AMERICA,

Including the New Discoveries on the Continent and Islands off the Coast.

INTRODUCTION.

IN treating of those parts of the world which have already come under consideration; viz. Asia and Africa, we have, with peculiar care, collected, and, in full display, presented, both the New Discoveries, and the striking descriptions of our celebrated countryman Captain Cook, and, we trust to the satisfaction of our numerous readers. America will afford us no less scope for gratification, nor shall we be less attentive, or less remiss in our endeavours, to render our account of this part of the world as instructive and entertaining as either of the former; to which a description of the different countries therein explored by our eminent Navigator will much conduce, as it will bring to view new countries, new men, and new manners, as well as exhibit novelty in the animal and vegetable systems. But previous to this, and in conformity to the order of our plan, as well as our desire to preserve every important historical event, it is expedient that we should introduce a circumstantial narrative of the first discovery made of America by the great Columbus, together with a general description of the country; to which will succeed, with due propriety, the discoveries of our no less celebrated countryman Captain Cook; and tend to hand him down, as well as the former, to suture ages, as a character worthy of universal admiration.

C H A P. I.

FIRST DISCOVERY OF AMERICA BY COLUMBUS.

As few or no discoveries have displayed more human figacity and resolution, or been attended with more important consequences than that of America, we deem it expedient to present our readers with a circumflantial detail of that interesting event.

This was made in the fifteenth century, towards the close of which, Venice and Genoa were become, thro' the means of their commerce with the eastern world, the greatest maritime powers in Europe. Frequent voyages, some of which were of extent, introduced several improvements in the practical part of navigation; but the knowledge of mankind was still very imperfect, hardly extending beyond their sensible horizon. The true system of the world was unknown; and the imperfect notions entertained with regard to the figure and magnitude of the earth, had no other foundation than conjecture.

In this state of things Christopher Columbus, a native of Genoa, a man of aspiring genius, whose knowledge of the mathematics exceeded that of his cotemporaries in general, conceived a plan of sailing to the Indies by an unknown route, and thereby opening to his country a new source of opulence and power. This plan being presented to his countrymen, and by them rejected as vague and chimerical, Columbus, exasperated at their ungenerous treatment, laid it before the courts of France, England, and Portugal, who like-No. 42.

wise spurned at it as imaginary, and reprobated the principles on which it was founded as absurd and illustive; His last resource was the court of Spain, where, after eight years attendance, he succeeded through the special patronage of Queen Isabella, confort of King Ferdinand. This princes raised money necessary for the design upon her own jewels; so that he sailed, to his inexpressible joy, with three ships, in the year 1492, on a voyage, in the event of which the inhabitants of two worlds were concerned.

In this arduous attempt Columbus had many difficulties to encounter. He had no chart to direct him, no lights from former navigators; to which was added the despondency of his failors, who, on their voyage, threatened to throw him overboard, and infished on their return. At length, however, when his own invention and hopes were nearly exhausted, they for nately discovered land, after a voyage of 33 days, which put an end to the commotion, so that his commands were obeyed with alacrity.

Columbus first landed on one of the Bahama Isles. The people, on the 11th of October, 1492, discovered a light upon the Island Guanahani, which the admiral-called St. Salvador, as it delivered him and his crew from impending destruction. Here he erected the royal standard, and took possession of the island, by the appellation of St. Salvador, in the name of their Catholic

Ma efties. The Indians, ignorant of his intention, made no opposition, being amused with the novelty and glitter of divers toys and trinkets which Columbus ordered to be distributed among them. These people were entirely naked, of the middle stature, and an olive complexion. Their features were regular, excepting their forcheads, which were rather out of proportion. Their hair, which, as well as their eyes, was black, was mostly cropped about their ears. Some painted their whole bodies, others only their faces, with a kind of faints fired. Many of them had ornaments pendant from the nose over the upper lip. They followed the strangers to their ships, some swimming, and others in canoes. The articles of exchange they brought on board were parrots and cotton yarn. They expressed the highest satisfaction with the European commodities; but gazed with peculiar delight at their swords and shining arms, being at that time ignorant of the use of item.

Having taken a furvey of this and feveral other islands adjacent, and being convinced, from the poverty of the inhabitants, that these could not be the Indies he was in quest of, Columbus steered to the southward, and discovered the island called by him Hispaniola, abounding in all the necessaries of life, inhabited by a humane and hospitable people, and, whit was of still greater consequence, promiting, from one samples he had received, considerable quantities of gold and precious stones. This island, therefore, he proposed to make the center of his stuture discoveries; and having erected a fort, and placed in it a small garrison, he sailed for Spain, to procure necessary reinforgements for establishing his infant colony, and completing his discoveries.

The Spanish court was then at Barcelona, which he had entered amidst the acclamations of the people, attended by some of the Americans, arrayed in the gold, the arms, and ornan ents, of the New World just discovered. He had the honour of presenting to the king and queen, in the presence of the whole court, a particular account of his discoveries, and received the universal applause of the public.

But regardless of honours, the prosecution of his main design engrossed the attention of Columbus; and as his late success had obviated former prejudices, a fleet of 17 sail was immediately equipped, with all necessaries for conquest or discovery, and 1500 men embarked, among whom were some of the best families in Spain. Thus prepared, he set sail a second time, in September 1493, with an ample commission, as governor of all the countries he should discover.

On his arrival at Hispaniola, he found the fort he had erested demolished, and most of the Spaniards murdered. It appeared upon examination, that they had violated the laws of decency and justice in their behaviour towards the natives, to whose resentment they had therefore fallen victims. Columbus, however, found means to conciliate the minds of the Indians, which being effected, he chose a more commodious station for his colony, erected stronger fortifications than the former, encouraged agriculture, and exerted every effort for the establishment of the colony.

In his first voyage he had touched at Cuba; but whether it was an island, or part of some extensive continent, could not then be ascertained; therefore, to determine this was now his grand object. In coasting along the southern shore of Cuba, he found a multitude of small islands, most of them pleasant, and well inhabited. This archipelago he called Jardin de la Reyna, the Queen's Garden, in gratitude to his benefactress Queen Isabella. In this voyage he discovered the Island of Jamaica; and, after a series of the greatest dangers and distress, put into Hispaniola, without accomplishing his grand design respecting Cuba.

But as there, is no difficulty in finding specious grounds for accusation against such as are employed in the execution of extensive and complicated plans, throw the base infinuation of his enemies, an officer was dispatched from Spain, whose presence demonstrated to

Columbus the necessity of returning to Europe, to ob-

Having furmounted these obstacles, he set out, in 1498, on a third expedition, still more important than the former. In this navigation, after being long buried in a thick fog, and fuffering numberless hardships from the excessive heats and rains between the tropics, he discovered the continent of America. The first land he made was the Island of Trinidada, on the coast of Guiana. After passing this island, and two others lying at the mouth of the river Oroonoko, the admiral was surprized at finding his ship agitated by a dreadful conflict of waves, occasioned between the tide of the fea, and the rapid current of that immense river. Intrepidly pursuing his courfe, he foon perceived that they were in fresh water; and judging rightly, that no island could fupply fo valt a river, he began to fuspect he had discovered the continent; but when he left the river, and found that the land-continued on to the westward for a great way, he was convinced of it. Satisfied, in fome measure, with this discovery, he yielded to the cries of his distressed crew, and bore away for Hispaniola. In the course of the passage he landed at feveral places, and traded with the inhabitants for gold and

In a subsequent voyage, being the sourth, Columbus discovered all the coast of Terra Firma to the Isthmus of Darien, where he hoped to have found a passage into the South Sea. In this he was disappointed; but he was not so in the other part of his project; for every where, as he advanced, he became more sensible of the value of his discoveries on the continent. He found a people more civilized, and more abounding in gold, than the Islanders with whom he had been acquainted.

The fuccess of Columbus roused a spirit of discovery; and adventurers in divers parts of Europe, stimulated by a thirst for gold, equipped ships at their own expence. The most remarkable of these was Americus Vespucio, a merchant of Florence, who sailed to the southern continent of America, and being a man of address, found means to acquire the honour of giving his name to half the globe. But no one is now imposed on by the name, for the glory of the discovery is awarded by the whole world to Columbus.

Such, however, were the machinations of malice and envy, and fuch the effect of the calumny of his enemies at the coart of Spain, in depreciating the merits of this great man, that he was fent for to Europe ignominiously loaded with fetters. The court of Spain, however, on his arrival, ordered him to be fet at liberty, and difavowed the proceeding. Columbus retired in difgust to Vallidolid, where he died in 1506, after having rendered such important services to mankind, as will transmit his name with honour to the latest postericy.

Succeeding adventurers purfued no form or plan in their undertakings, gold being their object, to obtain which they followed fortune wherever the led them. They contributed, however, to augment the power and riches of the Spanish monarchy, though at the ex-pence of the blood of millions. Thus the kings of Spain, without any exertion of policy, or the leaft public charge, were, by private adventurers among their fubjects, put in possession of a greater, and more wealthy territory, than ever the most renowned heroes had obtained by their valour or their wisdom. This conquest is the more extraordinary for the shortness of the time in which it was effected; for, from the departure of Columbus in 1492, to the entire reduction of Chili, which happened in 1541, feveral confiderable kingdoms were brought to fubmit to the Spanish yoke. We shall point out by whom, and the magner in which these exploits were performed, under the heads of each respective country, and after having treated of America in general, begin with the discoveries, descriptions, &c. of our British Columbus, Captain Cook.

C H A P. II.

GENERAL DESCRIPTION OF AMERICA.

THIS vast track, frequently denominated the New World, extends from latitude 78 degrees north, to latitude 56 degrees fouth, that is 134 degrees, which, taken in a strait line, amounts to 8040 miles in length. Its breadth is various, being, in some places, 3690 miles, and in others not above 60 or 70. It forms a part of both hemispheres, and boasts all the different climates of the earth. It is bounded on the north by unknown lands, on the south by the Southern Ocean, on the east by the Atlantic Ocean, and on the west by the Great Pacific Ocean. By means of these feas it carries on a direct commerce with the other three parts of the world.

America, generally confidered, confifts of two extenfive continents, joined together by a narrow neck of
land, called the Ifthmus of Darien, and diffinguished
by the appellations of North and South. A great variety of islands are feattered on both sides of America,
Several on the north-west coast were discovered by
Captain Cook. On a large gulph, formed by the coasts
of the northern and fouthern continents, and those of
the Isthmus of Darien, lie a multitude of islands, many
of them large, and most of them sertile. They are
called the West Indies, and will, as well as all the rest,
be described in their proper order.

Though America is not, in general, a mountainous country, it has the greatest mountains in the world. In South America the Andes run from north to south along the coast of the Pacific Ocean. They extend from the Isthmus of Darien to the Straits of Magellan, divide the southern parts of America, and run a length of between 4 and 5000 English miles. In North America are several losty and extensive chains, the principal of which are called the Algennay or Apalachian mountains.

North America is watered by many rivers, the most remarkable of which will be described in their respective provinces. The river Mislishppi, rising from unknown fources, runs a prodigious course from north to fouth. There are five great lakes, which, communicating with each other, afford a most advantageous inslet for commerce. Many parts are, indeed, so interfected with navigable rivers and creeks, that numbers of planters may be said to have each an harbour at his own door.

South America has three of the largest rivers in the world, the river of the Amazons, the river Plata, and the river Oroonoko.

A country of fuch prodigious extent as America on each fide of the equator, must necessarily have a variety of foils as well as climates.

It is very remarkable that the climates of North America are colder, by many degrees, than any of the countries in the fame latitude in Europe. Thus New Britain, which is nearly in the fame latitude with Great Britain, is almost insufferably cold to an European. The greatest part of the frozen country of Newfoundland, the Bay of St. Laurence, and Cape Breton, lie opposite to the coast of France. Nova Scotia and New England are in the same latitude as the Bay of Biscay. New York and Pennsylvania lie opposite to Spain and Portugal. Hence the coldest winds of North America blow from the north and the west, as they do here from the north and east.

If we except the most northern and southern parts, which are naturally cold and barren, the rest produce, in abundance, most of the metals, minerals, plants, fruits, trees, and woods, to be met with in the other parts of the world, and some of them in greater quantities, and higher perfection. America also produces

diamonds, pearls, emeralds, amethysts, and other valuable stones. To these may be added a great number of other commodities, which, though of less price, are of much greater use.

Sheep, goats, cows, affes, and horfes, were not found here upon the first landing of the Europeans, but having been brought in plenty, increased so fast in fertile pastures, as to afford an ample supply.

Here is a vast variety of birds, surpassing all that

Here is a vaft variety of birds, furpassing all that are to be found in any other part of the world, for beauty, shape, and colour, which will be described in their proper places.

The feas, lakes, and rivers, abound with the greatest

plenty and variety of fish.

Before the arrival of the Europeans, the natives of America had arts of their own. They had some notion of painting, and also formed pictures by the beautiful arrangements of feathers of all colours; and in some parts erected stately buildings. Though the use of iron was unknown, they polished precious stones, cut down trees, and made not only small canoes, but boats of considerable bulk. Their hatchets were headed with a sharp slint; and of slints they made knives. Thus at the arrival of the Europeans, they presented a lively picture of the state of mankind in the earliest ages.

America is chiefly divided between the Spanish, English, Portuguese, and the United States. The French and Dutch have, indeed, settlements in South America, called Guiana and Surinam, but these are of bittle importance. They have also colonies in North America. The Indians are in quiet possession of many large inland tracks. The Spaniards, who discovered the New World, still enjoy the largest and richest portion of it, and thence draw immense wealth.

Next to Spain, the most considerable proprietor of America was Great Britain, which derived a claim to North America from the first discovery of that continent by Sebastian Cabot, in the name of Henry VII. about fix years after the discovery of South America by Columbus, in the name of the king of Spain. This northern country was, in general, called Newfoundland, a name now appropriated folely to an island upon its coast. It was a long time before any attempt was made to fettle a colony in it. Sir Walter Raleigh, of respectable memory, first shewed the way, by fixing the English standard in that part which he called Virginia, in honour of his royal mistress Queen Elizabeth.

The British nation had, at an immense expense, and with the loss of thousands of gallant subjects, preserved, secured, and extended its colonies so far, as to render it difficult to ascertain the precise bounds of its empire in North America, to the northern and western sides: But, alas; these flattering prospects have been annihilated by a most unhappy contest between the mother country and the colonies, which, after a continuance of eight years, at great expense of blood and treasure, terminated in the establishment of a new republic, stiled, "The Thirteen United States of America."

We propose to divide the New World into three

- I. NORTH AMERICA, prefixing to our account fuch parts, continental, infular, &cc. as have been difcovered, vifited, or deferibed, by Captain Cook,
- II. WEST INDIAN and AMERICAN ISLANDS.

III. SOUTH AMERICA.

CHAP,

ed of America

feriptions, &c.

C H A P. III.

NORTH AMERICA.

Particular Parts of North America, continental, infular, &c. &c. discovered, visited and described by CAPTAIN COOK, on his third and last Voyage.

CAPTAIN COOK, with a perfeverence and intre-pidity peculiar to himself, explored the coast of North America till he reached to the latitude of 70 deg. 44. min. when all further attempts to proceed were frustrated by a prodigious mass of ice, which extended

from continent to continent.

The most extreme point he mentions is Cape Lisburne. It is situated in the latitude of 69 deg. 5 min. north. He says it appeared to be tolerably high land, even down to the fea. In almost every other part, as our navigators advanced to the north, they had found a low coast, from which the land rose to a moderate height. The coast now before them was free from fnow, except in one or two places, and had a greenish hue, but they could not discern any wood upon it.

To the fouthward of Cape Lifburne is a point, named by Gaptain Cook Point Mulgrave. It is fituated in lat. 67 deg. 45 min. north. The land feemed to be very low near the sea, but a little farther it rose into hills of a moderate height: the whole was free from fnow, and

apparently destitute of wood.

The western extreme of America, hitherto known, is a point of land, which Captain Cook distinguished by the name of Cape Prince of Wales. It stands in the lat. of 65 deg. 46 min. north.

SLEDGE ISLAND lies in lat. 64 deg. 30 min. north, and is about 12 miles in circumference. The furface of the ground principally confifts of large loofe stones, covered in many places with mofs, and other vegetables, of which 20 or 30 different species were observed, and most of them in slower. But not a tree or shrub was feen, either on the island, or upon the neighbouring continent. Near the beach where our people landed was a confiderable quantity of wild purssane, long-wort, peafe, &c. some of which they took on board for boil-They faw feveral plovers, and other fmall birds, also a fox. They met with some decayed huts, built partly under ground. It appeared some people had been lately on the island, and it was more than probable that they often came thither, there being a beaten path from one end to the other. At a small distance from that part of the shore where our people landed they found a fledge, which induced Captain Cook to give the island, the name of Sledge Island. It appeared to be such a one as is used by the Russians in Kamtschatka, for the purpose of conveying goods from one place to another over the show and ice. Its construction was admirable, and its various parts were put together with great neat-nefs, fome with wooden pins, but for the most part with thongs or lashings of whalebone; in consequence of which, Captain Cook imagined that it was entirely the workmanship of the natives.

KING's ISLAND, fo called by Captain Cook, is a fmall island, which was descried at the distance of eight or nine leagues from the former.

CLERR'S ISLAND, which also received its appellation from Captain Cook, lies in lat. 63 deg. 15 min. north. It seemed to be an island of considerable extent, in which were feveral hills, all connected by low ground, so that it looked at a distance like a group of islands. Near its eastern part is a little island, which is remarkable for having on it three elevated rocks. Both the greater island, and this smaller one, were apparently inhabited.

GORE'S ISLAND lies in nearly the fame latitude as the former. It is about 30 miles in extent, and particularly narrow at the low necks of land, by which the hills are connected. Captain Cook found afterwards that it was entirely unknown to the Russians, and therefore confidering it as a discovery of his own, named it Gore's Island. It appeared to be barren, and destitute of inhabitants, at least our navigators saw none. Near Gore's Islands a small island, whose losty summit terminates in feveral pinnacle rocks, for which reason it obtained the name of PINNACLE ISLAND.

hed b

ANDERSON'S ISLAND, fo called by Captain Cook, to perpetuate the memory of Mr. Anderson, surgeon of the Resolution, who departed this life just before the difcovery of it, lies in lat. 62 deg. 34 min. north. This is the only circumstance worthy of mention concerning it.

NORTON'S SOUND.

Situation. Survey of the Country. Interview with the Natives. Articles of Barter. Divers Incidents. Perfons, Drefs, Habitations, Vegetable Productions, &c.

THIS inlet, to which Captain Cook gave the name of Norton's Sound, in honour of Sir Fletcher Norton, afterwards Lord Grantley, lies between the latitudes of 64 and 65 deg. north. The bay wherein the ships lay at anchor is situated on the south-east side of it, and by the natives denominated Chacktoole. It is not a very good flation, nor is an harbour to be met with in all this found.

with in all this found.

Captain Cook, at first fight, imagined this spot of land to be two islands, but afterwards found that it was a peninsula connected with the continent by a low lsthmus, on each side of which a bay is formed by the coast. Having cast anchor at about a league's distance from the point of the peninsula, to which spot the appellation

of Cape Denbigh was given, they observed several of the natives on the peninsula, and one of them came off in a small canoe. Captain Cook gave this man a knife and some beads, with which he appeared to be well pleafed. Our people made tigns to him to bring them fome provisions, upon which he inflantly quitted them, and paddled towards the shore. Happening to meet another man coming off, who had two dried falmons, he got them from him; and when he returned to the flip, he refused to give them to any body except Capt. Cook. Some of our people fancied that he asked for him under the name of capitaine, but in this they were perhaps mistaken. Others of the inhabitants came off foon afterwards, and gave them a few dried fifh, in exchange for fuch trifles as they had to barter with them. They shewed no dislike to tobacco, but were most defirous of knives.

Mr. Gore was dispatched to the peninsula, to procure wood and water, of the sormer of which articles the people observed great plenty upon the beach. At the same time a boat from each of the ships was sent to found round the bay; and at three o'clock, the wind freshening at north-east they weighed anchor, and endeavoured to work further in : but that was quickly found to be impracticable, by reason of the shoals, which extended entirely round the by, to the distance

of upwards of two miles from the more.

Captain Cook went affiore, and took a walk into the country, which, in those parts where there was no wood, abounded with heath, and other plants, several of which had plenty of berries, all ripe. Scarce a single plant was in flower. The underwood, such as birch, alders, and willows, occasioned walking to be very troublesome among the trees, which were all spruce, and none of which exceeded seven or eight inches in diameter; but some were observed lying on the beach, that were above twice that size. All the drift-wood seen in these northern parts was fir.

A family of the natives came near the fpot where our people were occupied in taking off wood. The Captain faw only the husband and wife, and their child, besides a fourth person, who was the most deformed cripple he had ever seen. The husband was nearly blind; and neither he nor his wife were fuch well-looking people as many of those whom he had met with on this coast. Both of them had their lower lips perforated; and they were in possession of some glass beads, resembling those that had been seen before among their neighbours. Iron was the article that pleased them most. For four knives, which had been formed out of an old iron hoop, the Captain obtained from them near 400 pounds weight of fish, that had been lately caught by them. Some of these were trout, and others were, with respect to fize and taste, somewhat between a herring and a mullet. The Captain gave a few beads to the child, who was a female; upon which the mother immediately burst into tears, then the father, next after him the cripple, and at last, to add the finishing stroke to the concert, the child herself. This, however, was not of long duration

Lieutenant King had before been in company with the same family. His account of this interview is to the following purport: While he attended the wooding party, a canoe, filled with natives approached, out of which an elderly man and woman (the husband and wife above-mentioned) came afhore. Mr. King prefented a small knife to the woman, and promised to give her a much larger one in exchange for some fish, She made figns to him to follow her. After he had proceeded with them about a mile, the man fell down as he was croffing a flony beach, and happened to cut his foot very much. This occasioned Mr. King to ftop; upon which the woman pointed to her hufband's eyes, which were covered with a thick whitish film. He afterwards kept close to his wife, who took care to apprize him of the obstacles in his way. The woman had a child on her back, wrapped up in the hood of her jacket. After walking about two miles they arrived at an open skin-boat, which was turned on one side, the convex part towards the wind, and was made to ferve for the habitation of this family. Mr. King now performed a remarkable operation on the man's eyes. He was first desired to hold his breath, then to breathe on the diftempered eyes, and afterwards to fpit on The woman then took both the hands of Mr. King, and preffing them in the man's ftomach, held them there for some time, while she recounted some melancholy history respecting her family, sometimes pointing to her hufband, fornetimes to her child, and at other times to the cripple, who was related to her. Mr. King purchased all the fish they had, which confifted of excellent falmon, falmon-trout, and mullet. These fish were faithfully delivered to the person he sent

The woman was fhort and fquat, and her visage was plump and round, She wore a jacket made of deer-fkin, with a large hood, and had on a pair of wide boots. She was punctured from the lip to the chin. Her hufband was well made, and about five feet two inches in height. His hair was black and short, and he had but little beard. His complexion was of a light copper cast. He had two holes in his lower lip, in which, however, he had no ornaments. The teeth of both of them were black, and appeared as if they had been filed down level with the gums.

ofthe WESTERN or ATLANTIC OCEAN

A New & Accurate

H· A R

As doubts were still entertained whether the coastupon which they now were belonged to an island, or
to the continent of America, Lieutenant King was
dispatched by Captain Cook, with two boats, well
manned and armed, to make fuch a search as might
tend to remove all difference of opinion on the subject.
He was instructed to proceed towards the north as fir,
as the extreme point seen before, or a little further, if
he should find it necessary; to land there, and from
the heights endeavour to discover whether the land he
was then upon, imagined to be the island of Alaschka,
was really an island, or was connected to the land to
the eastward, supposed to be the American continent,

After the departure of Lieutenant King, several of the natives came off in canoes, and gave the crew fome dried falmon in exchange for trifling articles. Early the next morning nine men, each in a separate canoe, paid them a visit, with the sole view of gratifying their curiofity. They approached the ship with caution, and drawing up abreast of each other, under the stern, favoured them with a fong; while one of their number made many ludicrous motions with his hands and body, and another beat upon a fort of drum. There was nothing favage either in the fong or the gestures with which it was accompanied. There seemed to be no dis-ference either with respect to size or seatures between these people, and those on the other northerly parts of the coast. Their dress, which chiefly consisted of the skins of deer, was made after the same mode; and they had adopted the practice of perforating their lower lips, and affixing ornaments to them.

The habitations of these Americans were situated close to the beach. They consist merely of a sloping roof, without any side walls, formed of logs, and covered with earth and grass. The slove is likewise laid with logs. The entrance is at one end, and the fireplace just within it. A small hole is made near the door of the hut, for the purpose of letting out the smoak.

door of the hut, for the purpose of letting out the smoak. The berries found here by the party that went on shore for brooms and spruce, were hurtle-berries, heath-berries, pattridge-berries, and wild currant-berries. Captain Cook also went ashore, and took a walk over part of the peninsula. He met with very good grass in several places, and scarcely observed a single spot on which some vegetable was not growing. The low land, by which this peninsula is united to the continent, abounds with narrow creeks, and likewise with ponds of water, several of which were at this time frozen over. There were numbers of bustands and geefe, but they were so shy, that it was impossible to get within musket-shot of them. Some snipes were also seen; and on the higher grounds were partridges of two species. Where there was wood, musketos were numerous. Some of the officers, who went further into the country than the Captain did, met with some of the natives of both sexes, who treated them with civility and kindness.

It was the opinion of Captain Cook that this peninfulathad been an island in some distant period; for there were marks of the sea having sormerly slowed over the isthmus; and even at present it appeared to be kept out by a bank of sand, stones, and wood, which the waves had thrown up. It was manifest, from this bank, that the land here encroached upon the sea; and it was not difficult to trace its gradual formation.

Lieutenant King returned from his expedition about four days after he left the ship. The crews of the boats rowed without intermission towards the land for the space of a day. They then set their sails, and stood across the bay which the coast forms to the westward of Bald-Head. They afterwards made use of their oars, and had got within two miles of Bald-Head, under the lee of the high land. At that time all the men in the boat belonging to the Resolution, except two, were so oppressed with fatigue and sleep, that Mr. King's utmost endeavours to make them put on were ineffectual. They were at length so far exhausted as to drop their oars, and fall assept at the bottom of the boat. In

consequence of this Mr. King, and two gentlemen who were with him, were obliged to lay hold of the oars; and they landed, a little after three o'clock, between Bald-Head and a point that projects to the eastward.

Mr. King, upon his landing, aftended the heights, from which he could fee the two coafts join, and that the inlet terminated in a fmall creek or river, before which there were banks of fand or mud, and in every part shoal water. The land, for some distance towards the north, was low and swampy; then it rose in hills; and the perfect junction of those, on each side of the inlet, was traced without the least difficulty.

From the elevated fituation in which Mr. King took his furvey of the found, he could differn many spacious vallies, with rivers flowing through them, well wooded, and bounded by hills of a moderate height. One of the rivers, towards the north-west, seemed to be considerable: and he was inclined to suppose, from its difference to the Bay. Some of his people, penetrating beyond this into the country, found the trees to be of a larger size the further they proceeded.

The weather being fine afforded an opportunity of making a great number of lunar observations, the result of which gave 197 deg. 13 min. east, as the longitude of the anchoring place on the western side of the sound; while its latitude was 64 deg. 31 min. north. With respect to the tides, the night flood rose two or three feet, and the day flood was scarcely perceivable.

Captain Cook was now perfectly convinced that Mr. Stæhlin's map was extremely erroneous, and that the continent of America was the very space which that gentleman had imagined to be the Island of

Alaschka.

Captain Cook thought it now high time to quit thefe northerly regions, and retire to some place for the winter, where he might obtain provisions and refreshments. He did not consider Petropaulowska, or the harbour of St. Peter and St. Paul, in Kamtschatska, as likely to furnish a sufficient supply. He had likewise other reasons for not going thither at present, the principal of which was his great unwillingness to remain inactive for fix or feven months, which would have been the consequence of passing the winter in any of these northern countries. He at length concluded that no fituation was so convenient as the Sandwich Islands. To them, therefore, he formed a refolution of repairing. But a supply of water being necessary before he could execute that defign, he determined with a view of procuring this affential article, to fearch the coast of America for a harbour, by proceeding along it to the fouthward. If he should not meet with success in that fearch, his intention was to reach Samganhoodha, which was appointed for the place of rendezvous in cafe the ships should happen to separate.

STUART'S ISLAND lies in the latitude of 63 deg. 35 min. north, and is fix or feven leagues in circumference. Though fome parts of it are of a moderate height, yet, in general, it is low, with fome rocks off the western part. Some drift wood was observed on the shore, but not a single tree was seen.

The greatest part of the coast of the continent is low land, but they perceived high land up the country. It forms a point opposite this island, which was diffinguished by the name of Cape Stephens, and is situated in the latitude of 63 deg. 33 min. north, and in the longitude of 197 deg. 41 min. east.

Before they reached Stuart's Island they passed two little islands, situate between them and the main land; and as they ranged along the coast, several of the natives made their appearance upon the shore, and, by signs, seemed to invite them to approach.

ROUND ISLAND, so denominated by Captain Cook on account of its figure, lies in the latitude of 58 deg. 37 min. north, and is seven miles distant from the continent.

BARREN ISLES, fo called from the nakedness of their appearance, are fituated in latitude 59 deg. north. They are a group of high islands and rocks, and unconnected with any other land.

Near these islands was perceived a very losty promontory, whose elevated summit appeared above the clouds, forming two very high mountains. . Captain Cook named this promontory Cape Douglas, in honour of Doctor Douglas, now bishop of Carlisle.

KAYE's ISLAND

HIS island, discovered by Captain Cook, lies in latitude 59 deg. 49 min. north. It does not exceed 12 leagues in length, nor in breadth above a league and a half in any part of it. The fouth-west point is a naked rock, confiderably elevated above the land within There is also a high rock lying off it, which, when feen in some paaticular directions, has the appearance of a ruinous castle. This island terminates towards the fea in bare floping cliffs, with a beach confifting of large pebbles, intermixed in fome places with a clayey fand. The cliffs are composed of a blueish stone or rock, and are, except in a few parts, in a foft or moul-dering state. Some parts of the shore are interrupted by small vallies and gullies, in each of which a rivulet or torrent rushes down with a considerable degree of impetuofity, though, perhaps, only furnished from the fnow, and lafting no longer than till the whole is diffolved. These vallies are filled with pine-trees; and they also abound in other parts of the island, which, indeed, is covered, as it were, with a broad girdle of The trees, however, are far from being of an extraordinary growth, few of them feeming to be larger than what a person might grasp round with his arms, and their general height being 40 or 50 feet; fo that they would be of no great service for shipping, except as materials for making top-gallant-mafts, and other fmall things. The pine trees appeared to be all of one species; and neither the Canadian pine, or cypress, was to be feen.

Among the trees was some current and hawberry bushes, a yellow-flowered violet, and the leaves of other plants not then in flower, particularly one which was supposed by the naturalists to be the heracleum of

A crow was feen flying about the wood: two or three white headed eagles, like those of Nootka, were also observed; besides another species equally large, which had a white breaft. Captain Cook likewife faw, in his passage from the ship to the shore, a number of fowls fitting on the water, or flying about, the principal of which were gulls, burres, shags, ducks, or large petrels, divers, and quebrantahuesses. The divers were of two forts; one very large, whose colour was black, with a white belly and breaft; the other of a smaller fize, with a longer and more pointed bill. The ducks were also of two species; one brownish, with a dark blue or blackish head or neck; the other smaller, and of a dirty black colour. The shags were large and black, having a white spot behind the wings. The gulls were of the common sort, slying in slocks. There was also a single bird flying about, apparently of the gull kind, whose colour was a snowy white, with some black along part of the upper fide of the wings. At the place where the party landed, a fox came from the verge of the wood, and eying them with little emotion, walked leifurely on without manifefting any figns of fear. He was not of a large fize, and his colour was of a reddiff yellow. Two or three fmall feals were likewise seen near the shore; but no traces were discovered of inhabitants having ever been in the island.

On a fmall eminence near the shore, Captain Cook left, at the soot of a tree, a bottle, containing a paper, on which the names of the ships, and the date of the discovery, were inscribed. He also enclosed two silver two-penny pieces of English coin, which, with many others, he had been surnished with by Dr. Kaye, dean

of their per, and of their a of Lincoln; and, in testimony of his esteem for that gentleman, distinguished the island by the name of Kaye's Island.

He also called a spacious inlet, about three leagues diftant from this island, Cape Hinchinbroke. Having cast anchor under this cape, Mr. Gore was dispatched in a boat, in order to shoot some birds that might ferve for food. He had fearcely arrived when about 20 of the natives appeared in two large canoes, upon which he returned to the ships, and they followed They were unwilling however, to venture along-fide, but kept at a distance, shouting aloud, and clasping and extending their arms alternately. They then began a kind of fong. Their heads were strewed with feathers; and one of them held out a white garment, which it was supposed they intended as a token of friendship; while another, for near a quarter of an hour, stood up in the canoe, entirely naked, with his arms extended like a cross, and motionless. Their canoes were constructed upon a different plan from those our people had hitherto feen. The frame confifted of flender laths, and the outlide was formed of the skins of feals, or other animals of a fimilar kind. Though our people returned their figns of amity, and endeavoured, by the most expressive gestures, to encourage them to come along-fide, they were unable to prevail upon them. Some of our people also repeated several of the common words that they had heard in the adjacent parts, but they did not appear to understand them. After they had received some presents that were thrown to them, they retired towards the shore, intimating, by figns, that they would return the next morning. They accordingly came off in five or fix canoes, but as the ships were under fail, they could not reach, though they followed them for some time.

PRINCE WILLIAM'S SOUND.

SECTION I.

Situation. Reception from the Natives. Their Appearance and Behaviour.

THIS inlet on the coast, distinguished by Captain Cook under the name of Prince William's Sound, is in the latitude of 59 deg. 33 min. north. He also gave the place where the ships Resolution and Discovery took up their station, the appellation of Snug Corner Ray.

When our people first entered the Bay, three of the natives came off in two canoes, two men in one, and one in the other, being the number that each canoe could carry. The men had each a flick of the length of about three feet, with the large feathers, or wings of birds, fastened to it. These they frequently held up, probably as tokens of peace. The treatment these three received induced many others to visit the ships, in both great and small canoes. Some of them ventured on board the Resolution, though not before some of our people had stepped into their boats. Among those who came on board was a middle-aged man, who was afterwards found to be the chief. His dress was made of the skin of the sea-otter, and he had on his head a cap, embellished with sky-blue glass beads. He appeared to value these much more than our white glass beads. Any kind of beads, however, feemed to be in high estimation among these people, who readily gave in exchange for them whatever they had, even their fine sea-otter skins,

Iron was a great object, but they absolutely rejected small bits, and wanted pieces nine or ten inches long at least, and of the breadth of three or four fingers. They obtained but little of that article, as, by this time, it was become rather scarce. The points of some of their spears were of this metal, others were of copper, and a few were of bone; of which last the points of their arrows, darts, &c. were formed.

The chief could not be prevailed upon to venture below the upper deck, nor did he and his companions continue long on board. While they were on board it was necessary to watch them narrowly, as they soon manifested an inclination for thieving. At length, when they had been three or four hours along-side the Resolution, they all quitted her, and repaired to the Discovery, which ship none of them had before been on board of, except one man, who came from her at this very time, and immediately returned to her, in company with the others.

The natives, foon after quitting the Discovery, made their way towards the boat that was employed in founding. The officer who was in her observing their approach, returned to the ship, and all the canoes followed him. The crew of the boat had no soner repaired on board, leaving in her, by way of guard, two of their number, than several of the natives stepped into her, some of whom presented their spears before the two men, while others losed the rope by which she was fastened to the ship, and the rest were so daring as to attempt to tow her away. But the moment they saw our people were preparing to oppose them, they let her go, stepped out of her into their own boats, and made signs to persuade them to lay down their arms.

The man already mentioned as having conducted his countrymen from the Refolution to the Discovery, had first been on board of the latter, where looking down all the hatchways, and observing no one except the officer of the watch, and one or two others, he doubtlefs imagined that she might be plundered with ease, parcicularly as she was stationed at some distance from the Refolution. It was unquestionably with this intent that the natives went off to her. Several of them went on board without the least ceremony, and drawing their knives, made figns to the officer, and the other people upon deck, to keep off, and began to fearch for plunder. The first thing they laid hold of was the rudder of one of the boats, which they immediately threw overboard to those of their party who had continued in the canoes. But before they had time to find another object that struck their fancy, the ship's crew were alarmed, and many of them, armed with cutlaffes, came upon deck. On observing this, the plunderers all fneaked off into their canoes, with evident marks of indifference.

From the above circumftances it may reasonably be inferred, that these people were not acquainted with fire-arms; for had they known any thing of their effect, they would by no means have ventured to attempt carrying off a boat from under a ship's guns, in the sace of upwards of an hundred men; for most of the Resolution's people were looking at them at the very instant of their making the attempt. However, they were lest as ignorant, in this particular, as they were found; for they neither saw or heard a musket fired, except at birds.

SECTION II.

Perfons, Drefs, Canoes, Weapons, Utenfils, Food, Language, &c.

THE natives seen by our voyagers were, in general of a middling stature, though many of them were under it. They were square, or strong-chefted, with short thick necks, and large broad visages, which were, for the most part, rather slat. The most disproportioned part of their bodies appeared to be their heads, which were of great magnitude. Their teeth were of a tolerable whiteness, broad, well set, and equal in size. Their noses had full round points, turned up at the tips; and their eyes, though not small, were scarcely proportioned to the largeness of their faces. They had black hair, which was strong, strait, and thick. Their beards were, in general, thin, or deficients but the hairs growing about the lips of those who had

them, were brittly or stiff, and often of a brownish colour; and some of the elderly men had large, thick, strait beards.

Very few, however, could be faid to be handsome, though their countenances, in general indicated famkness, vivacity, and good nature; yet some of them shewed a referve and fullenness in their aspect. The faces of some of the women were agreeable; and many of them, but principally the younger ones, might easily be distinguished from the other sex, by the superior delicacy of their features. The complexion of some of the females, and of the children, was white, without any mixture of red. Many of the men, whom our people saw naked, had rather a swarthy cast, which was scarcely the effect of any stain, as it is not their

custom to paint their bodies.

The men, women, and children, of this found, are all cloathed in the fame manner. Their ordinary drefs is a fort of close frock, or rather robe, which sometimes reaches only to the knees, but generally down to the ancles. It has, at the upper part, a hole just fufficiently large to admit the head, with fleeves reaching to the wailt. These frocks are composed of the skins of various animals, fuch as the grey fox, racoon, pinemartin, sea-otter, seal, &c. and they are commonly worn with the hairy side outwards. Some of the natives have their frocks made of the skins of fowls, with only the down left on them, which they glue upon other substances. One or two were seen with woollen garments. At the feams, where the different skins are fewed together, they are usually adorned with fringes or taffals of narrow thongs, cut out of the fame fkins. There is a fort of Cape or collar to a few of them, and fome have a hood; but the other is the most customary form, and appears to constitute their whole dress in fair weather. They put over this, when it is rainy, another frock, made with fome degree of ingenuity from the intestines of whales, or of some other large animal, prepared with fuch skill, as to resemble, in a great measure, our gold-beaters leaf. It is formed so as to be drawn tight round the neck; and its sleeves extend down to the wrift, round which they are fastened with a string. When they are in their canoes, they draw the skirts of this frock over the rim of the hole in which they fit, fo that the water is prevented from entering. At the same time it keeps the men dry upwards; for no water can penetrate through it. It is apt to crack or break, if it is not constantly kept moist. This frock, as well as the common one made of skins, is nearly similar to the dress of the natives of Greenland. Some of them wear a kind of fkin stockings, reaching half way up their thighs. Few of them are without mittens for their hands, formed from the skins of bears paws. Those who wear any thing on their heads refemble, in this particular, the people of Nootka, having high truncated, conical caps, composed of ftraw, and fometimes of wood.

The hair of the men is commonly cropped round the forehead and neck, but the females fuffer it to grow long. The greatest part of them tie a lock of it on the crown, while a few club it behind, after our method. Both the men and women perforate their ears with feveral holes, about the outer and lower part of the edge, wherein they suspend fmall bunches of beads. They also perforate the septum of the nose, though which they often thrust the quill feathers of birds, or little bending ornaments, made of a tubulous shelly subflance, strung on a stiff cord, of the length of three or four inches, which give them a ridiculous and grotefque appearance. But the most extraordinary ornamental fashion, and which is adopted by some of the natives of both fexes, is their having the under lip cut quite thro' lengthways, rather below the fwelling part. This inci-fion frequently exceeds two inches in length, and, either by its natural retraction while the wound is still fresh, or by the repetition of some artificial management, affirmes the appearance and shape of lips, and becomes fufficiently large to admit the tongue through.

This happened to be the case when a person, with his under lip thus flit, was first feen by one of our failors, who immediately exclaimed, that the man had two mouths, which, indeed is greatly refembled. They fix in this artificial mouth a flat, narrow kind of ornament, made principally out of a folid shell or bone, cut into small narrow pieces, like teeth, almost down to the base, or thick part, which has, at each end, a projecting bit, that ferves to support it when put into the divided lip, the cut part then appearing outwards. Some of them only perforate the lower lip into separate holes: on which occasion the ornament consists of the same number of diffinct shelly studs, the points of which are thrust through these holes, and their heads appear within the lip, not unlike another row of teeth under their natural ones.

Besides the native ornaments of these people, were observed among them many beads of European manufacture, chiefly of a pale blue colour, which are hung in their ears, or about their caps, or are joined to their lip ornaments, which have a little hole drilled in each of the points to which they are fastened, and others to them, till they fometimes even hang as long as the point of the chin. In this last case, however, they cannot remove them with fuch facility; for, with respect to their own lip-ornaments, they can take them out with their tongue at pleasure. They likewife wear bracelets of beads, made of a shelly substance; or others of a cylindrical form, composed of a substance resembling They are, in general, so fond of ornaments of fome kind or other, that they fix any thing in their perforated lip; for one of them appeared with two iron nails projecting like prongs from it; and another one attempted to put a large brass button into it.

The men often paint their faces of a black colour, and of a bright red, and fometimes of a bluish or leaden hue, but not in any regular figure. The woman puncture or stain the chin with black, that comes to a point in each of their cheeks; a custom similar to which is in vogue among the Greenland semales. Their bodies are not painted, which may probably be owing to the scarcity of materials for that purpose; all the colours which they brought for sale being in very small quantities. Captain Cock observes, upon the whole, that in no country he had seen savages who take more pains than these do to ornament, or rather to dissigure, their

persons.

Their canoes are of two forts, the one large and open, the other small and covered. The larger refemble, in their construction, the great or woman's boat of Greenland, with no other difference than in the form of the head and stern, particularly of the former, which is somewhat like that of the head. The framing consists of sender pieces of wood; and the outside is composed of the skins of seals, or rather sea animals, stretched over the wood. The smaller canoes are made of the same form and materials with those of the Esquimaux and Greenlanders, and curved on the fore part like the head of a violin.

Many of their spears are headed with iron, and their arrows are generally pointed with bone. Their larger darts are thrown by means of a piece of wood about a foot long, with a small groove in the middle, which receives the dart: at the bottom is a hole for the reception of one singer, which enables them to grasp the piece of wood much sirmer, and to throw with greater force. For defensive armour they have a fort of jacket, or coat of mail, formed of laths, sastened together with sinews, which renders it very slexible, though it is so close as not to admit a dart or arrow. It serves only to cover the trunk of the body, and may not improperly

be compared to the stays of women.

Our voyagers had not an opportunity of seeing any of the habitations of these people, as none of them dwelt in the bay where our ships anchored, or where

any of them landed. With respect to their domestic utensils, they brought, in their canoes, some round and oval wooden dishes, rather shallow; and others of a

this found understoo which the use the fa it was the that if t

cylindrical form, confiderably deeper. The fides confifted of one piece, bent round, after the manner of our chip boxes, but thick, and nearly faftened with thongs; the bottoms being fixed in with small pegs of wood. Others were somewhat smaller, and of a more elegant figure, not unlike a large oval butter-boat, without any handle, but shallower. These were com-posed of a piece of wood, or some horny substance, and were fometimes neatly carved. They had a number of little fquare bags, made of the fame gut with their exterior frocks, curiously adorned with very small red feathers interwoven with it, in which were contained feveral very fine finews, and bundles of fmall cord, made out of them, plaited with extraordinary ingenuity. They likewife brought fome wooden models of their canoes, chequered baskets, wrought so closely as to hold water, and a confiderable number of fmall images, of the length of four or five inches, either of wood, or fluffed, which were covered with a piece of fur, and embellished with quill feathers, with hair fixed on their heads. Our people could not determine whether these were intended merely as children's toys, or were held in veneration, as reprefenting their deceased friends and relations, and applied to some superstitious purpose. They have many instruments formed of two or three hoops, or concentrical pieces of wood, having a cross-bar fixed in the middle, by which they are held. To these they fix a number of dried barnacle-shells, with threads, which, when shaken produce a loud noile, and thus serve the purpose of a rattle. This contrivance is probably a substitute for the rattling bird at King George's Sound.

It is uncertain with what tools their wooden utenfils, frames of canoes, &c. are made, the only one obferved among them being a kind of frone adze, fomewhat refembling those of Otahcire, and other islands in the Pacific Ocean. They have a great quantity of iron knives, some of which are rather curved, others straight, and some very small ones, fixed in longish handles, with the blades bent upwards. They have also knives of another fort, sometimes almost two feet in length, shaped, in a great measure, like a dagger, with a ridge towards the middle. They wear these in sheaths of skins, hung by a thong round their necks, under their robe or frock. It is probable that they use them only as weapons, and that their other knives are applied to different purposes.

Upon the whole, confidering the uncivilized state of the natives of this found, their northerly situation amidst a country almost continually covered with snow, and the comparatively wretched materials they have to work with, it appears that, with respect to their skill and invention, in all manual operations, they are at least equal to any other people.

The food they were feen to eat was the flesh of some animal, either roasted or broiled, and dried fish. Some of the former, that was purchased, had the appearance of bear's slesh. They likewise eat a larger fort of sernoot, either baked, or dressed in some other method. Some of our people observed them eat freely of a substance which they imagined was the interior part of the pine bark. Their drink, in all probability, is water; for, in their canoes, they brought snow in wooden vessels, which they swallowed by mouthfuls. Their manner of eating is decent and cleanly, for they constantly took care to remove any dirt that might adhere to their food; and though they would sometimes eat the raw fat of some sea animal, they did not fail to cut it carefully into mouthfuls. Their persons were, to appearance, always clean, and their utensils, in general, were kept in excellent order, as were also their boats.

With respect to the language of the inhabitants of

With respect to the language of the inhabitants of this sound, it appeared to our people difficult to be understood, perhaps owing to the various significations which their words bear; for they seemed frequently to use the same word on very different occasions; though it was the opinion of the speculative part of our people, that if they had a longer intercourse with them, No. 43.

this might probably have proved to be a mistake on their part.

SECTION III.

Beafts, Birds, Fish, Vegetables, and Metals, of Prince William's Sound. Conjectures whence the Natives procure Beads and Iron.

OUR voyagers could derive no other knowledge of the animals of this part of the world, than what they obtained from the skins that were brought by the natives for fale. These were chiefly of bears, common and pine martins, fea-otters, seals, racoons, small ermines, foxes, and the whitish cat or lynx. Among these various skins the most common were those of racoons, martins, and sea-otters, which constituted the ordinary dress of these people. The skins of seals and bears were also pretty common; and the former were, in general, white, beautifully spotted with black, or sometimes simply white; and many of the bears here

were of a dark brown hue.

Here is the white bear, of whose skins the natives brought several pieces, and some complete skins of cubs. There is also the woolverine, or quickhatch, whose skin has very bright colours; and a larger species of ermine than the common one, varied with brown, and having scarcely any black on its tail. The skin of the head of some very large animal was likewise brought to our people, but they could not positively decide what it was; though, from the colour and shagginess of the hair, and its not resembling any land animal, they conjectured that it might be that of the male ursine seal, or sea-bear. One of the most beautiful skins that came under their observation was that of a small animal, near a foot in length, of a brown colour on the back, with a number of obscure whitish specks, the sides being of a bluish ash colour, with a few of these species. The tail is about a third part of the length of the body, and is covered with whitish hair. This animal is the same with that called by Mr. Stæhlin, in his account of the New Northern Archipelago, the spotted field-mouse. But whether it was really of the mouse kind, or the squirrel, could not be determined for want of an entire skin.

Of birds found here were the halcyon, or king's fisher, the shag, the white headed eagle, and the humming bird, which often sew about the ships as they lay at anchor. The water fowl seen were black seapies, gees, a small fort of ducks, shipes, grouse, plovers, &c. &c. There is a species of the diver peculiar to the place, and of the size of a partiage.

The chief fish brought by the natives for sale were torsk and halibut; and our people caught some sculpins about the ship, with star-sish of a purplish hue, that had sixteen or eighteen rays. The rocks were almost destitute of shell sish; and the only other animal of this tribe observed, was a reddish crab, covered with very large spines.

Few vegetables of any kind were feen. The trees that chiefly grew about this found were the Canadian and fpruce pine, fome of which were of a confiderable

fize

The metals feen here were iron and copper, both of which, but more particularly the former, were in fuch abundance, as to form the points of numbers of their lances and arrows. The ores which they made use of to paint themselves with, were a brittle, unctuous, red ochre, or iron ore; a pigment of a bright blue, and black lead. Each of these seemed to be very scarce among them. Copper these people, perhaps procure by their own means, or, at most, it passes to them through sew hands; for when our people offered any of it by way of barter, they used to express its being in sufficient plenty among them by pointing to their weapons, as if they meant to intimate, that, as they had so much for their own, there was no occasion for increasing their stock.

If, however, the natives of this inlet are furnished with European Commodities by means of their terme-diate traffic to the eaftern coaft, it is rather remarkable that they should never, in return, have supplied the more inland Indians with fome of their fea-otter fkins, which would undoubtedly have appeared, at fome time or other, in the environs of Hudfon's Bay.

The natives of this place must doubtless have received from some more civilized nation the beads and iron found among them. Our voyagers were almost certain that they were the first Europeans with whom they had ever had a direct communication; and it remained to be determined from what quarter they had procured these manufactures by intermediate conveyance. It is more than probable that they had obtained these articles through the intervention of the more inland tribes, either from the fettlements about Hudson's Bay, or those on the lakes of Canada; unless the supposition can be admitted that the Ruffians, from Kamschatka, have already extended their traffic to this diffance; or that the natives of their most easterly islands carry on an intercourfe along the coast with the inhabitants of Prince William's Sound.

There are two passages into the inlet that leads to Prince William's Sound, separated from each other by an island that extends 18 leagues in the direction of fouth-west and north-east, to which Captain Cook gave

the appellation of Montague Island.

In this channel are feveral islands. Those situate in the entrance next the open fea are elevated and rocky. Those that are within are low; and as they were totally free from fnow, and covered with wood and verdure,

they were denominated Green Islands.

As Captain Cook was pursuing his voyage, feeing the appearance of a shoal, he came to anchor. noes, with a man in each, then came off to the ship. It cost them some labour to paddle across the strong-tide; and they hesitated a little before they dared venture to approach. One of them was very loquacious, but to no purpose, for the Europeans could not understand a syllable he said. While he was talking, he kept continually pointing to the shore, which was supposed to be an invitation for our people to go thither. Captain Cook made them a present of a few trifles, which he conveyed to them from the quarter gallery. These people strongly resembled those seen in Prince William's Sound, both in dress and person. Their canoes were also constructed in the same manner. One of these vifitors feemed to have no beard, and his face was painted of a jet black: the other, who was older, was not painted, but he had a large beard, and a countenance like the common fort of people in the found. Smoak was feen upon the flat wettern shore, whence it was inferred, that those lower spots were the only places in-

COOK'S RIVER.

Discovery of and Country adjacent; with an Account of the Manners, Cuftoms, Language, &c. of the Natives.

APTAIN COOK observed, in his progress on this coast, that the water, till he arrived at a certain spot, in the latitude of 60 deg. 8 min. retained an equal degree of faltness, both at high and low water, but here the marks of a river evidently appeared. Having anchored under a point of land, the water which was taken up was much more fresh than any our people had tasted, whence they concluded that they were in a large river, and not in a strait, which had a communication w' h the northern feas. Having proceeded thus far, they were anxious to have ftronger proofs, and therefore weighed with the flood, and drove up with the tide, having but little wind.

The tide is very confiderable in this river, and greatly affifts to facilitate the navigation of it. In the ftream it is high water between two and three o'clock, on the days of the new and full moon; and the tide rifes between three and four fathoms. The mouth of the river being in a corner of the coast, the ocean forces the flood into it by both shores, which swells the tide to a greater height than at other parts of this coast.

As the ships were under fail, they were attended by

many of the natives, in one large canoe, and feveral fmall ones. The latter had only one person on board each of them; and some of the paddles had a blade at each end. Men, women, and children, were contained in the large canoes. At some distance from the ship they exhibited, on a long pole, a kind of leathern frock, which our people interpreted to be a fign of their peaceable intentions. They conveyed this frock into the ship, as an acknowledgement for fome trifles which Caaptain Cook had given them.

The persons, dress, and canoes of these people, refembled those of Prince William's Sound, except that the fmall canoes were not fo large as those of the found,

and carried only one man.

Our people bartered with them for some of their fur dresses, made of the skins of animals, particularly those of sea-otters, martins, and hares. They also They also had a few of their darts, and a fupply of falmon and halibut, for which they gave fome old clothes, beads,

and pieces of iron, in exchange.

The natives were already possessed of large iron knives, and glass beads of a sky-blue colour, such as were feen among the inhabitants of Prince William's Sound. The latter, as well as those which they received from our people, they feemed to value highly. But they were particularly earnest in asking for large pieces of iron, to which they gave the name of goone; though with them, as well as with their neighbours in the found, one word feemed to have many fignifications. Their language is certainly the fame. words oonaka, keeta, and nahema, and a few others, which were frequently used in Prince William's Sound, were also commonly used by this new tribe. After paffing about two hours between the two ships, they retired to the western shore.

Our people observed that, at the lowest ebb, the water at and near the furface of the river, was perfectly fresh; though it retained a considerable degree of saltness, if taken deeper than a foot below it. not only this, but many other convincing proofs of its being a river, fuch as thick muddy water, low shores, trees and rubbish of various kinds floating backwards and forwards with the tide. Captain Cook finding, from divers observations, that all the low land which he at first imagined to be an island, was one continued track, from the great river to the foot of the mountains, terminating at the fouth entrance of the eastern branch. he denominated that branch the river Turnagain.

Captain Cook observes, that the time spent in the discovery of this great river [called afterwards, by the direction of Lord Sandwich, Cook's River] ought not to be regretted, if it should hereafter prove uleful to the present, or any future age. But the delay the co-cassioned, was an effectial loss r voyagers, who had an object of greater magnituden view. The season r voyagers, who had n view. The feafon was far advanced; and it was now evident that the continent of North America extended much farther to the west than they had reason to expect from the most approved charts. Captain Cook, however, had the fa-tisfaction to reflect, that if he had not examined this very large river, speculative fabricators of geography would have ventured to affert, that it had a communication with the fea to the north, or with Hudson's or Baffin's Bay to the east; and it would probably have been marked, on future maps of the world, with much appearance of precision.

Lieutenant King was fent with two armed boats, with orders from Captain Cook to land on the fouth-east fide of the river, where he was to difplay the flag, and, in his Majesty's name, to take possession of the country and the river. He was also ordered to bury a bottle in the earth, containing fome English coin of 1772, and a paper, whereon was written the names of the ships, people lane Lieuten on board. particular

wo armed boats, on the fouth-east play the flag, and, ion of the country o bury a bottle in pain of 1772, and armes of the ships, and the date of the discovery. The point where our people landed was named Point Possession.

Lieutenant King having executed his orders returned on board, and gave information to Captain Cook of the particular incidents which had occurred on shore. He said, that on his approach to the shore, he saw 18 or 20 of the natives with their arms extended; an attitude, he supposed, meant to signify their peaceable disposition, and to convince him they were without weapons. Seeing the officer and his attendants land, and observing muskets in their hands, they were alarmed, and requested (by expressive signs) that they would lay them down. This was immediately complied with, and then our party were permitted to walk up to them, when they appeared to be very sociable and chearful.

The natives had feveral dogs with them, and a few pieces of fresh salmon. A gentleman of our party purchased one of the dogs, and, taking it towards the boat, immediately shot it dead. At this the natives feemed exceedingly surprized; and not thinking themselves safe in such company, walked away: but it presently appeared, that they had concealed their spears and other weapons in the bushes close behind them. The ground, according to Mr. King's account, was swampy, and the foil poor and light. It, however, produced some pines, alders, birch, and willows; some rose and plant in flower to be seen.

The ships having weighed, stood to the westward, and there anchoring, were visited by several of the natives, in canoes, who bartered their skins, and afterwards parted with their garments, many of them returning perfectly naked. Among others they brought a great quantity of the skins of white rabbits and red foxes, but only two or three of those of sea-otters. Our people also purchased some pieces of halibut and salmon. They gave iron the preference to every thing offered them in exchange.

The lip ornaments were less in fashion among them than at Prince William's Sound; but those which pass through the nose were more frequent, and, in general, considerably longer. They had, likewise, more embroidered work on their garments, quiver, knife-cases, and many other articles.

Plying down the river, and casting anchor about two miles below a spot called by Captain Cook the Bluff Point, the ships were again visited by many of the natives, who attended them all the morning; and, indeed, their company was highly exceptable, as they brought with them a quantity of sine salmon, which they exchanged for some trifles. Several hundred weight of it was procured for the two ships, and the greatest part of it split, and ready for drying.

The mountains now, for the first time after the ships

The mountains now, for the first time after the ships entered the river, were free from clouds, and a volcano was perceived in one of those on the western side. Its latitude is 60 deg. 23 min. and it is the first high mountain north of St. Augustin. The volcano is near the summit, and on that part of the mountain next the river. It emits a white simoke, but no fire.

Captain Cook remarks, that all the people seen in this

Captain Cook remarks, that all the people feen in this river had a striking resemblance, in every particular, to those who inhabit Prince William's Sound.

The points of their spears and knives are made of iron: some of the sormer, indeed, are made of copper. Their spears resemble the British spontoons; and their knives, for which they have sheaths, are of a considerable length. Except these, and a few glass beads, every thing seen amongst them was of their own manufacture.

Conjectures have been formed from whence they derive their foreign articles. It cannot be supposed, however, that the Russians have been amongst them, for they would not then have been seen cloathed in such valuable skins as those of the sea-otter.

A very beneficial fur trade might certainly be carried on with the natives of this vast coast; but, without a northern passage, it is too remote for Great Britain to be benefitted by such commerce. It should,

however, be observed, that almost the only valuable skins on this west side of North America, are those of the fea-otter. Their other skins were of a superior quality; and it should be further observed, that the greater part of the fkins which were purchased of them were made up into garments. Some of them, indeed, were in pretty good condition; others old and ragged; and all of them extremely loufy. But as fkins are used by these people only for cloathing themselves, they, perhaps, are not at the trouble of dreffing more of them than they require for this purpose. This is probably the chief cause of their killing the animals, for they principally receive their fupply of food from the feas and rivers. But if they were once habituated to a conftant trade with foreigners, fuch an intercourse would increase their wants, by acquainting them with new luxuries; to be enabled to purchase which, they would become more affiduous in procuring fkins; a plentiful fupply of which might doubtless be obtained in this

ISLANDS.

ST. HERMOGENES lies in latitude 58 deg. 15 min. north; and longitude 207 deg. 24 min. It is about fix leagues in circumference, and one of a cluster of islands that are barren and uninhabited.

TRINITY ISLAND. The greatest extent of this island, according to Captain Cook's account, is about fix leagues in the direction of east and west. It has naked, elevated land at each end, and is low towards the middle. Its latitude is 56 deg. 36 min. north; longitude 205 deg. It is distant about three leagues from the continent, between which rocks and islands are interspersed. There seems nevertheless, to be a good passage, and safe anchorage.

FOGGY ISLAND lies in latitude 56 deg. 10 min. and longitude 202 deg. 45 min. and is nine miles in circumference. Captain Cook observes that it is so named in the chart, and thinks it reasonable to suppose, that it is the island on which Beering, a samous Russian navigator, had bestowed the same appellation.

The Schumagins Islands. This clufter of islands begin in the longitude of 200 deg. 15 min. east, and extend about two degrees to the westward. They are, in general, high, barren, and rugged, exhibiting very romantic appearances, and abounding with rocks and cliffs. They have several bays and coves about them, and some fresh water streams descend from their elevated parts; but the land is not embellished with a single tree or bush. The largest of the group is called Kodiak, and lies in 55 deg. 18 min. north.

HALIBUT ISLAND, so called from its abounding with the fish of that name, is seven leagues in circumference, and, except the head, is low and barren. Several small islands are near it, between which and the main there appears to be a passage of the breadth of two or

Our navigators were kept at fuch a distance from the continent by the rocks and breakers, that they had a very distant view of the coast between Halibut Island and Rock Point. They could, however, perceive the main land covered with snow, and particularly some hills, whose elevated tops towered above the clouds to a most stupendous height. On the most south-westerly of these hills was seen a volcano, which perpetually threw up immense columns of smoke. The volcano is at no great distance from the coast, and is in the latitude of 54 deg. 48 min. north. Its figure is a complete one, and the volcano is at the summit of it. Our voyagers observed, that, remarkable as it may appear, the wind, at the height to which the smoke of the volcano rose, often moved in an opposite direction to what it did at sea, even in a fresh gale.

Captain Cook takes occasion to observe, that it was evident, from divers circumstances, that the Russians had fome communication with the people of this spot, and particularly from the following. While our people were fishing they were visited by a man in a small canoe, who came from the large island. He had on a pair of green cloth breeches, and a jacket of black cloth under the frock of his own country. He had with him a grey fox fkin and fome fifhing implements; alfo a bladder, in which was supposed to be oil, as he opened it, drank a mouthful, and then closed it up. His features refembled those of the natives of Prince William's Sound, but he was perfectly free from any kind of paint. His lip had been perforated in an oblique direction, though at that time he had not any or-nament in it. Many of the words frequently used by the people of the Sound were repeated to him, but he did not appear to understand any of them, owing, as it was imagined, either to his ignorance of the dialect, or the erroneous pronunciation of our people.

From Halibut Island the thips proceeded in various directions, but mostly to the fouthward, till at length land presented itself in every direction. That to the south extended in a ridge of mountains to the southwest, which our voyagers afterwards found to be an island called.

OONALASHKA.

Introductory Remarks. Interview with the Natives. Description of their Persons, Diseases, Dispositions, Dress and Employments. Food. Habitations. Method of producing Fire. Furniture. Utensils. Tools. Canoes. Implements for Fishing and Hunting. Musical Instruments.

IT is remarked by Captain Cook, from observations he made upon his first arrival at the Island of Oonalashka, that though such of the natives as came off to the ships, and engaged in a little traffic with the crews, seemed remarkably, shy, it was evident that they were not unacquainted with vessels refembling, in some degree, those in which our voyagers sailed. He adds, that their behaviour discovered a politeness he never observed before in rude and uncultivated nations.

On coming to anchor our people were visited by several of the natives in separate canoes. They bartered some fishing implements for tobacco. A young man among them overset his canoe while he was along side of one of our boats. He was caught hold of by one of our people, but the canoe was taken up by another, and carried ashore. In consequence of this accident the youth was obliged to come into the ship, where he was invited into the cabin, and readily accepted the invitation, without any suprize or embartassment. He had on an upper garment, resembling a shirt, made of the gut of a whale, or some other large sea animal. Under this he had another of the same form, made of the skins of birds with the seathers on, curiously sewed together; the seathered side placed next his skin. It was patched with several pieces of silk stuff, and his cap was ornamented with glass beads.

His clothes being wet he was furnished by our failors with some of their own, which he put on with as much readiness as they could have done. From the behaviour of this youth, and that of several others, it evidently appeared, that these people were no strangers to Europeans, and to many of their customs. Something in the ships, however, greatly excited their curiosity; for, such as had not canoes to bring them off assembled on the neighbouring hills to have a view of

Soon after a number of the natives of both fexes were feen on the shore, seated on the grass, partaking of a meal of raw fish, which they seemed highly to relish.

The ships afterwards lest their former station, and came to anchor in the harbour called by the natives Sanganoodha. It is situated on the north side of Oonalashka, the latitude being 53 deg. 15 min. the longitude 193 deg. 30 min. and in the strait which separates this island from those to the north. It is about a mile broad at the entrance, and runs in about four miles south by west. It narrows towards the head, the breadth there not exceeding a quarter of a mile. Plenty of good water may be procured here, but not a piece of wood of any kind.

The natives when they came on board brought with them dried falmon and other fish, which the failors received in exchange for tobacco. Only a few days before every ounce of tobacco that remained in the ship had been distributed among them, and the quantity was not half sufficient to answer their demands. Notwithstanding this, so thoughtless and improvident a being is an English failor, that they were as profuse in making their bargains as if they had arrived at a port in Virginia; by which means, in less than two days, the value of this commodity was raised on board above a thousand per cent.

The men of Oonalashka are in general of the middling stature. Their faces are broad, their eyes small, their noses mostly stat, their mouths wide, and their lips thick; their teeth are uneven, and often discoloured. Their hair is black, and rather long behind, but cut before so as to reach nearly to their eye-lids. The women are generally shorter than the men, and their seatures more agreeable. They wear their hair on their foreheads in the same manner as the men.

The Russians that were here at this time never had any connection with their women on account of their not being Christians. Our people, however, were less scrupulous; and some of them had reason to repent that the women of Oonalashka encouraged their address; for their health was injured by a distemper that is not wholly unknown here. The natives are also subject to the cancer, or a complaint of a similar nature, which those who are attacked by it are studious to conceal. They do not appear to be long-lived. The Captain did not see a person, man or woman, whom he could suppose to be sixty years of age; and observed very sew who seemed to exceed fifty.

The native inhabitants of this island are, to all appearance, a very peaceable, inoffensive race of people: they are exceeding cheerful and friendly among each other, and always treated the Europeans with great civility. In point of honesty Captain Cook observed, they might ferve as a pattern to the most civilized nations. But, from what he faw of their neighbours, with whom the Ruffians are unconnected, he had fome doubt whether this was their original disposition: and was rather inclined to be of opinion, that it is the confequence of their present state of subjection. Indeed, if he did not misunderstand the Russians, they had been under the necessity of making some severe examples before they could bring the islanders into tolerable order. If sometimes the islanders into tolerable order. rable order. If feverities were really inflicted at first, the best excuse for them is, that they have produced the most beneficial effects: at present the greatest harmony subsists between the Russians and the natives. The latter have their own chiefs in each island, and feem to enjoy liberty and property without moleftation. Whether they are tributaries to the Ruffians or not he could never learn, but had fome reason to suppose they are.

The dress of the women is a frock of claim of seals ornamented with a kind of husk or ill encircling the upper part of the garment, and thence hanging down to the waist. They have the same ornament round the shoulders. They adorn their under lips with slips of narrow carved bone, wear strings of beads at the nose, as well as bunches of beads in their ears. They puncture their checks sometimes with one, and sometimes with two lines: these lines extend from the middle part of the checks to the ears. They decorate

Capta

Capta chief of a large I given to with no After th fish tool and feat pulled u was place their chins in the same form. The practice of puncturing or tattowing is confined to the female fex, who are not allowed to adopt it till they attain to a certain Their caps are of an oval form and composed of ikin, feathers and hair, the whole of which are inter-

woven with fingular ingenuity.

The dress of the men is a frock composed of the Tkins of birds ingenioully wrought together, with the feather fide inwards. Their best dress is painted before and behind just below the shoulders and breast; and to the teams which go over the shoulders are fastened rows of fur. They also wear fur upon other parts of the garment, the rows being about eight inches diftant from each other. Over these frocks, when they go on the water, they wear an additional covering composed of gut, which water cannot penetrate. It has a hood to it which is drawn over the head. They have a kind of oval fnouted cap made of wood, with a rim that admits the head. They dye their caps with green and other colours, and round the upper part of the rim they fix the long briftles of some sea animal, on which glass beads are firung; and on the front is a small image or two formed of bone.

The drefs, in its general appearance, excepting the embellishments of the fur, bears a great resemblance

to a waggoner's frock.

Various are the employments of the women, fuch as affilting in drying fish in the fummer, cutting grass in autumn for the different purposes of making thatch, baskets, mats and other utenfils, as well as gathering berries and roots.

All fewing business is confined to the women. They are the shoe-makers, taylors, and boat-builders, or boat-coverers; for the men construct the wooden frame over which the skins are sewed. They manufacture mats, and baskets of grass, which are both strong and beautiful. There is, indeed, a neatness and perfection in most of their work, that shews they are neither deficient in ingenuity or perseverance. Instead of thread they use the fibres of sinews, which they split to the thickness required. Their needles being made of bone and without eyes renders the European needles a valuable article of traffic. They manufacture mats and balkets, and indeed display a neatness and perfection in most of their works.

The men are employed in fummer in catching and drying fifth, killing whales for the winter stock of provision, making and repairing canoes, and also in do-mestic matters. They converted the greatest part of the tobacco they received by way of barter into fnuff. The method was to reduce the tobacco into powder by rubbing it in a fmall wooden bowl with a flick, to the upper end of which they fastened several stones to render it heavy. When fufficiently pulverized, it paffed

through a fine sieve, and thus ended the process.

Their food confists of whales' flesh, fish, birds, roots and berries. As the whales are generally taken at the approach of fummer, they have time to dry the flesh and prepare the blubber, which are principal parts of their winter provision. With the blubber they eat the dried halibut. This feems in some measure, to supply the want of bread. Sometimes they dip it in train oil, of which they are very fond. They likewise eat the dryed whales' flesh with oil. They are not nice in cleaning their fish, and frequently eat them raw. Boiling and broiling were the chief methods of cookery practifed among them. Some had fmall brass kettles, and some a fubilitute made of a flat stone with sides of clay.

Captain Cook once happened to be present when the chief of this island made his dinner of the raw head of a large halibut, just caught. Before any part of it was given to the chief, two of his fervants are the gills, with no other drefling than squeezing out the sime.

After this one of them having cut off the head of the fish took it to the sea and washed it, then came with it, and feated himfelf by the chief; but not before he had pulled up some grass, upon a part of which the head was placed, and the rest was strewed before the chief. No. 43.

He then cut large pieces off the cheeks, and put them within the reach of the chief, who swallowed them with great fatisfaction. When he had finished his meal the remainder of the head being cut in pieces were given to the servants, who tore off the meat with their teeth, and gnawed the bones like fo many dogs.

They dress whales' flesh in such a manner as to make it very good eating; and they have a kind of panpudding of falmon roe, beaten up fine, and fried, which is a tolerable substitute for bread. They may, perhaps occasionally, taste real bread, or have a dish in which flour is one of the ingredients. Except the juice of berries, which they generally fip at their meals, they drink no other liquor than pure water.

Berries compose a principal part of their food. They eat them with train oil, which they think adds much to their flavour. Of roots the Saranne is the most agreeable eating: when boiled it becomes mealy, and re-

fembles a potatoe.

The following is their method of building: they dig in the ground an oblong pit, which rarely exceeds fifty feet in length, and twenty in breadth; but the dimensions are in general smaller. Over this excavation they form the roof of wood, which they cover first with grass, and then with earth, so that the external appearance refembles a dung-hill. Near each end of appearance reiembies a dung-fill. Near each end of the roof is left a fquare opening, which admits the light; one of these openings being intended only for this purpose, and the other being also used to go in and out by, with the affistance of a ladder, or rather a post, in which steps are cut. In some of the houses there is another entrance below, but this is rather uncommon. Round the fides and ends of the habitations, the families, several of which dwell together, have their separate apartments, where they fleep, and fit at work; not on benches, but in a fort of concave trench, dug entirely round the infide of the house, and covered with mats, so that this part is kept pretty clean and de-cent. The same cannot be said of the middle of the house. For, though it is covered with dry grass, it is a receptacle for every kind of dirt, and the place where the urine trough stands, the stench of which is by no means improved by raw hides, or leather, being almost continually steeped in it. Behind, and over the trench, they place the few effects they have in their possession, fuch as their mats, fkins, and apparel.

No fire-place was feen in any one of their habitations; which are lighted, as well as heated, by lamps. Both fexes often warm themselves over one of these lamps by placing it between their legs under their garments, and fitting thus over it for feveral minutes. These people produce fire by collision and attrition; the first by striking two stones against each other, on one of which a quantity of brimttone has been previously robbed. The latter method is performed by means of two pieces of wood, one of which is flat, and the other is a flick of the length of about a foot and a half. They press the pointed end of the slick upon the other piece, whirling it nimbly round as a drill, and thus fire is procured in a few minutes. This method is common in many countries. It is not only practifed by these people, but also by the Kamtschadales, the Greenlanders, the

Otaheiteans, the New Hollanders, and the Brazilians, and probably by other nations.

Their household furniture confifts chiefly of wooden bowls, troughs and platters; cans, buckets, and fome-times a Ruffian kettle or pot. Though these utensils are made in a neat manner, no other tools were seen among them than the knife and the hatchet, that is, a fmall piece of flat iron made like an adze, by fixing it into a crooked wooden handle.

The canoes in use among the natives are smaller than any of those seen upon the coast of America, from which, however, they differ but little in their con-ftruction. The head is forked, and the upper point of the fork projects without the under one, which is level with the furface of the water. It is remarkable that they should thus construct them, for the fork generally

SECTION II.

catches hold of every thing that comes in the way; to prevent which, they fix a piece of small stick from one point to the other. In other respects they build their canoes after the manner of those of the Esquimaux and Greenlanders; the frame being of slender laths, and the covering of the skins of seals. They are about 12 feet in length, 18 inches in breadth in the middle, and 12 or 14 inches in depth. They fometimes carry two persons, one of whom sits in the seat, or round hole, which is nearly in the middle, and the other at about three feet distance. Round these holes is a rim or hoop of wood, about which gut skin is sewed, which can be drawn together, or opened like a purse, with leathern ftrings fitted to the outer edge. The men sit in this place, draw the fkin tight about their bodies over the gut-frock, and bring the ends of the thongs, or purfe-ftrings, over their shoulders. The sleeves of their frocks are fastened tight round their wrists; and it being close round their necks, and the hood being drawn over the head where the cap confines it, water cannot penetrate, either into the canoe, or to the body. In their fingle canoes they make use of a double-bladed paddle, which is held with both hands in the middle, ftriking the water first on one side, and then on the other, with a quick regular motion. Thus the canoe is impelled at a great rate, and in a direction perfectly straight. In failing from Egoochshak to Sanganoodha, though the ship went at the rate of feven miles an hour, two or three

canoes kept pace with her.

Their implements for fishing and hunting are well contrived and executed, being of wood and bone, and, in some respects, resembling those used by the Greenlanders. The main difference is in the point of the miffile dart, of which fome were feen on this island not above an inch in length, whereas fome of those of the Greenlanders are about fourteen inches long. Their darts (which as well as their other instruments, are curious) are generally made of fir, and are about four feet in length. One end is formed of bone, into which, by means of a focket, another small piece of bone, which is barbed, is fixed, but contrived in such a manner, as to put in and take out without trouble. This is fecured in the middle of the flick by a ftrong, though thin, piece of twine, composed of finews. The bird, fish, or other animal, is no sooner struck, than the pointed bone flips out of the focket, but remains fixed in its body by means of the barb. The dart then ferves as a float to trace the animal, and also contributes to fatigue it confiderably, fo that it is eafily taken. They throw these darts by the affistance of a thin piece of wood, twelve or fourteen inches long. The middle of this is flightly hollowed, for the better reception of the weapon; and at the termination of the hollow, which does not extend to the end, is fixed a fhort point-ed piece of bone, to prevent the dart from slipping. The other extremity is furnished with a hole for the reception of the fore-finger; and the fides are made to coincide with the other fingers and thumb, in order to grasp with the greater firmness. The natives throw these darts to the distance of 80 or 90 yards, with great force and dexterity. They are exceedingly expert in striking fish, both in the sea, and in rivers. They also use hooks and lines, nets and wears. The lines are formed of twifted finews, and the hooks of bone.

The only mulical inftrument feen here (if it deserves the name) was a kind of drum, like that of the Tschutfchi. It had only one head, composed of a part of the gut of a whale, strained very tight over a frame. But notwithstanding the distinguished simplicity of this inftrument, they greatly admire it, and it furnishes them not only with amusement, when individuals invite each other to their houses, but it also highly contributes to the entertainment of the company at all public affem-

No offensive, or even defensive, weapon was seen among the natives, of which, it was naturally supposed, they had been deprived by the Russians, for their own fafety.

Description of the Country. Vegetables. Quadrupeds. Birds. Sea Animals. Fish. Repositories of the Dead. Intercourse with the Russians. Information received from them. Conclusive Remarks.

THIS island abounds in hills, some of which are very high. The low land, of which there is but little, is very marshy, owing to the waters that are per-petually flowing from the hills. The soil on the tops of the hills is about two feet deep, under which there is a layer of small stones. The sides of the hills are rich; and the marshy low ground a fine, deep, black

As the excursions and observations of our voyagers were confined to the fea-coaft, they had not an opportunity of obtaining an extensive or particular knowledge of the animal or vegetable productions of the country.

Among the plants found here are the plantain, marthmarigold, violet, faxifrage, forrel, dock, geranium, dandelion, cole's-foot, faranne, wild cellery, a kind of creffes, and a species of mustard, all of which afforded our people excellent fallads, and were very agreeable in foups. There are berries of different species, as cran-berries, hurtle-berries, bramble-berries, heathberries, &c. There was a berry here unknown to the naturalists: it had somewhat of the taste of a sloe, but differed from it in every other respect. When eaten in any considerable quantity, it proved very aftringent. Brandy might be distilled from it. Captain Cook endeavoured to preserve some, but they fermented, and became as strong as if they had been steeped in spirits. The low land is generally covered with a long coarfe

The natives are indebted to the fea for all the wood which they use for building and other necessary purposes; as there is not a tree to be seen growing on the island, or upon the neighbouring coast of the continent.

The feeds of plants have been conveyed, by various means, from one part of the world to another; even to islands lying in the midst of extensive oceans, and far diftant from any other lands. It is, therefore, remarkable, that there are no trees growing on this part of the American continent, or upon any of the adjacent isles. They are doubtless as well fituated for receiving feeds, by the various ways of conveyance, as those coasts which have plenty of wood. Nature has, perhaps, denied to fome foils the power of raifing trees, without the affiftance of art. With respect to the driftwood upon the shores of these islands, there is no doubt of its coming from America. For though there may be none on the neighbouring coast, a sufficient quantity may grow farther up the country, which may be broke loose by torrents in the spring, and brought down to the fea; and not a little may be conveyed from the woody coafts, though fituated at a more confiderable diffance.

The quadrupeds feen here were the artic fox, and a fpecies of marmotte without ears, and having a fhort tail. The natives call them anump-cho. Here are no deer, or any domestic animals, not even dogs.

Water fowls are neither found here in fuch numbers, or in such variety, as in the northern parts of the Atlantic Ocean. However, there are some in these parts that the naturalists did not recollect to have seen in other countries, particularly the alca monochroa of Steller, and a black and white duck, which they judged to be different from the stone-duck that Krascheninikoff has described in his History of Kamtschacka. All the other birds mentioned by this author were feen, except some which were observed near the ice; and the greatest part of these, if not all, have been described by Martin, in his voyage to Greenland. Captain Cook observes, it is fomewhat extraordinary, that penguins, which are fo frequently met with in many parts of the world, should not be found in this sea. Albatrosses are extremely scarce too. The land birds seen were the bull-sinch,

the wood-pecker, the yellow-finch, titmoufe, fwallow, and wren.

Seals, and the tribe of fea animals, are not fo numerous in this as in many other feas. Sea-horfes are, indeed, to be found in prodigious numbers about the ice; and the fea-otter is fcarce any where to be met with but in this fea. An animal was fometimes feen by our people that blew after the manner of whales. It had a head refembling that of a feal. It was larger than that animal, and its colour was white, with dark fpots inter-fperfed. This was, perhaps the manati, or fea-cow.

The fish that most abound here are falmon, rockcod, trout, and halibut. About the middle, and to the end, of October, the inhabitants catch cod. Whales, porpoiles, and grampules, are likewife taken here.

There are few other infects here belides mulketos,

and few reptiles, except lizards.

Native fulphur was observed among the people of this island, but our people could not learn where they procured it. They also found ochre, and a stone that affords a purple colour; besides another that gives a good green. This last, in its natural state, is of a greyish green hue, coarse, and heavy. It readily disfolves in oil; but when it is put into water, it altogether loses its properties. The stones about the shore and hills were in no inftance remarkable.

The Oonalashkans inter their dead on the tops of hills, and raife over the grave a little hillock. One of the natives, who attended Captain Cook in a walk into the country, pointed out feveral of these repositories of the dead. There was one of them by the side of a road, that had a heap of stones over it; and all who passed it added a ftone to the heap. In the country were feen feveral ftone hillocks, that feemed to have been artificially raifed. Some of them were to appearance, of great antiquity.

Our countrymen could derive no knowledge respect-ing either the religion or diversions of these people, having feen nothing that could give them an infight into

An extraordinary incident brought on an intercourfe between our officers and the Russians resident at Oona-Jashka. Captain Cook received, by the hands of a native a few days after he came to anchor in Sanganoodha Bay, a very fingular prefent. It was a rye loaf, or rather a pie in the form of a loaf, as it enclosed some falmon, well seasoned with pepper. This man had brought a similar present for Captain Clerke, and a note for each of the captains, written in a character which they did not understand. It was natural to imagine that these two presents were from some Russians then in the neighbourhood, and therefore the captains fent, by the fame messenger, to these unknown friends, a few bottles of rum, wine, and porter, which they supposed would be highly acceptable. Captain Cook also sent with the native the corporal of the marines, an intelligent man, for the purpose of gaining farther informa-tion, with orders, that if he met with any Russians, he should endeavour to make them understand, that the strangers were Englishmen, the friends and allies of their

The corporal returned with three Ruffian feamen, or furriers, who, with feveral others, refided at Egoochfhac, where they had some store-houses, a dwellinghouse, and a sloop of about thirty tons burthen. One of these Russians was either master or mate of this vessel. They were all three intelligent, well-behaved men, and extremely ready to give our people all the information they could defire.

They appeared to have a perfect knowledge of the at-tempts which their countrymen had made to navigate the Frozen Ocean, and of the discoveries that had been made from Kamtíchatka, by Beering, Tscherikoss, and Spangenberg. Never was greater respect paid to the memory of any eminent person, than by these men to that of Beering.

The trade in which they are engaged is very advantageous, and its being undertaken and extended to the

eastward of Kamtschatka was the immediate result of the second voyage of that distinguished navigator, whose misfortunes proved the source of much private benefit to individuals, and of public utility to the Ruf-sian empire. And yet, if his diffresses had not accidentally carried him to the island which bears his name, where he ended his life, and from whence the remainder of his ship's crew brought back specimens of its valuable fors, the Ruffians would probably have undertaken no future voyages, which could lead them to make difcoveries in this fea, towards the American coaft. Indeed after this time, their ministry seem to have paid less attention to this object; and for what discoveries have been since made, the world is principally indebted to the enterprizing spirit of private merchants, encouraged, however, by the superintending care of the court of Petersburgh.

The three Rushans departed perfectly satisfied with the recention they had mer with and promised to re-

the reception they had met with, and promised to return in a few days, and bring with them a chart of the islands situate between Kamtschatka and Oonalashka.

While Captain Cook was at a village not far from Sanganhoodha, a Ruffian landed there, who proved to Sanganhoodha, a Ruffian landed there, who proved to be the principal person among his countrymen in this and the adjacent isles. His name was Erasim Gregorioff Sin Ismyloff. When he came on board the Resolution, Captain Cook sound him very well acquainted with the geography of those parts, and with all the discoveries which had been made in this quarter by the

Not only Ismyloff, but also the other Russians affirmed that they were totally unacquainted with the American continent to the northward, and that no Ruffian had feen it of late years. They called it by the fame name which Mr. Stæhlin has erroneously affixed to his

large island, that is, Alaschka.

The Russians, as our people were informed, have made feveral attempts to gain a footing upon that part of the North American continent that lies contiguous to Oonalashka and the adjacent islands, but have con-ftantly been repulsed by the inhabitants, whom they reprefented as a very treacherous people. They made mention of two or three captains, or chief men, who had been murdered by them; and some of the Russians shewed wounds, which they declared they had received there. They also informed our people, that, in the year 1773, an expedition had been undertaken into the Frozen Ocean in sledges, over the ice, to three large islands, that are fituate opposite the mouth of the river

A few days after their promife, the three Ruffians whom the corporal had brought, returned with the charts before-mentioned. These charts were two in number, were both manuscripts, and bore every mark of authenticity. One of them comprehended the Pen-fhinskian Sea; the coast of Tartary, as low as the lati-tude of 41 deg. north; the Kurile Islands, and the peninsula of Kamtschatka. The other chart compre-hended all the discoveries that the Russians had made to the eastward of Kamtschatka towards America.

The latitude of the coast discovered by Beering and Ticherikoff, particularly that part of it discovered by the latter, differs considerably from Mr. Muller's

According to Ismyloff's account, neither the number or situation of the islands which are dispersed between 32 deg, and 55 deg. of latitude, in the space between 32 deg. tween Kamtschatka and America, is properly ascer-tained. He struck out a third of them, assuring Capt. Cook that they did not exift, and he confiderably altered the fituation of others, which, he faid, was necessary from the observations which he himself had made; and there was no reason to entertain a doubt about this these islands are nearly under the same parallel, different navigators, mifled by their different reckonings, might eafily mistake one island, or cluster of islands, for another, and imagine they had made a new discovery, when they had only found old ones, in a position forme-

what different from that which their former visitors had

affigned to them.

The Isles of St. Theodore, St. Stephen, St. Abraham, St. Macarius, Seduction Island, and several others which are represented in Mr. Muller's chart, were not to be found in this now produced. Nay, If-myloff, and the other Russians, affured Captain Cook, that they had been frequently fought for without effect. Nevertheless, it is difficult to believe that Mr. Muller could place them in his chart without fome authority. Captain Cook, however, confiding in the testimony of these people, whom he thought competent witnesses, omitted them in his chart, and made fuch corrections respecting the other islands, as he had reason to think were necessary.

The American continent is here called, by the Ruffians, as well as by the islanders, Alaschka; which appellation, though it properly belongs only to that part which is contiguous to an island called Ooneemak, is made use of by them when speaking of the American

continent in general.

This was all the intelligence Captain Cook got from these people respecting the geography of this part of the globe; and, perhaps, all the information they were able to give. For they repeatedly affured him, that they knew of no other islands besides those which were represented upon this chart, and that no Russian had ever visited any part of the American continent to the northward, except that which is opposite the country of the Tíchutíki.

Having contracted an acquaintance with these Rusfians, our officers visited their settlement on the island. It confifted of a dwelling-house and two store houses. Besides the Russians, there was a number of the Kamtschadales, and of the Oonalashkans, as servants to the former. Some other natives of this island, who appeared to be independent of the Ruffians, lived at the fame place. Such of them as belonged to the Ruffians were all of the male fex; and they are either taken, or purchased, from their parents when young. There were at this time about twenty of these, who could be considered in no other light than as children. They all refided in the same house; the Russians at the upper end, the Kamtíchadales in the middle, and the Qonalashkans at the lower end.

Captain Cook, at the close of his account of this island, remarks, that though the resemblance of the inhabitants of his north-western side of America, to those of the Esquimaux and Greenlanders, in various particulars of person, dress, weapons, canoes, and the like, could not but attract his attention, he was much less ftruck with this, than with the affinity subsisting between the dialects of the Greenlanders of Esquimaux, and those of Oonalashka. He observes, that, with respect to the words which were collected by our people on this fide of America, too much stress is not to be laid upon their being accurately represented; for after the death of Mr. Anderson, there were sew who took any great degree of pains about fuch matters; and they had often found that the same word, written down by two or more persons, from the mouth of the same native, differed confiderably, on being compared together. Nevertheless he affirms, there is enough to authorize this judgement, that there is great reason to suppose that all these nations are of the fame extraction; and if that be the cafe, there is a little doubt of there being a northern communication by fea, between the western fide of America, and the eaftern fide, through Baffin's Bay; which communication, however, is, perhaps, effectu-ally flut up against ships, by ice and other obstructions; fuch, at least, was Captain Cook's opinion.

Having thus described every particular observation made by Captain Cook relative to the island of Oonalashka, together with the manners, customs, and fingular ceremonies of the inhabitants, we shall now proceed to his account of Nootka, or King George's Sound, which he vifited in his laft voyage, and of

which he gives the following account:

NOOTKA, OR KING GEORGE'S SOUND.

SECTION I.

Discovery. First Interview with the Natives. Curious Ceremonies previous to their coming on board. Trade established. Articles of Trassec. European Trade engroffed by the Natives of Superior power.

APTAIN COOK, in his last voyage, being in the latitude of 30 deg. north, observes, that tho' it was then the winter season the people on board only began to seel a sensation of cold in the mornings and evenings, and he makes this remark as a proof of the equal and durable influence of the heat of the fun at all times to 30 degrees on each fide the equinoctial line.

When they reached the latitude of 49 deg. 29 min. north, numbers of lofty mountains prefented themfelves to view, the fummits of which were covered with fnow. The vallies between them and the land towards the coast were covered with tall straight trees that appeared like a vast forest. Between two Points, called by Captain Cook, Point Breakers and Woody Point, a large Bay is formed, which he called Hope Bay, hoping, as he faid, to find in it a good harbour, and the event proved he was not mistaken.

As foon as they approached an inlet to the northeast corner of the bay, they perceived the coast to be inhabited; and three canoes came off to the ship, in one of which were two men, in another six, and in the other ten. Advancing pretty near, a person stood up in one of the two last, and spoke for a considerable time, inviting our people, as they supposed by his gestures, to go alhore, and, at the fame time continued strewing feathers towards them. Some of his companions also threw a red powder in the same manner.

The person who was the orator on this occasion was cloathed with the fkin of fome animal, and held fomething in each hand which rattled as he shook it. At length, grown weary with his repeated exhortations, of which they could not comprehend a word, he became quiet; and the others, in their turn, had fomething to fay; but their speeches were neither so long, or so vehement as that of the other. The hair of two or three of these people was strewed over with small white feathers; and that of others with large ones, stuck into different parts.

The tumultuous noise having ceased, they lay at a fmall distance from the ship, conversing together much ease and composure, without shewing the least distrust or surprize. Some of them rose occasionally, and faid fomething aloud, after the manner of their first harangues; and one, in particular, sung a most agreeable air, accompanied with a degree of melody and foftness; the word baela being frequently repeated

as the burden of the fong.

When the ships came closer to the shore, the canoes began to visit them in great numbers, there being, at one time, no less than 32 of them about them, containing from three to seven or eight persons each, and of both sexes. Several of these also stood up and spake aloud, using the same gestures as the first visitors. One canoe particularly attracted observation, by a peculiar head, which had a bird's eye, and an enormous large beak, painted on it. The person who was in it, and who appeared to be a chief, was equally remarkable for his fingular appearance, having a large quantity of feathers hanging from his head, and being painted or fmeared in a very extraordinary manner. In his hand he had a carved bird of wood, of the fize of a pigeon, with which he often rattled, and was equally vocife-rous in his harangue, which was accompanied with many expressive gestures. Though these visitors were fo peaceable, that they could not be suspected of any hostile intention, not any of them could be prevailed upon to come on board. They were ready, however, to part with any thing they had, and received whatever

Some ceremonies took place among these people previous to their coming on board. They paddled, with their utmost strength and activity, round both the fhips; a chief, all this time, flanding up with a fpear in his hand, and fpeaking, or rather bawling, most vo-ciferously. The face of this orator was fometimes covered with a mask, representing either a human countenance, or that of some other animal; and, instead of a spear, he had a kind of rattle in his hand. Having made this ceremonious circuit round the ship, they would come along fide, and then begin to traffic with our people. Frequently, indeed, they would first enter-tain them with a fong, in which their whole company joined, and produced a very agreeable harmony. When the ships came to anchor they were surrounded

by canoes filled with the inhabitants, a reciprocal trade was commenced, and conducted with the strictest harmony and integrity on both fides. Their articles of commerce were the skins of various animals, such as bears, fea-otters, wolves, foxes, deer, racoons, marbears, fea-otters, wolves, foxes, deer, racoons, martins, and pole-cats. They also produced garments made of skins; and another kind of cloathing, fabricated from the bark of a tree, or a plant resembling hemp. Besides these articles, they had bows, arrows, spears, sish-hooks, various kinds of instruments, wooden vizors representing horrid figures, a fort of woollen stuff, carved work, beads, and red ochre; also several little organizers of thin brass and iron, resembling a horseornaments of thin brass and iron, resembling a horseshoe, which they wore pendant at their nofes. They had likewife several pieces of iron fixed to handles, fomewhat resembling chiffels. From their being in posession of these metals, it was natural for our people to infer, that they must either have been visited before by people of fome civilized nation, or had connections with those on their own continent, who had some communication with them.

But the most extraordinary articles which they offered to fale were human skulls and hands, with some of the flesh remaining on them, which they acknow-ledged they had been feeding on; and some of them, indeed, bore evident marks of their having been upon the fire. From this circumstance it was but too ap-parent, that the horrid custom of devouring their ene-mies is practifed here as much as at New-Zealand, and other South Sea islands. There is too much reason, from their bringing to sale human skulls and bones, to infer, that they treat their enemies with a degree of brutal cruelty; yet this circumstance rather marks a general agreement of character with that of almost every tribe of uncivilized men, in every age, and in every part of the globe. For the various articles they brought, they received in exchange, knives, chiffels, nails, looking-glaffes, buttons, pieces of iron and tin, or any kind of metal. They had not much inclination for glass beads, and rejected every kind of cloth.

glass beads, and rejected every kind of cloth.

Such of the natives as visited our people daily, were the most beneficial to them; for, after disposing of their trifles, they employed themselves in fishing, and they always pertook of what they caught. They also procured for them a considerable quantity of good animal oil, which they brought in bladders. Some, indeed, attempted to chear, by mixing water with the oil; and, once or twice, they so far imposed upon them, as to fill their bladders with water only. But it was better to wink at these impositions, than suffer them to produce a quarrel; for the European articles of traffic produce a quarrel; for the European articles of traffic chiefly confifted of trifles, and it was found difficult to produce a conflant supply even of these. Beads, and such like toys, of which some were remaining, were not highly estimated. Metal was principally commanded by the natives; and brass had now supplanted iron, being fought after with fuch eagerness, that before the thips left the found, hardly a bit of it was to be found in them, except that conflituted a part of the necessary

inftruments. Suits of cloaths were stripped of their buttons, bureaus of their furniture, kettles, cannificts, and candlesticks; all went to rack; so that they procured a greater variety of things than any other nation our people had visited.

A party of ftrangers, in feven or eight canoes, came into the cove, and, after looking at the ftrangers for fome time, retired. It was apprehended that their old friends, 'who, at this time, were more numerous about the ships than the new visitors, would not suffer them to have any dealings with our people. It was evident, indeed, that the principal natives engrossed them entirely to themselves; and that they carried on a traffic with more diftant tribes in those articles they had received; for they frequently disappeared for four or five days to-gether, and returned with fresh cargoes of curiosities and skins, which our people were so passionately fond of, that they always came to a good market. Our people were convinced of this on many other occasions.

Nay, even among those who lived in the found, the weaker were often obliged to submit to the stronger party, and were plundered of every thing, without even attempting to make any reliftance.

SECTION II.

Vifits from and to the Natives of the different Parts of the Sound, and Inflances of their Civility. Treatment received from an inhospitable Chief. Groundless Apprehen-sions of an Attack. Injurious Thests. Claims of the Natives for the Produce of the Country.

THE natives were not discouraged, by some bad weather that happened, from making our people daily vifits; and, in their fituation, fuch vifits were very acceptable. They frequently brought them a supply of fish, when they were unable to catch any with a hook and line; and they had not a convenient place to draw The fish they brought were small cod, and a fmall kind of bream, or fardine.

The officers received a vifit, in the evening, from a tribe of natives not feen before, and who, in general, made a better appearance than their old friends. They were conducted into the cabbin, but there was not an object that engaged their attention: all hovelties were looked on with indifference, except by a very few, who

shewed a certain degree of curiosity.

When the most important business of the ship was finished, Captain Cook set out to survey the found, and going first to the west point, he discovered a large village, and, before it, a very fnug harbour, with from nine to four fathom water. The inhabitants, who were nine to four fathom water. The inhabitants, who were numerous, received him with great courtefy, every one preffing him to enter his apartment; for feveral families have habitations under the fame roof. He politely accepted the invitations; and the hospitable friends whom he visited testified every mark of civility and respect.

Captain Cook, proceeding up the west-side of the found, for near three miles, faw feveral islands, fo situated as to form fome convenient harbours.

Proceeding some distance farther he found the ruins of a village. The framings of the houses remained standing, but the boards or roofs were taken away. Behind this deferted village was a fmall plain, covered with large pine trees. This was, indeed, fingular, as most of the elevatest ground on this side of the sound appeared rather nakell.

On the east-fide of the found the Captain found what he had before imagined, that it was an island under which the ships lay, and that many smaller ones lay feattered on the west side of it. Upon the main land, opposite the north end of the island, he observed a village, and landed there; but he was not fo politely received by the inhabitants, as by those of the other vil-lage he had visited. This cold reception was occasioned by one surely chief, who would not suffer the Captain to enter their houses, but followed him wherever he went,

No. 44.

making expressive figns that he was impatient for him to be gone. The Captain attempted, but in vain, to footh him with presents; for though he did not result them, he continued the same kind of behaviour. But notwithstanding this treatment from the inhospitable chief, fome of the young women expeditionly apparelled themselves in their best, assembled in a body, and gave him a hearty welcome to the village, by joining in an agreeable fong. Evening now drawing on, the Captain proceeded for the ships round the north end of the island. When he returned on board, he was informed that, in his absence, some strangers, in two or three large canoes, had made a vifit to the ships, from whom our people understood by figns, that they had come from the south east. They brought with them several garments, skins, and other articles, which they bartered for some of ours. But the most remarkable circumstance was, that two filver table-spoons were purchased of them by our people, which appeared to be of Spanish manufacture. They were worn round the neck of one of these visitors by way of ornament.

The day following a party of the natives from the

fouthward advanced towards the ships, all standing up in their canoes, and began to fing. Some of their fongs were flow and folemn, and in which they were joined by the whole body: others were in quicker time, and their notes were regularly accompanied by the motions of their hands, their paddles beating in concert on the ficles of the canoes; and they, at the fame time, exhibited the most expressive gestures. They remained filent, for a few feconds, after the conclusion of each fong, and then began again, frequently pronouncing the word home as a kind of chorus.

Having thus favoured our people with a specimen of their mulic, with which they were highly entertained for half an hour, they came nearer the thips, and barterer with them. They now perceived that some of their old friends from the found were among them, who managed for the strangers in the traffic carried on

between them and our people.

Soon after our people had occasion for a very ferious alarm. The party who were employed on shore, in cutting wood and filling water, observed that the natives, in all quarters, were arming themselves in the best manner they were able; and that those who had not proper weapons, were collecting flicks and flones. Hearing this, they thought it necessary to arm also, but resolved to act upon the defensive only, Captain Cook ordered all the workmen to repair to the rock on which the obfervatories had been placed, leaving the supposed enemy in possession of the ground where they had affem-bled, which was within about 100 yards of the Resolution's stern. The danger, however, was only imaginary: for these hostile preparations were directed against a body of their own countrymen, who were advancing to attack them; and when they perceived the apprehenfions of our people, they exerted their best endeavours to convince them that this was really the case. People were observed looking out on both sides of the cove, and canoes were frequently dispatched between them and the main body. The adverse party, on board about a dozen large canoes, at length drew up in line of battle, off the fouth point of the cove, a negociation for the restoration of peace having been commenced. In conducting the treaty, feveral people in canoes passed between the two parties, and some debates en-At length the matter in dispute appeared to be adjusted; but the strangers were not permitted to approach the ships, or to have any intercourse or dealings with our people.

Our people were, no doubt, the occasion of the quarrel, the strangers, perhaps, infisting on having a right of sharing in the advantages of a trade with them, their first friends rejolving to engross them entirely

to themselves.

If they at first had apprehended that our people meant to be hostile, their fears were now removed; for they ventured on board the ships, and mixed with them with the utmost freedom and familiarity.

Our people found, after a short intercourse with the natives, that they were as much addicted to theft as any they had met with during the voyage; and having sharp instruments in their possession, they could easily cut a hook from a tackle, or a piece of iron from a rope. Besides other articles, they lost several hooks in this manner, one of which weighed between twenty and thirty pounds. They stripped the boats of all the iron that was worth taking away, though some of the crew were always left in them as a guard. They were, indeed, fo dextrous in effecting their purposes, that one fellow would contrive to amuse our people at one end of the boat, while another was forcing off the iron-work at the other. If any article that had been stolen was immediately missed, the thief was easily detected, as they were fond of impeaching each other. But the prize was always reluctantly given up by the guilty person; and fometimes compulfive means were obliged to be

Engrai

exercised for that purpose.

These visitors being gone, the Captains Cook and Clerk went with two boats to the village at the west point, where Captain Cook had been two days before, and had observed that plenty of grass was to be had near it; and it was necessary to get a supply of this for the few remaining goats and sheep which are still on board. They experienced the same welcome reception that the Captain had met with before; and foon after they were ashore, Captain Cook ordered some of his people to begin cutting, not imagining that the natives would object to their furnishing themselves with what could not be of any use to them, though effentially heceffary for the Europeans. In this, however, he was milaken; for as foon as the men began gutting the grafs, some of the inhabitants would not permit them to proceed, saying, "makook," which signified that they must buy it first. The Captain, at this time, was in one of the houses, but, hearing of this, he repaired immediately to the field, where he found about a dozen claimants of different parts of the grass that grew on the premises. He treated with them for it, and having complied with the terms of his purchase, thought his men had now full liberty to cut whatever they pleafed. Here he was again mittakin; for he had fo liberally paid the first pretended proprietors, that fresh demands were made from others; so that it almost appeared that every fingle blade of grass had a separate owner; and so many of them were to be facisfied, that his pockets prefently became empty. When they were, however, convinced that he had nothing more to give, they ceased to be importunate, and the men were permitted to cut where they pleased, and as much as they pleased.

Captain Cook observes, that he never met with any uncivilized nation, or tribe, who possessed such strict notions of their having an exclusive property in the pro-duce of their country, as the, inhabitants of this found. They even wanted our people to pay for the wood and water that was carried on board. Had the Captain been present when these demands were made, he would doubtless have complied with them; but the workmen thought differently, and paid little or no attention to fuch claims. The natives, thinking they were determined to pay nothing, at length ceafed to apply. they frequently took occasion to remind them, that they had given the wood and water out of friendship.

SECTION III.

Perfons, Dress, Disposition, and Language. Political and Religious Institutions of the Natives. Number of Inhabitants."

these the face frequently appears fallen in quite across between the temples. The nose flattens at its base, has wide nostrils, and a rounded point. The forehead is low; the eyes small, black, and languishing; the mouth round, the lips thick, and the teeth regular and well set, but not remarkable for their whiteness.

Many of the men have no beards at all, and others only a small thin one upon the point of the chin. This does not arise from an original deficiency of hair on that part, but from their plucking it out by the roots; for those who do not destroy it have not only considerable beards on every part of the chin, but also whiskers, or mustachias, running from the upper lip to the lower jaw obliquely downwards. Their eye-brows are also fearty and narrow, but they have abundance of hair on the head, which is ftrong, black, ftrait, and lank. Their necks are fhort, and their arms are rather clumfy, having nothing of beauty or elegance in their for-mation. The limbs, in all of them, are fmall in propor-tion to the other parts; besides they are crooked and ill-formed, having projecting ancles, and large feet, which are aukwardly shaped. The latter defect seems to be occasioned, in a great measure, by their sitting so continually on their hams or knees.

Their colour cannot properly be ascertained, their bodies being encrusted with paint and nattiness; though when the paint as been carefully rubbed off, the skin was little inserior in whiteness, to that of the Europeans, but of that palish cast which distinguishes the inhabitants of our fouthern nations. Some of them, when young, appear rather agreeable, when compared to the generality of the people; that period of life being attended with a peculiar degree of animation; but, after a certain age, the diffinction is hardly observable; a remarkable fameness characterizes every countenance, dulness and want of expression being visibly pourtrayed in every vifage. The women, in general, are of the fame fize, colour, and form, with the men; nor is it easy to diffinguish them, as they possess no natural seminine delicacies. Nor was there a fingle one to be found, even among those who were in their prime,

who had the least pretentions to beauty or comline's.

The ordinary dress of both sexes is a flaxen kind of mantle, ornamented with a narrow stripe of fur on the upper edge, and fringes on the lower edge. Paffing under the left arm, it is tied over the right shoulder, leaving both arms perfectly free. Sometimes the mantle is failened round the waift by a girdle of coarse matting. Over this is worn a small cloak of the same substance, reaching to the waift, also fringed at the bottom. They wear a cap like a truncated cone, or a flower-pot, made of a very fine matting, ornamented with a round knob, or a bunch of leathern taffals, having a ftring paffing under the chin, to prevent its blowing off.

The above dress is common to both sexes; and the men often wear, over their other garments, the fkin of forme animal, as a bear, wolf, or fea-otter, with the hair outwards: fometimes tying it before, and fome-times behind, like a cloak. They throw a coarse mat about their shoulders in rainy weather; and they have woollen garments, which are but little used. They generally wear their hair hanging loofely down; but those who have not a cap tie it in a kind of bunch on the crown of the head.

Their dress is certainly convenient, and, were it kept clean, would not be inelegant; but as they are continually rubbing their bodies over with a red paint, mixed with oil, their garments become greafy, and contract a rancid, offentive fmell. The appearance of these people is both wretched and filthy, and their heads and garments fwarm with vermin. So loft are they to every idea of cleanlines, that our people frequently saw them pick them off and eat them with the greatest com-

Their bodies, it has been observed, are always covered with red paint, but their faces are ornamented with a variety of colours; a black, a brighter red, or a white colour. The last of these gives them a ghally

horrible appearance.

Many of their ears are perforated in the lobe, where they make a large hole, and two finaller ones higher up on the outer edge. In these holes are hung bits of bone, quills fastened upon a leathern thong, shells, bunches of tassals, or thin pieces of copper. In some the feptum of the nose is also personated, and a piece of cord drawn through it.

The bracelets, which they wear about their wrifts, are bunches of white fingle beads, or thongs with taffals, or a broad black horny thining substance. Round their ancles they frequently wear leathern thongs, or the sinews of animals curiously twisted.

They have some dresses that are used only on extraordinary occasions, such as going to war, and exhibiing themselves to strangers in ceremonial visits. Amongst these are the skins of wolves or bears, tied on like other garments, but edged with broad borders of fur, ingeniously ornamented with various figures. These are occasionally worn separately, or over their common cloathing. The most usual head-dress, on these occasions, is a quantity of withe, wrapped about the head, with large feathers, particularly those of eagles, stuck in it; or it is entirely covered with small white feathers. At the same time the sace is variously painted; the upper and lower parts being of opposite colours, and the strokes having the appearance of fresh gashes-or it is besmeared with a kind of fat or tallow, mixed with paint, formed into a great variety of figures, fomewhat like carved work.

Sometimes the hair is separated into small parcels, and tied, at intervals, with thread; and others tie it together behind, after the English manner, and stick in it some branches of the cupressus thyoides. Thus equipped, they have a truly favage and ridiculous appearance, which is much heightened when they affume their monftrous decorations. These consist of great variety of wooden masks, applied to the face, fore-head, or upper part of the head. Some of shese vizors refemble human faces, having hair, beards, and eye-brows; others represent the heads of birds, and many the heads of animals; fuch as deer, wolves, porpoifes,

and others. These representations generally exceed the natural fize, and they are frequently strewed with pieces of the foliaceous mica, which makes them glitter, and augments their deformity. Sometimes they fix large pieces of carved work upon the head, projecting to a confiderable diffance, and refembling the prow of a canoe, So much do they delight in these disguises, that, for want of another mask, one of them was seen to thrust his head into a tin-kettle, which he had brought from our

People.

Whether these extravagant masquerade ornaments are used on any religious occasion, or in any kind of diver-fion, or whether they are calculated to intimidate by their monstrous appearance, or as decoys when hunting animals, is uncertain: but if travellers, in an ignorant and credulous age, when more than marvellous things were supposed to exist, had seen several people decorated in this manner, and had not approached so near them as to be undeceived, they would have believed, that a race of beings exilled, partaking of the nature of man

and beaft.

Among the people of Nootka, one of the dreffes feems particularly adapted to war. It is a thick tanned leathern mantle doubled, and appears to be the skin of an elk or buffalo. This is fastened on in the ordinary manner, and is so contrived as to cover the beast quite up to the throat; part of it, at the fame time, falling down to their heels. This garment is sometimes very curiously painted; and is not only strong enough to reeven spears cannot piece it; so that it may be considered as their compleated defensive armour. Sometimes they wear a fort of leathern cloak, over which are rows of the hoofs of deer placed horizontally, and covered with quills, which, on their moving, make a loud ratling noife.

Though these people cannot be viewed without a kind of horror, when they are thus strangely apparelled, yet, when divested of these extravagant dresses, and behind in their common habit, they have no appearance of ferocity in their countenances, but feem to be of a quiet, phlegmatic disposition; deficient in animation and vivacity, to render themselves agreeable to society. They are rather referved than loquacious; but their gravity feeras constitutional, and not to arise from a conviction of its propriety, or to be the result of any particular mode of education; for, in their highest paroxysms of rage, they have not heat of language, or significancy of gestures, to express it sufficiently. They appear to be docile, courteous, and good-natured; but they are quick in refenting injuries, notwithstanding the predominancy of their phlegm; and, like other paffionate people, as quickly forgetting them, These fits of passion never extended farther than the parties immediately concerned; the spectators never entering into the merits of the quarrel, whether it was with any of the Europeans, or among their own people, shewing as much indifference as if they were wholly unacquainted with the whole transaction. It was common to see one of them rave and scold, while all his aguation did one of them rave and icoid, while all his aguation did not in the leaft excite the attention of his countrymen, and when the people could not difcover the object of his displeasure. They never betray theleast symptom of timidity upon these occasions, but seem resolutely determined to punish the insulter. With respect to our people, they were under no apprehensions about our superiority; but if any difference arose, were as anxious to avenge the wrong, as if the cause of quarrel had been among themselves.

been among themselves.

Their other passions appear to lie dormant, especially their curiosity. Few expressed any desire or inclination to fee or examine things with which they were unacquainted, and which, to a curious observer, would have appeared aftonishing. If they could procure the articles they knew and wanted, they were perfectly fatissied, regarding every tilling else with great indiffer-ence. Nor did the persons, dress, and behaviour of the English, (though so very different from their own,) or even the size and construction of their ships, seem to

command admiration or attention.

Their indolence may, indeed, be a principal cause of this. But it must be admitted that they were not wholly unsusceptible of the tender passions, which is evident from their being sond of music, and that too of the tru-

ly pathetic kind.

Their eagerness to possess iron, brass, or any kind of metal, was fo great, that, when an opportunity prefented itself, few of them could resist the temptation to steal it. The Natives of the South Sea islands, as appears in many instances, would steal any thing they could find, without confidering whether it was ufeful to them or not. The novelty of the object was a fufficient inducement for them to get possession of it by any means. They were rather actuated by a childish curiofity, than by a thievish disposition. The inhabitants of Nootka, who made free with the poperty of our people, are intitled to no such apology. The appellation of thief is certainly due to them; for they knew that what they pilfered from them might be converted to the purposes of private utility, and, according to their estimation of things, was really valuable. Luckily they fet no value upon any European articles except the metals. Linens, and many other things, were fe cure from their depredations, and might fafely be left hanging out all night ashore, without being watched, The principle which prompted these people to pilser, would probably operate in their intercourse with each other. There was, indeed, abundant reason to believe, that stealing is very common amongst them, and frequently produced quarrels, of which our people saw more instances than one.

The younger part of the men are flothful, being generally fitting about, in scattered companies, balking themselves in the fun, or wallowing in the fand upon the beach like fo many hogs, without any kind of covering. This difregard of decency was, however, confined folely to the men. The women were always decently cloathed, and behaved with great propriety, justly meriting all commendation for a modelt bashful-

ness, so becoming their fex.

Their language is by no means harsh or disagreeable, farther than proceeds from their using the k and h with more force, or pronouncing them with less foftness, than we do; and, upon the whole, it abounds rather with what we may call labial and dental, than with guttual founds. The fimple founds, which our people have not heard them use, and which consequently may be reckoned rate, or wanting in their language, are those represented by the letters a, d, f, g, r, and v.

Their method of fpeaking is very flow and diffinct. The language has few prepolitions and conjunctions, and, as far as could be discovered, is destitute of even a fingle interjection, to express admiration or surprize.

With respect to the relation or affinity the language of these people may bear to that of any others, Captain Cook observes, that, from the few Mexican words he had been able to procure, there was an obvious agreement in the very frequent terminations of the words in , tl, and z, throughout the language.

Their orations, which are made either when engaged in any altercation or dispute, or to explain their ntiments publicly on other occasions, feem little more than fhort fentences, or rather fingle words, forcibly repeated, and constantly in one tone and degree of ftrength, accompanied only with a fingle gefture; which they use at every sentence, jerking their whole body a little forward, by bending the knees, their arms hang-

ing down by their fides at the time.

With respect to the political and religious inflitutions of the inhabitants, little information could be obtained. It appeared, however, that there were such men as chiefs, diftinguished by the title of Acweek, to whom the others are, in some degree, subordinate. But the authority of each of these great men seems to extend no farther than to his own family, who acknowledge him as their head. As they were not all elderly men, it is posible this title may be hereditary.

No opinion could be formed of their religion, but from what they called Klumma. These, perhaps, were idols: but as the word Acweek was frequently mentioned when they spoke of them, we may suppose them to be the images of some of their ancestors, those me-

mories they venerate.

A pretty exact computation of the number of inha-bitants might be made from the canoes that visited the bitants might be made from the canoes that whited the fhips the fecond day after their arrival. They conflitted of about 100, which, upon an average, contained at least five persons each. But as there were very sew women, old men, children or youths, then among them, we may reasonably suppose, that the number of the substitute could are the less than countries and the inhabitants could not be less than four times the number of the vifitors, being 2000 in the whole.

SECTION VI.

Employments, Manufactures, Carving, Painting, Concerts, Musical Instruments, Weapons, Canoes, Implements for Fishing and Hunting, Tools, Gc.

THE chief employment of the men was fishing and killing animals for the fuftenance of their families, few of them being feen engaged in any business in the houses. The women were employed in manufacturing their garments, and curing their fardines, which they also carry from the canoes to their houses. The women also go in the small canoes, to gather muscles and other shell-fish. They are as dextrous as the men in the management of these canoes; and when there are men in the canoes with them, they are paid very little attention to on account of their fex, none of them offering to relieve them from the labour of the paddle. Nor do they shew them any particular respect on other occasions.

was fishing and of their families, business in the manufacturing es, which they The women iscles and other men in the maere are men in y little attention offering to re-

er occasions.

Women

Women were employed in making dreffes of bark, and executed their business much like the inhabitants of New Zealand. Others were employed in opening fardines, large shoals of which were seen on shore, and mea-fured out to several people, who carried them home, where they performed the operation of curing them, which is done by fmoke-drying. They are hung upon fmall rods, at first, about a foot over the fire, and then removed higher and higher, to make room for others. When dried, they are closely packed in bales, and the bales covered with mats. Thus they are preferved till they are wanted; and they are not unpleafant food. They also cure cod, and other large fish, in the same manner; but these are sometimes dried in the open air.

They display more ingenuity in their manufactures and mechanic arts, than might be expected from a people fo uncultivated. The flaxen and woollen garments engage their first care, as being the most material of those that may be classed under the head of manufactures. The former are fabricated from the bark of the pinetree, beat into a mals resembling hemp. After being prepared in a proper manner, it is spread upon a stick, which is fastened to two others in an erect polition. The manufacturer, who fits on her hams at this fimple machine, knots it across, at the distance of about half an inch from each other, with fmall plaited threads. Though it cannot, by this method, be rendered so close and firm as cloth that is woven, it is sufficiently impervious to the air, and is likewise softer and more pliable.

Their woollen garments are probably manufactured in the fame manner, though they have much the appearance of a woven cloth: but the supposition of their being wrought in a loom is destroyed by the various figures that are ingeniously interted in them; it being very improbable that these people should be able to produce fuch a complex work, except immediately by their hands.

They are of different qualities, some refembling our coarfest fort of blankets, and others not much inferior to our finest fort, and certainly both warmer and fofter. The wool of which they are manufactured feems to be produced by different animals, particularly the fox and brown lynx. That from the lynx is the finest, and nearly resembles our coarser wools in colour; but the hair, which also grows upon the animal, being inter-mixed with it, the appearance of it is sometimes different when wrought.

The ornamental figures in these garments are disposed with great taste, and are generally of a different colour, being usually dyed either of a deep brown or a yellow; the latter of which, when new, equals, in brightness, the best in our carpets.

Their fondness for carving on all their wooden articles corresponds with their tafte in working figures upon their garments. Nothing is to be feen without a kind of freeze-work, or a representation of some animal upon it; but the most general figure is that of the human face, which is frequently cut out upon birds, and the other monstrous things already mentioned; and even upon their weapons of bone and stone. The gene-ral defign of these figures convey a sufficient knowledge of the objects they are intended to represent.

The carving is not executed with the nicety that a dexterous artist would bestow even upon an indifferent defign. The fame, however, cannot be faid of many of the human marks and heads, where they shew themfelves to be ingenious feulptors. They preferve, with the greatest exactness, the general character of their own faces, and finish the more minute parts with great accuracy and neatness. That these people have a strong propenfity to works of this fort is observable in a variety of particulars. Representations of human figures, birds, beafts, fish, models of their canoes, and household utenfils, were found among them in very great

Having mentioned their skill in some of the imitative arts, fuch as working figures in their garments, and

No 44.

engraving or carving them in wood, we may also add their drawing them in colours. The whole process of their whale fishery has been represented, in this manner, on the caps they wear. This, indeed, was rudely executed for feveral, at leaft, to shew, that, though they have not the knowledge of letters amongst them, they have a notion of reprefenting actions, in a lafting way, exclusive of recording them in their fongs and traditions. They have also other painted figures, which, perhaps, have no established fignifications, and are only the creation of fancy or caprice.

The materials of which they make every thing of the rope kind, are formed either from thongs of skins and finews of animals, or from the flaxen substance of which they manufacture their mantles. The finews were fometimes fo remarkable long, that it was hardly possible they could have belonged to any other animal than the whale.

These people are not wholly unsusceptible of the tender paffions, which is evident from their being fond of mulic, and that too of the truely pathetic kind. They keep an exact concert in their fongs, which are often fung by great numbers together; and with their chorusses they used to entertain the Europeans. Their longs are generally flow and folemn; but their mulic is lefs confined than that which is usually found in other rude nations; the variations being very numerous and expref-five, and the melody powerfully foothing. Besides their concerts, sonnets were frequently sung by single performers, keeping time by striking the hand against the thigh. Though solemnity was predominant in their music, they sometimes entertained us in a gay and lively strain, and even with a degree of pleasantry and

The only instruments of music seen among them were a rattle and finall whiftle. The rattle is used when they fing; but upon what occasions the whiftle is used was never known, unless it be when they assume the figures of particular animals, and endeavour to imitate their howl or cry. Our people once saw one of them dressed in the skin of a wolf, with the head covering his own, striving to imitate that animal by making a squeaking noise with a whiftle he had in his mouth. The rattles are generally in the shape of a bird, with, fmall pebbles in the belly, and the tail is the handle. They have another fort, which refembles a child's

Their weapons are bows and arrows, spears, slings, fhort trunches made of bone, and a fmall pick-axe, fomewhat refembling the American tomahawk. Some of the arrows are pointed with iron, and others with in-dented bone. The spear was usually a long point made of bone. The tomahawk is a stone of the length of feven or eight inches; one end terminating in a point, and the other fixed in a wooden handle. This handle is intended to refemble the head and neck of a human figure; the stone being fixed in the mouth, so as to represent a tongue of great magnitude. To heighter the refemblance, human hair is also fixed to it. weapon is called teaweefh: and they have another weapon made of flone, which they call feeik, about ten or twelve inches long, having a fquare point.

From the number of their ftones and other weapons,

it may be reasonably concluded that they frequently engage in close combat: and our people had very difa-greeable proofs of their wars being both frequent and bloody, from the number of human skulls that were offered them for fale.

Though the structure of their canoes is simple, they appear well calculated for every uteful purpole. largest, which contain upwards of twenty people, are formed of a single tree. The length of many of them is forty feet, the breadth feven, and the depth three. They become gradually narrower from the middle to-wards each end, the ftern ending perpendicularly with a knob at the top. The fore part firetches forwards and upwards, and ends in a point or prow, much higher than the fides of the canoe, which are nearly firait.

The greatest part of them are without any ornament: fome have a little carving, and are fludded with feals teeth on the furface. Some also have a kind of additional prow, utually painted with the figure of fome animal. They have neither feats, or any other supporters, on the infide, except fome small round sticks, about the fize of a walking-cane, placed across, about half the depth of the canoe. They are very light, and, on account of their breadth and flatness, swim firmly, without an out-rigger, of which they are all deftitute; a remarkable diffinction between the navigation of all the American nations and that of the fouthern parts of the East Indies, and the islands of the Pacific Ocean. Their paddles, which are finall and light, refemble a large leaf in shape, being pointed at the bottom, broad in the middle, and gradually becoming narrower in the shaft, the whole length being about five feet. By conftant use, they have acquired great dexterity in the management of these paddles; but they never make use of any fails.

The cances of the larger fort are not only very fpacious, but perfectly dry; so that under shelter of a skin, they are, except in rainy weather, much more com-

fortable habitations than their houses.

Their implements for fifhing and hunting, which are ingeniously contrived, and well made, are nets, hooks and lines, harpoons, gigs, and an instrument like an oar. This last is about 20 feet long, four or five inches broad, and about half an inch thick. Each edge, for about two thirds of its length, (the other third being its handle,) is fet with sharp bone teeth, about two inches With this instrument they attack herrings and fardines, and fuch other fish that come in shoals. It is struck into the shoal, and the fish are taken either upon or between the teeth. Their hooks, which are made of bone and wood, display no great ingenuity; but the harpoon, which is used in striking whales, and other fea-animals, manifest a great extent of contrivance. It confifts of a piece of bone, formed into two barbs, in which the oval blade of a large muscle-shell, and the point of the inftrument, is fixed. Two or three fathoms of rope is fastened to this harpoon; and, in throwing it, they use a shaft of about sifteen feet long, to which the rope is faltened; to one end of which the harpoon is fixed, fo as to leave the shaft floating, as a buoy upon the water, when the animal is struck with the harpoon.

Their manner of catching and killing land animals cannot be afcertained: but it is probable that they shoot the smaller forts with their arrows, and encounter bears, wolves, and foxes, with their spears. They have feveral forts of nets, which are, perhaps, applied to that purpose; as it was customary for them to throw them over their heads, to signify their use, when they offered them for sale. Sometimes they decoy animals by disguising themselves with a skin, and running upon all sours, in which they are remarkably nimble. The masked or carved heads, as well as the dried heads of different animals, are used upon these occasions.

Their great dexterity in works of wood may, in some measure, be ascribed to the affistance they receive from iron tools; for, as far as is known, they use no other; at least, our people only saw one chiffel of bone: and though their tools must have been originally made of different materials, it is not improbable that many of their improvements have been made since they required a knowledge of that metal, which pow is universally

used in their various wooden works.

The knife and chiffel are the principal forms that iron affirmes amongft them. The chiffel confifts of a flat long piece, faitened into a wooden handle. A tione is their mallet, and a bit of fish-skin their polisher. Some of these chiffels were nine or ten inches in length, and three or sour in breadth; but they were, in general, considerably smaller.

Some of their knives are very large, and their blades are crooked; the edge being on the back, or convex part. Most of them seen were about the breadth and thickness of an iron hoop, and their fingular form marks that they were not of European make. Probably they are imitations of their own original instruments used for the same purposes. They sharpen these iron tools upon a coarse slare whetstone, and likewise keep the whole instrument constantly bright.

SECTION V.

Habitations and Furniture. Food, and manner of preparing it.

THE village, which is fituated at the entrance of the found, stands on the side of a pretty deep ascent, extending from the beach of the wood. The houses confift of three ranges or rows, placed at equal diffances behind each other, the front row being the largest; and there are a few straggling houses at each end. These rows are intersected by narrow paths, or lanes, at irregular diftances, paffing upward; but those between the houses are considerably broader. Though this general disposition has some appearance of regularity, there is none in the fingle houses; for every division made by the paths may either be confidered as one or more houses, there being no regular separation to distinguish them by, either within or without. These erections confift of very long broad blanks, refting upon the edges of each other, tied in different parts, with withes of pine-bark. They have only flender posts on the outlides, at confiderable distances from each other, to which they are also fastened; but there are some larger poles within, placed aflant. The fides and ends of these habitations are about seven or eight feet in height, but the back part is somewhat higher. The planks, therefore, which compose the roof, slant forward, and, being loofe, may be moved at pleafure. They may either be put close to exclude the rain, or feparated to admit the light in fine weather.

Upon the whole, however, they are most miserable dwellings, and display very little attention or ingenuity in their construction; for though the side-planks are pretty close to each other in some places, they are quite open in others. Besides, these habitations have no regular doors, and can only be entered by a hole, which the unequal length of the planks has accidentally made. In the sides of the house they have also holes to look out at, serving for windows; but these are very irregularly disposed, without attending, in the least, to

the shape and size of them.

Within the habitations is frequently a view from one end to the other of these ranges of building; for though there are some appearances of separations on each side for the accommodation of different persons or families, they do not intercept the fight, and generally confift of pieces of plank, extending from the fide to the middle of the house. On the sides of each of these parts is a little bench, about five or fix inches higher than the reft of the floor, covered with mats, whereon the family fit and fleep. The length of these benches is generally seven or eight seet, and the bendth sour or five. The fire-place, which has neither hearth or chimney, is in the middle of the floor. One house, in particular, was nearly separated from the rest by a close partition; and this was the most regular building of any we had feen. In it there were four of these benches, each holding a fingle family at the corner; but is had not any fepara-tion by boards; and the middle of the house seemed to be common to all the inhabitants.

The irregularity and confusion of their houses is, however, far exceeded by their mastiness and stench. They not only dry their fish within doors, but they also gut them there, which, together with their bones and fragments, thrown upon the ground at meals, occasions several heaps of filth, which are never removed till it becomes troublesome, from their bulk, to pass over them. Every thing about the house stinks of train-oil, fish, and smoak; and every part of it is as filthy as can be imagined.

Totwithstanding

Notwithstanding all this filth and confusion, many of these houses are decorated with images, which are nothing more than the trunks of large trees, of the height of four or five feet, placed at the upper end of the apartment, with a human face carved on the front, and the hands and arms upon the fides. These figures are too variously painted, and make, upon the whole, a monstrous appearance. These images are generally called Klumma; but the names of two particular ones, standing a-breast from each other, at the distance of about three or four feet, were Natchkoa and Masseeta. The best idea that can be formed of these figures will be from the representation of them in the engravings. A fort of curtain, made of mat, usually hung before them, which the natives were fometimes unwilling to remove; and when they did confent to unvail them, they feemed to express themselves in a very mysterious manner. It feems probably that they fometimes make offerings to them; for if their figns were rightly interpreted, they requested our people to give something to these images, when they drew the mats from before them. From these circumstances it was natural for them to suppose that they were representatives of their gods, or some superstitious symbols; and yet they were held in no very extraordinary degree of estimation; for, with a small quantity of brass or iron, any person might have purchased all of them in the place.

An ingenious artift, who accompanied Captain Cook on the voyage, in drawing a view of the infide of a Nootka houle, wherein these figures were represented, was interrupted from proceeding by one of the inhabitants. While he was employed, a man approached him with a large knife in his hand, feemingly displeased, from observing that the eyes of the artist were fixed on two representations of human figures, which were placed at one end of the apartment, carved on planks, of a gigantic proportion, and painted after their cuftom. As the artist took as little notice of him as possible, and proceeded, the native, in order to prevent him, provided himself with a mat, and placed it in such a manner as to obstruct the view. As the object was too interesting to be omitted, the artist determined to try the effect of a bribe. Accordingly he made an offer of a button from his coat, which, being metal, he thought would have pleafed him. This instantly produced the defired effect; for the mat was removed, and the artist was at liberty to proceed as before. He had scarcely made a beginning when the native returned, and renewed his former practice, continuing it till he had parted with every fingle button; and when he found that he had completely stripped him, he permit-ted him to proceed without further obstruction.

The furniture of their houses consists particularly of chests and boxes of various sizes, piled upon each other, at the sides or ends of the houses; in which are disposited their garments, skins, masks, and other articles that are deemed valuable. Many of them are double, or the upper one serves as a lid to the other. Some have a lid sastened with thongs. Others, that are very large, have a square hole cut in the upper part, for the convenience of putting things in, or taking them out. They are frequently painted black, studded with teeth of animals, or rudely carved with figures of birds, &cc. as decorations. They have also square and oblong pails; round wooden cups and bowls; wooden troughs, of about two set in length, out of which they eat their food, bars of matting, baskets of twics. &c.

food; bags of matting, balkets of twigs, &c.

Their implements for filhing, and other things, are hung up, or feattered in different parts of the house, without any kind of order, making, in the whole, a perfect scene of confusion; except on the sleeping benches, which have nothing on them but the mats, which are of a superior quality to those they usually have to sit on in their boats.

The principal fifth are herrings and fardines, two fpecies of bream, and fome fmall cod. The herrings and fardines not only ferve to be eaten fresh in their feason, but to be dried and smoked as stores. The

herrings also afford them another grand resource for food, which is a vast quantity of roe, prepared in a very extraordinary manner. It is strewed upon small branches of the Canadian pine. It is also prepared upon a long sea-grass, which is found in great plenty upon the rocks under water. It is preserved in baskets or mat, and used occasionally, after being dipped in water. It has no disagreeable taste, and serves these people as a kind of winter bread. They also eat the roe of some other large fish, that has a very rancid smell and taste.

Another affential article of their food is the large muscle, which is found in great abundance in the sound. After roasting them in their shells, they are stuck upon long wooden skewers, and taken off as they are wanted to be eaten, as they require no surther preparation, though they are sometimes dipped in oil as a sauce. The smaller shell-sish contribute to encrease the general stock, but cannot be considered as a material stock.

The porpoise is more common among them as food than any of the sea animals, the sless had rind of which they cut into large pieces, dry them as they do herrings, and eat them without farther preparation. They have also a very singular manner of preparing a fort of broth from this animal, when in its fresh state. They put some pieces of it into a wooden vessel or pail, in which there is also some water, and throw heated stones into it. This operation is repeatedly performed till the contents are supposed to be sufficiently stewed. The fresh stones are put in, and the others taken out, with a cleft stick, serving as a pair of tongs, the vessel being, for that purpose, always placed near the fire. This is a common dish among them, and seems to be a very strong nourishing sood. From these, and other sea animals, they procure oil in great abundance, which they use upon many occasions, mixed with other food, as sauce, and frequently sip it alone with a kind of scoop made of horn.

They probably feed upon other fea animals, fuch as whales, feals, and fea-otters; the skins of the two last being common amongst them: and they are furnished with implements of all forts for the destruction of these different animals, though, perhaps, they may not be able, at all seasons, to catch them in great plenty. No great number of fresh skins were to be seen while the ships lay in the sound. Land animals, at the time, appeared to be scarce, as they saw no slesh belonging to any of them; and though their skins were to be had in plenty, they might, perhaps, heve been procured by traffic from other tribes.

It plainly appears, from a variety of circumstances, that these people procure the greatest part of their animal food from the sea, excepting a sew gulls, and some other birds, which they shoot with their arrows.

Their only winter vegetables feemed to be the Canadian pine branches, and fea-grass; but, as the spring advances, they use others as they come in season. The most common of these were two forts of liliacious roots, of a mild sweetish taste, which are mucilaginous, and eaten raw. The next is a root called aheitu, and has a taste resembling liquorice. Another small sweetish root, about the thickness of sarsaparilla, is also eaten raw. As the season advances, they have, doubtless, many others which were not seen. For though there is not the least appearance of cultivation among them, there are plenty of alder, goosseberry, and currant bushes. One of the conditions, however, which they seem to require in all food, is, that it should be of the less acrid kind; for they would not touch the leek or garlic, though they sold our people vast quantities of it, when they understood they liked it. They seemed, indeed, not to relish any of their food, and rejected their spirituous liquors, as something disgusting and unnatural.

Small marine animals, in their fresh state, are sometimes eaten raw; though it is their ordinary practice to roast or broil their food; for they are absolute strangers to our method of boiling, as appears from their manner of preparing porpoife broth. Besides, as they have only wooden vessels, it is impossible for them to perform such an operation. Their manner of eating corresponds with the nastiness of their houses and persons; for the platters and troughs out of which they eat their food seem never to have been washed since their original formation; the dirty remains of a former meal being only swept away by a succeeding one. Everything solid and tough they tear it to pieces with their hands and teeth; for though their knives are employed in cutting off the larger portions, they have not yet endeavoured to reduce these to mouthfuls by the same means, tho so much more cleanly and convenient. They do not possess which are dug from the ground, without attempting to shake of the foil which adheres to them.

It is not certainly known whether they have any fet time for their meals, as they were feen at all hours to eat in their canoes. But as feveral meffes of porpoife broth were feen preparing at the village about noon, it is probable that they make a principal meal about that

time.

SECTION VI.

Description of the Country. Climate. Vegetable Productions. Quadrupeds. Sea Animals. Birds. Filb. Reptiles. Insetts. Minerals. Remarks. Departure.

CAPTAIN COOK gave the appellation of King George's Sound to this inlet on his first arrival; but it was called Nootka by the inhabitants. The entrance is in the east corner of Hope Bay. Its latitude is 49 deg. 33 min. north; and its longitude 233 deg. 12 min. east. The east coast of the Bay is covered by a chain of funken rocks; and near the found are some island and rocks above water. The ships entered the sound between two rocky points, lying east-south-east and west-north-west from each other, distant about sour miles. The sound widens within these points, and extends to the northward at least sour leagues.

A number of islands, of various sizes, appear in the middle of the found. The depth of water, not only in the middle of the found, but also close to some parts of its shore, is from forty-seven to ninety sathoms, or more. Within its circuit the harbours and anchoring

places are numerous.

The cove, where our ships anchored, is on the east-fide of the found, and also on the east of the largest island. It is, indeed, covered from the sea, which is its principal recommendation; for it is exposed to the south-east winds, which sometimes blow with great violence, and make great devastation, as was but too ap-

parent in many places.

Upon the sea-coast the land is tolerably high and level; but, within the sound, it rises into steep hills, which have a uniform appearance, ending in roundish tops, with sharp ridges on their sides. Many of these hills are high, and others of a more moderate height; but all of them are covered to the tops with the thickest woods. Some bare spots are to be seen on the sides of some of the hills; but they are not numerous, though they sufficiently shew the general rocky disposition of sufficiently shew the general rocky disposition of these hills. They have, indeed, no foil upon them, except what has been produced from rotten mosses and trees, of the depth of about two feet. Their soundations are, indeed, nothing more than stupendous rocks, which are of a grey or whitish cast when exposed to the weather, but, when broken, are of a blueish grey colour. The ricky shores consist endrely of this; and the beaches of the little coves in the sound are composed and fragmented of it.

All these coves are surnished with a great quantity of fallen wood lying in them, which is carried in by the tide; and with rills of fresh water sufficient for the use of a ship, which seem to be supplied entirely from the rains and sogs that hover about the tops of the hills. The water of these rills is perfectly clear, and dissolves

foap with great eafe.

The climate appears to be infinitely milder than that on the eaft coast of America, under the same parallel of latitude. The mercury in the thermometer never, even in the night, sell lower than 42 degrees; and very often, in the day, it rose to 60 degrees. No frost was perceived on any of the low ground; but, on the contrary, vegetation proceeded very briskly; for grass was seen, at this time, upwards of a foot long.

The trees, of which the woods are particularly composed, are the Canadian pine, white cypres, and two or three other forts of pine. The two first are in the greatest abundance, and, at a distinguished on a nearer view, the cypress being of a paler green than the other. In general, the trees grow here with great vigour, and are of a large size. At this early season of the year was seen but little variety of other vegetable productions.

About the rocks, and borders of the woods, were found fome strawberry plants, and raspberry, currant, and gooseberry bushes, all in a flourishing state. There were also a few black alder trees, a species of fow-thistle, fome crow's-foot with a fine crimson flower, and two forts of anthericum. Some wild rose bushes were feen just budding; some young leeks, a small fort of grass, and some water-cresses, besides a great abundance of andromeda. Within the woods were two fort of under-

wood fhrubs, unknown to our naturalists.

All the animals feen alive here were two or three racoons, martins, and fquirrels. Some of our people, indeed, who landed on the continent on the fouth-east fide of the found, faw the prints of a bear's feet, not far from the shore. The principal account given of the quadrupeds is taken from the Ikins which were purchased of the inhabitants; and these were sometimes fo mutilated in the heads, tails, and paws, that it could not be diffinguished to what animals they belonged; though others were either so perfect, or so well known, that they did not admit a doubt about them. The most common among them were bears, deer, foxes, and wolves. Bears fkins are very plentiful, generally of a shining black colour, but not very large. The deer-fkins were not so plentiful, and appeared to belong to what the historians of Carolina call the fallow-deer; though Mr. Pennant diftinguishes it by the name of Virginian deer, and thinks it quite a different species from ours. Their foxes are numerous, and of leveral varieties; the skins-of some being yellow, with a black tip at the tale; others of a reddiff yellow, intermixed with black; and others of an ash colour, also intermixed with black.

When the skins were so mutilated as to admit of a doubt, our people applied the name of sox or wolf indiscriminately. At length they met with an entire wolf's skin, and it was grey. Here is the common martin, the pine-martin, and another of a lighter brown colour. The ermine is also found in this country, but is small, and not very common. Its hair is not remarkably sine, though the animal is entirely white, except about an inch at the tip of the tail. The racoons and squirrels are such as are common, but the latter is not so large as ours, and has a rusty colour extending the length of the back.

Our naturalits were fufficiently clear respecting the animals already mentioned; but there are two others that they could not, with any certainty, difftinguish. One of them was concluded to be the elk or mouse-deer; and the other was conjectured to be the wild cat, or lynx. Hogs, dogs, and goats, have not yet made their appearance in this place. Nor have the natives any knowledge of our brown rats, to which they applied the name they give to squirrels, when they saw them

on board the ships.

The sea animals near the coast are whales, porposses, and seals; the latter, from the skins seen, seemed to be of a common fort. The porposse is the phocena. Though the sea-otter is amphibious, it may be considered as belonging to this class, as living principally in the water. It was doubted, for some time, whether

the skins, which the natives fold for otter skins, really belonged to that animal; but a short time before their departure, a whole one, just killed, was purchased from fome strangers, of which the painter made a drawing. It was young, weighing only twenty-five pounds; of a gloffy black colour; but many of the hairs being tipt with white gave it, at first, a greyish cast. The face, throat, and breast, were of a light brown, or yellowish white; and, in many of the fkins, that colour extended the whole length of the belly. In each jaw it had fix cutting teeth; two of the lower jaw being exceeding fmall, and placed without, at the base of the two in the middle. In these respects it differs from those found by the Ruffians, and also in the outer toes of the hind feet not being skirted with a membrane. There also appeared a greater variety and colour than is mentioned by those who describe the Russian sea-otters. It is most probably that these changes of colour naturally take place at the different gradations of life. The very young ones had coarse brown hair, with a little fur un-derneath; but those of the size of the animal just deferibed had a greater quantity of that substance. After they have attained their full growth, they lose the black colour, which is succeeded by a deep brown. At that period they have a greater quantity of fine fur, and very few long hairs. Some, which were supposed to be older, were of a chesnut brown; and some sew were of a perfect yellow. The fur of these creatures is certainly finer than that of any other animal known of; confequently the discovery of this part of North America, where so valuable an article of commerce is to be procured, ought certainly to be confidered as a matter of fome confequence.

Birds are far from being numerous here, and those that are to be seen are remarkably shy, owing, perhaps, to their being continually harrassed by the natives, either to eat them, or become possessors of their feathers, to be worn as ornaments. These are crows and ravens, not differing in the least from those in England; also a jay or magpie; the common wren, which is the only finging bird heard; the Canadian thrush; the brown eagle, with a white head and tail; a fmall species of hawk, a heron, and the large-crefted American king-fisher. There are also some that have not yet been men-tioned by those who have treated on natural history. The two first are a species of wood-peckers. One is fornewhat fmaller than a thrush, of a black colour on the back, having white spots on the wings; the head, neck, and breaft, of a crimfon colour; whence it might with propriety be called the yellow-bellied wood-pecker. The other is larger, and more elegant; the back is of a dufky brown colour, richly waved with black: the belly has a reddift caft, with black fpots: it has also a black spot on the breast; and the lower part of the wings and tail are of a scarlet colour; the upper part blackish. A crimson streak runs on each side, from the angle of the mouth, a little down the neck. The third and fourth are, one of the finch kind, not larger than a linnet, of a dufky colour, black head and neck, and white bill; and a fand-piper, of a dufky brown colour, with a broad white band across the wings, of the fize of a small pidgeon. There are also humming birds, which differ, in some degree, from the numerous forts already known of this delicate little

The quebrantahuessos, shags, and gulls, were seen off the coast; and the two last were also frequent in the found. There are two forts of wild ducks; one of which was black, with a white head; the other white, and had a red bill, but of a larger size. Here are also the greater lumme, or diver, which are found in our northern countries. Some swans, too, were once or twice seen slying in the northward. On the shores was found another sand-piper, about the size of a lark, and not unlike the burre; also a plover, very much resembling a common lark.

Though the variety of fish is not very great here, they are more plentiful in quantity than birds. The principal

forts are the common herring, which are very numerous, though not exceeding feven inches in length; a smaller fort, which, though larger than the anchovy, or fardine, is of the same kind; a sliver-coloured bream, and another of a gold brown colour, with narrow blue stripes. It is most probably that the herrings and sardines come in large shoals at stated seasons, as is usual with those kind of sish. The two sorts of breams may be reckoned next to these in quantity; and those which were full grown weighed about a pound. The other sish were scarce; and consisted of a brown kind of sculpin, such as are taken on the coast of Norway; another of a reddish cast; frost sish; a large one, without scales, resembling the bull-head; and a small brownish cod, with whitish spots. Sharks also frequent the sound, the teeth of which many of the natives had in their possession. The other marine animals are a small cruciated medusa, or blubber, star-sish, small crabs, and a large cuttle-sish.

About the rocks there is abundance of large muscles, and also sea-ears. Shells of a pretty large chamae were found: also some trochi of two species, a curious kind of mures, rugged wilks, and a snail. Besides these three are some plain cockles and limpets. Many of the muscles are a span long; in some of which there are large pearls, but they are disagreeable both in colour and shape. It is probably that there is red coral either in the sound or on the coast, large bunches of it having been seen in the canoes of the natives.

The only reptiles observed here were brown snakes, about two feet in length, having whitish stripes on the back and sides; and brownish water lizards. The former are so perfectly harmles, that the natives were

feen to carry them alive in their hands.

The infect tribe feem to be more numerous: for tho' the feafon of their appearance was only beginning, feveral different forts of butterflies were feen, all of which were common. Some humble bees were found; also fome gooseberry moths, a sew beetles, two or three forts of flies, and some musketos.

Though our people found both iron and copper here, they did not imagine that either of them belonged to this place. They did not even fee the ores of any metal, except a coarfe red ochry fubstance, used by the natives in painting or staining themselves. This may, perhaps, contain a small quantity of iron; as may also a black and white pigment made use of for the same

Exclusive of the rock, which constitutes the shores and mountains, were seen, among the natives, some articles of hard black granite, which was neither very compact, or fine grained; also a greyish whetstone, the common oil-stone, and a black fort, little inferior to the horn-stone. The natives were seen to use transparent leasy glimmer, and a brown leasy or martial fort. They had also pieces of rock crystal. The two first articles were probably to be obtained near the spot, as they had considerable quantities of them; but the latter, it may be supposed, came from a greater distance, or is extremely scarce; for the natives would not part with it without a very valuable consideration.

Iron is called by the natives feekemaile, a name which they also give to tin, and other white metals. It being so common among them, our people were anxious to discover how it could be conveyed to them. As soon as they arrived in the sound they perceived that they had a knowledge of traffic, and an inclination to pursue it; and were afterwards convinced that they had not acquired this knowledge from a cursory interview with any strangers, but it seemed habitual to them, and as a practice in which they were skilled.

With whom they carried on this traffic admitted of doubt; for though several articles of European manufacture were seen among them, or such, at least, as had been derived from some civilized nation, particularly brass and iron, it does not follow that they were received immediately from these nations: for our people never could obtain the least information of their having

feen fhips like theirs, or of their having been engaged in commerce with fuch people. Many circumstances concur to prove this without a doubt. On the arrival of the ships, they were earnest in their enquiries whether our people meant to fettle amongst them, informing them at the same time, that they gave them wood and water from motives of friendship. This sufficiently proves that they considered themselves as proprietors of the place, and dreaded superiority: for it would have been an unnatural enquiry if any ships had been here before, and fupplied themselves with wood and water, and then departed; for they might then reasonably expect that others would do the same. It must be admitted, indeed, that they exhibited no marks of furprize at beholding the ships; but this may, with great propriety, be attributed to their natural indolence of temper, and their wanting a thirst of curiosity. They were never startled at the report of a musket, till they one day shewed that their head-dresses were impenetrable to their spears and arrows, when one of our people fhot a musket-ball through one of them that had been fix times folded. Their aftorishment at this plainly indicated their ignorance of the effect of fire-arms. This was afterwards very frequently confirmed when they faw our people shoot birds, at which they appeared greatly confounded. Their explanation of the piece, together with the nature of its operation, with the aid of fhot and ball, struck them fo forcibly, as to afford convincing proof of their having no previous ideas of this matter.

Captain Cook mentions, that though fome account of a voyage to this coast by the Spaniards in 1774 or 1775, had arrived in England before he failed, these circumftances sufficiently prove that these ships had never touched at Nootka. It has since, indeed, appeared that they were not within two degrees of Nootka; and probably the inhabitants of that place never heard of those Spanish ships.

They use their tools with as much dexterity as the longest practice can acquire. The most natural conjecture, therefore, is, that they trade for their iron with other Indian tribes, who may have some communication with European settlements upon that continent, or receive it through several intermediate nations. By the same means they probably obtain their brass and

copper. Not only the rude materials, but fome manufactured articles feem to find their way hither. The brafs ornaments for nofes are made in fo mafterly a manner, that the Indians cannot be fupposed capable of fabricating them. The material seem to be European, as the American tribes are ignorant of the method of making brafs; though copper has been frequently met with,

and, from its ductility, might eafily be fashioned into any shape, and polished. If such articles are not used by our traders to Hudson's Bay and Canada, in their traffic with the natives, they must have been introduced at Nootka from Mexico, whence it is probable two silver table-spoons were originally derived.

Captain Cook remarks, that as these people so effentially differ from the natives of the islands in the Pacific Ocean, in their persons, customs, and language, it cannot be supposed that their respective progenitors, belonged to the same tribe, when they emigrated into those places where their descendants were sound.

Our people having compleated their deligns, and put the ships into a proper condition for failing, they got under way. They were attended by the natives till they were almost out of the found; some in their canoes, and others on board the ships. One of the chiefs, who had particularly attached himself to Captain Cook, was among the last who parted from them. The Captain, a little time before he went, made him a fmall prefent, for which he received, in return, a beaver-skin of a much superior value. This occasioned him to make fome addition to his prefent, which pleafed the chief fo highly, that he prefented to the Captain the beaverfkin cloak which he then wore, and of which he was particularly fond. Struck with this inftance of generofity, and wishing him not to be a sufferer by his gratitude, Captain Cook infifted upon his acceptance of a new broad-fword, with a brass hilt, with which he appeared greatly delighted. The officers were earneftly importuned by the chief, and many of his countrymen, to pay them another vifit, who, by way of inducement, promifed to procure a large flock of skins.

Captain Cook gives it as his firm opinion, that whoever may come after him to this place will find the natives prepared with no inconfiderable supply of skins, being an article of trade which they could observe the Europeans were eager to possess, and which the Europeans found could be purchased to great advantage.

Thus have we, as proposed, attended particularly to those parts of North America, continental, insularly to those parts of North America, continental, insularly to the continental parts of North America, we shall, with the same precision of South America, we shall, with the same precision, relate every particular that can be derived from his accurate and authentic accounts of the respective places be wristed in that division of this quarter of the globe; ever desirous of bolding to view the transactions of a man who has so effentially contributed to the instruction and entertainment of the public, in the most important points of buman speculation,

SECTION I.

Countries bordering on Hudfon's Bay, Labrador or New Britain, Gc. Account of their Difcovery, Situation, Boundaries, Climate, Soil, Rivers, Animals, particular Defeription of the Beaver, Vegetables, Articles of Trade, Gc. Peculiar method of preferving Animal Food.

F we were to extend the country claimed by Great Britain, as far as her mariners have discovered to the northward, we might stretch it to 81 deg. 30 min. north latitude; for so far our countrymen, Baffin and Hudson, failed, and gave their respective names to the lays called after them.

The knowledge we have obtained of these countries is owing to the repeated attempts that have been made to discover a north-west passage to the East Indies. This passage was attempted by Forbisher in the year 1576. He discovered the strait that bears his name, together with the main and of New Britain, or Labrador; but failing in the principal design, it was laid aside till the year 1585, when it was revived by John Davis, who surveyed the coasts of Labrador, but did not extend the discoveries of his predecessor. Bassin and Hudson, as before mentioned, penetrated as far as 81 deg. 30 min. north lattitude, some years after. The latter of these wintered in this region of frost and snow, and would probably have effected the discovery, had not his men mutinied, and committed him, with

feven of his faithful adherents, to the mercy of the icy fea in an open boat, where they perished. The next fea in an open boat, where they perished. attempt was made in 1746, by Captain Ellis, who wintered here, but also failed in it. In 1761 the defign was revived by a Captain Christopher, at the inftange of the Hudson's Bay Company; but he found neither inlet or river which could contribute to the interests of commerce. In December 1770, the same company caused a journey to be taken by land, which was performed by a gentleman in their fervice, attended by some trusty northern Indians. In this he was employed more than eighteen months, during which he proceeded to latitude 72 deg. His most western distance from the coast of Hudion's Bay was near 600 miles, and a valt track of continent stretched farther on in that direction. These regions are inhabited by different tribes of Indians, who also go under various de-nominations, as Dog-ribbed, Copper-coloured, and Northern Indians.

Whilft Captain Cook was employed in his last voyage, a confiderable object of which was to explore the western coast of North America in high latitudes, and to afcertain if, by means of any large rivers, the interior parts of that continent could be rendered accessible by shipping, and a communication opened with Lake Superior, the armed brig Lyon was fent out, in the fummer of 1776, to Davis's Straits and Baffin's Bay, to explore the coasts, and obtain a passage on that side, with a view to co-operate with Captain Cook, who, it was supposed, would, about that time, be trying for a passage on the opposite side of America. This attempt not being made to the fatisfaction of the board of admiralty, another commander was fent out the next year, in the fame thip, for the fame purpose; but this voyage proved no more fatisfactory than the former.

The most northern part of America which may properly be faid to belong to Great Britain, particularly the countries bordering on Hudson's Bay, are fituated between 50 and 62 degrees of north latitude, and be-tween 50 and 95 deg. of west longitude. They are bounded on the north by unknown lands and seas about the pole, on the fouth by the Gulph of St. Lawrence and Canada, on the east by the Atlantic Ocean, and on the west by unknown lands.

So intenfely cold in the climate, that Mr. Ellis, who wintered in only 57 deg. 30 min. north latitude, was fearce able to preferve his own life, and the lives of his party, although every precaution was taken to fence against the cold, by constructing a house of thick pieces of timber, and each crevice close stuffed with moss, and plaistered over with clay; yet, at the beginning of November the cold became so intense, that all the bottled beer became frozen, although packed up in tow, and placed near a good fire. The cold became infupportable abroad, unless they were entirely covered in the warmest furs. No kind of liquid, indeed, could withfland the cold; for brandy, and even spirits of wine, froze; the latter only to a confiftence of oil. If the men touched iron, or any other folid furface, their fingers were frozen fast to it: and if, in drinking a dram of brandy out of a glass, they chanced to touch the glass with their tongue or lips, in pulling it away the skin was left on it.

The foil is, in general, barren in the northern parts, but in some of the fouthern it is tolerably fertile.

The mountains in this country, towards the north, are of a tremendous height, and perpetually covered with fnow, which is the cause of the extreme rigour of the climate, and the barrenness of the foil.

The rivers are numerous, and called, in general, after the names of the navigators by whom they were first discovered. The principal bays are those of Bassian and Hudson; in the latter of which are several others of less note; and the straits are those of Hudson, Davis, and Belleisle.

The animals in the woods here are moofe-deer, elks, stags, bears, tigers, buffalos, wolves, foxes, beavers, otters, lynxes, ermines, squirrels, wild cats, hares, &c.

Of the feathered kind are geefe, buftards, ducks, par-tridges; and many others, both wild and tame.

The feas abound with whales, feals, cod, and a white fish preferable to herrings; and the rivers and

fresh waters with pike, perch, carp, and tench.

All the animals of these countries are cloathed in winter with a close, foft, warm fur, In the summer, which holds only for three months, they are, as in other places, of a variety of colours; but as foon as the winter approaches they gradually change, the beafts, and most of the birds, becoming of the colour of the snow. Indeed, every thing, animate or inanimate, is white. Even the dogs and cats carried from England to Hudson's Bay are subject to the same alteration, and acquire a much longer, fofter, and thicker fur, than they have in their own climate.

Here it may be proper to remark, that the animals of America, in general, are neither fo large or fo fierce as those of Asia and Africa. But then it is to be observed, that if the quadrupeds of America are small, they are more numerous than those of the old world. The goat exported from Europe will, in a few generations, become, indeed, much lefs, but it will also become more prolific, producing, instead of one or two kids at a time, five, fix, and fometimes more.

As the inhabitants of this country are cloathed in the skins of beavers, and as their principal trade consists in those skins, it will be proper to give a description of that curious animal. A large beaver is about twentyeight inches in length, from the hind part of the head to the root of the tail, and weighs fixty or feventy pounds; but their colour is different; in some places they are black, in others white, and in others almost of the colour of the deer. It is an amphibious animal. The beaver, or, as it is likewise called, the castor, lives to a great age. The females generally bring forth four young ones at a time. Their jaws are furnished with two cutters and eight grinders: the upper cutter is two inches and a half in length, and the lower formething longer. The upper jaw projects over the lower one. The head is shaped like that of a rat, and the tail like the blade of a paddle. It is about fourteen inches in length, and about an inch thick. It is covered with a scaly skin; the scales being a quarter of an inch long, and folding over each other like those of a fift.

The industry, forefight, and good management of these animals, are extremely surprising, and scarce cre-dible to those who never saw them. When they want dible to those who never saw them. When they want to form a settlement, three or four, or more of them, affemble together, and first pitch upon a place where they may have provisions, such as the bark of trees, roots, or grafs, with every thing necessary for erecting their edifices, which must be surrounded by water: and if there be neither a convenient lake or pond, they make one, by stopping the course of some brook or river. For this purpose they cut down trees, above the place where they they was resolved to build, and take their measures so well, as always to make the tree fall towards the water, that they may have the less distance to roll it when they have cut off the branches. This done, they float it to the place appointed, and these pieces they cut bigger or less, to suit their convenience. Sometimes they use the trunks of large trees, which they lay flat in the water. At others they fasten stakes in the bottom of the channel, and then interweaving small branches, fill up the vacancies with clay, mud, and moss, in such a manner, as renders the dam very tight and fecure. In these works their tails serve them for carts and trowels, and their teeth for faws and axes. Their paws supply the place of hands, and their feet ferve instead of oars.

The construction of their houses is no less admirable, they are generally built upon piles, at some distance from the shore, but sometimes close to the banks of the rivers. They first make holes at the bottom of the water for planting fix posts, upon which each of their edifices is built in a most curious manner. Their form is round, with a flat roof. The walls are two feet thick, and

as conve

fometimes more: they are formed of the same materials as the dams just mentioned; and every part is so well finished that no air can possibly enter. About two thirds of the edifice is raised above the water: in this they lodge, and are careful to keep it clean. They have generally three or four different avenues to each house, which they enter under water. To provide provisions against the winter, they draw the sticks they cut from the trees, and thrusting one end into the mud, let them lie under the water to preserve the bark green and tender for their winter provisions. There are fometimes found eight or ten beavers in one house, at others not more than three or four; and let them be as numerous as they will, they all lodge upon one floor.

The beavers are excellent food; but the tongue and tail are the most delicious parts. The Indians fome-times roast these animals in the same manner as we do

pigs, first burning off their fur.

Besides the fur, the beaver produces the true castoreum, which is contained in bags in the lower part of the belly, different from the tefticles. The value of this

drug is well known.

The lands near the upper parts of Hudson's Bay produce large timber, and plenty of herbage, and, if properly cultivated, might yield corn. Those parts which are low and marshy produce juniper, birch, poplar, and a small tree of the spruce or sur kind; but there is little other herbage besides the moss.

In the year 1670 a charter was granted to a company confifting of about nine or ten persons, known by the appellation of the Hudson's Bay Company, for an exclusive trade to that bay, which they have carried on ever fince with great benefit to themselves, though comparatively with little advantage to Great Britain. The chief commodities are fur and hides. This company generally employ four fhips. They have four forts, viz. Churchill, Nelfon, New Severn, and Ale bany, which stand on the west side of the bay. The commodities with which the company furnish the natives are guns, powder, shot, knives, hatchets, beads, cloaths both for men and women, tobacco, powder horns, combs, kettles, looking-glasses, and various other articles, the principal part of which are the ma-nufactures of Great Britain, and in the mercaptile phrase deemed drugs. Their exports and imports are not fo confiderable as they were before the conqueft of Canada,

The Europeans, who refide in the factories here, have a peculiar method in preferving their animal food, whether flesh or fish, fix or seven months, free from putrefaction. The fish are caught in the winter by cutting holes in the ice, to which they come for air. As foon as taken out of the water, they are immediately frozen and stiff, but may be thawed again by being immerfed in cold water. In this manner the falt provisions are thawed and freshened here. The meat is let down through a hole in the ice into the water, and, in a short time, becomes soft, pliable, and eats well; whereas if roafted or boiled in its frozen state, it would eat as if rotten, and be nauseous to the palate. they are well supplied with flesh, fish, and fowl all the year round.

Persons, Drefs Habitations, Subsistence, Manners, Cuf-toms, &c. of the Indians on the Coasts of Hudson's Bay.

SHE natives fituated on the western coast of Hudfon's Bay, comprehending the New North and South Wales, are of the middle fize, and of a copper colour. They have black eyes, and long, lank, black hair; but their features vary as in Europe. They are of a cheerful disposition, good-natured, affable, friendly, and honest in their dealings.

In fummer the men are cloathed in a close coat made of a blanket, which they buy of the English settled in their neighbourhood. They have a pair of leather flockings, which reach to high as to ferve also for breeches; and their shoes are made of the same materials.

The cloaths of the women differ from those of the men only by their generally wearing a petticoat, that in winter comes a little lower than their knees. Their ordinary apparel is made of the skins of a deer, otters, or beaver, with the hair on the fur of them. The fleeves of their upper habit are generally tied on with strings at the (houlders, fo that their arm-pits, even in the depth of winter, are exposed to the cold, which they imagine contributes to their health. Their difeases, indeed, are but few, and those generally arise from colds caught after drinking spirituous liquors, which they buy of the English: and it is melancholy truth, that those who live near the fettlements of the Hudson's Bay Company, are, by drunkenness, become meagre, small, indolent, and hardly able to encounter the hardships of the country; while those who live at a distance are hardly, vigorous, and active.

They dwell in tents covered with moofe and deer-fkins fewed together. These are of a circular form, probably on account of its being most capacious and convenient for their fitting round the fire, which is in the middle. They are formed of poles, which are extended at the bottom, and at the top lean to the center, where an opening is left to admit the light, and let out the smoak. They strew the floor with the tops of pinetrees, and lie with their feet to the fire, and their heads to the fides of the tent. The entrance is generally on the fouth-west side, and they go in by lifting up one of the skins, to which is fastened a piece of stick to make

it flap close.

They have no dependence for sublistence on the fruits of the earth, but live entirely on the animals they take in hunting, or catch in traps. They every feafon make a prodigious flaughter among the deer, from the abfurd opinion, that the more they destroy the greater plenty will fucceed; hence they fometimes leave three or four hundred dead on the plains, taking out only their tongues, and leaving their carcasses either to rote or be devoured by the wild beafts. At other times they attack them in the water, and bring great numbers on floats to the factories. They also live upon birds, and even feed on eagles, hawks, crows, and owls, as well as on partridges, wild-geefe, and ducks. They generally boil their flesh, and eat it by itself, drinking the water it is boiled in, which they efteem very wholesome: and in the same manner they dress their fish.

These ignorant people have many amiable qualities. These are influenced in their behaviour by natural love of rectitude, that restrains them from all acts of violence and injuffice, as effectually as the most rigorous laws. The chiefs of every family or tribe, who are generally chosen from among the most ancient of the people, usually for their skill in hunting, their experience in trade, and their valour in war, in which they frequently engage, direct those who reside with them in their different employments; but their advice is rather followed though deference and respect, than from any compul-

five obligation.

They have, however, some customs which must appear very whimfical, and others that are extremely cruel. It is esteemed a great offence for a woman to stride over the legs of a man when he fits on the ground; and they even think it beneath them to drink out of the same veffel with their wives. They have another custom that must appear shocking to every humane mind, and in which they are, in some measure, imitated by the Hottentots. The latter expose their parents, when labouring under the infirmities of old age, to perifh with hunger, or to be devoured by wild beafts; and these wretches strangle theirs: for when their parents grow fo old as to be unable to support themselves by their own labour, they require their children to strangle them, and their performing it is efteemed an act of duty. This is done in the following manner: The old person's grave being dug, he goes into it, and, after having converfed and smoaked his pipe, or perhaps drank a dram or two with his children, he informs them that he is ready; upon which two of them put a thong about

his neck, one standing on one side, and the other opposite to him, which they pull violently till he expires: they then cover him with earth, and over that erect a kind of rough monument of stones. Such old people as have no children require this office of their friends; but in this case it is not always complied with.

They have also a very strange maxim of policy, which is obliging their women to procure frequent abortions, by the use of a certain herb, common to that country, in order to ease themselves of the burden

of a helple's family.

The natives dwelling on the eastern coast of Hudfon's Bay, are those called Esquimaux, which name is
derived from the Indian word that signifies eaters of raw
fless, for after thoroughly drying the sless of raw
fless, for after thoroughly drying the sless of raw
they kill, they eat it without any other preparation.
They are of a middle size, robust, and inclinable to
be fat. Their heads are large, and their faces round
and swarthy; their eyes are black, small and sparkling;
their noses slat, their lips thick, and their hair lank
and black; they have broad shoulders, and their limbs,
are proportionable; but their fect are very small.

The behaviour of the Equimaux residing on the east side of Hudson's Bay is chearful and sprightly; but some are subtle, cunning and deceiful, great staterers, and much addicted to pisser from strangers; easily rendered bold by encouragement; but as easily frightened; and so attached to their own country, that some, who have been taken prisoners by the southern Indians when they were boys, and brought to the factories, have, for several years, regretted their absence from their native country, and the enjoyment of what they loved when they were there; thus one of them, after having been sed upon English diet, being present when an Englishman was cutting up a seal, from which the trainoil ran very plentifully, scooped up what he could save with his hands, and swallowing it crycd, "Ah! commend me to my dear country, where I could get my belly full of this."

The mens cloaths are made of feal fkins, and fometimes of the skins of land and sea-fowl sewed together: their coats have a hood like a capuchin, are close from the breast before, and reach no lower than the middle of the thigh: the breeches are close before and behind, gathered like a purse, with a string, and tied about their waists: they have several pairs of boots and focks, which they wear one over another, to keep them warm and dry. The difference between the drefs them warm and dry. of the men and that of the women is, that the latter have a narrow flap behind their jacket that reaches to their heels. Their hoods are likewise larger and wider at the shoulders, for the sake of carrying their children in them at their backs; and their boots, which are a great deal wider, are commonly fluck out with whalebone, because when they want to put a child out of their arms they slip it into one of their boots till they can take it up again. A few of them wear shifts of seal bladders sewed together. Their cloaths are, in general, sewed very neady: this is performed with an ivory needle, and the finews of a deer split fine and used for thread. They discover a good deal of taste in adorning them with stripes of different coloured skins fewed in the manner of borders, cuffs, and robings for their cloaths, which altogether appear handsome as well as convenient.

One fingular part of their dress is their fnow eyes, as they properly call them. These are bits of wood, or ivory, formed to cover the organs of sight, and tied at the back of the head: in each piece are two slits of the same length with the eyes, but narrower, thro' which they see distinctly. This invention prevents fnow blindness, a very painful disorder occasioned by the brightness of the light reflecting from the snow, especially in the season they call spring. Their use strengthens the sight, and becomes so habitual to them, that when they would observe an object at a great distance, they commonly look through them as we do through a perspective glass.

Their inftruments for fishing and fowling discover a genius for invention. Their darts and harpoons are well made, as are also their bows and arrows. Their boats are easy of carriage and quick in motion. The frames are made of wood or whale bone. They rubthe seam with a kind of fize made of seals blubber. In these boats they carry their little conveniences and their instruments for killing whales and other sea animals. When they have killed a whale they tow it to shore with their canoes, and strip it of the fat, which not only serves them for sood, but to burn in their lamps during winter.

On their going to sea in order to catch fish they generally take in their boats a bladder filled with train oil, as our people do a dram bottle, and seem to drink the contents with the fame relish; and when their stock is out they have been seen to draw the bladder through their teeth in order to extract the very last drop of this precious liquid. They are probably convinced by experience of the salutary effects of such coarse kind of oil in their rigorous climate, which occasions their

fondness for it.

It is observed by voyagers, that in failing to the northward in these regions every thing dwindles; the men become lower in stature, and the very trees sink into brushwood.

SECTION II.

CANADA.

Situation. Boundaries. Climate. Soil. Animal and Vegetable Productions. Rivers. Lakes. Principal Places. Laws. Commerce, &c.

CANADA is fituated between 45 and 50 degrees of north latitude, and between 68 and 90 deg. of east longitude. It is bounded on the north by New Britain, on the east by Nova Scotia, on the south by the Apalachian mountains, and on the west by unknown lands.

The climate and foil vary greatly in this extensive track. Along the banks of the river St. Lawrence it is excessive cold in winter, and as intensively hot in summer. The rest of the country is intersected with large woods, lakes and rivers, which render it still colder. The foil, however, in many places is sertile, producing whales and vegetables in abundance.

producing whales and vegetables in abundance.

Canada abounds in itags, elks, deer, bears, foxes, wild cats, ferrets, weafels, fquirrels of different kinds, hares, rabbits, &c. In the fouthern parts are wild bulls, divers forts of roebucks, goats, &c. The marfhes, lakes, and pools, fwarm with beavers, of which we have already given a deferition.

which we have already given a description.

The Canadians have different ways of taking beavers. They sometimes shoot them, and at other times catch them in traps, which last method they preser, because it does not damage the skin. In winter they break the ice at some distance from the huts, and placing stakes in the water they saften nets to them. The beavers being disturbed in their huts, by a dog fent in for that purpose, immediately take to the water, when they are soon entangled in the net.

There is a diminutive species of beaver called the Musk Rat, the tail of which produces a very strong

There are two forts of bears in this country, one of a reddifh, and the other of a blackish colour.

The Indians scarce undertake any thing with greater folemnity than hunting the bear; and an alliance with a noted bear-hunter, who has killed several in one day, is more eagerly sought after than that of one who has rendered himself samous in war; this chace supplying them both with food and raiment. The bears lodge, during the winter either in hollow trees or caves; and, as they lay up no provisions, have no food during that season.

The bear is not naturally fierce, except when wounded or pinched with hunger. They run themselves very poor in the month of July; and it is fomewhat dangerous to meet them till their hunger is fatisfied, and they recover their flesh, which they do very suddenly. They are fond of grapes, and most kinds of fruit. When provisions are scarce in the woods they venture out among the fettlements, and make great havock of the Indian corn, and fometimes kill the fwine. Their chief weapons are their fore-paws, with which they will hug any animal they feize immediately to death.

The buffalo of Canada is larger than that of Europe. The body is covered with a very valuable black wool, and the hide is remarkably foft and pliant.

Wolves are scarce in Canada, but they afford the finest furs in all the country: their flesh is white, and good to eat, and they purfue their prey to the tops of the tallest trees. The black foxes are greatly esteemed, and very fcarce; but those of other colours are more common; and some on the Upper Mississippi are of a filver colour, and very beautiful. They live on water-fowls, which they decoy within their clutches by a thousand antic tricks, and then spring upon them and devour them.

The Canadian poll-cat has a most beautiful white fur, except the tip of the tail, which is as black as jet. When purfued, he lets fly his urine, which, it is faid, infects the air for a quarter of a mile sound; for which reason he is called by the inhabitants the devil's brat,

or the stinkard.

The canadian rat is of a beautiful filver colour, with a bushy tail, and as big again as the European. The female carries under her belly a bag, which she opens and shuts at pleasure; and in that she places her young

when purfued.

There are three forts of squirrels: that called the flying squirrel will leap forty feet and more from one tree This little animal is very lively and eafily to another. tamed, and he puts up wherever he can find a place, in the sleeve, pocket, or muff: he first pitches on his mafter, whom he will diftinguish among twenty persons.

The Canadian porcupine is less than a middling dog: when roasted, he eats full as well as a sucking

Pig.

The bares and rabbits differ little from those of Eu-

rope, only they turn grey in winter.

Some of the rivers breed crocodiles, which differ but

little from those of the Nile.

Among the other animals of this country which most deferve the attention of the naturalist is the elk, which is about the fize of a horse or mule. Many extraordidicinal qualities, particularly for curing the falling to kness, are ascribed to the hoof of the left foot of this animal. They live in cold countries, and when the winter affords them no grass they gnaw the barks of trees.

Of the feathered creation here are eagles, falcons, partridges, red, grey and black, with long tails, which they fpread out like a fan, and make a fine appear-Here are also snipes, ducks, geese, turkies, &c. Of finging birds there are thruthes and goldfinches refembling those of Europe; but the chief finging bird of Canada is the white bird, a species of ortolan very fliewy and remarkable for proclaiming the return of

fpring.

The lakes are large and numerous; the chief are Lake Superior, which is 100 leagues in length, 70 broad, and contains feveral islands; the lakes Michigan, Illinois, Hurons, Ontario, Frontenac, Cham-plain, &c. Of the rivers, which are innumerable, the principal are, the Great River St. Lawrence, St. John, Trois Rivieres, &c. The Bay of St. Lawrence is entered between Cape Retz in Newfoundland and Cape Breton; and after doubling Cape Rose, you steer into the river of the same name. Towards the fouth lie the Bay and Point of Gaspey: below this Bay is a Steep, called the Pierced Island, from an aperture in its middle, through which a floop might pass with her fails up. At a league distance from the Bored Island lies the island Bonaventure; and at a league distance from that the island Miscon, which has an excellent harbour, and is eight leagues in circumference. A fpring of fresh water spouts up to a considerable height in the offing, not far from this island. The next object that prefents itself in the river St. Lawrence is the island Anticofti; and the current fetting strongly in upon it renders the navigation here very dangerous, in case of a calm, especially as the island is lined with breakers. This island is narrow; but lies in the midtle of the river, and extends about forty leagues from north-east to fouth-west.

