upon the chief of the Flemings. It is a royal borough, where the sherisf holds his court, and the seat of a presbytery, situated near the mouth of a river, in a bay of the same name, it miles in breadth, at the distance of 88 miles from Edinburgh. It has the advantage of a tolerable harbour and is well situated for trade; but this is entirely neglected, and the town is very poor, and thinly inhabited.

The length and breadth of the counties of North Britain may be known by inspecting the following table.

Counties.	Leng.	Bred.	Counties.	Leng.	Bred.

SECTION VII.

Antiquities, &c. of Great Britain.

THE most celebrated antiquity in Great Britain is the famous Druid temple, about fix miles from Salisbury, called Stonehenge, which consists of two circles and two ovals, respectively concentric. The stones that compose it are really stupendous; their height, breadth, and thickness are enormous; and to see so many of them placed together in a nice and critical figure with exactness: to consider, as it were, not a pillar of one stone, but a whole wall, a side and end, of a temple, of one stone; to view them curiously creates such an association in the mind as words cannot express.

Near this amazing work of antiquity are a great number of elevations, fomething refembling the form of a bell, called burrows or barrows. These are sepolichral tumuli, wherein the antient Britons deposited the other dead, and raised in memory of sol-

diers flain there.

Monuments of the same kind as that of Stonehenge are to be met with in many parts of England as well as in Scotland.

The Roman antiquities in Great Britain confift of altars, monumental infcriptions, walls, and military ways, the principal of the latter being one that began at Dover, and paffed through the whole ifland to Cardigan in Wales. The chief Roman wall is that called the wall of Severus, or Picts wall, which runs through Northumberland and Cumberland, beginning at Tinmouth and ending at Solway Firth, being about 80 miles in length. The Saxon antiquities confift of ftrong fortrefles, and ecclefiaftical edifices. The Danish are hardly discernible from the Saxon; and the Anglo-

SECTION VIII.

CONCISE VIEW of the HISTORY of GREAT BRITAIN.

THIS island was originally named Albion, from its white cliffs; afterwards Britain from its painted inhabitants. The fouthern parts received the name of England from the Anglo-Saxons; and the whole, after the union with Scotland, was termed Great Britain.

The antient Britons were known to the Phoenicians and Gauls, who traded with them, till the fertility of the country, and richnels of the mines, induced the Romans to invade the island under Julius Cæfar. The Romans having conquered it retained the greatest part under feveral successive emperors; but the empire itfelf at length beginning to decline, the Roman forces were drawn from Briton to defend Waly from the incursions of the northern barbarians. The Britons, unprotected by the Romans, being incapable of defending themselves from the Scots and Picts, called in the Saxons to their affiftance. These strangers, having defeated the foes of the Britons, became themselves their greatest enemies, drove them up into the mountains of Wales, possessed themselves of the most fertile parts of the country, and divided it into feven kingdoms, called the Heptarchy. England was afterwards invaded and conquered by the Danes, who kept it a few years, when it returned again beneath the Saxon government, and fo remained till it was invaded and conquered by William, duke of Normandy, who afterwards reigned by the title of

William I, commonly called the Conqueror. This fuccessful prince was a descendant of Canute the Dane, born 1027; paid a visit to Edward the Confessor, in England, 1051; betrothed his daughter to Harold II. 1058; made a claim of the crown of England, 1066; invaded England, landing at Pevensey, in Suffex, the fame year, defeated the English troops at Hastings, on October 14, 1066, when Harold was slain, and William affumed the title of Conqueror. He was crowned at Westminster, December 29, 1066; invaded Scot-land, 1072; subverted the English constitution, 1074; refused to swear fealty to the Pope for the crown of England; wounded by his fon, Robert, at Gerberot, in Normandy, 1079; invaded France, 1086; foon after fell from his horfe, and contracted a rupture; died at Hermentrude, near Rouen, in Normandy, 1087; was buried at Caen, and fucceeded in Normandy by his eldest son, Robert, and in England, by his second fon

William II. born in 1057; crowned at Westminfter, September 27, 1087; invaded Normandy with fucces, 1090; killed by accident, as he was hunting in the New Forest, by Sir Walter Tyrrel, August 1100, aged 43; was buried at Winchester, and succeeded by his brother

Henry I. surnamed Beauclerc, born in 1068; crowned, August 5, 1100; married Matilda, daughter of Malcolm, king of Scots, November 11 following; made peace with his brother, Robert, 1101; invaded Normandy, 1105; attacked by Robert, whom he defeated, and took prisoner, 1107, and fent to England; betrothed his daughter Maude to the emperor of Germany, 1109; challenged by Lewis of France, 1117; his eldest son, and two others of his children, shipwrecked and loft, with 180 of his nobility, in goming from Normandy, 1120; in quiet possession of Normandy, 1129; furfeited himself with eating lampreys, at Lyons, near Rouen, in Normandy, and died December 1, 1135, aged 68. His body was brought over to England, and buried at Reading. He was fucceeded by his nephew. Stephen, third fon of his fifter Adela, by the earl of Blois. He was greatly interrupted in the principal part of his reign by

Maude, daughter of Henry I. born 1101; married to Henry IV. emperor of Germany, 1109; had the English nobility swear scalty to her, 1126; buried her husband 1127; married Jeffery Plantagenet, earl of Anjou, 1130; fet aside from the English succession, by Stephen, 1135; landed in England, and claimed her right to the crown, September, 1139; crowned, but soon after deseated at Winchester, 1141; escaped to Gloucester on a bier; fled from a window of Oxford-castle, by a rope, in the winter of 1142; retired to France 1147; returned to England, and concluded a peace with Stephen, 1153; and died abroad, September 10, 1167.

Stephen was born 1105; crowned December 2, 1135; taken prisoner at Lincoln, by the earl of Gloucester. Maude's half brother, February, 1141, and put in irons at Briftol, but released in exchange for the earl of Gloucester, taken at Winchester; made peace with Henry, Maude's fon, 1153; died of the piles; October 25, 1154, aged 50; was buried at Feversham, and fucceeded by Henry, fon of Maude. Matilda, Stephen's queen, was crowned on Easter-day, 1136; died May 3, 1151, at Henningham-castle, Essex, and was buried in a monastery at Feversham.

Henry II. furnamed Plantagenet, grandfon of Henry I. born in 1133, began his reign in 1154; arrived in England December 8, and was, with his queen, Eleanor, crowned at London, the 19th of the same month; crowned at Lincoln, 1158; again at Worcester, 1159; quelled the rebellion at Maine, 1166; had his fon Henry crowned king of England, 1170; invaded Ireland, and conquered it, 1172; imprisoned his queen on account of Rolamond, his concubine, 1173; did penance at Becket's tomb, July 8, 1174; took the king of Scotland prifoner, and obliged him to give up the independency of his crown, 1175; named his for John, king of Ireland, 1176; had, the same year, an amour, with Alice, of France, the intended princess of his fon Richard, 1181; loft his eldeft fon, Henry, June 11, 1183; his fon Richard rebelled, 1185; had his fon Jeffery trodden under foot, and killed, at a tournament at Paris, 1186; made a convention with Philip, of France, to go to the holy war, 1188; died with grief at the altar, curfing his fons, July 6, 1186, aged 61; was buried at Fonteverand, in France, and fucceeded by his fon Richard. Eleanor, queen to king Henry II. died, 1204.

Richard I. furnamed Cœur de Lion, was born at Oxford, 1157; crowned at London, September 3, 1189; fet out on the crufade, and joined Philip of France on the plains of Vezelay, June 29, 1190; took Messina the latter end of the year; married Berengera, daughter of the king of Navarre, May 12, 1191; defeated the Cyprians, 1191; taken prifoner near Vienna, on his return home; by the duke of Austria, December 20, 1192; ranfomed for 40,000l. and fet at liberty 1193; returned to England March 20 following; wounded with an arrow at Chaluz, near Limoges, in Normandy, and died, April 6, 1199; was buried at Fonteverand, and succeeded by his brother

John, the youngest fon of Henry II. born at Oxford, December 24, 1166; was crowned, May 27, 1199; divorced his wife Avifa, and married Isabella, daughter of the Count of Angoselme; went to Paris, 1200; befieged the castle of Mirabel, and took his nephew, Arthur, prisoner, August 1, 1202, whom he murdered; the same year he was expelled the French provinces, and re-crowned in England; imprisoned his queen, and banished all the clergy in his dominions, 1208; was excommunicated, 1209; landed in Ireland, June 8, 1210; furrendered his crown to Pandolf the Pope's legate, May 25, 1213; abfolved, July 20 following; obliged, by his barons, to confirm Magna Charta, 1215; loft his treature and baggage in passing the marshes of Lynn, 1216; died at Newark, October 18, 1216; was buried at Worcester, and succeeded by his son

Henry III. born October 1, 1207; crowned at Glou. cefter, October 28, 1216; received homage from Alex.

onfift of alitary ways, began at to Cardihat called is through ng at Tinabout 80 confift of The Da-; and the Angloander, of Scotland, at Northampton, 1218; crowned again at Westminster, after Christmas, 1219; married Eleanor, daughter of the Count of Provence, January 14, 1236; pledged his crown and jewels for money, when he married his daughter Margaret to the king of Scots, 1242; obliged, by his nobles, to refign the power of a fovereign, and fell Normandy and Anjou to the French, 1258; shut himself up in the Tower of London for fear of his nobles, 1261; taken prisoner at Lewes, May 14, 1264; wounded at the battle of Evesham, 1265; died at St. Edmundsbury, in Suffolk, November 16, 1272; and was succeeded by his fon Edward.

Eleanor, Henry III's queen, died in a monastery at

Ambersbury, where the had retired, about 1292.
Edward I born June 16, 1239: married Eleanor, princes of Castile, 1253; succeeded to the crown, November 16, 1272; wounded in the Holy Land with a poisoned dagger; recovered, and landed in England, July 25, 1274; crowned at Westminster, August 19 following, with his queen; went to France, and did homage to the French king, 1279; reduced the Welch princes, 1282; Eleanor, his queen, died of a fever, on her journey to Scotland, at Horneby, in Lincolnshire, 1296, and was conveyed to Westminster (when elegant stone crosses were erected at each place where the corpse rested); married Margaret, fifter to the king of France, September 12, 1299; conquered Scotland, 1299, and brought to England their coronation chair, &c. died of a flux at Burch upon the Sands, in Cumberland, July 7, 1307; was buried at Westminster; and, on May 2 1774, some antiquarians, by consent of the chapter, examined his tomb, when they found his corpfe unconfumed, though buried 466 years. He was succeeded by his

Edward II. born at Caernaryon, in Wales, April 25, 1284. He was the first king of England's eldest fon that had the title of Prince of Wales, which he received in 1300. He afcended the throne July 7, 1307; married Isabel, daughter of the French king, 1308; obliged, by the barons, to invest the government of the kingdom in 21 persons, March 16, 1310; went on a pilgrimage to Boulogne, December 13, 1313; declared his queen and all her adherents enemies to the kingdom, 1325; dethroned, January 13, 1327; was fucceeded by his eldeft fon, Edward III. and murdered at Berkely-caftle, September 21 following. He

was buried at Gloucester.

Edward III. was born at Windsor, November 15, 1312; succeeded to the crown, January 10, 1327; crowned at Westminster, February I following: married Philippa, daughter of the earl of Hainault, January 24, 1327; claimed the crown of France, 1329; confined his mother Isabel and caused her favourite Mortimer to be hanged, November 29, 1330; defeated the Scots at Halidown, 1333; invaded France, and pawned his crown and jewels for 50,000 florins, 1340; quartered the arms of England and France, 1341; made the first distinction between lords and commons, 1342; defeated the French at Creffy, when 30,000 were flain, among whom was the king of Bohemia, 1346. The queen took the king of Scotland prisoner, and 20,000 Scots flain, the same year. Calais befieged and taken, August 16, 1347; and St. Stephen's chapel, now the house of commons, built, 1347. The order of the Garter instituted, 1349; the French deseated at Poictiers; their king and prince taken and the king of Navarre imprisoned, 1356; the king of Scotland ranformed for 100,000l. 1357; in which year Edward loft his eldest son, Edward the Black Prince, of a consumption. The king of France ranfomed for 300,000l. 1359. Four kings entertained at the lord mayor's feaft, viz, England, France, Scotland, and Cyprus, 1364. Philippa, his queen, died at Windsor, August 16, 1369, and was buried at Westminster. Edward died at Richmond, June 21, 1377, and was fucceeded by his grandion, Richard I. fon to

Edward the Black Prince, who was born June 15, 1330; created duke of Cornwall, 1337; the first in England that bore the title of duke; created prince of Wales, 1344; brought the king of France prisoner to England, from the battle of Poictiers, September 19, 1356; went to Castile, 1367; died of a consumption, June 8, 1376, and was buried at Canterbury.

John of Gaunt, duke of Lancaster, fourth fon of

Edward III. was born 1340; married Blanch, daughter of the duke of Lancaster, 1359; by whom he became poffessed of that dukedom and title: she died 1369; and, in 1372, he married the daughter of the king of Castile and Leon, and took that title. In 1396 he married a third wife, Catharine Swinford, from whom descended Henry VII; He died 1399; was buried in St. Paul's, London; and was succeeded by his son

Richard II. born at Bourdeaux, January 6, 1367; had two royal godfathers, the kings of Navarre and Majorca; made guardian of the kingdom, August 30, 1372; created prince of Wales, 1376; fucceeded his grandfather, Edward III. June 21, 1377, when not feven years old. The rebellion of Wat Tyler and Jack Straw, 1378. Married Anne, fifter to the emperor of Germany, and king of Boliemia, January 1382, who died without iffue, at Shene, and was buried in Westminster-abbey, August 3,1395. Married Isabella, daughter to the king of France, 1396. He was taken prisoner by Henry, duke of Lancaster, his cousin, and sent to the Tower, September 1, 1399; refigned his crown, September 20 following; and was succeeded by Henry IV. Richard was murdered in Pomfret-castle, January 1400, and buried at Langley, but removed to Westminster.

Thomas, duke of Gloucester, uncle to Richard II.

as fmothered, February 28, 1397.

Henry IV. duke of Lancaster, grandson of Edward III. was born 1367; married Mary the daughter of the earl of Hereford, who died 1394, before he obtained the crown; fought with the duke of Norfolk, 1397, and banished; returned to England in arms against Richard II. who refigned his crown; and Henry was crowned October 12, 1200, when he infiltured was crowned October 13, 1399, when he instituted the order of the Bath, and created 47 knights; con-spired against, January, 1400; defeated by the Welch, 1402; married a fecond queen, Joan of Navarre, widow of the duke of Bretagne, 1403; who was crowned with great magnificence the 26th of January following, and died in 1437. In 1403 began the rebellion of the Percies, and suppressed July following. He died of an apoplexy, in Westminster, March 20, 1413; was buried at Canterbury, and fucceeded by his fon

Henry V. who was born in 1388, and, when prince of Wales, was committed to prison for affronting one of the judges, 1412; crowned at Westminster April 9, 1413; claimed the crown of France, 1414; gained the victory of Agincourt, October 24, 1415; pledged his regalia for 20,000l. to puth his conquests, 1416. The emperor Sigismund paid a visit to Henry, and was installed knight of the Garter, 1416. Henry invaded Normandy with an army of 26,600 men, 1417; de-clared regent, and married Catherine of France, June 3, 1420; who was crowned at Westminster the Fe-bruary following; out-lived Henry; and was married afterwards to Owen Tudor, grandfather to Henry VII. Henry died of a pleurify, at Rouen, August 31, 1422, aged 34, was buried at Westminster, and succeeded by Henry VI. who was born at Windsor, December 6,

1421; ascended the throne, August 31, 1422; programed king of France the same year; crowned at Westminster, November 6, 1429; crowned at Paris, December 17, 1430; married to Margaret, daughter of the duke of Anjou, April 12, 1445. Jack Cade's infurrection, 1446. Henry taken prisoner at St. Alban's, 1455; but regained his liberty, 1461; and deposed, March 5 following, by his fourth cousin, Edward IV. fled into Scotland, and taken prisoner in Lancashire, 1463; restored to his throne, 1470; taken prisoner again by Edward, April 11, 1471. They have a numerous progeny.

IRELAND.

SECTION I.

Situation, Boundaries, Extent, Climate, Soil, Productions, Rivers, Lakes, Mountains, Metals, Minerals, &c.

HIS island is situated between the 5th and 10th deg. of west long. and the 51st and 56th deg. north lat. It is bounded on the north by the Ducalidonian Sea, on the west by the Atlantic, and on the eaft and fouth by St. George's channel. It is about 300 miles in length, and 150 in breadth.

The climate of Ireland differs little from that of England, except that it is more moift, the feafons, in general, being much wetter. The air is clear and wholesome, except in those parts where there are bogs and fenny grounds: of these, however, few now remain, the greater part having, within the present century, been drained, and the ground cultivated. The foil, in general, is very fruitful both in corn and grafs, especially the latter; for which reason they breed a prodigious number of theep and black cattle. The productions of the boggy parts are various. Some are covered with grafs, fome with reeds and rufhes, and others with little thrubs, interspersed with water. Some yield abundance of excellent turf; and others, called Bed Bogs, produce large firs, and other trees.

The productions of Ireland, with respect to animals and vegetables, are much the fame as those of England. But they have a much greater quantity of game, infomuch that hares, pheasants, &c. are fold in the

public markets.

The whole country is well watered with rivers;

among which the most remarkable are, the Shannon, Barrow, Neor, Suir, Bann, Lee, Liffey and Boyne. The Shannon is a much larger river than any in England, but not navigable above 50 miles. It runs, from north to fouth, upwards of 300 English miles, and, like all the rest, abounds with great plenty of

excellent fish, particularly falmon and pike.

Here are likewife a great number of lakes, or, as they are usually called, loughs, many of which produce large quantities of excellent fish; and the great lake, called Neagh, is remarkable for its petrifying quality. But the bays, harbours, and creeks, which every where indent the coast, form the chief glory of Ireland, and render that country, beyond any other

in Europe, the best sitted for foreign commerce.

Though Ireland cannot be called a mountainous country, yet there are several losty chains, as well as single mountains, in the kingdom. Three words in the Irish language express the different degrees of their elevation, namely, Knock, Slieve, and Bein. The first fignifies a low kill, unconnected with any other eminence. A Slieve marks a craggy high mountain, gradually ascending, and continued in several ridges; and a Bein fignifies a pinnacle, or mountain of the first magnitude, ending in a sharp or abrupt precipice. Some of these mountains contain in their bowels beds of ruins, minerals, coals, quarries of stone, slate and marble, with veins of iron, lead, and copper.

Some of the forests produce excellent timber, particularly oak; which is esteemed as good as any of the English growth, and equally serviceable for ship-building. The mines of Ireland are late discoveries. Some

contain filver and lead; others copper and iron. Quarries of flate are found in many parts. The coals that are dug at Kilkenny emit very little fmoak; it contains a chryftalline ftream which has no fediment. Those peculiarities, with the ferenity of the air in that place, have given rife to the well known proverb, "That "Kilkenny contains fire without fmoak, water with-"out mud, and air without fog."

SECTION II.

Grand Divisions of Ireland, with a Description of each Division.

RELAND is divided into four Provinces, which we shall describe in order.

ULSTER, the most northern province of Ireland is, in some parts, mountainous, but, in general, fertile, and well valered. It contains the following counties.

The county of Donegal is, in general, very fertile,

The county of Donegal is, in general, very fertile, and the air clear and wholefome. The town of Donegal, which gives name to it, is a poor mean place; and the only thing in the whole county worthy of notice is the falt-water lake, or rather arm of the fea, called Lough-Swilly, which extends 18 miles in length, and is about five miles broad at its mouth. A thouland fail might ride in it with latety. There are many villages and gentlemen's feats on its banks, but no town or trade of any confequence.

The county of LONDONDERRY, or COLERAIN, is also tolerably fertile, being well watered by the river Bann.

Londonderry, or Derry, the capital of the county, and the see of a bishop, stands at the bottom of Lough-Foyle. It has a good port, to which ships of the greatest burthen have access, and a considerable trade. It is well fortisted; and along the banks of the river are several castles, and a fort. Great quantities of salmon, salted and barrelled, are exported from hence to foreign parts.

Colerain is a handsome walled town, fituated near the mouth of the river Bann; and before the building of Londonderry, gave name to the county. Here is a valuable figure of the property.

luable falmon fishery.

The county of ANTRIM confifts chiefly of bogs and marshes; but those parts which are cultivated are tole-

rably fertile.

Belfaft is the most considerable town in all this part of Ireland, for extent, wealth, trade, and number of inhabitants. The harbour below the town is commodious, and has a good depth of water. A considerable trade is carried on from hence to Scotland, particularly to Glasgow.

Carrickfergus is a populous town, walled and fortified, with an excellent harbour, and defended by a caftle on a high rock. Here the affizes and quarter-fessions are held, not only for the town, but the county at large.

In this county is one of the greatest natural curiofities to be met with in Europe. It is called the Giant's Caufeway, and is fituated by the fea-fide, about eight miles from Colerain. It is composed of pillars all of angular shapes, from three sides to eight. The eastern angular shapes, from three fides to eight. point, which joins to a rock, terminates in a perpendicular clift, formed by the upright fides of the pillars, fome of which are upwards of 33 feet in height. Each pillar confifts of feveral joints or stones, lying one upon another, from fix inches to about a foot in thickness; and what is very furprifing, some of these joints are so convex, that their prominence are nearly quarters of fpheres, round each of which is a ledge, which holds them together with the greatest firmness, every stone being concave on the other fide, and fitting, in the exactest manner, the convexity of the upper part of that beneath it. The pillars are from one to two feet in diameter, and generally confift of about forty joints.

The county of Tyrone contains many mountains, which are very barren; but the vallies and low grounds are fruitful both in corn and pasture.

The principal town in this county is Omagh, but it does not contain any thing worthy of particular notice.

The county of FERMANACH is one of the most unwholesome counties in this province, the greatest part of it being taken up with bogs, and a large lake called Lough-Earne.

Innifkillin, the capital of the county, is fituated on an ifland, and being an important pals, it is well fortified and garrifoned. It is chiefly remarkable for producing a regiment of its name in the war between king William and James II. in Ireland.

The county of CAVAN is very boggy, notwithstanding which the air is far from being unhealthy. The town, which gives name to it, is very small and infignificant. But Kilmore, situated in this county, though a mean place, is a bishop's see.

The county of Monaghan is very mountainous, woody, and marshy; and the principal town, which gives name to it, doth not contain any thing remarkable.

The county of Armagh is, in general, very fertile, the foil being efteemed the richeft in Ireland; only there is a certain track in it called the Fews, which is hilly and barren.

Armagh, which gives name to the county, is the see of the primate of all Ireland.

Charlemont is a fmall neat town, fituated on the river Blackwater, and received its name from a fort or mount, built by Charles Blount, lord Montjoy.

Lugarn is pleafantly fituated on a gentle eminence, in a fertile and populous country, about two miles from, and commanding a prospect of, Lough-Neagh, one of the largest lakes in the kingdom. This town, from the similarity of its general figure, of the language, manners, and dispositions of its inhabitants, to those of the English, hath, for many years, acquired the name of Little England.

The county of Down is fertile, has a good air, and

is populous.

Down-Patrick, the chief town of the county, is a bishop's see, erected, about the end of the 5th century, by St. Patrick, Besides the cathedral, here are several handsome public buildings, as the church, the session house, two alms-houses, two schools, a market-house, and barracks for a troop of horse.

Newry flands near a river of the fame name, over which it has two bridges. The town is a great thoroughfare, and in it a garrifon is conflantly kept.

Killeleagh is a finall, but neat town, and had the honour of giving birth to that great naturalift and phyfician Sir Hans Sloane. Here is a handfome church, a caftle, and barracks for a troop of dragoons.

Bangor has a confiderable manufacture for linen yarn. Here are still feen the ruins of a very ancient

abbey

LEINSTER is, in general, well cultivated, has a good air and foil, and abounds in corn, cattle, fifth, and fowl. Its principal rivers are the Boyne, Barrow, Liffey, Nuer, Slane, and Mor. The counties into which this province is divided are as follow:

DUBLIN, or DEVELIN. This county, except a mountainous track in the fouth part of it, is very populous and fertile, and abounds with all the necessaries of life. It far exceeds any other part of the kingdom, not only in populousness, culture, trade, and wealth, but in the

politeness and ingenuity of its inhabitants.

Dublin, the capital of this county, and of the whole kingdom, is, in magnitude, and the number of inhabitants, the second city in the British dominions. It is built in the form of a square, about two miles and a half long, and nearly as much in breadth. It is situated about seven miles from the sea, at the bottom of a large and spacious bay, upon the river Liffey, which divides it almost into two equal parts, and is banked in thro' the principal part of the city, on both sides, which form spacious quays for the convenience of loading and unloading vessels. The increase of Dublin, within 30 years past, is incredible. In appearance it bears a great resemblance to London. The houses are of brick. The old streets are narrow and mean, but many of the new streets are as elegant as those of the metropolis of

Great Britain. Sackville street, otherwise called the Mall, is particularly noble. The houses are elegant, lofty, and uniformly built; and a gravel walk runs through the whole, at an equal distance from the sides.

The river Liffey, though navigable for veffels as far as the custom-house, is but small, when compared to the Thames at London. Over it are two handiques bridges of stone, A new street has been opened, leading from Effex bridge to the caftle, where the lord lieutenant refides. The new exchange is an elegant structure of white stone, richly embellished with semi-columns of the Corinthian order, a cupola, and other or-

The parliament-house is a very elegant and substantial edifice. The portico, in particular, is perhaps, without parallel. The internal parts have also many beauties; and the manner in which the building is lighted has been much admired. Near at is Trinity-College, which extends about 300 feet, and is built of Portland stone, in the finest taste. But one of the greatest and most laudable undertakings this age can boast of is the building of a flone wall, about the breadth of a moderate ftreet, a proportionable height, and three miles in length, to confine the channel of the bay, and to shelter veffels in ftormy weather.

Stevens-Green is a very extensive square, being one mile in circumference. It is partly laid out in gravel-walks, like St. James's Park, in which may be ieen, in fine weather, a refort of as much finery and gaiety as in any of the public places in England. Many of the houses round the Green are very stately, but their beau ties are greatly injured for want of uniformity. Near Stevens-Green are several new streets, the buildings

of which are exceeding elegant.

The linen-hall was crected at the public expence, and opened in the year 1728, for the reception of fuch linen cloths as were brought to Dublin for fale, for which there are convenient apartments. It is entirely under the direction of the truftees for the encouragement of the linen manufactory of Ireland, who are composed of the lord-chancellor, the primate, the archbishop of Dublin, and the principal part of the nobility and gentry. This national institution is productive of great advantages, by preventing many frauds, which otherwife would be committed in a capital branch of trade, by which many thousands are employed, and the kingdom greatly enriched.

