Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured covers/  
Couverture de couleur
- Covers damaged/  
Couverture endommagée
- Covers restored and/or laminated/  
Couverture restaurée et/ou pelliculée
- Cover title missing/  
Le titre de couverture manque
- Coloured maps/  
Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black)/  
Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations/  
Planches et/ou illustrations en couleur
- Bound with other material/

The copy filmed here has been reproduced thanks to the generosity of:

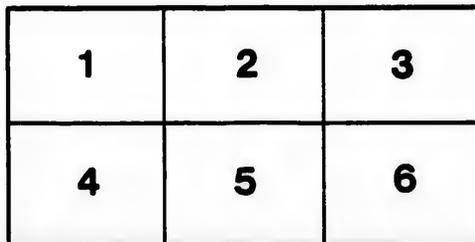

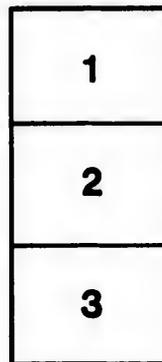

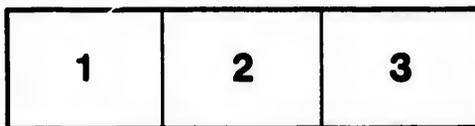

D. B. Weldon Library  
University of Western Ontario

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol  $\rightarrow$  (meaning "CONTINUED"), or the symbol  $\nabla$  (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

D. B. Weldon Library  
University of Western Ontario

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole  $\rightarrow$  signifie "A SUIVRE", le symbole  $\nabla$  signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

P R E F A C E.

**T**O a man sincerely interested in the welfare of society and of his country, it must be particularly agreeable to reflect on the rapid progress and general diffusion of learning and civility, which, within the present age, have taken place in Great Britain. Whatever may be the case in some other kingdoms of Europe, we, in this island, may boast of our superiority to those illiberal prejudices, which not only cramp the genius, but sour the temper of man, and disturb all the agreeable intercourse of society. Among us, learning is no longer confined within the schools of the philosophers, or the courts of the great; but, like all the greatest advantages which Heaven has bestowed on mankind, it is become as universal as it is useful.

This general diffusion of knowledge is one effect of that happy constitution of government, which, towards the close of the last century, was confirmed to us, and which constitutes the peculiar glory of this nation. In other countries, the great body of the people possess little wealth, have little power, and consequently meet with little respect; in Great Britain, the people are opulent, have great influence, and claim, of course, a proper share of attention. To their improvement, therefore, men of letters have lately directed their studies; as the great body of the people, no less than the dignified, the learned, or the wealthy few, have an acknowledged title to be amused and instructed. Books have been divested of the terms of the schools, reduced from that size which suited only the purses of the rich and the avocations of the studious; and adapted to persons of more ordinary fortunes, whose attachment to other pursuits admitted of little leisure for those of knowledge. It is to books of this kind, more than to the works of our Bacons, our Lockes, and our Newtons, that the generality of our countrymen owe that superior improvement, which

a

distinguishes

## P R E F A C E.

distinguishes them from the lower ranks of men in all other countries. To promote and advance this improvement, is the principal design of our present undertaking. No subject appears more interesting than that which we have chosen, and none seems capable of being treated in a manner that may render it more generally useful.

The knowledge of the world, and of its inhabitants, though not the sublimest pursuit of mankind, is that which most nearly interests them, and to which their abilities are best adapted. And books of Geography, which describe the situation, extent, soil, and productions of kingdoms; the genius, manners, religion, government, commerce, sciences, and arts of all the inhabitants upon the earth, promise the best assistance for attaining this knowledge.

The Compendium of Geography, now offered to the public, differs in many particulars from other books on that subject. Besides exhibiting an easy, distinct, and systematic account of the theory and practice of what may be called Natural Geography, the Author has attempted to render the following performance an instructive, though compendious, detail of the general history of the world. The character of nations depends on a combination of many circumstances, which reciprocally affect each other. There is a nearer connection between the learning, the commerce, the government, &c. of a state, than most people seem to apprehend. In a work of this kind, which pretends to include moral or political, as well as natural geography, no one of those objects should pass unnoticed. The omission of any one of them would, in reality, deprive us of a branch of knowledge, not only interesting in itself, but absolutely necessary for enabling us to form an adequate and comprehensive notion of the subject in general. We have thought it necessary, therefore, to add a new article to this work, which comprehends the history and present state of learning in the several countries we describe, with the characters of such persons as have been most eminent in the various departments of letters and philosophy. This subject will, on a little reflection, appear altogether requisite, when we consider the powerful influence of learning upon the manners, government, and general character of nations. These objects, indeed, till of late, seldom found a place in geographical performances; and, even when occasionally introduced, are by no means handled in an entertaining or instructive manner.

## P R E F A C E.

ner. Neither is this to be altogether imputed to the fault of geographical writers. The greater part of travellers, acting solely under the influence of avarice, the passion which first induced them to quit their native land, were at little pains, and were indeed ill qualified to collect such materials as are proper for gratifying curiosity, or affording instruction. The geographer, then, who could only employ the materials put into his hands, was not enabled to give us any important information. In the course of the present century, however, men have begun to travel from different motives. A thirst for knowledge, as well as for gold, has led many into distant lands. These they have explored with a philosophic attention; and by laying open the internal springs of action, by which the inhabitants of different regions are actuated, exhibit to us a natural and striking picture of human manners, under the various stages of barbarity and refinement. Without manifest impropriety, we could not but avail ourselves of their labours, by means of which, we have been enabled to give a more copious, and a more perfect detail of what is called Political Geography, than has hitherto appeared.

In considering the present state of nations, few circumstances are of more importance than their mutual intercourse. This is chiefly brought about by commerce, the prime mover in the œconomy of modern states, and of which, therefore, we have never lost sight in the present undertaking.

We are sensible, that a reader could not examine the present state of nations with much entertainment or instruction, unless he was also made acquainted with their ancient situation, and with the various revolutions and events, by the operation of which they have assumed their present form and appearance. This constitutes the Historical part of our Work; a department which we have endeavoured to execute in a manner entirely new. Instead of fatiguing the reader with a dry detail of news-paper occurrences—occurrences no way connected with one another, or with the general plan of the whole, we have mentioned only such facts as are interesting, either in themselves or from their relation to objects of importance. Instead of a meagre index of incoherent incidents, we have drawn up a regular and connected epitome of the history of each country—such an epitome as may be read, we hope, with pleasure and advantage, and which may be considered as a proper introduction to more copious accounts.

## P R E F A C E.

Having, through the whole of the work, mentioned the ancient names of countries, and, in treating of their particular history, sometimes carried our researches beyond the limits of modern times, we have thought it necessary, for the satisfaction of such readers as are unacquainted with classical learning, to begin our Historical Introduction with the remote ages of antiquity. By inserting an account of the ancient world in a book of geography, we afford an opportunity to the reader, of comparing together not only the manners, government, and arts of different nations, as they now appear, but as they subsisted in ancient ages; which, exhibiting a general map, as it were, of the history of mankind, renders our work more complete than any geographical treatise extant.

In the execution of our design, we have all along endeavoured to observe order and perspicuity. Elegance we have sacrificed to brevity; happy to catch the leading features which distinguish the characters of nations, and by a few strokes to hit off, though not completely to finish, the picture of mankind in ancient and modern times.

What has enabled us to comprise so many subjects within the narrow bounds of this work, is the omission of many immaterial circumstances, which are recorded in other performances of the same kind, and of all those fabulous accounts or descriptions, which, to the disgrace of the human understanding, swell the works of geographers; though the falsity of them, both from their own nature and the concurring testimony of the most enlightened and best-informed travellers and historians, be long since detected.

As to particular parts of the work, we have treated them more or less diffusely, in proportion to their importance to us as men, and as subjects of Great Britain. Our own country, in both respects, deserved the greatest share of our attention. Great Britain, though she cannot boast of a more luxuriant soil or happier climate than many other countries, has advantages of another and superior kind, which have made her the delight and envy of the world: these are the equity of her laws, the freedom of her political constitution, and the moderation of her religious system. With regard to the British empire, we have therefore been singularly copious.

## P R E F A C E.

Next to Great Britain, we have examined most extensively the other states of Europe; and always in proportion as they present us with the largest field for useful reflection. By comparing together our accounts of the European nations, an important system of practical knowledge is inculcated; and a thousand arguments will appear in favour of a free government, religious toleration, and an extended, unrestrained commerce.

Europe having occupied so large a part of our volume, Asia next claims our attention; which, though in some respects the most famous quarter of the world, offers, when compared to Europe, extremely little for our entertainment or instruction. In Asia, a strong attachment to ancient customs, and the weight of tyrannical power, bear down the active genius of the inhabitants, and prevent that variety in manners and character, which distinguishes the European nations.

In Africa, the human mind seems degraded below its natural state. To dwell long upon the manners of this country, a country immersed in rudeness and barbarity, besides that it could afford little instruction, would be disgusting to every lover of mankind. Add to this, that the inhabitants of Africa, deprived of all arts and sciences, without which the human mind remains torpid and inactive, discover no great variety in manners or character. A gloomy sameness almost everywhere prevails; and the trifling distinctions which are discovered among them, seem rather to arise from an excess of brutality on the one hand, than from any perceptible approaches towards refinement on the other. But though these quarters of the globe are treated less extensively than Europe, there is no district of them, however barren or savage, entirely omitted.

America, whether considered as an immense continent inhabited by an endless variety of different people, or as a country intimately connected with Europe by the ties of commerce and government, deserves very particular attention. The bold discovery and barbarous conquest of this New World, and the manners and prejudices of the original inhabitants, are objects, which, together with the description of the country, deservedly occupy no small share of this performance.

Next

In

## P R E F A C E.

In treating such a variety of subjects, some less obvious particulars, no doubt, must escape our notice. But if our general plan be good, and the outlines and chief figures sketched with truth and judgment, the candour of the learned, we hope, will excuse imperfections which are unavoidable in a work of this extensive kind.

We cannot, without exceeding the bounds of a Preface, insist upon the other parts of our plan. The science of natural geography, for want of proper encouragement from those who are alone capable of giving it, still remains in an imperfect state; and the exact divisions and extent of countries, for want of geometrical surveys, are far from being well ascertained. This consideration has induced us to adopt the most unexceptionable of Templeman's Tables; which, if they give not an account strictly accurate, afford at least a general idea of this subject; which is all indeed that we can attain, until the geographical science arrives at greater perfection.

CON-

## ADVERTISEMENT.

**T**HE nature and design of this work is explained in the original preface, which immediately follows this advertisement: but it is proper that our readers should be apprised of the numerous improvements made in this enlarged edition.

The fifth edition, which immediately preceded this, was much enriched by information borrowed from the new works of Robertson, Rennel, Coxe, Morse, and other writings of acknowledged authenticity. But amidst the rapid advances of geographical science, and the adventurous spirit of British navigators and travellers, so many new publications are continually coming from the press, that, within the short space of only two years, a great mass of geographical materials has been created, of which we have endeavoured fully to avail ourselves in the present volume.

By a comparison of this edition with the last, it will be found that there is no country in Europe, the description of which is not much improved, and scarcely a single page, in which there is not some considerable melioration. Among the numerous travellers who have enriched our work, Smirnhove, Confett, Townsend, Bourgoanne, Watkins, and Gray, have afforded valuable communications concerning Russia, Sweden, Lapland, Finland, Denmark, Spain, Switzerland, and Italy.

Great additions have been made to the description of India: its geography, religion, laws, literature, and commerce, have been examined with particular care: and many new articles have been added concerning the manners of the inhabitants, their languages, allegories, writing materials, pagodas, funerals, mausoleums, &c. drawn chiefly from lieutenant Moor's accurate Narrative, and that highly ornamented work, Mr. Hodges' Travels. Major Dirom's account of the campaign, which terminated the war with Tippoo Sultan in 1792, with other publications equally authentic, have enabled us to bring down the history of India to the present time. The Abbé Grosier's History of China, and Mr. Franklin's Travels in Persia, have afforded their guidance in traversing those vast regions of Asia.

As the stock of our *African* geography is small, great attention has been paid to the new works on that subject; from which valuable information has been derived.

CON-

To Mr. Morfe we owe an *enlarged* edition of the geography of America. His information is the more to be depended on, as he maintained an extensive correspondence with men of letters, and visited in person the several states in the Union. From him, we have learned many important particulars; among others, the *latest* division of the several states into districts, counties, towns, &c. together with the actual condition of the new-formed states of Vermont, the country N. W. of the Ohio, Kentucky, and the country of the Ohio, or the Tennessee government.

It remains to name one gentleman, to whom this edition is under peculiar obligations,—Bryan Edwards, esq. of the island of Jamaica, from whose History of the British Colonies in the West Indies, a new description of these islands in general, and a circumstantial account of the British possessions, particularly Jamaica, have been extracted; containing articles of information too various to be distinctly specified in this short address. In treating this important part of our subject, we have borrowed the accurate and elegant language of Mr. Edwards, who has surveyed and depicted with an animated eye and an energetic pencil the sublime scenes displayed in those tropical regions.

The present publication comprehending history as well as geography, the variety and magnitude of some recent transactions have rendered numerous alterations or additions requisite in the historical part of our undertaking. The history of each country is brought down to the present time; that of Great Britain is considerably enlarged; and the calamitous events in a neighbouring nation are related with such circumstances as cannot fail to make every honest Briton cherish the well-poised constitution of government in his own happy island; a constitution formed and improved by the accumulated wisdom of ages.

To make room for these important insertions, great pains have been employed in abridging diffusiveness, and lopping off redundancy; yet the new materials lately brought to light have unavoidably swelled this edition far beyond the last, and much more beyond all preceding editions.

October, 1795.

**T**H E science of **GEOGRAPHY** cannot be understood without considering the earth as a planet, or as a body moving round another at a considerable distance from it. The science which treats of the planets, and other heavenly bodies, is called **ASTRONOMY**: hence the necessity of beginning this work with an account of the heavenly bodies. Of these, the most conspicuous is the sun, the fountain of light and heat to the planets that move round it; and which, together with the sun, compose what is called the Solar System. The path in which the planets move round the sun, is called their Orbit; and it is now proved by astronomers, that there are seven planets which move round the sun, each in its own orbit. The names of these, according to the nearness to the centre, or middle point of the sun, are Mercury, Venus, the Earth, Mars, Jupiter, Saturn, and the Georgium Sidus. The two first, because they move within the orbit of the earth (being nearer the sun) are called *inferior* planets, or, perhaps more properly, *interior* or *inner* planets; the four last, moving without the orbit of the earth, are called *superior*, or, perhaps more properly, *exterior* or *outer* planets. If we can form a notion of the manner in which any one of these planets, suppose the earth, moves round the sun, we can easily conceive the manner in which all the rest perform that revolution. We shall only therefore particularly consider the motion of the earth, leaving that of the others to be collected from a table, which we shall deliver, with such explanations as may render it intelligible to the meanest capacity.

The earth was long considered as one extensive plane, of no remarkable thickness, and the regions below it were supposed to be the habitations of spirits. The heavens, in which the sun, moon, and stars appeared to move daily from east to west, were conceived to be at no great distance from it, and to be only designed for the use or ornament of our earth: several reasons, however, occurred, which rendered this opinion improbable; and we have now a sufficient proof of the figure of the earth, from the voyages of many navigators who have sailed round it, particularly from that of Magellan's ship, which was the first that surrounded the globe, sailing east from a port in Europe in 1519, and returning to the same, after a voyage of 1124 days, without apparently altering his direction, any more than a fly would appear to do in moving round a ball of wax.

The roundness of the earth being established, a way was naturally opened for the discovery of its motion; for while it was considered as a plane, mankind had an obscure notion of its being supported, like a scaffolding, on pillars, though they could not conceive what supported these. But the figure of a globe is much better adapted to motion. This is confirmed by considering, that, if the earth did

not move round the sun, not only the sun, but all the stars and planets, must move round the earth. Now, as philosophers, by reckonings founded on the surest observations, have been able to judge pretty nearly of the distances of the heavenly bodies from the earth, and from each other, just as every one that knows the first elements of mathematics can measure the height of a steeple or any object placed on it; it appeared that if we conceived the heavenly bodies to move round the earth, we must suppose them endowed with a motion or velocity so immense as to exceed all conception; whereas all the appearances in nature may be as well explained by imagining the earth to move round the sun in the space of a year, and to turn on its own axis once in the twenty-four hours.

To form a conception of these two motions of the earth, we may imagine a ball moving on a bowling-green: the ball proceeds forwards upon the green, not by sliding along like a plane upon wood, or a slate upon ice, but by turning round its own axis, which is an imaginary line drawn through the centre of the ball, and ending on its surface in two points called its poles. Conceiving the matter then in this way; and that the earth, in the space of 24 hours, moves from west to east, the inhabitants on the surface, like men on the deck of a ship, who are insensible of their own motion, and think that the banks move from them in a contrary direction, will conceive that the sun and stars move from east to west in the same time, in which they, with the earth, move from west to east. This diurnal motion of the earth being once clearly conceived, will aid us in forming a notion of its annual motion round the sun; for as that luminary seems to have a daily motion round our earth, which is really occasioned by the daily motion of the earth round its axis, so, in the course of a year, he seems to have an annual motion in the heavens, and to rise and set in different points of them, which is really occasioned by the annual motion of the earth in its orbit or path round the sun, which it completes in a year. Now as to the first of these motions we owe the difference of day and night, so to the second we are indebted for the difference in the length of the days and nights, and in the seasons of the year.

THE PLANETS.} Thus much being premised with regard to the motion of the earth, which the smallest reflection may lead us to apply to the other planets, we must observe, before exhibiting our table, that, beside the seven planets already mentioned, which move round the sun, there are fourteen other bodies which move round four of these, in the same manner as they do round the sun; and of these our earth has one, called the moon; Jupiter has four, Saturn has seven\* (two of these having been lately discovered by Dr. Herschel), and is also encompassed with a broad ring†. The Georgium Sidus has two moons, as that excellent

\* See the lxxxth vol. of the Philosophical Transactions.

† The space between the ring and the globe of Saturn is supposed to be rather more than the breadth of the ring, and the greatest diameter of the ring to be in proportion to that of the globe as 7 to 3. It puts on different appearances to us, sometimes being seen quite open, at others only as a line upon the equator. It is probable that it will at times cast a shadow over vast regions of Saturn's body. There is a paper by Dr. Herschel in the Philosophical Transactions for 1790, (vol. lxxx.) on the subject of Saturn, its ring and satellites, in which he hints his suspicion that the ring of that planet is composed of two rings, nearly, if not perfectly in the same plane, and concentric to one another, and separated by a very narrow space, which appeared to him like a black zone, or list, on the surface of the ring. He suspended, how-

ever, his opinion, till the planet in its orbit should give us a sight of the other edge of the ring, on which if the same appearance should be seen, it would amount to a pretty clear demonstration that what he saw was a separation of the ring.— Since the publication of that paper, the southern side of Saturn's ring has become visible to us; and the doctor tells us he has had several excellent opportunities of viewing that side of the ring to the greatest advantage, and has always seen the same black list, at the same distance from the edge of the ring, and of the same breadth, as nearly as he can judge, that it appeared to be on the northern side. He therefore thinks himself now authorised to say, that the planet Saturn has two concentric rings, of unequal dimensions and breadth, situated in one plane, and at a considerable distance from each other. Phil. Transactions for 1792, part I.

astronomer has shewn. These are called moons, from their agreeing with our moon, which was first attended to: and sometimes they are called *secondary* planets, because they seem to be attendants of the Earth, Jupiter, Saturn, and the Georgium Sidus, about which they move, and which are called *primary*.

There are but two observations more, necessary for understanding the following table. We have already said that the annual motion of the earth occasioned the diversity of seasons. But this would not happen, were the axis of the earth exactly parallel to the axis of its orbit; because then the same parts of the earth would be turned towards the sun in every diurnal revolution; which would deprive mankind of the grateful vicissitudes of the seasons. The axis of the earth, therefore, is inclined to the plane of the earth's orbit, which we may conceive by supposing a spindle put through a ball, with one end of it touching the ground; if we move the ball directly forwards, while one end of the spindle continues to touch the ground, and the other points towards some quarter of the heavens, we may form a notion of the inclination of the earth's axis to its orbit, from the inclination of the spindle to the ground. The same observation applies to some of the other planets, as may be seen from the table. It now remains, to consider what is meant by the *mean distances* of the planets from the sun. In order to understand this, we must learn that the path which a planet describes, were it to be marked out, would not be quite round or circular, but in the shape of a figure called an *ellipsis*, which, though resembling a circle, is longer than broad. Hence the same planet is not always at the same distance from the sun, and the mean distance of it is that which is exactly betwixt its greatest and least distance. Here follows the table.

A TABLE of the Diameters, Periods, &c. of the several Planets in the Solar System.

Names of the planets.	Diameters in English Miles.	Mean distances from the sun as determined from observations of the transit of Venus in 1761.	Annual periods round the sun.			Diurnal rotation on its axis.	Hourly motion in its orbit.	Hourly motion of its equator.	Inclination of axis to orbit.
			y.	d.	h.				
Sun	890,000		d.	h.	m.				
Mercury	3,000	36,841,468	0	87	23	25 6 0	109,699	3,818	8° 0' 0"
Venus	9,330	68,891,486	0	224	17	24 8 0	80,295	43	75° 0' 0"
Earth	7,979	95,173,000	1	0	0	1 0 0	68,243	1,042	23° 29' 0"
Moon	2,180	ditto	1	0	0	29 12 44	22,290	9½	2° 10' 0"
Mars	5,400	145,014,148	1	321	17	0 24 40	55,287	556	0° 0' 0"
Jupiter	94,000	494,999,976	11	314	18	0 9 56	29,083	25,920	0° 0' 0"
Saturn	78,000	907,956,130	29	167	6	unknown.	22,101	unknown.	unknown.
Georgium Sidus	34,217	1,815,912,260	83	121	0	unknown.	unknown.	unknown.	0° 43' 35"

The Georgian planet (or Georgium Sidus) having greatly excited the attention of the learned world, it would be unpardonable, in a work of this nature, to omit giving the reader a brief account of it. It was discovered by Dr. Herschel, with his telescope of great size and power, forty feet in length and four and a half in diameter, in the year 1781. For this discovery he obtained from the Royal Society the honorary recompence of sir Godfrey Copley's medal. In so recent a discovery of a planet so distant, many particulars cannot be expected. We have introduced some account of it into the above table from the first authority.

Though the Georgium Sidus was not known as a planet till the time of Dr. Herschel, yet there are many reasons for supposing it had been seen before, but had

then been considered as a fixed star; but, from the steadiness of its light, from its diameter being increased by high magnifying powers, and from the change which he had observed in its situation, he concluded that it was a comet; but in a little time, he, with others, determined that it was a planet, from its vicinity to the ecliptic, the direction of its motion, being stationary in the time, and in such circumstances as correspond with similar appearances in other planets. When the moon is absent it may be seen by the naked eye; and the discovery of two satellites on the 11th January, 1787, attending it, seems to confer upon it a dignity, and to raise it into a more conspicuous situation among the great bodies of our solar system. As the distances of the planets, when marked in miles, are a burden to the memory, astronomers often express their mean distances in a shorter way, by supposing the distance from the earth to the sun to be divided into ten parts. Mercury may then be estimated at four of such parts from the sun, Venus at seven, the Earth at ten, Mars at fifteen, Jupiter at fifty-two such parts, Saturn at ninety-five, and the Georgium Sidus at one hundred and ninety parts.

[THE COMETS.] The reader having acquired this information respecting the planets, must next turn his attention to the Comets, which, as they revolve round our Sun, make part of the solar system. These, descending from the far distant parts of the system with great rapidity, surprise us with the singular appearance of a train, or tail, which accompanies them; become visible to us in the lower parts of their orbits, and, after a short stay, go off again to vast distances, and disappear. Though some of the ancients had more just notions of them, yet as the erroneous opinion prevailed, that they were only transient meteors in the air, no care was taken to record their phenomena accurately, till of late. The general doctrine now is, that they are solid, compact bodies, like other planets, and regulated by the same laws of gravity, describing equal areas in proportional times by radii drawn to the common centre. They move about the sun in very eccentric ellipses, and are of a much greater density than the earth; for some of them are heated in every period to such a degree as would vitrify any substance known to us. Sir Isaac Newton computed the heat of the comet that appeared in the year 1680, when nearest the sun, to be 2000 times hotter than red-hot iron, and that, being thus heated, it must retain its heat till it comes round again, although its period should be more than 20,000 years; and it is computed to be only 575. It is believed that there are at least 21 comets belonging to our system, moving in all directions; and all those which have been observed have moved through the ethereal regions and the orbits of the planets, without suffering any sensible resistance in their motions, which proves that the planets do not move in solid orbs. Of all the comets, the periods of three only are known with any degree of certainty, being found to return at intervals of 75, 129, and 575 years: that which appeared in 1680 is the most remarkable; its greatest distance is about 11 thousand 200 millions of miles from the sun, while its least distance from the centre of the sun is about 490 thousand miles; within less than one third part of the sun's semidiameter from his surface. In that part of its orbit, which is nearest to the sun, it flies with the amazing velocity of 880,000 miles in an hour; and the sun, as seen from it, appears 100 degrees in breadth, consequently 40,000 times as large as he appears to us. The astonishing distance that this comet runs out into empty space, naturally suggests to our imagination, the vast distance between our sun, and the nearest of the fixed stars, of whose attractions all the comets must keep clear, to return periodically and move round the sun. Dr. Halley, to whom every part of astronomy, but this in a particular manner, is highly indebted, has joined his labours to those of Sir Isaac Newton on this subject. Our earth was out of the way, when this comet last passed near her orbit; but it requires a more perfect knowledge of the motion of the comet, to be able to determine whether it will always pass by us with so little effect;

effect; for it may be observed, that the comet, in one part of its orbit, approaches very near to the orbit of our earth: so that, in some revolutions, it may approach near enough to have very considerable, if not fatal effects upon it. See Newton, Halley, Gregory, Keill, M'Laurin, Derham, Ferguson, and Whiston.

**THE FIXED STARS.]** Having thus briefly surveyed the solar system, which, though great in itself, is small in comparison with the immensity of the universe, we next proceed to the contemplation of those other vast bodies called the *fixed Stars*; which being of infinite use in the practice of geography, claim a particular notice in this work. These fixed stars are distinguished by the naked eye from the planets, by being less bright and luminous, and by continually exhibiting that appearance which we call the twinkling of the stars. This arises from their being so small, that the interposition of the least body, of which there are many constantly floating in the air, deprives us of the sight of them; when the interposed body changes its place, we again see the star, and this succession being perpetual, occasions the twinkling. But a more remarkable property of the fixed stars, and that from which they have obtained their name, is their never changing their situation, with regard to each other, as the planets, from what we have already said, must evidently be always changing their's. The stars which are nearest to us seem largest, and are therefore called of the first magnitude. Those of the second magnitude appear less, being at a greater distance; and so proceeding on to the sixth magnitude, which includes all the fixed stars that are visible without a telescope. As to their number, though in a clear winter's night, without moonshine, they seem to be innumerable, which is owing to their strong sparkling, and the consequent confusion in our sight; yet when the whole firmament is divided, as was done by the ancients, into signs and constellations, the number that can at any time be seen by the bare eye, exceeds not a thousand. Since the invention of telescopes, indeed, the number of the fixed stars may be deemed indefinite; because the greater perfection we arrive at in our glasses, the more stars always appear to us. Mr Flamsteed, late royal astronomer at Greenwich, has given us a catalogue of about 3000 stars. These are called telescopic stars, from their being invisible without the assistance of that instrument. Dr. Herschel, to whose ingenuity and allduity the astronomical world is so much indebted, has evinced what great discoveries may be made by improvements in the instruments of observation. In speaking here of his discoveries, I shall use the words of M. de la Lande. "In passing rapidly over the heavens with his new telescope, the universe increased under his eye; 44,000 stars, seen in the space of a few degrees, seem to indicate that there were seventy-five millions in the heavens." But what are all these, when compared to those that fill the boundless fields of ether? Who can say how far the universe extends, or point out those limits, where the Creator stayed. "his rapid wheels," or where he "fixed the golden compasses!"

The immense distance of the fixed stars from our earth, and from each other, is of all considerations the most proper for expanding our ideas of the works of God. For notwithstanding the great extent of the earth's orbit or path (which is at least 190 millions of miles in diameter) round the sun, the distance of a fixed star is not sensibly affected by it; so that the star does not appear to be any nearer us when the earth is in that part of its orbit nearest the star, than it seemed to be when the earth was at the most distant part of its orbit, or 190 millions of miles farther removed from the same star. The star nearest us, and constantly the largest in appearance, is the dog-star, or Sirius. Modern discoveries make it probable that each of these fixed stars is a sun, having planets and comets revolving round it, as our sun has the earth and other planets revolving round him. Now the dog-star appears 27,000 times less than the sun; and as the distance of the stars must be greater in proportion as they seem less, mathematicians have computed the distance of Sirius from us.

to be two billions and two hundred thousand millions of miles. The motion of light, therefore, which though so quick as to be commonly thought instantaneous, takes up more time in travelling from the stars to us, than we do in making a West-India voyage. A sound would not arrive to us from thence in 50,000 years; which, next to light, is considered as the quickest body we are acquainted with. And a cannon ball, flying at the rate of 480 miles an hour, would not reach us in 700,000 years.

The stars, being at such immense distances from the sun, cannot possibly receive from him so strong a light as they seem to have; nor any brightness sufficient to make them visible to us; for the sun's rays must be so much weakened before they reach such remote objects, that they can never be transmitted back to our eyes, so as to render these objects visible by reflection. The stars therefore shine with their own native and unborrowed lustre, as the sun does; and since each star, as well as the sun, is confined to a particular portion of space, it is plain that the stars are of the same nature with the sun.

It is not credible that the Almighty, who always acts with infinite wisdom, should create so many glorious suns at such immense distances from each other, without placing proper objects near enough to be benefited by their influences. Whoever imagines that they were made only to give a faint glimmering light to the inhabitants of this globe, must have a very superficial knowledge of astronomy\*, and a mean opinion of the Divine Wisdom; since, by an infinitely less exertion of creating power, the Deity could have given our earth much more light by one single additional moon.

Instead then of one sun and one world only in the universe, as the unskilful in astronomy imagine, that science discovers to us such an inconceivable number of suns, systems, and worlds, dispersed through boundless space, that if our sun, with all the planets, moons, and comets belonging to it, were annihilated, they would be no more missed, by an eye that could take in the whole creation, than a grain of sand from the sea-shore; the space they possess being comparatively so small, that it would scarcely be a sensible blank in the universe, although the Georgium Sidus, the outermost of our planets, revolves about the sun in an orbit of 10,830 millions of miles in circumference, and some of our comets make excursions many thousand millions of miles beyond the orbit of the Georgium Sidus; and yet, at that amazing distance, they are incomparably nearer to the sun than to any of the stars; as is evident from their keeping clear of the attractive power of all the stars, and returning periodically by virtue of the sun's attraction.

From what we know of our own system, it may be reasonably concluded, that all the rest are with equal wisdom provided with accommodations for rational inhabitants; for although there is almost an infinite variety in the parts of the creation which we have opportunities of examining, yet there is a general analogy connecting all the parts into one scheme, one design, one whole!

Since the fixed stars are prodigious spheres of fire, like our sun, and at inconceivable distances from each other, as well as from us, it is reasonable to conclude they are made for the same purposes that the sun is; to bestow light, heat, and vegetation on inhabited planets, moving around them in their respective orbits.

What an august, what an amazing conception, if human imagination can conceive it, does this give of the works of the Creator! Thousands of thousands of suns, multiplied without end, and ranged all around us, at immense distances from each other, attended by ten thousand times ten thousand worlds, all in rapid motion, yet calm, regular, and harmonious, invariably keeping the paths prescribed

\* Especially since there are many stars which are not visible without the assistance of a good telescope; and, therefore, instead of giving light to this world, they can only be seen by a few astronomers.

them;

them; and these worlds peopled with myriads of intelligent beings, formed for endless progression in perfection and felicity.

If so much power, wisdom, goodness, and magnificence is displayed in the material creation, which is the least considerable part of the universe, how great, how wise, how good must HE be, who made and governs the whole!

[THE CONSTELLATIONS.] The first people who attentively observed the fixed stars, were the *Shepherds* in the beautiful plains of Egypt and Babylon; who, partly from amusement, and partly with a view to direct them in their travelling during the night, observed the situation of these celestial bodies. Endowed with a lively fancy, they divided the stars into different companies or constellations, each of which they supposed to represent the image of some animal, or other terrestrial object. The peasants in our own country do the same; for they distinguish that great northern constellation, which philosophers call the *Ursa Major*, by the name of the *Plough*, the figure of which it certainly may represent, with a very little help from the fancy. But the constellations in general have preserved the names which were given them by the ancients; and they are reckoned 21 *northern*, and 12 *southern*; but the moderns have increased the number of the northern to 36, and of the southern to 32. Beside these, there are the twelve *signs* or constellations in the *Zodiac*, as it is called, from a Greek word signifying *an animal*, because each of these 12 represents some animal. This is a great circle dividing the heavens into two equal parts, of which we shall speak hereafter. Meanwhile, we shall conclude this section with an account of the rise, progress, and revolutions in astronomy.

[DIFFERENT SYSTEMS OF THE UNIVERSE.] Mankind must have long reflected on the motions of the heavenly bodies, before they could so far disengage themselves from the prejudices of popular opinion, as to believe that the earth upon which we live was not immovable. We find accordingly, that *Thales*, the Milesian, who, about 580 years before Christ, first taught astronomy in Europe, had calculated eclipses, or interpositions of the moon between the earth and the sun, or of the earth between the sun and the moon (the nature of which may be easily understood, from what we have already observed.) *Pythagoras*, of Samos, flourished about 50 years after *Thales*, and considering eclipses with more attention, conceived an idea, which there is no reason to believe had ever been thought of before, namely, that the earth itself was in motion, and that the sun was at rest. He found that it was impossible, in any other way, to give a consistent account of the heavenly motions. This system, called the *PYTHAGOREAN SYSTEM*, was not widely diffused, till many ages after. The philosophers of antiquity, despairing of being able to overcome ignorance by reason, endeavoured to adapt the one to the other, and to form a reconciliation between them. This was the case with *Ptolemy*, an Egyptian philosopher, who flourished 138 years after Christ; and the hypothesis which he invented is called from him the *PTOLEMAIC SYSTEM*. He supposed, with the vulgar, that the earth was fixed immovably in the centre of the universe, and that the seven planets, considering the moon as one of the primaries, were placed near to it; above them was the firmament of fixed stars, then the crystalline orbs, then the primum mobile, and, lastly, the *cælum empyrium*, or heaven of heavens. All these orbs he supposed to move round the earth once in 24 hours; and to explain the particular motions of the planets, supposed a number of circles, called *excentrics* and *epicycles*, intersecting each other. This system was universally maintained by the *Peripatetic* philosophers, who formed the most considerable sect in Europe from the time of *Ptolemy* to the revival of learning in the sixteenth century.

At length, *Copernicus*, a native of Poland, adopted the *Pythagorean*, or true system of the universe, and published it to the world in the year 1530. This doctrine had been so long in obscurity, that the restorer of it was considered as the in-

ventor;

ventor; and the system obtained the name of the Copernican philosophy, though only revived by that great man.

Europe was still immersed in ignorance; and Copernicus had many opponents. Tycho Brahe, in particular, a noble Dane, sensible of the defects of the Ptolemaic system, but unwilling to acknowledge the motion of the earth, endeavoured, about 1586, to establish a new system, called the *Tychonic System*, which was still more perplexed and embarrassed than that of Ptolemy. It allows a monthly motion to the moon round the earth, as the centre of its orbit, and it makes the sun to be the centre of the orbits of Mercury, Venus, Mars, Jupiter, and Saturn. The sun, however, with all the planets, is supposed to be whirled round the earth in a year, and even once in the twenty-four hours. This system, notwithstanding its absurdity, met with its advocates. Longomontanus, and others, so far refined upon it, as to admit the diurnal motion of the earth, though they insisted that it had no annual motion.

About this time, after a darkness of many ages, the dawn of learning and taste appeared in Europe. Learned men in different countries began to cultivate astronomy. Galileo, a Florentine, about the year 1610, introduced the use of telescopes, which afforded new arguments in support of the motion of the earth, and confirmed the old ones. The fury and bigotry of the clergy had almost checked this flourishing bud: Galileo was obliged to renounce the Copernican system, as a damnable heresy. The Reformation, however, placed a great part of Europe beyond the reach of the papal thunder. It taught mankind that the scriptures were not given for explaining systems of natural philosophy, but for a nobler purpose, to inspire piety and charity: that instead of opposing the word of God, which, in speaking of natural things, suits itself to the prejudices of weak mortals, we employed our faculties in a manner acceptable to our Maker, in tracing the nature of his works, which, the more they are considered, afford us the greater reason to admire his attributes of power, wisdom, and goodness. From this time, therefore, the *Copernican System* prevailed against all opposition, and has been received by the greatest mathematicians and philosophers that have since lived, as *Kepler*, *Galileo*, *Descartes*, *Gassendus*, and *Isaac Newton*; the last of whom has established this system on such an everlasting foundation of mathematical and physical demonstration, as can never be shaken, and none who understand him can hesitate about it. From this time the most noble discoveries were made in all the branches of astronomy. The motions of the heavenly bodies were not only clearly explained, but the general law of nature, according to which they moved, was discovered and illustrated by the immortal *Newton*. This law is called *Gravity*, or *Attraction*, and is the same principle by which heavy bodies fall to the ground, when disengaged from what supported them. It has been demonstrated, that this same law which keeps the sea in its channel, and the various bodies which cover the surface of this earth from flying off into the air, operates throughout the universe, confines the planets in their orbits, and maintains, unimpaired, the harmony of nature.

## S E C T. II.

### Of the Doctrine of the SPHERE.

**H**AVING, in the foregoing Section, treated of the *UNIVERSE* in general, in which the earth has been considered as a planet, we now proceed to the Doctrine of the *SPHERE*, which ought always to be premised before that of the *Globe* or earth, as we shall see in the next Section. In discussing this subject, we shall consider the earth as at rest, and the heavenly bodies, as performing their revolutions round it.

This

This method cannot lead the reader into error, since we have previously explained the true system of the universe, and shewn that it is the *real* motion of the earth which occasions the *apparent* motion of the heavenly bodies. It is besides attended with the advantage of corresponding with the information of our senses. The imagination, therefore, is not put on the stretch; the idea is easy and familiar, and, in delivering the elements of science, this object cannot be too much attended to\*.

The ancients observed, that all the stars apparently turned round the earth, from east to west, in twenty-four hours; that the circles, which they describe in those revolutions, were parallel to each other, but not of the same magnitude; those passing over the middle of the earth, being the largest, while the rest diminished in proportion to their distance from it. They also observed, that there were two points in the heavens, which always preserved the same situation. These points they termed celestial poles, because the heavens seemed to turn round them. In order to imitate these motions, they invented what is called the *Artificial Sphere*, through the centre of which they drew a wire or iron rod, called an *Axis*, whose extremities were fixed to the immoveable points called *Poles*. They first observed, that on the 20th of March, and 23d of September, the circle described by the sun was at an equal distance from both the poles. This circle, therefore, divided the earth into two equal parts, and on this account was called the *Equator* or *Equaller*. It was also called the *Equinoctial Line*, because the sun, when moving in it, makes the days and nights of equal length all over the world. Having also observed, that from the 21st of June to the 22d of December, the sun advanced every day towards a certain point, and having arrived there, returned towards that from whence he set out, from the 22d of December to the 21st of June: they fixed *these points*, which they called *Solstices*, because the direct motion of the sun was stopped at them, and represented the bounds of the sun's motion, by two circles, which they named *Tropics*, because the sun no sooner arrived there than he turned back. Astronomers observing the motion of the sun, found its quantity, at a mean rate, to be nearly a degree (or the 360th part) of a great circle in the heavens, every 24 hours. This great circle is called the *Ecliptic*, and it passes through certain constellations, distinguished by the names of animals, in a zone called the *Zodiac*. It touches the tropic of Cancer on one side, and that of Capricorn on the other, and cuts the equator obliquely at an angle of 23 degrees 29 minutes, the sun's greatest declination. To express this motion, they supposed two points in the heavens, equally distant from, and parallel to, this circle, which they call the *Poles of the Zodiac*, which, turning with the heavens, by means of their axis, describe the *two polar circles*. In the artificial sphere, the equinoctial, the two tropics, and two polar circles, are cut at right angles, by two other circles called *Colures*, which serve to mark the points of the solstices, equinoxes, and poles of the zodiac. The ancients also observed, that when the sun was in any point of his course, the people inhabiting directly north and south, as far as the poles, have noon at the same time. This gave occasion to imagine a circle passing through the poles of the world, called a *Meridian*, and immoveable in the artificial sphere. The horizon is another immoveable circle representing the bounds betwixt the two hemispheres, or half spheres, viz. that which is above it, and that which is below it.

\* N. B. In order more clearly to comprehend what follows, the reader may occasionally turn his eye to the figure of the artificial sphere.

## S E C T. III.

The Doctrine of the **GLOBE** naturally follows that of the **SPHERE**

**BY** the Doctrine of the **GLOBE** is meant the representation of the different places and countries of the earth, upon an artificial globe. The manner in which geographers have represented the situation of one place with regard to another, or to the earth in general, has been by transferring the circles of the sphere to the artificial globe; and this is the only method they could employ, as will appear from an example. After that circle in the heavens, which is called the equator, was known to astronomers, there was nothing more easy than to transfer it to the earth, by which the situation of places was determined, according as they lay on one side of the equator or another. The same may be observed of the other circles of the sphere. The reader having obtained an idea of the principle upon which the Doctrine of the Globe is founded, may proceed to consider this doctrine itself; or, in other words, the description of our earth, as represented by the *artificial globe*.

[**FIGURE OF THE EARTH.**] Though in speaking of the earth, along with the other planets, it was sufficient to consider it as a spherical or globular body; yet it has been discovered, that this is not its true figure, and that the earth, though nearly a sphere or ball, is not perfectly so. This occasioned great dispute between the philosophers of the last age, among whom sir Isaac Newton, and Cassini, a French astronomer, were the heads of two parties. Sir Isaac demonstrated, from mathematical principles, that the earth was an *oblate sphere*, or that it was flatted at the poles, and juted out towards the equator; so that a line, drawn through the centre of the earth, and passing through the poles, which is called a diameter, would not be so long as a line drawn through the same centre, and passing through the east and west points. The French philosopher asserted the contrary. But the dispute was terminated by the French king, in 1736, who sent out a company of philosophers towards the north pole, and likewise towards the equator, in order to measure a degree, or the three hundred and sixtieth part of a great circle in these different parts; and from their report, the opinion of sir Isaac Newton was confirmed beyond dispute. Since that time, therefore, the earth has always been considered as more flat towards the poles than the equator. The reason of this figure may be easily understood, if the reader comprehends what we observed, with regard to the earth's motion; for if we fix a ball of clay on a spindle, and whirl it round, we shall find that it will project towards the middle, and flatten towards the poles. This is exactly the case with regard to our earth, only that its axis, represented by the spindle, is imaginary. But though the earth be not perfectly spherical, the difference from that figure is so small, that it may be represented by a globe, without any sensible error.

[**CIRCUMFERENCE AND DIAMETER OF THE EARTH.**] In the table which we have exhibited, the diameter of the globe is given according to the best observations; so that its circumference is 25,038 English miles. This circumference is conceived, for the conveniency of measuring, to be divided into three hundred and sixty parts or degrees, each degree containing sixty geographical miles, or sixty-nine English miles and an half. These degrees are in the same manner conceived to be divided each into sixty minutes.

[**AXIS AND POLES OF THE EARTH.**] The **AXIS** of the Earth is that imaginary line passing through its centre, on which it is supposed to turn round once in twenty-four hours. The extreme points of this line are called the **Poles** of the Earth; one in the north, and the other in the south, which are exactly under the two points of the heavens called the north and south poles. The knowledge of these poles is of great use to the geographer in determining the distance and situation of places; for

the poles mark the ends of the earth, which is divided in the middle by the equator; so that the nearer one approaches to the poles, the farther he removes from the equator; and, in removing from the poles, he approaches the equator.

**CIRCLES OF THE GLOBE.]** These are commonly divided into the *greater* and *lesser*. A great circle is that whose plane passes through the centre of the earth, and divides it into two equal parts or hemispheres. A lesser circle is that which, being parallel to a greater, cannot pass through the centre of the earth, nor divide it into two equal parts. The greater circles are six in number, the lesser four.

**EQUATOR.]** The first great circle is the *Equator*, or *Equinoctial*, called by sailors the *Line*. The poles of this circle are the same with those of the world. It passes through the east and west points of the world, and divides it into the northern and southern hemispheres. Itself is divided into three hundred and sixty degrees, the use of which will soon appear.

**HORIZON.]** This great circle is represented by a broad circular piece of wood, encompassing the globe, and dividing it into the upper and lower hemispheres. Geographers properly distinguish the horizon into the *sensible* and *rational*. The first is that which bounds the utmost prospect of our sight, when we view the heavens around us apparently touching the earth or sea.

This circle determines the rising or setting of the sun and stars, in any particular place; for when they begin to appear above the eastern edge, we say they rise, and when they go beneath the western, we say they set. It appears then that each place has its own *sensible* horizon. The other horizon, called the *rational*, encompasses the globe exactly in the middle. Its poles (that is two points in its axis, each ninety degrees distant from its plane, as those of all circles are) are called the *Zenith* and *Nadir*; the first exactly above our heads, and the other directly under our feet. The broad wooden circle, which represents it on the globe, has several circles drawn upon it: of these the innermost is that exhibiting the number of degrees of the twelve signs of the Zodiac, viz. thirty to each sign. Next to this you have the names of these signs, with the days of the month, according to the old and new style. Besides these, there is a circle representing the thirty-two rhumbs, or points of the mariner's compass.

**MERIDIAN.]** This circle is represented by the *brass ring*, on which the globe hangs and turns. It is divided into three hundred and sixty degrees, and cuts the equator at right angles; so that counting from the equator each way to the poles of the world, it contains four times ninety degrees, and divides the earth into the eastern and western hemispheres. This circle is called the *meridian*, because when the sun comes to the fourth part of it, it is then mid-day, and the sun has its greatest altitude for that day, which is therefore called its meridian altitude. Now as the sun is never in its meridian altitude at two places east or west of one another at the same time, each of these places must have its own meridian. There are commonly marked on the globe twenty-four meridians, one through every fifteen degrees of the equator.

**ZODIAC.]** The Zodiac is a *broad circle*, which cuts the equator obliquely; in which the twelve signs above mentioned are represented. In the middle of this circle is supposed the *Ecliptic*, from which the sun never deviates in his annual course, and in which he advances thirty degrees every month. The twelve signs are,

Capricorn ♑ — — December</li> <li>11. Aquarius ♒ — — January</li> <li>12. Pisces ♓ — — February.</li> </ol> |
|--|--|---|

**COLURES.]** If you imagine *two great circles* passing both through the poles of the world, and one of them through the equinoctial points Aries and Libra, and the other through the solstitial points Cancer and Capricorn, these are called the Colures, the one the Equinoctial, the other the Solstitial Colure. They divide the ecliptic into four equal parts or quarters, denominated according to the points through which the Colures pass, viz. the first points of Aries, Libra, Cancer, and Capricorn, called the cardinal points: and these are all the *great circles*.

**TROPICS.]** If you suppose two circles drawn parallel to the equinoctial, at twenty-three degrees thirty minutes distance from it, measured on the brazen meridian, and one towards the north, the other towards the south, these are called Tropics, because the sun appears, when in them, to turn backwards from his former course. The one is called the tropic of Cancer, the other Capricorn, because they pass through these points.

**POLAR CIRCLES.]** If two other circles are supposed to be drawn at the like distance of twenty-three degrees thirty minutes, reckoned on the meridian from the poles, these are called the Polar Circles. The *northern* is called the *Arctic*, because the north pole is near the constellation of the Bear; the *southern* the *Antarctic*, because opposite to the former. And these are the *four lesser circles*. Besides these ten circles now described, which are always drawn on the globe, there are several others, which are only supposed to be drawn on it. These will be explained as they become necessary, lest the reader should be disgusted with too many definitions at the same time, without seeing the purpose for which they serve. The main design of all these circles being to exhibit the respective situation of places on the earth, we shall proceed to consider more particularly how they effect this purpose. It was found easier to distinguish places by the quarters of the earth in which they lay, than by their distance from any one point. Thus, after it was discovered, that the equator divided the earth into two parts, called the Northern and Southern hemispheres, it was easy to see that all places on the globe might be distinguished, according as they lay on the north or south side of the equator.

**ZONES.]** After the four lesser circles we have mentioned came to be known, it was found that the earth by means of them, might be divided into five portions, and consequently that the places on its surface might be distinguished according as they lay in one or other of these portions, which are called Zones, from the Greek word *ζώνη*, which signifies a girdle; being broad spaces, like swathes, encompassing the earth.

The *torrid zone* is that portion of the earth between the tropics, and called by the ancients *torrid*; because they believed, that, being continually exposed to the perpendicular or direct rays of the sun, it was rendered through heat barren and uninhabitable. This notion, however, has long since been refuted. It is found that the long nights, great dews, regular rains and breezes, which generally prevail in the torrid zone, render it not only habitable, but highly fruitful. All sorts of spices and drugs are almost solely produced there; and it furnishes the most perfect metals, precious stones, and pearls. This Zone comprehends the East and West Indies, Philippine Islands, those of Borneo, Sumatra, Java, Madagascar, great part of South America and Africa, and almost all east. Cook's discoveries, including the northern parts of New Holland.

The *frigid zones* are those regions round the pole, where the sun does not rise for some days in the winter, nor set for some days in the summer. The two poles are the centres of these zones, which extend from these points to twenty-three degrees and a half nearly; that is, they are bounded by the northern and southern parallels of latitude of sixty-six degrees and a half. The part that lies in the northern hemisphere is called the north frigid zone, and is bounded by a parallel, called the arctic or polar circle; and that in the southern hemisphere, the south frigid

frigid zone, and the parallel of latitude which bounds it, is called the antarctic, or polar circle.

The northern *frigid zone* comprehends Nova Zembla, Lapland, part of Norway, Baffin's Bay, part of Greenland, and part of Siberia. The southern *frigid zone* has no land known to us; and from the observations of captain Cook, who in the years 1772, 1773, 1774, and 1775, disproved the notion of a southern continent, we have reason to think that there is no land belonging to the southern frigid zone. That great navigator having traversed the southern hemisphere between the latitudes of 40° and 70°, in such a manner as not to leave a possibility of the existence of any continent within the reach of navigation.

The *two temperate zones* are the spaces contained within the tropics and polar circles.

The *northern temperate zone* contains almost all Europe, the greater part of Asia, part of Africa, the United States of America, and the British Colonies.

The *southern temperate zone* comprehends the south part of New Holland (including Botany Bay) Cape of Good Hope, and Cape Horn.

**CLIMATES.]** The division of the earth into hemispheres and zones, though it serves to let us know in what quarter of the world any place lies, is not sufficiently minute. The first step taken for determining more accurately the relative situation of places, was to divide the earth into what are called Climates. It was observed, that the day was always twelve hours long on the equator, and that the longest day increased in proportion as we advanced north or south on either side of it. By the length of the day at different places, the ancients ascertained their distance from the equator, or what is called their Latitude; and conceiving a number of circles parallel to the equator, and bounding the length of the day at different distances from it, they called the spaces contained between these circles Climates, because they declined from the equator towards the pole. This new division of the earth, more minute than that of zones, still continues in use; though, as we shall shew, the design which first introduced it, may be better answered in another way. There are 30 climates between the equator and either pole. In the first twenty-four the days increase by half hours; but in the remaining six, between the polar circle and the poles, the days increase by months. This the reader will be convinced of, when he becomes acquainted with the use of the globe: in the mean time we shall insert a table, which will serve to shew in what climate any country lies, supposing the length of the day, and the distance of the place from the equator, to be known.

C.	Latitude.		Breath.		Long.		Day.	Names of Countries and remarkable Places situated in every Climate, north of the Equator.
	D.	M.	D.	M.	H.	M.		
1	8	25	8	25	12	30	I. Within the first Climate lie the Gold and Silver Coasts in Africa; Malacca in the East-Indies; Cayenne and Surinam in Terra Firma, S. America.	
2	16	25	8		13		II. Here lie Abyssinia in Africa; Siam, Madras, and Pondicherry, in the East Indies; Straits of Darien, between N. and S. America; Tobago, the Granades, St. Vincent and Barbadoes in the W. Indies.	
3	23	50	7	25	13	30	III. Contains Merca in Arabia; Bombay, part of Bengal in the East Indies; Canton in China; Mexico, Bay of Campeachy, in North America; Jamaica, Hispaniola, St. Christopher's, Antigua, Martinico, and Guadalupe, in the West Indies.	
4	30	25	6	30	14		IV. Egypt, and the Canary Islands, in Africa; Delhi, capital of the Mogul Empire in Asia; Gulf of Mexico, and East Florida, in North America; the Havanna, in the West Indies.	
5	36	28	6	8	14	30	V. Gibraltar, in Spain; part of the Mediterranean sea; the Barbary coast, in Africa; Jerusalem, Ispahan, capital of Persia; Nankin, in China; California, New Mexico, West Florida, Georgia, and the Carolinas, in North America.	

6	41	22	4	54	15	VI. Lisbon in Portugal; Madrid in Spain; Minorca, Sardinia, and part of Greece, in the Mediterranean; Asia Minor, part of the Caspian Sea; Samarcand, in Great Tartary; Pekin in China; Corea and Japan; Williamsburgh, in Virginia; Maryland, and Philadelphia, in North America.	
7	45	29	4	7	15	30	VII. Northern provinces of Spain; Southern ditto of France; Turin, Genoa, and Rome, in Italy; Constantinople, and the Black Sea, in Turkey; the Caspian Sea, and part of Tartary; New York, Boston in New England, North America.
8	49	1	3	32	16	VIII. Paris, Vienna capital of Germany; New-Scotland, Newfoundland, and Canada, in North America.	
9	52	00	2	57	16	30	IX. London, Flanders, Prague, Dresden; Cracow in Poland; southern provinces of Russia; part of Tartary; North part of Newfoundland.
10	54	27	2	29	17	X. Dublin, York, Holland, Hanover, and Tartary; Warsaw, in Poland; Labrador, and New South-Wales, in North America.	
11	56	37	2	10	17	30	XI. Edinburgh, Copenhagen; Moscow capital of Russia.
12	58	29	1	52	18	XII. South part of Sweden; Tobolki, capital of Siberia.	
13	59	58	1	29	18	30	XIII. Orkney Isles, Stockholm, capital of Sweden.
14	61	18	1	20	19	XIV. Bergen in Norway; Peterburgh in Russia.	
15	62	25	1	7	19	30	XV. Hudson's Straits, North America.
16	63	23		57	20	XVI. Siberia, and the fourth part of West Greenland.	
17	64	6		44	20	30	XVII. Drontheim, in Norway.
18	64	49		42	21	XVIII. Part of Finland, in Russia.	
19	65	21		32	21	30	XIX. Archangel on the White Sea, Russia.
20	65	47		22	22	XX. Hecla in Iceland.	
21	66	6		19	22	30	XXI. Northern parts of Russia and Siberia.
22	66	20		14	23	XXII. New North Wales, in North America.	
23	66	28		8	23	30	XXIII. Davis's Straits, in North America.
24	66	31		3	24	XXIV. Samoieda.	
25	67	21			1	Month	XXV. South part of Lapland.
26	69	48			2	Months	XXVI. West-Greenland.
27	73	37			3	Months	XXVII. Zembla Australis.
28	78	30			4	Months	XXVIII. Zembla Borealis.
29	84	5			5	Months	XXIX. Spitzbergen or East Greenland.
30	90				6	Months	XXX. Unknown.

**LATITUDE.]** The distance of places from the equator, or what is called their *Latitude*, is easily measured on the globe by means of the meridian above described. As latitude is reckoned from the equator towards the poles, a place on the northern side of the equator is said to be in north latitude, and a place on the southern side in south latitude. The nearer the poles the greater the latitude; and no place can have more than 90 degrees of latitude, because the poles respectively are at that distance from the equator.

**PARALLELS OF LATITUDE.]** Through every degree of latitude, or more properly through every particular place on the earth, geographers suppose a circle to be drawn, which they call a parallel of latitude. The intersection of this circle, with the meridian of any place, shews the true situation of that place.

**LONGITUDE.]** The *longitude* of a place is its situation with regard to its first meridian, and consequently reckoned towards the east or west: in reckoning the longitude there is no particular spot naturally preferable to another; but for the sake of a general rule, the meridian of Ferro, the most westerly of the Canary Islands, was considered as the first meridian in most globes and maps, and the longitude of places was reckoned to be so many degrees east or west of the meridian of Ferro. The modern globes fix the first meridian, from which the degrees of longitude are reckoned, in the capital city of the different kingdoms where they are made, viz. the English globes date the first meridian from London or Greenwich, the French globes from Paris, &c. The degrees of longitude are marked on the equator. No place can have more than 180 degrees of longitude, because, the circumference of the globe being 360 degrees, no place can be remote from another

above

above half that distance; but many foreign geographers improperly reckon the longitude quite round the globe. The degrees of longitude are not equal like those of latitude, but diminish in proportion as the meridians incline, or their distance contracts in approaching the pole. Hence in 60 degrees of latitude, a degree of longitude is but half the quantity of a degree on the equator, and so of the rest. The number of miles contained in a degree of longitude, in each parallel of latitude, are exhibited in the following table:

A TABLE shewing the Number of Miles contained in a Degree of Longitude, in each Parallel of Latitude from the Equator.

Degrees of Latitude.	Miles.										
1	59 96	16	57 60	31	51 43	46	41 68	61	29 04	76	14 51
2	59 94	17	57 30	32	50 88	47	41 00	62	28 17	77	13 50
3	59 92	18	57 04	33	50 32	48	40 15	63	27 24	78	12 48
4	59 86	19	56 73	34	49 74	49	39 36	64	26 30	79	11 45
5	59 77	20	56 38	35	49 15	50	38 57	65	25 36	80	10 42
6	59 67	21	56 00	36	48 54	51	37 73	66	24 41	81	09 38

LONGITUDE AND LATITUDE ON THE ARTIFICIAL GLOBE FOUND.] To find the Longitude and Latitude of any place, we need only bring that place to the brazen meridian, and we shall find the degree of longitude marked on the equator, and the degree of latitude on the meridian. So that, to find the difference between the latitude or longitude of two places, we have only to compare the degrees of either, thus found, with each other, and the reduction of these degrees into miles, according to the table above given, and, remembering that every degree of longitude at the equator, and every degree of latitude all over the globe, is equal to 60 geographic miles, or 60 English, we shall be able to determine the distance between any places on the globe.

DISTANCE OF PLACES MEASURED.] The distances of places which lie in an oblique direction, i. e. neither directly south, north, east, nor west, from each other may be measured in a readier way, by extending the compasses from the one to the other, and then applying them to the equator. For instance, extend the compasses from Guinea in Africa, to Brazil in America, and then apply them to the equator, and you will find the distance to be 25 degrees, which at 60 miles to a degree, makes the distance 1500 miles.

QUADRANT OF ALTITUDE.] In order to supply the place of the compasses in this operation, there is commonly a pliant narrow plate of brass, screwed on the brazen meridian, which contains 90 degrees, or one quarter of the circumference of the globe, by means of which the distances and bearings of places are measured without the trouble of first extending the compasses between them, and then applying the same to the equator. This plate is called the Quadrant of Altitude.

HOUR

**HOUR CIRCLE.]** This is a small brass circle fixed on the brazen meridian, divided into 24 hours, and having an index moveable round the axis of the globe.

**PROBLEMS PERFORMED BY THE GLOBE.**

**PROB. 1.** *THE diameter of an artificial globe being given, to find its surface in square, and its solidity in cubic measure.*

Multiply the diameter by the circumference, which is a great circle dividing the globe into two equal parts, and the product will give the first: then multiply the said product by one sixth of the diameter, and the product of that will give the second. After the same manner we may find the surface and solidity of the natural globe, as also the whole body of the atmosphere surrounding the same, provided it be always and every where at the same height; for having found the perpendicular height thereof, by that common experiment of the ascent of Mercury at the foot and top of a mountain, then double the said height, and add the same to the diameter of the earth; then multiply the whole, as a new diameter by its proper circumference, and from the product subtract the solidity of the earth, it will leave that of the atmosphere.

**PROB. 2.** *To rectify the globe.*

The globe being set upon a true plane, raise the pole according to the given latitude, then fix the quadrant of altitude in the zenith, and if there be any mariner's compass upon the pedestal, let the globe be so situated, that the brazen meridian may stand due south and north, according to the two extremities of the needle, allowing their variation.

**PROB. 3.** *To find the longitude and latitude of any place.*

For this see above.

**PROB. 4.** *The longitude and latitude of any place being given, to find that place on the globe.*

Bring the degree of longitude to the brazen meridian; reckon upon the same meridian the degree of latitude, whether south or north, and make a mark with chalk where the reckoning ends; the point exactly under the chalk is the place desired.

**PROB. 5.** *The latitude of any place being given, to find all those places that have the same latitude.*

The globe being rectified (*a*) according to the latitude of the given place, and that place being brought to the brazen meridian, make a mark exactly above the same, and turning the globe round, all those places passing under the said mark have the same latitude with the given place.

**PROB. 6.** *To find the Sun's place in the Ecliptic at any time.*

The month and day being given, look for the same upon the wooden horizon, and over-against the day you will find the particular sign and degree in which the Sun is at that time, which sign and degree being noted in the ecliptic, the same is the sun's place, or nearly, at the time desired.

**PROB. 7.** *The month and day being given, as also the particular time of that day, to find those places of the globe to which the Sun is in the meridian at that particular time.*

The pole being elevated according to the latitude of the place where you are, bring the said place to the brazen meridian, and setting the index of the horary circle at the hour of the day, in the given place, or where you are, turn the globe till the index points at the upper figure XII. which done, fix the globe at that situation, and observe what places are exactly under the upper hemisphere of the brazen meridian, for those are the places desired.

I N T R O D U C T I O N .

**PROB. 8.** *To know the length of the day and night in any place of the earth at any time.*

Elevate the pole *(b)* according to the latitude of the given place; find the sun's place in the ecliptic *(c)* at that time, which being brought to the east side of the horizon, set the index of the horary circle at noon, or the upper figure XII. and turning the globe about till the aforesaid place of the ecliptic touch the western side of the horizon, look upon the horary circle, and wheresoever the index points, reckon the number of hours between the same and the upper figure of XII. for that is the length of the day, the compliment whereof to 24 hours is the length of the night.

**PROB. 9.** *To know what o'clock it is by the globe in any part of the world, and at any time, provided you know the hour of the day where you are at the same time.*

Bring the place in which you are to the brazen meridian, the pole being raised *(a)* according to the latitude thereof, and set the index of the horary circle to the hour of the day at that time. Then bring the desired place to the brazen meridian, and the index will point out the present hour at that place wherever it is.

**PROB. 10.** *A place being given in the Torrid Zone, to find those two days of the year in which the sun shall be vertical to the same.*

Bring the given place to the brazen meridian, and mark what degree of latitude is exactly above it. Move the globe round, and observe the two points of the ecliptic that pass through the said degree of latitude. Search upon the wooden horizon (or by proper tables of the sun's annual motion) on what days he passeth through the aforesaid points of the ecliptic, for those are the days required in which the sun is vertical to the given place.

**PROB. 11.** *The month and the day being given, to find by the globe those places of the North Frigid Zone, where the sun begins then to shine constantly without setting: as also those places of the South Frigid Zone, where he then begins to be totally absent.*

The day given (which must always be one of those either between the vernal equinox and the summer solstice, or between the autumnal equinox and winter solstice), find *(b)* the sun's place in the ecliptic, and marking the same, bring it to the brazen meridian, and reckon the like number of degrees from the north pole towards the equator, as there is between the equator and the sun's place in the ecliptic, setting a mark with chalk where the reckoning ends: This done, turn the globe round, and all the places passing under the said chalk are those in which the sun begins to shine constantly without setting upon the given day. For solution of the latter part of the problem, set off the same distance from the south pole upon the brazen meridian towards the equator, as was formerly set off from the north, then marking with chalk, and turning the globe round, all places passing under the mark are those where the sun begins his total disappearance from the given day.

**PROB. 12.** *A place being given in the North Frigid Zone, to find by the globe what number of days the sun constantly shines upon that place, and what days he is absent, as also the first and last day of his appearance.*

Bring the given place to the brazen meridian, and observing its latitude *(c)* elevate the globe accordingly; count the same number of degrees upon the meridian from each side of the equator as the place is distant from the pole; and making marks where the reckonings end, turn the globe, and carefully observe what two degrees of the ecliptic pass exactly under the two points marked in the meridian; first for the northern arch of the circle, namely that comprehended between the two degrees marked, being reduced to time, will give the number of days

days that the sun constantly shines above the horizon of the given place; and the opposite arch of that circle will give the number of days in which he is totally absent, and also will point out which days those are. In the interval he will rise and set.

**PROB. 13.** *The month and day being given, to find those places on the globe, to which the sun, when on the meridian, shall be vertical on that day.*

*(d) PROB. 6.* The sun's place in the ecliptic being *(d)* found, bring the same to the brazen meridian, in which make a small mark with chalk, exactly above the sun's place. Which done, turn the globe, and those places which have the sun vertical in the meridian will successively pass under the said mark.

**PROB. 14.** *The month and day being given, to find upon what point of the compass the sun then rises and sets in any place.*

Elevate the pole according to the latitude of the desired place, and, finding the sun's place in the ecliptic at the given time, bring the same to the eastern side of the horizon, and you may there clearly see the point of the compass upon which he then rises. By turning the globe till his place coincide with the western side of the horizon, you may also see upon that circle the exact point of his setting.

**PROB. 15.** *To know by the globe the length of the longest and shortest days and nights in any part of the world.*

Elevate the pole according to the latitude of the given place, and bring the first degree of Cancer if in the northern, or Capricorn if in the southern hemisphere, to the east side of the horizon; and setting the index of the horary circle at noon, turn the globe till the side of Cancer touch the western side of the horizon, and then observe upon the horary circle the number of hours between the index and the upper figure of XII. reckoning them according to the motion of the index, for that is the length of the longest day, the complement whereof is the extent of the shortest night. The shortest day and longest night are only the reverse of the former.

**PROB. 16.** *The hour of the day being given in any place, to find those places of the earth where it is either noon or midnight, or any other particular hour at the same time.*

Bring the given place to the brazen meridian, and set the index of the hoary circle at the hour of the day in that place. Then turn the globe till the index point at the upper figure of XII. and observe what places are exactly under the upper semicircle of the brazen meridian, for in them it is mid-day at the time given. Which done, turn the globe till the index point at the lower figure of XII. and what places are then in the lower semicircle of the meridian, in them it is midnight at the given time. After the same manner we may find those places that have any other particular hour at the time given, by moving the globe till the index point at the hour desired, and observing the places then under the brazen meridian.

**PROB. 17.** *The day and hour being given, to find by the globe that particular place of the earth to which the sun is vertical at that time.*

The sun's place in the ecliptic *(a)* being found and brought to the brazen meridian, make a mark above the same with chalk; then *(b)* find those places of the earth in whose meridian the sun is at that instant, and bring them to the brazen meridian; which done, observe narrowly that individual part of the earth which falls exactly under the aforesaid mark in the brazen meridian; for that is the particular place to which the sun is vertical at that time.

**PROB.**

**PROB. 18.** *The day and hour at any place being given, to find all those places where the sun is then rising, or setting, or on the meridian; consequently, all those places which are enlightened at that time, and those which are in the dark.*

This problem cannot be solved by any globe fitted up in the common way, with the hour-circle fixed upon the brass-meridian; unless the sun be on or near some of the tropics on the given day. But by a globe fitted up according to Mr. Joseph Harris's invention, where the hour-circle lies on the surface of the globe, below the meridian, it may be solved for any day in the year, according to his method; which is as follows:

Having found the place to which the sun is vertical at the given hour, if the place be in the northern hemisphere, elevate the north pole as many degrees above the horizon, as are equal to the latitude of that place; if the place be in the southern hemisphere, elevate the south pole accordingly; and bring the place to the brazen meridian. Then all those places which are in the western semicircle of the horizon have the sun rising to them at that time; and those in the eastern semicircle have it setting: to those under the upper semicircle of the brass meridian, it is noon; and to those under the lower semicircle, it is midnight. All those places which are above the horizon, are enlightened by the sun, and have the sun just as many degrees above them, as they themselves are above the horizon; and this height may be known, by fixing the quadrant of altitude on the brazen meridian over the place to which the sun is vertical; and then laying it over any other place, observe what number of degrees on the quadrant are intercepted between the said place and the horizon. In all those places that are 18 degrees below the western semicircle of the horizon, the morning twilight is just beginning; in all those that are 18 degrees below the semicircle of the horizon, the evening twilight is ending; and all those that are lower than 18 degrees, have dark night.

If any place be brought to the upper semicircle of the brazen meridian, and the hour-index be set to the upper XII. or noon, and then the globe be turned eastward on its axis; when the place comes to the western semicircle of the horizon, the index will shew the time of sun-rising at that place; and when the same place comes to the eastern semicircle of the horizon, the index will shew the time of sun-set.

To those places which do not go under the horizon, the sun sets not on that day; and to those which do not come above it the sun does not rise.

**PROB. 19.** *The month and day being given, with the place of the moon in the zodiac and her true latitude, and to find thereby the exact hour when she shall rise and set together with her southing, or coming to the meridian of the place.*

The moon's place in the zodiac may be found readily at any time by an almanac; and her latitude, which is her distance from the ecliptic, by applying the semicircle of position to her place in the zodiac. For the solution of the problem (a.) elevate the pole according to the latitude of the given place and (b) PROB. 2. the sun's place in the ecliptic at that time being (b) found and marked (b) PROB. 6. with chalk, and as also the moon's place at the same, bring the sun's place to the brazen meridian, and set the index of horary circle at noon, then turn the globe till the moon's place successively meet with the eastern and western side of the horizon, as also the brazen meridian, and the index will point at those times, the particular hours of her rising, setting, and southing.

**PROB. 20.** *Two places being given on the globe, to find the true distance between them.*

Lay the graduated edge of the quadrant of altitude over both the places, and the number of degrees intercepted between them will be their true distance from each other, reckoning every degree to be 69½ English miles; or take the distance of the two places with a pair of compasses, and apply it to the equinoctial, which will give the number of degrees between them.

PROB.

**PROB. 21.** *To find all those countries in which an eclipse of the sun or moon will be visible.*

1. *Of the sun.* Find the place to which the sun is vertical at the time of the eclipse, by problem 17th, and bring it to the zenith or top of the globe; then to all those places above the horizon, if the eclipse be large, will the sun appear (in part) visibly obscured.

2. *Of the moon.* Bring the antipodes, or country, opposite to the place where the sun is vertical at the time of the eclipse, to the zenith, or top of the globe, and then the eclipse will be seen in all places above the horizon at that time.

**PROB. 22.** *A place being given on the globe, and its true distance from a second place, to find thereby all other places of the earth of the same distance from the given place.*

Bring the given place to the brazen meridian, and elevate the pole according to the latitude of that place; then fix the quadrant of altitude in the zenith, and reckon upon that quadrant the given distance between the first and second place, provided the same be under 90 degrees, otherwise you must use the femicircle of position, and marking where the reckoning ends, and moving the quadrant round upon the surface of the globe, all places passing under that mark are those desired.

#### PROBLEMS solved on the CELESTIAL GLOBE.

The equator, ecliptic, tropics, polar circles, horizon, and brazen meridians, are exactly alike on both globes. Both also are rectified in the same manner. *N. B.* The sun's place for any day in the year stands directly over that day on the horizon of the celestial globe, as it does on that day of the terrestrial.

The *latitude* and *longitude* of the stars, or of all other celestial phenomena, are reckoned in a very different manner from the latitude and longitude of places on the earth; for all terrestrial latitudes are reckoned from the equator; and longitudes from the meridian of some remarkable place, as, of London by the British, and of Paris by the French. But the astronomers of all nations agree in reckoning the latitudes of the moon, stars, planets, and comets, from the ecliptic; and their longitudes from the equinoctial colure, in that semicircle of it which cuts the ecliptic at the beginning of Aries; and thence eastward, quite round the same semicircle again. Consequently those stars which lie between the equinoctial and the northern half of the ecliptic, have north declination and south latitude; those which lie between the equinoctial and the southern half of the ecliptic, have south declination, and north latitude; and all those which lie between the tropics, and the poles, have their declinations and latitude of the same denomination.

**PROB. 1.** *To find the right ascension and declination of the sun, or any fixed star.*

Bring the sun's place in the ecliptic to the brazen meridian; then that degree in the equinoctial which is cut by the meridian, is the sun's *right ascension*; and that degree of the meridian which is over the sun's place, is his *declination*. Bring any fixed star to the meridian, and its right ascension will be cut by the meridian in the equinoctial, and the degree of the meridian that stands over it is its declination. So that the right ascension and declination on the celestial globe are found in the same manner as longitude and latitude on the terrestrial.

**PROB. 2.** *To find the latitude and longitude of any star.*

If the given star be on the north side of the ecliptic, place the 90th degree of the quadrant of altitude on the north pole of the ecliptic, where the twelve semicircles meet, which divide the ecliptic into twelve signs; but if the star be on the south side of the ecliptic, place the 9th degree of the quadrant on the south pole of the ecliptic. Keeping the 9th degree of the quadrant on the proper pole, turn the quadrant about, until its graduated edge cuts the star; then the number of degrees

in

in the quadrant, between the ecliptic and the star, is its latitude; and the degrees of the ecliptic, cut by the quadrant, is the star's longitude, reckoned according to the sign in which the quadrant then is.

**PROB. 3.** *To present the face of the starry firmament, as seen from any given place of the earth, at any hour of the night.*

Rectify the celestial globe for the given latitude, the zenith, and sun's place, in every respect, as taught by the problem for the terrestrial; and turn it about till the index points to the given hour; then the upper hemisphere of the globe will represent the visible half of the heavens for that time; all the stars upon the globe being then in such situations, as exactly correspond to those in the heavens. And if the globe be placed duly north and south by means of a small sea-compass, every star in the globe will point to the like star in the heavens, by which means the constellations and remarkable stars may be easily known. All those stars which are in the eastern side of the horizon, are then rising in the eastern side of the heavens; all in the western, are setting in the western side; and all those under the upper part of the frozen meridian, between the south point of the horizon and the north pole, are at their greatest altitude, if the latitude of the place be north; but if the latitude be south, those stars which lie under the upper part of the meridian, between the north point of the horizon and the south pole, are at their greatest altitude.

**PROB. 4.** *The latitude of the place, and day of the month being given, to find when any star will rise, or be upon the meridian, or set.*

Having rectified the globe, turn it about until the given star comes to the eastern side of the horizon, and the index will shew the time of the star's rising; then turn the globe westward, and when the star comes to the brazen meridian, the index will shew the time of the star's coming to the meridian of your place; lastly, turn on until the star comes to the western side of the horizon, and the index will shew the time of the star's setting. *N. B.* In northern latitudes, those stars which are less distant from the north pole than the quantity of its elevation above the north point of the horizon, never set; and those which are less distant from the south pole than the number of degrees by which it is depressed below the horizon, never rise: and *vice versa* in southern latitudes.

**PROB. 5.** *To find at what time of the year a given star will be upon the meridian, at a given hour of the night.*

Bring the given star to the upper semicircle of the brazen meridian, and set the index to the given hour; then turn the globe, until the index points to XII. at noon, and the upper semicircle of the meridian will then cut the sun's place, answering to the day of the year sought; which day may be easily found against the like place of the sun among the signs on the wooden horizon.

#### *Methods for finding the LATITUDES and LONGITUDES of Places from CELESTIAL OBSERVATIONS.*

It being a matter of vast importance to navigators to know the situation of any place they may touch at, or in what part of the ocean they are, in other words, to know their longitude and latitude; the methods of finding them are here pointed out.

I. OF FINDING THE LATITUDE.] As the latitude of a place is an arch of the meridian intercepted between the zenith and the equinoctial, which is always equal to the height of the visible pole above the horizon, it follows that if the meridional altitude, or its complement, the zenith distance of any celestial object, whose place in the heavens is known, can be found, the latitude is easily discovered. Thus if the heavenly object be in the equinoctial, the zenith distance will be equal

to the latitude, which will be either north or south, according as the observer is situated either to the northward or southward of the object. But if the sun or star hath either north or south declination, that is, if its apparent diurnal motion be either to the northward or southward of the equinoctial, the declination must either be subtracted from, or added to the zenith distance, according as the zenith distance and declination are of the same or different denominations. The method is this:

1. Observe by a quadrant the meridional distance of the sun from the zenith, which is always the complement of his meridian altitude; correct for the DIP of the horizon, and REFRACTION; and add to this the sun's declination, when the sun and the place are on the same side of the equator; or subtract the declination, when they are on different sides; the sum in the former case, and the difference in the latter, will be the *latitude* required. But when the declination of the sun is greater than the latitude of the place, which is known from the sun's being nearer to the elevated pole, than the zenith of the place is, as it frequently happens in the torrid zone, then the difference between the sun's declination, and his zenith distance, is the *latitude* of the place.

If the sun or star have no declination, but move in the equinoctial that day, then the elevation of the equator will be equal to his meridian altitude, and consequently his meridian altitude is the complement of the *latitude* to 90. This method is best accommodated to the uses of navigation, as being practicable at sea; but for observations at land, another method may be pointed out.

2. The altitude of the pole, it has been already shewn, is always equal to the *latitude*; for which reason the *latitude* might be best found by observing the pole's height; but as the pole is only a mathematical point, and no ways to be observed by our senses, its height cannot be determined in the same manner as that of the sun and stars, &c. for which reason another manner has been contrived.

In order to this, a meridian line is first drawn. Place a quadrant on this line, so that its plane may be in the plane of the meridian; then take some star near the pole, v. gr. the pole-star (which never sets), and observe both its greatest, and least altitude: half of the difference deducted from the greatest altitude, or added to the least, will give the altitude of the pole above the horizon, which is equal to the latitude of the place.

II. OF FINDING THE LONGITUDE.] To find exactly the *longitude* at sea, is a problem that has extremely perplexed the mathematicians of these two last centuries; and for the solution of which, great rewards have been publicly offered by the English, French, Dutch, and other nations, this being almost the only thing wanting to render navigation perfect.

In the year 1598, Philip the Third, king of Spain, offered a reward of 1000 crowns for the solution of this problem; this example was followed by the States General, who offered 10,000 florins. In 1635, John Morrin, professor of mathematics at Paris, proposed his discovery of the longitude to Cardinal Richlieu; the commissioners, who were appointed to examine this method, judged it insufficient, on account of the imperfection of the lunar tables; but Cardinal Mazarin, in 1645, procured for its author a pension of 2000 livres. In 1714 an act was passed by the British parliament, appointing and empowering certain commissioners to make out a bill for a sum not exceeding 2000l. towards making necessary experiments; and also granting a reward of 10,000l. to the person who should determine the *longitude* at sea to one degree of a great circle, or 60 geographical miles; 15,000l. if the longitude be determined to two-thirds of that distance; and 20,000l. if it be determined to half that distance.

It should be observed that the difference of longitude between any two places, might be determined, by knowing the difference between the times that any re-  
mark-

markable appearance in the heavens was seen in those places. For since the sun and fixed stars appear to move round the earth, or, which is the same thing, the earth revolves about its axis in twenty-four hours; it follows, that in every hour there passes over the meridian one twenty-fourth part of 360 degrees, or of the whole circumference of the equator, equal to 15 degrees; and a proportional part in a greater or lesser time.

The heavenly bodies afford frequent opportunities of making observations of this kind. For as these appearances consist in the appulses, that is, the approaches of the heavenly bodies to each other, or their passing by each other; and these appulses when they happen, are seen at the same instant of absolute time in all parts of the earth where they are visible; therefore by knowing the relative times of the day when such appearances are seen in two distant places, the difference between those times is known, and consequently the difference of longitude between those two places; always observing that for every hour of time you must allow 15 degrees of longitude either east or west, according as the time is either sooner or later than the time marked out for such appearances to happen at Greenwich, for instance, from whence the first meridian commences.

Several ephemerides or almanacs are annually published, in which the times when the eclipses of the sun, moon, and Jupiter's satellites; the rising, setting, and southing of the planets; the appulses of the moon to certain fixed stars; and other celestial appearances, are determined with regard to some meridian. By the help of one of these books, and a careful observation of these appearances, the longitude may be determined.

Eclipses of the moon, when they happen, afford one method of finding the difference of longitude. For as these eclipses are occasioned by an interposition of the earth between her and the sun, and consequently she is immerged in the sun's shadow, the moment any part of her body is deprived of the solar rays, it is visible to all those people who can see her, at the same instant of absolute time. Hence by observing the beginning, middle, or end of the eclipse of the moon in any part of the world, noting the apparent time of these phenomena, and comparing it with the calculations of the same eclipse adapted to some other meridian, the difference of time, and consequently the difference of longitude between those two places, will be known.

Suppose for instance the beginning of an eclipse of the moon happened at London sixteen minutes after two in the morning, and at thirty-four minutes twenty seconds after nine in the evening at Boston in New England; then will the difference of time be four hours, forty-one minutes, forty seconds, equal to seventy degrees, twenty-five minutes, the difference of longitude; and because the time is later at Boston, than at London; for when it is past two in the morning at London, it is only a little after in the preceding evening at Boston; in other words, Boston is about four hours and three quarters later in coming to the meridian than London, the difference of longitude will be west. Consequently if the longitude be reckoned from the meridian of London, the longitude of Boston will be seventy degrees twenty-five minutes west.—See Ferguson's Astronomy, sixth edit. p. 122. Also White's Ephemeris for 1794, p. 37.

The longitude of places may also be obtained from the observations of solar eclipses, but these being incumbered with the consideration of parallaxes, are much less adapted to that purpose than those of the moon.

But as the eclipses of the sun and moon happen but seldom, another expedient offers, viz. the eclipses of Jupiter's satellites. That planet has four moons or satellites, moving round him at different distances, and at different intervals of time; one or more of which is eclipsed almost every night: for they disappear either in going behind Jupiter, or in passing before him: and the instant of such immer-  
8  
may

may be seen by a refracting telescope of about eight or nine feet long, or a reflecting one of nine inches focal length.

The passage of the moon, or the superior planets over the meridian, affords another method of discovering the longitude; for by having the time in an ephemeris, when the moon or any of the planets pass the meridian of some place, and finding by observation the time when the object passes the meridian of another place, the longitude will be determined; for the difference of time converted into degrees, &c. will give the difference of longitude.

There is still another method, equally expeditious and certain, namely the appulses of the moon to certain fixed stars, and their occultations by reason of her body. For the moon finishing her revolution in twenty-seven days, seven hours, forty-three minutes, there are but few clear nights, when the moon does not pass over, or so near some fixed star, that the time of the nearest approach or the visible conjunction may be easily observed. Marking exactly the apparent time of these observations, and comparing that with the time of the place for which meridian they are calculated, will give you the difference of longitude between the two places.

It will be obvious to every reflecting reader, that as many of the above observations must be made by the telescope, the constant motion of a ship under sail, will render it impossible to make them accurately at sea. To remedy that inconvenience Mr. Christopher Irwin invented what he calls a marine chair. This chair was tried by Mr. Matkelyne, in his voyage to Barbadoes, who found it totally impracticable to derive any advantage from it. And besides, since all methods, which depend upon the phenomena of the heavens, have also this other defect, that they cannot be observed at all times, it became a great desideratum in navigation to discover some other method of ascertaining the longitude at sea.

It is well known that if a time-keeper could be made to go with perfect accuracy, by having such a clock or watch on board, the longitude might be easily determined; for by finding the time of the day at any other place, and comparing it with the time then shewn by such a machine, the difference of longitude between those places will be known. The ingenious Mr. Harrison a few years since completed such a time-keeper, which was found upon trial to answer even beyond the most sanguine expectations; and he accordingly received ten thousand pounds from government, as a reward for his discovery; but for some reasons, not generally known, the time-keeper has been hitherto kept from the public.

*The different MANNER by which some NATIONS and PEOPLE reckon TIME.*

The Babylonians, Persians, and Syrians, and the inhabitants of some part of Germany, begin their day at sun-rising.

The (ancient) Jews, Athenians, and Italians, reckon from sun-setting.

The Egyptians, like the English, &c. begin at midnight.

The astronomers and seamen begin the day at noon, and reckon 24 hours to the next day at noon; and according to this mode of reckoning are all the calculations of the sun, moon, and planets, made in the common almanacks.

*An ACCOUNT of the GREGORIAN or NEW STYLE.*

Pope Gregory XIII. made a reformation of the Calendar. The Julian Calendar, or Old Style, had, before that time, been in general use all over Europe. The year, according to the Julian Calendar, consists of 365 days and 6 hours; which 6 hours being one fourth part of a day, the common years consisted of 365 days, and every fourth year one day was added to the month of February, which made each of those years 366 days, which are usually called Leap years.

This computation, though near the truth, is more than the solar year by eleven minutes, which in 131 years amounts to a whole day. In consequence of this, the vernal equinox was anticipated ten days from the general council at Nice, held in the year 325 of the Christian *Æra*, to the time of pope Gregory, who therefore caused ten days to be taken out of the month of October, 1582, to make the equinox fall on the 11th of March, as it did at the time of that council. And to prevent the like variation in future, he ordered that three days should be abated in every four hundred years, by reducing the leap year at the close of each century, for three successive centuries, to common years, and retaining the leap year at the close of each fourth century only.

At that time this was considered as exactly conformable to the true solar year; but Dr. Halley makes the solar year to be 365 days, 5 hours, 48 minutes, 54 seconds, 41 thirds, 27 fourths, 36 fifths; according to which, in 400 years, the Julian year of 365 days, 6 hours, will exceed the solar by one hour and 53 minutes (besides the three days already accounted for) which is nearly two hours, so that in 50 centuries it will amount to a day.

Though the Gregorian Calendar, or New Style, had long been used throughout the greater part of Europe, it did not take place in Great Britain and America till the 1st of January 1752; and in September following, the eleven days were adjusted, by calling the third day of that month the fourteenth, and continuing the rest in their order.

## G E O G R A P H I C A L O B S E R V A T I O N S .

1. The latitude of any place is equal to the elevation of the pole above the horizon of that place, and the elevation of the equator is equal to the complement of the latitude, that is, to what the latitude wants of 90 degrees.

2. Those places which lie on the equator, have no latitude, it being there that the latitude begins; and those places which lie in the first meridian have no longitude, it being there that the longitude begins. Consequently, that particular place of the earth where the first meridian intersects the equator, has neither longitude nor latitude.

3. All places of the earth equally enjoy the benefit of the sun, in respect of time, and are equally deprived of it.

4. All places upon the equator have their days and nights equally long, that is, 12 hours each, at all times of the year; for though the sun declines alternately, from the equator towards the north and towards the south, yet, as the horizon of the equator cuts all the parallels of latitude and declination in halves, the sun must always continue above the horizon for one half a diurnal revolution about the earth, and for the other half below it.

5. In all places of the earth between the equator and poles, the days and nights are equally long, viz. 12 hours each when the sun is in the equinoctial; for, in all the elevations of the pole, short of 90 degrees, (which is the greatest), one half of the equator will be above the horizon, and the other half below it.

6. The days and nights are never of an equal length at any place between the equator and polar circles, except when the sun enters the signs ♈ Aries and ♎ Libra; for, in every other part of the ecliptic, the circle of the sun's daily motion is divided into two unequal parts by the horizon.

7. The nearer any place is to the equator, the less is the difference between the length of the days and nights in that place; and the more remote, the contrary; the circles which the sun describes in the heaven every 24 hours, being cut more nearly equal in the former case, and more unequal in the latter.

8. In all places lying upon any given parallel of latitude, however long or short, the day and night be at any one of these places, at any time of the year, it is then of the same length at all the rest; for, in turning the globe round its axis (when rectified according to the sun's declination), all these places will keep equally long above or below the horizon.

9. The sun is vertical twice a year to every place between the tropics; to those under the tropics once a year, but never any where else. For, there can be no place between the tropics, but that there will be two points in the ecliptic, whose declination from the equator is equal to the latitude of that place; and but one point of the ecliptic which has a declination equal to the latitude of places on the tropic which that point of the ecliptic touches, and as the sun never goes without the tropics, he can never be vertical to any place that lies without them.

10. In all places lying exactly under the polar circles, the sun, when he is in the nearest tropic, continues 24 hours above the horizon, without setting; because no part of that tropic is below their horizon. And when the sun is in the farthest tropic, he is for the same length of time without rising; because no part of that tropic is above the horizon. At all other times of the year he rises and sets there, as in other places; because all the circles that can be drawn parallel to the equator, between the tropics, are more or less cut by the horizon, as they are farther from, or nearer to, that tropic which is all above the horizon: and when the sun is not in either of the tropics, his diurnal course must be in one or other of these circles.

11. To all places in the northern hemisphere, from the equator to the polar circle, the longest day and shortest night is when the sun is in the northern tropic; and the shortest day and longest night is when the sun is in the southern tropic; because no circle of the sun's daily motion is so much above the horizon, and so little below it, as the northern tropic; and none so little above it, and so much below it, as the southern. In the southern hemisphere, the contrary.

12. In all places between the polar circles and poles, the sun appears for some number of days (or rather diurnal revolutions) without setting; and at the opposite time of the year without rising; because some part of the ecliptic never sets in the former case, and as much of the opposite part never rises in the latter. And the nearer unto, or the more remote from the pole, these places are, the longer or shorter is the sun's continuing presence or absence.

13. If a ship sets out from any port, and sails round the earth eastward to the same port again, let her perform her voyage in what time she will, the people in that ship, in reckoning their time, will count one day more than those who reside at the same port; because, by going contrary to the sun's diurnal motion, and being forwarder every evening than they were in the morning, the sun will descend sooner below their horizon than if they had kept at any particular place. And thus, by cutting off a part proportionable to their own motion, from the length of every day, they will have reckoned a complete day more at their return; without gaining one moment of absolute time; because that complete day is only gained by the diminution of each day in their passage. If they sail westward they will reckon one day less than the people do who reside at the said port; because, by gradually following the apparent diurnal motion of the sun, they will keep him each particular day so much longer above their horizon as answers to that day's course; and thereby they cut off a whole day in reckoning, at their return, without losing one moment of absolute time.

Hence, if two ships should set out at the same time from any port, and sail round the globe, one eastward and the other westward, so as to meet at the same port on any day whatever, they will differ two days in reckoning their time, at their

return. If they fail twice round the earth, they will differ four days; if thrice, then six, &c.

## OF THE NATURAL DIVISIONS OF THE EARTH.

**T**HE constituent parts of the Earth are two, the *land* and *water*. The parts of the land are continents, islands, peninsulas, isthmuses, promontories, capes, coasts, mountains, &c. This land is divided into two great continents (besides the islands) viz. the *eastern* and *western* continent. The eastern is subdivided into three parts, viz. Europe, on the north-west; Asia, on the north-east; and Africa (which is joined to Asia by the isthmus of Suez, 60 miles over), on the south. The western continent consists of North and South America, joined by the isthmus of Darien, near 70 miles broad.

A *continent* is a large portion of land, containing several countries or kingdoms, without any entire separation of its parts by water, as Europe. An *island* is a smaller part of land surrounded by water, as Great-Britain. A *peninsula* is a tract of land surrounded by water, except at one narrow neck, by which it joins the neighbouring continent; as the Morea in Greece: and that neck of land which so joins it, is called an *isthmus*: as the isthmus of Suez which joins Africa to Asia, and the isthmus of Darien which joins North and South America. A *promontory* is a hill, or point of land, stretching itself into the sea, the end of which is called a *cape*: as the Cape of Good-hope. A *coast* or *shore* is that part of a country which borders on the sea-side. Mountains, vallies, woods, deserts, plains, &c. need no description. The most remarkable are taken notice of in the body of this work.

The parts of the water are oceans, seas, lakes, straits, gulphs, bays, or creeks, rivers, &c. The waters are divided into three extensive oceans (besides lesser seas, which are only branches of these), viz. the *Atlantic*, the *Pacific*, and the *Indian* Ocean. The Atlantic Ocean divides the eastern and western continents, and is 3000 miles wide. The Pacific divides America from Asia, and is 10,000 miles over. The Indian Ocean lies between the East Indies and Africa, being 3000 miles wide.

The *ocean* is a vast collection of water, without any entire separation of its parts by land; as the Atlantic Ocean. The *sea* is a smaller collection of water which communicates with the ocean, confined by the land; as the Mediterranean and the Red Sea. A *lake* is a large collection of water, entirely surrounded by land; as the lake of Geneva, and the lakes in Canada. A *strait* is a narrow part of the sea, restrained or lying between two shores, and opening a passage out of one sea into another; as the strait of Gibraltar, or that of Magellan. This is sometimes called a *sound*: as the strait into the Baltic. A *gulf* is a part of the sea running up into the land, and surrounded by it, except at the passage whereby it communicates with the sea or ocean. If a gulph be very large it is called an inland sea; as the Mediterranean; if it do not go far into the land, it is called a *bay*, as the Bay of Biscay: if it be very small, a *creek*, *haven*, *station*, or *road* for ships, as Milford Haven. Rivers, canals, brooks, &c. need no definition; for these lesser divisions of water, like those of land, are every where to be met with, and every one has a clear idea of what is meant by them. But in order to strengthen the remembrance of the great divisions of land and water, it is proper to observe, that there is a strong analogy or resemblance between them. The description of a continent resembles that of an ocean. An island encompassed with water resembles a lake encompassed with land. A peninsula of land is like a gulf or inland sea. A promontory, or cape of land, is like a bay or creek of sea. And an

isthmus, whereby two lands are joined, resembles a strait which unites one sea to another.

To this description of the divisions of the earth, rather than add an enumeration of the various parts of land and water, which correspond to them, and which the reader will find in the body of the work, we shall subjoin a table exhibiting the superficial contents of the whole globe in square miles, sixty to a degree, and also of the seas and unknown parts, the habitable earth, the four quarters or continents; likewise of the great empires and principal islands, which shall be arranged according to their magnitude.

GENERAL

GENERAL OBSERVATIONS concerning HEAT and COLD \*.

That the presence of the sun is the principal source of heat, as well as of light, and its absence of cold, is too obvious ever to have been doubted.

The next source of heat is the condensation of vapour. It is well known, that vapour contains a quantity of the matter of heat, which produces no other effect but that of making it assume an aerial expanded state, until the vapour is condensed into a liquid; but during this condensation a quantity of sensible heat is let loose, which warms the surrounding atmosphere. This condensation is frequently caused by the attraction of an electrical cloud, and hence the fulminations we frequently experience before rain.

As the earth is the chief source of heat, in the atmosphere that surrounds it, distance from the earth is the source of cold; or, in other words, the greatest cold must prevail in the highest regions of the atmosphere, and so much the greater, as clear unclouded air seems to receive no heat whatsoever from the rays of the sun, whether direct or reflected. Thus if the focus of the most powerful burning glass be directed on mere air, it does not produce the smallest degree of heat.

Hence the highest mountains, even under the equator, are, during the whole year, covered with snow. Mr. Bouguer found the cold of Pinchinca, one of the Cordeliers, immediately under the line, to extend from seven to nine degrees under the freezing point, every morning before sun-rise; and hence at a certain height which varies in almost every latitude, it constantly freezes at night, in every season, though in the warm climates it thaws to some degree the next day: this height he calls the *lower term of congelation*: between the tropics he places it at the height of 15,577 feet.

At still greater heights it never freezes, not because the cold decreases, but because vapours do not ascend so high; this height Mr. Bouguer call the *upper term of congelation*, and under the equator he finds it at the height of 28,000 feet, at most. Under the equator there being very little variety in the weather, the height of both terms is nearly constant; under other latitudes the height is variable, both in summer and winter, according to the degree of heat which prevails on the surface of the earth.

The next general source of heat is *evaporation*; for the attraction of the particles of liquids decreases as their points of contact diminish, and thereby their capacity for receiving the matter of heat (which is the same as that of light) increases; by this increased capacity, the matter of heat or fire contained in the neighbouring bodies, which, like all other fluids, flows where it finds least resistance, is determined to flow towards the vapour; and consequently those bodies are cooled, though the vapour is not heated; because the re-action of its particles is barely equal to that which it had before its capacity was increased †.

From what has been already said, it follows, that some situations are better fitted to receive or communicate heat than other situations; thus, high and mountainous situations being nearer to the source of cold, must be colder than lower situations; and countries covered with woods, as they prevent the access of the sun's rays to the earth, or to the heaps of snow which they may conceal, and present more numerous evaporating surfaces, must be colder than open countries, though situated

GENERAL

in the same latitude; and since all tracts of land present infinite varieties of situation, uniform results cannot here be expected.

With respect to the annual temperature, we may remark,

1st. That within 10 degrees of the poles, the temperatures differ very little; neither do they differ much within 10 degrees of the equator.

2d. The temperatures of different years differ very little near the equator, but they differ more and more, as the latitudes approach the poles.

3d. It scarce ever freezes in latitudes under 35°, unless in very elevated situations, and it scarce ever hails in latitudes higher than 60°.

4th. Between latitudes 35° and 60°, in places adjacent to the sea, it generally thaws when the sun's altitude is 40°, and seldom begins to freeze, until the sun's meridian altitude is below 40°.—Hence we may observe,

That the month of January is the coldest in every latitude:—That July is the warmest month in all latitudes above 48°; but in lower latitudes, August is generally the warmest:—That December and January, and also June and July differ but little. In latitudes above 30°, the months of August, September, October, and November, differ more from each other, than those of February, March, April, and May. In latitudes under 30°, the difference is not so great. The temperature of April approaches more, every where to the annual temperature, than that of any other month; whence we may infer, that the effects of natural causes, that operate gradually over a large extent, do not arrive at their *maximum*, until the activity of the causes begins to diminish; this appears also in the operation of the moon on seas, which produces tides; but after these effects have arrived at their *maximum*, the decrements are more rapid than the increments originally were during their progress to that *maximum*.—That the differences between the hottest and coldest months, within 20° of the equator, are inconsiderable, except in some peculiar situations; but that they increase in proportion as we recede from the equator.—That in the highest latitudes we often meet with a heat of 70 or 80 degrees; and particularly in latitudes 59 and 60, the heat of July is frequently greater, than in latitude 51°.—That every habitable latitude enjoys a heat of 60 degrees at least for two months, which heat seems necessary, for the growth and maturity of corn. The quickness of vegetation in the higher latitudes proceeds from the long duration of the sun over the horizon. Rain is little wanted, as the earth is sufficiently moistened by the liquefaction of the snow, that covers it during the winter; in all this we cannot sufficiently admire the wise disposition of Providence.—It is owing to the same provident hand, that the globe of the earth is intersected with seas and mountains, in a manner, that on its first appearance seems altogether irregular and fortuitous; presenting to the eye of ignorance, the view of an immense ruin; but when the effects of these seeming irregularities, on the face of the globe, are carefully inspected, they are found most beneficial and even necessary to the welfare of its inhabitants; for, to say nothing of the advantages of trade and commerce, which could not exist without these seas; it is by their vicinity, that the cold of the higher latitudes is moderated, and the heat of the lower. It is for want of seas that the interior parts of Asia, as Siberia and Great Tartary, as well as those of Africa, are rendered almost uninhabitable; a circumstance which furnishes a strong prejudice against those who think these countries were the original habitations of man. In the same manner mountains are necessary, not only as the reservoirs of rivers, but as a defence against the violence of heat, in the warm latitudes: without the Alps, Pyrenees, Appennine, the mountains of Dauphinè and Auvergne, &c. Italy, Spain, and France would be deprived of the mild temperature they at present enjoy. Without the Balgate Hills, or Indian Appennine, India would have been a desert. Hence Jamaica, St. Domingo, Sumatra, and most other intertropical islands, are furnished with mountains, from which the breezes proceed that refresh them.

We cannot finish the doctrine of the earth, without considering Winds and Tides, from which the changes that happen on its surface principally arise.

WINDS.] The earth is every where surrounded by a fine invisible fluid, which extends to several miles above its surface, and is called *Air*. It is found by experiments, that a small quantity of air is capable of being expanded, so as to fill a very large space, or to be compressed into a much smaller compass than it occupied before. The general cause of the expansion of air is heat, the general cause of its compression is cold. Hence if any part of the air or atmosphere receive a greater degree of cold or heat than it had before, its parts will be put in motion, and expanded or compressed.

compressed. But when air is put in motion, we call it *wind* in general; and a breeze, gale, or storm, according to the quickness or velocity of that motion. Winds, therefore, which are commonly considered as things extremely variable and uncertain, depend on a general cause, and act with more or less uniformity in proportion as the action of this cause is more or less constant. It is found by observations made at sea, that from thirty degrees north latitude to thirty degrees south, there is a constant east wind throughout the year, blowing on the Atlantic and Pacific oceans, and called the *Trade Wind*. This is occasioned by the action of the sun, which, in moving from east to west, heats, and consequently expands the air immediately under him; by which means a stream or tide of air, always accompanies him in his course, and occasions a perpetual east wind within these limits. This general cause is modified by a number of particulars, the explication of which would be too tedious and complicated for our present plan; which is to mention facts rather than theories.

It is likewise found, that in some parts of the Indian ocean, which are not more than two hundred leagues from land, there are periodical winds, called *Monsoons*, which blow half the year one way, and half the year another way. At the change of these monsoons, which always happens at the equinoxes, there are terrible storms of thunder, lightning, wind, and rain. It is discovered also, that in the same latitudes, there is another kind of periodical winds, which blow from the land in the night and good part of the morning, and from the sea about noon, till midnight; these, however, do not extend above two or three leagues from shore. Near the coast of Guinea in Africa, the wind blows always from the west, south-west, or south. On the coast of Peru in South America, the winds blow constantly from the south-west. Beyond the latitude of thirty north and south, the winds, as we daily perceive in Great-Britain, are more variable, though they blow often from the west than any other point. Between the fourth and tenth degrees of north latitude, and between the longitude of Cape Verd and the easternmost of the Cape de Verd islands, there is a tract of sea condemned to perpetual calms, attended with terrible thunder and lightning, and such rains, that this sea has acquired the name of *the Rains*.

It may be also useful to students in navigation and geography, to observe farther, that the course of latitude our ships generally keep in their passage from England to America, and the West Indies, is,

To Boston in New England, and Halifax in Nova Scotia, from 42 to 43 degrees.

To New York by the Azores or Western Islands, 39 degrees.

To Carolina and Virginia by Madeira, which is called the upper course, 32 degrees, but the usual course, to take advantage of the trade winds, is from 16 to 23 degrees; and in this course they frequently touch at Antigua: it is this course our West India ships fall in.

The Spanish galleons, and the flota from Spain, keep from 15 to 18 degrees; and in their return to Spain about 37 degrees.

[TIDES.] By the *tides* are meant the regular motion of the sea, according to which it ebbs and flows twice in twenty-four hours. The doctrine of the Tides remained in obscurity till sir Isaac Newton explained it by his great principle of gravity or attraction; for having demonstrated that there is a principle in all bodies, within the solar system, by which they mutually draw or attract each other, in proportion to their distance; it follows, that those parts of the sea which are immediately below the moon, must be drawn towards it, and consequently wherever the moon is nearly vertical, the sea will be raised, which occasions the flowing of the tide there. A similar reason occasions the flowing of the tide in those places where the moon is in the nadir, and must be diametrically opposite to the former; for, in the hemisphere farthest from the moon, the parts in the nadir being less at

tracted by her than the other parts which are nearer to her, gravitate less towards the earth's center, and consequently must be higher than the rest. Those parts of the earth, on the contrary, where the moon appears on the horizon, or ninety degrees distant from the zenith and nadir, will have low water; for as the waters in the zenith and nadir rise at the same time, the waters in the neighbourhood will press towards those places, to maintain the equilibrium; to supply the places of these, others will move the same way, and so on to the places ninety degrees distant from the zenith and nadir, where the water will be lowest. By combining this doctrine with the diurnal motion of the earth, we shall be sensible of the reason why the tides ebb and flow twice in the length of a lunar day, or about twenty-four hours, fifty minutes.

Hence we see the reason why the time of high-water is about fifty minutes later every day; that is, if it be high-water at eleven to day, it will not be high-water till near fifty minutes after eleven tomorrow.

The tides are higher than ordinary, twice every month, that is, about the times of new and full moon, and are called *Spring Tides*: for at these times the actions of both the sun and moon are united, and draw in the same straight line, and consequently the sea must be more elevated. At the conjunction, or when the sun and moon are on the same side of the earth, they both conspire to raise the waters in the zenith, and consequently in the nadir; and at the opposition, or when the earth is between the sun and moon, while one occasions high-water in the zenith and nadir, the other does the same. The tides are less than ordinary twice every month, about the first and last quarters of the moon, and are called *Neap Tides*: for in the quarters the sun raises the waters where the moon depresses them, and depresses where the moon raises them; so that the tides are only occasioned by the difference by which the action of the moon, which is nearest us, prevails over that of the sun. These things would happen uniformly, were the whole surface of the earth covered with water; but since there are a multitude of islands, and continents, which interrupt the natural course of the water, a variety of appearances are to be met with in different places, which cannot be explained, without taking into the account, the situation of shores, straits, and other objects, which have a share in producing them.

**CURRENTS.]** There are frequently streams or currents in the Ocean, which set slips a great way beyond their intended course. There is a current between Florida and the Bahama Islands, which always runs from north to south.

This is called the *Gulph-stream*, which is probably generated by the great accumulation of water on the eastern coast of America between the tropics, by the trade winds which constantly blow there. This vast quantity of water runs down in a strong current through the West India Islands into the bay of Mexico, and from thence issuing through the gulph of Florida, proceeds along the coasts to the banks of Newfoundland, where it turns off towards, and runs down through the western islands. From the thermometer it appears that it is always warmer than the sea on each side of it. Nor is it to be wondered at, that so vast a body of deep warm water, several leagues wide, coming from between the tropics, and issuing thence into the northern seas, should retain its warmth longer than the twenty or thirty days spent in passing the banks of Newfoundland. The quantity of deep water is too great to be suddenly cooled by passing under a cooler air. The air immediately over it, however, may receive so much warmth from it as to be rarefied and rise, being rendered lighter than the air on each side of the stream; hence those airs must flow in to supply the place of the rising warm air, and thus countering each other, form those tornadoes and water-spouts frequently met with, and seen near and over the stream; and as the vapour from a cup of tea or the breath of an animal is scarcely visible in a warm room, but becomes immediately visible in the cold air, so the vapour from the gulph-stream, in warm latitudes,

is scarcely perceptible, but when it comes into the cool air from Newfoundland, it is condensed into the fogs for which those parts are so remarkable.

The power of wind to raise water above its common level in the sea, is known in America, by the high tides occasioned in all their sea-ports, when a strong north-easter blows against the gulph-stream.

The conclusion from these remarks is, that by consulting the thermometer, a vessel may avoid stemming a current that is against her to the value of three miles an hour, and thus shorten her passage from Europe to North America; and in her return to Europe, she may take advantage of the same current to accelerate her course\*.

A current runs constantly from the Atlantic, through the straits of Gibraltar, into the Mediterrann. A current sets out of the Baltic sea, through the Sound or Strait between Sweden and Denmark, into the British channel; so that there are no tides in the Baltic. About small islands and head-lands, in the middle of the ocean, the tides rise very little; but in some bays, and about the mouths of rivers, they rise from 12 to 50 feet.

[MAPS.] A map is the representation of the earth, or a part of it, on a plane surface. Maps differ from the globe in the same manner as a picture does from a statue. The globe truly represents the earth, but a map no more than a plane surface can represent one that is spherical. But although the earth can never be exhibited exactly by one map, yet, by means of several, each containing about ten or twenty degrees of latitude, the representation will not fall much short of the globe for exactness; because such maps, if joined together, would form a spherical convex nearly as round as the globe.

[SEA-CHARTS.] In some books of geography, particularly those where the voyages of navigators are described, the sea-coasts, islands, &c. are laid down by a method very different from common maps, both the meridians, and parallels of latitude being right lines. These are called Mercator's charts, from Gerard Mercator, who, about the year 1550, published a very incorrect chart of this kind, but without the least mention of the principles on which it was constructed. This was referred for Mr Edward Wright, who, in the year 1599, published a book entitled "Errors of Navigation detected and corrected," in which he shewed the method of constructing a true sea-chart, and explained the principles on which it is founded. It is necessary, in the practice of navigation, that the rhumbs should be straight lines, and this essential property cannot be obtained unless the meridians are parallel to one another, and the parallels of latitude cross them at right-angles. But as the meridians on the globe meet in the pole, and consequently the degrees of longitude become less and less, in advancing from the equator to the poles, a chart delineated in the above manner must be extremely inaccurate, unless some method can be found to balance the errors flowing from the very nature of the construction. This is performed by increasing the degrees of latitude as they approach the poles in the same proportion, as the degrees of longitude between any two meridians decrease on the terrestrial globe.

The principal difficulty in constructing a true sea-chart seems to have consisted in discovering a proper method of applying the surface of a globe to a plane, which is accomplished by the following ingenious conception.

Suppose a rectangular plane was rolled about a globe till the edges of the plane met, and formed a kind of concave cylinder inclosing the globe, and touching its equator. Conceive the surface of this globe to swell (like a bladder while it is blowing up) from the equator towards the poles, proportionally in latitude as it does in longitude, until every part of its surface meet that of the concave cylinder, and impress thereon the lines that were drawn on the globular surface. Then the cylinder,

\* The reader may see more upon this subject (extremely interesting to mariners) in Dr. Franklin's Philosophical Papers, where he will find a chart of this stream.

viz. the rectangular plane, being unrolled, will represent a sea-chart, whose parts bear the same proportion to one another, as the corresponding parts do on the globe.

For in this formation of the nautical chart, every parallel of latitude on the globe will be increased till it is equal to the equator; and so the distance of the meridians in those parallels will become equal to their distance at the equator; consequently the meridians on the chart will be expressed by right lines. Also because the meridians are lengthened as the parallels increase, therefore the distances between the parallels of latitude become wider and wider as they approach the poles: but these parallels are also right lines, and as the rhumb lines on the globe cut the meridians at equal angles, they will also on the chart cut the meridians at equal angles, and consequently be expressed by right lines, because none but right lines can cut several parallel right lines, at equal angles.

This chart is principally adapted to the practice of navigation, and in that particular may be justly discovered as one of the most useful discoveries that have been made since the revival of learning in Europe; because the conclusions resulting from it are accurate, and, at the same time, the rectilinearity of the rhumb lines is preserved. The bearings and distances of places are found on this chart, with the greatest ease and expedition, but the different parts of the globe are by no means represented in their true magnitudes. An island in the latitude of sixty degrees, for instance, will be represented in this projection, twice as large as it really is, and for this reason, we rarely meet with any of these maps in books of geography. The reader is referred, for an illustration of these remarks, to Mercator's chart, at the end of the set of maps given with this system of Geography.

**CARDINAL POINTS.]** The north is considered as the upper part of the map; the south is at the bottom, opposite to the north; the east is on the right hand, the face being turned to the north; and the west on the left hand, opposite to the east. From the top to the bottom are drawn meridians, or *lines of longitude*; and from side to side, *parallels of latitude*. The outermost of the meridians and parallels are marked with degrees of latitude or longitude, by means of which, and the scale of miles commonly placed in the corner of the map, the situation, distance, &c. of places may be found, as on the artificial globe. Thus, to find the distance of two places, suppose London and Paris, by the map, we have only to measure the space between them with the compasses, or a bit of thread, and to apply this distance to the scale of miles, which shows that London is 210 miles distant from Paris. If the places lie directly north or south, east or west, from one another, we have only to observe the degrees on the meridian and parallels, and by turning these into miles, we obtain the distance without measuring. Rivers are described in maps by black lines, and are wider towards the mouth than towards the head or spring. Mountains are sketched on maps as on a picture. Forests and woods are represented by a kind of shrub; bogs and morasses, by shades; sands and shallows are described by small dots; and roads usually by double lines. Near harbours, the depth of the water is expressed by figures representing fathoms.

**LENGTH OF MILES IN DIFFERENT COUNTRIES.]** There is scarcely a greater variety in any thing than in this sort of measure; not only those of separate countries differ, as the French from the English, but those of the same country vary, in the different provinces, from each other, and all from the received standard. Thus the common English mile differs from the statute mile, and the French have three sorts of leagues. We shall here give the miles of several countries compared with the English by Dr. Halley.

The English statute mile consists of 5280 feet, 1760 yards, or 8 furlongs.

The Russian verst is little more than  $\frac{1}{2}$  English.

The Turkish, Italian, and old Roman lesser mile is nearly 1 English.

The Arabian, ancient and modern, is about  $\frac{1}{4}$  English.

The Scotch and Irish mile is about 1½ English.  
 The Indian is almost three English.  
 The Dutch, Spanish, and Polish, is about 3½ English.  
 The German is more than 4 English.  
 The Swedish, Danish, and Hungarian is from 5 to 6 English.  
 The French common league is near 4 English, and  
 The English marine league is 3 English miles.

## P A R T II.

*Of the Origin of NATIONS, LAWS, GOVERNMENT, and COMMERCE.*

**H**AVING, in the following work, mentioned the ancient names of countries, and even sometimes, in speaking of these countries, carried our historical researches beyond modern times; it was thought necessary, in order to prepare the reader for entering upon the particular history of each country we describe, to place before his eye a general view of the history of mankind, from the first ages of the world, to the reformation in religion during the 16th century. By a history of the world, we do not mean a mere list of dates, which, when taken by itself, is a thing extremely insignificant; but an account of the most interesting and important events which have happened among mankind; with the causes which have produced, and the effects which have followed from them. This we judge to be a matter of high importance in itself, and indispensibly requisite to the understanding of the present state of commerce, government, arts, and manners, in any particular country; which may be called commercial and political geography, and which, undoubtedly, constitutes the most useful branch of that science.

The great event of the creation of the world, before which there was neither matter nor form of any thing, is placed, according to the best chronologies, in the year before Christ 4004; and in the 710th year of what is called the Julian period, which hath been adopted by some chronologers and historians, but is of little real service. The sacred records have fully determined the question that the world was not eternal, and also ascertained the time of its creation with great precision\*.

It appears, in general, from the first chapters in Genesis, that the world, before the flood, was extremely populous, that mankind had made considerable improvement in the arts, and had become extremely vicious in their morals. Their wickedness gave occasion to a memorable catastrophe, by which the whole human race, except Noah and his family, were destroyed. The deluge happened in <sup>2348.</sup> Before Christ, the 1656th year of the world, and produced a very great change on the soil and atmosphere of this globe, giving them a form less friendly to the frame and texture of the human body. Hence the abridgment of the life of man, and that formidable train of diseases which hath ever since made such havoc in the world. A curious part of history follows that of the deluge, the recopying of the world, and the rising of a new generation from the ruins of the former. The memory of the three sons of Noah, the first founders of nations, was long preserved among their several descendants. Japhet continued famous among the western nations, under the celebrated name of Japetus; the Hebrews paid an equal veneration to Shem, who was the founder of their race; and among the Egyptians, Ham was long revered as a divinity, under the name of Jupiter-Hammon. It ap-

\* The Samaritan copy of the Bible makes the ante-diluvian period only 1307 years, 349 short of the Hebrew Bible computation; and the Septuagint copy stretches it to 2262 years, which is 666 years exceeding it; but the Hebrew chronology is generally acknowledged to be of superior authority.

pears that hunting was the principal occupation some centuries after the deluge. The world teemed with wild beasts; and the great heroism of those times consisted in destroying them. Hence Nimrod acquired immortal renown; and being greatly admired for his courage and dexterity, was enabled to found at Babylon the first monarchy whose origin is particularly mentioned in history. Not long after, the foundation of Nineveh was laid by Assur; and in Egypt, the four governments of Thebis, Theri, Memphis, and Tanis, began to assume some appearance of form and regularity. That these events should have happened so soon after the deluge, whatever surprize it may have occasioned to the learned some centuries ago, need not excite the wonder of the present age. We have seen, from many instances, the powerful effects of the principles of population, and how speedily mankind increase when the generative faculty lies under no restraint. The kingdoms of Mexico and Peru were incomparably more extensive than the first empires of Babylon, Nineveh, and Egypt; and yet these kingdoms are not supposed to have existed four centuries before the discovery of America by Columbus\*. As mankind continued to multiply on the earth, and to separate from each other, the tradition concerning the true God was obliterated or obscured. This occasioned the calling of Abraham to be the father of a chosen people. From this period the history of ancient nations begins to dawn; and we learn several particulars of importance.

Mankind had not long been united into societies before they discovered an inclination to oppress and destroy each other. Chaderlaomer king of the Elamites, or Persians, soon became a robber and a conqueror. His force, however, must not have been very great, since in one of those expeditions, Abraham, assisted only by his household, set upon him in his retreat, and after a fierce engagement, recovered all the spoil that had been taken. Abraham was soon after obliged, by a famine, to leave Canaan, the country where God had commanded him to settle, and to go into Egypt. This journey gives occasion to Moses to mention some particulars with regard to the Egyptianians, which plainly discover the characters of an improved and powerful nation. The court of the Egyptian monarch is described in brilliant colours. He is surrounded with a crowd of courtiers, solely occupied in gratifying his passions. The particular governments into which this country was divided, are now united under one powerful prince; and Hamm, who led the colony into Egypt, is become the founder of a great empire. We are not, however, to imagine that all the laws which prevailed in Egypt, and which have been so justly admired for their wisdom, were the work of this early age. Diodorus Siculus, a Greek writer, mentions many successive princes, who laboured for their establishment and perfection. But, in the time of Jacob, two centuries after, the first principles of civil order and regular government seem to have been tolerably understood among the Egyptians. The country was divided into separate departments; councils, composed of experienced and select persons, were established for the management of public affairs; granaries for preserving corn were erected; and, in fine, the Egyptians already enjoyed a commerce far from inconsiderable. These facts, though of an ancient date, deserve particular attention. It is from the Egyptians that many of the arts, both of elegance and utility, have been handed down, in an uninterrupted chain, to the modern nations of Europe. The Egyptians communicated their arts to the Greeks; the Greeks taught the Romans all their refinements; and to the Romans the present inhabitants of Europe are chiefly indebted for their civilization. The kingdoms of Babylon and Nineveh remained separate for several centuries; but we know not even the names of the kings who governed them, un-

\* The more our knowledge improves, the more strongly is the scripture history confirmed. Of this we have a remarkable proof in the confirmation of the Mosiac account, of the dispersion of mankind, and peopling of the earth, from the languages and history of the east. See the Asiatic Researches, v. iii.

lets it be Ninus, the successor of Assur, who, fired with the spirit of conquest, extends the bounds of his kingdom, adds Babylon to his dominions, and lays the foundation of that monarchy, which attained its splendour under Semiramis, and distinguished by the name of the Assyrian empire, ruled Asia for many ages.

Javan, son of Japhet, and grand-son of Noah, is the stock from whom the people known by the name of Greeks are descended. Javan established himself in the islands on the western coast of Asia Minor, from whence small colonies passed over into Europe. The kingdom of Sicyon near Corinth, founded by the Pelasgi, is generally supposed to have commenced in the year before Christ 2090. To these first inhabitants succeeded a colony from Egypt, who, about 2000 years before the Christian era, penetrated into Greece, and under the name of Titans, endeavoured to establish monarchy in that country, and to introduce into it the laws and civil policy of the Egyptians. But the empire of the Titans soon perished, and the ancient Greeks, who seem at this time to have been as rude and barbarous as any people in the world, again fell back into their lawless and savage manner of life. New colonies, however, soon after sailed from Asia into Greece, and, by remaining in that country, produced a more considerable alteration in the manners of its inhabitants. The most ancient establishments were made by Inachus and

B. C. Ogyges; of whom the former settled in Argos, and the latter in Attica.

1850. We know very little of Ogyges or his successors. Those of Inachus endeavoured to unite the dispersed and wandering Greeks; and their endeavours for this purpose were not altogether unsuccessful.

But the history of God's chosen people, the Israelites, is the only one of which we have clear and circumstantial accounts. The train of curious events, which occasioned the settling of Jacob and his family in that part of Egypt of which Tanis

B. C. was the capital, are universally known. That patriarch died, according to the Septuagint version, 1794 years before Christ; but according to the Hebrew chronology, only 1689 years, and in the year of the World 2315.

1689. This remarkable era terminates that period of time which the Greeks have greatly distinguished by their fabulous narrations. Let us consider then what we can learn from the sacred writings, with respect to the arts, manners, and laws of ancient nations.

It is a common error among writers on this subject, to regard all the nations of antiquity as being then on the same footing. They find some nations extremely rude and barbarous, and hence they conclude, that all were equally so. They discover others acquainted with many arts, and hence they infer the wisdom of the first ages. There appears, however, to have been nearly as much difference in point of art and refinement, in those ages as at present. Noah was undoubtedly acquainted with all the science of the antediluvian world: this he would communicate to his children, and they again would hand it down to their posterity. Those nations, therefore, who settled nearest the original seat of mankind, and who had the best opportunities to avail themselves of the knowledge which their great ancestor possessed, early formed themselves into regular societies, and made improvements in the arts which are most subservient to human life. Agriculture appears to have been known in the first ages of the world. Noah cultivated the vine: in the time of Jacob, the fig-tree and the almond were well known in the land of Canaan; and the instruments of husbandry, long before the discovery of them in Greece, are often mentioned in the sacred writings. It is hardly to be supposed, that the ancient cities, both in Asia and Egypt, whose foundation, as we have already mentioned, reaches the remotest antiquity, could have been built, unless the culture of the ground had been practised at that time. Nations who live by hunting or pasturage only, lead a wandering life, and seldom fix their residence in cities. Commerce naturally follows agriculture; and though we cannot trace the steps by

which it was introduced among the ancient nations, we may, from detached passages in sacred writ, ascertain the progress which had been made in it during the patriarchal times. We know, from the history of civil society, that the commercial intercourse between men must be pretty considerable, before the metals come to be considered as the medium of trade; and yet this was the case even in the days of Abraham. It appears, however, from the relations that establish this fact, that the use of money had not been of an ancient date; it had no mark to ascertain its weight or fineness; and in a contract for a burying-place, in exchange for which Abraham gave silver, the metal is weighed in the presence of all the people. As commerce improved, and bargains of this sort became more common, this practice was hid aside, and the quantity of silver was ascertained by a particular mark, which saved the trouble of weighing it. But this does not appear to have happened till the time of Jacob, the second from Abraham. The *sephel*, of which we read in his time, was a piece of money, stamped with the figure of a lamb, and of a precise and stated value. It appears, from the history of Joseph, that the commerce between different nations was by this time regularly carried on. The Ishmaelites and Midianites, who bought him of his brethren, were travelling merchants, who carried spices, perfumes, and other rich commodities, from their own country into Egypt. The same observations may be made from the book of Job, who, according to the best writers, was a native of Arabia Felix, and also a contemporary with Jacob. He speaks of the roads of Thema and Saba, i. e. of the caravans which set out from those cities of Arabia. If we reflect, that the commodities of this country were rather the luxuries than the necessaries of life, we shall have reason to conclude, that the countries into which they were sent for sale, and particularly Egypt, had already made considerable advances in civilization.

In speaking of commerce, we ought to distinguish between the species of it which is carried on by land, or inland commerce, and that which is carried on by sea: which last kind of traffic is both later in its origin, and slower in its progress. Had the descendants of Noah been left to their own ingenuity, and received no tincture of the antediluvian knowledge from their wise ancestors, it is not likely that they should have ventured on navigating the open seas so soon as we find they did. That branch of his posterity, who settled on the coast of Palestine, were the first people of the world among whom navigation was made subservient to commerce: they were distinguished by a word, which, in the Hebrew tongue, signifies *merchants*, and are the same nation afterwards known to the Greeks by the name of Phœnicians. Inhabiting a barren and ungrateful soil, they set themselves to improve their situation by cultivating the arts. Commerce was their principal pursuit, and, with all the writers of pagan antiquity, they pass for the inventors of whatever served to improve it. At the time of Abraham they were regarded as a powerful nation: their maritime commerce is mentioned by Jacob in his last words to his children: and, according to Herodotus, the Phœnicians had by this time navigated the coasts of Greece, and carried off the daughter of Inachus.

The arts of agriculture, commerce, and navigation, suppose the knowledge of several others; astronomy, for instance, or a knowledge of the situation and revolutions of the heavenly bodies, is necessary both to agriculture and navigation; that of working metals to commerce; and so of other arts. In fact, we find that, before the death of Jacob, several nations were so well acquainted with the revolutions of the moon, as to measure by them the duration of their year. It had been an universal custom among all the nations of antiquity, as well as the Jews, to divide time into the portion of a week, or seven days: this undoubtedly arose from the tradition with regard to the origin of the world. It was natural for those nations who led a pastoral life, or who lived under a serene sky, to observe that the

various

various appearances of the moon were completed nearly in four weeks: hence the division of a month. Those people who lived by agriculture, and who were acquainted with the division of the month, would naturally remark, that twelve of these brought back the same temperature of the air, or the same seasons: hence the origin of what is called the *lunar year*, which prevailed every where in the infancy of science. This, together with the observation of the fixed stars, which, as we learn from the book of Job, must have been very ancient, naturally paved the way for the discovery of the *solar year*, which at that time would be thought an amazing improvement in astronomy. But with regard to those branches of knowledge which we have mentioned, it is to be remembered, that they were peculiar to the Egyptians, and a few nations of Asia. Europe offers a frightful spectacle during this period. Who could believe that the Greeks, who, in later ages, became the patterns of politeness and every elegant art, were descended from a savage race of men, traversing the woods and wilds, inhabiting the rocks and caverns, a wretched prey to wild animals, and sometimes to each other? This, however, is no more than what was to be expected. Those descendants of Noah, who had removed to a great distance from the plains of Shinar, lost all connection with the civilised part of mankind. Their posterity became still more ignorant; and the human mind at length sunk into an abyss of wretchedness.

We might naturally expect that, from the death of Jacob, and, as we advance forward in time, the history of the great empires of Egypt and Assyria would gradually brighten. But this is far from being the case: we only get a glimpse of them, and they totally disappear for ages. After the reign of Ninias, who succeeded Semiramis and Ninus in the Assyrian throne, we find an astonishing blank in the history of this empire, for no less than eight hundred years. The silence of ancient history, on this subject, is commonly ascribed to the softness and effeminacy of the successors of Ninus, whose lives afforded no events worthy of record. Wars and commotions are the great themes of the historian, while the gentle and happy reigns of wise princes pass unregarded. Sesostris, a prince of wonderful abilities, is supposed to have mounted the throne of Egypt after Amenophis, who was swallowed up in the Red Sea about the year before Christ 1492; by his assiduity and attention, the civil and military establishments of the Egyptians received great improvements. Egypt, in the time of Sesostris and his immediate successors, was in all probability the most powerful kingdom upon earth, and, according to the best calculation, is supposed to have contained twenty-seven millions of inhabitants. But ancient history often excites without gratifying our curiosity: for from the reign of Sesostris to that of Bocchoris, in the year before Christ 781, we have little knowledge of even the names of the intermediate princes. If we judge, however, from collateral circumstances, the country must still have continued in a very flourishing condition; for Egypt continued to pour forth her colonies into distant nations. Athens, that seat of learning and politeness, that school for all who aspire after wisdom, owes its foundation to Cecrops, who landed in Greece with an Egyptian colony, and endeavoured to civilize the rough manners of the original inhabitants. From the institutions which Cecrops established among the Athenians, it is easy to infer their condition before his arrival. The laws of marriage, which few nations are so barbarous as to be altogether unacquainted with, were not known in Greece. Mankind, like the beasts of the field, were propagated by accidental connections, neither knowing nor caring who were their progenitors. Cranaus, who succeeded Cecrops in the kingdom of Attica, pursued the same salutary path, and endeavoured, by wise institutions, to bridle the keen passions of a rude people.

While these princes used their endeavours for civilising this corner of Greece, the other kingdoms, into which this country, by the natural boundaries of rocks, mountains,

mountains, and rivers, is divided, and which had been already peopled by colonies from Egypt and the East, began to assume some appearance of regular policy. **B. C. 1496.** This engaged Amphictyon, one of those inventive minds who appear in the world for the benefit of the age in which they live, and the admiration of posterity, to think of some expedient by which he might unite in one confederacy the several independent kingdoms of Greece, and thereby deliver them from those intestine divisions, which rendered them a prey to each other, and exposed them defenceless to the first enemy who might choose to invade them. These reflections he communicated to the kings, or leaders of the different territories; and by his eloquence and address engaged twelve cities to unite together for their common preservation. Two deputies from each of these cities assembled twice a year at Thermopylae, and formed what, after the name of its founder, was called the Amphictyonic Council. In this assembly, whatever related to the general interest of the confederacy was discussed, and finally determined. Amphictyon likewise, sensible that those political connections are the most lasting which are strengthened by religion, committed to the Amphictyons the care of the temple at Delphi, and of the rich dedications which began to be sent from those who consulted the oracle. This assembly, constituted on such solid foundations, remained one great spring of action in Greece, while that country preserved its independence; and, by the union which it inspired, encouraged the Greeks to defend their liberties against all the force of the Persian empire.

Considering the circumstances of the age in which it was instituted, the Amphictyonic council is perhaps the most remarkable political establishment which ever took place among mankind. In the year before Christ 1322, the Isthmian games were celebrated at Corinth, and in 1303, the famous Olympic games by Pelops; which games, together with the Pythian and Nemean, have been rendered immortal by the genius of Pindar.

The Greek states, formerly unconnected, except by mutual inroads and hostilities, soon began to act with concert, and to undertake distant expeditions for the general interest of the confederacy. The first of these was the celebrated expedition of the Argonauts, in which all Greece appears to have been concerned. **B. C. 1263.** The object of the Argonauts was to open the commerce of the Euxine sea, and to establish colonies in the adjacent country of Colchis. The ship Argo, which was the admiral galley, is the only one particularly named; though we learn from ancient writers, that several others were employed. The fleet of the Argonauts was, from the ignorance of those who conducted it, long tossed among different coasts. The rocks, at some distance from the mouth of the Euxine sea, occasioned much difficulty to the Argonauts: they sent forward a light vessel, which passed through, but returned with the loss of her rudder. This is expressed in the fabulous language of antiquity, by their sending out a bird which returned with the loss of its tail, and may give us an idea of the allegorical obscurity in which the other events of this expedition are involved. The fleet at length arrived at Aeon, the capital of Colchis, after performing a voyage, which, considering the condition of the naval art during that age, was not less important than the circumnavigation of the world by our modern discoverers. From this expedition to that against Troy, which was undertaken to recover the fair **B. C. 1184.** Helena, a queen of Sparta, who had been carried off by Paris, son of the Trojan king, the Greeks must have made a wonderful progress in arts, in power, and opulence: no less than twelve hundred vessels were employed in this voyage, each of which, at a medium, contained upwards of a hundred men. But these vessels were but half decked; and it does not appear that iron entered at all into their construction. If we add to these circumstances, that the Greeks had

not the use of the saw, an instrument so necessary to the carpenter, a modern must form but a mean notion of the strength or elegance of this fleet.

Having thus considered the Grecian confederacy, let us examine the circumstances of its several members. This is of great importance to our present undertaking, because in this country only we can trace the origin and progress of government, arts, and manners. In their internal policy, the Grecian kingdoms nearly resembled each other. They were governed each by a king, or rather by a chieftain, who was their leader in time of war, their judge in time of peace, and who presided in the administration of their religious ceremonies. This prince, however, was far from being absolute. In each society there were a number of other leaders, whose influence over their particular clans or tribes was not less considerable than that of the king over his immediate followers. These captains were often at war with each other, and sometimes with their sovereign; and each particular state was in miniature what the whole country had been before the time of Amphictyon. They required the hand of another delicate painter to shade the opposite colours, and to enable them to produce one powerful effect. The history of Athens affords us an example of the manner in which these states, that, for want of union, were weak and insignificant, became, by being cemented together, important and powerful. Theseus, king of Attica, about the year B. C. 1234, had acquired great reputation by his generosity and valour. He saw the inconveniences to which his country, from being divided into twelve districts, was exposed; and conceived, that by means of the influence which his personal character, united to the royal authority with which he was vested, had universally procured him, he might be enabled to remove them. For this purpose he endeavoured to maintain, and even to increase his popularity among the peasants and artisans: he detached, as much as possible, the different tribes from the leaders who commanded them: he abolished the courts which had been established in different parts of Attica, and appointed one council-hall common to all the Athenians. Theseus, however, did not trust solely to the force of political regulations. He called to his aid all the power of superstition; by establishing common rites to be performed in Athens, and by affording protection to all strangers who settled there, he raised this city from an inconsiderable village to a powerful metropolis. The splendor of Athens and of Theseus now totally eclipsed that of the other villages and their particular leaders. All the power of the state was united in one city, and under one sovereign. The turbulent chiefs thus divested of influence and consideration, became humble and submissive; and Attica remained under the peaceful government of a monarch.

This is a rude sketch of the origin of the first monarchy of which we have a distinct account, and may, without much variation, be applied to the other states of Greece. This country, however, was not destined to continue long under the government of kings. A new influence arose, which in a short time proved too powerful both for the king and the nobles. Theseus had divided the Athenians into three distinct classes; the nobles, the artisans, and the husbandmen. In order to abridge the exorbitant power of the nobles, he had bestowed many privileges on the inferior ranks. This policy was imitated by his successors; and the lower ranks of the Athenians, partly from the countenance of their sovereign, and partly from the progress of arts and manufactures, which gave them an opportunity of acquiring property, became considerable and independent. These circumstances were attended with a remarkable effect. Upon the death of Codrus, a prince of great merit, in the year B. C. 1070, the Athenians, become weary of the regal authority, under pretence of finding no one worthy of filling the throne of that monarch who had devoted himself to death for the safety of his people, abolished the regal power, and proclaimed that none but Jupiter should be king of Athens.

This revolution in favour of liberty was so much the more remarkable, as it happened soon after that the Jews became unwilling to remain under the government of the true God, and desired a mortal sovereign, that they might be like unto other nations.

B. C.  
1095.

The government of Thebes, another of the Grecian states, much about the same time assumed the republican form. Near a century before the Trojan war, Cadmus, with a colony from Phœnicia, had founded this city, which from that time had been governed by kings. But the last sovereign being overcome in single combat, by a neighbouring prince, the Thebans abolished royalty. Till the days, however, of Pelopidas and Epaminondas, a period of seven hundred years, the Thebans performed nothing worthy of the republican spirit. Other cities of Greece, after the example of Thebes and Athens, created themselves into republics. But the revolutions of Athens and Sparta, two rival states, which, by means of the superiority they acquired, gave the tone to the manners, genius, and politics of the Greeks, deserve our principal attention. We have seen a tender shoot of liberty spring up in the city of Athens, upon the decease of Codrus, its last sovereign. This shoot gradually improved into a vigorous plant. The Athenians, by abolishing the name of king, did not at once abolish the regal authority: they established a perpetual magistrate, who, under the name of Archon, was invested with many royal prerogatives. At length they fancied the archontic office to be too lively an image of royalty for a free state. After it had continued, therefore, three hundred and thirty-one years in the family of Codrus, they endeavoured to lessen its dignity, not by abridging its power, but by shortening its duration. The first period assigned for the continuance of the archonship in the same family, was ten years. But the desire of the Athenians for a more perfect degree of freedom, still continued to increase. They again demanded a reduction of the power of their archons; and it was at length determined, that nine annual magistrates should be appointed. These magistrates were not only chosen by the people, but accountable to them for their behaviour in office. These alterations were too violent not to be attended with some dangerous consequences. The Athenians, intoxicated with their freedom, broke out into the most unruly licentiousness. No written laws had been as yet enacted in Athens; and it was hardly possible that the ancient customs of the realm, which were naturally supposed to be in part abolished by the successive changes in the government, should sufficiently restrain the tumultuary spirits of the Athenians, in the first flutter of their independence. This engaged the wiser part of the state, who began to prefer any system of government to their present anarchy, to cast their eyes on Draco, a man of an austere but virtuous disposition, as the fittest person for composing a system of law, to bridle the furious passions of the multitude. Draco undertook the office, about the year 628, but executed it with so much rigour, that, in the words of an ancient historian, "his laws were written with blood, and not with ink." Death was the indiscriminate punishment of every offence; and the laws of Draco were found to be a remedy worse than the disease. Affairs again fell into confusion, which continued till the time of Solon, 594 B. C. Solon's wisdom, virtue, and accommodating manners, recommended him to the most important of all offices, the giving laws to a free people. This employment was assigned him by the unanimous voice of his country, but he long deliberated whether he should undertake it. At length, the motives of public utility overcame all considerations of private ease, safety, and reputation, and determined him to enter an ocean pregnant with a thousand dangers. The first step of his legislation was to abolish all the laws of Draco, except those relative to murder. The punishment of this crime could not be too great; but to consider other offences as equally criminal, was to confound all notions of humanity and

B. C.

B. C.  
694.

justice. Solon next proceeded to new-model the political law; and his establishments on this head remained among the Athenians, while they preserved their liberties. He seems to have set out with this principle, that a perfect republic, in which each citizen should have an equal political importance, was a system of government, beautiful indeed in theory, but not reducible to practice. He divided the citizens into four classes, according to the wealth which they possessed, and the poorest class he rendered incapable of magistracy. They had a voice, however, in the general council of the nation, in which all matters of principal concern were determined in the last resort. But lest this assembly, which was composed of all the citizens, should, in the words of Plutarch, like a ship with too many sails, be exposed to the gust of folly, tumult, and disorder, he provided for its safety by the two anchors of the Senate and Areopagus. The first of these courts consisted of four hundred persons, a hundred out of each tribe of the Athenians, who prepared all important business that came before the assembly of the people; the second, though but a court of justice, gained a prodigious ascendancy in the republic, by the wisdom and gravity of its members, who were not chosen, but after the strictest scrutiny.

Such was the system of government established by Solon, which, the more we examine it, will be the more approved. Upon the same plan most of the other ancient republics were established. To insist on all of them, therefore, would neither be entertaining nor instructive. But the government of Sparta, or Lacedæmon, had something in it so peculiar, that the great lines of it at least ought not to be omitted. Sparta, like the other states of Greece, was originally divided into a number of petty principalities, of which each was under the jurisdiction of its own immediate chieftain. Lelex is named as the first king, about the year

B. C. 1516. At length, the two brothers, Euristhenes and Procles, getting possession of Lacedæmon, became conjunct in the royalty; and, what is extremely singular, their posterity, in the direct line, continued to rule conjunctly for nine hundred years, ending with Cleomenes, anno 220 before the

Christian æra. The Spartan government, however, did not take that singular form which renders it so remarkable, until the time of Lycurgus, the celebrated legislator. The plan of policy devised by Lycurgus agreed with that already described, in comprehending a senate and assembly of the people, and in general in all those establishments which are deemed most requisite for the security of political independence. It differed from that of Athens, and indeed from all other governments, in having two kings, whose office was hereditary, though their power was circumscribed by proper checks and restraints. But the great characteristic of the Spartan constitution arose from its high military spirit. To promote this, all sorts of luxury, all arts of elegance or entertainment, every thing which had the smallest tendency to soften the minds of the Spartans, was absolutely proscribed. They were forbidden the use of money; they lived at public tables on the coarsest fare; the younger were taught to pay the utmost reverence to the more advanced in years, and all ranks, capable of bearing arms, were daily accustomed to the most painful exercises. To the Spartans alone war was a relaxation rather than a hardship, and of their prowess in the field hardly any but a Spartan could even form a conception.

