Vol. 3.

Toronto and Montreal, Canada, January 14, 1893,

No. 49

THE CANADIAN CONTRACT RECORD.

PUBLISHED EVERY SATURDAY As an Intermediate Edition of the "Canadian Architect and Builder."

Subscription price of "Canadian Architect and Builder" (including "Canadian Contract Record"), \$2 per annum, payable in advance

C. H. MORTIMER, Publisher,

CONFEDERATION LIFE BUILDING, TORONTO.
Telephone 2362.

64 Temple Building, Bell Telephone 2299. Montreal.

Information solicited from any part of the Dominion regarding contracts open to tender.

ADVERTISING RATES ON APPLICATION.

At its Convention held in Toronto, Nov. 20 and 21, 1889, the Ontario Association of Architects signified its approval of the OANADIAN CONTRACT RECORD, and Pleaged its members to use this fournal as their medium of communication with contractors with respect to advertisements for Tendera.

The following resolution was unanimous. ly adopted at the First Annual Lecting of the Province of Quebeo Association of Architects, held in Montreal, Oct. 10th and 11th. 1890: "Moved by M. Perrault, seconded by A. F. Dunlop, that we the Architects of the Province of Quebec now assembled in Convention being satisfied that the CANADIAN CONTRACT RECORD affords us a direct communication with the Contractors .- Resolved, that we pledge our support to it by using its columns when calling for Ten-

Subscribers who may change their address thould give prompt notice of same. In doing so, give both old and new address. Notify the publisher of any arregularity an delivery of paper.

TENDERS

Will be received by the undersigned for the following works required in the erection of a church building at Cote St. Antoine until noon of Friday, the soth day of January:

I Jaduary: MASON AND BRICKWORK. CARPENTER WORK. ROORING WORK, PLASTER WORK, PAINTING AND GLAZING.

mmittee do not bind themselves to accept the

ELECTRIC WIRING.

Two young men (who wish to continue work plants in factories, or wire houses in best style, are open for employment. Can satisfy as to experience. Apply, "Electric," Box 1464 P. O., Montreal.

TENDERS

Will be received until WEDNESDAY, 25TH INST., for the erection of a

BRICK PRESBYTERIAN CHURCH

at East Toronto Village. Plans and specifica tions may be seen at my office or at the residence of Rev. Mr. Johnston, East Toronto.

HENRY SIMPSON, Architect.
91 Adelaide St. East, Toronto.

CONTRACTS OPEN.

MOSBORO, ONT,-Mr. Wm. Berner is making arrangements to erect a new house.

KINGSTON, ONT .- Mr. Wm. Phillips, of Toronto, was in the city recently making arrangements for the building of a steam yacht.

BRANDON, MAN.-A company is being formed at this place, with a capital stock of \$100,000, to erect a woollen mill. Particulars may be obtained from the Mayor.

WINNIPEG, MAN.-C. H. West, Chairman Committee on Works, will receive tenders until noon on January 16th for the supply of 800 cords of cedar block paying wood.

HAMILTON, ONT.-It is proposed to erect a school house in connection with the First Methodist church, to cost \$8,000.-It is urged that the city purchase the old post office building on James street and convert it into a police headquarters.

NIAGARA FALLS, ONT.—It is said that the Ontario Legislature will shortly be asked to grant a charter to a company to be known as the Ontario Niagara Electric Railway and Power Company, the object being to build an electric railroad from this town to St. Catharines.

STE. CUNEGONDE, QUE.-The municipality will ask the Legislature of Quebec to amend its charter so as to authorize the corporation to expend the sum of \$425,000 raised by the sale of the waterworks for the purpose of constructing asphalt pavements. The Council has already passed by-laws appropriating the money for the

LONDON, ONT .- A syndicate of Cleveland, Ohio, capitalists is endeavoring to secure control of the London & Port Stanley Railway. The commany agree to establish a commercial line hetween Cleveland and this city, and to erect a large hotel and slip-dock at Port Stanley .- G. Craddock, architect, will receive tenders until the 18th inst, for the different works required in making alterations and additions to the residence of Mr. G. C. Gibbons, on Dufferin avenue,

QUEBEC, QUE.-A number of Quebec capitalists, among whom are Messrs, Frank Ross, R. R. Dobell, Hon, P. Garneau, John Sharples and Hon. I. Thibaudeau, have secured the Great Northern road, with the intention of making it a link in the trunk line between Quebec and Parry Sound. Two short links, one of 75 and the other of 35 miles, are required to make the connection. It is expected that arrangements will be made to proceed at once with the work.