The barracks are pleafantly fituated on an eminence near the river. They confift of four large courts, in which are generally quartered four battallions of foot, and one regiment of horse: from hence the castle and city guards are relieved daily. These barracks are faid to be the largest and most commodious of any in

Europe.

Phænix Park, which belongs to his majesty, is very fuperior to St. James's, being much more extensive, and commanding the most delightful prospects.

Dublin is the fee of an archbithop, who has a handfome cathedral, and a chapter, confifting of a dean, chanter, chancellor, treasurer, two archdeacons, and 22 prebendaries. Here is a fociety, called the Dublin Society, which hath been of infinite benefit to the kingdom, by diffributing premiums, to a very confiderable amount yearly, for encouraging and promoting husbandry, and other useful arts and manufactures.

The civil government of Dublin is by a lord-mayor,

&c. the same as in London.

The provisions of this city are, in general, exceeding good, and at a reasonable price, more especially li-quors. The best spirits may be had at half the price they fell for in London, Their wine is chiefly claret, the common price of which is 2s, per bottle; and the best the town assords may be had for 2s, 6d. But it is remarkable that, notwithstanding the general conveniencies here, they are defective of proper accommo-dations for travellers, there not being a place of public entertainment in the city, that deserves the name of an

The rates of hackney coaches and chairs are fixed here, as in London, for the different diffances, or fet-downs, as they are called. But here are two forts of carriages, peculiar to the place. The one is called a noddy, which is nothing more than an old caft off one horse chaise, with a kin l of stool fixed in the front, just before the feat, on which the driver fets just over the rump of the horse, and drives you from one part of the town to another, at stated rates, for a setdown. This is neither a very fafe or eafy vehicle; but it is convenient for fingle persons, the fare not being much more than half that of a coach. The other is called a chaife marine, and is little less than a common car with one horse. They are used not only in this city, but throughout the kingdom, for the conveyance of people on parties of pleafure, and for the carriage of goods and merchandize of every kind, hay, straw, corn, dung, turf, &c. When used for parties of pleasure, a mat is laid on the level part for the commonalty; and for the genteeler fort, a bed is

In Dublin there are two theatres; but fince an exclusive patent has been obtained, performances are rarely exhibited at more than one of them at a time

There is also the Rotunda, a place of polite resort

refembling Ranelagh.

In this city are 18 parish churches, 8 chapels, 3 churches for French and 1 for Dutch Protestants, 7 presbyterian meeting-houses, one for methodists, 2 for quakers, and 16 Roman Catholic chapels. Here are likewise a royal hospital, like that at Chelsea, for invalids; a lying-in-hospital, with gardens, built and laid out in the finest taste; an hospital for lunatics, erected by the famous dean Swift; and feveral other charitable and uteful foundations.

LOUTH is the smallest county in the whole kingdom; but it has a pleatant and healthy air, and is very truitful

in corn and grafs.

Drogheda, the chief town in this county, is fituated near the mouth of the Boyne, about 20 miles from Dublin. It is divided into two parts by the faid river, over which there is a plain bur convenient bridge.

Wicklow is a very mountainous county, but it has a clear and wholesome air; and the low lands are well cultivated. Between the mountains are fome of those deep dark vallies called glyns, which are very beautiful and picturefque, together with fome grand and aftonishing water-falls. The most remarkable among the latter is that called the Fall of Powerfcourt, which from the peculiarity of its fituation, its prodigious height, and fingular beauty, well deferves the notice of a traveller. The water falls at least 300 feet, of which 200 are vifible on the plain below.

Wicklow, which gives name to the county, is remarkable for producing the best ale in the kingdom. It has barracks for three companies of foot, and a kind of castle and haven at the mouth of the river Leitrim; but most of its trade consists in carrying provisions in

fmall veffels to Dublin.

The county of WEXFORD is fituated to the fouth of Wicklow. The air is good, but the foil various. In some places it is coarse and poor, but in others it is

fruitful both in corn and grafs.

Wexford, the capital of the county, is a large, ancient town, fituated at the mouth of the Slane. Here is a very good harbour for veffels of a confiderable burthen, and barracks for two companies of foot, with a very ancient castle.

Longford is a pleafant county, and, in general, tolerably fertile; but some parts of it are very boggy.

Longford is the capital of the county, and, believes

a castle, has barracks for a troop of horse.

EAST-MEATH is a very fertile county, abounding in corn, pafture, and herds of cattle. Anciently it had

petty kings, by whom it was governed.

Trim, the county town, is fituated on the Boyne; but hath not any thing remarkable, except barracks for a troop of horse.

WEST-MEATH contains a great many rivers, lakes, and bogs; but where the land is free from these it is abundantly fertile.

Mullingar, the chief town, is small, but very compact, and contains barracks for a troop of horse.

Athlone is a tolerable good town, fituated on the

Shannon, and has a castle and garrison.

KING's-COUNTY (which takes its name from king Philip of Spain, husband to queen Mary) was formerly full of bogs; but it is now well drained and culti-

Philip's-Town, or King's Town, the capital of the county, had formerly a castle; but it hath not at present any thing remarkable except barracks for a company

QUEEN's-COUNTY was anciently full of bogs and woods; but it is now tolerably well enclosed, cultivated, and inhabited.

Maryborough or Queen's Town, the capital of the county, received its name from queen Mary, wife of

Philip of Spain. It has barracks for a troop of horse.

KILKENNY is one of the most healthful, pleasant, and populous counties of Ireland. It is divided, as it were, into two parts, by the river Neor, or Nura, which has its fource from those lofty mountains called the Slieu-

bloom, or Blandine-hills.

Kilkenny, the capital, took its name from the cell or church of Conic, who was an eminent hermit in this county. It is the seat of a bishop, and is divided into the English and Irish towns. The former is by far the most considerable, the other being only a kind of suburbs. Both together make one of the largest, most wealthy, populous, and trading towns in the kingdom. Here are barracks for a troop of horse and four companies of foot, and a well endowed free school, called the college. Most of the streets are paved with a very good fort of black marble, (of which they have large quarries near the town,) which takes a fine polith, and is beautifully intermixed with white

KILDARE county is fituated to the fouth of East Meath, and is, in general, very rich and fertile.

Kildare, the capital, is the see of a bishop, who has precedence of all the Irish bishops except that of Meath. In the neighbourhood is a plain, called the Currough, admirably adapted for the purpose of

CARLOW county is chiefly fituated between the rivers Barrow and Slane. It enjoys a wholesome air, and pro-

duces good corn and grafs.

Carlow, the county town, flands on the Barrow, and contains barracks for a troop of horse, with an antient castle.

MUNSTER was a petty kingdom of itself, before the English invaded and conquered Ireland. The air is temperate and healthful. As to the soil, the plains and vallies, where properly cultivated, are fruitful both in corn and grafs; but the mountains are bleak and barren. Great numbers of cattle are fed here; and it is well supplied with fish, especially cod and herrings. The counties contained in this province are as follow :

The county of Cork is the largest in the kingdom. Though a confiderable part of it is boggy, mountainous, and barren, yet by the industry of the inhabitants, it is pretty well cultivated and improved, and contains

feveral towns and harbours.

Cork is much the largest and most populous city in the kingdom, next to the capital. It is encompassed not only by walls, but also by the channel of the river Lee, over which there are several bridges. Cork is an epilcopal fee, and a city of great trade, fituated 15 miles up the river. Though smaller vessels can come up to the quay, yet the larger generally ride at a place called Paffage. The city, together with its liberties, makes a county, and is governed by a mayor, aldermen, and theriffs. It has the most trade of any town in the kingdom, particularly in beef, butter, and tallow, of which great quantities are exported to foreign parts; and many ships, bound to the West-Indies, put in here to victual. It had formerly several above, and has now many handsome public structures, particularly a cathedral, custom-house, and two gates, one on the north, and the other on the fouth. Its churches are unexceptionably the neatest, and the most elegantly finished, of any in the kingdom.

Kinsale, situated at the mouth of the river Banor, is reckoned the third town in the kingdom, and only inferior to Cork in point of trade. The town is neat, well-built, and strongly fortified with lines and outworks. Great quantities of provisions are thipped off from hence to Flanders, Holland, France, and other

foreign parts.

KERRY is, in general, a very mountainous, barren, and dreary county; but the foil of some particular spots is fruitful, especially in corn and grass.

Tralee, the county town, is fituated on a bay of the fame name; but doth not contain any thing that merits

particular notice.

The greatest curiofity in this county is the lake of Killarney, faid to be the most beautiful, perhaps, in the world. It is surrounded with one continued range of lofty mountains, rocks, and precipices, the immense declivities of which are covered with woods, intermixed with ever-greens, from nearly their tops down to the verge of the lake. In the neighbourhood of the lake are many feats and villas, and the remains of an old abbey, which are well deserving the notice of a tra-

LIMERICK county contains feveral lofty mountains, one of which, called Knock-Patrick, affords a very fine prospect of the sea, the Shannon, and the adjacent

country.

Limerick, which gives name to the county, is the fee of a bishop, and a very strong, handsome town. It stands upon the Shannon, which is navigable for ships of burden almost up to the city, though situated about 60 miles from its mouth. The city is divided into two parts, both of which are strongly fortified with walls, caftles, baftions, and bulwarks, with draw-bridges upon the river. Here is a fine cathedral, and barracks for 22 companies of foot.

TIPPERARY is, in general, a very fertile county; but the northern part of it is mountainous, and the air

bleak and unwholesome.

Clonmell, the county town, is fituated on the banks of the Suir. Here are barracks for two troops of horse, and a good market. The town is walled, neat, and populous, and has a strong jail and a court-house.

WATERFORD county is chiefly level; notwithstanding which a great part of it is barren, and the air thick

and unwholefome

The town of Waterford was first built by certain pirates of Norway, and hath been a bishop's see ever since the year 1096. Till it was eclipsed by Cork, it was accounted the fecond city in the kingdom for trade, wealth, and populousness, being situated on a fine har-bour, and defended on the east side by Duncannon fort. Here is a fine cathedral. The city carries on a great trade, particularly with England; and ships of bur-den come up close to its quay, which is one of the finest in Europe. The haven extends near eight miles, almost in a strait line, and is but little encumbered with rocks or fands. The city, and its liberties, make a diffinct county. There is a citadel on the west side, and on the east a block-house and store-house.

CONNAUGHT is the most mountainous of the four provinces into which Ireland is divided. It is the least cultivated and enclosed, the thinnest of inhabitants, and those the most ignorant and unpolished. Grazing is the chief employment of the peafants. mense numbers of sheep and bullocks are bred here, particularly in the counties of Clare and Galway. It also abounds in horses, game, venison, honey, and hawks; and is well supplied with fith, having many convenient bays and creeks on the coast, and seve 11 D

GALWAY is the largest county, next to Cork, in the whole kingdom; and, in general, very fertile in corn,

pasture and cattle.

fos, and Gyll.

counties.

The city of Galway, which gives name to the county, is feated on a noble bay, having many harbours and roads on every fide. It is a very neat, strong, and flourishing city; and admirably fituated for trade, not only to France and Spain, but also to the West Indies. The buildings, both public and private, are generally of stone, and handsome. The harbour is about two miles from the city, to which the goods are brought in lighters. Here are barracks for two companies of foot. The city is walled, and was once the fee of a bishop, but is now within the archbishopric of Tuam. It carries on a very confiderable herring-fifthery, and is almost the only place upon this coast that has any foreign trade.

Tuam has been the fee of an archbishop ever fince

the beginning of the 6th century.

CLARE county has a good air and foil, but contains very few towns. The most remarkable is Clare, so called from Richard and Thomas de Clare, younger fons of the earl of Gloucester, to whom Edward I. gave the county. At this place are barracks for two companies of foot.

Ennis is the county town, and by much the best in it, flanding about two miles from Dublin. It is fituated on a lake formed by the Shannon, is a neat place, and

has a good market.

Killaloe, a bishop's see, with the privilege of a fair and market, flands on the Shannon. The diocele is very large, containing 100 parish churches, besides chapels. A little to the south of this town is a ridge of rocks, which run quite across the river Shannon, and ftop all navigation farther up.

SLIGO is a very mountainous county, and, in the plains and vallies, the air is very unwholesome, owing to their being full of bogs. The soil, where it is free from lakes and fens, is tolerably good, and fit either

for grazing or tillage.

Sligo, the capital, flands on a bay, to which it gives name, as well as the county. Though not large, it is pretty populous, and has an old castle; but its trade is inconfiderable; not with standing its harbour is so deep that ships of 200 tons burthen can come up to the quay.

In the hill, or rather rock, of Corren, in this county, many strange caves and recesses have been discovered. They are called the Giants-houses, and supposed to be

the works of the Danes.

Mayo county abounds in lakes, and, on one fide. is enclosed by the sea. The air is moift and cold, especially upon the mountains, where the foil is also poor and coarse; but in the other parts there is good pasturage, with herds of cattle and deer.

Among the lakes and rivers in this county abounding with fifh, particularly falmon, is Lough-Mafk, a lake 11 miles long and five broad. On the banks of this lake formerly lived the Galoglaffes, a people de-feended from the Scots of the Western Isles, who used to fight in coats of mail with two-edged battle-axes.

Mayo, the county town, ftands on the borders of Sligo, at the mouth of the river Moy. It was once a bishop's see; but the bishopric hath been some time

annexed to Tuam.

Caftlebar, the only parliamentary borough in the county, contains barracks for a troop of horfe, and stands on a little river, which falls into Lough-Conn.

Roscommon is a very healthy county. The air is clear, and the foil yields plenty of grafs, with fome corn. It is enclosed on the north by the Curlew Mountains, which are very high and fteep.

Roscommon, the county town, is a very infigrificant

Ballina-Sloe, a finall town in this county, is remarkable for having the largest beast or stock-fairs in the king's dominions. It is kept twice a year, and each time continues a week.

LEATRIM county is very mountainous, but noted for grazing vaft herds of cattle.

The town, which gives name to the county, is fituated near the Shannon. It was formerly a tolerable good

town, but is now greatly decayed. To the foregoing geographical description of Ireland, we shall add the following table, exhibiting, at one view, the names of the respective counties, their length, breadth, chief towns, and the members they

respectively send to parliament.

SECTION III.

Manners, Customs, Language, Religion, Government, Sc. of the People of Ireland.

THE prefent descendants of the old Irish, or, as they are usually termed, the Wild Irish, are generally represented as an ignorant and uncivilized To this may be attributed those acts fort of people. of favage cruelty fo frequent in this country, as well as the irregularities attending all their public meetings, which generally end in bloodshed. Many of their furnames have an O, or Mac, placed before them, which fignify grandfon and fon. Formerly the O was used by their chiefs only, or fuch as piqued themselves upon the antiquity of their families. Their music is the bagpipe, but their tunes are generally of a melancholy strain. In the interior parts of the kingdom some of their old customs still prevail, particularly their funeral howlings. They pay little respect to the Sabbath, the principal part of the day being configned to amusements; and in the evening they affemble at public houses, when they dance to the bagpipe, which generally terminates

in riot and debauchery.

The common Irifh, in their manner of living, feem to resemble the ancient Britons, as described by Roman authors, or the present Indian inhabitants of America. Mean huts, or cabins, built of clay and straw, partitioned in the middle by a wall of the fame materials, ferve the double purpoles of accommodating the faEUROPE.]

living, feem I by Roman of America. raw, partitine materials, ting the family,

mily, who live and fleep promifcuoufly, having their fires of turf in the middle of the floor, with an opening through the roof for a chimney; the other being occupied by a cow, or fuch pieces of furniture as are not in immediate use.

Their wealth confifts of a cow, formetimes a horse, fome poultry, and a spot for potatoes. Coarse bread, potatoes, eggs, milk, and fometimes fifth, conftitute their food: for however plentifully the fields may be flocked with cattle, they feldom tafte butcher's meat of any kind. Their children fcarcely know the use of cloaths, and are not ashamed to gaze upon strangers, or make their appearance upon the roads in a state of mere nakedness.

The gentry, and better fort of the Irish nation in general, differ very little in language, dress, manners, and customs from those of the same rank in Great Britain, and are generally represented as being very hot-

The language of the Irish is fundamentally the same with the British or Welch, and a dialect of the Celtic, which is made use of by the Scotch Highlanders, opposite the Irish coasts. It is, however, in a great meafure defaced by provincial alteration, but not so changed as to render the Irifh, Welch, and Highlanders, un-intelligible to each other. The native language is only fpoken by the peafants and lower fort of people, those of the capital and principal places using the Englifh.

Ireland has produced many persons, whose genius and learning would have done honour to any nation. Amongst these might be enumerated, archbishop Usher, Bishop Berkeley, Mr. Boyle, Dr. Leland, several of the earls of Orrery, Sir Richard Steele, Dean Swift, Dean Parnel, Farquhar, Congreve, Sterne, and Gold-fmith, &c. all of whom ftand high in the republic of

letters, and reflect a credit on their country.

The established religion and ecclesiastical discipline, of Ireland, is the same with that of England. But among the bulk of the people, in the most uncultivated parts, Popery, and that too of the most abfurd, illiberal kind, is prevalent. The Irish Papits ftill retain their nominal bishops and dignitaries, who subsist on the voluntary contributions of their votaries. But even the blind submisfion of the latter to their clergy does not prevent Protestantism from making some progress there in towns and communities. Great efforts have been made ever fince the time of James I. in erecting free schools for civilizing and converting the Irish Papists. The institution of the incorporated fociety for promoting English Protestant working schools, though of no older date than 1718, has been amazingly fuccessful, as have many inflitutions of the same kind, in introducing induftry and knowledge among the Irish; and no country can shew greater public-spirited efforts than have been made by the Irish government since that time for these purposes.

Befides the Protestant and Popish religions, this kingdom contains at least as many sectaries as England, particularly prefbyterians, baptists, quakers, and methodifts, who are all of them connived at and tole-

The government of the church is under four archbishops, viz. of Armagh, who is primate of all Ireland; of Dublin, who is stilled primate of Ireland; of Cashell, and Tuam. These archbishops have under them 20 fuffragans, whose fees are, in general, well

There is but one university (if a college can be called fuch) in the whole kingdom, which is that of Dublin. It was founded by queen Elizabeth, and at prefent confifts of a provoft, feven fenior, and thirteen junior fel-lows, and feventy feholars of the house, who have maintenance upon the foundation. The visitors are maintenance upon the foundation. the chancellor, vice-chancellor, and the archbishop of

As Ireland is fubordinate to England, the government of it is much the fame. The king fends a vice-

roy, who is stiled lord-lieutenant, and who comes as near the grandeur and dignity of a king as any viceroy in Christendom. To affist him on all occasions he has a privy-council, composed of the officers of state, and fuch others as his majesty is pleased to appoint parliament is convened, prorogued, and diffolved, at the pleasure of the king. During former reigns the same parliament continued till the death of the king; but by a late act a new one is to be chosen every eight years. The laws made by the parliament here are fent to England for the royal approbation; when, if approved of by his majesty and council, they pass the Great Seal of England, and are returned.

The feveral orders and degrees of the people and nobility are much the fame here as in England; as are also the courts of justice, the terms and manner of proceeding, affizes, justices of the peace, &c.

The new order of St. Patrick was inflituted Feb. 5; and the installation of the first knights was performed on the 17th of March, 1783. It confifts of the fovereign, and 15 other knights companions. The knights are installed in the cathedral of St. Patrick, Dublin. The badge is three crowns united together on a cross, with the motto round, Quis feparabit? 1783, fastened by an Irish harp to the crown imperial.

With respect to the commerce of Ireland, her chief exports confift of linen-cloth, yarn, lawn, and cambricks, which are encouraged by the English govern-Wool and bay yarn are allowed by law to be exported to England only; but great quantities of both are finuggled into other countries. The other exports are horses, black-cattle, beef, pork, green hides, some tanned leather, dried calf fkins, tallow, butter, candles, cheefe, ox and cow horns, ox-haif, horfe-hair, herrings, dried fish, rabbit-skins, otter-skins, goat-skins, &c. The chief articles of their importation are wine, brandy, tobacco, fpices, hops, coals, copper, block-tin, lead, West-India commodities, mercery, grocery, and haberdafhery goods.

The coins used here are the same with those of England, (the Irish having no mint;) but they differ in their denomination, an English shilling passing for thirteen-pence, a guinea for 1l. 2s. 9d. and fo of the

other coin in proportion.

The principal matters relative to the Hiftory of Ireland have been already noticed in that of England. We shall therefore only preserve a few particulars relative to the origin of its inhabitants. Setting afide the ridiculous legends and fables of the Irish, with refpect to their antiquity, it feems highly reasonable to conclude that the country was first peopled from Britain. There is no great reason to believe, that it was ever conquered by the Romans, notwithstanding what hath been alledged to the contrary. Towards the decline of the Roman empire a colony of Scots began to make a great figure in Ireland, whence it acquired the name This colony is supposed to have come origi-Scotia. nally from Spain. The island was afterwards harrassed by the Norwegians and Saxons; but never entirely fub-dued till Henry II, king of England, made himfelf mafter of it, It hath been ever fince subject to the kings of England, who were only stiled lords of Ireland, till the title of king was bestowed on Henry VIII. by the states of the realm in parliament assembled.

MINOR ISLANDS,

SURROUNDING AND APPERTAINING TO

GREAT BRITAIN.

THE Island of ANGLESEY is the most western county of North Wales. It is 24 miles long, 14 broad, and fends one member to parliament. The river Meni separates it from Caernaryonshire; and on every fide it is furrounded by the fea. It abounds in corn, cattle, fish, fowls, &c. produces mill-stones, grind-ftones, asbetos or mountain flax, copper-ore, stony oker, white clay, &c.

Beaumaris,

Beaumaris, 242 miles from London, a handsome well built town, on the east fide of the island, has a good harbour for ships, a very handsome church with some fine monuments of the Bulkeley family, and the Knights Templars. It was formerly fortified with a strong castle built by Edward I, the ruins of which

Holy-Head, 28 miles from Beaumaris, and 244 from London, is the station for the packet boat to Ireland, being the nearest land to Dublin. It is the most western point of Anglesey, but is a little island of itself, and has a small village, called, in Welch, Caer Gybi, confifting of a heap of straggling houses built on rocks; but several of them have very comfortable accommodations for passengers, both with regard to lodging and diet. The church was formerly collegiate, and founded by one Kecius a hermit, about the year 650. The walls of the church are the remains of a British fortification, built about the year 450, by Caswallon Lawhire, Lord of Anglesey.

The Isle of WIGHT is reckoned a part of Hampshire, though it is near 6 miles from the Main Land. It is 22 miles long, 12 broad, and is divided into 30 parishes. The air is pure and healthful, and the foil fo rich, as to produce corn enough in one year to ferve it feven. Through the middle of the ifland runs a ridge of lofty hills, which not only afford plentiful pasture, but a delightful prospect of the sea. The vales below con-fift of meadow and corn-fields; nor is the coast deftitute of natural curiofities; and here is excellent fish of various kinds. The extremities of the coaft, on the fouth and west sides, are very rocky; and westward, not far from the shore, are those rocks called the Needles, from their sharpness. Farther to the southward are the Shingles; at both which places the island is inacceffible, and where it is almost level, as it is towards the fouth-east, it is fortified by art.

Newport, the principal town in the island, is a very ancient borough, and a large populous place, greatly enriched by its plenty and commerce, which the inhabitants have not failed to improve: and as they are grown very polite, they have levelled and new pitched the town, posted and paved it with broad stone, about five feet from the houles, for foot passengers; for being the only market town, it is often very much crowded. Cowes river is navigable for barges to Newport quay, which extends itself round great part of the town, and renders their shipping goods from the store-houses very commodious. The streets are regular and uniform, meeting at right angles. The corn, beaft, and butter markets are kept in diffinct fquares, very large and commodious. The buildings are greatly improved, but neither grand or regular.

Carifbrook, a small village, about a mile from Newport, is famous for a castle, built about the time of the Norman conquest, which was the residence of the ancient lords of the island. It is now greatly decayed by time; but the intrenchment without the walls, the many curiofities within, and the extensive prospect it affords, render it one of the greatest curiosities in the island. Here king Charles I. was confined till removed to Hurst castle. Cowes is a remarkable port and

harbour at the mouth of Newport river.

St. Helen's lies at the east end of the island, 12 miles from Newport. It is only remarkable for its road, which is large enough to contain the whole navy of

England.

The Islands of Scilly have been always deemed part of Cornwall. They confift of about 140 (mall iflands, 30 miles from the Land's End, the largest of which, called St. Mary's, is nine miles in circumference. It has a good harbour and a castle, stands high, and is more fruitful than the rest. Several of these islands are overflowed at high water; fome of them bear good corn; and others abound with rabbits, cranes, herons, &c. They formerly were rich in tin mines, but there

are no veftiges remaining. The Phoenicians, Carthaginians, and Romans, frequented these islands. They are fituated in the middle, betwixt the Briftol Channel on the north, and English Channel on the fouth, so that it is no wonder they have proved the destruction of so many ships and lives. Here Sir Cloudesly Shovel met his much lamented sate, October 22, 1707. Great pains were taken to fix the latitude, and affift the mariners to avoid these islands, by Dr. Halley.

The Isle of Man, in the Irish Sea, is 30 miles long, 8 broad, and contains 17 parishes. The soil is fertile, and the air good. Here is a bishop, called the bishop of Sodor and Man, but he has not a voice in the British parliament. The commodities are wool, hides,

Caftle Town is the metropolis, where the governor keeps his court, and where the courts of justice are The castle is built of marble, and surrounded with two broad walls and a moat, over which is a drawbridge; and adjoining to it, within the walls, is a small tower, where state prisoners were formerly con-

Douglas, fituated on the western coast, is the most populous town, and has the best market in the island. It has increased in trade, and proportionally in buildings.
The harbour is one of the best in the British dominions.

Peel, fituated on the western coast, is a place of con-fiderable trade. Upon a small island close to the town is Peel-castle, one of the strongest in the world, and has a garrison in it. The island on which it stands is a stupendous rock, inaccessible from all quarters but that of the town, from which it is separated by a narrow strait, fordable in low tides. Within one of the churches is a chapel appropriated to the use of the bishop; and underneath the chapel is a dungeon, or prison, for offenders, one of the most dreadful places of confinement that imagination can form. The castle is a magnificent structure; and the prospect of the fea and the ships, which, by reason of the vast height, appear like buoys floating on the waves, fill the mind of the spectator with the utmost astonishment.