In order to see the effect of these principles, and to connect under one point of view the history of the different quarters of the globe, we must now cast our eyes on Asia, and observe the events which happened in those great empires, of which

B. C. we have so long lost sight. We have already mentioned in what obscurity  
791. the history of Egypt is involved, until the reign of Bocchoris. From this period, to the dissolution of their government by Cambyses of Persia, in the year B. C. 524, the Egyptians are chiefly celebrated for the wisdom of their laws

and

and political institutions. Several of these seem to have been dictated by the true spirit of civil wisdom, and were admirably calculated for maintaining good government in an extensive kingdom. The great empire of Assyria likewise, which had so long disappeared, becomes again an object of attention, and affords the first instance we meet with in history, of a kingdom which fell afunder by its own weight, and the effeminate weakness of its sovereigns. Sardanapalus, the last emperor of Assyria, neglected the administration of affairs, and shutting himself up in his palace with his women and eunuchs, fell into contempt with his subjects. The governors of his provinces, to whom, like a weak and indolent prince, he had entirely committed the command of his armies, did not fail to lay hold of this opportunity of raising their own fortune on the ruins of their master's power. Arbaces, governor of Media, and Belshis, governor of Babylon, conspired against their sovereign, set fire to his capital, in which Sardanapalus perished, B. C. 826, and divided between them his extensive dominions. These two kingdoms, sometimes united under one prince, and sometimes governed each by a particular sovereign, long maintained the chief sway in Asia. Pul reviv'd the kingdom of Assyria B. C. 777, and Shalmaneser, one of his successors, put an end to the kingdom of Israel, and carried the ten tribes captive into Assyria and Media, B. C. 721. Nebuchadnezzar king of Babylon, also B. C. 587, overturned the kingdom of Judah, which had continued in the family of David from the year 1055, and mastered all the countries around him. But in the year 538, Cyrus the Great took Babylon, and reduced Asia under the Persian yoke. The manners of this people as brave, hardy, and independent, as well as the government of Cyrus, in all its branches, are elegantly described by Xenophon, a Grecian philosopher and historian. It is not necessary that we should enter into the same detail upon this subject, as with regard to the affairs of the Greeks. We have, in modern times, sufficient examples of monarchical governments; but how few are our republics? But the era of Cyrus is in one respect extremely remarkable, beside delivering the Jews from their captivity, because it terminates the history of the ancient empires, which have hitherto engaged our attention. Let us consider then the genius of the Assyrians, Babylonians, and Egyptians, in arts and sciences; and, if possible, discover what progress they had made in those acquisitions which are most subservient to the interests of society.

The taste for the great and magnificent, seems to have been the prevailing character of those nations; and they principally displayed it in their works of architecture. There are no vestiges, however, now remaining, which confirm the testimony of ancient writers, with regard to the great works which adorned Babylon and Nineveh: neither is it clearly determined in what year they were begun or finished. There are three pyramids, stupendous fabrics, still remaining in Egypt, at some leagues distance from Cairo, and about nine miles from the Nile, which are supposed to have been the burying places of the ancient Egyptian kings. The largest is five hundred feet in height, and each side of the base six hundred and ninety-three feet in length. The apex is thirteen feet square. The second stands on as much ground as the first, but is forty feet lower. It was a superstition among this people, derived from the earliest times, that even after death the soul continued in the body as long as it remained uncorrupted. Hence proceeded the custom of embalming, or of throwing into the dead body such vegetables as experience had discovered to be the greatest preservatives against putrefaction. The pyramids were erected with the same view. In them the bodies of the Egyptian kings were concealed. This expedient, together with embalming, as these superstitious monarchs conceived, would inevitably secure a safe and comfortable retreat for their souls after death. From what we read of the walls of Babylon, the temple of Belus, and other works of the East, and from what travellers have recorded

corded of the pyramids, it appears that they were really superb and magnificent structures, but totally void of elegance. The orders of architecture were not yet known, nor even the constructing of vaults. The arts, in which those nations, next to architecture, principally excelled, were sculpture and embroidery. As to the sciences, they had all along continued to bestow their principal attention on astronomy; but it does not appear that they made great progress in explaining the causes of the phenomena of the universe, or in any species of rational and sound philosophy. To demonstrate this to an intelligent reader, it is sufficient to observe, that, according to the testimony of sacred and profane writers, the absurd reveries of magic and astrology, which always decrease in proportion to the advancement of true science, were in high esteem among them, during the latest periods of their government. The countries which they occupied were extremely fruitful, and afforded without much labour all the necessaries and even luxuries of life. They had long inhabited great cities. These circumstances had tainted their manners with effeminacy, and rendered them an easy prey to the Persians, a nation just emerging from barbarism, and of consequence brave and warlike. Such revolutions were natural in the infancy of the military art: when strength and courage were the only circumstances which gave the advantage to one nation over another; when, properly speaking, there were no fortified places, which in modern times have been found so useful in stopping the progress of a victorious enemy; and when the event of a battle commonly decided the fate of an empire. But we must now turn our attention to other objects.

The history of Persia, after the reign of Cyrus, who died in the year B. C. 529, offers little, considered in itself, that merits our regard: but when combined with that of Greece, it becomes particularly interesting. The monarchs who succeeded Cyrus gave an opportunity to the Greeks to exercise those virtues which the freedom of their government had created and confirmed. Sparta remained under the influence of Lycurgus's institutions: Athens had just recovered from the tyranny of the Pisistratidæ, a family who had trampled on the laws of Solon, and usurped the supreme power. Such was their situation, when the lust of universal empire, which seldom fails to torment the breast of tyrants, led Darius to send forth his numerous armies into Greece. But the Persians were no longer those invincible soldiers who, under Cyrus, had conquered Asia. Their manners has been corrupted by their rich conquests, and were debased by slavery. Athens, on the contrary, teemed with great men, whose minds were animated by the late recovery of their freedom. Miltiades, on the plains of Marathon, with ten thousand Athenians, overcame the Persian army of a hundred thousand foot, and ten thousand cavalry. His countrymen, Themistocles and Aristides, the first celebrated for his abilities, the second for his virtue, gained the next honours to the general. It does not fall within our plan to mention the events of this war, which will be for ever read and studied as the noblest monuments of virtue over force, of courage over numbers, of liberty over servitude.

Xerxes, the son of Darius, came in person into Greece, with an army, which, according to Herodotus, amounted to two millions and one hundred thousand men. This account is perhaps somewhat exaggerated. The exact truth cannot now be ascertained: but that the army of Xerxes was extremely numerous, is the more probable from the great extent of his empire, and from the absurd practice of the eastern nations, of encumbering their camp with a superfluous multitude. Whatever the numbers of his army were, he was every where defeated, by sea and land, and escaped to Asia in a fishing-boat. Such was the spirit of the Greeks, and so well did they know that "wanting virtue, life is pain and woe; that wanting liberty even virtue mourns, and looks around for happiness in vain." But though the Persian war concluded

concluded gloriously for the Greeks, it is, in a great measure, to this war that the subsequent misfortunes of that nation are to be attributed. It was not the battles in which they suffered the loss of so many brave men, but those in which they acquired the spoils of Persia; it was not their enduring so many hardships in the course of the war, but their connection with the Persians after the conclusion of it, which subverted the Grecian establishments, and ruined the most virtuous confederacy that ever existed upon earth. The Greeks became haughty after their victories: delivered from the common enemy, they began to quarrel among themselves; their quarrels were fomented by Persian gold, of which they had acquired enough to make them desirous of more. Hence proceeded the famous Peloponnesian war, in which the Athenians and Lacedæmonians acted as principals, and drew after them the other states of Greece. They continued to weaken themselves by these intestine divisions, till Philip king of Macedon (a country till this time little known, but which, by the active and crafty genius of this prince, became important and powerful) rendered himself the absolute master of Greece, by the battle of Cheronæa. But this conquest is one of the first we meet with in history which did not depend on the event of a battle. Philip had laid his schemes so deeply, and by bribery, promises, and intrigues, gained such a number of considerable persons in the states of Greece to his interest, that another day would have put in his possession what Cheronæa had denied him. The Greeks had lost that virtue which was the basis of their confederacy. Their popular governments served only to give a sanction to their licentiousness and corruption. The principal officers in most of their states, were bribed into the service of Philip; and all the eloquence of a Demosthenes, assisted by truth and virtue, was unequal to the mean, but more seductive arts of his opponents, who, by flattering the people, used the surest method of gaining their affections.

Philip had proposed to extend the boundaries of his empire beyond the narrow limits of Greece: but he did not long survive the battle of Cheronæa. Upon his decease, his son Alexander was chosen general against the Persians, by all the Grecian states, except the Athenians, Lacedæmonians and Thebans. These made a feeble effort for expiring liberty: but they were obliged to yield to superior force. Secure on the side of Greece, Alexander set out on his Persian expedition, at the head of thirty thousand foot, and five thousand horse. The success of this army, in conquering the whole force of Darius, in three pitched battles, in over-running and subduing not only the countries then known to the Greeks, but many parts of Upper Asia, the very names of which had never reached an European ear, has been described by many authors both ancient and modern, and constitutes a singular part of the history of the world. Soon after this rapid career of victory and success, Alexander died at Babylon. His captains, after sacrificing all his family to their ambition, divided his dominions among them. This gives rise to a number of aras and events too complicated for our present purpose. After considering, therefore, the state of arts and sciences in Greece, we shall pass to the Roman affairs, where the historical deduction is more simple and more important.

The bare names of illustrious men, who flourished in Greece from the time of Cyrus to that of Alexander, would fill a large volume. During this period, all the arts were carried to the highest pitch of perfection; and the improvements we have hitherto mentioned were but the dawns of this glorious day. Though the eastern nations had raised magnificent and stupendous structures, the Greeks were the first people in the world, who, in their works of architecture, added beauty to magnificence, and elegance to grandeur. The temples of Jupiter Olympus, and the Ephesian Diana, are the first monuments of good taste. They were erected by the Grecian colonies, who settled in Asia Minor, before the reign of Cyrus. Phidias, the

the Athenian, who died in the year B. C. 432, is the first sculptor whose works merited immortality. Zeuxis, Parrhasius, and Timantheus, during the same age, first displayed the power of the pencil, and all the magic of painting. Composition, in all its various branches, reached a degree of perfection in the Greek language, of which a modern reader can hardly form an idea. After Hesiod and Homer, who flourished 1000 years before the Christian era, the tragic poets Æschylus, Sophocles, and Euripides, were the first great improvers of poetry. Herodotus gave perspicuity and elegance to profane writing. Isocrates gave it cadence and harmony; but it was left to Thucydides and Demosthenes to discover the full force of the Greek tongue. It was not, however, in fine writing only, that the Greeks excelled. Every species of philosophy was cultivated among them with the utmost success. Not to mention the divine Socrates, the virtue of whose life, and the excellence of whose philosophy, justly entitled him to a very high degree of veneration; his three disciples, Plato, Aristotle\*, and Xenophon, may, for strength of reasoning, justness of sentiment, and propriety of expression, be put on a footing with the writers of any age or country. Experience, indeed, in a long course of years, has taught us many secrets in nature, with which these philosophers were unacquainted, and which no strength of genius could reach. But whatever some empirics in learning may pretend, the most learned and ingenious men, in all civilized countries of Europe, have acknowledged the superiority of the Greek philosophers, and have reckoned themselves happy in catching their turn of thinking, and manner of expression.

The Greeks were not less distinguished for their active than for their speculative talents. It would be endless to recount the names of their famous statesmen and warriors, and it is impossible to mention a few without doing injustice to a greater number. War was first reduced into a science by the Greeks. Their soldiers fought from an affection to their country, and an ardor for glory, and not from a dread of their superiors. We have seen the effect of this military virtue in their wars against the Persians; the cause of it was the wise laws which Amphictyon, Solon, and Lycurgus, had established in Greece. But we must now leave this nation, whose history, both civil and philosophical, is as important as their territory was inconsiderable, and turn our attention to the Roman affairs, which are more interesting, from the relation in which they stand to those of modern Europe.

The character of Romulus, the founder of the Roman state, when we view  
 B. C. him as the leader of a few lawless and wandering banditti, is an object of ex-  
 753- treme insignificance; but when we consider him as the founder of an empire  
 as extensive as the world, and whose progress and decline have occasioned the two  
 greatest revolutions that ever happened in Europe, we cannot help being inter-  
 ested in his conduct. His disposition was extremely martial; and the political state  
 of Italy, divided into a number of small but independent districts, afforded a noble  
 field for the display of military talents. Romulus was continually embroiled with  
 his neighbours; and war was the only employment by which he and his compa-  
 rions expected not only to aggrandize themselves, but even to subsist. In the  
 conduct of his wars with the neighbouring people, we may observe the same max-  
 ims by which the Romans afterwards became masters of the world. Instead of de-  
 stroying the nations he had subdued, he united them to the Roman state, whereby  
 Rome acquired a new accession of strength from every war she undertook, and be-  
 came powerful and populous from that circumstance which ruins and depopulates  
 other kingdoms. If the enemies, with which he contended, had, by means of  
 the art or arms they employed, any advantage, Romulus immediately adopted that  
 practice, or the use of that weapon, and improved the military system of the Ro-

\* Olympiodorus and Ammonius say that Aristotle was the disciple of Socrates; but, from Eusebius, it appears that he began his studies under Plato.

## I N T R O D U C T I O N .

49

mans by the united experience of all their enemies. We have an example of both these salutary maxims, in the war with the Sabines. Romulus having conquered that nation, not only united them to the Romans, but finding their buckler preferable to the Roman, instantly threw aside the latter, and made use of the Sabine buckler in fighting against other states. Romulus, though continually occupied in war, did not neglect the civil policy of his infant kingdom. He instituted what was called the Senate; a court originally composed of a hundred persons, distinguished for their wisdom and experience. He enacted laws for the administration of justice, and for restraining the fierce and unruly passions of his followers; and, after a long reign, spent in promoting the civil or military interests of his country, was, according to the most probable conjecture, privately assassinated B. C. 717.

The successors of Romulus were all extraordinary personages. Numa, who came next to him, established the religious ceremonies of the Romans, and inspired them with that veneration for an oath, which was ever after the soul of their military discipline. Tullus Hostilius, Ancus Martius, Tarquinius Priscus, and Servius Tullius, laboured each during his reign for the grandeur of Rome. But Tarquinius Superbus, the seventh and last king, having obtained the crown by the execrable murder of his father-in-law Servius, continued to support it by the most cruel and infamous tyranny. This, together with the insolence of his son Sextus Tarquinius, who, by dishonouring Lucretia, a Roman lady, affronted the whole nation, occasioned the expulsion of the Tarquin family, and with it the dissolution of the regal government. As the Romans were continually engaged in war, they found it necessary to have some officer invested with supreme authority, who might conduct them to the field, and regulate their military enterprises. In the room of the kings, therefore, they appointed two annual magistrates called consuls, who, without creating jealousy, exercised all the royal functions. This revolution was extremely favourable to the Roman grandeur. The consuls, who enjoyed but a temporary power, were desirous of signalizing their reign by some great action: each vied with those who had gone before him, and the Romans were daily led out against some new enemy. When we add to this that the people, naturally warlike, were animated to deeds of valour by every consideration which could inspire them; that the citizens of Rome were all soldiers, and fought for their lands, their children, and their liberties, we need not be surprised that they should, in the course of some centuries, extend their power all over Italy.

The Romans, now secure at home, turn their eyes abroad, and meet with a powerful rival in the Carthaginians. This state had been founded or enlarged on the coast of the Mediterranean, in Africa, some time before Rome, by a colony of Phœnicians, B. C. 869, and, according to the practice of their mother country, they had cultivated commerce and naval greatness.

Carthage, in this design, had proved wonderfully successful. She now commanded both sides of the Mediterranean. Besides that of Africa, which she almost entirely engrossed, she had extended herself on the Spanish side, through the Straits. Thus mistress of the sea, and of commerce, she had seized on the islands of Corsica and Sardinia. Sicily had difficulty to defend itself; and the Romans were too nearly threatened not to take up arms. Hence a succession of hostilities between these rival states, known in history by the name of Punic wars, in which the Carthaginians were an unequal match for the Romans. Carthage was a powerful republic, when Rome was an inconsiderable state; but she was now become corrupt and effeminate, while Rome was in the vigour of her political constitution. Carthage employed mercenaries to carry on her wars; Rome, as we have already mentioned, was composed of soldiers. The first war with Carthage

lasted twenty-three years, and taught the Romans the art of fighting on the sea, with which they had been hitherto unacquainted. A Carthaginian vessel was wrecked on their coast; they used it for a model, in three months fitted out a fleet, and the consul Dullius, who fought their first naval battle, was victorious. The behaviour of Regulus, the Roman general, may give us an idea of the spirit which then animated this people. Being taken prisoner in Africa, he is sent back on his parole, to negotiate a change of prisoners. He maintains in the senate, the propriety of that law, which cut off from those who suffered themselves to be taken, all hopes of being saved, and returns to a certain death.

Neither was Carthage, though corrupted, deficient in great men. Of all the enemies the Romans had to contend with, Hannibal was the most inflexible and dangerous. His father Hamilcar had imbibed an extreme hatred to the Romans, and having settled the intestine troubles of his country, he embraced an early opportunity to inspire his son, though but nine years old, with his own sentiments. For this purpose he ordered a solemn sacrifice to be offered to Jupiter, and leading his son to the altar, asked him whether he was willing to attend him in his expedition against the Romans; the courageous boy not only consented to go, but conjured his father by the gods present, to form him to victory, and teach him the art of conquering. That I will joyfully do, replied Hamilcar, and with all the care of a father who loves you, if you will swear upon the altar to be an eternal enemy to the Romans. Hannibal readily complied; and the solemnity of the ceremony, and the sacredness of the oath, made such an impression upon his mind, as nothing afterwards could efface. Being appointed general, at twenty-five years of age, he crosses the Ebro, the Pyrenees, and the Alps, and unexpectedly falls down upon Italy. The loss of four battles threatens the fall of Rome. Sicily sides with the conqueror. Hieronymus, king of Syracuse, declares against the Romans, and almost all Italy abandons them. In this extremity Rome owed its preservation to three great men. Fabius Maximus, despising popular clamour, and the military ardour of his countrymen, declines coming to an engagement. The strength of Rome has time to recover. Marcellus raises the siege of Nola, takes Syracuse, and revives the drooping spirits of his troops. The Romans admired the character of these great men, but saw something still superior in the young Scipio. The success of this young hero confirmed the popular opinion, that he was of divine origin, and held converse with the gods. At the age of four-and-twenty, he flies into Spain, where both his father and uncle had lost their lives, attacks New Carthage, and carries it at the first assault. Upon his arrival in Africa, kings submit to him, Carthage trembles in her turn, and sees her armies defeated. Hannibal, sixteen years victorious, is in vain called home to defend his country. Carthage is rendered tributary, given hostages, and engages never to make war, but with the consent of the Romans.

After the conquest of Carthage, Rome had inconsiderable wars but great victories; before this time its wars were great, and its victories inconsiderable. At this time the world was divided, as it were, into two parts; in the one fought the Romans and Carthaginians; the other was agitated by those quarrels which had lasted since the death of Alexander the Great. Their scene of action was Greece, Egypt, and the East. The states of Greece had once more disengaged themselves from a foreign yoke. They were divided into three confederacies, the Etolians, Acheans, and Beotians; each of these was an association of free cities, which had assemblies and magistrates in common. The kings of Macedon maintained that superiority, which, in ancient times, when the balance of power was little attended to, a great prince naturally possessed over his neighbours. Philip, the reigning monarch, had

rendered himself odious to the Greeks, by some unpopular and tyrannical steps; the Etolians were most irritated; and hearing the fame of the Roman arms, called them into Greece, and overcame Philip by their assistance. The victory, however, chiefly redounded to the advantage of the Romans. The Macedonian garrisons were obliged to evacuate Greece; the cities were all declared free; but Philip became a tributary to the Romans, and the States of Greece became their dependents. The Etolians, discovering their first error, endeavoured to remedy it by another still more dangerous to themselves, and more advantageous to the Romans. As they had called the Romans into Greece to defend them against king Philip, they now invited Antiochus, king of Syria, to defend them against the Romans. The famous Hannibal too had recourse to the same prince, who was at this time the most powerful monarch in the East. But Antiochus did not follow his advice so much as that of the Etolians; for, instead of renewing the war in Italy, where Hannibal, from experience, judged the Romans to be most vulnerable, he landed in Greece with a small body of troops, and being overcome without difficulty, fled over into Asia. In this war the Romans made use of Philip for conquering Antiochus, as they had before done of the Etolians for conquering Philip. They now pursue Antiochus, the last object of their resentment, into Asia, and, having vanquished him by sea and land, compel him to submit to a disgraceful treaty. B. C. 198.

In regulating the conquered countries, the Romans allowed the ancient inhabitants to retain their possessions; they did not even change the form of government; the conquered nations became the allies of the Roman people, which denomination, under a specious name, concealed a condition very servile, and inferred that they should submit to whatever was required of them. When we reflect on these easy conquests, we have reason to be astonished at the resistance which the Romans met with from Mithridates king of Pontus, for the space of twenty-six years. But this monarch had great resources. His kingdom, bordering on the inaccessible mountains of Caucasus, abounded in a race of men, whose minds were not enervated by pleasure, and whose bodies were firm and vigorous.

The different states of Greece and Asia, who now began to feel the weight of their yoke, but had not a spirit to shake it off, were transported at finding a prince, who dared to shew himself an enemy to the Romans, and cheerfully submitted to his protection. Mithridates, however, at last was compelled to yield to the superior fortune of Rome. Vanquished successively by Sylla and Lucullus, he was at length subdued by Pompey, and stripped of his dominions and of his life, in the year B. C. 63. In Africa, the Roman arms met with equal success. Marius, in conquering Jugurtha, made all secure in that quarter. Even the barbarous nations beyond the Alps began to feel the weight of the Roman arms. B. C. 106. Gallia Narbonensis had been reduced into a province. The Cimbri, Teutones, and other northern nations of Europe, broke into this part of the empire. The same Marius, whose name was so terrible in Africa, then carried terror into Gaul. The Barbarians, less formidable than the Roman legions, retired to their wilds and deserts. B. C. 102. But while Rome conquered the world, there subsisted an eternal war within her walls. This war had subsisted from the first periods of the government. The descendants of the senators, who were distinguished by the name of Patricians, were invested with so many odious privileges, that the people felt their dependence, and became determined to shake it off. A thousand disputes on this subject arose betwixt them and the Patricians, which always terminated in favour of liberty.

These disputes, while the Romans preserved their virtue, were not marked with blood. The Patricians, who loved their country, cheerfully parted with some of their privileges to satisfy the people; and the people, on the other hand, though

they obtained laws, by which they might be admitted to enjoy the first offices of the state, and though they had the power of nomination, always named Patricians. But when the Romans, by the conquest of foreign nations, became acquainted with their luxuries and refinements; when they became tainted with the effeminacy and corruption of the eastern courts, and sported with every thing just and honourable, in order to obtain them, the state, torn by the factions between its members, and without virtue on either side, became a prey to its own children. Hence the bloody seditions of the Gracchi, which paved the way for an inextinguishable hatred between the nobles and commons, and made it easy for any turbulent demagogue, or proud patrician, to inflame them to outrage. The love of their country was now no more than a specious name; the better sort were too wealthy and effeminate to submit to the rigours of discipline, and the soldiers, composed of the dregs of the republic, were no longer citizens. They had little respect for any but their commander; under his banner they fought, conquered, and plundered. He might command them to embue their hands in the blood of their country. They who knew no country but the camp, and no authority but that of their general, were ever ready to obey him. The multiplicity of the Roman conquests, however, which required their keeping on foot several armies at the same time, retarded the subversion of the republic. These armies were so many checks upon each other. Had it not been for the soldiers of Sylla, Rome would have surrendered its liberty to the army of Marius.

Julius Caesar at length appears. By subduing the Gauls, he gained his country the most useful conquest it ever made. Pompey, his only rival, is overcoming in the plains of Pharsalia. Caesar appears victorious, almost at the same time, all over the world: in Egypt, in Asia, in Mauritania, in Spain, in Gaul, and in Britain: conqueror on all sides, he is acknowledged master at Rome, and in the whole empire. Brutus and Cassius attempt to give Rome her liberty, by stabbing him in the senate-house. But though they deliver the Romans from the tyranny of Julius, the republic does not obtain its freedom. It falls into the hands of Marc Anthony; Caesar Octavianus, nephew to Julius Caesar, wrests it from him by the sea-fight at Actium, and there is no Brutus nor Cassius to put an end to his life. Those friends of liberty had killed themselves in despair; and Octavius, under the name of Augustus, and title of emperor, remained the undisturbed master of the empire. During these civil commotions, the Romans still maintained the glory of their arms among distant nations; and, while it was unknown who should be master at Rome, the Romans were, without dispute, the masters of the world. Their military discipline and valour abolished all the remains of the Carthaginian, the Persian, the Grecian, the Assyrian, and Macedonian glory; they were now only a name. No sooner, therefore, was Octavius established on the throne, than ambassadors, from all quarters of the known world, crowd to make their submissions. Ethiopia sues for peace; the Parthians, who had been a formidable enemy, court his friendship; India seeks his alliance; Pannonia acknowledges him; Germany dreads him; and the West receives his laws. Victorious by sea and land, he shuts the temple of Janus.

The whole earth lives in peace under his power; and Jesus Christ comes into the world, four years before the common era.

Having thus traced the progress of the Roman government, while it remained a republic, our plan obliges us to say a few words with regard to the arts, sciences, and manners of that people. In the infancy of the republic, and even long after the consular government was established, learning and the arts made little progress at Rome. Agriculture, and the cultivation of arms, principally engaged its attention. A memorable proof of this is the edict of Mummius, who, having destroyed the city of Corinth, ordered the pictures painted by the most eminent artists of

Greece, to be carried to Rome, with this remarkable caution, that if any were lost, the ship-masters should make good the damage. Nor were the sciences in more request at Rome. Some of the ablest philosophers of Greece coming there in the time of Cato the Elder, he ordered them to depart the city, lest the minds of the youth should be corrupted by philosophy. They had for a long series of years no written laws at Rome: those of Solon, brought from Greece, gave birth to the laws of the twelve tables. These constituted the civil law of the Romans. They were afterwards enlarged by various decrees of the senate, orders of the people, and edicts of the praetors.

After the destruction of Carthage, and the states of Greece, when the Romans had no rival to fear, they applied themselves to cultivate the arts of peace. The curious remains of Grecian magnificence which were sent to Rome inspired them with a desire of imitating such perfect models. Whatever was elegant, whatever was curious, whatever was beautiful, might be consulted without trouble or expence. But the Romans, though undoubtedly great artists, never equalled the finished models of their masters: Eloquence had been long studied in Rome, but it did not reach its greatest height till Cicero appeared. His orations are inferior only to those of Demosthenes. Cicero gave to eloquence all the graces of which it is susceptible, without lessening its dignity and gravity. He gave cadence and harmony to the Roman language, and enriched it with beauties before unknown. The poetry of Virgil is equal to any thing but the works of Homer, which he aspired to rival. But if Virgil fell short of Homer, Horace excelled all that went before him in his satires and epistles. His odes have not indeed the majesty and sublimity of Pindar; but they abound in beauties; a delicacy of sentiment, a smooth harmonious flow of verse, and the most lively images, conveyed in the correctest language.—In historians, Rome also abounded; and till Livy appeared, Sallust was placed at their head. His great work has perished; but in the pieces happily preserved, his descriptions, his characters, his harangues, are equally beautiful; he succeeds alike in all: nothing can be added to their force, spirit, and eloquence. Livy is one of those few writers who have rendered their names immortal. Throughout his whole history there reigns an eloquence perfect in every kind. His style, though varied to infinity, is every where equal; simple without meanness; elegant without affectation; uniting sweetness with strength. Tacitus did not flourish till after the reign of Augustus; nor has his style the purity of the writers in that age of literary competition. The part of his history which contains the reign of Tiberius, has always been considered as his master-piece. There was no necessity for the abilities of a great writer to paint the vices of Caligula, the stupidity of Claudius, or the cruelties of Nero; but to write the life of Tiberius required the genius of Tacitus, who could unravel all the intrigues of the cabinet, assign the real causes of events, and withdraw the veil of deception, which concealed from the eyes of the public the real motives of action. The Romans never applied themselves greatly to philosophy. Lucretius, who delivered in spirited versification the opinions of Epicurus, is the only philosopher, except Cicero, whose writings are worthy of study.—In tragedy, the Romans never produced any thing that can bear the least comparison with the immortal writers of Greece, Æschylus, Euripides, and Sophocles. At the head of their comic writers, Plautus and Terence are justly placed; but neither were possessed of the *vis comica*, or lively vein of humour, which is essential to comedy, and which distinguishes the writings of the comic poets of Greece, and of our Shakspeare.

We now return to our history, and are arrived at an era, which presents us with a set of monsters, under the name of emperors, whose transactions disgrace human nature. They did not indeed abolish the forms of the Roman republic, though they

they extinguished its liberties; and while they enslaved and oppressed their subjects, they themselves were the slaves of their soldiers. Rome, from the time of Augustus, became the most despotic empire that ever subsisted in Europe; and its affairs were generally directed with caprice and cruelty. But the list of the first Cæsars is adorned by the name of a Titus: and a succession of wise and good princes brightens the second century of the Christian æra.

When it is said that the Roman republic conquered the world, it is only meant of the civilized part of it, chiefly in Greece, Carthage, and Asia. A more difficult task still remained for the emperors, to subdue the barbarous nations of Europe: the Germans, the Gauls, the Britons, and even the remote inhabitants of Scotland. These nations, though rude and ignorant, were brave and independent. It was rather from the superiority of their discipline than of their courage, that the Romans gained any advantage over them. The Roman wars with the Germans are described by Tacitus, and from his accounts, though a Roman, it is easy to discover with what bravery they fought, and with what reluctance they submitted to a foreign yoke. From the obstinate resistance of the Germans, we may judge of the difficulties the Romans met with in subduing the other nations of Europe. The contests were on both sides bloody; the countries of Europe were successively laid waste, the inhabitants perished in the field, many were carried into slavery, and but a feeble remnant submitted to the Roman power. This situation of affairs was extremely unfavourable to the happiness of mankind. The barbarous nations, indeed, from their intercourse with the Romans, acquired some taste for the arts, sciences, language, and manners of their new masters. These, however, were but miserable consolations for the loss of liberty, for being deprived of the use of their arms, for being overawed by mercenary soldiers kept in pay to restrain them, and for being delivered over to rapacious governors, who plundered them without mercy.

The Roman empire, now stretched out to such an extent, had lost its spring and force. It contained within itself the seeds of dissolution; and the violent irruption of the Goths, Vandals, Huns, and other barbarians, hastened its destruction. These fierce tribes, who came to take vengeance on the empire, either inhabited the parts of Germany which had never been subdued by the Romans, or were scattered over the vast countries of the north of Europe, and north-west of Asia, which are now inhabited by the Danes, the Swedes, the Poles, the subjects of the Russian empire, and the Tartars. They were drawn from their native country by that restlessness which actuates the minds of Barbarians, and makes them rove from home in quest of plunder, or new settlements. The first invaders met with a powerful resistance from the superior discipline of the Roman legions; but this, instead of daunting men of a strong and impetuous temper, only roused them to vengeance. They returned to their companions, acquaint them with the unknown conveniencies and luxuries that abounded in countries better cultivated, or blessed with a milder climate than their own; they acquaint them with the battles they had fought, or the friends they had lost, and warm them with resentment against their opponents. Great bodies of armed men, with their wives and children, and slaves and flocks, issued forth like regular colonies, in quest of new settlements. New adventurers followed them. The lands which they deserted were occupied by more remote tribes of Barbarians. These in their turn pushed forward into more fertile countries, and like a torrent continually increasing, rolled on, and swept every thing before them. Wherever the Barbarians marched, their route was marked with blood. They ravaged or destroyed all around them. They made no distinction between what was sacred, and what was profane. They respected no age, or sex, or rank. If a man was called to fix upon the period in the history of the world, during which the condition of the human race was most calamitous and afflicted, he would, without hesitation, name that which elapsed from the death of Theodosius the Great, A. D.

395, to the establishment of the Lombards in Italy, A. D. 571. The contemporary authors, who beheld that scene of desolation, labour, and are at a loss for expressions to describe the horror of it. *The scourge of God, the destroyer of nations*, are the dreadful epithets by which they distinguish the most noted of the barbarous leaders.

Constantine, who was emperor in the beginning of the fourth century, and who had embraced Christianity, changed the seat of empire from Rome to Constantinople. In consequence of this event, the western and eastern provinces were separated from each other, and governed by different sovereigns, as independent empires. The withdrawing the Roman legions from the Rhine and the Danube to the East, threw down the western barriers of the empire, and laid it open to the invaders.

Rome, weakened by this division, becomes a prey to the barbarous nations. Its ancient glory, vainly deemed immortal, is effaced, and Odoacer, a Barbarian chieftain, is seated on the throne of the Cæsars. But the immense fabric of the Roman empire was the work of many ages, and several centuries were employed in demolishing it. The military discipline of the ancient Romans, which was not yet totally forgotten or neglected, might have rendered them superior to their enemies, had it not been for the vices of their emperors, and the universal corruption of manners among the people.

Towards the close of the sixth century, the Saxons, a German nation, were masters of the southern, and more fertile provinces of Britain; the Franks, another tribe of Germans, of Gaul; the Goths, of Spain; the Goths and Lombards, of Italy. Scarcely any vestige of the Roman policy, jurisprudence, arts, or literature remained. New forms of government, new laws, new manners, new dresses, new languages, and new names of men and countries, were every where introduced.

From this period, till the 15th century, Europe exhibited a picture of most melancholy Gothic barbarity. Literature, science, taste, were words scarcely in use during these ages. Persons of the highest rank, and in the most eminent stations, could not read or write. Many of the clergy did not understand the brevity which they were obliged daily to recite: some of them could scarcely read it. The human mind neglected, uncultivated and depressed, sunk into the most profound ignorance. The superior judgment of Charlemagne, who, in the beginning of the 9th century, governed France and Germany, with part of Italy; and Alfred the Great in England, during the latter part of the same century, endeavoured to dispel this darkness, and gave their subjects a short glimpse of light. But the ignorance of the age was too powerful for their efforts and institutions. The darkness returned, and even increased; so that a still greater degree of ignorance and barbarism prevailed throughout Europe.

A new division of property gradually introduced a new species of government formerly unknown; which singular institution is now distinguished by the name of the *Feudal System*. The king, or general, who led the Barbarians to conquest, parcelled out the lands of the vanquished among his chief officers, binding those on whom they were bestowed to bear arms in his service. The chief officers imitated the example of the sovereign, and in distributing portions of their lands among their dependents, annexed the same condition to the grant; a system admirably calculated for defence against the foreign enemy, but which degenerated into a system of domestic oppression.

The usurpation of the nobles became unbounded and intolerable. They reduced the great body of the people into a state of actual servitude. All who were not soldiers, were peasants, fixed to the soil which they cultivated, and together with it were transferred from one proprietor to another, by sale or by conveyance. Every offended baron, or chieftain, huddled on his armour, and sought redress at the head of his vassals. His adversaries met him in like hostile array. The kindred and dependents

dependents

pendents of the aggressor, as well as of the defender, were involved in the quarrel. They had not even the liberty of remaining neuter.

The monarchs of Europe perceived the encroachments of their nobles with impatience. In order to create some power that might counterbalance those potent vassals, who, while they enslaved the people, controlled or gave law to the crown, a plan was adopted of conferring new privileges on towns. These privileges abolished all marks of servitude; and the inhabitants of towns were formed into corporations or bodies politic, to be governed by a council and magistrates of their own nomination.

The acquisition of liberty soon produced a happy change in the condition of mankind, and a spirit of industry revived; commerce became an object of attention, and began to flourish.

Various causes contributed to revive this spirit of commerce, and to renew the intercourse between different nations. Constantinople, the capital of the eastern or Greek empire, had escaped the ravages of the Goths and Vandals, who overthrew that of the West. It was still a learned and a commercial city; and the crusades,

which were begun by the Christian powers of Europe with a view to drive the Saracens from Jerusalem, having opened a communication between Europe and the East, Constantinople became the general place of rendezvous for the Christian armies, in their way to Palestine, or on their return from thence. Though the object of these expeditions were conquest, and not commerce, and though the issue of them proved unfortunate, their commercial effects were both beneficial and permanent.

Soon after the close of the holy war, the mariners compass was invented, A. D. 1302. which facilitated the communication between remote nations, and brought them nearer to each other. The Italian states, particularly those of Venice and Genoa, began to establish a regular commerce with Egypt, and to draw from thence the rich productions of India. These commodities they disposed of to great advantage among the other nations of Europe, who began to acquire some taste of elegance, unknown to their predecessors, or despised by them. During the 12th and 13th centuries, the commerce of Europe was almost entirely in the hands of the Italians, more commonly known in these ages by the name of Lombards. Companies, or societies of Lombard merchants settled in every different kingdom; they became the carriers, the manufacturers, and the bankers of Europe. One of these companies settled in London; and from hence the name of Lombard-street was derived.

While the Italians in the south of Europe cultivated trade with such industry and success, the same pursuit began in the North towards the middle of the thirteenth century. As the Danes, Swedes, and other nations around the Baltic, were at that time extremely barbarous, and infested that sea with their piracies, this obliged the cities of Lubec and Hamburgh, soon after they had begun to open some trade with the Italians, to enter into a league of mutual defence. They derived such advantages from this union, that other towns acceded to their confederacy; and, in a short time, eighty of the most considerable cities, scattered through those large countries of Germany and Flanders, which stretch from the bottom of the Baltic, to Cologne on the Rhine, joined in an alliance, called the *Hanseatic League*; which became so formidable, that its alliance was courted, and its enmity was dreaded by the greatest monarchs. The members of this powerful association formed the first systematic plan of commerce known in the middle ages, and conducted it by common laws enacted in their general assemblies. They supplied the rest of Europe with naval stores; and pitched on different towns, the most eminent of which was Bruges, in Flanders, where they established staples, in which their commerce was regularly carried on. Thither the Lombards brought the produc-

tious

tions of India, together with the manufactures of Italy, and exchanged them for the more bulky, but not less useful commodities of the North.

As Bruges became the centre of communication between the Lombards and Hanseatic merchants, the Flemings traded with both in that city to such extent as well as advantage, as diffused among them a general habit of industry, which long rendered Flanders and the adjacent provinces the most opulent, the most populous, and best cultivated in Europe.

Struck with the flourishing state of these provinces, of which he discovered the true cause, Edward III. of England endeavoured to excite a spirit of industry among his own subjects, who, blind to the advantages of their situation, and ignorant of the source from which opulence was destined to flow into their country, totally neglected commerce, and did not even attempt those manufactures, the materials of which they furnished to foreigners. By alluring Flemish artificers to settle in his dominions, as well as by many wise laws for the encouragement and regulation of trade, he gave a beginning to the woollen manufactures of England; and first turned the active and enterprising genius of his people towards those arts which have raised the English to the first rank among commercial nations.

The Christian princes, alarmed at the progress of their inveterate enemies the Turks, endeavoured to gain the friendship and assistance of the khans of Tartary. The Christian embassies were managed chiefly by monks, who, impelled by zeal and undaunted by difficulties and danger, found their way to the remote courts of these infidels. The English philosopher, Roger Bacon, was so industrious as to collect from their relations, or traditions, many particulars of the Tartars, which are to be found in Purchas's Pilgrim. The first regular traveller, of the monkish kind, who committed his discoveries to writing, was John du Plant Carpin, who, with some of his brethren, about the year 1246, carried a letter from pope Innocent to the great khan of Tartary, in favour of the Christian subjects in that prince's extensive dominions. Soon after this, a spirit of travelling into Tartary and India became general; and it would be no difficult matter to prove that many Europeans, about the end of the fourteenth century, served in the armies of Tamerlane, one of the greatest princes of Tartary, whose conquests reached to the most remote corners of India; and that they introduced into Europe the use of gunpowder and artillery; the discovery made by a German chemist being only partial and accidental.

After the death of Tamerlane, who, jealous of the rising power of the Turks, had checked their progress, the Christian adventurers, upon their return, magnifying the vast riches of the East Indies, inspired their countrymen with a desire of sailing thither. The Portuguese had long been distinguished by their application to maritime affairs; and to their discovery of the Cape of Good Hope, Great Britain is to this day indebted for her Indian commerce.

The first adventurers contented themselves with short voyages, creeping along the coast of Africa, discovering cape after cape; but by making a gradual progress southward, Vasco de Gama, in the year 1497, first doubled the extreme cape, which opened a passage by sea to the eastern ocean, and all those countries known by the name of India, China, and Japan.

While the Portuguese were intent upon a passage to India by the east, Columbus, a native of Genoa, conceived a project of sailing thither by the west. His proposal being condemned by his countrymen as chimerical and absurd, he laid his schemes successively before the courts of France, England, and Portugal, where he had no better success. Such repeated disappointments would have broken the spirit of any man but Columbus. The expedition required expence, and he had nothing to defray it. Spain was now his only resource, and there, after eight years attendance, he at length succeeded through the interest of queen Isabella. This princefs

was prevailed on to patronise him, by the representations of Juan Perez, guardian of the monastery of Rabida. He was a man of considerable learning, and of some credit with queen Isabella; and being warmly attached to Columbus, from his personal acquaintance with him, and knowledge of his merit, he had entered into an accurate examination of that great man's project, in conjunction with a physician, settled in his neighbourhood, who was eminent for his skill in mathematics. This investigation completely satisfied them of the solidity of the principles on which Columbus founded his opinion. Perez, therefore, so strongly recommended it to queen Isabella, that she entered into the scheme, and even generously offered, to the honour of her sex, to pledge her own jewels, in order to raise as much money as might be required in making preparations for the voyage. But Santangel, another friend and patron of Columbus, immediately engaged to advance the requisite sum, that the queen might not be reduced to the necessity of having recourse to that expedient.

Columbus now set sail the 3d of August, anno 1492, with three ships, upon one of the most adventurous attempts ever undertaken by man, and in the fate of which the inhabitants of two worlds were interested. In this voyage he had many difficulties to contend with; and his sailors, who were often discontented, at length began to insist upon his return, threatening, in case of refusal, to throw him overboard: but the firmness of the commander, and the discovery of land, after a passage of 33 days, put an end to the commotion. From the appearance of the natives, he found, to his surprise, that this could not be the Indies he was in quest of, but that he had fortunately discovered a new world, of which the reader may see a circumstantial account in that part of the following work which treats of America.

Europe now began to emerge out of that darkness into which she had been sunk since the subversion of the Roman empire. Learning awoke from her slumber of near twelve centuries, and the inhabitants of Europe became another people. The art of printing, which spreads with such rapidity from country to country the wisdom and follies of mankind, was invented: artillery and engineering made a rapid progress, and totally changed the operations of war. Every maritime nation fitted out fleets for making discoveries, and the whole world became connected by commerce. The reformation in religion restored liberty to genius; the human mind was released from the shackles of superstition, which had long silenced reason. The arts and sciences began to be cultivated, literature was esteemed; commerce was every day improved, and riches from many distant sources flowed into Europe. But the powers of the human mind are unfolded only by slow degrees. Many prejudices were to be removed, many abuses corrected, and many difficulties surmounted, before the sciences could appear in their genuine lustre. Truth and beauty seem indeed to surround mankind; but they are disregarded till properly displayed. The veil must be withdrawn from the face of nature, before her genuine graces can be discerned. A succession of great geniuses is necessary to explore the hidden paths of true philosophy.

The first studies that engaged mankind at the revival of learning, were languages and history. Memory was the first faculty cultivated; because the most easily satisfied, and the knowledge it procures the most easily attained. Hence proceeded that swarm of scholars, so deeply skilled in the learned languages, as to neglect their own; and who studied every thing in the ancients but their graces. An inventive genius is always dissatisfied with its own province; because it sees much farther than it reaches; and the most penetrating minds often find in themselves a secret rigorous judge; which the approbation of others may silence for a while, but can never totally corrupt. We need not therefore be surprised that these scholars should boast so highly of their slender attainments in a style often ridiculous, and sometimes barbarous.

But this fondness for the ancient, and neglect of the modern languages, did not long continue. The learned were soon convinced that beautiful thoughts lost nothing by being clothed in a living language; and hence they endeavoured to express in their own tongues, what the ancients had delivered in theirs. Thus the imagination of the moderns was gradually kindled up by that of the ancients; and produced all the noble performances in the last and present centuries in eloquence, history, and poetry.

The arts of elegance are so closely connected with polite learning, that a genius for cultivating the one, leads to the improvement of the other. The various works of the ancients were no sooner carefully examined, than judicious artists were struck with those inestimable models, which had escaped the fury of Gothic barbarity. The forms of Grecian sculpture might be imitated, but could not be surpassed. Hence Raphael and Michael Angelo brought the arts of design to a degree of perfection, which has not since been exceeded.

The progress of philosophy was much slower than that of the polite arts. The face of nature is the primary book of philosophers; and from the loss of many ancient works, and the obscurity of those which remained, the moderns were obliged to study it. But ignorance, prejudice, and superstitious bigotry, declared open war with science, whose interests were upheld by a few extraordinary men, thinly scattered over Europe, who transmitted to posterity a light too strong for the feeble eyes of their contemporaries. In this noble undertaking the English had a principal share: at once the champions of liberty and learning. In the profound parts of science they were never surpassed: they demolished the systems which imagination had built on the foundations of sophistry, followed nature through her intricate mazes, and established philosophy on the solid basis of calculation and experiment.

It was in the 15th and 16th centuries that the powers of Europe were formed into one great political system, in which each took a station, wherein it has since remained, with less variation than could have been expected, after the shocks occasioned by so many internal revolutions, and so many foreign wars, of which we have given some account in the history of each particular state in the following work. The great events which happened then, have not hitherto spent their force. The political principles and maxims then established, still continue to operate; and the ideas concerning the balance of power then introduced, or rendered general, still influence, in some degree, the councils of European nations.

In the north, this balance has been shaken of late years by the successful ambition of Russia. But it is probable the competition of so many rival powers, will always prevent any one of them from gaining the empire over Europe. Their conquests will be partial and transient; for the more any kingdom is extended, it becomes proportionally the weaker; and great projects have not been so often executed by slow reiterated efforts, as in the course of a few years, and sometimes by a single expedition. A prince may form a deliberate plan of destroying the liberties of his subjects; he may proceed by slow degrees in the execution of it; and if he die before it is completed, his successor may pursue similar steps, and accomplish the fatal design: but external conquests cannot be concealed. Hence the alarms they excite, the confederacies they give occasion to, by which the prince who, by misfortune has been a conqueror, is commonly reduced to the last extremities. This doctrine, however contrary to the prejudices of a powerful and victorious nation, is one of the best established in the science of politics. It is confirmed by examples both ancient and modern. The states of Greece, in particular, delivered from the terror of the Persian invasions, exhibit the same truth in a great variety of lights. Several of those warlike communities imbibed the frenzy of conquest, and each in its turn was reduced by this frenzy to the utmost misery and distress.

trefs\*. The modern examples are so well known, that it is almost unnecessary to mention them. Who does not know that the house of Austria † excited the terror of all Europe, before it excited the pity of Great Britain! Had that family never been the object of fear, the empress-queen would never have become the object of compassion. France affords an example not less striking. The nerves of that kingdom was strained so far beyond their strength, by an ambitious monarch, that it seemed unlikely they should acquire their natural tone in the course of this century. The debility of their efforts in the war of 1756 proved the greatness of the evil, and the inefficacy of any remedy which was not slow and gradual. It is to be hoped, for the interests of civil society, that democratic will prove as unfortunate as monarchic ambition.

Of all the kingdoms of Europe, Great Britain enjoys the greatest prosperity and glory. She ought, therefore, to be the more careful to preserve so brilliant an existence. A great empire is best maintained by extreme political caution, and by moderation even in victory. Some of the wisest men have thought that the conquest of Canada paved the way for the revolution in America, and the evils which followed that memorable event; and which have rebounded with such just violence on the ambitious country that unwarrantably lent its aid towards the dismemberment of the British empire.

## P A R T III.

## OF THE ORIGIN AND PROGRESS OF RELIGION.

**D**EITY is an awful object, and has ever roused the attention of mankind, who being incapable of elevating their ideas to the sublimity of his perfections, have too often brought down his perfections to the level of their own ideas. This is more particularly true with regard to those nations whose religion had no other foundation but the natural feelings, and more often the irregular passions, of the human heart, and who had received no light from heaven respecting this important object. In deducing the history of religion, therefore, we must make the same distinction which we have hitherto observed, in tracing the progress of arts, sciences, and of civilization among mankind. We must separate what is human from what is divine, what had its origin from particular revelations, from what is the effect of general laws, and of the unassisted operations of the human mind.

Agreeably to this distinction, we find, that in the first ages of the world, the religion of the eastern nations was pure and luminous. It rose from a divine source, and was not then disfigured by human fictions. In time, however, the ray of tradition was obscured, and among those tribes which separated at the greatest distance, and in the smallest numbers, from the more improved societies of men, it was altogether obliterated.

\* The reader who would see this subject fully illustrated, may look at Isocrates' Oration on the Peace; one of the most finished models of ancient eloquence; and which contains a rich fund of political knowledge.

† Germany, Holland, and all the Low Countries, several states in Italy, the kingdom of Spain, with the vast empires of Mexico and Peru, in South America, were, at the time of the Reformation, governed by Charles V. of the house of Austria: territories rivalling in riches and extent

the most powerful empires of antiquity, but which did not gratify the ambition of that monarch; and his whole reign was a scene of hostility against his neighbours. One of his successors, the late empress-queen, and the representative of that family, was, however, upon the death of her father, not only stripped of her dominions, but reduced so low as to be in want of necessaries; and contributions were actually raised for her in Great Britain, whose king, George II. engaged in her cause, and reinstated her in the imperial throne.

In this situation a particular people was selected by God himself, to be the depositaries of his law and worship; but the rest of mankind were left to form hypotheses upon these subjects, which were more or less perfect according to an infinity of circumstances, which cannot properly be reduced under any general heads.

The most common religion of antiquity, that which prevailed the longest, and extended the widest, was POLYTHEISM, or the doctrine of a plurality of Gods. The rage of system, the ambition of reducing all the phenomena of the moral world to a few general principles, has occasioned many imperfect accounts, both of the origin and nature of this species of worship. For, without entering into a minute detail, it is impossible to give an adequate idea of the subject; and what is said upon it in general, must always be liable to many exceptions.

One thing, however, may be observed, that the polytheism of the ancients seems seldom to have been the fruit of philosophical speculations, or of disguised traditions, concerning the nature of the divinity. It appears to have arisen during the rudest ages of society, while the rational powers were feeble, and while mankind were under the tyranny of imagination and passion. It was built chiefly upon sentiment: as each tribe of men had their heroes, so likewise they had their gods. Those heroes who led them forth to the combat, who presided in their councils, whose image was engraven on their fancy, whose exploits were imprinted on their memory, even after death enjoyed an existence in the imagination of their followers. The force of blood, of friendship, of affection, among rude nations, is what we cannot easily conceive; but the power of imagination over the senses is what all men have in some degree experienced. Combine these two causes, and it will not appear strange that the images of departed heroes should have been seen by their companions, animating the battle, taking vengeance on their enemies, and performing, in a word, the same functions which they performed when alive. An appearance so unnatural would not excite terror among men unacquainted with evil spirits, and who had not learnt to fear any thing but their enemies. On the contrary, it confirmed their courage, flattered their vanity, and the testimony of those who had seen it, supported by the extreme credulity and romantic cast of those who had not, gained an universal assent among all the members of their society. A small degree of perfection would be sufficient to convince them, that, as their own heroes existed after death, the same thing might happen to those of their enemies. Two orders of gods, therefore, would be established, the propitious and the hostile; the gods who were to be loved, and those who were to be feared. But time which wears off the impressions of tradition, the frequent invasions by which the nations of antiquity were ravaged, desolated, or transplanted, made them lose the names, and confound the characters of those two orders of divinities, and form various systems of religion, which, though warped by a thousand particular circumstances, gave no small indications of their first texture and original materials. In general the gods of the ancients gave abundant proof of human infirmity: they were subject to all the passions of men; they partook even of their partial affections. They did not eat and drink the same substances with men; but they lived on nectar and ambrosia; they had a particular pleasure in smelling the steam of the sacrifices, and they made love with an ardour unknown in northern climates. The rites by which they were worshipped, naturally resulted from their character. The most enlightened among the Greeks entertained nearly the same notion of gods and religion, with those that are to be met with in the poems of Hesiod and Homer; and Anaxagoras, who flourished B. C. 430 years, was the first Grecian that publicly announced the existence of one Creator and governor of the universe.

It must be observed, however, that the religion of the ancients was not much connected, either with their private behaviour, or with their political arrangements. The greatest part of mankind were then extremely tolerant in their principles. They had their own gods who watched over them; their neighbours, they ima-

gined, also had their's ; and there was room enough in the universe for both to live together in friendship, without disturbing each other.

The introduction of Christianity, by inculcating the unity of God, by announcing the purity of his character, and by explaining the service he required of men, produced a total alteration in their religious sentiment and belief. But this is not the place for handling this sublime subject : it is sufficient to observe here, that Christianity made its way among the civilized part of mankind, by the sublimity of its doctrines and precepts ; it required not the aid of human power ; it sustained itself by the truth and wisdom by which it was characterised. But in time it became corrupted by the introduction of worldly maxims, of maxims very inconsistent with the precepts of its divine author, and by the ambition of the clergy.

The management of what related to the church being naturally conferred on those who had established it, first occasioned the elevation, and then the domination, of the clergy, and the exorbitant claim of the bishop of Rome, over all the members of the Christian world. It is impossible to describe, within our narrow limits, all the concomitant causes, some of which were extremely delicate, by which this species of universal monarchy was established. The bishops of Rome, by being removed from the controul of the Roman emperors, then residing in Constantinople ; by borrowing, with little variation, the religious ceremonies and rites established among the heathen world, and otherwise working on the credulous minds of Barbarians, by whom that empire began to be dismembered ; and by availing themselves of every circumstance which Fortune threw in their way, slowly erected the fabric of their antichristian power, at first an object of veneration, and afterwards a terror to all temporal princes. The causes of its happy dissolution are more palpable, and operated with greater activity. The most efficacious were the invention of printing, the rapid improvement of arts, government, and commerce, which after many ages of barbarity, made their way into Europe. The scandalous lives of those who called themselves the *ministers of Jesus Christ* ; their ignorance and tyranny ; the desire natural to sovereigns of delivering themselves from a foreign yoke ; the opportunity of applying to national objects, the incredible wealth which had been diverted to the service of the church in every kingdom of Europe, conspired with the ardour of the first reformers, and hastened the progress of the reformation. The absurdity of the claims of the church of Rome was demonstrated ; many of her doctrines were proved to be equally unscriptural and irrational ; and many of her absurd mummeries and superstitions were exposed both by argument and ridicule. The services of the reformers in this respect cannot be too highly extolled ; but involved, as they had themselves been, in the darkness of superstition, it was not to be expected that they should be able wholly to free themselves from errors. With all their defects, they are entitled to admiration and gratitude ; and the Reformation begun by Luther in Germany in the year 1517, and which took place in England A. D. 1534, was an event highly favourable to the civil, as well as to the religious liberties of mankind.

We shall now proceed to the main part of our work, beginning with EUROPE.

## E U R O P E.

**EUROPE**, though the least extensive quarter of the globe, containing according to Zimmermann \* only about 2,627,574 square miles, whereas the habitable parts of the world in the other quarters, are estimated at 36,666,806, is in many respects that which most deserves our attention. There the human mind has made the greatest improvements; and there the arts, whether of utility or ornament, the sciences, both military and civil, have reached the highest perfection. If we except the earliest ages of the world, it is in Europe that we find the greatest variety of character, government, and manners and from whence we draw the greatest number of facts and memorials for our entertainment or instruction.

Geography discovers to us two circumstances with regard to Europe, which perhaps have had a considerable tendency in giving to it this distinguished superiority. First, the happy temperature of its climate, no part of it lying within the torrid zone; and secondly, the great variety of its surface. The effect of a moderate climate, both on plants and animals, is well known from experience. The great number of mountains, rivers, seas, &c. which divide the different countries of Europe from each other, is likewise extremely commodious for its inhabitants. These natural boundaries check the progress of conquest or despotism, which has always been so rapid in the extensive plains of Africa and the East: the seas and rivers facilitate the intercourse and commerce between different nations; and even the barren rocks and mountains are better calculated to sharpen human industry and invention, than the natural unsolicited luxuriance of more fertile soils. There is no part of Europe so diversified in its surface, so interrupted by natural boundaries or divisions, as Greece; and we have seen that it was there mankind reaped their highest honours in arts and arms. What Greece therefore was with regard to Europe, Europe is with regard to the rest of the globe. The analogy may even be carried farther, and it is necessary to attend to it. As ancient Greece (for we do not speak of Greece as it is at present, under the dominion of Barbarians) was distinguished above the rest of Europe for the equity of its laws, and the freedom of its governments; so has Europe in general been remarkable for smaller deviations, at least, from political justice, than have been admitted in other quarters of the world. Though most of the European governments are monarchical, we may discover, on due examination, that there are innumerable springs, which check the force, and soften the rigour of monarchic power. In proportion to the strength of these checks, Russia, Spain, Denmark, Prussia, and other monarchies, vary in their political fabric, till the series ends in Great Britain, the happiest constitution that the history of the world has ever exhibited. Besides *monarchies*, in which one man bears the chief sway, there are in Europe, *aristocracies* or governments of the nobles, and *democracies* or governments of the people. Venice is an example of the former; Holland, and some states of Italy and Switzerland, incline to the latter.

The Christian religion is established throughout every part of Europe, except Turkey; but, from the various capacities of the human mind, and the different lights in which speculative opinions are apt to appear, when viewed by persons of

\* See Zimmermann's Political Survey of Europe, p. 5, where the reader will find an account of the geographical square miles contained in Europe, as stated by six of the ablest modern geographers, viz. Busching, Kitchin, Templeman, Bergman, Crome, and Stahl. Ueberlich; of their different accounts the average is exactly the number stated above.

different

different educations and passions, that religion is divided into a number of different sects, but which may be comprehended under three general denominations; 1st, The Greek church; 2d, Popery; and 3d, Protestantism: which last is again divided into Lutheranism and Calvinism, so called from Luther and Calvin, the two distinguished reformers of the 16th century.

The languages of Europe are derived from the Greek, Latin, Teutonic or old German, the Celtic, Slavonic, and Gothic.

The greatest part of Europe being situated above the 45th degree of northern latitude, and even its most southern provinces being far distant from the torrid zone, the species of organized bodies are much less numerous in Europe than in the other parts of the globe. Thus, for instance, upon an equal number of square miles, the number of species of quadrupeds in Europe is to the number of them in Asia as 1 to 2½, to that in America as 1 to 2½, and to that in Africa as 1 to 10: and the number of the vegetable species in the other three divisions of the globe, is greatly superior to that in Europe. Of the precious fossils, diamonds and platina are wanting; gold and silver are not abundant; but the commercial and warlike spirit of Europe enriches it with the productions of all parts of the earth.

It will doubtless be agreeable to the inquisitive mind to have at one view in round numbers a comparative estimate of the different states of Europe, both as to the article of revenue, and that of their land and naval forces.

PUBLIC REVENUE of the PRINCIPAL STATES in EUROPE.

1. Great Britain	£. <i>Stm.</i>	11. Sweden	—	1,300,000
2. Austria	—	12. Venice	—	1,000,000
	12,400,000	13. Denmark	—	1,000,000
3. France	—	14. Electorate of Saxony	—	1,100,000
	18,000,000			
4. Spain	—	15. Electorate of Hanover	—	900,000
	5,000,000			
5. Russia	—	16. Joint Elect. of the Palat. and Bavaria	—	1,100,000
	5,800,000			
6. Turkey	—	17. Sardinia	—	1,000,000
	5,000,000			
7. Prussia	—			
	3,600,000			
8. Portugal	—			
	1,800,000			
9. Sicily	—			
	1,400,000 medium			
10. Holland	—			
	4,000,000			

The power of states is not to be estimated merely by their finances, because, in some countries, the value of money is much higher than in others; thus, for instance, the whole Russian army costs the state less than two millions of rubles.

LAND FORCES of the EUROPEAN STATES in the Year 1783.

France	—	—	300,000	Holland	—	—	37,000
Austria	—	—	282,000	Naples and Sicily	—	—	30,000
Russia (450,000 in all) in Europe	—	—	290,000	Electorate of Saxony	—	—	26,000
Prussia	—	—	224,000	Portugal	—	—	20,000
Turkey (210,000 in all) in Europe only	—	—	170,000	Electorate of Bavaria and the Palatinate	—	—	24,000
Spain	—	—	60,000	Hesse Cassel	—	—	15,000
Denmark	—	—	72,000	Hanover	—	—	20,000
Great Britain	—	—	58,000	Poland	—	—	15,000
Sweden	—	—	50,000	Venice	—	—	8,000
Sardinia	—	—	40,000	Wurtemberg	—	—	6,000
				The Ecclesiastical State	—	—	5,000
				Tuscany	—	—	3,000

If we calculate the armies of all the countries in Europe at two millions of men, and suppose 140 millions of inhabitants, no more than  $\frac{1}{70}$  of the whole population are soldiers. The present military establishment of every kingdom, in a time of general peace, differs somewhat from the above statement. Austria and Prussia have by far the most formidable armies: as to Russia, the immense extent of its provinces can never allow an army of more than 120,000, or 130,000 men, to act against an enemy; and as to the Turkish forces, they are at present much inferior to any other well-disciplined army. The different proportions, in different countries, between the population, and the number of soldiers, is not unworthy of observation. There are in Germany nearly 300,000 soldiers, consequently  $\frac{1}{70}$  of the whole population; in Italy, on the contrary, even supposing the standing armies of that country to amount to 120,000 men, this number makes only  $\frac{1}{77}$  of the whole population, which amounts to 16 millions. How then can France expect to maintain  $\frac{1}{70}$  of its people in arms and idleness?

- NAVAL FORCES.

NUMBER OF SHIPS of the LINE, FRIGATES, CUTTERS, SLOOPS, &c.

1. England	—	465		8. Russia	—	61
2. France	—	266		9. Sardinia	—	32
3. Spain	—	150		10. Venice	—	30
4. Holland	—	95		11. Sicily	—	25
5. Sweden	—	85		12. Portugal	—	24
6. Denmark	—	60				
7. Turkey	—	50	} commonly reckoned 60	Total		1325

This table, taken from the lists of 1783, will convey some idea of the respective naval strength of the different powers of Europe. Denmark, Sweden, Sicily, Portugal, having built but a small number of ships, of late years, are capable of maintaining a much larger navy than they now have.

The proportion of the surface of the countries in which the Protestant religion is established, to those in which the Roman Catholic religion prevails, is nearly as 3 to 4: the number of Roman Catholics has been calculated at 90,000,000; the number of Protestants only 24,000,000, which is a proportion of nearly 4 to 1.

Europe is not deformed by those immense deserts which cover great part of Asia, Africa, and America, deserts of many thousand square miles, and which are partly owing to natural and insuperable disadvantages of situation, partly to want of industry. Europe excels in all the arts, and has established innumerable institutions for preserving and propagating useful knowledge. It has at present about 130 universities, and a great variety of literary societies, or academies of sciences, arts, and languages. In consequence of our superiority in knowledge and enterprise, we enjoy all the conveniences of life in a much higher degree than the inhabitants of regions, on which nature has bestowed greater riches. And such is our proficiency in astronomy and navigation, that, having conquered, in a great measure, the dangers of the ocean, the commerce of the Europeans seems to be bounded only by the limits of the globe itself.

The states of Europe, considered with respect to their intrinsic power and influence abroad, may be divided into three classes; France, Great-Britain, Austria, Prussia, and Russia, belong to the first class. Secondary powers are those of Turkey, Spain, Holland, Denmark, Sweden, and Sardinia: the third class comprehends Portugal, Naples and Sicily, Poland, the joint Electorate of the Palatinate and Bavaria, the Electorate of Saxony, Switzerland, and Venice.

## GRAND DIVISIONS OF EUROPE.

**T**HIS grand division of the earth is situated between the 10th degree west, and the 64th degree east longitude from London; and between the 36th and 72d degree of north latitude. It is bounded on the north by the Frozen Ocean; on the east by Asia; on the south by the Mediterranean Sea, which divides it from Africa; and on the west by the Atlantic Ocean, which separates it from America; being three thousand miles long from Cape St. Vincent in the west, to the mouth of the river Oby in the north-east; and 2500 broad from north to south, from the north Cape in Norway to Cape Caya or Metapar in the Morea, the most southern promontory in Europe. It contains the following kingdoms and states:

Kingdoms.	Length.	Breadth.	Chief City.	Dist. & Bearing from London.	Diff. of Time from London.	Religion.
British Empire.	England	380	London	Miles. . . . .	H. M. . . . .	Calvinists, Luth. &c.
	Scotland	350	Edinburgh	400 N.	0 12 aft.	Calvinists, &c.
	Ireland	285	Dublin	270 N. W.	0 26 aft.	Calvinists and Pap.
	Norway	1000	Bergen	540 N.	0 24 bef.	Lutherans
	Denmark	340	Copenhagen	500 N. E.	0 50 bef.	Lutherans
	Sweden	800	Stockholm	750 N. E.	1 10 bef.	Lutherans
	Russia	1500	Peterburgh	1140 N. E.	2 34 bef.	Greek Church
	Poland	700	Warsaw	760 E.	1 24 bef.	Pap. Luth. and Calv.
	K. Pr. Dom.	600	Berlin	540 E.	0 49 bef.	Luth. and Calv.
	Germany	600	Vienna	620 E.	1 5 bef.	Pap. Luth. and Calv.
Nether-lands.	Bohemia	300	Prague	600 E.	1 4 bef.	Papists

	Spain	700	Madrid	800 S.	0 17 aft.	Papists
	Portugal	300	Lisbon	850 S. W.	0 18 aft.	Papists
	Switzerland	260	Bern, Coire, &c.	420 S. E.	0 28 bef.	Calvin. and Papists.
Italy.	Several small states		Piedmont, Montferrat, Milan, Parma, Modena, Mantua, Venice, Genoa, Tuscany, &c.			
	Chief cities	Turin, Casal,	Milan, Parma, Modena, Mantua, Venice, Genoa, Florence.			
	Popedom	240	Rome	820 S. E.	0 52 bef.	Papists
	Naples	280	Naples	870 S. E.	1 0 bef.	Papists
Turkey in Europe.	Hungary	300	Buda	780 S. E.	1 17 bef.	Pap. and Protestants
	Danubian Provinces	600	Constantinople	1320 S. E.	1 58 bef.	Mahometans, and Greek Church.
	Lit. Tartary*	380	Precop	1500 E.	2 24 bef.	
	Greece	400	Athens	1560 S. E.	1 37 bef.	

\* This includes the Crim Tartary, now ceded to Russia; for the particulars of which, see RUSSIA.

D E N M A R K.

Exclusive of the British Isles, before mentioned, Europe contains the following principal islands:

	Islands.	Chief Towns.	Subject to
In the Northern Ocean,	Iceland	Skalholt,	Denmark.
	Zeland, Funen, Alfen, Falster, Langland, Laland, Femeren, Mona, Bornholm,	—	Denmark.
Baltic Sea,	Gothland, Aland, Rugen, Ost, Dogbo, Ufedom, Wollin,	—	Sweden.
	Ivica, Majorca, Minorca, Corfica, Sardinia, Sicily,	Ivica, Majorca, Port Mahon, Baffia, Cagliari, Palermo,	Spain, Ditto*, France, King of Sardinia, King of Two Sicilies.
Mediterranean Sea,	Lufena, Corfu, Cephalonia, Zant, Leucadia,	—	Venice.
Adriatic, or Gulf of Venice,	Candia, Rhodes, Negropont, Lemnos, Tenedos, Scyros, Mytelena, Scio, Samos, Patmos, Paros, Cerigo, Santorin, &c. being part of Ancient and Modern Greece.	—	Turkey.
Archipelago and Levant Seas,			

D E N M A R K.

I shall, according to my plan, begin this account of his Danish Majesty's dominions with the most northerly situations, and divide them into four parts: 1st, East and West Greenland, Iceland, and the islands in the Atlantic Ocean; 2d, Norway; 3d, Denmark Proper; and 4th, his German territories.

The dimensions of these countries may be seen in the following table:

Denmark.		Square Miles.	Length.	Breadth.	Chief Cities.
Denmark Proper,	North Jutland,	9,600	155	98	Wyburg.
	South Jutland, or Sleswick,	2,115	70	63	Sleswick.
Islands at the entrance of the Baltic Sea,	Zeland,	1,935	60	60	COPENHAGEN, { N. Lat. 55—41 E. Long. 12—50
	Funen,	768	38	32	Odensee.
	Falster and Langland,	220	27	14	{ Nikoping. Naakaw.
	Femeren,	50	13	8	Borge.
	Alfen,	54	15	6	Sonderborge.
	Mona,	39	14	5	Stee.
	Bornholm,	160	20	12	Rostcomby.
In the North Seas,	Iceland Island,	46,000	435	185	Skainolt.
	Norway,	71,400	750	170	Bergen.
	Danish Lapland,	28,400	284	172	Wardhuys.
Westphalia,	Oldenburg,	1260	62	32	Oldenburg.
Lower Saxony,	Storwar,	1000	52	32	Gluckstadt.
	Danish Holstein				
	Total	163,041			

\* Minorca was taken from Spain by general Stunhope, 1708, and confirmed to Great Britain by the treaty of Utrecht, 1713, but was besieged

and taken by the Spaniards, February 15, 1782, and confirmed to them by the definitive treaty of peace, signed at Paris, September 3, 1783.

Exclusive

The reader may perceive, that in the preceding table no calculation is made of the dimensions of East and West Greenland; because they are very imperfectly known: we shall proceed to give the latest accounts of them, from the best authorities.

### EAST AND WEST GREENLAND, ICELAND, AND THE ISLANDS IN THE ATLANTIC OCEAN.

#### EAST GREENLAND,

THE most northerly part of his Danish majesty's dominions; or, as others call it, New Greenland, and the country of Spitzbergen, lies between 11 and 25 deg. E. long. and 76 and 80 deg. N. lat. according to Lord Mulgrave's Observations in his voyage towards the North Pole, in 1773. Though it is now claimed by Denmark, it certainly was discovered by sir Hugh Willoughby in 1553; and is supposed to be a continuation of Old Greenland. It obtained the name of Spitzbergen from the height and raggedness of its rocks. Few animals or vegetables are to be found here, and the fish and fowl are said to forsake the coast in winter. The Russians of Archangel have formed, within the last thirty years, settlements for hunting in several places of the island of Spitzbergen. The Aurora Borealis, or northern lights, reflected from the snow, enable them to pursue the chase during the long winter's night that reigns in those gloomy regions, and they take a great number of sealions, which serve them for food. There is a whale-fishery, chiefly prosecuted by the Dutch and British vessels, on its coast. It likewise contains two harbours; one called South Haven, and the other Maurice Bay; the inland parts are uninhabited.

#### WEST GREENLAND

LIES between the meridian of London, and 50 deg. W. long. and between 60 and 76 deg. N. lat.

[INHABITANTS.] By the latest accounts from the missionaries employed for the conversion of the Greenlanders, their whole number does not exceed 957 stated inhabitants: Mr. Crantz, however, thinks that the roving southlanders of Greenland may amount to about 7000. There is a great resemblance between the aspect, manners, and dress of those natives, and the Esquimaux Americans, from whom they differ but little, after all the pains which the Danish and German missionaries have taken to convert and civilize them. They are low in stature, few exceeding five feet in height, and the generality not so tall. The hair of their heads is long, straight, and of a black colour; but they have seldom any beards, because it is their constant practice to root them out. They have high breasts and broad shoulders, especially the women, who are obliged to carry great burdens from their younger years. They are very light and nimble of foot, and can use their hands with skill and dexterity. They are not very lively in their tempers, but are good humoured, friendly, and unconcerned about futurity. Their most agreeable food is the flesh of rein-deer; but that is now scarce among them, and their best provisions are fish, seals, and sea-fowl. Their drink is clear water, which stands in the house in a great copper vessel, or in a wooden tub, which is very neatly made by them, ornamented with fish bones and rings, and provided with a pewter ladle or dipping-dish. The men make their hunting and fishing implements, and prepare the wood-work of their boats; and the women cover them with skins. The men hunt and fish, but when they have towed their booty to land, they trouble themselves no farther

farther about it; accounting it beneath their dignity even to draw the seal upon the shore. The women are the butchers and cooks, and also the carriers to dress the pelts, and make clothes, shoes, and boots, out of them; so that they are likewise both shoemakers and tailors. They also act as masons in building and repairing the houses and tents, the men doing only the carpenters work. They live in huts during their winter, which is incredibly severe; but Mr. Crantz, who has given us the latest and best accounts of this country, says, that in their longest summer days it is so hot, from the long continuance of the sun's rays, that the inhabitants are obliged to throw off their summer garments. They have no trade, though they have a most improveable fishery upon their coast; but they employ all the year either in fishing or hunting, in which they are very dexterous, particularly in catching and killing seals.

**CURIOSITIES.**] The taking of whales in the seas of Greenland, among the fields of ice that have been increasing for ages, is one of the boldest enterprises of man. These pieces of ice are frequently more than a mile in length, and upwards of 100 feet in thickness; and when they are put in motion by a storm, nothing can be more terrible; the Dutch had 13 ships crushed to pieces by them in one season.

There are several kinds of whales in Greenland; some white, and others black. The black sort, the grand bay whale, is in most esteem, on account of his bulk, and the great quantity of fat or blubber he affords. His tongue is about 18 feet long, inclosed in long pieces of what we call whalebone, which are covered with a kind of hair like horse-hair; and on each side of his tongue are 250 pieces of this whalebone. The bones of his body are as hard as an ox's bones, and of no use. There are no teeth in his mouth; and he is usually between 60 and 80 feet long; very thick about the head, but grows less from thence to the tail.

When the seamen see a whale spout, the word is immediately given, *fall, fall*, when every one hastens from the ship to his boat; six or eight men being appointed to a boat, and four or five boats usually belong to one ship.

When they come near the whale, the harpooner strikes him with his harpoon (a barbed dart), and the monster, finding himself wounded, runs swiftly down into the deep, and would carry the boat along with him if they did not give him line fast enough; and to prevent the wood of the boat taking fire by the violent rubbing of the rope on the side of it, one wets it constantly with a mop. After the whale has run some hundred fathoms deep, he is forced to come up for air, when he makes a noise with his spouting, which some have compared to the firing of cannon. As soon as he appears on the surface of the water, some of the harpooners fix another harpoon in him, whereupon he plunges again into the deep; and when he comes up a second time, they pierce him with spears in the vital parts till he spouts out streams of blood instead of water, beating the waves with his tail and fins till the sea is all in a foam, the boats continuing to follow him some leagues, till he has lost his strength; and when he is dying he turns himself upon his back, and is drawn on shore, or to the ship, if they be at a distance from the land. There they cut him in pieces, and by boiling the blubber, extract the oil, if they have conveniences on shore; otherwise they barrel up the pieces, and bring them home: but nothing can smell stronger than these ships do. Every fish is computed to yield between 60 and 100 barrels of oil, of the value of 3l. or 4l. a barrel. Though the Danes claim the country of E. and West Greenland, where these whales are taken, the Dutch have in a manner monopolized this fishery. Of late the English have also been very successful in it.

## ICELAND.

## I C E L A N D

**T**HIS island, which receives its name from the great masses of ice that are seen near it, lies between 63 and 67 deg. N. lat. and between 11 and 27 deg. W. long. It extends four hundred miles in length, and an hundred and sixty in breadth, containing about 46,000 square miles. In April, 1783, the inhabitants of Iceland observed something rising and flaming in the sea, to the south of Grinbourg, at eight miles distant from the rocks des Oiseaux, which afterwards was found to be a new island. The situation and dimensions of this island are not well ascertained. The information brought by the last ship from thence, was, that the island was still increasing, and that great quantities of fire issued from two of its eminences.

**POPULATION, INHABITANTS, MANNERS, AND CUSTOMS.**] It appears that a Norwegian colony, among which there were many Swedes, settled in Iceland in the ninth century. They found there inhabitants who were Christians, and whom they called *Papas*. It is said, that the Norwegians also found among them Irish monks, bells, and croziers: and it is conjectured, that the people who were there, when the Norwegians arrived in the island, originally came from England and Ireland. The inhabitants long retained their freedom; but they were at last obliged to submit to the kings of Norway, and afterwards became subject, together with Norway, to the kings of Denmark. They were at first governed by an admiral, who was sent there every year to make the necessary regulations, but that mode has now been changed for many years, and a governor appointed, who is styled *Stiftamtman*, and who constantly resides in the country.

The number of the inhabitants of Iceland is computed at about 60,000. It was much more populous in former times, when great numbers were destroyed by contagious diseases. The plague carried off many thousands, from 1402 to 1404. Many parts of Iceland have also been depopulated by famines, chiefly occasioned by the Greenland floating ice; which, when it comes in great quantities, prevents the grass from growing, and puts an entire stop to their fishing. The small-pox has likewise been very fatal here; for, in the years 1707 and 1708, that disease destroyed 16,000 persons.

The Icelanders in general are middle-sized, and well-made, though not very strong. They are an honest, well-intentioned people, moderately industrious, and very faithful and obliging. Theft is seldom heard of among them. They are much inclined to hospitality, and exercise it as far as their poverty will permit. Their chief employments are fishing, and the care of their cattle. On the coasts the men employ their time in fishing both winter and summer; and the women prepare the fish, and sew and spin. The men also prepare leather, work at several mechanic trades, and some sew work in gold and silver. They likewise manufacture a coarse kind of cloth, which they call *Wadmal*. They have an uncommonly strong attachment to their native country, and think themselves no where else so happy. An Icelander, there, seldom settles in Copenhagen, though the most advantageous conditions should be offered him. Their dispositions are ferocious, and they are much inclined to religion. They never pass a river, or any other dangerous place, without previously taking off their hats, and imploring the divine protection; and they are always thankful for their preservation, when they have escaped the danger. When they meet together, their chief pastime consists in reading their history. The master of the house begins, and the rest continue in their turns, when he is tired. They are famous for playing at chess; and one of their pastimes consists in reciting verses. Sometimes a man and woman take one another by the hand, and by turns sing stanzas, which are a kind of dialogue, and in which

the company occasionally join in chorus. The dress of the Icelanders is not elegant or ornamental, but it is neat, cleanly, and suited to the climate. On their fingers the women wear several gold, silver, or brass rings. The poorer women dress in the coarse cloth called Wadmál, and always wear black: those who are in better circumstances wear broad cloth, with silver ornaments gilt. In some places their houses are built of drift wood, and in others they are raised of lava, with moss stuffed between the lava. Their roofs are covered with sods laid over rafters, or sometimes over ribs of whales, which are both more durable and more expensive than wood. They have not even a chimney in their kitchens, but only lay their fuel on the earth, between three stones; and the smoke issues from a square hole in the roof. Their food consists of dried fish, sour butter, which they consider as a dainty, milk mixed with water and whey, and a little meat. Bread is so scarce among them, that there is hardly any peasant who eats it above three or four months in the year.

**RELIGION.]** The only religion tolerated in Iceland is the Lutheran. The churches on the east, south, and west quarters of the island, are under the jurisdiction of the bishop of Skalholt (the capital of the island), and those of the north quarter are subject to the bishop of Hoolum. The island is divided into 189 parishes, of which 127 belong to the see of Skalholt, and 62 to that of Hoolum. All the ministers are natives of Iceland, and receive a yearly salary of four or five hundred rix-dollars from the king, exclusive of what they have from their congregations.

**LANGUAGE.]** The language in Iceland is the same formerly spoken in Sweden, Denmark, and Norway, and has been preserved so pure, that many Icelanders understand their most ancient traditional histories.

**LEARNING AND LEARNED MEN.]** It is said that poetry formerly flourished very much in Iceland; and we are informed that Egil Skallagrimson, Kormak Ogmundson, Glum Geirson, and Thorlief Jarlax, were celebrated as great poets. But the art of writing was not much in use till after the year 1000; though the Runic characters were known in that country before that period, and most probably brought thither from Norway. After the reception of the Christian religion, the Latin characters were immediately adopted, as the Runic alphabet, which only consists of sixteen letters, was found insufficient. The first Icelandic bishop, Isteif, founded a school at Skalholt; and soon after four other schools were founded, in which the youth were instructed in the Latin tongue, divinity, and some parts of theoretic philosophy. And from the introduction of the Christian religion here, till the year 1264, when Iceland became subject to Norway, it was one of the few countries in Europe, and the only one in the North, wherein the sciences were cultivated and held in esteem.

But this period of time seems to have produced more learned men in Iceland than any other period since. It appears from their ancient chronicles, that they had considerable knowledge in morality, philosophy, natural history, and astronomy. Most of their works were written in the 11th, 12th, 13th, and 14th centuries; and some of them have been printed. Sir Joseph Banks presented one hundred and sixty-two Icelandic manuscripts to the British Museum. That gentleman visited Iceland in 1772, accompanied by Dr. Solander, Dr. Van Troil, and Dr. Lind. Dr. Van Troil, who published an account of their voyage, observes that he found more knowledge among the lower class in Iceland than is to be met with in most other places; that many of them could repeat the works of some of their poets by heart; and that a peasant was seldom to be found, who, besides being well instructed in the principles of religion, was not also acquainted with the history of his own country; which proceeds from the frequent reading of their traditional histories, that being one of their principal amusements.

John Arefon, bishop of Hoolum, employed John Matthieson, a native of Sweden,

in establishing a printing-press in Iceland, about the year 1530; and the first book printed by him there was the *Breviarium Nidarosense*. He also printed an ecclesiastical Manual, Luther's Catechism, and other books of that kind. The Icelandic code of laws appeared in 1578, and the Icelandic Bible in 1584. A new privileged printing-office has lately been established at Hrappey in this island, where several valuable books have been printed.

**MOUNTAINS, VOLCANOES, AND NATURAL CURIOSITIES.]** Though this island is situated so far to the north, earthquakes and volcanoes are more known than in many countries is much warmer climates. The former have several times laid the country almost desolate, particularly in the years 1734, 1752, and 1755, when fiery eruptions broke out of the earth, and produced very fatal effects. Many of the snowy mountains have also gradually become volcanoes. Of these burning mountains Heckla is the best known to foreigners. This mountain is situated in the southern part of the island, about four miles from the sea-coast, and is divided into three points at the top, the highest of which is that in the middle; and which is computed to be above 5000 feet higher than the sea. It has frequently sent forth flames and a torrent of burning matter. Its eruptions were particularly dreadful in 1693, when they occasioned terrible devastations, the ashes being thrown all round the island to the distance of 180 English miles. The last eruption of mount Heckla happened in 1766. It began on the 5th of April, and continued to the 7th of September following. Flames proceeded also from it in December 1771, and in September 1772; but no eruptions of lava.

Amongst the curiosities in Iceland, nothing is more worthy of attention than the hot spouting water springs with which this island abounds. The hot springs at Aix-la-Chapelle, Carlsbad, Bath, and Switzerland, and several others found in Italy, are considered as very remarkable: but except in the last mentioned country, the water no where becomes boiling hot; nor is it any where known to be thrown so high as the hot spouting water-springs in Iceland. All those water-works that have been contrived with so much art, and at so an enormous an expence, cannot by any means be compared with these. The water-works at St. Cloud, which are thought the greatest amongst all the French water-works, cast up a thin column eighty feet into the air: while some springs in Iceland spout columns of water, of several feet in thickness, to the height, as many affirm, of several hundred feet. These springs are of unequal degrees of heat. From some, the water flows gently as from other springs, and it is then called a bath: from others, it spouts boiling water with a great noise, and it is then called a kettle. Though the degree of heat is unequal, yet Dr. Van Troil does not remember ever to have observed it under 188 of Fahrenheit's thermometer. At Geyser, Rœynum, and Laugarvatn, he found it at 212; and in the last place, in the ground, at a little hot current of water, 213 degrees. It is common for some of the spouting-springs to cease, and others to rise up in their stead. Frequent earthquakes, and subterranean noises heard at the time, cause great terror to the people who live in the neighbourhood. In several of these hot springs, the inhabitants who live near them boil their victuals, only by hanging a pot into which the flesh is put in cold water, in the water of the spring. They also bathe in the rivulets that run from them, which, by degrees, become lukewarm, or are cooled by admixture with rivulets of cold water. The cows that drink of these springs are said to yield an extraordinary quantity of milk; and it is esteemed very wholesome when drank by the human species.

The largest of all the spouting-springs in Iceland is called Geyser. It is about two days journey from Heckla, and not far from Skalholt. In approaching towards it, a noise is heard, like the rushing of a torrent, precipitating itself from stupendous rocks. The water here spouts several times a day, but always by starts,

starts, and after certain intervals. Some travellers have affirmed that it spouts to the height of sixty fathoms. The water is thrown up much higher at some times than at others: when Dr. Van Troil was there, the utmost height to which it mounted was computed to be 92 feet.

Basaltine pillars are likewise very common in Iceland, which are supposed to have been produced by subterraneous fires. The lower sort of people imagine these pillars to have been piled upon one another by giants, who made use of supernatural force to effect it. They have generally from three to seven sides, and are from four to six feet in thickness, and from twelve to sixteen yards in length, without any horizontal divisions. In some places, they are only seen here and there among the lava in the mountains; but, in some other places, they extend two or three miles in length without interruption.

Every year great damage is done to this country by immense masses of ice which arrive commonly with a N. W. or N. N. W. wind from Greenland. The field ice is of two or three fathoms thickness, is separated by the winds, and less dreaded than the rock or mountain ice, which is often seen more than fifty feet above water, and is at least nine times the same depth below water. These prodigious masses of ice are frequently left in shoal water, fixed, as it were, to the ground, and in that state remain many years undissolved, chilling all the ambient part of the atmosphere for many miles round. When many such lofty and bulky masses of ice are floating together, the wood that is often drifted along between them is so much chafed, and pressed with such violence together, that it takes fire; which circumstance has occasioned fabulous accounts of the ice being in flames. The ice caused so violent a cold in 1753 and 1754, that many horses and sheep were killed by it, and through want of food: horses were observed to feed upon dead cattle, and the sheep to eat of each other's wool. A number of bears arrive yearly with the ice, which commit great ravages, particularly among the sheep. The Icelanders attempt to destroy these intruders as soon as they get sight of them; and sometimes they assemble together, and drive them back to the ice, with which they often float off again. For want of fire arms, they are obliged to make use of spears on these occasions. The government encourages the natives to destroy these animals, by paying a premium of ten dollars for every bear that is killed. Their skins are also purchased for the king, and are not allowed to be sold to any other person.

It is extraordinary that trees do not thrive in Iceland; nay, there are very few to be found on the whole island, though there are certain proofs that wood formerly grew there in great abundance. Nor can corn be cultivated here to any advantage; though cabbages, parsley, turnips, and peas, may be met with in five or six gardens, which are said to be all that are in the island.

[TRADE.] The commerce of this island is monopolized by a Danish company. The soil upon the sea-coasts is tolerably good for pasture; and though there is not any considerable town in the whole island, the Icelanders have several frequented ports. Their exports consist of dried fish, salted mutton and lamb, beef, butter, tallow, train-oil, coarse woollen-cloth, stockings, gloves, raw wool, sheep-skins, lamb-skins, fox-furs of various colours, eider-down, and feathers. Their imports consist of timber, fishing-lines and hooks, tobacco, bread, horse-hoes, brandy, wine, salt, linen, and a little silk; exclusive of some necessaries and superfluities for the more wealthy.

[STRENGTH AND REVENUE.] As Iceland affords no bait for avarice or ambition, the inhabitants rest securely upon his Danish majesty's protection: the revenue he draws from the country amounts to about 30,000 crowns a year.

## THE FARO OR FERRO ISLANDS:

SO called from their lying in a cluster, and the inhabitants ferrying from one island to another. They are about twenty-four in number, and lie between 61 and 63 deg. N. L. and 6 deg. 10 min. W. long, from London. The space of this cluster extends about 60 miles in length, and 40 in breadth, 300 miles to the westward of Norway; having Shetland and the Orkneys on the south-east, and Greenland and Iceland upon the north and north-west. The trade and income of the inhabitants, who may be about 4000, add little to the revenues of Denmark.

## N O R W A Y.

Containing 158,400 SQUARE MILES, with less than four Inhabitants to each.

NAME, BOUNDARIES, } THE natural signification of Norway is, the *Nor-*  
AND EXTENT. } *thern-way*. It is bounded on the south by the en-  
trance into the Baltic, called the Seaggerac, or Categate; on the west and north,  
by the northern ocean; and on the east it is divided from Sweden by a long ridge  
of mountains, called at different parts by different names; as Fillefield, Dofre-  
field, Rundfield, and Dourfield. The reader may consult the table of dimensions in Den-  
mark for its extent, which is not, however, well ascertained.

[CLIMATE.] The climate of Norway varies according to its latitude, and its  
position towards the sea. At Bergen the winter is moderate, and the sea is prac-  
ticable. The eastern parts of Norway are commonly covered with snow; and the  
cold generally prevails from the middle of October, with intense severity, to the  
middle of April; the waters being all the time frozen to a considerable thickness.  
In 1719, 7000 Swedes, who were on their march to attack Drontheim, perished  
in the snow, on the mountains which separate Sweden from Norway; and their  
bodies were found in different postures. But even frost and snow have their con-  
veniences, as they facilitate the conveyance of goods by land. As to the more  
northerly parts of this country called Finmark, the cold is so intense that they are but  
little known. At Bergen, the longest day consists of about 19 hours, and the short-  
est of about five. In summer, the inhabitants can read and write at midnight by  
the light of the sky; and in the most northerly parts, about midsummer, the sun is  
continually in view. In those parts, however, in the middle of winter, there is only  
a faint glimmering of light at noon for about an hour and a half; owing to the re-  
flection of the sun's rays on the mountains. Nature, notwithstanding, has been so  
kind to the Norwegians, that in the midst of their darkness the sky is so serene,  
and the moon and the aurora borealis so bright, that they can carry on their fishery,  
and work at their several trades in open air.

The air is so pure in some of the inland parts, that it has been said the inhabi-  
tants grow tired of their long lives, and cause themselves to be transported to a less  
salubrious air. Sudden thaws, and snow-falls have, however, sometimes dreadful  
effects, and destroy whole villages.

[MOUNTAINS.] Norway contains a chain of unequal mountains running from  
south to north: to pass that of Hardanger, a man must travel about seventy English  
miles; and to pass others, upwards of fifty. Dofrefield is counted the highest moun-  
tain in Europe. The rivers and cataracts which intersect those dreadful precipices,  
and that are passable only by slight tottering wooden bridges, render travelling in  
this country very terrible and dangerous; though the government is at the expence  
of

of providing, at different stages, houses accommodated with fire, light, and kitchen furniture. Detached from this vast chain, other immense mountains present themselves all over Norway; some of them with reservoirs of water on the top, and the whole forming a most surprising landscape. The activity of the natives, in recovering their sheep and goats, when penned up, through a false step, in one of those rocks, is wonderful. The owner directs himself to be lowered down from the top of the mountain, sitting on a cross stick, tied to the end of a long rope; and when he arrives at the place where the creature stands, he fastens it to the same cord, and it is drawn up with himself. The caverns that are to be met with in these mountains, are more wonderful than those, perhaps, in any other part of the world. One of them, called Dolsteen, was, in 1750, visited by two clergymen, who reported, that they proceeded in it till they heard the sea dashing over their heads; that the passage was as wide and high as an ordinary church, the sides perpendicular, and the roof vaulted: that they descended a flight of natural stairs; but when they arrived at another, they durst not venture to proceed, but returned; and that they consumed two candles going and returning.

**FORESTS.]** The chief wealth of Norway lies in its forests, which furnish foreigners with masts, beams, planks, and boards; and serve beside for all domestic uses; particularly the construction of houses, bridges, ships, and for charcoal to the founderies. The timber growing here are fir and pine, elm, ash, yew, benweed, birch, beech, oak, eel or alder, juniper, the aspin-tree, the comol or sloe-tree, hazel, elder, ebony (under the mountains of Kolen), lime or linden tree, and willows. The sums which Norway receives for timber are very considerable; the industry of the inhabitants is greatly assisted by the course of their rivers, and the situation of their lakes; which afford them not only the conveniency of floating down their timber, but of erecting saw-mills, for dividing their large beams into planks and deals. A tenth of all sawed timber belongs to his Danish majesty, and forms no inconsiderable part of his revenue.

**STONES, METALS, } AND MINERALS. }** Norway contains quarries of excellent marble as well as many other kinds of stones; and the magnet is found in the iron mines. The amianthus, or asbestos, is likewise found here; as are crystals, granites, amethysts, agate, thunder-stones, and eagle-stone. Gold found in Norway has been coined into ducats. His Danish majesty is now working, to great advantage, a silver mine at Koningsberg; other silver mines have been found in different parts of the country; and one of the many silver masses that have been discovered, weighing 560 pounds, is to be seen at the royal museum at Copenhagen. Lead, copper, and iron mines, are common in this country: one of the copper-mines at Roraas is thought to be the richest in Europe. Norway produces quicksilver, sulphur, salt, coal, vitriol, alum, and various kinds of loam; the manufactures of which bring in a large revenue to the crown.

**RIVERS AND LAKES.]** The rivers and lakes in this country are well stocked with fish, and navigable for vessels of considerable burden. The most extraordinary circumstance attending the lakes is, that some of them contain floating islands formed by the cohesion of roots of trees and shrubs; and, though torn from the main land, bear herbage and trees. In the year 1702, the noble family-seat of Borge, near Fredericstادت, suddenly sunk, with all its towers and battlements, into an abyss a hundred fathom in depth; and its site was instantly filled with water, and formed a lake 300 ells in length, and about half as broad. This melancholy accident, by which 14 people and 200 head of cattle perished, was occasioned by the foundation being undermined by the waters of a river.

**UNCOMMON QUADRUPEDS, } FOWLS, AND FISHES. }** All the animals that are natives of Denmark are to be found in Norway, with an addition of many more. The wild beasts peculiar to Norway, are the elk, the rein-deer, the hare,

the rabbit, the bear, the wolf, the fox, the lynx, the glutton, the leming, the martin, and the beaver. The elk is a tall, ash-coloured animal, its shape partaking at once of the horse and the stag; it is harmless, and in winter, social; and the flesh of it tastes like venison. The hares are small; and are said to live upon mice in the winter time, and to change their colour from brown to white. The Norwegian bears are strong and fagacious; they are remarkable for not hurting children; but their other qualities are in common with the rest of their species in northern countries; nor can we much credit the extraordinary specimens of their sagacity, recorded by the natives. The Norwegian wolves, though fierce, are shy even of a cow or goat, unless impelled by hunger; the natives are dexterous in digging traps for them, in which they are taken or killed. The lynx, by some called the goupes, is smaller than a wolf, but as dangerous; they are of the cat kind, and have claws like tygers; they dig under ground, and often undermine sheep-folds, where they make dreadful havoc. The skin of the lynx is beautiful and valuable, as is that of the black fox. White and red foxes are likewise found in Norway, and partake of the nature of that wily animal in other countries; they have a particular way of drawing crabs ashore, by dipping their tails in the water, which the crab lays hold of. The glutton, otherwise called the erven, or vielfras, resembles a turnspit dog; with a long body, thick legs, sharp claws and teeth; his fur, which is variegated, is so precious, that he is shot with blunt arrows, to preserve the skin unhurt; he is bold, and so ravenous, that it is said he will devour a carcase larger than himself, and unburthens his stomach by squeezing himself between two close-standing trees: when taken, he has been even known to eat stone and mortar. The ermine is a little creature, remarkable for its thyness and cleanliness; and its fur forms a principal part even of royal magnificence. There is little difference between the martin and a large brown forest cat, only its head and snout are sharper; it is very fierce, and its bite dangerous. We shall mention the beavers in treating of North America.

No country produces a greater variety of birds than Norway. The alks build upon rocks; their numbers often darken the air, and the noise of their wings resembles a storm; their size is that of a large duck, and their flesh is much esteemed. Many kinds of thrushes reside in Norway; with various kinds of pigeons, and several sorts of beautiful wild ducks. The Norwegian cock-of-the-wood is of a black or dark grey colour; his eye resembles that of a pheasant; and he is said to be the largest of all eatable birds. Norway produces two kinds of eagles, the land and the sea; the former is so strong, that it has been known to carry off a child of two years old: the sea, or fish eagle, is larger than the other; he subsists on aquatic food; and sometimes darts on large fishes with such force, that, being unable to free his talons from their bodies, he is dragged into the water and drowned.

Nature seems to have adapted these aerial inhabitants for the coast of Norway; and industry has produced a species of mankind peculiarly fitted for making them serviceable to the human race: these are the bird-men, or climbers, who are amazingly dexterous in mounting the steepest rocks, and bringing away the birds and their eggs: the latter are nutritive food, and are sometimes parboiled in vinegar; the flesh is eaten by the peasants, who generally relish it; while the feathers and down form a profitable commodity. Even the dogs of the farmers, in the northern districts, are trained up to be assistants to these birdmen in seizing their prey.

The Scandinavian lakes and seas are astonishingly fruitful in most kinds of fishes that are found on the sea-coasts of Europe. Stock-fish innumerable, which are dried upon the rocks without salting. The haemoren is a species of shark, ten fathoms in length, and its liver yields three casks of train oil. The tuella-flynder is an excellently large turbot, which has been known to cover a man who had fallen over-board, to keep him from rising. The season for herring-fishing is an-  
nounced

nounced to fishermen by the spouting of water from the whales (of which seven different species are mentioned) in following the herring shoals. The large whale resembles a cod, with small eyes, a dark marbled skin, and white belly: they spout out the water, which they take in by inspiration, through two holes or openings in the head. They copulate land animals, standing upright in the sea. A young whale, when first produced, is about nine or ten feet long; and the female sometimes brings forth two at a birth. The whale devours such an incredible number of small fish, that his belly is often ready to burst; in which case he makes a most tremendous noise from pain. The smaller fish have their revenge; some of them fasten on his back, and incessantly beat him; others, with sharp horns, or rather bones, on their beak, swim under his belly, and sometimes rip it up; some are provided with long sharp teeth, and tear his flesh. Even the aquatic birds of prey declare war against him when he comes near the surface of the water; and he has been known to be so tortured, that he has beat himself to death on the rocks. The coast of Norway may be said to be the native country of herrings. Innumerable are the shoals that come from under the ice at the north pole, and about the latitude of Iceland divide themselves into three bodies; one of these supply the Western Isles and coasts of Scotland, another directs its course round the eastern part of Great Britain down the Channel, and the third enters the Baltic through the Sound. They form great part of the food of the common people; the cod, ling, kabeliau, and torlk-fishes follow them, and feed upon their spawn; and are taken in prodigious numbers in 50 or 60 fathoms water: these, especially their roes, and the oil extracted from their livers, are exported and sold to great advantage; and above 150,000 people are maintained by the herring and other fishing on the coast of Norway. The sea-devil is about six feet in length, and is so called from its monstrous appearance and voracity. The sea scorpion is likewise of a hideous form, its head being larger than its whole body, which is about four feet in length; and its bite is said to be poisonous.

The most seemingly fabulous account of the ancients, concerning sea-monsters, are rendered credible by the productions of the Norwegian seas; and the sea-snake, or serpent of the ocean, is no longer counted a chimera. In 1756, one of them was shot by a master of a ship; its head resembled that of a horse; the mouth was large and black, as were the eyes, a white mane hanging from its neck: it floated on the surface of the water, and held its head at least two feet out of the sea: between the head and neck were seven or eight folds, which were very thick; and the length of this snake was more than a hundred yards, some say fathoms. They have a remarkable aversion to the smell of castor; for which reason, ship, boat, and bark-masters provide themselves with quantities of that drug to prevent being overfet, the serpent's olfactory nerves being exquisitely sensible. The peculiarities related of this animal are attested upon oath. Egede (a very reputable author) says, that on the 6th day of July, 1734, a large and frightful sea-monster raised itself so high out of the water, that its head reached above the main-top-mast of the ship; that it had a long sharp snout, broad paws, and spouted water like a whale; that the body seemed to be covered with scales: the skin was uneven and wrinkled, and the lower part was formed like a snake. The body of this monster is said to be as thick as a hoghead; the skin is variegated like a tortoise-shell; and his excrement, which floats upon the surface of the water, is corrosive.

The existence of the kraken, or korven, is strongly asserted. Its bulk is said to be a mile and a half in circumference; and when part of it appears above the water, resembles a number of small islands and sand-banks, on which fishes sport, and sea-weeds grow: upon a farther emerging, a number of pellucid antennae, each about the height, form, and size of a moderate mast, appear; and by their  
action

action and reaction he gathers his food, consisting of small fishes. When he sinks, which he does gradually, a dangerous swell of the sea succeeds, and a kind of whirlpool is formed in the water. In 1680, a young kraken perished among the rocks and cliffs of the parish of Alstahong; and his death occasioned such a stench, that the channel was impassible. It is thought that this fish accounts for the phenomena of floating islands, and other transitory appearances in the sea, that had formerly been held fabulous.

The mer-men and mer-women hold their residence in the Norwegian seas. The mer-man is about eight spans long; and, as described, bears nearly as much resemblance as an ape does, to the human species; a high forehead, little eyes, a flat nose, and large mouth, without chin or ears, characterise its head; its arms are short, but without joints or elbows, and they terminate in members resembling a human hand, but of the paw kind, and the fingers connected by a membrane; the parts of generation indicate their sexes; though their under parts, which remain in the water, terminate like those of fishes. The females have breasts, at which they suckle their young ones.

**CURIOUSITIES.]** Those of Norway are only natural. On the coast, latitude 67, is that dreadful vortex, or whirlpool, called by navigators the navel of the sea, and by some *Malestrom*, or *Moskoesstrom*. The island *Moskoe*, from whence this stream derives its name, lies between the mountain *Hedleggen* in *Lofoden*, and the island *Ver*, which are about one league distant; and between the island and coast on one side, the stream makes its way. Between *Moskoe* and *Lofoden*, it is near 400 fathoms deep; but between *Moskoe* and *Ver* it is so shallow as not to afford passage for a small ship. When it is flood, the stream runs up the country with a boisterous rapidity; and when it is ebb, returns to the sea with a violence and noise unequalled by the loudest cataracts. It is heard at the distance of many leagues, and forms a whirlpool of great depth and extent; so violent that if a ship, comes near, it is immediately drawn irresistibly into the whirl, and there disappears, being carried down to the bottom in a moment, where it is dashed to pieces against the rocks; and just at the turn of ebb and flood, when the water becomes still for about a quarter of an hour, it rises again in scattered fragments. When the torrent is agitated by a storm, it has reached vessels at the distance of more than a Norway mile, where the crews have thought themselves in perfect security. Perhaps it is hardly in the power of fancy to conceive a situation of more horror than that of being violently driven forward to an overwhelming vortex, of which the noise and turbulence still increasing as it is approached are an earnest of quick and inevitable destruction. Even whales are frequently carried away; and the moment they feel the force of the water, are said to struggle against it, howling and bellowing in a frightful manner. The like happens frequently to bears, who attempt to swim to the island to prey upon the sheep.

It was the opinion of *Kircher*, that the *Malestrom* is a sea vortex, which attracts the flood under the shore of Norway, and discharges it again in the gulph of *Bothnia*: but this opinion is now known to be erroneous, by the return of the shattered fragments of whatever happens to be sucked down by it. The large stems of firs and pines rise again so shivered and splintered, that the pieces look as if covered with bristles. The whole phenomena are the effects of the violence of the daily ebb and flow, occasioned by the contraction of the stream in its course between the rocks.

PEOPLE, LANGUAGE, RELIGION, } The Norwegians exhibit an intermediate  
AND CUSTOMS OF NORWAY. } character, between the simplicity of the  
Greenlanders and Icelanders, and the more polished manners of the Danes. Their  
religion is Lutheran; and they have bishops, as those of Denmark, without temporal

poral jurisdiction. The viceroy, like his master, is absolute; but commonly governs without oppression.

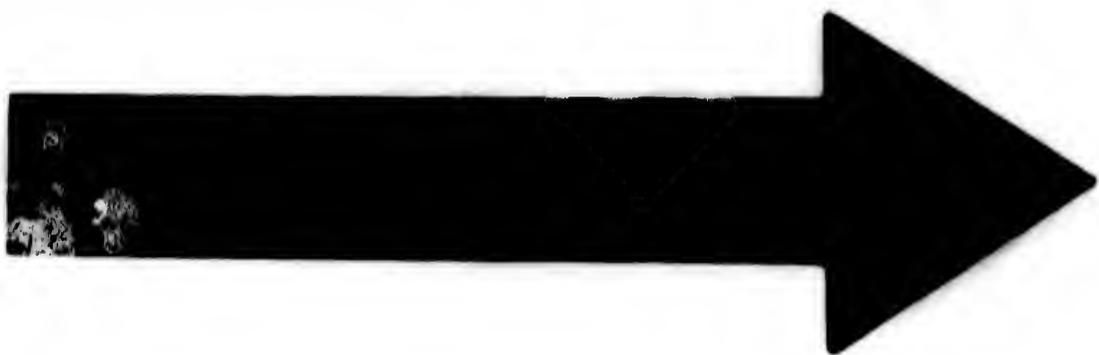

The Norwegians in general are strong, robust, and brave. The women are handsome and courteous; and the Norwegian forms of life much resemble the primitive manners of our own Saxon ancestors. As in other rude countries there is in Norway little discrimination of trades, each family supplying for the most part all its own wants. The poorest class often mix with oat-meal the bark of fir, made into a kind of flour; and they are reduced to extraordinary shifts for supplying the place of bread, or farinaceous food. The middling Norwegians lead that kind of life which we may say is furnished with plenty; but they are neither fond of luxury, nor do they dread penury; and this middle state prolongs their lives surprisingly. Though their dress is in many respects accommodated to their climate, yet, by custom, instead of guarding against the inclemency of the weather, they outbrave it; for they expose themselves to cold without any cover over their breasts or necks. A Norwegian of a hundred years of age is not counted past his labour; and in 1733, four couples were married, and danced before his Danish majesty at Frederichshall, whose ages, when joined, exceeded 800 years old.

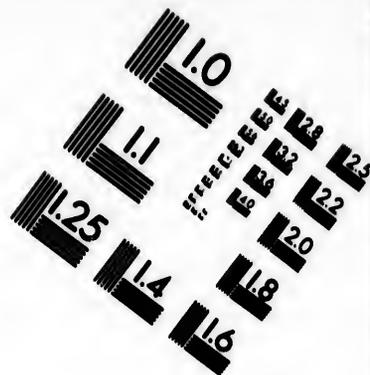

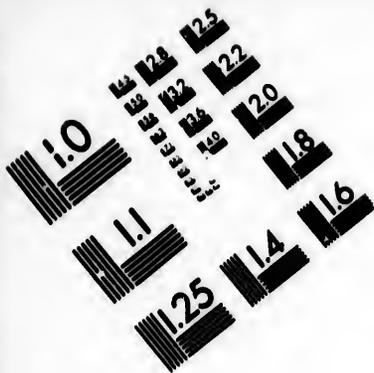

The funeral ceremonies of the Norwegians contain vestiges of their former paganism: they play on the violin at the head of the coffin, and while the corps is carried to the church, which is often done in a boat. In some places the mourners ask the dead person why he died: whether his wife and neighbours were kind to him, and other such questions; frequently kneeling down and asking forgiveness, if ever they had offended the deceased.

COMMERCE.] We have little to add to this head, different from what will be observed in our account of Denmark. The duties on their exports, most of which have been already recounted, amount to about 100,000 rixdollars a year.

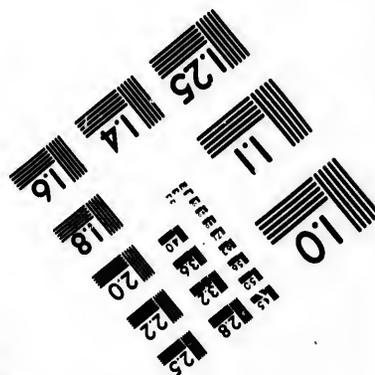

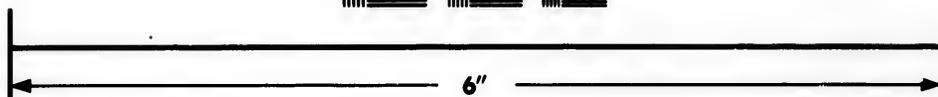

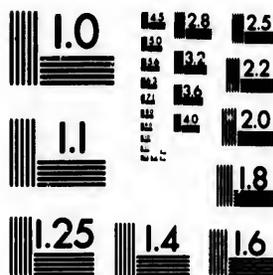

STRENGTH AND REVENUE.] By the best calculations, Norway can furnish out 14,000 excellent seamen, and above 30,000 brave soldiers, for the use of their king. The royal annual revenue from Norway amounts to near 200,000*l.* and till his present majesty's accession, the army, instead of being expensive, added considerably to his income, by the subsidies it drew from foreign princes.

HISTORY.] We must refer to Denmark for this head. The ancient Norwegians certainly were a powerful people, and the hardiest seamen in the world. If we are to believe their histories, they were no strangers to America long before it was discovered by Columbus. Many Norwegian customs are yet discernible in Ireland and the north of Scotland, where the Normans made frequent descents, and some settlements, which are generally confounded with those of the Danes. From their being the most turbulent, they are become now the most loyal subjects in Europe; which may be partly accounted for, from the barbarity and tyranny of their ancient kings. Since the union of Calmar, which united Norway to Denmark, their history, as well as interests, are the same with those of Denmark.

DENMARK \*PROPER, or JUTLAND, exclusive of the ISLANDS  
in the BALTIC.

EXTENT AND SITUATION.

Miles.		Degrees.
Length 240† }	between	} 54 and 53 North latitude. 8 and 11 East longitude.
Breadth 114 }		

Containing 15,744 SQUARE MILES, with 139 Inhabitants to each.

BOUNDARIES AND DIVISIONS. } IT is divided on the north from Norway by the Scaggerac sea, and from Sweden on the east by the Sound; on the south by Germany and the Baltic; and the German sea divides it from Great Britain on the west.

Denmark proper is divided into two parts: the peninsula of Jutland, anciently called *Cimbria Chersonesus*, and the islands at the entrance of the Baltic, mentioned in the table. It is remarkable, that though all these together constitute the kingdom of Denmark, yet not any one of them is separately called by that name. Copenhagen, the metropolis, is in the island of Zealand.

AIR, CLIMATE, SOIL, STATE OF AGRICULTURE, &c.] One of the largest and most fertile of all the provinces of this kingdom is Jutland, which produces abundance of all sorts of grain and pasturage, serving as the granary of Norway. A great number of small cattle are bred in this province, and afterwards transported into Holstein, to be fed for the use of Hamburg, Lubec, and Amsterdam. Jutland is every where interspersed with hills, and on the east side has fine woods of oak, fir, beech, birch, and other trees; but the west side being less woody, the inhabitants are obliged to use turf and heath for fuel. Zealand is for the most part a sandy soil, but rather fertile in grain and pasturage, and agreeably variegated with woods and lakes. The climate is more temperate here on account of the vapours from the surrounding sea, than it is in many more southerly parts of Europe. Spring and autumn are seasons scarcely known in Denmark, on account of the sudden transitions from cold to heat, and from heat to cold, which distinguish the climate of this kingdom. In all the northern provinces of Denmark, the winters are very severe, so that the inhabitants often pass arms of the sea in sledges upon the ice; and during the winter all their harbours are frozen up.

The greatest part of the lands in Denmark and Holstein are fiefs, and the ancient nobility, by grants which they extorted at different times from the crown, gained such a power over the farmers, and those who resided upon their estates, that at length they reduced them to a state of extreme slavery; so that they were bought and sold with the lands, and were esteemed the property of their lords. Many of the noble landholders in Sleswick and Holstein have the power of life and death. The situation of the farmers has been most essentially improved by some late edicts, of which we shall take particular notice. Till very lately, if a farmer in Denmark, or in Holstein, happened to be an industrious man, and was situated upon a poor farm, which by great diligence he laboured to cultivate advantageously, as soon as he performed the toilsome task, and expected to reap the profits

\* See Mallet's Denmark, p. 1 to 18. vol. v.

† Meaning where longest and broadest, a method which is the practice of other writers on the subject. Great allowances must therefore be

made in most countries, as the reader will perceive by looking on the maps. Jutland, for instance, is 114 miles where broadest, though in sundry other parts it is not so.

of what he had sown, his lord, under pretence of taking it into his own hand, removed him from that farm to another of his poor farms, and expected that he should perform the same laborious task there, without any other emolument than what he shall think proper to give him. This had been so long the practice in this country, that it necessarily threw the greatest damp upon the efforts of industry, and prevented those improvements in agriculture which would otherwise have been introduced: the consequence of which was, that nine parts in ten of the inhabitants were in a state of great poverty. But the farmers now having some security for their property, the lands of Denmark will be cultivated to much greater advantage than they have been lately, and a much greater number of people supported by the produce of agriculture.

**ANIMALS.]** Denmark produces an excellent breed of horses, both for the saddle and carriage, about 5000 are sold annually out of the country, and of their horned cattle 30,000. They have also sheep, hogs, and game; and the sea-coasts are generally well supplied with fish.

**POPULATION, MANNERS, AND CUSTOMS.]** By a numeration made, in 1759, of his Danish majesty's subjects in his dominions of Denmark, Norway, Holstein, the islands in the Baltic, and the counties of Oldenburgh and Delmenhorst, in Westphalia, they were said to amount to 2,444,000 souls, exclusive of the Icelanders and Greenlanders. The most accurate account of the population, is that made under the direction of the famous Struensee, by which

Jutland numbered	358,136		Iceland	46,201
Denmark Iceland	283,466		Duchy of Sleswick	243,605
Funen	143,988		Duchy of Holstein	134,665
Norway	723,141		Oldenburgh	62,854
Islands of Ferro	4,754		Delmenhorst	16,217
			<hr/>	
			Sum Total,	2,501,027

Several of the smaller islands, included in the district of Fionia are omitted in this computation, which may contain a few thousands.

However disproportioned this number may seem to the extent of his Danish majesty's dominions; yet, every thing considered, it is greater than could have been expected from the uncultivated state of his possessions. But the trade of Denmark hath been so shackled, and her merchants so terrified by the despotism of her government, that this kingdom is at present one of the most indigent states in Europe. The empress of Russia, in 1773, ceded to the king of Denmark that portion of Holstein which descended to the line of Holstein Gottorp, in exchange for Oldenburgh and Delmenhorst, which she gave to the prince of Lubeck. This exchange is favourable to Denmark, both as to trade and population.

The ancient inhabitants of Denmark possessed a degree of courage which approached even to ferocity; but by a continued series of tyranny and oppression, their national character is much changed, and from a brave, enterprising, and warlike people, they are become indolent and timid. They value themselves extremely upon those titles and privileges which they derive from the crown, and are exceedingly fond of pomp and shew. They endeavour to imitate the French in their manners, dress, and even in their gallantry; though they are naturally the very contrast of that nation. The Danes, like other northern nations, are given to intemperance in drinking, and convivial entertainments; but their nobility, who now begin to visit the other courts of Europe, are refining from their provincial habits and vices.

**RELIGION.]** The religion is Lutheran; and the kingdom is divided into six dioceses; one in Zealand, one in Funen, and four in Jutland; besides four in Norway.

way; and two in Iceland. These dioceses are governed by bishops, whose duty it is to superintend the other clergy; nor have they any other mark of pre-eminence than a distinction of their ecclesiastical dress, for they have neither cathedral nor ecclesiastical courts, nor the smallest concern with civil affairs. They are paid by the state, the church lands having been appropriated to the government at the Reformation.

[LANGUAGE AND LEARNING.] The language of Denmark is a dialect of the Teutonic; but High Dutch and French are spoken at court; and the nobility have lately made great advances in the English, which is now publicly taught at Copenhagen. A company of English comedians occasionally visit that capital, where they find tolerable encouragement. Denmark has two universities, that of Copenhagen, and that of Kiel; two academical colleges at Soroe and Odensee, and thirty-two other great schools in the principal towns. There is at Copenhagen a royal society of sciences, an historical society for the study of northern history, another of Icelandic history and literature, an academy for painting and architecture, a college of physicians and surgeons, and another society of sciences at Drontheim\*.

The university of Copenhagen has funds for the gratuitous support of 328 students; these funds are said to amount to 300,000 rix-dollars; but the Danes in general make no great figure in literature; though astronomy and medicine are highly indebted to their Tycho Brahe, Borchius, and the Bartholines; the science of botany owes much to the celebrated Christian Oeder, to whom, through the liberality of his monarch, we are indebted for the *Flora Danica*. In speaking of the publications on natural history, it would be unpardonable to omit mentioning the most splendid work of the kind ever produced in any nation; it is a collection of rare shells, in two volumes folio, engraved and coloured by Francis Michael Regenfus, at the royal expence. "The first volume, which is the only one I have seen, contains a short account of the collections of natural history, and particularly of shells in Denmark; a preliminary discourse on conchology, with a detail of the several authors who have written on the subject, and their different systems, and 78 complete and delicately coloured figures, in 12 plates, accompanied with scientific descriptions in the Latin, French, and German languages†." The round tower and Christian's haven display the mechanical genius of a Longomontanus: the Danes begin to make some promising attempts in history, poetry, and the drama; and several of their learned men have lately employed their researches on the history and antiquities of the North.

[CITIES AND CHIEF BUILDINGS.] Copenhagen, which is now situated on the fine island of Zealand, was originally a settlement of sailors, and first founded by some wandering fishermen in the twelfth century, but it is now the metropolis, and makes a magnificent appearance at a distance. It is very strong, and defended by four castles or forts. It contains ten parish churches, besides nine others, belonging to the Calvinists and other persuasions, and some hospitals. Copenhagen is adorned by some public and private palaces, as they are called. Its streets are 186 in number; and its inhabitants amount to 100,000. The houses in the principal streets are built of brick, and those in the lanes chiefly of timber. But the chief glory of Copenhagen is its harbour, formed by a large canal flowing through the city, which admits of only one ship to enter at a time, but is capable of containing 500. Several of the streets have canals, and quays for ships to lie close to the houses; and its naval arsenal is said to exceed that of Venice. The road for the shipping begins about two miles from the town, and is defended by 90 pieces of cannon, as well as the difficulty of the navigation. The police of Copenhagen

\* Zimmerman, p. 78.

† Cox's Travels into Poland, Russia, Sweden, and Denmark, 4to. vol. 2. p. 566, 568.

is extremely regular, and people may walk through the city at midnight with great safety. Indeed, it is usually as quiet here at eleven o'clock at night as in a country village.

It is with much concern we hear, that on the 16th of February, 1794, a dreadful fire broke out in the royal palace of Christianburg, which, in the space of seven or eight hours, reduced the whole to a heap of ashes. The royal family have happily escaped without accident; but the greater part of their valuable effects have been a prey to the flames. This palace, one of the most commodious, and most sumptuously furnished in Europe, was built in the reign of Christian VI. and is said to have cost, in building only, considerably above a million sterling; and probably the whole loss may amount to two millions. It is some consolation, in so great a disaster, that the royal library, consisting of between two and three hundred thousand volumes, which stood detached from the principal pile, had been fortunately saved. The finest palace belonging to his Danish majesty lies about 20 English miles from Copenhagen, and is called Fredericsholm. It is a very large building, moated round with a triple ditch, and calculated, like most of the ancient residences of princes, for defence against an enemy. It was built by Christian the IVth. and, according to the architecture of the times, blends the Greek and Gothic styles. In the front of the grand quadrangle appear Tuscan and Doric pillars, and on the summit of the building are spires and turrets. Some of the rooms are very splendid, though furnished in the antique taste. The knight's hall is of great length. The tapestry represents the wars of Denmark, and the ceiling is a most minute and laboured performance in sculpture. The chimney-piece was once entirely covered with plates of silver, richly ornamented; but the Swedes, who have often landed here, and even besieged the capital, tore them all away, and rifled the palace, notwithstanding its triple moat and formidable appearance. About two miles from Elsinour is another small royal palace, flat roofed, with 12 windows in front, said to be built on the place formerly occupied by the palace of Humlet's father. In an adjoining garden is shown the very spot where, according to that tradition, that prince was poisoned.

Jagersburg is a park which contains a royal country seat, called the Hermitage, remarkable for the disposition of its apartments, and the quaintness of its furniture; particularly a machine which conveys the dishes to and from the king's table in the second story. The chief ecclesiastical building in Denmark is the cathedral of Roskilde, where the kings and queens of Denmark were formerly buried, and their monuments still remain. Joining to this cathedral, by a covered passage, is a royal palace, built in 1733.

Elsinour is well built, contains 5000 inhabitants, and, with respect to commerce, is only exceeded by Copenhagen. It is strongly fortified on the land-side; and towards the sea is defended by a strong fort, containing several batteries of long cannon. Here all vessels pay a toll, and in passing lower their top-sails.

COMMERCE.] Denmark is extremely well situated for commerce; her harbours are well calculated for the reception of ships of all burthens, and her mariners are very expert in the navigation of the different parts of the ocean. The dominions of his Danish majesty also supply a great variety of timber, and other materials for ship-building; and some of his provinces afford many natural productions for exportation. Among these, besides fir, and other timber, are black cattle, horses, butter, stock-fish, tallow, hides, train-oil, tar, pitch, and iron, which being the natural product of the Danish dominions, are consequently ranked under the head of exports. To these we may add furs; but exportation of oats are now forbidden. The imports are salt, wine, brandy, and silk, from France, Portugal, and Italy. Of late the Danes have had a great intercourse with England, from whence they im-

port broad-cloths, cloaks, cabinet, lock-work, and all other manufactures carried on in the great trading towns of England.

Nothing shews the commercial spirit of the Danes in a more favourable light than their establishments in the East and West Indies. In 1612 Christian IV. of Denmark established an East India Company at Copenhagen; and soon after four ships sailed from thence to the East Indies. The hint of this trade was given to his Danish majesty by James I. of England, who married a princess of Denmark; and in 1617 the Danes built and fortified a castle and town at Tranquebar, on the coast of Coromandel. The security which many of the Indians found under the cannon of this fort invited numbers of them to settle here; so that the Danish East-India Company were soon rich enough to pay to their king a yearly tribute of 10,000 rix-dollars. The company, however, willing to become rich all of a sudden, in 1620 endeavoured to possess themselves of the spice trade at Ceylon; but were defeated by the Portuguese. The truth is, they soon embroiled themselves with the native Indians on all hands; and had it not been for the generous assistance given them by Mr. Pitt, an English East-India governor, the settlements at Tranquebar must have been taken by the rajah of Tanjour. Upon the close of the wars in Europe, after the death of Charles XII. of Sweden, the Danish East-India Company found themselves so much in debt, that they published proposals for a new subscription for enlarging their ancient capital stock, and for sitting out ships to Tranquebar, Bengal, and China. Two years after, his Danish majesty granted a new charter to his East-India company, with vast privileges; and for some time its commerce was carried on with great vigour. I shall just mention, that the Danes likewise possess the islands of St. Thomas and St. Croix, and the small island of St. John, in the West Indies, which are free ports, and celebrated for smuggling; also the fort of Christianburg, on the coast of Guinea; and carry on a considerable commerce with the Mediterranean.

CURIOSITIES, NATURAL AND ARTIFICIAL.] Denmark Proper affords fewer of these than the other parts of his Danish majesty's dominions, if we except the contents of the royal Museum at Copenhagen, which consists of a numerous collection of both. It contains several good paintings and a fine collection of Roman and other coins. Besides artificial skeletons, ivory carvings, models, clock-work, and a beautiful cabinet of ivory and ebony, made by a Danish artist who was blind, here are to be seen two famous antique drinking vessels; the one of gold, the other of silver, both in the form of a hunting horn: that of gold seems to be of Pagan manufacture; and from the raised hieroglyphical figures on its outside, probably was made use of in religious ceremonies: it is about two feet nine inches long, weighs 102 ounces, contains two English pints and a half, and was found in the diocese of Ripen, in the year 1639. The other, of silver, weighs about four pounds, and is termed *Cornu Oldenburgicum*; which, they say, was presented to Otho I. duke of Oldenburg, by a ghost. Some, however, are of opinion, that this vessel was made by order of Christian I. king of Denmark, the first of the Oldenburg race, who reigned in 1448. Several vessels of different metals, and the same form, have been found in the North of England, and are probably of Danish original. This museum is likewise furnished with a prodigious number of astronomical, optical, and mathematical instruments; some Indian curiosities, and a set of medals, ancient and modern. Many curious astronomical instruments are likewise placed in the round tower at Copenhagen, which is so contrived that a coach may drive to its top. The village of Anglen, lying between Elensburg and Sleswick, is also esteemed a curiosity, as giving its name to the Angles, or Anglo-Saxon inhabitants of Great Britain.

The greatest rarities in his Danish majesty's dominions are omitted, however, by geographers; I mean those ancient inscriptions upon rocks, generally thought to be

he the old and original manner of writing, before the use of paper of any kind, or waxen tables, were known. These characters are Runic, and so imperfectly understood by the learned themselves, that their meaning is very uncertain; but they are imagined to be historical. Stephanus, in his notes upon Saxo-Grammaticus, has exhibited specimens of several of those inscriptions.

[CIVIL CONSTITUTION, GOVERNMENT, AND LAWS.] The ancient constitution of Denmark was originally upon the same plan with other Gothic governments. The king came to the throne by election; and, in conjunction with the senate where he presided, was invested with the executive power. He likewise commanded the army, and decided disputes among his subjects. The legislative power, together with the right of election of the king, was vested in the states; who were composed, first, of the order of nobility, and secondly, the order of the citizens and farmers: and after the Christian religion had gained ground in the North, the clergy were also admitted, not only to be an order of the states, but to have seats likewise in the senate. These orders had their respective rights and privileges, the crown had also its prerogatives, and a certain fixed revenue arising out of lands, which were appropriated to its support. This constitution had many evident advantages: but, unfortunately, its balance was never properly adjusted; so that the nobles very soon assumed a dictatorial power, and greatly oppressed the people, as the national assemblies were not regularly held to redress their grievances. And when the Roman Catholic clergy came to have a share in the civil government, they far surpassed the nobility in pride and ambition. The representatives of the people had neither power, credit, nor talents, to counteract the efforts of the other two orders, who forced the crown to give up its prerogatives, and to tyrannize over the people. Christian the Second, by endeavouring, in an imprudent manner, to stem the torrent of their oppression, lost his crown and his liberty; but Christian the Third, uniting with the nobles and the senate, destroyed the power of the clergy; and in the reign of Frederick the Third, the people, instead of exerting themselves to maintain their common liberties, were so insatuated as to make the king despotic, in hopes of rendering themselves less subject to the tyranny of the nobles. A series of unsuccessful wars had brought the nation in general into so miserable a condition, that the public had not money for paying off the army. The dispute came to a short question, which was, that the nobles should submit to taxes, from which they pleaded an exemption. The inferior people, upon this, threw their eyes towards the king for relief. In a meeting of the states, it was proposed that the nobles should bear their share in the common burden. Upon this, Otta Craeg reminded the people that the commons were no more *slaves* to the lords. This was the watch-word, which had been concerted between the leaders of the commons, the clergy, and even the court itself. Nanson, speaker of the commons, exclaimed at the term *Slavery*; the assembly broke up in a ferment; and the commons, with the clergy, withdrew to a house of their own, where they resolved to make the king a solemn tender of their liberties and services, and formally to establish in his family the hereditary succession to their crown. This resolution was executed the next day. The king accepted of their tender, promising them protection. The gates of Copenhagen were shut; and the nobility, thus surpris'd, were compelled to reluctant submission.

On the 18th of October, 1660, the three orders of nobility, clergy, and people, signed each a separate act; by which they consented that the crown should be hereditary in the royal family, as well in the female as in the male line, and by which they invested the king with absolute power, and gave him the right to regulate the succession and the regency, in case of a minority. This renunciation of their rights, subscribed by the first nobility, is still preserved as a precious relic among the archives of the royal family.

After

After this extraordinary revolution in the government, the king of Denmark divested the nobility of many of their privileges; but he took no method to relieve those poor people who had been the instruments of investing him with the sovereign power, but left them in the same state of slavery in which they were before, and in which they have remained to the present age. The supreme court of judicature for the kingdoms of Denmark and Norway is holden in the royal palace at Copenhagen, of which the king is the nominal president. What they call the German provinces have likewise their supreme tribunal; which, for the duchy of Holstein, is holden at Gluckstadt; and for the duchy of Sleswick, in the town of that name.

As to matters of importance, the king for the most part decides in his council, the members of which are named and displaced at his will. It is in this council, that the laws are enacted; and that any great changes or establishments are proposed, approved, or rejected. It is here likewise, or in the cabinet, that the king grants privileges, and decides upon other matters of state.

In this kingdom, as in many others, the king is supposed to be present to administer justice in his supreme court; and, therefore, the kings of Denmark not only preside nominally in the sovereign court of justice, but they have a throne erected in it, towards which the lawyers always address their discourses in pleading, and the judges the same in giving their opinion. Every year the king is present at the opening of this court, and often gives the judges such instructions as he thinks proper. The decision of these judges is final in all civil actions; but no criminal sentence of a capital nature can be carried into execution till it is signed by the king.

There are many excellent regulations for the administration of justice in Denmark; but it is so far from being distributed in an equal and impartial manner, that a poor man can scarcely ever have justice against the nobility, or one who is favoured by the court. If the laws are so clearly in favour of the former, that the judges are ashamed to decide against them, the latter, through the favour of the minister, obtains an order from the king to stop all the law-proceedings, or a dispensation from observing particular laws; and there the matter ends. The code of laws at present established in Denmark was published by Christian V. founded upon the code of Valdenar, and the other codes afterwards published, and is nearly the same with that published in Norway. These laws are very just and clear; and, if they were impartially carried into execution, would be productive of many beneficial consequences to the people. But as the king can alter the laws, and support his ministers and favourites in any acts of violence and injustice, the people have abundant reason to regret the tameness and servility with which their liberties were in 1660, surrendered into the hands of their monarchs. From that period, the peasants, till 1787, had been in a situation little better than the brute creation; they scarce could be said to possess any loco-motive power, inasmuch that they had no liberty to leave one estate, and to settle on another, without the purchased permission from their masters; and if they chanced to move without their permission, they were claimed as strayed cattle. Such was the state of those wretched beings, who, at best, only might be said to vegetate. These chains of feudal slavery were then broken, through the interest of his royal highness, the prince, and heir apparent to the crown; and the prisoners, for such I think they might be called, were declared free. Notwithstanding the remonstrances which were made against this by the landed gentry were very numerous, yet, after the minute examination of the whole, an edict was issued, which restores the peasants to their long lost liberty, which once contributed so much to the glory of the state; and many heavy grievances, under which the peasantry laboured, were abolished.

**PUNISHMENTS.]** The common method of execution in Denmark is by beheading or hanging; in some cases, as an aggravation of the punishment, the hand is

chopped off before the other part of the sentence is executed. For the most atrocious crimes, such as the murder of a father or mother, husband or wife, and robbery upon the highway, the malefactor is broken upon the wheel. But capital punishments are not common in Denmark: and the other principal modes of punishments are branding in the face, whipping, condemnation to the rasp-house, to houses of correction, and to public labour and imprisonment; all which are varied in duration and rigour, according to the nature of the crime.

**POLITICAL AND NATURAL.** After the accession of his present majesty, his INTERESTS OF DENMARK. } court seemed for some time to have altered its maxims. His father, it is true, observed a most respectable neutrality during the late war; but never could get free from French influence, notwithstanding his connections with Great Britain. The subsidies he received maintained his army; but his family-disputes with Russia concerning Holstein, and the ascendancy which the French had obtained over the Swedes, not to mention other circumstances, did not suffer him to act that decisive part in the affairs of Europe, to which he was invited by his situation; especially about the time when the treaty of Closter-seven was concluded. His present Danish majesty's plan seemed, soon after his accession; to be that of forming his dominions into a state of independency, by availing himself of their natural advantages. But sundry events which have since happened, and the general feebleness of his administration, have prevented any further expectations being formed, that the real welfare of Denmark will be promoted, at least in any great degree, during the present reign.

With regard to the external interests of Denmark, they are certainly best secured by cultivating a friendship with the maritime powers. The exports of Denmark enable her to carry on a very profitable trade with France, Spain, and the Mediterranean; and she has been particularly courted by the Mahometan states, on account of her naval stores.

The present imperial family of Russia has many claims upon Denmark, on account of Holstein; but there is at present small appearance of her being engaged in a war on that account. Were the Swedes to regain their military character, and to be again commanded by a Charles XII. they probably would endeavour to repossess themselves, by arms, of the fine provinces torn from them by Denmark. But the greatest danger that can arise to Denmark from a foreign power is, when the Baltic (as has happened more than once) is so frozen over as to bear not only men but heavy artillery; in which case the Swedes have been known to march over great armies, and to threaten the conquest of the kingdom.

**REVENUES.** His Danish majesty's revenues have three sources: the impositions he lays upon his own subjects; the duties paid by foreigners; and his own demesne lands, including confiscations. Wine, salt, tobacco, and provisions of all kinds, are taxed. Marriages, paper, corporations, land, houses, and poll-money, also raise a considerable sum. The expences of fortifications are defrayed by the people: and when the king's daughter is married, they pay about 100,000 rix-dollars towards her portion. The internal taxes of Denmark are uncertain, because they may be abated or raised at the king's will. Customs, and tolls upon exports and imports, are more certain. The tolls paid by strangers arise chiefly from foreign ships that pass through the Sound into the Baltic, through the narrow strait of three miles between Schonen and the island of Zealand. These tolls are in proportion to the size of the ship and the value of the cargo, exhibited in bills of lading. This tax, which forms a capital part of his Danish majesty's revenue, has more than once thrown the northern parts of Europe into a flame. It was often disputed by the English and Dutch, being nothing more originally than a voluntary contribution of the merchants towards the expence of light-houses on the coast; and the Swedes who command the opposite side of the pass, for some time refused to pay it; but in the

the treaty of 1720, between Sweden and Denmark, under the guarantee of his Britannic majesty George I. the Swedes agreed to pay the same rates as are paid by the subjects of Great Britain and the Netherlands. The first treaty relative to it was by the Emperor Charles V. on behalf of his subjects in the Low Countries. The toll is paid at Elleneur, a town situated on the Sound, at the entrance of the Baltic sea, and about 20 miles distant from Copenhagen. The whole revenue of Denmark, including what is received at Elleneur, amounts at present to above 5,000,000 of rix dollars, or 1,002,000 sterling yearly.

The following is a list of the king's revenues, exclusive of his private estates:

	Rix-dollars at 4s. each.
Tribute of hard corn, or land-tax, - - -	1,000,000
Small taxes, including poll-tax, pound rents, excise, &c. - -	950,000
Custom-house duties, - - - - -	154,000
Duties of the Sound, - - - - -	200,000
Duties of Jutland, from salt-pits, - - - - -	27,000
Tythes and poll-tax of Norway, - - - - -	770,000
Tolls of Bergen, Drontheim, Christiansand, and Christiansa, - -	160,000
Other tolls, - - - - -	552,000
Revenues from mines, - - - - -	300,000
Revenue from Sleswick, Holstein, Oldenburgh, and Delmenhorst, -	690,000
Taxes on acorns, and masts from beech, - - - - -	20,000
Tolls on the Weter, - - - - -	75,000
Post-office, - - - - -	70,000
Farms of Iceland and Ferro, - - - - -	35,000
Farms of Bornholm, - - - - -	14,800
Oyster Fishery, - - - - -	22,000
Stamp Paper - - - - -	40,000
<b>Sum total</b>	<b>5,012,300</b>

In English money, 1,002,460

By a list of the revenue taken in 1730, it then only amounted to £. 454,700

ARMY AND NAVY.] The three last kings of Denmark, notwithstanding the degeneracy of their people in martial affairs, rendered themselves respectable, by the number and discipline of their troops. The present military force of Denmark consists of near 70,000 men, cavalry and infantry, the greatest part of which consists of a militia, who receive no pay, but are registered on the army list, and every Sunday exercised. The regular troops are about 20,000, and mostly foreigners, or officered by foreigners; for Frederic III. was too refined a politician to trust his security in the hands of those he had tricked out of their liberty. Though this army is extremely burdensome to the nation, yet it costs little to the crown: great part of the infantry lie in Norway, where they live upon the boors at free quarter; and in Denmark the peasantry are obliged to maintain the cavalry in victuals and lodging, and even to furnish them with money. The fleet of Denmark is composed of 36 ships of the line, and 18 frigates; but many of them being old, and wanting great repairs, they cannot fit out more than 25 ships upon the greatest emergency. This fleet is generally stationed at Copenhagen, where are the dock-yards, store-houses, and all the materials necessary for the use of the marine. They have 26,000 registered seamen, who cannot quit the kingdom without leave, nor serve on board a merchantman without permission from the admiralty: 4000 of these are kept in constant pay, and employed in the dock-yards; their pay, however, scarcely amounts to nine shillings a month, but then they

they have a sort of uniform, with some provisions and lodgings allowed for themselves and families.

**ORDERS OF KNIGHTHOOD IN DENMARK.]** These are two; that of the *Elephant*, and of *Daneburg*: the former was instituted by Christian I. and is deemed the most honourable; its badge is an elephant surmounted with a castle, set in diamonds, and suspended to a sky-coloured watered ribband; worn like the George in England; its members, besides the sovereign, are thirty, and the knights of it are addressed by the title of Excellency. The badges of the Daneburg order, said to have been instituted in the year 1219, and after it had been long obsolete, revived in 1671, by Christian V. consist of a white ribband with red edges, worn scarf-ways over the left shoulder; from which depends a small cross of diamonds, and an embroidered star on the breast of the coat, surrounded with the motto, *pacato & iustitia*. The badge of which is a cross pattée enamelled white, on the centre the letter C and S, crowned with a regal crown, and this motto, *Resistitur*. The number of the knights is great, and unlimited.