After paffing this island the navigation becomes more tolerable; but still great precaution must be used. The mounts Notre Dame and Lewis lie on the larboard side: near the latter are some plantations. The next point is Trinity Point, which must be avoided with great care. A little higher are the Paps of Montani, so called from the appearance of the mountain, fituated about two leagues from the shore. The land in the neighbourhood is not only unprofitable, but appears fruitful, being covered with rocks, fands, and impenetrable thickets: it contains, however, plenty of game. On the other fide the river, and advancing two leagues into its bed, lies the fhoal of Manicouagu, which is the most dangerous in the river: it is named from a river that falls from the mountains of Labrador, and otherwise called the river of St. Barnabas, and the Black River. From this to Green Island the navigation is flow and uncertain, and the shores uncomfortable and uninhabited. Somewhat higher lies the river Saguenay, which carries ships 25 leagues above its mouth, where is an excellent harbour called Tadouffac; in failing from which great care must be taken to avoid the Red Island or Cape Rouge, which is a dangerous rock of that colour, whose surface is equal to the water, and often proves fatal to shipping.

Many voyagers are of opinion, if the Canadian fishery was improved it would be more beneficial than the fur trade. Besides a great variety of other sish in the lakes and rivers, particularly that of St. Lawrence, are sea-wolves, sea-cows, porpoises, the lencornet, the goberque, the fea-plaife, falmon-trouts, turtles, lobfters, the chaourafou, sturgeon. the achigau, and the gilthead. The fea-wolf, fo called from its howling, is an amphibious creature. His head refembles that of a dog: he has four very short legs, of which the fore ones have nails; but the hind ones terminate in fins. The largest weigh 200 pounds, and are of different Their flesh is good eating; but the profit of it lies in its oil, which is proper for burning, and currying of leather. Their skins make excellent coverings for trunks; and though not fo fine as Morocco leather, they preserve their freshness better, and are less liable to cracks. The shoes and boots made of those skins let in no water, and, when properly tanned, make excellent and lafting covers for feats. The Canadian fea-cow is larger than the fea-wolf, but refembles it in figure. It has two teeth of the thickness and length of a man's arm, that, when grown, look like horns, and is a very fine ivory as well as its other teeth. The sturgeon is from eight to twelve feet long and proportionably thick, but there is a small species, the flesh of which is very delicate.

In Canada are many reptiles, among which the rattle-fnake is the most remarkable for fize and venom. The bite of this fnake is mortal, if the root of a certain plant is not immediately applied to the wound.

The cultivated parts of this country yield large crops of Indian corn, barley, tye and other grain. Melons and grapes are produced here, as also the hop plant. The meadow grounds that are well watered yield excellent grafs, and feed numbers of cattle. Tobacco, in particular, thrives well, and is much cultivated.

The uncultivated parts of Canada contain the greatest forests in the world. They form one continued Good unplanted by the hands of men, and to all ap-

pearance as old as the creation. Nothing can be more magnificent to the view. The trees lose themselves in the clouds: and such is the prodigious variety of species, that even amongst these persons who have taken most pains, to know them, there is not one, perhaps, that is acquainted with half the number.

This province produces two forts of pine, the white and the red; four forts of furs; three forts of cedar and oak, the white and the red; three forts of winnt-trees, the hard, the foft, and the smooth; the male and female maple, white and red elms, and poplars. About November the bears and wild cats take up their habitations in the hollow elms, and remain their till April. Here are also cherry frees, plumb-trees, and other fruit-trees, similar to those in Europe. Near Quebec is a fine lead mine, and the whole country abounds in

The principal towns in Canada are Quebec, Trois Rivieres, or the Three Rivers, and Montreal. Niagara, though not extensive, is diffinguished by a famous cataract, between 7 and 800 feet high, half a league broad, the water of which runs fo violently, that all beafts attempting to crofs it a quarter of a league above are swallowed up. It tumbles off the precipice with such fury, that it makes an arch under which three men may pass a-breast without danger.

Here it is necessary to observe, that the French comprehended, under the name of Canada, a very large territory, taking into their claims part of Novia Scotia, New England, and New York, on the east; and, to the west, extending it as far as the Pacific Ocean. That part, however, which they were able to cultivate, lay chiefly on the banks of the river St. Lawrence, and the numerous fmaller rivers which it receives. This being reduced by the British arms in the glorious year 1759, has been fince founded into a British province, called the province of Quebec, of which the capital is a city of the fame name, fituated at the confluence of the rivers St. Lawrence and St. Charles, about 140 leagues from Cape Rouge or Rofiers. It is built on a rock and divided into an upper and lower town. The haven is fafe and commodious. The houses in both towns are of stone, and built in a tolerable manner. Before the city was taken by the English it made a very fine appearance.

Among the principal edifices were the epifcopal palace; the fort or citadel, the refidence of the governorgeneral; the house and church of the Recollects; the church of the Urfuline nuns, in which is the tomb of M. Montcalm, who commanded the French, and was mortally wounded, at the battle of Quebec, (in which, also, fell the gallant Wolfe, who commanded the Englith;) the sumptuous college of the Jesuits, the intendant's house, the royal magazines, &cc. &c.

The fortifications of Quebec, at the time it was taken by the British arms, were as complete as it was possible to render them.

In failing up the river St. Lawrence from Quebec to Montreal, which is 170 miles, the eye is delighted with beautiful landscapes, the banks, in many places: being very steep, and shaded with lofty trees. The farms lie pretty close all the way; several gentlemens houses, neatly built, shew themselves at intervals; and there is all the appearances of a flourishing colony, tho' but sew towns or villages. Many fine illands are interspersed in the river, and afford a pictursque view. After passing the Richlieu Islands, the air becomes so mild and temperate, that the voyager thinks himself transplanted to another climate; but this is only to be understood of the summer months.

The town called Trois Rivieres is about half way between Quebec and Montreal, and has its name from three rivers, which join their currents here, and fall into the river St. Lawrence. It is much reforted to by feveral nations of Indians, who come to trade with the inhabitants in various kinds of furs and Ikins.

Montreal is fituated on the island formed by the river.
St. Lawrence, which is ten leagues in length, and four in breadth. While the French had possession of Canada,

both the city and island of Montreal were private property, and so well improved, that the whole island was a most delightful spot, and produced every thing that could administer to the conveniencies of life. When it was reduced by General Amherst, it was populous. The houses were built in an handsome manner, and every house might be seen at one view from the harbour. This place is surrounded by a wall and dry ditch, and its fortifications have been improved by the English. It is nearly as large as Quebec; but since its conquest by the British arms it has suffered much by fire.

Before the conquest of the province of Canada, the different tribes of Indians inhabiting it were almost innumerable. But these people are observed to decrease in population where the Europeans are most numerous, owing chiefly to the immoderate use of sprituous liquors, of which they are excessively fond.

In the year 1774 an act was passed by the Parliament of Great Britain, allowing the inhabitants of the province of Quebec, professing the Roman Catholic religion, the free exercise of the same, subject to the King's supermacy. By the same act their clergy may enjoy their accostomed dues and rights, but with respect only to persons of their own religion; for a right is reserved to his Majesty to make a suitable provision for the Protestant clergy. In matters of property, reference is to be had to the laws of Canada; but criminal cases are to be determined by the laws of England.

While the French were in poffession of this country the Indians supplied them with peltry; and the French had traders who, in the manner of the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the most remote parts of America, amongst people unknown to any other Europeans. Thus they habituated the Indians to commerce, and they vifited the French in their fettlements. For this purpose people from all parts, even from the diffance of 1000 miles, came to the French fair at Montreal, which began in June, and fometimes lasted three months. Many folemnities were observed on these occasions; guards were placed, and the governor affifted, to preferve order in fuch a concourle, composed of so great a variety of favage nations. But fometimes great tumults happened; and the Indians being fo fond of brandy, frequently gave all their merchandize for a small quantity of that spirituous liquor.

It is very remarkable, that many of these Indians actually passed by our settlement of Albany, in New York, and travelled upwards of 200 miles farther to Montreal, though they might have purchased the commodities cheaper at the former place. So great an ascendancy had the Krench gained, by their infinuating address, over the minds of these people.

Since the English became possessed of Canada, their exports to Great Britain, in skins, furs, ginseng, snakeroot, capillaire, and wheat, have greatly increased, as well as the imports from Great Britain. Hence the value and importance of this trade must be evident. It would soon be increased to a great degree, were the river St. Lawrence always open. But the excessive cold, which continues there from December to April, renders all navigation impracticable. Another inconvenience arises from the falls of the river St Lawrence, below Montreal, which prevent large ships from coming to that emporium of inland commerce.

SECTION II.

NOVA SCOTIA, OR NEW SCOTLAND.

Name, Situation, Extent, Boundaries, Climate, Soil, Produce, Revolutions, Divisions, Chief Towns, &c.

THIS country obtained the name of Nova Scotia from Sir William Alexander, fecretary to King James I. that monarch having made him the first grant of lands in it.

Nova

ong which the fize and venom. It root of a certicle wound, yield large crops grain. Melons of the hop plant, atered yield extitle. Tobacco, cultivated, ontain the great-one continued.

, and to all ap-

pearance

Nova Scotia is situated between the 43d and 49th degrees of north latitude. It is about 350 miles in length, and 250 in breadth, and bounded on the north by the river St. Lawrence, on the east by the Atlantic Ocean, on the fouth by the same, and on the west by

Canada and New England.

A great part of the country confifts of the peninfula that is formed by the Bay of Fundy, Chenigto, and Green Bay; all the coast of which, from Cape Sable on the west, to Cape Canso on the east, is lined with shoals or fands. Belides the Bays above-mentioned, there is a great number of others all along the coast, particularly Gaspé, Chaleurs, and Chedibucto, on the north-east; the Bay of Islands, Chebucto, and La Here, on the fouth; and the Bay of Annapolis on the fouth fide of the Bay of Fundy. In these bays, and other parts of the coast, are many fine roads and havens. The chief capes are those of Rosieres and Gaspé, on the north-east; Capes Portage, Ecoumenac, Tourmentin, Port, Epis, Fogery, and Canso, on the east; Capes Blanco, Vert, Teodore, Dore, La Heve, and Negro, on the fouth; Cape Sable, and Cape Fourche, on the fouth-west. The rivers and lakes are very numerous. Of the former the most material are those of St. John, Passamagnadi, Penobscot, and St. Croix, which run from north and south, and fall into the Bay of Fundy; and those of Rifgouche and Nipisiguit, which run from west to east, and fall into the Gulph of St. Lawrence; and that of Chebucto, that falls into the Atlantic. Of the latter, those called Keseben and Freneuse are very large: but there are many that have not yet received any particular names.

The climate of this country, through the fudden transition from heat to cold, has been found unfavourable to European conflicutions. A feven months intense cold is generally succeeded by a heat as intense, without the intervening and refreshing seasons of spring and autumn; added to which, the country is inveloped in the gloom of a fog a great part of the year.

In to an unfavourable climate little produce can be expected from the foil, which being thin and barren, the corn is of a shrivelled kind like rye, and the grass intermixed with a cold spongy moss. There are tracks, however, to the fouthward, which are fertile; and, in general, the foil is adapted to the produce of hemp and flax. The timber is, in general, very proper for ship

building.

There are the same animals here as in the neighbouring provinces, as deer, beavers, otters, wild fowl, and all species of game. Many kinds of European quadrupeds and sowls have been sent here from time to time, and thrive well. The sish begin to spawn at the close of March, when they enter the rivers in vast fhoals. Herrings come up in April, and falmon in May. But the most valuable appendage to Nova Scotia is Cape Sable coast, along which is one continued

range of cod fishing banks, and excellent large har-

This country has often reverted from one private proprietor to another, and from the French to the Enghish nation. It was ceded to the French by the treaty of Breda in 1661; but being afterwards taken by the English, it was, by the treaty of Utrecht, yielded up to them.

From divers political motives, a refolution was taken in the year 1749, to form a fettlement in this province at the expence of government. Purfuant to the fame, 3000 British families were transported hither, and a town was erected on the Bay of Chebucto, and called Hallifax, in honour of the Earl of Hallifax, to whose wisdom and care we owe this settlement.

The town of Hallifax is very commodiously situated for the fishery, and has a communication with most parts of the province, either by land carriage, the sea, or navigable rivers, with an excellent harbour for shipping. It has an intrenchment, strengthened with forts of timber. The trade of the inhabitants is in fish, furs, and naval stores.

The other towns of less note are Annapolis-Royal, which, though but fmall, was once the capital of the province. It has one of the finest harbours in America, capable of containing 1000 veffels to anchor, in the

utmost fecurity.

St. John's is a new fettlement at the mouth of the

river of that name.

Before Canada was ceded to the English, that colony fuffered greatly from the incursions of the Indians, infomuch that the people could hardly extend themselves beyond the reach of the cannon of the fort, or attend their works, even in that confined circle, without the

greatest danger.

In the year 1784 this province was divided into two governments, viz. New Scotland and New Brunfwick. The latter is bounded on the westward of the river St. Croix by the faid river to its fource, and by a line drawn due north from thence to the fouthern boundary of Quebec; to the northward of the same boundary as far as the western extremity of the Bay of Chaleurs; to the eastward by the faid bay to the Gulph of St. Lawrence. to the bay called Bay Verte; to the fouth by a line in the center of the Bay of Fundy, from the center of St. Croix aforefaid to the mouth of the Musquat river; by the faid river to its fource, and from thence by a due east line across the isthmus into the Bay Verte, to join the eastern lot above described, including all islands within fix leagues of the coaft.

Since the conclusion of the American war, the emigration of loyalists to this province from the United States has been very great. By them new towns have been raised, particularly Shelburne, which extends two miles on the water-fide, contains a great number of

houses, and many thousand inhabitants.

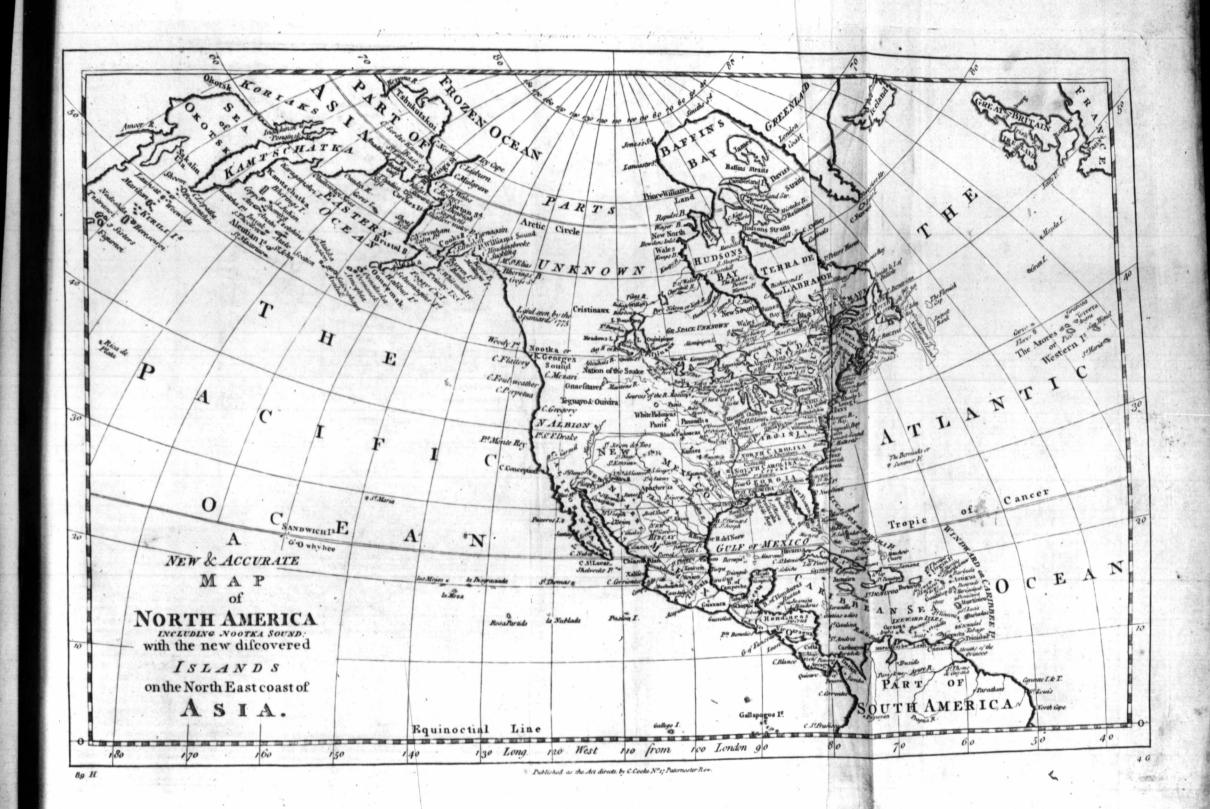

C H A P. V.

UNITED STATES OF AMERICA.

INTRODUCTION.

WITHOUT entering on the particulars relative to the war between Great Britain and her American Colonies, which terminated the establishment of the United States of America, as these are univerfally known, it may fuffice, by way of introduction to this part of our work, to remark, that on the 4th of July, 1776, the congress published a solemn declaration, fetting forth the causes of their withdrawing their allegiance from the crown of Great Britain.

They tlated, in the name, and by the authority, of the united colonies of New Hampshire, Massachusett's Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia, that they then were, and, of right, ought, to be Free and Independent States, and that, as fuch, they had full power to levy war, conclude peace, contract alliances, eftablish commerce, and perform all other acts and things, which independent states may of right do. They also published articles of confederation and perpetual union between the united colonies, in which they affumed the title of " The United States of America."

For the more convenient management of the general interests of these states, it was determined, that delegates should be annually appointed in such manner as the legislature of each state should direct, to meet in congress on the first Monday in November of every year, with a power referved in each flate to recall its delegates, or any of them, at any time within the year, or to fend others in their stead, for the remainder of the year. In determining questions in the United States, in congress affembled, each state is to have one vote. Every state is to abide by the determination of the United States in congress affembled, on all questions fubmitted to them by the confederation. The articles of the confederation are to be inviolably observed by every state, and the union is to be perpetual: nor is any alteration, at any time hereafter, to be made in any of them, unless such alteration be agreed to in a congress of the United States, and to be afterwards confirmed by the legislature of every state.

On the 30th of January, 1778, the French King concluded a treaty of amity and commerce with the Thirteen United Colonies of America, as independent states. Holland acknowledged them as such April 19, 1782: and on the 30th of November 1782, provisional articles were signed at Paris by the British and American commissioners, in which his Britannic Majesty acknowledged the thirteen colonies to be free, sovereign, and independent states; and these articles were afterwards ratisfied by a desintive treaty. Sweden acknowledged them as such February 5, 1783; Denmark 25th of February, 1783; Spain in March, and Russia in July, 1783.

SECTION I.

NEW ENGLAND.

Situation. Extent. Boundaries. Divisions. Climate. Soil.

Produce. Articles of Exportation and Importation. Inland Trade. Religion. Government. Description of
particular Colonies and Towns.

EW England is fituated between the 41ft and 45th degrees of north latitude, and 67th and 73d degrees of west longitude. It is bounded by Canada on the north-west; by Nova Scotta, or Arcadia, on the north-east; by the Atlantic Ocean on the east and fouth; and by the province of New York on the west; being 550 miles long. It comprehends sour colonies, viz. New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantation, and Connecticut.

The fummers in New England are but of short duration. For the space of two months the sky is perfectly clear, which renders the country so healthy, that it is said to agree better with British constitutions than any other of the American provinces. The winters are here long and severe, the wind often boisserous, and the air extremely sharp, but not intolerable. Naturalists ascribe the early approach, and the length and severity of the winters, to the large fresh water-lakes lying to the north-west of New England, which being constantly frozen over from the beginning of November to June or July, occasion those piercing winds, which prove so fatal to mariners on this coast. Towards the sea the land is generally low, and frequently marshy; but in the country it rises into hills, and on the north-east becomes altogether rocky and mountainous.

The foil about the Massachusetts Bay is black, and the grass rank, but the uplands are fruitful. The fruits of Old England come to great persection here; and the country in general produces corn, pulse, esculent plants, Indian corn, and all kinds of timber. The oaks here are inferior to those of Old England; but the firs are of a prodigious bulk; and they draw from these and other trees, pitch, tar, rosin, turpentine, gums, and balm: the soil also producing hemp and slax, a ship may be built, and rigged out, with the produce thereos.

There is here great abundance and variety of fowl, as geefe, ducks, turkies, hens, partridges, widgeons, fwans, herons, heathcocks, pigeons, &c. nor is the feathered kind in greater plenty than the quadrupeds, more immediately necessary to human subsistence and convenience. All kinds of European cattle thrive and multiply exceedingly. The horses of the province are hardy, mettlesome, and serviceable, but small. Here are also elks, deer, hares, rabbits, squirrels, beavers, otters, monkies, racoons, fables, bears, wolves, foxes, together with a variety of other tame and wild quadrupeds: but the most extraordinary of these animals is the mose, or moose deer; the black species of which is about 12 feet high, with four horns, and broad palms, fome distant near 12 feet from the tip of one horn to the other. His body is about the fize of a bull; his neck resembles a stag's; his tail is somewhat longer, and his flesh extremely grateful. The light-coloured moose, called wampoon by the Indians, is of a smaller stature, and much more common than the black. The rattle-snake is another natural curiosity of New England, though not peculiar to it.

The furrounding feas, and interfecting rivers, afford abundance of fifth; confequently there are many fiftheries, particularly for cod and mackarel.

Sugar-baking, diffilling, paper-making, and the falt-works, are improveable; and the iron-mines are confiderable.

The people export biscuit, meal, falt provisions, sometimes cattle and horses, planks, hoops, shingles, pipe-staves, butter, cheese, grain, oil, tallow, turpentine, bark, calf-skins, tobacco, apples, cyder, and onions. They import, in return, sugar, cotton, girrger, and various other commodities. From Europe they import wine, silks, woollen cloths, toys, hardware, linen, ribbons, stuffs, laces, paper, household furniture, husbandry tools of all kinds, cordage, hats, stockings, shoes, and India goods. They manufacture coarse linen and woollen cloth for their own use. Hats are also made here, and find a good sale in the other colonies. The business of ship-building was one of the greatest and most profitable employments of this country.

The inland trade, besides masts, yards, and provifions of all kinds, consists chiefly of surs, and the skins of beavers and martins. The surs and skins are brought in by the Indians, especially those on the rivers Penobsect and St. John.

In New England every feet of Christians is allowed the free exercise of their own mode of religion, and is equally under the protection of law.

With respect to the government of New England previous to the revolt of the colonies, the appointment of a governor, lieutenant-governor, secretary, and all the officers of the admiralty, was vested in the crown. The power of the militia was wholly in the hands of the governor as captain-general. All judges, justices, and sheriffs, to whom the execution of the law was entrusted, were nominated by the governor, with the advice of the council. The governor had a negative on the choice of counsellors, preremptory and unlimited. He was not obliged to give a reason for what he did in this particular, or restrained to any number. Authentic copies of the several acts passed by this colony, as well as others, were transmitted to the court of England for the royal approbation: but if the laws of this colony were not repealed within three years after they were presented, they were not repealable by the crown after that time. No laws, ordinances, elections of magistrates, or acts of government whatsoever, were valid without the governor's consent in writing.

But this mode of government has been totally changed with the revolution that fince took place, of which we have already given an account. It was on the 25th of July, 1776, that, by an order from the council at Bofton, the declaration of the American congress, abfolving the united colonies from their allegiance to the British crown, and declaring them free and independent.

house in that town.

A conflitution, or form of government, for the com-mon wealth of Maffachufett's, including a declaration of rights, was agreed to, and took place, in October, 1780. This government was formed absolutely upon republican principles, both in a civil and religious

The Massachusetts colony received its name from the Indians who inhabited these parts when the English first came hither. It is subdivided into the provinces

of Plymouth, Massachusetts Proper, and Maine.
Plymouth province is divided into the counties of Briftol, Plymouth, and Barnstaple. Briftol, the chief town of the county of that name, is large and populous, has a commodious harbour, and is well fituated for trade.

In the province of Massachusetts Proper are the counties of Susfolk, Middlesex, and Essex. Their

Bofton is not only the chief town of Maffachufetts
Proper, but of all New England. It flands on a peninfula at the bottom of Maffachufetts Bay, about eight miles from its mouth, and is well fortified. The approach to the harbour by fhipping is narrow, but within it there is room enough for 500 fail to lie at anchor, in a good depth of water. On one of the islands of the bay flands fort William, the most regular fortress belonging to the United States. No ship can approach the town without passing directly under the guns of the fort. About two leagues from the city is a light-house, erected on a rock. At the bottom of the bay, which is very spacious, is a pier, near 2000 feet in length, with a row of merchants warehouses on the north side. city lies in the shape of a half-moon round the harbour, being in length about two miles, and in some places near three quarters of a mile broad. The principal street runs from the pier up to the town-house, which is a handsome building, with walks for the merchants. This edifice contains the courts of justice, the councilchamber, and the house of representatives. There are fome places of public worship, and other structures, both spacious and elegant.

Cambridge Town, commonly called Newton, is fituated on the northern branch of Charles's river, about three miles from Boston, in which are several good streets: but it is most considerable for its university, confifting of two colleges, called by the names of Haverford College and Stoughton-Hall. The univerfity is governed by a prefident, five fellows, and the treasurer, who have each of them a competent revenue fettled

on them.

At Lexington, in the county of Middlesex, the first blood was shed in the unhappy contest between Great Britain and the colonies. Charles Town, opposite to Boston, was set on fire in the attack of Bunker's Hill.

Salem is fituated on a plain between two rivers, on each of which it has a harbour about 18 miles north of Boston. Its principal business is ship-building, particularly the construction of fishing-smacks.

The province of Maine contains the two counties of York and Cornwall, of which the chief towns are Scar-

borough and Falmouth.

The chief towns of the province of New Hampshire are Hampton, Portsmouth, and Exeter, all of which

lie near the mouth of the river Pifcataqua.

The colony of Connecticut is about 100 miles in length, and 70 in breadth. Connecticut River, which is one of the largest in New England, runs through the heart of the province, and is navigable about 40 miles for large veffels, and much farther for small ones. This colony abounds in metals and naval stores, especially timber, and has many good ports. The colony is divided into four counties, and its chief towns are Newhaven, Hertford, and New London.

Newhaven stands upon the coast, and has a college for academical learning, called Yale-Hall, pretty well

endowed, and furnished with a good library.

Hertford is a handfome, populous town, fituated on the banks of Connecticut River.

New London is a town of good trade, fituated on the west fide, and near the mouth of the river, called

Thames.

Connecticut is deemed, in proportion to its extent, to exceed every other colony of America, as well in the abundance of people, as cultivation of foil. The men, in general, are robult, frout, and tall. The greatest care is taken of the limbs and bodies of infants, which are kept strait by means of a board; a practice learned of the Indian women; fo that deformity is here a rarity. The women are handsome and genteel in their persons, and modest and reserved in their behaviour. They do not follow idle amusements, but employ their time in fuch pursuits as tend to the improvement of the mind. The people here are very hospitable to strangers.

In no part of the world are the people in general fo independent, or possess more of the conveniencies of life, than in New England. They are used, from their infancy, to the exercise of arms: and before the contest with the mother country, they had a militia which was by no means contemptible: but their military strength is now much more considerable.

The colony of Rhode Island comprehends a district on the continent, called Providence Plantation. The island, which is about 15 or 16 miles long, and about four or five broad, is called the Paradise of New England, from the fruitfulness of the foil, and the temperateness of the climate.

Providence Plantation, which lies opposite to Rhode-Island, is about 20 miles square, and has two large towns, one of which is called Providence, and the other Warwick.

The lovers of literature cannot but feel a fatisfaction when they are reminded that, notwithstanding the calamities of a war, carried on with the utmost animosity by the parties engaged on each fide, the council and house of representatives of Massachusetts Bay, passed an act in May 1780, for incorporating and establishing a fociety for the cultivation and promotion of the arts and sciences, intitled " The American Academy of Arts and Sciences,"

SECTION II.

YORK.

THE colony of New York is fituated between 40 and 46 degrees of north latitude. Its length is about 300 miles, and its breadth about 150. province, including the Island of New York, Long Island, and Staten Island, is divided into the ten following counties, New York, Albany, Ulfter, Duchefs, Orange, West Chefter, King's, Queen's, Suffolk, and Richmond. The chief towns are New York, Albany, and Schnectady.

The principal rivers are Hudsons, the Mohawk, and the Delaware. The former abounds with excellent harbours and a great variety of fish. On the Mohawk is a large cataract, called the Cohoes, or great Waterfall. This surprising cataract is a quarter of a mile broad, and to feet deep. The water precipitating it-felf from several rocks which project from the reft, falls down on every fide in torrents, and being broken near the bottom by many separate crags, rises in a white froth. From the whole arises a misty cloud, that defeends like small rain, and exhibits, when the sun shines, a beautiful rainbow. The chief lakes are George, Champlain, and Ontaria.

As New York lies to the fouthward of New England, it enjoys a more happy temperature of climate. The air of this province is very falutary. The face of the country, refembling that of the neighbouring colonies, is low, flat, and marshy, towards the sea. As you recede from the coast, the eye is entertained with the gradual AMERIC

New England, dimate. The he face of the uring colonies, As you reuned with the gradual gradual swelling of hills, which become large in pro-portion as you advance into the country.

The foil is very fertile in most parts of the province, producing wheat, rye, Indian corn, barley, flax, and ruits, in great abundance and perfection. The timber fruits, in great abundance and perfection. The timber is nearly the same with that of New England. A great deal of iron, and of excellent quality, is found here.

The animals, in general, of this province, are the fame with those of New England.

The city of New York stands on the fouth-west end of York Island, which is about twelve miles long, and three broad, and extremely well fituated for trade, at the mouth of Hudson's River, being a noble conveyance from Albany, and many other towns towards Canada and the lakes. This city is about a mile in length, and half a mile in breadth. The city and harbour are defended by a fort and battery. In the fort is a spacious mansion-house for the use of the governor. Some of the houses are elegant; and the city, though irregularly built, affords a fine prospect. A fourth part of the city was burnt down by some incendiaries in 1776, on the King's troops taking it. A great part of the inhabitants are descended from the Dutch families who remained here after the furrender of the New Netherlands to the

No part of America is better supplied with markets, abounding with great plenty and variety of provisions. It is at once the metropolis and grand mart of the province, and, by its commodious fituation, commands also the trade of the western part of Connecticut, and that of East Jersey, No season prevents ships from putting to sea; and during the severest part of the winter, an equal activity runs through all ranks, orders,

and employments.

The town of New Albany is fituated on the western banks of Hudion's River, about 150 miles from New York. The houses are built with brick in the Dutch tafte. The public buildings are two churches, the fort, and town-hall.

Saratoga, a fmall for t to the northward of Albany, was the place where a combined army of British and Hessians, surrendered prisoners of war to the Ameri-

cans, in October 1777.

About 16 miles north-west of Albany lies Schenectady, situate on the banks of the Mohawk River. It is compact and regularly built. It has a large Dutch church; and the windings of the river through the place and the adjacent fields, which are overflowed in the spring, form a most beautiful prospect about harvest The lands are remarkably fertile.

Kingston has a number of inhabitants, and is a well-

built town.

With respect to religion, it is ordained by the late constitution of New York, that the free exercise of profession and worship, without discrimination or pre-ference, shall be allowed by that state to all mankind. About the year 1755 a college was erected by the affem-bly; but the members being at that time divided into parties, it was formed on a contracted plan, and for that reason never met with the encouragement which might naturally have been expected of a public feminary in fo populous a city.

The commerce of New York does not effentially differ from that of New England. The chief commodities of trade are wheat, flour, barley, oats, beef, and other kinds of animal food. They have a share in the log-wood trade, and that which is carried on with the Spanish and French plantations. Their European trade is the same with that of New England, and they

import the fame species of commodities.

The Dutch and Swedes were the first Europeans who formed fettlements on this part of the American coaft. They called it the New Netherlands, and continued in possession of it till the reign of Charles II. when it was taken by the English in 1664. The Dutch, to balance this conquest, made themselves masters of Surinam, then belonging to the English. At the treaty of Breda in 1667 the New Netherlands were ceded to the English, and Surinam to the Dutch. The New Netherlands had not been long in our poffession before they were divided into provinces, and New York took its name from the king's brother James duke of York, to whom his majefty granted it, with full powers of go-vernment by letters patent. On the accession of king James to the throne this province became a royal government. The king appointed the governor and council, and the people, once in feven years, elected their representatives to ferve in general affemblies. These three branches of the legislature had power to make any laws not repugnant to those of England, but in order to their being valid, the royal affent was first to be obtained.

In 1777 the supreme legislative power was vested in two separate and distinct bodies of men; the one to be called " The affembly of the State of New York," to confift of feventy members annually chosen by ballot; and the other, "The Senate of the State of New York," to confift of twenty-four for four years, who together were to form the legislature, and to meet once at least in every year for the dispatch of business. The supreme executive power was to be vested in a governor, who was to continue in office three years, affifted by four counsellors chosen by and from the senate. Every male inhabitant of full age who should possess a freehold of the value of twenty pounds, or have rented a tenement of the yearly value of forty shillings, and been rated and have paid taxes to the flate for fix months preceding the election, was entitled to vote for members of the affembly; but those who voted for the governor and members of the fenate were to be possible of freeholds of the value of one hundred pounds. The delegates to the congress, the judges, &c. were to be chosen by ballot of the senate and assembly.

Before we close our account of this province, it will be necessary to observe, that the north-west parts of it are inhabited by five Indian nations called Iroquois. These people, by their unanimity, firmness, military skill and policy, raised themselves to the greatest and

most formidable power in America.

As their manner of carrying on war is implacable and barbarous, they reign the lords of a prodigious defert inhabited only by a few scattered infignificant tribes, whom they have permitted to live out of a con-tempt of their power, and who are in the lowest state of fubjection.

Every nation of the Iroquois is a diffinct republic, governed by their fachems, or civil magistrates, in times of peace, and by their warriors or captains in their wars: but their chiefs never refolve on, or execute, any thing of importance without confulting the heads

of their tribes.

They are very strict in observing the oaths they swear to each other, especially those which their warriors make of standing by one another to the last. These they keep to fuch a degree as to hazard their lives to rescue the bare carcases of their fallen brethren.

They commonly make a kind of feaft over the grave, and put into it wheat, tobacco, and every thing they think the deceased may want in the other world.

The women are very prolific, yet they do most of the drudgery, fuch as grinding the wheat, fetching of wood, water, and the like. The children are often fo stubborn, that if they are found fault with, the girls will dispatch themselves with some poisonous weed, the boys with a gun. The business of the men is hunting, going to war, building their huts, felling timber, tilling the ground, and the like.

SECTION III.

JERSEY.

THIS province is fituated between 39 and 43 deg. of north latitude. It is bounded on the north by New York, on the fouth by Delaware Bay, on the east by the Atlantic Ocean, and on the west by Pennsylvania. It is about 160 miles in length, and near 60 in breadth.

New Jersey comprises two divisions, east and west. The east division contains the counties of Middlesex, Monmouth, Effex, Somerfet and Bergen. The west those of Burlington, Gloucester, Salem, Cumberland, Cape May, Huntingdon, Morrisand Suffex.

The principal rivers are the Delaware, Raritan and Paffaick. On the latter is a stupendous cataract. The height of the rock from which the water falls is about 70 feet perpendicular, and the breadth of the river at the fall 80 yards.

The air of New Jersey is falubrious, and the climate nearly the fame with that of New York; but the fummers are fomething longer, and the cold in winter less fevere. The foil is various: one fourth of the pro-vince is barren landy land; the other is good, and some

of it very fertile.

The animal and vegetable productions here are, in general, the fame with those in New England. The fandy parts of the country produce pines and cedars, and the arable lands good crops of excellent wheat, barley, rye, Indian corn, &c. together with a great variety of delicious fruits.

In the country of Bergen there is a very valuable copper mine, which is worked to great advantage; excellent iron ore is also found in several parts of the pro-

vince.

The foreign trade of this province is not extensive, owing principally to its vicinity to the large trading towns of New York and Philadelphia. The principal exports are, wheat, flour, copper ore, pig and bar iron, and black cattle, which they drive in great numbers to Philadelphia, on the rich pastures of which they are fed for some time before they are fent to market and killed.

The chief towns in New Jersey are, Perth-Amboy and Burlington. They were once feats of government, but the governors generally refided at the latter. Perth-Amboy is commodiously situated at the mouth of the river Raritan. The town is not very large, but the houses are neat, and some of them elegant. It has a good port, and the harbour is fafe and capacious to contain many large ships.

Burlington is pleasantly situated in a small island formed by the river Delaware, about twenty miles from Philadelphia. It flands commodiously for trade, is well built, has a large town-house, and two bridges (called London and York bridges) over the branch of the De-laware, which separates it from the main land.

New Jersey was part of the New Netherlands, which, as before observed, was given by Charles II. to his brother James duke of York. He fold it to lord Berkley and Sir George Carteret, and as the latter was before possessed of estates in the island of Jersey, the same name was given to this province. It was fold by thefe proprietors to others, who, in the year 1702, furrendered their charter to Queen Anne, after which it became a royal government. From that time to the revolt of the colonies its government was much the fame as that of the colonies in general. But by the new charter of rights established in 1776, it is vested in a governor, legislative council, and general assembly. The members of the legislative council are to be freeholders, and worth at least 1000l. real personal estate, and the members of the general affembly to be worth

All inhabitants worth 50l. are entitled to vote for reprefentatives in council and affembly, and for all other public officers. The governor and lieutenantgovernor to be chosen out of, and by, the affembly and council. The judges of the supreme court are chosen for seven years, the officers of the executive power for five years, and the provincial treasurer for only one year.

All religious fects are tolerated here, and enjoy their respective tenets and modes of worship without moleftation.

In the year 1746, governor Beldrier founded a college at Prince-Town, and procured it the privilege of conferring degrees in the fame manner as at Oxford or Cambridge. Before the late unhappy diffentions fludents came here from all parts of the continent.

SECTION. IV.

PENNSYLVANIA.

THIS province is fituated between 39 and 44 deg. of north latitude, and 72 and 78 deg. of well longitude. It is about 300 miles in length and 240 in breadth. It is bounded on the north by the country of the Iroquois, on the fouth by Maryland, on the east by the river Delaware, and on the west by the river

Pennfylvania is divided into feven counties. The upper are those of Buckingham, Philadelphia, Chester and Lancaster: the three lower counties are, Newcastle, Kent and Suffex. Thefe, though originally appertaining to Pennsylvania, have a separate government of their own, and as such were diftinguished at the establishment of the United States of America, being specified in the lift of those states under the appellation of "The State of Delaware," as they are firuated on the river of that name.

The chief rivers are the Delaware, which is navigable more than 200 miles above Philadelphia. The Sufquehana and Schwylkill, which are also navigable a confiderable way up the country. These rivers, with the numerous creeks and harbours in Delaware Bay, are admirably fuited to the trade of the province.

The air of this country is fweet, ferene, and clear. Autumn fets in about the 20th of October; winter the beginning of December, and continues till March, during which the weather is extremely cold, the frofts being very intense. Spring begins in March, and con-tinues till June. The summer season includes the months of July, August, and September, when the heat would be intolerable, were it not mitigated by frequent cool breezes.

The foil is fertile, producing a variety of trees, fruits, and vegetables in general. The animal productions are much the fame with those of New England.

It may be remarked in general, that in all the plantations from New York to the fouthern extremity, the woods are full of vines of divers species, and all different from those we have in Europe. But whether from fome defect in their nature, or want of skill in the planters, they have not been known to produce any wine that deferves to be mentioned; though the Indians from them make a kind of wine with which they regale themselves. It may further be observed, that the timber of the fouthern colonies is not fo good for shipping as that of the northern, because it is less compact, and fplits more eafily; properties which, though lefs ferviceable in ship-building, render it more useful for

flaves and wainfcotting.

The province of Pennfylvania contains many confiderable cities and towns, as German Town, Chefter, Oxford, Radnor, &c. But the city of Philadelphia flands unrivalled in America, and therefore deferves principal attention. It was built after the plan of the famous Penn, the founder and legislator of this colony, and lies between two navigable rivers, the Delaware, which terminates it on the north, and the Skoolkill on the fouth. It forms an oblong of near two miles in length. The fireets are wide and spacious, and exactly strait and parallel to each other. The houses are, in general, well built, and make a handsome appearance, feveral of the public buildings being elegant. Every owner of 1000 acres has his house in one of the two fronts facing the river, or in the high street, running from the middle of the one front to the middle of the other. In the center of the city is a square of ten acres, encompassed by the town house and other public buildings. There are noble barracks, and a spacious quay, with

wet and dry docks for building and repairing ships; befides magazines, warehouses, and all other conveniences for exporting and importing merchandize. The governor's feat is a most magnificent building. In a word, nothing can well appear more beautiful than this city and the adjacent country, which, for fome miles, may be compared to a fine and flourishing garden.

The other towns in Pennsylvania are German Town, Oxford, Radnor, Chefter, Chichefter, and Newcastle. German Town is a thriving, populous place, inhabited mostly by Germans. At Chester and Chichester are ports fufficient to receive and fecure the largest fleets from storms. Newcastle carries on a considerable trade, and has an iron mine in its neighbourhood.

This country, forming a part of what was called the New Netherlands, was originally poffeffed by the Dutch and Swedes. After Admiral Penn, who, in conjunction with Colonel Venables, had fome years before taken the Island of Jamaica, being in favour with Charles the Second, obtained a promife of this country from that monarch.

Upon his death his fon, the celebrated quaker, claimed the royal promife, and, after a tedious court folicitation, obtained the grant of this province in 1679, and called it Pennfylvania, or Penn's Country. The fituation of the times induced great numbers to follow him into his new fettlement, to avoid the perfecutions to which the quakers were then particularly exposed. But it was to his own wisdom and ability that they were indebted for that charter of privileges which placed this colony on fo respectable a footing. That great man laid down civil and religious liberty as the chief foundation of all his inflitutions. His generofity extended to the Indian nations; for inflead of taking immediate advantage of his patent, he purchased of them the lands he had obtained by grant; judging that the original property, and eldeft right, were vested in them. By this act of justice in the beginning, he rendered all his suture dealings with those people successful. Prepossessed with a favourable opinion of him as to his defigns, they were fo far from annoying the fettlers, that they were ready to give them affiltance whenever it was wanted. In fine, Mr. Penn, by pursuing an equitable plan, soon established this colony, which may be faid to have attained to a degree of superiority over the rest.

There were in the city of Philadelphia a great number of wealthy merchants, which is not furprifing, when we confider the great trade which it carried on with divers nations in different quarters of the globe. The imports and exports, therefore, must have been very confiderable.

The general congress assembled at the city of Philadelphia in 1774, and continued their meetings till it was taken by the British arms in 1777. But the enfuing fummer the British troops retreated to New York, and the congress met at Philadelphia as before.

By the conftitution established by general convention at Philadelphia, in September, 1776, the fupreme legislative power of Pennsylvania is vested in an affembly of representatives, chosen annually by ballot; and the executive power in a president and council of twelve, chosen by the freemen. Delegates to congress

are chosen by ballot, out of, and by, the affembly.

The legislature of the state of Delaware is, by the convention in the fame year and month as the former, composed of two diffinct bodies; the house of affembly, chosen annually by the freeholders of the counties of Newcastle, Kent, and Suffex; and the council of nine members, childen in like manner: The executive power is a prefident, chosen out of the general affem-bly by joint ballot, and a privy council of two of the legislative council, and two of the house of assembly. Delegates to congress are annually to be elected by, and out of, the general affembly, by ballot; and the officers of state, civil and military, chosen by the prefident and general affembly.

No. 46.

Religious liberty is founded in Pennfylvania on the most ample basis, so that here are Christians of all denominations, and they live together in the utmost harmony. In the fmall town of Ephrata, in the county of Suffex, there is an extraordinary religious feet called Dunkards, a very harmless and inoffensive set of peo-

A German hermit, who fettled on the fpot where Ephrata is now built, was the founder of this feet. The fame of his folitude inspired some of his countrymen with curiofity; and the fimplicity of his life, with the piety of his conversation, induced them to join and imitate him. A people who leave their native country to enjoy liberty of conscience can bear all subsequent mortifications. The Germans of both sexes, who joined the hermit, foon accustomed themselves to his way of thinking, and confequently to his manner of living. Industry became part of their duty, and divided their time with devotion. Their gains are thrown into one common flock, which supplies all their exigences, private as well as public. Their families are cloistered up by themselves in a separate part of the town, the fituation of which is delightful, and fcreens them from the north wind. It is triangular, and fenced round with thick rows of apple, beech, and cherry trees, belides having an orchard in the middle. The houses, which are of wood, are mostly three stories high; and every person has a separate apartment, that he may not be disturbed in his devotions. The women never fee the men but at public worship, or when it is necessary to consult upon matters of public aconomy. Their garb is the most simple that can well be imagined, being a long white woollen gown in winter, and linen in the fummer, with a cape, which ferves them for a hat, like that of a capuchin behind, and faftened round the waift with a belt. Under the gown they wear a waiftcoat of the fame materials, a coarfe shirt, trow-fers, and shoes. The dress of the women is the same, only, inflead of trowfers, they wear petticoats; and when they leave their numbery (for fuch it is) they muffle up their faces in their capuchins. The diet of the Dunkards confifts chiefly of vegetables: but it is no principle with them to abstain from animal food, only they think that fuch abstinence is most agreeable to a Christian life. This temperance emaciates their bodies, and, as the men fuffer their beards to grow to their full length, gives them a hollow ghaftly appearance. Their beds are no better than benches; a little wooden block ferves them for a pillow; and they celebrate public worship twice every day, and as often every night. But though, such modes of life appear absurd and impracticable, the Dunkards are far from being extravagant. Their chapel is very decent: and they have, upon a fine stream, a griff-mill, a papermill, an oil-mill, and a mill for pearl barley, all of them most ingeniously constructed by themselves. They have even a printing-office. They are, especially the nuns, extremely ingenious in working, and in embellishments of all forts. Though the two fexes live feparate from each other in their town, the Dunkards are far from being averse to matrimony. In this case the parties must, indeed, leave the town; but they are fupplied out of the public fund with whatever is neceffary for their fettling elfewhere. This feet, among themselves, know nothing but harmony and mutual affection; every one chearfully performs the task of industry affigned him; and their hospitality to strangers is unbounded; but their principles forbid them to receive the smallest recompence.

Among the feveral different fects in Philadelphia, that of the Moravians is none of the least considerable. The wildness and extravagance of this sect are well known all over Europe; but though they have kind of chapel here, their principal fettlement is at a place called Bethlehem, near fixty miles from the

city of Philadelphia.

SECTION V. MARYLAND.

THIS province is lituated between 38 and 40 degrees of north latitude, and between 74 and 80 degrees west longitude. It is about 140 miles in length, and 135 in breadth; and is bounded by Pennsylvania on the north, by Virginia on the south, by the Atlantic Ocean on the east, and by the Apalachian mountains on the west.

Maryland is divided into two parts by the Bay of Chefapeak, viz. the eaftern and western divisions. The eastern division contains the counties of Worcester, Somerset, Dorset, Talbot, Cecil, Queen Anne's, and Kent. The western contains St. Mary's, Charles, Prince George, Calvert, Arundel, and Baltimore.

The air is excessive hot in the summer, and pinching cold in the winter; but the latter is not of above three months duration. The parts next the sea are very low, but the interior districts are hilly. It is watered by innumerable springs, sorming a great many fine rivers, of which the chief are Patowmack, Pocomoae, Patuxhent, Severn, Cheptouk, Sassafaras, Wicomoca, and St. George. These and other rivers, capable of receiving large ships, with the numerous bays and creeks that indent the land on every side, give the seamen an opportunity of bringing their vessels up to the planters doors. The chief bays are those of Chesapeak and Delaware; and the most noted cape that of Henelopen, at the entrance of Delaware Bay. The foil is fruitful, and, as the rivers and brooks dissusse firetility, produces trees, plants, and grain in abundance.

The chief commodity of Maryland is tobacco, of

which vaft cargoes, confifting of many thousand hogfheads, are annually exported. This commodity forms the medium of currency of Maryland, being received in debts and taxes; and the infpector's notes for tobacco, delivered to him, are transferable. An industrious man can manage 6000 plants of tobacco, and four acres of Indian corn. The tobacco of this province, called Oroonoko, is different from that of Virginia; and though not much liked or used in England, yet, in the eaftern and northern parts of Europe, it is preferred before the fweet-scented tobacco of James and York Rivers, in Virginia. Another confiderable commodity of Maryland is pork, the woods containing vaft droves of wild fwine, which are generally of a fmall fize. Good land in Maryland yields about 15 bushels of wheat an acre, or 30 bushels of Indian corn; but the grain is subject to the weevil. Great quantities both of hemp and flax are raised in this province; and the mountains yield abundance of iron ore, which is run into pigs, and refined into iron. Maryland oak is not greatly esteemed for building large ships, but is very proper for staves and small craft.

Their imports confift chiefly of wine from Madeira, Fyal, and France; rum from Barbadoes, flaves from Africa, and malt, beer, linens, woollens, utenfils of every kind, and, in fhort, most of the elegances, as well as conveniences of life, from England.

The capital of this province is Annapolis; but tho' the governor generally refides there, it is fmall and inconfiderable. Baltimore contains fome scattered buildings, and scarcely merits the name of a town.

Maryland was discovered in the year 1606, when Virginia was first planted, and, for some time, was esteemed a part of Virginia, till King Charles I. in 1632, granted all that part of Virginia, which lay north of Patowmack River, to the Lord Baltimore, of the kingdom of Ireland, and his heirs. The Baltimore family were deprived of the government of this province during the civil wars in England, but recovered it again at the restoration; and they still remain proprietors. The estate enjoyed by them here is the most considerable of any subject of Great Britain abroad; for, besides their plantations, they have certain re-

venues granted to them by feveral affemblies, as a duty on each hogshead of tobacco, and other incomes, which, with the sale of lands, uncultivated and unpurchased, must amount, at present, to a very considerable sum yearly.

The first adventurers having been Roman Catholics, followed by many families of that persuasion, who came over from England to avoid the penal laws, many of the planters profess that religion. However, the church of England was afterwards established here; and churches have not only been built, but parishes allotted to them, with annual stipends to the ministers.

The Americans have large plantations, which prevent the increase of towns. Indeed, each plantation is a little town of itself, and can substitute for without and necessaries; every considerable planter's warehouse being like a shop, where he supplies inferior planters, servants, and labourers, and has commodities to barter for tobacco, &c. here being little money, and little occasion for it, tobacco answering all the uses of gold and silver in trade. There is, indeed, both Spanish and English money, but then it serves but for pocket expences, &c. Here are but sew shopkeepers that can be properly so called, or who may be said to live by their trades.

Most of the sew Indians live on the east shore, where they have two or three little towns. They are employed in hunting for deer by the Americans. The cause of their diminishing proceeded from their own perpetual discords and wars amongst themselves. 'Tis observable, that though they are very timorous, and cowardly in fight, yet, when taken prisoners, and condemned, they die like heroes, braving the most exquisite tortures, and singing all the time they are on the rack.

The government of Maryland, as fettled in 1776, is now vested in a governor and five council, a senate of fifteen, and a house of delegates. All freemen, above 21 years of age, having a freehold of 50 acres, or property to the value of 301. have a right of suffrage in the election of delegates. All persons appointed to any office of profit or trust, are to subscribe a declaration of their belief in the Christian religion.

In 1782 a college was founded at Chefter town in this province, under the name of Washington College, in honour of General Washington.

VIRGINIA.

Situation. Extent. Boundaries. Divisions. Rivers. Climate. Soil. Productions. Chief Towns. Dispositions, Manners, Customs, &c. of the Virginians, as a Specimen of the People of the Provinces in General. Description of the Persons, Manners, Customs, &c. of the Indians, original Inhabitants of America.

THE province of Virginia is situated between 36 and 40 degrees of north lat. and 74 and 80 degrees west longitude, being about 750 miles in length, and 240 in breadth. It is bounded on the north by the river Potomac, on the south by Carolina, on the east by the Bay of Chesapeak, and on the west by the Apalachian mountains. It is properly divided into sour parts, viz. the northern, the middle, the southern, and the eastern divisions. Each of these contains a number of counties, towns, &c. of which we shall mention such as are most worthy of notice.

The entrance to Virginia for shipping is by Chesapeak Bay, which runs up 200 miles into the land. Through this bay, also, all vessels must pass that are bound to Maryland.

The four principal rivers in this country are James River, York River, Raphannock, and Potomac. Thele are not only navigable for large fhips into the heart of the country, but have fo many creeks, and receive such a number of smaller navigable rivers, that Virginia is, of all countries, the most convenient for navigation.

navigation. It has been observed, and without exaggeration, that every planter has a river at his door.

The climate is deemed healthy for English constitutions, having a clear sky, and a kindly soil. The frosts in winter are very severe, but of short continuance. The heats of summer are most violent in June, July, and August, but are much mitigated by the rains; and the fresh breezes that are common to Virginia contribute to render the heat tolerable to new comers, and hardly sensible to the inhabitants. Storms of thunder and lightning are very frequent here, but seldom attended with any mischief.

The foil, in general, is a rich deep mould, and under it a loam, of which they make fine bricks; but the quality varies as it is moift or dry. It is diftinguished into three forts, viz. high, low, and marshy, all which, having fand mixed with them, makes their land warmer than that of Great Britain. Their high lands are mostly fandy, but bear large crops of to-bacco. The low lands are rich, but the marsh lands poor. Upon the whole, however, Virginia abounds with every thing necessary for the pleasure or prosit

of the inhabitants.

The animals peculiar to this country are beavers, otters, foxes, wild cats, racoons, martins, minks, in the fresh waters, where the Indians are dexterous in catching them for the fur trade. The woods are stocked with deer; and they have also elks, buffalos, bears, wolves, and English cattle of all forts. Hares and rabbits are plentiful, and as good as those in England; besides which they have the arronghena, somewhat like the badger, the slying squirrel, the opossum, and the mussacus, a fort of water rat, with a musky scent.

Of birds they have great variety, both for feather and song. The Virginian nightingale, which takes its distinguishing epithet from this province, is adorned with a plumage of bright crimson and blue, and sings most delightfully. The natural note of the mocking bird is very melodious; besides which it attains to that of the linet, lark, nightingale, &c. There is also the humming bird, the smallest of all the winged creation, and by far the most beautiful, being arrayed in scarlet, green, and gold. It sips the dew from the slowers, which is its chief nourishment, and is too delicate to be brought alive to England. They have also hawks and eagles, with great variety of wild sowl of the usual species.

A country so interfected with large rivers may be fupposed to abound with fish. On the sea coasts are sturgeon and cod; and in the rivers almost every kind of fish that are found in other parts of the world.

The forests yield oaks, elms, poplar, pines, cedars, and firs; and the whole country is interspersed with variety of shrubs, plants, and slowers. They have fruits not only peculiar to the foil, but those introduced from England, as well as garden herbs in great abundance.

Tobacco is the staple commodity of the country, and brought to such perfection as to command a large traffic, not only to England, but to all parts of the world. This traffic has employed 200 fail of ships. Besides the advantages accruing to the national stock from the exportation of tobacco, are to be considered the prodigious number of hands it employs in the manufacture. Great quantities of divers commodities were exported from Great Britain to this colony, whose merchants and planters supplied the West India islands with tobacco, cattle, and provisions, bringing back, in exchange, molasses, sugar, and rum.

Virginia is adorned by feveral magnificent public buildings; but the only towns, worthy of notice, are Williamsburg and James Town. Williamsburg, now the capital of the province, has a number of houses, and some spacious edifices. It is about forty miles from the mouth of James River, and seven from James Town, which was formerly the capital, but now chiefly contains houses for the entertainment of sea-

faring people.

At Williamsburg is a college founded by King William III. called William and Mary College. The royal donor gave 2000l. towards it, and 20,000 acres of land, with power to purchase and hold lands to the value of 2000l. a year; and a duty of one penny per pound on all tobacco exported to the other plantations. The Honourable Mr. Boyle made a very large donation to the college for the education of Indian children.

Virginia was the first colony planted by the English in America: for though the continent of North America was discovered by Sebastian Cabot, in 1497, no attempts were made for settling a colony on it till the reign of Queen Elizabeth, when Sir Walter Raleigh, the most enterprizing genius of that age, obtained letters patent for the purpose. A squadron of ships was accordingly fitted out, and a number of adventurers embarked. Upon their arrival Sir Walter erested the English standard, took possession of the country in the name of Queen Elizabeth, and, in honour of his royal mistress, called it Virginia. Unfortunately, however, this great man failed in his expedition, and his grand designs were consequently rendered abortive.

The bad fuccess attending the first attempts seemed to give little hopes of their being ever completed; for near one half of the first colony was destroyed by the Indians; and the rest, worn out by fatigue and famine, returned to their native country. The fecond colony was cut off by the Indians. The third shared the same fate. The fourth had dwindled to a poor remainder, and were returning in a famished condition to England, when, just in the mouth of Chesapeak Bay, they were met by Lord Delaware, with a fquadron loaded with provisions, and every thing necessary for their relief and defence. At his perfuation they returned. By his advice, prudence, and winning behaviour, the government of the colony was fettled within itself, and put on a respectable footing with regard to its enemies. This nobleman, who had accepted the government of Virginia from the most laudable motives, was compelled, by the decayed state of his health, to return to England, but left behind him a deputy and council, composed of liberal and intelligent men. Nor did the noble governor, on his return to England, forget the colony. For eight years together he was indefatigable in purfuing every plan that could tend to the peopling, support, and government of this fettlement. He died in purfuit of the same object in his passage to Virginia, having fitted out fome veffels laden with flores for the use of the colony. The settlers, however, were so firmly established, that they effectually frustrated the attempts of the Indians to oppose them, and erected James Town, the first place built by the English in this part of the world. The colony now continued to flourish, and the true fource of its wealth began to be discovered and improved.

This fettlement was, at first, greatly distressed for wives, few females caring to go over; and the planters feemed to think it a wicked thing to match with Pagans. But as foon as the colony was fettled, and the planters in good circumstances, a great many girls went over thither from England, in expectation of making their fortunes, carrying certificates with them of their chafte behaviour on this fide the water; for, without fuch certificates, the cautious planters, though ever formuch diffreffed for wives, would not admit them to their beds. If they were but moderately qualified in other respects in those days, they might depend upon being well married. The planters were fo far from expecting money, with a woman, that it was a common thing to buy a deferving wife, who came over thither a fervant, at the price of 1001. if the carried good testimonials with her. But afterwards, when the fruitfulness of Virginia was better known, and the dangers incident to an infant fettlement were over, people in good circumftances went over thither with their familes, either to improve their estates, or avoid persecution at home; and particularly, at the time of the grand rebellion, feveral good cavalier families retired thither, as those on the other fide did, upon the refloration of King Charles the Second: but Virginia had few of the latter, having diftinguished herfelf by her loyalty, in adhering to the royal family, after all other people had submitted to the usurpation. The round-heads, for the most part, therefore, went to New England.

During the troubles in the reign of Charles I. many of the loyalifts fled to Virginia, and, under the command of Sir William Berkeley, held out for the crown, till the parliament found means to reduce them.

There is nothing very interesting in the history of this province after the restoration. A kind of rebellion, indeed, broke out on account of some restrictions having been laid by government on trade. But the death of the leader of the insurgents restored the peace of the colony, and prevented the dreadful

confequences of a civil war.

While Virginia continued under the British government, the governor was vested with plenary powers in all acts of administration, and his usual falary was from 2 to 30001. a year, including perquisites. The council was the upper house in the affembly, who claimed a negative voice in all laws. The affemblymen were two for each county, chosen by the free-holders; but their acts were to be approved by the crown. As in the other provinces, there is universal toleration here in matters of religion.

The government of this province, as fettled in convention, in July 1776, is vested in a governor, senate of 24, and a house of delegates, all of whom are chosen annually. But the privy-council, or council of state, confishing of eight members, is also to be chosen by the joint ballot of the senate and house of delegates, to assist in the administration of government.

As the province of Virginia is deemed the most considerable of the United States of America, and there is a fimilarity of disposition, manners, customs, &c. between the people of the provinces in general, we shall treat of those particulars under this head, as a specimen of the whole.

The Virginians are reprefented as generous, hospitable, and possessing very liberal fentiments. There appears to be but three degrees of rank among all

the inhabitants, exclusive of the negroes.

The first rank confists of gentlemen of the best families and fortunes in the colony. These, in general, have had a liberal education, possess much discernment, and such a competent knowledge of the world, as produce an ease and freedom of manners and conversation that cannot be affected by circumstances or fituation.

They are deemed, upon the whole, most agreeable companions, friends and neighbours. The greater part live in elegance and splendour, and maintain the appearance of grandeur both at home and abroad.

Those of the second degree are very numerous, and consist of such a variety, singularity and mixture of characters, that the leading seature can searcely be afcertained. They are, however, generous, friendly and hospitable; but these good qualities are mixed with an appearance of bluntness, which seems to result from their general intercourse with slaves, over whom they are accustomed to exercise an harsh and absolute command.

Some of the fecond rank possess fortunes superior to many of the first, but their families are not so ancient or respectable, a circumstance to which much

dignity is here annexed.

They are addicted to every kind of fport, gaming and diffipation, particularly horfe-racing and cockfighting. Taken altogether, they form a ftrange combination of principles and practices directly opposite; fome being as laudable and worthy of imitation, as others are contemptible and obnoxious.

Notwithstanding this apparent inconfishency of character, principle and conduct, numbers of them are truly valuable members of fociety, and few or none deficient in natural genius, which, though in a great

measure unimproved, frequently appears in very forcible instances.

The third, or lower class of the people (who ever compose the bulk of mankind) are mostly hospitable and generous, though noisy and rude. They are much addicted to inebriety, and averse to labour.

The general hospitality that prevails throughout all the southern provinces will evidently appear from the following peculiar customs that are universal:

A traveller, even of the lowest rank, observing an orchard full of fine fruit, either apples or peaches, in or near his way, enters without ceremony, and fills his pockets (and even a bag if he has one) without asking permission, or being liable to censure.

This freedom will not appear fo strange when it is considered that no kind of fruit here is saleable, and that it is in such plenty that the inhabitants daily feed their hogs with the finest fort during the feason.

Travellers, in the cyder feafon, are generally offered on the road as much as they can drink, and frequently requested to slay all night, and be hospitably

entertained.

When a perfon of apparent rank calls at an ordinary (the name of their inns) for refreshment and lodging for a night, as foon as any gentleman of fortune in the neighbourhood hears of it, he either comes for him himself, or sends him a polite and pressing invitation to his house, where he is entertained much more agreeably than he could be at the inn. He is treated in the most hospitable manner, and his fervants and horses fare plenteously during the time of his stay. This is done with a good grace, nor is the least hint dropped of a curious desire to know the business or even name of the stranger.

Virginia, at the commencement of the late unhappy commotions, was faid to contain 650,000 inhabitants, of which nearly two thirds were blacks. But that account, by most calculators, has been deemed exaggerated, and the medium may be said to be fixed at

500,000 in the whole.

As there is a difference in rank among the inhabitants, not only of Virginia, but the colonies in general, fo also is there in their manner of living, of which

the following may ferve as a specimen.

The man of fortune usually rifes about nine oclock, and breakfafts between nine and ten. His breakfaft generally confifts of tea or coffee, bread and butter, and very thin flices of venifon, ham, or hung beef. He then repofes (if in the hot weather) on a pallet, on the floor, in the cooleft room in the house, in his shirt and trowfers only, with a negro at his head and another at his feet, to fan him and keep off the flies Between twelve and one he takes a draught of bombo or toddy, a liquor composed of water, fugar, rum and nutmeg, which is made weak and kept cool. He dines between two and three; and at every table, whatever elfe there may be, a ham and greens form generally a standing dish. At dinner he drinks cyder, toddy, punch, port, claret, or Madeira, which is, in general, excellent here. After dinner he returns to his pallet with his two blacks to fan him, and continues to drink toddy or fangaree all the afternoon: he does not always drink tea. Between nine and ten in the evening he eats a light fupper of milk and fruit, or wine, fugar, fruit, &c. and almost immediately retires to bed for the night, in which, if he be not furnished with musqueto curtains, he is generally fo molested with the heat, and harraffed and tormented with infects, that he receives very little refreshment from sleep. This is the general mode of living of a man of fortune in his family when he has no company. It is not mentioned as without exception, but as a mode that more follow than do not:

The mode of living of many of the middling, and all the lower classes of whites, is very different. A man in this line rises about fix o'clock. He then drinks a julap made of rum, water and sugar, but very strong. After this he walks or rides round his plantation, takes a survey of his stock, and all his crop, and breakfasts

about ten on cold turkey, cold meat, toast and cyder, ham, bread and butter, tea, coffee or chocolate, which laft, however, is feldom tafted but by the women. The rest of the day he spends much in the same manner before described as a man of the first rank, only cyder fupplies the place of wine at dinner, and he eats no fupper: they feldom think of it. The women very feldom drink tea in the afternoon; the men never.

The lot of the poor negro flaves is hard indeed. It is aftonishing to conceive what amazing fatigue these poor wretches undergo, and can support. The negro is called up in the morning at break of day, and feldom allowed time enough to fwallow three mouthfuls of homminy, or hoe cake, but is driven out immediately to the field to hard labour, at which he continues without intermission till noon. It is observed as a singular circumstance, that the negroes always carry out a piece of fire with them, and kindle one just by their work, let the weather be ever so hot and fultry. About noon is the time he eats his dinner, which confifts of homminy and falt, and if his mafter be a man of humanity, he has a little fat, skimmed milk, rusty bacon, or a falt herring, to relish his homminy, which kind masters allow their slaves twice a week. They then return to hard labour, which continues in the field until dusk in the evening, when they repair to the tobacco houses, where each has his task in stripping allotted him; that employs him for some hours. If it be found next morning that he has neglected, slighted, or not performed his talk, he is tied up and receives a number of lashes on his bare back, most severely inslicted at the diferetion of the overfeers, who are permitted to exercife an unlimited dominion over these wretches. It is late at night before he returns to his other fcanty meal, and even the time taken up at it encroaches upon his hours of fleep, which altogether do not exceed eight in number for eating and fleeping.

But what is amazing, confidering the fatigue he has undergone, which must naturally dispose him to rest, be frequently fets out from home and walks fix or feven miles in the night, be the weather ever fo fultry, to a negro dance, in which he bears his part with aftonishing agility and the most vigorous exertions, keeping time and cadence most exactly with the music of a banjor (a large hollow instrument with three ftrings) and a quaqua (fomewhat refembling a drum) until he exhaults himfelf, and fearcely has time or frength to return home much before the hour he is

called forth to toil the next day.

He fleeps on a bench, or on the ground, with an old featily fingle blanket, and not always even that, to ferve both for bed and covering. His clothing confifts of a fhirt and trowfers made of coarfe hempen His clothing fluff in the fummer, with the addition of a woollen jacket, breeches, and shoes in the winter.

In the same manner the female slaves are treated, with respect to fare, labour and repose. Even when they breed, they feldom lose more than a week's work either in the delivery or fuckling the child.

These wretched beings are obliged to be entirely passive, nor dare resist, or even defend themselves egainst any injury from the whites, for the law directs a negro's arm to be ftruck off, who raifes it against a white person, on any pretence whatever.

Fortunately for them, they feem to be endowed with an apathy, or fatisfied disposition, which, notwithstanding their degraded fituation, and the rigid feverity to which their race is subjected, renders them apparently jovial, contented and happy. Were it not for this peculiar bleffing of Providence, human nature, unequal to the weight, must fink under the pressure of such complicated misery.

Having had frequent occasion, in the course of our description of the mode of life these people lead, to mention homminy, hoe cake, &c. we deem it neces-

fary to explain those terms.

Homminy is an American dish made of Indian corn freed from the hufks, boiled along with a finall proportion of a large kind of French beans, until it becomes almost a pulp. It is in general use, and, to most palates, agreeable. Hoe-cake is Indian corn ground into meal, kneaded into dough, and baked on a hot, broad, iron hoe. This is in common use, but

we shall now give a description of the persons, dispositions, character, customs, &c. of the Indians,

or original inhabitants of America.

These people go under divers denominations, as Lake Indians, Attalvavas, Bulls, Delawares, Shawnees, Mowhawks, Cherokees, Chickefaws, Creeks, &c. &c.

The Indians of America are tall, straight, and well proportioned in their limbs. Their bodies are strong, but their strength is of a species adapted to support hardship rather than perform labour. Their features are regular, their complexion somewhat of a copper colour, their hair long, black and strong, as that of a horfe.

They generally wear only a blanket wrapped about them, or a shirt, both which they purchase of the Eu-ropean settlers. Those who first visited these parts found fome nations entirely naked, and others with a coarfe cotton cloth, wove by themselves, round their waift; but in the northern parts their whole bodies are in winter covered with skins.

The Indians are not deficient in natural understanding or ingenuity, many of them shewing a capacity

for some art or science.

One of their leading characteristics is revenge, to gratify which an Indian will travel on foot feveral hundred miles through woods in night and darkness, fecreting himself during the day to avoid suspicion. Notwithstanding this revengeful disposition, laudable qualities are attributed to them, and many are reprefented by writers as entertaining noble, spirited and just ideas. Generally speaking, they have no great command over their sensual appetites, and are parti-

cularly addicted to inebriation.

Another leading trait of the character of these Indians is duplicity, in the art of which, not with standing the uncultivated state of their minds, they excel the most subtle of the whites. But the true cause of this complete diffimulation feems to have arisen from the treacherous and barbarous usage they first received from the whites, the remembrance of which leads them to caution against future snares and treacherous defigns. Their disposition, however, whether hostile or amicable, is of little avail at prefent, as they are not sufficiently powerful either to contend against the whites in arms, or to do them any material injury. It must, however, be granted, that though implacable enemies, they are zealous, fleady friends, and that those whites who behave to them with uprightness and affability are greatly

respected by them, and gain an ascendancy over them.

The Indians are much less averse to Europeans than to the whites born in America. The white Americans also have the most rancorous antipathy to the whole race of Indians, who, in general, do not appear to en-tertain any diflike to such of the British or French that are natives of Europe; nor have the real British or French any particular aversion to them as the na-

tive Americans have

Polygamy is practifed in fome nations; but it is not neral. Though incontinent before wedlock, the chastity of their women after marriage is remarkable. The mothers are very fond of their children, and often thereby induced to shew them too much indulgence.

The men are remarkable for their indolence, on which they feem even to value themfelves, faying, that labour would degrade them, and belongs folely

to the women.

The Indians, in general, possess great patience and equanimity, with the command of most passions except that of revenge. They are grave on ferious occasions observant of what passes in conversation, and cool and deliberate in offering opinion.

The darling paffion of these Indians is liberty in its fullest extent; to this they facrifice every confideration. Though fome tribes are found amongst them with a head, whom they call king, his power is rather perfuafive than coercive; and he is revered as a father, more than feared as a monarch. He has no guards, no pri-fons, no officers of justice. The great council is composed of heads of tribes and families, with such whose capacity has raifed them to the same degree of confide-In these councils, which are public, they proration. pose all matters that concern the state. Upon these occasions they entrust their fentiments with a person who is called their fpeaker or orator, there being one of this profession in every tribe or town; and their manner of speaking, in general, is natural, easy, and perfuasive. The internal peace, and order of the ftate, come under the cognizance of the fame council. Their fuits are few, and foon decided. Criminal matters, if flagrant, are brought before the fame jurisdiction; but in ordinary cases, the crime is either revenged or compromifed by the parties concerned. Governed, as they are, by manners, not by laws, example and education inspire them with a facred regard for their constitution, and the customs of their ancestors.

They entertain the most exalted fentiments of friendfhip, the band of which connects the whole fociety; and the loss of any of their people, whether by war or a natural death, is lamented by the whole town to which he belongs. No bufinefs, however important, is taken in hand, no rejoicing is heard, till all the ceremonies due to the deceafed are performed, and thefe are always executed with the greatest folemnity. The dead body is washed, anointed, and painted, and then interred in the most pompous ornaments of the deceaf-After some time, the relations revisit the grave, clothe the remains of the body in new ornaments, and repeat the folemnities of the first interment.

But the most striking instance of their friendship, and, at the same time, the greatest instance of their regard, to their deceafed brethren, is what they call the feaft of the dead, or the feaft of fouls, which is celebrated every eight or ten years. The day for this ceremony is appointed in the councils of their chiefs, who give orders for every thing necessary for celebrating it with pomp and magnificence. The riches of the nation are exhausted on this occasion, and all the ingenuity of the Indians displayed. The neighbouring people are invited to partake of the feaft, and be witnesses of the folemnity. All those who had died fince the last feast of fouls are now taken out of their graves. Those who have been interred at the greatest distance from the villages are diligently fought for, and, when all the bo-dies they can possibly collect, are brought to the great rendezvous of mortality, they are dreffed in the finest skins they can procure. A feast is held on this folemn occasion, when their great actions are celebrated, and all the tender intercourfes that took place between them are recounted. A large pit is dug in the ground, and the bodies re-interred with pomp, with mourning, and with lamentation. Though among these favage nations this custom is impressed with strong marks of the ferocity of their nature, it argues a respect for the memory of the dead, and a tender feeling of their absence.

The chief occupations of these Indians are hunting

and war. No man is confidered as brave and ufeful among his tribe, till he has increafed the ftrength of his country with a captive, or adorned his hut with the fealp of an enemy. When their chiefs refolve upon a war, the principal officer fummons the youth of the town to which he belongs; the war-kettle is fet on the fire; the war fongs and dances commence; and the most hideous howlings, without intermission, are heard over the whole track of country. All the warriors have their faces blackened with charcoal, intermixed with dathes and streaks of vermilion, which give them

a most horrid appearance.

They never fight in the open field, but on very extraordinary occasions. Secrecy is the foul of all their actions, and on this the fuccess of the expedition entirely depends. During their marches they light no fire to warm themselves, or dress their food. They lie close to the ground in the day-time, and march only in the night-time, and even then with the greatest precaution. When they discover an army of the enemy, they throw themselves flat on their faces among the withered leaves, the colour of which their bodies are painted exactly to refemble. They generally let a part pass unmolested, and then rising a little, and setting up a tremendous fhout, which they call the war-hoop, they pour a shower of musket balls upon the enemy. party attacked returns the fame cry, and every man fhelters himself behind a tree, and returns the fire of the adverse party the moment they raise themselves from the ground to give the fecond fire. Afterfighting for fome time in this manner, they leave their covert, and rush upon each other with small axes, which they use with great dexterity. The contest is soon decided, and the conquerors fatiate their favage fury, with the most horrid infults and barbarities, on the dead bodies of the enemy, which they fcalp and treat in a manner fhocking to humanity.

But the fate of prisoners is still more deplorable, when they are fo unhappy as to be fentenced to death, which depends on the caprice of the victors. In this case they first strip the wretched victim, and fixing two posts into the ground, fasten to them two pieces of wood, from one to the other; one about two feet from the ground, the other about five or fix feet higher; then obliging him to mount upon the lower crofs piece, they tights legs to it a little afunder; and his hands are extended, and tied to the angles formed by the other piece. In this posture they burn him all over the body, sometimes daubing him first with pitch. The whole village, men, women, and children, affemble round him, every one torturing him in what manner they please, each striving to exceed the other in cruelty, as long as he has life. This is the most usual method of murdering their prisoners; but sometimes they fasten them to a fingle stake, and build a fire round them. At other times they cruelly mangle their limbs, cut off their fingers and toes, joint by joint, and fometimes feald them to death.

Their military appearance is very odd and terrible. They cut off all their hair, except a fpot on the crown of their head, and pluck off their eye-brows. The lock left upon the head is divided into feveral parcels, each of which is fliffened and intermixed with beads and feathers of various shapes and colours, the whole twisted and connected together. They paint themfelves with pigment down to the eye-brows, which they fprinkle over with white down. The griftles of their ears are flit almost round, and hung with ornaments. Their nofes are bored, and hung with beads; and their faces painted with various colours. On their breafts are medals of various metals; and, by a ftring round their necks, is fuspended that horrid weapon

called the fcalping-knife. The weapons used by those who trade with the Europeans are commonly a firelock, hatchet, and fealpingknife; but the others use bows, tomahawks, and pikes. The head of the tomahawk is a round knob of folid wood, calculated to knock a man down. It has on the other fide a point, bending a little towards the handle; and near the center, where the handle pierces the head, another point projects forward, of a confiderable length, which ferves to thrust with fike a spear. The tomahawk is ornamented with paintings and feathers, disposed and variegated in many fignificant forms, according to the occasion and end for which it is used. When they folicit an offensive or defensive alliance with a whole nation, they fend an embally with a whole belt of wampum, and a bloody hatchet, inviting them to come and drink the blood of their enemies. The wampum-belt confifts of a kind of cylindrical beads, made of white and black shells, which are efteemed among them as filver and gold are among us. They dye the wampum of various colours and shades, and, as they are made, significant of almost any thing they please. By these their records are kept, and their thoughts communicated to one another as ours are by writing. Thus the belts that pass from one nation to another, in all important transactions, are carefully preserved in the cabins of their chiefs, and serve both as a record or history, or as a public treasure.

The calumet, or pipe of peace, is of no less importance, nor is it less revered among them. The bowl of this pipe is made of a kind of fost red stone, easily wrought, and hollowed out. The stem is of cane, or a kind of light wood, painted of different colours, and adorned with the head, tails, and feathers, of the most beautiful birds. The use of the calumet is to smoke either tobacco or some other herb, when they enter into an alliance, or any solemn engagement; this being esteemed the most solemn oath that can be taken. The size and decorations of their calumets are commonly proportioned to the importance of the occasion, to the quality of the persons to whom they are presented, and to the esteem and regard they have for them.

Religion is little known, and as little practifed, by the American Indians. There are, indeed, nations among them which feem to pay fome homage to the fun and moon; and as most of them have a notion of the existence of invisible beings, who intermeddle in their affairs, they often mention demons and other spirits, particularly one whom they call Arestoui, or the god of war, whom they always invoke before they march against an enemy. Though destitute of religion, they abound in superstitions, are great observers of omens and dreams, and pry into suturity with the greatest eagerness. Hence their country abounds in diviners, augurs, and magicians; and on their predictions they greatly rely, in all affairs relative to health, hunting, or war.

hunting, or war.

These Indians formerly inhabited the sea coasts, where they were very numerous, but have fince retired into the internal parts of the country; fo that few of them are found within less than two or three hundred miles of the fea. Some of them have had parcels of land allotted them in feveral of the colonies, where they have been formed into focieties; yet it has been found, that, in proportion as they lay by their ancient customs, and conform to our manner of life, they dwindle away, either because the change is prejudicial to their constitutions, or because they have then greater opportunities of procuring spirituous liquors, of which both fexes are inordinately fond. Thus where, a few years ago, there were confiderable fettlements of them, their name is forgotten; and those who still remain, have, for the most part, joined themfelves to other nations in the interior parts of the country, on the banks of lakes and rivers.

We have been favoured by an intelligent correspondent, long resident in North America, with some anecdotes, which display the hospitable disposition of the Indians, and the opinion they entertain of some of the customs of the whites with whom they traffic.

When any of the Indians come into the towns belonging to the whites, the latter are generally observed to crowd around, gaze at, and incommode them, where they defire to be private. The Indians deem this custom very rude, and the highest breach of civility. They have remarked, upon the occasion, that, though they have as much curiosity as the whites, when they come into their towns, they hide themselves behind bushes, where they are to pass, and never intrude themselves into their company.

They observe particular forms in entering one anothers villages. To enter a village abruptly, without notifying approach, is reckoned, in travelling strangers, very uncivil. For this cause, as foon as they arrive within hearing, they stop and haloo, remaining there till invited to enter. Two old men usually come out, and conduct them in. There is, in every village, a vacant habitation, called the stranger's house. Here

they are placed, while the old men go round from hut to hut, to acquaint the inhabitants of the arrival of strangers, who may be hungry and weary, and every one lends them what he can spare, of food to eat, and skins to repose on. When the strangers are refreshed, pipes and tobacco are brought, and then, and not be fore, begins conversation, which usually ends with offers of service, if the strangers have occasion for guides, or any thing necessary for the prosecution of their journey. Nothing is exacted for the entertainment.

The following is a striking proof of the hospitality of a private person. An Indian Interpreter, in going through the country; to carry a meffage from a governor of one of the states, called at the habitation of an old Indian friend, who embraced him, fpread furs for him to fit on, placed before him fome boiled beans and venison, and mixed some rum and water for his drink. When he was well refreshed, and had taken his pipe, his host entered into conversation with him concerning particulars. The interpreter fatisfied him; and when the discourse began to flag, his Indian friend thus addressed him: "You have, my old acquaintance, lived long among the white people, and know fomething of their customs. I have been sometimes at Albany, and have observed, that, once in feven days, they thut up their shops, and affemble all in the great house. Tell me, what is it for? What do they there?" " They meet there (replied the interpreter) to hear and learn good things." "I do not doubt (faid the Indian) that they tell you fo; they have told me the fame; but I doubt the truth of what they fay, and will tell you my reasons. I went lately to Albany to sell my skins, and buy blankets, knives, powder, rum, &c. When I called upon the merchant with whom I usually deal, and asked him what he would give for beaver, he replied, he could not give more than four shillings a pound; but defired to wave all bufiness then, as it was the day their people met together to learn good things, adding, that he was going to the meeting. Finding I could not transact any business with him that day, I went with him. There flood up a man in black, and began to talk to the people very angrily. I did not understand what he faid; but observing that he looked much at me, and at my merchant, imagined he was angry at feeing me there, therefore I withdrew, and waited near the house till the meeting should break up. I then ac4 coffed the merchant, intimating, that I hoped he would give more than four shillings a pound for beaver. He replied he could not give more than three shillings and fixpence. I then applied to feveral other dealers, but their general tone was three and fixpence, three and fixpence. This confirmed my fuspicion, that, notwithstanding their pretence of meeting to learn good things, the real purpose was to consult how to cheat Indians in the price of beaver. Confider but a little, my old friend, and you must be of my opinion. It they met fo often to learn good things, they would certainly have learned fome before this time. But they are ftill ignorant. You know our practice. If a white man is travelling through our country, and enters one of our cabins, we all treat him as I treat you. We dry him, if he is wet; we warm him, if he is cold; and give him meat and dripk, if he is hungry and thirsty; and we spread furs for him to repose on, demanding nothing in return. If I go into a white man's house at Albany, and ask for victuals and drink, they fay, Where is your money? And if I have none, they fay, Get out, you Indian dog! You fee they have not yet learned those little good things that we need no meetings to be instructed in, because our mothers taught them to us when we were children; and therefore it is impossible their meetings should be, as they fay, for any fuch purpose, or have any fuch effect. They are only to continue the cheating of Indians in the price of beaver."

SECTION VII.

CAROLINA, NORTH AND SOUTH.

HE provinces of North and South Carolina, comprehending two of the United States of North America, are fituated between 30 and 37 degrees of north latitude; and between 76 and 91 degrees of west longitude; being about 700 miles in length, and 380 in breadth. The boundaries are Virginia on the north, the Atlantic Ocean on the east, Georgia on the fouth, and the Apalachian mountains on the west.

In the two provinces of North and South Carolina are the following rivers, viz. Roanoke or Albemarle, Pamticoe, and New Clarendon, in North Carolina; Pedee and Santee, in South Carolina. These rivers are all navigable, and contain fifth in abundance, but have troublesome cataracts, which obstruct navigation. The capes of this country are Flatteras, Look-out, and The harbours are Roanoke and Pamticoe, in North Carolina; George-Town, Charles-Town, and Port-Royal, in South Carolina. Their respective rivers rife in the Apalachian mountains, and fall into the Atlantic Ocean.

The climate of Carolina, like that of America in general, is subject to sudden transitions, from heat to cold, and from cold to heat, but not to fuch violent extremes as Virginia. The winters here are not fo fevere as in that province. The frosts never have sufficient ftrength to refift the noon-day fun; fo that many tender plants, which do not stand the winter of Virginia, slourish in Carolina. This is the principal province on the continent of North America subject to hurricanes.

The foil here is various. The country near the fea is little better than an unhealthy falt marsh, and, for eighty miles distant from it, is an even plain, not a hill, a rock, or fcarcely a pebble, being to be met with. Beyond this it gradually improves; and at about one hundred miles distance from Charles Town, where it begins to grow hilly, the foil is very fertile, adapted to supply the necessaries of life, and exhibiting a plea-fing prospect to the view. The worst of the land, however, in the country, produces that valuable article of its commerce, indigo.

There is no kind of regetable but, with proper cul-tivation, would flourish here. The foil, even when left to itself, yields flowers and flowering shrubs; and all the European plants are in a greater degree of perfection here than they attain to in their native foil.

The productions of these provinces are vines, some wheat, Indian corn, barley, oats, beans, peas, hemp, flax, cotton, farfaparilla, tobacco, and indigo. There are the olive, orange, lemon, citron, cypress, oak, and walnut-trees; besides the pine trees, which afford turpentine, tar, and pitch, in abundance. There are feveral trees that yield gums. Of all these the three great staple commodities are indigo, rice, and the produce of the pine. The two latter are confined to South Rice is cultivated with peculiar attention there, and constitutes the greatest part of the food of the people in common. The ground is not favourable for the cultivation of wheat, with which the inhabitants are supplied from New York and Pennsylvania, in exchange for rice. The trees here, as in every part of America, grow to an amazing fize, their trunks being often from 50 to 70 feet high, without a branch or limb, and some upwards of 36 feet in circumference. The people of Charles-Town, as well as the Indians, hollow these into canoes, which serve to transport goods from place to place; and fome of them, confifting of one entire piece of timber, are large enough to carry thirty or forty barrels of pitch. There is a tree in this country which distils an oil, very efficacious in the cure of wounds; and another which yields a very falutary balm. These provinces produce large quantities of excellent honey, of which is made a fine spirit, and mead equal to Malaga sack.

The original animals of this country are the fame as those of Virginia. European animals abound here: it is not uncommon for an individual to poffels three hundred head of cattle; fome are faid to have more than a thousand. They are turned out in the morning, and range the forests for food; but their calves being kept in fenced pastures, they return to them in the evening. The horses and hogs are equally numerous, The beavers are destroyed here, as in other places,

by the encouragement the Indians receive to kill them for the profit arifing from the fale of their fkins.

The Carolinians cultivated fome tobacco; but their chief trade lay in provisions; for they supplied Jamaica, Barbadoes, and the Leeward Islands, with beef, pork, grain, peas, butter, fuet, raw hides, and leather. They likewife fent to the fame islands tar, turpentine, timber, masts and furs; but the last were of an inferior Maize, or Indian corn, thrives here exceedingly; but, in fome other respects, the product has not been answerable to the expectation from the foil and

Though many parts of Carolina, especially on the fea-coast, abound with vines, yet no progress worth mentioning has been made in producing wine. The manufactures of filk, notwithstanding the great quantities of mulberry-trees they have, are not very confiderable. Though cochineal is found here, the inhabitants feem to neglect the profits arising from that infect; and, for fome years, their attention has been chiefly turned towards making indigo.

The Carolinians import all kinds of woollen and linen drapery, hardware, strong beer, cyder, raisins, potters-earth, tobacco pipes, paper, coverlets, mat-traffes, hats, stockings, gloves, tin-ware, powder and shot, gun slints, cordage, looking-glasses and glass ware, thread, haberdashery and small wares. From Jamaica, Barbadoes, and the Leeward Islands they had fugar, rum, molasses, cotton, chocolate, negroes, and filver. From New England, New York, and Pennfylvania, wheat flour, wheat being very backward in the Carolinas; and hard wares and wine from Madeira, and the other islands in the western ocean.

Before the late disturbances the method of settling in this pleafant country was, to pitch upon a void piece of ground, and either to purchase it at the rate of 201. for 1000 acres, and 1s. quit-rent for every 100 acres, or elfe pay a penny an acre quit-rent yearly to the proprictors, without purchase money: the former method was the most common, and the tenure a freehold. The land being laid out, the purchaser built upon it, raifed flock, planted orchards, and made fuch commodities as when fold procured him flaves, houshold goods, and other conveniences: after this he yearly increased his capital, and, by industry, became rich.

Both North and South Carolina are divided into diftricts. The former contains those of Wilmington, Newbern, Edenton, Halifax, Hilfborough and Salifbury. Thefe districts have their respective counties, but they contain nothing worthy of description.

In the latter are included the districts of Charles-Town, Beaufort, Orangeburgh, George-Town, Cam-den and Cheraws. The chief towns are, Charles-Town and Port Royal.

Charles-Town is fituated in 79 deg. west longitude, and in 32 deg. north latitude; on a peninfula formed by Ashley and Cowper rivers; the former of which is navigable for thips 20 miles above the town, and in it is a most fecure and commodious harbour; but there is a bar which prevents veffels of more than 200 tons from entering it. The town is well built, and pretty ftrongly fortified both by nature and art. The ftreets are wide and strait, intersecting each other at right angles; those running east and west extend about a mile from one river to the other. Charles-Town contains about 1000 houses, some of brick and others of wood, but in general handsome, elegant, and very The church is a spacious building, and high rented. executed in elegant tafte, and there are also several

meeting-houses belonging to different seets of diffenters, some of which are very neat. This town was the seat of the governor, and the place where the affembly met. Its vicinity is beautiful beyond description. Several handsome equipages are kept here. The planters and merchants are opulent and well bred, and before the war between Great Britain and the Colonies, were both shewy and expensive in their dress and manner of living. It ought to be observed, to the honour of the people of Carolina, that when in common with the other Colonies they resolved against the use of certain luxuries, and even necessaries of life, shose articles which improve the mind, enlarge the understanding, and correct the taste, were excepted: the importation of books was permitted as usual.

There are more white people in North than in South Carolina, though the former is not fo wealthy as the latter.

In the year 1780, Charles-Town being befieged by the king's troops, furrendered on capitulation with 6000 men in arms prisoners, after the fiege had continued seven weeks. It was afterwards evacuated and restored to the Americans.

Port Royal, or Beaufort Town, is fituated on the island of Port Royal, in 31 deg. north lat. 100 miles fouth of Charles Town, having a capacious harbour, capable of receiving the royal navy of England, if they could get over the bar: however, ships of good burthen may enter, there being 18 feet depth at low water. George Town is about 50 miles north of Charles Town.

All attempts to form a fettlement in Carolina proved abortive till the year 1663, in the reign of Charles II. At that time feveral English noblemen, and other persons of distinction, obtained a charter from the crown, investing them with the property and absolute jurisdiction of this country. They parcelled out the lands to such as were willing to embark for the new settlement, and to submit to a system of laws composed by the celebrated Locke.

They began their first fettlement at a point of land near the southern limits of their district, between two navigable rivers, where they laid the soundation of the city, called Charles Town, in honour of king Charles. This town was designed to be, what it now is, the capital of the province. Observing what advantages the other colonies derived from opening an harbour for refugees, they resolved to benefit by the example, so that they extended the scheme, and gave an unlimited toleration to people of all religious persuasions.

Religious disputes, however, in process of time, produced discentions, tumults and riots, whereby the colony was rent; and these, with some disagreements among the proprietors, threatened its destruction. The legislature now thought it time to interpose, and an act of parliament was accordingly passed, by virtue of which this colony was put under the immediate protection of the crown. The proprietor accepted a recompence of about 24,000l. both for the property and jurisdiction; but earl Granville retained his share, which continued in the possession of affairs, Carolina was divided into two districts and two governments, North and South. This happened in the year 1728, and from that time, peace being made with the Cherokees and other Indian tribes, the colony began to flourish, and wealth and internal tranquillity succeeded to poverty and commotions.

When the property of Carolina was purchased by his late majesty, orders were issued for building towns here, each of which was to have a district of 20,000 acres of land square, to be divided into shares of five acres for each man, woman, or child of one family, which was to be augmented, as the planters should be in a condition to cultivate a larger quantity: each town was also to be formed into a parish, the extent whereof was to be about six miles round; and, as soon

No. 46.

as the parish contained 100 masters of families, it was qualified to fend two members to the assembly of the province, and to enjoy the same privilege of any of the other provinces.

The government of North Carolina is now vefted in a governor, fenate, and house of representatives, all elected annually. The executive power is in a governor and seven counsellors. South Carolina is under a governor, senate of 23, and a house of representatives of 202 members.

SECTION VIII.

THIS province is fituated between 20 and 33 deg. north latitude, and between 80 and 85 deg. west longitude. It is about 700 miles in length and 120 in breadth. It is bounded by Carolina on the north, by Florida on the fouth, by the Atlantic Ocean on the east, and by the Aplachian mountains on the west. The rivers in Georgia are the Alatamaha, the Savannah and St. John's; the mouths of the two first form excellent harbours.

To the fouth of the river Savannah is a capacious road called Teky-Sound, where a large fleet may anchor in between 10 and 14 fathoms water, being landlocked, and having a fafe entrance over the bar.

The climate of this province is much the same as that of Carolina. The soil is in some parts less proper for cultivation than in others, but it is fertile in general.

Georgia produces Indian corn, wheat, oats and barley. Here are also potatoes, pumpkins, water and
musk melons, cucumbers, English and Italian peas, sallading in general the year round, together with all kinds
of sweet herbs and pot herbs. Nectarines, peaches
and plumbs are as plentiful as apples in England. The
fruit of the mulberry trees are not comparable in slavour to those of England, but the leaves are excellent
food for filk worms. Olives abound here in perfection,
and the oranges exceed those of the provinces in general. The trees of Georgia are pines, oaks, hiccory,
black walnut, cedar, black and white cypres, white
and red laurels, bays, myrtles, of the berries of which
they make candles; saffafras, an infusion of which
makes good drink, beech trees, and many others.

In the winter feafon, from November to March, the country abounds with game, fuch as wild geefe, ducks, teals, widgeons, woodcocks, and partridges, but they are fmaller than those in England. There is a creature between a rabbit and a hare, which is good eating, and in very cold weather there are vast flights of wild pigeons, which are easily shot. The summer game are deer and ducks. The sleft of the bears cubs nearly

refembles in tafte that of young pigs.

Though the woods abound with snakes, none are venemous but the rattle-snake. The rivers abound with sharks and alligators. Oysters are innumerable, but not so well slavoured as the English. There are also crabs, muscles, and large prawns.

also crabs, muscles, and large prawns.

The inhabitants export some cornto the West Indies, raise some rice, and have made some progress in the cultivation of indigo.

Of all the manufactures none feems fo practicable here, nor more beneficial, than the raifing of filk, the foil being well adapted to the culture of mulberry-trees, and the climate highly benign to filk worms.

From the quay may be feen the whole course of the river towards the sea one way, and, on the other, for about fixty miles up the country. This river is navigable for large boats from Savannah to Augusta, which are 200 miles distant from each other. Augusta is fituated in one of the most sertile parts of the province, and carries on a considerable trade with the Indians. Frederica is a regular fortress, mounted with several pieces of cannon. At Savannah the Rev. Mr. George Whitfield sounded an orphan-house, which was afterwards converted into a college for the reception of stu-

6 M

den

Savannah was in possession of the dents in divinity. British troops in October 1779, when being besieged by the Americans and French, they repulsed them with great flaughter. It was, however, evacuated and reflored to the Americans.

In 1732, a number of gentlemen formed a defign of making that track of land called Georgia, which is fitua-ted between the rivers Savannah and Alatamaha, ferviceable to Great Britain, by erecting it into a kind of bulwark, for the fouthern British colonies, against the Spaniards; for producing great benefits to the mother country; but, above all, of giving employment to vast numbers of people who were burthensome at home to their friends and parishes; and petitioned the king for a charter, which was accordingly granted them. This charter, which was dated that year, constituted them a corporation, by the name of truftees for establishing a colony in Georgia, including all that country fituated in South Carolina, which lies from the most northern ftream of the Savannah River, along the coaft, to the most fouthern stream of the Alatamaha, and west from the heads of the faid rivers, in a direct line, to the South Sea. The corporation was vested with all the necessary powers, for the term of 21 years from the date of the charter, particularly to collect benefactions for fitting out the emigrants, and fupporting them till their houses could be built, and their lands cleared. General Oglethorpe, one of the truftees, a gentleman of unbounded benevolence and public spirit, coinmanded the first embarkation to Georgia, to whom the Creek nation voluntarily relinquished their right to all the lands lying between the above mentioned rivers, which they did not use themselves. Upon this Mr. Oglethorpe laid out the town of Savannah, and erected feveral forts to cover the colony against any hostile attempts of the Spaniards or Indians. In the year 1734 a confiderable number of Protestant Saltzburghers went over, who, with others of their countrymen, who followed, were fettled in a town on the Savannah, which they called Ebenezer, and, by their habits of industry and sobriety, they soon became a confiderable fettlement. In 1734 another embarka-tion, confifting of 300 men, 110 women, 102 boys, and 83 girls, arrived from England, most of them at the public expence. In 1735 about 160 Scotch High-landers went over, and fettled themselves upon Alatamaha rivers, 16 miles by water from the Island of St. Simon. They gave the name of Darien to a finall fort they built there; and that of New Inverness to a small town they afterwards added to it. In February, 1736, Mr. Oglethorpe, with about 300 passengers on board two ships, anchored in the road of Savannah, and foon after laid the foundations of the town and fort of Frederica. Befides the private benefactions received by the truftees during the term of their charter, large supplies were granted by parliament. In 1739 a specimen of Georgian raw filk was exhibited in London, which the merchants, who dealt in that commodity, declared to be as good as any raw filk that came from Italy, and worth at least 20s. per pound. In 1742, about 5 or 6000 Spaniards and Indians invaded Georgia, in about 50 veffels of all kinds, but were repulfed by General Oglethorpe, at the head of the English forces, and a small body of Indians. From that time it remained undisturbed, but not out of danger from the Spaniards, till the reduction of St. Augustine by the English.

In process of time new sums were raised, and new inhabitants fent over; fo that before the year 1752, the fettlers in the province were every where nume-Diffentions at length sprang up, when government interposed, and placed Georgia on the same footing with Carolina. Since the revolt of the colonies, the government of Georgia has been vefted in a governor, executive council of 12, and house of affembly of 72 representatives. It has a church, a courthouse, a storehouse, a goal, a wharf, a guard-house, and other public buildings. There is also a constant watch. The houses are regularly built at some distance from each other, for the fake of being more airy, and form feveral spacious squares and streets.

THE INDEPENDENT STATE OF VERMONT.

HE independent state of Vermont contains an extensive track of country, situated to the eastward of New Hampshire and Massachusetts Bay, and to the north of Connecticut, between the river of that name, and Hudson's River. It was formed by emigrations from New Hampshire and New-York. The emigrants having settled on lands to the westward, neither claimed or cultivated by the people of the provinces before-mentioned, foon grew numerous, and spread

themselves to a considerable extent.

The inhabitants of those provinces had long been jealous of the rising greatness of the colony of Vermont, and desirous of crushing it, but never could effect their design, while the colonies were under the jurisdiction of the mother country. When the late diffentions began, they represented the Vermontese When the late to Congress as a disaffected and encroaching people. The Vermontese, on their part, professed their attachment to the general American caufe, and requested representation in congress, in common with the other states. Congress, far from complying with the request of the Vermontefe, decided in favour of the colonies of New Hampshire and New York, and contracted the boundaries of that of Vermont. In process of time, however, congress relaxed in their feverity, and transmitted a favourable proposal to the Vermontese, which being acceded to, matters were adjusted in April, 1782. With refpect to perfon, manners, cuftoms, &c. it is reasonable to conclude, that the people of this province bear refemblance, in fuch particulars, to those of the provinces from which they emigrated. The climate, foil, and produce, are much the same as those of New Hampshire and New York.

Properly fpeaking, there is no established form of government. Ethan Allen, famous for the expedition he undertook against Ticonderago, in 1775, without any other aid than that of a body of volunteers who followed his fortunes, made himfelf chief of this country. This enterprizing genius formed there an affem-bly of representatives. This affembly grants lands, and the country is subject to its own laws alone. The inhabitants were known, for a confiderable time, by the name of " Green Mountain Boys;" but thinking that an ignominious appellation, they Frenchified Green Mountain, which made Verd Mont, and, by corruption, Vermont. Hence the origin of the name

CHAP. VI.

SPANISH DOMINIONS IN NORTH AMERICA.

SECTION I.

FLORIDA, EAST AND WEST.

HIS country was discovered by Sebastian Cabot, fome years before it was known to the Spaniards. That nation, in 1512, gave it a vast extent, comprehending, under the name of Florida, all the country from the 25th to the 39th degree of north latitude. But what is now properly called the Peninfula of Florida, is fituated between 25 and 31 degrees of north latitude, and in about 85 degrees of west longitude. It is bounded on the north by Georgia, on the fouth by the Gulph of Mexico, on the east by the straits of Bahama and the Atlantic Ocean, and on the west by the river Missiffippi. It is about 500 miles in length, and 440 in breadth.

Of the mountains the most considerable are the Apalachian, which divide Carolina, and the rest of the American States, from Florida. A vast number of noble rivers pass through this country, the most of which rife in the Apalachian mountains, and fall into the Gulph of Mexico, or the Atlantic Ocean. The chief are the Missiffipi, the Ohio, the Coza, Coussa, or Mobile, and the river St. John. The Missiffippi, Mobile, and the river St. John. The Miffiffippi, which the French call St. Louis, is, in many respects, the finest river in the world. It runs a very long course, free from shoals and cataracts, and is navigable within 60 leagues of its fource. In these rivers is good ftore of fish.

Florida, by the treaty of peace in 1763, was ceded by Spain to Great Britain, who divided it into two colonies, East and West Florida, according to which we fh ll confider it, having premifed, that, in the year 1780, it was taken by the Spaniards, and ceded to

them by Great Britain by the treaty of 1783.

EAST FLORIDA comprehends about twelve millions of acres, which is about the quantity of Ireland. In the eastern and fouthern parts are a number of islands, formed by narrow straits and bays, which run in from the west, and join others from the fouth and east. One of the principal of the bays is called Laguna del Espiritu Santo, which extends, from north to fouth, about 27 leagues, and is near 8 leagues wide. It has feveral communications with the bay on the west side of the peninsula, as well as with the Gulph of Florida. To the fouth-east of this part of the country is a chain of islands and rocks, called Cayos de los Martyrs, or the Keys of the Martyrs, which extend, in a circular form, at the diftance of thirteen leagues from Punta Florida to the most southern point. In 1773 a sleet of 14 gal-leons, on their return through the Gulph of Florida for Old Spain, ran soul of these rocks, through the ignorance or inattention of the commander in chief. One of the captains disobeying the fignals, avoided the danger, and faved his ship; but the other thirteen were entirely loft, with great part of their treafure.

The foil, except in the middle, is very low. fhores are fandy or marshy to a great distance within land.

The country abounds with all kinds of timber and fruit trees, especially pines, laurels, palms, cedars, cyprefs, and chefnut trees, which grow to an extraordinary length and fize, and, with the oaks, afford nourishment to fwine. But the wood most prized, and in greatest plenty, is the fassafras, of which remarkable quantities are exported. Excellent limes and prunes alfo growhere in great abundance, with vines of various forts, and cotton trees, hemp, flax, pulse, roots, and herbs. The root called mendihoca, of which the caffava flour and bread are made, is very common. Of the fruits there is one called tuna, so exquisite and

wholesome, when ripe, that, among the Europeans, it goes by the name of the cordial julep.

There are woods which ferve for dying, as fuftic, braziletto, logwood, &c. There are shrubs, which may be of great consequence in trade, such as the myrtle-wax fhrub, which grows in every foil, the opuntia, the imna shrub, &c. To this may be added, that East Florida has the greatest part of the fruit trees of the New World. East Florida has also much of the plant called barilla, or kali, with which pearl-ashes are made, and of which considerable quantities are imported into Europe for divers ufeful purpofes. Here is a fort of grain like our oats, and when rightly prepared exceeds our best oatmeal. It grows spontaneoully in marshy places, and by the sides of rivers, like rushes. The Indians, when it is ripe, take handfulls and shake them into their canoes, and what escapes them, falling into the water, produces, without further

trouble, the next year's crop.

But the most fingular production in the vegetable system, in this or in any other country, is the cabbagetree, called by fome naturalists the palmello royal. The trunk bulges out a little near the ground, which gives it the becoming appearance of a substantial basis to support its towering weight. It is strait as an arrow, rifes above an hundred feet in height, and the trunk near the earth is about fix or feven feet in circumference, the whole body growing tapering to the top. The infide texture of the leaves appear as threadlike filaments, which being fpun, are used in making cordage of every kind as well as fishing-nets. What is called the cabbage lies in many thin, white, brittle flakes, which, when raw, have fomething of the tafte of almonds, and when boiled, fomething of that of cabbage, but sweeter and more agreeable.

Here is good beef, veal and mutton, with plenty of

hogs, especially on the sea coast, and also not only cattle for draught of the Tartar breed, but horses for the faddle, that may be purchased for any trifle of European commodity.

The wild beafts of this country are panthers, bears, catamountains, buffaloes, deer, hares, goats, rabbits, beavers, otters, foxes, flying fquirrels, &c.

The feathered creation is numerous, as cranes, wild geefe and ducks, turtle doves, partridges, thrushes, jays, hawks and crows. The maccoa, the humming-bird, and a great number of others, fome of which are of beautiful plumage.

All the low lands on the coaft, as far as they can be approached, are bordered with mangrove trees, to which adhere an incredible number of small oysters, of exquifite flavour. Others, much larger, and not fo delicious, are found in the fea, and that in fuch numbers, that they form shelves therein, which, at first yiew, seem like rocks level with the surface of the

The other products of East Florida are ambergris, cochineal, indigo, and filk-grafs. It also produces amethysts, turquoifes, lapis-lazuli, and other precious stones: likewise copper, quickfilver, pit-coal, iron ore, and a kind of stone pitch, called copea, which the

Spaniards use as tar for their shipping.
The principal town in East Florida is St. Augustine, flanding on the eastern coast of the peninsula, about 70 leagues from the Gulph of Florida and Channel of Bahama, 30 fouth of the river Alatahama or Alatumacha, and 47 from the town and river of Savannah. It is fituated in latitude 30 degrees north, and lies along the shore, or the bottom of a hill, in the form of a parallelogram, the streets cutting each other at right angles. The port is formed by anishand and a long point of land, almost divided from the continent by a river, | which falls into the fea two miles fouth of the town. About a mile to the northward of the town stands the caftle, called St. John's Fort, defended by four baftions, and pretty strong. The entrance into the port lies between the island and the point of land, and is about one mile and a quarter over, as is, indeed, most part of the coast of Florida. Down by the fide, about three quarters of a mile fouth of the town, flands the church and monastery of St. Augustine. The best built part of the town is on the north fide, leading to the caftle. On the north and fouth are two Indian towns, without the city walls.

West Florida is a long track of land of more than 80 leagues, extending from east to west, along the coast of the Bay of Mexico. The climate is hot, damp, and unhealthy, particularly near the fea. The ftrand takes up a great depth, and is composed of white and dry fand. On advancing into the country, which is pretty even, the climate is found to be more healthy, and the lands more fruitful. They have annually two harvests of maize. They have also good pasturage, and plenty of cattle. The trees and plants are much the same as in East Florida; but the West affords some articles which are wanted there. The inland parts are

alfo much better.

Pearls are found here in great abundance; but the Indians prize the European beads more. Upon the whole coast, for 200 leagues, are several vast beds of oysters, and in the fresh water lakes and rivers is a fort of shell fish, between a muscle and an oyster, in which is found abundance of pearls, many of which are larger than ordinary.

The French inhabitants, who are numerous here, are chiefly employed in the building ships, and cultivating rice, cotton, and indigo. Their cotton is very fine, of a clear white, and their indigo is as good as that

from St. Domingo.

On the banks of the Miffiffippi are feveral fprings and lakes, which produce excellent falt. The plants producing hemp and flax abound here, as well as that fort of filk-grafs of which are made fuch fluffs as come from the East Indies, called herb stuffs. Vast flights of wild pigeons come here at some seasons of the year, and rooft on the trees in great numbers. In many places are mines of pit-coal; and iron ore is often found near the furface of the earth, whence a metal is extracted little inferior to fteel. Here are also some mines of quickfilver, or rather the metal from which it is extracted. It is only used by the original natives to paint their faces and bodies in time of war, or at high festivals.

The inhabitants of West Florida are more numerous than those of East Florida, it being more healthy and inviting, especially in the western parts, near the

banks of the Miffiffippi.

The chief town of West Florida is Pensacola, The landing-place is within the bay, the town being fituated on a fandy shore, perfectly white, that can only be approached by small vessels. The road, however, is one of the best in all the Gulph of Mexico, as vessels may lie there in fafety against every kind of wind. The bottom affords excellent anchorage, and the fea, which is feldom agitated, on account of being furrounded by the land on every fide, is capable of containing a great number of thips. On the west fide of the harbour flands the town, defended by a fmall fort. A very fine river falls into the Bay of Mexico on the east fide of the harbour, after running above 100 miles through the country. The land here produces plenty of the trees fit for masts of ships, and accordingly many of them are cut down and carried to Vera Cruz for that purpofe.

As there are many particulars respecting person, drefs, manners, and customs, which are peculiar to the original Indians of Florida, we shall present them to the reader. The bodies of these people are robust, and well proportioned. Both fexes go naked, except having a deer fkin round the waift. They ftain their fkin with the juice of plants, and have long black hair,

which they have a method of twifting and binding upon the head, fo as to render it rather becoming. women, who, in general have good features, and are well made, are so active that they will climb with amazing swiftness to the tops of the highest trees, and fwim across broad rivers with their children on their backs. The men make use of bows and arrows with great dexterity. The strings of their bows are made of the finews of stags; and they point the ends of their arrows with fharp flones, or the teeth of fishes. With respect to religion, they are idolaters.

Their economy in the management and distribution of their corn, which is accounted the common flock of the public, is well worthy of notice. The crop, which is calculated to ferve only half the year, is collected into granaries appointed for that purpose, and afterwards regularly delivered out to every family, in proportion to the number of persons it contains. The foil, is indeed, capable of affording much more corn than they are able to confume; but they choose to fow no more than will ferve them for that term, retiring, for the remainder of the year, into the recesses of the forests, where they build huts of palm trees, and live upon roots, wild fowl, and fish. They are very fond of the roots, wild fowl, and fish. They are very fond of the flesh of alligators, which has a strong musky smell. Their meat is dreffed in the smoak, upon a gridiron made of flicks, and water ferves for their common drink.

The people are, in general, fatisfied with one wife, but the chiefs are indulged with more, though the children of only one of them fucceed to the father's

dignity.

The government of the original Floridas is in the hands of many chiefs, who are called caciques. They are frequently at war with each other. In their warlike expeditions they carry with them honey and maize, and fometimes fifth dried in the fun. The chief marches at the head, carries a bow in one hand, and a bow and arrows in the other; his quiver hangs at his back; and the rest follow tumultuously with the same arms.

In their warlike deliberations, if the matter be of great moment, their pricits, who are also a kind of phyficians, are called in, and their opinions particu-larly asked. Then the cacique carries round a kind of liquor, like our tea, made by the infusions of the leaves

of a certain tree.

The funeral of a deceafed cacique is celebrated with great folemnity. They place upon his tomb the bowl out of which he was accustomed to drink, and stick great numbers of arrows in the earth around him, bewailing his death for three days with fasting and loud lamentations. The generality of them cut off their hair as a fingular testimony of their forrow. Their chieftains also set fire to, and consume, all the household furniture, together with the hut that belonged to the deceased, after which some old women are deputed, who every day, during the space of half a year, at morning, noon, and evening, bewail him with dreadful howlings, according to the practice of some more civilized nations, and particularly the ancient Romans, who frequently hired women at the funerals of their relations and friends.

SECTION II. LOUISIANA.

OUISIANA, a country of confiderable extent, is bounded on the north by the territories of the wild Indians, on the fouth by the Gulph of Mexico, on the east by Florida, and on the west by New Mexico. It extends from latitude 26 to lat. 40 deg.

Notwithstanding the several attempts of the Spaniards and French to make fettlements in this country, which generally miscarried, it appears that the latter had hardly any fettlements in it till 1720, except that of Isle Dauphine, on the banks of the Mobile, about 80 leagues east of the mouth of the Miffiffippi.

mpts of the Spaits in this country, ars that the latter 1700, except that he Mobile, about Miffiffippi.

This country may be confidered as comprehended under the government of Florida. It was ceded, in part, to the English by the treaty of 1763, and by them, together with Florida, ceded to the Spaniards, according to the treaty of 1783. Louisiana is rendered exceedingly pleasant and fertile by the overflowing of several rivers at certain seasons. The meadows are delightful, and well adapted to agriculture. In some parts the ground yields two or three crops; for in the winter there are only heavy rains, without any nipping frosts. All the trees known in Europe flourish here, together with a great variety of others unknown to us; fuch as the tall cedar, which diftils an odoriferousgum; and the cotton tree, which is of a prodigious height. The foil, to the fouthward, is adapted to the cultivation of indigo and rice; and, to the northward, to that of wheat. The whole country abounds with variety of game, fowl, and cattle, and all the necessaries of life.

The rivers of Louisiana, besides the Mississippi, are St. Francis, the Black River, and the Mobile, which waters a very fine tract of country, and forms at its

mouth a noble bay.
In the life of Orleans, at the mouth of the Miffifippi, is the town of New Orleans, the capital of Louifiana; both of which derived their names from the French. New Orleans is the refidence of the governor, grand council, and courts of justice, as well as the emporium of Louisiana.

The original inhabitants of this country differ, in general, from those of Canada, being more sprightly and active, and less thoughtful and morose. They and active, and less thoughtful and morose. knew nothing of any instruments made of iron and fteel, much less of fire arms, till the coming of the French, all their cutting tools being very ingeniously made of fharp flints, and used with great dexterity. I heir principal ornaments are bracelets, pendants, and collars; fome of which are pearl, but spoiled for want of knowing in what manner to bore them.

SECTION III. NEW MEXICO AND CALIFORNIA.

NEW Mexico, including California, is 2000 miles long, and 1600 broad. It is bounded on the east by Louisiana, on the fouth by New Spain, or Mexico Proper, on the west by the Gulph of California, and on the north by high mountains. It is fituated between 25 and 37 degrees of north latitude, and between 94 and 126 degrees of west longitude. The country is watered by rivers and rivulets. The principal rivers are those called the Rio Solado, and the Rio del Norte. I here are several smaller ones that fall into the Gulph of Mexico; and some bays, ports, and creeks on that coaft, that might be converted into good harbours, were the Spaniards poffeffed, in any degree, of that active spirit which animates the other maritime powers of Europe. The lands are interfected with rifing grounds and fertile plains, covered with trees, fome of which are fit for timber, and others produce various forts of fruits. Here are all kinds of wild and tame cattle, with variety of fowl; and the rivers are ftored with the choicest fish.

Santa Fé, the capital of New Mexico, is fituated 130 leagues from the fea, near the fource of the river Rio del Norte. It is an opulent city, regularly built, and the fee of a bishop, fuffragan of Mexico, as well as the feat of the governor of the country, who is subordi-

nate to the viceroy of Mexico.

New Mexico is inhabited by a great variety of different nations, entirely unconnected with each other; but the principal are the Apaches, the feveral tribes of whom are diffinguished by their towns and settlements. They are a refolute and warlike people, fond of liberty, averie to tyranny and opprefion, and formidable on account of the dexterity with which they handle their bows and arrows. When the Spaniards first entered the country, they found the natives pretty well cloathed,

their lands cultivated, their villages neat, and their towns built of stone, in which they discovered some knowledge of architecture, not drawn from the rules of art, but the convenience dictated by nature. They were great lovers of mules flesh, and, upon that ac-count, frequently seized the mules of Spanish travellers, leaving their chefts of filver upon the road, because they set no value upon that metal. Their princes were little more than leaders of their armies, elected at the pleasure of the people for their wisdom or valour. These people may now be said to be rather the allies, than the subjects, of the Spaniards. The Spaniards have been rather sparing in their accounts of this country, which must be imputed either to their ignorance or caution.

California, the most northern of all the Spanish dominions on the continent of America, towards the Pacific Ocean, was for a long time supposed to be an island, but at last was found to be only a peninsula, issuing from the north coasts of America, and extending into the Pacific Ocean 800 miles from Cape Sebattian, in 43 deg. 30 min. north latitude; towards the fouth-east, as far as Cape St. Lucar, in 22 deg. 30 min. north latitude. The eastern coast lies nearly parallel with that of Mexico, opposite to it; and the tea between is called the Gulph or Lake of California;

or the Vermilion Purple or Red Sea.

The breadth of the peninfula is very unequal. Towards the north it is near 200 miles broad, but at the fouthern extremity it tapers away, and is fcarcely 50 miles over.

California was first discovered to be a peninsula by a German jesuit, who landed in it from the Island of Su-matra, and passed into New Mexico, without crossing any other water than Rio Azul, or the Blue River. The more fouthern part was known to the Spaniards foon after the discovery of Mexico, for Cortez discovered it in 1535: but they did not penetrate far into it till some time after, contenting themselves with the pearl fishery on the coast.

It was visited by our countryman Sir Francis Drake in 1578, who called it New Albion, and took possession of it in the name of Queen Elizabeth, fince which time,

however, the English have made no pretentions to it. In fummer the heats are violent along the coasts, but up the country the air is more temperate, and, in winter, sometimes cold. However, in so extensive a country, there must be great variations both of foil and climate; and though upon a general view, California appears rather rough, craggy, and unproming, with due culture it would furnish most of the necessaries of life.

The country produces timber fit for thip-building, and has most of the fruits to be found in other parts of America. Here is a species of manna, supposed to fall with the dew, and to become inspiffated on the leaves of the trees. Botanists are agreed that this manna is a juice oozing from the tree; though the natives think

that it drops from heaven.

With respect to animals, here are deer, of which two kinds are peculiar to the country; a particular species of theep, buffaloes, beavers, or animals much refembling them, a peculiar species of wild dogs, lions, wild cats, and many other wild beafts. The horfes, mules, affes, oxen, theep, hogs, goats, and other quadrupeds, that have been imported hither from Spain and Mexico, multiply exceedingly. Of the two species of deer peculiar to California, that called by the natives taye is greatly effeemed, and eat with the fame

relish as venison by many Europeans.

Of the feathered kind here is great variety; in particular, the coast is plentifully stocked with peacocks, bustards, geefe, cranes, vultures, gulls which are larger than geefe, cormorants, mews, quails, linnets, larks, nightingales, and many other species.

The multitude and variety of fifh with which the Gulph of California, the Pacific Ocean, and the rivers are fupplied, is almost incredible. Salmon, turbot,

barbe!, fkate, mackarel, pilchards, thornbacks, foles, bonetas, and many other species, are caught here with very little trouble; together with pearl oysters, common oysters, cray fish, lobsters, and a variety of exquisite shell fish. However, of the testaceous or shell kind, the most remarkable and abundant is the tortoife, caught in the utmost plenty upon the coasts. On the fouth coast also is a shell sish the most beautiful that can be imagined, being of an elegant vivid blue colour, like the lapis lazuli.

California affords one of the richest pearl fisheries in the world, and is likewife thought to have mines. Infects swarm here, as in most warm countries; yet

Infects fwarm here, as in most warm countries; yet they are neither fo numerous or troublefome as in fome, on account of the dryness of the foil and climate.

There are two confiderable rivers in California, viz. RioColloredo, and Riodu Carmel, with feveral finaller ftreams, and fine ports, bays, creeks, and roads, both on the east and west side.

In the heart of the country there are plains of falt, quite firm, and clear as crystal, which, considering the vast quantities of 5th of all forts found here, might be of great advantage to any civilized nation.

The original Indians who inhabit California are, in general, well formed and robust, of a healthy countenance, but swarthy complexion. Their habitations are wretched huts, built near the few streams, wells, and ponds found in the country. As they are under the necessity of frequent migrations in search of food, they easily shift their residence, it requiring only the labour of a few hours to build a little habitation fitted for all their purposes; and it is usual with them, in the severity of winter, to live in subterraneous caverns. Their furniture and property consists of implements for fishing, hunting, and war, in which most of their time is spent. Their boats are only rafts; and their arms are bows, arrows, and jagged clubs.

The dress of the men is little more than a girdle round the waift, with a few ornaments about their hair. The women wear their hair loofe. They have also a kind of cloak and petricoat, made of palm leaves; some wear fillets of neat net-work. Their arms are likewise frequently adorned with net work, or strings of pearls in the form of bracelets. The love of ornament prevails among the women more than among the men.

Their greatest ingenuity appears in their fishing nets, which are made with admirable skill, of various colours, and such diversity of texture and workmanship, as cannot be described.

They have a high festival at the gathering in of the fruits of the earth, when they indulge themselves in feasing, dancing, and mirth.

SECTION IV.

OLD MEXICO, OR NEW SPAIN.

Situation, Extent, Boundaries, Vegetables, Animals, Birds, Fish, Articles of Trade, Mines, Divisions, chief Cities and Towns, Inhabitants, Persons, Dispositions, Manners, Customs, &c.

OLD Mexico, or New Spain, the first valuable acquisition of the Spaniards on the continent of America, lies between 7 deg. 30 min. and 30 deg. 40 min. north latitude, is 2000 miles long, 600 broad, where widest, and has the listhmus of Darien on the south, New Mexico on the north, the Gulph of Mexico on the east, and the Ocean on the west.

There are fome mountains on the western coast of New Spain, near the Pacific Ocean, most of which are said to be volcanos. Several rivers rise in these mountains, and sall some into the Gulph of Mexico, and some into the South Sea, on both of which there are several capes and bays. Among the bays on the gulph are those of Campeachy and Honduras. In the Jucatan, a large peninsula in the Gulph of Mexico, the Spaniards

first discovered that well-known plant called tobacco, in the year 1520.

The air of this country is temperate, confidering its fituation in the torrid zone. The rainy feafon begins the latter end of April, and continues till September, being preceded by terrible ftorms, which are fo variegated, that the wind blows from almost every point of the heavens, increasing their fury daily till the month of June, at which time the rain falls as if a second de-

luge were to enfue.

No country under heaven abounds more with grain, delicious fruits, roots, and vegetables, many of which are peculiar to it, or at least to America. Of these the most remarkable are bamboos, mangroves, and logwood, which grow on the coasts; red and white cotton trees, cedars, blood-wood, and maho, of which the natives make ropes and cables; light wood, of which they make floats, being as light as cork; white wood, the cabbage tree, the calabath, cocoa, and vanilla, which the Spaniards call bexuco, or bainilla; plan-tains, bananas, pine apples, fapadillo, avogato pear, mammee, mammee-tapota, grape, prickle, bibby, and other curious fruit-trees; befides which, the Spaniards have introduced most of the European fruits. Mexico also produces the poisonous manchineel apple, gourds of a prodigious fize, melons, filk-grafs, tamarinds, and locust trees; the little black, white, and borachio fapota trees, the last of which takes its name from the inebriating quality of the fruit. To these we may add the Grenadillo de China, creeping-plant, and the mayhey, which furnishes the natives with thread for linear and cordage, and also a balfam and liquor, which, when fermented, is as pleasant and strong as wine. From this, too, is distilled a strong spirit, which is not unlike brandy.

Other valuable productions of New Spain are copal, aninie, tacamahaca, earanica, liquid amber, and oil of amber. Balfam of Peru is alto found in Mexico, guaiacum, China-root, fariaparilla, and the root mechoacan, which are well known to druggifts and apothecaries, and of excellent use in a variety of diffempers. Besides the maize, or native grain of Mexico, the Spaniards have introduced the use of barley, wheat,

peas, beans, and other grain.

The numbers of horned cattle here are immense, many of them running wild. Their sless turns to little account by reason of the extreme heat; but their hides and tallow are productive of great advantages. Swine are very numerous, and their lard is much in request, and used instead of butter throughout the country. Sheep are likewise numerous, but their wool is of no great consideration, being hairy and short. There are several forts of red and fallow deer, hares, rabbits, squirrels, foxes, jackalls, monkies, and divers other animals.

With respect to the feathered race, there are, in Mexico, tame poultry, turkies, pidgeons, parrots, parroquets, macaws, humming birds, eagles, vultures, pelicans, cormorants, bats, and a multitude of other

ipecies.

On the coasts and banks of rivers are caught alligators, turtle, paracoad, gar fish, mullets, and mackarel, which refemble those of Europe, but are of a very large size. There are oysters and mussels of a prodigious size, also great plenty of lobsters, crabs, and shrimps.

The principal trading commodities of New Spain are wool, cotton, fugar, filk, cochineal, chocolate, feathers, honey, ballams, drugs, dyeing woods, falt, tallow, hides, tobacco, ginger, amber, pearls, precious stones, jasper, porphyry, exquitite marble, and gold and filver.

The gold and filver mines are found in the rocky barren parts of the country. There are several, it is said, of the former, and no fewer than 1000 of the latter. Gold is also found in grains, or dust, in the sands of rivers and torrents. Whoever discovers a mine of gold or filver is at liberty to work it, paying the king

a tenth of the product, and limiting himfelf within 50 yards round the place upon which he has fixed. All the filver and gold, either dug or found in grains, is en-tered in the royal exchequer; and it is reported, that, notwithstanding great quantities are run and concealed, no less than 2,000,000 of filver marks, weighing eight ounces each, are entered yearly, out of which they coin 700,000 marks, into pieces of eight, quarter pieces, rials, and half pieces; the value of the latter being about three-pence sterling.

The whole of the trade between Old Spain and the Spanish American dominions, is by means of a fleet called the flota, which is fitted out at Cadiz, and deftined to La Vera Cruz. The ships are not permitted to break bulk, on any account, till they arrive there. When all the goods are landed and disposed of at La Vera Cruz, the sleet takes in the plate, precious stones, cochineal, indigo, cocoa, tobacco, sugar, and hides, which are the returns for Old Spath. From Vera Cruz they fail to the Havannah, which is the place of their rendezvous, where they meet the galleons. These are another fleet, which carry on all the trade of Terra Firma, by Carthagena; and of Peru, by Panama and Porto-Bello; in the fame manner as the flota ferves for New Spain. When the flota arrives at the Havannah, and joins the galleonsand register thips, which affemble at the fame port from all quarters, some of the cleanest and, best failing vessels are dispatched to Old Spain, with advice of the contents of these several fleets, as well as with treasure and goods of their own, that the court may judge what duty is proper to be laid on them, and what convoy is necessary for their fafety.

Register-ships are fent out by merchants at Cadiz and Seville, when they judge that goods must be wanted at any particular ports in the West Indies. Their way is to perition the council of the Indies for a license to fend a ship of 300 tons burthen, or under, to that port. They pay 40 or 50 dollars for this licenfe, befides prefents to the officers, in proportion to the conruns only to 300 tons at most, the vessel street out is seldom less than 600. The ship and cargo are registered at the pretended burthen. It is required, too, that a certificate be brought from the king's officer at that port to which she is bound, that she does not exceed the size at which she is registered. All this passes of course. courfe. These are what they call register ships, and by these the trade of Spanish America has been carried

on for fome years past. Old Mexico is divided into three diffricts or governments, called audiences, as having fovereign courts, which, though under theinfpection of the viceroy, decide all civil and criminal cases. His employment, in point of trust and power, is one of the greatest the Spanish monarch has in his gift; and it is, perhaps, the richelt government entrufted to any fubject in the world. But neither the viceroy or any other officer is fuffered to hold his post longer than three years. This being the cafe, the miserable inhabitants become a prey to the rapacity of every new governor. The districts are Guadalaxara, Mexico, and Guatimala, comprehending each their respective provinces as follow. Those of Guadalaxara are Cinaloa, Culiacan, Xalifco, Guadalaxara Proper, and New Bifcay. Those of Mexico are Mechoacan, Mexico Proper, Tlascala, Guaxaca, and Jucatan.' Those of Guatimala are Chiapa, Guatimala Proper, Honduras, Costa Ricca, and Veragua. These diffricts have their respective capitals. Guadalaxara is the capital of the province of that name, and is a large, populous, and neat city, containing spacious streets, several churches, a stately cathedral, and some con-

vents for both fexes. Mexico, the capital of the audience of Mexico, stands in the middle of a great lake of its own name, in latitude 19 deg. 40 min. about 170 miles west of the Gulph of Mexico. In point of regularity, it exceeds most cities in the universe; the streets being to straight, and exactly disposed, that from any part of the town

the whole is visible. The want of gates, walls, and artillery, together with the five great caufeways leading to the city, renders Mexico extremely remarkable. Ad the buildings are convenient; but the public edifices, especially the churches and convents; are magnificent. Here are 29 cathedrals and churches, and 22 monafteries and nunneries. Besides there are several hospitals, which are richly endowed, and amongst the rest is one for young maids who are left orphans. The feveral trades have their respectivestreets: a very spacious one, that runs from the fquare, belongs to the goldsmiths. The shops are furnished with such a variety of brilliant articles, as to exhibit a luftre not to be paralleled in any part of the known world. The city is supplied with fresh water from a hill at three miles distance, to which an aqueduct, supported on strong arches, ex-

tends from the city.

Another place worthy of notice in this diffrict is Acapulco, which stands in 17 deg. north latitude, on a bay of the South Sea, about 210 miles fouth-east from Mexico. The haven is large and commodious, and the entrance secured by a flat island running across, at each end of which is a deep channel, sufficiently broad for the greatest vessels. The only inconvenience is, that ships must enter by the sea wind, and go out by the land breeze, which seldom fail to succeed each other alternately; fo that they are frequently blown off to fea after repeated attempts to make the harbour. The town is large, but ill built; and a part of it consists of warehouses. The climate here is unhealthy, and earthquakes very common. During the fair, after the arrival of the Lima and Manilla thips, the town is so excessively crowded, that great numbers are obliged to pitch tents in the neighbourhood for their accommo-dation. It is supposed that the Manilla galleon carries off from Acapulco at least 10,000,000 of dollars, in return for the goods she bringsthither, and for the payment of the Spanish garrisons in the Philippine Isles. In the province of Tlascala, in this district, is the

city of La Vera Cruz, or Ulva, fituated on the Gulph of Mexico, about 70 leagues from the capital. It is very strong, both by art and nature, being the great mart of all the Spanish trade in the North Sea, and has a fafe commodious harbour. The air, however, is fo unhealthy, that few Spaniards of distinction make

their common refidence in it.

Guatimala, the capital of the audience and province of that name, is fituated on a beautiful plain, and is well built and inhabited. The cathedral and parish churches are elegant and fumptuous; and here are two

fine monafteries, a nunnery, and an hospital.

In the province of Jucatan is the town of Campeachy. It has a fine appearance, being built of stone, and encompaffed with a good wall, and has a strong citadel.

The present inhabitants of Mexico are a mixed people, composed of the native Indians and the Negroes, and the descendants of these are divided and diftinguished by various names, as Creoles, Mestizes, Mestiches, Terceroons, and Quarteroons. The issue of an European and Negro is called a Mulatto: befides which there is a mixed breed of Negroes and Indians, which

is generally deemed the lowest rank of the people.

With respect to the persons, dispositions, eustoms, and, indeed, general character of the Mexicans, or Free Indians, we are enabled, through favour of a correspondent, to present our readers with the following most genuine, as well as modern, account that can

The Mexicans are, in common, of good stature, and well-proportioned form. Their complexion is a deep olive. They have narrow forcheads; black eyes; firm, regular, black teeth; black, coarfe, gloffy hair; thin beards; and generally no hair on their legs, thighs, and arms. Some tribes look upon flat notes as a great beauty. Almost all the Mexicans paint their bodies with the figures of various birds and beafts, and anoint them with oil or fat. Some tribes are cloathed; but the men of others go almost quite naked. The Mexi-

cans, in general, have their noies, lips, ears, necks, and arms, adorned with pearls and other jewels, or trinkets made of gold, filver, or fome other metal.

There are very few deformed persons in Mexico, where it would be more difficult to find a fingle humpbacked, lame or fquint-eyed man among a thousand of the natives, than among an hundred of any other nation. When their personal defects and excellencies are poifed impartially, they can neither be called very beautiful, or the contrary, but feem to hold a middle place between the extremes. Their appearance nei-ther engages or difguits. Among the young women there are many highly attracting, from the union of accomplishments personal and mental. Their senses in general are acute, but particularly fo that of fight, which they enjoy to a great age unimpaired. Their constitutions are robust. They are free from many diforders common to the Spaniards; but to the epidemical difeases to which their country is occasionally subject, they fall the principal victims: with them thefe difeases begin, and with them they end. They are rarely affected with that naufeouiness of breath which is occasioned in other people by the corruption of the humours or indigestion. They become grey-headed and bald earlier than the Spaniards, and although most of them die of acute difeates, yet they fometimes at-tain to the age of one hundred years.

They are moderate in eating, but their passion for strong liquors is carried to the greatest excess, which exposes them to all the baneful impressions of disease, and is, undoubtedly, the principal cause of the havock made among them by epidemical disorders. Their minds, like the children of Adam in general, are succeptible of cultivation, and experience has actually shewn, that their faculties are adapted to every kind

of science.

The Mexicans are not violently transported by their passions: they are flow in their motions, and discover a wonderfultenacity and steadines in those works which require long-continued attention. They are patient of injury and hardship, and grateful for kindness shewn where they suspect no evil intention. By nature tacitum, ferious and austere, they shew more anxiety to punish crimes than to reward virtues.

The principal characteristics of the Mexicans are generofity and difinterestedness: hence gold with them loses its value, and they seem to give, without reluctance, what has cost them the utmost labour to ac-

quire.

The respect paid by parents to their children, and by the young to the old, seems to arise from congenial principles. Parents are fond of their children, but the affection which hasbands bear to their wives is certainly less than that borne by wives to their husbands; and it is too common for the men to love their neighbours wives better than their own.

Their minds are so alternately affected by resolution and fear, that it is often difficult to determine which of them bears the sway. Dangers which proceed from natural causes they encounter with intrepidity, but the freedom of a Spaniard thrills them with horror.

To fum up the whole, the character of the Mexicans, like that of every other people in the world, is a mixture of good and bad; but the bad qualities may be corrected by a proper education, as hath been demonstrated by frequent experience.

As it is our defire by no means to omit any subject that can conduce to the entertainment of our readers, we shall present them with a description of the facrifices of the people of that part of the world previous to their being conquered by the Spaniards.

The facrifices of the ancient Mexicans were various, and horrid beyond expression. In general the victims suffered death by having their breasts opened; sometimes they were drowned in a lake; sometimes they died with hunger shut up in caverns of the mountains; and sometimes they fell in what was called the gladiatorian sacrifice.

The place for the performance of the common facrifice was the temple, in the upper area of which flood the altar. The ministers were the priests, the chief of whom, on Juch occasions, was cloathed in a red habit fringed with cotton. On his head he wore a crown of green and yellow feathers. The other ministers, which were five in number, were dreffed in habits of the fame make, but embroidered with black, and their bodies were dyed all over with the fame colour. These barbarous ministers carried the victim naked to the upper area of the temple, and having pointed out to the byestanders the idol to whom the facrifice was made, extended him upon the altar. Four priefts held his legs and arms, and another kept his head firm with a wooden instrument made in the form of a coiled serpent, and put about his neck. The body of the victim lay arched, the breaft and belly being raifed up and totally prevented from moving. The inhuman chief prieft then approached, and with a cutting knife made of flint dexteroufly opened the breaft, and tore out the heart, which while yet palpitating, he offered to the fun, and afterwards threw it at the feet of the idol: he then took it up and burnt it, and the aftes were preferved as a precious relic. If the idol was of large fize and hollow form, it was customary to introduce the heart of the victim into its mouth with a golden spoon. It was usual alto to anoint the lips of the idol, and the cornices of the door of the temple, with the blood of the victim. If the victim was a prisoner of war, they fevered the head from the body, to preferve the skulf. The body was carried by the officer, or foldier, to whom the pritoner had belonged, to his house, to be boiled and dreffed for the entertainment of his friends. If he was not a prisoner of war, but a slave purchased for facrifice, the proprietor carried off the body from the altar for the same purpose. They eat only the legs, thighs and arms, burning the reft, or preferving it for food for wild beafts and birds of prey. Some feets among them having flain the victim, tore the body in pieces, which they fold at market. Others facrificed men to their gods, women to their goddeffes, and children to the inferior deities. This was the most common mode of facrifice: there were others less frequent; fuch as putting the victims to death by fire. drowning children of both fexes in the lake, flutting them up in a cavern, and fuffering them to periffi with fear and hunger.

The principal facrifice among the ancient Mexicans was that called by the Spaniards the Gladiatorian. This was an honourable death, and only prifoners diffinguished by their valour were permitted to die by it. The prifoner was placed on a stone in a confpicuous part of the city, armed with a shield and a short sword, and tied by one foot. A Mexican officer, or foldier, better armed, mounted the stone to combat with him. If the prisoner was vanquished, he was carried by a priest, dead or alive, to the altar of the common-facrifices, where his breast was opened, and his heart taken out, while the victor was applauded and rewarded with some military honour. If the prisoner conquered six different combatants, who successively engaged him, he was granted his life, his liberty, and dismissed

HISTORY and CONQUEST of MEXICO.

with honour to his native country.

THE great and extensive empire of Mexico was under the fole government of its own monarchs, till the Spaniards, under the command of Fernando Cortez, invaded and conquered it. This expedition was undertaken with only 508 foot, 16 troopers, and 108 feamen. Cortez with his forces landed on the coast of the Bay of Campeachy, and having dispersed the natives with his artillery, marched to the city of Tabasco, which he seized upon. The next day the Indians affembled an army of 40,000 men, with which they attacked the Spaniards; but Cortez, at the head of the horse, attacking them in the slank, they retired.

of Mexico was own monarchs, d of Fernando his expedition of troopers, and landed on the aving differfed to the city of text day the Inext, at the head k, they retired. The day after the battle the cacique, or prince, fent a folemn embaffy to Cortez, to implore peace, attended with a prefent of fuch fruits and provisions as hiscountry afforded, together with jewels, plumes, and painted cotton linen, and whatever he thought most acceptable to the conquerors. The ambaffadors approached Cortez as they used to do their gods, with golden pads or cenfers, in which they burnt aromatic gums, and other incense: the cacique afterwards came in person, and made his submission, bringing him 20 beautiful Indian virgins, which he made Cortez a prefent of. One of these, whom the general afterwards caused to be baptized by the name of Donna Marina, ferved him, during the whole expedition, in the doubie capacity of concubine and interpreter; for the was a native of Mexico, a female of ready wit, and underftood the cuftoms of the country and the language perfectly well; and indeed to her merit and address the Spaniards ascribe the success of their arms in a great measure. When the cacique of Tabasco came to make his fubmission, Cortez let him know, that he came from a powerful prince; and that his principal view was to make them all happy in this world and the next, by making them fubjects of the fame fovereign, and converting them to the true religion. To this the frighted cacique answered, that he and his people should think themselves happy in obeying a king, whose power and greatness appeared to such advantage in the valour of his fubjects; but as to the point of religion, he gave very little hopes of their convertion.

AMERICA.

Cortez, being about to advance fill farther with his fleet on the Mexican coast, was underthe greatest concern that he must leave those people before he hadfully initructed them in the Catholic teligion; and on Palm-Sunday, the day he appointed to embark his troops, he first caused an alcar to be erected in the open field, where he celebrated high mass in the presence of the Indians, and all his troops marched in their ranks to the altar, with boughs or palms in their hands, to celebrate that feftival: the procession feemed to excite in the natives the utmost awe and reverence, infomuch that fome of them cried out, "This must be a great God, that such brave men adore." Cortez failed to the port of St. John de Ulva, where he landed, and Donna Marina acted as interpreter. When the general was informed that Montezuma, the emperor of Mexico, had fent to know the reason of the Spaniards invading his country, he answered ambiguously, but still preferved his defign of penetrating into the country. Montezuma, in all his mellages, tried to prevent the Spaniards from coming to Mexico, and Cortez as infiexibly perfifted in that intent.

Cortez forefaw that the Mexicans would not be able to prevent his approaching Mexico, especially as he was joined about this time by a cacique, or prince of the country, named Zempoala, who offered to enter into analliance with Cortez against Montezuma, whom he represented as a cruel tyrant and oppressor.

The cacique furnished him with 400 men to carry his baggage, and others to draw his artillery, there not being any beaits in this part of the country fit to draw carriages; but every thing of this kind was done by the firength of men.

The general continuing his march by the fea-coaft to Vera Cruz, was joined there by about 30 caciques from the mountains, who reinforced his troops with 100,000 men? and iome parties of Europeans hearing of the fueces of Cortez allo voluntarily followed him thither, and joined his troops: whereupon he became to confident of his free ets, that he burnt all his thips, and having fortified Vera Cruz, in which he left a small garriton, he began his march directly for the city of Mexico, being joined by the people of Tlafcala, a cointry of great extent, who offered to become fubjects of the trig of Spain; at which Montezuma was to alarmed, that he offered to pay the Spaniards an annual tribute, amounting to one half of his revenues;

and when he found it in vain to oppose the general's march, he thought sit to give him an invitation to his capital: but Cortez, who was determined to have the plunder of the capital city, pretended that the Mexicans were not sincere in their invitation, but had entered into a conspiracy to surprize the Spaniards, when they had drawn them into an ambuscade, and massacrethem; and, therefore, immediately began hostilities, and cut to pieces some thousands of Montezuma's subjects.

After this, the Spaniards, continuing their march, were attended by feveral other caciques and lords of the country, who complained of the intolerable opprefions of Montezuma; telling Cortez that they looked upon him as their deliverer, fent from heaven to restrain and punish the injustice and cruelty of tyrants; to whom he promised his protection: and drawing near to Mexico, in order to strike the greater terror into the natives, he ordered his artillery and small-arms to be discharged; and caused several Indians to be shot, that approached too near his quarters, while he lay encamped at Amemeca, on the borders of the Mexican lake.

HereprinceCacumatzin, the nephew of Montezuma, attended by the Mexican nobility, came to the general, and bid him welcome; afforing him that he would meet with a very kind and honourable reception from the emperor; but intimated, that there having been lately a great fearcity of provisions in the city of Mexico, occasioned by unfeasonable weather, they could not accommodate them as they defired; and, therefore, entreated he would defer his entrance into that capital, if he did not think fit entirely to decline going thither. But Cortez appearing determined to advance, the prince feemed to acquiefce; and the preparations for the reception of the Spaniards were continued.

for the reception of the Spaniards were continued.

Cortez being arrived at Quitlavaca, a city fituated on an island in the great lake, five or fix leagues from Mexico, had fome apprehensions that the Mexicans would break down the causeway, and remove the bridges on it; which would very much have embarraffed him, because he could neither have advanced or retired in that case, especially with his horse and artillery. But the cacique of Quitlavaca, who appeared to be a friend of the Spaniards, very much encouraged the general, telling him, he had nothing to sear; that the prodigies in the heavens, the answers of the oracles, and the same of the great actions and surprizing arms of the Spaniards, had perfectly dispirited their emperor, and disposed him to submit to whatever the general should impose on him.

Soon after Cortez entered Mexico, at the head of 450 Spaniards, and 6000 Tlåfcalans; when they were met by Montezuma himfelf, who was brought in a chair of beaten gold, on the thoulders of his favourite courtiers.

The conference between the emperor and the general was short, their speeches were fuitable to the occasion, and the emperor commanded one of the princes, his relation, to conduct the general to the palace assigned for his residence, and then returned to his own palace.

It was about noon that the Spaniards were brought to the royal house appointed for their reception, which was so spacious, as to contain all the Europeans and their auxiliaries: it had thick stone walls, stanked with towers: the roof of the palace was star, and defended by battlements and breast-work; insomuch that when the general had planted his artillery, and placed his guards, it had very much the appearance of a fortress.

Hither Montezuma came the fame evening, and was received by Cortez in the principal square of the palace; and that monarch having entered the room of state, and seated himself, ordered a chair for Cortez, and a signal was made for his courtiers to retire to the wall; whereupon the Spanish officers did the same; and Cortez being about to begin his speech by his interpreters, Montezuma prevented him, by speaking as follows:

"Huftrious and valiant ftranger! Before you difclose the important message the great monarch you 6 O came

came from has given you in command, it is necessary fome allowance be made for what fame has reported of us on either fide. You may have been informed by fome, that I am one of the immortal gods; that my wealth is immenfely great, and my palaces covered with gold: and on the other hand, you may have heard that I am tyrannical, proud and cruel. But both the one and the other have equally imposed upon you: you fee I am a mortal of the fame species with other men; and though my riches are confiderable, my vaffals make them much more than they are; and you find that the walls of my palaces are nothing more than plain lime and stone. In like manner, no doubt, has the feverity of my government been magnified: but suspend your judgment of the whole, till you have an opportunity of informing yourfelf concerning it; and you will find that what my rebellious subjects call oppression, is nothing more than the necessary execution of justice.

" After the same manner have your actions been reprefented to us: some speak of you as gods; affirming that the wild beafts obey you; that you grasp the thunder in your hands, and command the elements: while others affure me, you are wicked, revengeful, proud, and transported with an infatiable thirst after the gold

our country produces.

" I am now fensible ye are of the same composition and form as other men, and diftinguished from us only by accidents which the difference of countries occasions.

"These beats (horses) that obey you are, probably, a large species of deer, that you have tamed and bred up in such imperfect knowledge as may be attained by animals: your arms are made of a metal, indeed, unknown to us, and the fire you discharge from them, with fuch an aftonishing found, may be some secret taught by your magicians. As to your actions, my ambatfadors and fervants inform me, that you are pious, courteous, and governed by reason: that you bear hardthips with patience and chearfulness, and are rather liberal than covetous; so that we must, on both fides, lay afide our prejudices and prepoffessions, and rely only on what our eyes and experience teach us."

To this the general answered, "That it was true,

various were the reports they had heard : fome endeayoured to defame and afperfe him, while others adored him. But the Spaniards, who were endowed with a penetrating spirit, easily faw through the different colours of discourse, and the deceit of the heart; that they neither gave credit to his rebellious subjects, or those that flattered him; but came in his prefence, affured that he was a great prince, and a friend to reason; but very well fatisfied, however, that he was a mortal, as they themselves were: that the beasts which obeyed him were not deer, but fierce and generous animals, inclined to war, and feemed to aspire after the same giory as their mafters; that their fire-arms were, indeed, the effect of human industry, and owed nothing to the skill of the magician, whose arts were abominated by the Spaniards.'

Having thus given some answer to the emperor's speech, Correz proceeded to inform him, " That he came ambaffador from the most potent monarch under the iun, to defire his friendthip and alliance: that there might be a communication and intercourse between their respective dominions; and by that means, the Christians might have an opportunity of convincing them of their errors, and, initead of blocks of wood, (the works of men's hands) instruct them to worship and adore the true God, the Creator of the whole uni-I hat this was the first and principal thing the king his matter commanded him to infift on, as the most likely means of establishing a lasting amity; that, being united in principles of religion, their alliance

might become indiffoluble.

Montezuma replied, that " he accepted the alliance proposed by the king of Spain; but as to the overture concerning religion, he totally objected to it;" and making Cortez a rich prefent, returned to his palace. Cortez continued, for some time, very intimate with Montezuma, often visiting the Mexican court; and that monarch frequently came to the Spanish quarters, making prefents to the general, and to his officers and foldiers, exhibiting thows and entertainments for their diversion. The Mexicans still treated the Spaniards with a respect that savoured of great humility and condescension. Montezuma spoke of their king with the greatest veneration. His nobility paid a profound repect to the Spanish officers, and the people bowed the knee to the meanest Spanish foldier. But an accident happened which very much lessened the esteem, or rather dread, the Mexicans at first entertained of these

One of the emperor's generals, levying the annual tax imposed on the vastal princes in that part of the country which lay in the neighbourhood of the Spanish garrifon of Vera Cruz those caciques who had thrown off their subjection to the Mexican empire, and entered into an alliance with the Spaniards, applied theinfelves to John de Escalante, governor of Vera Cruz, for protection; who thereupon marched out of that fortrefs, with 40 Spaniards, and 3 or 4000 confederate Indians, to their affiliance; and though he had the good fortune to defeat the Mexican general, yet one of the Spaniards was killed, and his head fent up to the court; and the governor, with five or fix more of his garrison, were mortally wounded. This news being brought to Cortez, gave him great uneafiness; and the more, because he was informed, by the confederateIndians, that the Mexicans were confulting how to drive him out of their territories, which they did not apprehend to be

impracticable fince the engagement near Vera Cruz. The Spanish general therefore, finding it impossible to maintain his authority among the Indians any longer without entering on fome action that might give them fresh cause of attonishment, and recover that reputation they feemed to have loft by that unfortunate accident, refolved to seize the person of Montezuma, and bring him prisoner to his quarters; and accordingly, at an hour when the Spaniards were used to pay their court to that prince, Cortez, having given orders for his men to arm themselves without noise, and posses themselves of all the avenues leading to the palace in small parties, that no notice might be taken of it, went to the Mexican court attended by feveral of his officers, and 30 foldiers, whose resolution the could rely on, and being admitted to the emperor's prefence, he complained of the violation of the peace between them, by one of the Mexican generals falling upon his confederates, and afterwardskilling a Spaniard he had taken in coldblood. To which Montezuma answered, "That if any thing of that nature had been done, it was without his orders; and he was ready to make fafisfaction for any injury that might have been done undefignedly, either to the Spaniards or their allies." But Cortez gave him to But Cortez gave him to understand, that nothing would fatisfy them but his furrendering himself into their hands, and refiding with them in the palace affigned to the Spaniards for their quarters.

Montezuma at first seemed aftonished at the infolent demand, and remained for some time filent; but recovering from his furprize, he faid, that princes of his rank were not accustomed to yield themselves up to a prison; nor would his subjects permit this, even if he should forget his dignity so far. Cortez answered, "Is he would go along with them voluntarily, they were not afraid of any opposition his subjects should make; and they would treat him with all the regard due to his dignity: he might continue to exercise his authority as formerly, and no restraint should be put on his actions; only, for their fecurity, he infifted that the emperor should reside among them." Montezuma, still refufing to put himfelf into their hands, was given to understand, that if he would not, they would carry him off by force, or murder him if they were opposed; whereupon he submitted to do what he found it was impossible to avoid; and gave orders to his officers to prepare went in th ance, exc Spaniards. for his removal to the Spanish quarters, whither he went in the usual state, and voluntarily, to all appearance, except that he was attended by a company of Spaniards, who furrounded his chair.

Montezuma, as must be easily supposed, was rendered very milerable by this indignity; and his fervants, lamenting their emperor's hard fate, threw themselves at his feet, endeavouring to ease him of the weight of his fetters; and though, when he recovered from his first amazement, he began to express some impatience, yet, correcting himself, he acquiesed in his misfortunes, and waited the event, not without apprehensions that there was a design against his life: but Cortez having seen his plan performed, by which he found he had struck such a terror into the Mexicans that little was to be feared from them, he returned to Montezuma's apartment, and ordered his fetters to be taken off; and, as fome writers relate, he feil on his knees, and took them off with his own hands; for which favour the emperor embraced and thanked him. But what is flill more difficult to be believed, they affure us, that Cortez gave the emperor leave to return to his palace, and that he refused the offer out of regard to the Spaniards; telling them, he knew very well that as foon as he was put out of their power, his subjects would prefs him to take up arms against them, to re-venge the wrongs he had suffered: nay, the Spanish historians positively affirm, that, notwithstanding all the injuries and indignities they had offered to Montezuma, he expressed a more than ordinary friendship and regard for them, preferring their interest to that of his own fubjects.

De Solis, the Spanish historian, fays, that Cortez gave Montezuma leave to go whither he pleafed, which he feems to contradict in a very few lines afterwards: for he tells us, when that prince only defired to perform his devotions in one of his temples, it was granted upon certain conditions, namely, that he should give his royal word to return to the Spanish quarters again, and from that day abolish human facrifices; and we make no doubt but they infifted on a third, viz. that he should take a guard of Spaniards with him; for they acknowledge that a body of Spaniards actually attended him to the temple, which they could do with no other view than that of fecuring their prifoner: though De Solis hys, indeed, it was at the request of Montezuma, that they went with him; nor did he ever go abroad without a Spanish guard, or without asking leave of Cortez; or ever lay one night out of their quarters, by their own confession; which they would have us ascribe purely to choice, and his affection to the Spaniards, who had put fuch indignities upon him. They add, that Cortez was now become his prime minister; that all pofts of honour or profit were disposed of by him and his principal officers, who were courted by the Mexican nobility, when they faw that no places or preferments could be had but by their interest; which poffibly might be true; but furely it is much more probable that Montezuma was influenced more by his fears than his affection for the Spaniards. And we may observe from hence, that, with all these advantages, Cortez and his Spaniards might have established their power upon fuch a foundation, as could not eafily have been overthrown, without such a deluge of blood as they fpilt afterwards, if Cortez had been as able a politician as he was a foldier; or if his benevolence and humanity had exceeded his cruelty and avarice.

He feems to have left fearce any means untried for his fecurity and establishment but the principal, namely, gaining the affection of the Indians, and winning them over to his party, as well as to the Chriftian religion, by acts of generofity and beneficence. He was to careful of himfelf, that he caused some brigantines to be built on the lake of Mexico, whereby he entirely commanded the lake, and the caufeways leading to the city; and at the fame time he increased his reputation with the Mexicans by the artful management of those veffels; for the Indians were, at this time,

ignorant of the use of fails and rudders.

Don Diego Velasques, governor of Cuba, being informed that Cortez had met with great fuccess in Mexico, and was endeavouring to render himself independent of him, declared him a rebel, and fent Pamphilio de Narvaez, with 800 men, to reduce him, and take upon him the command of the Spanish forces in Mexico. Whereupon Cortez leaving a garrison in the city of Mexico, and confining Montezuma there, marched to meet Narvaez hisrival, furprifed him in the night-time, made him prisoner, and so corrupted the officers of the troops that came over with Narvaez, by the rich prefents he made them, that they agreed to join Cortez.

Thus reinforced, he returned to the city of Mexico again; and now imagining himfelf powerful enough to fubdue that empire by force, without courting Montezuma or his fubjects, he treated that monarch with great contempt. But some of the Spanish historians observe, that in this he committed a very great error : for had the general, on his returning in triumph with fuch an addition of forces, entered into a treaty with that emperor and his nobility, they would have yielded to al-moft any terms; and he might have gained the domi-nion of that empire for the king of Spain, his mafter; without any bloodshed. But he was too much elated with fuecess to think of pacific measures. On the contrary, he refolved to give the Mexicans all manner of provocations, and even rendered them desperate, that he might have a colour to destroy them, and seize all their poffessions, whether lands or treasure. He found a garrison of 80 Spaniards able to repel the whole force of Mexico; and he did not doubt, now he faw himfelf at the head of 1100 Spanish horse and foot, with a multitude of confederate Indians, he should be able, by force, to reduce the Mexicans, and make flaves of But he was near paying very dear for his prefumption; for fending out a detachment of 400 Spaniards and confederate Indians in fearch of the enemy, who were retired to the farthest part of the city, they were furrounded, and in danger of having their retreat cut off; and he himfelf, with the rest of his troops, very narrowly escaped being starved or cut in pieces; for the Mexicans, rendered brave by their despair, were not afraid to attack Cortez in his quarters, the defended by a numerous garrison, and a train of artillery; and when, at any time, he made a fally, he found intreachments in the streets, and the bridges broken down, which rendered his cavalry, in a manner, ufeless; and though he usually came off victorious, he found he had committed a very great error in shutting himself up in Mexico, from whence it was almost impossible to make his retreat, and where he found it impracticable to fetch in provisions; the enemy being mailers of all the caufeways that lead to the town, and of all the boats upon the lake; fo that if his people were not deflroyed by the continual attacks of the enemy, they must certainly, in a short time, be reduced by

In this diffress Cortez thought fit to endeavour a reconciliation with Montezuma, and make use of the authority he still retained among his subjects to induce them to lay down their arms, and permit the Spaniards to march out of Mexico, which, it was prefumed, they would readily have come into, that they might get rid of a people so much dreaded, as well as hated, by them. Accordingly, a parley being proposed and agreed to, Montezuma appeared on the battlements of the palace, and some of the Mexican nobility advancing to hear what overtures he would make them, the Spaniards tell us, their emperor made a speech to his fubjects, wherein he greatly reprimanded them for taking up arms without his leave, though it was with an intention to obtain the liberty of their prince, declaring that he was, in reality, under no manner of reftraint, but remained with the Spaniards from choice; that he thought himself obliged to shew the Spaniards this favour on account of the respect they had always paid him, and out of duty to the prince that had fent them; that their embaffy being dispatched, he was about to difmis these foreigners from his court, and defired his fubjects would lay down their arms, and not interrupt their march, and he should readily pardon their having

taken up arms, or to that effect.

The Mexicans paid little regard to this speech. Whatever their emperor's words were, they knew they were put into his mouth by the Spaniards, whose pri-foner he was, and tended only to procure them a safe retreat; and they were sensible, if they lost the advantage they had, they must never expect such another opportunity of getting rid of their unwelcome guefts. They had them now cooped up in this fortress, where no relief could be brought them, and from whence it was fearce possible for them to retreat, if the Mexicans broke down the bridges and causeways upon the lake, and made fuch dirches and trenches in the streets, as the Spaniards themselves had taught them; but forefaw, if ever their enemies got over the lake again, they might not only receive fresh reinforcements from Spain and their Indian allies, but they must engage them to great disadvantage in their open country, having no-thing to oppose their horse and artillery. The Mexicans refolved, therefore, not to confent to a ceffation of arms, but rejected the overture with difdain, as being framed only to give their mortal enemies an opportunity of escaping out of their hands, and reinforcing themselves to the destruction of their country; and they were fo enraged at the overture, that they shot at their emperor for making it to them, and mortally wounded him.

Cortez, finding the Mexicans were not to be amufed with infidious propofals, from what hand foever they came, that his provisions were almost spent, and that it would be impracticable to make his retreat in the daytime, refolved to attempt it in the dark night. Having divided the treasure, therefore, amongst his men, with which they were pretty well loaded, for it amounted to an immente fum, he iffued out of his quarters at midnight, the weather being extremely tempestuous, whereby his march was for some time concealed; but he had not advanced a mile upon the causeway, before he found himfelf attacked on every fide by the Mexicans, both by land and water, the lake being filled with their canoes or boats; and as they had broke down the bridges, and cut the causeways through in several places, the Spaniards were in great danger of being entirely cut off. Cortez, indeed, had forefeen this, and provided a portable bridge to pass the breaches in the caufeways, which was of great use to him in several places: but the Indians found means to destroy this bridge before they were all paffed over, and their rearguard, confiding of 2 or 300 Spaniards, and 1000 confederate Indians, were cut in pieces. They also lost their artillery, prifoners, baggage, and treasure, with Cortez, however, with the best part of his force, broke through the Indians, and escaped to the other fide of the lake. Some impute this lofs to the avarice of his foldiers, who were to loaded with gold and filver, that they could fcarce make use of their arms; and possibly there may be some truth in it; but we believe every one who confiders his circumstances, must be of opinion, that he was very fortunate in efcaping fo well. Had the enemy provided a body of forces to oppose him on the further fide of the lake, he must inevitably have perished; but they did not expect his fallying out so suddenly, especially in that tempestuous featon, and were not, therefore, provided to attack him.

De Solis, the historian, endeavours to give us a particular account of this action, admires the valour and conduct of Cortez and his officers, and informs us how every one diffinguished himself in this memorable retreat. He proceeds to inform us, that they arrived just as it was day-light on firm land, and thought themselves very happy that there was no army to oppose them there, and that they were pursued no further, till they had time to form and recover themselves from their constenation.

This good fortune, it feems, was owing to the compassion the Mexicans expressed for the two sons of Montezuma, and feveral princes of the royal blood, whom they found flaughtered among the Spaniards, when the day-light appeared. The Mexicans relate, that Montezuma himfelf was of this number; and that the Spaniards murdered both him and his fons, when they found they could not carry them off. The Spaniards, on the other hand, fay, that Montezuma was killed before by the arrows of the Mexicans; and that the princes, also, were accidentally killed in the engagement while it was dark, and they could not diffinguilh friends from foes. But however that was, it is agreed the princes were found dead, pierced through with many wounds: and the Mexicans deferred the pursuit of the Spaniards, to folemnize the obsequies of those two princes, or of Montezuma himself; to which piece of piety Cortez and the Spaniards, who were left alive, in a great measure owed their fafety.

The Spaniards, having halted fome time to refresh themselves, and take care of their wounded men, continued their march towards. Tlascala, the country of their faithful allies and confederates: but they had not advanced many leagues before they were again over-taken, and attacked by the Mexicans, at a time when they were fo fatigued and harraffed, that had not Cortez taken poffession of a temple, that very fortunately lay in his way, he would have found it difficult to have repulfed the enemy. But the Mexicans, finding they could make no impression on the Spaniards, as they lay intrenched within those walls, thought sit to found a retreat. However, Cortez, apprehending he should be diffressed here for want of provisions, began his march again at midnight, with great filence, in hopes to have got the start of the enemy to far, that he should have reached the Tlascalan territories before they could have overtaken him; but, to his great furprize, being arrived on the top of avery high mountain, he discovered the whole forces of the Mexicans, confifting of 200,000 men, drawn up in battalia in the valley of Otumba, through which it was necessary to pass, in his way to Tlascala: whereupon Cortez made only this thort speech to his officers, "We must either die or conquer;" and finding an uncommon ardour in his foldiers to engage, he immediately led them on. The fight was, for forne time, bloody and obstinate; and Cor-tez, apprehending his men would be wearied out by the continual supplies of fresh forces, which the Indians poured in upon him, gave a furprising turn to the battle, by attacking the imperial standard, carried by the Mexican general, who was furrounded by the no-bility; for having routed them, killed the general, and taken the standard, the rest of their troops turned their backs and fled, and were purfued with incredible flaughter by the Spaniards and their Indian allies, who made themselves ample amends with the spoils of the enemy. for the treasure they lost on retiring from the city of Mexico.

Cortez now found it necessary to cultivate a good understanding with the cociques and princes of the country, and to take their troops into his service, and made himself master of such posts as might be of most advantage to him in reducing the city of Mexico; and as he could not approach it by land but on the causeways, he built 13 brigantines and sloops, whereby he became master of the navigation of the lake, and then attacked the town by water as well as on the land side, having about 1000 Spaniards in his army, and 200,000 Indian allies. He took the city by storm on the 13th of August, 1521.

One hundred thousand Mexicans perished in defence of the city; and this conquest was attended with the submission of most of the neighbouring provinces, who consented to acknowledge themselves subjects to the king of Spain (she then emperor Charles V.).

The city of Mexico being thus reduced, Cortez diftributed the plunder among his foldiers, referving only a fifth, with the most remarkable curiosities, for the

The arifes fi year ro and felpen, th ceedin king, which he fent to Spain by some of his principal officers, together with an account of his conquest, and the state of that country, desiring his Majesty would confirm the magistrates he had appointed to govern it, with the grants of the conquered lands, and Indian staves he had made, to his soldiers. Among the rich jeweis Cortez sent to the emperor, it is faid, there was a fine emerald, of a pyramidal form, as large as the palm of a man's hand at the biggest end; a noble set of gold and silver vessels; several things cast in gold and silver, viz. beasts, birds, fishes, fruits, and flowers; bracelets, rings, pendants, and other ornamental pieces of plate and jewels; some of their idols, cotton vestments of their priests, surs, and feathers of various colours.

The general requested his Imperial Majesty to send over persons qualified to survey the country, that it might be improved to the best advantage, with priests and missionaries for the conversion of the people; as also cattle, with seeds and plants to improve the lands: but it is said, he provided particularly against the sending over physicians or lawyers. What could have been his reason against sending physicians is not easy to be conceived; but he had certainly all the reason in the world to desire that neither laws or lawyers should be admitted there, having determined to treat the natives as slaves, and seize both their persons and possessions, and, indeed, to usurp an arbitrary dominion over both Spaniards and Indians in the New World.

C H A P. VII

BRITISH ISLANDS IN THE WEST INDIES AND AMERICA.

GENERAL DESCRIPTION OF THE WEST-INDIES.

In the extensive gulph between the two continents of America lie a great number of islands, called by the general appellation of the West Indies. They are distinguished by seamen into the Windward and Leeward Islands, merely with regard to their situation either to the east or west. Some geographers distinguish them by the names of Great and Little Antilles, while others call them the Caribees, from their first inhabitants. They lie in a semicircular form, stretching from the coast of Florida to the main continent of South

America, near the river Oroonoko.

The climate of all the West-India Islands is nearly the same, allowing for those accidental differences which the several situations, and qualities of the lands themselves, produce. As they lie within the tropics, they are continually subject to an extreme of heat, which would be intolerable, if the trade wind, rifing gradually as the fun gathers ftrength, did not blow in upon them from the fea, and refreth the air in fuch a manner as to enable them to follow their necessary occupations even under the meridian fun. On the other hand, as the night advances, a breeze begins to be perceived, which blows finartly from the land, as it were from its center, towards the fea, to all points of the compass at once. By the same remarkable providence in the disposing of things it is, that when the fun has made a great progress towards the tropic of Cancer, and becomes in a manner vertical, he draws after him fuch a vast body of clouds, as shield them from his direct beams, and, diffolving into rain, cool the air, and refresh the country, thirsty with the long drought, which generally continues from the beginning of January till the latter end of May. These rains are rather floods of water poured from the clouds with vaft impetuofity: the rivers rife in a moment; new rivers and lakes are formed; and, in a short time, all the low country is under water. Hence it is, that the rivers which have their fources within the tropics, fwell and overflow their banks at a certain feafon. But fo miftaken were the ancients in their idea of the torrid zone, that they imagined it to be dried and fcorched up with a continual and fervent heat, and to be, for that reason, uninhabitable; when, in reality, some of the largest rivers in the world have their course within its limits; and the moilture is one of the greatest inconveniences

of the climate in feveral places.

The only diffinction of feafons in the West Indies arises from the rains. The trees are green the whole year round. They have no cold, no frost, no snow, and seldom any hail; but when storms of that kind happen, they are very violent, and the hail-stones are exceeding large and heavy.

No. 47.

It is in the rainy feafon that they are affaulted by hurricanes, the most terrible calamity to which the inhabitants of these islands are subject. One of these hurricanes destroys, at one stroke, the labours of many years, and baffles all the endeavours of the planter. It is a fudden and violent ftorm of wind, rain, thunder, and lightning, attended with a furious swelling of the fea, and fometimes with an earthquake; in fhort, with every circumflance which the elements can affemble, that is terrible and destructive. First, they fee as the prelude to the enfuing havock, whole fields of fugar-canes whirled into the air, and fcattered over the face of the country. The strongest trees are torn up by the roots, and driven about like flubble. Their windmills are fwept away in a moment. Their utenfils, the fixtures, the ponderous copper boilers, and ftills of feveral hundred weight, are wrenched from the ground, and battered to pieces. Their bouses are no protection, the roofs being torn off at one blaft; whilft the rain, which rifes five feet in an hour, rushes in upon them with irrefiftible violence.

The hurricane comes on either in the quarters, or at the full change of the moon. If it comes on at the full moon, the following figns precede it. That day you will fee the fky very turbulent; you will observe the fun more red than at other times; you will perceive a dead calm, and the hills clear of all those clouds and mists which usually haver about them. In the clefts of the earth, and in the wells, you hear a hollow rumbling found, like the rushing of a great wind. At night the stars seem much larger than usual, and surrounded with a fort of burs; the north-west sky has a black and menacing look; the sea emits a strong smell, and rises into vast waves, often without any wind; the wind itself now forsakes its usual steady easterly stream, and shifts about to the west, from whence it sometimes blows, with intermissions, violently and irregularly, for about two hours at a time. The moon herself is surrounded with a great bur, and sometimes the sun has the same appearance. These are signs which the Indians of these islands taught our planters, by which they can prognosticate the approach of an hurricane.

Sugar, the grand staple commodity of the West-Indies, was not known to the Greeks and Romans; though it was made in China in very early times, from whence we had the first knowledge of it: but the Portuguese were the first who cultivated it in America, and brought it into use as a luxury in Europe. It is not settled whether the cane from which this substance is extracted, be a native of America, or brought hither by the Portuguese from India and the coast of Africa: but however that may be, in the beginning they made the most, as they still do the best, sugar which comes to market in this part of the world. The juice within

the fugar came is the most lively, elegant, and least cloying sweet in nature; and which, sucked raw, has proved very nutritive and wholesome. From the molasses rum is distilled, and from the scummings of the sugar, a meaner spirit is procured. Rum finds its market in North America, where it is consumed by the inhabitants, or employed in the Indian trade, or distributed from thence to the fishery of Newsoundland and other parts, besides what comes to Great Britain and Ireland. The tops of the cane, and the leaves which grow upon the joints, make very good provender for cattle, and the resuse of the cane, after grinding, serves for fire; so that no part of this excellent plant is without its use.

When things are well managed, the rum and molasses are computed to pay the charges of the planta-tion, and the sugars are clear gain. However, the expences of a plantation in the West Indies are, doubtless, very great, and the profits, at the first view, precarious: for the chargeable articles of the windmill, the boiling, cooling, and distilling houses, and the buying and subsisting a suitable number of slaves and will not fuffer any man to begin a fugar plantation of any consequence, not to mention the purchase of the land, which is very high, under a capital of at least 5000l. Nor is the life of a planter, if he means to acquire a fortune, a life of idleness and luxury; at all times he must keep a watchful eye on his overseers, and even overfee himfelf occasionally. But at the boiling feafon, if he is properly attentive to his affairs, no way of life can be more laborious, and more dangerous to the health; from a conftant attendance day and night, in the extreme united heats of the climate, and fo many fierce furnaces: add to this, the loffes by hurricanes, earthquakes, and bad feafons; and then confider, when the fugars are in the casks, that he quits the hazard of a planter, to engage in the hazards of a merchant, and thips his produce at his own rifk. Notwithstanding these considerations, there are no parts in the world in which great fortunes are got in fo fhort a time, from the produce of the earth, as in the West Indies. The products of a few good featons generally provide against the ill effects of the worlt, as the planter is fure of a fpeedy and profitable market for his produce, which has a readier fale than perhaps any other commodity in the world.

The larger plantations are generally under the care of a manager, or chief overleer, who has a good falary, with overfeers under him in proportion to the extent of the plantation: fome plantations have a furgeon, at a fixed falary, employed to take care of the negroes which belong to it. But the course which is the least troublesome to the owner of the estate is, to let the lands, with all the works, and the stock of cattle and slaves, to a tenant, who gives security for the payment of the rent, and keeping up repairs and stock. The estate is generally estimated to such a tenant at half the net produce of the best years; such tenants, if industrious and frugal men, soon make good estates for themselves.

The negroes in the plantations are subsisted at a very easy rate. This is generally by allotting to each family of them a small portion of land, and allowing them two days in the week (Saturday and Sunday) to cultivate it: some are subsisted in this manner, but others find their negroes with a certain portion of Guinea and Indian corn, and to some a salt herring, or a small portion of bacon or salt pork per day. All the rest of the charge consists in a cap, a shirt, a pair of breeches, and a blanket, the whole not exceeding 40s. a year, and the profit of their labour yields 10 or 121. The price of men negroes, on their first arrival, is from 33 to 361, women and grown boys about 50s. lets; but such negro families as are acquainted with the business of the Islands generally bring about 40l. on an average one with another, and there are instances of a single negro main, expert in business, bringing 150 guineas; and the wealth of a planter is generally computed from the number of slaves he possess.

Traders here make a very large profit upon all they fell; but from the numerous (hipping conftantly arriving from Europe, and a continual fuccession of new adventurers, each of whom carries out more or less as venture, the West India market is frequently overstocked; money must be raised, and goods are sometimes sold at prime cost, or under. Those who can afford to store their goods, and wait for a better market, acquire fortunes equal to any of the planters. All kinds of handicrastimen, especially carpenters, bricklayers, braziers, and coopers, get very great encouragement.