The Isle of Man, though held by the British crown, was, till of late, no part of the kingdom of Great Britain; but was governed by its own laws and cuftoms, under the hereditary dominion of a lord, who formerly had the title of king, and who, though he long ago waved that title, was to the last invested with regal rights and prerogatives. But, in the year 1765, for the further and more effectually preventing the mischiefs arising to the revenue and commerce of Great Britain and Ireland, from the illicit and claudestine trade carried on to and from the Isle of Man, it was thought expedient to vest in the crown all rights, jurisdictions, and interests, in and over the said island, and all its dependencies holden by the proprietor, the duke of Athol; who then furrendered the same, excepting only his landed property, and the patronage of the bishopric of Sodor and Man, the temporalities of the same when vacant, and all patronages and ecclefiaftical benefices. Upon this annexation of the island, the fum of 70,000l. was paid as full compensation to the proprietor, according to his own propofals to the commissioners of the treasury. This contract was executed by both parties under the authority of parliament, April 19, 1765. Before the fouth promontory of Man is a little island called the Calf of Man. It is about three miles in circuit, and separated from Man by a channel, about two furlongs broad.

The HEBRIDES, or WESTERN ISLES, are scattered in the Deucaledonian Sea, to the north-west of Scotland, of which kingdom they constitute a part, and are fituated between 55 and 59 deg. of north lat. They are computed to exceed 300 in number, and contain about 50,000 inhabitants. The air is cold, the appearance dreary, and many parts mountainous, which produce heath, wild myrtle, grass, &c. but other districts, which are cul plentiful crop few thrubs or fimples, and r ble, lime-fton curious pebbl The horses ar The black ca The sheep ar come a prey try, wild-fow The fea prod great abunda

which are cultivated, and manured with fea-weed, yield plentiful crops of oats and barley. Here are but very few farubs or trees, but plenty of pot-herbs, roots, fimples, and medicinal plants; fome lead mines, marble, lime-stone, free-stone, iron, talc, crystals, and many curious pebbles. Fuel is scarce, the chief being peat. The horses are small, but strong, hardy, and nimble. The black cattle are of a small fize, but good eating. The sheep are prolific; but the lambs frequently become a prey to the eagle. All domestic animals, poultry, wild-fowl, fea-fowl, birds of prey, &c. abound. The fea produces whales, feals, and most other fish in great abundance.

The people inhabiting these islands are of the same race with those who live in the Highlands of Scotland, fpeak the same language, wear the same habit, and observe the same customs. They are, in general, strong, vigorous, and healthy; their constitutions being feeled with labour, and preserved by temperance.

The better fort of the Highlanders live like their neighbours; but the common people are wretchedly lodged, in paltry cottages or cabins, built of loofe stones and mud, and thatched with straw. Their partitions are no other than a kind of hurdle, plaistered with clay. They have neither glass in their windows, or any other chimney than a hole in the middle of the roof, through which the fmoak finds its way. Immediately under this aperture is a hearth, made of stone, upon which they burn wood, peat, or turf, the fmoak of which fills the whole house in such a manner, that a stranger, unaccustomed to the annoyance, would be in danger of fuffocation. Around the hearth, in cold weather, the family fit or lie, and work or fleep, as occasion requires. At the farther end of the same house the cattle are stalled; and it is not at all uncommon to fee the calves, the pigs, and the children, lying together promiscuously. These people are utter strantogether promiscuously. These people are utter strangers to cleanlines. They are extremely sluttish in their houses, and filthy in their persons; and this impurity is, in all likelihood, one great cause of that inveterate itch with which they are so generally in-

In particularizing the Hebrides, we shall begin with St. Kilda, which is only five miles in circumference,

and fituated in 58 deg. of north lat.

The whole Island is one hard rock, divided into four high mountains, thinly covered with black mould, except on the tops, where the foil is three feet deep. The hills are cloathed with short grass, which yields good pasturage to the horses, cattle, and sheep; and the vallies of arable land produce large crops of excellent barley. The whole island is naturally fenced with perpendicular rocks, except at one bay to the foutheast, about half a mile broad, where there is generally fuch a tumbling furf and raging fea, that no veffel can anchor with any fecurity. The only landing-place is on the north fide of this bay, and extremely hazardous; for it is with great difficulty that a boat can be brought to the fide of a flippery rock, on which he that lands must jump with uncommon exertion. There is, moreover, a small bay on the west side of the island, in which fome veffels take shelter when the wind is at fouth, or blows from the north-east: but the sea is generally fo impetuous all round, that it frequently removes fragments of rocks and stones of a prodigious weight.

The fea-fowl, which are here very numerous, may be diffinguished into these different species: the guer-towl, larger than a goofe, of a black colour, red about the eyes, with fhort wings, and a broad bill, lays a very large spotted egg, and hatches it on the bare rock; comes hither about the first of May, and departs about the middle of June. The Solan goofe equals the common goofe in fize, and refembles it in shape and colour, with this difference, that the tips of the wings are black, and the top of the head yellow: the bill is long, ftrait, and crooked at the point; the legs are black and short, and the bird is web-footed. It comes hither in

No. 86.

March, builds its neft among the rocks with grafs, lays its eggs, hatches its young, and, when they are fledged, retires in August or September.

The inhabitants of St. Kilda are originally descended from the people of the Harries, and adjacent ifles, Like these they speak the Erse language in purity, and profess the Christian religion. They live together in a fmall village, fituated in a bottom among hills, and composed of low, wretched cottages, the thatch and roof being fecured by straw ropes, with stones hanging at the end of them. All the animals on the main land, including dogs, cats, and even wild-fowl, are fpotted. Their arable land is divided into ten equal parts, and these again are subdivided, according to the number of families. They manure the land with a compost of turf ashes, mixed with straw and urine, and add to this the bones and entrails of the fea-fowl. They plough with a small crooked instrument, fow their barley very thick, and reap an harvest of twenty fold. The fea-coast furnishes them with plenty of cod, ling, mackarel, herring, and all the other species of fish common to the fea. Here are likewife otters and feals: but their chief dependance, for food and profit, is upon the fea-fowl, which they catch many different ways; but this employment subjects them to the most imminent dangers; for they are obliged to climb rocks, the very fight of which, to a stranger, would fill him with horror.

Sixty miles to the westward of St. Kilda is the Lewis. or, Long Island, extending 100 miles in length from north to fouth, and from 13 to 14 in breadth. It confifts of a great number of ifles and rocks, and is parted by the fea into two divisions, called Lewis and Harries; the former lying to the westward of the other.

There is a confiderable number of inferior adjacent isles and rocks, which are visited every summer by the inhabitants of the Lewis, who go thither in quest of fowls, eggs, down, quills, and feathers, as well as to sheer or kill the sheep that are kept here for

The Isle of Harries, separated by a channel from Lewis, extends about 24 miles in length, and, in some places, about fix in breadth. The air and climate are the same with those of Lewis. The face of the ground is rocky and mountainous, covered with grass and On the west side, however, the land is more flat and arable, producing (naturally) abundance of clover and daify, which, in the fummer, perfume the air with an agreeable fragrance. The foil is dry and fandy; but, when manured with fea-weed, yields very great harvests of oats, rye, and barley. There are divers fresh water lakes in this island, abounding with trout, eels, and falmon; the overplus of every lake being discharged into the sea, by an agreeable serpentine river.

Among the larger islands of the Hebrides we rank the Isle of Skie, so called from Skianach, which, in the Erfe dialect, fignifies winged; because the two promontories of Valerness and Trotterness, by which it is bounded on the north-west and north-east, are supposed to refemble wings. The island lies between the shire of Ross and the western part of Lewis, extending 40 miles in length, from north to fouth; in fome places 20, and in others 30, in breadth; the circumference of the whole amounting to about 100. This, too, is composed of many different islands and rocks. The island of Skie is divided between two proprietors; the fouthern part belonging to the laird of Macleod; and the northern diffrict, or barony of Trotterness, being the property of a Macdonald, whose ancestor was Donald, king, or lord of the ifles, and chief of the numerous clan of Macdonalds, who are counted the most warlike of all the Highlanders. Skie is part of the shire of Inverness, and formerly belonged to the diocese of the isless. On the south it is parted from the main land by a channel, three leagues in breadth; though at the ferry of Glenelly it is to narrow, that a man may be heard calling for the boat, from one fide

EUROPE.]

to the other. Skie is well provided with a variety of excellent bays and harbours, and is furrounded by inferior ifles. Soa-Brettil, to the fouthward, is five miles in circumference, exhibiting a mixture of heath, wood, morafs, and pafture ground. Oronfa, a peninfula at low water, may be about a mile in circuit, and is remarkably fertile. The Isle of Paybay, more to the northward, two miles in compass, produces excellent pasture. Scalpa, in the same direction, is twice as large, generally mountainous, woody, and well watered with springs and rivulets. On the east side of the island a stream, running down the face of a rock, petrifies into a white substance, of which the natives make excellent lime.

The smaller and less considerable islands containing little that is remarkable, do not merit description. But the most celebrated of all the western islands is Jona, likewise called St. Columb-kill, from St. Columba, who came hither from Ireland, and was here buried. The island stretches two miles in length from south to north, in the neighbourhood of Mull, and is about a mile broad from east to west. One end of it is rocky and barren; the other plain, arable, and fruitful. The isle of Jurah, which is 20 miles in length, and seven broad, belongs to the Argyle family; and Isla, to the west of Jurah, belongs to the Campbells of Shawfield. Gigay, part of the sheristsom of Argyle, fretching four miles in length, and one in breadth, yields good harvests of oats and barley, and excellent patturage for cattle.

The Isle of Bute, extending ten miles in length, appears on the west side of Cowal, from whence it is separated by a narrow channel. Part of it is rocky and barren; but, from the middle, southwards, the ground is cultivated, and produces pease, oats, and barley.

Between the Isles of Bute and Kintire, the Island of Arran presents itself to the view. It is high and mountainous, affording good pasturage, and extending 24 miles from north to south, but is so narrow that the breadth scarce amounts to seven.

The Orcades, or Orkney Isles, lying in the Caledonian Sea, 18 leagues from Shetland, between 58 and 60 deg. of lat. and in long. from London, between 1 deg. 30 min. and 2 deg. 50 min. are divided, on the fouth, from Caithness, the most northern point of Scotland, by the Pentland, or Pictland Frith, from 12 to 16 miles in breadth. They are in number about 30; but not all inhabited, the greater part being small holmes, that produce nothing but pasturage for sheep and goats. The currents and tides slowing between the iflands are extremely rapid; and in the neighbourhood of Swinna are two great whirlpools, called the Wells of Swinna, which are counted dangerous by mariners, especially in a calm. When failors find themfelves fucked into the vortex, they throw overboard a barrel, or fome bulky substance, which smooths the vortex, until the veffel hath paffed, to be swept down to the bottom, and thrown up again at a confiderable distance. When there is a breeze of wind, however, fhips crofs them without fear or hefitation.

The principal Islands of Shetland are these; Mainland, Brassa, the Skerries, Burray, Whalsey, Vust, Yell, Fislar, &c. Mainland, extending 60 miles in length, and 20 in breadth, is indented by a great number of bays, and abounds with mosses, bogs, and mountains, so that it is more adapted for pasturage thancorn: nevertheless, the low grounds, near the shore, produce oats and barley. On the east side of the island stands the principal town, Lerwick, containing about 300 families. Towards the west is situated Scalloway, which, though very small, is the seat of judicature; and here likewise the probytery of Shetland assemble. It was formerly secured by a castle, now fallen into decay, in which there was once a garrison of English

foldiers, fent thither by Oliver Cromwell. The Island of Brassa, situated to the eastward of Mainland, is about five miles long, and two in breadth; has fome arable ground, and two churches; but is chiefly remarkable for its found, in which the great herring-fishery is carried on. The landlords here are confiderable gainers by letting out their ground and houses for shops to the Dutch and Hamburghers. The Skerries, Burray, Whalfey, and Vust, are inconsiderable islands, the largeft and laft not exceeding eight miles in length: but all of them are provided with churches; and in Vust there are three good harbours. Yell, in length, amounts to 16 miles, is indented like the figure of eight, has three churches, and feveral chapels; but the country is moorish and barren. Feslar, or Fetlor, five miles in length, is remarkable for nothing but the ruins of fome watch-towers, which the natives call Picts houses. These are from 20 to 30 feet high, 12 broad, and tapering to the top.

The natural history of the Orcades, and Shetland Islands is fimilar to those of the Hebrides, as are likewise the characters, customs, and manners of the inhabitants.

To the above we must add four islands in the British Channel, which, though they are situated nearer to the French than the English coast, are subject to England. These are.

JERSEY, an island known to the Romans, and situated 18 miles west of Normandy. The north side is inaccessible through losty cliss, but the south is almost level with the water. The higher midland parts are well planted, particularly with apple-trees, from which great quantities of cyder are made. The vallies are fertile, and well cultivated; and the pastures feed great quantities of cattle, sheep, &c. The inhabitants apply themselves, in times of peace, to the improvement of commerce, and more particularly to the manufacture of flockings, the produce of honey, which ishere very exquifite, &c. In war time they have, in general, a concern in privateering, for which the fituation of the island is admirably adapted. Jersey is about 12 miles in length, hath a healthy air, and contains about 20,000 inhabitants. The capital town, St. Helier, is handfome, and contains about 400 houses. The language is French, corrupted by an intermixture of English words. The governor is appointed by the British crown; but the civil jurisdiction is invested in a bailist and 12 jurats.

GUERNSEY, 13½ miles long, and near as much in breadth, contains 10 parifhes, which have, however, only eight ministers, four of the parishes being united; and Alderney and Sark, which are appendages, having one each. This island, though naturally finer than Jersey, is neither to populous, or so well cultivated. The language is nearly the same as that of Jersey. Much cyder is made here, but fuel is scarce in both the islands. The people, in war time, are fond of privateering. The only harbour is St. Peter le Port, which is guarded by two forts, one called the Old Castle, the other Castle Cornet.

Alderney, about eight miles in compass, is only separated from the coast of Normandy by a narrow strait, called the Race of Alderney. It is a very healthy place, and remarkable for a fine breed of small cows.

Sark is still lesser than the former, has a fine air, and is fertile. The three last of these islands are computed to contain about 20,000 inhabitants; and all the four are part of the Norman patrimony, being the only remains of our antient conquest of France.

ISLANDS in the MEDITERRANEAN.

THE Islands of IVICA and FERMENTORA were called Pythyusæ by the Greeks, from the vast quantities of pines they produced. The former separately

was called Ebusus, and the other Ophiusa and Collubraria. They lie about 36 miles west of Cape St. Martin, on the coast of Spain. The former is about 40 miles long, and 22 broad, and very mountainous, but not unsruitful where cultivated. The commodities are salt and figs. The principal place is Ivica, a small town, with a fort and harbour, and the residence of the governor who is subordinate to the viceroy of Majorca. Fermentora, six miles south of Ivica, is small, and, at present, uninhabited. Cabrera is another little sistant from the multitude of goats sound upon it; has a small garrison and castle to defend the entrance of the harbour, and is a receptacle for exiles.

Majorca, 60 miles in length, and 40 in breadth, is the nearest of any of those islands on the Spanish coast. It abounds in corn, cattle, horses, wine, oil, honey, saffron, deer, rabbits, wild sowl, &c. and is plentifully supplied with fish. Here are four capes, viz. Pedra east, Grosser west, Salmas south, and Termentor north. It has watch towers all round it. Towards the north and west it is mountainous, but has several good harbours, with plenty of water. The air is wholesome, but very hot and dry in summer. A considerable body of horse and foot is kept here for the desence of the island. The language of the better fort is Spanish; but that of the common people is a medley of Spanish, Latin, Greek, and Arabic. The principal place in it is that from which it takes its name, viz.

Majorca, anciently Palma, which stands on the south-west side of the island, on a bay betwixt two capes, and is a large and well-fortisted town, the residence of the viceroy, the seat of a court of inquisition and other courts, and also of a bishop, who is suffragan to the archbishop of Valentia, and has a revenue of 20,000 ducats per annum. Here likewise is an university, a stately cathedral, a great many churches, with several hospitals, handsome streets, and squares. Of the last there is one called Borfi, where the bull-fights and other shews are exhibited. The inhabitants are computed at upwards of ten thousand.

MINORCA lies 33 miles east-north-east of Majorca. Its greatest length, from east to west, is 38 miles and its breadth 15. The air is moift, but never excessive cold or hot. Here are lead mines, plenty of fish, falt, fine marble, rabbits, theep, honey, wax, capers, oil, cotton, wine, fome of which is excellent, fine acorns, opuntia, palm-trees, which, however, bear no fruit, myrtles, with a vaft variety of petrified shells, and a great deal of cattle. The water is said to be none of the best. The inhabitants, like the Spaniards, are too proud and lazy to cultivate the ground in a proper manner, and consequently have but little corn. They have a natural turn to poetry, love music and dancing, and, like their ancestors, are expert slingers. In 1756 the French got possession of this island. At the conclufion of the war in 1763, it was restored to the English: but it was taken by the Spaniards last war, and is now become a Spanish island again.

Citadella, the capital, lying on the west coast, where the governor resides, is a small place, but well fortified, and chiefly inhabited by the English.

Port Mahon is one of the finest harbours in Europe, both for its capaciousness and security from wind and enemies, being four miles long, and above half a mile in breadth. The town is small, but has a brisk trade. Near it is St. Philip's castle, a square fort of sour bastions, which has always a good garrison.

Corsica, between the Gulph of Genoa and the Island of Sardinia, extends from 41 to 43 degrees of north latitude, and from nine to ten degrees of east longitude.

The island being for the most part mountainous, woody, dry, and stony, has little arable land. Some

of the low grounds and vallies, however, yield corn, wine, figs, almonds, chefnuts, olives, and other fruits. Here is also a good breed of cattle and horses; and the woods and forests abound with deer, and other game, together with honey and wax. There are also some saltworks and hot baths on the island, with crystals, iron, and allum.

The Island of Corfica will ever be famous for the noble stand its inhabitants made for their liberty against their Genoese tyrants; and afterwards against the base and ungenerous efforts of the French to enslave them, though they were at length overpowered by numbers, and compelled to submit. Paoli, who commanded them in the struggle for freedom, was taken under the protection of the British court. In consequence of this distinguished tyranny and oppression, Theodore, their king, took refuge in England, where he remained in a very impoverished state many years, and at length died at a private lodging in Soho, in the year 1757.

Baftia, the capital, fituated on the north-east coaft of the island, has a good harbour and castle, is pretty well fortified, and is the see of a bishop.

San Fiorenzo, fituated also on the northern side of the island, on a gulph to which it gives name, has a good haven, is fortified, and the residence of a bishop. Bonisacio is a small, but well peopled town, on the southern coast of the island. Porto Vecchio is a little sea-port town on the eastern coast. Corto, on the Golo, is an episcopal see, with a strong castle and wall for its defence.

Ajazza is an epifcopal fee, a place of good trade, and well peopled.

The Island of Sardinia, which gives a royal title to the duke of Savoy, lies 150 miles west of Leghorn, is 160 miles in length, and 80 in breadth, has but an indifferent air, but a fruitful soil, and abounds in corn, wine, oil, fruit, cattle, game, busfalos, bears, and deer, (some of which have fine spotted skins) gold, silver, lead, iron, sulphur, allum, &c. The only venomous creature is a kind of spider. The commodities, independant of the productions already mentioned, are coral, linen, silk, wool, hides, and cheese. The inhabitants are of a dissolute and idle disposition. The religion is Roman Catholic, and the language Spanish.

Cagliari, the capital, fituated on the fouth fide of the ifland and on the declivity of a hill, is divided into high and low; the former being handfome and well-built, but the latter poor and unhealthy. The cathedral is magnificent; the archbifhop and viceroy refide here; the port is fpacious, and defended by a battery and caftle; and the town contains feveral convents.

The rivers Sacro and Tirfo, by an opposite course, cut Sardinia nearly into two equal parts or provinces: the one called Il Capo de Cagliari, and the other Il Capo de Sastiari, or Lugedori. There are many ports, gulphs, and bays in it, with several strong towns, a great number of villages, three archbishoprics, and four bishoprics. The clergy, both secular and regular, have great privileges, incomes, and immunities. The only university is that of Cagliari.

About Sardinia lie many smaller islands, of which the principal are, St. Pietro, St. Antiocho, La Vacca, Il Toro, Rossa, Bovara, Tavolata, Asinaria, Serpentera, Tazzo, Carbonera, and Ogliastro. Asinaria, the most considerable of these, by the antients stilled the great island of Hercules, is about 28 miles in compass, and lies about four miles from Cape Monte Falcone, and 15 north of the city of Sassaria.

Capri, or Caprea, is much taken notice of for the noble ruins on it. It is about four miles long, and one broad, and is fituated at the entrance of the gulph of Naples, about three miles from the continent. This ifle was the refidence of the emperor Augustus, for some time, who came here for his health and recreation. Tiberius, after him, made it a scene of the most infa-

mous pleasures. The principal ruins and remains of antiquity are at the extremity of the eastern promontory. What chiefly recommended this island to Tiberius was its temperate healthful air, being warm in winter, and cool in fummer; and the nature of its coast, which is so very steep, that a small number of men may defend it against a great army. The furface of the island was then cut into easy ascents, adorned with the emperor's and other palaces, and planted with a variety of groves and gardens. The rocks also underneath were cut into highways, grottos, galleries, bagnios, and subterraneous retirements: but they were afterwards defaced or demolished by the Romans. It contains about 1500 inhabitants, who are exempt from all taxes; and belongs to the province of Lovoro, in the kingdom of Naples. There are feveral fprings of fresh water in it; and, in a delightful valley between the mountains at the two extremities, flands a city of the fame name with the island, which is the fee of a bishop, whose revenue arises chiefly from the prodigious flights of quails that come thither at certain feafons, particularly in March, when vast quantities of them are fent to Naples and fold very cheap. On this account, the bithopric is fometimes jocolely ftiled, the Bithopric of Quails.

ISCHIA is a small but pleafant and fertile island, lying on the Neapolitan coast, about two miles from the Cape of Messina, and 25 from Naples. Most of it is furrounded with high, craggy, and inacceffible rocks, which shelter it from the winds, and defend it from invaders. I Some parts of it are rich and delightful, yielding all manner of delicious fruits, and excellent wines; but others are as difmal and barren. It was antiently called Inarime; and much fubject to earth-There are feveral hot baths and medicinal quakes. waters in it, with a number of pleafant towns and villages.

Sicily, the most considerable island of the Mediterranean, is divided from Italy by a narrow strait, called the Faro of Meffina. The tides here flow irregularly and violently. The rock antiently called Scylla, and now Capo Sciglio, is on the Calabrian fide; and the whirlpool formerly named Charybdis, but now denominated Calofara, lies not far from Meffina.

In the first shock of the terrible earthquake, which involved this country in all the horrors of defolation, in the year 1783, part of a rock, near Scylla, was detached from its foundation, and thrown with violence into the fea. Fearful that succeeding earthquakes would be attended with the same dreadful consequences, the inhabitants of Scylla, with their prince, took refuge in their boats, and retired to a small beach furrounded by rocks. But those unfortunate people found not the fafety they fought. A fecond shock detached a mountain near Scylla, and much larger than Scylla itself, from its base, and precipitated it with such violence into the lea, as to raife a most tremendous wave, which first broke upon the Punto del Faw, in Sicily, and then inftantly returning with a loud noise, dashed the unfortunate prince, with more than 2000 of his subjects, into the ocean.

The air of Sicily is falubrious, and the foil fo fertile, that it is stiled the granary of Italy. It produces abundance of oxen, wine, oil, fruits, fugar, honey, faffron, wax, filk, &c. with fome gold, filver, iron, allum, vi-triol, falt-petre, and mineral falt. The mountains yield emeralds, jasper, agate, porphyry, lapis lazuli, and a stone called catochite, of a greenish speckled colour, which grows foft by the warmth of one's hand, flicking to it like glue, and is an excellent antidote against the fting of fcorpions, and fome other poilonous infects. A great deal of coral is found upon the coaft, and plenty of excellent fish; among which are the pefce spada, or fword-fish, and tunnies. Great quantities of filk, raw and manufactured, are exported from Messina, where a conful from almost every nation in Europe resides, to manage and protect the trade of his nation.

Here are feveral rivers, and good fprings: but few of the rivers are navigable, having but a fhort courfe, and descending precipitately from the mountains.

Of the mountains in this island the most noted is Mount Ætna, now called Monte Gibello, or Mongibello, a volcano, whose eruptions have often proved fatal to the neighbouring country. It is 70 miles in circuit, and fo high that it harbours many wild beafts. At the bottom are corn-fields and plantations of fugar canes. Among the other mountains one of the most confiderable is Mount St. Julian, near Palermo, antiently called Eryx, and vulgarly Trepani. The eruptions of Mount Ætna are generally preceded by an earthquake, which often does more damage than the eruptions.

These people, with respect to their character, are far from appearing in a favourable light; being a perverfe race, and a mixture of Italians and Spaniards. speak chiefly Spanish, and follow the Spanish fashions,

particularly in wearing black.

The established religion of the island is the Roman Catholic. The number of churches, convents, and religious foundations, is very great, and they are wellendowed. There is a fovereign tribunal, which judges in all ecclefiaftical affairs, and admits of no appeal to

The police of Sicily is, perhaps, the most fingular in the world. The banditti, who, in any other country, would have fuffered the fevere punishment due to their crimes, are, in Sicily, not only publicly protected, but univerfally feared and respected. These wretches have taken poffession of the Val Demoni, in the eastern part of the island, where it has been found impossible to extirpate them from their fecret and subterraneous retreats: and this circumstance, together with their desperate valour, and vindictive spirit, has induced the Prince of Villa Franca, from a motive of policy, to declare himself their protector and patron. They are the guides and protectors of travellers; and fuch are their high notions of what they call their point of honour, that, however defective they are with regard to fociety in general, they ever maintain the most unshaken fidelity, wherever they have once professed it. Whoever reposes confidence in them may be secure of not finding it in the smallest instance abused; but, on the contrary, may wrap himfelf up in the certainty that his person will be protected from infult or injury, and his property from imposition or depredation by these faithful and resolute adherents; all of whom are known to the other banditti of the island, who, from the same principle of honour, respect not only the persons of their own worthy fraternity, but those whom they escort. The generality of travellers hire a couple of these guards to accompany them in their journies, and, by this means, traverse, with fafety, the most dangerous fituations in the island. Those of this desperate set who place themselves in the fervice of the Prince of Villa Franca are invefted with his livery, yellow and green, with filver lace, and wear a badge of their order; which, if not very honourable, entitles them at least to so much fear and respect, that the magistrates have been often obliged not only to protect, but even to pay them court, in order to be secure against their revengeful disposition, which impels them to chastise with death whoever has given them just cause of provocation.