**HISTORY.]** We owe the chief history of Denmark to a very extraordinary phenomenon, the revival of the purity of the Latin language in Scandinavia, in the person of Saxo-Grammaticus, at a time (the 12th century) when it was lost in all other parts of the European continent. Saxo, like the other historians of his age, has adopted, and at the same time ennobled by his style, the absurdities of remote antiquity. We can, however, collect enough from him to conclude, that the ancient Danes, like the Gauls, the Scots, the Irish, and other northern nations, had their bards, who recounted the military achievements of their heroes; and that their first histories were written in verse. There can be no doubt that the Scandinavians or Cimbri, and the Teutones (the inhabitants of Denmark, Norway, and Sweden) were Scythians by their original; but how far the tracts of land, called either Scythia \* or Gaul, formerly reached, is uncertain.

Even the name of the first christian Danish king is uncertain; and those of the people whom they commanded were so blended, that it is impossible for the reader to conceive a precise idea of the old Scandinavian history. This, undoubtedly, was owing to the remains of their Scythian customs, particularly that of removing from one country to another; and of several nations or septs joining together in expeditions by sea or land; and the adventurers being denominated after their chief leaders.

Thus the terms Danes, Saxons, Jutes or Goths, Germans, and Normans, were promiscuously used long after the time of Charlemagne. Even the short revival of literature, under that prince, throws very little light upon the Danish history. All we know is, that the inhabitants of Scandinavia, in their maritime expeditions, went generally under the name of Saxons with foreigners; that they were bold adventurers, rude, fierce, and martial: that so far back as the year of Christ 500, they insulted all the sea-coasts of Europe; that they settled in Ireland, where they built stone houses; and that they became masters of England, and some part of Scotland; both which kingdoms still retain proofs of their barbarity. When we read the history of Denmark and that of England under the Danish princes who reigned over both, we find events recorded very differently in the two kingdoms.

\* By Scythia may be understood all those northern countries of Europe and Asia, now inhabited by the Danes, Norwegians, Swedes, Russians, and Tartars, whose inhabitants overturned and peopled the Roman empire, and continued, so late as the 13th century, to issue forth in large bodies, and

naval expeditions, ravaging the more southern and fertile kingdoms of Europe; hence by sir William Temple, and other historians, they are termed the *Northern Hive, the Mark of Nations, the Storchoufs of Europe.*

In the eleventh century, under Canute the Great, Denmark may be said to have been in its zenith of glory, as far as extent of dominion can give sanction to the expression. Few interesting events preceded the year 1385, when Margaret mounted that throne; and partly by her address, and partly by hereditary right, formed the union of Calmar, anno 1397, by which she was acknowledged sovereign of Sweden, Denmark, and Norway. She held her dignity with such firmness and courage, that she was styled the Semiramis of the North. Her successors being destitute of her great qualifications, the union of Calmar, by which the three kingdoms were in future to be under one sovereign, was dissolved, Norway continuing annexed to Denmark. In 1448, the crown of Denmark fell to Christian, count of Oldenburg, from whom the present royal family of Denmark is descended.

In 1513, Christian II. one of the worst tyrants that modern times have produced, mounted the throne of Denmark; and having married the sister of the emperor Charles V. gave a loose to his innate cruelty. Being driven out of Sweden, for the bloody massacres he committed there, the Danes rebelled against him likewise; and he fled, with his wife and children, into the Netherlands. Frederick duke of Holstein, being unanimously called to the throne, embraced the opinions of Luther; and about the year 1536, the protestant religion was established in Denmark by that wise and polite prince Christian III.

Christian IV. of Denmark, in 1629, was chosen for the head of the protestant league, formed against the house of Austria; but, though brave in his own person, was in danger of losing his dominions; when he was succeeded in that command by Gustavus Adolphus, king of Sweden. The Dutch having obliged Christian, who died in 1648, to lower the duties of the Sound, his son, Frederic III. consented to accept of an annuity of 150,000 florins for the whole. The Dutch, after this, persuaded him to declare war against Charles Gustavus, king of Sweden, which had almost cost him his crown in 1657. Charles stormed the fortrefs of Fredrichstadt; and in the succeeding winter marched his army over the ice to the island of Funen, where he surpris'd the Danish troops, took Odensee and Nyburg, and marched over the Great Belt to besiege Copenhagen. Cromwell, who then governed England under the title of Protector, interposed; and Frederic defended his capital with great magnanimity till the peace of Roschild; by which he ceded the provinces of Halland, Bleking, and Scania, the island of Bornholm, and Bahus and Drontheim in Norway, to the Swedes. Frederic fought to elude those severe terms; but Charles took Cronenburgh, and once more besieged Copenhagen by sea and land. The steady intrepid conduct of Frederic, under these misfortunes, endeared him to his subjects; and the citizens of Copenhagen made an admirable defence till a Dutch fleet arrived in the Baltic, and beat the Swedes. The fortune of war was now entirely changed in favour of Frederic, who shewed on every occasion great abilities, both civil and military; and having forced Charles to raise the siege of Copenhagen, might have carried the war into Sweden, had not the English fleet under Montague appeared in the Baltic. This enabled Charles to besiege Copenhagen a third time; but France and England offering their mediation, a peace was concluded, by which the island of Bornholm returned to the Danes; but the island of Rugen, Bleking, Halland, and Schonen, remained with the Swedes.

Though this peace did not restore to Denmark all she had lost, yet the magnanimous behaviour of Frederic, under the most imminent dangers, and his attention to the safety of his subjects, even preferably to his own, greatly endeared him in their eyes; and he at length became absolute, in the manner already related. Frederic was succeeded in 1670, by his son Christian V. who obliged the duke of Holstein Gottorp to renounce all the advantages he had gained by the treaty of Roschild. He then recovered a number of places in Schonen; but his army was

defeated

defeated in the bloody battle of Lunden, by Charles XI. of Sweden. Christian obstinately continued the war, till he was defeated at the battle of Landferoon: and having almost exhausted his dominions in military operations, and being abandoned by all his allies, he was forced to sign a treaty, on the terms prescribed by France, in 1679. Christian afterwards became the ally and subsidiary of Lewis XIV. who was then threatening Europe with chains; and, after a variety of treating and fighting with the Holsteiners, Hamburgers, and other northern powers, died in 1699. He was succeeded by Frederic IV. who, like his predecessors, maintained his pretensions upon Holstein; and probably must have become master of that Duchy, had not the English and Dutch fleets raised the siege of Tonning, while the young king of Sweden, Charles XII. who was then no more than sixteen years of age, landed within eight miles of Copenhagen, to assist his brother-in-law the duke of Holstein. Charles probably would have made himself master of Copenhagen, had not his Danish majesty agreed to the peace of Travendahl, which was entirely in the duke's favour. By another treaty concluded with the States General, Charles obliged himself to furnish a body of troops, who were to be paid by the confederates; and afterwards did great service against the French in the wars of Queen Anne.

Notwithstanding this peace, Frederic was perpetually engaged in wars with the Swedes, and while Charles XII. was an exile at Bender, he made a descent upon the Swedish Pomerania; and another, in the year 1712, upon Bremen, and took the city of Stade. His troops, however, were totally defeated by the Swedes at Gadesbuck, who laid his favourite city of Altona in ashes. Frederic revenged himself, by seizing great part of the ducal Holstein, and forcing the Swedish general, count Steinbock, to surrender himself prisoner, with all his troops. In the year 1716, the successes of Frederic were so great, by taking Tonningen and Stralsund, by driving the Swedes out of Norway, and reducing Wismar in Pomerania, that his allies began to suspect he was aiming at the sovereignty of all Scandinavia. Charles of Sweden, returning from his exile, renewed the war against Denmark with a most imbibtered spirit; but on the death of that prince, who was killed at the siege of Fredericshall, Frederic durst not refuse the offer of his Britannic majesty's mediation between him and the crown of Sweden; in consequence of which, a peace was concluded at Stockholm, which left him in possession of the duchy of Sleswick. Frederic died in the year 1730, after having, two years before, seen his capital reduced to ashes by an accidental fire. His son, Christian Frederic, or Christian VI. made the best use of his power, and the advantages with which he mounted the throne, by cultivating peace with all his neighbours, and promoting the happiness of his subjects, whom he eased of many oppressive taxes.

In 1734, after guarantying the Pragmatic sanction\*, Christian sent 6000 men to the assistance of the emperor, during the dispute of the succession to the crown of Poland. Though he was pacific, yet he was jealous of his rights, especially over Hamburg. He obliged the Hamburgers to call in the mediation of Prussia, to abolish their bank, to admit the coin of Denmark as current, and to pay him a million of silver marks. He had, in 1738, a dispute with his Britannic majesty about the little lordship of Steinhort, which had been mortgaged to the latter by a duke of Holstein Lawenburg, and which Christian said belonged to him. Some blood was spilt during the contest; in which Christian, it is thought, never was in earnest. It brought on, however, a treaty, in which he availed himself of his Britannic majesty's predilection for his German dominions, who agreed to pay

\* An agreement by which the princes of Europe engaged to maintain the succession of the House of Austria in the queen of Hungary, daughter of the emperor Charles VI. who had no male issue.

Christian a subsidy of 70,000l. sterling a year, on condition of keeping in readiness 7000 troops for the protection of Hanover. Two years after, he seized some Dutch ships, for trading without his leave to Iceland; but the difference was made up by the mediation of Sweden. Christian had so great a party in that kingdom, that it was generally thought he would revive the union of Calmar, by procuring his son to be declared successor to his then Swedish majesty. Some steps for that purpose were certainly taken; but whatever Christian's views might have been, the design was frustrated by the jealousy of other powers. Christian died in 1746, with the character of being the father of his people. His son and successor, Frederic V. in 1743, married the princess Louisa, daughter to his Britannic majesty George II. He improved upon his father's plan, for the happiness of his people; but took no concern, except that of a mediator, in the German war. It was by his intervention that the treaty of Closter-seven was concluded between the late duke of Cumberland and the French general Richlieu. Upon the death of his first queen, who was mother to his present Danish majesty, he married a daughter of the duke of Brunwic-Wolfenbuttle; and died in 1766.

His son, Christian VII. was born the 29th of January 1749; and married his present Britannic majesty's youngest sister, the princess Carolina-Matilda. This alliance, though it wore at first a very promising appearance, had a very unfortunate termination. This is partly attributed to the intrigues of the queen-dowager, mother-in-law to the present king, who has a son named Frederic, and whom she is represented as desirous of raising to the throne. When the princess-Carolina-Matilda came to Copenhagen, she received her with all the appearance of friendship and affection, acquainting her with all the king's faults, and at the same time telling her, that she would take every opportunity, as a mother, to assist her in reclaiming him. By this conduct, she became the depositary of all the young queen's secrets, whilst at the same time, it is said, she placed people about the king, to keep him constantly engaged in all kinds of riot or debauchery, to which she knew he was naturally too much inclined; and at length it was so ordered, that a mistress was thrown in the king's way, whom he was persuaded to keep in his palace. When the king was upon his travels, the queen-dowager used frequently to visit the young queen Matilda; and, under the mask of friendship and affection, told her of the excesses which the king had fallen into in Holland, England, and France, and often persuaded her not to live with him. But as soon as the king returned, the queen gently reproaching him with his conduct, his mother-in-law endeavoured to persuade the king to give no ear to her counsels, as it was presumption in a queen of Denmark to direct the king. Queen Matilda now began to discover the designs of the queen-dowager, and afterwards lived upon good terms with the king, who for a time was much reclaimed. The young queen also now assumed to herself the part which the queen-dowager had been complimented with in the management of public affairs. This stung the old queen; and her thoughts were now entirely occupied with schemes of revenge. But her views of this kind at first appeared the more difficult to carry into execution, because the king had displaced several of her friends who were about the court, who had been increasing the national debt in times of the most profound peace, and who were rioting on the spoils of the public. However, she at length found means to gratify her revenge in a very ample manner. About the end of the year 1770, it was observed that Brandt and Struensee were particularly regarded by the king; the former as a favourite, and the latter as minister, and that they paid great court to queen Matilda, and were supported by her. This opened a new scene of intrigue at Copenhagen; all the discarded placemen paid their court to the queen-dowager, and she became the head of the party. Old count Molke, an artful displaced statesman, and others, who were well versed in in-

trigues

trigues of this nature, perceiving that they had unexperienced young persons to contend with, who, though they might mean well, had not sufficient knowledge and capacity to conduct the public affairs, very soon predicted their ruin. Struensee and Brandt wanted to make a reform in the administration of the public affairs at once, which should have been the work of time; and thereby made a great number of enemies among those whose interest it was that things should continue upon the ancient footing. After this, queen Matilda was delivered of a daughter; but as soon as the queen-dowager saw her, she immediately turned back, and, with a malicious smile, declared that the child had all the features of Struensee: on which her friends published it among the people, that the queen must have had an intrigue with Struensee; which was corroborated by the queen's behaviour to this minister in public, and by the libertinism of his principles and character.

Many councils were held between the queen-dowager and her friends upon the proper measures to be taken for effectuating their designs: and it was at length resolved to surprize the king, in the middle of the night, and force him immediately to sign an order, which was to be prepared in readiness, for committing the persons before mentioned to separate prisons, to accuse them of high treason in general, and in particular of a design to poison or dethrone the king; and if that could not be properly supported, by torture or otherwise, to procure witnesses to confirm the report of a criminal commerce between the queen and Struensee. This was an undertaking of so hazardous a nature, that the wary count Molke and most of the queen dowager's friends excused themselves from taking any active part in it. However, the queen dowager at last procured a sufficient number of instruments for the execution of her designs. On the 16th of January, 1772, a masked ball was given at the court at Denmark. The king had danced at this ball, and afterwards played at quadrille with general Gahler, his lady, and counsellor Struensee, brother to the count. The queen, after dancing as usual one country dance with the king, gave her hand to count Struensee during the remainder of the evening. She retired about two in the morning, and was followed by him and count Brandt. About four the same morning, prince Frederic who had also been at the ball, went with the queen dowager to the king's bed-chamber, accompanied by general Eichstedt and count Rantzau. They ordered his majesty's valet-de-chambre to awake him, and in the midst of the surprize that this intrusion excited, they informed him, that queen Matilda and the two Struensees were at that instant busy in drawing up an act of renunciation of the crown, which they would immediately compel him to sign: and that the only means to prevent so imminent a danger, was to sign the orders which they had brought with them for arresting the queen and her accomplices. It is said that the king was not easily prevailed upon to sign these orders, but at length complied. Count Rantzau, and three officers, hastened at that untimely hour to the queen's apartments, and immediately arrested her. She was put into one of the king's coaches, conveyed to the castle of Cronenburgh, together with the infant princess, attended by lady Mostyn, and escorted by a party of dragoons. In the mean time, Struensee and Brandt were also seized in their beds, and imprisoned in the cathedral. Struensee's brother, and most of the members of the late administration, were seized the same night, to the number of about eighteen, and thrown into confinement. The government after this seemed to be entirely lodged in the hands of the queen-dowager and her son; assisted by those who had the principal share in the revolution; while the king appeared to be little more than a pageant of state. All the officers concerned in the revolution were immediately promoted, and an almost total change took place in the departments of administration. A new council was appointed, in which prince Frederic presided, and a commission of eight members, to examine the papers of the

the prisoners, and to commence a process against them. The son of queen Matilda, the prince royal, now entered into the fifth year of his age, was put into the care of a lady of quality, who was appointed governess, under the superintendancy of the queen-dowager. Struensee and Brandt were put in irons, and very rigorously treated in prison; they both underwent frequent examinations, and at length received sentence of death. They were beheaded on the 28th of April, having their right hands previously cut off. Struensee at first absolutely denied having any criminal intercourse with the queen; but this he afterwards confessed: and though he is said to have been induced to do this only by the fear of torture, the proofs of his guilt were esteemed notorious, and his confessions full and explicit.

During the confinement of queen Matilda in the palace of Cronenburgh, she inhabited the governor's apartment, and had permission to walk upon the side-batteries, or upon the leads of the tower. She was uncertain of the fate that awaited her; and had great reason to apprehend, that the party which had occasioned her arrest meditated still more violent measures. When the English minister at Copenhagen brought an order for her enlargement, which he had obtained by his spirited conduct, she was so surprized with the unexpected intelligence, that she instantly burst into a flood of tears, embraced him in a transport of joy, and called him her deliverer. After a short conference, the minister proposed that her majesty should immediately embark on board of a ship that was waiting to carry her from a kingdom in which she had experienced such a train of misfortunes. But however anxious she was to depart, one circumstance checked the excess of her joy: a few months before her imprisonment, she had been delivered of a princess, (as has already been related) whom she suckled herself. The rearing of this child had been her only comfort; and she had conceived a more than parental attachment to it, from its having been the constant companion of her misery. The infant was at that period afflicted with the measles; and, having nursed it with unceasing solicitude, she was desirous of continuing her attention and care. All those circumstances had so endeared the child to her, rendered more susceptible of tenderness in a prison than in a court, that when an order for detaining the young princess was intimated to her, she testified the strongest emotions of grief, and could not, for some time, be prevailed upon to bid a final adieu. At length, after bestowing repeated caresses upon this darling object of her affection, she retired to the vessel in an agony of despair. She remained upon the deck, her eyes immovably directed towards the palace of Cronenburgh, which contained her child, that had been so long her only comfort, until darkness intercepted the view. The vessel having made but little way during night, at day-break she observed, with fond satisfaction, that the palace was still visible; and could not be persuaded to enter the cabin as long as she could discover the faintest glimpse of the battlements.

It is well known that her majesty resided in the city of Zell, in the electoral dominions of his Britannic majesty, where she was carried off by a malignant fever, on the 10th of May 1775, and in the sixteenth day of her illness; aged 23 years, and 10 months.

In 1780, his Danish majesty acceded to the armed neutrality proposed by the empress of Russia. He appears to have such a debility of understanding, as to disqualify him for the proper management of public affairs. On the 16th of April, 1784, another court revolution took place. The queen-dowager's friends were removed, a new council formed under the auspices of the prince royal, some of the former old members restored to the cabinet, and no regard is to be paid in future to any instrument, unless signed by the king, and countersigned by the prince royal.

The conduct of this prince is stamped with that consistency of behaviour, which enables him to pursue, with unremitting zeal, the prudent and benevolent schemes which

which he has planned for the benefit of his grateful country. The restoration of the peasantry to their long-lost liberty, and the abolition of many grievances under which they laboured, have already been distinctly mentioned. To this may be added, the exertions he makes for the general diffusion of knowledge; the patronage he affords to societies of learning, arts and science; the excellent measures he has adopted for the suppression of beggars, with whom the country was over-run, and the encouragement of industry, by the most extensive enquiries into the state of the poor throughout the kingdom; the wise regulations he has introduced into the corn-laws, equally beneficial to the landed interest, and to the poor; and the judicious laws which, under his influence, have been made to encourage foreigners to settle in Iceland. If any thing is wanting to complete his happiness, his late matrimonial choice crowns it. The princess of Hesse-Cassel, whom he has chosen, is said to possess the most amiable dispositions and goodness of heart.

Count Schimmelmann, minister of state, finances, and commerce, has the merit of accomplishing the abolition of the slave trade among the subjects of Denmark. His plan was approved by the king on the 22d of February, 1792, and is to be gradual, and in 1803 all trade in negroes is to cease on the part of Danish subjects. The disinterestedness of this minister, who possesses large estates in the Danish West-India islands, recommends his exertions to greater praise. The above ordinance does not seem to have caused any stir in Denmark among the West-India merchants, and it is not thought it will cause any in the islands. A scheme for defraying the national debt has been suggested and followed. One million has already been discharged.

Christian VII. reigning king of Denmark and Norway, LL. D. and F. R. S. was born in 1749; in 1766 he was married to the princess Carolina-Matilda of England, and has issue, 1. Frederic, prince-royal of Denmark, born January 28, 1768, and married in 1790, to the princess Mary-Anne-Frederica of Hesse. 2. Louisa-Augusta, princess-royal, born July 7, 1771, and married May 27, 1786, to Frederic, prince of Sleswick-Holstein, by whom she has issue.

Brothers and sisters to the king: 1. Sophia Magdelene, born July 3, 1746, married to the late king of Sweden, Gustavus III. 2. Wilhelmina, born July 10, 1747; married, September 1, 1764, William, the present prince of Hesse-Cassel. 3. Louisa, born January 30, 1750; married August 30, 1766, Charles, brother to the prince of Hesse-Cassel. 4. Frederic, born October 28, 1753.

---

### HIS DANISH MAJESTY'S GERMAN DOMINIONS.

**H**OLSTEIN, a duchy of Lower Saxony, about 100 miles long; and 50 broad, and a fruitful country, was formerly divided between the empress of Russia, (termed Ducal Holstein) the king of Denmark, and the imperial cities of Hamburg and Lubeck: but on the 16th of November, 1773, the Ducal Holstein, with all the rights, privileges, and territorial sovereignty, was formally transferred to the king of Denmark. The duke of Holstein Gottorp is joint sovereign of great part of it now with the Danish monarch. Kiel is the capital of Ducal Holstein, and is well-built, has a harbour, and neat public edifices. The capital of the Danish Holstein is Gluckstadt, a well-built town and fortrefs, but in a marthy situation, on the right of the Elbe, and has some foreign commerce.

Altëna, a large, populous, and handsome town, of great traffic, is commodiously situated on the Elbe, in the neighbourhood of Hamburg. It was built in

that situation, that it might share in the commerce of the former. Being declared a free port, and the staple of the Danish East-India Company, the merchants also enjoying liberty of conscience, great numbers flocked to Altona from all parts of the North, and even from Hamburg.

The famous city of Hamburg lies, in a geographical sense, in Holstein; but is an imperial, free, and Hanseatic city, lying on the verge of that part of Holstein called Stormar. It has the sovereignty of a small district round it, of about ten miles circuit: it is one of the most flourishing commercial towns in Europe; and though the kings of Denmark still lay claim to certain privileges within its walls, it may be considered as a well regulated commonwealth. The number of inhabitants are said to amount to 180,000; and it is furnished with a variety of noble edifices, both public and private: it has two spacious harbours, formed by the river Elbe, which runs through the town, and eighty-four bridges are thrown over its canals. Hamburg has the good fortune of having been peculiarly favoured in its commerce by Great Britain, with which it still carries on a great trade. The Hamburgers maintain twelve companies of foot, and one troop of dragoons, besides an artillery company.

Lubec, an imperial city, with a good harbour, and once the capital of the Hans Towns, and still a rich and populous place, is also in this duchy; and governed by its own magistrates. It has 20 parish churches besides a large cathedral. Lutheranism is the established religion of the whole duchy.

In WESTPHALIA, the king of Denmark has the counties of Oldenburg and Delmenhurst, about 2000 square miles; they lie on the south side of the Weser; their capitals have the same name; the first has the remains of a fortification, and the last is an open place. Oldenburg gave a title to the first royal ancestor of his present Danish majesty. The country abounds with marshes and heaths, but its horses are the best in Germany.

## L A P L A N D.

**T**HE northern situation of Lapland, and the division of its property, require that I should treat of it under a distinct head, and in the same method observed in other countries.

**SITUATION, EXTENT, DIVISION, AND NAME.]** The whole country of Lapland extends, so far as it is known, from the North Cape in 71. 30. N. lat. to the White Sea, under the arctic circle. Part of Lapland belongs to the Danes, and is included in the government of Wardhuys; part to the Swedes, which is the most valuable; and some parts in the east, to the Russians. The part belonging to the Swedes may be seen in the table of dimensions given in the account of Sweden: but other accounts say, that it is about a hundred German miles in length, and ninety in breadth; it comprehends all the country from the Baltic, to the mountains that separate Norway from Sweden. The Muscovite part lies toward the east, between the lake Enarak and the White Sea. Those parts, notwithstanding the rudeness of the country, are divided into smaller districts; generally taking their names from rivers: but, unless in the Swedish part, which is subject to a prefect, the Laplanders can be said to be under no regular government. The Swedish Lapland, therefore, is the object chiefly considered by authors in describing this country. It has been generally thought, that the Laplanders are the descendants of Finlanders driven out of their own country, and that they take their name from *Lappes*, which signifies exiles. The reader, from what has been said in the Introduction, may easily con-

ceive that in Lapland, for some months in the summer, the sun never sets; and, during winter, it never rises: but the inhabitants are so well assisted by the twilight, and the aurora borealis, that they never discontinue their work through darkness.

**CLIMATE.]** In the winter it is no unusual thing for their lips to be frozen to the cup in attempting to drink; and in some thermometers, spirits of wine are congealed into ice: the limbs of the inhabitants very often mortify with cold: drifts of snow threaten to bury the traveller, and cover the ground four or five feet deep. A thaw sometimes takes place, and then the frost that succeeds presents the Laplander with a smooth level of ice, over which he travels with a rein deer in a sledge with inconceivable swiftness. The heats of summer are excellent for a short time; and the cataracts, which dash from the mountains, often present to the eye the most picturesque appearances.

**MOUNTAINS, RIVERS, LAKES, AND FORESTS.]** Lapland is covered by mountains, irregularly crowded together, and often diversified by rivers and lakes, with innumerable islands, believed by the natives to have been the seat of paradise. Roses and other flowers grow wild on their borders in the summer; though this is but a short gleam of temperature, for the climate in general is excessively severe. Dusky forests, and noisome, unhealthy morasses, and barren plains, cover great part of the flat country, so that nothing can be more uncomfortable than the state of the inhabitants.

**METALS AND MINERALS.]** Silver and gold mines, as well as those of iron, copper, and lead, have been discovered and worked in Lapland to great advantage; beautiful crystals are found here, as are some amethysts and topazes; also various sorts of mineral stones, surprisingly polished by the hand of nature.

**QUADRUPEDS, BIRDS, FISHES, AND INSECTS.]** The *zibelius*, a creature resembling the martin, is a native of Lapland; and its skin, whether black or white, is highly esteemed. The Lapland hares grow white in the winter; and the country produces a large black cat, which attends the natives in hunting. The most remarkable of the Lapland animals is the *rein deer*, a most useful animal resembling the stag, only it somewhat droops the head, and the horns project forward. All naturalists take notice of the cracking noise that the *rein deer* makes in moving its legs, which is attributed to its separating and afterwards bringing together the divisions of the hoof. The under part is entirely covered with hair in the same manner that the claw of the *Ptarmigan* is with scathery bristles, which is almost the only bird that can endure the rigour of the climate. The hoof, however, is not only thus protected; the same necessity which obliges the Laplanders to use snow shoes, makes the extraordinary width of the rein's hoof to be equally convenient in passing over snow, as it prevents their sinking too deep, which they continually would, did the weight of their body rest only on a small point. This quadruped hath therefore an instinct to use a hoof of such a form in a still more advantageous manner, by separating it when the foot is to touch the ground so as to cover a larger surface of snow. The instant, however, the leg of the animal is raised, the hoof is immediately contracted, and the collision of the parts occasions the snapping noise. And probably the cracking which they perpetually make, may serve to keep them together when the weather is remarkably dark. In summer, the rein-deer provide themselves with leaves and grass, and in the winter they live upon moss: they have a wonderful sagacity at finding it out, and when found, they scrape away the snow that covers it with their feet. The scantiness of their fare is inconceivable, as is the length of the journies, which they can perform without any other support. They fix the rein deer to a kind of a sledge, shaped like a small boat, in which the traveller, well secured from cold, is laced down, with the reins (which are fastened to the horns of the animal) in one hand, and a kind of

bludgeon

bludgeon in the other, to keep the carriage clear of ice and snow. The deer, whose harnessing is very simple, sets out, and continues the journey with prodigious speed; and is generally so safe and tractable, that the driver is at little trouble in directing him. At night they search for their own provender; and their milk often helps to support their master. Their instinct in choosing their road, and directing their course, can only be accounted for by their being well acquainted with the country during the summer months, when they live in woods. Their flesh is a well tasted food, whether fresh or dried; their skin forms excellent clothing both for the bed and body: their milk and cheese are nutritive and pleasant; and their intestines and tendons supply their masters with thread and cordage. When they run about in the fields, they may be shot at as other game. But it is said, that if one is killed in a flock, the survivors will gore and trample him to pieces; therefore single stragglers are generally pitched upon. Their surprising speed (for they are said to run at the rate of 200 \* miles a day) seems to be owing to their impatience to get rid of their incumbrance. None but a Laplander could bear the uneasy posture in which he is placed, when he is confined in one of those carriages or pulkhas; or would believe that, by whispering the rein-deer in the ear, they know the place of their destination.

About autumn, when the lakes of Lapland begin to freeze, the water-fowl, which are found there in great abundance, migrate towards the south; and upon the first opening of the spring, they return in large flocks to their prior habitations, where they find a plentiful subsistence from the grubs of the gnats. These grubs too serve for the food of the *tetraones* or partridge tribe, thousands whereof, and even myriads, are daily taken, and sent to Stockholm. These birds are caught in such large quantities by the Laplanders, as to supply them with their ordinary provision in autumn, as the eggs of the water-fowl are their support in spring †.

Their prey is in such plenty that should one of them go out a shooting for two hours, and not bring home a load of game, he would certainly conclude that some enchanter, who bore him a grudge, had, out of mere spite, spoiled his sport ‡.

PEOPLE, CUSTOMS, AND MANNERS.] The language of the Laplanders is of Finnish origin, and comprehends so many dialects, that it is with difficulty they understand each other. The greater part have neither writing nor letters among them, but a number of hieroglyphics, which they make use of in their Routes, a sort of sticks that they call Pistave, and which serve them for an almanack. However harsh and unharmonious their language, we have some specimens of Lapland poetry, which convey no unfavourable impressions of their taste and sensibility. In the Spectator we have two elegant odes translated from the language of Lapland, (N<sup>o</sup>. 366. and 406.) We shall make no apology for adding a third in the note below §. Hieroglyphics are the marks they use instead of signatures, even in

\* Holberg says, the rein-deer, "if he is pressed, will travel at the rate of ten or twelve Swedish miles a day (70 or 84 English miles), but by such hard driving he is generally destroyed. It, however, frequently happens, that he will persevere in his journey 50 miles, without intermission, and without taking any refreshment." *Linnæi Amœnit. Academ. Vol. I. p. 169.*

† Holberg,

‡ Mortray's Travels, vol. ii. p. 321.

#### § A LAPLAND SONG.

The snows are dissolving on Tornao's rude side,  
And the ice of Lulhea flows down the dark tide:  
Thy dark stream, oh Lulhea, flows freely away,  
And the snow-drop unfolds her pale beauties to-day.

Far off the keen terrors of winter retire,  
And the north's dancing streamers relinquish their  
fire;

The sun's genial beams swell the bud on the tree,  
And Anna chaunts forth her wild warblings with  
glee.

The rein deer unharne'd in freedom shall play,  
And safely o'er Oloa's steep precipice stray;  
The wolf to the forest's recesses shall fly,  
And howl to the moon as the glides thro' the sky.

Then hast, my fair Luah, oh! haste to the grove,  
And pass the sweet season in rapture and love;  
In youth let our bosoms in ecstacy glow,  
For the winter of life ne'er a transport can know.

matters of law. Missionaries, from the christianized parts of Scandinavia, introduced among them the Christian religion; but they can hardly be said even yet to be Christians, though they have among them some religious seminaries, instituted by the king of Denmark. The majority of the Laplanders practise as gross superstitions and idolatries as are to be found among the most uninstructed pagans; and so absurd, that they scarcely deserve to be mentioned, were it not that the number and oddities of their superstitions have induced the northern traders to believe that they are skilful in magic and divination. For this purpose their magicians make use of what they call a drum, made of the hollowed trunk of a fir, pine, or birch-tree, one end of which is covered with a skin; on this they draw, with a kind of red colour, the figures of their own gods, as well as of Jesus Christ, the apostles, the sun, moon, stars, birds, and rivers; on these they place one or two brass rings, which, when the drum is beaten with a little hammer, dance over the figures; and, according to their progress, the forcerer prognosticates. These childish operations are generally performed for gain; and the northern ship-masters are such dupes to the arts of those impostors, that they often buy from them a magic cord, which contains a number of knots, by opening of which, according to the magician's directions, they gain what wind they want. The Laplanders still retain the worship of many of the Teutonic gods; and have among them great remains of the Druidical institutions. They believe the transmigration of the soul; and have festivals set apart for the worship of certain genii, called Juhles, who they think inhabit the air, and have great power over human actions; but, being without form or substance, they assign to them neither images nor statues.

Agriculture is not much attended to among the Laplanders. They are chiefly divided into Lapland fishers, and Lapland mountaineers. The former always make their habitations on the brink, or in the neighbourhood of some lake, from whence they draw their subsistence. The others seek their support upon the mountains, and their environs, possessing herds of rein-deer more or less numerous, which they use according to the season, but go generally on foot. They are excellent and industrious herdsmen, and are rich in comparison of the Lapland fishers. Some possess six hundred or a thousand rein-deer, and have often money and plate besides. They mark every rein-deer on the ears, and divide them into classes; so that they instantly perceive whether any one is strayed, though they cannot count to so great a number as that to which their stock often amounts. Those who possess but a small stock, give to every individual a proper name. The Lapland-fishers, who are also called Laplanders of the woods, because in summer they dwell upon the borders of the lakes, and in winter in the forests, live by fishing and hunting, and choose their situation by its convenience for either. The greatest part of them, however, have some rein-deer. They are active and expert in the chase; and the introduction of fire-arms among them has almost entirely abolished the use of the bow and arrow. Besides looking after their rein-deer, the fishery, and the chase, the men employ themselves in the construction of their canoes, which are small, light, and compact. They also make sledges, to which they give the form of a canoe, harness for the rein-deer, cups, bowls, and various other utensils, which are sometimes neatly carved, and sometimes ornamented with bones, brass, or horn. The employment of the women consists in making-nets for the fishery, in drying fish and meat, in milking the rein-deer, in making cheese, and in tanning hides: but it is understood to be the business of the men to look after the kitchen; in which, it is said, the women never interfere.

The Laplanders live in huts in the form of tents. A hut is about twenty-five to thirty feet in diameter, and not much above six feet in height. They cover them according to the season, and the means of the possessor; some with briars, bark of birch, and linen; others with turf, coarse cloth, or felt, or the old skins of rein-

deer. The door is of felt, made like two curtains, which open afunder. A little place furrounded with stones is made in the middle of the hut for the fire, over which a chain is fufpended to hang the kettle upon. They are fcarceely able to ftand upright in their huts, but conftantly fit upon their heels round the fire. At night, they lie down quite naked; and, to feparate the apartments, they place upright fticks at fmall diftances. They cover themfelves with their cloths, or lie upon them. In winter, they put their naked feet into a fur bag. Their houfehold-furniture confifts of iron or copper kettles, wooden cups, bowls, fpoons, and fometimes tin, or even filver bafons; to thefe may be added the implements of fifhing and hunting. That they may not be obliged to carry fuch a number of things with them in their excursions, they build in the forefts, at certain diftances, little huts, made like pigeon-houfes, and placed upon the trunk of a tree, cut off at about the height of fix foot from the root. In thefe elevated huts they keep their goods and provifions; and though they are never fhut, yet they are never plundered. The rein-deer fupply the Laplanders with the greateft part of their provifions; the chace and the fishery afford the reft. Their principal difhes are the flefh of the rein-deer, and puddings made of their blood, by putting it either alone, or mixed with wild berries, into the ftomach of the animal from whence it was taken, in which they cook it for food; but the flefh of the bear is efteemed their greateft luxury. They eat every kind of fifh, even the fea-dog; as well as all forts of wild animals, not excepting birds of prey, and carnivorous animals. Their winter-provifions confift chiefly of flefh and fifh dried in the open air, which they eat raw. Their common drink is water, fometimes mixed with milk: they make alfo broths and fifh-foups. Brandy is fcarce with them, but they are extremely fond of it. Whenever they are inclined to eat, the head of the family fpreads a mat on the ground; and then men and women fquat round this mat, which is covered with difhes. Every Laplander carries about him a knife, a fpoon, and a little cup for drinking. Each has his portion feparately given him, that no perfon may be injured; for they are great eaters. Before and after the meal they make a fhort prayer: and, as foon as they have done eating, each gives the other his hand.

In their drefs the Laplanders ufe no kind of linen. In the Flora Lapponica, Linnaeus fays, "Perhaps the curious reader will wonder how the people in Lapland, during the terrible cold that reigns there in winter, can preferve their lives; fince almoft all birds, and even fome wild beafts, defert it at that time. The Laplander, not only in the day, but through the whole winter-nights, is obliged to wander about in the woods with his herds of rein-deer. For the rein-deer never come under cover, not eat any kind of fodder, but a particular kind of *livertwort*. On this account the herdsmen are under a neceffity of living continually in the woods, in order to prevent their cattle being devoured by wild beafts. No part of the body is more eafily deftroyed by cold than the extremities of the limbs, which are moft remote from the fun of this microfom, the heart. The kibes that happen to the hands and feet, fo common in the northern parts of Sweden, prove this. In Lapland you will never fee fuch a thing; although, were we to judge by the fiteuation of the country, we fhould imagine juft the contrary; efpecially as the people wear no ftockings. The Laplander guards himfelf againft the cold in the following manner. He wears breeches made of rein-deer fkins with the hair on, reaching down to his heels, and fhoes made of the fame materials, the hairy part turned outwards. He puts into his fhoes *fleuder-eared, broad-leaved, cyperus grafs, carex veficaria, Spec. Pl.* (or the bladder carex) that is cut in fummer and dried. This he firft combs and rubs in his hands, and then places it in fuch a manner, that it not only covers his feet quite round, but his legs alfo; and being thus guarded, he is quite fecured againft the intense cold. With this grafs they ftuff their gloves likewife, in order to preferve their hands. As this grafs keeps off the cold in winter, fo in fummer it hinders

hinders the feet from sweating, and at the same time preserves them from being annoyed by striking against stones, &c. for their shoes are very thin, being made, not of tanned leather, but of the raw hide\*.

Their doublet is made to fit their shape, and is open at the breast. Over this they wear a close coat with narrow sleeves; the shirts reaching to the knees, and fastened round them by a leathern girdle, ornamented with plates of tin or brass. To this girdle they tie their knives, their instruments for obtaining fire, their pipes, and the rest of their smoking apparatus. Their clothes are made of fur, or leather, or of cloth; the close coat of cloth or leather, always bordered with fur, or bindings of cloth of different colours. Their caps are edged with fur, pointed at top, and the four seams adorned with lists of a different colour from that of the cap. The women wear breeches, shoes, doublets, and close coats, in the same manner as the men; but their girdle, at which they carry likewise the implements for smoking tobacco, is commonly embroidered with brass wire. Their close coat hath a collar, which comes up higher than that of the men. Besides these, they wear handkerchiefs, and little aprons, made of painted cloth, rings on their fingers, and ear-rings, to which they sometimes hang chains of silver, which pass two or three times round the neck. They are often dressed in caps folded after the manner of turbans, sometimes in others fitted to the shape of the head; and, being much addicted to finery, they are all ornamented with the embroidery of brass wire, or at least with list of different colours.

Lapland is but poorly peopled, owing to the general barrenness of its soil. The number of its inhabitants may amount to about 60,000. Both men and women are in general considerably shorter than more southern Europeans. Maupertuis measured a woman, who was suckling her child, whose height did not exceed four feet two inches and a half; they make, however, a much more agreeable appearance than the men, who are often ill-shaped and ugly, and their heads too large for their bodies. Their women are complaisant, chaste, well-made, and extremely nervous. It frequently happens that a Lapland woman will faint away, or even fall into a fit of frenzy, on a spark of fire flying towards her, an unexpected noise, or any other sudden occurrence, equally trivial. During these paroxysms of terror, they deal about blows with the first thing that presents itself; and, on coming to themselves, are utterly ignorant of all that has passed.

When a Laplander intends to marry, he, or his friends, court her father with brandy; when, with some difficulty, he gains admittance to his fair one, he offers her a beaver's tongue, or some other eatable; which she rejects before company, but accepts of in private. Cohabitation often precedes marriage; but every admittance is purchased with a bottle of brandy, and this prolongs the courtship sometimes for three years. The priest of the parish at last celebrates the nuptials; but the bridegroom is obliged to serve his father-in-law for four years; after which he carries his wife and her fortune home.

COMMERCE.] Little can be said of the commerce of the Laplanders. Their exports consist of fish, rein-deer, furs, baskets, and toys; with some dried pikes, and cheeses, made of rein-deer's milk. They receive for these, six-dollars, woollen cloths, linen, copper, tin, flour, oil, hides, needles, knives, spirituous liquors, tobacco, and other necessaries. Their mines are generally worked by foreigners, and produce no inconsiderable profit. The Laplanders travel in a caravan, with their families, to the Finland and Norway fairs. The reader may make some estimate of the medium of commerce among them, when he is told, that fifty squirrel skins, or one fox skin, and a pair of Lapland shoes, produce one six-dollar; but no computation can be made of the public revenue, the greatest part of which is allot-

\* Stillingfleet's Travels, p. 137, 138.

Of Gothland, the following are the subdivisions :

East Gothland,	Dalia,
West Gothland,	Schonen,
Smaland,	Heking,
Werneland,	Hulland.

Of Swedish Lapland, the following are the subdivisions :

Thorne Lapmark,	Pithia Lapmark,
Kimi Lapmark,	Uma Lapmark.
Lula Lapmark,	

The principal places in West Bothnia are Umea, Pitea, and Tornea.

Of Finland, the following are the subdivisions :

East Bothnia,	Nyland,
Cajania,	Travastia,
Savoloxia,	Finland Proper.

The Swedish isles are Gothland, Oeland, Aland, and Rugen.

**CLIMATE, SEASONS, SOIL, } In Sweden summer bursts suddenly from winter;**  
**AND PRODUCTIONS. } and vegetation is more speedy than in southern**  
 climates, owing to the long continuance of the sun's rays, being eighteen hours and a half above the horizon every day for some weeks: so that the solar heat is increased in proportion to its duration. Stoves and warm furs mitigate the cold of winter, which is so intense, that the noses and extremities of the inhabitants are sometimes mortified; and in such cases, the best remedy that has been found out, is rubbing the affected part with snow. The Swedes, since the days of Charles XII. have been at incredible pains to correct the native barrenness of their country. The soil is much the same with that of Denmark, and some parts of Norway, generally very bad, but in some vallies surprizingly fertile. The peasants now follow the agriculture of France and England; and some late accounts say, that they raise almost as much grain as maintains the natives. Gothland produces wheat, rye, barley, oats, peas, and beans; and in case of deficiency, the people are supplied from Livonia and the Baltic provinces. The woods consist chiefly of oak, horse-chestnut, birch, and mountain-ash. In summer, the fields are verdant, and covered with flowers, and produce strawberries, ratherries, currants, and other small fruits. The common people know little of the cultivation of apricots, peaches, nectarines, and the like high-flavoured fruits; but melons are brought to great perfection in dry seasons.

**MINERALS AND METALS.]** Sweden produces crystals, amethysts, topazes, porphyry, lapis-lazuli, agate, cornelian, and marble. The chief wealth of Sweden arises from her mines of silver, copper, lead, and iron. The last mentioned metal employs no fewer than 450 forges, hammer-mills, and smelting houses. A kind of a gold mine has likewise been discovered in Sweden, but so inconsiderable, that from the year 1741 to 1747, it produced only 2398 gold ducats, each valued at 9s. 4d. sterling. The first gallery of one silver mine is 100 fathoms below the surface of the earth; the roof is supported by prodigious oaken beams; and from thence the miners descend about forty fathoms to the lowest vein. This mine is said to produce 20,000 crowns a year. These subterranean mansions are astonishingly spacious, and highly commodious, forming, as it were, a hidden world. The water-falls in Sweden afford excellent conveniency for forges; and in some former years, the iron exported brought in 300,000l. sterling, constituting two-thirds of the national revenue. It must be observed, that the exactions of government,

verment, and the importation of American bar-iron into Europe, and some other causes, have greatly diminished this manufacture.

**ANTIQUITIES AND CURIOSITIES.]** A few leagues from Gottenburg is a hideous precipice, down which a dreadful cataract of water rushes with such impetuosity, from the height into so deep a bed of water, that masts, and other bodies of timber, precipitated down it, disappear for near an hour, before they are recovered; the bottom of this bed has never been found, though sounded by lines of several hundred fathoms. A remarkable slimy lake, which tinges things put into it, has been found in the southern part of Gothland; and several parts of Sweden contain a stone, which, being of a yellow colour, intermixed with several streaks of white, as if composed of gold and silver, affords sulphur, vitriol, alum, and minium. The Swedes pretend to have a manuscript copy of a translation of the Gospels into Gothic, done by a bishop 1300 years ago.

**SEAS.]** Their seas are the Baltic, and the gulfs of Bothnia and Finland, which are arms of the Baltic; and on the west of Sweden are the Categate sea, and the Sound, a strait about four miles over, which divides Sweden from Denmark.

These seas have no tides, and are frozen up usually four months in the year; nor are they so salt as the ocean, never mixing with it, because a current sets always out of the Baltic into the ocean.

**QUADRUPEDS, BIRDS, AND FISHES.]** These differ little from those already described in Norway and Denmark; the Swedish horses are very serviceable in war. The Swedish hawks, when carried to France, have been known to revisit their native country; as appears from one that was killed in Finland, with an inscription on a small gold plate, signifying that he belonged to the French king. The fishes found in the rivers and lakes of Sweden are the same with those in other northern countries, and taken in such quantities, that their pikes (particularly) are salted and pickled for exportation. The train-oil of the seals taken in the gulf of Finland, is a considerable article of exportation.

**INHABITANTS, MANNERS, AND CUSTOMS.]** The character of the Swedes has differed greatly in different ages. At present, their peasants seem to be a heavy plodding race of men, strong and hardy; but without any other ambition than that of subsisting themselves and their families: the mercantile classes are much of the same cast; but among persons of all descriptions great application and perseverance are very conspicuous. One would not suppose that the modern Swedes are the descendants of those, who under Gustavus Adolphus and Charles XII. carried terror through distant countries, and shook the foundation of the greatest empires. The intrigues of their senators dragged them to take part in the late war against Prussia; yet their behaviour was spiritless. The nobility and gentry of Sweden are naturally brave, polite and hospitable; they have high notions of honour, and are jealous of their national interests. In Stockholm, as in other cold climates, the custom of drinking spirits prevails too much; even ladies, who by no means deserve an improper epithet, comply with this pernicious custom. It is usual in this country, previous to dinner, for the company to assemble round the side-board, and to regale themselves with bread, butter, cheese, or any thing of that nature, which preface is regularly followed in both sexes by a bumper of brandy. Their method of conducting themselves at table has a very singular appearance to a stranger. Every dish, after being cut up, is handed about in rotation from one to another; every one helps himself and passes it to the next. Wine and all other liquors stand upon the table. The rule is to help yourselves without any kind of ceremony; they drink no kind of healths. The cloth is not removed as in England, neither do the gentlemen sit after the ladies rise. Each gentleman conducts a lady to another suit of apartments where coffee is ready prepared. Tea  
about

about three hours after; then cards and music, or a walk till supper. Music is esteemed one of the most polite accomplishments among the ladies; it is, indeed, almost a general science in this country. Many of their music masters are held in high repute, and that vocation is thought to be honourable, as to introduce them to all assemblies with people of the first distinction. The church-music of the Swedes inspires the mind with religious awe. It operates, however, often too powerfully on weak minds, and produces more the shew than the spirit of religion. The drolls, exercises, and diversions of the common people, are almost the same with those of Denmark: the better sort are lustrated with French modes and fashions. They are not fond of marrying their daughters when young, as they have little to spare in their own life-time. The women go to plough, thresh out the corn, row upon the water, serve the bricklayers, carry burdens, and do all the common drudgeries in husbandry.

[RELIGION.] Christianity was introduced here in the ninth century. Their religion is Lutheran, which was propagated among them by Gustavus Vasa, about the year 1523. The Swedes were surprisngly uniform and unremitting in religious matters; and had such an aversion to popery, that castration was the fate of every Roman catholic priest discovered in their country. The archbishop of Upsal has a revenue of about four hundred pounds a year; and has under him thirteen suffragans, besides superintendants, with moderate stipends. No clergyman has the least direction in affairs of state; but their morals, and the sanctity of their lives, endeared them so much to the people, that the government would repeat making them its enemies. Their churches are neat, and often ornamented. A body of ecclesiastical laws and canons direct their religious œconomy. A conversion to popery, or a long continuance under excommunication, which cannot pass without the king's permission, is punished by imprisonment and exile.

[LANGUAGE, LEARNING, AND LEARNED MEN.] The Swedish language is a dialect of the Teutonic, and resembles that of Denmark. The passion of the famous queen Christina for literature is well known to the public, and that she excelled in many branches of knowledge. The Swedish nobility and gentry are, in general, more conversant in polite literature than those of many other more flourishing states. They have lately exhibited some specimens of uncommon nunsistence in the pursuit of science; one of which deserves particular notice, in their sending, at the expence of private persons, that excellent and candid natural philosopher Hasselquist, into the eastern countries for discoveries, where he died. This noble spirit is eminently encouraged by the royal family; and her Swedish majesty purchased at no inconsiderable expence for that country, all Hasselquist's collection of curiosities. That able civilian, statesman, and historian Puffendorf, was a native of Sweden; and so was the late celebrated Linnæus, whose memory will be ever dear to all the lovers of science, but particularly to those who cultivate the study of botany.

The name of Linnæus may be classed amongst those of Newton, Boyle, Locke, Haller, Euler, and other great philosophers, who were friends to religion: he always testified in his conversations, writings, and actions, the highest reverence for the Supreme Being; and was so strongly impressed with the idea of omnipresence, that he wrote over the door of his study: *Innæi vivite, numen adeſt.*

The mere catalogue of his works would make an ordinary pamphlet; and it required a considerable volume to trace even the outlines of his system, now distinguished by the appellation of Linnæan, which new methodized and reformed the whole compass of natural history. In these extensive and various pursuits, we know not which to admire most, his indefatigable industry, his scientific arrangement,

ment, or that wonderful exactness in discriminating, where the minutest shades of difference are scarcely perceptible\*.

Even in the midst of the late distractions of Sweden, the fine arts, particularly drawing, sculpture, and architecture, were encouraged and protected. Agricultural learning, both in theory and practice, is also carried to a considerable height in that kingdom.

UNIVERSITIES.] The principal is that of Upsal, instituted near 400 years ago, and patronized by several successive monarchs, particularly by the great Gustavus Adolphus, and his daughter queen Christina. The students in this university are numerous; but they do not inhabit, as in our universities, any distinct colleges, there being no buildings for their accommodation, but lodge in the town; and repair to the general or public lectures, given by the several professors, either at their own houses, or at the public halls appropriated to such purposes. The poorer students are assisted in their expences, by being appointed to scholarships, the highest of which amount to about thirteen pounds per annum. The professors in different branches of literature are about twenty-two; of whom the principal are those of divinity, eloquence, botany, anatomy, chemistry, natural philosophy, astronomy, and agriculture. Their salaries are from seventy to one hundred pounds per annum. This university, justly called by Stillingfleet, "that great and hitherto unrivalled school of natural history," is certainly the first seminary of the North for academical education; and has produced, from the time of its institution, persons eminent in most branches of science. The learned publications, which have lately been given to the world by its members, sufficiently prove the flourishing state of literature in those parts, particularly the *Amenitates Academicæ*, or a collection of Theses upon Natural History, held under the celebrated Linnæus, and chiefly selected by that able master. There is another university at Abo, in Finland, but not so well endowed, nor so flourishing, and a third at Lunden, in Schonen, which is fallen into decay. Every diocese is provided with a free-school, in which boys are prepared for the university †.

Much credit is due to this nation with respect to the education of young people, particularly among the inferior classes, so as to render them useful members of society; for which purpose they have instituted seminaries and schools, which are carefully inspected by the superior and dignified clergy. When a youth attains a certain age, so as to be capable either of trade or any professional line of life, if he shews any particular marks of genius, or an uncommon assiduity in any of the walks of science, these ecclesiastical directors report him to the king, who gives orders, as the reward of his merit, that he may receive an education suitably adapted to his temper and the bent of his genius. If he continues his diligence and attention his promotion is certain. This truly laudable institution, and exemplary pattern, may well be thought worthy the imitation of more enlightened nations, as it is certainly productive of much emulation and improvement. To dig the rough diamond from the mine is doubtless a commendable labour, but to polish it and make it fit for use deserves the highest praises.

MANUFACTURES, TRADE, COM- } The Swedish commonalty subsist by agriculture, mining, grazing, hunting, and fishing. Their materials for traffic are bulky and useful commodities of matts, beams,

\* The reader, who is desirous of further information concerning this great naturalist, will find his curiosity amply gratified from the perusal of Dr. Pultney's "General View of the Writings of Linnæus." See also Coxe's Travels, 4to. vol. iiii. p. 428-448.

† An academy of arts and sciences was some years since established at Stockholm, and is now in a flourishing condition. They have published several volumes of memoirs, which have been well received by the public.

deal-boards, and other sorts of timber for shipping; tar, pitch, bark of trees, potash, wooden utensils, hides, flux, hemp, peltry, furs, copper, lead, iron, cordage, and fish. Even the manufacturing of iron was introduced into Sweden so late as the 16th century; for till that time they sold their crude ore to the Hanse towns, and brought it back again manufactured into utensils. About the middle of the 17th century, by the assistance of the Dutch and Flemings, they set up some manufactures of glass, starch, tin, woollen, silk, soap, leather-drelling, and saw-mills. Book-selling was at that time a trade unknown in Sweden. They have since had sugar-baking, tobacco-plantations, and manufactures of flannel-cloth, cotton, fustian, and other stuffs; of linen, alum, and brimstone; paper-mills, and gunpowder-mills. Vast quantities of copper, brass, steel, and iron, are now wrought in Sweden. They have also founderies for cannon, forges for fire-arms and anchors, armories, wire and flattening-mills; mills also for fulling, and for boring and stamping; and of late they have built many ships for sale.

Certain towns in Sweden, 24 in number, are called staple-towns, where the merchants are allowed to import and export commodities in their own ships. Those towns which have no foreign commerce, though lying near the sea, are called land-towns. A third kind are termed mine-towns, as belonging to the mine districts. The Swedes, about the year 1752, had greatly increased their exports, and diminished their imports, most part of which arrive, or are sent off in Swedish ships; the Swedes having a navigation-act, like that of the English. These promising appearances were, however, blasted by the jealousies of the Swedish government.

Stockholm is a staple-town, and the capital of the kingdom; it stands about 760 miles north-east from London, upon seven small rocky islands, besides two peninsulas, and built upon piles. It strikes a stranger with its singular and romantic scenery. A variety of contrasted and enchanting views are formed by numberless rocks of granite rising boldly from the surface of the water, partly bare and craggy, partly dotted with houses, or feathered with wood. The harbour, which is spacious and convenient, though difficult of access, is an inlet of the Baltic: the water is clear as crystal, and of such depth, that the ships of the largest burthen can approach the quay, which is of considerable breadth, and lined with spacious buildings and warehouses. At the extremity of the harbour, several streets rise one above another in the form of an amphitheatre; and the palace, a magnificent building, crowns the summit. Towards the sea, about two or three miles from the town, the harbour is contracted into a narrow strait, and, winding among high rocks, disappears from the sight; and the prospect is terminated by distant hills, overspread with forest. It is far beyond the power of words, or of the pencil, to delineate these singular views. The central island, from which the city derives its name, and the Ritterholm, are the handsomest parts of the town.

Except in the suburbs, where the houses are of wood painted red, the generality of the buildings are of stone, or brick stuccoed white. The royal palace, which stands in the centre of Stockholm, and upon the highest spot of ground, was begun by Charles XI. It is a large quadrangular stone edifice, and the style of architecture is both elegant and magnificent\*. The number of housekeepers, who pay taxes, are 60,000. This city is furnished with all the exterior marks of magnificence, and erections for manufactures and commerce (particularly a national bank, the capital of which is 466,666l. 13s. 4d. sterling), that are common to other great European cities.

GOVERNMENT.] The government of Sweden has undergone many changes. The Swedes, like the Danes, were originally free, and during the course of many

\* Coxe, vol. ii. p. 327, 328.

centuries the crown was elective; but after various revolutions, Charles XII. who was killed in 1718, became despotic. He was succeeded by his sister Ulrica, who consented to the abolition of despotism, and restored the states to their former liberties; and they, in return, raised her husband, the landgrave of Hesse-Cassel, to a share in the government. A new model of the constitution was then drawn up, by which the royal power was brought too low; for the king of Sweden could scarcely be called by that name, being limited in every exercise of government, and even in the education of his children. The diet of the states appointed the great officers of the kingdom; and all employments of any value, ecclesiastical, civil, or military, were only to be conferred with the approbation of the senate. The estates were formed of deputies from the four orders, nobility, clergy, burghers, and peasants. The representatives of the nobility, which included the gentry, amounted to above 1000, those of the clergy to 200, the burghers to about 200, and the peasants to 200. Each order sat in its own house, and had its own speaker, and each chose a secret committee, for the dispatch of business. The states were to be convoked once in three years, in the month of January; and their collective body had greater powers than the parliament of Great Britain, because the king's prerogative was more bounded.

When the states were not sitting, the affairs of the public were managed by the king and the senate, which were no other than a committee of the states, but chosen in a particular manner; the nobility, or upper house, appointed 24 deputies, the clergy 12, and the burghers 12; these chose three persons, who were to be presented to the king, that he might nominate one out of the three for each vacancy. The peasants had no vote in electing a senator. Almost all the executive power was lodged in the senate, which consisted of 14 members, besides the chief governors of provinces, the president of the chancery, and the grand marshal. Those senators, during the recess of the states, formed the king's privy council; but he had no more than a casting vote in their deliberations. Appeals lay to them from different courts of judicature; but each senator was accountable for his conduct to the states. The senate had the power of imposing upon the king a sub-committee of their number, who were to attend upon his person, and to be a check upon all his proceedings, down to the very management of his family. It would be endless to recount the numerous subordinate courts, boards, commissions, and tribunals, which the jealousy of the Swedes had introduced into the administration of civil, military, commercial, and other departments. Their officers and ministers, under the notion of making them checks upon one another, were multiplied to an inconvenient degree; and the operations of government were greatly retarded, if not rendered ineffectual, by the tedious forms through which they must pass.

But in August, 1772, the whole system of the Swedish government was totally changed by the late king, in the most unexpected manner. The circumstances which attended this revolution will be found in our history of this kingdom. By that event, the Swedes, instead of having the defects of their constitution rectified, found their king invested with a degree of authority little inferior to that of the most despotic princes of Europe; with power to assemble and separate the states whenever he pleases; to have the sole disposal of the army, the navy, finances, and all employments civil and military; and though a power of imposing taxes on all occasions be not openly claimed, yet such as already subsist are to be perpetual; and in case of invasion, or pressing necessity, the king may impose some taxes till the states can be assembled; of which necessity he is to be the judge, and the meeting of the states to depend upon his pleasure: and when they are assembled, they are to deliberate upon nothing but what the king thinks proper to lay before them. It is easy to discern, that a government thus constituted

situated, can be little removed from despotism. Yet in the new system, which consists of fifty-seven articles, a senate is appointed, consisting of seventeen members, comprehending the great officers of the crown, and the governor of Pomerania; and they are required to give their advice in all affairs of state, whenever the king shall demand it. In that case, if the questions agitated are of great importance, and the unanimous advice of the senators should be contrary to the opinion of the king, the king, it is said, shall follow their advice. But this, it may be observed, is a circumstance that can hardly ever happen, that all the members of a senate, consisting chiefly of officers of the crown, should give their opinions against the king; and in every other case the king is to hear their opinions, and then to act as he thinks proper.

**PUNISHMENTS.]** The common methods of execution in Sweden are beheading and hanging; for murder, the hand of the criminal is first chopped off, and he is then beheaded and quartered; women, after beheading, instead of being quartered, are burned. No capital punishment is inflicted without the sentence being confirmed by the king. Every prisoner is at liberty to petition the king, within a month after the trial. The petition either complains of unjust condemnation, and in such a case demands a revial of the sentence; or else prays for pardon, or a mitigation of punishment. Malefactors are never put to death, except for very atrocious crimes, such as murder, house-breaking, robbery upon the highway, or repeated thefts. Other crimes, many of which in some countries are considered as capital, are chiefly punished by whipping, condemnation to live upon bread and water, imprisonment and hard labour, either for life, or for a stated time, according to the nature of the crime. Criminals were tortured to extort confession till the reign of the late king; but, in 1773, his Swedish majesty abolished this cruel and absurd practice.

**POLITICAL INTERESTS OF SWEDEN.]** In the reign of Gustavus Vasa, a treaty of alliance took place between Sweden and France; and Sweden entered into a subsidiary treaty with that crown, in the reign of Gustavus Adolphus. In consequence of these treaties, France by degrees acquired an ascendancy in Sweden, which was very pernicious to the interests of the kingdom. This crown has generally received a subsidy from France for 100 years past, and has suffered greatly by it. During the reign of Charles the Xth and Charles the XIIth, Sweden was sacrificed to the interest of France; and during the last war with the king of Prussia, for the sake of a small subsidy from France, the crown of Sweden was forced to contract a debt of 3,500,000*l.* which has since been considerably augmented: so that this debt now amounts to near five millions. Some of their wisest men perceived the mischievous tendency of their connection with France, and endeavoured to put an end to it. But the influence of the French court in Sweden, in consequence of their subsidies and intrigues, has occasioned considerable factions in that kingdom. In 1738, a most powerful party appeared in the diet in favour of French measures. The persons who composed it went under the denomination of *Hats*. The object they held out to the nation was, the recovery of some of the dominions yielded to Russia; and consequently the system they were to proceed upon, was to break with that power, and connect themselves with France. The party directly opposed to them was headed by count Horn, and those who had contributed to establish the new form of government, which was settled after the death of Charles XII. Their object was peace, and the promotion of the domestic welfare of the nation. The system, therefore, which they adopted, was to maintain a close correspondence with Russia, and to avoid all farther connection with France. These were styled the *Caps*. There was besides a third party, called the *Hunting Caps*, composed of persons who were as yet undetermined to which of the other two they would join themselves. These parties long continued,

continued; but the French party generally prevailed greatly to the detriment of the real interest of the kingdom. Some efforts were employed by the English court to lessen or destroy the French influence in Sweden, and for some time they were successful; but the *Hat* party again acquired the ascendancy. These parties are now abolished, in consequence of the late king having made such a change in the constitution of government.

**REVENUE AND COIN.]** The revenue of Sweden, since the unfortunate wars of Charles XII. and with the Russians since, has been greatly reduced. Livonia, Bremen, Verden, and other places disunited from that kingdom, contained about 78,000 square miles. Her gold and silver specie, in the late reign, arose chiefly from the king's German dominions. Formerly the crown-lands, poll-money, tithes, mines, and other articles, are said to have produced a million sterling. The payments, that are made in copper, which was till lately the chief medium of commerce, is extremely inconvenient, some of those pieces being as large as tiles; and a cart or wheelbarrow is often required to carry home a moderate sum. The Swedes, however, have good ducats, and eight-mark pieces of silver, valued each at 5s. 2d. but these are scarce, and the inhabitants of Sweden have little specie in circulation; large pieces of copper stamped, and small bank notes being almost their only circulating money.

**STRENGTH AND FORCES.]** No country in the world has produced greater heroes, or braver troops, than the Swedes; and yet they cannot be said to maintain a standing army, as their forces consist of a regulated militia. The cavalry is clothed, armed, and maintained, by a rate raised upon the nobility and gentry, according to their estates; and the infantry by the peasants. Each province is obliged to find its proportion of soldiers, according to the number of farms it contains; every farm of 60 or 70l. per annum is charged with a foot-soldier, furnishing him with diet, lodging, and ordinary clothes, and about 20s. a year in money; or else a little wooden house is built for him by the farmer, who allows him hay and pasturage for a cow, and ploughs and sows land enough to supply him with bread. When embodied, they are subject to military law, at other times to the civil law of the country. This national army is thought to amount to above 40,000 men, and Sweden formerly could have fitted out 40 ships of the line; but of late years their ships, together with their docks, have run to decay.

**ROYAL STYLE.]** The king's style is king of the Goths and Vandals, great prince of Finland, duke of Schonen, Pomerania, &c.

**ORDERS OF KNIGHTHOOD.]** These are, the order of the *North Star*, consisting of 24 Members; the order of *Vasa*; and the order of the *Sword*; the last created in 1772.

**HISTORY OF SWEDEN.]** The Goths, the ancient inhabitants of this country, joined by the Normans, Danes, Saxons, Vandals, &c. have had the reputation of subduing the Roman Empire. I shall not follow the romances of Swedish historians through the early ages, but only observe that Sweden has as good a claim to be an ancient monarchy as any with which we are acquainted. The history of this kingdom, and indeed of all the northern nations, even during the first ages of Christianity, is confused, uninteresting, and often doubtful; but replete with murders, massacres, and ravages. That of Sweden is void of consistency, till about the middle of the fourteenth century, when it assumes a more regular appearance. At this time the government was far from being clearly ascertained, or uniformly administered. The crown was elective, though in this election the rights of blood were not altogether disregarded. The great lords possessed the most considerable part of the wealth of the kingdom, which consisted chiefly in land; commerce being unknown or neglected, and even agriculture in a very rude and imperfect state. The clergy, particularly those of a dignified rank, from the

great

great respect paid to their characters among the inhabitants of the North, had acquired an influence in all public affairs, and obtained possessions of what lands had been left unoccupied by the nobility. These two ranks of men, enjoying all the property of the state, formed a council called the senate, which governed all public deliberations. This system of government was extremely unfavourable to the national prosperity; and in the dissensions between their prelates and laybarons, or between those and their sovereign, the Swedes were drained of the little riches they possessed, to support the indolent pomp of a few bishops; and, what was more fatal, the unlucky situation of their internal affairs exposed them to the inroads and oppression of a foreign enemy. These were the Danes, who, by their neighbourhood and power, were able to avail themselves of the dissensions in Sweden, and to subject, under a foreign yoke, a country weakened and exhausted by its domestic broils. In this deplorable situation Sweden remained for more than two centuries; sometimes under the nominal subjection of its own princes, sometimes united to the kingdom of Denmark, and in either case equally oppressed and insulted.

Magnus Ladeslaus, crowned in 1276, was the first king of Sweden who pursued a regular system to increase his authority; for which purpose, he made the augmentation of the revenues of the crown his principal object. He was one of the ablest princes who ever sat on the Swedish throne; by his address he prevailed upon the convention of estates to make very extraordinary grants to him for the support of his royal dignity. The augmentation of the revenues of the crown was followed by a proportional increase of the regal power; and, by the steady and vigorous exertion he made of it, Magnus humbled the haughty spirit of his nobles, and by employing his authority in many respects for the public good, reconciled his subjects to acts of power, which in former monarchs they would have opposed with violence. The successors of Magnus did not maintain their authority with equal ability; and several revolutions followed, which threw the nation into great confusion.

In the year 1387, Margaret, daughter of Valdemar, king of Denmark, and widow of Huguin, king of Norway, reigned in both these kingdoms. That princess, to the ordinary ambition of her sex, added a penetration and enlargement of mind, which rendered her capable of conducting the greatest and most complicated designs. She has been called the Semiramis of the North, because like Semiramis she found means to reduce by arms, or by intrigue, an immense extent of territory; and became queen of Denmark, Norway, and Sweden, being elected to this last in 1394. She projected the union of Calmar, so famous in the North, by which these kingdoms were for the future to remain under one sovereign, elected by each kingdom in its turn, and who should divide his residence between them all. Several revolutions ensued after the death of Margaret; and at length Christian II. the last king of Denmark, who, by virtue of the treaty of Calmar, was also king of Sweden, engaged in a scheme to render himself absolute. The barbarous policy by which he attempted to effect this design, proved the destruction of himself, and afforded an opportunity for changing the face of affairs in Sweden. To establish his authority in that kingdom, he laid a plot for massacring the principal nobility. This horrid design was actually carried into execution, November 8, 1520. Of all those who could oppose the despotic purposes of Christian, no one remained in Sweden but Gustavus Vasa, a young prince, descended of the ancient kings of that country, and who had signalized his arms against the king of Denmark. A price was laid on his head. The Danish soldiers were sent in pursuit of him; but by his dexterity he eluded all their attempts, and escaped, under the disguise of a peasant, to the mountains of Dalecarlia. This is not the place to relate his dangers and fatigues, his labours in the brass-mines, his being

†

betrayed

betrayed by those in whom he reposed his confidence, his surmounting a thousand obstacles, and his engaging the savage but warlike inhabitants of Dalecarlia to undertake his cause, to oppose, and to conquer his tyrannical oppressor. Sweden, by his means, again acquired independence. Gustavus was at the head of a victorious army, who admired his valour, and loved his person. He was created therefore first administrator, and afterwards king of Sweden, by the universal consent of the whole nation. His circumstances were much more favourable than those of any former prince who had possessed this dignity. The massacre of the nobles had freed him from those proud and haughty enemies, who had long been the bane of all regular government. The clergy were no less powerful and dangerous; but the opinions of Luther, which began at this time to prevail in the North, and the credit which they had acquired among the Swedes, gave him an opportunity of changing the religious system of that country; and the exercise of the Roman catholic religion was prohibited in the year 1544, under the severest penalties, which have never been relaxed. Instead of a Gothic aristocracy, the most turbulent of all governments, and, when empoisoned by religious tyranny, of all governments the most wretched, Sweden, in this manner, became a regular monarchy. Some favourable effects of this change were soon visible: arts and manufactures were established and improved; navigation and commerce began to flourish; letters and civility were introduced; and a kingdom, known only by name to the rest of Europe, began to be known by its arms, and to have weight in all public treaties or deliberations. Gustavus died in 1559.

Under Eric, who succeeded his father Gustavus Vasa, the titles of count and baron were introduced into Sweden, and made hereditary. Eric's causeless jealousy of his brothers forced them to take up arms; and the senate siding with them, he was deposed in 1566. His brother John succeeded him, and entered into a ruinous war with Russia, and a fruitless scheme for restoring the Catholic religion in Sweden. John's son, Sigismund, was chosen king of Poland in 1587, John died in 1592.

Charles, brother to king John, was chosen administrator of Sweden; and being a strenuous protestant, his nephew Sigismund endeavoured to drive him from the administrathip, but without effect; till at last he and his family were excluded from the succession to the crown, which was conferred upon Charles in 1599. The reign of Charles, through the practices of Sigismund, who was a powerful prince, and at the head of a great party both in Sweden and Russia, was turbulent; which gave the Danes encouragement to invade Sweden. Their invasion was checked by the great Gustavus Adolphus, then a minor, and heir apparent to Sweden. Upon the death of his father, in 1611, he was declared of age by the states, though then only in his eighteenth year. Gustavus, soon after his accession, found himself, through the intrigues of the Poles, Russians, and Danes, engaged in a war with all his neighbours, under infinite disadvantages; all which he surmounted. In 1617 he made a peace, under the mediation of James I. of England, by which he recovered Livonia, and four towns in the prefecture of Novogorod, with a sum of money besides.

The ideas of Gustavus began now to extend. He had seen much military service, and was assisted by the counsels of L. Gardie, one of the best generals and wisest statesmen of his age. His troops had become the best disciplined and most warlike in Europe. The princes of the house of Austria supported his ancient implacable enemy Sigismund, whom Gustavus defeated. In 1627, he formed the siege of Dantzick, in which he was unsuccessful; but the attempt which was defeated only by the sudden rise of the Vistula, added so much to his military character, that the Protestant cause placed him at the head of the confederacy for reducing the house of Austria. His life, from that time, was a continued chain

of

of the most rapid and wonderful successes: the very mention of which would exceed our limits. After taking Riga, and over-running Livonia, he entered Poland, where he was victorious; and from thence, in 1630, he landed in Pomerania, drove the Germans out of Mecklenburgh, defeated the famous count Tilly, who was till then thought invincible, and over-ran Franconia. Upon the defeat and death of Tilly, Walenstein, another Austrian general of equal reputation, was appointed to command against Gustavus, who was killed upon the plain of Lutzen, 1632, after obtaining a victory, which, had he survived, would probably have put a period to the Austrian greatness.

The amazing abilities of Gustavus Adolphus, both in the cabinet and the field, never appeared so fully as after his death. He left behind him a set of generals, trained by himself, who maintained the glory of the Swedish army with most astonishing valour and success. The names of duke Bernard, Bannier, Torstenfon, and Wrangel, with their illustrious actions in war, never will be forgotten. It is uncertain what course Gustavus would have pursued, had his life been prolonged; but there is the strongest reason to believe, that he had in his eye somewhat more than the relief of the Protestants, and the restoration of the Palatine family. His chancellor Oxenstern was as consummate a politician as he was a warrior; and during the minority of his daughter Christina, Oxenstern managed the affairs of Sweden with such success, that she in a manner dictated the peace of Westphalia, 1648, which brought the affairs of Europe into a new system.

Christina was but six years of age when her father was killed. She received a good education; but her fine genius took an uncommon, and romantic turn. She invited to her court Descartes, Salmasius, and other learned men; to whom she was not generous. She expressed an esteem for Grotius; and was an excellent judge of the polite arts; but illiberal and indelicate in the choice of her favourites. The duties of her high station she invariably attended to, and though her generals were basely betrayed by France, she continued to support the honour of her crown. Being resolved not to marry, she resigned her crown to her cousin Charles Gustavus, son to the duke of Deux-Ponts, in 1654.

Charles had great success against the Poles: he drove their king, John Casimir, into Silesia; and received from them an oath of allegiance, which, with their usual inconstancy, they broke. His progress upon the ice against Denmark has been already mentioned; and he died of a fever in 1660. His son Charles XI. was not five years of age at his father's death; and this rendered it necessary for his guardians to conclude a peace with their neighbours, by which the Swedes gave up the island of Bornholm, and Drontheim in Norway. All differences were accommodated at the same time with Russia and Holland; and Sweden continued to make a respectable figure in the affairs of Europe. When Charles came to be of age, he received a subsidy from the French king, Lewis XIV. but perceiving the liberties of Europe to be in danger from that monarch's ambition, he entered into the alliance with England and Holland. He afterwards joined with France against the house of Austria; but being defeated in Germany at Felen-Bellin, a powerful confederacy was formed against him. The elector of Brandenburg made himself master of the Swedish Pomerania: the bishop of Munster over-ran Bremen and Verden, and the Danes took Wismar, and several places in Schonon. They were afterwards beaten; and Charles by the treaty of St. Germain, recovered all he had lost, except some places in Germany. He then married Ulrica Leonora, the king of Denmark's sister; but made a very bad use of the tranquillity he had regained, by employing his arms to enslave his people. The states lost all their power, and Sweden was now reduced to the condition of Denmark. He ordered the brave Patkul, who was at the head of the Livonian deputies, to lose his head and his right hand, for the boldness of his remonstrance in favour of his country-

men, but that patriot saved himself by flight; and Charles became so powerful, that the conferences for a general peace at Ryſwick, 1697, were opened under his mediation.

Charles XI. died in 1697, and was ſucceeded by his minor ſon, the famous Charles XII. The history of no prince is better known than that of this hero. His father's will had fixed the age of his majority to eighteen; but it was ſet aſide for an earlier date by the management of count Pier, who became his firſt miniſter. Soon after his acceſſion, the kings of Denmark and Poland, and the czar of Muſcovy, formed a powerful confederacy againſt him, encouraged by the mean opinion they had of his youth and abilities. He oppoſed them all; and beſieging Copenhagen, he dictated the peace of Travendahl to his Daniſh majeſty, by which the duke of Holſtein was re-eſtabliſhed in his dominions. The czar Peter was at this time ravaging Ingria, at the head of 80,000 men, and had beſieged Narva. The army of Charles did not exceed 20,000 men; but ſuch was his magnanimity, that he advanced at the head of 8000, entirely routed the main body of the Ruſſians, and raiſed the ſiege. His ſucceſſes were ſo great that the Ruſſians attributed his actions to necromancy. His achievements in Saxony equalled thoſe of Guſtavus Adolphus. He dethroned Auguſtus, king of Poland; but ſtained all his laurels, by putting the brave count Patkul to a death equally painful and ignominious. He raiſed Stanislaus to the crown of Poland in 1705, and he was courted by all the powers of Europe; and, among others, by the duke of Marlborough, in the name of queen Anne, amidſt the full career of her ſucceſſes againſt France. His implacable diſpoſition, however, was ſuch, that he cannot be conſidered in a better light than that of an illuſtrious madman; for he loſt in the battle of Pultowa, which he fought in 1709, in his march to dethrone the czar, more than all he had gained by his victories. His brave army was ruined, and he was forced to take refuge among the Turks at Bender. His actions there, in attempting to defend himſelf with 300 Swedes againſt 30,000 Turks, prove him to have been worſe than frantic. The Turks afterwards found it convenient for their affairs to ſet him at liberty. After his return to his dominions, he proſecuted his revenge againſt Denmark, till he was killed by a cannon ſhot, at the ſiege of Frederichſhall, in Norway, in 1718, when he was no more than thirty-fix years of age. It has been ſuppoſed, that Charles was not in reality killed by a ſhot from the walls of Frederichſhall, but that a piſtol\*, from one of thoſe about him, gave the deciſive blow, which put an end to his life. This opinion is ſaid to be very prevalent in Sweden. And it appears, that the Swedes were tired of a prince, under whom they had loſt their richeſt provinces, their braveſt troops, and their national riches; and who yet, untamed by adverſity, purſued an unſucceſſful war, nor would ever have liſtened to the voice of peace, or conſulted the internal proſperity of his country.

Charles XII. was ſucceeded by his ſiſter, the princeſs Ulrica Eleonora, wife to the hereditary prince of Heſſe. We have ſeen in what manner the Swedes recovered their liberties, and have given ſome account of the capitulation ſigned by the queen and her husband. The Swedes, to prevent farther loſſes by the progreſs of the Ruſſian, the Daniſh, the Saxon, and other arms, made many ſacrifices to obtain peace from thoſe powers. The French, however, about the year 1738, formed that dangerous party in the kingdom, under the name of the *Habs*, which hath been already mentioned, and which not only broke the internal quiet of the kingdom, but led it into a ruinous war with Ruſſia. Their Swediſh majeſties having no children, it was neceſſary to ſettle the ſucceſſion; eſpecially as the duke of

\* The reader, who is deſirous of ſeeing the arguments on both ſides of this queſtion, which could not with propriety be given in detail in this concluſion

narrative, will be highly gratified by conſulting Coxe's Travels into Poland, Ruſſia, Sweden, and Denmark, 4to. vol. ii. p. 351—363.

Holstein was descended from the queen's eldest sister, and was, at the same time, the presumptive heir to the empire of Russia. Four competitors appeared; the duke of Holstein Gottorp, prince Frederic of Hesse-Cassel, nephew to the king, the prince of Denmark, and the duke of Deux-Ponts. The duke of Holstein would have carried the election, had he not embraced the Greek religion, that he might mount the throne of Russia. The czarina interposed, and offered to restore all the conquests she had made from Sweden, except a small district in Finland, if the Swedes would receive the duke of Holstein's uncle, the bishop of Lubeck, as their hereditary prince, and successor to their crown. This was agreed to; and a peace was concluded at Abo, under the mediation of his Britannic majesty. This treaty was so firmly adhered to by the czarina, that his Danish majesty thought proper to forget the indignity done to his son. The prince's successor, Adolphus Frederic, married the princess Ulrica, sister to the king of Prussia; and entered into the possession of his new dignity in 1751. He was a prince of a mild and gentle temper, much harrassed by the contending Swedish factions, and found his situation extremely troublesome, in consequence of the restraints and opposition which he met with from the senate. He passed the greatest part of his reign very disagreeably, and was, at length, through the intrigues of the queen, brought over to the French party. He died in February 1771, and was succeeded by his son, Gustavus the Third, the late king, who was married in 1766, to Sophia Magdalena, daughter of Frederic V. of Denmark.

Gustavus was about five and twenty years of age when he was proclaimed king of Sweden; his understanding had been much cultivated, he had an intuiating address, and a graceful and commanding elocution. He was at Paris at the time of his father's death, from whence he wrote in the most gracious terms to the senate, repeatedly assuring them that he designed to govern according to the laws. In consequence of the death of his predecessor, an extraordinary diet was called to regulate the affairs of the government, and to settle the form of the coronation-oath. Some time after his arrival in Sweden, on the 28th of March, 1773, he solemnly signed and swore to observe twenty-four articles, relative to his future administration of the government. This was termed a capitulation; and among the articles were the following: "The king promises before God to support the government of the kingdom as then established; to maintain the rights and liberties of the states, the liberties and security of all his subjects, and to reign with gentleness and equity according to the laws of the kingdom, the form of the regency as it was established in the year 1720, and conformable to the present act of capitulation. In consequence of the declaration of the states, the king shall regard any person, who shall openly or clandestinely endeavour to introduce absolute sovereignty, as an enemy of the kingdom, and as a traitor to his country, and every person must take an oath respecting this matter before he can take possession of any employment. With regard to the affairs of the cabinet and the senate, the king promises to follow the regulations of the year 1720 upon that head, which were to be directed always by a majority of votes, and never to do any thing therein without, and much less against, their advice. To the end that the council of state may be so much the more convinced of the inviolable designs of his majesty, and of his sincere love for the good of his people, he declares them to be entirely disengaged from their oath of fidelity, in case that he unjustly acts contrary to his coronation-oath, and to this capitulation. And lastly, the king threatens any person with his highest displeasure, who shall be so inconsiderate as to propose to him a greater degree of power and splendor than is marked out in this act of capitulation, as his majesty desires only to gain the affection of his faithful subjects, and to be their powerful defender against any attempts which may be made upon their lawful liberties."

But scarcely had the king taken these solemn oaths to rule according to the then established form of government, and accepted the crown upon these conditions, before he formed the plan to govern as he thought proper, regarding most sacred engagements as matters of ceremony. On his first arrival at Stockholm, he adopted every method which the most profound dissimulation and the utmost dexterity could suggest, to increase his popularity. Three times a week he regularly gave audience to all who presented themselves. Neither rank, fortune, or interest, were necessary to obtain access to him: it was sufficient to have been injured, and to have a legal cause of complaint to lay before him. He listened to the meanest of his subjects with affability, and entered into the minutest details that concerned them; he informed himself of their private affairs, and seemed to interest himself in their happiness. This conduct made him considered as truly the father of his people, and the Swedes began to idolize him. In the warmth of their gratitude they forgot that motives of ambition might have some share in forming a conduct which to them appeared to proceed from principles of the purest benevolence. At the same time that he laboured to render himself generally popular, he also endeavoured to persuade the leading men of the kingdom, that he was sincerely and inviolably attached to the constitution of his country, that he was perfectly satisfied with the share of power the constitution had allotted to him, and he took every opportunity to declare, that he considered it as his greatest glory to be the first citizen of a free people. He seemed intent on banishing corruption, and promoting union; he declared he would be of no party but that of the nation, and that he would ever pay the most implicit obedience to whatever the diet should enact. These professions lulled the many into a fatal security, though they created suspicions among a few of greater penetration, who thought his majesty promised too much to be in earnest. In the mean time there happened some contentions between the different orders of the Swedish states, and no methods were left untried to foment these jealousies. Emisaries were likewise planted in every part of the kingdom, for the purpose of sowing discontent among the inhabitants, of rendering them disaffected to the established government, and of exciting them to an insurrection. At length, when the king found his scheme ripe for execution, having taken the proper measures for bringing a considerable number of the officers and soldiers\* into his interest, on the 19th of August, 1772, he totally overturned the Swedish constitution of government. In less than an hour he made himself master of all the military force of Stockholm. He planted grenadiers, with their bayonets fixed, at the door of the council-chamber, in which the senate were assembled, and made all the members of it prisoners. And that no news might be carried to any other part of Sweden, of the transaction in which the king was engaged, till the scheme was completed, cannon were drawn from the arsenal, and planted at the palace, the bridges, and other parts of the town, and particularly at all the avenues leading to it. Soldiers stood over these with matches ready lighted; all communication with the country was cut off, no one without a passport from the king being allowed to leave the city. The senators were then confined in separate apartments in the palace, and many others, who were supposed to be zealously attached to the liberties of Sweden, were put under arrest. The remainder of the day the king employed in visiting different quarters of the town, in order to receive oaths of fidelity from the magistrates, the colleges, and city militia. Oaths were also tendered the next day to the people in general, to whom he addressed a speech, which he concluded by declaring, that his only attention was to

\* The fidelity which was manifested by a private soldier, on this occasion, deserves to be recorded. The night preceding the revolution, the king being desirous of visiting the arsenal, went thither, and

ordered the sentinel to admit him. The latter refused, "Do you know who you are speaking to?" said the king, "Yes: replied the soldier, "but I likewise know my duty."

restore tranquillity to his native country, by suppressing licentiousness, overturning the aristocratic form of government, reviving the old Swedish liberty, and restoring the ancient laws of Sweden, such as they were before 1680. "I renounce now," said he, "as I have already done, all the idea of the abhorred absolute power, or what is called *sovereignty*, esteeming it now, as before, my greatest glory to be the first citizen among a truly free people." Heralds then went through the different quarters of the town, to proclaim an assembly of the states for the following day. This proclamation contained a threat, that if any member of the diet should absent himself, he should be considered and treated as a traitor to his country.

On the morning of the 21st of August, a large detachment of guards was ordered to take possession of the square, where the house of nobles stands. The palace was invested on all sides with troops, and cannon were planted in the court, facing the hall where the states were to be assembled. These were not only charged, but soldiers stood over them with matches ready lighted in their hands. The several orders of the states were here compelled to assemble. The king being seated on his throne, surrounded by his guards, and a numerous band of officers, after having addressed a speech to the states, he ordered a secretary to read the new form of government, which he offered to the states for their acceptance. As they were surrounded by an armed force, they thought proper to comply with what was required of them. The marshal of the diet, and the speakers of the other orders, signed the form of government, and the states took the oath to the king, which he dictated to them himself. This extraordinary transaction was concluded in a manner equally extraordinary. The king drew a book of *Pluma* from his pocket, and taking off his crown, began to sing *Te Deum*, in which he was joined by the assembly. He afterwards informed them, that he intended in six years time again to convene an assembly of the states. Thus was this great revolution completed without any bloodshed, in which the Swedes surrendered that constitution, which their forefathers had bequeathed to them.

The people over whom Gustavus reigned, had lost all political consequence, and all internal harmony, since the fatal reign of Charles XII. The imbecillity which succeeded upon the death of that celebrated monarch, had for half a century rendered them a prey to their ambitious and intriguing rivals. There was in the diet, says the royal historian of Prussia, a French and a Russian party; but there was not an individual among them that supported the party of the nation. Gustavus endeavoured to remedy this inconvenience; he had counteracted an aristocracy which could never have been productive of benefit to his people; he had not thought proper to disseminate principles of impartial liberty, as the most effectual balance to this dangerous inconvenience. He had found it necessary to employ the influence of France in opposition to the grasping ambition of the empress of Russia, but he was too enlightened and too proud to submit implicitly to the dictates of either. For six years from the revolution of 1772, assisted by the judicious and moderate counsel of count Charles Schetter the governor of his youth, and baron Lilljencrantz minister of the finances, he had reigned with great tranquillity; but the diets of 1773, and 1786, had enabled the higher orders of the state to recover a share of their authority, while the intrigues of Russia were daily becoming more formidable.

Such were the circumstances that induced Gustavus III. to meditate a project of hostilities against Russia. It can scarcely be doubted that he was encouraged in these views by the king of Prussia; and he was himself exceedingly anxious to engage the court of Denmark, which was equally exposed to the oppressive tyranny of Russia, to make a common cause with him in the present crisis. But the gold of Russia, as it should seem, and the sinister counsels of the corrupt courtiers of the prince of Denmark prevailed. Preparations were commenced in Sweden, in the

close

close of the year 1787, and it was on the 9th of June 1788, that the duke of Sudermania, brother to the king, set sail with twelve ships of the line from the port of Carlscron; at the same time that a number of troops rendezvoused at Stockholm, and seemed only to wait for a favourable wind to transport them to the frontiers of Finland.

It was in this situation that count Rafomoufki, ambassador from the czarina to the court of Stockholm, delivered an official note to the Swedish administration on the 18th of June, demanding an explanation respecting these warlike preparations. It will not be easy to understand the transactions that followed upon this note, without recollecting the nature of the Russian ambassador's situation, in the court of Gustavus. He was not considered here simply as what his title imported, the representative of his mistress, but as the head of a party in Sweden, as a visible centre of cabal and intrigue, and the animating soul of a body of men, who, instigated by the monarchy that delegated him, had frequently shaken the throne of Sweden to its foundation. The Russian party in this country had suffered a temporary defeat from the decisive conduct of Gustavus in the commencement of his reign; but they had since recovered the blow, and their machinations became every day more formidable. In this light the expressions of count Rafomoufki in the state-paper we have mentioned, will appear exceptionable, where he "declares to the administration of the king as well as to all persons of the Swedish nation, possessing any share in its government, that the czarina entertained dispositions towards them the most entirely pacific, and took a sincere interest in the preservation of their tranquillity."

The established rights of independent nations thus trampled upon, the king conceived the warmest resentment against the language of this note. Appointed to declare the sentiments of his masters, an envoy could properly address himself to the monarch alone. Every other authority was foreign to him; every other witness superfluous. Such was the law, such the proceeding of every court in Europe, which had in no instance been violated, but for unfriendly purposes. Gustavus quitted the port of Stockholm on the 24th of June 1788, and arrived with his army in Finland on the 2d of July.—In our account of Russia, the reader will find a narrative of some of the principal transactions of the war. After various engagements both by land and sea, in which Gustavus III. gave a display of most indefatigable exertions, an agreement for establishing an everlasting peace, and fixing the frontiers of Russia, as they were before the war broke out, was signed at Werela on the river Kymene, between the plenipotentiaries of the empress of Russia and the king of Sweden.

A diet, summoned by the king to meet at Gesslé, a solitary place on the Bothnic Gulf, near seventy miles from Stockholm, excited much attention. Some imagined that the diet might assert the national freedom against a despotic monarch; but Gustavus had guarded against any such design, by his choice of the spot, and by posting his mercenary troops around. He found some difficulty in gaining his only intention, that of raising money, and was obliged to put up with a part of his demand.

The diet being dissolved, the king returned to Stockholm, where, at a masquerade in the opera-house, on the night of the 10th of March, 1792, he was shot with a pistol by an assassin, named Ankerstroem; in consequence of a conspiracy among some of the discontented nobles; and, having lived in great pain till the 29th of that month, he expired, in the 40th year of his age, and the 20th of his reign.

The rejection of dying gloriously through the means of a vice assassin is said to have embittered the last moments of the king's life, much more than even the agonizing pain of his wounds. He threw the same noble and brave spirit on his death-bed, as he had done before his enemies during his lifetime. He retained all his mental faculties

facilities to the last, which enabled him so well to arrange the future government of his country: the wounds at first indicated the most promising appearances of recovery, and the fluxes were all extracted, but some rusty pieces of iron had penetrated so far into the body as to render any surgical operation immediate death. The presence of mind shewn by Gustavus during his illness was very singular. While he waited for the arrival of his surgeons in an apartment adjoining the saloon of the opera-house, several of the foreign ministers presented themselves, to whom he said, "I have given orders, gentlemen, that the gates of the city shall be shut. You will, therefore, not take it ill, if you should be unable to send couriers to your courts until after three days. Your advices will then be more certain, since it will probably be known whether I can survive or not." His conversation then related to the effects, which the accident might produce in Europe; and the love of fame, which was always his predominant passion, was perceptible in his remarks.

General Baron d'Armfeldt, one of his most affectionate friends, entered the room, pale with horror, and unable to utter a word. As he approached, the king stretching out his hand to him, said, "what's the matter, my friend? be not alarmed on my account. You know, by experience, what a wound is!" thus politely alluding to a wound which the general had received in Finland.

Finding that he was not likely to survive, he settled all his affairs, as a man does who is preparing for a journey, with all the composure imaginable. He sent for his son, the prince royal, and addressed a speech to him on the nature of a good government, in a manner so truly affecting, that all those who were present, were dissolved in tears. At eight o'clock, on the morning of his death, he received the sacrament. The queen had taken leave of him the evening before, and at half past ten he died in great agonies.

Thus fell by the hand of treason, Gustavus III. a prince of high ambition, but rather a man of address than of ability. His manners were popular and insinuating, his eloquence fluent and bold. His conduct was, however, seldom tempered with judgment, or his speeches replete with wisdom. If in private life a turbulent disposition unfits a man for society, surely the evil is increased in an infinite proportion, where the lives of millions, and the treasures of nations are wantonly squandered. By the passion of Gustavus for war, Sweden was exhausted of its resources, and reduced in its population. It is but just, however, to add, that except his love of war, which certainly always indicates a want of feeling and humanity, the errors of Gustavus appear to have been rather errors of the understanding, than of the heart. Even in desiring arbitrary power, he does not seem to have been prompted by any inclination to abuse it; for he was not practically a tyrant. The last scene of his life was such indeed as ought to blot from remembrance a long catalogue of crimes. His last words were a declaration of pardon to the conspirators against his life. The actual murderer alone was excepted; and he was excepted at the strong instance of the regent, and those who surrounded his majesty in his dying moments.

The prince royal, being fourteen years of age, was immediately proclaimed king, by the name of Gustavus Adolphus; and the duke of Sudermania, his uncle, and brother to the late king, in compliance with his majesty's will, was declared sole regent, and guardian of the young sovereign, till he attains his majority, which is fixed at the age of eighteen. The mild and equal conduct of the regent has preserved the country from the horrors of internal war; while the wisdom, spirit, and patriotism of his councils, will probably save it from the insidious attacks of a restless and dangerous neighbour. Wisely averse to hostility, the duke of Sudermania has cultivated successfully the friendship of all the belligerent powers, except Russia. In the mean time, his attention has been laudably directed to exciting the

dormant

dormant spirit of industry in the nation; to the encouragement of their domestic manufactures, and to the enforcing of rigid œconomy among all the dependents of government, in order that the example of the court, co-operating, with his own, may exert a salutary influence over the people in opposing the increase of luxury, gambling and dissipation. It is a pleasure to contemplate such dispositions in so elevated a station; and while the regent perseveres in this conduct, he will undoubtedly merit the enviable title of the father of his prince and his country.

Several circumstances have occurred in Sweden, which induce us to believe that there exists a spirit of freedom in that country. Intelligence from Stockholm announces, that very free sentiments are indulged in that city, and that even the government is not disposed to proceed with much severity against the advocates of liberty. In the beginning of the year 1793, Mr. Thorild published a pamphlet, intitled, "The Liberty of Reason laid open to the Regent and to the Swedish Nation." This pamphlet is addressed to his highness, and summons him to grant to the nation the liberty of reason, and points out the advantages of a republic. This pamphlet was immediately suppressed and the author imprisoned. When Mr. Thorild was tried, however, the citizens insisted that the doors of the court of justice should be open, that they might assist at the trial. This request was complied with, and when they heard his defence, they applauded the prisoner, and on his return, are said to have accompanied his carriage with shouts of approbation.

The court of Stockholm published a proclamation, in June 1793, in which it was most solemnly asserted, that the ill reports which were spread of the bad situation of this country, were without foundation; that the situation of the kingdom is as good as could be expected, after a destructive war, and a great revolution; that it is in the best understanding with foreign powers; that public credit increases; the national debts are paid by degrees; that the king's household observes the strictest œconomy; that the debts of the late king amounting to one hundred and fifty thousand six-dollars, are all liquidated; and the expences of the court diminished above thirty-three thousand six-dollars; and that, although it cannot yet repeal the taxes, it is certain that no fresh burdens are necessary. This proclamation concludes with an assurance, that during the minority of the king, no diet will be convoked, as being absolutely contrary to the will of the late monarch.

The allied powers at war with France have made considerable exertions to persuade this country to relinquish their neutrality. A note was delivered in August last by Mr. Keene, chargé d'affaires from his Britannic majesty, to the members of the cabinet of Sweden, wherein it is asserted on the part of his Britannic majesty, that orders have been issued, in his privy council, concerning several measures relative to the trade and navigation of neutral nations, during the present war; and his majesty therefore expects on the part of Sweden, that no vessels or goods taken by the enemy from British subjects, shall be permitted to enter the Swedish ports, or be sold in Sweden; also that all the British sailors, prisoners, &c. carried into the ports of Sweden by the enemy, shall immediately be set at liberty. To this note the Swedish government replied that the strictest orders would be given to observe the articles of the treaties of neutrality.

The last intelligence from Stockholm announces the discovery of a conspiracy to overturn the government. Several conspicuous characters have been imprisoned upon suspicion of being concerned in it; and by the latest accounts it appears to be the relics of the famous plot formed by the aristocracy for the subversion of the government, for which Ankerstroem suffered in the preceding year.

Gustavus Adolphus IV. of Holstein-Gottorp, king of Sweden, was born November 1, 1778; and succeeded his father March 29, 1792.

Brothers

Brothers and sisters to the late king :

1. Charles duke of Sudermania, born October 7, 1748.
2. Frederic Adolphus duke of West-Gothland, born July 18, 1750.
3. Sophia Albetina, abbess of Quedlingburgh, born in October, 1753.

## MUSCOVY, OR THE RUSSIAN EMPIRE IN EUROPE AND ASIA.

SITUATION AND EXTENT OF THE RUSSIAN EMPIRE IN EUROPE.

Length 1500 }	between	{ 23 and 65 East longitude.
Breadth 1100 }		{ 47 and 72 North latitude.

Russia in Europe contains 1,194,976 SQUARE MILES, with 17 Inhabitants to each.

**DIVISIONS } ACCORDING** to the most authentic accounts of this mighty em-  
**AND NAME. }** pire, it consists of forty-two provinces, or governments, besides  
 part of Carelia, Esthonia, Ingria, Livonia, and part of Finland, conquered from  
 Sweden; the Crimea, or Crim Tartary, anciently the Taurica Cherfonefus, a pen-  
 ninsula in the Euxine sea, subject to the Turks formerly, but added, in the year 1783,  
 to the Russian empire, together with the isle of Taman, and part of Cuban. The  
 Russians are supposed to have gained above a million of subjects by this cession; they  
 possess also the duchy of Courland, and a great part of Lithuania, in Poland; together  
 with some large territories, in consequence of a second partition of Poland, in the  
 year 1793, between the czarina, and the king of Prussia; so that she has for ever  
 united to her empire the following tracts of land, with all their inhabitants, viz.  
 a line beginning at the village of Druy, on the left bank of the river Dwina, from  
 thence extending to Neroch and Dubrova; from thence passing Kunish, near the  
 frontier of Galicia; from thence to the river Dniester; and lastly, running along  
 the river till it enters the old border of Russia and Poland at Jegertic\*.

The following table will give some idea of the Russian empire, properly so call-  
 ed, or Russia in Europe, with its acquisitions from Sweden in the present century;  
 and also of the Russian empire in its most extensive sense, for we must also include  
 all the acquisitions in Tartary now known by the name of Siberia: the whole  
 comprehending the northern parts of Europe and Asia, stretching from the Baltic  
 and Sweden on the West, to Kamtschatka and the Eastern Ocean; and on the  
 North, from the Frozen Ocean to the forty-seventh degree of latitude, where it  
 is bounded by Poland, Little Tartary, Turkey, Georgia, the Euxine and Caspian  
 Seas, Great Tartary, Chinese Tartary, and some unknown regions in Asia.

The country now comprised under the name of Russia, or the Russias, is of an  
 extent nearly equal to all the rest of Europe, and greater than the Roman empire  
 in the zenith of its power, or the empire of Darius subdued by Alexander, or  
 both put together, as may be seen by turning to the table, page 28.

\* See the Ukase (or Manifesto) of the empress relative to the second partition of Poland, dated  
 March, 1793.

Russia takes its name from the Ruffi or Boruffi, a Slavonic tribe. The word Muscovy is derived from the river Mosca, on which the ancient capital Moscow stands. According to its situation and climate, the country is divided into the northern, middle, and southern regions; and those again divided into governments, named after those towns in which courts of judicature are established. The northern division contains the governments of St. Peterburg, Archangel, Olonetz, Vybourg, Revel, Riga, Pfcov, Tver Novgorod, Vologda, Yarostavl, Kostroma Vitka, Perme, Tobolsk. The middle division contains the governments of Moscow, or Moscov, generally called Mosqua by the Russians, Smolensk, Polotsk, Mooghilev, Tchernigow, Novgorod, and Sieverskoy, Kharkov, Kourik, Orel, Kalouz, Toola, Riazane, Vladimer, Nezney-Novgorod, Kazane, Sinberk, Penza, Tambow, Voronez, Saralov, Oufa, Kolkvanc, Irkoutk. The southern region contains the governments of Kiev, Featherinoflav, Caucasus, the province of Taurida, and the habitations of the Don Kozaks\*.

CLIMATE, SOIL, PRODUCTIONS, VEGETABLES, MINES, AND MINERALS. } Muscovy, the longest day does not exceed fifteen hours and a half: whereas in the most northern the sun is seen in summer two months above the horizon. The reader from this will naturally conclude, that there is in Muscovy a great diversity of soil as well as climate, and that the extremes of both are to be seen and felt in this vast empire.

The severity of the climate in Russia, properly so called, is very great. Dr. John Glen King, who resided eleven years in Russia, observes that the cold in St. Petersburg, by Fahrenheit's scale, is, during the months of December, January, and February, usually from 8 to 15 or 20 degrees below 0; that is, from 40 to 52 degrees below the freezing point; though commonly, in the course of the winter, it is for a week or ten days some degrees lower. "It is difficult," says Dr. King,

\* In this table, which is copied from the authentic work of Captain Plecheef, the spelling of the Russian names is adapted to the English pronunciation, by his accurate translator, Mr. Smirnov, chaplain to the Russian legation at the court of Great Britain.

"for

“ for an inhabitant of our temperate climate to have any idea of a cold to intense; when a person walks out in that severe weather, the cold makes the eyes water, and that water freezing, hangs in little icicles on the eye-lashes. As the peasants usually wear their beards, you may see them hanging at the chin like a solid lump of ice; but, even in that state, the beard is found very useful in protecting the glands of the throat; and the soldiers, who do not wear their beards, are obliged to tie a handkerchief under the chin to supply their place. All the parts of the face which are exposed are liable to be frozen: though it has often been observed, that the person himself does not know when the freezing begins; but is commonly told of it by those who meet him, and who call out to him to rub his face with snow, the usual way to thaw it. It is also remarked, that the part which has once been frozen, is ever after most liable to be frozen again. In some very severe winters, sparrows, though a hardy species of birds, have been seen quite numbed by the intense cold, and unable to fly; and drivers, when sitting on their loaded carriages, have sometimes been found frozen to death in that posture. When the thermometer has stood at 25 degrees below 0, boiling water, thrown up into the air by an engine, so as to spread, has fallen down perfectly dry, formed into ice. A pint bottle of common water was found frozen into a solid piece of ice in an hour and a quarter. A bottle of strong ale has also been found frozen in an hour and an half: but in this substance there was about a tea-cup full in the middle unfrozen, which was as strong and inflammable as brandy or spirits of wine. But notwithstanding the severity of the cold in Russia, the inhabitants have such various means to guard against it, that they suffer much less than might be imagined. The houses of persons in tolerable circumstances are so well protected, both without doors and within, that there is seldom reason to complain of cold. The method of warming the houses in Russia is by an oven constructed with several flues, supplied by wood, which is the common fuel, and in great plenty. These ovens consume a much smaller quantity than might be imagined, and yet they serve at the same time for the ordinary people to dress their food. They put a very moderate faggot into them, and suffer it to burn only till the thickest black smoke is evaporated; they then shut down the chimney to retain all the rest of the heat in the chamber; by this method the chamber keeps its heat twenty-four hours, and is commonly so warm, that they sit with very little covering. The windows in the huts of the poor are very small, that as little cold may be admitted as possible: in the houses of persons of distinction, the windows are caulked up against winter, and commonly have double glass frames. They can regulate the warmth in their apartments by a thermometer with great exactness, opening or shutting the flues to increase or diminish the heat. When the Russians go out, they are clothed so warmly, that they almost bid defiance to frost and snow; and it is observable, that the wind is seldom violent in the winter; but when there is much wind, the cold is exceedingly piercing.”

One advantage, which the Russians derive from the severity of their climate, is the preserving of provisions by the frost. Many families, as soon as the frost sets in for the winter, about the end of October, kill their poultry, and keep them in tubs packed up with a layer of snow between them, and then take them out for use as occasion requires: by this means they save the nourishment of the animal for several months. Veal frozen at Archangel, and brought to Peterburgh, 850 miles, is esteemed the finest they have; nor can it be distinguished at the table from what is fresh killed, being equally juicy. The markets in Peterburgh are thus supplied in winter with all manner of provisions, at a cheap rate; and it is curious to see the vast stacks of whole hogs, sheep, fish, and other animals, which are piled up in the markets for sale. The method of thawing frozen provisions in Russia is by immersing them in cold water: for when the operation of thawing

“ for

them is effected by heat, it occasions a violent fermentation, and almost a sudden putrefaction; but when produced by cold water, the ice is attracted out of the body, and forms a transparent incrustation round it. If a cabbage, which is thoroughly frozen, be thawed by cold water, it is as fresh as if just gathered out of the garden; but if it be thawed by fire or hot water, it becomes so rancid and strong that it cannot be eaten.

The quickness of vegetation in Russia is pretty much the same as in Scandinavia, or Sweden and Denmark. The snow is the natural manure of the land, where grain grows in plenty, near Poland, and in the warmer provinces. The bulk of the people, however, are miserably fed; the soil produces incredible numbers of mushrooms for their subsistence; and in some places, besides oaks and firs, Russia yields rhubarb, flax, hemp, pasture for cattle, wax, honey, rice, and melons. The boors are particularly careful in the cultivation of honey, which yields them plenty of metheglin, their ordinary drink; they likewise extract a spirit from rye, which they prefer to brandy.

That a great part of Russia was populous in former days, is not to be disputed; though it is equally certain, that the inhabitants, till lately, were little acquainted with agriculture: and supplied the place of bread, as some inhabitants of Scandinavia do now, with a kind of saw-dust, and a preparation of fish-bones. Peter the Great, and his successors, down to the present empress, have been at incredible pains to introduce agriculture into their dominions; and though the soil is not every where proper for corn, yet its fertility in some provinces bids fair to make grain as common in Russia as it is in the southern countries of Europe. The easy communications, by means of rivers, which the inland parts of that empire have with each other, serve to supply one province with those products in which another may be deficient. As to mines and minerals, they as much abound in Russia as in Scandinavia, and the people are daily improving in working them. Mountains of rich iron ore are found in some places, most of which produce the loadstone, and yield from 50 to 70 per cent. Rich silver and copper mines are found on the confines of Siberia.

MOUNTAINS, RIVERS, FORESTS, } Russia is in general a flat, level country,  
AND FACE OF THE COUNTRY. } except toward the north, where lie the Zimnopoias mountains, thought to be the famous Montes Rhiphei of the ancients, now called the Girdle of the Earth. On the western side of the Dnieper comes in part of the Carpathian mountains, and between the Black Sea and the Caspian, Mount Caucasus borders a range of vast plains extending to the Sea of Oral. And here we may observe, that from Peterburgh to Pekin, one shall hardly meet with a mountain on the road through Independent Tartary; and from Peterburgh to the northern part of France, by the road of Dantzick, Hamburg, and Amsterdam, we scarcely can perceive the smallest hill.

The most considerable rivers are the Wolga, or Volga, taking its source from morasses in Tver, running east and south, traversing the greatest part of Muscovy, and which, winding a course of 3000 English miles, discharges itself into the Caspian sea: producing many kinds of fish, and fertilizing the lands on each side. In this long course there is not one cataract to interrupt the navigation, but the nearer it approaches to the mouth, the river multiplies its number of isles, and divides itself into a greater number of arms than any known river in the world: all these arms divide themselves into others still less, which join and meet again; so that the Wolga discharges itself into the Caspian sea by more than 70 mouths. By means of this noble river, the city of Moscow preserves a communication, not only with all the southern parts of Russia, but even with Persia, Georgia, Tartary, and other countries bordering on the Caspian. The Don, or Tanais, which divides the eastern part of Russia from Asia, in its course towards the east, comes so near the  
Wolga,

Wolga, that the late czar intended to have cut a canal between them; but this grand project was defeated by the irruptions of the Tartars. This river, exclusive of its windings, discharges itself into the Palus Mæotis, or Sea of Afoph, about four hundred miles from its rise. The Boristhenes, or Dnieper, which is likewise one of the largest rivers in Europe, runs through Lithuania, the country of the Zaporog Cossacs, and that of the Nagaïsch Tartars, and falls into the Euxine, or Black Sea, at Kinbourn near Oczakow; it has thirteen cataracts within a small distance. To these may be added the two Dwinas, one of which empties itself at Riga into the Baltic; the other has its source near Ustiaga, and dividing itself into two branches near Archangel, there falls into the White Sea.

Forests abound in this extensive country; and the northern and north-eastern provinces are in a manner desert; nor can the few inhabitants they contain be called Christians rather than Pagans.

QUADRUPEDS, BIRDS, FISHES, } These do not differ greatly from those de-  
AND INSECTS. } scribed in the Scandinavian provinces. The

lynx, famous for its piercing eye, is a native of this empire; it is said to be produced chiefly in the fir tree forests. Hyænas, bears, wolves, foxes, and other quadrupeds already described, afford their furs for clothing the inhabitants; but those of the black foxes and ermine are more valuable in Russia than elsewhere. The dromedary and camel were formerly almost the only beasts of burden known in many parts of Russia. The czar Peter encouraged a breed of large horses for war and carriages; but those employed in the ordinary purposes of life are small, as are their cows and sheep.

We know of few birds in Russia, that have not been already described. The same may be said of fishes, except that the Russians are better provided than their neighbours with sturgeon, cod, salmon, and beluga: the latter resembles a sturgeon, and is often called the large sturgeon; it is from twelve to fifteen feet in length, and weighs from 9 to 16 and 18 hundred weight; its flesh is white and delicious. Of the roe of the sturgeon and the beluga the Russians make the famous caviar, so much esteemed for richness and flavour, that it is often sent in presents to crowned heads. In cutting up the belugas, they often find what is called the beluga-stone, concealed in that mass of glandular flesh which covers the posterior part of the dorsal spine, supplying the place of a kidney in fish. When it is taken from the fish, it is soft and moist, but quickly hardens in the air. Its size is that of a hen's egg, shape sometimes oval and sometimes flatted, and commonly sells for a ruble. This stone is supposed by professor Pallas to belong to the genitals of the fish: it holds a considerable rank, though with little merit, among the domestic remedies of the Russians, who scrape it, and mixed with water, give it in difficult labours, in the diseases of children, and other disorders.

POPULATION, MANNERS, AND CUSTOMS.] The new register in 1764, contains 8,500,000 subject to the poll-tax; and a late ingenious writer, resident some time in Russia, gives the following estimate:

Lower class of people paying capitation tax,	-	18,000,000
Conquered provinces,	-	1,200,000
Noble families,	-	60,000
Clergy,	-	100,000
Military,	-	360,000
Civil,	-	30,000
Ukraine, Siberia, Cossacks, &c.	-	350,000
		<hr/>
		20,100,000

To these must now be added near a million more by the acquisitions of the Crimea, and part of Cuban Tartary; and at least 1,500,000 in the provinces dismembered from Poland.

As her imperial majesty of all the Russias possesses many of the countries from whence the swarms of barbarians who overthrew the Roman empire issued, there is reason to believe that her dominions must have been better peopled formerly than they are at present. Perhaps the introduction of the small-pox and the venereal disease may have assisted in the depopulation; and it is likely that the prodigious quantity of spirituous liquors, consumed by the inhabitants of the North, is unfriendly to generation.

The Russians, properly so called, are personable, hardy, vigorous, and patient of labour, especially in the field, to an incredible degree. Their complexions differ little from those of the English; but the women think that an addition of red heightens their beauty. Their eye-sight seems to be defective, occasioned probably by the snow, which for a long time of the year is continually present to their eyes. Their officers and soldiers always possessed a large share of passive valour; but in the war with the late king of Prussia, they proved as active as any troops in Europe; and in the recent war with the Turks they greatly distinguished themselves. They are implicitly submissive to discipline, let it be ever so severe; they endure hardships with great patience, and can content themselves with very hard fare.

Before the days of Peter the Great, the Russians were barbarous, ignorant, mean, and much addicted to drunkenness; no less than 4000 brandy shops have been reckoned in Moscow. Not only the common people, but many of the boyars, or nobles, lived in a continual state of idleness and intoxication; and the most complete objects of misery and barbarity appeared in the streets, while the court of Moscow was the most splendid of any upon the globe. The czar and his grandees dressed after the superb Asiatic manner. The earl of Carlisle, in the account of his embassy, says, that he could see nothing but gold and precious stones in the robe of the czar and his courtiers; and his account is corroborated by travellers who have lately visited Russia. The manufactures, however, of those, and all other luxuries, were carried on by Italians, Germans, and other foreigners. Peter saw the bulk of his subjects, at his accession to the throne, treated little better than beasts of burden, to support the pomp of the court. He forced his great men to lay aside their long robes, and dress in the European manner; and he even obliged the laity to cut off their beards. The Russians, before his time, had few ships upon their coasts. They had no conveniences for travelling, no pavements in their streets, no places of public diversion; and they entertained a contempt for all improvements of the mind. At present, a French or English gentleman may live as comfortably and sociably in Russia, as in most other parts of Europe. Their polite assemblies, since the accession of the present empress, have been put under proper regulations; and few of the ancient usages remain. It is, however, to be observed, that notwithstanding the severities of Peter, and the prudence of succeeding governments, drunkenness still continues among some ranks; nor are even priests and ladies ashamed of it on holidays; and the bulk of the people are unenlightened.

The Russians were formerly noted for so strong an attachment to their native soil, that they seldom visited foreign parts. This was the consequence of their pride and ignorance; for Russian nobility, besides those who are in a public character, are now found at every court in Europe. Her imperial majesty even interests her-

\* A set of rules for the regulation of a Russian assembly concludes with this injunction—  
N. B. Ladies are not to be drunk before ten o'clock. Consett's Travels,—p. 115.

self in the education of young men of quality in the knowledge of the world, and foreign services, particularly that of the British fleet.

It is said that the Russian ladies were formerly as submissive to their husbands in their families, as the latter are to their superiors in the field; and that they thought themselves ill treated if they were not often reminded of their duty by the discipline of a whip, manufactured by themselves, which they presented to their husbands on the day of their marriage. Their nuptial ceremonies are peculiar, consisting of some very whimsical rites, many of which are now disused. When the parents have agreed upon a match, though the parties perhaps have never seen each other, the bride is critically examined by a number of females, who are to correct, if possible, any defects they find in her person. On her wedding-day she is crowned with a garland of wormwood; and after the priest has tied the nuptial knot, his clerk or sexton throws a handful of hops upon the head of the bride, wishing that she may prove as fruitful as that plant.

**FUNERALS.]** The Russians entertain many fantastic notions with regard to the state of departed souls. After the dead body is dressed, a priest is hired to pray for his soul, to purify it with incense, and to sprinkle it with holy water while it remains above ground, which, among the better sort, it generally does for eight or ten days. When the body is carried to the grave, which is done with many genuflections of sorrow, the priest produces a ticket, signed by the bishop and other clergymen, as the passport of the deceased to heaven. When this is put into the coffin between the fingers of the corpse, the company return to the house of their departed friend, where they drown their sorrow in intoxication; which lasts, among the better sort, with a few intervals, for forty days. During that time, a priest every day says prayers over the grave of the deceased; for though the Russians do not believe in purgatory, yet they imagine that their departed friend may be assisted by prayer in his long journey to the place of his destination after this life.

**PUNISHMENTS.]** The Russians were remarkable for the severity and variety of their punishments, which were both inflicted and endured with a wonderful insensibility. Peter the Great used to suspend the robbers upon the Wolga, and other parts of his dominions, by iron hooks fixed to their ribs, on gibbets, where they writhed themselves to death. The single and double knout have been inflicted upon ladies\*, as well as men of quality. Both of them are execrating; but in the double knout, the hands are bound behind the prisoner's back, and the cord being fixed to a pulley, lifts him from the ground, with the disorder of both his shoulders, and then his back is in a manner scarified by the executioner, with a hard thong, cut from a wild ass's skin. This punishment has been so often fatal, that a surgeon generally attends the patient, to pronounce the moment that it

\* A particular account of the manner in which this punishment was inflicted upon a Russian lady, is given in *menſ. l'Abſié Châppe D'Antroche's* journey into Siberia. "Mad. Lapouchin was one of the finest women belonging to the court of the empress Elizabeth, and was intimately connected with a foreign ambassador, then engaged in a conspiracy. Amidst a vast concourse of people, one of the executioners seized her by both hands, and turning half round, threw her on his back, bending forwards, so as to raise her a few inches from the ground; the other executioner then laid hold of her delicate limbs, and, without any remorse, adjusted her on the back of his companion. Sometimes he laid his large hand brutally upon her head, in order to make her keep it down; son etimes, like a butcher going to slay a lamb, he seemed to footh

her, as soon as he had fixed her in the most favourable attitude. This executioner then took a kind of whip called knout, made of a long strap of leather prepared for this purpose; he then retreated a few steps, measuring the requisite distance with a steady eye; and leaping backwards, gave a stroke with the end of the whip, so as to carry away a slip of skin from the neck to the bottom of the back; then striking his feet against the ground, he took his aim for applying the second blow parallel to the former; so that in a few moments all the skin of her back was cut away in small slips, most of which remained hanging to the first. Her tongue was cut out immediately after, and she was sent into Siberia. In 1762, she was recalled from banishment by Peter III."

should

should cease. It is not always the number of the strokes, but the method of applying them, which occasions the death of the criminal; for the executioner can kill him in three or four blows, by striking upon the ribs; though persons are sometimes recovered, in a few weeks, who have received three hundred strokes, moderately inflicted. The boring and cutting out the tongue, are likewise practised in Russia; and even the late empress Elizabeth, though the prohibited capital punishments, gave way to the supposed necessity of those tortures.

According to the strict letter of the law, there are no capital punishments in Russia, except in the case of high treason: but there is much less humanity in it than has been supposed; for there are many felons who die under the knout, and others die of fatigue in their journeys to Siberia, and from the hardships they suffer in the mines: so that there is reason to believe, that not fewer criminals suffer death in Russia than in those countries wherein capital punishments are authorized by the laws. The prohibition of torture does honour to the humanity of the present empress.

Felons, after receiving the knout, and having their cheeks and foreheads marked, are sometimes sentenced for life to the public works at Cronstadt, Vissnei Volotok, and other places; but the common practice is to send them into Siberia, where they are condemned for life to the mines at Nerzhink. There are upon an average from 1600 to 2000 convicts at these mines. The greatest part are confined in barracks, excepting those who are married; the latter are permitted to build huts, near the mines, for themselves and families.

TRAVELLING.] Among the many conveniences introduced of late into Russia, that of travelling is extremely remarkable, and the expence very trifling. Like their Scandinavian neighbours, the Russians travel in sledges made of the bark of the linden-tree, lined with thick felt, drawn by rein-deer, when the snow is frozen hard enough to bear them. In the internal parts of Russia, horses draw their sledges; and the sledge-way, in February, becomes so well beaten, that they erect a kind of couch upon the sledges, in which they may lie at full length, and so sleep and travel night and day, wrapped up in good furs; thus they often perform a journey of about 400 miles, such as that between Peterburgh and Moscow, in three days and three nights. Her imperial majesty, in her journeys, is drawn in a house which contains a bed, a table, chairs, and other conveniences for four people, by 24 post-horses; and the house itself is fixed on a sledge.

DIFFERENT NATIONS.] Russia is not a nation but a vast collection of nations, SUBJECT TO RUSSIA. } differing in persons, language, and religion. They have been divided by the Russian geographers, into the 17 following classes. 1. The Slavonic nations comprehending the Russians properly so called, who are the predominant inhabitants of the whole empire; and the Poles who inhabit the banks of the river Irith, and the governments Polotk and Mogbileu. 2. The Germanic nations, comprehending the Germans, Swedes, and Danes; the first inhabiting Esthonia and Livonia; the second, the Russian Finland; the third, the islands in the Baltic; and all the three are Lutherans. 3. The Luttonian or Livonian nations; who are intermixed in many parts with the Finns. 4. The Finns or Tehoude nations inhabiting the governments of Viborg and St. Peterburgh, Revel, the district of Riga, and part of Livonia, and chiefly Lutherans. Not less than nine nations are supposed from the similarity of their language, to descend from the Finns. They are the Laplanders or Lopari inhabiting the government of Archangel, and subsisting by hunting and fishing. The Permians who live in the government of Perme; and about the northern parts of the river Obe. The Zheryane and the Votiaki who live in the governments Kazane and Viatka, and employ themselves in husbandry. The Tcheuembili who inhabit Kazane Niznev-Novogorod and Orenburg. The Tchuvafchi and the Mordva who live together

in Kazane, Oufa, Penza, and Nizney-Novogorod. The Vogoulitchi, dwelling in the northern parts of the Oural\* mountains. The Ostiaki, who are the most numerous people in Siberia. Many of those nations, whose names are so uncouth to an English ear, are Christians; but, in many others, the greater part are Pagans, governed in all their concerns by Shamans or Wizzards. 5. The Tartarean nations, of whom we shall speak hereafter. 6. The Caucasian nations, living on the eastern coast of the Black Sea, the banks of the Kubane and the Sinja, and the broad belt of the Caucasian mountains, between the Black Sea and the Caspian. They are herdsmen and robbers, and hardly acknowledge any authority but that of their own chiefs. 7. The Samoeds, divided into European and Siberian, inhabiting the northernmost parts of Russia, along the coasts of the icy Sea from the river Pelchora as far as the Lena. They lead a wandering life, and subsist chiefly on deers flesh, and are for the most part governed by Shamans. 8. The Mungalian nations, of which the Kalmucks are the most distinguished. They moved from the east towards the river Oural, and came into the interior parts of Russia, as far as the Volga in 1723. They speak the Mungalian language, profess the religion of Lama, and live by the breeding of cattle. 9. The Youngoosi are dispersed even beyond the Chinese frontier, they live by hunting and fishing, and are idolaters, governed by Shamans. 10. The Kamtchadals, who live by hunting and fishing in the southern part of Kamtchatka. They inhabit huts in winter; and in summer build huts, a kind of buildings raised on pillars in the manner of a pigeon house. 11. The Koriaki, inhabiting the northern part of Kamtchatka, divided into the wandering or hunting, and the rein-deer Koriaki, which last live by rearing rein-deer. 12. The Kouriltzie, inhabiting part of Kamptchatka and the Kouriltzie islands. They are more civilised than the Kamptchadals, and savage nations of Siberia. 13. The Aleauti inhabit the isles between Siberia and America. These much resemble the Eskimaux, from whom they probably are descended. 14. The Arintzi, a very numerous people scattered in the government of Kolhirane. 15. The Yukaghiri are dispersed in the coasts of the Glacian sea, and seem a mixture of Samoeds and Tartars. 16. The Tchoukchi occupy the north-eastern part of Siberia. They subsist by rearing the rein-deer and by hunting, and bear much resemblance to the Koriaki, but are still more rude and savage, and much addicted to suicide. 17. Settlers from foreign nations in the Russian empire, as the Persians and Georgians in the province of Astracan; the Indians there, and the Perliar; Greeks in little Russia, and in the government of Ecatherinolloff and the province Yaurida; and Jews and Armenians in various parts of the empire; the former chiefly in the governments of Polotk and Moghelef. This general enumeration will assist the reader in consulting the largest Russian maps; a more particular account follows, of the more considerable classes of inhabitants in this great empire.

Many of the Tartars, who inhabit large portions of the Russian dominions, now live in fixed houses and villages, cultivate the land, and pay tribute like other subjects. Till lately, they were not admitted into the Russian armies; but they now make excellent soldiers.

The *Cossacs*, who lately made a figure in the military history of Europe, were originally Polish peasants, and served in the Ukraine as a militia against the Tartars. Being oppressed by their unfeeling lords, a part of them removed to the uncultivated banks of the Don, or Tanais, and there established a colony. They were soon after joined, in 1637, by two other detachments of their countrymen; and they reduced Afoph, which they were obliged to abandon to the Turks, after laying it in ashes. They next put themselves under the protection of the Russians, and their possessions, which consisted of

\* Oural is a Tartarean word signifying a belt.

thirty-nine towns on both sides of that river, soon reached from Ribna to Afoph. They professed the Greek religion; and occasionally served against the Tartars and Turks on the Palus Maeotis.

The internal government of the Cossacs approaches very near to the idea we form of that of the ancient Germans, as described by Tacitus. The captains and officers of the nations choose a chief, whom they call hauptman, and he resides at Circaska; but this choice is confirmed by the czar; and the hauptman holds his authority during life. He acts as a superior over the other towns of the nation, each of which is formed into a separate commonwealth, governed by its own hetman, who is chosen annually. They serve in war, in consideration of their enjoying their laws and liberties. They indeed have several times rebelled, for which they suffered severely under Peter the Great. But the Russian yoke was so much easier than that of the Poles, that, in 1654, the Cossacs of the Ukraine put themselves likewise under the protection of Russia. They complained, however, that their liberties had been invaded; and in the war between Charles XII. and Peter, their hetman, Mazeppa, joined the former; but he found himself unable to fulfil the magnificent promises he had made to Charles.

The mien and character of the Tartars of Kasan, and of their descendants, are very uniform, and may serve for the characteristic marks of all the Mahometan Tartars in their neighbourhood. Very few of them are tall; but they are generally straight and well-made, have small faces, with fresh complexions, and a sprightly and agreeable air. They are haughty and jealous of their honour, are sober and frugal, dexterous at mechanical trades, and fond of neatness. The Tartarean women are of a wholesome complexion rather than handsome, and of a good constitution; from their earliest infancy they are accustomed to labour, retirement, modesty, and submission. The Tartars of Kasan take great care of the education of their children. They habituate their youth to labour, to sobriety, and to a strict observance of the manners of their ancestors. They are taught to read and write, and are instructed in the Arabic tongue, and the principles of their religion. Even the smallest village has its chapel, school, priest, and school-master. The best Tartarean academies in the Russian empire are those of Kasan, Toboak, and Astracan, which are under the direction of the Gagouns, or high-priests. It is not uncommon to find small collections of historical anecdotes in manuscript, in the huts of the bears; and their merchants are pretty extensively acquainted with the history of their own people, and that of the circumjacent states. Such as choose to make a progress in theology, enter themselves into the schools of Bougharia, which are more complete than the others.

The Tartar citizens of Kasan, Orenberg, and other governments, carry on commerce, exercise several trades, and have some manufactures. Their manner of dealing is chiefly by way of barter; coin is very rarely seen among them, and bills of exchange never. Many of them carry on a great deal of business. At Kasan they prepare what is called in England, Morocco leather. The villages of these people comprehend from ten to one hundred farms. These villages were at first composed of troops of wandering shepherds; but being drawn gradually closer together by successive population, they found themselves under the necessity of cultivating the earth, and erecting fixed habitations. They never leave their fields fallow, for which reason they use more manure than the Russians. They are well acquainted with the management of bees, from which they derive great profit. Most of the villages contain tanners, shoe-makers, tailors, dyers, smiths, and carpenters. The laborious females spin, and make cloth from the fleece of their flocks, and thread from hemp of their own cultivation.

A chest or two, some carpets and pieces of felt, mats made of the bark of trees, with which they cover broad benches, that they use instead of beds, with a few chairs

chairs and tables, are commonly all the furniture to be seen in their houses; though some of the principal people have stuffed cushions and pillows on their sleeping benches. But chairs and tables are only seen in towns; and even there, never but in the houses of such as have business with foreigners. They commonly make four meals a day, at which their bench serves them for table and chairs; for on this they place themselves round the dishes, each person sitting on his heels, after the oriental manner. They make ablutions, and say prayers, at the beginning and end of all their meals. The Tartars of Kafan, as well as most of the Mahometan Tartars, are very polite towards strangers. Old men, who have maintained good characters, are held in great veneration among them, and are the arbitrators in all disputes.

The habitations and manner of living of the Tartar citizens and villages of Astracan are perfectly similar to those of the Tartars of Kafan. In the city of Astracan they have a large magazine for goods, built of bricks, and several shops upon arches. They carry on an important commerce with the Armenians, Persians, Indians, and Bougharians; and their manufactories of Morocco leather, cottons, camelots, and silks, are in a very thriving state.

The *Votiaks*, a Finnish race, chiefly inhabit the governments of Kafan and Viatka. This nation was one of those who were formerly under the protection of the Tartars; but since it has been subjected to Russia, it has preferred the quiet and fecundity, which agriculture affords, to the ambulatory life of herdsmen and shepherds. The *Votiaks* are of a middle stature, and generally red-haired; they are honest, peaceable, and hospitable. They are assiduous in rural economy, neglecting neither the culture of bees, nor the chase; in the latter they use indifferently the bow or fire-arms. In their leisure hours many of them employ themselves in making all sorts of turnery, such as cups, spoons, and shuttles; and others varnish all kinds of cups and bowls. The women are employed in sewing, in making linen, coarse cloths, and ornaments of embroidery. Some of the *Votiaks* are christians, but a great part of them are idolaters; though even these believe the doctrine of a future state of rewards and punishments.

The *Ostjaks*, likevise a Finnish race, are one of the most numerous nations of Siberia. Before they were in subjection to Russia, they were governed by princes of their own nation, and their descendants are still reputed noble. As these people divide themselves into different tribes, they choose their chiefs from among the progeny of their ancient rulers. These maintain peace and good order, and superintend the payment of the taxes. They are entirely unacquainted with the use of letters, and are extremely ignorant; they can reckon no farther than ten, as is the case with some other Finnish nations. These people have a singular custom, that the daughter-in-law never uncovers her face in the presence of her father-in-law; nor is the son-in-law allowed to appear before the mother-in-law till his wife has had a child. They are idolaters; and one of their opinions is, that bears enjoy after death a happiness at least equal to that which they expect for themselves. Whenever they kill one of these animals, they sing songs over him, in which they ask his pardon for the injury they have done him. Indeed, it appears that bears are in great estimation among all the Pagan nations of the north, and north-east.

The *Tschouatches* are supposed to be Finns from their language, they dwell along the two sides of the Wolga, in the governments of Nichnei-Novogorod, Kafan, and Orenberg. They never live in towns, but assemble in small villages, and choose the forests for their habitations. They are very fond of hunting, and procure for that purpose ferew-barrel markets, which they prefer to the bow. One of their marriage ceremonies is, that on the wedding night the bride is obliged to pull off her husband's boots. A late writer says, "Among the *Tschouatches* the husband is master of the house; he orders every thing himself; and it is the duty of the wife to obey with a reply."

The *Tungusians*, a Mungalian race, form one of the most numerous nations of Siberia. They are of a middle stature, and well made. Their sight and hearing are of a degree of acuteness and delicacy that is almost incredible; but their organs of smelling and feeling are inferior to ours. They are acquainted with almost every tree and stone within the circuit of their perambulations; and they can even describe a course of some hundred miles by the configurations of the trees and stones they meet with, and can enable others to take the same route by such description. They also discover the tracts of the game by the compression of the grass or moss. They learn foreign languages with ease, are alert on horseback, good hunters, and dexterous at the bow.

The *Kalmucs*, also a Mungalian race, are a courageous tribe, and numerous; for the most part raw-boned and stout. Their visage is so flat that the skull of a Kalmuc may easily be known from others. They have thick lips, a small nose and a short chin, their complexion a reddish and yellowish brown. Their women are of a similar shape with the men, but their skin a healthy white and red; they are lively, agreeable, and industrious. They are much attached to their chiefs or masters, but their active spirit, and their improvidence and carelessness, make them thievish and dirty. In their robberies, they use more stratagem than violence, and as they believe in the nocturnal wandering of dead men's spirits, are seldom guilty of murder. They are superstitious about good and bad days, and have written laws, which are founded on reason, custom, and the will of the prince. Their code is very favourable to females, and never regards a woman as the author of any crime. Rape and adultery are punished with a mulct of nine head of cattle. Their speech is a mongrel dialect, with many Tartarean words, but their religious books are in the Tangut or Tibetan. The sole profession among them is the breeding of cattle; they pursue the chase as an amusement: their dwelling is in tents, or yours of felt, which they call *gar*, and the Russians *kibitka*. Their clothing is oriental. Some of their women wear a large golden ring in their nostrils. Their principal food is animals, tame and wild; with the roots and plants of their deserts; in which they are very indelicate; for even their chiefs will feed upon cattle that have died of distemper or age; so that in every horde the flesh-market hath the appearance of a lay-stall of carrion. Although they consume a vast quantity of food, they can endure want for a long time without complaint. Both sexes smoke continually; during the summer they keep to the north, and in winter to the southern deserts. They sleep upon felt or carpeting, and cover themselves with the same.

The *Kamtshadales* subsist by hunting and fishing. The chase furnishes them with fables, foxes, and other game. Their nets are made of the stamina of nettles. They sometimes employ themselves in building huts, forming different wooden utensils, cutting wood for fuel and building, and making bows and arrows: but much of their time is passed in absolute idleness, and indolence, which are extreme. Poverty gives them no concern; and nothing but the calls of hunger can drive them to the chase. They live in villages, consisting of a few small houses, and situated in general near some river. When a village becomes too populous, they separate and form a new one. They eat and drink much; but as their food is always cold, their teeth are very fine. Dogs are their only domestic animals, upon which they put a high value. Some of them travel in small carriages drawn by these animals; and a complete Kamtshadalian equipage, dogs, harness, and all, costs in that country 4l. 10s. or near twenty rubles. The Kamtshadales believed the immortality of the soul, before they embraced the Christian religion.

The manners of the *Siberians* were formerly so barbarous, that Peter the Great thought he could not inflict a greater punishment upon his capital enemies, the Swedes, than by banishing them to Siberia. The effect was, that the Swedish officers

cers and soldiers introduced European usages and manufactures into the country, and thereby acquired a comfortable living. In this forlorn region, so long unknown to Europe, some new mines have lately been discovered, which, upon their first opening, have yielded 45,000 pounds of fine silver, said to have been obtained with little difficulty or expence. Kamtschatka is now considered as the most horrid place of exile in the vast empire of Russia, and hither some of the greatest criminals are sent.

[RELIGION.] The established religion of Russia is that of the Greek church, the tenets of which are too numerous and complicated to be discussed here. The pope's supremacy they disavow; and though they disclaim image worship, they retain many idolatrous and superstitious customs. Their churches are full of pictures of saints whom they consider as mediators. They observe a number of fasts and lents, so that they live half the year very abstemiously; an institution which is extremely convenient for their soil and climate. They have many peculiar notions with regard to the sacraments and Trinity. Their bishops and other ecclesiastics, though not their secular priests, are obliged to observe celibacy. Peter the Great shewed his profound knowledge of government in nothing more than in the reformation of his church. He declared himself the head of the church; and preserved the subordinations of metropolitans, archbishops, and bishops. Their priests have no fixed income, but depend for subsistence upon the benevolence of their flocks and hearers. Peter, after establishing this great political reformation, left his clergy in full possession of all their idle ceremonies; nor did he cut off the beards of his clergy; that impolitic attempt was reserved for the late emperor, and greatly contributed to his fatal catastrophe. Before his time, an incredible number of both sexes were shut up in convents; nor has it been found prudent entirely to abolish those societies. The abuses of them, however, are now in a great measure removed; for no male can become a monk till he is turned of thirty; and no female a nun, till she is fifty; and even then not without permission of the superiors. The present empress has annexed the church lands to the crown, and, in return, grants pensions to the higher clergy and the monks.

The conquered provinces, as already observed, retain the exercise of their religion; but such is the extent of the Russian empire, that many of its subjects are Mahometans, and more of them no better than Pagans, governed by Shamans, or wizards who pretend to cure diseases, to avert misfortunes, and to fore-tell or controul the events of futurity. Many ill-judged attempts have been made to convert them by force, which have only tended to confirm them in their infidelity. On the banks of the river Sarpa is a flourishing colony of Moravian brethren, to which the founders have given the name of Sarepta: the beginning of the settlement was in 1765, with distinguished privileges from the imperial court.

[LANGUAGE.] The common language of Russia is a mixture of the Polish and Sclavonian; their priests, and the most learned of their clergy, make use of what is called modern Greek; and they who know that language in its purity are at no loss for understanding it in its corrupted state. The Russians have at present thirty letters, the forms of which have a strong resemblance to the old Greek alphabet.

[LEARNING AND LEARNED MEN.] The Russians formerly made but an inconsiderable appearance in the republic of letters; but the great encouragement lately given by their sovereigns, has produced sufficient proofs, that they are not deficient in intellectual abilities. The papers exhibited by them, at their academical meetings, have been favourably received all over Europe; especially those that relate to astronomy, the mathematics, and natural philosophy. The speeches pronounced by the bishop of Turer, the metropolitan of Novogorod, the vice-chancellor, and the marshal, at the late opening of the commission for a new code of laws,

are elegant and classical. Many of the Greek and Latin classics have been transferred by natives into the Russian language. The efforts to civilize them did not begin with Peter the Great, but were much older. A small glimmering, like the first day-break, was seen under czar Iwan in the middle of the 16th century. This became more conspicuous under Alexius Michaelowitz: but under Peter it burst forth with the splendor of a rising sun, and hath continued ever since to ascend towards its meridian.

**UNIVERSITIES.]** Three colleges were founded by Peter the Great at Moscow; one for classical learning and philosophy, the second for mathematics, and the third for navigation and astronomy. To these he added a dispensary, which is a magnificent building, and under the care of some able German chemists and apothecaries, who furnish medicines not only to the army, but all over the kingdom. The present empress established an university at Peterburgh, and invited some of the most learned foreigners in every faculty, who are provided with good salaries; a military academy also owes its origin to the same royal patronage, where the young nobility and officers' sons are taught the art of war. It ought likewise to be mentioned to the honour of the same benefactress, that she is actually employed in founding a number of schools, for the education of the lower classes of her subjects, throughout the best inhabited parts of the empire.

**CITIES, TOWNS, PALACES, & OTHER BUILDINGS.]** Peterburgh naturally takes the lead in this division. It lies at the junction of the Neva with the lake Ladoga, already mentioned, in latitude 60; but the reader may have a better idea of its situation, by being informed that it stands on both sides the river Neva, between that lake and the bottom of the Finland gulf. In the year 1703, this city consisted of a few small fishing huts, on a spot so swampy, that the ground was formed into nine islands; by which, according to Voltaire, its principal quarters are still divided. Without entering into a minute description of this wonderful city, it is sufficient to say that it extends about six miles every way; and contains every structure for magnificence, the improvement of the arts, revenue, navigation, war, and commerce, that can be found in the most celebrated cities in Europe. There is a convent which deserves particular notice, in which 440 young ladies are educated at the empress's expence; 200 of them of superior rank, and the others, daughters of citizens and tradesmen, who, after a certain time allotted to their education, quit the convent with improvements suitable to their conditions of life, and those of the lower class are presented with a sum of money as a dowry if they marry, or to procure to themselves a proper livelihood. Near to this convent is a founding hospital, assistant to that noble one established at Moscow, where the mother may come to be delivered privately, and then, after the utmost attention to her, she leaves the child to the state, as a parent more capable of promoting its welfare.