Previous to our description of the British Islands in America, we shall present our readers with the following Table of the

JAMAICA.

JAMAICA, which is the largest of the British West Indian islands, was first discovered by the great Columbus in the year 1694, but at that time he did not attempt to make any settlement there. Some years after, in his fourth expedition, he was cast ashore here by a storm; the loss of his ships putting it out of his power to get away, he implored the humanity of the savages, and received from them all the help of a natural compassion: but these people, who planted only for their own necessities, were tired with maintaining strangers who put them in danger of starving by a famine, and therefore removed themselves insensibly from the neighbourhood. The Spaniards no longer kept any measure with the Indians, and soon grew so mutinous as to take up arms against their commander. Columbus, forced to yield to their threats to get out of a desperate situation, took the advantage of one of those appearances of nature where a man of genius sometimes finds a resource, pardonable through necessity. His astronomical knowledge informed him that there would soon be an eclipse of the moon; and

he defired from him When he proached t ed him and for it," fai God-who his most te moon red only the p refuling to lyceaseds ed: the f thought t mercy, at to them, had appea refume it rived from he could

he defired all the caciques to affemble together to hear from him some things very important to their fafety. When he was in the midft of them, after having reproached them for their cruelty with which they suffered him and his companions to perifh, "To punish you for it," faid he with an air of great importance, " the God whom I adore is going to inflict on you one of his most terrible strokes: this evening you will see the moon redden, grow dark, and refuse you light : this is only the prelude of your misfortunes, if you perfift in refusing to give me provisions." Columbus had hardly ceased speaking, when his prediction was accomplished: the fright was general among the favages: they thought themselves going to be destroyed, begged for mercy, and promised every thing. He then declared to them, that Heaven, touched with their repentance, had appealed its wrath, and that Nature was going to refume its courfe. After this moment provisions arrived from all parts, and Columbus had every thing he could wish for till his departure.

The court of Spain had granted the property of Jamaica to Columbus, who gave it the preference to all other parts, on account of its populousness and happy fituation: he called it the Sicily of the Indies, Diego his fon was the first governor of it, with the title of duke de la Vega, from the city of St. Jago de la Vega, founded by him, and which became its capital. Don Diego had caused about 100 Indians to go over from St. Domingo, under the conduct of Juan d'Efquimel; others foon followed them, but in a few years

after they all deferted the island.

The Spaniards had built feveral other cities here, but all their lettlements, erected on the dead remains of the Indians, fell to decay as fast as the depopulation increased; and as the ravagers were convinced the island produced no gold, they were foon reduced to that of St. Jago de la Vega, which then consisted of 1100 houses, four churches, and an abbey. The inhabitants of this city, plunged into that indolence which follows tyranny after devastation, contented themselves to live on some plantations, whose overplus they fold to the ships which passed by their coasts. The whole people of the ifland, collected into a finall territory which nourished this useless race of destroyers, was confined to 1500 flaves commanded by their tyrants; when the English coming at last to attack their capital, made themselves masters of it, and settled

there in 1655.

At first their new colony had only 3000 inhabitants, part of that fanatical militia which had fought and triumphed under the rebellious standard of Cromwell. They were foon joined by a number of royalifts, who went to America to meet with some alleviation for their defeat, and to enjoy the calm of peace. fpirit of division which had so long and so cruelly rent the two parties in Europe, followed them beyond the feas; there was enough to renew in the New World the fcenes of horror and bloodshed so often repeated in the Old: But admiral Penn and colonel Venables, after conquering Jamaica, had left the command to one of the wifeft and bravest men, who by good luck was the fenior officer: it was D'Oyley, a friend to the Stuarts. Cromwell twice substituted some of his party in his place, and both times their deaths restored D'Oyley to the head of affairs. His manner of ruling was quite military: he had to keep in order and govern an infant colony entirely composed of foldiers, and to prevent or repel the invations of the Spaniards, who might try to recover what they had just loft. But when Charles the second was reftored to the throne, a civil government was established at Jamaica, formed, like those in the other islands, after the model of the mother-country; but the first attempts were confined to compiling, without any method, Tome provisional regulations for the police, justice, and finances. It was not till 1682 that the body of the laws was formed by which the island is at prefent governed:
This colony was to increased after the Reformation,

that it contained 18,000 persons, who had almost no other trade but their depredations on the Spaniards. Sir Thomas Modiford, a rich planter of Barbadoes, was then governor, who came to Jamaica to increase his possessions; he introduced into this island the art of making fugar, and of planting cocoa trees; and erected falt works. His attention to encourage culture and industry could not make the people of Jamaica give up their maritime expeditions; adventurers of all kinds increased the croud of these romantic pirates, who often deserved the appellation of heroes, known by the name of Free-booters and Buccaneers: they infested the whole West Indian Sea, and laid waste all the coasts of the New World. The plunder of Mexico and Peru was always carried to Jamaica, both by the natives and strangers: they found in this island a greater felicity, received more protection and liberty than elsewhere, both to disembark and to spend, at their own pleafure, the booty they had acquired in their courses. There the extravagance of their debaucheries foon plunged them into diffress. This only fting of their cruel and bloody industry made them fly to new combats and to new prey. Thus the colony profited by their continual changes of fortune, and enriched itself by the vices which were the origin and ruin of their treasures: and when this lawless race was destroyed by its own activity, these same treasures became the base of a new opulence, by the help they offered to increase the plantations and productions, or to open a contraband trade with the Spaniards. On the whole, in whatever point of view any one confiders Jamaica, it will be found that England owes the pofteffion of it, as well as the means which determined the grandeur of its fettlement, to the Buccaneers.

This island extends from 75 deg. 57 min. to 78 deg. 37 min, west longitude, and from 17 deg. 48 min. to 18 deg. 50 min. north largude. It is about 140 miles in length, and 60 in breadth, where broadest; but being of an oval form, it grows narrower at each end. It is near about 36 leagues to Cuba, and 39 leagues to the west of St. Domingo: these two large islands defend it from the winds which defolate the Atlantic, whilft the number and disposition of its harbours put it in a condition to carry on a great trade with either these and the other islands of the West Indian Sea, or with the continent. There are about 16 principal harbours, besides 30 bays, roads, or good anchoring places. Though this situation may expose it to the infults of its too powerful neighbours, it at the fame time facilitates the entrance of the fuccours the mother-country has at all times lavished on it.

There is no country between the tropics where the heat is more moderate, being constantly cooled with refreshing breezes, frequent rains, and night dews : however, it is unwholesome, especially on the seacoast, and excessively hot in the mornings all the year round, till about eight o'clock, when the fea breeze begins, increasing gradually till about twelve, when it is commonly strongest, and lasts till two or three, when it begins to die away, and fo continues till about five o'clock, when it is quite fpent, and returns no more till next morning. About eight in the evening begins a land breeze, which blows four leagues into the fea, and continues increasing till twelve at night, after which it decreases till four in the morning, when it ceases, and returns again at night. The fea breeze is stronger at fome times than at others, and more fo near the coast than within land; whereas it is just the reverse with the land breeze. Sometimes the fea breeze blows day and night for a week or two. In December, January, and February, the north wind blows furioufly, checking the growth of the canes, and all other vegetables, on the north fide of the island; but the fouth fide is sheltered from them by the mountains.

The dews here are fo great within land, that the water drops from the leaves of the trees in the morning as if it had rained; but there are seldom any fogs, at least in the plain, or fandy places near the fea.

are expose fimple and from exam his native their spirit would oth as a bleffir rage and i transporter they fhall

There is a ridge of hills, called the Blue Mountains, that run through the island from east to west: the tops are covered with different kinds of trees, particularly cedar, lignum-vitæ, and mahogany, which render them equally pleasant and profitable to the inhabitants. Several fine rivers, well stored with fish, and navigable by canoes, take their rife from these mountains. A lower ridge runs parallel to the greater; and the vallies, or favannahs, are exceeding level, without stones, fit for passure, and fruitful, when cleared of wood, especially on the fouth fide of the island. After the rains, or feafons, as they are called, the favannahs are very pleasant, and produce such quantities of grass, that the

inhabitants are foretimes forced to burn it; but, after long droughts they are quite parched and burnt up.

Though the ifland abounds with rivers and lakes, water is very fearce in fome places, and in others fo mixed with find and fediment, that it is not fit for ufe till it is purified for some days in earthen jars; and, in fome years, many cattle perish for want of water. In the island are several salt springs, which form a salt river, and several lakes. Near the sea, as well as at Port-Royal, the well water is brackish and unwhole-

In the mountains, not far from Spanish Town, is a hot bath, of great medicinal virtue. It affords relief in the dry belly-ach, which, excepting the bilious and yellow fever, is one of the most terrible distempers of

Though the foil of Jamaica, in general, is exceeding fertile, yet it is thought not one fourth of the fugar ground upon the island is cultivated. Even the grounds lying near the rivers and the fea are, in many places, over-run with wood, infomuch that a planter who has planted 3 or 4000 acres, has feldom above 500 well cultivated.

The most valuable production of this island is sugar. The cane from whence it is extracted, is a kind of reed, which rifes commonly about eight or nine feet, taking in the leaves growing out of the top; and the most common thickness is from two to four inches. It requires a light, porous, and deep foil, and is usually cut at the end of eighteen months. Within 24 hours after the canes are cut down, they break them between two rollers of iron or copper, which are put in motion by a horizontal wheel, turned by oxen or horses. The juice, with which the inner part of the cane is filled, is received in a refervoir, from whence it is successively carried to feveral boilers, to reduce it into crystals. This liquor is called treacle, or molaffes. After the draining, they have mufcovada, or rough fugar, which is greatly, brown, and loft. This fugar does not become white, filning, and hard, till it is refined, which is generally done in Europe though there are two refining-houses at Kingfton. The molaffes are usually the result have of the walve of the result of the state. the twelfth part of the value of the fugar. A great deal of this article is confumed in the Northof Europe, and in North America, where they supply the place of butter and fugar to the common people. The Americans use them to produce a fermentation; and they give an agreeable taste to a drink called Pruss, which is nothing more than the infusion of the bark of a tree. These molaffes are likewife prodigiously useful, fince the secret has been discovered to convert them, by distillation, into a ipirituous liquor, known by the name of rum. The operation is performed by mixing one third of fyrup with two thirds of water. When these two subflances have sufficiently fermented, at the end of twelve or lifteen days they are put into a still, where the distillation is carried on with great facility. The annual exports of Jamaica in their feveral articles, the produce of fugar-canes, come to upwards of 100,000 hogheads of fugar, between 30 and 40,000 puncheons of rum, and 300,000 gallons of molaffes.

Afterfugar, the most considerable production of this iffand is Pimento, great quantities of which are annually exported. There are several kinds, more or less strong, and more or less acrid. The tree which produces that kind of pimento known by the name of Jamaica Pepper, was not cultivated in regular plantations till the year 1668. It commonly grows on the mountains, and rifes above 30 feet high. It is very straight, and covered with a grey, close, thining bark. The leaves are, in all respects, like the laurel; and at the end of the branches grow the flowers, to which fueceed berries a little larger than juniper. They are gathered green, and laid to dry in the fun, when they grow brown, and get that fpicy finell which has given to pimento the name of All-Spice. Its use is excellent in strengthening the cold stomach subject to crudities.

To the culture of pimento the people on this island join that of ginger. This is the root of a small plant about 18 or 20 inches high. It was greatly in vogue about the middle of the last century; but, fince that time, it has by degrees grown out of fashion, and is

now only a fecondary article of trade.

This island also produces a number of trees, shrubs, and ufeful plants, some of them natives of the foil, and others brought from the other illands of the continent. Among there are the following: the mahogany, the filk cotton tree, the dog-wood, the bitter wood, the baftard mammea, or Wood of St. Mary, and the lignum-vitæ. The trees are the oil-nut tree, the cocoatree, the tamarind-tree, and others which have their respective uses both for wood, convenience, and profit.

Here are likewise various forts of dying woods, gums, and medicinal drugs. Among the latter are guaiacum, china-root, farfaparilla, cassia, vanillas, aloes, and the wild cinnamon-tree, which is esteemed a fovereign re-medy for dispelling wind and affisting digestion.

The fruits of Jamaica are oranges, lemons, citrons, palms, pomegranates, shaddo:ks, momies, sour sops, papas, pine-apples, custard ditto, slar ditto, prickly pears, Alicada ditto, melons, plantains, tamarinds, and guavas, befides berries of several kinds.

This island also produces some tobacco, but of a coarse kind, and cultivated only for the sake of the negroes, who are fond of it; Indian and Guinea corn, with peas of various kinds, but none refembling those of Great Britain, except fuch as are reared with great care and tenderness in gardens, together with cabbages and a variety of roots, particularly caffava, of which they make bread, yams and potatoes.

The cattle of this island are but few: what they have are very small, and the flesh tough and lean. sheep, however, are tolerable, and their flesh very good; but the wool, which is long and full of hairs, is of little use. They have great plenty of hogs, and their flesh is sweet and delicate. Horses, asses, and mules are very plentiful: the former are fmall, mettlesome and hardy, and, when well made, setch a good price.

Here are various forts of fowl, both wild and tame, and in particular more parrots than in any of the other islands; besides parroquets, pelicans, snipes, teal, Guinea hens, geefe, ducks and turkies; the humming-bird, and a great variety of others.

In the bays and rivers is plenty of excellent fish; but the tortoile, or turtle, is by much the most valuable, both for its shell and fish, the latter being accounted the most delicious, and at the same time the most wholesome in all the Indies. The manatee, or seacow, which is often taken in calm bays, is reckoned by the Indians very good eating.
In the mountains are numberless adders, and other

noxious animals, and in the fens and marshes the gua-

na and gallewaip; but these last are not venomous.

The insects called the ciror, or chegoe, eat into the nervous and membranous parts of the flesh of the negroes; and the white people are fornetimes plagued with them. These infects get into any part of the body, but chiefly the legs and feet, where they breed in great numbers, and shut themselves up in a bag. As foon as the person feels them, which is not, perhaps, till a week after they have been in the body, they pick them out with a needle, or the point of a pen-knife, th

taking care to destroy the bag entirely, that none of the I friends and acquaintance. When a negro is about to breed, which are like nits, may be left behind. Thefe infects sometimes get into the toes, and eat the flesh to the bone.

The inhabitants of Jamaica confift of English, or Negroes, Mulattos, or their defeendants. The better fort of the English, on Sundays, or particular days, appear very gay. At other times they generally wear thread flockings, linen drawers, a veft, a Holland cap, and a hat upon it. Men fervants wear a coarse linear frock, with buttons at the neck and hands, long trowfers of the fame, and a check shirt. The negroes, except those who are immediately employed in domestic services, go naked. The morning habit of the ladies is a loole night-gown, carelessly wrapped about them. Before dinner they put off their dishabille, and appear with a good grace, in all the advantages of a rich and becoming drefs. There is no country in the world where luxury is carried to a higher pitch than in this island Equipages, clothes, furniture, tables, all bear the marks of the greatest affluence and profusion.

The common drink of persons in affluent circumstances is Madeira wine mixed with water, sherbet, or weak punch. Ale and claret are extravagantly dear; and London porter fells for more than is. per bottle. But the general drink, especially among those of inferior rank, is rum punch, which they call kill-devil, because, being frequently drank to excess, it heats the blood, and brings on fevers, which, in a fhort time, fend them to their graves, especially those who are just come to the ifland, which is the reason that so many die here foon after their arrival.

The current coin of the island is Spanish. hardly any place where filver is more plentiful, or has a quicker circulation. Notwithstanding provisions are, in general, tolerably reasonable, yet a person cannot dine decently for less than a piece of eight; and the

common rate of boarding is three pounds per week.

Learning is here at a very low ebb. There are, indeed, fome gentlemen well verfed in literature, and who fend their children to Great Britain, where they have the advantage of a polite and liberal education. But the bulk of the people take little care to improve their minds, being generally engaged in trade, or riotous diffipation.

The established religion here, as well as in all the British islands, is that of the church of England; but The bishop of London's comthere are no bishops. miffary is the principal ecclefiaftic in thefe iflands.

The administration of public affairs in this island is by a governor, who represents the king, a council of 12, and 43 representatives of the people. ment, next to that of Ireland, is the best in the King's

The mifery and hardfhips of the negroes in general are great; and though the utmost care is taken to make them propagate, the ill treatment they receive fo shortens their lives, that, instead of increasing by the course of nature, many thousands are annually imported, to fupply the place of those who pine and die by the hardships they receive. Many of them, however, who fall into the hands of humane mafters, find their fituations eafy and comfortable: and it has been observed, that in North America, where, in general, these poor wretches are better used, there is a less waste of negroes,

they live longer, and propagate better.

On their first arrival from the coast of Guinea, they are exposed naked to fale, and are then generally very fimple and innocent; but they foon become roguish from example. They believe every negroe returns to his native country after death. This thought cheers their spirits, and renders the burthen of life easy, which would otherwise be intolerable. They look on death as a bleffing; and it is furprifing to fee with what courage and intrepidity some of them meet it. They are transported to think their flavery is near at an end, that

expire, his fellow flaves embrace him, with him a good journey, and fend their hearty good wishes to their relations in Guinea. They make no lamentations when he is dead, but, with great joy, inter his body, believing he is gone home, and happy.

Jamaica is divided into three counties, Surry, Middlefex, and Cornwall. These contain 19 parithes, over each of which presides a magistrate called a Custos. There are but few towns in the island, and the reason is, that the greater part of the inhabitants are dispersed on their plantations, which form fo many villages or

hamlets. The following are the chief:

St. Jago de la Vega, commonly called Spanish-Town, in Middlefex, is a small city, pleasantly situated. It is the residence of the governor, of the courts of justice, and the place where the affembly is held. The greater part of the inhabitants are persons of fortune or rank, which gives it an air of iplendor and magnificence. The principal building is the governor's house, which is one of the most handsome in America. Here are also a handfome church, a chapel, and a Jewish fynagogue.

Between this town and that of Kingston, is Fort-Paffage, a village of but few houses, and so called, because those who go from one town to the other, land or

embark there.

Kingfton, in the county of Surry, is the most confiderable in the whole island, and at present the capital, being the refidence of the merchants, and the chief place for trade. It is about a mile and a half long, and half a mile broad. All the streets, which are broad and regular, cross each other at right angles. houses are much more elegant than those of St. Jago de la Vega, but the air is far from being so healthy. Jews, who are very numerous here, have a fine fyna-This town received confiderable damage by a dreadful hurricane, which happened in the month of August, 1781. Many houses were blown down, and numbers of veffels that lay in the harbour, as well as at Port Royal, were driven ashore, some of which were funk, and many others greatly damaged.

Kingston harbour is one of the most commodious in America, and so capacious, that 1000 fail of ships may ride in fafety. It is the station of the British fleet.

The fmall town of Port-Royal was the most considerable and richest on the island at the time of the Buccaneers, whose wages it encouraged. It contained at that time 2000 houses, of which 1600 were swallowed up, or overturned, by a terrible earthquake, that happened in 1692. They had rebuilt a great part of them, when they were confumed by a fire in 1703. cellence of the fituation engaged the people to rebuild them a fecond time, when a hurricane, in 1722, made them an heap of ruins. These were again raised, but again destroyed, in 1744, by another hurricane, but never rebuilt. In October, 1780, was a dreadful hurricane, which almost overwhelmed the little sea-port town of Savannah-la-Mar, and part of the adjacent country.

The commerce of this island is very considerable. The articles of exportation are fugar, rum, molaffee, cotton, coffee, pimento, ginger, medicinal drugs, mahogany, and manchineel planks. Those of importation are linen, filk and woollen cloathing of all kinds, wrought iron, brass and copper, all forts of hardware, toys, household furniture, and great quantities of flour.

To the north-west of Jamaica are three small islands dependent on this, and known by the name of the Caymans. The most foutherly is diftinguished by the name of Great Cayman: the other two, which are distant from it about 20 leagues, are called little Cayman and Cayman-Brack. Great Cayman is the only one that is confiantly inhabited: it is very low, and covered with high trees. It has not any harbour for thips of burthen, only a tolerable anchoring place on the fouth-west. The inhabitants, who amount to about 200, are descended from the old Buccaneers. They have given themselves they shall revisit their native shores, and see their old a set of laws, and choose a chief to see them executed, in conjunction with the justices of peace appointed by | commission from the governor of Jamaica. As they have no clergyman among them, they go to Jamaica to be married. This colony is undoubtedly the most happy in the West Indies; the climate and the kind of food, which are of a fingular falubrity, rendering the people healthy and vigorous, and making them live to a very advanced age. Their little island produces plenty of corn and vegetables, hogs and poultry, much beyond what is required for their own confumption. They have, befides, fugar-canes, and fome fprings of pretty good water. Being quite hardened to the fea, they are excellent pilots for the neighbouring coafts; and their ifland, as well as their activity and humanity, have been many times a relief to ships which were distressed in this part of the fea. Their principal employment is fifhing for turtle. Inflinct every year leads a prodigious number of turtles to these islands, to lay their eggs, the greater part of which come from the Bay of Honduras. The low and sandy shores of these islands, particularly of the Great, are perfectly commodious to receive and cover their eggs. A female lays fome hundreds. When they have done laying, the turtles retire towards the Isle of Cuba, and the other large islands, where they recover themselves in the submarine pastures, and, in about a month's time, acquire that fatness which makes them so much esteemed on the tables of the great. The inhabitants of Great Cayman shut them up, as foon as they are caught, in enclosures, which they call cralls, made with stakes, in a smooth water, between the shore and a reef of rocks on the norts-east coaft. These turtles serve for all the traffic which they carry on with Port-Royal. It is an article of food which is very wholesome, and the shelf of the hawk's-bill kind is a commodity which has a place among the exportations to Great Britain.

BARBADOES.

WHEN the English first landed here in 1625, hav-VV ing obtained a grant through the interest of the Earl of Carlisle, they found the island ouncultivated, and uninhabited. At first they applied themselves to the planting of tobacco, which not thriving as they expected, they planted cotton and indigo, which turned to a tolerable good account. Little fugar, however, was made till 1647, when other adventurers, living uneafy in England under the usurpation of Cromwell converted their estates into money, and transported themselves to Barbadoes, where they erected sugar-works, and acquired very great possessions. In the year 1650, the white inhabitants of the island were increafed to upwards of 30,000, with twice that number of negroes. King Charles II. purchased the property of the island in 1661, ever since which time it has been a royal government; and the colony granted a duty on their fugars for maintaining the forces and fortifications of the island.

Barbadoes, the most considerable of all the British fugar iflands next to Jamaica, lies in between 59 deg. 50 min. and 60 deg. 2 min. west longitude; and between 12 deg. 56 min. and 13 deg. 16 min. north lat. extending 21 miles from north to fouth, and 14 from east to west.

The climate is hot, especially for eight months in the year, but not unwholesome; for though there are no land breezes, there are others arifing from the fea, which increases as the fun advances to, and decrease as he declines from the meridian. A temperate regimen renders it as fafe to live in as any climate in Europe, fouth of Great Britain. The days are very near equal, the fun rifing and fetting about fix o'clock all the year

Barbadoes is, in general, a plain level country, with me finall hills. The woods have been all cut down fome fmall hills. to make room for the plantations of fugar-canes, which now take up the major part of the ifland, and render it the most valuable plantation to Great Britain, of its

fize, that it ever possessed. The foil is various, being in some places sandy and light, in others rich, and in others fpongy: but all of them are cultivated according to their feveral natures. The most valuable productions of this island are fugar, rum, molasses, cotton, indigo, and ginger. The rum which it produces is next in efteem to that of Jamaica.

The fruits here are various, and very plentiful; particularly pine-apples, guavas, plaintains, oranges, mons, citrons, limes, tamarinds, mangroves, cedars, prickled apples, pomegranates, papays, cuftard apples, Indian corn figs, bullies, cocoa, and cocoa-nuts. can be imported from North America cheaper than it can be fold for when growing upon the ifland.

Here are great quantities of hogs; also oxen, cows, horses, affes, goats, monkies, and racoons, with a few sheep and rabbits; but the mutton is greatly inferior to that of England.

The wild fowl are teals, curlews, plovers, fnipes, wild-pigeons, wild ducks, and a kind of bird called a man-of-war. The tame pigeons, pullets, ducks, and poultry of all kinds, that are bred in Barbadoes, have a man-of-war. fine flavour, and are accounted more delicious than

those of Europe. Infects are very numerous here, but they are not venemous; nor do either their fnakes or fcorpions ever

The furrounding fea abounds with fifth, fome of which are almost peculiar to itself, as parrot-fifth, fnappers, grey cavellos, tarbums, and coney-fish. Their mullets, lobsters, and crabs, are excellent; and the green turtle are caught here in vaft quantities.

This ifland has two treams that are called rivers on

each fide, with wells of good water all over it, and large ponds or refervoirs for rain water. In its center it is faid to have a bituminous fpring, which fends forth a liquor like tar, and ferves for the fame uses as pitch

The inhabitants of Barbadoes, like those of the other islands, may be divided into three classes, viz. the masters, the white servants, and the black servants. The former of these are either English, Scotch, or Irish, with fome Dutch, French, Portuguese, and Jews. The white fervants lead more easy lives than the common day-labourers in England; and when they come to be overfeers, their wages, and other allowances, are confiderable. As to the black fervants, it is the interest of every planter to be more careful of them than even of the white; the former, unless they should happen to be made free, being his perpetual property. Most of the negroes are employed in the field; but fome of them work in the fugar-mills and storehouses; while those of both sexes, who are most likely, are employed as housemaids and menial fervants. Every negroe family has a cabbin, and a fmall piece of ground adjoining to it, by way of garden, in which the more industrious fort plant potatoes, yams, and other roots, and rear live flock, which they are at liberty to eat, or convert into money for their own use. They are fond of rum and tobacco.

The governor of Barbadoes has a confiderable falary. The council confifts of twelve members, and the affeinbly of 22, chosen yearly, out of the several parishes, viz. two for each, by a majority of votes. Most of the civil officers are appointed by the governor, who also collates rectors to the parishes of the island. Their perquisites are very considerable. The church affairs of Barbadoes are governed by a furrogate of the bishop's appointment. There are upon the island some Jews and quakers, but very few other diffenters.

The inhabitants of this island support their own military establishment, which is respectable, with great

The ifland is divided into five diffricts. In each of the diffricts is a judge and five affiftants, who hold a court of common pleas every month, from January to September, and if any difficult matter arises, it is referred to the arbitration of the governor.

it is re-BridgeBridge-Town, the capital, is fituated on Carlifle-Bay, in the fouth-west part of the island, and has the best, or rather the only harbour in it. It is reckoned the finest and largest town in all the Caribbee Islands, if not in all the British West-Indian colonies. Bridge-Town takes its name from a bridge in the east part of it, erected over the waters that come from the neighbouring marshes; but a dreadful fire, which happened some years ago, destroyed a great part of it. It is the seat of the governor, council, and assembly, and also of the court of chancery. The governor's house is about a mile out of the town, which is not reckoned very healthy, on account of the neighbouring marshes. There are several forts and batteries about the town and

There is a college in the town, which was founded and liberally endowed by Colonel Codrington, who was a native of this illand.

With respect to the commerce of Barbaboes, the principal articles of exportation are aloes, cotton, ginger, sugar, rum, and molass. Those of importation are timber of various kinds, bread, slour, Indian corn, rice, tobacco, some salt beef and pork, sish, pulse, and other provisions, from the northern colonies; slaves from the coast of Africa; wine from Madeira, Tercera, and Fial, as also some brandy; beef and pork from Ireland; salt from Curassa; been all forts, broad cloth, kerseys, silks and stuffs, red caps, stockings, and shoes of all forts, gloves and hats, millenery ware and perriwigs, laces, peas, beans, oats, strong beer, pale ale, pickles, candles, butter and cheese, iron ware for their sugar works, leaden ware, powder and shot, brass and copper wares, &c.

This island, as well as Jamaica, fuffered the greatest calamities by the dreadful hurricane which happened in the month of October, 1780. The plantations were almost all destroyed; and Bridge-Town was reduced to a mere heap of ruins, scarce a building in it being left standing. No less than 11 parish churches, and 2 chapels, were levelled with the ground, among which was the fine church of St. Michael. The streets were covered with the ruins of the houses; and it was supposed that no less than 3000 persons perished. The ships in Carlisse Bay were driven out to sea, and several of them cast associated as not to be estimated; and the whole formed a scene more melancholy and deplorable than it is possible for words to describe.

ST. CHRISTOPHER.

THE Island of St. Christopher, called by mariners St. Kitt's, is situated in 17 deg. north latitude about 14 leagues from Antigua, and is about 20 miles long, and 7 broad. It had its name from Columbus, in his first voyage to America The French and English arrived here the same day in 1625, and divided the island between them. Three years after their settling, the Spaniards drove them out of it. They soon returned, and continued to live in harmony till 1666, when war being commenced between the two nations, St. Christopher became, at different periods, the scene of war and blood-shed for half a century. In 1702 the French were entirely expelled, and the peace of Utrecht confirmed this island to the English. In February, 1782, it was taken by the French, but restored again to Great Britain by the late treaty of peace.

The affemblage of a great number of high and barren mountains make St. Kitt's appear, to those who approach it by sea, like one huge mountain covered with wood; but they find, as they come nearer, that the coast grows more easy, as well as the ascent of the mountains, which, rising one above another, are cultivated as high as possible.

The climate of St. Christopher is hot, though, from the height of the country, much less than might be expected. The air is pure and healthy; but the island is subject to frequent storms, hurricanes, and earth-

quakes. The foil is, in general, light and fandy, but very fruitful, and well watered by feveral rivulets, which run down both fides of the mountains. The animals, vegetables, &c. are the fame with those of Barbadoes. The whole ifland is covered with plantations, whose owners (noted for the foftness of their manners) live in agreeable, clean, and convenient habitations, adorned with fountains and groves. Most of their houses are built of cedar, and the lands hedged with orange and lemon trees.

The most considerable town upon the island is Baffe-terre, formerly the capital of the French part: the other is called Sandy-Point, and always belonged to the English. There is no harbour : on the contrary, the furf is continually beating on the fandy shore at the few places fit to land, which not only prevents the building any quay or wharf, but renders the landing or fhipping of goods always inconvenient, and very of-ten dangerous. They have been, therefore, obliged to adopt a particular method to embark, or put the heavy goods, fuch as hogsheads of sugar or rum, on beard. For this purpose they use a small boat of a peculiar construction, called a moses: this boat sets off from the ship with some very active and expert rowers: when they fee what they call a lull, that is, an abatement in the violence of the furge, they push to land, and lay the fides of the moses on the strand; the hogshead is rolled into it, and the fame precautions are used to carry it to the ship. It is in this inconvenient and very hazardous manner, that the fugars are conveyed on board by fingle hogheads. Rum, cotton, and other goods that will bear the water, are generally floated to the ship both in going and coming.

The public affairs at St. Chriftopher's are administered by a governor, a council, and an affembly chosen from the nine parishes into which the island is divided, and which have each a large handlone church

which have each a large handsome church.

The Island of St. Christopher suffained great damage by a violent hurricane, which happened in the month of October, 1780. All the goods in the warehouses and cellars near the beach were totally destroyed, and upwards of 100 vessels were driven out to sea, many of which were lost, and the crews perished.

ANTIGUA.

A NTIGUA was discovered by Christopher Columbus, but not settled upon till the year 1632, when the English took possession of it. It is situated in 17 deg. north latitude, and is of a circular form, about 20 miles each way, and near 60 in circumference. It is more noted for good harbours than all the English islands in these seas, yet so encompassed with rocks, that it is of dangerous access in many parts, especially to those that are not well acquainted with the coast.

The climate is hotter than Barbadoes, and very fubject to hurricanes. The foil is fandy, and much of it overgrown with wood. There are but few fiprings, and not to much as a brook in the whole ifland; to that the principal dependance of the inhabitants arises from the water fupplied by cafual rains, which they save in cisterns.

The capital of Antigua is St. John, a regular built town on the western shore, with a good harbour of the same name, whose entrance is defended by Fort James. It is the residence of the governor-general of the Caribbee Leeward Islands, the place where the affembly for this island is held, and the port where the greatest trade is carried on. It was a very stourishing town before the fire in 1769. The best port in the island is English Harbour, on the south-side. At much trouble and expence, it has been made sit to receive the greatest ships of war. There are also a dock-yard with stores, and all the materials and conveniencies necessary to repair and careen. English Harbour is at a small distance from the town and harbour of Falmouth. There are, besides, Willoughby Bay, to the windward of English Harbour; Nonsuch Harbour, on the east

point; and the town and harbour of Parham, on the north fide; also a great number of creeks and finaller bays; but, in general, the shore being rocky, wherever the landing would be practicable, it is defended by forts and batteries; and there is commonly one regiment of regular troops quartered there for the defence of the island:

The governor-general, when he thinks proper, calls a general affembly of the reprefentatives of the other iflands. Antigua has, befides, a lieutenant-governor, a counfel, and its own affembly, composed of 24 members. It is divided into 6 parishes and 11 districts, of which 10 send each two representatives, and that of St. John four.

NEVIS.

NEVIS, which is no more than a vaft mountain rifing to a very confiderable height, is fituated about four miles to the fouth, of St. Christopher's. The foil is fruitful, and the staple commodity fugar, which ferves all the purposes of money. Here are sometimes violent rains and hurricanes, as in the other islands, and the air is everywhotter than that of Barbadoes.

On this island are many remarkable infects and reptiles, particularly the flying-tyger, the horn-fly, and a kind of finail called the foldier. The fea abounds with a variety of excellent fifth, as groopers, rock fifth, old wives, cavallies, welch-men, many fifth, wilks, cockles, lobsters, &c. Land-crabs are very common here; they are finaller than fea-crabs, and make little burrows, like rabbits, in the woods, towards the tops of the mountains. The only venomous creatures are fcor-

pions and centipedes.

They have plenty of asparagus here; and there is a tree called diddle-doo, which bears a lovely bloffom of the finest yellow and scarlet colours, and is esteemed a fovereign remedy in fome diforders. The liquorice bush runs wild along the stone walls of common fields, like the vine. The butter here is not good, and their new cheefe far worfe. The sheep have neither horns or wool, but are cloathed with finooth hair, and generally full of small red or black spots, resembling those of a fine spaniel. They breed twice a year, if not oftener, and generally bring two, three, or four lambs at a time, and, what is more extraordinary, fuckle them all. rams are of a pale red colour, with a thick row of long, ftrait, red hair hanging down from the lower jaw to the breaft, as far as the fore legs. The hogs, being fed with Indian corn, Spanish potatoes, and sugar-cane juice, are exceeding fweet food, white, and fat; as are the fowls and turkies, which are fed with the fame diet. The ground doves here are about the fize of a lark, of a chocolate colour, fpotted with a dark blue, their heads like that of a robin-red-breaft, and their eyes and legs of a most pure red. They have excellent game cocks and fierce bull dogs, besides large cur-dogs, but no hounds or spaniels.

Nevis was formerly much more flourishing than at present, and, before the revolution, contained 30,000 inhabitants. The invasion of the French about that time, and some epidemical disorders, have strangely diminished the number to what they then were.

Here are three tolerable roads or bays, on which are as many little towns, viz. Newcastle, Littleborough on Moreton-Bay, and Charles-Town the capital, with a fort called Great Fort, that defends the anchoring-place, where the governor, council and affembly meet: the last is composed of five members for each of the three parishes into which the island is divided.

Here, as in some of the other Caribbees, if a white man kills a black, he cannot be tried for his life for the murder; and all that he suffers is a fine of 30l. currency to the master for the loss of his slave. If a negro strikes a white man he is punished with the loss of his hand; and if he should draw blood, with death. A negro cannot be evidence against a white man.

The inhabitants have three public annual fasts, to

implore the Divine Protection against hurricanes; and if none happen in July, August or September, they appoint a public thanksgiving in October.

The trade of Nevis confifts in molasses, rum, and a

prodigious quantity of lemons.

This island, as well as the following, was taken by the French in the year 1782, but restored at the peace in 1783.

MONTSERRAT.

MONTSERRAT was discovered by Columbus in 1493. It lies in 16 deg. 37 min. north latitude, and 62 deg. 13 min. west longitude. It is 25 miles almost south south-east from Nevis; 20 west south-west from Antigua; 40 north west-from Guadaloupe; and 240 from Barbadoes. It is of an oval figure; about three leagues in length; the same in breadth; and 18 in compass. The Spaniards gave it the name of Montserrat from a fancied resemblance it bore to a mountain of that name near Barcelona in old Spain. It was settled in 1632 by Sir Thomas Warner, and taken in the beginning of the reign of Charles II. by the French, who restored it to England at the peace of Breda. The first settlers were Irithmen, and the present inhabitants are principally composed either of their descendants, or natives of Ireland.

The climate, foil, and produce of Montferrat are much the same as those of the other English Caribbee Mands. The mountains yield cedars, the cyprestree, the iron tree, with other woods, and some odoriferous shrubs. It is well watered and fruitful; and the planters formerly raised a great deal of indigo. The surrounding seas produce some hideous monsters, particularly two, which, from their remarkable ugliness, as well as the positionous quality of their slesh, are called sea devils. The lamanture, by some called the seacow, is found in this island, and generally at the entrance of fresh water rivers. According to the accounts we have of it, it is an amphibious animal; and lives mostly on herbage. Its slesh is reckoned very wholesome food, when salted; and they are so large

that two or three of them load a canoe.

The government of Montferrat is composed of a lieutenant-governor, a council, and an assembly of eight representatives, two for each of the four districts which divide the island.

Monferrat has not any harbour, only three roads, namely, at Plymouth (which is the chief town in the ifland) Old Harbour, and Ker's Bay, where the shipping and landing of goods is attended with the same inconveniences as in the island of St. Christopher.

BARBUDA.

BARBUDA is a small island in 18 deg. north lat. and 61 deg. 35 min. west long. 15 miles north-east of Montserrat; its length being about 20 miles, and its breadth 12. It is the property of the Codrington family, who have the appointment of the governor. Part of the estate arising from it, amounting, as is said, to 2000l. a year, with two plantations in Barbadoes, were bequeathed, in 1710, by Christopher Codrington Esq. governor and captain-general of Barbadoes, to the society for propagating the gospel, towards the instruction of the negroes, in the Caribbee Islands, in the Christian religion, and the erection of a college at Barbadoes, for teaching the liberal arts.

The land of this island lies low, but is fertile: the inhabitants apply themselves chiefly to the breeding of cattle, and raising provisions, with which they supply the neighbouring islands. Many of the commodities, however, which are raised in the other West India islands, may be also raised here, such as citrons, pomegranates, oranges, raisins, Indian figs, maize, cocoanuts, cinnamon, pine-apples, and the sensitive plant, with various kinds of woods and drugs, such as Brasil, ebony, pepper, indigo and the like. large ferpents on the island, but they are so far from being poisonous or noxious, that they destroy rats, toads and frogs; though the sting or bite of others is mortal, unless an antidote is quickly applied. On the west side of the island is a good well-sheltered road, clear from rocks and fands.

ANGUILLA

Is fituated in 19 deg. north lat. and 62 deg. 57 min. weft longitude, about 75 miles north-weft of St. Christopher's. It is very long and narrow, which induced the Spaniards to give it the name of Anguilla, or "Eel." It is so low and flat, that the French, who were there first, did not think it worth cultivating, or even keeping. The English adopted the same opinion when they took possession of it, and the island was a long time in their hands before they perceived the contrary. Within a few years, industry, and the indefatigable labours of the planters of Anguilla, have convinced them that their island produces not only all the necessaries of life, but, besides, many provisions which they sell to their neighbours, as well as sugar and cotton. The climate is very healthy, and the inhabitants strong and vigorous. Their exportations are sugar, rum, and cotton.

To the north of Barbuda are several small uninhabited islands. The most remarkable of them lies at six leagues distance, and is about a league long. It confists of an eminence, in which the Spanish discoveres, sinding some resemblance to a hat, they gave it the name of Sombrero, which it has always preserved.

of Sombrero, which it has always preferved.

To the west of Barbuda and Sombrero, after baving crossed a channel of eight leagues, begin the Virgin Islands. These take up a space, from east to west, of about 24 leagues long, quite to the eastern coast of Porto Rico, with a breadth of about 16 leagues. They are composed of a great number of isles, whose coasts, rent throughout and sprinkled with rocks, every where dangerous to navigators, are famous for shipwrecks, and particularly of several galleons. Happilly for the trade and navigation of these islands, nature has placed in the middle of them a large bason of three or sour leagues broad, and six or seven long, the finest that can be imagined, and in which ships may anchor land-locked, and sheltered from all winds. The Buccaneers called it The Virgins' Gangway; but its true name is The Bay of Sir Francis Drake, who first entered it in 1580, when he made his expedition against St. Domingo.

One of these islands is called The Tropic Keys, from the astonishing quantity of tropic birds which breed

One of their iflands is called The Tropic Keys, from the aftonishing quantity of tropic birds which breed there. Their birds are about the fize of a pigeon, but round and plump like a partridge, and very good to eat. Their plumage is quite white, except two or three feathers in each wing, which are of a clear grey. Their beaks are short, thick, and of a pale yellow. They have a long feather, or rather quill, about seven inches long, which comes out of their rump, and is all the tail they have. They obtained their name from not having been ever seen but between the tropics

The Virgin Islands are all of them small, and the greatest part uninhabited.

DOMINICA.

THIS island was discovered by Columbus, who called it Dominica, because he first saw it on a Sunday. It is situated in 16 deg. north latitude, and 62 deg. west longitude; lies about half way between Guadaloupe and Martinico; and is about 28 miles in length, and 13 in breadth. The soil is thin, and better adapted to the rearing of costee than sugar: but the sides of the hills bear the sinest trees in the West Indies; and the whole island is well supplied with rivulets of sine water. Here, as in some other of the Caribbees, is a sulphur mountain, and hot spring, equal, in salubrity, to those of Bath, in England; and the sine sruits, particularly

the pine-apples, are superior to any that grow on the French islands. At the north-west end of the island is a deep, spacious, sandy bay, called Prince Rupert's, which is well secured from the winds by mountains on all sides.

The most distinguished place in this island is the town of Roseau, situated on a spacious harbour. The houses are low and irregularly placed; and the town is sheltered by the circumjacent mountains, some of which rise to a considerable height. The most advantageous view of the town is from the bay or harbour, where ships of considerable size ride at anchor with the greatest fafety.

The French have ever exerted their efforts to prevent the English from settling on this island, as it must cut off their communication, in time of war, between Martinico and Guadaloupe. By the treaty, however, in 1763, it was ceded to the English; afterwards taken by the French, in 1778, and restored to Great Britain in 1782.

ST. VINCENT.

ST. Vincent, fituated in 13 deg. north latitude, and 61 deg. weft longitude, is about 24 miles in length, and 18 in breadth, lying about 50 miles north-weft of Barbadoes. Out of the ridge of mountains, which crofles it from fout to north, rife a great number of rivers, which are well flored with fish. These mountains are, in general, of an easy ascent; and the vallies and plains, some of them of a large extent, are exceeding fertile, producing most of the necessaries of life, particularly sugar, cosee, cocoa, and anatta.

When this island was ceded to Great Britain, by the treaty of Versailles in 1763, there was a great number of a mixed breed of the ancient Caribbees, and of ship-wrecked or runaway negroes; but these have been all

long fince exterminated.

The most remarkable place in St. Vincent's is Kingstown, situated on a bay of the same name at the southwest end of the island. It is the residence of the governor, and the place where the affembly meet. About three miles from Kingstown, towards the south-east, is the town of Calliagua, whose harbour is the most considerable in the whole island.

GRENADA, AND THE GRENADINES.

GRENADA is fituated in 12 deg. north latitude, and 62 deg. west longitude, about 30 leagues south-west of Barbadoes, and almost the same distance north of New Andalusia, or the Spanish Main. This island is about 30 miles long, and 15 broad. The climate is good, and the soil rich and fertile, and particularly adapted for producing sugar, cosse, tobacco, and indigo. A lake on the top of a hill in the middle of an island, supplies it plentifully with sine rivers, which adorn and fertilize it. Several bays and harbours lie round the island. Some of these may be fortissed with great advantage, which renders it very convenient for shipping; and it has the happiness of not being subject to hurricanes. St. George's bay has a sandy bottom, and is extremely capacious, but open. In its harbour, or careening-place, 100 large vessels may be moored with perfect safety.

Near Grenada is a cluster of small islands, called the Grenadines. These islands produce very fine timber, sugar, indigo, tobacco, pease, millet, but the cocoatree does not thrive so well in them as in the other islands. These islands were all discovered by Columbus, but never settled by the Spaniards. The French sirst established a colony here, but were disturbed by the natives, who carried on a long and bloody war with their invaders. At length, however, they were compelled to submit to superior force, and then the settle-

ments of the French rapidly increased.

In the laft war but one, when Grenada was attacked by the English, the French inhabitants, who were not very numerous, were so amazed at the reduction of Gaudaloupe and Martinico, that they lost all spirit, and surrendered without making the least opposition; and the full property of this island, together with the Grenadines, were confirmed to the crown of Great Britain by the treaty of peace in 1763. But in July, 1779, the

In the laft war but one, when Grenada was attacked by French made themselves masters of it; though it was a English the French inhabitants, who were not very reftored by the treaty of 1780.

The Island of Grenada, with all those adjoining to it, sustained considerable damage by a dreadful hurricane that happened in the month of October, 1780. Many of the houses were levelled with the ground, the plantations destroyed, and several ships which lay in the harbour totally lost.

CHAP. VIII.

BRITISH AMERICAN ISLANDS.

AVING described the British Islands in the West-Indies, we shall next survey the other American Islands belonging to us, which are situated in different parts of the ocean; and as we shall begin at the northern extremity, Newsoundland will first engage our attention.

NEWFOUNDLAND.

THIS island, which was discovered by Sebastian Cabot, in 1507, is situated to the east of the Gulph of St. Lawrence, between 46 and 52 deg. north latitude, and between 53 and 59 deg. west longitude. It is about 350 miles in length, and 200 in breadth; and is bounded on the north by Belleisle Strait, on the fouth and east by the Atlantic Ocean, and on the west by the Gulph of St. Lawrence. It has many excellent harbours. The climate of Newsoundland is intolerably hot in

fummer, and intenfely cold in winter. For four or five months in the winter the ground is covered with fnow, frozen as hard as crystal. The southern and eastern coasts seldom enjoy a very serene sky, from their neighbourhood to the Great Bank, which is almost constantly covered with a thick fog; but in the northern and western parts the sky is very clear, both in summer and The foil is, in general, barren. Most of the meadows and vales produce nothing but a kind of moss. Many fpecies of timber, however, grow here in the utmost perfection; and the firs are as fit for masts as those of Norway. There are some fruitful spots, and a kind of rye which grows naturally without culture, and is very nourifhing, with wild ftrawberries and rafp-berries. The ifland abounds with wild fowl, deer, hares, rabbits, foxes, fquirrels, bears, beavers, wolves, otters, and other quadrupeds; and the sea is plentifully stocked with different kinds of delicious fish, besides cod, the staple commodity. It is certain, however, that the inhabitants would be in the utmost distress for bread, and many other necessaries, but from the exports thither from the mother country, or the continent of America, from which they have almost every thing, except fish, venison, and wild fowl.

The value of Newfoundland confifts in the trade for fifth, of which there is fuch plenty on the coafts of the ifland, that the whole world almost might be supplied from it, all forts being taken in immense quantities: but the principal fishery is of cod, wherewith a great number of ships are laden every year, for England, France, Spain, Portugal, Italy, and other parts. The main fishery is on the Great Bank, and the other banks about this island, as also along the coast. The Great Bank is a vast mountain under water, extending, in length, according to the most accurate sea-charts, from the 41st deg. of north latitude, to 49 deg. 25 min. and, in breadth, from 42 deg. 30 min. to 51 deg. 30 min. of west longitude. Its depth of water is from 5 to 60 sathoms. This bank is covered with a vast quantity of shells, and several kinds of fish of all fizes, most of which serve for food to the cod-fish, whose number is immense. Great numbers of vessels have loaded here an nually for two centuries, yet this vast consumption has produced no very apparent diminution of their numbers.

The Green Bank is about 120 miles long, and about 50 over where broadest. It lies off the fouth coast of Newfoundland. There are several other banks, but they are not considerable enough to deserve particular

The Great Strand, or drying-place for fish, which is about a league in extent, lies between two steep hills, one of which is separated from the Strand by a small rivulet, which forms a kind of lake, called the Little Bay, abounding with salmon. The Great Strand may contain at once wherewithal to load 60 ships. There is another lesser Strand for the use of the inhabitants, who sish all along the coast. The sishing season is from Spring to September. All the train oil that comes from Newsoundland is drawn chiefly from the livers of the cod. The principal towns are Placentia, Bonavista, and St. John.

The Indians, or natives, of this island, are said to be a gentle, mild, tractable people, easily gained by civility and good usage. They paint their bodies, and, in winter, are clad in skins and surs.

The following is the process in catching the fish, preparing them, &c. The cod is caught with a har-poon, the best bait being a little fish, called capelau, but, for want of this, they formetimes make use of the intestines of the cod itself. As soon as the sisherman has caught a fifh with his line, he pulls out its tongue, and gives the fish to another man, whom they call the beheader. This man, with a two-edged knife, like a lancet, flits the fish from the vent to the throat, which he cuts across to the bones of the neck: he then lays down his knife, and pulls out the liver, which he drops into a kind of tray, through a little hole made on purpose in the scaffold he works upon, he then guts it, and cuts off the head. This done, he delivers the fish and cuts off the head. This done, he delivers the fifth to the next man, who ftands over against him. This man, who is called the flicer, takes hold of it by the left gill, and refts its back against a board, a foot long, and two inches high: he pricks it with the flicing knife on the left fide of the vent, which makes it turn out the left gill: then he cuts the ribs, or great bones all along the vertebræ, about half way down from the neck to the vent, he likewife does the fame on the right fide; then cuts aflant three joints of the vertebræ through to the spinal marrow; lastly, he cuts all along the vertebræ and spinal marrow, dividing them into two; and thus ends his operation. A third helper then takes this fish, and, with a kind of wooden spatula, scrapes all the blood that has remained along the vertebree that were not cut. When the cod is thus thoroughly cleanfed (fometimes washed) he drops it into the hold, through a hole made for that purpose, and the salter is there ready to receive it. This affistant crams as much salt as he can into the inner part of the fish, lays it down, the tail end lowest, tubs the skin all over with salt, and even covers it with more falt; then goes through the same process with the rest of the cod, which he heaps up one upon another till the whole is laid up. The fish, thus falted and piled up in the hold, is never meddled with any more till it is brought home and unloaded for

in some few particulars.

This island, after various disputes, was ceded to England in 1713; but the French were left at liberty to dry their nets on the northern shores. By the treaty of 1763, they were permitted to fish in the Gulph of St. Lawrence, on condition that they did not approach within three leagues of any of the coasts belonging to Great Britain. The small islands of St Pierre and Miquelon, to the fouth of Newfoundland, were ceded to the French by the fame treaty, for curing their fish; but they engaged not to erect any fortifications, and to keep only 50 foldiers to enforce the police. By the last treaty of peace, the French are to enjoy the fisheries on the north and west coasts of Newfoundland.

CAPE BRETON.

THIS island is fituated in the Gulph of St. Lawrence, between 45 and 57 deg. north latitude, and between 61 and 62 deg. weft longitude, being about 100 miles long, and 80 broad. It lies about 20 leagues fouth-weft from Newfoundland, and is separated by the Strait of Causo from Nova Scotia. The north coast is high, and almost inaccessible; but the south coast contains feveral excellent harbours, more particularly that of Louisburgh, one of the finest in America. The climate here is much the fame with that of Quebec, only more fubject to fogs. The air, however, feems to be pretty wholefome.

The island abounds with lakes and rivers, coals, and lime-stone; and though there are many barren spots in it, apples, pulse, wheat, and other corn, flax and hemp, are, or may be raifed in it. The most common trees are oaks of a prodigious fize, pines fit for mafts, ash, maple, plane, and aspin trees. There is no oc-

anh, mapie, plane, and airlin trees. There is no occasion for digging deep, or draining the waters, to come at the coals here, as in other countries.

Of animals there are horses, hogs, oxen, sheep, goats, and poultry, on the island, but game is scarce. The partridges are almost as big as pheasants, and not unlike them in the colour of their feathers. The guantities of each and the scale on the coals is almost over the scale of th tities of cod and other fish on the coast is almost incredible; and there are numbers of whales, fea-wolves,

porpoifes, and feals.

The French began a fettlement on this island in 1714, which they continued to increase, and fortified it in They were distressed by the English in 1745; but reinstated by the treaty of Aix-la-Chapelle, in 1748. It was afterwards reduced in 1758, by the British troops and feamen, under General Amherst and Admiral Boscawen. It was ceded to the crown of Great Britain by the treaty of 1763, fince which the fortifications of Louisburgh have been demolished. There are feveral finall islands lying round Cape Bre-

ton, particularly those of St. Peter and Madame, or

Maurepas.

ST. JOHN.

THE Island of St. John is also situated in the Gulph of St. Lawrence, about 40 miles north-west of Cape Breton, in between 45 and 47 deg. of north lat. being about 60 miles in length, and upwards of 30 in breadth. The air is clear and healthy, and the foil in most places rich, producing Indian corn, and a great variety of garden plants. Great part of the country was cleared, and so well improved, by the French, that it was called the Granary of Canada, from its sup-plying that colony with corn. The animals are the plying that colony with corn. The animals are the same as in Cape Breton. It abounds in excellent

This island was ceded to the crown of Great Britain by the treaty of 1763.

THE BERMUDAS, OR THE SUMMER ISLANDS.

HESE are a cluster of very small islands, and were discovered by John Bermudez, a Spaniard, from whom they received their first name, as they did their fecond from Sir George Summer, who was cast away upon them in 1609, fince which they have belonged to Great Britain. They are fituated in the Atlantic Ocean, in 32 deg. north latitude. They have a clear temperate air, with plenty of flesh, fish, poultry, fruits, herbs, roots, &c. The climate, however, of late years, is altered for the worse. Cedars grow here, ambergris is found on the shores, and whales and turtles are caught on the coast. Here is a breed of black hogs which are much valued. White chalk-stones and tobacco are exported. Oranges and palmettos abound; and many things are found in great plenty, water excepted; for the inhabitants have none but what falls from the clouds.

The chief island is St. George, which takes its name from George-Town, and is a pleafant place, 16 miles in length, and three in breadth, and contains handsome buildings. The chief employment of the inhabitants

is building fmall veffels.

These islands are thus described by Waller, the celebrated poet, who refided here during the civil wars of England.

BERMUDAS wall'd with rocks; who does not know That happy island, where huge lemons grow, And orange trees, which golden fruit do bear; Th' Hesperian gardens boast of none so fair; Where shining pearl, coral, and many a pound, On the rich shore, of ambergris is found. The lofty cedar, which to heav'n aspires, The prince of trees, is fewel for their fires; The fmoak by which their loaded fpits do turn, For incense might on facred altars burn; Their private roofs on odorous timber borne, Such as might palaces for kings adorn. Their fweet palmettos a new Bacchus yield, With leaves as ample as the broadest shield; Under the shadow of whose friendly boughs, They fit caroufing where their liquor grows. Figs there unplanted thro' the field do grow, Such as fierce Cato did the Romans shew, With the rare fruit inviting them to spoil Carthage, the mistress of so rare a soil. The naked rocks are not unfruitful here, But, at fome constant seasons ev'ry year, Their barren tops with luscious food abound, And with the eggs of various fowl are crown'd. Tobacco is their worst of things, which they To English landlords as their tribute pay. Such is the mould that the bleft tenant feeds On precious fruits, and pays his rent in weeds. With candied plantains and the juicy pine, On choicest melons and sweet grapes they dine, And with potatoes fat their wanton fwine. Nature these cates with such a lavish hand Pours out among them, that our coarfer land Taftes of that bounty, and doth cloth return, Which not for warmth, but ornament, is worn: For the kind fpring, which but falutes us here, Inhabits there, and courts them all the year. Ripe fruits and bloffoms on the fame trees live; At once they promise what at once they give. So fweet the air, fo moderate the clime, None fickly lives, or dies before his time.

THE BAHAMAS, OR LUCAYA ISLANDS.

HESE islands are situated in the Atlantic Ocean, to the north of the Island of Cuba, and not far from the coast of Florida, stretching from the north-west to the south-east, between 21 and 27 deg. north latitude, and between 73 and 81 deg. west longitude. They are

very numerous, and twelve of them pretty large. Bahama, which is the largest, being about 50 miles in length, though very narrow, and gives name to the rest; lies 25 leagues from the continent of Florida. It enjoys a ferene temperate air, with a fruitful foil, well watered every where with fprings and rivulets

Though these were the first lands discovered in America by Columbus, the Spaniards never thought of fet-tling in them. The English knew nothing of them till 1667, when Captain William Seyle, being bound to Carolina, was forced among them by a ftorm, which gave him an opportunity of examining them carefully, particularly that which at prefent is known by the name of Providence. At his return he reported the benefit they might be made of to the state; upon which grants of them were made out to proprietors, called the Bahama Company; but the government was referved in the hands of the crown.

The Straits of Bahama, which the British fleet so happily cleared in the last expedition against the Havannah, are well known to navigators, for the danger and difficulties that attend the paffing them.

These islands lie near to Hispaniola, and to the noted port of the Havannah, in the Island of Cuba, where the Spanish galleons and flota always rendezvous before they return to Europe, having the Gulph of Florida to the west, and the Windward Passage to the east of them. In times of peace they are capable of great improvement in point of trade, and have always been a good retreat for difabled ships, blown from different parts of the continent of America. In times of war, the British cruizers and privateers, flationed at the Bahama Islands, are more capable to obstruct and annoy the Spanish trade, homeward bound, than any that are stationed at the rest of the British colonies in America.

The Bahamas were captured by the Spaniards during the last war, but they were retaken by the British arms

FALKLAND ISLANDS.

THESE iflands were first discovered by Sir Richard Hawkins in 1594, the principal of which he named Hawkins Maidenland, in honour of Queen Elizabeth. The prefent English name of Falkland was probably given them by Captain Strong, in 1639, and being adopted by Halley, it has from that time been received in our maps.

In the year 1764 the admiralty revived the scheme of a settlement in the South Seas, and Commodore Byron, who was fent to take possession of Falkland Islands in the name of his Britannic Majesty, in his journal reprefents them as a valuable acquisition. On the other hand, they are represented by Captain Macbride (who in 1766 fucceeded that gentleman) as the outcasts of nature. "We found (fays he) a mass of islands and broken lands, of which the foil was nothing but a bog, with no better prospect than that of barren mountains, beaten by storms almost perpetual. Yet this is summer; and if the winds of winter hold their natural proportion, those who lie but two cables length from the shore, must pass weeks without having any communication with it." The plants and vegetables which were planted by Mr. Byron's people, and the fir-tree, a native of rugged and cold climates, had withered away. But the goats, theep, and hogs, that were carried thi-ther, were found to thrive and increase as in other places. Geefe, of a fifty tafte, fnipes, foxes, fea-lions, penguins, plenty of good water, and, in the fummer months, wild celery and forrel, are the natu-ral productions of these parts.

Falkland Islands can hardly be deemed British, as they feem to have been rather abandoned by the English, in order to avoid giving umbrage to the court of

Spain.

CHAP. IX.

THE FOX ISLANDS.

INDER the general denomination of the Fox | roof of these caves is a kind of wooden grate, which is Islands (which were discovered by a Russian navigator) are comprised the Island of Ooneemak, Oonanska, Amoghta, Saivooghan, Arnluk, Acootan, Ooneila, Ataka, Kannaton, and Onoolashka. Of the latter we have given a particular description from the account of our much-efteemed countryman Captain Cook.

This group of islands (called by the Russians, Lyssie Astrova, or Fox Islands, from their abounding in foxes of divers colours) lies in about 42 deg. north latitude, and 150 deg. west longitude. The winters are milder here than in the more eaftern climes, and continue, in general, only from the beginning of November to the end of March. The produce is, underwood, and small fhrubs and plants, for the most part fimilar to those found in Kamtschatka. Warm springs and native sulphur are to be found in some parts.

Great numbers of fea animals, as fea lions, fea bears, and fea otters, refort to the shores. The foxes, during the day, lie in caves and cliffs of rocks. Towards the evening they come to the shore in fearch of food. They have long ago extirpated the brood of mice, and other finall animals. They are not in the least afraid of the natives, but distinguish the Russians by fcent, having found the effects of their fire arms.

The Fox Islands are, in general, populous. natives live in feparate communities, composed of fifty, and fometimes of two and even three hundred perfons. Their habitations are in large caves from 40 to 80 yards long, from 6 to 8 broad, and from 4 to 5 high. The first spread over with earth. In the top are several openings, through which the inhabitants go up and down by means of ladders. In each cave is a number of partitions, appropriated to the feveral families, and these partitions are marked by means of stakes driven into the earth. The men and women fit on the ground, and the children lie down, having their legs bound together under them, in order to make them learn to fit upon their hams.

These caves are generally so warm, that both sexes often sit naked. The natives obey the calls of nature openly, without deeming it indecent. They wash themselves first with their own urine, and afterwards with water. In winter, and when they want to warm themselves, especially before they go to sleep, they set fire to dry grass, and walk over it.

Their habitations being almost dark, they use, particularly in winter, a fort of large lamps made by hollowing out a stone, into which they put a rush wick, and burn train oil.

With respect to their persons, the natives have black hair, flat faces, and are of good stature. The mea shave, with a sharp stone or knife, the circumference and top of the head, and let the hair which remains hang from the crown. The women cut their hair in a strait line over the forehead. Behind they let it grow to a considerable length, and tie it in a bunch. Some of the men wear their beards, others shave or pull them out by the roots. They mark and colour their faces with different figures. They make three incisions in AMERICA]

The men umference a remains ir hair in et it grow h. Some pull them their faces acifions in

the under lip. They place in the middle one a flat bone, or a fmall coloured ftone: in each of the fide ones they fix a long, pointed piece of bone, in fuch a manner as to keep the noftrils extended. They also pierce holes in their ears, and wear in them what little ornaments they can procure.

The men wear a kind of shirts made of the skins of cormorants, sea-divers, and gulls; and, in order to keep out the rain, they have upper garments of the bladders and intestines of divers sea-animals. Some of them wear common caps, of a party-coloured bird skin, upon which they leave part of the wings and tail. On the fore part of their hunting and silhing caps they place a small board like a screen, adorned with the jaw-bones of sea bears, and ornamented with glass beads, which they receive in barter from the Russians. At their festivals and dancing parties they wear a much more showy fort of caps.

The womens dress is made of the skins of sea otters, and sea bears. These skins are dyed with a fort of red earth, and neatly sewed with sinews, and ornamented with various stripes of sea otter skins and leathern fringes. They have also upper garments, made of the intestines of the largest sea calves and sea lions.

Their food chiefly confifts of fish, and other sea animals, and they generally eat it raw. When they dreis their food they use a hollow stone. Having placed the fish or sless their, they cover it with another, and close the chink with lime or clay. They then say it upon two stones, and light a fire under it. The provision which is intended for keeping is dried in the open air, without salt. Their greatest delicacies are wild lilies and other roots, together with different kinds of berries. They eat at any time of the day without distinction; but, in cases of necessity, are capable of sast-ing several days together.

They do not understand the art of distilling brandy, or any strong liquors; but are very fond of tobacco and fnuss, which the Russians have introduced among them.

They feed their children, when very young, with the coarsest flesh, and for the most part raw. If an infant cries, the mother immediately carries it to the sea side, and, whether summer or winter, holds it naked in the water untill it is quiet. This custom is so far from doing the children any harm, that it hardens them against the cold; and they accordingly go bare-stooted through the winter, without the least inconvenience. They are also trained to bathe frequently in the sea; and it is an opinion generally received among the islanders, that by such means they are rendered bold, and become fortunate in sishing.

No traces are found of any religious worship amongst

No traces are found of any religious worship amongst them. Several persons, indeed, pass for forcerers, and are held in high efteem, but without receiving any emolument. Filial duty and respect towards the aged are not held in estimation by these people. They are not, however, deficient in sidelity to each other; and are of lively and chearful tempers, though rather impetuous, and prone to anger. Notwithstanding their favageness they are very docile; and the boys, whom the Russians keep as hostages, soon acquire a knowledge of their language.

Marriage ceremonials are unknown among them. Each man takes as many wives as he can maintain, but the number feldom exceeds four. These women are occasionally allowed to cohabit with other men; and they and their children are not unfrequently bartered in exchange for other commodities.

Feafts are very common among these islanders, and particularly when the inhabitants of one island are visited by those of another. The men of the village meet their guests beating drums, and preceded by the women, who sing and dance. This done, the guests sit down to partake of the fare provided for them; after which the diversions are introduced by the children, who dance and caper at the same time, making a noise with their small drums, while the owners of the hut, of both sexes, sing. Next follow the men almost naked, tripping after one another, and beating drums of a larger size. These are relieved by women, who dance in their cloaths, while the men sing and beat their drums. Those of the male natives who have several wives, do not withold them from their guests; but where the host has no more than one wise, he makes the offer of a female servant.

The month of November is chiefly employed by these islanders in hunting, by which they obtain the skins of sea bears for their cloathing. In the spring shey kill old sea bears, sea lions, and whales. In calin weather, both in summer and winter, they row out to sea, and catch cod and other fish. Their hooks are made of bone, and their lines of long tenacious seaweed, which, in those seas, are sometimes sound near 160 yards in length.

They have two forts of veffels: the larger are leathern boats, or baidars, which have oars on both fides of them, and will hold 30 or 40 people: the finaller are rowed with a double paddle, and will contain but two at most. In these, however, they pass from one island to another; and sometimes do not scruple to yenture out to sea in them to a very considerable distance.

Strangers are not permitted to hunt or fifh near a village, or to carry off any thing that is fit for food: therefore, when their provisions are quite exhausted on a journey, they are compelled to beg from village to village, and call upon their triends and relations for affishance.

. The natives of these islands are very seldom engaged in war, either among themselves or with their neighbours. When it so falls out, and they happen to get wounded, they apply a kind of yellow root to the wound, and fast for some time. For relief in the head-ach they open a vein in that part, with a lancet made of some

Their weapons are bows, arrows, and darts. The latter they throw with great dexterity, and a very confiderable diffance. For defence of their persons they use wooden shields, which they call kuijakin. When they want to glue the points of their arrows to the shaft, they strike their noses pretty hard till they bleed, and use the blood as glue.

As these islanders have neither law or judge, the most atrocious crimes, and even murders, are suffered to pass unpunished.

Their funeral ceremonies, which are very fingular, are as follow. When a poor person dies, the body is wrapped either in their own cloaths or mats, then laid in a grave, and covered over with earth. The bodies of the rich are bound round with thongs, and afterwards put in a kind of wooden cradle, supported by poles, which are placed cross-ways, and are exposed to the air until they fot. The surviving relations and friends express their grief, upon these occasions, by bitter lamentations.

MARKE

SPANISH WEST-INDIA AND AMERICAN ISLANDS.

CUBA.

THIS ifland was discovered by Columbus in 1492. He had but a flight view of it, yet it proved fatal to the natives; for they having prefented him with gold, fome pieces of which he carried into Spain, it occasioned an immediate resolution to settle in it, which

was accordingly effected in 1511.

The Island of Cuba extends in latitude from 20 deg. 20 min, to the tropic of Cancer; and from 74 deg. to 85 deg. 15 min. west longitude. It is about 700 miles in length from east to west, but very narrow in proportion, not being above 70 in breadth. It lies 60 miles to the west of Hispaniola, 25 leagues to the north of Jamaica, 100 miles to the east of Jucatan, and as many to the fouth of Cape Florida. It commands the entrance of both the Gulphs of Mexico and Florida, and the Windward Paffage; fo that the Spaniards, who are the only poslessors of it, may, with a tolerable fleet, not only fecure their own trade, but annoy their

In Cuba there are no winters; but in the months of July and August, when the fun is vertical, the rains and ftorms are great, otherwife the climate would be intolerably hot. The faireft feafon is when the fun is farthest off, and then it is hottest in the morning; for brifk till the evening. The trade winds in their feasible from the north-east. At the full and change of the moon, from October to April, there are brisk winds at north and north-west, which, in December and January, often turn to storins; though this is called

the fair feafon.

The country is well watered, and agreeably diversified with woods, lawns, and vallies. The foil is capable of producing, in the greatest plenty, every thing that grows in the other American islands; but the Cuba (commonly called the Havannah) tobacco is thought to excel that of all the world: and their fugar would equal their tobacco in goodness, had they hands to cultivate the canes. The other products are ginger, long pepper, and other fpices; cassia, mastic, aloes, large cedars, and other odoriferous trees; oaks, pines, palmtrees, plenty of large vines, fine cotton-trees, planbahanas, ananas, guavas, lemons, cocoas, and two forts of fruit, called camilor and guanavana; the first like a china orange, and the other shaped like a heart, with a juice between tweet and acid.

The Spanish plantations are furnished by the mines of Cuba with a fufficiency of metal for all their brafs guns. Gold duft is found in the fands of the rivers; but it is uncertain whether there are any gold or filver mines, the hopes of which occasioned the butchery of all the ancient inhabitants, who were either unable or unwilling to discover them. If there are any, they are not worked. A chain of hills runs through the middle of the island; but the land near the coast is generally a level champaign country. The interior parts lie quite uncultivated, and uninhabited.

The ports and harbours here are of great advantage to thips for paffing the gulph in fafety; but there are fcarce any navigable rivers. Both the coasts and rivers abound with filh, and also with alligators. There are great conveniencies for making falt, but the inhabitants avail themselves very little of them. The cattle brought hither by the Spaniards have multiplied exceedingly, great numbers now running wild in the woods, of which many are killed chiefly for their hides and tallow, that are fent to Spain. Their flesh also, being cut into pieces and dried in the fun, ferves to victual These cattle are often so fat, that they die through the burthen of their greafe. Here are likewife abundance of mules, horfes, sheep, wild boars, and hogs, together with wild and tame fowl, parrots, partridges, blue heads, large tortoiles, quarries of flint, and feveral fountains of bitumen, which is used instead

of pitch, as well as for medicinal purpofes.

The Island of Cuba is pleasant, and its present state flourishing, the Spaniards having every year, for a confiderable time past, added something to its improvement. Formerly its exportations never equalled those of the finall British Island of Antigua. The reason of this, next to the indolence of the Spaniards, was the great facility with which the inhabitants got their money, by means of the galleons and the flota, and the very great contraband trade carried on here, in defiance of their laws, and even with the connivance of the government of the island.

The civil government of Cuba is dependent on that of St. Domingo, or Hispaniola. Its bishop, whose see is at St. Jago, though he commonly refides at the Havannah, is fuffragan to the archbishop of St. Domingo. The east part of the island is under the governor of St. Jago, and the west under the governor of the Havan-There are several large towns in the island, but the most considerable are the two above-mentioned.

The Havannah, the capital, is fituated on the northwest coast of the island, 50 leagues from Cape Antonio, its westermost point; 490 miles west from St. Jago; 41 leagues south of the Cape of Florida, the guiph of which it commands, by being fituated at its mouth, and two days fail from the Straits of Bahama. The town itself, distinct from the fortifications, is about two miles in circuit. The port is one of the finest and most secure in the world, yet the narrowness of its pas-fage has rendered it so difficult of access, that the galleons have often been infulted and taken within fight of it, without receiving any affiftance from the fortifications. The churches here are inconceivably magnificent, and rich in plate and ornaments; the streets clean and strait, but narrow; and the houses, which are of stone, make a good appearance, but are ill furnished. The inhabitants, in general, are faid to be more fociable and converfable than those of the other Spanish dominions in America. The city, which is one of the most rich in America, especially when the galleons are here, flands in the most fruitful part of the island, on the west side, along the thore, which rounds so much, that above half of it is washed by the sea, and the rest by two branches of the river Lagida. There is a fine square, with uniform buildings in the middle of it. This city is of greater importance to the Spaniards than any other in America, being the place of rendezvous for all their fleets, in return from that quarter of the world to Old Spain, and lying at the mouth of the Gulph of Florida, through which they are all obliged to país. They justly give it the appellation of the Key of all the West-Indies, to lock or open the door or entrance thereto; and, indeed, no thip can pais that way without leave from this port. Here is always a squadron of Spanish men of war; and here, in September, meet the galleons, flota, and other thips, from feveral ports, both of the continent and islands, to the number of, perhaps, 50 or 60 fail, to take in provisions and water, with great part of their lading, and for the convenience of returning to Old Spain in a body. A continual fair is kept till their departure, which is generally before the end of the month, when a proclamation is made, forbidding any that belong to the fleet to flay in the town, on pain of death; and, upon firing a warning gun, they all go on board. The value of the cargo is feldom lefs than 700,000l. fterling: fo that it may be

This city, after a long and obstinate defence, was furrendered, with all its forts and dependencies, to his Britannic Majesty's arms, by capitulation, on the 12th of August, 1762, but was restored by the peace of the following year.

The Spaniards have taken care to repair the damages which the fortifications received during the fiege by the English, and added new ones, befides using every other precaution to fecure it, for the future, from all attempts

St. Jago stands at the bottom of a large bay, about two leagues from the fea, on the fouth-east fide of the island. It is distinguished from St. Jago in Chili, by the addition of Di Cuba, as the other is by that of Di Chili. Since the unfuccessful attempt made by the English, under Admiral Vernon and General Wentworth, the fortifications have been repaired, and the town has recovered fome degree of its former splendor, carrying on a good trade with Old and New Spain, and above all with the Canaries.

The other towns of note are Santa Cruz, which has a to erable harbour, and stands about 163 miles east of the Havannah; Porto del Principe, situated on the coast, about 300 miles south-east of the Havannah; and Baracoa, fituated on the north-east part, which has a fmall harbour.

HISPANIOLA, OR ST. DOMINGO.

THIS island, stiled by the natives Aitji, extends from latitude 17 to 20 deg. north, is about 450 miles in length, and about 150 in breadth. It is about 13 leagues distant from Cuba, which strait is called the Windward Passage.

Though the climate of this island is hot, it is not unwholetome, being refreshed by breezes and rains. is both fruitful and pleafant, being diverlified with hills and vallies, woods and rivers, producing ananas, bananas, grapes, oranges, lemons, citrons, toronias, limes, dates, and apricots; together with whole forests of cabbage trees, clms, oaks, pines, acajou, and other trees, large and lofty. The other commodities are fugar, hides, indigo, cotton, cocoa, coffee, ginger, tobacco, falt, wax, honey, ambergris, and various kinds ef drugs and dying woods. Crocodiles and alligators infet its coats and rivers; but they abound at the

fame time with tortoiles or turtles, This island is possessed in common by the Spaniards and French. Columbus discovered it in 1492, and called it Spanish Island; a denomination which it has preferved under the name of Hispaniola, along with preserved unter the name of Fupaniola, along with that of St. Domingo, derived from St Dominique, to whom it was dedicated. They found there some gold mines exceedingly rich, which brought all the robbers of Spain in crowds. The greater part of the male Indians perished in these mines; and almost all the semales by the excessive labour of cultivating the fields of maize for the use of the conquerors: the others were maffacred, either in cool blood, or in ranged battles; for so they called those kinds of chaces which the Spaniards, covered with iron, and followed by bull-dogs, made to a multitude of these unhappy wretches, quite naked, and flying with all their might. The quick extermination of the natives, and confequently the difficulty of working the mines; the bloody quarrels of the conquerors among one another; the discovery of Mexico, foon after that of St. Domingo, drawing thither all the invaders; and, laftly, the pillaging of the capital by Drake in 1586; all these events conspired to bring on the decay of the new colony a few years after its eftablishment. The Spaniards, scattered about this large ifland, having become unable to hinder the Buccancers from feizing the western parts, and fettling themselves there, retired to the eastern side, which they

well imagined, that a place of so much importance is in a condition both to defend itself, and to protect the ships that frequent it.

The Spaniards, through their natural indolence, plant very little: their principal employment is to breed cattle, or to hunt those which have multiplied in the They get from their neighbours, stockings, hats, linen, guns, iron ware, and some cloaths; which they give in return, horfes, horned cattle, imoaked beef, hogs, and hides,

The principal places in the ifland, belonging to the

Spaniards, are the following:

St. Domingo, the capital, is a large well built city, fituated on a spacious harbour on the south side of the island, and defended by a castle and other works. It has a univerfity and a college, a Latin school, several convents, a magnificent cathedral, an hospital, and a fine market place in the center of the city. St. Domingo is also the residence of the governor-general of the Spanish Indies, of an archbishop, and court of royal audience. The archbithop's fuffragans are the bithops of Conception in this island, St. John's in Porto Rico, St. Jago in Cuba, Venzuela in New Castile, and of the city of Honduras. The jurisdiction of the court of royal audience extends to all the Spanish West-Indian Islands. A fine navigable river falls into the fea a little to the west of it.

Conception is a confiderable town, and the fee of a bishop, 20 leagues north of St. Domingo. St. Jago de los Cavalieros lies 10 leagues north-welt of Concep-tion, and enjoys a fine air. Porto la Piata, or the Haven of Silver, stands on an arm of the sea, 35 leagues north of St. Domingo and Monto Christo, at the mouth of the river Yaguey, 10 miles west of Porto de la Plata, and 40 north-west from St. Domingo.

The towns belonging to the French in this island are

the following:
Cape St. Frençois, fituate on the north fide of the island, is in a very flourishing and opulent condition, having a fine harbour, a brifk trade, and a great number of inhabitants.

St. Lewis, or Port Lewis, flands on a finall ifland on the fouth-west coast of the island, and possesses a good harbour, with a fort, but labours under a fcarcity of fresh water.

Port Paix is a place of confiderable strength, lying opposite the Island of Tortuga, on the north-west coast

of the island.

Petit Cuaves, and Leogane, stand on Donna Maria Bay, near Cape St. Nicholas, at the west end of the island. The former is the oldest French settlement in the island, and a place of considerable trade; and the latter is the refidence of the French governor-general, and of the royal judicature, with that of the supreme council, whole jurifdiction extends from Cape Mougon to the river Artibonite.

There are two other fmall places belonging to the French, called La Petit Riviere, and L'Esterre, the latter of which stands a little within land,

The Island of Tortuga had its name from the turtles with which it formerly abounded. It is about 6 leagues long from east to west, and 3 where broadest. The French have a populous and flourishing settlement, called Cayona, with a harbour in the fouth part of the island. It yields all the commodities found in the other West-India Islands, together with wild boars; but has little or no fresh water.

Of the other islands on this coast the chief are Savona and Mona, belonging to the Spaniards.

PORTO RICO.

THIS island is situated between 64 and 67 degrees west longitude, and in 18 degrees north latitude, lying between Hifpaniola and St. Christopher's. It is about 100 miles in length, and 40 in breadth. have occupied fince that time. Their part, both for I chief part of the country is divertified with woods,

AMERICA.]

vallies, and plains, and it is extremely fertile, producing the fame fruits as the other islands. It is well watered with fprings and rivers; but the air is excessive hot, and, during the rainy feafon, very unwholesome.

The north part of the island, which is the most barren, contains feveral mines, fome of which formerly produced great quantities of filver and gold. It was on account of the latter that the Spaniards fettled here; but there is no longer any confiderable quantity found

In the woods are parrots, wild pigeons, and other fowl. European poultry is found here in plenty, and the coast abounds with fish. A breed of dogs, which the Spaniards brought over to hunt and tear in pieces the defenceless natives, are faid to run wild in the woods, and fubfift upon land-crabs that burrow in the ground.

The principal commodities here are fugar, ginger, hides, cotton, thread, cassia, mastic, &c. Their pork is excellent, as is likewise the flesh of their kids, but their mutton is very indifferent. They have good thiptimber and fruit-trees, with rice and Indian corn.

This island was taken from the Spaniards by Sir Francis Drake. It was afterwards conquered by the Earl of Cumberland, in the reign of Queen Elizabeth; but he was obliged to abandon it, having loft most of his men by fickness in the latter end of the summer, when this and all other places in these latitudes are very unhealthy.

The Spanish government have taken great pains to prevent an illicit trade being carried on at this place; but fuch is the convenience of its fituation for that traffic, that all the fevere edicts iffued against it have

been ineffectual:

Porto Rico, the capital town, is fituated on a fmall island on the north coast. This island forms a very convenient harbour, and is joined to the chief island by a caufeway. It is defended by forts and batteries, which render the place almost inaccessible, The town is well built, and populous, and the feat of a governor, as well as a bishop's see.

The only places worthy of notice in this island, exclusive of the capital, are Port del Agnada, where the Flota provide themselves with water, and other necessaries, in their voyage to Old Spain; and Boraba de Infernes, which is remarkable for having an excellent

turtle fithery.

On the coast of Porto Rico is a small place, called Crabs Island, from the great number of crabs that are found on it.

TRINIDAD.

THIS island lies between the Island of Tobago and the Spanish Main, from whence it is separated by the Straits of Paria. It is about 90 miles long, and 60 broad; and is an unhealthy climate, though a fruitful foil. It was taken by Sir Walter Raleigh in 1595, and by the French in 1676, who plundered it, and extorted money from the inhabitants.

The principal productions of this island are fugar, fine tobacco, indigo, ginger, variety of fruit, fome cotton trees, and Indian corn.

MARGARITA

IES 200 miles west of Trinidad, is about 40 miles in length, and 24 in breadth, and, being always verdant, affords a most agreeable prospect. It abounds in pastures, fruits, and Indian corn; but there is a great fearcity of wood and water. On the coast of this island was formerly a pearl fishery, but it has been for many years discontinued.

IN the South Seas the Spaniards claim the Islands of Chiloe, St. Mary, Quiriquina, Moca or Mocha, Juan Fernandez, Tierra, Fuera, and feveral others; but Juan Fernandez, Fuera, and Chilo, only deferve description.

SPANISH ISLANDS IN THE SOUTH SEAS.

JUAN EERNANDEZ.

JUAN Fernandez, and Fuera, or Mafa-Fuero, are diftant from each other about 31 leagues. They were first discovered by Juan Fernandez, a Spaniard, from whom they take their name, in 1572. The Spaniards diffinguith them by the Greater and Leffer Juan Fernandez; but the smaller island is more generally known by the name of Mafa-Fuero. The Greater Juan Fernandez lies to the eaftward, in latitude 33 deg. 40 min. fouth, and longitude 78 deg. 30 min. weft. It was formerly a place of refort for the buccaneers, who annoyed the western coast of the Spanish continent. They were led to refort hither by the multitude of goats which it nourished; to deprive their enemies of which advantage, the Spaniards transported a confiderable number of dogs here, which, increasing greatly, have almost extirpated the goats, who now only find fecurity among the fteep mountains in the northern parts, which are

inacceflible to their purfuers.

There are inflances of two men living, at different times, alone on this island for many years: the one a Musquito Indian; the other Alexander Selkirk, a Scotchman, who was, after five years, taken on board an English ship, the Duke privateer, from Bristol, which touched here in about 1710, and brought back to Europe. From the hiftory of this recluse, Daniel Defoe is faid to have conceived the idea of writing the Adventures of Robinson Crusoe. Selkirk was a native of Largo, in the county of Fife, and was bred a failor from his youth. The reason of his being left on the island was a difference between him and his captain. He had his cloaths and bedding with him; also a firelock, a little powder, fome bullets and tobacco, a hatchet, a kettle, a knife, a bible, fome books of practical divinity, and his mathematical infruments and books. He built himself two huts; one for the purpose of reading, fleeping, and amusement; the other for dreffing his victuals. He procured fire by rubbing two flicks of pimento wood upon his knee. He found here a fort of cray-fish, of exquisite flavour, and as large as a middling fized lobster. These he both broiled and boiled, as he did the goats slesh, and made very good broth of it. There was abundance of good turnips and cabbages here. When his clothes were worn out, he made himfelf a coat and cap of goats skin Having fome linen cloth by him, he cut out fome shirts, which he sewed with the worked of his old flockings, pulled out on purpose, using an old nail to make holes instead of a needle; and he had his last shirt on when he was found.

He had so far forgot his native tongue, for want of use, that, on his first going on board, he could not fpeak plainly. A dram was offered him, but he would not tafte it, having drank nothing but water for 60 long a time. He was left here by Capt. Straddling, commander of a veffel called the Cinque Ports, and taken away by Capt. Wood Rogers, who landed at this island

to procure water,

This island was very propitious to the remains of
Commodore Anson's squadron in 1741, after having been buffeted with tempests, and debilitated by an in-Cape Horn. They continued here three months, during which time the dying crews, who, on their arrival, could fearcely, with one united effort, heave the anchor, were reftored to perfect health.

Capt. Carteret, in the Swallow, in 1767, having met with many difficulties and impediments in his paffage into the South Sea, by the Straits of Magellan, attempted to make this island, in order to recruit the health of his men; but he found it fortified by the Spaniards, and therefore chose rather to proceed to the Island of Masa-Fuero. But M. de Bourgainville, that fame year, is faid to have touched here for refreshments all lough, fuppreffed.

rugh,

This ifland is not quite 15 miles long, and about 6 broad. It has only one fafe harbour, which is on the north fide. It is faid to have plenty of excellent water, and to abound with a great variety of esculent vegeta-bles, highly antiscorbutic: besides which, Commodore Anson fowed a variety of garden feeds, and planted the ftones of plumbs, apricots, and peaches, which he was many years afterwards informed had thriven greatly, and now, doubtless, furnish a very valuable addition to the natural productions of this ipot.

Vast shoals of fish, of various kinds, frequent this coast, particularly cod of a prodigious fize, and, it is faid, in not less abundance than on the banks of Newfoundland. There are but few birds here, and those

are of species well known and common.

FUERA, OR MASA-FUERO.

COMMODORE BYRON anchored off this island in 1765, and fent out his boats to endeavour to get wood and water; but as the shore was rocky, and a furf broke with great violence upon it, he ordered the men to put on cork jackets, by the help of which they brought off a confiderable quantity of both. Here they found plenty of goats, which proved to be as good food as venilon in England. In this expedition the gunner, and a scaman who could not swim, went on shore with the waterers, and, when the bufiness was completed, the violence of the furf, which beat against the shore, made them afraid to venture off to the boat : they were, therefore, left behind on the island. The next day the commodore fent out a boat to bring them back. The gunner fwam through the furf, and got on board; but the feaman had fo thorough a prelage of being drowned in the attempt to reach the boat, that, preferring life to focial intercourse, he chose to remain on the island at all events. Having formed this resolution, he took an affectionate leave of the people in the boat. A midshipman, however, just as they were about to return without him, taking one end of a rope in his hand, jumped into the iea, and fwam through the furf to the beach, where the poor infulated despondent sat ruminating on his fituation. The young man remonstrated to him on the abfurdity of the resolution he had formed, and having made a running noofe in the rope, fuddenly threw it over the failor, and fixing it round his body, the people in the boat began to drag him through the furf, and thus brought him on board; but he had swallowed fo great a quantity of water on his paffage, that he was to all appearance dead; yet proper means being used, he foon recovered, and was, no doubt, abundantly thankful for the friendly violence that had forced him from the dreary folitude which his fears had before

Capt. Carteret describes this island to lie in 33 deg. 45 min. fouth longitude, 80 deg. 46 min. weft, from Greenwich. It is very high and mountainous, and at a distance, appears as one hill or rock. It is of a triangular form, and feven or eight leagues in circumference.

Here is fuch plenty of fish, that a boat with a few hooks and lines, may prefently catch as much as will ferve 100 people. Here are coal-fish, cavilliers, cod, hallibut, and cray-fish. Capt. Carteret's crew caught a king-fisher that weighed 87 pounds, and was five feet and a half long. The sharks here were so ravenous, that in taking foundings, one of them swallowed the lead, by which they hauled him above water; but he regained his liberty by difgorging his prey. Seals are to numerous here, that Capt. Carteret fays, if many thousands were killed in a night, they would not be miffed the next morning. These animals yield excellent train oil; and their hearts and plucks are very good food, having a tafte fomething like those of a hog. Their kins are covered with very fine fur. There are many birds here, and some very large hawks. Of the pintado bird the crew of the swallow caught 700 in one

CHILOE.

HILOE, a confiderable island, on the coast of Chili, lies in fouth latitude deg. and is above 112 miles long, and 21 broad. The fouth part of it is divided from the continent by a narrow sea, and the continent there makes a bay. This coast is subject to tempestuous weather, especially in March, when winter begins. The Spaniards have but one little fort in this island, called Chacao, always ill provided with warlike stores. Bating wine, this island produces all necessary refreshments and provisions; and a great deal of ambergris is found here. About this island are 40 more, all taking name from it.

A late navigator tells us, these islands of Chiloe are reputed barren; but their foil is not really fo, only the excessive rains choak the feed, and let no corn thrive, fo that they are without wheat, wine, or oil, and other

plants which need much fun.

The nature of the climate of this cluster of islands is fuch, that it rains almost all the year; so that only maize, or other fuch grain, can ripen, that want not fo much fun. The diet of the natives is mostly of a root called papahs, which grows bigger here than in any other place. The manufactures are clothing for the Indians, who have a kind of veft, which they call macun, without fleeves, over which is a kind of cloak. They have vast woods of cedar trees of a prodigious fize, fo as hardly to be encompaffed by a rope fix yards long. The principal town is called Castro.

CHAP. XI.

WEST-INDIA ISLANDS belonging to the FRENCH, DUTCH, and DANES.

SECTION I.

FRENCH WEST-INDIA ISLANDS.

MARTINICO.

THE Island of Martinico is situated between the 14th and 15th deg. of north lat. and in the 61st deg. of west longitude. It lies about 40 leagues nothwest of Barbadoes, and is about 60 miles in length, and 30 in breadth.

No. 49.

The climate of Martinico is not efteemed unwholefome; though there is a dampness in the air which, at times, must be disagreeable. The inland parts are mountainous, and from thence arise many rivulets, which, in their course towards the sea, at once adorn

and fertilize the country.

The productions of this ifland confift of fugar, tobacco, cotton, ginger, indigo, aloes, pimento, cocoas, plantains, and other tropical fruits. The coasts abound with turtles; but the French are not so expert in fishing for them as the English.

6 T

THIS iflar

breadth. It w

Guadalou

In the year 1700 the French fettled upon the island of Martinico were computed to be 1500, besides the negroes whom they employed, and great numbers of Caribbeans, who were re-admitted into the island, but were obliged to work as flaves, and to live among the French, that they might have no opportunity to form conspiracies or plots with their countrymen, or to associate together. Before it was fubdued by the English in 1759, it contained 10,000 white inhabitants fit to carry arms, and above 40,000 negroes or flaves. Befides this force, fome companies of regulars were always quartered in the island; so that nothing but the most notorious misconduct could have rendered the British troops mafters of it with so little loss as they suffered on that occasion.

Martinico is not only the refidence of the governorgeneral and intendant, but likewise of a sovereign council, which tuperintends all their other islands, and even the fettlements of St. Domingo and Tortuga.

The island owes its flourishing state to the French go vernment having transported thither, by way of punishment, great numbers of its Protestant subjects, some

of whom voluntarily fettled there.

The two principal towns in this island are Fort Royal and St. Pierre, or St. Peter's. The first is the feat of government: its streets are regular, the houses agreeable, and the inhabitants very much given to all kinds of luxury: they are the Parifians of the West-Indies. To the east of the town, on a neck of land, is an irregular fort, badly built, and worse defigned, which gives name to the town it poorly defends. Fort Royal, as well as the rest of the island, fell under the power of the English in the year 1756, but they restored it at the peace of 1763. The French have fince built a citadel upon Morne Carnier, an eminence higher than the most elevated points of Mornes Patate, Tartanson, and Cartouche, which all command Forte Royal.

The harbour of Fort Royal, where the men of war anchor in winter, is one of the best of the Windward Islands, and its security against the hurricanes generally acknowledged. It is supposed that the inner part has been spoiled by finking the hulks of several ships to make a fence against the English in the war of 1759.

The Fort of St. Pierre, is five leagues to the leeward of Fort Royal, in a round bay of the western coast. The town, the first built in the island, is the place of communication between the colony and mother country. It is the refidence of merchants, and the center of bufiness. That part fituated along the fea-fide, on the strand itself, called Le Mouillage, (the anchoringplace,) is very unhealthy.7 The other port, separated from this by a river, is built upon a low hill; and they call it the Fort from a fmall fortress which defends the This road is very convenient for loading and unloading the ships, and the facility of coming in or going out; but they are obliged in winter time, to take shelter at Fort Royal.

The town of St. Pierre fuffered great damage by a dreadful hurricane which happened in the month of October 1780, in which 200 houses were blown into the sea, and great damage was done among the shipping

that lay in the harbour.

The chief export of Martinico is fugar, of which vaft quantities are annually thipped for France.

GUADALOUPE.

THIS Island is rtuated about 30 leagues north-west of Martinico, in 16 deg. north latitude. It is about 45 miles in length, and 38 in breadth, and is divided by a deep gulph or bay, and a channel called the Salt River.

The air of Guadaloupe is preferable to that of Martinico, being more falubrious, and less fultry. The foil is very fertile. Its products are fugar, coffee, cotton, bastard cinnamon, indigo, ginger, and many other vegetables, particularly the capua-tree, from which is extracted a most excellent balm; the milkshrub, fo called from its yielding a substance like milk, when preffed, which falls little short of the capua balfam; the moubane-tree, which bears a yellow plumb, with which the natives fatten their hogs; and the corbary-tree, the gum of which, when hardened in the fun, becomes to translucent, that the Caribbeans wear it formed into beads and bracelets.

Many of the mountains with which Guadaloupe abounds, are covered with wood; and nothing can be more verdant, or more beautifully variegated, than the large plains which lie beneath them. One of the mountains emits a continual fmoak, and communicates a ful-

phurous tafte to the neighbouring streams.

The most remarkable bird on this island is that called the Devil's Bird, which is peculiar to this island and Dominica; it is a bird of passage, of the size of a pullet, and all its plumage coal black: it lives on fifth, which it catches in the fea at night, being unable to bear the light in the day-time when flying; so that they often run against interposing objects, and fall down. After their fish-hunting in the night, they repair to a mountain called the Devil's Mountain, where they lodge by pairs in holes like rabbits. Their flesh is good nourishing food, though of a fishy taste.

The island is pestered with an infect called a ravet, shaped like a cock-chaffer, of a stinking smell, which destroy both books and furniture; and whatever they do not gnaw is discoloured by their ordure: but great numbers of them are destroyed by a kind of spiders found on the ifland, some of which are as big as a man's fift. The bees of Guadaloupe are exceeding different from those of Europe, being black, smaller, and without ftings. These bees, instead of making combs, lay their honey in bladders of wax, about the form and fize of a pigeon's egg. The only use made of their wax, which is of a dark purple colour, is to fecure the corks of bottles. The honey is never of a thicker confiftence than that of olive oil.

The Cul de Sacs, as the French call them, or gulphs about this island, abound with turtle, sharks, land

crabs, and various other fifnes.

One of the two divisions of this island is called Grande-Terre; and the other is divided into Capes Terre, or Cables Terre, and Basse-Terre, which last is also the name of the capital, a very confiderable town, fituated on both fides of Bailiff River, and well fortified.

This island, as well as Martinico, was reduced by the British arms in the year 1759, but restored by the defi-nitive treaty of peace in 1763. The French first began

to fend colonies to it about the year 1632.

ST. LUCIA.

THIS island, which is fituated in 14 deg. north latitude, was first settled on by the English in 1637, who were much annoyed by the natives and the French. At length it was agreed between the latter and the English, that St. Lucia, with Dominica and St. Vincent, should remain neutral. By the definitive treaty of 1763, it was ceded to France. St. Lucia lies two miles fouth of Martinico, and is about 23 miles in length, and 12 in breadth. It is one of the fineft and most convenient of any of the Caribbee Islands, being diversified with hills and vallies, well watered, and furnished with excellent harbours. The land is rich, but a great part of it is covered with woods, which abound in wild fowl, and yield great quantities of excellent timber. The neighbouring fea is well flored with fish.

St. Lucia fultained confiderable damage by a dreadful hurricane which happened in the month of October, 1780. Great numbers of houses were levelled with the ground; and the ships in the harbour being driven out

to sea, many were loft.

This island was taken by the English forces in 1778, but restored to the French by the treaty of peace in 1783. .

MARAGALANTE.

THIS island, which is situated to the south-east of Guadaloupe, is about 15 miles in length, and 12 in breadth. It was discovered by Columbus in 1493, and named by him Marigalante, or the Gallant Mary, after the name of his ship. It abounds with tobacco, cinnamon-trees, and other productions of the Caribbee Islands; and contains a great many grottos, where large crabs are found; as also several rivers, and ponds of fresh water. Along the eastern shore run high perpendicular rocks, which give shelter to vast numbers of tropical birds, as they are full of holes like a pidgeon-house.

TOBAGO.

THE Island of Tobago lies 40 leagues south by west from Barbadoes, about 35 south-east from St. Vincent, 40 east from Grenada, and between 30 and 40 from the Spanish Main. It is 32 miles in length, about 9 in breadth, and 70 in circumference; so that it is rather larger than Barbadoes, or, indeed, any of our Leeward Islands; and near the north-west extremity lies a small island called Little Tobago, which is two

miles in length, and one in breadth.

The climate is far more temperate than could be expected in an island that is but 11 deg. 10 min. north from the equator, for the force of the sun is diminished by the sea breezes. The spice and gum trees, with which it abounds. contribute to its falubrity. Tobago has another favourable circumstance to recommend it, namely, its lying out of the track of those hurricanes that often prove fo fatal to the other West India Islands. The north-west extremity is mountainous, but the rest of the island agreeably diversified with risings and fallings. The foil, in general, is a rich black mould, proper for producing, in the greatest plenty, whatever is raised in other parts of the West Indies. There are many fprings, together with commodious bays and creeks. But the valuable trees which grow here, are, perhaps, its greatest riches; for, besides the different kinds of wood that are found in the other West India Islands, it is faid, that the true nutmeg-free, and the cinnamon tree, with that which produces the real gumcopal, are found on this island. The fig-trees of Tobago are reckoned equal to those of Spain and Portugal. Indian and Guinea corn, French beans, various kinds of peas, the coshou-apple, that is both meat and drink, and yields an excellent lamp-oil the prickle-apple, banana, pomegranate, pine-apple fweet and bitter orange, lemons, fugar, tobacco, iadigo, ginger, fariaparilla, femper vivum, citrons, vanellos, limes, guavas, plaintains, tamarinds, grapes, cuftard-apple, iour-apple, papaw-apple, mammea-apple, yellow plum, cherries; the cocoa-tree, that yields both meat; drink, and clothing; mufk, cucumbers, water-melons, pumkins, gourds, potatoes, yams, carrots, turnips, parinips, omons, caitada-root, natural balfam, filk-grafs, with five different forts of pepper, the long, the cod, the beli, the round, and the Jamaica are also produced on this itland.

Here are wild hogs, pickarees, which refemble a hog; armadilioes; guanoes, which are of the alligator kind; Indian comes, badgers, hories, cows, affes, sheep, deer, goats, and rabbits. No island in the world, we are told, can boast such a variety of fishes, both shell and others, particularly turtle and mullets, of a most delicious taste. Of the feathered species there is also a great variety. Lastly, in different parts of the island are found green tar, soap earth, with many curious shells, strongs, progrations, and minerals.

ous shells, stones, marcaines, and minerals.

The value and importance of this island appears from the expensive and formidable ornaments which have been tent thither by European powers in support of their different claims. It was heretofore chiefly possessed by the Dutch, who defended their pretensions against both England and France with the most obstinate persever-

rance. By the treaty of Aix-la-Chapelle, in 1748, it was declared neutral; but by the treaty of peace in 1673, it was yielded up to Great Britain. In June, 1781, it was taken by the French, and ceded to them by the treaty of 1783.

ST. MARTIN, ST. BARTHOLOMEW, AND DESEADA ISLANDS.

THESE are three of the inconfiderable iflands the French posses in those parts. St. Martin's is of no consequence whatever. St. Bartholomew produces some tobacco, also excellent woods and lime-stones. Deseada, which is a corruption of the word Desiderada, or the Desirable Island, was so called by Columbus, being the first land he discovered in his second voyage to America. It produces very good cotton.

SECTION. II.

DUTCH WEST-INDIA ISLANDS.

ST. EUSTATIA.

THE Island of St. Eustatia is situated about three leagues north-west of St. Christopher's, is about 29 miles in circumference, and well cultivated. Besides tobacco, the inhabitants have of late years raised and exported great quantities of sugar. They also breed hogs, rabbits, goats, and most sorts of poultry. The air is wholesome, but it is subject to terrible thunder-claps, earthquakes, and hurricanes; and there is a scarcity of fresh water. Besore a hurricane, it is said, the birds lay themselves stat on the ground; and the rain that precedes it is always salt and bitter.

St. Eustatia is reckoned the strongest of all the Caribbee Islands, there being but one landing-place, which is commanded by a fort, and may be easily defended by a few men. The Dutch took possession of it in 1635; and, since the treaty of Ryswick, preserved it till February, 1781, when it was taken from them by the British forces, under Admiral Rodney and General Vaughan: but in November following it was retaken

by the French.

This island sustained considerable damage by a dreadful hurricane which happened in the month of October, 1780. Great numbers of warehouses were blown down, and most of the goods destroyed, the whole loss of which was estimated at 150,000l.

CURASSAO, OR CURACOA,

S fituated about 10 leagues from the coaft of Terra-Firma, in 12 deg. 14 min. north latitude. It is about 30 miles in length, and 10 in breadth. The climate is neither wholelome or agreeable, nor the foil fruitful; yet the island is populous, and the industry of the inhabitants fuch, that it produces a great deal of fugar and tobacco. It is well fupplied with provifions, and all other commodities from Europe, and the other Dutch fettlements, in which it carries on a very lucrative and extensive contraband trade with the Spaniards in Terra-Firma. Let the Spanish governors prohibit this trade ever fo feverely, the Spaniards ftand fo much in need of European commodities, that they will run all hazards to obtain them. The chief town and harbour is about three leagues from the fouth-east end of the island. The town, for its fize, is one of the fairest and finest in America, and contains every thing necessary to render it commodious and agreeable, as far as the climate and foil will permit.

Here are three other smaller islands belonging to the

Dutch, namely, Saba, Bonaire, and Aruba.

Saba is a very pleafant island, fituated about 13 miles north-west of Eustatia. The sea is so shallow about it, that none but sloops can come near it; nor even those, but at a small creek, on the south side of the

n 1778, peace in

reace iii

ANTE.

makers, or dealers in shoes, There is a delightfull valley in the island, which produces necessaries for the inhabitants, with fome indigo and cotton.

Saba, and an ifland called St. Martin's, were both captured by Admiral Rodney and General Vaughan at the time of the furrender of St. Eustatia; but were

afterwards re-taken by the French.

Bonaire and Aruba are chiefly confiderable (which is also the case with Curasiao) for their situation near the coast of Terra-Firma, which gives the inhabitants an opportunity of carrying on a clandestine trade with the Spanish settlements in Terra-Firma.

On the fouth fide of Bonaire is a good falt-pond, whither the Dutch floops come for falt, which is be-

come a confiderable commodity.

SECTION III.

DANISH WEST-INDIA ISLANDS.

ST. THOMAS.

THE island of St. Thomas is situated to the east of Porto-Rico, and is the chief of those called The Virgin Islands. It is about 15 miles in circumference, and has a fafe and commodious harbour, which by being open to traders of all nations, enriches the inhabitants. Its foil is, in general, very fandy, notwith-flanding which it produces most of the West-Indian commodities; but it is greatly infested with musquetos. The principal advantage of this island confists in a

very good harbour on the fouth fide, where 30 thips may he in fafety. It is is defended by a fort, whose batteries at the fame time protect the fmall town built round the shore. This harbour is much frequented by merchant flips: when they are chased, in time of war, they find here a fafe protection; and, in time of peace, a vent for their goods, by the clandestine trade which the boats of St. Thomas continually carry on with the Spanish coasts.

Two leagues to the fouth of St. Thomas is another island, about the same size, called St. John's. It is the best watered among the Virgins, and its harbour has not only the reputation of being better than that of St. Thomas, but passes also for the best to the leeward of Antigua. The English give it the name of "Crawl Bay." But notwithstanding these advantages, there is so little good land in the island, that its planting and exportations form only a very trifling object.

St. CROIX, or SANTA CRUZ.

Is the most considerable of the West-India islands belonging to Denmark It is fituated out of the group of the Virgins, five leagues to the fouth of St. John's, being about 30 miles in length, and ten in breadth. It is tolerably fertile, producing most of the necessaries of life, together with oranges, citrons, granates, lemons, the manioc root, and the papan tree, the fruit of which makes a most excellent sweet-meat, Here is also a variety of dying and other woods proper

for house and ship-building.

The greatest parr of the inhabitants of Santa Cruz confifts of English and Irish catholics, and German Morayians: there is a finall number of Danes.

PORTUGUESE ISLANDS in AMERICA.

On the coast of Brazil are three islands belonging to the Portuguese, viz. Fernando de Norona, St. Barbara, and St. Catharine's.

Fernando de Norona lies in 3 deg. 50 min. fouth latitude. It is but finall, and in a few places only fufceptible of tillage, owing to a want of moisture, for through fearcity of water, the island is, in general, bar-

island Most of the inhabitants are said to be shoe- 11 ren. There are only three small brooks in the inland parts. Fernando de Norona has two harbours capable of receiving thips of burthen. Here are two forts built of stone, spacious, and well provided with artil-

> The inhabitants confift principally of the troops from Brazil fent thither by way of defence, a few poor There are some cattle on families, and fome Indians. the ifle d. Great plenty of fish are taken in the harbours, and turtles abound in the feafon, which is from December to April. The French made a fettlement on this island in 1738, but were forced to retire by the Portuguese, who then sent a colony over, and erected the forts already mentioned.

> St. Barbara is fituated in 18 deg. 6 min. fouth latitude. It is small, fertile, but thinly inhabited, and having no capacious harbour, is very little frequented.

> The island of St. Catharine lies in latitude 27 deg. 45 min. fouth. The foil is fertile, producing divers kinds of fruits ipontaneously The woods are very fragrant from the aromatic trees and shrubs with which they abound. Here is a fpecies of black cattle refemb ling buffaloes; also monkies, parrots, and pheasants.
> The harbours and bays are stored with fish. The water is good, and found in various parts of the island; but the air is far from being falutary, as the country is overipread with a vapour all the night, and a great part of the morning, which continues till the fun gains strength to diffipate if, or it is dispersed by a brisk sea-

NEW DISCOVERIES.

TERRA DEL FUEGO.

Arrival. First interview with the natives. Their manner of behaviour. Incidents on ascending a mountain in quest of plants. Second interview with the natives. in quest of plants. Second interview with the natives. Description of their persons, dress, extraordinary decorations, Nood, habitations, surniture, weapons, cances, animals, birds, sist, insects, plants, government, religion, &c. Description of some parts of Terra del Fuego visited by Captain Cook on his second with the control of th cond voyage.

OR the most accurate description of the island of Terra del Fuego, or the Land of Fires, (fo called from a volcano which emits flames visible at a great distance) we have recurred to the account of our celebrated navigator Captain Cook, as most particular, authentic and entertaining.

When Captain Cook, upon his first voyage, fell in with Terra del Fuego, about 21 leagues to the westward of the Strait of Le Maire, trees were plainly to be diftinguished by the affistance of the glasses. As our people came nearer the land, they discovered, in fome fpots, patches of fnow on the fide of the hills, and the sea coasts appeared to be covered with a beautiful verdure. The hills are lofty, and the fummits of them quite naked. The foil in the vallies is rich, and of a confiderable depth. At the foot of every hill is a brook, the water of which has a reddish hue, but is by no means ill tasted. Captain Cook says, that it proved, upon the whole, the best that was taken in during the

They ranged the coast to the Strait, and had foundings all the way from 40 to 20 fathoms, upon a gra-

velly and fandy bottom.

The most remarkable lands on Terra del Fuego are, an hill in the form of a fugar loaf, which flands on the west fide not far from the sea, and the three hills called the Three Brothers, about nine miles to the westward of Cape St. Diego, the low point that forms the north entrance of the Strait of La Maire.

The ifland of Terra del Fuego lies between 53 and 55 degrees fouth latitude.

en 53 and

When

Good Success, Captain Cook went on shore, accompanied by Mr. Banks and Dr. Solander, to look for a watering place, and confer with the Indians, feveral of whom had come in fight. They landed on the ftarboard fide of the bay, near fome rocks, which made fmooth water and good landing; thirty or forty of the Indians foon made their appearance at the end of a fandy beach, on the other tide of the bay, but feeing the number of our people, which was ten or twelve, they retreated. Mr. Banks and Dr. Solander then advanced about 100 yards before the rest, upon which two of the Indians returned, and having advanced fome paces towards them, fat down: as foon as they came up, the Indians role; and each of them having a fmall flick in his hand, threw it away in a direction both from themselves and the strangers, which was confidered as the renunciation of weapons, in token of peace. They then walked briskly towards their companions, who had halted at about fifty yards behind them, and beckoned the gentlemen to follow, which They were received with many uncouth figns of friendship, and in return they distributed among them fome beads and ribbons, which had been brought on thore for that purpose, and with which they were greatly delighted.

A mutual confidence and good-will being thus effected, the parties joined, and the conversation, such as it was, became general, and three of them accompanied our people back to the ship. When they came on board, one of them (supposed to be a priest) performed much the same coremonies as are described by Monf. Bougainville which he is of opinion were of a religious nature. When this person was introduced religious nature. When this person was introduced into a new part of the ship, or when any thing he had not feen before caught his attention, he shouted with all his force for some minutes, without directing his voice either to our people or his companions. eat fome bread and beef, but not apparently with much pleasure, though such part of what was given them as they did not eat, they took away with them; but they would not swallow a drop of either wine or spirits: they put the glass to their lips, but having tasted the liquor, they returned it with very strong expressions of

They appeared to have very little of the passion of curiofity, as they went from one part of the thip to another, and looked at the great variety of new objects that every moment prefented themselves, without any expression of wonder or pleasure; for the vociferations

of the supposed priest seemed to be neither.

The natives, after having been on board two hours, expressed a desire to go on shore. Mr. Banks accompanied them, landed them in safety, and conducted them to their companions, among whom he remarked the fame vacant indifference as in those who had been on board: for as on one fide there appeared no eagerness to relate, so on the other there seemed to be no curiofity to hear, how they had been received, or what they had feen. When Mr. Banks, Dr. Solander, and other gentlemen, with their attendants and fervants, fet out from the ship, with a few of the men, to penetrate as far as they could into the country, and return at night, the hills, when viewed at a diffance, feemed to be partly a wood, partly a plain, and above them a bare rock. Mr. Banks hoped to get through the wood, and made no doubt but that beyond it he fhould, in a country which no botanist had ever yet vifited, find plants which would abundantly compensate his labour.

They entered the wood at a finall fandy beach, a little to the westward of the watering place, and continued to afcend the hill through the pathless wilderness for feveral hours, before they had a near view of the places they intended to vifit. Soon after they reached what they had taken for a plain; but to their great disappointment they found it a swamp covered with low bushes of birch, and so interwoven and stubborn,

No. 49.

When the ship was brought to anchor in the Bay of || that it was necessary to lift the leg over them, which at every step was buried ancle deep in the foil. To aggravate the pain and difficulty of fuch travelling, the weather, which hitherto had been very fine, much like one of our bright days in May, became gloomy and cold, with fudden blafts of a most piercing wind, accompanied with fnow. They pushed forward, however, in good spirits, notwithstanding their fatigue; but when they had got about two thirds over this woody fwamp, Mr. Buchan, one of Mr. Banks's draughtimen, was unhappily feized with a fit. This made it necessary for the whole company to halt, and, as it was impossible he should go any farther, a fire was kindled, and those who were most fatigued were left behind to take care of him. Mr. Banks and the other gentlemen went on, and in a fhort time reached the fummit. As botanifts, they were abundantly gratified by finding a variety of plants, which, with respect to the Alpine plants in Europe, are exactly what those plants are, with respect to fuch as grow in the plain.

The cold was now become more fevere, and the fnow blafts more frequent; the day also was so far spent, that it was found impossible to get back to the ship before the next morning. To pais the night on fuch a mountain, in fugh a climate, was not only comfortless, but dreadful: it could not, however, be avoided, and they were to provide for it as well as possible.

While they were gathering the plants two of the company went back to the draughtiman and the people that were with him, with directions to bring them to an hill, which it was thought lay in a better rout for returning to the wood, and which was therefore ap-

pointed as a general rendezvous.

Their whole company affembled at this rendezvous. and, though pinched with the cold, were in health and fpirits. The draughtiman himleif had recovered his strength in a much greater degree than could have been expected. Though now near eight o'clock in the morning, it was ftill day-light, and they fet forward for the nearest valley, Mr. Banks himself undertaking to bring up the rear, and fee that no itraggler was left behind; a caution that foon appeared to be of the utmost importance.

Dr. Solander, who had more than once croffed the mountains which divide Sweden from Norway, well knew that extreme cold produces a fleepiness that is almost irrefistible, and therefore conjured the company to keep moving, however painful it might be. His words were, "Whoever fits down will fleep, and whoever fleeps will wake no more." Though thus admonithed, the cold became fuddenly to intenfe as to produce the effects most dreaded. Dr. Solander himself was the first who found the inclination, against which he had warned others as irrefiftible, and infifted upon being fuffered to lie down. Mr. Banks in vain remonstrated; he lay down upon the ground, though it was covered with fnow, and it was with great difficulty his friend could keep him from fleeping. Richmond also, one of the black fervants, began to linger, having suffered from the cold in the fame manner. Mr. Banks, therefore, fent five of the company, among whom was Mr. Buchan, forward to prepare a fire at the first convenient place; while himself, with four others, remained with the Doctor and Richmond, whom partly by perfuation and entreaty, and partly by force, they brought on, but when they had got through the greatest part of the birch and fwamp, they both declared they could go no farther. Mr. Banks again entreated and exposulated, but without effect. When Richmond was told, that if he did not go on he would be frozen to death in a short time, he answered, that he defired nothing but to lie down and die. Doctor Solander did not fo explicitly renounce his life: he faid he was wiking to go on, but that he must first take some sleep, notwithstanding his former declaration that whoever slept would wake no more.

As it was impossible to carry them, and there was no remedy, they were both fuffered to fit down on the ground, ground, and, in a few minutes, they fell into a pro-

Soon after some of those who had been sent forward returned with the welcome news, that a fire was kindled about a quarter of a mile farther on. Mr. Banks then happily awakened Dr. Solander, who, though he had not slept five minutes, had almost loft the use of his limbs; and the muscles were so thrunk, that his shoes fell from his seet. He consented to go forward with such affistance as could be given him: but all attempts to relieve poor Richmond were ineffectual. Mr. Banks, therefore, left his other black servant, and a seaman who seemed to have suffered least from the cold, to look after him, promising that as soon as two others should be sufficiently warmed, they should be relieved. Mr. Banks, with great difficulty, got the Doctor to the fire; and soon after sent two of the people who had been refreshed, hoping that, with the affistance of those who had been left behind, they would be able to bring Richmond, though it might still be impossible to awake

In about half an hour they had the mortification to fee the two men return alone. They informed them, that, after the most minute fearch, they could neither find Richmond, or those who had been left with him; and that though they had repeatedly shouted, no voice had replied. As Mr. Banks was expressing his surprize at this circumstance, he missed a bottle of rum, the company's whole stock, which they concluded to be in the knapsack of one of the absentees. It was supposed that by means of this, Richmond had been routed by the two men that had been left with them, and that having drank too freely of it themselves, they had all rambled from the place where they had been left, in search of the fire, instead of waiting for guides and affishants.

Another fall of fnow came on, and continued inceffantly for two hours; fo that all hope of feeing them again, at least alive, was given up: but in fome time, to the general joy of the company at the fire, a shouting was heard at a distance. Mr. Banks, with four others, immediately went out, and found the feaman with just strength enough left to stagger along, and call for affistance. Mr. Banks having sent him immediately to the fire, proceeded, by his directions, in fearch of the other two, whom he soon after found. Richmond was upon his legs, but not able to put one foot before the other. His companion was lying upon the ground, as senseless as a stone.

The whole company was now called from the fire, and an united attempt was made to carry them to it, but without effect. The night was extremely dark, the fnow very deep; fo that finding it very difficult to make way through the bufles and bogs themfelves (all getting many falls in the attempt) the only alternative was to make a fire on the fpor, but the fnow that had fallen, and was ftill falling, befides what was momentarily shaken in slakes from the trees, rendered it equally impracticable to kindle one there, or to bring any part of that which had been kindled in the wood thither. They were reduced to the melancholy necessity of leaving the unhappy wretches to their fate, having previously made them a bed of boughs from the trees, and spread a covering of the same kind over them to a considerable height.

After fuffering the rigour of the cold and fnow near an hour and a half, fome of the rest began to lose their feeling; and Briscoe, another of Mr. Banks's servants, was so ill, that it was apprehended he must die before he could get to the fire. However, at length they reached the fire, and passed the night in a situation dreadful in itself, and rendered more so by the remembrance of past severities, and the uncertainty of what was to come.

They were twelve in number who had fet out in health and fpirits. Of these two were supposed to be already dead; a third was so bad, that it was doubtful whether he would be able to proceed in the morning; and a fourth (Mr. Buchan) was in danger of the return

of his fits, from fresh fatigues after so uncomfortable a night. They were a long day's journey diftant from the thip, through pathlels woods, in which they might be bewildered till overtaken by the enfuing night; and not having prepared for a journey of more than eight or ten hours, their whole stock of remaining provision was a vulture, which they happened to fhoot when they were out, and which, if equally divided, would not afford each of them half a meal; and they knew not how much more they might fuffer from the cold, as the fnow flill continued to fall; a dreadful proof of the rigour of the climate, as it was now the midft of fummer in this part of the world; and every thing might be dreaded from a phænomenon, which, in the correfponding leafon, is unknown even in Norway and Lapland.

The only object visible at day-break was fnow, which seemed to be as thick upon the trees as upon the ground; and the blasts returned so frequently, and with such violence, that they sound it impossible for them to set out. They knew not how long this might last, and had but too much reason to apprehend, that it would confine them in that desolate forest till they perished with hunger and cold.

A dawn of hope fucceeded these terrific apprehenfions; for, about six o'clock in the morning, they discovered the place of the sun, through the clouds, which were become thinner, and began to break way. Their first care was to know whether the poor wretches they had been obliged to leave among the bushes were yet living: for this purpose they dispatched three of the company, who soon after returned with the melancholy news of their death.

Favourable as appearances had been, the fnow continued to fall fo thick, as to prevent their fetting out for the fhip. But about eight o'clock a finall regular breeze fprang up, which, with the prevailing influence of the fun, at length cleared the air, and, to their great joy, they foon after faw the fnow fall in large flakes from the trees; a certain fign of an approaching thaw.

It was now deemed expedient to examine more minutely into the ftate of their invalids. Brifcoe, though he remained very bad, faid he thought himfelf able to walk; and Mr. Buchan was much better than there was reason to expect. They were now, however, pressed by the calls of hunger, to which every other consideration must give way. They therefore came to an unanimous resolution, before they set forward, to eat their vulture, which was accordingly skinned; and it being thought best to divide it before it was fit to be eaten, it was cut into ten portions, and every man

cooked his own as he thought proper. After this flender meal, which furnished about three mouthfuls each, they prepared to fet out; but it was ten o'clock before the fnow was fo far diffolved as to render their progress practicable. Having proceeded about three hours, they were most agreeably surprized to find themselves upon the beach, and much nearer the thip than they had reason to expect, Upon reviewing their track from the veffel, they perceived that, initead of afcending the hill in a line, fo as to penetrate into the country, they had made almost a circle round it. On their arrival on board, they congratulated each other, and were congratulated by the crew in general, with an extafy of joy that can only be conceived by fuch as have been exposed to equal danger; and Captain Cook, to the honour of his humanity, observes, that, as he fuffered the greatest anxiety from their not returning in the evening of the day on which they fet out, he participated in no small degree of the general joy,

The next time that Mr. Banks and Dr. Solander went on shore, they landed in the bottom of the bay; and while the seamen were employed in cutting brooms, they pursued their great object, the improvement of natural knowledge, and had great fucces in the collection of shells and plants hitherto unknown. They afterwards visited an Indian town. When they got within a small distance, two of the people came out to neet

them, with fuch state as they could assume. On joining them, they began to hollow as they did on board the ship, without addressing themselves either to the strangers or their companions; and having continued this strange vociferation for some time, conducted them to the town, which was situated on a small hill.

The natives were, in appearance, an ugly, half

The natives were, in appearance, an ugly, half flarved, beardless race. Their colour resembled that of the ruft of iron, mixed with oil. They have long black hair. The men are disproportioned in their form. Their flature is from five feet eight, to five feet ten. The women are confiderably lefs. Both fexes have, in general, horrid and dejected afpects. Their language is, in general, guttural, and they express some of their words by a found exactly refembling that which we make to clear the throat, when any thing happens to obstruct it. Their cloathing confilts of the skins of the guanicoe, or feal, thrown over their fhoulders, exactly in the fame state in which it comes from the animal. A piece of the same skin is drawn over their feet, and gathered about the ankles like a purfe; and two or three fkins fewed together, fo as to make a cloak, which reaches to their knees: but the major part have only one skin, hardly large enough to cover their shoulders; and the lower parts are quite naked. The women have a fmall flap, as a fuccedaneum for a fig-leaf. Their drefs, in no other respect, differs from that of the The children go entirely naked, and are thus inured in their infancy to cold and hardships. But although they are content to be naked, they are very ambitious to be fine. Their faces are painted in various forms: the region of the eye was, in general, white; and the rest of the face adorned with horizontal streaks of red and black; yet fcarcely any two were exactly alike. This decoration feems to be more profuse and elaborate upon particular occasions; for the two natives who introduced Mr. Banks and Dr. Solander into the town, were almost covered with streaks of black, in all directions, fo as to make a very ftriking appearance. Both fexes wear bracelets of fuch beads as they can make themselves of small shells or bones. The women have them both upon their wrifts and ancles; the men upon their wrifts only; but to compenfate for the want of bracelets upon their legs, they wear a kind of fillet of brown worsted about their heads. They fet a particular value upon any thing that is red, and prefer beads even to a knife or hatchet.

Their chief food is shell-fish and seals. The former are collected by the women, whose business it is to attend at low water, with a basket in one hand, a stick pointed and barbed in the other, and a fatchel at their backs. They loosen the limpets, and other sish, that adhere to the rocks, with the stick, and put them into the basket, which, when suil, they empty into the satchel. The muscles are of a very sine slavour. When they cannot procure a sufficient supply of these, and the other shell-fish, necessity urges them to seek other refources; but as, from their want of ingenuity, they have so sew implements, and those so badly constructed for the purposes of catching and destroying animals, they are frequently reduced to the utmost diffress.

Their habitations are of the most rude and artificial structure, consisting of nothing more than a few poles, set up so as to incline towards each other, and meet at the top, forming a kind of cone, which resembles some of our bee-hives. On the weather side they are covered with a few boughs, and a little grass; and on the lee side, about one eighth of the circle is left open, both for a door and a fire-place. Of this kind were huts seen in a contiguous place called St. Vincent's Bay, in one of which the embers of a fire were still remaining.

The furniture feen was, if it may be fo called, a little grafs, which lay within-fide of a hovel, and ferved for chairs and beds. And of all the utenfils and implements, which necessity, or ingenuity, have concurred to produce amongst other lavage nations, here were only feen a basket to carry in the hand, a fatchel to hang at the back, and the bladder of some beast to hold wa-

ter, which the natives drink through a hole that is made near the top for that purpose,

Their weapons confift of a bow and arrow. Their bows are indifferently formed, but the arrows are extremely neat, being made of wood, and polifhed to the higheft degree. The point, which is of glass or flint, and barbed, is formed and fitted with wonderful dexterity. Some pieces of glass and flint, unwrought, were feen among them; belides rings, buttons, cloth, and canvas, with other European commodities. It was thence inferred, that they must sometimes travel to the northward, as it was many years fince any ship had been so far fouth as this part of Terra del Fuego. Our people observed that they shewed no surprize at their firearms, with the use of which they appeared to be well acquainted; for they made signs to Mr. Banks to shoot a seal, which followed the boat as they were going on shore from the ship. They have likewise darts, or rather harpoons, made of bone, and fitted to a staff with which they kill seals, whales, and other sish.

Their canoes were made of bark, and in each was a fire, over which the poor frozen creatures huddled themselves together. Captain Cook observes, that he could not suppose they earried a fire in their canoes for this purpose only, but rather that it may be always ready to remove on shore wherever they land; as, let their method of obtaining a fire be what it may, they could not always be sure of finding suel that would kindle from a spark. They likewise carried in their canoes large seal hides, which Captain Cook judged was to shelter them when at sea, to serve as coverings to their huts on shore, and to be used occasionally as fails,

No quadrupeds were feen in this country, but fealions, feals, and dogs. It was deemed remarkable that these dogs barked, which those that are originally bred in America do not. This is adduced as a further proof that the people seen here by our voyagers, either immediately, or remotely, communicated with the Europeans. When Mr. Banks ascended the highest hill, in his expedition through the woods, he saw the footsteps of a large beaft imprinted upon the surface of a bog, though he could not, with any probability guess of what kind it might be.

The wild fowl are fea-pies, shags, hawks, vultures, ducks, geefe, and a large bird called the Port Egmont hen. There were ducks called by our people race-horses, on account of the great swiftness with which they run on the water; for they cannot fly, the wings being too short to support the body in the air. The geete here are much smaller than those of England, but in slavour equally agreeable. They have short black bills, and yellow feet. The gander is quite white; the semale is spotted black and white, or grey, with a large spot oneach wing. Here are several other aquatic birds, and some land ones, but not many of the latter,

Scarce any fifth were seen, nor could our people catch any with their hooks that were fit to eat. The shell-fish were limpets, clams, and muscles, and were found in abundance.

Among the infects, which were not numerous, there were neither gnat or mufketo, nor any other species that was either hurtful or troublesome, which in an uncleared country, was deemed extraordinary. During the snow blasts (which happened every day while our people were here) they hide themselves; and the moment it is fair weather appear again, as nimble and vigorous as the warmest weather could make them.

The labour of the botanists was amply rewarded; for they found a vast variety of plants, the far greater part of which were wholly different from any they had seen or heard of before, but cannot be enumerated here. One was found particularly beneficial: this was the wild celery, as it contained antiscorbutic qualities, which may be of great benefit to the crews of such ships as may hereafter visit this place. Captain Cook ordered large quantities of this plant to be put into the seamens soup, which, thus medicated, produced the same salutary effects, which seamen generally derive from vegetable

diet, after having been long confined to the use of salt II posed of rocky mountains without the least appearance provisions.

The tree which produces the winter's bark is known by its broad leaf, shaped like the laurel, of a light green colour without, and inclining to blue within. The bark is eafily stripped with a bone or slick, and its vir-tues are well known. It may be used for culinary purpofes as a spice.

There is also a species of birch tree, the stem of which is from 30 to 40 feet high, and from two to three feet in diameter; fo that in case of necessity they would supply a thip with topmasts. They are a light white wood,

bear a fmall leaf, and cleave very ftrait.

Cranberries grow here on a bufly plant, and have a bitterish taste, rather insipid, but may be eaten either raw or in tarts. They are fometimes eaten by the

natives.

The natives do not appear to have among them any government or fubordination: no one is more respected than another, yet they feem to live together in the utmost harmony and good fellowship. No appearance of religion is discovered among them, except the noises that have been mentioned, and which are supposed to be a fuperfitious ceremony, merely because it cannot be re-ferred to any thing else. Upon the whole, these people appear to be the most destitute and foloro, as well as the most stupid, of all human beings; the very outcasts of nature, who fpend their lives in wandering about the dreary waftes where two of our people perished with cold in the midft of fummer, with no dwelling but a wretched hovel of fticks and grafs, which will not only admit the wind, but the fnow and rain, almost naked, and destitute of every convenience that is furnished by the rudest art, having no utenfil even to dress their food; yet they are contented. They seem to have no with for any thing more than they poffers; nor did any thing offered them by our voyagers appear acceptable, except beads, as an ornamental superfluity of

Captain Cook expresses his surprize that these people do not clothe themselves better, since nature has certainly provided materials. They might line their feal fkin cloaks with the fkins and featners of aquatic birds; they might make their cloaks larger, and employ the fame fkins for other parts of cloathing; for it cannot be fupposed they are scarce with them. They were ready enough to part with those they had to our peo-ple, which they would hardly have done had they not known where to get more. These people appear doomed to live in one of the most inhospitable climates in the world, without having fagacity enough to provide themselves with such conveniences as may render life, in some measure, more comfortable; and, strange as it may appear, Captain Cook remarks, that the cloathing they wore, when he was here in the fummer, was fearcely fufficient to prevent their perifling with cold even in that feafon. What, then, mult they feel from the extreme rigour of their clime in the winter? In a word, they are, without exception, the most dejected, miferable, and uncouth beings on the face of the earth.

It is worthy of observation, that almost all writers who have mentioned the island of Terra del Fuego describe it as destitute of wood, and covered with fnow. In the winter it might be, and those who saw it that feafon might, perhaps, be easily deceived by its appearance into an opinion that it was destitute of wood. Lord Anfon was there in the beginning of March, Captain Coofk in the beginning of January, (that is the first time) which answers to our July a circumstance that may account for the difference of his description from that of Captain Cook.

Captain Cook, in his fecond voyage, when he left New Zealand, failed again to Terra del Fuego, and gives the following description of several parts on the fouth-west coast, which materially differ from those he had visited before. He observes, that this is the most defolate coast he ever faw. It feemed entirely com-

of vegetation. A These mountains terminate in horrid precipices, whose craggy fummits spire up to a vast height, fo that hardly any thing in nature can appear with a more barren and tavage afpect than this part of the country. The inland mountains were covered with fnow, but those on the fea coast were not.

To a lofty promontory, which terminated in two high towers, within which was a hill shaped like a sugarloaf, Captain Cook gave the name of York Minster. Leaving this fpot they arrived in Christmas Sound, and came to anchor in an harbour diffinguished by the name of the Devil's Bason. It is a very secure place, but nothing could be more gloomy; for the vast height of the rocks which encompais it deprive great part of

the harbour of the meridian fun.

On the shore to the westward were found other harbours, in all of which were fresh water and wood for fuel, but from the little tufts of bushes the whole country appeared as a barren rock, doomed by nature to perpetual sterility. The sea coast is composed of a number of large and small islands. On one of the latter our people, in an expedition up the country, found feveral huts which had lately been inhabited: hear them grew a good deal of cellery, which was ga-thered and taken on board the ship. They met with thered and taken on board the thip. They met with little game, one duck, three or four thags, and about that rumber of rails, or fea pies, being all they got.

The island under which the ship was brought to anchor Captain Cook called Shag Island, from observation made of the shags breeding in great numbers in cliffs of the rocks. Our people shot some of the old ones, but could not come at the young ones, which are by far the best eating. They saw some geete, of which they killed three, which proved highly acceptable.

One of the lieutenrnts fent to explore the east fide of the Sound, having informed Captain Cook that the land opposite the spot where the ship was stationed was an island, and that without the island lay a cove in which were many geeie, two shooting parties went thither the next day. Captain Gook's party went by the fouth-west side. As soon as they got under the island which obtained the name of Goofe Island, they found plenty of shags in the cliffs, and on the fouth fide many geese. It happened to be moulting time, and most of them were on thore for that purpole, and could not fly. There being a very great furf, the parties found much difficulty in landing, and very bad climbing over the rocks when they were landed; fo that hundreds of the geefe cicaped them, fome into the fea, and others up into the island. By some means or other they got 62, with which they returned on board, all heartily tired. but the acquifition overbalanced every other confideration, and they fat down with a good appetite to fupper on part of what the preceeding day had produced. The other party had before brought on board 14 geefe; fo that the Captain was able, the next day, to make a distribution to the whole crew, which was the more acceptable on account of the approaching festival, this being the 24th of December; and had not Providence thus fingularly provided for our voyagers, the Christmas fare must have been falt provision.

During the absence of the Captain, a number of the natives had been along-fide the ship, and some on board. They feemed well acquainted with Europeans, and had amongst them some of their knives. On another visit, the 25th, Captain Cook found them to be of the fame nation as those he had before feen in Success Bay, on his former voyage. They were observed to be very fond of train oil, as they, and every thing they had, fmelt of it most intolerably. Captain Cook ordered them some biscuit, but they did not appear to be so fond of it as he had been told. They were much pleafed when he gave them some medals, knives, and other articles

of hardware.

The natives all retired before dinner, and did not wait to partake of the Christmas fare. Indeed, the Captain was of opinion, that they received no invitarance orrid vaft opear art of vered

tion, and for a very obvious reason, as their filthy persons, and their nauseous stench, were enough to spoil the appetite of any European; and that would have been a most mortifying disappointment, our people not having had such a good fare for some time. Roast and boiled geese, goose-pie, &c. was a treat little known to them; and the cabin guests had yet some Madeira wine left, which was the only article of provision that was better for keeping. Capt. Cook observed at the close of the day, that their friends in England did not, perhaps, celebrate Christmas more chearfully than they did in this remote part of the world.

The day following the natives paid our people another vifit; and the Captain humanely feeling, when he faw these poor wretches trembling and naked on the deck, gave them some baize and canvas to cover themselves.

A party went out again to fhoot geefe, the weather being fine and pleafant. They proceeded round by the fouth-fide of Goofe Island, and picked up in all 31.

From the feftival celebrated at this place, Captain Cook gave it the name of Christmas Sound. The en-

trance, which is three leagues wide, is fituated in latitude 55 deg. 27 min. fouth, and longitude 70 deg. 16 min. weft, 10 leagues from St. Ildefonfo Isle which, are the best land-mark for finding the found. York Minster, Captain Cook observes, will hardly be known by a stranger, from any description that can be given of it, because it alters its appearance according to the different fituations from which it is viewed. Besides the Black Rock, which lies off the end of Shag Island, there is another about midway, between this and the east shore. He adds, that a copious description of this found is unnecessary, as very sew would derive entertainment or benefit from it.

HAVING thus given an ample description of all the American and West-Indian Islands, with every curious incident we could procure from the latest and most authentic navigators (particularly our celebrated countryman Capt. Cook) we shall now proceed to give a description of the continent of South America, in which, as well as in other parts of the world, we shall insert every new discovery; including all those of our celebrated countryman Captain Cook.

C H A P. XII.

SOUTH AMERICA.

INTRODUCTION.

THIS immense track, extending from the Ishmus of Darien to Cape Horn, in form of a triangle, derived the general appellation of Peruviana from the Spaniards; though other nations, particularly the Portuguese, possess a considerable part of it. On one side the Spanish territories reach no farther than from the North Sea to the Equinoxial, and commence again at Rio de la Plata on the other, the fine country of Brazil occupying the middle space; and from the River of Plate quite to the Straits of Magellan, the Spaniards rather claim than possess a real dominion.

Such a profusion of wealth has accrued both to the Spaniards and Portuguese from their respective territories in this part of the globe, that they seem to have no farther inducement to extend either their conquests or discoveries. From this cause a prodigious expanse of interior parts, comprehending near 2000 miles from east to west, and about 1000 from north to south, remains unexplored, and consequently in possession of the natives; though from the produce of those parts which are known, there is the greatest reason to suppose, they abound in the most choice and valuable commodities, as gold, silver, gems, drugs, fruits, cattle, corn, and various other articles.

The Spanish dominions in South America are under two governors, stiled viceroys and captain-generals, subordinate to whom are several audiences, as those of Panama, Terra-Firma, Chuquisaca, Quito, Lima, Los Charcas, and Chili, consisting each of a president and a certain number of counsellors, appointed by the king, with the inserior officers dependent on them.

Brazil, the most important part of the Portuguese dominions in south America (as they possess besides only two or three single islands) for the better regulation of government, is divided into 15 provinces, called Capitaneas, or Capitainries, the whole forming a principality, which gives title to the presump-

tive heir of the crown of Portugal. There are only fix of these capitainries annexed to the crown. These are offices of great honour and profit, and therefore objects of pursuit among the first grandees of Portugal. They are, as in other states, presented to the savourites of the monarch, and productive of good or ill, in proportion to the character and disposition of those on whom they are conferred.

those on whom they are conferred.

Those parts of the continent of South America belonging to the French and Dutch, are very inconfiderable, when compared with the opulent and extensive dominions of the Spaniards and Portuguese.

As we proceed in our description of South America, we shall point out the nations to which the various parts respectively belong, with every particular worthy of description. But previous to this, it may not be improper to insert the following Table, shewing, at one view, the respective parts into which the whole is divided.

C H A P. XIII.

SPANISH DOMINIONS IN SOUTH AMERICA.

SECTION I.

TERRA-FIRMA, OR CASTILE DEL ORO.

THIS province is fituated between the equator and 12 deg. north latitude, and between 60 and 82 deg. weft longitude, being about 1400 miles in length, and 700 in breadth. It is bounded on the north by part of the Atlantic Ocean, on the eaft by Guiana; on the weft by New Spain and the Pacific Ocean; and on the fouth, by Peru, and the country of the Amazons. It derived the name of Castile del Oro, or the Golden Coast, from the great quantity of gold it contained.

The Isthmus of Darien, or Terra-Firma Proper,

The lithmus of Darlen, or Terra-Firma Proper, joins North and South America. The climate of Terra-Firma, especially in the northern divisions, is very fultry during the whole year. From the month of May to the end of November, there is an almost continual succession of thunder, rain, and tempest. The excessive heats raise the vapour of the sea, which is precipitated in such rains as seem to threaten a deluge. From the middle of December to the middle of April, the rains cease, and the weather becomes more agreeable.

The foil of this country is very different, the inland parts being rich and fertile, and the coafts fandy and barren. The productions are Indian corn, balms, gums and drugs, feveral forts of fruit, fugar, tobacco, various kinds of dying woods, precious ftones, particularly emeralds and fapphires, venifon, and game. Great numbers of cows and hogs are fed in the meadows. The mountains abound with tigers, and numbers of other wild beafts. In the forefts and woods are monkies of various colours and fizes. The flesh of them, in general, but that of the red in particular, is highly valued by the Negroes; and it is faid that, in many places, not only the Negroes, but the Creoles, make no fcruple of eating them.

Many birds are found in this country, whose plumage is particularly beautiful and brilliant. But the most remarkable is the toucan, or preacher. The bill of this bird is variegated with all those bright colours which adorn the plumage of other birds. It is called the preacher from its custom of perching on the top of a tree, and making a noise resembling ill articulated founds. The rivers, sea, and lakes, abound with a variety of fish.

The Isthmus of Darien swarms with reptiles and infects of divers species. Many of them are baneful to the inhabitants, and others objects of curious and philosophical speculation.

The trees most remarkable for their dimensions are the caobe, the ceder, and the mania. The manzanillo tree is particularly remarkable: it bears a fruit refembling an apple, but which, under this specious appearance, contains a most subtile poison, against which common oil is found to be the best antidote. Such is the malignity of this tree, that if a person sleeps under it, his body fwells, and he is racked with the feverest tortuses. The beafts, from instinct, always avoid it. In the woods about Carthagena is a species of willow, particularly known on account of its fruit, called Habella de Carthagena, or the bean of Carthagena. This bean contains a kernel refembling an almond, but less white, and very bitter. This kernel is an excellent remedy for the bites of vipers and ferpents, which are very common throughout this country. Those who frequent the woods, therefore, usually take a little of this kernel fasting, and then repair to their work, without any apprehension of danger.

There were once a number of gold mines in this country, but they are now in a great measure exhausted,

Terra-Firma is a very mountainous country. Terra-Firma Proper, in particular, confifts of prodigious high mountains and deep vallies, flooded more than half the year. The mountains in the province of Carthagena and St. Martha, according to Dampier, are the highest in the world, being seen at sea 200 miles off, From these run a chain of hills, of almost equal height, quite through South America, as far as the Straits of Magellan, called the Cordilleros des Andes. The province of Venezuella, and the district of the Caraccas, are likewise very mountainous. Some of the mountains in the province of Popayan contain volcanos; but towards the shore of the Pacific Ocean the country is low and marshy. The whole is watered by a great number of rivers, the principal of which is that of Oroonoko; and here are many gulphs, bays, &c. The provinces of this country are thus divided:

Terra-Firma Proper, which lies in the form of a crefcent about the Bay of Panama, being the ifthmus which joins South and North America, is 300 miles in length, but only 60 in breadth, where the ifthmus is narrowest. It is tolerably fruitful, and abounds in gold and pearls. The principal places are,

Panama, which, in 1737, was entirely confumed by fire, but has fince been rebuilt in a neat, though not magnificent, manner. It is strongly fortified and gar-rifoned, and the walls mounted with large cannon. Here is the residence of the governor of the province, and the feat of a royal audience, with a convenient harbour, well fecured against storms by a number of furrounding islands. At the bottom of the sea are found numbers of pearls, and the oysters are exceeding delicious in which they are found. This kind of fishery is very beneficial to the inhabitants of all the islands in the bay; and there are few persons of substance about Panama, who do not employ a part of their flaves in it at leaft. The flaves thus employed must be expert swimmers, and capable of holding their breath a long time. During the season, eight, ten, or twenty of them fet out, under the command of an officer, in a boat, from the islands, where they have huts built for their lodgings, to fuch parts of the bay as are known to produce pearls, and where the depth of the water is not above 10, 12, or 15 fathoms. Here they come to an anchor; and the negroes, having a rope fastened round their bodies, and the other end to the fide of the boat, take with them a fmall weight, to accelerate their finking, and plunge into the water. On reaching the bottom, they take up an oyster, which they put under the left arm; the fecond they hold in their left hand, and the third in their right. With these three oysters, and sometimes another in their mouth, they rife to breathe, and put them in a bag. When they have rested themselves awhile, they dive a fecond time; and thus consinue till they have either completed the task, or their strength fails them. Every one of these negro-drivers is obliged daily to deliver to his master a certain number of pearls; fo that when they have got a fufficient number of oyfters in their bag, they begin to open them, and deliver the pearls to the officer, till they have made up the number due to their master; and if the pearl be but formed, it is fufficient, without regard to its being fmall or faulty. The remainder, however large or beautiful, are the negro's own property; nor has the master the least claim to them, the slaves being allowed to fell then to whom they please; though the master generally purchases them himself at a very finall price.

Besides the toil of this sishery, from the oysters adhering strongly to the rocks, the negroes are in no small danger from some kinds of fish, which either seize them.

them, or run against them so violently, as either to kill, or crush them against the bottom. Every negro, to defend himself against these animals, carries with him a sharp knife, with which the fish being struck, immediately slies off. The officers keep a watchful eye on these voracious creatures, and, on discovering them, shake the ropes fastened to the bodies of the negroes, that they may be upon their guard. Many, on the diver's being in danger, have thrown themselves into the water, with the like weapon, to affift in his defence: but all their dexterity and precaution have frequently not been fufficient to protect the diver from being devoured by these fish, or losing a leg or an arm by their bite.

Porto-Bello is situated close to the sea, on the declivity of a mountain, which furrounds the harbour. This harbour is so large, deep and fafe, that Columbus gave it the name of Porto-Bello, or Fine Harbour. The governor is always a military officer, subordinate to the prefident of Panama. The town is but thinly inhabited, owing to its noxious air, and contains not more than 200 wooden houses, which most of the inhabitants let when the galleons are here, and make any temporary shift for themselves. At the east end of the town there is a quarter called Guinea, where all the negroes, and many of the mulattoes refide. During the fair, while the fleet is here, the place becomes extremely populous, and barracks are erected for the ships crews, but taken down after the departure of the galleons. Formerly the fair was not limited to any particular time; but as a long stay here was found to be very prejudicial to the health of the traders, an order was made by the king of Spain, that it should not continue above 40 days. Once the En-glish were allowed to fend a ship hither annually, which turned to very good account; but they have fince been abridged of that privilege.

In the year 1739, the gallant Admiral Vernon, with fix ships only, took this place, demolished the forts, and difmantled the fortifications.

The furrounding country is full of forests and mountains. One of the latter, named Capira, which is extremely high, ferves as a barometer to the people; for by the appearance of the clouds on its fummit, they can prognosticate what weather will enfue, the changes of which are very fudden, and frequent. The heat here is excessive, the torrents of rain impetuous, and the storms of thunder and lightning dreadful. So that not only the people die very fast, but the cattle brought from distant places soon lose their slesh, and become scarce eatable.

In 1695, a Scotch company having obtained, from the English government, permission to trade to Africa and the East and West Indies, planted a colony on the Ifthmus of Darien, near the north-west point of the gulph. Here a fortress was erected, called New-Edin-burgh, and the circumjacent district was termed Caledonia. The Indian princes were pleased at this, as they thought, by the help of the Scotch, to expel the Spaniards. For some time the colony flourished; but at last the company was ruined, by the jealousy of the English East India Company, and the remonstrances of the court of Madrid.

Carthagena produces some valuable gums, balms, and drugs, but no mines of gold or filver, nor any

great quantity of corn or cattle.

Carthagena, the metropolis of the province, is not only a fine opulent city, but a strong fortress, situated on a fandy island. The harbour lies between the island and the main, and the entrance is at the fouth-west end; the other passage, called Boccha-chica, having been filled up by an order from the court of Spain fince the attack made upon the town in the year 1741, by Admiral Vernon and General Wentworth. To the eastward the town has a communication, by means of a wooden bridge, with a large suburb, called Xexemani, built on another island, which is joined to the continent by a bridge of the same materials. The fortifications, both of the city and suburbs, are constructed in

the modern fashion, and built with free-stone; and, in time of peace, the garrison consists of 10 companies, besides the militia. The city and suburbs are well laid out, and the streets straight, broad, uniform, and well The houses are built of stone or brick, with balconies and lattices of wood, which is more durable in this climate than iron, the latter being fooner corroded by the acrimonious quality of the nitrous atmofphere. The city is populous, though most of the in-habitants are descendants of the Indian tribes; but it is by no means opulent, compared with many other cities in South America, the country producing no

At a small distance from the suburb of Xexemani. on a hill, is a fort called Lazaro, commanding both the city and suburbs, and affording a very extensive and agreeable prospect over the sea and land.

The government of Carthagena was independent of any other till the year 1739, when the viceroy of New Granada was appointed. It extends about 53 leagues from west to east, and 85 from south to north, containing several fruitful vallies, called by the natives favannahs, in which are many fettlements of Europeans, Spanish Creoles, and Indians. The Bay of Carthagena is the first place in America at which the galleons touch.

The climate is hot and unhealthy; and, among other diseases, the black vomit and leprosy are particularly statal to Europeans. The Guinea worm is very troublefome, as it occasions painful tumours in the muscles of the legs and thighs; and another infect, peculiar to this country and Peru, is still more dreadful; it is called pigue, and, being extremely finall, is scarce visible to the naked eye. It breeds in the dust, and infinuates itself into the soles of the feet, giving exquisite pain, and frequently attended with imminent danger.

The province of Santa Martha is 200 miles long, and 140 broad, very mountainous, but produces gold, jewels, marble, falt, &c. The capital of the fame name, on a branch of the Rio Grande, is the see of a bishop, and residence of a governor.

Rio de la Hacha is a pleasant and sertile province. It has a pearl fishery, and mines of jasper and chalci-dony. The capital, which gives name to the pro-vince, contains nothing remarkable.

Venezuela, which includes the district of Caraccas, lies on the North Sea. It is populous and fertile, but rather labours under a scarcity of water. The capital of the same name is the see of a bishop, and the residence of a governor; and Caraccas is a large, populous inland town.

New Andalufia, including the districts of Commona and Paria, is fertile, and rich in gums, drugs, medicinal plants, fugar, tobacco, and feveral forts of va-luable timber. Comana, or New Cordulia, is the capital, but the town of St. Thomas is superior to it.

New Granada, fometimes called Santa Fé, and Caftile del Oro, is an inland province, of great extent, beautifully diverlified with mountains and vallies. The mountains contain gold, filver, and emeralds; and the vallies produce corn, cattle, roots, and fruits, with great quantities of guaiacum, balms, gums, drugs of various kinds, with other rich articles of commerce. Fanta Fe de Bagota, the capital not only of this province, but of all Terra Firma, and the feat of the viceroy, of the royal audience, and an arehbishop, is a large, populous, opulent, and well built city, fituated on the banks of a lake, with alters at flated dif-tances, higher than houses, and richly adorned.

Guiaquil is a confiderable commercial town, on a river of the same name: and Paita, a sea-port town, was facked by the late Lord Anfon in 1741.

The original natives of Terra Firma are bold and warlike; and as they have almost impregnable and inaccessible fastnesses, and bear an inveterate hatred to the Spaniards, they never have been, and it is probable never will be, entirely fubdued. They have lank, coarfe, long blackhair. Their natural complexion is a copper colour. The inhabitants are differently dreffed according to the Spanish fashion. The men wear a

cassock without folds, descending to the knees, a large cape, and seeves open at both sides. It has button-holes, and two rows of buttons. The habits of the better fort are made of embroidered stuffs. The handicrasts wear a blue stuff, of the manufacture of the country, but in make it differs not from the other. The Indians of distinction are singular in wearing a kind of trowfers of white cotton, which descend from the waist to the middle of the leg. The barbers here are shiftinguished by the sineness of their linen, and elegancy of their dress in general. They have shirts without sleeves, about the neck they have a kind of black collar, with a lace of four singers breadth, which forms a fort of fringe that falls on the stomach and shoulders. They wear shoes with gold or silver buckles, but no stockings.

The women wear the Faldelin, a species of stays, or rather jumps. A shift which descends only to the waist. A bay mantle which incloses the upper part of the body, consisting of an ell and a half of that stuff, and their whole dress is ornamented with rich laces. The dress of the labouring women is not distinguishable from that of the ladies, but by its inferiority, the fashion being the same. A Mongrel, or Creole, is known by the superiority of his habit and his ingenuity. The Indian peasant wears a bay mantle; and the common native Indian a piece of fackcloth

fastened over the shoulders by two pins.

There is another species of Indians in this country, of rather a fair complexion, delicate habit, and smaller stature than the ordinary Indians. They are particularly distinguished by their large, weak, blue eyes, which, unable to bear the light of the sun, see best by moon-light, from which they are called moon-eyed Indians.

The government of Terra Firma is on the fame

footing with that of Mexico.

The crucities and ravages committed by Pedrorias and others who first reduced these Provinces under the crown of Spain, almost exceed belief. Pedrorias and his successor did not destroy less in Terra Firma only than \$00,000 people; and plundered the country of prodigious quantities of gold. The governor and his officers, every day, invented new torments to make the Indians did over their gold; some they racked, others they burnt by inches, till they expired in torments. Many thousands were destroyed on the coast of New-Andalysia, by being obliged to dive for pearls beyond their strength. They kept packs of great mastiffs on purpose to hunt and tear in pieces the Indians; and would often kill one without any offence given.

The greatest prince of the country, named Bagota, from whom the capital city was afterwards called Santa Fe de Bagota, after he had brought in a prodigious quantity of gold, by dispatching expresses to every part of his dominions, was so tortured to make him produce more, that he expired under the hands of his

merciless persecutors.

We shall, for the entertainment of our readers, conelude our description of Terra Firma with an account of the famous expedition to Panama, made by the celebrated Buccaneer captain (afterwards Sir Henry)

Morgan

This enterprifing genius, who was a gentleman of a good family in Wales, fetfail from Jamaica, on this expedition, with nine fail of ships and sloops, well manned with active and bold failors. Arriving on the coast of Terra Firma, he let his people understand that his first design was against Porto Bello: some of them objecting that his force was too small to reduce so important a fortress, he boldly replied, "If our numbers are small our hearts are great; and the sewer we are the greater will be our share of the plunder." He soon made himself master of a castle which defended the harbour, and this capture was succeeded by the furrender of the city; but the governor, and many of the principal people, having retired into another castle with their treasure, effects, the church plate, &c. kept

up a brisk fire on the Buccaneers. This occasioned Morgan to hit upon the following stratagem: He feized all the friars and nuns in the town, and compelling them to march before him up to the very walk, he obliged them to fix the scaling ladders; in doing which many were killed by the fire of their friends, as well as enemies, crying for mercy in vain: at length the Buccaneers scaled the walls, took the place by storm, and afterwards employed 15 days in removing the immense treasures on board his ship. He then obliged the governor to procure 100,000 pieces of eight, which had been carried off, in order to ransom the town from being burnt.

Having intelligence that the governor of Panama was in full march against him, he possessed himself of a difficult passage, and there totally defeated him.

Morgan now difmantled the forts, took some of the best artillery on board his ships, and returned to Jamaica, it being computed that the Buccaneers brought back with them 250,000 pieces of eight, besides a great deal of other rich effects; but the seamen soon consumed every shilling that came to their share, and made money more plentiful in that island than ever it had been before.

The captain, having gained great reputation by the Porto-Bello expedition, the seamen crowded to be admitted to serve under him: having assembled 500 of them, therefore, he sailed to Tortugua, a little island near the northern coast of Cuba, where he was joined by a great many seamen more, to the number of 2000, whom he employed in hunting and salting up beef, in the island of Hispaniola, to victual his sleet; and being now ready to sail, he divided his sleet; and being now ready to sail, he divided his sleet; consisting of 37 ships, into two squadrons, constituting admirals and other officers, to whom he gave commissions to commit hostilities against the Spaniards, declaring them enemies to the crown of England, and caused articles to be signed by his officers, wherein every man's share of the prizes which should be taken was specified, referving an hundredth part of them only to himself.

Their first enterprize was against the island of Providence, which they retook from the Spaniards again; and while the fleet lay here he fent Brodley, his viceadmiral, with four ships and 400 men, to take the castle of Chagre, at the mouth of the river of that name, which they fortunately reduced, though it was very obstinately defended. Morgan receiving advice of the fuccess of his squadron at Chagre, followed them with the rest of his fleet, and leaving a garrifor in the castle, selected 1200 men, with whom he marched over the ifthmus towards Panama, and the country being destroyed before him, his men underwent incredible hardships, as well for want of provisions, as from the badness of the roads, which lay over rocks, mountains and morasses, almost impassable, and at length was obliged to fight his way through an army, which the governor of Panama, had affembled to oppose him. Ascending a mountain on the ninth day, they obtained a view of the South Sea, and the bay of Panama, at which they were so overjoyed, that they seemed to defpife all danger, threw up their caps, founded their drums and trumpets, and shouted as if they had been already masters of the city, and encamped, or rather lodged, for they had no tents with them, in view of the town, defigning to attack the place the next morning, but were prevented by the governor's marching out against them at the head of four regiments of foot and two fquadrons of horse, with whom Morgan engaged, and within two hours defeated, when they fled, leaving 600 of their men dead upon the field of battle; and the lofs on the fide of the Buccancers was very confiderable: however, following the enemy close at the heels, they scaled the walls without making any breach in them, for indeed they had no artillery, and became mafters of the place that day. Morgan apprehending that his men would be fo elated with fuccefs, that they would get drunk now they were come into plentiful quarters, gave out that all the wine was poi-

foned, and proceed to the city to fecure whole city appeare in feveral places at fome of Morgan's tain he gave orders that the Spaniards treasures laid up th Buccaneers; nor ca burn the town before plunder, and destr with fo much haz that was, it is gener burning several da itanding. foned, and proceeded to place guards at all the avenues to the city to fecure his conquest, when on a sudden the whole city appeared in flames, having been fet on fire in feveral places at the fame instant; which though fome of Morgan's enemies charge on him, it is certain he gave orders for extinguishing it; others suggest that the Spaniards fired it themselves, to prevent the treasures laid up there falling into the hands of the Buccaneers; nor can it be supposed that Morgan should burn the town before he had possessed himself of the plunder, and destroy the rich prize he had obtained with fo much hazard and difficulty. But, however that was, it is generally agreed that the city continued burning several days, and very few houses were left standing. They related that 2000 of the houses inhabited by the principal people were built with cedar, and that there were 5000 more of the inferior tradefmen, with several beautiful churches and monasteries in the place, before this accident, it being the magazine of all the treasures of Chili and Peru, which were annually laid up here, in order to be transported to various parts of Europe.

The foldiers afterwards found great quantities of plate and money melted down among the ruins, and more hid in wells, or buried, and took 200,000 pieces of eight out of a ship that lay at anchor in the har-

Morgan having remained near a month at Panama, and collected the ranfom his prisoners had agreed to pay, loaded 200 beafts with the treasure he had gotten, and returned to Venta de Cruz, where he put it into boats, and sent it down the river Chagre to the castle of that name: but the Buccaneers of the French and Dutch nations murmured, that there did not more than 200 pieces of eight fall to the share of each private man, and charged their admiral with concealing the most valuable part of the prizes; whereupon the foreigners left him, and sailed to the ssands of Tortuga and Hispaniola to join their countrymen; and Morgan, after he had blown up the castle of Chagre, and the fortifications about it, returned to Jamaica with the rest of his sleet.

SECTION II.

PERU.

THIS country was discovered and conquered by the Spaniards. It does not seem to have been known by any general name when they arrived here; but it is said that the discoverers, meeting with one of the natives on the coast, and demanding what country it was, the Indian answered Peru, or Beru, that is, What do you say? The Spaniards, apprehending he understood them right, concluded the name of the country was Peru, by which it has been called from that time to the present. It was governed by a viceroy, whose jurisdiction likewise extends over Chili, Jucatan and Paraguay.

Peru is situated between the equator and 25 deg. of south latitude, and extends from 60 to 75 deg. of west longitude, being about 1500 miles in length and 500 in breadth. It is bounded by Terra Firma on the north; on the east by the mountains called Cordelleros des Andes; on the south by Chili, and on the west by the Pacific Ocean.

Many rivers rife in the Andes, and run through this country, among which are the Grande, Oroonoko and the Amazones, supposed to be the largest river in the world, either with regard to the length of its course or the depth of its water.

There are some waters in Peru, which, in their course, turn into stone; and here are also sountains of liquid matter called Coppey, resembling pitch and tar, and used by seamen for the same purposes.

tar, and used by seamen for the same purposes.
Towards the Pacific Ocean the coast is high. Thirty
miles from thence within land a chain of mountains extends a considerable way, and about 80 miles farther
No 50

are the Cordilleros des Andes, the upper parts of which are continually covered with snow, and the air is so subtile as to be unsit for respiration. It never rains in those parts of this country which lie contiguous to the sea coast, except near the equator. The whole is well watered, the low grounds are fertile, and this is the only country between the tropics that produces wine.

In one part of Peru are mountains of a stupendous height and magnitude, having their summits continually covered with snow. In the inlaid parts, and but the banks of rivers, the soil is in general sertile; but

along the sea coast it is a barren fand.

The most remarkable animals of this country are, the Peruvian sheep, called pacos or huancui. They are of the bigness of a stag, and resemble a camel. body is covered with a course kind of wool: they are very tractable, and were formerly the only beafts of burthen among the Indians. Their flesh is very good meat, and esteemed as innocent as a chicken. as white as veal, pleafant to the palate, and eafy of digestion. Their height is from four feet to four and a half. They generally carry an hundred weight; and walk, holding their heads up, with wonderful gravity and majesty, and so regular a pace, that no beating will make them alter it. At night it is impossible to make them move with their burthen; they lie down till it is taken off, and then go to graze. Their com-mon food is a fort of grass, somewhat like a small rush, with which all the mountains are covered. These sheep eat little, and never drink; so that they are very eafily kept. The Spaniards use them in the mines to carry the ore to the mills. The vicunas (another species of sheep) are shaped like a pacos, only they are smaller and lighter. The Spaniards call them Infinaller and lighter. The Spaniards call them Indian goats, because they resemble that animal. Their wool is very fine, and much valued: befides, the be-zar ftone, which is faid to expel poison, and to perform many great cures, is found in them. Their deer are much lefs then ours. They have not many wild beafts; and fuch as they have are not fierce or dangerous. The cattle imported from Europe are much increased; and most of them run wild, and are hunted like other game. The Peruvians have no tame fowl but the nuana, which fomewhat refembles the duck, but is much larger.

A very valuable article of their produce and commerce is the quinquina, or Jefuits Bark, which grows in the mountains of Potofi, and alfo in the province of Quito. It is about the fize of a cherry-tree, the leaves round and indented, and it bears a long reddift flower. The most useful tree here is called maguey, which at once supplies a delicious drink, honey, vinegar, timber, hemp and thread, the two last being made from the leaves, stalks, &c. Needles are made of the prickles, and the fruit converted into a kind of soap. Rhubarb, tamarinds, sarsaparilla, dragons blood, storax, guaiacum, bananas, melons, &c. are other vegetable productions of Peru. Here are European corn and fruits in plenty, but the principal part of the bread is made of cassav root; but most of that balsam which bears the name of Peru comes in fact from Mexico.

That valuable article of the commerce of this country, cochineal, was formerly supposed to be the fruit or seed of some particular plant, but now is ascertained to be an infect. It is bred on a plant called Opuntia, or Prickly Pear, which consists wholly of thick succulent oval leaves joined end to end, and spreading out on the sides in various ramifications. The flower is large, and the fruit refembles a sig; this is full of a crimson juice, and to this juice the cochineal owes its colour. When the rainy seasons come on, those who cultivate this plant cut off the heads, which abound most with such insects as are not arrived at their full growth, and preserve them very carefully from the weather and all other injuries. These branches, though separated from their parent stock, preserve their juices for a long time, and this enables the insect not only to live till the rains are over, but to grow to its full size.

6 Y

and

and be in readiness to bring forth its young as soon as When this time the inclemency of the feafon is past. When this time comes on, they are brought out, and placed upon the proper plants, disposed in little nests of some mostly substance. By the enlivening influence of the fresh air, they bring forth in three or four days at farthest, when the young, scarce bigger than a mite, run about with wonderful celerity, and the whole plantation is immediately peopled. What is fingular, this animal, folively in its infancy, quickly lofes all its activity, and, attaching itself to the least exposed, and most succulent part of the least, clings there without ever moving. It as remarkable, that it does not, at least in any visible manner, injure the plant, but extracts its nourishment by means of its proboscis, through the fine teguments of the leaves. The males of this species of infect, differ greatly from the females, than which they The males, in fact, are of no value, the females only being gathered for use. The value of the drug chiefly consists in the method of killing and drying the infect. The first is by dipping the basket, into which they are gathered, into boiling water, and afterwards drying them in the fun; the second by drying them in ovens; and the third by drying them on cakes of maize, which are baked upon flat stones. The last is the worst kind. One admirable quality of this drug is, that, though it belongs to the animal creation, it never decays. Without any other care than having been put into a box, some have been known to keep 60, and even an 100 years, and retain their quality. It is used in dying all the several kinds of the finest scarlet, crimson, and purple. Gold is found in every province of Peru; and there are abundance of filver mines, of which the most rich are those of Potosi, discovered in 1545. The quickfilver mines, near Lima, were discovered in 1567; and in 1571 the Spaniards first began to refine their filver with mercury.

The natives of this empire, in general, acknowledge the dominion of Spain, and appear (at least outwardly) to profess the Roman Catholic persuasion. They are, however, very much oppressed by the Spaniards in

The native Peruvians are of a middling stature, have olive complexions, and black hair. When they were first conquered, their manufactures were woollen and cotton cloths, which were wove and dyed with all manner of colours; but none were permitted to wear a variegated garment, except those of the blood royal. Their carpets were made of the wool of their sheep or fine goats hair; and their hammocks of cotton or network. Their carpenters tools were principally hatchets, made of copper or flints. Their store-cutters tools were sharp flints or pebbles. Pullies, and other hinges, were entirely unknown to them: yet under all these disadvantages, they raised strong and magnificent edifices. Their needles were thorns or fine bones, and their threads the finews of animals, or the fibres of plants, or of the bark of a certain tree. Sciffars they had none; and their knives were flint or copper. Their combs were made of long thorns, fet on each fide of a piece of cane, which ferved for the back of the comb: and the razors they shaved their heads with were no better than fharp flints; in which operation the person suffered so much, that there was nothing the Spaniardscarried over more acceptable to them than the razor and sciffars. They had no looking-glasses, but instead of them, the Peruvian ladies made use of a round plate of polished brass or copper, and in this the natives of the East Indies agree with them, having no other mirrors at this day than what they get of the Europeans. The feveral nations were diffinguished by their head-dreffes, some wearing a kind of turban of cotton cloth, others a fingle piece, others a kind of hats, and others caps in the form of a fugar-loaf, &c. The blackness of the negro flaves that the Spaniards

brought with them, struck them greatly. They could not believe it to be natural, having never feen a black in America. They defired the Spaniards, therefore, to let them make experiment, and try if they could not

wash off the black paint, as they took it to be.
The Peruvians possess a quickness of wit and strength of judgement. Such of them as have had the advantage of masters, fince the arrival of the Spaniards, have generally made an extraordinary proficiency. When the Spaniards first appeared among them, they acknowledged one Almighty Being, maker of heaven and earth, whom they called Pacha-Camac, i. e. The Soul of the Universe. The next object of adoration was the Sun; the priests of which, who officiated at Cusco, were of blood royal. Besides their festivals celebrated every month, they had four other grand ones, the principal of which was celebrated in June, in honour of their first Inca, Manca Capac.

The meanest of the Europeans assume stare as soon as they find themselves transported among the Indians, blacks, mulattoes, mestizoes, &c. Any good or generous actions performed by them are the effects of

their vanity and imaginary nobility.

The Creolians bear a great antipathy to the native Spaniards, of which one reason is supposed to be, be-cause they see those strangers in possession of prime places of the state. In their outward behaviour they affect great gravity, like the European Spaniards, to whom they are not inferior in wit and genius, acuteness and understanding, but less active and hardy.

Effeminacy and floth feem to be peculiar to the in-habitants of this country; for it is observed, that those who have been bred to labour in Spain, grow idle here in a fhort time, like the Creolians. They are fober as to wine, but eat a great deal, and after an indecent manner, fometimes all out of the same dish, and with-

The Creolians freely facrifice to the paffion of love. Bastards are as much regarded here as the lawfully begotten children, provided they are owned by the father, and there is no difference inherent to that birth.

The Creolian women, though not under the restrictions of the Spanish women, seldom go abroad in the day-time; but at night they pursue their pleasure with great freedom, and are fond of intriguing, though they usually conduct their gallantries under the shade of their

Some of the Peruvian barks, or veffels, are made like double canoes joined together, with poles which pass cross-ways, and being covered with a skin, serve the boatmen to fit upon. Others are constructed in the form of rafts, with a large fail made of matting, and a rudder at one end, near which there is the fire-place or hearth, and a fire always alight. Between the two masts there is a kind of cabin on the deck; and the masts themselves join to the top, and support not only the

fail, but the little pendant.

They supply the place of bridges, in many parts of Peru, by contrivances, which they call tarabites. These are ropes and thongs of leather, extended from one fide of the river to the other, and fastened to piles of wood fixed in the earth. A hammock, with two loops, hangs to these, in which a man may lie at his ease. Those who attend on the fide from whence it fets off, give him a push, which carries him on to the middle with great velocity: from the middle, those on the opposite side pull the hammock by ropes saftened to it, and the person thus gets over in a sewind ants. For the passage of horses and mules, there are two ropes at a small distance from each other. The animal being girded tight is suspended upon a flat piece of wood, between the two ropes, to which he is fastened by grooves, & drawn over byropes. Some beafts will go over very quietly, but others are forced to have their legs tied. In ma-ny places the tarabites are made of skins spread all the way over the river, for people to walk upon, who hold by a rope on each fide, which fecures them in the manner of railing, and enables them to pass the unsteady bridges without any danger.

Callao, the port of that city. It is the fereened from the Two flotas annual near Potofi, about ing received the fine of March; the oth May, with all the Chili, and Peru. Valparaifo fleet, annually for Acap and the commodit magazines here, a vinces of America.

Lima, the capital of the audience of that name, and of all Peru, is fituated in a fine valley near the fea, in the latitude of 12 deg. 2 min. S. A river of the same name washes the walls, over which was a handsome stone bridge. In 1746 a dreadful shock of an earthquake almost entirely destroyed this city in the space of three minutes, burying in the ruins those inhabitants, who endeavouring to fave their most precious moveables, had not made fufficient hafte into the streets and fquares. At the fame time the fea, receding to a very confiderable diftance, returned with fuch violence, that Callao, which was the port of Lima, and all the neighbouring country, were laid under water; men, women, and houses, being swept away with the torrent. Nineteen veffels, out of 23, were funk ; and the frigate called St. Firmin, was carried, by the force of the waves, to a great distance up the country. For the space of four months the concustions continued, with fhort intervals, and many of them were as violent as the first; so that before the 24th of March in the following year, no less than 450 shocks had been felt, and fome of them no less dreadful than the first. Above 12,000 people perished in the ruins of their own effects and property. It has now, in some measure, recovered, and is still the capital and great emporium of Peru, and the refidence of the viceroy, whose government is triennial; though, at the expiration of that term, the fovereign may renew his commission. He enjoys all the pomp and prerogatives of royalty. officers are appointed, and places filled up, by him. For the fecurity of his person, he has two corps of guards, one of horse, and the other of halberdiers.

The horse guards consist of 160, under the command of
a captain and lieutenant; and their uniforms are blue, laced with filver. The halberdiers, in number 50, are clad in crimfon velvet waiftcoats, deeply laced with gold, and do duty in rooms leading to the royal audience chamber. Besides these, there is another guard within the palace, of 100 men, being a detachment from the garrison of Callao. All officers are occasionally employed in executing the orders of the viceroy, and enforcing the decrees of the tribunals after they havereceived the royal affent; for fuch the concurrence of the viceroy is efteemed, who, besides assisting at the courts of justice and councils, gives daily audience to all degrees of persons. The supreme tribunal of Lima, called audienca, is held in the viceroy's palace, and confifts of eight auditors, and a fifcal, for civil affairs. Here is also a chamber of accounts, a board of treasury, a court for the effects of persons dying intestate and without lawful heirs, a council of commerce, and a tribunal of the inquifition; many convents, chapels and hospitals, with an university, in which are professors of the several sciences, and three subordinate colleges.

The inhabitants of this city, as of all the others in Spanish America, confists of Spaniards, Mestizoes, Mulattoes, Indians, and Negroes. The Spanish families were very numerous before the earthquake. third or fourth part of them confifted of the chief nobility of Peru, who lived in the greatest splendour.

If Lima was not subject to earthquakes, it would be one of the most defirable places of abode in the world; but, unhappily the interval between these is never of

length sufficient to obliterate the remembrance of them. Callao, the port of Lima, is situated six miles west of that city. It is the best harbour in the fouth, being screened from the winds by the Island of St. Laurence. Two flotas annually fail from hence; one for Africa, near Potosi, about the end of February, which hav-ing received the filver on board, returns in the month of March; the other for Panama, in the beginning of May, with all the treasures and merchandize of Potosi, Chili, and Peru. Those of Chili were brought by the Valparaiso fleet. Besides these fleets, two ships sail annually for Acapulco, freighed with gold or filver; and the commodities they bring back are lodged in magazines here, and retailed to all the fouthern provinces of America.

Cufco, the capital of the empire of Peru, before the arrival of the Spaniards, and the feat of the Incas or kings, stands about 326 miles from Lima; towards the It was then very large, magnificent, and popu-Here flood the famous Temple of the Sun, which is called Curiaclianchi, and contained immense The lineas refided in a part of the citadel, riches. the walls of which were encrusted with gold and filyer, and the whole fortress was built of stones, fo long that feveral oxen could hardly draw one of them. It is still a considerable town, containing great numbers of Spaniards, Creolians and Indians. The air is very pure and wholesome, and the neighbouring country very pleasant and fruitful. Here are some manufactures of bays and cotton cloth, and also of leather: and in the adjacent countries are gold and filver mines:

Arequiba stands in the valley of Quiloa, on a fine river, by which it has a communication with the fea, distant about 20 leagues. It is one of the most beautiful and pleasant towns in all Peru.

Guamanga, 180 miles east of Lima, is the see of a

bishop, and contains an university.

