Technical and Bibliographic Notes / Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming are checked below.

- Coloured covers / Couverture de couleur
- Covers damaged / Couverture endommagée
- Covers restored and/or laminated / Couverture restaurée et/ou pelliculée
- Cover title missing / Le titre de couverture manque
- Coloured maps / Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black) / Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations / Planches et/ou illustrations en couleur
- Bound with other material / Relié avec d'autres documents
- Only edition available / Seule édition disponible
- Tight binding may cause shadows or distortion along interior margin / La reliure serrée peut causer de l'ombre ou de la distorsion le long de la marge intérieure.
- Blank leaves added during restorations may appear within the text. Whenever possible, these have been omitted from filming / Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.
- Additional comments / Commentaires supplémentaires:

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured pages / Pages de couleur
- Pages damaged / Pages endommagées
- Pages restored and/or laminated / Pages restaurées et/ou pelliculées
- Pages discoloured, stained or foxed / Pages décolorées, tachetées ou piquées
- Pages detached / Pages détachées
- Showthrough / Transparence
- Quality of print varies / Qualité inégale de l'impression
- Includes supplementary material / Comprend du matériel supplémentaire
- Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image / Les pages totalement ou partiellement obscurcies par un feuillet d'errata, une pelure, etc., ont été filmées à nouveau de façon à obtenir la meilleure image possible.
- Opposing pages with varying colouration or discolourations are filmed twice to ensure the best possible image / Les pages s'opposant ayant des colorations variables ou des décolorations sont filmées deux fois afin d'obtenir la meilleure image possible.

This item is filmed at the reduction ratio checked below / Ce document est filmé au taux de réduction indiqué ci-dessous.

10x	14x	18x	22x	26x	30x
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

12x 16x 20x 24x 28x 32x

The copy filmed here has been reproduced thanks to the generosity of:

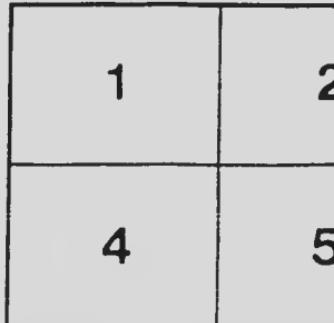

Library
Agriculture Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol → (meaning "CONTINUED"), or the symbol ▽ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

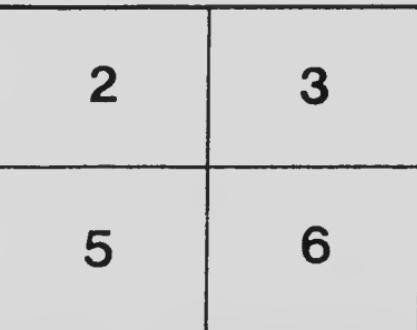

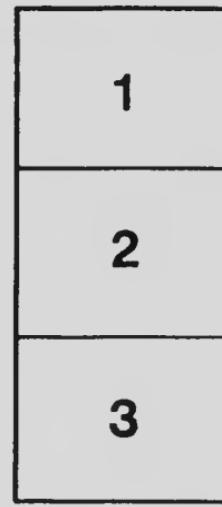

Bibliothèque
Agriculture Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

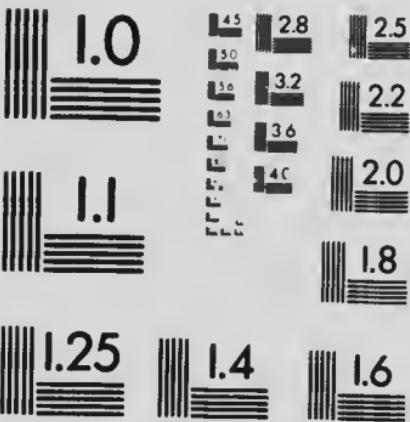

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole → signifie "A SUIVRE", le symbole ▼ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

HOW TO RID A HENHOUSE OF MITES

BY

GEORGE ROBERTSON,

Assistant.

In the warm weather there are frequent inquiries as to why hens stop laying. In some cases the hens have laid very well all season, but suddenly the egg yield begins to fall off and sometimes ceases entirely.