As Peterburgh is the emporium of Russia, the number of foreign ships trading to it in the summer-time is surprising. In winter, 3000 one-horse sledges are employed for passengers in the streets. It is supposed that there are above 130,000 inhabitants in this city; and it is ornamented with thirty-five great churches: for in it almost every sect of the Christian religion is tolerated. It also contains five palaces, some of which are superb, particularly that which is called the New Summer Palace, near the Triumphal Port, which is an elegant piece of architecture. This magnificent city is defended on that side next the sea by the fortress of Cronstadt; which, considering the difficulty and danger of navigating a large naval force through the gulf of Finland, is sufficient to guard it on that side from the attacks of any enemy. Peterburgh is the capital of the province of Ingria, one of those on the Great's conquests from the Swedes. In the neighbourhood of this city are many country houses and gardens.

The

The city of Moscow was formerly the glory of this great empire. It stands on the river from whence it takes its name in lat. 55-45, and about 1414 miles north-east of London; and though its streets are not regular, it presents a very picturesque appearance; containing a number of gardens, groves, lawns, and streams. Neither Voltaire nor Buschin give us any satisfactory account of this capital; and little credit is to be given to the authors who divide it into regular quarters, and each quarter inhabited by a different order or profession. Buschin speaks of it as the largest city in Europe; but that can be only meant as to the ground it stands on, computed to be near 26 miles in circumference. It is generally agreed that Moscow contains 1600 churches and convents, and forty-three places or squares. The merchants' exchange, according to the last writer, contains about 6000 fine shops, which display a vast parade of commerce, especially to and from China. No city exhibits a greater contrast than Moscow of magnificence and meanness in building. The houses of the inhabitants in general are miserable timber booths; but their palaces, churches, convents, and other public edifices, are spacious and lofty. The Kremlin, or grand imperial palace, is mentioned as one of the most superb structures in the world: it stands in the interior circle of the city, and contains the old imperial palaces, pleasure-houses, and stables, a victualling-house, the palace which formerly belonged to the patriarch, nine cathedrals, five convents, four parish churches, the arsenal, with the public colleges, and other offices. All the churches in the Kremlin have beautiful spires, most of them gilt, or covered with silver: the architecture is in the Gothic taste; but the insides of the churches are richly ornamented; and the pictures of the saints are decorated with gold, silver, and precious stones. Mention is made of the cathedral, which has no fewer than nine towers, covered with copper double gilt, and contains a silver branch with forty-eight lights, said to weigh 2800 pounds. A volume would scarcely suffice to recount the other particulars of the magnificence of this great city. Its sumptuous monuments of the great dukes and czars, the magazine, the patriarchal palace, the exchequer, and chancery, are noble structures. The jewels and ornaments of an image of the Virgin Mary, in the Kremlin church, and its other furniture, can be only equalled by what is seen at the famous house of Loretto, in Italy. Mr. Voltaire says, that Peter, who was attentive to every thing, did not neglect Moscow at the time he was building Peterburgh; for he caused it to be paved, adorned it with noble edifices, and enriched it with manufactures.

The foundling hospital at Moscow appears to be under very judicious regulations. It was founded by the present empress, and is supported by voluntary contributions, legacies, and other charitable endowments. It is an immense pile of building, of a quadrangular shape, and contains 3000 foundlings: when the establishment is completed, it is intended to contain 8000. The greatest care is taken of the children, who, at the age of fourteen, have the liberty of choosing any particular branch of trade; and for this purpose there are different species of manufactures established in the hospital. When they have gone through a certain apprenticeship, or about the age of twenty, they are allowed the liberty of setting up for themselves: a sum of money is bestowed upon each foundling for that purpose, and they are permitted to carry on trade in any part of the Russian empire. This is a very considerable privilege in Russia, where the peasants are slaves, and cannot leave their villages without the permission of their masters.

Nothing can be said with certainty as to the population of Moscow. When lord Carlisle was ambassador there, in the reign of Charles II. this city was twelve miles in compass, and the number of houses were computed at 40,000. When Voltaire wrote, Moscow was twenty miles in circumference, and its inhabitants said to amount to 300,000. Mr. Coxe confirms this account of the circumference of this city, but thinks the statement of its population much exaggerated.

rated; according to an account which was given to him by an English gentleman, which he received from the lieutenant of the police, and which he says may be relied on, Moscow contains within the ramparts 250,000 souls, and in the adjacent villages 50,000.

**CURIOSITIES.]** This article affords no great entertainment, as Russia has but lately been admitted into the rank of civilized nations. She can, however, produce many stupendous monuments of the public spirit of her sovereigns; particularly the canals made by Peter the Great, for the benefit of commerce. Siberia is full of old sepulchres of an unknown nation, whose instruments and arms were all made of copper. In the cabinet of natural history at Petersburg is a rhinoceros dug up on the banks of the river Valui, with his skin, and the hair upon it perfect. The Russians have a great passion for the ringing of bells, which are always tinkling in every quarter. The great bell of Moscow, the largest in the world, weighs, according to Mr. Coxe, "432,000 pounds. Its bulk is so enormous, that our traveller could scarcely have given credit to the account of it, if he had not examined it himself, and ascertained its dimensions with great exactness. Its height is nineteen feet, its circumference at the bottom twenty-one yards eleven inches, its greatest thickness twenty-three inches." It was cast in the reign of the empress Anne; but the beam on which it hung being burnt, it fell, and a large piece is broken out of it; so that it lately lay in a manner useless. Mr. Bruce, in his late Memoirs, mentions a bell at Moscow, founded in czar Boris's time, nineteen feet high, twenty-three in diameter, and two in thickness, that weighed 336,000 pounds. The building of Petersburg, and raising it from a few fishing huts to be a populous and rich city, is an enterprise hardly to be paralleled since the erection of Alexandria in Egypt. The fortrefs of Cronstadt employed, for some years, 300,000 men, in laying its foundations, and driving piles night and day; a work which no monarch in Europe (Peter excepted) could have executed. The plan, with a very little assistance from some German engineers, was drawn by his own hand. Equally wonderful was the navy which he raised to his people, at the time when they could hardly be said to have possessed a ship in any part of the globe. What is more wonderful than all, he often wrought in person at all those amazing works, with the same assiduity as if he had been a common labourer.

**COMMERCE.]** By the surest information, the annual exports of Russia at present amount to about 2,400,000*l.* and her imports do not exceed 1,600,000*l.* so that the balance of trade is yearly 800,000*l.* sterling in her favour\*.

The productions and exports of Russia, in general, are many, and very valuable, viz. furs and peltry of various kinds, red leather, linen and thread, iron, copper, sail-cloth, hemp and flax, pitch and tar, wax, honey, tallow,ising-glass, lin-seed oil, pot-ash, soap, feathers, train-oil, hogs bristles, mulk, thubarb, and other drugs; timber, and also raw silk from China and Persia. Her foreign commerce is much increased since her conquests from Sweden, especially of Livonia and Ingria; and since the establishing of her new emporium of Petersburg, whereby her naval intercourse with Europe is made much more short and easy. The Ukraine may be called the granary of the empire; the best corn, hemp, flax, honey, and wax, come from this fertile province, and 10,000 horned cattle are annually sent from its pastures into Silesia and Saxony.

Russia carries on a commerce over land, by caravans, to China, chiefly in furs: and they bring back from thence, tea, silk, cotton, gold, &c. To Bocharia, near the river Oxus, in Tartary, Russia sends her own merchandize, in return for Lu-

\* See Coxe's Travels, vol. ii. p. 247.

dian silks, curled lamb-skins, and ready money; she sends her products to the annual fair at Samarcand; and likewise trades to Persia by Astracan, cross the Caspian Sea, for raw and wrought silk. The empress, in 1784, issued an edict, permitting all foreigners to carry on a free trade by sea and land with the several countries bordering on the Euxine, which have been lately annexed to the empire. The same privileges, religious and civil, are allowed to them in the ports of Cherfon, Sebastopolis, and Theodosia (formerly Cassa), in the province of Taurica, as in Peterburgh.

Before the time of Peter the Great, Archangel, which lies upon the White Sea, was the only port of naval communication which Russia had with the rest of Europe; but it was subject to a long and tempestuous voyage. They have now thirteen ports for trade, viz. Archangel, Peterburgh, Riga, Revel, Perneau, Narva, Wibourg, Frederichsham, Astracan, and Kola; and the three opened in their new conquests. Archangel is about three English miles in length, and one in breadth; built all of wood, excepting the exchange, which is of stone. Notwithstanding the decrease of the trade of this town by building Peterburgh, it still exports a considerable quantity of merchandize. Their masts and timber for the dock-yards come chiefly from the forests of Kafan, that border on the province of Astracan.

ARMY.] The army is generally calculated to amount to from 400 to 450,000 men; according to Buschin they amounted, in 1772, to above 600,000. The army, in 1784, amounted to 368,901, viz.

Guards,	-	-	-	-	-
Cavalry,	-	-	-	-	-
Infantry,	-	-	-	-	7,291
Artillery,	-	-	-	-	59,562

NAVY.] The maritime force of this empire consists of 63 armed ships, of which 24 are of the line, and 20,000 sailors. It has been related, that (in 1785) there were 48 ships of the line at Cronstadt, and 12 ships of the line in the Black Sea. By other accounts, the strength of the Russian navy is much less considerable.

The chief harbours for the navy are, 1. Cronstadt, not far from Peterburgh, on the gulf of Finland, where there is a fine dock-yard. 2. Revel, in the province of Livonia, on the Baltic Sea. 3. Archangel, on the White Sea. 4. Cherfon, on the Black Sea. The admiralty consists of one high-admiral, three admirals, three vice-admirals, and four countre admirals.

GOVERNMENT, LAWS, AND } The sovereign of the Russian empire is absolute and despotic, and master of the lives and properties of all his subjects; who, though they are of the first nobility, or have been highly instrumental in promoting the welfare of the state, may, notwithstanding, for the most trifling offence, or even for no offence at all, be sent to Siberia, or made to drudge for life on the public works, and have all their goods confiscated, whenever the sovereign or his ministers shall think proper. When persons of any rank are banished into Siberia, their possessions are confiscated, and a whole family may at once be ruined by the insinuations of an artful courtier. The secret court of chancery, which was a tribunal composed of a few ministers, chosen

chosen by the sovereign, had the lives and fortunes of all families at their mercy; but this court was suppressed by Peter III.

The system of civil laws at present established in Russia is very imperfect, and in many instances barbarous and unjust; being an assemblage of laws and regulations drawn from most of the states of Europe, ill digested, and in many respects not adapted to the genius of the Russian nation. The courts of justice were in general very corrupt, and those by whom it was administered extremely ignorant; but the empress hath lately made some judicious regulations, and fixed a certain salary to the office of judge, which before depended on the contributions of the unhappy clients, and thus the poor were without hope or remedy. It is hoped that the new code of laws, for which she hath given instructions, will soon be produced, to increase the people's liberty, security, and felicity.

The distinctions of rank form a considerable part of the Russian constitution. The late empresses took the title of Autocratrix, which implies that they owed their dignity to no earthly power. Their ancient nobility were divided into knezes or knazeys, boyars, and vaivods. The knezes were sovereigns upon their own estates, till they were reduced by the czar; but they still retain the name. The boyars were nobility under the knezes, and the vaivods were governors of provinces. Those titles, however, so often revived the ideas of their ancient power, that the present and late empresses have introduced among their subjects the titles of counts and princes, and the other distinctions of nobility that are common to the rest of Europe.

REVENUE AND EXPENCES.] Nothing certain can be said concerning the revenues of this mighty empire; but they are undoubtedly, at present, far superior to what they were, even under Peter the Great. The vast exertions for promoting industry, made by his successors, especially her present imperial majesty, have greatly added to their income, which falls little short of 30,000,000 of rubles, or nearly six millions sterling annually. Thus computed:

	RUBLES.
Capitation tax, - - - - -	8,500,000
Other taxes and duties, - - - - -	7,000,000
Her own estates, with other dominions taken from the clergy,	6,000,000
Produce of the mines, - - - - -	1,500,000
Monopoly of distilled liquors, - - - - -	4,000,000
Monopoly of salt, - - - - -	1,800,000
	<hr/>
	28,800,000

According to Mr. Plefcheef's computation, published in English by the rev. Mr. Smirnov, the revenues of Russia exceed 40,000,000 rubles; and the expences, even in time of war, are said not to amount to 30,000,000.

The importance of this revenue in countries so cheap, appears from the vast armies maintained and paid by the late and present empress, in Germany, Poland, and elsewhere, when no part of the money returned to Russia; nor do we find that they received any considerable subsidy from the houses of Bourbon and Austria, who, indeed, were in no condition to grant them any. The other expences, besides the payment of the army and navy of her present majesty, the number and discipline of which are at least equal to those of her greatest predecessors, is very considerable. By the peace establishment in 1778, the regular troops amounted to about 130,000 effective men. The irregular troops are numerous, but consist of horse, and of this desultory body the corps of Cossacs are esteemed the most excellent. Her court is elegant and magnificent, her guards and attendants splendid, and the encouragement she gives to learning, the improvement

provement of the arts, and useful discoveries, cost her vast sums, exclusive of her ordinary expences of state.

Some of the Russian revenues arise from monopolies, which are often necessary in the infancy of commerce. The most hazardous enterprise undertaken by Peter the Great was his imitating the conduct of Henry the VIIIth of England in seizing the revenues of the church. He found that good policy required the greatest part of them to be restored, which was accordingly done; his great aim being to bridge the patriarch's power.

The Russian armies are raised at little or no expence; and, while in their own country, subsist chiefly on provisions furnished them by the country people, according to their internal valuation. The pay of a soldier scarcely amounts to 30 shillings yearly; in garrison he receives only five rubles yearly. A sailor and a gunner receives a ruble a month, and they are supplied with provisions when a-shore.

ORDERS.] The order of St. *Andrew*, or the blue ribband, was instituted by Peter the Great in 1698, to animate his nobles and officers in the wars against the Turks. He chose St. Andrew for his patron, because by tradition he was the founder of christianity in the country. The badge is the image of St. Andrew on the cross, enamelled on an imperial eagle. The order of St. *Alexander Newski*\*, or the red ribband, was also instituted by Peter the Great, and confirmed by the empress Catherine I. in the year 1725: the ensign of the order is a cross pattee enamelled red, and edged with gold; the centre enamelled white, and thereon St. Alexander on horseback. The order of St. *Catherine* was instituted by Peter the Great, in honour of his empress for her assistance on the Banks of the Prutl. He declared her sovereign of it, and though both sexes were first admitted, yet it is now appropriated to the fair alone, and persons of the first distinction in Europe: the badge is a medallion enriched with diamonds and charged with the image of St. Catherine, pendant to a broad white ribband worn fallwise over the right shoulder: on the left side of the stomacher is embroidered a silver star of three points, on the centre of which is a cross. The order of St. *George*, instituted in 1769 by the present empress Catherine II. in favour of the military officers in her service. The badge is a golden cross enamelled white, on the centre of which is a medallion with the figure of St. George killing the Dragon: this is worn pendant to a black ribband striped and edged with yellow. The order is divided into four classes; the first is confined to commanders in chief. The order of St. *Woldemir* was instituted about October 3d, 1782, by the empress, in favour of those who serve her in a civil capacity, and nearly on the same footing with the order of St. George: there are ten great crosses of it, twenty of the second class, thirty of the third, and sixty of the fourth, besides a fifth class for those who have served in a civil employment 35 years, which entitles them to wear it. The order of St. *Anne* of Holstein, in memory of Anne, daughter of Peter the Great, was introduced into Russia by Peter III. and is in the disposal of the great-duke, as sovereign of Holstein.

HISTORY.] It is evident, both from ancient history and modern discoveries, that some of the worst parts of the Russian empire at present were formerly rich and populous. The reader who throws his eyes on a general map of Europe and Asia, may see the advantages of their situation, and their communication by rivers with the Black Sea, and the richest provinces in the Roman and Greek empires. In later times, the Asiatic part of Russia bordered with Samarcand in Tartary, once the capital under Jenghis Kan and Tamerlane, of a far more extensive empire than any mentioned in history; and nothing is more certain than that the conquest of

\* Alexander, son of the great-duke Yaroslaf, was of distinguished abilities; he defeated the Tartars, Swedes, &c. and wounded the king of Sweden with his own hand, on the banks of the Neva; from whence his appellation of Newski; he died in 1262.

Russia was among the last attempts made by the former of those princes. The chronicles of this empire, which reach no higher than the 9th century, say that Kiowia and Novogorod were founded by Kii in the year 430. This Kii is by some considered as an ancient prince, while others mention him as a simple boatman, who used to transport goods and passengers across the Neipper. For a long time the chief or ruler had the title of grand-duke of Kiow. We cannot, with the smallest degree of probability, carry our conjectures, with regard to the history of Russia, higher than the introduction of Christianity, which happened about the tenth century; when a princess of this country, called Olga, is said to have been baptized at Constantinople, and refused the hand of the Greek emperor, John Zimisces, in marriage. This accounts for the Russians adopting the Greek religion and alphabet. Photius, the famous Greek patriarch, sent priests to baptize the Russians, who were for some time subject to the see of Constantinople; but the Greek patriarchs afterwards resigned all their authority over the Russian church; and its bishops erected themselves into patriarchs, who were in a manner independent of the civil power. Until the year 1250, the princes of Russia were but very little considered, being chiefly subject and tributary to the Tartars. It was about this time, that John, or Iwan Basilides, conquered the Tartars, and, among others, the duke of Great Novogorod, from whom he is said to have carried 300 cart-loads of gold and silver. His prosperous reign, of above 40 years, gave a new aspect to Russia.

His grandson, the famous John Basilowitz II. having cleared his country of the intruding Tartars, subdued the kingdoms of Kasan and Astracann Tartary, in Asia, and annexed them to the Russian dominions. He gave to his subjects the first code of laws, introduced printing, and promoted commerce. By his cruelty, however, he obliged the inhabitants of some of his finest provinces, particularly Livonia and Esthonia, to tarow themselves under the protection of the Poles and Swedes. Before the time of this John II. the sovereign of Russia took the title of Wellke-Knez, "great prince," great lord, or great chief; which the Christian nations afterwards rendered by that of great-duke. The title of Tzar, or, as we call it, Czar, (an expression which in the Slavonian language, signifies *king*), was added to that of the Russian sovereigns. Upon the death of John Basilowitz, in 1584, the Russian territories were laid waste by civil wars. The last monarch left two sons, Theodore and Demetrius. Theodore succeeded his father on the throne; and at the instigation of Boris, his prime minister, ordered his brother Demetrius to be murdered. He himself died soon after; and Boris, though suspected of poisoning his master, was proclaimed king. Meanwhile a young man appeared in Lithuania, under the name and character of the prince Demetrius, pretending that he had escaped out of the hands of the assassins. Assisted by a Polish army, he entered Moscow in 1605, and was proclaimed czar without opposition; the mother and son of Boris, who was now dead, being dragged to prison by the populace. The rage of that populace was soon turned against Demetrius. He was slain on his marriage day, together with most of his Polish attendants, who had rendered him obnoxious to the Russians. A body, said to be his, was exposed to public view; and Zuzki, a nobleman who had fomented the insurrection, was declared his successor. But scarce was Zuzki seated on the throne, when a second Demetrius made his appearance; and after his death, a third. Poland and Sweden took part in the quarrel. Zuzki was delivered up to the Poles, and Demetrius was massacred by the Tartars. But a fourth, and even a fifth Demetrius appeared; and Russia, during these struggles, was repeatedly ravaged by opposite factions and foreign troops. At length Michael Theodorowitz, son of Romnow bishop of Rissiw, afterwards patriarch, related by females to the czar John Basilowitz, was raised to the throne, and governed with great prudence and success. He defeated

the

the Poles, and successfully resisted the claims which a brother of Gustavus Adolphus of Sweden made to the throne. The claims of the Swedes and Poles upon Russia occasioned a war between those two people, which gave Michael a breathing-time; and he made use of it for the benefit of his subjects. Soon after the election of Michael, James I. of England sent, at his invitation, sir John Meyrick, as his ambassador to Russia, upon some commercial affairs, and to reclaim a certain sum of money which James had advanced to Michael or his predecessors. The English court, however, was so ignorant of the affairs of that country, though a Russian company had been established at London, that James was actually unacquainted with the czar's name and title, for he gave him no other denomination than that of great-duke and lord of Russia. Three years after, James and Michael became much better acquainted; and the latter concluded a commercial treaty with England, which shews him to have been not only well acquainted with the interests of his own subjects, but with the law and usages of nations. He reigned thirty-three years; and, by his wisdom and the mildness of his character, he restored ease and tranquillity to his subjects. Michael's intention to marry being known, the most celebrated beauties of his dominions were sent for to court, and there entertained. They were visited by the czar, and the most magnificent nuptial preparations were made, before the happy lady was declared, by sending to her magnificent jewels, and a wedding robe. The rest of the candidates were then dismissed to their several homes, with suitable presents. The name of the lady's father, who pleased Michael as Strefebuen; and he was ploughing his own farm when it was announced to him, that he was father-in-law to the czar.

Alexius succeeded his father Michael, and was married in the same manner. He appears to have been a prince of great genius. He recovered Smolensko, Kiow, and the Ukraine; but was unfortunate in his wars with the Swedes. When the grand signior, Mahomet IV. haughtily demanded some possessions from him in the Ukraine, his answer was, "that he scorned to submit to a Mahometan dog, and that his scymitar was as good as the grand signior's sabre." He promoted agriculture; introduced into his empire arts and sciences, of which he was himself a lover; published a code of laws, some of which are still used in the administration of justice; and greatly improved his army by improving its discipline. This he effected chiefly by the help of strangers, most of whom were Scotch. He cultivated a polite correspondence with the other powers of Europe; and even with the court of Rome, though he ordered his ambassadors not to kiss the pope's toe. He subdued a chief of the Don Cossacs, named Stenko Rasin, who endeavoured to make himself king of Astracan; and the rebel, with 12,000 of his adherents, was hanged on the high road. He introduced linen and silk manufactures into his dominions: and instead of putting to death, or enslaving his Lithuanian, Polish, and Tartarian prisoners, he sent them to people the banks of the Wolga and the Kama. Theodore succeeded his father Alexius in 1667. He was of a gentle disposition, and weak constitution; fond of pomp and magnificence; and, in gratifying this propensity, contributed to polish his subjects, by the introduction of foreign manufactures, and articles of elegance. He delighted much in horses, and he rendered a real service to his country in the beginning and establishing very fine breeds of them in the Ukraine, and elsewhere. He reigned seven years, and having on his death-bed called his boyars round him, in the presence of his brother and sister, Iwan and Sophia, and of Peter, who was afterwards to be celebrated, and who was his half-brother, according to Voltaire, he said to them, "Hear my last sentiments; they are dictated by my love for the state, and by my affection for my people. The bodily infirmities of Iwan necessarily must affect his mental faculties; he is incapable of ruling a dominion like that of Russia; he cannot take it a mile, if I recommend to you to set him aside, and to let your approbation fall on

Peter,

Peter, who to a robust constitution joins great strength of mind, and marks of a superior understanding." But this wife destination extremely offended the princess Sophia, who was a woman of great ambition, and who, after the death of Theodore found means to excite a horrible sedition among the Strelitzes, who then formed the standing army of Russia. Their excesses surpassed all description. The city of Moscow underwent a general pillage and massacre for three days. At last, by a compromise between the two parties, Iwan and Peter were declared joint-sovereigns, May 18, 1682; but as one was judged incapable of governing, and Peter was only ten years old, the administration was vested in their sister, who was of popular manners and great abilities. However Voltaire and other authors may have blackened Sophia's character, it is now evident, from Muller and other good authorities \*, that she was a princess of great merit, and by no means deserving of the reproaches cast upon her: her administration was wise and vigilant, and much to the advantage of her country. She reposed much confidence in prince Basil Galitzin, a consummate politician. Peter, as he advanced in years, being encouraged by his mother and her adherents, claimed a share in the administration, and took his seat in the privy council, Jan. 25, 1688. From this period dissensions arose between them, and the aspiring genius of Peter acquired the ascendancy. Under the pretence of a conspiracy against his life, he arrested his sister, and imprisoned her for life in the nunnery of Devitz. Galitzin's life was spared, but his great estate was confiscated; and the following curious sentence pronounced as his punishment: "Thou art commanded by the most clement czar to repair to Kargga, a town under the pole, and there to continue the remainder of thy days. His majesty, out of his extreme goodness, allows thee three pence per day for thy subsistence." He died in prison at Pookork in 1713. This left Peter with no other competitor, in the year 1689, than the mild and easy Iwan, and upon his death, which happened in 1696, Peter reigned alone, and cruelly provided for his own future security by the execution of above 3000 Strelitzes, and at the same time broke the whole body, and abolished their name.

Peter, though he had been but very indifferently educated, associated himself with the Germans and Dutch; with the former for the sake of their manufactures, which he early introduced into his dominions; and with the latter for their skill in navigation, which he practised himself. His inclination for the arts was encouraged by his favourite Le Fort, a Piedmontese; and general Gordon, a Scotchman, disciplined the czar's own regiment, consisting of 5000 foreigners; while Le Fort raised a regiment of 12,000, among whom he introduced the French and German exercises of arms, with a view of employing them in curbing the insolence of the Strelitzes. Peter, after this, began his travels; leaving his military affairs in the hands of Gordon. He set out as an attendant upon his own ambassadors; and his adventures in Holland and England, and other courts, are too numerous and too well known to be inserted here. By working as a common ship-carpenter at Deptford and Saardam, he completed himself in ship-building and navigation; and through the excellent discipline introduced among his troops by the foreigners, he not only over-awed or crushed all civil insurrections, but all his enemies on this side of Asia; and at last he exterminated, except two feeble regiments, the whole of the Strelitzes. He rose gradually through every rank and service both by sea and land; and the many defeats which he received, especially that from Charles XII. at Narva, seemed only to enlarge his ambition. The battles he lost added experience to his courage; and the generous friendship he shewed to Augustus, king of Poland, both before and after he was dethroned by the king of Sweden, redounds greatly to his honour. Having

\* Coxe's Travels, 4to. vol. i. p. 395 to 418.

no regard for rank when separate from merit, he, in 1711, married Catharine, a young Lithuanian woman, who had been betrothed to a Swedish dragoon at Marienburg. General Bauer, taking that place in 1701, was smitten with her, and took her to his house. She was soon removed into the family of the prince Menzikoff, with whom she lived till 1704, when in the 17th year of her age she became the mistress of Peter, and then his wife; because, after a long cohabitation, he found her possessed of a soul formed to execute his plans, and to assist his councils. Catharine was so much a stranger to her own country, that her husband afterwards discovered her brother, who served as a common soldier in his armies. But military and naval triumphs, which succeeded one another after the battle of Pultowa, in 1709, with Charles XII, were not the chief glories of Peter's reign. He applied himself with equal assiduity to the cultivation of commerce, arts, and sciences; and upon the whole, he made such acquisitions of dominion, even in Europe itself, that he may be said, at the time of his death, which happened in January, 1725, to have been the greatest prince of his age, but more feared than beloved by his subjects.

Peter the Great was unfortunate in his eldest son, who was called the Czarowitz, and who, marrying without his consent, entered, as his father alledged, into some dangerous practices against his person and government; for which he was tried and condemned to death. Under a sovereign so despotic as Peter was, we can say nothing as to the justice of the charge. He publicly treated him with inhuman ferocity, and it was undoubtedly his will, that the young prince should be found guilty. The most probable opinion is that he was secretly executed in prison, and that marthal Weyde was the person who beheaded him. After this event; in 1724, Peter ordered his wife Catharine to be crowned, with the same magnificent ceremonies as if she had been a Greek empress, and this was the principal cause of her subsequent elevation. For just before his death he discovered a secret connection between her and her first chamberlain Mons. He surprised them together in an arbour of the garden, when striking her with his cane, as well as the page, who would have prevented him from entering the arbour, he retired without uttering a single word. But presently Mons was taken up, and being threatened with the torture, confessed, and was beheaded. The day after the execution Peter conveyed Catharine in an open carriage under the gallows, to which the head of Mons was nailed. It is said, that the empress without changing colour at this dreadful sight, exclaimed, "What a pity! that there is so much corruption among courtiers!" This event was soon followed by Peter's death, who probably had destined his eldest daughter Anne to be his successor, but the suddenness of his death prevented it; and some of the nobles and officers being gained by money, jewels, and promises, and the two regiments of guards by a largess, Catharine mounted the Russian throne. She was in her person under the middle size, and possessed abilities not above mediocrity; she could neither read nor write; her daughter Elizabeth usually signed her name for her, and particularly that affixed to her last will and testament. During her short reign, of two years, which may rather be considered as the reign of Menzikoff, her life was very irregular. An intemperate use of tokay wine, joined to a cancer and dropsy, hastened her end on the 17th of May, 1727. She was succeeded by Peter II. a minor, son to the Czarowitz. Many domestic revolutions happened in Russia during the short reign of this prince; but none was more remarkable than the disgrace and exile of prince Menzikoff. Peter died of the small-pox in 1730.

Notwithstanding the despotism of Peter and his wife, the Russian senate and nobility, upon the death of Peter II. ventured to set aside the order of succession, which they had established. The male issue of Peter was now extinguished; and the duke of Holstein, son to his eldest daughter, was, by the destination of the

late

late empress, entitled to the crown; but the Russians, for political reasons, filled their throne with Anne, dutchess of Courland, second daughter to Iwan, Peter's eldest brother; though her eldest sister, the dutchess of Mecklenburgh, was alive. Her reign was extremely prosperous; and though she accepted of the crown under limitations that some thought derogatory to her dignity, yet, by the assistance of the guards, she broke them all, and asserted the prerogative of her ancestors. She raised her favourite Biron to the duchy of Courland, and gave way to many sanguinary measures and severe executions on his account. Upon her death, in 1740, John, the son of her niece, the princess of Mecklenburgh, by Anthony Ulric of Brunswic Wolfenbuttel, was, by her will, entitled to the succession; but being no more than two years old, Biron was appointed to be administrator of the empire during his nonage. This destination was disagreeable to the princess of Mecklenburgh and her husband, and unpopular among the Russians. Count Munich was employed by the princess of Mecklenburgh to arrest Biron, who was tried, and condemned to die, but was sent into exile to Siberia, where he continued till Peter III. recalled him, and Catharine restored him to the duchy of Courland.

The administration of the princess Anne of Mecklenburgh and her husband was upon many accounts, but particularly that of her German connections, disagreeable, not only to the Russians, but to other powers of Europe; and notwithstanding her prosperous war with the Swedes, the princess Elizabeth, daughter, by Catharine, to Peter the Great, formed such a party, that in one night's time she was proclaimed empress of all the Russias; and the princess of Mecklenburgh, her husband, and son, were made prisoners.

Elizabeth's reign may be said to have been more glorious than that of any of her predecessors, her father excepted. She abolished capital punishments; and introduced into all civil and military proceedings a moderation, till her time unknown in Russia. Count Munich was confined at Pelm in Siberia, in a prison, which by his order was erected for Biron; he had a daily allowance of 12s. for himself, his wife, and a few servants. After 21 years imprisonment he was released and restored to his ancient rank by Peter III. in 1762, and died in 1765, eighty-three years old. The chief disgrace of Elizabeth's reign, was the punishment of the countesses Bestucheff and Lapuchin; each received 50 strokes of the knout in the open square of Peterburgh, their tongues were cut out, and they were banished into Siberia. The real crime of the last was her commenting too freely on the empress's amours. Having gloriously finished the war with Sweden, Elizabeth replaced the natural order of succession in her own family, by declaring her heir the duke of Holstein Gottorp, who was descended from her eldest sister. She gave him the title of grand-duke of Russia; and soon after her accession to the throne, she called him to her court, where he renounced the succession to the crown of Sweden, which undoubtedly belonged to him, embraced the Greek religion, and married a princess of Anhalt-Zerbit, by whom he had a son, who is now heir to the Russian empire. Few princes have had a more uninterrupted career of glory than Elizabeth. She was completely victorious over the Swedes. Her alliance was courted by Great Britain, at the expence of a large subsidy; but many political and some private reasons, it is said, determined her to take part with the house of Austria against the king of Prussia in 1756. Her arms gave a turn to the success of the war, notwithstanding that monarch's amazing abilities both in the field and cabinet. Her conquests were such as portended the entire destruction of the Prussian power, which was, perhaps, saved only by her critical death, on January 5, 1762.

Elizabeth was succeeded by Peter III. grand-duke of Russia, and duke of Holstein, a prince whose conduct has been variously represented. He mounted the throne possessed of an enthusiastic admiration for his Prussian majesty's virtues; to

whom he generously gave peace, and whose principles and practices he seemed to have adopted as the directories of his future reign. Several salutary regulations were made during his short dominion, and he abolished many prerogatives that were oppressive and tyrannical. But he soon incurred the general odium by his public contempt of the Russian manners and religion. He might have surmounted the effects of many peculiarities, unpopular as they were, but he aimed at ecclesiastical reformations in his dominions, which Peter the Great durst not attempt; and he even ventured to cut off the beards of his clergy. It is also alledged, that he had formed a resolution to destroy both his empress and her son; and the advocates of Peter the Third acknowledge, that he had resolved to shut up his wife in a convent, or rather in the fortress of Schlüsselburg, and then to place his mistress, the countess of Voronzof, upon the throne. The execution of his designs was prevented by an almost general conspiracy formed against him, in which the empress took a very active part; and this unfortunate prince scarcely knew an interval between the loss of his crown and his life, of which he was deprived, while under an ignominious confinement at Robscha, in July, 1762. His wife Catharine II. was proclaimed empress.

The most remarkable domestic occurrence of her reign is the death of prince Iwan, son to the princefs of Mecklenburgh. This young prince, as soon as he came into the world was designed, though illegally, to wear the imperial crown of Russia, after the death of his great aunt, the empress Anna Iwanona; but by the advancement of the empress Elizabeth, he was condemned to lead an obscure life in the castle of Schlüsselburg under a strong guard, who had particular orders, that if any person, or any armed force, was employed in attempting to deliver him, they should kill him immediately. He lived quietly in his prison when the empress, Catharine II. mounted the throne; and as the revolution which deposed her husband Peter III. had occasioned a strong ferment in the minds of the people, Catharine was apprehensive that some attempts might be made in favour of Iwan; she therefore doubled the guards of this unhappy prince, and particularly entrusted him to the care of two officers, who were devoted to her interest. A lieutenant of infantry, who was born in the Ukraine, undertook to deliver Iwan by force of arms from the fortress of Schlüsselburg; which furnished a pretence for putting the prince to death, the 16th of July, 1764, after an imprisonment of 23 years. The lieutenant who attempted to deliver him was arrested, and afterwards beheaded, and his body burnt with the scaffold; but, notwithstanding this, it has been represented that he was a mere tool of the court, though he suffered for executing the instructions he had received.

While this event excited the attention of the Russian nation, the flames of civil war broke out with great violence in Poland, which has generally been the case when the throne was vacant. And as the internal tranquillity of Poland is a capital object with Russia, the empress Catharine sent a body of troops into Poland, and by her influence count Poniatowski was raised to the throne. She also interposed in order to secure the rights which the treaty of Olivia had given to the Greek and Protestant subjects of Poland. But the umbrage which her imperial majesty's armies gave to the Roman Catholic Poles, by their residence in Poland, increased the rage of civil war in that country, and produced confederacies against all that had been done during the late election; which rendered Poland a scene of blood and confusion. The conduct of Russia, with regard to Poland, gave so much offence to the Ottoman court, that the Grand Signior sent Obrekoff, the Russian minister, to the prison of the Seven Towers, declared war against Russia, and marched a very numerous army to the confines of Russia and Poland. Hostilities soon commenced between these rival and mighty empires. In the months of February and March, 1769, Crim Gueray, Khan of the Tartars, at the head of a great body of Tartars, supported by 10,000 Spahis, having broken the Russian

lines of communication, penetrated into the province of New Servia, where he committed great ravages, burning many towns and villages, and carrying off thousands of captives. In April following, the Grand Vizer, at the head of a great army, began his march from Constantinople, and proceeded towards the Danube. In the mean time, prince Galitzin, who commanded the Russian army on the banks of the Neister, thought this a proper time to attempt something decisive, before the arrival of the great Turkish force in that quarter. He advanced to Choczim, where he encamped in sight of a body of 30,000 Turks, commanded by Caraman Pacha, and intrenched under the cannon of the town. The prince attacked the Turks in their entrenchments early in the morning of the 30th of April, and notwithstanding an obstinate defence, and a dreadful fire from the fortrefs, at length beat them out of their trenches. The Turks endeavoured to cover their retreat, by detaching a large body of cavalry to attack the right wing of the Russian army; but they had such a warm reception from the artillery, that they soon retired in great disorder. General Stoffeln, and prince Dolgorucki were then ordered to pursue the fugitives, at the head of eight battalions; which they did so effectually, that they followed them into the suburbs of Choczim, where the pursuit was only stopped by the pallisadoes of the fortrefs. Soon after, the town was set on fire by red-hot balls, and a great number of Jews and Christians took refuge in the Russian camp. From these successes of the Russians, it might have been expected that Choczim would have immediately fallen; but prince Galitzin thought proper to retire, and to repass the Neister, being deficient in artillery. Indeed, it appears that the Turkish cavalry had over-run the neighbouring country, burnt some small towns, and destroyed some Russian magazines.

While the Russians and Turks were attacking each other in different places of their dominions on the side of Europe, the Tartar Asiatic nations, in their different interests, extended the rage of war into another quarter of the globe. On the 9th of May a bloody engagement was fought between the Kalmucs and those Tartars that inhabit the banks of the Cuban, lying between the Black and the Caspian seas. This engagement continued from two in the afternoon till sun-set; when the Kalmucs, by the assistance of some Russian officers, with a detachment of dragoons and Cossacs, and two pieces of cannon, obtained a complete victory, having made a great slaughter, as the Kalmucs gave no quarter. On the other hand, the European Tartars penetrated into the Russian Ukraine on the side of Backmuth, where they made great devastations.

On the 13th of July, a very obstinate battle was fought between a considerable Turkish army, and the Russians under prince Galitzin in the neighbourhood of Choczim, in which the Turks were defeated. The Russians immediately invested Choczim, but the garrison, being numerous, made frequent sallies, and received great reinforcements from the grand vizir's camp, who was now considerably advanced on this side of the Danube. Several actions ensued, and prince Galitzin was again obliged to retreat and repass the Neister. It was computed that the siege of Choczim, and the actions consequent to it, cost the Russians above 20,000 men. In the management of this war, the grand vizir acted with a degree of prudence, which it has been thought would have proved fatal to the designs of the Russians, if the same conduct had been afterwards pursued. But the army of the vizir was extremely licentious, and his caution gave offence to the Janizaries: so that, in consequence of their clamours, and the weakness of the councils that prevailed in the seraglio, he at length became a sacrifice, and Moldovani Ali Pacha, a man of more courage than conduct, was appointed his successor.

During these transactions, general Romanzow committed great devastations on the Turks on the borders of Bender and Oczakow, where he plundered and burnt several towns and villages, defeated a Turkish detachment, and carried off a great  
booty

booty of cattle. The Tartars also committed great ravages in Poland, where they almost destroyed the palatinate of Bracklaw, besides doing much mischief in other places. In the beginning of September, the Russian army was again posted on the banks of the Neister, and defended the passage of that river against the Turks, whose whole army, under the command of the new vizir, had arrived on the opposite shore. Having laid three bridges over the Neister, the Turkish army, began to pass the river in the face of the enemy. Prince Galitzin having perceived this motion early in the morning of the 9th of September, immediately attacked those troops that had crossed the river in the night, who consequently could neither choose their ground, nor have time to extend or form themselves properly where they were. Notwithstanding these extreme disadvantages, the engagement was obliged to re-pass the river with great loss. It was computed that about 60,000 Turks crossed the river, before and during the time of the engagement. Prince Galitzin charged at the head of five columns of infantry, with fixed bayonets, who destroyed the flower of the Turkish cavalry. It is said, that the loss of the Turks in this battle, amounted to 7000 men killed upon the spot, besides wounded and prisoners, and a great number who were drowned. Though the ill conduct of the vizir had greatly contributed to this capital misfortune, yet this did not prevent him from engaging in another operation of the same nature. He now laid but one bridge over the river, which he had the precaution to cover with large batteries of cannon, over which he intended the whole army should pass. On the 17th of September eight thousand Janizaries and four thousand regular cavalry, the flower of the Ottoman forces, passed over with a large train of artillery, and the rest of the army were in motion to follow, when a sudden and extraordinary swell of the waters of the Neister totally destroyed the bridge. The Russians lost no time in making use of this great and unexpected advantage. A most desperate engagement ensued; not only the field of battle, but the river over which some few hundreds of Turks made their escape by swimming, was for several miles covered with dead bodies. The Turks immediately broke up their camp, abandoned the strong fortrefs of Choczim, with all its stores and numerous artillery, and retired towards the Danube. They were much exasperated at the ill conduct of the vizir; and it was computed that the Turks lost 28,000 of the bravest of their troops within little more than a fortnight; and that 48,000 more abandoned the army, and totally deserted, in the tumultuous retreat to the Danube. Prince Galitzin placed a garrison of four regiments in the fortrefs of Choczim, soon after resigned the command of the army to general Count Romanzow, and returned to Peterburgh covered with laurels.

The Russians carried on the war with success: they over-run the great province of Moldavia, and general Elhpt took possession of the capital, Jassy, without opposition. As the Greek natives of this province had always secretly favoured the Russians, they now took this opportunity of their success, and the absence of the Turks, to declare themselves open. The Greek inhabitants of Moldavia, and afterwards those of Wallachia, acknowledged the empress of Russia as their sovereign, and took oaths of fidelity to her. On the 18th of July, 1770, general Romanzow defeated a Turkish army, near the river Larga, said to have amounted to 80,000 men, and commanded by the Khan of the Crimea. But on the second of August, the same Russian general obtained a still greater victory over another army of the Turks, commanded by a new grand vizir. This army was very numerous, but was totally defeated. It is said that above 7000 Turks were killed on the field of battle, and that the roads to the Danube were covered with dead bodies.

But it was not only by land, that the Russians carried on the war successfully against the Turks. The empress sent a considerable fleet of men of war, Russian built, into the Mediterranean, to act against the Turks on that side; and, by means of this fleet, under count Orloff, the Russians spread ruin and desolation through the open islands of the Archipelago, and the neighbouring defenceless coasts of Greece and Asia; the particulars of which will appear in the history of Turkey. It is observable, that in their naval enterprizes, the Russians were much indebted to English officers. A peace was concluded on the 21st of July 1774, highly honourable and beneficial to the Russians, by which they obtained the liberty of a free navigation over the Black sea, and a free trade with all parts of the Ottoman empire.

Before the conclusion of the war with the Turks, a rebellion broke out in Russia, which gave much alarm to the court of Peterburgh. A Cossack, whose name was Pugatcheff, assumed the name and character of the late unfortunate emperor Peter the Third. He appeared in the province of Kasan, and pretended, that he made his escape, through an extraordinary interposition of Providence, from the murderers who were employed to assassinate him; and that the report of his death was only a fiction of the court. His person is said to have had a striking resemblance to that of the late emperor, a circumstance which first induced him to engage in this enterprize. As he possessed abilities and address, his followers soon became very numerous; and he at length found himself so powerful, that he stood several engagements with the ablest Russian generals, at the head of large bodies of troops, and committed great ravages in the country. But being totally defeated, and then betrayed by two of his confidants, he was brought to Moscow in an iron cage, and there beheaded and quartered on the 21st of January, 1775.

The peace of 1774, was then indispensably necessary to the immediate preferation of the Turkish empire; but, within so small a space of time as five years, a new war was just upon the point of breaking out between the two empires; and was only prevented by a new treaty of pacification, which took place on the 21st of March, 1779. But the great source of discord was still left open. The pretended independency of the Crimea, afforded such an opening to Russia, into the very heart of the Turkish empire, and such opportunities of interference, that it was scarcely possible that any lasting tranquillity could subsist between the two empires. A claim made and insisted on by Russia, of establishing consuls in the three provinces of Moldavia, Wallachia, and Bessarabia, was exceedingly grievous to the Porte. After long disputes, the Turkish ministers, more from a sense of the disability of the state for war, than from pacific dispositions, found it necessary, towards the close of the year 1781, to give up the point of debate with respect to the consuls. This concession, however mortifying, produced but a short-lived effect. New troubles were continually breaking forth. The emperor of Germany having avowed his determination of supporting all the claims of Russia as well as his own, all sides prepared for the most determined hostility, and the preparations were immense on all. The year 1783, accordingly exhibited the most formidable apparatus of war on the northern and eastern borders of Europe. However, in the midst of all these appearances of war, negotiations for a peace were continually carried on at Constantinople, which was at last signed January 9th, 1784. By this treaty Russia retains the full sovereignty of her new acquisitions, viz. the Crimea, the Isle of Taman, and part of Cuban.—As the recovery and restoration of every thing Greek, is the predominant passion of the court of Peterburgh, so the Crimea and its dependencies are in future to be known by the name of Taurica; particular places are likewise restored to their ancient appellations, and the celebrated port and city of Cassa, has now resumed its long-forgotten name of Theodosia. Since this accession of dominion, new towns, with Greek or Russian names,

names, are rising fast in the deserts, and are peopled mostly by colonies of Greeks and Armenians.

The year 1787 opened with the extraordinary spectacle of the journey of the empress of Russia to Cherfon, where it seems to have been her original intention to have been crowned with all possible magnificence, and under the splendid titles of empress of the East, liberator of Greece, and reviver of the series of Roman emperors, who formerly swayed the sceptre over that division of the globe; but this coronation, for reasons we are unable to assign, was laid aside. The splendor of the rout of the czarina exceeded whatever the imagination would spontaneously suggest. She was escorted by an army. Pioneers preceded her march, whose business it was to render the road as even and pleasant as it could possibly be made. At the end of each day's journey, she found a temporary palace erected for her reception, together with all the accommodations and luxuries that Peterburgh could have afforded. In the list of her followers were the ambassadors of London, Versailles and Vienna; and her own ambassador as well as the envoy of the emperor to the court of Constantinople, were appointed to meet her at Cherfon. The king of Poland met her on her journey; and the emperor, not satisfied with swelling her triumph at Cherfon, appeared in that capital eight days before her, and proceeded to a considerable distance up the Dnieper, to intercept her progress. Her route was through Kiow, where she remained three months, and was received under triumphal arches; and upon her arrival at Cherfon, having thought proper to extend the walls of the city, she inscribed over one of the gates, "Through this gate lies the road to Byzantium." The czarina returned to Peterburgh, by the way of Moscow.

Scarcely had the empress returned to her capital, before she was followed by the Turkish declaration of hostilities. The emperor of Germany joined her in declaring war against the Porte, who, instead of being disheartened at the formidableness of this confederacy, applied themselves with redoubled ardour to prepare for resistance. The operations of the Russian forces were directed against Choezim and Oczakow. In the former of these undertakings they acted rather as auxiliaries to the emperor's general, the prince of Saxe Cobourg, who from the last day of June to the twenty-ninth of September 1788, continued a very powerful attack on this city, when it surrendered to the arms of the imperial forces. Oczakow, after an obstinate contest, in which the Russians at length became exposed to all the rigours of a winter's campaign, was taken by storm on the seventeenth of December following.

It was during the progress of these hostilities with the Porte, that Russia found herself suddenly involved in a new and unexpected war. As a nation, Sweden had the greatest causes of resentment against Russia for past injury and loss, at the same time that she had every thing to dread from her present overgrown power and boundless ambition, which was as little qualified in the wanton display, as it was ungoverned in the actual exertion. Russia has constantly found means to maintain a strong and numerous party in Sweden. All these causes operating together, induced Gustavus the Third, to meditate a project of hostilities against Russia, which were commenced in Finland; a few days after the king's arrival in that province. But the principal action of the campaign was the naval battle off Hoogland, in the Gulph of Finland. The engagement, which lasted five hours, was fought with considerable skill and obstinacy on both sides. The forces were nearly equal. The Russian fleet, commanded by Admiral Greig, consisted of seventeen ships of the line; and the Swedish, under the command of the duke of Sudermania, the king's brother, consisted of fifteen, of an inferior weight of metal, but reinforced by five frigates, one of forty-four, and the rest of forty guns each, which occasionally ranged themselves in order of battle. The Russians possessed, upon

upon the whole, a superiority of 294 pieces of cannon; while that in the weight of metal was perhaps of greater moment. The victory, as is usually the case in actions not apparently and absolutely decisive, was claimed by both sides. But, it seems upon the whole, that the Swedes in the highest period of their glory, had never displayed greater gallantry by sea, or land, than they did upon this occasion. Their princely commander merited a very considerable share of the glory of this engagement. At last, after many other engagements attended with various success, on the 14th of August 1790, a convention for a peace was signed between the courts of Russia and Sweden, and was ratified in six days after.

At the close of the year 1790, the empress had the satisfaction to see her conquests no longer bounded by the course of the Danube. The capture of Ismail was the last important action. Eight different times were the Muscovites repulsed with the slaughter of many of their bravest soldiers. At the ninth, general Suvarrow put himself at their head, and snatching a standard out of an officer's hand, he ran directly towards the town, passed the trenches, and clambering up the wall, planted it himself upon the ramparts. "There," cried he, "my fellow soldiers, behold there your standard in the power of your enemy, unless you will preserve it; but, I know you are brave, and will not suffer it to remain in their hands." This speech had the desired effect. It was taken by storm on the 22d of December, 1790, and it is said that the siege and capture did not cost the Russians less than 10,000 men. The most shocking part of the transaction is, that the garrison (whose bravery merited, and would have received from a generous foe, the highest honours) were massacred in cold blood, by the merciless Russians, to the amount of upwards of 30,000 men, by their own account; and the place was given up to the unrestrained fury of the brutal soldiery. The most horrid outrages were perpetrated on the defenceless inhabitants, and the conduct of the conquerors, was more that of a horde of cannibals, than of a civilized people.

England and Prussia, after a long and expensive armed negotiation, at length assented to the demand of the empress, which was strengthened by the interference of Spain and Denmark, that Oczakow, and the territory between the rivers Bog and Niester, shall in full sovereignty belong to Russia, that the river Niester shall for the future determine the frontiers of Russia and the Porte; that the two powers may erect on the shores of that river what fortresses they think proper; and Russia engages to grant a free navigation on the river Niester. This was concluded on the 11th of August, 1791.—Thus has the Porte entered into a war, for the purpose of regaining the Crimea, and after reducing the Ottoman empire to extreme weakness, and internal symptoms of ruin, irretrievable by a government in a regular progress of deterioration, lost an important territory, and left the existence of the empire, at the mercy of another Russian war. By some advantages offered to Russia and Poland, and a few intrigues, Russia may change the fluctuating stream of European politics, and by one powerful campaign, overturn the Turkish monarchy. The final treaty with the Turks, concluded at Jassy the 9th of January, 1792. The empress is improving Oczakow, and rendering it a place of great strength, importance, and commerce.—At the same time, Catharine is not negligent of her share in European politics. She has assured the pope that she will support him in the resumption of Avignon; and has published a warm manifesto against the French revolution. But Poland, and the efforts which that people made in the cause of liberty, gave her the greatest apprehensions. To this unhappy kingdom, the only recent transactions of her reign, worthy of attention, have been directed. Whilst she has been amusing the world with manifestoes against France, she has beheld with pleasure the greatest powers of Europe waiting their strength and treasure, and has, undisturbed by any foreign interference,

made a second partition of Poland; the circumstances of which the reader will find briefly narrated in our account of that unfortunate country.

The present empress of Russia, notwithstanding the very unfavourable circumstances which attended her taking possession of the government of that empire, has, from the commencement of her reign, filled her high station with distinguished renown. She has encouraged learning and the arts, and endeavoured greatly to extend the commerce of her subjects. Her imperial majesty has effected many beneficial and important regulations in the interior police, and particularly in the courts of justice. She has abolished the use of torture, and adopted an excellent plan for the reformation of prisons. The new code of laws, for which she hath given her instructions, is yet wanting to mitigate the rigour of despotism. One of the most remarkable transactions of her reign is, her establishment of an armed neutrality, for the protection of the commerce of nations not at war, from any attacks or insults from belligerent powers. By the code, which her imperial majesty has endeavoured to enforce, neutral ships are to enjoy a free navigation from port to port, and on the coasts of belligerent powers; and all effects belonging to the subjects of such powers are looked upon as free, on board such neutral ships, except the goods stipulated contraband in her treaty of commerce with Great Britain. It was in 1780, that her imperial majesty invited the powers at war to accede to this armed neutrality. Those who engaged were to make a common cause at sea against any of the powers who should violate, with respect to neutral nations, these principles of maritime law. The armed neutrality was acceded to, the same year, by the kings of Sweden and Denmark, and by the States-General.

Catharine II. empress of all the Russias, princess of Anhalt Zerbst, was born May 2d, 1729, and ascended the throne July 9th, 1762, upon the deposition and death of her husband. She was married to that prince whilst duke of Holstein Gottorp, September 1st, 1745, by whom she has issue Paul Petrowitz, great-duke of Russia, born October 1st, 1754, who has been twice married; and by his present duchess, the princess of Wirtemberg, has issue,

1. Alexander, born December 23d, 1777.
2. Constantine, born May 8th, 1779.
3. Alexander Powlowna, born in August, 1783.
4. Helena, born December 24th, 1784.
5. A princess, born in March, 1786.
6. Another princess, born in May, 1788.
7. Another princess, born in 1792.

## SCOTLAND, AND ITS ADJACENT ISLES.

### ISLES OF SCOTLAND.

ACCORDING to the general plan I have laid down, I shall treat of the islands belonging to Scotland, before I proceed to the description of that kingdom: and, to avoid prolixity, shall comprehend, under one head, those of Shetland, Orkney, and the Hebrides, or Western isles.

**SITUATION AND EXTENT.** The isles of Shetland lie north-east of the Orcaades, or Orkney-islands, between 60 and 61 degrees of north latitude; and form part of the shire of Orkney.

The

The Orkades lie north of Dungenby-head, between 59 and 60 degrees of north latitude; divided from the continent by a tempestuous strait called Pentland Frith, twenty-four miles long, and twelve broad.

The Hebrides, or Western isles, are numerous, and some of them large; situated between 55 and 59 degrees of north latitude.

**CLIMATE.]** In all these islands the air is keen, piercing, and salubrious; and many of the natives live to a great age. In the Shetland and Orkney isles they see to read at midnight in June and July; and during four of the summer months, they have frequent communications, both for business and curiosity, with each other, and with the continent: the rest of the year, they are almost inaccessible, through fogs, darkness, and storms.

**CHIEF ISLANDS AND TOWNS.]** The largest of the Shetland islands, which are forty-six in number (though many of them are uninhabited) is Mainland, which is 60 miles in length, and 20 in breadth. Its principal town is Larwick, which contains 300 families; the whole number of families in the island not exceeding 500. Skalloway is another town, where the remains of a castle are still to be seen, and it is the seat of a presbytery. On this island the Dutch begin to fish for herrings at Midsummer, and their fishing season lasts six months.

The largest of the Orkney islands, which are about thirty in number (though several of them are unpeopled), is called Pomona. Its length is thirty-three miles; and its breadth, in some places, nine. It contains nine parish churches, and four excellent harbours.

The isle of Mull, in the Hebrides, is twenty-four miles long, and, in some places, almost as broad. It contains two parishes, and a castle, called Daart, which is the chief place in the island. The other principal western islands are, Lewis or Herries (for they both form but one island), which belongs to the shire of Ross, and is 100 miles in length, and thirteen or fourteen in breadth; its chief town is Stornway. Sky, belonging to the shire of Inverness, is forty miles long, and, in some places, thirty broad; fruitful, and well peopled. Bute, which is about ten miles long, and three or four broad, is famous for containing the castle of Rothsay, which gave the title of duke to the eldest sons of the kings of Scotland; as it now does to the prince of Wales. Rothsay is likewise a royal burgh; and the islands of Bute and Arran form the shire of Bute. The isles of Ila and Jura are part of Argyleshire, and contain together about 370 square miles; but they have no towns worthy of notice. North Uist contains an excellent harbour, called Lochmaddy, famous for herring-fishing. Iona, once the seat and sanctuary of western learning, and the burying-place of many kings of Scotland, Ireland, and Norway, is still famous for its reliques of sanctimonious antiquity. Some authors have been at great pains to describe the island of St. Kilda, or Hirt, for no other reason, that I can discover, but because it is the remotest of all the north-west islands, and very difficult of access; for it does not contain above thirty-five families.

**INHABITANTS, CUSTOMS, POPULATION, LANGUAGE, AND RELIGION.]** It is not to be imagined that the inhabitants of the isles belonging to Scotland can be so minutely described here, as they have been by some other authors; not so much on account of their importance, as their curiosity. Those of Shetland and Orkney were formerly subject to the Normans, who conquered them in 1099, a few years after they landed in England under William the Conqueror. In the year 1263 they were in possession of Magnus of Norway, who sold them to Alexander king of Scots, and he gave them as fiefs to a nobleman of the name of Speire. After this, they became subject to the crown of Denmark. Christian I. in the reign of James III. conveyed them in property to the crown of Scotland, as a marriage portion with his daughter Margaret, and all future pretensions were

entirely ceded on the marriage of James VI. of Scotland with Anne of Denmark. The isles of Shetland and Orkney form a stewartry, or shire, which sends a member to parliament. Their inhabitants differ little from the Lowlanders of Scotland; except that their manners are more simple, and their minds less cultivated. Men of fortune have improved their estates wonderfully of late years; and have introduced into their families many elegancies and luxuries. They build their dwellings, and other houses, in a modern taste; and are remarkable for the fineness of their linen. As to the common people, they live upon butter, cheese, fish, and land fowl (of which they have great plenty) particularly geese: and their chief drink is whey, which they have the art of fermenting, so as to give it a vinous quality. In some of the northern islands, the Norwegian, which is called the Norse language, is still spoken. Their intercourse with the Dutch, during the fishing season, renders that language common in the Shetland and Orkney islands. The people are as expert as the Norwegians in seizing the nests of sea-fowls, which build in the most frightful precipices and rocks. The people's temperance preserves them from most diseases. They cure the scurvy and the jaundice, to which they are subject, with the powder of snail-shells and scurvy-grass, of which they have plenty. Their religion is protestant, according to the discipline of the church of Scotland; and their civil institutions are the same with those of Scotland.

We have the most undoubted evidences of history, that about 400 years ago, these isles were much more populous than they are now: for the Hebrides alone sent 10,000 fighting men into the field, without prejudice to their agriculture. At present their numbers are said not to exceed 48,000. The people of the Hebrides are clothed, and live like the Scotch Highlanders. They are similar in persons, constitutions, customs, and prejudices; with this difference, that the more polished manners of the Lowlanders are every day gaining ground in the Highlands: perhaps the descendants of the ancient Caledonians, in a few years, will be discernible only in the Hebrides.

Those islands alone retain the ancient usages of the Celts, as described by the oldest and best authors; with a strong tincture of the feudal constitution. Their shanachies or story-tellers supply the place of the ancient bards, so famous in history, as historians and genealogists. The chief is likewise attended, when he appears abroad, with his musician, who is generally a bagpiper, and dressed in the manner, but, as it is said, more sumptuously than the English minstrels of former times\*. That kind of music was cultivated with wonderful care among these islanders so late as the beginning of the present century. They had regular colleges and professors, and the students took degrees according to their proficiency. Many of the Celtic rites, some of which were too barbarous to be retained, or even mentioned, are now abolished. The inhabitants, however, still preserve the most profound respect and affection for their several chieftains, notwithstanding all the pains that have been taken by the British legislature to break those connexions. The common people are but little better lodged than the Norwegians and Laplanders; though they certainly fare better, for they have oatmeal, plenty of fish and fowl, cheese, butter-milk, and whey; and also mutton, beef, goat, kid, and venison. They indulge themselves, like their forefathers, in a romantic poetical turn; and the agility of both sexes, in the exercises of the field, and in dancing to their favourite music, is remarkable.

The reader would not pardon an author who should omit that remarkable manalogy, or gift of prophecy, which distinguishes the inhabitants of the Hebrides under the name of the *second sight*. It would be equally absurd to attempt to dis-

\* See Percy's Reliques of Ancient English Poetry.

prove the reality of some instances of this kind that are brought by reputable authors, and to admit all that has been said upon the subject. The adepts of the second-sight pretend that they have certain revelations, or rather presentations, either really or typically, which swim before their eyes, of certain events that are to happen in the compass of 24 or 48 hours. But from the best information, no two of those adepts agree as to the manner and forms of these revelations, or have any fixed method for interpreting their typical appearances. The truth seems to be, that those islanders, by indulging themselves in lazy habits, acquire visionary ideas, and overheat their imaginations, till they are presented with those phantoms, which they mistake for fatidical or prophetic manifestations. They instantly begin to prophesy; and it would be absurd to suppose, that amidst many thousands of predictions, some did not happen to be fulfilled; and these, being well attested, give a sanction to the whole.

Many learned men have been of opinion, that the Hebrides, being the most westerly islands planted by the Celts, their language must remain there in its greatest purity. This opinion, though plausible, is not justified by experience. Many Celtic words, as well as customs, are there found; but the intercourse which the Hebrides had with the Danes, Norwegians, and other northern nations, whose language is mixed with the Sclavonian and Teutonic, which last has no affinity with the Celtic, has rendered their language a compound; so that it approaches in no degree to the purity of the Celtic, commonly called Erse, which was spoken by their neighbours in Lochaber and the coasts of Scotland, the undoubted descendants of the Celts, among whom their language remains more unmix'd.

The religion professed in the Hebrides is chiefly presbyterian, as established in the church of Scotland; but popery and ignorance are still pretty prevalent.

**SOIL, MINES, AND QUARRIES.]** The surface of these islands has undergone great alterations. Many of them were habitations of the Druids, whose temples are still visible; and those temples were surrounded by groves, though little or no timber now grows in the neighbourhood. The stumps of former trees are discernible, as are many vestiges of buildings erected since the introduction of Christianity, which prove the decrease of riches, power, and population. Experience daily shews, that the cold sterility of the northern isles was owing to their want of culture; for such spots as are now cultivated produce corn and vegetables in abundance; and fruit-trees are now brought to maturity. Tin, lead, and silver mines; marl, slate, free-stone, and even quarries of marble, have been found upon these islands. They are not destitute of fine fresh water; nor of lakes and rivulets teeming with excellent trout.

**TRADE AND MANUFACTURES.]** These are all in their infancy in those islands. Their staple commodities consist of fish, especially herrings, which, when properly cured, are equal to those of the Dutch. They carry on likewise a considerable trade in down and feathers; their sheep afford them wool, which they manufacture into coarse cloths; and linen manufactures begin to make some progress among them. They carry their black cattle alive to the adjacent parts of Scotland, where they are disposed of in sale or barter; as are large quantities of their mutton, which they salt in the hide. Upon the whole, application and industry, with some portion of public encouragement, are only wanting to render these islands, not only comfortable for their inhabitants, but ornamental and beneficial to Great Britain.

**BEASTS, BIRDS, AND FISHES.]** In the neighbouring countries already described, mention has been made of most of the birds and fishes that have been discovered here; only it is thought that the isles contain a species of falcon or hawk, of a more noble and docile nature than any that are to be found elsewhere. The Shetland isles are famous for a small breed of horses, which are incredibly active, strong, and hardy,

hardy, and frequently seen in the streets of London, yoked to the splendid carriages of the curious or wealthy. The coasts of those islands, till within these 20 years, seemed, however, to have been created, not for the inhabitants, but for strangers. The latter furnish the former with wines, strong liquors, spice, and luxuries of all kinds, for their native commodities, at the gain of above 100 per cent. But it is to be hoped that this pernicious traffic now draws to an end. Three thousand buffes have been known to be employed in one year by the Dutch in the herring fishery, besides those fitted out by the Hamburgers, Bremeners, and other northern ports.

**RARITIES AND CURIOSITIES.** These islands exhibit many proofs of their former cultivated state, in their churches, the vestiges of old forts, and other buildings both sacred and civil. In a gloomy valley belonging to Hoy, one of the western islands, is a kind of hermitage, cut out of a stone called a dwarf-stone, 36 feet long, 18 broad, and nine thick; in which is a square hole, about two feet high, for an entrance, with a stone of the same size for a door. Within this entrance is the resemblance of a bed, with a pillow cut out of the stone, big enough for two persons to lie on; at the other end is a couch, and in the middle a hearth, with a hole cut out above for a chimney. It would be endless to recount the various vestiges of Druidical temples, some of which must have required equal labour with the famous Stone-henge near Salisbury. Others seem to be memorials of particular persons, or actions, consisting of one large stone, standing upright; some have been sculptured, and others have served as sepulchres, and are composed of stones cemented together. Barrows, as they are called in England, are frequent in these islands; and the monuments of Danish and Norwegian fortifications might long employ an able antiquary to describe. The gigantic bones found in many burial-places here give room to believe, that the former inhabitants were of larger size than the present. It is likewise probable, from some ancient remains, particularly catacombs; and nine silver fibule or clasps, found at Stennis, one of the Orkneys, that the Romans were well acquainted with these parts.

The cathedral of Kirkwall, the capital of the Orkneys, is a fine Gothic building, dedicated to St. Magnus, but now converted into a parish church. Its roof is supported by 14 pillars on each side, and its steeple, in which is a good ring of bells, by four pillars. The three gates of the church are chequered with red and white polished stones, embossed and elegantly flowered.

The Hebrides are still more distinguished than the Orkney or Shetland isles for their remains of antiquity. The isle of Iona, called St. Columb-Kill, seems to have served as a sanctuary for St. Columba, and other holy persons, while Ireland, England, and Scotland, were desolated by barbarism. It appears that the northern pagans often landed here, and paid no regard to the sanctity of the place. The church of St. Mary, which is built in form of a cathedral, is a beautiful fabric. It contains the bodies of some Scotch, Irish, and Norwegian kings, with some Gaelic inscriptions. The tomb of Columba, who lies buried here, is uninscribed. The steeple is large, the cupola 21 feet square, the doors and windows are curiously carved, and the altar is of the finest marble. Innumerable inscriptions, referring to ancient customs and ceremonies, are discernible in this island; which gives countenance to the well-known observation, that when learning was nearly extinct on the continent of Europe, it found a refuge in Scotland, or rather in these islands.

The islands belonging to Scotland contain likewise some natural curiosities peculiar to themselves; the phaseoli, or Mollucca beans, have been found in the Orkneys, driven, as is supposed, from the West Indies, by the westerly winds, which often force ashore many curious shells and marine productions, highly esteemed by naturalists. In the parish of Ham, a large piece of stag's horn was found very deep in

the earth, by the inhabitants, who were digging for marl; and certain bituminous effluvia produce surprising phenomena, which the natives believe to be supernatural.

But some of the most astonishing appearances in nature have remained undescribed, and, till lately, unobserved, even by the natives. A discovery reserved for the inquisitive genius of sir Joseph Banks, who, in relating his voyage through the Hebrides, anno 1772, says, "We were no sooner arrived than we were struck with a scene of magnificence which exceeded our expectations, the whole of that end of the island (viz. Staffa, a mile in length, and half a mile in breadth) supported by ranges of natural pillars, mostly above fifty feet high, standing in colonnades upon a firm basis of rock; above these the stratum which reaches to the surface of the island, varied in thickness as the island itself formed into hills or vallies; each hill, which hung over the columns below, composed an ample pediment; sometimes sixty feet in thickness from the base to the point, and formed, by the sloping of the hill on each side, almost into the shape of those used in architecture.

"Proceeding farther to the N. W. you meet with the highest ranges of pillars, the magnificent appearance of which surpasses description: here they are bare to their very bases, and the stratum below them is also visible."—Sir Joseph particularises sundry other appearances in this, and a neighbouring island, which is wholly composed of pillars without any stratum. In some parts of Staffa, instead of being placed upright, the pillars were observed to lie on their sides, each forming a segment of a circle; but the most striking object in this picturesque scene is Fingal's Cave, which he describes in the following manner:—"With our minds full of such reflections, we proceeded along the shore, treading upon another *Giant's Causeway*; every stone being regularly formed into a certain number of sides and angles; till, in a short time, we arrived at the mouth of a cave, the most magnificent, I suppose, that has ever been described by travellers\*; supported on each side by ranges of columns, and roofed by the bottoms of those which have been broken off in order to form it; between the angles of which, a yellow stalagmitic matter has exuded, which serves to define the angles precisely, and at the same time to vary the colour, with a great deal of elegance; and to render it still more agreeable, the whole is lighted from without; so that the farthest extremity is very plainly seen from without; and the air within being agitated by the flux and reflux of the tide, is perfectly dry and wholesome, free entirely from the damp of vapours with which natural caverns in general abound."

Mr. Pennant, who also made a voyage to these islands in the same year, had a glance of Staffa, in his passage from Iona to Mull, but was prevented by stormy weather from approaching it. "On the west," says he, "appears the beautiful groupe of the *Treshumish* isles. Nearest lies Staffa, a new *Giant's Causeway*, rising amidst the waves, but with columns of double the height of that in Ireland; glossy and resplendent, from the beams of the eastern sun."—And in the isle of Sky, a considerable way northward, he resumes the subject: "We had in view a fine series of genuine basaltic columns, resembling the *Giant's Causeway*; the pillars were above twenty feet high, consisting of four, five, and six angles, but mostly of five. At a small distance from these, on the slope of a hill, is a tract of some roads.

\* The dimensions of the cave are thus given by sir J. Banks.

	Feet		Feet
Length of the cave from the arch without	371	At the end	70
From the pitch of the arch	250	Height of an outside pillar	39
Breadth of ditto at the mouth	53	Of one at the N. W. corner	54
At the farther end	20	Depth of water at the mouth	18
Height of the arch at the mouth	117	At the bottom	9

I

entirely

entirely formed of the tops of several series of columns, even and close set, forming a reticulated surface of amazing beauty and curiosity. This is the most northern basaltic I am acquainted with; the last of four in the British dominions, all running from south to north, nearly in a meridian; the Giant's Causeway appears first in Staffa, &c. succeeds; the rock Humbla about twenty leagues farther, and finally, those columns of Sky: the depth of the ocean, in all probability, conceals the vast links of this chain."

S C O T L A N D.

EXTENT AND SITUATION.

Length 300 } between { 54 and 59 North latitude.  
 Breadth 190 } { 1 and 6 West longitude.

**NAME.]** THE Celts or Gauls are supposed to have been the original inhabitants of this country. The Scots, a Scythian tribe, invaded it about the beginning of the fourth century, and having conquered the Picts, the territories of both were called Scotland. The word Scot being no other than a corruption of Scyth, or Scythian, being originally from that immense country, called Scythia by the ancients. It is termed by the Italians, Scotia; by the Spaniards, Escotia; by the French, Ecosse; and Scotland by the Scots, Germans, and English.

**BOUNDARIES.]** Scotland, which contains an area of 27,794 square miles, is bounded on the south by England; and on the north, east, and west, by the Deucaledonian, German, and Irish seas, or more properly the Atlantic Ocean.

**DIVISIONS AND SUBDIVISIONS.]** Scotland is divided into the countries south of the Frith of Forth, the capital of which, and of all the kingdom, is Edinburgh, and those to the north of the same river, where the chief town is Aberdeen. This was the ancient national division; but some modern writers, with less accuracy, have divided it into Highlands and Lowlands, on account of the different habits, manners, and customs of the inhabitants.

Eighteen counties, or shires, are allotted to the southern divisions, and 15 to the northern; and those counties are subdivided into sheriffdoms, stewartries, and bailiwicks, according to the ancient tenures and privileges of the landholders.

Shires.	Sheriffdoms and other subdivisions.	Chief Towns.
1. Edinburgh (429*)	{ Mid-Lothian - - - }	{ Edinburgh, W. Long. 3. N. lat. 56. Musselburgh. Leith, and Dalkeith.
2. Haddington (121)	{ East-Lothian - - - }	{ Dumbar, Haddington, and North-Berwick.

\* The numbers shew the proportion of militia as proposed to be raised in each shire, when that scheme was laid before parliament in 1775.

Shires.	Sheriffdoms and other subdivisions.	Chief Towns.
3. Merse, anciently Berwick *	(114) { The Merches, and Lauderdale - - - - }	{ Dunfer, and Lauder.
4. Roxborough	(165) { Tiviotdale, Lidfale, Eskdale and Eufdale - - }	{ Jedburgh, Kelso, and Melrose.
5. Selkirk	(19) { Etrick Forest - - - }	{ Selkirk.
6. Peebles	(42) { Tweeddale - - - - }	{ Peebles.
7. Lanerk	(388) { Clydesdale - - - - }	{ Glasgow, W. long. 4-5. N. lat. 55-52. Hamilton, Lanerk, & Rutherglen.
8. Dumfries	(188) { Nithsdale, Annandale - - - }	{ Dumfries, Annan.
9. Wigtown	(190) { Galloway, West Part - - }	{ Wigtown, Stranraer, and Whitehorn.
10. Kircudbright	(100) { Galloway, East Part - - }	{ Kircudbright.
11. Air	(280) { Kyle, Carrick and Cunningham - - - }	{ Air, Kilmarnock, Irwin, Maybold, Stewarton, and Saltcoats.
12. Dumbarton	(66) { Lenox - - - - }	{ Dumbarton.
13. Bute (34) and	(105) { Bute, Arran, and Caithness - - - - }	{ Rothesay.
14. Caithness		{ Wick, N. lat. 58-40. and Thurso.
15. Renfrew	(226) { Renfrew - - - - }	{ Renfrew, Paisley, Greenock, and Port-Glasgow.
16. Stirling	(76) { Stirling - - - - }	{ Stirling and Falkirk.
17. Linlithgow	(80) { West Lothian - - - }	{ Linlithgow, Burroughstonness, & Queensferry.
18. Argyle	(314) { Argyle, Cowal, Knapdale, Kintire, and Lorn, with Part of the Western Isles, particularly Ila, Jura, Mull, Wist, Tarrif, Col, and Lismore - - }	{ Inverary, Dunstaffnage, Killonmer, and Campbelltown.
19. Perth	(570) { Perth, Athol, Gowry, Broadalbin, Monteith, Strathern, Stormount, Glenfield, & Raynork - - }	{ Perth, Scone, Dumblane, Blair, and Dunkeld.
20. Kincardine	(109) { Merns - - - - }	{ Bervie, Stonhivie and Kincardine.
21. Aberdeen	(551) { Mar, Buchan, Garioch, and Strathbogie - - }	{ Old Aberdeen, W. long. 1-40. N. lat. 57-22. New Aberdeen, Fraserburg, Peterhead, Kintore, Strathbogie, Inverary, and Old Meldrum.
22. Inverness	(282) { Aird, Strathglafs, Sky, Harris, Badenoch, Lochaber, and Glennorison - - - - }	{ Inverness, Inverlochry, Fort Augustus, Boileau.

\* Berwick, on the north side of the Tweed, belonged formerly to Scotland, and gave name to a county in that kingdom; but it is now formed into

a town and county of itself, in a political sense, distinct from England and Scotland, having its own privileges.

Shires,	Sheriffdoms and other subdivisions.	Chief Towns.
23. Nairne (27) and	{ Western Part of Murray and Cromartie - - - }	{ Nairne, Cromartie.
24. Cromartie (24)	{ Fife - - - - - }	{ St. Andrews, Cowper, Falkland, Kirkcaldy, Innerklythen, Ely, Burnt Island, Dumfermline, Dyfart, Anstruther and Aberdour.
25. Fife (387)	{ Forfar, Angus - - - }	{ Montrose, Forfar, Dundee, Arbroth, and Brechin.
26. Forfar (326)	{ Bamff, Strathdovern, Boyne, Euzy, Balveny, Strathawin, and part of Buchan - - }	{ Bamff and Cullen.
27. Bamff (182)	{ Strathnaver and Sutherland - - - - - }	{ Strathy and Dornoch.
28. Sutherland (100)	{ Fife Part - - - - - }	{ Culrofs, Clacmannan, Alloa, and Kinrofs.
29. Clacmannan (31)	{ Easter and Wester Ross, Isle of Lewis, Lochbroom, Lochearren, Ardmeanach, Redcastle, Ferrintosh, Strathpeffer, and Ferrindonald - - - - - }	{ Taine, Dingwall, Fortrose, Rosamarkie, and New Kelfo.
30. Kinrofs (23)	{ Murray and Strathspey	{ Elgin and Forres.
31. Ross (201)	{ Isles of Orkney and Shetland - - - - - }	{ Kirkwall, W. lon. 3. N. lat. 59-45. Skalloway, near the Meridian of London, N. lat. 61.
32. Elgin (145)		
33. Orkney (183)		

In all thirty-three shires, which choose thirty representatives to sit in the parliament of Great Britain; Bute and Caithness choosing alternately, as do Nairne and Cromartie, and Clacmannan and Kinrofs.

The royal Boroughs which choose representatives are,

Edinburgh - - - - -	1	Innerklythen, Dumfermline, Queensferry, Culrofs, and Stirling	1
Kirkwall, Wick, Dornock, Dingwall, and Tayne - - - - -	1	Glasgow, Renfrew, Rutherglen, and Dumbarton - - - - -	1
Fortrose, Inverness, Nairne, and Forres - - - - -	1	Haddington, Dunbar, North-Berwick, Lauder, and Jedburgh	1
Elgin, Cullen, Bamff, Inverary, and Kintore - - - - -	1	Selkirk, Peebles, Linlithgow, and Lanerk - - - - -	1
Aberdeen, Bervie, Montrose, Aberbrothe, and Brechin - - - - -	1	Dumfries, Sanquhar, Annan, Lochmaban, and Kircudbright - - - - -	1
Forfar, Perth, Dundee, Cowper, and St. Andrews - - - - -	1	Wigtown, New Galloway, Stranraer, and Whitehorn - - - - -	1
Crail, Kilrenny, Anstruther East and West, and Pittenweem - - - - -	1	Air, Irwin, Rothsay, Campbeltown, and Inverary - - - - -	1
Dyfart, Kirkaldy, Kinghorne, and Burnt Island - - - - -	1		

**CLIMATE, SOIL, AIR, AND WATER.]** In the northern parts, day-light, at Midsummer, lasts 18 hours and five minutes; which proportion of day to night is reversed in winter. The air of Scotland is more temperate than could be expected in so northerly a climate. This arises partly from the variety of its hills, vallies, rivers, and lakes; but still more, as in England, from the vicinity of the sea, which affords those warm breezes, that not only soften the natural keenness of the air, but, by keeping it in perpetual agitation, render it pure and healthful, and prevent those epidemic distempers that prevail in many other countries. In the neighbourhood of some high mountains, however, which are generally covered with snow, the air is keen and piercing for about nine months in the year. The soil in general is not so fertile as that of England; and in many places less fitted for agriculture than for pasture. At the same time, there are particular plains and vallies of the most luxuriant fertility. The finer particles of earth, incessantly washed down from the mountains, and deposited in these vallies, afford them a strong vegetative nourishment; though experience has proved that hortulane productions do not come so soon to maturity in this country as in England. There is, indeed, a great variety of soils in Scotland, the face of which is agreeably diversified by an intermixture of natural objects. The inequalities of the ground, if unfavourable to the labours of the husbandman, are particularly pleasing to the traveller, and afford those delightful situations for country houses, of which many of the Scottish nobility and gentry have availed themselves. It is their situation as much as their magnificence, that occasions the seats of the dukes of Argyle and Athol, of the earl of Hopetoun, and some other Scottish nobles, to fix the attention of every traveller. The water in Scotland, as every where else, depends on the qualities of the soil. Water passing through a heavy soil is turbid and noxious, but filtering through sand or gravel, is clear, light, and salutary to the stomach. This last is commonly the case in Scotland, where the water is better than that of more southern climates in proportion as the land is wofe.

**MOUNTAINS.]** The principal mountains in Scotland are the Grampian hills, which run from east to west, from near Aberdeen to Cowal in Argyleshire, almost the whole breadth of the kingdom. Another chain of mountains, called the Pentland-hills, runs through Lothian and joins those of Tweeddale. A third, called Lammer-Muir, rises near the eastern coast, and runs westward through the Merse. Besides these continued chains, among which we may reckon the Cheviot or Tiviot-Hills, on the borders of England, Scotland contains many detached mountains, sometimes of great height, which, from their conical figure, have been distinguished by the Celtic appellation of *Laws*. Many of them are stupendously high, and display a grandeur in their form, but too numerous to be particularized here.

**RIVERS, LAKES, AND FORESTS.]** The largest river in Scotland is the Forth, which rises in Montevih near Callendar, and passing Stirling, after a number of beautiful meanders, discharges itself near Edinburgh into that arm of the German sea, to which it gives the name of Firth or Forth. Second to the Forth is the Tay, which issues out of Loch Tay, in Breadalbin, and running south-east, passes the town of Perth, and falls into the sea at Dundee. The Spey, the most rapid river in Scotland, issues from a lake of the same name in Badenoch, and running from south-west to north-east, falls into the sea near Elgin; as do the rivers Dee and Don, which run from west to east, and disembogue themselves at Aberdeen. The Tweed rises on the borders of Lanerkshire, and after many serpentine turnings, discharges itself into the sea at Berwick, where it serves as a boundary between Scotland and England, on the eastern side. The Clyde is a large river on the west of Scotland, has its rise in Annandale, runs north-west through the valley of that name, and, after passing by Lanerk, Hamilton, Glasgow, Kenfrew, Dumbarton, and

and Greenock, falls into the Frith of Clyde, opposite to the isle of Bute. Besides those capital rivers, Scotland contains many others well provided with salmon, trout, and other fishes. Several of those rivers go by the name of *Fa*, which is the old Celtic name for water. The greatest improvement for inland navigation that has been attempted in this part of Great Britain is the canal joining the rivers Forth and Clyde; by which a communication is opened between the east and west seas, to the advantage of the whole kingdom.

The lakes of Scotland (there called *Lochs*) are too many to be particularly described. Loch Tay, Loch Lomond, Lochnefs, Loch Au, and some others, present us with such picturesque scenes as are scarcely equalled in any other country of Europe. Several of these lakes are beautifully fringed with woods, and contain plenty of fresh-water fishes. The Scots sometimes give the name of a loch to an arm of the sea; for example, Loch Fyn, which is 60 miles long and four broad, and is famous for its herrings. The Loch of Spinie, near Elgin, is remarkable for swans and cygnets, which often darken the air with their flights; owing, as some think, to the plant *alarina*, which grows in its water, with a straight stalk and a cluster of seeds at the top. Near Lochnefs is a hill almost two miles perpendicular, on the top of which is a lake of cold fresh water, about 30 fathoms in length, too deep ever yet to be fathomed, and which never freezes; whereas, but 17 miles from thence, the lake Lochanwyn, or Green Lake, is covered with ice all the year round. The ancient province of Lochaber receives that name from being the mouth of the lochs. The coasts of Scotland are indented with large, bold, and navigable bays or arms of the sea; as the bay of Glencuce and Wigtown bay; sometimes they are called Friths, as the Solway Frith, which separates Scotland from England on the west; the Frith of Forth, Murray Frith, and those of Cromarty and Dornoch.

The face of Scotland, even where it is most uninviting, presents us with the most incontrovertible evidences of its having been formerly over-run with timber. The deepest moles, or morasses, contain large logs of wood; and their waters being impregnated with turpentine have an antiseptic quality. Several woods still remain, and many attempts have been made for reducing them into charcoal, for the use of furnaces and founderies; but though the work succeeded in the execution, there was little encouragement to continue it, owing to the great distance from water-carriage. Fir trees grow in great perfection almost all over Scotland. The Scotch oak is excellent in the Highlands, where some woods reach 20 or 30 miles in length, and four or five in breadth; but, through the inconvenience already mentioned, without being of much emolument to the proprietors. It must be acknowledged that the greatest part of Scotland is destitute of hedge-rows and plantations. The country is beautiful, but it is a naked beauty. But the exertions now making in all branches of agriculture, promise to remedy, in due time, this unseemly defect; and to cloath Scotland with ornaments, that will well become her green hills and irriguous vallies.

**METALS AND MINERALS.** Scotland formerly afforded a sufficient quantity of gold for its coinage. James V. and his father contracted with certain Germans for working the mines of Crawford-Moor; and when that prince married the French king's daughter, a number of covered dishes, filled with coins of Scotch gold, were presented to the guests by way of desert. The civil wars and troubles which followed, under his daughter, and in the minority of his grandson, drove those foreigners, the chief of whom was called Cornelius, from their works, which since that time have never been resumed. Some small pieces of gold have been found in those parts washed down by the floods. It likewise appears by the public records, that those beautiful coins struck by James V. called *bonnet-pieces*, were fabricated of gold found in Scotland, as were other medals of the same metal.

Several landholders in Scotland derive a large profit from their lead mines, which are rich, and contain large quantities of silver; but no silver mines are worked at present. Some copper mines have been found near Edinburgh; and many parts of Scotland, in the eastern, western, and northern counties, produce excellent coal of various kinds, large quantities of which are exported to the great emolument of the public. Lime-stone is here in great plenty, as is free-stone; so that the houses of the better sort are constructed of good materials. The peat-mosses being in many parts of the north especially, almost exhausted, the inhabitants suffer much from the scarcity of fuel; but the taste for planting that now prevails, will soon remedy that inconveniency.

Lapis lazuli is said to be dug up in Lanerksire; alum mines have been found in Bamfshire; crystal, variegated pebbles, and other transparent stones, which admit of the finest polish for seals, are found in various parts; as are tale, flint, sea-shells, potters clay, and fullers earth. The stones which the country people call elf-arrow-heads, and to which they assign a supernatural origin and use, were probably the flint-heads of arrows made use of by the Caledonians and ancient Scots. No country produces greater plenty of iron-ore, both in mines and stones, than Scotland; of which the proprietors now begin to reap the advantage, in their founderies, and other metalline manufactures.

VEGETABLE AND ANIMAL PRO- } It is said, that some tracts of the low  
DUCTIONS, BY SEA AND LAND. } countries of Scotland exceed in value Eng-  
lish estate, of the same extent, because they are far less exhausted than those of the southern parts of the island. Such is the mutability of things, and the influence of commerce, that a very considerable part of the landed property has lately and fortunately fallen into the hands of merchants and manufacturerers, who while they are daily introducing new branches of trade, are no less attentive to the progress of agriculture. The active genius of these men extends even to moors, rocks, and marshes, which, being hitherto reckoned useless, were frequently neglected, but are now brought to produce those species of grain or timber, for which the soil is best adapted. In the counties lying upon the river Forth, called the Lothians, the effects of skill and industry are chiefly perceivable, where, as well as in Angus, the farmers, who often rent from 3 to 500*l.* per annum, are well fed, well clothed, and comfortably lodged. The reverse, however, may be observed of a very considerable part of Scotland, where the landlords, ignorant of their real interest, refuse to grant such leases as would encourage the tenant to improve the soil. In such places, the husbandman barely exults upon the gleanings of a scanty farm, seldom exceeding 20 or 30*l.* per ann. the cattle are lean and small, the houses mean, and the face of the country exhibits the most deplorable marks of poverty and oppression.

The soil in general produces wheat, rye, barley, oats, hemp, flax, hay, and pasture. In the southern counties, the finest garden fruits, particularly apricots, nectarines, and peaches, are said to fall little short of those in England; and the same may be said of the common fruits. The uncultivated parts of the Highlands abound in various kinds of salubrious and pleasant-tasted berries; while many extensive tracts are covered with a strong heath. The sea-coast produces the algamarina, dulce or dulith, in great quantities, and other marine plants, which are eaten for nourishment or pleasure.

The fishes on the coast of Scotland are much the same with those of the islands and countries already described; but the Scotch have improved in their fisheries as much as they have in their manufactures and agriculture; and the bill which passed in 1786, bids fair to enable them to emulate the Dutch, in curing, as well as catching, their fish. In former times, the Scotch seldom ventured to fish above a league's distance from the land; but they now ply in the deep waters as boldly

as any of their neighbours. Their salmon, which they can send more early, when prepared, to the Levant and southern markets than the English or Irish can, are of great service to the nation, as the returns are generally made in specie, or marketable commodities.

This country contains few or no kinds, either of wild or domestic animals, that are not common with their neighbours. The red-deer and the roe-buck are found in the Highlands, but their flesh is not comparable to English venison. Hares, and other game, are here plentiful; also the grouse and heath-cock: the capercaillie, and the ptarmigan, birds of an exquisite flavour, but which are scarce and shy. The black cattle from the hills of Scotland towards the Highlands, and sheep that are fed upon the mountains of Tweedale, and other parts of the south, formerly brought large sums into the country; the black cattle especially, which, when fattened on the southern pastures, have been reckoned superior to English beef. This trade is now on its decline, by the increase of manufacturers, whose demand for butcher's meat must lessen the exportation of cattle into England. Some are of opinion, that a sufficient stock, by proper methods, may be raised to supply both markets, to the great emolument of the nation.

Formerly the kings of Scotland were at infinite pains to mend the breed of the Scotch horses, by importing a larger and more generous kind from the continent: but, notwithstanding all the care that was taken, it was found that the climate and soil of Scotland were unfavourable to that noble animal, for they diminished both in size and spirit; so that about the time of the union, few horses, natives of Scotland, were of much value. Great efforts have been made of late to introduce the English and foreign breeds, and such pains have been taken for providing them with proper food and management, that success has answered the most sanguine expectations.

POPULATION, INHABITANTS, } The population of Scotland is generally fixed  
MANNERS, AND CUSTOMS. } at about a million and a half; but this is only a vague conjecture, as no attempt has been made to support its probability. It is to be regretted that some public encouragement has not been given to bring this matter nearer to a certainty, which might be done by the returns of the clergy from their several parishes. The number of soldiers, furnished by Scotland in the war of 1755, amounted to 80,000 men; of whom above 60,000 were raised in the islands and Highlands, which form by far the least populous part of Scotland. It belongs, therefore, to political calculation to compute whether the population of Scotland does not exceed two millions, as no country in the world, exclusive of the army, sends abroad more of its inhabitants.

The people of Scotland are generally raw-boned or lean, but clean limbed, and can endure incredible fatigues. Their adventuring spirit was chiefly owing to their laws of succession, which invested the elder brother, as the head of the family, with the inheritance, and left but a scanty portion for the other sons. This obliged the latter to seek their fortunes abroad, though no people have more affection for their native soil. It is true, this disparity of fortune among the sons of one family prevails in England likewise; but the resources which younger brothers have in England are numerous, compared to those of a country so narrow, and so little improved, either by commerce or agriculture, as Scotland was formerly.

An intelligent reader may easily perceive, that the ridiculous family pride, which is perhaps not yet entirely extinguished in Scotland, was owing to the feudal institutions which prevailed longer there than in England. Their family differences, especially those of the Highlanders, familiarized them to blood and slaughter; and the most ferocious passions were authorized and cherished by their chieftains. Their kings, except some who were endowed with extraordinary virtues, were considered in no other light than commanders of their army

in time of war; for in peace their civil authority was so little felt, that every clan, or family, even in the most civilized part of Scotland, looked upon its own chieftain as the sovereign. These prejudices were confirmed even by the laws, which gave those petty tyrants a power of life and death upon their own estates; and they generally executed their hasty sentences in four-and-twenty hours after the parties were apprehended. The pride which those chieftains had in surpassing each other, created perpetual animosities, which seldom or never ended without bloodshed; so that the common people, whose best qualification was a blind devotion to the will of their masters, lived in a state of continual hostility. The late Archibald, duke of Argyle, was the first chieftain who had the patriotism to attempt to reform his dependents, and to banish those barbarous enormities. His example has been followed by others; and there can scarcely be a doubt, but that a very few years will reconcile the Highlanders to all the milder habits of society.

Scotch gentlemen, who formerly piqued themselves upon their family, or the antiquity of their descent, were very disagreeable members of society; because, forgetting all the virtues of their ancestors, they imitated them only in their capricious vanity and revenge. Those who go abroad, and endeavour by industry to raise the lowness of their circumstances, excel in the civil, commercial, and military duties. They are in general hospitable, open, communicative, and charitable, and adopt the manners of the people with whom they live, with more ease and freedom than the natives of most other countries.

It remains a question, whether that lettered education, for which the Scots were noted by the neighbouring nations, was not of prejudice to their country, while it was of the utmost service to many of its natives. Their literature rendered them acceptable and agreeable among foreigners; but at the same time it drained the nation of that order of men, who are the best fitted for forming and executing the great plans of national improvement.

Few nations ever underwent a speedier revolution of manners than the Scots. Gentlemen who live at home, upon estates of 3000. a year and upwards, now differ little or nothing in their manners and stile of living, from their English neighbours of the like fortunes. The peasantry have their peculiarities; their ideas are confined; but no people can conform their tempers better than they do to their stations. They are taught from their infancy to bridle their passions, to behave submissively to their superiors, and live within the bounds of the most rigid œconomy. Hence they save their money and their constitutions, and few instances of murder, perjury, robbery, and other atrocious vices, occur at present in Scotland. They seldom enter singly upon any daring enterprise; but when they act in concert, the secrecy, sagacity, and resolution, with which they carry on any desperate undertaking, is not to be paralleled; and their fidelity to one another, under the strongest temptations arising from their poverty, is still more extraordinary. Their mobs are managed with all the caution of conspiracies; witness that which put Porteous to death in 1736, in open defiance of law and government, and in the midst of 20,000 people; and, though the agents were well known, and some of them tried, with a reward of 5000. annexed to their conviction, yet no evidence could be found sufficient to bring them to punishment. The fidelity of the Highlanders of both sexes, under a still greater temptation, to the young Pretender, after his defeat at Culloden, could scarcely be believed, were it not well attested.

They affect a fondness for the memory and language of their forefathers beyond perhaps any people in the world; but this attachment is seldom or never carried into any thing that is indecent or disgustful, though they retain it abroad as well as at home. They are fond of ancient Scotch dishes, such as the baggess, the sheep's head fringed, fish in sauce, friars chicken and minced collops. These dishes,

in their original dressing, were favoury and nutritive for keen appetites; but the modern improvements that have been made in the Scotch cookery have rendered them agreeable to the most delicate palates.

The lower clafs are not so much accustom'd as the English to convivial entertainments; but when they partake of them, they seem, for that very reason, to enjoy them more completely. One testimony there is, at once social and charitable, and that is, the contributions rais'd for celebrating the weddings of people of an inferior rank. Those festivities partake of the ancient Saturnalia; but though the company consists promiscuously of the high and the low, the entertainment is as decent as it is jovial. The guests pay according to their inclination or ability, for which they have a wedding dinner and dancing. When the parties happen to be servants in respectable families, the contributions are so liberal that they often establish the young couple in the world.

The inhabitants of those parts of Scotland, who live chiefly by pasture, have a natural vein of poetry; and the beautiful simplicity of the Scotch tunes is relish'd by all the true judges of music. Love is generally the subject, and many of the airs have been brought upon the English stage with variations, under new names, but with this disadvantage; that, though rendered more conformable to the rules of art, they are stripp'd of that original simplicity and expressive energy which possesses such powers over the human breast. Those of a more lively strain have had better fortune, being introduced into the army in their native dress by the fife, an instrument for which they are remarkably well suited. It has been ridiculously suppos'd that Rizzio, the unhappy Italian secretary of Mary queen of Scots, reform'd the Scotch music. This is a falsehood invented, and propagat'd in envy to the Scots. Their finest tunes were compos'd by James I. long before Rizzio's arrival; nor does it appear that Rizzio, who was chiefly employ'd by his mistress in foreign dispatches, ever wrote an air during the short time he liv'd in Scotland.

The common people retain the solemn decent manner of their ancestors at burials. When a relation dies in a town, the parish beadle is sent round with a passing bell; but he stops at certain places, and with a slow melancholy tone announces the name of the party deceas'd, and the time of his interment, to which he invites all his fellow parishioners. At the hour appointed, if the deceas'd was belov'd in the place, vast numbers attend. The procession is often preceded by the magistrates and their officers, and the body is carried in a coffin, cover'd by a velvet pall, with chairpoles, to the grave, where it is silently interred. The funerals of the nobility and gentry are perform'd in much the same manner as in England, but without any burial service. The Highland funerals were generally preceded by bagpipes, which play'd certain dirges, call'd *crounchs*, and were accompanied by the voices of both sexes.

Dancing is a favourite amusement in this country, but little regard is paid to art or gracefulness: the whole consists in agility, and in keeping time to their own tunes, which they do with great exactness. One of the peculiar diversions practis'd by the gentlemen is the Golf, which requires an equal degree of art and strength: it is play'd by a bat and a ball; the latter is smaller and harder than a cricket ball; the bat is of a taper construction till it terminates in the part which strikes the ball, which is load'd with lead, and faced with horn. The diversion itself resembles that of the Mall, which was common in England, in the middle of the last century. An expert player will send the ball an amazing distance at one stroke: each party follows his ball upon an open heath, and he who strikes it in fewest strokes into a hole, wins the game. The diversion of Curling is, perhaps, peculiar to the Scots. It is perform'd upon ice, with large flat stones, often from twenty to two hundred pounds weight each, which they hurl from a common stand to a mark at a certain distance; and whoever is nearest the mark is the victor.

These

These two may be called the standing summer and winter diversions of Scotland. The natives are expert at all the other diversions common in England, cricket excepted.

[LANGUAGE AND DRESS.] These two articles are placed under the same head, because they had formerly an intimate relation to each other; both of them being evidently Celtic. The Highland plaid is composed of a woollen stuff, sometimes very fine, called *tartan*. This stuff is of a various colour, forming stripes which cross each other at right angles; and the natives value themselves upon the judicious arrangement, or what they call *sets*, of those stripes and colours. Above the shirt, the Highlander wears a waistcoat of the same composition with the plaid, which commonly consists of twelve yards in width, and which they throw over the shoulder into very near the form of a Roman toga, as represented in ancient statues: sometimes it is fastened round the middle with a leathern belt, so that part of the plaid hangs down before and behind like a petticoat. This they call being dressed in a *phelg*, which the Lowlanders call a *kilt*, and which is, probably the same word with Celt. Sometimes they wear a kind of petticoat of the same variegated stuff, buckled round the waist, and this they term the *philibeg*, which seems to be of Milesian extraction. The stockings are likewise of tartan, tied below the knee with tartan garters formed into tassels. The poorer people wear upon their feet brogues made of untanned or undressed leather; for their heads a blue flat cap is used, called a bonnet, of a particular woollen manufacture. From the belt of the philibeg hung generally their knives, and a dagger, which they called a dirk, and an iron pistol, sometimes of fine workmanship, and curiously inlaid with silver. The introduction of the broad sword of Andrea Ferrara, seems to be no earlier than the reign of James III. who invited that excellent workman to Scotland. A large leathern purse, richly adorned with silver, hanging before them, was always part of a Highland chieftain's dress.

The dress of the Highland women consisted of a petticoat and jerkin, with straight sleeves, trimmed or not trimmed, according to the quality of the wearer; over this they wore a plaid, which they either held close under their chins with the hand, or fastened with a buckle of a particular fashion. On the head they wore a kerchief of fine linen of different forms. The woman's plaid has been but lately disused in Scotland by the ladies, who wore it in a graceful manner, the drapery falling towards the feet in large folds. There is a strong resemblance between the Scottish plaids and the variegated and fimbriated draperies of the ancients, especially the Tuscans, as they are to be seen in the monuments of antiquity.

The attachment of the Highlanders to this dress rendered it a bond of union, which often proved dangerous to government. Many efforts were made by the legislature, after the rebellion in 1715, to oblige them to conform to the Low-country dresses. The disarming scheme was the most successful, for when the rebellion in 1745 broke out, the common people had scarcely any other arms than those which they took from the king's troops. Their overthrow at Culloden rendered it no difficult matter for the legislature to force them into a total change of their dress. Its conveniency, however, for the purposes of the field, is so great, that the Highland regiments still retain it. Even the common people have of late resumed the use of it; and many of the Highland gentlemen wear it in the summer time. The dress of the higher and middling ranks in the Low-country, differs little from the English; but many of the peasantry still retain the bonnet, for the cheapness and lightness of the wear.

The Earle, or Celt'e, is still spoken in the Highlands; but the language of the Low countries, which is of the same origin with the English, is continually extending its province. The English and Scotch are written in the same manner; and

d.e

the pronunciation of the latter is scarcely more different from that of London, than are those of the northern and western English counties.

**PUNISHMENTS.]** These are much the same in Scotland as in England, only that of beheading is performed by an instrument called the Maiden: the model of which was brought from Halifax in England to Scotland by the regent earl of Morton, where it was first used for the execution of himself.

**RELIGION.]** Ancient Scottish historians, with Bede, and other writers, generally agree that Christianity was first taught in Scotland by some of the disciples of St. John the Apostle, who fled to this northern country to avoid the persecution of Domitian, the Roman emperor; though it was not publicly professed till the beginning of the third century, when a prince, whom Scottish historians call Donald the First, his queen, and several of his nobles, were solemnly baptized. It was farther confirmed by emigration from South Britain, during the persecutions of Aurelius and Diocletian, when it became the established religion of Scotland, under the management of certain learned and pious men, named Culdees, who seem to have been the first regular clergy in Scotland.

Christianity seems to have been thus taught, planted, and confirmed in Scotland, where it flourished in its native simplicity, till the arrival of Palladius, a priest sent by the bishop of Rome, in the fifth century, who found means to introduce the ceremonies of the Romish church. The Culdees retained their original manners, notwithstanding the oppression of the Romish clergy, till the age of Robert Bruce, in the 14th century, when they disappeared. The opposition to popery in this island, though it ceased in Scotland upon the extinction of the Culdees, was in the same age revived in England by John Wickliffe, a man of parts and learning, who was the forerunner in the work of reformation to John Hufs and Jerome of Prague, as the latter were to Martin Luther and John Calvin. But though the doctrines of Wickliffe were nearly the same with those propagated by the reformers in the 16th century, and the age seemed strongly disposed to receive them, affairs were not fully ripe for this great revolution; and the finishing blow to popery in England was reserved for the reign of Henry VIII.

Soon after that important event took place in England, when learning, arts, and sciences began to revive in Europe, the unscriptural doctrines of the church of Rome, as well as the profligate lives of her clergy, did not escape the notice of a free and inquiring people, but gave rise to the Reformation in Scotland. It began in the reign of James V. made great progress under that of his daughter Mary, and was completed through the preaching of John Knox, who had adopted the doctrines of Calvin, and was the chief reformer of Scotland. It was natural for his brethren to imagine, that upon the abolition of the Roman Catholic religion, they were to succeed to the revenues of that clergy. The great nobility, whose imaginations had already ingrossed these possessions, did not at first discourage this notion; but no sooner had Knox succeeded in his designs, which, through the fury of the mob, destroyed some of the finest ecclesiastical buildings in the world, than the parliament, or rather the nobility, appropriated the church-livings, and most scandalously left the reformed clergy to live almost in a state of beggary. The great landholders left the doctrine and discipline of the church to be modelled by the preachers, and they were confirmed by parliament. Succeeding events rendered the presbyterian clergy of great importance to the state; and their revenues have been so much mended, that though few stipends exceed 150*l.* a year, few fall short of 60*l.* and none of 50*l.* If the present expensive mode of living continues in Scotland, the established clergy will have many unanswerable reasons to urge for the increase of their revenues.

The bounds of this work admit not of entering upon the doctrinal and oeconomic part of the church of Scotland. It is sufficient to say, that its first principle

ciple is a parity of ecclesiastical authority among all its presbyters; that it agrees in its censures with the reformed churches abroad in the chief heads of opposition to popery; but that it is modelled principally after the Calvinistical plan established at Geneva. The greater and lesser excommunication, which were attended by a forfeiture of estate, and sometimes of life, has been abolished. That relic of popery, the obliging fornicators of both sexes to sit upon what is called a repenting-stool, in the church, and in full view of the congregation, begins to wear out. The power of the Scotch clergy is at present very moderate, or at least very moderately exercised. They have been, ever since the Revolution, firm adherents to civil liberty, and the house of Hanover; and they acted with remarkable intrepidity during the rebellion in 1745. They dress without clerical robes: but some of them appear in the pulpit in gowns and bands, after the Geneva form. They make no use of set forms in worship. The rents of the bishops, since the abolition of episcopacy, are paid to the king, who commonly appropriates them to pious purposes. A thousand pounds a year is always sent by his majesty for the use of the protestant schools erected by act of parliament in North-Britain and the Western Isles; and funds have been lately established for the support of the widows and orphans of the clergy. The number of parishes in Scotland are eight hundred and ninety, whereof thirty-one are collegiate churches, that is, where the cure is served by more than one minister.

The highest ecclesiastical authority in Scotland is the general assembly, consisting of commissioners, (some of whom are laymen, under the title of ruling elders) from presbyteries, royal burghs, and universities. A presbytery, consisting of under twelve ministers, sends two ministers and one ruling elder; if it contains between twelve and eighteen ministers, it sends three, and one ruling elder: if it contains between eighteen and twenty-four ministers, it sends four ministers and two ruling elders: but if the presbytery has twenty-four ministers, it sends five ministers and two ruling elders. Every royal burgh sends one ruling elder, and Edinburgh two; whose election must be attested by the respective kirk-sessions of their own burghs. Every university sends one commissioner. The commissioners are chosen yearly, six weeks before the meeting of the assembly. The ruling elders are often persons of the first quality of the country. The king presides by his commissioner (who is always a nobleman) in this assembly, which meets annually, in May: but he has no voice in their deliberations. This assembly chooses a clergyman for its moderator or speaker. Appeals are brought from all the other ecclesiastical courts in Scotland to the general assembly; and no appeal lies from its determinations in religious matters.

Provincial synods are next in authority. They are composed of a number of the adjacent presbyteries, over whom they have a power; and there are fifteen of them in Scotland; but their acts are reversible by the general assembly.

Subordinate to the synods are presbyteries, sixty-nine in number, each consisting of several contiguous parishes. The ministers of these parishes, with one ruling elder, chosen half-yearly out of every kirk-session, compose a presbytery. These presbyteries meet in the head town of that division; but have no jurisdiction beyond their own bounds, though within these they have cognizance of all ecclesiastical matters. A chief part of their business is the ordination of candidates for livings, in which they are regular and solemn. The patron of a living is bound to nominate or present in six months after a vacancy, otherwise the presbytery fills the place *jure devoluto*; but that privilege does not hold in royal burghs.

A kirk-session is the lowest ecclesiastical judicatory in Scotland, and its authority does not extend beyond its own parish. The members consist of the minister, elders, and deacons. The deacons are laymen, and act much as church-wardens do in England, by having the superintendency of the poor, and taking care of other parochial

parochial affairs. The elder, or ruling-elder, is a place of great parochial trust, and he is generally a lay person of consideration in the parish. The elders are supposed to act in a kind of co-ordinancy with the minister, and to be assisting to him in many of his clerical duties, particularly in catechising, visiting the sick, and at the communion-table.

The office of ministers, or preaching presbyters, includes the offices of deacons and ruling-elders; they alone can preach, administer the sacraments, catechise, pronounce church censures, ordain deacons and ruling-elders, assist at the imposition of hands upon other ministers, and moderate or preside in all ecclesiastical judicatories.

The established religion in Scotland formerly partook of the austerities of Calvinism, and of the intolerance of popery; at present is mild and gentle; and the sermons and other theological writings of many of the modern Scotch divines, are equally distinguished by good sense and good writing. A great number of seceding congregations are to be found in the Lowlands. They maintain their own preachers; though scarcely any two congregations agree either in principle or practice. We do not, however, find that they oppose the civil power; or at least very seldom. Perhaps many of these *secessions* are justifiable on account of the great abuses of patronages, by which many parishes have unworthy or incapable ministers imposed upon them, as is the case in many places in England.

A different set of dissenters in Scotland consists of the episcopalians, a few quakers, many papists, and other sectaries, who are denominated from their preachers. Episcopacy, from the time of the Restoration, in 1660, to that of the Revolution, in 1688, was the established church of Scotland; and would probably have continued so, had not the bishops, who were in general very weak men, and creatures of the duke of York, afterwards James VII. and II. refused to recognise king William's title. The partisans of that unhappy prince retained the episcopal religion; and king William's government was rendered so unpopular in Scotland, that in queen Anne's time, the episcopalians were more numerous in some parts than the presbyterians; and their meetings, which they held under the act of toleration, as well attended. Their meetings still subsist, but thinly; the decline of the nonjurors not having suppressed episcopacy in Scotland: the English bishops supply clergymen qualified according to law, whose chapels are chiefly filled by the English, and such Scotch hearers of that persuasion as have places under the government.

The defection of some great families from the cause of popery, and the extinction of others, have rendered its votaries inconsiderable in Scotland. They are chiefly confined to the northern parts, and the islands; and though a violent opposition has lately been raised against them, they appear to be as quiet and inoffensive as protestant subjects.

Scotland, during the time of episcopacy, contained two archbishopsricks, St. Andrew's and Glasgow; and twelve bishopsricks, Edinburgh, Dunkeld, Aberdeen, Murray, Brechin, Dumblain, Refs, Caithness, Orkney, Galloway, Argyle, and the Isles.

LEARNING, AND LEARNED MEN.] For this article we may refer to the literary history of Europe for 1400 years past. The western parts and isles of Scotland produced St. Patrick, the celebrated apostle of Ireland, and many others since, whose bare names would make a long article. The writings of Adamnanus, still extant, and of some others, who lived before, and at the time of the Norman invasion, afford specimens of their learning. Charles the Great, or Charlemagne, most unquestionably held a correspondence by letters with the kings of Scotland, with whom he entered into league; and employed Scotchmen in planning, settling, and ruling his favourite universities, and other seminaries of learning, in France.

Italy, and Germany. It is an undoubted truth, though a seeming paradoxical fact, that Barbour, a Scotch poet, philosopher, and historian, though prior in time to Chaucer, having flourished in the year 1368, wrote, according to the modern ideas, as pure English as that bard, and his versification is perhaps more harmonious. The destruction of the Scotch monuments of learning and antiquity have rendered their early annals lame, and often fabulous; but the Latin style of Buchanan's History is equal in classical purity to any modern production; and both Buchanan and Arthur Johnston have very successfully cultivated the Lyric muse, by two elegant Latin versions of the Psalms of David. The letters of the Scotch kings to the neighbouring princes are incomparably the finest compositions of the times in which they were written, and are free from the barbarisms of those sent them in answer. This has been considered as a proof that classical learning was more cultivated at the court of Scotland than at any other in Europe.

The discovery of the logarithms, a discovery which, in point of ingenuity and utility, may vie with any that has been made in modern times, is the indisputable right of Napier of Merchiston; and since his time, the mathematical sciences have been cultivated in Scotland with great success. Keil, in his physico-mathematical works, to the clearness of his reasoning has sometimes added the colouring of a poet. Gregory was long held the best writer on astronomy; and is still allowed to be one of the most perfect and elegant. Maclaurin, the companion and the friend of Sir Isaac Newton, was endowed with all that precision and force of mind, which rendered him peculiarly fitted for bringing down the ideas of that great man to the level of ordinary apprehensions. While Maclaurin pursued this new career, a geometrician no less famous distinguished himself in the almost deserted tract of antiquity. This was the late Dr. Simson, well known for his illustrations of the ancient Geometry. The fine arts have been called sisters, to denote their affinity. There is the same connection between the sciences, particularly those which explain the works of nature. Mathematics, and physics properly so called, were in Scotland accompanied by the other branches of study to which they are allied. In medicine particularly, the names of Piteairn, Arbuthnot, Monro, Whytt, Cullen, Gregory, &c. hold a distinguished place.

In the department of history, this nation have acquired the highest celebrity. Hume was the first who, with any pretensions to classical elegance, wrote the history of England. Dr. Robertson began his literary career of glory with the history of his own country. This was followed by that of all Europe, in the reign of the emperor Charles V. The captivating account of the discovery of America was next presented to the world; and an historical disquisition concerning India, was the last production of this philosophical historian. To Dr. Henry, his country and the world are indebted for a history of Great Britain upon a plan entirely new, in which, at the expence of immense labour, he has brought within one glance of the eye, every thing interesting in the civil history, religion, constitution, learning, arts, commerce, and manners of the people from the earliest authenticity. From an infinite variety of authors of the first respectability, he has collected a great mass of knowledge, and has concentrated these scattered rays into one focus, so as to render his work both instructive and entertaining.

Nor have the Scots been unsuccessful in cultivating the Belles Lettres. Foreigners who inhabit warmer climates, and conceive the northern nations incapable of tenderness and feeling, must acknowledge the poetic genius and delicate sensibility of Thomson. But of all literary pursuits, that of rendering mankind more virtuous and happy, which is the proper object of what is called *morals*, ought to be regarded with peculiar honour and respect. The philosophy of Dr. Hutcheson, not to mention other works more subtle and elegant, but less convincing and less instructive, deserves to be read by all who would know their duty, or who

would wish to practise it. Next to Locke's *Essay on the Human Understanding*, it is perhaps the best dissertation of the human mind that hath appeared in modern times; and it is likewise a most useful supplement to that essay. It would be endless to mention all the individuals who have distinguished themselves in the various branches of literature; particularly in those who are alive (some of them in high esteem for historical, ethical, and sermonic composition) dispute the palm of merit with the dead, and cover their country with laurels.

UNIVERSITIES.] The Universities of Scotland are four, viz. St. Andrews\*, founded in 1411.—Glasgow †, 1454.—Aberdeen ‡, 1477.—And Edinburgh §, 1582.

CITIES, TOWNS, AND OTHER EDIFICES, } Edinburgh, the capital of Scotland, PUBLIC AND PRIVATE. } naturally claims our first attention in this division. Its castle, before the use of artillery, was deemed impregnable; and was probably built by the Saxon king Edwin, whose territories reached to the Frith of Forth, and who gave his name to Edinburgh, as it certainly did not fall into the hands of the Scots till the reign of Indulphus, who lived in the year 953. The town was built for the benefit of protection from the castle, and a more inconvenient situation for a capital can scarcely be conceived; the high-street, which is on the ridge of a hill, lying east and west; and the lanes running down its sides, north and south. In former times the town was surrounded by water, except towards the east; so that when the French landed in Scotland, during the regency of Mary of Guise, they gave it the name of Lillebourg. This situation suggested the idea of building very lofty houses, divided into stories, each of which contains a suite of rooms, generally large and commodious, for the use of a family; so that the high-street of Edinburgh, which is chiefly of hewn stone, broad, and well-paved, makes a most august appearance, especially as it rises a full mile in a direct line, and gradual ascent from the palace of Holyrood-house on the east, and is ter-

§ The old buildings in the university of Edinburgh, having fallen into decay, have been partly taken down, and a new building is now erecting, the foundation of which was laid with great ceremony, December 16th, 1789. The east and west fronts of this structure extends 255 feet, and the south and north 338. The rooms for the Library and Museum are each to be 68 feet in length, and the dimensions of the Hall for degrees and public exercises are about 90 feet by 30. Our most gracious sovereign has been a very liberal benefactor to this edifice, which promises to be a noble monument of national taste and spirit.

minated on the west by the rude majesty of its castle, built upon a lofty rock, inaccessible on all sides, except where it joins to the city. The inconveniences arising from this crowded population being so very apparent, the modern houses are generally built in the English taste, of a moderate height, and accommodated to the use of a single family. This improvement particularly prevails in the new town. The castle not only overlooks the city, its environs, gardens, the new town, and a rich neighbouring country, but commands a most extensive prospect of the river Forth, the shipping, the opposite coast of Fife, and even some hills at the distance of forty or fifty miles, which border upon the Highlands. The castle has some good apartments, a tolerable train of artillery, a large magazine of arms and ammunition, and contains the regalia, which were deposited here under the most solemn legal instruments of their never being removed from thence. All that is known at present of those regalia is contained in the instrument which was taken at the time of their being deposited, where they are fully described.

Facing the castle, at a mile's distance, stands the abbey, or rather palace of Holyrood-house. The inner quadrangle of this palace, begun by James V. and finished by Charles I. is of magnificent modern architecture, built according to the plan, and under the direction of sir William Bruce, a Scotch gentleman of family, and one of the greatest architects of that age. Round the quadrangle runs an arcade, adorned with pilasters; and the inside contains good apartments. Its long gallery contains figures, some of which are from portraits, painted by modern hands, of the kings of Scotland, down to the time of the Revolution. James VII. when duke of York, intended to have adorned the neighbourhood of this palace, which is situated at the bottom of bleak crags and bare mountains. The chapel belonging to the palace, as it stood when repaired and ornamented by that prince, is thought to have been a most elegant piece of Gothic architecture. It had a very lofty roof, and two long stone galleries supported by curious pillars. It was the conventual church of the old abbey. Its inside was demolished and rifled of all its rich ornaments, by the fury of the mob at the Revolution, which even broke into the repositories of the dead, and discovered a vault, till that time unknown, which contained the bodies of James V. his first queen, and Henry Darnley. The walls and roof of this ancient chapel fell down on the 2d and 3d of December, 1768, occasioned by the enormous weight of a new stone roof, laid over it some years ago, which the walls were unable to support.

The hospital, founded by George Herriot, goldsmith to James VI. stands to the south-west of the castle, in a good situation. It is the finest and most regular specimen which Inigo Jones, who went to Scotland as architect to queen Anne, wife of king James VI. has left us of his Gothic manner. It was built for the maintenance and education of poor children belonging to the citizens of Edinburgh, and is under the direction of the city magistrates.

The college at Edinburgh claims the privileges of an university, founded by king James VI. and by him put under the direction of the magistrates, who have the power of chancellor and vice-chancellor. Its original buildings were only calculated for the sober literary manners of those days. We have already mentioned the new university which is now erecting; but what is of more importance, it is supplied with excellent professors in the several branches of learning; and its schools for every part of the medical art are reckoned equal to any in Europe. This college is provided with a library, founded by Clement Little, and of late greatly augmented.

The Parliament-square, or, as it is there called, Clove, was formerly the most ornamental part of the city; it is formed into a quadrangle, part of which consists of lofty buildings; and in the middle is a fine equestrian statue of Charles II. The room built by Charles I. for the parliament-house, though not so large, is said to be

\* A b  
fouth, w  
that quan  
mits of a  
bridge for

be better proportioned than Westminster-hall; and its roof, though executed in the same manner, has been by good judges held to be superior. It is now converted into a court of law, where a single judge, called the lord ordinary, presides by rotation; in a room near it, sit the other judges; and adjoining are the public offices of the law, exchequer, chancery, shrievalty, and magistracy of Edinburgh; and the valuable library of the lawyers. This equals any thing of the kind to be found in England, or perhaps in any part of Europe, and was at first founded and furnished by lawyers. It contains the most valuable manuscript remains of the Scotch history, chartularies, and other papers of antiquity, with a series of medals.

The high church of Edinburgh, called that of St. Giles, is now divided into four churches, and a room or hall where the general assembly sits. It is a large Gothic building, and its steeple is surmounted by arches formed into an imperial crown, which has a good effect. The modern edifices in and near Edinburgh, such as the exchange, public offices, hospitals, bridges, and the like, demonstrate the improvement of the taste of the Scots in their public works. Parallel to the city of Edinburgh, on the north, the nobility, gentry, and others, have almost completed a new town. The streets and squares are laid out with regularity, and the houses are built of stone, in an elegant taste.

Between the old and the new town lies a narrow bottom or vale, which agreeably to the original plan, was to have been formed into a sheet of water, bordered by a terrace walk, and the ascent towards the new town covered with pleasure gardens, shrubberies, &c. This design has not yet been carried into execution. At the west, or upper end of this vale, the castle, a solid rock, not less than twenty stories high, looks down with awful magnificence. The eastern extremity is bounded by a striking object of art, a lofty bridge\*, the middle arch being ninety feet high, which joins the new buildings to the city, and renders the descent on each side the vale (there being no water in this place) more commodious for carriages. I am the more particular in describing this city, that the reader may form some idea of its magnificent situation, standing on an eminence, with a gentle declivity on each side, in the heart of a rich country; the view southward, that of a romantic city, its more romantic castle, and distant hills rising to an amazing height; while the prospect across the Frith, gives full scope to the eye, pleases the imagination, and expands the mind.

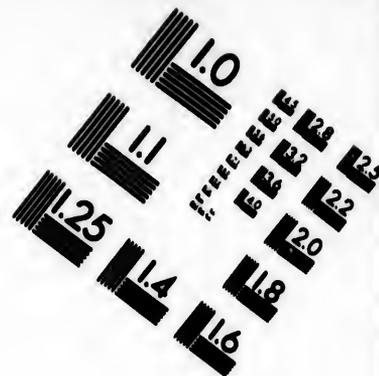

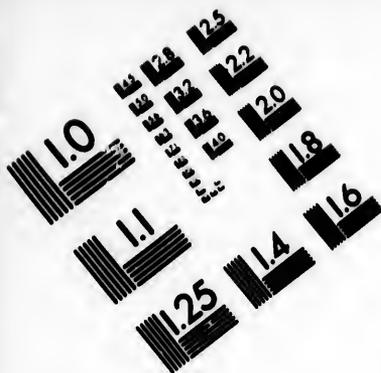

This city may be considered, notwithstanding its castle, and a wall which encloses it on the south side, as an open town; so that it would have been impracticable for its inhabitants to have defended it against the rebels, who took possession of it 1745. Edinburgh contains a play-house, which has now the function of an act of parliament; and concerts, assemblies, balls, music-meetings, and other polite amusements, are as frequent and brilliant here, as in any part of his majesty's dominions, London and Bath excepted. In the new town are several handsome and convenient hotels, and the coffee-houses and taverns in the old town are much improved.

Edinburgh is governed by a lord provost, four baillies, a dean of guild, and a treasurer, annually chosen from the common-council. Every company, or incorporated trade, chooses its own deacon, and here are 14; viz. surgeons, goldsmiths, skinners, furriers, hammer-men, wrights or carpenters, masons, tailors, bakers, butchers, cordwainers, weavers, fullers, and bonnet-makers. The lord provost is colonel of the town-guard, a military institution to be found in no part of his

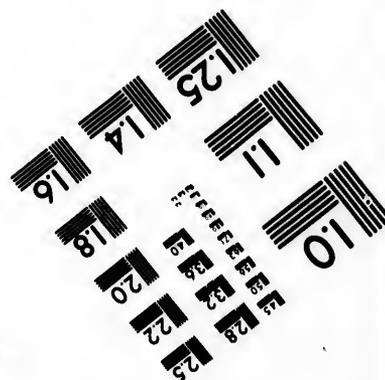

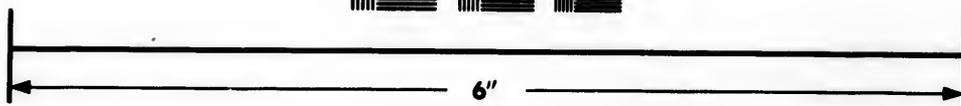

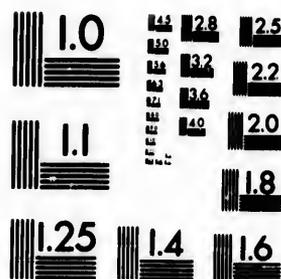

\* A bridge has been lately erected towards the south, which not only connects the buildings in that quarter with the old and new towns, but admits of an easy access to the country. This south bridge forms a most elegant street, with magnificent

buildings on each side, and is directly opposite to that over the North Loch, and will be productive of many advantages, and afford a great increase of revenue to the city of Edinburgh.

majesty's dominions, but at Edinburgh: this guard serves for the city watch, and patrols the streets, is useful in suppressing small commotions, and attends the punishment or execution of criminals. The soldiers are divided into three companies, and wear an uniform; they are commanded by three officers, under the names of captains. Besides this guard, Edinburgh raises 16 companies of trained bands, which serve as militia. The revenues of the city consist chiefly of that tax which is now common in most of the bodies corporate of Scotland, of two Scotch pennies, amounting in the whole to two thirds of a farthing, laid upon every Scotch pint of ale (containing two English quarts) consumed within the precincts of the city. Its product has been sufficient to defray the expence of supplying the city with excellent water, brought in leaden pipes at the distance of four miles; of erecting reservoirs, enlarging the harbour of Leith, and completing other public works, of great expence and utility.

Leith, though near two miles distant, may be properly called the harbour of Edinburgh, being under the same jurisdiction. It contains the remains of two citadels (if they are not the same), which were fortified and bravely defended by the French, under Mary of Guise, against the English, and afterwards repaired by Cromwell. The neighbourhood of Edinburgh is adorned with noble seats, which are increasing; particularly, the earl of Ahercorn's, a short way from the city, the duke of Buccleugh's house at Dalkeith, that of the marquis of Lothian at Newbottle, and Hopetoun-house, so called from the earl its owner. About four miles from Edinburgh is Roslin, noted for a stately Gothic Chapel, counted one of the most curious pieces of workmanship in Europe; founded in the year 1440 by William St. Clair, prince of Orkney, and duke of Oldenburgh.

Glasgow, in the shire of Lanerk, situated on a gentle declivity sloping towards the river Clyde, 44 miles west of Edinburgh, is, for population, commerce, and riches, the second city of Scotland, and considering its size, the first perhaps in Europe, as to elegance, regularity, and the materials of its buildings. The streets cross each other at right angles, and are broad, straight, and well paved. The houses make a grand appearance, and are in general four or five stories high, and many of them, towards the centre of the city, are supported by arcades, which form piazzas, and give the whole an air of magnificence. Some of the modern built churches are in a good style of architecture; and the Gothic cathedral contains three churches, one of which stands above another, and is furnished with a fine spire springing from a tower; the whole being reckoned a masterly fabric. It was dedicated to St. Mungo or Kentigern, who was bishop of Glasgow in the 6th century. The cathedral is upwards of 600 years old, and was preserved from the fury of the rigid reformers by the resolution of the citizens. The town-house is a lofty building, and has noble apartments for the magistrates. The university is esteemed the best built of any in Scotland. In this city are several well-endowed hospitals; it is well supplied with inns; and, near the most populous part of the town, where the traders assemble, is a hotel, tavern, and spacious coffee-house, named the *Tontine*, supported by subscription. In Glasgow are seven churches, and eight or ten meeting-houses for sectaries of various denominations. Its inhabitants have been estimated at 50,000.

Aberdeen is the third town in Scotland for improvement and population. It is the capital of a shire, to which it gives name, and contains two towns, New and Old Aberdeen; the former is the shire-town, and evidently built for the purpose of commerce. It is a large well-built city, and has a good quay, or tide-harbour; in it are three churches, and several episcopal meeting-houses, a considerable degree of foreign commerce and much shipping, a well-frequented university, and above 20,000 inhabitants. Old Aberdeen, near a mile distant, though almost joined to the New, by means of a long village, has no dependence on the other:

it

it is a moderately large market-town, but has no haven. In each of these places there is a well-endowed college, both together being termed the univerlity of Aberdeen, though independent of each other.

Perth, the capital town of Perthshire, lying on the river Tay, trades to Norway and the Baltic, is finely situated, has an improving linen manufactory, and lies in the neighbourhood of one of the most fertile spots in Great Britain, called the Carle of Gowry. Dundee, by the general computation, contains about 16,000 inhabitants; it lies near the mouth of the river Tay; is a town of considerable trade, exporting much linen, grain, herrings, and peltry, to foreign parts; and has three churches. Montrose, Aberbrothick, and Brechin, lie in the same county of Angus; the foreign trade of the first begins to revive, and the manufactures of the other two are in an improving state.

It may be necessary again to mention, that the population of Scotland is spoken of with great uncertainty, as it makes very considerable improvement. The number of inhabitants in the towns already mentioned, has been rather under than over-rated. Edinburgh certainly contains more than 60,000 souls, which is the common computation; but the influx of people, and the increase of matrimony in proportion to that of property, must create great alterations for the better, and few for the worse, because the inhabitants who are disposed to industry may always find employment. This uncertainty is the reason why a particular description of Dumfries, Air, Greenock, Paisley, Stirling, and about 50 other burghs and towns of very considerable trade in Scotland, is omitted. But great allowances are to be made on the other hand, for numerous emigrations to England, America, the West and East Indies, for new settlements.

The ancient Scots valued themselves upon trusting to their own valour, and not to fortifications, for the defence of their country. This was a maxim more heroic than prudent, as they have often experienced. The castles of Edinburgh, Stirling, and Dumbarton, formerly thought places of great strength, could not hold out 48 hours, if besieged by 6000 regular troops, with proper artillery. Fort William, which lies in the West Highlands, is sufficient to bridle the inhabitants of the neighbourhood, as far as Fort George and Fort Augustus, in the north and north-west; but none of them can be considered as defences against a foreign enemy.

ANTIQUEITIES AND CURIOSITIES, } The Roman and other antiquities found  
NATURAL AND ARTIFICIAL. } in Scotland, have furnished matter for large  
volumes. We can still trace the Roman Wall (or, as it is called by the country  
people, *Graham's dyke*, from a tradition that a Scottish warrior of that name first  
broke over it) between the Clyde and Forth, which was first marked out by Agri-  
cola, and completed by Antoninus Pius. The Roman camps in Scotland have  
been recently described, in a splendid work, published from the manuscript of the  
late General Roy, by the Society of Antiquaries: they are distinguished into three  
classes; 1. those between the wall of Antoninus, and the borders of England;  
2. those between the same wall, and the river Tay; 3. the camps to the north-  
east of that river, ending in the camp at Kiethick, near Brechin. The three Sta-  
tions at Grassy walls and Ardoch, in Perthshire, and Battle Dykes, between Killy-  
moor and Brechin, are the only camps hitherto discovered, that could contain  
Agricola's whole army. By comparing the relation which Tacitus has given of  
that general's last campaign with the face of the country, general Melvill was led  
to conclude that the decisive defeat of the Caledonians under Galgacus, happened  
near the eastern extremity of the Grampians, and not at Strathern, as had formerly  
been supposed. General Roy adopted his friend's opinion, and prosecuted his  
discoveries; and both these gentlemen think, that between Battle-Dykes and the  
eastern extremity of the Grampians, one at least, if not two large camps, must have  
existed,

†

existed,

existed, and will probably sometime be discovered. The camp at Ardoch is the best preserved of all those in Scotland, having on the south side five rows of ditches and six ramparts; and of the four gates, three are very distinct, the prætoria, decumana, and dextra.

The Roman temple, or building in the form of the Pantheon at Rome, or the dome of St. Paul's at London, stood upon the banks of the river Carron, in Stirlingshire, but has been lately barbarously demolished by a neighbouring Goth, for the purpose of mending a mill-pond. Its height was twenty-two feet, and its external circumference at the base was eighty-eight feet; so that, upon the whole, it was one of the most complete Roman antiquities in the world. It is thought to have been built by Agricola, or some of his successors, as a temple to the god Terminus, as it stood near the pretenture which bounded the Roman empire in Britain to the north. Near it are some artificial conical mounts of earth, which still retain the name of Duni-pace, or Duni-pucis; which serve to evince that there was a kind of compromise between the Romans and Caledonians, that the former should not extend their empire farther to the northwards.

Innumerable are the coins, urns, utensils, inscriptions, and other remains of the Romans, that have been found in different parts of Scotland; some of them to the north of the wall, where, however, it does not appear that they made any establishment. By the inscriptions found near the wall, the names of the legions that built it, and how far they carried it on, may be learned. The remains of the Roman highways are frequent in the southern parts.

Danish camps and fortifications are discernible in several northern counties. The elevations of two extraordinary fabricks, to be seen in Ross-shire, are given in Gordon's Itinerarium Septentrionale. I am of opinion that they are Norwegian or Scandinavian structures, and built about the fifth century to favour the descents of that people upon those coasts.

There are two elegant Pictish monuments, one of them at Abernethy in Perthshire, the other at Brechin in Angus; both of them are columns, hollow in the inside, and without a stair-case; that of Brechin is the most entire, being covered at the top with a spiral roof of stone, with three or four windows above the cornice; it consists of sixty regular courses of hewn freestone, laid circularly and regularly, and tapering towards the top\*.

The ancient Scots had a rude notion of sculpture, by which they transmitted the actions of their kings and heroes. At a place called Aberlemno, near Brechin, four or five ancient obelisks are still to be seen, called the Danish stones of Aberlemno. They were erected as commemorations of the Scotch victories over the Danes; and are adorned with bas-reliefs of men on horseback, and many emblematical figures and hieroglyphics, now inexplicable, but minutely described by Mr. Gordon. Many other historical monuments of the Scots have been discovered; and the obscurity of their sculptures has encouraged a field of boundless and frivolous conjectures. It would be unpardonable not to mention the stone near the town of Forres, or Fortrose, in Murray, which far surpasses all the others in magnitude, and is (says Mr. Gordon) perhaps one of the most stately monuments of that kind in Europe. It rises about 23 feet in height, above ground, and is, I am credibly informed, no less than 12 or 15 feet below; so that the whole height

\* If these columns, which stand in the ancient dominions of the Picts, be really the work of that nation, their architects must have been far superior to those of any coeval monuments to be found in Europe, as they have all the appearances of an order; and the building is neat, and in the Roman style of architecture. It is, however, difficult to assign them to any but the Picts, as they stand in their dominions; and some sculptures upon that at Brechin, denote it to be of Christian origin. It is not indeed impossible that these sculptures may be of later date. Besides these two pillars, many other Pictish buildings are found in Scotland, but not of the same taste.

is at least 35 feet, and its breadth near five. It is all one single and entire stone, upon which a great variety of figures in relievo are carved, some of them still distinct and visible; but the injury of the weather has obscured those towards the upper part." Though this monument has been generally looked upon as Danish, yet I have little doubt of its being Scotch, and that it was erected in commemoration of the final expulsion of the Danes out of Murray, where they held their last settlement in Scotland, after the defeat they received from Malcolm a few years before the Norman invasion.

At Sandwick, in Ross-shire, is a splendid ancient obelisk, surrounded at the base with large, well cut flag stones, formed like steps. Both sides of the column are covered with various embellishments, in well finished carved work. The one face presents a sumptuous cross, with a figure of St. Andrew on each hand, and some uncouth animals and flowerings underneath. The central division, on the reverse, exhibits a variety of curious figures, birds, and animals. The remains of the cathedral of Elgin display much grandeur and dignity. The west door is ornamented with much elegance in the carvings, and the whole edifice exhibits very elaborate workmanship.

Among the remains of ancient castles may be mentioned Kildrummy castle in the north of Scotland, formerly a place of great strength and magnificence, and often used as an asylum to noble families in periods of civil war. Inverurie castle, the ancient seat of the earl-marschals of Scotland, is also a large and lofty pile, situated on the steep bank of the river; two high towers adorn the extremities of the front, which, even in their decaying state, give the castle an air of grandeur and antiquity. Rows of venerable trees, inclosing the adjoining garden, add to the effect of the decayed buildings. Near the town of Huntley are the ruins of the castle, of that name. On the avenue that leads to it, are two large square towers which had defended the gateway. The greatest part of this ancient castle is demolished; but there is a massy building of a more modern date, in which some of the apartments, and their curious ceilings, are still in tolerable preservation. They are painted with a great variety of subjects, in small divisions, in which are contained many emblematical figures.

Besides these remains of Roman, Pictish, Danish, and Scottish antiquities, many Druidical monuments and temples are discernible in the northern parts of Scotland, as well as in the isles, where we may suppose that paganism took its last refuge. They are distinguishable by their circular forms; but though equally regular, yet none of them are so stupendous as the Druidical monuments in South Britain. There is in Perthshire a barrow which seems to be British; it exactly resembles the figure of a ship with the keel uppermost. The common people call it Ternay, which some interpret to be *terre navis*, the ship of the earth. It appears to be of the most remote antiquity, and perhaps was erected to the memory of some British prince, who acted as auxiliary to the Romans.

The traces of ancient volcanos are not infrequent in Scotland. The hill of Finchaven is one instance; and the hill of Bergonium, near Dumfries castle, is another, yielding quantities of pumices or scoria of different kinds. Among other natural curiosities, mention is made of a heap of white stones, most of them clear like crystal, together with great plenty of oyster and other sea-shells, that are found on the top of a mountain called Skorna Lappich, in Ross-shire, twenty miles distant from the sea. Slains, in Aberdeenshire, is said to be remarkable for a petrifying cave, called the Dropping-cave, where water, oozing through a spongy porous rock at the top, quickly consolidates, after it drops to the bottom. Other natural curiosities belonging to Scotland have their descriptions and histories, but they generally owe their extraordinary qualities to the credulity of the vulgar, and vanish when they are skillfully examined. Some caverns in Fife-shire are probably

natural, and of extraordinary dimensions, and have been the scenes of inhuman cruelties.

COMMERCE AND MANUFACTURES.] In these respects Scotland has, for some years past, been in a very improving state. Without entering into the disputed point, how far Scotland was benefited by its union with England, it is certain that the expedition of the Scots to take possession of Darien, and to carry on an East and West-India trade, was founded upon true principles of commerce, and, (so far as it went) executed with a noble spirit of enterprize. The miscarriage of that scheme, after receiving the highest and most solemn sanctions, is a disgrace to the annals of that reign in which it happened; as the Scots had then a free, independent and unconnected parliament. We are to account for the languor of the Scottish commerce, and many other misfortunes which that country sustained, by the disgust the inhabitants conceived on that account, and some invasions of their rights afterwards, which they thought inconsistent with the articles of union. The entails, and narrow settlements of family-estates, and some remains of the feudal institutions, might contribute to the same cause. Mr. Pelham, when at the head of the administration in England, after the extinction of the rebellion in 1745, was the first minister who discovered the true value of Scotland, which then became a more considerable object of the attention of government than ever. All the benefits received by that country, for the relief of the people from their feudal tyranny, were effected by that great man. The bounties and encouragement granted to the Scots, for the benefit of trade and manufactures, during his administration, made them sensible of their own importance. Mr. Pitt, a succeeding minister, pursued Mr. Pelham's wise plan; and justly boasted in parliament, that he availed himself of the courage, good sense, and spirit of the Scots, in carrying on the most extensive war that Great Britain was ever engaged in. Let it be remarked, to the honour of the British government, that the Scots have been suffered to avail themselves of all the benefits of commerce and manufactures they can claim, either in right of their former independency, the treaty of union, or posterior acts of parliament.

This is manifest from the extensive trade they lately carried on with the British settlements in America and the West Indies, and with all the nations to which the English themselves trade; so that the increase of their shipping within these 40 years' past has been very considerable. The exports of those ships are composed chiefly of Scotch manufactures, fabricated from the produce of the soil, and the industry of its inhabitants. In exchange they import rice, cotton, sugar, and rum, from the British plantations; and from other countries, their products, to the immense saving of their nation. The prosperity of Glasgow and its neighbourhood hath been greatly owing to the connection and trade with Virginia and the West Indies.

The fisheries of Scotland are not confined to their own coasts, for they have a great concern in the whale fishery carried on upon the coast of Spitzbergen; and their returns are valuable, as the government allows them a bounty of 40s. for every ton of shipping employed in that article. The late improvement of their fisheries, which has been already mentioned, will, it is to be hoped, open inexhaustible funds of wealth; their cured fish being preferred by foreigners, and the English planters in America, to those of Newfoundland.

The busses or vessels employed in the great herring fishery on the western coasts of Scotland, are fitted out from the north-west parts of England, the north of Ireland, as well as the numerous ports of the Clyde and neighbouring islands. The grand rendezvous is at Campbeltown, a commodious port in Argyshire, facing the north of Ireland, where sometimes 300 vessels have been assembled. They clear out the 12th of September, and must return to their different ports by the

13th

13th of January. They are also under certain regulations respecting the number of tons, men, nets, &c. but although the political existence of Great Britain depends upon the number and bravery of our seamen, this noble undertaking still labours under many difficulties.