Truxillo, 250 miles north-west of Lima, contains only low houses, on account of the frequent earthquakes. Guamchaco is its port; and the inhabitants carry on a great trade in wine, brandy, flax, marmalade, and, above all, fugar, as they cultivate plenty of fugar-canes in the neighbourhood.

The audience of Los Charcos, or La Plata, is bounded on the north by that of Lima, being 570 miles in a straight line, and 400 wide where broadest. The climate is various, the foil is in general fertile, and the principal commodities filver, gold, and pimento. The chief places are,

La Plata, the capital, which is the feat of the governor of the province, of the archbishop, an university, and court of inquifition, which is subordinate to that

Potofi, fo famous on account of the rich filver mines in its neighbourhood, stands about 60 miles from La Plata to the fouth-east. The Spaniards and Creolians here are possessed of immense riches. All their clothes are of gold and filver stuffs, and their kitchen furniture and plates of filver, which is not to be wondered at in a country where that metal is as common as copper and iron are elsewhere. They have great frosts and fnows here in May, June, and July; and the neighbouring country is barren and uncouth, especially the mountain that contains the mines. The town is near two leagues in compass; and consequently the largest in Peru. There are four principal mines of filver, be-fides other fmaller ones. Notwithstanding the barrenness of the country, the town is well provided with every necessary, some provinces sending the best of their grain and fruit, others their cattle, and others their manufactures. Those who trade in European commodities refort to Potofi as to a market, where they are fure of converting their merchandize into filver. Another species of commerce, carried on by a fet of people called Aviadores, confifts in exchanging coins towards paying the necessary expences of the workmen, for ingots and pinnos. As for the article of quickfilver, it is wholly ingroffed by the crown.

An opinion prevails, that the discovery of the filver mines was owing to this accident: An Indian, Hualpa, pursuing fome wild goats, came to a steep place, and feizing a shrub to aid his affent, it gave way, when he beheld a mass of filver beneath the roots. He hastened home with the first fruits of his discovery, washed the filver, and made use of it; repairing, when his stock was exhausted, to the mountains for a new fupply. In the course of time, an intimate friend of his observing the extraordinary change in his circumstances, was defirous of knowing the cause, and urging him closely on this head, obtained an ample discovery of the whole fecret. For some time they maintained a kind of partnership; but Hualpa refusing

to disclose his method of purifying the metal, so offended his comrade, that he immediately revealed the whole to his mafter Villareal, a Spaniard, who lived at Porco.

Besides the filver mines near Potosi there are many others in the audience, especially towards Chili.

There are also some of gold.

At a small distance from this place are hot medicinal baths, to which, as in other countries, fome re-

fort for health, and others for diversion.

La Paz is a confiderable town fituated near the fpring-head of a river, about 220 miles from La Plata to the north-west. The mountains of the adjacent country abound in gold, and the plain and vallies in grain, fruit trees, and fields of maize. About thirty miles to the north-west of this town lies the lake of Titicaca, which is 80 miles in circumference, and has a communication with the lake of Paria.

Arica stands on the sea-coast, and has a good harbour, but contains only about 150 families. merly most of the filver of Potosi was shipped here

for Lima, but now it is chiefly fent by land.
Santa Cruz de la Sierra, or the Holy Cross of the Mountain, is the capital of a little province north-

east of Plata.

Although the Spaniards possess only a few cities, in the extensive province of Tucuman, they have never-

theless the dominion of the whole.

The cities poffeffed by the Spaniards are, St. Jago de Estero, so called from a river on which it is situated, whose inundations greatly contribute to ferti-lize the adjacent land, St. Miguel del Tucuman, Neustra Sennora de Talavara, Cordova de la Nueva, Andalufia, Rioja, and the large village of San Salva-The two first of these are the most considerable; the two last are small, and built without order or fymmetry. The chief defign of the court of Madrid in maintaining fettlements here is, to fecure a communication between the colonies on the South and North Seas; for the commodities of the country of themselves would hardly reimburse the expence of keeping garrifons: they confift chiefly in honey, wax, fugar, wine, cotton, woollen stuffs, manufactured by the natives; and mules, much admired for their ftrength and agility, on which account great numbers of them are exported to other provinces of South

The province of Quito is estimated at about 400 miles in length, and is fituated between two chains of the high mountains called Cordilleros des Andes. The lands are generally well cultivated, and there are a great number of towns and villages inhabited by the Spaniards or native Americans. Every vil-lage is ornamented with a large square, and the church stands on one side of it. All the roads are laid out in a line, croffing each other, fo that the aspect of the country has the appearance of a large garden. It might be imagined that this country is very hot, but it lies fo high, and fo near the mountains covered with thow, that the air is very temperate. They might have plenty of wine here, if Lima had not an exclusive privilege of making it themselves. They have no vicunas or guanacoes here, but they have an animal of the fame kind, called by the natives famas, which is like a finall camel, and can carry fifty pounds weight. They have all forts of materials proper for dying; and feveral forts of fruits and plants which have been brought from Spain, besides those that naturally grow here. They have also imported beeves and sheep. In

the northern parts they have great quantities of gold.
The inhabitants of Quito are fond of drefs. Perfons of diffinction of both fexes wear long garments, and a kind of loofe mantle over their shoulders. The dress of the Spaniards is plainer than that of the Indians, the latter being usually of flowered cotton: both are fond of wearing ear-rings, and rows of beads round their necks, and the Indians will fometimes ornament even their ancles with bracelets. An Indian barber has a long loofe garment, and carries his

bason and other utenfils with him. A mechanic is dressed much in the same manner, with this differ-ence, that he walks about with all his tools packed up in a bundle behind him, which has fomewhat the refemblance of a porter's knot. The peafants are neat, but ornament themselves with beads or shells, and a common Indian only wears a plain loofe garment, which the women fo contrive as to carry their children on their backs.

Quito, the capital of the province, is feated in a pleafant valley, between two chains of high mountains. It is about a mile in length and three quarters of a mile in breadth, and is a bishop's sec. There are several religious communities, and two colleges, which are a fort of univerlities, under the direction of the Jesuits and Dominicans. It contains about 35,000 inhabitants, of which one third are original Spaniards. All forts of merchandizes and commodities are exceeding dear, chiefly on account of the difficulty of bringing them hither. It is the feat of the treasurer of the kingdom, as well

as of the other officers.

HISTORY OF PERU.

TO defign was entertained of conquering Peru, which was discovered by a Spaniard called Vasco Numez de Balboa, till the conclusion of the war in Mexico, when the expedition was undertaken by three private persons, viz. Pizarro, Almagro, and De Luque; the two first being officers, and the last an ecclesiastic. It was stipulated, that Pizarro should command the embarkation; that Almagro should from time to time raife and fend him recruits: and, that De Luque should remain at Pinama, and lay in ammunition and provisions for the support of the enterprize: and they agreed to share the profits arising by the expedition equally, after the emperor's fifth should be deducted.

The difficulties Pizarro met with in the first attempt from the cross winds and currents, and the incessant rains that fell near the Equator were fuch, that all his men forfook him, and returned to Panama, except 14; but Almagro joining him with fome recruits, thefe two heroes demanded to continue their course to the southward, and having croffed the bay of Panama, went on shore, expecting to have found a passage to Peru by land; but the country being overflowed, or encumbered by rocks, woods, and mountains, they were obli-ged to return on board again, and fetting fail to the fouthward, made so little way, that they were two years in advancing to the bay of Guiaquil.

The first considerable town they visited there was the city of. Tumbez, to the cacique whereof Pizarro fent one of his officers to let him know they came as friends, and the cacique thereupon fent them all manner of refreshments. Not having a sufficient body of troops to undertake fo important an expedition, he returned to Panama for re-inforcements, taking with him fome of the inhabitants, animals, and treasures of Peru. Pizarro then went to Spain, procured the emperor's commission, returned and took with him three of his brothers, and fet fail for Panama upon another expedition, A. D. 1530. He had now with him 125 fol-diers, and 37 horses, with which he landed and began his depredations. The Indians sled before him, but many of his people dying, he fent his ships back laden with plunder, to bring more recruits. Almagrojoining him with re-inforcements, they advanced together, defeated a large body of Peruvians, took the town of Tombaz, with immenfe treasures, which were heaped up in the temple of the Sun and the Inca's palace. They now erected a fortrefs near the fea, and then purfued the Inca, or emperor Atabilipa.

Pizarro, finding that the Peruvians were engaged in a civil war among themselves, took pains to soment their intestine divisions, in order to prevent their uniting against him. The case was, that Atabilipa, a prince of illegitimate birth, had deposed and confined the emperor Huascar, and oppressed his friends. These AMERICA.

Arabilips and Pizarro, having appointed an interview, the Spaniards tracerously attacked the Indians during the conference, and having staughtered many,

made the inca priloner,

Almagro, having raifed a confiderable body of forces at Panama, arrived at the camp of Pizarro foon after the flaughter of the Indians, and the imprisonment of their emperor Atibilipa. Pizarro went out to meet Almagro, congratulated his arrival, received him with all the marks of affection and efteem imaginable; and offered to divide the spoils with him, though it is evident they were, at that time, meditating each other's destruction, and it is faid, Pizarro distributed as much gold and filver at this time among the Spanish foldiers as amounted to 15,000,000l. Sterling. The foldiers being possessed of this prodigious wealth, fell into all manner of excesses, railing the price of things to a very great rate, by offering any fums to gratify their appetites or fancies. And now Pizarro thought it a proper time to fend over the fifth part of the treasure to the emperor, as he had (tipulated, and with it his brother Ferdinando Pizarro, to folioit for such reinforce-ments as might establish the dominion of the Spaniards in Peru, and to petition that his government might be extended ftill farther to the fouthward; the marshal Aimagro also employed his agent to represent to the court of Spain, with what expence and application he had fent and carried re-inforcements, and supplied the general with ammunition and provisions from time to time, to enable him to make this conquest; and to defire that all that part of South America which lay to the fouthward of the lands granted to Pizarro, might be put under his government: and with these agents. fent by the general and the marihal, returned feveral adventurers, to the number of 50 or 60, who having ubrained 30,000 or 40,000 ducats a-piece for their refpective shares of the spoils, were perfectly satisfied with of their lives in their own country, rather than undergo more hazards and difficulties to increase their for-

Atabilipa, the royal prifoner, having offered Pizarro a prodigious treasure for his liberty, and actually paid great part of it, was still detained, and at length being tied upon what were called Articles of Impreachment, was most unjustly put to death Atauchi; the brother of this unfortunate prince, having determined on re-yenge surprized the Spaniards on their march to Cusco, killed fome, and took others, Sancho de Cellar, who had drawn up the processagainst the late Inca, being among the later. With these they retired strangling Sancho at that very place where the emperor was put to death; but fuch of the Spaniards, as had been against the cruel measure, they restored to liberty. The Peruvians were fill inclined to treat upon reasonable terms; but the Spaniards infifted that they should immediately renounce their religion, give up their country, and refign their freedom. This broke off the treaty, when Pizarro marched forward to the capital city of Cufco, where he arrived in the month of October, 1532, the people having abandoned the city, and carried off greatest part of their treasure; but still the Spaniards found fo much left behind, that they were amazed at the heaps of gold and filver they met with there: but the reigning Inca, Manco Capac, being about to affemble the whole Peruvian nation against these invaders, Pizarro thought fit to treat with the Inca and his Peruvians. He even invited the emperor to return to his capital, and proclaimed him Inca. These measures Pizarro found himself under the necesfity of taking at this time, not only because he saw all the fouthern provinces of Peru affembling against them, under the Inca, Manco Capac, but because Rumminavi Quinquiz, and other Persivan generals, No. 50.

had affembled a very great army in the northern provinces, and possessed themselves of Quico, which obliged him to send a considerable detachment of his forces under the command of Sebastian Beialcazar to re-inforce the new colony to St. Michael's, and to make head against the Peruvian generals in Quito.

Balaleazar, thereupon, marching into Quito, made himself mader of that capital city, and was in a fair way of reducing the rest, when advice was brought that Don Pedro de Alvarado was upon the coast of Peru with a confiderable fleet, and landed 700 or 800 men, intending to take the government of Peru upon him, and expel Pizarro and Almagro from thence; at which news, thefe two adventurers were thunder fruck. apprehending they should be dispossessed of all the spoils they had taken, and perhaps fent prisoners to Spain, to give an account of their murdering the late Inca Atabilipa and massacring his people; they continued therefore to cultivate a good understanding with the Indians of the fouthern provinces, and treated the Inca and his subjects as their friends and allies, promiting to perform punctually whatever they had agreed on ; knowing how great an advantage it must be to have the country in their interest, if they were obliged to contend with Alvarado for the possession of it. They, however, at length found means to bribe Alvarado from the country and to perfuade most of his followers to enter into their fervice. These additional forces rendered the adventurers very formidable, when Almagro marched to Cufco; and Pizarro founded the city of Lima, and other places on the coast. Pizarro now, according to the grant of the emperor, remained in possession of Peru, and Almagro made an expedition into Chili.

Almagro advanced as far as the province of Charcas, 200 leagues to the fourthward of Cufco, without meeting with any thing to obstruct his designs, that country being all under the dominion of the Inca, and supplying him with provisions as he went; but finding Charcas a wretched barren country, and being ignorant of the rich mines it contained; he resolved to proceed farther to the kingdom of Chili; though, had he known the invaluable mines of Potosi were situated in this barren country, he would certainly have set up his rest here, for in this mountain was afterwards sound more filver than any or perhaps all the countries in the Old World

produced at that time.

The Indians informed Almagro, that there were two to approach the kingdom of Chili, both extremely ifficult and hazardous. The first was over a branch the mountains of the Andes, or Cordeleros, which at this time (being winter) were covered deep in fnow, and fo cold that no Indian could live on the tops of them (though this was much the shortest passage, if it could be performed;) the other was over a fandy defart by the fea-fide, in which they would be in danger of perishing by excessive heat, and the scarcity of water; intimating that they were averse to the journey either way, but most dreadful that over the mountains of the Andes: however, Almagro refolving to remove forward, took the way of the mountains, as being the shortest, and more agreeable to the constitutions of his Europeans, than the fcorching fands; and having gathered what provisions the country afforded, and laid it on the shoulders of the Indian porters, he began to ascend the hills; but had not advanced far before he found the fnow fo deep, that they were forced to dig their way through it, the Indians dying by hundreds with the intense cold: the Spaniards, also, were almost starved, and many of them perished with their horses on those mountains, either by cold or want; and fome of the men loft their fingers and toes, who escaped with their lives. However, Almagro himself, with between 300 or 400 Spaniards, the Inca Pualla, the high-prieft, and about 5000 Indians, reached the other fide of the mountains, and came to a fine temperate, and pleasant country. The people of Chili presented the Spaniards with many presents; and Almagro penetrated into the country a confiderable way,

but being informed, by the arrival of some Spaniards from Europe, that a part allotted to him by the emperor, included Cufco, he returned to Peru. Having fuffered fo much in their march over the mountains, the Spaniards and Peruvians returned by the way of the defart, where the hardships they underwent were but little inferior to the former. In the mean time the Inca Manco Capac observing that Pizarro only gave him the title of Inca, and that in reality he had very little command even in the capital city of Cuseo, where he resided, put him in mind of his promife of restoring him to his empire, and performing the capitulations that had been agreed on between them; but Pizarro put him off from time to time, telling him he must wait with patience till he heard that those capitulations were ratified by his fovereign the emperor, which he expected to receive every day by his brother Ferdinando, and was going to Lima in hopes of meeting him there; defiring that the Inca, during his absence, would reside in the castle, and not ftir from thence. The Inca sinding they would make him prisoner by force, if he did not voluntarily submit to this confinement, difguifed his refentment and immediately went to the castle.

But the Indians were far from taking this imprisonment of their emperor patiently; they only waited for a favourable conjuncture to obtain his liberty; for Ferdihando Pizarro returning from Spain with his brother's new commission, and the patent for the title of marquis, brought fome orders with him that were not acceptable to the marquis or his people; particularly he informed them, that the emperor expected they should be accountable to him for all the treasure they had received as the ranfom of Atabilipa, his imperial Majesty alone being entitled to it, or at least that they should raife him a good round fum, and fend over to Spain in lieu of it; but the marquis and his officers replied, this was neither reasonable nor possible; as they had hazarded their lives, and made a conquest of the country at their own expence, without any change to his imperial majefty, they ought to reap the fruits of their labour; and besides, that money had been long since spent in fupporting the conquest, building towns, and planting colonies, to preserve what they had gained, which would all redound to the honour and profit of his majefty, who by that means was confirmed and established in the fovereignty of that rich country. Whereupon Ferdinando defired his brother would confer on him the government of the capital city of Cufco, and he did not doubt but he should foon have it in his power to raise a sum of money to gratify the court of Spain; which the marquis confenting to, his brother Ferdinando immediately repaired to his government of Cufco; where observing that several officers had been greatly enriched by prefents Manco Inca had made them, in order to be kindly used, he applied himself also to the Inca, giving him to under and, that he would be reftored to his dominions, and all his demands granted, if he could procure a confiderable fum for the court of Spain; and suffered the Inca to come out of the castle to his palace in the city again, and to be treated with the honours of a fovereign prince. Whereupon the Inca fent expresses to several parts of his dominions, directing them to bring their usual tribute of gold and filver plate, as the most probable means of delivering him from the hands of the Spaniards.

The treasures were brought, but the Spaniards still deceived him, when he delivered himself by this stratagem. He pretended, that in the valley of Yarico, great riches were hid, particularly a statue of solid gold as big as life, but that none but himself could find out the place. Ferdinando Pizarro was deluded by this pretence, and suffered the Inca to go to the valley with only a guard of Spaniards, from whom (as they did not suspect his design) he made his escape. Being at liberty, he raised three powerful armies, one being designed against Lima, the second to attack

Cufco, and the third to cut off Almagro. The principal army, under the Inea himfelf, attacked Cufoo with great fury, but were repulfed with terrible flaughter.

After cutting off feveral detachments of Spaniards, the fecond Peruvian army invefted Lima, which not being able to take, they only blockaded; but the third army did not attack Almagro, who arriving before the walls of Cufco, formmoned Ferdinando Pizarro to furender, who refufed; but the place was betrayed to Almagro by fome of the garrifon, when the governor and another of the marquis of Pizarro's brothers were made prifouers.

In the mean time the marquis of Pizarro, not hearing from his brothers, fent a strong force to Cusco, under the command of Don Alonzo de Alvarado. Peter de Lerma was ordered also to march with this detachment as a private captain of a troop of horse, though he was an older officer that Alvarado, and had done great service in those wars, which so disgusted de Lerma, that he, from this time, meditated the ruin of the enterprize, as is supposed by the Spanish writers.

Alonzo de Alvarado continuing his march with the utmost diligence, most of the Indians that were pressed to carry his baggage, amounting to upwards of 5000, perished in the first part of the journey, either by the intolerable fatigue, being loaded and driven beyond their strength, or starved for want of food:

Almagroreceiving intelligence that Alonzo was advancing to the city, sent some Spaniards of quality to him, to represent that Cusco belonged to his government, according to the division the emperor made of Peru, between him and the marquis de Pizarro, and therefore advised him to retire to Lima again, till he and the marquis should adjust the limits of their respective governments: but Alvarado was so far from entertaining any pacific thoughts, that he made all the gentlemen prisoners that were fent to treat with him. Whereupon Almagro took the field, constituting Don Orgonnez his lieutenant-general; and having made a party of Alvaro's horse prisoners, understood by them, that great part of his troops were better affected to him, than they were to the Pizarros; particularly, he understood that Peter de Lerma, with a great many of his friends, would desert Alvarado the first opportunity.

He advanced therefore as far as the bridge of Abancay, on the other fide whereof Alvarado lay encamped, fo that there was nothing but a fmall river that parted their forces; they remained quiet, however, without attempting to attack each other all day; but in the night time Orgonnez fording the river, at the head of Almagro's horfe, put Alvarado's forces into great confusion; and giving Peter de Lerma, and the reft of their friends, by this means, an opportunity to join them, Almagro gained an easy victory, with very little bloodshed, making Don Alonzo de Alvarado his prisoner; with whom he returned in triumph to Cuse.

Almagro, after the battle, marched with 500 Spanish horse and foot, and some thousand Indians, towards the valley of Chiaca on the sea-coast, taking with him his prisoner Ferdinando Pizarro, but he left Alonzo Pizarro and Alonzo de Alvarado prisoners in the city of Cusco.

In the mean time, the marquis de Pizarro hearing no news from Alonzo, and imagining the Indians might have possessed themselves of the passes in the mountains, and thereby cut off his communication with that general, marched in person at the head of 300 or 400 Spaniards, towards the mountains to get intelligence; and after some days march, received advice, that the Indians had raised the siege in Cusco: that Almagro was returned from Chili, had possessed himself of that capital, and made his brothers Ferdinando and Alonzo prisoners; and, that his other brother John Pizarro was killed during the siege of Cusco:

and a day or two the deseat of Don he thought fit to there, till he should which he expected from taking the ad putting his brother niards of quality terms he should liberty : Almagre view with only 1 with fo much trea gro, with great d At len for him. tained the liberty not only Cuico, magro very natura fition, when a wa those rivals; whe prisoner, and at t loft. and a day or two after he had news brought him of the defeat of Don Alonzo de Alvarado. Whereupon he thought fit to retire to Lima, and fortify himfelf there, till he should receive a re-inforcement of troops, which he expected every day; and to divert Almagro from taking the advantage of his present weakness, and putting his brother to death, he dispatched several Spaniards of quality to attend him, and offer him any terms he should insist upon, to procure his brother's liberty: Almagro was willing to treat, and an interview with only 12 horsemen of a side was agreed; but with fo much treachery on Pizarro's fide, that Almagro, with great difficulty escaped an ambuscade laid for him. At length Pizarro, by various artifices, obtained the liberty of his brothers, and then demanded not only Curco, but all the conquefts in Peru. Almagro very naturally rejected this unreasonable requifition, when a war immediately commenced between those rivals; when Almagro was defeated and taken prisoner, and at the same time the city of Cusco was loft. The unfortunate Almagro was afterwards cruelly put to death by his rival Pizarro, but the latter did not long furvive him, being affaffinated in his palace at Lima by a natural fon of Almagro. Thus untimely fell the two conquerers of Peru, by means of their own reciprocal enmity, of whom it is only necessary to fay, that both were equally possessed of courage, forti-tude, and temperance; but both were equally ambitious and rapacious. Almagro was the most generous, Pizarrothe most politic; the former possessed the most noble sentiments, but the latter had the greatest pene-

SECTION III.

PARAGUAY, OR LAPLATA.

HIS country lies between 12 and 37 degrees fouth latitude, and is about 1 500 miles in length and an 100 in breadth. It is bounded by Peru on the north; by Brazil on the east, by Patagonia on the fouth, and by Chili on the west.

Independent of horses, mules, sheep, goats, hogs, poultry, game, grain, fruit, &c. it produces an admirable drug called by the name of the country, Paraguay. This is an excellent emetic, and of itself might form a confiderable article of commerce. The forests abound with wild beafts, and the rivers and lakes, besides various kinds of fish, with crocodiles, alligators, &c. The mines contain gold; filver, copper, iron, amethyfts, &c. To the west of the great river Paraguay, the country is barren, but to the east it is fertile. The next confiderable river is that of Plate or La Plata, which rifes in Peru, and falls into the Atlantic Ocean. The climate of Paraguay differs but little from that of Spain; and the diffinctions between the feafons are much the fame. In winter in deed, violent tempelts of wind and rain are very frequent, accompanied with fuch dreadful claps of thunder and lightning, as fill the inhabitants, though used to them, with terror and conflernation. In fummer the exceffive heats are mitigated by gentle breezes, which constantly begin at eight or nine in the morning. In short, for the enjoyment of life, especially with regard to the falubrity of the air, a finer country cannot be imagined.

The forests of this country abound with bees, which make their hives in the hollow trees. There are ten different species of these useful insects. That most effected for the whiteness of its wax, and the delicacy of its honey, is called opemus, but is very scarce. The cotton tree is a native of this country. The Spaniards fow and use hemp in pretty large quantities.

Venomous herbs, with which fome Indians poifon their arrows, abound here; but the antidotes are no lefs common; and, among others, the herb called Sparrows Herb, which forms pretty large bushes, and was discovered, and obtained its name, in the following manner,

There is a very pretty kind of sparrow called Macagua. This little kind of sparrow creature is very fond of the sless of vipers, against whom, for this reafon, he wages continual war. As foon, therefore, as he spies one of these reptiles, he puts his head under his wing, and gathers himself up into a round ball, without the least appearance of life or motion: he gloes not, however, cover his eyes fo entirely, but that he may peep through the feathers of his wing, and obferve the motions of his game, which he fuffers to approach without ftirring, until he finds it near enough to receive a stroke of his bill, which he then suddenly discharges at it. The viper immediately retorts with another of his tongue, but the minute the sparrow finds himself wounded, he flies to his herb, ears some of it, and is instantly cured. He then returns to the charge, and has recourse to his herb every time the viper stings him. This conflict lasts till the viper, destitute of the fame refource, has loft all his blood: as foon as the reptile is dead, the sparrow eats the carcase, and then has recourse again to its antidote.

Here are vast numbers of all kinds of serpents, and the rattle-snake in particular is a very formidable creature. This reptile fuffers greatly when its gums are too much diftended with venom, to get rid of which it falls upon every thing in its way, with two crooked fangs terminating in a point; and by means of a hollow in these fangs pours into the wound it makes all the venomous matter which tormented it. The effects of the bite are fudden, and the confequences dreadful, unless antidotes are speedily applied. The chief anti-dote is a stone, to which they have given the name of St. Paul Bezoard, and a poultice of chewed garlick. The very head of the animal, and its liver, which is likewife eaten to purify the blood, are equally efficacious as antidotes. The furest method, however, is to begin by making an incision directly in the part that has been flung, and then apply brimftone to it; nay, this drug alone has been frequently found to make a perfect cure.

Here are likewise some hunting serpents, which climb up the trees to discover their prey, and from thence dart upon it when within reach, squeeze it so tight that it cannot ftir, and then devour it at their leifure.

The missionaries greatly contributed to the subjection and civilization of the inhabitants of this country. They instituted parochial and provincial jurisdictions for the purposes of order and good government, and may be faid to have acquired and maintained that fuperiority which the Europeans now hold over it.

The natives of Paraguay are in general of a mode-rate stature, and well made. They have slat round faces, olive complexions, and long black hair. Their garments were formerly the skins of beasts, but now in most things they conform in dress to the Spanish fashions. Previous to their embracing Christianity they worshipped the fun, moon, stars, thunder, lightning, groves, rivers, animals, &c. The women are allowed to propose matches as well as the men. When an Indian woman likes a man, she acquaints one of the misfionaries with it, who immediately fends for the young fellow. If he does not like her, the prieft perfuades the woman to overcome her paffion; but on the contrary, if the man is inclined to return her affection the priest immediately marries, and gives his bleffing. wives of the petty princes or lords wear a kind of tri-ple crown made of ftraw, and their lords hang doe-fkins over their shoulders. The boys and girls goquite naked. They wrap up their infants as foon as born in a tygers skin, and give them the breast for a little while, and then a piece of half-raw meat to suck. Their beds are the hides of oxen, or tygers, spread on the ground: but the people of rank use hammocks of net-

The rude and uncultivated inhabitants of Paraguay, especially the Chaconese, and the Guaranis, are of an extraordinary stature; and there have been found men

among them above feven feet high. Their features differ greatly from ours; and the colours with which they paint themselves give them such an aspect, that ftrangers cannot, at first fight, help being terrified a little. Accordingly, by this means they pretend to strike a terror into their enemies. Most of the men go quite naked, all to a parcel of feathers, of different colours, hanging to a string about the waist. But at their public solemnities they wear caps made of the fame feathers. In very cold weather they wrap themfelves up in a kind of cap and cloak, made of fkins pretty well dreffed, and adorned with painted figures. Among some tribes the women are not better covered than the men. The bad qualities common to all thefe people are ferocity, inconstancy, perfidy, and drunken-ness. They are all sprightly, though very dull of apprehenfion in every thing that does not immediately fall under the fenfes. There is, properly speaking, no form of government among them. Every town, in-deed, has its cacique; but thefochiefs have no authority, but in proportion to the efteem they have acquired. Several do nothing but rove from place to place with their furniture, which confifts of nothing but a mat, a hammock, and a calabash. The cabins of those who live in towns are no better than wretched hovels, made with branches of trees, and covered with ftraw, or rather grafs. Those who live nearest to Tucuman are better lodged and clothed.

Their favourite liquor is chica. They affemble to drink it, and to dance and fing; and in these exercifes they perfift till they are all drunk. They then quarrel, and, from words, foon proceed to blows; fo that their merry-makings feldom terminate without bloodshed, if not in the deaths of some of the guests. Several take advantage of the confusion to be revenged of their enemies. These exercises are almost peculiar to the men. The women generally withdraw the moment they perceive the liquor begins to get the better of the men, and carry off with them all the arms they can lay their hands on. A fmall matter is sufficient to breed a war between them; but their unconquerable inveteracy against the Spaniards easily unites them again on the first alarm from that quarter.

Their arms are bows, arrows, and lances, which they use with great dexterity and strength. They fasten a rope to the latter, by which they can, as the end is barbed, draw the wounded person to them. Besides fawing the necks of their prisoners with the jaw-bone of a fish, they scalp them, and preserve their scalps as tokens of victory. They are admirable horsemen, and tame and manage the wild horses with great address, which has made the Spaniards repent ever having stocked the country with those useful animals.

The Chaconefe women have a custom of pricking their faces, breafts, and arms, in order to mark them. They are ftrong, robuft, have easy labours, and bathe themselves and children immediately after delivery. They are very jealous of their husbands, yet entertain very little affection for their offspring.

These people usually bury their dead on the spot

where they expire; plant a javelin, and the skull of an enemy (if they can get one) over the grave; and then remove to a distance from the place.

When the Spaniards first arrived in this country, the people lived in populous towns, and were governed by caciques, who were hereditary, and independent of each other. But if the fuccession failed, the election of a new cacique usually fell upon one famed either for valour of eloquence. At the death of a cacique, it was lawful for one of his brothers to marry the widow; but this feldom happened. In general, these Indians did not approve of such marriages between near relations; and the men among them, who have embraced the Christian religion, never marry any of their relations, even within those degrees with which the church readily dispenses.

They observed a number of forms and customs,

fome abfurd and ridiculous, and others horridly barbarous. The ceremonies they observed in giving names to their new-born children, will best serve to give a just idea of the favageness of this nation. Thinking it unlawful to perform the ceremony without the death of a prisoner of war, they deferred it till they could make one. After entertaining him plentifully for feveral days, they cut his throat on the day appointed for that purpose with great ceremony. As soon as he was dead, every one touched his body, or fruck it with a flick; and during this operation they gave names to all the children that had not as yet received any. This done, the body was cut up, and every family took home a piece of it to make into broth, of which every one took a mouthful, not excepting children at the breaft, whom their mothers took care to make partakers of this repair.

Their manner of receiving persons returned from a long journey had fomething very fingular in it. The traveller, on entering his cabin, immediately feated himself, without uttering a fingle syllable; and the next moment the women began to walk round and round him, observing the same silence all the time, till at last they suddenly burst out into exclamations, which were followed by a long relation of all the difagreeable events that had happened in his family during his absence. The men, covering their faces, repeated the fame things with a low tone of voice. This ceremony lasted a longer or shorter time, in proportion to the effects they had for the traveller. At last they all congratulated him on his happy arrival, and entertained him in the best manner they were able.

Previous to marriage, the intended bride was placed under the care of a woman, appointed for that purpose, for the space of eight days. It was the business of the latter, during the whole time, to make the former work hard, to teize and thwart her, and, in fine, not to permit her to have any peace, reft, or eafe. If the went patiently through this fevere trial, her hair was cut off, and the was declared marriageable.

Phylicians and fortune-tellers were formerly in great repute here. They were, however, only jugglers, pretending to prophecy from the finging of birds, and to cure diseases by sucking the parts affected.

Paraguay is divided into feveral provinces, which take their names from the rivers that pals through them. The principal are Paraguay and La Plata, properly fo called. The chief place in Paraguay fo called, is the town of Affumption, which is fituated at the conflux of the rivers Parana and Paraguay, and is a large, well built, and populous city. It was erected by the Spaniards in 1531, in the midft of a very rich and fruitful

The province of La Plata takes its denomination from the river of the same name. It is a fine, fertile, plentiful province, and abounds with provisions of all kinds, the principal wants being those of falt and fuel.

The great river of Plate, or La Plata, rifes in Peru, and, among other rivers, receives the Paraguay in its courfe. The water is clear, abounds in fish, is full of delightful islands, and may be navigated for the greateft part of its course. Along its banks are seen the most beautiful birds of all kinds: but it fometimes overflows the adjacent country to a great extent, and is infefted by ferpents of a prodigious fize. Before it falls into the Paraguay, it is called Panama.

Buenos-Ayres, the capital of the province, taking its name from the pleafantness of the climate, was founded in 1535, under the direction of Pedro de Mendoza, at that time governor. It flands on a point, called Cape Blanco, on the fouth fide of the Plata, fronting a small river, in 34 deg. 34 min. fouth latitude, in a fine plain, rifing by a gentle ascent from the river. Nothing can exceed the temperature of the air, the fertility of the foil, or the beautiful verdure which overspreads the whole face of the country about this city, of which the inhabitants have an uninterrupted pro red, arderennen im tertere

Here is a very handsome fquare, with a magnificent cathedral, and a caftle, in which the governor holds his court, and has a large garrifon. The Spaniards bring hither part of the treafures of Peru down the river, and ship them for Spain, with vast quantities of hides, and other commodities of this country. The river is here feven leagues in breadth, and navigable for any fhips 60 leagues above the town, but no farther, by reason of a cataract.

The trade of this country confifts in cattle, fruits, and the herb Paraguay, already mentioned. Cotton is also a considerable article of commerce. Their returns, by importation, are gold, filver, fugar, and hides.

SECTION IV.

CHILI.

HIS country, though comprehended in the vice-royalty of Peru, is very extensive, reaching from the frontiers of Peru to the Straits of Magellan. fituated between 25 and 45 degrees of fouth latitude, being about 1200 miles in length, and 500 in breadth. It is bounded on the north by Peru, on the eaft by Paraguay or La Plata, on the fouth by Patagonia, and on the west by the Pacific Ocean.

Chili lying fouth of the equator, the feafons are almost opposite to those in the northern hemisphere; but the face of the country, except on the fea-coaft, is beautiful, and the climate wholesome. On the east the country is screened by the Andes, while, from the west, the air is cooled by the most refreshing breezes. Along the coast of the Pacific Ocean they enjoy not only a fine temperate air, but a clear ferene sky, most part of the year. Sometimes, indeed, the winds, that blow from the mountains, are exceeding sharp in winter; but, in general, this is one of the most comfortable climates in the world, being a medium between the intense heats of the torrid zone, and the piercing winds of the frigid.

The Andes, being covered with fnow great part of the year, fupply the country with innumerable rivulets, which greatly contribute to its extraordinary fertility. There are many volcanos among these mountains; and the air is fo sharp and subtle, and they cannot be passed without great danger. This country abounds in gold, filver, copper, tin, quickfilver, iron, lead, &c. foil produces Indian and European corn, hemp, and fruits in great variety and abundance. Among feveral remarkable herbs produced in this country, fome of which are medicinal, and others applied to various uses, is the panqua, which is of so infinite service in tanning leather.

Of animals there are horses, mules, oxen, goats, and sheep, all excellent in their kind. Birds, tame and wild, are found in profusion; the coasts abound with most forts of fish. The country is not infested with venomous infects.

The natives of Chili are of a middle stature, strong. built, of a tawny complexion, and have long black hair on their heads, but pluck off that on their chins, and other parts of their bodies. They are tall, robust, active, and couragerous, enduring fatigue, heat, and cold, to admiration.

The ordinary dress of the men is a kind of long frock, which reaches half way down the legs. From the neck is suspended a chain of gold or copper rings. Women of the common class have a short covering, hardly reaching down to the knee; but the dress of the better fort is long, and they wear a petticoat under the outer garment. Their heads are ornamented with

rings.

The common people usually carry clubs and staves.

Their arms are pikes, bows, arrows, and swords; and No. 51.

their discipline much more regular than that of the other Their manners are very simple. no gold or filver, though these metals are so common in their country. All their bedding is fome fkins laid on the ground; and they eat on the ground, or elie on a little bench, and wipe their hands on a broom, inftead of a napkin. Their food is of maize, fruit, herbs, and what they catch by hunting and fifting. Their drink, also, is made of maize toasted, steeped, and boiled, or of fruits. Their furniture confists of four or five dishes, and some wooden spoons or shells, a calabash or gourd to drink out of, and a leaf of a tree or maize for a falt-feller. When they make bread, they fet great earthen platters, full of fand, upon the fire, and, when hot enough, take them off, put the grains of maize into the hot fand, ftir them about till they be toafted enough for the purpose, and then grind them between two stones. They let blood with a sharp flint, fixed in a little piece of wood, and just long enough to open a vein. Though they can neither read nor write, yet they have a peculier way of regiltering events, and keeping accounts of things committed to their charge, by ftrings of differences, in which they make knots of feveral colours, called quipos. A French writer tells us, that the knowledge of thefe knots is a fecret fcience, which fathers do not reveal to their children, till they find their death draw near.

As we are treating of the natives of Chili, it is neceffary to observe, that these Indians may be considered under two distinct classes, the subjected and the free. The first of these live among the Spaniards in a state of ser-The latter, which are very numerous, are independent, and have hitherto eluded the attempts made for reducing them to the fubjection of the Spaniards.

It is remarkable that these Indians, in their contests with the Spaniards, have generally spared the white women, carrying them to their huts, and intermarrying with them, which is the reason that many Indians of these parts have the complexions of Spaniards born in that country.

The audience of Chili is divided into three provinces,

St. Jago, Conception, and Chiguito. St. Jago certains St. Jago the capital of Chili, founded in the year 1541, by Valdivia. It is fituated on the river Mapocho, which gives name to a valley of great extent, and fupplies the city with water. In the center stands the grand piazza, which is square, with a beautiful fountain in the middle. Here are the apartments of the governor or prefident, the palace of the royal audience, the town-house, the public prison, the cathedral, and many other handsome public and private buildings. The Spaniards in St. Jago, and the suburb of Chimba, on the other side of the river, are reckoned to amount to 8000, and the other inhabitants to about 30,000. Those who have acquired fortunes at Valdivia, Valparaifo, and Conception, repair hither to spend their days in ease and enjoyment. In the neighbourhood are the gold mines of Tiltil, and the Lavaderos, by their concerns in which many of the citizens amass vast fortunes. The royal audience, refiding in St. Jago, fince its removal from Conception, is composed of a prefident, four auditors, and a fiscal, together with an officer who bears the title of protector of the Indians. Though subordinate, in some respects, to the viceroy of Peru, the determinations of the court are without appeal, except to the council of the Indies. The prefident is also governor and captain-general of the whole kingdom of Chili, in which quality he refides one half of the year in the capital, and the other at Conception. There is a tribunal of the inquisition in this city, and the see of a bishop, subordinate to the archbishop of Lima. Earthquakes have often done great damage here. That of 1647 was so violent, that it almost overturned the whole town, and left such unwholesome vapours in the air, that all the inhabitants died, except about 3 or 400, Another dreadful shock, in 1730, laid the city in ruins.

Valparaifo,

Valparaifo, a fmall town, is fituated in 32 deg. 15 min. fouth latitude. The bay, or harbour, though greatly exposed in winter to the north winds, which then blow with great violence, is much frequented by

ships from Callao and Panama.

The province of Conception is fouth of that of St. Jago; and the town of the fame name is the oldest European fettlement in Chili, and the fecond city in point of dignity. The fame earthquake that destroyed St. Jago in 1730, laid this city also in ruins. The harbour is good, the fortifications indifferent, but the garrifon ftrong. The peasant in the neighbourhood of Conception have great address in the use of the noose and lance: with these they will combat the most fierce bull, throwing the noofe fo artfully as to lay certain hold of fome part of the body. When a bull is haltered they draw the knot, at the fame time given spurs to their horses, and ham-stringing him with their lances, so that the animal is taken and disabled at the same inftant. This dexterity in throwing the noofe, and hamftringing the animal in an inftant, while they ride at full speed, cannot fail of surprizing the Europeans. In private quarrels, also, they fight with the noose and lance; all attacks from which they are taught to parry with fuch dexterity, that, after a combat of an hour, it is no uncommon case to see the parties separate untouched, notwithstanding both have exerted the greatest alertness. Conception is the see of a bishop, which was transferred hither at the time that the city of Imperial was destroyed by the Indians. The inhabitants are numerous; the fertility of the foil, and the excellency of the climate, having induced a great number of Spaniards and Mestizoes to settle here.

Baldivia, or, as the Spaniards call it, Valdivia, flands about 195 miles fouth of conception, at the bottom of a fine bay, on a river to which it gives name, as it takes its own from the first Conqueror of this country. It is defended by four strong castles, mounting above 100 pieces of fine brass cannon; but they are never properly garrifoned, nor fupplied with ammunition.

Chicuito province contains feveral towns, of which the Spanish writers have not given any description.

HISTORY OF CHILI.

IT has been already observed, in the history of Peru, that Almagro, who fell a victim to the imperious, cruelty of Pizarro, attempted the conquest of Chili, but was defeated in his defign by the Indians laying fiege to Cosco, which rendered his presence necessary in that country. The conquest of Chili was suspended till the year 1541, when Pedro de Valdivia was sent to finish the war which Almagro had begun. He pene-trated to the valley of Mapocho, where he founded the city of St. Jago, and built a castle for its desence. The Chilefians attacked this castle; but Valdivia, receiving reinforcements from the viceroy of Peru, did all he could to fecure his conquefts. But still it appears that he was not strong enough to make any great progress; and the Indians giving out that there were many very rich gold mines in a certain part of the country, not far from St. Jago, drew a detachment of his forces (who went in fearch of them) into an ambuscade, and cut off every man of them, except their commander and a negro, who escaped to St. Jago by the swiftness of their horses; whereupon Valdivia sent for another reinforcement of troops, to enable them to advance against the Chilesians, and built the town and castle of Coquimbo, or Serera, on a bay of the sea, to secure his communication with Peru.

When the civil wars between the Spaniards and Peru broke out, Valdivia was recalled, but afterwards returned to Chili with a large body of veteran troops. The Spaniards now disagreeing among themselves, the Chilesians took advantage of their broils, and destroyed the garrifons of Copiapo and Coquimbo, demolishing, at the same time, the towns and fortifications. Valdivia, however, recovered what he had lost, rebuilt those towns, proceeded farther fouthward, and erected the towns of Conception. The fortifications here being finished, though under considerable difficulties, Valdivia determined to continue his rout still farther fouthward, when he founded the city of Imperial, four leagues eaft of the Pacific Ocean, and 40 fouth of Conception. From hence he marched to the mountains of Andes, 16 leagues eaft of Imperial, and built the city of Villa Rica.

The Araucans, the bravest nation of the Chilesians, had opposed the Spaniards with the greatest success, but had been at last obliged to submit; and this being one of the most desirable countries in Chili, Valdivia, in the distribution of the lands, had referved this valley for himself; and being sensible that the natives were not to be kept under but by pure force, he erected three castles in this valley, and left garrisons in them, while he marched farther fouthward. He built the town of Valdivia, where finding ftill richer mines, it is faid, he employed 50,000 Indians in working them, and fpent fo much time in amassing wealth, that the Araucans, taking advantage of his absence, engaged the whole country in a contpiracy against the Spaniards, and chole the celebrated Caupolican for their general.

Valdivia, receiving intelligence of the intended in-furrection, returned in fome hafte to the valley of Arauca, where he found 13 or 14,000 of the natives affembled in arms, whom he charged with his horse, and obliged them to retire into the woods and enclosures as often as they appeared, but was not in a condition to disperse them entirely. They frequently rallied, and attacked his troops; and thus they continued to encounter him for feveral days in a fort of running fight.

The Chilesian general, observing that this engaging the Spaniards with fuch numbers only occasioned confusion among the people, those in the front frequently giving way to the Spanish cavalry, and disordering the rest of his forces, before ever they were engaged, divided his army into batallions of 1000 each, ordering them to charge the enemy by turns. He represented to them, that the Spaniards were but 150 horse, and that 1000 of his brave countrymen might eafily maintain their ground for some time against so small a number, notwithstanding the advantage the enemy had in their arms and hories. However, he only defired they would make their utmost effort. He had no expectation that the first batallions would gain the victory, but when they found themselves obliged to retire, required them to take care, in their retreat, not to diforder the other bodies, but rally themselves, and draw up in the rear, that they might be ready for a fecond charge; and the fame commands he gave to the officers of the other

In pursuance of these orders, the first batallion engaged the Spanish horse with great resolution, and having held them in play fome time, leifurely retired, being fucceeded by the fecond, and that by the third, and fo on, till the Spaniards had continued the engagement for seven or eight hours without intermission, and both men and horses began to faint with the labours of the day, or for want of refreshment; which Valdivia too late observing, made a precipitate retreat, ordering his troops to take possession of a pass about a mile from the field of battle, where he did not doubt he should be able to defend himfelf against all the power of the enemy. But a Chilefian, who had been page to Valdivia, and baptized by the name of Philip, whose Indian name was Lautaro, hearing his master give orders for their retreat, deferted at that instant to his countrymen, and directed them to take possession of the pass before the Spaniards could arrive there. He bid them make use of the advantages they had in their hands, recover their liberties, and rescue their country from destruction, by cutting off these thieves and usurpers who had invaded it; and, taking a spear, charged his late lord Valdivia at the head of a company of Chilesians, while another detachment of the Indians secured a pass as he directed them.

refift their attacks any longer, prefied them on every fide, without giving them a moment's time to breather They cut them all in pieces on the spot, except the general Valdivia. Him they bound and carried before Caupolican, the Chilefian general, who ordered him to be tied to a tree, that he might be executed with more ceremony than those that fell in the battle. Valdivia, it is faid, meanly begged his life of the conquerors, addreffing himfelf chiefly to Lautaro, who was but a few hours before his slave. He promised, if they would spare him, to withdraw all the Spanish forces out of Chili, and never more difturb their peace, fwearing by all that was facred to perform his promife; but the unrelenting enemy was deaf to his intreaties: even Lautaro observed, that it was madness to trust to the promifes of a captive, who would infallibly change his note if he was fet at liberty. Whereupon the general pronounced his doom. Though authors differ about the manner of his execution. Some affirm that they poured melted gold down his throat, bidding him fatisfy himfelf with that metal he fo violently thirfted after. Others relate that one of the Indian caciques, not bearing to hear it debated whether the destroyer of their country should live or die, beat out his brains with a club, without asking the general's leave: and all the Spanish writers agree, that they made trumpets and flutes of his bones, and preferved his skull as a memorial of that important victory; which they celebrated by featling and dancing after their country manner, and inflituted public foorts and exercises; such as running, wrestling, and leaping, to be observed annually in memory of it; and expecting the Spaniards would give them another visit, they encamped in some of their most inaccessible woods and mountains, and Caupolican constituted Lautaro his lieutenant-general, for the fervices he had done in the late battle, finding him every way qualified for that poft. The Spaniards attempted to recover their loffes; the

The Chilefians now feeing the Spaniards unable to

The Spaniards attempted to recover their losses; the war continued about 50 years, but the Chilesians were most generally successful, and at length almost expelled them from their country. The Dutch being informed of these particulars in 1642, sent a squadron of men of war under the command of captain Brewer, with some land forces on board to make a settlement at Chili.

Brewer arrived on the coast of Chili on the 30th of April, 1643; and landing 50 soldiers on the 20th of May, they had a smart engagement with a Spanish party, whom they defeated, and some Chilesians came on board, who gave the Hollanders hopes of success; but Brewer, the Dutch commodore, dying, who projected the enterprize, and the natives growing jealous of the designs of the Hollanders, and seeming ready to join the Spaniards against them, Herekerman, who succeeded Brewer in the command of the squadron, thought sit to return home without effecting any thing, having first demolished

a little fort they had erected on the harbour of Valdivia.

In the year 1669, an old Spaniard, who refided in the court of England, having represented to king Charles II. that the Spaniards had been beaten out of most of their fettlements on the coast of Chili, and that it would be no difficult matter for the English to possess themselves of them; Sir John Narborough was fent with a man of war, called the Sweepstakes, of 36 guns, to view the coast of Chili, and enquire into the feazableness of planting colonies there: he was accompanied thither by the old Spaniard, (Don Carlos abovementioned) Sir John paffed through the streights of Magellan, and not round Cape-Horn, as Brewer had done; and arriving on the coast of Chili near Valdivia, Don Carlos was set on shore, and took the road to the fort of Valdivia, which the Spaniards had rebuilt, being then in possession of the country, and Don Carlos was never heard of more. The Spaniards permitted the English to trade with their people for trifles at first, but would not suffer them to have a communication with the Indians, and, at length, made one of the lieutenants and three feamen prifoners, whom they refused to release, and what became of them was never known. Sir John Narborough, having no authority to commit hostilities against the Spaniards, returned home.

In queen Anne's reign the design of making settlements here was refumed, but proved abortive. Thus the martial genius of the natives continually retarded the progress of foreigners, and has always been the cause why the Spanish fettlements here are so disproportionate to the extent, fertility, and riches of the country. The free Indians are much more numerous than the Spaniards, who are computed at no more than 20,000. All the inhabitants of Chili, including Europeans, Mestizoes, Mulattoes, and Negroes, are reckoned at 150,000 only. Even the free Indians, it feems, now acknowledge the dominion of the king of Spain, and pay tribute to his governor; but the subjected Indians belong entirely to the Spaniards, living among them, and ferving them in the fame manner as the natives of Peru and Mexico. The greater part of Chili is still possessed by the free Indians, who are rather allies than fubjects of Spain, having, it is faid, in the last treaty, consented to acknowledge the king of Spain for their lawful fovereign, only upon condition that they were fuffered to continue under the protection of their own laws and government; an engagement which it will be hazardous for the Spaniards to break, however it may counteract their great defign of gaining entire possession of these countries, and thereby repairing the constant decline of wealth and decay of their precious metals in their other fettlements. The free Indians are governed by their own chiefs, whom the Spaniards call caciques, who claim no authority, besides that of administring justice, and com-manding their tribes in time of war; having neither palaces, guards, nor revenue, or any other badges of fovereign authority.

C H A P. XIV

PORTUGUESE DOMINIONS IN SOUTH AMERICA.

BRASIL

THE name of Brafil was given to this country because it was observed to abound with a wood of that name. It lies between the equator and 35 degrees of south latitude. Its length is about 2500 miles, and its breadth about 700. It is bounded on the north by the mouth of the river Amazon and the Atlantic Ocean, on the east by the same ocean, on the south by the mouth of the river Plata, and on the west by a chain of mountains which divide it from Paraguay.

The aspect of the country is not inviting from the fea, as it appears mountainous and rough, but when

entered nothing can be more delightful, as the mountains are covered with woods of evergreens, and the vallies are cloathed with yerdure. Among the inland mountains are various fprings and lakes, which difembogue themselves into the great river of Paraguay, and the river of Amazons.

The climate varies in different parts of this extensive country. In the northern provinces, towards the equator, great rains, and variable winds, are frequent. The former fometimes overflow the country, and occasion the air to be very unwholesome; but, in the southern provinces, the heats are more tolerable, and the air more falubrious.

is late lord

esians, while

país as he

This country breeds a great variety of ferpents and venomous creatures; among which are, the Indian falamander, a kind of four-legged infect, whose sting is mortal; the ibibaboka, a kind of ferpent, about feven yards long, and half a yard in circumference, whose poiton is inftantaneously fatal to the human kind; the rattle-fnake, which grows here to an enormous fize; the liboya, or roebuck-fnake, which is able to fwallow a roebuck whole, with its horns, being between 20 and 30 feet in length, and two or three yards in circumference; scorpions, one fort of which are between four and five feet long; lizards of three or four feet long; mellipedes both venomous and dangerous; and many others. The pifmires here are very large, numerous, and de-

Here are ant-bears; tygers or madilloes; porcupines; janonveras, a very fierce ravenous animal, fomewhat like a greyhound; armadilloes; various forts of monkies, fome of which are very large; that called by Europeans the floth, or lazy beaft; and the topiraffou, a creature between a buil and an afs, but without horns, and very harmless. The slesh of the topirassou is good, and tastes like beef. They have great plenty of deer, hares, and other game, and a variety of other

animals, wild and tame.

Brafil abounds with birds, fome of which are remarkable for their beauty, and others for their tafte." Of the first fort is the humming-bird, fo called from the noise he makes with his wings, when he fucks the juice of flowers. A naturalist, who calls it calubri, fays, it is not much bigger than a large beatle, and has a fine pipe like that of a nightingale, and near as loud. Their feathers, which way foever you turn them, appear of a different colour and hue, like those of the fun beams, on which account it is not unfitly called by the natives the fun-beam. The anhima hath a horn two or three inches long growing out of his forehead, and, on that account, is called by Europeans the unicorn-bird. The toucan is of the bigness of a wood-pigeon, and of a perfect jet black all over, except under the breaft and belly, which is of a fine yellow, and a fmall circle of red about the neck; but what is most extraordinary in this bird is, that its bill is bigger than its body, yellow without and red within, and about a fpan long. The guira, called by Europeans the fea-curlew, is remarkable for often changing its native colour, being at first black, then ash-coloured, next white, asterwards scarlet, and last of all crimson, which last grows richer and deeper the longer the bird lives. The cocoi, a very beautiful bird, paroquets, parrots, cockatoos, ma-caws, and a variety of others, are very common here. Their poultry are, turkies very large and delicious; a fort of white hens; ducks and other water-fowl. Their bats are of a prodigious fize: they will go into houses in the night, and if they find any persons asleep, and uncovered, they will fasten on them, and suck their

The fea-coafts, lakes and rivers are stored with great plenty and variety of fifth, among which is the globe fifth, called by the Latins orbis miner, from its orbicular form, which is fo befet all round with tharp fpikes, like those of a hedge-hog, that it bids defiance to all fishes of prey. But of all the living creatures in this sea, the most remarkable is the sea-bladder, so called because it greatly resembles one, and swims on the surface of the waves. The infide is only filled with air, except about a spoonful of water that seems to posse it. The tkin is thin and transparent, and like a bubble raised in the water reflects a great variety of colours.

The whole country contains a great deal of timber, but that which is termed Brafil wood is the principal fpecies. This wood has a red colour, grows to a great height and confiderable thickness, and thrives best among the rocks. The flowers are of a bright red, and have a strong agreeable aromatic scent. The wood is red, hard and dry, and is used in dying, but likewife used medicinally both as a stomachic and astringent. The palm-trees of Brafil are of five different kinds, befides which here are woods of ebony, mastick, cotton-trees, citron, &c. and many others which produce admirable fruits and ballams, and diffuse around

a most delicious fragrancy.

The principal commodicies of this country are, ambergreafe, balfams, fugar, sweetmeats, gold, emeralds, rosin, indigo, tobacco, pebbles, diamonds, &c.

The gold and diamond mines were first opened in the year 1681, and have ever fince been computed to yield 5,000,000 fterling, a fifth of which belongs to the king.

The Brasil fugar is remarkably fine and white, and the tobacco is admirable. Of the last article great exports are made to Africa, where they not only dispose of it to the natives, but even supply the vessels of other nations, who are obliged to purchase it for the convenience of carrying on the gold dust and slave trade with any tolerable advantage. The north and fouth parts of Brafil abound with horned cattle, which are hunted for their hides, and great numbers are annually

exported to Europe.

The Portuguese trade is carried on at Brasil upon a very extensive plan. They do not fend out single ships as the convenience of the feveral places, or the judgment of the European merchants may direct, but annual fleets, which fail in the following order, and at the following stated periods: that to Rio Janeiro sets fail in January; that to Bahia, or the Bay of All Saints, in February; and the third fleet to Fernambuco, in the month of March. The cargoes of these sleets, like those of the Spanish to their American colonies, confift of woolen goods from England, France and Holland; linens and laces from Holland, France and Germany; filks from France and Italy; filk and thread flockings, hats, lead, tin, pewter, iron, copper, and all forts of utenfils wrought in those metals, from England, as well as falt fish, bees, flour and cheese. These articles are conveyed up and down from the lower to the upper city on fledges, which are drawn by cranes turned by flaves, and tied with strong cable ropes; and the afcent being steep, is boarded along, that the fledges may meet with nothing to obstruct their way.

Brafil is divided into fifteen provinces, called capitaneas, or captainries, the whole being a principality, which gives title to the prefumptive heir of the crown of Portugal. Of these captainries only eight are an-

nexed to the crown.

The principal places in Brafil are,

The city of San Salvador, or Ciudad da Bahia, fituated on the bay of All Saints: it is large, rich and well built, but stands on so disadvantageous and uneven a ground, (that is, on an eminence of about 100 fathoms, formed by the east fide of the bay) as to make the accession to it very difficult, by reason of its great steepness, infomuch that they are forced to have recourse to cranes and other machines for conveying the goods up and down from the city to the ports. plan of the upper town is as regularly drawn as the unevenness of the hills would permit; but though the ftreets are strait and of a good breadth, most of them have so deep a descent that they would be impassable for our coaches and chairs; to supply which desect the rich there, who are no less ambitious to distinguish themselves from the rest of mankind, by shewing themfelves above using those legs which nature hath given them to walk on, cause themselves to be carried about in a most lazy manner, in beds of fine cotton hanging by the ends to a long pole, which two negroes carry either on their heads or shoulders. The bed is covered with a tester or canopy, to which are hung some curtains to draw close or open, by which the person is secured from rain, wind, and, if he pleases, from fight. Thus lying at his ease, and his head reclined on a soft velvet pillow, the proud fluggard is carried about more gaily than in coaches or fedans. The cotton hammocks are here called ferpentins, and not palankins, as in other parts.

Votwithstanding

Notwithstanding the irregular and inconvenient situation, St. Salvador is one of the most trading and richeft cities in this country, and we may add, that it contributes much to the strength of it, so that with a fmall expence it might be made impregnable, nature having formed ditches and outworks flanking one another in such a manner that the ground might be disputed inch by inch. The east side of St. Salvador is almost inaccessible; the rest are all well fortified both by art and nature, and the avenues guarded by feveral forts, particularly that of St. Peter, which is a regular tetragon of earth faced with stone, surrounded with a ditch; of St. Diego or James, much of the same form the materials, but without ditches; Cafa de la Pulvera, or powder magazine, another strong tetragon, containing eight distinct magazines, vaulted and covered pyramidwife; the fort of St. Anthony, of the same form, but larger, and fituated on the north fide exactly over the watering-place, and commanding the road on the other; that of Nuestra Segnora de Victoria, situated about half a cannon flot from the last; that of St. Bartholomew, which defends a little harbour, where hips may careen; and lastly, that of Montferrat, befides those which command the entrance; fo that upon the whole, there feems little elfe wanting to render it inaccessible to the enemy, but the keeping those fortifications in better repair, rebuilding some others gone to ruin, and furnishing those forts with better cannon, and greater supply of ammunition, than are commonly found in them. Both town and forts are garrifoned by regular forces maintained by the king of Portugal, all well armed, disciplined, cloathed and paid.

The following place was visited by Captain Cook on his first voyage, and from whose authority we shall give a particular description of it.

RIO DE JANEIRO.

Town, Harbour, Country round it, Climate, Vegetables, Fish, Birds, Insetts. Gold Mines, Precious Stones, Diamonds, Restriction on Travellers, Coin, Manufactures, Inhabitants, Government, haughty feverities of the Military officers, despotic Power of the Viceroy, Manners and Customs, Religion, with some general

THIS town, which is the capital of the Portuguese dominions in America, derives its name from Rio de Janeiro, or the river of Jannarius, probably so called from its having been discovered on the feast day of that saint. Captain Cook says, it is rather an arm of the sea, as it did not appear to receive any confiderable stream of fresh water. The town stands on a plain close to the shore on the west side of the bay, at the foot of several high mountains that rise behind. It is neither ill defigned or ill built; the houses in general are of stone, and two ftories high, every house having, after the manner of the Portuguese, a little balcony before its windows, and a lattice of wood before the balcony. Its circuit was computed by Captain Cook at about three miles, for it appeared to be equal in fize to the largest county in England. The streets are strait, and of a convenient breadth, interfecting each other at right angles: the greater part, however, lie in a line with the citadel called St. Sebastian, which stands at the top of a hill that commands the town.

Rio de Janeiro is supplied with water from the neighbouring hills by an aqueduct raifed upon two ftories of arches to a great height from the ground, from which the water is conveyed by pipes into a fountain in the great square that fronts the viceroy's palace. At this fountain great numbers of people are continually waiting for their turn to draw water, and the foldiers who are posted at the governor's door, find it very difficult to maintain any regularity among them. The water at the fountains, however, was fo bad, that our people, who had been two months at fea confined to that in the casks, which was almost always foul, could

not drink it with pleasure. Water of a better quality for laid into some other part of the town; but our people could not learn by what means.

The harbour of Rio de Janeiro, situated west by north, 18 leagues from Cape Trio, may be known by a remarkable hill, in the form of a fugar-loaf, at the west part of the bay; but as all the coast is very high, and rifes in many peaks, the entrance of the harbour may be more certainly distinguished by the islands that lie before it; one of which, called Rodonda, is high and round like a hay-stack, and lies at the distance of two leagues and an half from the entrance, in the direction of fouth by west.

Though the entrance is not wide, this harbour is certainly a good one; for the fea breeze, which daily blows from ten or twelve o'clock till fun fet, makes it easy for any ship to go in before the wind; and it grows wider as the town is approached, fo that a-breaft of it there is room for the largest fleet, in five or fix fathom water, with an oozy bottom. At the narrow part

the entrance is defended by two forts.

The country, at a small distance round the town, (which was all that was seen by any of our people) is beautiful in the highest degree; the wildest spots being varied with a greater luxuriance of flowers, both in beauty and make, than most of the gardens in England.

Though the climate is hot here, the situation of this town is wholesome; for Captain Cook remarks, that, during his ftay here, the thermometer never role higher than 83; though there were frequent rains, and

once a very hard gale of wind.

With respect to cultivation, there is but little appearance: the greater part of the land, indeed, is wholly uncultivated, and very little care or labour feems to have been bestowed upon the rest. There are, indeed, spots, or gardens, in which many kinds of European garden stuff are produced, particularly cabbages, peas, beans, kidney beans, turnips, and white radifies, but all much inferior to those of our country. Water melons and pine-apples are also produced in these spots; and they are the only fruits that were seen cultivated; though the country produced musk-melons, oranges, lemons, limes, fweet lemons, citron, plaintains, bananas, mangos, mamane-apples, accajou or cathou-apples and nuts; jamboira of two kinds, one of which bear a small black truit; cocoa nuts, plam nuts of two kinds, one long, the other round; and palm cherries; all of which were in featon when our people were here, which was in the month of De-

The water melons and oranges were the best fruits of their kind. The pine-apples, Captain Cook fays, were inferior to those he had eaten in England: he adds, that they are, indeed more juicy and sweet, but have no flavour, and that he believed them to be natives of this country; though he heard of none that, at this time, grew wild. They have, however, very little care bettowed upon them, the plants being fet be-tween any kind of garden stuff, and suffered to take the chance of the season. The musk melons are mealy and inlipid; but the water melons are excellent, having a flavour, at least a degree of ascidity, which ours have not. Several species of the prickly pea, and fome European fruits, were feen, particularly the apple and peach, both which were very mealy and infipid. In the gardens, also grew yams and mandioca, which, in the West Indies, is called caffava, and to the flour of which the people here give the name of Farinha de Pao, which may not be improperly translated, Powder of Post.

The foil, though it produces tobacco and fugar, will not produce bread-corn; fo that the people here have no wheat flour, but what is brought from Portugal, and fold at the rate of a shilling a pound; though it is generally spoiled by being heated in the passage. naturalifts were of opinion that all the products of our West-India Islands would grow here; notwithstanding

The military eff

which the inhabitants import their coffee and chocolate from Lifbon

Most of the land in this country is laid down in grass, upon which cattle are pastured in great plenty; but they are so lean, that Englishmen will scarcely eat of the flesh. The herbage of these pastures consists chiefly of cresses, and is, therefore, so short, that, though it may afford a bite for horses and sheep, it can hardly be grazed by horned cattle in a fufficient quantity to keep them alive. With respect to drugs, all that could be found in the apothecaries shops were, pareira brava and balfam capivi, both excellent in their kinds, and fold at a very low price.

The river, and, indeed, the whole coast, abound with great variety of fish: almost every day one or more of a new species were brought to Mr. Banks. The bay is admirably adapted for catching these fish, being full of small islands, between which there is shallow water, and proper places for drawing the feine. The fea without the bay abounds with dolphins, and large mackarel of different kinds, which readily bite at a hook; and the inhabitants always tow one after their

boats for that purpose.

Soon after the ship left the harbour some of the people hooked a shark, and, while they were playing it under the cabin window, it threw out, and drew in, feveral times, what appeared to be its stomach. proved to be a female, and, upon being opened, fix young ones were taken out of it: five of them were alive, and fwam brifkly in a tub of water; but the fixth appeared to have been dead some time.

The banks of the fea, and of the fmall brooks, which water this part of the country, are almost covered with finall crabs. Some of these had one of the claws called by naturalists the hand, very large; others had them both remarkably small, and of equal size; a difference which is faid to diffinguish the sexes, that with the large claw being the male.

In this country is a variety of birds, especially small ones, many of them adorned with the most beautiful plumage. Among these is the humming bird, equal to any heretofore described.

There is as great a variety of infects, fome of which are very beautiful, especially the butterflies, which being more nimble than those of Europe, many of them flew near the tops of trees, and were, therefore, very difficult to be caught, except when the fea-breeze blew fresh, which kept them nearer the ground.

The sea, a league or two distant from this place, was observed to be covered with broad streaks of a yellowish colour, feveral of them a mile long, and three or four hundred yards wide. Some of the water thus coloured was taken up, and found to contain innumerable atoms, pointed at the end, of a yellowish colour, and none of them the fortieth part of an inch long. In the micro-scope they appeared to be small fibres, interwoven with each other; but whether they were animal or vegetable fubstances, or for what they were designed, our natural-

ifts could not determine.

The mines, in which the riches of the place confift, our people supposed to lie far up the country, though they could never learn where, or at what diffance; for the fituation is concealed as much as possible; and troops are continually employed in guarding the roads that lead to them. It is almost impossible for any man to get a fight of them, except those who are employed there. Indeed, the strongest curiosity would scarcely induce any man to attempt it; for whoever is found upon the road to them, if he cannot produce undeniable evidence of his having bufiness there, is immediately hanged upon the next tree.

The gold from these mines is acquired at an expence of life, that must strike every man with horror to whom custom has not rendered it familiar. No less than 40,000 Negroes are annually imported, on the king's account, to dig in the mines: and Captain Cook was credibly informed, that the last year but one before he arrived here, this number fell to short, probably from some epidemic diseases, that 20,000 more were draughted from the town of Rio.

Such a plenty of precious stones is found here, that a certain quantity only is allowed to be collected in a year. To collect this quantity a number of people are fent into the country where they are found, and when it is got together, which fometimes happens in a month, fometimes in less, and fometimes in more, they return; and after that, whoever is found in thefe districts, on any pretence, before the next year, is put to death.

Diamonds, topazes, and feveral forts of amethysts, are found here. Our people did not fee any of the diamonds, but were informed, that the viceroy had a large quantity by him, which he would fell on the king of Portugal's account, but not at a less price than they were fold for in Europe. Mr. Banks purchased a few pazes and amethysts. Of the topazes there are three forts of very different value, which are diftinguished here by particular names. They are fold, large and fmall, good and bad, together, by octavos, or the eighth part of an ounce; the best at four shillings and nine-pence. All dealing, however, in these stones, is prohibited the subject under the most severe penalties. There were jewellers here formerly, who purchased and worked them on their own account. About fourteen months before the arrival of our people, orders came from the court of Portugal that no more stones should be wrought except on the king's account. The jewellers were ordered to bring all their tools to the viceroy, and left without any means of fubliftence. The people employed here to work stones for the king are slaves.

To restrain the people from travelling into the country, or getting into any district where gold or diamonds may be found, of both which there are more than the government could otherwise secure, certain bounds are prescribed them at the discretion of the viceroy, sometimes at a few, and fometimes at many miles distance from the city. On the verge of these limits a guard constantly patroles, and whoever is found beyond it is immediately seized and thrown into prison; and if a man is, upon any pretence, taken up by the guard with-out the limits, he will be fent to prifon, though it should appear he did not know their extent.

The current coin here is either that of Portugal, confifting chiefly of thirty-fix shilling pieces, or pieces both of gold and silver, which are struck at this place. The pieces of silver, which are very much debased, are called petacks, and are of different value, and eafily diftinguished by the number of rees that is marked on the outside. Here is also a copper coin, like that in Portugal, of five and ten ree pieces. A ree is a no-minal coin of Portugal, ten of which are equal in value to about three farthings sterling.

With respect to manufactures, none were seen or heard of here, except that of common hammocks, in which people are carried about as they are with us in fedan chairs; and these are principally, if not wholly,

fabricated by the Indians.

The inhabitants of this place, which are very numerous, confift of Portuguese, Negroes, and Indians, the original natives of the country. The Indians, who are employed to do the king's works in this neighbourhood, can scarcely be considered as inhabitants. Their residence is at a distance, from whence they come by turns to their talk, which they are obliged to perform for fmall pay. The guard boat was constantly rowed to these people, who are of light copper colour complexions, and have long black hair.

Though the government here, as to its form, is mixed, it is, in fact, very despotic. It consists of the viceroy, the governor of the town, and a council. Without the confent of this council, in which the viceroy has a casting vote, no judicial act should be performed; yet both the viceroy and governor frequently commit persons at their own pleasure; and sometimes fend them to Lifbon, without acquainting their friends or family with what is laid to their charge, or where they may be found.

The military establishment here consists of twelve regiments of regular troops, fix of which are Portuguele, and fix Creoles, and twelve other regiments of provincial militia. To the regulars the inhabitants behave with the utmost submission. Captain Cook was told, that if any one should neglect to take off his hat upon meeting an officer, he would immediately be knocked down. These haughty severities render the people extremely civil to any stranger who has the appearance of a gentleman. But the subordination of the officers themselves to the viceroy is enforced with circumstance of the people of the cumitances equally mortifying, for they are obliged to attend in his hall three times every day to ask his commands. The answer constantly is, " There is nothing Captain Cook was told that this fervile attendance is exacted to prevent their going into the country, and remarks upon the occasion, that, if so, it effectually answers the purpose.

With regard to the women, it is on all hands agreed, that the females of the Portuguese and Spanish settlements in South America, are less averse to granting amorous favours than those of any other civilized part of the globe. According to Dr. Solander's account, as foon as the evening began, females appeared on all fides, in every window, and particularized those of the male fex they liked by giving them nofegays. The Doctor, and two other gentlemen, received so many of these bouquets, that they threw handfuls away. Captain Cook, upon this occasion, very candidly observes, that great allowance must be made for local customs; that which in one country would be an indecent familiarity, being a mere act of general courtefy in another; and that, therefore, he had only to fay, he was confident of the truth of the fact thus related.

The churches are very fine; and there is more religious parade in this place than in any of the Popish countries of Europe. There is a procession in some parish or other every day, with various infignia, all fplendid and costly in the highest degree. They beg money, and fay prayers in great form, at the corner of every street.

While the English lay here one of the churches was rebuilding, and, to defray the expence, the parish to which it belonged had leave to beg in proceffion through the whole city once a week, by which very confiderable fums were collected. At this ceremony, which was performed by night, all the boys of a certain age were obliged to affilt, the fons of gentlemen not being excused. Each of these boys was dressed in a black casfock, with a short red cloak hanging about as low as the waift, and carried in his hand a pole about fix feet long, at the end of which was tied a lantern. The number of lanterns was generally above 200, and the light they gave was fo great, that the people, who faw it from the cabin window, thought the town had been on fire.

The inhabitants, however, may pay their devotions at the shrine of any faint in the calendar without waiting till there is a proceffion; for before almost every house there is a little cupboard, furnished with a glass window, in which one of the titulary powers is waiting to be propitious; and to prevent his being out of mind, by being out of fight, a lamp is kept constantly burning before the window of his tabernacle in the night. The people, indeed, are by no means remis in their devotions, for, before these faints they pray and sing hymns with fuch vehemence, that, in the night, they were diffinctly heard on board the ship, though she lay at the diftance of at least half a mile from the town.

The churches here afford an afylum to criminals in cases of murder. It is related, that as Captain Cook's cockswain was one day looking at two men who appeared to be talking together in a friendly manner, one of them fuddenly drew a knife, and stabbed the other, who not inflantly falling, the murderer drew out the weapon, and stabbed him a fecond time. He then ran away, and was purfued by fome Negroes, who were also witnesses of the fact; but whether he escaped, or was taken, Captain Cook never heard.

Rio de Janeiro is a very good place for ships to put in for refreshment. The harbour is fafe and commodious, and provisions, except wheaten bread and flour, may eafily be procured. As a fuccedaneum for bread, there are yams and cassava in plenty. Beef, both fresh and jerked, may be bought at about twopence-farthing a pound, though, as before observed, it is very lean. The method of jerking beef here is by taking out the bones, cutting it into large thin flices, then curing it with falt, and drying it in the shade. It eats well, and, if kept dry, will remain a long time at fea. Mutton is scarcely to be procured, and hogs and poultry are dear. There is abundance of garden-stuff and fruit, of which, however, none can be preserved at sea but the pumpkin. Rum, sugar, and molasses, all excellent in their kind, may be had at a reasonable price. Tobacco is cheap, but not good.

Ships water at the fountain in the great square, tho', as before remarked, the water is not good. The casks are landed upon a smooth fandy beach, about an hundred yards diftant from the fountain; and, upon application to the viceroy, a centinel may be appointed to look after them, and clear the way to the fountain where they are to be filled.

Here is a good yard for ship-building, and a small hulk to heave down by: for as the tide never rises above six or seven feet, there is no other way of coming at a ship's bottom.

Fernambuco, the chief town of the province to which it gives name, is a very confiderable place. It is also called Rerief, or Arraife, from a neighbouring harbour of that name, which is now the ftrengeft in all Brasil, a number of forts being erected all round, and the access naturally so intricate and dangerous, by that the affiftance of a skilful pilot is absolutely necessary to avoid them.

There are many more towns in Brafil, and some of them considerable; as Olinda, in the province of Fernambuco; Paraiba, St. Viacent, Tamora, or Tamarica, and Sierra, in the provinces fo named; Belem, or Para, in the province of Paria; and Maragnano, in an island and captainry of that name, towards the northern extremity of Brafil.

About 30 miles north of the province of St. Vincent, which is the most foutherly of Brasil, lies the little republic of St. Paul, furrounded by lofty mountains and thick forests. This state was originally composed of outlaws from all the neighbouring colonies, Spaniards, Portuguese Creoles, Mestizoes, Mulattoes, and Negroes, who took refuge on this fpot, and lived at first without order, society, faith, honour, or religion; preying upon each other, and fubfifting by mutual rapine, and the plunder of their neighbours; the danger to which it exposed them, foon drove them into confederacies, and these, at last, produced a regular democracy. If they were more numerous, they would be formidable to the Portuguese colonies; but as they are not reputed above 4 or 5000, and want firearms, they give no apprehensions, and confequently no attempts are made to reduce them. At present, this little community claims entire independence; though they pay an annual tribute to the king out of their gold mines, rather to preferve commercial benefits than to acknowledge his fovereignty. It was the tyranny of the Brafilian government that gave birth to this little flate, which is at length grown to jealous of its liberty, that no stranger is suffered to set soot within its dominions, outlaws and run-away flaves excepted. convicts from Brasil are transported to the island of St. Catherine's, which is fituated in 27 deg. 35 min. fouth lat, and though appropriated to this purpose, is one of the most delightful spots imaginable, being about 27 miles long, and fix broad.

Of the natives in Brasil, the most considerable tribes are, the Tapoyers and Topinamboys; of whom the former inhabit the northern, and the other the fouthern

parts. The former are men of a good flature, of a dark copper colour, their hair black, and hanging over their shoulders; but they suffer no hair on their bodies or faces, and go almost naked. Their ornaments are, glittering stones, hung upon their lips or nostrils, and bracelets of feathers upon their arms: the men have also a cap or coronet of feathers.

The complexion of the Topinamboys are not fo dark as their northern neighbours, who live nearer the line; and neither the one or the other as those of the Africans, who lie under the fame parallels. The native Brasilians are partly freemen, and partly slaves; but the negro flaves are much more valuable, being of a more robust constitution, and fitter for labour.

The Brafilians have been represented as very savage, devoid of all principles in religion, cruel in war, and cannibals, or devourers of flesh; but these stories are generally looked upon as fictions of the Portuguese, to justify their cruel and inhuman treatment of them. They believe in certain invisible beings, the dispensers of good and evil, the rewarders and punishers of virtue and vice; and their notion with respect to a suture state is, that after death they shall visit their ancestors, dwelling beyond the Andes; but they have no temples. Their priests make them believe, that if they bring them offerings, those invisible beings, who give them food and all the good things they enjoy, will profiper their affairs, but if they neglect this, some terrible mif-fortune will befall them. They have caciques who rule them in peace, and lead them in war. Their towns are without walls; their mode of carrying on war is by ambuscades, and their weapons are bows, arrows, shields, and wooden clubs.

HISTORY OF BRASIL.

HIS country was first feen by Americus Vespucius in 1489, but not planted till 1549, when the Portuguese fixed themselves at the Bay of All Saints, and sounded the city of St. Salvador. The Portuguese met with very great interruption in their fettlement from the court of Spain, who confidered the country as part of their dominions, till at length it was agreed that they should possess all those parts lying between the rivers Amazon and Plata, which they still enjoy.

The French made an attempt to plant colonies on this coast, but were driven from thence by the Portuguese, who remained without a rival till the year 1580, when their king, the great Don Sebastian, loft his life in an expedition against the Moors in Africa, by which event a period was put to the liberty of the Portuguese, their kingdom being absorbed into the Spanish domi-

After this the Dutch made bold and vigorous attempts to extend their power, attacked the possession of the Portuguese in the East Indies, and at length turned their arms upon Brafil, took feveral of its pro-vinces, and would have subdued the whole country, that they not been stopped in their victorious career by the Archbishop Don Michael de Texira, at the head of a few scattered forces. The Dutch owed their conquests in Brasil to the samous Prince Maurice of Nasfau, whom they appointed governor of Fernambuco: but their West India Company, to whom this colony was subject, disapproving the measures of Prince Maurice, treated him with indignity, and thereby obliged him to refign his government.

A change of fortune upon this took place; and, in 1654, the Dutch were totally expelled Brafil by the Portuguese. But as they still continued their pretenfions to the colony, the Portuguese agreed, in 1661, to pay them an enormous fum to relinquish their interest, which being accepted, the Portuguese remained in peaceable possession of the country till the close of the year 1762, when the Spanish governor of Buenos Ayres, hearing that war was declared between Spain and Portugal, belieged and took the fortress of St. Sacrament, which, by the treaty of peace, was soon afterwards restored to the Portuguese.

H A P.

FRENCH AND DUTCH DOMINIONS IN SOUTH AMERICA.

SECTION I.

FRENCH GUIANA.

THAT part of Guiana that belongs to the French extends about 240 miles along the coast, from Cape Orange, in the latitude of 4 deg. 27 min. north, to the river Marani, in latitude 6 deg. 46 min. north. The fettlements are not extended above twenty miles from the sea-coast, the inland country being still inhabited by the native Indians, of whom a particular ac-count will be given in our description of Dutch Guiana, or Surinam, which is separated from French Guiana by the river Marani. The land along the coast is low and marshy, and the climate of course unhealthy. But on the higher parts, where the trees are cut down, and the ground laid out in plantations, the air is healthy, and the heats are greatly mitigated by the sea breezes.

The chief settlements of the French in Guiana are

fituated in the Isle of Cayenne, which lies 100 miles west of Cape Orange, at the mouth of a river of the tame name. It is about 45 miles in circumference, well wooded and watered, admirably cultivated, and extremely fertile in fugar, tobacco, Indian corn, plants, fuits, and other necessaries of life. But the French fort, which stands at the bottom of the harbour, has no other fresh water than what is faved from rain in large

cisterns. On the eastermost part of the island are the town and fort of St. Douis. The town contains about 200 houses, occupied by mechanics and tradesmen, and the fort has a good garrison.

The French first established themselves here in 1633.

The place was afterwards possessed alternately by the English, then by the French again, to whom succeeded the Dutch, but the French finally prevailed, and still keep it.

SECTION II.

DUTCH GUIANA.

THAT part of Guiana belonging to the Dutch is distinguished by the appellation of Surinam. This country was formerly the property of the English. The Dutch took it in the reign of Charles II. and it was ceded to them by treaty in 1674, in exchange for what they had possessed in the province now called New York.

The only divisions of the season known here is into wet and dry; of which there are annually two, of about three months duration each. The excessive rains render the foil too rich, fo that the canes being too luxuriant to make good fugar are, during the first and fecond crops, converted into rum. 674, in exprovince now here is into

illy two, of xceffive rains es being too the first and the elevated parts

parts bloffoms and green and ripe fruit are to be found on the fame tree throughout the year.

The climate of this country is by no means difagreeable or unhealthy; for the trade winds by day, the land breezes in the evening, and the invariable length of the nights, with refreshing dews, render the air temperate and falubrious.

Besides trees and plants belonging to other countries, the Simaraba tree, peculiar to Guiana, is esteemed a specific in dyfenteries. The carunce is a pernicious nut, the powder of which the Indians conceal unde their nails till they have no opportunity of putting it into the food or drink of those they wish to poison.

There is an extraordinary animal here peculiar to the country, called laubba, an amphibious creature, about the fize of a fmall pig. The head and feet are like those of a pug dog, but it is without a tail. The monkies of this country are innumerable, and their species various. Here are bats twice as large as ours, and without tails. Most people in Guiana sleep in hammocks, as being more fecure from ferpents and poisonous infects; but this does not secure them from the bats which approach any part of the body that is uncovered, generally the feet, open a vein, and fuck the blood till they are fatisfied. There is also peculiar to Guiana a large venemous toad, called the pipa. Its young are bred in the back of the male, where the female deposits the eggs.

There is fo great a variety of beautiful birds in Guiana, that feveral persons in the Dutch colony employ themselves and their slaves in killing and preserv-

ing birds for the cabinets of Europe.

Most of the fishes of Guiana also are common to it with other countries. The torporific eel, when touched either by the hand, or by a rod of iron, gold, filver, copper, or by a flick of some particular kinds of heavy American wood, communicates a shock resembling that of electricity.

Guiana abounds in ferpents of various kinds. There is one fort, not venomous, that measures fometimes above thirty feet in length, and three in circumference. It has a taper tail armed with two claws, like those of a dunghill cock. Small deer have been found in their ftomachs. There are also some of those called amphis bæna.

The infects of Guiana are innumerable, owing to the constant warmth and humidity of the climate.

The inhabitants of Guiana are either natives, who are of a reddish brown, or negroes and Europeans, or a mixed progeny of these in various combinations. The natives are divided into different tribes, more or less enlightened, and polished as they are more or less remote from the fettlements of the Europeans. They allow polygamy, and have no division of lands. The men go to war, hunt and fish; the women look after domestic affairs. Their arms are bows, arrows, clubs, and poisoned darts blown through a reed. They go almost naked, excepting upon particular occasions; when they ornament their heads with seathers. They are chearful, humane and friendly; but timid, and addicted to drinking.

Their houses are quadrangular, confisting of four stakes with cross poles, and are covered with leaves. They fet them up, pull them down, and carry the whole with them at pleasure; as their dwellings are light, and their lives ambulatory. They bury their dead naked, and get drunk at the funeral to bury their forrows. When the body has been interred a fufficient time for the flesh to be rotten they take up the bones, distribute them among the relations and friends of the defunct, and again get drunk to testify their respect for the memory of the deceased. Their wants are easily supplied, and their vices are but sew. Continence before marriage is not confidered as a virtue; a man cares not whether the woman he marries is a virgin or not; but no injury is fo furely revenged as the infidelity of a

Nothing is cultivated here by the natives but plan-No. 5 t

tains, caffava and yams; and one month's cultivation is fufficient for all these. The men are all hunters, and they can always find game or fish, if they prefer it, without danger or toil. They dress it by boiling, either in water or in the juice of cassava, and season it very high with kyan, or red pepper. The only fet time of eating is the evening, when they return from hunting: in general, they eat when they are hungry. They scarce know falt, but sometimes preserve animal food by smoak-drying it. Their drink is water, or a fermented liquor, prepared from the plantain, called pievorce: when they have plenty of this they are continually drunk; fo that their indolence and improvidence, by preventing a constant supply, become public and private bleffings.

As supplying the wants of nature in so fertile and delightful a country takes up but a small portion of their time, they fill up the intervals by various amusements: they bathe and fwim in the rivers, in large companies, feveral times a day, without paying any regard to di-ftinction of fex; and they fwim fo well, that they may be almost reckoned among amphibious animals. At other times they vifit each other, and are mutually entertained with the fimple occurrences of their lives, and a great variety of fables, which are merry, fignificant and moral. Sometimes they dance, and frequently burst into immoderate laughter; and fometimes they recline indolently in their hammocks, where they not only fleep, but eat, converse, and play, blow a kind of rustic flute, pluck out the hair of their beards, or admire themselves in looking-glasses.

The women fuffer nothing in child-birth, which is attended neither with danger or pain. The mother and child, immediately after delivery, are plunged into the water, and the next day she returns to her domestic em-ployment, as if nothing had happened. The children are fed, and during their infancy no other care is taken of them; none are fickly or deformed: the boys, as they grow up, attend their fathers in hunting, and the girls affift their mothers. In old age they become wrinkled; but never either bald or grey. As they have no method of computing time to any number of years, their age cannot be ascertained; but there is sufficient reason to conclude, that their lives are long.

In all their traffic with each other, or with the Europeans, they estimate every thing by their present want of it; they will at one time demand a hatchet, for what at another time they will exchange for a fish-hook.

These happy people live together upon terms of perfect equality, having no diffinction but of age, or perfonal merit; neither have they any division of property: each amicably participates the ample bleffings of a delightful and extensive country: envy, fraud, and violence are precluded, natural defires are immediately and innocently indulged, and government rendered wholly unnecessary.

The States of Holland, to whom the colony of Suriman originally belonged, made it over to the Dutch West-India company; but that company not being in a condition to fend thither the necessary supplies, made over a third part of their fhare to the magistrates of Amsterdam, and another third part to Mynheer Van Aarsens, lord of Sommelfdyk Hence this colony is the joint property of the West-India company, the city of Amsterdam, and the lord of Sommelfdyk, but the fovereignty is invefted in the states-general. Accordingly five directors of this colony are chosen by the city of Amsterdam, four by the West-India company, and one by the lord of Sommelfdyk, but the governor must be approved by the states-general as well as by the directors. The whole colony is at prefent in a very flourishing condition, and carries on a great trade in various commodities.

Surinam, the capital, gives name to the adjacene district, which is at least 100 miles in circumference. It flands on a river of the same name, which is navigable for near 100 miles up the country, and commanded by feveral forts, particularly that of Zelandria, fituated about fix miles from the entrance; near which fortrefs is the small town of Paramairambo.

About 32 leagues from Surinam is the colony of Berbice, fo called from a river of the same name. Fort Naffau is the feat of government.

There are several settlements and plantations on the river Conya, which form a part of the colony of

We might here mention, as connected with Surinam, the Dutch colonies of Demerary and Islequibo, on the Spanish main, which surrendered to the British arms in 1781, and were represented as a very valuable acquisition; but the report feems not to have had much weight, for the colonies were left in a defenceless state, and soon after retaken by a French frigate.

C H A P. XVI.

Dominions in South America in Possession of the Natives.

SECTION I.

A M A Z O N I A.

THIS extensive country derived its name from the Spaniards under the command of Orellana, being opposed by troops of women when they entered the river. The female warriors vied in heroifm with the men; and from this circumstance the country was called Amazonia, or the country of the Amazons.

It is bounded on the north by Terra Firma, on the fouth by Praguay or La Plata, on the east by part of Brafil and the Atlantic Ocean, and on the west by Peru. It is 1200 miles in length, and 960 in breadth.

We have already mentioned the river of the Amazons as the largest in the known world, and shall only add, that, in the long course of this prodigious river, which is 5000 miles, there are several straits, or narrow paslages, where the velocity of the current is very great.

No European nation has made any fettlement in this country. Indeed, very little of it is known, except along the west banks of the river, and the west frontiers of the Portuguese colonies in Brasil.

The air is cooler here than might be well expected fo near the equator, which proceeds from the heavy rains, that occasions the river to overflow their banks one half of the year; and from the cloudy weather, and shortness of the days, which never exceed twelve hours. A brisk eafterly wind also cools the air, which blows from the Atlantic Ocean quite through the country, so ftrong, that veffels are thereby enabled to fail against the stream, and perform a voyage up the river Amazons almost as soon as down it, which requires eight or ten months. Here are terrible storms of thunder and

lightning during the time of the rains-The face of the country is very beautiful, and the foil fertile, producing cocoa-nuts, ananas or pineapples, guavas, bananas, and other tropical fruits; cedar; iron wood, to called from its weight and denfity, red wood, oak, ebony, logwood, and many other forts of dying woods and drugs; together with cotton, tobacco, fugar, maize, caffava root, yams, potatoes, farfaparilla, and canela, or fpurious cinnamon.

They have store of excellent honey, balm, wild fowl, and venifon, in the woods, which also abound with tygers, wild boars, buffalos, &c. The honey is exquisite, and the balm good against all wounds. Parrots are as numerous here as pigeons in England. They have vast numbers of fish of all forts in the rivers and lakes; and, among others, manatees, or fea-cows, that are amphibious, and feed on the banks; and tortoiles of a large fize and a delicate tafte: but the fishers must be upon their guard against crocodiles, alligators, and water-ferpents.

The natives, like almost all the Americans, are of a good stature, have handsome features, long black hair, and copper complexions. They have a tafte for the imitative arts, especially sculpture and painting, and are good mechanics. Their cordage is made of the barks of trees, their fails of cotton, their hatchets of tortoifethells or hard stones; their chiffels, plains, and wimbles, of the teeth and horns of wild beafts; and their canoes are hollowed trees. They fpin and weave cotton garments themselves; and their houses and huts are of wood, thatch, and clay. Their arms, in general, are darts and javelins, bows and arrows, with targets of cane or fish-skins. They are such good archers, that they kill fish in the water with their arrows, which they eat without bread or falt. The feveral nations are governed by their chiefs or caciques; for it is observable, that the monarchical form of government has prevailed almost universally, both among the ancient and modern barbarians, as requiring by far a much less refined policy than the republican system. The regalia by which the chiefs are diftinguished are a crown of parrots feathers, a chain of lyons teeth or claws about their middle, and a wooden fword in their hand. Both fexes fometimes wear mantles of the skins of beafts or cotton, but generally go naked. In fome diffricts the men thrust pieces of cane through their ears and under lips, and hang glass beads to the griftles of their nofes, which bob to and fro when they speak; but in others they wear plates of gold at their ears and noftrils. All their nations allow of polygamy, or a plurality of wives and concubines; and the women here, as in the other American nations, do the most laborious work. They worship the images of their ancient heroes, or subordinate deities; but have no temples, or orders of priests among them.

Here are a people called Omaguas, who, to render their children what they call beautiful, flat the fore and hind parts of the head, which gives them a monstrous appearance. This practice is strictly kept up among them; and they make a jest of the other inhabitants of

Amazonia calling them calabash-heads.

HISTORY OF AMAZONIA.

ONZALO Pizarro, brother to the famous adventurer Marquis Pizarro, conqueror of Peru, was the first who undertook to explore the climes of Amazonia. Preparatory to the expedition, he raifed an army, composed of some Spanish veterans, horse and foot, together with about 4000 Indians. The latter were principally employed in carrying the baggage, and driving a great number of Indian sheep, hogs, &c. before them, for the subsistance of the army by the way. Thus prepared, he fet out from Quito about Christmas, in the year 1539. A dreadful earthquake, and a terrible ftorm, which lasted near tifty days, greatly impeded his march, and many of his Indians died through the feverity of the weather. After furmounting innumerable difficulties, they arrived at a province called Cumaco, where they found plenty of provisions, a great number of cinnamon trees, and many naked inhabitants. Here Gonzalo lest the principal part of his people, taking with him only a few of the most active to fearch for a pass into the neighbouring country; for hitherto they had been enveloped with mountains and woods, through the latter of which they were forced to cut their way, and in the former they endured aftonishing hardships.

Here provisions were plentiful, and the cacique, or king of the country, came in a peaceable manner to welcome them, and brought them provisions.

In these parts they remained two months, in expectation of the arrival of those Spaniards, whom they had lest in Cumaco, and had directed to sollow them by such traces and marks as they should find of the way they had taken before them. Their companions being come up and refreshed after their journey, they marched by the banks of a great river, for the space of so leagues, in all which way they neither found bridge or ford.

At length they came to a place, where the whole river falls from the top of a rock about 200 fathoms high, which cataract makes a noise that is heard about fix leagues from the place; at which though the Spaniards were amazed, yet it was much more wonderful to fee above 40 or 50 leagues lower, that immense quantity of water contracted and straitened within a channel made by one great rock. This channel is fo narrow, that from one fide to the other, it is not above 20 feet wide; but so high, that the top where the Spaniards made their bridge was 200 fathoms from the water. Gozalo Pizarro, and his captains, confidering there was no other passage to be found on the river, and that it was necessary to pass to the other fide, because the country was barren on that fide where they were, agreed to make a bridge over the top of

The Indians, on the opposite side, though few in number, stough desended the pass, but were driven from it by the fire of the muskets. The pass being now clear, the Spaniards fell to work on the bridge of timber, which coft much labour before the first beam could be passed over to the opposite rock; by the help of which, a feeond was more eafily laid, and then other pieces of timber; fo that by degrees they formed a bridge, over which both men and horses passed securely: after this they marched by the fide of the river over mountains covered fo thick with wood, that they were forced to open their way again with hatchets. Through these difficulties they came at length to a country called Guema, where the Spaniards, and their Indian fervants, were forced to fustain themselves with herbs and roots, and with tender sprouts of trees. Thus with famine and perpetual rains many of the Spaniards fell fick and died. They arrived afterwards at a country, where the natives were more civilived than in the former. These eat maize, or Indian corn, and clothed themselves with garments of cotton; but still the climate was subject to violent rains.

While they staid in this place they sent out parties every way, to see if they should discover a better country; but they met with nothing but wild mountains full of dogs, lakes and moorish grounds, over which was no passage. Hereupon they resolved to build a brigantine, to serry over from one side of the river to the other, which was become two leagues broad. In order to this, the first thing to be done was to set up a smith's forge, for nails and iron work, which they made of the shoes of the horses they had killed for sood, and some iron bars they had carryed with them; but iron was now become more scarce than gold.

Gonzalo Pizarro, though chief commander, was the first that laid his hand to an ax to hew down the timber, and to make charcoal, which was requisite to forge the iron, and always the most forward in every menial office, that by thus given a good example, none might take occasion to excuse himsels. The rosin, which issued from certain trees, served them instead of pitch, and their old shirts and rags were made use of instead of oakum, to caulk the seams of their vessel, which being in this manner sinished, they launched into the water with great joy and triumph, imagining that hereby they should quickly escape out of all their

dangers and difficulties. But it proved otherwise, for a few days shewed the contrary, and gave them cause to repent that they had ever made it.

All the gold they had gathered, which amounted to above the value of 100,000 pieces of eight, with abundance of emeralds, some of which were of great value, as also their iron and iron work, and whatsoever was of any efteem, they loaded in their veffel: and fuch as were weak and fick, and not able to travel, were also put on board. Then after a journey almost of 200 leagues, they departed from this place, taking their course down the stream, some by water, and others by land, keeping such a convenient distance from each other, that at night they always joined and lodged together, which journey was performed with great difficulty; for those on the land were forced to open a great part of the way with hatchet and bill, and those on the water were put to hard labour, to keep the vessel from being forcibly carried down by the current from the company on shore. When at any time their paffage was inturrupted by fome mountain, fo that they could not keep near the river, they ferried to the other fide by help of their veffel, and four canoes they had made; but this was a great hindrance to them, and very grievous to men starving and perishing with hunger.

Having in this manner, travelled for the space of two months, they at length met with certain Indians, who by figns, and fome words which they understood by their Indian fervants, gave them intelligence, that, about ten days journey from thence they would find a country well peopled, flocked with provisions, and abounding with gold and other riches, of which they were in pursuit; and further fignified to them, that this country was fituated on the banks of another great river, which joined and fell into that wherein they now were. The Spaniards being encouraged with this news, Gonzalo Pizarro made Francisco de Orellena captain of his brigantine, and put fifty foldiers on board giving them orders to pass down the stream to that place where the two rivers met, and that there leaving the goods he had then on board, he should load his veffel with provisions, and return towards them with all speed imaginable, to relieve them in their distress; many of the Spaniards being already dead, and more Indians, who from 4000 were now reduced to half the number.

Accordingly to these orders, Francisco de Orellana entered on the voyage, and in the space of three days without oars or fail, only by force of the current, was carried to the confluence of the two rivers, mentioned by the Indians, but found no provisions there: whereupon Orellana, pretending it was impossible to return to Pizarro against the stream, resolved to set up for himself; to continue his voyage to the mouth of the river, and then go over into Sprin and obtain the government of those countries for himself; but this cruel refolution was opposed by many of those who were then with him. They told him plainly, that he was not to exceed the orders of his captain-general, and that it was inhuman to forfake his companions in their great diffrefs, knowing how useful and necessary that brigantine was to them. In this point, none was more zealous than friar Gaspar Carvajal, and a young native of Badajoz, named Hermando Sanchez de Vargas, whom those of the contrary opinion made their chief, and were fo warm in their debates on this subject, that the quarrels had come to blows, had not Orellana, with fair words, appealed the tumult: however, he managed fo artfully afterwards with those who had opposed his intentions, that he inticed them all over to his party; and then rudely treated the friar, whom he had exposed to the same famine and misery, (had it not been for respect to his habit and profession) as he did Sanchez de Vargas, whom he left in that defert, encompassed with high mountains on the one side, and a great river on the other, to perish by famine.

Francisco de Orellana asterwards found some provifions amongst the natives on the river below; but because the women came out at first with their husbands to oppose his landing, he gave it the name of the River of Amazons.

Proceeding yet farther down the river, they found these Indians more civil than the other, who received them amicably, admiring the brigantine, and men fo ftrangely habited. These treated the Spaniards hospitably, and furnished them with as much provision as they had occasion for. Orellana remained here, therefore feveral weeks, and built another brigantine, for they were very much streightened for room in the first; and having fitted it up as well they were able, they adventured out to fea, failing along the coast of Caribbiana, about 200 leagues to the northward, till they arrived at the island of the Holy Trinity, having escaped fuch dangers that they often gave themselves over for loft. At this island Orellana brought a ship, with which he failed into Spain, where he requested his majesty's commission, for the request and government of the country of the Amazons, as he thought proper

To make his enterprize appear the more desirable, he alledged, that it was a country abounding with gold, filver, and precious stones, and in testimony thereof produced the riches which he had brought with him; whereupon his majesty granted the request he made, for the government of what he should conquer there; and Orellana was joined by 500 volunteers, the greatest part of them men of rank, with whom he embarked at St. Sucar, for the river Amazon, in the year 1554; but he loft one of his ships in his voyage thither, and met with fo many difficulties and misfortunes before he had failed 100 leagues up the river, that he abandoned the enterprize, and died on his return home.

Gonzalo Pizarro, who was left in fuch diffress after Francisco de Orellana ran away with the brigantine, first built 10 or 12 canoes, and then floats to pass from one fide of the river to the other, as often as his march was interrupted by impassable mountains or morasses, and proceeded in that manner down the river, in hopes to meet the brigantine they had dispatched for provisions. At the end of two months they arrived at the point where two rivers met; but instead of their brigantine, and the provisions they expected to meet with they found only Hernan de Vergas, who, with conftancy of mind becoming a man of honour, had endured, with great resolution, famine, and all the miferies, to which he was exposed in that solitude. From him they received a particular account of the villainy of the perfidious Orellana, which Pizarro could fcarce credit, having hitherto reposed an entire confidence in

The general, however, cheared his men, and encouraged them with hopes of better fortune; telling them, that they ought, like Spaniards, to bear with equality of mind these labours and disappointments; that the more danger, the more honour, and the greater their renown would be in history, which would transmit the fame of their adventures to future ages. The foldiers, observing the chearfulness of their general, who had most cause to resent Orellana's usage, took heart, and continued their march by the banks of the river, fometimes one fide, and fometimes on the other.

But the difficulty of carrying the horses over upon floats (for there still remained about 50 of them) cannot be expressed, and more than the famine they were exposed to. However, the Indians who remained alive served their masters with great faithfulness and affection in these extremities, bringing them herbs, roots and wild fruit; fnakes and other vermin, they found in these mountains, all which went down with the Spaniards; nor could they have sublisted without inch kind of food.

Gonzalo Pizarro, being now refolved to return to Peru, left the river, and took his way more to the northward, which proved shorter by 100 leagues than the way they came, but no less difficult, being forced frequently to cut their way through the woods; and for want of other provisions they now cut up all their remaining horses and dogs; for the 4000 Indians, who used to purvey for them, all died in this expedition; and there were but 80 Spaniards who returned to Quito alive, and these almost without cloaths, and so tunburnt and emaciated with the fatigue and want of food, that their nearest friends scarce knew them.

With fuch insupportable hardships and hazards did the first Spanish adventurers struggle in fearch of gold, even when they had before acquired enough to have fatisfied the most boundless avarice. Gonzalo Pizarro, who was one of the proprietors of the mines of Potofi, had not amaffed less than 1,000,000 of crowns before

he entered upon his expedition.

Peter de Oríua, who afterwards obtained a commission from the governor of Peru, in the year 1550, to fubdue the provinces bordering on the river Amazon, embarked on the river Xauxa in Peru with 700 armed Spaniards, and 200 Indians, and failed down the stream 200 or 300 leagues, till he came to the confluence of the two rivers Amazon and Xauxa, and continuing his voyage afterwards 200 leagues farther, was killed in a mutiny of his men, which put a period to that enterprize.

Several other adventures made the like attempts afterwards, but most of them proved unfortunate, till two monks and fome foldiers, who fet with John de Palacios from Quito in Peru, in the year 1635, and embarking on the river Amazon, where it first becomes navigable, failed the whole length of it, till they arrived at Paria in Brasil, which lies in the fouth side of the mouth of this great river: but their captain John Palacious was killed in a kirmish with the natives in their

The friars having given an account of their voyage to the governor of Brasil, he ordered sloops and boats to be provided, on which he embarked 70 Portuguese and 2000 Indians; and in October 1637 ordered them to fail up the river, under the command of Texeira, a mariner of great skill and experience, who, by the help of the eafterly wind, which generally blows here, failed up against the current, till he arrived at Les Reys, a town of Quito in Peru; but the river not being navigable hither for his veffels, he left them there, and went by land to the city of Quito, where he was kindly received by the Spanish governor, and furnished with whatever he wanted to facilitate his return to Brafil. The governor fent two Spanish jesuits down the river with him, ordering them to embark for Spain, when they arrived at Brasil, and communicate the observations they should make in this voyage to the Catholic majesty; and embarking again at Les Reves, on the river Amazon, with the two jefuits, in the month of February 1638-9, arrived at Paria in Brafil the December following; from whence the jesuits went over to Spain, and published a narrative of their voyage in 1640.

SECTION II. .

TERRA MAGELLANICA, OR PATAGONIA.

AHIS country, which lies a little to the northward of the Straits of Magellan, was called by the Spaniards Terra Magellanica, as are the Straits denominated the Straits of Magellan, from Ferdinando Magellan, a Portuguese of that name in the servee of Spain, who discovered them in the year 1520.

The appellation of Patagonia was derived from a principal tribe of its inhabitants called Patagons. The whole country, which goes under the name of Patagonia, extends from Chili and Paraguay to the utmost extremity of South America, that is, from 35 almost to 45 deg. of fouth lat. being 700 miles long and 300 broad where wideft. The northern parts contain an almost inexhaustible stock of large timber; but in the southern districts scarce a tree (fit for any mechanical purpose) is to be

Here is good pasturage, and incredible numbers of wild horned cattle and horses, which were brought hither by the Spaniards, and have increased amazingly. The east coast is mostly low land, with few or no good harbours. One of the best is Port St. Julian.

Patagonia is inhabited by a variety of Indian tribes, as the Patagons, from which the country takes its name, the Pampas, the Coffares, &c.

The country and inhabitants of Patagonia are mentioned by an Italiah author, who wrote an account of Magellan's voyage round the world; but the moft accurate, authentic, and interesting details, are those of Commodore, afterwards Admiral Byron, and Captain Wallis, who have aftertained several points which before were matters of doubt, and from whom we shall give the following conjunctive account.

Interview with the Natives. Description of their Persons.

Dress, and Weapons. Food. Language. Visit from
the Natives. Productions of the Country, &c.

COMMODORE BYRON relates, that when he came to anchor on this coast, about two miles from the shore, he could plainly see with his glass a number of horsemen, riding backwards and forwards directly a breast of the ship, and waving something white, as an invitation to the people to come on shore. In consequence of this, the Commodore, attended by some of his officers and scamen, advanced in his boat towards the beach, and, on a near approach, saw about 500 people, some on foot, but the greater part on horseback. They drew up upon a stony spot, and kept waving and sallooing, which our people supposed were invitations to land.

According to the account of the voyage of the Wager, this was the fpot where the crew, as they were passing the Strait in their boat, after the loss of the vessel, saw a number of horsemen, who waved what appeared to be white handkerchiefs, inviting them to come on shore, which they wished to have done, but were prevented by a gale of wind, that obliged them to stand out to sea. The writer says, they were in doubt whether these people were Europeans wrecked on the coast, or natives of the country.

Though no weapons were feen among the natives, the Commodore deemed it prudent to make figns that they should retire to a little distance, with which they immediately complied. They continued to shout most vociferously; and the Commodore having landed with his people, drew them up upon the beach, with his officers at their head, giving strict orders that none of them should quit their station till he should give the signal. He then advanced alone towards the Indians, and, perceiving that they retreated, made signs that one of them should come near. Accordingly a person, who afterwards appeared to be a chief, approached. He was of gigantic stature, and seemed to realize the tales of moniters in human shape. He was not measured, but the Commodore judged, from the proportion of his stature to his own, that it could not be much less than seven seet.

When this frightful Coloffus came up, he and Mr. Byron muttered fomething to each other as a falutation. The Commodore then walked with him towards his companions, to whom, as he advanced, he made figns to fit down, and they all readily complied. Therewere among them many women, who feemed to be proportionably large; and few of the men were lefs than the chief who came forward to meet the Commodore. He had heard the voices of the favages very loud at a diffance, and when he came near, perceived a great number of very old men, who were chanting fome unintelligible words in the most doleful cadence, with an

No. 52.

air of ferious folemnity, which inclined him to think

that it was peligious ceremony.

Having looked round upon their enormous goblins with no fmall aftonishment, and, with fome difficulty, made those that were full galloping up fit down with the rest, the Commodore took out a quantity of yellow and white beads, which he distributed among them, and which they received with very ftrong expressions of pleafure. He then took out a whole piece of green filk ribbon, and giving the end of it into the hand of one of them, made the person that sat next take hold of it, and fo on as far as it would reach. During this time they fat very quietly; nor did any of those that held the ribbon attempt to pull it from the rest; though it was eafily perceived that they were ftill more delighted with it than with the beads. While the ribbon was thus extended, Mr. Byron took out a pair of feiffars, and cut it between each two of the Indians that held it, fo that he left about a yard in the possession of every one, which he afterwards tied about their heads, where they fuffered it to remain, without fo much as touching it, while he was with them. Their peaceable and orderly behaviour on this occasion did them honour, especially as the prefents could not extend to the whole company. Neither impatience to thare the new finery, or curiofity to gain a nearer view of what was doing, brought any one from the flation allotted them.

It appeared evident to Mr. Byron, that the Indians on whom he had conferred their ornamental prefents were not entirely firangers to European commodities, as, upon a nicer observation, he remarked one woman who had bracelets, either of brass or very pale gold, upon her arms; and some beads of blue glass, firing upon two long queues of hair, which, being parted at the top, hung down over each shoulder before her. She was of a most enormous fize, and her face most hideously painted. The Commodore endeavoured, by every possible means, to learn where she procured the beads and bracelets, but could not effect it through want of being sufficiently understood.

It would be very natural for those who have read Gay's Fables, if they form an idea of an Indian almost naked returning to his fellows in the woods adorned with E propean trinkets, to think of The Monkey who had feed be World: yet before we despife their fondness for glass beads, ribbons, and other things which are held in no estimation among us, we should consider that, in themselves, the ornaments of savage and civil life are equal; and that those who live nearly in a flate of nature have nothing that refembles glass fo much as glass refembles a diamond. The value which we fee upon a diamond is more capricious than the value which they fet upon glass. The love of ornament feems to be an univerfal principle in human nature; and the splendid transparency and regular figure of a bead are the qualiries that, by the constitution of our nature, excite pleafing ideas; and although in one of these qualities the diamond exceeds the glass, its value is much more than in proportion to the difference. The pleature which it gives among us is principally by conferring diffinction and gratifying vanity, which is independent of natural tafte, which is gratified by certain hues or figures, to which, for that reason, we give the name of beauty. It should be remembered, that an Indian is more diftinguished by a glass button or a bead, than any indi-vidual among us by a diamond; though, perhaps, the fame facrifice is not made to his vanity, as the potterion of his finery is rather a teltimony of his good fortune than of his influence or power, in confequence of his having what, as the common medium of all earthly possessions, is supposed to confer virtual superiority and intrinsic advantage.

One of the men produced the bowl of a tobacco-pipe, which was made of a red earth; but the Commodore foon perceived they had no tobacco among them. Indeed, this man gave him to understand that he wanted fome. Upon this he beckoned to his people, who had remained upon the beach drawn up in the order he had

left them, and three or four of them ran forward, fup-poing that he wanted them. The Indians, who had been observed to keep their eyes continually upon them, no fooner faw fome of them advance, than they all rofe up with a great clamour, and were leaving the place, as imagined, to get their arms, which were probably left at a little distance. To prevent mischief, and put an end to the alarm, the Commodore ran to meet the people, who were advancing in confequence of the fignal given, and told them, as foon as he was got within hearing, that he would have only one of them come up with all the tobacco he could collect from the reft. When the Indians perceived this they recovered from their furprize, and every one returned to his station, except a very old man, who came up to the Commodore and fung a long fong. Before the fong was well finished, an officer came up with the tobacco, and indicated a laughable aftonishment in his countenance, upon perceiving himfelf, though fix feet two inches high, become at once a pigmy among giants.

After the Commodore had presented the tobacco, four or five of the chief men came up to him, and, as he understood by the figns they made, wanted him to mount one of the horses, and go with them to their habitations; but as it would have been highly imprudent to comply, figns were made to them, that the Commodore must return to the ship, at which they expressed much concern, and sat down in their former

stations.

During this dumb flew conference an old man often laid his head down upon the stones, and, shutting his eyes for about half a minute, afterwards pointed first to his mouth, and then to the hills, meaning, as the Commodore imagined, that if he would stay till the morning, they would furnish him with some provisions; but this offer he was obliged to decline. When he left them not one of them offered to follow, but, as long as they could be seen, continued quiet in their stations.

Commodore Byron's description of his first interview with the natives of Patagonia is, in general, confirmed by that of Captain Wallis, who visited his country two years after him. That navigator relates, that, when he approached Cape Virgin Mary, he saw several men riding upon the point of it, who made signals for the people on board to come ashore. Having anchored in a bay close under the fouth side of the Cape, the natives continued a-breast of the ship all night, making great fires, and frequently shouting very loud. At day-light great numbers of them were seen in motion, making signals for our people to land.

Having taken the necessary precautions, and left particular orders on board to bring the ship's broadside to bear upon the landing-place, Captain Wallis went in his barge, attended by some officers and men, properly armed, and having reached the beach, before he left the barge made signs to the natives to retire to some distance, with which they immediately complied.

Captain Wallis having landed with federal officers, and ordered the marines to be drawn up, made figns to the natives to approach, and directed them to fit down in a femi-circle, which they did with great order and cheerfulnefs. The Captain then diftributed among them feveral knives, feiflars, buttons, beads, combs, and divers toys, particularly fome ribbons to the women, which were received with equal pleafure and respect.

After the distribution of these presents, Captain Wallis endeavoured to make them understand that he had other things to dispose of, but expected some articles in return. He then caused some hatchets and bill-hooks to be produced, and pointed to some guanicoes that happened to be near, and some oftriches which he saw dead among them, making signs that he wanted to eat at the same time; but they either could not, or would not, understand him; for though they seemed very desirous of the hatchets and bill-hooks, they gave not the least intimation that they would give any provision in return. These people, in general, had horses.

With respect to the persons of the natives, Commodore Byron expectes the highest admiration at seeing 500 people, the shortest of whom were at least sour inches taller than any even of those of extraordinary stature among us, all bulky in proportion to their height; whereas with us scarcely any bear that proportion; and a man who should measure only six seet two inches, and equally exceed a stout well-set man of common stature in breadth and muscle, would strike us rather as a giant than an individual of ordinary form.

Captain Wallis, at his first interview with the natives, caused those that appeared to be the tallest among them to be measured. One of these was fix seet seven inches high; and several were fix seet five and fix seet fix inches. They were well made, robust, and bony; but their hands and feet were remarkably small. Their complexion was a dark copper colour, like that of the Indians in North America. Their hair was straight, and nearly as harsh as hogs bristles. It was tied back with a cotton string: but neither sex wore any head-dress. Their teach were near white seven and well set.

Their teeth were very white, even, and well fet.
The chief who first came up to Commodore Byron had the skin of some wild beast thrown over his shoulders, as a Scotch Highlander wears his plaid, and was painted to as to make the most hideous appearance he had ever beheld. Round one eye was a large circle of white, a circle of black furrounded the other, and the rest of his face was streaked with paint of different colours. The whole group feen by the Commodore were painted and cloathed nearly in the fame manner. The circles round the two eyes were in no instance of one colour; but they were not univerfally black and white, fome being white and red, and fome red and black. Except the fkins, which they wore with the hair inwards, most of them were naked; a few only of them having a kind of boot upon their legs, with a fhort pointed flick fastened to each heel, which served as a fpur.

It appears from the account of Captain Wallis, that the chief cloathing of these people is composed of the skins of the guanico, sewed together into pieces about fix feet long and five wide. These are wrapped round the body, and fastened with a girdle, with the hairy side inwards. Some of them had a square piece of cloth, made of the downy hair of the guanico, through which a hole being cut for the head, the rest hung round them as low as the knee. They are described by Captain Wallis as wearing the buskins, or boots, and painting themselves in the outre manner mentioned by Commodore Byron, with this difference only, that the eye-lids of all the young women were painted black.

The Patagonians commonly carry a miffile weapon of a fingular kind tucked into a girdle. It confifts of two round ftones, covered with leather, each weighing about a pound, which are faftened to the two ends of a ftring about eight feet long. This is used as a sling, one ftone being keptin the hand, and the other whirled round the head till it is supposed to have acquired sufficient force, and then discharged at the object. They are so expert in the management of this double-headed shot, that they will hit a mark not larger than a shilling with both the stones, at the dislance of sisteen yards. It is not, however, their custom to strike either the guanico or the oftrich with them in the chace, but they discharge them so as that the cord comes against the legs of the offrich, or two of the legs of the guanico, and is twisted round them by the force and swing of the balls, so that the animal, being unable turun, becomes an easy prey to the hunter.

With respect to food, our people, while they flaid on shore, observed the natives cat some of their flesh meat raw, particularly the paunch of an offrich, without any other preparation or cleaning, than just turn-

ing it infide out, and thaking it.

The natives talked much, and fome of them called out to Mr. Wallis Ca-hi-ta-ne; but when they were fpoken to in Spanish, Portuguese, French and Dutch,

they made no re only one word of vow. They hap ways pronounced and when by fig they were spoker with ease, and g come on shore."

of them called then they were ich and Dutch, they made no reply. Our people could distinguish only one word of their own language, which was Chevow. They supposed it to be a salutation, as they always pronounced it when they shook hands with them, and when by signs they asked for any thing. When they were spoken to in English they repeated the words with ease, and got by heart the words "Englishmen, come on shore."

The disposition of these people will be best displayed by a recital of their deportment during the incidents which occurred on their visit to Capt. Wallis on board

When a propofal was made to them by figns that the Captain would take some of them on board if they were defirous to go, about one hundred eagerly offered to vifit the thip; but it was not deemed prudent to admit more than eight of the number. They jumped into the boat with the joy and alacrity of children going to a fair, and having no intention of mischief against our people, discovered no apprehension of harm from them. They sang several of their country songs while they were in the boat, and when they came on board did not express either the curiofity or wonder which the multiplicity of objects, to them equally strange and stupendous, that at once presented themfelves, might be supposed to excite. When taken down into the cabin they looked about with great indifference, till one of them happened to cast his eyes upon a looking-glass, which afforded them infinite di-They advanced, retreated, and played a thousand tricks before it, laughing excessively, and talking very earnestly to each other. Some beef, pork, biscuit, and other articles of the ship's provisions, being fer before them, they eat of them indifcriminately; but would drink nothing but water.

When conducted throughout the ship, they looked at nothing with much attention except the animals. They examined the hogs and sheep with some curiosity, and were delighted to the highest degree with the Guinea hens and turkies. They did not feem to defire any thing except apparel, and only one of them, an old man, asked for that. Captain Wallis gratified him with a pair of shoes and buckles, and gave to each of the others a canvas bag, in which were put some needles ready threaded, a few slips of cloth, a knife, a pair of scissars, some twine, a few beads, a comb and a looking-glass, with some new-fix-pences and halfwith fome new-fix-pences and half-pence, through which a hole had been drilled that was fitted with a ribbon to hang round the neck. They were offered fome leaves of tobacco rolled up into what are called fegars. They finoaked a little, but did not feem to enjoy it. When they were shewn the great guns, they did not appear to have any notion of their use. their use. When the marines were drawn up in order to go through part of their exercise, and the first volley was fired, they were struck with astonishment and ter-ror. The old man, in particular, threw himself on the deck, pointed to the muskets, and then striking his breast with his hand lay some time motionless with his eyes shut. By this it was supposed he meant to indicate that he was not unacquainted with fire-arms and their fatal effects. The reft, feeing the crew merry and finding themselves unburt, soon resumed their chearfulness, and heard the second and third volley fired without much emotion; but the old man continued proftrate upon the deck fome time, and never recovered his spirits till the firing was over.

Being made to understand by signs that the ship was

Being made to understand by signs that the ship was proceeding farther, and that they must go on shore, they discovered much reluctance to comply: all, however, except the old man and one more, were got into the boat without much difficulty; but these stopped at the gang-way, where the old man turned about, went towards the stem, and stood some time without speaking. He then uttered what was supposed to be a

prayer, as he frequently lifted up his hands and eyes to the heavens, and fpoke in a manner and tone different from what had been observed in their common conversation. His prayer teemed to be rather sung than faid, so that our people could not distinguish one word from another.

When Captain Waliis intimated to him that it was expedient for him to go into the boat, he pointed to the fun, and then moving his hand round to the west paused, looked in his face, laughed, and pointed to the shore. By this it was easy to understand that he wished to stay on board till sun-set, and no little pains were taken to convince him of the necessity of his going into the boat. At length, however, he went over the ship's side with his companion, and when the boat put off they all began to sing, and continued their merriment, till they got on shore. When they landed, great numbers of those on shore pressed eagerly to get into the boat; but the officers on board having positive orders to bring none of them off, to their great mortification, prevented them.

The most remarkable animal of this country is the Guanico, which in fize, make, and colour, refembles a deer; but it has a hump on its back, and no horns. They are very shy and very swift. Some parts abound with seals, of which upon one spot our people killed above fifty, many of them larger than a bullock. The tygers here are very ravenous. A part of the ship's crew being fent on shore to fetch some guanicos, which had been that the night before, they found nothing left except the bones, the tygers having devoured the flesh, and even cracked the bones to come at the marrow. An officer upon an excursion shot a tyger-cat, a small but very fierceanimal, for though it was much wounded, it maintained a very tharp contest with a dog for a confiderable time before it was killed. There are abundance of hares, the flesh of which is very white and of excellent flavour. A great number of dogs were feen with the natives, which were supposed to be kept for the purpose of chasing the wild animals which ferve them for food. The horses were well made and nimble, and in general fourteen hands high. as well as the dogs feemed to be of a Spanish breed. The horse furniture were, a saddle, stirrups and bridle. The men had wooden spurs. One in particular was observed to have a large pair of such as are worn in Spain. The women had no fpurs. They rode aftride, and, as well as the men, evinced great resolution and dexterity in horsemanship, for they fearlessly galloped over a fpot where the stones were very loose and slip-

In some parts of the country birds are so numerous, that Commodore Byron says, when they rose they literally darkened the sky; and as they walked, the eggs were so numerous that they trod upon them. Among the rest was one very remarkable for its plumage and magnitude. The head resembled that of an eagle, except that it had a large comb upon it. Round the neck was a white rust exactly resembling a lady's tippet, the seathers on the back were as black as jet, and as bright as the finest polish could render that mineral. The legs were remarkably strong and large, the talons were like those of an eagle, except that they were not so sharp, and the wings, when extended, measured from point to point no less than eight feet. The offrich is very large here, and constitutes part of the food of the natives. Our people eat of their eggs, and thought them very good.

eat of their eggs, and thought them very good.

There feemed to be plenty of fish on the coast, and many porpoises were seen swimming after the ships, that were as white as snow, with black spots, a very uncommon but beautiful sight.

Of vegetables there is no particular account; indeed, the country is represented as being barren in the extreme. Passage up the Straits of Magellan. Account of the Coest on each side. Incidents. Dispositions, Customs, Manners, &c. of the Inhabitants.

OMMODORE Byron observes, that on his departure from Patagonia, to pass through the Straits of Magellan, his course through the first narrow was very rapid, the tide being then remarkably strong. The people saw a single Indian on the south shore, who kept waving to them as long as they were in fight. They saw also some guanicoes on the hills, though it had been said by a former navigator that there were none on that thore.

The ship coming to anchor on account of foul winds off St. Bartholomew's Island, fix Indians came down to the water-fide, and continued waving and hallooing for a long time; but as our people wanted rest, the Commodore was unwilling to employ them in holiting out a boat, and the Indians, feeing their labour fruit-

lefs, at length departed.

The Commodore going in his boat in fearch of Fresh Water Bay, landed with an officer upon Sandy Point, where they found plenty of wood and very good water, and for four or five miles the shore was exceeding pleasant. Over the point there is a fine level country, with a foil that, to all appearance, is very rich, for the ground was covered with showers of various kinds that perfumed the air with their fragrance, and among them were berries almost innumerable where the blossoms had been shed. The grass was very good, and intermixed with a great number of peas in full blossom.

Among this luxuriance of herbage were feen many hundreds of birds feeding, which, from their form and the uncommon beauty of their plumage, our people

called painted geefe.

In the courfe of their walk, during which the Commodore and officer found great plemy of fine fresh water, though not the bay they fought for, they fell in with great numbers of the huts or wigwams of the Indians, which appeared to have been very lately deferted, as in some the fires they had kindled were hardly extinguished. They were in little recesses of the woods, and always close to fresh water. In many places were found plenty of wild celery, and a variety of plants, which might prove of great benefit to feamen after a long voyage. The keen air of this place made the people fo voraciously hungry, that they could have eaten three times their allowance: the Commodore was therefore pleafed to find fome of them employed in hauling the feine, and others on thore with their guns. Sixty very large mullets were taken with the feine, and the gunners had good sport, for the place abounded with geefe, teal, inipes, and other birds that were excellent food.

Captain Wallis, on his departure from Patagonia, turned into the Straits of Magellan with the flood tide between Cape Virgin Mary and the Sandy Point that refembles Dungeness. When the ship got abreast of this point, they stood close into the shore, where they observed two guanicoes, and many of the natives on horseback, who seemed to be inpursuit of them. When the horsemen came near they ran up the country at a great rate, and were pursued by the hunters with their slings in their hands teady for the cast, but neither of them was taken while our people were within fight.

Having come to anchor about three miles from the shore the natives made several large fires a break of the ship, and at break of day about 400 of them were seen encamped in a sine green valley between two hills with their borses for large before them.

hills, with their horses feeding beside them.

Observing great numbers of the natives on horses a breast of the ship, and being given to understand by an officer that this was the place where Commodore Byron had the conference with the tall man, Captain Wallis sent two officers to the shore, but with orders not to land, as the ships were at too great a distance to protect them. The officers, on their return, reported,

that the boat having lain upon her oars very near the beach, the natives came down in great numbers, whom they knew to be the faine perfons they had feen before, with many others, particularly women and children; that when they perceived our people had no defign to land, they feemed to be greatly disappointed; and those who had been on board, the ship waded off to the boat, making figns for it to advance, and pro-nouncing the words they had been taught, "English-men come on shore," very loud, many times; that when they could not get the people to land, they were with great difficulty prevented from getting into the boat; that they prefented them with some bread, tobacco, and a few toys, pointing, at the fame time, to fome guanicoes and offriches, and making figns that they wanted them as provisions, but that they could not make themselves understood; and finally, that finding they could obtain no refreshment, they rowed along the shore in search of fresh water; but seeing no appearance of a rivulet, they returned on board.

At Port Famine, where both our navigators touched, the Spaniards, in the year 1531, built actown, which they called Philippeville, and left in it a colony confifting of 400 persons. When the English navigator Cavendish arrived here in 1587, he found one of thefe unhappy wretches (which was the only one that remained) upon the beach. They had all perithed for want of lubliftence except 24. Twenty-three of thefe fet out for the river Plata, and were never afterwards heard of. This man, whose name was Hernando, was brought to England by Cavendith, who called the place where he had taken him up Port Famine. It is a very fine bay, and fufficiently capacious for many ships to moor in great fafety. In this place there is very good wooding and watering; and fuch a quantity of drift-wood, as the Commodore faid would furnish. a thousand sail. Many fine small fish were taken with a hook and line off the ship's side; and the seine was hauled with great forces in a fine fandy bay, a little to the fouthward of Sedger River. A great number of birds, of various kinds, were fhot, particularly geefe, ducks, teal, fnipes, plovers, and race-horfes. The water of Sedger River is excellent, but the boars cannot get in till about the hour of flood, because it is very fallow at low water for about three quarters of a mile. Commodore Byron went up it about four miles in his boat, but the fallen trees rendered it impossible to go farther. It was found not only difficult, but dangerous, to get up thus far. The stream is very rapid, and many tumps of trees lie hidden under it, One of these made its way through the bottom of the boat, and she was full of water in an instant. boat was got on shore, and afterwards, with great difficulty, hauled up upon the fide of the river, where the hole was stopped; so that a shift was made to get her down to the mouth of the river, where the was properly repaired.

On each fide of this river are the finest trees ever feen. Commodore Byron was of opinion that they would supply the British navy with the best matts in the world. Some of them are of a great height, and more than eight feet in diameter, which is proportionably more than, eight yards in circumference; to that four men joining hand in hand, could not compass them. Among others were found the pepper tree, or

winter bark, in great plenty.

In the woods, notwithfunding the coldness of the climate, there are abundance of parrots and other birds of most beautiful plumage. The Commodore every day that geese and ducks enough to serve his own table and several others; and every one on board might have done the same. There was, indeed, great plenty of fresh provisions of all sorts; for as much tish was caught every day as served the whole ship's company. Being much on shore, the Commodore tracked many wild beasts in the sand, but never saw one. Many huts, or wigwams, were found, but not an indian was met with.

The country between Port Famine and Cape Forward, which is diffant about four leagues, is very fine; the foil appears to be pretty good; and there are three large rivers in this part, befides feveral brooks.

While Commodore Byron lay in Port Famine, he went with a party to Cape Forward. On fetting out they intended to have gone farther, but the weather became to bad with heavy rain, that they ftopped there, and made a great fire to dry their clothes, which were wet through. From the place where they ftopped the Indians had gone to lately, that the wood, which lay half burnt where they had made their fires, was ftill warm; and foon after the fire was kindled they perceived that another was kindled directly opposite to it on the Terra del Fuego shore, probably as a fignal, if our people had been Indians, they would have understood. The party having dried and refreshed at the fire, and the rain being abated, they walked across the Cape to fee how the strait ran, which they found to be about W. N. W. The hills, as far as could be seen, were of immense height, very craggy, and covered with snow from the summits to the bases.

The country along the shore to the northward is very pleafant, the ground being in many places covered with slowers, equally beautiful and fragrant with those in our gardens. Mr. Byron gives it as his opinion, that if it were not for the severity of the cold in winter, this country might, by cultivation, be rendered one of the finest in the world.

A small tent had been set close to a little rivulet, and just at the skirts of a wood, where three men had been employed in washing \$1\$ hey slept on shore; but soon after sun-set were washened out of their sirst sleep by the roasing of some wild beasts, which the darkness of the night, and their solitary situation on this pathless defart, rendered horrid beyond imagination. The tone was deep and hollow, so that the beasts, whatever kind they might be of, were certainly large; and the men perceived that they drew nearer and nearer, as the sound every minute became more loud. From this time sleep was renounced for the night; a large sire was immediately kindled, and a constant blaze kept up. This prevented the beasts from invading the tent; but they continued to prowl round it at a little distance, with incessant howlings, till the day broke, and then, to the great joy of the affrighted sailors, disappeared. The latitude of Port Famine is 53 deg. 42 min. south; longitude 71 deg. 28 min. west.

The account of Captain Wallis confirms that of Commodore Byron with respect to the abundance of provisions in this place. He says, that during his ship's stay there, they caught sist enough to furnish one meal a-day, both for the sick and the well. Great plenty of celery was also found, and pea-tops, which were boiled with peas and portable soup. Besides these were gathered great quantities of fruit, that resembled the cranberry, and the leaves of a shrub, somewhat like our thorn, which were remarkably sour. On the arrival of the ship all the crew began to look pale and meagre; many had the scurvy to a great degree, and upon others there were manifest signs of its approach, yet in a fortnight there was not a scorbutic person on board. The recovery was effected by their being on shore, eating plenty of vegetables, being obliged to wash their clothes, and keep their persons clean by daily bathing in the sea.

An officer, who was fent out in quest of anchoring places, reported, on his return, that he had been on shore at several places, where he had found plenty of wood and water close to the beach, with abundance of cranberries and wild celery. He had seen a great number of currant bushes full of fruit, though none of it was ripe; and a great variety of beautiful shrubs in blossom, bearing flowers of different colours, particularly red, purple, yellow, and white, besides great plenty of the winter's bark, a grateful spice, well known to the botanists of Europe. He shot several wild ducks, geese, gulls, a hawk, and other birds.

Port Egmont, so called by Commodore Byron in honour of the Earl, then First Lord of the Admiralty, is one of the finest harbours in the world, and so capacious, that the whole British navy might ride in it with perfect security from all winds. In every part of this port there is plenty of fresh water. Geese, ducks, snipes, and other birds, are so numerous, that the people grew tired of them. Wood, however, is wanting here, except a little that is found adrift along different parts of the shore.

Among other refreshments which are in the highest degree falutary to those who have contracted scorbutic diforders during a long voyage, here are wild celery and wood forrel in the greatest abundance. There are also mussels, clams, cockles, and limpets. The seals and penguins are innumerable; and the coast abounds with fea-lions, many of which are of an enormous fize. This animal was found to be very formidable. The Commodore was once attacked by one of them very unexpectedly, and it was with the utmost difficulty that he could difengage himfelf. The people at other times had many battles with them, and it has sometimes afforded a dozen of them an hour's work to dispatch one of them. A bite of one of these creatures almost tore a very fine maltiff dog to pieces. Nor were these the only dangerous animals found here. An officer having been fent out to found the coast upon the south shore, reported, at his return, that four fierce creatures, refembling wolves, ran up to their belies in the water, to attack the people in his boar, and that, as they hap-pened to have no fire-arms with them, they had immethat the put the boat off into deep water. On the fouthern, there the officer afterwards found one of the largest fea-lions are feen. As the boat's crew were well armed they immediately engaged him, and, during the contest, one of the other purposes. contest, one of the other animals was seen running to-wards them. He was fired at before he came up, and prefently killed; though the Commodore wished they had taken him alive, which, if they had been aware of his attack, might, he thought, eafily have been done. When any of these creatures got fight of any of the crew, though at ever so great a distance, they ran directly at them; and no less than five of them were killed in one day. They were always called wolves by the thip's company, though, except in their fize, and the shape of their tails, they more resembled foxes. They are as big as a middle-fized mastiff, and their fangs are remarkably long and tharp. There are great numbers of them upon this coaft, though it is not eafy to guess how they first came thither. They burrow in the ground like foxes; and pieces of feal, which they had mangled, were frequently feen; and the fkins of penguins lay fcattered about their holes. To get rid of these creatures the people fet fire to the grass; fo that the country was in a blaze, as far as the eye could reach, for feveral days, and they were feen running in great numbers to feek other quarters.

The Commodore, in the course of his passage, obferved at the entrance of Jerom's Sound, on the north
side, three or four fires, and soon afterwards perceived
two or three canoes paddling after the ship. At length
the canoes came up, and one of them had the resolution to come on board. The canoe was of bark, badly
constructed, and the people on board, which were four
men and two women, the most miserable wretches ever
feen. They were all naked, except a slinking scalskin that was thrown loosely over their shoulders. They
were armed, however, with bows and arrows, which
they readily gave in return for a few beads and other
trisses. The arrows were made of reed, and pointed
with a green stone. They were about two sect long,
and the bows were three feet. The cord of the bow
was the dried gut of some animal.

Soon after the thip was at anchor a breaft of Batchelor's River, feveral Indians came on board, and were prefented with beads, ribbons, and other trifles, with which they appeared highly delighted. Commodore Byron returned this vifit by going on thoreamong them,

taking only a few people with him in the boat, that the natives might not be alarmed by numbers. The vifitors were received with great expressions of kindness, and, to make them welcome, the natives brought some berries, which they had gathered for that purpose, and which, with a few mussels, seemed to be the principal part, if not the whole of their subsistence.

The Commodore having fent out an officer in the boat to look for harbours on the fouthern shore, was informed by the officer, on his return, that near Cape Upright he had fallen in with a few Indians, who had given him a dog, and that one of the women had offered him a child which was sucking at her breast. The offer was refused, as more degrading to these poor forlorn savages than any thing in their appearance or manner of life, as well as an instance of the strangest depravity of human nature, that leaves them destitute of affection for their offspring, or, a most deplorable situation, that impels them to necessities by which it is surmounted.

The Commodore, in the course of his passage, met with very tempestuous weather to the eastward of Cape Monday. He says, when the season is so far advanced as it was when he attempted the passage of this Strait, it is a most difficult and dangerous undertaking, as it blows a hurricane incessantly, night and day; and the rain is as violent and constant as the winds; with such fogs, as often render it impossible to discover any object

at the distance of twice the ship's length.

Another officer, fent out for the same purpose as the former, having found two anchoring places, reported on his return, that being on shore to the westward of Cape Monday, he had fallen in with some Indians, who had with them a canoe of a construction very different from any that had been feen in the Strait before: This veffel confifted of planks fewed together; but all the others were nothing more than the barks of large trees tied together at the ends, and kept open; and fhort pieces of wood thrust in transversely between the two fides, like the boats which children make of a beanshell. The people, he faid, were the nearest to brutes, in their manner and appearance, of any he had ever feen. They were like fome which had been met with before, quite naked, notwithstanding the severity of the weather, except part of a feal-skin thrown over their shoulders. They eat their food, which was such as no other animal but a hog would touch, without any dreffing. They had with them a large piece of whale blubber, which flunk intolerably, and one of them tore it to pieces with his teeth, and gave it about to the rest, who devoured it with the voracity of a wild beaft. They did not, however, look upon what they faw in the possession of our people with indifference; for while one of them was afleep, they cut off the hinder part of his jacket with a sharp flint, which they use as a knife.

While the ship lay at anchor in a bay on the fouthern shore, about a league to the eastward of Cape Upright, feven or eight Indians, in a canoe, came round the western point of the bay, and having landed opposite to the ship, made a fire. Our people invited them to come on board by all the figns they could devise, but without fuccess: the Commodore, therefore, took a boat, and went on shore to them. He introduced himfelf by making them prefents of feveral trifles, with which they feemed to be much gratified, and an intimacy came on in a few minutes. Having fent on board for fome bread, he divided it among them, and remarked with equal pleasure and surprise, that if a bit of the biscuit happened to fall, not one of them offered to touch it till he gave his confent. In the mean time fome of the crew were cutting a little grass for two or three sheep still remaining on board. At length the inhabitants, perceiving what they were doing, ran immediately, and tearing up all the weeds they could get, carried them to the boat, which was loaded in a fhort time. This token of their good will gratified the Commodore, who perceived that they were pleafed with the pleasure he expressed upon the occasion. They had, indeed, taken such a fancy to our people, that when they returned on board the boat, they all got into their canoe and followed them. When our people came near the ship, however, they stopped, and gazed at her with an apparent mixture of astonishment and terror, till at length, with some difficulty, sour or sive of them were prevailed on to venture on board. As soon as they entered the ship they received several presents, and appeared to be perfectly at ease in a short time.

The Commodore being very defirous to entertain them, one of the petty officers played upon the violin, and fome of the crew danced. At this they were fo much delighted, and fo impatient to shew their gratitude, that one of them went over the ship's side into the canoe, and fetched up a feal-skin bag of red paint, and immediately simeared the sider's face all over with it. He was very desirous to pay the Commodore the same compliment, which, however, he thought sit to decline; but he made many very vigorous efforts to get the better of his modesty. It was with some difficulty that he desended himself from receiving the honour designed him in his own despite. After having entertained them for several hours, it was intimated to them that it would be proper for them to go on shore; but such was their attachment, that it was by no means an

eafy matter to get them out of the ship.

Captain Wallis represents the country about Cape Gallant as most dreary and forlorn, and the mountains on each fide the straits as of immense height. About one fourth of the ascent is covered with trees of a confiderable fize: in the space from thence to the middle of the mountain there is nothing but withered fhrubs. Above these are patches of snow, and fragments of broken rock. The summit is altogether rude and naked, towering above the clouds in vail crags that are piled upon each other, and look like the ruins of nature, devoted to perpetual fterility and defolation. Captain Wallis fays, that whoever navigates this pare, of the strait should keep the north shore close on board. and not venture more than a mile from it till the Royal Islands are passed. The current sets easterly through the whole twenty-four hours, and the indraught fhould by all means be avoided. The latitude of Cape Galby all means be avoided. The latitude of Cape Gallant Road is 53 deg. 30 min. fouth; longitude 73 deg.

9 min. west.

The thip having come to an anchor in Elizabeth Bay, which lies in latitude 53 deg. 43 min, fouth, Captain Wallis fent the boats on thore for water; and foon after our people landed, three canoes put off from the fouth fhore, and landed fixteen of the natives on the east point of the bay. When they came within an hundred yards of our people, they stopped, called out, and made signs of friendship. Our people did the same, shewing them some beads and other toys. At this they feemed pleafed, and began to shout. Our people imitated the noise they made, and shouted in return. The Indians then advanced, still shouting and laughing very loud. When the parties met they shook hands, and our people presented the Indians, with feveral of the toys which they had shewn them at a distance. They were covered with seal-skins, which stunk abominably; and some of them were eating the rotten flesh and blubber raw, with a keen appetite, and great feeming fatif-faction. Their complection was the same as that of those our navigators had seen before, but they were low of stature, the tallest of them not being more than five feet fix inches. They appeared to be perifhing with cold, and immediately kindled feveral fires. they subfift in winter is not easy to guess; for the weather was at this time fo fevere, that there were frequent falls of fnow. They were armed with bows, arrows, and javelins. The arrows and javelins were pointed with flint, which was wrought into the shape of a ferpent's tongue. They discharge both with great force and dexterity, fcarce ever failing to hit a mark at a great distance. To kindle a fire they strike a pebble against a piece of mundic, holding under it, to catch

Three of the natives came on board with the boat, but they seemed to regard nothing with any degree of curiosity except clothes and a looking-glass. The looking-glass afforded them as much divertion as it had done the Paragonians, and it feemed to surprise them more. When they first peeped into it they started back, first looking at our people, and then at each other. They then took another peep, as it were by ftealth, ftarting back as before, and then eagerly look-ing behind it. When by degrees they became familiar ing behind it. with it they smiled, and seeing the images smile in return, they were exceedingly delighted, and burst into fits of the most violent laughter. This, however, they lest, and every thing elle, with perfect indifference, the little they possesses, to all appearance, equal to their desires. They eat whatever was given them but would drink pathing but makes them, but would drink nothing but water.

Captain Wallis went on shore with them when they left the ship, and by this time several of their wives and children were come to the watering-place. He distributed some trinkets among them, with which they feemed pleased for a moment, and gave some of their arms in return. They also gave several pieces of mundic, such as is found in the tin mines of Cornwall. They gave our people to understand, that they found it on the mountains, where there are probably mines of

tin, and perhaps of more valuable metal.

As this feemed to be the most dreary and inhospitable country in the world, the people appeared to be the lowest and most deplorable of human beings. Their perfect indifference to every thing they faw, which marked the depravity between our state and their own, though it may preferve them from the regret and anguish of unsatisfied desires, seem, notwithstanding, to imply a defect in their nature, for those who are satisfied with the gratifications of a brute can have little pretenfions to the prerogatives of men.

When they embarked in their canoes they hoisted a feal-skin for a fail, and steered for the fouthern shore, where our people faw many of their hovels, and remarked that not one of them looked behind, fo little impression had the wonders they had seen made upon their minds, and fo much did they appear to be abforbed in the present, without any habitual exercise of

power to reflect upon the paft.

About three miles up Batchelor's River, on the west fide, between Mount Misery and another mountain of flupendous height, there is a cataract which has a very striking appearance. It is precipitated from an eleva-tion of above 400 yards; half the way it rolls over a. very steep declivity, and the other part is a perpendicular fall. The found of this cataract is not less aw-

ful than the fight.

The country to the fouthward of the Strait appeared horrid and dreary beyond description. It consisted of craggy mountains much higher than the clouds, that were altogether naked from the base to the summit, there not being a fingle shrub, nor even a blade of grafs, to be feen upon them. The vallies between them were equally defolate, being entirely covered with deep fnow, except in a few places where it had been washed away, or converted into ice, by the torrents which were precipitated from the crags of the mountains above, where the fnow had been disfolved, and even those vallies, in the parts that were free from fnow, were as destitute of verdure as the rocks between which

Having steered for Cape Upright, and anchored in the bay, while the people were employed in getting wood and water, and gathering celery and muffels, two canoes full of Indians came along-fide the ship. They had much the fame appearance as the deplorable wretches feen before in Elizabeth's Bay. They had on board some seals slesh, blubber, and penguins, all of which they eat raw. Some of our people, who were sishing with a hook and line, gave one of them a fish fomewhat bigger than a herring, alive, just as it came out of the water. The Indian took it hastily as a dog would take a bone, and inftantly killed it by giving it a bite near the gills. He then proceeded to eat it, be-ginning with the head and going on to the tail, with out rejecting either the bones, fins, scales, or entrails. They are every thing that was given them indifferently, whether falt or fresh, dressed or raw, but would drink nothing but water.

They thivered with cold, yet had nothing to cover them but a feal skin thrown loosely over their shoulders, which did not reach to their middle, and they were observed, when rowing, to throw even this aside, and sit stark naked. They had some javelins rudely pointed with bone, with which they used to strike seals and penguins, and one of them was observed to have a

and penguins, and one of them was observed to have a piece of iron about the fize of a common chiffel faftened to a piece of wood, as it intended rather for a tool than a weapon.

They had all fore exp which was imputed to their fitting over the smoke of their fires, and they smelt more offensively than a fox, which, perhaps, was partly owing to their diet, and partly to their natural filthings.

Their canoes were about fifteen feet long, three broad, and nearly three deep. They were made of the bark of trees fewed together either with the finews of some beaft, or thongs cut out of a hide. Some kind of rush was laid into the seams, and the outside was fmeared with a gum, which prevented the water from foaking into the bark. Fifteen flender branches bent into an arch were fewed transversely to the bottom and fides, and some straight pieces were placed across the top from gunwale to gunwale, and fecurely fastened at each end. On the whole, however, it was poorly made, nor had these people any thing among them in which there was the least appearance of ingenuity. An hatchet or two were given them, with fome beads and a few other toys, with which they went away to the northward, and were no more feen by any of our

A party fent out in fearch of anchoring places spent a night upon an island adjacent to Cape Upright, called Dolphin Bay. They there faw feveral fmall coves, which were all dangerous. While they were there fix canoes landed about thirty Indians, who ran to the boat, and were carrying away every thing they found in her, but our people discovered them just time enough to prevent them. As foon as they found themselves opposed, they went to their canoes, and armed themselves with long poles and javelins pointed with the bones of fish. They did not begin an attack, but stood in a threatening posture. Our people, who were twenty-two in number, acted only on the defensive, and by parting with a few trifles among them rendered them friends, and induced them to behave peaceably during their

ftay.

After a feries of fatigue and hardships, Captain
Wallis, and those under his command, quitted this dreary and inhospitable region, where they were almost in perpetual danger of shipwreck for near four months, having entered the Straits on the 17th of December 1766, and quitted them on the 11th of April 1767: a region where, in the midst of summer, the weather was cold, gloomy, and tempestuous; where the pro-fpects had more the appearance of a chaos than nature; and where, for the most part, the vallies were without herbage, and the hills without wood.

Commodore Byron observes, that it is probable those navigators who may read of the difficulties and dangers, which are by him represented to attend the pasfage through the Straits of Magellan will conclude, that it ought never to be attempted again; but that all the thips which might after him fail a weftern courfe from Europe into the South Seas ought to go round

disputes.

Cape Horn. He professes himself of a different opinion, and thinks that, at a proper feafon of the year, not only a fingle vessel, but a large squadron, might pass the Straits in less than three weeks; and adds, that, to take the proper season, they should be at the castern entrance fome time in the month of December. one great advantage of this passage, he adduces the facility with which fish is almost every where to be procured, with wild celery, feurvy-grafs, berries, and many other vegetables in great abundance.

Our late celebrated navigator Captain Cook declares, that though the doubling of Cape Horn is so much dreaded in the general opinion, it is more eligible to paisthan through the Straits of Magellan The wea-ther was to moderate when he doubled that Cape, that the thip was not once brought under close-reefed topfails after the left the Strait of Le Maire. He was just thirty-three days in coming round the land of Terra del Fuego, or Cape Horn, from the eastern entrance of the strait. He observes, that Captain Wallis, in the Dolphin, at the same season of the year, had been three months in getting through the Straits of Magellan; and is fully perfuaded, that if he had come by that paffage, his people would have been fatigued, and his anchors, cables, fails, and rigging, much damaged; neither of which inconveniences he had fuffered.

These respective opinions are submitted to the candid and judicious reader, who will determine upon them accordingly as the mind may be impressed by scientific

or experimental knowledge.

That the reader may form a judgment of the perfons and characters of the original inhabitants of South America in general, we shall present them with the following description.

All the ancient natives of the country are tawny, of a colour fomewhat reddith, and more or less clear, This variety of shades in their complexion is probably owing chiefly to the different temperature of the air in the feveral climates they inhabit, varying from the intense heat of the torrid zone, to the nipping cold

caused by the vicinity of the snows.

This diversity of climes, with that of woody countries, plains, mountains, and rivers, as also the difference of their diet, and the little correspondence the neighbouring nations have with each other, with a thousand other causes, must necessarily have produced great variety in the occupations and customs of these people. Besides, it may easily be imagined, that a nation who have been Christians, and subject to the crowns of Spain and Portugal for an age or two, must inevitably have learned fome of the manners of their conquerors; and confequently that an Indian who lives in a town or village of Peru must differ from a savage in the inner parts of the continent, and even from a new inhabitant of the missions lately settled on the banks of the Maranon. It would be needful therefore, in order to give any one an exact idea of the Americans, to make almost as many descriptions as there are nations among them. Nevertheless, as all the European na-tions, though differing among themselves in tongues, manners, and customs, would still have somewhat in common to all of them in the eyes of an Afiatic, who should examine them attentively; so all the American Indians of the feveral countries have certain touches of refemblance in common with each other; and, some flight touches excepted, all of them, at the bottom, feem to be of one common temper, whereof infenfibility is the basis, which, whether it ought to be honoured with the name of apathy, or branded with that of flupidity, we leave others to decide.

This undoubtedly proceeds from the fmall number of their ideas, which extend no farther than their neceffities. Gluttons even to voracity, when they have wherewith to fatisfy themselves; yet moderate when they needs must, even to shifting without any thing, or feeming to defire aught. Pufillanimous and cowardly to the last degree, if drunkenness does not tranfport them; enemies to labour; unmoved by any in-

centive to glory, honour, or graticude; wholly intent upon the object that is before them, and always deter mined thereby, without any regard to futurity. Incapable of foretight and reflection; giving themselves up, when not under restraint, to a childish joy, which they express by skipping about, and immoderate fits of laughter, without either meaning or design: thus they pass their lives without thought; and grow old without having taken leave of infancy, all the failings whereof they retain.

Having thus given an ample Geographical account and description, not only of the whole continent of America, but likewife of the adjoining iflands, with every New Discovery made by the most modern, accurate and authentic navigators and travellers, and preferved every incident and circumftance we could collect for the entertainment of the Reader, we shall conclude our account of this part of the globe with giving a concife detail of the particular circumstances that unfortunately occasioned the separation of a great part of it from the Mother-country.

Concise History of the War between GREAT BRITAIN and AMERICA; with its subsequent confequences.

'HE circumstance that gave rife to the diffentions which took place between Great Britain and her American colonies (and which was productive of a tragic progrefs and unfortunate iffue) was that unpopular act of the British legislature called the Stemp

The first commotions were in the province of Masfachusetts Bay, and more particularly at Boston, where the commissioners for enforcing the revenue acts, and collecting the monies arising therefrom, were badly received, and narrowly escaped with their lives. All perfons, directly or indirectly, belonging to government, were looked upon with a fulpicious eye; the cool and dispassionate were filent, and the commonalty declared they would not be taxed by the British parliament without their own confent; that was to fay, without actual reprefentation. Some of the commissioners were compelled, upon oath, to renounce at that time and for ever all concern with these taxes. The tax-gatherers were tarred and seathered; the ships which carried over the stamps were threatened with conflagration unless they delivered up the exceptionable parts of their cargoes to be committed to the flames ; and, in fine, anarchy succeeded amity, and mutual enmity usurped the place of reciprocal concord.

At length, the inhabitants of Bofton, and fome other parts of New England, came to a determination not to make use of any articles of British manufacture; and about the beginning of February 1768 the House of Representatives gave their function and authority to

this refolution.

The most acrimonious disputes now took place be-tween many of the inhabitants of New England in general; most of the people of Boston in particular on the one part, and governor Bernard with the loyalifts on the other. Aggravating things were faid, iff-natured actions done, and libels were published by both parties. Thus a war of fentiments commenced before real hostilities; the obsolete terms of Whig and Tory were revived, and the fouls of each faction were in arms, previous to any manual exertions of the animofity that subfifted between them.

In the middle of June 1768, the captain of a flighlop wanting to run fome wine, and ill using the tidewater, the veffel was feized, and, for better fecurity, put along-fide the Romney man of war. This occafioned a riot, when the comptroller and collector of the customs took refuge on board the faid man or

o conciliate matflamp act; but for they infifted that

that, though the act itself was repealed, yet the spirit of it remained, while a revenue was demanded from the colonies. Frequent meetings were continued, riots were frequent, and interrefted persons fomented the disputes.

In June, 1768, the governor directed the house of reprefentatives at Bolton, to refeind a refolution concerning a circular letter to fome of the other governments, but they refusing, he dissolved the assembly on

the 3d of August following.

At length it was determined to coerce the Americans, and a body of troops arrived there accordingly, from Halifax, September 30, 1768, escorted by some ships of war.

The riotous proceedings of the Bostonians increasing, more troops were ordered to Boston, and a variety of altercations took place, not only between the governor and the people, but between them and General Gage.

In the beginning of the year 1769, many persons in the colony of New York thought proper to adopt the fentiments of the Bostonians, and to engage in the political fquabbles which were daily heightening in New England. Other colonies foon after acceded to the combination, and, in particular, to the resolutions for the non-importation of the British manufactures and East-India goods: and thus the fire of diffention increafed with great rapidity, and the flame of difcord blazed through the greatest part of North America.

The Boftonians now fummed up a variety of grievances, among which complaints were these: "That the civil power was difregarded, and centinels placed in various parts of the town: That the negroes had been united to take away the lives and properties of their mafters, and to repair to the army for protection: That forme of the foldiers had attacked the magistrates of the town: That many foldiers had Leen repeatedly refcued from the peace-officers: That many persons had been wounded by the military: And that on the 5th of March, 1770, eleven persons were either killed, or dangerously wounded."

These charges were either denied or palliated by the other party, by the plea of the military being compelled to act as they did, and to defend themselves; and at the fame time accufations, equally attrocious, were brought against the people of New England. Some persons were tried for the murders, but none executed.

Sir Francis Barnard having returned to England, the animolities and disputes still continued between the people and Lieutenant-governor Hutchinson, who remained in his room. But as political fquabbles are not worthy of recording in a performance of this kind, and acrimonious acculations, proceeding from prejudice, and propagated by partiality, ought to be configned to oblivion, and not introduced into a work of science, we shall wave trivial altercations, and only register the more important points of these unhappy differences by which the mind may be informed, and the memory will not be oppressed.

About the middle of December, in the year 1773, fome ships, laden with tea, being a Boston, (as a duty was to be paid,) the people would not suffer them to be I. The ships being refused a clearance by the governor, unless the cargoes were landed, and pro-perly disposed of, a mob, dressed like Mohawk Indians, entered the three ships which contained the tea, and were commanded by the Captains Hall, Bruce, and Coffin, and emptied the cargoes, confifting of 342 chests of tea, into the water. This, and other outrages, occasioned the Boston-Port Bill, passed April 4, 1774, by which the town of Botton was profcribed and blocked up.

The people of New England now began to form themselves into companies, practise the military arts, enter into solemn leagues and covenants, &c. Several of the other colonies followed their example, provincial affemblies were held, and a general congress established, to which disputes from the several provinces were invited.

Exclusive of Bickerings and animosities between the Royalists and Provincials, and the martial parade of the latter, the next martial transaction was the seizure of Fort William and Mary, near Portsmouth, in New Hampshire, by the Provincial militia, in which they found 106 barrels of gunpowder, several cannon, shot, fmall arms, &c.

General Gage being informed that a great quantity of military stores were in the possession of the Provincial troops, at the town of Concord, fent a detachment of troops, under the command of Lieutenant-Colonel Smith, and Major Pitcairn, supported by another body, commanded by Lord Percy, in order to seize or deftroy them. This fervice was effectually performed, after some skirmishes; but on April 19, 1775, the troops were attacked at Lexington, on their return to-wards Boston, Several were killed and wounded on both fides, the Provincials firing from behind stone walls, hedges, bushes, &c.

The Provincials now invested the town of Boston; and the people of New York, hearing of the action at Lexington, and the affair of Concord, rose in a tumultous manner, entered the town-house, seized a great many stands of arms, appropriated to their own use the cargoes of two ships laden with military stores for General Gage, and then marched to the affiftance of the

Boftonians.

The Provincials not only continued to block up the town of Boston, but began to raise batteries on the heights of the peninsula of Charles Town, in order to cannonade his Majetty's troops. This brought on the action of Bunker's Hill; for, on the 17th of June, 1775, a confiderable body of troops, under the command of Major-General Howe, and Brigadier-General Pigot, were fent to dislodge the Provincials. This body of forces, with a proportionable quantity of artillery, made good their landing against Bunker's Hill, under the protection of the thips of war, armed veffels, floating batteries, &c. and being foon after reinforced by another detachment, a desperate action commenced, in which the British forces were victorious, the Provincial lines being forced, and themselves compelled to retreat, leaving behind them feveral pieces of cannon, and other military stores. The loss of the Provincials, in killed and wounded, was very great. Of the British troops, according to the return of General Gage, 226 were killed, and 828 were wounded, some of the latter dying foon after; and more than a proportionable number of officers being included in both lifts.

At New York, on the night of the 23d of August, 1775, the cannon were feized upon, by order of the congress, though the Asia man of war, which lay in the harbour, tried to prevent it, by cannonading the

At the fame time General Carleton was indefatigable in putting the province of Canada into a proper state of desence. And the earl of Dunmore, governor of Virginia, having thought proper to take refuge on board a ship of war, harrassed the coast, and made frequent descents upon the last mentioned province, laying waste the country; carrying off, or spiking up, a great number of cannon; destroying vast quantities of mili-tary stores belonging to the Provincials, &c. &c. But, on the other fide, Fort St. John furrendered to the Pro-vincial forces, on the 3d of November, 1775, and the garrison became prisoners.

On the 18th of November, 1775, the Regulars and Provincials had a hot engagement near Savannah, in Georgia, in which the latter were defeated: And on the 31st of December, in the same year, the Provincial General Montgomery, who had for some time laid siege to the city of Quebec, attempted to take it by storm. In this attempt, however, he was defeated and flain, with feveral of his officers, and about 60 private men, and 300 were taken prisoners. On January the 4th, 1776, some ships of war destroyed the town of Norfolk,

in Virginia.

General Gage having been recalled, General Howe, who fucceeded in the command, thought proper to evacuate the town of Boston, which he effected on the 17th of March, 1776, and made good his landing, and the capture of New York. In June, 1776, a battle was fought in Canada, between the Regulars, under General Carleton, and the Provincials, at a place called Three Rivers, when the latter were defeated, many of them being killed and wounded, and about 200 taken prisoners. In June, 1776, an attempt was made on Charles Town, South Carolina, by Sir Peter Parker, at the head of a fleet of ships of war, and General Clinton, with a body of land forces; but it failed of fucces. On the 4th of June following, the congress declared the colonies independent.

After the King's troops were in possession of New York, many skirmishes happened between them and the Provincials, but nothing decifive till October, 1776, when the latter were defeated, in an action, which, from the place where it was fought, was termed the battle of the White Plains.

In the month of November, 1776, Fort Washington, and Fort Lee, were taken by the British forces, together with a great variety of military stores, and many prisoners. In December Rhode Island was taken by General Clinton. About the same time Lord Cornwallis took possession of East Jersey; and General Lee was taken prisoner by a patrole, consisting of 30 British dragoons, commanded by Lieutenant-Colonel (after-

wards Lord) Harcourt.

Several skirmishes happened in the beginning of the year 1777, in the Jerseys, with various success. On the 23d and 24th of March, a great quantity of provifions, stores, &c. with barracks, storehouses, &c. belonging to the Provincials, were destroyed by the King's troops at Peek's Hill, upon the North River. The cruizers belonging to Lord Howe and Commodore Hotham's fleet, continued to take many prizes. In Connecticut, on the 27th of April, 1777, the King's troops destroyed a great quantity of stores at

General Burgoyne, with the northern army, proceeded to Ticonderago, and Fort Independence, which he took poffession of July 6, 1777, and found in them creat quantities of stores and provisions, besides what ne destroyed of both at Skenesborough. Soon after he took possession of Fort Edward, which the Provincials abandoned, and then proceeded to Saratoga, where

they were strongly posted.

On the 11th of September, 1777, the troops under the command of General Howe, had an engagement with the Provincials on the Heights of Brandywine, in which many were killed and wounded on both fides, and 400 Provincials were taken prifoners: but though the latter were defeated, and the action at first feemed of an indecifive nature, yet it occasioned Philadelphia to fall into the hands of the British toops. While General Howe was thus employed, an unfuccefsful attack was made by the Provincials on Staten island; for they were repulsed. Much about the same time General Clinton ftormed and took Fort Clinton and Fort Mont-

On the 16th of October, 1777, the provincials, under the command of General Gates, having furrounded General Burgoyne's army at Saratoga, the latter thought proper to enter into articles of capitulation, by which himself and his troops, after laying down their arms,

were to have a free passage to Great Britain. In the latter end of the year 1777 feveral forts were taken by the troops and shipping; and many skirmishes happened on the banks of the Delaware, in order to keep up the communication with the army at Philadel-phia. The Provincials likewife evacuated their intrenchments at Red Bank.

The campaign of 1778 began by many ravages made by the British troops in the neighbourhood of Phila-delphia, and they possessed themselves of great quan-trices of military stores, provisions, vessels, &c.

On the 18th of June General Clinton (Sir William Howe having previously departed for England, and left to him the grand command of the British forces,) purfuant to the inftructions received from government, evacuated Philadelphia. He was attacked on his march by the Provincials, whose principal object appeared to be the gaining possession of the British baggage: but in this, however, they were disappointed, and every where repulfed.

About this time the Earl of Carlifle, Mr. Eden, and Governor Johnstone, were fent as commissioners from Great Britain, to treat of a pacification with America, but they did not meet with the fuccess that every true

lover of both countries withed.

On the 10th of December Commodore Hotham arrived at Barbadoes with about 4000 troops from England, where he was joined by a fmall fquadron under the command of Admiral Barrington. They failed together to St. Lucia, where they landed the troops; but before they could make themselves masters of the island, Count D'Estaign appeared, and landed 5000 men. He was, however, repulsed with great slaughter, and the men obliged to make a precipitate retreat to their ships; against which Admiral Barrington's small force had fully defended the harbours.

In the beginning of the year 1779 two bodies of forces, one under the command of Colonel Campbell, and the other from St. Augustin, in Florida, were ordered for the reduction of Georgia, in which they fucceeded after a few actions and desperate resistance from

their opponents.

In the month of December Count D'Estaign, having conquered the Grenades and St. Vincent's, laid close fiege to Charles Town, then in the hands of Sir Henry Clinton, but was repulfed with great flaughter, and himfelf severely wounded in the action.

In the month of April, 1780, Sir Henry Clinton quitted Charles Town, and went to New York, leaving the care of the former place to the Lords Cornwallis

and Rawdon. The Americans, during his absence, made feveral attempts on the place, but were always repulsed, owing to the vigilance of the British commander. During Admiral Byron's stay in the West-Indies, he,

in company with Admiral Barrington, engaged the French off St. Vincent's, with fome loss, both parties claiming the victory. About the fame time Count D'Estaign made an unsuccessful expedition to the Savannah, and afterwards returned to France.

Some time after this Admiral Rodney (who had been with fuccours to the relief of Gibraltar, then closely belieged by the Spaniards) arrived in the West-Indies, and engaged the French fleet under the command of M. Guichen, but it terminated without any material vic-

tory on either fide.

About this time hostilities were commenced between Great Britain and the United States of Holland, owing to a bag of papers being found belonging to Mr. Laurens, formerly prefident of the continental congress, who was taken by his Majesty's frigate the Vestal, as he was passing over to Holland. Mr. Laurens, after his examination, was committed close prisoner to the

During these transactions a mutinous spirit prevailed among the continental forces in America. Brigadier Arnold had for fome time held a correspondence with the English General, which was principally carried on by means of Major André, adjutant-general to the British army. This young officer gave Arnold a meetin at a place appointed, the latter of whom advised him to difguise himself, and, under the seigned name of John Anderson, to make his way for New York. This advice he readily followed; but at a place called Ferry Town was feized by three militia men, and conducted to General Washington. He was immediately tried by a court-martial as a fpy, and being found guilty, and fentenced to death, was executed accordingly.

The British forces proved victorious, all the artillery and ammunition waggons belonging to the enemy being taken, and between eight and nine hundred flain, besides great numbers taken prifoners.

On 17th of February Lieutenant-Colonel Tarleton, being detached with a body of forces, engaged a ftrong party of the enemy near Broad River, under the command of General Morgan. The battle continued obstinate on both sides for some time, till at length Tarleton was obliged to retreat, leaving his kill-

ed and wounded behind him.

While these things were taking place on the continent, an attack was made on the Island of St. Eustatius, by Sir George Brydges Rodney and General Vaughan, and the place was furrendered by the enemy without the least resistance. The quantity of merchan-dize found on the island was so great that the warehouses could not contain it. The Islands of St. Martha and Saba likewife furrendered. This blow was feverely felt by the Dutch. The ships in the harbour were seized, and a sleet of 30 sail of merchantmen sell into the hands of the English; but, on their way home, 22 of them were re-taken by the French.

About this time the Spaniards laid fiege to Penfacola, which they took up after an obstinate resistance. The garrifon obtained honorable terms, and were convey-

ed to New York.

During these transactions the war was carried on with great vigour on the continent. The British troops repeatedly baffled the efforts of the Provincials, and in most encounters came of victorious. Lord Cornwallis engaged a confiderable body of troops, under the command of General Greene, at the town of Guildford, and, after an obstinate resistance, which lasted about half an hour, obtained a complete victory, great num-bers of the Provincials being killed, and the rest put to flight. General Greene, however, after being thus defeated, marched to Wilmington, where getting fome fupplies, and recruiting his feattered forces, he fet out for Camden, which he expected to have found ill defended; but Lord Rawdon, who was left there, did not wait for the attack of the enemy; on the contrary, he with about 800 men, marched out to meet General Greene, whom he encountered and defeated, obliging the enemy to fave themselves by a very precipitate flight.

On the 20th of May Earl Cornwallis arrived at Petersburgh in Virginia, where he joined a body of British troops that had been under the command of Major-general Philips, but the command of which, in confequence of the death of that officer, had devolved upon Brigadier-general Arnold. Before this junction he had encountered confiderable inconveniences from the difficulty of procuring provisions and forage

On the 26th of June, about fix miles from William-Iburgh, Lieutenant-colonel Simcoe, and 350 of the Queen's Rangers, were attacked by a much fuperior body of the Americans, but whom they repulfed with great gallantry, and with equal fuccess, making four officers and twenty private men prisoners. The loss of the Americans in this action amounted to 120, besides great numbers taken prisoners.

On the 6th of July an action happened near a place called the Green Springs in Virginia, between a reconnoitring party of the Americans under General Wayne amounting to about 800, and a large part of the British army under lord Cornwallis, in which the Americans had 127 killed and wounded, and the loss of the royal troops was considerably greater. It was an action in which no small degree of military skill and courage were exhibited by the Americans.

In South Carolina an action happened on the 9th of September near the Eataw Springs, between a large body of British troops, under the command of Lieutenant-colonel Stewart, and a much superior body of Americans, amounting to 4000, under the command of General Greene. It was an obstinate battle, and lasted near two hours; but the Americans were defeated, and two of their fix pounders fell into the hands of the English. The loss, however, of the royal troops was very considerable, amounting to more than 400 killed and wounded, and upwards of 200 miffing.

In the course of the same month General Arnold was fent on an expedition against New London in Connecticut, where he destroyed a great part of the shipping, and an immense quantity of Naval stores, European manufactures, and East and West India commodities. The town itself was also burnt, which was unavoidable on account of the explosions of great quantities of gunpowder, which happened to be in the storehouses that were set on fire. A fort, of which it was thought necessary to gain possession in this expedition, was not taken without considerable loss. This was fort Griswold, which was defended by the Americans with great gallantry, and the affault was made by the English with equal bravery. The British troops entered the works with fixed bayonets, and were opposed with great vigour by the garrifon with long spears. After a most obtained defence of near forty minutes the affailants gained possession of the fort, in which 85 Americans were found dead, and 60 wounded, most of them mortally. Of the British troops Major Montgomery was killed by a fpear in entering the American works: and 192 men were also killed and wounded in this expedition.

During these transactions the most effectual measures were adopted by General Washington for surrounding the British army under earl Cornwallis. A large body of French troops under the command of Lieutenantgeneral the Count de Rochambeau, with a very confiderable train of artillery affifted in the enterprize. Americans amounted to near 8000 continentals, and 5000 militia, and General Washington was invested with the chief command of these combined forces.

In the mean time various skirmishes took place in different parts of the American continent, and were attended with various success; but in general the Eng-

lifh gained the fuperiority.

On the 18th of October, 1781, a most desperate battle took place between the conjunctive forces under the Provincial General Washington and M. Rochambeau, the French commander, and the British troops under the command of Lord Cornwallis. The latter was fituated in a very disadvantageous spot, being hemmed in on one side by the French sleet in the Chefapeak River, and on the other by the continental land forces. The attack was made with great resolution by the enemy, and, for some time, as strongly resisted by the brave Cornwallis, who cut to pieces the greater part of three regiments of the French forces; but being at length overpowered with numbers, he was obliged to furrender, and enter into the like articles of capitulation as took place with general Burgoyne at Saratoga. Sir Henry Clinton had left New York with a confiderable body of forces, in order to give affiftance to the brave Cornwallis; but, by a manœuvre of General Washington (who, a fhort time before, appeared to have fome defigns against New York) Sir Henry was too late, and the whole army of Lord Cornwallis, which amounted to 7000 men, fell into the hands of the Provincials. The earl made a defence fuitable to the character he had acquired for courage and military skill; but he was compelled to submit to superior numbers. A considerable number of cannon, and a large quantity of mili-tary stores, fell into the hands of the Americans on this

The furrender of earl Cornwallis was the last military transaction of moment on the continent of North America, and led to the conclusion of a civil war, which had been unhappily attended with the lofs of a vast profusion of blood and treasure on both sides.

No other event of that war contributed to affectually to produce a general conviction in the minds of men of the impracticability of the conquest of the American colonies, especially as they had formed such powerful alliances.

When intelligence of the defeat of Earl Cornwallis arrived in England, that conviction appeared to be irrefifible; for men of all ranks and parties now declaimed against the continuance of a war unproductive of the effects originally defigned, and absolutely ruinous to the interests of both countries.

A member of the British House of Commons, in December 1781, made two motions declaratory of the sense of the house against the further prosecution of the American war.

On the 22d of February 1782 a motion was made of the same tendency by a military officer, and negatived by only one voice. In a short time after the same motion being carried, instructions were dispatched in confequence of the resolution of the house of Sir Guy Carleton (who succeeded Sir Henry Clinton in the command of the army and the government of New York) to use his utmost endeavours for producing an accommodation with the Amegcans.

Sir Guy Carleton having received these advices, dispatched, in the month of May, 1782, a letter to General Washington, informing them of the proceedings of parliament, of the disposition prevalent both in that body and the British government, and of his own consequent instructions, accompanied with such written or printed documents as were necessary to illustrate and authenticate what he had stated.

As by a refolution of the British House of Commons powers had been granted to the crown for negociation and concluding a general or particular peace or truce with the whole, or any part, of the Americans, the several states reprobated the idea of opening separate negociations with particular governments, or bodies of men, or even of attempting to open a treaty with Congress without the concurrence of his allies, and came to a general determination to exert their utmost power conjunctively to carry on the war with vigour until peace should be obtained in a manner consistent with their national union.

A refolution was also passed by Congress, that the United states could not, with propriety, hold any conference, or treaty, with any commissioners on the part of Great Britain, unless they should, as a preliminary thereunto, either withdraw their sleets or armies, or else, in positive and express terms, acknowledge the independence of the said States.

In the month of October Congress issued a public declaration, in which, after reciting, that France and they were equally bound by the conditions of their alliance, that neither should conclude either peace or truce with Great Britain without the consent of the other, and observing that their ministers in Europe were vested with full power and authority in their behalf, and in consort with their allies, to negociate and conclude a general peace, they proceeded to declare, in the strongest terms, their fixed and unalterable determination inviolably to adhere to the treaty of alliance with his most Christian Majesty, and to conclude neither a separate peace or truce with Great Britain; and that they would not enter into the discussion of any overtures for pacification, but in considence and in consort with his most Christian Majesty.