The mixture of vice and virtue observable in this ferocious fraternity is very remarkable. While they commit, with impunity, every crime which difgraces humanity, their point of honour is observed in the minutest instances, and the promise of one of these banditti would be performed with as exact a punctuality as the bond of any other man. They frequently borrow money from the country people, who dare not refuse their requests; but if they promise to return it, they will rather fulfil their engagement at the expence of the life and property of some unfortunate passenger, than fail in the honourable performance of what they have undertaken. Those of them who have entered into the service of fociety, and attend as guards to travellers, carry arms,

but few of courfe, and

which they make ready for action, and place in a pofture ready either for attack or defence, in all fufpicious or dangerous places. They tax their landlord's bills according to their own pleafure; and fuch is the authority with which they either are invefted, or which they affume, that they threaten, and would, perhaps, execute, inflant death upon the hardy wretch who should dare to attempt an imposition upon the travellers under their protection.

The ifland is commonly divided into three parts or provinces, viz. Val di Demoni, Val di Noto, and

Valdi Mazara. Meffina, a large well built city, with a spacious harbour, near the strait to which it gives name, is one of the greatest magt-towns in the Mediterranean, contains many noble edifices, is the fee of an archbishop, and contends with Palermo for being the capital of the island. The cathedral is a large spacious building, very rich in plate, and finely adorned in the infide. The other buildings most worthy notice are, the archbishop's palace, the general hospital, called La Loggio, the Lazaretto, and forts. At the annual fair, kept here in August, great quantities of foreign goods are exposed to sale. The city lies on a gentle declivity along the sea, has large fuburbs, and is well furnished with water by subterraneous aqueducts, and all kinds of provisions, from fea and land. The port is of an oblong oval form, well fortified, with a citadel, and other works; and fo deep, that ships of 80 guns can come close up to the quay. The city also is strongly fortified, though not regularly. In its neighbourhood are fome not mineral waters, efteemed very good against all rheumatic diseases. The chief manufacture of this place is that of filks. Some of the inhabitants are also employed in fishing, cultivating vines and mulberry-trees, and breeding filk-worms.

The ravages of the fatal earthquakes of 1783 were feverely felt here. A range of magnificent buildings, in the form of a crefcent, which extended for the space of an Italian mile, was, in some parts, totally ruined. In the lower parts of Messina most of the buildings were destroyed; and 700 of the unfortunate inhabitants were either carried off by the dreadful wave which came from the rock of Scylla, or buried in the ruins of their habitations.

Syracufe, anciently a very noble city, is pretty well fortified, and has a port capable of receiving the largest vessels, with a strong castle, supplied with plenty of water by the fountain of Arethusa, so famed among the ancients.

Palermo, anciently Panormus, is a large, rich, and well-built city, fituated at the very bottom of a gulph, to which it gives name. It is an archiepifcopal fee. The vicerov's palace is a magnificent ftructure, adorned with fine fculptures, gardens, &c. and ferves inftead of a caftle, ftanding high, and being flanked with fome lofty towers, and other works. There are many other fine public edifices, as the cathedral, feveral fountains, the city gate, which leads to the fea fide, the quay, mole, forts, convents, town-houfe, lombard-houfe, and univerfity. The quay is one of the fineft walks about the city, being wide, of a great length, and planted with trees. The port is fafe and commodious every where, except on the fouth-west fide, which is full of rocks, that rife no higher than the furface of the fea.

Off the north coasts of Sicily, in the Tuscan sea, lie several small islands, called the Lipari Islands. Lipari, the principal, enjoys a wholesome air, and rich soil, producing corn, wine, and fruit, especially sigs and raisins, in great plenty, together with sulphur, allum, and bitumen. It hath also some excellent hot springs; and on the coasts are caught a great variety of sin sight, with which it carries on a considerable commerce. The capital, called also Lipari, is strong both by nature and art, well inhabited, and an episcopal see, under that of Messina. Stromboli, the most northern of these islands, is now considered as the great light-house of

No. 86.

the Mediterranean Sea. The volcano rifes to a confiderable height; and it is agreed that, in clear weather, it is discoverable at the distance of 25 leagues, and that, at night, its stames are to be seen much farther; so that its visible horizon cannot be less than 500 miles. The small islands of Levanzo, Maritima, and Favagnana, lie at the west end of Sicily, and both they and the Lipari Isles are subject to the king of the Two Sicilies.

MALTA, 66 miles fouth of Cape Paffaro in Sicily, as of an oval figure, 20 miles long, and 12 broad. The air is hot, but clear; and the whole ifland is of a white foft rock, covered to the depth of a foot with earth, which produces cotton, indigo, and a variety of fruits, roots, herbs, &c. but corn and falt are the principal commodities. It contains about 60,000 inhabitants, who fpeak Italian in the towns, and a corrupt Arabic in the country.

The order of the knights of St. John of Jerusalem ook its rife in the Holy Land in the 11th century. The knights maintained their ground in Syria, and the Holy Land, against all the efforts of the Turks, for the space of two hundred years; but being at last compelled to quit them, they retired to Cyprus; and afterwards made themselves masters of the Island of Rhodes, which they also defended, for 200 years, against all the power of the infidels. At the expiration of that time they were compelled to refign the ifland, with all its dependencies, to Solyman II. After feveral affecting viciflitudes of fortune, the order at length obtained from the emperor Charles V. an afylum for their scattered forces; and in the year 1530 took possession of the islands of Malta and Gozzo. In these islands the order still exists, and is distinguished by the title of the knights of Malta.

The knights confift of eight tongues or nations, the chief of which are French, Italian, Spaniards, English, and German. They have commanderies, or estates, in all, or most parts, of the Roman Catholic countries, and are said to amount to about 3000. They ought all to be of ancient noble families; but sometimes nobility is dispensed with, on account of personal merit, and such are called cavalieri di gratia. Not only the grand-master, but the knights in general, are capable of being advanced to a cardinal's hat. According to the statutes, no natural children, those of great princes excepted, nor persons under 18 years of age, can be admitted into the order: but the pope may dispense with these qualifications; and the grand-master has an unlimited privilege to grant this favour to fix

Valetta, the capital, is a handfome town, with an excellent harbour, and strongly fortified. Here are a handfome palace for the grand master, several convents, nunneries, and churches, the principal of which is dedicated to St. John, a college of jesuits, a large hospital, and a building where Turkish slaves are kept. Of the other towns, the most considerable are, Citta Vittoriosa, or Il Borgo Senglea, Malta, called also Medini, and Citta Vecchia, where the bishop resides, Bormola, Cittanuova, Cottonera, Forte di S. Thomasso, and Forte Rosso.

The ifland of Gozzo is very fruitful, and has feveral good harbours, and ftrong forts.

ISLANDS OF THE ADRIATIC, &c.

USIONA, or Lefina, 75 miles north-eaft of Naples, is about 70 miles long, and 16 broad. The fhore is low, has two caftles, and a Mofaic kind of decayed caufeway. The reft is inhabited by hufbandmen, who cultivate the most fertile part of the country, which, though mountainous and rocky, produces plenty of corn, wine, olives, faffron, honey, and fruits. There live in towns and large villages, some of 100, some 500 families; and there is confiderable gain from good fitheries. Here are many fine churches, monasteries, &c. The capital, of the same name, is a well built and populous city.

ı F

CORFU.

CORFU, or CORCURA, near the mouth of the Adriatic, is about 120 miles in circumference, and a very important place to the Venetians, who have generally about 15 gallies, and other veffels. The place is famous for falt, wine, olives, lemons, cyder, &c. Corfu, the principal city, has a metropolitan church of the Greeks. It is a handfome town, and well defended by an impregnable caftle, called St. Ange.

CEPHALONIA is rather larger than Corfu, and very fruitful. The capital, called Cephalonia, is a bishop's fee. Argolisto is the principal port, and the residence of the governor; and Asso is a strong fortress.

ZANTE, 12 miles fouth of Cephalonia, is 150 miles in circumference, mountainous, and subject to earthquakes. It has, however, plenty of wines, oil, corn, and fruit. Zante, the capital, is populous; and near Chiari, a fea-port town, are two springs of clear water, which throw up pitch. South from Zante, on the Morea coast, lie two small clusters of islands, the one called Strophades, the other Strivali. Cerigo, formerly Cerhera, is a rocky barren island, 60 miles in circumference, between Candia and the Mare, and containing a town of the same name.

LEUCADIA, or St. MAURA, lies in the Ionian Sea, and is divided from the continent by a strait not above 50 paces over, or more than four feet deep. The Carthaginians settled a colony here, and formed the strait; for Leucadia was formerly a peninsula. Near the town of Leucas (a few remains of which are still to be seen) stood the samed rock of Leucate, from which despairing lovers threw themselves, as an effectual cure for love. The whole island is fruitful, and near 40 miles in circumference.

Candia, formerly Crete, is fituated in the fouth of the Archipelago. Candia, antiently the capital place, is now in ruins, and the harbour fo fpoiled as to admit only boats. The walls, however, which are yet flanding, are pretty ftrong. It belongs to the Turks, who took it in 1669. The air is good, and the foil fertile. In the city of Candia the beglerbeg refides, and in the town of Candia there is a bafhaw. Mount Ida, fo famed in hiftory, is only a barren, difagreeable, fharp-pointed eminence, fituated in the middle of the ifland.

The CYCLADES are a number of islands of the Archipelago, disposed in the form of a circle, as their name imports. We shall enumerate them, and attend to such of them particularly as merit description.

The island of Milo, or Melos, is 50 miles in circumference; and contains about 5000 inhabitants. It has a town of the same name in the eastern part of the island, with one of the largest and best harbours in the Mediterranean; which serves as a retreat for vessels passing to or from the Levant. The island abounds in delicate fruits, excellent wines, and good cattle. It is remarkable for producing plume allum, and salt is so plentifin as scarcely to bear a price. It is governed by a cadi; and there are two bishops, one of the Greek, and the other of the Latin church.

The cavern, at fome distance from the harbour, has a very romantic appearance. It serves as a shelter for shepherds, who retire under it to dress their victuals; and is the porch to certain galleries, the purpose of which is difficult to determine, unless they are antient quarries, from which stone was formerly dug for building the town; but this stone is light, spongy, and bears all the marks of speedy decay. The surrounding rocks are of the same nature; and the subterraneous fire is continually undermining them.

On the very edge of the sea, about a mile from these quarries, is a grotto, plentifully supplied by a hot sulphurous spring; the vapour of which makes the place a natural stove or sweating-room, falutary in various

diforders: and for many ages the people have had recourfe to this bath for complaints that required the most active medicines, which derived their efficacy from the use of the waters. It was peculiarly good in eruptive diforders, and is much frequented by the Greeks of the neighbouring islands on that account.

Argentiera is an island of the Grecian Archipelago, formerly known by the name of Cimolis, and which is still, by the modern inhabitants; called Kimoli. The French navigators have named it Argentiera, from the silver mines discovered in it; but these are now shut up, and the natives deny all knowledge of such metal being in the island, from an apprehension that the Turks might compel them to labour in the mines. It is a barren spot, destitute of all water but what can be saved in cisterns, and has but one village in it.

There is not a more difinal place in all the Levant than this island, which is covered with rocks, that scarcely suffer a few trees to grow; and in which the land exhibits no verdure. Some fields of barley and cotton are, indeed to be found round the village, which is only an affemblage of miscrable cottages, where the women, children, and cattle, all croud promiscuously together. The dress of the women is in-conceivably ridiculous, consisting of an enormous load of linen sufficiently dirty! Their under petticoat is only their short shift, embroidered with red, that leaves their legs exposed; the thickness of which is esteemed a principal article of female beauty. Those to whom nature has denied this advantage endeavour to fupply the deficiency by three or four pair of thick flockings. When the leg is so uniformly thick all the way, as to be truly perfect, according to their standard, the ladies add a pair of half boots of cut velvet, frequently de-corated with fmall filver buttons. The pirates, who infest the Archipelago, pass their winter in Argentiera; and, by spending their money among the natives, confole them for all their inconveniences.

An usage is established in this island, well known to East-India failors, of taking a wife for the term of a man's residence there. The issue of such occasional adventures are sufficiently handsome to be distinguished among the women, notwithstanding the dress by which they dissigne themselves. The number of inhabitants is much diminished of late years; and they

now scarcely amount to two hundred.

This ifland is celebrated for the earth known by the name of Cimolia terra; which, according to the antients, was efficacious in St. Anthony's fire, inflammatious, and other external affections; being applied by way of cataplasm. They also used it for bleaching of linen, and cleaning of cloaths. This earth, though long difregarded, and supposed to be lost, is, however, still very plentiful in Argentiera, Siphanto, Milo, and other islands; and is a marle of a lax and friable texture, of a pure bright white colour, and soft to the touch. It is evidently the same substance that is found in the county of Cornwall, and which we call Steatites, or the soap-rock.

Siphanto is an ifland of the Grecian Archipelago. The air is fo wholesome here, that many of the inhabitants live to the age of 120. Their water, fruits, wild-fowl, and poultry, are excellent, but more especially the grapes. It abounds with marble and granite; and is not only one of the most fertile, but one of the best cultivated of these islands. The inhabitants employ themselves in raising olive trees and capers, and have very good silk. They trade in figs, wax, honey, onions, and straw-hats, and their number may amount

to about five thousand.

The dress of the women of Siphanto is much less disagreeable than that of some of the neighbouring islands, and bears a little resemblance to the true Grecian habit. The plate exhibits the representation of a woman attending the concerns of her young family. Harnmocks are used for young children in many of the islands in the Archipelago; but the beds are higher, larger, and more aukward, in Siphanto, than in any

other. The women plait their hair with woollen bands, and, turning up the ropes thus formed, faften them on the crown of the head. When they travel into the country, they fkreen their complexions from the heat of the fun, by covering their faces with ftripes of linen, faftened under the chin.

The ifland of Paros is one of the most celebrated of the Cyclades. In its riches and population it found a commanding influence over the fate of its neighbours; and, by the courage of its inhabitants, its freedom and prosperity were long secured. The great Miltiades attacked them in vain; but the more fortunate Themistocles compelled them to submit to the Athenian arms. It then fell successively under the power of Mithridates, the Romans, and the Venetians, till the famous Barbarossa finally subjected it to the Turkish empire under Solvman II.

This ifland is now but thinly inhabited. In a former war with the Turks, the Ruffians had very prudently fixed their head quarters here. The refidence of the forces, of courfe, drove away a part of the inhabitants. Every where, indeed, we may view the fad veftiges of defolation. In thort, the country is over-fpread with the richeft fragments.

The marble of Paros has been famous for many ages for its fuperior excellence.

Of all the dances, which the modern Greeks practife in great variety, the most common is called the Romeca. This has a most surprising conformity with the dances of their ancestors. The passion for dancing has always been the same among the Greeks; nor have misfortune and servitude been able to subdue their natural love for pleasure; for in the gaieties of a sessional they forget their misery.

Antiparos is remarkable for a grotto, which is, perhaps, one of the greatest curiofities in nature. It appears to be about 40 fathoms high, and 50 broad. The roof forms a pretty good arch, which every way entertains the eye with an infinite variety of figures, of a white transparent chrystaline marble, representing vegetables, pillars, and a superb pyramid, all which appear to be natural.

Naxia, or Naxos, is a confiderable ifland, 25 miles in length, and 88 in circumference. The whole is covered with orange, lemon, olive, cedar, citron, pomegranate, fig, and mulberry trees; and abounds with fprings and brooks. The ifland has no good harbour; yet the inhabitants carry on a confiderable trade in barley, wine, figs, cotton, filk, flax, cheefe, falt, oil, and cattle. It is inhabited both by Greeks and Latins, who live in great dread of the Turks; fo that when the meaneft of their fhips appear here, they always wear red caps like galley-flaves; but as foon as they are

gone, they then put on their caps of velvet.

The female drefs of this ifland has fomething truly ridiculous in its appearance. The two wings of the black velvet, which they fix behind to their shoulders, are altogether prepoflerous. They wear a heavy flo-macher, or breaft-piece, of velvet, covered with embroidery and finall pearls. If we view them behind, we shall be again disgusted to see round their loins, what, for want of a better name, we must be content to call a circular shelf, calculated to support the ends of a kind of laced lappets hanging down from their shoulders; in which all we have to admire is a com-position of absurdity. They add to this romantic cumberous dress all the coquetry of behaviour they can asfume. They paint, blacken their eye-brows and eyelashes, and cover their faces with patches, made of the leaves of a black shining tale, which they find in the island. But in the form of their patches they betray a fickleness beyond even what is shewn in our climate: they fometimes cut them triangular, fometimes like a flar; but a patch like a crescent, or half-moon, placed between the eyes, is thought to be irrefiltibly beauti-

To finish the character of these fantastic ladies, it may be added, that they are so vain, that when they

return out of the country to their town-houses, they will have perhaps forty women in their train, some on affes, and some on foot; one of whom carries a napkin or two, a second a petticoat, a third a pair of stockings, and so on: all which composes a very whimsical kind of procession to strangers.

The island of Nio, anciently called Ios, from being first planted by a colony of Ionians, and celebrated as the burial-place of Homer, is about 35 miles in eircumference, is fertile in corn, but has very little wood or oil. A few years ago a Dutch officer, in the Russian fervice, who had occasion to visit this island, from finding some antique marbles, persuaded himself that he had discovered the tomb of Homer; but as we have heard no more about it, there is reason to suppose he has renounced the pretension.

The drefs of the women of Nio is far from being difagreeable. They wear only a plain waiftcoat, which thews their flape without any conftraint; and their petticoats are thort enough to bring their modefty in question; a circumstance which cannot be considered as an indication of the purity of their manners: but tho' they are not able to indulge much in the article of drefs, they nevertheless do not violate the general rules of decency.

The regular manners and behaviour of these islanders, one among another, with their kind treatment of strangers, revives an idea of the simplicity of the primitive ages. Men, women, and children, appear eager to do any good offices for travellers, without permitting their fervants to share in their diligence. This benevolent disposition is without any mixture of impertinent curiosity or interest, but is the genuine remains of ancient hospitality. An ingenious gentleman, who was lately on the ifland, experienced the truth of this representa-He could not prevail on any of them to accept the least pecuniary recompence for their trouble. They only required an attestation of the welcome hereceived; their character, in this respect, seeming to be what these honest people chiefly prided themselves in. It may be truly affirmed that hospitality is the point of honour in the east, and that this virtue is constitutional in the Greeks; fince we find it in modern, as well as in remote times, under their tyrannical government, as well as in their republican ages; under the Chriftian and Mahometan faiths, as well as under Paganism. The Greeks inherit hospitality from their ancestors; the Turks derive it from their religion.

Tina, anciently Tinos, is seventeen miles in length, and eight in breadth. The riches of this island confist in silk. They make exceeding good silk stockings; but nothing can compare with the silk gloves knit here for the ladies. The fortress of Tinos stands upon a rock, and the town adjoining contains about 500 houses.

The easy labour in which the maid-servants of the island of Tina are employed allows them to preserve all their personal attractions. Their principal objects of attention are the nourishing of filk-worms, or winding the filk that they produce. There prevails here a general attention to neatness, that is very pleasing to a traveller, because it is a certain evidence of prosperity; and shews the facility with which they can procure the necessaries of life. The inhabitants of Tina sind themselves sufficiently easy and satisfied, without being reduced to the desire of appearing gaudy in their apparel.

The love of their country is predominant throughout all the Grecian islands, but no where more conspicuous than among the natives of Tina. Great numbers of servants, born on this island, are to be found all over the Levant, who are distinguished, by their drefs, their good understanding, and by their fidelity; but who never lose fight of a defire to return to their own country, to enjoy, with freedom, the acquisitions of their industry. Policandro contains only one village; from its castle may be seen all the islands of the Archipelago. Lemnos, or Stalimene, lies on the north part of the Archipelago, and is almost a square of 25 miles

in length and breadth. Though it produces corn and wine, yet its principal riches arile from its mineral earth, called Terra Sigillata, and much used in medicine, from which the Turks receive a confiderable revenue.

Negropont, the ancient Eubæa, is 90 miles long and 25 broad. Here the Turkish gallies lie. The tides on its coast are irregular, and the island is fertile, producing corn, wine, fruit, and cattle, in such abundance, that all kinds of provision are extremely cheap.

Delos, only about eight miles in compass, is the center of the Cyclades. Mycone has a town of the fame name, and its inhabitants are the best failors in the Archipelago. Andros, 120 miles in compass, is pleasant, fertile, and well watered. Zia, is fruitful, and contains fome antiquities. Joura is defolate. Thermia populous.

The Sporades, or Scattered Islands, are as follow: Engia, 30 miles in circumference, is very fruitful. Colouri, anciently Salamis, 50 miles in circumference, contains three villages, one of which is called Colouri, and gives name to the island.

Scyro is 60 miles in circumference, and has a town of the fame name. Stalimene, or Lemnos, is of a square form, being about 25 miles on each fide. Samondra chi, or Samothrace, near the coast of Romania, is 25 miles in circuit. Embro contains four villages, one

bearing the name of the island. Theffus is famous for wine and marble. Macronifi, is barren and uninhabited. Syra has a town of the same name, with a good harbour. Sikino produces plenty of figs, and the best wheat in the Archipelago; and Serphanto abounds in iron and loadstone. This latter was the place where the Romans banished their malefactors.

Cerigo, or Cytherea, is about 50 miles in circumference, but rocky and mountainous, and chiefly remarkable for being, according to the account of the ancients, the favourite refidence of Venus, and the native place of Helen, who was the occasion of the fiege of Troy.

Santorini is one of the fouthernmost islands in the Archipelago. Though feemingly covered with pumice stones, yet, through the industry of the inhabitants, it produces barley and wine, with fome wheat. Near this illand another arose, of the same name, from the bottom of the fea, in 1707. At the time it arose there was an earthquake, attended with the most dreadful lightning and thunder, and boilings of the fea for feveral days; so that it was a mere volcano: but the burning soon ceased. It is about 200 feet above the fea, and, at the time of its first emerging, it was about a mile broad, and five miles in circumference; but it has fince increased. Several other islands, in the Archipelago, appear to have had the like original; but the sea in their vicinity is so deep as not to be fathomed.

PURSUANT to our proposal of presenting to our readers the most authentic accounts we could procure of discoveries that might be made by navigators, or events that might occur in any part of the world, through the progress of our work to the close of it, we subjoin the following particulars.

That chain of islands called the Palos, or Pelew

ISLANDS, fituated in the west part of the Pacific Ocean, between the 5th and 9th degrees of north latitude, and between 130 and 136 degrees of east longitude, tho' heretofore imperfectly noticed by some ships making the eaftern paffage from China, were never vifited by any Europeans, till the crew of the Antelope, captain Wilfon, a packet belonging to the East India Company, which was wrecked, in August 1783, landed there, and were the means of discovering to us, a new world, or fet of human beings, who, though of an un-cultivated nature, appeared to be greatly different from those commonly termed favages, and evince principles of humanity and generofity, that would reflect the highest honour on the most exalted of our race.

As the Antelope, which failed from Macao, the 20th of June, 1783, was proceeding on her voyage from China, the unfortunately struck on a rock in the night

of the oth of the following August.

The crew, waiting with anxious suspence the approach of morning, in order to discover whether any land was near, descried, at the dawn of day, a small island to the southward, about three or four leagues distant: and soon after some other islands were seen to the eastward, which proved to be those under con-

Apprehensions were naturally felt on account of the natives. Boats, however, were manned, loaded with fuch articles as were deemed most necessary, and difpatched from the ship under the direction of a principal officer, whose design was to obtain, if possible, a friendly intercourse with the inhabitants, in case they should find any. As the ship was expected every moment to go to pieces, those who remained went immediately to work to make a raft, on which, when

compleated, with the affiftance of two boats, they all, except one man, who fell over-board before they fet out, reached the shore, after encountering many difficulties.

In the course of two days from their landing, the crew observed some natives approaching, in canoes, from the points of the bay. This spread so great a from the points of the bay. consternation, that all ran to their arms: but as there were only two canoes, the captain ordered the people out of fight till farther notice.

A very fingular circumstance much facilitated the intercourse between our countrymen and the natives. A Malay, who some time before was cast away upon this island, had acquired the language; and it happened that one of the Antelope's men was a native of Bengal, and spoke the Maylay tongue, by which means, a ready communication was maintained on both fide.

When the canoes which advanced flowly towards the shore, got within hearing, the native of Bengal spoke to them in the Maylay tongoe; on which, tho' they did not seem to understand him, they stopped their canoes. Soon after, however, one of them spoke in the above language, asking our people " who they " were? whether they were friends or enemies?" The native of Bengal, by the captain's direction, replied, "That they were diffressed Englishmen, who had loft " their ship on the reef, and that they were friends." On this they feemed to commune together; and foon after came out of their canoes, which captain Wilson observing, he waded into the water to meet them; and after embracing them in a friendly manner, conducted them to his officers, and the others who had

These people were entirely naked. They were of a deep copper colour, and their skins fost and glossy, owing to the external use of cocoa nut oil. Each chief had a basket of beetle nut, and a bamboo, finely polished, and inlaid at each end, in which they carried a kind of coral, burnt to a lime, called chinam. It was observed that all their teeth were black, and that the beetle nut, of which they had always a quid in their mouths.

mouths, rendered the faliva red, which, together with their black teeth, gave their mouths a very difgusting appearance. They were of a middling stature, strait, and muscular, their limbs well formed, and they had a majestic gait. Their hair was black, long, and rola majette gait. I their hair was orack, long, and rolled up behind close to their heads, which appeared neat and becoming. They tatooed their legs a little above the ancies to the middle of their thighs, which gave them a deeper colour than the other parts of their bodies. None of them had any beards, except the youngest of the king's brothers; and it was, in course of time, observed, that they plucked out the hairs by the roots, and that very few only, who had strong thick beards, cherifhed and let them grow.

Whatever furprize the fingularity of these natives might excite in the minds of our people, the natives were no less wrapt in admiration at their appearance. The whiteness of colour attracted them so much, that it was evident they had never before feen any Europeans. They were continually exclaiming, weel, weel! and weel-a-trecey; words which implied that they were perfectly pleafed with their vifitors. They stroked their bodies and arms outside the garments, feeming to doubt whether their coverings were not a part of their real body, being totally ignorant of the use of cloaths. However, the Malay informed them, that the English, living in a much colder climate than theirs, were obliged to have recourse to artificial warmth, to shield them from the inclemency of the weather, and that, from custom, they could not dis-pense with it, in a degree, even in the warmest re-

The hands of the Europeans next engaged their attention, and particularly the black veins of the wrifts. They probably imagined the whiteness of the hands and face to be artificial; and the blackness of the veins caused them to think, that it was a mode of tatooing; for they defired to look at the top parts of the arms, to fee if the whiteness was continued. After this they requested a farther view of the body, when some of the crew opened their bosoms, and told them that the other parts were nearly the fame as that. The hair on the breafts of the Europeans excited their aftonishment, as they consider such incumbrance highly indelicate, and pluck it out wherever it is found.