To encourage this fishery, a bounty of 50s. per ton was granted by parliament, but whether from the insufficiency of the fund appropriated for this purpose, or any other cause, the bounty was withheld from year to year, while in the mean time the adventurers were not only sinking their fortunes, but also borrowing to the utmost limits of their credit. The bounty has since been reduced from 50, to 30s. with the strongest assurances of its being regularly paid when due. Upon the strength of these promises adventurers have again embarked in the fishery; and it is to be wished that no consideration whatever may tend to withdraw an inducement so requisite to place this fishery on a permanent footing.

The benefits of these fisheries are perhaps equalled by manufactures carrying on at land; particularly that of iron at Carron, in Stirlingshire.

The linen manufactory, notwithstanding a strong rivalship from Ireland, is in a flourishing state. The thread manufactory of Scotland is equal, if not superior, to any in the world; and the lace fabricated from it, has been deemed worthy of royal wear and approbation. It has been said, some years ago, that the exports from Scotland to England, and the British plantations, in linen, cambrics, checks, osenaburgs, neckle, and the like commodities, amounted annually to 400,000*l.* exclusive of home consumption: and there is reason to believe that the sum is considerably larger at present. The Scots are making very promising efforts for establishing woollen manufactures; and their exports of caps, stockings, mittens, and other articles of their own wool, begin to be very considerable. It is true, that they cannot pretend to rival the English in their finer cloths; but they make some broad cloth proper for the wear of people of fashion in an undress, and in quality and fineness equal to what is commonly called Yorkshire cloth. Among their late improvements, we are not to forget the progress they have made in working the mines, and smelting the ores of their country. Their coal trade to England is well known; and even their whin-stones have been turned to account, by their contract for paving the streets of London. If the great trade in cattle, which the Scots carried on of late with the English, is now diminished, this is partly owing to an increase of home consumption.

The trade carried on by the Scots with England, is chiefly from Leith, and the eastern ports; but Glasgow was the great emporium of American trade, before the commencement of the late war. The junction of the Forth to the Clyde renders the commercial benefits of the two sides of Scotland mutually advantageous to each other; and the more that the seas, the situation, the soil, harbours, and rivers of this country are considered, the better adapted it appears for all the purposes of commerce.

The town of Paisley employs an incredible number of hands, in fabricating a particular kind of flowered and striped lawns, which are a reasonable and elegant wear. Sugar-houses, glass-works of every kind, delft-houses, and paper-mills have of late been greatly multiplied. The Scotch carpeting makes neat and lasting furniture. After all that has been said, many years will be required, before the trade and improvements in Scotland can be brought to maturity. In any event, they never can give umbrage to the English, as the interests of the two people are, or ought to be, the same.

Having said thus much, I cannot avoid observing the prodigious disadvantages under which both the commercial and landed interest of Scotland lie, from her nobility and great landholders, having too fond an attachment for England and foreign countries, where they spend their ready money. This is one of the evils

arising to Scotland from the union, which removed the seat of her legislature to London; but it is greatly augmented by the resort of volunteer absentees to that capital. While this partiality subsists, the Scots will probably continue to be distressed for a currency of specie. How far paper can supply that defect, depends upon an attention to the balance of trade; and the evil may, perhaps, be somewhat prevented, by money remitted from England, for the support of government, and for carrying on the manufactures and works now set on foot in Scotland. The gentlemen who reside in Scotland have, in some measure, abandoned the use of French brandy and claret, for port, and rum produced in the British plantations; their own malt-liquors are now come nearly to as great perfection as those in England; and it is said, that they have lately exported large quantities of their ale to London, Dublin, and the Plantations.

REVENUES.] See England.

COINS.] In the reign of Edward II. of England, the value and denominations of coins were the same in Scotland as in England. Towards the reign of James II. a Scotch shilling answered to about an English six-pence; and about the reign of queen Mary of Scotland, it was not more than an English groat. It continued diminishing in this manner till after the union of the two crowns under her son James VI. when the resort of the Scotch nobility and gentry to the English court, occasioned such a drain of specie from Scotland, that by degrees a Scotch shilling fell to the value of one twelfth of an English shilling, and their pennies in proportion. A Scotch penny is now very rarely to be found; and they were succeeded by bodles, which were double the value of Scotch pennies, and are still current, but daily wearing out. A Scotch halfpenny was called a *babie*; some say, because it was first stamped with the head of James III. when he was a babe or baby; but perhaps it is only the corruption of two French words *bas piece*, signifying a low piece of money. The same observation made of the Scotch shilling holds of their pounds or marks; which are not coins, but money of account. In all other respects, the currency of money in Scotland and England is the same; as very few people now reckon by the Scotch computation.

ORDER OF THE THISTLE.] This is a military order, instituted, as the Scotch writers assert, by their king Achais, in the ninth century, upon his making a league with Charlemagne, king of France. It has been frequently neglected, and as often resumed. It consists of the sovereign and 12 companions, who are called Knights of the Thistle, and have on their ensign this significant motto, *Nemo me impune lacesset*. "None shall safely provoke me."

LAWS AND CONSTITUTION.] The ancient constitution of government in Scotland has been applauded, as excellently adapted to the preservation of liberty; and it is certain, that the power of the king was greatly limited, and that there were many checks in the constitution, which were well calculated to prevent his assuming or exercising a despotic authority; but the Scottish constitution of government was too much of the aristocratic kind, to afford the common people equal liberty. The king's authority was sufficiently restrained; but the nobles, chieftains, and great landholders, had it too much in their power to oppress their tenants and the common people.

In some instances there is now a difference between the laws and constitution of Scotland, and those of England, which was not the case formerly; though both countries have long been under one sovereign, and, since the union, form one kingdom. By the law of England, the subsequent marriage of the parents doth not legitimize the children of the same parents, born before that marriage. This was also the law of Scotland in the eleventh century; but the contrary rule of civil and canon law hath been long since adopted in North Britain. The trial of civil causes by a jury of twelve men, is considered as one of the most excellent properties

properties of English jurisprudence, and most valuable privileges of English subjects: this also was once the privilege of Scotland, but it is well known that the use of juries in civil causes, except in the court of exchequer, has been long since discontinued in Scotland \*.

The ancient kings of Scotland, at their coronation, took the following oath, containing three promises, viz. "In the name of Christ, I promise these three things to the Christian people my subjects: First, That I shall give order, and employ my force and assistance, that the church of God, and the Christian people, may enjoy true peace during our government. Secondly, I shall hinder all persons, of whatever degree, from violence and injustice. Thirdly, In all judgements I shall follow the prescriptions of justice and mercy, to the end that our merciful God may shew mercy unto me and to you."

The parliament of Scotland anciently consisted of all who held any portion of land however small, of the crown, by military service. This parliament appointed the times of its own meeting and adjournment, and committees to superintend the administration during the intervals of parliament; it appropriated the public money, ordered the keeping of it, and called for the accounts; it armed the people, and appointed commanders; it named and commissioned ambassadors; it granted and limited pardons; it appointed judges and courts of judicature: it named officers of state and privy-counsellors; it annexed and alienated the revenues of the crown, and restrained grants by the king. The king of Scotland had no negative voice in parliament; nor could he declare war, make peace, or conclude any other public business of importance, without its advice and approbation. So late as the minority of James IV. who was contemporary with, and son-in-law to, Henry VII. of England, the parliament pointed out to him his duty. The abuse of aristocratical powers, by the chieftains and great landholders, gave the king a very considerable interest among the lower ranks; and a prince, who had sense and address to retain their affections, was generally able to humble the most arrogant of his subjects. The kings of Scotland, notwithstanding this paramount power in the parliament, found means to weaken and elude its force; and in this they were assisted by their clergy, whose revenues were immense, and who had very little dependence upon the pope, and were always jealous of the powerful nobility. This was done by establishing a select body of members, who were called *the lords of the articles*. They were chosen from the clergy, nobility, knights, and burghesses. The bishops, for instance, chose eight peers, and the peers eight bishops; and these sixteen chose eight barons (or knights of the shire), and eight commissioners for burghs; to whom were added eight great officers of state, the chancellor being president of the whole.

Their business was to prepare all questions and bills, and other matters brought into parliament; so that, though the king could give no negative, yet being by his clergy, and the places he had to bestow, always sure of the lords of articles, nothing could come into parliament that could call for his negative. It must be acknowledged, that this institution seems to have prevailed by stealth; nor was it ever brought into any regular system; even its modes varied; and the greatest lawyers are ignorant when it took place. The Scots, however, never lost sight of their original principles: and when Charles I. endeavoured to form these lords of the articles into machines fit for his purposes, the melancholy consequences are well known. At the revolution, the Scots gave a fresh instance how warmly they asserted the principles of liberty, by omitting all debates about *abdication*, and the like terms, and voting king James at once to have *resigned* his crown, which they conferred on the prince and princess of Orarg.

\* Dr. Henry's History of Great Britain, vol. vi. p. 53. 8vo. edit.

This spirit of resistance was the more remarkable, as the people had groaned under the most insupportable ministerial tyranny ever since the Restoration. It is asked, Why did they submit to that tyranny? The answer is, In order to preserve their independency, which Cromwell and his parliament endeavoured to destroy, by uniting them with England; they therefore chose to submit to a temporary evil; but they took the first opportunity to get rid of their oppressors.

Scotland, when it was a separate kingdom, cannot be said to have had any peers in the English sense of the word. The nobility, who were dukes, marquises, earls, and lords, were hereditary members of parliament; but they formed no distinct house, for they sat in the same room with the commons, who had a deliberate and decisive vote with them in all public matters. And a baron, though not a baron of parliament, might sit upon a lord's assize in matters of life and death.

Great uncertainty occurs in the Scotch history, by confounding parliaments with conventions; the difference was, that a parliament could enact laws as well as lay on taxes; a convention, or meeting of the states assembled for the purposes of taxation only. Before the Union, the kings of Scotland had four great and four lesser officers of state; the great, were the lord high-chancellor, high-treasurer, privy-seal, and secretary; the four lesser were, the lords register, advocate, treasurer-depute, and justice-clerk. Since the Union none of these continue, excepting the offices of privy-seal, register, advocate, and justice-clerk; a third secretary of state has occasionally been nominated by the king for Scottish affairs. The above officers of state sat officially in the Scotch parliament.

The officers of the crown were, the high-chamberlain, constable, admiral, and marshal. The offices of constable and marshal were hereditary. A nobleman has still a pension as admiral; and the office of marshal is exercised by a knight marshal.

The office of chancellor in Scotland differed little from that in England; the same may be said of the lords treasurer, privy-seal, and secretary. The lord register was head-clerk to the parliament, convention, treasury, exchequer, and session, and keeper of all public records. Though his office was only during the king's pleasure, yet it was very lucrative, by disposing of his deputation, which lasted during life. He acted as teller to the parliament; and it was dangerous for any member to dispute his report of the numbers upon a division. The lord-advocate's office resembles that of the attorney-general in England, only his powers are more extensive, since he is not only the prosecutor of all capital crimes before the judiciary, and likewise concurs in all pursuits before supreme courts for breaches of the peace, and in all matters civil, wherein the king or his donator hath interest. Two solicitors are named by his majesty, by way of assistants to the lord-advocate. The office of justice-clerk entitles the possessor to preside in the criminal court of justice, when the justice-general, an office which will be described hereafter, is absent.

The ancient constitution of Scotland admitted of many other officers both of the crown and state; but they are either now extinct, or too inconsiderable to be described. That of Lyon king at arms, or the rex facialis, or grand herald of Scotland, is still in being; and it was formerly a place of great splendor and importance, inasmuch that the science of heraldry was preserved there in greater purity than in any other country, except Germany. He was even crowned solemnly in parliament with a golden circle; and his authority, in all armorial affairs, might be carried into execution by the civil law.

The privy council of Scotland before the Revolution, had, or assumed inquisitorial powers, even that of torture; but it is now sunk in the parliament and privy council of Great Britain; and the civil and criminal causes in Scotland are chiefly cognizable by two courts of judicature.

The

The first is that of the college of justice, which was instituted by James V. after the model of the French parliament, to supply an ambulatory committee of parliament, who took the names of the lords of council and session, which the present members of the college of justice still retain. This court consists of a president and fourteen ordinary members, besides extraordinary ones named by the king, who may sit and vote, but have no salaries, and are not bound to attendance. This court may be called a standing jury in all matters of property that lie before them. The civil law is their directory in all matters that come not within the municipal laws of the kingdom. It has been matter of surprize, that the Scots were so tenacious of the forms of their courts, and the essence of their laws, as to reserve them by the articles of the Union. This, however, can be easily accounted for, because those laws and forms were essential to the possession of estates and lands, which in Scotland are often held by modes incompatible with the laws of England. The lords of council and session act likewise as a court of equity; but their decrees are reversible by the British house of lords, to which an appeal lies. The supreme criminal judge was named the Justiciar, and the court of Justiciary succeeded to his power.

The justice court is the highest tribunal in Scotland; but in its present form it was instituted so late as the year 1672, when a lord justice general, removeable at the king's pleasure, was appointed. This lucrative office still exists in the person of one of the chief nobility; but the ordinary members of the court, are the justice-clerk, and five other judges, who are always nominated from the lords of session. The verdict of a jury condemns or acquits, but without the necessity of their being unanimous. Twice in the year, during the spring and harvest vacations, the judges of this court hold circuits in certain boroughs appointed by statute.

Besides these two great courts of law, the Scots, by the articles of the Union, have a court of exchequer. This court has the same power, authority, and jurisdiction, over the revenue of Scotland, as the court of exchequer in England has over the revenues there; and all matters competent to the court of exchequer of England, are likewise competent to the exchequer of Scotland. The judges of the exchequer in Scotland exercise certain powers which formerly belonged to the treasury, and are still vested in that of England.

The court of admiralty in Scotland was, in the reign of Charles II. by act of parliament, declared to be a supreme court, in all causes competent to its own jurisdiction; and the lord high-admiral is declared to be the king's lieutenant and justice-general upon the seas, and in all ports, harbours, and creeks of the same; and upon fresh waters and navigable rivers, below the first bridge, or within flood-mark; so that nothing competent to his jurisdiction can be meddled with, in the first instance, but by the lord high-admiral and the judges of his court. Sentences passed in all inferior courts of admiralty, may be brought again before his court; but no appeal lies from it to the lords of the session, or any other judicatory, unless in cases not maritime. Causes are tried in this court by the civil law, which, in such cases, is likewise the common law of Scotland, as well as by the laws of Oleron, Wisby, and the Hanse towus, and other maritime practices and decisions common upon the continent. The place of lord admiral of Scotland is little more than nominal, but the salary is reckoned worth 1000*l.* a year; and the judge of the admiralty is commonly a lawyer of distinction, with considerable perquisites pertaining to his office.

The college or faculty of advocates, which answers to the English inns of court, may be called the seminary of Scotch lawyers. They are an orderly court, and their forms require great precision and examination to qualify its candidates for admission. Subordinate to them is a body of inferior lawyers, or attorneys, who are

are named writers to the signet, because they alone can subscribe the writs that pass the signet; they likewise have a bye government for their own regulation.

The government of the counties of Scotland was formerly vested in sheriffs and stewards, courts of regality, baron courts, commissaries, justices of the peace, and coroners.

Formerly sheriffdoms were generally hereditary; but, by act of parliament, they are now all vested in the crown; it being enacted, that all high-sheriffs, or stewards, shall, in future, be nominated and appointed annually by his majesty, his heirs and successors. In regard to the sheriff-deputes and steward deputes, it is enacted, that there shall only be one in each county or stewardry, who must be an advocate, of three years standing at least. For the space of seven years, these deputies are to be nominated by the king, with such continuance as his majesty shall think fit; after which they are to enjoy their offices for life, unless guilty of some offence.

Stewartries were formerly part of the ancient royal domain; and the stewards had much the same power in them, as the sheriff had in his county.

Courts of regality of old were held by virtue of a royal jurisdiction vested in the lord, with particular immunities and privileges; but these were so dangerous, and so extravagant, that all the Scotch regalities are now dissolved by an act of parliament.

Baron courts belong to every person who holds a barony of the king. In civil matters, they extend to causes not exceeding forty shillings sterling; and in criminal cases, to petty actions of assault and battery; but the punishment is not to exceed twenty shillings sterling, or setting the delinquent in the stocks for three hours, in the day-time. These courts were, in former days, invested with the power of life and death, which they have now lost.

The courts of commissaries in Scotland answer to those of the English diocesan chancellors, the highest of which is kept at Edinburgh; wherein, before four judges, actions are pleaded concerning matters relating to wills and testaments; the right of patronage to ecclesiastical benefices, tythes, divorces, and causes of that nature; but in other parts of the kingdom, there sits but one judge on these causes.

According to the present institution, justices of the peace in Scotland exercise the same powers as those in England. In former times their office, though of old standing, was insignificant, being cramped by the powers of the great feudal tyrants, who obtained an act of parliament that they were not to take cognizance of riots till fifteen days after the fact.

The institution of coroners is as old as the reign of Malcolm II. the great legislator of Scotland, who lived before the Norman invasion of England. They took cognizance of all breaches of the king's peace; and they were required to have clerks to register the depositions and matters of fact, as well as verdicts of jurors; the office is now but seldom exercised.

From the above short view of the Scotch laws and institutions, it is plain that they were radically the same with those of the English. The latter allege, indeed, that the Scots borrowed the contents of their *Regiam Majestatem*, their oldest law-book, from the work of Glanville, who was a judge under Henry II. The Scots, on the other hand, say, that Glanville's work was copied from their *Regiam Majestatem*, even with the peculiarities of the latter, which do not now, and never did, exist in the laws of England.

The royal burghs in Scotland form, as it were, a commercial parliament, which meets once a year, consisting of a representative from each burgh, to consult upon the common good of the whole. Their powers are extensive, and before the Union they made laws relating to shipping, to masters and owners of ships, to mar-

riners and merchants by whom they were freighted; to manufacturers; to the curing of salmon and herrings; and to the importing and exporting several commodities. The trade between Scotland and the Netherlands is subject to their regulation: they fix the staple-port, which was formerly at Dort, and is now at Campvere. Their conservator is nominated by the crown, but then their convention regulates his power, approves his deputies, and appoints his salary: so that the whole staple trade is subjected to their management. This is a very singular institution, and proves the attention which the government of Scotland paid to trade, so early as the reign of James III. 1487, when it was established.

The conformity between the practice of the civil law of Scotland, and that in England, is remarkable. The English law reports are of the same nature with the Scotch practices; and their acts of federunt answer to the English rules of court; the Scottish wadsets and reversions, to the English mortgages and defeasances; their pointing of goods, after letters of horning, is much the same as the English executions upon outlawries; and an appeal against the king's pardon, in cases of murder, by the next of kin to the deceased, is admitted in Scotland as well as in England. Many other usages are the same in both kingdoms. One observation proves the similarity between the English and Scotch constitutions, which I believe has been mentioned by no author. In old times, all the freeholders in Scotland met together in presence of the king, who was seated on the top of a hillock, which, in the old Scotch constitutions, is called the Moot, or Mute-hill: here all national affairs were transacted, judgments given, and differences ended. This Moot-hill I apprehend to be of the same nature as the Saxon Folc mote, and to signify no more than the hill of meeting.

[HISTORY.] Though the writers of ancient Scotch history are too fond of system and fable, yet it is easy to collect, from the Roman authors, and other evidences, that Scotland was formerly inhabited by different people. The Caledonians were the first inhabitants; the Picts were Britons, forced northwards by the Belgic Gauls, above fourscore years before the descent of Julius Cæsar; and who settling in Scotland, were joined by great numbers of their countrymen, driven northwards by the Romans. The Scots probably were a nation of adventurers from the ancient Scythia, who had served in armies on the continent, and, after conquering the other inhabitants, gave their own name to the country. The tract lying southward of the Forth appears to have been inhabited by Saxons, and by the Britons who formed the kingdom of Alcuith, the capital of which was Dumbarton: but all these people, in process of time, were subdued by the Scots.

It does not appear that the Caledonians, the ancient Celtic inhabitants of Scotland, were attacked by any of the Roman generals before Agricola, anno 79. The name of the prince he fought with was Galdus, by Tacitus named Galgacus; and the history of that war is not only transmitted with great precision, but corroborated by the remains of the Roman encampments and forts, raised by Agricola in his march to Dunkeld, the capital of the Caledonians. The brave stand made by Galdus against that great general, does honour to the valour of both nations; and the sentiments of the Caledonian, concerning the freedom and independency of his country, appear to have warmed the noble historian with the same generous passion. It is plain, however, that Tacitus thought it for the honour of Agricola, to conceal some part of this war; for though he makes his countrymen victorious, yet they certainly returned southward, to the province of the Horesti, which was the county of Fife, without improving their advantage.

Galdus, otherwise called Corbred, was, according to the Scotch historians, the 21st in a lineal descent from Fergus I. the founder of their monarchy; and though this genealogy has of late been disputed, yet nothing can be more certain, from

the Roman histories, than that the Caledonians, or Scots, were governed by a succession of brave and wise princes during the abode of the Romans in Britain. Their resistance obliged Agricola, and after him the emperors Adrian and Severus, to build two famous pretentures or walls, one between the Frith of Clyde and Forth; and the other between Tinmouth and the Solway Frith, to defend the Romans from the Caledonians and Scots.

Christianity was introduced into Scotland about the year 201 of the Christian era, by Donald I. The Picts, who were the descendants of the southern Britons, had at that time gained a footing in Scotland; and being often defeated by the ancient inhabitants, they joined with the Romans against the Scots and Caledonians, who were of the same original, and considered themselves as one people; so that the Scotch monarchy suffered a short eclipse: but it broke out with more lustre than ever under Fergus II. who recovered his crown; and his successors gave many severe overthows to the Romans and Britons.

When the Romans left Britain in 448, the Scots, as appears by Gildas, a British historian, were a powerful nation, and, in conjunction with the Picts, invaded the Britons; and having forced the Roman walls, drove them to the very sea; so that the Britons applied to the Romans for relief: and, in the famous letter, which they called *their groans*, they tell them, that they had no choice left, but that of being swallowed up by the sea, or perill by the swords of the barbarians; for so all nations were called who were not Roman, or under the Roman protection.

Dongard was then king of Scotland, and it appears from the oldest histories, even those the least favourable to monarchy, that the succession to the crown of Scotland still continued in the family of Fergus, but generally devolved on collaterals; till the inconveniences of that mode of succession were so much felt, that it fell into disuse, and was at last settled in the descending line.

About the year 796, the Scots were governed by Achaius, a prince so much respected, that his friendship was courted by Charlemagne, and a league was concluded between them, which long continued inviolate. No fact of equal antiquity is better attested than this league, together with the great service performed by the learned men of Scotland, in civilizing the dominions of that great conqueror, as has been already observed under the article of learning. The Picts still remained in Scotland, as a separate nation, and were powerful enough to make war upon the Scots; who, about the year 843, when Kenneth Mac Alpin was king of Scotland, finally subdued them; but not in the savage manner mentioned by some historians, by extermination; for he obliged them to incorporate themselves with their conquerors, by taking their name, and adopting their laws. The successors of Kenneth Mac Alpin maintained almost perpetual wars with the Saxons on the southward, and the Danes and other barbarous nations towards the East; who, being masters of the sea, harassed the Scots by powerful invasions. The latter, however, were more fortunate than the English; for while the Danes were erecting a monarchy in England, they were every where overthrown in Scotland, and at last driven out of the kingdom. The Saxon and Danish monarchs, who then governed England, were not more successful against the Scots, who asserted their freedom and independency against foreign invaders and domestic usurpers. The feudal law was introduced among them by Malcolm II.

Malcolm III. commonly called Malcolm Canmore, from two Gaelic words, which signify a *large head*, but most probably from his great capacity, was the eighty-sixth king of Scotland, from Fergus I. the supposed founder of the monarchy; the forty-seventh from its restorer, Fergus II. and the twenty-second from Kenneth III. who conquered the kingdom of the Picts. Every reader who is acquainted with the tragedy of Macbeth, as written by the inimitable Shakspeare,

who keeps close to the facts delivered by historians, can be no stranger to the fate of Malcolm's father, and his own history previous to his mounting the throne in 1057. He was a wise and magnanimous prince, not inferior to his contemporary the Norman conqueror, with whom he was often at war. He married Margaret, daughter to Edward, surnamed the Outlaw, son to Edmund Ironside, king of England. By the death of her brother Edgar Atheling, the Saxon right to the crown of England devolved upon the posterity of that princess, who was one of the wisest and worthiest women of the age; and her daughter Maud was married to Henry I. of England. Malcolm, after a glorious reign, was killed, with his son, treacherously, it is said, at the siege of Alnwick, by the besieged.

Malcolm III. was succeeded by his brother Donald VII. who was dethroned by Duncan II. whose legitimacy was disputed. Edgar, the son of Malcolm III. a wise and valiant prince, assumed the government; and was succeeded by Alexander I. upon whose death, David I. mounted the throne.

Notwithstanding the endeavours of some historians to conceal what they cannot deny, viz. the glories of this reign, it appears, that David was one of the greatest princes of his age, whether we regard him as a man, a warrior, or a legislator. The actions he performed in the service of his niece, the empress Maud, in her competition with king Stephen for the English crown, give us the highest idea of his virtues, as they could be the result only of duty and principle. To him Henry II. the mightiest prince of his age, owed his crown; and his possessions in England, joined to the kingdom of Scotland, placed David's power nearly on an equality with that of England, when confined to this island. His actions, and the resources he found in his own courage, prove him to have been a real hero. If he appeared to be too lavish to churchmen, we are to consider, that by them only he could hope to civilize his kingdom: and the code of laws drawn up by him do his memory immortal honour. They are said to have been compiled under his inspection by learned men, whom he assembled from all parts of Europe in his magnificent abbey of Melros. He was succeeded by his grandson Malcolm IV. and he, by William, surnamed from his valour, the Lion. William's son, Alexander II. was succeeded in 1249 by Alexander III. who was a good king. He married, first, Margaret, daughter to Henry III. of England, by whom he had Alexander, the prince who married the earl of Flanders' daughter; David; and Margaret who married Hanguowan, or, as some call him, Eric, son to Magnus IV. king of Norway, who bore to him a daughter named Margaret, commonly called the Maiden of Norway: in whom king William's posterity failed, and the crown of Scotland returned to the descendants of David, earl of Huntingdon, brother to king Malcolm IV. and king William.

This detail has been given, because it is connected with great events. Upon the death of Alexander III. John Baliol, who was great-grandson to David, earl of Huntingdon, by his elder daughter Margaret, and Robert Bruce, grandson to the same earl of Huntingdon, by his younger daughter Isabel, became competitors for the crown of Scotland. The laws of succession, which were not then so well established in Europe as they are at present, rendered the case very difficult. Both parties were almost equally matched in interest; but after a confused interregnum of several years, the great nobility agreed in referring the decision to Edward I. of England, the most ambitious prince of his age. He accepted the office of arbiter: but having long had an eye to the crown of Scotland, he revived some obsolete claims of its dependency upon that of England; and finding that Baliol was disposed to hold it by that disgraceful tenure, Edward awarded it to him: but afterwards dethroned, and treated him as a slave, without Baliol's consenting it.

After this, Edward used many bloody endeavours to annex the crown of Scotland

to his own ; but though the Scots were often defeated, and he for a short time made himself master of Scotland, yet the people were ready to revolt on every favourable opportunity. Those who were so zealously attached to the independence of their country, as to be resolved to hazard every thing, were but few, compared to those in the interest of Edward and Baliol. Edward availed himself of their weakness and his own power. He accepted of a formal surrender of the crown of Baliol, to whom he allowed a pension, but detained him in England ; and sent every nobleman in Scotland, whom he in the least suspected, to different prisons in or near London. He then forced the Scots to sign instruments of their subjection to him ; and most barbourously carried off, or destroyed, all the monuments of their history, and the evidences of their independency ; and particularly the famous fatidical or prophetic stone, which is still to be seen in Westminster-Abbey.

These severe proceedings, while they rendered the Scots sensible of their slavery, revived the desire of freedom ; and Edward, finding their spirits were not to be subdued, affected to treat them upon an equality with his own subjects, by projecting an union, the chief articles of which have since taken place between the two kingdoms. The Scotch patriots treated this project with disdain, and united under the brave William Wallace, the truest hero of his age, to expel the English. Wallace performed actions that entitle him to eternal renown, in executing this scheme. Being, however, no more than a private gentleman, and his popularity daily increasing, the Scotch nobility, among whom was Robert Bruce, the son of the first competitor, began to suspect that he aimed at the crown, especially after he had defeated the earl of Surry, Edward's viceroy of Scotland, in the battle of Stirling, and had reduced the garrisons of Berwick and Roxburgh, and was declared by the states of Scotland their protector. Their jealousy engaged them in cabals against the brave Wallace. Edward, upon this, once more invaded Scotland, at the head of the most numerous and best disciplined army England had ever seen, for it consisted of 80,000 foot, 3000 horse-men completely armed, and 4000 light armed ; attended by a fleet to supply it with provisions. With 40,000 men, under his immediate command, he attacked the Scotch army under Wallace at Falkirk, at the same time that the brave regent was deserted by Cumming, the most powerful nobleman in Scotland, and at the head of the best division of his countrymen. Wallace, whose troops did not exceed 30,000, was defeated with great loss, but made an orderly retreat ; during which he found means to have a conference with Bruce, and to convince him of his error in joining with Edward. Wallace still continued in arms, and performed many gallant actions against the English, but he was betrayed by his countryman Monteith, and ungenerously put to death at London as a traitor. Edward died, as he was preparing to renew his invasion of Scotland with a still more desolating spirit of ambition, after having destroyed, according to the best historians, 100,000 of her inhabitants.

Bruce died soon after the battle of Falkirk ; but not before he had inspired his son, who was a prisoner at large about the English court, with the glorious resolution of vindicating his country's independency. He escaped from London, and with his own hand killed the treacherous Cumming ; and after collecting a few patriots, among whom were his four brothers, he assumed the crown ; but was defeated by the English (who had a great army in Scotland) at the battle of Methven. After this defeat, he fled with one or two friends to the Western Isles of Scotland, where his fatigues and sufferings were as inexpressible as the courage with which he and his few friends bore them (the lord Douglas especially) was incredible. Though his wife and daughter were sent prisoners to England, where his best friends, and two of his brothers, were put to death, yet such was his persevering spirit, that he recovered all Scotland, except the castle of Stirling, and improved every

every advantage that was given him by the thoughtless conduct of Edward II. who at last raised an army more numerous and better appointed than that of his father, to make a total conquest of Scotland. It is said that it consisted of 100,000 men; the army of Bruce did not exceed 30,000; but all veterans, bred up in a detestation of tyranny. Edward led his host towards Stirling, then besieged by Bruce; who had chosen, with the greatest judgment, a camp near Bannockburn. The chief officers under Edward were, the earls of Gloucester, Hereford, Pembroke, and Sir Giles Argenton; those under Bruce were, his own brother Sir Edward, who, next to himself, was reckoned the best knight in Scotland; his nephew Randolph, earl of Murray, and the young lord Walter, high-steward of Scotland. Edward's attack of the Scotch army was exceedingly furious, and required all the courage and firmness of Bruce and his friends to resist it, which they did so effectually, that they gained one of the most complete victories recorded in history. The Scotch writers make the loss of the English to amount to 50,000 men, while their own exceeded not 4000. The flower of the English nobility were killed or taken prisoners. Their camp, immensely rich, and calculated for the purpose rather of a triumph than a campaign, fell into the hands of the Scots; and Edward himself, with a few followers, were pursued by Douglas to the gates of Berwick, from whence he escaped in a fishing-boat. This great and decisive battle happened in the year 1314.

The remainder of Robert's reign was a series of glorious successes; and so well did his nobility understand the honour of their country, and so unfettered were they by superstition, that, in a letter they sent to the pope, they acknowledged that they had set aside Baliol for debasing the crown by holding it of England; and that they would do the same by Robert, if he should make the like attempt. Robert having thus delivered Scotland, sent his brother Edward to Ireland, at the head of an army, with which he conquered the greatest part of that kingdom, and was proclaimed its king; but by exposing himself too much, he was killed. Robert, before his death, made an advantageous peace with England; and died, in 1328, with the reputation of being the greatest hero of his age.

The glory of the Scots may be said to have been in its zenith under Robert I. who was succeeded by his son David II. He was a virtuous prince, but his abilities, both in war and peace, were eclipsed by his brother-in-law and enemy Edward III. of England, whose sister he married. Edward, who was as ambitious as any of his predecessors of making the conquest of Scotland, espoused the cause of Baliol, son to Baliol the original competitor. His progress was at first amazingly rapid; and he and Edward defeated the royal party in many bloody battles; but Baliol was at last driven out of his usurped kingdom by the Scotch patriots. David, however, had the misfortune to be taken prisoner by the English at the battle of Durham: and after continuing above eleven years in captivity, he paid 100,000 marks for his ransom; and died in peace without issue, in the year 1371.

The crown of Scotland then devolved upon the family of Stuart, by its head having been married to the daughter of Robert I. The first king of that name was Robert II. a wife and brave prince. He was succeeded by his son Robert III. whose age and infirmities disqualified him from reigning; so that he was forced to trust the government to his brother, the duke of Albany, an ambitious prince, who seems to have had an intention to seize the crown. Robert, on this, attempted to send his second son to France; but he was ungenerously intercepted by Henry IV. of England; and after suffering a long captivity, he was obliged to pay an exorbitant ransom. During the imprisonment of James in England, the military glory of the Scots was carried to its greatest height in France, where they supported that tottering

tottering monarchy against England, and their generals obtained some of the first titles of the kingdom.

James, the first of that name, upon his return to Scotland, discovered great talents for government, enacted many wise laws, and was beloved by the people. He had received an excellent education in England during the reigns of Henry IV. and V. where he saw the feudal system refined from many of the imperfections which still adhered to it in his own kingdom; he determined, therefore, to abridge the overgrown power of the nobles, and to recover such lands as had been unjustly wrested from the crown during his minority and the preceding reigns: but the execution of these designs cost him his life, he being murdered in his bed by some of the nobility in 1437, and the 44th year of his age.

A long minority succeeded; but James II. promised to equal the greatest of his ancestors in warlike and civil virtues, when he was killed by the accidental bursting of a cannon, in the thirteenth year of his age, as he was besieging the castle of Roxburgh, which was defended by the English.

Suspicion, indolence, immoderate attachment to females, and many of the errors of a feeble mind, are visible in the conduct of James III. and his trulent reign was closed by a rebellion of his subjects, during which he was slain in battle in 1488, aged thirty-five.

His son, James IV. was the most accomplished prince of the age: he was naturally generous and brave; loved magnificence, delighted in war, and was eager to obtain fame. He encouraged and protected commerce, which greatly increased in his reign; and the court of James, at the time of his marriage with Henry VII's daughter, was splendid and respectable. Even this alliance could not cure him of his family-distemper, a predilection for the French, in whose cause he was killed, with the flower of his nobility, by the English, in the battle of Flodden, anno 1513, and the fortieth year of his age.

The minority of his son, James V. was long and turbulent; and when he grew up, he married two French ladies; the first a daughter of the king of France, and the latter, of the house of Guise. He instituted the court of session, enacted many salutary laws, and greatly promoted the industry of Scotland, particularly the working of the mines. At this time the balance of power was so equally poised between the contending princes of Europe, that James's friendship was courted by the pope, the emperor, the king of France, and his uncle Henry VIII. of England, from all whom he received magnificent presents. But James took little share in foreign affairs; he seemed rather to imitate his predecessors in their attempts to humble the nobility; and the doctrines of the reformation beginning to be propagated in Scotland, he gave way, at the instigation of the clergy, to a religious persecution, though it is generally believed that, had he lived longer, he would have seized all the church-revenues, in imitation of Henry. Having slighted some friendly overtures made to him by the king of England, and thereby given great umbrage to that prince, a war at length broke out between them. A large army, under the command of the duke of Norfolk, entered Scotland, and ravaged the country north of the Tweed. After this short expedition, the English army retired to Berwick. Upon its retreat, James sent ten thousand men to the western borders, who entered England at Solway Frith: and he followed at a small distance, ready to join them. Soon after, he gave great offence to the nobility and the army, by imprudently depriving their general, lord Maxwell, of his commission, and conferring the command on his favourite, Oliver Sinclair, a private gentleman. The army were so much disgusted with this alteration, that they were ready to disband, when a small body of English appeared, not exceeding five hundred. A panic seized the Scots, who immediately took to flight, supposing themselves to be attacked by  
the

the whole English army. The English cavalry, seeing them fly with such precipitation, closely pursued, and slew great numbers, taking prisoners seven lords, two hundred gentlemen, and eight hundred soldiers, with twenty-four pieces of ordnance. This disaster so much affected king James, that it threw him into a fit of illness, of which he died, on the 14th of December, 1542.

His daughter and successor, Mary, was but a few hours old at the time of her father's death. Her beauty, her imprudence, and her misfortunes, are alike famous in history. It is sufficient to say, that during her minority, and while she was wife to Francis II. of France, the reformation advanced in Scotland: that being called to the throne of her ancestors while a widow, she married her cousin-german, lord Darnley, whose untimely death hath given rise to much controversy. The consequence of her husband's death, and of her marriage with Bothwell, who was considered as his murderer, was an insurrection of her subjects, from whom she fled into England, where she was ungenerously detained a prisoner for eighteen years; and, afterwards, on motives of state policy, cruelly beheaded by queen Elizabeth, in 1587, in the forty-sixth year of her age.

Mary's son, James VI. of Scotland, succeeded, in right of his blood from Henry VII. upon the death of queen Elizabeth, to the English crown, after shewing considerable abilities in the government of Scotland. This union of the two crowns, destroyed the independency, as it impoverished the people of Scotland; for the seat of government being removed to England, their trade was checked, their agriculture neglected, and their gentry obliged to seek for situations in other countries. James, after a splendid, but troublesome reign over his three kingdoms, left them, in 1635, to his son, the unfortunate Charles I. That prince, by his unwise conduct, stirred both his Scottish and his English subjects to arms. It was in Scotland that the sword was first drawn against Charles. But when the royal party was totally defeated in England, the king put himself into the power of the Scottish army; they at first treated him with respect, but afterwards delivered him up to the English parliament, on condition of their paying 400,000 pounds to the Scots, which was said to be due to them for arrears. The Scots afterwards made several unsuccessful attempts to restore his son, Charles II. That prince was finally defeated by Cromwell, at the battle of Worcester, 1651, after which, to the time of his restoration, the commonwealth of England, and the protector, gave law to Scotland.

The state of parties in England, at the accession of queen Anne, was such, that the Whigs once more had recourse to the Scots, and offered them their own terms, if they would agree to the Union as it now stands. It was long before the majority of the Scotch parliament would listen to the proposals; but at last, partly from conviction, and partly through the force of money distributed among the needy nobility, it was agreed to; since which event, the history of Scotland becomes the same with that of England.

## EXTENT AND SITUATION.

	Miles.		Degrees.
Length	380	} between	{ 50 and 56 North latitude.
Breadth	300		{ 2 East and 6-20 West longitude.

GREAT BRITAIN contains 79,712 SQUARE MILES, with 119 inhabitants to each.

**CLIMATE AND BOUNDARIES.** } THE longest day, in the northern parts, contains 17 hours 30 minutes; and the shortest, in the southern, near 8 hours. It is bounded, on the North, by that part of the island called Scotland; on the East, by the German Ocean; on the West, by St. George's Channel; and on the South, by the English Channel, which parts it from France, and contains 49,450 square miles.

The situation, by the sea washing it on three sides, renders England liable to a great uncertainty of weather; so that the inhabitants on part of the sea-coasts are often visited by agues and fevers. On the other hand, it prevents the extremes of heat and cold, to which other places, lying in the same degree of latitude, are subject; and it is, on that account, friendly to the longevity of the inhabitants in general, especially those who live on a dry soil. That perpetual verdure for which England is remarkable, is occasioned by refreshing showers and the warm vapours of the sea.

**NAME AND DIVISIONS.** } Antiquaries are divided with regard to the etymology of the word *England*: some derive it from a Celtic word, signifying a level country; but I prefer the common etymology, of its being derived from Anglen, a province now subject to his Danish majesty, which poured a great part of the original Saxon adventurers into this island. In the time of the Romans, the whole island went by the name of *Britannia*. The word *Brit*, according to Mr. Camden, signified painted or stained; the ancient inhabitants being famous for painting their bodies. The western tract of England, which is almost separated from the rest by the rivers Severn and Dee, is called Wales, or the *land of Strangers*, because inhabited by the Belgic Gauls, who were driven thither by the Romans, and were strangers to the old natives.

When the Romans provinciated England, they divided it into,

1. Britannia Prima, which contained the southern parts of the kingdom;
2. Britannia Secunda, containing the western parts, Wales included; and,
3. Maxima Caesariensis, which reached from the Trent as far northward as the wall of Severus, between Newcastle and Carlisle, and sometimes as far as that of Adrian in Scotland, between the Forth and Clyde.

To these divisions some add the Flavia Caesariensis, which they suppose to contain the midland counties.

When the Saxons invaded England, about the year 450, and established themselves there, in the year 582, their leaders appropriated to themselves, after the manner of the other northern conquerors, the countries which each had been the most instrumental in acquiring; and the whole formed a heptarchy, or political confederacy, consisting of seven kingdoms. In time of war, a chief was chosen from the seven kings by public consent; so that the Saxon heptarchy nearly resembled the constitution of Greece during the heroic ages.

Kingdoms

E N G L A N D

Kingdoms erected by the Saxons, usually styled the Saxon Heptarchy.

Kingdoms.	Counties.	Chief Towns.
1. Kent founded by Hengist in 475, and ended in 823.	Kent	Canterbury.
2. South Saxons, founded by Ella in 491, and ended in 600.	Suffex Surry	Chichester Southwark.
3. East Angles, founded by Uffa in 575, and ended in 793.	Norfolk Suffolk Cambridge With the Isle of Ely Cornwall	Norwich Bury St. Edmund's Cambridge Ely.
4. West-Saxons, founded by Cerdic in 512, and ended in 1060.	Devon Dorset Somerset Wilts Hants Berks Lancaster York	Launceston Exeter Dorchester Bath Salisbury Winchester Abingdon Lancaster York Durham Carlisle Appleby
5. Northumberland, founded by Ida in 574, and ended in 792.	Durham Cumberland Westmoreland Northumberland, and Scotland to the Frith of Edinburgh	Newcastle.
6. East-Saxons, founded by Ercewin in 527, and ended in 740.	Essex Middlesex, and part of Hertford The other part of Hertford	London.
7. Mercia, founded by Cridda in 582, and ended in 874.	Gloucester Hereford Worcester Warwick Leicester Rutland Northampton Lincoln Huntingdon Bedford Buckingham Oxford Stafford Derby Salop Nottingham Chester	Hertford Gloucester Hereford Worcester Warwick Leicester Oakham Northampton Lincoln Huntingdon Bedford Aylesbury Oxford Stafford Derby Shrewsbury Nottingham Chester.

It is the more necessary to preserve these divisions, as they account for different local customs, and many very essential modes of inheritance, which to this day prevail in England, and which took their rise from different Saxon institutions. Since the Norman invasion, England has been divided into counties, a certain number of which, except Middlesex and Cheshire, are comprehended in six circuits, or annual progresses of the judges, for administering justice to the subjects who are at a distance from the capital. These circuits are:

Circuits.	Counties.	Chief Towns.
1. Home Circuit.	Essex - -	Chelmsford, Colchester, Harwich, Malden, Saffron Walden, Bocking, Braintree, and Stratford.
	Hertford -	
	Kent - -	
	Surry - -	
	Suffex - -	
	Bucks - -	
2. Norfolk Circuit.	Bedford -	Aylesbury, Buckingham, High-Wickham, Great-Marlow, Stoney Stratford, and Newport Pagnel.
	Huntingdon	
	Cambridge	
	Suffolk	
	Norfolk -	
	Oxon - -	
3. Oxford Circuit.	Berks - -	Abingdon, Windfor, Reading, Wallingford, Newbury, Hungerford, Maidenhead, Farringdon, Wantage, and Oakingham.
	Gloucester	
	Worcester	
	Monmouth	

E N G L A N D.

Circuits.	Counties.	Chief Towns.
3. Oxford Circuit continued.	Monmouth	Monmouth, Chepstow, Abergavenny, Caerleon, and Newport.
	Hereford	Hereford, Leinster, Weobley, Ledbury, Kyneton, and Rofs.
	Salop - -	Shrewsbury, Ludlow, Bridgnorth, Wenlock, Bishop's Castle, Whitchurch, Oswestry, Wem, and Newport.
4. Midland Circuit.	Stafford -	Stafford, Litchfield, Newcastle under Line, Wolverhampton, Rugeley, Burton, Uttoxeter, and Stone.
	Warwick	Warwick, Coventry, Birmingham, Stratford upon Avon, Tamworth, Aulcester, Nuneaton, and Atherton.
	Leicester	Leicester, Melton-Mowbray, Ashby-de-la-Zouch, Bosworth, and Harborough.
	Derby -	Derby, Chesterfield, Wirksworth, Ashbourne, Bakewell, Balfover, and Buxton.
	Nottingham	Nottingham, Southwell, Newark, East and West Retford, Mansfield, Tuxford, Workfop, and Blithe.
	Lincoln -	Lincoln, Stamford, Boston, Grantham, Croyland, Spalding, New Sleaford, Great Grimsby, Gainfborough, Louth and Horncastle.
	Rutland - Northampton	Northampton, Peterborough, Daventry, Higham-Ferrers, Brackley, Oundle, Wellingborough, Thrapston, Towcester, Rockingham, Kettering, and Rothwell.
5. Western Circuit.	Hants - -	Winchester, Southampton, Portsmouth, Andover, Basingstoke, Christchurch, Petersfield, Lymington, Ringwood, Rumsley, Arlesford, and Newport, Yarmouth, and Cowes, in the Isle of Wight.
	Wilts - -	Salisbury, Devizes, Marlborough, Mahmsbury, Wilton, Chippenham, Calne, Cricklade, Trowbridge, Bradford, and Warminster.
	Dorset -	Dorchester, Lyme, Sherborn, Shaftsbury, Poole, Blandford, Bridgeport, Weymouth, Melcombe, Wareham, and Winburn.
	Somerfet -	Bath, Wells, Bristol in part, Taunton, Bridgewater, Ilchester, Minehead, Milbourn-port, Glastonbury, Wellington, Dulverton, Dunster, Wacht, Yeovil, Somerton, Axbridge, Chard, Bruton, Shepton-Mallet, Croscomb, and Froome.
	Devon -	Exeter, Plymouth, Barnstable, Biddeford, Tiverton, Honiton, Dartmouth, Tavilock, Topsham, Okehampton, Athburton, Crediton, Moulton, Torrington, Totnefs, Axminster, Plympton, and Ilfracomb.
	Cornwall -	Launceston, Falmouth, Truro, Saltash, Bodmyn, St. Ives, Padstow, Tregony, Fowey, Pemyu, Kellington, Leskard, Leiwithiel, Helston, Penzance, and Redruth.

Circuits.	Counties.	Chief Towns.
6. Northern Circuit*.	York - -	York, Leeds, Wakefield, Halifax, Rippon, Pontefract, Hull, Richmond, Scarborough, Boroughbridge, Malton, Sheffield, Doncaster, Whitby, Beverly, Northallerton, Burlington, Knareborough, Barnsley, Sherborn, Bradford, Tadcaster, Skipton, Wetherby, Ripley, Heydon, Howden, Thirike, Gilborough, Pickering, and Yarum.
	Durham -	Durham, Stockton, Sunderland, Stanhope, Barnard-Castle, Darlington, Hartlepool, and Auckland.
	Northumb.	Newcastle, Tinnmouth, North-Shields, Morpeth, Alnwick, and Hexham.
	Lancaster	Lancaster, Manchester, Preston, Liverpool, Wigan, Warrington, Rochdale, Bury, Ormskirk, Hawkshead, and Newton.
	Westmorel.	Appleby, Kendal, Lonsdale, Kirkby-Stephen, Orton, Ambleside, Burton, and Milthorpe.
Cumberland	Carlisle, Penrith, Cockermouth, Whitehaven, Ravenglass, Egremont, Kefwick, Workington, and Jerby.	

Middlesex is not comprehended; and Cheshire, being a county palatine, enjoys municipal laws and privileges. The same may be said of Wales, which is divided into four circuits.

Circuits.	Counties.	Chief Towns.
Counties not included in the Circuits.	Middlesex	LONDON, first meridian, N. Lat. 51-30. Westminster, Uxbridge, Brentford, Chelsea, Highgate, Hampstead, Kenfington, Hackney, and Hampton-Court.
	Chester -	Chester, Nantwich, Macclesfield, Malpas, Northwich, Middlewich, Sandach, Congleton, Knotford, Froditham, and Haulton.

## C I R C U I T S O F W A L E S.

North-East Circuit.	Flint - -	Flint, St. Asaph, and Holywell.
	Denbigh -	Denbigh, Wrexham, and Ruthen.
	Montgom.	Montgomery, Llanvylin, and Welchpool.
North-West Circuit.	Anglesey -	Beaumaris, Holyhead, and Newburgh.
	Caernarvon	Bangor, Conway, Caernarvon, and Pullilly.
	Merioneth	Dolgelly, Bala, and Harlegh.
South-East Circuit.	Radnor -	Radnor, Prestean, and Knighton.
	Brecon -	r ecknock, Built, and Hay.
	Glamorgan	Llandaff, Cardiff, Cowbridge, Neath, and Swansey.

\* In the Lent or Spring Assizes, the Northern Circuit extends only to York and Lancaster; the Assizes at Durham, Newcastle, Appleby, and Carlisle, being held only in the Autumn, and distinguished by the appellation of the *Long Circuit*.

67	Cities and Boroughs	- - -	15 burgessees.

Total 558

Besides the 52 counties into which England and Wales are divided, there are counties corporate, consisting of certain districts, to which the liberties and jurisdictions peculiar to a country have been granted by royal charter. Thus the city of London is a county distinct from Middlesex; the cities of York, Chester, Bristol, Norwich, Worcester, and the towns of Kingston upon Hull, and Newcastle upon Tyne, are counties of themselves, distinct from those in which they lie. The same may be said of Berwick upon Tweed, which lies in Scotland, and hath within its jurisdiction a small territory of two miles on the north side of the river.

Under the name of a town, boroughs and cities are contained: for every borough or city is a town, though every town is not a borough or city. A borough is so called, because it sends up burgessees to parliament; and this makes the difference between a village or town, and a borough. Some boroughs are corporate, and some not corporate; and though decayed, as Old Sarum, they still send burgessees to parliament. A city is a corporate borough, that hath had, or at present hath, a bishop; for if the bishoprick be dissolved, yet the city remains. To have suburbs proves it to be a city.

[SOIL, AIR, SEASONS, AND WATER.] The soil of England and Wales differs in each county, not so much from the nature of the ground, though that must be admitted to occasion a very considerable alteration, as from the various degrees of proficiency which the inhabitants have made in the cultivation of lands and gardens, draining of marshes, and many other local improvements, which are here carried to a much greater degree of perfection than they are perhaps in any other part.

part of the world, if we except China. We cannot enter upon particular proofs of these improvements. All that can be said is in general, that if no unkindly seasons happen, England produces corn, not only sufficient to maintain her own inhabitants, but to make considerable exports. The benefits from these exports have sometimes tempted the inhabitants to carry out of the kingdom more grain than could be conveniently spared; for which reason exportations have been properly regulated. No nation exceeds England in the productions of the garden. London and its neighbourhood, though peopled by 1,000,000 of inhabitants, is plentifully supplied with all kinds of fruits and vegetables from grounds within a few miles distance. The plantations surrounding almost every country house, and the perpetual hedge-rows in the fields are equally delightful and useful. Some have observed a decay of that oak-timber which anciently formed the fleets that England put to sea; but it is supposed, with great probability, that great stores are still in reserve.

As to air, little can be added to what has been already said concerning the climate\*. The westerly breezes, which most commonly prevail, convey from the Atlantic Ocean a vast quantity of vapour, which is ventilated by winds and storms, so that in this respect England is to foreigners, and people of delicate constitutions, rather disagreeable than unwholesome. It cannot, however, be denied, that the weather is exceedingly capricious, and so unfavourable to certain constitutions, that many of the inhabitants are induced to repair to foreign countries, in hopes of obtaining a renovation of their health.

After what we have observed of the English air, the reader may form some idea of its seasons, which are so uncertain, that they admit of no description. Spring, summer, autumn, and winter, succeed each other, but in what month their different appearances take place is very undetermined. The spring begins sometimes in February, and sometimes in April. In May the face of the country is often covered with hoar-frost instead of blossoms. The beginning of June is sometimes as cold as in the middle of December, yet at other times the thermometer rises in that month as high as it does in Italy. Even August has its vicissitudes of heat and cold; and upon an average September, and next to it October, are two of the most agreeable months in the year. The natives sometimes experience all the four seasons within the compass of one day; cold, temperate, hot, and mild weather. This inconstancy, however, is not attended with the effects that might be naturally apprehended. A fortnight, or at most three weeks, generally make up the difference with regard to the maturity of the fruits of the earth; and it is hardly ever observed that the inhabitants suffer by a hot summer. Even the greatest irregularity, and the most unfavourable appearances of the seasons, are not, as in other countries, attended with famine, and very seldom with scarcity. Perhaps this, in a great measure, may be owing to the vast improvements of agriculture; for when scarcity has been complained of, it generally, if not always, proceeded

\* The climate of England has more advantages than are generally allowed it, if we admit the opinion of king Charles the Second upon this subject, which is corroborated by that of sir William Temple; and it may be observed, that they were both travellers. I must needs add one thing (says sir William, in his *Miscellanea*, part ii. p. 114. edit. 8vo. 1690.) in favour of our climate, which I heard the king say, and I thought new and right, and truly like a king of England, that loved and esteemed his own country. It was in reply to some company that were reviling our climate, and extolling those of Italy and Spain,

or at least of France. He said, "He thought that was the best climate where he could be abroad in the air with pleasure, or at least without trouble or inconvenience, the most days in the year, and the most hours in the day; and this he thought he could be in England, more than in any country he knew in Europe." And I believe (adds sir William) it is true, not only of the hot and the cold, but even among our neighbours in France and the Low Countries themselves, where the heats or the colds, and changes of seasons are less treatable (or moderate) than they are with us.

from

from the excessive exportations of grain on account of the drawback, and the profit of the returns.

In speaking of water, rivers, brooks, or lakes, are not included; but only waters for the common conveniences of life, and those that have mineral qualities. The champaign parts of England are generally supplied with excellent springs and fountains; though a discerning palate may perceive, that they frequently contain some mineral impregnation. In some very high lands, the inhabitants are distressed for water, and supply themselves by trenches, or digging deep wells. The constitutions of the English, and the diseases to which they are liable, have rendered them extremely inquisitive after mineral waters. Those of certain efficacy are the hot baths of Bath and Bristol in Somersetshire, and of Buxton and Matlock in Derbyshire; the mineral waters of Cheltenham, Tunbridge, Epsom, Harrowgate, and Scarborough. Sea water is used as commonly as any other for medicinal purposes; and so delicate are the tones of the English fibres, that the patients can perceive, both in drinking and bathing, a difference between the sea-water of one coast and that of another.

FACE OF THE COUNTRY } The industry of the English supplies those favours  
AND MOUNTAINS. } which nature has so liberally bestowed upon some  
foreign climes. No country in the world rivals the cultivated parts of England in beautiful scenes. The variety of high-lands and low-lands, the former gently swelling, and both forming prospects surpassing the pictures of fancy; the corn and meadow ground, the intermixtures of enclosures and plantations, the noble seats, cheerful villages, and well-fenced farms, often rising in the neighbourhood of populous towns and cities, decorated with the most vivid colours of nature, are objects of which an adequate idea cannot be conveyed by description. The most barren spots are not without their verdure; but nothing can better prove the extent of English industry, than observing that some of the pleasantest counties in the kingdom are naturally the most unfruitful.

England contains few mountains of great altitude. The most noted are the Peak in Derbyshire, the Endle in Lancashire, the Wolds in Yorkshire, the Cheviot-hills on the borders of Scotland, Skiddaw in Cumberland, Malvern in Worcester-shire, Cotswold in Gloucestershire, the Wrekin in Shropshire; with those of Plinlimmon and Snowdon, in Wales. In general, however, Wales and the northern parts, may be termed mountainous.

RIVERS AND LAKES.] The rivers in England add greatly to its beauty, as well as its opulence. The Thames rises on the confines of Gloucestershire, a little S.W. of Cirencester, and after receiving many smaller streams, it passes to Oxford, then by Abingdon, Wallingford, Reading, Marlow, and Windsor. From thence to Kingston, where formerly it met the tide, which, since the building of Westminster-bridge, is said to flow no higher than Richmond; then it moves on to London, and, after dividing the counties of Kent and Essex, it widens in its progress, till it falls into the sea at the Nore, from whence it is navigable for large ships to London-bridge. It was formerly a reproach to England, among foreigners, that so capital a river should have so few bridges; those of London and Kingston being the only two it had, from the Nore to the last mentioned place. The increase of riches, and inland trade, has of late greatly multiplied bridges. Those of Westminster and Blackfriars stand unrivalled for strength and grandeur. Battersea, Putney, Kew, Richmond, Walton, and Hampton-court have also bridges over the Thames, and others are projecting by public spirited proprietors of the grounds on both sides.

The river Medway, which rises near Tunbridge, falls into the Thames at Sheerness, and is navigable for the largest ships as far as Chatham. The Severn, reckoned the second river for importance in England, and the first for rapidity, rises at Plinlimmon-hill in North Wales, becomes navigable at Welch-Pool, runs east

east to Shrewsbury, then turning south, visits Bridgenorth, Worcester, and Tewkesbury, where it receives the Upper Avon; after having passed Gloucester, it takes a south-west direction, is near its mouth increased by the Wye and Ustre, and discharges itself into the Bristol-channel, near King-road; where the great ships anchor which cannot get up to Bristol. The Trent rises in the Moorlands of Staffordshire, and running south-east by Newcastle under Line, divides that country into two parts; then turning north-east on the confines of Derbyshire, visits Nottingham, running the whole length of that county to Lincolnshire, and being joined by the Ouse, and several other rivers towards the mouth, obtains the name of the Humber, falling into the sea south-east of Hull.

The other principal rivers in England are the Ouse (a Gaelic word signifying water in general), which falls into the Humber, after receiving the water of many other rivers. Another Ouse rises in Bucks, and falls into the sea near Lynn in Norfolk. The Tine runs from west to east through Northumberland, and falls into the German Sea at Tinmouth, below Newcastle. The Tees runs from west to east, dividing Durham from Yorkshire, and falls into the German Sea below Stockton. The Tweed runs from west to east on the borders of Scotland, and falls into the German Sea at Berwick. The Eden runs from south to north through Westmoreland and Cumberland, and passing by Carlisle, falls into Solway Frith below that city. The Lower Avon runs west through Wiltshire to Bath, and then dividing Somersetshire from Gloucestershire, runs to Bristol, falling into the mouth of the Severn below that city. The Derwent, which runs from east to west through Cumberland, and passing by Cocker-mouth, falls into the Irish Sea a little below. The Ribble, which runs from east to west through Lancashire, and passing by Preston discharges itself into the Irish sea. The Mersey, which runs from the south-east to the north west through Cheshire, and then dividing Cheshire from Lancashire, passes by Liverpool, and falls into the Irish Sea a little below that town; and the Dee rises in Wales, and divides Flintshire from Cheshire, falling into the Irish channel below Chester.

The lakes of England are now few; though meres and fens were frequent in England, till drained and converted into arable land. The chief lakes remaining, are Soham mere, Wittlessea mere, and Ramfay mere, in the isle of Ely, in Cambridgeshire. These meres in a rainy season unite, and form a lake of 40 or 50 miles in circumference. The northern counties of Cumberland, Westmoreland, and Lancashire, contain several small lakes, which are remarkable for their beauty. Winander mere lies in Westmoreland, and some small lakes in Lancashire go by the name of Derwent waters. The various disposition of their banks, sometimes cultivated, often covered with wood, or enlivened by herds, the intermixture of hill and dale, rude rocks and green mountains, render the scenery of this part of England scarcely inferior to that of Switzerland and Italy.

FORESTS.] The first Norman kings of England, that they might the more effectually enslave their new subjects, converted immense tracts of grounds into forests, for hunting, governed by particular laws: so that it was necessary, about the time of passing the Magna Charta, to form a code of the forest laws; the justices in eyre, so called from their sitting in the open air, were appointed to see them observed. By degrees those tracts were disforested; and the chief forests, properly so called, remaining out of no fewer than 60, are those of Windfor, New Forest, Dean, and Sherwood. These forests produced formerly great quantities of excellent oak, elm, ash, and beech, besides walnut-trees, poplar, maple, and other kinds of wood. In ancient times England contained large forests of chefnut trees, which exceeded all other kinds of timber for the purposes of building, as appears from many great houses still standing, in which the chefnut beams and roofs remain fresh and undecayed, though some of them are above 600 years old.

METALS

**METALS AND MINERALS.]** Among the minerals, the tin mines of Cornwall are the principal. They were known to the Greeks and Phœnicians, the latter especially, some ages before the Christian era; and since the English have manufactured their tin into plates, and white iron, they are of immense benefit to the nation. An ore called mundic is found in the beds of tin, which was very little regarded till about 80 years ago. Sir Gilbert Clark discovered the art of making the best Spanish copper, yielding a proportionable quantity of lapis calaminaris for making brass. Those tin-works are regulated by the stannary laws; and the miners have parliaments and privileges of their own, which are in force at this time. The number of Cornish miners are said to amount to 100,000. Some gold has likewise been discovered in Cornwall, and the lead is impregnated with silver. The English coined silver is particularly known by roses, and that of Wales by that prince's cap of feathers. Devonshire, and other counties of England, produce marble; but the best kind, which resembles Egyptian granite, is exclusively hard to work. Quarries of free-stone are found in many places. Northumberland and Cheshire yield alum and salt pits. The English fullers earth is of such consequence to the clothing trade, that its exportation is prohibited under severe penalties. Pit and sea-coal is found in many counties of England: but the city of London, to encourage the nursery of seamen, is chiefly supplied from the pits of Northumberland, and the bishoprick of Durham. The cargoes are shipped at Newcastle and Sunderland, and the exportation of coals to other countries is very considerable. The mines of Northumberland alone send every year upwards of 600,000 chaldron of coals to London, and 1500 vessels are employed in carrying them to that harbour, along the eastern coast of England.

**VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.** } This is so copious a subject, and such improvement have been made in gardening and agriculture, even since the best printed accounts we have seen, that much must be left to the reader's own observation and experience... Nothing can be said with any certainty concerning the quantities of wheat, barley, rye, peas, beans, vetches, oats, and other grains growing in the kingdom.

Excellent institutions for the improvement of agriculture are now common in England, and their members are so public-spirited as to print periodical accounts of their discoveries and experiments, which serve to shew that agriculture and gardening may be carried to a much higher state of perfection. The publications of the Bath society upon the subject of agriculture are well known; and such has been the attention of the nation to this important object, that his present majesty has been pleased, Aug. 31, 1793, by letters patent, under the great seal, to constitute a board for the encouragement of agriculture, and internal improvement. The proper cultivation of the soil is an object so peculiarly interesting to the community at large, that those who most assiduously attend to it, are perhaps to be accounted the most meritorious citizens of their country.

Honey and saliron are natives of England. It is almost needless to mention in what plenty the most excellent fruits, apples, pears, plums, cherries, peaches, apricots, nectarines, currants, gooseberries, raspberries, and other hortulan productions, grow here, and what quantities of cyder, perry, meadegin, and the like liquors, are made in some counties. The cyder of Devon and Herefordshire, is by many preferred to French white wine. The English have made the different fruits of the world their own, sometimes by simple culture, but often by hot beds and other artificial means. The English pine-apples are delicious, and now plentiful. Our kitchen gardens abound with all sorts of greens, roots, and fallads, in perfection; such as artichokes, asparagus, cauliflowers, cabbages, coleworts, brocoli, peas, beans, kidney-beans, spinage, beets, lettuce, celery, endive, turneps, carrots, potatoes, mushrooms, leeks, onions, and shallots.

Wood for dying is cultivated in Bucks and Bedfordshire, as hemp and flax are in other counties. In nothing have the English been more successful than in the cultivation of grasses for meliorating the soil. It belongs to a botanist to recount the various kinds of useful and salutary herbs, shrubs, and roots, that grow in different parts of England. The soil of Kent, Essex, Surry, and Hampshire, is most favourable to the difficult and tender culture of hops, which now form a considerable article of trade.

With regard to ANIMAL PRODUCTIONS, quadrupeds, being of the first importance, deserve the most particular notice. The English oxen are large and fat, but some prefer for the table the smaller breed of the Scotch and Welch cattle, after grazing in English pastures. The English horses are the best in the world. Incredible have been the pains taken, by all ranks, for improving the breed of this favourite and noble animal, and the success has been answerable; for they now unite all the qualities and beauties of Indian, Persian, Arabian, Spanish, and other foreign horses. The irresistible spirit and weight of the English cavalry render them superior to all others in war: an English hunter will perform incredible things in a fox or stag-chace; and the English dray-horses are unrivalled for strength and docility. The exportation of horses has become a considerable article of commerce. The breed of asses and mules begin likewise to be improved and encouraged in England.

The English sheep are generally divided into two kinds; those that are valuable for their fleece, and those that are proper for the table. The former are very large, and their fleeces constitute the original staple commodity of England. In some counties the inhabitants are as curious in their breed of rams, as in those of their horses and dogs; and in Lincolnshire particularly, it is not uncommon for one of those animals to sell for 50*l.* and there are instances, that a single ram of extraordinary beauty and strength has been purchased for 100 guineas. It was thought at the beginning of this century (since which the number must have been greatly increased) that in England, twelve millions of fleeces are shorn annually, which, at a medium of 2*s.* a fleece, makes 1,200,000*l.* The other kind of sheep which are fed upon the downs, such as those of Banstead, Bagshot-heath, and Devonshire, where they have what the farmers call a short bite, is little, if at all, inferior in flavour and sweetness to venison.

The English mastiffs and bull-dogs are said to be the strongest and fiercest of the canine species in the world; but, either from the change of soil, or feeding, they degenerate in foreign climates. James I. of England, by way of experiment, turned out two English bull-dogs upon one of the fiercest lions in the Tower, and they soon conquered him. The mastiff has all the courage of the bull-dog, without its ferocity, and is particularly distinguished for his fidelity and docility. All the different species of dogs that abound in other countries, for the field as well as domestic uses, are to be found in England. What is observed of the degeneracy of the English dogs in foreign countries is applicable to the English game cocks, which afford much barbarous diversion to our sportsmen. The courage of these birds is astonishing, and one of the true breed never leaves the pit alive, without victory. The proprietors and feeders of this animal are extremely curious as to his blood and pedigree.

Tame fowls are much the same in England as in other countries; turkeys, peacocks, common poultry, such as cocks, pullets and capons, geese, swans, ducks, and tame pigeons. The wild sort are bustards, wild geese, wild ducks, teal, widgeon, plover, pheasants, partridges, woodcocks, growse, quail, landrail, snipe, wood-pigeons, hawks of different kind, kites, owls, herons, crows, rooks, ravens, magpies, jackdaws and jays, blackbirds, thrushes, nightingales, goldfinches, linnets, larks, and a great variety of small birds; Canary birds also breed in England. The wheat-

wheat-car is by many preferred to the ortolan, for the delicacy of its flesh and flavour, and is peculiar to England.

Few countries are better supplied than England with river and sea-fish. Her rivers and ponds contain plenty of salmon, trout, eels, pike, perch, smelts, carp, tench, barble, gudgeons, roach, dace, grey mullet, bream, plaice, flounders, and craw-fish, besides a delicate lake fish, called char, which is found in some fresh water lakes of Wales and Cumberland, and, as some say, no where else. The sea-fish are cod, mackarel, haddock, whiting, herrings, pilchards, skate, soles. The john dory, found towards the western coast, is reckoned a great delicacy, as is the red mullet. Several other fish are found on the same coasts. As to shell-fish, they are chiefly oysters, the propagation of which, upon their proper banks, requires a peculiar culture. Lobsters, crabs, shrimps, and escallops, one of the most delicious of shell-fishes, cockles, wilks, periwinkles, and muscles, with many other final shell-fish, abound in the English sea. The whales chiefly visit the northern coast; but great numbers of porpoises and seals appear in the Channel. The English are justly accused of not paying proper attention to their fisheries. The best fish that come to the tables of the great in London are sold by the Dutch to English boats, and that industrious people even take them upon the English coasts.

With regard to reptiles, such as adders, vipers, snakes, and worms; and insects, such as ants, guats, wasps, and flies, England is pretty much upon a par with the rest of Europe; and the difference, if any, becomes more proper for natural history than geography.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.

The exemption of the English constitution from the despotic powers exercised in foreign nations, not excepting republics, is one great reason why it is very difficult to ascertain the number of inhabitants in England; and yet it is certain that this might occasionally be done by parliament, without any violation of public liberty, and probably soon will take place. With regard to political calculations, they must be very fallible, when applied to England. The prodigious influx of foreigners, the emigrations of natives to the colonies, their return from thence, and the great number of hands employed in shipping, are matters that render any calculation extremely precarious. Upon the whole, it may fairly be supposed that England is more populous than the estimators of her inhabitants are willing to allow. The war with France and Spain, before the last, annually employed about 200,000 Englishmen, exclusive of Scots and Irish, by sea and land; and its progress indeed sensibly felt, but not so much as during the wars in queen Anne's reign, though not half of the numbers were then employed in the sea and land service. The great quantities of land taken into tillage, and the prodigious increase of our manufactures and industry, makes it certain that the populousness of England far exceeds the seven millions at which it was long estimated.

From the continual accession of strangers, and other obvious causes, it is impossible to ascertain the numbers of London by rules derived from the proportions of births and burials. At the very gates of this metropolis, 100,000 inhabitants are not included within the bills of mortality.

Englishmen, in their persons, are generally well sized, regularly featured, most commonly fair and florid in their complexions. It is to be presumed, that the vast numbers of foreigners intermarried with the natives have given a cast to their persons and complexions different from those of their ancestors 150 years ago. The women, in their shapes, features, and complexions, appear so graceful and lovely, that England may be termed the native country of female beauty; and these personal graces are peculiarly adorned by prudence, chastity, and all the virtues of domestic

domestic life. Of all European nations, the English keep themselves the most cleanly. Their nerves are so delicate, that the people of both sexes are sometimes forcibly, nay mortally, affected by imagination; insomuch, that before the practice of inoculation for the small pox took place, it was thought improper to mention that loathsome disease by its true name in any polite company. This over-sensibility has been considered as one of the sources of those singularities, which so strongly characterise the English nation. They sometimes magnify the slightest appearances into realities, and bring the most distant dangers immediately home to themselves; and yet when real danger approaches, no people face it with greater resolution or constancy of mind. In short, many of the English feel, as if it really existed, every evil, in person and estate, which they form in their imagination. At particular intervals they are sensible of this absurdity, and run into a contrary extreme, striving to banish it by dissipation, riot, intemperance, and diversions. They are fond, for the same reason, of convivial associations; and when these are kept within the bounds of temperance and moderation, they prove the best cures for the mental evils, which are so peculiar to the English, that foreigners have pronounced them to be national.

Such of the English noblemen and gentlemen, as do not strike into high walks of life, affect rather what is called the snug way of living. They understand, perhaps, better than any people in the world, convenience in their houses, gardens, equipages, and estates; it has, however, been observed, that this turn renders them less communicative than they ought to be: but, on the other hand, the few connections they form are sincere, cheerful, and indissoluble. The like habits descend into the lower ranks, and are often discernible among tradesmen. This love of conveniency may be called the ruling passion of the English, and the ultimate end of all their application, labours, and fatigues. A good œconomist, with a brisk run of trade, is generally, when turned of 50, in a condition to retire from business; that is, either to purchase an estate, or to settle his money in the funds. He then commonly retires in a comfortable house in the country, often his native county, and expects to be treated on the footing of a gentleman; but his style of living is always judiciously suited to his circumstances.

Few people know better than tradesmen, and men of business in England, how to pay court to their customers and employers. Those arts they consider only as the means of acquiring that independence, the pride of which too often leads them into a contrary extreme. This carries them to that petulance, which is so offensive to strangers, and though encouraged, through the want of education, has its root in the noblest of principles badly understood; I mean, that right which the laws of England give to every man over his own property.

The humanity of the English is discovered in nothing more than in the subscriptions for public charities. An Englishman feels all the pains which a fellow-creature suffers, and poor and miserable objects are relieved in England with unexampled liberality. The same persons who contribute to those collections, are assessed in proportion to their property for their parochial poor, who have a legal demand for a maintenance; and upwards of three millions is said to be collected yearly in this country for charitable purposes. The institutions of extra-parochial infirmaries, hospitals, and the like, are in some cases reprehensible. The sums bestowed on building them, the contracts made by their governors, and even the election of physicians, who thereby acquire credit, which is the same as profit, often begets heat and cabals, very different from the purposes of disinterested charity, owing to the attachments and prepossessions of friends, and even to party considerations.

The English, though irascible, are the most placable people in the world, and will often sacrifice part of their interest rather than proceed to extremity. The unsuspecting nature of the English, and their honest open manners, especially of those

those in the mercantile way, often render them dupes. They listen to the voice of misfortunes in trade, whether real or pretended, deserved or accidental, and generously contribute to the relief of the parties, sometimes even by placing them in a more creditable condition than ever. The lowest of the people are capable of generous actions; but they often make an ostentatious display of their own merits, which diminishes their value. There is among persons of all ranks an unparadonable preference given to wealth, above most other considerations. This offensive failing arises partly from the people being so much addicted to trade and commerce, the great object of which is gain; partly from the popular part of their constitution, which makes the possession of property a qualification for the legislature, and for almost every other species of magistracy, government, honours, and distinctions.

The same attention to property operates in many other ways among the lower classes, who think it gives them a right to be rude and disregarding of all about them: nor are the higher orders exempt from the same failing. Noblemen of the first rank have been seen laying bets with butchers and cobblers at horse-races and boxing-matches. Gentlemen and merchants of great property are sometimes not to be distinguished, either by their dress or conversation, even from their servants; and a wager offered to be staked in ready money against a penniless antagonist has been often thought a decisive argument in public company; but the practice of laying wagers has become much less prevalent than it used to be.

An Englishman, of education and breeding, is the most accomplished gentleman in the world; but constitutionally shy and reserved in his communications with strangers. It is not unusual for Englishmen to throw aside the best productions of literature, if they are not acquainted with the author. While the state-distinction of Whig and Tory subsisted, the heads of each party affected to patronize learned men; but the pecuniary encouragements given them were but very moderate, and the few who met with preferments in the state might have earned them more easily by a competent knowledge of business, and that pliability which the dependents in office generally possess. Mr. Addison had about 300*l.* a year of the public money, to assist him in his travels; and Mr. Pope, though a Roman Catholic, was offered, but did not accept of, the like pension from Mr. Cruggs, the Whig secretary of state; and it was remarked, that his Tory friend and companion the earl of Oxford, when sole minister, did nothing for him, but bewail his misfortune in being a Papist. In the encouragement of learning, his present majesty has displayed a munificence unrivalled in English history.

The unevenness of the English in their conversation is very remarkable: sometimes it is delicate, sprightly, and replete with true wit; sometimes it is solid, ingenious, and argumentative; sometimes it is cold and phlegmatic in the extreme. In many of their convivial meetings they are noisy, and their wit is often offensive, while the loudest are the most applauded. This is particularly the case in large companies; but in smaller and more select parties, all the pleasures of rational conversation, and agreeable society, are enjoyed in England in a very high degree. Courage is a quality that seems to be congenial to the nation. Boys, before they can speak, discover that they know the proper guards in boxing with their fists; a quality that perhaps is peculiar to the English, and is seconded by a strength of arm that few other people can exert. This gives their soldiers an infinite superiority in all battles that are to be decided by the bayonet scrawed upon the musket. Their passive courage is not less conspicuous than their active. Their soldiers will keep up their fire in the mouth of danger, but when they deliver it, it has a dreadful effect upon their enemies: and in naval engagements they are unequalled. In the mechanical arts, they excel all nations. The intense application which an Englishman gives to a favourite study is incredible: it absorbs all his other ideas.

ideas. This creates the numerous instances of mental absences that are to be found in the nation.

The customs of the English have, since the beginning of this century, undergone a considerable change. The great fortunes made in the East and West Indies, as well as by contracts and offices at home, have introduced a class of men who have become opulent without industry, and who are expensive without taste. From the contagion of such examples, a spirit of luxury and gambling has been two widely diffused among the middle ranks. Their ancient hospitality has decayed; many of their favourite diversions are diffused. Those remaining are, operas, dramatic exhibitions, ridottos, and sometimes masquerades in or near London; but concerts of music, and card and dancing assemblies, are common all over the kingdom. I have already mentioned stag and fox-hunting and horse races, of which many Englishmen are fond even to infatuation. Somewhat, however, may be offered, by way of apology, for those diversions: the intense application which the English give to business, the sedentary lives, and luxurious diet, require exercise; and some think that their excellent breed of horses is increased and improved by those amusements. Next to horse-racing and hunting, cock-fighting, to the reproach of the nation, is a favourite diversion among the great as well as the vulgar. Multitudes of both classes assemble round the pit at one of those matches, and enjoy the pangs and death of the generous animal, every spectator being concerned in a bet, sometimes of high sums. The athletic diversion of cricket is still kept up in many parts of England, and is sometimes practised by people of the highest rank. Many other pastimes are common in England, some of them of a very robust nature, such as cudgelling, wrestling, bowls, skittles, quoits, and prison-bale; not to mention duck-hunting, foot and ass-races, dancing, puppet-shews, May garlands, and, above all, ringing of bells, a species of music which the English boast of having carried to perfection. The barbarous diversions of boxing and prize-fighting, which were as frequent in England as the shews of gladiators of Rome, are now prohibited, though often practised; and all places of public diversions, except the royal theatres, are under regulations by act of parliament. Other diversions, which are common to other countries, such as tennis, fives, billiards, cards, swimming, angling, fowling, courting, and the like, are familiar to the English. Two kinds, and those highly laudable, are perhaps peculiar to them, and these are rowing and sailing. The latter, if not introduced, was patronized and encouraged by his present majesty's father, the late prince of Wales, and may be considered as a national improvement. The game acts have taken from the common people a great fund of diversion, though without answering the purposes of the rich: for the farmers and country people destroy the game in their nests, which they dare not kill with the gun. This monopoly of game, among so free a people as the English, has been often attacked, and as often defended.

[DRESS.] The English, at present, bid fair to be the dictators of dress to the nations of Europe, at least with regard to elegance, neatness, and richness of attire. People of quality and fortune, of both sexes, appear on high occasions, in cloth of gold and silver, the richest brocades, satins, silks, and velvets, both flowered and plain, all which are now manufactured at home. The quantities of their jewels are incredible, especially since the vast acquisitions in the East Indies. Persons of distinction, on ordinary occasions, dress like creditable citizens, that is, neat, clean, and plain, in the finest cloth, and the best of linen. The full dress of a clergyman consists of his gown, cassock, scarf, beaver-hat and rose, all of black: his undress is a dark grey frock, and plain. The physicians, the formality of whose dress, in large eye perukes and swords, was formerly ridiculous, begin now to dress like  
other

other gentlemen. Few Englishmen, tradesmen, merchants and lawyers, as well as men of landed property, are without some passion for the sports of the field, on which occasions they dress with remarkable propriety. The people of England love rather to be neat than fine in their apparel; and the appearance of an artisan or manufacturer in holyday times is commonly an indication of his industry and morals.

[REMARKS.] Eusebius, and other ancient writers, positively assert, that Christianity was first preached in South-Britain by the apostles and their disciples; and it is reasonable to suppose, that the success of the Romans paved the way for the triumphs of the Gospel of peace. It is certain also, that many of the soldiers and officers in the Roman armies were christians; and as their legions were repeatedly sent over to England to extend as well as to preserve their conquests, it is probable that thus Christianity was diffused among the natives. If any of the apostles visited this country and our heathen ancestors, it was St. Paul, whose zeal, diligence, and fortitude were abundant. But who was the first preacher, or the precise year and period, the want of records leaves us in doubt; for the belief of Joseph of Arimathea and St. Peter's preaching the Gospel in Britain, and Simon Zelotes suffering martyrdom here, rests on no better foundation than monkish legends. We have good authority to say, that about the year 150, a great number of persons professed the Christian faith, and, according to archbishop Usher, in the year 182, there was a school of learning to provide the British churches with proper teachers; and from that period it should seem that Christianity advanced its benign and salutary influences among the inhabitants, in their several districts. It is unnecessary to repeat what has been said in the introduction, respecting the rise and fall of the church of Rome in Europe. John Wickliffe, an Englishman, educated at Oxford in the reign of Edward III. has the honour of being the first person in Europe who publicly called in question, and boldly refuted, those doctrines which had passed for certain during so many ages. The constitution of the church is episcopal, and is governed by bishops, whose benefices were converted by the Norman conqueror into temporal baronies, in right of which, every bishop has a seat and vote in the house of peers. The benefices of the inferior clergy are now freehold, but in many places their tithes have been *impropriated*, i. e. conferred on the laity. The œconomy of the church of England has been accused for the inequality of its livings; some of them extending from three hundred to fourteen hundred a year, and many, particularly in Wales, being too small to maintain a clergyman's family with any tolerable decency: but this seems not easy to be remedied, unless the dignified clergy would adopt and support the reforming scheme. The crown, as well as private persons, has done great things towards the augmentations of poor livings.

The dignitaries of the church of England, such as deans, prebendaries, and the like, have generally large incomes; some of them exceeding in value those of bishopricks, for which reason the revenues of a rich deanery, or other livings, is often annexed to a poor bishoprick. At present, the clergy of the church of England, as to temporal matters, are in a most flourishing condition, because the value of their tithes increases with the improvement of lands. The sovereigns of England, ever since the reign of Henry VIII. have been called, in public writs, the supreme heads of the church; but this title conveys no spiritual meaning, as it only denotes the regal power, to prevent any ecclesiastical differences; or, in other words, to substitute the king in place of the pope before the Reformation, with regard to temporalities, and the internal œconomy of the church. The kings of England never intermeddle in ecclesiastical disputes, unless by preventing the convocation from sitting to agitate them, and are contented to give a sanction to the legal rights of the clergy.

The

The church of England is under the crown governed by two archbishops, and twenty-four bishops, besides the bishop of Sodor and Man, who, not being possessed of an English barony, does not sit in the house of peers\*. The two archbishops, are those of Canterbury and York, who are both dignified with the address of "Your Grace." The former is the first peer of the realm, as well as metropolitan of the English church. He takes precedence, next to the royal family, of all dukes and officers of state. He is enabled to hold ecclesiastical courts upon all affairs that were formerly cognisable in the court of Rome, when not repugnant to the law of God, or the king's prerogative. He has the privilege consequently, of granting, in certain cases, licences and dispensations, together with the probate of wills, when the party dying is worth upwards of five pounds. Besides his own diocese, he has under him the bishops of London, Winchester, Ely, Lincoln, Rochester, Litchfield and Coventry, Hereford, Worcester, Bath and Wells, Salisbury, Exeter, Chichester, Gloucester, Oxford, Peterborough, Bristol; and in Wales, St. David's, Landaff, St. Asaph, and Bangor.

The archbishop of Canterbury has, by the constitution and laws of England, such extensive powers, that ever since the death of archbishop Laud, government has thought proper to raise to that dignity men of moderate principles; and generally men of considerable learning and abilities. This practice has been attended with excellent effects, with regard to the public tranquillity of the church, and consequently of the state.

The archbishop of York takes place of all dukes, not of the blood royal, and of all officers of state, the lord chancellor excepted. He has in his province, besides his own diocese, the bishopricks of Durham, Carlisle, Chester, Sodor and Man. In Northumberland, he has the power of a palatine, and jurisdiction in all criminal proceedings.

The bishops are addressed by the appellation of your lordships, styled "Right reverend fathers in God," and take the precedence of all temporal barons. They have the privileges of peers, and the bishopricks of London, Winchester, Durham, Salisbury, Ely, and Lincoln, require no additional revenues to support their prelates in the rank of noblemen. English bishops are to examine and ordain priests and deacons, to consecrate churches and burying-places, and to administer the rite of confirmation. Their jurisdiction relates to the probate of wills; to grant administration of goods to the heirs of such as die intestate; to take care of perishable goods when no one will administer; to collate to benefices; to grant

\* To the following list, I have subjoined the sum each see is charged in the king's books; for though that sum is far from being the real annual value of the see, yet it affords in forming a comparative estimate between the revenues of each see with those of another.

institutions

institutions to livings; to defend the liberties of the church; and to visit their own dioceses once in three years.

England contains about sixty archdeacons, whose office is to visit the churches twice or three every year, but their offices are less lucrative than they are honourable. Subordinate to them are the rural deans, formerly styled arch-presbyters, who signify the bishop's pleasure to his clergy, the lower class of which consists of priests and deacons.

The ecclesiastical government of England is, properly speaking, lodged in the convocation, which is a national representative or synod, corresponding pretty nearly to the ideas we have of a parliament. They are convoked at the same time with every parliament, and their business is to consider of the state of the church, and to call those to an account who have advanced new opinions, inconsistent with the doctrines of the church of England. Some clergymen of an intolerant and persecuting spirit, during the reign of queen Anne, and in the beginning of that of George I. raised the powers of the convocation to a height that was inconsistent with the principles of religious toleration, and indeed of civil liberty; so that the crown was obliged to exert its prerogative of calling the members together, and of dissolving them; since that time they have not been permitted to sit long enough to do business.

The court of arches is the most ancient consistory of the province of Canterbury, and all appeals in church-matters, from the judgment of the inferior courts, are directed to this. The processes run in the name of the judge, who is called dean of the arches; and the advocates, who plead in this court, must be doctors of the civil law. The court of audience has the same authority with this, to which the archbishop's chancery was formerly joined. The prerogative court is that wherein wills are proved, and administrations taken out. The court of peculiars, relating to certain parishes, have a jurisdiction among themselves, for the probate of wills, and are therefore exempt from the bishop's courts. The see of Canterbury has no less than fifteen of these peculiars. The court of delegates receives its name from its consisting of commissioners delegated or appointed by the royal commission; but it is no standing court. Every bishop has also a court of his own, called the consistory court. Every archdeacon has likewise his court, as well as the dean and chapter of every cathedral.

The church of England is now beyond any other national church, tolerant in its principles. Moderation is its governing character, and in England, no religious sect is prevented from worshipping God in that manner which their consciences approve. Some severe laws were, indeed, lately in force against those protestant dissenters who rejected the doctrinal articles of the church of England; but these laws were seldom executed; and, in 1779, religious liberty received a considerable augmentation, by an act which was then passed for granting a legal toleration to dissenting ministers and schoolmasters. Not to enter upon the motives of the reformation under Henry VIII. it is certain, that episcopal government, excepting the few years from the civil war under Charles I. to the restoration of his son, has ever since prevailed in England. The wisdom of acknowledging the king the head of the church, is conspicuous in discouraging all religious persecution and intolerance, and if religious sectaries have multiplied in England, it is from the same principle that civil licentiousness has prevailed; I mean a tenderness in matters that affect either conscience or liberty. The bias which the clergy had towards popery in the reign of Henry VIII. and his son, and even so late as that of Elizabeth, occasioned an interposition of the civil power, for a farther reformation. Thence arose the *puritans*, so called from their maintaining a singular purity of life and manners. Many of them were worthy, pious men, and some of them good patriots. Their descendants are the modern presbyterians, who retain the

same character, although their theological sentiments have undergone a considerable change. Their doctrine, like the church of Scotland, was originally derived from the Geneva plan, instituted by Calvin, and tended to an abolition of episcopacy, and to vesting the government of the church in a parity of presbyters. But the modern English presbyterians, in their ideas of church-government, differ little from the independents, or congregationalists, who are so called from holding the independency of congregational churches; and in this sense almost all the dissenters in England are now become *independents*. As to points of doctrine, the presbyterians are generally Arminians. Many of their ministers have greatly distinguished themselves by their learning and abilities, and some of their writings are held in high estimation by the clergy and other members of the established church. The same may be said of some of the independent and baptist-ministers. The independents are generally Calvinists. The baptists do not believe that infants are proper objects of baptism, and in the baptism of adults they practise immersion into water. They are divided into two classes, which are styled general, and particular baptists. The general baptists are Arminians, and the particular baptists, Calvinists. The moderate clergy of the church of England treat the protestant dissenters with affection and friendship: and though the hierarchy of their church, and the character of bishops, are capital points in their religion, they consider their differences with the presbyterians, and even with the baptists, as not material to salvation; nor indeed do many of the established church think that they are strictly and conscientiously bound to believe the doctrinal parts of the thirty-nine articles, which they are obliged to subscribe before they can enter into holy orders. Several of them have of late contended in their writings, that all subscriptions to religious systems are repugnant to the spirit of christianity, and to reformation.

The *Methodists* are a sect of a late institution, and their founder is generally looked upon to be Mr. George Whitfield, a divine of the church of England; but it is difficult to describe the tenets of this numerous sect. All we know is, that they pretended to great fervor and devotion, and their founder thought that the form of ecclesiastical worship, and prayers, whether taken from a common prayer book, or poured forth extempore, was a matter of indifference, and he accordingly made use of both these methods. His followers are rigid observers of the doctrinal articles of the church of England, and profess themselves to be Calvinists. But even the sect of methodists is divided: not to mention a variety of subordinate sects (some of whom are from Scotland, particularly the *Sandemanians*) who have their separate followers, but very few at London and other places in England. To this may be added the sect of the *Swedenborgians*, the followers of Emanuel Swedenburgh, which has arisen within these very few years. But in the writings of the founder of this sect, as well as in those of his disciples, there is so much mystical obscurity, expressed in a jargon so perfectly unintelligible, that we own our inability of communicating to our readers, any very clear ideas of the nature and doctrines of the *New Jerusalem* church.

Mr. Whitfield died some years since; but the places of worship erected by him, near London, are still frequented by persons of the same principles, and they profess a great respect for his memory. Some of the Calvinistic doctrines were opposed by Mr. Wesley and his followers, particularly that of predestination; but they appear still to retain some of them. He erected a very large place of public worship near Moorfields, and had under him a considerable number of preachers, who submitted to their leader implicitly, propagating his opinions, and making profelytes with great industry. After a very long life, spent in the most strenuous endeavours to do good, and having had the felicity of reforming the morals of thousands of the lower ranks in society, and in promoting their best interests, he died in 1791.

The

The Quakers are a religious sect, which took its rise about the middle of the last century. A summary account of their tenets having been published by themselves, the following is abstracted from it :

" They believe in one eternal God, the Creator and preserver of the universe, and in Jesus Christ his Son, the Messiah and Mediator of the new covenant.

" When they speak of the miraculous conception, birth, life, miracles, death, resurrection, and ascension of our Saviour, they use Scriptural terms, and acknowledge his divinity.

" To Christ alone they give the title of the word of God, and not to the Scriptures, although they highly esteem these sacred writings, in subordination to the Spirit, from which they were given forth.

" They believe (and it is their distinguishing tenet), that every man coming into the world, is endued with a measure of the light, grace, or good spirit of Christ, by which, as it is attended to, he is enabled to distinguish good from evil, and to correct the corrupt propensities of his nature, which mere reason is altogether insufficient to overcome.

" They think the influence of the Spirit especially necessary to the performance of worship ; and consider as obstructions to pure worship, all forms which divert the attention of the mind from the secret influence of this unction from the Holy One. They think it incumbent on Christians to meet often together, and to wait in silence to have a true sight of their condition bestowed upon them ; believing even a single sigh arising from such a sense to be more acceptable to God, than any performances, however specious, which originate in the will of man.

" As they do not encourage any ministry but that which is believed to spring from the influence of the Holy Spirit, so neither do they restrain this influence to persons of any condition in life, or to the male sex alone ; but as male and female are one in Christ, they allow such of the female sex, as are endued with a right qualification for the ministry, to exercise their gifts for the general edification of the church.

" Respecting Baptism, and, what is termed the Lord's Supper, they believe, that the baptism with water, administered by John, belonged to an inferior and decreasing dispensation.

" With respect to the other rite, they believe that communion between Christ and his church is not maintained by any external performance ; but only by a real participation of his divine nature through faith.

" They declare against oaths and war ; abiding literally by Christ's positive injunction, " Swear not at all." From the precepts of the Gospel, from the example of our Lord, and from his Spirit in their hearts, they maintain that wars and fightings are repugnant to the gospel.

" They disuse the names of the months and days, which were given in honour of the heroes of false Gods of the heathens ; and the custom of speaking to a single person in the plural number, as having arisen also from motives of adulation. Compliments, superfluity of apparel, and furniture, outward shows of rejoicing, and mourning, and observations of days and times, they esteem to be incompatible with the simplicity and sincerity of a Christian life ; and public diversions, gaming, and other vain amusements of the world, they condemn as a waste of time, and diverting the attention of the mind from the sober duties of life.

" This society hath a discipline established among them, the purposes of which are, the relief of the poor—the maintenance of good order—the support of the rectitudes which they believe it is their duty to bear to the world—and the help and recovery of such as are overtaken in faults.

" It is their decided judgment that it is contrary to the gospel to sue each other at law. They enjoin all to end their differences by speedy and impartial arbitration according

according to rules laid down. If any refuse to adopt this mode, or having adopted it, to submit to the award, it is the rule of the society that such be disowned."

It is well known that William Penn, one of this society, founded the province of Pennsylvania, into which he introduced a plan of civil and religious liberty. The government of the province was at first, and for many years, chiefly in the hands of the Quakers; but as persons of other persuasions increased, and became partakers of power, they grew uneasy at the pacific plan of the Quakers, and at length succeeding to establish such modes of defence for their country as did not accord with the principles of the latter, these gradually withdrew themselves from active employments of the state. For some time previous to the late revolution, few of them were found in any other station than that of private citizens; and during its progress, their refusing to arm exposed them to much suffering, by distrains levied on them, in order to procure their quota in support of the war.

Many families in England still profess the Roman catholic religion, and its exercise is under very mild and gentle restrictions. Though the penal laws against Papists in England appear at first to be severe, yet they are either not executed, or with so much lenity, that a Roman catholic feels himself under few hardships. Legal evasions are found out for their double taxes upon their landed property, and as they are subject to none of the expences and troubles (unless voluntary) attending public offices, parliamentary elections, and the like burdens, the English Papists are in general in good circumstances, as to their private fortunes. Some of the penal laws against them were repealed by the 18 G. 3. c. 66. much to the satisfaction of all liberal-minded men, though a vehement outcry was afterwards raised against the measure by ignorance and bigotry, which occasioned the dreadful riots of 1780. By the 31 G. 3. c. 32. a further enlargement of their liberties was granted, so that upon taking and subscribing an oath, and declaration therein expressed, they are not liable to any prosecution on account of their religion; their ministers are exempted from serving on juries; they are protected in the public exercise of their worship, by severe penalties against those who shall disturb them; and persons professing this religion are authorized to act as counsellors, barristers, solicitors †, &c. They now seem to be convinced, that a change of government would hurt their situation, because it would increase the jealousy of the legislature, which must undoubtedly expose them daily to greater burdens and heavier penalties. This consideration has of late made the Roman catholics as dutiful and zealous subjects as any his majesty has. Scarcely any English Papists, excepting those who were bred, or had served abroad, were engaged in the rebellion of the year 1745; and though those at home were carefully observed, few of them were found guilty of disloyal practices.

As England has been remarkable for the variety of its religious sects, so it has been famous for its *Free thinkers*; but that term has been applied in very different senses. It has sometimes been used to denote opposers of religion in general, and in particular of revealed religion; but it has also been applied to those who have been far from disbelieving Christianity, and who have only opposed some of those doctrines which are to be found in public creeds and formularies, but which they conceived to be no part of the original Christian system. As to those who are truly *Deists*, or *Infidels*, there is abundant reason to believe, that this class of men is much more numerous in some Papish countries than in England. Christianity is so much of fained and disfigured by the fopperies and superstitions of the Romish church, that men who think freely are naturally apt to be prejudiced against it,

\* See Burn's Justice, vol. iii. p. 25, edition of 1793.

† Burn, vol. iv. p. 2—7.

when

when they see it in so disadvantageous a form; and this appears to be very much the case abroad. But in England, where men have every opportunity of seeing it exhibited in a more rational manner, they have less cause to be prejudiced against it; and therefore are more ready to enter into an examination of its divine origin. Nor does it appear that the writings of the Deists against Christianity have been of less service to it. On the contrary, they have caused the unanswerable arguments in its favour to be examined with greater attention, and exhibited with more irresistible evidence; and have produced such defences of it, as all the acuteness of modern fidelity has been unable to overthrow.

[LANGUAGE.] The English language is known to be a compound of almost every other language in Europe, particularly the Saxon, the French, and the Celtic. The Saxon predominates; and the words that are borrowed from the French, being radically Latin, are common to other nations, particularly the Spaniards and the Italians. The English is more energetic, manly and expressive, than either the French or the Italian; more copious than the Spanish, and more harmonious than the German, or the other northern tongues. It is however, subject to provincialisms in its accent, there being much difference in the pronunciation of the inhabitants of different countries; but this chiefly affects the lowest of the people; for as to well-educated and well-bred persons, there is little difference in their pronunciation. People of fortune and education in England, of both sexes, also commonly either speak, or understand the French, and many of them the Italian; but it has been observed, that foreign nations have great difficulty in understanding the English who talk Latin, owing to their peculiarity in pronouncing the vowels.

[LEARNING AND LEARNED MEN.] England may be looked upon as another word for the seat of learning and the muses. Her great Alfred cultivated both, in the time of the Saxons, when barbarism and ignorance overspread the rest of Europe; nor has there since his time been wanting a continual succession of learned men, who have distinguished themselves by their writings or studies. These are so numerous, that a bare catalogue of their names, down to this day, would form a moderate volume. The English institutions, for the benefit of study, partake of the character of their learning. They are solid and substantial, and provide for the ease, the disengagement, the peace, the plenty, and the convenience of its professors; witness the two universities of Oxford and Cambridge, institutions that are not to be equalled in the world, and which were respected amidst the barbarous rage of civil war. The industrious Leland, himself a moving library, was the first who published a short collection of the lives and characters of those learned persons, who preceded the reign of his master Henry VIII. among whom he has inserted several of the blood-royal of both sexes, particularly a son and daughter of the great Alfred, Editha the queen of Edward the Confessor, and other Saxon princes, some of whom were equally devoted to Mars and the Muses.

In speaking of the dark ages, it would be unpardonable to omit the mention of that prodigy of learning and natural philosophy, Roger Bacon, who was the forerunner in science to the great Bacon lord Verulam, as the latter was to sir Isaac Newton. Among the other curious works written by this illustrious man, we find treatises upon grammar, mathematics, physics, the flux and reflux of the British seas, optics, geography, astronomy, chronology, chemistry, logic, metaphysics, civics, medicine, theology, philology, and upon the impediments of knowledge. He lived under Henry III. and died at Oxford, about the year 1294. Mr. Walpole has preserved the memory of some noble and royal English authors, who have done honour to learning and the Muses, and to this work I must refer. Since the Reformation, England resembles a galaxy of literature, and it is but doing justice to

\* See the Biographia Britannica.

the memory of cardinal Wolsey, though otherwise a dangerous and profligate minister, to acknowledge, that his example and encouragement laid the foundation of the polite arts, and greatly contributed to the revival of classical learning in England. As many of the English clergy had different sentiments in religious matters at the time of the Reformation, encouragement was given to learned foreigners to settle in England. Edward VI. during his short life, encouraged these foreigners, and shewed dispositions for cultivating the most useful parts of learning. Learning, as well as liberty, suffered an almost total eclipse in England during the bigoted reign of queen Mary. Elizabeth was herself a learned princess. She advanced many persons of consummate abilities to high ranks, both in church and state; but always considered their literary accomplishments as secondary to their civil. She would have been a more amiable queen, had she raised genius from obscurity; but though no stranger to Spenser's Muse, she suffered herself to be so much imposed upon by a tasteless minister, that the poet languished to death in obscurity. Though she relished the beauties of the divine Shakspeare, yet we know not that they were distinguished by any particular acts of her munificence. Her favourite the earl of Essex, the politest scholar of his age, and his friend the earl of Southampton, were liberal patrons of genius.

The encouragement of learned foreigners in England continued to the reign of James I. who was very munificent to Casaubon, and other foreign authors of distinction, even of different principles. He was himself no great author, but his example had an effect upon his subjects; for in his reign were formed those great masters of polemic divinity, whose works are almost inexhaustible mines of knowledge. Nor must it be forgotten, that the second Bacon, whom I have already mentioned, was by him created viscount Verulam, and lord high chancellor of England. He was likewise the patron of Camden, and other historians, as well as antiquaries, whose works are still standards in those studies. Upon the whole, it cannot be denied, that English learning is under obligations to James I. though, as he had a very pedantic taste himself, he was the means of diffusing a similar taste among his subjects.

His son Charles I. cultivated the polite arts, especially sculpture, painting, and architecture. He was the patron of Rubens, Vandyke, Inigo Jones, and other eminent artists; he spared no expence in his collections; and had it not been for the civil wars, he would probably have converted his capital into a second Athens. His favourite, the duke of Buckingham, imitated him in that respect, and laid out the amazing sum of 400,000l. upon his cabinet of paintings and curiosities.

The earl of Arundel was another Mæcenas of that age, and greatly distinguished himself by his collection of antiquities, particularly his famous marble inscriptions called the Arundelian Marbles, now to be seen at Oxford. Charles and his court had little relish for poetry; but, he increased the salary of his poet laureat, the famous Ben Jonson, from 100 marks to 100l. per annum, and a tierce of Spanish wine; which salary is continued to the present time.

The public encouragement of learning and the arts suffered indeed an eclipse, during the time of the civil wars, and the succeeding interregnum. Many learned men, however, found their situations under Cromwell, though he was no stranger to their political sentiments, so easy, that they pursued their studies, to the benefit of every branch of learning; and many works of literary merit appeared even in those times of distraction. Usher, Walton, Willes, Harrington, Wilkins, and a number of other great names, were unmolested and even favoured by that usurper; and he would even have filled the universities with literary merit, could he have done it with any degree of safety to his government.

The

The reign of Charles II. was distinguished by the great proficiency to which it carried natural knowledge, especially by the institution of the Royal Society. The king was a good judge of those studies, and though irreligious himself, England never abounded more with learned and able divines than in his reign. He loved painting and poetry, but was far more munificent to the former than the latter. The incomparable *Paradise Lost*, by Milton, was published in his reign, but its glory was reserved for posterity. The reign of Charles II. notwithstanding the had taste of his own court in several of the polite arts, by some is reckoned the Augustan age of England, and is dignified with the names of Boyle, Halley, Hooke, Sydenham, Harvey, Temple, Tillotson, Barrow, Butler, Cowley, Waller, Dryden, Wycherley, and Otway. The pulpit assumed more majesty, a better style, and truer energy, than it had ever known before. Classic literature recovered many of its native graces. Sir Christopher Wren \* introduced a more general regularity in architecture than had before prevailed, while his discoveries in philosophy, mechanics, &c. contributed much to the reputation of the Royal Society. Some excellent English painters (for Lely and Kneller were foreigners) also flourished in this reign.

That of James II. though he likewise had a taste for the fine arts, is chiefly distinguished in the province of literature by those compositions that were published by the English divines against popery, and which, for strength of reasoning and depth of erudition, never were equalled in any age or country.

The names of Newton and Locke adorned the reign of William III. and he had a particular esteem for the latter, as he had also for Tillotson and Burnet, though he was far from being liberal to men of genius. Learning flourished, however, in his reign merely by the excellency of the soil in which it had been planted.

The most uninformed readers are not unacquainted with the improvements which learning, and all the polite arts, received under the auspices of queen Anne, and which put her court at least on a footing with that of Lewis XIV. in its most splendid days. Many of the great men who had figured in the reigns of the Stuarts and William were still alive, and in the full exercise of their faculties, when a new race sprung up, in the republic of letters. Addison, Prior, Pope, Swift, lord Bolingbroke, lord Shaftesbury, Arbuthnot, Congreve, Steele, Rowe, and many other excellent writers, both in verse and prose, need but to be mentioned to be admired; and the English were as triumphant in literature as in war. Natural and moral philosophy kept pace with the polite arts.

The ministers of George I. were the patrons of erudition, and some of them were no mean proficient themselves. George II. was himself no Mæcenas, yet his reign yielded to none of the preceding in the numbers of learned and ingenious men it produced. The bench of bishops was never known to be so well provided with able prelates, as it was in the early years of his reign; a proof that his nobility and ministers were judges of literary qualifications. In other departments of erudition, the favour of the public generally supplied the coldness of the court. After the rebellion in the year 1745, when Mr. Pelham was considered as first minister, this screen between government and literature was in a great measure removed, and men of genius began then to taste the royal bounty. Since that period, a great progress has been made in the polite arts in England. The Royal Academy has been instituted, some very able artists have arisen, and the annual public exhibitions

\* Mr. Horace Walpole, now Lord Orford, says, that a variety of knowledge proclaims the universality, a multiplicity of works the abundance, and St. Paul's the greatness, of Sir Christopher's genius. So many great architects as were employed on St. Peter's have not left, upon the whole, a more perfect

edifice than this work of a single mind. The noblest temple, one of the largest palaces, and the most sumptuous hospital in Britain, are all the works of the same hand. He restored London, and recorded its fall. He built above fifty parish churches, and designed the monument.

of painting and sculpture have been extremely favourable to the arts, by promoting a spirit of emulation, and exciting a greater attention to works of merit of this kind among the public in general. Notwithstanding these favourable circumstances, the fine arts (except music, the encouragement of which becomes daily more extravagant) have been far from meeting with that public patronage to which they have so just a claim. Few of our public edifices are adorned with paintings or with statues. The sculptors meet with little employment, nor is the historical painter much patronized; though the British artists of the present age have proved their genius not inferior to that of any nation whatever, and the English is now the first school in the world.

The English excel in what we call the learned professions. Their courts of justice are adorned with greater abilities and virtues, than those which any other country can boast. A remarkable instance of which occurs in the appointments, for the last 200 years, of their lord chancellors, who hold the highest and the most uncontrolable judicial seat in the kingdom. The few instances that are alledged of their injustice fix no imputation of wilful guilt upon the parties. The great lord chancellor Bacon was censured indeed for corrupt practices, but malevolence itself does not say that he was guilty any farther than in too much indulgence to his servants. The case of one of his successors is still more favourable to his memory, as his censure reflects disgrace only upon his enemies; and his lordship was, in the judgment of every man of candour and conscience, fully acquitted. Even Jefferies, infernal as he was in his politics, was never accused of partiality in the causes that came before him as chancellor.

It must be acknowledged, that the eloquence neither of the pulpit nor the bar has been sufficiently studied in England; but this is owing to the genius and the laws of the people. The sermons of their divines are often learned, and always found as to the practical and doctrinal part; for the many religious sects in England require to be opposed rather by reasoning than eloquence. An unaccountable notion has, however, prevailed, even among some of the clergy themselves, that the latter is incompatible with the former, as if the arguments of Cicero and Demosthenes were weakened by those powers of language with which they are adorned. A short time, perhaps, may remove this prepossession, and convince the clergy, as well as the laity, that true eloquence is the first and fairest handmaid of argumentation. It is not intended to intimate that the preachers of the English church are destitute of the graces of elocution: no clergy in the world can equal them in purity and perspicuity of language, though if they studied more than they do the powers of elocution, they would preach with more effect. If the semblance of those powers coming from the mouths of ignorant enthusiasts, is attended with the amazing effects we daily observe, what must not be the consequence if they were exerted and supported with spirit and learning?

The laws of England are of so peculiar a cast that the pleadings at the bar do not admit, or but very sparingly, of the flowers of speech: and there is reason to think that a pleading in the Ciceronian manner would not succeed in Westminster-hall. The English lawyers, however, though they deal little in eloquence, are well versed in rhetoric and reasoning.

Parliamentary speaking, not being bound down to that precedent required in the courts of law, no nation in the world can produce so many examples of true eloquence as the English senate; witness the fine speeches made by both parties in parliament, in the reign of Charles I. and those that have been printed since the accession of the present family.

Medicine and surgery, botany, anatomy, chemistry, and all the arts founded on observation and experiment, have been carried to a great degree of perfection by the English. Even agriculture and mechanism are now reduced in England to

sciences.

See, British

sciences. In ship-building, clock-work, and the various branches of cutlery, they stand unrivalled.

UNIVERSITIES.] The two universities of Oxford and Cambridge, which have been the seminaries of more learned men than any in Europe, have already been mentioned. It is certain that their buildings, which in splendor and architecture rival the most superb royal edifices, the endowments, the liberal ease and tranquility enjoyed by those who inhabit them, surpass all the ideas which foreigners, who visit them, conceive of literary societies. So respectable are they in their foundations, that each university sends two members to parliament, and their chancellors and officers have a civil jurisdiction over their students, the better to secure their independency. Their colleges, in their revenues and buildings, exceed those of many other universities.

In Oxford there are twenty colleges and five halls: the former are very liberally endowed, but in the latter the students chiefly maintain themselves. This university is of great antiquity: it is supposed to have been a considerable place even in the time of the Romans; and Camden says, that "wise antiquity did, even in the British age, consecrate this place to the Muses." It is said to have been styled an university before the time of king Alfred; and the best historians admit, that this most excellent prince was only a restorer of learning here. Alfred built three colleges at Oxford; one for divinity, another for philosophy, and a third for grammar.

The number of officers, fellows, and scholars, maintained at present by the revenues of this university, is about 1000, and the number of such scholars as live at their own charge is usually about 2000; the whole amounting to 3000 persons, besides a great number of inferior officers and servants belonging to the several colleges and halls. Here are four terms every year for public exercises, lectures, and disputations, and particular days and hours when the professors of every faculty read their lectures; and in some of the colleges are public lectures, to which all persons are admitted.

There are libraries belonging to the several colleges; but besides these, the university library, usually called the Bodleian library, from sir Thomas Bodley, its principal founder, is a large lofty structure, in the form of a roman H. The original library has been prodigiously increased, by many large and valuable collections of Greek and Oriental manuscripts, as well as other choice and curious books. The Radcliffe library is a sumptuous pile of building; erected at the sole expence of that eminent physician Dr. John Radcliffe, who bequeathed forty thousand pounds for this purpose. The theatre at Oxford is also a very magnificent structure, by sir Christopher Wren, at the expence of archbishop Sheldon. In this edifice are performed the public acts of the university: on which occasions the vice-chancellor is seated in the centre of the semi-circular part, the noblemen and doctors on his right and left-hand, the proctors and curators in their robes, the masters of arts, batchelors and under-graduates, in their respective habits and places, together sometimes with a great concourse of strangers of both sexes.

The colleges of Oxford are,

University, which is situated near, or on the spot, where the colleges or halls which were erected by king Alfred stood.

Baliol, founded by sir John de Baliol, in 1263.

Merton, founded by Walter de Merton, bishop of Rochester, and high chancellor of England, in 1267.

Exeter, founded in 1316, by Walter Stapleton, bishop of Exeter, and lord treasurer of England.

Oriel, founded by Edward II. in the year 1324.

Queen's, founded by Robert Eglesfield, chaplain to queen Philippa, consort to Edward III. in her honour.

New College, founded in 1386, by William of Wykeham, bishop of Winchester, but finished by Thomas de Rotheram, archbishop of York, and lord high chancellor, in the year 1475.

All Souls, founded by Henry Chicheley, archbishop of Canterbury, in 1437.

Magdalen, founded by William Patten, alias Wainfleet, bishop of Winchester, and lord chancellor, in the year 1458.

Brazen Nose, founded in 1516, by William Smith, bishop of Lincoln.

Corpus Christi, founded in 1516, by Richard Fox, bishop of Winchester.

Christ Church, founded by cardinal Wolsey, in 1515, but completed by others, and is now the cathedral of the diocese.

Trinity, founded by sir Thomas Pope, soon after the Reformation.

St. John Baptist was founded, in 1555, by sir Thomas White, lord mayor of London.

Jesus was begun by Dr. Hugh Price, prebendary of Rochester, and appropriated chiefly to the Welch.

Wadham, so called, from its founder, Nicholas Wadham, of Somersetshire, esq. It was begun by him in the year 1609, but finished after his death, by his lady, in 1613.

Pembroke, so called in honour of the earl of Pembroke, then lord high chancellor, was founded by Thomas Tisdal, esq. and Richard Whitwicke, B. D. in 1624.

Worcester was erected into a college by sir Thomas Cooke, of Akeley, in Worcestershire.

Lincoln college, which was founded by two bishops of Lincoln.

To these 19 may be added Hertford college, formerly Hart-Hall; but a patent having passed the great seal in the year 1740 for erecting it into a college, that design is now carried into execution.

The five halls are these following: Alban-hall, Edmund-hall, St. Mary's-hall, New-Inn-hall, and St. Mary Magdalen-hall.

The University of Cambridge consists of twelve colleges, and four halls; but though they are distinguished by different names, the privileges of the colleges and halls are in every respect the same. They are the following:

Peter-house, founded by Hugh Balsam, prior of Ely, in 1257, who was afterwards bishop of that see.

Clare-hall founded in 1340 by Richard Badew and lady Elizabeth Clare, countess of Ulster.

Pembroke-hall, founded seven years after by a countess of Pembroke.

St. Bennet's or Corpus Christi, founded about the same time by the united guilds, or fraternities, of Corpus Christi and the blessed Virgin.

Trinity-hall, founded by William Bateman, bishop of Norwich, about the year 1548.

Gonvil and Caius, founded by Edmund de Gonvil, in 1448, completed by bishop Bateman, and additionally endowed, 200 years after, by John Caius, a physician.

King's college, founded by Henry VI. and completed by his successors.

Queen's college was founded by the same king's consort, but finished by Elizabeth, wife to Edward IV.

Catharine-hall, founded by Richard Woodlark, in 1475.

Jesus college, founded by John Alcock, bishop of Ely, in the reign of Henry VII.

Christ

Christ college was founded about the same time, by that king's mother, Margaret, countess of Richmond.

St. John's college was founded by the same lady.

Magdalen college was founded by Thomas Audley, baron of Walden, and lord high chancellor, in the reign of Henry VIII.

Trinity college was founded by Henry VIII.

Emanuel college, by sir Walter Mildmay, in 1584.

Sidney college was founded by Thomas Radcliff, earl of Suffex, in 1588, and had its name from his wife Frances Sidney.

The whole number of fellows in the University of Cambridge are four hundred, and six hundred and sixty-six scholars, with about two hundred and thirty-six officers and servants of various kinds, who are maintained upon the foundation. These, however, are not all the students of the university; there are also two sorts of students, called pensioners, the greater and the less; the greater pensioners are sons of the nobility, and of gentlemen of large fortunes, and are called fellow-commoners, because, though they are scholars, they dine with the fellows; the lesser pensioners dine with the scholars that are on the foundation, but live at their own expence. There are also a considerable number of poor scholars, called fizar, who wait upon the fellows and scholars and the pensioners of both ranks, by whom they are in a great degree maintained; but the number of pensioners and fizar cannot be ascertained, as it is in a state of perpetual fluctuation.

The senate-house at Cambridge is an elegant edifice, executed in the Corinthian order, and is said to have cost sixteen thousand pounds. Trinity college library is also a very magnificent structure, and in Corpus Christi college library is a valuable collection of ancient manuscripts, which were preserved at the dissolution of the monasteries, and given to this college by archbishop Parker.

ANTIQUITIES AND CURIOSITIES. } The antiquities of England are either  
NATURAL AND ARTIFICIAL. } British, Roman, Saxon, Danish, or Anglo-Norman; but these, excepting the Roman, throw no great light upon ancient history. The chief British antiquities are those circles of stones, particularly that called Stonehenge, in Wiltshire, which probably were places of worship in the times of the Druids. Stonehenge is, by Inigo Jones, Dr. Stukeley, and others, described as a regular circular structure. The body of the work consists of two circles and two ovals, which are thus composed: the upright stones are placed at three feet and a half distance from each other, and joined at the top by over-thwart stones, with tenons fitted to the mortises in the uprights, for keeping them in their due position. Some of these stones are vastly large, measuring two yards in breadth, one in thickness, and above seven in height; others are less in proportion. The uprights are wrought a little with a chissel, and sometimes tapered; but the transoms, or over-thwart stones, are quite plain. The outside circle is near one hundred and eighty feet in diameter: between which and the next circle there is a walk of three hundred feet in circumference, which has a surprising and awful effect upon the beholders. After all the descriptions of this celebrated antiquity and the dissertations upon it, by ingenious writers, it has given rise to many extravagant ridiculous conjectures, from the time of Leland, who has been very particular on the subject, down to Stukely, who, on a favourite point of antiquity, sometimes formed the most enthusiastic conclusions. The barrows that are near this monument were certainly graves of persons of both sexes, eminent in peace or war; some of them having been opened, and bones, arms, and ancient trinkets, found within them.

Monuments of the same kind as that of Stonehenge are to be met with in Cumberland, Oxfordshire, Cornwall, Devonshire, and many other parts of England, as well as in Scotland and the isles, which have been already mentioned.

The Roman antiquities in England consist chiefly of altars and monumental inscriptions, which instruct us as to the legionary stations of the Romans in Britain, and the names of some of their commanders. The Roman military ways give us the highest idea of the civil as well as military policy of those conquerors. Their vestiges are numerous; one is mentioned by Leland, as beginning at Dover, and passing through Kent to London, from thence to St. Albans, Dunstable, Stratford, Towcester, Littleburn, St. Gilbert's Hill near Shrewsbury, then Stratton, and so through the middle of Wales to Cardigan. The great *via militaris*, called Hermen-street, passed from London through Lincoln, where a branch of it from Pontefract to Doncaster strikes out to the westward, passing through Tadcaster to York, and from thence to Aldby, where it again joined Hermen-street. Many vestiges of the Roman roads in England serve as foundations to our present high-ways. The great earl of Arundel, the celebrated English antiquary, had formed a plan for describing those which pass through Sussex and Surry towards London; but the civil war breaking out put an end to the undertaking. The remains of many Roman camps are discernible all over England; one particularly very little defaced, near Dorchester, in Dorsetshire, where also is a Roman amphitheatre. Their situations are generally so well chosen, and their fortifications appear to have been so complete, that there is some reason to believe, that they were the constant habitations of the Roman soldiers in England; though it is certain, from the baths and tessellated pavements that have been found in different parts, that their chief officers or magistrates lived in towns or villas. Roman walls have likewise been found in England; and, perhaps, upon the borders of Wales, many remains of their fortifications and castles are blended with those of a later date. The private cabinets of noblemen and gentlemen, as well as the public repositories, contain a vast number of Roman arms, coins, fibulae, and trinkets, which have been found in England; but the most amazing monument of the Roman power in England is the præenture, or wall of Severus, commonly called the Picts Wall, running through Northumberland and Cumberland; beginning at Tinmouth, and ending at Solway Frith, being about eighty miles in length. The wall at first consisted only of stakes and turf, with a ditch; but Severus built it with stone forts, and turrets at proper distances, so that each might have a speedy communication with the other; and it was attended all along by a deep ditch, or vallum, on the north, and a military high-way on the south. This prodigious work, however, was better calculated to strike the Scots and Picts with terror than to give any real security to the Roman possessions. In some places, the wall, the vallum, and the road, are plainly discernible. A critical account of the Roman antiquities in England is among the desiderata \* of history.

The Saxon antiquities in England consist chiefly in ecclesiastical edifices and places of strength. At Winchester is shewn the round table of king Arthur, with the names of his knights; which table, if it be not British, is certainly Saxon. The cathedral of Winchester served as the burying place of several Saxon kings, whose bones were collected by bishop Fox, in six large wooden chests. Many monuments of the Saxons present themselves in different parts of the kingdom, though they are often not to be distinguished from the Normanic; and the British Museum contains several striking original specimens of their learning. Many Saxon charters, signed by the king and his nobles, with a plain cross instead of their names, are still to be met with. The writing is neat and legible, and was always performed by a clergyman, who affixed the name and quality of every

\* Until a work of this nature appear, we refer our readers to a very ingenious and splendid work, "The Antiquities of England, Wales, and Scotland," by the late Francis Grose, Esq. F. A. S. and

Dr. Henry's excellent History of Great Britain; to which we may add, General Roy's Military Antiquities of the Romans in North-Britain, printed in 1793.

donor,

donor, or witness, to his respective cross. The Danish erections in England are hardly distinguishable from the Saxon. The form of their castles round, and they are generally built upon eminences, but their forts are square.

England is full of Anglo-Norman monuments, which I chuse to call so, because, though the princes under whom they were raised were of Norman origin, the expence was defrayed by Englishmen. York-minster and Westminster-hall and abbey are perhaps the finest specimens to be found in Europe of the Gothic architecture. It is uncertain, whether the artificial excavations, found in some parts of England, are British, Saxon, or Norman. That under the old castle of Ryegate in Surry is very remarkable, and seems to have been designed for concealing the cattle and effects of the natives, in time of war and invasion. It contains an oblong square hall, round which runs a bench, cut out of the same rock, for sitting upon; and tradition says, that this was the room in which the barons of England met during their wars with king John. The rock is soft, and very practicable; but it is difficult to say where the excavation, which is continued in a square passage, about six feet high, and four wide, terminates, because the work has in some places given way, and filled the passage with ruins.

The natural curiosities of England are so various, that a general account can only be given. The medicinal waters and springs which are found in many parts of the country, have been analysed with great accuracy by several learned naturalists, who, as their interests or inclinations led them, have not been sparing in recommending their salutarious qualities. The most remarkable of these wells have been divided into those for bathing, and those for drinking. The chief of the former lie in Somersetshire and Derbyshire; and the Bath and Buxton waters are famous, both for drinking and bathing. Spaws of the same kind are found at Scarborough, and other parts of Yorkshire; at Tunbridge, in Kent; Epsom and Dulwich, in Surry; and at Acton and Islington, in Middlesex. There are also many remarkable springs, whereof some are impregnated with salt, as that of Droitwich in Worcesterhire; or sulphur, as the famous well of Wigan in Lancashire; or bituminous matter, as that at Pitchford in Shropshire. Others have a petrifying quality, as that near Lutterworth in Leicesterhire; and a dropping well in the west-riding of Yorkshire. And finally, some ebb and flow, as those of the Peak in Derbyshire, and Laywell near Torbay, whose waters rise and fall several times in an hour. To these we may add that remarkable fountain near Richard's castle in Herefordshire, commonly called Bonewell, which is generally full of small bones, like those of frogs or fish, though often cleared out. At Ancliff, near Wigan, in Lancashire, was the famous burning well; the water was cold, neither had it any smell; yet there was so strong a vapour of sulphur issuing out with the stream, that upon applying a light to it, the top of the water was covered with a flame, like that of burning spirits, which lasted several hours, and emitted so fierce a heat, that meat might have been boiled over it. The fluid itself would not burn when taken out of the well\*.

Derbyshire is celebrated for many natural curiosities. The Mam-Tör, or Mother Tower, is said to be continually mouldering away, but never diminishes. The Elden Hole, about four miles from the same place, is a chasm in the side of a mountain, near seven yards wide, and fourteen long, diminishing in extent within the rock, but of what depth is not known. A plummet once drew 884 yards of line after it, whereof the lowest eighty were wet, without finding a bottom. The entrance of Pool's Hole near Buxton, for several paces, is very low, but soon opens

\* This extraordinary heat has been found to proceed from a vein of coals, which has been since dug from under this well; at which time the uncommon warmth ceased.

into a very lofty vault, like the inside of a Gothic cathedral. The height is certainly very great, yet much short of what some have asserted, who reckon it a quarter of a mile perpendicular, though in length it exceeds that dimension: a current of water, which runs along the middle, adds, by its sounding stream, re-echoed on all sides, very much to the astonishment of all who visit this vast concave. The drops of water which hang from the roof and on the sides have an amusing effect; for they not only reflect numberless rays from the candles carried by the guides, but as they are of a petrifying quality, they harden in several places into various forms, which, with the help of a strong imagination, may pass for lions, fountains, organs, and the like. The entrance into the stupendous cavern at Catterton, is wide at first, and upwards of thirty feet perpendicular. Several cottagers dwell under it, who subsist by rope-making, and by guiding strangers. It is crossed by four streams of water, and terminates, at the distance of half a mile from the mouth, in a subterranean lake. The vault, in several places, is chequered with various coloured stones; and the singular effect of sinking into deep catacombs, of being waisted over subterranean rivers, of crouching under a low roof of rock, and suddenly emerging into lofty cathedrals, cannot be communicated by description.

Some spots of England are said to have a petrifying quality. We are told, that near Whitby, in Yorkshire, are found certain stones, resembling the folds and wreaths of a serpent; also other stones of several sizes, and so exactly round, as if artificially made for cannon balls, which being broken, commonly contain the likeness of serpents, wreathed in circles, but generally without heads. In some parts of Gloucestershire stones are found, resembling cockles, oysters, and other testaceous marine animals. Those curiosities, however, are often magnified by ignorance and credulity.

**CITIES, TOWNS, FORTS, AND OTHER.** This head is so very extensive, that I can only touch upon objects that may assist in giving the reader some idea of its importance, grandeur, or utility.

London\*, the metropolis of the British empire, is the first in this division. It appears to have been founded between the reigns of Julius Cæsar and Nero, but by whom is uncertain; for we are told by Tacitus, that it was a place of great trade in Nero's time, and soon after became the capital of the island. London was first walled about with hewn stones and British bricks by Constantine the Great, and the walls formed an oblong square, in compass about three miles, with seven principal gates. The same emperor made it a bishop's see; for it appears that the bishops of London and York, and another English bishop, were at the council of Arles, in the year 314: he also settled a mint in it, as is plain from some of his coins.

London, in its large sense, including Westminster, Southwark, and part of Middlesex, is a city of surprising extent, of prodigious wealth, and of the most extensive trade. This city, when considered with all its advantages, is now what ancient Rome once was; the seat of liberty, the encourager of arts, and the admiration of the world. London is the centre of trade; it has an intimate connection with all the counties in the kingdom; it is the grand mart of the nation, to which all parts send their commodities, from which these commodities are again returned. From hence innumerable carriages by land and water are constantly employed: and from hence arises that circulation in the national body, which

\* London is situated in 51° 31' north latitude, 400 miles south of Edinburgh, and 270 south-east of Dublin; 180 miles west of Amsterdam, 210 north-west of Paris, 500 south-west of Copenhagen, 600 north-west of Vienna, 790 south-west of

Stockholm, 800 north-east of Madrid, 820 north-west of Rome, 850 north-east of Lisbon, 1160 north-west of Constantinople, and 1414 south-west of Moscow.

maintains

maintains its health and vigour. Merchants are here as rich as princes, witness their loans to government: and there is no place in the world where the shops of tradesmen make such an elegant appearance, or are so well stocked.

It is situated on the banks of the Thames, which river is continually covered with fleets, sailing to or from the most distant climates; and its banks extending from London-bridge to Blackwall, almost one continued magazine of naval stores, containing three large wet docks, 32 dry docks, and 33 yards for the building of merchant-ships, besides the places allotted for the building of boats and lighters, and the king's yards lower down the river, for the building of men of war. As this city is about sixty miles distant from the sea, it enjoys, by means of this beautiful river, all the benefits of navigation, without the danger of being surpris'd by foreign fleets, or of being annoy'd by moist marine vapours. It rises regularly from the water-side, and extending itself on both sides along its banks, reaches a prodigious length from east to west in a kind of amphitheatre towards the north, and is continued for near twenty miles on all sides, in a succession of magnificent villas, and populous villages.

The irregular form of this city makes it difficult to ascertain its extent. Its length from east to west, is generally allowed to be above seven miles from Hyde-park corner to Poplar, and its breadth in some places three, in others two; and in others again not much above half a mile. According to a modern measurement, the extent of continued, and still encreasing buildings, is 35 miles two furlongs and 39 roods. But it is much easier to form an idea of the magnitude of a city so irregularly built, by the number of the people, who are computed to be above a million, and from the number of edifices devoted to the service of religion.

Of these, beside St. Paul's cathedral, and the collegiate church at Westminster, there are 102 parish churches, and 69 chapels of the established religion; 21 French protestant chapels; 11 chapels belonging to the Germans, Dutch, Danes, &c. 26 independent meetings; 34 presbyterian meetings; 20 baptist meetings; 19 popish chapels, and meeting-houses for the use of foreign ambassadors, and people of various sects; and three Jews synagogues. So that there are 305 places dedicated to religious worship, in the compass of this vast pile of buildings, without reckoning the 21 out-parishes usually included in the bills of mortality, and a great number of methodist tabernacles.

There are also in and near this city 100 alms-houses, about 20 hospitals and infirmaries, 3 colleges, 10 public prisons, 15 flesh-markets; 1 market for live cattle, 2 other markets more particularly for herbs; and 23 other markets for corn, coals, hay, &c. 15 inns of court, 27 public squares, besides those within single buildings, as the Temple, &c. 3 bridges, 49 halls for companies, 8 public schools, called free-schools; and 131 charity-schools, which provide education for 5034 poor children; 207 inns, 447 taverns, 551 coffee-houses, 5975 alehouses; 1000 hackney-coaches; 400 ditto chairs; 7000 streets, lanes, courts, and alleys, and 150,000 dwelling-houses, containing, as has been already observed, above 1,000,000 inhabitants, who, according to a late estimate, consume annually the following articles of provisions:

Black cattle	-	-	-	-	-
Sheep and lambs	-	-	-	-	-
Calves	-	-	-	-	98,244
Swine	-	-	-	-	711,123
Pigs	-	-	-	-	194,700
Poultry and wild fowl innumerable	-	-	-	-	186,932
Mackarel sold at Billingsgate	-	-	-	-	52,000
					14,740,000
					Oylers,

Oysters, bushels	.	.	.	.	.	115,536
Small boats with cod, haddock, whiting, &c. besides those brought by land-carriage, and great quantities of river and salt-fish	.	.	.	.	.	1,398
Butter, pounds weight, about	.	.	.	.	.	16,000,000
Cheese, ditto, about	.	.	.	.	.	20,000,000
Gallons of milk	.	.	.	.	.	7,000,000
Barrels of strong beer	.	.	.	.	.	1,172,494
Barrels of small beer	.	.	.	.	.	798,493

Gallons of rum, brandy, and other distilled waters, above	.	.	.	.	.	11,000,000
Pounds weight of candles, above	.	.	.	.	.	11,000,000

London-bridge was first built of stone in the reign of Henry II. about the year 1163, by a tax laid upon wool, which in course of time gave rise to the report that it was built upon wool-packs; from that time it has undergone many alterations and improvements, particularly since the year 1756, when the houses were taken down, and the whole rendered more convenient and beautiful. The passage for carriages is 31 feet broad, and 7 feet on each side for foot passengers. It crosses the Thames where it is 915 feet broad, and has 19 arches of about 20 feet wide each, but the centre one is considerably larger.

Westminster bridge is reckoned one of the most complete and elegant structures of the kind in the known world. It is built entirely of stone, and extended over the river at a place where it is 1223 feet broad; which is above 300 feet broader than at London bridge. On each side is a fine ballustrade of stone, with places of shelter from the rain. The width of the bridge is 44 feet, having on each side a fine foot-way for passengers. It consists of 14 piers, and 13 large and two small arches, all semicircular, that in the centre being 76 feet wide, and the rest decreasing four feet each from the other; so that the two least arches of the 13 great ones are each 52 feet. It is computed that the value of 40,000l. in stone, and other materials, is always under water. This magnificent structure was begun in 1738, and finished in 1750, at the expence of 389,000l. defrayed by the parliament.

Black-friars bridge is not inferior to that of Westminster in magnificence or workmanship; but the situation of the ground on the two shores obliged the architect to employ elliptical arches; which have a very fine effect. This bridge was begun in 1760, and finished in 1770, at the expence of 152,840l. which has been discharged by a toll upon the passengers. It is situated almost at an equal distance between those of Westminster and London, commands a view of the Thames from the latter to Whitehall, and discovers the majesty of St. Paul's in a very striking manner.

The cathedral of St. Paul's is the most capacious, magnificent, and regular Protestant church in the world. The length within is 500 feet; and its height, from the marble pavement to the cross, on the top of the cupola, is 340. It is built of Portland stone, according to the Greek and Roman orders, in the form of a cross, after the model of St. Peter's at Rome, to which in some respects it is superior. St. Paul's church is the principal work of sir Christopher Wren, and undoubtedly the only work of the same magnitude that ever was completed by one man. He lived to a great age, and finished the building 37 years after he laid the first stone. It takes up six acres of ground, though the whole length of this church measures no more than the width of St. Peter's. The expence of rebuilding it after the fire of London was defrayed by a duty on coals, and is computed at near a million sterling.

The ruins of th

Westminster abbey, or the collegiate church of Westminster, is a venerable pile of building in the Gothic taste. It was first built by Edward the Confessor; king Henry III. rebuilt it from the ground, and Henry VII. added a fine chapel to the east end of it; this is the repository of the deceased British kings and nobility; and here are also monuments erected to the memory of many great and illustrious personages, commanders by sea and land, philosophers, poets, &c. In the reign of queen Anne, 4,000*l.* a year, out of the coal-duty, was granted by parliament for keeping it in repair.

The inside of the church of St. Stephen's Walbrook is admired for its lightness and elegance, and does honour to the genius of sir Christopher Wren. The same may be said of the steeples of St. Mary-le-Bow and St. Bride's, which are supposed to be the most complete in their kind of any in Europe, though architecture has laid down no rules for such erections. The simplicity of the portico in Covent Garden is worthy the purest ages of ancient architecture. That of St. Martin's in the Fields would be noble and striking, could it be seen from a proper point of view. Several of the new churches are built in an elegant taste, and even some of the chapels have gracefulness and proportion to recommend them. The Banqueting house at Whitehall is but a small part of a splendid palace designed by Sir Inigo Jones for the royal residence, and as it now stands, under all its disadvantages, its symmetry and ornaments are in the highest style and execution of architecture.

Westminster hall, though on the outside it makes no very advantageous appearance, is a noble Gothic building, and said to be the largest room in the world, whose roof is not supported by pillars, it being 220 feet long, and 70 broad. Its roof is the finest of its kind that can be seen. Here are held the coronation feasts of our kings and queens; also the courts of chancery, king's bench, common-pleas, and exchequer.

The Monument, erected at the charge of the city, to perpetuate the memory of its being destroyed by fire, is worthy of notice. This column, which is of the Doric order, exceed all the obelisks and pillars of the ancients, it being 202 feet high, with a stair-case in the middle to ascend to the balcony, from whence there are other steps, made for persons to look out at the top, which is fashioned like an urn, with a flame issuing from it. On the base of the Monument next the street, the destruction of the city, and the relief given to the sufferers by Charles II. and his brother, is emblematically represented in bas relief. The north and south sides of the base have each a Latin inscription, the one describing its dreadful solation\*, and the other its splendid resurrection; and on the east side is an inscription, shewing when the pillar was begun and finished. The charge of erecting this monument, which was begun by sir Christopher Wren in 1671, and finished by him in 1677, amounted to upwards of 13,000*l.*

\* Which may be thus rendered: "In the year of Christ, in 1666, Sept. 2. eastward from hence at the distance of 202 feet (the height of this column) a terrible fire broke out about midnight; which, driven on by a high wind, not only wasted the adjacent parts, but also very remote places, with incredible crackling and fury. It consumed 89 churches, the city-gates, Guildhall, many public structures, hospitals, schools, libraries, a vast number of stately edifices, 13,000 dwelling-houses, and 400 streets. Of the 26 wards it utterly destroyed 15, and left eight others shattered and half burnt. The ruins of the city were 436 acres, from the

Tower by the Thames side to the Temple church; and from the north-east along the wall to Holborn-bridge. To the estates and fortunes of the citizens it was merciless, but to their lives very favourable; that it might in all things resemble the last conflagration of the world. The destruction was sudden, flourishing and reduced to nothing. Three days after, when this fatal fire had baffled all human counsels and endeavours, in the opinion of all, it was on every side extinguished."

The Royal Exchange, a large and commodious building, is said to have cost above 80,000*l*.

The terrace in the Adelphi is a very fine piece of architecture, and has laid open one of the finest prospects in the world.

We might here give a particular description of the Tower †, Bank of England, the New Treasury, the Admiralty-office, and the Horse-guards at Whitehall, the Mansion-

† In examining the curiosities of the Tower of London, it will be proper to begin with those on the outside the principal gate; the first thing a stranger usually goes to visit is the wild beasts; which, from their situation, first present themselves; for having entered the outer gate, and passed what is called the spur-guard, the keeper's house presents itself before you, which is known by a painted lion on the wall, and another over the door which leads to their dens. By ringing a bell, and paying six-pence each person, you may safely gain admittance.

The next place worthy of observation is the Mint, which comprehends near one-third of the Tower, and contains houses for all the officers belonging to the coinage. On passing the principal gate you see the White Tower, built by William the Conqueror. This is a large, irregular stone building, situated almost in the centre, no one side answering to another, nor any of its watch towers, of which there are four at the top, built alike. One of these towers is now converted into an observatory. In the first story are two noble rooms, one of which is a small armoury for the sea-ferretier, it having various sorts of arms, very curiously laid up, for above 10,000 seamen. In the other room are many closets and presses, all filled with warlike engines and instruments of death. Over this are two other floors, one principally filled with arms, the other with arms and other warlike instruments, as spades, shovels, pick-axes, and chevaux de frize. In the upper story, are kept match, sheep-skins, tanned hides, &c. and in a little room, called Julius Cæsar's chapel, are deposited some records, containing perhaps the ancient usages and customs of the place. In this building are also preserved the models of the new-invented engines of destruction, that have from time to time been presented to the Government. Near the south-west angle, of the White Tower, is the Spanish armoury, in which are deposited the spoils of what was vainly called the Invincible Armada; in order to perpetuate, to latest posterity, the memory of that signal victory, obtained by the English over the whole naval power of Spain, in the reign of Philip II.

You next come to the grand store-house, a noble building to the northward of the White Tower, that extends 245 feet in length, and 60 in breadth. It was begun by king James II. who built it to the first floor; but it was finished by king William III. who erected that magnificent room, called the New, or Small Armoury, in which that prince, with queen Mary, his consort, dined in great honour, having all the warrant-workmen and labourers to attend them, dressed in white gloves and aprons, the usual badges of the order of masonry.

To this noble room you are led by a folding-door, adjoining to the east end of the Tower chapel, which leads to a grand stair-case of 50 easy steps. On the left side of the uppermost landing-place is the workshops, in which are constantly employed about 14 furthithers, in cleaning, repairing, and new-plating the arms. On entering the armoury, you see what they call a wilderness of arms, so artfully disposed, that at one view you behold arms for near 80,000 men, all bright, and fit for service; and besides those exposed to view, there were, before the war with America, sixteen chests shut up, each chest holding about 1000 muskets. The arms were originally disposed by Mr. Harris, who contrived to place them in this beautiful order both here and in the guard-chamber of Hampton-court. He was a common gunsmith; but after he had performed this work, which is the admiration of people of all nations, he was allowed a pension from the crown for his ingenuity.