While the Americans were thus avowing their inflexible attachment to their allies, and endeavouring, as it were, to shut out every overture towards a seperate accommodation, the belligerent powers in Europe seemed disposed to pacific measures.

As the attainment of the independence of America was avowedly the grant object of the French court in the war, its being granted feemed at once to remove the very ground of contention. With respect to the adjustment of matters with the British court, that did not feem to be very difficult, as, though the acquisitions of France in the West Indies were considerable, her losses in the East left the means of a considerable equivalent in the hands of the English.

As to Spain, which feems to have entered into the war rather as an auxiliary, and in confequence of the family compact, than as acting upon national principles, neither the embarrafled flate of her finances, the repeated failure of her defigns upon Jamaica, her very fignal defeat at Gibraltar, or other circumstances of her then condition, feemed to afford any folid ground upon which she could reasonably establish further claims.

The United States of Holland, fallen and degraded to the lowest degree, were reduced to the necessity of depending entirely upon the favours and protection of France, as well in the conclusion of a peace as she had through the progress of the war.

With respect to the general circumstances of the contending parties, the most successful members of the alliance, great and formidable as it was, scarcely stood much less in need of peace than Great Britain, notwithstanding all her losses, and exposed as the had so long been as a common mark to withstand singly all their attacks in every quarter.

Under these general circumstances of the contending powers, the independence of America being allowed, there did not seem to be any infurmountable obstacle in the way to the restoration of the public tranquility.

This plan was adopted by the new administration in England by their coming into power; commissioners and plenipotentiaries were appointed by the respective powers, and on the 30th of November 1782, provisional articles were signed by the commissioners from his Britannic Majesty, and the commissioners on the part of the United States of America, which were to be inferted in, and to constitute a future treaty of peace to be finally concluded between the parties, when that between Great Britain and France took place.

The hiftory of this civil war is handed down at large to pofterity by able writers, in order to ferve as the most forcible lessons of instruction to the sovereigns and subjects of every state. In the course of such a war the passions may be supposed to be instanted to a high degree of rancour; but this will ever be the case in all sublunary events; and the cruelties preperrated on either side by heated or unprincipled individuals no intelligent person will impute to the national character at large. The virtues that shine in human nature, and render life desirable and happy, are the growth of no particular country; for where the light of knowledge is dissuffed, their endearing influence will be felt with irresistible force; and the posterity of Great Britain and America, while they read with concern the phrenzy of their stathers, may be nobly vying with each other in virtuous and philosophical emulation, and cultivating such friendly connections as may render both a great and happy people.

E U R O P E.

INTRODUCTION.

THIS part of the globe was formerly called by the Romans, as it is at present by the Spaniards and Italians, by the name of Europa; but from whence that appellative originated has not been determined. By the English and French it is filled Europe; by the Turks Alfrank, or Rymelia; by the Georgians of Asia Frankoba; and by the Asiatics in general Frankistan.

Europe is bounded on the north by the Frozen Sea, on the east by Asia, on the fouth by the Mediterranean Sea, and on the west by the Atlantic Ocean.

This grand division of the earth is situated between 35 and 72 degrees of north latitude, and between 9 deg. 35 min. west, and 72 deg. 25 min. east longitude. Its utmost extent, in length, is about 3600 miles, and in breadth about 2200.

Europe, though inferior, in point of magnitude, to Afia, Africa, and America, is far superior to them all in several important respects. As to the advantages of situation, it is to be observed, that no part of it is exposed to the scorching heat of the torrid, and but a small part of it to the chilling cold of the frigid zone.

To these advantages may be adde: many seas, navigable rivers, mountains, &c. admirably a lapted to the purposes of extensive commerce between different states and nations; and happily situated as barriers against the efforts either of invasion or despotism.

The principal rivers of Europe are the Danube and the Rhine in Germany, the Volga and Divina in the Russian empire, the Loire and Scine in France, the Thames and Severn in England, &c. &c.

The chief Lakes are Constance in Germany, Geneva and Guarda in Italy, Wener in Sweden, Ladoga and Onega in Russia, Loquabar in Scotland, and Neagh in Ireland.

The principal mountains are the Pyrenean Mountains between France and Spain, the Alps between France and Italy, the Dofrin hills in Sweden, the Grapach hills in Hungary, some hills in the Highlands of Scotland, and several, particularly Snowden, in Wales.

Europe, through superiority of cultivation, produces a greater abundance of corn, wines, fruit, cattle, and, indeed, most of the luxuries, as well as necessaries, of life, than the other quarters of the globe. As to the valuable articles of gold, filver, jewels, fpices, &c. though not its natural productions, they are supplied by means of navigation and commerce.

Fearless the merchant now pursues his gain, And roams securely o'er the boundless main: Now o'er his head the polar bear he spies, And freezing spangles of the Lapl nd skies; Now swells his canvas to the faltry line, With glittying spoils, where Indian grottos shine; Where sumes of incense glad the fouthern seas, And wasted citrons scent the balmy breeze; And here the ore whose melted mass shall yield, On faithful coins, each memorable field, Which, mix'd with medals of immortal Rome, May clear disputes, and teach the times to come.

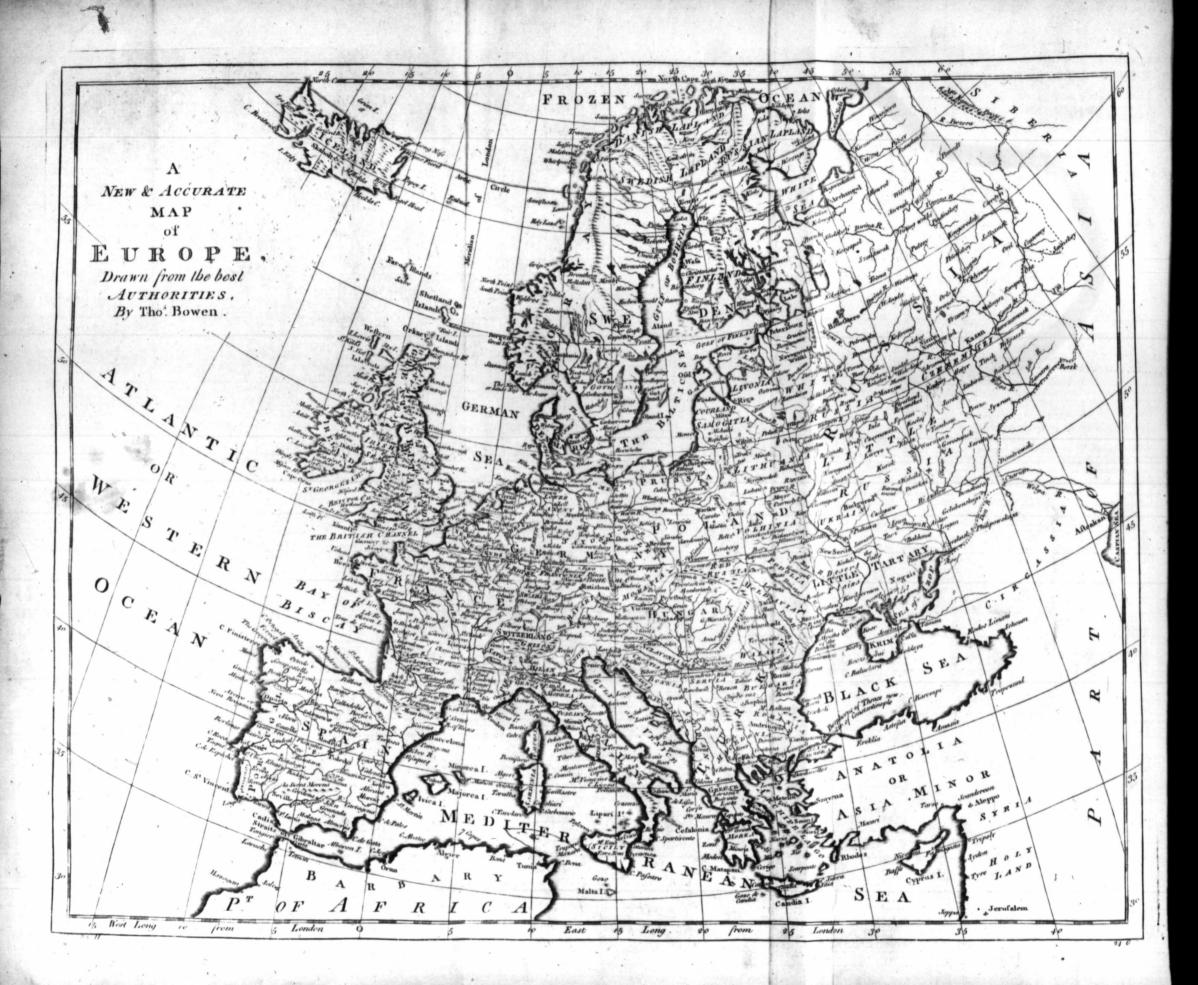

Europe is fuller of cities, towns, villages, and the buildings, in general, more ftrong, elegant, and commodious, than those of the other parts. The inhabitants are better featured, and better made, than either the inhabitants of Asia, or Africa, and are all whites; though their complexions have different degrees of delicacy, according to their situations, and other local circumstances.

With respect to mental endowments, and the exercion of the intellectual faculties, the inhabitants of Europe must be permitted to claim pre-eminence. Pertinent to this remark may be cited some observations of a very learned and ingenious writer, in words to the following effect. Having premised that in Greece the human mind seemed first to have duly conceived and exerted its powers in the invention and improvement of such arts as were conducive either to pleasure or utility, this writer goes on to observe, that what Greece is in this

7 G

poin

No. 53.

point of view with regard to Europe, Europe itself is with regard to the other divisions of the earth; and concludes with this reflection; "That as ancient Greece was diffinguished above all the rest of Europe for the equity of its laws, and the freedom of its politi-cal conflitution, fo has Europe, in general, been remarkable for fmaller deviations at least from the laws of nature and equality, than have been admitted in

other quarters of the world."

To this pre-eminence in mental acquisitions must be attributed the invention of printing, the revival of learning, arts, and sciences, and, lastly, the happy re-formation in religion, which distinguish the 15th and 16th centuries, and embellish the history of Europe. In these ages the powers of Europe were formed into one grand political system, in which each took a station, wherein it has fince remained, with less variation than could have been expected, after the thocks occasioned by fo many internal revolutions and foreign wars. The established political principles and maxims still continue to operate; and the ideas concerning the balance of power, long introduced, and rendered general, have ftill fome degree of influence in the councils of the nations of Europe.

From these concurring circumstances it is evident that the concurrence of so many rival princes will always prevent any one of them from gaining the empire over Europe. It is equally evident that, in contending for it, they must weaken their own force, and may at length render themselves incapable of defending their just possessions. The partial conquests they make are illustrie; for, instead of promoting, they rather oppose their defigns. The more any kingdom is extended, it becomes the weaker; and great projects have not been so often executed by flow reiterated efforts, as in the course of a few years, and sometimes by a single

A prince may form a deliberate plan for destroying the rights of his fubjects; he may proceed by flow degrees in the execution of it; and if he dies before the accomplishment, his successor may pursue the same steps, and avail himself of what was done before him: But external conquests cannot be concealed. They, in general, excite alarms, and occasion confederacies, by which the conquering prince is reduced to the last extremities. This maxim, however contrary to the prejudices of a powerful and victorious nation, is one of the best established in the whole system of politics, and confirmed by a variety of examples, both ancient and modern.

To these remarks may be justly added, as an instance of the pre-eminence of Europe, the invention and im-provement of the art of navigation in particular, of all others the most beneficial to mankind: and amongst these we may here be permitted to enroll the name of

our renowned countryman Captain Cook.

To this improvement of the mind, and cultivation of the liberal arts, it is owing that, though feveral of the most extensive parts of Europe are under monarchial forms of government, the administration of those forms are by no means fo arbitrary, nor are their fovereigns fo despotic, as those of Asia and Africa. Various, indeed, are the forms of government, exclusive of that of monarchy, which prevail in Europe. Here are aristocracies, or governments of the nobles; democracies, or governments of the people; and, laftly, there is the mixed form of government, composed of three parts, participating of the benefits, and exempted from the inconveniencies, of the other three classes or forms. This form is the peculiar boast and glory of Great Britain.

The languages of Europe are derived from fix radical ones, viz.

1. Latin, of which the Italian, French, and Spanish, are dialects.

2. Teutonic, from whence proceed the German, Dutch, Swedish, Danish, and English tongues.

3. Sclavonian, which reigns in different dialects in Poland, Muscovy, Bohemia, and a great part of Turkey in Europe.

4. The Celtic, of which there are remaining dia-

lects in Wales, Ireland, the Highlands of Scotland, Brittany in France, and Lapland.

5. Greek, of which feveral dialects are spoken in the Morea, and the islands of the Levant.

6. Gothic, fome remains of which are preferved in the islands of the Baltic, and the southern parts of Sweden.

To these we may add the languages spoken in Turkey

and little Tartary as European languages.

The Christian religion prevails throughout every part of Europe, except that in the possession of the Turks: but as men conceive differently concerning points of speculation, according to their different paifions and education, that religion is divided into a number of fects. Hence Italy, Spain, France, part of Germany and the Netherlands, with part of Poland, ftill follow the doctrine of the church of Rome; whereas England, Scotland, Ireland, Denmark, Sweden, Norway, great part of Germany, the United Provinces, part of Swifferland, &c. have embraced the reformarion, and profess the Protestant religion: And in Muscovy, some parts of Poland, in Walachia, Mol-davia, Padolia, Volhinia, and Greece, the doctrine of the Eastern or Greek church is followed.

Europe may claim, upon the whole, pre-eminence over the rest of the world, by having the doctrines of Christianity professed throughout the greatest part of it, and being enlightened by a religion at once pure, majeftic, chearful, and fecuring the eternal felicity of its

profeffors.

Sudden religion on the wond'ring blaze, From heav'n's broad concave burit the rapid blaze; At once descending from the realms on high, An angel shape arrests the dazzled eye: Loofe o'er her limbs the floating garments roll'd, Her sparkling pinions flam'd with beamy gold; Her eyes like light'ning glanc'd a piercing ray, And all th' illumin'd æther glean'd with day! Near as the came, fuperior, tho' refign'd, Her form majettic aw'd the dubious mind; With heighten'd grace her bloomy features glow'd; Free on her robe the mazy ringlets flow'd; Her balmy breath ambrofial icents perfume, And o'er her cheek was pour'd celeffial bloom. Pale forrow brighten'd as religion came, And flow-pac'd time stood trembling at the name; Rage, dragg'd in triumph, fwell'd her folenin train, And death behind her grin'd and clank'd his chain.

To these introductory remarks concerning Europe confidered in general, we fubjoin the following Table, exhibiting, in one point of view, its feveral parts, continental and infular, with their length, breadth, chief cities, distances and bearings from London, religions, &c. &c. And, we prefume, such a general view will afford our readers a pleafing anticipation of our fubiequent particular description, to render which as entertaining and instructive as possible, no pains shall be wanting, either in the felection or arrangement of the most modern and best authenticated materials.

GREENLAND

Nour description of this country we shall consider it as comprising two parts, viz. Groenland, West Greenland, or Old Greenland; and East Greenland, New Greenland, or Spitzbergen.

SECTION I.

GROENLAND

Discovery, &c.

NORWEGIAN, named Torwald, and his fon Erick, furnamed Raude, or the Red-haired, having committed a murder in his country, fled over to Iceland, where Torwald died. His fon Erick, having afterwards committed another murder in Iceland, to escape the severity of the law, resolved to seek for shelter in a country which one Gunderbairne had told him he had seen to the west of Iceland. Erick landed, by his direction, in a certain harbour, made by two capes or points of land, one at the end of an island opposite to the continent of Groenland, the other on the continent. The cape of the isle was named Huidserken, and that of the continent Huars, having between both a very good harbour called Sanstaffin, where ships may ride safely at anchor even in the greatest storm.

It appeared to this adventurer most eligible to land on the island, to which he gave the name of Ericksand, i. e. Erick's slie, and continued there all the winter. In the spring he passed over to the continent, which he called Groenland, i. e. the Green Country, from the verdure of its passed trees. To the place where he had landed he gave the name of Ericksfiorden, i. e. Erick's Haven; at a small distance from which he built habitations called Ostraburg, i. e. East borough or plantation. Next autumn he went to the western side, where he erected another plantation called Westreburg. But whether the air of the continent seemed to him colder and sharper than that of the island, or whether he found it less secure, he went back the next winter to

Erickfand. He returned, however, from thence the next fummer to the continent, taking his course towards the north to the foot of a great rock, which he called Sneefiel, or the Snow-Rock, and thence to a certain harbour, upon which he bestowed the name of Ravensforden, or Raven's Harbour, from the great number of those birds he found there. Ravensforden lies directly opposite to the north side of Erickssforden, which is seated on the fouth side, being divided only by a branch or arm of the sea. About the end of autumn Erick returned to his island, where he passed the third winter. In the spring he resolved to go in person to Iceland, to engage the inhabitants of that isle, with whom he had a good correspondence, to follow him into Groenland. He described the wonders of this new discovered country, its plenty of large and small cattle, excellent passures, sish, and all sorts of game, in 6 alluring a manner, that great numbers of the Icelanders were prevailed on to cross the sea with him into Groenland.

Erick had a fon named Leiffe, who accompanied him to Iceland, and from thence croffed over into Norway, where he gave a favourable account, to King Olaus Trugger, of the country discovered by his father. The king of Norway, having then but lately embraced the Christian religion, caused Leiffe to be instructed in the same, and to be baptized. Having continued at his court all the winter, the next summer he sent him back to his father, into Groenland, accompanied by a priest, to instruct Erick and his people in the Christian saith, who, by Leiffe's persuasion, were all baptized. This happened about the year 770 of the Christian æra.

As the fucceffors of Erick increased in number in Groenland, they ventured farther into the country, and met with a fruitful foil, meadows, and rivers, in the vallies between the mountains. They divided the country into East and West Groenland, according to the different situations of the two boroughs, Offraburg and Westreburg, built by Erick. In the east they laid the soundation of a town named Garde, whither the Norwegians transported divers merchandizes, and sold

them to the inhabitants. Their posterity advanced, and built a city, to which they gave the name of Albe; and, as their zeal for religion increased, they built a monastery upon the sea shore, dedicated to St. Thomas. The city of Garde was the residence of their bishops; and the church of St. Nicholas (the patron of seamen) the cathedral of Groenland.

EUROPE.1

In the year 1256 Groenland revolted, and refused to pay tribute to King Magnus, of Norway, which induced King Erick, of Denmark, at the request of King Magnus, who had married his neice, to equip a fleet against them: but they no sooner saw the Danish slags displayed on the coast of Groenland, that they were seized with a panic, which induced them to sue for pardon, and desire peace. The king of Denmark, from the love he bore his neice and her children, would not take any advantage of the weakness of the king of Norway, but less him in full possession of Groenland.

A confiderable commerce was carried on between Norway and Groenland, and a regular intercourfe maintained, till the year 1046, when the last bishop was fent over to Groenland; but, from that period, all correspondence was cut off, and all knowledge of Groenland configned to oblivion. This strange and abrupt ceffation of trade and intercourse has been ascribed partly to the change and translation of the Norwegian government in the reign of Queen Margaret, partly to the enfuing wars between Denmark and Sweden, which could not fail to interrupt the maritime commerce, and partly to the difficulty and danger which attended the navigation of Groenland. But the most probable cause of such a sudden privation is found in another event. The inland colony, from its first fettlement, had been harraffed by the Aborigines of Groenland, a favage barbarous people, agreeing in customs, garb, and appearance, with those Americans who have fince been found to the northward of Hud-fon's Bay. This nation, called the Schrellings, at length prevailed against the Iceland settlers, who had chosen their habitation in the western district, and exterminated them in the 14th century, infomuch, that when their brethern of the eaftern diffrict came to their affiftance they found nothing alive but fome cattle, and flocks of fheep, running wild about the fields and meadows. Perhaps they themselves afterwards experienced the fame fate, and were totally destroyed by those Schrellings, whose descendants still inhabit the western parts of Groenland, and, from tradition, confirm this conjecture. They affirm, that the houses and villages, whose ruins still appear, were inhabited by a nation of strangers, whom their ancestors destroyed. There are fome reasons, however, for believing, that there may be still some descendants of the ancient Iceland colony remaining in the eaftern diffrict, though they cannot be visited by land on account of the stupendous mountains, perpetually covered with frost and snow, which divide the two parts of Groenland; while they have been rendered inaccessible at sea, from the vast quantity of ice driven from Spitzbergen, and other northern coasts upon the eastern shore, to which it adheres, forming an insuperable barricade.

All that we gather from authentic records is, that Groenland was divided into two diffriets, viz. Weft Bygd, or the western division, and East Bygd, or the eastern division. The western division contained four parishes and 100 villages. The eastern division was still more flourishing, as being nearer to Iceland, sooner settled, and more frequented by shipping from Norway.

About a century after all intercourse had subdued between Groenland and Norway, many ships were successively sent by the English and Danes, in order to rediscover, and again settle this country, but all their attempts proved unsuccessful.

The most remarkable of these voyages was made by the English, under Martin Forbisher; we shall, therefore, present the following account of it. In the year 1557 this adventurer set sail from England, to attempt No. 53.

the discovery of Groenland, which he got fight of at last; but, by reason of the vast quantities of ice, and the approaching winter, not being able to come near the shore, he was forced to return home, where he gave an account of his voyage to Queen Elizabeth, who fent him in the following fpring with three ships, to pursue the former defign, when he got fafe to Groenland. The inhabitants, at the approach of the English, leaving their huts, retired among the rocks, from whence feveral of them precipitated themselves into the sea. The English, after they had in vain endeavoured to conciliate these savages, went to their huts, where they met with no living creature except an old woman with a child, which they took from her, and she made a most terrible outcry for the loss. From thence they failed along the coast, where they saw a sea monster's head above water, with a horn about three or four feet They landed again, and found the surface of the earth rocky, but very good ground beneath it. They also met with great store of glittering fand, containing gold, of which they took a great quantity with them. They used their utmost endeayours to enter into discourse with the favages, who seemingly shewed no great aversion to them, and gave them to understand, by certain figns, that, if they would row higher up the river, their expectation should be answered. Accordingly Forbisher got a boat with some soldiers, and, having ordered his ship to follow him, went up the river; but feeing great numbers of the savages posted among the rocks, would not expose himself by approaching too near the banks. At last three of the favages, who appeared of some consequence among them, having made a fignal for him to land, he refolved to do it, all the rest being at a considerable distance: but his boat scarce touched the bank of the river, when the favages began to appear in great numbers, which caused him to put back again. Nevertheless, the savages endeavoured to pursuade them, by signs, to come ashore, throwing to them some raw slesh; but finding the English mistrustful, they resolved to draw them thither by the following stratagem: They laid one of their men upon the bank, who pretending to be lame, they supposed the English would come to take him, whilft they made a shew of retiring to a farther diftance, being all out of fight behind the adjacent rocks. The English, being aware of the snare, dif-charged a gun at him, which made him soon recover his legs; and the favages, coming to his affiftance, pelted the English in the boat with stones and arrows, but were foon difperfed by the great guns. Forbisher, however, landed in another place, took possession of the country in the name of Queen Elizabeth, and, befides his glittering fand, brought away great quantities of a black stone, which contained gold ore, and likewife two of the natives, a male and a female, whom

he contrived to enfnare. A third armament was afterwards fitted out, and the command given to Forbifher, who was now promoted to the rank of an admiral. This armamens confifted of 15 fail, on board of which were many foldiers, miners, finelters, carpenters, bakers, &c. who were to remain all the winter near the mines, or the places which produced the gold fand, and black stones that contained gold ore. They carried with them all the materials neceffary to erect a wooden fort, which might be put together as foon as they landed, the different pieces having been properly prepared in England. They, however, met with boifterous weather, impenetrable fogs, and prodigious strong currents, on the coast of Groenland, which retarded their operations till the fea-fon was too far advanced. They had likewife loft part of their wooden fort at fea, and had neither fuel or provisions sufficient to subsist these who were appointed to be left there during the winter. On these accounts the admiral determined to procure as much ore as he poffibly could, and then return to England, without leaving any person behind him. Pursuant to this design, they traced out a mine, to which they gave the name

any ship to ven as the 62d deg more practicabi the Promontory this means a cor tained betwirt only touch at the

of the counters of Suffex, and from which they procured a great quantity of ore, having erected a house of lime and frone, provided with ovens, and many other conveniencies, for their residence and security during their stay. In order to attract the notice, and gain the affection of the natives, they left behind them looking-glasses, beads, knives, bells, leaden pictures, and other things, with some loaves of bread, &c.

Before their departure they fowed corn and other grain, peas, &c. by way of experiment, to try how they would thrive, and afcertain what the country would produce, on their return the enfuing year. They likewife buried the remaining part of the wooden fort, in fuch a manner as to be able eafily to find it again; and having taken these necessary precautions, set sail from hence in the commencement of September, and, after a disagreeable passage of a month, arrived sase in

England.

This noble defign being abandoned by the English, the Danes took it up, and endeavoured, in feveral expeditions, to complete it. The first of these was undertaken under the command of Godske Lindenow with three thips. When he arrived on the eaft coaft of Groenland he found none but wild and uncivilized people. He ftaid three days, during which time the wild Groenlanders came to trade with him, changing furs and skins, with pieces of precious stones, for all kinds of fmall trifling iron-ware, as knives, fciffars, needles, &c. common looking-glaffes, and other fuch trifles. When he fet fail from thence there were two Groenlanders remained in the ship whom he carried off and brought home with him. The other ships that set sail in company, under the command of Lindenow, after they had doubled Cape Farewell, fleered directly for Davis's Strait: in this navigation they discovered many fine convenient harbours and delightful meadows; but all the inhabitants along the coast were wild and favage as before. These thips brought four favages home with them to Copenhagen.

Nothing can be more repugnant to the dictates of common justice than this practise of tearing away poor creatures from their country, their families and connexions, unless we suppose them altogether destitute of natural affection. That this was not the case with those poor Groenlanders, who were brought to Copenhagen, appears from the whole tenor of their conduct, upon their first capture, and during their confinement in Denmark. When first made captives they rent the air with their cries and lamentations: they even leaped into the fea, and when taken on board for some time refused all sustenance. Their eyes were continually turned towards their dear country, and their faces always bathed in tears. Even the countenance of his Danish majesty, and the caresses of the court and people, could not alleviate their grief. One of them was perceived to fhed tears always when he faw an infant in the mother's arms; a circumstance from whence it was naturally concluded that he had left a wife with a young child in Groenland. Two of them went to sea in a small canoe, in hopes of reaching Groenland, but one of them was retaken; two more made the fame attempt, but were driven by a florm on the coaft of Schonen, where they were apprehended by the peafants, and re-conveyed to Copenhagen. One of them afterwards died of a fever, caught by fishing for pearl during the winter for the governor of Konding. The rest lived some years in Denmark; but at length, seeing no prospect of being able to re-visit their native country, sunk into a kind of melancholy diforder, and expired."

The fecond expedition was made in the year 1606, with five flips, under the command of the beforementioned admiral Lindenow. This time he directed his course to the westward of Cape Farewell, standing for Davis's Strait, where, coasting along, he took the survey of several plans, and returned home again.

The third expedition proved abortive on account of the ice. The fourth, under captain John Munk, in the year 1626, was not made for the discovery of Groenland, but to find out a passage between Groenland and America to China.

Befides these four expeditions at the king's cost, a fifth was undertaken, by a company of merchants at Copenhagen, in the year 1636. They fitted out two thips which directing their course to the westward of Groenland, fell in with the Strait of Davis, where they traded for some time with the favages; but this was not the principal object of the commander, who was acquainted with a coast the fand of which had the colour and weight of gold; he accordingly directed his course thither, and freighted the ships with the same. After his return to Copenhagen the goldsmiths were ordered to make trial whether this fand would yield any gold or not. But not being skilful enough to make such trial, condemned it to be all thrown overboard; which was done accordingly by order of the high-chancellor, prefident of the company. Some part of this fand was, however, kept as a curiofity, out of which a fkilful artificer, who afterwards came to Copenhagen, extracted a great deal of pure gold. The honest and well-meaning commander, who went upon this adventure, was turned out of favour, and died foon after of grief, whereby not only the treasure he had brought home, but also the knowledge of the place where it was to be found, was entirely loft, as he kept this a profound fecret.

After fome other unfuccefsful expeditions, the Danes laid afide all thoughts of Groenland till the year 1721, when after many well-concerted plans proposed by Mr. Egede (a learned and ingenious divine) to the Groenland company at Bergen in Normandy, approved and authorised by Frederic IV. the company resolved not only to send ships, but also to settle a colony in Groenland, on the river Boalt, in latitude 64. Mr. Egede himself went over thither, and continued there fifteen years. During his stay he endeavoured to get all the intelligence he could procure, both by sea and land, of the state of the country. Nor did he lose his labour; for he met with some places that formerly were inhabited by the ancient Norwegians, on the

western shore.

But his main defign being to discover the eastern district of Groenland, which was always deemed the best of the Norwegian colonies, he resolved to make the voyage in person. Accordingly he coasted along southward as far as the States Promontory (called Staten-Hoeck in the maps) in the latitude 60, looking out for Forbisher's Strait, which would have been his shortest way, according to those charts which lay the Strait down in this place; but he failed in his design, probably through the advanced state of the season, the month of September being nearly at an end, when the winter commences in those parts, attended with dreadful storms.

In the year 1724 the directors of the Bergen company fitted out a fhip to attempt a landing on the eattern fhore, which lies opposite to Iceland; but the large quantity of ice which barricadoed the coast rendered that enterprize abortive, as many others had been before. As there was no possibility for ships to approach this shore, the king, in the year 1728, resolved to make horses transported to this colony, in hopes that, by their help travelling might be effected by land to the eastern district. But this project proved impracticable, on account of the high and craggy mountains perpetually covered with snow. All the difficulties, and continual disappointments, made most people lose every hope of succeeding in this attempt.

Mr. Egede offered it as his opinion, that it might be rendered practicable by coasting the land from the States Promontory, or (as the Danes now call it) Cape Christian northwards. This opinion was confirmed by information received from some Groenlanders, who, with their boats, had coasted a great part of the east side. It is judged, however, on the whole, uniase for

By this means a constant correspondence might be maintained betwink the colonies, though large ships can only touch at the most southerly.

Description of the Country; Climate, Soil, Productions Vegetable, Animal, &c.

ROENLAND, West Greenland, or Old Greenland, begins in 59 deg. 50 min. north lat. The eastern coast is supposed to extend as far northward as Spitzbergen, or East Greenland; and the western part is only separated by a channel of 40 miles in breadth. The western shore has been discovered higher than the 70th deg. of north lat.

This country is exceeding mountainous; and the mountains are fo very high that they may be different at fea at the diffance of 30 leagues. The inland mountains and hills are perpetually covered with fnow; but the low lands on the fea fide are, in fummer, cloathed with verdure. The coaft is difficult of access, on account of the great number of rocks with which the furrounding feas, and the mouths of the Groenland rivers, abound, independent of the vast mountains of floating ice which feem to threaten the adventurous na-

vigator with destruction.

From the most foutherly part of Groenland to the 68th degree of north latitude is not so severe as might at first be imagined. The summer includes the latter end of May, the whole of June, July and August, and half the month of September; during which the weather is generally warm: while the wind blows easterly the sky is always serene, but when it veres to the other points storms are sure to ensue. The sea coast is generally insested with unhealthy and disagreeable fogs, which are, however, so fattening to the land, that the shores are covered with verdure; but the inland moun-

tains are perfectly capped with fnow.

To the northward of the 68th degree the weather is much more fevere, and the cold fo very intenfe, that even in the midft of fummer the very ftrongest spiriwinter in this part continues from September to May, and fometimes June, during which time the fea is co-vered with vaft mountains of ice. "Nothing (fays an eminent writer) can exhibit a more dreadful, and, at the same time, a more dazzling appearance than those prodigious masses of ice that furround the whole coast in different forms of rocks, castles, towers and tpires, reflecting a variety of colours according to the nature of the concrete, and floating from place to place as if the whole fcene was illufion, or enchantment; fuch are the prospects they yield in calm weather, but when the winds begin to blow, and the fea to fwell in valt fuccessive billows, the conflict of those congregated bodies of ice encountering, dashing, cracking, burfting, and shivering into ten thousand fragments, fills the eye and ear with terror and aftonishment. Thunder and lightning feldom difturb the air of Groenland, which, however, is subject to many other na-tural phænomena, such as shooting stars, and in particular the aurora borealis, or northern lights. In the fpring of the year, and about the new moon, this phæmomenon appears to univerfally bright over the face of the whole northern fky, darting its rays, and glaring with fuch radiancy, as to afford fufficient light whereby to read.

At the fummer folltice there is no night, and those who reside here have the pleasure to see the sun turn about the horizon all the twenty-four hours: but in the depth of winter they have but little comfort in the planet, the nights being proportionably long; yet they can see to travel up and down the country, though sometimes it is neither moon-shine or star-light.

The temperature of the air is not unwholesome; for,

except the scurvy, and the distemper of the lungs, the inhabitants know nothing of many other diseases with which other countries are plagued; and these pectoral infirmities are not so much the effects of the excessive cold, as of the foggy weather, to which this country is very much subject. From the beginning of April to the end of July is the foggy season; and from that time the fog daily decreases. But as in the summertime they are troubled with fogs, so in the winter season they are plagued with the vapour called frost-smoak, which, when the cold is excessive, rises out of the sea, as the smoak out of a chimney, and is as thick as the thickest mist, especially in bays, where there is any opening in the ice.

There is a wonderful harmony and correspondence observed in Groenland between fountains and the main sea: at spring tides in new and sull moon, when the strongest ebbing is at sea, the hidden sountains or springs of fresh water break out on the shore, and discover themselves often in places where they might be little expected, especially in winter, when the ground is covered with ice and show; yet at other times there

are no water fprings in those places.

The hills of Groenland are barren, and indeed frozen all the year; the low lands are tolerably fertile, particularly towards the fea. A few oak trees are found in the fouthern parts near the States Promontory.

In these particular parts the meadows are rich in grass: turnips and coleworts are easily raised, and excellently flavoured; underwood, which grows to a vast height, is plentiful! birch, elm and willows are not scarce, and juniper berries grow in abundance.

The herb angelica grows wild, and is found in great profusion: it is endued with the turpentine flavour, and yields an aromatic oil, which is extracted by distilla-

tion

The shores abound with pleasant and salutary kind of scurvy-grass, and the mountains near the bays and creeks are covered with wild thyme. A species of grass bearing yellow slowers, the herb tormentil, and many other plants, herbs and vegetables, abound in this country. The fruits of Groenland are bramble-berries, bil-berries, blue-berries, and juniper berries. Here it is to be observed, when any thing is said relative to the fertility of Groenland, that the southern parts are only meant, for with respect to the northern parts they are destitute of herbs and plants.

Groenland produces various metals: to the fouthward of the Dutch colony copper ore is found. Mr. Egede once received a lump of ore from a Groenlander, and himfelf found calamine of a yellow colour. He likewife fent a confiderable quantity of yellow fand mixed with vermillion streaks to the Bergen company, who, by letter, requested him to procure as much as possible of that commodity: he could not, however, execute his commission, as he was never after able to find the place where he got the first specimen: it was, it feems, one of the smallest among a great cluster of islands, and the mark he had set up was blown down by a storm, so that he could not a second

time trace out the fpot. Rock chrystals, both red and white, are the produce of this country; and a baftard marble, of various colours, is very plentiful about the Danish colony, which is known by the name of Good Hope; of the latter the natives make bowls, lamps, pots, and crucibles. The seas and bays, besides a variety of beautiful shells, yield great quantities of excellent coral. But one of the greatest natural curiofines of this country is the atbeftos, or amianthus, which has the vulgar appellation of earth-flax, and is a fibrous, flexible, and mineral fubstance, composed of short and abrupt filaments. It is a flony concrete, of the talcky kind, though differing from talc in its external appearance. It is neither fo bright, so smooth, or so unctuous, and is not composed of leaves or plates, but of long filaments, like flax. It has been fpun into cloth, and formed into paper, both of an incombustible nature, and not to be con-

fumed

fumed by fire. Some kinds have filaments that are rigid and brittle, and others more flexible. The first cannot be spun, or formed into cloth; the latter may, but not without difficulty. This manufacture appears to have been known to the ancients, who, according to Pliny, wrapped the bodies of the dead in cloth made of earth-flax, to preserve their ashes separate from those of the funeral pile, a use to which this kind of cloth is still applied by some of the Tartarian chiefs.

Groenland is not infefted with any ravenous animal, the great white bear excepted, which, however, very

feldom appears near the Danish colony.

The quadrupedes of Groenland are dogs, foxes, hares, and rein-deer. The dogs are large and rough, white or speckled; and their ears stand upright, which is a peculiarity belonging to curs in general in all cold climates. These dogs are timorous and stupid, do not bark, but make a most dismal howling at times. In the northern parts they are rendered of infinite fervice, as the natives there yoke them to fledges, which, when heavy laden, they are able to draw upon the ice at the rate of 70 miles a day. These poor useful animals are, however, very ill rewarded for their fervices, being left to provide for themselves, except when their owners happen to be fuccefsful in taking a great number of feals, at which times their mafters gratify them with a meal, composed of the intrails and blood.

The foxes appear of different colours, white, grey, and blueish. They are neither so hairy, or so large,

as those of Denmark and Norway.

Hares are found in Groenland in great abundance: they are of a white colour, very fat in furnmer, and of

an exquisite flavour.

Rein-deer feed in great herds, and are hunted all the fummer by the natives, who are usually accompanied by their wives and children in these excursions, and penetrate very far into the country in purfuit of their game.

Serpents, lizards, toads, newts, &c. are unknown In Groenland; but gnats fwarm in the fummer time,

and are exceedingly troublesome.

Partridges, which are white in winter, and grey in fummer, abound here; as do sparrows, linnets, snow-

birds, and ice-birds.

A great number of ravens hover about the huts of the Groenlanders, as, near the habitations of these people, the ground is usually strewed with the offals of feals, and other fish. Groenland likewife abounds with eagles and faicons of a prodigious fize, and large speckled

The infects of this country are bees, wasps, spiders, and slies. The people, however, are not plagued with

beetles, ants, rats, or mice.

The Groenlanders are fond of the feal, which contributes at once to their fustenance and conveniency. There is some difference in feals, but the most remarkable species is that called the Cap-mis, which appellation it receives from the cap, or cawl, with which it covers its head occasionally. The head itself refembles that of a dog with cropped ears, his fnout is bearded like a cat, his eyes are large, and his teeth sharp. His skin is covered with a short thick fur, which is white, black, brown, or tawny: he is web-footed, which is a great convenience to him in fwimming; and he feems to drag himfelf along, rather than walk.

Seals are from five to eight feet in length. The fat of this creature furnishes the Groenlanders with oil, the flesh with food, the skin with cloathing, and with co-

verings for their huts and boats.

Besides scals, the Groenland seas abound with turbut, cod, haddock, fcate, falgaon, halibut, cat-fifh, roe-filly, stents, whiting, bream, muscles, crabs, thrimps, &c.

That aftonishing creature the whale will be amply described from some late minute observations, under

the article of East or New Greenland.

With respect to sea fowl, the principal, in Groenland, is the edder-fowl, fwarms of which, at times, feem to cover the whole furface of the ocean. warm feafon infinite numbers of them hover abo Danish colony every evening, and take their flight to the fea regularly the enfuing morning. In fpring they retire to the illands to lay their eggs, and hatch their young, and return to the continent about June or July, The Groenlanders are very fond of their eggs and their young, but make no manner of vie of their fine down feathers, which are excellent in their kind, and to be found in large quantities in and about their nefts.

There are three species of ducks, which are found in, or frequent Groenland. The first, which is of the tame duck kind, has fine speckled feathers, and lays and hatches its eggs in the islands, returning afterwards with its young to the continent. The second fort is fmaller, has a long pointed bill, frequents only fresh waters, and builds its neit in the flags, or reeds of The third kind, which is the largest of all, has the appellation of the wood-duck, and is diffin-

guithed by a black breaft and grey belly.

The alkes is another kind of fea fowl, which the Groenlanders are fond of feeding on: it is less than a duck, and of a rancid tafte. But the most beautiful fea bird in these parts is the tungoviariek. This bird is not bigger than a lark, but its feathers are uncommonly elegant. Swarms of wild geefe come to the northern parts of Groenland, from more fouthern climates, in the fpring, and breed, and quit the place at the commencement of winter. Many fea-mews build in the rocks and cliffs; and fea-terns lay their eggs on the islands about Groenland. Lundes, or Groenland seaparrots, are common here, as are fea-ernes, and fea-

Descent, Persons, Dress, Disposition, Food, Marriage and Funeral Ceremonies, Amusements, particular Customs, Employment, Weapons, Habitations, Articles of Traffic, Language, Religion, Diseases, scientific Knowledge, &c. of the inhabitants of Groenland.

CCORDING to the concurring testimony of dif-A ferent authors, the native or original Groenlanders are descended from the Schrellings, who formerly exterminated the Iceland fettlers. These people bear a near refemblance to the Laplanders and Lamoides, in their persons, complexions, and way of life. There will always be found a ftrong affinity between the cuftoms of different nations living in the fame kind of climate, exposed to the same wants and necessities, and involved in the fame ignorance and brutality, The Groenlanders are fhort of stature, thick made, and inclined to fat: their faces are broad, their lips thick, and their nofes flat." They have black hair and eyes, and yellow complexions, possess health and vigour, but

have very fhort lives. Their cloaths are, for the most part, made of reindeer, or feal fkins; as also of birds fkins, nicely dreffed and prepared. The mens habits are, a coat, or jacket, with a cape or hood fewed to it, to cover the head and shoulders. This coat reaches nearly to the knees. Their breeches are very finall, not coming above their loins, that they may not hinder them from getting into their boats; and the hair of the skins the coat is made of is turned inward to keep them warm. Over this coat they put on a large frock, made of feal skins dreffed and tanned without hair, in order to keep out the water; and thus they are dreffed when they go to fea. Between the leathern frock and the under coat they wear a linen shirt, or, for want of linen, one made of feals guts, which also helps to keep out the water from the under coat. 'Of late they appear fometimes in more gaudy dreffes; as shirts made of striped linen, and coats and breeches of red and blue stuffs or cloth, which they buy of the Danish or Dutch merchants, but fashioned after their own way. In these they parade and feaft, when they keep holidays on shore. The hose they wore formerly were made of rein-deer or feal-skins; but now they prefer our fort of

Their shoes and boots are made of feal-fkins, red or yellow, well dreffed and tanned. They are nicely wrought, with folds behind and before, without heels, and fit well upon their feet. The only difference between the drefs of the men and women is, that the womens coats are higher on the shoulders, and water than the mens, with higher and larger hoods. The married women, that have children, wear much larger coats than the rest, like gowns, because they must carry their children in them upon their backs. They wear drawers which reach to the middle of the thigh, and over them breeches. drawers they always keep on, and fleep in them. Their breeches come down to the knees: these they do not wear in fummer or in winter, but when they go abroad; and, as foon as they come home, they pull them off again. Next to their bodies they wear a waiftcoat made of young fawn-fkins, with the hairy fide inward. The coat, or upper garment, is also made of fine coloured fwan-skins, or (in defect of that) fealfkins, trimmed and edged with white, and neatly wrought in the feams, and about the brim. Their hair, which is very long and thick, is braided, and tied up in a knot. They commonly go bare-headed, as well without as within doors: nor are they covered with hoods, but in case of rain or snow. 'Their chief ornaments are glass beads, of divers colours, or coral, about their necks and arms, and pendants in their ears. They also wear bracelets made of black skin set with pearls, with which they trim their cloaths and shoes. Some have, besides this, another fort of embellishment; they make long black strokes between the eyes on the forehead, upon the chin, arms, and hands, and even upon the thighs and legs. They keep their cloaths pretty clean, though in other things, especially in their victuals, they are not so nice. The women, in general, who have children, are very dirty and flovenly, well knowing that they cannot be repudiated. But those unfortunate women that are barren, or whose children are dead, and do not know the moment they may be fent away, are obliged to take more care to be cleanly, that they may please their husbands.

With respect to disposition, the Groenlanders are good-natured and orderly, but indolent, dull, and phlegmatic. They live peaceably without laws, and act regularly without discipline.

In cases of murder (which, however, feldom happen) no cognizance is taken of the murderer, unless the nearest relation to the deceased thinks proper, personally, to revenge his death. Old women, who, from an untoward disposition, are supposed to be witches, they kill, by the unanimous consent of the neighbourhood.

As they think all the productions of nature defigned for mankind in general, they deem every thing common property. This naturally obviates the idea of robbery, as none can fteal where he has a right to take whatever he happens to lay his hands on. But this idea they extend to ftrangers, and take as freely from them as from their own neighbours, which occasions them to have a worse name than they deserve; as the notions they are brought up in excuse, in some measure, their supposed delinquency.

Fornication and adultery are unknown to the Groenlanders, except upon particular occasions, when certain ceremonials, at which both sexes attend, admit of promissions intercourse; and these permissions do not proceed so much from vice as arbitrary custom; for, in general, the Groenlanders are modest, civil, generous, and hospitable. Only married people are admitted to the above mentioned sestivates; for the unmarried, of both sexes, are remarkable for their modesty and continency. To consirm this affertion, Mr. Eggde, the Danish missionary, says, he never saw any of them hold any loose conversation, or shew the least inclination to it, either in word or deed. During sistem years that he lived in Groenland, he did not hear of

more than two or three unmarried young women who were pregnant, because it is reckoned the greatest difference.

The most exceptionable propensity of the Groenlanders is their being fo exceeding dirty, for they are flowers to a degree of beaftiality. The men are fo fond of dirt, that they never wash themselves with clean water, but, in the manner of cats, lick their fingers, and clean their faces, as well as they can, with the spittle. They even eat their victuals in the same bowls and platters that have been licked by their half starved dogs, without the least idea of making them clean. The women think they are never fo fweet as when they wash themselves in urine, that being deemed their grand perfume; and a female, when fo cleaned, imagines her fmell to be peculiarly grateful. Even the men adopt this opinion fo far as to compliment a woman, after having been thus scowered, with the title of niviarfiar fuarneaks, or, maidenly sweet. Company never hinders either fex from complying with the calls. of nature; and the utenfils for those purposes being always in the same room as the family, a disagreeable effluvia arifes, which is extremely offensive to any but those who are, by long use, familiarized to such stenches. Many of these people soak raw hides in these very utenfils, which contributes confiderably to the naufeous finell of the place, and renders a Groenlander's habitation almost insufferable.

The Groenlanders feed upon the flesh of sea-partridges, hares, feals, rein-deer, and whales. Their fleth-meat they eat either boiled, dried in the fun or wind, or raw. Their fish they either boil or dry tho, roughly. Indeed, it is by perfectly drying that they preferve their falmon, halibut, or ftents, which are caught in the fummer, and laid up for winter ftore: for these people, with all their ignorance, are as careful as the ant in providing for future exigencies. Seals are only to be eaught in the fummer, unless they happen, in the winter, now and then to meet with a few floating upon the ice. The mode of preferving these animals is by burying them under the fnow, from whence they are dug out as occasion requires, and eaten without further preparation. They are as nafty in eating as other things; for they never clean either platters, pots, or kettles; and the dirty ground ferves them for a table. But they act wifer than many more polished nations, in not eating fet meals at particular hours, but gratifying the calls of hunger when the craving appetite requires. The women usually eat by themselves; but when the Groenlanders return from fea, they make merry together, and regale fumptuoufly.

As these people are not delicate in their appetites, they are not very particular, in times of scarcity, with respect to their food, as they will feed upon pieces of rotten skins, sea-weeds, slags, any kind of roots, whale's fat, train oil, &c. In summer they use wood as suel to dress such victuals as they do not choose to eat raw; but, in winter, they usually boil their food upon their train-oil lamps. Their kettles are made either of brass, copper, or marble, and, in general, manufactured by themselves. Their method of kindling a fire is by the friction of a piece of hard wood upon a dried fir-tree block.

The Danes found great difficulty in bringing the Groenlanders to taste their provisions. Some, howers, at length came to be fond of bread and butter; but very sew have, as yet, overcome their strong aversion to spirituous liquors; and none can be persuaded to chew or smooth tobacco.

There are forme, indeed, but those are very sew, that keep two, three, or four wives; but these pass for heroes, or more than ordinary men; because, by their industry, they are able to maintain so many wives and children. Before the arrival of the Danes, jealously never prevailed among those wives; but they agreed well together; though the first wise was reckoned the mistress. But since the Danes have informed them of

the word and will of God, importing, that, in the beginning, the all-wife Creator made one man and one woman to live in matrimony as hufband and wife, there have been fome refentment in the wives, when their hufbands have been disposed to take any others beside them. They have applied to Mr. Egede, defiring him to put a stop to such a proceeding. Also, when he has instructed them in their catechism, they have always reminded him fully to inftruct their hutbands in the duty of the feventh commandment. They refrain from marrying their next relations, even in the third degree, deeming fuch matches unwarrantable and unnatural. It is likewife cenfurable, if a young man and woman, that have ferved and been educated in one family, should defire to be married together; for they look upon them as brother and fifter.

Their marriage ceremonies are as follow. When a young man fancies a maiden, he commonly propofes it to the parents and relations on both fides. After he has obtained their confent, he procures two or more old women to fetch the bride. There go to the place where the young woman is, and carry her away by force; for, though the approves of the match, yet, out of modefly, the must effect coyness, in order to avoid the censure of forwardness. After the is brought to the bridegroom's house, she keeps, for some time, at a distance, and sits retire in some corner, upon a bench, with her hair dishevelled, and her face veiled. In the mean while the bridegroom uses all the rhetoric he is mafter of, and spares no careffes to bring her to compliance, which being effected, the maiden yields to his embraces and the wedding is over.

Husbands often repudiate their wives, either if they do not fuit their humours, or if they are barren, (which they hold to be very ignominious,) and for many other reasons: but if they have children by them they keep

them for life.

The robust constitution of the women is particularly evinced in child-bearing; for as foon as it is over they will go to work and do their ordinary bufiness: but fometimes it costs them their lives. They have a tender love for their children. The mother always carries her infant upon her back, wrapped up in her coat, wherever the goes, or whatever bufinels the has in hand; for they have no cradles. They fuckle their children till they are three or four years old, or more; because, in their tender infancy, they cannot digest the flrong victuals that the rest must live upon.

They are negligent in the education of their children, for they never chaftife or correct them when they do amifs, but leave them to their own difcretion; notwithstanding which, when they are grown up to years of maturity, they feldom feem inclined to vice. Altho' they shew no great respect to their parents in any outward forms, they are always very willing to do what they order them. They are under the care of their parents, boys as well as girls, till they are married; af-terwards they shift for themselves; yet they continue to dwell in the fame house, or under the same roof, with their fathers, together with other kindred and relations; and what they get they all enjoy in common.

On the death of a Groenlander all his property is thrown away as impure and unfortunate. All who refide in the fame house are obliged to carry whatever belongs to them in the opin air to purify; but in the evening they fetch their effects back again. They drefs the corple in its best apparel, bend the legs under the back, wrap the whole up in rein deer and feal fkins, and bury it under a heap of stones. Those who are concerned in the funeral are for fome time deemed unclean; and the mourners, to teftify their grief, make most hideous howlings. A corpse is always conveyed out of the back part of a hut, but never through the door; and, at the funeral a woman lights a flick, and, waving it round her head, pronounces the woods " Pikleruk pok," which is, he is no more to be procured.

They fix a dog's head upon the burial place of a young child, for this curious reason, that as a child is

deficient in point of understanding, it would not be capable of finding its way to the land of spirits without a faithful dog to run before and guide it.

The principal amusements of the Groenlanders are finging in-a very harsh discordant manner, dancing after a very ruftic mode, running, wreftling, foot-ball, &c. They very feldom quarrel with each other, not having, indeed, in their language any fcurrilous words, or fuch as are calculated to express anger or refentment. They are never known to fight: but when a Groenlander conceives himfelf aggrieved or affronted, he challenges the aggressor to a trial of satirical skill, or bandy farcasm with him. The two parties meet accordingly, when the challenger begins first, and, in a humerous poetical manner, charges his antagonist with having affronted him, and likewise recapitulates what-ever faults or follies he has been guilty of. The perfon challenged replies in a fimilar strain, exculpates fon challenged replies in a minute binnfelf as well as he can, and retorts by recounting the errors of the challenger. In this war of words, if the challenger has the advantage, his antagonist is obliged to apologize for having affronted him; but, on the contrary, if he is out-fatirized, he must confess himfelf wrong, and beg pardon for having made the accufation. Let the fatirical contest conclude how it will, a reconciliation is fure to take place, and the day to conclude with the utmost mirth and festivity. In this manner terminate the quarrels of the Groenlanders, and fuch is their severest resentment. It is to be wished that nations which pretend to great politeness and benevo-lence, would terminate their differences in a like sensible and friendly manner, without having recourse to that Gothic, unchriftian, and inhuman practice of du-elling, or appealing to the favage brutality of blows.

The fongs, which are fung at their affemblies, are fatires against their neighbours follies, or rather goodnatured poetical documents and representations of each others faults. The person who sings always beats a little drum with his finger, as an accompaniment to his veries, and likewife make strange gesticulations for

the greater entertainment of those present.

The greater part of the year is employed by these people either in hunting or fifthing. The principal game they hunt is the rein-deer. To purfue this ani-The principal mal they penetrate into the interior parts, accompanied by their whole families. Having found a herd of reindeer, a number of Groenlanders furround them at a confiderable distance, and then, with shouts and hideous yellings, drive them into a narrow compass, by contracting the circle they have formed round them. The animals being thus cooped up, become an easy prey, and may be killed with great facility.

The hunting weapons of the Groenlanders are fir-

tree bows, wound about with the twifted finews of animals, and flrung with the fame, or with flips of fealfkins. The arrows are near fix feet in length, and bearded with iron or sharp pointed bone; but those they shoot birds with are blunt pointed, that they may not tear the flesh, the blow being sufficient to kill the bird, without mangling it. In killing sea fowls they use lances, which they throw with aftonishing dexterity,

and very feldom mifs the mark.

Their method of whale-fifthing is different from what is practifed by other Europeans. When they fet our upon those expeditions, they go in a large long-boat, called kone-boat, because it is rowed by women; for the word kone implies a women. About 50 perfons go in one of these boats, and when they find a whale, the men strike him with their harpoons, to which are faftened, with very long lines, blown feal-fkins, which are filled with wind like bladders. These artificial bladders are of infinite use to the Groenlander in their whale-fishing; for by sheating on the surface of the fea, they not only discover the track of the whale after he is wounded, but hinder him from diving under the water for any length of time. When the whale hofes his strength, and is exhausted by fatigue, the Groenlanders again attack him with spears and lances till he expires,

expires. On this occasion they are clad in skin coats, consisting of only one piece, with boots, gloves, and caps, sewed and laced to tight together, that no water can penetrate them. In this garb they jump into the fea, and begin to slice the fat all round the whale's body, even under water; for in these coats they cannot sink, as they are always full of air; so that they can stand upright in the sea. Nay, they are sometimes so daring that they will get upon the whale's back while there is yet his in him, to make an end of him, and cut away his fat.

Seals are taken by various methods, fuch a striking them with harpoons, fimilar in form, to those used in whale-fifthing, but much finaller; watching them when they come to breathe at the air holes in the ice, and firiking them with lances, approaching them difguited like their own species, that is, covered with a seal-skin, creeping upon the ice, and wagging the head in the very fame manner as a feal; by which means the Groenlander approaches the animal without fuspicion, and kills him with his lance. Previous to the falling of the faow, these people can see the seals through the transparent ice, and trace them to the openings, where they are easily killed. They are likewise surprized while they bask themselves in the sun, either upon rocks or floating species of ice. The Groenlanders angle with lines made of whalebone, cut very small, and generally catch a great many sish. The halibut is caught with lines of hemp, or seal-skin. Salmon and roe-sish are taken by means of weirs or Rone enclosures, into which the tide carries them at flood, and leaves them on dry land at low water. Stent fith are caught by means of netting extending upon poles. They are dried upon the rocks in the open air, and ferve for part of the winter provision of the natives, being dressed in melted fat or train oil.

They have two forts of boats; the one, which the men alone make use of, is a small vessel, and sharp pointed at both ends, three fathoms in length, and but three quarters of a yard wide at most, with a round hole in the middle, just large enough for a man's body to enter, and fit down in it. The infide of the boat is made of thin rafts, tacked together with the finews of animals; and the outlide is covered with feal fkins, dreffed, and without hair. No more than one can fit in it, who fastens it so tight about his waist that no water can penetrate it. In these small boats they go to fea, managing them with one oar, a fathom long, broad at both ends, with which they paddle about in the most stormy weather, to catch seal and sea fowls; and if they happen to overfet, eafily raife themselves, and recover their boats by means of their paddles. The kone-boat is made in the same manner, but more durable, and longer, being 60 feet in length, and likewife has a malt, with a triangular fail, which is made of the membranes and entrails of feals, and managed The women with the help of the braces and bowlings, build, repair and row these boats, and likewise build all the Groenlanders huts; the whole mechanic employment of the men being to make hunting implements and fifthing-tackle.

This country is but thinly peopled. The huts which the inhabitants relide in during winter are low, and built of ftone and turf. The windows are on one fide, made of the bowels of feals, dreffed, and fewed together, or of the maws of halibuts, and are white and transparent. On the other fide are placed their beds, which confist of shelves or benches, made of deal boards, raised half a yard from the ground. Their bedding is made of feal or rein-deer skins. Several families live together in one of these houses or huts, each family occupying a room by itself, separated from the rest by wooden posts, by which also the roof is supported. Before the posts, is a hearth or fire place, in which is placed a great lamp, in the form of a half-moon, seated on a trivet. Over this are hung their kettles of brass, copper, or marble, in which they boil their victuals. Under the roof, just about the lamp,

they have a fort of rack, or shelf, to put their wet cloathes upon. They burn train-oil in their lamps, and moss serves them as a substitute for wick. The door of the hut is low, that as little cold as possible may be admitted. The house is lined with old skins within, and furrounded with branches. The men and women fit to work with their backs to each other. In the summer the Groenlanders dwell in tents made of long poles, fixed in a conical form, covered with deer-skins within, and outwardly with dressed feal-skins, so that rain cannot pierce them.

The Groenlanders traffic with the Danes, by exchanging whalebone, blubber, train-oil, horns of fea-unicorns, rein-deer skins, seal ditto, and fox ditto, for coats, shirts, stockings knives, hand-saws, needles, angling-hooks, chests, boards, looking-glasses, toys, &c. &c.

The language of the Groenlanders is guttural, and full of confonants. The alphabet is without the letters C, D, Q, X; and they have a great number of polyfyllables like the people of North America.

These people treat the Danish missionaries with great respect, and attend to what they preach with the utmost patience; but at the same time hear them with the most mortifying indifference; fo that those gentlemen make but few profelytes, or, at leaft, if any are converted, they feldom long remember what has been faid to them. Those who remain in their original fuperstition believe in the immortality of the foul, but have very confused and inadequate ideas of the Deity, whom they called Torngarfeck, and suppose that he re-fides either in the bowels of the earth, or in the sea. They likewise believe in another spirit, whom they call Innirirrirfok, or the restrainer, because they fancy he prevents them from eating or drinking what is pernicious, and from doing wrong in other things. A third spirit, called Erloerfortok, or the gutter, they represent as a monster, and imagine he lives upon the entrails of the dead. They suppose all the elements to be filled with fpirits; and believe that their priefts, whom they call Angekots, have each one of thefe fpirits, as an attendant or familiar; and this ideal familiar spirit they call Tornagh, and fancy that he always comes with great readiness to the Angekut when summoned.

When an Angekut pretends to invoke the great spirit Torngarseck, he retires in some uniferquented place, where none of the people dare follow him, and, on his return, makes them believe that he has invoked Torngarseck, who answered his invocation by appearing in such a horrid form that he was overcome by terror, sickened, sunk into a trance, and remained without signs of life for the space of three days, and that when he recovered, he found himself induced with the spirit of conjuration.

These Angekuts are very great impostors, and, by a great variety of artifices, maintain entire ascendency over the poor deluded people.

The principal diseases of the Groenlanders are of a feorbutic nature, and they are great accustomed to weak eyes, which latter disorder is occasioned by the sharp piercing winds incident to the country, and the white glare reslected from the ice and snow, with which the whole country is covered so great a part of the year. The small-pox being brought among these people in the year 1734, from Copenhagen, made great havock. With respect to surgery or physic, they are extremely ignorant. Their great specific plaister for all kinds of wounds, is the composition of the bark of a tree, burned moss, and train-oil; and all their instruments of surgery consist in a common knife, a fish-hook, and a needle.

The Groenlanders are utterly ignorant of natural philosophy, and, indeed, of science in general, a small inattering of astronomy excepted; for they have made sufficient observations of the stars to be able to steer by them to sea. They measure time by months, commencing the year after the sun's first rising above the horizon in the winter; and by every month they are

precifely acquainted with the proper times for killing, or taking, the feveral species of sishes, fowls, animals, &c. So that their little aftronomy ferves to direct all their avocations, fuch as remaining at home to do their little domestic and mechanic works, going abroad to hunt, fifh, and the like.

SECTION II.

EAST GREENLAND, NEW GREENLAND or the Country of SPITZBERGEN.

Account of the Difcovery, including a Detail of the Voyages undertaken by divers Navigators in Quest of a Passage to the East Indies by the North Pole.

THE idea of a paffage to the East Indies by the North Pole was first suggested in the year 1527 by a merchant of Bristol, who addressed Henry VIII. on that subject; but the plan he proposed was never

put into execution.

The first attempt was made in the reign of Queen Elizabeth, in the year 1553, by Sir Hugh Willoughby, who failed with three ships to the latitude of 75 deg. north, within fight, as it was supposed, of Greenland, which was afterwards re-discovered by the Dutch, and named Spitzbergen. Being driven back by a ftorm, he was compelled to winter in the river Arzena, in Lapland, where himfelf and his whole company were unfortunately frozen to death.

Three years after captain Borroughs, comptroller of the navy to queen Elizabeth, fucceeded Sir Hugh Willoughby in attempting this discovery. He passed the north cape in the year 1556, penetrated to the 78th deg. of north lat. discovered the Wygate, or strait, which feparates the country of the Samoides from Nova Zembla; and then returned to England, contented with having proceeded much farther than his prede-

The report made by captain Burroughs occasioned queen Elizabeth to fit out two flout vessels to perfect the discovery. These were put into commission, and the command given to captain Jackman and captain Pell, who, in the year 1580, paffed the ftrait which captain Burroughs had discovered, and entered the eaftern fea; but there the mountains of ice were fo dreadful, and the weather to tempestuous, that captain Pell, with his ship and crew, were lost, and captain Jackman returned to England. The bad success of this expedition occasioned the ardour of the English, at that time, to subside with respect to the main enterprize, which was the discovery of a north-east passage.

The Dutch began to purioe the fame object in 1595, when John Cornelius made the attempt, but without

any degree of fuccefs.

Cornelius was succeeded in 1606 by William Barens, an experienced navigator and able mathematician, who having proceeded in the coacle previously pointed out by the English navigators, and passed the Wygate, met with the impediments which had prevented the fuccels of others, and returned home fully convinced that the defired paffage was not to be found in that direction. In 1607 he entered upon a fecond voyage, which he determined to profecute upon a different plan, by steering to the northward of Nova Zembla; but when he had reached the 77th deg. of North latitude his ship was forced by the floating ice, upon the rocks, and there crushed to pieces. Barens, and the greatest part of his crew, got safe to land; but there they experienced the most excruciating miseries, by being obliged to winter in a place where the feverity of the weather caused the flesh to perish upon the bones of fome, and put an end to the existence of others. The furvivors, however, with great ingenuity and fortitude, framed a pinnace from the wrecks of the ship; and, at the commencement of the summer, fet tail in it for Lapland, but the captain died before their

arrival at Coln in that country, and with him perished the hopes of perfecting the discovery at that time.

In 1710 the celebrated Henry Hudson, who discovered the strait and Bay that still bear his name, attempted the north-east passage, but was as unsuccessful as those that had gone before.

Though all these adventurers had miscarried in the main defign of their expedition, the discovery of a north-east passage, yet their voyages proved beneficial, in forme measure, to their respective countries, by introducing to them the knowledge of feal-fishing, whale-

fifhing, and other profitable pursuits.

The English re-assumed the design in 1676, when two ships were fitted out by order of Charles II. and at the expence of the king himself, the duke of York his brother, and feven other persons of rank. The command of these ships was given to that excellent navigator and mathematician captain John Wood, and captain Hawes, the former being appointed to act as principal, and direct the expedition in the character of commodore.

They failed on the 28th of May, 1676, and proceeded to the Northern Ocean. On the 15th of the ensuing month they entered the Polar Circle, and on the 29th of the fame month the ship named the Speed-well, in which captain Wood failed, was unfortunately wrecked on fome rocks in the icy feas. After having struck, the captain gives the following affecting and animated description of the diffresses of himself and his crew. " Here (fays he) we lay beating upon a rock, in the most frightful manner, for the space of three or four hours, using all possible means to save the ship, but in vain; for it blew so hard, that it was wholly out of our power to carry out an anchor capable of doing us any fervice. At length we faw land close under our flern, to the great amazement of us all, as before we could not see it for the foggy weather. I ordered the men to get out the boats before our mast came by the board, which was done. I then fent the boatswain towards the shore in the pinnace, to see if there was any possibility of landing, which I much seared because the sea ran so high. In half an hour he returned, and gave for answer, that it was impossible to land a man, the fnow being in high cliffs, and the shore inaccessible. In confequence of these bad tidings we went to prayers, to befeech the almighty to have mercy on us, as nothing but inevitable ruin appeared before our eyes. After prayers the weather cleared up a little, and looking over the ftern I faw a fmall beach on the spot where I thought there might be some chance of getting on shore. I therefore sent off the pinnace a second time, with some men in her to be first landed, but she durst not venture to attempt the beach. I then ordered out the long boat, with twenty men in her to land, who attempted it, and got fafe on shore. Those in the pinnace feeing that followed, and landing their men likewife, both veffels returned to the fhip without any ac-

" The men on shore defired some fire arms and ammunition, for there were many bears in fight. I therefore ordered two barrels of powder, some small arms, provisions, with my own papers and money, to be put on board the pinnace, but as the put off from the thip's fide, a fea overfet her, fo that all was loft, with the life of one man, and feveral others were taken up for dead. The pinnace was dashed to pieces to our great regret, as by that difatter one means of escaping from this difinal country was cut off. 'The long-boat being on board, and the sea running high, the boatfwain and fome others would compel me and the lieutenant to leave the ship, declaring that it was impossible for her to live in that fea, and that they had rather be drowned than their commander; but defired me, when I came ashore, if possible, to fend the boat again for them. Before we had got half way to the shore the ship overfet, is that making all possible haste to land the men we had on board I went off to the ship again, to save those men who had given me such proofs of their regard. With g thip, and they only one man w in the pinnace though very w boat, and went where our mer canvas and nars and in which next morning t vered got upo taken on fhore high, that, tho would venture " The wind

gard. With great hazard I got to the quarter of the fhip, and they came down the ladder into the boat, only one man was left for dead, who had been cast away in the pinnace. I returned, however, to the shore, though very wet and cold. We then hawled up the boat, and went up the land about a mufquet shot, where our men were making a fire, and a tent with canvas and oars, which we had faved for that purpose, and in which we lay all night wet and weary. next morning the man we left on board having recovered got upon the mizen-maft, and entreated to be taken on fhore; but it blew so hard, and the sea ran so high, that, though he was an expert feaman, none would venture to bring him off.

GREENLAND.

" The wind continuing to blow, with extreme fogs, frofts, fnow, and all the ill compacted weather that could be imagined, we built more tents to preferve ourfelves; and the ship breaking to pieces came all on shore to the same place were we landed, which served us for shelter and firing; besides, there came to us some hogsheads of brandy, and good store of slour, which was great comfort to us in our extremity. We now lay between hope and despair, praying for fair weather, that captain Hawes might find us, which it was impoffible for him to do while the weather continued foggy; but fearing at the fame time he might thare the fame fate. At all events I was refolved to try the utmost to save as many as I could in the longboat. In order thereunto we raifed her two feet, and raifed a deck upon her, to keep the fea out as much as poffible: with this boat and thirty men (for fhe would carry no more) I intended alternately to row and fail to Russia; but the crew not being satisfied as to the choice of the men, began to be mutinous, every one having as much reason to save himself as another. In this perilous state brandy was our best resourse, for it kept the men always intoxicated, and frustrated their defigns. Some were refolved to go by land, but that I knew was impossible: neither had we provision or ammunition to defend us from the wild beafts.

" The weather still continued very bad, with fogs, fnow, rain and froft, till the ninth day of our being on fhore, which was the 8th day of July, when in the morning it cleared up, and, to our great joy, one of our people called out, a fail! This proving to be captain Hawes we fet fire to our town, that he might fee where we were, which he prefently discovering, came up, and fent his boat to us. Before I went off I wrote a brief relation of the defign of the voyage, with the accident that had befallen us, put it into a glass bottle and left it in the fortification I had there built. By twelve o'clock they all got fafe on board, but left all on thore we had faved from the ship, for we much feared it would prove foggy again, and that we should be once more driven on this miferable country; a country for the most part covered perpetually with snow, and principally boggy land, on whose surface grows a kind of moss bearing a blue and yellow flower, the whole produce of the earth in this defolate region. The ice cliffs, which are exceeding high, and the arches over-hanging supporting mountains of snow, exhibit a most tremendous spectacle. Being all on board the Profperous, we fet fail for England, where we arrived in 45 days."

The expectations of the English government, and the hopes of the British navigators, with respect to the discovery of a north-east passage, subsided with the iffue of this unfortunate expedition; and many mariners ferioufly began to think that no fuch paffage exifted; notwitstanding the Dutch, but a few years before this expedition, failed very near that open fea which the Ruffians at prefent navigate with great facility; and might, without the least doubt, have easily reached the coasts China and Japan, had they per-

fevered in their undertaking.

Soon after these enterprizes the astonishing genius of Peter the Great, Czar of Muicovy, not only humanized and polifhed his fubjects, (who before were little No. 54 better than barbarians) but compelled them to great and noble undertakings. Hence the Ruffians, who scarcely . had any veffels larger than a fmall bark, began not only to build thips of confiderable burthen, but to attempt new discoveries. These arduous endertakings occasioned the valt and almost desert country of Siberia to be explored, Kamtschatka to be discovered, and the feas on the north of Afia to be traverfed. Thefe attempts were begun by Beering, who, on the 5th of February 1725, received orders from count Apraxim, admiral of Ruffia, to proceed on his paffage into Siberia. By his inftructions, figned by the Czar, he was to inform himfelf of the north-eaftern frontiers of , that country, in order to discover whether they were contiguous to, or what might be their distance from, the continent of North America: and if any paffage could be obtained that way at fea. He traversed Siberia, partly by land, and partly in boats by rivers, till he came to Lower Kamtschatka, in the 56th deg. of north lat, and about long. 94. 30. east from London. It stands on a river of the fame name, which runs to the east, and about 120 miles from the town falls in the Sleeping Sea, as it is called in the map annexed to Beering's voyage. Beering failed from the river Kamtichatka the 14th of July 1728, and the 8th of August found the latitude to be 6+ deg. 30 min. On the 15th the lat. was 67. 18. and he thought proper not to proceed, as he could not observe that the land reached farther northward, and was apprehensive lest some contrary winds might prevent his return to Kamtschatka before the end of fummer.

There was a ridge of mountains covered with snow all along the shore, from Kamtichatka to this place, which appeared at fea like a wall. In September Beering returned to the river of Kamtschatka, and wintered in Lower Kamtichatka. On the 5th of June 1729 he failed again from that river, and iteered eaftwards, being informed that land might that way be discerned at sea in clear weather. But having made 200 worstes, or 144 English miles, and no land ap-pearing, he changed his course along the coast of Shatzick, to double the point of the continent of Kamtichatka, which was before unknown. That point ties in lat. 51. and about long. 60. 10. east from Lon-About 80 miles to the north of it is the mouth of Bolfkhaya, from whence Beering croffed the fea to Okotíki, in lat. 58. 30, and long. 78. and thence he returned by land to Siberia, and fo to Peterfburg, where he arrived in March 1730. In the account of this voyage he gives a fhort description of those parts of Siberia and Samoieda through which he travelled. In this voyage, however, he made no confiderable difcoveries; and, on a fecond voyage, he unfortunately

perifhed in his attempt. With respect to Beering's second voyage, we know little more than that he began it about the year 1740, penetrated as far as the Isle of Japan, and then failed eastward about 80 leagues, after which he was shipwrecked on an ifland before unknown, where he and most of his company perished through cold, hunger and fatigue. The news was brought by Mr. Stoller, a botanift, and of the Academy of Sciences at Peterfburg, who accompanied Beering. Mr. Stoller, with the affiftance of fome of his companions, found means to build, out of the ruins of their great ship, a small bark, in which himself, and nineteen others, after a thousand perilous adventures, arrived at Kamtschatka. The fame gentleman reports, that Ticheribow, who accompanied Beering in that expedition, had been more fortunate, and even discovered the coast of America, but his men were beaten off by the favages.

From the fecond enterprize, however, and from fome fubfequent voyages of the Ruffians, the reality of a north-east passage is ascertained. This is effected by fumming up the courses run by the English and Dutch; by fome Ruffians who failed fince Beering, and by Beering in his last voyage, the whole amounting to an absolute passage from Europe by the north-east to Japan and China; for the English and Dutch have repeatedly failed to Wygatz, or the Straits of Nova Zembla; the Russians have failed from the failed North Cape of Asia; and Beering failed from the failed North Cape to the Isles of Japan. Hence the voyage has been completely performed, though not throughout by the same persons. These incontestible proos, and the voyage of Commodore Phipps, (now Lord Mulgrave,) clearly evince that, although a north-east passage really exists, yet it is useless with respect of commercial purposes. For though the passage from Europe to China, or Japan, is much shorter this way than by the usual track, yet, from the innumerable impediments, three years would be required to make the voyage, which has hitherto been performed, by doubling the Cape of Good Hope, in less than one. For the gratification of our readers, we shall prevent a concise and succinet account of Commodore Phipps's voyage, as it is equally important and entertaining.

This great point of geography having remained without further investigation till the year 1773, the Earl of Sandwich, then first lord commissioner of the admiralty, in confequence of an application made to him by the Royal Society, for an expedition to be undertaken, in order to afcertain how far navigation was practicable towards the north pole, communicated the fame to his Majesty, who was graciously pleased to countenance the proposal, and ordered the expedition to be undertaken with every affiftance and encouragement that could give it fuccefs. Every neceff ry was, therefore, amply provided, which could promote the defign of the enterprize, or tend to convenience or comfort to those that were engaged in it. The veffels chofen for the expedition were two bomb-ketches, which, of all others, are the best adapted for such voyages, as they are uncom-monly stout, and not over large. These vessels, whose names were the Racehorse and Carcase, to increase their natural ftrength, had a fheathing of feafoned oak plank, three inches thick, and were furnished with a double fet of anchors, cather, fails, rigging, ice-poles, &c.
For the comfort and convenience of the officers and

For the comfort and convenience of the officers and men, a great quantity of prime beef and pork was ordered to be cured in the best manner. An hundred butts of porter were ordered to be double brewed from the best hops and malt; plenty of coals to be stowed in the ships for firing; peas, oatmeal, rice, molasses, spirituous liquors, wine, vinegar, oil, mustard, portable soup, tea, sugar, &c. &c. in great abundance: and that warm cloathing might not be wanting, besides that was usual, every man was provided with jackets made of that warm stuff called fearnought, two milled caps, two pair of searnought trowfers, four pair of milled shockings, an excellent pair of boots, two cotton shirts, two handkerchiefs, and a dozen pair of milled mits.

The necessary preparations being completed, the Honourable Constantine John Phipps (now Lord Mulgrave,) as commodore, went on board the Racehorse, of 350 tons burthen, mounted with 8 six-pounders and 14 sivels; and Captain Skiffington Lutwidge went on board the Carcase, of 300 tons burthen, mounting 4 six-pounders and 14 sivels; when the wind being fair, they set fail on the 3d of June, 1773.

On the 21st of the same month they saw a whale, which was the first they had yet seen in the North Seas. The same day they met with a homeward bound Hamburgh whaling snow, when Mr. Wyndham, a gentleman of fortune, who had designed to prosecute the voyage with the Commodore, not being pleased with the heavy seas and foul weather, which he had already seen, and finding his health decline, went on board the Hamburghman, in order to return home. On the 29th they met with a Groenland fishing-vessel, called the Marquis of Rockingham, from the captain of which they learned that, the day before, three whalers had been crushed to pieces by the ice.

Nothing particular happened till the 8th of July, when both thips were in great danger from being almost

furrounded fuddenly by ice. The Commodore gave orders to fland to the fouthward; but this being foon found impossible, by the continual accumulation of the ice, the companies of both ships were obliged to have recourse to their ice-anchors and ice-poles, in order, if possible, to extricate themselves from the imminent danger with which they were nearly enveloped; but this they found impossible till the evening, when the ice beginning to open, they hoisted out their long-boats, and towed the ships round a prodigious large cape of ice, in doing which, both vessels, however, received some damage.

On the 9th of July they lost fight of each other, but joined company the next day, when the weather being intensely cold, it was agreed by the officers, that every man should be allowed daily two quarts of porter, and

a pint of brandy.

They now failed through vast mountains of floating ice, and were continually in imminent danger of being crushed to pieces. At the same time it was generally agreed among the officers, that no discovery could be made towards the north pole in that direction; they therefore changed their course, and, on the 11th of July, having worked themselves out of the moving mountains of ice, they began to coast a vast icy continent, if we may be allowed the expression. This prodigious mass of ice extended towards the north-east, to an immense distance; and they had a tolerable clear sea till, the 13th, when they came to anchor in Smearingburgh

Harbour in Greenland or Spitzbergen.

Spitzbergen lies in latitude 77 deg. 59 min. 11 fec. longitude 9 deg. 13 min. eaft. The coast appeared to be neither habitable or accessible. It is formed of high, barren, black rocks, without the least marks of vegetation; in many places bare and pointed, in other parts covered with fnow, appearing even above the clouds. The vallies between the high cliffs were filled with fnow or ice. " This profpect (fays Captain Phipps) would have fuggefted the idea of perpetual winter, had not the mildness of the weather, the smooth water, bright sun-shine and constant day-light, given a chearfulness and novelty to the whole of this striking and romantice scene." The current run across this coast half a knot an hour north. The height of one mountain feen here was found to be 1503 yards. The harbour of Smearingburgh has good anchorage in 13 fathoms. Close to this harbour is an Island called Amsterdam Island, where the Dutch used formerly to boil their whale oil; and the remains of some conveniency, erected by them for that purpose, are still visible. Once they attempted to make an establishment here, and left fome people to winter, who all perished. The Dutch ships still refort to this place for the latter feafon of the whale fishery. It lies in 79 deg. 44 min. north, and 9

deg. 50 min. 45 fec. eaft.

The most remarkable views which these dreary regions present are what are called icebergs. These are large bodies of ice, filling the vallies between the high mountains. Their face towards the sea is nearly perpendicular, and of a very lively light-green colour. One was about 300 feet high, with a cascade of water issuing out of it. The black mountains on each side, the white snow, and green-coloured ice, composed a very beautiful and romantic picture. Large pieces frequently broke off from the icebergs, and tell with great noise into the water. One piece was observed to have sloated out into the bay, and grounded in 24 fathom: it was 50 feet high above the surface of the water, and of the same beautiful colour as the iceberg from which

it had been separated.

The stone seen about Smearingburgh is chiefly a kind of marble, which dissolved easily in the marine acid. There were no appearances of minerals of any kind, or any signs of ancient or modern volcanos. No infects, or any species of reptiles, were seen, not even the common earth-worm. There were no springs or rivers, but great plenty of water was produced from the snow which melted from the mountains. Captain Phipps has

chiefly a kind marine acid. any kind, or No infects, even the comngs or rivers, from the fnow ain Phipps has been very accurate in his description of the few animals which these inhospitable regions cherish. Here is the fea-horse, or morse, (the Trichettus Rosmarus of Linnæus.) It is found every where about the coaft of Spitzbergen, as well as generally wherever there is ice, though at a diffance from the land. It is a gregorious animal, not inclined to attack, but dangerous if attacked, as the whole herd will join their forces to revenge any injury received by an individual. One of these animals being fired at and wounded by some people in a boat, dived immediately, and brought up with it a number of others, who made a joint attack upon the boat, and wreited an oar from one of the men, and had well nigh flaved or overfet her; but another boat coming up they difperfed.

GREENLAND.

The arctic fox (Canis Lagopus of Linnæus,) found on the main land of Spizbergen, and the illands adjacent, differs from our fox, not only in colour, but in having its ears much more rounded. It finells very little, and its flesh is good food. The polar bear (Urfus Maritimus of Linnaus) is found in great numbers on the main land of Spitzbergen, alfo on the islands and ice-fields adjacent. This animal is much larger than the black, bear. The feamen eat of their flesh, though very coarse. The rein-deer (Cervus Tarandus

of Linnæus) furnishes excellent venison.

The coast abounds with the whale, fip-fish, eiderduck, puffin, fulmar, northern diver, the fea-fnail, and coral-fish; as also the prawn, found in the stomach of a feal caught near the coast of Spitzbergen. There are three fingular species of crab, which have not been before described, two of them found in the stomach of a feal. A fmall worm, found adhering by its fnout to the infide of the intestines of an eider-duck. The sea May-fly, and fnail slime-fish, found in innumerable quantities about the Arctic Seas, peopling, as it were, this almost uninhabited ocean.

On the 27th of July they found themselves enveloped by immense shoals and mountains of ice; and on taking a view from the mait-head, they discovered a vast icy continent, and feven fmall iflands, being then in 80 deg. 47 min. north lat. and 21 deg. 10 min. east long. "Here (fays the journal) the whole prospect was more pleafing and picturefque than any they had yet beheld in this remote region. The very ice in which they were belet looked beautiful, and put forth a thousand glittering forms; and the tops of the mountains, which they could fee like sparkling gems at a vast distance, had the appearance of so many filver stars illuminating a new firmament. On the ice were many bears, some of which came so near the ships as to be shot dead with small arms. These bears are very good eating, and, where no better is to be got, the whalers account them as good as beef. They are many of them as large as the largest oxen, and weigh heavier. In many parts of their body they are mulket proof; and unless they are hit on the open cheft, or on the flank, a blow with a mufket ball will hardly make them turn their backs. Some of the bears killed in the encounters weighed from feven to eight hundred weight.'

In these seas they found the water less falt than they had ever before experienced fea-water to be; and when they melted the ice it produced excellent fresh water. They likewise filled their water-casks by this method. In places where frow lay thick upon the furface of the ice, they dug pits, which immediately

filled with clear, foft, fweet water.

On the 1st of August, the Commodore being desirous of surveying the westernmost of the islands before mentioned, ordered the ships to be made fast to the main body of ice with ice-anchors; a method frequently practifed by the Greenland fifthing-veffels. This being effected, a party fet forward upon the excursion, consisting of three principal officers and gentlemen, the pilots, and some prime failors felected from both ships. They continued their progress, femetimes rowing the boat, and sometimes drawing it over the ice, and at length, with fome difficulty, reached land, where they found a fine herd of deer, fo tame, that their approach did not in the least intimidate them: " A proof (fays the journalift) that animals are not naturally afraid of man, till, by the fate of their affociates, they are taught the danger of approaching them: a proof, too, that animals are not defitive of reflection; otherwise how should they conclude that what has befallen their fellow animals will certainly happen to them, if they run the like rifk?" They afcended the highest hill, but were disappointed in the prospect they expected by the haziness of the weather. On returning to the ships, they found, to their great surprize, that, by grappling to the ice, they were in the most imminent danger of lofing them both; for the loofe ice had closed so fast round them, that it was deemed impracticable to disengage them, and they had great reason to fear that both the ships would be crushed to pieces. prevent, if possible, so dreadful an accident, the Commodore prudently, ordered a great number of men to form a dock in the folid ice, fufficiently large to moor both thips; and by the performance of this arduous undertaking with amazing alacrity and expedition, both veffels and crews were almost miraculously preserved. No fooner were the thips thus fecured, than a general council was fummoned of all the officers, pilots, and mafters of both ships, to consult what steps were to be taken in this emergency; the refult of which was, that they must either winter upon the neighbouring islands, or drag their boats over the ice, and launch them in the open fea, which was now, by the continual accumulation of the ice, at a very confiderable diffance. A desperate attempt was first made to extricate the ships, by cutting open a channel to the fea towards the westward; but that was foon given up as a chimerical and impracticable attempt.

On the 3d of August it was unanimously determined to drag the long-boats belonging to both the ships over the ice, and then attempt to launch them into the open fea, when they hoped in them they might reach Spitzbergen before the whaling thips were all departed. While the boats were getting ready they killed feveral bears, who, being attracted by the fmell of the food dreffed on board the thips, came over the ice to visit them. They likewise killed a sea-horse, in the desperate engagement with which, the second lieutenant of the Carcafe was in imminent danger of losing his life. The following circumstance, which happened while the ships remained in the ice, is fingularly remarkable.

" Early in the morning of the 5th of August, the man at the mast-head of the Carcale gave notice, that three bears were making their way very fast over the ice, and that they were directing their course towards the ship. They had, without doubt, been invited by the scent of the blubber of the sea-horse killed a few days before, which the men had fet on fire, and which was burning on the ice at the time of their approach. They proved to be a she bear and her two cubs; but the cubs were nearly as large as the dam. They ran eagerly to the fire, and drew out from the flames part of the flesh of the sea-horse that remained unconsumed, and eat it voraciously. The crew from the ship, by way of diversion, threw great lumps of the flesh of the fea-horse, which they had still left, out upon the ice, which the old bear fetched away fingly, laid each lump before her cubs as the brought it, and, dividing it, gave each a share, reserving but a small portion to herself. As the was fetching away the last piece they had to beflow, they levelled their muskets at the cubs, and shot them both dead; and, in her retreat, they wounded the dam, but not mortally. It would have drawn tears of pity from any but unfeeling minds, to have marked the affectionate concern expressed by this poor beast in the dying moments of her expiring young. Though fhe was forely wounded, and could but just crawl to the place where they lay, the carried the lump of flesh the had fetched away as the had done the others before, tore it in pieces, and laid it down before them; and when the faw that they refused to eat, the laid her paws first

upon one, and then upon the other, and endeavoured to raife them up., All this while it was pitiful to hear her moan. When the found the could not ftir them the went off, and, when the had got at some distance, looked back and mouned; and that not availing her to entice them away, the returned, and fenelling round them, began to lick their wounds. She went off a fecond time, as before, and, having crawled a few paces, looked again behind her, and, for forne time, flood moaning; but still, her cubs not rising to follow her, fhe returned to them again, and, with figns of inexpreflible fondnefs, went round one, and round the other, pawing them, and moaning. Finding, at laft, that they were cold and lifeless, the raised her head towards the thip, and, like Caliban in the Tempest, growled a curfe upon the murderers; which they returned by a volley of mufket-balls, when she fell between her cubs, and died licking their wounds.

On the 7th of August, the boats being ready, and properly fitted with weather-cloths to keep off the cold, if they thould be fo fortunate as to launch them, every man was furnished with a bag, containing bread for 25 days, and what necessaries he chose to take; the other requifite provisions, liquors, utenfils, &c. being flowed in the boats. Having made these preparations, a detachment of 50 men, under their respective commanders, was ordered from each thip, to begin the arduous and difficult undertaking of dragging the boats thus laden over the ice. The Commodore took upon himself the direction of these two parties, and left Capt. Lutwidge to take care of the ships, with the remaining

part of their crews.

Previous to their fetting out, a ffrict order had been given, that no man whatever should encumber himself with more cloaths than what he wore upon his back; which prohibition occasioned the following whimsical circumstances: The officers, in order to provide themfelves with habits fuitable to the extremity of cold which they might probably experience, had thrown off their own cloaths, and put on warm flannel garments. The men observing this, and thinking it a great pity that fuch good laced cloaths should be lost, rejected their own, and put on the cloaths of the officers, that they might at leaft be fine in the midft of their difficulties. Hence the two bands, when properly harneffed to draw the boats, made a most motly and whimsical appearance. Nor were they in the leaft afflicted: they had the fhip's music to play before them. Not a gloomy countenance was to be feen; but, inftead of appearing terrified at the dangers that furrounded them, they, to a man, were as jovial and merry as if they had been in perfect fafety, and drinking with each other in Old England.

After exerting the greatest industry, and labouring with aftonishing affiduity, they had proceeded but one mile at the expiration of fix hours, which was the time the Commodore had ordered the dinner for himfelf and the officers to be brought after them. The head cook having dreffed it, fet out with his mates to bring the different dishes, under covers, towards the boats; but having unluckily fwallowed too much brandy, in order to fortily themselves against the cold, (which they magined would affail them with double rigour after just coming from the fire fide,) they could not conveniently fleer strait, but were fometimes very near boarding each other. Having proceeded about half way, they came to a chaim, or parting of the ice, which they were obliged to leap. The mates vaulted over pretty well, and balanced themselves tolerably, confidering their drunken condition; but, after making the best effort he was able, down came the head cook; when dish, cover, meat, and the Commodore's fervice of plate, fell through the aperture into the fea, and disappeared in a twinkling. This accident, in some measure soberized the poor cook, who, after scratching his head, very fignificantly faid, " Rat it, now I am quite puzzled to know whether I had best jump into the fea after the plate, or go and let the Commodore

know what a confounded accident I have met with. After mature deliberation upon this weighty matter, it was at length agreed, that the Cook fhould throw himself upon the Commodore's mercy, and trust to his good-nature. " For (observed one of the mates) his honour is a kind-hearted gemman, and will never take away a man's life for a flip upon the ice: befides, it was a great jump for a fat man; and Commodore would rather lose all the plate in the great cabin than lofe cook?" This curious mode of reasoning, in some measure, comforted the cook. He did not, however, choose to go to the Commodore, till he had dispatched the mates Aft to carry the remainder of the provisions, and to inform that gentleman of the difafter which had befallen him.' When the Commodore had heard the tale, he asked were the cook was? " He's blubbering and crying behind, an please your honour," says one of them. When the cook came up, "Cook, (said the Commodore,) bring me your dinner. I will dine to-day with my comrades." "My dinner! (faid the Cook:) A pound of the flesh next my heart, if your honour likes it." This reply, uttered with the voice of sincerity, pleased the Commodore more than the most fumptuous entertainment would have done.

Soon after dinner word was brought that the whole mass of ice had changed its situation, and was parting, and that the ships were affoat. The men were instantly ordered to the ships to assist in working them. This oy was, however, short-lived; for the ice re-assumed its former fituation; and, what was worfe, the ships, from having been fet a-float, were in more danger of being crushed to pieces than before. The crews of both thips now thought their condition more desperate than ever. None could go back to the boats, as it was necessary that all hands should be employed in defending the fhips from immediate destruction with their But when all were exhaufted with fatigue, ice-poles. and very little hope feemed to remain, Providence, on a fudden relieved them. A brifk wind fprung up, and the ice fuddenly feparated and broke afunder, with a notife which exceeded the loudest clap of thunder. Some fragments formed themselves, almost instanta-neously, into huge mountains; and others coalesced into plains; while various channels opened between the difuniting parts of the late tremendous barrier of congealed waters. Every countenance cleared up, all hearts revived, and the fails were spread with alacrity. A party was dispatched to regain the boats, which the men effected with great difficulty. " And now (fays the author of the journal) they had time to admire the ice which had parted from the main body, as it no longer obstructed their course. The various shapes in which the broken fragments appeared, were, indeed, very curious and amufing. One remarkable piece de-feribed a magnificent arch, fo large and completely formed, that a floop of confiderable burthen might have failed through it without lowering her maft. Another represented a church, with windows, pillars, and domes; and a third a table, with iceicles hanging round it like the fringes of a damask table-cloth. A fertile imagination might here find entertainment enough; for; has already been observed, the similitude of what art or

nature has ever yet produced, might here be fancied." Both thips now determined to fteer immediately for England, and nothing worth recording happened till the 11th of September, when the ships parted in a strong gale of wind, and did not come into company again till the 26th of the same month, when they met off Harwich, and four days after came to an anchor at

Deptford.

The following are fome of the most curious observa-

tions made on the voyage.

n observation at 37 min. 30 fec. . 39 fec. north, n lat 67 deg. 35 very heavy lead ng ground; and by a thermometer invented by lord Charles Cavendish for the purpose, found the temperature of the water at that depth to be 26 deg. of Fahrenheit's thermometer, the temperature of the air being 48 deg. and a half. June 24, in lat. 73 deg. 40 min. a fire was made in the cabin for the first time. On the first of July it was found fo warm, that they fat without a fire in lat. 78 deg. 13 min. 36 fec. In 78 deg. 0 min. 50 fec. at four in the morning, lord Charles Cavendish's thermometer was 31, that of the air 40 and a half. At two in the afternoon at 115 fathoms the water was 33 deg. and three quarters. July 16th the greatest height of the thermometer was 58 deg. and a half at eleven in the forenoon, and at midnight 57 deg. in lat. 79 deg. 50 min. long. 10 deg. 2 min. 30 fec. eaft. On the 19th of August, at eleven at night, an appearance of dusk was observed at Smeerenberg. On the 24th of Sep-tember stars became visible. The fight of a star (says tember flars became visible. The fight of a flar (fays captain Phipps) was now become almost as great a phenomenon as the fun at midnight had been two months before, when we first got within the Arctic circle. The fky was in general loaded with hard white clouds, infomuch that the fun and horizon were never entirely clear of them, even in the clearest weather. The first Venetians who explored the northern extremity of the European continent were struck with the greatest astonishment at the continual appearance of the fun above the horizon, and relate that they could only diffinguish day from night by the instinct of the fea-fowl, which went to rooft on thore for the space of four hours. Pietro Quirino failed in April 1431, and in January 1432 he was shipwrecked under the polar circle. A bright appearance near the horizon was always the herald to fignify the approach of ice; and this the pilots called the blink of the ice. And the fame appearance was feen on Captain Cook's voyage towards the fouth pole in 1773 and 1774. Dr. Irving tried the specific gravity of ice on board the Racehorse. A piece of the most dense cold ice he could find being immerfed in fnow water, thermometer 34 deg. 14 fifteenth parts funk under the furface of the water. In brandy, just proof, it barely floated: in rectified spirits of wine it sell to the bottom at once, and dissolved immediately.

Particulars relative to East to Greenland, or Spitzbergen, and the Country adjacent. Climate, Vegetable, Aninal and Mineral Productions.

HIS country was called Greenland by Sir Hugh Willoughby, who discovered it in 1553. It af-terwards derived from the Dutch the appellation of Spitzbergen, which fignifies fharp mountains. The whole of its boundaries are not known. However, on the west it has the northern ocean; on the fouth the fame ocean between this and the Ruffian Lapland, and the northernmost part of Norway, over-against which it lies; on the east it has an undiscovered country, to which it is joined by an ifthmus. On the weft fide of Spitzbergen lies Charles ifland, which is divided from the main land by a narrow strait called Foreland-Ford; between which, and Muscle-Haven, are the highest mountains, most of which are of a red colour, and reflect the fun's beams fo as to feem all on fire: but feven of the mountains, all of remarkable sharpness, are of a fine sky-blue. South-Haven is the most commodious place on the island, affording all the conveniencies necessary for repairing leaky or damaged ships; and is fo large that 30 or 40 fail may ride at anchor there very conveniently: here also may be had fresh water, from the melting of the fnow; for as to the rivers they are brackish, as far as hitherto they have been discovered; and no springs or wells have yet been found. The mountains about South-Haven are very high, especially on the left; and in the midst of the harbour is an island cailed Dead-man's Island, because fuch as die in the voyage are usually buried there.

The next capacious haven is that called by the Dutch Maurice Bay, where fome of them have wintered: near this place are a few cottages, built by the Dutch for the convenience of making their oil; and this place they call Smearburg, or Smearingburg, or the Haerlem Cookery. In the north bay there is an island called Vogel-Sang by the Dutch, (i. e. Bird-Song), from the great noise which the fowls make when they take their flight. Deer Sound is fo called from the abundance of Deer which feed about it, though the foil feems to be all flates fet edge-ways. Muscle-Haven lies at the mouth of the Waygate, to the north of which, Martens fays, he failed to 81 degrees, and faw feven islands, but could not approach them because of the ice; the lowest part of that country lies about this harbour. The Waygate mentioned here must not be mistaken for the famous strait of that name, which lies between Nova Zembla and the main land of Samoieda. Waygate here meant is a harbour, of which the Dutch voyagers fay they do not know whether it goes through the country. They call it by this name be-cause of the winds which frequently blow there; and about this place, they fay, the country is low, and adorned with fmall hills. Roefield harbour is fo called because it abounds with deer. Alderman Freeman's Inlet (called by the Dutch Walter Thymen's Fort) is the large mouth of a river, which is not yet discovered. The voyagers mention also the English, Danish, Hamburg, and Magdalen Havens; with one called the Bay of Love, but not fo diffinctly as to enable us to judge whether they are different from those already mentioned, with Dutch or English names. Bell-Harbour, on the western coast of this country, is the place where, in the year 1630, eight English failors win-tered, and suffered very great hardships during nine months and twelve days, the fingular circumstances of which will be hereafter related.

These particulars are confirmed by the concurrent testimonies of most voyagers, previous to the expedi-tion under commodore Phipps. The account given by the writer of that voyage corroborates what they have faid, and adds fome new particulars which we shall transcribe. "This country (fays the journalist) is stony, and, as far as can be seen, full of mountains, precipices and rocks. Between these are hills of ice, generated, as it appears, by torrents that flow from the melting of the fnow on the fides of those towering elevations, which being once congealed are continually encreased by the snow in winter, and the rain in summer, which often freezes as foon as it falls. By looking on these hills a stranger may fancy a thousand different shapes of trees, castles, churches, ruins, ships, whales, monsters, and all the various forms that fill the universe. Of the ice hills there are seven that more particularly attract the notice of strangers. These are known by the name of the Seven Icebergs, and are thought to be the highest of the kind in that country. When the air is clear, and the fun shines full upon these mountains, the prospect is inconceivably brilliant. They fometimes put on the bright glow of the evening rays of the fetting fun when reflected upon glass at its going down: fometimes they appear of a bright blue like fapphire, and fometimes like the variable colours of a prim, exceeding in luftre the richeft gems in the world, difposed in shapes wonderful to behold, all glittering with luftre that dazzles the eye, and fills the air with aftonishing brightness."

When every object is new, it is not easy for a stranger to fix on which first to admire. The rocks are striking objects: before a ftorm they exhibit a fiery appearance, and the fun looks pale upon them, the fnow giving the air a bright reflection. Their fummits are almost always involved in clouds, so that it is but just
possible to see the tops of them. Some of these rocks
are but one stone from top to bottom, appearing like
an old decayed ruin. Others consist of huge masses, veined differently like marble, with red, white and yellow, and, probably, were they to be fawed and polish-

7 L

ed, would equal, if not excel, the finest Egyptian marble we now fo much admire. Perhaps the diffance and danger of carrying large blocks of stone may be the reason that no trials have been made to manufacture them. On the foutherly and westerly sides of those rocks grow all the plants, herbs and mosses peculiar to this country. On the northerly and eafterly fides the wind strikes so cold when it blows from these quarters that it perishes every kind of vegetable. These plants grow to persection in a very short time. Till the middle of May the whole country is locked up in ice; in the beginning of July the plants are in flower, and about the latter end of the same month, or the beginning of August, they have perfected their feed. earth owes its fertility, in a great measure, to the dung of birds, who build and breed their young here in the fummer, and in the winter retire to more favourable climates.

The rocks and precipices are full of fiffures and clefts, which afford convenient harbour for birds to lay their eggs, and breed their young in fafety. Most of these birds are water-fowls, and feek their food in the fea: fome, indeed, are birds of prey, and purfue and kill others for their own affiftance, but thefe are rare; the water-fowl eat strong and fishy, and their fat is not to be endured. They are so numerous about the rocks as fometimes to darken the air when they rife in flocks; and they shriek so horridly that the rocks eccho with

their noile.

The air about Spitzbergen is at no time free free from icicles: if you look through the fun-beams transversely as you fit in the shade, or where you see the rays confined in a body, instead of dark motes as are feen here, you behold myriads of shining particles that spangle like diamonds; and when the fun shines hot, as it fometimes does fo as to melt the tar in the feams of ships, when they lie sheltering from the wind, these fhining atoms appear to melt away, and descend like

It is feldom that the air continues clear for many days together in this climate, but when that happens the whalers are generally successful. There is no difference between night and day in the appearance of the atmosphere about Spitzbergen, one being as light as the other; only when the fun is to the northward you may look at him with the naked eye, as at the moon, without dazzling. The fogs here come on fo fuddenly that from bright fun-shine you are presently enveloped in fuch obscurity, that you can hardly see from one end of

the ship to the other.

The cold here is generally very intense, but in the extremity of winter it is intolerable, particularly when the wind blows from the north or the eaft. The air tolerably calm during the month of June, July, and August , not but the winds fometimes blow incredibly cold even at this feafon, and the frost continues without intermission. The sea-water here is less salt than in foutherly climates, and changes its colour with the fky, that is, in a clear air it appears blue, when the atmofphere is overcast with clouds it seems green, during fog it is yellow, and quite black in ftormy weather.

The fun usually appears in this country about the beginning of February, and disappears about the first of October. From May to August he continues above the horizon without fetting, and then the night and day are diffinguishable only by his appearing either in the eastern or western parts of the heavens. The face of this country exhibits scarce any thing but rugged rocks and barren mountains that rife into the clouds, or vallies choaked up with stones and ice that fall from those mountains. About Deer Sained and Muscle Haven are fome detached pieces of low lands, which are ufually covered with fnow; but in a fine fummer, when that diffolves, a coat of heath or moss is seen interspersed with a few plants. No fprings have been found here, and the rivers are all brackish; but these inconveniencies are recompenced by the great plenty of fnowwater, which is at once healthful and pleafant.

The vegetables of Spitzbergen are, excellent fcurvygrafs, forrel, wild lettuce, finake-root, ground-ivy, hearts-eafe, limeworth, fea-buglofs, wild ftrawberries, wall-pepper, and houseleek. "These (fays a learned author) are confidered as effectual remedies supplied by the hand of Providence for the cure of the fcurvy, and other difeases incident to those who yearly visit this inhospitable country. The feurvy-grafs here, as in many other northern climates, has no pungency to the tafte, but is mild, grateful to the palate, and such an excellent anti-scorbutic, that the seamen term it the " Gift of God." Although the ships employed in the whale-fifhery are, of all others, the best supplied with good provisions, and plenty of fresh water, yet the mariners are in these northern latitudes much more fubject to the fea-scurvy than in any southern voyage. The attack of the malady is here more fudden, and the progress of it more rapid. The patient feels its symptoms increase as he advances near the pole; nor does he enjoy the leaft alleviation until the weather foftens in the month of July, which is very moderate, and, indeed, the only interruption of winter. Then the fcurvy-grafs appears in plenty as an infallible cure, and performs wonders, reftoring, in a few days, to health and vigour, those who were seemingly in the last stage of the diftemper.

The other vegetable productions of this country are, poppies, helebore, dandelion, mountain-heath, faxi-frage, dwarf-willow, &c. but all are finall and flunted in their growth, the natural consequence of a scanty

foil and inclement fky.

There is an aquatic vegetable peculiar to this country called the rock plant; the leaves are shaped like a man's tongue, about fix feet long, of a dull yellow colour, the stalk is round and smooth, and of the same colour with the leaf, it rifes tapering, and finells like muscles. It grows in the water, and rifes in height in proportion to the depth of water in which it is found.

In the year 1757 a Groenland captain brought to England feveral pieces of gold, which he found accidentally in a hunting excursion among the rocks of Spitzbergen. This discovery, however, was not profecuted. Alabafter, Selenites, and Lapis Spicularis are found here; and naturalists conjecture that the

country abounds in iron ore.

Few land-birds are feen this country, except par-tridges, a few birds of the fnipe kind, fome fmall birds that, even in this dreary climate, fometimes warble fweetly, the snow-bird and the ice-bird; the latter is a finall but very beautiful bird; in fize and shape it refembles the turtle-dove, but the plumage when the fun fhines upon it, is of a bright yellow, like the golden ring in the peacock's tail, and almost dazzles the eye to look upon it.

The Greenland fox differs but little in shape from those we are acquainted with; but in colour there is no fimilitude, for the body is white and the head is black. Foxes are feen here in great plenty; they are exceeding fwift, and very fubrile; fo that it is a difficult matter to catch them. The author of commodore Phipps's voyage fays, " The Dutch feamen report, that when they (the foxes) are hungry, they will feign themfelves dead, and when the ravenous birds come to feed on them, they

rife and make them their prey."

The deer of this country are large, grey and shaggy, with branching horns, thort tails and long ears. Their flesh of an admirable flavour; and, in the fummer feafon, they are exceeding fat, which is owing to their feeding on the yellow mois: this natural ftore of fat en-ables them to subsift during the winter; many of them are, however, flarved to death; and all in general appear very thin and meagre in the foring. On this occasion a learned gentleman says, "In all probability these animals sleep in caverns during winter like the bears in Norway. Perhaps the abundance of poppies in this country may dispose them to a lethargy, which seems necessary for their preservation, as little or no nourishment is required for animals that have no exercise, and a languid PHY.

languid circulation." These deer sty at the fight of a human creature, but immediately stop when their pursuers stop, and thus are shot wirh falicity.

The bears here have long fnouts, and bark in a hufky manner, like dogs that are hoarfe. large, white, lean, fwift, and fierce. Some have been found that were fix feet high, and four long, which yielded an hundred weight of fat. The largest kind are termed water bears, because they are fond of subfifting chiefly on the productions of the fea, and have been feen near twenty miles from the shore. When a bear is attacked he makes a dreadful roaring, and his companions, who are within hearing, immediately run to his affiftance. A she bear will suffer herself to be killed rather than abandon her cubs; notwithstanding which attachment, when a bear is found dead, his fellows will eat him without the least scruple. These creatures are fo flipulated with hunger, that they will frequently venture to attack whole armed crews; and have been known to take the water, and attempt to board large veffels. They are fo tenacious of life that they fometimes escape with many shots in their bodies. They are attacked with mufkets and lances; and, when at bay, rife on their hind legs, and frequently break the lances of the affailants; fo that they are not affaulted without imminent danger. They take to the water naturally, and fometimes, when attacked in that element, dive like an otter.

Here are innumerable swarms of water-fowl, such as are common to all the northern countries of Europe; and seals, sea-horses, whales, &c.

Description of the different species of those enormous Marine Monsters called Whales, with the mode of the Whale Fishery.

THE true large Greenland, or whalebone whale, having no teeth; instead of which, on each fide of the upper jaw grows the whalebone, in four or five hundred different blades, at equal distances, some exceeding twelve feet in length, and a foot broad at bottom, growing narrow upwards, like the flicks of a fan inverted, the largeft of them weighing about twenty pounds. He contracts and dilates the diffances of those blades at the shutting and opening his mouth, making them serve as strainers, to separate the water from the thrimps, prawns, and fuch small fish as his food confists of; and, for the same purpose, on the inside of the bone, next to the tongue, grows a quantity of hair, to make a still finer percolation, or straining; which is the more necessary, because, notwithstanding the bulk of a whale's body, the throat in general is not much above a foot wide. The head makes near a third part of the whole body, with very small eyes in the midst of it, confidering the fize of the creature; and the eye-lids are fringed with hair, like those of a man. Instead of the ears, appear, on the outlide, only two holes, fo fmall, that they can hardly be found out, and will scarce admit of a fingle straw; but within the head they have large orifices, which are formed like ears, and afford them a sharp hearing. On the top of the head he has two pipes, for the drawing in and out of the air; and discharging the water which he swallows in his mouth, and which is forced out through these holes in a valt quantity, and to a great height. The tongue is very large; in some whales of the fize of an ordinary wool-pack, and will yield attonishing quantities of oil. His bones are hard, like those of sour sooted beasts; but, inflead of having one large cavity in the middle, are porous, and full of marrow. His belly and back are quite red. His flesh is coarse and hard, like that of a bull, mixed with many finews, and is very dry and lean, because the fat lies between the flesh and the skin. The fat is mixed with finews, which holds the oil as a fpunge does water. The other strong sinews are about the tail, with which he turns and winds himself as a ship is guided by a rudder. He swims with great celerity,

and makes a track in the fea like a large ship under sail. Besides the uppermost thin skin, there is another almost an inch thick, but neither of them are very strong, which is believed to be the reason why the whale does not exert that great force that might be expected from a sish of its size. They are mightily tormented with lice, which makes them sometimes spring out of the sea in an agony. It is also believed that they feel great pains in their bodies before a storm, which makes them twist and tumble violently, while the wind blows from the east. They are, however, harmless, unless provoked, and rather of a very timorous nature; tho some of them will now and then approach very close to a ship. The middling sized ones are from sity to sixty seet long, and yield from seven to an hundred barrels of blubber; though sometimes they are much larger. A voyager mentions one that yielded an hundred and thirty hogsheads. This blubber lies immediately under the skin, and is very valuable.

the skin, and is very valuable.

One of the authors of this work, to afford scope for a more minute description of this wonderful part of the creation, took an opportunity of surveying the skeleton of a Sperma-Ceti whale, in the repository of an eminent virtuoso in London. This aftonishing production of nature measures seventy-two seet in length, and between seven and eight seet in breadth, The skull alone measures sifteen seet in length, and is supposed to weigh three tons. This great weight of bone is probably buoyed up in the sea by a vast quantity of fat or oil, contained in the cellular membrane, between the skin of the head and the upper surface of the skull. From this oil, and also from that which surrounds the body, the substance called Sperma-Ceti is extracted. That species of whale called the Sperma-Ceti whale, differs from the whalebone whale, which, as before observed, has no teeth; whereas the former has one row of sharp-pointed teeth along each side of the lower jaw, but none in the upper. With these, it is probable he can devour sist of a blowing-hole, but more particularly set he can sais a also a blowing-hole, but more particularly set he can see the surround of the set he can sais a blowing-hole, but more particularly set he can see the surround of the set he can devour sist of a blowing-hole, but more particularly set he can set he can sais a also a blowing-hole, but more particularly set he can see the surround.

larly for the purpose of breathing.

The following is the mode of catching whales. As foon as a ship arrives at a large field of ice, as is termed, three or four boats are put out to watch for the whale's coming from beneath the ice, which is judged of by the noise they make in approaching and When the whale gains the furface of the water, the harpooneer feizes the opportunity to dart the harpoon either into his body, or near his fnout; for there is no striking into the bone of his head. When the whale is struck, the other boats, which are near at hand, approach to give affistance, and an oar is put up at the head of the harpooneer's boat who wounded the animal, and they cry out, fall! fall! upon which token other boats from the fhip join those already concerned, to render every needful help as exigencies may require. As soon as the whale is struck, they take care to give him rope enough, for otherwife, when he goes down, as he frequently does, he would inevitably fink the boat; and this rope he draws fo quick, that, if it were not well watered, it would fet the boat on fire. The line fastened to the harpoon is fix or seven fathoms long, and is called the forerunner. It is made of the finest and foftest hemp, that it may slip the easier. To this they join a heap of lines of ninety or an hundred fathoms each? and when there are not enough in one boat, they borrow from another. The man at the helm observes which way the rope goes, and steers the boat accordingly, that it may run exactly out before; for the whale runs away with the line as fast as the wind, and would overfet the boat if it were not kept ftrait; during which the other boats row before, and observe which way the line stands and sometimes pull it. If they feel it stiff, it is a sign the whale still pulls in strength; but if it hangs loose, and the boat lies equally high, before and behind, upon the water, they pull it in gently, but take care to lay it fo, that the whale may have it eafily again, if he recovers strength.

They are cautious, however, not to give him to much line, because he sometimes entangles it about a rock, and so gets loofe. When this happens, however, if he is afterwards taken by the crew of another ship, he is returned to those who first wounded him, as that is known by the harpoon, which is always diffinguished by a particular mark. They begin to stink as soon as they expire; and their flesh ferments, creating such a steam as inflames weak eyes. When they see him spout out blood, they know that he draws towards his end, and then prepare for cutting him up. In order to do this they hawl him close to the ship's side, and slice his fides with great knives, raifing the blubber by a hook and a pulley, which they lift up as they cut. work they must be extremely expeditious, otherwise the sharks, which abound here, will have a greater share of the slesh than the whalers themselves. Of the great flakes of flesh they used formerly to make their oil upon the spot, but at present the blubber is barrelled up, and brought to England, Holland, &c. to be boiled at leifure, the huts of Spitzbergen being rather neglected. Some ships even return from the whale fishery without feeing that country, proceeding no farther than a certain latitude, and there fishing without being molested by a lee shore, ice or currents. The ships that use this trade-usually carry from 30 to 50 men, fix or seven boats, and from 400 to 800 hogheads of blubber. Their arms confift of 60 lances, 6 fea-horfe lances, 40 harpoons, 10 long harpoons for striking whales under water, 6 fmall fea horse harpoons, and 30 lines, of nine or ten hundred fathoms each.

Seal-catching also makes a valuable branch of the fishing practifed in these seas. Three hundred seals yield near as much blubber as a middling fized whale. The feals are not harpooned, but are generally knocked on the head with clubs; and many bears are likewife shot, killed with lances, &c. upon the ice. The ships fet fail in February for the feal fishery, and in April for the whale fishery; government allowing a bounty to these ships of 40s. per ton, as far as 300 tons; so that a ship of such a burthen receives 600l. bounty money. If a ship is clear of the ice after the 1st of June, and goes back again, or if it is known the carries out with her less than fix months provisions, she forfeits her

bounty.

Within the body of the whale is feldom found any thing but ten or twelve handfuls of a kind of small black spiders, and some small quantities of green herbs, torn up from the bottom of the fea, which are supposed to be the food upon which the whales chiefly live. fea hereabouts is so covered with these insects, that it appears quite black; which is a fign, to those who go about catching the whales, that they are like to make a good booty. The whales generally de of the sea which produces these insects. The whales generally delight in that part

Of the whale kind there are also the dragon-fish, long, thin, grey, and glittering, with two fins on his back, and two holes, through which he fpouts the

The butshorf, or laced-head, is fixteen feet long, with a spout-hole in his neck, a brown back, and a white belly.

The white-fish is as long as the butshorf, but much fatter.

The fea-unicorn whale is from fixteen to twenty feet in length with a spout-hole in his neck, and projecting from his fnout, having a fine wreathed horn, for which he is principally valued. The throne of his Danish majesty is entirely composed of these horns, which were formerly deemed great specifics against poison.

The fin-fish whale is as long as the blubber, or whalebone whale, but not above one third part fo bulky. It is known by the fin on the back near the tail, and by the spouting up of the water more violently, and higher, than the other whale. The back is more strait than that of a whale, and the lips are of a brownish colour, appearing like a twifted rope. The whalebone hangs from the upper lip, as it does in the whale, but not out of the mouth at the fides, as in that animal. The infide of the mouth, between the whalebones, is all over hairy, and is of a blue colour, that is, when the bone begins to grow; for the other is brown, with yellow ftreaks, which are thought to be the oldest. The colour of this fish is like that of a tench, and the shape of the body is long and slender. The tail is flat, like that of the whale; and he feldom appears till the whales are gone. All these creatures swim before the wind, and are observed to tumble immediately before ftorms; a circumstance from which some naturalists have concluded, that, from the change in the atmosphere, they are violently seized with the cramp in their bellies.

The whale is harraffed by a variety of enemies, befides the vermin which adheres to his body like lice. He is purfued by the faw-fish, or sword-fish, some of which are twenty feet long. This fish is shaped like a man's arm, and his eyes are remarkably prominent. His fword projects from his fnout, is of different lengths, according to the different fizes of the fish, fometimes fmooth and fharp, like a real fword, and fometimes indented like a faw; hence the creature is called either fword-fish, or saw-fish. A very few of these animals will attack and master a great whale; yet, when they have flain him, they eat no part of him but the tongue. In calm weather the fishermen lie upon their oars, as spectators of this combat, until they perceive the whale at the last gasp, when they row towards him, and his enemies retiring at their approach, the fishermen enjoy the fruits of the victory.

There is another more desperate enemy of the whale, known by the name of the hay, which is of the shark kind: they are of different fizes, being from one to three fathoms long. The hay is fo voracious that it tears large pieces of flesh from the whale, as if they had been dug-with shovels. The liver of this fish abounds with oil, and is exceffively large. The flesh on their backs; when dried some days in the air, is accounted tolerable provision, either boiled or roasted; and the smaller the fish the better. They are caught by a large hook, baited with flesh, and fastened to a long iron chain: and if men fall overboard by accident, the

hays, in their turn devour them.

The whale, in scripture is called leviathan. In the book of Job it is particularly mentioned; fome part of the paraphrase on which, by Dr. Young, we shall here preserve.

His bulk is charg'd with fuch a furious foul, That clouds of smoak from his spread nostrils roll, As from a furnace; and, when round his ire, Fate iffues from his jaws in streams of fire. The rage of tempests, and the roar of seas, Thy terror, this thy great superior please. Strength on his ample shoulders fits in state: His well join'd limbs are dreadfully complete. His flakes of folid flesh are flow to part: As steel his nerves, as adamant his heart. Large is his front, and when his burnished eyes Life up their lids the morning feems to rife. His pastimes like a cauldron, boil the flood, And blacken ocean with the rifing mud. The billows feel him as he works his way; His hoary footsteps shine along the sea. The foam, high wrought with white, divides the green,

Narrative

Narrative of the extraordinary Adventures of Eight British Mariners, who passed a whole Winter in the rigorous Climate of Greenland, with the Expedients they used to procure a Subspience, the extreme Hardships they sustained, and the Means of their Deliverance and Return to their Native Land.

FROM the extreme rigour of the climate of this out the year, till the fate of some British mariners, who failed thither in the year 1630, proved the contrary.

The Salutation, a Greenland ship, which failed from the Thames on the 1st of May, and arrived here the 11th of the next month, being in want of provision the latter end of the year, fent eight men on shore in a boat, to a place frequented by rein-deer, to kill venifon, leaving them there, with orders to follow the ship to Green Harbour, which lies to the fouthward of the place where they went ashore. These men, having killed 14 or 15 deer, lay that night ashore, and proposed next day to have gone on board, but a great quantity of ice driving towards the shore, obliged the ship to stand out so far to sea, that when they came to Green Harbour she was out of fight. The ships being to rendezvous in Belfound, further to the fouthward, and being to leave the country within three days, our huntfmen began to be very auxious, lest the shipping should. be gone from thence too before they arrived. They thought it proper, therefore, to throw their venison into the sea, in order to lighten the boat, and made the best of their way to Belfound, distant from thence about fixteen leagues: but none of them knowing the coast, they overshot their port about ten leagues, when, sensible of their error, they returned to the northward. One of their company, however, being positive that Bel-found lay farther to the south, they were induced to sail to the fouthward again till they were a fecond time convinced of their miftake, and turned their boat to the north again, and at length arrived at Belfound; but had fpent fo much time in rowing backwards and forwards, that the fhips had actually left the coaft, and were gone to England, to their great aftonishment, being provided neither with cloaths, food, firing, or house to shelter themselves from the piercing cold they were to expect in so rigorous a climate. They stood were to expect in fo rigorous a climate. fome time looking on one another, amazed at the diftrefs to which they were fo fuddenly reduced; but their confternation being a little abated, they began to think of the most proper means to subsist themselves during the approaching winter. The weather being favourable, they agreed, in the first place, to go to Green Harbour, and hunt for venison, having two dogs with them very fit for their purpose.

On the 25th of August they went in their boat to Green Harbour, where they arrived in twelve hours, being 16 leagues to the northward of Belfound. Here they fet up a tent made with the boat's fail, the oars ferving for poles; and, having flept a few hours, went early next morning to their fport, killing feven or eight The day following they killed deer, and four bears. twelve deer more, with which they loaded their boat; and finding another boat, which had been left there by the company, they loaded that with the greaves of whales, (being the pieces which remain in the coppers after the oil is drawn from them,) and returned with their booty to Belfound. Here happened to be fet up a large fubftantial booth, which the coopers worked in at the fishing season: it was 80 feet long, and 50 broad, covered with Dutch tiles, and the fides were well boarded. Within this booth these failors deter-mined to build another of less dimensions, being furnished with boards and timber, by pulling down a booth which stood near the former; and from the chimnies of three furnaces, used for the boiling of oil, they got 1000 bricks. They found also four hogsheads of very fine lime, which, mingled with the fand on the fea shore, made excellent mortar. But the weather was

now grown to cold, that they were obliged to have two fires to keep their mortar from freezing. They per-fifted, however, in their work, and raifed a wall, of a brick thickness, against one of the sides of their innermost booth; but wanting bricks to finish the rest in like manner, they nailed thick boards on each side the timbers, and filled up the space between with fand; by which means it became so tight and close, that the least breath of air could not enter it; and their chimney's vent was in the greater booth. The length of the leffer booth, or rather house, was 20 feet, the breadth 16, and the height 10; their ceiling being made of deal boards five or fix times double, and so overlaid, that no air could possibly come in from thence. Their door they not only made as ftrong and close as possible, but lined it with a bed which they found there. They made no windows, except a little hole in the tiles of the greater booth, by which they received some little light down the chimney of the leffer. The next work was to make them four cabins, chusing to lie two in each cabin. Their bedding was the skins of the reindeer, the fame that the Laplanders use; and they found them exceeding warm. For firing they took to pieces fome casks, and seven or eight of the boats which were left behind; for it feems they used a great many boats in whale-fishing, which they left in the country every winter, rather than be at the trouble of carrying them backwards and forwards. Our failors flowed their firing between the beams and the roof of the greater booth, in order to make it the warmer, and keep out the fnow, which would have covered every thing in the greater booth, if it had not been for this contrivance.

On the 12th of September, observing a piece of ice come driving towards the shore, with two morfes (or fea-horses) asleep upon it, they went out in their boat with a harping-iron, and killed them both. On the 19th they killed another, which was some addition to their But taking a furvey of all their provisions, they found that there was not half enough to ferve them the whole winter, and therefore flinted themselves to one meal a day, and agreed to keep Wednesdays and Fri-days as fasting days, allowing themselves then only the fritters or greaves of the whales, which, as observed already, are only the scraps of the fat of the whale, which are thrown away after the oil is got out of them, and is very loathfome food.

By the 10th of October the nights were grown long, and the weather become so cold that the sea over; and having no business now to divert their thoughts, as hitherto, they began to reflect on their miserable circumstances; sometimes complaining of the cruelty of the mafter of the ship for leaving them behind; at other times excusing him and bewailing his misfortunes, as believing him to have perished in the ice. At length, putting their confidence in the Almighty, who alone could relieve them in their great diftress, they offered up their prayers for strength and patience to go through the diffnal trial.

Having furveyed their provisions again, they found

that the fritters of the whale were almost all mouldy, having taken some wet; and that, of their bear and venison, there was scarce enough left to afford them five meals a week; whereupon it was agreed to live four days in the week upon the mouldy fritters, and the other three to feast upon bear and venison. Lest they should want firing hereafter to dress their meat, they thought proper to roaft half a deer every day, and flow it up in hogsheads. With this kind of food they filled three hogsheads and a half, leaving as much raw as would ferve to roast a quarter every Sunday, and a quarter for Christmas-day.

It being now the 14th of October the fun left them, and they faw it no more till the 3d of February; but they had the moon all the time, both day and night, though very much obscured by the clouds and foul wea-There was also a glimmering kind of a day-light for eight hours, the latter end of October, which shortened every day till the 1st of December; from which time to the 20th of the same month, they could perceive no day-light at all. It was now one continued night, there appearing only, in clear weather, a little whiteness, like the dawn of day, towards the fouth.

On the rit of January they found the day to increase a little. They counted their days, it seems, in the dark feafon, by the moon, and were so exact, that, at the return of the shipping, they were able to tell the very day of the month on which the sleet arrived. For light within doors they made three lamps of some sheet lead they had found upon one of the coolers; and there happened to be oil enough to supply them left in the cooper's tent. For wicks they made use of rope-yarn. These lamps were one of the greatest comforts to them in that long continued night. Their hardships, however, were fo great, that fometimes they were driven to defpair. At other times they hoped they were referved as a wonderful instance of God's mercy in their deliverance, and continued to fall down on their knees, and implore divine protection.

With the new year the cold increased to that degree, that it fometimes raised blifters in their flesh, as if they had been burnt; and the iron they touched fluck to their fingers. When they went abroad for water, the cold often feized them in fuch a manner that it made them fore, as if they had been beaten. Their water, the first part of the winter, issued from a bay of ice, and ran down into a kind of bason, or receptacle, by the fea fide, where it remained with a thick ice over it, which they dug open at one certain place with pick-axes every day. This continued to the 10th of January, when they drank fnow water, melted with a hot iron,

until the 20th of May following.

On taking another review of their provisions, they found that they would not last them above fix weeks To alleviate their mifery, however, on the 3d of February they were cheared again with the bright rays of the fun, which shone upon the tops of the snowy mountains with inconceivable lustre. To them, at least, this afforded the most delightful scene that ever was beheld; for, after a night of many weeks and months, what could be imagined more glorious or pleafing to a mortal eye? As an addition to their joy, the bears began to appear again, on the flesh of which animal they made many hearty meals. But the bears were as ready to devour our countrymen as they were the bears; and being pinched with hunger in this barren country, came up to their very door. One of these creatures, with her cub, they met at the entrance of their apartment, and gave her fuch a reception with their pikes and lances, that they laid her dead upon the foot, and the young one was glad to make its efcape. The weather was to very cold that they could not stay to flay her, but dragged the beast into their house. There they cut her into pieces of a stone weight, one of which ferved them for a dinner. Upon this they fed twenty days, effecting her flesh beyond venifon. Her liver only did not agree with them; for, upon eating it, their fkins peeled off; though one of the company, who was fick, attributed his cure, in part, to the eating it. If it be demanded how they kept their venifon and bear's flesh without falt, it is to be observed, the cold is so intense that no carcase ever putrefies. Flesh needs no salt to keep it here: that was their happiness. Had they been stocked with salt pro-visions, they had infallibly died of the scurvy, as others did who were left on the shore, much better provided with liquors, and other necessaries, than these poor men were. By the time they had eaten up this bear, others came about their booth frequently, to the num-ber of 40 or more, of which they killed leven, (one of them fix feet high at least,) roasting their flesh upon wooden fpits, having no other kitchen furniture, except a frying-pan they found in one of the booths. Having now plenty of provisions, they eat very hearti-ly, and found their strength increase apace.

Being now the 16th of March, and the days of a reasonable length, sowls, which, in the winter time,

were fled to the fouthward, began to refort to Greenland again in great abundance, where they live and breed in the fummer, feeding upon small sith. The foxes, also, which had kept close in their holes under the rocks all the winter, now came abroad, and preyed upon the fowls; of which our countrymen having taken some, baited traps with their skins, and caught five foxes in them, which they roafted, and found them to be very good meat, at least in the opinion of men who had hitherto fed much on bear's flesh. Thus they continued taking fow's and foxes till the 1st of May, meeting with no further misfortunes, except the loss of one of their mastiff dogs, which went from their house one morning in the middle of March, and was never feen afterwards, being probably overpowered and eaten by

The weather beginning to grow warm in May, they rambled about in fearch of willocks eggs, a fowl about the fize of a duck, of which they found fome, being a change of diet they were very much pleafed with.

The feafon now coming on for the arrival of the shipping, some of them went every day almost to the top of a mountain, to fee if they could difcern the water in the fea, which they had no fight of till the 24th, when, it blowing a ftorm, and the wind fitting from the main ocean, broke the ice in the bay, and foon after turning about eafterly, carried great part of the ice out to fea; but still the water did not come within three miles of

their dwelling.

The next morning, the 25th of May, none of their men happened to go abroad; but one of them being in the outer booth, heard fomebody hale the house in the fame manner as failors do a ship, to which the men in the inner booth answered, in feamen's terms, that they were just then going to prayers, and stayed but for the man in the outer booth to join with them. The man who hailed them was one of the boat's crew that belonged to an English ship just arrived; which our failors no sooner understood, than they ran out to meet their countrymen, looking upon them as fo many angels fent from heaven to their relief; and certainly the transport of joy they felt upon this occasion, if it may be conceived, can never be expressed. A mortification still remained, which no man could well have expected. One of the ships which arrived, was commanded by the fame mafter who left these poor wretches on shore, and he, like a barbarous brute, in order to excuse is own inhumanity, began to revile them in the most opprobrious terms. This man, it seems, had left seven or eight other men in Greenland two years before, who were never heard of afterwards; for which, no doubt, he richly deferved the feverest punishment. Notwithstanding the barbarity of their own captain, the commander and officers of the other ship took care they should be kindly used, and brought to England when the season for whale fishing was over, where they received a gratuity from the Ruffia company, and were otherwise well provided for by them. Perhaps there is no instance in history of a company of men, in fuch extreme diffress, who shewed more courage and patience, or made a more wife provision for their prefervation than these did.

Singular Adventures of Four Russian Sailors, who remained several Years in Greenland or Spitzbergen.

N the year 1743 a merchant of Mesen, a town in the province of Jugovia, in the government of Archangel, fitted out a veffel, carrying 15 men. She was deftined for Spitzbergen, to be employed in the whale or feal fishery. For eight successive days, after they had failed, the wind was fair; but on the 9th it changed; fo that instead of getting to the west of Spitzber-gen, the usual place of rendezvous for the Dutch ships, and those of other nations, annually employed in the whale fishery, they were driven eastward. After some days, however, they appraoched within two English miles of the shore, when their vessel was suddenly furrounded

furrounded by ice, and they found themselves in an extreme dangerous fituation.

In this alarming state a council was held, when the mate informed them, that he recollected to have heard, that several of the people of Mesen, some time before, having formed a resolution of wintering here, had ac-cordingly carried from that city tamber proper for building a hut, and actually erected one at some diftance from the shore.

This information induced the whole company to refolve on wintering there, if the hut, as they hoped, ffill exifted; for they clearly perceived the imminent danger they were in, and that they must inevitably perish if they continued in the ship. They therefore dis-patched four of their crew in fearch of the hut, or any

other fuccour they could meet with.

As the shore, on which they were to land, was uninhabited, it was necessary that they should make some provision for their expedition. They had almost two miles to travel over loose ridges of ice, which, being raifed by the waves, and driven against each other by the wind, rendered the way equally difficult and dangerous. Prudence, therefore, forbade their loading themselves too much, lest, being overburthened, they might fink in between the pieces of ice, and perish.

Having thus maturely considered the nature of their undertaking, they provided themselves with a musket, and a powder horn containing twelve charges of powder, with as many balls, an axe, a small kettle, a bag with about 20 pounds of flour, a knife, a tinder-box and tinder, a bladder filled with tobacco, and every man his wooden pipe. Thus accourted, these four failors quickly arrived at Spitzbergen, little suspecting the misfortunes that would befal them.

They began with exploring the country, and foon discovered the hut they were in search of, about an English mile and a half from the shore. It was 36 feet in length, 18 in height, and as many in breadth. It contained a small anti-chamber, about 12 feet broad, which had two doors, the one to shut it up from the outer air, and the other to form a communication with the inner room. This contributed greatly to keep the In the large large room warm, when once heated. room was an earthen stove, constructed in the Russian manner, that is, a kind of oven without a chimney, which ferves occasionally either for baking, for heating the room, or, as is customary among the Russian peasants, in very cold weather, for a place to fleep upon.

The failors were exceeding glad at having discovered the hut, which had, however, fuffered much by the weather, it having been built a confiderable time; but, bad as it was, they contrived to pass the night in it. Early the next morning they haftened to the shore, impatient to inform their comrades of their fuccefs; and alfo to procure, from their veffel, fuch provisions, ammunition, and other necessaries, as might better

enable them to pass through the winter.

The reader may more eafily conceive, than it is poffible for words to describe, the astonishment and agony of mind these people must have felt, when, on reaching the place of their landing, they faw nothing but an open fea, free from the ice which, but a day before, had covered the ocean. A violent storm, which had arisen during the night, had certainly been the cause of this difastrous event. But they could not tell whether the ice, which had before hemmed in the vessel, agitated by the violence of the waves, had been driven against her, and shattered her to pieces, or whether she had been carried by the current into the main, a circum-flance which frequently happens in those seas. Whatever accident had befallen the ship, they saw her no more; and as no tidings were ever after received of her, it is most probable that she sunk, and that all on board her perifhed.

This melaneholy event depriving the unhappy wretches of all hope of ever being able to quit the place, they returned to the hut full of horror and despair.

Their first attention was employed, as may be naturally imagined, in devising means for providing sub-listence, and for repairing their hut. The 12 charges of powder, which they had brought with them, foon procured them as many rein-deer; the country, fortunately for them, abounding in those animals.

It has already been observed, that the hut had suftained fome damage. There were cracks in many places between the boards of the building that freely admitted the air. This inconvenience, however, was remedied, as they had an axe; and the beams were ftill found, fo that it was easy for them to make the boards join again: besides, moss growing in great abundance all over the country, there was more than sufficient to stop up the crevices, which wooden houses must always be liable to. Repairs of this kind cost the unhappy men less trouble as they were Ruffians; for most Ruffian pea-

fants are known to be good carpenters.

The intense cold, which renders these climates habitable to few species of animals, renders them equally unfit for the production of vegetables. No species of tree, or even firub, is found in Spirzbergen; a cir-cumstance of the most alarming nature to these failors. Without fire it was impossible to result the rigour of the climate,; and without wood, how was that fire to be produced or supported? Providence, however, has fo ordered it, that, in this particular, the fea fupplies the defects of the land. In wandering along the beach they collected plenty of wood, which had been driven ashore by the waves, and which at first, consisted of the wrecks of ships, and afterwards of whole trees, with their roots, the produce of some more hospitable, but to them unknown, climate, which the overflowing of rivers, or other accidents, had fent into the ocean.

Nothing proved of more effential service to these unfortunate men, during the first year of their exile, than fome boards they found upon the beach, having a long iron hook, fome nails of about five or fix inches long, and proportionably thick, and other bits of iron fixed in them; the melancholy relics of fome veffel cast away in those remote parts. These were thrown ashore by the waves, at a time when the want of pow-These were thrown der gave these persons reason to apprehend that they must fall a prey to hunger, as they had nearly consumed those rein-deer they had killed. This lucky circum-stance was attended with another equally fortunate: they found, on the shore, the root of a fir tree, which nearly approached to the figure of a bow.

As necessity has ever been the mother of invention, they foon fashioned this root into a good bow, by the help of a knife; but still they wanted a string and ar-rows. Not knowing how to procure these at present, they refolved upon making a couple of lances to defend themselves against the white bears, whose attacks they

had reason to dread.

Finding they could neither make the heads of their lances, or of their arrows, without the help of a ham mer, they contrived to form the large iron hook, before mentioned, into one, by beating it, and widening a hole it happened to have about its middle, with the help of one of their largest nails. This received the handle; and a round button, at one end of the hook, ferved for the face of the hammer. A large pebble sup-plied the place of an anvil, and a couple of rein-deer horns made the tongs. By means of these tools they made two heads of spears; and, after polishing and sharpening them on stones, they tied them as saft as possible, with thongs made of rein-deer skins, to sticks about the thickness of a man's arm, which they procured from fome branches of trees that had been cast on fhore.

Thus equipped with spears, they refolved to attack a white bear, and, after a most dangerous encounter, they killed one, and thereby furnished a new supply of pro-visions. The slesh of this animal they relished exceedingly, as they thought it much refembled beef in tafte and flavour. They faw, with infinite pleafure, that the tendons could, with little or no trouble, be divided into filaments of what fineness they thought fit. This, perhaps, was the most fortunate discovery they could have made; for, belides other advantages, they were hereby furnished with strings for their bow.

The fuecels of the fe people in making their spears, and the utility they produced, encouraged them to proceed, and to forge fome pieces of iron into heads of arrows of the fame shape, though somewhat smaller in lize than the spears. Having ground and sharpened these like the former, they tied them, with the sinews of the white bear, to pieces of fir, to which, by the help of fine threads of the fame, they fastened feathers of fea-fowl, and thus became possessed of a complete bow and arrows. Their ingenuity, in this respect, was crowned with fuccess far beyond their expectation; for, during the time of their continuance here, they killed no less than 250 rein-deer, besides a great number of blue and white soxes. The sless of these animals serv-ed them also for food, and their skins for cloathing, and other necessary preservatives against the intense

coldne's of a climate fo near the pole.

They killed, however, only 10 white bears, and that not without the utmost danger; for these animals, being prodigiously strong, defended themselves with astonishing vigour and sury. The first they attacked delignedly, but the other nine they killed in defending themselves from their assaults; for some of these creatures even ventured to enter the outer room of the hut, in order to devour them. All the bears, indeed, did not shew equal ferocity, either owing to some being Jess preffed by hunger, or to their being, by nature, less carnivorous than the others: for some of them which entered the hut immediately betook themselves to flight on the first attempt of the sailors to drive them away. A repetition, however, of these attacks, threw the poor men into great terror and anxiety, as they were almost in perpetual danger of being devoured. The three different kinds of animals before mentioned, viz. the rein-deer, the foxes, and the white bears, were the only food these wretched mariners tasted during their continuance in this dreary abode.

They were for some time reduced to the necessity of eating their meat almost raw, and without either bread or falt; for they were deftitute of both. The intenfe-ness of the cold, together with the want of proper conveniencies, prevented them from cooking their victuals in a proper manner. There was but one flove in the hut, and that being fet up agreeable to the Russian taste, was more like an oven, and confequently not well adapted for boiling any thing. Wood, also, was too precious a commodity to be wasted in keeping up two fires; and the one they might have made out of their habitation to drefs their victuals would in no way have ferved to warm them. Another reason against their cooking in the open air was the continual danger of an attack from the white bears.

To remedy, in some degree, the hardships of eating their meat half raw, they bethought themselves of drying some of their provision, during the summer, in the open air; and afterwards of hanging it up in the upper part of the hut, which was continually filled with smoak. This meat, fo prepared, they used for bread, and it made them relish their other flesh the better, as they could only half dress it. Finding this experiment anfwer, in every respect, their wishes, they continued to practife it during the whole time of their confinement in this country, and always kept up by that means a fufficient stock of provisions. Water they had in summer from fmall rivulets that fell from the rocks; and in winter from the fnow and thawed ice: this was, of course, their only beverage: and their small kettle was the only vessel they could make use of for this and other purpofes.

It is well known that feafaring people are extremely fubject to the feurvy. This difease increases in proportion as we approach the poles, which must be attri-buted to the excessive cold, or some other cause yet unknown. However that may be, the failors, feeing

themselves quite destitute of every means of cure, in case they should be attacked with so satal a disorder, judged it expedient not to neglect any regimen generally adopted as a preservative against this impending evil. One of their number, who had feveral times wintered on the coast of Spitzbergen, advised his un-fortunate companions to swallow raw and frozen meat broken into fmall bits; to drink the blood of reindeer warm as it flowed from their veins immediately after the killing them; to use as much exercise as possible; and, lastly, to eat scurvy-grass, which grows in this country.

Experience proved these remedies to be effectual; for three of these sailors, who pursued this method, continued totally free from all taint of the diforder. The fourth, on the contrary, who was naturally indolent, averfe to drinking the rein-deer blood, and unwilling to leave the hut, when he could possibly avoid it, was, foon after their arrival, feized with the fourvy, which afterwards became so bad, that he passed almost fix years under the greatest sufferings. In the latter part of that time he became so weak that he could no longer fit erect, or even raise his hand to his mouth; fo that his humane companions were obliged to feed and tend him, like a new-born infant, to the hour of

We have before observed, that they brought with them a small bag of flour. Of this they had consumed about one half with their meat; and the remainder they employed in a different manner, though equally useful. They foon found the necessity of keeping up a continual fire in fo cold a climate, and perceived that, if it should unfortunately go out, they had no means of lighting it again: for though they had a steel and flint, yet they wanted both match and tinder.

In their excursions through the country, they had met with a flimy loam, or a kind of clay, out of which they found means to form an utenful that might ferve for a lamp; and they proposed to keep it constantly burning with the fat of the animals they should kill. This was certainly the most rational scheme they could have thought of; for to be without a light in a climate where, during the winter, darkness reigns for several months together, would have added much more to their calamities. Having, therefore, fashioned a kind of lamp, they filled it with rein-deers fat, and stuck in fome twifted linen, flaped into a wick. But they had the mortification to find that, as foon as the fat melted, it not only foaked into the clay, but ran through on all fides. It was therefore necessary to devise fome means for preventing this inconvenience, not rifing from cracks, but from the fubftance of which the lamp was made being too porous. They therefore made a new one, dried it thoroughly in the air, then heated it red hot, and afterwards quenched it in their kettle, wherein they had boiled a quantity of flour down to the conin they had boiled a quantity of flour down to the confiftence of thin flarch. The lamp being thus dried, and filled with fat, they now found, to their great joy, did not leak; but, for greater fecurity, they dipped linen rags in their paste, and covered all its outside with them. Succeeding in this attempt, they immediately made another lamp, for fear of an accident, that, at all events, they might not be destitute of light. When they had, made themselves these two, they When they had made themselves these two, they thought proper to fave the remainder of their flour for fimilar purpofes.

As they had carefully collected whatever happened to be cast on shore to supply them with fuel, they had found among the wrecks of veffels fome cordage, and a fmall quantity of oakum, which ferved them to make wicks for their lamps. When these stores began to fail, their shirts and drawers were employed to make good the deficiency. By these means they kept a lamp burning without intermission, from the day they first made them, until that of their embarkation for their native country.

t effential parts and drawers, to

ey kept a lamp day they first kation for their the use before specified, exposed them the more to the rigour of the climate. They also found themselves in want of shoes, boots, and other articles of dress; and, as winter was approaching, were again obliged to have recourse to that ingenuity which necessity suggests, and which seldom sails in the trying hour of diffress.

They had skins of rein-deer and for s in abundance,

that had hitherto ferved them for bedding, and which they now thought of employing in fome more effential fervice; but the question was how to tan them. After deliberating on this matter, they took the following method. They joaked the Ikins for feveral days in fresh water, till they could pull off the hair tolerably eafy: they then rubbed the wet leather with their hands till it was nearly dry, when they foread some melted rein-deer's fat over it, and again rubbed it well. By this process the leather became fost, pliant, and supple, proper to answer every purpose for which it was intended. Those skins which they designed for furs they only foaked one day, to prepare them for being wrought, and then proceeded in the manner before mentioned, except only that they did not remove the hair. Thus they foon provided themselves with the necessary materials for all the parts of drefs they wanted.

But here another difficulty ocurred. They had neither awls for making shoes or boots, or needles for fewing their garments. These wants, however, they soon supplied, by means of the bits of iron they had occasionally collected. Out of these they made both, and, by their own industry, even brought them to a certain degree of persection. The making eyes to their needles indeed, gave them no small trouble; but this they also performed with the affishance of their knife; for having ground it to a very sharp point, and heated red hot a kind of wire, they pierced a hole through one end, and, by wetting and smoothing it on itones, brought the other to a point, and thus gave the whole needle a tolerable good form.

The next material inftrument wanted was a pair of feisars to cut out the fkins: but this deficiency was supplied by their knife; and though there was neither taylor or shoemaker among them, yet they contrived to cut out their leather and furs well enough for the purpose. The sinews of the bears and rein-deer served them for thread. Thus provided with the necessary implements they proceeded to make their new cloaths.

Their fummer drefs confifted of a kind of jacket and trowfers, made of fkins prepared as above. In winter they wore long fur gowns, like the Samoides or Laplanders, furnished with a hood, which covered the head and neck, leaving only an opening for the face. These gowns were sewed close round, to that, to put them on, they were obliged to bring them over their heads like a thirt.

When our mariners had passed near fix years in this dismal place, the man, whose illness has been already mentioned, and who had been all along in a languid condition, died, after having, in the latter part of his life, suffered the most excruciating pains. Though they were thus freed from the trouble of attending him, and the grief of being witnesses to his misery, without being able to afford him any relief, they were greatly affected at his death. They saw their number lessened, and every one wished to be the first that should follow him. As he died in winter, they dug a grave in the snow as deep as they could, in which they laid the corple, and then covered it over in the best manner they could, to secure it from the bears.

At the time when the melancholy reflection, occafioned by the death of their comrade, came fresh in their minds, and when each expected to pay this last duty to the remaining companions of his misfortunes, or to receive it from them, they unexpectedly got fight of a Ruffian ship. This happened on the 15th of August, 1749. This vessel belonged to a trader of the sect called by its adherents Stata Vieva, that is, The Old Faith, who had come from Archangel, and proposed wintering in Nova Zembla; but the contrary winds they met with on their passage rendered it impossible for them to reach the place of their destination. The veffel was driven towards Spitzbergen, directly oppofite to the refidence of our mariners, who, as foon as they perceived her, haftened to light fires on the hills nearest their habitation, and then ran to the beach, waving a flag, made of rein-deer's hide, fastened to a The people on board, feeing these signals, concluded that they were men on the shore who implored their affiftance, and therefore came to an anchor not far from the land.

It is almost impossible to describe the joy of these poor people at seeing the moment of their deliverance so near. They soon agreed with the master of the ship to work for him on the voyage, and to pay him 80 rubles on their arrival, for taking them on board, with all their riches, which consisted in 50 pud, or 2000 pounds weight, of rein-deer fat, in many hides of these animals, and in skins of the blue and white soxes, together with those of the ten white bears they had killed. They took care not to forget their bow and arrows; their spears; their knise and axes, which were almost worn out; their awls and needles, which they kept carefully in a bone box, very ingeniously made with the knise only; and, in short, every thing they were possessed.

Our adventurers arrived fafe at Archangel on the 28th of September, 1749, having fpent fix years and three months in their rucful folitude.

The moment of their landing had nearly proved fatal to the loving and beloved wife of one of them, who, being prefent when the vessel came into port, immediately knew her husband, and ran with so much eagerness to his embraces, that she slipped into the water, and very narrowly escaped being drowned.

All three, on their arrival, were ftrong and healthy; but having lived so long without bread, they could not reconcile themselves to the use of it, and complained that it filled them with wind: neither could they bear any spirituous liquors, and therefore drank nothing but

However aftonishing the above recital may appear, the truth of these adventures is sufficiently authenticated. When these unfortunate failors arrived at Archangel, they were examined by the chief auditor of the admiralty of that city, who minuted down all the particulars, which exactly corresponded with each other. Mr. Le Ray, profesior of history in the Imperial Academy, fome time after fent for two of the men to Peterfburgh, from whose mouths he took the before mentioned narrative, which also agreed with Mr. Klinftadt's minutes. The original was published in the German language at Petersburgh, in the year 1769, and transmitted from thence to the ingenious Mr. (now Sir Jofeph) Banks, who, with feveral other members of the Royal Society, were so well pleased with the account, that they directed a translation of it to be made into English, for the gratification of the curious.

SECTION I.

Name, Boundaries, Extent, Divisions, Subdivisions, Climate, Soils Mountains, Rivers, Vegetables, Animal and Mineral Productions.

THE natives of this country were called Scritofinni by the ancients, to whom the appellation of Lapland, or Lappia, was unknown. They originally inhabited Failand, from whence they were driven more northward, after which they were called Lappes, which, in the Finick tongue, fignified exiles driven to the most remote places. The natives, of courfe, deeming that appellation opprobrious, call themselves Sabmienladsi,

Lapland being subject to three distinct sovereignties, viz. Sweden, Denmark and Russia, is divided into three parts; but as Swedish Lapland is by far the most considerable, both in point of extent and population, and as they all bear a similarity with respect to most particulars, we shall confine our description to that division; observing, in general, that all the country lying above the Gulph of Bothnia, along the composition of the north sea, even to the White Sea, is called Lapland.

Swedish Lapland is bounded on the east by Russia

Swedish Lapland is bounded on the east by Russia Lapland; on the west by a ridge of mountains that separate it from Norway; on the north by Danish Lapland; and on the south by Bothnia, Angermania, and Septerland. Its greatest extent, from east to west, is about 350 miles; in breadth it extends from 65 deg. 33 min. to 69 deg. of north latitude. It is divided into six provinces, or districts, the names of which are as follows, viz. Angermanland-Lapmark, Uma-Lapmark, Pitha-Lapmark, Lula-Lapmark, Tosno-Lapmark, and Kimi-Lapmark.

These provinces, each of which receives its name from the chief river that waters it, are again subdivided into smaller districts called Biars, and these contain a certain number of families, called by the Swedes Reckars. Every Reckar, or family, is allowed a considerable track of land, with forests, lakes and brooks, for the maintenance of their families and cattle; but their lands are not enclosed, so that the property of one is often converted to the use of another.

Lapland is fituated so near the pole, that the sun neither sets in summer, or rises in winter. In the latter season the cold is so intense, that none but the natives are able to bear it. The most rapid rivers are then frozen up, and the ice is two or three, and sometimes four or five feet thick. In summer the weather is as sultry as it is cold in winter: for autumn and spring are unknown in this climate. The excessive heat, however, is qualified by the vapours that rise from the sea, and by the snow that continues all the summer on the tops of the mountains, and in ditches that are sheltered from the sun. It seldom rains in the summer, but in winter the whole country is covered with snow.

The best description of the climate of this country is given by M. Maupertuis; who, with several other astronomers, was sent hither by order of the king of France, to discover the figure of the earth at the polar circle. "In December (says he) the snow continually falling, or ready to fall, for the most part hid the sun the sew moments he might have appeared at mid-day. In the month of January the cold was increased to that extremity, that M. Reaumour's mercurial thermometer, which, at Paris, in the great frost of 1709, it was thought strange to see fall to fourteen degrees below the freezing point, was now got down to thirty-seven. The spirits of wine in the others was frozen. If we opened the door of a warm room, the external air in-

ftantly converted all the vapour in it into fnow; whirling it round in white vortexes. If we went abroad, we felt as if the air was tearing our breafts in pieces; and the cracking of the wood, of which the houses are built, as if split by the violence of the frost, continually alarmed us with an increase of cold: in this country you may often see people who have lost an arm or a leg by the frost. The cold, which is always very great, fometimes increases by such violent and sudden degrees, as are almost infallibly fatal to those who are so unhappy as to be exposed to it; and sometimes there rise sudden tempests of snow that are still more dangerous. The winds feem to blow from all quarters at once, and drive about the fnow with fuch fury, that all the roads are in a moment rendered invisible. Dreadful is the situation of a person surprised in the sields by fuch a ftorm: his knowledge of the country, and even the mark he may have taken by the trees, cannot avail him; he is blinded by the fnow, and if he attempts to find his way home is generally loft. In fhort, during the whole winter, the cold was fo exceffive, that on the 7th of April, at five in the morning, the thermometer was fallen to twenty divisions below the point of freezing, though every afternoon it rose two or three divisions above it; a difference in the height not much less than that which the greatest heat and cold felt at Paris usually produce in that instrument. Thus in 24 hours we had all the variety felt in the temperate

zones in the compass of a whole year." Though the nights in winter are very cold, long and tedious, yet those inconveniences are, in some degree, obviated by the ferenity of the fky, the brightness of the moon and stars, and the refulgent light of the aurora borealis, which is reflected from the white furface of the earth covered with fnow, from all which fuch a light is produced, that the inhabitants are enabled to discharge their ordinary occupations. M. Maupertuis, in speaking of these nocturnal lights, says, " The days are no fooner closed than fires of a thousand figures and colours light up the sky, as if designed to compensate for the absence of the fun. These fires have not here, as in more fouthern climates, any conftant fituation. Though a luminous arch is often feen fixed towards the north, they feem more frequently to possible the whole extent of the hemisphere. Sometimes they begin in the form of a great scarf of bright light, with as extremities upon the horizon, which, with a motion resembling that of a fishing-net, glides foftly up the sky, preserving, in this motion, a direction nearly perpendicular to the meridian; and most commonly after these preludes all the lights unite at the zenith, and form the top of a crown. Arcs, like those seen in France towards the north, are here frequently fituated towards the fouth; and often towards both the north and fouth at once. Their fummits ap-proach each other; the diffance of their extremities widens towards the horizon. I have feen fome of the opposite arcs, whose summits almost joined at the zenith; and both the one and the other have frequently feveral concentric arcs beyond it. Their tops are all placed in the direction of the meridian, though with a little declination to the west; which I did not find to be constant, and which is fometimes insensible. It would be endless to mention all the different figures these meteors represent, and the various motions with which they are agitated. Their motion is most commonly like that of a pair of colours waved in the air, and the different tints of their lights give them the appearance of so many vast streamers of changeable tassaty. Sometimes they line a part of the sky with scarlet. On the eighteenth of December I saw a phenomenon of this was now ever

To the fouth a great space of the sky appeared tinged with fo lively a red, that the whole constellation of Orion looked as if it had been dipped in blood. This light, which was at first fixed, foon moved, and changing into other colours, violet and blue, fettled into a dome, whose top stood a little to the south-west of the zenith. The moon shone bright, but did not in the least efface In this country, where there are lights of fo many different colours, I never faw but two that were red; and such are taken for presages of some great missortune. After all, when people gaze at these phenomena with an unphilosophic eye, it is not surprising if they discover in them the appearance of armies engaged, fiery chariots, and a thousand other prodigies."

The foil of this country is, in general, exceeding bad, being to intermixed with stones, that hardly any thing will grow in it; but in some places it is very moilt, owing to the number of marshes and brooks with which it abounds.

The whole country is full of rocks and mountains. Those called the Dofrine Mountains, which separate Lapland from Norway, are of a prodigious height; and the high winds that blow there prevent all trees from taking root. Beneath these mountains are large marshes and extensive forests, where there are many trees, though they stand at a great distance from each other. At the bottom of the hills are pleasant vallies, which are the most fertile parts of the country, being well watered by an infinite number of springs and

Most of the rivers rise from the mountains of Norway, and sall into the Bothnian Gulph. The chief of these are the Uma, Lula, Rima, and Torna. The Uma is greatly increased by the waters that slow into it from the rivers Vendilor and Skialfre. The Lula and Rima are both very considerable, and are swelled, in their course, by a great number of lesser ones. The Torna receives 29 rivers, one of which is a Swedish mile in breadth. When the snow melts, all these rivers overshow their banks; and the chief part of them have stupendous cataracts. Besides the rivers here are also many lakes, which, as well as the former, abound with various kinds of sish.

The forests of Lapland produce a great number of trees, among which are the birch, pine, and fir. Some parts of it also produce the service-tree, willow, poplar, elder, and the corneil. They have several forts of plants; but the most useful are the angelica and forrel, which are greatly esteemed by the natives, who use them in their food. They have likewise different kinds of grass, heath, and fern: but the most plentiful, as well as most useful vegetable, is the moschus, or moss, of which there are several species, either adhering to trees, or growing on the surface of the earth. The rein-deer is almost wholly sustained by this vegetable, which, indeed, he prefers to all others, and without which he cannot subsist. The natives not only use it as forage for their cattle, but boil it in broth as a cordial and restorative.

Here is also great plenty of berries, such as black currants; the Norwegian mulberry, which grows upon a creeping plant, and is much esteemed as an antiscorbutic; rasberries, cranberries, and bilberries. Juniper-berries are also very plentiful, and some of the trees grow to a considerable height.

The animals of this country are stags; bears, wolves, foxes of several colours, squirrels, ermines; martens, hares, glittens, beavers, otters, elks, and rein-deer; but the last of these is the most useful to the natives, who, without them, could not possibly preserve their existence; for these animals not only afford them food and garments, but also supply the place of horses, and travel in those parts where the latter animals would be entirely useles.

The rein-deer is a kind of stag, with large branched horns, the tops of which bend forward like a bow. He

is larger, stronger, and swister than the stag; and his hair changes colour according to the season of the year. His hoofs are cloven and moveable, for which reason he spreads them abroad as he runs along the snow, to prevent his finking into it. The horns are very high, and divided into two branches near the root. On each horn are three branches, one above another, which are again fubdivided into fmaller ones; infomuch, that no horned beaft whatever has the like, either for bulk, branches, or weight. The horns are of a light colour, and there are veins, or blood veffels, running along them, under which there are furrows. When the beaft runs, he lays these horns upon his back; but there are two branches that always hang over his forehead, and almost cover his face. Most of these animals are wild; but fome of them are tame, and exceeding ferviceable to the natives. Those which are produced between a tame doe and a wild buck are not only the largest, but by far the strongest. These animals are of infinite use to the Laplanders; for, without subjecting them to the least expence, they supply them with almost every neceffary of life. From these creatures they are furnished with milk and cheefe, as also flesh, which they lay up for winter store. The skins afford caps, cloaths, boots, shoes, bedding, thongs, and many other articles. The nerves and sinews are twisted into thread. Their bows and arrows are tipped with the bones, and their boxes inlaid with the horn, which is likewife formed into curious spoons, toys, and utenfils. These animals are likewife used as beasts of draught or burthen; and far from demanding any provision or provender, dig with their feet among the snow for the moss, which they prefer to every other kind of food.

The dogs here are very small, not being above a foot in height. They turn up their tails, which are short; and their ears stand erect, like those of wolves. They are of a red colour, and very serviceable in hunting.

The birds of Lapland are fwans, geefe, ducks, lapwings, fnipes, moft forts of water-fowl, heath-cocks, ftock-doves, wood-cocks, and partridges. Befides thefe, they have two kinds of fowl peculiar only to this country. The first is called the kniper, and is a kind of snipe, black on the head, back, and wings; but the breast and belly are white. It has a long red beak, set with teeth, and short red feet, resembling those of waterfowl. The other is called the loom, and is never seen on the ground, but either in the water, or slying. The partridges here are as white as snow, and, instead of feathers, their bodies are covered with a kind of wools. The rocks and mountains are frequented by eagles, hawks, falcons, kites, and other birds of prey.

The chief infects here are flies, which, in the fummer, are hatched in the moraffes and woods, and are frequently fo numerous as to obscure the light of the day. They are venomous, and exceeding troublesome; infomuch, that the rein-deer fly to the tops of the mountains for shelter; and the inhabitants move to the fea-fide; these parts being the least infested by these pestilent vermin. Monsieur Maupertuis says, that; while he was there, the flies were fo troublesome, that even the Finland foldiers, who were counted the most hardy troops in the fervice of Sweden, were obliged to cover their faces with the skirts of their coats from the attacks of these animals, which swarmed to such a degree, that the moment a piece of flesh appeared, it was blackened all over. Some of these flies are very large, with green heads, and draw blood from the skin wherever they strike.

The rivers and lakes abound with delicious falmon, which come from the Gulph of Bothnia; also trout, bream, and perch, all of which are of exquisite flavour,

and of amazing fize.

In some of the districts are mines of silver, lead, and copper, together with excellent veins of iron; but they are not at present worked to any considerable advantage, their fituation being almost inaccessible. In the district of Torno there is a vein of gold and silver mixed, another of lead and silver, and a third of

copper; and here they have both copper works and a foundry. They have also furnaces in the province of Lula, where they melt the silver which they dig in that part of the country. These mines, however, are only worked for a short time in the summer, the climate being so severe for the principal part of the year, as to prevent the engines from performing their offices.

In the rivers and lakes are found beautiful cryftals of a prodigious fize, and so hard and fine, that, when polifhed, they appear like real diamonds. Here are likewise a great variety of curious stones, some of which bear the resemblance of animals, trees, &cc. When the natives sind these, they place them in some conspicuous place, and worship them as deities.

SECTION II.

Persons, Dispositions, Longevity, Habitations, Dress, Utensils, Employments, Method of Travelling, Customs, Marriage and Funeral Ceremonies, Diseases, Language, &c. of the Natives of Lapland.

THE Laplanders are remarkably fhort in stature, the generality of them not being above four set and a half high, and some of them even under that size; the cause of which is attributed to the severity of the climate, and the poorness of their living. They are, in general, very disagreeably formed, having a large head, a broad forehead, hollow and bleared eyes, a short and flat nose, and a broad face, with short, black, and rough hair. They have broad breasts, slender waists, and small legs; but they are strong, shardy, and active, insomuch, that they will bear incredible fatigue; and it is remarked, that the stoutest Norwegian is not able to bend the bow of a Laplander. The women, however, are much less homely than the men, and some of them have a delicate and florid consolation.

In their dispositions they are very honest and hospitable; but so timorous, that they will sty the moment they perceive a vessel at sea, or the least footstep of a stranger. They are naturally hasty and passionate, and, when once provoked, not easily appeased. They induse themselves in laziness to such a degree, that they neither plough nor sow, but leave their ground totally uncultivated; neither will they seek for provender either by hunting or sishing, till they are compelled to it from mere necessity. It shath been observed, that when they have been transported to more moderate climates, they have soon died, though in their own country they live to a great age. It is no uncommon thing to see a Laplander, upwards of an hundred years of age, hunting, sowling, skaiting, and performing all the ieverest exercises with the most aftonishing agility.

Their houses, or rather huts, are made of pieces of timber, or rafters joined together, and covered with turf, or the branches of pine-trees and coarse cloth. Some of them are built upon trees to prevent their being overwhelmed with snow, and to secure them from the wild beasts. Their huts have two doors, at the lesser of which no woman must enter, because from thence the men go to hunt; and should they meet the woman at going out, it would be considered as a bad omen. They have no other chimnies than a hole at the top of their huts, which serves to let the smoak out, and the light in. Their storehouses are built in trees, to secure their provisions from bears and other wild beasts.

Their dress in summer consists of a close garment, reaching to the middle of the legs, and sastened round the waist with belts. They have not any linen, and their cloachs are made of coarse wool, of a dark grey colour. The richer fort have their cloaths of various colours, but red is the most universally esteemed. At their girdles they hang a Norway knife and a pouch, the latter of which contains slints, matches, and to

bacco, with other necessaries; the girdle itself being decorated with brass rings and chains. Their night-caps are made of the skins of the bird-loom, with the seathers on; and their shoes of the skins of rein-deers, with the hair outwards. In winter they are totally cased up in coats, caps, boots, and gloves, made of the rein-deer's skin, with the hair inwards. The women's apparel differs but little from that of the menthey hang to their girdles many rings, chains, toys, and knives, with a needle case, and other trifles. Their thread is made of the sinews of rein-deer; and in winter they lie in their skins. In summer they all cover themselves at night with large pieces of coarse cloth, to secure them from being stung by the slies and gnats.

The Laplanders make all their own furniture; their boats, their fledges, and their bows and arrows. The boards with which they make their boats are faftened together with twigs, the nerves of rein-deer, or the finall roots of trees twifted together like ropes; and they caulk them with moss to keep out the water. They make boxes of their birch planks, which they neatly inlay with the horns of rein-deer; and they are very dextrous at making baskets of the roots of trees, slit in long thin pieces, and twisted together. Some of these are made so neat that they will hold water; and they are particularly admired by the

Swedes.

These articles are made by the men, who also perform the office of cook, by dreffing victuals for the family. The women are employed as taylors and embroiderers; they make cloaths, shoes, and boots, and harness for the rein-deer: they spin thread with sur, and knit it into caps and gloves, which are very soft and warm: they likewise draw tin into wire through a horn, and with this they cover their thread, which they use, in embroidering on their caps and girdle, the figures of beasts, slowers, trees, stars, &c.

The mountaineers live chiefly on the flesh and milk of the rein-deer; the former of which they dry, and from the latter they make great quantities of cheefe. Those who live in the low country feed on venison and fish. They have neither bread or falt; but instead thereof use the inner rind of the pine-tree, dried and ground, and dried fish reduced to powder. They make broth of fish and flesh boiled together; and their usual drink is water heated in a kettle, which in winter hangs continually over the fire: but their great it dainty is bear's flesh, which they eat on all particular feftivals. On these occasions likewise they include themfelves with brandy, and never think themselves so happy as when they can enjoy a pipe of tobacco. These commodities the better fort purchase at Norway, as also a few cows and sheep for their winter store. They make decoctions of berries, angelica, and forrel, which they are not only fond of, but also deem them excellent preservatives against all scorbutic disorders.

Besides their domestic business, the Laplanders employ themselves in hunting, in which excursions they travel through the snow with aftonishing expedition. They wear a pair of skaits, or snow shoes, which are made of fir boards, covered with the rough skin of the rein deer; one of these is usually as long as the person who wears it, but the other is about a foot shorter. The seet are placed near the middle, and the shoes are fastened to them with strings, or thongs made with the sinews of the rein-deer. When the Laplander travels in this manner he carries a long pole in his hand, near the end of which is a round ball of wood; and this not only secures him from penetrating too deep into the snow, but also enables him to stop himself when occasion requires.

A Laplander will travel in his fnow shoes at the rate of fixty miles a day without being satigued. But the most expeditious method of travelling in this country is with a sledge drawn by rein-deer. This carriage, which is called by the natives pulkha, is made in the form of a small boat, with a convex bottom,

ow shoes at the g fatigued. But ravelling in this deer. This cardeer. pulkha, is made convex bottom,

that it may flide the more eafily over the fnow the head of it is sharp and pointed, but the hinder part is quite flat. The traveller fits, or rather lays with his back against the end of the sledge, and holds a slick in his hand, with a large wooden ball at the end of it, with which he disengages the sledge from such obstructions as he may happen to meet with in the course of his He must likewise take care properly to ballance the carriage with his body, otherwise he will be fubject to be overturned. The traces, by which the fledge is fastened to the rein-deer, are fixed to a collar about the animal's neck, and run down over the breaft, between the fore and hind legs, to be connected with the prow of the fledge; the reins are tied to the horns, and the trappings are furnished with little bells, the found of which is very pleasing to the animal. The rein-deer is fo fleet that he will run with his carriage upwards of 100 miles a day. Before a Laplander fets out on his journey, he whispers in the ear of the animal the way he is to go, and the place at which he is to halt, from a perfuafion that the beaft understands his meaning; but, in spite of this intimation, he frequently stops short, and sometimes overshoots the mark by several miles.

Though this method of travelling is exceedingly expeditious, yet it is far from being easy, the person being continually in a confined posture; neither is it exempted from the most imminent danger, on account of the uncertainty of the roads, and the drifts of loofe fnow, which, if the wind blows high, are driven about with incredible fury.

As foon as the winter commences, the Laplanders mark the most frequented roads by strewing them with fir-boughs. Indeed, these roads are no other than path-ways made through the fnow by the rein-deer and fledges; their being frequently covered with new fnow, and alternately beaten by the carriage, confolidates them into a kind of causeway, which is the harder if the furface has felt a partial thaw, and been crushed by a subsequent frost. It requires great caution to follow these tracks; for if the carriage run either on one side or the other, the traveller is thrown into an abyss of fnow. In less frequented parts, where there is no such beaten road, the Laplander directs his course by certain marks which he has made on the trees; but, notwithstanding all his caution, the rein-deer very often finks up to his horns in snow; and should a hurricane arife, which is fometimes the case, the traveller would be in great danger of his life, were he not provided with a kind of tent, to screen him in some measure from the fury of the tempest.

The rein-deer in winter is rather weak and dispirited, fo that he cannot travel with the same alacrity as in fummer. In this season the traveller is obliged to halt at different times, that the animal may rest himself; and in these intervals be fed with a kind of cake made of moss and now, which serves him both for drink and

The principal employment of the Laplanders, ex-clusive of their domestic affairs, consists in hunting and fishing. Those who practise the latter have small boats, so lightly constructed that they can carry them on their shoulders, which they frequently do, when interrupted on the rivers by whirlpools or cataracts. The boats are of different fizes, from two to fix yards in length, managed with oars, and caulked with moss so tight, as effectually to keep out the water. They fteer with amazing rapidity, even among the rocks, and down the most rapid water falls; but when they go against the stream, and meet with a cataract, they take out their boat, and carry it on their shoulders till they have passed it, when they launch it again, and renew their bufiness.

The Laplanders who employ themselves in hunting, perform it various ways. In summer they hunt wild beafts with small dogs trained to the diversion. In winter they purfue them by their tracks upon the fnow, faiting with fuch velocity that they frequently run No. 55.

down their prey. They catch ermines in traps, and fometimes with dogs. They kill fquirrels, martens, and fables, with blunt darts, to avoid injuring the skins. Foxes and beavers are killed with sharp pointed darts and arrows, in shooting of which they are accounted the best markimen in the world. The larger beasts, such as bears, wolves, elks, and wild rein-deer, they either kill with fire arms, or else enfrare by digging pits in those parts where they mostly resort.

They have particular laws relative to the chace; which they observe with great punctuality. The beast becomes the property of the man in whose snare or pit he is caught; and he who discovers a bear's den has the exclusive privilege of hunting him to death. The conquest of a bear is the most honourable atchievement that a Laplander can perform; and the flesh of this animal they think more delicious than that of any other The bear is always dispatched with a fufil, fometimes laid as a fnare, ready cocked and primed; but more frequently by the hands of the hunter, who runs the most imminent danger of his life, should he miss his aim.

The killing a bear is celebrated by the Laplanders with great rejoicings. The carcase is drawn to the cabin, or hut of the victor, by a rein-deer, which, on this account, is afterwards kept a whole year without doing any work. The bear is furrounded by a great number of men, women, and children, who recite a particular fong of triumph, in which they thank the vanquished enemy for having allowed himself to be overcome, without doing any mischief to his conqueror: after this they address themselves to Providence, acknowledging the fingular benefits they receive from his having created beafts for their use, and endowed them with strength and courage to attack and overcome them. The conqueror is saluted by the women, and is feasted by the men of the village for three successive days; besides which, he is ever after distinguished from the rest, by having laces round his cap, wrought with tin ware.

The marriage ceremonies of the Laplanders are very remarkable and ludicrous. When a young man has made choice of a female, he employs some friends as mediators with the girl's parents; and these being pro-vided with some bottles of brandy, the suitor accompanies them to the hut of his intended father-in-law, who invites the mediators to enter: but the fuitor is left without, until the liquor be drank, and the propofal discussed. After this he is called in, and entertained with fuch fare as the hut affords, but without feeing his miftress, who, on this occasion, is obliged to retire. The fuitor having at length obtained leave to make his addresses to the girl in person, he goes home, puts on his best attire, and then returns to the hut, when his mistress appears, and he salutes her with a kiss, after which he presents her with the tongue of a rein-deer, a piece of beaver's flesh, or some other kind of provi-The girl at first declines the offer, it being made in the presence of her relations; but at the same time she makes a signal to the lover to follow her into the fields, where the accepts the prefents. Thus encouraged he begs permission of her to let him sleep with her in the hut; if she consents, she keeps the presents; but if not, she throws them with contempt upon the ground. When the lovers are agreed, the youth is permitted to visit his mistress as often as he thinks proper; but every time he comes he must purchase this pleasure with a fresh bottle of brandy, a perquisite so agreeable to the father, that he often postpones the celebration of his nuptials for two or three years. At length the ceremony is performed at the nearest church, by the priest of the parish; but even after this, the husband is obliged to serve his father-in-law a whole year, at the expiration of which he retires to his own habitation with his wife, and then receives presents from all his relations and friends. From this time he sequesters his wife from the company of all strangers of the male fex, and watches over her conduct with great vigilance.

When a lover goes to pay a vifit to his miftrefs, during his journey through the fenny moors, he ufually diverts himself with a fong, which he addresses to his rein-deer. We shall present a translation of one of these from the original taken from the Spechator, for the entertainment of the reader. The circumstances that successively present themselves to him during his journey, are naturally interwoven. The anxiety of absence, the gloominess of the roads, and his resolution of frequenting them, as those only carry him to the object of his wishes; the distance he expresses even at the great swiftness with which he is carried, and his joyful surprize at the unexpected fight of his mistress, as she is bathing, are all beautifully described in the following composition.

Haste, my rein-deer, and let us nimbly go Our am'rous journey thro' this dreary waste; Haste, my rein-deer! still, still thou art too slow; Impetuous love demands the light'ning's haste.

Around us far the rushy moors are spread; Soon will the sun withdraw his chearful ray: Darkling and tir'd we shall the marshes tread; No lay unsung to cheat the tedious way.