The natives having in some degree satisfied their curiofity, began to express apprehensions that they had intruded too much; but the captain convinced them, by means of the Malay, that their fears were ground-

As the natives expressed a desire that captain Wilfon would fend one of his people to Pelew, that the king might fee what kind of beings white men were, the captain complied, and appointed his brother for that purpofe, giving him a small remnant of blue cloth, a cannister of tea, another of sugar-candy, and a jar of preferved fruit, as a prefent for the king. The natives behaved in the most friendly manner to the English; and their monarch foon after paid them a visit, with his fon and brother. His majesty was perfectly naked, and had no kind of ornament or mark of diftinction, like his principal officers, who wore a bracelet of bone at their wrifts. He bore a hatchet on his shoulder, the head of which was made of iron, a circumstance which surprized our people much, as all the other hatchets they had feen were of shell. handle of it, which formed a tharp angle, fluck close to his shoulder, lying before and behind, and wanting no tying to keep it steady in walking.

His majesty would not go into the tents. A fail was therefore spread for him, on which he sat down, with his chief minister opposite, and his two brothers on each fide; and the whole was encompassed by his attendants, who were numerous. He drank a cup of tea, but did not approve of the tafte. Captain Wilfon availed himfelf of this opportunity to obtain permission from the king to build a vessel, in order to convey the crew to some European lettlement; and highly gratified him by caufing a party of men to be drawn up, and fire three vollies. This occasioned such hooting and chattering, as equalled in noise the report of the pieces.

Captain Wilson dreffed the king in a filk coat and blue trowfers. He was extremely well made, but had lost his nose, whether in battle, or from a scrophulous disease, which is prevalent there, was not known.

Arra Kooker, one of the king's brothers, requested a white shirt, and as soon as it was given him, he put it on, in transports of joy, which he indicated by dancing and jumping, and in forming a humourous con-traft between his shirt and his skin. This prince had This prince had a great propenfity to mimicry, and often amused our people by taking off their manners, but with fo much good nature, that no one could feel the least offence. He entertained a great partiality for their Newfoundland dog, which he often fed; till at length the creature felt a partiality for him, and, at his appearance, would jump, bark, leap, and play a variety of tricks. Arra Kooker would often imitate him in the same mode of falutation, by barking, jumping, &c. which could not fail of exciting the rifible faculties. This prince was feemingly about forty years of age, thort in stature, but so plump and fat, that he was almost as broad as he was long.

After various ceremonies had paffed, the captain presented his majesty with a scarlet coat; who then making figns to go on shore, jumped into the water, and fwam to land.

When the captain, and feveral officers, reached Pelew, on a visit to the king, they came into a large fquare pavement, round which were feveral houses, and was conducted into one that stood in the center of one of the fides. Out of this house issued a number of women, who were waiting to fee those new beings the English. Those our people were given to understand were the wives of some of the rupacks, or great officers of state. They were rather fairer than the rest of the women, had fome little ornaments about them, and their faces and breafts were rubbed over with turmeric.

The king, and one of his brothers, led his guests into this house; the women then returned, and received them with much joy, prefenting their company with cocoa nuts and fweet drink, which all fat down and partook of. The ladies also seated themselves, and taking a parcel of leaves, began to make nets, an employment in which they pass great part of their time. The king informed his guests that his house was to be their abode as long as they remained at Pelew, and that there they were to fleep. After this he rose up, previously apologizing to the captain for retiring, faying he was going to bathe.

Soon after a meffage came to Raa Hook from the queen, requesting that she might see the English at her dwelling. They attended him thither, and observed immediately before it a rail, on which were fome tame pigeons tied by the leg. This is a bird held in fuch estimation in those islands, that none but rupacks and their families are allowed to eat them.

As they approached, the queen opened her window, and spoke to Raa Hook, to defire the English would fit down on the pavement before her, which being complied with, a number of attendants brought out yams, cocoa nuts, and fweet drink. While they were partaking of these, the queen asked Raa Hook many questions about our people, of whom the took very great notice, and withed fome of them would come close to the window, and draw up their coat fleeves, that the might fee the colour of their fkins. After the had viewed them attentively, and asked, through Raa Hook, as many circumstances respecting them as the thought she could with propriety obtrude, the fignified that the would not longer trespass on their time, by detain-

ing them; so they role and took their leave.

Raa Hook now took them to his own house, where they were welcomed without any parade. His wife,

No. 86.

11 G

among other things, gave them a broiled pigeon, a delicacy that, as before observed, only falls to the share of the dignified.

There the character of the prince appeared in a new and interefting light: his children encompaffed him, and climbing to his knee, fondly careffed their father, while his fupreme pleafure appeared to be in rolling and toffing them about. This domeftic fcene, however, fo much occupied the minds of the captain and officers, that it was dark before they thought of retiring. Raa Hook begged they would dispense with his attendance, and ordered the Malay to conduct them to their destined habitation, where they found some fish for supper, sent by the king. Though the night proved tempestuous, their house was so well thatched that the

rain could not penetrate.

The king, whose name was Abba Thulle, having fignified to captain Wilson his pleasure of tendering to him the island where the English resided, as a present, and informed him that they diftinguished it by the name of Oroolong, in order to announce possession of it, the British pennant was hoisted, and three vollies of small arms fired. To this island the captain would have returned the day following, (the night he passed with the officers under the roof of the hospitable prince Raa Hook,) if the weather had not turned unfavourable. They therefore took a ramble farther into the country, where the lands appeared to be pretty well cultivated, and the villages full of inhabitants. They observed that the lower orders of the women were busied in looking after the yam plantations, which were mostly in swampy ground. Others they found employed in making baskets and mats, and in nursing their children.

The employment of the men feemed to be that of gathering cocoa nuts, felling trees, and making spears and darts, the chief warlike inftruments of the Pelewans. In the use of these they were remarkably expert, as they afforded abundant proof in divers engagements with the subjects of a neighbouring prince; in which they were aided by a select party of the English at the request of Abba Thulle, and obtained a compleat victory by dint of the superior force of our fire arms.

As the English had been useful in their assistance against the enemy, the king was deliberating what present or compensation he should make to the English leader. After a while he sent him, as a particular mark of his gratitude and esteem, two lovely young women. Captain Wilson, who was a grave sober man, and had his son with him, a youth about seventeen, was particularly embarrassed. He, however, thought proper to send them back again. The king of Pelew was exceedingly unhappy that his present was not accepted, and concluded, in his own mind, that their being rejected was owing to their not being sufficiently young. To obviate this objection, after some strong parental struggles, he actually sent captain Wilson his own daughter, a sweet little girl, who was no more than twelve years old. She was of course returned also; but it was extremely difficult to satisfy the king that in this rejection of his presents no infult was intended.

The death of Raa Hook's valiant fon afforded our people an opportunity of being acquainted with their funeral ceremonies. Having been invited to an entertainment by one of the rupacks, they were furprized, when the repast was ended, at hearing the doleful lamentations of women at some distance; and going to the place from whence the found proceeded, they obferved a concourse of females following a dead body, held up in a mat, and laid on a fort of bier, made of bamboos, carried by four men on their shoulders. These were the only males in company. Our people followed to the place of interment, where the body was deposited without any religious ceremony, the bearers filling up the grave with their hands and feet, while the women knelt down, and again vented the most piercing cries, at times indicating as if their phrenzy would lead them to tear up the corpfe.

The marriages of these people are simply a mutual contract between the sexes, which is held inviolate. A plurality of wives is allowed; but they have seldom more than two. They had no established religion, but seemed to possess an innate considence of the efficacy of virtue, and the temporal advantages arising from moral rectitude.

After three months stay on the island, our countrymen were enabled, by the most persevering toil, but still more by the beneficence and integrity of the natives, to build a vessel out of the fragments of their wreck. In this, after leaving one of the crew, named Madan Blanchard, who requested permission to remain on the island, they departed on the 12th of November, and arrived at Macao on the 30th of the same month, whence they afterwards proceeded to

England.

We cannot omit mentioning at the close of this account, that a short time before the departure of our people, the king of Pelew requested captain Wilson to take with him his fecond fon, whose name was Lee Boo, to England, expressing a patriotic hope that he would acquire many things which, at his return, would greatly benefit his native country. This youth, who added, to an active and penetrating mind, the most ingenious and endearing manners, was treated with the greatest care and attention by captain Wilson, and was advancing rapidly in a knowledge of the English language, and of writing, when he fell a victim to the small-pox, at the age of 20 years. In the extremity of his last illness he made use of these words to a person who came over with him. "When you go to Pelew, " tell Abba Thulle that his fon take much drink to make fmall-pox go away, but he die;-that the captain and mother (meaning Mrs. Wilson) very " kind;-all English very good men;-was much " forry I could not speak to the king my father the number of fine things the English had got."

He was buried in Rotherhithe church, where a tomb was erected to his memory by the East-India Company,

with the following inscription:

Of Prince Lee Boo,
A Native of the Pelew, or Pelos Islands;
And son to Abba Thulle,
Rupack or King of the Island Coordoraa;
Who departed this Life on the 17th of December, 1784,
Aged 20 years.
This island is inscribed
By the Honourable United East-India Company,

As a testimony of esteem for the humane and kind treatment assorbed by his father to the crew of their ship

The Antelope, Captain Wilfon, Which was wrecked off that ifland, On the night of the 9th of August, 1783.

Stop reader, stop!—let NATURE claim a tear; A Prince of mine—Lee Boo lies bury'd here.

HISTORY OF THE RISE AND PROGRESS OF THE ENGLISH EAST INDIA COMPANY.

The capital commercial object in England being the East India company, it demands our attention to its rise and progress. The first idea of it was formed in the reign of queen Elizabeth; but it has since admitted of vast alterations. Though the establishment of this company was vindicated in the clearest manner by several able advocates, the partiality which the duke of York, afterwards James II. had for his favourite African trade, the losses it suffained in wars with the Dutch, and the revolutions which had happened in the affairs of Hindostan, damped the ardour of the public to support it, so that at the time of the revolution, when

the war brok ferent fituati to its having flock was of therefore it eftablished u

S OF THE NY. I being the tion to its

formed in ice admithment of nanner by he duke of urite Afrithe Dutch. the affairs public to tion, when the the war broke out with France, it was in a very indifferent fituation. This was, in a great measure, owing to its having no parliamentary function, whereby its flock was often fold for one half lefs than its real value, therefore it was refolved that a new company should be established under the authority of parliament.

The opposition given to all the public spirited meafures of king William, by faction, rendered this propofal a matter of vast difficulty; but at last, after many parliamentary enquiries, the new subscription prevailed, and the subscribers obtained an act of par-liament in their favour. The old company, however, retained a vast interest, both in the parliament, and the nation, and the act being found in some respects defective, so violent a struggle between the two companies arose, that, in the year 1702, they were united by an indenture tripartite. In 1708, from some important public confiderations, the company obtained a prolongation of its exclusive privileges, and a new charter was granted them under the title of "The United Company of Merchants trading to the East "Indies." Its exclusive right of trade was continued from time to time, and, from confiderations fimilar to the former, its privileges were extended; yet the interest of their capital was reduced to three per cent. and called the India three per cent. annuities

Those annuities are different from the trading stock of the company, the proprietors of which, instead of receiving a regular annuity, have, according to their different thares, a dividend of the profits ariting from the company's trade; and that dividend rifes or falls according to the circumstances of the company, either real or pretended. Out of the body of directors are chosen several committees, who have the peculiar inspection of certain branches in the company's business. These have under them a secretary, cashier, clerks, and

warehouse-keepers.

The amazing territorial acquisitions of this com-pany must necessarily be attended with a proportionable increase of trade, and this, joined to the diffentions among its managers both at home and abroad, have, of late, greatly engaged the attention of the legiflature, infomuch that a restriction has occasionally been laid on their dividends for a certain time.

In November, 1783, a bill was brought forward by Mr. Fox, then fecretary of state, for new regulating the company, under the supposition of the incompetency of the directors, and the infolvent state of the company. The bill passed the commons, but an opposition being formed against it in the house of lords, after long and elaborate debates, it was thrown out. ous attempts for a new bill were afterwards made by Mr. Pitt, and the new ministry, but failed, which occasioned, with other disputes on privilege, a dissolution of the house of commons.

A bill paffed at the close of the fessions of 1784, including the three following particulars.

First, the establishing a power of controll in this kingdom, by which the executive power in India is to be connected with that over the rest of the em-

Secondly, the regulating the company's fervants in India, in order to remedy the evils which have prevailed there.

Thirdly, the providing for the punishment of those persons who shall nevertheless continue in the practice of crimes which have brought difgrace upon the com-.

Earl, now Marquis Cornwallis, was appointed to the fupreme government in India, both civil and military, an extent of authority never before vefted in an individual. Upon his arrival in that country he purfued fuch measures as eventually tended to the aggrandizement of the Company, both in character and poffeffions, as well as promoting the true interests and happiness of the natives. To check the turbulent spirit Tippoo Saib, whose general object was to destroy the power of the English in India, the Marquis formed an alliance with the Mahrattas and the Nizam of the Decan, and a plan was concerted jointly to invade the dominions of the Sultan.

Pursuant to this defign, war commenced in the beginning of the year 1790, which was attended with fuc-cess to the British arms; and in the following year his Lordship took the command himself, and advanced rapidly towards Seringapatam, the capital of Tippoo Saib's dominions; but upon the swelling of the river, and the weak state of the draft cattle, his Lordship was reduced to the necessity of abandoning the enterprize for that feafon. Accordingly, after rendering his battering train totally useless, he retreated with the army to

Early on the return of the enfuing feafon, however, the Marquis, in conjunction with his allies, refumed the important enterprize: he invefted Seringapatam; and having carried some of the outposts, brought to terms of submission the haughty Tippoo, who purchased a peace by a treaty to surrender up one half of his dominions to the powers in alliance, and also to pay three crores and thirty lacks of rupees; for the per-formance of which he delivered up two of his fons as hostages to Marquis Cornwallis, who, by this gallant atchievement greatly extended the territories and advanced the revenue of the Company, and transmitted his own name with honour to posterity.

ORIGIN and PROGRESS of the ART of NAVIGATION.

ARIOUS opinions have been formed respecting the origin of that most important of arts, navigation, to which a diversity of events might probably have given birth. The fea-coafts, in many places, are full of islands, at no great distance from the continent. Curiofity would naturally inspire men with an inclination to pals over into thele islands. As this passage would not appear either very long, or very dangerous, they would attempt it. Success in one of these attempts would encourage to a fecond. Pliny relates, that anciently they failed only among the islands, and that on rafts.

Fishing, to which feveral nations applied themselves in the earliest ages, might also contribute to the origin of navigation. We are, however, most inclined to of navigation. We are, however, most inclined to think, that the first ideas of this art were owing to those nations which were feated near the mouths of the rivers, where they fell into the fea. As they failed upon thefe rivers, they would fometimes be carried out to sea, either by the current, by florm, or eyen by defign. They would be terrified at first at the violence of the waves, and the dangers with which they threatened them. But when they had got over these first terrors, they would soon be fenfible of the great advantages which the fea might procure them, and, of consequence, would endeavour

to find out the means of failing upon it.

In whatever way mankind became familiar with that terrible element, it is certain that the first essays in navigation were made in the most ancient times. Moses informs us, that the grandions of Japhet paffed over into the iflands near the continent, and took poffession of them. It is also an undoubted fact, that the colonies very foon failed from Egypt into Greece. Sanchoniathio ascribes the invention of the art of building thips, and the glory of undertaking fea-voyages, to the Caberites. The antient traditions of the Phænicians make the Caberites cotemporary with the Titans.

Experience

性的美國鐵鐵管門社

Experience foon convincing them, that thips, defigned for navigating the feas, ought to be of a different construction from those intended for rivers, they would make it their study to give such a form and solidity to ships designed for the sea, as would enable them to resist the impetuosity of its waves.

They would next endeavour to find out a method of guiding and directing them with ease and safety. Sculls and oars were the only inftruments that occurred to them for some time. It must have been long before they thought of adding the helm. The ancients imagined, that it was the fins of fishes which first suggested the idea of oars, and that the hint of the helm was taken from observing how birds directed their slight by their tails. The shape of ships, excepting the sails, seems to be copied from that of sishes: what the sins and tails are to sishes, that the oars and helm are to ships. But these are only conjectures more or less probable, and not worth examin-

ing to the bottom.

The action of the wind, whose effects are so sensible and so frequent, might soon suggest the use of fails. But the manner of adjusting and managing them was more difficult, and would not be so soon discovered. This, in all probability, was the very last part of the construction of ships which was found out; and we are construction of ships which was found out; and we are consirmed in this opinion by the practice of the favages, and other rude nations, who make use only of oars, but have no sails. It would be the same in the first ages. The first navigators only coasted, and cautiously avoided losing sight of land. In such circumstances sails would have been more dangerous than useful. It required the experience of several ages to teach navigators the art of employing the wind in the direction of ships.

If we believe, however, the ancient traditions of the Egyptians, this art of using the wind, by means of masts and fails, was exceeding ancient. They give the honour of this discovery to Iss. But over and above the little credit which is due to the greatest part of the history of that princes, it evidently appears that this discovery cannot be ascribed to the Egyp-

tians.

Men must soon have endeavoured to find out some method of stopping thips at sea, and keeping them firm at their moorings. They would at first make use of various expedients for this purpose, such as large flones, hampers or facks full of fand, or other heavy bodies. These they fixed to ropes and threw into the fea. These methods would be sufficient in the first ages, when the veffels they used were only small and light barks. But as navigation improved and larger ships were built, some other machine became necesfary. We know not at what time, or by whom the anchor, that machine at once to simple and to admirable, was invented. We find nothing certain on this fubject in ancient authors. Only they agree in placing this discovery in ages greatly posterior to those we are now examining. They afcribe this invention to feveral different persons. The anchor, like several other machines, might be found out in many different countries, much about the fame time. It is certain that the first anchors were not made of iron, but of stone, or even of wood. These last were loaded with lead. We are told this by several writers, and amongst others by Diodorus. This author relates, that the Phænicians, in their first voyage into Spain, having amaffed more filver than their ships could contain, took the lead from their anchors, and put filver in its place. We may observe further, that the first anchors had only one flook. It was not till many ages after that Anacharfis invented one with

All these different kinds of anchors are still in use in some countries. The inhabitants of Iceland, and of Bander Congo, use a large stone with a hole in the midle, and a stick thrust through it. In China, Japan, Siam, and the Manillas, they have only wooden anchors, to which they tie great stones. In the kingdom of Cali-

cut they are of stone. The ignorance of the first ages, and of many nations to this day, of the art of working iron, has been the occasion of all these rude and clumly contrivances.

Though the first navigators coasted along the shores, and took all possible pains not to lose sight of land, yet, in the very first ages, they must frequently have been driven off to sea by storms. The confusion and uncertainty they sound themselves in when these accidents happened would put them upon studying some method of finding where they were in these circumstances. They would soon be sensible, that the inspection of the heavenly bodies was the only thing that could afford them any direction. It was in this manner, probably, that astronomy came to be applied to navigation.

From the first moment men began to observe the motions of the heavenly bodies, they would take notice that in that part of the heavens where the sun never passes there are certain stars which appear constantly every night. It was easy to discover the position of these stars in respect of our earth. They appear always on the less hand of the observator, whose face is turned on the east. Navigators were soon sensible, that this discovery might be of great advantage to them, as these stars constantly pointed out the same part of the world. When they happened to be driven from their course, they found, that, in order to recover it, they had only to direct their ship in such a manner, as to bring her into her former position, with respect to those stars which they

faw regularly every night.

Antiquity gives the honour of this discovery to the Phænicians, a people equally industrious and enterprifing. The Great Bear would probably be the first guide which these ancient navigators made choice of. constellation is easily distinguished, both by the brightness and peculiar arrangement of the stars which compose it. Being near the pole, it hardly ever sets with respect to those places which the Phænicians frequented. We know not in what age navigators first began to obfervethe northern stars, for the direction of their course; but it must have been in very ancient times. Great Bear is mentioned in the book of Job, who feems to have converfed much with merchants and navigators. The name by which that constellation was known among the ancient inhabitants of Greece, and the tales which they related about its origin, prove it was observed for the direction of navigators in very remote ages.

But the observation of the stars in the Great Bear was a very imperfect and uncertain rule for the direction of a ship's course. The truth is, this constellation points out the pole only in a very vague and confused manner. Its head is not fufficiently near it, and its extremities are more than 40 degrees diftant from it. This vast extent occasions very different aspects, both at different hours of the night, in the same season of the year, and in the same hour in different seasons. This variation would be confiderably increased, when it came to be referred to the horizon, to which the course of navigators must necessarily be referred. They have made an allowance for this variation by guefs, which could not but occasion great mistakes and errors in those ages, when they were guided only by practice inflead of geo-metrical rules and tables, which were not invented till many ages after.

It must have been long before navigation arrived at any tolerable degree of persection. There is no art or prosession which requires so much thought and knowledge. The art of sailing is of all others the most complicated; its most common operation depends upon various branches in different sciences. It appears, however, that even in the ages we are now examining, some nations had made some progress in maritime affairs. These discoveries can be ascribed to nothing but that love to commerce with which these nations were animated, and their great ardour for the advancement of it; the like of which continuing in future ages, has brought

the art of navigation to its present state of perfection.

GEOGRAPHY, ASTRONOMY, the Use of the GLOBES, MAPS, &c.

GEOGRAPHY is a term derived from two Greek words, (m, fignifying the earth, and γραφω, to describe,) implying a general Description of what is called the Terraqueous or Terrestrial Globe.

There are other terms, which, though comprised in the general one of Geography, may be defined abstractedly: thus, Hydrography implies a description of water; Chorography signifies the description of a country, or province; Topography means the description of a particular district, city, town, village, &c.

TERMS USED IN GEOGRAPHY.

THE principal terms used in Geography, respecting the description of land and water, are as follow:

A Continent implies a large portion of earth, comprising several countries, which are not separated by the sea.

An Island is a portion of earth entirely surrounded by water.

A Peninfula is a quantity of land, joined to the continent by a finall neck, and every where else furrounded by water.

An Isthmus is that neck which connects the peninfula to the main land.

A Promontory, or Cape, is a high point of land, which stretches into the sea.

An Ocean is an immense collection of water, surrounding a great part of the continent.

A Sea is a smaller collection of water, or an inferior ocean.

A Gulph is a part of the fea almost furrounded by land, except at one small part, where it joins the main sea.

A Bay is, in general, less than a gulph, and has a wider entrance.

A Creek is less than a bay, and may be deemed a fmall inlet of water, running a little way into the land.

A Road is a place on the coast, where there is a good anchorage.

A Streight, or Strait, is a narrow paffage of water, which joins two feas, two gulphs, a fea and a gulph, &c.

A Lake is a collection of water, furrounded by land.

A River is a stream of water, which derives its source from some inland spring, meanders through the country, and empties itself either into the ocean, the sea, or some other river.

For the help of memory, we shall recapitulate the foregoing geographical terms in verse.

A Continent's a Track of land defin'd, Comprising countries not by seas disjoin'd. The wat'ry element an Island bounds, And ev'ry where with circling waves furrounds; And a Peninfula's an earthly space, Which (one part only) flowing waves embrace. That part, or neck, which joins it to the main, By the word Isthmus fully we explain. A Promontory is, as all agree,
A point of land projecting in the fea.
The earthly globe the furging Oceans bound, And leffer Seas more narrow thores furround. For an inferior fea a Gulph may stand, Almost enclos'd and circumscrib'd by land. A Bay is a fmaller Gulph defin'd: A Creek's a smaller bay, less mov'd by wind. A Road is where a ship may ride with ease: A Streight's a narrow pass that joins two seas. A Lake's an inland sea with certain bounds, Which banking earth on ev'ry fide furrounds. A River through the land meand'ring goes, Streams from its fource, and to the ocean flows.

11 L

OF THE ARTIFICIAL SPHERE, OR GLOBE.

THE Sphere is an artificial machine, confifting of many circles, invented by the fagacity of mathematicians, to explain the doctrine of the Globe, or Orrery; and to illustrate the motions of the earth, planets, &c.

Every circle is divided into 360 equal parts, which we call degrees; each degree into 60 more equal parts, called minutes.

The Plane of a circle means that furface on which it is drawn; and if the furface be supposed of an infinite extent from the center, it is still called the Plane of that circle. But circles are said to be in different Planes, when the surfaces on which they are made incline to or intersect each other.

The Axis is that line which we conceive to pass through the middle of the earth, and on which the whole mass turns round, represented in the artificial Globe by a wire. The two extremities of the Axis are called the Poles of the Equator; and if the Axis be imagined to reach the stars, one point is called the Arctic, and the other the Antarctic, or the North and South Poles of the World.

The principal Great Circles are thefe:

The Equator is a great circle, going from east to west, which parts the globe into the north and south hemispheres. It is named the Equator, or Equinoctial Line, because when the sun arrives there the nights and days are equal. It is also divided into 360 degrees, reckoned eastward from the first Meridian.

The Horizon is that great circle which parts the upper hemisphere from the lower, or the visible from the invisible hemisphere. So much of the earth as we comprehend in our view, in a circular manner when we stand on a plain, is called the Sensible Horizon. It is a moveable circle, having the zenith point over the spectator's head, and the nadir point under his feet, for its two poles. But the Rational Horizon is to suppose the eye at the center of the earth, viewing the whole celestial hemisphere upwards; which is represented by a broad wooden circle encompassing the globe, on which are described several other circles. The inner one is divided into twelve equal parts, shewing the twelve signs of the zodiac; each of which is subdivided into thirty degrees, marked 10, 20, 30. The next contains a calendar, according to the Old Style, divided into months and days; and the other is a calendar according to the New Style.

The Meridian is a great circle, dividing the globe into the eaft and west hemispheres; it lies directly north and south, passing through the poles of the equator. The Meridian is changeable, being properly that part of the heavens where the sun is at noon; so that every place on the earth has a different Meridian, if we move east or west; but passing north or south, it remains the same. The Meridians marked on the Globe are 24 semi-circles, ending in the poles, which we may multiply at pleasure; for Geographers usually settle one Meridian, from whence they reckon the longitude of any place, east or west; as in the new set of Maps for this Geography, London is made the first Meridian. The globe hangs in a brass circle, on which is placed another small brass one, called the horary circle; this is divided into 24 equal parts, and describes the hours of day and hight, which, in turning of the Globe, are pointed out by an index sitted to the pole. This is to shew the rising and setting of the sun, moon, and stars; or the time of day in all parts of the earth. The degrees of latitude are marked on any Meridian line; but in maps always on the two outermost.