Upon the ground floor, under the small armoury, is a large room of equal dimensions with that, supported by an pillar, all hung round with implements of war. This room, which is 24 feet high, has a passage in the middle 16 feet wide.

The horse armoury is a plain brick-building, a little to the eastward of the White Tower; and is an edifice rather convenient than elegant, where the spectator is entertained with a representation of those kings and heroes of our own nation, with whose gallant actions it is to be supposed he is well acquainted; some of them equipped and sitting on horseback, in the same bright and shining armour they were used to wear when they performed those glorious actions which gave them a distinguished place in the British annals.

You now come to the line of kings, which your conductor begins by reversing the order of chronology; so that in following them we must place the last first.

In a dark, strong stone-room, about 20 yards to the eastward of the grand store-house, or new-armoury, the crown jewels are deposited. 1. The imperial crown, with which it is pretended that all the kings of England have been crowned since Edward the Confessor, in 1040. It is of gold, enriched with diamonds, rubies, emeralds, sapphires and pearls; the cap within is of purple velvet, lined with white taffety, turned up with three rows of ermine. They are, however, mistaken in shewing this as the ancient imperial diadem of St. Edward; for that, with the other most ancient regalia of this kingdom, was kept in the arched room in the cloisters in Westminster-Abbey, till the civil war; when, in 1642, Harry Martin, by order of the parliament, broke open the iron chest in which it was secured, took it thence and sold it, together

Mansion-house of the lord-mayor, the Custom-house, Excise-office, India-house, and many other public buildings; besides the magnificent edifices raised by our nobility; as lord Spencer's house, Marlborough-house, and Buckingham-house in St. James's park; the earl of Chesham's house near Hyde-park; the duke of

together with the robes, sword, and sceptre of St. Edward. However, after the restoration, king Charles II. had one made in imitation of it, which is that now shewn. II. The golden orb, or globe, put into the king's right hand before he is crowned; and born in his left hand with the sceptre in his right, upon his return into Westminster-Hall after he is crowned. It is about six inches in diameter, edged with pearl, and enriched with precious stones. On the top is an amethyst, of a violet colour, near an inch and an half in height, set with a rich cross of gold, adorned with diamonds, pearls, and precious stones. The whole height of the ball and cup is 11 inches. III. The golden sceptre, with its cross, set upon a large amethyst of great value, garnished round with table diamonds. The handle of the sceptre is plain; but the pommel is set round with rubies, emeralds, and small diamonds. The top rises into a *flor de lis* of six leaves, all enriched with precious stones, from whence issues a mound or ball, made of the amethyst already mentioned. The cross is quite covered with precious stones. IV. The sceptre, with the dove, the emblem of peace, perched on the top of a small Jerusalem cross, finely ornamented with table diamonds and jewels of great value. This emblem was first used by Edward the Confessor, as appears by his seal; but the ancient sceptre and dove was sold with the rest of the regalia, and this now in the Tower was made after the restoration. V. St. Edward's staff, four feet seven inches and an half in length, and three inches three quarters in circumference, all of beaten gold, which is carried before the king at his coronation. VI. The rich crown of state, worn by his majesty in parliament; in which is a large emerald seven inches round; a pearl esteemed the finest in the world, and a rubie of inestimable value. VII. The crown belonging to his royal highness the prince of Wales. The king wears his crown on his head while he sits upon the throne; but that of the prince of Wales is placed before him, to shew that he is not yet come to it. VIII. The late queen Mary's crown, globe, and sceptre, with the diamond she wore at her coronation, with her consort king William III. IX. An ivory sceptre, with a dove on the top, made for king James II.'s queen, whose garniture is gold, and the dove on the top gold, enamelled with white. X. The *custons*; or sword of mercy, which has a blade of thirty-two inches long, and near two broad, is without a point, and is borne naked before the king at his coronation, between the two swords of justice, spiritual and temporal. XI. The golden spurs, and the armillas, which are bracelets for the wrists. These, though very antique, are worn at the coronation. XII. The *ampulla*, or eagle of gold, finely engraved, which holds the holy oil the kings and queens of England are anointed with; and the golden spoon that the bishop pours the oil into.

These are two pieces of great antiquity. The golden eagle, including the pedestal, is about nine inches high, and the wings expand about seven inches. The whole weighs about ten ounces. The head of the eagle serves off about the middle of the neck, which is made hollow, for holding the holy oil; and when the king is anointed by the bishop, the oil is poured into the spoon out of the bird's bill. XIII. A rich salt-seller of state, in form like the square White Tower, and so exquisitely wrought, that the workmanship of modern times is in no degree equal to it. It is of gold, and used only on the king's table at the coronation. XIV. A noble silver font, double gilt, and elegantly wrought, in which the royal family are christened. XV. A large silver funtalis, presented to king Charles II. by the town of Plymouth, very curiously wrought; but much inferior in beauty to the above. Besides these, which are commonly shewn, there are in the jewel-office, all the crown jewels worn by the princes and princesses at coronations, and a great variety of curious old plate.

The record-office consists of three rooms, one above another, and a large round room, where the rolls are kept. These are all handsomely wainscoted, the wainscot being framed into presses round each room, within which are shelves and repositories for the records; and for the easier finding of them, the year of each reign is inscribed on the inside of these presses, and the records placed accordingly. Within these presses, which amount to 65 in number, are deposited all the rolls, from the first year of the reign of king John to the beginning of the reign of Richard III. but those after this last period are kept in the rolls Chapel. The records in the Tower, among other things, contain the foundation of abbeys, and other religious houses; the ancient tenures of all the lands in England, with a survey of the manors; the original of laws and statutes; proceedings of the courts of common law and equity; the rights of England to the dominion of the British seas; leagues and treaties with foreign princes; the achievements of England in foreign wars; the settlement of Ireland, as to law and dominion; the forms of submission of some Scottish kings for territories held in England; ancient grants of our kings to their subjects; privileges and immunities granted to cities and corporations during the period above mentioned; enrollments of charters and deeds made before the Conquest; the bounds of all the forests in England, with the several respective rights of the inhabitants to common pasture, and many other important records, all regularly disposed, and referred to in near a thousand folio indexes. This office is kept open and attendance constantly given, from seven o'clock, till one, except in the months of December, January, and February, when it is open only from eight to one, Sundays and holidays excepted. A search here is half a guinea, for which you may peruse any one subject a year.

Devonshire's, and the late earl of Bath's, in Piccadilly; lord Shelburne's, in Berkeley Square; Northumberland-house in the Strand; the duke of Bedford's, and Montague house \*, in Bloombury; with many other splendid mansions, whose names would fill a large volume.

This great city is supplied with abundance of fresh water from the Thames and the New River; which is not only of inconceivable service to every family, but by means of fire-plugs, the keys of which are deposited with the parish-officers, the city is in a great measure secured from the spreading of fire.

This plenty of water has been attended with another advantage. It has given rise to several companies, who insure houses and goods from fire; an advantage that is not to be met with in any other nation: the premium is small †, and the recovery, in case of loss, easy and certain. Every one of these offices keep a set of men in pay, who are ready at all hours to give their assistance; and are extremely bold, dexterous, and diligent: but though their labours should prove unsuccessful, the person who suffers by this devouring element, has the comfort that must arise from a certainty of being paid the value (upon oath) of what he has insured.

Before the conflagration in 1666, London was inelegant, inconvenient, and unhealthy, of which latter misfortune many melancholy proofs are authenticated in history, and which, without doubt, proceeded from the narrowness of the streets, and the unaccountable projections of the buildings, that confined the putrid air, and joined with other circumstances, such as the want of water, rendered the city seldom free from pestilential devastation. The fire which consumed the greatest part of the city, dreadful as it was to the inhabitants at that time, was productive of consequences, which made ample amends for the losses sustained by individuals;

\* The British Museum is deposited in Montague house. Sir Hans Sloane, bart. (who died in 1753) may not improperly be called the founder of the British Museum; for its being established by parliament, was only in consequence of his leaving by will his noble collection of natural history; his large library, and his numerous curiosities, which cost him 50,000*l.* to the use of the public, on condition that the parliament would pay 20,000*l.* to his executors. To this collection were added the Cottonian library, the Harleian manuscripts collected by the Oxford family, and purchased likewise by the parliament, and a collection of books, given by the late major Edwards. His late majesty, in consideration of its great usefulness, was graciously pleased to add thereto the royal libraries of books and manuscripts collected by the several kings of England.

The Sloanian collection consists of an amazing number of curiosities; among which are, the library, including books of drawings, manuscripts, and prints, amounting to about 50,000 volumes. Medals, and coins, ancient and modern, 20,000. Canoes and intaglios, about 700. Seals 268. Vessels, &c. of agate, jasper, &c. 542. Antiquities, 1125. Precious stones, agates, jasper, &c. 2256. Metals, minerals, ores, &c. 2725. Crystal, spars, &c. 1864. Fossils, flints, stones, 1275. Earths, sands, salts, 1035. Bitumens, sulphurs, ambers, &c. 399. Talcs, micae, &c. 388. Corals, sponges, &c. 1421. Testacea, or shells, &c. 5843. Helixi, echinix, &c. 659. Alteria trochi, entrochi, &c. 241. Crustacea, crabs, lobsters, &c. 363. Stella marina, star-fishes, &c. 173. Fish, and their parts, &c. 1555.

Birds, and their parts, eggs, and nests, of different species, 1172. Quadrupeds, &c. 1886. Vipers, serpents, &c. 521. Insects, &c. 5439. Vegetables, 12,506. Horti feci, or volumes of dried plants, 334. Calculi humani, and anatomical preparations, 756. Miscellaneous things, natural, 2098. Mathematical instruments, 55. A catalogue of all the above is written in a number of large volumes.

† The terms of insurance are as follow, viz.

Every person insuring shall pay annually	1	2
for every 100 <i>l.</i> insured on goods, inclosed in brick or stone	2	0
If half hazardous, as to situation, or kind of goods	3	0
If hazardous	4	0
If hazardous, and half hazardous	5	0
If hazardous, and hazardous	6	0
For every 100 <i>l.</i> insured on goods, inclosed in part brick and part timber	2	6
If half hazardous, as to situation, or kind of goods	3	9
If hazardous	5	0
If hazardous, and half hazardous	6	3
If hazardous, and hazardous	7	6
For every 100 <i>l.</i> insured on goods, inclosed in timber	3	0
If half hazardous, as to situation or kind of goods	4	6
If hazardous	6	0
If hazardous, and half hazardous	7	6
If hazardous, and hazardous	9	0

The premium is double upon any sum between one and two thousand, and treble between two and three thousand pounds.

a new

a new city arose on the ruins of the old ; but, though more regular, open, convenient, and healthful than the former, yet it is ever to be lamented that the magnificent and useful plan of the great sir Christopher Wren was sacrificed to the mean and selfish views of private property.

The plan of London, in its present state, will in many instances appear, to very moderate judges, to be as injudicious a disposition as can easily be conceived for a city of trade and commerce, on the borders of so noble a river as the Thames. The wharfs and quays on its banks are extremely mean and inconvenient. And the want of regularity and uniformity in the streets, and the mean avenues leading to many of them, are also circumstances that greatly lessen the grandeur of its appearance. Many of the churches, and other public buildings, are likewise thrust up in corners in such a manner as might tempt foreigners to believe that they were designed to be concealed. The improvements of the city of London for some years past have, however, been great ; and the new streets, which are numerous, are spacious, and built with regularity.

In the centre of the town, and upon the banks of the Thames, was a number of inelegant, ruinous houses, known by the names of Durham-Yard, the Savoy, and Somerset House. The first, being private property, engaged the notice of the ingenious Adams, who opened the way to a piece of scenery, which no city in Europe can equal. On the site of Durham-Yard was raised upon arches the pile of the Adelphi, celebrated for its enchanting prospect, the utility of its wharfs, and its subterraneous apartments answering a variety of purposes of general benefit. Contiguous to the Adelphi stands the Savoy, the property of government, hitherto a nuisance ; and, adjoining to the Savoy, towards the Temple, stood Somerset-House, where, being the property of government also, a new pile of buildings for public offices has been erected ; and here, in a very magnificent edifice, are elegant apartments appropriated for the use of the Royal Society, the Royal Academy of Painting and Sculpture, and the Society of Antiquaries.

Though a variety of circumstances have hitherto been disadvantageous to the embellishment of the metropolis, it must at the same time be acknowledged, that a spirit of improvement now seems universal. London is better paved and better lighted than any other great city. Spacious roads are continued for several miles around, and exclusive of lamps regularly placed on each side, at short distances, are secured by watchmen stationed within call of each other. Nothing can appear more brilliant than those lights when viewed at a distance, especially where the roads run across ; and even the principal streets, such as Pall-Mall, New Bond-street, Oxford-street, &c. convey an idea of elegance and magnificence.

Among the list of improvements worthy of notice may be included the Six Clerks Office, in Chancery-lane, and that very substantial building in the Old Bailey, which does honour to a people celebrated for their cleanliness, and for their humanity. Here the unfortunate debtor while he enjoys free air, is no longer annoyed by the dreadful rattle of chains, or by the more horrid sounds issuing from the lips of incorrigible offenders.

Foreigners are surpris'd that the monarchs of the richest nation in Europe should be so indifferently lodged in his capital, especially as Charles I. whose finances were but low, compared to some of his successors, had he lived undisturbed, would probably have completed the plan which Inigo Jones drew for a royal palace, suitable to the dignity of an English monarch. The truth is, his son Charles II. though he had a fine taste for architecture, dissipated his revenues upon his pleasures. The reign of his brother was too short for such an undertaking. Perpetual wars, during the reigns of king William and queen Anne, left the parliament no money to spare, and the two succeeding monarchs were not admirers of architectural magnificence.

Windfor castle is distinguished by its magnitude, and unrivalled in its beautiful and commanding situation; which, with the form of its construction, rendered it, before the introduction of artillery, impregnable. Hampton Court was the favorite residence of king William. It is built in the Dutch taste, has some good apartments, and, like Windfor, lies near the Thames. Both these palaces contain good pictures, but nothing equal to the magnificent collection made by Charles I. and dissipated in the time of the civil wars. The cartoons of Raphael, which for design and expression are reckoned the master-pieces of painting, have by his present majesty been removed from the gallery built for them at Hampton Court, to the queen's palace, formerly Buckingham-house, in St. James's Park. The palace of St. James's is commodious, but has the air of a convent; and that of Kensington, which was purchased from the Finch family by king William, is remarkable only for its extensive and beautiful gardens.

Not inferior to these and other royal houses, are many private seats in the neighbourhood of London, and all over the kingdom, wherein the opulence of the English nation is fully displayed and often made subservient to the finest classical taste; witness the seats of the marquis of Buckingham, and earl Pembroke. At the seat of the latter more remains of antiquity are to be found than are in the possession of perhaps any other subject.

But those capital houses of the English nobility and gentry are peculiarly distinguished by the nice adaptation of their parts, the richness and elegance of their furniture, and the admirable preservation in which the whole is kept; as well as by their hortulane and rural decorations, vistas, opening landscapes, temples, all the result of that enchanting art of imitating nature, and uniting beauty with magnificence. Of such seats the following are the most distinguished, viz.

The earl of Pembroke's, at Wilton, in Wiltshire.  
 Lord Clifford's, King's-Weston, Gloucestershire.  
 Duke of Beaufort's, Badmington-Magna, ditto.  
 Earl Spenser's, Wimbleton, Surry.  
 The late sir Gregory Page's, Blackheath, Kent.  
 Sir James Tylney Long's, Epping Forest, Essex.  
 Duke of Grafton's, Euston-Hall, Suffolk.  
 Earl of Orford's, Houghton, Norfolk.  
 Duke of Marlborough's, Blenheim, Oxfordshire.  
 Earl of Litchfield's, Ditchley, ditto.  
 Marquis of Buckingham's, Stowe, Buckinghamshire.  
 Earl of Bute's, Luton Hoo, Bedfordshire.  
 Earl of Winchelsea's, Okeham, Rutlandshire.  
 Earl of Stafford's, Broughton, Northamptonshire.  
 Earl of Pomfret's, Eaton, ditto.  
 Earl Spenser's, Althorp, ditto.  
 Earl of Exeter's, Stamford, ditto.  
 Duke of Norfolk's, Worktop, Nottinghamshire.  
 Duke of Devonshire's, Chatsworth, Derbyshire.  
 Lord Scarfdale's, near Derby.  
 Mr. Aislabe's, Studley-Park, Yorkshire.  
 Earl of Carlisle's, at Castle-Howard, ditto.  
 Duke of Northumberland's, at Alnwick, Northumberland, and Sion House, Middlesex.  
 Lord Clive's, Claremont, Surry.  
 Earl of Inchiquin's, Cliefden-house, Buckinghamshire  
 Earl of Harrington's, at Peterham, Surry.

Mr.

Mr. Coke's, *Holkham-House, Norfolk.*

Lord Despencer's, *Mereworth Castle, Kent.*

Lord Edgcombe's, *Mount Edgcombe, Cornwall.*

Lord Byron's, *Newstead Abbey, Nottinghamshire.*

Mr. Hoare's, *Stourton Park, Wiltshire.*

The late marquis of Rockingham's, *Wentworth-House, Yorkshire.*

Lord Petre's, *Thornton, Essex.*

A particular detail of all the cities and towns of England, which would far exceed the limits of this work, cannot be expected; the most considerable will, therefore, only be noticed.

Bristol is reckoned the second city in England for wealth and populousness; but in trade and shipping, Liverpool surpasses it. The former stands upon the north and south sides of the river Avon, and the two parts of the city are connected by a stone bridge. The city is not well-built; but it is supposed to contain 15,000 houses, and 95,000 inhabitants. Here is a cathedral and 18 parish-churches, besides seven or eight other places of worship. On the north side of a large square, called Queen's Square, which is adorned with rows of trees, and an equestrian statue of William the Third, there is a custom-house, with a quay half a mile in length, one of the most commodious in England. The exchange, where the merchants and traders meet, is of free-stone, and one of the best of its kind in Europe.

York is a city of great antiquity, pleasantly situated on the river Ouse; it is populous, and surrounded with a good wall, through which are four gates, and five posterns. Here are seventeen parish-churches, and a cathedral, or minster, the finest Gothic buildings in Europe. It extends in length 525 feet, and in breadth 100 feet. The nave, which is larger than any in Christendom, except that of St. Peter's church at Rome, is four feet and a half wider, and eleven feet higher, than that of St. Paul's cathedral at London. At the west end are two towers, connected and supported by an arch which forms the west entrance, and is reckoned the largest Gothic arch in Europe. The windows are finely painted; and the front of the choir is adorned with statues of the kings of England from William the Norman to Henry VI. and here are thirty-two stalls, all of fine marble, with pillars, each consisting of one piece of alabaster. Here is also a very neat Gothic chapter-house. Near the cathedral is the assembly-house, an elegant structure, designed by the late earl of Burlington. This city has a stone bridge of five arches over the river Ouse.

The city of Exeter was for some time the seat of the West Saxon kings; and the walls which at this time enclose it were built by king Athelstan, who encompassed it with a ditch. It has six gates, and, including its suburbs, is more than two miles in circumference. There are sixteen parish churches, besides, chapels, and five large meeting-houses, within the walls of this city. The trade of Exeter in ferges, perpetuans, long-ells, druggets, kerseys, and other woollen goods, is very great. Ships come up to the city by means of sluices. There was a long and very ancient bridge over the river Ex, with houses on both sides; one half of it is now demolished, and an arm turned to join it to the new bridge built on a line with the fore street.

The city of Gloucester stands on a pleasant hill, with houses on every descent, and is clean and well-built, with the Severn on one side, a branch of which brings ships up to it. The cathedral is an ancient and magnificent structure, and there are also five parish-churches. Here is a good stone bridge over the river, besides a quay, a wharf, and a custom-house: but the trade of this city is not so considerable as formerly.

Litchfield stands in a valley, three miles south of the Trent, divided by a stream which runs into that river. The cathedral was founded in 1148: it was much damaged

maged during the civil war, but was so completely repaired after the Restoration, that it is now one of the noblest Gothic structures in England.

Chester is a large, populous, and wealthy city, with a bridge that has a gate at each end, and twelve arches over the Dee, which falls into the sea. It has eleven parishes, and nine well-built churches. The streets are generally even and spacious, and, crossing one another in straight lines, meet in the centre. The walls were erected by Edelfleda, a Mercian lady, in the year 908, and join on the south side of the city to the castle, from whence there is a pleasant walk round the city upon the walls, except where it is intercepted by the towers over the gates; from hence there is a prospect of Flintshire, and the mountains of Wales.

Warwick is a town of great antiquity, and appears to have been of eminence, even in the time of the Romans. It stands upon a rock of free-stone, on the banks of the Avon; and a way is cut to it through the rock from each of the four cardinal points. The town is populous, and streets spacious and regular, and all meet in the centre of the town. The principal ornament of the place is a castle belonging to the earl of Warwick, standing upon the banks of the Avon, on a rock which rises 40 feet perpendicularly above the level of that river; and adjoining to the castle is a fine terrace, 50 feet above the same level, from whence there is a beautiful and extensive prospect of the river, and of the country beyond. The apartments of the castle are adorned with many original pictures of Vandyke and other great masters.

The city of Coventry is large and populous, has an handsome town-house, and twelve gates. Here is also a spacious market-place, with a cross in the middle, 60 feet high, adorned with statues of several kings of England as large as the life.

Salisbury is a large, neat, and well-built city, situated in a valley, and watered by the Upper Avon on the west and south, and by the Bourne on the east. The streets are generally spacious, and built at right angles. The cathedral, which was finished in 1258, at the expence of above 26,000 pounds, is, for a Gothic building, the most elegant and regular in the kingdom. It is in the form of a lantern, with a beautiful spire of free-stone in the middle, which is 410 feet high. The length of the church is 478 feet, the breadth is 76 feet, and the height of the vaulting 80 feet. This church has a cloister, which is 150 feet square, and of fine workmanship. The chapter-house, which is an octagon, is 150 feet in circumference; and yet the roof bears all upon one small pillar in the centre, so much too weak in appearance for the support of such a prodigious weight, that the construction of this building is thought one of the greatest curiosities in England.

The city of Bath took its name from the medicinal waters for which this place has been long celebrated and much frequented. The season for drinking the Bath waters are the spring and autumn: the spring season begins with April, and ends with June; the autumn season begins with September, and lasts till December, and some patients remain here all the winter. In the spring, this place is most frequented for health, and in the autumn for pleasure, when at least two-thirds of the company, consisting chiefly of persons of rank and fortune, come to partake of the amusements of the place. In some seasons there have been 8000 persons at Bath, besides its inhabitants. Some of the buildings are extremely elegant, particularly Queen's-square, the North and South Parade, the Royal Forum, the Circus, and Crescent.

Nottingham is pleasantly situated on the ascent of a rock, overlooking the river Trent, which runs parallel with it about a mile to the south, and is navigable. It is one of the neatest places in England, and has a considerable trade.

No

No nation in the world has such dock-yards, and all conveniencies for the construction and repairs of the royal navy, as Portsmouth (the most regular fortification in England), Plymouth, Chatham, Woolwich, and Deptford. The royal hospital at Greenwich, for superannuated seamen, is a truly noble pile. Almost every town in England is noted for some particular production or manufacture, to which its building and appearance are generally fitted; and though England contains many excellent and commodious sea-ports, yet all have an immediate connection with London, the common centre of national commerce.

COMMERCE AND MANUFACTURES.] It is well known that commerce and manufactures have raised the English to be a great and powerful people. It was not till the reign of Elizabeth that England began to feel her true weight in the scale of commerce. That queen planned some settlements in America, particularly Virginia, but left the expence to be defrayed by her subjects; and indeed she was too parsimonious to carry her own system into execution. James I. entered upon great and beneficial schemes for the English trade. The East-India company owes to him its success, and British America saw her most flourishing colonies rise under him and his family. The spirit of commerce went hand in hand with that of liberty, and though the Stuarts were not friendly to the latter, yet, during the reigns of the princes of that family, the trade of the nation greatly increased. It is not intended to follow commerce through all its fluctuations, but only to give a general representation of the commercial interest of the nation.

The present system of English politics may properly be said to have taken rise in the reign of queen Elizabeth. At this time the Protestant religion was established, which naturally allied us to the reformed states. We began in the same reign to extend our trade, by which it became necessary to watch the commercial progress of our neighbours, and, if not to incommode and obstruct their traffic, to hinder them from impairing ours. We then likewise settled colonies in America, which was become the great scene of European ambition; for, seeing with what treasures the Spaniards were annually enriched from Mexico, and Peru, every nation imagined that an American conquest or plantation would fill the mother-country with gold and silver. The discoveries of new regions, which were every day made, the profit of remote traffic, and the necessity of long voyages, produced in a few years a great increase of shipping. The sea was considered as the wealthy element; and by degrees a new kind of sovereignty arose, called *naval dominion*.

As the chief trade of Europe, so the chief maritime power was at first in the hands of the Portuguese and Spaniards, who, by a compact, to which the consent of other powers was not asked, had divided the newly discovered countries between them: but the crown of Portugal having fallen to the king of Spain, or being seized by him, he was master of the naval force of the two nations, with which he kept all the coasts of Europe in alarm, till the Armada, he had raised at a vast expence for the conquest of England, was destroyed; which put almost an end to the maritime strength of the Spaniards.

At this time the Dutch, who were oppressed by the Spaniards, and feared yet greater evils than they felt, resolved no longer to endure the insolence of their masters: they revolted; and after a struggle in which they were assisted by the money and forces of queen Elizabeth, erected an independent powerful commonwealth. When the inhabitants of the Low Countries had formed their system of government, and some remission of the war gave them leisure to form schemes of future prosperity, they easily perceived that as their territories were narrow, and their numbers small, they could preserve themselves only by that power, which is the consequence of wealth; and that by a people whose country produced only the necessaries of life, wealth was not to be acquired but from foreign dominions, and by transportation of the products of one country into another. From this necessity, thus justly estimated,

estimated, arose a plan of commerce, which was for many years prosecuted with an industry and success perhaps never seen in the world before; and by which the poor tenants of mud-walled villages and impassable bogs erected themselves into high and mighty states, who set the greatest monarchs at defiance, whose alliance was courted by the proudest, and whose power was dreaded by the fiercest nations. By the establishment of this state there arose to England a new ally, and a new rival.

When queen Elizabeth entered upon the government, the customs produced only 36,000*l.* a-year; at the Restoration they were let to farm for 400,000*l.* and produced considerably above double that sum before the Revolution. The inhabitants of London, before we had any plantations, and when our trade was inconsiderable, were computed at about 100,000: at the death of queen Elizabeth, they were increased to 150,000, and are now above six times that number. In those days we had not only naval stores, but ships from our neighbours. Germany furnished us with all things made of metals, even to nails; wine, paper, linen, and a thousand other things, came from France. Portugal supplied us with sugars; all the produce of America was poured on us from Spain; and the Venetians and Genoese retailed to us the commodities of the East Indies at their own price. The legal interest of money was 12 per cent. and the common price of our land 10 or 12 years purchase. We may add, that our manufactures were few, and those but indifferent; the number of English merchants very small, and our shipping inferior to what belonged in the late war to the single county of Lancaster.

For exportation England furnishes many of the most substantial and necessary commodities; as butter, cheese, corn, cattle, wool, iron, lead, tin, copper, leather, copperas, pit-coal, alum, saffron, &c. Our corn sometimes preserves other countries from starving. Our horses are the most serviceable in the world, and highly valued by all nations for their hardiness, beauty, and strength. We victual not only our own fleets, but many foreign vessels. Our iron we export manufactured in great guns, carcasses, bombs, &c. Prodigious, and almost incredible, is the value likewise of other goods from hence exported; viz. hops, flax, hemp, hats, shoes, household-stuff, ale, beer, red-herrings, pilchards, salmon, oysters, liquorice, watches, ribbands, toys, &c.

There is scarcely a manufacture in Europe but what is brought to great perfection in England. Our woollen manufacture exceeds that of any other nation. Hardware is another capital article; locks, edge-tools, guns, swords, and other arms, are of superior excellence; household utensils of brass, iron, and pewter, are also very great articles; and our clocks and watches are in the highest esteem.

The surprizing perfection, to which the manufactures of England have been brought, arises from many circumstances which now here coincide so happily to promote their progress as they do in this island. To this the national character, the situation of the country, and the excellence of its constitution all contribute. Nothing could be more favourable to the progress of the mechanical arts, than the English reflection, and perseverance, and the exclusive attention they are able to bestow on favourite pursuits, often with the neglect of every other concern; their enterprising spirit; and the certainty of enjoying the glory and fruits of their labours. The insular situation of Britain taught its inhabitants to consider the surrounding ocean as the bulwark of their safety, the theatre of their power, and the source of their wealth. Navigation with its appendages, distant acquisitions and colonization, gave an astonishing extent to commerce, an air of grandeur and importance to the occupations of the merchant, and flattered ambition as well as the love of gain. The mere natural productions of the country were insufficient for so large a market, especially as it was deficient in articles of luxury and the precious metals. Manufacturing industry was therefore called forth, to supply materials

rials for commerce, and every new invention of mechanical genius found liberal support and encouragement from the great number of people who had acquired wealth. The English government, favourable to liberty, and to every exertion of genius, has provided by wise and equitable laws for the secure enjoyment of property acquired by ingenuity and labour, and has removed obstacles to industry, by prohibiting the importation of such articles from abroad, as could be manufactured at home.

In the years 1769, 1770, and 1771, the value of the woollens exported from England amounted to upwards of 10,500,000l. sterling, exclusive of the woollens of Yorkshire, the value of which, in the same period of time, amounted to upwards of 3,000,000l. sterling. Next to the woollen manufactory, that of cotton is the most considerable, as it is reckoned to employ in the northern and middle counties not less than 500,000 persons, women and children included.

Among the advantages the British islands are possessed of, with respect to navigation, the following are worthy of attention; the great extent of the coasts, the sea-line of which, including both Great Britain and Ireland, extends near 3800 miles, whereas the sea-coast of France is but 1000 miles; the neighbourhood to the continent; the number of excellent harbours; the numerous navigable canals, which form a communication between the sea-ports on the eastern and western coasts of England.

The constant increase of this immense commerce is astonishing. In the years 1783 and 1784, 1. ships cleared outwards, amounting to 950,000, exceeded the number of tons of the ships employed twenty-four years before, by upwards of 400,000 tons. The value of the cargoes exported in 1784, amounted to upwards of 15,000,000l. sterling; and the net customs paid for them into the exchequer were upwards of 3,000,000l. sterling; and even this sum was exceeded the following year, 1785, by upwards of 1,000,000l.

The balance of trade in favour of England is estimated by some writers at 3,000,000l. sterling. Far more considerable is the inland trade, valued at upwards of 42,000,000l. sterling. As the quantity of circulating specie may in some measure indicate the extent of commerce, we may judge of the increase of the latter, by comparing the sums which the three last monarchs found necessary to coin. By George I. 8,725,921l. sterling were coined. In the long reign of George II. 11,966,576l. sterling, and in the first twenty-four years of his present majesty's reign, the sums coined amounted to 33,089,274l. sterling.

The coasting trade is said to give employment to about 100,000 people; but this number seems to be exaggerated; yet some branches of the fisheries require a great number of hands. About 10,000 people are employed in the oyster-fishery along the coasts of England.

Of the British commerce, that branch which we enjoyed exclusively, viz. the commerce with our colonies, was long regarded as the most advantageous. Yet since the separation of the American States from Great Britain, the trade, the industry, and manufactures of the latter have continually increased. New markets have opened, the returns from which are more certain and less tedious than those from America. By supplying a greater variety of markets, the skill and ingenuity of our artificers hath taken a wider range; the productions of their labour have been adapted to the wants, not of rising colonies, but of nations the most wealthy and the most refined; and our commercial system, no longer resting to the artificial basis of monopoly, hath been rendered more solid as well as more liberal. Before the late war, the chief commodities exported to the colonies were wrought iron, steel, copper, pewter, lead, and brass, cordage, hemp, sail-cloth, ship-chandlery, painter's colours, millinery, hosiery, haberdashery, gloves, hats, broad cloths, stuffs, flannels, Colchester bays, long ells, silks, gold and silver lace, Manchester goods, British, fo-

reign, and Irish linens, earthen wares, grind-stones, Birmingham and Sheffield wares, toys, sadlery, cabinet wares, seeds, cheese, strong beer, smoking pipes, snuffs, wines, spirits, and drugs; East India goods, books, paper, and leather.

The commodities exported from America to Great Britain, and other markets, were tobacco, rice, flour, biscuit, wheat, beans, peas, oats, India corn, and other grain; honey, apples, cyder, and onions; salt-beef, pork, hams, bacon, venison, tongues, butter, and cheese; prodigious quantities of cod, mackarel, and other fish, and fish oil; furs and skins of wild beasts, such as bear, beaver, otter, fox, deer, and racoon; horses, and live stock; timber planks, masts, boards, staves, shingles, pitch, tar, and turpentine; ships built for sale; flax, flax-seed, and cotton; indigo, pot-ash, bees-wax, tallow, copper ore, and iron in bars and in pigs; besides many other commodities, peculiar to the climes and soil of different provinces. The following is a state of the trade between Great Britain and the colonies, as it existed before the differences broke out between them, marking at the same time the commercial strength and shipping of the colonies.

Colonies.	Ships.	Seamen.	Exports from Great Britain.	Exports from the Colonies
Hudson's Bay	4	130	£. 16,000	£. 29,340

The principal islands belonging to the English, in the West Indies, are Jamaica, Barbadoes, St. Christopher's, Grenada, Antigua, St. Vincent, Dominica, Anguilla, Nevis, Montserrat, the Bermudas, or Summer Islands, and the Bahama, or Lucayan Islands in the Atlantic ocean; besides our new conquests of Martinico, Gaudaloupe, St. Lucie, and part of the French possessions in St. Domingo.

The English trade with the West India Islands consists chiefly in sugars, rum, cotton, logwood, cocon, coffee, pimento, ginger, indigo, materials for dyers, mahogany and machinell planks, drugs and preserves; for these the exports from England are osnaburgs, a coarse kind of linen, with which the West Indians now clothe their slaves; linen of all sorts, with broad cloth and kersties, for the planters, their overseers and families; silks and stuffs for their ladies and household servants; hats; red caps for their slaves of both sexes; stockings and shoes of all sorts; gloves and millinery ware, perukes, laces for linen, woollen and silks; strong beer, pale beer, pickles, candles, butter, and cheese; iron ware, as saws, files, axes, hatchets, chisels, adzes, hoes, mattocks, gouges, planes, augers, nails; lead, powder, and shot; brags and copper wares; toys, coals, and pantiles; cabinet wares, snuffs, and, in general, whatever is raised or manufactured in Great Britain; also negroes from Africa, and all sorts of India goods.

The trade of England to the East Indies, constituting the most stupendous, political, as well as commercial machine known in history, will be explained under the head of the East India company.

This

This company exports to the East Indies all kinds of woollen manufacture, all sorts of hard-ware, lead, bullion, and quicksilver. Their imports consist of gold, diamonds, raw-silks, drugs, tea, pepper, arrack, porcelain or China ware, salt petre for home consumption: and of wrought silks, mullins, calicoes, cottons, and all the woven manufactures of India, for exportation to foreign countries. I shall now proceed to a concise view of the English trade to other countries, according to the latest and most authentic accounts.

To Turkey, England sends in her own bottoms, woollen cloths, tin, lead, and iron, hard-ware, iron utensils, clocks, watches, verdegris, spices, cochineal, and log-wood. She imports from thence raw-silks, carpets, skins, dying drugs, cotton, fruits, medicinal drugs, coffee, and some other articles. Formerly, the balance of this trade was about 500,000*l.* annually, in favour of England; and will soon exceed that sum, should France continue to neglect commerce.

England exports to Italy woollen goods of various kinds, peltry, leather, lead, tin, fish, and East India goods: and brings back raw and thrown silk, wines, oil, soap, olives, oranges, lemons, pomegranates, dried fruits, colours, anchovies, and other articles of luxury; the balance of this trade in favour of England, is annually about 200,000*l.*

To Spain England sends all kinds of woollen goods, leather, tin, lead, fish, corn, iron, and brass manufactures; haberdashery wares, assortments of linen from Germany, and elsewhere, for the Spanish colonies: and receives in return, wines, oils, dried fruits, oranges, lemons, olives, wool, indigo, cochineal, and other dying drugs, colours, gold and silver coin.

Portugal formerly was, upon commercial accounts, the favourite ally of England, whose fleets and armies have more than once saved her from destruction. England sends to this country almost the same kind of merchandizes as to Spain, and receives in return vast quantities of wines, with oils, salt, dried and moist fruits, dying drugs, and gold coins.

The treaty of commerce between England and France has been so variously represented, that it is not easy accurately to estimate its advantages to this country; but whatever they were, a total suspension has now taken place, occasioned by the present war.

England sends to Flanders, serges, flannels, tin, lead, sugars, and tobacco; and receives in return, laces, linen, cambrics, and other articles of luxury, by which England loses upon the balance, 250,000*l.* sterling yearly. To Germany, England sends cloths and stuffs, tin, pewter, sugars, tobacco, and East India merchandize; and brings thence, linen, thread, goat-skins, tinned plates, wines, and many other articles. Before the late war, the balance of this trade was thought to be 500,000*l.* annually to the prejudice of England, but that disadvantage is now lessened, as most of the German princes find it their interest to clothe their armies in English manufactures. I have already mentioned the trade with Denmark, Norway, Sweden, and Russia, which formerly was against England; but the balance was lately diminished by the great improvements of her American colonies, in raising hemp, flax, making pot-ashes, iron-works, and tallow, all which used to be furnished to her by the northern powers. The goods exported to Poland, chiefly by the way of Dantzic, are many, and the duties upon them low. Many articles are sent there for which there is no longer any demand in other countries. Poland consumes large quantities of our woollen goods, hardware, lead, tin, salt, sea-coal, &c. and the export of manufactured tobacco is greater to Poland than to any other country. The balance of trade may be estimated much in our favour.

To Holland, England sends an immense quantity of merchandize, such as all kinds of woollen goods, hides, corn, coals, East India and Turkey merchandize, tobacco, tar, sugar, rice, ginger, and other American productions: and takes in return

return fine linen, lace, cambrics, thread, tapes, inele, madder, boards, drugs, whalebone, train-oil, and toys. The balance is supposed to be in favour of England.

England sends to the coast of Guinea, sundry sorts of coarse woollen and linen, iron, pewter, brass, and hardware manufactures, lead-shot, swords, knives, firearms, gun-powder, and glass manufactures. Guinea lately supplied the American colonies with negro slaves, amounting in number to above 100,000 annually. The other returns are in gold-dust, gum, dyeing and other drugs, red-wood, Guinea grains, and ivory.

To Arabia, Persia, China, and other parts of Asia, England sends much foreign silver coin, and bullion, and sundry English manufactures of woollen goods, and of lead, iron, and brass; and brings home from those remote regions, muslins and cottons of many various kinds, calicoes, raw and wrought silk, chintz; teas, porcelain, gold-dust, coffee, saltpetre, and drugs. And so great a quantity of those various merchandizes are re-exported to foreign European nations, as more than compensates for the silver bullion which England carries out.

During the infancy of commerce with foreign parts, it was judged expedient to grant exclusive charters to particular bodies or corporations of men; hence the East India, South Sea, Hudson's bay, Turkey, Russia, and Royal African companies; but the trade to Turkey, Russia, and Africa, is now laid open, though the merchant who proposes to trade thither must become a member of the company, be subject to their laws and regulations, and advance a small sum at admission, for the purposes of supporting consuls, forts, &c.

The foreign trade of England is supported by great rational industry, the produce of the land, and labour of the country, being calculated at more than 42,000,000*l.* annually.

Cornwall and Devonshire furnish tin and lead, and woollen manufactures are common to almost all the western counties. Dorsetshire makes cordage for the navy, feeds an incredible number of sheep, and has large lace manufactures. Somersetshire, besides furnishing lead, copper, and lapis calaminaris, has large manufactures of bone-lace, stockings, and caps. Bristol is said by some to employ 2000 vessels of all sizes, coasters as well as ships, employed in foreign voyages: it has many very important manufactures; its glass-bottle and drinking-glass occupying fifteen large houses: its brass-wire manufactures are also very considerable. Manufactures of all kinds (glass, jewellery, clocks, watches, and cutlery, in particular), are carried on in London and its neighbourhood; the gold and silver manufactures of London, through the encouragement given by the court and the nobility, exceed those of any other country in Europe. Colchester is famous for its manufactures of bays and serges, and Exeter for serges and long-ells; and Norwich for its excellent stuffs, camelots, druggets, and stockings. Birmingham, though no corporation, is one of the largest and most populous towns in England, and carries on an amazing trade in excellent and ingenious hardware manufactures, particularly snuff and tobacco boxes, buttons, shoe-buckles, and many other sorts of steel and brass wares; it is here, and in Sheffield, which is famous for cutlery, where it is supposed upwards of 40,000 workmen are employed by about 600 owners and manufacturers, that the true genius of English art and industry is to be seen; for such are their excellent inventions for fabricating hardwares, that they can afford them for a fourth part of the price at which other nations can furnish the same of an inferior kind: the cheapness of coals, all necessaries, and the conveniency of situation contribute greatly to this. One company of iron manufacturers in Shropshire use every day 500 tons of coals in their works. In Great Britain there is made every year from 50 to 60,000 tons of pig-iron, and from 20 to 30,000 tons of bar-iron.

The

The northern counties of England carry on a prodigious trade in the coarser and lighter woollen manufactures; witness those of Halifax, Leeds, Wakefield, and Richmond, and above all, Manchester; which, by its variety of beautiful cottons, dimities, tickens, checks, and the like stuffs, is become a large and populous place, though only a village, and its highest magistrate a constable. Beautiful porcelain and earthen ware have of late years been manufactured in Worcester-shire and Staffordshire. The English carpets, especially those of Axminster, Wilton, and Kidderminster, though but a late manufacture, greatly excel in beauty any imported from Turkey, and are extremely durable. Paper, which till very lately was imported in vast quantities from France and Holland, is now made in every part of the kingdom. The parliament, of late, has given encouragement for reviving the manufacture of salt-petre, which was first attempted in England by sir Walter Raleigh, but was dropt afterwards in favour of the East India Company.

After all that has been said, the seats of manufactures, and consequently of trade, in England, are fluctuating; they will always follow those places where living is cheap, and taxes are easy: for this reason, they have been observed of late to remove towards the northern counties, where provisions are in plenty, and the land-tax very low; and, probably, in a few years, the inland navigations which are completed in many parts of England, will make great improvements in its natural advantages.

The immense accumulation of the public debts, and the depressed state of public credit, of the revenue, and of the funds, at the close of the last war, together with the loss of several extensive and populous colonies in North America, led some of the ablest and most experienced men in the kingdom, not in general inclined to despondency, to doubt whether it would be possible for Great Britain, reduced apparently to the lowest ebb, by a succession of misfortunes, and by expences unprecedented in any former time, ever to regain prosperity at home, or influence abroad. The events, however, which have since happened, shew as well the effect which may be produced by a resolution to encounter the difficulties of the most embarrassed situation, as the extent of the resources to be derived from a spirit of national industry and enterprize.

Among other causes which have contributed to the prosperity of the nation since the peace of 1783, the writer of a pamphlet, entitled, *A brief Examination into the Increase of the Revenue, Commerce, and Navigation of Great Britain*, published 1793, mentions an *act for auditing public accounts*. Losses to an immense amount had been sustained by the public, from persons to whom large sums of money had been issued, and who had not rendered any account: a very large proportion of them had never been called upon; the few who were with those who voluntarily tendered themselves, passed their accounts for millions before a deputy or clerk, appointed by an auditor, who always considered his own office as a sinecure. To remedy this evil, an act was passed in 1785, for better examining and auditing the public accounts of the kingdom; since which, they have been examined with attention and scrupulous exactness, and the effects of this law will be felt in its full extent, in the present (1794) war with France. Sums, beyond all belief to persons not experienced in such matters, would have been saved, if such an institution had been provided previous to the two last wars.

It must be in the recollection of every one, how universal a persuasion prevailed, that the separation of the American Colonies from Great Britain, would be felt as a great and severe wound, injuring our resources and lessening our navigation. We cannot, therefore, but contemplate with the highest pleasure the effects produced by the measures before alluded to, and by various other causes which have contributed to the general prosperity of the country. To compare the revenue at

different periods, before and since the separation, would not alone be admitted as a criterion, because new taxes have been since added to a large amount; although it is the strongest proof of the energy of the country, that under an immense accumulation of debt and taxes, it has been able to effect most successfully what was never before attempted, the gradual and certain reduction of the debt.

A more direct argument will, however, arise from an inquiry into the state of our navigation and commerce during the years of our greatest prosperity, after the peace of 1763, and at this time.—In this inquiry there occurs some difficulty as to the navigation;—it is to be lamented, that previous to 1786, no ships were registered in Great Britain, except those which traded to the plantations; entries of ships outwards were till then made very loosely; there was no sort of check on the master or owner, who invariably represented the vessels of a less burthen than the real tonnage, to save the payment of light duties and other charges; notwithstanding which, a tolerable judgment may be formed of the increase of our navigation, by comparing the number of the ships cleared out at the different periods, having in view that, previous to the separation of the colonies of Great Britain, all American shipping was deemed British, and that the size of our ships is now larger than at that time.

Number of British ships entered *inwards* to Great Britain.

*A Short View of the STOCKS, or PUBLIC FUNDS, in England; with An Historical Account of the East India, the Bank, and the South-Sea Companies.*

As there are few subjects of conversation more general than the value of stock, and hardly any thing so little understood, nothing can be more proper in this place than a short account of them, which shall be given in as clear and concise a manner as possible; presenting the reader with a *rationale* of the stocks, and a short history of the several companies, describing the nature of their several funds, the uses to which they are applied, and the various purposes they answer, both with respect to the government, the companies themselves, and the community in general.

In order to give a clear idea of the money transactions of the several companies, it is proper we should say something of money in general, particularly of paper-money, and the difference between that and the current specie. Money is the standard of the value of all the necessaries and accommodations of life, and paper-money is the representative of that standard to such a degree, as to supply its place, and to answer all the purposes of gold and silver coin. Nothing is necessary to make this representative of money supply the place of specie, but the credit of that office or company who delivers it; which credit consists in the facility

\* Including a postponed payment of the India Company for duties, which were not paid till a subsequent year.

† This is on the estimate of the peace establishment at £15,811,000, as stated by Mr. Pitt in his speech on opening the Budget 17th February, 1792.

afforded by the bank for converting the paper into specie. The notes of the bank of England are of the same value as the current coin, as they may be turned into it whenever the possessor pleases. From hence, as notes are a kind of money, the counterfeiting them is punished with death, as well as coining.

The method of depositing money in the bank, and exchanging it for notes (though they bear no interest), is attended with many conveniencies; as they are not only safer than money in the hands of the owner himself, but as the notes are more portable, and capable of a much more easy conveyance: since a bank note for a very large sum may be sent by the post, and to prevent theft, may, without damage, be cut in two, and sent at two several times. Or bills, called Bank post-bills, may be had by application at the bank, which are particularly calculated to prevent fraud, they being made payable to the order of the person who takes them out, at a certain number of days after sight; which gives an opportunity to stop bills at the bank, if they should be lost, and prevents their being so easily negotiated by strangers as common bank-notes are; and whoever considers the hazard, the expence, and trouble, in sending large sums of gold and silver to and from distant places, must also regard this as a very important advantage. Besides which another benefit attends them; for if they are destroyed by time, or other accident, the Bank will, on oath being made of such accident, and security being given, pay the money to the person who was in possession of them.

*Bank Notes* differ from all kinds of stock in these three particulars: 1. They are always of the same value; 2. They are paid off without being transferred; and, 3. They bear no interest; while *stocks* are a share in a company's funds, bought without any condition of having the principal returned. *India bonds* indeed (by some persons, though erroneously, denominated stock) are to be excepted, they being made payable at six months notice, either on the side of the company, or of the possessor.

By the word *Stock* was originally meant, a particular sum of money contributed to the establishing a fund to enable a company to carry on a certain trade, by means of which the person became a partner in that trade, and received a share in the profit made thereby, in proportion to the money advanced. But this term has been extended farther to signify any sum of money which has been lent to the government, on condition of receiving a certain interest till the money is repaid. As the security both of the government and the public companies is esteemed preferable to that of any private person, as stock is negotiable and may always be readily transferred, as the interest is always punctually paid when due; so for these reasons government may commonly borrow money cheaper than individuals, from whom there is often some danger of losing both principal and interest.

Every fund being raised for a particular purpose, and limited by parliament to a certain sum, it follows, that when the fund is completed, no more stock can be bought; though shares, already purchased, may be transferred from one person to another. This being the case, there is frequently a great disproportion between the original value of the shares, and what is given for them when transferred; for if there are more buyers than sellers, a person who is indifferent about selling, will not part with his share without a considerable profit to himself; and on the contrary, if many are disposed to sell, and few inclined to buy, the value of such shares will naturally fall in proportion to the impatience of those who want to turn their stock into specie.

These observations were necessary, to give our readers some idea of the nature of that unjustifiable and dishonest practice called *Stock-jobbing*, the mystery of which consists in nothing more than this: the persons concerned in that practice, who are denominated *Stock-jobbers*, make contracts to buy or sell at a certain distant time,

time, a certain quantity of some particular stock; against which time they endeavour, according as their contract is, either to raise or lower such stock, by spreading rumours, and fictitious stories, in order to induce people either to sell out in a hurry, and consequently cheap, if they are to deliver stock; or to become unwilling to sell it, and consequently to make it dearer, if they are to receive stock.

The persons who make these contracts are not in general possessed of any real stock; and when the time comes that they are to receive or deliver the quantity they have contracted for, they only pay such a sum of money as makes the difference between the price the stock was at, when they made the contract, and the price it happens to be at when the contract is fulfilled; and it is no uncommon thing for persons not worth 100l. to make contracts for the buying or selling 100,000l. stock. In the language of Exchange-Alley, the buyer in this case is called the Bull, and the seller the Bear; one is for raising or toiling up, and the other for lowering or trampling upon the Stock.

Besides these, there is another set of men, who, though of a higher rank, may properly come under the same denomination. These are the great moneyed men, who are dealers in stock, and contractors with the government whenever any new money is to be borrowed. These indeed are not fictitious, but real buyers and sellers of stock; but by raising false hopes, or creating groundless fears, by pretending to buy or sell large quantities of stock on a sudden, by using the forementioned set of men as their instruments, and other like practices, they are enabled to raise or lower the stocks one or two per cent. at pleasure.

However, the real value of one stock above another, on account of its being more profitable to the proprietors, or any thing that will really, or only in imagination, affect the credit of a company, or endanger the government by which that credit is secured, must naturally have a considerable effect on the stocks. Thus, with respect to the interest of the proprietors, a share in the stock of a trading company which produces 5l. or 6l. per cent. per ann. must be more valuable than an annuity with government security, that produces no more than 3l. or 4l. per cent. per annum; and consequently such stock must sell at a higher price than such an annuity. Though it must be observed, that a share in the stock of a trading company producing 5l. or 6l. per cent. per annum, will not fetch so much money at market as a government annuity producing the same sum, because the security of the company is not reckoned equal to that of government; and the continuance of their paying so much per annum, is more precarious, as their dividend is, or ought to be, always in proportion to the profits of their trade.

As the stocks of the East India, the Bank, and the South Sea companies, are distinguished by different denominations, and are of a very different nature, we shall give a short history of each of them, together with an account of the different stocks each is possessed of, beginning with the East India company, as the first established.

**EAST INDIA COMPANY.]** The first idea of it was formed in queen Elizabeth's time, but it has since undergone great alterations. Its shares, or subscriptions, were originally only 50l. sterling; and its capital only 360,891l. 5s. but the directors having a considerable dividend to make in 1676, it was agreed to join the profits to the capital, by which the shares were doubled, and consequently, each became of 100l. value, and the capital, 739,782l. 10s. to which capital, if 963,639l. the profits of the company to the year 1685, be added, the whole stock amounted to 1,703,402l. Though the establishment of this company was vindicated in the clearest manner by sir Josiah Child, and other able advocates, yet the partiality which the duke of York, afterwards James II. had for his favourite African trade, the losses it sustained in wars with the Dutch, and the revolutions which

had happened in the affairs of Indostan, damped the ardour of the public to support it; so that at the time of the Revolution, when the war broke out with France, it was in a very bad situation. This was in a great measure owing to its having no parliamentary sanction, whereby its stock often sold for one half less than it was really worth; and it was resolved that a new company should be erected, under the authority of parliament.

The opposition given to all the public-spirited measures of king William, by faction, rendered this proposal a matter of difficulty; but at last, after many parliamentary enquiries, the new subscription prevailed; and the subscribers, upon advancing two millions to the public at 8 per cent. obtained an act of parliament in their favour. The old company, however, retained a great interest both in the parliament and nation; and the act being found in some respects defective, so violent a struggle between the two companies arose, that in the year 1702, they were united by an indenture tripartite. In 1708, the yearly fund of 8 per cent. for two millions, was reduced to 5 per cent. by a loan of 1,200,000*l.* to the public, without any additional interest; for which consideration the company obtained a prolongation of its exclusive privileges; and a new charter was granted to them, under the title of "The United Company of Merchants trading to the East Indies." Its exclusive right of trade was prolonged from time to time; and a further sum was lent by the company in 1730, by which, though their privileges were extended for thirty-three years, yet the interest of their capital, which then amounted to 3,190,000*l.* was reduced to three per cent. and called the India 3 per cent. annuities.

Those annuities are different from the trading stock of the company, the proprietors of which, instead of receiving a regular annuity, have, according to their different shares, a dividend of the profits arising from the company's trade; and that dividend rises or falls according to the circumstances of the company, either real, or as is too often the case, pretended. A proprietor of stock to the amount of 1000*l.* whether man or woman, native or foreigner, has a right to be a manager, and to give a vote in the general council. Two thousand pounds is the qualification for a director: the directors are twenty-four in number, including the chairman and deputy-chairman, who may be re-elected in turn, six a year, for four years successively. The meetings, or court of directors, are to be held at least once a week; but are commonly oftener, being summoned as occasions require. Out of the body of directors are chosen several committees, who have the peculiar inspection of certain branches of the company's business; as the committee of correspondence, a committee of buying, a committee of treasury, a house committee, a committee of warehouse, a committee of shipping, a committee of accounts, a committee of law-suits, and a committee to prevent the growth of private trade; who have under them a secretary, cashier, clerks, and warehouse-keepers.

The amazing territorial acquisitions of this company, computed at the termination of the former war in India, to be 182,122 square miles, containing near eleven millions of people, with the addition of 21,580\* square miles, in the countries lately ceded by Tippoo Sultan, must be necessarily attended with a proportionable increase of trade †: and this, joined to the dissensions among its managers both at home and abroad, greatly engaged the attention of the legislature. A restriction

was

was occasionally laid on their dividends for a certain time. From a report of the committee, in 1773, appointed by parliament on India affairs, it appears that the India company, from the year 1708 to 1756, for the space of forty-seven years and a half, divided the sum of 12,000,000*l.* or above 280,000*l.* per annum, which on a capital of 3,190,000*l.* amounted to above eight and a half per cent: and that at the last mentioned period it appeared that, besides the above dividend, the capital stock of the company had been increased 180,000*l.* Considerable alterations were made in the affairs and constitution of the East India company by an act passed in 1773, intitled, "An act for establishing certain rules and orders, for the future management of the affairs of the East India company, as well in India as in Europe." It was thereby enacted, that the court of directors should, in future, be elected for four years: six members annually; but none to hold their seats longer than four years. That no person should vote at the election of the directors, who had not possessed their stock twelve months. That the stock of qualification should, instead of 500*l.* as it had formerly been, be 1000*l.* That the mayor's court at Calcutta should in future be confined to small mercantile causes, to which only its jurisdiction extended before the territorial acquisitions. That in lieu of this court, thus taken away, a new one be established, consisting of a chief justice and three puisne judges; and that these judges be appointed by the crown. That a superiority be given to the presidency of Bengal, over the other presidencies in India. That the right of nominating the governor and council of Bengal should be vested in the crown. The salaries of the judges were also fixed, at 8000*l.* to the chief justice, and 6000*l.* a year to each of the other three. The appointments of the governor-general and council were fixed, the first at 25,000*l.* and the four others at 10,000*l.* each annually.

In the month of November 1783, Mr. Fox, then secretary of state, brought forward a bill for new regulating the company, under the supposition of the incompetency of the directors, and the then insolvent state of the company. The intention of the bill was, to vest the whole powers of the East India company in *seven directors*, whose names were moved by the secretary of state, and adopted by the house of commons. They were to hold their offices four years, removable, like the twelve judges, by an address of either house of parliament, and not by any other power: and *nine gentlemen*, moved for and adopted in the same manner, were to assist them in managing the commercial affairs of the company.

The effect of this was, to vest in these seven directors the whole influence of the offices of every kind both in India and at home, belonging to the company; and the whole influence arising from their transactions in the purchase of goods for exportation, furnishing shipping, stores, and recruits; the influence arising from the method of selling their goods, by bringing forward or keeping back goods at the sales, or giving indulgencies as to payments, so as to accommodate those who were meant to be favoured; the influence arising from the favour they may shew to those who are now in England, and have left debts or effects in India, as to the mode of bringing home and recovering their fortunes; the influence of contracts of all kinds in India; of promotions, from step to step; of favour in the inland trade; of intimidation with respect to every person now there, who may come home with a fortune, with regard to recovering his debts, the means of remittance, and enquiries into his conduct; the influence upon foreign companies, or foreign states, who have establishments in that country, who, in return, may have the means of acting upon individuals in Britain; the influence upon the native princes of India, some of whom have already found the way of procuring the elections of members of parliament; and many other means of influence, which it is impossible to foresee, or to trace.

The

The amount of the whole cannot be computed. It was called equal to two or three millions a year; but there can be no doubt that its magnitude was very great indeed, and that it might have produced very remarkable consequences.

This power was not, indeed, taken from the crown; but it was to be placed in new hands, independent, during four years, equally of the crown and of the people. These consequences were supposed necessarily to follow, that the whole power and patronage of India would be vested in the members of that present administration, not only during four years, but as long as India shall belong to this kingdom, and without any fear from a future parliament. The bill passed the commons, but, it seems, by the influence of the crown, an opposition was formed against it in the house of lords, as placing too dangerous a power in the hands of any men, and which would be sure to operate against the necessary power of the crown; and after long debates it was rejected by a majority of 19 peers. The consequence of this was the downfall of the ministry, and a general revolution of the cabinet.

A new bill passed at the close of the sessions, 1784, by which three things were intended. First, the establishing a power of control in this kingdom, by which the executive government in India is to be connected with that over the rest of the empire. Secondly; the regulating the conduct of the company's servants in India. Thirdly, the providing for the punishment of those guilty of malversation in office.

Accordingly, six persons were nominated by the king as commissioners for the affairs of India, of whom one of the secretaries of state and the chancellor of the exchequer for the time being shall be two, and the president is to have a casting vote. New commissioners are to be appointed at the pleasure of the crown. This board is to superintend and control all operations respecting the civil or military government or revenue of the British territorial possessions in the East Indies. The court of directors of the company are to deliver to this board all minutes and resolutions of themselves and of the courts of proprietors, and copies of all letters and instructions proposed to be sent abroad, for their approbation or alteration. The directors are still to appoint the servants abroad, but the king hath a power by his secretary of state to recall the governors and members of the councils, and all inferior magistrates. By this bill there is given to the governor and council of Bengal a control over the other presidencies in all public transactions; but the council of Bengal are subjected to the direction of the company at home, and except in cases of immediate danger and necessity, restrained from acting without orders received from hence.

Another object of the bill is the redress of the grievances of the natives of India; to provide for the payment of the just debts of the nabob of Arcot, which are a burthen on his country; to ascertain the indeterminate right and pretensions on which so many differences have arisen between him and the rajah of Tanjore, fomented by Europeans, and to deliver the zemindars, and other native landholders of India, from oppression.

A material part of this bill is directed also against the abuses said to have prevailed in the civil and military departments, enjoining a thorough revival of their establishment; together with a suppression of such places as are found to be useless, and of such expences as may be conveniently avoided. And, in order to prevent any delusive shew of retrenchment in the present motion, or any deviation from the wise system of œconomy at a future period, this reform is directed to be constantly submitted, in its whole state and progress, to parliament.

Cadets and writers had hitherto been sent to India in such numbers, as to remain a burthen upon the establishments of the company. No more of these are

now

now to be sent out, till their number is reduced within the proper complement, which is not to be exceeded in future.

The recommendations also of the directors to offices abroad are now rendered ineffectual; and a system is established, of succession by seniority. From this regulation necessarily flows a limitation of the age of persons entering upon the line of East India service from fifteen to twenty-two years; for, if no provision was made to prevent children being enrolled on the establishment, they might be brought by succession to many important employments before they arrived at manhood: or, on the other hand, persons advanced in years might be appointed to the stations of young men, for the sole purpose of repairing dissipated fortunes; and that without the prospect of being able to do it in the course of years by regular advancement and legal profit. On the same ground, and on that of preventing, as far as possible, the mischief of tainting the government of that continent, by introducing into it the parties of Great Britain, all persons who have resided five years in Europe, since their return from India, are precluded from any farther re-appointment to offices in that country.

The last body of regulations for the company's servants in India applies to offences committed in that country.

Security had been derived to Indian delinquents, from the circumstance of their offences being committed within the territories of Indian princes, so as not to come within the cognizance of the British government. This act provides against further evasions of this mischievous nature, by declaring the offence equally punishable in whatever territory of India it is committed. Under the specious name of *Presents*, the grossest extortion had frequently been practised; and all attempts to draw a line having proved nugatory, nothing remained but to put an entire stop to the practice. The act, therefore, of receiving presents, is declared to be in itself extortion, and punishable by law accordingly. Of the same kind with these are the regulations against disobedience of orders; and also against the bargaining for offices. Both of these offences are pronounced misdemeanours: and provision is made, that the guilty persons shall not compound for them with the company, nor ever be restored to appointments in their service.

To prevent, or more easily punish, the misconduct of the servants of the company, every person returning from India is, within the space of two calendar months after his return, to deliver in upon oath, before the barons of the exchequer, an inventory of all lands, tenements, goods, debts, monies, securities for money, &c. &c. specifying what part thereof was not acquired or purchased by property acquired in consequence of his residence in the East Indies. A duplicate is to be given to the court of directors, for the inspection of the proprietors of the company; and in case of a complaint within three years after the delivery of the inventory, that it is evasive, insufficient, or false, then the person is to be examined upon oath, in the exchequer, to such interrogatories as the court shall think fit, or be imprisoned; and if he hath been guilty of any omission or concealment to the value of 2000*l.* all his real and personal estate shall be forfeited, one moiety to the king, and the other to the united company. Any person who shall within the space of three years make discovery, on oath, of any part of the estate or property, real or personal, of any person delivering such an inventory, which shall have been concealed, shall, upon conviction of the person, be allowed ten per cent. of the value of the estate or effects so discovered. It is also, by this bill, lawful for the attorney-general, or court of directors, to exhibit an information against any person guilty of the crime of extortion or other misdemeanors committed in the East Indies, which information is to be tried by commissioners.

Soon after the passing of this act, Mr. Dundas, who had long given unwearied application to the affairs of India, being placed at the head of the board of con-  
troul,

troul, introduced the laudable practice of bringing annually before a committee of the house of commons, a statement of the financial concerns of the company abroad, exhibiting the balance upon the comparison of the revenues and charges of the several settlements. As the company's right to their exclusive trade was, by an act passed in 1781, to terminate in March 1794, it became necessary to make provision for that event; which was effectually done by Mr. Dundas's bill, proposed the 25th February 1793; which meeting the approbation of parliament, had the singular good fortune of giving equal satisfaction to the public, and to the company; to the public, because instead of 400,000*l.* they were to receive 500,000*l.* per ann. from the revenues of India; and to the company, because they were still to preserve their power and privileges, in as far as these contributed to promote the interests of their commerce.

This salutary regulation proceeded on the principle, that the concerns of government and trade were to intimately blended in our Indian provinces, (it being by trade only that the revenues of India can be realized in Europe) that the two objects could not be separated without putting both to hazard, nor in any event without incurring great inconvenience and certain loss. Both the political and the commercial affairs of the company were to remain, therefore, for the term of twenty years under the management of the court of directors, subject to the controul of the executive power, itself responsible to parliament: the governor-general of Bengal was to appear in India, under the character of an absolute prince, to preside not only in the council of Calcutta, but in the councils of Madras and Bombay, when affairs called him thither, and his commands were to be obeyed over the whole of our Indian dominions, spreading over an extent of territory, little inferior to that of Europe. But while the governor-general thus displayed in Asia, a character analogous to the feelings and habits of thinking of the natives, and therefore essential to the efficiency of his government, he was still responsible for every act of his administration, from which he might be removed at pleasure, by the executive power at home; while he remained in Asia, he was to obey implicitly the orders sent to him from Britain; the inferior governors, with all the boards and tribunals, respecting the concerns of justice, police, revenue, and trade, were accountable in the first instance to the governor-general, and amenable in the next place to the laws of Great Britain. The magistrates who superintended the police, and the officers who collected the revenues, were no longer to be entrusted with the distribution of justice, and the judging and punishing of crimes; powers which in their hands, might have been employed as engines of oppression. The Mahomedans and Hindoos were to preserve their own religion and laws; and without offering violence to their feelings or prejudices by sudden innovations, means were to be employed for engrafting slowly, but firmly, on an Asiatic stock, the equity and liberality which distinguish the English laws, and the enlightened domestic policy which has raised this island to unrivalled prosperity.

The information which preceded or accompanied this salutary bill, gave the most favourable view of the company's affairs, and of the great national benefits which have already accrued, and which might be expected in future to flow in still greater abundance from the Indian trade and territory. The revenues of the countries ceded to the company by Tippoo Sultan, were stated at 390,000*l.* and the future revenues of the British possessions in India, were estimated at nearly 7,000,000*l.* leaving a net surplus, after deducting the interest on the debts in India and the civil, military, and commercial charges of 1,059,000*l.* per ann. The annual sales of India goods in Europe, are estimated at nearly 5,000,000*l.* which exceeds the prime cost and charges by 743,600*l.* and the net surplus on the whole of the revenues and trade of the East India company, after paying eight per cent. dividend on the capital stock of five millions, is estimated at 1,239,241*l.* per ann.

BANK

**BANK OF ENGLAND.]** The company of the Bank was incorporated by parliament, in the 5th and 6th years of king William and queen Mary, by the name of the Governors and Company of the Bank of England; in consideration of the loan of 1,200,000*l.* granted to the government; for which the subscribers received almost 8 per cent. By this charter the company are not to borrow under their common seal, unless by act of parliament; they are not to trade, or suffer any person in trust for them to trade, in any goods or merchandize; but they may deal in bills of exchange, in buying or selling bullion, and in foreign gold and silver coin.

By an act of parliament, passed in the 8th and 9th year of Will. III. they were impowered to enlarge their capital stock to 2,201,171*l.* 10*s.* It was then also enacted that the Bank stock should be a personal, and not a real estate; that no contract, either in word or writing, for buying or selling Bank stock, should be good in law, unless registered in the books of the Bank within seven days, and the stock transferred in fourteen days, and that it should be felony, without the benefit of clergy, to counterfeit the common seal of the Bank, or any Bank note, or to alter or erase such notes.

By another act, passed in the 7th of queen Anne, the company were impowered to augment their capital to 4,402,343*l.* and they then advanced 400,000*l.* more to the government; and in 1714 they advanced another loan of 1,500,000*l.*

In the third year of the reign of king George I. the interest of their capital stock was reduced to 5 per cent. when the Bank agreed to deliver up as many exchequer bills as amounted to 2,000,000*l.* and to accept an annuity of 100,000*l.* and it was declared lawful for the Bank to call from their members, in proportion to their interests in their capital stock, such sums of money as in a general court should be found necessary. If any member should neglect to pay his share of the monies so called for, at the time appointed, by notice in the London Gazette, and fixed upon the Royal Exchange, it should be lawful for the Bank, not only to stop the dividend of such member, and to apply it toward payment of the money in question; but also to stop the transfers of the share of such defaulter, and to charge him with the interest of five per cent. per annum, for the money so omitted to be paid; and if the principal and interest should be three months unpaid, the Bank should then have power to sell so much of the stock belonging to the defaulter as would satisfy the same.

After this, the Bank reduced the interest of the 2,000,000*l.* lent to the government, from 5 to 4 per cent, and purchased several other annuities, which were afterwards redeemed by the government, and the national debt due to the Bank reduced to 1,600,000*l.* But in 1742, the company engaged to supply the government with 1,600,000*l.* at 3 per cent. which is now called the 3 per cent. annuities; so that the government was now indebted to the company 3,00,000*l.* the one half carrying 4, and the other 3 per cent.

In the year 1746, the company agreed that the sum of 986,800*l.* due to them in the Exchequer bills unsatisfied, on the duties for licences to sell spirituous liquors by retail, should be cancelled, and in lieu thereof to accept of an annuity of 39,442*l.* the interest of that sum at 4 per cent. The company also agreed to advance the farther sum of 1,000,000*l.* at 4 per cent. into the exchequer, for exchequer bills issued upon the credit of the duties arising from the malt and land-tax; in consideration of which, the company were enabled to augment their capital with 986,800*l.* the interest of which, as well as that of the other annuities, was reduced to three and a half per cent. till the 25th of December, 1757, and from that time to carry only 3 per cent.

In order to enable them to circulate the said exchequer bills, they established what is now called Bank circulation: the nature of which may be explained thus:

K k

The

The company of the Bank are obliged to keep cash sufficient to answer not only the common, but also any extraordinary demand that may be made upon them; and whatever money they have by them, over and above the sum supposed necessary for these purposes, they employ in what may be called the trade of the company; that is to say, in discounting bills of exchange, in buying gold and silver, and in government securities, &c. But when the Bank entered into the above mentioned contract, as they did not keep unemployed a larger sum of money than what they deemed necessary to answer their ordinary and extraordinary demands, they could not conveniently take out of their current cash so large a sum as a million, with which they were obliged to furnish the government, without either lessening the sum employed in discounting, buying gold and silver, &c. (which would have been very disadvantageous to them), or inventing some method that should answer all the purposes of keeping the million in cash. The method which they chose, and which fully answers their end, was as follows:

They opened a subscription, which they renew annually, for a million of money; the subscribers advance 10 per cent. and enter into a contract to pay the remainder, or any part thereof, whenever the Bank shall call upon them, under the penalty of forfeiting the 10 per cent. so advanced; in consideration of which, the Bank pays the subscriber 4 per cent. interest for the money paid in, and one fourth per cent. for the whole sum they agree to furnish; and in case a call should be made upon them for the whole, or any part thereof, the Bank farther agrees to pay them at the rate of 5 per cent. per annum for such sum, till they repay it, which they are under an obligation to do at the end of the year. By this means the Bank obtains all the purposes of keeping a million of money by them; and though the subscribers, if no call is made upon them (which is in general the case), receive six and a half per cent. for the money they advance, yet the company gains the sum of 23,500l. per annum by the contract; as will appear by the following account:

The Bank receives from the government, for the advance of a million,	} £. 30,000
The Bank pays to the subscribers who advance, 100,000l. and engage to pay (when called for) 900,000l. more	} 6,500
The clear gain to the Bank therefore is	<u>23,500</u>

This is the state of the case, provided the company should make no call on the subscribers, which they will be very unwilling to do, because it would not only lessen their profit, but affect the public credit in general.

Bank stock may not improperly be called a trading stock, as with this they deal very largely in foreign gold and silver, in discounting bills of exchange, at four per cent, until 1773, when it was advanced to five. Besides which they are allowed by government very considerable sums annually for the management of the annuities paid at their office. All which advantages render a share in their stock very valuable; though it is not equal in value to the East India stock. The company make dividends of the profits half-yearly, of which notice is publicly given; when those who have occasion for their money may readily receive it: but private persons, if they judge convenient, are permitted to continue their funds, and to have their interest added to the principal\*.

This company is under the direction of a governor, deputy-governor, and twenty-four directors, who are annually elected by the general court, in the same manner

\* The Bank company is supposed to have twelve millions of circulating paper.

as in the East India company. Thirteen, or more, compose a court of directors for managing the affairs of the company.

**SOUTH SEA COMPANY.]** During the long war with France, in the reign of queen Anne, the payment of the sailors of the royal navy being neglected, they received tickets instead of money, and were frequently obliged, by their necessities, to sell these tickets to avaricious men at a discount of 40l. and sometimes 50l. per cent. By this and other means the debts of the nation unprovided for by parliament, and which amounted to 9,471,321l. fell into the hands of these usurers. On which Mr. Harley, at that time chancellor of the Exchequer, and afterwards earl of Oxford, proposed a scheme to allow the proprietors of these debts and deficiencies 6l. per cent. per annum, and to incorporate them for the purpose of carrying on a trade to the South Sea; and they were accordingly incorporated under the title of "the Governor and Company of Merchants of Great Britain trading to the South Seas, and other parts of America, and for encouraging the Fishery, &c."

Though this company seem formed for the sake of commerce, the ministry never thought seriously, during the course of the war, about making any settlement on the coast of South America, which was what flattered the expectations of the people; nor was it indeed ever carried into execution, or any trade ever undertaken by this company, except the Alliance, in pursuance of the treaty of Utrecht, for furnishing the Spaniards with Negroes; of which this company was deprived, upon receiving 100,000l. in lieu of all claims upon Spain, by a convention between the courts of Great Britain and Spain, soon after the treaty of Aix la Chapelle, in 1748.

Some other sums were lent to the government, in the reign of queen Anne, at 6 per cent. In the third of George I. the interest of the whole was reduced to 5 per cent. and the company advanced two millions more to the government at the same interest. By the statute of the 6th of George I. it was declared, that they might redeem all or any of the redeemable national debts; in consideration of which, the company were empowered to augment their capital according to the sums they should discharge: and for enabling them to raise such sums for purchasing annuities, exchanging for ready money new Exchequer bills, carrying on their trade, &c. they might, by such means as they should think proper, raise such sums of money as in a general court of the company should be judged necessary. The company were also empowered to raise money on the contracts, bonds, or obligations, under their common seal, on the credit of their capital stock. But if the sub-governor, deputy-governor, or other members of the company, should purchase lands or revenues of the crown upon account of the corporation, or lend money by loan or anticipation on any branch of the revenue, other than such part only on which a credit of loan was granted by parliament, such sub-governor, or other member of the company, should forfeit treble the value of the money so lent.

The fatal South Sea scheme, transacted in the year 1720, was executed upon the last mentioned statute. The company had at first set out with good success, and the value of their stock, for the five years, had risen faster than that of any other company; and his majesty, after purchasing 10,000l. stock, had condescended to be their governor. Things were in this situation, when, taking advantage of the above statute, the South Sea bubble was projected. The pretence was, to raise a fund for carrying on a trade to the South Sea, and purchasing annuities, &c. paid to the other companies: and proposals were printed and distributed, shewing the advantages of this design. The sum necessary for carrying it on, together with the profits that were to arise from it, were divided into a certain number of shares, or subscriptions, to be purchased by persons disposed to adventure therein. And the better to carry on the deception, the directors engaged to make very large dividends; and actually declared, that every 100l. original stock would yield 50l. per annum: which occasioned so great a rise of their stock, that a share of 100l. was sold for upwards of

800l. This was in the month of July; but before the end of September it fell to 150l. by which multitudes were ruined. Most of the directors were severely fined, because even those who had no share in the deception, ought to have foreseen and prevented it.

By a statute of the 6th of George II. it was enacted, that from and after the 24th of June, 1733, the capital stock of this company, which amounted to 14,651,103l. 8s. 1d. and the shares of the respective proprietors, should be divided into four equal parts; three-fourths of which should be converted into a joint-stock, attended with annuities, after the rate of 4 per cent. until redemption, by parliament, and should be called the New South Sea annuities; and the other fourth part should remain in the company as a trading capital stock, attended with the residue of the annuities or funds payable at the Exchequer to the company for their whole capital, till redemption; and attended with the same sums allowed for the charge of management, with all effects, profits of trade, debts, privileges, and advantages, belonging to the South Sea company. That the accountant of the company should, twice every year, at Christmas, and Midsummer, or within one month after, state an account of the company's affairs, which should be laid before the next general court, in order to their declaring a dividend: and all dividends should be made out of the clear profits, and should not exceed what the company might reasonably divide without incurring any farther debt; provided that the company should not at any time divide more than 4 per cent. per annum, until their debts were discharged; and the South-Sea company, and their trading stock, should, exclusively from the new joint stock of annuities, be liable to all the debts and incumbrances of the company; and that the company should cause to be kept, within the city of London, an office and books, in which all transfers of the new annuities should be entered, and signed by the party making such transfer, or his attorney; and the person to whom such transfer should be made, or his attorney, should underwrite his acceptance; and no other method of transferring the annuities should be good in law.

The annuities of this company, as well as the other are now reduced to 3l. per cent.

This company is under the direction of a governor, sub-governor, deputy-governor, and twenty-one directors; but no person is qualified to be governor, his majesty excepted, unless such governor has, in his own name and right, 5000l. in the trading stock; the sub-governor is to have 4000l. the deputy-governor 3000l. and a director 2000l. in the same stock. In every general court, every member having in his own name and right 500l. in trading stock, has one vote; if 2000l. two votes; if 3000l. three votes, and if 5000l. four votes.

The East India company, the Bank of England, and the South Sea company, are the only incorporated bodies to which the government is indebted, except the Million Bank, whose capital is only one million, constituted to purchase the rever- sion of the long Exchequer orders.

The interest of all the debts owing by the government was lately reduced to 3 per cent. excepting only the annuities for the year 1758, the life annuities, and the Exchequer orders: but the South-Sea company still continues to divide 4 per cent. on their present capital stock; which they are enabled to do from the profits they make on the sums allowed to them for management of the annuities paid at their office, and from the interest of annuities which are not claimed by the proprietors.

As the prices of the different stocks are continually fluctuating above and below *par*, so when a person, who is not acquainted with transactions of that nature, reads in the papers the prices of stocks, where Bank stock is marked perhaps 127, India ditto 134 a 134½, South Sea ditto, 97½, &c. he is to understand that 100l. of those respective stocks fell at such a time for those several sums.

In comparing the prices of the different stocks one with another, it must be remembered, that the interest due on them from the time of the last payment, is taken into the current price, and the seller never receives any separate consideration for it, except in the case of India bonds, where the interest due is calculated to the day of the sale, and paid by the purchaser, over and above the premium agreed for. But as the interest on the different stock is paid at different times, this, if not rightly understood, would lead a person, not well acquainted with them, into considerable mistakes in his computation of their value; some always having a quarter's interest due in them more than others, which makes an appearance of a considerable difference in the price, when in reality there is none at all. Thus, for instance, Old South Sea annuities sell for 85*l.* or 85*l.* 10*s.* while New South Sea annuities fetch only 84*l.* or 84*l.* 15*s.* though each of them produces the same annual sum of 3 per cent; but the old annuities have a quarter's interest more due on them than the new annuities, which amounts to 15*s.* the exact difference. There are also considerations that will make one species of annuities sell somewhat lower than another, though of the same real value; one of which is, the annuities making but a small capital, and there not being, for that reason, so many people at all times ready to buy into that fund, as into others, where the capital is larger; because it is apprehended that whenever the government pays off the national debt, it will begin with that particular species of annuity, the capital of which is the smallest.

A stock may likewise be affected by the court of Chancery; for if that court should order the money which is under its direction to be laid out in any particular stock, that stock, by having more purchasers, will be raised to a higher price than any other of the like value.

By what has been said, the reader will perceive how much the credit and the interest of the nation depend on the support of the public funds, of which more particulars will be given under the article REVENUES. While the annuities are regularly paid, and the principal insured by the credit of both prince and people, foreigners will lend us their property, and all Europe be interested in our welfare; the paper of the companies will be converted into money and merchandise, and Great Britain can never want cash to carry her schemes into execution. In other nations, credit is founded on the word of the prince, if a monarchy; or that of the people, if a republic; but here it is established on the united interests of both, and to hold men by their interests, is deemed the surest tenure.

CONSTITUTION AND LAWS.] Tacitus, in describing such a constitution as that of England, seems to think, that however beautiful it may be in theory, it would be found impracticable in the execution. Experience has proved his mistake; for by contrivances unknown to antiquity, the English constitution has existed for above 500 years. It must be admitted, that it has received, during that time, many amendments, and suffered some interruptions: but its principles are the same with those described by the above mentioned historian, as belonging to the Germans, and the other northern ancestors of the English nation, and which are very improperly blended under the name of Gothic. On the first invasion of England by the Saxons, who came from Germany and the neighbouring countries, their laws and manners were pretty much the same as those celebrated by Tacitus. The people had a leader in time of war. The conquered lands, in proportion to the merits of his followers, and their abilities to serve him, were distributed among them; and the whole was considered as the common property which they were to unite in defending against all invaders. Fresh adventurers coming over, under separate leaders, the old inhabitants were driven into Wales; and those leaders, at last, assumed the title of kings over the several districts they had conquered. This change of appellation made them more respectable among the Britons, and their

neigh-

neighbour the Scots and Picts, but did not increase their power, which was still confined to military affairs.

All civil matters were proposed in a general assembly of the military officers and the people, till, by degrees, sheriffs and other civil officers were appointed. To Alfred we owe that masterpiece of judicial polity, the subdivision of England into wapentakes and hundreds, and the subdivision of hundreds into tythings, names that still subsist in England; and overseers were chosen to direct them for the good of the whole. The sheriff was the judge of all civil and criminal matters within the county, and to him, after the introduction of Christianity, was added the bishop. In process of time, as business multiplied, itinerant and other judges were appointed; but by the earliest records, it appears that all civil matters were decided by 12 or 16 men, living in the neighbourhood of the place where the dispute lay; and here we have the original of English juries. It is certain that they were in use among the earliest Saxon colonies, the institution being ascribed by bishop Nicholson to Woden himself, their great legislator and captain. Hence we find traces of juries in the laws of all those countries which adopted the feudal system, as in Germany, France, and Italy; which had a tribunal composed of 12 good men and true, equals or peers of the party litigant. In England we find mention made of them so early as the laws of king Ethelred, and that not as a new invention.

Before the introduction of Christianity, we know not whether the Saxons admitted of juries in criminal matters; but we are certain that there was no action so criminal as not to be compensated by money\*. A *mulct* was imposed in proportion to the guilt, even if it was the murder of the king, upon the malefactor, and by paying it he purchased his pardon. Those barbarous usages seem to have ceased soon after the Saxons were converted to Christianity; and cases of murder and felony were then tried, even in the king's court, by a jury.

Royalty, among the Saxons, was not, strictly speaking, hereditary, though in fact it came to be rendered so through the affection which the people bore for the blood of their kings, and for preserving the regularity of government. Even estates and honours were not strictly hereditary, till they were made so by William the Norman.

That prince, though he made considerable innovations in the English constitution, and is generally styled the Conqueror, in consequence of the victory which he obtained over Harold at the battle of Hastings, yet before ascending the throne he made a compact with his new subjects, by his coronation oath, the same with that of the Saxon kings. His administration was, however, tyrannical in a very great degree; but the constitution established under him in this kingdom was not absolute monarchy, but rather an ingraftment of the feudal tenures and other customs of Normandy upon the ancient Saxon laws of Edward the Confessor. He more than once swore to maintain those laws; and in the fourth year of his reign confirmed them in parliament; yet not without great alterations, to which the whole legislature agreed, by a more complete introduction of the strict feudal law, as it was practiced in Normandy; which produced a different political system, and changed both power and property in many respects; though the first principles of that law, and general notions of it, had been in use among the English some ages before. It must, indeed, be admitted, that William divided many of the English estates among his Norman followers, under pretence that their former owners had fought against him at the battle of Hastings; and he portioned out the lands into knights fees, an indetermined number of which formed a barony, and those baronies were given to the great noblemen who composed what is called the King's Court, or

\* Called by the Saxons *GUELTY*, and thence the word *guilty* in criminal trials.

Court of Peers, from every baron being a peer, or equal to another. In this court all civil, as well as military matters, and the proposition of knights and men, which each baron was to raise for the king's service, were settled. Even bishopricks were converted into lay baronies, and were obliged, as others, to furnish their quotas. In many respects, the first princes of the Norman line afterwards did all they could to efface from the minds of the people the remembrance of the Saxon constitution; but the attempt was to no purpose. The nobility, as well as the people, had their complaints against the crown, and after much war and bloodshed, the famous charter of English liberties, so well known by the name of Magna Charta, was forcibly obtained from king John, and confirmed by his son Henry III. who succeeded to the crown in 1216. It does not appear, that till this reign, and after much blood had been spilt, the commons of England were represented in parliament, or the great council of the nation; so entirely had the barons engrossed the disposal of property.

The precise year when the house of commons was formed is not known; but we are certain there was one in the reign of Henry III. though we shall not enter into any disputes about their specific powers\*. We therefore now proceed to describe the CONSTITUTION as it stands at present.

In all states there is an absolute supreme power, to which the right of legislation belongs; and which, by the admirable constitution of these kingdoms, is vested in the king, lords, and commons.

OF THE KING.] The supreme executive power of Great Britain and Ireland is vested by our constitution in a single person, king or queen; for it is indifferent to which sex the crown descends: the person entitled to it is immediately intrusted with all the ensigns, rights, and prerogatives of sovereign power.

The grand fundamental maxim upon which the right of succession to the throne of these kingdoms depends, is: "that the crown, by common law and constitutional custom, is hereditary; and this in a manner peculiar to itself; but that the right of inheritance may be limited by act of parliament: under which limitations the crown still continues hereditary."

That the reader may enter more clearly into the deduction of the following royal succession, by its being transferred from the house of Tudor to that of Stuart, it may be proper to inform him, that on the death of queen Elizabeth, without issue, it became necessary to recur to the other issue of her grandfather Henry VII. by Elizabeth of York his queen: whose eldest daughter Margaret, having married James IV. king of Scotland; king James the Sixth of Scotland, and of England the First, was the lineal descendant from that alliance. So that in his person, as clearly as in Henry VIII. centered all the claims of the different competitors from the Norman invasion downward; he being indisputably the lineal heir of William I. And what is still more remarkable, in his person also centered the right of the Saxon monarchs, which had been suspended from the Norman invasion till his succession; for Margaret the sister of Edgar Atheling, the daughter of Edward the

\* Judge Blackstone maintains, that a great or general council of the realm hath been held immemorially under the several names of *michel fynch*, or great council; *michel-gemote*, or great meeting; and more frequently *witena-gemote*, or the meeting of wise men. It was also styled in Latin *commune concilium regni*, and sometimes *communis regni Anglie*. We have instances of its meeting to order the affairs of the kingdom, to make new laws and amend the old, so early as the reign of Ina king of the West Saxons, A.D. 725, Offa, king of the Mercians, and Ethelbert king of Kent, in their several realms of the heptarchy. The Mix-

nova informs us, that king Alfred ordained for a perpetual usage, that these councils should meet twice a year or oftener if need be. Our succeeding Saxon and Danish monarchs held frequent councils of this sort, as appears from their respective codes of laws. There is also no doubt but these great councils were held regularly under the first princes of the Norman line; for in Edward the Third's time, an act of parliament made in the reign of William the Conqueror, was pleaded in the case of the Abbey of St. Edmundsbury, and judicially allowed by the court.

Outlaw,

Outlaw, and grand-daughter of king Edmund Ironside, was the person in whom the hereditary right of the Saxon kings, supposing it not abolished by the Conquest, resided. She married Malcolm III. king of Scotland; and Henry II. by a descent from Matilda their daughter, is generally called the restorer of the Saxon line. But it must be remembered, that Malcolm by his Saxon queen, had sons as well as daughters; and that the royal family of Scotland, from that time downward, were the offspring of Malcolm and Margaret. Of this royal family king James I. was the lineal descendant; and therefore united in his person every possible claim by hereditary right, to the English as well as Scottish throne, being the heir both of Egbert and William the Norman.

At the Revolution in 1688, the convention of estates or representative body of the nation, declared, that the misconduct of James II. amounted to an abdication of the government, and that the throne was thereby vacant.

In consequence of this vacancy, and from a regard to the ancient line, the convention appointed the next Protestant heirs of the blood royal of king Charles I. to fill the vacant throne, in the old order of succession; with a temporary exception, or preference to the person of king William III.

On the impending failure of the Protestant line of king Charles I. (whereby the throne might again have become vacant) the king and parliament extended the settlement of the crown to the Protestant line of king James I. viz. to the princess Sophia of Hanover, and the heirs of her body, being protestants; and she is now the common stock, from whom the heirs of the crown descend\*.

The

The true ground and principle, upon which the Revolution proceeded, was entirely a new case in politics, which had never before happened in our history; the abdication of the reigning monarch, and the vacancy of the throne thereupon. It was not a defeasance of the right of succession, and a new limitation of the crown, by the king and both houses of parliament: it was the act of the nation alone, upon a conviction that there was no king in being; for, in a full assembly of the lords and commons, met in convention upon the supposition of this vacancy, both houses constituted the kingdom, by breaking the original contract between king and people; and by the advice of Jesuits, and other wicked persons, having violated the fundamental laws; and having withdrawn himself out of this kingdom, has abdicated the government, and that the throne is thereby vacant." Thus ended at once, by this sudden and unexpected revolution, the old line of succession: which from the Norman invasion had lasted above 600 years, and from the union of the Saxon heptarchy in king Egbert, almost 900.

Though in some few points the revolution was not so perfect as might have been wished, yet from thence a new æra commenced, in which the bounds of prerogative and liberty have been better defined, the principles of government more thoroughly examined and understood, and the rights of the subject more explicitly guarded by legal provisions, than in any other period of the English history. It is worthy of observation, that the convention avoided with great wisdom the extremes into which the visionary theories of some zealous republicans would have led them.

They held that the misconduct of king James amounted to an endeavour to subvert the constitution, and not to an actual subversion, or total dissolution of the government. They, therefore, very prudently voted it to amount to no more than an abdication of the government, and a consequent vacancy of the throne; whereby the government was allowed to subsist, though the executive magistrate was gone: and the kingly office to remain, though James was no longer king. Thus the constitution was kept entire; which, upon every sound principle of government, must otherwise have fallen to pieces, had so principal and constituent a part as the royal authority been abolished, or even suspended.

Hence it is easy to collect, that the title to the crown is at present hereditary, though not quite so absolutely hereditary as formerly; and the common stock or ancestor, from whom the descent must be derived, is also different. Formerly the common stock was king Egbert; then William the Conqueror; afterward, in James I.'s time, the two common stocks united, and so continued till the vacancy of the throne in 1688: now it is the princess Sophia, in whom the inheritance was vested by the new king and parliament. Formerly the descent was absolute, and the crown went to the next heir without any restriction; but now, upon the new settlement, the inheritance is conditional; being limited to such heirs only, of the body of the princess Sophia, as are Protestant members of the church of England, and are married to none but Protestants.

In this due medium consists the true constitutional notion of right of succession to the imperial crown of these kingdoms. The extremes, between which it steers, have been found destructive to those ends for which societies were formed, and continued. Where the first magistrate, upon every succession, is elected by the people, and may by the express provision of the laws be deposed, (if not punished) by his subjects, this may sound like the perfection of liberty, and look well enough when delineated on paper; but in practice will be found always dangerous, often ruinous. On the other hand, divine indefeasible hereditary right, when joined with the doctrine of unlimited passive obedience, is of all constitutions the most thoroughly slavish and intolerable. But when such an hereditary right, as our laws have created and vested in the royal stock, is interwoven with those liberties which are equally the inheritance of the subject, this union will form a constitution, in theory the most beautiful of any, in practice the most approved, and, there is every reason to hope, in duration the most permanent. This constitution it is the duty of every Briton to understand, to revere, and to defend.

The principal duties of the king are expressed in his oath at the coronation, which is administered by one of the archbishops, or bishops of the realm, in the presence of all the people; who, on their parts, do reciprocally take the oath of allegiance to the crown. This coronation oath is conceived in the following terms:

"*T.* archbishop, or bishop, shall say, Will you solemnly promise and swear, to govern the people of this kingdom of England, and the dominions thereunto belonging, according to the statutes in parliament agreed on, and the laws and customs of the same?—*The king or queen shall say,* I solemnly promise so to do.

"*Archbishop or bishop.* Will you to your power cause law and justice, in mercy, to be executed in all your judgments?—*King or Queen.* I will.

"*Archbishop or bishop.* Will you to the utmost of your power maintain the laws of God, the true profession of the gospel, and the Protestant reformed religion established by the law? And will you preserve unto the bishops and clergy of this realm, and to the churches committed to their charge, all such rights and privileges as by the law do or shall appertain unto them, or any of them?—*King or queen.* All this I promise to do.

"*After*

"After this the king or queen, laying his or her hand upon the holy gospels, shall say, The things which I have here before promised, I will perform and keep: so help me God. And then kifs the book."

This is the form of the coronation oath, as it is now prescribed by our laws; and we may observe, that in the king's part, in this original contract, are expressed all the duties that a monarch can owe to his people; viz. to govern according to law; to execute judgment in mercy; and to maintain the established religion. With respect to the latter of these three branches, we may farther remark, that by the act of union, § Anne c. 8. two preceding statutes are recited and confirmed; the one of the parliament of Scotland, the other of the parliament of England, which enact, the former, that every king at his succession shall take and subscribe an oath, to preserve the Protestant religion, and Presbyterian church-government in Scotland: the latter that, at his coronation, he shall take and subscribe a similar oath, to preserve the settlement of the church of England within England, Ireland, Wales, and Berwick, and the territories thereunto belonging.

The king of Great Britain, notwithstanding the limitations of the power of the crown, is the greatest monarch reigning over a free people. His person is sacred in the eye of the law, which makes it high treason to imagine or intend his death; neither can he, in himself, be deemed guilty of any crime, the law taking no cognizance of his actions, but only in the persons of his ministers, if they infringe the laws of the land. As to his power, it is very great, though he has no right to extend his prerogative beyond the ancient limits, or the boundaries prescribed by the constitution; he can make no new laws, nor raise any new taxes, nor act in opposition to any of the laws; but he can make war or peace; send and receive ambassadors; make treaties of league and commerce; levy armies, and fit out fleets; for the defence of his kingdom, the annoyance of his enemies, or the suppression of rebellions; grant commissions to his officers both by sea and land, or revoke them at pleasure; dispose of all magazines, castles, &c. summon the parliament to meet, and when met, adjourn, prorogue, or dissolve it at pleasure; refuse his assent to any bill, though it had passed both houses; which, consequently, by such a refusal, has no more force than if it had never been moved; but this is a prerogative that the kings of England have very seldom chosen to exercise. He enjoys the right of choosing his own council; of nominating all the great officers of state, of the household, of the army, the navy, and the church: and in fine, is the fountain of honour, from whom all degrees of nobility and knighthood are derived. Such is the dignity and power of a king of Great Britain.

[OF THE PARLIAMENT.] Parliaments, or general councils, in some shape, are, as has been observed\*, of as high antiquity as the Saxon government in this island, and coeval with the kingdom itself. Blackstone, in his valuable Commentaries, says, "it is generally agreed, that in the main the constitution of parliament, as it now stands, was marked out so long ago as the 17th of king John, A. D. 1215, in the great charter granted by that prince; wherein he promises to summon all archbishops, bishops, abbots, lords, and greater barons personally; and all other tenants in chief, under the crown, by the sheriff and bailiffs, to meet at a certain place, with forty days notice, to assess aids and scutages when necessary. And this constitution hath subsisted, in fact, at least from the year 1266, 49 Henry III. there being still extant writs of that date to summon knights, citizens, and burghers to parliament."

The parliament is assembled by the king's writs, and its sitting must not be intermitted above three years. Its constituent parts are, the king sitting there in his royal political capacity, and the three estates of the realm; the lords spiritual, the

\* See the note, page 255.

lords temporal (who sit together with the king in one house), and the commons, who sit by themselves in another. The king and these three estates together form the great corporation or body politic of the kingdom, of which the king is said to be *caput, principium, et finis*. For upon their coming together the king meets them, either in person, or by representation; without which there can be no beginning of a parliament; and he also has alone the power of dissolving them.

It is highly necessary for preserving the balance of the constitution, that the executive power should be a branch, though not the whole, of the legislature. The crown cannot begin of itself any alterations in the present established law; but it may approve or disapprove of the alterations suggested and consented to by the two houses. The legislature therefore cannot abridge the executive power of any rights which it now has by law, without its own consent: since the law must perpetually stand as it now does, unless all the powers will agree to alter it. And herein consists the true excellence of the English government, that all the parts of it reciprocally checking each other's encroachments, each retains its due weight, and the constitution preserves its inalterable stability.

The lords spiritual consist of two archbishops and twenty-four bishops. The lords temporal consist of all the peers of the realm, the bishops not being in strictness held to be such, but merely lords of parliament. Some of the peers sit by descent, as do all ancient peers; some by creation, as do all the new-made ones: others, since the union with Scotland, by election, which is the case of the sixteen peers, who represent the body of the Scotch nobility. The number of peers is indefinite, and may be increased at will by the power of the crown.

A body of nobility is peculiarly necessary in our mixed constitution, in order to defend the rights of both the crown and the people. It creates and preserves that gradual scale of dignity, which proceeds from the peasant to the prince; rising like a pyramid from a broad foundation, and diminishing to a point as it rises. The nobility therefore are the pillars, which are reared from among the people, more immediately to support the throne; and if that falls, they must also be buried under its ruins. Accordingly, when in the last century the commons had determined to extirpate monarchy, they also voted the house of lords to be useless and dangerous.

The commons consist of all such men of any property in the kingdom as have not seats in the house of lords; every one of which has a voice in parliament, either personally, or by his representatives\*. In a free state, every man, who is supposed a free agent, ought to be, in some measure, his own governor; and therefore a branch at least of the legislative power should reside in the whole body of the people. In so large a state as ours, it is very wisely contrived, that the people should do that by their representatives, which it is impracticable to perform in person: representatives, chosen by a number of minute and separate districts, wherein all the voters are, or easily may be, distinguished. The counties are therefore represented by knights, elected by the proprietors of lands: the cities and boroughs are represented by citizens and burgesses, chosen by the mercantile part, or supposed trading interest of the nation †. The number of English representatives is 513, and

\* This must be understood with some limitation. Those who are possessed of land-estates, though to the value of only 4*s.* per annum, have a right to vote for members of parliament; as have most of the members of corporations, boroughs, &c. But there are very large trading towns, and populous places, which send no members to parliament; and of those towns which do send members, great numbers of the inhabitants have no votes. Many

thousand persons of great personal property, have, therefore, no representatives. Indeed, the inequality of the representation has been justly considered as one of the greatest imperfections in the English constitution.

† Copy of the bribery oath, which is administered to all persons before they poll:

" I do swear (or, heing one of the people called Quakers, do solemnly affirm)

of Scotch 45; in all 558. And every member, though chosen by one particular district, when elected and returned, serves for the whole realm. For the end of his coming thither is not particular, but general; not merely to serve his constituents, but also the commonwealth, and to advise his majesty, as appears from the writ of summons.

These are the constituent parts of a parliament, the king, the lords spiritual and temporal, and the commons. Parts, of which each is so necessary, that the consent of all three is required to make any new law that should bind the subject. Whatever is enacted for law by one, or by two only, of the three, is no statute; and to it no regard is due, unless in what relates to their own privileges.

The power and jurisdiction of parliament, says sir Edward Coke, is so transcendent and absolute, that it cannot be confined, either for causes or persons, within any bounds. It hath sovereign and uncontrollable authority in making, confirming, enlarging, restraining, abrogating, repealing, reviving, and expounding of laws, concerning matters of all possible denominations, ecclesiastical or temporal, civil, military, maritime, or criminal: this being the place where that absolute despotic power, which must in all governments reside somewhere, is entrusted by the constitution of these kingdoms. All mischiefs and grievances, operations and remedies, that transcend the ordinary course of the laws, are within the reach of this extraordinary tribunal. It can regulate or new-model the succession to the crown; as was done in the reign of Henry VIII. and William III. It can alter the established religion of the land; as was done in a variety of instances, in the reign of king Henry VIII. and his three children, Edward VI. Mary, and Elizabeth. It can change and create afresh even the constitution of the kingdom, and of parliaments themselves; as was done by the act of union, and the several statutes for triennial and septennial elections. It can do every thing that is not naturally impossible; and therefore some have not scrupled to call its power by a figure rather too bold, the *omnipotence of parliament*. But then its power, however great, was given to it in trust, and therefore ought to be employed according to the rules of justice, and for the promotion of the general welfare of the people. And it is most essential to the liberties of the kingdom, that such members be delegated to this important trust, as are most eminent for their probity, their fortitude, and their knowledge; for it was a known apophthegm of the great lord treasurer Burleigh, "that England could never be ruined but by a parliament:" and, as sir Matthew Hale observes, this being the highest and greatest court, over which none other can have jurisdiction in the kingdom, if by any means a misgovernment should any way fall upon it, the subjects of this kingdom are left without all manner of legal remedy.

In order to prevent the mischiefs that might arise, by placing this extensive authority in hands that are either incapable, or else improper, to manage it, provision is made, that no one shall sit or vote in either house of parliament unless he be twenty-one years of age. To prevent innovations in religion and government, it is enacted that no member shall vote or sit in either house, till he hath, in the presence of the house, taken the oaths of allegiance, supremacy, and abjuration; and subscribed and repeated the declaration against transubstantiation, the invocation of saints, and the sacrifice of the mass. To prevent dangers that may arise to the kingdom from foreign attachments, connexions, or dependencies, it is enacted, that no alien, born out of the dominions of the crown of Great Britain, even

affirm) I have not received or had, by myself, or any person whatsoever in trust for me, or for my use and benefit, directly or indirectly, any sum or sums of money, office, place or employment, gift or reward, or any promise or security for any money, office, or employment, or gift, in order to give my vote at this election; and that I have not before been polled at this election. So help me God."

though

though he be naturalized, shall be capable of being a member of either house of parliament.

Some of the most important privileges of the members of either house are, privilege of speech, of person, of their domestics, and of their lands and goods. As to the first, privilege of speech, it is declared by the statute of 1 W. & M. ft. 2. c. 2. as one of the liberties of the people, "that the freedom of speech, and debates, and proceedings in parliaments, ought not to be impeached or questioned in any court or place out of parliament." And this freedom of speech is particularly demanded of the king in person, by the speaker of the house of commons, at the opening of every new parliament. So are the other privileges, of person, servants, lands, and goods. This includes not only privilege from illegal violence, but also from legal arrests, and seizures by process from the courts of law. To assault by violence a member of either house, or his menial servants, is a high contempt of parliament, and as such punished with the utmost severity. Neither can any member of either house be arrested and taken into custody, nor served with any process of the courts of law; nor can his menial servants be arrested; nor can any entry be made on his lands; nor can his goods be distrained or seized, without a breach of the privilege of parliament\*.

The house of lords have a right to be attended, and consequently are, by the judges of the court of king's bench and common pleas, and such of the barons of the exchequer as are of the degree of the coif, or have been made serjeants at law; as likewise by the masters of the court of chancery; for their advice in point of law, and for the greater dignity of their proceedings.

The speaker of the house of lords is generally the lord chancellor, or lord-keeper of the great seal, which dignities are commonly vested in the same person. Each peer has a right, when a vote passes contrary to his sentiments, to enter his dissent on the journals of the house, with the reasons for such dissent; which is usually styled his protest. Upon particular occasions these protests have been so bold as to give offence to the majority of the house, and have therefore been expunged from the journals; but this is considered a violent measure.

The house of commons may be properly styled the grand inquest of Great Britain, empowered to enquire into all national grievances. The peculiar laws and customs of the house of commons relate principally to the raising of taxes, and the elections of members to serve in parliament. With regard to taxes, it is the ancient indisputable privilege, and the right of the house of commons, that all grants of subsidies, or parliamentary aids, do begin in their house, and be first bestowed by them; although their grants are not effectual until they have the assent of the other two branches of the legislature. The general reason given for this exclusive privilege of the house of commons is, that the supplies are raised upon the body of the people, and therefore it is proper that they alone should have the right of taxing themselves. And so reasonably jealous are the commons of this privilege, that herein they will not suffer the other house to exert any power but that of rejecting; they will not permit the least alteration or amendment to be made by the lords to the mode of taxing the people by a money-bill. Under this appellation are included all bills by which money is directed to be raised upon the subject, for any purpose, or in any shape whatsoever; either for the exigencies of government, and collected from the kingdom in general, as the land-tax; or for private benefit, and collected in any particular district, as by turnpikes, parish-rates, and the like.

\* This exemption from arrests for lawful debts, was always considered by the public as a grievance. The lords and commons, therefore, generously relinquished their privilege by act of parliament in 1770; and members of both houses may now be sued like other debtors.

The method of making laws is much the same in both houses. In each house the act of the majority binds the whole: and this majority is declared by votes openly and publicly given; not as at Venice, and many other senatorial assemblies, privately or by ballot. This latter method may be serviceable to prevent intrigues, and unconstitutional combinations, but it is impossible to be practised in the house of commons, where every member's conduct is subject to the future censure of his constituents, and therefore should be openly submitted to their inspection.

To bring a bill into the house of commons, if the relief sought by it be of a private nature, it is first necessary to prefer a petition, setting forth the grievance desired to be remedied. This petition must be presented by a member, and, when founded on facts that may be in their nature disputed, is referred to a committee of members, who examine the matter alleged, and report it to the house; and then (or, otherwise, upon the mere petition) leave is given to bring in the bill. In public matters, the bill is brought in upon motion made to the house, without any petition. (In the house of lords, if the bill begins there, it is, when of a private nature, referred to two of the judges, to examine and report the state of the facts alleged, to see that all necessary parties consent, and to settle all points of technical propriety.) This is read a first time, and, at a convenient distance, a second time; and after each reading, the speaker explains to the house the substance of the bill, and puts the question, whether it shall proceed any farther. The introduction of the bill may be opposed, as the bill itself may at either of the readings; and, if the opposition succeeds, the bill must be dropt for that session.

After the second reading, it is committed, that is, referred to a committee; which is either selected by the house in business of small importance; or else, if the bill is a matter of great or national consequence, the house resolves itself into a committee of the whole house. A committee of the whole house is composed of every member; and, to form it, the speaker quits the chair, (another member being appointed chairman), and may sit and debate as a private member. In these committees, the bill is debated clause by clause, amendments made, the blanks filled up, and sometimes the bill entirely new-modelled. After it has gone through the committee, the chairman reports it to the house, with such amendments as the committee have made; and then the house reconsider the whole bill again, and the question is repeatedly put upon every clause and amendment. When the house has agreed or disagreed to the amendments of the committee, and sometimes added new amendments of their own, the bill is then ordered to be engrossed, or written in a strong gross hand, on one or more long rolls of parchment sewed together. When this is finished, it is read a third time, and amendments are sometimes then made to it; and if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a rider. The speaker then again explains the contents; and, holding it up in his hands, puts the question, whether the bill shall pass? If this be agreed to, the title to it is then settled. After this, one of the members is directed to carry it to the lords, and desire their concurrence; who, attended by several more, carries it to the bar of the house of peers, and there delivers it to their speaker, who comes down from his woofack to receive it. If there passers through the forms, as in the other house (except engrossing, which is already done), and if rejected, no more notice is taken, but it passes *sub silentio*, to prevent unbecoming altercations. But if it be agreed to, the lords send a message by two masters in chancery (or, sometimes, in matters of high importance, by two of the judges) that they have agreed to the same: and the bill remains with the lords, if they have made no amendment. But if any amendments are made, such amendments are sent down with the bill, to receive the concurrence of the commons. If the commons disagree to the amendments, a conference usually follows between

tween

tween members deputed from each house; who, for the most part, settle and adjust the difference: but if both houses remain inflexible, the bill is dropped. If the commons agree to the amendments, the bill is sent back to the lords by one of the members, with a message to acquaint them therewith. The same forms are observed, *mutatis mutandis*, when the bill begins in the house of lords. But when an act of grace or pardon is passed, it is first signed by his majesty, and then read once only in each of the houses, without any new engrossing or amendment. And when both houses have done with any bill, it is deposited in the house of peers, to wait the royal assent; except in the case of a money-bill, which, after receiving the concurrence of the lords, is sent back to the house of commons. No expression can be inserted, nor the slightest alteration take place, till the speaker, or the chairman, puts the question; which, in the house of commons, is answered by *aye*, or *no*; and, in the house of peers, by *content*, or *not content*.

The giving the royal assent to bills is a matter of great form. When the king is to pass bills in person, he appears on his throne in the house of peers, in his royal robes, with the crown on his head, and attended by his great officers of state, and heralds. A seat on the right hand of the throne, where the princes of Scotland, when peers of England, formerly sat, is reserved for the prince of Wales. The other princes of the blood sit on the left hand of the king; and the chancellor on a close bench removed a little backwards. The viscounts and temporal barons, or lords, face the throne, on benches or wool-packs, covered with red cloth or baize. The bench of bishops runs along the house to the bar on the right hand of the throne; as the dukes and earls do on the left. The chancellor and judges, on ordinary days, sit upon wool-packs between the barons and the throne. The common opinion is, that the house sitting on wool is symbolical of wool being formerly the staple commodity of the kingdom. Many of the peers, on solemn occasions, appear in their parliamentary robes. None of the commons have any robes, excepting the speaker, who wears a long black silk gown; and when he appears before the king, it is trimmed with gold.

The royal assent may be given two ways: 1. In person. When the king sends for the house of commons to the house of peers, the speaker carries up the money-bill or bills in his hand; and, in delivering them, he addresses his majesty in a solemn speech, in which he seldom fails to extol the generosity and loyalty of the commons, and to tell his majesty how necessary it is to be frugal of the public money. It is upon this occasion, that the commons of Great Britain appear in their highest lustre. The titles of all bills that have passed both houses are read; and the king's answer is declared by the clerk of the parliament in Norman-French. If the king consents to a public bill, the clerk usually declares, *le roy le veut*, "the king wills it so to be;" if to a private bill, *soit fait comme il est désiré*, "be it as it is desired." If the king refuses his assent, it is in the gentle language of *le roy l'avisera*, "the king will advise upon it." When a money-bill is passed, it is carried up and presented to the king by the speaker of the house of commons, and the royal assent is thus expressed, *le roy remercie ses loyaux sujets, accepte leur benevolence, et aussi le veut*, "the king thanks his loyal subjects, accepts their benevolence, and wills it so to be." In case of an act of grace, which originally proceeds from the crown, and has the royal assent in the first stage of it, the clerk of the parliament thus pronounces the gratitude of the subject; *les prelates, seigneurs, et commons, en ce present parlement assemblez, au nom de tous vous autres sujets, remercient tres humblement votre majesté, et prient à Dieu vous donner en santé bonne vie et longue*; "the prelates, lords, and commons, in this present parliament assembled, in the name of all your other subjects, most humbly thank your majesty, and pray to God to grant you in health and wealth long to live." 2. By the statute 33 Hen. 7. VIII. c. 21. the king may give his assent by letters patent under his great seal,

signed

signed with his hand, and notified, in his absence, to both houses assembled together in the high house, by commissioners, consisting of certain peers, named in the letters. And when the bill has received the royal assent in either of these ways, it is then, and not before, a statute or act of parliament.

This statute or act is placed among the records of the kingdom; there needing no formal promulgation to give it the force of a law as was necessary by the civil law with regard to the emperor's edicts; because every man in England is, in judgment of law, party to the making of an act of parliament, being present by his representative. However, copies are usually printed at the king's press, for the information of the whole land.

An act of parliament, thus made, is the exercise of the highest authority that this kingdom acknowledges upon earth. It hath power to bind every subject in the land, and the dominions thereunto belonging; nay, even the king himself, if particularly named. And it cannot be altered, amended, dispensed with, suspended, or repealed, but in the same forms, and by the same authority of parliament: for it is a maxim in law, that it requires the same strength to dissolve as to create an obligation.

Such is the parliament of Great Britain; the source and guardian of our liberties and properties, the strong cement which binds the foundation and superstructure of our government, and the wisely concerted balance maintaining an equal poise, that no one part of the three estates overpower or distress either of the other.

From the above general view of the English constitution, it appears, that no security for its permanency, which men can devise, is wanting. If it should be objected, that parliaments may become so corrupted as to give up or betray the liberties of the people, the answer is, that parliaments, as every other body politic, are supposed to watch over their political existence as a private person does his natural life. If a parliament was to act treacherously to its constituents, it must become *sele de se*, an evil that no human provisions can guard against. But there are great resources of liberty in England; and though the constitution has been dangerously wounded, and sometimes overturned, yet its own innate powers have recovered, and still preserve it.

The king of England, besides his high court of parliament, has subordinate officers and ministers to assist him, who are responsible for their advice and conduct. They are named by the king, without either patent or grant; and on taking the necessary oaths, they become privy-counsellors during the life of the king that chooses them, but subject to removal at his pleasure.

The duty of a privy-counsellor appears from the oath of office, which consists of seven articles: 1. To advise the king according to the best of his cunning and discretion. 2. To advise for the king's honour and good of the public, without partiality through affection, love, need, doubt, or dread. 3. To keep the king's counsel secret. 4. To avoid corruption. 5. To help and strengthen the execution of what shall be there resolved. 6. To withstand all persons who would attempt the contrary. And, lastly, in general, 7. To observe, keep, and do all that a good and true counsellor ought to do to his sovereign lord.

As no government can be so complete as to be provided with laws that may answer every unforeseen emergency, the privy-council, in such cases, must supply the deficiency. Upon great and urgent occasions, such as that of a famine, or the dread of one, they can supersede the operation of the law, if the parliament is not sitting; but this is considered as illegal, and an act of parliament must pass for the pardon and indemnification of those concerned.

Among the privy-counsellors, the two secretaries of state are more officially so than the others, as they are entrusted with the king's signet, and are supposed to

advise him in acts of government that may not be proper to be communicated even to a privy-counsellor; such as giving orders for secret expeditions, correspondence with foreign agents, securing traitors, and the like. The secretaryship of state is now held by two noblemen or gentlemen; formerly the king nominated three, but the office was not then of that consequence which it is now. Since the accession of the family of Hanover, we have likewise known three principal secretaries of state; but one of them was supposed to transact the affairs of Scotland, which are now often committed to other ministers. Upon the increase of the British colonies, a new board of trade was erected, and the first commissioner acted as secretary for the American affairs, but without that title. A third secretary of state was afterwards appointed for carrying on the American war, whose office ceased with the peace; the board of trade also hath been abolished as useless.

The office of secretary of state was formerly divided into a southern and a northern department. The southern contained France, Spain, Portugal, Italy, the Swiss Cantons, Constantinople, and, in short, all the states in the southern part. The northern comprehended the different states of Germany, Prussia, Poland, Russia, Sweden, Denmark, Holland, Flanders, and the Hanseatic towns. This distinction is now abolished; and there is one secretary for foreign, and another for domestic affairs.

The cabinet-council is a committee of the privy-council, consisting of a select number of ministers and noblemen, according to the king's opinion of their integrity and abilities, or attachment to the views of the court; but though its operations are powerful and extensive, a cabinet-council is not essential to the constitution of England.

This observation naturally leads me to mention the person who is so well known by the name of the *first minister*; a term unknown to the English constitution, though the office, in effect, is perhaps necessary. The constitution points out the lord high chancellor as minister, but the affairs of his own courts give him sufficient employment. When the office of first lord of the treasury is united with that of chancellor of the exchequer in the same person, he is considered as first minister. The truth is, his majesty may make any of his servants his first minister. But though it is no office, yet there is a responsibility annexed to the name and common repute, that renders it a post of difficulty and danger. I shall now take a short review of the nine great officers of the crown, who by their posts take place next to the princes of the royal family and the two primates.

The first is the lord high-steward of England. This is an office very ancient, and formerly was hereditary, or at least for life; but now, and for centuries past, it is exercised only occasionally; that is, at a coronation, or to sit as judge on a peer or peers, when tried for a capital crime. In coronations it is held for that day only, by some nobleman of the first rank. In cases of trials, it is exercised generally by the lord chancellor, or lord keeper; whose commission, as high steward, ends with the trial, by breaking his white rod, the badge of office.

The lord high chancellor presides in the court of chancery, to moderate the severities of the law, in all cases where the property of the subject is concerned, and he is to determine according to the dictates of equity and reason. He is an officer of the greatest weight and power of any now subsisting in the kingdom, and is superior in precedence to every temporal lord. He is a privy-counsellor by his office, and, according to some, prolocutor of the house of lords by prescription. To him belongs the appointments of all justices of the peace; he is vintor in right of the king of all hospitals and colleges of the king's foundation, and patron of all the king's livings under the value of 20*l.* per annum in the king's books. He is the general guardian of all infants, idiots, and lunatics; and hath the superintendance

tendance of all charitable uses in the kingdom, over and above the extensive jurisdiction which he exercises in his judicial capacity in the court of chancery.

The post of lord high treasurer has of late been vested in a commission, consisting of five persons, who are called lords of the treasury; but the first commissioner is supposed to possess the power of lord high treasurer. He has the management and charge of all the revenues of the crown kept in the exchequer; as also the letting of the leases of all crown-lands, and the gift of all places belonging to the customs in the several parts of the kingdom. From this short view of his office, its importance may be easily understood; as he has, in fact, the public finances in his hands, besides the disposal of so great a number of lucrative places, that the bare catalogue of them would exceed the bounds we allot to a long article.

The lord president of the council was an officer formerly of great power, and hath precedence next after the lord chancellor and lord treasurer. His duty is to propose all the business transacted at the council-board, and to report to the king, when his majesty is not present, all its debates and proceedings. It is a place of great dignity as well as difficulty, on account of the number of American and West India causes, captures, and the like affairs, that come before the board; all which may be abridged, to the great conveniency of the subject, by an able president.

The office of lord privy seal consists in his putting the king's seal to all charters, grants, and the like, which are signed by the king, in order to their passing the great seal. The lord privy seal has likewise under his cognizance several other affairs, which do not require the great seal; and he is responsible if he should apply the privy seal to any thing against the law of the land.

The office of lord great chamberlain of England is hereditary to the duke of Ancafter's family. He attends the king's person, on his coronation, to dress him; he has likewise charge of the house of lords during the sitting of parliament; and of sitting up Westminster hall for coronations, trials of peers, or impeachments.

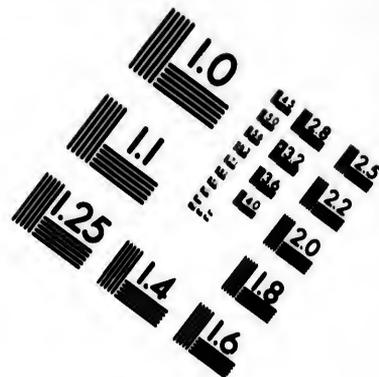

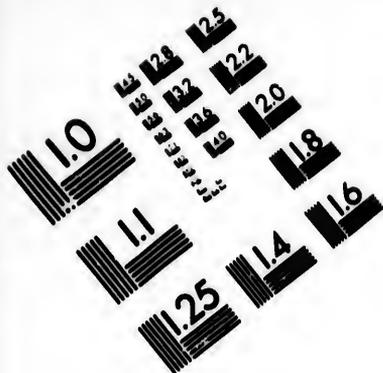

The office of lord high constable has been disused since the attainer and execution of Stafford duke of Buckingham, in the year 1521, but is occasionally revived for a coronation. It was formerly a place of the highest trust, as it commanded all the king's forts and garrisons, and took place of all officers in the field.

The duke of Norfolk is hereditary earl marshal of England. Before England became so commercial a country as it has been for a hundred years past, this office required great abilities, learning, and knowledge of the English history. In time of war he was judge of army-causes, and decided according to the principles of the civil law. If the cause did not admit of such a decision, it was left to a personal combat, which was attended with a variety of ceremonies; the arrangement of which fell within the marshal's province. To this day he, or his deputy, regulates all points of precedency according to the archives kept in the heralds' office, which is entirely within his jurisdiction. He directs all solemn processions, coronations, proclamations, general mournings, and the like.

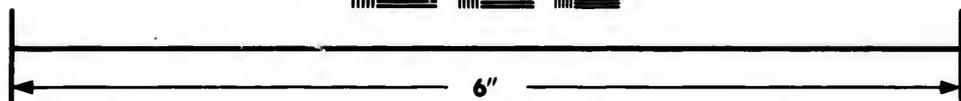

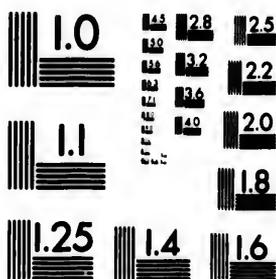

The office of lord high admiral of England\* is now likewise held by commission, and is equal in its importance to any of the preceding, especially since the increase of the British naval power. The English admiralty is a board of direction as well as execution, and is in its proceedings independent of the crown itself. All trials upon life and death, in maritime affairs, are appointed and held under a commission immediately issuing from that board; and the members, must sign even the death warrants for execution; but it may be easily conceived, that, as they are re-

\* The last lord high admiral was George prince of Denmark, and husband to queen Anne.

moveable at pleasure, they do nothing that can interfere with the prerogative of the crown, and conform themselves to the directions they receive from his majesty. The board of admiralty regulates the naval force of the realm, and names all its officers, or confirms them when named; so that its jurisdiction is very extensive. They appoint vice-admirals under them; but an appeal from them lies to the high court of admiralty, which is of a civil nature: London is the place where it is held; and all its processes and proceedings run in the lord high admiral's name, or those of the commissioniers, and not in that of the king. The judge of this court is commonly a doctor of the civil law, and its proceedings are according to the method of the civil law; but all criminal matters, relating to piracies, and other capital offences committed at sea, are tried and determined according to the laws of England, by witnesses and a jury, ever since the reign of Henry VIII. It now remains to treat of the courts of law in England.

[COURTS OF LAW.] The court of chancery, which is a court of equity, is next in dignity to the high court of parliament, and is designed to relieve the subject against frauds, breaches of trust, and other oppressions; and to mitigate the rigour of the law. The lord high chancellor sits as sole judge, and in his absence the master of the rolls. The form of proceeding is by bills, answers, and decrees; the witnesses being examined in private: however, the decrees of this court are only binding to the persons of those concerned in them, for they do not affect their lands and goods; and consequently, if a man refused to comply with the terms, they can do nothing more than send him to the prison of the Fleet. This court is always open; and if a man be sent to prison, the lord chancellor, in any vacation, can, if he sees reason for it, grant a *habeas corpus*. The clerk of the crown likewise belongs to this court, he, or his deputy, being obliged always to attend on the lord chancellor as often as he sits for the dispatch of business; through his hands pass all writs for summoning the parliament, or choosing of members; commissions of the peace, pardons, &c.

The King's Bench, so called either from the kings of England sometimes sitting there in person, or because all matters determinable by common law between the king and his subjects are here tried, except such affairs as properly belong to the court of Exchequer. This court is likewise a kind of checque upon all the inferior courts, their judges, and justices of the peace. Here preside four judges, the first of whom is styled lord chief justice of the king's bench, or, by way of eminence, lord chief justice of England, to express the great extent of his jurisdiction over the kingdom; for this court can grant prohibitions in any cause depending either in spiritual or temporal courts; and the house of peers does often direct the lord chief justice to issue out his warrant for apprehending persons under suspicion of high crimes. The other three judges are called justices or judges of the king's bench.

The court of Common Pleas take cognizance of all pleas debateable, and civil actions depending between subject and subject; and in it, besides all real actions, fines and recoveries are transacted, and prohibitions are likewise issued out of it, as well as from the King's Bench. The first judge of this court is styled lord chief justice of the Common Pleas, or common bench; beside whom there are likewise three other judges or justices of this court. None but serjeants at law are allowed to plead here.

The court of Exchequer was instituted for managing the revenues of the crown, and has a power of judging both according to law and according to equity. In proceedings according to law, the lord chief baron of the Exchequer and three other barons preside as judges. They are styled barons, because formerly none but barons of the realm were allowed to be judges in this court. Beside these, there is a fifth, called curfitor baron, who has not a judicial capacity, but is only employed in administering the oath to sheriffs and their officers, and also to several of

\* Sheriffs

the officers of the custom-house. But when this court proceeds according to equity, then the lord treasurer and the chancellor of the Exchequer preside, assisted by the other barons. All matters touching the king's treasury, revenue, customs, and fines, are here tried and determined. Besides the officers already mentioned, there belong to the Exchequer the king's remembrancer, who takes and states all accounts of the revenue, customs, excise, parliamentary aids and subsidies, &c. except the accounts of the sheriffs and their officers. The lord treasurer's remembrancer, whose business is to make out processes against sheriffs, receivers of the revenue, and other officers.

For putting the laws effectually in execution, a high-sheriff is annually appointed for every county (except Westmoreland and Middlesex) by the king\*; whose office is both ministerial and judicial. He is to execute the king's mandate, and all writs directed to him out of the king's court of justice; to impanel juries, to bring causes and malefactors to trial, to see sentences, both in civil and criminal affairs, executed; and at the assize to attend the judges, and guard them while they are in his county. He is likewise to decide in the first instance, the elections of knights of the shire, or coroners, and of verderers; to judge, of the qualifications of voters, and to return such as he shall determine to be duly elected. It is also part of his office to collect all public fines, distresses and amerciaments into the Exchequer, or where the king shall appoint, and to make such payments out of them as his majesty shall think proper.

As his office is judicial, he keeps a court, called the county-court, to hear and determine all civil causes in the county, under forty shillings: this, however, is not now a court of record. As the keeper of the king's peace, both by common law and special commission, he is the first man in the county, and superior in rank to any nobleman therein, during his office. He may command all the people of his county to attend him, which is called the *potestas comitatus*, or power of the county.

Under the sheriff are various officers; as the under-sheriff, clerks, stewards of courts, bailiffs (in London called serjeants), constables, gaolers, beadles, &c.

The next officer to the sheriff is the *justice of the peace*, several of whom are commissioned for each county: and to them is entrusted the power of putting great part of the statute law in execution, in relation to the highways, the poor, vagrants, treasons, felonies, riots, the preservation of the game, &c. &c. They examine and commit to prison all who break or disturb the peace, and disquiet the king's subjects. In order to punish the offenders, they meet every quarter at the county-town, when a jury of twelve men, called the grand inquest of the county, is summoned to appear. This jury, upon oath, is to enquire into the cases of all delinquents, and to present them by bill guilty of the indictment, or not guilty: the justices commit the guilty to gaol for their trial at the next assizes. This is called the quarter-sessions for the county. The justice of peace ought to be a person of sagacity, and integrity, and not without some knowledge of the law; otherwise he will be apt to make mistakes, and to step beyond his authority, for which he is amenable to the court of king's bench.

Each county contains two *coroners*, who are to enquire by a jury of neighbours, how and by whom any person came by a violent death, and to enter it on record as a plea of the crown. Another branch of his office is to enquire concerning shipwrecks, and certify whether wreck or not, and who is in possession of the goods. In his ministerial office the coroner is the sheriff's substitute.

\* Sheriffs were formerly chosen by the inhabitants of the several counties. In some counties the sheriff's office was hereditary, and still continues in the county of Westmoreland. The city of London hath also the inheritance of the shirevalty of Middlesex vested in their body by charter.

The civil government of cities is a kind of small independant polity of itself; for every city hath, by charter from the king, a jurisdiction within itself, to judge in matters civil and criminal: with this restraint only, that all civil causes may be removed from their courts to the higher courts at Westminster; and all capital offences are committed to the judge of the assize. The government of cities differs according to their different charters, immunities, and constitutions. They are constituted with a mayor, aldermen, and burgesses, who together make the corporation of the city, and hold a court of judicature, where the mayor presides as judge. Some cities are counties, and chuse their own sheriffs; and all of them have a power of making bye-laws for their own government. Some have thought the government of cities, by mayor, aldermen, and common-council, is an epitome of the English government, by king, lords, and commons. The government of incorporated boroughs is nearly simular: in some there is a mayor, and in others two bailiffs; who, during their mayoralty or magistracy, are justices of the peace within their liberties, and consequently esquires.

The cinque-ports are five havens, formerly esteemed most important ones, that lie on the east part of England toward France, as Dover, Sandwich, Romney, Hastings, and Hythe, to which Winchelsea and Rye, have been since added, with simular franchises in many respects. These cinque-ports were endowed with particular privileges by our ancient kings, upon condition that they provide a certain number of ships at their own charge, to serve in the wars for forty days, as often as they were wanted.

For the better government of villages, the lords of the soil, or manor (who were formerly called barons), have generally a power to hold courts, called courts-leet and courts baron, where their tenants are obliged to attend and receive justice. The business of courts-leet is chiefly to prevent and punish nuisances; and at courts-baron the conveyances and alienations of the copyhold tenants are enrolled, and they are admitted to their estates on a descent or purchase.

A *constable* is a very ancient and respectable officer of the peace, under the English constitution. Every hundred has a high constable, and every parish in that hundred a constable; and they are to attend the high-constable upon proper occasions. They are assisted by another ancient officer, called the *tything-man*, who formerly superintended the tenth part of an hundred, or ten free burghs, as they were called in the time of the Saxons, and each free burgh consisting of ten families. The business of constable is to keep the peace in all cases of quarrels and riots. He can prison offenders till they are brought before a justice of peace; and it is his duty to execute, within his district, every warrant directed to him from that magistrate, or a bench of justices. The neglect of the old Saxon courts, both for the preservation of the peace, and the more easy recovery of small debts, has been regretted by many eminent lawyers; and it has of late been found necessary to revive some of them, and to institute others of a simular nature.

Besides these, there are courts of conscience in many parts of England for the relief of the poor, in the recovery or payment of small debts, not exceeding forty shillings.

There neither is, nor ever was, any constitution provided with so many fences as that of England, for the security of personal liberty. Every man imprisoned has a right to bring a writ before a judge in Westminster-hall, called his Habeas Corpus. If that judge, after considering the cause of commitment, shall find that the offence is bailable, the party is immediately admitted to bail, till he is condemned or acquitted in a proper court of justice.

The rights of individuals are so attentively guarded, that the subject may, without the least danger, sue his sovereign, or those who act in his name, and under his authority: he may do this in open court, where the king may be obliged to pay damages

damages to his subject. The king cannot take away the liberty of the least individual, unless he has, by some illegal act, forfeited his right to liberty; or except when the state is in danger, and the representatives of the people think the public safety makes it necessary to confine persons suspected, and accused on oath. The king has a right to pardon; but neither he nor the judges, to whom he delegates his authority, can condemn a man as a criminal, except he be first found guilty by twelve men, who must be his equals. That the judges may not be influenced by the king, or his ministers, to misrepresent the case to the jury, they have now their salaries for life. Neither can the king take away, nor endanger the life of any subject without trial, and the persons being first charged with a capital crime, as treason, murder, felony, or some other act injurious to society; nor can any subject be deprived of his liberty, for the highest crime, till some proof of his guilt be given upon oath before a magistrate; and he has then a right to insist upon his being brought, the first opportunity, to a fair trial, or to be restored to liberty on giving bail for his appearance. If a man is charged with a capital offence, he must not undergo the ignominy of being tried for his life till the evidences of his guilt are laid before the grand jury of the town or county in which the fact is alleged to be committed, and not unless twelve of them agree to a bill of indictment against him. If they do this, he is to stand a second trial before twelve other men, whose opinion is definitive. By the 28 Edward III. it is enacted that where either party is an alien born, the jury shall be one half aliens, and the other denizens, if required, for the more impartial trial. A privilege indulged to strangers in no other country, but which is as ancient with us as the time of king Ethelred \*. In some cases, the man (who is always supposed innocent till there be sufficient proof of his guilt) is allowed a copy of his indictment, in order to help him to make his defence. He is also furnished with the pannel, or list of the jury, who are his true and proper judges, that he may learn their characters and discover whether they want abilities, or whether they are prejudiced against him. He may in open court peremptorily object to twenty of the number †, and to as many more as he can give reason for their not being admitted as his judges; till at last twelve unexceptionable men, the neighbours of the party accused, or living near the place where the supposed fact was committed, are approved of, who take the following oath, that they *shall well and truly try, and true deliverance make, between the king and the prisoners whom they shall have in charge, according to the evidence.* By challenging the jury, the prisoner prevents all possibility of bribery, or the influence of any superior power: by their living near the place where the fact was committed, they are supposed to be men who knew the prisoner's course of life, and the credit of the evidence. Upon their integrity and understanding the lives of all that are brought in danger ultimately depend; and from their judgment there lies no appeal: they are to be all of one mind, and after they have fully heard the evidence, are to be confined without meat, drink, or candle, till they are unanimous in acquitting or condemning the prisoner. Every jurymen is therefore invested with a solemn and awful trust: if he without evidence submits his opinion to that of any other of the jury, or yields in complaisance to the opinion of the judge; if he neglects to examine with the utmost care; if he questions the veracity of the witnesses, who may be of an infamous character; or, after the most impartial hearing, has the least doubt upon his mind, and yet joins in condemning the person accused; he will wound his own conscience, and bring upon himself the complicated guilt of perjury and murder. The freedom of Englishmen consists in its being out of the power of the judge on the bench to injure them.

\* Statute de Moticolis Wallie.

† The party may challenge thirty-five, in case of treason.

Were

Were not this the case, tyranny might triumph over the lives and liberties of the subject.

Trial by jury being so great a security, it is much to be regretted, that persons of education and property are often too ready to evade serving the office. Those who, from indolence or pride, decline discharging this duty to their country, seem hardly to deserve that security and liberty which the inhabitants of England derive from this invaluable institution. Juries have, indeed, always been considered as giving the most effectual check to tyranny; for in a nation like this, where a king can do nothing against law, they afford a security that he shall never make the laws, by a bad administration, the instruments of cruelty and oppression. Were it not for juries, the advice given by father Paul, in his maxims of the republic of Venice, might take effect in its fullest latitude. "When the offence is committed by a nobleman against a subject, says he, let all ways be tried to justify him; if that be impossible, let him be chastised with greater noise than damage. If it be a subject that has assaulted a nobleman, let him be punished with the utmost severity, that the subjects may not get too great a custom of laying their hands on the Patrician order." But by our happy constitution, which breathes nothing but liberty and equity, all imaginary indulgence is allowed to the meanest as well as the greatest. When a prisoner is brought to take his trial, he is freed from all bonds; and though the judges are supposed to be his counsel, yet, as he may be incapable of vindicating his own cause, other counsel are allowed him; he may try the validity and legality of the indictment, and may set it aside, if it be contrary to law. Nothing is wanting to clear up the cause of innocence, and to prevent the sufferer from sinking under the power of corrupt judges, and the oppression of the great. The racks and tortures that are cruelly employed in other parts of Europe, to make a man accuse himself, are here unknown, and none punished without conviction, but he who refuses to plead in his own defence.

As the trial of malefactors in England is very different from that of other nations, the following account may be useful to foreigners and others, who have not seen those proceedings.

The court being met, and the prisoner called to the bar, the clerk commands him to hold up his hand, then charges him with the crime of which he is accused, and asks him whether he is *guilty or not guilty*. If the prisoner answers *guilty*, his trial is at an end: but if he answers *not guilty*, the court proceeds on the trial, even though he may before have confessed the fact; for the law of England takes no notice of such confession; and unless the witnesses, who are upon oath, prove him guilty of the crime, the jury must acquit him: for they are directed to bring in their verdict according to the evidence given in court.

When the witnesses have given their evidence, and the prisoner has, by himself or his counsel, cross-examined them, the judge recites to the jury the substance of the evidence given against the prisoner, and bids them discharge their conscience; when, if the matter be very clear, they commonly give their verdict without going out of the court; and the foreman, for himself and the rest, declares the prisoner *guilty or not guilty*. But if any doubt arises among the jury, and the matter requires debate, they all withdraw into a room with a copy of the indictment, where they are locked up till they are unanimously agreed on the verdict; and if any one of the jury should die during this their confinement, the prisoner will be acquitted. When the jury have agreed on the verdict, they inform the court thereof by an officer who waits without, and the prisoner is again set to the bar to hear his verdict. This is unalterable, except in doubtful cases, when the verdict is brought in *special*, and is therefore to be determined by the twelve judges of England.

If the prisoner be found guilty, he is then asked what reason he can give why sentence of death should not be passed upon him? There is now properly no benefit of clergy—it is changed to transportation, or burning in the hand. Upon a capital conviction the sentence of death, after a summary account of the trial, is pronounced on the prisoner, in these words: *The law is, That thou shalt return to the place from whence thou comest, and from thence be carried to the place of execution, where thou shalt be hanged by the neck till thy body be dead, and the Lord have mercy on thy soul!* whereupon the sheriff is charged with the execution.

All the prisoners found *not guilty* by the jury are immediately acquitted and discharged; and, in some cases, obtain a copy of their indictment from the court, to proceed at law against their prosecutors.

[OF PUNISHMENTS.] Though the laws of England are esteemed more merciful to offenders than those which at present prevail in any other part of the world, yet the punishment of such as at their trial refuse to plead guilty or not guilty was formerly very cruel. In this case the prisoner was laid upon his back upon the bare floor, naked, and his arms and legs being stretched out with cords, and a considerable weight of iron laid upon his breast, he was allowed only three morsels of barley bread the first day, the next day he was allowed nothing but three draughts of foul water that shall be nearest to the prison door; and, in this situation, this was to be alternately his daily diet till he expired. This punishment, however, there was seldom occasion to inflict, and by a late act of parliament the prisoner's refusal to plead is to be considered as a conviction, and he is to suffer the same punishment as if he had been tried, and found guilty. And formerly, in case of high treason, though the criminal stood mute, judgment was given against him, as if he had been convicted, and his estate was confiscated.

The law of England includes all capital crimes under *high treason*, *petty treason*, and *felony*. The first consists in plotting, conspiring, or rising up in arms against the sovereign, or in counterfeiting the coin. The traitor is punished by being drawn on a sledge to the place of execution, when, after being hanged upon a gallows for some minutes, the body is cut down alive, the heart taken out and exposed to public view, and the entrails burnt: the head is then cut off, and the body quartered, after which the head is usually fixed on some conspicuous place. All the criminal's lands and goods are forfeited, his wife loses her dowry, and his children both their estates and nobility. But though coining of money is adjudged high treason, the criminal is only drawn upon a sledge to the place of execution, and there hanged. Though the sentence passed upon all traitors is the same, yet with respect to persons of quality, the punishment is generally altered to beheading: a scaffold is erected for that purpose, on which the criminal placing his head upon a block, it is struck off with an axe\*.

The punishment for misprision of high treason, that is for neglecting or concealing it, is imprisonment for life, the forfeiture of all the offender's goods, and the profits arising from his lands.

*Petty treason* is when a child kills his father, a wife her husband, a clergyman his bishop, or a servant his master or mistress. This crime is punished by the offender's being drawn in a sledge to the place of execution, and there hanged upon a gallows till dead. Women guilty either of this crime or of high-treason, are sentenced to be burnt alive; but this law has been very lately repealed, and they are now hanged, without being burnt.