The wat'ry length of these unjoyous moors, Does all the flow'ry meadow's pride excel; Thro' these I sty to her my soul adores; Ye slow'ry meadows, empty pride, farewel.

Each moment from the charmer I'm confin'd, My breast is tortur'd with impatient fires. Fly, my rein-deer, fly swifter than the wind; Thy tardy feet wing with my fierce desires.

Our pleafing toil will then be foon o'erpaid, And thou, in wonder loft, shalt view my fair; Admire each feature of the lovely maid, Her artless charms, her bloom, her sprightly air.

But lo! with graceful motion there she swims, Gently removing each ambitious wave;

The crowding waves transported class her limbs, When, when, oh when shall I such freedoms have!

In vain, ye envious streams, so fast you flow, To hide her from a lover's ardent gaze; From ev'ry touch you more transparent grow, And all reveal'd the beauteous wanton plays.

To this we shall subjoin a Laplander's love-song, the original having been procured from a native of Lapland. The translation is the performance of a nobleman deceased, whose genius, politeness, and literary accomplishments, were the admiration of all the courts in Europe.

Source of my daily thoughts, and nightly dreams, Whose captivating beauties I adore,
O may the radiant sun's refulgent beams,
Shine on the charms of lovely Orra Moor.

I'd clime the fummit of the lofty pine, Could I my Orra Moor at diffance view; No labour, danger, care would I decline, To fee my charmer, and to find her true.

Could she be wasted to terrestrial bow'rs, And there in pleasant shades induc'd to stay; Or range enamell'd fields of sweetest flow'rs, Charm'd by the birds that warble on each spray.

Enrag'd, those pretty birds I would deftroy, Pluck up the flowers that beautify the fields, Cut down the bow'rs that rob me of my joy, And from my view my Orra's beauties shields.

O that I could but foar unto the fky,
And wing my paffage through the ambient air,
Swift as the feather'd race could I but fly,
I'd foon be with my captivating fair.

But vain, alas! my wishes are in vain; No stork or raven will a pinion lend: Fated to seel unmitigated pain, With scarce a hope my passion to besidend.

So long my blifs can Orra Moor delay?
Reflect, the fummer's fun now brightly gleams:
Short are our fummers; hafte, then hafte away,
And, with thy love, enjoy his glad'ning beams.

Alas! unkindly you delay the time;
Our short-liv'd summer wears away apace:
You've tortur'd me, and dally'd with your prime,
'Till frowning winter shews his rugged face.

Still, ftill my lovely charmer I'll pursue, And scorn all danger to reveal my pains; For what can love, all-pow'rful love subdue! He laughs at tempests, and despises chains.

Love! mighty victor, truimplis o'er mankind, Brings ev'ry thought beneath his own controul, Enflaves the heart, puts fetters on the mind, And captivates the haughty human foul.

But hark! ftern reason whispers in my ear, Friend, you are wrong, thus to pour oil on fire; Rashly to follow what you ought to fear, And rush into a whirlwind of desire.

A thousand things advise you to desirt,
A thousand dread examples bid you view
The fate of those whom love's delusive mist
Hath slily blinded, sadly to undo.

Reason, avaunt! to passion I submit, And will not hear thy disimpassioned tone: Others thy thousand counsellors may sit, But I'll attend the voice of love alone.

As foon as a child is born in Lapland, it is washed all over with snow or cold water, except the head, which must not be touched with water till after the child has been baptized. The woman does not remain in child-bed above sour or five days, and in fourteen is generally quite recovered. She then carries the child to be baptized; but before she can reach the residence of the priest, she is often obliged to traverse large forests, mountains, sakes, and wide extended wastes of snow. The infant is sastened in a hollowed piece of wood, stretched naked on a bed of sine moss, covered with the skin of a young rein-deer, and slung by two straps to the back of the mother, who always suckles her own child. At home this little cradle is hung to the roof of the hut, and the child is lulled to sleep by swinging it from one side to the other.

When the children grow up, their parents are very careful in teaching them most kinds of work; but they have a great aversion to schools. The boys, from their infancy, are taught to practife the bow; and they are not allowed to break their fast till they have hit the mark. The semale children are early initiated in the

business peculiar to their sex.

The Laplanders have not any physicians among them; neither have they, indeed, occasion for any, not being subject to those distempers common in other countries. The disorder they are most subject to is fore eyes, occasioned by the smoke of their huts, and the fire to which they are almost continually exposed. They are sometimes afflicted with rheumatic pains, and the scurvy; and a few are subject to the vertigo and apoplexy. To cure all inward disorders they use a drink made with the root of a certain species of moss, which they call jerth; and when that cannot be procured, they boil the stalk of angelica in the milk of rein-deer. When they feel a pain in any part of the body, they take a kind of mushroom, which grows upon the birch tree like a cake, and having set fire to it, apply it, burning hot, to the part affected; and this produces a blister, which is supposed to draw off the peccant humour. They have no other plaister for wounds but the rosin which drops from fir-trees. When they have

When a Laplander is supposed to be on his deathbed, fuch friends as are advocates for the Christian religion, give him Christian exhortation. But those who have no great zeal for the Christian religion, forfake the dying person, and think of nothing but the funeral entertainment. As foon as the breath is out of the body, most of the company leave the hut, being of opinion they shall receive some injury from the spirit or ghost, which they believe remains with the corpse, and takes all opportunities of doing mischief to the living. The deceased is wrapped up in linen or woollen, according to his circumstances, and deposited in a coffin by a person selected for that pupose; but this office he will not perform till he receives a confecrated brafs ring, which is placed on his left arm, and which he imagines fecures him against receiving any injury from the ghost of the deceased.

Before the Laplanders embraced the Christian reli-gion, they used to bury the dead in the first place they happened to think of, which they still do when they are very far from any church. Many of them also preferve the rites of heathenish superstition; for with the body they put in the coffin an axe, a flint and fteel, a flask of brandy, some dried fish, and venison. With the axe the deceased is supposed to hew down the bushes or boughs that may obstruct him in the other world; the steel and flint are to furnish him with a light, should he find himself in the dark; and the provision

is for him to fublift on during his journey.

Before the body is carried to the place of interment, the friends of the deceafed kindle a fire of fir boughs near the coffin, and express their forrow in tears and lamentations. They walk in procession several times round the body, demanding in a whining tone, the reason of his leaving them on earth. They ask whether he was out of humour with his wife? whether he was in want of meat, drink, cloathing, or other necessaries? and whether he had not succeeded in hunting or fishing? These, and other such interrogations, are intermingled with groaps and hideous howlings; and between them the priest sprinkles the corpse and the mourners alternately with holy water. After these ceremonies are over, the body is conveyed to the place of interment, in a fledge drawn by a rein-deer, and followed by the friends and relations, who shew their concern for the lofs of the deceafed, by dreffing themselves in the worst garments they have, and keeping a continual howl during the procession. As foon as the ceremony is over, the people retire; and the fledge, with the cloaths which belonged to the deceased, are left as the prieft's perquifite. Three days after the funeral, the relations perquifite. and friends of the defunct are invited to an entertainment, where they eat the flesh of the rein-deer which

terred with great ceremony The effects of the deceased are divided between the brothers and fifters, the former having two-thirds, and the latter one; but the lands, lakes, and rivers, are held jointly by all the children of both fexes, according to the division made by Charles IX. of Sweden, when he affigned a certain track of land for the support of each family.

conveyed the corple to the grave. The animal being made a facrifice to the manes of the deceased, the bones

of it are collected together, put into a basket, and in-

The language of the Laplanders is altogether barbarous, and varies in different parts of the country, according to the correspondence which the natives maintain with the different nations; fuch as Norwegians, Swedes, Finlanders, and Russians. The greater part of them are totally ignorant of letters; and the fame may be faid also of the arts, except such as neceffity has taught them to make use of for their own prefervation.

SECTION III.

Religion, Government, Trade, Revenue, &c.

HRISTIANITY was first supposed to have been introduced into Lapland about the year 1300. However, no material progress was made in the establishment of it till the last century, when missionaries were fent for that purpose from Norway, Sweden, and Ruffia. Several churches were built in different parts of the country, and supplied with ministers from Sweden and Ruffia. Gustavus Adolphus founded two schools, one in the province of Pitha, and the other in that of Ulma, for instructing the children of the Laplanders in the Christian religion and in letters. He also ordered several pious books to be translated from the Swedish into the Lapland language; such as the catechism, with some prayers, and the manual, containing the plalms of David, the proverbs of Solomon, That they might be encouraged to fend their children to school, an annual revenue was allotted for the maintenance of the scholars. Hence Lapland produced fome preachers, which greatly promoted the knowledge of Christianity in that country; for, heretofore, their clergy having been Swedes, whose language the people did not understand, it could not be reasonably supposed that they should profit much by their instructions. Since that time, however, many have intermixed idolatry with the pure profession of Christianity, and, from local cuftoms, their particular fondness for omens, particular times and feafons, diftinguished by the names of black and white days, &c. &c. retain many of their former superstitions.

They have some notion of the doctrine of the transmigration of fouls; for they not only respect the manes of their departed relations and friends, but dread them as being mischievous, till they imagine the spirits of the defunct have re-animated other bodies. They believe there are fairies that wander about among the rocks, mountains, rivers, and lakes, and give them also a share of their devotion. They own one Supreme Being, whom they arm with thunderbolts; they make the rainbow his bow, and have the fame notion of him that the old Pagans had of their Jupiter. another fubordinate deity, to whom they acknowledge they owe all the bleffings of life, and never fail to worship him. The fun is another of their divinities, because of his influence on the bodies of men and beafts. They have temples and images confecrated to each of their gods. Their idols are either the trunks of trees rudely carved, or of stone. One of these is preserved in the royal cabinet of antiquaries at Upfal. All their women are excluded from worship. They anoint the idol with the heart's blood of the facrifice; and when they cannot reach the top of a mountain confecrated to Storjunkar, one of their deities, they dip a stone in the blood of the facrifice, throw it up to the mountain, and fo conclude their devotion.

The Laplanders were formely deemed great magicians, and the credulous supposed them to be mightily skilled in divination. So excessively credulous, indeed, are these poor Laplanders, and so preposterously in favour of their conjurors, that they implicitly follow their directions. If these pretended vizards tell them, that on such a day they shall take plenty of fish or game, they will not fail to go out that day, and as there is most commonly abundance of both in this country, they usually verify the prediction, by coming home loaded whenever they go out in fearch of game. And if the wizards mark another day as unfortunate they infallibly make it fo, by not going abroad in queft of any thing.

The three powers to which Lapland is now subject, depute different governors, or prefects, to prefide over their respective districts. The Laplanders, however, had kings of their own till the year 1277, when the Swedes conquered part of the country, and the Ruf-

In Swedish Lapland, which is the most considerable district of the three, the laws of Sweden are observed; and three tribunals, or courts of justice, are erected: one for Angermanland Lapmark; a second for Uma, Pitha, and Lula Lapmark; and the third for Torno and Kimi Lapmark; in each of which courts there is a presect, who determines all causes. They administer justice in the king's name, and in the presence of the priest.

The Laplanders, who live near the mountains which part Norway from Sweden, wade with the inhabitants of those countries. Such as are at a greater distance from those mountains trade only with the Swedes; and those who are fituated towards the north and east, trade with the Russians and Finlanders. The commodities they receive from those nations are rix-dollars, woollen stuffs, linen, copper, tin, sour, salt, hides, needles, knives, spirituous liquors, and especially tobacco, of which they are extremely fond. They give, in return, rein-deer and fish, of the latter of which they take such large quantities, that they stock whole reservoirs with them, and put them afterwards into barrels, which they carry to the neighbouring countries; namely, the north of Bothnia, and White Russia. They also trade

in fine ermines, the skins of several wild beafts, dried pikes, and cheese made of the milk of their rein-deer.

The tribute paid by the Laplanders, confifted for-merly in skins of wild beasts; but now they consist in a certain coin, rein-deer, and in fkins, either dreffed for certain uses, or raw; and are proportionable to the extent of land poffeffed by each head of a family. The largest are stiled entire territories, or territories of a full tribute; and the owner is obliged to pay yearly two rix-dollars, in coin, to the crown of Sweden. They who possess a territory, or land of half a tribute, pay only one rix-dollar. But as it happens very often, that many of them have no rix-dollars, they are allowed to give skins of foxes or squirrels instead of coin. Fifty squirrel skins, or one fox's skin, with a pair of shoes, after the fashion of Lapland, are valued at one rix-dollar: besides which, every head of a family is obliged to give yearly a white fox's skin, or a pair of shoes; and if he cannot procure those things, he must give half a pound of dried pikes. Part of these taxes are employed for the maintenance of the priests who live in that country, to instruct the Laplanders. The inhabitants of the other districts of Lapland trade much in the same commodities; and pay the revenues in a fimilar manner to the respective states to which they are sub-

C H A P. III.

NORWAY.

SECTION I.

Situation. Extent. Boundaries. Description of a tremendous Whirlpool called the Moskoestrom.

TORWAY, Norwegia, or Nordway, fo called in different languages, from the vicinity of its fituation to the north pole, lies between 57 and 72 deg. north lat. and between 4 and 15 deg. east long. fo that it extends about 5 deg. 30 min. within the polar circle. The length, from Lindasnoes, in the diocese of Christiansand, to the North Cape, at the extremity of Fin-mark, is about 1000 miles. Its breath, from the frontiers of Sweden westward, to the Cape Staff, is better than 300 miles; but from thence the country narrows towards the north, and becomes much less in different parts. On the north and west this country is bounded by the Northern Ocean; on the east it is divided from Sweden by a long ridge of high mountains; and on the fouth it is bounded by the Schagenrack, or Cate-Gate, which is the entrance into the Baltic Sea. The coast extends near 400 leagues, and is surrounded by many islands, which afford pasture for cattle and is inhabited by fishermen.

The barriers of rocks and narrow channels formed by these islands, render Norway inaccessible to naval attacks. Nor is the North Sea the least impediment, for it is extremely difficult to navigate, contains many dangerous hidden rocks, and is subject to the most violent storms. But, above all, the terrible currents, and dreadful whirlpools, are great objects of sear to those

who navigate these seas.

The principal of these whirpools is called the Moskoestrom, or vulgarly the Mastrom, receiving this appellation from the small islands of Moskoe and Moskoenas, between which it is stuated. This current runs six hours from north to south, and returns from south to north the succeeding six hours, like the ebbing and slowing of the sea, but in direct opposition to the motion of the tides: for, during the slood, which runs from south to north, the Moskoestrom runs from north to south; and during the restux, or ebb, when the sea runs from north to fouth, this current impetuously returns from fouth to north. It runs with surprising rapidity, especially between the island Moskoe, and the extremity of the island Moskoenas, where the tides rise highest; but gradually abates its impetuosity as it approaches the islands of Werroe and Rost.

The Moskoestrom never runs in a direct line like other currents, but whirls about in a circular manner. For when it is half flood in the fea, the current here runs to the fouth-fouth-east: as the tide rifes it winds fouthward, then proceeds towards the fouth-west, and afterwards due west. As soon as it is high water the current runs on to due west. When it is high water out at fea, the current of the Moskoestrom alters its courfe to the north-west, and so gradually on to the north, where its impetuofity is at a ftand for about three quarters of an hour. This interval is observed twice a day, after which the motion begins again. The appearance and effects of the Molkoestrom have been described as very dangerous and dreadful; but, it must be owned, not without some exaggeration. A curious obferver, who has feen it, relates, that it has no whirlpool or vortex, but that it is formed by the collision of an affemblage of foaming waves, rifing, as it were, pyramidically to a great height, and with a prodigious noise. According to Schelderup's account, the Mofkoestrom is full of vortices, or terrible whirlpools, in the form of inverted cones, and about two fathoms deep from the base to the apex, or summit, and, as some relate, four fathoms in diameter. However, both accounts may, in some measure, be reconciled. This is certain, first, that the Moskoestrom is not agitated with equal violence at all times; that about the new and full moon, the equinoxes, or in stormy weather, it rages with the greatest impetuosity; and that at other times it is more moderate, and twice a day quite calm. Secondly, that the navigation in that part of the fea is not absolutely impeded by it, as at half flood a vessel can fafely go from Moskoenas to Werroe or Rost, and at half ebb may fafely return to Moskoenas. Thirdly, that the streight betwixt Moskoenas and Werroe is twice a day quite smooth and navigable for three quarEUROPE.]

ters

ters of an hour: and lastly, that the inhabitants of those islands accordingly row in their boats to Moskoe, which lies in the middle of it, to look after their sheep, which feed on that island, and the fishermen found the bottom of it. After these intervals, the swiftness of the current gradually increases to its usual boisterous rapidity and violence. Sometimes the waves in this current are not larger than those that are seen at sea in a hard gale of wind; but when its agitations are at the height, thips that fail on either fide of it, keep at the distance of two or three Norway miles, otherwise they would be absorbed by it, and entirely destroyed. It is discernable, indeed, at a great distance at sea, and even within a quarter of a Norway mile of the continent; but this does not render the fea unnavigable at fuch a diftance; for large veffels and fmall barks fail very fecurely within half a league of the Island of Werroe. This phenomenon does not proceed from any cavern or abysis under the water, but from its impetuous oppofition to the current of the tides, and the collision of

An eminent navigator, and Fellow of the Royal Society, in the year 1769, informed that learned body, in a letter, that, during the time of his being in the North e made particular enquiries concerning the Mosko strom, without being able to obtain any fatiffactory information, till he met with the mafter of a Norwegian veilel, who, being a very intelligent person, gave him the following account: That at high water it is perfectly smooth, and safe to pass over; but as the tide, either at ebb or flood, gathers strength, it becomes in proportion exceedingly agitated and dangerous; which extreme agitation and whirling the navigator imputes to the unevenness of the rocky bottom, over which the current rolls with vaft rapidity, being confined in a narrow paffage: for this Norwegian told. him, that, at very low water, pointed rocks, reaching above the furface, have been feen between the islands. It is no wonder then that fuch veffels may have been turned upfide down, as have been drawn by the tide, in its most rapid state, into this gulph. The simple agitation of the water would fufficiently account, in-deed, for the loss of open boats. This relation unravels, in fome measure, the mystery of the Norwegian whirlpool; and feems to be confirmed by the following circumstances, related by a learned gentleman, from the concurrent testimonies of others. "The surface exhibits different vortices, and if in one of them any thip or veffel is abforbed, it is whirled down to the bottom, and dashed to pieces against the rocks. These violent whirlpools continue without intervals, except for a quarter of an hour at high and low water in calm weather; for the boiling gradually returns as the flood or ebb advances. When its fury is heightened by a ftorm, no veffel ought to venture within a league of it. Whales have been frequently absorbed within the vortex, and howled and bellowed hideoufly in their fruitless endeavours to disengage themselves. A bear, in endeavouring to swim from Loasden to Moskoe, was once hurried into this whirlpool, from whence he ftruggled in vain for deliverance, roaring fo loud as to be heard on fhore; but notwithstanding all his efforts, he was borne down and destroyed. Large trees, being absorbed by the current, are sucked down, and rife again all fhattered into fplinters."

SECTION II.

Climate. Rivers. Soil. Mountains. Productions, Vegetable, Animal, Mineral, &c.

THE climate of this country is extremely different, according to the fituation of the different parts. At Bergen, and its vicinity, the winter is remarkably moderate. On the eaftern parts of the kingdom it fets in about the middle of October, and continues till towards the latter end of April with uncommon feverity, during which time the furface of the country in those No. 56.

parts is covered with fnow, and the waters are all frozen. On the mountain of Ruden, or Tydal, in this diffrict. a most dreadful affair happened in the year 1719. A body of Swedes being ordered to attack Drontheim, attempted to pass this mountain for that purpose, but being overtaken by a violent storm of snow and hail, they were bewildered and overwhelmed; and by thus having their march impeded, upwards of 7000 men, many officers, and the generals Labarre and Zoega, milerably perished. They were soon after found frozen to death by a body of 200 Norwegian fledgemen, under the command of Major Emahus, who discovered these unfortunate-victims to the feverity of the weather in various postures, some fitting, some prone on the earth, and others in a praying attitude. It appeared, that, in order to preferve their lives as long as possible, they had cut to pieces their muskets, and burned the wood they afforded them.

The northern parts of Norway are fell more intenfely cold during the winter; but the fummer is always warm, and often exceflively hot, throughout most parts of the kingdom. By the reverberation of the sun's beams from the sides of the mountains, the weather in the vallies is rendered fultry. Add to this, that the sun is so very short a time below the horizon, that the atmosphere and mountains have not hours enough to become cool. Hence vegetation is remarkably quick; and the summer, by rendering vegetation exceedingly expeditious, seems to make some amends for the horizons of winter.

The longest day at Bergen consists of 19 hours, and the shortest of 6. In the beginning of the summer the light increases with vast rapidity, and declines with equal celerity at the commencement of winter, which phenomenon are owing to the earth's inclination towards the pole. At the northern extremity of Norway the fun is, for a considerable time, continually in view, keeping always above the horizon, circulating daily round the pole, and gradually enlarging and contracting his orbit, until he at length quits that hemisphere. When this happens, all the light perceived at noon, for some weeks, is but very faint; and a winter's day can at best be deemed but a glimmer; but, happily for the inhabitants, the portion of time called night, is brighter than that denominated day; for what with the excessive glare of the moon, stars, aurora borealis, or northern lights, &c. the atmosphere is fufficiently illuminated to admit of their following their ordinary occupations at midnight, without the affiftance of any artificial

The air of Norway is, in general, healthy, except towards fome parts of the fea-coaft, where the moist exhalations are hurtful. Indeed, fome persons, of confumptive dispositions prefer such situations, on account of the greater ease with which a moist atmosphere acts on the lungs in respiration.

The great number of rivers, lakes, creeks, fprings, &c. with which Norway abounds, and the melting of the fnow in fummer time, occasion frequent rains, which often cause floods. But the inhabitants are exposed to the greatest evils from sudden thaws, and the vaft quantities of fnow and ice which are thereby loofened from mountains and precipices, and overwhelm, in their fall, men, cattle, houses, boats, and even sometimes whole villages and hamlets. Somewhat more than two centuries ago, a whole parish, near Hardanger, was deftroyed by the fall of a prodigious mass of This being converted into ice still accumulated, and afterwards formed a frozen mountain, beneath which a rivulet ran through a kind of subterraneous paffage, and, for fome time, its waters frequently brought with them many of the utenfils and fragments of the parish which had been so unfortunately over-

The northerly winds here are the freezing winds; the foutherly bring warmth; the eafterly winds are ftormy, and the westerly partake of the nature of trade winds, particularly on the coast of Bergen. It must be imagined

gined that the feas near this country are subject to a variety of fqualls, hurricanes, &c. Indeed they are frequently dreadful Nor is the dangerous phenomenon of the water-spout uncommon.

The fresh water of Norway is heavy and impure, full of particles of iron and ochre; yet it is not fo unhealthy, or unpleasant, as might be imagined.

The principal rivers of this country are the Nied, Sule-Ely, Gulen, Offeroen, Syre, Nid, Sheen, Tyrefiord or Drammoe, Laven, Glaamen or Stor-Elven. Of these rivers all the circumstances worth remarking are, that the river Gulen, in the year 1344, buried itfelf under ground, from whence it again burit forth with fuch violence, that the earth and itones thrown up by the eruption filled a valley near it, and formed a dam, which afterwards burit, through the force of the water, and occasioned the destruction of several churches, 48 farm-houses, and 250 persons. That the rivers Nid and Sheen have had their passages diverted by immense labour, and canals cut through the rocks for the convenience of navigation, and the greater facility of transporting timber to various places. And that the river Glaamen is the largeft in Norway.

The chief fresh water lakes of Norway are Rysvand, Shaafen, Selboe, the greater and lefter Mioes, Sluie-vand, Sperdille, Rand and Veften, Saren and Modum, Lund, Norfoe, Huidfæ, Farifyand Oeyavand.

"Wars (fays an ingenious writer) have been maintained on these inland seas, in some of which are small floating iflands, or parcels of earth with trees on them, feparated from the main land, and probably preferved in compact maffes by the roots of trees, Thrubs, and grafs, interwoven in the foil. In the year 1702 the family feat of Borge, near Frederickstadt, a noble edifice, with lofty towers and battlements, suddenly sunk into an abyfs 100 fathoms in depth, which was inftanta-neoutly filled with a piece of water, forming a lake 300 ells in length, and about half as broad. Fourteen per-fons, with 200 head of cattle, were destroyed by the river Glaamen precipitating itself down a water-fall near. Sarp, and undermining the foundation. Of all the water-falls in Norway this of Sarp is the most dangerous, from its height and rapidity. The current drives feventeen miles, and roars along with fuch violence, that the water, dashed and comminuted among the rocks, rises in the form of rain, and, when the sun fhines, continually exhibits a beautiful rainbow. In ancient times this cataract was used for the execution of traitors and other malefactors. They were thrown down alive, that they might be dashed in pieces on the points of rocks, and the in a dreadful commotion, analogous to those they had endeavoured to excite in the community.

The foil of rocky, mountainous, and low fituations, must differ materially of course. The mountains of Norway are bare and barren; but the foil washed down from them by torrents of fnow and rain, greatly increase the worth of the vallies, by fertilizing them to a prodigious degree. The earth confifts of unequal firata of black mould, fand, loam, chalk and gravel; the former, which lies uppermost, being extremely rich, and fit to nourish all kinds of vegetables. In fome parts of the kingdom clay is found, of which a tolerable kind of earthen-ware is made. Those parts which are deformed by fwamps and marthes, are exceeding dangerous to travellers. A narrow wooden caufeway, in the diocese of Christiansand, is extended above a mile over one of these swamps; in passing which, if either man or horse make a false step, it is certain destruction. A

The Norwegian mountains are aftonishingly high, dreadful to travel over, and tremendous to behold. That flupendous chain of mountains which extends through Norway from north to fouth, and is indifferently called Rucfield, Sudefield, Skarsfield, and Scareberg, receives different appellations at different parts. In particular, the principal names of the respective divisions of this chain are Dofresield, Lamsfield, Sagnefield, Tilefield, Halnefield, Hardangerfield, Jockle-field. Byglefield, Hicklefield, and Hangfield. The heighth and breadth of the whole vary as this extensive chain runs. That part called Dorefield is supposed to be higher than any other mountain in Europe. In some places a traveller goes about feventy, and in others lefs/ than fifty miles, to pass the hugh summit of this asto-nishing chain. Bridges are thrown over many dreadful cataracts, and other tremendous vacancies; and fome of these are but very indifferently fastened to the steep rocks on the other fide.

The road over that part called Tilefield, is named the King's, or Post Road; and, as guides, posts are fixed all the way, at the distance of 200 paces, to direct the traveller. This road extends 50 miles; and the only place of refreshment throughout the whole, are two houses, or mountain stoves, as they are called, which are maintained, at the public expence, for the reception of travellers, as well as furnished with kitchen

utenfils, firing, &c.

Imagination cannot conceive, or language express, more difinal fcenes than prefent themselves to those who pass these dreary mountains. 'Continually surrounded by dangers, and perpetually beholding spectacles of horror, the most hardy traveller must shudder, the most courageous be astonished, and the more timid be abfolutely terrified.

There is a fingle defile, by which a person may go from Sweden to Nordensfield, without passing the chain, that is, where the whole is interrupted by a very long and deep valley, extending from Romidale to Guldbranfdale. In the year 1612 a body of 1000 Scots, commanded by Sinclair, and fent over as auxiliaries to the Swedes, were put to the Sword, in this defile, by the peafants of Guldbranfdale, who neve give quarter to any whom they deem foes.

Independent of this aftonishing chain of mountains, there are a great number of others detached over the face of the whole country, and exhibiting a great variety of uncommon appearances. The vaft mountains and rugged rocks that deform the face of this country, are productive of numberless inconveniences. They admit of little arable ground. They render the country impafiable in some parts, and every where difficult to travellers. They afford flielter to wild beafts, which come from their lurking holes, and make terrible havock among the flocks of cattle.

They expose the sheep and goats, as well as the peafants, to daily accidents, in falling over precipices. They occasion sudden torrents and falls of snow, delcend with incredible impetuolity, and often fweep away the labours of the hulbandman. They are fubject to dreadful eruptions, by which huge rocks are rent from their fides, and, being hurled down, overwhelm the plains with inevitable ruin.

The peafants frequently build their houses on the edge of a fteep precipice, to which they must climb by ladders at the hazard of their lives; and when a person dies, the corpse must be let down with ropes before it can be laid in the coffin.

In winter the mail is often drawn up the fides of the mountains; and even in the King's road travellers are exposed to the frequent risks of falling over those dreadful rocks; for they are obliged to pass over narrow pathways, without rails, or rifing on the fides, being either shored up with rotten posts, or suspended by iron bolts, fastened in the mountains. In the narrow pass of Naeroe is a remarkable way of this kind, which

upwards of fix centuries ago, King Suerre caused to be made, with great pains and labour, for the passage of his cavalry.

Similar to the last mentioned road is another difficult and dangerous way between Vaug and Shogtadt: it winds by the fide of a fleep mountain, and, in many parts, is so narrow, that if two travellers should meet in those places, they would find it impracticable either to pass each other, or turn their horses; so that they mult both inevitably perish, unless one consents to throw his horse down th

When a sheep or goat falls down a rock, the owner hazards his life to regain his animal. For which purpose he is let down tied to the end of a long rope, and fitting a-cross a stick, when he gets to the bottom, he fastens the creature to the same cord, and thus both are drawn up together. Sometimes the rope breaks, and at other times the affiftants above are dragged down from the top, when all fall down the precipice, and ufually perith together.

When a man or horse fall from a very high precipice, it has been observed that the breath is not only stopped, by the repercussion of the air, but the body always burfts before it reaches the ground.

The trees of Norway conftitute a very principal part of its trade and commerce. Befides the vast quantities used at home in building houses, bridges, piles, moles, fences, ships, boats, &c. very large sums are received for firs and pines exported to various parts. The floating mafts and large beams down the rivers, and dividing other timber into boards at the faw-mills, employ a vast number of hands, and contribute greatly to the revenue; for a tenth of all fawed timber appertains to his Danish majesty.

The ploughed lands in Norway, with respect to those parts which are mountainous, boggy, and covered with forests, is only as one to eighty; it cannot, therefore, be supposed, that the kingdom produces near a fufficiency of grain to fupply the inhabitants. Peas, hops, hemp, flax, &c. are cultivated in fome parts, but to no confiderable advantage: the pasturage of the meadows, however, is rich, and nutritive to cattle.

The Norwegians formerly had garden-fluff, pot-herbs, &c. imported from England and Holland: for fome years past, however, they have paid such attention to the cultivation of those articles, that they can now fupply themselves.

Here are many wild plants, the infusion of one of which fome of the inhabitants drink in the manner of tea, and deem it an admirable pectoral.

As the scurvy is a prevailing diforder in Norway, nature hath bountifully supplied that country with a profusion of antifeorbutic herbs, such as angelica, rosewort, gentian, creffes, trefoils, forrel, fcurvy-grafs &c. But to counterbalance these conveniences, Norway abounds with many naufcous and poilonous herbs and plants, that are prejudicial both to men and cattle.

And admirable grafs, called viola camina, grows here, and which was rendered particularly famous by having, in the year 1652, contributed, in a most astonishing manner, to the preservation of two Norway youths. The story of this transaction is as follows:

Two brothers, on the first day of August, in the said year, made an excursion of about seven leagues from their father's house, to take their pleasure in hunting, shooting, fishing, &c., After having enjoyed the diver-sion of fishing for the space of four days, in the lake Riff, they rowed, in a small skiff, to a very small island on the faid lake. While they flaid here a fudden fquall of wind occasioned the skiff to break loofe, and drive to the shore, where their dog stood waiting for them.

As neither of the youths could fwim, they faw them-felves fuddenly abandoned to famine, on a defolate island, and sequestered from all intercourse with mankind. Their first care was to build a kind of hut, with finall flones, that they might, in some degree, be free from the inclemency of the weather. Towards the close of the fecond day, their appetites being whetted to the keenest sense of hunger, they industriously sought some vegetable food, and ventured to eat the viola camina, each to the amount of an ounce twice a day; and this was all that they could find at one fearch. Their stomachs were eased, their spirits refreshed, and the acute pains which had begun to feize their arms and shoulders immediately abated. Eleven days did they subsift on this vegetable, but it failed on the twelfth,

and they were reduced to the brink of defpair; when they accidentally found a little fpot overgrown with forrel, which they confirmed at one meal: nevertheless it was re-produced in less than twenty four hours, and the devout young men, with tears of gratitude to heaven, owned it as an interpolition of Providence in their behalf. During the first days of their suffering they had called and beckoned to their dog, and used every possible allurement to induce that animal to swim over, that they might kill him for their fubfiltence, but he would not obey their fignals. They were now reduced to fuch a weak condition that they could not fland, and could hardly make shift to creep from their but in quest of the forrel. The eldest was seized with a violent palpitation of the heart; and the youngest carved their names, and a short account of the sad accident they had met with, upon a piece of timber, pointing out, at the fame time, a text from the pfalms, on which he requested that their funeral fermon might be preached. Then having joined in fervent prayer, they embraced each other, and became perfectly refigned to their approaching fate.

In the mean time their dog, having tarried eight days with their baggage on the shore, returned to their fa-ther's house, where he refused food, and incessantly moaned in a most dismal manner: hence the parents concluded that their sons had met with some missortune, and diffpatched a man in fearch of them. The meffenger arrived at the lake, found their baggage, and con-cluding they were drowned, returned with the melancholy tidings. On the thirteenth day of their being on the island, and after having refigned every hope of re-lief, they heard the trampling of horses feet, and exerting their utmost efforts, they called out loud enough to be heard. The travellers immediately came to the shore, and, having found the skiff, humanely put off to the island, where they found the brothers almost exhaufted. The eldeft, when food was offered him, could fearce bear the fmalleft portion; and, after being conveyed to his father's house, remained for some time in great danger; but at length recovered, and furvived this difafter thirty-feven years. The younger recovered his ftrength fomewhat fooner, and afterwards drew up this narrative as a pious acknowledgement of God's

providence. Common fruits grow tolerably well here; but the fuperior fort but very indifferently. Norway, however, produces a great variety of excellent berries, fuch as juniper-berries, fun-berries, goofe-berries, barberries, cranberries, coriander-berries, rafp-berries, black-berries, bilberries, ftrawberries, &c. With respect to the stones of Norway, they have a

brown pebble, which eafily decays; black, blue, grey, and variegated marble; alabafter, black, white, stone, cement-stone, fand-stone, mill-stone, bakingftone, load-ftone, flate, tale, amianthus or afbeftos, fwine-ftone or a kind of cryftal, real cryftals, granates, amethyfts, agates, various kinds of fpars, thunderftones, and eagle ftones. The eagle-ftone is very fingular, and feems to confift of feveral thells, or crufts, laid one over another: but that which diftinguishes it from all others is its being hollow in the infide, in which cavity there is another stone that is smaller. This, when it is shook, may be heard to rattle. It is of various colours, as white, grey, dun, or brown. Modern authors mention only three forts of this ftone; the first of which is rough on the outside, and is of different colours, but commonly of a black dun. This makes a very diffinet noise when rattled. The second is of an ash colour, and contains a fort of marl in the The outfide is rough and fandy, and feems to confift of the particles of flint. A third is of feveral colours, but has the like contents as the former. The first kind is no larger than a peach-stone, but the other two are often as large as a man's sist. These sorts of stones are often as large as a man's fift. found in most parts of the country.

Metals and minerals abound in Norway. Iron is found in great plenty, and was the first metal ever worked in the country. Great quantities are annually exported, partly in bars, and partly in cannons, floves, pots, kettles, &c. the national profits of which are very confiderable. There is one species called moor-iron, found in large lumps in moraffes, and of this many domestic tools and utenfils are made for home consumption. The lead mines are deemed of little importance, but the copper mines are thought ineftimable. Of the latter are four of a capital nature, viz. That of Roaas, fituated about 100 miles from Drontheim. Theseopper works at Lykken, about 20 miles from Drontheim. Thele are very confiderable though inferior to the former. The mine at Indset, about 30 miles from Drontheim, where the copper is precipitated from its anen-ftruum by the means of iron. The copper works at Selboe, which is the least considerable of the four.

In the diocese of Christiansand gold has been found, but not in any confiderable quantities. At Kongsberg is a very valuable filver mine, the ore of which is admirable. Large maffes of pure filver have been found, among which one piece, weighing 560 pounds, is still preserved in the Museum at Copenhagen. The value of the filver annually obtained from this mine, is equivalent to the value of a ton and a half of gold; and the works employ, and give subfiftence to, great numbers of persons. At Jarliberg other silver mines are worked, but not to equal advantage, for this reason, that the ore is blended with lead and copper. At Kongf-berg a vitriol-work is established; and many parts of the kingdom yield sulphur and allum Salt is likewise made here, and turns to very confiderable advantage.

The quadrupeds of Norway are horses, black cattle, sheep, goats, hogs, dogs, cats, &c. The horses are small but swift, hardy and spirited. The black cattle are of a diminutive breed, but their flesh is tender, delicate and juicy: and the cows yield plenty of milk. The flesh of the sheep is delicious, and the sleeces profitable. The goats are very strong, exceeding hairy, and their fkins are much valued. Few hogs are reared here, but dogs are numerous of various kinds, and uncommonly serviceable: and the skins of cats both wild and tame, bear a great price, being used for winter garments.

The wild animals of Norway are the elk, rein-deer, hare, rabbit, bear, wolf, lynx, glutton, lerning, ermine, marten, and beaver.

The elk is a tall, ash-coloured animal, bearing some refembiance both to the horfe and ftag. It hath long legs, flat horns, and cloven hoofs. It is of a harmless disposition: the flesh tastes like venison, and the hide is tanned into strong leather.

The rein-deer has already been described.

The hares are fmall, and change their colour with the feafons, being brown in fummer, and white in winter; but the rabbits refemble those which are common in

England.
The bear here is, by some, reckoned of the cat kind. While his hair is on, he is a very ugly creature; but when he is stripped of his skin, he, in some degrees, refembles the human form. This resemblance consists chiefly in the length of the thighs, in which he is quite different from other brutes; and he has five toes oppofite to the heel. The bones on the wrifts are also like those of a man; but the thumbs are not separated from the rest of the fingers as in a man, and are placed on the contrary fides. Likewife the great toe on the foot is placed outwardly. In treading the bear does not touch the ground with his heel, for which reason it is covered with hair like the leg. Likewise the fingers of the fore paw are of a bad formation, being thick, and fet close to each other.

The wolves in Norway traverse in troops the immense forests, thick woods, and lofty mountains, and make terrible devastations, devouring every creature they can conquer: they likewise affail the small hamlets, break into the farmers yards, and do incredible mischief.

Wolves and bears in Norway are afraid of the found of a horn, on which account shepherds, shepherdesses, farmers, travellers, &c. always take care to fupply themfelves with fuch fonorous inflruments, in order to drive away those destroyers from their slocks and herds.

Various methods are taken, and fnares laid, to deftroy wolves: they are shot, poisoned, blown up with trains of gunpowder, taken in pits dug in the ground, and covered over with boughs, shot with spring-guns, &c. When any person digs a pit in order to entrap wolves and bears, he is obliged by law to give intimation of it through the whole diffrict, left any traveller, or other person, should, by accident, pass that way, and fall into it.

The lynx, called, in Latin, lupus cervarius, which, in English, is a wolf-hart, has been supposed to be of the shape of a wolf, and the colour of a hart. Others have thought that it was engendered between a wolf and a leopard, which is a great miftake, for he is nothing like a wolf; and that in which he refembles a leopard and a hart, is so common to many other animals, that it is very probable he has the name of lupus cervarius, because he pursues the harts in the same manner as a wolf does a sheep.

The muzzle of a lynx is not long and pointed like a wolf, but blunt and short like a cat, and the length of his head is about feven inches, his neck four, and his body twenty-four inches, without including the tail, which is eight in length. His height, from the extremity of the fore feet to the top of the back, is twenty inches; and from the bottom of his hind feet to the upper parts of his buttocks, twenty-three. He has five claws on the fore foot, and four on those behind. Each toe is armed with long, crooked, sharp claws, which are fometimes concealed like those of a cat.

The back is of a reddish colour, spotted with black; and the belly, and the infide of the thighs, are of a grey ash-colour, spotted likewise with black, but in a different manner; for the spots on the belly are larger, not quite so black, and more distant from each other, than those on the back, legs, and paws, whose outsides are reddish. However, all the hair is of three different colours; for the root is of a greyish brown, the middle red, or of an ash-colour, and the ends white. But this whiteness at the ends takes up so small a part of the hair, that it is no hindrance from feeing the principal colour, which is that in the middle; and it only makes the furface of the body appear as if it was filvered over.

The glutton is not larger than a turnspit dog, and is shaped very much like him. His skin is beautifully variegated, and has a most admirable lustre like damask; being fo fine and precious that he is shot with blunt arrows, that the skin may not be injured. This animal is fo ravenous, and hath fuch an infatiable appetite, that he will devour a carcase nearly as big as himself When he is fo overgorged as to be quite uneasy to himself, he fearches out two trees that grow near together, and fqueezes himfelf between them till he exonerates his fomach; and during this operation he is so sick that is fiercenels fubfides, and he may be eafily taken.

The lerning, or Norway moute, is, in shape, like a

common mouse, or rather like a dormouse, only his tail is lefs; he is about five inches in length, and covered with thin hair of various colours. These creatures do great mischief in pastures and corn-fields; and when they die, they infect the air in fuch manner that it

causes dangerous diseases.

The ermine, or hermelin, is a kind of weazel, and usually resides in the clists of rocks, or among a heap of stones. It is all over white, except the end of the tail, which is black. It is greyish about the eyes, and there is a fpot of the same colour in the middle of the head, as also between the shoulders, and on the tail. However, the colour varies according to the season of the year, being white in winter, and brown in fummer. None are ignorant of the high efteem in which the fkin of this little animal is held throughout all Europe. It is the foftest and the most beautiful whi cream coloui fuch like; b that they will putrid.

However, of the year, be-: fkin of this little It is the foftest and the most beautiful of all furs; but then it loses its beautiful whiteness by age, and turns of a yellow or cream colour. It feeds upon rats, mice, moles, and fuch like; but it is remarkable in those kept in cages, that they will never touch any kind of flesh until it be

The marten is of the fize of a cat, but fomewhat longer. The ears are short, broad, and roundish; the eyes thine in the night like those of a cat, and the note is fomewhat prominent; the upper jaw is blunt, the tongue long and fmooth, and covered with sharp papillæ, but they are foft, and the points are turned backwards. The teeth are very white, unequal and rough; and it has whifkers like those of a cat: the feet are divided into five toes, and are hairy all over; they are united half way by a membrane, and what is called the great toe is the shortest, and at a distance from the rest. The tail is covered with long hair, which makes it seem thicker than it really is.

In fome places the common marten delights to be among buildings, fuch as caftles, churches, barns, haylofts, flacks of woods, pigeon-houses, and the like. He is a great enemy to domestic fowls and pigeons, and will kill a great number whenever he can come at them. He is also very fond of eggs, and will carry them from one place to another without breaking. The dung is faid to have a musky smell, by which means their haunts may be found out. Martens fleep in the day time, and go abroad in the night in quest of their prey. They are hunted in some places by a fort of dogs, that feem to be defigned by nature for that purpose. Perhaps they may be the same as our fitchet dogs, so called from their hunting the pole-cat, or fitchet. These animals are hunted for their furs, which are very valuable, and they are in feafon in the beginning of the winter.

The flesh of the marten is faid to be good eating. In fome places they make use of the dung as a pertume; and fome pretend it is good to diffolve the fwelling of the glands. The gall, when mixed with fenel-water, is recommended to take out spots in the eyes.

Some authors diftinguish martens into two kinds, the domestic marten with a white throat, and the woodmarten, that is to be found in the forests confishing of fmall trees, in which they make their nefts, much in the fame manner as fquirrels. This may be known from the former in having a yellow throat, and the fur on the rest of the body more of a sallow colour. Some call it the golden marten, and its fkin is much more valuable than that of the other.

Befides the before mentioned animals, Norway is productive of foxes and squirrels. The skins of the foxes are greatly valued, their fur being either white, red or black; but the latter is the most estimable. The Norway foxes have the common character for cunning which the foxes of other countries have; nor do the fquirrels feem to be behind hand with them in point of fagacity.

The reptiles and infects of this country are both va-

rious and numerous.

The west wind brings many insects that greatly hurt vegetation; and the waters are productive of infects that are exceedingly injurious to the fisheries, by de-ftroying the fish. The most particular of the latter is the little fea-horfe, which exceeds nine inches in length; and, in the head, fnout, and mane, is fomewhat like a horse. It is about the thickness of a man's thumb, and the body is full of clefts and furrows. The fnout is a fort of tube, with a hole at the bottom, to which there is a cover that he can open and shut at pleasure. The upper part of the body feems to have feven fides; but below the vent it refembles a figure confifting of four fides. The eyes are finall and prominent, and between them are two high tubercles. The tail ends in a point, and is generally very much bent. Behind the eyes, where the gills are placed in other fish, there are two fins which look like ears, and above them are two holes; but there are no gills, either outwardly or No. 56.

inwardly. The whole body feems to be composed of griftly rings, on the intermediate membranes of which teveral imall prickles are placed. Their colour is a dark green, but towards the tail inclining to black. The belly is marked with ipots of a whitish blue. It is taken in the Mediterranean, and also in the Western Ocean.

Norway abounds in most of the fowls and birds common to, and well known in, European countries.

The fea-coasts are overspread with innumerable flights of Aquatic fowls, that build their nefts, and hatch their young, among the cliffs, rocks. neighbouring iflands, &c. and feed on fifnes, infects, and feaweeds, Among these are aftonishing numbers of wildducks, geefe, and alks: the latter are peculiar to the country, build in the most inacceffible rocks, fly in fuch numbers as even to darken the air, and, with their wings, make a furprifing noife, that fomewhat refembles the rifing of a tempest. Many other birds build in the cliffs and mountains, though not in fuch vast numbers; and the Norwegian peasants, who refide near the sea coasts, are employed, at a certain seafon of the year, in climbing the rocks at the most imminent danger of their lives. But their skill and intrepidity, in general, furmount every obftacle; and the birds they make prize of are to them very valuable, as the flesh and eggs furnish them with food, and the down and feathers fell to great advantage. An in-genious writer, in speaking of the Norwegian methods of bird-catching, says, "In some of the Nordland districts, the farmers train dogs to fpring the shore, and strand birds from their holes, which are almost inacceffible. These are auxiliaries to the bird-men or climbers, who either fcramble up the face of perpendicular rocks, with most aftonishining courage and dexterity, or they are lowered down by ropes, fometimes above 100 fathoms over projecting precipes. Some of the birds will allow themselves to be seized in their nests; others are taken in a net fixed to the end of a pole, which the bird-man applies to the mouths of the holes from whence they take their flight. In climbing up the rocks two bird-men tie themselves together with a rope of a moderate length. The first being pushed up by the other's pole to a proper flanding-place or projection, fixes himself to the rock, and the second clambers up, affifted by the rope that is tied round the waift of his fellow. In this manner they proceed alternately, till they arrive at the birding places. But fometimes, in spite of all their skill and precaution, one slips, and dragging the other after him, both perish. Some perions also lose their lives yearly in the other operation of descending from the summits; loose fragments of the rock being moved in the descent, sometimes fall upon and kill the bird-man; and fometimes the rope being cut by the sharp-pointed stones, he is precipiated and dashed to pieces among the rocks.

Two of the Norwegian birds are known by the names of the north-wind-fowl and fouth-wind-fowl: the former is of a grey colour, fmaller than a starling, and makes a very uncommon noise previous to the blowing of the north wind; and the latter never appears in Norway but as the fore-runner of a fouth wind; hence they

both receive their appellations.

The trier, or cock of the wood, is the principal of the game fowls, and the largest of all the eatable birds in the country; it refembles a wild Turkey-cock in the bill and feet, has black or dark grey feathers, and red round the eyes.

The Norwegian eagle is of two species, the water and land eagle. The water eagle is the largeft, and lives chiefly on the produce of the feas and rivers. The land eagle preys upon land animals, fuch as fheep, hares, lambs, kids, &c. Independent of which he kills many birds, and has fometimes been known to deftroy children.

About the latter end of autumn the Norway swallows try to conceal themselves among the reeds and bushes in fresh-water lakes, where they remain all the winter in a state of insensibility, and revive again in the spring. The peafants and fishermen frequently find whole flocks of them in this benumbed condition, coupled together, with their legs and bills entangled. If brought into a warm apartment they feel the enlivening warmth, and in about half an hour's time, begin to move; foon after they flutter, and even begin to fly about; but, within the space of an hour, they drop down dead; which is owing to their being prematurely waked from their lethargy, or revivified before the natural time.

The Norwegian feas abound with fish, among which is a species of the shark called haac-moeren, which is ten fathoms in length, and whose liver is so fat as to

yield three casks of train oil.

The helleflynder is a prodigious large kind of turbot, which, upon various occasions, appears to have exhibited fymptoms of revenge against mankind.

The whalebone, or blubber-whale, which we have already described in our account of Greenland, is likewise found in the Norwegian seas, as are great numbers of

fperma-cæti whales.

In January, 1762, a fperma-ceti whale was brought into Greenland dock by a trading vetlel. Those who were concerned in taking it, give the following account of this fish, and the manner in which they kil-

led it.

As they were going through the Hope they faw fomething floating at a diffance, which appeared to them like the maft of a ship; but as they approached it, they discovered it to be a large fish, and, upon seeing it call up a great quantity of water, concluded it was a whale. They chaced him athore below the Hope-Point, and went off to him in their boats. He feemed a motionless lump, his head and tail being concealed in the water. They first pierced the prominent parts; and, having dug a hole twelve inches deep, a great torrent of blood issued forth. Upon this they withdrew to a distance, and soon after the boat had passed him (as the water was deep enough over his tail) he ftruck the ground with fuch violence as to force up ftones and mud to a great height in the air. They waited about three quarters of an hour, and then he expired with the most horrible groans. After this they fastened a cable to his body, and at last brought him to Greenland-dock where he was feen by several thousands of people.

They took out of his head eight puncheons of sper-

ma-ceti, which lay between the eyes and the spout-hole, in different cells in the brain. . Its extreme length was 54 feet, and its breadth 14; the lower jaw was 10 feets and the length of the penis eight; the tail measured 15

Amongst a valuable collection of curious anatomical figures in this metropolis is the skeleton of a whale of this kind. Those who shew this curiosity say, that it will contain thirty people in its head, and fifty in its cheft; and that twelve hogheads of spermaceti oil were taken out of its upper jaw, or rather that part of the head above it, which was entirely com-

posed of flesh and oil.

This whale was thrown ashore on the Isle of Thanet, Feb. 2, 1762, and measures, from the snout to the tail-fin, 72 feet. The upper jaw, which appears to be one solid bone, is 16 feet long, and fix broad at the top, where it is widest, and from whence it grows narrower to the end of the snout, which terminates in a point. Along the middle of it runs a deep round groove, through which is sucked up the water, which he afterwards discharged at the spout-hole. From the top of this jaw proceeds a large thick bone, which turns upwards almost perpendicularly to the height of about four feet, and forms, as it were, part of a kind of skull. The under jaw is not near so wide as the upper, herein being just the reverse of the toothless whale. At the dif-tance of about eight feet from the snout it divides and becomes forked, in order to receive in the cavity a pro-tuberance of the upper jaw, which feems exactly to fit it. This jaw had two rows of teeth. The upper jaw

has no teeth; but, instead therefore, there is a groove or focket to receive those of the lower; so that, when the mouth was shut, they must have resembled so many pointed weapons in a sheath. The sockets of the eyes, which are of an oval form, and placed almost at the further part of the jaws, measure about eighteen inches Hence what is told us by some writers, that the chrystalline humour of the eye in this fish is not bigger than a pea, must appear to common reason as a sable; for we must not suppose that nature is so unequal in her proportions. Beyond the fockets of the eyes are the two fin bones, which are very thick, five feet long, and two feet three inches in the broadest part. There are eleven ribs on each fide, the largest of which is ten inches in circumference. The ribs form a cavity eight feet wide within the body of the fifth, and in which were contained the heart, lungs, &c. The back-bone is at much the fame distance from the floor, by which the ribs are supported. The back bone, which is three feet ten inches thick, (meatured in the round part only, for the upper part of it is closely fet, throughout the whole length of it, with spinal bones, like those of a hog) and the tail fins, which extends about 15 feet, compole the rell of this skeleton.

Though many parts of this skeleton-seem much decayed, probably owing, in a great measure, to the injuries it must have unavoidably received in being temoved from place to place, it is nevertheless highly worthy the attention of those who delight in natural curiosities. The particulars, as related above, were lately taken by

one of the authors of this work.

Seals abound about the coast of Norway, they reside in caverns and rocks in the fea, but go on shore twice a year, to bring forth their young. They are easily killed by the fishermen, who strike them over the note with large sticks; after which the fat is flead off with the skin; the latter being sprinkled with salt, and rolled up fingly, and the former deposited in casks for train oil.

The sea scorpion is a fish about four feet long, with a head larger than the whole body, of a hideous afpect, wide mouth, enormous jaws, and finall scales, of a reddish colour. Its bite is poisonous, and it is an exceed-

ing voracious creature.

The fea devil is about fix feet in length, but the head makes full one half of the fifh. The body fuddenly tapers into a sharp-pointed tail; the eyes are large, and the jaws wide and horrible, let with different rows of sharp teeth; the tongue is likewife furnished with a kind of teeth, or tharp protuberances, so that the bite is terrible; and all round the under jaw, which projects beyond the inpec, there are hanging flips, or griftly furs, of about four inches in length. This fifth is extremely voracious, defroying innumerable other fifthes of various species and fizes; and if he can feize upon a man that is bathing, he is fure to kill and devour him.

Salmon fwarm in these seas, are caught in great quantities, and highly esteemed all over Europe.

The salmon is a very beautiful fish, and is every where in great esteem. The semale may be distinguished from the male, by having a longer and more hooked shout, in having scales that are not quite so bright, and having its body speckled over with dark brown spots. Likewise the belly is statter, the sless more day, and not so red, more vet is the tasse. is more dry, and not fo red; nor yet is the tafte fo

The flesh of this fish is not so red when boiled, as the fleth of this film is not to red when bouled, as when raw or falted. It is tender, flaky, and lufcious; for which reason it satisfies sooner, and is harder of digestion, though generally preserved to that of other fish. About the time of spawning it grows more inspid, and loses a great deal of its lively colour. Some begin to be out of season about the beginning of July, and others much later; which may be known by their falling away, their losing their beautiful spots, and by their colour; infomuch, that when they are quite out

of feafon, they look like fish of a different kind.

pring of a fick-

ly falmon, which has been forcibly detained from vifit- || ing the falt water: it is agreeable enough to the eye, though its tafte is very ordinary and infipid. The falmon chuses the river for its abode about fix months in the year, entering the fresh water about February or March, in some places, where they continue to the autumnal feafon, at which time they cast their spawn, and foon after return to the fea. In general the falt water contributes most to their growth, and the fresh renders them fat.

When the time of spawning comes, the female makes a hole in a gravelly bottom, like a kind of nest, of her own dimensions; which done, the discharges her spawn and retires. Then the male, or milter, advances and covers the spawn with its belly, emitting at the same time, a whitish stuid like milk. After this the female returns, and they both endeavour to cover their brood with gravel, in which they work with their nofes like

They then return to the deep to recover their ftrength, which, they usually do in about twenty days.

The falmon has different names, according to its different agaes, being in the first year called finelts, in the fecond fprods, in the third morts, in the fourth forktails, in the fifth half fith, and in the fixth, at which time they are thought to have attained their proper growth, they are judged worthy of the name of falmons. When they are largest they weigh near forty pounds.

The herring is from fix inches to a foot in length. That which diftinguishes this fish from all others, is a fealy line that runs along the belly from the head to the tail. The colour on the belly and fides is of a fining filver; befides, the feales are large, and come regularly off. It has no fpots, and the belly is fharp like a wedge, with red eyes The scales are large in proa wedge, with red eyes portion to the body.

A herring dies immediately after it is taken out of the water, whence the proverb arties, "As dead as a herring." The flesh is every where in great esteem, being, fat, soft, and delicate, especially if it be drest as soon as caught; for then it is incomparably better than on the next day. There are valt quantities of these fish taken, salted, smoak-dried, and consumed all over

Herrings are diftinguished into fix differents forts; as the fat-herring, which is the largest and thickest of all, and will keep longer than any; the meat herring, which is likewife large, but not so thick or so fat as the for-mer; the night herring, which is of a middling size; the pluck, which has received some damage from the nets; the shotten herring, which has lost its roe; and the copfhen, which by tome accident or other, has loft

These useful fishes annually visit the western coast of Norway in fuch amazing fwarms as to exceed all belief. The innumerable shoals that emerge from their shelter under the ice; towards the north pole, divide them-felves into three-bodies, about the latitude of Iceland. One of these directs its course westward, steering round the Hebrides, and coast of Scotland, towards Newfoundland; the fecond steers towards the coast of Great Britain; and the third, coasting about Norway, paffes the Sound into the Baltic.

The herring and cod are driven in great shoals upon the coast of Norway, by the great herring whales; who, not daring to venture in among the rocks, or be-tween the iflands, remain about fix weeks on the back of the great fand-bank parallel to the shore, extending about 30 miles in length, in order, as is supposed, to watch the return of the shoals. But though the herring. whale is thus ftopped in his purfuit, the tharks, por-poiles, and other finaller fithes of prey, can eafily enter between the channels, and among the rocks near the fhore, and these continue the pursuit in such a manner, as to drive the cods and herrings into every little creek and inlet, and even to the very margin of the water; fo that innumerable quantities may be easily taken.

veral hundred ship loads of pickled herrings are yearly exported from Bergen only, besides the great quantity confumed at home by the common people.

The largest and fattest herrings appear upon the coast from Christmas to Candlemas, at which season the country people affemble upon the shore in great numbers, with their boats, casks, salt, sishing-tackle, &c. In the compass of one mile near 300 boats are daily employed, for a month together, in fishing. are about 20 feet in length, and, in each, the fisher-men will often catch near 5000 herrings. The fattest men will often catch near 5000 herrings. The fattest and best are pickled for exportation; but the worst fort are confumed in the country. The cod, ling, kabelian, and forsk, are caught in strong nets of 400 fathoms in length, in 50 or 60 fathom water: then being pickled with French or Spanish falt, or dried by various methods, they are, in general, exported to Bremen, Hamburgh, Amfterdam, &c. The Norwegian cod and herring fisheries employ and maintain an incredible number of people.

The fea produces a great variety of shell-fish. Of these the most particular are the pearl-mussel, the right of which fishery appertains to the King of Denmark, and is carried on at his expence. The pearls which are taken annually about Midfummer, become the property of the queen, as part of the regalia of Norway; and fome of these are very little inferior to the oriental

The star-fish is commonly about nine inches in length, and fometimes twelve. The whole face, and the covers

of the gills, are very rough, with a fort of warts or tu-bercles, fome of which are prickly.

That extraordinary production of nature which is ranked among fifhes, and called the fea-nettle, is of two kinds, one of which comprehends those that always remain fixed in one place, like fea plants; and the other

contains those that change their place.

The wandering fea-nettles have nothing common with the preceding, except in the name, and they have different appellations in different places, as also according to their fizes. When they are thrown upon the fea-coast they appear to be quite motionless, which perhaps may be owing to the shocks they have received against stones or the fand, which may be sufficient to deprive them of life; for it is certain they are a fort of animals.

The Northern Ocean produces fome very extraordinary animals, as the merman, mermaid, great fea-fnake, and kraken or korven.

The mermaid or merman are fea animals, that bear fome refemblance to the human form. In the year 1719 one of the males of this species was found dead on a point of land in Noordland. His colour was of a dark grey; the face refembled that of a man, with a large mouth, and flat nose; the arms were attached to the fides by a thin membrane, and terminated in paws like those of the sea-calf. The body tapered into a fish's tail, like that of a porpoise, and the length ex-tended to three fathoms. The mermaid is formed in the same manner, bating the difference of sex, which is diffinguished like that of the human race. creatures have been feen in many parts of the North Sea, have appeared of various magnitudes, from two feet to three fathoms.

In the year 1723, three fishermen of Elsineur, in Denmark, being examined, upon oath, before the privy counfellor Frederick Van Gram, declared that, in the month of July, in calm weather, between Hveen and Saediand, they approached, in their boat, something that floated on the furface like a dead body, which lay without motion till they were within feven or eight fathoms of it, when it funk instantaneously, and rose again nearly in the same place. There he stood near a quarter of an hour staring at them, and was seen above the water to his breast. Being terrified at the fight of this monster they began to row away. He then blew up his cheeks, uttered a kind of muttering roar, and dived under water. He appeared like an old man,

with broad shoulders, and a small head, covered with a huge sea monster, or prodigious large sish. For want short, black, curled hair. His eyes were hollow, his of knowing this, those beautiful passages in the book face was meagre and weather-beaten, and his skin was coarfe and hairy. One of these deponents further declared, that about twenty years before, he had feen a

mermaid, with long hair, and large breafts.
"The marmiele, or marmate, belongs to the fame class, and is, perhaps, the young of this species. It is formed of different fizes, and often caught on hooks by the fishermen of Norway. Some are no bigger than infants half a year old, and others are as large as children

of three years.

" The fea-fnake is peculiar to the Norwegian feas, where it has been feen by many hundred people, mariners, fishermen, and others. In the year 1746, a mariner belonging to Bergen, shot at a fea-snake, which immediately disappeared; and when the boat was rowed near the place, the water appeared tinged with blood. The head of this animal, which it held at least two feet above the furface of the water, was of a greyish colour, and refembled the head of a horse. The mouth was very large, and black; the eyes were of the same colour; and a long white mane hung down from its neck, which floated on the fea. Befides the head, they they faw feven or eight coils of this make, about the diffance of a fathom one from the other.

" In Egede's journal of the Greenland mission, we find that, on the 6th of July, 1734, a large and frightful fea monster raised itself to a most surprising height out of the water: that it had a long sharp frout, broad paws, and spouted water like a whale: that the body feemed to be covered with scales: the skin was uneven and wrinkled; and the lower part was formed like a fnake. It plunged itself back in the water, and then raifed its tail above the furface a whole ship's length

from the head.

"Though the exact dimensions of the sea-snake cannot be afcertained, it may be concluded, from the concurring testimony of those who have feen it at sea, that it is 100 fathoms in length, and that its body is as large as a hogshead. That its sense of smelling is very acute, the fishermen conjecture from the circumstance of its avoiding the fcent of castor, a quantity of which they therefore provide themselves with when they go out to fish in the summer; and when they meet the sea-snake they throw a finall portion of it overboard.

"But the most furprising creature in this sea, and, perhaps, in the whole world, is the kraken, or korven, an animal of the polypus kind, but feemingly a mile and a half in circumference. The Norwegian fishermen fometimes, in a hot fummer's day, find no more than 20 or 30 fathoms water where the depth used to be 80 or 100; and here they catch great plenty of cod and ling. They know the kraken is below them, and that they are filhing upon his back. When they perceive, by their lines, that the water grows more and more shallow, they judge he is rifing flowly to the surface, and row away with great expedition. At a proper diffance they lie upon their oars, and in a few minutes, part of him appears above the water, representing a number of fmall iflands and fand-banks covered with fea-weeds, and abounding with a great variety of fish, that leap about, and roll off his fides into the water. At length a great number of pellucid antennæ rife upon his back, as large and high as the masts of moderate vessels. By means of these instruments, or tentacula, he moves himself, and gathers in his food, which confifts of small After he has remained a little time at the furface, he begins to fink again gradually, and this motion produces a dangerous swell and whirlpool in the water. In all probability the floating islands, which have been described by so many voyage writers, were no other than the back of this huge monster."

In the holy scriptures the whalebone, or blubber whale, the sperma-ceti whale, the great sea-fnake, and the kraken, feem to have been all described under the general name of Leviathan; for that word is of universal acceptation, and implies not a particular fifh only, but of Job, where Leviathan is described, having been frequently misunderstood. Those parts (as finely paraphrased by the celebrated Dr. Young) which apply to the whalebone or blubber whale, we have already given in our account of Greenland. The lines which fuit the sperma-ceti whale, as rendered by the same reverend author, are these:

At length my huge leviathan shall rife, Boaft all his ftrength, and spread his wond'rous size. Whose heart sustains him to draw near? Behold Destruction yawns. His spacious jaws unfold, And, marshall'd round the wide expanse, disclose Teeth edg'd with death, and crowding rows on rows, What hideous fangs on either fide arife! And what a deep abysis between them lies! Mete with thy lance, and with thy plummet found, The one how long, the other how profound!

Those suitable to the great sea-snake are as follow:

When late awak'd he rears him from the floods, And, stretching forth his stature to the clouds, Writhes in the fun aloft his scaly height, And strikes the distant hills with transient light. Far round are fatal damps of terror spread: The mighty fear, nor blush to own their dread.

The following lines are applicable to the kraken, that aftonishing animal, hitherto unconquered by the most fubtle, and dreaded by the most courageous:

His like earth bears not on her spacious face; Alone, in nature, stands his dauntless race. For utter ignorance of fear renown'd, In wrath he rolls his baleful eyes around Makes ev'ry swol'n, disdainful heart subside, And holds dominion d'er the fons of pride.

SECTION III.

Descent, Language, and Religion of the Norwegians. Description of the distinct Governments or Provinces of the Kingdom.

THE people of Norway derive their origin from the ancient Normanni, a barbarous race, who annoyed great part of the coasts of Europe with piratical armaments, in the eighth, ninth, and tenth centuries. Many Danish, English, Dutch, Scotch, and German families, have fince fettled in this country, and now form a confiderable part of the inhabitants.

Their language, in most places, is the same with that of Iceland, which proves them to be of the same origin: but, in the civilized parts of the country, the language

differs but little from that of Denmark.

The Christian religion is faid to have been planted here about the middle of the tenth century: the reformation was established by the Danes: so that Lutheranism is the national religion. They have an archbishop at Drontheim, and a bishop in each of the four following towns, namely, Bergen, Staffanger, Hammer, and Obfolo, otherwise called Christianburgh.

Justice is administered here in several courts, from which appeals lie to the fupreme court, which is fettled in the capital of the kingdom, where the viceroy refides, who governs this ftate with an absolute power.

Norway is divided into four governments, or prefectorships, which are those of Aggerhus, Bergen, Drontheim, and Wardhus; besides that of Babus, which is subject to Sweden; and the several islands de-pending on Norway. Of all these we shall give a distinct account.

The province of Aggerhus, in Latin Aggerhusia Præfectura, is the fouth-east part of Norway, and is

fituated between from which it and Bahus, w mouth of the and the provin tent from fout east to west, in narrower north mountainous a fruitful, being which pass thre It is divided in finden, Halling ritkir, and Tal particularly Flo pretty confider The most co

rnments, or preggerhus, Bergen, that of Babus, feveral iflands dee shall give a dif-

Latin Aggerhusia Norway, and is situated fituated between the province of Bergen on the west, from which it is separated by vast mountains; Dalcarlia and Bahus, which belong to Sweden, on the east; the mouth of the Baltic, called the Categate, on the south; and the province of Drontheim on the north. Its extent from south to north, is about 300 miles, and from east to west, in the south part, about 120; but it grows narrower northward, till it ends in a point. The land is mountainous and woody, but the vallies are tolerably fruitful, being watered by many lakes and rivulets, which pass through the sountry, and fall into the Baltic. It is divided into fix particular governments, viz. Agdefinden, Hallingdal, Hammer, Hennemark, Rommerritkir, and Tallemark. There are here several sea-ports, particularly Fleckeren, were the sishing-trade affords a pretty considerable income.

The most considerable cities and towns of this province are Obselo, Anslo, or Christiana, in Latin Ansloa, or Ansloga Civitas, or Christiana. They chief city of this province is seated at the bottom of a narrow bay, and is 30 miles distant from the Baltic, and about 110 from Schagen-Cape in Jutland, to the north. It is the seat of the sovereign court of justice, where sentences are pronounced in the presence of the governor of the province of Aggerhus, and of the viceroy. This city owes its foundation to king Harold, cotemporary with Sweno, king of Denmark, surnamed Estritius, because he was the son of Margaret, surnamed Estrita, daughter to Sweno II. and sister to Canute the Great. Harold kept his court here in the middle of the eleventh century.

When the Swedes were befieging the fort of Aggerhus, in the year 1567, the Danes, in order to take from them all pretences for flaying in the country, burnt the city of Obselo. A peace was concluded between them three years after; and Frederick II. of Denmark, under whose reign this town was burnt, dying in 1588, his fucceffor Christian IV, rebuilt it in 1614, and called it Christiana, by which name it has been generally known ever fince. It is the fee of a bishop, under the archbishop of Drontheim. The cathedral is dedicated to St. Alward, and in it is shewn the sword of Haquin, one of their ancient kings, the hilt of which is of chryftal, and a great curiofity for art, as well as antiquity. This is a place of good trade for fir-timber, pitch, &c. Many mackarel are caught here; and much pearl is found: of the latter, Henricus Arnoldi, a Dane, gives the following account: their shells are like those of muscles, but larger, and the fish like an oyster, which produces a great cluster of eggs, like those of cray-fish, some white, and some black. These eggs, when ripe, are cast out, and grow like the shell, from whence they came: but fometimes it happens, that one or two of these eggs flick fast to the side of the matrix, and are not voided with the rest: these being fed by the fish, in time grow into pearls of different fizes, and imprint a mark, both in the fifh and shell, of the same figure with themfelves. In this city the nuptial rites between king James VI. of Scotland, afterwards king of England, and Anne, the daughter of Frederick II. king of Denmark, were folemnized, on the 23d day of November 1589, that prince having taken a voyage thither, upon the lady's being driven back by contrary winds, when she first set out for Scotland.

Aggerhus, or Aggerhuslor, in Latin Aggerhusia, from which the whole province takes its names, lies on the bottom of the same bay, about 15 miles from Christiana, to the south-west. It has a strong castle, memorable for the brave resistance it made against the Swedish army in the year 1567, which besieged it hotly for 18 weeks together, but was at last beat off, and forced shamefully to retire.

Friderickshall, or Friderickshadt, in Latin Fridirico-shadium, stands on the Categate, at the mouth of the river Glammen, which rises in the mountains, in the province of Drontheim, and having passed through Aggerhus, falls here into the sca, and thereby assorb this city a pretty good trade. It is about 50 miles distant from the town of Aggerhus towards the south-east, well fortisted, and of such importance, that it is deemed No. 57.

the key of this kingdom. Charles XII. king of Sweden, fat down before it in the beginning of December, 1718, and was killed there by a cannon ball, the 11th of the same month, as he was viewing the trenches.

Saltzberg is a small town on the river Drammen, which falls into the bay of Christiana, from which city it is about 15 miles distant to the north. It has a pretty considerable trade from the neighbouring copper and iron mines.

Tonsberg stands on the left shore of the bay of Christiana, and is about 20 miles distant from the city of that name to the south.

Skeen, or Scheen, a few miles from Tongsberg, stands on the Categate. Both these towns are places of good trade, by means of the beforementioned mines. A tilver one was discovered in the neighbourhood under the reign of Christian IV. but it appears that it is not a rich one, not being worked at present.

Hammer, or Hammear, stands on the eastern bank of a long and narrow lake, formed by a river which, above 40 miles lower, falls into the Glammen. It is 100 miles distant from Christiana, to the north-east, and was formerly a bishop's see, which has been removed to Christiana. It is divided into the Greater and Lesser Hammer, which are parted by a small canal, or arm of the lake.

Hollen, feated on the lake of Nordsee, 15 miles from Tonsberg to the north-west, is remarkable for its church, which is cut out of the rock called Vear, and has a burying-place on the top of it. It is very ancient, and supposed, by Olaus Wormius, to be originally a temple of the heathens.

The province or government of Bergen, or Bergenhus, comprizes the most southerly, and also the most westerly part of Norway, and is surrounded by the sea on the south, south-west, west, and north. It has the government of Drontheim on the north-east, and that of Aggerhus on the east. Its extent from Cape Naze, in the south, to lat. 62 deg. 30 min. where the government of Drontheim begins, is about 290 miles; but its greatest breadth, from east to west, is not above 90 miles, and in many places much less. It is divided into the governments of Bergen, properly so called, and Stavinger, which are again subdivided into lesser districts, or præfectures.

The chief towns here are Bergen, an ancient and fa-mous fea-port, mentioned by Pomponius Mela, and Pliny; it stands on a crooked bay called Jeltefiord, into which the entrance is by a narrow streight named Carmefundt, bordered on each fide with high rocks for several miles together. This town is 137 miles distant from Christiana to the north-west. The bay here is so deep, that veffels of above 400 tons can enter it, and come to load and unload before the merchants warehouses. The inhabitants are partly natives of this country, and partly Germans and Danes, whom the convenience of the town for trade has drawn thither, this being the principal mart and magazine for feveral merchandizes; divers forts of fine furs, vast quantities of hides, tallow, fir-timber, &c. being brought hither from the neighbouring provinces, and shipped off to foreign parts. The inhabitants drive also a considerable trade in stock-fish, which are taken on these coasts, and in the lakes, in January, and dried in the open air. The privileges granted by the king of Denmark to strangers make them flock to this town, and import thither those necessaries of life which the country does not produce; as wheat, rye, bifcuits, beer, wine, brandy, &c. which they exchange for the merchandizes abovementioned. This is the fee of a bithop, fuffragan to the archbifhop of Drontheim. The churches here are pretty well built, as are also all the edifices raised by the merchants of the Hans-Towns, and particularly their exchange. The common people's houses were formerly of timber only, and covered with turf, fo that the town was several times reduced to ashes; but since the year 1702, when it was almost entirely burnt down, the houses have been rebuilt with stone, so that it is now reckoned

the largest, most beautiful, and most populous town in Norway, and is the capital of the whole kingdom. On the west-side of the town stands a royal citadel, in which the governor resides, and which serves also to defend the harbour.

There is at Bergen a factory called the Cloyfter, in which a community of merchants live, who are ftiled Monks, though they wear no particular habit, and have nothing in common with monks, except that they are

not married.

Stavanger, or Staffanger, the chief town of the diftrict of the fame name, stands in the bay called Buckenfiord, which is very spacious, full of small islands, and 80 miles distant from Berger to the south, and 100 from Christiana to the west. The harbour is spacious and safe, and would have a great trade were it not for the neighbourhood of Bergen. Though the town be but small, it is the see of a bishop, suffragan to the archbishop of Drontheim. It is the residence of the governor of this district, who is subject to the governor of Bergen. The town is defended by the strong fortress of Doeswyck, which stands to the seaward, about two miles from Stavanger. To the bishoprick of Stavanger belongs Tyle-Marchia, whose name gave rise to the opinion of Procopius and Ortelius, that Scandinivia was the ancient Thule. The district of Stavanger is the most temperate, the best peopled, and best cultivated in all Norway; yet it has no other town

of any note but Stavanger.

Drontheim, Trontheim, Dronthem, or Dronthen, is the largest government of Norway. It lies along the coast of the North Sea, being about 500 miles in length, from south to north. It has the North Sea on the west, the government of Wardhus on the north, that of Bergen on the south, and on the east it is separated from Sweden by a long ridge of mountains. It extends from the 61st to the 69th deg. of lat. Its greatest breadth, from east to west, is not above 120 miles, and in many places it is much less. The country is mountainous, woody, cold, and barren; so that, though it be large, the towns are not very considerable. It is divided into two parts, namely, the government of Drontheim, properly so called, where is the city of that name, and seven small bailiwicks, and the sub-government of Salten, which contains seven other small districts, or vallies, on the sea-coast. This whole province was yielded to the Swedes in 1658; but the king of Denmark recovered it 1660, by the treaty of Copenhagen. The vallies of Nomendall, Helligeland, or Halgoland, Frosten, Hinder, Hero, and some others, belonged formerly to this province, but were given up to the Swedes in 1645, by the treaty of Bromsbroe, together with the province of Jempland, or Jemterland. This whole country is very thinly peopled, and not cultivated but along the sea-shore, till within 25 or 30 miles from it.

The most considerable towns here are Drontheim, or Nidrosia, formerly the capital of Norway: it is seated on the coast of the Northern Ocean, on a little gulph at the mouth of the river Nider, from whence it was anciently called Nidrosia. It is about 220 miles distant from Bergen to the north-east, and has a harbour pretty well frequented by small vessels, though very incommodious for large ones, the entrance being obstructed by rocks. It was formerly the residence of the kings of Norway; but the town being only built with timber, was several times burnt down, and is very much decayed. It is without ditches or fortifications, being only enclosed by a single wall. The castle is not strong, and sustained but a few days siege when the town was taken by the Swedes in 1658. The Danes re-took it the same year, after a siege of ten weeks. It is the see of an archbishop, being the only one in Norway. The cathedral church, dedicated to St. Olaus, was formerly a very magnificent building, but now lies almost in ruins, having been destroyed by fire in the year 1522. This town has a considerable trade, consisting in small masts, fir-deals, copper, iron, tar,

goats fkins, &c. for which they import fpices, wines brandy, vinegar, cheefe, tobacco, coarfe cloths, &c. The governor has his feat here, and refides chiefly in the caftle.

The other towns of this province, viz. Leerstand, Stonden, Scoredale, Opdal, Ramsdael, and Soledael, are fo small and inconsiderable, as to merit no particular

description.

The province of Wardhus is bounded, the north and west, by the ocean, on the cast by Russian Lapland, on the south by Swedish Lapland, and on the south-west by the government of Drontheim. It is 310 miles in length, from east to west, 200 in breadth from north to south, and is divided into two parts, viz.

The western, or maritime part, which is called Fin-

land.

The eaftern part, which is called Norwegian, or Danish Lapland.

The town of Wardhus, from whence this province hath its name, is the feat of a governor, but only confifts of a caftle, and a street of cottages, inhabited chiefly by filhermen.

The province of Bahus, though yielded to the Swedes in 1658, is yet accounted a part of Norway, being its most fouthern province. It is 90 miles long, but not above 25 broad where widest, and only 10 in some places. It hath West Gothland to the fouth, Dalia on the east, the government of Aggerhus on the north, and the Cattegate on the west. The principal places are

Bahus, a strong castle, built on a small island made by the river Nore-Elf, which there receives the Giotha Elf, and both together are called Trolhetta. It is 116 miles distant from Christiana, was built in 1309 by Haquin, the second king of Norway, and stands on a steep rock near the banks of the river. The kings of Denmark had fortified it after the modern fashion, but surrendered it to the Swedes in 1658, by the treaty of Roschiled.

Maelftrand, a ftrong built town on a rock in a kind of peninfula, about 10 miles below Bahus, is a place of great trade for fish, and hath a ftrong caffle to guard it.

SECTION IV.

Persons, Employments, Amusements, Dispositions, Mode of living, Diseases, Dress, Buildings, Armament, Articles of Export and Import, Privileges, &c. of the Inbabitants of Norway.

THE Norwegians in general, are tall, frout, robust, hardy and well made; hospitable, brave, and honest, but litigious. The women are finely shaped, comely, fair and obliging. The mountaineers are remarkably strong, as the tone of their nerves acquires great firmness by hard living, much labour, continual exercise, and being exposed from infancy to all the rigors of the cold season. Those who dwell in the maritime parts of the kingdom become excellent maritimers, from the incessant practice of fishing and navigation. The peasants are generally their own handicrastmen, that is, they are in general able to make, for the use of themselves and families, the following articles, viz. Hats, woollen cloths, linen cloths, stockings, shoes, iron-work, joinery-work, carpentry-work, &c.

They are likewise excellent tanners, expert ship and boat-builders, and some of them make tolerable violins, and other musical instruments. Their general propensity, however, is to carve in wood, which they do in a most surprising manner, with only a common knife, which is likewise of their own mak-

ing.
Their amusements are riding, wrestling, swimming, skaiting, climbing, shooting, blowing a horn, playing on the violin, thrumming upon a kind of guittar, and making verses. Indeed they are so fond of music, that they even play on the violin at their funerals.

The Norwe their intrepidi cour, their co are always qu their quarrels to generation, posterity; wi to their childr on that accou cability. The Norwegians, upon various occasions, have evinced their intrepidity; but while under the influence of rancour, their courage degenerates into brutality. They are always quarrelling with each other, and fometimes their quarrels have been known to rage from generation to generation, and to be transmitted from posterity to posterity; with particular injunctions from the parents to their children, to confider it as a family quarrel, and on that account to carry it on with the greatest implacability. The lowest class of people have their punctilios of honour, and when they conceive themselves affronted, fend challenges to fight in fingle combat; but these duels being generally founded in malice, are carried to the most savage extremes, and degenerate into absolute butchery. When a combat of this kind is to be fought, the combatants fasten themselves together by hooks fixed to the extremities of their belts, and then fight furiously with their knives till one or both fall to the ground, either dead or mortally wounded. The common people, in many things refemble the three nations now subordinate to the crown of Great Britain : like the Scotch, they have afpiring thoughts, which even difficulties cannot subdue; like the Irith, they cherish ideas of independence; and, like the Welch, they plume themselves upon their pedigrees.

The principal people of Norway live as luxurioufly as the nature and commerce of the country will admit; but the peafants, in general, are frugal and temperate, except at the time of keeping any of their festivals.

The common bread is made of oatmeal, and formed into cakes like those of Scotland. In times of dearth they dry the bark of the fir-tree, or elm-tree, and grind it into a kind of flour, which they mix with a small portion of oatmeal, and thus compose a kind of substitute for bread.

In the maritime parts it is common to knead the roes of cod with oatmeal or barley meal, and boil the composition for a pudding; and the liquor, which serves as a kind of soup, is enriched with a salt mackarel, or pickled herring.

Beef, mutton, or goats flesh, they pickle, smoke, or dry, for winter stock; but in the summer, usually eat fresh fish, growse, partridge, deer, hare, rein-deer, &c. Cheefe they have all the year, and in common drink sour whey; but at Christmas, and other festivals, christenings, weddings, &c. they provide good store of strong ale; and, indeed, these are the only times in which they ever run into any excesses; for their usual temperance is such, that they are generally very long lived: a great number are to be sound who are hearty and well after being turned of an hundred years of age. In the year 1733 four couples danced before his Danish majefty at Frederickshall, whose ages, when added together, exceeded 800 years.

Some few, by temp'rance taught, approaching flow To distant sate, by easy journies go; Gently they lay them down, as evening sheep On their own woolly sleeces ioftly sleep. So noiseless would I live, such death to find, Like timely fruit not shaken by the wind, But ripely dropping on the sapless bough, And dying, nothing to myseif would owe. Thus daily changing, with a duller taste Of lessening joys, I by degrees would haste; Still quitting ground by unperceiv'd decay, And steal myself from life, and melt away.

Some of the Norwegians, however, are subject to the gout, epilepsy, rheumatism, catarrhs, leprosy, scurvy, &c.

The peafants of this country dress in a wide, loose jacket, made of coarse cloth, with waistcoat and breeches of the same. On their heads they wear a slouched hat, or a cap decorated with ribbons: their fummer shoes are without soles, but in winter they use leather buskins; and, besides these, they have snow shoes and skaits to travel in the winter. A corps of

light troops, thus accoutered, are kept always in readiness for winter expeditions, in case of emergencies, and these travel with more speed than the swiftest horses.

The Norwegian peafant never wears a neckcloth, or closes his waiftcoat, but on certain occasions, choosing always to have his neck and breast bare, and suffers the snow to beat into his bosom. Round his waist he wears a leathern belt, adorned with brass plates, from which hangs a brass chain, that sustains a knife, gimblet, &c.

The women dress in jackets laced close about them; round their waists they wear girdles of leather, ornamented with silver; and about their necks silver chains, embellished with silt medals; their caps and handkerchiefs, and, on certain occasions, their tresses are adorned with small plates and spangles of silver, brass, and tin; large rings, buttons, and a variety of other trinkets.

The public edifices of Norway are built with ftone; the houses of the principal people with ftone or brick; but the common people, in general, refide in wooden habitations.

The wooden houses are made of fir and pine-trees laid upon each other, and joined with mortices at the corners. Few of the farm-houses have either chimnies or windows; but a hole in the roof ferves for both, as it lets out fmoak, and lets in light. In fummer time the whole is left quite open, but in winter it is covered with the transparent membrane of some animal, which admits the light, and at the fame time is fo placed, as not to impede the evaporation of the fmoak. This membrane is occasionally fixed or removed by the means of a long pole, which pole every stranger, who enters the house, is obliged to go and touch, agreeable to an ancient custom. The roof is covered with the bark of birch trees, which is deemed incorruptible; and that again is coated with turf, from which the grafs is cut every feason. The ceiling, on the infide, is about eight feet from the ground; and being arched like a cupola, the smoak rolls about within the circular part till it finds a vent at the hole. Just beneath this aperture stands a table, furrounded with branches, and at the end a high feat for the mafter of the family, where, during meal times, he fits in great state; and, indeed, upon all occasions, assumes the appearance of dignity, puts on many confequential airs, and fancies himself a person of the utmost importance. It hath been the observation of many travellers, that the inhabitants of all conquered nations are much more proud than those to whom they are held in subordination; and that, as they are usually kept poor and illiterate, their vanity rifes in proportion to their ignorance.

Of all the causes which conspire to blind Man's erring judgment, and misguide the mind; What the weak head with strongest bias rules Is pride, the never-failing vice of fools. What ever nature has in worth deny'd, She gives in large recruits of needful pride: For, as in bodies, so in souls, we find What wants in blood and spirit's fill'd with wind. Pride, where wit fails, steps in to our defence, And fills up all the mighty void of sense.

The armament of Norway confifts in about 30,000 land forces, and about 14,000 feamen; and the annual revenue amounts to 180,000l. The commodities exported are numerous, as wrought and unwrought copper, iron, lead, marble, mill-ftones, cow-hides, goat-fkins, fox-fkins, feal-fkins, bear-fkins, beavers, martens, ermines, mafts, deal boards, timber, herrings, cod, ling, falmon, lobfters; flounders, down, feathers, butter, tallow, train oil, juniper and other berries, falt, glafs, tar, nuts, allum, vitriol, pet-aftes, &c. The commodities imported chiefly confift of luxurious articles.

Every freeholder in Norway enjoys the right of primogeniture, and power of redemption. It is very

For ev'ry f

usual to see a peasant inhabiting the same house which had been possessed 400 years by his ancestors. The odels-gads, or freehold, cannot be alienated by sale, or otherwise, from the right heir, called odels-mand. If he is not able to redeem the estate, he declares his incapacity every tenth year at the sessions: and if he,

DENMARK Proper, anciently called Dania, confifts of several islands, together with the peninsula of Jutland. Though not any one of these is separately called by the name of Denmark, they retain in gene-

ral that appellation.

Jutland lies between the 54th and 59th deg. of north lat. and from the 8th to the 45th deg. of east long. extending from north to fouth near 240 miles; the breadth in fome parts, not being above 24 miles, and in others, comprizing near 180 miles. The German Ocean washes it on the northern or western parts; on the east it is bounded by the Categate, and Middle Fort Sound, or Leffer Belt; and on the fouth it is divided from the duchies of Lunenburg and Bremen by the river

SECTION I.

Soil, Climate, &c.

THE foil varies greatly on the continent, and in the islands which form this kingdom. In the former there are good pastures, but the latter are too fandy to be fruitful. The mountains are barren, but most of the plains exhibit marks of fertility.

It has been observed, as a great natural defect in Denmark, that the king has not, in all his dominions, one navigable river for veffels of any confiderable burthen: for the Eyder cannot be reckoned as fuch; and the Elbe is rather to be efteemed one of the confines and boundaries of his territories, than any ways belonging to him. There are fome lakes here which afford a great quantity of fish. The forests are abundantly stocked with venison of all forts, as stags, elks, and hares; as also wild boars. There is likewise great

plenty of wild fowl.

The air in Denmark, though very cold, is not fo fharp as in some places of Germany situated much more to the fouth, which may be afcribed to the fea flowing about it, the vapours of which melt and diffolve the nitrous particles, that are carried by the wind from the northern countries, before they arrive in this; by which means the sharpness of the air is very much abated. The gentle breezes, which blow from the fea, contribute also to make the air cooler in summer. However, in Denmark there are but too feafons of the year, winter and fummer; the other two more agreeable ones, fpring and autumn, not being commonly known; the fpring never, and the autumn feldom; fo that there is an immediate transition from extremity of heat to extremity of cold; and fo, on the contrary, when winter is over, from cold to heat. During the three months of June, July, and August, the heat is much more intense than in England, and very fultry in the nights; but it is a gloomy heat; and people generally perceive some interposition of thick vapours between them and the fun. In Copenhagen, during these three months, they are constantly troubled with the plague of flies, which they endeavour to destroy by a poilonous water; upon the laying of which in their kitchens and chambers, whole bushels of dead flies are fometimes swept together in one room.

This country, in general, produces but little corn; and the vaft number of barren mountains are great incumbrances and blemishes to the whole kingdom. The Eyder is the only, stream worthy of the name of a river, which can be faid properly to belong to Denmark. This rifes near Sedgebourg, runs by Renfbourg, and difembogues itself into the sea at Tonmingen, after having divided Slefwic from Holftein.

A late traveller, speaking of the climate, says, he apprehends the year is more properly divided here into fummer and winter, than, as with us, into four feafons. A short fummer fucceeds to the long series of cold and darkness, which environs them from October till April; and, during this period, they often experience very great heats for a few days, or fometimes weeks. Certainly man is much affected by physical causes; and one is not surprized to find the elegant arts chiefly confined to luxurious and fouthern climates, and faintly raifing their heads amidst these fnowy and inhospitable regions, where the inhabitants feem, in some degree, to partake of the asperities of their foil, and where royal munificence, however unbounded, can only ratie a few fickly and straggling

This account is forcibly illustrated by the following poetical description, which we insert as strikingly picturefque. These lines are addressed by Mr. Philips to the Earl of Dorfet, his patron.

From frozen climes, and endless tracks of snow, From streams that northern winds forbid to flow, What prefent shall the muse to Dorset bring? Or how, fo near the pole, attempt to fing? The hoary winter here conceals from fight, All pleafing objects that to verse invite. The hills and dales, and the delightful woods, The flow'ry plains, and filver streaming floods, By snow disguis'd, in bright confusion lie, And with one dazzling waite farigue the eye. No gentle breathing breeze prepares the fpring; No birds within the defart region fing.

The ships, unmov'd, the boilt rous winds defy, While rattling chariots o'er the ocean fly : The vast leviathian wants room to play, And fpout his waters in the face of day: The flarving wolves along the main fea prowl, And, to the moon, in icy vallies howl. For many a thining league the level main Here spreads itself into a gloffy plain; There folid billows, of enormous fize, Alps of green ice, in wild diforder rife. And yet, but lately, have I feen, e'en here, The winter in a lovely dress appear. Ere yet the clouds let fall the treasur'd snow, Or winds began thro' hazy skies to blow, At evining a keen eaftern breeze arose, And the descending rain unfully d froze: Soon as the filent shades of night withdrew, The ruddy morn disclos'd at once to view The face of nature, in a rich disguise, And bright'ned ev'ry object to my eyes:

And ev'ry In pearls, a While thro The thick-Seem polith The ftag, i Sees chryfta The spreadi Glaz'd over The frighter That wave : When, if a The brittle The crackli And, in a fou And, by de The travelle And journe Like fome Thro' fragra While here And airy fal His wand'rin And while h The trackles And woods, A tedious ro And, as he

For ev'ry shrub, and ev'ry blade of grass, And ev'ry pointed thorn, feem'd wrought in glass: In pearls, and rubies rich, the hawthorns show, While thro' the ice the crimfon berries glow: The thick-sprung reeds the wat'ry marshes yield, Seem polith'd lances in a hostile field: The stag, in limpid currents, with surprize, Sees chrystal branches on his forehead rife; The spreading oak, the beech, and tow'ring pine, Glaz'd over, in the freezing æther shine: The frighted birds the rattling branches shun, That wave and glitter in the distant fun. When, if a fudden guft of wind arife, The brittle forest into atoms flies; The crackling wood beneath the tempest bends, And, in a spangled show'r, the prospect ends. Or, if a fouthern gale the region warms, And, by degrees, unbinds the wint'ry charms, The traveller a miry country fees, And journey's fad beneath the dropping trees; Like fome deluded peafant Merlin leads Thro' fragrant bow'rs, and thro' delicious meads; While here enchanted gardens to him rife, And airy fabricks there attract his eyes : His wand'ring feet the magic paths pursue, And while he thinks the fair illusion true, The trackless scenes disperse in fluid air, And woods, and wilds, and thorny ways appear: A tedious road the weary wretch returns, And, as he goes, the transient vision mourns.

SECTION II.

Divisions, Subdivisions, Cities, and Towns of Denmark.

THE grand divisions of Denmark are the four following. Jutland, properly fo called, or North Jutland. The duchy of Slefwic, or South Jutland. The duchy of Holftein, and the Danish islands. We shall describe them in that order.

JUTLAND fo called, or North Jutland, is bounded on the fouth by the duchy of Slefwic, on the north and west by the German Ocean, and towards the east by the Baltic, the Cattegate, and the Lesser Belt.

This country is divided into four dioceses, viz. Ripen to the fouth, Arhusen to the east, Wilburg to the west, and Aalburg to the north.

The diocese of Ripen is bounded on the south by the duchy of Sleswic, on the north by the diocese of Arthusen and Wiburg, and extends east and west from the Baltic to the German Ocean. It contains 30 pre-fectorships, or bailiwicks, 282 parishes, 10 royal palaces, 100 noblemens feats, and feven cities, which are as follows:

Ripen, or Rypen, in Latin Ripa, is feated on the river Nipfaw, which, before it comes to this city, divides itself into three branches, the largest of which runs on the north fide of the town; the middle branch, which is the smallest, runs on the south of it; the third also on the south, but at some distance: they join again a little lower, and fall into the German Ocean, three miles below, forming a commodious harbour. This city is 26 miles distant from Tonderon, towards the north, and 24 from Colding to the north-west. It is a place of confiderable trade: the neighbouring paftures and fields produces abundance of cattle and corn. Hither are drove almost all the black cattle from many parts of Jutland, which are here shipped off for foreign countries, especially for Holland; and their corn they export into the neighbouring countries. These articles afford them very great profit. But the city is often exposed to imminent dangers from the tides flowing in with prodigious violence from the fea, so that the water fometimes comes into the very church-yard of the cathedral, which stands on a hill; and even during the terrible inundation that afflicted Jutland in the year 1734, the water rose an ell high in the very cathedral.

This town is strong by nature only, without much affiftance from art. Towards the west there is a castle flanked with four bulwarks, after the old fashion, built in the year 1150. The citizens houses are pretty well built, and the inhabitants were formerly in better circumstances than they are now; but they suffered very much during the wars with Sweden, the city being taken by the Swedes in 1645, but foon after recovered by the Danes. Before the reformation this was a bi-shop's see, as it is now of a superintendant or Lutheran bishop. The cathedral is a noble pile, built with free-stone, as well as its steeple, which is square, very high, and covered with lead. This church is adorned within with feveral marble columns, and with the tombs of fome kings. There is another church dedicated to St. Catherine. Here are also two public schools for the education of youth in polite literature, and a college for divinity, in the court of the bishop's palace, where there is also a public library. The city is governed by two burgomasters, or confuls, and by a senate, who formerly administered justice with fo much severity, that the justice of Ripen was become a proverbial faying, to express a rigorous execution of the law.

Colding, or Kolding, an old city mentioned by Ptolemy, stands on the banks of a little river called Coldinger Aa, which parts north Jutland from the duchy of Slefwic, and falls into a little gulph, thence named the Gulph of Colding. The city is about 11 miles distant from Haderleben to the north. It was burnt down during the civil wars in 1247. In 1268, king Eric VI. redeemed it out of the hands of Eric, duke of Slefwic, and fon to king Abel. He built a citadel there, to be a bulwark to Denmark, and fortified the town, especially towards the fouth. Christian III. who liked the city very much, on account of its agreeable situation, and wholesome air, built the castle of Arnfburg, above the city, removed thither with his court, and died there January the 1st, 1559. The hospital was built by Frederick II. whose son endowed it confiderably. In May, 1644, the Danes gained a confiderable victory over the Swedes near Colding. This town is but finall, fince it does not contain above 100 or 120 houses; but what makes it chiefly confiderable is its bridge over the Aa, which is called Boherrit, and gives name to the whole country about it. All the black cattle and horses that come from Jutland, and go into Slefwic, must pass over this bridge, and pay each a crown for toll; whence arises a considerable part of the king of Denmark's revenue. Though this town lies commodious for trade on the Leffer Belt, over against Middlefort in Funen, yet they have hardly any trade but in cattle. They have good fish, and the river Aa produces excellent eels.

Frederick's Ode, in Latin Frederici Oda, stands on the banks of the Lesser Belt, 10 miles from Colding to the north-east, and about 27 from Ripen towards the east. It was built by king Frederick III. of Denmark, and is well feated on a point of land, with an eafy defcent to the feaward: it has been well fortified, being a pass over the Lesser Belt, or Middlesort Sound. The works are very high on the land fide; and on the other fide of the point there are eight bastions: it has four gates, and before each a ravelin, but ruinous. Towards the fea the fortifications are lower, and of a greater extent; where there are baftions, platforms, and some batteries on the shore. Those fortifications enclose a great deal of ground, but the fifth part of it is not inhabited, for there are many corn-fields and orchards within the walls. This place was formerly a refuge for bankrupts and Jews; but king Frederick IV. recalled those privileges. Here are two churches, one Danish, and another German, but they have no In 1658 this town was taken by Charles fteeples. Gustavus's troops, commanded by Wrangel; the garrison, consisting of 2000 men, were all killed or taken. This opened a way to the king of Sweden to undertake his expedition over the ice from this place to Fu-

7 S

nen, where the passage over the Belt is above three

English miles.

Weille, or Weel, is fix miles distant from Frederick's Ode, to the north-west, and about 12 from Colding to the north. It stands on a little river, which falls into a great bay that communicates with the Lesser Belt, and makes a good harbour. The city is neat, and well-built, but not large. About 22 miles to the north-west stands Warde, on a river that falls into the German ocean, 10 miles below the town, which is conveniently situated for trade.

Ringcopin, or Ringkiobing, is 45 miles from Ripen, and 24 from Warde, to the north. It lies on a bay of the German Ocean, made by a neck of land 25 miles in length from north to fouth, so that ships ride in the

port fafe from all winds.

Lenwick stands on the gulph of Limford (from whence it has its name) on the north-west borders of this diocese, 10 miles from the German ocean to the east, 56 from Ripen, and 81 from Ringcoping, to the north.

Hostlebrow, or Hodselbrow, stands about 11 miles from Lenwick to the south-east, and 12 from Ring-coping to the north-east. It is an inland town, but lies on a river which communicates with the German Ocean by

a lake, into which the river falls.

The diocese of Arhusen is the eastern part of Jutland, having on the north the diocese of Wiburg and Aalburg, on the west and south that of Ripen, and on the east the Categate and Lesser Belt. It extends about 60 miles along the coast of the Baltic, but is not much above 30 miles in breadth at the widest part. It contains 31 prefectorships, or bailiwicks, 304 parishes, five castles, or forts, and eight cities, or walled towns, viz.

Arhusen, the capital of the diocese, stands at the mouth of the river Gude, which runs through it, and a little lower falls into the Categate. It is 86 miles to the northward of Sleswic, and 42 north-east of Ripen. The situation is pleasant, being surrounded with forests sull of game, pastures that are exceeding rich for the country, and fields which produce a considerable quantity of grain. The town itself is neat and agreeable, well furnished with provisions and domestic necessaries from the neighbouring country, and with other commodities and luxuries from various countries, by the means of shipping. The harbour is tolerable, and the cathedral church erected after a curious stile of architecture, beautished and embellished with various monuments of noblemen, prelates, &c. The bishop's palace was once a magnificent structure, but is now fallen to decay. The city was made an episcopal see in the year 1014, and is now the see of a su-

perintendant.

Scanderburg, fix miles from Arhusen to the fouthwest, is a good fortress, near the spring of the river

Gude.

Horsens, 12 miles distant from Arhusen to the southwest, is a small city or town situated on a little gulph, which serves it instead of a harbour, and falls into the Baltic.

Randers is a very ancient city, fituated on the river Gude, which about 12 miles lower, falls into the Baltic, and thus affords this place a good conveniency for navigation. It is a place of great trade, and famous for the best falmon in Jutland. The neighbouring fields produce plenty of corn.

Ebeliftot is feated at the bottom of a bay of the Categate, about 18 miles from Arhusen to the north-west.

Grinaa flands near the point or Cape of a peninfula, which juts out into the Categate, and is feven miles diflant from Ebelftot to the north. It is defended by a caftle.

Mariager flands on the fouth-fide of a large bay of the Categate, 16 miles diffant from Arhusen to the north.

Hobro, or Hebro, is a finall town on the same bay, fix miles above Mariager to the west.

The diocefe of Wiburg has that of Aalburg on the north, from which it is partly separated by the gulph of Limford, Arhusen on the east, and Ripen on the fouth and weft. It is not above 24 miles from fouth to north, and 26 from eaft to west, being almost of a round figure. Though it is an inland country, yet it wants not the conveniency of navigation; for here are large lakes, that branch out into feveral parts of this land, and from whence, by means of the Limford, into which they run, and which communicates with the Baltic Sea, they receive veffels of great burthen. Among these lakes there is one named Othesunde, from the emperor Otho, furnamed the Great, who, about the year 948, made an inroad this way, penetrated even as far as this country, and, casting his javelin into the water, gave it the name it still retains. The best horses in Denmark are bred in that part of the diocese named Salling. In this territory are comprehended 16 prefectorthips, or bailiwicks, 218 parifles, and three gar-riions. The most considerable towns are

Wiburg, which flands in the middle of North Jut-

land, of which it is the capital city.

It is a place of great refort, being the feat of a high court of judicature, which receives the appeals from inferior courts, but none can be made from it, except to the king.

Wiburg has been the sea of a bishop for above 600 years; but the exact time cannot be fixed; for it is a matter still disputed whether this or Aalburg be the most ancient. The bishop and chapter still subsist. It stands near a branch of the gulph of Limsord, called Virksund, and was anciently called Cimmersburg, as being the chief city of the Cimbri; but whence it had its present name is not certain.

Scheve, or Schitthnis, which flands on the fame gulph, is fituated 12 miles from Wiburg to the north-

wef

The peninfula of Salling, furrounded on all fides by the fame gulph, except towards the fouth, is the most noted place in Denmark for fine horses, which are exported by foreigners

Nybe, in Latin Nibe, on the fame gulph, 18 miles from Wiburg to the north-eaft, is also noted for a good

breed of horses.

The diocese of Aalburg is the most northern part of Jutland, and furrounded by the fea on all parts, ex-cept on the fouth, where it is divided from Wiburg and Reipen by the gulph called Limford, which runs from the Baltic Sea above 50 miles across the country, and is thut out of the German Ocean by a narrow ifthmus, or neck of land, made by the fand-hills on the west shore of Jutland, over-gainst a great shoal called Jusche-Riff. This diocefe is about 70 miles long, from the Buth-west to the uttermost point of Schager-Riff, in the north-east; but as it is of a triangular form, is breadth is not equal every where, being but about 40 miles where broadest. The north part of this diocese, which is cut off by the gulph, (for the city of Alburg lies on the fouth-lide of it,) is called Wentulah, and by Latin authors Vandalia, whence fome apprehend it was the feat of the Vandals. The inhabitants are the hardiest of the king of Denmark's subjects. The country is fruitful, and pretty well enriched by trade. It is divided into 13 bailiwicks, which contain 177 parishes, 100 castles, and the following cities and towns.

Aalburg, fo called from the great quantity of eels taken in the gulph of Limford, flands on the fouth fhore of it, about fix miles from the Categate to the west. It is the see of a billiop, founded about the year 1060; but the bishops rended anciently at Burglaw, whence the diocese was then called the diocese of Burglaw; but since the reformation, the Lutheran bishops have had their palace at Aalburg.

Wenfusal, or Burglaw, stands on the river Ryaa, which, 14 miles lower, falls into the gulph of Limford,

from which this city is as many miles diftant to the north. It was formerly the fee of a bishop, which has been removed to Aalburg.

The town is more frequented by merchants from all parts of Europe than any other town in Jutland, because they touch here in their way to the Sound. Its trade would be far greater still, were it not for the dangerous coast it lies on.

Nikioping fituated in the Isle of Mors, made by the

gulph of Limford, is a confiderable town.

Tysted stands on the south-west part of this diocese near 30 miles from Aalburg to the west, in the middle of the ifthmus made by the German Ocean and gulph of Limford, which is the most fruitful place of this district. This town is noted for a kind of university, which was first a free-school only, founded by Christian the Third.

Seeby is a finall feaport town on the Eastern shore, 15 miles distant from Schagen, towards the fouth-west.

The Duchy of SLESWICK, or SOUTH JUTLAND, is as ancient dependance on the kingdom of Denmark; for in the year 1128, king Nicholas the First gave it to his nephew Canute, the fon of Eric. Denmark was afterwards deprived of it; but in the year 1459, Chriftian the First re-united it to that kingdom. It is about 86 miles in length, and 60 in breadth, being bounded by Jutland on the north, by the Baltic on the east, by the duchy of Holstein on the fouth, and by the German Ocean on the west.

It is watered by feveral streams, which render it exreeding fruitful in most parts, and in general abounds in meadows and pastures. The eastern parts lie confiderably higher than the western, and in the latter there are large plains, which produce a great plenty of all forts of corn. The nobility here are rich, and the common people enjoy a great share of independence. This duchy is divided into four circles, viz, Gottorp, Ton-

deron, Flenfburg, and Hadersleben. The principal cities and towns are the following.

Sieswie, the capital of the whole duchy, is situated on a small arm of the sea, called the Sley, at the distance of about 38 miles from Gluckstadt to the north east, and 28 from Lamden to the east. Christianity was established here in the hinth century, and the great church founded by Eric Barn, in conjunction with St. Anschar, bishop of Hamburg; and in the year 930, king Herold Blatand erected an episcopal see. Afterwards the Sclavonians invaded these parts in the year 1065, destroyed the church, and restored the pagan superstitions; but soon after these foreigners were expelled, Christianity was restored, and the cathedral rebuilt. In the next century it became a place of great trade, and much frequented by merchants from Great Britain, France, Spain, Flanders, &c. The foil, especially towards the fouth and east, is not very fruitful; but the town is fufficiently fupplied with all necessaries of life from the neighbouring country, and the Sley affords abundance of fish. They brew beer here, which is not very palatable; but they import fome from abroad, as well as wine, which is pretty cheap. Among the public buildings is a ducal palace, which they shew to strangers: it does not contain much that is worthy of notice, except a library, which contains a few ancient manuscripts, and a cabinet of rarities in natural history, which has a few things that are really curious. In the gardens are fome water-works, and many walks in the old tafte, which the poor people of this country think great exertions of magnificence. The principal church is ancient, and a very large fabric; it contains many monuments of the ducal families, but none that will yield much entertainment to a traveller. In the fuburbs there is a church dedicated to St. Michael. Slefwic was formerly the fee of a Roman Catholic bishop, and is now that of a protestant super-

Within a few miles from Slefwic to the fouth, are yet to be feen, in many places, the ruins of the famous wall and trench, which was built in ancient times by the Danish kings, against the incursions of the Saxons. It is thought to have been begun by Gotherick, or Gothofred, king of Denmark, to keep out the armies of the emperor Charles the Great, about the year 808, and afterwards improved by queen Thyra, and other Danish monarchs, and rendered so strong as to be esteemed impregnable by the counsellors of Henry, furnamed the lion, duke of Saxony. This rampart was called Denewark, and, like Hadrian's wall in England, is reported to have reached from sea to sea, quite

across this neck of land. Gottorp was the ancient feat and patrimony of the dukes of Holstein, the chief branch of which family, after the royal one, took from thence the title or furname of Gottorp. It is about fix miles diftant from Slefwic to the fouth-west, and stands on the Sley, which almost furrounds it, and carries veffels of small burthen to and from the Baltic. This place is, at the same time, a fortress, and a noble palace, being accounted one of the finest seats in all these northern The castle stands to the west of the Sley, in the middle of a little lake, and is built in the form of an oblong square, fortified with four bastions of earth; the bottom is paved with free-stone, the curtains are long, and the fides ftands north and fouth. You approach the castle by a bridge, which joins it to the fouth shore. It is commanded by a mountain that stands north-east of it, from whence the Danes annoyed the caftle in the year 1675, whence the duke was trea-cherously surprised by the king of Denmark at Rents-burg. The duke, before his death, had designed to rebuild the castle, but the front only is finished; if the whole had been completed, it would have been one of the finest palaces in Europe. A rampart encompasses the first court, and the gate of the castle is a fine blue stone, as hard as marble, with a lantern over it that has 27 lights. On the north fide of the castle there is a bridge of 200 paces over the lake; and at the end of the bridge, a walk, between two rows of trees, that lead to the garden, which is adorned with many fine water-works and cascades. On the left there is a bafon, or fish-pond, 200 paces square, with rows of trees on all fides, except to the north; there are, also, fig arbours on the fides of the pond; and in the middle, a Hercules, of a monstrous size, represented with club, going to kill the Lernæan hydra. Out of every part the water plays. In every corner of the pond, there are statutes which form cascades. On the north there is a parterre, in the form of a crescent divided into feveral compartments, with niches round, containing bufts of many kings, and modern princes. There are also the representations of many fabulous animals that throw water. At the end of the walk there is a small room, in which is to be seen a globe, made by the famous Tycho Brahe, fo contrived, that, by mechanism, it represents his system of the world. There is another admirable globe of copper, 10 feet and an half in diameter, with a sphere, wherein the fun rhoves in the ecliptic, and all the heavenly bodies are carried round in exact order, by means of certain wheels, which are turned about by water, conveyed from the adjacent mountain. Before this house there is a level ground 50 paces broad, and three times as long, divided into three parts: those on the sides have fine parterres, and that in the middle has a great bason in the centre, with water-works; the next terrace is higher; and the whole is inclosed with green pales, as high as each terrace, with bufts all round. From the highest terrace there is the finest prospect perhaps in the world, viz. the caftle in the front, in the middle of a lake furrounded with a charming country, and a fine plain before it. On the left there is a great orangery, or green-house, where they keep the Indian trees, myrtles, pomegranates, and other exotics, in boxes, The park is noble, about four English miles in cir-

cumference

cumference, and full of fallow deer and ftags. There is a toll-booth, or custom-house, where all toll is paid for great numbers of black cattle, that pass from Jutland into Germany; this produces a confiderable fum to the king of Denmark, fince, in some years, toll is paid for

above 50,000 head of cattle.

Eckrenford ftands on a little gulph of the Baltic, which makes a very commodious haven, and affords it a confiderable trade, being one of the fafest ports on that shore. It is about 22 miles distant from Gottorp to the east, and fix from Kiei towards the north.

Christianpreis, the capital of a bailiwick of that name, which borders on the duchy of Holftein, is fituated on a gulph of the Baltic, at the entrance of the haven of Kiel, and is commanded by a castle that was built in 1637, by Christian IV. king of Denmark. It is about five miles diftant from Kiel to the north, and four from Eckrenford to the east. It has about 500 houses, and two gates, defended with strong works. The Eyder ferves for a ditch, and makes it inacceffible; and where the river grows narrower they have built a crescent in the water, with port-holes for 16

pieces of cannon.

Frederickstadt was thus called from its founder, Frederick, duke of Holftein and Slefwic, who built it in the year 1621, peopled it with Hollanders, and granted them great privileges. He endeavoured also to settle a filk trade there, and, for that purpose, sent an embasily to Muscovy and Persia, which gave occasion to Adam Oleanius, fecretary to it, to publish an account thereof in an excellent book of travels. This town stands on the banks of the river Eyder, and is 24 miles distant from Slefwic towards the west, and 42 from Gluckftadt to the north. It is built after the Dutch fashion, and all religions are tolerated there. The town is fquare, and furrounded with a large canal, planted with rows of trees. It is divided into two parts by another canal, also with trees on the fides. The Lutheran church is built with bricks, and very neatly.

Tonderon is also fituated on the river Eyder, 10 miles below Frederickstadt, and about 14 miles from the German Ocean. It is not an ancient fown, but it has a good trade, which encreases daily, by means of its commodious harbour formed by the Eyder. It was formerly well fortified, but the fortifications were demolished in 1714 by the Danes, who, after a long blockade, forced the town to furrender upon terms. This is the capital of the bailiwick of Eyderstadt, and much frequented by the Dutch, who buy black cattle

Flensburg, the capital of a district known by the fame name, as well as that of Angelen, or Engeland, the country of the Angles, who invaded South Britain, and bestowed upon it the appellation of England, is fituated eight miles to the northward of Slefwic, on the gulph of Flens, formed by the Baltic; and the harbour is fo commodious, that ships of great burthen may come up, and lie loaded from the ware-

Hufum, which is 10 miles from Tonderon, and fituated on the gulph of Hover, was formerly flourishing and opulent, but it is now greatly decayed; its ruin being deduced from three capital causes, war, inundations, and conflagrations.

Lohm-Closter is an inconsiderable town, situated on the river Lohm-Beoke, about 10 miles from the Ger-

man Ocean.

Hadersleben is a large sea-port town, by the lake of Hadersleben, which runs into a narrow gulph, that difembogues itself into the Baltic. The inhabitants carry on a tolerable trade by means of the fifth that are caught in great plenty, both in the lake and gulph.

Timder, 12 miles to the westward of Hadersleben,

is a remarkable neat town, fituated in a fertile foil, on the fouthern bank of the river Wydaw. Here is a fmall ftrong fort, which the king keeps in excellent repair. The harbour, however, is choaked up at prefent, and the town hath scarcely any trade.

Apenrade is fituated at the bottom of a gulph of the Baltic, 25 miles north of Slefwic. It is defended by a tolerable citadel; but has, nevertheless, been frequently plundered in time of war.

Luxburg, or Glucksburg, is four miles to the east-ward of Flensburg, near the same gulph, but on the opposite side. It is but a small town, yet has a castle, and gives title to the Dukes of Holftein-Glucksburg.

THE Duchy of HOLSTEIN, though introduced into most fystems of geography under the article of Germany, we shall treat of under that of Denmark, for the following reasons; because Holstein lies on the north-east fide of the river Elbe, is subject to the King of Denmark, and is one of the richest provinces in the dominions of that monarch.

A traveller, who had access to the public records of the kingdom of Denmark, and received many curious particulars from the unfortunate prime minister Count Struensce, thus describes this duchy. The great duchy of Holstein, which is all united to the Danish dominions at prefent, is famous for its fine pastures, and for producing excellent beef. Great quantities of horned cattle are bought up in Jutland, and other provinces of Denmark, and brought here to be fattened: and their beef, besides what is used for the consumption of Hamburgh and Lubeck, is falted, dried, and exported; the former to Holland, and the latter to all parts of Lower Germany; and, together with an excel-lent breed of horses, of which great numbers are ex-ported yearly, bring confiderable sums of money into the province, of the whole of which the court of Denmark has not hitherto found the means to drain them; so that this province may justly be faid to be the richest in the Danish dominions.

This duchy is bounded on the west by the German Ocean, on the east by the Baltic, on the fouth-east by Mecklenburgh, on the fouth-west by the river Elbe, and on the fouth by the territory of Hamburg, and by Lauenburg. It is 80 miles in length, 60 in breadth, where broadeft, and divided into four principal parts, or provinces, viz. Holftein Proper, Wagria, Stormar,

and Ditmarsh.

Holstein is remarkably fertile, and contains many rich marth, pasture, and meadow lands. Dykes have been cut through the marth lands at an immenfe expence, not only to drain off the waters, which naturally accumulate there, but to drain off fuch as are occafioned by the inundations both of the fea and rivers, which are frequent. Thefe, however, give fuch a richness to the foil of the marshes, that cattle are bred in great numbers, and fattened in them, and vast quantities of excellent butter and cheefe are made of the milk. In some parts of them they sow wheat, barley, peas, beans, rape-feed, &c. which thrive exceedingly. Sheep are bred in the more fandy, heathy, and barren districts; and woods and orchards abound in other parts. The beef, veal, mutton, lamb, and pork, are all fat and palatable; and the best sea and river fish are caught in great plenty. The Holstein hories are exceeding beautiful, and, on that account, are highly prized both in Denmark and Germany. The pruncipal people usually farm out their cattle to a kind of bailiff, who runs all hazards, receives all profits, and allows the proprietor fo much per head for the whole: thus the gentry receive a certain income without having any trouble, and the bailiff is fufficiently rewarded for his pains, as he usually makes a fortune by the extra

The country is in general plain and level, and watered by the rivers Eyder, Sor, and Trave, with many rivulets, dykes, &c. An odd custom prevails here, which is to drain the lakes and ponds, at certain times, and fell the carp, lampreys, pike, perch, &c. which are found in them; and then fome years after to fow them with oats, or use them for pasture; and after that to lay them under water, and breed fish in them again. The houses and churches are very neat; for the people

l level, and waave, with many prevails here, at certain times, rch, &c. which ars after to fow are; and after that h in them again. for the people here, with respect to nicety, resemble the Hollanders. The duchy contains about 30 cities and towns, great and simall, and 600 parishes. The clergy are annually chosen, and removeable at pleasure. The people are rigid Lutherans; so that they give but very little countenance to Calvinists, and are strongly prejudiced against the Roman catholics. With regard to their character, in other respects, they are, in general, well made, finely featured, fair, strong, courageous, and so celebrated for their integrity, that the expression Holsteinglaube, or bonest Holsteiner, is proverbial throughout Germany, Denmark, &c. The principal cities, towns, &c. in Holstein are as follow:

Lubeck, an imperial city, and chief of the Hans Towns, is fituated at the conflux of feveral rivers, the largest of which is the Trave, It is 12 miles from the Baltic, where it has a fine harbour, 25 miles north of Lauenburg, 40 north-east of Hamburg, and 117 southwest of Copenhagen. It is a bishopric under the archbishop of Bremen, and was translated hither from Ol-

denburg in 1163.

Lubcck is a government or republic within itself, with royal jurisdiction, viz. to make and execute its own laws, as well in civil as in capital causes. From the consistory there lies an appeal to the senate of the city, which consists of four burgomasters, two syndies, who are civilians, and 16 common-councilmen; each of whom has in particular province, and they are all for life: but the common-council is only formed of lawyers and merchants, with an exclusion of mechanics. Father and son, or two brothers, cannot be in the re-

gency at the same time.

The name of this city is supposed to be derived from Lob-eck, the German word for a point of land, which agrees with its fituation. It is an ancient place, and, as the Poles fay, was founded by one of their kings, who conquered this part of the kingdom; but the Germans ascribe its foundation to Codeschalk, one of the kings of the Vandals, in 1040. It has fustained wars, both offensive and defensive, for several years, not only against the dukes of Mecklenburg, but against the king of Sweden. It is faid to have been a confiderable city when taken in the year 1134, by Crito, a prince of Rugen, who destroyed it; but it was rebuilt in the year 1140, by Adolph II. count of Holftein. and then first endowed with the immunities of the city. In 1158 it was again reduced to a heap of ruins by fire, and was afterwards restored by Henry the Lion, duke of Saxony, in whose time the collegiate church was founded. In 1164 the famous league of the Hans Towns was begun here, and their college is still kept, together with the records, and common flock raifed by contributions. In 1181 the emperor Frederick I. brought it under subjection to the empire; but Henry the Lion retook it; upon which it tell into the hands of Holftein, and afterwards of Den-The city having fuffered greatly by fire, particularly in 1276, was rebuilt in the handsome manner now feen; the fenate having made an order, that none of the houses should, for the future, be built with timber, or covered with thatch. In 1350 it was almost depopulated with the plague, which carried off vast numbers of the inhabitants. At present it is a fine noble city, spacious, and well fortified; two miles in length, and more than one broad; the streets being ftrait, uniform and wide. Many of the streets have rows of lime-trees on the fides, and a canal in the middle. The churches are magnificent, and about twenty of them have high fpires. The two chief ftreets leading from the cathedral, and the Miller's Gate, to the royal and castle gate, being the highest parts of the city, are interfected by others that descend gradually on each fide to the Trave and Wagnitz Rivers. The houses are large and stately, being built of brick, covered with tiles, generally high, and adorned with sculpture. The river Trave brings thips into the very heart of the city, which is near ten miles from the fea. The largest vessels, however, unload at Tra-

vermund, a fort on the bay of Lubeck. The principal trade is to Riga, Revel, Narva, and Petersburg; and the magazines and warehouses are well stocked with the productions and commodities of England, France, Spain, Holland, the East and West Indies, &c. The fortifications are strong, well finished, and kept in good repair. The bastions are lofty and extensive, the out-works numerous, and the haven defended by feveral forts and ramparts. The feveral market-places are large, and well supplied; and the public buildings stately, particularly the fenate-house, arfenals, hospitals, &c. St Mary's church is the most confiderable in the place being a lofty edifice, standing in the midst of the city, and has a double fteeple, two hundred and feventeen yards high, built in 1304. The infide of it is profusely ornamented with pillars, monuments, &c. but there are few of them which deserve much notice. The great altar is very richly executed in marble, by Quillin, who did fo many at Antwerp; and near it is a famous clock, which is the most remarkable object at Lubeck, exhibiting the eliptic, zodiac, equator, and topics, and the planets in their feveral courfes; which are fo minutely done, that the station of any of them is to be found at every hour of the day. It shews the regular variations of the celeftial bodies, fun rifing and fetting, the eclipses, festivals, and other remarkable days; all which it will continue to shew till the year 1875. Befides all this, there are feveral automatons; and among others, a figure of our Saviour, with a door on its right hand, which opening at twelve at noon, out come, in order of procession, the emperor and the feven eldest electors, and turning to the image, make a profound obeifance: this the figure returns by a wave of his hand; after which the whole groupe retires in the same order, through a door on the left, and both doors thut directly. In the tower is another piece of machinery, the chimes, which plays the hours with a pleafing melody, and minute exactness. Under them is the bell, on which is ftruck the hour. This is performed by a figure of time; whilft a leffer figure, reprefenting Mortality, and flanding at the other fide of the bell, turns afide its head at every stroke. This work, for its preservation, is surrounded with a frame of wire. By the infcription it appears to have been erected in 1405.

Among others is a very curious piece called Death's Dance, which represents human beings in all stations of life, from an emperor to the meanest person, and from an old man to an infant, led round a circle by so many skeletons, shewing that death spares neither

age or condition.

Ah! what is life, with ills encompass'd round? Amidst our hopes fate strikes the sudden wound. To-day the statesman of new honour dreams, To-morrow death destroys his airy schemes. Is mouldy treasure in thy chest confin'd? Think all that treasure thou must leave behind. The heir with smiles shall view the blazon'd herse, And all thy hoards with lavish hands disperse. Should certain fate th' impending blow delay, Thy mirth will sicken, and thy bloom decay: Then feeble age will all thy nerves disarm, No more thy blood its narrow channels warm. Who then would wish to stretch this narrow span, To suffer life beyond the date of man?

The cathedral of Lubeck is a building of very great antiquity, being elected in the year 1170, by duke Henry the Lion, ancestor of the present elector of Hanover. The occasion of building it is mentioned in an inscription on one of the walls, viz, that Henry the Lion, duke of Saxony, hunting in this part of the country, caught a stag with a gold collar and cross about its neck, on which was this inscription, Hoc me Cassar donavit, containing the date of the year, which was in the reign of Charlemain: and the duke, from surprize at this accident, erected this cathedral.

7 T

for

All parts of this city are ferved with water by pipes from a refervoir. The next staple commodity to corn is beer, which is in high estimation, not only as a pleafant liquor, but as a medicine, when externally applied to bruifes, wounds, &c. Here are feveral hospitals, which are well supported. There is one for ancient people of both fexes, which was once a caftle, from whence the citizens drove out the Danish garri-St. Ann's is for orphans, and other children of poor burghers, who are instructed in some handicraft bufiness; and there is an apartment for the confinement of libertines and lunatics. There are two other hospitals for the reception of poor travellers, where they are allowed three days refreshment, and then sent forward with a pass; but such as happens to be sick are provided with all necessaries till they recover or The richest foundation of this fort is St. George's Cloyfter, which is chiefly for the maintenance of fuch artificers as are grown old and past their labour. There is also St. Gertrude's hospital, which is a pest-house. There are, moreover, several alms-houses, endowed by the merchants, for the maintenance of the widows of poor members; belides feveral little streets of houses for the widows of other poor citizens.

Travemund, dependent on Lubeck, from whence it is but nine miles to the north-east, and 32 west of Wilmer, is a little town near the mouth of the river Trave, One of the counts of Holftein fold it, in 1320, for 4000 marks, to the Lubeckers, who fortified it with four good bastions, erected a light-house to guide the ships at night, and commonly keep a garrison here of three or 400 men, commanded by a burgher of Lubeck, who receives his orders from the burgomafters, and admits no perfors into the place without a paffport. It was feized by the czar in 1617, in order to fecure transports for his troops; but he was perfuaded to quit it.) There is a peninfula over against it, about a quarter of a league in circumference, which belongs to the duchy of Mecklenburg. The river Trave rifes out of a great lake, in the jurisdiction of Segeberg; and after a ferpentine course, from north to fouth, by Segeberg and Oldelo, turns short to the east, waters the city of Lubeck, of which this town is the port,

Oldeflo, or Odelfo, on the river Treve, feven miles fouth of Segeberg, 18 west of Lubeck, and 31 northeast of Hamburg, is a little old town, which was formerly a very flourithing place, and the capital of this part; but fuffered fo much by the neighbouring princes, who contended for this province, and by a duke of Brunfwick, who destroyed its falt-works, to favour those of Lunenburg, that is greatly decayed.

Travendal, on the same river, within a mile of Segeberg, is only noted for several treaties betwixt the king of Denmark and the duke of Holstein in 1700,

for adjusting the duke's rights.

Eutin, or Utin, about 16 miles from Lubeck, has given title of duke, and feat, to the younger fon of the duke of Holftein, ever fince the year 1596.

Ploen is a town almost furrounded by lakes: it is

the capital of what is deemed a principality of the fame name. It has a palace, which stands high, and commands a beautiful prospect, and is adorned with pleasant gardens and a park. The neighbouring lakes and woods furnish great quantities of fish and timber, upon the fale of which the inhabitants principally

Oldenburg, or Alterburg, was once a very confiderable town, but is now fallen to decay. It is fituated near the Baltic, 27 miles north of Lubec, and gives name to a fmall district. In ancient times the Sclavonian kings kept their court here.

Lemben is a market town on the confines of Slefwic, not far from the Eyder. It is celebrated for its beer, which is fent into many parts of the circumjacent country, and even transported abroad.

Meldorp, or Meldorf, is a large town, standing on a river or stream, called the Meele. It has some trade, and three market-places round its church, diftinguished by the names of the north, south, and west markets. Here is likewise a public school for the study of the classics and rhetoric.

Heyde is a large but poor town, 10 miles to the

north of Meldrop.

Krempi is a finall open town, on a little river of the same name.

Gluckstadt is fituated on the north fide of the Eibe, 26 miles fouth-west of Hamburg. It is a neat wellbuilt town, and fo ftrong as to be deemed impregnable.

The Danes have 2000 men in garrifon here, and fomeomen of war in the harbour, which is very fafe and spacious. Here the Calvinists have a church, the Roman Catholics a chapel, and the Jews a fynagogue. The town was founded in 1620, when Christian IV. king of Denmark, ordered it to be called Gluckstadt, which implies Fortunate-Town. There being no fprings about the town, the inhabitants use rain-water, or that of the river. Those who are convicted of theft receive this fentence; to draw during life, the dust carts belonging to the town, to which they are chained like flaves.

Bredenberg, or Britenburg, is a village on the Stor, defended by a caftle: it gives name to a lordthip that has long been the property of the ancient and

celebrated family Ranzau.

Primeburg is a market town on the Pinace, 13 miles from Hamburg, and 14 from Gluckstadt. It is only remarkable for giving name to a county which fell to the crown of Denmark by the death of its last count, in 1640.

Altena, a large and populous village, is joined by a row of houses on the Elbe to Hamburg. It had its name from the king of Denmark, as it is faid, purely to banter the deputies of Hamburg. The latter remonstrated to him against building this town too near their city; and having frequently observed thereupon, in their discourse to the king, "Dat is al te na," which, in the language of this country, is "It is too " near," the king, taking particular notice of the three laft monofyllables, faid to the deputies, he could not excuse himself, if he did not go on with the buildings; but that to oblige them, he would call it by the name they had given it. It was formerly a refuge, not only for infolvent debtors, but even malefactors, that came from Hamburg; because, though the inhabitants, a few fishermen and failors, subject to the king of Denmark, depended entirely on the trade and bufiness of that city, yet it was quite out of his jurisdiction. noted for a treaty in 1689, betwixt the king of Denmark and the duke of Holftein-Gottorp; but much more for its calamity in 1712, when Count Steinboch, the Swedith general, having juil defeated the king of Denmark and his army at Gadebusch, came and burnt this town to the ground. The reasons pretended by the Swedes were, that magazines of bread, beer, &c. were preparing here for the Muscovites and Saxons; and that it was partly in reprifal for the burning of Staden, and other cruelties committed by the Danes and Muscovites in the duchies of Bremen and Pomerania; but there was this difference as to Staden, that the Danes befieged it in form, and deftroved it by their bombs; whereas Steinboch was judged to act the part of an incendiary. As foon as he appeared before Altena, he fent in a meffage to advise the inhabitants to retire with what they could carry off, for that he was going to destroy their town. The magistrates came out in a body, and, falling at his feet, offered him 50,000 rixdollars to fave the town; but Steinbock infilted on 200,000, which they were ready to comply with, and only defired time to go to Hamburg for the money; but the general would admit of no delay; fo that the poor inhabitants were obliged to turn out; the mothers with their infants at their breafts, and fons with their aged and infirm parents on their backs, others groaning under loads of houshold-goods, and all lamenting their fate with the most lamentable cries. The Swedes flood at the barriers with flaming torches in their hands

mation, was a Franciscan monastery. The trade of this town is not fo confiderable as it

while they paffed, and, before they were all gone out, entered the town, and let fire to all parts of it, which burnt 2000 houses, with several fine magazines, and the Popish church. Several old men and women, befides infants, perished in the flames; but they spared the Lutheran and Calvinist churches, with about 80 houses that lay nearest to Hamburg. Never was greater desolation known. But what completed the ruin of this place was the raging of the plague at the fame time in Holftein, infomuch that the Hamburgers were forced, for their own prefervation, to shut the gates against their distressed neighbours, many of whom perished with cold and want. The king of Denmark relieved them as far as the necessity of the times would permit, and caused them to be supplied with materials for rebuilding their town. The buildings at Altena are now better in appearance than those of Hamburg; the streets are strait and regularly built, wide, and well-paved. There is a town-house erected; and several other public buildings shew that the place is in a flourishing and improving state. The merchants houses are on the water-side, so that ships unload and load at their doors. The king of Denmark made it the staple of the Danish East India company, which has been of very great importance to the town. This meafure was an admirable one for Altina, by means of her fituation, distributes the India goods were no other town in Denmark could: the fends large quantities into most parts of Germany, and herein rivals the Hamburgers, who are forced to buy theirs of the Dutch. In all these points the interest of Denmark has been very well confidered for this last century, from a noble attention in their kings to promote whatever has been most for the interest of their subjects.

Toleration is allowed here, which is denied at Hamburg, to all Christian sects, of whom there is said to be a greater variety at Altena than in any city of Europe, except Amfterdam. The Calvenifts of Holland and France have handsome churches, built all together on two fides of the fame court. The Papifts, tho' tolerated, are not io publicly countenanced as the Protestants.

Kiel is a town of great trade at the mouth of the river Swentin, on a bay of the Baltic, and the capital of all Holftein, 17 miles east of Rensburg, 24 of Gottorp, 36 north-west of Lubeck, and 48 north of Hamburg, and flands between hills on an arm of the fea, where it forms a lake. It has a good harbour, well frequented by thips from Germany, Sweden, &c. and is populous and wealthy. Both the town and harbour are defended by a caftle on a neighbouring hill. On the right, or east-fide of this castle, the sea washes its walls; and on the other side of the bay there is a delightful country, though woody. On the left there is a small arm of the fea, and another delicate country adjoining to it. There is a garden facing this cattle, which is the only place whereby Kiel has communicated with the main land; only to the left of the castle there is a row of houses leading to a village called Bruntwick. This garden which stands along the fea-fide, is above 200 paces broad, and confists of a terrace walk, levelled with the foundation of the castle, from whence there is a descent to parterres full of all forts of flowers, and adorned with a fountain and wilderness: and this leads to other parterries, from whence there is a small ascent to another terrace. It fuffered very confiderably during the war between Sweden and Denmark. An university was established here by the duke in 1665, which has had many learned profeffors. It is divided into the new and old towns, of which the former is the largeft and most pleasant, the ftreets being planted with rows of trees. The old town, which is a fort of peninfula, is fortified by deep ditches; and there are fine walks of trees on the harbour. There is a palace facing the town on the north-fide, but it is in very bad repair. Here are feveral confiderable buildings, particularly a large church and an hospital, which, before the refor-

baffy to Perfia in 1633, to fettle a commerce with that country. But it is much enriched by its yearly fair, which is kept for three weeks after twelfth-day, and frequented by multitudes of all ranks, especially by the nobility and gentry of the duchies of Sleswic and Holftein, who meet every evening at a house, where there is a variety of gaming; and very often parties are made for supper, which is generally followed with a ball. Vast sums of money are here negociated; and payments made of fums contracted before-hand, as punctually as by an Amfterdam banker upon the exchange; infomuch, that the man who does not preferve his credit at this fair, is looked upon as a bankrupt, and fubjected to punishment, besides the scandal. During this fair Hamburg looks like a defart, because every body hurries either to pay their rents, to renew their leafes, or to let out money, &c. by which means the town, which at other times is but inconfiderable, is fo full, that it is difficult to get lodgings.

The old town is separated from the new one by a bridge, at the end whereof is a draw-bridge and gate, guarded.

Rensburg is fituated near 20 miles west of Kiel, and 32 fouth-east of Lunden, being near the borders of Sleswic. It is small, but well built, and very strong, having modern built fortifications, a capacious morals on one fide, and a neat old caftle, with a round tower, on the other. The town is furrounded by the river Eyder, which forms two fmall lakes, and abound with fish. It is divided into the old and new town.

Wilster is a small town on a river of the same name,

fix miles from Gluckstadt.

Itzehoe is a finall town on the river Stor, which is navigable from thence to the Elbe. The country from hence to Hamburg is remarkably pleafant, and exceeding fertile. The town is divided into the old and new, the latter of which is extremely well built. Here is a Lutheran nunnery for ladies of quality, but they do not make vows, or lie under those restrictions which are customary in Roman Catholic convents, It consists of an abbess and 19 other ladies, and has the advowfon of several churches.

ISLANDS, COMPREHENDING THE PRINCIPAL PARTS AND PLACES IN THE DANISH DOMINIONS.

VE annex our description of the following infular to the continental parts of Denmark, because, collectively confidered, they are the feat of regal and legislative government, contain the metropolis of the realm, the general archives of the nation, and are the fources whence flow the chief political, civil, and ecclefiaftical decrees, statutes, &c. Add to these reasons, they are so absolutely blended with, and nearly contiguous to, the other main parts of the nation, that it would be impossible to describe Denmark as a kingdom, without taking them into particular confideration. The other islands, not so immediately connected with, though fubject to, or dependant on, Denmark, we shall describe in our account of the islands in those feas, where they are respectively situated.

Before we enter into a description of these parts of the Danish monarchy, it is necessary to premise a few observations concerning the Baltic. This sea, or rather inland gulph, fituated between Denmark, Sweden, Germany, and Ruffia, receives into its bosom feveral other gulphs, particularly the gulphs of Finland, Bothnia, Livonia, and Dantzick. It is remarkable that this sea, or gulph, neither ebbs nor flows; and there is always a current from it, that sets through the Sound into the ocean. It is likewise generally frozen over

three or four months in the winter.

ZEELAND, ZEALAND, or SEELAND.

ZEELAND is the most extensive and fertile island of the Baltic, and the principal part of the kingdom of Denmark. It is bounded on the east by the Sound, which divides it from Schonen, and on the west by the was in the time of duke Frederick, who fent an em- Geater Belt, which separates it from Funen.

islands of Moon, Falfter, and Laland, lie on the fouth; and on the north are the Categate and Schager- port and fleet, and faces the tolbooth, or customrack. It is almost of a round form, being 70 miles in diameter, and about 200 in circumference. The land, in general, is low, and very fertile; and its woods, forefts, &c. abound with game. The coast is indented with many gulphs, bays, creeks, &c. which are of great commercial use, as they afford many secure harbours. The fea vapours render the air thick, but not unwholfome, as the people here, in general, live to a very old age; but they are dull, dispirited, and inactive. Zealand is divided into 26 bailiwicks, called herrits, and these contain 346 parishes, with several considerable cities, towns, &c. Of these the prin-

Copenhagen, the capital of the whole kingdom. This city takes its name from the commodiousness of its port; for the word itself fignifies, The Merchant's Port or Haven. It is fituated on the eastern thore of Zeeland, upon a fine bay of the Baltic, near the strait called the Sound, in 55 deg. 40 min. north lat. and

12 deg. 56 min. east long.

Copenhagen was originally a mean little village of fishermen's huts, which, by the affistance of the bishops of Roschild, gradually rose to be a considerable town, and at length was declared a city, and made the royal feat of the Danish sovereigns. The houses were formerly of wood; but in the year 1728, almost the whole city was reduced to ashes by fire; and since that time it has been more fumptuoufly and fecurely built of free-stone. The then reigning king exhausted immense treasures to erect a superb palace; and the town is em bellished with elegant houses, belonging to the nobility, many magnificent churches, and other elegant public edifices. An ingenious gentleman, however, who was very lately in this city, fays, " fo few perfons vifit this metropolis, or kingdom, from motives of curiofity, that they are quite furprized when I affure them I have no fort of bufiness here, and am only employed in the fearch of knowledge. There is no face of industry or business here; and Copenhagen, though one of the finest ports in the world, can boast of little commerce. The public places are filled with officers, either in the land or fea fervice; and they appear to constitute three-fourths of the audience, both at the comedy and the opera. The number of forces are indeed much too large for this little kingdom. They can boaft, it is true, a vast extent of dominion; but of what importance are the barren and almost uninhabited mountains of Norway and Lapland, stretching to the pole, or the plains of Iceland, where the inhabitants are yet, and will propably ever remain, in the most profound barbarism? Their dominions in Holstein are by far the most rich, and furnish a large part of the royal revenue. There needs, indeed, no ftronger proof of the poverty of the kingdom, than the scarcity of specie. I have seen no gold, and hardly any silver. They pay every thing in paper; and if you lose a fingle dollar at the card-table, or the billiard-table, it is given in a bill." The excellency of the harbour is owing to the island of Amack, which breaks off the waves, and shelters from the surge of the sea. Here stands the arefenal, the exchange, the castle, and the mint, with about 500 houses, known by the name of the New Town. The whole city of Copenhagen is about five miles circumference. It lies very low; but there is a riling ground within about half a league of it, and two or three little hills that cover it on the west-side, from whence the city may easily be bombarded. It has a very regular citadel on the north and north-west, built on the shore, with several fine bastions, with ravelins of earth, well ftored with cannon, and pallifadoed. The other fides are of more difficult access, by reason of marshes. There are feveral royal baftions, with ravelins before the curtains, which reach from the citadel to the fouth part, and continue beyond the arm of the fea, which teparates Zeeland from Amack. A circuit of fortifications, confitting of eight

port and fleet, and faces the tolbooth, or customhouse battery, which secures the entry into the haven. Theie fortifications make the city of a round form, The houses, which are not above 7000 in number, do not take up above half the ground enclosed. trance into the harbour is fo narrow, that one ship only can pass at a time; and this entrance is shut up every night with a strong boon. The citadel on one fide, and a good block-house, well furnished with cannon, on the other, command the mouth of it. Within this haven rides the royal navy, every thip having its place affigned to it. A wooden gallery ranges round the whole enclosure where the fleet lies, and is laid over the water in fuch a manner, that all the fhips may be viewed near at hand, as eafily and commodiously as if they lay on dry land. This harbour is capacious enough to hold 500 fail, where neither the wind or the enemy can do them the least mischief. The road without is very good and fafe, being fenced from the sea with a large land-bank, on the points of which are always two buoys floating to direct all ships that come in or go out. Here are no tides to fear, and there is always a fufficient depth of water. Sometimes, indeed, according as the wind blows in or out of the Baltic, there lies a current; but it is neither frequent or dangerous.

The island of Amack lies east from the city of Copenhagen, on the other fide of the haven, and is called the Garden of Copenhagen. It is almost of an oval form, and was chiefly planted by Hollanders, fent thither by Margaret, duchels of Savoy, and governess of the Low Countries, at the desire of Christian II. who had married her niece, fifter to Charles V. emperor of Germany. He wished that his queen might have pulse, and other garden-stuff, planted there, which none knew fo well how to cultivate as the Hollanders. Half the island was granted to them, and keeps to this day the name of Hollandesby. They still retain the Dutch fashions, and fupply Copenhagen with milk, butter, and cheese. The other half of the island is inhabited by Danes. Befides pulse, and other fruit, which this island produces, here is also plenty of wheat, barley, and oats. It also produces abundance of hares. The inhabitants are industrious, and their houses neat and

cleanly.

Here is a place which approaches nearer to the nature of a circus than a iquare. Each fide is formed of only one fingle palace; and in the center is an equestrian statue in bronze, of king Frederick the Fifth. This place has a good effect, and is much more handfome than the Place de Victoires at Paris. There is a fine collection of paintings in one of thefe palaces, and a very curious private museum in another. But the greatest curiofities, natural and artificial, both for variety and intrinsic value, are preserved in the Royal Museum, in eight chambers, erected over the king's library. The chambers, or apartments, are large and well furnished. One of these rooms is wholly taken up with medals, antique and modern, each fort being kept by themselves, and very judicioufly arranged; and in a separate case are contained the Paduans, and other counterfeit medals, which, in workmanship, so nearly refemble the true Grecian and Roman antiquities, that a good judge can fearcely diffinguish them from originals. The feries of the modern medals of European nations are absolutely complete, and those of each nation kept distinct. Here it is proper to observe, by way of explanation, that a Paduan, amongst medalists, is a modern medal struck with all the marks and characters of antiquity. The name is taken from a famous Italian painter, called the Paduan, from Padua, the place of his birth, who fucceeded fo well in the cheat, that the best judges are at a loss to diffinguish his medals from those which are really antique.

Amongst the natural curiofities preserved in the chambers, one of the most remarkable is a petrified EUROPE.7

It was cut out of the mother's belly at Sens, in Champagne, in the year 1582, after having lain there between 20 and 30 years; and that it is a human fœtus, and not artificial, is evident beyond all difpute. Its head, shoulders, and belly, are of a whitish colour, and very much resemble alabaster; the back and loins are somewhat brown and harder; but, from the hips downwards, it is of a red colour, and as hard as perfect stone can be, exactly resembling the hard fort of stones generated in the bladder. This services, after it was taken from the mother, was first carried to Paris, where it was fold to a jeweller of Venice, who happened to be there, for about 201. sterling; of whom it was afterwards purchased by Frederick III. king of Denmark, for 601. and added to this collection.

EUROPE.7

In one of the chambers are to be feen two elephants teeth, each weighing an hundred and fifty pounds, which were dug out of a stone quarry in Saxony.

In this fine collection there are feveral large pieces of filver ore, dug out of the mines of Norway in 1666, one of which weighs 460 pounds, and is valued at 5000 crowns. Another piece, somewhat less, is valued at more than 3000; both being so rich, that they are reckoned to contain at least three parts filver. They are composed of a whitish stone, the cracks or cavities whereof seem to be filled with pure virgin filver, which, in some places, lies in broad shat plates, and in others like pieces of sine filver lace. But what is most admired in these pieces of ore, are the threads, or branches of filver, which shoot out an inch or two beyond the surface of the stone, appearing in the form of small shrubs or bushes. Several other rarities of this kind are to be seen among the filver ores preserved in this museum.

Here are also several large pieces of amber, some weighing 40 or 50 ounces; which, upon opening the diches about Copenhagen, when they fortified the city, were found sticking to the sides of old trees that were buried there, like the gum on the plum-trees in our gardens.

In the fame chamber are a great many large branches of white and red coral, and one of black; likewise a pair of stag's horns growing out of a piece of wood in a surprizing manner.

Here is a human thigh bone three feet three inches long; and two very large feollop shells, holding about three gallons each, and weighing 224 pounds a piece. These were brought from the East-Indies; and, it is said, the fish they belong to is of such strength, that if a man happens to get his arm or leg between the shells when they open, it claps them together so forcibly as to cut the limb clear off.

A piece of marble is preferved in this collection, which the Lutherans reckon a very valuable curiofity, the natural veins of the stone running in such a manner as to represent the exact sigure of a crucifix. Some, indeed, have suspected the representation to have been by art; but, upon the nicest examination, it appears to be entirely the work of nature.

Among the artificial curiofities there is a fkeleton made of ivory, two feet fix inches high, in imitation of a human one; and it is so nicely formed and put together, that it may be easily taken for a natural one.

There are likewife two crucifixes of ivory, and the whole history of our Saviour's passion, beautifully expressed in a piece of carved work.

A finall man of war in ivory, with filver guns, is a curiofity much admired; as is also a watch made of ivory, with all its wheels and movements.

Besides these there are many other curiosities in ivory,

Besides the there are many other curiosities in ivory, ebony, box, amber, and other materials, which are kept for the lake of their elegant workmanship. There is likewise a common cherry-stone, on the surface of which are engraved 220 heads, but their smallness makes them appear imperfect and consused.

In this royal repository are fix golden sepulchral urns, which were found in the island of Funen in 1685, by a peasant, as he was ploughing his land, and con-

No. 58.

tained each of them some ashes of a greyish colour. The largest of them weighs two ounces and a half, and the others two ounces and a dram. They are extremely thin, and each has three rings of gold about its neck, with several circles carved upon the outside of the urn, having one common center. This discovery consists the accounts given by various writers, that it was an ancient custom among the northern nations to burn their dead, and then bury their collected ashes in golden urns.

There is another fepulchral urn of chrystal, of a conical figure, which has also a golden ring about it, and was found near Bergen in Norway.

There are likewife in this collection feveral veffels of different fizes, fome of glafs, and others of earth, which are called lachrymal urns, or lachrymatories, being ufed by the ancient Romans to catch the tears of weeping friends, which were afterwards mixed with the after of the deceafed.

We shall conclude our account of this celebrated museum with a description of the Danish and Oldenburg horns, two curiofities which are greatly admired. The Danith horn is of pure gold, weighs an hundred and two ounces and an half, is two feet nine inches long, and holds about two quarts of wine measure. This horn was accidentally discovered in the year 1639, by a country girl, in the diocese of Ripen, in Jutland, and is undoubtedly a piece of great antiquity, by the figures carved on the outfides, which feem to be hieroglyphies, &c. It is likely that some of these figures were designed to represent their deities; and the horn was probably used in facrifices, as among the ancient Affyrians, and other nations, who, upon fuch folemnities, made a great noise with horns and trumpets, and used them to drink out of at their folema entertainments.

The Oldenburg horn is of pure filver, gilt with gold, weighs about four pounds, and is curiously enamelled with green and purple colours. The Danish antiquaries relate many fabulous flories of this horn, which are not worth repeating; and as to what they say of its being given to Otho, earl of Oldenburg, in the year 982, it is plain it cannot be of that date, for the figures and characters on the outside are modern; which, however, with the enamelling, and other ornaments, are of excellent workmanship, and make it a very sine

and valuable curiofity.

An ingenious traveller, in fpeaking of the palace of Rosenburg, in this city, says, it was constructed by our famous Inigo Jones, and stands in the middle of a large garden. It is finall, and at prefent very little used by the king, or royal family. There is an air of antiquity in all the apartments, tapeftry, and furniture, which is not displeasing, and impresses with respect. The grand fala, or dining-room in particular, is in this ffile. The hangings, which are not ill-executed, reprefent the various actions by fea and land, which diverfified the ancient laws between the Swedes and Danes, who feem always to have had the fame rivalship and animosity which the French and English are distinguished for, and which, 'tis probable, they will ever, in fome degree, retain. At one end of this grand apartment are three filver lions as large as life, who feem, by the ferocity and rudeness of their appearance, defigned to characterize the age and nation in which they were cast. Here are several cabinets full of curious rarities, which the various fovereigns of Denmark have fuccessively collected and left to their posterity. Many of them are intrinsically valuable, others only preserved from some event or accident connected with them. Among the first is a saddle, on which Christian IV. made a fort of triumphal entry into Copenhagen. It is covered with pearls, diamonds, and other precious stones; and the spurs are of stones enriched with jewels. The coat worn by the king, and a light helmet on the fame occasion, are likewise covered with pearls. They preferve likewife, with great care, a handkerchief of this prince, dyed with his blood from a wound which he received by a ball, that

deprived him of an eye. The man who accompanied us flewed me, with exultation in his countenance, a fword of Charles XII. of Sweden. It is just such a fword as fuch a monarch may be supposed to have used, and would well become the meanest foldier. It, indeed, evinces his ftrength and vigorous frame of body, by its fize and weight: the blade is at least four feet long, and both the hilt and garde are entirely com-

The gardens of this place constitute one of the chief diversions of this city, as they are always open, and on festivals or Sundays crouded with company. They are large, but not laid out with tafte, or adorned with any productions of art, one flatue only excepted of Hercules vanquifting the Næmean lion, which flands under a portico, raifed to defend it from the inclemency of the weather. This is of Italian workmanship; and the artist has found means to display great anatomical skill and beauty in the attitude and muscles of the hero, who, by an extraordinary exertion of strength, forces open, and breaks the jaw of his adverfary.

The other principal buildings of Copenhagen are the king's mews, or stables, the orphan-house, the operahouse, the military school, the royal library, which contains above 40,000 printed books and manuscripts, in various languages, and the univerfity. With respect to the latter, it must be observed, that, prior to the reign of Christian I. (who was one of the best kings that ever ruled the Danes, and, indeed, may be deemed the Alfred of Denmark,) the Danish nobility and gentry, for want of proper feminaries of learning in their own country, were under the necessity of fending their children to the French and German universities and colleges for education. To remedy this great incon venience, Christian applied to, and obtained leave of, the pope, to establish a public seminary of learning in his own dominions, when the univerfity of Copenhagen was accordingly founded in the year 1475. But neither the successors of this wife and patriotic monarch, or even the clergy, have feconded his laudable endeayours with a proper degree of spirit: for a very intelligent gentleman, who recently visited this city, says, There are several hundreds of students in the univerfity of Copenhagen who were entered upon establishments which were made by former kings, when all the necessaries of life were very cheap, and when their young men could live decently upon what were allowed them; but now, as all these necessaries are become much dearer, and as few of those students have any private fortune, many of them are in the greatest mifery. I have met with feveral young men of lively parts, in the univerfity, which might make a confider-able figure in the world; but fince the new titular nobility bear the fway here, ignorance and impudence, as coming the nearest to their own character, are rewarded; whilft real merit, modefly, and decency, are treated with the greatest contempt. Some time since, the king had a French comedy established at Copenhagen, to the fight of which every decent perfon was admitted gratis: but I was really aftonished to see three or four young men of genius refused admittance to this comedy, because they were students in the university, though they were very decently dreffed, and even folicited to be admitted into the galleries; while those places were filled with valet de chambres, and others of that class. No class of people are held in more contempt, in this country, than the students of the university. What encouragement, then, have men of genius to study and cultivate the sciences?

Helfeneur, or Elfeneur, is fituated about 20 miles north of Copenhagen, on a neck or strait of the fea, called the Sound, and furrounded by walls. The castle of Cronenburg, which defends Helfeneur, and the caitle of Helfinburg, on the opposite shore, command the commerce of the Baltic; for between these two forts all vessels that trade into that sea must pass; so that this strait is the most frequented of any in Europe, that of Gibraltar excepted. The caffle of Cronenburg

was built by Frederick II. of free-stone, brought from Gothland. Every ship that passes this strait must strike fail at Cronenburg, and come to the town to compound for the cultom, under the penalty of forfeiting the veffel and cargo. Helieneur was furrounded with walls under the reign of Christian IV. and peopled not only with Danes, but also with citizens from several nations. The city fuffered very much when Charles Gustavus, king of Sweden, besieged Cronenburg in 1658. It was taken by him, but reftored to the Danes by the treaty of Copenhagen in 1660. This was the native place of the celebrated John Isaac Pontanus, though his parents were of Haerlem in Holland. was doctor of physic, profesior in the university of Hardewyck, and hiftoriographer to the king of Denmark, and the province of Gelderland.

The castle of Cronenburg is sour or 500 paces distant from Helseneur, on the spot where stood form thy the fortress of Orekrange. It is built upon oaken piles, fastened with hewn stones, and so solid, that it supports the fury of the tide, which fometimes beats against it most violently, without damaging it in the leaft. It makes a large square court, and was adorned with fine statues; the apartments also being very fplendid. The pipes of the ciftern, which supplied the garrifon with water, and the locks of the doors, were all of fine filver, before it was plundered by the Swedes. It has four little towers at each corner, covered with copper: but the castle, with the chapel, steeple, and ornaments of it, are all going to decay. It has a ditch towards the fea, furrounded with another ditch; and the land fide is fecured by five baftions, and a half baltion. They have five cannons upon them : but the baftion that fecures the paffage of the Sound has but two cannons, 36 pounders each; and 11 more of fmaller fize. The rampart is vaulted with free itone. Frederick II. who built this caftle, fpent none but his own money in the building of it; and declared, that if he knew there was one fingle stone in it that cost his people a farthing, he would have it removed.

The unfortunate queen Caroline Matilda was confined in this castle. There is a little hunting-seat, or palace, about a quarter of a mile from Elfeneur, to which the king reforts, for a few hours, in fummer. There is nothing worthy of observation in the structure itself; but from the roof the prospect is enchanting, as it commands the town of Helfeneur, the cattle of Cronenburg, the Sound, and the coast of Sweden, for a

confiderable way.

Over against Helfeneur lies the island of Huen, or Ween, remarkable only for the castle of Uraniburg, built by the famous Tycho Brahe. King Frederick II. had given him that ifland for his life, that he might build an observatory there, with other buildings proper for his purpose. The king gave him also a pension of 2000 golden crowns, a confiderable fief in Norway, and a prebend in the church of Roschild. This island was perfectly well fuited to Tycho Brahe's defign; for it is properly a hill, which rifes in the middle of the fea, the top of which is flat and fmooth, and commands a prospect all over the coast of Schonen, and the neighbouring country, affording thus a very extensive horizon. Add to this, that the sky is here generally clear, there feldom ariting any fogs. Tycho Brahe laid, towards the middle of the illand, the foundation of his cattle, which he named Uraniburg, that is to fay, the Town of Heaven; and finished it in four years time. From the disposition and convenience of the apartments, together with the engines and inftruments for observations it contained, it was looked upon as a building that had not its equal in the world. In the neighbourhood of it were lodgings for workmen of all kinds, maintained at the expence of the mafter; a printing-house, a paper-mill, forges for making of instruments, laboratories for chymical experiments, &c. Four years after he built, in the fouth part of the island, another house, which he called Stelburg, that is, Starburg; there he kept feveral instruments, and lodged EUROPE.]

fome students and servants, who applied themselves to some particular study. But Uraniburg is now gone to decay. The island of Huen belongs now to the Swedes.

The chair in which Tycho Brahe used to fit, to make his astronomical observations, is still preserved in the Royal Museum, and held, by the Danes, in the highest veneration. "Thus (says a judicious traveller in a letter to a friend) it ever happens! I need not remind you that the astronomer himself was driven from his native country by faction and malevolence; or that he died at Prague, in the court, and under the protection, of the emperor Rodolphus, who sheltered this illustrious sugitive, and assorbed him an asylum. Dr. Johnson's lines, so often quoted on similar occasions, are very applicable:

"See nations flowly wife, and meanly just, "To bury'd merit raise the tardy bust."

Holbeck, Callenburg, Ringstede, Presto, Koge, Warienburg, Newstad, Skelskor, and Korsor, are places which contain nothing worthy of description.

Fredericksburg is a small town, 20 miles distant

from Copenhagen, to the north-west, and 18 from Helfeneur to the fouth-west. It is considerable only by the stately castle and royal palace which stands near it. That castle was formerly but a small seat belonging to a private gentleman. King Frederick II. being charmed with its fituation, bought it of him, and be-gan to enlarge it. His fon, Christian IV. finished it. This is the Verfailles of Denmark. The house is built on piles in a lake. The body of the castle con-The house is fifts of a very fair front, with two great wings. The chapel is well adorned, and covered with gilt copper. It has 12 filver statues of the apostles; and all the locks, bolts, &c. were filver, till it was plundered by the Swedes. The hall is adorned with paintings, and has the pictures of feveral of the kings of Denmark, and of the royal family, as large as the life; and a frame of paintings, which reprefents the fea and land battles of the kings of Denmark. It is hung with rich tapeftry of mohair, reprefenting the actions and battles of Christian IV. There is a gallery which leads from the calle to the hall of audience, adorned with pictures, most of which were bought in Italy. Here is a park about nine miles long, of a proportionable breadth, and interspersed with pools and fish ponds, with a mixture of green plods, hillocks, and fmall vallies. It was stocked with fallow deer from England. There is a pretty flower garden behind the castle, in the very lake; in which, though it is exceeding deep, they have built a kind of terrace on piles that cost an hundred thousand crowns.

Roschild, or Roskild, lies at the bottom of the bay of Ifefiord, and is 18 miles diftant from Copenhagen to the west. It was formerly the capital of Denmark, when the king refided there; but fince they have chosen Copenhagen for their residence, it has dwindled greatly in point of importance, and is much decayed with respect to wealth and commerce. Of 27 churches, which formerly embellished this town, only two are now standing. It continues, however, to be the burial place of the royal family. Among the monuments of the Danish sovereigns, some of which are extremely magnificent, stands a beautiful marble pillar, erected by queen Margaret, as a support to the whetstone sent her by Albert, king of Sweden, to fharpen her needles, in derision to her fex. But it whetted her refentment in fuch a manner, that he fuffered feverely for his farcasm; for he was taken prifoner by the queen, detained feven years in custody, and obliged to relinquish all his pretentions to the crown of Sweden. Here is a convent of Lutheran nuns belonging to the best families; but they are not obliged to wear any particular habit, or to be restricted by the vows usual in convents; but are permitted, if they think proper, to quit the convent, and marry.

In 1658 the famous treaty of peace was here concluded between Denmark and Sweden. The university is interacted declining condition; and, indeed, the whole town exhibits evident marks of poverty and decay.

Sora is fituated on the banks of a lake, about the center of Zealand, was formerly the feat of a rich abbey, and has many pleafant fields and forefts near it. To this place the academy of Frederickfburg was removed, and the foundations of the univerfity were augmented by Christian IV. Charles Gustavus, king of Sweden, was educated here, and retained such a veneration for the place, that when he invaded Zealand, he would not fusser his foldiers to enter the town. But the revenues of this feminary have been annexed to the crown of Denmark, and the whole is gone to decay. Absolom, archbishop of Lunden, once sounded here an establishment for the maintenance of those who should write the history of Denmark; and to this foundation we owe the history written by the celebrated Saxo Grammaticus.

FUNEN.

THIS island is the next to that of Zealand, in the fcale of importance, among the feveral parts which form the Danish kingdom. It is bounded by the Greater Belt on the east, by the Lesser Belt on the west, by the Baltic on the fouth, and by a little channel, which separates it from the island of Samsæ, on the north. It is about 36 miles from east to west, and 30 from north to fouth. The country is fertile and agreeable, being finely divertified with verdant hills, fhady woods, pleafant groves, fruitful fields, rich paf-tures, &c. The foil is good, well cultivated, and affords a great deal of grain, not only for home con-fumption, but exportation. Great quantities of black cattle, horses, hogs, &c. are bred here. This island is an appendage to the eldest fons of the kings of Denmark, and is deemed one of the richest governments belonging to that fovereignty. It contains four garrifoned towns, and 264 villages; but the most considerable places, and the only ones, indeed, worthy of description, are the following.

Odenice, the capital of the island, stands about its center, and is a capacious, well-built, pleasant town. Here the kings once resided, and the assembly of the states met before the crown became hereditary, and the sovereign absolute. In a church here, which is dedicated to St. Canute, the body of that prince was found near a century and a half ago. It was deposited in a copper cossin, gilt, and adorned with precious stones. The most particular circumstance relative to this town, at present, is, that the inhabitants brew the

best beer in the whole kingdom.

Nyburg lies on the narrower part of the Greater Belt, between Funen and Zealand. This place has some trade, the harbour is good, and the adjacent country is fertile. The damages done to the fortifications in the late wars with Sweden, are not yet thoroughly repaired. Embarkations for the island of Zealand are made at this town.

Schwenborg is an agreeable town, with a commodious harbour, fituate on the fouth-east part of the island. From hence Charles Gustavus, in the year 1658, began his march, over the ice, to the islands of Langeland, Zealand, and Falster.

Woburg, or Foburg, is a small town, fituate on a little gulph on the southern coast of Funen, overagainst the island of Arroe, and is about 10 miles dis-

tant from Schwenborg to the weft.

Affens lies on the fouth-west coast of this island, over-against Hadersleben, in the duchy of Sleswie. It is about 11 miles distant from Odensee to the fouth. In the year 1535 the army of king Christian III. commanded by John Rantzaw, routed that commanded by Christopher, earl of Oldenburg, and killed Gustavus Troll, archbishop of Upsal. Rantzaw afterwards levelled this town with the ground.

Amron, or Ar

Middlefar, on the western shore of the island, lies on the Lesser Belt, hence also called Middlefar-Sound. It is 17 miles distant from Assent to the north-west, and as many from Odensee towards the south-west. It is a small, but neat town, in a country abounding with all the necessaries of life. It is the common passage from this island to Colding in Jutland; the Belt not being broader here than the Thames is at Gravesend. On the 13th of January, 1658, Charles Gustavus, king of Sweden, led his army over the ice to this place, routed the Danish forces that opposed him, and made himself master of the whole island of Funen.

FALSTER.

THIS island lies to the north-east of Laland, from which it is separated by a narrow strait. It has Zealand on the north, and the island of Moon on the north-east. It is 20 miles in length, and eight in breadth. Its soil is very fruitful; and much corn is sent from hence to Mecklenburg, and other parts of Germany. It is divided into two bailiwicks; that of the fouth, or Synder-Herrit; and that of the north; or Norre-Herrit. It has several towns; among which the chief are Nycoping, on the western coast of the island, of which it is the capital. It is one of the most pleasant and well-built towns in the whole kingdom, and stiled, by Dr. Heylin, the Naples of Denmark. It has a strong castle, and a well-frequented harbour. Stubcoping, in Latin Stubcopia, seated on the north coast, is a place of some trade, being the usual passage from Zealand into Germany.

ARROE.

THE island of Arroe is situated near the coast of Funen, being eight miles in length, and two in breadth. It is extremely fruitful in corn, and abounds in aniseed, with which the inhabitants give a slavour toutheir bread, and season their meat. In this island are plenty of horses and black cattle; and some woods, in which are abundance of hares. The whole Island has but three parishes, the most considerable of which is Kopin, or Kioping. The town belonging to it stands on the southernmost part of the island, and bears the same name as the parish. It has a trade on account of its port, and is situated at the bottom of the bay.

LALAND.

THE island of Laland is situated on the eastward of Langeland, and to the southward of Zealand, from which it is separated by a narrow strait, called Grone Sound. From its lowness, or slatness, it has the appellation of Laland, or Lowland. It is near 40 miles in length, and about 20 in breadth, where widest. The soil is very fertile; so that Copenhagen is supplied from hence with great quantities of corn, besides what the Dutch traders are surnished with for exportation. This island is divided into five districts, or bailimands subject to its jurisdiction. It contains various pleasant little villages and hamlets, and a few seats belonging to the noblesse, exclusive of sour towns, Nascow, Saxcoping, Levenscoping, and Nysted.

Nascow, or Naskow, the capital, is 59 miles fouthwest from Copenhagen, and has a commodious harbour for trade. The fishery is of some consequence, and the circumjacent country is rich in meadow and pasture lands. The rest contain nothing worthy of particular notice.

M O O N.

THE island of Moon lies to the south-east of Zealand, and to the north-east of Falster. It is about 20 miles long, eight broad, and full of high chalky hills. Here is some pasture ground, but very little corn land. It was formerly part of the Danish admiral's allowance, as being the first place for him to reside in.

There are in this island several villages, large parishes, and a considerable city, called Stege, or Stekee, which lies on the north of the island, on a little rivuler, that a mile lower falls into the strait called Grone Sound. This city made a brave defence against the Lubeckers in the year 1510, and forced them to retreat: and the valour of the inhabitants of the whole island was signalized in 1659, when they desended themselves better against the Swedes than the larger islands had done.

LANGELAND.

THIS island, which is 22 miles long, and eight broad, is fituated on the Greater Belt, to the fouthward of Funen. It abounds with wheat, rye, and barley, of which the natives export great quantities. It is divided into 16 parishes; and Rutcoping, on its western coast, is the most considerable town, being defended by the fort of Traneker, which is always surnished with a strong garrison.

FEMEREN

LIES near the coast of Holstein, from whence it is feparated by a strait which is not above two miles broad, and is called Der Femmer Sundt, i. e. the Straits of Femeren. Though it is but a small spot of ground, yet it has always been looked upon as one of the keys of Denmark, with regard to the empire. Therefore king Christian IV. was more asraid of the Germans becoming master of this island, than of their over-running Jutland, which caused him to fortify all the old castles, and put strong garrisons into every place of importance here. This island is extremely fruitful in corn and passures, and yet has but two parishes, namely, Borg and Petersdorp. There is a fort at the place where people land from Holstein, called Schichans, that is, the Fort of the Passage.

BORNHOLM.

BORNHOLM, anciently Boringia, is faid to have been discovered by Thicloraus, the son of a prince of Jutland. It is the remotest and most easterly of all the islands belonging to the king of Denmark, being about 75 miles diffant from Zealand to the east, and not above 15 from the nearest coast of Schonen to the fouth-east. It is about 18 miles long, from north-west to fouth-east, and about 10 in breadth, from south-welt to north-east. Bornholm is a place of great importance for its fituation and fruitfulness, and belonged once to the archbishop of Lunden; but king Christian II. took possession of it in the year 1524, as being abfolutely necessary for the seet he was preparing against Sweden'; which usurpation George Sesteburg, who was then archbishop, opposed with all his power, but in vain, for he was forced afterwards to fly into Germany, to avoid the effects of the king's displeasure. The Swedes have frequently laid this island waste; and, in the war with Frederick II. they made themfelves mafters of it, and defigned to keep it; but they were obliged to reflore it by the treaty of Copenhagen, concluded May 27th, 1660. The most considerable places are Sandwyck, on the northern coast; Rattenby, on the fouth western; Nex, on the eastern; and Sand-Hamer, to the north of Nex, on the fame coast; besides which there are here several villages.

MANY little islands furround the above mentioned more confiderable ones; but they are either uninhabited, or of so little importance, as not to be thought worthy of notice by travellers, or of mention by geographers. Some others are contiguous to them, and belong to the other provinces of Denmark; the most confiderable of which are Samsoe and Lessaw, on the coast of Jutland.

Samfoe, or Samfoi, is in the Baltic, eight miles from the coast of Jutland. It is near nine miles in length, three in breadth, fruitful, healthy, and pleasant.

large parishes, Stekoe, which rivulet, that Grone Sound. he Lubeckers reat: and the fland was figmfelves better had done.

Lessaw belongs to the diocese of Aabur, opposite to which it lies, at about the distance of 12 miles from the shore. It is surrounded by sand hills, but has two places where ships may ride safely at anchor, on the north and east fides, and contains three small

Appertaining and contiguous to the duchy of Slef-

wic, are the following iflands, viz.

Rom, which is in length feven, and in breadth four miles, contains feveral finall hamlets, and about 1500 inhabitants. Towards the eaftern parts the pasturage for cattle is excellent; and on the western fide of the island are feveral harbours, in which fmall veffels may ride in fafety.

The greatest part of Manoe, formerly a considerable

island, has been swallowed up by the sea.

The island of Sylt is situated to the northward of Fora, and is of a triangular form, the longest side being about 14 miles in length. It is fandy, barren, and inhospitable; and the people, who are a hardy, clownish race, are annually engaged in the whale fisheries, on the coasts of Iceland, Greenland, and Spitsbergen. Earthen urns, containing human bones, affies, &c. have been found in the hills of this ifland, which farther evinces that the ancient inhabitants burned their dead.

Northstrand lies opposite to the bailiwick and town of Hufum, and was, it is faid, feparated from the continent by a violent florm. When it became an island it was about 12 miles long, and four broad, in fome places, and in others lefs. Its foil is very fruitful, and produced abundance of corn before the inundations we shall mention hereunder. It had also very fat pastures, where they fed exceeding good cattle; and they used to fend daily to Hufum, and other places, a prodigious number of theep, fowls, ducks, and geefe, and great quantities of butter. It contained 21 or 22 parishes, and about 8000 inhabitants; but it has fuffered prodigiously at several times by fatal inundations. the year 1300 the little city of Rungholt, with feveral churches and villages, were carried away by the waves, which drowned also great numbers of people, as well as cattle. In 1532 there arose such a violent ftorm, that almost the whole island was overslowed; when 1600, or, according to others, 1900 persons perished in the water. The next year another storm damaged the dykes very much. From 1672 to 1618, there happened every year fuch inundations, as occasioned prodigious losses, and put the inhabitants to very great expence; and particularly in 1615, when 3 o per-fons perished in the waves. They were afterwards free for fome years, and had time to repair their banks and dykes; but all their care and precautions proved ineffectual against the storm that happened October the 11th, 1634. At ten of the clock at night the whole island lay under water, above 6000 persons were drowned, and, of all the inhabitants, there were hardly 1500 that faved their lives. The churches, which flood on the rifing grounds, held out the florm indeed, but fell down afterwards; and 28 wind-mills were carried away by the waves. The lofs of cattle of all forts was reckoned to amount to 50,000 heads; and the dykes were broke in 44 different places. The whole island continued thus overflowed, except a small spot of ground which flood higher than the rest. Since that time the inhabitants have laboured, with the affistance of some Dutchmen, to regain part of the land they have loft.

Amron, or Amroen, is a small island to the north-west of Northstrand, from which it is about seven miles dif-It is in the form of a crefcent, and is only confiderable for its oyster fishery.

Fora, or Foehr, lies towards the north-east of Amron, and nearer the coast of Sleswic, between Northstrand and Sylt. It belongs to the prefectorship of Tunder, and is of an oval figure, about fix miles in length, and four in breadth. It abounds in cattle and eorn, has about 4200 inhabitants, and feveral villages. The in-No. 58.

habitants still preserve the language, manners, and dress of the ancient Frisons, though some of them fpeak the dialect of Lower Saxony.

SECTION IV.

Language, Religion, Learning, and Forms of Government of the Danes, ancient and modern.

THE language of the Danes, like that of the Norwegians, is a corrupted dialect of the Teutonic, and in pronunciation harfh and diffonant. It is intermixed with many Dutch, German and French words; but the French is the language of the court.