HALIFAX. N. S. - The Board of Commission ers of City Works will receive tenders until noon on Monday, February 20th, for the manufacture and delivery of about 2,400 tons of cast iron pipe and necessary specials and valves. Plans and other information may be obtained from the City Engineer.- The Board of Works has decided to call for tenders for the construction of a sewer on Guttingen street, from Cornwallis to Gerrish street. and for the one connecting Kempt road, Agricola and McCarra streets.

VICTORIA, B. C.-An English syndicate has purchased a site on the corner of Douglas and Broughton streets and it is said will erect a large business block thereon. - The owners of the pro

perty at the corner of Yates. Government and Broad streets have decided to erect a fine new block of buildings on the site. - A site has been chosen at William's Head for the proposed quarantine station which the Dominion Government propose to establish. The total cost of equipping the station will be about \$00,000, out of which the sum of \$30,000 will be required for constructing a wharf. The Aibert Iron Works, of this city, is at present engaged in building the steam

MONTREAL, QUE .- Tenders will be received by the Road Committee of the City Council until Wednesday next, the 18th inst., for the excuvation and masonry for a subway to be constructed under Notre Dame street on Berri street. Plans may be seen at the office of the City Surveyor -Tenders are also asked by the Road Committee until the same date for the excavation, masonry, and steel superstructure for two bridges on Seigneurs street, over the tail races, one at Ogilvie's mill and one at Shearer's mill, the tenders for steel superstructure to be accompanied by strain sheets giving sizes. - The City Surveyor has been instructed by the City Council to ascertain the cost of widening Chaboillez square in line with Bonaventure depot.

OTTAWA, ONT. -The Temiscounta Railway Company will apply in Parliament for permission to continue their railway from Edmundston to St. Leonard's, N. B., there to bridge the river St. John to Van Buren, Maine, so as to enable them to make connection with the Bangor and Aroostook railway. It was stated that tenders for the new bridge across the Gatineau river would be called for during the month of December, but owing to the extra cost of construction during the winter months the work will be delayed until spring.—The Secretary of the Department of Public Works will receive tenders until Friday, 3rd of February, for the erection of a post office building at Calgary, N. W. T. Plans may be seen at the Department of Public Works, this city, and at the office of H. S. Johnson, Calgary.-Tenders are also asked by the Department of Public Works until Tuesday, the 31st inst,, for the erection of a post-office at West Farnham, Que.

TORONTO, ONT .- Mr. W. G. McWilliams, solicitor, gives notice that application will be made to the Ontario Legislature at its next session for an act to incorporate a company to construct a railway from this city to Gravenhurst. Parry Sound and French river, thence westerly to connect with the Canadian Pacific railway at Spanish river and from French river northerly to Sudbury, also to construct and operate telegraph and telephone lines, wharves, piers, bartiors, storehouses and elevators.-A meeting of the shareholders of the Nipissing & James Bay Railway was held in this city last week at which it was urged that work on the line should be procecded with during the coming season.-The Mayor has given instructions to advertise for tenders for improving Ashbridge's Bay, according to the plan prepared by the City Engineer. The council will be asked to provide the funds out of the general taxation. - The Toronto & Richmond Hill Street Railway Company, 91 Adelaide street east, will receive tenders up to January 20th for the supplying of 30,000 ties and 600 trolley poles.

to be delivered before March 20th at the C. P. R. station, Bathurst street, or Forest Hill station, G. T. R. Belt Line. The ties are to consist of cedar, tamarac, hemlock, or white oak, 7 feet 6 inches long, 6 inches thick and not less than 6 inches face. I rolley poles to be of sound, straight cedar 30 feet long and 7 inches, diameter at small end. clear of bark, -Messrs, Voorhees & Co., of New York, have purchased a site at the corner of Wel lington and Simcoc street, this city, on which they will erect a large biscuit factory, at a cost of \$100,000. - The East Toronto Presbyterian con gregation have decided on the erection of a new church, to be situated near the present building, Tenders will be called for at once. - The chief of the Fire Brigade has recommended to the Fire and Light Committee that a large fire hall be built west of Yonge street and south of Queen street for the accommodation of large apparatus and appliances. He also calls attention to the necessity of purchasing and equipping a first-class steam fire engine. -The Committee of Works has decided to call for tenders for moving out the buildings south of Union Station in connection with the Esplanade improvements, in accordance with the report of the surveyors, also to construct the necessary cribbing and filling in to the new wind-mill line. Work on the York street hadge and the new Union Station will be begun at and the new Union Station will be begun at once.—Plans have been prepared and submitted to the trustees for the erection of a new church for the Fern avenue Presbyterian congregation.—A building perint has been granted to Chas. E. Bailey, Sussex Ave., s. d. 2 story and attic bk. dwellings, w. side St George st., n. of Bernard Ave., cost \$8,000.