There are two other meridians, called Colures, which being also great circles, cut the sphere into four equal parts. The Solftice Colure goes through the poles, and cuts the ecliptic at the first degree of Cancer and Capricorn: the Equinox Colure goes likewise through the poles, but cuts the ecliptic at the beginning of Aries and Libra. By these the seasons are distinguished; for when the earth, in its annual course, passes under the Equinox Colure, then commence the spring and autumn; but when it passes under the Solstice Colure, the winter and summer begin.

The Ecliptic is a great oblique circle, cutting the equator at angles of 23 degrees, 29 minutes. It defcribes the annual course of the earth, north and south: but the course of the planets and moon lies eight degrees farther on each side; which broad part of the sphere is commonly called the Zodiac, containing 16 degrees; the Ecliptic being that circle in the middle, which is divided into 12 signs, each containing 30 degrees. The characters and names of the signs are thus:

Aries	Υ	Cancer	9	Libra	sth.	Capricorn	V9
Taurus	8	Leo	S.	Scorpio	m	Aquarius	-
Gemini	11	Virgo	100	Savittarius	1	Pisces	×

There are two more Great Circles, called Vertical, or Azimuth Circles. These are perpendicular to the horizon, and pass through the zenith and nadir. They are not drawn on the Globe, but represented by the quadrant of altitude, which is a very thin plate of brass, made to screw on the zenith of any place, and to reach the horizon; being also divided into 90 degrees, for taking the altitude of the sun or stars, when they are not on the meridian.

The Leffer Circles are four.

The two Tropics are those of Cancer and Capricorn: the first is 23 degrees, 29 minutes, north from the equator; and the other is the same distance to the south. On all globes and maps they are known by a double line.

way of dif the globe found very upon Ten very high The two remaining Circles are still smaller, called the Artic or Polar Circles. The North Pole Circle is distant 23 degrees, 29 minutes, from the North Pole; and the South Pole Circle is equidistant from the South Pole. These Circles have also double lines.

The Cardinal Points are the four quarters of the world, east, west, north, and south.

The Collateral Points are the principal divisions and subdivisions of the four chief: in all 32.

The earth being divided into five parts, by the two Tropics and the two Polar Circles, those five parts are named Zones. Two Temperate, two Frigid, and the Torrid Zone.

The North Temperate Zone includes all the land between the Tropic of Cancer and the North Pole Circle; and the South Temperate Zone includes all between the Tropic of Capricorn and the South Pole Circle.

The two Frigid Zones contain all the land from the two Polar Circles to the very Poles. These, by the ancients, were thought uninhabitable; but navigators have discovered many well-peopled countries within the Arctic Circle, almost round the North Pole; though none as yet has been discovered within the Antarctic, or South Frigid Zone.

The Torrid Zone includes all the space between the two Tropics, the Equator being in the middle. The whole is thoroughly inhabited, thought it lies under the full annual course of the sun; for which reason the ancients thought it could not be peopled for extreme heat, any more than the Frigid Zones for extreme cold.

The Temperate Zones contain, in latitude, each 43 degrees, 2 minutes, being the space between each Tropic and the Pole Circle. The Frigid Zones contain each 46 degrees, 58 minutes; that is to say, 23 degrees, 29 minutes, on either side the Pole: and the Torrid Zone, in like manner, contains 46 degrees, 58 minutes, latitude; that is, 23 degrees, 29 minutes, on each side the Equator.

OF SHADOWS.

THE ancients also named the inhabitants of the earth according to which way the Shadows of their bodies were cast by the moontide sun.

Periscii are those beyond the Polar Circles, whose bodily Shadows turn round every 24 hours.

Heterofcii are those people in the Temperate Zones, whose noon Shadows ever fall one way; the North Temperate Zone throwing it north, and the South Temperate Zone throwing it fouth.

Amphiscii are those who live in the Torrid, or Middle Zone. Their noon Shadows fall different ways at different Seasons: for when the sun gets to the fign Cancer, being the North Tropic, their Shadows fall south; and when the sun reaches Capricorn, or the South Tropic, the Shadows go North. And because, twice a year, their bodies make no shade at all, the sun passing just over their heads, they are therefore called Ascii.

Periscii is from τοςὶ, which means round about; and σκιὰ, a Shadow. Heteroscii is from ετερος, meaning one only, and σκιὰ. Amphiscii is from ἀμορὶ, both ways. And Ascii is from α, and σκιὰ; that is, without a Shadow.

OF SITUATIONS.

THE Perieci are those people who live in the same parallel, have the same latitude and seasons, and the same pole elevated; but have opposite meridians, and consequently opposite days and nights.

The Antieci are those who have the same meridian, but opposite parallels; equidistant from the Equator, though on contrary sides. Their longitude is the same, and consequently the same length of day and night; but they have contrary poles and seasons; and when it is noon with one, it is midnight with the other.

Antipodes are fuch whose parallel and meridian are both opposite. They have the whole globe of the earth between them, in diametrical opposition: they have contrary poles elevated: their feet are directly opposite, and consequently their nights and days, winter and summer.

OF LATITUDE AND LONGITUDE.

THE exact fituation of cities and places, where the inhabitants of the earth relide, is more particularly called their Latitude and Longitude. Latitude is the diffance of any place from each fide of the Equator to either of the Poles; which diffance being but 90 degrees each, no Latitude can exceed that number.

Longitude is the diffance of a place from the first, or some other meridian. When Ptolemy invented the way of distinguishing the situation of places, he did it by parallel and meridian lines; the latter passing round the globe through the Equator and Poles, and the former lying parallel to the Equator, which parallel lines were found very convenient for marking the Latitude into degrees and minutes. Then for Longitude, he fixed upon Tenerisse, one of the Canary Islands, as the most western part of the then known world; which having a upon Tenerisse, one of the Canary Islands, as the most western part of the then known world; which having a very high mountain, was a good mark for mariners, and the fittest place from whence to begin a general computation

by the to reach e not on

from the

The

putation. Accordingly all the old maps begin their East Longitude from Teneristic; and, because then only one fide of the globe was known, the degrees were only 180: but since the discovery of America, they are carried quite round to 360. This method was always esteemed, and Teneristic reckoned a good standing meridian, till the French, who like nothing which they themselves do not invent, thought proper to alter &, and make the Island Faro their new meridian, which, by late observations, lies just two degrees more west. Wherefore, to prevent consusting, our modern Geographers, and delineators of maps, make the metropolis of their own nation the first real meridian; and, in this case, Longitude is two-fold, being, from London, either west or east; as at sea it is computed from some known port or head-land.

The Longitude of any place from London being known, the difference in the hour of the day is also known. For as the sun performs his diurnal circuit in 24 hours, he gains in each hour 15 degrees, being a twenty-fourth part of 360, or one degree in four minutes. So that at any place 15 degrees east of us, noon is an hour sooner with them, as it is an hour later with those who live 15 degrees west from us. The town of Pembroke, in Wales, being five degrees west of London, their noon is therefore 20 minutes later. If a clock, or any time-piece, could be so made as to go equal and true at any season, or distance, the theory of Longitude at sea would be no more a mystery, but as that is impracticable, our modern Astronomers have contented themselves with observing the Solar and Lunar Eclipses; for if their appearances and calculations are exactly known with us, and the same appearances are observed in any other part of this globe, the difference arising from those times will settle the difference in Longitude by the foregoing rule. The Eclipses also of Jupiter's Moons, and the spheroidal figure of the Earth, two important discoveries of the seventeenth century, will each, in their turn, lead us farther on to a true system of Longitude.

Lastly, Though all degrees of Latitude are equal in length, yet degrees of Longitude vary in every new parallel of Latitude: for all the meridian lines meeting and interfecting each other at the poles, the degrees of Longitude do naturally diminish as they proceed either way from the Equator. The best explanation of which is an orange with the peel stripped off; where the natural partitions not only resemble, but are truely the meridians of a Globe, crossing each other at the top and bottom: whereas, if the orange is cut in slices the contrary way, the divisions are parallel, and the degrees of Latitude all equal.

The following Table shews how the degrees of Longitude diminish throughout all the parallels of Latitude; reckoning 60 parts, or miles, for a degree at the Equator.

A TABLE, shewing the Number of Miles contained in a Degree of Longitude, in each Parallel of Latitude from the Equator.

THE SOLAR SYSTEM.*

TO explain the disposition of the several parts of the universe, and demonstrate the nature of the heavenly motions with respect to each other, and to the earth, it is necessary to understand the System of the

Several Systems have, at various times, been formed chiefly from conjecture; but the aftonishing improvements in aftronomy, made in later ages, have exploded erroneous suppositions; and experience, affilted by experiment, have, at length, fixed, on a permanent basis, the only true System, called the Solar System.

This admirable System was invented by Copernicus, a Prussian, and afterwards fully domonstrated and explained by the incomparable Sir Isaac Newton, who clearly elucidated the harmony of the universe;

" Where order in variety we fee;

" And where, tho' all things differ, all agree."

This System consists of the Sun in the center, and the Planets and Comets moving about it. The Planets are vast bodies, which, to us, appear like stars; not that they have any light in themselves, but shine merely by reflecting the light of the sun.

> " Each Planet, thining in his proper fphere, " Does, with just speed, his radiant voyage steer: Each fees his lamp with different luftre crown'd,

- " Each knows his course with different periods bound; And, in his paffage through the liquid space,
 - " Nor haftens, nor retards, his neighbours race: " Now thine thefe Planets with fubftantial rays? " Does innate luftre gild their meafur'd days?
 - " No; but they do, as is by fystem shewn,
 " Dart fertive beams, and glory, not their own; " All fervants to that fource of light, the Sun."

The Planets are either Primary, or Secondary. The Primary Planets are fix in number, viz.

> Mercury, Venus,

Earth, Mars,

Jupiter. Saturn.

These are called Primary Planets, because they move round the Sun; and the other Planets are called Second-

ary, because they move round the Primary Planets.

The Secondary Planets are ten in number, and go under the general name of Moons: of these one moves round

the Earth, four round Jupiter, and five round Saturn.

With respect to Comets, it is universally agreed, that they are immense bodies, revolving about the sun in elliptical orbits. Their periodical times are equally constant, certain, and regular, as those of the Planets; but the bodies themselves are abundantly more denie, as they pass through greater extremes of heat and cold, without any fentible diminution.

All Comets are Spheres, with large atmospheres furrounding them. These, in their nearest access to the sun, by the intense heat emitted therefrom, are so much rarified, as to be abundantly lighter than the sun's atmosphere, and extended into long lucid tails, towards those parts opposite the sun. As Comets recede from the sun, their tails diminish, and their atmospheres increase gradually, until they approach the greatest distance from the sun, and then their tails are contracted into circumambient atmospheres. With regard to motion, Comets and Planets have this difference: all Planets move from east to west in the plane of the ecliptic, and in orbits nearly circular; but Comets, in their very elliptical orbits, traverse the compass in all directions, (the plane of the ecliptic excepted), and that in a manner fo wonderful, as not to interfere in the orbits of each other. Superfittion long held them as ominous, and the vulgar supposed they were certain forerunners of some tremendous event.

" Thus terribly in air the Comets roll,

" And shoot malignant gleams from pole to pole :

'Tween worlds and worlds they move, and, from their air,

" Shake the blue plague, the pestilence, and war."

SUN.

THE Sun, fituated in the centre of the universe, is the fountain of light, the source of the seasons, the cause of the vicisfitudes of day and night, the parent of vegetation, and the friend of man. It is a prodigious body of intense heat, and amazing illumination. In fine, when we view the Sun we behold a globe of liquid fire, whose diameter is equal to 100 diameters of the earth; the thickness being 793,000 miles. Its surface is 10,000 times larger than the earth, and its folidity 1,000,000 greater: that is, the furface is the fquare of the thickness, and the folidity its cube.

^{*} Though the Newtonian System seems to differ, in some respects, from the account of the Creation by Moses, yet both are true, and the variation is only in point of expression. Moses alludes to the rotation of the sun round its own axis, which some have mistaken for a motion round the earth. But it should be recollected, that Moses had an ignorant and stiff-necked people to deal with; in consequence of which he talked as a Moralys, not as a Philosopher, and wished to make them good, not learned: he therefore facrificed mathematical distinctions to the more immediate duties of his sunction as a religious Law-giver.

"O'er earth, and o'er the main, and the ethereal way.

" He in the morn renews his radiant round,

" And warms the fragrant bosom of the ground; But, ere the noon of day, in firy gleams, " He darts the glory of his blazing beams.

Beneath the burnings of his fultry ray, " Earth, to her center pierc'd, admits the day."

MERCURY.

THE Planet Mercury is about two-thirds of the earth's magnitude, being 2700 miles in diameter. His diftance from the earth is \$8,000,000 of miles, and from the fun 32,000,000 of miles. His revolution round the fun is made in a little more than 88 days, with the velocity of 100,000 miles in an hour, which is almost as swift again as the earth travels; for we only go 56,000 miles in the fame fpace. The heat of the fun in this Planet is formething more than feven times greater than the heat of the hottest part of the earth in the most sultry summer, which is fufficient to make water boil.

> " Mercury, nearest to the central Sun, " Does, in his oval orbit, circling run; " But feldom is the object of our fight,

" In folar glory funk, and more prevailing light."

VENUS.

THE Planet Venus appears to the eye to be the brightest of all the Planets: and, from its superior lustre, it cannot be mistaken for any of them. The distance of Venus from the sun is 60,000,000 of miles: her revolution round the sun is performed in little more than 224 days, and her motion in an hour is 70,000 miles. From the uncommon brightness of this Planet, the poets have made it the Goddess of Beauty.

" She turn'd, and made appear

"Her neck refulgent, and dishevel'd hair;
"Which, flowing on her shoulders, reach'd the ground,

" And widely spread ambrofial scents around:

"In length of train defcends her sweeping gown;
"And by her graceful walk the Queen of Love's known?"

EARTH.

THE Earth forms its revolution round the fun in 365 days, 5 hours, and 49 minutes, which revolution makes what we term a year. The Earth is near 80,000 miles in diameter, and diffant from the fun about 81,000,000 of miles. The line which this Planet describes in its annual motion is called the Ecliptic, through which it proceeds from west to east, according to the signs of the Zodiac; and it is this motion which causes the different feafons of fpring, fummer, autumn, and winter, and of the various lengths of days and nights in

The Earth, in paffing through the ecliptic, always keeps its axis in a fituation parallel to itself, and equally

inclined to the plane of the ecliptic, which is 23 degrees and a half.

The rotation of the Earth round its own axis, makes it day in those parts which are turned towards the sun, and night in those parts which are turned from the fun.

" While the bright radiant fun in centre glows,

" The Earth, in annual motion, round it goes; " At the same time on its own axis reels,

" And gives us change of feafons as it wheels: " Hence stars we see in various order bright;

" Hence we are bleft with change of day and night."

MARS.

MARS is fituated next above the earth in the fystem of the universe, his course being in the interval between the orbit of Jupiter and that of the Earth, but very distant from both. It is the least of all the Planets, Mercury excepted; has less lustre than any other star, and appears of a dusky red hue. Mars is considerably less than the Earth, its diameter being only 4400 miles. His distance from the sun is 123,000,000 of miles; and he revolves about that central luminary in 687 days, proceeding at the rate of 45,000 miles in an hour. From the fanguinary appearance of this Planet, the ancient poets, in their fables, deemed it the God of War.

" Thus on the banks of Hebrus' freezing flood,

" The God of Battles, in his angry mood,

" Clashing his fword against his brazen shield,

" Lets loofe the reigns, and scours along the field. " Before the wind his firy couriers fly;

"Groans the fad earth, refounds the ratling fky.

"Wrath, Terror, Treason, Tumult, and Despair, Dire faces, and deform'd, surround the car,

" Friends of the God, and followers of the war.

JUPITER.

A GUIDE TO GEOGRAPHY, &c.

JUP TER.

JUPITER is the largest of all the Planets; but being very remote from the Sun, would scarce enjoy any light, had not the great Author of Nature provided it with four moons, or satellites, which revolve round it in different orbits.

The diameter of Jupiter is upwards of 80,000 miles, and the mass of matter it contains 220 times greater than our Earth. His diftance from the fun is 424,000,000 of miles. He revolves round his own axis in 9 hours and 56 minutes; round the fun in 11 years and 10 months; and proceeds at the rate of 24,000 miles

Exclusive of a famous spot by which the diurnal motion of this Planet was originally determined, it has swatches, or belts, round it, that are moveable, and which are formed by clouds; and like the trade winds to us, lie in tracks parallel to the equator. The poets feigned this Planet to be the head of the heathen Deities, or fabulous Gods, and represented him as having the command of the thunderbolts.

" The pow'r immense, eternal energy,

" The king of Gods and men, whose awful hand

" Disperses thunder on the seas and land,

" Disposing all with absolute command."

SATURN.

SATURN is the most distant Planet in the whole system, being 779,000,000 of miles from the sun. He is 30 years in performing his revolution, and yet moves at the rate of 18,000 miles an hour. He is 61,000 miles in diameter, contains 94 times as much matter as the Earth; but his denfity is not more than a feventh part of the matter which composes our Planet.

As the light and heat in Saturn are not above a ninetieth part of what we enjoy from the fun, the wife Creator of the Universe hath accommodated Saturn with five moons, which revolve round him in different orbs. the most fingular circumstance relative to this Planet is his ring. This is a vast body of earth, of the thickness of near 800 miles, which furrounds Saturn in form of a circle, at the distance of 21,000 miles from its furface.

SECONDARY PLANETS.

HE Secondary Planets, as we have already observed, are ten in number, vix. five belonging to Saturn, four

to Jupiter, and one to our Earth.
With respect to nine of these Moons, or Satellites, namely, those belonging to Saturn and Jupiter, they were unknown till the last century, by reason of their being so diminutive, that they could not be seen from our Earth without the use of long telescopes; hence, till those optical glassies were improved, these Secondary Planets were

The Moon, which lights our Earth, contains about the fortieth part of the quantity, or mais of matter, which compose the Planet we reside upon. It is near 2200 miles in diameter, 240,000 miles distant from us; and its furface is about 14,000,000 of square miles.

The Moon is the quickest in its motion of all the Planets, making its revolution in 27 days, seven hours, and three quarters. The light which this Planet affords us at night is not the only benefit we receive from it; for it governs the waters, and occasions the tides, which are of infinite benefit to mankind.

> " The Moon, as day-light fades, " Lifts her broad circle in the deep'ning shades:

"Array'd in glory, and enthron'd in light,
"She breaks the folemn terrors of the night:

" Sweetly inconstant in her varying flame,

"She changes still, another, yet the same:
Now, in decrease, by slow degrees the throuds

" Her fading luftres in a vale of clouds:

" Now, at increase, her gath'ring beams display

" A blaze of light, and give a paler day.

Ten thousand stars adorn her glitt'ring train, " Fall when the falls, and rife with her again;

44 And o'er the deferts of the fky unfold

"Their burning spangles of sidereal gold.
"Thro' the wide heav'ns she moves serenely bright,

" Queen of the gay attendants of the night.

" Orb above orb in fweet confusion lies,

" And with a bright diforder paints the fkies."

FIXED STARS.

THE difference, with regard to vision, between the fixed Stars and Planets is, that the latter have a more placid luftre than the former. The fixed Stars have the fource of light within themselves, being Suns; but the Planets are composed of opake matter, and have no light but what they receive from the Sun, or their own Satellites. Hence, though the fixed flars are at an immense distance, their brightness exceeds that of the Planets, and they are to be diffinguished by their twinkling; though Venus and Mercury both twinkle, but not in so great a degree as the fixed Stars.

Beyond the atmosphere of our System the heavens are filled with a fluid much more rarified than our air, and here the fixed Stars are placed at different, but immense, distances from us, and very great distances from each other. "W the fixed Sta conceive fro to the leaft, the others; naked eye; a fome idea of

THERE twelve hour an hour; a lage, is in, duct will be

IN the grand poin are confine provinces, eafterly, o

The inv that ever b of another inhabitant

The F statute m

other. "We must have a vast idea of this space, (says an accurate writer,) when we consider that the largest of the fixed Stars, which are probably the nearest to us, are at a distance too great for the expression of all that we can conceive from figures, and for all means of admeasurement. The small of are, doubtless, more and more remote, to the least, which are of the fixth magnitude. These must be in a part of the beavens more remote from us than the others; and yet beyond these telescopes discover to us more Stars, too distant to be at all perceptible to the naked eye; and in proportion to the power of these instruments, more or less we discover." Hence we may obtain some idea of the infinite wisdom and power of the Great Creator of the Universe;

- " Who fpread the pure cerulean fields on high,
- " And arch'd the chambers of the vaulted fky;
- "Which he, to fuit their glory with their height,
- " Adorn'd with globes that reel, as drunk, with light.
- " His hand directed all the timeful fpheres;
- " He turn'd their orbs, and polith'd all the Stars."

OF THE CLIMATES.

THERE are 24 Climates on each fide the equator; and under the equator the longest day is no more than twelve hours; and in proportion as we advance towards the Polar Circle, the days increase in every Climate half an hour; and at the Polar Circles the longest day is 24 hours. To know what Climate any city, town, or village, is in, observe the longest day, from which deduct 12, and multiply the remainder by two, when the product will be the number of the Climate.

EXAMPLE.

The longest day in	London is —	ours.
	From which deduct	12
		4
	Multiply the remainder by	2
The product is the	Climate of London —	8

Like feafons, climes must differ ev'ry where; But man is fitted ev'ry clime to bear.

OF THE COMPASS.

IN the Compass there are four Cardinal Points, viz. East, West, North, and South. Between these four grand points many intermediate points are formed; but these, for the purposes of Geography and Navigation, are confined to 32. As all these respect the position of places, we find by them how empires, kingdoms, states, provinces, districts, &c. are situated with regard to each other; that is, whether they lie northerly, southerly, easterly, or westerly, or agreeable to any of the inferior or intermediate points.

The invention of the Mariner's Compats has been, perhaps, of as great and general utility as any discovery that ever benefited mankind, as, by its means, the wants of one country are accommodated with the superfluities of another; the welfare of individuals, situated at a great distance, becomes interesting to each other; and the inhabitants of the whole universe are linked in one great society.

- " While the touch'd Needle trembles to the Pole,
- "The failor fleers wherever waves can roll,
- " Loft to the fight of earth, and light of day,
- " Thro' boundless oceans he explores his way :
- " On the true Compass all his hopes depend,
- " His faithful guide, and his directing friend."

OF MAPS.

IN all Maps the north is at top, the fouth at bottom, the east on the right, and the west on the left; or, if it be otherwise, it is always expressed either by words on each side, or by a Mariner's Compass, wherein the mark of a fleur-de-lis always denotes the north.

Maps are laid down and proportioned to a certain scale, which is always taken from the degrees of Latitude.

The degrees of Latitude are always marked on the east and west side of the Map.

The degrees of Longitude are always marked on the north and south side of the Map.

A degree of Latitude is always of the same breadth: wherefore the distance of two places scated directly north and south, is immediately known by knowing the different Latitudes. But a degree of Longitude is of different

The Latitude and Longitude of a place being known, you may find it immediately in the Map, by drawing a line, or thread, cross the Map both ways; and where the two lines cut one another, the place stands.

The Earth being a Globe, a Map of the whole Earth must necessarily consist of two parts, both sides of the Globe not being visible at once. Accordingly, in a universal Map, the right hand circle shews the Old World, or Europe, Asia, and Africa; and the left hand circle shews the New World, or America.

Upon the general Map are marked the Circles correspondent to those in the Sphere, namely, the Equinoctial Line, the two Tropics, and the two Polar Circles, all which cross the Map from east to west; and the first Meridians surrounding the two Hemispheres from north to south, the Parallels lying from north to south at ten degrees diffance; and the Meridians at the same diffance from west to east, are also marked upon general Maps.

Particular Maps, being parts of this, retain the Meridians and Parallels belonging to that particular part, which are made fmaller or larger, as the paper on which it is drawn will admit; and the distance of places mentioned in it are always exactly proportioned to the breadth of the Parallels. So that let a Map be ever fo fmall, the distance of places is exactly shewn, if measured according to the degrees of Latitude in that particular

In both general and particular Maps, the thick shadowing denotes the Sea-coast. Rivers are marked by large shadowed serpentine lines; Roads by double lines; divisions of Countries by dotted lines; harger for Provinces, and smaller for Subdivisions; and divisions of Nations are often shewn by chain lines. Forests are represented by trees; Mountains by rising shadows; Sands by dotted beds; Marshes by shadowed beds; Lakes by shadowed coasts.

The names of Provinces are written in larger capitals; and fmaller Divisions in smaller capitals; great Cities

in round Roman characters; fmaller Towns in Italic.

The exact fituation of a Town is flewn by a little round o; but larger places have the addition of a church for a Market-Town, if the fize of the Map-will admit. A city is noted by a church with houses about it, as much as the scale will allow. Particular qualifications of Cities are distinguished by marks, as a Bishopric has a cross, or fometimes a mitre over it.

An Archbishopric has a double cross over it. An University has a star, or sometimes a Coduceus. An Abbey is shewn by a crook, or pastoral staff. A Fortress by angles like bassions.

A Caftle by a little flag.

A Gentleman's Seat by a house only.

Other marks are affected by particular engravers, which they explain in the margin.

OF THE EARTH ABSTRACTEDLY CONSIDERED.

THE first thing that presents itself to our view is that huge massly substance the Globe of the Earth, confifting of many folid materials, as well as great quantities of falt and fresh water; for which reason the philo-fophers commonly call it the Terraqueous Globe. And though the folid matter may, perhaps, be more than the fluid, yet the water takes up much the greater part of the turface of the Globe, as is plain to any one who looks upon a Map of the Earth: for, befide the rivers and lakes, pools and fountains, which water the Earth in various places, the ocean, and its particular feas, are much more extended than the dry land; which, doubtless, was ordered by the Maker of all Things, for the good of mankind; there being such great occasion for water to moisten the Earth, supply us with fish, and facilitate commerce and navigation.

But referring to another place what we shall say about the waters, if we consider the Earth properly so called, we shall find it to be a heap of various bodies; for therein are discovered fand, clay, mould of various colours, feveral forts of ftones, many falts, fulphur, bitumen, minerals, and metals, without number. Nor is it necesfary to dig to the center of the earth, whither human industry can never penetrate, for the discovery of these things; they are fometimes met with, in great abundance, not many feet deep. But in the mines of Hungary

and Peru, which are faid to be deeper than ordinary, great flore of fuch things appear.

The ancient philosophers (and schoolmen, who followed their opinion, and maintained that the Earth is one of those four Elements whereof all things consist) observing such a medley of things to lie under the surface of the Earth, faid this was not the pure Element they meant, but that it was formewhere about the center; but fince no man can ever come at those parts near the center of the Earth, this conjecture of theirs is useless.