The established religion of Denmark is the Lutheran. The kingdom is confidered as divided into fix diocefes, viz. one in Zealand, one in Funen, and four in Jutland; but these are, in fact, no other than superintendencies; for they are without cathedrals, ecclefiaftical courts, or temporalities. The principal bufiness of their bishops, or rather superintendants, is to inspect the doctrines and morals of the inferior clergy. The fuperintendants are not diftinguished from other minifters by their habit; the clerical dress confisting of a black gown with fhort fleeves, a round cap with flat edges, and a large ruff about the neck. The revenue of the bishop or superintendant of Copenhagen, which is the richest benefice in the whole kingdom, amounts to no more than 2000 rix-dollars, or about 510l. flerling per annum. The clergy are wholly dependent on the government, and are obliged to act with the utmost submission and servility to the court. But to make amends for being obliged to be fo obsequious to one class of people, they take care to shew their authority, and domineer over another class; for having acquired an absolute influence over the minds of the common people, they exercise a kind of spiritual tyranny over their confciences. The clergy, in general, preach without notes, and fome of them lead very exemplary lives. Their churches are kept neater, and are more embellished with ornaments, than those of England; but the decorations are usually inelegant, and often abfurd. This incongruous tafte is very pointedly ridiculed by an ingenious traveller, who, in a letter dated from Copenhagen, fays, "I have been in all the churches here, whether German, French or Danish; but it is not in the Lutheran places of devotion one must fearch for the productions of art or elegance. Madonas and Magdalenas are confined to Roman catholic walls. There is one church here, indeed, where they have placed in flatues of plaister before the high altar. As they have armed two of these with monstrous gilt fwords, as big as Charles the XIIth's, and a third is employed in blowing a trumpet, I must own I took them, at first fight, for a kind of guard drawn up to defend the place; but on a nearer approach I found (probably for fear of fuch a mistake) they had christened them all, and placed their names severally and respectively at their feet. To four of them they applied the Jewish appellations of the angels which occur in fcripture, Gabriel, Uriel, Raphael, and Michael; but unhappily when they had got fo far, having yet two figures remaining, and no more angelic titles, they feem to have been at a fad loss; as under one of them they have put the word cherub, but left it undetermined who he might be; and to the other they have affixed Jeremeill; but who that Jeremeill is continues uncertain.

The Danes have a great passion for sonorous music; hence their organists entertain the congregation for a confiderable time, both before and after fervice. it appears, that where the belles-lettres find a difficulty in gaining ground, harmony will obtain an easy admittance; and people without tafte, and who, in general, have but very crude notions of elegance, will ftill

admire music.

" Man may justly tuneful strains admire,

" His foul is music, and his breast a lyre;

- " A lyre which, while its various notes agree, " Enjoys the sweets of its own harmony.
- " In us rough hatred with foft love is join'd,
- "And sprightly hope, with grov'ling fear combin'd, "To form the parts of our harmonious mind. What ravishes the foul, what charms the ear,
- " Is mufic, though a various dress it wear. " Beauty is music too, tho' in disguise; " Too fine to touch the ear, it strikes the eyes.
- "Tis music heavenly, such as in a sphere "We only can admire, but cannot hear.
- " Nor is the pow'r of numbers less below; "By them all humours yield, all paffions bow, "And stubborn crowds are chang'd, yet know
- not how. " Let other arts in fenfeless matters reign,
- " Mimic in brafs, or with mix'd juices stain;
- "Music, the mighty artist, man can rule,
 "As long as it has numbers, he a foul."

Though learning, from the attention given to various manufactures, and the science of agriculture, is at a low ebb in this kingdom, it has produced some few persons admirably eminent in the mathematical sciences, and the art of medicine, such as Tycho Brahe, Borrichius, Bartholines, &c. But the merit of these is to be confidered as the effulgence of a comet, challenging the greater admiration, because fo feldom feen. The small progress of the Danes in the sciences, however, appears also to result from a defective conflitution, and an oppreflive government; for the clergy and lawyers, as they are entirely dependant upon the court, and great lords of the kingdom, are most meanly subservient. It is true they fill their respective places in the scale of flavery, but they fill them as fo many cyphers, or rather as fo many machines, that are moved at the will of others.

As the ancient form of government in Denmark was the same with the Goths and Vandals established in most, if not all, parts of Europe, whither they carried their conquests, Denmark was, till lately, governed by a king, chosen by the people of all ranks; even the boors had their voices; which king Waldemar III. who reigned in 1334, acknowledged in his memorable answer to the pope's nuncio, who pretended to a great power over him: " Our being we have from God, our kingdom from our subjects, our riches from our parents, and our religion from the church of Rome; and if you grudge it us, we renounce it by these presents." The states of the realm being convened, were to elect, for their prince, such a person as to them appeared handsome, valiant, just, merciful, affable, a maintainer of the laws, a lover of the people, prudent, and adorned with all other virtues fit for government, and requifite for the great trust reposed in him; yet with a due regard to the family of the preceding king. If, within that line, they found a person thus qualified, or effected to be so, they thought it but a point of gratitude to prefer him be fore any other to this high dignity, and were pleafed when they had reasons to chuse the eldest son of their former king rather than any of the younger, as well because they had regard to priority of birth, when all other virtues were equal, as because the greatness of his personal estate might put him above the reach of temptations to be covetous or dishonest, and enable him, in fome degree, to support the dignity of his office. But if, after fuch a choice, they found themfelves mistaken, and that they had advanced a cruel, vicious, tyrannical, covetous, or profuse person, they frequently depoted him, often times banished, and fometimes destroyed him. This they did either formally by making him answer before the representative body of the people; or if, by ill practices, fuch as making of parties, levying foldiers, contracting of alliances to support himself in opposition to the people's rights, he was grown too powerful to be legally contended with, they dispatched him, without any more

ceremony, the best way they could and elected pre-fently a better man in his stead; fometimes the next of kin to him; fometimes the valiant man that had exposed himself so far as to undertake the execution, or the killing of the tyrant; and, at other times, a private person of good reputation, who possibly least dreamt of fuch an advancement.

Frequent meeting of the states was a fundamental part of the constitution. In those meetings all matters relating to good government were transacted; good laws were enacted; all affairs belonging to peace or war, alliances, disposal of great offices, contracts of marriages for the royal family, &c. were debated. The imposing of taxes, or demanding of benevolences, were purely accidental; no constant tribute being ever paid, or any money levied on the people, unless either to maintain a necessary war, with the advice and confent of the nation, or, by way of free gift, to contribute to raife a daughter's portion; the king's revenue, at that time, confitting only in the rents of his lands and demennes, in his herds of cattle, forests, services of tenants in manuring and cultivating his grounds, &c. customs upon merchandize being an imposition of late crept into this part of the world; fo that he lived, like one of our modern noblemen, upon the revenues of his own estate, and eat not through the sweat of his fubjects brows.

The business of the king was then to see a due and impartial administration of justice executed according to the laws; nay, often to fit and do it himfelf; to be watchful and vigilant for the welfare of his people; to command in person their armies in time of war; to encourage religion, arts, and learning: and it was his interest, as well as his duty, to keep fair with the nobility and gentry, and be careful of the prosperity of his fubiects.

Such was the ancient form of government in this kingdom, which continued with little variation (excepting that the power of the nobles increased too much) till the year 1660, when, at one instant, the whole face of affairs was changed, the crown made hereditary, and the king absolute.

This fingular revolution was thus brought about. After the peace with Sweden the whole nation was in a most calamitous situation; for the treasury was so much exhausted, that, when the army was to have been difbanded, there was no money to pay off the troops; hence the foldiery became infolent and licentious. the same time the nobles were proud and tyrannical; the clergy discontented, from their want of importance, and the difrespect with which they were treated; and the commonalty quite desperate on account of the heavy taxes with which they had been oppressed to

carry on the war. At this crifis the states affembled to deliberate and redrefs the grievances of the nation, when it was propofed by the commons that an equal and equitable tax fhould be laid upon all perfons indifcriminately, and without distinction, in an exact proportion to their respective eircumstances. The nobles, however, strenuously pleaded their privileges, which they afferted, were a full exemption from their payment of any taxes whatever; and the commons as ffrenuously contended, that as the nobles engrofied and enjoyed the greatest part of the lands, wealth, honours, &c. in the kingdom, it was more particularly incumbent on them to bear their share of the common burthen, and to contribute to the general defence. The debates grew warm, and the altercation became violent. Each party conceived an implacable animofity against the other, and the passions of all were equally over-heated. In the height of this ferment a nobleman, called Otto Cracg, flood up, and, in a transport of rage, told the commons, that they neither understood the privileges of the nobility, who were always exempted from fuch impositions, or the condition of themselves, who were no other than their These degrading expressions irritating the commons beyond all degree of forbearance, Nanson,

This resolution they accordingly put in execution the next day; and though the nobility helitated at first on the matter, yet they were also obliged at length to comply, and in three days time the alteration was completed; fo that the kings have been ever fince, and are at prefent, abfolute and arbitrary, not the least shadow of liberty remaining to the subject. All meetings of the estates in parliament are abolithed. Nay, the very name of eftates and liberty is quite forgotten; as if there had never been any fuch thing; the very first and principal ar-ticle in the Danish law being, "That the king has the privilege referved to himfelf to explain the law; nay, to alter and change it as he shall think proper." The confequences of this are obvious; frequent and arbitrary taxes, and commonly very excessive ones, even in time of peace, little regard being had to the occafions of them; fo that the value of estates, in most parts of the kingdom, is fallen three-fourths: and it is worse near the capital city, under the eye and hand of the government, than in remoter provinces: poverty in the gentry, which necessarily causes extremity of mifery in the peafants; partiality in the distribution of justice, when favourites are concerned; with many other mischiefs; being the constant effects of arbitrary rule in this and all other countries wherein it has prevailed.

In a word, it may be truly faid, that the people of Denmark, with a rash and desperate hand, from motives of revenge, somented by an artful ministry and ambitious clergy, resigned their liberty and independence, and invested their sovereign with despotic power over their lives and fortunes.

From this time the kings of Denmark unite, in their perfons, all the rights of the fovereign power; but not being able to exercife the whole themselves, they are obliged to delegate some part of the executive power to their consideratial subjects.

The fupreme court of judicature, for Denmark and Norway, is held in the royal palace at Copenhagen, the king being prefent; the tribunal of Holftein is held at Gluckftadt; and that for the duchy of Slewic in the town of that name. The nod of the fovereignesis decifive in the council, the members being obliged implicitly to obey his will, as they are removeable at his pleafure.

Every man, if he chuses it, may plead his own cause; and the proceedings are so summary, that a suit may be carried through all the courts, and finally decided in thirteen months.

Subordinate to the supreme court of judicature, at which the king presides, there are three other courts, viz. the land-stag, or provincial court; the Herredsfougds, or district court; and the Bysoglids, or town court. Appeals lie from each of these courts to the other, according to superiority; and the final appeal to the supreme court, where an absolute decision is given by the king as the ultimate legislator.

The judges are appointed by the king, but removeable at pleasure. They are punishable for misdemeanors, that is, if the monarch thinks proper to deem their actions such; and thus royally condemned, are obliged to make reparation to the injured party. Their salaries, which are inconsiderable, are paid from the king's treasury, from sines, and from gratuities where sentence is passed. In Copenhagen are likewise an exchequer court, to try causes relative to the revenue; and a commercial court, to decide all differences respecting trade. The admiralty court manages all

marine disputes; and the chancellory executes all manner of business respecting treaties, alliances, &c.

The police in Denmark is very strict. At the entrance of many towns a whipping-post stands conspicuous, on the top of which the figure of a man is placed, with a fword by his side, and a whip in his right hand. Gibbets, and wheels are also placed on eminences, on which the bodies of malefactors are sometimes left, after execution, to deter others from their crimes.

Some criminals are punished by being whipped in the market place, and bandhed. Some of the lower fort are punished by being led through the city of Copenhagen in what is called the Spanish mantles. This is a kind of heavy vest, fomething like a tub, with an opening for the head, and irons to enclose the neck. This mode of punishment is very much dreaded, and is one cause that night robberies are rarely heard of in Copenhagen.

The place of execution is out of the city. Decollation is deemed more honourable by the fword than the axe. This is the common mode of execution. But of fome more heinous crimes the punishment is breaking on the wheels; and; on executing this on state prifoners, it has been the practice sometimes to begin with cutting off their right hands. Executions, however, are rare. A great number for child-murder are condemned to work in spin-houses for life, and to be whipped annually, on the day when, and the spot where, the crime was committed. This mode of punishment is dreaded more than death; and since it has been adopted, has greatly prevented the frequency of the crime. The punishment for grand-larceny is whipping, and slavery for life. Those who are condemned to slavery are distinguished by a brown coat, with red sleeves, and irons on one leg, with a chain saftened to their waists. They work on the fortifications, in summer, from sive to eleven, and from one to fix. Their bread is coarse and black. Besides at allowance of bread, they have a pay of one stiver (a penny) per day. They lie on barrack beds.

At Copenhagen the state prison is in the citadel. In this prison there are five or six rooms, about 15 feet by 14, with one window, and a case (or both) in each. A traveller, who lately visited this kingdom, relates, that he observed here one prisoner who was guarded by an officer and soldier in the room, and another at the door, though the guard-room was below. The weather being then very warm, he was permitted to have the window open; and this is all the fresh sir allowed state prisoners; for they are never suffered to go out of their rooms. The king makes them an ample allowance for diet. At the time of divine service their doors are open, and they hear it by an oblique perforation into the church, through the thick walls opposite to the doors.

The fame traveller observed chains fastened to the walls in the close rooms, where the Counts Struensee and Brandt had been confined; and was informed that Struensee, who had been confined above three months, when he first came out, though in view of a terrible death, exclaimed, "O what a blessing is fresh air!" Here are some dark rooms for the punishment of soldiers, but no dungeons.

In the prison of the stat-house there were nine perfons confined for crimes, and eleven for debt. The female criminals were at work in their several apartments, which were clean; but the male criminals were dirty and offensive. The allowance granted them is three marks (27 pence) per week. There are in this prison arched damp dungeons. A resident chapsain says prayers to the prisoners every day.

The blue tower (the prison for the bailiwick and servants of the court) consists of four small rooms on three floors. There were in it eight men and two women. Their allowance is two pence a day, with which they purchase what they please of the gaolet, who keeps a public house, and has a salary from the court. Here, as well as in the prison at the stat-house, was observed

the neatness of the women, whose rooms were a contrast to those of the mens. The reason is, that the gaolers wives inspect the apartments of their own fex, and are more attentive than their husbands.

The stock-house is near the ramparts. Here criminals from the garrison, and convicts from the different classes of the people, are condemned to flavery. There were feen in this place 143 flaves. They never put off their cloaths at night; and as they have new clothes only once in two years, and are very flight, many of them were almost naked. Some had light chains on one leg, fome heavy chains on both legs. Others had iron collars. One was chained by his wrift to a wheel-barrow. These were punishments inflicted upon those who had attempted to escape, or been obstre-

On the other fide of the court, down ten steps, are feven arched dungeons, with one finall window, in which were eleven prisoners, who lay on barrack beds. The diffress and despair, in the pale and fickly countenances of these slaves, were shocking to humanity. The traveller before-mentioned went to the fervice of the chapel, where, of the few that attended, the man chained to the wheel-barrow was one. They fat together on benches, and foldiers were properly placed at different parts of the chapel; and two, with bayonets fixed, flood at the door. Service being ended the flaves first passed down. This prison was extremely

offentive.

In the spin house were about 300 or 400 prisoners, forting, carding, and spinning wool for the king's manufactory in Copenhagen. In the court were feen feveral rooms, with one man in each, employed in either rafping or chapping logwood. Sixty-fix women were confined for life; and all employed in carding and fpin-ning in one room. Soveral rooms are affigued to the

The public executioner, though universally despited, is usually rich, as he is not only well paid to deprive culprits of life, but is the general contractor to empty all the jakes, and remove from houses, stables, ftreets, &c. all kinds of filth, and, in particular, dead cats, dogs, &c. which no other Dane will touch upon any

account whatever.

In Copenhagen there is a mafter of the police, who superintends the council and civil affairs of the city; and fuch diligence and circumfpection is used, that a person may walk through the whole city, at midnight, in perfect fafety. To prevent fires, the chimneyfweepers are bound to keep a register of all the chimnies they fweep, that, in case of an accident from a foul vent, the owner may be convicted or punished for his avarice or neglect.

The apothecaries of this kingdom are under excellent regulations; only two are allowed in Copenhagen, and one in all other towns of importance. They are licenfed by the coilege of physicians, and confirmed by the king; and are obliged to keep an exact register of the drugs they fell, by whom preferibed, and to whom

The code of Danish laws is so perspicuous and short, that it is contained in only one quarto volume, which is written in the language of the country, and divided into fix books, which comprize these feveral particulars: The procedure of the courts of justice, eccleficatical law, Theral and honorary law, maritime law, property law, and criminal law.

Denmark is divided into feven capital governments, each being under the direction of a governor appointed by the king, who is called flifts ampts-man; and this flifts-ampts man, or governor, is ufually a court fa-

Each of these seven capital governments, is again fub-divided into three finaller jurifdictions, called ampts; and the governors of these ampts are called amptfinen. - But flifts ampts-men, and amptfinen, are equally subservient to the court, and oppressive to the poor.

Present State of Commerce, Coin, Revenue, Armament, Military and Naval, Sc.

DENMARK is commodiously situated for carrying on an extensive commerce, but the subjects are prevented from availing themselves of it by the intolerable exactions of the great. When an industrious farmer here is fituated upon a poor farm, which he is by his great diligence and industry, endeavouring to cultivate and enrich, as foon as he has performed the laborious task, and expects to reap the profits of what he has fown, his lord, under prétence of taking it into his own hand, removes him from that farm to another of his poor farms, and expects that he hould perform the fame laborious task there, without any other emolument than what he shall think proper to give him. Hence many of the farmers, thus difcouraged, fearce raife grain enough for their own confumption, but fuffer their lands to run to pasture, on which they breed cattle; but, at the fame time, these pastures will not bring cattle to perfection, as they are obliged to be feat to Holstein to fatten.

The commercial commodities of this country are chiefly fish, timber, sallow, pitch, tar, planks, skins, live cattle, horses, and, from some provinces, grain.

The money of Denmark is reckone in rix-dollars and flivers; the first being 4s. 6d. each, the latter rather

more than an English penny.

In 1012 an East India company was established in Denmark; and a fettlement made at Tranquebar, on the Coromandel coast: but this East India trade, though it benefits individuals, is detrimental to the nation in general, as the Danes pay in specie for all their tea, porcelane, bale goods, &c. not having natural productions, or manufactured goods, proper for those markets: and were it not for the fmall quantities of those goods which they fend into Germany, Prusie, Courland, &c. and the teas which they occasionally fmuggle, the whole country would foon be ruined by the company.

Christian VI. indeed, did the utmost in his power to benefit his country. He abolished the monopolies of wine, brandy, falt, and tobacco. He terminated the disputes which had long subfished between the crown of Denmark and the city of Hamburg; influsted a council of trade; invited artiffs, workmen, and manusacturers from foreign countries, to settle in Denmark; established a bank; maintained a respectable effect and army, &c. &c. and his fon, Frederick the Vth, trod in his laudable footfleps; but in later times, these prospects have been obscured by oppression, im-

prudence, faction, and party.

The revenues of Denmark arise from crown lands, taxes, and duties; and thefe are extremely heavy. The landholders pay dearly to the flovereign for the privilege of holding their lands, for the implements and liberty of cultivating them, and for every necessary article of life. All perfons, not fervants, (the clery, excepted,) pay eight faillings annually, as a capitation tax for themselves, the same for their wives, and the same for all their children who exceed twelve years of age. The clergy only are exempted, in confideration of the trouble they take in making out lifts every year. of all taxable persons within their respective parishes. Here is likewife a tax of four shillings upon every flable where horses are kept. There are some sew exemptions from the general mode of taxation; but the person so exempted pays a particular tax, levied in a pregliar manner.

With respect to domesties, those who serve the nobility are thus taxed : flewards and housekeepers four shillings, footmen two shillings, and maid fervants one shilling annually. Labourers pay yearly four shillings, and

their wives two, if not hired fervants.

One of the most considerable articles in the revenue of Denmark is the money raifed by a duty, or toll, paid by all thips which pass through the Sound into the Baltic; the Sound being a narrow strait between Schonen and the island of Zealand. On the Danish side flands the town of Helfeneur, or Elfeneur, and the castle of Cronenburg; and, on the Swedish fide, the town of Helsinburg. Between these pass and repass all the ships and vessels that trade to the Baltic. The Danes, by different treaties of peace, have expressly retained their title to the Sound, and receive toll from all ships and veffels that pass, those of Sweden excepted; yet they do not esteem the security of that title so firm as they could wish; for as they are not masters of the land on both fides, they may have the right, but, not the power, to affert it upon occasion, and feem only to enjoy it during their good behaviour; as their strong neighbours the Swedes, are able to make use of the first opportunity, or umbrage, to their prejudice; and this they could perhaps do with impunity.

The laws of nations always run a length Proportion'd to their wealth, their pow'rs, and ftrength: The rules of equity are fet at nought, If, to back int'rest forces can be brought; For whatfoever politicians fay, Their int'rest points, and passions lead, the way:

The origin and nature of this toll are as follow. It was laid by the confent of the traders into the Baltic, who were willing to allow a fmall fum for each ship that paffed, towards maintaining of lights on certain places of that coast, for the better direction of failors in dark nights: hereupon this paffage of the Sound became the most used, that of the Great Belt being, in a little time, quite neglected, as well because of the great convenience of those lights to the shipping that passed in and out of the East Sea, as because of an agreement made, that no ship should pass the other way, to the end that all might pay their fhares; it being unreasonable that fuch thips thould have the advantage of those lights in dark or flormy winter nights, who avoided paying towards the maintaining of those fires, by passing another way in good weather. Besides, if this manner of avoiding the payment had been allowed, the revenue would have been fo infignificant, confidering the small fum which each ship was to pay, that the lights could not have been maintained by it; and the Danes were not willing to be at the charge folely for the use and benefit of their own trading ships; because they were masters of so few, as made it not worth their while; the Lubeckers, Dantzickers, and merchants of other Hans Towns, being the greatest traders at that time in the northern parts of Europe, by which they arrived to a great height of power and riches. But there being no fixed rule, or treaty whereby to be governed, with regard to the different bulk of the ships belonging to so many different nations, the Danes began, in process of time to grow arbitrary, and exacted smaller or greater fums, according to the strength or weakness of those they had to deal with, or according to their friendship or discontent with those princes or states to whom the feveral ships belonged; therefore the emperor Charles V. to afcertain this toll, concluded a treaty with the king of Denmark, which was figned at Spire on the Rhine, and was in behalf of his fubjects of the Netherlands, who had great traffic in the Balcie; and agreed that as a toll-custom in the Sound, every ship of 200 tons, and under, should pay two rose-nobles at its entrance into, or return from the Baltic; and every ship above 200 tons, three rofe-nobles. A rofe-noble is worth about eighteen shillings sterling. This agreement remained in force till such time as the United Provinces shook off the Spanish yoke, when the Danes, taking advantage of those wars, raised their toll to an extravagant height, the troublesome times not affording the Dutch leifure to attend to the redrefling fuch an exaction. N9 58

The toll at present, however, is greatly reduced, and much more reasonable; and if the principal maritime powers chofe to dispute the matter, they certainly would have no occasion to pay it at all; for the Danes have not a fufficient naval strength to oblige either the English or Dutch to pay this toll, or pass through this passage, if they rather chose to shoot either of the Belts. Besides, the breadth of this Sound, in the narrowest part, is four English miles over, and every where of a sufficient depth; so that the king of Denmark's caftles could not command the channel, was he mafter of both fides, much less now he has but one. It is plain, therefore, that this pretended fovereignty is very precarious, being partly founded on the inattention of fome princes concerned in it, to the great injury of trade.

This toll affords the king yearly a confiderable profit, though much less at present than it did formerly. About the year 1640 it produced 240,000 rixdollars per annunc; but fince 1645 it has not yielded above 190,000; fome years not above 80,000. In 1691 it did not extend to full 70,000; and is now much lefs.

All people of rank, who have public employments, pay a fum equivalent to ten pounds sterling, for the privilege of being married: people of rank, who have no public employment, pay at the rate of four pounds sterling; clergymen, citizens, free farmers, and the stewards of the nobility, pay fixteen shillings; mechanics eight shillings; and servants and labourers four shillings. Seamen, foldiers, and hufbandmen, who are vaffals, are exempted from this tax; and with very good reason, for they are totally unable to pay it; and some, indeed, have fcarce a fufficiency to purchase the common necessaries of life.

There is a tax, or exemption fubfidy, which though exorbitant and oppreflive, is chearfully paid by all housekeepers that can raise the money, because, by the payment, they are exempted from having foldiers quartered on them. This tax is rated by the civil magistrate, according to the fize, fituation, rent, &c. of the house.

Besides the taxes to government, two more are paid by all citizens and burghers, for the fupport of their respective cities and towns, viz. a capitation tax, and a ground rent tax.

Here is also a heavy stamp act; and taxes upon patents, commissions; a titulary tax, paid by the nominal nobility, &c. From these various taxes, duties, imposts, and emoluments, the whole revenue of Denmark, at prefent, amounts to the annual value of about 1,200,000 l. and this is the utmost that government can possibly draw from the people, without draining the kingdom of the little money that remains in circula-

The military strength of this kingdom confists of regular troops, militia, and navy.

The greatest part of the regular troops are foreignand more particularly Germans. The cavalry and dragoons are well mounted, and confift of 11 regiments; and each regiment of four squadrons, including the body guards. Of these regiments three are quartered in Zealand, one in Funen, three in Jutland, and four in Holstein.

The infantry is composed of 16 regiments, of which two do duty as the king's guards. When the regiments are complete, each confifts of two battalions, and each battalion contains fix companies of 100 men each.

The artillery confifts of three regiments, one of which is stationed in Denmark, another in Norway, and a third in Holstein.

The body of engineers is divided into three parts, each of which comprizes 20 officers of various ranks. Since the reduction of the Danish forces their numbers are 10,000 cavalry and dragoons, and 30,000 infantry and artillery; the whole of the regular troops comprizing 40,000.

Every person who cultivates or possesses 360 acres of land, is obliged to find one man for the militia, and

pay half the expence of a man towards a corps-de-referve, to be embodied and called out upon emergencies.

The Danish sleet is composed of about 30 ships of the line, and about 16 frigates; but these are usually kept in such bad repair, that the Danes would find a dissibility, upon an emergency, in fitting out 20 ships capable of putting to sea. To man this sleet there are two orders of seamen; viz. 30,000, who are constantly enrolled and retained in times of peace, by a trisling annual stipend, and being exempted from the payment of certain taxes; and a second class, composed of four divisions, each division having a chief, and ten companies of 118 men each. These are commanded by a captain, who has two subaltern officers under him. In this class, there are a certain number of gunners, who have a kind of naval academy, and instruct the seamen. This second class, or order, contains about 4720 men, who are always ready for immediate service, and constantly kept in full pay. They are occasionally recruited from the enrolled seamen, and wear a blue uniform, faced with different colours, according to their respective squadrons and divisions.

The Danish men of war carry the same complement of men, in proportion to their guns, as the French ships of war do; but they are much inferior in point of construction, both to English and French ships of war; and, indeed, are far from being equal to the

Swedish ships.

A marine academy was inflituted for the inflruction of young cadets by Frederick IV. Appointments were made for 50 cadets to be trained up to a thorough knowledge of naval affairs, and perfectly taught navigation, gunnery, drawing, fencing, history, geography, geometry, several other branches of the mathematics, &c. In order to join practice to theory, they were annually to make a voyage in a frigate, and successively to perform the service of common seamen, pilots, and officers. This noble institution, however, is now greatly, if not wholly, neglected.

SECTION VI.

Ranks or Classes, different Manner of Living, Dispositions, Persons, Dress, Food, Customs, Diversions, Diseases, and Employments of the Danes. Divers Remarks, &c.

THE inhabitants of Denmark may be divided into five claffes, viz. the nobility, who have privileged fiefs in the kingdom. The titular nobility. Clergy, lawyers, and fludents. Merchants and Citizens. Sea-

men, farmers, and labourers.

The fuperior classes are of an high spirit, and have as much vivacity in them as any people in Europe, the French alone excepted. The nobility in particular are shewy, fond of magnificence, and live in a mean between the English and the Germans; more sumptuous than the latter, but not with fuch a general confiftency as the former. In their drefs the French fashions are principally followed; and the language of that nation, as before observed, is universal among them. In their houses they are expensive, not only in the architecture, but also in the furniture, exceeding, in this respect, the Germans, but not equalling the Englifh. At their tables they refemble the Germans most for cookery, but do not fit fo long at their meals. In Germany four courses and a defert will hold, upon a moderate computation, four hours and an half, which, in England, are dispatched in one; but the Danes are between the two, seldom rising, however, under the two hours. Some of the nobility are very expensive in French cooks, but it is not general. In their wines they are particularly curious, both as to quality and variety. Their tables are admirably well ferved with fish, particularly of the fresh water kind; and sea fish is in great abundance, though not of the best forts. Wild fowl they abound greatly in, and have a greater variety than in England. Their venifon is excellent; but their butcher's meat is not, on the whole, to be compared to that of the English. All the rich nobility have hot houses, and hot walls, fronted with glass, in their gardens; yet, for want of a complete knowledge in the management of the plants, their fruit, in general, is bad. In other forts of provisions they are upon a par with their neighbours; and their importations of various eatables of luxury have much increased of late years.

The figh that heaves by flealth, the starting tear, The melting languish, the obliging fear; Half utter'd wishes, broken, kind replies, And all the filent eloquence of eyes, That teach the fair, by various wiles, to move The foften'd foul, and bend the heart to love. Proud of her charms, and conscious of her face, The haughty beauty calls forth ev'ry grace; With fierce defiance throws the killing dart; By force the wins, by force the keeps the heart, The witty fair a nobler game purfues, Aims at the head, but the rapt foul fubdues. The languid nymph enflaves with fofter art; With fweet neglect fhe fleals into the heart: Slowly the moves her fwimming eyes around; Conceals her fhaft, but meditates the wound: Her gentle languishments the gazers move: Her voice is music, and her looks are love.

Many of the fecond class, or titular nobility, are foreigners, and in particular Germans, who generally come hither very poor; but by fervilely attending the court, and falling into all the schemes of the favourite or minister, usually acquire wealth.

Those who compose the third class, as they are dependent on, are obliged to be subservient to, the court, and submissive to the minister and savourites.

The people of the fourth class are conceited and haughty, but at the same time servile and timid.

With respect to the fifth class, the seamen would be much more alert in their business, if they were better used; and act with greater spirit and courage, if they were not familiarized to fear, and trained from their births, to the most abject slavery. The farmers are perfect vassals, and by not being permitted to have any will of their own, become timid, careless, and indolent. If any of these happen to get a little money, they become perfect sots, and usually destroy themselves by intoxication; taking no delight in any thing but out-drinking their neighbour; and in this they exactly resemble the country squire described by Gay, who says,

Methinks I fee him in his hall appear,
Where every table floats with clammy beer;
'Midft mugs and glaffes, flatter'd o'er the floor,
Dead drunk his fervile crew fupinely fnore.
Triumphant o'er the proftrate brutes he flands;
The mighty bumper trembles in his hands:
Boldly he drinks, and, like his glorious fires,
In copious gulps of potent ale expires.

Indeed, this vice of drinking to excess is almost general among the Danes. The labouring people are some of the most oppressed and miserable wretches in Europe.

These people seldom enter into quarrels with each other, although they are very fond of drinking, and smoaking tobacco, which are of general use here, and doubtless contribute much to their health, and to the little vivacity they possess in the midst of such a cold and wet atmosphere.

The warlike genius for which the Danes were formerly celebrated, is now totally loft. They are timid, suspicious, deceitful, dull, and, in general, stupid. To be more minute in their characters, an accurate writer says, "Their general character is a strange composition of pride and meanness, insolence and poverty. If

any gentleman king, by the I the purchase n with imposition alienation, even person would o fuch terms; an to make a furre tile land in the enjoy their poffe am arbitrary for improve their e neath their dig ments with the the immediate tony, and extra money from the land in Denma Hamburg and burghers tread fpend all their impatient avidit the suspicion of tion. any gentleman can find a purchaser for his estate, the king, by the Danish law, has a right to one third of the purchase money; but the lands are so burthened with impositions, that there would be no danger of alienation, even if this restriction was not in force. No person would offer money for an estate to be held upon fuch terms; and fome gentlemen have actually offered to make a furrender to the king of large tracks of fertile land in the island of Zealand. Conscious that they enjoy their poffessions, thus encumbered, at the nod of am arbitrary fovereign, they are at little or no pains to improve their estates; and they look upon trade as beneath their dignity. They therefore rack their tements with the utmost oppression, in order to procure the immediate means of gratifying their vanity, gluttony, and extravagance. Those courtiers who derive money from their employments, instead of purchasing land in Denmark, remit their cash to the banks of Hamburg and Amfterdam. The merchants and burghers tread in the footsteps of their superiors, and fpend all their gain in luxury and pleafure, with an impatient avidity, as if they were afraid of incurring the fuspicion of affluence, and being stripped by taxation. The peafant, or boor, follows the fame example; for no fooner has he earned a rix-dollar, than he makes hafte to expend it in brandy, left it fhould fall into the hands of his oppressive landlord. This lower class of people are as absolute slaves as the negroes in the West-Indies, and fubfift upon much harder fare. The value of estates is not computed by the number of acres, but by the stock of boors, who, like the timber, are reckoned a parcel of the freehold."

The Danes, in person, are usually tall, strong, well-simbed, and tolerably seatured; in general they have red, yellow, and light hair. In the summer they dress in light apparel; and, in winter, wear warm survey woollen cloathing. They feed upon stock-fish, falt meat, and other coarse diet. The only good piece of surniture in their houses is the seather-bed.

The Danes equally feaft and make merry at marriages and funerals. The nobility pique themselves upon having fumptuous burials and monuments for their dead. The principal divertions of these people are being drawn in fledges upon the ice, during winter, and running at the goofe on Shrove Tuefday. The king annually partakes of the pastime of stag-hunting, during which diversion he lays aside the trappings of royalty, and mingles, as an equal, with his nobles and attendants. Even the common people are indulged with very extraordinary freedoms at this time. When the hunting is over, about fix in the evening the hunting affizes are held in the great court before the palace, where the ftag, with great ceremony, is cut up by the huntimen, who are cloathed in red, and have huntinghorns about their necks, while the hounds attend with the most clamorous impatience. Proclamation is made, that if any person has, that day, transgressed the laws of hunting, he should be immediately accused. Some individual is always felected for this purpose, tried, and found guilty. Then he is led by two gentlemen towards the flag, where he first kneels down between the horns. He is afterwards obliged to raise up his posteriors, on which an officer, with a large wand, inflicts a certain number of stripes, to the infinite diver-tion of the queen, ladies, and other spectators; during which the hounds open, and the huntimen blow their horns, as if in concert, to proclaim the king's justice. The criminal having undergone this ludicrous chastisement, rifes up, and makes a profound obeifance; and then the hounds are permitted to regale upon the stag they had run down.

Swan-hunting is another royal diversion, which the court enjoys in a small island near Copenhagen, where those birds breed in great numbers. Before the young ones are sufficiently fledged to take their slight, the king, queen, courtiers, &c. set out for this island in a number of pinnaces, enclose the haunt of the swans, and, with sowling-pieces, destroy them by thousands.

The flesh is never eaten, but the feathers and down belong to the king.

In many of their diversions the Danes follow the fashions of the French and English. Cards make a greater progress than formerly; and the wives of the nobility, and of such other classes as can afford it, have, at Copenhagen, their affemblies almost as regularly as any at London. The men are great chess players, it being a game they are very fond of, and which is more commonly introduced at their visits than in England. Billiards and tennis are also common at Copenhagen. The theatre is French; though they have established a Danish one, where pieces, translated from the English and French, are indifferently performed. Attempts have been made for an Italian opera, but with no success.

The people of Denmark are subject to apoplexies and epilepsies, which are owing to hard drinking, and low living. While the peasants are employed without doors, at their labour, the women are occupied at home in spinning yarn for linen, which is here made to a-great degree of fineness and goodness. The cities and towns afford but bad accommodations to strangers, the taverns being poorly supplied; and a traveller, to be in any wife contented in this country, must carry with him a traveller's appetite and patience.

The titles and distinctions, of which the Danes are fo fond, are partly annexed to military, civil, and ecclefiaftical employments, and partly nominal. rious employments give a kind of dignity, during life, to those who hold them; and the nature of the employ fixes the rank between those who are in the same train; It cannot decide the precedency between an officer, a magistrate, and an ecclesiastic; and therefore this is regulated by an ordinance for the etiquette or rank. With respect to the nominal ranks, nobility and title, the best information is thus given by a very intelligent writer : " As those whose offices are named in the edict, are supposed to be superior to those who have no employ, or whose employ is not classed in the ordinance, the defire, and even the want of having a rank, is the reason why simple titles, which are not annexed to any employment or emolument, are fo much the objects of ambition. It is common, in this country, to obtain the title of an employment, which the person never exercifes, and from which he never receives any pecuniary benefit, but even pays a confiderable fum yearly for bearing the title: and very often those who have a certain rank by their employments, after some time, obtain titles superior to their respective functions. These titles are likewise sometimes imaginary; as thus, when a person has the title of counsellor of state, of justice, or of finances, it is not to be concluded from thence, that he has neceffarily any part of the government of the flate of justice, or of the public revenue, except the word actual is added to his character, otherwise it is only a nominal character which marks his rank. The king of Denmark has a great number of lords of the bed-chamber, who pay about ten pounds fterling yearly for wearing a golden key, which gives them a confiderable rank; and yet there are not ten paid for their attendance at court. To the court belong two ancient orders of knighthood, viz. That of the Elephant, and that of Daneburg.

The badge of the former, which is the most honourable, is an elephant furmounted with a castle set with diamonds, and suspended to a sky-coloured ribbon, worn like the George in England. This order was instituted by Christian I. at his son's wedding. It is conferred only on persons of the highest quality; and the number of companies amount to thirty, besides the sovereign. The order of Daneburg, though less honourable, is much more ancient. This is bestowed, as an honorary reward, upon the noblesse of inferior rank; its infignia being a white ribbon with red edges, worn over the left shoulder, from which depends a small diamond cross, and an embroidered star on the breast of the coast, surrounded with the motto Pietate & Justina, or piety and justice.

Here

Here is likewife a modern order of Knighthood, ealled the order of St. Matilda, and inflituted in honour of the late unfortunate queen; but it is now but little regarded, and confequently not aspired to or sought after.

SECTION VII.

HISTORY OF DENMARK, NORWAY, &c.

THE original inhabitants of Denmark and Norway appear, from the most authentic intelligence that can be obtained, to have been colonies of the ancient Scythians, and were called by the appellation of the Cimbri. They had spread themselves through all the northern and western parts of Europe, and acquired their first fame from their celebrated expedition into Italy, their conquest of the Gauls, and succeeding en-terprizes against the Romans, till that people, roused by their ancient spirit, drove them back into their own

Little more is mentioned of those people for many years, when, it is faid, that a great person, named Woden, or Oden, made himself sovereign of all the northern nations; and his abilities being equal to his courage, he not only fubdued all around him as a general, and ruled the people for them as king, but formed a new religion for them as prieft, and prescribed a code of laws as a legislator. Hengist and Horsa, who first brought over the Saxons into England, derived their lineage from him; and most of the royal and noble families of the northern parts of Europe, to this very day, pretend to trace their descent from him. Yet historians do not pretend to afcertain from whence this celebrated person came, or when he died, unless a very ridiculous and fabulous account of his death can be credited. They, indeed, fay, that he lived about 60 years before the birth of Christ, and that he was the first who ever bore the title of king of Denmark.

Woden's progeny reigned after him in the feveral northern nations, and at length revenged the misfortunes and miscarriages of their ancestors upon the Romans, by gradually weakening, and at length overturning, the empire.

From Woden, the first Danish king, to Regner, surnamed Logbrog, who began his reign A. D. 750, the Danish chronicles mention 18 kings, but furnish us with little more than their names, or at least with only fuch fables as are too ridiculous and abfurd for commemoration, or even recital, in this enlightened age.

The prodigious number of people who left this country in the fifth century, to join the armies which effected the conquest of the western empire, greatly weakened the kingdom. It recovered about the eighth century, when we find the Danes rife into importance as a mari-time people, and harrafs the coafts of Courland, Livonia, Pomerania, Ireland, Scotland, France, and England. They even attacked the emperor Charlemagne, burnt his palace at Aix-la-Chapelle, over-run Lower Saxony, Friezeland, Holland, and Flanders; conquered the greatest part of the kingdom of France; obliged her kings to pay an immense tribute; ravaged Spain and Italy, and committed many other depredations. Alfred the Great, king of England, was the first monarch who gave them any considerable check, by building a fleet to oppose their naval expeditions, and attack them on that element where they feemed to have fuch a manifest superiority.

At this time the greatest part of the people were bred up to the fea from their childhood, and had no ideas of the dangers to which they were exposed on this element. When a prince had attained the age of 18 or 20 years, he generally requested his father to have fome ships equipped, by which he might attempt some glorious and useful exploit with his followers. This the father regarded as a mark of his rifing courage, and of a great mind. A fleet was armed immediately, of which the admiral, and all his officers and men, made reciprocal promifes never to return, except loaded with spoils and laurels. If they had received any injury from a neighbouring nation, that nation was cho-fen for the first victim. Those whom they vanquished were generally put to death. Sometimes, indeed, they contented themselves with making slaves of them; and often, likewife, by a fingular kind of generofity, or rather by a define of fignalizing themselves, if they found themselves superior to the enemy which presented itself against them, they ordered off a part of their fleet; that they might fight the enemy with equal force, defpifing the gaining an advantage with fuperior numbers, and regarding it as an infamous practice to fur-prize an enemy in the night. Their veffels were always well provided with arms, and their men were all taught to fwim, fo that as they generally fought near the shore, they were often in a situation of securing themselves, although their vessels were destroyed.

The manner in which the lands were divided in Denmark and in Norway, shews us that the chief end of their government was to have a great maritime force. Every division, whether it was greater or less, took its name from the number of vessels that it could equip, and in fome places their names are still in use. In the beginning of their maritime expeditions their fleets were not very confiderable; but when their princes had enriched themselves by plundering their neighbours, they came to have 2 or 300 fail of ships of war, and each ship to carry from 100 to 120 men. To a nation that is wholly addicted to plunder and rapine, civil laws and a police are of very little ufe. This was ftrictly the case of Denmark when their king, called Gorman, came to the throne in the year 840. The few useful regulations which had been left them by Woden and others, were now laid afide, and the kingdom was divided among two or three princes, who governed with a very limited power: and that confusion which we find in the history of Denmark to this time, was occasioned by one historian writing the history of one prince who reigned in this country, and another the history of another prince who reigned at the same time. But Gorman, by uniting to his crown all the provinces of Denmark, of which his ancestors had been dispossessed, and being forced by the emperor to receive the Christian religion into his states, gave this government again some form; and from hence we may date the origin of the civil government which existed in this state for many years afterwards.

In the year 999 it is related that there was a general massacre of the Danes settled in England, which is still commemorated annually at Hocktide. Some are apt to doubt the truth of this fact; but however that be, certain it is, that Swein and his fon, Canute, or Knute, made an entire conquest of this kingdom about the year 1014, though feveral battles were fought with the Saxon king Ethelred, and his fon, Edmund Ironfide, before the Danes could establish themselves here, Upon the death of Edmund Ironfide, anno 1017, all the great men acknowledged Canute their king, fwore allegiance to him, and renounced the two fons of Edmund, Edward and Edmund, who were banished into Sweden, from whence they went into-Hungary, where they refided many years. King Canute, in the mean time, obliged the English to raile him 10,000l. every year, with which he paid his forces, and maintained his court: and in the year 1019 he conquered the kingdom of Norway. In the 15th year of his reinn appearance, he wifeted Rome, when he gave reign, anno 1031, he visited Rome, when he gave great part of the spoils of the countries he had conquered to that fee, and returning to England, died at Shaftsbury, on the 12th of November, 1036, having divided his dominions between his three fons. To Harold he gave England, to Swein Norway, and to Canute Denmark. Harold died anno 1040, leaving neither wife or iffue, and was fucceeded by his brother Hardicanute, the third fon of Canute, who died in the year 1042. This was the last king of the Danish race in England; for he was succeeded here by Edward, called the Confessor, son of king Ethelred. Canute

Canute VI. subdued Vandalia, (the present Pomerania and Mecklenburgh,) and took upon him the stile of king of the Vandals, which country continued subject to the Danes 27 years. He made a conquest also of Livenia.

Waldemar II, extended his dominions in Germany, and lived in great reputation in the beginning of his reign: but count Swein committing the care of his territories, as well as his wife, during his absence in the Holy Land, to his majesty's protection, he debauched the count's wife in his absence, of which her husband being informed at his return, took the king prisoner by a stratagem, and having confined him three years, inade him pay 45,000 marks to obtain his liberty.

While the king was prisoner, Pomerania, Mecklenburg, Lubeck, and Dantzick, revolted; the Teutonick knights took Livonia from him; and Adolph, count Schawenburg, subdued Holstein and Stomaria.

On the death of Olaus, without iffue, anno 1387, queen Margaret, his mother, was elected queen of Denmark and Norway, who, having affociated her nephew, Erick, with her in the government, fubdued the king of Sweden; and it was enacted by the flates that these three kingdoms should be united for the future under one prince; and, upon the death of queen Margaret, Erick became sole sovereign of the whole; but he was deposed on pretence of mal-administration, and retiring into Pomerania, lived a private life there till he died.

Christian, earl of Oldenburg, was elected anno 1439, and from him the present royal samily of Denmark is descended. He subdued the kingdom of Sweden, which had revolted; and the emperor Frederick gave him the country of Holstein. This prince married his daughter Margaret to James III. king of Scotland, and gave him with her the islands of Orkney and Shetland, the last being a very valuable acquisition, as it assorts the best herrings in these seas. Here the Dutch begin that fishery every year at Midsummer, without asking leave of the British court; though they paid 30,000l. annually for this privilege in the reign of king Charles I. Christian was succeeded by his son John, who divided the duchy of Holstein with his brother Frederick.

In the reign of Christian III. the Lutheran religion was established in Denmark. He was succeeded by his fon Frederick II. anno 1538. Christian IV. his fon, being engaged in a war with Sweden, in order to obtain peace, was compelled to yield up the province of Holland to the Swedes.

Frederick HI. his fon, was befieged in his capital city of Copenhagen by Charles Guftavus, king of Sweden, who drew his artillery over the ice into the province of Zealand; and if the Dutch had not come to his affiftance, would probably have made a conquest of that island. But though this prince was unfortunate in his wars with foreigners, he raifed his prerogative to that height, that he perfectly fubdued his fubjects, and, from a limited elective monarchy, made himself an absolute prince, and established the fuccession of the crown in his family in the year 1660, when the peafants and lower class of people complained they were not able to discharge the debts the public had contracted during the war, and therefore entreated the nobility and gentry, that, as the profits of the lands were theirs, they would condefcend to bear part of the burthen; the nobility and gentry, before this time, paying no taxes for their lands. To this they answered the commons with great infolence, told them that they were born in a flate of fervitude, their flaves and valfals, and did not understand their duty. The commons made no reply, but retired from the affembly with the clergy, who adhered to them, and going immediately to court, acquainted his majefty that they were come to a resolution to make him an absolute monarch, and his throne hereditary. His majesty, being apprized of the defign, had introduced an army into the town, No. 59.

in order to compel the upper-house to concur in this resolution of the commons, if they resuled their confent. The lords being acquainted with the funftance of the address the commons had made to the throne, and, fensible that they were in no condition to dispute with the court and them, supported by the army, they offered to make the crown hereditary, and entreated that the constitution, in other respects, might not be altered: but they were given to understand, that the king would be fatisfied with nothing lefs than their unanimous concurrence with the refolution taken by the clergy and commons, which they found themselves obliged to fubmit to, and took the oaths to his majesty, acknowledging him the fupreme and only legiflator. Thus was the conflitution changed from a republic. with a nominal king at the head of it, into an absolute hereditary monarchy; not one of the nobility daring to oppose it; only Gerdorf, a popular member, said, he was consident his majesty designed the happiness of his people, and not to govern them according to Turk:fh politics, wiffed his fucceffors might follow his example, and make use of this unlimited power only for the good of their fubjects.

Christian V. succeeded his father Frederick III. anno 1670, and being joint-fovereign of Holftein and Slefwic, with the duke of Holftein, in order to exclude the duke from his fhere in those provinces, or at least to oblige the duke to acknowledge his dependence on the crown of Denmark, treacheroully invited him to an entertainment, and then made him prisoner, and fent detachments of his army to take poffession of such towns as belonged to him; with which the duke re-proaching him, the king answered, he was always in the interest of Sweden, and never to be trusted; and unless he would renounce his right to certain places, he would take possession of the whole country; and particularly demanded of him an order to the commander of Tonningen, the strongest fortress belonging to the duke, to furrender it to his majefty's troops; which the duke confented to, apprehending the king would have taken his life if he had refused, and Tonningen was thereupon delivered up to the Danes. Several other articles he was obliged to fign, that were very prejudicial to him: but the duke making his escape to Hamburg, protested against the validity of all the acts he had been obliged to fign. The king thereupon gave orders for the demolishing Tonningen, and fequestered the duchy of Sleswic, causing both magistrates and people to fwear allegiance to him, declaring them absolved from their allegiance to the duke. He also caused all the duke's revenues to be brought into his own treafury, continued garrifons in his towns, and even in his palace of Gottorp. But not knowing how foon he might be obliged, by the duke's allies, to deliver up what he had fo unjuftly feized, he exacted contributions from the poor subjects, to the value of many millions, to the ruin of as flourishing a province as any in Germany, whereby he filled his own treafury, and difabled the duke's fubjects from giving him any affiftance. The duke remained still at Hamburg, from whence he fent his fon to the German princes to implore their affiftance. He applied to the court of England, which was guarantee of the peace of the north, but to very little purpose, till the king of Sweden, Charles XI. undertook his cause in the year 1689, and was about to have transported an army into Germany for his reftoration. The German princes, and the English and Dutch, who were now entered into a confederacy against France, being apprehensive that this might difturb the peace of the empire, and divert the troops from the French war, held feveral conferences on this subject at Altena; and, at length, obliged the king of Denmark to reftore the duke of Holftein his dominions, after he had been in poffeffion of them 13 years; but took no care that the Dane should make him any fatisfaction for the devastation of his territories. From the conclusion of the differences between the king of Denmark and the duke of 7 Z

Holstein at Altena, by the mediation of the confederates in 1689, to the year 1696, things remained tolerably quiet: but the late duke of Holftein, Chriftian Albert, dying about that time, and the king of Denmark having fent a deputation to his fon and fucceffor, duke Frederick, to renew the union between them, and to let him have a fight of the late duke's will, that he might fee if there was any thing in it in favour of the eldest prince, in relation to the ducal part of the duchy of Slefwic, the duke refused both the one and the other; alledging, that the treaty of Altena, in 1689, had not been observed, or justice done to the ducal house, particularly in restoring the seigniory of Gottes-

Gabre, in the illand of Aroa.

The guarantees of the treaty of Altena, feeing both fides inclined to a rupture, interpofed their good offices, and engaged them to fettle conferences for compoling their differences, which were held at Penenburg: but the duke continuing to introduce Swedish forces into Holftein, and build and enlarge his fortifications during the time of the treaty, the king of Denmark marched an army into the country, and caufed the new fortifications to be demolished in the year 1697, which the duke, at that time, not finding himfelf in a condition to oppose, thought fit to acquiesce in, till the death of the then king, which happened the 4th of September, 1699, when he was fucceeded by his fon, Frederick IV. This the duke looked upon as a favourable opportunity to rebuild the fortifications which had been destroyed, especially as having married the king of Sweden's fifter, and being affured of fupport from that crown. He began, therefore, to repair the fortifications of his demolifhed forts, as he infifted he had a right to do by the treaty of Altena, and introduced into the country a confiderable number of Swedish troops, to prevent their being demolished again. The mediators and guarantees of the treaty of Altena employed their good offices to prevent a rupture, and proposed that both the Swedes, and the Danes should withdraw their troops out of Holstein, and that the fortifications should not be proceeded in till the matter was fettled by a treaty.

But the Dane being determined on a war, both with Sweden and Holftein, and having entered into a confederacy both with Ruffia and Poland for that end, would not hearken to any pacific measures. On the contrary, he ordered his general, the duke of Wirtemburg, to demolish Husum, Frederickstadt, and other places belonging to the duke of Holftein, which he foon after effected. Not contented with razing fuch new fortifications as had been erected, he invested Tonningen, in which General Bannier commanded with a garrison of 5000 men. Upon this the princes guarantees gave the king of Denmark to understand, that fince he had rejected all friendly propofals, they should no longer fee the treaty of Altena broken, or fuffer the duke of Holstein to be dispossessed of his country again, under the pretence of oppofing the building of forts which were already demolifhed. The duke of Holftein also published a manifesto, shewing the right he had, by the treaty of Altena, to build fortifications in his dominions, and the injustice of the Danish invafion. Not only the German princes, but the Dutch now joined their forces with the Swedes, in order to bring the Dane to reason; and as they were marching towards Tonningen, the Danish general thought fit to raile the fiege, without coming to a battle. The English and Dutch also sent each of them a squadron into the Baltic, and, joining the Swedish fleet, compelled the Danes to retire into the harbour of Copenhagen. In the mean time the young king of Sweden landed with 15,000 horse and foot upon the island of Zealand, about three miles to the fouthward of Elfineur, and was preparing to invest Copenhagen, when the Dane, finding himself overpowered, was glad to accept of such terms as the princes guarantees, who at this time held their conferences at Travendale, were pleafed to pre-

By this treaty, which was concluded the 18th of August 1700, it was agreed, that the house of Holftein should continue independent sovereigns in Holftein and Slefwic; and the crown of Denmark should pay the duke of Holftein 260,000 crowns for the damages they had done him. A mifunderstanding, however, happened between the two courts the year following; one part of the chapter of Lubeck chufing the brother of the duke of Holftein coadjutor, and fucceffor to their bishop, and the other chusing the king of Denmark's fon. The bishop dying anno 1705, the king of Denmark determined to make good his fon's election to that bishopric by force, and took several places belonging to Lubeck; but the court of Great Britain interpoling, the duke of Holstein's brother was afterwards confirmed in the possession of the bishopric of Lubeck, in confideration of a fubfidy granted by Great Britain to Denmark, for a body of Danish troops to join the allies against France, which they could not have had, if the war had been revived at that time in the north; one article in this treaty being, that the duke of Holstein should permit that body of Danes to pass through his territories, and join the confederates. The duke of Holstein having been killed at the battle of Liffau in Poland, anno 1702, and fucceeded by his fon Charles Frederick, an infant of two years old, the duke of Holstein Eutin, brother to the late duke of Holstein Gottorp, and afterwards bishop of Lubeck, was conflituted regent of Holftein during his nephew's minority.

Charles XII. of Sweden, being defeated by the Ruffians at Pultowa, anno 1709, Frederick, king of Denmark, immediately joined his former allies, the Czar and Augustus, king of Poland, and recalled the Danish troops which were in the emperor's fervice in Hungary, and quartered them in Holftein. He transported 10,000 men from Norway to Denmark, levied new troops at Hamburg, and fitted out a ftrong fquadron of men of war. Having affembled an army of 18 or 20,000 men, the king of Denmark, on the 28th of November, 1709, published a manifesto to justify this intended enterprize, fetting forth, that the ambitious defigns of the king of Sweden, who had, for a fucceffion of years, evinced the most hostile intentions against him and his fubjects, as well as arrogated to himfelf titles derogatory to the crown of Denmark, had compelled him to declare war against all the territories of Sweden, except those in Germany; and embarking 6000 horse and dragoons, and 12,000 foot, he made a defcent upon Schonen, landing at Helfinburg, the 12th of November, 1709: but it being winter time, he only took up his quarters in the country towns at first, and invited the people of Sweden to join him, waiting for a proper feafon to enter upon action, which gave the Swedes time to put themselves in a posture to

defend their country.

About the middle of January, through favour of a hard froft, the Danes advanced towards Christianstadt, where a battalion of Saxons, which were in garrison, laid down their arms, and went over to the Danes, fo that the town fell into their hands. They afterwards made themselves masters of Carelshaven, in the province of Bleking, and threatened Carelfcroon, where the Swedish fleet and magazines were laid up. At the fame time a ftrong detachment extended themselves towards Holland on the western side of Schonen; and their forces receiving frequent supplies, their army was confiderably increased, and became very formidable, But the Swedish general, count Steinboch, having affembled 18,000 or 20,000 men, and marching towards Helfinburg, as if he intended to cut off the communication of the Danes with that place, they immediately abandoned all their conquests, quitting Carelshaven and Christianstadt, and retreated to Helsinburg, near which place the armies came to an engagement, and the Danes were entirely defeated. A day or two after they quitted Helfinburg, transporting the remainder of their troops to Denmark in the night, which, after

expedition against Schonen. The Danes having been disappointed in their enterprize upon Schonen, the next year joined the troops of king Augustus and the Czar, and fell upon Swedish Pomerania, laying waste the whole country; and the Swedish forces not being strong enough to oppose these united powers, retired into Stralfund, the ifle of Rugen, and other places of fecurity. The king of Denmark, while the Ruffians and Saxons blocked up Stralfund, paffed the Elbe, and entered the duchy of Bremen, where the Swedish general not having a fufficient body of troops to oppose him, the Dane took the town of Staden, and made himself master of the whole country. In their return the Danes infulted the city of Hamburg, threatening them with a bombard-ment; to avoid which the burghers were compelled to raife them 230,000 rix-dollars. Count Steinboch, the Swedish general, found means afterwards, on the 22d of December, 1712, to engage the Danes fingly, when they were separated from their allies near Wismar; and having given them a total defeat, purfued them into Holftein, feized the magazines the Danes had laid up there, and put the Danish Holstein under contribution. From hence he marched to Pinenburg, near Hamburg, where he determined to burn the Danish city of Altena; not fo much by way of retaliation, or revenge for the many Swedish cities destroyed by the Danes, and their allies the Russians and Saxons, (as he declared in a memorial published on this occasion,) as to deter them from committing the like barbarities for

the future. The Danes, Saxons, and Ruffians, being now joined, to the number of 50,000 men, and marching towards count Steinboch, whose army did not consist of above 14 or 15,000, he found himfelf under a necesfity of retiring into the ducal Holftein, whither the allies followed, and at their entering he threw himfelf into Tonnington, and by that means avoided them for that time. The Dane afterwards made a pretence for feizing the duke of Holftein's dominions, alledging, that the governor of Tonningen admitted general Steinboch into the place by the direction of his mafter the duke of Holstein, (who was not at that time above 12 years of age,) this occurrence happening in February, However that be, the confederates blocked 1712-13. up the city of Tonningen till May following; and the Swedes not being in a condition to fend general Steinboch any reinforcements or fupplies, he was obliged to furrender himself and his little army, consisting of 9000 men, prisoners of war, on condition of keeping their cloaths and baggage, and being exchanged or ranfomed the first opportunity; and thus, for a little time, the war feemed to be at an end in Germany. But the allies the next year invefting Stetin, the king of Pruffia fo managed the matter, that, by the agreement of the Czar and the Swedish governor, the town was sequestered into the hands of his Pruffian majesty, and agreed to be garrifoned by an equal number of Pruffians and Holfteiners, but was to be restored to the king of Sweden at the end of the war.

In the latter end of November, 1714, the king of Sweden returning out of Turkey, arrived at the city of Stralfund, and found a league was formed against him, in which the kings of Denmark, Prussia, and Poland, and the king of Great Britain, as elector of Hanover, were parties; the avowed defign whereof was to preferve the peace of Germany, which was proposed to be done by securing the sequestration of Stetin to the king of Prussia, and the possession of Bremen and Ferden, and whatever elfe the Dane had feized of the dominions of Sweden in Germany, to the Dane, and those to whom he should or had assigned his interest in those conquests. The king of Sweden thought it highly unreasonable that he should not be permitted to recover those territories again, which had been furprized in his absence. The kings of Prusha and Eng-

their ill fuccess, did not amount to above 6000 or 7000 | land infifted, that the restoring to the king of Sweden these territories, would embroil the north of Germany in a war, and joined in a confederacy against the king of Sweden, who had before powerful allies to contend

The king of Prussia, on the 28th of April, 1715, proclaimed war against Sweden, disarmed the regiment of Holstein, which was in Stetin, entering upon that city as a conquest from Sweden, and holding it no longer in fequestration. The Danes and Pruffians foon after affembled their forces to the number of 60,000 men, and appeared before Stralfund, under the walls of which city the king of Sweden found himself obliged to retire, his army not confifting of more than a fourth part of the enemy's number.

In the month of July a treaty was fet on foot beween the king of Denmark and the court of Hanover, by which the king of Denmark flipulated to convey and deliver up Bremen and Ferden, which he had taken from the king of Sweden, to the elector of Hanover, in confideration of the elector's entering into the war against Sweden, and advancing a fum of money to his Danish majesty. The confederates before Stralfund being joined by 24,000 Ruffians, and a body of Saxons, carried on the fiege of that town with great vigour; but finding the place continually received fresh supplies and reinforcements from the island of Rugen, which lies over-against it, they landed a great body of troops on the island; and, after a sharp dispute, in which the king of Sweden was in person, made themselves masters of it on the 17th of November.

Still the king of Sweden determined to defend the town till the last extremity; and it was a terrible winter's fiege, the centinels being frequently frozen to death at their posts. The attacks were desperate, and in one of them the confederates loft near 1000 men: however, they prevailed by their numbers at length; and the king of Sweden, finding the town not tenable, retired in a light frigate, and arrived fafely in Sweden, giving the governor orders to capitulate, which he did the latter end of December, upon very honourable terms; and both the town and the island of Rugen were put into the possession of the king of Denmark; and all the inhabitants of the Swedish Pomerania were obliged to take an oath of allegiance to him, except those of the city and district of Stetin, the islands of Usedom and Wollin, and the lands between the Oder and the river Pene, which were left in the hands of his Pruffian majesty.

The city of Wismar, in the duchy of Mecklenburg, the only town which the Swedes had left in Germany, was invested by the Danes, Pruffians, Hanoverians, and Ruffians, the next spring, and obliged to furrender, after which the king of Denmark was left in the poffession of it; and thus ended the war in

The Danes and Ruffians then made mighty preparations for invading the king of Sweden's dominions in Schonen. The Czar went in person to Copenhagen for that purpose, whither his generals led an army of 30,000 horse and foot. The Danes also affembled between 20 and 30,000 of their troops for this expedition, and had prepared 7 or 800 veffels to transport But great part of the Danish sleet being employed in Norway during the fummer, to oppose an enterprize of the Swedes on that fide, all thefe preparations were ineffectual. Upon this the Czar upbraided the king of Denmark, that his fleet was not ready in time; and the Dane retorting on the Ruffian monarch, that he would not make the defcent in the latter end of the year, which the Czar observed was impracticable. This altercation produced animofity between them, fo that the Dane drew up his forces under the cannon of Copenhagen, as if he had some jealoufy of his old ally, and the Czar foon after returned with his troops to Germany.

The Danish monarch being now left almost alone to defend himfelf against the Swedes, was threatened in his return, with an invafion of Zeland by his Swedish majefty, which had certainly been put into execution, had not the king of Great Britain been under fome apprehenfions that those preparations of the Swedes were intended against his British dominions, or rather for the recovery of Bremen and Ferden, and thereupon fent a squadron of men of war to the affistance of his Danish majesty, which put an end to the king of Sweden's intended enterprize against Zealand.

The following year, 1718, the Swedes marched two armies into Norway; one to the northward, as high as Drontheim; and the other, led by the king in person, towards Christiana, laying the whole country under contribution, there being no army in Norway ftrong enough to oppose them. But the Swedish mo-narch, laying siege to Frederickshall, was unfortunately thot in the trenches, and the Danes and Hanoverians thereby delivered from their fears: for had the Swedes made themselves matters of Frederickshall, as it was computed they might have done in a fortnight more, all Norway had been irrecoverably loft; and the Danish dominions reduced to a very narrow compass.

By the death of the king of Sweden the war between Denmark and that crown was in a manner brought to a conclusion; though the peace was not formally figned till the year 1720, when the Swedes, being invaded and diffressed by the Russians, were obliged to accept of fuch conditions as the mediators and guarrantees of it, the kings of Great Britain and France, were pleafed to prescribe. By the fifth article of this treaty the king of Denmark obliged himself not to affist the Czar against Sweden, or permit the Russian men of war to enter his ports. By the fixth article the Swedes obliged themselves not to oppose such measures as should be taken by the faid mediators in behalf of the king of Denmark, in relation to the dominions of the duke of Holstein. By the seventh article the king of Denmark promifed to deliver up to Sweden the city of Stralfund, and part of Pomerania, as far as the river Pene; to evacuate the fortress of Marstrand, the iffe of Rugen, and all other Islands taken by the Danes in the late war; as also the town of Wismar in Mecklenburgh: in confideration whereof the Swedes, by the ninth article, renounced the privilege of passing the Sound without paying toll, and agreed to pay the fame toll as the English and Dutch. And by the tenth article the crown of Sweden engaged to pay to the king of Denmark 600,000 crowns before the abovefaid places fhould be delivered to the Swedes. By a feparate ar-ticle it was agreed, that Wifmar, the fortifications whereof were demolished, should never be fortified again. As to Bremen and Ferden, these provinces had been confirmed to his Britannic majesty by another treaty. By the abovefaid treaty his Danish majesty obtained the guarantee of the French king for the possession of the duchy of Slewic; and the king of Great Britain removed his guarantee of that duchy, which he had given by a former treaty.

The king of Denmark now reigning in peace, applied himself to promoting the trade of his kingdom; but had the misfortune to fee his capital city of Copenhagen almost destroyed by a fire, which happened in the year 1728. His first queen was the princess Louifa, daughter of Augustus Adolphus, duke of Mccklenburgh, by whom he had iffue, prince Christian, born December 10, 1699; and Charlotte Amelia, born October 6, 1706; and other children, who died in their infancy. His fecond wife, the daughter of count Raventlau, his chancellor, he married within four days after the decease of his first queen, and died the 1 th of October 1730, in the 61st year of his

age. Christian VI. his fon, married Sophia Magdalena of Brandenburgh-Culembach, by whom he had iffue, Frederick V. born March 31, 1723, and the princes's Louisa born Oct. 19, 1726, and married Oct. 1, 1749, to the duke of Saxe Hilburghaufen. He began his reign with fome popular acts, particularly in abolishing the monopo-

lies for the fole vending of wine, brandy, falt and tobacco, which were very grievous to the fubject. In the year 1732 he acceded to the treaty between the courts of Vienna and Petersburgh, whereby he obtained their guarantee for his own dominions, and guaranteed the dominions of those powers, and the pragmatic fanction; and by a feparate article in this treaty, king Christian agreed to pay the duke of Holstein 100,000 rix-dollars, on his renouncing his right to the duchy of Slefwic; and, in pursuance of his treaty, anno 1734, he fent 6000 men to the affistance of the emperor against the French. In 1736, he relinquished his pretensions to the city of Hamburg, on their paying him 500,000 marks of filver.

About the same time he erected a council of trade to examine all propofals that should be made for the advantage of it; and invited foreigners, skilled in manufactures, to refort to Denmark, and established them there, prohibiting the importation of foreign manufactures. He erected a bank also, in imitation of England and Holland, and concluded treaties of fubfidy with foreign powers, particularly with England, which country was at the charge of raifing, cloathing, and paying 6000 of his troops: and yet, when their fervice was wanted, withdrew those troops, and would take no part in the enfuing wars between the powers

of Europe.

The Danes, about the year 1739, feizing on the lord-fhip of Steinburft, which his British majesty appre-hended himself entitled to, as duke of Lawhenburg, a fkirmish happened between the troops of Hanover and those of Denmark, wherein several were killed on both fides. The Hanoverians recovered the territory in dispute. However, as the Danes seemed determined not to relinquish their claim, a treaty was set on foot between those powers, and Britain agreed to pay a fubfidy to the Danes for permitting the Hanoverians to enjoy Steinhurft.

The Danes also had a quarrel with the Dutch for fishing upon the coast of Iceland. Their guard-lhips feized on fome of the Dutch fifling veffels, and carried them to Copenhagen; but the Hollanders threatening to make reprifals, those vessels were released.

Christian having reigned 16 years, with great reputation, was fucceeded by his fon Frederick V. on the 26th of July, 1746. This prince trod in his father's foot-steps, encouraging the manufactures, extending the commerce, and improving the trade of his country. He was first married to the princess Louis, daughter to his Britannic majesty. Upon the death of his queen, who was the mother of his present Danish majesty, he again married a daughter of the duke of Brunswic Wolfenbuttle, and died in 1766, being fuc-

ceeded by his fon. Christian VII. the present king of Denmark and Norway, L. L. D. and F. R. S. was born in 1749; married in 1766, to the princefs Caroline Matilda; and has iffue; Frederick, prince royal of Denmark, born January 28, 1768; and Louisa Augusta, princels royal, born July 7, 1771. The reign of this young monarch opened aufpiciously; but was afterwards darkened by a fatal event, which occasioned much aftonishment to all Europe, and of which we shall give the following account in the words of an intelligent gentleman, who made the most minute enquiries concerning it, of the most cool and dispassionate Danes, and wrote this narrative in the metropolis of Denmark. " I have (favs this gentleman) made it my endeavour, fince my arrival here, to gain the most authentic and unprejudiced intelligence respecting the late celebrated and unbappy favourite count Struenfee, and the late extraordinary revolution which expelled a queen from her throne and kingdom, and brought the ministers to the feaffold. Struenfee had not any noble blood in his veins; or, confequently, any hereditary and preferiptive title to the immediate guidance of the affairs of flate. with great repuderick V. on the 'od in his father's flures, extending ade of his counprincefs Louifa, 'pon the death of is prefent Danifh 'of the duke of 1766, being fuc-

of Denmark and born in 1749; aroline Matilda; ral of Denmark, Augusta, princess gn of this young was afterwards ecafioned much nich we shall give of an intelligent te enquiries conaffionate Danes, olis of Denmark. it my endeavour, oft authentic and he late celebrated fee, and the late led a queen from t the ministers to oble blood in his ary and preferipof the affairs of ar circumstances, address, feem to have have drawn him from his native mediocrity of condition, and placed him in an elevated rank. He originally practifed physic at Altena, on the Elbe, and afterwards attended the prefent king of Denmark, on his travels in England, in quality of physician. On his return he advanced, by rapid strides, in the royal favour; and feems to have eminently poffeffed the powers of pleafing, fince he became equally the fa-vourite of both king and queen. He was invefted with the order of St. Matilda, instituted in honour of her majesty, created a count, and possessed unlimited ministerial power. His conduct, in this fudden and uncommon eminence, marks a bold and daring mind; perhaps, I might add, an expanded and patriotic heart. Unawed by the precarious tenure of courtly greatness, and more peculiarly of his own, he began a general reform. The state felt him through all her members: the finances, chancery, army, navy, nobles, peafants, were all fenfible of his influence. He not only dictated, but penned his replies to every important question or dispatch; and a petition or scheme of public import and utility, rarely waited two hours for an answer.

" The civil judicature of this capital was then vefted in 30 magistrates. Struensee sent a message to this tribunal, demanding to know the annual falary or penfion annexed to each member. Rather alarmed at this enquiry, they fent an answer, in which they diminished their emoluments near two thirds, and estimated them at 1500, instead of 4000 rix-dollars. The count then informed them that his majesty had no further occasion for their fervices; but, in his royal munificence and liberality, was graciously pleased to continue to them the third part of their avowed incomes, as a proof of his fatisfaction with their conduct. He, at the same time, constituted another court, composed only of fix persons of integrity, to whom the same power was de-He proceeded to purge the chancery and other bodies of the law. Then entering on the military department, he, at one stroke, broke all the horseguards, and afterwards the regiment of Norwegian footguards, the finest corps in the service, who were not difbanded without a fhort, but very dangerous fedition.

" Still proceeding in this falutary, but most critical and perilous atchievement, he ultimately began to attempt a diminution of the nobles, and to let the farmers and peafants at perfect liberty. No wonder that he fell a victim to fuch measures, and that all parties joined in his destruction. These were his real crimes, and not that he was too acceptable to the queen, which only formed a pretext. It was the minister, and not the man, who had become obnoxious. I do not pretend, in the latter capacity, either to excuse or condemn him; but, as a politician, I rank him with the Clarendons and Mores, whom tyranny, or public bufiness, and want of time, have brought, in almost every age, to an untimely and ignominious exit; but to whose memory impartial posterity have done ample justice. Though Struenfee does not appear to have made a bad use, yet he certainly made a violent and imprudent one, of his extensive power. He seems, if one may judge by his actions, to have been intoxicated with royal favour, and accumulated honours, and not to have adverted fufficiently to the examples which hiftory furnishes of Wolfeys in former days, and of Chiofeuls in modern times, who most strikingly evince the slippery foundation of political grandeur. When he was even preffed, only a fhort time before his feizure, to withdraw from court, and pass the Belts, with the most ample fecurity for his annual remitment of forty, fifty, or even an hundred thousand dollars, an unhappy fascination detained him, in defiance of every warning, and referved him for the prison and the block. The queendowager, and prince Frederick, were the only feeble inftruments to produce this catastrophe, as being, by their rank, immediately about the person of the sovereign; though common report has talked loudly of the former's intrigue, and attributed it to her imaginary abi-The only mark of capacity, or address, they No. 59.

exhibited, was in preferving a fecrecy which deluded Struensee, and the queen Matilda, till the time of their being arrested. On the last levy-day preceding this event, the count was habited with uncommon magnificence, and never received greater homage, or court fervility, from the crowd, than when on the verge of ruin. On the night fixed for his feizure there was a bal pare in the palace. The queen, after dancing, as ufual, one country dance with the king, gave her hand to Struenfee during the reft of the evening. She re-tired about two in the morning, and was followed by him and count Crandt. The moment was now cone; the queen-dowager, and her fon prince Frederick, haftened to the king's private chamber, where he was already in bed. They kneeled down befide him, and implored him, with tears and expollulations, to fave himfelf and Denmark from impending destruction, by arrefting those whom they called the authors of it. is faid the king was not cefily induced to fign the order, but did it with reluctance and hefitation. At length their intreaties prevailed, and he affixed his fign manual to the paper. Colonel Koller Barmer instantly repaired to Struenfee's apartment, which, as well as Brandt's, was in the palace: they were both feized at nearly the fame inftant, and, as all defence was vain, hurried away immediately to the citadel. When count Struensee stepped out of the coach, he faid, with a fmile, to the commandant, " I believe you are not a little furprized at feeing me brought here as a pri-" No, and please your excellence, (replied the old officer bluntly) I am not at all furprized; but on the contrary, have long expected you." It was five o'clock in the morning when count Rantzaw came to the door of her majefty's anti-chamber, and knocked for admittance. One of the women about the queen's perfon was ordered to wake her, and give her information that she was arrested. They then put her into one of the king's coaches, drove her down to Elfeneur, and thut her up in the castle of Cronenburg. Mean while they dreaded an infurrection in Copenhagen: every military precaution was taken to prevent it: the most infamous and filly reports were circulated among the populace to render the state prisoners odious: that they had put poison into the king's coffee to destroy him; that they intended to declare him incapable of governing; to fend the dowager-queen Juliana out of the kingdom, as well as her fon prince Frederick, and to proclaim Matilda regent. To confirm these extraordinary and contradictory reports, the king himfelf, and his brother, appeared in a state-coach, and paraded through the streets of the city, to show himself unburt, and as if escaped from the most horrid conspiracy. During these transactions Struensee and Brandt were detained in the most rigorous imprisonment. They loaded the former with very heavy chains about his arms and legs, and he was at the fame time fixed to the wall by an iron bar. The room is not above 10 or 12 feet fquare, with a little bed in it, and a miferable iron flove; yet here, in this abode of mifery, did he though chained, compleatly, with a pencil, give an account of his life, and conduct as minister, which is penned with uncommon genius!

"A tribunal was appointed for the trial of the queen and two counts, and a counfel affigned for each, to preferve an appearance of judice and equity."

The refult of this was, the counts were fentenced to lofe their heads, and the queen to banishment. The two counts were executed April 28, 1772; and their skulls and bones exposed on wheels, about a mile and a half out of the metropolis. Hence the precariousness of favouritism may be seen; and that those who rife rapidly, generally fail with equivalent velocity.

He that in court fecure will keep himself, Must not be great, for there he's envy'd at. The shrub is safe when as the cedar shakes; For where the king doth love above compare, Of others they as much more envy'd ar. Yet with what avidity are fleeting riches, imaginary pomp, temporal titles, and precarious power, fought after, while folid happiness is neglected! How universal is the wish to acquire wealth, dominion, and worldly honours! and yet when disappointments, the natural concomitants of these objects, attend the purfuit, mankind blame not themselves, but lay the fault on fate, whereas their own wishes alone are erroneous.

But why, alas! do mortal men in vain, Of fortune, fate, or Providence complain? God gives us what he knows our wants require, And better things than those which we defire. Some pray for riches, riches they obtain,
But, watch'd by robbers, for their wealth are flain,
Some pray from prifon to be freed, and come,
When guilty of their vows, to fall at home;
Murder'd by those they trusted with their life,
A favour'd fervant, or a bosom wise.
Such dear-bought bleffings happen ev'ry day,
Because we know not for what things to pray.
Like drunken sots about the streets we roam;
Well knows the fot he has a certain home;
Yet knows not how to find th' uncertain place,
But bunders on, and staggers ev'ry pace.
Thus all seek happines, but sew can find,
For far the greater part of men are blind,"

SECTION I.

Extent, Boundaries, Climate, various Productions, Lakes, Soil, Beafts, Birds, Fish, Minerals, and Mines. Account of a Descent into one, and the Manner of manufacturing the Iron.

THIS kingdom extends from 55 deg. 20 min. to 69 deg. 30 min. north latitude, and from 12 to 32 deg. east longitude, being near 800 miles in length, and 500 in breadth. It is bounded on the north by Lapland; on the fouth by the Baltic, the Sound, and the Categate; on the east by Russia: and on the west by the stupendous mountains of Norway. The inhabited or cultivated parts of Sweden are very small, when compared with the vast space comprised by extensive lakes, gulphs, steril mountains, immense rocks,

and barren heaths.

With respect to the climate of this country, it may be justly faid, that cold and heat prevail in the extreme. The fun, at the highest, is above the horizon of Stockholm 18 hours and an half, and for fome weeks makes a continual day. In winter the days are proportionably fhort, the fun being up five hours and an half; which defect is fo well fupplied, as to lights, by the moon, the whiteness of the snow, and the clearness of the sky, that travelling by night is as usual as by day; and journeys are begun in the evening as frequently as in the morning. The want of the fun's heat is repaired by floves within doors, and warm furs abroad; inflead of which, the meaner people use sheepfkins, and other fuch defences, and are generally better provided with cloathing, befitting their condition, and the climate they live in, than the common people in most other parts of Europe; though, where any neglect or failure happens, it usually proves fatal, and occasions the loss of notes, or other members, and sometimes of life, unless the usual remedy to expel the frost, when it has feized any part, be carefully applied, which is to remain in the cold, and rub the part affected with fnow till the blood returns to it again.

The feafons of the year, though regular in themfelves, do not altogether answer those of other climates, as a French ambassador observed, who, in raillery, said, there were in Sweden only nine months winter, and all the rest was summer: for as winter commonly begins very soon, so summer immediately succeeds it, and leaves little or no space to be called spring. The productions, therefore, of the earth ought to be, as they really are, more speedy in their growth than in more southern countries: the reason of which seems to be, that the oil and sulphur in the earth (as appears by the trees and minerals it produces) being bound up all

the winter, are then on a fudden actuated by the heat of the fun, which almost continually shines, and thereby makes amends for its short stay, and brings to maturity the fruits proper to the climate. In the summer season the shelds are covered with a variety of slowers, and the whole country overspread with strawberries, raspberries, currants, &c. which grow upon every rock. In their gardens melons are brought to good perfection in dry years; but apricots, peaches, and other wall-fruits, are almost as scarce as oranges. They have cherries of several sorts, and some tolerably good, which cannot be said of their apples, pears, and plumbs; for these are neither common, nor well-tasted. But all kinds of roots are in plenty, and contribute much to the nourishment of the poor people.

Their woods and vast forests overspread much of the country, and are for the most part of pines, fir, beech, birch, alder, juniper, and some oak; especially in the province of Bleking in fouth Gothland; the trees growing in most places so close together, and lying to rot where they fall, that the woods are scarcely passable. These associated a plentiful and cheap firing; and being generally very strait and tall, are easily convertible into timber sit for all uses; so that the Dutch export, from hence, boards and masts for their shipping; which prove as good as those of Norway. In the parts near the mines the woods are much destroyed; but the want is so well supplied from distant places, by the convenience of rivers and water-carriages, that they have charcoal above fix times as cheap as in England; though it is deemed not half so good.

The principal lakes in Sweden are the Vetter, We-

mer, and Maeler.

Lake Vetter is in Ostrogothia, or East Gothland, and is remarkable for its foretelling of storms, by a continual thundering noise, the day before, in that quarter from whence they arise; as also for the sudden breaking of the ice upon it, which sometimes surprises travellers, and in half an hour becomes navigable. It is extremely deep, being in some places above 300 fathoms, tho' no part of the Baltic sea exceeds 50. It supplies the river Motala, which runs through Norkoping, where it was a fall of above 30 feet; and in some winters is so choaked up with ice, that for many hours no water passes.

The fecond is in Westrogothia, or West Gothland, from which issues the river Elve, falling down a rock

near 60 feet, and paffes Gottenburg.

The third empties itself at Stockholm, and furnishes one side of the town with fresh water, as the sea does the other with salt. These, and abundance of other lakes, whereof many, like ponds, have no yent, are APHY.

we'll flored with a variety of fish: as falmon, pike, perch, tench, trout, eels, and many other forts, unknown elsewhere; of which the most plentiful is the streamling, a fish less than the pilchard, taken in great quantities, falted in barrels, and distributed all over the country.

The gulph of Finland, which feparates Sweden from that province, abounds with feals, of which a confiderable quantity of train-oil is made and exported: and in the lakes of Finland are vaft quantities of pike, which they falt, dry, and fell at very cheap rates. These lakes are of great use for the convenience of carriage; in summer by boats, and in winter by fledges; and among them, on the sea-coast, are almost innumerable little islands, some of which are inhabited, some uninhabited, but covered with wood, and others are merely barren rocks.

The rivers of Sweden will be mentioned when we come to enumerate the feveral provinces and diffricts.

Concerning the foil of Sweden, an ingenious traveller fays, "I think it may be very juftly afferted, that not one twentieth part of this country is in a flate to be cultivated. I have travelled near 700 English miles in this kingdom, and, except in the province of Scania, and in some parts of Finland, did not see 20 acres of good land lying together.

The foil, however, in places capable of cultivation, is tolerably fruitful, though feldom above half a foot deep; and frequently the barren land, being enriched by the affes of the trees burnt on the places where they grow, and the feed raked among the affes, produces a plentiful crop, without further cultivation. This practice is fo ancient, that their writers derive the name of Sweden from a word in their language that expresses it; but the danger of destroying the woods has, of late, occasioned some law to limit that custom. If the inhabitants were industrious above what necessity forces them to, they might, at least have corn sufficient of their own; but as things are managed they have not: nor can they fubfift, without great importations of all forts of grain; and notwithstanding these supplies, the poorer fort, in many places remote from traffic, are obliged to grind the bark of birgh-trees to mix with their corn, and make bread, of which they have not always plenty.

As in other northern countries the cattle are generally of a very finall fize: neither can the breed be bettered by bringing in larger from abroad, which foon degenerate; because in summer the grass is much less nourishing than in the places from whence they came, and in winter they are usually half starved for want of fodder of all kinds, which often falls so very short, that they are forced to unthatch their houses to keep a part of their cattle alive. Their sheep bear a very coarse wool, only fit to make cloathing for the peafants. Their horfes, especially those of Finland, are hardy, vigorous, ffrong, fure-footed, and nimble trotters, which is of great use to the people, because of the length of their winter, and the fitness of these horses for sledges, which are their only carriages in that feafon. In war their horses are not only able to refift, but even to break a body of the best German cavalry.

The farmers in fome parts of Sweden, when the winters are uncommonly fevere, and the cattle almost flarved, in order to nourish them, and cause the fodder to hold out during the season, make hay-tea; that is, they boil about a handful of hay in three gallons of water, and the drink thus made is so extremely nutritive, that it nourishes the cattle associately replenishes the udders of the cows with a prodigious quantity of milk, and makes one truss of fodder go as far as ten would otherwise do. If this was tried in England, upon similar occasions, it might prove a beneficial experiment.

Sweden produces elks, bears, wolves, deers, hares, foxes, wild cats, fquirrels, &c. and these are hunted either for their flesh, skins, or furs; the Swedish hunts-

men using guns, and being in general excellent markf-

The Swedish squirrel is somewhat thicker than a weasel, but not quite so long. He is of a reddish colour on the upper part of the head and back, but on the belly is white. The tail is long and bushy, which being turned over his back, is sufficient to shade it; whence the Latin name Sciurus, which fignifies a shade.

This animal fits upon his backfide when he feeds, laying hold of the provision with his fore feet, and putting it into his mouth. He lives upon nuts and acorns of all kinds, but is most fond of hazel nuts, which he gathers in the proper feason, and hoards up against winter. Squirrels are generally to be met with upon trees, where they build their nests, and bring up their young. They can leap very readily from bough to bough, and sometimes from tree to tree, at which time they use their tails instead of wings; for it is of great help in keeping them from finking.

Poultry of various kinds are reared in Sweden. Of game there is plenty, both of land and water-fowl; particularly partridges, and a bird called a yerper,

which refembles the partridge.

The orra is a fowl of the fize of a hen, and the keder is very near as big as a turkey. In winter the Swedish sportsmen amuse themselves with killing blackbirds, thrushes, and sydenswars; the latter being beautiful birds, sumptuously arrayed in gorgeous plumes, which are finely tipped with scarlet: they are about the fize of fieldsares, and their slesh is of a most exquisite slavour. Pigeons are searce, on account of the great number of voracious birds which destroy them.

The eagle is the most remarkable bird of prey. This bird is of a large size, very strong, and can never be tamed like the hawk in order to pursue game; and it is much more majestic in appearance than the vulture.

The eagle principally inhabits inaccessible mountains, and roofts on the loftiest trees, being fond of such places as are least frequented by mankind. However, as birds, as well as other animals, are found in greater plenty round the habitations of men, the eagle is fometimes induced to frequent those places for the convenience of its prey. They live much on fifh, crabs, tortoifes, wild-ducks, poultry, pigeons, and the like. They have been known not to spare even their own species, when pressed with hunger. They attack not only lambs and young goats, but sometimes deer, sheep, and even horned cattle. They build their nefts on the most inacceffible parts of rocks, and the highest trees, some of which have been found near fix feet in diameter. They are usually lined with the hair of foxes, wool, or the fur of hares and rabbits, to keep the eggs warm, of which the female generally lays two, or fometimes three at a time, and hatches them in thirty days, during which time the male fupplies her with food. As foon as the young ones are produced, the old become remarkably mischievous, and destroy lambs and poultry for several miles round them. They often bring hares and partridges alive to their young, to regale them with the relish of warm blood. The country folks fometimes avail themselves of these provisions, by taking it from the eaglets in the absence of the old ones, and carrying it home for their own use.

The vulture differs from the eagle in not having its beak turned immediately crooked from the root, it continuing strait to the length of two inches. It is much more lazy than the eagle, and fond of carrion, which the eagle will not touch. However, they prev upon live birds, hares, kids, fawns, &c. if they can get them; and if not, eat any filth that comes in their

The hawk has wings so long as to reach to the end of the tail, which resembles that of a sparrow-hawk. The beak is partly blue and partly yellow; the seet are of a pale green; the toes are slender; the talons large, sharp, and darkish; the breast, belly, and thighs, white, streaked with black; the neck, back, wings, and head are brown, and the latter is slattish at the top: the tail

is of a light brown, with black lines running acrofs it; and the legs and feet are of a yellow colour. Some years ago a hawk was killed in Finland, which had a plate of gold on one leg, and a plate of filver on the other. On the former was this French inscription: Gesuis au Roi;" which, in English, implies, "I belong to the king;" and on the latter, were words thefe in the fame language: "Le Duc de Chevreuse me garde;" which may be thus translated: "The duke of Chevreuse keeps me."

The kite is diftinguishable from all other rapacious birds by having a forked tail. It is usually about 28 inches long, from the head to the tip of the tail, when the neck is strait; but when the wings are extended, it measures, from extremity to extremity, 64 inches, or better. The head is of an ash colour, the neck red, the back brown, and the wings are diverlified with red, black, and white. The beak is black, the tongue thick, the legs and feet yellow, and the talons of a fable hue. It has always been famous for its rapacity, and is often mentioned by the ancients.

-" Thus the fpeaking kite, That finells the flaughter'd victim from on high, Flies at a diftance, if the priefts are nigh, And fails around, and keeps it in her eye."

The seas of Sweden, as well as the rivers, abound with a great variety of fifh, particularly falmon, perch, pike, ftreamling, trout, tench, cels, feals, &c.
Pikes are fo abundant that vaft quantities are falted

and dried for fale; and great numbers of ftreamlings (which is a delicious fifh, fmaller than a pilchar, or pilchard) are pickled and barrelled, both for home con-fumption and exportation. The train oil, extracted from the feals, is a valuable article of traffic, Sweden abounds with excellent mines. The prin-

cipal of these is the great filver mine, into which workmen are let down in baskets to the first floor, which is 105 fathoms under ground: the roof there is as high as a church, supported by vast arches of oak; thence the descent is, by ladders, or baskets, to the lowest mine. above 40 fathoms. They have no records fo ancient as the first discovery either of this or the great copper mine, which must needs have been the work of many ages. The ore feldom yields above four per cent, and requires great pains to refine it. They are also at the charge of a water mill to drain the mines, and have the benefit of another to draw up the ore. This mine formerly produced between 20,000 and 30,000 of fine filver crowns, annually; and the king had an exemption in his favour, of being allowed to purchase whatever quantity he thought proper of it, and to pay one forth lefs than the intrinsic value. A late traveller informs us, that this mine is, at present, much diminished in value, by having been fo greatly exhausted. However, it may not be improper, in this place, to describe the metal called filver, and the nature of the various ores from which it is produced.

Silver is a noble and perfect metal, of a white shining colour, fonorous and ductile, but not fo perfect as gold. It is fometimes found in fmall maffes of many different flrapes, but most commonly like filaments and fcales in feveral forts of stones and mould, and in many

forts of land. &

The Vitrean filver is of an irregular form, very weighty, and may be eafily flatted with a hammer; for it is not much harder than lead, and is much of the fame colour: for which reason it is often mistaken for lead. It melts prefently, and foon grows red-hot. It confifs of fulphur, and pure filver, and above three quarters of it is filver. The horny filver ore is half transparent, and of a deeper yellow or brown colour, according as it confifts of larger or fmaller lumps. It looks like rofin, and is of an irregular shape. carefully examined, it appears to confift of very thin plates. It is not very weighty or hard, for it may be

eafily ground: and when brought fuddenly to the fire, it crackles, burfts, and exhales a fulphurious fmell, and fometimes burfts lightly. This hard fort contains two thirds of filver. The red filver ore is fometimes of a lighter, and fometimes of a deeper fearlet colour. The first case is transparent, like a garnet, and has been miltaken for transparent cinnabar; and in the fecond case it is of a deeper dye. It is heavier than the former horny ore, but burfts when brought near a candle or a mild fire, and the remaining part melts before it grows red-hot; then it emits a difagreeable finell of arfenic, together with a thick fmoke. It contains the fame quantity of filver as the horny ore just men-

The white filver ore is of a light grey colour, of an irregular figure, pretty weighty, and very brittle. It has not only copper in it, but fometimes more of it than of filver; for it differs from the white copper ore in nothing but the quantity of filver it contains. Thefe are the principal filver ores hitherto known; though many others are looked upon by fome as fuch, because they contain a confiderable quantity of filver; but then there is always more of other metals along with them, therefore they cannot properly be called filver

Silver may be eafily extracted from lead, by melting it in channels, made with afhes in the furnace, and then blowing up the fire till it turns into glafs, finks into the channels, and leaves the pure filver behind.

Silver is harder than gold, but not fo ductile, and is lighter than gold or lead, the weight, with regard to gold, being little less than five to nine. It will not ruft, but will grow black by fulphurous vapours, and will diffolve in aqua fortis, but not in aqua regia. When it is mixed with common falt, and melted, it turns into a half transparent mass like horn, which is hard to be brought back to filver again, because it is volatile, and in a violent fire will all fly away. When filver is diffolved in aqua fortis it may be chrystalized; and the crystals are very corrosive, and of an exceeding bitter tafte. When applied to the skin, they leave an impression like that of a burning coal, and make an escar of a black colour. The folution of filver will turn any thing black, and therefore, when properly diluted, is often used to colour the hair. These cryftals will melt in a very moderate heat before they grow red, and form a blackish mass; it is then proper for the use of surgeons, and is called the filver caustic.

The great copper mine is about 80 fathoms deep, of great extent, but subject to damages by the fallingin of the roof; yet that is fometimes recompensed by the abundance of ore which the ruined pillars yield, though most commonly the loss is very great. occasion of these falls is ascribed to the throwing the earth and stones, brought out of the mine, upon the ground over it; by which the pillars become overcharged, and give way. The reason of this is said to be, that the profit arifing, to those who are concerned, is fo little, that they are not able to work it off as they ought, and to remove the rubbish to a greater distance: and unlefs the king abates a confiderable part of the profit arifing to the crown from this mine, it is believed it will, in a few years, be at a stand, especially if the defigns of making copper, which are on foot elfewhere, take any tolerable effect. The copper yearly made out of this mine amounts to the value of about 200,000. of which the king has a fourth part, not by way of pre-emption, but in kind; befides which, he has, upon the remainder, a cuftom of 25 per cent. when it is exported unwrought. Many years ago a gentleman of Italy came into Sweden, with propofals to make copper a fhorter and cheaper way than had till then been practifed, fo as to make that in five days, which before required three weeks, and with one fifth, part of the charcoal, and with fewer hands. The bargain was made, and his reward to be 100,000 crowns. The first essay he made succeeded to admiration; but

The baro.ooo crowns. Imiration; but

when he came to work in earness, and had got his new ovens built to his mind, the miners, as he complained, picked out the very worst ore, and were otherwise so envious and untractable, that he sailed of success, and lost his reward: nor was it without difficulty that he obtained leave to buy ore, and practise his invention at his own charge.

This mine, travellers tell us, in the last century, supplied the greatest part of Europe with copper; but at present it is worked so very deep, that it is become extremely expensive; and though the ore is uncommonly rich, the produce is considerably diminished.

Copper is a hard, ignoble metal, fofter than iron, and, when polifhed, of a fhining reddish colour. It will melt in the fire, and is fo ductile, that it may be beaten into exceeding thin leaves. It is more frequently found in its metallic form than iron, in various fhapes; but its ore never diftinguishes itself by any ecrtain figure, for it is almost always irregular. But the finest colours of any kind, except the red and transparent, most commonly betray the presence of copper; for this reason there is hardly any copper ore that is not mixed with iron, in a larger quantity than the ores of other metals commonly are. However, there is not fo much in some as in others; and those that contain the least iron, are naturally more easily melted than the rest. The vitrious copper ore is of a darkish violet fky colour, like that of a piece of fteel that has touched a red-hot iron. It is very heavy, and of a moderate hardness; but commonly variegated with fpots, and grey veins. One hundred weight of this ore contains from 50 to 80 pounds of copper. The azure copper ore is of a most beautiful blue colour, not foft, very heavy, and, when broken, shines like blue is. This is most free from iron, arsenic, and sulphur; and a great quantity of excellent copper may be extracted out of it with eafe. The green copper ore is like green crystal, and sometimes very prettily streaked; but in other things it has the properties of the former. The light dufky-blue concretes, as well as the green, called by fome copper okers, yield a great deal of very good copper when they are pure, which may be known from their colour and weight; but those that are more light, are mixed with unmetallic earth, and those that are yellow contain iron oker, on which account they are the more difficult to be met with, and yield less copper of an inferior fort.

Iron mines and forges are in great numbers, especially towards the mountainous parts, where they have the conveniency of water-falls to turn their mills. From these, besides supplying the country, there is yearly exported iron to the value of near 300,000l. but of late years the number of these forges has been so much increased, that each endeavouring to underfell others, the price has been much lowered. Since the prohibition of foreign manufactures, in exchange for which iron was plentifully taken off, it is grown fo cheap, that it is found necessary to lessen the number of forges. Neither has that contrivance had the effect intended; but, on the contrary, many more are like to fall of themseves, because they cannot work but with lofs: in which case many thousands of poor people, whose livelihood depend upon those forges and mines, will be reduced to a flarving condition.

Aron is an ignoble metal, remarkable for its hardness. It is of a whitish livid colour when polished, but before that it is blackish. When it is cleanfed it is called steel. The ore of common iron is of no certain form, but most commonly of a rusty colour. There is also an ore which is very heavy, and of a red bluish colour when broken. It is very rich in the best kind of iron, and usually yields, at the first melting, from 60 to 80 pounds out of an hundred weight. There is also a singular kind of iron ore, of a yellowish colour, though sometimes grey, and sometimes of a kind of semi-transparent white. It will yield, when melted, about thirty pounds of iron out of an hundred weight.

When iron is melted, it is formed into large maffes, which are long and thick, and commonly called pigs. These are melted over again, and stirred with an iron rod, in order to render them malleable. While they are yet red hot, they are placed under hammers, and by that means the heterogenous particles are forced away by the repeated strokes. One fort of iron differs greatly from another; but that which is toughelt is best; and that which is most brittle is worst of all. However, all forts of iron are of the fame nature; and they are only more or less tough, in proportion to the earthy, vitriolic, and fulphurous particles mixed therewith. Iron being often melted and cleanfed, is turned into feel; though in some cases, little labour is required for that purpose, and in others a great deal. When iron is very good, they melt it in a furnace, and throw in gradually a mixture of equal parts of an alkalous falt, and filings of lead, with the rafpings of oxes horns; then they flir the melted metal, and at length place it on the anvil, where they beat it into

A late traveller gives the following interesting defcription of his descent into the mines of Danmora.

"We lay (fays he) at a pretty village, called Offarby, and went about three miles the next morning to fee the mines of Danmora. They are celebrated for producing the finest iron ore in Europe, the iron of which is exported into every country, and conflitutes one of the most important fources of the national wealth, and royal revenues of Sweden. The ore is not dug as in the mines of tin or coal, which we have in England, but is torn up by power. This operation is performed every day at noon, and is one of the most tremendous and awful it is poslible to conceive. We arrived at the mouth of the great mine (which is near half an English mile in circumference) in time to be prefent at it. Soon after twelve the first explosion began. I cannot compare it to any thing fo aptly as subterraneous thunder, or rather vollies of artillery discharged under-ground. The stones are thrown up by the violence of the powder to a valt height above the surface of the earth; and the concussion is so great as to shake the furrounding earth, or rock, on every fide. I felt a pleafure mixed with terror, as I hung over this vaft and giddy hollow, to the bottom of which the eye in vain attempts to penetrate. As foon as the explosions were finished, I determined, however, to descend into the There is no way to do this but in a large deep bucket, capable of containing three persons, and fastened to chains by a rope. The inspector, at whose house I had slept the preceding night, took no little pains to diffuade me from the resolution, and affured me that not only the rope, or chains, fometimes broke, but that the fnow and ice, which lodged on the fides of the mines, frequently tumbled in, and deftroyed the workmen; nor could he warrant my absolute security from one or both of these accidents. Finding, however, that I was deaf to all his remonstrances, he provided me a clean bucket, and put two men into it to accompany me. I wrapped myfelf, therefore, in my great coat, and stepped into the bucket. The two men followed, and we were let down. I am not ashamed to own, that when I found myself thus suspended between heaven and earth by a rope, and looked down into the deep and dark abyss below me, to which I could fee no termination, I shuddered with apprehenfion, and half repented my curiofity. This was, however, only a momentary fensation, as before I had defeended an hundred feet, I looked round on the feene with very tolerable composure. I was near nine minutes before I reached the bottom, it being 80 fathoms, or 480 feet. The view of the mine, when I fet my foot to the earth, was awful and fublime in the highest degree. Whether terror or pleafure formed the predominant feeling, as I looked at it, is hard to fay. light of the day was very faintly admitted into these fubterraneous caverns. In many places it was ablolutely loft, and flambeaux supplied its place. I faw 8 B

beams of wood across some parts, from one side of the rock to the other, where the miners fat employed, in boring holes for the admission of powder, with as much unconcern as I could have felt in any ordinary, though the least dizziness, or even a failure in preserving their equilibrium, must have made them lose their seat, and dash them to pieces against the rugged surface of the rock beneath. The fragments torn up by the explofion, previous to my descent, lay in vast heaps on all fides; and the whole scene was calculated to inspire a gloomy admiration in the beholder. A confinement for life, in these horrible iron dungeons, must furely of all punishment which human invention has devised, be one of the most terrible. I remained three quarters of an hour in these gloomy and frightful caverns, and traversed every part of them which was accessible, conducted by my guides. The weather above was very warm, but here the ice covered the whole furface of the ground, and I found myfelf furrounded with the colds of the most rigorous winter, amid darkness and caves of iron. In one of thefe, which run a confiderable way under the rock, were eight wretches warming themselves round a charcoal fire, and eating the little feanty fubfiftence produced from their miserable occupation. They rose with surprize at seeing fo unexpected a guest among them; and I was not a little pleafed to dry my feet, which were wet with treading on the melted ice, at their fire. There are no less than 1300 of these men constantly employed in the mines, and their pay is only a common dollar, of three-pence English, a day. They were first open-ed about 1580, under the reign of John the Third, but have been constantly worked only fince the time of Christina. After having gratified my curiofity with a full view of these subterranean apartments I made the fignal for being drawn up, and can most feriously affirm, I felt fo little terror while reafcending, compared with that of being let down, that I am convinced, in five or fix times more, I should have been perfectly indifferent to it, and could have folved a problem in mathematics, or composed/a fonnet to my miftrefs, in the bucket, without any degree of fright or apprehension. So strong is the effect of custom on the human mind, and fo contemptible does danger or horror become, when familiarised by continual repetition !"

The fame writer, in fpeaking of the manner in which the peafants manufacture the iron, fays, "I have vifited fix or feven forges on my journey, each of which conflantly employs from four to fourteen hundred workmen, only in iron. Wherever there is a country feat, you may be certain to see one of these fabrics; and no Cyclops were ever more dextrous in working their materials. I have feen them fland close to, and hammer, in their coarse frocks of linen, a bar of ore, the heat and refulgence of which were almost insupportable to me at 10 feet distance, and with the sparks of which they are covered from head to foot. I had the pleafure of viewing the whole process used to reduce the ore into iron, and must own it is very curious.— They first roast it in the open air for a considerable time; after which it is thrown into a furnace, and, when reduced to fusion, is poured into a mould of fand about three yards in length. These pigs, as they are then denominated, are next put into a forge heated to a prodigious degree. They break off a large piece with prickers, when red hot, and this is beat to a leffer fize with hammers. It is put again into the fire, and from thence entirely finished by being laid under an immense engine resembling a hammer, which is turned by water, and flattens the rude piece into a bar. Nothing can exceed the dexterity of the men who conduct this concluding part of the operation, as the eye is their fole guide, and it requires an exquifite nicety and precifion. It is certainly a most happy circumstance that Sweden abounds with these employments for her peafants, as, from the ungrateful foil and inclement latitude, they must otherwise perish by misery and famine."

SECTION II.

Grand Divisions, and particular Description of the distinct Parts of the Kingdom of Sweden.

HIS kingdom has been generally confidered as divided into feven provinces, viz. Sweden Proper, Gothland, Livonia, İngria, Finland, Swedish Lapland, and the Swedish Islands in the Baltic; but it is to be observed, that two of these provinces, Livonia and Ingria, at prefent appertain to Russia, having been conquered by Peter the Great, and ceded to the Rusfians by fubsequent treaties.

The five provinces which still remain in the posses-

fion of the Swedes are thus divided:

I. Sweden Proper, which contains Uplandia, Sudermania, Westmania, Nericia, Gestricia, Helsingia, Delecarlia, Medolpadia, Angermania, Iniptia, and West Bothnia.

II. Gothland, or Gothia, which contains East Gothland, West Gothland, and South Gothland.

III. Finland, which contains Finland Proper, Nylandia, Carelia, Kenholm, Savolaxia, Tavaltia, and Cajunia.

IV. Swedish Lapland, which contains Augermanice Lapmark, Uma Lapmark, Pitha Lapmark, Lula Lapmark, Torno Lapmark, and Kima Lapmark.

V. The Swedish Islands, which are Gothland, Ocland, Oefel, Dago, Aland, Hagland, and Rugen. We shall treat of each division in their respective

SWEDEN PROPER.

order, beginning with

SWEDEN, properly fo called, is bounded on the noth by Lapland, on the fouth by Gothland, on the east by the gulph of Bothnia, and the mountains part it on the west from Norway; extending 710 miles from fouth to north, and about 225 from east to west, though in many places it is much narrower. The country is fruitful, though mountainous in fome parts; abounds with rich mines of copper, and affords conveniency of water, and fuel for working them. It is divided, as we have already observed, into eleven parts, which are

Upland, furrounded on the north-east and east by the Baltic Sea; on the fouth it has part of the same fea, and part of Sundermania, from which it is separated by the lake of Maeler; on the west it is bounded by Westmania; and on the east by Gestricia, from which the river Dala parts it. It extends about 75 miles from north to fouth, and about 65 from east to west. Here are many mines of iron and lead, and some of silver. The country is fruitful, and produces, amongst other things, excellent wheat. The most considerable cities and towns here are as follow:

Stockholm, the capital of the whole kingdom, and the refidence of the king, had its name from its fituation, and the great quantity of timber used in building it; Stock fignifying timber, and Holm an island. It is built upon piles in feveral little islands, which he near one another. It takes up at prefent fix of those iflands, together with the fouthern and northern fuburbs; the one in the peninfula of Toren, and the other in Athundria. It is commonly divided into four parts, which are South Malm and North-Malm, the two fuburbs, between which the city flands in an island: the fourth part is called Garceland. The isle, within which the greatest part of Stockholm is enclosed, is surrounded by two arms of a river, which run with great force out of the lake Maeler. Over each of these arms there is a wooden bridge. There are fome other islands separated by the city but by small canals. From the city there is a prospect on one fide over the lake, and on the other over the fea, which here forms a gulph, that, running between feveral rocks, feems as if it were another lake. The water is fo little brackif drank; which is water that runs in

The water drank; which is owing to the great quantity of fresh water that runs into the fea from the lake.

About 300 years ago this place was only a barren island, with two or three cottages for fishers; but upon the building of a castle there, to stop the inroads of the Ruffians, and the translation of the court thither, it grew, by degrees, to furpass the other more ancient cities, and is now supposed to be as populous as Bristol. The castle, which is covered with copper, is a place of no strength or beauty, but of great use; for it is a spacious building, where the court resides; and also furnishes apartments for most of the great officers, the national court of justice, the colleges of war, chancery, treasury, reduction, liquidation, commerce, and execution. Here is also an armoury, chapel, library, the public records, &c. It contains very few of the inferior officers and fervants of the court; they, together with the foot-guards, being quartered upon the burg-hers, at their landlord's charge for lodging, fire, and candle.

In this city are nine large churches, built with brick, and covered with copper; and three or four wooden chapels.

The palace of the nobility, which is the place of their affembly at the convention of the states, and the depository of their privileges, titles, and such other records as concern their body, is a very flately pile, and one of the finest in the kingdom. It is but one large pavilion, adorned on the outside with marble figures and columns, and within with pictures and fculptures; especially in two large halls, where the nobility meet. Next to this palace is that of the lord high chancellor; and a little farther are two other palaces belonging to noblemen. These four palaces stand on the banks of the lake, are built after the fame manner of architecture, and are all covered with copper. The bank, built at the city's charge, is also a noble edifice, and, together with feveral magnificent houses of the nobility, all covered with copper, affords a handsome prospect.

Most of the burghers houses are built with brick, except in the fuburbs, where they are of timber, and thereby fubject to the danger of fire, which commonly, when it gets a head, destroys all before it in the quarter where it happens. 'To repair this misfortune, they fometimes fend the dimensions of the house they intend to build, into Finland, where the walls, and feveral feparations, are built of pieces of timber laid one upon another, and joined at the corners; and afterwards marked, taken down, and fent by water to Stockholm, there to be fet up and finished; and, when they are kept in good repair, they will last 30 or 40 years; and are warmer, cleanlier, and more healthful, than those of either brick or stone. To prevent the danger of fire, the city is divided into, 12 wards; and in each of these there is a master, and four affistants; who, upon notice of any fire, are immediately to repair to it: as also all porters and labourers, who mostly range themselves under the master of their respective ward. There is, befides, a fire-watch by night, who walk about only for that purpofe; and in each church steeple is kept a watchman, who tolls a bell upon the first appearance of fire.

The government of this city is in the hands of the great fladtholder, who is also a privy counsellor. He fits once a week in the town-house, and presides in the college of execution, affifted by an under fladtholder, and a bailiff of the caftle. Next to him are the four burgomafters; one for justice, another for trade, the third for the polity of the city, and the fourth has the inspection over all public and private buildings, and determines fuch cases as arise on that account. With them the counsellors of the city always fit, and give their votes, the majority of which decides. Their number is uncertain, but usually about 20, mostly merchants and shop-keepers, or such as have ferved the king in some inferior employment. Befides

is fo little brackish before Stockholm, that it might be || their falary, they have an immunity from such impositions as are laid on the inhabitants to support the government of the city; which pays all its-officers and fervants, maintains a guard of 300 men, and defrays the charge of all public buildings and repairs. To fupport this expence, befides a duty belonging to the city of goods imported and exported (which is about 4 per cent. of the customs paid to the king, and amounts to about 5000l. per ann.) the magistrates impose a yearly tax on the burghers, in which they are affifted by a common-council of 48, which chuses its own members, and meet every fpring, to proportion the payments for the enfuing year. On the traders they usually impose 40, 50, or 60 pounds sterling; upon others of a meaner condition, as shoemakers, taylors, &c. five or fix pounds, and on no housekeeper less than 15 shillings; besides quartering the guards, inferior officers, and fervants of the court, with other leffer charges; which, all together, would be thought a great burden, even in richer countries: neither is it otherwife efteemed by the inhabitants of this city, who can fcarce be kept in heart by the privileges they enjoy, as well in customs, as in the trade of the place, which must needs pass through their hands: for the natives of other parts of the kingdom, as all foreigners are obliged to deal only with the burghers, (except those of the gentry, who make iron,) have not the privilege to fell it immediately to ftrangers.

This city is, in a manner, the staple of Sweden; to which most of the goods of their own growth, as iron, copper, wire, pitch, tar, masts, deals, &c. are brought to be exported. The greatest part of the commodities imported from abroad come to this port, where there is a haven capable to receive 1000 fail of ships, and a bridge or key near an English mile long, to which the greatest vessels may lie with their broadsides. The only inconvenience is, that it is 10 miles from the fea, the river very crooked, and no tides. It opens into the Baltic, but is of dangerous access, by reason of the rocks. Within it is one of the most commodious harbours in Europe; for ships of the largest size lie close to the key, where they are so fecure from the wind, that they need neither anchors or cables to hold them. Its entrance is defended by two forts.

Upfal stands on the banks of the river Sal, or Sala, which fall into the lake of Ekolen, and is 42 miles distant from Stockholm towards the north-west. It is a very ancient city, formerly the capital of the north, and the feat of the king. It is divided into two parts by the river, which is here pretty large, and fo hard frozen up in February, that a fair is yearly kept there upon the ice in that month. The town is large, but without any confiderable fortifications. Here is to be feen the fineft church in the whole kingdom, namely, the cathedral. It is covered with copper, and adorned with feveral tombs, especially those of the kings. In the chapel, behind the altar, stands the monument of king Gustavus in marble, between the statues of his two wives, who lie also buried here. In another chapel is the tomb of king John's wife, who was mother to Sigifmund III. king of Poland: it is of white marble. Above the city, on a steep hill, there is a beautiful castle, which is fortified. It is very large, built after the Italian manner, and has a noble prospect over the city, which it commands, and over the whole country.

Upfal was, at first, a bishop's see, but afterwards rendered an archbishopric by pope Alexander III. at the request of king Charles, successor to St. Erick. Stephen, who died in the year 1158, was the first archbishop of this see; and John Magnus, who, at the reformation, refused to admit the Lutheran confession, and removed to Rome, was the 56th. Since his time there have been only Protestant archbishops, who do not live with the fame pomp and magnificence as the Roman Catholic prelates used to do; for the latter never appeared in public without a retinue of 4 or 500 people on horfeback.

The univerfity of Upfal confifts of a chancellor, who || is always a great minister of state; a vice-chancellor, always the archbishop; and a rector, chosen out of the profellors, of which there are about 20, that have each 120l. a year falary. The ordinary number of fludents is about 7 or 800, 50 of which are maintained by the king, and fome few others were formerly by perfons of quality: the rest, that cannot subfift of themfelves, fpend the vacation in gathering the charities of the diocese they belong to, which is commonly given them in corn, butter dried fifth, or flesh, &c. upon which they subfift at the university the rest of the year. They do not live collegiately, but in private houses; wear no gowns, nor observe any other discipline than their own necessity or disposition leads them to.

The city of Upfal boafts the refidence of the celebrated Linnæus, who was the head of the university, and whose same in natural history is as great as that of Charles XII. for his victories. This great man, who was of a focial communicative difpolition, always received strangers with the greatest politeness, and was happy in folving any queftions in the line of his botanical profession, which they might propound. To him we are indebted for an account of the Swedish turnip, a root of inestimable value in this country. He says the farmers had it originally from Lapland. It spread by degrees through the northern parts of the kingdom, and was found of more use than all other winter plants put together. The great property of it is refifting the fharpest and most continual frosts known in the country. Befides this, cattle are remarkably fond of them, and will thrive on them better than on any other winter plant. One of the greatest advantages of the culture of this root, is its being as good a preparation for corn, as a fallow of mere ploughing, which is an object of infinite importance.

Engkoping is a place of confiderable trade, on the lake Maeler, about 25 miles from Stockholm to the

westward, and 24 from Upfal to the fouth.

The next fubdivision of Sweden Proper is Sudermania, which is separated from Upland, on the north, by the lake Maeler; bounded on the fouth, by East Gothland; on the west, by Nericia; and by the Baltic on the eaft. It is a populous country, extending 60 miles in length, and 45 in breadth; fruitful in corn, wines, and timber, of which laft many thips are built in this province. It is divided into Sudermania Proper, and the islaand of Foren, formed by the lake Maeler and Rekarne.

Nicoping, the capital of this province, flands on the fhore of the Baltic, 48 miles to the fouthward of Stockholm. It is a place of some trade, with a commodious harbour, and a caltle, in which the dukes of Sudermania

used to refide.

Strengthnifs is a small town on the fouth fide of the lake Maeler, the fee of a bifhop, fuffragan to the metropolitan of Upfal. Some Gothic infcriptions in the Runic characters evince the antiquity of the place. Charles IX. lies buried in the cathedral, which is an ancient gothic edifice. Opposite to the town an annual fair is held upon the ice.

Trofa, or Trefen, is fituated on the Baltic, about 40 miles from Stockholm, and has a very good harbour.

Telga, which is 20 miles diftant from Stockholm towards the fouth west, and Torisilia, which is 18 miles to the west of Strengthniss, contain nothing now worthy of observation; though Telga was formerly a place of some consequence, and is thus mentioned by Monficur Huct, the celebrated bishop of Arranches, in his poetical account of his journey to Stockholm.

> Once fam'd, by fubterranean fires Now wasted, Telga next aspires; Each stable here rein-deer contains, The denizens of northern plains; Two curling horns their lofty brow Defend, like stags their bodies shew: O'er ice and fnow, the lake and mead, They whirl the fledge with Eurus speed.

The province of Westmania, or Westmanland is a very barren country, stretching about 90 miles in length, from fouth-east to north-west, about 60 miles in breadth, from fouth to north. It had formerly fome confiderable filver mines, but now they are exhaufted.

Aroson is the capital of Westmania, and is fituated on the fide of the lake Maeler, between Koping and Engkoping, about 35 miles from Stockholm. It is a bishop's fee, and well defended by a strong castle, The hereditary convention was fettled here in the year 1544, by which the fuccession to the crown of Sweden was fettled in the family of Gustavus Vasa,
Arbogen, Koping, Nota, and Lindeszar, contains
nothing worthy of notice.

The province or diffrict of Nericia is bounded on the north by Westmania; on the east by Sudermania; on the fouth by East Gothland; on the west by part of West Gothland, and the northern extremity of the lake Veter, or Vetter. It contains feveral lakes and rivers, of which the river Trofa separates the country into two parts, from west to east. Silver mines were formerly worked in this province; but at prefent it produces only iron, fulphur, and allum. The chief places here are Arebro, Hillsmerberg, Askersund, and Glanshamme. But none of these are in any respect remarkable.

The province or diffrict of Gestricia is fituated between Delecarlia, or Dalekarlia, the Bothnian Gulph, and the rivers Tynea and Dala. It contains three towns, Cavalia, Borna, and Coperberget. The two latter are inconfiderable; but the former being at the mouth of the river Hafunda, which forms a gulph that ferves as a good harbour, carries on a confiderable trade.

The province of Helfingi is very extensive, being

bound on the north by Jemptia and Medolpadia; on the west and south west by Delecarlia; on the south by Gestricia; and on the east by the Bothnian Gulph, The country is mountainous and woody, and the inhabitants employ themselves principally in fishing and

Hudswickswald is the capital of this province, and is fituated near the Bothnian Gulph: it carries on a confiderable traffic in rolin, pitch, corn, timber, &c.

Sorderhamn has a good haven, formed by the mouth of the river Luifpa.

The other towns, Hien Swegh, Korbole, Lufdal, and

Alta, are of little importance.

The province of Delecarlia, or Dalekarlia, is bounded on the west and north by the mountains of Norway; on the east by Helfingia and Gestricia: and on the west by Westermania and Westermanland. It is 165 miles in length, and 100 in breadth. Its fubdivision is into what are called Three Vallies; yet, though it is fo extenfive, it contains only a few very inconfiderable vil-The mountains abound with iron and copper, and fome of the mines are incredibly deep. It hath been an observation often made, that the greatest number of the revolutions of Sweden have begun or originated in this province, on which account the inhahitants have been characterized as more courageous, bold, and ferocious, than any of the Swedes, as well as possessed of a more liberal spirit of independency. The principal villages are Idra, fituated on the river Elfi-nain, one of the fources of the Dala, which runs into the Silian lake; Lima, 36 miles more to the fouthward, and Hedernora, about 40 miles from Upfal, and fituated on the river Dala, near the confines of Wester-

The province of Medolpadia hath the Bothnian Gulph on the east, Angermania on the north, Jempterland on the north-west, and Helfingia on the fouth-west. It is woody, mountainous, and watered by three fmall rivers. The fea-coast here is about 40 miles long, and full of rocks, to the fouth of Sunfwald, the capital of this province, fituated at the mouth of the middle river, with a pretty good harbour. There are feveral other fea-port towns on this coaft.

Angermania,

Angermania, or Angermanland is bounded on the north by West Bothnia and Lapland; on the east by the Gulph of Bothnia; on the south by Medolpadia; and on the west by Jempterland. It is above 90 miles in length, and near as many in breadth. The river Angerman-Flodt runs through it; but it is a mountainous country, full of rocks and forests; so that there are very sew villages, and but one town of any note, which is Hernosand, on the Bothnic Gulph, where it has a pretty good harbour, which affords it some trade. It lies about 70 miles from Hudwickswald to the north.

Iniptia, Jemptia, or Jempterland, has Lapland on the north; Angermania on the eaft; Medolpadia, Helfingia, and Dalecarli on the fouth; and the high mountains of Norway on the west. It is watered by two pretty considerable rivers. Here are no cities, only

a few inconfiderable villages and hamlets.

West Bothnia, thus called, to distinguish it from Cajunia, which lies on the other side of the gulph, and is sometimes called East Bothnia, lies along the northern part of the gulph, thence called the Bothnia Gulph, which bounds it on the east. It has Angermania on the south, and is surrounded by Swedish Lapland on the west and north. That part of this province which lies along the coast, is pretty well peopled, and has many villages, but sew towns of any note. The country is well watered by several rivers, which arise from the lakes in Lapland. The chief towns here are Uma, Lula, and Torno. The latter has a good harbour, and is a place of some trade.

The fecond grand division of Sweden, called Gothland, comprizes East-Gothland, West-Gothland, and South-Gothland.

GOTHLAND.

Eaft-Gothland includes the country properly fo called, Smaland, and the ifland of Ocland.

East Gothland Proper is bounded on the north by Sudermania; on the east by the Baltic; on the west by the lake Vetter, or Veter; and on the south by Smaland. It is a fertile, open, flat country, producing corn, cattle, fowl venison, fish, &c.

corn, cattle, fowl, venison, fish, &c.

The chief town, called Norkoping, (which term implies the Northern Market,) is populous, large, and hath considerable commerce. The bishop of Avranches, in mentioning it says,

At Norkoping, where copper-plates
Are forg'd, the steeds our driver baits:
Large coins are here impres'd, and threads
Form'd of vast length from copper shreds:
To distant lands these precious wares,
In loaded ships, the merchant bears.

The place is likewife celebrated for a falmon fishery, which affords a maintenance to many people.

Suderkoping, a town of fome trade, flands on a branch of the fea, about 16 miles from the Baltic; is unfortified, but has been remarkable for fome cutious crystal stones which have been found in the neighbourhood.

Ten miles to the eaftward of Sudercoping flands Stegeburg. It is a finall town, but has a tolerable harbour, and fome commerce.

Western, or Vandan, situated on the eastern bank of the lake Vetter, 25 miles distance from Norkoping, is only remarkable for the ruins of an ancient royal palace.

The bifhop of Avranches, in speaking of East-Gothland in general terms, says,

Now wild East-Gothland's bounds we gain, Where beafts-skins clothe each livid swain: Frost-bit their faces, coarse their fare; Caps of warm freize the women wear, Well jolted with the rugged way, Each night in cottages we lay, Which upright trunks of trees compole; Grass on the turfy covering grows; Where sheep, as on a level mead, Undaunted, unmolested, seed.
The roof has peep-holes—So, 'tis faid, Thy temple, Terminus, is made.

Smaland is fituated between East-Gothland, the Baltic, Bleking, and Halland. It is 170 miles in length, and about 75 in breadth. It abounds in wood, cattle, copper, lead, iron, &c.

Calmer, the capital of this district, is a very confiderable city. It is fituated 160 miles to the fourthward of Stockholm and built ward of Stockholm and built was supported by the support of the suppor

ward of Stockholm, and built upon a strait of the ward of Stockholm, and built upon a trait of the Baltic, called Calmar Sund, which is fituated opposite to the isle of Ocland. It is divided into the Old and New Town. Old Calmer is famous by a deed executed there in the year 1393, by which the three northern crowns of Sweden, Norway, and Denmark, were settled on the head of queen Margaret. This is called in history, the union of Calmar. Erick, Margaret's successor, founded 13 prebends here, and Margaret's fucceflor, founded 13 prebends here, and gave a decree, by which he put the church of Calmar among the collegiate ones. After the division of the crowns, which the fatal union of Calmer had united, this city became a frontier town, with regard to the Danes, who were in possession of Schonen. It was often taken, re-taken, and plundered; and, to comofficer taken, re-taken, and plundered; and, to complete its ruin, was burnt down to the ground in the part 15-17; nothing escaping the fire but the church, and about threescore houses. Soon after this misfortune, the new city was built at a musquet shot's distance from the Old Town, in a little island called Owarnholm. This new city is large, the streets are broad and strait, and the houses well built; but the town is not populous. The new sortifications confish town is not populous. The new fortifications confift only of thick walls, built with large pebble flones taken out of the fea, and a few ramparts built only with fand, and therefore supported by another wall, which the fea furrounds almost on all fides, except the gate. The lituation of this city renders it very ftrong, all the avenues to it being full of marshes, or cut off by water from the sea, which abounds here with rocks, between which there are, as it were, so many abysses, that it is impossible to approach the place, either in boats, on horseback, or on foot. On the sea-side there is a long mole, built with stone, along which boats and ships ride secure. This mole is defended by a fortress, called Grimskar, built at about 50 paces from it, on a rock furrounded by the fea, and where a garrison is constantly kept. Behind the Old Town stands the castle, which is of very difficult access, having on one side the sea, which is full of rocks; and on the other good ramparts, large bassions, and ditches full This city is, at prefent, the relidence of a fuperintendant for the government of the clergy, who is honoured with a place in the public confitory of the kingdom. This is a town of good trade, and the paffage from Sweden into Germany.

Wexio, a bishops's see, where some of the first planters of Christianity lie buried, stand on the banks of the lake Salem, and is 45 miles distant from Calmar, towards the north-west.

Westerwick, Ekesio, and Jonkioping, are places of some trade, and worthy of note on that account only. A late ingenious traveller has favoured us with the following curious account of his journey from Helsinburg (the first town in the Swedish dominions, on the side of Denmark) to Jonkioping. It runs thus: "I crossed the celebrated passage of the Sound, though it blew very fresh. We were over in a little more than half an hour. At Helsinburg, where I entered the Swedish dominions, I had the pleasure of viewing the beautiful landscape reversed, which I had seen the preceding evening, from the island of Zealand. Which of the two is actually the most charming, I leave connoisseurs to determine. I drove 20 miles in the afternoon, and was then obliged, by the approach

of night, and the want of horses, to stop at a miserable little inn, or rather cabin, where I could procure nothing besides milk. I lay down five hours in my cloaths, and then got into the carriage at three o'clock in the morning. Had I underflood properly the manner of travelling in this country, which is to fend a peafant forward from every post-house, to procure horses in readiness, I should have doubtless made a confiderable progress on my way; but as I neglected this necessary step, I was obliged to wait at every stage an hour or two, while the hories were brought from the

neighbouring villages.

neighbouring villages.

"I was forced to fpend this night in a more defolate and dirty hovel than the first, where I wrapped myfelf in my great coat, and slept upon a table. In the morning, when I continued my journey, the whole aspect of nature was changed. The snow lay upon the ground two feet deep; and the winter seemed to have renewed its empire over these inhospitable plains, from whence the finiling month of May cannot banish him. In hopes of reaching Jonkioping at night, I fet out, however, in defiance of the inclemency of the weather, which, from having been very warm, was become, in a few hours, as cold and piercing as our Decembers. The drivers feemed totally unaffected by this fudden alteration, which did not produce any change in their dreis or cloathing; and the peafants, both men and women, were all barefooted as before. The fnow, however, confpiring with the want of horses, prevented me from reaching Jonkioping, and I staid all night at a house, which, for horror of fituation, I never remember, peafulled. It is more detected from reaching ber paralleled. It is quite detached from any village or hamlet, and the fpot on which it flands is a bare rock, destitute of any covering or earth, and furrounded on every fide by the deepest woods it is possible to conceive, and in which I had not feen one human creature for two leagues before my arrival. Yet, in this fituation, fatigue made me fleep very found, and my fervant by me, till three in the morning, when, with the return of the day, I entered my carriage, and left this most melancholy and wretched habitation. Had I been in Spain or Portugal, I own my fears would have kept me awake, and I should have recollected every dismal recital of murders and affaffinations, which nurses or novels had informed me of; but here those accidents rarely or never happen, and one may travel in perfect

fafety.

"I got to Jonkioping the next morning about ten o'clock, and gladly enjoyed a few hours of relaxation after fo many unpleating occurrences. It is difficult to give a picture of the country through which I paffed from Helfingburg, the colours of which you will not imagine are heightened by fancy or invention. The first twenty miles exhibited some few marks of cultivation and agriculture; and though there was not one collection of huts or houses, which could be denominated a viliage, yet scattered cottages, and a little ploughed land, amidst an immense waste, informed the passenger that it was not totally unoccupied or unpeopled. But as I advanced farther into the province of Scania, and afterwards into that of Smaland, even these faint traces of human residence vanished. Groves of fir or aspin covered the country; and in the course of 60 miles, I can affirm, I saw not 100 people, and not 10 hamlets. Villages there are not any. I have drove from one flage to another, of 12 or 14 English miles, without meeting or seeing a single person, though I cast my eyes impatiently round on every side, in hopes to discern the

countenance of man.

" In many places the firs, on either fide the road, form avanues as noble as those which are often planted at the entrance to palaces, or noblemens feats; and through the whole was forcad a kind of rude and gloomy magnificence, which, superadded to their filence and loncliness, very strongly affected the mind. Even the birds feem to have abandoned these dreary forests. I. heard or faw none, except woodpeckers, and now number of thips belonging to it, have for these twenty and then a cuckoo. I enquired if they did not afford years past, been much upon the increase. Indeed,

population; but the peafants affured me, the former were only in fmall numbers, and rarely feen: and as to bears, there are not any.

" The peafants are civil and humble to obsequiousnels, grateful for the third part of a halfpenny, and infinitely lets uncivilized and barbarous than one would be tempted to suppose from the appearance of every think around them. Had I not taken the precaution to carry wine and provisions with me, I must have been almost starved in my journey, through these miserable provinces, where the peafants are ftrangers to every kind of aliment, except bread, and falt pork or fish. It is, indeed, a question whether the former of these deferves the name of bread, as it is a compound of rye and oats; among which they mingle, in times of dearth and famine, a kind of flour made of the internal bark of trees rafped: it is of a colour approaching to black, and of a taste which you must be as hungry as I was

" My fervant, who is a German, and has wandered over half Europe in various fervices, was quite tired with four days of fuch miferable accommodation, and exclaimed in a rapture, at the fight of this place, that it was le paradis terrestre. It is, indeed, of itielf, a very neat country town, and most delightfully situated on the lake Vetter. I looked down from the top of the church on it; and the furrounding meadows, which were all cultivated after the deferts I had paffed, were peculiarly grateful to the eye. The lake itself, which is near 200 English miles in length, extends, far beyond the view, to the north, and rather refembles the fea, than a piece of inland water."

The ifle of Orland will be described in those islands which are contiguous to, and form a part of, the king-

dom of Sweden.

West-Gothland is a large province, having Smaland on the fouth-east, Halland on the fouth west, the river Gothelba on the north-west, by which it is parted from the government of Bahufe, and the province of Dalia; on the north it has the lake Wenner, and part of Vermeland; and on the east it has part of Nericia, and the lake Vetter, which divides it from East-Gothland Proper. It is watered by many lakes and rivers, and abounds with excellent pastures, where great quantities of cattle are bred, and the country is enriched by the fale of them.

The most considerable towns are the following:

Gottenburgh, or Gothburg, which flands on the Scha-ger-Rach, or Categate, on the fourthern branch of the river Cothelba, which there falls into the fca, and forms the harbour of this city, is 170 miles diffant from Calmer towards the west, and 225 from Stock-holm to the south-west. It is not an ancient town, being built in the year 1607, under the reign of king Charles IX. His fucceffors have granted it great privileges, by which it is become a confiderable mart. The Dutch drive a large trade here. In the war of 1644, the Danes exerted their utmost efforts to ruin this city, but to no purpole; and it has been so well fortified since, that it is now one of the strongest maritime towns in the kingdom.

Gottenburg, from its fituation, much exceeds any other fea-port in Sweden for trade; yet the commerce carried on here is not fo much as at Stockholm. Formerly Norkoping exceeded it; but the establishment of the Swedish East India company here has been of very great advantage to it, by bringing much other trade; to that now it is the second port in Sweden. have here large magazines and warehouses, with an exceeding good dock for building, repairing, and careening their fhips. There are also at Gottenburg feveral tolerable churches; and, among other buildings, the arienal and town-house are pretty considerable. The commerce of this place is very thriving; and the

of Great Britain, where the merchants of Gottenburg, as well as those of Copenhagen, had considerable magazines of Eaft India goods, was a terrible loss to the Swedish and Danish companies."

Skara, Skaren, or Skar, a bishop's see, about 12 miles distant from the lake Wenner to the south, and 84 from Gottenburg to the north-west, was the seat of the ancient kings of Sweden, and had a palace, one of the stateliest, not only in the north, but in all Europe, as may still be judged by its fituation, walls, and structure. It is now a defenceless town, though formerly the metropolis of West-Gothland. Near the lake Wenner, and the ancient palace just mentioned, frands the mountain called Kindakulle, which is very high, and produces all kinds of herbs and plants, except vines. Every thing grows there naturally; and this mountain, which may be deemed one of the most fruitful in the north, is also one of the most delightful, through the warbling of an infinite number of birds that meet here.

Linkoping, or Lidkoping, which implies the mart of Lida, flands on the lake Wenner, at the mouth of the river Lida, which there falls into the lake. It is 15 miles distant from Skara. Concerning this place

the bifhop of Avranches tays,

Wide branching pines, as on we past, A welcome shade around us cast: The night o'ertook us at a town Nam'd Linkoping, to fame well known, Where first their breath the Magni drew, Johannes and Olaus too.

The Magni above alluded to were the two celebrated brothers, viz. Johannes Magnus, archbishop of Upfal, the author of the Swedish history, and Olaus his brother, who fucceeded him in the archbishopric, and wrote a treatife on the manners, customs, and wars of the northern nations.

There are in this province two other cities, Talcoping, and Marieftadt, but neither is confiderable.

rmeland, or Wermeland, has Delecarlia on the north, Westermania and Nericia on the east, the lake Wenner on the fouth, and Norway, with part of Dalia, on the west. Its greatest extent, from east to weft, is about 97 miles; and from north to fouth, about 144. It has many lakes and marshes, is but indifferently cultivated, and thinly peopled. Here are fome mines of iron, and one of copper.

The chief towns are Carloftad, or Carlitad, built by

Charles IX. king of Sweden, Phillipftad, and Rufcoy.

Dalia, which the Swedes spell Daal, one of the simulated provinces in the kingdom, is, in extent, from north to fouth about 84 miles; and from east to west, not above 24. It is full of mountains, lakes, and rivers, which fall into the lake Wenner, and has pretty good paftures for cattle, which are of larger fize than ordinary; but otherwise the country is barren. Dale-

leburg is the chief place in this province. South Gothland has East and West-Gothland on the north, and is furrounded every where elfe by the fea. It is divided into three provinces, Halland, Schonen,

and Bleking.
Halland has the fea of Denmark, or Categate, on the fouth-west, Schonen on the fouth, and part of East-Gothland, and West-Gothland, on the north-east and north. Its extent, along the fea-coast, is about 75 miles; but its greatest breadth is not above 22 miles. This is a pleasant and fruitful country, which belonged formerly to Denmark, but was, in 1645, engaged to the Swedes, as a fecurity for a free passage of the Sound, and was afterwards yielded to them for every the Sound; and was afterwards yielded to them for ever by the treaty of Roschild.

The chief towns here are the following: Halmftad, the capital of this province, has a good harbour, and

trade feems to be getting much more amongst these six a place of trade. It was fortified by Christian IV. The uniting of the Isle of Man, however, to the crown of Bromsbro in 1645.

Laholm has a citadel, and good harbour. Falkenberg is a fea-port, defended by a caftle. Warberg is a fmall town with a ftrong caftle, and a large harbour.

Schonon is a peninfula, feparated from Zealand by the Sound, which washes its coast on the west. It is bounded on the north, partly by Halland, and partly by Smaland: on the east it has part of Bleking, and the Baltic sea, which waters it also on the south. It is about 80 miles from north to fouth, and about 60 from east to west. As it is the most fouthern, it is also the most fruitful province, abounding with corn, cattle, fowl, and all conveniences of life. It has also mines of filver, lead, and iron. This province belonged formerly to the Danes, but was yielded to the Swedes in 1660. The Danes again feized the greatest part of it in 1676 and 1677, but were obliged to restore it to the Swedes by the treaty concluded at Fontainbleau in France, September 16, 1679. This province is subject to be the theatre of war, whenever any breaks out between Sweden and Denmark, because of the proximity of these two kingdoms.

Notwithstanding the fruitfulness of this province, the bishop of Avranches speaks of it in the following

Spite of the wind's tempestuous roar. We cross'd the Sound to Schonen's shore, Our hoft there cook'd a ftrange repait, Delicious to a Gothland tafte. He kindly urg'd us first to eat, Sprinkled with faffron, salted meat: Then on board at once appear Raw mutton-stakes, dry'd currants, beer, Sweet-fcented herbs, rice pounded, wine, Cloves, and quick pepper, fifted fine. The table last full many a pound Of ginger, butter, fugar, crown'd; With mustard, honey, fennel, oil, And coriander. All the toil And skill of Hecaté could ne'er, In Stygian shades, such cates prepare; Nor worse the drugs, if same be true, Which unrelenting step-dames brew. Each dish untouch'd, we haste away, Refolv'd to travel night and day. Thro' fir-tree forests, large and brown, We pass to Gothlanders well known. Our thirst with proffer'd mead we flak'd; They then brought biscuits, which, well bak'd, With falt and cin'mon they prepare, And harden in the smoke and air: Your knife can no impression make; Then, in its flead, a hammer take.

Luden, the capital of this province, was formerly the fee of an archbishop; but in 1658, when the Swedes took the city, that dignity was removed to Copenhagen; and it is now only an epifcopal fee. was adorned with an univerfity, erected by Charles IX. in 1668, which has produced eminent men; and parti-cularly the celebrated Samuel Puffendorff: but this university has been suppressed.

Luden was formerly a very confiderable city, in which were 22 churches, whereof the cathedral of St. Lawrence is a magnificent structure, having a very high spire, which is a land-mark for sailors; and a clock of the most ingenious coutrivance, said to be the work of Casper Bartholinus. It not only shews the hour, day, month, and year, together with all the seftivals; but the movements, are so artificially contrived, that at the hour two horsemen come forth, and encounter each other, giving fo many blows as the hammer is to strike upon the bell: then a door opens, discovering the Virgin Mary fitting on a throne, with our Saviour in her

arms, and the wife men paying their homage to him, while two trumpeters found a note of triumph. In the neighbourhood of this city is the hill on which the kings of Sweden were formerly elected.

Melmoe, Landskroon, and Elfinburg, are places now

greatly on the decline.

The province or diffrict of Bleking is fituated be-tween Smaland, Schonen, and the Baltic, stretches above 80 miles in length, from east to west; and is about 50 from north to fouth, at the broadest part. The coasts are rocky, and the interior parts mountainous, woody, and barren. The principal towns are

Christianstadt, which has been several times taken and retaken in the course of the wars with Denmark.

Christianople, which was once the capital of this province, and had formerly a good harbour, which Charles XI. took a great deal of pains to ruin and render useless.

Ahuys, which is fituated on the Baltic, at the mouth of the river Hellea, has a fafe, capacious, and muchfrequented harbour. And Carlfcroon, which has an excellent harbour, and is well fortified.

FINLAND.

THIS grand division of Sweden is about 386 miles in length, from north to fouth, and 215 from east to west. It is bounded by the Bothnian Gulph, part of Russia, and part of Lapland. It abounds in grain, cattle, fish, &c. of which exports are made to other parts of the kingdom. It likewife furnishes other provinces with butter, cheefe, &c. The inhabitants, in general, are Lutherans; and they speak a very peculiar dialect, fo as to be scarcely intelligible to the Swedes of other provinces.

The Finlanders had kings of their own till about the middle of the 13th century, when they were fubdued by Erick, king of Sweden. However, part of the province of Savolaxia, all that of Kenholm, a portion of Carlia, and the fortress of Nyslot, were by the treaty of Abo, in 1743, ceded for ever to Russia.

Finland is divided into feven provinces, Finland Proper, Nylandia, Carelia, Kenholm, Savolaxia, Ta-

vaftia, and Cajunia.

The towns in general, of Finland Proper, are inconfiderable. At Abo, the capital, is an university, which was founded and endowed by the celebrated queen Christina; and the town is the see of a bishop. The houses are almost all of wood; and the episcopal palace is composed of no better materials, except that it is painted red. The town, however, derives fome trade from its harbour, in the neighbourhood of which is a rock furrounded by the water. It is fingular that, when any ship passes this rock, the needle no longer points towards the north; from whence a vulgar conjecture hath arisen, that the rock contains a load-stone mine.

The province of Nylandia contains the following

Helfingfors, the capital of this province, is a small town, fituated on a gulph of the same name, at the mouth of the river Winda. It has a pretty good harbour, and an immense fortress, lately built, which is garrifoned by 8000 men.

Burgo, Raseburg, and Ekenes, we pass over as un-

worthy of notice.

The province of Carelia is very fruitful, and extends, from east to west, about 150 miles. The principal town is Wyburg, a bishop's see, which has considerable trade, is well fortified, commanded by a castle, and greatly benefited by having a good harbour.

The province of Kenholm is extensive, but unfertile, as it contains many large lakes and barren mountains. It contains but one place of any note, viz. Russians, till about the beginning of the last century, when the Czar promifed Charles IX. king of Sweden, to furrender the town and province to him, if he would affift him against the Poles, by whom he was then closely beset; but, being freed from the danger, he refused to perform his promise; which caused the Swedes to invade his dominions, and oblige him to yield up by treaty, in the year 1616, not only this town and country, but also the most considerable place in Ingria. But the Russians have retaken all of them.

Savolaxia an inland province is a barren and defert country, covered with forests, and abounding with lakes, which afford its few inhabitants plenty of fish. There is not a place in the whole province that merits description.

Tavastia, or Tavastland, is a marshy country, neither much cultivated, or populous. There are, how-ever, iron mines, which afford a pretty confiderable profit.

Tavastus, the capital of the province, is strong by its fituation in a marshy ground, which renders it of very difficult accefs.

Martin Zeiller afferts, that Birger Jari, a Swedish general, fortified this city in 1250, in order to keep the inhabitants in awe, whom he had obliged to embrace the Christian religion.

There are feveral other towns in this province, but

they are all fmall, and of no importance.

The province of Cajunia abounds with rivers, which empty themselves into the Gulph of Bothnia. northern and eaftern parts are bound with mountains, but the rest of the country is fruitful.

Cajaneburg, the chief place of this province, from which it borrows its name, is defended by a good

citadel.

The other towns are Ula, Ulaburg, Carelby, Jacobstadt, Lochto, Wasa, and Christianstadt. Of these the only remark worthy of notice is, that Wasa is the native place of the celebrated Gustavus Vasa, wh se glorious reign is perpetuated in the annals of history.

. SWEDISH LAPLAND.

HAVING already given a minute description of Lapland in general, both with respect to the country and inhabitants, we have only to specify those parts of it, which being under the dominion of Sweden, are particularized by the appellation of Swedish Lapland. Pitha-Lapmark, Lula-Lapmark, Uma-Lapmark, Pitha-Lapmark, Lula-Lapmark, and Kima-Lapmark. As the towns of these provinces in general, contain not one article of real information or entertainment, we omit the infertion of their respective names, as tedious and uninteresting to the reader, conveying only mere founds.

The following islands, immediately appertaining to the crown of Sweden, are, therefore, here introduced in

their proper order, viz.

GOTHLAND.

OTHLAND, or Gothia Infola, is fituated in the GOTHLAND, or Gotha Inota, is in Earl Gothland, in Sweden, from which it is about two miles diffant to the Eaft. It lies between 57 and 58 deg. of north lat. and between 18 deg. 30 min, and 20 deg. of eaft long. Its greatest length, from the south-west to the north-east, is about 56 miles; but its breadth is not above 18 miles, from east to west. Olaus Magnus fays, it was called Gothland, that is to fay, Good Land, because it is fruitful, abounding with all the necessaries of life; and so well provided with the bleffings of nature, that it may be ranked among the best islands in the north. It is, fays he, in another place, a good land, in feveral respects: the inhabitants are a good fort of people; there are good harbours all round the coast; the soil is Kenholm, from which the province has its name. It is a final city, defended by a very strong citadel, and was formerly, with the whole province, subject to the good: it abounds in pastures, cattle, wild-fowl, fish,

The good water, woods, and beautiful marble. This island I Swedes got it in 1645; but it was retaken by the Danes in 1677, and restored to the Swedes by the treaty of Fontainbleau in 1679. There is here but one consi-

derable city, which is Wifby, or Wifburg, the chief place of this island, on the western coast of it. It is built on the declivity of a rock near the fea-shore, surrounded with a strong wall, and defended by a pretty ftrong caftle, erected near the harbour, where the governor of the island usually resides. Olearius relates, that the ruins of 14 churches, and of feveral houses, gates, and walls, of free-stone and marble, which he saw there in 1635, made him judge that this was formerly a confiderable city: but it is now very much decayed. It began to be important towards the end of the 8th century, fince which time it became so populous, that it contained 10,000 inhabitants, most of them merchants, without reckoning the Danes, Swedes, Vandals, Saxons, Ruffians, Jews, Greeks, Pruffians, Polanders, and Livonians, who traded there. These foreigners were so numerous, that they could make head against the inhabitants; and, in the year 1288, there arose a quarrel amongst them, and a battle was fought, in which great numbers were killed on both fides. However, the in-habitants gained the victory; and Magnus, king of Sweden, reconciled them with the foreigners.

The inhabitants of Wifby are faid to be the first who made hydrographical tables and fea-charts. They also pretend to the glory of being the first that made laws for regulating trade and navigation. But Monsieur La Martiniere, a French writer observes, that they have rather admitted, than invented them. He fays, that, being grown rich by navigation, they introduced among themselves the famous laws of Oleron, an island in France, in order to decide by them the disputes that might arise amongst merchants. They translated those laws into their own language, and made some additions to them; by which means they were not only looked upon as the authors of them, but acquired also the reputation of being the most famous traders in Europe. In 1597 the Hans Towns fent deputies to Lubeck, in order to draw up laws concerning navigation, which laws are still observed throughout the whole Baltic; but they, properly speaking, are the very laws of Wifby, with fome additions and improvements: and what shews that these laws are more modern than those of Oleron, is, that those of Lubeck are fuller than those of Wisby, as the latter are more compleat than those of Oleron.

OCLAND.

IS a narrow flip of land over-against the continent of South-Gothland, from which it is teparated by a strait, which is not above nine or ten miles broad, and is called Calmarfundt, or the Strait of Calmar. This island, the name of which fignifies the Land of Hay, is about 70 miles long, from fouth to north; but its greatest breadth is not above 12 miles. The foil affords good pafture, and many herds of oxen, horfes, and fallow-deer, feed upon it.

The western coast is not very populous, containing only two villages, named Alebeck and Smedeby, with the city of Borkolm, the capital of this island. under 56 deg. 57 min. north latitude, and 18 degrees, 80 min. east longitude. It is about 15 miles distant from Calmar towards the north-east, and is defended by a castle. The eastern coast, on the contrary, is very well peopled, and contains, going from north to fouth, the towns of Boda, Keningigard, Hogaby, Kilda, Stapeling, Genstala, Rematten, Mokleby, Stenasa, with the villages of Hulderstad and Ottenby. There are many forts and castles to desend this island, that have been often attacked. In 1530 it was taken by the Danes, soon after which the Swedes recovered No. 60.

it; but, being loft again, Guftavus Adolphus finally retook it in 1613, fince which time it has been conftantly poffeffed by the crown of Sweden.

DAGO.

IS of a triangular form, the fides being from 20 to 25 miles in length. On the western cape there is a high tower, which was built by the senate of Revel, as a light-house and land-mark. The northern and northeast parts are mountainous; and between here and the continent of Estonia, are some sand-banks, small islands, rocks, &c.

HAGLAND.

HAGLAND, in the gulph of Finland, is about nine miles in length. The whole is but a cluster of rocks, interspersed or covered with fir-trees, brambles, &c. and haunted by a few hares, that grow white in the winter.

ALAND.

A LAND is fituated in the Baltic, between 40 and 50 miles from the fouth-west part of Finland. The circumference is near 180 miles; and the inhabitants near 6000 in number. These live in small hamlets, as there is no regular town in the island; for indeed, the peafants have almost remonstrated against the founding any, which the Swedish government have been desirous of effecting. The unhappy king Erick XIV. was confined in a castle in this island, which goes under the name of Castleholm. An ingenious traveller mentions the following curious particulars concern-ing it: "I arrived (fays he) in half an hour, at the caftle, and alighted under the walls. It stands in a beautiful fituation, on the banks of a river, and commands an extensive view on every side. It was not till after a quarter of an hour's fearch, that the peafant who drove the carriage, and who had known the castle 40 years, could discover the passage which led to the chamber where the king had been imprisoned, and it was with ftill greater difficulty I could enter it when found. I crawled upon my hands and knees under an arch, the stones of which having fallen down in a course of years, had almost filled up the way; and after paffing this narrow entrance I had two ladders to mount, which did not appear capable of bearing too much preffure. I followed, however, where my guide led the way, and entered the apartment through a trapdoor. I must own that I was struck with compassion and horror, to think that a fovereign had been the tenant of fuch a dungeon, which is too miserable for the worst malesactor. It is composed of stone, and vaulted over head. I measured it by my paces: it was about 23 feet long, and 12 broad. The light is admitted by a narrow window through a wall five feet in thicknets. In one corner is a little fire place, and in the other a cupboard, hollowed in the wall. The flooring is of brick; and, as the pealant pretended to fhew me, is worn away in those places where the king was used to walk."

This island abounds in cattle, and some wild beafts, and is plentifully supplied with fish. It is surrounded by many fand-banks, rocks, and fmall islands; some of the latter being inhabited, and others uninhabited.

Of these little islands the most remarkable are Ekero, which is fix miles long, and separated from Aland only by a river of three miles over,) Flys, Landsweden, Rodan Nyan, and Lappo.

RUGEN.

RUGEN, which is fituated in the Baltic, opposite to Stralfund, is 23 miles in length, and 15 in breadth, a the title of a principality. It abounds with corn with the title of a principality. It abounds with corn and cattle; contains a town called Bergen, is ftrong by nature, and well fortified by art.

to the owner

The fame ingenious traveller, whom we have before quoted, in speaking of his departure from Finland, and concerning the adjacent iflands, fays, "It was my intention to have gone on to Finland by the post route, through feveral fmall islands or rocks, from one to another, for which there are constantly boats provided to convey travellers. Just as I was on the point of carrying this defign into execution, four or five of the country people came and proposed to convey me from thence strait to Abo. I did not hesitate long, but complied with the offer, and left Aland about midnight on Saturday. I flept, as I had done the preceding night, in my conveyance, and at feven in the morning, found myfelf in a narrow paffage, furrounded by high rocks, and the people employed in rowing. I made no question but we were already in the river of Abo; but was not a little chagrined to find, on enquiry, that the wind had fallen away, that we were hardly 30 miles from the place we had quitted, and that I must not flatter myself with landing in Finland that day. added, that the whole way was through fuch channels as I was then in; and feveral Islands, by which I failed, were inhabited; and that, if I pleafed, they would land me on one of them, where I might procure some refreshment. To this I gladly consented; and about nine o'clock I went on shore, on one callad Lappo. I walked to a little hamlet at a mile diffance from the shore. The poor peasants very chearfully brought me fome cream, and affifted in boiling my coffee. No-thing could exceed their poverty; a little black bread, fish, pork, and a fort of mixture they called beer, conftituting all their fustenance. After having made a very comfortable breakfast on this unknown and sequestered island, I returned again to the boat. During the whole day we purfued our voyage through a labyrinth of small rocks and isles; many of them covered with firs and aspins; some few green and beautiful, but far the greater number barren and rugged. I could have fancied myfelf among the Cyclades, fo famous in ancient flory; but here were no temples facred to Apollo or Juno, nor had genius and poetry conspired to render every cliff and promontory immortal. Many of the profpects were, however, wonderfully picturesque and romantic; and I frequently flopped the boatmen for a minute, to gaze upon the extraordinary feenes around me. Sometimes we went through channels of only 20 or 30 feet in breadth. Sometimes the water opened into a confiderable expanie, and often there appeared to be no avenue on any fide. I was aftonished how they so exactly knew their track in this intricate and perplexing maze, through which nothing befides long experience could have conducted them.

SECTION III.

Description of the Persons, Dress, Dispositions, Manner of Living, different Ranks, Employments, Diversions, Marriages, Funerals, Language, Religion, Learning, &c. of the Inhabitants of Sweden.

THE natives of this country are, in general, of good THE natives of this country are, in general feature and robust constitution, capable of enduring hardships. Their hair, like that of other northern nations, is inclined to yellow. The women are of just proportion, have good features, and those who are employed at home, are mostly fair, but the peafants compel their families to undergo an equal share in all laborious employments.

The cloathing of the Swedes is fuitable to the climate. The dress of the rich, in winter, is lined with furs; that of the poor with sheep skins, with the wool on. In fashion, the Swedes resemble the Germans, and other European nations. They wear, in summer, fuch stuffs as their circumstances enable them to procure; the great adorning themselves with lace and The common people are, in general, dull of apprehension, and little troubled with the spirit

of enquiry. However, it must be observed, to the credit of the country, that, by industry, experience, and travelling, fome of those of superior rank, arrive at fuch a mature and folid judgment as to make a confiderable figure in life, and to merit the title of great and able men. The nation has produced many excellent statesmen, and some learned men; among the latter of whom stand the celebrated Pussendors, historian, civilian, and philosopher; and, of our time, the famous boranist Linnæus, one of the best naturalists in Europe.

The inhabitants of Sweden compose the four following classes: the nobility and gentry; the clergy, the citizens and merchants; and the foldiers, feamen, and

The nobility and gentry chiefly apply themselves to a military life. They are naturally courageous and hospitable, fond of glory, and scrupluously observant of the functions of honour; but, at the same time, too generally proud, oftentatious, jealous, and vindic-Those who are employed in the administration of civil affairs, though they are laborious and inderatigable, feldom raife their speculations above what the neceffity of their employments require, their abilities proceeding not fo much from study, as experience in the track of bufiness. They preserve a graceful deportment, and make the best appearance they possibly can, in order to gain the respect of those beneath them. They never descend to any employment in the church, the practice of law or physic, or the exercise of any trade: nor will they ever accept the command of a merchant's ship, though, to gain experience in mantime affairs, they will fubmit to the lowest offices in foreign countries.

The young nobility of Sweden go very much into the French military fervice, both by lea and land; and, through a principle of policy in that nation, they receive rank before all others, because, by the laws of Sweden, when they return into their own country, they receive the fame rank in their own military fervice that they held abroad, whereby they are not only advanced much faster than they could possibly be, had they not been abroad, but become firm friends to the French interest, when any particular relative to it comes to be

debated before the diet.

The clergy of Sweden, who are very numerous, affect great gravity, are efteemed hospitable, and preferve a diftinguished authority over the lower order of

The citizens and merchants plod on in a beaten track, without ingenuity to discover, or spirit to purfue, new branches of commerce, notwithstanding all the care and encouragement bestowed by the legislature.

The common foldiers endure cold, hunger, long marches, and hard labour, to admiration; but they learn their duty very flowly, and are ferviceable more by their obedience to command, and flanding their ground, than by any great forwardness to attack the enemy, or activity in executing their orders.

The feamen are very bold and active, and well inftructed in their business. They have just fentiments of morality and honefty, and pay such attention to religious duties, that the captains of merchant thips have always prayers twice a day, whether the thips are

in harbour, or at fea.

The peafants, when fober, are obsequious and respectful; but, when intoxicated with strong liquors, furious and ungovernable. They live in great poverty, and rudely practite feveral mechanical arts, which necessity teaches them to exercise, such as making their own thoes, clothes, tools, and instruments of hul-They are very obliging, courteous, and remarkably hospitable to strangers

An English traveller, who lately made a tour through Sweden, as a proof of this disposition, remarks, that nothing can exceed the generous hospitality he found every where. He fays, it would even be refented, if a and refpect. fons travel in merous, it w afide, or at le With refpe fort have a pr but no taste i

a tour through remarks, that ality he found refented, if a stranger

ftranger visited a forge without paying his compliments to the owner who expects that mark of his attention and respect. This custom plainly shews how few per-fons travel in those parts of Europe: if they were numerous, it would, in all probability, be quickly laid afide, or at least restrained within narrow limits.

With refpect to their manner of living, the richer fort have a profusion of dishes at their entertainments, but no tafte in the arrangement or disposition of them. The table groans beneath a number of covers, which are all brought in at once, and then left to cool during a ceremonious meal of at least two hours. But the prologue to this scene is even worse. Before they sit down to dinner, the company take bread and butter, which they wash down with a glass of brandy; and this fathion prevails not only among perfons of condi-tion, but extends even to the ladies as well all the men.

The way of dividing the refidence of winter and fummer, as practifed in England, takes place here only in part. Many of the nobility and richest of the gentry, live entirely at Stockholm, scarcely ever seeing their estates. Others live entirely in the country, never feeing the capital, at least but very feldom. however, have houses at Stockholm for the winter feafon, but live in fummer on their estates, having very good houses, which they ornament with gardens and plantations.

As the nobility and gentry of Sweden are chiefly engaged in military employments, it is therefore little to be wondered at that they should be fond of martial entertainments, which are here frequently appointed by the king for their amusements, his majesty himself generally attending in person. Of one of these en-tertainments we present the following particular account, given by a gentleman, in a letter to his friend in

A fpectacle of a fingular kind detained me at Stockholm. The fcene lay in a large park, about an English mile without the gate of the city, where the camp has been pitched fome weeks, and which is finely adapted for a martial entertainment, from the nature of the ground, which is irregular and full of declivities. The rifing parts of it were covered with small woods of fir, and it is divided by a branch of the Maeler lake, over which is a floating bridge.

"The king of Sweden commanded about two regiments, mostly infantry. His younger brother, prince Frederick, had under him near 1000 troops, horse and foot. They were entirely ignorant of each others motions, his majefty only endeavouring to furround the inferior army, and the prince exerting his endeavours to effect a fecure retreat. The queen-dowager, with her daughter the princess of Sweden, were present in a little open chaife, which permitted them to follow the foldiers over the field, and be present every where. The king, dreffed in his uniform, was mounted on a creamcoloured horse, and appeared as much animated and interested in this essay of arms, as he could have been on a day of action. It was about five in the evening. I cannot pretend to purfue the two generals through the different manœuvres of their conduct, which paffed in two rapid a fuccession, and were of two intricate and uncertain a nature, to admit of a minute description. The refult, however, was favourable to the king. His brother having neglected to feize on a post which might have commanded a retreat in case of emergency, found his error too late; and when he would have availed himself of this passage, discovered that his rival's troops were already in poffession of it, having croffed the river in boats for that purpose. After having in vain endeavoured to force them from this post, he formed his infantry into a hollow fquare, and maintained a brisk fire on all fides for a confiderable time;

but finding himself environed by a much superior body

of forces, and no possibility of eccaping, he delivered up his fword to the king, and his foldiers remained pri-

ners of war. His cavalry had, however, feized on a

fmall, but most advantageous spot, and, unterrified by the fate of their companions, refused to furrender, and demanded permission to march off the ground with all military honours. Their fate was not yet decided when I quitted the place at eleven o'clock at night. It was a very elegant and gallant diversion, finely defigned to cultivate and practife the operations of a campaign, and keep alive the knowledge of war even amidit the most profound peace."

There is a theatre at Stockholm, on which, during a part of the year, are represented French comedies and ometimes concerts and orotorios; but the times of acting are very irregular; not meeting always with encouragement enough to keep it open even in the winter; to that it has been known to be thut up for

two years together.

The marriages of the Swedes are generally govern-ed by the will of the parents, and founded fo much upon interest, that the inclination of the parties is little regarded, nor the nation much troubled with the extravagancies of lovers. Stealing of matches is hardly heard of in an age; nor can the church give license to marry, without publication of the banns.

Persons of quality of both sexes, commonly remain unmarried till thirty, or above; because their fortunes, on both fides, being in their parents hands while they live, they are not in a condition to maintain a family, till the death of relations, or advancement to office, furnishes them with the means of subsisting.

The women, in general, are more distinguished for their chaftity before marriage, than for their fidelity after. They are very fruitful; and feldom fail of a numerous iffue. As before hinted, they are no where greater drudges than here; the meaner fort being, be-fides the ordinary offices of their fex, put to plow and thresh, to row in boats, and bear burdens.

Domestic quarrels happen feldom, and more rarely become public. Divorces fcarce ever happen. Coufin-germans may not marry without the the king's difpeniation, which is more frequently granted than re-

The Swedes generally, in nuptial ceremonies, have affected pomp and fuperfluity, beyond the proportion of their abilities; for, by the excess of one day, oftentimes many of them involve themselves in such inconveniencies, that they cannot remove them for feveral years.

The fame is observable in their funeral solemnities, which are usually accompanied with great jollity and feafting; and to gain time to make their preparations, they commonly transport their dead to vaults within, or adjoining to the churches, where they remain unburied some months. But of late these, and other unnecessary expences, have been much laid afide.

The Swedith language is formed of the ancient Gothic, or Tutonic, and bears a near affinity to that of Denmark. This language is a dialect of the Mæso-Gothic, spoken anciently by the inhabitants of Mæsian Tartary, from whence the northern parts of Europe are supposed to have been peopled. The only specimen of the language then spoken by the Scythian Goths in Mæsia, is preserved in a book at Upsal, being a translation of the four gospels, by Uphilas, bishop of the Goths, seated upon the Palus Mæotis. The purest dialect of this ancient tongue is now found among the Dalecarlians, or Highlanders of Sweden. and in the island of Iceland, in which places it appears to have a furprifing conformity to the English, both in language and pronunciation.

The religion of Luther was established in Sweden foon after it began to prevail in the Protestant parts of Germany. Gustavus Vasa was the prince who first introduced the tenets of that Theologist. He ascended the throne in the year 1523, and not only rendered the regal dignity hereditary in his own family, but established the reformed religion in Sweden, where it has ever fince continued to flourish. This is partly owing to the laws, which prohibit all noify fects; and partly

to the care, affiduity, and regular lives of the clergy, by which they acquire a furprifing influence over the minds of their audience. An attempt was once made to re-establish the Roman Catholic religion in Sweden, and the peace of the country was not a little diffurbed; but the scheme proved abortive; and now the government is fo much upon its guard against any future effort of the like kind, that no popish priest can enter the kingdom without running the rifque of

The Swedish church is governed by one archbishop and thirteen fuffragans, who confine themselves entirely to the occupation of their own function. They are, indeed, present at the assembly of the states; but are never called to council; nor do they ever intermeddle in the administration of state affairs. Their revenues are very moderate, that of the metropolitan not ex-ceeding 400l. fterling; and those of the bishops are proportionably smaller. Under these are seven or eight fuperintendants, vefted with the power, though not the name of bishops; and a provost, or rural dean, prefides over each 10 churches, to superintend the conduct of the inferior clergy; the number of whom, including chaplains and curates, may amount to 4000, the churches in Finland and Sweden being little less than half that number.

The metropolitan fee of Sweden is Upfal. The inferior dioceles are those of Linkoping, Skara, Strengnis, Westeros, Wegsio, Abo, Lund, Borgo, Gottenburg, Calmar, Carlitad, Hernofand, and Wisby. In the election of the archbishop, all the consistories, or chapters of the kingdom, give their votes; but the fuffragans are chosen in the following manner: three persons are presented by the chapter to the king, who confers the diocese on one of them, with the advice of the fenate. Simple benefices are bestowed in Sweden, as in England, by right of prefentation; which is fometimes vefted in the crown, and fometimes in the nobility.

The inferior clergy are generally of the lower class of people, fons of peafants or poor citizens; fo that they live the more contented with their small income, which arises from certain inconfiderable dues, glebelands, and one third of the tythes. The other two thirds are vested in the crown, to be employed in pious and charitable uses. Notwithstanding their poverty, the Swedish priests are extremely hospitable, and their houses are always open for the refreshment of strangers and travellers.

The Swedish churches are, in general, handsome and spacious buildings, and well ornamented. They are kept neat and clean, in good repair, and furnished with rich altar-cloths and veitments.

The church is governed according to a body of ecclefiaftical laws and canons, revised by a committee chosen from the different states that compose the diet, and approved by the king. By these canons it is, among other

things, ordained:

1. That if any Swedish subject changes his religion, he shall be banished the kingdom, and lose all right of inheritance for himself and his descendants.

2. That if any person continues excommunicated above a year, he shall be imprisoned a month, during which he shall be fed with bread and water only, and then banished.

3. If any person shall introduce into Sweden teachers of another religion, he shall be fined and banished.

4 Foreign ministers shall enjoy the free exercise of

their religion only for themselves and family.

4. Strangers shall not be allowed to exercise a different religion publicly; and their children shall be baptized by Lutheran ministers, and educated in their communion, otherwise they shall not enjoy the privileges of Swedish subjects.

By these laws the laity are obliged to pay a strict attendance to the duties of religion; and, indeed, the civil magistrate is empowered to punish with imprisonment, all those who absent themselves from divine ser-

vice without a proper excuse. But the clergy are not entrusted with the execution of their own laws; nor can they transact matters of any importance without the concurrence of the civil power. Many causes, formerly cognizable in the ecclefiaftical courts, are now tried in fecular tribunals. The clergy are not even permitted to pronounce the fentence of excommunication without the king's permiffion, because in that case, it would be confidered that the state had been deprived of a

Among the better fort of people, and the higher ranks, there is a confiderable degree of learning. A good education in Sweden fits a man to thine in any country in Europe. In their schools they learn Greek, Latin, French, Englith, and German; to that there are very few inftances of a young man's underflanding the dead languages, and not at the fame time being mafter of two or three very useful living ones.

They have feveral univerfities, which are provided with able professors. In these seminaries the savourite knowledge is natural hiftory and the mathematics; and therein they shew their good sense as much as any nation in Europe, for there are no other parts of knowledge that deferve fo much attention, the rest being for ornament alone; but these are useful in every branch of life. Many of their own mathematicians are in general efteem, as they are very rarely without feveral whose works are known to all Europe. In natural history they are unrivalled, but they do not owe their fame in this branch merely to Linnaus; for, before he was born, this fludy was the favourite one in their universities; and they have produced many men that gained them great reputation for their works; but they have fince been eclipfed by Linnæus, and his numerous

The Swedes are most deficient in the polite arts. You look amongst them in vain for a painter, a poet, a flatuary, or a mufician. If the Abbé du Bois's fystem is a just one, this is the fault alone of their climate; but without attributing it to physical causes, we may find a reason in the moral ones. The fine arts never make a great progress in any country till it becomes im-mensely rich, and very luxurious. The arts are the children of luxury. Without a great flow of expence running through every class of the people, we may pronounce that a nation is not rich enough for the fine arts to fettle among them. The artifts that excel must always be fure of tomething more than a competency; they must have affluence. They are generally men of they must have affluence. They are generally men of warm imaginations, and lovers of pleasure. They must include their inclinations, and not be crampt in poverty, while they are attempting to produce works that shall be the admiration of succeeding ages. Hence all the samous ages in which the arts have risen to a great degree of eminence, from many very famous men being cotemporaries, have univerfally been the richeft and most luxurious ages in the world: not that wealth

is alone fufficient without luxury. The Swedes have no poets: fome attempt that fort of composition, but it is always in Latin, and confequently of no merit. Their painters never rife higher than very bad portrait ones: the same fashion obtaining in Sweden as formerly in England, when we had nothing but portrait painters, because no others met with any encouragement. You hear very good music at Stockholm, but it is all by German muficians. This is not, therefore, a kingdom to which any person would refort to be entertained by the fine arts.

SECTION IV.

Commerce, Revenues, Armaments, Military and Naval Laws, Judicature, &c. of the Kingdom of Sweden.

WITH respect to commerce in general, there is no country in which inland navigations would be attended with better confequences than in Sweden; for all their products are very bulky, and must have

general, there is ivigations would than in Sweden; and muft have waterwater-carriage, or they cannot be got to market. Many of the rivers are navigable: but there are many tracks, covered with the finest woods, which yield searcely any profit, for want of water-carriage, at the same time that considerable rivers run through them, which might, at a very small expence, be made navigable only by removing local obstructions, and not by a general deepening or widening.

Few countries are better supplied with harbours, many of which are extremely spacious and safe; and the number is so considerable, that their trade will never stand still for want of them in any part of the kingdom.

The Swedish manufactures are not considerable. They have some linen fabricks, in which are wrought very good forts both of hemp and flax; but they are not near considerable enough to supply their home consumption. Of glass and paper they import very little. Hardware is a considerable article among them, not in the stile of our Birmingham manufactures, but principally in the foundery way. They cast great numbers of cannon, which they export to all Europe; also bells in great number, and many other articles. Indeed, they are unrivalled in their iron and copper mines, which are far more considerable then those of any other country in Europe; so that they apply copper to most of the purposes that we do lead in England, such as coverings to their churches, public buildings, great private edifices, &c.

Commerce flourishes more in Sweden than it did fome years ago. To what this is owing is matter of doubt; for their products are not greater in proportion to the increase of their shipping; and though several very judicious laws have been made for its encouragement, it cannot be supposed the effect would have been answerable to what appears, unless other reasons had conspired at the same time. However, the fact is, that their shipping is much increased. Their ships they build of a greater burthen, and they engage in more trading voyages than formerly. This is a point of very great importance for if they are able to export the principal part of their iron, timber, pitch, tar, hemp, and copper, in their own bottoms, it will add more than any thing else to the wealth of the kingdom; at the same time that their naval force will be increased greatly, which is the best and most useful force they can cherish. Increasing their shipping, is improving and accelerating the markets for all their products, and cannot but increase them in a very high The building and fitting out the ships is the most advantageous manufacture in the kingdom, and that which more, than any other, brings wealth into the country. The branches of commerce, which they have more particularly increased of late years, are the East-India trade, the trade to Portugal, Spain, and the Mediterranean.

The exports of Sweden are iron, wood, tar, pipeflaves, dried-cod, copper, brass-wire, pitch, herrings, and train-oil. The imports confist of grain, various kinds of provisions, coffee, flax, manufacturing materials, fugar, hemp, &cc.

It is fingular, that about one half of the bar iron which is made in this country, is exported either to Great Britain or Ireland.

The trade to Portugal and Spain, for falt, fruits, and wines, is in favour of the Swedes, as they barter for those commodities their iron, fish, and copper. But the trade to France is destructive, as it takes off but few of their commodities, except iron and a little brass wire, yet runs away with a great deal of their specie, and returns them hardly any thing but luxuries. The payments in this country are usually made in copper, that being the principal, but, at the same time, a very inconvenient medium of trade, as some of the copper coins are as large as a tile, and when a person receives a sum of this money, it must be carried home in a cart, wheelbarrow, or sack. But here are some gold ducats, value 9s. 3d. each; eight mark pieces of silver, valued at 5s. 2d. and sour-mark pieces of silver,

No. 61.

half the value of the latter. A dollar filver-mint, as it is termed, is worth about an English shilling; and three dollars copper-mint make one dollar filver-mint.

The established revenues of Sweden arise from a capitation tax, crown lands, excises, customs, certain tythes, filver mines, copper mines, law proceedings, and a few less considerable particulars.

A third part of the revenues are appropriated to the use of the royal family, and the rest to support the civil and military establishments. The revenues of the king of Sweden were anciently fo small, that they could hardly maintain him; as they arose only from some duties on merchandizes imported or exported, either by fea or land. It was confiderably increased by the discovery of the mines; but chiefly by the introduction of the reformation: for Gustavus I. having proposed to the nobility to fhare with him the church lands, which made up above one-third of the kingdom, feized the greatest part of them; and united, also, with the crown, the right of forseitures, which belonged to the bishops almost throughout all Sweden: and the resumption of lands, granted away from the crown by preceding kings, to the nobility and gentry, have raifed the king's revenues to a very high degree. This was done by king Charles XI. in the year 1680: and though it was much opposed by the assembly of the states, especially by the nobility, yet the lower order confenting, the nobility were forced to comply. Befides these branches, the king has a third part of all fines, when they do not exceed forty marks of filver; and, when they do, he takes it all. He has also all forfeitures upon the account of high treason; and the estates of strangers, if their heirs do not appear within a year after their death.