FIRES.

FIRES.

On Saturday of last week fire at Centreville, N. B., destroyed Wilkinson & Burtt's woodworking factory, McKenzie's blacksmith shop. Capit. G. N. Perkin's house and harn, D. Friagerald & Sons shoe factory and H. D. White's store.—The residence of Frank Thomas, at Elkhorn, Man., was burned on the 7th inst.—The residence of A. B. Hay. Owen Sound, was almost completely destroyed by fire on Saturday night last. The house was insured for \$2,500.—W. AV. Chown's brick dwelling at Belleville, Ont., was damaged by fire recently to the extent of \$4,500, which is covered by insurance.—The residence of Alexander McKenzie, Brookholm, Ont., was burned to the ground on Fuesday last.—The Dominion House at Tilsonburg, Ont., owned by Mr. Matheson, was enurely consumed by fire on Wednesday last. The loss on the building is estimated at \$8,000, the insurance being \$5,000.—Fire at Miawi, Man., on the 11th inst., destroyed the Massey-Harris Company's warehouse, Young's drug store, S. Chubb's grocery, Dr. McPhillip's office and several other buildings.—Sinth's hotel at Rodney, Ont., was burned on the 11th inst. Loss \$4,000, insurance \$2,000.

CONTRACTS AWARDED.

The contract for heating and ventilating the Industrial Home at Newmarket Ont., has been awarded to the J. F. Pease Furnace Co., of Tor-

MONTREAL, QUE.—The Dominion Bridge company have been awarded the contract for building a new steel bridge over the Lachine canal at the price of \$35,000.

EAST TORONTO ONT. The Village Council has accepted the tender of G. H. Anderson, electrician, for four electric fire alarm signal boxes, with apparatus, at the price of \$275.

OTIAWA, ONT.—The contracts for sections 8, 9 and 10 of the Soulanges canals have been awarded as follows: No. 8, C. H. Raynor, Syracuse, N. Y. No. 9, R. Macdonald, Toronto; No. 10, Rogers & Taylor, Brockville.

THE EFFECT OF HEAT ON THE STRENGTH OF MATERIALS.

The effect of low temperatures on the mechanical properties of iron and steel appears to have received rather more attention than those of high temperatures. On February 10th, 1880, a paper was read by Mr. John James Webster, before the Intitution of Civil Engineers, on "Iron and Steel at Low Temperatures," in which, before recounting his own experiences, the author gives a brief account of the work done by previous investigators in the same direction.

The most elaborate and careful experiments of this kind on record are those by Mr. Knut Styffe, Director of the Royal Technological Institute at Stockholm, carried out in 1865, for the information of a Swedish Government committee. The following conclusions were arrived at by

Mr. Styffe:—

(1) "That the absolute strength of iron and steel is not diminished by cold, but that even at the lowest temperature which ever occurs in Sweden it is at least as great as at the ordinary temperature

(about 60 deg. Fahr?"
(2) "That at temperatures between 212 deg and 392 deg. Fahr, the absolute strength of steel is nearly the same as at the ordinary temperature, but in soft iron it is always greater"

(3) "That neither in steel nor in iron is the extensibility less in severe cold than at the ordinary temperature; but that from 266 deg. to 230 deg. Fahr. it is generally diminished, not to any great extent, indeed, n steel, but considerably in iron."

(4) "That the limit of elasticity in both

(4) "That the limit of elasticity in both steel and iron lies higher in severe cold; but that at about 284 deg. Fahr, it is lower at least in iron, than at the ordinary temperature."

(5) "That the modulus of elasticity in both steel and iron is increased on reduction of temperature, and diminished on elevation of temperature; but that these variations never exceed 0.05 per cent. for a change of temperature of 1.8 deg. Fahr. and therefore such variations, at least for ordinary purposes, are of no special im-

ordinary purposes, are of no special importance.