*Felony* includes murders, robberies, forging notes, bonds, deeds, &c. These are all punished by hanging, only † murderers are to be executed soon after sentence

\* This is not to be considered as a different punishment, but as a remission of all the parts of the sentence mentioned before, excepting the beheading.

† By a late act, murderers are to be executed with-

in twenty-four hours after sentence is pronounced; but as Sunday is not reckoned a day, they are generally tried on a Saturday; so that they obtain a respite till Monday.

is passed, and then delivered to surgeons in order to be publicly dissected. Persons guilty of robbery, when there were some alleviating circumstances, used sometimes to be transported for a term of years to his majesty's plantations; but since the American war, they are now generally condemned to hard labour in works of public utility, upon the river, &c. for a certain number of years; lately some have been sent to Africa, Nova Scotia, and Botany-Bay.

Other crimes punished by the laws are,

*Manslaughter*, which is the unlawful killing of a person, without premeditated malice, but with a present intent to kill; as when two, who formerly meant no harm to each other, quarrel, and the one kills the other; in this case the criminal is allowed the benefit of his clergy for the first time, and only burnt in the hand.

*Chance-medley* is the accidental killing of a man without an evil intent, for which the offender is also to be burnt in the hand, unless the offender was doing an unlawful act: which last circumstance makes the punishment death.

*Shoplifting* and receiving goods knowing them to be stolen, are punished with hard labour for a number of years, or burning in the hand.

*Perjury*, or keeping disorderly houses, are punished with the pillory and imprisonment.

*Petty-larceny*, or small theft, under the value of twelve pence, is punished by whipping.

*Libelling*, using false weights and measures, and forestalling the market, are commonly punished with standing in the pillory.

For striking, so as to draw blood, in the king's court, the criminal is punished with losing his right hand.

For striking, in Westminster-hall, while the courts of justice are sitting, the punishment is imprisonment for life, and forfeiture of all the offender's estate.

Drunkards, vagabonds, and loose, idle, disorderly persons, are punished by being fet in the stocks, or by paying a fine.

OF HUSBAND AND WIFE.] The first private relation of persons is that of marriage, which includes the reciprocal rights and duties of husband and wife; or, as most of our elder law-books call them, *baron* and *feme*. The holiness of the matrimonial state is left entirely to the ecclesiastical law; the punishment, therefore, or annulling, of incestuous, or other unscriptural marriages, is the province of spiritual courts.

The first legal disability is a prior marriage, or having another husband or wife living; in which case, besides the penalties consequent upon it as felony, the second marriage is to all intents and purposes void: polygamy being condemned both by the law of the New Testament, and the policy of all prudent states. The second legal disability is want of age. This is sufficient to void all other contracts, on account of the imbecility of judgment in the parties contracting. Therefore if a boy under fourteen, or a girl under twelve years of age, marries, this marriage is imperfect; and, when either of them comes to the age of consent aforesaid, they may disagree, and declare the marriage void, without any divorce or sentence in the spiritual court. This is founded on the civil law. But the canon law pays a greater regard to the constitution than the age of the parties: for if they are *habiles ad matrimonium*, it is a good marriage, whatever their age may be. And in our law it is so far a marriage, that if at the age of consent they agree to continue together, they need not be married again. If the husband be of years of discretion, and the wife under twelve, when she comes to years of discretion he may disagree as well as she may; for in contracts the obligation must be mutual; both must be bound, or neither; and so it is, *vice versa*, when the wife is of years of discretion, and the husband under.

Another incapacity arises from want of consent of guardians. By the common law, if the parties themselves were of age to consent, there wanted no other concurrence to make the marriage valid; and this was agreeable to the canon law. But by several statutes, penalties of 100*l.* are laid on every clergyman, who marries a couple without either publication of banns (which may give notice to parents or guardians), or without a licence; to obtain which, the consent of parents or guardians must be sworn to. And it has been lately thought proper to enact, that all marriages celebrated by licence (for banns suppose notice), where either of the parties is under twenty-one (not being a widow, or widower, who are supposed free) without the consent of the father, or if he be not living, of the mother or guardians, shall be absolutely void. A provision is made, as in the civil law, when the mother or guardian is *non compos*, beyond the sea, or unreasonably forward, to dispense with such consent at the discretion of the lord chancellor; but no provision is made in case the father should labour under any mental, or other incapacity. Much may be, and much has been said, both for and against this innovation upon our ancient laws and constitution. On the one hand, it prevents the clandestine marriages of minors, which are often a great inconvenience to those private families wherein they happen. On the other hand, restraints upon marriages, especially among the lower class, are detrimental to the public, by hindering the increase of people; and to religion and morality, by encouraging licentiousness and debauchery among the single of both sexes.

A fourth incapacity is want of reason: without a competent share of which, as no other contract, so neither can that of marriage be valid.

Lastly, the parties must not only be willing and able to contract, but actually must contract themselves in due form of law, to make it a good civil marriage. Verbal contracts are now of no force, to compel a future marriage. Neither is any marriage at present valid, that is not celebrated in some parish-church or public chapel, unless by dispensation from the archbishop of Canterbury. It must also be preceded by publication of banns, or by licence from the spiritual judge. It is held to be also essential to marriage, that it be performed by a person in orders: though in the times of the civil war, all marriages were performed by the justices of the peace; and these marriages were declared valid in the succeeding reign; as the marriages of quakers are at present. As the law now stands, we may upon the whole collect, that no marriage by the temporal law is void, that is celebrated by a person in orders, in a parish church, or a public chapel (or elsewhere, by dispensation) in pursuance of banns or a licence, between single persons, consenting, of sound mind, and of the age of twenty-one years; or of the age of fourteen in male, and twelve in female, with consent of parents or guardians, or without it in case of widowhood.

There are two kinds of divorce, the one total, the other partial. The total divorce must be for some of the canonical causes of impediment, and those existing before the marriage: as consanguinity, affinity, or corporeal imbecility. The issue of such marriage, as it is thus entirely dissolved, are bastards.

The other kind of divorce is when the marriage is just and lawful, and therefore the law is tender of dissolving it; but, for some supervenient cause it becomes improper or impossible, for the parties to live together; as in the case of intolerable ill temper, or adultery, in either of the parties. In this case the law allows alimony to the wife (except when for adultery, the parliament grants a total divorce, as has happened frequently of late years), which is that allowance which is made to a woman, for her support, out of the husband's estate; being settled at the discretion of the ecclesiastical judge, on the consideration of all the circumstances of the case, and the rank and quality of the parties.

Having thus shewn how marriages may be made, or dissolved, I come now, lastly, to speak of the legal consequences of the making, or dissolution of them.

By marriage, the husband and wife are one person in law; that is, the very being, or legal existence of the woman, is suspended during the marriage, or at least is incorporated and consolidated into that of the husband: under whose protection, and *cover*, she performs every thing, and is therefore called in our Law French, a  *feme-covert*, under the guidance of her husband, her *baron* or lord; and her condition during her marriage, is called her *coverture*. Upon this principle of an union of person in husband and wife depends almost all the legal rights, duties, and disabilities, that either of them acquire by the marriage. I speak not at present of the rights of property, but of such as are merely *personal*. For this reason a man cannot grant any thing to his wife, or enter into a covenant with her; for the grant would be to suppose her separate existence; and the covenant with her would be only to covenant with himself; and therefore it is generally true, that all compacts made between husband and wife, when single, are voided by the inter-marriage. A woman indeed may be an attorney for her husband; for that implies no separation from, but is rather a representation of, her lord. And a husband may also bequeath any thing to his wife by will; for that cannot take effect till the *coverture* is determined by his death. The husband is bound to provide his wife with necessaries by law, as much as himself; and if the contracts debts for him, he is obliged to pay them; but for any thing besides necessaries, he is not chargeable. Also if the wife elopes, and lives with another man, the husband is not chargeable even for necessaries: at least, if the person who furnishes them is sufficiently apprized of her elopement. If the wife be indebted before marriage, the husband is bound afterwards to pay the debt; for he has adopted her and her circumstances together. If the wife be injured in her person or property, she can bring no action for redress, without her husband's concurrence, and in his name, as well as her own; neither can she be sued, without making the husband a defendant; except when the husband has abjured the realm, or is banished; for then he is dead in law. In criminal prosecutions, it is true, the wife may be indicted, and punished separately: for the union is only a civil union. But, in trials of any sort, they are not allowed to be evidences for, or against, each other; partly because it is impossible their testimony should be impartial; but principally because of the union of person. But where the offence is directly against the person of the wife, this rule has been usually dispensed with; and therefore, in case a woman be forcibly taken away, and married, she may be a witness against such her husband, in order to convict him of felony.

In the civil law, the husband and the wife are considered as two distinct persons; and may have separate estates, contracts, debts, and injuries; and therefore, in our ecclesiastical courts, a woman may sue, and be sued, without her husband. Though our law in general considers man and wife as one person, yet there are some instances in which she is separately considered, as inferior to him, and acting by his compulsion. Therefore all deeds executed, and acts done, by her, during her *coverture*, are void; except it be a fine, or the like matter of record, in which case she must be solely and secretly examined, to learn if her act be voluntary. She cannot by will devise land to her husband, unless under special circumstances; for, at the time of making it, she is supposed to be under his coercion. And in some felonies, and other inferior crimes committed by her through constraint of her husband, the law excuses her; but this extends not to treason or murder.

The husband also (by the old, and likewise by the civil law) might give his wife moderate correction: for, as he is to answer for her misbehaviour, the law thought it reasonable to entrust him with this power of restraining her, by domestic chastisement, in the same moderation that a man is allowed to correct his servants or children: for whom the master or parent is also liable in some cases to answer. But in the poster reign of Charles II. this power of correction began to be doubted; and a wife may now have security of the peace against her husband; or,

in

\* From  
amount of  
5000. to  
the gross  
was in th

In return, a husband against his wife; yet the lower rank of people claim and exert their ancient privilege; and the courts of law will permit a husband to restrain a wife of her liberty, in case of any gross misbehaviour.

These are the chief legal effects of marriage during the coverture; upon which we may observe, that even the disabilities, which the wife lies under, are for the most part intended for her protection and benefit. So great a favourite is the female sex with the laws of England!

**REVENUES OF THE BRITISH GOVERNMENT.** } The king's ecclesiastical revenues consist in, 1. The custody of the temporalities of vacant bishopricks; from which he receives little or no advantage. 2. Corodies and pensions, formerly arising from allowances of meat, drink, and cloathing, due to the king from an abbey or monastery, and which he generally bestowed upon favourite servants; and his sending one of his chaplains to be maintained by the bishop, or to have a pension bestowed upon him till the bishop promoted him to a benefice. 3. Extra-parochial tithes. 4. The first fruits and tenths of benefices. But such has been the bounty of the crown to the church, that those branches now afford little or no revenue.

The king's ordinary temporal revenue, until the reign of his present majesty, consist in, 1. The demesne lands of the crown, which at present lie in a narrow compass. 2. The hereditary excise; being part of the consideration for the purchase of his feudal profits, and the prerogatives of purveyance and pre-emption. 3. An annual sum issuing from the duty on wine licences; being the residue of the same consideration. 4. His forests. 5. His courts of justice, &c. In lieu of all which 900,000*l.* per annum is now granted for the support of his civil list.

The extraordinary grants are usually called by the synonymous names of aids, subsidies, and supplies; and are granted by the commons of Great Britain, in parliament assembled: who, when they have voted a supply to his majesty, and settled the *quantum* of that supply, usually resolve themselves into what is called a committee of ways and means, to consider of the ways and means of raising the supply so voted. And in this committee, every member (though it is looked upon as the peculiar province of the chancellor of the exchequer) may propose such scheme of taxation as he thinks will be least detrimental to the public. The resolutions of this committee (when approved by a vote of the house) are in general deemed final and conclusive; for, though the supply cannot be actually raised upon the subject till directed by an act of the whole parliament, yet no monied man will scruple to advance to the government any quantity of ready cash, if the proposed terms be advantageous, on the credit of the bare vote of the house of commons.

The annual taxes are, 1. The land-tax or the ancient subsidy raised upon a new assessment. 2. The malt-tax, being an annual excise on malt, mum, cyder, and perry.

The perpetual taxes are, 1. The customs, or tonnage and poundage of all merchandise exported or imported. 2. The excise duty, or inland imposition on a great variety of commodities. 3. The salt duty. 4. The post-office\*, or duty for the carriage of letters. 5. The stamp-duty on paper, parchment, &c. 6. The duty on houses and windows. 7. The duty on licences for hackney coaches and chairs. 8. The duty on offices and pensions, with a variety of new taxes imposed in the year 1784.

\* From the year 1644 to 1744, the annual amount of this revenue gradually increased from 500*l.* to 198,226*l.* but it should be observed, that the gross amount of both inland and foreign offices was in that year 235,492*l.* In 1764, the gross amount of the revenues of the Post-office for that year was 432,048*l.* which, by the act passed in the sessions of 1784, increasing the duty according to the distance, and abridging the franking, must be greatly augmented.

The neat annual produce of these several branches of the revenue, old and new taxes, after all charges of collecting and management paid, is estimated at eleven millions sterling; with two millions and a quarter raised at an average, by the land and malt-tax. How these immense sums are appropriated, is next to be considered. And this is, first and principally, to the payment of the *interest* of the national debt.

In order to take a clear and comprehensive view of the nature of this NATIONAL DEBT, it must be first premised, that after the Revolution, when our new connections with Europe introduced a new system of foreign politics; and the expences of the nation, not only in settling the new establishment, but in maintaining long wars, as principals, on the continent, for the security of the Dutch barrier, reducing the French monarchy, settling the Spanish succession, supporting the house of Austria, maintaining the liberties of the Germanic body, and other purposes, increased to an unusual degree; it was not thought advisable to raise all the expences of any one year by taxes to be levied within that year, lest the unaccustomed weight of them should create murmurs among the people. It was therefore the policy of the times, to anticipate the revenues of their posterity, by borrowing immense sums for the current service of the state, and to lay no more taxes upon the subject than would suffice to pay the annual interest of the sums so borrowed: by this means converting the principal debt into a new species of property, transferable from one man to another, at any time and in any quantity, a system which seems to have had its original in the state of Florence, A. D. 1344: which government then owed about 60,000l. sterling: and being unable to pay it, formed the principal into an aggregate sum, called, metaphorically, a mount or bank: the shares whereof were transferable like our stocks. This laid the foundation of what is called the NATIONAL DEBT: for a few long annuities created in the reign of Charles II. hardly deserve that name. And the example then set, has been so closely followed during the long wars in the reign of queen Anne, and since, that the capital of the funded debt at Midsummer 1775 was 129,860,018l. and the annual charge of it amounted to 4,219,254l. 7s. The American war commencing at this time, and the execrable policy continuing of alienating the sinking fund, with the extravagancies in every department of government, and the manner of borrowing the money for supplies, have considerably increased it\*.

The following was the state of the national debt in the year 1783, extracted from the eleventh report of the commissioners of public accounts:

£.	s.	d.		£.	s.	d.
211,363,254	15	4½	Funded debt			
			Interest thereon	7,951,930	1	0
18,856,541	11	4½	Unfunded 1st of October, 1783:			
			fifteen millions of this bears interest now.			
			Interest thereon	612,742	0	0
<u>230,219,796</u>	<u>6</u>	<u>9½</u>				
			Charges at the Bank for managing the business	134,291	13	1
			Fees at the auditor's office of interest	19,874	2	8
			Some other fees of office	696	12	4
				<u>8,719,534</u>	<u>9</u>	<u>1</u>

\* In the course of the late war from 1776, to 1782, 46,553,000l. was added to the 3 per cent. annuity, 26,750,000l. to the 4 per cent. making together a capital of 73,400,000l. for which the money advanced was only 48 millions.

Exchequer Bills		3,500,000	0	Interest and management of the funded debt	9,919,514
Deficient balance by loan of £11,000,000 3 per cent consols, at 6 1/2 per cent. £1,730,000 of 4 per cent, at 3s and £81,971 19s 4d, long annuities, at 60 years purchase at per vote of £11,000,000 Sterling		11,028,197	14	101	920,000
		£13,397,167	11	101	£ 14,197,167

The produce of the several taxes were originally separate and distinct funds; being securities for the sums advanced on each several tax, and for them only. But at last it became necessary, in order to avoid confusion, as they multiplied yearly, to reduce the number of these separate funds, by uniting them together: superadding the faith of parliament for the general security of the whole. So that there are now only three capital funds of any account: the *aggregate fund*, the whole produce of which hath been for some years about 2,600,000*l.* per annum; which for some years have amounted to rather more than a million per annum; and the *South Sea fund*, being the produce of the taxes appropriated to pay the interest of such part of the national debt as was advanced by that company and its annuitants, the produce of which lately hath been about half a million per annum. The separate funds, which were thus united, are become mutual securities for each other; and the whole produce of them, thus aggregated, liable to pay such interest or annuities as were formerly charged upon each distinct fund; the faith of the legislature being more-over engaged to supply any casual deficiencies.

The customs, excises, and other taxes, which are to support these funds, depending on contingencies, upon exports, imports, and consumptions, must necessarily be of a very uncertain amount: but they have always been considerably more than sufficient to answer the charge upon them. The surplusses therefore of the three great national funds, the aggregate, general, and South Sea funds, over and above the interest and annuities charged upon them, are directed by statute 3 George I. c. 7. to be carried together, and to attend the disposition of parliament; and are usually denominated the *sinking fund*, because originally defined to sink or reduce the national debt. To this have been since added many other entire duties, granted in subsequent years; and the annual interest of the sums borrowed on their respective

tive credits, is charged on, and payable out of, the produce of the sinking fund. However, the neat surplusses and savings, after all deductions paid, amount annually to a very considerable sum; for, as the interest on the national debt has been at several times reduced (by the consent of the proprietors, who had their option either to lower their interest, or be paid their principal), the savings from the appropriated revenues must be extremely large. This sinking fund is the last resort of the nation; its only domestic resource, on which must chiefly depend all the hopes we can entertain of ever discharging or moderating our incumbrances.

Between the years 1727 and 1732, several encroachments were made upon the sinking fund; and in the year 1733, half a million was taken from it, under pretence of easing the landed interest. The practice of alienating the sinking fund still continued; and in 1736, it was anticipated and mortgaged, and subsequent administrations repeatedly broke in upon it, thus converting an excellent expedient for saving the kingdom, into a supply for the worst purposes.

In some years, the sinking fund hath produced from two to three millions; and, if 1,212,000*l.* of it had been inviolably applied to the redemption of the public debts from the year 1733 to the present time, one hundred and sixty millions would have been paid off, and the nation much relieved. Different schemes have been formed for paying the public debts, but no method can be so expeditious and effectual, as an unalienable sinking fund, as this money is improved at *compound interest*, and therefore in the most perfect manner; but money procured by a loan bears only simple interest. "A nation therefore whenever it applies the income of such a fund to current expences, rather than the redemption of its debts, chooses to lose the benefit of compound interest, in order to avoid paying simple interest, and the loss in this case is equal to the difference between the increase of money at compound and simple interest\*."

No permanent provision had ever been made for the progressive and permanent payment of this immense debt, until 1736; when parliament had the wisdom and the firmness to pass an act for vesting unalienably, in commissioners, the sum of one million annually; in which act every possible precaution was taken that could be devised for preventing the surplus from being diverted at any future time, and for carrying to the account of the commissioners for the purposes of the act, the interest of such stock as should be purchased, and such temporary annuities as should fall in. Under the provisions of this act, *Eight Millions Two Hundred Thousand Pounds* of the capital of the debt has been purchased †; and the amount of the annual sum, now applicable for the reduction of it is 1,360,000*l.*

\* Dr. Price's calculation plainly shews that, "A million borrowed annually for twenty years, will pay off, in this time, 25 millions 3 per cent. stock, if discharged at 6*l.* in money for every 100*l.* stock, and in forty years more, without any further aid from loans, 537 millions (that is, 388 millions in all) would be paid off.

† The addition of thirteen years to this period would pay off 1000 millions.

‡ A surplus of half a million per annum, made up to a million, by borrowing half a million every year for twenty years, would discharge the same sums in the same periods.

§ It is, therefore, necessary it is at present to expedite, by every possible means, the redemption of our debts, that, let the surplus which can be ob-

tained for a sinking fund be what it will, an addition to it, by annual loans, will be proper in order to give it greater efficiency and a better chance for relieving the kingdom.—The increase of taxes which such a measure must occasion, would be so inconsiderable and so gradual, as to be scarcely perceptible; and at the same time, it would manifestly shew a determined resolution in our rulers to reduce our debt, as might have the happiest influence on public credit.

¶ Debenture, as a compensation to Loyalties, for the loss of property in America, have been raised to the amount of 650,000*l.* which may be considered as a further reduction of the debt to that amount.

N. B. Dividends paid at the Bank from 9 to 11, and 1 to 3.—Transfers 11 to 1.—Dividends at the S. S. and India House, from 9 to 12.—Transfers from 12 to 1.

\* This stock comprised the whole of the unfunded debt in 1784, which consisted of certain navy, victualling, and transport bills, bearing interest at 4 per cent. as well as ordinance and other bills at non-interest. No part of this stock can be redeemed till 25 millions of the 3 or 4 per cents are paid off.

† Last year the India Company added one million to their capital, by a subscription of the Stockholders at 200l. per cent. and this year (1794) 2 millions by bonds.

‡ Fall in January 1865, the original annuity was for 99 years.

§ These fall in 1868.

In

FUNDS

In lieu of their hereditary revenues, our late kings received the produce of certain branches of the excise and customs, &c. but his present majesty is pleased to accept the annual sum of 900,000*l.* chargeable on the aggregate fund, which is called his Civil List. The expences defrayed by the civil list, are those that in any shape relate to civil government; as the expences of the household, all salaries to officers of state, to the judges, and every one of the king's servants; the appointments to foreign ambassadors, the maintenance of the queen and royal family, the king's private expences, or privy purse, and other very numerous outgoings; as secret service-money, pensions, and other bounties. These sometimes have so far exceeded the revenues appointed for that purpose, that application has been made to parliament, to discharge the debts contracted on the civil list, which is properly the whole of the king's revenue in his own distinct capacity; the rest being rather the revenue of the public, or its creditors, though collected and distributed again in the name, and by the officers of the crown.

MILITARY AND MARINE STRENGTH } The *military state* includes the whole of  
OF GREAT BRITAIN. } the soldiery; or, such persons as are peculiarly appointed among the rest of the people, for the safeguard and defence of the realm.

In a land of liberty (says judge Blackstone), it is extremely dangerous to make a distinct order of the profession of arms. In such, no man should take up arms, but with a view to defend his country and its laws: he puts not off the citizen when he enters the camp; but it is because he is a citizen, and would wish to continue so, that he makes himself for a while a soldier. The laws and constitution of these kingdoms formerly knew no such state, as that of a perpetual standing foldier, bred up to no other profession than that of war; and it was not till the reign of Henry VII. that the kings of England had so much as a guard about their persons.

It seems universally agreed by all historians, that king Alfred first settled a national militia in this kingdom, and by his prudent discipline made all the subjects of his dominions soldiers. In the mean time we are not to imagine that the kingdom was left wholly without defence, in case of domestic insurrections, or the prospect of foreign invasions. Besides those, who by their military tenures were bound to perform forty days service in the field, the statute of Winchester obliged every man, according to his estate and degree, to provide a determinate quantity of such arms as were then in use, in order to keep the peace; and constables were appointed in all hundreds, to see that such arms were provided. These weapons were changed by the statute 4 and 5 Ph. and M. c. 2. into others of more modern service. It was usual from time to time, for our princes to issue commissions of array, and send into every county officers in whom they could confide, to muster and array (or set in military order) the inhabitants of every district; and the form of the commission of array was settled in parliament in the 5 Henry IV. But at the same time it was provided, that no man should be compelled to go out of the kingdom at any rate; nor out of his thire, but in cases of urgent necessity; nor should himself serve, or provide soldiers, unless by consent of parliament. About the reign of king Henry VIII. lord lieutenants began to be introduced, as standing representatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the statute 4 and 5 Ph. and M. c. 3. though they had not been then long in use; for Camden speaks of them in the time of queen Elizabeth as extraordinary magistrates, constituted only in times of difficulty and danger.

Soon after the Restoration of king Charles II. when the military tenures were abolished, it was thought proper to new-model the militia; the general scheme of which, as it now stands, is to discipline a certain number of the inhabitants of every county, chosen by lot for three years, and officered by the lord lieutenant, the

the deputy-lieutenants, and other principal land-holders, under a commission from the crown. They are not compellable to march out of their counties, unless in case of invasion, or actual rebellion, nor in any case to be sent out of the kingdom. They are to be exercised at stated times, and their discipline in general is liberal and easy; but when drawn out into actual service, they are subject to martial law. This is the constitutional security which our laws have provided for the public peace, and for protecting the realm against foreign or domestic violence.

But as the mode of keeping standing armies has prevailed over all Europe for a considerable time, it has also for many years past been annually judged necessary by our legislature, for the safety of the kingdom, the defence of the possessions of the crown of Great Britain, and the preservation of the balance of power in Europe, to maintain, even in time of peace, a standing body of troops, under the command of the crown; who are, however, *ipso facto*, disbanded at the expiration of every year, amount to about 40,000 men, including troops and garrisons in Ireland, Gibraltar, the East Indies, and America; but in time of war, there have formerly been in British pay, natives and foreigners, above 150,000. To regulate this body of troops an annual act of parliament passes, "to punish mutiny and desertion, and for the better payment of the army and their quarters." This regulates the manner in which they are to be dispersed among the several innkeepers and victuallers throughout the kingdom; and establishes a law martial for their government. By this, among other things, it is enacted, that if any officer and soldier shall excite, or join any mutiny, or knowing of it, shall not give notice to the commanding officer; or shall desert, or list in any other regiment, or sleep upon his post, or leave it before he is relieved, or hold correspondence with a rebel or enemy, or strike or use violence to his superior officer, or disobey his lawful command; such offender shall suffer such punishment as a court martial shall inflict, though it extend to death itself.

Officers and soldiers that have been in the king's service are, by several statutes, at liberty to use any trade or occupation they are fit for, in any town of the kingdom (except the two universities), notwithstanding any statute, custom, or charter to the contrary. And soldiers, in actual military service, may make verbal wills, and dispose of their goods, wages, and other personal chattles, without those forms, solemnities, and expences, which the law requires in other cases.

\* The land forces consist of,

CAVALRY

- 2 Regiments of life guards, raised in 1660.
- 1 Royal regiment of horse guards, raised in 1661.
- 7 Regiments dragoon guards, raised in 1685, and 1688.
- 19 Regiments of dragoons, raised between 1683, and 1781.

INFANTRY.

- 3 Regiments of foot guards, raised in 1650, and 1660.
- 77 Regiments of foot, raised between 1633, and 1778.
- 70 Companies of marines.
- 4 Battalions of royal artillery.

Invalids.

In time of peace, most regiments consist only of one battalion, composed of ten companies; in time of war additional companies are raised, and the number of regiments increased. The whole of the army last war, including the foreign troops in English pay, amounted to about 135,000 men. Twelve regiments of cavalry, and 20 of infantry, are usually in Ireland, and are maintained by that kingdom, amounting from about 12 to 14,000 men. For the service of Great Britain, the garrisons, and colonies, about 17,000 are voted annually by parliament, exclusive of marines. A militia of about 40,000 men.

Daily Pay of each Rank in his Majesty's Land-Forces on the British Establishment.

The royal navy of England hath ever been its greatest defence and ornament ; it is its ancient and natural strength ; the floating bulwark of the island ; from which, however strong and powerful, no danger can be apprehended to liberty ; and accordingly it has been assiduously cultivated, from the earliest ages. To such perfection was our naval reputation arrived in the twelfth century, that the code of maritime laws, which are called the Laws of Oleron, and are received by all nations in Europe as the ground of their marine constitutions, was confessedly compiled by our king Richard I. at the isle of Oleron, on the coast of France, then part of the possessions of the crown of England. And yet, so inferior were our ancestors in this point to the present age, that, even in the maritime reign of queen Elizabeth, sir Edward Coke thinks it matter of boast that the royal navy of England consisted of 33 ships. The present condition of our marine is by many ascribed to the navigation act framed in 1650, which prohibited all ships of foreign nations from trading with the English plantations without licence from the council of state. In 1651, the prohibition was extended also to the mother-country ; and no goods were suffered to be imported into England, or any of its dependencies, in any other than English bottoms, or in the ships of that European nation, of which the merchandise imported was the genuine growth or manufacture. At the Restoration, the former provisions were continued, by statute 12 Car. II. c. 18. with this very material improvement, that the master, and three-fourths of the mariners, shall also be English subjects.

The complement of seamen, in time of peace, hath usually amounted to 12 or 15,000. In time of war, they have formerly amounted to no less than 80,000 men ; and after the commencement of the American war, they amounted to above 100,000 men, including marines.

This navy is commonly divided into three squadrons ; namely, the red, white, and

Sloop  
Bom  
In comm  
old, or unfir  
her bottom.  
of parliament

and blue, which are so termed from the differences of their colours. Each squadron has its admiral: but the admiral of the red Squadron has the principal command of the whole, and is styled vice-admiral of Great Britain: subject to each admiral is also a vice and rear-admiral. But the supreme command of our naval force is, next to the king, in the lords commissioners of the admiralty.

Many laws have been made for the supply of the royal navy with seamen for their regulation when on board; and to confer privileges and rewards on them during, and after their service.

1. For their supply. The power of impressing men for the sea-service by the king's commission, has been a matter of much dispute, and submitted to with great reluctance; though it hath very learnedly been shewn by sir Michael Foster, that the practice of impressing, and granting powers to the admiralty for that purpose, is of very ancient date, and hath been uniformly continued by a regular series of precedents to the presents time; whence he concludes it to be a part of the common law. The difficulty arises from hence, that no statute, or act of parliament, has expressly declared this power to be in the crown, though many of them very strongly imply it.

Besides this method of impressing (which, even if legal, is only defensible from public necessity), the principal trading cities, and sometimes the government, offer bounty-money to seamen who enter voluntarily into his majesty's service: and every foreign seaman who, during a war, shall serve two years in any man of war, merchantman, or privateer, is naturalized *ipso facto*.

The wages of seamen on board of merchantmen, in time of war, is usually 50s. to 4l. per month; on board of the royal navy, they receive considerably less. They are flattered indeed with the hopes of prize-money, which, if divided in a more equitable manner, would produce the happiest effects. There would then be less occasion for bounty-money or pressing; our fleets would be speedily manned, and regularly supplied with experienced and able seamen; on whom, under Providence, not only the very existence of this nation, its commerce, and foreign settlements, but the liberties of Europe, and security of the Protestant religion, solely depend\*.

2. The method of discipline in the royal fleet is directed by certain express rules, first enacted by authority of parliament soon after the Restoration; but new-modelled and altered since the peace of Aix-la-Chapelle, to remedy some defects, which were severely felt in conducting the preceding war. In these articles of the navy almost every possible offence is set down, and the punishment thereof annexed, in which respect the seamen have much the advantage over their brethren in the land service; whose articles of war are not enacted by parliament, but framed from time to time at the pleasure of the crown.

\* The Royal Navy of GREAT BRITAIN, as it stood at August 31, 1784.

When a ship of war becomes old, or unfit for service, the same name is transferred to another, which is built, as it is called, upon her bottom. While a single beam of the old ship remains, the name cannot be changed unless by act of parliament.

3. With

3. With regard to the privileges conferred on sailors, they are pretty much the same with those conferred on soldiers; with regard to relief, when maimed or wounded, or superannuated, it is afforded them either by county rates, or from the royal hospital at Greenwich; they are also allowed the exercise of trades in corporations, and the power of making verbal testaments; and, farther, no seaman aboard his majesty's ships can be arrested for any debt, unless the same be sworn to amount to at least twenty pounds; though by the annual mutiny act, a foldier may be arrested for a debt which extends to half that value.

I shall close this account of the military and maritime strength of Great Britain, by observing, that though sea-officers † and sailors are subject to a perpetual act of

The motto  
of Richard I

parliament, which answers the annual military act, that is passed for the government of the army, yet neither of those bodies are exempted from legal jurisdiction in civil or criminal cases, but in a few instances of no great moment. The soldiers particularly may be called upon by a civil magistrate, to enable him to preserve the peace against all attempts to break it. The military officer who commands the soldiers on those occasions, is to take his directions from the magistrate; and both he and they, if their proceedings are regular, are indemnified against all consequences, be they ever so fatal. But those civil magistrates who understand the principles of the constitution, are extremely cautious in calling for the military on these occasions, or indeed upon any commotion whatever, and with good reason; for the frequent employment of the military power in a free government is exceedingly dangerous, and cannot be guarded against with too much caution.

**COINS.** In Great Britain money is computed by pounds, shillings, and pence; twelve pence making a shilling, and twenty shillings one pound, which pound is only an imaginary coin. The gold pieces consist only of guineas, halves, and quarters: the silver, of crowns, half-crowns, shillings, six-pences, groats, and even down to a silver penny, and the copper money only of half-pence and farthings.

In a country like England, where the intrinsic value of silver is nearly equal, and in some coins, crown pieces particularly, superior to the nominal, the coinage of silver money is a matter of great consequence; and yet the present state of the national currency seems to demand a new coinage of shillings and six-pences; the intrinsic value of the latter being, as to many of them, worn down to half their nominal value. This can only be done by an act of parliament, and by the public losing the difference between the bullion of the new and the old money. Besides the coins already mentioned, five and two guinea pieces are impressed at the Tower of London, but they are not generally current; nor is any silver coin that is lower than six-pence. The coins of the famous Simon, in the time of Cromwell, and in the beginning of Charles II's reign, are remarkable for their beauty.

**ROYAL TITLES, ARMS, & ORDERS.** The title of the king of England, is, By the Grace of God, of Great Britain, France, and Ireland, King, his or her Grace, or Highness, till Henry VIII. to put himself on a footing with the emperor Charles V. assumed that of majesty; but the old designation was not abolished till towards the end of queen Elizabeth's reign. The title of Defender of the Faith above mentioned was given to Henry VIII. by the pope, on account of a book written by the king against Luther, and the Reformation. To the titles already given, the King of Great Britain has others from his German dominions, as Elector of Hanover, Duke of Brunswick Lunenburg, &c.

Since the accession of the present royal family of Great Britain, anno 1714, the royal achievement is marshalled as follows: quarterly, in the first grand quarter, *Mars, three lions passant guardant, in pale, Sol*, the imperial ensigns of England, impaled, with the royal arms of Scotland, which are *Sol, a lion rampant within a double tressure flowered, and counterflowered, with fleurs-de-lis, Mars*. The second quarter is the royal arms of France, viz. *Jupiter, three fleurs-de-lis, Sol*. The third, the ensigns of Ireland: which is, *Jupiter, an harp, Sol, stringed Luna*. And the fourth grand quarter is his present majesty's own coat, viz. *Mars, two lions passant, guardant, Sol, for Brunswick, impaled with Lunenburg, which is, Sol senée of hearts, proper, a lion rampant, Jupiter; having ancient Saxony, viz. Mars on horse currant Luna, ente (or grafted) in base; and in a shield fourtout, Mars, the diadem, or crown of Charlemagne; the whole, within a garter, as sovereign of that most noble order of knighthood.*

The motto of *Dieu et mon Droit*, that is, *God and my Right*, is as old as the reign of Richard I. who assumed it to shew his independency upon all earthly powers.

It

It was afterwards revived by Edward III. when he laid claim to the crown of France. Almost every king of England had a particular badge or cognisance; sometimes a white hart; sometimes a fetlock with a falcon, by which it is said Edward IV. alluded to the infidelity of one of his mistresses; and sometimes a portcullis, which was that of the house of Lancaster, many of the princes of which were born in the castle of Beaufort. The white rose was the bearing of the house of York; and that of Lancaster, by way of contradistinction, adopted the red. The thistle, which is now part of the royal armorial bearings, belonged to Scotland, and was very significant, when joined to its motto, *Nemo me impune lacesset*, "None shall provoke me unpunished."

The titles of the king's eldest son, are, prince of Wales, duke of Cornwall and Rothsay, earl of Chester, electoral prince of Brunswick and Lunenburg, earl of Carrick, baron of Renfrew, lord of the Isles, great steward of Scotland, and captain general of the artillery company.

The order of the GARTER, the most honourable in England, was instituted by Edward III. January 19, 1344. It consists of the sovereign who is always the king or queen of England, of 25 companions called Knights of the Garter, who wear a medal of St. George killing the dragon, supposed to be the titular saint of England, commonly enamelled on gold, suspended from a blue ribband, which was formerly worn about their necks, but since the latter end of James I. crosses their bodies from the shoulder. The garter, which is of blue velvet, bordered with gold, buckled under the left knee, and gives the name to the order, was designed as an ensign of unity and combination; on it is embroidered the words, *Honi soit qui mal y pense*, "Evil to him who evil thinks." Authors are divided as to the original of that motto; but it probably alluded to the bad faith of the French king John, Edward's contemporary; the latter thereby declaring the equity of his own intention, and retorting shame on any who should think ill of the enterprize he had engaged in to support his right to the crown of France. This order is so respectable, that some of the most illustrious foreign princes have been companions of it. It has a prelate, who is the bishop of Winchester, and a chancellor, who is the bishop of Salisbury for the time being. It has likewise a register, who is dean of Windsor, and a principal king at arms, called Garter, whose office it is to marshal and manage the solemnities at the installation, and seats of the knights. The place of installation is Edward III.'s chapel at Windsor, on which occasion the knights appear in magnificent robes, appropriated to their order, and in their collars of SS. The collar and cap and feathers were introduced by Henry VIII. and to the cross of the order encompassed with the garter worn on the left side of their coat, Charles II. added a silver star of eight points.

Knights of the BATH, so called from their bathing at the time of their creation, are supposed to have been instituted by Henry IV. about the year 1399, but the order seems to be more ancient. For many reigns they were created at the coronation of a king or queen, or other solemn occasions, and they wear a scarlet ribband hanging from the left shoulder, with an enamelled medal the badge of the order, a rose issuing from the dexter side of a sceptre, and a thistle from the sinister, between three imperial crowns placed within the motto, *Tria juncta in uno*, "Three joined in one." This order being discontinued, was revived by king George I. on the 18th of May, 1725, and the month following eighteen noblemen and as many commoners were installed knights of the order, with great ceremony, at Westminster, where the place of installment is Henry VII.'s chapel. Their robes are splendid and showy, and the number of knights is undetermined. The bishop of Rochester is perpetual dean of the order, which has likewise a register and other officers.

The order of the THISTLE, as belonging to Scotland, is mentioned in the account

of

of that country; as is also the order of St. PATRICK, newly instituted for Ireland, in our account of that kingdom.

The origin of the English peerage, or nobility, has been already mentioned. Their titles, and order of dignity, are dukes, marquises, earls, viscounts, and lords or barons.

Baronets can scarcely be said to belong to an order, having no other badge than a bloody hand in a field, argent, in their arms. They are the only hereditary honour under the peerage, and would take place even of the knights of the Garter, were it not that the latter are always privy counsellors; there being no intermediate honour between them and the parliamentary barons of England. They were instituted by James I. about the year 1615. Their number was then two hundred, and each paid about 1000*l.* on pretence of reducing and planting the province of Ulster in Ireland: but at present their number amounts to 700.

A knight is a term used almost in every nation in Europe, and in general signifies a soldier serving on horseback; a rank of no mean estimation in ancient armies, and entitling the party himself to the appellation of *Sir*. In the common laws they are called *militis* or *soldiers*; and they are made, by the king laying a sword upon their shoulders, and desiring them to rise by the title of *Sir*. It is a mark of personal regard from the crown, and therefore the title does not descend to posterity. Other knighthoods formerly took place in England; such as those of *bannerets*, bachelors, knights of the carpet, and the like, but they are now disused. Indeed in the year 1773, at a review of the royal navy at Portsmouth, the king conferred the honour of Knights Bannerets on two admirals and three captains. They have no particular badge on their garments, but their arms are painted on a banner placed in the frames of the supporters.

It is somewhat difficult to account for the origin of the word *esquire*, which formerly signified a person bearing the arms of a nobleman or knight, and they were therefore called *armigeri*. This title denoted any person, who, by his birth or property, was entitled to bear arms; but is at present applied promiscuously to any man who can afford to live in the character of a gentleman without trade, and even a tradesman, if he is a justice of peace, demands the appellation. This degree, so late as in the reign of Henry IV. was an order, and confirmed by the king, by putting about the party's neck a collar of SS. and giving him a pair of silver spurs. Gower the poet appears from his effigies on his tomb in Southwark, to have been an esquire by creation. Serjeants-at-law, and other serjeants belonging to the king's household, justices of the peace, doctors in divinity, law, and physic, take place of other esquires; and it is remarkable, that all the sons of dukes, marquises, earls, viscounts, and barons, are in the eye of the law no more than esquires, though commonly designed by noble titles. The appellation of gentleman, though now bestowed so promiscuously, is the root of all English honour; for every nobleman is presumed to be a gentleman, though every gentleman is not a nobleman.

[HISTORY.] It is generally agreed, that the first inhabitants of Britain were a tribe of the Gauls, or Celtae, that settled on the opposite shore: a supposition founded upon their evident conformity in language, manners, government, religion, and complexion.

When Julius Caesar, about fifty-two years before the birth of Christ, meditated the conquest of Britain, the natives were much connected with the Gauls, and other people of the continent. Caesar wrote the history of his two expeditions, which were accompanied with great difficulties. It plainly appears, from the subsequent history of Britain, that his victories were indidicive; nor did the Romans derive the least advantage from the tribute which he imposed on the islanders. The Britons at that period were governed in the time of war by a political con-

federacy, of which Cassibelan, whose territories lay in Hertfordshire, and some of the adjacent counties, was the head: and this form of government long continued among them.

In their manner of life, as described by Cæsar and the best authors, they differed little from the rude inhabitants of the northern climates that have been already mentioned; they sowed corn, but chiefly subsisted upon animal food and milk. Their cloathing was skins, and their fortifications beams of wood. They were incredibly dexterous in the management of their chariots; and they fought with lances, darts, and swords. Women sometimes led their armies to the field, and were recognised as sovereigns of particular districts. They favoured a primogeniture or seniority, in their succession to royalty, but set it aside on the smallest inconveniency attending it. They painted their bodies with woad, which gave them a bluish or greenish cast; and they are said to have had figures of animals and heavenly bodies on their skins. In their marriages they were not very delicate. Twelve or fourteen men married as many wives, and each wife was in common to them all, but her children belonged to the original husband.

The Britons lived, during the long reign of Augustus Cæsar, rather as the allies than the tributaries of the Romans; but the communications between Rome and Great Britain being then extended, the emperor Claudius Cæsar, about forty-two years after the birth of Christ, undertook an expedition in person, in which he seems to have been successful. His conquests, however, were imperfect; Caractacus, and Boadicea, though a woman, made noble stands against the Romans. The former was taken prisoner after a desperate battle, and carried to Rome, where his undaunted behaviour before Claudius gained him the admiration of the victors. Boadicea being oppressed in a manner that disgraces the Roman name, and defeated, disdained to survive the liberties of her country; and Agricola, general to Domitian, after subduing South Britain, carried his arms northwards, as has been already seen in the history of Scotland, where his successors had no reason to boast of their progress, every inch of ground being bravely defended. During the time the Romans remained in this island, they erected those walls which have been so often mentioned, to protect the Britons from the invasions of the Caledonians, Scots, and Picts; and we are told, that the Roman language, learning, and customs, became familiar in Britain. There seems to be no great foundation for this assertion; and it is more probable, that the Romans considered Britain chiefly as a nursery for their armies, on account of the superior strength of body and courage of the inhabitants. That this was the case appears plainly enough from the defenceless state of the Britons, when the government of Rome recalled her forces from that island. I have already taken notice, that during the abode of the Romans in Britain, they introduced into it all the luxuries of Italy; and it is certain, that under them the South-Britons were reduced to a state of great vassalage, and that the genius of liberty retreated northwards, where the natives made a brave resistance against those tyrants of nations. The Roman emperors and generals, while in this island, assisted by the Britons, were frequently employed in repelling the attacks of the Caledonians and Picts (the latter are thought to have been the southern Britons retired northwards), and they appeared to have had no difficulty in maintaining their authority in the southern provinces.

Upon the mighty inundations of those barbarous nations, which, under the names of Goths and Vandals, invaded the Roman empire with infinite numbers, and with danger to Rome itself\*, the Roman legions were withdrawn out of Britain, with the flower of the British youth, for the defence of the capital and centre of the empire. As the Roman forces decreased in Britain, the Scots and Picts,

who had always opposed the progress of the Romans in this island, advanced the more boldly into the southern parts, carrying terror and desolation over the whole country. The effeminated Britons were so accustomed to have recourse to the Romans for defence, that they again and again implored their return. But the Romans, at length reduced to extremities at home, and fatigued with distant expeditions, acquainted the Britons that they must no longer look to them for protection, and exhorted them to arm in their own defence; and that they might leave the island with a good grace, they assisted the Britons in rebuilding with stone the wall of Severus, between Newcastle and Carlisle, which they lined with forts and watch-towers; and having done this good office, took their last farewell of Britain about the year 448, after having been masters of the most fertile parts of it, if we reckon from the invasion of Julius Cæsar, near 500 years.

The Scots and Picts finding the island finally deserted by the Roman legions, now regarded the whole as their prize, and attacked Severus's wall with redoubled forces, ravaged all before them with a fury peculiar to northern nations in those ages, and which a remembrance of former injuries could not fail to inspire. The poor Britons, like a helpless family deprived of their parent and protector, already subdued by their own fears, had again recourse to Rome, and sent over their miserable epistle for relief (still upon record), which was addressed in these words: *To Actius, thirce consul: The groans of the Britons;* and, after other lamentable complaints, said, *That the barbarians drove them to the sea, and the sea back to the barbarians; and they had only the hard choice left of perishing by the sword or by the waves.* But having no hopes given them by the Roman general of any succours from that side, they began to consider what other nation they might call over to their relief: Gildas, who was himself a Briton, describes the degeneracy of his countrymen at this time in mournful strains, and gives some confused hints of their officers, and the names of some of their kings, particularly one Vortigern, chief of the *Daumonii*, by whose advice the Britons struck a bargain with two Saxon chiefs, Hengist and Horsa, to protect them from the Scots and Picts. The Saxons were in those days masters of what is now called the English Channel, and their native countries comprehending Scandinavia and the northern parts of Germany, being overstocked with inhabitants, they readily accepted the invitation of the Britons, whom they relieved, by checking the progress of the Scots and Picts, and had the island of Thanet allowed them for their residence. But their own country was so barren, and the fertile lands of Britain so alluring, that in a very little time Hengist and Horsa began to meditate a settlement for themselves: and fresh supplies of their countrymen arriving daily, the Saxons soon became formidable to the Britons, whom, after a violent struggle of near 150 years, they subdued, or drove into Wales, where their language and descendants still remain.

Literature at this time in England was so rude, that we know but little of its history. The Saxons were ignorant of letters, and public transactions among the Britons were recorded only by their bards and poets, whom they held in great veneration. Nennius, who seems to have been contemporary with Gildas, mentions indeed a few facts, but nothing that can be relied on, or that can form a connected history. We can therefore only mention the names of Merlin, a reputed prince and prophet; Pendragon, the celebrated Arthur, and Thaislin, whose works are said to be extant, with others of less note. After many repeated bloody wars, in which the Britons were sometimes the enemies and sometimes the allies of the Scots and Picts, the Saxons became masters of all England to the south of Adrian's, or rather Severus's wall; but the Scots and Picts seem to have been masters of all the territory to the north, though they suffered the Britons, who had been driven into their territories, to be governed by their own tributary kings: an intermixture that has created much confusion in history.

A sketch of the constitution and government which the Saxons imported into England, and which form by far the most valuable part of their ancient history, has already been given. We have no account of their conversion to Christianity but from Popish writers, who generally endeavour to magnify the merits of their superiors. According to them, Ethelbert king of Kent, who claimed pre-eminence in the heptarchy, as being descended from Hengist, one of the first invaders, married the king of France's daughter, and she being a Christian, pope Gregory the Great seized that opportunity to enforce the conversion of her husband to Christianity, or rather to Popery. For that purpose, about the year 596, he sent over to England the famous Austin, the monk, who probably found no great difficulty in converting the king and his people, and also Sebert, king of the East Saxons, who was baptized, and founded the cathedral of St. Paul in London. The monk then, by his master's order, attempted to bring the churches of the Britons in Wales to a conformity with that of Rome, particularly as to the celebration of Easter; but finding a stout resistance on the part of the bishops and clergy, he persuaded his Christian converts to massacre them, which they did to the number of 1200 priests and monks, and reduced the Britons, who were found in the heptarchy, to a state of slavery, which some think gave rise to the ancient villenage in England. Austin is accounted the first archbishop of Canterbury, and died in 603, as his convert Athelbert did soon after.

It does not fall within the design of this work to relate the separate history of each particular nation that formed the heptarchy. It is sufficient to say, that the pope, in Austin's time, supplied England with about 400 monks, and that the popish clergy took care to keep their kings and laity under the most deplorable ignorance, but always magnifying the power and sanctity of his holiness. Hence it was that the Anglo-Saxons, during their heptarchy, were governed by priests and monks; and, as they saw convenient, persuaded their kings either to shut themselves up in cloisters, or to undertake pilgrimages to Rome, where they finished their days; no less than thirty Anglo-Saxon kings, during the heptarchy, resigned their crowns in that manner, and among them was Ina, king of the West Saxons, in other respects a wise and brave prince. The bounty of those Anglo-Saxon kings to the see of Rome was therefore unlimited; and Ethelwald, king of Mercia, imposed an annual tax of a penny upon every house, which was afterwards known by the name of Peter's pence, because paid on the holiday of *St. Peter ad Vincula*, August 1st\*.

The Anglo-Saxon kings, during the heptarchy, commonly chose one who was to be the head of their political confederacy, for regulating their concerns, but without any jurisdiction in the dominion of others. The clergy, we may easily suppose, had great influence on those occasions; and the history of the Saxon heptarchy is little more than that of crimes, treasons, and murders, committed at the instigation of priests and monks. Even their criminal law, as hath been already observed, admitted of a pecuniary compensation for murder, and regicide itself.

Under all those disadvantages of bigotry and barbarity, the Anglo-Saxons were happier than the nations on the continent; being free from the invasion of the Saracens, who had erected an empire in the East upon the ruins of the Roman, and began to extend their ravages over Spain and Italy. London was then a place of very considerable trade; and if we are to believe the Saxon chronicles quoted by Tyrrel, Withred, king of Kent, paid at one time to Ina, king of Wessex, a sum

\* This tax was imposed at first for the support of a college at Rome for the education of English youth, founded by Ina, king of Wessex, under the

name of *Rome-Scot*, but in process of time the popes claimed it as a tribute due to St. Peter and his successors.

in silver equal to 90,000l. sterling in the year 694. England, therefore, we may suppose to have been about this time a *refuge* for the people of the continent. The venerable but superstitious Bede, about the year 749, composed his Church History of Britain, from the coming in of the Saxons down to the year 731. The Saxon Chronicle is one of the oldest and most authentic monuments of history that any nation can produce. Architecture, such as it was, with stone and glass-working, was introduced into England; and we read, in 799, of a Northumbrian prelate who was served in silver-plate. It must however be owned, that the Saxon coins, which are generally of copper, are many of them illegible, and all of them mean. Ale and alehouses are mentioned in the laws of Ina, about the year 728; and in this state was the Saxon heptarchy in England when, about the year 800, most of the Anglo-Saxons, tired out with the tyranny of their petty kings, united in calling to the government of the heptarchy Egbert, who was the eldest remaining branch of the race of Cerdic, one of the Saxon chiefs who first arrived in Britain. On the submission of the Northumbrians, in the year 827, he became king of all England.

Charles the Great, otherwise Charlemagne, was then king of France and emperor of Germany. In a former part of this work has been mentioned the commercial treaty between him and Offa, king of Mercia, to whom he sent as a present a Hungarian sword, a belt, and two silken vests. Egbert had been obliged by state-jealousies to fly to the court of Charles for protection from the persecutions of Eadburga, daughter of Offa, wife to Birthric, king of the West Saxons. At the court of Charles he acquired the arts both of war and government. His prosperity excited the envy of the northern nations, who, under the name of Danes, then infested the seas, and were no strangers to the coasts of England; for about the year 833 they made descents upon Kent and Dorsetshire, where they defeated Egbert in person, and carried off abundance of booty to their ships. About two years after they landed in Cornwall, and, though they were joined by the Cornish Britons, they were driven out of England by Egbert, who died in the year 838 at Winchester, his chief residence.

Egbert was succeeded by his son Ethelwolf, who divided his power with his eldest son Athelstan. By this time England had become a scene of desolation, through the renewal of the Danish invasions; and Ethelwolf, after some time bravely opposing them, retired in a fit of devotion to Rome, to which he carried with him his youngest son, afterwards the famous Alfred, the father of the English constitution. The gifts which Ethelwolf made to the clergy on this occasion (copies of which are still remaining) are so prodigious, even the tithes of all his dominions, that they shew his head to have been turned by his devotion, or his heart gained by the arts of Swithin, bishop of Winchester. Upon his death, after his return from Rome, he divided his dominions between two of his sons (Athelstan being then dead), Ethelbald and Ethelbert, but we know of no patrimony that was left to young Alfred. Ethelbert, who was the surviving son, left his kingdom, in 866, to his brother Ethelred; in whose time, notwithstanding the courage and conduct of Alfred, the Danes became masters of the sea-coasts, and the finest counties in England. Ethelred being killed, his brother Alfred mounted the throne in 871. He was one of the greatest princes, both in peace and war, mentioned in history. He fought seven battles with the Danes with various success, and when defeated, he found resources that rendered him as terrible as before. He was at one time reduced to an uncommon state of distress, being forced to live in the disguise of a cowherd; but still kept up a secret correspondence with his brave friends, whom he collected together, and by their assistance gave the Danes many signal overthrows, till at last he recovered the kingdom of England, and obliged the Danes who had been settled in it to swear obedience to his government.

Among;

Among the other glories of Alfred's reign was that of raising a maritime power, by which he secured his coasts from future invasions. He rebuilt the city of London, which had been burnt down by the Danes, and founded the university of Oxford about the year 895: he divided England into counties, hundreds, and tythings; or rather he revived those divisions, and the use of juries, which had fallen into decay since the ravages of the Danes. Having been educated at Rome, he was not only a scholar but an author: and he tells us, that upon his accession to the throne, he had scarcely a lay subject who could read English, or an ecclesiastic who understood Latin. He introduced stone and brick buildings in palaces as well as churches, though it is certain that his subjects, for many years after his death, were fond of timber buildings. His encouragement of commerce and navigation may seem incredible to modern times, but he had merchants who traded in East India jewels; and William of Malmibury says, that some of their gems were repositied in the church of Sherbone in his time. He received from one Oether, about the year 890, a full discovery of the coasts of Norway and Lapland, as far as Russia; and he tells the king, in his memorial printed by Hakluyt, "that he sailed along the Norway coast so far north as commonly the whale hunters use to travel." Alfred invited numbers of learned men into his dominions, and found faithful and useful allies against the Danes, in the two Scotch kings his contemporaries, Gregory and Donald. He is said to have fought no less than fifty-six pitched battles. He was inexorable against his corrupt judges, whom he used to hang up in the public highways, as a terror to evil doers. He died in the year 901, and his character is so completely amiable and heroic, that he is justly dignified with the epithet of the Great.

Alfred was succeeded by his son Edward the Elder, under whom, though a brave prince, the Danes renewed their invasions. He died in the year 925, and was succeeded by his eldest son Athelstan. This prince, to encourage commerce, enacted, that every merchant who made three voyages on his own account to the Mediterranean, should be put upon a footing with a *thane*, or *noblesman* of the first rank. He caused the Scriptures to be translated into the Saxon tongue. He encouraged coinage, and we find by his laws, that archbishops, bishops, and even abbots, had then the privilege of coining money. His dominions were confined towards the north by the Danes, although his vassals still kept a footing in those counties. He was successful in his wars with the Scots, and died in 941. The reigns of his successors, Edmund, Edred, and Edwy, were weak and inglorious, they being either engaged in wars with the Danes, or disgraced by the influence of priests. Edgar, who mounted the throne about the year 959, revived the naval glory of England, and is said to have been rowed down the river Dee by eight kings, his vassals, he sitting at the helm; but, like his predecessors, he was the slave of priests, particularly St. Dunstan. His reign, however, was pacific and happy, though he was obliged to cede to the Scots all the territory to the north of the Twe. He was succeeded in 975, by his eldest son Edward, who was barbarously murdered by his stepmother, whose son Ethelred mounted the throne in 978. The nation was at that time harassed by the Danes. To get rid of them, Ethelred agreed to pay them 30,000*l.* which was levied by way of tax, and called *Danegeld*, and was the first land-tax in England. In the year 1002 they had made such settlements in England, that Ethelred consented to a general massacre of them by the English. But this atrocious design served only to enrage the Danish king Swein, who, in 1013, drove Ethelred, his queen, and two sons, out of England into Normandy, a province of France, facing the south-east coast of England, at that time governed by its own princes, styled the dukes of Normandy. Swein being killed, was succeeded by his son Canute the Great; but Ethelred returning to England, forced Canute to retire to Denmark, from whence he invaded England with a vast army, and obliged

ligned Edmund Ironside (so called for his great bodily strength), Ethelred's son, to divide with him the kingdom. Upon Edmund's being assassinated, Canute succeeded to the undivided kingdom; and dying in 1035, his son Harold Harefoot did nothing memorable, and his successor Hardicanute was so degenerate a prince that the Danish royalty ended with him in England.

The family of Ethelred was now called to the throne; and Edward, commonly called the Confessor, mounted it, though Edgar Atheling, a weak youth, being descended from an elder branch, had the lineal right. Edward the Confessor was a soft, good natured prince, a great benefactor to the church, and excessively fond of the Normans, with whom he had resided. He was governed by his minister earl Godwin, and his sons, the eldest of whom was Harold. He durst not resent, though he felt, their ignominious treatment of him. It is said, that he desired the succession of his crown to William duke of Normandy. Be that as it will, it is certain that, upon the death of the Confessor, in the year 1066, Harold, son to Godwin, earl of Kent, mounted the throne.

William duke of Normandy, though a bastard, possessed that great duchy, and resolved to assert his right to the crown of England. For that purpose, he invited the neighbouring princes, as well as his own vassals, to join him, and made liberal promises to his followers, of lands and honours in England, to induce them to assist him effectually. By these means he collected 40,000 of the bravest and most regular troops in Europe, and while Harold was embarrassed with fresh invasions of the Danes, William landed in England without opposition. Harold returning from the North, encountered William in the place where the town of Hastings now stands, in Suffex, and a most bloody battle was fought between the two armies; but Harold being killed, the crown of England devolved upon William, in the year 1066.

Few improvements, either in arts or arms, were made by the Saxons in England, during the Danish invasions. These barbarians seem to have carried off with them almost all the bullion and ready money of the Anglo-Saxons; for Alfred the Great left no more to his two daughters for their portions than 100l. each. The return of the Danes to England, and the victories which had been gained over them, had undoubtedly brought back great part of the money and bullion they had carried off: for we are told, that Harold in his last victory over the Danes, regained as much treasure as twelve lusty men could carry off. We have indeed very particular accounts of the value of provisions and manufactures in those days; a palfrey cost 1s. an acre of land (according to bishop Fleetwood, in his *Chronicon Pretiosum*) 1s. a hide of land containing 120 acres, 100s. but there is great difficulty in forming the proportion of value which those things bore to the present standard of money, though many ingenious treatises have been written on that head. A sheep was estimated at 1s. an ox was computed at 6s. a cow at 4s. a man at 3l. The board wages of a child the first year was 8s. The tenants of Shireburne were obliged at their choice to pay either 6d. or four hens. Silk and cotton were quite unknown. Linen was not much used. In the Saxon times, land was divided among all the male children of the deceased. Entails were sometimes practised in those times.

With regard to the manners of the Anglo-Saxons, we can say little, but that they were in general a rude uncultivated people, ignorant of letters, unskilful in the mechanical arts, untamed to submission under law and government, addicted to intemperance, riot, and disorder. Even so low as the reign of Canute, they sold their children and kindred into foreign parts. Their best quality was their military courage, which yet was not supported by discipline or conduct. Even the Norman historians, notwithstanding the low state of the arts in their own country, speak of them as barbarians, when they mention the invasion made upon them by the duke of

of Normandy. Conquest put the people in a situation of receiving slowly from abroad the rudiments of science and cultivation, and of correcting their rough and licentious manners.

The loss which both sides suffered at the battle of Hastings is uncertain. Anglo-Saxon authors say, that Harold was so impatient to fight, he attacked William with half of his army, so that the advantage of numbers was on the side of the Norman; and, indeed, the death of Harold seems to have decided the day; and William, with little farther difficulty, took possession of the throne, and made a considerable alteration in the constitution of England, by converting lands into knight's fees \*, which are said to have amounted to 62,000, held by the tenure of assisting him in his wars. To one of his favourites he gave the whole county of Chester, which he erected into a palatinate, and rendered by his grant almost independent of the crown. William found it no easy matter to keep possession of his crown. Edgar Atheling, and his sister, the next Anglo-Saxon heirs, were affectionately received in Scotland, and many of the Saxon lords took arms, and formed conspiracies in England. William got the better of all difficulties, especially after he had made a peace with Malcolm king of Scotland, who married Atheling's sister; but not without exercising horrible cruelties upon the Anglo-Saxons. He introduced the Norman laws and language. He built the stone square tower at London, commonly called the White Tower; bridled the country with forts, and disarmed the old inhabitants; in short, he attempted every thing possible to obliterate every trace of the Anglo-Saxon constitution; though, at his coronation, he took the same oath that used to be taken by the ancient Saxon kings.

He caused a general survey of all the lands of England to be made, or rather to be completed (for it was begun in Edward the Confessor's time), and an account to be taken of the villains, slaves, and live stock upon each estate; all which were recorded in a book called Doomsday-book, which is now kept in the Exchequer. But the repose of this fortunate and victorious king, was disturbed in his old age, by the rebellion of his eldest son Robert, who had been appointed governor of Normandy, but now assumed the government as sovereign of that province, in which he was favoured by the king of France. In this transaction we have the rise of the wars between England and France; which have continued longer, and been attended with more memorable achievements, than any other national quarrel we read of in ancient or modern history. William seeing a war inevitable, entered upon it with his usual vigour, and with incredible celerity, transporting a brave English army, invaded France, where he was every where victorious, but died before he had finished the war, in the year 1087, the sixty-first of his age, and twenty-first of his reign in England, and was buried in his own abbey at Caen in Normandy.

By the Norman conquest, England not only lost the true line of her ancient Saxon kings, but also her principal nobility; who either fell in battle in defence of their country and liberties, or fled to foreign countries, particularly Scotland, where, being kindly received by King Malcolm, they established themselves; and, what is very remarkable, introduced the Saxon or English, which has been the prevailing language in the Lowlands of Scotland to this day.

On the other hand, England, by virtue of the conquest, became much greater, both in dominion and power, by the accession of so much territory upon the continent. For though the Normans gained much of the English land and riches, yet England gained the large and fertile dukedom of Normandy, which became an appendage to its crown. England likewise gained much by the great increase of naval

\* Four hides of land made one knight's fee; a barony was twelve times greater than a knight's-

fee; and when Doomsday-book was framed, the number of great barons amounted to 700.

power,

power, and multitude of ships, wherein Normandy then abounded. This, with the perpetual intercourse between England and the continent, gave us an increase of trade and commerce, and of treasure to the crown and kingdom, besides a natural right to the dominion of the Channel, which had been before maintained only by the greater naval power of Edgar, and other Saxon kings. For the dominion of the narrow seas seems naturally to belong, like that of rivers, to those who possess the banks or coasts on both sides; and thus the former title was confirmed, by so long a coast as that of Normandy on one side, and of England on the other side of the Channel.

The succession of the crown of England was disputed between the Conqueror's sons, Robert and William (commonly called Rufus, from his being red-haired), and was carried in favour of the latter. He was a brave and intrepid prince, but no friend to the clergy, who have therefore been unfavourable to his memory. He was likewise hated by the Normans, who loved his elder brother, and consequently he was engaged in perpetual wars with his brothers and rebellious subjects. About this time the crusades to the Holy Land began, and Robert, who was among the first to engage, accommodated matters with William for a sum of money, which he levied from the clergy. William behaved with great generosity towards Edgar Atheling and the court of Scotland, notwithstanding all the provocations he had received from that quarter, but was accidentally killed by an arrow shot by Tyrrel at a stag, as he was hunting in New Forest in Hampshire, in the year 1100, and the forty-fourth year of his age. He is chiefly accused of rapacity and oppression; but the circumstances of his reign required money, which he had no other means of raising but from a luxurious, over-grown clergy, who had engrossed all the riches of the kingdom.

This prince built Westminster-hall as it now stands, and added several works to the Tower, which he surrounded with a wall and ditch. In the year 1100 happened that inundation of the sea which overflowed great part of earl Goodwin's estate in Kent, and formed those shallows in the Downs, now called the Goodwin Sands.

William Rufus was succeeded by his brother Henry I. surnamed Beauclerc, on account of his learning, though his brother Robert was then returning from the Holy Land. Henry may be said to have purchased the throne; first by his brother's treasures, which he seized at Winchester; secondly, by a charter, in which he restored his subjects to the rights and privileges they had enjoyed under the Anglo-Saxon kings; and thirdly, by his marriage with Matilda, daughter of Malcolm III. king of Scotland, and niece to Edgar Atheling, of the ancient Saxon line. His reign restored the clergy to their influence in the state, and they formed a separate body dependent upon the pope, which afterwards created great convulsions in England. Henry, partly by force and partly by stratagem, made himself master of his brother Robert's person, and duchy of Normandy; and, with a most ungenerous meanness, detained him a prisoner for twenty-eight years, till the time of his death; meanwhile quieting his conscience by founding an abbey. He was afterwards engaged in a bloody but successful war with France; and before his death he settled the succession upon his daughter the empress Matilda, widow to Henry IV. emperor of Germany, and her son Henry, by her second husband Geoffrey Plantagenet, earl of Anjou. Henry died of a surfeit of lampreys in the seventy-eighth year of his age, in 1135.

Notwithstanding the late settlement of the succession, the crown of England was claimed, and seized by Stephen earl of Blois, the son of Adela, fourth daughter to William the Conqueror. Matilda and her son were then abroad; and Stephen was assisted in his usurpation by his brother the bishop of Winchester, and the other great prelates, that he might hold the crown dependent upon them. Matilda, however, found a generous protector in her uncle, David, king of Scotland; and a

worthy subject in her natural brother Robert, earl of Gloucester, who headed her party until her son grew up. A long and bloody war ensued, the clergy having absolved Stephen and all his friends from their guilt of breaking the act of succession; but at length, the barons, who dreaded the power of the clergy, inclined towards Matilda; and Stephen, having been abandoned by his partizans, was defeated and taken prisoner in 1141. Being carried before Matilda, she impotently upbraided him, and ordered him to be put in chains.

Matilda was proud and weak, the clergy were bold and ambitious; and when joined with the nobility, who were factious and turbulent, they were an overmatch for the crown. They demanded to be governed by the Saxon laws, according to the charter that had been granted by Henry I. upon his accession; and finding Matilda refractory, they drove her out of England in 1142. Stephen having been exchanged for the earl of Gloucester, who had been likewise taken prisoner, upon obtaining his liberty, found that his clergy and nobility had in fact excluded him from the government, by building 1100 castles, where each owner lived as an independent prince. Stephen attempted to force them to declare his son Eustace heir apparent to the kingdom; and exasperated the clergy so much, that they invited over young Henry of Anjou, who accordingly landed in England with an army of foreigners.

This measure divided the clergy from the barons, who were apprehensive of a second conquest; and the earl of Arundel, with the heads of the lay aristocracy, proposed an accommodation, to which both parties agreed. Stephen, who about that time lost his son Eustace, was to retain the name and office of king; but Henry, who was in fact invested with the chief executive power, was acknowledged his successor. Though this accommodation was only precarious and imperfect, yet it was received with joy by the English, who had seen and suffered so many evils during the late civil wars: and Stephen dying very opportunely, Henry mounted the throne, without a rival, in 1154.

Henry II. surnamed Plantagenet, was by far the greatest prince of his time. He soon discovered extraordinary abilities for government, and had performed, in the sixteenth year of his age, exploits that would not have disgraced the most experienced warriors. At his accession to the throne, he found the condition of the English boroughs greatly bettered, by the privileges granted them in the struggles between their late kings and the nobility. Henry perceived the good policy of this, and brought the boroughs to such a height, that if a bondman or servant remained in a borough a year and a day, he was by such residence made free. He erected Wallingford, Winchester, and Oxford, into free boroughs, for the services the inhabitants had done to his mother and himself.

Without being very scrupulous in adhering to his former engagements, he resumed the excessive grants of crown lands made by Stephen, which were represented as illegal. He demolished many of the castles that had been built by the barons; but when he came to touch the clergy, he found their usurpations not to be shaken. He perceived that the root of all their enormous disorders lay in Rome, where the popes had exempted churchmen, not only from lay courts, but civil taxes. The bloody cruelties and disorders occasioned by those exemptions, all over the kingdom, would be incredible, were they not attested by the most unexceptionable evidences. Unfortunately for Henry, the head of the English church, and chancellor of the kingdom, was the celebrated Thomas Becket. This man, powerful from his offices, and still more by his popularity, arising from a pretended sanctity, was violent, intrepid, and a determined enemy to temporal power of every kind, but withal cool and politic. The king assembled his nobility at Clarendon, in Wiltshire, the name of which place is still famous for the constitutions there enacted; which in fact, abolished the authority of the Romish see over the English clergy.

Becket finding it in vain to resist the stream, signed those constitutions, till they could be ratified by the pope, who, as he foresaw, rejected them. Henry, though a prince of the most determined spirit of any of his time, was then embroiled with all his neighbours; and the see of Rome was in its meridian grandeur. Becket having been arraigned and convicted of robbing the public, while he was chancellor, fled to France, where the pope and the French king espoused his quarrel. The effect was, that all the English clergy who were on the king's side were excommunicated, and the laity absolved from their allegiance. This disconcerted Henry so much, that he submitted to treat, and even to be insulted by his rebel prelate, who returned triumphantly through the streets of London in 1170. His return swelled his pride, and increased his insolence, till both became insupportable to Henry, who was then in Normandy. Finding that he was in fact only the first subject of his own dominions, he was heard to say in the anguish of his heart, "Is there none who will revenge his monarch's cause upon this audacious priest?" These words reached the ears of four knights, Reginal Fitzurse, William de Tracy, Hugh de Moreville, and Richard Brito; who, without apprising Henry of their intentions, went over to England, where they beat out Becket's brains before the altar of his own church at Canterbury, in the year 1171. Henry was in no condition to defend the blind obedience of his knights; and the public resentment rose so high, on the supposition that he was privy to the murder, that he submitted to be scourged by monks at the tomb of the pretended martyr.

Henry, in consequence of his well known maxim, endeavoured to cancel all the grants which had been made by Stephen to the royal family of Scotland, and occasioned a war between the two kingdoms, in which William king of Scotland was taken prisoner; and, to deliver himself from captivity, was obliged to pay liege homage to king Henry for his kingdom of Scotland, and for all his other dominions. It was also agreed, that liege homage should be done, and fealty sworn to Henry, without reserve or exception, by all the earls and barons of the territories of the king of Scotland, from whom Henry should desire it, in the same manner as by his other vassals. The heirs of the king of Scotland, and the heirs of his earls, barons, and tenants in chief, were likewise obliged to render the liege homage to the heirs of the king of England.

Henry likewise distinguished his reign by the conquest of Ireland; and by marrying Eleanor the divorced queen of France, heiress of Guienne and Poictou, he became almost as powerful in France as the French king himself, and the greatest prince in Christendom. In his last years he was unhappy, having embarrassed himself by intrigues with women, particularly the fair Rosamond. His infidelity was resented by his queen Eleanor, even to the seducing her sons, Henry, (whom his father had unadvisedly caused to be crowned in his own life-time) Richard, and John, in repeated rebellions, which affected their father so much as to throw him into a fever, and he died at Chinon in France, in the year 1189, and 57th of his age. The sum he left in ready money at his death has perhaps been exaggerated, since the most moderate accounts make it amount to 200,000*l.* of our money.

During the reign of Henry, corporation charters were established all over England, by which the power of the barons was greatly reduced. Those corporations encouraged trade; but manufactures, especially those of silk, seem still to have been confined to Spain and Italy; for the silk coronation robes, made use of by young Henry and his queen, cost 87*l.* 10*s.* 4*d.* in the sheriff of London's account, printed by Mr. Maddox; a vast sum in those days. Henry introduced the use of glass windows into England, and stone arches in building. William of Malmshury,

Henry

Henry archdeacon of Huntingdon, and other historians who lived under him, are remarkable for their Latin style, which is often pure and elegant.

In this reign, and in those barbarous ages, it was a custom in London for great numbers, to the amount of a hundred or more, of the sons and relations of eminent citizens, to form themselves into a licentious confederacy, to break into rich houses and plunder them, to rob and murder passengers, and to commit the most daring crimes. Henry, about the year 1176, divided England into six parts, called *circuits*, appointing judges to go at certain times of the year and hold *assizes*, to administer justice to the people, as is practised to this day.

Henry so far abolished the barbarous and absurd practice of forfeiting ships which had been wrecked on the coast, that if one man or animal were alive in the ship, the vessel and goods were restored to the owners. This prince was also the first who levied a tax on the moveable or personal estates of his subjects, nobles as well as people. Their zeal for the holy war made them submit to this innovation; and a precedent being once obtained, this taxation became in following reigns an usual method of supplying the necessities of the crown. It was the practice of some kings of England to repeat the ceremony of their coronation thrice a year, on assembling the states at the three great festivals. Henry, after the first years of his reign, never renewed this ceremony, which was found to be very expensive and very useless. None of his successors ever revived it. Since we are here collecting some detached instances, which show the genius of those ages, it may not be improper to mention the quarrel between Roger archbishop of York and Richard archbishop of Canterbury. We may judge of the violence of military men and laymen, when ecclesiastics would proceed to such extremities. The pope's legate having summoned an assembly of the clergy at London, and as both the archbishops pretended to sit on his right hand, this question of precedency begot a controversy between them. The monks and retainers of archbishop Richard fell upon Roger in the presence of the cardinal and of the synod, threw him on the ground, trampled him under foot, and so bruised him with blows, that he was taken up half dead, and his life was with difficulty saved from their violence.

Richard I. surnamed *Cœur de Lion*, from his great courage, was the third, but eldest surviving son of Henry II. The clergy had found means to gain him over, and for their own ends they persuaded him to make a most magnificent, but ruinous crusade to the Holy Land, where he took Ascalon, and performed such actions of valour as give countenance even to the fables of antiquity. After several glorious, but fruitless campaigns, he made a truce of three years with Saladin emperor of the Saracens; and, in his return to England, he was treacherously surpris'd by the duke of Austria, who, in 1193, sent him a prisoner to the emperor Henry VI. His ransom was fixed by the fardid emperor at 150,000 marks; about 300,000. of our present money: According to temporary authors, the raising of this ransom proved to be a matter of so much difficulty, that all the church plate was melted down, and a tax was laid on all persons, both ecclesiastical and secular, of one-fourth part of their income for one year; and twenty shillings on every knight's fee; also one year's wool borrowed of the Cistercians; besides money raised upon the clergy of the king's French dominions; and 2000 marks which were furnished by William king of Scotland, in gratitude for Richard's generous behaviour to him before his departure. Though all these sums are well authenticated, yet it is not easy to reconcile them with certain other money-transactions of this reign, but by supposing that Richard carried off with him, and expended abroad, all the visible specie in the kingdom; and that the people had reserved vast hoards, which they afterwards produced, when commerce took a brisker turn.

Whilst the Scottish kings enjoyed their lands in England, they found it their interest,

\* It appears Scotland, and the king's revenue, to be

interest, once generally in every king's reign, to perform homage; but when they were deprived of their said lands, they paid it no more \*.

Woollen broad cloths were made in England at this time. An ox sold for three shilling, which answers to nine shillings of our money, and a sheep at four pence, or one shilling. Weights and measures were now ordered to be the same all over the kingdom. Richard, upon his return, found his dominions in great disorder, through the practices of his brother John, whom he however pardoned; and by the invasions of the French, whom he repelled; but was slain in besieging the castle of Chalons, in the year 1199, the 42d of his age, and 10th of his reign.

The reign of his brother John, who succeeded him, is infamous in the English history. He is said to have put to death Arthur, the eldest son of his brother Geoffry, who had the hereditary right to the crown. The young prince's mother, Constance, complained to Philip the king of France; who, upon John's non-appearance at his court as a vassal, deprived him of Normandy. John notwithstanding, in his wars with the French, Scotch, and Irish, gave many proofs of personal valour; but became at last so apprehensive of a French invasion, that he rendered himself a tributary to the pope, and laid his crown and regalia at the foot of the legate Pandulph, who kept them for five days. The great barons resented his meanness, by taking arms; but he repeated his shameful submissions to the pope, and, after experiencing various fortunes of war, was at last brought so low, that the barons obliged him, in 1216, to sign the great deed, so well known by the name of *Magna Charta*. Though this charter is deemed the foundation of English liberty, yet it is in fact no other than a renewal of those immunities which the barons and their followers had enjoyed under the Saxon princes, and which they claimed by the charters of Henry I. and Henry II. As the principles of liberty came to be more enlarged, and property to be better secured, this charter, by various subsequent acts and explanations, came to be applicable to every English subject, as well as to the barons, knights, and burghesses. John had scarcely signed it, when he retracted, and called upon the pope for protection, when the barons withdrew their allegiance from him, and transferred it to Lewis, the eldest son of Philip Augustus, king of France. This gave umbrage to the pope; and the barons being apprehensive lest their country should become a province to France, they returned to John's allegiance; but he was unable to protect them, till the pope refused to confirm the title of Lewis. John died in 1216, in the 18th year of his reign, and the 49th of his age, just as he had a glimpse of resuming his authority. Without disputing what historians have said of his arbitrary, inconstant, and cruel disposition, it is evident, from the same relations, that he had great provocations from the clergy and the barons, who in their turns attempted to annihilate the regal prerogative. It is undeniable at the same time that, under John, the commons of England laid the foundation of all the wealth and privileges they now enjoy; and the commerce of England received a most surprising increase. He may be called the father of the privileges of free boroughs, which he established and endowed all over his kingdom.

The city of London owes some of her privileges to him. The office of mayor, before his reign, was for life; but he gave them a charter to chuse a mayor out of their own body annually, and to elect their sheriffs and common council annually, as at present.

\* It appears however, that William I. king of Scotland, and his subjects, consented to acknowledge the king of England and his heirs, to all perpetuity, to be their sovereigns and liege lords, and

that they did homage for the kingdom of Scotland accordingly; but this advantage was given up by Richard I. *Vide* Lord Lyttelton's History of Henry. II. vol. v. p. 220, 223, 225. 8vo. edit.

England was in a deplorable situation when her crown devolved upon Henry III. the late king's son, who was but nine years old. The earl of Pembroke was chosen his guardian; the pope taking part with the young prince, the French were defeated and driven out of the kingdom, and their king obliged to renounce all claims upon the crown of England. The regent, earl of Pembroke, who had thus retrieved the independency of his country, died in 1219, and the regency devolved upon the bishop of Winchester. The French king all this time kept possession of Normandy; but at home the power of the pope became exorbitant; and he sent no fewer than 300 of his rapacious clergy, in the year 1240, to take possession of the best English benefices, and to load the people with taxes. This evil was increased by the marriage of Henry with the daughter of the earl of Provence, a needy prince, whose poor relations engrossed the best estates and places in the kingdom. The king was of a soft, pliable disposition, and had been persuaded to violate the Great Charter. Indeed he seemed always endeavouring to evade the privileges which he had been compelled to grant and confirm. An association of the barons was formed against him, and a civil war breaking out, Henry seemed to be abandoned by all but his Gascons and foreign mercenaries. His profusion brought him into inexplicable difficulties; and the famous Stephen Montfort, who had married his sister, and was made earl of Leicester, being chosen general of the association, the king and his two sons were defeated, and taken prisoners at the battle of Lewes. A difference happening between Montfort and the earl of Gloucester, a nobleman of great authority, prince Edward, Henry's eldest son, obtained his liberty, and assembling as many as he could of his father's subjects, who were jealous of Montfort, and weary of the tyranny of the barons, he gave battle to the rebels, whom he defeated at Evesham, August 4, 1265, and killed Montfort. The representatives of the commons of England, both knight and burgeses, now formed part of the English legislature, in a separate house; and before this reign historians are not agreed as to the office or powers of this branch of the parliament. Prince Edward being engaged in a crusade, Henry, during his absence, died in 1272, the 64th year of his age, and 56th of his reign, which was uncomfortable and inglorious; and yet to the struggles at that time the people in great measure owe the liberties of the present day. During his reign, the principal customs arose from the importation of French and Rhenish wines, the English being as yet strangers to those of Spain, Portugal, and Italy. Interest had in that age amounted to an enormous height: there are instances of 50l. per cent. being paid for money, which tempted the Jews to remain in England, notwithstanding the grievous oppressions they laboured under, from the bigotry of the age and Henry's extortions. In 1255 Henry made a fresh demand of 8000 marks from the Jews, and threatened to hang them if they refused compliance. They now lost all patience, and desired leave to remove with their effects from the kingdom. But the king replied, "How can I remedy the oppression you complain of? I am myself a beggar; I am despoiled; I am stripped of all my revenues; I owe above 200,000 marks; and if I had said 300,000, I should not exceed the truth; I am obliged to pay my son, prince Edward, 15,000 marks a year; I have not a farthing, and I must have money from any hand, from any quarter, or by any means." King John his father once demanded 10,000 marks from a Jew at Bristol; and, on his refusal, ordered one of his teeth to be drawn every day till he should consent: the Jew lost seven teeth, and then paid the sum required. Trial by *ordeal* was now entirely disused, and that by *duel* discouraged. Bracton's famous law treatise was published in this reign.

Edward returning to England, on the news of his father's death, invited all who held of his crown *in capite* to his coronation dinner, which consisted (that

the reader may have some idea of the luxury of the times) of 278 bacon hogs, 450 hogs, 440 oxen, 430 sheep, 22,600 hens and capons, and 13 fat goats (see Rymer's *Fœdera*). Alexander III. king of Scotland was at the solemnity, and on the occasion 300 horses were let loose, for those that could catch them to keep them.

Edward was a brave and politic prince, and being perfectly well acquainted with the laws, interests, and constitution of his kingdom, his regulations and reformation of the laws, have justly given him the title of the English Justinian. He passed the famous mortmain act, whereby all persons "were restrained from giving, by will or otherwise, their estates to (those so called) religious purposes, and the societies that never die, without a licence from the crown." He granted certain privileges to the cinque-ports, which, though now very inconsiderable, were then obliged to attend the king, when he went beyond sea, with fifty-seven ships, each having twenty armed soldiers on board, and to maintain them at their own costs for the space of fifteen days. He reduced the Welch to pay him tribute, and annexed its principality to his crown, and was the first who gave the title of prince of Wales to his eldest son.

His vast connections with the continent were productive of many benefits to his subjects, particularly by the introduction of reading-glasses and spectacles; though they are said to have been invented, in the former reign, by the famous friar Bacon. Windmills were erected in England about the same time, and the regulation of gold and silver workmanship was ascertained by an assay and mark of the goldsmith's company. Edward was often embroiled with the pope, especially upon the affairs of Scotland; and he died in 1307, the 69th year of his age and 35th of his reign, while he was upon a fresh expedition against Scotland. He ordered his heart to be sent to the Holy Land, with 32,000*l.* for the maintenance of what was called the *Holy Sepulchre*.

His son and successor Edward II. shewed early dispositions for encouraging favourites; but Gaveston, his chief minion, a Gascon, being banished by his father, he mounted the throne with vast advantages, both political and personal, all which he soon forfeited by his own imprudence. He recalled Gaveston, and loaded him with honours, and married Isabella, daughter to the French king, who restored to him part of the territories which Edward I. had lost in France. The barons, however, obliged him once more to banish his favourite, and to confirm the great charter, while king Robert Bruce recovered all Scotland, except the castle of Stirling; near to which, at Bannockburn, Edward in person received the greatest defeat that England ever suffered, in 1314. Gaveston being beheaded by the barons, they fixed upon young Hugh Spencer as a spy upon the king, but he soon became his favourite. Through his pride, avarice, and ambition, he was banished, together with his father, who had been created earl of Winchester. The queen, an ambitious and worthless woman, persuaded her husband to recall the Spencers, while the common people, from their hatred to the barons, joined the king's standard, and after defeating them, restored him to the exercise of all his prerogatives. A cruel use was made of those successes, and many noble patriots, with their estates, fell victims to the queen's revenge; but at last she became enamoured with Roger Mortimer, who was her prisoner, and had been one of the most active of the anti-royalist lords. A breach between her and the Spencers soon followed, and, going over to France with her lover, she found means to form such a party in England, that, returning with some French troops, she put the eldest Spencer to an ignominious death, made her husband prisoner, and forced him to abdicate his crown in favour of his son Edward III. then fifteen years of age. Nothing now but the death of Edward II. was wanting to complete her guilt; and he was most barbarously murdered in

in Berkeley-castle by ruffians, supposed to be employed by her and her paramour Mortimer, in the year 1327.

Upon an average, the difference of living then and now, seems to be nearly as 5 or 6 is to 1, always remembering that their money contained thrice as much silver as our money or coin of the same denomination does. Thus, for example, if a goose then cost 2½*d.* that is 7½*d.* of our money, according to the proportion of 6 to 1, it would now cost 3*s.* 9*d.* The Knights Templars were suppressed in this reign, owing to their enormous vices.

Edward III. mounted the throne in 1327. He was then under the tuition of his mother, who cohabited with Mortimer; and they endeavoured to keep possession of their power, by promoting many popular measures, and putting an end to all national differences with Scotland, for which Mortimer was created earl of March. Edward, young as he was, became sensible of their designs. He surprised them in person at the head of a few chosen friends in the castle of Nottingham. Mortimer was hanged as a traitor on the common gallows at Tyburn, and the queen herself was shut up in confinement twenty-eight years, to her death. It was not long before Edward found means to quarrel with David king of Scotland, though he had married his sister. David was driven to France by Edward Baliol, who did homage to Edward for Scotland. Upon the death of Charles the Fair, king of France (without issue), who had succeeded by virtue of the Salic law, which the French pretended cut off all female succession to that crown, Philip of Valois claimed it, as being the next heir male; but he was opposed by Edward, who asserted his right as son of Isabella, who was sister to the three last mentioned kings of France, and first in the female succession. The former was preferred; but, the case being doubtful, Edward pursued his claim, and invaded France with a powerful army.

On this occasion the vast difference between the feudal constitutions of France, which were then in full force, and the government of England, more favourable to public liberty, appeared. The French officers knew no subordination. They and their men were equally undisciplined and disobedient, though far more numerous than their enemies in the field. The English freemen, on the other hand, having now vast property to fight for, which they could call their own, knew its value, and had learned to defend it by providing themselves with proper armour, and submitting to military exercise and proper subordination in the field. The war, on the part of Edward, was therefore a continued scene of success and victory. In 1340 he took the title of king of France, using it in all public acts, and quartered the arms of France with his own, adding this motto, *Dieu et mon droit*, "God and my right." At Cressly, August 26th, 1346, above 100,000 French were defeated by 30,000 English, chiefly by the valour of the prince of Wales, who was but sixteen years of age (his father being no more than thirty-four). The loss of the French far exceeded the number of the English army, whose loss consisted of no more than three knights, one esquire, and about fifty private men. The battle of Poitiers was fought in 1356, between the prince of Wales and the French king John, but with greatly superior advantages of numbers on the part of the French, who were totally defeated, and their king and his favourite son Philip taken prisoners. It is thought that the number of French killed in this battle was double that of all the English army; but the modesty and politeness with which the prince treated his royal prisoners, formed the brightest wreath in his garland.

Edward's glories were not confined to France. Having left his queen Philippa, daughter to the earl of Hainault, regent of England, he had the good fortune to take prisoner David king of Scotland, who had ventured to invade England about six weeks after the battle of Cressly. Thus Edward had the glory to see two crowned heads

heads his captives at London. Both kings were afterwards ransomed; David for 100,000 marks, after being eleven years in captivity, and John for three millions of gold crowns; but John returned to England, in order to adjust some differences respecting his ransom, and died at the palace of the Savoy. After the treaty of Bretigny, into which Edward III. is said to have been frightened by a dreadful storm, his fortunes declined. He had resigned his French dominions entirely to the prince of Wales, and he sunk in the esteem of his subject at home, on account of his attachment to his mistress, one Alice Pierce. The prince of Wales, commonly called the Black Prince \*, from his wearing that coloured armour, while he was making a glorious campaign in Spain, where he reinstated Peter the Cruel on that throne, was seized with a consumptive disorder, which carried him off in the year 1372. His father did not long survive him; for he died, dispirited and obscure, at Shene, in Surry, in the year 1377, the 65th of his age, and 51st of his reign.

Edward was one of the most illustrious kings that sat on the English throne. Bent on the conquest of France, he gratified the more readily his people in their demands for security to their liberties and properties: but his ambition exhausted his regal dominions; and his successor, when he mounted the throne, was less powerful than Edward in the beginning of his reign. He has the glory of inviting over and protecting fullers, dyers, weavers, and other artificers from Flanders, and of establishing the woollen manufacture among the English, who, till this time, generally exported the unwrought commodity. The rate of living in his reign seems to have been much the same as in the preceding; and few of the English ships, even of war, exceeded forty or fifty tons. But, notwithstanding the vast increase of property in England, villenage still continued in the royal, episcopal, and baronial manors. Historians are not agreed whether Edward made use of artillery in his first invasion of France, but it certainly was well known before his death. The magnificent castle of Windsor was built by Edward III. and his method of conducting that work may serve as a specimen of the condition of the people in that age. Instead of alluring workmen by contract and wages, he assailed every country in England to send him to many masons, tilers, and carpenters. Soldiers were enlisted only for a short time; they lived idle all the rest of the year, and commonly all the rest of their lives; one successful campaign, by pay and plunder, and the ransom of prisoners, was supposed to be a small fortune; which was a great allurements to enter into the service. The wages of a master carpenter was limited through the whole year to three pence a-day, a common carpenter to two pence, money of that age.

Dr. John Wickliffe, a secular priest, born at Oxford, began, in the latter end of this reign, to spread the doctrines of Luther, by his discourses, and writings; and he made many disciples of all ranks. He was a man of learning, and piety; and has the honour of being the first person in Europe who publicly called in question those doctrines which had passed for certain during so many ages. The doctrines of Wickliffe being derived from his search into the scriptures, and into ecclesiastical antiquity, were nearly the same with those propagated by the reformers in the sixteenth century. But, though many seemed strongly disposed to receive them, affairs were not yet fully ripe for this great revolution, reserved for a more free and enquiring age. He had many friends in the university of Oxford and at court, and was powerfully protected against the evil designs of the pope and bishops, by John of Gaunt duke of Lancaster, one of the king's sons, and

\* He was also the first in England that had the title of Duke, being created by his father duke of Cornwall; and ever since, the eldest son of the king of England is by birth duke of Cornwall.

great men. His disciples were distinguished by the name of Wickliffites or Lollards.

Richard II. son of the Black Prince, was only eleven years of age when he mounted the throne. The English arms were then unsuccessful both in France and Scotland; but the doctrines of Wickliffe took root under the influence of the duke of Lancaster, the king's uncle and one of his guardians, and gave enlarged notions of liberty to the villains, the lower ranks of people. The truth is, that agriculture was then in so flourishing a state, that corn, and other victuals, were suffered to be transported, and the English had fallen upon a way of manufacturing, for exportation, their leather, horns, and other native commodities; and with regard to the woollen manufactures, they seem from records to have been exceeded by none in Europe. John of Gaunt's foreign connections with the crowns of Portugal and Spain were of prejudice to his country; and so many men were employed in unsuccessful wars, that the commons of England, like powder, receiving a spark of fire, all at once flamed out into rebellion, under the conduct of Ball, a priest, Wat Tyler, Jack Straw, and others, the lowest of the populace. The conduct of these insurgents was violent and unjustifiable; but it cannot be denied, that the common people of England then laboured under many oppressions, particularly a *poll tax*.

Richard was not then above sixteen, but he acted with great spirit and wisdom. He faced the storm of the insurgents, at the head of the Londoners, while Walsworth, the mayor, and Philpot, an alderman, had the courage to put Tyler, the leader of the malcontents, to death, in the midst of his adherents. This, with the reasonable behaviour of Richard, quelled the insurrection for that time; but it broke out with the most bloody effects in other parts of England; and, though it was suppressed by making many examples of severity among the insurgents, yet the common people never after abandoned the cause, till by degrees they obtained those privileges which they now enjoy. Had Richard been a prince of real abilities, he might, after the suppression of those insurgents, have established the tranquillity of his dominions on a sure foundation; but he delivered himself up to worthless favourites, particularly Michael de la Pole, son to a merchant of London, whom he created earl of Suffolk and lord chancellor, judge Tretilian, and, above all, Robert de Vere, earl of Oxford, whom he created marquis\* of Dublin and duke of Ireland. They were obnoxious both to the parliament and people, attainted, and condemned to suffer as traitors. The chief justice Tretilian was hanged at Tyburn, but de la Pole and the duke of Ireland escaped abroad, where they died in obscurity. Richard then associated to himself a new set of favourites. His people and great lords again took up arms, and being headed by the duke of Gloucester the king's uncle, they forced Richard once more into terms; but being insincere in all his compliances, he was upon the point of becoming more despotic than any king of England had ever been, when he lost his crown and life by a sudden catastrophe.

A quarrel happened between the duke of Hereford, son to the duke of Lancaster, and the duke of Norfolk; and Richard banished them both, with particular marks of injustice to the former, who now became duke of Lancaster by his father's death. Richard carrying over a great army to quell a rebellion in Ireland, a strong party was formed in England, the natural result of Richard's tyranny, who offered the duke of Lancaster the crown. He landed from France at Ravenspur in Yorkshire, and was soon at the head of 60,000 men, all of them English. Richard hurried back to England, where his troops refusing to fight, and his subjects, whom he had

affected to despise, generally deserting him, he was made prisoner with no more than twenty attendants; and being carried to London, he was deposed in full parliament, upon a formal charge of tyranny and misconduct; and soon after he is supposed to have been starved to death in prison, in the year 1399, the 32d of his age, and the 23d of his reign. He had no issue by either of his marriages.

Though the nobility of England were possessed of great power at the time of this revolution, yet we do not find that it abated the influence of the commons. They had the courage to remonstrate boldly in parliament against the usury, which was but too much practised in England, and other abuses of both clergy and laity; and the destruction of the feudal powers soon followed.

Henry the Fourth\*, son of John of Gaunt, duke of Lancaster, fourth son of Edward III. being settled on the throne of England, in prejudice to the elder branches of Edward III.'s family, the great nobility were in hopes that this glaring defect of his title would render him dependent upon them. At first some conspiracies were formed against him by the dukes of Surry and Exeter, the earls of Gloucester and Salisbury, and the archbishop of York; but he crushed them by his activity and steadiness, and laid a plan for reducing their overgrown power. This was understood by the Percy family, the greatest in the north of England, who complained of Henry having deprived them of some Scotch prisoners, whom they had taken in battle, and a dangerous rebellion broke out under the old earl of Northumberland, and his son the famous Henry Percy, surnamed Hotspur; but it ended in the defeat of the rebels, chiefly by the valour of the prince of Wales. With equal good fortune, Henry suppressed the insurrections of the Welch, under Owen Glendower; and by his prudent concessions to his parliament, to the commons particularly, he at last conquered all opposition, while, to remedy the defect of his title, the parliament entailed the crown upon him and the heirs male of his body lawfully begotten, thereby shutting out all female succession. The young duke of Rothsay, heir to the crown of Scotland (afterwards James I. of that kingdom), falling a prisoner into Henry's hands, kept the northern frontier from invasion; and before his death, which happened in 1413, in the 46th year of his age, and 13th of his reign, he had the satisfaction to see his son and successor, the prince of Wales, disengage himself from many youthful follies, which had till then disgraced his conduct.

The English marine was now so greatly increased, that we find an English vessel of 200 tons in the Baltic, and many other ships of equal burden, carrying on trade in various parts, particularly with the Hanse towns. With regard to public liberty, Henry IV. as I have already hinted, was the first prince who gave the different orders in parliament, especially that of the commons, their due weight. It is, however, a little surprising, that learning was at this time at a much lower pass in England, and all over Europe, than it had been 200 years before. Bishops, when testifying synodal acts, were often forced to do it by proxy, in the following terms, viz. "As I cannot read myself, N. N. hath subscribed for me;" or, "As my lord bishop cannot write himself, at his request I have subscribed." By the influence of the court and the intrigues of the clergy, an act was obtained in the sessions of parliament 1401 for the burning of heretics, occasioned by the great in-

\* The throne being now vacant, the duke of Lancaster stepped forth, and having crossed himself on his forehead and on his breast, and called upon the name of Christ, he pronounced these words, which I shall give in the original language, because of their singularity.

*In the name of Father, Son, and Holy Ghost, I Henry of Lancaster, challenge the crown of Eng-*

*land, and the crown, which all the members, and the appurtenances; als I that am descended by right line of the blood (meaning a claim in right of his mother) coming from the said king Henry third, and charge that right that God of his grace hath sent me, with help of kyn, and of my frendes, to recover it; the which crown was in point to be online by default of governance, and undoying of the gode helpe.*

crease of the Wickliffites or Lollards; and immediately after, one Sawtree, parish-priest of St. Osithe, in London, was burnt alive by the king's writ, directed to the mayor and sheriffs of London.

The balance of trade with foreign parts was against England at the accession of Henry V. in 1413, so greatly had luxury increased. The Lollards, or the followers of Wickliffe, were excessively numerous, and sir John Oldcastle, lord Cobham, having joined them, it was pretended that he had agreed to put himself at their head, with a design to overturn the government; but this appears to have been a groundless accusation, from the bloody zeal of the clergy, though he was put to death in consequence of it. His only real crime seems to have been the spirit with which he opposed the superstition of the age, and he was the first of the nobility who suffered on account of religion. Henry was about this time engaged in a contest with France, which he had many incitements for invading. He demanded a restitution of Normandy, and other provinces, that had been ravaged from England in the preceding reigns; also the payment of certain arrears due for king John's ransom since the reign of Edward III. and availing himself of the distracted state of that kingdom by the Orleans and Burgundy factions, he invaded it, took Harfleur, and then defeated the French in the battle of Agincourt, which equalled the glory of Cressy and Poitiers, but exceeded them in its consequences, on account of the vast number of French princes of the blood, and other great noblemen, who were slain. Henry, who was as great a politician as a warrior, made such alliances, and divided the French among themselves so effectually, that he forced the queen of France, whose husband Charles VI. was a lunatic, to agree to his marrying her daughter, the princess Catherine, to disinherit the dauphin, and to declare Henry regent of France during her husband's life, and him and his issue successors to the French monarchy, which must at this time have been destroyed, had not the Scots (though their king still continued Henry's captive) furnished the dauphin with effectual supplies, and preserved the French crown for his head. Henry, however, made a triumphal entry into Paris, where the dauphin was proscribed; and after receiving the fealty of the French nobility, he returned to England to levy a force that might crush the dauphin and his Scotch auxiliaries. He probably would have been successful, had he not died of a pleuritic disorder, 1422, the 34th year of his age, and the 10th of his reign.

By an authentic and exact account of the ordinary revenues of the crown during this reign, it appears that they amounted only to 55,714*l.* a year, which is nearly the same with the revenues in Henry III.'s time, and the kings of England had neither become much richer nor poorer in the course of 200 years. The ordinary expences of the government amounted to 52,507*l.* so that the king had of surplus only 3207*l.* for the support of his household, for his wardrobe, for the expence of embassies, and other articles. This sum, though money of the same denomination then contained thrice as much silver as it does at present, was not nearly sufficient even in time of peace; and to carry on his wars, this great conqueror was reduced to many miserable shifts: he borrowed from all quarters; he pawned his jewels and sometimes the crown itself; he ran in arrears to his army; and he was often obliged to stop in the midst of his career of victory, and to grant a truce to the enemy. From these particulars the reader may judge of the simplicity and temperance of our predecessors near four centuries ago, when the expences of the greatest king in Europe were little better than the emolument of a superannuated courtier of the present age.

It required a prince equally able with Henry IV. and V. to confirm the title of the Lancaster house to the throne of England. Henry VI. furnished of Windfor, was no more than nine months old, when, in consequence of the treaty of Troyes, concluded by his father with the French court, he was proclaimed king of France

as well as England. He was under the tuition of his two uncles the dukes of Bedford and Gloucester, both of them princes of great accomplishments, virtues, and courage, but unable to preserve their brother's conquests. Upon the death of Charles VI. the affections of the French for his family revived in the person of his son and successor Charles VII. The duke of Bedford, who was regent of France, performed many glorious actions, and at last laid siege to Orleans, which, if taken, would have completed the conquest of France. The siege was raised by the valour and good conduct of the Maid of Orleans, a phenomenon hardly to be paralleled in history, she being born of the lowest extraction, and bred a cow-keeper, and sometimes a helper in stables at public inns. She mult, notwithstanding, have possessed an amazing fund of sagacity as well as valour. After an unparalleled train of heroic actions, and placing the crown upon her sovereign's head, she was taken prisoner by the English in making a sally during the siege of Compiègne, and burnt alive for a witch at Roan, May 30, 1431.

The death of the duke of Bedford, and the agreement of the duke of Burgundy, the great ally of the English, with Charles VII. contributed to the entire ruin of the English interest in France, and the loss of all their fine provinces in that kingdom, notwithstanding the heroic resistance of Talbot, the first earl of Shrewsbury, and their other officers. The capital misfortune of England, at this time, was its disunion at home. The duke of Gloucester lost his authority in the government, and the king married Margaret of Anjou, daughter to the needy king of Sicily; a woman of a high spirit, but an implacable disposition; while the cardinal of Winchester, who was the richest subject in England, if not in Europe, presided at the head of the treasury, and by his avarice ruined the interest of his country, both at home and abroad. Next to the cardinal, the duke of York, who was lord lieutenant of Ireland, was the most powerful subject in England. He was descended by the mother's side from Lionel, an elder son of Edward III. and prior in claim to the reigning king, who was descended from John of Gaunt, Edward's youngest son; and he affected to keep up the distinction of a white rose, that of the house of Lancaster being red. It is certain that he paid no regard to the parliamentary entail of the crown upon the reigning family, and he lost no opportunity of forming a party to assert his right, but acted at first with profound dissimulation. The duke of Suffolk was a favourite of the queen, and a professed enemy to the duke of York; but, being impeached in parliament, he was banished for five years, and had his head struck off on board a ship, by a common sailor. This was followed by an insurrection of 20,000 Kentish men, headed by one Jack Cade, a man of low condition, who sent to the court a list of grievances; but he was defeated by the valour of the citizens of London. The inglorious management of the English affairs in France proved advantageous to the duke of York, and, upon his arrival in England from Ireland, he found a strong party of the nobility his friends; but being considered as the fomentor of Cade's rebellion, he professed the most profound reverence to Henry.

The persons in high power and reputation in England, next to the duke of York, were the earl of Salisbury, and his son the earl of Warwick. The latter had the greatest land estate of any subject in England, and his vast abilities, joined to some virtues, rendered him equally popular. Both father and son were secretly on the side of York; and during a fit of illness of the king that duke was made protector of the realm. Both sides now prepared for arms, and the king recovering, the queen, with wonderful activity assembled an army; but the royalists were defeated in the first battle of St. Alban's, and the king himself was taken prisoner. The duke of York was once more declared protector of the kingdom; but it was not long before the queen resumed all her influence in the government, and the

king,

king, though his weakness became every day more and more visible, recovered all his authority.

The duke of York upon this, threw off the mask, and, in 1459, openly claimed the crown, and the queen was again defeated by the earl of Warwick, who was now called the King-maker. A parliament being assembled, it was enacted, that Henry should possess the throne for life, but that the duke of York should succeed him, to the exclusion of all Henry's issue. The queen alone rejected this compromise. She retreated northwards, and the king being still a prisoner, she pleaded his cause so well, that assembling a fresh army, she fought the battle of Wakefield, where the duke of York was defeated and slain in 1460.

It is remarkable, that though the duke of York and his party openly asserted his claim to the crown, they still professed allegiance to Henry; but the duke of York's son, afterwards Edward IV. prepared to revenge his father's death, and obtained several victories over the royalists. The queen, however, advanced towards London, and, defeating the earl of Warwick in the second battle of St. Alban's, delivered her husband; but the disorders committed by her northern troops disgusted the Londoners so much, that she durst not enter London, where the duke of York was received on the 28th of February, 1461, while the queen and her husband were obliged to retreat northward. She soon raised another army, and fought the battle of Towton, the most bloody perhaps that ever happened in any civil war. After prodigies of valour had been performed on both sides, the victory remained with young king Edward, and near 40,000 men lay dead on the field of battle. Margaret and her husband were once more obliged to fly to Scotland, where they met with a generous protection.

This civil war was carried on with uncommon animosity. Margaret was as blood-thirsty as her opponents, and when prisoners of either side were made, their deaths, especially if they were persons of rank, were deferred only for a few hours.

Margaret, by the concessions she made to the Scots, soon raised a fresh army there, and in the north of England, but met with defeat upon defeat, till at last her husband, the unfortunate Henry, was carried prisoner to London.

The duke of York, now Edward IV. being crowned on the 29th of June, fell in love with, and privately married Elizabeth, the widow of sir John Gray, though he had some time before sent the earl of Warwick to demand the king of France's sister in marriage, in which embassy Warwick was successful, and nothing remained but the bringing over the princess into England. When the secret of Edward's marriage broke out, the haughty earl, deeming himself affronted, returned to England inflamed with rage and indignation; and from being Edward's best friend became his most formidable enemy, and gaining over the duke of Clarence, Edward was made prisoner, but escaping from his confinement, Warwick, and the French king, Lewis XI. declared for the restoration of Henry, who was replaced on the throne, and Edward narrowly escaped to Holland. Returning from thence, he advanced to London, under pretence of claiming his dukedom of York; but being received into the capital, he resumed the exercise of royal authority, made king Henry once more his prisoner, and defeated and killed Warwick, in the battle of Barnet. A few days after, he defeated a fresh army of Lancastrians, and made queen Margaret prisoner, together with her son prince Edward, whom Edward's brother, the duke of Gloucester, murdered in cold blood, as he is said (but with no great show of probability) to have done his father Henry VI. then a prisoner in the Tower of London, a few days after, in the year 1471. Edward being now settled on the throne, was guilty of the utmost cruelty to all the Lancastrian party, whom he put to death, wherever he could find them.

The great object of his vengeance was Henry, earl of Richmond. He was descended from John Beaufort the eldest son of the earl of Somerset, who was the eldest son of John of Gaunt, by his last wife Catherine Swinford, but born in adultery, during her husband's life-time. This disability, however, was afterwards removed both by the pope and by the parliament, and the descendants of John of Gaunt, by that lady, as far as could be done, were declared legitimate. The last duke of Somerset left a daughter, Margaret, who was married to Edmund Tudor, earl of Richmond, son of the widow of Henry V. by Owen Tudor, a Welsh gentleman whom she had condescended to marry; and their son was Henry, earl of Richmond (afterwards Henry VII.), who then lived in France, to secure himself from the cruelty of Edward. The reader may see, from the detail of this important genealogy; that the young earl of Richmond had not the smallest claim in blood (even supposing the illegitimacy of his ancestors had been removed) to the crown of England.

In 1474, the kingdom was in a deplorable situation. The king was immersed in expensive and criminal luxuries, in which he was imitated by his great men; who, to support their extravagancies, became pensioners to France. The parliament seemed to act only as the executioners of Edward's bloody mandates. The best blood in England was shed on scaffolds; and even the duke of Clarence fell a victim to his brother's jealousy. Edward, partly to amuse the public, and partly to supply the vast expences of his court, pretended sometimes to quarrel, and sometimes to treat with France; but his irregularities occasioned his death (1483) in the twenty-third year of his reign, and forty-second of his age.

Notwithstanding the turbulence of the times, the trade and manufactures of England, particularly the woollen, increased during the reigns of Henry VI. and Edward IV. So early as 1440, a navigation act was contrived by the English, as the only means to preserve the benefit of being the sole carriers of their own merchandise; but foreign influence prevented Henry's passing the bill for that purpose. The invention of printing, which is generally supposed to have been imported into England by William Caxton, and which received some countenance from Edward, is the chief glory of his reign; but learning in general was then in a poor state. The lord Tiptoft was its chief patron, and seems to have been the first English nobleman who cultivated what are now called the belles lettres. The books printed by Caxton are mostly re-translations, or compilations from the French or Monkish Latin; but it must be acknowledged, at the same time, that literature, after this period, made a more rapid and general progress among the English than it did in any other European nation. The famous Littleton, judge of the common pleas, and Fortescue, chancellor of England, flourished at this period.

Edward IV. left two sons by his queen, who had exercised her power with little prudence, and nobilitated many of her obscure relations. Her eldest son Edward V. was about thirteen; and his uncle the duke of Gloucester, taking advantage of the queen's want of popularity among the great men, found means to bastardize her issue, by act of parliament, under the scandalous pretext of a pre-contract between their father and another lady. The duke, at the same time, was declared guardian of the kingdom, and at last accepted the crown, which was offered him by the Londoners; having first put to death all the great men whom he thought well affected to the late king's family. Whether the king and his brother were murdered in the Tower by his direction, is doubtful. The most probable opinion is, that they were clandestinely sent abroad by his orders, and that the elder died, but that the younger survived, and was the same who was well known by the name of Perkin Warbeck. Be this as it will, the English were prepossessed so strongly against Richard, as the murderer of his nephews, that the earl of Rich-

mond, who still remained in France, carried on a secret correspondence with the remains of Edward IV.'s friends, and by offering to marry his eldest daughter, he was encouraged to invade England at the head of about 2000 foreign troops; who were soon joined by 7000 English and Welch. A battle between him and Richard, who was at the head of 15,000 men, ensued at Bosworth-field, in which Richard, after displaying the most astonishing acts of personal valour, was killed, having been first abandoned by a main division of his army, under lord Stanley his brother, in the year 1485.

There can scarcely be a doubt but that the crimes of Richard have been exaggerated by historians. He was exemplary in his distributive justice. He kept a watchful eye over the great barons, whose oppression he abolished, and was a father to the common people. He founded the society of heralds; an institution, which, in his time, was found necessary to prevent disputes among great families. During his reign, short as it was, we have repeated instances of his relieving cities and corporations that had gone into decay. He was remarkable for the encouragement of the hardware manufactures, and for preventing their importation into England, no fewer than seventy-two different kinds being prohibited by one act. He was the first English king who appointed a consul for the superintendency of English commerce abroad; one Strozzi being nominated for Pisa, with an income of one quarter per cent. on all goods of Englishmen imported to or exported from thence.

Though the act of bastardy obtained by Richard affected the daughters as well as the sons of his brother, yet no disputes were raised upon the legitimacy of the princess Elizabeth, eldest daughter to Edward IV. and who, as had been before concerted, married Henry of Lancaster earl of Richmond, thereby uniting both houses, which happily put an end to the long and bloody wars between the contending families of York and Lancaster. Henry, however, rested his right upon conquest, and seemed to pay little regard to the advantages of his marriage. He was the most sagacious monarch that had ever reigned in England; but, at the same time, the most jealous of his power; for he shut up the earl of Warwick, son to the duke of Clarence, brother to Edward IV. a close prisoner in the Tower, though he was but a boy, and though nothing was alledged against him but his propinquity to the house of York. He was the first who instituted that guard called *Yeoman*, which still subsists, and, in imitation of his predecessor, he gave an irrecoverable blow to the dangerous privileges assumed by the barons, in abolishing liveries and retainers, by which every malefactor could shelter himself from the law, on assuming a nobleman's livery, and attending his person. Some rebellions happened in the beginning of his reign, but they were easily suppressed; as was the imposture of Lambert Simnel, who pretended to be the imprisoned earl of Warwick: Simnel was taken prisoner, and after being employed in the king's kitchen, was made one of his falconers. The despotic court of star-chamber owed its original to Henry; but, at the same time, it must be acknowledged, that he passed many acts, especially for trade and navigation, that were highly for the benefit of his subjects. They expressed their gratitude by the great supplies and benevolences they afforded him; and, as a finishing stroke to the feudal tenures, an act passed by which the barons and gentlemen of landed interest were at liberty to sell and mortgage their lands, without fines or licences for the alienation.

This, if we regard its consequences, is perhaps the most important act that ever passed in an English parliament, though its tendency seems only to have been known to the politic king. Luxury, by the increase of trade, and the discovery of America, had broken with irresistible force into England, and money being chiefly in the hands of the commons, the estates of the barons became theirs, but without any

any of their dangerous privileges; and thus the baronial powers were soon extinguished.

Henry, after encountering and surmounting many difficulties both in France and Ireland, was attacked in the possession of his throne by a young man, one Perkin Warbeck, who pretended to be the duke of York, second son to Edward IV. and was acknowledged as such by the dukes of Burgundy, Edward's sister. We shall not follow the adventures of this young man, which were various and uncommon; but it is certain that many of the English, with the courts of France and Scotland, believed him to be what he pretended. Henry endeavoured to prove the death of Edward V. and his brother, but never did it to the public satisfaction; and though James IV. of Scotland banished Perkin his dominions, being engaged in a treaty of marriage with Henry's eldest daughter, yet, by the kind manner in which he entertained and dismissed him, it is plain that he believed him to be the real duke of York, especially as he refused to deliver up his person, which he might have done with honour, had he thought him an impostor. Perkin, after various misfortunes, fell into Henry's hands, and was shut up in the Tower of London, from whence he endeavoured to escape along with the innocent earl of Warwick, for which Perkin was hanged, and the earl beheaded. It is said, that Perkin made a confession of his impostures before his death; but if he did, it might have been extorted from him, either by the hope of pardon, or the fear of torture. In 1499, Henry's eldest son, Arthur prince of Wales, was married to the princess Catharine of Arragon, daughter to the king and queen of Spain, and he dying soon after, such was Henry's reluctance to refund her great dowry, 200,000 crowns of gold, that he consented to her being married again to his second son, then prince of Wales, on pretence that the first match had not been consummated. Soon after, Henry's eldest daughter, the princess Margaret, was sent with a magnificent train to Scotland, where she was married to James IV. Henry, at the time of his death, which happened in 1509, the 52d year of his age, and 24th of his reign, was possessed of 1,800,000l. sterling, which is equivalent to five millions at present; so that he may be supposed to have been master of more ready money than all the kings in Europe besides possessed, the mines of Peru and Mexico being then only beginning to be worked. He was immoderately fond of replenishing his coffers, and often tricked his parliament into subsidies for foreign alliances, which he intended not to pursue.

The vast alteration which happened in the constitution of England during Henry VII's reign, has been mentioned. His excessive love of money and avarice was the probable reason why he did not become master of the West Indies, he having the first offer of the discovery from Columbus, whose proposals being rejected by Henry, that great man applied to the court of Spain. Henry, however, made some amends by encouraging Cabot a Venetian, who discovered the main land of North-America, in 1498; and we may observe, to the praise of this king, that sometimes, in order to promote commerce, he lent to merchants sums of money without interest. From the proportional prices of living, produced by Maddox, Fleetwood, and other writers, agriculture and breeding of cattle must have been prodigiously advanced before Henry's death; an instance of this is given in the case of lady Anne, sister to Henry's queen, who had an allowance of 20s. per week, for her exhibition, sustentation, and convenient diet of meat and drink; also for two gentlewomen, one woman child, one gentleman, one yeoman, and three grooms, (in all eight persons) 51l. 11s. 8d. per annum, for their wages, diet and clothing; and for the maintenance of seven horses yearly, 16l. 9s. 4d. *i. e.* for each horse 2l. 17s. od.; yearly, money being then  $1\frac{1}{2}$  times as weighty as our modern silver coin. Wheat sold that year at 3s. 4d. a quarter, which answers to 5s. of our money, consequently it was about seven times as cheap as at present.

The fine arts were as far advanced in England at the accession of Henry VIII. 1509, as in any European country, if we except Italy: and perhaps no prince ever entered with greater advantages than he did on the exercise of royalty. Young, vigorous, and rich, unrivalled master of the throne, he might have held the balance of power in Europe, had he been careful to improve his advantages. Inauguring he stood not in need of a supply, he improved not Cabot's discoveries, but suffered the East and West Indies to be engrossed by Portugal and Spain. His vanity engaged him too much in the affairs of the continent, and his flatterers encouraged him to make preparations for the conquest of France. These projects, and his establishing what is properly called a *navy royal*, for the permanent defence of the nation (a most excellent measure), led him into incredible expences. He was on all occasions the dupe of the emperor Maximilian, the poorest prince in Europe; and early in his reign he gave himself also entirely up to the guidance of the celebrated cardinal Wolsey, the son of a butcher at Ipswich, but educated at Oxford, and made dean of Lincoln by Henry VII. While involved in a war with France, his lieutenant, the earl of Surrey, conquered and killed James IV. of Scotland, who had invaded England; and Henry became a candidate for the German empire, during its vacancy, but soon resigned his pretensions to Francis I. of France, and Charles of Austria, king of Spain, who was elected in 1519. Henry's conduct, in the long and bloody wars between those princes, was directed by Wolsey's views upon the popedom, which he hoped to gain by the interest of Charles; but finding himself twice deceived, he persuaded his master to declare himself for Francis, who had been taken prisoner at the battle of Pavia. Henry, however, continued to be the dupe of both parties, and to pay great part of their expences, till at last he was forced to lay vast burthens upon his subjects.

Henry continued all this time the great enemy of the Reformation, and the champion of the popes and the Romish church. He wrote a book against Luther, "of the *Seven Sacraments*," about the year 1521, for which the pope gave him the title of *Defender of the Faith*, which his successors retain to this day; but about the year 1527, he began to have some scruples with regard to the validity of his marriage with his brother's widow. I shall not say how far, on this occasion, he might be influenced by scruples of conscience, or aversion to the queen, or the charms of the famous Anne Boleyn, maid of honour to the queen, whom he married, before he had obtained a divorce from Rome. The difficulties he met with in this process ruined Wolsey, who died heart-broken, at being stript of his immense power and possessions.

A variety of circumstances, it is well known, induced Henry at last to throw off all relation to, or dependence upon, the church of Rome, and to bring about a Reformation; in which, however, many of the Romish errors and superstitions were retained. Henry never could have effected this mighty measure, had it not been for his despotic disposition, which broke out on every occasion. Upon a slight suspicion of his queen's inconstancy, and after a sham trial, he cut off her head in the Tower, and put to death some of her nearest relations; and in many respects he acted in the most arbitrary manner, his wishes, however unreasonable, being too rapidly complied with, in consequence of the shameful servility of his parliaments. The dissolution of the religious houses, and immense wealth that came to Henry, by seizing all the ecclesiastical property in the kingdom, enabled him to give full scope to his sanguinary disposition; so that the best and most innocent blood of England was shed on scaffolds. Among others, was the aged counsellor of Salisbury, descended immediately from Edward IV. and mother to cardinal Pole; the marquis of Exeter, the lord Montague, and others of the blood royal, for holding a correspondence with that cardinal.

His third wife was Jane Seymour, daughter to a gentleman of fortune and family; but she died in bringing Edward VI. into the world. His fourth wife was Anne, sister to the duke of Cleves; he disliked her so much, that he separated with her, and obtaining a divorce, suffered her to reside in England, on a pension of 3000*l.* a year. His fifth wife was Catharine Howard, niece to the duke of Norfolk, whose head he cut off for anti-nuptial incontinency. His last wife was Catharine Parr, in whose possession he died, after she had narrowly escaped being brought to the stake for her religious opinions, which favoured the Reformation. Henry's cruelty increased with his years, and was now exercised promiscuously on Protestants and Catholics. He put the brave earl of Surrey to death without a crime being proved against him; and his father, the duke of Norfolk, must have suffered the next day, had he not been saved by Henry's own death, in the year 1547, in the 56th year of his age, and the 38th year of his reign.

By the help of printing, the reign of Henry VIII. is better known than that of his predecessors. His attention to the naval security of England is highly commendable; and he sometimes employed his unjust and arbitrary power for the glory and interest of his subjects. Without enquiring into his religious motives, it must be candidly confessed, that had the Reformation gone through all the forms prescribed by the laws, and the courts of justice, it probably could never have taken place, or at least not for many years; and whatever Henry's personal crimes or failings might have been, the partition he made of the church's property among his courtiers and favourites, and thereby rescuing it from dead hands, undoubtedly promoted the present greatness and future prosperity of England. With regard to learning and the arts, Henry was a generous encourager of both. He gave a pension to Erasmus, the greatest scholar of his age. He brought to England, encouraged, and protected Hans Holbein, that excellent painter and architect; and in his reign noblemen's houses began to have the air of Italian magnificence and regularity. He was a constant and generous friend to Cranmer: and though, upon the whole, rather whimsical than settled in his own principles of religion, he advanced and encouraged many who became afterwards the instruments of a more pure reformation.

In his reign the Bible was ordered to be printed in English. Wales was united and incorporated with England. Ireland was erected into a kingdom, and Henry took the title of king instead of lord of Ireland.

Edward VI. was but nine years old at the time of his father's death; and after some disputes were over, the regency was settled in the person of his uncle the earl of Hertford, afterwards the protector and duke of Somerset, a declared friend of the Reformation, and a bitter enemy to the see of Rome. Much of the popish leaven, however, still remained in the council, which was embroiled at once with France and Scotland. The protector marched with an army into Scotland, to force that people to give their young queen Mary, only child of James V. in marriage to Edward, with a view to unite the two kingdoms; a measure which the late king had recommended with his dying breath to his executors. The protector defeated the Scots at Pinkey, but the match never took place; and the factions now forming against the protector, obliged him to return with his army to England. His own brother, who married the queen dowager, was at the head of his enemies; and, she dying, he paid his addresses to the princess Elizabeth, afterwards queen. This gave a handle to the protector to bring his brother, who was lord admiral, to the block.

The reader is to observe in general, that the Reformation was not effected without many public disturbances. The common people, during the reigns of Henry and Edward, being deprived of the vast relief they had from abbeyes and religious houses, and being ejected from their small corn-growing farms, had often taken

arms, but had been as often suppressed by the government. A war, which was not very happily managed, broke out with Scotland; and the protector, who was upon the whole a weak, but conscientious man, was first driven from the helm of state, and then lost his head upon a scaffold. Dudley, who was created duke of Northumberland, then took the lead in the government, and drove Edward, who, though young, meant extremely well, and was a sincere Protestant, into many impolitic acts; so that England made but an inconsiderable figure in this reign.

The Reformation, however, went on rapidly, through the zeal of Cranmer, and others, some of them foreign divines. In some cases, particularly with regard to the princess Mary, they lost sight of that moderation which the reformers had before so strongly recommended; and some sanguinary executions, on account of religion, took place. Edward's youth excuses him from blame, and his charitable endowments, as Bridewell and St. Thomas's hospitals, and also several schools which still exist and flourish, shew the goodness of his heart. He died of a consumption in 1553, in the 16th year of his age, and the 7th of his reign.

Edward, on his death-bed, from his zeal for religion, had made a very unconstitutional will, for he set aside his sister Mary from the succession, which was claimed by lady Jane Grey, daughter to the duchess of Suffolk, younger sister to Henry VIII. This lady, though she had scarcely reached her 17th year, was a prodigy of learning and virtue; but the bulk of the English nation recognized the claim of the princess Mary, who cut off lady Jane's head. Her husband lord Guildford Dudley, and his father, the duke of Northumberland, shared the same fate.

Mary being thus settled on a bloody throne, suppressed an insurrection under Wyatt, and proceeded, like a female fury, to re-establish popery over England. She recalled cardinal Pole from banishment, made him instrumental in her cruelties, and lighted up the flames of persecution, in which archbishop Cranmer, the bishops Ridley, Cooper, and Latimer, and many other illustrious confessors of the English reformed church, were consumed; not to mention a vast number of other sacrifices of both sexes and all ranks. Bonner, bishop of London, and Gardiner, bishop of Winchester, were the chief executioners of her sanguinary mandates; and had she lived, she would have endeavoured to exterminate all her Protestant subjects.

Mary now married Philip II. king of Spain, who, like herself, was an unfeeling bigot; and the chief praise of her reign is, that, by the marriage articles, provision was made for the independency of the English crown. By the assistance of troops, which she furnished to her husband, he gained the important battle of St. Quintin; but that victory was so ill improved, that the French, under the duke of Guise, soon after took Calais, the only place then remaining to the English in France, and which had been held ever since the reign of Edward III. This loss, which was chiefly owing to cardinal Pole's secret connections with the French court, is said to have broken Mary's heart, who died in 1558, in the 42d year of her life, and 6th of her reign. "In the heat of her persecuting flames (says a contemporary writer of credit), were burnt to ashes, one archbishop, 4 bishops, 21 divines, 8 gentlemen, 84 artificers, and 100 husbandmen, servants, and labourers, 26 wives, 20 widows, 9 virgins, 2 boys, and 2 infants; one of them whipped to death by Bonner, and the other, springing out of the mother's womb from the stake as she burned, thrown again into the fire." Several also died in prison, and many were otherwise cruelly treated.

Elizabeth, daughter to Henry VIII. by Anne Boleyn, mounted the throne under the most discouraging circumstances, both at home and abroad. Popery was the established religion of England; her title to the crown, on account of the circumstances attending her mother's marriage and death, was disputed by Mary

queen of Scots, grandchild to Henry VII.'s eldest daughter, and wife to the dauphin of France; and the only ally she had on the continent was Philip king of Spain, who was the main support of the popish cause, both abroad and in England. Elizabeth was no more than twenty-five years of age at the time of her inauguration; but her sufferings under her bigoted sister, joined to the superiority of her genius, had taught her caution and policy.

In matters of religion she succeeded with surprising facility; for in her first parliament, in 1559, the laws establishing Popery were repealed, her supremacy was restored, and an act of uniformity passed soon after. And it is observed, that of 9400 beneficed clergymen in England, only about 120 refused to comply with the Reformation. With regard to her title, she took advantage of the divided state of Scotland, and formed a party there, by which Mary, now become the widow of Francis II. of France, was obliged to renounce, or rather to suspend her claim. Elizabeth, not contented with this, sent troops and money, which supported the Scotch malcontents, till Mary's unhappy marriage with lord Darnley, and then with Bothwell, the supposed murderer of the former, and her other misfortunes, drove her to take refuge in Elizabeth's dominions, where she had been often promised a safe and an honourable asylum. It is well known how unfaithful Elizabeth was to this profession of friendship, and that she detained the unhappy prisoner eighteen years in England, then brought her to a sham trial, pretending that Mary aimed at the crown, and, with unfeeling cruelty, cut off her head.

The same Philip, who had been the husband of her late sister, upon Elizabeth's accession to the throne, offered to marry her, but she dexterously avoided his addresses; and by a train of skilful negotiations between her court and that of France, she kept the balance of Europe so undetermined, that she had leisure to unite her people at home, and to establish an excellent internal policy. She sometimes supported the Protestants of France against their persecuting princes; and sometimes gave the dukes of Anjou and Alençon, brothers of the French king, the strongest assurances that one or other of them should be her husband; by which she kept that court, who dreaded Spain, in such good humour with her government, that it shewed no resentment when she cut off queen Mary's head.

When Philip was no longer to be imposed upon by Elizabeth's arts, which had so long amused and baffled him, it is well known that he made use of the immense sums he drew from Peru and Mexico, in equipping the most formidable armament that perhaps had ever been put to sea, and a numerous army of veterans, under the prince of Parma, the best captain of that age; and that he procured a papal bull for absolving Elizabeth's subjects from their allegiance. No reader can be so uninformed as to be ignorant of the consequences, — that the largeness of the Spanish ships proved disadvantageous to them on the seas where they engaged; that the lord admiral Howard, and the brave sea officers under him engaged, beat, and chased the Spanish fleet for several days; and that the seas and tempests finished the destruction which the English arms had begun, and that few of the enemy recovered their ports. Next to the admiral lord Howard of Effingham, sir Francis Drake, captain Hawkins, and captain Frobisher, distinguished themselves against this formidable invasion, in which the Spaniards are said to have lost 81 ships of war, large and small, and 13,500 men.

Elizabeth had for some time supported the revolt of the Hollanders from Philip, and had sent them her favourite, the earl of Leicester, who acted as her viceroy and general in the Low Countries. Though Leicester behaved ill, yet her measures were so wise, that the Dutch established their independency; and then she sent forth her fleets under Drake, Raleigh, the earl of Cumberland, and other gallant naval officers, into the East and West Indies, from whence they brought prodigious treasures, taken from the Spaniards.

After

After the death of the earl of Leicester, the young earl of Essex became Elizabeth's chief favourite, and commanded the land forces in a joint expedition with the lord admiral Howard, in which they took and plundered the city of Cadiz, destroyed the ships in the harbour, and did other damage to the Spaniards, to the amount of twenty millions of ducats.

Elizabeth, in her old age, grew distrustful, peevish, and jealous. Though she undoubtedly loved the earl of Essex, she teased him by her capriciousness into the madness of taking arms, and then cut off his head. She complained that she had been betrayed into this sanguinary measure, and this occasioned a sinking of her spirits, which brought her to her grave in 1603, the 70th year of her age, and 45th of her reign, having previously named her kinsman James VI. king of Scotland, and son to Mary, for her successor.

The above form the great lines of Elizabeth's reign; and from them may be traced, either immediately or remotely, every act of her government. She supported the protestants in Germany against the house of Austria, of which Philip, king of Spain, was the head. She crushed the papists in her own dominions, and made a farther reformation in the church of England, in which state it has remained ever since. In 1600 the English East India company received its first formation, that trade being till then in the hands of the Portuguese (in consequence of their having first discovered the passage to India by the Cape of Good Hope, by Vasco de Gama in the reign of Henry VII.) who at this time were subjects to Spain; and factories were established in China, Japan, Amboyna, Java, and Sumatra.

Before queen Elizabeth's reign, the kings of England had usually recourse to the city of Antwerp for voluntary loans; and their credit was so low, that, besides the exorbitant interest of 10 or 12 per cent. they were obliged to make the city of London join in the security. The trade to Turkey was begun about 1583; and that commerce was immediately confined to a company by queen Elizabeth. About 1590 there were in London four persons only rated in the subsidy book so high as 400l. In 1567 there were found, on enquiry, to be 4851 strangers of all nations in London, of whom 3838 were Flemings, and only 58 Scots.

As to Elizabeth's internal government, the successes of her reign have disguised it; for she was far from being a friend to liberty, civil or religious; witness her cruel statutes against the Puritans, which were as cruelly put in execution.

We can scarcely require a stronger proof that the English began to be tired of Elizabeth, than the joy testified by all ranks at the accession of the Scottish prince, notwithstanding the inveterate animosities between the two kingdoms. James was far from being destitute of natural abilities for government; but he had received wrong impressions of the regal office, and too high an opinion of his own dignity, learning, and political talents. It was his misfortune that he mounted the English throne under a full conviction that he was entitled to all the unconstitutional powers that had been occasionally exercised by Elizabeth and the house of Tudor; and which various causes had prevented the people from opposing with proper vigour. The nation had been wearied and exhausted by the long and destructive wars between the houses of Lancaster and York, and was inclined to endure much rather than again involve itself in similar calamities. James made not any allowance for the glories of Elizabeth; which, as I have observed, disguised her most arbitrary acts. He forgot to consider the free, liberal sentiments, which the improvement of knowledge and learning had diffused through England, and the vast increase of property, through trade and navigation, which might encourage and enable the people manfully to defend their liberties. James's first important measure was an attempt to effect an union between England and Scotland; but though he failed in this, he shewed no violent resentment at the disappointment. It was

an advantage to him at the beginning of his reign, that the courts of Rome and Spain were thought to be his enemies; and this opinion was increased by the discovery and defeat of the gunpowder treason\*.

The obligations which commerce and colonization owed to this prince, have already been observed; and it must be acknowledged, that he laid the foundations of great national advantages. But his pedantry was ridiculous; and with the assistance of his ministers, he was continually contriving new and often illegal means for raising money. Among other expedients, he sold the titles of baron, viscount, and earl, at a certain price; made a number of knights of Nova Scotia, each to pay such a sum; and instituted a new order of knights baronets, which was to be hereditary, for which each person paid 1095*l*.

His pacific reign was a series of theological contests, in which he shewed himself more the theologian than the prince, and in 1617 he attempted to establish episcopacy in Scotland, but the zeal of the people baffled his design. Without enquiring from what motive his love of peace proceeded, it was eventually productive of many blessings to England; and though his perpetual negotiations have given rise to much satire against his person and government, yet they were less expensive and destructive to his people than any wars he could have entered into. He restored to the Dutch their cautionary towns, upon their discharging part of the sum for which they had been mortgaged; but he procured from Spain at the same time an acknowledgment of their independency.

James gave his daughter, the princess Elizabeth, in marriage to the elector palatine, the most powerful protestant prince in Germany, who soon after assumed the crown of Bohemia. The memory of James has been much abused for his tame behaviour, after that prince had lost his kingdom and electorate by the imperial arms; but it should be observed, that he strongly opposed his son-in-law's assuming the crown of Bohemia; that had he kindled a war to reinstate him in that and his electorate, he probably would have stood single in the contest, except the feeble and uncertain assistance he might have received from the elector's dependents and friends in Germany. It is certain, that James furnished the elector with large sums of money; and that he actually raised a regiment of 2200 men, under sir Horace Vere, who carried them over to Germany, where the Germans, under the marquis of Anspach, refused to assist them against Spinola the Spanish general.

James has been greatly and justly blamed for his partiality to favourites. His

\* This was a scheme of the Roman catholics to cut off at one blow the king, lords, and commons, at the meeting of parliament, when it was also expected that the queen and prince of Wales would be present. The manner of enlisting any new conspirator was by oath, and administering the sacrament; and this dreadful secret, after being religiously kept near 18 months, was happily discovered in the following manner: about ten days before the long-winded-for meeting of parliament, a Roman catholic peer received a letter, which had been delivered to his servant by an unknown hand, earnestly advising him to shun off his attendance on parliament at that time; but which contained no kind of explanation. The nobleman, though he considered the letter as a foolish attempt to frighten and ridicule him, thought proper to lay it before the king, who studying the contents with more attention, began to suspect some dangerous contrivance by gun-powder; and it was judged advisable to inspect all the vaults below the houses of parliament; but the search was purposely delayed till

the night immediately preceding the meeting, when a justice of peace was sent with proper attendants, and before the door of the vault under the upper house, finding one Fawkes, who had just finished all his preparations, he immediately seized him, and at the same time discovered in the vault 36 barrels of powder, which had been carefully concealed under faggots and piles of wood. The match, with every thing proper for setting fire to the train, were found in Fawkes's pocket, whose countenance bespoke his savage disposition, and who, after regretting that he had lost the opportunity of destroying so many heretics, made a full discovery. The conspirators, who never exceeded 80 in number, being seized by the country people, confessed their guilt, and were executed in different parts of England. Notwithstanding this horrid crime, the bigoted catholics were so devoted to Garnet, a Jesuit, one of the conspirators, that they fancied miracles to be wrought by his blood, and in Spain he was considered as a martyr.

first was Robert Carr, a private Scotch gentleman, who was created earl of Somerset. He married the countess of Essex, who had obtained a divorce from her husband, and was with her found guilty of poisoning sir Thomas Overbury in the Tower; but James, contrary, as is said, to a solemn oath he made, pardoned them both. His next favourite was George Villiers, a private English gentleman, who, upon Somerset's disgrace, was admitted to an unusual share of favour and familiarity with his sovereign. James had at that time formed a system of policy for attaching himself intimately to the court of Spain, that it might assist him in recovering the palatinate; and to this system he had sacrificed the brave sir Walter Raleigh, on a charge of having committed hostilities against the Spanish settlements in the West Indies. James having lost his eldest son Henry prince of Wales, who had an invincible antipathy to a popish match, threw his eyes upon the infanta of Spain, as a proper wife for his son Charles, who had succeeded to that principality. Buckingham, who was equally a favourite with the son as with the father, fell in with the prince's romantic humour, and against the king's will they travelled in disguise to Spain, where a most solemn farce of courtship was played; but the prince returned without his bride, and had it not been for the royal partiality in his favour, the earl of Bristol, who was then ambassador in Spain, would probably have brought the duke of Buckingham to the block.

James was all this while perpetually jarring with his parliament, whom he could not persuade to furnish money equal to his demands: and at last he agreed to his son's marrying the princess Henrietta Maria, sister to Lewis XIII. and daughter to Henry the Great of France. James died before the celebration of these nuptials. His death happened in 1625, in the fifty-ninth year of his age, after a reign over England of twenty-two years. James encouraged and employed that excellent painter sir Peter Paul Rubens, as well as Inigo Jones, who restored the pure taste of architecture, and in his reign the poetical genius of England displayed its greatest lustre, though not much encouraged at court. Mr. Middleton at this time projected the conveying water into the city from Hertfordshire, by means of pipes, which is now called the *New River*.

The death of the duke of Buckingham, the king's favourite, who was assassinated by one Felton, a sabalern officer, in 1628, did not deter Charles from his arbitrary proceedings, which the English patriots, in that enlightened age, justly considered as so many acts of tyranny. He, without authority of parliament, laid arbitrary impositions upon trade, which were refused to be paid by many of the merchants and members of the house of commons. Some of them were imprisoned, and the judges were checked for admitting them to bail. The house of commons resented those proceedings by denying admittance to the gentleman-usher of the black rod (who came to adjourn them), until the protest, which they were drawing up, should be finished. This served only to widen the breach, and the king dissolved the parliament; after which he exhibited informations against nine of the most eminent members, among whom was the great Mr. Selden, who was as much distinguished by his love of liberty as by his uncommon erudition. They objected to the jurisdiction of the court, but their plea was over-ruled, and they were sent to prison during the king's pleasure.

Every thing now operated towards the destruction of Charles. The commons would vote no supplies without some redress of the national grievances; upon which Charles, presuming on what had been practised in reigns when the principles of liberty were imperfectly understood, levied money upon monopolies of salt, soap, and such necessaries, and other obsolete claims, particularly for knighthood, and raised various taxes without authority of parliament. His government becoming every day more and more unpopular, Burton, a divine, Prynne a lawyer, and Balthazar, a physician, men of no great eminence or abilities, but warm and resolute,

published several pieces which gave offence to the court, and which contained some severe strictures against the ruling clergy. They were prosecuted for these pieces in the star-chamber in a very arbitrary and cruel manner; and punished with so much rigour, as excited an almost universal indignation against the authors of their sufferings. Thus was the government rendered still more odious, and unfortunately for Charles, he put his conscience into the hands of Laud, archbishop of Canterbury, who was as great a bigot as himself, both in church and state. Laud advised him to persecute the puritans, and in the year 1637 to introduce episcopacy into Scotland. The Scots upon this formed secret connections with the discontented English, and invaded England, in August 1640, where Charles was so ill-served by his officers and his armies, that he was forced to agree to an inglorious peace with the Scots, who made themselves masters of Newcastle and Durham; and being now openly befriended by the house of commons, obliged the king to comply with their demands.