If Des Cartes's hypothesis were but well grounded, that the Planets were once of the like mature with the fixed Stars, confitting of a firy fubstance, and came afterwards to be crusted over with thick and folid matter, there might be still, at this day, a great fire in the center of the Earth, as some people imagine. But since the grounds on which he supposed the Planets to be derived, may be reckoned among those things which are every way doubtful, and only feem not impossible, though, perhaps, as far from being true as real impossibilities,

it is a rathness in his followers to take this imaginary fire at the center of the Earth for a certain truth. If those parts which now make up the Earth were once loose, and carried round the same center in a circular motion, we could then gather, from most certain experiments, that the groffest of all the parts fell down to the center of the Earth. Now, fince we know nothing heavier than metals, it would not be abfurd to suppose, that the inmost bowels of the Earth were filled with a prodigious store of various metals; and this being prefumed, our opinion w Earth is of the the Earth, the hold a firy cer error, it is mu

However, there be no c found on the could go fom

our opinion would receive confirmation from magnetic experiments, by which it generally appears, that the Earth is of the nature of a great loadstone. Therefore we might, with great reason, suspect, that at the heart of the Earth, there are iron and loadstone in great abundance, which would be just contrary to their opinion who r, if it hold a firy center. But this our hypothesis is built upon no certain reason, and therefore, for the avoiding of error, it is much the fafest way to suspend our affent in this case.

However, this is observable, that the deeper we dig into the ground, the heavier the matter is; and though there be no coming near the center of the Earth, yet such metals are dug out of the deepest mines as are rarely found on the surface; and if, instead of digging mines a mile and a half deep, which is hardly ever done, we could go fome miles downward, perhaps the matter would still be closer and heavier.

But be this as it will, thus much we are fure of, as to the parts about the furface of the Earth, that they are under a continual change and alteration, which may proceed from various causes. Among those causes we will not reckon human labours; but this we see, that the hardest bodies in the world, the very adamant itself not excepted, being exposed to the open air, do wear and waste in time, and undergo various alterations without the hand of man; and, therefore, the whole furface of the Earth, whereon the air perpetually preffes, must needs be subject to such alterations.

Befide the perpetual change of feafons, heat and cold, rain and wind, earthquakes and running waters, are always making a wonderful change in that part of the Earth which is next the furface: and if we take in the daily mutations of innumerable animals and plants, which are fed by the fruits and moifture of the Earth, and after a short time, putrify and return to Earth again, we shall have reason to believe, that this surface on which we tread, especially in countries that have been long inhabited, is, for the most part, composed of the bodies of men and

especially in countries that have been long inhabited, is, for the most part, composed of the bodies of men and beafts, or rather of a matter which is every day putting an new forms.

And by such perpetual variations of matter, there must needs happen an increase of dry Earth, and a decay of moisture; for it does not appear that this parts of fluid bodies, which have been once blended with folids, and have been so impregnated with falts as to lose their fluidity, do ever retrieve it again. This is evident in plants and animals, which grow bigger so long as they receive spirit and nourishment from liquors, but afterwards turn to corruption. Some conclude from hence, that, it order to prevent too great a decay, or total failure of moisture in the Planets, God created Comets; that so their sumes, diffusing themselves through the vortex of the Sun, might stall into the latter vortices of the Planets, and augment their liquids.

Moreover, there must needs be a vast change made in the Earth by means of the many fires which prey upon it within.

it within.

Philosophers fometimes consider the Earth as a huge loadstone, which, when we come to speak of the loadstone, we shall have an opportunity to enlarge upon. Meanwhile we may here observe, that, in this respect also the Earth is much altered, as appears from the variations of the Magnetic Needle, which sometimes points directly at the Pole, and fometimes declines feveral degrees east or west. But this cannot happen without an alteration in the pores of that magnetic matter which slows out of the Earth, and which seems to come at one time directly from the Pole, and at another time from those parts which are on the right or left side of the Pole. And whether this variation proceeds from the fires under ground, which may fpoil here and there a mine of load-ftone, (yet so as that it may afterwards recover its virtue again,) or whether it be from some other cause, is what no man certainly knows.

GEOGRAPHICAL PROBLEMS.

PROBLEM I.

The Latitude of any Place being given, to restify the Globe for that Place.

LET it be required to rectify the Globe for the Latitude of London, 51 deg. 32 min. north; and Madrid. 40 deg. 10 min. north, proceed thus:

Turn the Pole, on which the dial-plate is fixed, towards the verge of the Horizon, flipping or moving the Globe backwards or forwards in the notches of the Horizon, till the Horizon cuts the brazen Meridian in 52 deg. 32 min. (viz. a little more than 51 and a half); fo is the Globe rectified for the Latitude of London; that is, the North Pole will then be elevated 51 deg. 32 min. above the Horizon; and London being brought to the Meridian itself, will then be in Zenith, or right up, and at equal distance from all parts of the

Depress the Pole till the Horizon cuts the brazen Meridian at 40 deg. 10 min. and you have then the position of the inhabitants at Madrid; and turning the Globe till Madrid comes to the Meridian, you will find it in the Zenith, or top of the Globe, under 40 deg. 10 min.

Note. If it were required to rectify the Globe for South Latitude, then you must elevate the South Bole to the given Latitude, instead of the North Pole; but this is better explained by the next Problem.

PROBLEM II.

The Latitude and Longitude of any Place given, to find the same.

First, You are to observe whether the Longitude be reckoned from Longitude, or from the first Meridian; for on some Globes the first Meridian begins 23 deg. on others 20 deg. and on Senex's Globes 18 deg. west of London; but if once you know where the first Meridian is on the Globe, it is very easy to know the difference from the Meridian in London.

EXAMPLE.

There are two certain places; one has 18 deg. North Latitude, and 77 deg. 5 min. West Longitude; the other is 33 deg. 45 min. South Latitude, and 18 deg. East Longitude from London; I demand what Places

Rule. For the first Place, I elevate to the North Pole 18 deg. because it is 18 deg. North Latitude: then I turn the Globe to the right hand, or eastward, (because the place lies westward,) till 77 deg. 5 min. on the Equator, counted from the Meridian of London, (which on Senex's Globe has a cypher thus (0) on the Equator,) passes through or under the Meridian: or, in other words, I turn the Globe till 77 deg. 5 min. westward, be brought under the

mark

7 north ifferent

of the World.

in a cir-I down to fuppofe, prefumed.

our

Meridian, and here I fix the Globe with a quill thrust in betwixt the Globe and the Horizon; then I look under the Latitude 18 deg. (which is in the Zenith,) on the Meridian a-top of the Globe, and under 18 deg. on the

Meridian I find Port Royal, in Jamaica, the place required.

For the fecond Place I elevate the South Pole (though there is no occasion to elevate the Pole barely to find a place, but it is better, because you have then the real situation of the inhabitants) to the given Latitude 34 deg. 45 min. and then turn the Globe till 18 deg. East Longitude of London come under the Meridian; and just under this I find the Cape of Good Hope, the place required.

PROBLEM III.

The Latitude of any Place given, to tell all those Places that have the same Latitude.

DEFINITION.

All those places that have the same Latitude, have the days and nights of the same length, at the same time

of the year.

Rule. Bring the given place or places to the Meridian (suppose London 50 deg. 32 min. and Madrid 40 deg. 10 min. North); then turn the Globe; and all those places that pass under 50 deg. 32 min. have the same Latitude as London, viz. Prague, in Germany, &c. and all that pass under 40 deg. 10 min. have the same Latitude as Madrid, which you will find to be Pekin nearly for one, and many other places.

PROBLEM IV.

To tell the Difference of the Latitude of Piaces.

Here are two Variations or Rules.

First. 1 the Latitudes be both North or both South, then substract the less from the greater Latitude, and the remainder is the difference, or answer. Thus between London and Madrid is 12 deg. 32 min. the first being 50 deg. 32 min. and the other 40 deg. And between Candy and S ockholm is 52 deg. 30 min. for Stockholm is about 59 deg. 30 min. North, and Candy 7 deg. 30 min. North.

Secondly. It one lies on the North, and the other on the South fide of the Equator. (that is to fay, if one be North, and the other South Latitude,) then add them together, and their turn is the difference of the Latitude

required.

Thus Copenhagen is 55 deg. 40 min. North, and the Island of Madagascar is 19 deg. 30 min. South: these added together make 75 deg. 10 min. the difference of Latitude required.

PROBLEM V.

The Longitude of any Place given from any Meridian, to tell those Places having the same Latitude.

This is done after the fame manner as the other; only here the answer will be on the Equator, as the others

I would know what places have the fame Longitude as London, and the fame Longitude as Mofcow.

The Rule is, bring London to the Meridian, then all those places on the Globe (from the North Pole to the South part of the Horizon) that lie under the edge of the Meridian, have the same Longitude as London: thus Fort Naffau, and Fort Mina, in Guinea, have the fame, or very nearly the fame Longitude as

And Moscow, in Muscovia, has very nearly the same Longitude as Aleppo, in Syria: also Scandaroon, Antioch, and Tripoli, in Syria, have the same Longitude, viz. 37 deg. 30 min. from London.

PROBLEM VI.

To tell the Difference of Longitude of Places.

Rule. Here are two Variations.

First. If the places lie both East or both West of the first Meridian, or where you reckon the Longitude from, viz. if they both be East, or both be West Longitude, then substract one from the other, and you have

Thus I find Jerusalem has 36 deg. 15 min. East Longitude from London, and Pekin 110 deg. 52 min. East Longitude; therefore substract 36 deg. 15 min. from 110 deg. 52 min. and there remains 74 deg. 37 min. difference of Longitude East or West; that is, Pekin is 74 deg. 37 min. East Longitude of Jerusalem, or Jerusalem, falem is 74 deg. 37 min. West Longitude of Pekin.

If one place be East, and the other West Longitude, of the first Meridian (suppose London, or Secondly. any other Meridian) then add their Longitudes together, and the fum is the difference of Longitude required.

EXAMPLE I.

I would know the difference of the Longitude between Jerusalem, 36 deg. 15 min. East of London, and Port Royal, in Jamaica, 77 deg. 5 min. West.

Here, as one is East, and the other West, I add 36 deg. 15 min. and 77 deg. 5 min. together, and their sum of the state makes 113 deg. 20 min. difference of Longitude; that is, Jerufalem is 113 deg. 20 min. East of Port Royal or Port Royal is 113 deg. 20 min. West of Jerusalem.

EXAMPLE II.

Pekin, in China, is 110 deg. 15 min. East Longitude, and Port Royal 77 deg. 5 min. West; I add their fum together, and find it 187 deg. 20 min. difference of Longitude; but because it is more than 180 deg. substract 187 deg. 20 min. from 360 deg. and there remains 172 deg. 40 min. the difference required.

PROBLEM VII.

The Day of the Month given to find the Sun's Place in the Ecliptic.

Rule. The day of the month being given, look on the inner Calendar on the new Globes, and you have the fign and the degree of that fign that the Sun is in for that day, according to the New Style.

If it be upon old Globes, look on the outer Calendar, you have the fign, and degree of the fign.

N.B. You may further observe, that the Calendar used throughout Europe is the Calendar for New Style, viz. New Style is always known from the other, because it has the Saints Days, and several other things, wrote on the Horizon.

EXAMPLE.

I would know the Sun's place in the Ecliptic on May 21, New Style; March 21, June 21, September 22, and December 21.

I look for these days of the months in order as they stand in the new Calendar, (viz. for New Style before described,) and right against the day of the month in the innermost Circle, on the Horizon, I find the Sun's place among the figns, as follows:

Thus, right against May 21 I find one deg. of Gemini: and also on March 21 I find he enters Aries: on June 21 he enters Cancer: on September 22 he enters Libra: and on December 21 he enters Capricorn.

PROBLEM VIII.

The Sun's Place given, to find the Day of the Month.

This is only the reverse of the former Problem: for having the Sun's place given, seek it in the Circles among the signs; then against that degree in the Calendar, New Style, you have the day of the month required.

EXAMPLE.

I would know what time of the year the Sun is in 1 deg. of Gemini. as also when he enters Aries, Cancer, Libra and Capricorn? Proceed according to the rule, and you will find the days to be May the 21st, June the 21st, September the 22d, and December the 21st, as in the last.

PROBLEM IX

The Latitude and Day of the Month given, to find the Sun's Place in the Ecliptic, and restify the Globes for use.

Rule. Find the Sun's place on the Horizon by Problem the Seventh; and having noted what degree he is in, look upon the Ecliptic on the Globe, and find the fame fign and degree as you did on the Horizon; then bring this degree of the Ecliptic very carefully to the graduate edge of the brazen Meridian, and holding the Globe fleady, turn the Index exactly to the upper twelve, (which represents twelve at noon); and thus is the Globe rectified for that day; and the degree of the Ecliptic that lies under the Equator represents the Sun's place at noon, or twelve o'clock that day.

* The Astronomer's day is reckoned from, or begins at, twelve o'clock; and if you fix the Quadrant of Altitude to the Latitude in the Zenith, the Globe will be completely rectified.

PROBLEM X.

To tell the Declination of the Sun on any Day of the Year.

Rule. Having found the Sun's place in the Ecliptic for the given day, bring it to the brazen Meridian, and observe what degree of the Meridian it lies under, and whether it be on the North or on the South side of the Equator, for that is the declination required, which is called North or South declination accordingly. Thus, on April 21ft the Sun has 11 deg. 30 min. North declination; and on May the 21ft he has 20 deg. 30 min. declination; but on October the 27th he has 12 deg. 30 min. South declination.

PROBLEM XI.

The Latitude and Day of the Month given, to tell the Sun's Meridian Altitude, viz. his Height at Noon.

Rule. Bring the Sun's place to the Meridian, and observe what degree of the Meridian the Sun's place is under; for those degrees on the Meridian that are intercepted, or lie between the South Verge of the Horizon, and the degree which is over the Sun's place on the Meridian, (counted on the Meridian,) is the Sun's Meridian

Thus, I find his Meridian Altitude in London, May the 21st, to be 59 deg. but on November the 5th he has but 23 deg. 30 min. Altitude.

PROBLEM XII.

The Latitude and Day of the Mouth given, to tell the Sun's Altitude at any Time.

On May the 21st, at nine in the morning, and at five in the afternoon, at London, I would know Example. On May the 211 the Sun's Altitude or height?

Rule. Rectify the Globe for the Latitude, and bring the Sun's place (1 deg. Gemini) to the Meridian, and the Index to the upper twelve on the Dial-plate; then forew the Quadrant of altitude on the Zenith, (viz. the left edge of the Nut must be fixed on the Meridian, at 51 deg. 30 min.) then turn the Globe till the Index points to the hour, viz. nine in the morning: this done, fix the Globe by thrusting a quill between it and the Horizon: laftly, turn the Quadrant about till the graduated or figured edge touch the Sun's place, (viz. 1 deg. Gemini,) and the degrees on the Quadrant, counted from the Horizon upwards on the Quadrant, is his height at that time, viz. 43 deg. 30 min. Then turn the Globe till the Index points at five in the afternoon; and also turn the Quadrant on the West-side (without unscrewing it) till it touches the Sun's place, and you have about 24 deg on the Quadrant, his Altitude at that time.

N.B. At North Cape, (viz. North Latitude, 72 deg. at nine in the morrning,) May the 21st, he will be but about 32 deg. high. No. 89

PROBLEM

PROBLEM XIII.

The Latitude given, to tell the Rifing and Setting of the Sun, and Length of the Day and Night, at any Time of the Year in any Place.

Rule. Rectify the Globe, (viz. elevate it for the Latitude; bring the Sun's place to the Meridian, and Index to the upper twelve); then turn it till the Sun's place comes even with, or lies right against, the inner Verge, on the East-side of the Horizon, then the Index will shew you the time of the Sun's rising; turn it to the West-side, or Verge of the Horizon, and the Index will shew you the setting. Or thus; having got the hour the Sun rises, count how many it wants of twelve, for so many hours will it set after. Thus, if the Index points to four in the morning at rising, it will of course be at eight at night, &c.

Proceed thus, and you will find the Sun, on May the 26th, at London, to rife about four in the morning, and fets at eight at night. Now double what he wants of twelve at rifing, viz. eight hours, and it gives the length of

that day in London, viz. fixteen hours.

PROBLEM XIV.

To tell the Sun's right Ascension.

Bring the Sun's place to the brazen Meridian, and note what degree of the Equator is cut by the Meridian, for that is his right Ascension required.

I would know the Sun's right Ascension on March the 21st, June the 21st, September the 22d, and December

the 21ft?

I find the Sun's place for these different days, and bring it to the Meridian; I find the Meridian cuts the Equa-

tor in (0), in (90), in (180), and in (270 deg.) his right Ascension required.

Note. When the Sun enters Aries, March the 21st, he has no right Ascension, because it is counted from, or begins at, Aries; therefore, on March the 20th, he must have his greatest right Ascension, viz. 359 deg.

PROBLEM XV.

To find the Sun's oblique Ascention and Descension at any Time, and in any Latitude.

Rule. Rectify the Globe for the Latitude, and bring the Sun's place down to the eaftern Verge of the Horizon; then observe what degree the Horizon cuts the Equator in, for that is the oblique Ascension required.

required.

Thus, on March the 21st, June the 21st, September the 22d, and December the 21st, viz. when the Sun enters Aries, Cancer, Libra, and Capricorn, you will find his oblique Ascension at London to be (0,) (56),

(180), and (304).

And on the same days his oblique Descension will be (0). (123,) (180), and (237 and a half.)

PROBLEM XVI.

The Latitude and Day of the Month given, to tell the Sun's afcensional Difference, viz. how much be rifes, or sets before and after Sin; and consequently to tell the Length of the Days, suppose there were no Index to the Globe.

Rule. By the last Problem find the Sun's right and oblique Ascension; then subtract the oblique from the right Ascension, or the contrary, and the remainder is the ascensional difference required; which divided by sisteen, the degrees of the Equator that pass through the Meridian of one hour, (or seven and a half for half an hour,) gives the answer in time, that the Sun rises and sets before and after six.

Thus, on May the 26th I find the Sun 6 deg. of Gemini, and his right Ascension is 64 deg. and on the same day, his oblique ascension is 34 deg. now 34 deg. from 64 deg. there remains 30 deg. his ascensional difference;

which, divided by 15, gives two hours, the time that he rifes before, or fets after fix.

PROBLEM XVII.

The Latitude and Day of the Month given, to tell the Sun's Amplitude, viz. his Distance from the East and West Points of the Compass he rises and sets upon.

Rule: The Globe being rectified, bring the Sun's place to the eaftern Verge of the Horizon, (which shews its rising,) then the degree upon the innermost Circle of the Horizon, counted from the true East Point to the place

where the Sun's place lies against on the Horizon, shews you the Sun's Amplitude.

Proceed according to the rule, you will find the Sun's Amplitude at London, (May the 21st,) at rifing, to be about 34 deg. from the East to the North, and at setting, 34 deg. from the West to the North; and the Point he rises upon is North-East by East, and he sets North-West by West; but on November the 5th he has about 25 deg. and a half Amplitude from the East to the South, and at setting 25 deg. and a half from the West to the South. The Point he rises upon is East-South-East, and the Point he sets upon is West-South-West.

PROBLEM XVIII.

The Latitude and Day given, to tell the Sun's Azimuth, viz. his Distance from the East and West, or from the North and South Points, at any Time.

Rule. Rectify the Globe in general, then turn the Globe till the Index points to the given hour: this being done, turn the Quadrant till it touches the Sun's place for the given day; and then the Quadrant will cut the Horizon in the Azimuth required, from the Eaft or Weft Points, or from the North or South Points; for you may reckon from either, only then name it properly, and accordingly.

reckon from either, only then name it properly, and accordingly.

Thus, on August the 17th, at nine in the morning, the Sun will have about 30 deg. Azimuth, from the East to the South, or, which is the same, 60 deg. from South to the East: for 60 deg. and 30 deg. make 90 deg. the

whole quarter from East to South.

PROBLEM XIX.

The Latitude, Day, and Hour given, to tell the Sun's Almicanter.

DEFINITION.

Almicanters are Circles of Altitude, that run parallel to the Horizon, whose Poles are the Zenith and Nadir; fo that you may imagine as many Circles of Altitude, viz. Almicanters, as you pleafe,

Rule. The Almicanter is found the same as the Altitude of the Sun at any time, therefore I refer you back to Problem 13.

PROBLEM XX.

The Latitude and Length of the Day given, to tell what other Day of the Year will be of the same Length.

Rule. Having found the Sun's place for the given day, bring it to the Meridian, and observe well its declination; then turn the Globe till some other degree of the Ecliptic comes under the same degree of declination under the Meridian; this being done, see what day of the Month answers to the Sun's place then under the Meridian, for that is the day required; which you may eafily prove. Thus, you will find July the 13th, and August the 20th, of the same length as May the 26th, and April the 17th.

PROBLEM XXI.

The Latitude and Day given, to tell the Beginning, Ending, and (confequently) the Length, or Continuance, of Twilight.

DEFINITION.

Twilight is that faint light which begins immediately after the Sun fets in the evening, till he is 18 deg. below the Horizon; and it begins in the morning, when the Sun comes within 18 deg. of the Horizon on the Eaft-fide, and ends when he rifes. Therefore it is plain, that Twilight is not only longer when days increase in length, but it is also much stronger, as will be seen by the work of the Problem.

OBSERVATION.

Note. You were told that Twilight begins and ends when the Sun is 18 deg. below the Horizon; and as the

Quadrant of Altitude reaches no lower than the Horizon, therefore the rule is this:

Rectify the Globe, and bring the opposite degree of the Sun's place to the Quadrant of Altitude, so that it touches just 18 deg. on the Quadrant, (then it is plain that the Sun's real place will be depressed 18 deg. below the Horizon); then look at the Index, for that will point (if among the morning hours) to the beginning, or (if among the evening hours) ending of Twilight.

Proceed then according to the rule, and you will find that on March the 21st, and September the 22d, Twi-

light begins about four in the morning, and ends about eight at night.

The Sun on these days, you know, rises and sets at six. Add, therefore, the length of morning and evening Twilight to twelve hours, (the length of the day then,) and it gives sixteen hours; this, subtracted from twenty-four hours, leaves eight hours, the length of the real or dark night.

So also on April the 24th, Twilight begins about half past two, ends about half past nine, which is in all seven hours. But on December the 20th it begins at fix, and ends at fix, which is in all but three hours and forty minutes.

PROBLEM XXII.

The Hour given where you are, to tell what Hour it is in any other Part of the World.

Rule. Bring the given place to the Meridian, and let the Index at the given hour; then turn the Globe till the other place, or places, come under the Meridian, and the Index will point to the real time in the place required. When it is two o'clock in the afternoon at London, I would know the time at Jerusalem, and at Port-Royal in Jamaica?

Proceed according to the rule, and you will find that when it is two in the afternoon at London, it is twenty-

five minutes past four at Jerusalem; and but fifty-two minutes past eight in the morning at Port-Royal.

Or thus, by Problem the Sixth, Jerusalem is 36 deg. 15 min. East Longitude of London; I divide, therefore 36 deg. 15 min. by fifteen, and the Quotient is two hours, and the remainder is fix, which is fix times, or twenty-tour minutes, and the odd fifteen minutes, or miles, in one minute; fo that the difference is two-hours, twentyfive minutes; and as Jerusalem is East of London, it has its hour before us; therefore it is twenty five minutes afterfour in the afternoon. And thus for other places.

PROBLEM XXIII.

The Day of the Month given, to tell those Inhabitants that will have the Sun in their Zenith (or over their Head)

This cannot happen to any other inhabitants but those in the Torrid Zones; that is, to all such as have not above 23 deg, and a half of Latitude, either North or South.

Rule. Bring the Sun's place to the Meridian, and observe exactly his declination for that day; then t unthe Globe any way, and observe what places pass under that degreee of declination on the Meridian; for all such will have the Sun right over their heads, fome time or other on that day.

I would know what inhabitants, or places, will have the Sun in their Zenith on May the 21st?

Proceed as directed by the rule, you will find St. Jago, in Hitpaniola; St. Jago, in Cuba; Campeachy, and many other places, will pass under that degree of declination, viz. (20 deg. North,) and will have the Sun in their Zenith that day.

Alfo, on April the 16th, the inhabitants of Porto-Bello, the Oroonoko-Islands, Bay of Siam, Isle of Ceylon, and the Philippine-Islands, will have the Sun in, or near, their Zenith, on that day.

PROBLEM XXIV.

The Day and Hour given in any Place, to tell those Inhabitants, or that Place, to which the Sun is then vertical, viz. in the Zenith.

Rule. Bring the given place to the brazen Meridian, and turn the Index to the given hour; this done, turn the Globe till the Index points to the upper 12, or noon; then look under the degree of declination on the Globe of that day, for that is the very spot, or place, to which the Sun is then vertical. OBLEM

Example. On May the 13th, at eight minutes past five in the afternoon at London, I would know what place

has the Sun in their Zenith? Answer, Port-Royal, in Jamaica.

Thus also you will find, when it is thirty-three minutes past six in the morning at London, on April the 12th, and August the 28th, the inhabitants of Candy, in the Island of Ceylon, will have the Sun then nearly in their Zenith.

OF THE MAGNET, OR LOADSTONE.

WE shall not enquire when the Loadstone was first known, our present business being only to give the Natural History of it. First, then, we will observe its various properties which experience has made known; and, in the next place, propose the opinions of philosophers concerning its internal nature and

The Loadstone is found in iron-mines, and is much of a colour and weight with iron. However, it is not to be melted and hammered out like iron, but flies to pieces under the hammer, and turns to a calx in the fire; which shews that its parts exceed those of iron for hardness, rigidness, and an intricate combination one with an-

other. This is worth observing, because it will be of use in the following discourse:

Its known properties are these: First, when it moves freely, and without any obstacle, it points North and South, fo as that part of it which stands to one Pole, never turns to the other. The way to give it a free motion,

is to fwim it in the water upon a piece of wood.

Philosophers have observed, that the Loadstone does not always point full North and South; but sometimes

inclines to the East or West without any rule.

Two Loadstones placed at a certain distance from each other, do mutually approach or recede, according to their various positions. Their parts which stand North, being opposed, go off to a distance from each other; but the South-end of the one draws to the North-end of the other; and so vice versa. These parts of the Loadstones we call their Poles; and, for a reason which will appear hereafter, we shall call that the South-Pole which turns to the North, and that the North-Pole which points to the South.

Two Loadstones will hold up one another in the air by turns, if the North-Pole of the one be put to the South-Pole of the other; and vice verfa. Sometimes a lighter Loadstone will hold up a heavier, when the heavier will

not hold up a lighter.

It is observable that all Loadstones are not equally brisk and nimble in turning to the Poles of the World; nor is their attracting virtue all alike.

Though a Loadstone generally has two Poles, pointing North and South, as we said before, yet there are some

irregular ones, which feem to have more Poles.

As one Loadstone holds up another, so it does iron, of greater or less weight than itself.