It is useless to expect a flock to lay equally well at all times. A flock that has laid heavily during the winter will generally slow up towards the middle of the summer and when they begin to moult, but when the egg yield drops rapidly until it practically ceases without any apparent reason, suspect vermin.

RED MITE.

Of all the many varieties of vermin that infest fowl, the Red Mite is the most troublesome. Unlike the ordinary hen louse, they are not, as a rule, found on the fowl, neither are they killed by dusting, as the ordinary body louse is; these pests breed very rapidly especially during the hot weather, usually in cracks containing filth or in dirty nesting material. They are not red in colour as is popularly supposed, but grey; it is only after they have come into contact with the fowl and have become filled with blood that they appear red. The young mites are white and have only six legs, but after casting their skins, which they do several times, they have eight legs. The cast skins may be seen like a white powder around the perches, this often being the first indication of the presence of mites. They are able to live and reproduce for months without animal food, the first food of the young probably being filth or decayed wood. They thrive best in dark, dirty houses, and have been found to exist in houses the following season after the fowl have been removed. They usually attack the birds at night, but are sometimes found on laying hens and they frequently drive broody hens from the nest. They pierce the skin with their needle-like jaws and suck the blood, after which they retire to the seclusion of the cracks and crevices of the roosts, nests or other parts of the house. They will bite man or other animal, causing severe irritation, but they never remain on them for any length of time.

REMEDIES.

If the fowl are not doing well and on examination are thinner than they should be, a sharp lookout should be kept for mites. At night they may be seen either on the fowl or running along the perches; in the daytime examine the cracks and crevices of the roosts and walls closely, or lift the roosts and examine the places

DOMINION EXPERIMENTAL FARMS.

EXHIBITION CIRCULAR No. 85.

(January, 1916.)

where they come in contact with the supports. If mites are found to be present, the first step in banishing them is to give the house a thorough cleaning. Remove all droppings and old nesting material, scrape and sweep out every particle of dirt and burn it. Then if you are so fortunately situated that you have water pressure at your command, turn on the hose with as much pressure as you can get, forcing the water into every crack; if as is the case on most farms, you cannot use this method it is advisable to scrub down the walls with a brush or old broom, but in any case they should be thoroughly sprayed or painted with a good strong disinfectant. This wash should be repeated in a few days to destroy the mites which hatch after the first application. The disinfectant may be applied with a hand spray-pump or, if such is not available, a brush will do, but in either case the fluid should be used liberally and every crack flooded.

DISINFECTANTS.

Fresh air and sunlight are wonderful disinfectants and, combined with cleanliness, are preventatives against most of the ills of the poultry yard.

One of the very best disinfectants to use against mites is made as follows: Dissolve one pound and a half of concentrated lye in as small a quantity of water as possible. It will be necessary to do this two or three hours before it is required, as the lye should be cold when used. Put three quarts of raw linseed oil into a five-gallon stone crock and pour in the lye very slowly, stirring meanwhile. Keep on stirring until a smooth liquid soap is produced, then gradually add two gallons of crude carbolic acid or commercial creosol, stirring constantly until the resulting fluid is a clear dark brown. Use two or three tablespoonfuls of the mixture to a gallon of water.

The foregoing is offered as a most effective remedy against mites; but those who regard the preparation of the mixture as too much work may use a good strong solution of "Zenecium" or any other creolin preparation.

Ordinary coal oil will kill the mites, but as it evaporates quickly the effects are not so lasting. An excellent "paint" to apply to the roosts and nest-boxes is composed of one part crude carbolic to three or four parts of coal oil.

Even after the house has been cleaned, the cracks in the roosts and nest-boxes should be flooded at regular intervals throughout the summer either with the fore-mentioned "paint" or with coal oil. This will go far to keep the pests in check, but it must be regarded simply as a check, and the thorough or annual house-cleaning described above put into effect as soon as possible.

To facilitate the ease with which this house-cleaning is done, all fixtures such as roosts or nest-boxes should be made movable. If they are stationary at present, advantage should be taken of the first rainy day to change them. It will be time well spent.