Mr. C. P. Sandberg, from whose translation of Mr. Styffe's report the above is quoted, made in 1867 a number of tests of iron rails at various temperatures by means of a falling weight, since he was of opinion that, although Mr. Styffe's conclusions were perfectly correct as regards tensile strength, they might not apply to resistance of iron to impact at low temperatures. Mr.

of iron to impact at low temperatures. Mr. Sandberg convinced himself that "the breaking strain" of iron such as was usually employed for rails, "as tested by sudden blows or shocks, is considerably influenced by cold: such iron exhibiting at 10 deg. Fahr. only from one-third to one-fourth of the strength which it possesses at 84 deg. Fahr." Mr. Webster, however, in the paper to which we have previously referred, gives reasons for doubting the accuracy of Mr. Sandberg's deductions, since the tests at the lower temperature were nearly all made with 21 ft. lengths of rail, while those at the higher tempera-

tures were made with short lengths, the supports in every case being the same distance apart.

We now come to Mr. Webster's own researches in this field. The material tested were wrought-iron, cast-iron, Bessemer steel, best cast steel, and malleable cast-iron. Three series of experiments were directed to ascertain, respectively, the tensile strengths, transverse strengths, and resistance to impact of the material at temperatures of 50 deg. and 5 deg. Fahr. The transverse test were confined to cast-iron. The results of the tensile tests on wrought-iron and steel agree generally with those observed by Mr. Styffe, and show clearly "that severe cold does not affect the tensile strength of the materials, but that it increases the ductility of each of them" to the extent of r per cent. in iron and 3 per cent. in steel.

Mr. Webster found, further—(1) "that

Mr. Webster found, further—(1) "that when bars of cast-iron are submitted to a transverse strain at a low temperature, their strength is diminished about 3 per

cent. and their flexibility about 16 per cent."; (2) that "when bars of wroughtiron, malleable cast-iron, steel and ordinary cast-iron are subjected to a force of impact at a temperature of 5 deg. Fahr., the force required to break them and the extent of their flexibility are reduced as follows, viz.:

The Bessemer steel tested by Mr. Webster was of a harder quality than that used in the German experiments which we have described, the former having a breaking strength of about 46 tons per square inch, with an elongation of at most 18.8 per cent. in 64 in, while the hardest quality of the latter had an ultimate stretch of about 30.5 tons per square inch, and an elongation of over 26 per cent. in a length of about 8 in. (equivalent to rather more in 64 in.)

rather more in 64 in.)

The experience of railway engineers in Russia, Canada, and other countries where the winter is severe is that the breakages of rails and tires are far more numerous in the cold weather than in summer. On this account a softer class of steel is employed in Russia, and, we believe, in Sweden, for rails, than is usual in more temperate climates.

The evidence extant in relation to this matter leaves no doubt that the capability of wrought-iron or steel to resist impact is reduced by cold. On the other hand, what, for the sake of convenient distinction, may be termed its static strength, is not impaired by low temperatures. former fact is chiefly of importance in connection with railway material, the latter is reassuring as regards the safety of all structures not liable to sudden shocks. There is obviously scope for further scientific investigation, both as to the elfect of cold and heat on materials of construction; more especially, it seems to us, would more precise information be welcome on the manner in which the behavior of steel at different temperatures varies according to its quality. We are glad to learn that it is the intention of the German technical societies, named at the outset, to continue the researches, of which we have noticed the first instalment.

It seems extremely probable that some connection will be found to exist between the phenomena to which we have just referred and those observed by M. Osmond, and described in his paper on "The Criti-cal Points of Iron and Steel," read before the Iron and Steel Institute on May 7th, 1890, (see *Industries*, Vol. VIII, page 446.) M. Osmond, it may be remembered, found that at certain temperatures sudden alterations taking place in the physical properties of iron and steel are indicated by changes in the rate of cooling (or heat-That such changes must correspoud to modifications in the strength and elasticity of the materials is a very plausible hypothesis, the confirmation of which would add another contribution to the ever accumulating mass of evidence showing the intimate relationship existing between different branches of science, and more especially between physical and chemical science.—Industries.