If iron-duft be flrewed upon a Loadstone, the particles will dispose themselves directly between the Poles, and then by degrees incline to an orbicular figure, so as to lie parallel with the axis of the Loadstone, unless it be one of the irregular forts before-mentioned.

The Loadstone imparts its virtues to iron so effectually, that iron, touched with a Loadstone, appears to have all the properties aforesaid, though not in an equal degree. The great use of this communication is experienced in the Mariner's Needle, by the help whereof they readily find the North and South, and all other parts of the world.

It is observable that, on this side the Equator, the North-Point of the Needle is more depressed than that which ftands to the South; on the further fide the North-Point is elevated, and the South depreffed; but under the Line it keeps no fituation, nor is of any use.

As the Loadstone communicates its virtue to iron, so when it is set in iron, it attracts a greater weight of it

than it does by itfelf.

Loadstones are spoiled if they lie long near one another, with the North or South Pole of one opposed to the fame Pole of the other; or if they are thoroughly heated in the fire, which likewife spoils the magnetic virtue in iron: and this virtue is much impaired in iron by its ruft, to which the Loadstone is not so liable

Laftly, iron placed at length North and South, and continuing to for a long time without alteration, has often

acquired a magnetic virtue: as the old croffes upon churches are found to do.

OF THE SEA.

AFTER fountains and rivers, it is now proper to view the common receptacle of them all, the Sea, which is that vast quantity of salt water extending from North to South, and from West to East, surrounding the dry land on every fide, into which all ftreams discharge themselves, and out of which mighty gulphs and bays are formed, the greatest of which is the Mediterranean. The whole is, in one word, called the Ocean, but variously distinguished and named, from the several countries by whose coasts it runs. In it there are these three properties chiefly confidered by Naturalists: First, its inseparable faltness; secondly, its constant equality of bulk, not-wishstanding the incessant flowing of all rivers into it; and Thirdly, the tide or flowing and ebbing of its waters twice every day: all which properties we shall consider.

The faltness of the sea-water seems to proceed from the same cause as that of several fountains, by the boiling of which water falt is produced: for fince the bottom of the Sea is of such vast extent, it is reasonable to think that there are large mines of falt in many places of it, which being diluted, foread throughout the Sea. And there is fomething even in the river-water which helps to increase this faltness; for the rivers carry down with them an incredible multitude of faline particles, which they wash off their banks as they run along. These particles are not, indeed, so considerable as to falt their particular streams; but when they all meet together, and fettle in one bottom, they may well be allowed to change the tafte of the water

Hence we may likewife be fatisfied why the faltness of the Sea is neither augmented or diminished, at least in a fenfible manner. It is not augmented by the influence of falt particles. 1. Because a world of faline particles are continually thrown off upon the flore, where they putrify, and come no more into the water. 2. Because people make salt upon the Sea-coast for common uses. 3. Water can be impregnated with salt only to a certain degree, at which it stands, and rejects the overplus. 4. In the last place, the saltness of the Sea is not di-

minished, because as much is imported or diluted from its own mines, as is got out of it.

To help us in finding out the reason why the water of the Sea is not augmented, let us see whether there be not a way for its daily diminution, as well as increase. It is sufficiently plain that there is a vast quantity of vapours in the air, from the abundance of snow and rain, which are formed of condensed vapours: but how to estimate the quantity of t happily atter

be not a pours in nate the quantity

quantity of the evaporations of water by some certain rule, is the material point; which the learned Dr. Halley has

happily attempted in the following manner:

He took a pan of water about four inches deep, and about eight inches diameter, falted to the same degree as is the common Sea water, by the solution of about a fortieth part of salt, in which he placed a thermometer, and, by means of a pan of coals, he brought the water to the fame degree of heat, which is observed to be that of our air in the hottest summer, the thermometer nicely shewing it. This done, he affixed the pan of water, with the thermometer in it, to one end of the beam of a pair of scales, and exactly counterpossed it with weights in the other scale; and, by the application or removal of the pan of coals, he found it very easy to maintain the water in the same degree of heat precisely. During this, he found the weight of the water sensibly to decrease; and, at the end of two hours, he observed that there wanted near half an ounce Troy, or 233 grains of water, which, in that time, had gone off in vapour, though he could hardly perceive it imoke, and the water not fensibly warm. This quantity, in io short a time, seemed very considerable, being little less than fix ounces in 24 hours, from so small a surface as a circle of eight inches diameter.

To reduce this experiment to an exact calculus, and determine the thickness of the skin of water that had so evaporated, he affumes the experiment alledged by Dr. Bernard to have been made in the Oxford Society, that the cube foot of English water weighs exactly 76 pounds Troy; this divided by 1728, the number of inches in a cube foot, will give 253 one-eighth grains, or half ounce, 13 one-third grains for the weight of a cube inch of water; wherefore the weight of 233 grains is about 35 parts of 38 of a cube inch of water, and shows that the thicknels of the water evaporated was the 53d part of an inch; but we will suppose it only the 50th part, for the fa-

cility of calculation.

If, therefore, water, as warm as the air in fummer, exhales the thickness of a 50th part of an inch in two hours from its whole surface, in 12 hours it will exhale the one-tenth of an inch; which quantity will be found abundantly sufficient to serve for all the rains, springs, and dews; and account for the Caspian Sea being always at a stand, neither wasting nor overslowing; as likewise for the current said to set always in at the Straits of Gibraltar, though those Mediterranean Seas receive so many and such considerable rivers.

To estimate the quantity of water arising in vapours our of the Sea, he thinks he ought to consider it only for the time the fun is up, for that the dews all night return as much, if not more, of the vapours than are exhaled; and in fummer the days being longer than 12 hours, this excess is balanced by the weaker action of the fun, especially when rifing before the water be warmed: fo that if we allow one-tenth of an inch of the furface of the Sea

to be raifed every day in vapour, it may not be an improbable conjecture.

Upon this supposition, every to square inches of the surface of the water yields in vapour daily a cube inch of water; and each fquare foot half a wine pint; every space of four feet square a gallon; a mile square 6914 tons;

and a square degree, suppose of 69 English miles, will evaporate 33 millions of tons.

And if the Mediterranean be estimated at 40 degrees long and four broad, allowances being made for the inequalities, there will be 160 square degrees of Sea; and, consequently, the whole Mediterranean must lose in vapour, in a summer's day, at least 5280 millions of tons. And this quantity of vapour, though very great, is as little as can be concluded from the experiment produced. And yet there remains another cause, which cannot be reduced to rule, namely the Winds, whereby the furface of the water is skimmed off sometimes faster than by the heat of the fun.

OF WINDS.

IT is well known that Wind is nothing else but the stream of the air, together with such vapours as the air carries along with it. But there are a great many properties of Winds, the reasons and grounds of which are not easily discovered. However, we will first consider the Winds in general, as they are constant and variable. Secondly, we will particularly examine their various appearances; and Laftly, fay fomething of their origin.

The Winds may be divided into conflant and variable: the former are always, at certain times of the year, and in certain parts of the world; but the latter vary fo much, that they cannot be reduced to any rule. Now fince it is easier to find out the cause of one regular effect, than of many irregular, let us, in the first place, treat of constant Winds. And here we must take notice, that the Winds are constant and periodical only in the open feas. Now the universal Ocean may most properly be divided into three parts. 1. The Atlantic and Ethiopic Oceans. 2. The Indian Ocean. 3. The great South-Sea, or Pacific Ocean; and though these seas do all communicate by the fouth, yet as to our present purpose of the periodical Winds, they are sufficiently separated by the interposition of great tracks of land; the first lying between Asrica and America; the second between

Africa and India; and the last between China and Japan, and the coast of America.

In the Atlantic and Ethiopic Seas, between the Tropics, there is a general easterly Wind all the year, excepting that it is subject to vary and desirect some sew points towards the north or south, according to the position the place. The observations which have been made of these desections are as follow: that near the coast of Africa, as foon as you pais the Canary Itles, you are fure to meet a fresh gale of north-east Wind, about the latitude of 28 degrees north, which feldom comes to the eaftward of eaft-north-eaft, or passes the north-north-eaft. This wind accompanies those bound to the fouthward, to the latitude of ten north, and about 100 leagues from the Guinea Coast, where, zill the fourth degree of north latitude, they fall into calms and tornadoes.

Those who are bound to the Caribbee lifes find, as they approach the American fide, that the aforefaid northeast Wind becomes still more and more casterly, so as sometimes to be east, sometimes east by south, but yet most commonly to the northward of the east, a point or two, not more. It is likewise observed, that the strength of thefe Winds gradually decreases as you tail westward.

The limits of the constant and variable Winds in this ocean, are farther extended on the American fide than the African: for whereas you meet not with this certain Wind till you have passed the latitude of 28 degrees on this fide on the American fide it commonly holds to 30, 31, or 32, degrees of latitude; and this is verified likewife to the fouthward of the Equator; for, near the Cape of Good Hope, the limits of the Trade Winds are three or

four degrees nearer the line, than on the coast of Brasil. From the latitude of four degrees north, to the aforefaid limits on the fouth of the Equator, the Winds are perpetually between the fouth and east, and most commonly between the fouth-east and east; observing always this rule, that, on the African fide, they are more foutherly, on the Brafilian more eafterly, to as to become almost due east, the little deslection they have being still the south. In this part of the ocean the Wind has been nicely observed, for a full year together, to keep constantly about the fouth-east, the most usual point fouth-east by east. When it is easterly it generally blows hard, with gloomy, dark, and sometimes rainy weather.

The season of the year has some small effect on these constant winds; for when the sun is to the north of the

Equator, the fouth-east Winds, especially between Brasil and the Coast of Guinea, vary a point or two to the No. 89.

fouth, and the north-east become more easterly; and on the contrary, when the Sun is towards the Tropic of Capricorn, the South-easterly Winds become more easterly, and the north-easterly Winds, on this side the Line,

vere more northward.

As there is no rule without some exception, so there is in this ocean a track of sea, wherein the southerly and south-west Winds are perpetual, and that is all along the coast of Guinea, for above 500 leagues together, from Sierra Leona to the Isle of St. Thomas; for the south-east Trade Wind having passed the Line, and approaching the coaft of Guinea within So or 100 leagues, inclines towards the shore, and becomes fouth fouth-east; and by degrees, as you came nearer, it veres about to fouth, fouth-fouth weft, and in with the land fouth-weft, and fometimes west-south-west, as is seen in the Map of the Trade Winds.

To the northward of the Line, between four and ten degrees of Latitude, and between the Meridians of Cape Verd, and of the easternmost islands that bear that name, there is a track of sea wherein it were improper to say there is any Trade Wind, or yet any variable; for it feems condemned to perpetual calms, attended with terrible thunder and lightning, and rains to frequent, that our navigators from thence call this part of the fea The Rains: the little Winds that are, confift only of some sudden uncertain gusts, of very little continuance, and less extent.

All who use the West-India trade, even those bound to Virginia, count it their best course to get as soon as they can to the fouth-ward, that they may be fure of a fair fresh gale to run before it to the westward; and for the fame reason, those homeward bound from America, endeavour to gain the latitude of 30 degrees as soon as posfible, where they first find the Winds to be variable; though the most ordinary Winds in the north part of the

Atlantic Ocean come from between the fouth and weft.

What is here faid is to be understood of the Sea Winds at some distance from land; for upon and near shore, the land and fea breezes are almost every where fensible; and the great variety which happens in their periods, force, and direction, from the situation of the mountains, valleys, and woods, and from the various texture of the foil, more or less capable of retaining and reflecting heat, and of exhaling or condensing vapours, is such, that it

were endless to endeavour to account for them,

In the Indian Ocean the Winds are partly general, as in the Ethiopic Ocean partly periodical; that is, half the year they blow, and the other half near upon the opposite points; and these points, and times of shifting, are different in different parts of this ocean, The limits of each track of fea, subject to the same change, or monfoon, (as the natives call it,) are certainly very hard to determine; but the diligence I have used (says Dr. Halley) to be rightly informed, and the care I have taken therein, has, in a great measure, surmounted that difficulty. I am perfuaded that the following particulars may be relied on:

That between the latitudes of 10 and 30 degrees fouth, between Madagascar and New-Holland, the general Trade Wind about the fouth-east-by-east is found to blow all the year long, to all intents and purposes, after the

fame manner as in the fame latitudes in the Ethiopic Ocean.

The aforefaid fouth-east Winds extend within two degrees of the Equator, during the months of June, July, and to November, at which time, between the fouth latitude of three and 10 degrees, being near the Meridian of the north end of Madagascar, and between two and 12 south latitude, being near Sumatra and Java, the contrary winds from the north-west, or between the north and west, set in and blow for half the year; that is, from the

beginning of December till May; and this monfoon is observed as far as the Molucca Isles.

To the northward of three degrees fouth latitude, over the whole Arabian or Indian Sea, and Gulph of Bengal, from Sumatra to the coast of Africa, there is another moniton blowing from October to April upon the north-east points; but in the other half year, from April to October, upon the opposite points of fouth-west and west-fouth-west, and that with rather more force than the other, accompanied with dark rainy weather; whereas the north-east blows clear. And the Winds are not so constant, either in strength or point, in the Gulph of Bengal, as they are in the Indian Sea, where a certain and fleady gale fearce ever fails. It is also remarkable, that the fouth-west Winds in these seas are generally more southerly on the African side, and more westerly on the

To the eaftward of Sumatra and Malacca, to the northward of the Line, and along the coast of Cambaya and China, the monfoons blow north and fouth; that is to fay, the north-east Winds are much northerly, and the fouth-west much foutherly. This constitution reaches to the eastward of the Philippine Isles, and as far north as Japan; the northern monicon fetting in here in October or November, and the fouthern in May, blowing all the fummer months. The points of the compafs, from whence the Wind comes in these parts of the world, are not fo fixed as in those lately described; for the southerly will often pass a point or two to the eastward of the fouth, and the northerly as much to the weilward of the north, which feems occasioned by the great quantity of land which is intersperfed in these feas.

In the fame Meridians, but fouthward of the Equator, being that track lying between Sumatra and Java to the west, and New-Guinea to the east, the same northerly monsoons are observed; but with this difference, that

the inclination of the northerly is towards the north-west, and of the foutherly towards the fouth-east.

Thefe contrary Winds do not shift' all at once, but in some places the time of the change is attended with calms, in others with variable Winds; and it is particularly remarkable, that the end of the westerly monsoon, on the coaft of Coromandel, and the two last months of the foutherly monfoon in the feas of China, are very subject to be tempeftuous: the violence of these storms is such, that they feem to be of the nature of the West-Indian hurricanes, and render the navigation of these parts very unsafe about that time of the year. These tempests are by our seamen usually termed, The breeking up of the Monfoons.

By reason of the thisting of these Winds, all those that fail in these seas are obliged to observe the seasons proper for their voyages; and by so doing, they fail not of a fair Wind, and speedy passage; but if they chance to outflay their time till the contrary monioon fets in, as it frequently happens, they are forced to give over hopes of accomplishing their intended voyage, and put into some other harbour, and there to remain till the Winds

come favourable.

The third Ocean, called the Great Pacific, whose extent is equal to that of the other two, (it being from the west coast of America to the Philippine Islands, not less than 150 degrees of longitude,) is that which is least known to all nations. The chief navigation is by the Spaniards, who go yearly from New-Spain to the Manillas by one beaten track; fo that we cannot be particular here, as in the other two. What the Spanith authors fay of the Winds they find in their courses, and what is confirmed by the old accounts of Drake and Cavendish, and fince by Schouten, is, that there is a great conformity between the Winds of this fea, and those of the Atlantic and Ethiopic; that to the northward of the Equator the predominant Wind is between the east and north-east; and to the fouthward thereof there is a constant steady gale between the east and south-east, and that on both sides the line with so much constancy, that they scarce ever need to attend the fails; and so much strength, that it is rare to fail of croffing this valt Ocean in 10 weeks time, which is about 150 British miles a day.

This is to be understood of the Pacific Sea at a great diffance from land; for about the shores are various Winds: and when the fouth-eaft or fouth-west blows, this sea is rough and dangerous; for the least Wind raises it very high; but when the wind ceales, though it blowed very ftrong just before, there is an immediate calm, as if there had been no Wind for a long time; whereas, on the contrary, the Atlantic Sea rolls for feveral days after the wind is laid, and is generally smooth on the coaft, and temperatuous out on the main.

The limits also of these general Winds are much the same as in the Atlantic Sea, that is, about the thirtieth degree of latitude on both sides; for the Spaniards, home-bound from Manilla, always take the advantage of the fouth-monfoon, blowing there in the furnmer-months, and run up to the north of that latitude as high as Japan, before they meet with variable Winds to shape their course eastward. Also Schouten, and others, who have gone by the Magellan Straits, have found the limits of the fouth-east Winds much about the same latitude to the fouthward: and a farther analogy between the Winds of this Ocean and the Ethiopic, appears in that upon the coast of Peru they are always much foutherly, as they are near the shores of Angola.

As for the variable Winds, they are felt most by land, and in such parts of the sea as are without the limits of the constant Winds to the north and fouth; that is, in the colder parts of the Ocean, and all over its outmost bays, the principal of which are the Mediterranean and Baltic: fome are common to all countries; others are more peculiar to form particular parts. Of this latter for the most famous are the hurricanes, which chiefly infest the Caribbees, but are not anniversary, nor equally frequent. Their fury is so great, that they throw down all before them, tear up trees, overturn houses, tols thips prodigiously, and blow about things of vast weight. They are not even, but blow in gufts, which fuddenly come and go; neither do they extend very wide, but are

formetimes confined to a narrow compass, and at other times take a large scope. As for their duration, it is but for a few days, and fometimes only a few hours. They are mor common in America than any where, though Europe and Asia are not altogether without them.

It may be observed of all Winds, whether constant or variable, that some are drying, others are moist; some gather clouds, others differefe them; some are warm, others cold. But their influence is not one and the same in all places; for fuch Winds as are cold and dry in one country, are warm and wet in another.

These are the principal observations concerning Winds; for to examine every thing belonging to this subject would be the work of a large volume, as no reasons can be given for several things, before the truth of them is better afcertained. Wherefore we shall, at prefent, confine ourselves to account for the causes of constant Winds.

Wind is most properly defined to be the stream, or current of the air; and where such a current is perpetual, and fixed in its courte, it is necessary that it proceeds from a permanent, unintermitting cause. Wherefore some have been inclined to propose the diurnal rotation of the earth, upon the axis, by which, as the Globe turns east, the loose and fluid particles of the air, being so exceeding light, are left behind; so that in respect to the earth's surface, they move westward, and become a constant easterly Wind. This opinion seems confirmed, for that these winds are found only near the Equinoctial, in those parallels of latitude where the diurnal motion is swiftest. And we should readily affent to it, if the constant calms in the Atlantic Sea near the Equator, the westerly Winds near the coast of Guinea, and the periodical westerly monfoons under the Equator in the Indian Seas, did not declare the infusiciency of that hypothesis. Belides, the air being kept to the earth by the principle of gravity, would require the same degree of velocity that the surface of the earth moves with, as well in respect of the

diurnal rotation, as of the annual about the fun, which is 30 times fwitter.

It remains therefore to find fome other cause, capable of producing a like constant effect, agreeable to the known properties of the elements of air and water, and the laws of the motion of fluid bodies. Such a one is, we conceive, the action of the fun-beams upon the air and water, as he paffes every day over the oceans, confidered together with the nature of the foil, and fituation of the adjoining continents: therefore First, according to the laws of statics, the air which is less rarified, or expanded by heat, and confequently more ponderous, must have a motion towards those parts thereof, which are more rarified and less ponderous, to bring it to an equilibrium: and Se ondly, the presence of the fun continually shifting to the westward, that part toward which the air tends, by reason of the rarefaction made by his great meridian heat, is with him carried westward, and confequently thetendency of the whole body of the lower air is that way. Thus a general eafterly wind is formed. which being imprefied upon all the air of a vaft. O. ean, the parts impel one another, and fo keep moving till the next return of the fun, whereby to much of the motion as was loft is again reftored; and thus the westerly Wind is made perpetual.

From the same principle it follows, that the easterly Wind should, on the north side of the Equator, be to the northward of the east, and, in fouth latitudes, to the fouthward thereof; for near the Line the air is much more rarified than at a greater distance from it, because of the sun being twice in a year vertical, and at no time diftant above 23 degrees and a half; at which diffance the heat, being as the fine of the angle of incidence, is but little fhort of that of the perpendicular ray. Whereas under the Tropics, though the fun continues long vertical, yet he is as long 47 degrees off; which is a kind of winter, wherein the air to cools, as that the funmer heat cannot warm it to the same degree with that under the Equator: wherefore the air to the northward and fouthward being lefs rarified than that in the middle, it follows, that from both fides it ought to tend toward the Equator: this motion compounded with the former eafterly Wind, answers all the phænomena of the general Trade Winds; which, if the whole were fea, would undoubtedly blow all round the world, as they are found to do in the Atlantic and Ethiopic Oceans.

But feeing that fo great continents do interpose and break the continuity of the oceans, regard must be had to the nature of the foil, and the position of the high mountains, which may be supposed the two principal causes of the feveral variations of the Winds from the former general rule: for if a country lying near the fun proves to be flat, fandy, low land, fuch as the defarts of Lybia are utually reported to be, the heat occasioned by the reflexion of the fun-beams, and the retention thereof in the fand, is incredible to those who have not felt it; whereby the air being exceedingly rarified, it is necessary that the cooler and more dense air should run thitherwards to reflore the equilibrium: this is most likely to be the cause why, near the coast of Guinea, the Wind always sets in upon the land, blowing westerly initead of easterly.

There is sufficient reason to believe that the inland parts of Africa are prodigious hot, since the northern borders thereof were fo intemperate, as to give the ancients cause to conclude, that all beyond the Tropics was uninhabitable by excels of heat. From the same cause it happens, that there are such constant calms in that part of the Ocean called the Rains: for this track being placed in the middle, between the westerly Winds blowing on the coast of Guinea, and the easterly Trade Winds blowing to the west thereof, the tendency of the air here is indifferent to either, and so stands in equilibrio between both; and the weight of the incumbent atmosphere being diminished by the continual contrary Winds blowing from hence, is the reason that the air here holds not the copious vapour it receives, but lets it fall into frequent rains.

But as the cool and dense air, by reason of its greater gravity, presses upon the hot and rarified, it is demonstrative that this latter must ascend in a continued stream as fast as it rarises; and that, being ascended, it must disperse itself to preserve the equilibrium; that is, the upper air must move by a contrary current from those parts where the greatest heat is: so, by a kind of circulation, the north-east Trade Wind below will be attended with a south-westerly above, and the south-easterly with a north-west Wind above. That this is more than a bare conjecture, the almost instantaneous change of the Wind to the opposite point, which is frequently sound in passing the limits of the Trade Winds, seems to affure us; but that which above all confirms this hypothesis, is the phænomenon of the monsoons, by this means most easily solved, and without it hardly explicable.

If the causes of tempests and hurricanes be demanded, they are hardly to be accounted for in all particulars. However, it may in the first place be noted, that the ratio of all liquids is much the same, and therefore an extraordinary motion may be excited in the air, by the fame way as it is in the water. Now if water falls from a high place, or if there be a confluence of several streams together, this gives it a violent motion, and causes many whirlings and eddies in it: this is apparent in torrents falling down from rocks, and confluences of rivers. If, therefore, fomething analogous to this may happen in the air, there must needs be furious tempests of Wind raifed in it. And such a thing may happen, if an extraordinary quantity of vapours be driven by the Wind upon a certain place, which they cannot eafily get over by reason of mountains or contrary Winds, that oppose them. For example, suppose a Wind from some point between north and east carries a vast collection of vapours out of Africa to the Caribbees, this wind lights upon the continent of America; now it is possible that not only the mountains and woods of Panama may refift the current of this Wind, and croud the vapours together, but a contrary Wind, from a point between the fouth and west, may blow at the same time on the western shore of America, which shall force the vapours back again. When such a rencounter happens, there must be a wild uproar in the air about the Caribbee Isles, and in all that track between South and North-America; and the vapours in this circular motion must be furious on all sides, just as it is in the water. For we see at the confluence of two rivers, if their currents be rapid at the place where they fall in, they cause violent eddies which whirl about things that are cast into them, swallowing them for a time, and then throwing them

This thews us the reason why heavy bodies are often tossed in the air by the whirling of hurricanes, and then dashed to the ground again. For the air being in a circular motion, is with great fury tossed backwards and forwards between the ground and the clouds. And as the waters of the rolling sea do not run to the shores in an even stream, but in such waves as dash by fits and turns, so the course of a violent Wind is broken

into diffinct blafts.

To come now to the common phanomena of Winds, the dry ones are fuch as carry few vapours along with them, and therefore draw off the moift particles from bodies over which they pais. Thus in Holland the north and east Winds, with the intermediate points, are drying, because the cold northern sea yields but sew vapours, in comparison of those which come from warmer parts of the Ocean; and from thence towards the east are vast tracks of land, where the heat at Midsummer is but very small. But the other Winds, especially the westerly, are moist, because they issue from the warm and vaporous parts. The Western Ocean seldom fails to send us rainy Winds: however, this property varies according to the various situation of countries.

Such Winds gather clouds as blow from the quarters where the vapours arife, which, in conjunction with the vapours of our own region, fill the air. On the other fide those Winds make fair weather, which bring little va-

pour along with them, and bear away that which hangs over us.

Winds are warm or cold, as the countries are from whence they blow; and, therefore, when a brisk Winds blows from a cold quarter, it allays the fummer heat, which is very tireform in still weather. Thus a quick blast of a pair of bellows will put out a stame, which a gentle blowing increases; for the quick blast drives all the stame to one side, where it is stissed by the force of the incumbent air, except it meet with more such that side; but a gentle Wind augments the motion of the stame every way, and makes it seize on more parts of the such.

Now, because all the heat or cold of Winds proceeds from the heat or cold of the country whence it blows, therefore the same Winds are hot and cold every where. Beyond the line they are just the reverse of what they are with us; for their cold Winds are from the sours are from the north; and as our south Winds are warm, for no other reason but because they bring us an air heated by the sun, for the very same reason the north

Winds are warm to our Antipodes.

From what has been faid it is sufficiently manifest, that the sun is the principal cause of Wind, and motion the cause of Yapours. But if we except those constant and periodical Winds which blow in some seas, the limits of the rest cannot be determined, nor can we say when they will begin, or when they will end. For instance, we cannot give a reason why an east Wind shall generally blow one summer, and a west Wind another. Possibly it might be discovered, if, for several years together, a nice observation was made of the Winds, and their shiftings in several countries; for that which seems inconstant and irregular to us, might, perhaps, be found to follow certain courses; at least we should know how far a raised Wind would continue its blast; but, till such experiments are made we must be satisfied with what knowledge we have.