The Swedish forces consist chiefly of an established

national militia, the regulations of which were either formed or improved by Charles XI. and thence continued to be the basis of the present establishment. The nobility and gentry were obliged to furnish the cavalry; and a nobleman, after having furnished a man, could not put either him or his horse to any other employment. The infantry are raifed from among the farms, and the king's commission distributes them through the various provinces, in proportion to the number of farms, each of which, to the value of above 60l. per annum, not being occupied by the officers, or appropriated to their peculiar fervices, are charged with one foot foldier, who receives, from the farmer, lodging, diet, cloaths, and a trifling annual allowance of money: or otherwise a wooden house is built for him at the farmer's charge, who must also furnish him with as much hay as will keep a cow in winter, and pasturage in fummer, and plough and fow for him fuch a parcel of ground as will afford him bread. Those that are married (as many of them are) generally accept this latter condition. The unmarried foldiers usually abide with the farmer, but are not obliged to do him any fervice without wages. When they have once taken the peafants money, and are lifted into the king's fervice, they can never quit it as long as they are able to ferve; and, if they defert, they are punished with death. The first institution of this method was very burdensome to the peasants, who were at great charge to hire their men, who cost them 10l. and sometimes 20l. a piece; and the fame they must do whenever their soldier dies. This, in peaceable times, is not fo chargeable as in times of war, when men are unwilling to ferve, and recruits more frequently wanted.

As all the common foldiers are thus provided for at the country's charge, so all officers, both of horse and foot, are maintained by the king, who has appropriated for that purpose some of the lands re-united, or formerly belonging, to the crown: so that every officer has a convenient house, and a competent portion of land to live upon, fituated in that part of the country where the regiment he belongs to is quartered; as also the rent of as many other farms as make up his pay; which, though it be somewhat less than formerly, yet, being punctually paid, either in money, corn, or other

commodities.

commodities, they find it more profitable than when I they were to folicit for it at the treasury. A colonel of foot has, of these lands, the yearly rent of about 300l. and the rest proportionably, which amounts to about 2500l. a year for the officers, both upper and under, of one foot regiment, and there being in Sweden, Fin-land, and Livonia, 28 regiments of foot under this eftablishment, the maintenance of all the officers belonging to them cost the the king about 70,000l. a year. What charge the cloathing of the common foldiers, once in two or three years, their arms, and fuch other necessaries, may amount to, cannot so easily be computed. The officers of horse are provided for after the fame manner, with fuch large allowance as is requifite. There are 15 regiments of horse thus established, and the maintenance of their officers is computed to be about 80,000l. a year; all which arises from the rents of crown lands; as do also the wages of civil officers in the country, who have farms annexed to their employments, in the fame manner as the militia.

The laws enacted for maintaining this conflictution are very particular, and provide, with great caution, that neither the peafants shall be oppressed, nor the lands or houses ruined: to which end all such lands are yearly visited, and the possessor compelled to make such repairs as are sound needful; and as every officer, upon his first coming to such an estate, subscribes an inventory of it, so, upon advancement, he cannot take possessor of another charge till he has put that estate into as good a condition as he sound it; and in case of his death; his heir cannot inherit it till that is done.

In times of peace, all trespasses and crimes, com-mitted by the soldiers, fall ordinarily under the cognizance of a civil magistrate, who has the same authority over them as over the rest of the king's subjects, except when they are encamped or in garrison, or any ways under flying colours: in all which cases, as also in matters that relate folely to their profession, their officers have jurisdiction over them, without whose leave a private soldier is not permitted to lodge out of his quarters, nor be absent a day from the parish he belongs to. The inferior officers cannot be abfent from their charge but by their colonel's permiffion; nor captains, and those above them, without the king's leave. Above the ordinary establishment, the king annexed to each regiment 20 supernumerary farms, to answer any extraordinary accident of fire, &c. and to furnish a sublistence for such officers as are past fervice. For common foldiers, whom age and wounds have rendered unfit for war, there is one general hofpital, which has a good revenue; and befides that, every officer who is advanced, pays to it a furn of money proportionable to the degree he is raifed to; a colonel paying 100 crowns, and others in proportion.

The naval force of Sweden confifts of thips of the line, from the first to the fixth rate, carrying from 100 to 40 guns; of frigates, carrying from 36 to 20 guns; of brigantines, carrying from 8 to 6 guns; with several bomb ketches, armed gallies, 86c.

bomb-ketches, armed gallies, &c.

The feamen of Sweden, as well as those of Denmark, are of two classes, viz. one order, which is always actually ready either to man the fleet, or work in the dock-yards; and another order, which is but nominally ready, as the individuals are only registered, and must

appear, upon occasion, as recruits.

In Sweden there are five great officers of the crown, who prefide each in a tribunal composed of some senators; and when any of their places become vacant, the king gives it generally to the most ancient senator of the tribunal where the vacancy happens: though he may bestow it in whose savour he pleases. These officers are, I. The drotser, or chief justice, who is the first officer in the nation, and was formerly a kind of viceroy: he has the honour of putting the crown on the king's head at the coronation; and presides in the supreme court of justice, to which there is an appeal from all other courts. 2. The constable: he pre-

sides in the council of war; has the inspection of the discipline, and all that relates to war; and enjoys many great and honourable privileges. 3. The admiral, whose power is also very great; he has the command of the fleet, and appoints all the officers who serve by fea and gives them their commissions; and justice, in all that relates to the admiralty, is administered in his name. He has also many other privileges. 4. The chancellor: he is the chief of the police; rectifies abuses, and gives the necessary order for the good of the public. He is the keeper of the feals of the crown, dispatches all state affairs, and lays the king's orders and demands before the flates general. 5. The lord high treasurer: he has the administration of the treafury, and of all the king's revenue; and audits the accounts of all the feveral receivers; figns all orders for payments; manages the public funds, and pays all the officers of the kingdom. He also presides in the chamber of accompts, where the imposts on the people are affeffed, and where all officers belonging to the exchequer refort.

The laws of Sweden were anciently as various as the provinces were numerous, each of which had flatutes and customs peculiar to itself, enacted as occasion required, by the laghman, or governor of the province, who was chosen by the people, and invested with great authority, especially when the kingdom was elective, his fuffrage concluding the province he governed, This variety was necessarily attended with great confufion; for remedy whereof, near 200 years ago, a body of laws was compiled for the direction of the whole kingdom: yet this collection is but an imperfect piece; and the laws are fo few, and conceived in fuch general terms, that in most cases they need the affistance of the civil law; and, after all, the final determination depends much upon the inclination of the bench, which, in a poor couptry, where falaries are fmall, is often filled with fuch men as are of weak parts, and fubject to corruption upon very flight temptations. The effects of this would be more visible, if each superior court did not keep a check upon the lower, and the king's court of reversion over-awe them all, to which all civil causes, amounting to the sum of 70l. are appealable; and very few end before they have been brought thither. In this supreme court the king frequently fits in person, and determines causes himself. Here the prefident of the chancery, and two or three privy-counfellors, also fit; as does the chancellor of the court, (an officer next in degree to a privy-counfellor,) who is prefident of the under-reversion, where he, and two fecretaries, prepare the buliness in a proper manner to be brought before the king.

The courts of juffice, inferor to this, are of three degrees. Of the lowest degree, or first instance, there s one in each corporation, (befides Stockholm, where there are three,) as also in each diffrict or territory, whereof every province contains feveral, fome above twenty. In the former, namely in cities, an alderman or counfellor prelides, and has fome of his brethren for affiliants: in the latter the governor of the territory prefides, with a flanding jury under him; his court being ambulatory, and ufually kept near or upon the place where the fact or trefpafs was committed. In these courts examinations are taken, and matters not exceeding forty shillings determined. The rest are transmitted to the next superior court, of which, in every corporation, there is one, where the burgomafter is prefident, and the alderman affiliants: and fo in every province there is one or more of these courts, the prefident whereof retains the name of laghman, without any other authority than that of a judge. From these all causes of blood must be transmitted to the respective national courts, where they are determined without farther appeal; and thicher also all civil actions, not exceeding 201. may be appealed. Of these national courts there are three: one for the kingdom of Sweden, held at Stockholm; another for the kingdom of Goth third for the of these a p the affestors All these

Of these or the kingdom r for the kingdom dom of Gothia, or Gothland, kept at Jonkioping; and a third for the dukedom of Finland, at Abo. In each of these a privy counsellor is president, and above half

the affestors must be gentleaten.

All these courts fit-commonally, or, at most, have but fhort vacations; and not being peffered with too much formality, give causes a speedy dispatch, unless retarded by fome underhand engagements.

Actions relating to the fea are tried in the ordinary courts, according to the fea-laws, founded upon those ancient ones of Wisby, in the iffe of Gothland, which have formerly been as famous in the Baltic fea, as the laws of Rhodes and Oleron in other places. The court of admiralty has not any peculiar jurifdiction in the administration of these laws, but only in such matters as directly concern the king's sleet, and in some places

that belong immediately to the admiralty.

For ecclefialtical causes there is a consistory in each diocese, of which the respective bishop is president, where causes of bastardy, contracts of marriage, and other matters of that nature are tried, and church cenfures of penance, divorce, &c. inflicted. These courts have no power to administer an oath, or to inflict any corporal punishment. From them there lies an appeal to the respective national courts, and, in some

cases, to the king, as in all other matters. For matters relating to the mines, befides inferior courts and officers fettled in the respective parts of the country, a general court, called the college of the mines, fits at Stockholm, of which most commonly the prefident of the treasury is the chief, with a vice-pre-fident, and other affestors. The laws in this respect are more particular than in other matters; and, for

the most part, justice is very carefully administered. The power of executing all judicial fentences is lodged in the governors of the provinces, the fladt-holders of Stockholm, and other places; and from them derived to inferior officers, who are accountable to the national courts, whither they may be furnmoned, and punished, upon plain proof of default: but the proof being difficult, and ministers of justice apt to favour each other, they take great liberty to delay execution, or to arbitrate and put their own fense upon fentences; fo that this part of juffice is administered the worft of all others, and has an influence not only at home, but leffens the credit of the Swedish subjects abroad; against whom justice cannot be obtained with-

The ordinary charges of law-fuits are no where more moderate than in Sweden, the greatest burden arising from a late constitution, that all declarations, acts, and fentences, must be written upon sealed paper of different prices, from two-pence to feven shillings a fleet, according to the quality of the cause; the benefit of which accrues to the king, and is comput-ed to bring about three thousand pounds a year. Other charges are very few, every man being permitted, and, in criminal actions, compelled, to plead his own cause. Accordingly the practice of the law is below a gentleman, and rather the resource than the choice of meaner persons, who are very few in number, and for the most part very poor.

The custom of a jury of 12 men is so ancient in Sweden, that their writers pretend it had its original among them, and was thence derived to other nations: but at prefent it is diffused every where, except only in the lower courts in the country; and there the jurymen are for life, and have falaries. They have this peculiar to themselves, that among them there must be an unanimous confent to determine a cause, which, in their other courts, is done by a majority of voices.

Titles to effates are rendered more fecure, and lefs

fubject to contests, by the registers that are kept of all fales and alienations, as well as of other engagements of them; the purchaser running the hazard of having an after-bargain take place, if he omits the recording his transaction in the proper court.

In criminal matters, where the fact is not very evi-

dent, or where the judges are very favourable, the defendant is admitted to purge himfelf by oath; to which are added the oaths of fix or twelve other men, who are all vouchers of his innocence. Treason, murder, burning of houses, witchcraft, and the like heinous crimes, are punished with death; which is executed by hanging of men and beheading of women; to which burning alive or dead, quartering, and hanging in chains, is formetimes added, according to the nature of the crime. Criminals of rank are usually shot to death. The punishment for stealing is several years since, inflead of death, changed into a kind of perpetual flavery; the guilty party being condemned to work all his life for the king, in making fortifications or other drudgery and has always an iron collar about his neck, with a bow coming over his head, to which is fastened a bell, that rings as he goes along.

Duels (if the one party be killed) are punished with the furvivor's death, and a note of infamy upon the memory of both. If neither be killed, they are both condemned to a prison, with bread and water, for two years: to which is added a fine of a thousand crowns; or one year's imprisonment, and two thousand crowns. Reparation of honour, in case of affront, is referred to the respective national court, where recantation, and public begging of pardon, is usually inflicted.

Estates, as well acquired as inherited, descend to the children in equal portions; of which a fon has two, and a daughter one: nor is it in the power of the parents to alter this proportion without the intervention of a judicial fentence, in case of their children's difobedience; only they may bequeath a tenth of their acquired possessions to such child or other as they are disposed to favour. Where an estate descends incumbered with debts, the heir usually takes two or three months time, as the law allows, to fearch into the condition of the deceased's estate; and then either accepts the inheritance, or leaves it to the law, which, in that cafe, administers.

The diffinct orders of knighthood in Sweden, are the following. The order of the North, or Polar Star, inflituted by Frederick 1. in 1743. The order of the Sword, inflituted by Guffavus Vafa in 1525. It foon declined, and lay dormant till revived as a military order by Frederick I. in 1748. The order of the Sera-phim, or of Jesus, instituted by Magnus II. in 1344, set afide at the reformation, but revived by Frederick I. alfo, in 1748. The order of Vafa, infittuted by the reigning king in 1772.

· SECTION V.

HISTORY OF SWEDEN.

HE first material and, indeed, duly authenticated event, respecting the history of Sweden, was the introduction of the Christian religion, by Anfgarius, bishop of Bremen, who was fent thither for that important purpose, by the emperor Lewis the

From that period, for a fucceffion of years, the history is replete with civil diffentions, or war with their neighbours of Denmark and Norway; by the

latter of whom they were frequently subjected through their own domedic broils.

The first king of Sweden, who appears to have been guided by maxims of found policy, was Magnus Ladulus, who ascended the throne in 1276. This prince formed fuch measures as conduced to the support of his royal dignity, and the promotion of the real interests of his people. His grand objects were the augmentation of the revenues of the crown, and the diminution of the power of the nobles; by which means he reconciled his subjects, in general, to his govern-

ment, and aggrandized his kingdom.

His fueceffors were inactive and putillanimous; to that diforder and confusion prevailed in the flate for more than a century following. In the year 1387

Margaret, daughter of Waldemar, king of Denmark, and widow of Frogin, king of Norway, held the regal government of these kingdoms, and being a princels of an afpiring and enterprizing genius, found means, in 1396, of becoming at once queen of Denmark, Norway, and Sweden, having reduced the latter under her power.

A plan was concerted, and carried into execution, by queen Margaret, for uniting the three kingdoms under one fovereign. It was called the Union of Calmar, and was efficient for a confiderable feries of

A fehrme was adopted by Christian II. king of Denmark, who, by virtue of the union before mentioned, was also king of Sweden, to render himself abfolutely despetic. This barbarous design, which was no less than the massacre of all the principal nobility, was actually accomplished in the year 1520. The only person remaining in Sweden, who dared to oppose the arbitrary measures of Christian, was Guttavus Vafa, a young prince descended from the ancient kings of Sweden, but reduced so low, at this time, as to be obliged to work in the copper mines of Dalecarha for his subsidence, and to conceal himself from that tyrannical monarch. Representing the miserable state of their country to the miners, and the neighbouring pealants, he prevailed on them to join with him in an attempt to shake off the Danish yoke; to which end having affembled a numerous body of these brave ruftics, he boldly iffued out of those subterraneous territories, and furprizing the feveral posts the Danes possessed, drove them entirely out of the kingdom; for which service the Swedes elected him their king. As the popish clergy had appeared his greatest enemies he introduced the Lutheran doctrines, and feized the revenues of the church, most of which he appropriated to the service of the state, and was enabled thereby to ease the people of their taxes, which rendered him popular. He was crowned at Upsal in the year 1528; but his reign was frequently diffurbed by conspiracies and infurrections, incited by the clergy: and when these were quelled, the Danes invaded the kingdom, endeavouring to recover the dominion of Sweden. Gustavus, however, proved successful, both against foreign and domestic enemies; and marrying the princess Katherine, daughter of Manus, duke of Sax Lawenburg, his eldest son by this marriage, Erick Augustus, was declared his successor, and the crown made hereditary by the states, anno 1544. At the same time the Catholic religion was abolished, and the Lutheran established, for the maintaining whereof, future fovereigns were always fworn. After this Guftavus reigned in peace, except that the Ruffians made an incursion into Finland, and were repulsed.

Though the king and states had settled the succession upon Erick, his eldeft fon, he gave fome part of his territories, as an appendage to his younger fons, John, Magnus, and Charles, and died in the year 1559, when his eldeft ion was preparing to embark for England, in order to marry queen Elizabeth. Having fome apprehension that the government would be disturbed in his absence by his brothers, he declined the voyage.

Frick, who was but a weak prince, and actuated by an ill grounded jealoufy, treated his brothers with the most rigorous severity, insomuch that the people took up arms in behalf of those princes, made Erick a prisoner, and he died in prison, supposed to have been porioned. He was fucceded by his brother John, who, endeavouring to reftore the Roman Catholie religion, met with great opposition; but dying in the year 1592, he was fucceeded by his fon Sigifmund, who likewise attempted to reftore the Roman Catholic religion; in confequence of which, he, with his pof-terity, were excluded from the crown, which was conferred upon prince Charles in 1604. The reign of Charles was greatly interrupted by powerful opponents both in Sweden and Ruffia; which afforded the Danes an opportunity of invading his territories in Sweden, Their progress, however, was checked by the extraor-dinary efforts of the celebrated Gustavus Adolphus, his fon, though then a minor, who afterwards totally defeated the Danes, and restored the independence of Swerlen. Charles dying the next year (1611) was fucceeded by his fon Gustavus Adolphus, then 18 years of age; when, by the confent of the states, he took upon him the administration of the government.

Gustavus, foon after his accession to the throne of Sweden, found himself involved in a war with the Danes and Ruffians: but he furmounted all its attendant difficulties with skill and resolution. This prince atchieved astonishing feats of valour. He obtained feveral victories over the Ruffians. He invaded the Polish dominions in Livonia, took Riga, and made

himself master of the whole province.

In 1630 he advanced into Pomerania, drove the Germans out of Mecklenburg, defeated Tilly, the famous Austrian general, and purfued his rout through Franconia, where he made divers conquetts.

In the beginning of the year 1632 he marched into Swabia, in pursuit of count Tilly, who, in an attack from his army, was mortally wounded by a cannon

ball, and foon after expired.

He then took Munich, the capital of Bavaria, and laid that duchy under contribution. In the mean time the Imperialifts, having driven the Saxons out of Bohemia, and entered Saxony, the elector entreated the king to come to his affaffance. He left Bavaria, there-fore, and joined the Saxons. Soon after which a general battle was fought in the plains of Lutzen, near Leipfick; and the Swedes made themfelves mafters of the cannon of the Imperialifts; but their horse being stopped by a small river, Gustavus, to encourage his men to attempt the paffing it, advancing at the head of the cavalry, was foon after found dead on the other fide of the river, having been shot through the back, which was generally thought to have been done by fome pretended friend. But, notwithstanding the loss of their great leader, the Swedish generals behaved so well, that they obtained a complete victory; and the war continued many years afterwards, in which the Swedes were generally victorious, notwithstanding the Saxons, and some other German princes, changed fides, and adhered to the Austrians. But the affiftance the Swedes received from the French, was more than an equivalent for the defertion of the German princes,

Guftavus Aldolphus left only one daughter, the princess Christina, who was proclaimed queen of Sweden on the death of her father, being then but fix years of age; whereupon the diet of Sweden determined, that the regency should be committed to the great officers, who behaved with that conduct and fidelity, that the kingdom appeared in a flourishing condition during her minority, notwithstanding they were engaged in a war with fuch potent enemies; and, at length, concluded a peace upon honourable terms, anno 1648, usually called, "the treaty of Westphalia." Queen Christina, one of the greatest geniusses of the age, one of the most learned of her fex, courted by all the princes of Europe, and in the highest reputation for her equitable administration, having reigned till the year 1654, refigned the crown in fayour of her nephew Charles Gustavus (that is Charles X.) who profecured the war against the Poles with fuch fuccess, that he drove their king, John Casimir, into Silefia, and received from them an oath of allegiance, which they foon perfidiously broke.

He then marched with his army gainst the Danes, who had declared war, passed over the ice into Holflein, (the Baltic being frozen over at that time,) and compelled the Danes to enter into a treaty, and yield up to the Swedes the provinces of Schonen, Halland, and Bleking, with the island of Bornholm. This was called the peace of Roschild, at which place plenipotentiaries mer, anno 1658; and the Danes have ever fince been expelled from the continent of Sweden. This was place plenipones have ever it of Sweden. d Poles, alfo entered entered into a confederacy against Sweden, and obtained a victory over the Swedes at Nieuburg; and while king Charles was levying another army to oppose them, he was taken ill of a fever, and died on the 23d of February, 1660, leaving only one fon, named Charles, then about five years of age. During the minority of Charles XI, the administration of the government was committed to his mother the queendowager, and five great officers of the crown, who, finding it necessary to be at peace with their neighbours, concluded a treaty, in May 1660, with the Poles, at the abbey of Oliva, near Dantzick, whereby the Poles relinquished their claim to Livonia, and less the Swedes in the entire possession of that province: and in the fame month they concluded a peace with Denmark, on the fame conditions they had agreed on at Roschild; only the Swedes ceded to the Danes the island of Bornholm, and the city and territory of Dron-

theim in Norway.

The Swedes afterwards entered into a treaty with England and Holland, against France, called the Triple Alliance; but, on the commencement of the war, anno 1674, they entered into an alliance with France, against the house of Austria, and invaled Brandenburg; but their forces were defeated by the elector, who made himself mailer of most of their territories in Pomerania, while the duke of Zell reduced Bremen and Verden, and the Danes recovered feveral towns in Schonen. The Danes, however, being afterwards defeated in feveral battles, were compelled to make a separate peace with Sweden, at St. Germains, which was fucceeded by the treaty of Nineguen, anno 1678, whereby all the territories the Swedes had loft in this war were restored them; and king Charles married the princess Ulrica Eleonora, fifter to the king of Denmark. After these transactions, the young king, being at peace with all the neighbouring states, seems to have applied the power vefted in him to the op-preffion of his fubjects; whom he enflaved and impoverished to render himself despotic, and his army formidable; so that the government of Sweden was in every respect monarchical. His power, at length, became fo very confiderable, that conferences for a general peace were opened at Ryfwick in 1697, under his mediation.

Charles XI, the fame year paid the debt of nature, and was fueceeded by his fon, the celebrated Charles XII. whose archievements are well known in the annals of history. This enterprifing genius was declared major by the fenate, though he had not attained to the age of fixteen years, and, in November, 1697, faw the peace of Ryfwick concluded under his mediation, which had been begun by his father. Soon after his accession, he had to contend with the united powers of Denmark, Poland, and Ruffia. The first of these had encroached on the territories of the duke of Holstein, who had espoused his sister. He, however, boldly withstood them all, laid siege to Copenhagen, and compelled the Danes to conclude a peace with him at Travendal, by which the duke of Holftein was reestablished in his dominions. In the mean time the Czar Peter entered the province of Ingria, and had belieged Narva. The army of Charles did not exceed 20,000 men, whereas that of the Czar amounted to 80,000. Such, however, was the progress of the Swedish hero, that he advanced at the head of 8000, routed the main body of the Russians, and raised the

This victorious hero then advanced with his arms into Saxony, where he atchieved feats of valour almost unrivalled in the annals of history. He defeated the duke of Courland, a most accomplished general, and marched to Warfaw, which opened her gates to him, Augustus, king of Poland, and his friends, being fled towards Cracow. In a word, by the exertion of military talents, a fortitude hardly to be equalled, and a courage almost invincible, which appears from exploits, as hazardous in their nature as extraordinary in their fuc-No. 61

cefs, he reduced Augustus, king of Poland, to the neceffity of abandoning his kingdom twice; and, at length, shutting himself up in Dresden, the capital of his German dominions, gave an opportunity to Staniflaus to refort to Warfaw again, where he was folemnly crowned on the 4th of October, 1705.

In the mean time the Czar, having fent a great reinforcement of troops into Poland, to the affiftance of his friend and ally, king Augustus, and Schulemburg, the Saxon general, having raifed another army in Saxony, with which he joined the Ruffians, a battle was fought at Fravenstad, on the 12th of February, 1706, wherein the Saxons and Ruffians were again defeated by the Swedes. The Ruffians threw down their arms and begged for mercy; but the Swedish general, Renchild, ordered them all to be put to death in cold blood, to re-venge the barbarities the Czar had committed in Livonia; for the Czar, taking advantage of the king of Sweden's absence from that province, had reduced most part of it, taken the chief towns, maffacred great numbers of the inhabitants, and fent the rest in chains to the

remotest part of his dominions.

The king of Sweden, having driven both the Ruffians and Saxons out of Poland, bent his march towards the river Oder, in order to enter Saxony, which induced the diet of the empire to declare him their enemy, in case he passed the Oder. The king, however, continuing his march, and entering the frontiers of Saxony, the inhabitants immediately fled from their houses, till his Swedish majesty published a proclamation, to inform them, that all who returned to their houses, and paid the contributions he required, should be treated as his fubjects; but to the rest he should give no quarter; and the people thereupon returned to their houses. The army being encamped at Alranstad, near Leipfick, Charles fummoned the states of Saxony to meet him there, and bring with them an account of the revenues of the electorate, which he having perufed, imposed on them a tax, or contribution, of 625,000 rix-dollars (crowns) a month; befides which, he obliged them to supply every one of his foldiers with two pounds of meat, two pounds of bread, two pots of beer, and four-pence a day, with forage for their horses. He then ordered every house, in which any of his foldiers were quartered, to fend him certificates of the foldiers behaviour every month, without which the foldier was not to receive his pay. He affigned inspectors also to vilit every house, and enquire if his foldiers had committed any irregularities, and punish them as they deserved: and under fuch exact discipline were his foldiers, that when a town was taken by ftorm, the troops dared not feize upon the plunder without leave; and fo well fatisfied were the people with their fecurity, while the Swedish forces remained in Saxony, that the great annual fairs were held at Leipfick as ufual, without interruption.

King Augustus sending to the conqueror to beg a peace on his own terms, he immediately fent him the

following articles.

1. That Augustus should for ever renounce the crown of Poland, and acknowledge Stanislaus lawful king; and promise never to remount the throne, even after the death of Stanislaus.

2. That he renounce all other alliances, especially

that of Ruffia.

3. That he release the princes Sobieski, and all his other prifoners.

4. That he deliver up all deferters, particularly

John Patkul; and that all who have deferted his fervice, and been entertained in the Swedish service, shall

not be liable to any profecution.

During this treaty Menzikoff, general of the Ruffians, entered Poland at the head of 30,000 men, and joined Augustus, who had still a body of 6000 Saxons with him. They attacked the Swedish general, Maderfield, who commanded 10,000 men, near Califh, and obtained a compleat victory, for which Augustus fung Te Deum at Warfaw: but, in the midst of these rejoicings, Augustus received advice that his plenipo-8 F

from Turkey

had been adv

ing honourab

tentiaries in Saxony had agreed to the terms abovementioned, which he found himself obliged to ratify, or fee his German dominions ruined, as well as Poland. Augustus had several conferences afterwards with Charles, and endeavoured to procure better terms; but Charles was so incensed at the defeat of his forces under Maderfield, that he made them still worse. He obliged Augustus to send Stanislaus the following letter, viz.

" SIR and BROTHER,

" AS I ought to regard the directions of the king of Sweden, I cannot avoid congratulating your majetty upon your accession to the crown; though, per-haps, the advantageous treaty the king of Sweden has lately concluded for your majesty, might have excused me from this correspondence. However, I congratulate your majefty, befeeching God that your fubjects may be more faithful to you than they have been to me.

Leipfick, April 8, 1707.

Augustus, king.

Augustus was also obliged to order his Saxon subjects not to address him as a king for the future.

The character of Charles XII. has undergone forme ignominy for condemning Patkul, a gallant officer, to the fentence of the wheel. But it should be candidly confidered, that Patkul had not only been guilty of defertion to the Russians, but remarkably active in exciting feveral princes to rebel against their fovereign.

The dethroning of Augustus, the raising of Sta-nislaus to the throne of Poland, and a succession of feats aftonishing to all Europe, fo enhanced the fame of the enterprizing king of Sweden, that he was courted by ambaffadors from most of the powers; and, among others, by the duke of Marlborough, in the name of queen Anne, amidst the full career of a successful war

He feems, however, in fome inflances, to have indulged a stubborn and implacable disposition to a very censurable degree. He faulted in his grand defign of invading Ruffia, and loft the battle of Pultowa, where the Czar obtained a victory fo decifive, as oblig-

ed him to take refuge among the Turks at Bender.

It was near two years before the Porte could be perfuaded by Charles to enter into a war against the Rusfians, in which they met with great fuccess; for the Czar entering into Moldavia before he had erected magazines for the fervice of his army, one half of them perished by famine; and the hardships the rest underwent, being furrounded by the Turks on the banks of the river Pruth, compelled the Czar to beg a peace, restore Azoph, and all the places he was possessed of on the Black Sea, and exclude himself from navigating it, before he could obtain leave to retire.

Peace being concluded between the Porte and Ruffia, Charles was defired to leave the Turkish dominions, which that prince refuling to do, the Turks attacked him in his quarters, in order to force him out of their territories; and he defended himself with the few people he had about him, till he was made prisoner, and carried away to a village near Adrianople, where the Grand Seignior let him know that he expected he should quit his dominions again; but if he chose to reside where he was, he would allow him and his people a fublishence during their stay. The king having re-mained here about mother year, was conducted to the frontiers, from whence he rode through Hungary and Germany, incognito, attended only by one gentleman, and arrived at Stralfund, in Pomerania, the only town almost that held out for him in Germany. Here being foon after befieged by the Danes, and Pruffians he defended the town four months; and then finding it no longer tenable, failed over to Sweden. Such was the military ardour of this prince, that, on his return

to his own dominions, he renewed the war against the Danes; hoping to have made himself some amends for Bremen and Verden, which the Danes had wrested from him during his absence in Turky; but, to the great joy of his adverfaries, who still dreaded his power, he was killed before Frederickshall, a Danish city on the frontiers of Norway, on the 11th day of December, 1718, in the 36th year of his age.

The character of the celebrated Charles XII. king of Sweden, has been variously represented by writers, accordingly as mankind are actuated by their different principles and prejudices. The great traits of his character are strongly depicted by a French author of the first eminence, in the following terms.

"No dangers, however sudden or imminent, occa-

fioned in him the least difmay. He feems, in short, to have been a man diverted of the smallest particle of fear; and the manner in which he endured cold and hunger, thews him to be a prodigy of strength as well as courage. His rapid fuccesses against the combined forces of Denmark, Poland, and Russia, prove him to have been no ordinary man; but, although they aftonished all Europe, yet, in their confequences, they were fatal to the kingdom which he governed. A strong resentment against the unprovoked attacks made upon him, led him to meditate enterprizes against his enemies, extravagant and impracticable in their nature; and the cool and undiffnayed perfeverance of his great adverfary, the Czar Peter, at length prevailed over his ill directed ardour."

Upon the demise of Charles XII. his fifter, Ulrica Leonora, confort of the prince of Hesse, ascended the throne by the free election of the states, having previoully refigned all pretentions to arbitrary power. In 1720 the government was transferred to her husband,

prince Frederick.

In order to fet bounds to the royal prerogative, which had been too far extended, a capitulation was drawn up by an appointed committee, and figned by Frederick and the queen, before they entered upon the exercise of government. By the articles of this capitulation the royal power was greatly reduced; for the king of Sweden could fearcely be called by that name, being limited in every branch of government. The diet of the states might be said to rule; and their collective body had greater powers than the parliament of Great Britain, because the king's prerogative was more bounded.

The war still continued with Russia; and the Czar would probably have made a conquest of their country, if the Swedes had not prevailed on the English to fend a fleet into the Baltic. What the English received for this important fervice does not appear. However, their fleet could not prevent the Ruffian gallies from plundering the coasts of Sweden, which he on the Bothnic Gulph, and destroying several of their copper and iron-works; this gulph not being deep enough for large ships to enter. The alliance between Great Britain and Sweden, at length prevented the Russians making any farther conquests in that kingdom: and, by the treaty of peace between Sweden and Denmark, his Danish majety promited not to a list the Ruffians in that war: for both these kingdoms began now to be apprehensive of the growing power of the Czar, and perceived that it was their mutual interest not to contribute to make him ftill greater. The Danes also agreed to restore to Sweden all their territories they had possessed themselves of in the late war (except Bremen and Verden) in confideration of a fum of money; but the ships of Sweden were, by this treaty, obliged to pay toll to the Danes on passing the Sound, as well as the fhips of other nations.

By a treaty of peace concluded with Roffia, at New-flade, anno 1721, the Swedes ceded to Ruffia the provinces of Livonia, Ingria, part of Carelia, and the diftricts of Wiburg and Kenholm, in Finland; as also the islands of Dago, Oesel, and all the islands in the gulph of Finland.

In the year 1728 an ambaffador arrived in Sweden | under pretence of supporting the interest of the prince from Turkey, to lettle an account of the money that had been advanced to the late king Charles, which being honourably discharged, the Porte and Sweden entered into an alliance, which gave great umbrage to the courts of Petersburg and Vienna.

About the year 1738, through the machinations of the French, the people of Sweden were divided into two great political parishes, distinguished by the names of Hats and Caps. The former elpoused the interest of the court, the latter the country, or patriotic party. These parties not only broke the internal quiet of the kingdom, but led it into a ruinous war with Russia.

The queen of Sweden dying without iffue, anno 1741, the diet took into their confideration the nominating a fuccessor, for which honour there appeared four candidates. The first was the young duke of Holftein-Gottorp, supported by many of the nobility, and by a strong party among the burgeffes, as well as by the whole order of peafants; the second prince Frederick of Hesse-Cassel, nephew to the king, for whom all the clergy declared; the third the prince of Denmark, who had a very confiderable party; and the fourth, the duke of Deuxponts, who was also of the royal family of Sweden, and had but a small party. After very warm debates, the duke of Holftein was declared fucceffor, in the month of October, 1742, by a majority of two votes only; and deputies were named, to offer him, on certain conditions, the reversion of the crown, in hopes he might induce the Czarina to reftore the grand duchy of Financia. But Greek rearrived at Petersburg, he had embraced the Greek religion, with a view to the succession of Russia, to restore the grand duchy of Finland. But before they was followed by confequences that were equally unavoidable and unexpected: for the peafants, that had expressed such unanimous affection for the house of Holstein, began with the same zeal and unanimity to efpouse the interest of the prince of Denmark, to whom the clergy were attached. They likewise insisted on calling to a severe account, the generals that had commanded the forces in the two last campaigns; and those very persons that had shewn the greatest warmth in promoting the war with Russia, were equally warm in demanding the punishment of all such as were the managers of that war, to whom they imputed its want of fuccess. Yet, in the midst of these domestic disputes, a peace appeared as precarious as ever; and the diet feemed equally unable to bear the thoughts of lofing Finland entirely, or falling upon any expedient for recovering it, except receiving it as an equivalent from the hands of the Czarina. His Britannic majetty having offered his mediation, the conferences were continued at Abo. These, at last, ended in a treaty, by which Russia consented to restore all that had been taken in this war from Sweden, except a small district in Finland; and to renew the peace between the two nations, in case the states of Sweden should elect prince Adolphus Frederick, administrator of Holstein, and bishop of Lubeck, successor to the crown; and, in this case, the young duke of Holstein, whom they had already elected, and who was now become hereditary prince of Ruffia, offered to make a folemn refignation of all his claim and right to the Swedish diadem.

When this treaty came to be confidered in the diet of Stockholm, there arose very high debates; but at last the consideration of those immediate advantages, which were to arife from the election of the bishop of Lubeck, and the prospect of continual disputes, in case they elected any other successor, brought over all the orders of the states to this proposition; and duke A-dolphus was accordingly chosen hereditary prince and

fucceflor of Sweden, on the 23d of June, 1743.

But while the diet was thus providing for their prefent peace and furure fafety, the Dalecarlians took up arms, and marched directly to the city of Stockholm,

of Denmark, in which they perfifted, notwithstanding the king took all posible methods to reduce them by fair means to their duty. At last the malecontents attempted to overturn all to which the king and the states of Sweden had consented. This obliged his majesty, much against his will, to employ force even in his capital city, where, after a sharp engagement, in which one of the senators, at the head of the king's troops, was mortally wounded, the rebels were totally defeated, obliged to lay down their arms, and fubmit to the king's merey, which was extended to them in the most ample degree. But this extraordinary instance of royal elemency did not sosten the refentment of the peafants against two unfortunate no-blemen, Count Lewenhaup, and Baron Buddenbrook, who, to satisfy them, had been condemned for want of success in the two last campaigns, and whose execution was demanded with fuch heat, that the king could not refuse it. Lieutenant-general Baron Buddenbrook fuffered first, on the 16th of July in the same year; but field marshal Lewenhaup made his escape, yet was foon after retaken; and, notwithstanding the nobility and clergy were inclined to spare his life, the peasants remained still instexible; and to fatisfy them, he was, according to his fentence, beheaded. The king retired to his country palace till these melancholy scenes were over; and the pealants, gratified in their revenge, confented to the election, which being fignified to duke Adolphus, he went foon after to Stockholm, where he was received with univerfal acclamations. The late king of Denmark, having many motives to diflike this fud den and extraordinary elevation of the house of Holftein, and, besides, not a little mortified on the score of his son's being set aside to make way for the bishop of Lubeck, began to make fuch vast military preparaof Lubeck, began to make fuch valt military prepara-tions as feemed to befpeak a defign of invading Swe-den, which, for fome months, not only amufed the north, but all Europe: yet the Czarina found means to lay this florm, by declaring roundly to the courts of Stockholm and Copenhagen, that the would maintain the election she had promoted with the whole force of her empire. To establish the peace of the kingdom more effectually, it was thought highly requifire that the new prince successfor should marry, and according-ly he espoused the princess Louisa Ulrica, filler to

the king of Pruffia.

Adolphus fucceeded to the crown of Sweden on the

death of the late king Frederick, anno 1751. He was a prince of a mild and gentle temper, and harraffed by contending factions. The intrigues of the fenators forced Adolphus to take part in the war The intrigues of against Prussa; but as that was was disagreeable, not only to the people, but also to the king of Sweden, the nation never made so mean an appearance; and, upon Ruffia's making a peace with Pruffia, the Swedes conciliated matters as well as they could. After a reign of tumult, commotion, and trouble, this monarch died of chagrin, in the year 1771, and was fucceeded by his fon, Guttavus, who was born in 1746, and married to the princess royal of Denmark in 1766. In the commencement of the reign of Gullavus a very remarkable revolution happened in Sweden, of which a late learned and ingenious traveller gives the following elegant account.

Adolphus, the late fovereign, was a weak men. and under him the democratical authority attained its utmost heighth. The royal revenue was very inadequate to his dignity, and his weight in the scale of go-

vernment inconfiderable and despised.

" In this fituation Guftavus III. fucceeded to the crown. He poffeffed the fame advantage over his two immediate predecessors, which his present majesty, George III. of England did over his, on his accesfion; that is, he was born in the country over which he reigned, and spoke the language perfectly. The Swedes, who, since the year 1720, had seen only so-reigners on the throne, were charmed to have, once more, a king from among themselves, infomuch, that | feveral filver medals were ftruck to commemorate this happy æra; on the reverse of which is this inscription, Fadern's land et; It is my native land.

"If one may credit the accounts given of the late procedures of government, while velted in the fenate, it was high time to redrefs the injuries they did the state, which suffered greater evils from the irresolutions, the delays, and the divisions of a large affembly, than it could even undergo from an absolute monarch. Time had matured these seeds of distaissaction, and a young prince, beloved by his subjects, was ready to take ad-

vantage of them.

" On the 19th of August, 1772, this extraordinary event was produced, which again restored to the crown those prerogatives which she had lost for more than half a century. The king's fecrecy, address, and oratory, in fo dangerous and critical a juncture, far furpaffed what might have been expected from his age. It is faid only five persons in the kingdom were intrusted with the defign, which was carried into execution |

with as much vigour, as it had been planned with fagacity and judgment. The foldiery and people were fuccessively gained by the eloquence with which the young king addressed them, who plainly evinced the vast importance of this quality in popular commotions and public affairs. Very few persons were imprisoned, and that only for a short time; nor have any of them experienced, in the fmallest degree, any diminution of the royal favour, on account of their opposition. The fenate took a new oath of allegiance to the prince, and tranquility was restored throughout the kingdom.

Hence we may perceive the great force of elocution, and the power which an orator has over the human

mind.

Where'er he speaks, heav'n, how the lift'ning throng Dwell on the melting music of his tongue! His arg'ments are th' emblems of his mien; Mild, but not faint; and forcing, tho' ferene: And when the pow'r of eloquence he'd try, Here light'nings strike you, there fost breezes figh.

R U S S I A.

SECTION

Extent, Situation, Boundaries, Origin of Names, Mountains, Rivers, Lakes, Climate, Soil; Productions, Vegetable, Animal, Mineral. &c.

THE Rufflan empire is admitted, by geographers in general, to be of greater extent than all the rest of Europe, or than the Roman empire in the zenith of its power.

The immense dominions now under consideration, are fituated beteen 47 and 72 degrees of north lati-fude, and between 23 and 65 degrees of east longitude, being about 1500 miles in length, and about 1100 in breadth.

Ruffia is bounded on the north by the Frozen Ocean, on the east by the empire of China; on the fouth by Perfia, the Caspian and Black Seas, and Turkey; and

on the west by Sweden.

This empire is known by the appellations of Russia and Muscovy; the former of which is most probably derived from the ancient inhabitants, the Russi, or Borussi; and the latter from the river Mosco, upon which Moscow, the ancient metropolis, was built. It is, at present, distinguished by the name of Great Ruffia.

This yast country is, in general, flat and level, except towards the north, where lie the Zinnopoias mountains, supposed to be the Montes Ripbei of the ancients, now called the Girdle of the Earth.

The most considerable rivers of Russia are the Wolga, or Volga, which traverses the far greater part of Russia, and, after a long winding course of upwards of 2000 English miles, falls into the Caspian Sea. In its course, which is mostly from east to west, it receives near 40 rivers (among which are the Occa and Kama,) some of them very large, waters the walls of near double that number of towns, fertilizes all the lands on could fide, and supplies them with prodigious quanticals. each fide, and supplies them with prodigious quanti-ties of fish, particularly sturgeon, salmon, pike, &c. of a large fize and exquisite taste. There grows like-wise along its banks the finest trussles, and a kind of the finell oaks that Muscovy produces, are to be found along its bank. The misfortune is, that a great track of that fruitful land along this noble river, is to exposed to the incursions of the Cuban Tartars, that it

lies altogether uncultivated, and almost unpeopled. To remedy this, the Czar Peter I. caused an intrenchment to be made from that river, a little on this side the city of Zaritza, quite to the river Don, near the city of Twia, by which means he hath secured all that part of the country which lies within the trench; but the rest, reaching above 80 leagues in length and breadth, is fill exposed to those free-booters, and lies neglected. The Volga, towards the latter end of its course, takes a winding towards the south, and falls into the Caspian Sea, about 36 miles below Astracan, in lat. 45 deg. 40 min. long. 50 deg. 30 min. eaft.

> Thus in meanders to the distant main, The liquid ferpent draws his filver train.

The Don, or Tanais of the ancients, is the next confiderable river in this country, and divides it, in its most eastern parts, from Asia. It hath its spring in the province of Rezan, on the north-east of the lake Jwanow-Ofero; and, in its course towards the east, comes so near the Volga, that the late Czar had undertaken to have cut a communication between them by means of a canal. But this defign, grand and useful as it would have proved, was defeated by the irruptions of the Tartars. This river, exclusive of its turnings and windings, discharges itself into the Palus Maoris, at the samed fortress of Assoc, or Azoph. The whole length of its course is very considerable.

The Dwina, or Dowina, hath no fpring-head of its own, but is formed from those called Succana, and Juga, or Jugh. Its name fignifies double, as it is composed of those two rivers; and its course bends northward, in which it receives the Vitlogda, and several other rivers; and, having paffed through Archangel, empties itself at two mouths, parted by a small

island, into the White Sea.

The Dnieper, or ancient Boristhenes, which is one of the largest rivers in Europe, after running a prodigious course, falls into the Euxine, or Black Sea. It

has thirteen cataracts within a finall diftance.

The lakes of this country are numerous; but the

This lake produces great quantities and variety of fish; such as salanon, sturgeon, and a peculiar kind of fish, called ladog, of the size of a herring, but of a finer taste; from which the lake is supposed to have had its name.

That of Onega lies about 50 miles eastward of the lake of Ladoga. It is about 40 leagues in length, and 18 in breach: though it has fresh water, seals are often

The lake of Peipus, in Livonia, is nearly 24 leagues in length, and upwards of 12 in breadth. It abounds with fifth, and runs into the gulph of Finland.

From the amazing extent of this vaft country, it may naturally be concluded, that there is a proportionable divertity of climate and foil. In the fourhern parts, the longest day does not exceed sisteen hours and an half; whereas, in the most northern, the sun is seen in summer two months above the horizon. This being the case, the extremes, both of climate and soil, must

be feen and felt in this extensive empire. To enable the reader to form an idea of the rigour of the cold feafon, we cite the following relation of a late ingenious and learned writer, who refided in this country feveral years. " It is almost difficult for an inhabitant of our temperate climate (meaning that of England) to have any idea of a cold fo great. It may, perhaps, help to give forme notion of it to relate, that when a person walks out in that severe weather, the cold makes the eyes water, and that water freezing, hangs in little icicles on the eye-lashes. As the common peafants usually wear their beards, you may see them hanging at the chin like a solid lump of ice; yet, by the way, the advantage of the beard, even in that state, to protect the glands of the throat, is worth observation, for the soldiers who do not wear their beards, are obliged to tie a handkerchief under their chin to supply their place. From this account it may be easily imagined, that the parts of the face which are exposed are very liable to be frozen; and it may feem strange, though a certain fact, that the party himself does not know when the freezing begins, but is commonly told of it first by somebody who meets him, and calls out to him to rub his face with fnow, the usual way to thaw it. It is also remarkable, that the part which has once been frozen, is ever after most liable to be frozen again,

"In some severe winters I have seen sparrows, tho' a hardy bird, quite numbed by the intense cold, and unable to sty: and I have heard that the drivers, who sit on their loaded carriages, have sometimes been sound frozen to death in that posture. The seasons, however, are seldom so severe, and that severity lasts but a sew days: though it is not unfrequent, in the course of a winter, that some poor wretches, getting drunk with spirituous liquors, fall down by the road side, and perish

by the cold before any one finds them.

"When the thermometer has ftood at 25 deg. below o, boiling water, thrown up into the air by an engine, so as to spread, sails down perfectly dry, formed into ice. I have made an experiment nearly like this, by throwing the water out of a window, two pair of stairs high. A pint bottle of common water I have found frozen into a solid piece of ice in an hour and a quarter. During the operation, I have observed the spicula stying towards the exterior part of the water, sull an inch, or an inch and a half long, where they form the chrystallization. The great length of these spicula is remarkable, and seems to be caused by the intensenses of the cold. A bottle of strong ale has been strozen in an hour and a half; but in this substance there is always about a tea-cup sull in the middle unstrozen, which is as strong and inflammable as brandy, or spirits of wine. I never saw good brandy or rum freeze to solid ice, though I have seen ice very thin in both, when put into a small star phial. The phials I made use of

for the experiment, were the common bottles, in which there had been lavender water.

"It may not be foreign to these instances to mention an experiment made by prince Orloss, master of the ordnance to her Imperial Majesty, which I had from him, though I was not a witness of it myself. He silled a bomb-shell with water, and then stopped the hole very closely with a plug; and as soon as the congelation began, the contents of the shell swelling, issued out by the side of the plug like a small fountain. He then made a screw to fasten up the hole of the bomb-shell after it was filled with water, and in 20 minutes the frost burst the shell with some degree of violence, so that some of the pieces slew to the distance of sour or sive yards.

"Tho' the cold is thus intenfe for fo great a part of the year, the small summer is very hot; and indeed, about six weeks of it is usually intolerable."

The writer last quoted observes, that, to balance the long absence of the sun in the winter season, they enjoy here a large share of his influence in the summer, which causes vegetation to be exceedingly quick; otherwise the shortness of the season would not suffice for the necessary business of sowing the land, for the growth of the corn, and for gathering it in.

growth of the corn, and for gathering it in.

Some persons deem the light nights in summer an agreeable circumstance, and these are very remarkable even in the latitude of Petersburg, which is in 62 degrees. This arises not only from the sum's being so short a time under the horizon, but from the strong restection of the atmosphere, which causes so great a brightness, one may see to read and write at midnight, unless it be cloudy, for full two months.

The foil of Ruffia is rather more various than the climate. The fouthern provinces produce wheat, barley, rye, oats, peas, and herbs, with various kinds of fruit; and all these with a vegetation so uncommonly expeditious, that corn is commonly reaped in two months after it begins to appear above the surface of the ground. This is attributed to the snow, which not only enriches and mellows the land, but cherishes and shelters the product of it, and makes it take deeper root.

—When high Jove his sharp artill'ry forms, And opes his cloudy magazine of storms, In winter's bleak uncomfortable reign, A snowy inundation hides the plain: He stills the winds, and bids the skies to sleep, Then pours the silent tempest thick and deep; And, first, the mountain tops are cover'do'er, Then the green fields, and then the sandy shore; Bent with the weight the nodding woods are seen, And one bright waste hides all the works of men: The circling seas alone, absorbing all, Drink the dissolving steeces as they fall.

The fowing time, in many parts, must follow the harvest immediately; because the summer not lasting above three months, there can be no sowing after the frost is begun. But in more moderate climes they do not sow till April or May, and then their reaping time comes in August and sometimes in July. As for manure, they have no need of any, the snow supplying that in every respect. Besides grain and fruits of various forts the country produces plenty of rhubarb, flax, hemp, good pasture for cattle, honey, wix, &c.

The astonishing quantity of must good pand relief

The aftonishing quantity of mushrooms produced spontaneously in Russia, are a great blessing and relief to the poor; while, at the same time, they are deemed delicacies at the tables of the rich and luxurious. It has been known, that above a thousand waggon loads of mushrooms have been annually fold at Mos-

Agriculture was but little understood in this country till the time of Peter the Great, who brought his subjects in some measure better acquainted with it. The principal articles in a Russian farm are wax and honey, which sometimes produce to the peasant a competency, as he fells the wax, and fome of the honey, and makes a domellic drink of the reft. This drink is a kind of metheglin, extremely ftrong, and very palatable. The Ruffian method of forming bee-hives is as follows: the peafant cuts down a tree, faws the trunk into many parts; hollows the pieces, then stops up the extremi-ties, and bores small holes into the body for the admittance of the bees; then the bee-hive is made, and the honey fecured from all the attacks of the bear, who is exceedingly fond of it, and tries a variety of experiments, and stratagems, to make himself-master of the fweet treasure.

The rye here ferves not only for bread, but a ftrong fpirituous liquor is extracted from it, which the Ruf-

fians prefer to brandy.

The wild beafts in this country are much the fame as those in Lapland, Norway, Sweden, &c. such as rein-deer, foxes, martins, hares, bears, ermines, fables, and squirrels. In the southern provinces are bred black cattle, camels, finall horfes, goats, fheep, &c.

The whole empire abounds with poultry, wild-fowl,

game, birds of prey, &c.

The different parts of this vast country are plentifully fupplied with various kinds of fifth, by means of the feveral feas contiguous to them, as well as innumerable lakes, rivers, rivulets, &c. These produce immense quantities of salmon, trout, pike, sturgeon, and belugo, which latter is a large fifh, of whose row the best

Caviare is made.

The fummer's heat hatches innumerable infects in the fands, moraffes, forests, &cc. and they are, indeed, very troublesome throughout the whole empire. Some are in common with those in the northern countries of Europe; and others are so imperfect as not to have received a name, or at least to have been assigned to any particular species; for; in the summer months, we may 1ay with Ovid.

The fat manure with heav'nly fire is warm'd, And crusted creatures as in womps are form'd; There, when they turn the glebe, the peafants find Some rude, and yet unfinish d, in their kind; Short of their limbs, a lame imperfect birth, One half alive, and one of lifeless earth.

Ruffia abounds with very rich mines of filver, iron, and lead. The two former metals have been already described; but the latter not having been particularized,

we shall here mention it.

Lead is of the least value of all metals, it being heavy, livid, and fouls the hand with a blackish colour. It yields little or no found, and melts quickly in the fire before it turns red. Pure lead is feldom found in the mines, but is extracted from ores of different kinds; for it is fometimes black, blue, yellow, or of an ash colour. It is full of shining minute particles; and fometimes again it is like a ftone of a leaden shining colour, confifting of fquares like dice, that lie in a white or reddish stone. The ore of lead almost always contains a finall quantity of filver.

When flints, and the like, are mixed with an ash or black colour, or are only marked here and there with veins and spots of the same, it is a fign that they contain either iron or lead. The green lead ore is very rare; but when it is found, it is variegated with a yellowith green colour, and femi-transparent. It is likewife heavy, but not hard; and one hundred weight of it yields from 70 to 80 pounds of lead. There is also white and ash coloured lead ore, but it is uncommon.

SECTION 11.

Particular Description of the several Parts of the Russian Empire in Europe.

OR the fake of order, we shall treat of the several parts of this empire under the following grand divisions, viz. Livonia and Ingria; Moscovy Proper, or Western Russia; Eastern Moscovy, or Russia; Rusfian Lapland and Nova Zembla.

LIVONIA.

HAT part of Ruffia called Livonia, is bounded on the north by the gulph of Finland, on the fouth by the duchy of Courland and Lithuania, on the west by the gulph of Riga, and on the east by Ingria.

This province is admirably fituated for commerce, having the fea on the north and west, the great lake Peipus on the east, and the river Dwina on the fouth. Three other internal lakes, and many small rivers, likewife greatly contribute to the advantage of this pro-vince, by facilitating the inland navigation. Livonia, from north to fouth, is 150 miles in length; and from east to well, where broadest, about 110 miles.

Livonia, though extremely marfly in some places, is, in general, very beautiful, plentifully producing honey, corn, cattle, pafture grounds, &c.

The Livonians, about the twelfth century, were in-

volved in Pagan superstitions; and with respect to their manners, were ferocious and savage to a great degree.

They were brought to embrace Christianity by their neighbours the Germans.

This fine country hath alternately been ravaged by the Germans, Russians, Poles, and Swedes. In 1660, by the treaty of Oliva, it was entirely ceded to the Swedes, who kept possession of it till the beginning of the present century, when, during the wars of Charles XII. the Ruffians fubdued the whole dutchy of Livonia, as well as Ingria; and they were afterwards confirmed to Ruffia by the treaty of Nyffadt.

The native peafants of Livonia are of strong constitutions, and fit to undergo hardships; but even at this time retain great part of their serocity. As some of their ceremonies, fuperfititions, and peculiarities, are

remarkable, we shall relate them.

When a country fellow marries a girl out of another village, he goes on horfeback to fetch her, fets her behind him, and makes her embrace him with the right hand. He hath in his hand a flick cleft at the top, where he puts a piece of brass money, which he gives to him who opens the wicket through which he is to pass. Before him rides a man that plays upon the bagpipe, as also two of his friends, who, having naked fwords in their hands, give two strokes across the door of the house where the marriage is to be confummated, and then they thrust the point of one of the swords into a beam over the bridegroom's head, which is done to prevent charms, which, they fay, are common in that country. It is to the fame end that the bride featters little pieces of cloth, or red terge, by the way, especially where cross-ways meet, near crosses, and upon the graves of little children, dead without baptifm, whom they bury in the high-ways. She hath a veil over her face while the is at the table, which is not long; for as foon almost as the guests are fet down, the married couple rife and retire. About two hours after they get up, and are brought to fit down at the table. Having drank and danced till fuch time as they are able to fland no longer, they lay down on the floor, and fleep all together like fo many fwine.

They believe there is another life after this, but their imaginations of it are very vague. A Livonian woman being prefent at her hufband's burial, puts a needle and thread into the grave, giving this reason for it, that her husband being to meet, in the other world, with persons of rank, she was assamed he should be

een with his clothes rent.

They are, in general, infatuated with notions of for-cery, which lead them to the belief and practice of the

greatest absurdities.

As they are stubborn in their superstitions, so are they no less exact in the observation of their customs; applicable to which we have a very pleafant flory concerning an old country fellow. Being condemned, for faults enormous enough, to cause sentence to be pronounced for him to lie along upon the ground to re-ceive his punishment, and a lady of the highest rank

The people of I ivonia are not permitted to make any purchase, and to prevent their so doing, they have only so much ground to manage as will afford them a subsistance. Yet they will venture to cut down wood in some places of the forests; and having prepared the ground, sow wheat in it, which they hide in pits to be fecretly sold. When they are taken in this, or any other fault, they make them strip themselves down to the hips, and to lie down upon the ground; or they are tied to a post, while one of their comrades beats them with a switch, or holly wand, till the blood runs on all sides; especially when then the master says, "Seleke rack maha pexema," "Beat him till the skin falls from the stell."

Nor are they fuffered to have any money; for as foon as it is known they have any, their fuperiors take it from them; which eruelty often drives these people into despair, of which there happened a fad example. A peasant, pressed by his officer, being deprived of the means whereby he should maintain his family, strangled his wife and children. The officer coming the next day to the house, thinking to receive the money, struck his head against the man's feet that was hanging, and so perceived the miserable execution of which he was the cause.

Livonia is divided into two parts, viz. Effonia and Letten.

ESTONIA is the most northern part of the province of Livonia. The chief cities and towns of which are

Revel, the capital, fituated in part on a plain, and in part on the declivity of a mountain, at the top of which there is a ftrong caftle. Waldemar, the fecond king of Denmark, founded this city, but fold it, together with Narva and Westemburg, to the grand master of the Teutonic order. Revel was one of the places originally admitted into the confederacy of the Hans Towns, and was a considerable commercial place till 1550, when the Russians removed the commerce of Revel to Narva, after having subdued the latter. But in 1711, when the Russians conquered the formers they again turned its trade into the old channel; and fince that period the place hath, in some degree, increased in opulence and importance. The Danish peasants, who formerly settled here, are still dikinguishable from the original inhabitants by their habits, customs, manners, &c.

Narva is fituated on the river Nerva, which divides Livonia from Ingria. It was originally built by Waldemar II. king of Denmark; taken by John Bafilowitz, Czar of Mulcovy or Ruflia; retaken by the Swedes; and finally reduced by Peter the Great, in the year 4700.

A late English traveller gives the following curious account of the Livonian dress: "I had the pleasure (fays he) to dine in company with four ladies yesterday, who were habited in the Livonian dress. Nothing could more aptly realize that barbarous splendor which has been so frequently depictured, but is now so rarely to be seen, in many parts of Europe. It was expensive, and might have been worn by persons of the first eminence, without degradation of their rank. Their heads were covered with a complete bonnet of pearls, which were not worth less than 2000 rubles, (450l. sherling, a ruble being 4s. 6d.) and round their necks was lest exposed, but the lower part was concealed by a vest of red filk, which sat close to the breast, and was bordered with a gold lace with a vast breadth, which

descended to the seet. Their arms had no other covering than the sleeves of their shifts; and when they walked out they threw over their heads and shoulders a piece of silk, resembling a Highland plaid, which was a fort of substitute for our capachin."

Among other ridiculous fuperfititions, the people of this part of Livonia have a cultom of observing the eve of Whit-Sunday as a sestival, shared to the memory of the dead. On this occasion the women assemble in the church-yard, spread clean napkins on the graves and tomb-stones, and cover them with painted eggs, sish dressed various ways, cakes, custards, &c. The priest then prays over, and persumes them with transincense; the clerk follows, and gathers up the offerings for the use of the church; and the women, during the whole ceremony, make the most dismal lamentations.

The river Nerva, which flows from the lake Peibus, and empries itself into the gulph of Finland, is exceedingly rapid: and near two miles from the city there is an impetuous cataract, which rushes violently down a precipice with the most tremendous noise, and dashes so turiously against the rocks, that a mist or vapour continually ascends from its foam, which, when the morning fun obliquely shines upon it, produces a rainbow.

The intercepted beams, mix'd with the shade Of temper'd other, and refracted light, Paints the fair rainbow, charming to the sight.

Parnaw, or Perna, which became subject to the Swedes in 1617, after it had been taken and retaken many times in the last century, in 1710 surrendered to the Russians. There is an university removed thither from Derpt, in the year 1685, but it is not much frequented.

Derpt, or, as the inhabitants call it, Derpat, and by the Muscovites, Junogorod, is a large and ancient city on the river Eimbeck, between the lakes Peibus and Wortzi, which have a communication together by that river. It was formerly the fee of a bishop, and adorned with an university, which has been since removed to Parnaw.

There are feveral other finall towns in the diffrict of Eftonia, but so inconsiderable, as not to deserve mention even in name.

LETTEN. The principal cities and towns in this part of the province of Livonia are as follow:

Riga is the capital, not only of Letten, but of all Livonia. It is the most considerable place for trade, next to Peterfburg, in the Russian dominions. It stands very advantageously for commerce, near the mouth of the river Dwina, which, with it branches, extending a great way into Poland and Russia, bring immense quantities of commodities, which are exported from this city. Among these the principal are hemp, slaw, timber for masts and other purposes, pitch, tar, and pot afhes. All these commodities are produced in the provinces, or near them, through which those rivers run; and fome of them, by means of thort land carriage, from one river to another, much further; even from the Ukraine and the l'olish provinces that border upon Turkey. Charles IX. king of Sweden, befieged Riga unfuccefsfully in 1605, and again in 1609; but his fon and fucceffor, Gustavus Adolphus, was more fortunate, and took it in 1620. Riga is well fortified; having strong walls, bulwarks, a very large trench on the land fide, and a strong castle on the river, where the governor general of Livonia refides. There is also a fort opposite the town, on the other side of the river, which is called fort Kobber, or Kobrums. bour is fecurely guarded by the Dunamond Fort, or, as it is called, the Dunamunder-Schans, feated about fix miles below the city, near the mouth of the river Dwina, as its name declares, and is a fortress of great importance, commanding the paffage of Riga; fo that, without leave from the governor, no thip can fail thither.

The inhabitants of Riga are a frank kind of people, and very police to strangers. They live by their trade; and have, by their policy, kept up hitherto a share of liberty. Their city is governed by four magistrates; and they have also a great number of counsellors, and a fyndic. Their magistrates have a salary annexed to their office; and they are not permitted to trade during their magistracy, which, though elective, may continue as long as they live, provided they please their council. They have great power in the city; but if any think they have not justice done them, they appeal to St. Peterfburg, and frequently get the magistrates fentence reversed. The women are handsome, rather bulky, but of fine features. The unmarried women are kept in good order; but, it is faid, that, after marriage, they do not pay a great regard to challicy. The ladies of quality are very vain, but at the fame time polite to those who pay them respect, Merchants wives, and other idle women, are to be feen at the doors of their houses almost through the whole day, for no other reason than to see the gentlemen pass by, and receive their compliments. To such a length is this absurd cuftom arrived, that the men fearcely can be covered one moment, and therefore walk with their hats under their arms.

The bridge over the Dwina is one of the most furprizing in Europe, being 900 paces in length. It con-fifts of transverie beams of timber joined together, and rifes or falls with the tide. It is always taken to pieces before the frost sets in, which happens in November, and put up as foon as the ice is gone. The inhabitants of the city of Riga itself are about 8000 in number, and the fuburbs contain about as many more. Three miles below the town, on the fouthern fide, is the place where Charles the XII. routed the Saxons, as he had first done the Ruffians before Narva. A high bank of fand is now collected, and poffesses the ground where the action happened, under which are still frequently found skulls and human bones.

Kokenhaufen, or Kokenhuys, stood on the river Dwina, 90 miles above Riga to the eaft. It was firong by its fituation on a hill, rather than by its fortifications, but was defended by a good citadel. It was formerly the refidence of the archbifnop of Riga. The Ruffians blew it up in 1701.

The other towns, in the district of Letten, are Nyenhaufen, Marienburg, Warbeck, Sewold, and Wolmer. The three former are fortified; the three latter are wholly infignificant.

INGRIA.

HIS part of Ruffia is 130 miles long, 70 broad, and abounds in cattle. In the winter here are a great number of elks, which, in the fummer, fwim in

the river Nieva, and make excursions into Carelia.

The Czar, Peter the Great, being desirous of opening a communication between Archangel and the Baltic, by means of the gulph of Finland, in order to improve the commerce of his dominions, determined to make himfelf mafter of Ingria, which he accordingly did in the beginning of this century. To render it an European magitime power, he determined on one of the most stupendous undertakings that ever was entered upon by human resolution, the building the city of Petersburg, which he defigned to make not only the capital of Ingria, but of the whole Russian empire, the center of trade, and the principal feat of the imperial refidence. It is fituated between Ingria and Finland, in a fenny illand, furrounded by the river Nieva,

in 60 deg. north lat. and 31 deg. 34 min. eaft long.

A fare traveller, who calls this city a creation of the
prefeat century, fays further of it, "I am flruck with a pleafing aftonishment while I wander among havens, ftreets, and public buildings, which have rifen, as by enchastment, within the memory of men fill alive; and have converted the marshy islands of the Nieva into one of the most magnificent cities on the earth. The imagination, aided by fo many visible objects, rifes to the wondrous founder, and beholds, in idea, the titulary genius of Peter yet hovering over the child of his own production, and viewing, with a parent's fondness, its rifing palaces and temples. The names on which ancient flory dwells with in much fondness, fink on a comparison with this immortal man; and the fabulous legislators of Greece and Egypt never prefumed to attempt the mighty transformation which the Czar completed. The followers of Cadmus, of Theseus, and of Romulus, were animated with the fame ardor as their leader; but the Muscovites, (Russians,) wrapt in the most profound barbartim, feeluded by their illiberal preju-dices from an intercourse with European nations, and equally the flaves of superflition and long prescription, were forcibly torn from this night of ignorance, and compelled to accept of refinement and civilization.

The island on which this fine city as been fo wonderfully raifed, was nothing but a heap of mud in the short summer of these climates, and a frozen pool in winter, not to be approached by land but by paffing over wild forests and deep morasses, and had been till then the habitation of bears and wolves, till it was, in 1703, inhabited by above 300,000 Russian, Tartar, Collack, &c. peafants, whom the Czar called together from all corners of his vast empire, some near 1200 miles; and these made a beginning of this work. He was obliged to break through forests, open ways, dry up moors, and raife banks, before he could lay the foundation. The whole was a force upon nature. At first the workmen had neither sufficient provisions, or even pickaxes, spades, wheelbarrows, planks, or huts to finelter in, yet the work went on fo expeditioully, that, in five months, the fortress was raised; though earth thereabouts was fo scarce, that the greatest part of the labourers carried it in the skirts of their cloaths, or in bags made of old rags and mats, barrows being then unknown to them. It is computed full 100,000 perished at the place; for the country had been defolated by war, and supplies by Ladoga lake were often retarded by contrary winds. The Czar himself drew the main plan. While the fortress was going on, the city began gradually to be built. He obliged many of the nobility, merchants, and tradefmen, to go and live there, and trade in such commodities as they were ordered. Provisions being scarce, and conveniencies wanting, the place, at first, was not at all agreeable to persons of distinction, who had in Moscow large buildings, and feats in the country, with fish-ponds, gardens, and other rural elegancies. However, he little regarded tile complaints of those who only considered their own ease. The boyars (nobility) brought great retinues with them; and merchants and shopkeepers foon found their account in fettling here. Many Swedes, Finlanders, and Livonians, from towns nearly depopulated by the wars, continued here. Artificers, mechanics, and scamen, were invited hither, to encourage shipping; who, having worked out the time agreed on for the Czar, were hired by the boyars; and alto built for themselves, and settled; each man being allowed to pitch on the spot he liked. In one year 30,000 houses were erected, and, in two or three more, double the number, which doubtless are very much increased since. Some, indeed, but chiefly in the slabo-das, or suburbs, are mean, and may be taken to pieces in two or three hours, and fet up elfewhere. To build this town, that of Nienschans (a strong fort on the Nieva, not far from Noteburg) was demolished for the materials, and the inhabitants removed hither. As he intended to remove the trade of Archangel to Peterfburg, in 1713 he made 1000 families come from Moscow, and offered great advantages to all foreigners that thould serile there; and ordered that all goods usually sent to Archangel, to be fold, &cc. to strangers, should be fent hither, and the duties to be in every respect the same. But the commerce, &c., were not entirely removed till some years after. In 1714 it was ordered that all houses should be built of brick, tiled.

The

lization.

The citadel is a long and irregular hexagonal, with fix bastions parallel to each other, except the two middlemost, one of which, opposite to Carelia, has two orillons or blinds; that over-against the river none; each of the four others one. They were all, at first, but earth and turf; but, in 1710, the Czar refolved to have them all lined with strong walls. Those on Carelia side were finished in his life-time; and the work has been carried on and compleated by his fucceffors. The wall is 30 feet high to the parapet, and the faces are all lined with large iron and brass guns. On the flanks, which are pretty short, are two rows of cazamattes, one above another, arched over, and covered with beams and turf, bomb-proof. The curtain on the right of this citadel's gates has one of the finest royal dispensaries in Europe, both for the great quantity of drugs and medicines, and the large number of beautiful porcelane vessels from China and Japan, which it contains. This citadel has two gates; one adorned with statues, particularly St. Peter with his two emblematic keys, and on its infide the black eagle of Ruffia, with the globe and the sceptre in its two talons; and below is the figure of the Ruffian St. Nicholas. Before' that gate is a ravelin, from whence is a bridge, with two draw-bridges over an arm of the river. In this place gallies and fmall veffels are sheltered from bad weather.

The academy established by Peter the Great, has a multiplicity of professors in most sciences, and the belles lettres, who have liberal falaries. The building is a fuperb pile, containing two ftories, with a beautiful cupola in the middle, and an observatory. Here is a good library, and all manner of natural and artifi-cial euriofities. " In one of the galleries, (fays a curious observer,) in a case, is the skin of a Frenchman tanned and stuffed. This has been the tallest man I ever faw. In another case is his skeleton, and a pair of breeches made of his wife's fkin, also dreffed. The leather was like buff. On the bottom, or pavement, flands the skin of an English chesnut horse, stuffed, faddled, and bridled, and befide it the skeleton. Peter the Great used to ride this horse. Here I saw the head of the unfortunate Miss Hamilton, a Swedish lady, who loft it for having murdered her child unlawfully begotten; and this is the only murder of that kind I ever heard of in Ruffia. This lady was maid of honour to the empress Catherine. It is faid Peter went and saw her executed. He wept much, but could not prevail upon himself to pardon her. He caused her head to be capped and injected. The forehead is almost compleat. The face is the most beautiful my eyes ever beheld. The dura mater, and brain, are all preserved in their natural fituation. This is kept in spirits in a large chrys-

Besides the above, here are deposited great quantities of earths, soffils, stones, ores, natural metals, minerals, shells, mostes, corals, &c. In one room is a figure of Peter the Great in wax work, as large as the life. He sits in an elbow chair cross-legged, dressed in a blue suit of cloaths, white stockings, and has a hanger by his side. He has short black hair, his head covered; and the figure is surrounded by mathematical, philosophical, and mechanical instruments.

Peter the Great also formed regulations for the management of this seminary. These referred to the professors, the students, the respective sciences, the succession to offices, and other particulars conducive to the interest of the institution in general.

Petersburg is amazingly increased in fize within these sifty years. At the death of Peter the Great, it did not contain 80,000 inhabitants; and now the Russians affert that there are 500,000; but this is deemed an exaggeration. It covers a very great extent of land and water. The streets are some of them very broad, long, and with canals in the middle of them; and others are planted in the Dutch sashion. The houses are immensely large. The palaces of the nobility exceed in fize those of most cities. That of the Em-No, 62.

press is an amazing structure. But these are rather great than beautiful. The size is all that strikes; and the buildings are stuck so thick with ornaments, that there is hardly any such thing as judging of their proportions. The Italian architecture is mixed with the Dutch, and the whole forms very inelegant piles, in which true taste is totally sacrificed to a profusion of ornament. But if the eye does not scrutinize into the separate parts of the buildings, but takes only the streets at large, the city may be fairly pronounced a very fine one.

very fine one. Among the public buildings there are many extremely worthy the attention of a traveller, particularly the dock-yards, the naval magazines, the arfenal, foundery, admiralty, &c. without infifting on the imperial palace, the cathedral, or many churches. In the docks they continually employ a great number of carpenters. They build here all forts of veffels, from ships of 120 guns down to boats; and the number on the stocks at a time is considerable. After the death of Peter the Great the marine was neglected, infomuch, that the Empress's naval strength was not computed to be a fifth part of what that great monarch poffessed; and this was owing to want of trade, which can alone make feamen; unless when in the hands of such a man as Peter, who created every thing. But the present Empress, who has thrown the spirit of that great mo-But the present narch into all the departments of the state, has revived it wonderfully; fo that, at prefent, the Ruslians have

a formidable navy.

There is fearcely any thing at Petersburg more deferving notice than the foundery. The iron is brought from Kexholm by water; and the number of cannon and mortars that are cast here is very great; also cannon balls, and all forts of military implements in which iron is used; which are made here at as small an expence as in Sweden, or any other part of the world. The arfenal is always well stored with them; and there are vast quantities made on a private account for exportation, forming a very considerable branch of com-

The grand market-place is on the fouthernmost part of the city, with many warehouses, to deposit all kinds of commodities and merchandize, both domestic and foreign, for sale. It is a large square, with sour entries, and a range of shops on each side, both within and without, with covered galleries, to secure those

who frequent it from the rain.

Woolen and linen manufactories were fet up here, of which the latter is brought to great perfection, as we may observe by the linen of late imported from thence. Here is particularly a workhouse, where an old Dutch woman has 80 young nymphs under her care, who are taught, with a whip, how to handle the spinningwheel; and feveral regulations are made for improving the plantations of hemp and flax. Paper-mills, and powder-mills, have also been erected, with laboratories for gunnery and fire-works; and other places for preparing falt-petre and brimftone. Rope-yards, like those in England and Holland, for making of cables and tackling for the navy, are also set up here, A printing house is established, and news-papers are now as regularly printed as in other countries of Eu-Several useful books have been translated out of the High-Dutch, and printed; the government encouraging their subjects to enquire into the state of the world abroad, instead of keeping them in ignorance, according to their ancient maxims. As to their filk and woolen manufactures, they have not been able hitherto to bring them to any degree of perfection.

At little diffance from Petersburg is a noble seminary for educating semales only, sounded by the late empress Elizabeth. The building is capacious and grand. Children of distinction are kept separate from those of an inferior rank; and the whole contains between 700 and

800 females.

Near the Nieva is a small palace, built by the prefent Empress, and called *The Hermitage*. When her majesty

cc A

majefty resides in this part of the building she is in re-treat, and there is no drawing-room or court. These apartments are very elegant, and surnished with great taste. There are two galleries of paintings, which have been lately purchased, at an immense expence, in Italy. The crown, in the palace itself, is perhaps the richest in It is shaped like a bonnet, and totally covered with diamonds. In the fceptre is the celebrated one purchased by prince Orloff for 500,000 rubles, (112,500l.) and presented by him to his sovereign mistress. It far exceeds Pitt's diamond in fize, and is not inferior in water. Lapidaries declare it the most beautiful and rare ever brought from Golconda. One of the noblest monuments of the gratitude and veneration univerfally paid to Peter I. is that which her present majesty has ordered to be erected. It is an equestrian statue; in which production the artist has united the greatest simplicity with the truest sublimity of conception. No other statuary, whether ancient or modern, gave him the defign, which is fingular in its kind, and admirably adapted to express the character of the man, and of the people over whom he reigned. Inftead of a pedeftal adorned with infcriptions, or furrounded by flaves, he appears mounted on a rock, or ftone of a prodigious fize, upon the ascent of which the horse labours, and appears to have nearly reached its fummit. This attitude has given him room to exert great anatomical beauty and skill in the muscles of the horse's hind parts and hams, on which the whole of his body is necessarily sustained. The Czar's figure is full of fire and spirit. He fits on a bear-skin, and is clad in a simple habit, not characteristic of any particular country, but fuch as may be worn without violation of propriety by an inhabitant of any country.

About 20 miles west from Petersburg is the beautiful palace of Peterhoff, figuated on an eminence, in a large garden, commanding a fine view, and furrounded by many out-houses, offices, &c. for servants and attendants. It faces the fouth; and, in the front, there is a beautiful canal of clear transparent water, from which three jet d'eaus are supplied, and constantly play. When the Empress is here, the guards are encamped in a part of the garden, where their tents make a very agreeable appearance. In speaking of one of these jet d'eaus, a curious traveller says, "Out of the water, much to my agreeable furprize, arofe a dog and three ducks, made of copper or iron, and, in appearance, all alive. The ducks flutter through the water quacking, the dogs follow after them barking. There is, in fubterraneous place, a charming chime of chrystal bells, which play by water. The grotto, which is covered before by a cascade, has two entries, one on each fide. The entries are guarded by statues, which, when you are in, prevent any one from getting out, till the keeper, by turning a handle, puts a ftop to them. These flatues evacuate fo much water, by vomiting, and shooting out of stone pistols and guns, that the keeper faid it would overwhelm any man. Besides the curiosities before mentioned, there is a beautiful gallery full of the finest china in the world; one end of which is a fmall but commodious room, with a bed in it, whither the Empress sometimes retires to repose herself.

The apartments here are all splendid and nobly surnished; and among the paintings there are five matchless portraits of the sovereigns of Russia, viz. 1. Peter the Great. 2. The Livonian villager, whose virtues raised her from a cottage to an imperial diadem, and to share the bed of Peter the Great. 3. The empress Ann. 4. The empress Elizabeth. 5. The present reigning sovereign.

Such was the foundation, and fuch is the present state, of the city of Petersburg, as appears from the most authentic and modern accounts we could possibly select. The only material circumstance relative to it, which remains to be mentioned, is the dreadful inundation and hurricane which happened in 1777, and were productive of the following state effects.

Almost all the houses in the little islands in the mouth of the Nieva were demolished, and a considerable number of the inhabitants lost.

The fortifications of this place fulfained great damage. The rapidity of the river was beyond all conception: it carried every thing before it, making a most dreadful havock, and roaring with a noise not easily to be described.

A poor man, with his wife and two daughters, getting out at a window, when a guft of wind blew down the house, were all killed except the man, who survived three days.

A poor young lady, in fixing a rope to descend by, was killed by the falling of the roof of another house; and two other persons in the said house lost their

The great bridge of pontons was totally borne away; and paper mills, elaboratories, manufactories, &c. demolified.

The dead body of one of the handfomest women was seen floating on the waters. The wind and stream conveyed her to a wreck, on which it was hoped she might have symptoms of life, but a contusion in her head soon banished every prospect of that kind.

A prodigious number of cattle and poultry were de-

A prodigious number of cattle and poultry were deferoyed, as well as horses drowned in stables. A tribe of itinerant Tartars were drowned in their temporary buts in the country. In short, both the city and neighbouring stat country exhibited a most horrible aspect.

An account transmitted from Petersburg to London, thus states the particulars of this calamitous event.

"An inundation happened here, more extensive and destructive than has ever been remembered in these parts. A violent hurricane of wind, at westfouth-west, which began about two o'clock in the morning, raifed the waters, in the short time of four hours, to the height of fourteen feet above the ordinary level of the Nieva, by which the whole town, and a great extent of the country in the neighbourhood, was rapidly overflowed. The water remained about half an hour at its extreme height; but the wind getting a little to the northward between fix and feven o'clock, it returned, in a very fhort time, to its usual bounds. It is impossible to estimate, with any degree of exactness, the loss which the state and individuals The number of persons drowned amounted to several hundreds. In the best parts of the town many houses were unroofed; and the loss of liquors, and other provisions, in the cellars and lower apartments, were very great. In the shops (which are all in the same quarter of the town) goods were destroyed to a very considerable amount. In the gardens of the fummer-palace, great numbers of the finest trees were broken or torn up by the roots. The lower skirts of the town, where the houses are mostly of wood, and inhabited by the poorer fort of people, prefented a fcene of defolation which can be more eafily imagined than described. Many persons were drowned in their beds; and others, who fought for fafety from the waters on the roofs of their houses, were carried from thence by the violence of the wind; and those who escaped with life, were left destitute of habitations and effects. Great damage was done at the quay of the exchange, and the lower magazines and warehouses. Numbers of barks, laden with iron, hemp, grain, wood, &c. to a very great amount, were staved, funk, or driven in pieces in the ftreets or fields. Several large vessels, lying between this place and Gronstadt, were driven ashore into woods and gardens. Many of the country houses in the neighbourhood were destroyed. The village of Catherinehoff, and fome others on the fame coalt, were entirely fwept away, with all the cattle; and many lives were loft there, as well as on the fide of the Galley Haven, where the ground is The great bridge of boats over the Nieva very low. was carried away; and most of the bridges in the town, that t the gi 1752. terially by the tempeft."

EUROPE.

After Peter the Great had laid the foundation of his new city of Petersburg, and made some progress in the buildings, he thought it necessary to have a convenient harbourgin which the shipping might ride secure, and pitched upon the island of Retriari, at the mouth of the gulph of Finland. There he built a new town called Cronstadt, and secured it with a castle called Cronflot, fituated on a fand bank near the fide of Ingria; fo that between the castle and the town, the fhipping ride in a fafe, deep, and commodious harbour. The caftle is built in the form of a round tower, and three tier of galleries, well furnished with cannon, furround it. In cases of emergency, the piers of the harbour may be mounted with a confiderable train of artillery; and two finall batteries at prefent are fituated on the opposite island.

Between Cronftadt and Petersburgh are many elegant houses; and on an island formed by the river Nieva, near the western banks of the lake Ladoga, is the strong fortress and seaport of Noteburg, or Oresco. It was taken from the Swedes by Peter the Great in the year 1702. With respect to the other towns, Nieuschan is demolished. Iwanogorod is a strong castle opposite to Narva; from which, at the diffance of 45 miles, is the fortrefs of Caporia, fituated on the banks of a fmall river. Fifteen miles to the north-east of Iwanogorod is Jama, another fortress, built on the river of the same

MUSCOVY PROPER, OR WESTERN RUSSIA.

HIS division of the Russian empire contains the following extensive provinces, which we shall

arrange in their proper order.

PLESCOW, or Pskow, was formerly a republic, after which it had the title of duchy. It was at length subdued by Iwan Bafilowitz, anno 1509. It hath a lake of its name, which lies on the confines of Ingria and Livonia, and empties itself into the larger one of Peipus or Crud-kow. Plefkow, the capital, is feated in the mouth of the river Muldow, on the right hand of the lake of its name. It is divided into four wards or quarters, each of which is encompaffed with its own walls; and the whole is defended by a frout castle, built on a high rock. It is a Ruffian archiepifcopal fee, and a confiderable populous city. The other cities of this territory are inconfiderable, and not worth notice.

GREAT NOVOGOROD VELIKI, or, the Duchy of No-VOGOROD, is fituate on the east of Pleskow, and divided into five diffricts. It is called Novogorod Veliki, or Superior, to diftinguish it from the Inferior, or Niso Novogorod. The chief produce is corn, flax, hemp, wax, honey, and leather; in all which it drove a confiderable traffic, when it was governed by its own princes; but fince it is become under subjection,

it is much decayed.

The city of Novogorod Veliki, capital of this province, called by the French Neugard, and by the Dutch New Garten, is a large and confiderable place, populous and well fortified. It was formerly more spacious. It is an archbishopric of the Russian rite. The cathedral, called Santa Sophia, is large and beautiful, though in the antique style.

On the other fide of the river is the castle, which

is joined to the city by a large bridge, famed for the ma ny thousands of clergy, citizens, and others, whom the tyrant of Novogorod, duke Iwan Bafilowick, caused to be thrown from it into the river, anno 1569. The castle is the residence of the Viavode; and near unto it is the archiepifcopal palace, and a monaftery, dedicated to the miraculous St. Antony of Padua. There is another monastery here, called Perunki Monaftir, faid to have been built on the ruins of an ancient temple, dedicated to Perun, or the god of fire, formerly worshipped here, under the figure of a deity, holding a thunderbolt in its hand. Here are also many churches and monafteries.

Staria, or Stara Ruffa, or Old Ruffa, is fituated on the opposite shore of the lake Ilmen, whose outlet is the river Lovat, from the water of which the inhabitants make a confiderable quantity of falt for expor-

tation.

The capital of this province is the only place worthy of mention, except the town of St. Nicholas, which is a large populous place, fituated near the Wolga, and celebrated for a stately and spacious monastery, dedicated to the faint from whom the town itself derives its

The Duchy of Twere is small and compact, but populous and fertile, and takes its name from its capital, and that from the river Twerza. Its chief city is Twere, the capital, fituate on the confluence of the rivers Twerza and Wolga; which last is by this time become fo wide, that they are obliged to cross it in ferry-boats. It ftands pleafantly on the fide of a rifing hill, on the bank of the Twerza, from which it hath its name; and is a large, rich, and populous city, having no lefs than fixty churches, and an epifcopal fee; and is the station of a mint.

A little below it, on the fame river, ftands the large town of Terfack, Torfak, or Tarfock, about 20 miles north from Twere. The other towns have nothing

worth notice.

The Duchy of Rzeva, or Reschaw. This pro-

vince contains the following towns.

Rzeva the defert, fo called because ruined and abandoned, was the capital, and flood on the western side of the province, on the fouth-west of Velike-Louki; but hath yielded its dignity to

Rzeva Volodemerski, which is pleasantly situated on the Wolga, on the eaftern fide of this province, near the fmall lake Wolga, which is one of the head springs of that river. It is faid to have been built by prince Volodimer, who made very confiderable conquests in this and the neighbouring provinces. It is but indifferently built, but well peopled, and drives some fort of trade in hemp, fish, &cc.

Toropecky is a fmall neat town, pleafantly fituated on a little river that falls into the Dwina. The other

towns contain nothing worthy of notice.

The Principality of BIELA, or BILISKI, was formerly governed by its own princes; and the capital, Biela, fituated on the river Ufca, which difcharges itself into the Dwina, was a confiderable town, till subdued and ruined by the czar Bafilowitz.

The Province of SMOLENSKO has been alternately fubdued by the Poles and Ruffians, and at length was finally ceded to the latter by treaty, towards the con-clusion of the last century. It is watered by the Nieper or Boristhenes. The land is in general sterile; but the skins of the wild beafts, with which it abounds, yield the inhabitants fome profit.

Smolensko, the capital, and the only place that deferves mention, is agreeably fituated on the banks of the Nieper, near the confines of Lithuania. It is large, populous, well fortified, and the houses are tolerably well built. It has a citadel and garrifon to defend it; was once a metropolitan, and is now a bi-The furrounding woods are faid to produce the best firs in the Russian dominions.

The Duchy of SEVERIA had formerly princes of its own, till the country was subdued by the Czar Basilowitz. lowitz. It afterwards fell into the hands of Sigifmund III. king of Poland, who incorporated it with his dominions; but it was at length finally ceded to Ruffia, as a member of the ancient palatinate of Smolensko.

This province being watered by the rivers Ubic, Doniza, and Nevin, is fertile and populous, yet woody. In the fouthern part there is one vast extensive forest, which is computed to be 100 miles square. Here

Horrid with fern, and intricate with thorn, Few paths of human feet, or tracks of beafts, are worn.

Nogogrodeck, the chief town, flands on the river Doniza, and is tolerably well fortified in the Rufflan flile. Branski is a well-fortified town, about 60 miles from Nogogrodeck. The other towns or villages of this

province are of no consequence.

The Dutchy of CZERNICHOW, though watered by the river Doniza, is exceeding sterile. The principal town, called Czernichow, is small, thinly peopled, and inconsiderable, as are all the other places in it.

The Principality of VOROTIN. The continual excursions of the Coffacks have almost desolated that portion of this province which is fituated near Lesser Tartary: but the other parts are populous and fertile, being watered by the river Occa.

On the banks of the Occa ftands Vorotin, the capital of the province. It is only a small town, but well fecured by a castle and other fortifications. On the same river stands Cromare, Starol, and Bolgoff.

The Duchy of Rezan, or Rhezan, or, as it is now called, the Province of Verones, includes a very large track of land, fituated between the Don and the Occa, and extending near 300 miles in length. It is watered by the Don or Tanais, and the Occa. The Ruffians deem the foil of this province the most fertile in the universe; and affirm, that the corn grows so thick and strong, that a horse cannot make his way through it. This must be owing to a great quantity of salts with which the snow impregnates and enriches the ground, by lying so many months upon it. The people here are courageous, warlike, civil, polite, and very numerous.

This country was formerly governed by its own dukes, who were efteemed powerful; but it hath long fince been subdued by the Czar, and become subject to Russia, since which time it hath much decayed. It continues, however, still fertile in corn, millet, and other grain, and also abounds all kind of game, as the rivers do with sissipping in this province, and runs almost across it, and, after a long serpentine course, discharges itself into the Paulus Mæotis at Azoph.

Most of the towns were formerly considerable, rich, and well-peopled but being miserably plundered and abused by the Crim Tartars in the year 1568, they have not fince been able to recover themselves.

Rezan, or Rhezan, the ancient capital of this province, which was formerly a fair, large and populous city, and advantageoully fituated on the Occa, is chiefly famed for the noble refiftance which it made against the Tartars in the year 1570, by which the whole empire was preferved from their fury; though the city itelf, and almost the whole duchy, were destroyed by them. All that the ancient Rezan now retains of its former grandeur, is the archiepiscopal see, and its being still the residence of the metropolitan.

Voronetz, commonly called Veronis, is the most confiderable place in this dutchy, on account of the great ships of war built there under the direction and inspection of the late czar Peter the Great, it being situated on a small river of its own name, which falls into the Don, or Tanais, a little below it, and is deep enough to carry them into the great river, and thence down to the Black sea, to which that prince opened himself a free passage by the taking of Azoph.

The town is fituated on a hill, furrounded with a wooden wall, almost rotten. It is divided into three parts;

one of which, called Jakaroff, is the common refidence of the Ruffian merchants. It hath large and extensive rope-walks, and a spacious subterranean magazine of powder without the walls. On the declivity of the hill, and along the water side, are several spacious houses, some of them 400 paces long, which belong to the Ruffian admirals, vice-admirals, and persons of rank. Most of them stand facing the citadel, and behind them are streets for those that are employed in ship-building. The city stands on the west side of the Veronis, and the citadel on the other; and a large bridge is built over it for communication.

The citadel is a large square building, stanked with a tower on each corner; hath large apartments in it, and makes a great figure without. It is surrounded with strong pallisadoes, and a ditch, and is defended by a strong garrison. This is the chief magazine in this part of Russia, in which there are about 150 cannon, mostly unmounted for speedy carriage; conveniencies for ship-building; and apartments three stories high, for all manner of naval stores. Here are some handsome churches, after the Russian taste: and, at a small distance from the town, may be seen a high mountain almost mouldered away, and full of cracks, on

which are fome ancient monuments.

Taverhoff was built by Peter the Great, on the fouth banks of the river Veronis, and two thirds of the town are washed by that river and the Don. The place is very unhealthy, on account of the circumjacent low flat grounds being covered either with wood or water. This town is regularly built, with streets intersecting each other at right angles; but the houses are of wood, as is a palace which stands at the west end. The citadel is made of earthen ramparts, pallisadoed with bastions at the corners, mounted with cannon. Taverhost itself is inhabited principally by failors and sistemen; and what is very singular, 3000 soldiers, who are the garrison, and appointed to defend the place, do not refide in the town, but dwell all together in a neighbouring village.

The other towns in this duchy worth mentioning, are Donkarod, a large place about 14 leagues fouth from Rezan, fituate near the fpring-head of the Don, or Tanais; and Toul, or Tula, on the western confines, near the borders of Vorotin, which is desended by a stout castle, built by the czar Basilowitz soon after

he took it.

The province of BIELGOROD lies in a temperate climate, is watered by feveral streams, and is naturally fertile; but being exposed to the continual attacks and inroads of the Don Coffacks, it is neither populous or well cultivated. In fact, the country originally belonged to those people, and the inhabitants still retain the Tartarian cultoms and manners; being themselves more inclinable to live by free-booting than by the cultivation of the earth, and to make wild excursions about the country, than to refide focially in cities and towns. Indeed, it hath a confiderable number of fmall towns, most of them poor, and half-ruined; but no cities, except that of Bielgorod, from which it has its name, and which is itself hardly remarkable upon any other account. The country of the Don Coffacks, on the fouth-east, called also Rodoni Donski, and the country of the Nogay Cossacks, on the south-west, are either very boggy or woody, and have few towns in their territory; which, with the palatinate of Bielgorod, was formerly part of Tartary, but hath been gradually conquered from it by the Ruffians.

The Province of Mordon, or Mordon, and Diftrict of Czermisse. Having gone through the western provinces of Russia, we must direct our course towards the north, where we meet the province called Mordon. The inhabitants of this province are said to be the most civilized of all the Tartarian people, and have some towns, but none of them worth describing. The people here are heathens, but have neither temples, altars, or priests. Their country is small, and full of

forests.

The district or province of Czeremisse, or Scheremiffe, which lies on the east fide of the former, is a vast track of land, extending from 54 to 61 deg. of latitude; and is divided by the river Volga into two-parts; the fouthern diftrict, which adjoins to Mordva, and has the name of Nagorna, which implies mountainous; and the northern, which is known by the name of Logowai, or Low Land. The inhabitants, who are deemed the most savage of all the Tartars, breed vast herds of cattle. They are without towns, faithless in their dealings, superstitious in their notions, and cruel in their dispositions. Some are called Mahometans; but the greater part, especially towards Cazan, have no fixed objects of faith, or modes of praczan, have no as vague in the one, as they are abfurd in the other. Their language is peculiar, understood by neither Muscovite or Tartar. A man is allowed three or four wives. The women wear only a coarse linen gown, which covers their whole body; and the headtire of the married ones rifes over their heads like a horn growing out of their skulls, at the top of which hangs a little bell, by a filk string of several colours. The men have much the same garb about their bodies, with drawers under. The married shave their heads, and the unmarried let their hair grow to a confiderable length. They are subject to the Czarina, and obliged to affish her in war; but are free from all tribute.

The Duchy of Nisi-Novogorop is watered by the Volga and Occa, and abounds with forests; but is, nevertheless, pleasant, populous, and fertile.

vertheless, pleasant, populous, and sertile.

The capital, Nisi-Novogorod, is situated on a rock, at the confluence of the Vosga and Occa, surrounded by a stone wall, and defended by a strong citadel. Near the river side, and before the flately gate of the city called Iwanossis, there is a spacious market-place. A noble street, intersected by others, runs through the whole town. The cathedral, which is built after the model of Santa Sophia at Constantinople, is a stately edifice, has sive cupolas beautifully varnished with green, and adorned at the top with elegant crosses. The superb archiepiscopal palace is near the cathedral, but contains a church within its own walls. The governor's palace, and the chancery, are noble fabricks; and the houses, in general, are well built of timber. The city itself is small, but the suburbs are large, and the whole has a good trade, and is well surnished with provisions. The luxuries, as well as the necessaries of life, are remarkably cheap; but the inhabitants, in general, women as well as men, are abominable drunkards.

Bafiligorod, fituated at the foot of a rifing ground, near the Volga, is a large village, confifting of wooden houses. It was originally sounded by the czar Balilius, as a check tipon the Tartars; but as the Russian frontiers at present extend much farther, the fortifications have been suffered to go to decay. The other towns of this province are Slaboda, Balagna, and Pastoff; but they are neither important or remarkable.

The Province of VOLODIMER contains some sens and forests; but in many parts is sertile, and well watered.

Volodimer, the capital, is fituated on a fine hill, which is beautifully diverfified with plantations. Hence a most noble appearance is exhibited to the distant eye. It was built by prince Volodimer, in the commencement of the tenth century; and here he and his succeptors resided till the court was removed to Moscow, fince which period its splendor hath gradually decayed. The other towns are Gorachowitz; Iless, situated on the river Chesma; and Baluchna, which stands on the banks of the Volga.

The Duchy of Susdal contains many forests, which are well stored with fallow deer and other game, and with wild beafts, whose furs bear a good price. John Bashowitz subdued this country anno 1565, and incorporated it with its own estates. Its chief towns are

Sufdal, the capital, Caftro-Moigorod, Louch, and

Suldal is fituated on the river Clefma, near the fouthern part of the duchy. It is an archiepifcopal fee, built

mostly of wood, after the Russian manner, but retains little of its pristine grandeur. It is, however, famed for a stately monastery of nuns, and some other ancient buildings.

The Duchy of Moscow, or Muscovy; properly fo called, in order to distinguish it from the great empire of which it is the principal province, bears the name of duchy, because, for a long time, the princes of it took only upon themselves the title of dukes. It hath its name from its capital, Muscow, or Muscova; and this from the river of that name, on which it is situated.

Its extent, from east to west, is computed to be about 68 leagues, or a little above 200 miles; and its breadth, from north to south, about 33 leagues, or 100 miles. The chief rivers that run through it are the Moscow, Occa, and Clesina, all which fall into the Volga; and on the western side of this province is a large forest, out of which slows that samed one called the Boristhenes, which, crossing the duchy of Smolensko, makes its course to Ukrania, Lithuania, and Poland. The soil, however, is not so serile as in some of the other provinces; but the air, though sharp, is very healthy; which, with the advantage of its situation amidst some of the best provinces of the empire, induced the monarchs to make it their chief residence, and the metropolis of the empire.

The chief cities and towns are the following: Moscow, the capital, once the metropolis of, and the greatest city in the whole Russian empire, is seated in a fine spacious plain, on the river of its name, dver which it hath a stately bridge of twelve arches, of a prodigious height and breacht, because that river often overslows. It was built by prince Gassichin, from the design of a Polish monk. The town stands in a gravelly soil, and wholesome air, and almost in the center of the best provinces of Moscovy. The population of this city cannot be ascertained. In 1662, when lord Carlisse was ambassador there from king Charles II, it was 12 miles in compass, sull of houses and inhabitants, insomuch that the number of the former is, by the lowest calculations, said to have amounted to 40,000; and by the Russians affirmed to have been above double that number. According to Voltaire, Moscow, when he wrote, was 20 miles in circumserence, and its inhabitants amounted to 500,000; but it is almost impossible to form a precise estimate of their present number. The houses are, in general, miserable timber booths, which always have subjected the city to violent constagrations.

Moscow is of a circular form, and confilts of four distinct parts, or quarters, all surrounded with a distinct wall, viz. Cataigorod, Czargorod, Skorodom, and Strelitze-Slaboda, so called because it was formerly the quarter of the Strelitzes, or Czar's guards.

The Cataigorod, or middle city, is furrounded with a brick wall; and on this stands the castle, which is two miles in circuit, and fortissed with three stout walls, stately towers, and a sosse. In the castle are two palaces of the Czar, one of timber, the other of stone, built after the Italian manner; the patriarchal palace, a large ancient building; the excheques, chancery, and other offices; the grand magazine; two handsome monasteries; sive large churches, among which is that noble one of St. Michael, in which are the tombs of the grand dukes, or czars. There are several other stately buildings in this great castle. At the gate stands that stately ancient sabrick called the church of Jerusalem.

Near the churches are hung feveral large bells, one of which is of a ftupendous fize. Concerning the celebrated great bell of Moscow, a learned traveller says, "I went to see the great bell, which was then in a large pit. A fire had, about two months before this, burnt down about two-thirds of this great city, and the belfry, being all of timber, shared the same sate. The bell fell into the bottom of the pit, and had a piece broken out of its edge, large enough to permit any man to go

into it. Its weight is 443,772 pounds, and its height about 21 feet four inches and a half. I then went to the top of a very high tower, called Ivan Veliki, or the Great John. From this tower I had a compleat the Great John. view of the whole city, which, indeed, made a very grand appearance. The weather being very cold, the Russians heat their stoves before day-light, and make ready; so that the view is never but at those times ob-fructed by the smooth. Upon the top of this tower there are three bells, I think the least of which is larger than the largest in London. Under the tower is the ancient imperial palace, a large Gothic stone build-ing. All these which I have mentioned, and all the imperial ancient archives, and different courts of juftice, are in that part of the city called the Crimline, which is furrounded by a high brick wall, faid to be about 2004 paces in circumference."

This quarter is called Cataigorod from Catai, the ancient and Ruffian name of China, because the chief merchandizes fold in it come from that country; fo that the name implies the same as the Chinese city.

The Czargorod, or ducal city, contains, among other The Czargorod, or ducal city, contains, among other buildings, the great arienal, and is watered by the Negliga, which runs through it, and thence flows into the ditch that furrounds the middle city.

The quarter called Skorodom, or Scarodum, is chiefly inhabited by timber-mongers and carpenters, who fell houses ready made. These houses are move-

able, fold very cheap, and in great numbers: and, in-deed, confidering the frequent fires that happen in this city, owing either to drunkennels, a reigning vice here, or to the neglect of putting out the candles, which they hight to some favourite faint, in their houses and chambers, they have need of fuch a large market to repair to on those occasions. It is called Scorodum, which, in the Ruffian language, fignifies done in hafte, allud-ing to the speedy raifing of the mud wall that surmunds it.

The Strelitze-Siaboda, formerly the quarter of the foldiers, or guards, stands on the east and south-east side of the Cataigorod and the castle: and is itself surrounded and fortified with wooden ramparts, and divided from the rest by the river Moscow; for which reason it is stiled a slaboda, or suburb.

Though the houses of the people in common are poor huts, those of the nobility and opulent, are fine fabricks of brick and ftone: most of them having, on the back part, large courts and gardens, which are spacious, in ample order, and surrounded with high and strong walls. The streets are not paved with stones, but boarded with thick fir planks.

Churches and chapels here, including those that belong to monafteries, are computed to amount to above 1500. Some of them are very large and flately; that, particularly, which is in the Crimline, or grand imperial palace, is a vaft, ancient building: on the right fide of the altar is the Czar's throne, and on the left that of the patriarch; and in the body of the church hangs a chandelier of immense weight and value. The very jewels, and other coffly ornaments, that enrich a picture of the Virgin Mary here, are valued at half a ton weight of gold; befides a valt number of chalices, pixes, patins, flatues, and other church utenfils of gold and filver, finely wrought, and enriched with precious stones; a vast number of other priestly vestments of great value, and an immense quantity of donations and prefents offered to the relicks of three eminent Ruffian faints, which are here interred. So that the treasure of this church is deemed equal to that of any church

The fuperb church of Saboor is 90 feet in length, hath a flately dome, supported by four large pillars, and is, though in the ancient the magnificent within and without. That of St. Michael is the repolitory of the dead czars, and of all the royal family of the male fex. The bodies of the princeffes of the blood are interred in the ftately abbey of the nuns, called Tzudoff

Monastir, in the same castle, and near the church above-mentioned. The tombs of the princes who never reigned, are in a feparate chapel. The palls with which their coffins are covered are superb. Those of the czars especially, are of the finest velvet, and have either a maffy or embroidered golden crucifix upon them, of curious workmanship, and enriched with vast variety of costly ornaments, especially inscriptions, which are mostly done with pearls and other precious

Monasteries of men and women are here numerous; and, in general, next to the palaces and noblemen's houses, some of the best edifices in the city; the founders of them have spared no cost to adorn them with curious architecture, paintings, gardens, and every thing that is convenient and beautiful. There is one thing that is convenient and beautiful. called Dewitze Monastir, about a mile out of the city; in which the ambitious princels Sophia, who had concerted fo many plots against her brother the czar Peter I. was at length confined, and ended her days. fituated on a spacious plain, and hath 300 nuns belong-ing to it, who lead a very regular life, and never stir out of their limits, as fome others are permitted to do.

These are only allowed, on holidays, to walk on the terraces round their gardens, which are raifed to a convement height for them to enjoy the prospect of the

adjacent plain.

Of the monaftery, church of Jerusalem, &ct. a late traveller gives the following account: "The church, bishops, priefts houses, &c. are all enclosed with high brick walls; the wall, forming one fide of the bifnop's palace, all built on a beautiful detached hill; having on the east, north, and west, the finest lawns in the world, through which glides a noble river. In the plain, upon the banks of the river, stands the builder's romantic house, all built of stone. It is quite alone, three stories in height, in every one of which are four rooms, except the ground flory, where are his kirchen, store-room, and a room for his attendants. The area of each of these rooms is but about eight, or at most but nine, feet square. In every one is a small stove. His bedstead is of stone, as are his bed and pillow. His chairs are of the same materials. Every story of his house is vaulted; and it is flat on the roof, for the convemency of taking a view of the country. It has but one entry, and every room receives light from one window of the least fize. The builder was an hermit, and a religious devotee. The hospital is not large, but well provided with every accellary but medicine, prayers being (in their opinion) fufficient to cure all difeases which appear in this holy place. At the west end of the church is a most capacious cupola. The dome is very magnificent and high, with a gallery which furrounds it near the top. The windows are dome is very magmacent and the windows are which furrounds it near the top. The windows are which furrounds it near the top. The walls are all hung withly large, and it is well lighted. The walls are all hung round with various pictures of the faints, very richly adorned with filver, gold, pearls, and precious ftones; and the altar is very grand, and adorned with various pieces of curious workmanship.

The late czar Peter I. founded here three colleges,

which he took care to fill up with men well versed in arts and sciences, and all kinds of literature, for the polishing of the next generation. The first is for humanity, rhetoric, and philosophy; the second for mathematics; and the third for navigation, altronomy, and other feiences subservient to them. In all these youth are kept under strict discipline, and have, at the same time, all due encouragement to excel in their respective studies. To these the same prince added a dispensary, which is not only one of the finest structures in Moscow, but one of the best furnished with all forts of medicines, drugs, &c. in Europe. It is put under the care of fome Germans, who are allowed the best matters in that art, shough the most slovenly in their compositions, never studying to please the eye or taste in their prescriptions, as we do in England, but nauseate their patients by the inelegance of their drugs, which could not possibly be taken by the people of any other

country. 20,000 rul nishes not cipal cities

cipal cities in the empire with medicines.

We cannot omit to mention, in this place; the foundling hospital, founded by the present Empress, supported by voluntary contributions, well endowed and conducted by very judicious regulations. It is a grand pile of building, and contained 300 foundlings fome few years ago; but their number is, in all probability, much increased. The children are taken great care of, and, at the age of fourteen, have the liberty of choosing any particular branch of trade; and for that purpose there are different species of manufactures established in the hospital. When they have gone through a certain apprenticeship, they are allowed the liberty of setting up for themselves. A sum of money is bestowed upon each foundling; and they are permitted to carry on trade in any part of the Russian empire. This is a great privilege in Russia, where the peasants are slaves, and cannot leave their villages without the permission of their masters.

The courts of judicature, cuftom-house, and other offices, are generally large, and built of stone; and resemble gaols, and, indeed, are such in some sense; having apartments for debtors, as well as criminals, who are kept there chained up. Justice is in general administered with some strictness and severity; but the people here being naturally lazy, and given to drinking, the whole city swarms with beggars and vagabonds, and mostly of such a sturdy breed, that it is dangerous to deny them alms. This makes it very hazardous to walk the streets in the night; for they frequently lurk in corners, with a short truncheon, or bludgeon, in their hands, which they throw at the heads of passengers with such dexterity, that they seldom sail of knocking them down, after which they rob and murder them, and go off. These disasters have happened more frequently on holidays, and especially during the carnival. When a person was sound murdered, they carried the body to a certain place, where it lay exposed a day or two; and, if it was not owned, it was flung into a deep large pit, made to serve on all such occasions. On the Whistuntide holidays, some priests came thither to say mass for their souls.

Murders were formerly fo frequent in Moscow, that few nights passed without some people being sound dead in the streets in the morning. The villains went in strong parties, and slew before they robbed. This they did with so little sear, that they often performed it before the perfon's own door; and the terror of these ruffians was so great, that none of the neighbours dared affist the unhappy victim, for sear of being butchered themselves, or at least having their houses burnt. This obliged people, who had occasion to be in the streets in the night, to go in companies together, or have a sufficient guard of servants on horseback to attend them. The weapon used by these ruffians was called a dubien, which was a long stick, with a round knob at one end, and made heavy with iron, with which they struck a man dead at one stroke; and if any one of them happened to be taken, a good sum of money, from the gang they belonged to, would generally get them off.

The highways are also much insested by these rashonies, as they were called, which made it very dangerous travelling in any part of Russia; for they had their spies in the towns, who informed them when any person was so set out on a journey, and how they were to be attended. According to this information they prepared themselves for an attack, and way-laid them in some

wood through which they were to pass.

The writer of this account was informed by a gentleman of rank and veracity, that the Czar himself had been attacked in his younger days, in the following manner. Going upon a visit one evening, attended by two servants, the one riding before, and the other standing behind the sledge, up came a sledge with eight rasponies in it, and were just going to fasten his sledge to theirs with a grappling iron, which they con-

monly used on these occasions; but the Czar being them young, stout; and vigorous, got up and seized one of the robbers by the hair of the head; pulled him out of their sledge; and keeping his hold, drove out of their reach, dragging the sellow along with him till he reached the house of the hobleman he intended to visit, which he entered all of a sweat; still holding the fellow by the hair.

When the ruffian understood it was the Czar they had attacked, he shook and trembled, saying, if they had known who he was; they would not have meddled with him; and then begged he might be put to death without being put to the torture. To this his majesty consented, on condition that he discovered the rest of his gang; but this he would not do; without a promise of his life, and a reward, which was also granted him; and he went with a detachment of soldiers to the rendezvous of his companions, and coming to the house; he called to them to open the door. On hearing his voice they directly opened it; so that the soldiers rushed in, and seized not only his seven accomplices, but thirteen others of the same gang, who were soon after all executed, except the informer.

At another time the Czar was attacked on his way from Moscow to Novogorod, when he was attended by four fervants only. Going from Tever he was stopped by a strong party of rasbonies, on which he immediately jumped out of his sledge with a sword drawn in one hand, and a coeked pistol in the other, and told them he was the Czar, asking them what they wanted? They replied they were poor fellows, reduced to great want; and as he was their lord and mafter, he was the properest person to relieve them. He told them he had no money about him; to which they answered, if he had they would take none from him; but defired that he would give them a written order to the governor of Novogorod, for what fum he pleafed to bestow upon them; begging that it might be such as would relieve them from their straits. The Czar then asked them if 1000 rubles would be sufficient; and on their saying they would, he wrote an order for that fum, payable at fight; for which they dispatched one of their number, who very foon returned with the money. They then obliged the Czar to return to Trever, and to pledge his royal word not to profecute, or even enquire after them; promifing to amend their lives, and become good fubects for the future. Instead of proceeding to Novogorod, the Czar returned back to Moscow?

The city of Moscow is much decayed from its ancient grandeur and opulence, fince the building of that of Petersburg. However, it is full of inhabitants; and all kinds of provisions are brought to it in great plenty, and fold very cheap; fish being the only dear food, which is occasioned both by the number of inhabitants, the four lents, and other fafts, that are observed by the Ruffians. This cheapness hath so far lowered the price of land all about the country, that the nobility and gentry are great sufferers by it, their estates being reduced to little more than one-third of what they formerly brought in, when the city was in its flourishing state. The canal, made by the order and direction of the late Peter the Great, to open a communicationbetween this metropolis and his new-built and favourite city of Petersburg, and, by that means, to the Baltic and German Ocean, is a great and noble work, which hath been some time finished; at an immense charge and labour, running between two cities, which, in a direct line, stand near 90 leagues afunder. It begins at Peterfburg, on the river Niewa, or Nieva, which empties itself into the gulph of Finland, and going up that river quite to the lake of Ladoga, croffes it at the fouth end, and enters into the Woltoff, another river, which flows thither from the province of Novogorod. From the capital of that province begins what is properly called the artificial canal, which, passing through the territories of Brog-nitz, Chrestitz, Chilolova, Witschna-Voloscha, Torschock, the province of Twere, and the dittrict of Kiln, reaches, at length, the city of Moscow, and enriches it by the vast quantities of merchandize that are

brought to and from that capital.

There is a very confiderable manufacture at Moscow of various hemp fabricks, particularly fail cloth and sheeting, which employs some thousands of looms, and many thousands of people. The hemp is most of it brought from the Ukraine. There are also great numbers of confiderable merchants here, who carry on a very extensive commerce with all parts of the empire; for there is water-carriage from hence to the Black and Caspian Seas, and with but few interruptions to the Baltic alfo, which are circumstances that make it the center of a very great commerce.

This city is much better fituated for the metropolis of the empire than Peterfburg. It is almost in the center of the most cultivated parts of it; communicating, in the manner above-mentioned, with the three inland feas, not at a great diffance from the most important province of the empire, the Ukraine; open to the fouthern territories on the Black Sea; and, by means of the rivers Wolga and Don, commanding an inland navigation of prodigious extent. Its vicinity also to the countries which must always be the feat of any wars with the Turks, the enemies most to be attended to of all those with whom the Russians wage war, upon the whole made it infinitely a better fituation for the feat of government, than that of Petersburg, which is at the very extremity of the empire, and possessing few of those advantages. Founding that city, and making it the feat of foreign commerce and naval power, was an admirable exertion of genius; but the feat of government, in our opinion, should always have been at Moscow. This city lies in lat. 55-42. Ion. 38. 45. E...
Treytza is a small but handsome town, samed for

the stately monastery of that name, or convent of the Trinity, a spacious building, with three large gates, and a noble church, standing in the middle of the square. The abbot here is fo rich, that he has 60,000 peafants dependent on him, befides other revenues. The czars have some apartments for themselves, and a noble palace, ftrongly fortified. In this monaftery it was that the late czar Peter I. in his younger days, was forced to retire, to fecure himfelf from the fury of the Boyard Couzantki and his Strelitzes, who plundered and murdered all opponents in his metropolis; and from the plots and conspiracies of his ambitious fifter. It stands

about 40 miles north of Moscow. Columna is fituated near the confines of the duchy of Rezan, on the western shore of the river Occa, which divides it from flaboda, or fuburb, on the opposite fide. It is almost of a round figure, half a mile in compassivell fortified with a stone wall, fix fathoms high, and two thick, and slanked with stout and high towers, at the distance of 200 paces from each other; but it is now gone to decay, and is almost ruined on one fide. The fuburb, which is called Columnia Slaboda, is the place where the merchandizes are exposed to fale. The city hath nothing confiderable in it except the fine flately church of the Virgin Mary, and the archiepifcopal palace; being therefore dignified with the title of an

archbishopric.

Colomensko is a small city in the neighbourhood of Moscow, fituate on an eminence, from which it yields a beautiful prospect. Here is a handsome church, with two high towers, and a ftately monastery. It hath two avenues to it over the Mosca, which must be croffed over a float of timber fastened together, so as to be loofened and divided, to give paffage to the veffels that go up and down.

Mofaitch is another town fituated on the fame river, about nine leagues touth-west of the city of Moscow, but not to confiderable at prefent as it was formerly.

The Duchy of Rosrow is a rich and plentiful country, and was formerly the first duchy in all Russia, next to that of Novogorod. It was governed by its own dukes, till the czar Iwan Bafilowitz put the last of them to death, and feized on this territory, anno 1564. It was afterwards affigned for the maintenance of the Czarowitz, or heir apparent. Roftow abounds with corn, fruit, herbs, game, &c. The capital, called Roftow, is a large town and metropolitan fee, fituated on the lake Roftow, from whence iffues the fmall river Cobris, or Kolfpar, which runs into the Volga. This city stands about 120 miles to the north of Moscow, and contains fome elegant stone churches.

Uglitz, fituated on the Volga, about 80 miles to the weltward of Roftow, is celebrated for the excellency of the bread made in it. It was here that the young prince Demetrius, fon of the czar Iwan Bafilowitz, was murdered by order of his brother-in-law, Trederowitz Gadenaw, during a tumult, which was occasioned by a conflagration made on purpole, and the murderer

usurped the throne.

Chlopigorod was formerly a place of confiderable trade, but is now gone to decay.

Periflaw is a large populous town, flanding at an equal diftance from Morcow and Roftow. The other towns and villages are known by the names of Mologe, Semebratoff, Guo, Imbilowa-Nova, and Baima-Nova; but none of them contain any thing remarkable.

The Duchy of YEROSLAWLA is exceeding fertile, abounds with corn, cattle, and honey, and is watered by the Volga, which runs through the heart of it.
The capital, Yeroflowla, is a ftrong, well fortified,

large, populous city, containing 40,000 inhabitants. It is about 36 miles to the northward of Rostow, and has a confiderable trade in corn, cattle, leather, honey, &c. The other towns of this diffrict are Roma-Nova, and Dornelofke; but neither of them contain any thing worthy of observation.

The Duchy of BILEJESORA is a very finall province, nearly circular, and derives its name from a lake called Biele-Ozoro, or the White Lake, which is 40 miles long, and 20 broad, and on the banks of which stands the capital of the fame name. The whole is so much encumbered with lakes, fens, bogs, woods, &c. that the roads, in general, are utelefs, except in the winter, when the frost renders them passable. There is plenty of fish all over the province, and some parts afford corn

The capital, Biele-Ozoro, or Belozera, is ftrongly fortified, hath an important castle, and is surrounded by the waters of the before mentioned lake. Upon the whole, it is a large and populous place.

The Duchy of Vologda is large, woody, mountainous, full of lakes, fens, and abounds with fifth and game, but is deftitute of most other kinds of provisions.

Vologda, the capital of this province, fituated on both fides of the river of the fame name, is a capacious, populous, and commercial place, as, befides natives, many English, Dutch, and other merchants reside in it. This city is one of the most ancient Russian archiepiscopal sees, fituate near 230 miles to the northward of Mofcow, furrounded by a stone wall, and defended by a strong fortress. The streets are open and regular, the houses handsome, and the markets well furnished, every commodity being fold in a peculiar quarter. The river is broad and navigable, and the cathedral magnificent: befides which here are 20 ftone and 43 wooden churches, three nunneries, with an elegant chapel apper taining to each, &c.

Dwinitza, fituated on a river of the fame name, which falls into the Vologda, is a fmall but well-peopled town. On the river Vologda are likewise two other inconsider-

able towns, named Soofka and Strelitz.

The Province of CARGAPOL has no town except Cargapol, which is fituated on the western banks of the river Onega. The people are exceedingly rude and barbarous. The diffrict of Wiga, and Onega, contiguous to it, are barren and thinly peopled.

The province of DWINA is of great extent, being near 300 miles in length, and in form of a rhombus.

The city of Archangel, or St. Michael the archangel, is advantageously fituated on the east fide of the Dwina, which falls into the White Sea, 18 miles be-

EUROP low it. I the builder

town except

ern banks of edingly rude and Onega, opled. xtent, being rhombus. the archanft fide of the 18 miles below it. The houses are mostly of modern architecture, the builders feeming to have had in view those excellent maxims of defign, which our inimitable poet Pope hath thus elegantly verfified:

To build, to plant, whatever you intend; To rear the column, or the arch to bend; To fwell the terrace, or to fink the grot; In all, let nature never be forgot: But treat the goddess like a modest fair; Nor over dress, nor leave her wholly bare: Let not each beauty ev'ry where be fpy'd, Where half the skill is decently to hide. He gains all points, who pleafingly confounds, Surprizes, varies, and conceals the bounds,

The most considerable edifice here is the palace, or hall, built of large fquare ftones, after the Italian manner, divided into three parts; in one of which the merchants, both Ruffian and foreign, have large and convenient apartments, for themselves and their wares: but after the fhips are failed away, which they commonly do in October, they are obliged to remove to other lodgings. This palace is a large stately building, with a spacious court before it, which reaches quite to the river. The courts of justice, both civil and criminal, are held in it, in their proper apartments. The citadel, where the governor refides, is built after the Ruffian manner, and furrounded with wooden fences, which reach also quite to the river. In it are a vast number and variety of shops, where the Russians store up their merchandizes against the fair. Here is plenty of provisions, as sless, fowl of all forts, especially wild, and fish in great variety. These are fold extra-ordinary cheap, particularly partridges, which commonly fell at about 3d. or 4d. per brace; of which here are two kinds; one like the common fort; and the other, which turn white in the winter, and refume their natural colour in fummer.

The foundation of the commerce of Archangel was laid by the English in the year 1553; and the advan-tages reaped from the Russian trade, induced other nations to refort thither. The gradual increase and prof-perity, however, of Petersburgh, caused this city to decline in the same proportion. Archangel is the see and residence of a Russian archbishop. Our geographers give its lat. 64 deg. 36 min. long. 40 deg. 5 min. eaft. St. Nicholas, a fea-port town upon the White Sea,

is inconfiderable, and the trade triffing.

Colmogorod is a confiderable town, and the fee of a Ruffian archbishop.

Nova Dwinska is a strong fortress, built to defend the mouth of the new canal, or most northern mouth of the Dwina, on the White Sea. It hath a large wooden bridge over that river, with a draw-bridge in the middle, wide enough for two veffels to pass a-breast.

Sottotiza is a very confiderable and populous city, and inhabited by many wealthy merchants and curious mechanics. Near this place is a territory of 70 German miles in extent, named Wolloftufgy, inhabited by men of a different language, and supposed to have come from Livonia. They are civilized, and Christians of the Greek church.

EASTERN MUSCOVY, or RUSSIA.

HIS third division of the Russian empire contains the following provinces. MEZZEN is a long track of land, narrow, barren, woody, fenny, mountainous, and cold. The chief town, called Mezzen, and the few villages which this province contains, are wretched places; and, indeed, the whole region is gloomy and uncomfortable.

The frozen earth lies buried here below A hilly heap, feven cubits deep in fnow. The fun from far peeps with a fickly face, Too weak the clouds and mighty fogs to chase, No. 62.

When up the skies he shoots his rosy head, Or in the ruddy ocean seeks his bed. Swift rivers are with fudden ice conftrain'd, And studded wheels are on their rocks fustain'd. The brazen cauldrons with the frost are flaw'd; The garments stiff with ice at hearths are thaw'd; From locks uncomb'd, and from the frozen beard, Long icicles depend, and cracking founds are heard.

JUGORA, or JUGORSKI, is a very large territory. Its fituation is cold enough to make the land barren and uncultivated; fo that the country is mostly overrun with forests, and covered with lakes and bogs. It hath abundance of rivers.

CONDORA is a large province, with the title of duchy; but so boggy, woody, and mountainous, that it deserves no farther description.

Teesca is a fmall territory, and hath but one town worth naming, viz. Gorodifche, which stands on a small river, that falls about 10 leagues below it into the gulph of Teesca.

PETZORA is a vast territory, extending itself from the lake Petzerskie, on the fouthernmost part of it, quite to the northern or Frozen Ocean; that is, from the 63d to almost the 70th degree of north latitude. Petzora, fituated upon the river of the fame name, about 30 leagues from the fea, is but a small place, and supposed to have been formerly called Puste Osoro, from fome golden mines, or fands, that fell from those Obian mountains into that river. The cold is so ex-cessive here, that the rivers are frozen about eight months in the year. They begin to thaw in the month

of May, and to freeze again in August.

The other towns in this province are wholly inconfiderable.

Voguliza. South of the province last named, are feated the Vogulizi, called also Vogulizi, Vogolskoi, and Vogolitzes. They are a rude, favage, uncultivated people; fo that their religion, customs, and manners, are, of courfe, extremely vague and abfurd. They go dreffed much like the Ruffian peafants; and bury the dead in their best cloaths, together with some money. As there is little corn comes to perfection in their country, they live chiefly upon the milk of their cattle, and fuch game as they kill. They marry as many wives as they can maintain, which they buy of their parents: but they are very ferupulous of marry-ing within certain forbidden degrees of confanguinity.

They have neither cities nor towns, but villages made up of huts, of a conic figure, with a hearth in the middle, and a hole at the top, to let the fmoak out; which hole, however, they cover with a thin transparent piece of ice, to let some light into their huts, as foon as their fewel is burnt to a coal. a woman is near the end of pregnancy, she is obliged to go into a private hut reared on purpose for her, and to live in it separate from her husband. The men shoot elks, fallow deer, and other game. They live quiet under the Ruffian government, and pay their tribute in skins and furs. This country reaches from 62 deg. 30 min. to almost 63 deg. of north latitude.

Permia, or Permesky, is one of the largest pro-

vinces of the Ruffian empire; but it is far from being confiderable in proportion to its extent. The most remarkable river is the Kama, which receives feveral others, and springs from that long chain of mountains which part it from Siberia, and extend themselves from the kingdom of Cazan quite to the Frozen Sea, that is from 55 to almost 70 deg. of lat. Besides this ridge, the country abounds with many more, as well as lakes; fo that its foil is fo far from being fertile, that the inhabitants are obliged to eat peas, beans, and other pulse, instead of bread. They differ likewife much from the nations around them in other respects, as in their customs, religion, &c. and have a language peculiar to themselves. They are subject to the Russians, and pay their tribute in horses, and several kinds of surs. The chief town is

Perma Velikaia, or the Great City, which feems to intimate fomething large and confiderable : but most authors, that have spoken of it, mention it as a place of little note.

Oustroug, or Ustrug, which takes its name from its capital, is not only fmall, but barren, a great part being covered with vaft and impenetrable woods.

These harbour such a prodigious number of black foxes, that their surs are one of the chief commodities The chief town is Ouflioug, Ufting, of this country. The chief town is Ouflioug, Ufting, or Uft Jugh. It is an archiepifcopal fee of the Ruffian church, and hath feveral neat churches built of white ftone, the cupolas and fpires of which are covered The other churches, as well as the over with tin. houses, are built of wood. The archiepiscopal palace, which is a large building, and the best edifices in this city, are on the west side of the river Suchand. other part of it, over the water, is less considerable, but extends itself along the fide of it, in form of a crefcent, a league in length, and a quarter in breadth. It is chiefly noted for a yearly fair for the fale of foxfkins, and other furs.

ZIRANIA, a long, defert, woody track of land, deferves rather the name of a forest than of a province, there being but few fpots inhabited, in comparison of the vaft and impenetrable woods that fpread themselves over it, and breed innumerable quantities of wild beafts. The people, who are here fcattered in villages, or groups of huts, are fierce, brutish, and untractable : they live upon the game they kill, and pay their tribute in furs, with which they make cloathing for themselves, and covering for their houses. The rest they sell and ex-

change to the best advantage they can.

VAITKA, OF VIATKA, has the title of a duchy, and is the last province in that we call Eastern Moscovy, or Ruffia. It is mostly woody, marshy, and barren; yet yields some honey, wax, and surs. It was conquered from the Tartars by the czar Iwan Basilowitz. It is watered by the river of its name, which fprings a little above the town of Sextanoff, or Seftakoff, and, running through that, and feveral other towns, falls into the Kama. This laft runs through another part of the country, and falls into the Volga a little above Cazan.

Viatka, the chief town of this duchy, hath little or

nothing worth notice, except its bishop's see, and a flout caftle, built by the czar above mentioned, to fuppress the incursions of the Scheremisse Tartars. are two high roads that lead from hence to Moscow; the one through Castroma and Galicz, the other through Ufting. The former is much the shorter, but the most troublesome and dangerous, on account of the vast marshes, that must be croffed, and of the Scheremisse

free-booters that infeft those parts Colcinitz is rather a confidential town, fituated near the confines of the kingdom of Cazan, or Casan: and Sladboda, another town, flands more to the north-west, on the borders of the Scheremisse Tartars. the above, this province includes Clinow, Orow, and Kaigorod, all fortified after the Ruffian manner.

Cazan, or Casan, was formerly governed by its own monarchs, who were formidable and opulent till the czar Bafilowitz fubdued the greatest part of it; and the cear barnowtz induced the greater part of it; and this fon, Iwan Bafilowitz, compleated the conqueft of the whole in the year 1554. Cazan has been always confidered as a valuable acquifition to Ruffia; this country being watered by the great rivers Volga and Kama, which increase the natural fertility of the ground, and enrich the whole country by means of commerce.

Cazan, or Cazanum, the capital, is a capacious and populous city, the feat of a Ruffian metropolitan, and contains many churches and monasteries. But the houses, and even the ramparts and towers, are all built with wood. The caftle, however, is of stone; and the river, by furrounding it, forms an excellent fosse; the whole being amply furnished with artillery, ammuni-tion, &c. and well secured by a Russian garrison. At a little diftance from the city, a large commodious dock, for fhip-building, is fituated at the confluence

of the Volga and Cafanka. Cazan is well fupplied, both by land and water, with all kinds of provisions. Wine and fruits are brought hither from Turkey; various commodities, belides groceries, from Moscow: teas from China; and iron and furs from Siberia and Tartary. The fituation is admirable for commerce, which is carried on not only with the abovementioned places, but with Persia, and other parts of the east. Large quantities of Russia leather, bark for tanning, timber for ship-building, &c. are annually sent hence to Petersburg, and other parts of Russia.

The other towns in this province contain nothing

worthy of description.

BULGARIA, formerly called Horda, or the region of Zavolina, was anciently inhabited by the Bulgaras, who made an irruption into those parts from Asia, and conferred their name on this country.

Here it is proper to observe that Bulgaria is divided into Little and Great. Little Bulgaria is fituated on the fouthern coafts of the Danube, belongs to the Turks, having been conquered by Amurath II. and forms part of Turkey in Europe. Great Bulgaria, now under confideration, was subdued by the Moscovite czars, and now is an appendage of the Ruffian empire.

This kingdom is watered by feveral rivers. Near its center are the defarts of Ufa; on the eaftern confines the mountains of Caf, which yield great quantities of iron, as well as some excellent crystals; and, towards the fouthern fide, the great lake Kerghewl. The foil is tolerably fertile, and many parts of the coun-

try populous.

Bulgar, or Bulgara, the capital, is fituated on the Volga, and deemed a confiderable city.

Samara, on the banks of a river of the fame name, which difembogues itself into the Volga, is built on the declivity of a mountain, and the fuburbs stretch along the river. The place is large, but poor and mean: the houses, walls, fortifications, &cc. being all built of timber. This city was erected in one month, by 30,000 men, fent thither, for that purpose, by Peter the Great. The work was directed by Prince Galitzin; and the place is an excellent check upon the Tartars, Cossacks, &c. Near Samara are the ruins of Sunbeska, which was destroyed by Tamerlane the Great: and we are informed, by an eminent voyager, that going ashore, at no great distance from hence, he ascended a mountain where formerly flood the city of Abuchim, and there discovered a stone with an inscription, which a Ruffian interpreted for him, and was to this effect; "Whosoever thou art, if thou hast strength enough to turn me, thou wilt make thy fortune." From this intimation, he and his company, expecting to find fome hidden treasure, immediately moved it from its place, and, on the other fide, found another infcription importing, "This is not the first time thou hast taken great pains to little purpose."

RUSSIAN LAPLAND.

AVING already presented a general description of Lapland, as to the country, inhabitants, cuftoms, manners, &c. as well as observed, that it is divided into three diffinct fovereignties, namely, those of Denmark, Sweden, and Russia, it remains for us, under the last article, to give a brief geographical account of that part which is distinguished by the appellation of Russian Lapland, referring our readers for other particulars to the general description.

Ruffish Lapland is bounded on the north by the Northern Ocean, on the east and fouth by the White Sea, and on the west by Danish Lapland. It is further divided into three parts, according to their fituation. One is called Leporia Mouremanskoi, or Maritime Leporia; Terrikoi, or Inland Leporia; and Bella-

moureskoi Leporia.

The whole territory of Leporia Mouremanskoi is barren, woody, and mountainous; the air extremely cold; the inhabitants rude and ignorant; and, in general. Il fupplied, provisions, irkey; vari-Moscow; Siberia and commerce, ementioned of the east, or tanning, fent hence

defcription tants, cuft it is diviy, those of us, under account of ellation of ther parti-

rth by the he White is further fituation. Maritime and Bella-

manfkoi is extremely nd, in general, neral, the country is much like the Swedish and Danish Lapland formerly spoken of. Most of the islands, cities, and towns, stand on the sea-coasts. The only observation worthy of mentioning concerning any of them is, that there are, in some of them, ancient monsteries; and that the rivers contiguous abound with fish, and particularly salmon.

Terrikoi Leporia, or inland part of the Ruffian Lapland, is almost surrounded with the sea, and is the land that makes the gulph of the White Sea. It is no less woody and barren than the rest; and the chief town in it is Warsiga, situated on the south coast, over-against

Archangel.

Bellamoureskoi Leporia lies at the bottom of the above mentioned gulph, called the White Sea, and, like the rest, is cold, barren, and thinly inhabited. The chief town is Soma, situated at the very entrance into the Russian Lapland, on the White Sea.

NOVA ZEMBLA.

OVA Zembla was a name given to this new difcovered track, which, in the Ruffian language, fignifies New Land. It is feparated from the northern part of Ruffia by the strait called Veigatz, or Wygatz, which lies in north lat. 70 deg. The land that forms this strait is a promontory, advancing southward from the main country, which is supposed to extend itself much farther north. It was long doubted whether this country joined to the continent of Greenland on the west, or of Tartary on the east; but it is now known to be an extensive island.

Nova Zembla was first discovered by the English, anno 1553, when captain Hugh Willoughby failed thither with three veffels, and advanced from the north cape of Finmark as far north as the 72d deg. of lat. where he thought he had deferied this land; but being obliged, through stress of weather, to put into a port of Lapland, he there perished with cold, with all his company. Captain Burroughs failed in fearch of it three years after, and having doubled the above men-tioned cape, discovered the strait of Wygatz, between the fouth part of Nova Zembla, and the north coast of Samoieda. Since that time it hath been often visited, both by Dutch and English, in hopes of finding out the north-east passage; but the coldness of the climate, and the mountains of fnow which covered that whole country, prevented their making any great discoveries. Some Dutchmen wintered there, anno 1 596; but found the cold fo excessive, that they, with great difficulty, kept themselves alive till the next summer. They saw no fun from January 4 to June 24; during which long and dark interval they had no light, but what the moon gave them from the first to the last quarter, in which the shone by day as well as night.

The account they gave of it is, that fome parts of that country is inhabited by a people of low flature, who are idolaters and barbarous. The attempts made after-wards by Barentz, a Hollander, by Hudfon, Wood, and Flaws, proved likewise of little or no consequence to the public, and of destructive consequence to them-Wood, indeed, made fome remarks, which gave him reason to think there was a passage between this country and that of Greenland. Nova Zembla he represents as the most forlorn spot in all the world, the greatest part of which is laid under snow and ice; and that where there are neither of these, nothing presents itself to the view but dismal quagmires, covered with mofs, and fome blue and yellow flowers. Upon digging two or three feet into the earth, they found the ice as hard as marble, which shews how vain it would be to attempt to winter there in caves dug under ground. In other northern countries the ice and frow is observed to melt much fooner on the fea-coafts than in the inland parts; but here it proves the reverse; and the sea, which beats against mountains of it of a prodigious height, hath fo undermined it, that it feems to hang in the air, and discovers such monstrous chasms, as cannot be beheld without horror.

The country, so far as our author had an opportunity to view it, breeds some forts of wild creatures, such as large white bears, foxes, forthe small creatures like rabbits, larger than rats, large penguins, &c. The penguin is of the size of a goose, and the seathers are fomewhat like hairs, and of an afh colour. The wings are very short in proportion to the body, the bill is black, and the legs are of a bright green. They keep in the water all the day; where they feed upon fish. As they cannot fly, they cannot flun their enemies, except by leaping along, which they do pretty well by the help of their short wings. However, this bird is active upon the water, and feems to be very skilful in catching its food. When the fun begins to fet, they retire to the rocks near the fea, where they continue till morning, at which time they are eafily taken. They build their nefts upon the rocks, on the craggy points, to which these birds can get up very easily. Their eggs are very good; but the sless a disagreeable sifty tafte, and is never eaten but in cases of great necessity. It is worthy of remark, that the bird penguin, which is not only common to these northern parts, but likewife in feveral countries in North America, is every where known by the same name, with little or no variation; and that the word penguin, in the Celtic, and in our present Welsh, signifies, a white head, as that bird actually hath. This, together with some great affinity which is found in many of the radical words, and proper names, used by those distant regions, confirms a curious conjecture of the authors of the Universal History, which is, that the descendants of Gomer, the eldest fon of Japhet, were not only the first peoplers of Europe, even in its remotest parts, but have preserved their ancient language more than any other nation we know of, except the Chinese.

The fouthern part has been fince found to be inhabited by a fouat, fwarthy fort of people, who cloath themselves with feal-skins, or with the skin of the bird penguin, with the feathers outward. They live upon what game or fish they catch. They worship the sun and moon; and have some little wooden idols, in human shape, but monstrously carved, or rather notched.

The various romantic tales, and manifest absurdities, advanced by many of the Dutch voyagers, the ridiculous relations of Ferdinand Mendez and Pinto, and the improbable stories of Sir John Mandeville, gave rife to a witty and ingenious satire, written by the celebrated Sir Richard Steele, and published in the Tatler, as if from a manuscript of Sir John Mandeville. The scene being sounded in Nova Zembla, the humour being admirable, and the satire pointed against all voyagers and travellers who attempt to impose upon the public, we shall make an extract from it without farther apology.

The relation being in the first person, as if Sir John Mandeville was the narrator, the words are, "We were separated by a storm, in the latitude of 73, insomuch that only the ship in which I sailed, with a Dutch and French vessel, got safe into a creek of Nova Zem-We landed in order to refit our veffel, and store ourselves with provisions. The crew of each vessel made themselves a cabin of turs and wood at some distance from each other, to fence themselves against the inclemencies of the weather, which was fevere beyond imagination. We foon observed, that, in talking to one another, we loft feveral of our words, and could not hear one another at above two yards distance, and that too when we fat very near the fire. After much perplexity, I found that our words froze in the air, before they could reach the ears of the person to whom they were spoken. I was soon confirmed in the conjecture, when, upon the increase of the cold, the whole company grew dumb, or rather deaf; for every man was fenfible, as we afterwards found, that he spoke as well as ever; but the founds no fooner took air, than they were condensed and loft. It was now a miserable

spectacle, to see us nodding and gaping at one another; every man talking, and no man heated. One might observe a seaman that could hail a ship at a league's distance, beckoning with his hand, straining with his lungs, and tearing his throat, but all in vain.

We continued here three weeks in this difmal plight. At length, upon a turn of wind, the air about us began to thaw. Our cabin was immediately filled with a dry clattering found, which I afterwards found to be the crackling of confonants that broke above our heads, and were often mixed with a gentle hiffing, which I imputed to the letter S that occurs so frequent in the English tongue. I soon after felt a breeze of whispers rushing by my ear; for those being of a soft and gentle fubitance, immediately liquified in the warm wind that blew across our cabin. These were foon followed by fyllables and short words, and at length by entire fentences, and melted fooner or later, as they were more or less congealed; so that we now heard every thing that had been spoken during the whole three weeks that we had been filent, if I may use that expression. It was now very early in the morning, and yet, to my furprize, I heard fomebody fay, Sir John, it is midnight, and time for the ship's crew to go to bed. This I knew to be the pilot's voice; and, upon recollecting myfelf, I concluded, that he had spoken these words to me some days before, though I could not hear them till the present thaw. My reader will eafily imagine how the whole crew was amazed, to hear every man talking, and fee no man open his mouth. In the midft of this great furprize we were all in, we heard a volley of oaths and curfes, lasting for a long while, and uttered in a very hoarse voice, which I knew belonged to the boatswain, who was a very choleric fellow, and had taken this opportunity of curfing and fwearing at me, when he thought I could not hear him; for I had feveral times given him the strappado on that account, as I did not fail to repeat for these his pious soliloquies when I got him on shipboard.

"I must not omit the names of several beauties in Wapping, which we heard every now and then in the midth of a long figh that accompanied them; as Dear Kate! Pretty Mrs. Peggy! When shall I see my Sugain? This betrayed several amours which had been concealed till that time, and furnished us with a great deal of mirth in our return to England.

"When this confusion of voices was pretty well over, though I was afraid to offer at speaking, as fearing I should not be heard, I purposed a visit to the Dutch cabin, which lay about a mile farther up in the country. My crew were extremely rejoiced to find they had again recovered their hearing, though every man uttered his voice with the same apprehensions that I had done,

" And, try'd his tongue, his filence foftly broke."

"At about half a mile's distance from our cabin, we heard the groanings of a bear, which at first startled us; but, upon our enquiry, we were informed by some of our company that he was dead, and now lay in sak, having been killed upon the very spot about a fortnight before, in the time of the frost. Not far from the same place, we were likewise entertained with some post-humous snarls and barkings of a fox."

With respect to those parts of the Russian empire situated in Asia, viz. Siberia, Kamtschatka, Samoieda, Astrachan, together with the Kalmuc, Usbec, Crim, Lesgee, and several other inserior tribes of Tartars, the reader will be furnished with an ample account of them by researing to our description of that quarter of the globe, which forms the first division of our work.

Those countries dismembered from Poland, and annexed to the dominions of Russia, will be treated of under our description of the former, on which occasion we shall consider every material circumstance and transaction relative thereunto. SECTION III.

Persons of the Russians, their different Ranks, Vassalage, Dress, Habitations, Manner of Living, Customs, Amusements, Religion, Ceremonies Baptismal, Matrimonial, Funeral, Sc.

THE Ruffians are, for the most part, of the middle stature, though many of them are tall and comely. Their teeth are remarkably good; their hair, in general, is black; and their complexions ruddy. The severity of the climate, which produces a dry and sharp air, disposes them, in general, to a robust constitution, and enables them to undergo great hardships.

The women are commonly well made, exclusive of their legs, which, as well as their feet, are always large. Their countenances are, in general, agreeable; and

their eyes black and languishing.

Before the time of Peter the Great, the Russians were savage and ignorant in the extreme; but that wise prince, by incredible application, and a proper mixture of severity and mildness, wrought so happy a change in their manners, as, in some measure, set them on a level with the more civilized nations of Europe; and this efforts have been happily seconded by succeeding monarchs, of which the effects have been evident to demonstration.

The court nobility, from the great connections they have had, of late years, with the most civilized European states, seem totally to have emerged from their barbarism into the height of elegance and politeness; and the young Russian nobility, at present, are much improved by studies of taste, and a propensity to

travel.

The people of Ruffia, like those of most other countries, are of different ranks and orders, as princes, nobility, gentry, commonalty, &c. and these have their respective sub-divisions; but it is to be observed, that, of late years, the military rank superfedes every thing, and now regulates every degree of precedency, whatever may be the rank or class of persons.

The Russian nobility exercise a most tyrannical power over the common people, and especially over the peasants, who are kept in a state of abject slavery, being deemed the property of the nobles, to whom they belong, as much as their horses and dogs. Indeed, the wealth of a great man in Ruffia, is not estimated by the extent of land he possesses, or the quantity of grain he can bring to market, but by the number of his flaves. Every flave pays about a ruble (40s.) yearly to his owner; and if he be in the way of making money, the tribute is augmented. In general, every Ruffian nobleman allots to the peafants, that belong to him, a certain portion of land, to be cultivated by them; the produce of which, excepting what fuffices for their own maintenance is paid to the proprietor. In fact, a Russian peasant has no property; as every thing he possesses, even the miserable raiment that shelters him from the cold, may be seized by his master as his own.

The owner has also the power of selling his slaves, or hiring their labour, to other persons. He may also instict on his slaves whatever punishment he pleases, and for any fort of offence. It is against the law, indeed, to put any of them to death; yet it sometimes happens, that a poor slave dies of the wounds he receives from a passionate and unrelenting superior.

Another hardship to which the Russian peasants are exposed is, that they are obliged to marry whatever person, or at what time, their superiors please. Every slave, who is a father, pays a certain tax to his owner for each of his children; and the owner is therefore solicitous that a new progeny be raised as soon as possible.

The condition of those peasants, who are immediate slaves of the crown, is deemed less wretched than that

The dr fpective refort refen worn in tindeed, a drefs, as of those who belong to the nobility; and they are of three kinds. The first are those who have, either-fecretly, or by the favour of a human superior, been able to procure as much money as may enable them to purchase their freedom; and have also the good fortune to live under a superior who is equitable enough to free them for the sum they offer. Such persons, and their children, are for ever after immediate slaves to the crown. On the same footing are all priests, and their children; though the dependance of the inferior on the superior clergy, is sometimes as grievous as the most painful bondage. Soldiers, also, and their children, (and this class includes the whole body of the nobility,) are immediate slaves of the crown.

According to travellers in general, the Ruffian peatants have no name. Indeed, as they have nothing but bondage to transmit to their children, such distinction is uselets. The most common Christian names among them are Gregory, Stephen; Ivan, which they translate Joh; Vasili, which they translate William; with others manifestly derived from their neighbours in the softh. If there are several of a name, they are distinguished by taking the name of their father, compounded with the words which, in their language, signify son or daughter. Thus Ivan Petrowitz, signifies Ivan, the son of Peter; and Anna Ivanowna, signifies Anna, the daughter of Ivan.

Such is the flavery in which the Muscovites of both fexes are kept by their parents, their patrons, and the emperor, that they are not allowed to dispute any match that may be provided for them by these directors, how-foever disagreeable or odious it may be. Officers of the greatest rank in the army, both natives and foreigners, have been saddled with wives by the sovereign in this arbitrary manner. A great general lately deceased, who was a native of Britain, having been pressed by the late czarina to wed one of her ladies, saved himself from a very disagreeable marriage, by pretending his constitution was so unsound, that the lady would be irreparably injured by his compliance.

The Ruffians are brought up with fuch high notions of their fovereigns, and of a blind implicit obedience they owe to them, as the only persons who have sense enough to diftinguish between right and wrong, that they never dispute their will in any thing, except where they at-tempt, as the czar Peter did, an innovation in their religion or customs, which they cannot but look upon as an impeachment of the wisdom of their ancestors who had established them. In all other cases they are so prepoffeffed with the notion of their unerring wifdom and knowledge, as well as of their own ignorance and imperfection that it is a common faying with them, in all dubious cases, "God and the Czar alone know." The very nobility dare not come near the throne without fear and trembling. They are banished into Siberia for the slightest political intrigue; and their possessions being confifcated, one whole family thus falls a victim to the artful infinuations of the courtier. The mutual diffrust in which people live in Russia, and the total filence of the nation upon every thing which may have the least relation either to the government or the fovereign, arises chiefly from the privilege every Ruffian has, without distinction, of crying out in public, flower dielo, that is to fay, I declare you guilty of high treason both in words and actions. All the bye-standers are then obliged to affift in taking up the person accused: a father arrests his son, the son his father, and nature fuffers in filence. The accuser and accused are both conveyed immediately to prison, and afterwards to St. Petersburg, where they are tried by the secret court of chancery.

The dreffes of the Ruffians are adapted to their respective ranks. That of the generality of the better fort resembles, in a considerable degree, the habits worn in the more southern parts of Europe. Some, indeed, at a distance from the capital, retain the old drefs, as well as the custom of wearing a long beard. The women of rank generally wear a loofe gown like a

domino; and both fexes love to appear fine, and confequently drefs as rich as the very extent of their cir-cumstances will admit. They use paint in general, married women as well as young girls; deeming red the most ornamental colour they can possibly bear. Nay, fuch is their fondness for red, that the word denoting it in the Russian language, is synonimous with beautiful. Furs, in the winter, are in univerfal wear; but they are proportionate, in quality, to the different classes. The poorer women commonly line their cloaks with hare skins; and the men, for the most part, have a drefs made of sheep's skin, with the wool turned inwards. On their heads they wear a warm fur cap; and they are very careful to cover their legs, not only with warm stockings, but boots, lined with skins, or a quantity of flannel, which they wrap feveral times round them. Instead of caps, most of the women, of middling rank, use handkerchiefs, which they manage with fuch adroitness, that this kind of head-dress often looks captivating. Their necks are naked, and exposed to the weather. Every Russian, of what rank foever, usually wears, upon the breast, and hanging by a ribbon, or ftring, tied about his neck, a small cross of gold, silver, or lead. They receive their croffes from their godfathers at their baptifin, and never past with them as long as they live.

With respect to the habitations of the Russians, we have already observed, that many of those of the higher class are built of brick and stone; and have only to point out the manner in which the houses, or huts, of the peasants are constructed. This is as follows. A number of trees are stripped of their bark. They are not cut into deals, but laid horizontally upon one another. They are fastened at the end with wooden pegs, and thus, by fixing the end of one tree into another, they constitute the walls. The roof is sometimes of boards, and sometimes thatched. In constructing their houses, the Russian peasantry use very sew instrument. The hatchet is the only one almost among them, and they exercise it with great dexterity. Professed carpenters are excepted in this account.

In Russia locksmiths, masons, carpenters, &c. are formed as a soldier is in other countries. Each regiments has in its own corps, all the necessary artists, and is not obligated to have recourse to manusactures, as is the custom every where else. They determine by the stature, what employment a man is most fit for. They give a soldier a lock for a pattern, with orders to make others like it, and he does it with the greatest dexterity: but the original must be perfect, otherwise he would copy it with all its defects, however easy it might be to correct them. The same may be observed with regard to artists and workmen of all kinds.

The Ruffians, in winter, contrive to make the warmth in their house suitable to the severity of the climate. They give a proper degree of heat to the different rooms by means of an oven, constructed with feveral flues; and their ovens confume a smaller quan-tity of wood than might at first be imagined. A single faggot only, and that but a little one, is put in, and fuffered to burn till the black thick smoke is evaporated. The chimney is then shut, by which the heat is re-tained, and the place kept warm for the space of 24 hours; and this fire ferves not only to warm the rooms, but to drefs the food. The windows, in the houses of the poor fort of people, are very small, that as little cold as possible may be admitted; but in the houses of fuperior persons they are large; and, in order to guard against the inclemencies of the weather, they double glass frames, and are caulked up in the winter. All ranks of people are very expert and nice in regulating the proper heat in their houses by means of a thermometer; and by opening and flutting the flues, they increase or diminish the heat to a great degree of critical exactness.

In the houses of the peasants there are generally one bed for the husband and wise; and one for the children; but all other persons lie promiscuously upon benches, or mats, which they spread on the ground. The beds have no curtains; and, instead of a bolster, the husband and wise have each of them seven or eight pillows, one less than the other, raised up in the form of two pyramids. The requisite benches, a large stove, and a few wooden chairs, make up the rest of the furniture.

At a Russian feast all the dishes are served up at once. It consists of soup, made of meat cut into small pieces; fome ragouts, which none but a Russian can touch; feveral pyramids of game and butcher's meat roafted; Chinese sweetmeats, and Russian fruits. A profound filence is observed at dinner, which is interrupted only at times by the healths which are drank. As foon as they fit down to table, each man pours into his glass fome Russian made wine, and then all rife to drink to each other. Every guest is drank to respectively by his christian and furname, and a drop of wine is swallowed to each person's health. I have (says an accucurate traveller) been at fome of these dinners, when there were more than 66 people all drinking to each other at the fame time. Their attitudes, and the confusion of different founds, had a very singular effect, Peter, not being able to make James hear him, was ftretching over the table, and bawling as loud as he could. At the fame instant he was interrupted by Francis, who was bowing to him; or by a knock of the head from Philip, who was turning about from right to left, without perceiving the posture Peter was in. Philip's turn came next; for as he was fitting his glass to his mouth, his neighbour gave him a jog of the el bow, and spilling part of his wine, interrupted him at his most interesting moment. Such scenes as these, varied in different ways, were repeated at almost every part of the table; and the pleasure of them was enhanced, by observing the impatience of some of the people. As to myfelf, I could never find an opportunity of drinking any one's health, but kept my head in conftant motion to the right and left, and forwards. It is reckoned a qualification to catch the opportunity fo leafonably, as to drink to every person's health without descending from one's dignity, or meeting with

any accident.

"The first health being over, every body sits down, and is at liberty to eat for a few minutes. Glass tumblers, of a cylindrical form, six inches high, and four wide, are placed on different parts of the table. Every guest, within reach of one of these tumblers, takes it up, and drinks out of it. It would be thought very impolitic, if he was to take a glass in order to avoid drinking out of the same tumbler as his neighbour.

"When the company has eat for a few minutes, the empres's health goes round. This toast is given in a different manner. A large glass bottle, to which there is also a glass top, is placed on the table before the person of the highest rank. This person rises from his feat, as well as his right hand neighbour, to whom he gives the head of the bottle, and pouring some wine into the cup, gives out the empres's health, bowing to the whole company. As soon as he hath drank, he gives the bottle to his neighbour, who passes the top to the person sitting next to him. All the company drink the sovereign's health in the same manner, while a band of musicians is employed in singing songs adapted to the ceremony.

"The health of the prince and the princesses of the royal family are then drank in the same order; and eating goes on for a little time longer. The healths of all the guests are then carried round with another glass bottle, which is not so beautiful as the first, and is covered with a crust of bread.

"This toast goes round meanly in the same way as the farmer, except that when the lid of the bottle is given to one's neighbour, it is usual, at the same time, to tell him the christian and the surname of the person whose health is going round; and this must be repeated, making a bow to him. This custom is very troublesome to strangers, as the Russians have generally three or four christian names. This ceremony is carried on

Such is the fare of the great and opulent: but the poor peafants eat a kind of black bread, made of rye, barley, and other grain of an inferior quality. It is four, but not unwholeforme. They eat a great deal of garlic, coarfe oil, and fish. They make no cheefe, and are not much acquainted with the uses of milk. They drink a bad kind of mead, and liquor made of wild fruit: but their chief potation, of which they partake very freely, is extracted from the corn which their country produces. Here it is to be observed, that drunkenness is their prevailing vice. Both men and women accustom themselves to steep constantly after dianer.

Provisions are as well preferred in Ruffia by the frost, as with us by the means of falt; and certainly while it lasts (that is, during the winter months) the former is a better prefervation than the latter; for this reason, that it never alters the talle or quality of whatever it preferves, as falt always does. The frost fixes, for a time, the parts and offy juices, but does not change the Veal, and other kinds of meat, frozen at Archangel, are effected the best of eating at Peterfburg; nor are they diftinguishable from what is fresh killed. Hence the capital, in the winter, is plentifully supplied with all kinds of fresh provisions; and the markets are filled with piles of carcaffes, confifting of frozen hogs, theep, fifth, poultry, vegetables, &c. But it is to be observed, that when any of these are to be dreffed, they must be thawed by immersion in cold water, and not by the means of fire or warm water, asthese would spoil them immediately.

The Ruffians are fond of music, particularly the bagipe; and have a kind of violin, with a large belly like that of a lute. Their music, however, is barbarous and desective. Public schools are established, in which the children are regularly taught to fing. The very beggats ask alms in a whining cadence, and ridiculous fort of recitative: and it is recorded, that a Russian ambaffador at the Hague, having been regaled with the best concert of vocal and instrumental music that could be procured, was asked how he liked the entertainment, and replied, "Perfectly well: the beggars in my country fing just in the same manner." Besides French, German, and Ruffian fingers, who perform before the court in their respective languages, there is fet of Italian fingers. No perfons pay either to go to the play or concert, none being allowed to enter except fuch as have tickets by authority. Some few years fince, an English company of comedians went over to St. Petersburg, where they met with great countenance and encouragement. The playhouse doors are guarded; and if any one should get in without a proper right, they would be severely punished. The Russians are fond of dancing, but in it display very little agility. The lower class are even infantine in their amofements, and divert themselves with fuch gambols as, in our country, would be thought too triffing for children.

They are extremely fond of hot baths and fweating-houses, in which they constantly go once or twice a week, and oftener, if they can afford it, and with so little regard to decency, the women and men make no scruple to go into them promiscuously, and to appear naked there to each other. Upon their coming out of them, they will leap, naked, and recking hot, into a river, if any be near; or pour two or three pails of cold water upon their bodies, to close the pores, and render them healthy and hardy; for they do it even in the heart of the winter.

An ingenious traveller, who was a frectator of this cultom among others, fays, "It was a promifcuous bathing, of not lefs than 200 perfons of both fexes. There are feveral of these public banios in St. Petersburg, and every one pays a few copecks (value a halfpenny English each) for admittance. There are, indeed, separate places for the men and women; but they seem quite regardless of this distinction, and in

or bathe in a flate of absolute nuclity among each other. What is equally extraordinary, they go furt into a room heated to so intense a degree, that it is scarce posfible to breathe in it; and, after having remained there till their bodies are in the most violent perspiration, they inflantly either plunge into the cold water, or elfe throw a quantity of it over them from little buckets, with which they are all provided for that purpose. This may harden a Ruffien conflication, but, I believe, would be found to have very different effects upon an Englith one."

Fireworks constitute a great part of the diversions of the Ruffians, who, if they excel in any thing, it is in making all kands in the artificial way. A traveller, of curiofity, gives the following account of a grand illumi-nation and malquerade; which he faw at the palace of Peterhoff. "1 went down (fays he) to Peterhoff, when there was a malquerade and illuminations in the gifdens. The former of thefe is rather a bal paré en'domino, as there are very few or no fancy dreffes, nor is any character supported. Every person, without diftingtion, is admitted upon this occation; and there were not less than four or five thousand persons prefent. Her Imperial majefty was dreffed in a blue domino, and played at cards most of the night. The illuminations in the gardens far furpaffed any I ever faw in my life. In thefe, as also in fireworks of every kind, I am affured that the Ruffians excel any nation of Europe. Two prodigious arcades of fire extended in the front of the palace. The canal, which reaches to the Gulph of Finland, was illuminated on both fides; and the view terminated by a rock, lighted in the in-fide, which had a beautiful effect. From either fide of the canal went off long arched waiks illuminated; and beyond these, in the woods, were hung sesteons of lamps differently coloured. All the jet d'eaus played artificial cafcades, where the water tumbled from one declivity to another, and under each of which lights, very artificially disposed, amused and surprized the spectators at the same time. Besides these there were summer-houses, pyramids, and temples of slame; and beyond all appeared the imperial yachts on the water, in the same brilliant and dazzling ornaments. Nothing could be better calculated to produce that giddy and tumultuous feeling of mingled wonder and delight, which, though it arifes neither from the understanding or the heart, has yet a most powerful influence over both.

They have also open fledges for amusement. In some of thefe, which are very diminutive, they slide down declivities with amazing velocity, and are mighty fond of this divertion. As Peterflourg is without natural hills, the people raife artificial mounts to enjoy this amusement. They are called ice hills, or glifs ades. The late empress, Elizabeth, was so fond of this diver-fion, that, at her palace of Zarsko Zelo, she had ar-tificial mounts, of a very singular construction, made for this purpofe. These have been called by some Englishmen, who visited the country, the Flying Mountains; nor is there a phrase which approaches nearer to There are five mounts of unequal the Ruffian name. heights, the first and highest of them being full 30 feet perpendicular altitude. The momentum, with which they descend, carries them over the second, which is above five or fix feet lower, just fufficient to allow for the friction and refistance, and so on to the last, from which they are conveyed, by a gentle descent, with nearly the fame velocity, over a piece of water into a little island. These slides, which are about a forlong and a half in length, are made of wood, that they may be used in summer as well as winter. The process is, two or four persons sit in a little carriage, and one stands behind; for the more there are in it, the greater is the fwiftness with which it goes. It runs on castors, and in grooves, to keep it in its right direction; and it defeends with a wonderful rapidity. Under the hill is a machine worked by horfes, for the drawing the carriages back again with the company in them.

The manner of travelling in Russia is extremely commodious, especially in winter, when their fledges glide away on the furface of the ice or fnow with incredible dispatch, and so very little labour to the horses, that they can easily perform a journey of 50 or 60 miles a day. Their fledges are made of the bark of the linden tree, fixed to the fize of a man, lined with forme thick felt; and when a man is laid along in them, he is wrapt up, and quite covered, in good turs. The driver, for the most part, runs by the fledge, to keep bimself warm, or fits at the feet of the person who travels. The fledges being built to very low, should they happen to overturn, there is little danger in the fall. In this mode of travelling the time is mostly spent in seeping; the easy and almost imperceptible motion favouring their When they happen to pass through desarts, or great forests, where they are obliged to remain all night in the open air, they kindle a great fire, round which they range their fledges; fo that being well closed on all fides, and well covered up with their furs, they rest more commodiously than in a country cottage, where man and beafts being lodged in one room, gready diffurb a man's reft.

The greatest inconvenience in travelling in those parts, is the want of inns on the road, which obliges travellers to carry provisions along with them, and other necessaries they may stand in need of. But shole who travel fingly, commonly go post, when they pay the whole expence of the journey at fetting out, and have no more oceasion to put their hand in their pocket till they come to the end of it, which is very convenient. The post boy receives a written order, which he delivers to the next who succeeds him, and so on to the end. They go day and night, having fresh horses every ten miles. They commonly travel an hundred and fifty miles in twenty-four hours, and fometimes go three stages without waking.

In the summer they travel either by water, on the

rivers, with which this country abounds, or by land, on horefeback, by coach, or fleeping waggons; the roads in Ruffia being very broad, beautiful, and eafy for travelling. For paffing the rivers they have a kind of floating bridges, made of large fir trees faftened together, which can support a great weight. But the violent heat of the fummer, and the prodigious quantities of mulketos and flies, are very troublesome, and greatly interrupt the pleafure a stranger would otherwise have in passing through this country, from the beauty and variety of its forests, rivers, and lakes.

The Ruffians profess the religion of the Greek church, the external parts of which confift in a number of fasts, festivals, and geremonies. Lent is observed by them with the greatest strictness. Besides the numerous fixed fafts, the Rustians, at particular times, reject, as impure, horse-stesh, elk, veal, hare, rabbit, affes milk, mare's milk, Venice treacle, and all compolitions which contain any thing of mulk, cafter, or civet. Respecting their images, they suffer none that are carved or graven either in their churches or houses, but fuch only as are painted on wood, in oil colours, by those of their own religion; and the walls of their churches are every where full of them. Over the porches of their churches, in the market place, and over the gates of their enies, you are fure to meet with the picture of fome taint or other; fo that numbers of people are conflantly feen croffing themselves, with a most profound bowing of the head, repeating the Gospodi Pondiu, or God have mercy upon me.

An English traveller relates, that a Russian once coming to him with a mellage, looked about the room for an image, and feeing none, afked him, Where is thy God? He answered in heaven; upon which the Ruffian immediately went away, without delivering his meffage. The traveller, however, in confequence of this, was advised by a Ruffian of rank, with whom he was in a habit of intimacy, to cause a faint's picture to be hung in his room, to prevent giving any farther of-

fence of that kind.

The Russian clergy are, in general, ignorant. There are, however, among them men of learning and ingenuity, but their number is fmall. They feldom preach, as their chief duty confifts in reading prayers and portions of scripture. It must be acknowledged, in favour of the Ruffian clergy, that they are tolerant, and very charitable to those of a faith different from their own. They fay all men may go to heaven; but that the chief places will be affigned to the Ruffians. The clergy confifts, at prefent, in fecular and monastic priefts: the fecular are archbifhops and bifhops; the monaftic are monks. The fecular order may marry: but if their wives die, they cannot officiate in their office, but must retire to a monastery; for which reason the priests in Russia are very kind to their wives. The monastic order is that of St. Basil, of which there are many monasteries in Russia. Each monastery has a prior, who is stilled Archmandit. The monks are not permitted to marry. The Russians never acknowledged the pope of Rome as head of the church, but the patriarch of Constantinople, till the time Constantinople was taken by the Turks. The Russian clergy elected a patriarch, who had his residence at Moscow, and he had fovereign's power in all ecclefiaftical matters, which Peter the Great thinking too great, deposed him, and declared himself head of the church.

The baptismal, matrimonial, and funeral ceremonies of the Russians, are very singular, as their religion consists of outward form, and much superstition.

At baptism the child is dipped three times in a large vessel of water, while the sponsors have each a wax

At baptism the child is dipped three times in a large vessel of water, while the sponsors have each a wax candle in their hands. After the child is dipped, the priest puts on the shirt, and then exorcises it; and, at the end of every sentence, he and the sponsors spit, to shew

they have triumphed over the devil.

Concerning the marriage ceremonies of the Russians, a person of rank, long resident in the country, thus speaks. "The wedding was one of my servants. The match was proposed to the girl's parents, and they approving of it, came to ask my consent. When that was obtained, the man sent her a present, consisting of a comb, some paint, and patches. Then he was admitted to her for the first time. They gave each other a ring, and a promise of marriage; and the wedding was appointed for that day se night. From that time to the day of the wedding, the girls of her acquaintance took turns to be with her night and day, continually singing songs to bemoan her loss out of their society. When the day came, they took a formal leave of her with many tears: and the man's relations came to fetch her, and her fortune, which was a bed and bedding, a table, and a picture of her patron saint."

A very ingenious writer has left upon a record, a whimfical and entertaining account of the fame ceremony. "In 1713 the princess Natalia, only sister to the reigning czar, by the same mother, ordered preparations to be made for a grand wedding, for two of her dwarfs, who were to be married. On this occasion feveral small coaches were made, and little Shetland horfes provided to draw them. All the dwarfs in the kingdom were fummoned to celebrate the nuptials, to the number of ninety-three. They went in grand procession through all the streets of Moscow. Before them went a large open waggon, drawn by fix horfes, with kettle drums, french-horns, and hautboys. Then followed the marshall and his attendants, two and two, on horseback. Then the bridegroom and bride, in a coach and fix, attended by the bride-man and maid, who fat before them in the coach. They were followed by fifteen small coaches, each drawn by fix Shetland horses, and each containing four dwarfs.

It was surprising to see such a number of little creatures in one company together, especially as they were furnished with an equipage conformable to their stature. Two troops of dragoons attended the procession, to keep off the mob; and many persons of sashion were invited to the wedding, who attended in their coaches to the church where the small couple were married.

From thence the proceffion returned in order to the princess's palace, where a grand entertainment was provided for the company. Two long tables were covered on each side of a long hall, where the company of dwarfs dined together. The princess, with her two nieces, were at the trouble themselves to see them all seated, and well attended, before they sat down to their own table. At night the princesses, attended by the nobility, conducted the married couple to bed in grand state; after which ceremony the dwarf company had a large room allotted them to make merry among themselves. The entertainment concluded with a grand ball.

Whether the custom of the bride's presenting her spouse with a whip, on her wedding-day, in token of submission be still in vogue in the more remote parts, since they have been polished in these latter reigns, we will not affirm, but there is authority fufficient to believe it to have been an ancient one; and our English reader will not, perhaps, be displeased to be told whence it had its rife. Russia is now part of the ancient Sarmatian Scythia, whose inhabitants, having formed a defign to feek fome new and better habitations, left their wives and country under the care of their flaves, went and conquered a great part of Greece, and held it a confiderable time; during which, their wives, hearing no tidings of them, and unwilling to lofe their teeming-time, took the flaves to their beds. The mafters returning from Greece, the flaves defigned to oppose them. Both fides being drawn up in order of battle, one of the Sarmatians, addressing himself to his fellows, observed, that they should debase themselves by using the fword and spear against slaves, whom they had formerly overawed with the found of a whip. He therefore proposed, that every man should arm him-felf with this weapon only. The advice was immediately purfued, and they attacked the enemy with fcourges. The flaves had been fo accustomed to dread this instrument, that they were instantly seized with a panic, and sled with the utmost precipation. The prisoners were pursued with vigour. A great part of the women made away with themselves, and the rest fubmitted to flagellation, which was feverely exercifed. In memory of this event, and as a warning to Ruffian wives, the whip, or fcourge, is one of the first wed-ding presents, and hung up in the most conspicuous part of the house, that, by presenting itself continually to the good woman's eyes it may never slip from her remembrance.

The Russians may not marry any one that is related to them within the fourth generation. Those of an equal degree of consanguinity, call each other brother and fister, with the distinction of first, second, and so on to the fourth degree; and those of a higher or lower degree, are called uncles, nephews, &c. with the same distinction. At their christenings they commonly have three or four godsathers, with an equal number of godmothers, who, after that ceremony, deem themselves so nearly related, that they can no more marry each other, than if they were children of the same parents.

The following is an account of the ceremonies of a Ruffian funeral, as performed on the demife of a lady of the first rank, given by an eminent traveller then present. "She died in childbed, and was buried with great pomp. After the company had sat some time, they all went into the room to the corpse. The costin was open. She was dressed in an undress, as she died in that condition, (otherwise she would have been sull dressed,) in a night gown of silver tissue, tied with pink ribbons. On her head was a sine laced mob, and a coronet, as princess of the Roman empire. Round her forehead was tied a ribbon, embroidered with her name and age. In her lest arm lay the child, who died a few minutes after its birth, dressed in silver tissue. In her right hand was a roll of paper, which was a certificate from her consessor to 5t. Peter, which ran thus. "We do certify by these presents, that the bearer hereof has always behaved and lived among us as became a good Christian, prosessing the Greek religion;

and although the may have committed fome fins, the has confessed the same, whereupon she hath received abfolution: that fhe has honoured God and his faints; that the has not neglected her prayers, and has fafted on the hours and days appointed by the church: that the has always behaved herself towards me, who am her confessor, ir such a manner, that I have no reason to complain of her, or deny her the absolution of her fins. In witness whereof we have given her those testimonials, to the end that St. Peter, upon fight of them, may not deny her the opening of the gate to eternal blifs.

"When all the company were ranged in the room, her fervants came to take their leave of her, the inferior first. They all kissed her hand, and the child, asked her pardon for any crime they had committed, and made the most terrible noise imaginable, rather howling than crying. After that her acquaintance took their leave, with this difference, that they kiffed her face, and made a hideous noise, though not so bad as the others. Then came her relations, the most distant ones first, When her brother came, I really thought he would have pulled her out of the coffin. But the most moving scene was the husband, who had begged to be excused this dismal ceremony; but his brother thought he ought to comply with the Russ custom, left, as he was a foreigner, it should be deemed a slight. He was brought from his own apartment by two gentlemen, as supporters, and they were really, in this case, more for use than shew. He had true but filent sorrow painted in his face. When he came to the door of the room where the corpse lay, he stopped and asked for some hartshorn; which, when he drank, and feemed to have armed himself, he advanced to the coffin, and there fainted. When he was then out of the room, and recovered, the corpse was carried down and placed in an open chariot. A great train of coaches followed; and, as a general officer's wife, a party of guards. She was carried to St. Alexander's monastery to be buried; and though the coffin lid was put on as the corpse passed the streets, it was taken off again when it came into the chapel; and the fame ceremony of leave was taken over again, except by the hufband, who was carried home in a fecond fainting fit, the moment the coffin was uncovered. The reft of the ceremony was much like the Roman Catholics. When the corpfe was buried, all the company retired to the house, to a grand dinner, which had more an air of rejoicing than mourning, as every body seemed to have forgot their forrow: but the hufband was affected with too much real forrow to attend."

SECTION IV.

Language, Heraldry, Government, Modes of punishing Criminals, Coins, Weights, Measures, &c. of Russia.

HE Ruffian language derives its origin from the old Sclavonic, but at present differs much from it; and, with respect to religious subjects, abounds with Greek words. Their alphabet confifts of a corrupt fort of Greek characters, to the number of 38. Various dialects are used in the different parts of the empire, as the Muscovite, the Novogrodian, the Ukraniah, and that of Archangel.

The arms of the fovereigns of Ruffia are, a Field Or, with a difplayed Eagle Sable, bearing a Shield Gules on her breaft, charged with a Cavalier Argent, fighting with a Dragon Sinople. On and between the heads of the eagles are the three crowns of Moscow, Cazan, and Aftrachan. According to others, they were Sable, a Portal open, with two leaves, and as many Steps, Or. The former was taken by John Basilowitz, anno 1540, on pretence that the Russian princes Rurio, Sinaas, and Truvor, were descended from the empty. Augustus. The eagle, however, spreads not its wings like the imperial, but hangs them down; and the knight fighting with the dragon was added, in memory of the total de-No. 63.

feat which the czar Demetrius gave to the Tartars in the Rulicoceian field.

The government of Russia is absolute despotism. The fovereigns, if males, were called czars; if females, czarinas; but at prefent the imperial title is affumed. The people are no less slaves than formerly, but much of the power of the nobility is fwallowed up in the great importance and authority of the crown. The fovereign appoints wavoides, or governors of provinces, and bestows all offices of confequence, whether ecclefiaftical, civil, or military. The czar Peter introduced the titles of count and prince of the empire, and instituted an order of knighthood in honour of St. Andrew, the patron of Ruffia, diffinguished by a blue ribbon and a star.