A somewhat novel and at the same time very interesting method of constitution is employed in connection with the building being erected on William street near the Brooklyn bridge approach to New York City. It is designed to accommodate manufacturing establishments using power, and is regarded as a decdied advance in its line. The structure is to be 14 stories high, each stories to be a loft of 210 feet long and from 50 to 55 feet wide. It fronts 50 feet on William and Rose streets, and will tower nearly 200 feet in the air. In this building the main consideration being strengte, both steel and brick are utilized. While the steel skeleton work is somewhat similar to that designated as "Chicago construction," W. Wheeler Smith, the

architect, has made use of massive brick walls, so combining them with the interior steel as to give the greatest solidity and utilized both sources of support to the fullest extent. The steel uprights on the outer edges of the building are inclosed at intervals by solid brick piers 8x4 feet in size, while the girders and flooring are so contrived as to receive this masonry support as well as the support of the steel uprights. Another advantage of this combined construction is that no interior brick walls appear, thus giving an open span of 210 feet. It is stated that with the heaviest machinery in motion on every floor at the same time, no tremor will be perceptible, even in the top story. It will be made as nearly fire-proof as possible, only brick, cement and steel being used in the construction. One of the interesting features is the number of windows, which are close together on every floor, so that the facade towards the bridge exhibits a greater surface of glass than brick. The projectors regard this building as making a new era in construction for manufacturing purposes. — Carpentry and Building.

MUNIGIPAL DEPARTMENT.

THE SMOKE TEST.

At a recent meeting of the Sanitary Association of Scotland, the following question was asked and answered, among a list of questions for sanitary certificates.

Question 6.— Describe the various methods for testing drains, the difficulties to be met with in smoke and other vapor tests, the means necessary to overcome them, the method you would prefer and the reason why.

Answer.—(1.) Smoke Test. Smoke generated by waste oil, sulphur, turpentine or other pungent material, and forced up thedrain by fanners, steam or water pressure; (2) rockets exploded in the drains; (3) water pressure; (4) paraffin, peppermint and artificial discoloration.

Presuming the difficulties referred to are those in connection with the circumstance, and not the apparatus employed at the test, as might be also inferred from the words used, they may be stated as consisting principally as (a) currents of air counteracting that of the smoke; (b) density of the atmosphere; (c) untrapped drainage allowing the smoke or vapor to escape into adjoining sections of drainage or to the main sewer; (d) escapes travelling along outside of pipes and up linings of walls; (c) difficulty in getting termination of pipes thoroughly closed; (f) tenants using the pipes during the test.

The remedies are: (a) close the whole pipes except the one entering on the far ide from the machine, and thereafter apply the test from that point; (b) there is no remedy for density other than extra pressure, but care must be exercised lest the pressure blows the smoke through the traps; (c) open up the drains and block at the functions with suitable India rubber bladders; (d) cases have been known in which defects were in the basement flats; but the smoke, through travelling in the way described, was found only in the top flat of the building; it is essential, therefore, to strip off coverings where practicable, and generally to be satisfied on this point by inspection; (e) clay makes a fairly good plug, but a considerable number of plumbers and others use with success India rubber bladders; (1) the only remedy is to warn the occupants that the test is being applied, and not to run water from the sinks, water-closets, etc., during the short time required. In general they are only too willing to comply with such a request if made in a polite manner.

There are a few minor difficulties met with, such as open windows, chimneys, etc., carrying the vapor out of apartments, but these are easily met by an intelligent and experienced operator.

As already stated, the smoke test is to be preferred over any other method. The rocket, paraffin and peppermint are uncertain. The rocket is liable to be extinguished on the exclusion of air, and the paraffin and peppermint are slow. By the smoke both smell and sight are proof of defects, whereas in the two former there is only the smell, which sometimes may be adhering to the operator himself. The water pressure test is suitable in ordinary cases for horizontal drains, and especially those of new construction, but it is not so convenient or handy as the smoke test

AUTOMATIC-ELECTRIC WARNING AGAINST FLOODS.

A valuable device to automatically notify the inhabitants along river banks and low districts of an increase in the water-course of the regions higher up, and to warn in time against mundation has been constructed by Mr. Morais Otto, of Saint Raphael (Var), France. It is thus described in a communication to La Nature:

In any public building, say the mayor's office, or a schoolhouse, in each commune, he places a galvanometer so arranged as to indicate automatically at every moment, day and night, the water-level as it exists m the upper district, say at a distance of 30 miles(or more, if necessary) The galvanometer he uses is an ordinary Mariel Duperz with magnet. Referring to the sketch below, the moveable needle, A B. runs around a sector whose divisions correspond to the various heights of the waters. The frame of the galvanometer, represented in section on the sketch, between the two poles of the magnet N, and S, is inclined sufficiently so as to allow a wider play for the movements of the needle. On the glass face of the apparatus is another moveable needle, DE, which may be placed at any division required of the graduated sector. As the level of the the water rises, so soon as the indicator-needle, AB, strikes against the end (bent at a right angle) of the needle DE, so soon does it close the circuit of a local pile which has a bell inserted at C, and this begins to ring. This takes place only in case of extreme danguer. A resistance is arranged at S in the general circuit which is intended to regulate or check the amplitude of the deviations in the galvano-meter from the effects of lightning, the inventor has arranged a lightning rod of fusible wire with points.

The next arrangement is one that enables anybody to read constantly the height of the water in a river or torrent situated at a distance from the observer. A hollow iron post is placed upright in the bed of the river or stream; and the line wire ends on an insulator at the top of this post. At intervals of about four inches from the bottom of the post, the latter has small metallic plates, properly insulated, L1, L2, L3, etc., and these are connected by means of bobbins of about 10 ohms resistance, placed inside the post. top post is connected with the galvanometer, and the circuit then contined through a resistance (s), a pile, and the earth (x). The best pile he has used for the purpose is one composed of several Daniel elements. Now, let us suppose a thaw to occur; the water rises along the post, thus establishing communication be-tween the small metal plates and the iron of the post which is planted in the earth.
At every rise of four inches the resistance of the circuit diminishes 10 ohms on account of the very position of the bobbins of resistance. The intensity of the current is, in consequence, increased, and the needle, AB, of the galvanometer runs forward one degree, which corresponds to

MUNICIPAL ENGINEERS, CONTRACTORS, AND MATERIALS.

the four inches, that is to say, to the exact distance which separates two consecutive insulated plates. On the other hand, when the waters fall the investe takes place. The resistances of 10 ohins, occurring successively in the circuit of the galvanometer, cause the intensity of the current to correspondingly diminish, and this the indicated by the retorgrade inovement of the indicator-needle. Thus, by watching the inovements of the needle along the graduated sector of the apparatus, an observer can read by tell the height of the waters in the more elevated district afar off at any particular moment.

The first meeting of the Municipal Council of the County of Wentworth for 1893 will be held in the Court House, Hamilton, on Tuesday, 24th inst.

DEBENTURES WANTED.

Municipalities issuing debentures, no matter for what purpose, will find a ready purchaser by applying to G. A. STIMSON, O Toronto Street, Toronto. N.B .- Money to loan at lowest rates on first mortgage.

Canada Pipe Foundry,

HAMILTON, ONTARIO.

ALEX. GARTSHORE.

Proprietor

Manufacturer of

CAST IRON WATER, GAS AND SEWER PIPES.

- ALAU -

Special Castings of every description.

CAPACITY: 50 TONS PER DAY.

In use from Vancouver to Sydney, Cape Breton. Correspondence solicited.

Municipal officers, contractors and others, are requested to mention the CONTRACT RECORD when corresponding with advertisers.

R. E. H. BUCKNER,

89 Adelaide St. East, - TORONTO.

PATENT CAST IRON GULLIES, Vitrified Clay Sewers - Dust Bins - Sewer Pipe Cements - Steam Road Rollers - Stone Breakers - Street Scrapers Horse Brushes, etc.

ASPHALT PAVING

We are prepared to do first-class work on WALKS, FLOORS, CELLAR BOTTOMS, &c., with ROCK ASPHALT, which is conceded to be the best for this class of work.

H. WILLIAMS & CO.,

Roofers and Paviors,

4 Adelaide Street East, - TORONTO.

THOROLD CEMENT

WELLAND CANAL ENLARGEMENT, RESIDENT ENGINEER'S OFFICE WKLLAND, April 17th, 1884.

JOHN BATTLE, ESQ., Thoroid.

JOHN BATTLE, Esq., Thorona.

Dear Sir,—Yours of yesterlay, relative to Thorold Hydraulic Cement, is received. In reply, I beg to say that my tests of the Thorold Hydraulic Cement have extended over a period of twenty-eight years, and have been on a large scale, as exemplified in the locks, bridges, culverts and other masoury on the Welland Canad and Welland Railway, and that the record, which has been invariably satisfactory, is to be found in examination of the structures. The necessity tearing down of masonry and concrete, during the Welland Canad Enlargement, has afforded abundant evidence of the rehability of the Phorold Hydraulic Cement, both in masonry and concrete, and above and under water. I desire no better cement for the class of work referred to I am, dear sir, yours truly,

I am, dear sir, yours truly,
W. G. THOMPSON,
Resident Engineer.

ISAAC USHER & SON, THOROLD, ONT.

Manufacturers of