Charles had made Wentworth, earl of Strafford, a man of great abilities, president of the council of the North, and lord lieutenant of Ireland; and he was generally believed to be the first minister of state. Strafford had been a leading member of the opposition to the court, but he afterwards, in conjunction with Laud, exerted himself so vigorously in carrying the king's despotic schemes into execution, that he became an object of public detestation. As lord president of the North, as lord lieutenant of Ireland, and as a minister and privy-counsellor in England, he behaved in a very arbitrary manner, and was guilty of many actions of great injustice and oppression. He was, in consequence, at length, on the 22d of May, 1641, brought to the block, though much against the inclinations of the king, who was in a manner forced by the parliament and people to sign the warrant for his execution. Archbishop Laud was also beheaded; but his execution did not take place till a considerable time after that of Strafford, the 10th of January, 1645.

In the fourth year of his reign, Charles had passed the *petition of right* into a law, which was intended by the parliament for the future security of the subject. It is enacted, "That no man hereafter be compelled to make or yield any gift, loan, benevolence, tax, or such like charge without common consent by act of parliament;" but he afterwards violated it in numerous instances, so that an almost universal discontent at his administration prevailed throughout the nation. A rebellion also broke out in Ireland, on October 23, 1641, where the protestants, without distinction of age, sex, or condition, to the amount of many thousands, were massacred by the papists; and great pains were taken to persuade the public that Charles secretly favoured them, out of hatred to his English subjects. The bishops were expelled the house of peers, on account of their constantly opposing the designs and bills of the other house; and the leaders of the English house of commons still kept up a correspondence with the discontented Scots. Charles went in person to the house of commons, January 4, 1642, and demanded that lord Kimbolton, Mr. Pym, Mr. Hampden, Mr. Hollis, sir Arthur Haselrig, and Mr. Stroud, should be apprehended; but they had previously made their escape. This act of Charles was resented as high treason against his people.

Notwithstanding the many acts of tyranny and oppression of which the king and his ministers had been guilty, yet, when the civil war broke out, there were great numbers who repaired to the regal standard. Many of the nobility and gentry, and the greatest part of the landed interest, were much attached to the crown. The parliament, however, took upon themselves the executive power, and were favoured by most of the trading towns and corporations; but their great resource lay in London. The king's general was the earl of Lindsey, a brave, but not an enterprising commander; but he had great dependence on his nephews,

the princes Rupert and Maurice, sons to the elector Palatine, by his sister the princess Elizabeth. In the beginning of the war, the royal army had the ascendancy, but in the progress of it, affairs took a different turn. The earl of Essex was made general under the parliament, and the first battle was fought at Edge-hill, in Warwickshire, the 23d of October, 1642; both parties claimed the victory, but the parliament was so much distressed, that they invited the Scots to come to their assistance, and they accordingly entered England anew with about 20,000 horse and foot. Charles attempted to remove the parliament to Oxford, where many members of both houses met; but his enemies were still sitting at Westminster, and continued to carry on the war against him with great animosity. The independent party, which had scarcely before been thought of, began now to distinguish themselves at Westminster. They were averse to the presbyterians, who till then had conducted the war against the king, nearly as much as to the royalists; and such was their management, under the direction of the famous Oliver Cromwell, that a plan was formed for dismissing the earls of Essex and Manchester, and the heads of the presbyterians, from the parliament's service, on a supposition that they were not for bringing the war to a speedy end, nor for reducing the king too low; and for promoting Fairfax, who was an excellent officer, but more manageable, though a presbyterian, and some independent officers. In the mean while, the war went on with resentment and loss on both sides. Two battles were fought at Newbury; one on September 20, 1643, and the other October 27, 1644, in which the advantage inclined to the king. He had likewise many other successes; and having defeated sir William Waller, he pursued the earl of Essex, who remained still in command, into Cornwall, from whence he was obliged to escape by sea; but his infantry surrendered prisoners to the royalists, though his cavalry delivered themselves by their valour.

The first fatal blow the king's army received, was at Marston-moor, July 2d, 1644, where, through the imprudence of prince Rupert, the earl of Manchester defeated the royal army, of which 4000 were killed, and 1500 taken prisoners. This victory was owing chiefly to the courage and conduct of Cromwell; and though it might have been balanced by the successes of Charles in the West, yet his whole conduct was a string of mistakes, till at last his affairs became irretrievable. It is true, many treaties of peace, particularly one at Uxbridge, were set on foot, and the heads of the presbyterian party would have agreed to terms that would have little bounded the king's prerogative. They were outwitted and overruled by the independents, who were assisted by the stiffness, insincerity, and unamiable behaviour of Charles himself. In short, the independents at last succeeded, in persuading the members at Westminster, that Charles was not to be trusted, whatever his concessions might be. From *that* moment the affairs of the royalists became desperate. Sir Thomas Fairfax, whose father, lord Fairfax, remained in the North, was at the head of the army, which was now new-modelled; so that Charles successively lost all his towns and forts, and was defeated by Fairfax and Cromwell, at the decisive battle of Naseby, June 14, 1645, owing partly, as usual, to the misconduct of prince Rupert. This battle was followed by fresh misfortunes to Charles, who retired to Oxford, the only place where he thought himself safe.

The Scots were then besieging Newark; and no good understanding subsisted between them and the English parliamentarians. In this situation of his affairs, Charles escaped in disguise from Oxford and came to the Scotch army before Newark, on May 6, 1646, upon a promise of protection. The Scots, however, were so intimidated, by the resolutions of the parliament at Westminster, that in consideration of receiving 400,000*l.* of their arrears, they put the person of

Charles into the hands of the parliament's commissioners, not suspecting the consequences.

The presbyterians were now more inclined than ever to make peace with the king, but they were no longer matters, being forced to receive laws from the army and the independents. The army now avowed their intentions. They first by force took Charles out of the hands of the commissioners, June 4, 1647, and then dreading that a treaty might still take place with the king, they imprisoned 41 of the presbyterian members, voted the house of peers to be useless, and that of the commons was reduced to 150, most of them officers of the army. In the mean while Charles, who unhappily promised himself relief from those dissensions, was carried from prison to prison, and sometimes cajoled by the independents with hopes of deliverance, but always narrowly watched. Several treaties were set on foot, but all miscarried; and he had been imprudent enough, after effecting his escape, to put himself into colonel Mammond's hands, the parliament's governor of the Isle of Wight. A fresh negotiation was begun, and almost finished, when the independents, dreading the general disposition of the people for peace, and strongly persuaded of the innocence of the king, once more seized upon his person, brought him a prisoner to London, carried him before a court of justice of their own erecting, and, after an extraordinary trial, his head was cut off, before his own palace at Whitehall, on the 30th of January, 1648-9, being the 49th year of his age, and 24th of his reign.

Charles is allowed to have had many virtues, and some have supposed that affliction had taught him so much wisdom and moderation, that had he been restored to his throne, he would have become an excellent prince; but there is abundant reason to conclude, from his private letters, that he retained his arbitrary principles to the last, and that he would again have regulated his conduct by them, if he had been reinstated in power. It is however certain, that, notwithstanding the tyrannical nature of his government, his death was exceedingly lamented by great numbers; and many, in the course of the civil war, who had been his great opponents in parliament, became converts to his cause, in which they lost their lives and fortunes. We cannot reflect upon the great loss of lives, to the amount of at least 100,000 fighting men, during the six years of the civil war, without admiring the populousness of England at that period. Though the history has been minutely related, by writers of all parties, who had the best opportunities to know the truth, yet we do not find that the loss of men had any influence upon agriculture or commerce, or the exercise of the common arts of life, and provisions rather sunk than rose in their value. The surviving children of Charles, were Charles and James, who were successively kings of England; Henry, duke of Gloucester, who died soon after his brother's restoration; the princess Mary, married to the prince of Orange, and mother to William prince of Orange, who was afterwards king of England; and the princess Henrietta Maria, who was married to Victor Amadeus, duke of Savoy and king of Sardinia.

They who brought Charles to the block, omitted no measure that could give a perpetual exclusion to kingly power in England; they erected themselves into a commonwealth, and successfully exerted themselves for retrieving the glory of England by sea. They were joined by many of the presbyterians, and both parties hated Cromwell and Ireton, though they were forced to employ them in the reduction of Ireland, and afterwards against the Scots, who had received Charles II. as their king. By cutting down the timber upon the royal domains, they produced a fleet superior to any that had ever been seen in Europe. Their general, Cromwell, invaded Scotland, and though he was there reduced to great difficulties, he totally defeated the Scots at the battles of Dunbar and Worcester. The same commonwealth passed an act of navigation; and declaring war against the Dutch,

who were thought till then invincible at sea, they effectually humbled those republicans.

By this time Cromwell, who hated subordination to a parliament, had the address to get himself declared commander in chief of the English army. Admiral Blake, and the other English admirals, carried the terror of the English name by sea to all quarters of the globe; and Cromwell, having now but little employment, began to be afraid that his services would be forgotten, for which reason he went, April 20, 1653, without any ceremony, with about 300 musqueteers, and dissolved the parliament, opprobriously driving the members from the house. He next annihilated the council of state, with whom the executive power was lodged, and transferred the administration of government to about 140 persons, whom he summoned to Whitehall, on the 4th of July, 1653.

The war with Holland, in which the English were again victorious, still continued. Seven bloody engagements by sea were fought in little more than the compass of one year; and in the last, which was decisive in favour of England, the Dutch lost their brave admiral Van Tromp. Cromwell all this time wanted to be declared king; but he perceived that he must encounter unfurmountable difficulties from Fleetwood, and his other friends, if he should persist in that resolution. He was, however, declared *lord protector* of the commonwealth of England; a title under which he exercised greater power than had ever been annexed to the regal dignity. No king ever acted, either in England or Scotland, more despotically than he did, yet no tyrant ever had fewer real friends, and even those few threatened to oppose him, if he should take upon him the title of king. Historians, in drawing the character of Cromwell, have been imposed upon by his amazing success, and dazzled by the lustre of his fortune; but when we consult his secretary Thurlo's, and other state papers, the imposition in a great measure vanishes. After a most uncomfortable usurpation of four years, eight months, and thirteen days, he died on the 3d of September, 1658, in the 60th year of his age.

It is not to be denied that England received much more respect from foreign powers, between the death of Charles I. and that of Cromwell, than she had been treated with since the death of Elizabeth. This was owing to the abilities of those who formed the republic, which Cromwell abolished, and who, as it were, instantaneously called forth the naval strength of the kingdom. In the year 1656, the public expenditure amounted to one million three hundred thousand pounds; of which a million went to the support of the navy and army, and the remainder to that of the civil government. In the same year, Cromwell abolished all tenures *in capite*, by knight's service, and soccage in chief, and likewise the courts of wards and liveries. Several other grievances, that had been complained of during the late reigns, were likewise removed. Next year the public expence of England amounted to two millions three hundred twenty-six thousand nine hundred and eighty-nine pounds. The collections by assessments, excise, and customs, paid into the Exchequer, amounted to two millions three hundred and sixty-two thousand pounds, four shillings.

Upon the whole it appears, that England, from the year 1648, to the year 1658, increased greatly in riches and in power. The legal interest of money was reduced from 8 to 6 per cent. a sure symptom of increasing commerce. The famous navigation-act was now planned and established, and afterwards confirmed under Charles II. Monopolies of all kinds were abolished, and liberty of conscience to all sects was granted, to the vast advantage of population and manufactures, which had suffered greatly by Laud's intolerant measures. To the above national meliorations, we may add the modesty and frugality introduced among the common people, and the citizens in particular, by which they were enabled to augment their

their capitals. It appears, however, that Cromwell, had he lived, and been firmly settled in the government, would have broken through the sober maxims of the republicans; for a short time before his death, he affected great magnificence in his person, court, and attendants. He maintained firmly the honour of the nation, and in many instances interposed effectually in favour of the Protestants abroad. Arts and sciences were not much patronized; but he had the good fortune to find in Cooper an excellent miniature painter, and his coins done by Simon exceed in beauty and workmanship any of that age. He certainly did many things worthy of praise; and as his genius and capacity led him to the choice of fit persons for the several parts of administration, so he paid some regard to men of learning, and particularly to those entrusted with the care of youth at the universities.

No friend to the British constitution, consisting in the proper equilibrium of the three estates of the kingdom, can ever speak of Cromwell or his usurpation with respect. Under the name of a republic, there was all the tyrannical spirit of despotism. The people had no share in legislation. Cromwell, with the title of Protector, exercised all the powers of an arbitrary monarch. His parliaments were but a name. He made what laws he pleased; and, by the help of his army, which supported them, he carried them into execution, and forced all to submit to his will. In comparison of Cromwell, Henry the VIII. revered the English constitution.

Richard Cromwell, a weak unambitious man, succeeded his father in the protectorship. He was placed in his dignity by those who wanted to make him the author of their own government; and he was soon after driven, without the least struggle or opposition, into obscurity. It is in vain for historians of any party to ascribe the restoration of Charles II. (who, with his mother and brothers, during the usurpation, had lived abroad on a very precarious subsistence) to the merits of any particular persons. The presbyterians were very zealous in promoting it, but it was effected by a general concurrence of the people, who seem to have thought that neither peace nor protection were to be obtained, but by restoring the ancient constitution of monarchy. General Monk, a man of military abilities, but devoid of probity, had the sagacity to observe this; and after temporizing in various shapes, being at the head of the army, he had the principal share in restoring Charles II. for which service he was created duke of Albemarle, confirmed in the command of the army, and loaded with honours and riches.

Charles II. being restored in 1660, in the first year of his reign seemed to have a real desire to promote his people's happiness. Upon his confirming the abolition of the feudal tenures, he received from the parliament a gift of the excise for life; and in this act coffee and tea are first mentioned. By his long residence, and that of his friends, abroad, he imported into England the culture of many useful vegetables; such as that of asparagus, artichokes, cauliflowers, and several kinds of beans, peas, and fallads. Under him, Jamaica, which had been conquered by the English under the government of Cromwell, was greatly improved, and made a sugar colony. The Royal Society was instituted, and many popular acts respecting trade and colonization were passed. In short, Charles knew and cultivated the true interests of his kingdom, till he was warped by pleasure, and sunk in indolence; failings that had the same consequences as despotism itself. He appeared to interest himself in the sufferings of his subjects when London was burnt down in 1666; and its being rebuilt with greater lustre and conveniency is a proof of the increase of trade; but there were no bounds to Charles's love of pleasure, which led him into the most extravagant expences. He has been severely censured for selling Dunkirk to the French king, to supply his necessities, after he had squandered the immense sums granted him by parliament. The price was about

250,000l. sterling. But even in this, his conduct was more defensible than in his secret connections with France, which were of the most scandalous nature, utterly repugnant to the welfare of the kingdom, and such as must for ever reflect infamy on his memory.

Among the evidences of his degeneracy as a king, may be mentioned his giving way to the popular clamour against the lord Clarendon, as the chief adviser of the late of Dunkirk; a man of extensive knowledge and great abilities, and more honest in his intentions than most of his other ministers, but whom he sacrificed to the sycophants of his pleasurable hours. The first Dutch war, which began in 1665, was carried on with great resolution and spirit under the duke of York; but through Charles's misapplication of the public money, which had been granted for the war, the Dutch, while a treaty of peace was depending at Breda, found means to insult the royal navy of England, by sailing up the Medway as far as Chatham, and destroyed several ships of the line. Soon after this, a peace was concluded at Breda between Great Britain and the States General, for the preservation of the Spanish Netherlands; and Sweden having acceded to the treaty, in 1668, it was called the *triple alliance*.

In 1671, Charles was so ill advised as to seize upon the money of the bankers, which had been lent him at 8 per cent. and to shut up the exchequer. This was an indefensible step; but Charles pretended to justify it by the necessity of his affairs, being then on the eve of a fresh war with Holland. This was declared in 1672, and had almost proved fatal to that republic, for the English fleet and army acted in conjunction with those of France. The duke of York commanded the English fleet, and displayed great gallantry in that station. The duke of Monmouth, the eldest and favourite natural son of Charles, commanded 6000 English forces, who joined the French in the Low Countries; and all Holland must have fallen into the hands of the French, had it not been for the vanity of their monarch Lewis XIV. who was in a hurry to enjoy his triumph in his capital. All confidence was now lost between Charles and his parliament, notwithstanding the glory which the English fleet obtained by sea against the Dutch. The popular clamour at last obliged Charles to give peace to that people, in consideration of 200,000l. which was paid him.

In some things Charles acted very despotically. He complained of the freedom taken with his prerogative in coffee-houses, and ordered them to be shut up, but in a few days after they were opened again. Great Rigour and severity were exercised against the presbyterians, and all other nonconformists to episcopacy, which was again established with a high hand in Scotland as well as in England. His parliament addressed him, but in vain, to make war with France in the year 1677, for he was entirely devoted to that crown, and regularly received its money as a pensioner, and hoped through its influence and power to be absolute. It is not, however, to be denied, that the trade of England was now incredibly increased, and Charles entered into many vigorous measures for its protection and support.

Charles's connections with France gave him no merit in the eyes of his parliament, which grew every day more and more exasperated against the French and the papists; at the head of whom was the presumptive heir of the crown, the duke of York. Charles dreaded the prospect of a civil war, and offered any concessions to avoid it. But many of the members of parliament were bent upon such a revolution as afterwards took place, and were secretly determined that the duke of York should never reign. In 1678, the famous Titus Oates, and some others, opened a plot, charging the papists with a design to murder the king, and to introduce popery by means of Jesuits in England, and from St. Omer's. Though nothing could be more ridiculous, and more self-contradictory, than some parts of

their narrative, yet it was supported with the utmost zeal on the part of the parliament. The aged lord Strafford, Coleman, secretary to the duke of York, with many Jesuits, and other Papists, were publicly executed; on evidences supposed now to have been perjured by those who will have the whole plot to be a fiction. The queen herself escaped with difficulty; the duke of York was obliged to retire into foreign parts; and Charles, though convinced, it is said, that the whole was an imposture, yielded to the torrent. At last it spent its force. The earl of Shaftesbury, who was at the head of the opposition, pushed on the total exclusion of the duke of York from the throne. He was seconded by the ill-advised duke of Monmouth; and the bill, after passing the commons, miscarried in the house of peers. All England was again in a flame; but the king, by a well-timed adjournment of the parliament to Oxford, seemed to recover the affections of his people.

The duke of York and his party made a scandalous use of their victory. They trumped up on their side a plot of the protestants for killing or seizing the king, and altering the government. This plot was as false as that which had been laid against the Papists. Lord Russel, who had been remarkable in his opposition to the popish succession, Algernon Sidney, and several other distinguished protestants were tried, condemned, and suffered death, and the king set his foot upon the neck of opposition. Even the city of London was intimidated into the measures of the court, as were almost all the corporations in the kingdom. The duke of Monmouth and the earl of Shaftesbury were obliged to fly, and the duke of York returned in triumph to Whitehall. It was thought, however, that Charles repented of some of his arbitrary steps, and intended to have recalled the duke of Monmouth, and have executed some measures for the future quiet of his reign; when he died February 6th, 1684-5, in the 55th year of his age, and 25th of his reign. He had married Catharine, infanta of Portugal, by whom he had received a large fortune in ready money, besides the town and fortress of Tangier in Africa; but he left behind him no lawful issue. The descendants of his natural sons and daughters are now amongst the most distinguished of the British nobility.

The principles, both of the king and of the opposition to his government, have been already delineated. The heads of the latter were presbyterians and moderate churchmen, who had been raised and preferred by Charles, in hopes of their being useful in bringing their party into his measures; and he would probably have succeeded, had not the remains of the old royalists, and the dissipated part of the court, fallen in with the king's foible for pleasure. The presbyterians, however, availed themselves of their credit, in the early part of his reign, when the fervor of loyalty was abated, to bring into parliament such a number of their friends as rendered the reign of Charles very uneasy, and it was owing, perhaps, to them, that civil liberty and protestantism now exist in the English government. On the other hand, they seemed to have carried their jealousy of a popish successor too far; and many of the people without doors certainly thought that the parliament ought to have been satisfied with the legal restraints and disabilities which Charles offered to impose upon his successor. This gave such a turn to the affections of the people as left Charles, and his brother, at the time of his death, almost masters of the laws and liberties of England; and they governed in an absolute and arbitrary manner, supported by the clergy's preaching up the old doctrines of passive obedience and non-resistance, and the flattering addictions presented from many persons advancing the prerogative of the crown to the most extravagant height.

The reign of Charles has been celebrated for wit and gallantry, but both were coarse and indelicate. The court was the nursery of vice, and the stage exhibited scenes of impurity. Some readers were found who could admire Milton's ver-

as Dryden, and never perhaps were the pulpits of England so well supplied with preachers as in this reign. Our language was much improved in harmony and refinement; and the days of Charles may be called the Augustan age of the mathematics and natural philosophy. Charles loved, patronized, and understood the arts, more than he encouraged or rewarded them, especially those of English growth; but this neglect proceeded not from narrow-mindedness, but indolence and want of reflection. If the memory of Charles II. has been traduced for his being the first English prince who formed a body of standing forces, as guards to his person, it ought to be remembered, at the same time, that he carried the art of ship-building to the highest perfection; and that the royal navy of England, at this day, owes its finest improvements to his and his brother's attention to naval affairs. As to his religion, James, soon after his death, published to the world, that his brother, notwithstanding his repeated professions of regard to the protestant faith, was a papist, and died such, of which there are now incontestible proofs.

The opposition which, during the late reign, had shaken the throne, seems to have vanished at the accession of James II. The popular affection towards him was increased by the early declaration he made in favour of the church of England, which, during the late reign, had formally pronounced all resistance to the reigning king to be unlawful. This doctrine proved fatal to James, and almost ruined protestantism. The army and people supported him in crushing an ill-concerted rebellion of the duke of Monmouth, who pretended to be the lawful son of Charles II. and, as such, had assumed the title of king. The duke's head being cut off, July 15, 1685, and some hundreds of his followers hanged, drawn, and quartered, in the west of England, exhibiting a scene of barbarity, scarcely ever known in this country, by the instrumentality of Jefferies and colonel Kirke, James desperately resolved to try how far the practice of the church of England would agree with her doctrine of non-resistance. The experiment failed him. He pretended to a power of dispensing with the known laws, he instituted an illegal ecclesiastical court, openly received and admitted into his privy-council the pope's emissaries, and treated them with uncommon respect. He sent an embassy to Rome, and received at court the pope's nuncio. His imprisoning seven bishops for presenting a petition against reading his declaration for liberty of conscience, greatly alarmed his protestant friends; and his encroachments upon the civil and religious rights of his subjects, are almost beyond description, and were disapproved, it is said, by the pope himself, and all sober Roman catholics.

In this extremity, many great men in England and Scotland, though they wished well to James, applied for relief to William prince of Orange, a prince of great abilities, and the inveterate enemy of Louis XIV. who then threatened Europe with chains. The prince of Orange was the nephew and son-in-law of James, having married the princess Mary; he embarked with a fleet of 500 sail for England, avowing it to be his design to restore the church and state to their due rights. Upon his arrival, he was joined not only by the Whigs, but by many whom James had considered as his best friends; and even his daughter the Princess Anne, and her husband, George prince of Denmark, left him and joined the prince of Orange. James might still have reigned; but he was surrounded with French emissaries, and ignorant Jesuits, who wished him not to reign rather than not restore popery. They secretly persuaded him to send his queen and son, real or pretended, then but six months old, to France, and to follow them in person, which he did; and thus, in 1688, ended his reign in England; which event in English history is termed *the Revolution*.

It is well known that king William's chief object was to humble the power of France, and his reign was spent in an almost uninterrupted course of hostilities with that power, which were maintained by England, at an expence never before known.

known. The nation had grown cautious, through the experience of the two last reigns, and he gave his consent to the *bill of rights*, by which the liberties of the people were confirmed and secured. The two last kings had made a very bad use of the national revenue, which was put into their hands, and which was found sufficient to raise and maintain a standing army. The revenue was therefore now divided; part was allotted for the current national service of the year, and was to be accounted for to parliament; and part, which is still called the civil list money, was given to the king for the support of his house and dignity.

It was the just sense the people of England had of their civil and religious rights alone, that could provoke them to agree to the late revolution; for they never in other respects had been at so high a pitch of wealth and prosperity, as in the year 1688. The tonnage of their merchant ships, according to Dr. Davenant, was that year nearly double to what it had been in 1666; and the tonnage of the royal navy, which in 1660, was only 62,594 tons, was in 1688 increased to 101,032 tons. The increase of the customs, and the annual rental of England, grew in the same proportion. It was therefore no wonder, that a strong party, both in the parliament and nation, should be formed against the government, which was hourly increased by the king's predilection for the Dutch. The war with France, which on the king's part was far from being successful, required an enormous expence, and the Irish continued, in general, faithful to king James. But many English, who wished well to the Stuart family, dreaded its restoration by conquest; and the parliament enabled the king to reduce Ireland, and to gain the battle of the Boyne against James, who there lost all the military honour he had acquired before. The marine of France proved superior to that of England, in the beginning of the war; but in the year 1692, that of France received an irrecoverable blow in the defeat at La Hogue.

Invasions were threatened, and conspiracies discovered every day against the government, and the supply of the continental war forced the parliament to open new resources for money. A land-tax was imposed, and every subject's lands were taxed, according to their valuations given in by the several counties. Those who were the most loyal gave the highest valuations, and were the heaviest taxed, and this preposterous burthen still continues; but the greatest and boldest operation in finances, that ever took place, was established in this reign, which was the carrying on the war by borrowing money upon parliamentary securities, which form what are now called the *public funds*. The chief projector of this scheme is said to have been Charles Montague, afterwards lord Halifax. His chief argument for such a project was, that it would oblige the monied part of the nation to befriend the Revolution interest; because, after lending their money, they could have no hopes of being repaid but by supporting that interest, and the weight of taxes would oblige the commercial people to be more industrious.

William, notwithstanding the vast service he had done to the nation, and the public benefits which took place under his auspices, particularly in the establishment of the bank of England, and the recoining the silver money, met with so many mortifications from his parliament, that he actually resolved upon an abdication, and had drawn up a speech for that purpose, which he was prevailed upon to suppress. He long bore the affronts he met with, in hopes of being supported in his war with France; but at last, in 1697, he was forced to conclude the peace of Ryswick with the French king, who acknowledged his title to the crown of England. By this time William had lost his queen\*, but the government was continued in his person. After peace was restored, the commons obliged him to disband his army, all but an inconsiderable number, and to dismiss his favourite Dutch guards. Towards the end of his reign, his fears of seeing the whole Spanish

\* She died of the small-pox, Dec. 28, 1694, in the thirty-third year of her age.

monarchy in possession of France at the death of the catholic king Charles II. which was every day expected, led him into a very impolitic measure, which was the partition treaty with France, by which that monarchy was to be divided between the houses of Bourbon and Austria. This treaty was highly resented by the parliament, and some of his ministry were impeached for advising it. It is thought that William saw his error when it was too late. His ministers were acquitted from their impeachment, and the death of king James discovered the insincerity of the French court, which immediately proclaimed his son king of Great Britain.

This perfidy rendered William again popular in England. The two houses passed the bill of abjuration, and an address for a war with France. The last and most glorious act of William's reign was his passing the bill for settling the succession to the crown in the house of Hanover, on the 12th of June, 1701. His death was hastened by a fall he had from his horse, soon after he had renewed the grand alliance against France, on the 8th of March, 1702, the 52d year of his age, and the 14th of his reign in England. This prince was not made by nature for popularity. His manners were cold and forbidding; he seemed also sometimes almost to lose sight of those principles of liberty, for the support of which he had been raised to the throne; and though he owed his royalty to the whigs, yet he often favoured the Tories. The former had the mortification of seeing those who had acted most hostilely to the free principles of the constitution, as the marquis of Halifax, the earl of Danby, and lord Nottingham, taken into favour, and resume their places in the cabinet; and the whole influence of government extended to silence all enquiries into the guilt of those who had been the chief instruments in the cruel persecutions of the past reign. The recovery of religion and public liberty were glorious to William; but England under him suffered severely both by sea and land, and the public debt, at the time of his death, amounted to 14,000,000.

Anne, princess of Denmark, by virtue of the act of settlement, and being the next protestant heir to her father James II. succeeded to the throne. As she had been ill treated by the late king, it was thought she would have deviated from his measures; but the behaviour of the French in acknowledging the title of her brother, who has since been well known by the name of the Pretender, left her no choice, and she resolved to fulfil all William's engagements with his allies, and to employ the earl of Marlborough, who had been imprisoned in the late reign on a suspicion of Jacobitism, and whose wife was her favourite, as her general. She could not have made a better choice of a general and a statesman, for that earl excelled in both capacities. No sooner was he placed at the head of the English army abroad, than his genius and activity gave a new turn to the war, and he became as much the favourite of the Dutch as his wife was of the queen.

Charles II. of Spain, in consequence of the intrigues of France, and at the same time resenting the partition treaty, to which his consent had not been asked, left his whole dominions by will to Philip, duke of Anjou, grandson of Louis XIV. and Philip was immediately proclaimed king of Spain, which laid the foundation of the family-alliance between France and that nation. Philip's succession was disputed by the second son of the emperor of Germany, who took upon himself the title of Charles III. and his cause was favoured by the Empire, England, Holland, and other powers, who joined in a confederacy against the house of Bourbon.

The capital measure of continuing the war against France being fixed, the queen found no great difficulty in forming her ministry, who were for the most part Tories; and the earl of Godolphin, who (though afterwards a leading whig) was thought all his life to have a predilection for the late king James and his queen,

was placed at the head of the treasury. His son had married the earl of Marlborough's eldest daughter, and the earl could trust no other with that important department.

In the course of the war several glorious victories were obtained by the earl, who was soon made duke of Marlborough. Those of Blenheim and Ramillies gave the first effectual checks to the French Power. By that of Blenheim in 1704, the empire of Germany was saved from immediate destruction. Though prince Eugene was that day joined in command with the duke, yet the glory of the day was confessedly owing to the latter. The french general Tallard was taken prisoner, and sent to England; and 20,000 French and Bavarians were killed, wounded, or drowned in the Danube, besides about 13,000 who were taken, and a proportionable number of cannon, artillery, and trophies of war. About the same time, the English admiral, sir George Rook, reduced Gibraltar, which still remains in our possession. The battle of Ramillies in 1706, was fought and gained under the duke of Marlborough alone. The loss of the enemy there has been variously reported; it is generally supposed to have been 8000 killed or wounded, and 6000 taken prisoners; but the consequences shewed its importance.

After the battle of Ramillies, the states of Flanders assembled at Ghent, and recognized Charles for their sovereign, while the confederates took possession of Louvain, Brussels, Mechlin, Ghent, Oudenarde, Bruges, and Antwerp; and several other considerable places in Flanders and Brabant acknowledged the title of king Charles. The next great battle gained over the French was at Oudenarde, 1708, where they lost 3000 on the field, and about 7000 were taken prisoners; and the year after, September 11, 1709, the allies forced the French lines at Malplaquet, near Mons, after a very bloody action, in which the French lost 15,000 men. These flattering successes of the English were balanced by great misfortunes.

The queen had sent a very fine army to assist Charles III. in Spain, under the command of lord Galway; but in 1707, after he had been joined by the Portuguese, the English were defeated in the plains of Almanza, chiefly through the cowardice of their allies. Prince George of Denmark, husband to the queen, was then lord high admiral: and though some advantages were gained at sea, yet great complaints were made against the general management of the naval department; and England felt severely the scarcity of hands in carrying on her trade and manufactures.

As Lewis XIV. professed a readiness for peace, the whigs at last consented to a negotiation, and conferences were held at Gertruydenburg, 1710. They were managed, on the part of England, by the duke of Marlborough and the lord Townshend, and by the marquis de Torcy for the French. The French king was gradually brought to comply with all the demands of the allies, except that of employing his own troops against the duke of Anjou, in Spain, where the fortune of war continued still doubtful. But all his offers were rejected by the duke and his associate, as only designed to amuse and divide the allies, and the war was continued.

The unreasonable haughtiness of the English plenipotentiaries at Gertruydenburg, (as some term it) and the then expected change of the ministry in England, saved France, and affairs from that day took a turn in its favour. Means were found to convince the queen, who was faithfully attached to the church of England, that the war in the end, if continued, must prove ruinous to her and her people, and that the whigs were no friends to the national religion. The general cry of the deluded people was, "that the church was in danger," which, though groundless, had great effects. One Sacheverel, an ignorant, worthless preacher, had espoused this clamour in one of his sermons, with the slavish doctrines of passive obedience and non-resistance. It was agreed by both parties to try their strength in this man's cause. He was impeached by the commons, and found

gully by the lords, who ventured to pass upon him only a very small censure. After this trial the queen's affections were entirely alienated from the duchess of Marlborough and the whig administration. Her friends lost their places, which were supplied by Tories, and even the command of the army was taken from the duke of Marlborough in 1712, and given to the duke of Ormond, who produced orders for a cessation of arms; but they were disregarded by the queen's allies in the British pay. And, indeed, the removal of the duke of Marlborough from the command of the army, while the war continued, was an act of the greatest imprudence, and excited the astonishment of all Europe. So numerous had been his successes, and so great his reputation, that his very name was almost equivalent to an army. But the honour and interest of the nation was sacrificed to court intrigues, managed by Mrs. Masham, a relation of the duchess of Marlborough, who had supplanted her benefactress, and by Mr. Harley.

Conferences were opened for peace at Utrecht, in January 1712, to which the queen and the French king sent plenipotentiaries; and the allies being defeated at Denain, they grew sensible that they were no match for the French, now that they were abandoned by the English. In short, the terms were agreed upon between France and England. The reader need not be informed of the particular conditions made by the French, especially that of Dunkirk: but, after all, the peace would have been still more indefensible and shameful than it was, had it not been for the death of the emperor Joseph, by which his brother Charles III. for whom the war was chiefly undertaken, became emperor of Germany; and the dilatoriness, if not bad faith of the allies, in not fulfilling their engagements, and throwing upon the British parliament almost the whole weight of the war.

The Whigs condemned the peace as injurious to the honour and interest of the nation. The majority of the house of lords was of that party, but the house of commons favoured the court. The queen was afraid that the peers would reject the peace, and by an unprecedented exercise of her prerogative, she created twelve peers at one time, which secured the approbation of her measures. Such was the state of affairs at this critical period; from the complexion of which, it has been conjectured, that the queen had, by some secret influence, which was even concealed from some of her ministers, inclined to call her brother to the succession. The rest of the queen's life was rendered uneasy by the jarring of parties, and the contentious among her ministers. The Whigs demanded a writ for the electoral prince of Hanover, as duke of Cambridge, to come to England, and she was obliged hastily to dismiss her lord-treasurer; when she fell into a lethargic disorder, which carried her off the first of August, 1714, in the fiftieth year of her age, and the thirteenth of her reign\*. I have nothing to add to what I have already said of her character, but that though she was a favourite with neither party in her parliament till towards the end of her reign, when the Tories affected to idolize her, yet her people dignified her with the name of the good queen Anne. The public credit was little or nothing affected by her death, though the national debt then

\* With her ended the line of the Stuarts, who, from the accession of James I. anno 1603, had swayed the sceptre of England 111 years, and that of Scotland 343 years, from the accession of Robert II. anno 1371. James, the late pretender, known by the name of the CHEVALIER DE SAINT GEORGE, son of James II. and brother to queen Anne, upon his father's decease, anno 1701, was proclaimed king of England, by Lewis XIV. at St. Germans, and for some time treated as such by the courts of Rome, France, Spain, and Turin. He resided at Rome, where he kept up the appear-

ance of a court, and continued firm in the Romish faith till his death, which happened in 1765. He left two sons, viz. Charles Edward, known by the name of the Young Chevalier, born in 1720, who was defeated at Culloden in 1746, and upon his father's death repaired to Rome, where he continued several years, and afterwards resided at Florence, under the title of count Albany, but died lately. Henry, his second son, who enjoys a dignified place in the church of Rome, and is known by the name of cardinal York.

amounted to about fifty millions; so firm was the dependence of the people upon the security of parliament.

In terms of the act of settlement above mentioned, George I. elector of Hanover, son of the princess Sophia, grand-daughter of James I. was proclaimed king of Great Britain; his mother, who would have been next in succession, having died but a few days before. He came over to England with strong prepossessions against the tory-ministry, most of whom he displaced; but this did not make any great alteration to his prejudice in England. Many of the Scots, by the influence of the earl of Mar, and other chiefs, were driven into rebellion in 1715, which was happily suppressed the beginning of the next year.

After all, the nation was in such a disposition that the ministry durst not venture to call a new parliament, and the members of that which was sitting voted a continuance of their duration from three to seven years, which is thought to have been the greatest stretch of parliamentary power ever known. Several other extraordinary measures took place about the same time. Mr. Shippen, an excellent speaker, and member of parliament, was sent to the Tower for saying that the king's speech was calculated for the meridian of Hanover rather than of London; and one Matthews, a young journeyman printer, was hanged for composing a silly pamphlet, that in later times would not have been thought worthy of animadversion. The truth is, the whig ministry were exceedingly jealous of every thing that seemed to affect their master's title; and George I. though a sagacious, moderate prince, undoubtedly rendered England too subservient to his continental connections, which were various and complicated. He had a dispute with the czar of Muscovy about their German concerns, and had not Charles XII. king of Sweden been killed so critically as he was, Great Britain probably would have been invaded by that northern conqueror, great preparations being made for that purpose, he being incensed at George as elector of Hanover, for purchasing Bremen and Verden of the Danes, which had been a part of his dominions.

In 1718, George quarrelled with Spain on account of the quadruple alliance that had been formed by Great Britain, France, Germany, and the States-general; and his admiral, sir George Byng, by his orders, destroyed the Spanish fleet near Syracuse. A trilling war with Spain then commenced, but it was soon ended by the Spaniards delivering up Sardinia and Sicily; the former to the duke of Savoy, and the latter to the emperor.

A national punishment, different from plague, pestilence, and famine, overtook England in the year 1720, by the sudden rise of the South-sea stock, one of the trading companies; but of this we have already given an account under the article SOUTH SEA COMPANY.

The Jacobites thought to avail themselves of the national discontent at the South-sea scheme and England's connections with the continent, which every day increased. One Lyster, a lawyer, was tried and executed for high treason. Several persons of great quality and distinction were apprehended on suspicion, but the storm fell chiefly on Francis Atterbury, lord bishop of Rochelle, who was deprived of his see and sent in parliament, and banished for life. So fluctuating was the state of Europe at this time, that in September, 1725, a fresh treaty was concluded at Hanover between the kings of Great Britain, France, and Prussia, to counterbalance an alliance that had been formed between the courts of Vienna and Madrid. A squadron was sent to the Baltic, to hinder the Russians from attacking Sweden, another to the Mediterranean, and a third, under admiral Hoſier, to the West Indies, to watch the Spanish plate-fleet. This last was a fatal as well as an inglorious expedition. The admiral and most of his men perished by epidemical diseases, and the hulks of his ships rotted so as to render them unfit for service. ment of the Spaniards was little better. They lost near 10,000 men in the siege of Gibraltar, which they were obliged to raise.

A quarrel with the emperor was the most dangerous to Hanover of any that could happen; and though an opposition in the house of commons was formed by sir William Wyndham and Mr. Pulteney, the parliament grew more lavish in granting money and enormous subsidies for the protection of that electorate, to the kings of Denmark and Sweden, and the landgrave of Hesse Cassel. Such was the state of affairs in Europe, when George I. suddenly died on the 11th of June 1727, at Osnaburgh, in the sixty-eighth year of his age, and the 13th of his reign. The reign of George I. is remarkable for an incredible number of bubbles and cheating projects; and for the great concern which the English took in the affairs of the continent. The institution of the sinking fund, for diminishing the national debt, is likewise owing to this period. The value of the northern parts of the kingdom began now to be better understood than formerly, and the state of manufactures began to shift. This was chiefly owing to the unequal distribution of the land-tax, which rendered it difficult for the poor to subsist in certain counties, which had been forward in giving in the true value of their estates when that tax took place.

Sir Robert Walpole was considered as first minister of England when George I. died, and some differences having happened between him and the prince of Wales, it was generally thought, upon the accession of the latter to the crown, that sir Robert would be displaced. That might have been the case, could another person have been found equally capable of managing the house of commons, and equally willing to gratify that predilection for Hanover which George II. inherited from his father. No minister ever understood better the temper of the people of England, and none, perhaps, ever tried it more. He filled all places of power, trust, and profit, and almost the house of commons itself, with his own creatures; but peace was his darling object, because he thought that war must be fatal to his power. During his long administration he never lost a question that he was in earnest to carry. The excise scheme was the first measure that gave a shock to his power; and even that he could have carried, had he not been afraid of the spirit of the people without doors, which might have either produced an insurrection, or endangered his interest at the next general election.

His pacific system brought him into inconveniences both at home and abroad. It encouraged the Spaniards to continue their depredations upon the British shipping in the American seas, and the French to treat the English court with insolence and neglect. At home, many of the great peers thought themselves slighted, and they interested themselves more than ever they had done in elections. This, together with the disgust of the people at the proposed excise scheme, and passing the *Gin Act*, in the year 1736, increased the minority in the house of commons to 130, some of whom were as able men and as good speakers as ever had sat in parliament; and taking advantage of the increasing complaints against the Spaniards, they attacked the minister with great strength of argument, and with great eloquence. In justice to Walpole, it should be observed, that he filled the courts of justice with able and upright judges, nor was he ever known to attempt any perversion of the known laws of the kingdom. He was so far from checking the freedom of debate, that he bore with equanimity the most scurrilous abuse that was thrown out to his face. He gave way to one or two prosecutions for libels, in compliance to his friends, who thought themselves affected by them; but it is certain, that the press of England never was more open or free than during his administration. And as to his pacific system, it undoubtedly more than repaid to the nation all that was required to support it, by the increase of her trade and the improvement of her manufactures.

With regard to the king's own personal concern in public matters, Walpole was rather his minister than his favourite; and his majesty often hinted to him, as Walpole himself has been heard to acknowledge, that he was responsible for all measures of government. The debates concerning the Spanish depredations in the West Indies, and the proofs that were brought to support the complaints of the merchants, made at last an impression even upon many of Walpole's friends. The heads of the opposition, in both houses of parliament, accused the minister of having, by the treaty of Seville, and other negotiations, introduced a branch of the house of Bourbon into Italy, and depressed the house of Austria, the ancient and natural ally of England. They exposed, with invincible force of eloquence and reasoning, the injustice and disgrace, as well as loss arising from the Spanish depredations, and the necessity of repelling force by force. Sir Robert still adhered to his pacific system, and concluded a shameful and indefensible compromise under the title of a convention with the court of Spain, which produced a war with that nation.

Queen Caroline, consort to George II. had been always a firm friend to the minister; but she died November 20th, 1737, when a variance subsisted between the king and his son, the prince of Wales. The latter complained, that through Walpole's influence he was deprived not only of the power but the promotion to which his birth entitled him; and he put himself at the head of the opposition with so much firmness, that it was generally foreseen that Walpole's power was drawing to a close. Admiral Vernon, who hated the minister, was sent, in 1739, with a squadron of six ships to the West-Indies, where he took and demolished Porto-Bello; but being a hot, impracticable man, he miscarried in his other attempts, especially that upon Carthagena, in which some thousands of British lives were wantonly thrown away. The opposition exulted in Vernon's success, and afterwards imputed his miscarriages to the minister's starving the war, by withholding the means for carrying it on. The general election approaching, so prevalent was the interest of the prince of Wales in England, and that of the duke of Argyle in Scotland, that a majority was returned to parliament who were no friends to the minister, and after a few trying divisions, he retired from the house, on the 9th of February, 1742, was created earl of Orford, and the 11th resigned all his employments.

George II. bore the loss of his minister with the greatest equanimity, and even conferred titles of honour, and posts of distinction, upon the heads of the opposition. By this time, the death of the emperor Charles VI. the danger of the pragmatic sanction (which meant the succession of his daughter to all the Austrian dominions) through the ambition of France, and many other concurrent causes, introduced George to take the leading part in a continental war. He was encouraged to this by lord Carteret, afterwards earl of Granville, (an able, but a headstrong minister, whom George had made his secretary of state) and indeed by the voice of the nation in general. George accordingly put himself at the head of his army, fought and gained the battle of Dettingen, June 16, 1743, and his not suffering his general, the earl of Stair, to improve the blow, was thought to proceed from tenderness for his electoral dominions. This partiality excited an universal flame in England; and a clamour raised against his lordship's measures was increased by the duke of Newcastle and his brother, lord chancellor Hardwicke, the lord Harrington, and other ministers, who resigned, or desired to resign their places, if lord Carteret should retain his influence in the cabinet. His majesty was obliged to give way to what he thought the voice of his people, and he indulged them with accepting the services of some gentlemen who never had been considered as zealous friends to the house of Hanover. After various removals, Mr. Pelham was placed at the head of the treasury, and appointed chancellor of the exchequer, and consequently

was

With

was considered as first minister; or rather the power of the premiership was divided between him and his brother the duke of Newcastle.

Great Britain was then engaged in a very expensive war both against the French and Spaniards, and her enemies sought to avail themselves of the general discontent that prevailed in England on account of the king's predilection for Hanover. This naturally suggested to them the idea of applying to the Pretender, who resided at Rome; and he agreed that his son Charles, who was a sprightly young man, should repair to France, from whence he set sail, and narrowly escaped, with a few followers, in a frigate, to the western coasts of Scotland, between the islands of Mull and Sky, where he discovered himself, assembled his followers, and published a manifesto exciting the nation to rebellion. It is necessary, before we relate the true cause of this enterprize, to make a short retrospect to foreign parts.

The war of 1741 proved unfortunate in the West Indies, through the fatal divisions between admiral Vernon and general Wentworth, who commanded the land troops; and it was thought that above 20,000 British soldiers and seamen perished in the impracticable attempt on Carthage, and the inclemency of the air and climate during other idle expeditions. The year 1742, had been spent in negotiations with the courts of Petersburg and Berlin, which, though expensive, proved of little or no service to Great Britain; so that the victory of Dettingen left the French troops in much the same situation as before. A difference between the admirals Matthews and Lestock had suffered the Spanish and French fleets to escape out of Toulon with but little loss; and soon after, the French, who had before acted only as allies to the Spaniards, declared war against Great Britain, who, in her turn, declared war against the French. The Dutch, the natural allies of England, during this war, carried on a most lucrative trade; nor could they be brought to act against the French, till the people entered into associations and insurrections against the government. Their marine was in a miserable condition, and when they at last sent a body of troops to join the British and Austrian armies, which had been wretchedly commanded for one or two campaigns, they did it with so bad a grace, that it was plain they intended not to act in earnest. When the duke of Cumberland took upon himself the command of the army, the French, to the great reproach of the allies, were almost masters of the barrier in the Netherlands, and were besieging Tournay. The duke attempted to raise the siege, but by the coldness of the Austrians, and the cowardice of the Dutch, whose government all along held a secret correspondence with France, he lost the battle of Fontenoy, and 7000 of his best men; though it is generally allowed that his dispositions were excellent, and both he and his troops behaved with unexampled intrepidity. To counterbalance such a train of misfortunes, admiral Anson returned this year to England, with an immense treasure (about a million sterling) which he had taken from the Spaniards in his voyage round the world; and commodore Warren, with colonel Pepperel, took from the French the important town and fortress of Louisbourg, in the island of Cape Breton.

Such was the state of affairs abroad in August 1745, when the Pretender's eldest son, at the head of some Highland followers, surprised and disarmed a party of the king's troops in the western Highlands, and advanced with great rapidity to Perth. The government never so thoroughly experienced, as it did at that time, the benefit of the public debt for the support of the Revolution. The French and the Jacobite party, (for such there was at that time in England) had laid a scheme for distressing the Bank; but common danger abolished all distinctions, and united the nation in the defence of one interest, which was private property. The merchants undertook, in their address to the king, to support it, by receiving bank-notes in payment. This seasonable measure saved the public credit; but the defeat of the rebels by the duke of Cumberland at Culloden, in the year 1746, did not restore tranquillity to

Europe. Though the prince of Orange, son-in-law to George II. was, by the credit of his majesty, and the spirit of the people of the United Provinces, raised to be their stadtholder, the Dutch could never be brought to act heartily in the war. The allies were defeated at Val, near Maastricht, and the duke of Cumberland was in danger of being made prisoner. Bergen-op-zoom was taken in a manner that has never yet been explained. The allies suffered other disgraces on the continent; and it now became the general opinion in England, that peace was necessary to save the duke and his army from total destruction. By this time, however, the French marine and commerce were in danger of being annihilated by the English fleet, under the command of the admirals Anson, Warren, Hawke, and other gallant officers: but the English arms were not so successful as could have been wished, under rear-admiral Boscawen in the East Indies. In this state of affairs, the successes of the French and English, during the war, may be said to have been balanced, and both ministries turned their thoughts to peace. The question is not yet decided which party had greatest reason to desire it; the French and Spaniards for the immense losses they had sustained by sea, or the allies for the disgraces they had suffered by land.

The preliminaries for peace were signed in April 1748, and a definitive treaty was concluded at Aix-la-Chapelle in October, the basis of which was, the restitution on both sides of all places taken during the war. The number of prizes taken by the English in this war, from its commencement to the signing the preliminaries, was 3434; namely, 1249 from the Spaniards, and 2185 from the French: they lost during the same time, 3238; 1360 being taken by the Spaniards, and 1878 by the French. Several of the ships taken from the Spaniards were immensely rich; so that the balance, upon the whole, amounted to almost two millions in favour of England. Such is the gross calculation on both sides; but the consequences plainly proved that the losses of the French and Spaniards must have been much greater. The vast fortunes made by private persons in England all of a sudden, sufficiently shewed that immense sums had not been brought to the public account; but the greatest proof was, the next year the interest of the national debt was reduced from four to three and a half per cent. for seven years, after which the whole was to stand reduced to three per cent.

This was the boldest stroke of financing ever attempted perhaps in any country, consistently with public faith; for the creditors of the government, after an ineffectual opposition, continued their money in the funds, and a few who sold out even made interest to have it replaced on the same security, or were paid off their principal sums out of the sinking fund. This was an era of improvements: Mr. Pelham's candour and rectitude of administration leaving him few or no enemies in parliament, he omitted no opportunity of carrying into execution every scheme for the improvement of commerce, manufactures, and the fisheries; the benefits of which were felt during the succeeding war, and are to this day. Every intelligent person, however, considered the peace of Aix-la-Chapelle as no better than a mere cessation of hostilities. The French employed themselves in recruiting and repairing their marine, and had formed the design of seizing the British back settlements in America, and for cutting off all communication between the English and the native Indians; in which case our colonies must have been reduced to a narrow slip on the coasts, without the means of getting subsistence but from the mother country.

In the mean while, a new treaty of commerce was signed at Madrid, between Great Britain and Spain, by which, in consideration of 100,000*l.* the South-Sea company gave up all their future claims to the assiento contract, by virtue of which, that company had supplied the Spanish West-Indies with negroes. In March, 1750, died universally lamented, his royal highness Frederick prince of Wales

In May, 1751, an act passed for regulating the commencement of the year, by which the old style was abolished, and the new one established. This was done by sinking eleven days in September 1752, and from that time beginning the year on the first of January. In 1753 the famous act passed for preventing clandestine marriages; but whether it is for the benefit of the subject, is a point that is still very questionable. The people of England about this time sustained an immense loss by the death of Mr. Pelham, who was one of the most honest, wife, and able ministers England had ever seen.

The barefaced encroachments of the French, who had built forts on our back settlements in America, and the dispositions they made for sending over vast bodies of veteran troops to support those encroachments, produced a wonderful spirit in England, especially after admiral Boscawen was ordered with eleven ships of the line to sail to the Banks of Newfoundland, where he took two French men of war, the rest of their fleet escaping up the river St. Lawrence, by the straits of Belleisle. No sooner was it known that hostilities were begun, than the people of England poured their money into the government's loan, and orders were issued for making general reprisals in Europe as well as in America; and that all the French ships, whether outward or homeward bound, should be stopped and brought into British ports. These orders were so effectual, that before the end of the year 1755, above 300 of the richest French merchant ships, and above 8,000 of their best sailors, were brought into the kingdom. This vigorous measure was followed by farther success, for about two years after, near 30,000 French seamen were found to be prisoners in England.

In July, 1755, general Braddock, who had been sent from England to attack the French, and reduce the forts on the Ohio, was defeated and killed, by falling into an ambuscade of the French and Indians near Fort du Quesne; but major-general Johnson defeated a body of French near Crown Point, of whom he killed about 1000.

The English navy, in 1755, consisted of one ship of 110 guns, five of 100 guns each, thirteen of 90, eight of 80, five of 74, twenty-nine of 70, four of 66, one of 64, thirty-three of 60, three of 54, twenty-eight of 50, four of 44, thirty-five of 40, and forty-two of 20; four sloops of war of 18 guns each, two of 16, eleven of 14, thirteen of 12, and one of 10; besides a great number of bomb-ketches, fire-ships, and tenders; a force sufficient to oppose the maritime strength of all the powers of Europe. Whilst that of the French, even at the end of this year, and including the ships then upon the stocks, amounted to no more than six ships of 80 guns, twenty-one of 74, one of 72, four of 70, thirty-one of 64, two of 60, six of 50, and thirty-two frigates.

In proportion as the spirits of the public were elevated by those invincible armaments, they were sunk with an account that the French had landed 11,000 men in Minorca, to attack Fort St. Philip there; that admiral Byng, who had been sent out with a squadron at least equal to that of the French, had been baffled, if not defeated, by their admiral Galissoniere, and that at last Minorca was surrendered by general Blakerney. The public outcry was such, that the king gave up Byng to public justice, and he was shot to death at Portsmouth for not doing all that was in his power against the enemy.

It was about this time that Mr. Pitt was placed, as secretary of state, at the head of the administration. He had been long known as a bold, energetic speaker, and he soon proved himself to be a spirited minister. The miscarriages in the Mediterranean had no consequence but the loss of Fort St. Philip, which was more than repaired by the vast success of the English privateers, both in Europe and America. The successes of the English in the East Indies, under colonel Clive, were extraordinary. He defeated Suraja Dowla, nabob of Bengal, Bahar and Orixia,

Orixa, and placed Jaffier Ally Cawn in the ancient seat of the nabobs of those provinces. Suraja Dowla, who was in the French interest, a few days after his being defeated, was taken by the new nabob Jaffier Ally Cawn's son, and put to death. This event laid the foundation of the great extent of territory which the English now possess in the East Indies.

Mr. Pitt introduced into the cabinet a new system of operations against France, than which nothing could be better calculated to restore the spirits of his countrymen, and to alarm their enemies. Far from dreading an invasion, he planned an expedition for carrying the arms of England into France itself; and the descent was to be made at Rochefort, under general sir John Mordaunt, who was to command the land-troops. Nothing could be more promising than the dispositions for this expedition. It failed on the 8th of September, 1757; but admiral Hawke brought back the sea and land forces on the 6th of October to St. Helen's, the general having made no attempt to land on the coast of France.

The French having attacked the electorate of Hanover with a powerful army, the English parliament voted large supplies of men and money to defend the electoral dominions. The duke of Cumberland had been sent thither to command an army of observation, but was so powerfully pressed by a superior army, that he found himself obliged to lay down his arms; and the French, under the duke of Richelieu, took possession of that electorate and its capital. At this time a scarcity, bordering on famine, raged in England; and the Hessian troops, who, with the Hanoverians, had been sent to defend the kingdom from an invasion intended by the French, still remained in England. So many difficulties concurring, in 1758, a treaty of mutual defence was agreed to between his majesty and the king of Prussia: in consequence of which, the parliament voted 670,000*l.* to his majesty; and also voted large sums, amounting in the whole to near two millions a year, for the payment of 50,000 of the troops of Hanover, Hesse-Cassel, Saxe-Gotha, Wolfenbuttel, and Buckeburg. This treaty, which proved afterwards so burdensome to England, was intended to unite the Protestant interest in Germany.

George II. with the consent of his Prussian majesty, declaring that the French had violated the convention concluded between them and the duke of Cumberland at Closterseven, ordered his Hanoverian subjects to resume their arms under prince Ferdinand of Brunswick, a Prussian general, who instantly drove the French out of Hanover; and the duke of Marlborough, after the English had repeatedly insulted the French coasts, by destroying their stores and shipping at St. Maloes and Cherbourg, marched into Germany, and joined Prince Ferdinand with 12,000 British troops, which were afterwards increased to 25,000. A war ensued, in the course of which the English gained great victories, which produced no decisive effects. Even the battle of Minden, one of the most glorious in the English annals, in which about 7000 English defeated 80,000 of the French regular troops, contributed nothing to the conclusion of the war, or towards weakening the French in Germany.

The expences of the war were borne with cheerfulness, and the activity and spirit of Mr. Pitt's administration were greatly applauded. Admiral Boscawen and general Amherst, in August 1758, reduced and demolished Louisbourg, in North America, which had been restored to the French by the treaty of Aix-la-Chapelle, and was become the scourge of the British trade, and took five or six French ships of the line; Frontenac and Fort du Quebec, in the same quarter, fell also into our hands; acquisitions that far over-balanced a check received at Ticonderago, and the loss of above 300 of the English guards, as they were returning under general Bligh from the coast of France.

The English affairs in the East Indies this year proved equally fortunate; and the lords of the admiralty received letters from thence, with an account that admiral Pococke had engaged the French fleet near Fort St. David's on the 29th of March, in which engagement a French man of war, called the *Bien Aimé*, of 74 guns, was so much damaged that they run her on shore. The French had 600 men killed and wounded on this occasion, and the English only 29 killed, and 89 wounded. That on the 3d of August following, he engaged the French fleet a second time near Pondicherry; when, after a brisk firing of ten minutes, the French bore away with all the sail they could make, and got safe into the road of Pondicherry: and that, on the 14th of December following, general Lally, commander of the French army in those parts, marched to besiege Madras, which was defended by the English colonels Laurence and Draper; and after a brisk cannonade, which lasted till the 16th of February following, the English having received a reinforcement of 600 men, general Lally thought proper to raise the siege, and retire with precipitation, leaving behind him forty pieces of cannon.

The year 1759 was introduced by the taking of the island of Gorée, on the coast of Africa, by commodore Keppel. Three capital expeditions had been planned for this year in America, which were all successful. One of them was against the French islands in the West Indies, where Guadaloupe was reduced. The second expedition was against Quebec, the capital of French Canada. The command was given, by the minister's advice, to general Wolfe, a young officer of a truly military genius. Wolfe was opposed with far superior force by Montcalm, the best and most successful general the French had. Though the situation of the country which Wolfe was to attack, and the works the French threw up to prevent a descent of the English, were deemed impregnable, yet Montcalm never relaxed in his vigilance. Wolfe's courage and perseverance, however, surmounted incredible difficulties; he gained the heights of Abraham, near Quebec, where he fought and defeated the French army, but was killed himself, as was Montcalm; general Monkton, who was next in command, being wounded, the completion of the French defeat, and the glory of reducing Quebec, was reserved for brigadier-general (now lord viscount) Townshend.

General Amherst, who was the first English general on command in America, conducted the third expedition. His orders were to reduce all Canada, and to join the army under general Wolfe on the banks of the river St. Lawrence. It is to the honour of the minister, that Mr. Amherst, in this expedition, was so well provided with every thing that could make it successful, that there scarcely appeared any chance for its miscarriage; and thus the French empire in North America became subject to Great Britain.

The affairs of the French being now desperate, and their credit ruined, they resolved upon an attempt to retrieve all by an invasion of Great Britain; but, on the 18th of August, 1759, admiral Boscawen attacked the Toulon squadron, commanded by M. de la Clue, near the straits of Gibraltar, took *Le Centaur*, of 74, *Le Téméraire* of 74, and *Le Modeste* of 74 guns; and burnt *L'Océan* of 80, and *Le Redoutable* of 74 guns. The rest of the fleet, consisting of seven ships of the line, and three frigates, made their escape in the night; and on November 20, sir Edward Hawke defeated the Brest fleet, commanded by admiral Conflans, off the island of Dumet, in the Bay of Biscay. The *Formidable*, a French man of war of 80 guns, was taken; the *Thésée* of 74, and the *Superbe* of 70 guns, were sunk; and the *Soleil Royal* of 80, and the *Héros* of 74 guns, were burnt and afterwards the *Juste* of 70, perished in the mouth of the Loire. Seven or eight French men of war of the line got up the river Vilaine, by throwing their guns over board; and the rest of the fleet, consisting of five ships of the line, and three frigates, escaped in the night. The English lost on this occasion, the *Ellex*

of 64, and the Resolution of 74 guns, which ran on shore in the chase. After this engagement, the French gave over all thoughts of their intended invasion of Great Britain.

In February 1760, captain Thurot, a French marine adventurer, who had with three sloops of war alarmed the coasts of Scotland, and actually made a descent at Carrickfergus in Ireland, was, on his return from thence, met, defeated, and killed by captain Elliot, the commodore of three ships, inferior in force to the Frenchman's squadron. Every day's gazette added to the accounts of the successes of the English, and the utter ruin of the French finances, which that government did not blush publicly to avow. In short, Great Britain now reigned as sole mistress of the main.

The war in Germany, however, continued still as undecided as it was expensive, and many in England began to consider it now as foreign to the internal interests of Great Britain. The French again and again shewed dispositions for treating, and the charges of the war, which began now to amount to little less than eighteen millions sterling yearly, inclined the British ministry to listen to their proposals. A negotiation was accordingly entered upon, which proved abortive, as did many other projects for accommodation; but on the 25th of October 1760, George II. died suddenly (from a rupture in the right ventricle of the heart), full of years and glory, in the 77th year of his age, and 34th of his reign, and was succeeded by his grandson, now George III. eldest son to the late prince of Wales.

The memory of George II. is reprehensible on no head but his predilection for his electoral dominions. He never could separate an idea that there was any difference between them and his regal dominions; and he was sometimes ill enough advised to declare so much in his speeches to parliament. We are, however, to remember, that his people gratified him in this partiality, and that he never acted by power or prerogative. He was just, rather than generous; and in matters of economy, either in his state or his household, he was willing to connive at abuses, if they had the sanction of law and custom. He was not very accessible in conversation, and therefore it is no wonder that, having left Germany, after he had attained to man's estate, he still retained foreign notions both of men and things. In government he had no favourite, for he parted with sir Robert Walpole with great indifference, and shewed very little concern at the subsequent revolutions among his servants. This quality may be deemed a virtue, as it contributed greatly to the internal quiet of his reign, and prevented the people from loading the king with the faults of his ministers. In his personal disposition he was passionate, but placable, fearless of danger, fond of military parade, and enjoyed the memory of the campaigns in which he served when young.

King George III. ascended the throne with great advantages. His being a native of England prejudiced the people in his favour: he was in the bloom of youth, in his person tall and comely; at the time of his accession Great Britain was in the highest degree of reputation and prosperity, and the most salutary unanimity and harmony prevailed among the people. The first acts of his reign seemed also calculated to convince the public that the death of his predecessor should not relax the operations of the war. Accordingly, in 1761, the island of Belleisle, on the coast of France, surrendered to his majesty's ships and forces under commodore Keppel and general Hodgson; as did the important fortrefs of Pondichery, in the East Indies, to colonel Coote and admiral Stevens. The operations against the French West Indies still continued under general Monkton, lord Kollo, and sir James Douglas; and in 1762, the island of Martinico, hitherto deemed impregnable, with the islands of Grenada, St. Lucia, Grenadillas, St. Vincent, and others of less note, were subdued by the British arms with inconceivable rapidity.

As his majesty could not espouse a Roman catholic, he was precluded from intermarrying

marrying into any of the great families of Europe; he therefore chose a wife from the house of Mecklenburg Strelitz, the head of a small but sovereign state in the north-west of Germany; and the conduct of his excellent consort has hitherto been such as most highly to justify his choice. She was conveyed to England in great pomp, and the nuptials were celebrated on the very night of her arrival, viz. Sept. 8, 1761: and on the 22d of the same month, the ceremony of the coronation was performed with great magnificence in Westminster-abbey.

In the mean time, Mr. Pitt, who had conducted the war against France with such eminent ability, and who had received the best information of the hostile intentions and private intrigues of the court of Spain, proposed in council an immediate declaration of war against that kingdom. He urged his reasons for this measure with his usual energy; asserting that "this was the time for humbling the whole house of Bourbon; that Spain was in daily expectation of a rich fleet from the West Indies; that if we could intercept that, it would give a disheartening blow to their power and pride; and that, should this opportunity escape, it might never be recovered." But he was over-ruled in the council. Mr. Pitt now found the decline of his influence; and it was supposed that the earl of Bute, who had a considerable share in directing the education of the king, had acquired an ascendancy in the royal favour\*. Mr. Pitt, however, said, that "as he was called to the ministry by the voice of the people, to whom he considered himself as accountable for his conduct, he would no longer remain in a situation which made him responsible for measures that he was not allowed to guide." He, therefore, resigned the seals, and lord Temple his brother-in-law also gave up the post which he held in the administration. But the next day, the king settled a pension of three thousand pounds a year upon Mr. Pitt, and at the same time was conferred upon his lady and her issue; and the pension was to be continued for three lives. These advantages and honours had unquestionably been well deserved by his public services; but his acceptance of them greatly lessened his popularity. A very considerable degree of discontent notwithstanding prevailed in the nation, on account of his removal from power; and it was extremely natural, that the people should behold, with the utmost regret, the removal of a minister, of whose abilities and integrity they had the highest opinion, and in the midst of a war which he had conducted with so much honour to himself and to his country. This great man had not resigned the seals many weeks, when the Spanish fleet arrived safe in their ports, richly laden. After this, the court of Spain soon threw off the mask, and gave the most unequivocal marks of their hostile intentions.

The war still continued to be carried on with vigour after the resignation of Mr. Pitt, and the plans were pursued that he had previously concerted. Lord Egremont was appointed to succeed him, as secretary for the southern department. It was at length also found indispensably necessary to engage in a war with Spain, the famous family compact among all the different branches of the Bourbon family being now generally known; and accordingly war was declared against that kingdom, on the 4th of January 1762. A respectable armament was fitted out under admiral Pococke, having the earl of Albemarle on board to command the land forces; and the vitals of the Spanish monarchy were struck at, by the reduction of the Havannah, the strongest and most important fort which his catholic majesty held in the West Indies, after a siege of two months and eight days. The capture of the *Hermione*, a large Spanish register ship, bound from Lima to Cadiz, the cargo of which was valued at a million sterling, preceded the birth of the prince of Wales, and the treasure passed in triumph through Westminster to the Bank, the very hour he was

\* It was on the 25th of March 1761, that the earl of Bute was appointed one of the principal secretaries of state; and on the 5th of October following, Mr. Pitt resigned the seals.

born. The loss of the *Havannah*, with the ships and treasures there taken from the Spaniards, was succeeded by the reduction of *Manilla* and the Philippine islands in the East Indies, under general Draper and admiral Cornish, with the capture of the *Trinidad*, reckoned worth three millions of dollars. To counteract those dreadful blows given to the family compact, the French and Spaniards employed their last resource, which was to quarrel with and invade Portugal, the faithful but feeble ally of Great Britain. Whether this quarrel was real or pretended, is not easy to decide. It certainly embarrassed his Britannic majesty, who was obliged to send thither armaments both by sea and land.

The negotiations for peace were now resumed; and the enemy at last offered such terms as the British ministry thought admissible. The defection of the Russians from the confederacy against the king of Prussia, and his consequent successes, produced a cessation of arms in Germany, and in all other quarters; and on the 10th of February 1763, the definitive treaty of peace between his Britannic majesty, the king of France, and the king of Spain, was concluded at Paris, and acceded to by the king of Portugal. March 10, the ratifications were exchanged at Paris. The 22d, the peace was solemnly proclaimed at Westminster and London; and the treaty having on the 18th been laid before the parliament, it met the approbation of a majority of both houses.

By this treaty, the extensive province of Canada, with the islands of Newfoundland, Cape Breton, and St. John, were confirmed to Great Britain; also the two Floridas, containing the whole of the continent of North America, on this side the Mississippi, (except the town of New Orleans, with a small district round it,) was surrendered to us by France and Spain, in consideration of restoring to Spain the island of Cuba; and to the French the islands of Martinico, Guadaloupe, Mariegalante, and Desirade; and in consideration of our granting to the French the two small islands of St. Pierre and Miquelon, on the coast of Newfoundland; and quitting our pretensions to the neutral island of St. Lucia, they yielded to us the islands of Grenada and the Grenadilles, and quitted their pretensions to the neutral islands of St. Vincent, Dominica, and Tobago. In Africa we retained the settlement of Senegal, by which we nearly engrossed the whole gum trade of that country; but we restored Goree, a small island of little value. The article that relates to the East Indies, restores to the French all the places they had at the beginning of the war, on condition that they shall maintain neither fort nor forces in the province of Bengal. And the city of *Manilla* was restored to the Spaniards; but they confirmed to us the liberty of cutting logwood in the bay of Honduras in America. In Europe, likewise, the French restored to us the island of Minorca, and we restored to them the island of Belleisle. In Germany, after six years spent in marches and countermarches, numerous skirmishes and bloody battles, Great Britain acquired much military fame, but at the expence of 30 millions sterling! As to the objects of that war, it was agreed that a mutual restitution and oblivion should take place, and each party sit down at the end of the war, in the same situation in which they began it. And peace was restored between Portugal and Spain, both sides to be upon the same footing as before the war.

The war, to which a period was now put, was the most brilliant in the British annals. No national prejudices nor party disputes then existed. The same truly British spirit by which the minister was animated, fired the breast of the soldier and seaman. The nation had then arrived at a pitch of wealth unknown to former ages; and the monied man, pleased with the aspect of the times, confiding in the abilities of the minister, and courage of the people, cheerfully opened his purse. The incredible sums of 18, 19, and 22 millions, raised by a few citizens of London, upon a short notice, for the service of the years 1759, 1760, and 1761, were no less

astonishing to Europe, than the success which attended the British fleets and armies in every quarter of the globe.

But the peace, though it received the sanction of a majority of both houses of parliament, was far from giving universal satisfaction to the people. The manner in which it was begun, and the precipitation with which it was concluded, were condemned. The terms also were censured by many, as extremely inadequate to what might justly have been expected from the numerous victories and advantages, which had been obtained against the enemy. And from this period various causes concurred to excite a spirit of discontent in the nation.

On the 30th of April, 1763, three of the king's messengers entered the house of John Wilkes, esq. member of parliament for Aylesbury, and seized his person, by virtue of a general warrant from the secretary of state, which directed them to seize "the authors, printers, and publishers, of a seditious and treasonable paper, intitled, *The North Briton*, No. 45." The papers published under this title, severely arraigned the conduct of the administration, and represented the earl of Bute as the favourite of the king, and the person from whom measures of government of a very pernicious tendency originated. The 45th number contained strictures on the king's speech. Mr. Wilkes was suspected to be the author, but his name was not mentioned in the warrant by which he was apprehended. He objected to being taken into custody by such a warrant, alleging that it was illegal. However he was forcibly carried before the secretaries of state for examination, and they committed him close prisoner to the Tower, his most secret and confidential papers, being also seized. He was likewise deprived of his commission as colonel of the Buckinghamshire militia. Not to mention the privilege of parliament, which was flagrantly violated, the warrants, though conformable to precedent, were inconsistent with the spirit of the British constitution, substituting discretion in the place of law, which knows no discretion, nor leaves the construction to be put on warrants to those low creatures who must be entrusted with their execution. A writ of habeas corpus being procured by his friends, he was brought up to the court of Common Pleas, and the matter being there argued, he was ordered to be discharged. This affair made a great noise; people of all ranks interested themselves in it, and Westminster-hall resounded with acclamations when he was set at liberty. An information, however, was filed against him in the court of King's Bench at his majesty's suit, as author of the *North Briton*, No. 45; on the first day of the meeting of parliament, after these transactions, Mr. Wilkes stood up in his place, and made a speech, in which he complained to the house, that in his person the rights of all the commons of England, and the privileges of parliament, had been violated by his imprisonment, the plundering of his house, and the seizure of his papers. The same day, a message was sent to acquaint the house of commons with the information his majesty had received, that John Wilkes, esq. a member of that house, was the author of a most seditious and dangerous libel, and the measures that had been taken thereupon. The next day a duel was fought in Hyde Park between Mr. Wilkes and Mr. Martin, another member of parliament, and secretary of the treasury, in which Mr. Wilkes received a dangerous wound in the belly with a pistol-bullet. Both houses of parliament soon concurred in voting the *North-Briton*, No. 45, to be a false, scandalous, and seditious libel, and ordered it to be burnt by the common hangman. This order was accordingly executed, though not without great opposition from the populace; and Mr. Harley, one of the sheriffs who attended, was wounded, and obliged to take shelter in the Mansion-house. Another prosecution was commenced against Mr. Wilkes, for having caused an obscene and profane poem to be printed, intitled, "*An Essay on Woman*." Of this, only twelve copies had been privately printed; and it did not appear to have been intended for publication. Finding, however, that he

should

should continue to be prosecuted with the utmost rigour, when his wound was in some degree healed, he thought proper to quit the kingdom. He was soon after expelled the house of commons; verdicts were also given against him, both on account of the *North Briton* and the *Essay on Woman*, and towards the end of the year 1764 he was outlawed. Sundry other persons had been taken up for being concerned in printing and publishing the *North Briton*; but some of them obtained verdicts against the king's messengers for false imprisonment.

In the mean while, the earl of Bute, who had been made first lord of the treasury, resigned that office, and was succeeded by Mr. George Grenville. And under this gentleman's administration, an act was passed, said to have been framed by him, entitled, "An Act for laying a *stamp-duty* in the British Colonies of North-America," which received the royal assent on the 22d of March 1765. Some other regulations were previously made, under pretence of preventing smuggling in America; but which in effect so cramped the trade of the colonies, as to be prejudicial both to them and to the mother-country. As soon as it was known in North America that the *stamp-act* was passed, the whole continent was kindled in to a flame. As the Americans had hitherto been taxed by their own representatives in their provincial assemblies, they loudly asserted, that the British parliament, in which they were not represented, had no right to tax them. Indeed, the same doctrine had been maintained in the British parliament, when the stamp-act was under consideration. On the other hand, it was contended, that the colonies, who had been protected by Great Britain, ought, in reason and justice, to contribute towards the expence of the mother-country. "These children of our own planting," said Mr. George Grenville, speaking of the Americans, "nourished by our indulgence, until they are grown to a good degree of strength and opulence, and protected by our arms, will they grudge to contribute their mite to relieve us from the heavy load of national expence which we lie under?"

When the stamp-act, as printed by royal authority, reached the colonies, it was treated with every mark of indignation and contempt. Several acts of violence were likewise committed, with a view of preventing its operation; and associations were also formed in the respective states, whereby the people bound themselves not to import or purchase any British manufactures, till that act should be repealed. The inhabitants of the different colonies also established committees to correspond with each other, concerning the general affairs of the whole, and even appointed deputies from those committees to meet in CONGRESS at New-York. They assembled in that city, in October 1765, and this was the first congress held on the American continent.

These commotions in America occasioned so great an alarm in England, that the king thought proper to dismiss his ministers. The marquis of Rockingham was appointed first lord of the treasury; and some of his lordship's friends succeeded to the vacant places. In March 1766, an act was passed for repealing the American stamp-act. This was countenanced and supported by the new ministry; and Mr. Pitt, though not connected with them, yet spoke with great force in favour of the repeal. He said of the late ministry, that "every capital measure they had taken was entirely wrong." He contended that the parliament of Great Britain had no right to tax the colonies. "For the commons of America, represented in their several assemblies, have ever been in possession of the exercise of their constitutional right, of giving and granting their own money. They would have been slaves if they had not enjoyed it. At the same time, this kingdom, as the supreme governing and legislative power, has always bound the colonies by her laws, by her regulations, and restrictions in trade, in navigation, in manufactures—in every thing except that of taking their money out of their pockets without their consent."

At the time that the stamp-act was repealed, an act was also passed for securing the dependence of the American colonies on Great Britain. But this does not appear then to have given much umbrage to the colonists; and the repeal of the stamp-act occasioned great rejoicings both in America and Great Britain.

The marquis of Rockingham and his friends continued in administration but a short time. On the 30th of July, 1766, the duke of Grafton was appointed first lord of the treasury, in the room of the marquis of Rockingham; the earl of Shelburne, secretary of state, in the room of the duke of Richmond; Charles Townshend, chancellor of the exchequer; and Mr. Pitt, now created earl of Chatham, was appointed lord-privy-seal; but that eminent statesman's acceptance of a peerage, as it removed him from the house of commons, greatly lessened his influence. Upon the death of Mr. Charles Townshend, who had exerted great ability both in the cabinet and in parliament, lord North was made chancellor of the exchequer, and afterwards first lord of the treasury, and head of the administration, which began the American war without necessity, conducted it without spirit or prudence, and at last concluded it with infinite dishonour and disadvantage.

In the year 1768, Mr. Wilkes, who had for a considerable time resided in France, came over to England, and again became an object of public attention. The parliament had just before been dissolved; and on his arrival in London, though he still lay under the sentence of outlawry, he offered himself a candidate to represent that city in the ensuing parliament. He was received with loud acclamations, and the generality appeared greatly interested in his favour, but he lost his election; only 1247 livesmen voted for him. His want of success did not discourage him, for he immediately offered himself a candidate for the county of Middlesex. He was attended by an amazing number of people to Brentford, the place of election. The two other candidates had large fortunes, and great connections in the county; they had represented it for several years, and were supported by the whole interest of the court. Mr. Wilkes, however, being considered as a man who had been unjustly and unconstitutionally persecuted by the government, was elected by a great majority, on the 28th of March. The extreme joy of the populace at this event, produced some irregularities in the city of London, on the evening of the day of election; and, on the following day, orders were given to the guards on duty at St. James's to be in readiness at the beat of drum, to march to suppress any riot that might happen. In May following, Mr. Wilkes having voluntarily surrendered himself to the court of king's-bench, was committed to the king's-bench prison. Soon after this, a number of persons having assembled in St. George's Fields, near that prison, in hopes of seeing Mr. Wilkes, some disorder ensued, and the soldiers were rashly ordered to fire among the mob. Several persons were killed, and in particular one William Allen, who was singled out, pursued by one of the soldiers, and shot near his father's house, in a manner which the occasion could in no respect justify. This affair made a great noise; and the pains taken by the minister to support and vindicate the military, increased the odium of the transaction. On the 8th of June Mr. Wilkes's outlawry was reversed, and on the 18th of the same month sentence was passed on him; that, for the republication of *The North Briton*, No. 45, he should pay a fine of five hundred pounds, and be imprisoned ten months; and for publishing the *Essay on Woman*, that he should pay the same fine and be imprisoned twelve months, to be computed from the expiration of the term of the former imprisonment. He afterwards petitioned the house of commons, complaining of the injustice and illegality of the proceedings against him; but the house voted, that his complaints were frivolous and groundless. He was also again expelled, for publishing some prefatory remarks on a letter written by one of the secretaries of state to the chairman of the quarter-sessions at Lambeth, previous to the unhappy affair of St. George's Fields, and

a new

a new writ was ordered to be issued for the election of a member for the county of Middlesex.

The rigour with which Mr. Wilkes was prosecuted only increased his popularity. Before his expulsion he had been chosen an alderman of London; and on the 16th of February, 1769, he was re-elected at Brentford member for the county of Middlesex. The return having been made to the house, it was resolved, that Mr. Wilkes, having been expelled that session, was incapable of being elected a member of that parliament. The late election, therefore, was declared void, and a new writ issued for another. He was once more unanimously re-elected by the freeholders, and the election was again declared void by the house of commons. After this a new election being ordered, colonel Luttrell, in order to recommend himself to the court, vacated the seat which he already had in parliament, by the acceptance of a nominal place, and declared himself a candidate for the county of Middlesex. Though the whole weight of court interest was thrown into the scale in this gentleman's favour, yet a majority of near four to one appeared against him on the day of election; the numbers for Wilkes being 1143, and for Luttrell only 296. Notwithstanding this, two days after the election, it was resolved in the house of commons, that Mr. Luttrell ought to have been returned a knight of the shire for the county of Middlesex; and the deputy-clerk of the crown was ordered to amend the return, by erasing the name of Mr. Wilkes, and inserting that of colonel Luttrell. The latter accordingly took his seat in parliament; but this was thought to gross a violation of the rights of the electors, that it excited a very general discontent.

Petitions, couched in very strong terms, were presented to the throne from different places, complaining of this and other national grievances. The county of Middlesex, as the most immediately affected, took the lead on this occasion, and presented a petition, in which they complained, "that their legal and free choice of a representative had been repeatedly rejected, and the right of election finally taken from them, by the unprecedented seating of a candidate who was never chosen by the county." They also said, that "instead of the ancient and legal civil police, the military were introduced at every opportunity, unnecessarily and unlawfully; that the civil magistracy was rendered contemptible, by the appointment of improper and incapable persons; and that the civil magistrates, being tampered with by administration, neglected and refused to discharge their duty." These petitioners likewise addressed his majesty in the following terms: "With great grief and sorrow we have long beheld the endeavours of certain evil-minded persons to infuse into your royal mind notions and opinions of the most pernicious tendency, and who promote and counsel such measures as cannot fail to destroy that harmony and confidence which should ever subsist between a just and virtuous prince, and a free and loyal people." Petitions of a similar nature were presented from the livery of London, the electors of Westminster, from several other cities and boroughs, and about seventeen counties. These petitions were said to be signed by upwards of 60,000 electors. Some of them were principally confined to the violated right of election, but others were more diffuse; and Yorkshire, Westminster, and some others, prayed, in express terms, for a dissolution of parliament, under the idea of its being venal and corrupt. Addresses were, however, procured from sundry other places, of a very different tendency, and breathing nothing but loyalty and attachment to the government; notwithstanding which, it was extremely manifest that a great spirit of discontent prevailed throughout the nation.

In the course of this year a very important act was passed for regulating the conduct of the house of commons in controverted elections. These used formerly to be determined by the house at large, and by a majority of votes, so that they were considered merely as party-matters; and the strongest party, which was always that

of the ministry, was sure to carry the point, without paying the least regard to the merits of the question on either side. But by the bill, which was now passed, commonly called the Grenville-act, as it was drawn up and brought in by Mr. Grenville, they were ordered for the future to be decided by a committee of thirteen members, chosen by lot, and under the sacred obligation of an oath; and since the enactment of this law, no well-grounded complaint has been made against their decisions.

After the term of Mr. Wilkes's imprisonment was expired, in the year 1771, he was chosen one of the sheriffs for London and Middlesex; and the same year a remarkable contest happened between the city of London and the house of commons. Several printers had been ordered to attend that house, being charged with having inserted in their news-papers, accounts of the speeches of members of parliament, contrary to a standing order of the house. One of these printers, who had refused to attend the summons of the house, was apprehended by a messenger of the house of commons in his own house; whereupon he immediately sent for a constable, and the messenger was carried before the lord-mayor at the mansion-house, where the aldermen Wilkes and Oliver also then were. The deputy serjeant at arms also attended, and demanded, in the name of the speaker, that both the messenger and the printer should be delivered up to him. This was refused by the lord-mayor, who asked, for what crime, and upon what authority, the messenger had arrested the printer? The messenger answered, he had done it by warrant from the speaker. It was then asked, if the warrant had been backed by a city magistrate? Which being answered in the negative, the warrant was demanded, and, after much altercation, produced; and its validity being argued by the printer's counsel, the three magistrates present discharged him from confinement. His complaint for an assault and false imprisonment being then heard, and the facts proved and admitted, the messenger was asked for bail, which the serjeant having refused to give, a warrant for his commitment to prison was made out, and signed by the lord-mayor and the two aldermen; but the serjeant then offered bail, which was accepted. The consequence of this transaction was, that a few days after, the lord-mayor Crosby, and alderman Oliver, members of the house of commons, were committed prisoners to the Tower for their share in this business, by the authority of the house; but they avoided, as much as possible, any new contest with Mr. Wilkes. That gentleman was chosen member for Middlesex in the subsequent parliament, and in the year 1783, after the change of lord North's administration, all the declarations, orders, and resolutions of the house of commons respecting his election for the county of Middlesex, were ordered to be expunged from the journals of that house, "as being subversive of the rights of the whole body of electors of this kingdom." And it should be remembered, that in consequence of his manly and spirited contests with the government, general warrants were declared to be illegal, and an end was put to such warrants, and to the unlawful seizure of an Englishman's papers by state messengers.

Elective kingdoms are subject to such violent shocks and convulsions upon every vacancy of the throne, that it has been thought proper in most of the modern states of Europe, to establish hereditary monarchies; and even in these last a disputed title is always attended with such civil wars and bloodshed, that it has been found expedient to keep the line of succession as clear and distinct as possible. This is the reason why so much attention is given in this kingdom to the marriages of the royal family. The king's two brothers, the dukes of Gloucester and Cumberland, having married privately, the former the countess dowager of Waldegrave, the latter a widow lady of the name of Horton, daughter to lord Iringham; a bill was now passed, in the year 1772, enacting, That all the descendants of his late majesty (other than the issue of princesses, who have married, or may hereafter marry into foreign

foreign families) shall be incapable of contracting marriage without the consent of the king, or his successors on the throne, signified under the great seal, and declared in council; that every such marriage, without such consent, shall be void; that, nevertheless, such descendants being above the age of twenty-five years, upon their giving the privy-council twelve months notice of their design, may, after the expiration of that term, enter into marriage without the royal consent, unless both houses of parliament shall within that time expressly declare their disapprobation of it.

After the repeal of the stamp-act, which was received with great joy in America, all things became quiet there: but unhappily new attempts were made to tax them in the British parliament, though, besides the experience of the ill success of the stamp-act, governor Pownall, a gentleman well acquainted with the disposition of the colonists, said in the house of commons in 1767, "It is a fact which this house ought to be apprised of in all its extent, that the people of America, universally, unitedly, and unalterably, are resolved not to submit to any internal tax imposed upon them by any legislature, in which they have not a share by representatives of their own election." He added, "this claim must not be understood, as though it were only the pretences of party leaders and demagogues; as though it were only the visions of speculative enthusiasts; as though it were the mere ebullition of a faction which must subside; as though it were only temporary, and partial—it is the cool, deliberate, principled maxim of every man of business in the country." The event verified the justice of these observations; yet the same year an act was passed, laying certain duties on paper, glass, tea, &c. imported into America, to be paid by the colonies for the purpose of raising a revenue to the government. About two years after, it was thought proper to repeal these duties, except that on tea; but as it was not the amount of the duties, but the right of the parliament of Great Britain to impose taxes in America, which was the subject of dispute, the repealing the other duties answered no purpose, while that on tea remained, which accordingly became a fresh subject of contest between the mother-country and the colonies.

In order to induce the East India company to become instrumental in enforcing the tea-duty in America, an act was passed, by which they were enabled to export their teas, duty-free, to all places whatsoever. Several ships were accordingly freighted with teas for the different colonies, by the company, who also appointed agents there for the disposal of that commodity. This was considered by the Americans as a scheme calculated to pave the way to an unlimited taxation. For it was easily comprehended, that if the tea was once landed, and in the custody of the consignees, no associations nor other measures would be sufficient to prevent its sale and consumption; and it was not to be supposed, that when taxation was established in one instance, it would be restrained in others. These ideas being generally prevalent in America, it was resolved by the colonists to prevent the landing of the tea-cargoes amongst them, at whatever hazard. Accordingly, three ships laden with tea having arrived in the port of Boston in December, 1773, a number of armed men, under the disguise of Mohawk Indians, boarded these ships, and in a few hours discharged their whole cargoes into the sea, without doing any other damage, or offering any injury to the captains or crews. Some smaller quantities of tea met afterwards with a similar fate at Boston, and a few other places; but in general, the commissioners for the sale of that commodity were obliged to relinquish their employments, and the masters of the tea-vessels, from an apprehension of danger, returned again to England with their cargoes. At New York, indeed, the tea was landed under the cannon of a man of war. But the persons in the service of government there, were obliged to consent to its being locked up from use. And in South Carolina some was thrown into the river, as at Boston, and the rest put into damp warehouses, where it perished.

These

These proceedings in America excited so much indignation in the English government, that on the 31st of March, 1774, an act was passed for removing the custom-house officers from the town of Boston, and shutting up the port. Another act was soon after passed "for better regulating the government in the province of Massachusetts' Bay." The design of this act was to alter the constitution of that province as it stood upon the charter of king William; to take the whole executive power out of the hands of the people, and to vest the nomination of the counsellors, judges, and magistrates of all kinds, including sheriffs, in the crown, and in some cases in the king's governor, and all to be removeable at the pleasure of the crown. Another act was also passed, empowering the governor of Massachusetts' Bay to send persons accused of crimes there, to be tried in England for such offences. Some time after an act was likewise passed "for making more effectual provision for the government of the province of Quebec," enabling the king to establish a legislative council for that province, in which his majesty's Canadian Roman catholic subjects were entitled to a place. The French laws, and a trial without jury, were also established in civil cases, and the English laws, with a trial by jury, in criminal; and the popish clergy were invested with a legal right to their tithes from all who were of their own religion. No assembly of the people, as in other British colonies, was appointed, it being said in the act, that it was then inexpedient; but the king was to erect such courts of criminal, civil, and ecclesiastical jurisdiction, as he should think proper. The boundaries of the province of Quebec were likewise extended by the act, thousands of miles at the back of the other colonies, whereby, it was said, a government little better than despotic was established throughout an extensive country. It was also thought extremely injurious to the British settlers in Canada, that they should be compelled to submit to French laws, and be deprived of those privileges which they would have enjoyed in other parts of his majesty's dominions.

The measures of government had so universally exasperated America, that agreements were entered into in the different colonies, whereby the subscribers bound themselves in the most solemn manner, and in the presence of God, to suspend all commercial intercourse with Great Britain, from the last day of the month of August, 1774, until the Boston-port bill, and the other late obnoxious laws, were repealed, and the colony of Massachusetts' Bay fully restored to its chartered rights. The flame continued to increase and extend in America, till at length twelve of the colonies, including that whole extent of country which reaches from Nova Scotia to Georgia, had appointed deputies to attend a General Congress, which was opened at Philadelphia, the 5th of September, 1774. They met accordingly, and the number of delegates amounted to fifty-one; who represented the several colonies of New Hampshire (2 delegates), Massachusetts' Bay (4), Rhode Island and Providence Plantations (2), Connecticut (3), New York (7), New Jersey (4), Pennsylvania (7), the lower counties on Delaware (3), Maryland (4), Virginia (7), North Carolina (3), and South Carolina (5); Georgia afterwards acceded to the confederacy, and sent deputies to the Congress. They entered into an association, in which they bound themselves and their constituents, not to import into British America, from Great Britain or Ireland, any goods, wares, or merchandise whatsoever, from the 1st day of December following; nor to import any East India tea from any part of the world; nor to export any merchandise or commodity whatsoever to Great Britain, Ireland, or the West Indies, from the 10th of September 1775, unless the act for stopping the port and blocking up the harbour of Boston, that for altering the charter and government of the province of Massachusetts' Bay, the Quebec act, the acts by which duties were imposed on any commodities imported into America, and some other acts, which they enumerated, were repealed. They avowed their allegiance to his majesty, and their affection

and regard for their fellow subjects in Great Britain, but asserted the necessity of their adopting such measures as were calculated to obtain a redress of those grievances which they laboured under; and which, they said, "threatened destruction to the lives, liberty, and property of the inhabitants of the colonies."

They also drew up a petition to the king, in which they enumerated their several grievances, and solicited his majesty to grant them peace, liberty, and safety. They likewise published an address to the people of Great Britain, another to the colonies in general, and another to the inhabitants of the province of Quebec. The congress broke up on the 26th of October, having resolved, that another congress should be held in the same place, on the 10th of May following, unless the grievances of which they complained should be redressed before that time: and they recommended to all the colonies to choose deputies, as soon as possible, for that purpose.

Shortly after these events, the earl of Chatham, who had been long in an infirm state of health, appeared in the house of lords, and expressed in the strongest terms his disapprobation of the whole system of American politics. He also made a motion for immediately recalling the troops from Boston. He represented this as a matter which should be instantly adopted; urging, that an hour then lost, in allaying the ferment in America, might produce years of calamity. He alleged, that this conciliatory measure would be well-timed; and as a mark of affection and good-will on our side, would remove all jealousy and apprehension on the other, and instantaneously produce the happiest effects to both. His lordship's motion was rejected by a large majority, 68 against 18; as was also a bill which he brought in soon after for settling the American troubles, by 61 to 32. The methods proposed in the house of commons for promoting an accommodation, met also with a similar fate. The number of his majesty's troops was ordered to be augmented; and an act was passed for restraining the commerce of the New England colonies, and to prohibit their fishery on the Banks of Newfoundland. A motion was, indeed, afterwards made in the house of commons, by lord North, first lord of the treasury, for suspending the exercise of the right of taxation in America, claimed by the British parliament, in such of the colonies as should, in their general assemblies, raise such contributions as were approved of by the king in parliament. This motion was carried, and afterwards communicated to some of the provincial assemblies; but it was rejected by them as delusive and unsatisfactory, and only calculated to disunite them. The petition from the congress to the king was ordered by his majesty to be laid before the parliament: whereupon Dr. Franklin, and two other American agents, solicited to be heard at the bar of the house of commons, on behalf of the colonies, in support of that petition: but their application was rejected; it being said, that the American congress was no legal assembly, and that therefore no petition could be received from it with propriety.

In the mean time, the inhabitants of the American colonies began to prepare for war; they trained and exercised their militia with great industry; and when advice was received of a proclamation which was issued in England, to prevent the exportation of arms and ammunition to America, measures were immediately adopted to remedy the defect. And to render themselves as independent as possible of foreigners, for the supply of those articles, mills were erected, and manufactories formed, both in Philadelphia and Virginia, for the making of gun-powder; and encouragement was given in all the colonies, for the fabrication of arms of every kind.

It was on the 19th of April, 1775, that the first blood was drawn in this unhappy civil war. The Americans having collected some military stores at the town of Concord in New-England, general Gage, governor of the colony, sent the grenadiers and light infantry of the army to destroy them. The detachment, consisting

of about 900 men, embarked in boats at Boston, and having landed at a place called Phipps's Farm, proceeded with expedition towards Concord. When they arrived at Lexington, they found a company of militia, of about 100 men, mustered near a meeting-house. It was just before sun-rise when the British troops came in sight of them; whereupon an officer in the van called out, "Disperse, you rebels! throw down your arms, and disperse!" the soldiers at the same time running up with loud huzzas. Some scattering shots were first fired, and immediately succeeded by a general discharge, by which eight of the American militia were killed, and several wounded. After this the detachment advanced to Concord, and proceeded to execute their commission, by rendering three pieces of cannon unserviceable, burning some new gun-carriages, a number of carriage wheels, and throwing into the river a considerable quantity of flour, gunpowder, musket-balls, and other articles. In the mean time a small body of the militia returned towards the bridge which they had lately passed; and upon this movement, the light infantry retired on the Concord side of the river, and began to destroy the bridge; but, upon the near approach of the militia, the soldiers immediately fired, and killed two men. The Americans returned the fire, and a skirmish ensued at the bridge, in which the English troops were forced to retreat, having several men killed and wounded, and a lieutenant and some others taken. About this time the country people began to rise more generally against the king's troops, and to attack them on all quarters; skirmish succeeded upon skirmish; and a continued, though irregular fire, was supported through the whole of a long and hot day. In the march back to Lexington, a distance of six miles, the troops were extremely annoyed, and it is probable that their whole body would have been cut off, had not general Gage sent lord Percy in the morning to support them with sixteen companies of foot, and a body of marines, with two pieces of cannon. This powerful reinforcement obliged the provincials for some time to keep their distance: but as soon as the king's troops resumed their march, the attacks, as the country people became more numerous, grew in proportion more violent, and the danger was continually augmenting, until they arrived, about sun-set, at Charles-Town, from whence they passed over directly to Boston, extremely harassed and fatigued. The loss of the king's troops amounted to 65 killed, 170 wounded, and about 20 prisoners. The Americans were computed not to have lost more than 60, including killed and wounded.

Soon after this action, numerous bodies of the American militia invested the town of Boston, in which general Gage and his troops were. In all the colonies they prepared for war with the utmost dispatch; and a stop was almost every where put to the exportation of provisions. The continental congress met at Philadelphia on the 10th of May, 1775, as proposed, and soon adopted such measures as confirmed the people in their resolutions to oppose the British government to the utmost. Among their first acts, were resolutions for the raising of an army, and the establishment of a large paper currency for its payment. They assumed the appellation of "The United Colonies of America," who were securities for realizing the nominal value of this currency. They also strictly prohibited the supplying of the British fisheries with any kind of provisions; and to render this order the more effectual, stopt all exportation to those colonies, islands, and places, which still retained their obedience.

In the mean time, a body of provincial adventurers, amounting to about 240 men, surprised the garrisons of Ticonderago and Crown Point. These fortresses were taken without the loss of a man on either side: and the provincials found in the forts a considerable number of pieces of cannon, besides mortars, and sundry kinds of military stores. However, the force of Great Britain in America was now augmented, by the arrival at Boston, from England, of the generals Howe, Burgoyne, and Clinton, with considerable reinforcements. But the continental con-

gress

gress were so little intimidated by this, that they voted, a few days after, that the compact between the crown and the people of Massachusetts' Bay was dissolved, by the violation of the charter of William and Mary; and therefore recommended to the people of that province, to proceed to the establishment of a new government, by electing a governor, assistants, and house of assembly, according to the powers contained in their original charter.

The town of Boston had now been for some time blocked up by the provincials: but the post of Charles-Town, which is separated from Boston only by a river, had hitherto been neglected by both parties. The Americans at last thought this post necessary for them, whether they should chuse to act on the offensive or defensive. They accordingly made preparations, and sent a body of men at night to throw up works upon Bunker's hill, a high ground that lies just within the isthmus, or neck of land that joins the peninsula to the continent. The party carried on their works with such order and silence, that though the peninsula was surrounded with ships of war, they were not heard during the night, and used such incredible dispatch in the execution, that they had a small but strong redoubt, considerable entrenchments, and a breast-work, which was in some parts cannon-proof, far advanced towards completion, by the break of day, June 17th, 1775. The sight of the works was the first notice that alarmed the Lively man of war early in the morning; and her guns called the town, camp, and fleet, to behold a sight which seemed little less than a prodigy. Upon this discovery, a heavy and continual fire of cannon, howitzers, and mortars, was carried on upon the works of the provincials, from the ships, from floating batteries, and from the top of Cop's Hill in Boston: but the Americans bore this severe fire with great firmness, and appeared to pursue their business as if no enemy had been near. About noon general Gage caused a considerable body of troops to be embarked under the command of major-general Howe, and brigadier-general Pigot, to drive the provincials from their works. This detachment, together with a reinforcement which it afterwards received, amounted in the whole to more than 2000 men. The attack was begun by a most severe fire of cannon and howitzers, under which the troops advanced very slowly towards the enemy, and halted several times, to afford an opportunity to the artillery to ruin the works, and to put the Americans into confusion. The Americans, on their part, sustained a severe and continual fire of small arms and artillery with remarkable firmness and resolution. They did not return a shot, until the king's forces had approached almost to the works, when a most dreadful fire took place, by which numbers of the British troops fell, and many of their officers. They were thereupon thrown into disorder; but being rallied, and again brought to the charge, they attacked the works of the Americans with fixed bayonets, and forced them in every quarter. Many of the provincials were destitute of bayonets, and their ammunition is said to have been expended; however, a number of them fought desperately within the works, from which they were not driven without great difficulty, and they at length retreated slowly over Charles Town Neck. Charles Town itself, during the action, was set on fire in several places, and burnt to the ground. This was the first settlement made in the colony, and was considered as the mother of Boston, that town owing its birth and nurture to emigrants from the former: it contained about 400 houses, and had a great trade. The loss of the king's troops in the action at Bunker's Hill amounted to 220 killed, and more than 800 wounded, including many officers.

After this action, the Americans immediately threw up works upon another hill, opposite to it, on their side of Charles Town Neck; so that the troops were as closely invested in that peninsula as they had been in Boston. About this time the congress appointed George Washington, esq. a gentleman of large fortune in Virginia, who had acquired considerable experience in the command of different bodies of provincials during the last war, to be general and commander in chief

of all the American forces. They also published a declaration, in which they styled themselves "the Representatives of the United Colonies of North America," and assigned their reasons for taking up arms. It was written in a very animated strain, and contained the following passage: "In our own native land, in defence of the freedom that is our birth-right, and which we ever enjoyed till the late violation of it; for the protection of our property, acquired solely by the honest industry of our forefathers and ourselves; against violence actually offered, we have taken up arms. We shall lay them down when hostilities shall cease on the part of the aggressors, and all danger of their being renewed shall be removed, and not before." A second petition to the king was also voted by the congress, in which they earnestly solicited his majesty to adopt some method of putting a stop to the unhappy contest between Great Britain and the colonies. This petition was presented by Mr. Penn, late governor, and one of the proprietors of Pennsylvania, through the hands of lord Dartmouth, secretary of state for the American department; but Mr. Penn was soon after informed, that no answer would be given to it. The refusal of the king to give an answer to this petition, from near three millions of people, contributed exceedingly towards farther exasperating the minds of the Americans. An Address was now published by the congress to the inhabitants of Great Britain, and to the people of Ireland.

But as no conciliatory measures were adopted, hostilities still continued; and an expedition was set on foot by the Americans against Canada, to which they were induced by an extraordinary commission given to general Carleton, the governor of Canada; by which he was empowered to embody and arm the Canadians, to march out of the country for the subjugation of the other colonies, and to proceed even to capital punishments against all those whom he should deem rebels and opposers of the laws. The American expedition against Canada was chiefly conducted by Richard Montgomery, an Irishman, on whom the congress conferred the rank of brigadier-general. He first made himself master of Chamblée, a small fort, in which he found 120 barrels of gunpowder, and other military stores. He afterwards took the fort of St. John's, in which was a garrison of about 500 regulars, together with some Canadian volunteers; and the town of Montreal also surrendered to him on the 13th of November, 1775. In the mean time colonel Benedict Arnold undertook to march with a body of Americans from Boston to Quebec, by a rout which had hitherto been considered as impracticable. After overcoming innumerable difficulties, in a march through thick woods, deep swamps, and steep mountains, they arrived in Canada, where Arnold published an address to the people of that province, signed by general Washington, in which they were invited to join with the other colonies in an indissoluble union, and to range themselves under the standard of general liberty. A similar publication had before been issued by Montgomery. Arnold appeared before Quebec on the 9th of November, and soon after joined Montgomery, on whom the chief command of the force devolved. General Carleton, the governor, employed every effort to repel the assailants. On the 31st of December, Montgomery attempted to gain possession of the place by storm, but was killed in the first fire from a battery, as advancing in the front of his men: Arnold was also dangerously wounded, about 60 of their men were likewise killed and wounded, and 300 taken prisoners. The besiegers immediately quitted their camp, and retired about three miles from the city, and the siege was for some months converted into a blockade. On general Carleton's receiving considerable reinforcements and supplies of provisions from England, May 1776, Arnold was obliged to make a precipitate retreat; Montreal, Chamblée, and St. John's were re-taken, and all Canada recovered by the king's troops.

During

During these transactions the royal army at Boston was distressed for want of provisions; the town was bombarded by the Americans, and general Howe, who now commanded the king's troops, which amounted to upwards of seven thousand men, was obliged to quit Boston, and embark for Halifax, leaving his artillery and stores behind. The town was evacuated on the 17th of March, 1776, and general Washington immediately took possession of it. On the 4th of July following, the congress declared the colonies, for reasons assigned in the act, absolved from all allegiance to the British crown, and that all political connection between them and the kingdom of Great Britain was totally dissolved; and also that, as free and independent states, they had full power to levy war, conclude peace, contract alliances, establish commerce, and do all other acts and things, which independent states may of right do. They likewise published articles of confederation and perpetual union among themselves, in which they assumed the title of "the United States of America." In the same month, an attempt was made by commodore sir Peter Parker, and lieutenant-general Clinton, upon Charles-town in South Carolina. But this place was so ably defended by the Americans under general Lee, that the British commodore and general were obliged to retire, the king's ships having sustained considerable loss, and a twenty-eight gun ship, which ran a-ground, was obliged to be burnt. However, a more successful attack against the Americans was soon after made under the command of general Howe, then joined with a large body of Hessians, and a considerable number of Highlanders. The fleet was commanded by his brother vice-admiral lord Howe; and both the general and admiral were invested with a power, under the title of "Commissioners for granting Peace to the Colonies," of granting pardons to those who would lay down their arms. But their offers of this kind were contemptuously rejected. An attack upon the town of New-York seems to have been expected by the provincials, and therefore they had fortified it in the best manner they were able. On Long Island, near New-York, the Americans had also a large body of troops encamped, and several works thrown up. General Howe first landed on Staten Island, where he met with no opposition; but early in the morning of the 22d of August, a descent was made by the British troops upon Long Island, and towards noon about fifteen thousand were landed. They had greatly the advantage of the Americans, by their superior skill and discipline, and being better provided with artillery, and every kind of military accommodation; and the American passes were far from being properly secured. Some skirmishes happened during several successive days; in which the British troops engaged their enemies with great ardour, and the Americans suffered exceedingly. Finding themselves so much overpowered, they at length resolved to quit the island, and general Washington came over from New-York to conduct their retreat, in which he displayed great ability. In the night of the 29th of July, the American troops were withdrawn from the camp and their different works, and with their baggage, stores, and part of their artillery, were conveyed to the water-side, embarked, and passed over a long ferry to New-York, with such extraordinary silence and order, that the British army did not perceive the least motion, and were surpris'd in the morning at finding the American lines abandoned, and seeing the last of their rear-guard in their boats, and out of danger. In the different actions previous to their retreat, the loss of the Americans had been very considerable. Upwards of a thousand of them were taken prisoners, including three generals, three colonels, and many inferior officers; their number of killed and wounded was computed to be still greater; they left also five field-pieces, and a quantity of ordnance was found in the different redoubts and forts on the island; whilst the whole loss of the British troops did not amount to more than three hundred killed and wounded.

But this success of the royal army was far from bringing the Americans to submission. When some overtures, tending towards a reconciliation, were, a few days after, made by lord Howe, he was answered by a committee from the congress, "that the colonies now considered themselves as independent states, and were settling, or had settled, their government accordingly; but that they were willing to enter into any treaty with Great Britain which might be beneficial to both countries." Soon after this, the Americans abandoned the city of New-York to the king's troops, who took possession of it with little opposition, and found therein a large quantity of ordnance and military stores. Some of the provincials afterwards found means to set fire to the city in several places, and a third part of it was burnt down.

After the surrender of New-York, the royal army obtained another important advantage at the White Plains, and took Fort-Washington, with a garrison of 2500 men, and Fort Lee, with a great quantity of stores, which losses obliged the American general to retreat through the Jerseys to the river Delaware, a distance of ninety miles. Also on the 8th of December, general Clinton and sir Peter Parker obtained possession of Rhode-Island; and the British troops covered the Jerseys. This was the crisis of American danger. Their forts were taken, the time of military service of the greatest part was expired, and the few that remained with their officers were ill prepared for defence. Had general Howe hastened at that time to Philadelphia, after Washington, it hath been maintained, there would have been an end of the contest. His delay gave time for volunteer reinforcements of gentlemen, merchants, farmers, tradesmen, and labourers, to join general Washington, who, in the night of the 25th of December, amidst snow, storms, and ice, with a small detachment, crossed the Delaware, and surprised a brigade of Hessian troops at Trenton. He took upwards of 900 of them prisoners, with whom he passed the river; having also taken three standards, six pieces of brass cannon, and near one thousand stand of arms. Immediately after this surprise of the Hessians, and depositing them in safety, Washington recrossed the river, and resumed his former post at Trenton. The British troops collected in force to attack him, and only waited for the morning. Washington ordered a line of fires in front of his camp, and then moving in the night, with his baggage and artillery, by a circuitous march of eighteen miles, reached Prince-town early in the morning, carried the British post at that place, and set off with near 300 prisoners on his return to the Delaware, just as the British troops at Trenton were under arms and proceeding to attack him, supposing him in his former position. By the skilful employment of a comparatively small force, Washington thus deranged all the measures of the British general; made him draw in his troops to a closer compass, to protect his magazines at Brunswick; and closed the campaign which had such an unpromising beginning, with signal glory to himself, and signal advantage to his country. The Americans had also fitted out a great number of privateers, which took many prizes; and, on the other hand, not a few of the American vessels fell into the hands of the English, but they were generally of little value.

In the month of September 1777, two actions of some importance happened between the armies of general Howe and general Washington, in both of which the former had the advantage; and soon after, the city of Philadelphia surrendered to the king's troops. But an expedition, that had for some time been concerted, of invading the northern colonies by the way of Canada, proved extremely unsuccessful. The command of this expedition had been given to lieutenant-general Burgoyne. He set out from Quebec with an army of near 10,000 men, and a fine train of artillery, and was joined by a considerable body of the Indians. For some time he drove the Americans before him, and made himself master of Ticonderago; but at length he encountered such difficulties, and was so vigorous-

ly opposed by the Americans under Gates and Arnold, that after two severe actions, in which great numbers fell, general Burgoyne and his army of 5,600 men were obliged to lay down their arms, October 17, 1777: they were, however, permitted to march out of their camp with all the honours of war, and were to be allowed to return to Europe, upon condition of their not serving again during the present contest. In one of the actions previous to this convention, brigadier-general Frazer, a very gallant officer, was killed; and at the time of their surrender, the British army was exceedingly reduced in numbers; and their stock of provisions was not more than sufficient for three days subsistence: whilst on the other hand, the American army had been joined by numerous bodies of the militia, who were exasperated at some late cruelties committed by the Indians in the service of Great Britain.

About the same time, sir Henry Clinton and general Vaughan made a successful expedition against the Americans up the North River; but the Americans complained that the British troops had wantonly set fire to houses and towns, particularly Esopus, and carried on the war in a manner not usual among civilized nations. General Howe soon after returned to England, and the command of the British army in America devolved upon general Clinton: but it was now found necessary to evacuate Philadelphia; and accordingly Clinton retreated with the army to New-York, in June 1778. The British troops were attacked on their march by the Americans, but the retreat was so ably conducted, or the American general Lee behaved so ill, that their loss did not amount to 300 killed and wounded.

This war with the colonies, the French court regarded as a favourable crisis for diminishing the British power. They supplied the Americans with arms and ammunition; some French officers also entered into the American service; and on the 6th of February, 1778, a treaty of alliance was concluded at Paris, between the king and the Thirteen United Colonies; and of this treaty, it was declared, that the essential and direct end was, "to maintain effectually the liberty, sovereignty, and independence, absolute and unlimited, of the United States of North America, as well in matters of government as of commerce."

In June, 1778, the earl of Carlisle, William Eden, and George Johnstone, esqrs. arrived at Philadelphia, as commissioners from his majesty, to settle the disputes between the mother-country and the colonies. They were invested with certain powers for this purpose by act of parliament. But it was now too late: the terms, which, at an earlier period of the contest, would have been accepted with gratitude, were now rejected with disdain. The congress refused to enter into any treaty with the British commissioners, unless the independency of the United States of America was previously acknowledged, or the British fleets and armies withdrawn from America. Neither of these requisitions being complied with, the war continued to be carried on with mutual animosity. At the close of the year, Georgia was invaded by the king's troops, the town of Savannah taken, and the whole province at length reduced.

The flagitious conduct of France towards Great Britain, in taking part with the revolted colonies, occasioned the commencement of hostilities between the two nations, though without any formal declaration of war on either side. On the 17th of June, 1778, the *Licorne* and *La Belle Poule*, two French frigates, were taken by admiral Keppel. Orders were immediately issued by the French court for making reprisals on the ships of Great Britain; and on the 27th of July a battle was fought off Brest between the English fleet, under the command of admiral Keppel, and the French fleet, under the command of the count d'Orvilliers. The English fleet consisted of 30 ships of the line, and the French of 32, besides frigates: they engaged for about three hours; but the action was not decisive, no ship being

taken.

taken on either side, and the French fleet at length retreated into the harbour of Brest. Of the English, 133 were killed in the action, and 373 wounded; and the loss of the French is supposed to have been very great. After the engagement, there was much murmuring throughout the English fleet, because a decisive victory had not been obtained over the French; at last the blame was thrown upon sir Hugh Palliser, vice-admiral of the blue, who was charged in a newspaper with misconduct and disobedience of orders. Though no regular accusation was brought against him, he required of admiral Keppel publicly to vindicate his conduct from the unfavourable reports that were propagated against him. This the admiral declined, which gave rise to some altercation between them; and sir Hugh Palliser afterwards thought proper to exhibit to the board of admiralty (of which he himself was a member) articles of accusation against admiral Keppel, though, for many months after the action, he had continued to act under him. A mode of conduct so extraordinary was very generally and severely censured; but the lords of the admiralty ordered a court-martial to be held for the trial of admiral Keppel. Soon after, a memorial was presented to the king by the duke of Bolton, signed by twelve admirals, among whom was lord Hawke, remonstrating against the injustice of holding a court-martial on admiral Keppel, upon the accusation of an inferior officer, "after forty years of meritorious service, and a variety of actions in which he had exerted eminent courage and conduct, by which the honour and power of this nation, and the glory of the British flag, had been maintained and increased in various parts of the world." When the court-martial was held, admiral Keppel was honourably acquitted; and sir Hugh Palliser's charge against him was declared by the court to be "malicious and ill-founded." Sir Hugh Palliser being afterwards tried by another court-martial, partly composed from some of the captains of his own division, he likewise was acquitted; and his disobedience to the admiral's orders was ascribed to the disabled state of his ship.

In the East Indies an engagement happened between some English ships of war under the command of sir Edward Vernon, and some French ships under the command of Mons. de Tronjolly, on the 10th of August, in which the former obliged the latter to retire; and on the 17th of October following, Pondicherry surrendered to the arms of Great Britain. In the course of the same year the island of St. Lucia, in the West Indies, was taken from the French; who in return made themselves masters of Dominica, and the following year they obtained possession of St. Vincent's and Grenada. In September, 1779, the count D'Estaing arrived at the mouth of the river Savannah, with a large fleet, and a considerable body of French troops, to the assistance of the Americans. An unprovoked attack was made upon the British troops at Savannah, under the command of general Prevost. But the latter defended themselves so well, that the French and Americans were driven off with great loss, and D'Estaing soon after totally abandoned the coast of America; and at the close of the year 1779, several French ships of war and merchant ships were taken in the West Indies, by a fleet under the command of sir Hyde Parker.

By the intrigues of the French court, Spain was at length brought to engage in the war against England, and to assemble forces to besiege Gibraltar, which was defended by the garrison with great vigour. The naval force of Spain was also added to that of France, now become extremely formidable, and their combined fleets seemed for a time to ride triumphant in the British Channel. So great were their armaments, that the nation was under no inconsiderable apprehensions of an invasion; but they did not venture to make an experiment of that kind, and after parading for some time in the Channel, thought proper to retire to their own ports. On the 8th of January, 1780, sir George Brydges Rodney, who had a large fleet under his command, captured seven Spanish ships and vessels of war belonging

to the royal company of Carraccas, with a number of trading vessels under their convoy; and in a few days after the same admiral engaged, near Cape St. Vincent, a Spanish fleet, consisting of eleven ships of the line and two frigates, under Don Juan de Langara. Four of the largest Spanish ships were taken, and carried into Gibraltar, and two others driven on shore, one of which was afterwards recovered by the English. A Spanish 70 gun ship, with 600 men, was also blown up in the action. In April and May three actions likewise happened in the West Indies, between the English fleet under admiral Rodney, who was now arrived in that part of the world, (having previously thrown supplies into Gibraltar), and the French fleet under the count de Guichen; but no ship was taken on either side. In July following admiral Geary took twelve valuable French merchant ships from Port au Prince; but on the 8th of August, the combined fleets of France and Spain took five English East Indiamen, and fifty English merchant ships, bound for the West Indies, which was a very severe stroke to the commerce of Great Britain.

On the 4th of May, 1780, sir Henry Clinton made himself master of Charlestown, South Carolina; and on the 16th of August, earl Cornwallis obtained a very signal victory over general Gates in that province, in which about a thousand American prisoners were taken, besides seven pieces of brass cannon, a number of colours, and their ammunition-waggons. But on the 10th of July, Mons. Ternay, with a fleet consisting of seven ships of the line, besides frigates, and a large body of French troops, commanded by the count de Rochambeau, arrived at Rhode Island, and landed 6000 men there. The American inhabitants congratulated the French general upon his arrival, and he assured them, that the king, his master, had sent him to the assistance of his good and faithful allies, the United States of America; and that the French troops were to act under the orders of general Washington, and would live with the Americans as their brethren.

Soon after, major-general Arnold deserted the service of the congress, made his escape to New York, and was appointed a brigadier-general in the royal service. His behaviour in the government of Philadelphia had incurred the displeasure of the Americans. He was reprimanded by a court-martial, but afterwards taken into service in the principal army, with considerable rank and trust. His affections however were totally estranged from the American cause. Accordingly, when the strong and important post of West Point, with its dependencies, and a wing or considerable division of the army were entrusted to him, a negotiation was discovered between him and general Clinton for the purpose of delivering up the post which he commanded. This would have enabled Clinton to surprize the other posts and batteries, and final ruin to the Americans must have been the result. Major André, adjutant-general of the British army, was employed in this clandestine negotiation. After an interview with Arnold, and staying in his tent a whole night and day, on his return to New York he was taken, disguised, within the American lines, and in his boot were found, in Arnold's hand-writing, exact returns of the state of the forces, ordnance, and distances at West Point and its dependencies, the artillery orders, critical remarks on the works, estimates of the number of men on duty to man them, and a copy of very interesting matters, which had been laid before a council of war by the commander in chief. These papers that were found upon him subjected him to instant execution, in the summary way usually practised with spies; but general Washington appointed a board of fourteen general officers to examine into his case, who reported, that he ought to be considered as a spy, and as such to suffer death, which was inflicted on him at Tappan, in the province of New York.

The great expences of the American war, and the burthens which were thereby laid upon the people, naturally occasioned much discontent, and seemed to convince persons of all ranks of the necessity of public economy. Meetings were  
therefore:

therefore held in various counties of the kingdom, at the close of the year 1779, and the beginning of the year 1780, at which great numbers of freeholders were present, who agreed to present petitions to the house of commons; in which they earnestly requested, "that before any new burthens were laid upon this country, " effectual measures might be taken by the house to inquire into and correct the " gross abuses in the expenditure of public money; to reduce all exorbitant emolument; to rescind and abolish all sinecure places and unmerited pensions; and " to appropriate the produce to the necessities of the state, in such manner as to " the wisdom of parliament should seem meet." The first petition of this kind was agreed to in the county of York; and the example was followed by the counties of Cheshire, Hertford, Suffex, Surry, Essex, Somerset, Wilts, Gloucester, Huntingdon, Dorset, Cumberland, Norfolk, Devon, Berks, Nottingham, Bucks, Cambridge, Bedford, Suffolk, Northumberland, Hereford, and Denbigh. The cities of London and Westminster, and several other towns and corporations, concurred in similar petitions. Some trivial attempts were made to remedy the grievances stated, but nothing important was effected; the ministry soon found means to regain their influence; a diversity of sentiment occasioned dissension among the popular leaders; and various causes conspired to bring the greatest part of the nation to a passive acquiescence in the measures of administration.

The middle of the year 1780 was distinguished by one of the most disgraceful exhibitions of religious bigotry that had ever appeared in this country; especially if it be considered as happening in an age, in which the principles of toleration were well understood, and very prevalent. An act of parliament had been lately passed " for relieving his majesty's subjects professing the Romish religion, from certain penalties and disabilities imposed upon them in the 11th and 12th years of " the reign of king William III." This act was generally approved by men of sense, and of liberal sentiments, by whom the laws against papists were justly deemed too severe. The act at first seemed to give little offence to persons of any class in England, but in Scotland it excited much indignation, though it did not extend to that kingdom. Resolutions were formed to oppose any law for granting indulgences to Papists in Scotland; and a Romish chapel was burned, and the houses of several Papists demolished, in the city of Edinburgh. The contagion of bigotry at length reached England; a number of persons assembled themselves together, with a view of promoting a petition to parliament, for a repeal of the late act in favour of the Papists, and they assumed the title of the Protestant Association. They were chiefly Methodists, and bigoted Calvinists, in the lower ranks of life; many of them well-intentioned persons, and having a just dislike to popery; but not sufficiently enlightened to consider, that a spirit of persecution was one of the worst characteristics of that system of superstition. They continued to hold frequent meetings; lord George Gordon, a young man, discontented at not being promoted from a lieutenant to a captain in the navy, became their president, and they increased in numbers. At a time when the nation was surrounded with real dangers, the heads of these weak men were filled with nothing but the fear of popery; and they even seemed to fancy that they were contending for religious liberty, when they were labouring to excite the legislature to prevent some of their fellow-subjects from worshipping God according to the dictates of their consciences. The Protestant Association at length agreed to a petition, which was said to have been subscribed by more than one hundred thousand persons. It was then resolved, in order to give the more weight to their petition, that it should be attended by great numbers of the petitioners in person; and a public advertisement was issued for that purpose, signed by lord George Gordon. Fifty thousand persons are supposed to have assembled with this view, on Friday the 2d of June, in St. George's Fields; from whence they proceeded, with blue cockades in their hats, to the house of commons,

commons, where their petition was presented by their president. In the course of the day several members of both houses of parliament were grossly insulted and ill-treated by the populace; and a mob assembled the same evening, by which the Sardinian chapel in Lincoln's-inn Fields, and another Romish chapel in Warwick-street, Golden-square, were entirely demolished. A party of the guards was then sent for, to put a stop to the farther progress of these violences, and thirteen of the rioters were taken, five of whom were afterwards committed to Newgate, escorted by the military. On the Sunday following another mob assembled, and destroyed a Popish chapel in Ropemaker's-Alley, Moorfields. On Monday they demolished a school-house, and three dwelling-houses, in the same place, belonging to the Romish priests, with a valuable library of books, and a mass-house in Virginia-street. They also destroyed all the household furniture of sir George Savile, because he had brought in the bill in favour of the Papists. On Tuesday great numbers again assembled about the parliament-house, and behaved so tumultuously, that both houses thought proper to adjourn. In the evening, a most daring and violent attempt was made to force open the gates of Newgate, in order to release the rioters who were confined there: and the keeper having refused to deliver them, his house was set on fire, the prison was soon in flames, and great part of it consumed, though a new stone edifice of uncommon strength; and more than three hundred prisoners made their escape, many of whom joined the mob. The Protestant Association, as they thought proper to style themselves, had been chiefly actuated by ignorance and bigotry; and their new confederates were animated by the love of mischief, and the hope of plunder. Two other prisons, the houses of lord Mansfield, and sir John Fielding, and several other private houses, were destroyed the same evening. The following day, the King's Bench prison, the New Bridewell, in St. George's Fields, some Popish chapels, several private houses of Papists, and other buildings, were destroyed by the rioters; some were pulled down, and others set on fire; and every part of the metropolis exhibited violence and disorder, tumults and conflagrations.

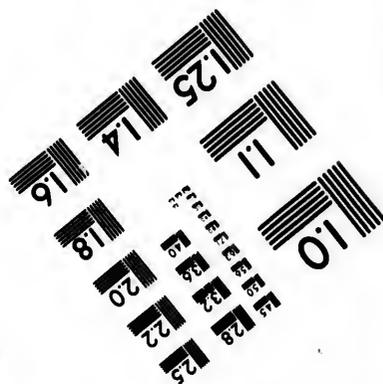

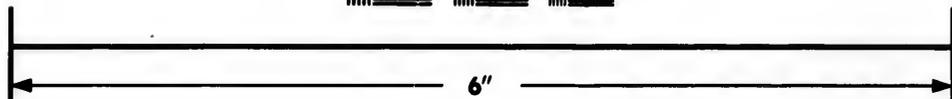

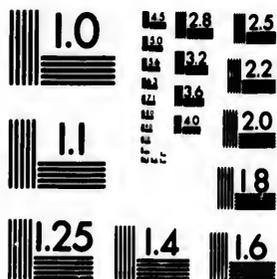

During these extraordinary scenes, there was a shameful inactivity in the lord-mayor of London, and in most of the other magistrates of the metropolis, and its neighbourhood; and even the ministry appeared to be panic-struck, and to be only attentive to the preservation of their own houses, and of the royal palace. The magistrates, at the beginning of the riots, declined giving orders to the military to fire; but at length, as all property began to be insecure, there was an evident necessity for making vigorous opposition to the rioters; large bodies of troops were brought to the metropolis from many miles round it; and an order was issued, by the authority of the king in council, "for the military to act without waiting for directions from the civil magistrates, and to use force for dispersing the illegal and tumultuous assemblies of the people." The troops exerted themselves with diligence in the suppression of these alarming tumults, great numbers of the rioters were killed, many were apprehended, who were afterwards tried and executed for felony\*, and the metropolis was at length restored to order and tranquillity. It is pretended, that no member of the Protestant association was executed, or tried, for any share in these riots. But however this may be, it was manifestly the bigotry of a few leaders of this pretended Protestant Association, to which these riots owed their origin. The manner in which these tumults were suppressed by the operations of the military, without any authority from the civil magistrate, however necessary from the peculiar circumstances of the case, was thought to be a very dangerous precedent; and that an act of indemnity ought

\* Lord George Gordon was himself committed to the Tower, and tried for high-treason, but acquitted.

to have been passed, not only with regard to inferior persons who had acted in the suppression of these riots, but also with respect to the ministry themselves, for the part they had taken in this transaction.

While the internal peace of the kingdom was disturbed by these commotions, there appeared reason to apprehend an increase of its foreign enemies. The American war had occasioned various disputes between Great Britain and Holland. Complaints were made by the Dutch, that their ships were seized by the English cruizers, without just cause. On the other hand, loud remonstrances were made by the British minister to the States-general, complaining that an unlawful commerce was carried on between their subjects and the Americans; that this was particularly the case at St. Eustatia, which was nothing better than one great magazine of military and naval stores. These disputes continued to increase; and on the first of January, 1780, commodore Fielding brought to Spithead several ships laden with naval stores, which were under the convoy of a Dutch admiral. The States-general alleged, that the naval stores which had been seized were not contraband goods, according to the express tenor of the treaties between Great Britain and Holland, and that the conduct of the English commodore, which was approved by his sovereign, was a direct insult upon the Dutch flag, and a violation of the treaties subsisting between the two nations. Previous to this transaction, the British minister had demanded of the States-general the succours which were stipulated in the treaty of 1678, and others; and which were now claimed particularly on account of the invasion with which Great Britain was menaced by her enemies. Repeated applications were made to the States-general on this subject, but they delayed giving any answer. On the 17th of April, a declaration was published by his Britannic majesty, by which it was announced, that repeated memorials having been presented by his majesty's ambassador to the States-general, demanding the succours stipulated by treaty; to which requisitions they had given no answer, and thereby deserted the alliance that had so long subsisted between Great Britain and the republic, and placed themselves in the condition of a neutral power; his majesty would consider them henceforth as standing only in that distant relation. He therefore declared, that the subjects of the United Provinces were henceforward to be considered upon the same footing with other neutral states, not privileged by treaty; and he suspended provisionally, and till further orders, all the particular stipulations respecting the subjects of the States-general, contained in the several treaties subsisting between Great Britain and the republic.

An incident happened, which shewed how necessary this declaration was. On the third of September, the Mercury, a congress packet, was taken by the Vestal, captain Keppel, near Newfoundland. On board this packet was Mr. Laurens, late president of the congress, who was bound on an embassy to Holland. Among his papers was found the sketch of a treaty of amity and commerce between the republic of Holland and the United States of America. Indeed it did not appear that the States-general were at all consulted upon the transaction, so that it was more properly a provisional treaty with the states of Amsterdam, or of the province of Holland, than with the United Provinces at large. This treaty appeared to be approved by Mr. Van Berkel, counsellor and pensionary of the city of Amsterdam. In consequence of this discovery, his Britannic majesty demanded a formal disavowal of the whole transaction, and the exemplary punishment of the pensionary Van Berkel, and his accomplices. The States-general not giving an immediate answer to this requisition, fresh applications were made on this subject by the British minister; who received for answer, that his memorial had been taken *ad referendum* by the deputies of the respective provinces, according to their received custom and constitution of government; and that they would endeavour to frame an answer to his memorial, as soon as the constitution of their government would permit.

permit. This gave so little satisfaction to the British court, that their ambassador was ordered to withdraw from the Hague; and a declaration of hostilities against Holland was published on the 20th of December, 1780. This measure seemed, at first, to be generally applauded by the British nation; but there were many who thought it a very rash and impolitic step, and that a war with Holland ought not to have been so much precipitated, at a time when Great Britain was already involved in hostilities with so many enemies.

The war with Holland commenced with great vigour; and that republic soon suffered a very severe stroke in the loss of the island of St. Eustatia, which was taken by the English on the 3d of February, 1781. When admiral Rodney, and general Vaughan, who arrived there with a large fleet, and a considerable body of troops, summoned the place to surrender, the inhabitants were seized with such consternation, that no resistance was made. Not only the military and naval stores, but the private property, goods, merchandize, and specie of the inhabitants, were considered as lawful plunder. The capture of shipping was also very great; upwards of 200 vessels being taken, besides a 60 gun ship, and a frigate of 38 guns. The islands of St. Martin and Saba likewise surrendered, but the seizure of the private property, at St. Eustatia, was thought a very rigorous measure. The inhabitants of the island of St. Christopher remonstrated against it as a dangerous precedent; and the British West India planters petitioned the king on the occasion, representing to him, they had always conceived it to be a maxim among nations, established in humanity and sound policy, that war should be carried on with the least possible injury to private property.

On the 5th of August, the same year, a very bloody engagement was fought between an English squadron of ships of war, under the command of admiral Hyde Parker, and a Dutch squadron, under the command of admiral Zoutman, off the Dogger Bank. According to the English accounts, the Dutch squadron consisted of eight ships of the line, and the English only of seven; but the Dutch represent their force to be inferior to that of the English. On both sides great gallantry was displayed. All the ships were much shattered, and a Dutch 74 gun ship sunk after the action. The English had 104 men killed, and 339 wounded; and the loss of the Dutch is supposed to have been much greater.

The war continued to be prosecuted with various success; the French made themselves masters of the island of Tobago; and the Spaniards of Pensacola, and the whole province of West Florida. Earl Cornwallis obtained a victory over the Americans commanded by general Green, at Guilford, in North Carolina, March 15, 1781, but it was a hard-fought battle, and the loss on both sides considerable. Indeed the victory was productive of all the consequences of a defeat; for three days after, lord Cornwallis was obliged to leave part of his sick and wounded behind him, and to make a circuitous retreat of 200 miles to Wilmington in North Carolina. The generals Philips and Arnold committed some ravages in Virginia, destroyed much shipping, and about 8000 hogheads of tobacco; but these events only contributed to draw the attention of the Americans and the French to Rhode Island to Virginia, where the next year the decisive blow was struck, which firmly established American independence. Lord Cornwallis's situation at Wilmington was very disagreeable, and his force reduced so low that he could not think of marching to Charles-Town by land; he turned his thoughts then to a co-operation in Virginia with Philips and Arnold, and began his march, April 25; 1781: In this central province, all the scattered operations of the war began at length to converge into a point. By different reinforcements, lord Cornwallis's force amounted to above 7000 excellent troops. Sir Henry Clinton, the commander in chief, amused by some intercepted letters of general Washington's, was prevented from sending those succours to Lord Cornwallis which he otherwise

would have done, by his fears for New York, against which he apprehend Washington meditated a formidable attack.

But that general, having kept New York and its dependencies in a continued state of alarm for about six weeks, suddenly marched across the Jerseys and through Pennsylvania to the head of Elk, at the bottom of the Chesapeake, from which the light troops were conveyed by shipping down the bay, and the bulk of the army, after reaching Maryland by forced marches, were also there embarked, and soon joined the other body under the marquis de la Fayette. Sir Henry Clinton receiving information that the count de Grasse was expected every moment in the Chesapeake, with a large French fleet to co-operate with Washington, now seriously attempted to reinforce lord Cornwallis, but without success, for on the 5th of September, after a partial action of a few hours between the British fleet under the admiral Graves, and that of the French under De Grasse, Graves returned to New York to refit, and left the French masters of the navigation of the Chesapeake. Presently the most effectual measures were adopted by general Washington for surrounding lord Cornwallis's army, and on the last of September it was closely invested in York-town, and at Gloucester on the opposite side of the river, with a considerable body of troops on one side, and a large naval force on the other. The trenches were opened in the night between the 6th and 7th of October, with a considerable train of artillery. The works which had been raised by the British, sunk under the weight of the enemies' batteries; the troops were much diminished by the sword and sickness, and worn down by constant watching and fatigue, and all hope of relief failing, the 19th of October lord Cornwallis surrendered himself and his whole army by capitulation\*, to general Washington, as prisoners of war. Fifteen hundred seamen underwent the fate of the garrison, but these, with the Guadalupe frigate of 24 guns, and a number of transports, were assigned to M. de Grasse, in return for the French naval assistance.

The surrender of this second British army may be considered as the closing scene of the war in America; for the expence incurred by a war so remote from the seat of preparation; the debt accumulated, the blood shed, the diminution of trade, and the vast increase of taxes—these were evils of such a magnitude, as could no longer be dissembled. Accordingly on the 1st of March, 1782, after repeated struggles in the house of commons, the house addressed the king, requesting him to put a stop to any farther prosecution of the war with America. This event rendered a change of councils absolutely necessary. Those country gentlemen who had generally voted with the ministry, feeling the pressure of the public burdens, at length deserted the standard of administration; a complete revolution in the cabinet was effected, March 27, 1782; and the marquis of Rockingham was appointed first lord of the treasury.

Peace was the first object of attention with the new ministry. Mr. Grenville was invested with full powers to treat at Paris with all the parties at war, and was also directed to propose the independency of the Thirteen United Provinces of America in the first instance, instead of making it a condition of a general treaty. The commanders in chief in America were also directed to acquaint the Congress with the pacific views of the British court, and with the offer to acknowledge the independency of the United States.

The new ministers also applied themselves to make some retrenchment in the public expences, and to reform some abuses, against which they had often inveighed. A bill was carried for excluding custom-house and excise officers from voting at the elections for members of the house of commons.—Another for excluding all contractors from being members; and by another bill, which also received the

\* The American return made the number of prisoners 7,247, land and marine.

royal assent, the board of trade, the board of works, the great wardrobe, and the different offices of third secretary of state, treasurer of the chamber, cofferer of the household, the lords of the police in Scotland, the pay-master of the pensions, master of the harriers, master of the stag-hounds, and clerks to the board of green-cloth, were abolished, which, with other savings specified in the bill, were computed to amount to 72,368*l.* per annum.

A series of losses had agitated the minds of the people. January 14th, 1782, the French took Nevis. On the 5th of February, the island of Minorca surrendered to the Spaniards; and on the 13th of the same month, the island of St. Christopher's was given up to the French. The valuable island of Jamaica would probably have soon shared the same fate, had not the British fleet under admiral Rodney fallen in with that of the French under the Count de Grasse in their way to join the Spanish fleet at St. Domingo. The van of the French was too far advanced to support the centre, and a signal victory was obtained over them. The French admiral, in the *Ville de Paris* of 110 guns (a present from the city of Paris to the French king) was taken, with two seventy-fours, and one of 64 guns; a 74 gun ship blew up by accident soon after she was in our possession, and another 74 sunk during the engagement. A few days after, two more of the same fleet, of 64 guns each, were captured. By this victory of the 12th of April, the design against Jamaica was frustrated. The new ministry had superseded Admiral Rodney, and intended to have prosecuted the inquiry into his transaction at Eustatia; but this victory silenced all, and procured him the dignity of an English peer.

May 8th, the Bahama islands surrendered to the Spaniards, while the credit of the British arms was gloriously sustained at Gibraltar, under general Elliot. The formidable attack on the 13th September with floating batteries of 212 brass cannon, &c. in ships from 1400 to 600 tons burden, ended in disappointment, and the destruction of all the ships and most of the assailants. The garrison was at length relieved by lord Howe in the month of October, who offered battle to the combined force of France and Spain, though 12 sail of the line inferior. The military operations, after this, were few and of little consequence. Negapatnam, a settlement in the East Indies, and Trincomale on the island of Ceylon, were taken from the Dutch by the British forces; but the French soon receiving considerable succours from Cuddalore, retook Trincomale, forced the British fleet in several actions, but none decisive, and enabled Hyder Ally to resist the efforts of sir Eyre Coote and his troops.

The death of the marquis of Rockingham, on the 1st of July, occasioned much commotion in the cabinet, and lessened the hopes which had been formed of important national benefits from the new administration. Lord Shelburne succeeded the marquis as first lord of the treasury, and it is said, without the knowledge of his colleagues. This gave great offence to some, particularly to Mr. Fox, and lord John Cavendish; who, with others, resigned their places, and commenced a fierce opposition in the house of commons. Mr. Fox declared, "that the principles on which the ministry first came in, were abandoned by lord Shelburne and his adherents; that the *old system* was to be revived, most probably, with the *old men*, or indeed with any men that could be found. They were persons whom neither promises could bind, nor principles of honour secure: they would abandon fifty principles for the sake of power, and they would now strive to strengthen themselves by any means which corruption could procure; and he expected to see, in a very short time, they would be joined by those very men whom that house had precipitated from their seats." The duke of Richmond, general Conway, and others, maintained, that there was no deviation in the present cabinet from the principles on which they had entered into office, and continued to act with lord Shelburne, till under his auspices, the preliminaries for a general peace were settled. Then,

then

royal

the public beheld Mr. Fox, and even lord John Cavendish, coalescing with the old ministers, lord North particularly; embracing the very men whom they had driven from their seats, and threatened with impeachments; and continuing to join with them in reprobating the peace as making too great concessions to the enemy, that they might storm the cabinet, drive lord Shelburne and his friends from it, and seat themselves and the men they had despised, in their places.

By the treaty of peace between Great Britain and France\*, Great Britain restored to France the island of Tobago, in the West Indies, and the river Senegal in Africa, with its dependencies and the forts on the river; and gave up a few districts in the East Indies, as dependencies on Pondicherry; it restored also the islands of St. Lucia, St. Pierre, and Miquelon, and the island of Goree, with Pondicherry, Karical, Mahe, Chandernagore, and the factory of Surat. To prevent disputes about boundaries in the Newfoundland fishery, it was agreed, that the French line for fishing should begin from Cape St. John on the eastern side, and going round by the North, should have for its boundary Cape Ray on the western side; and Great Britain renounced every claim respecting the demolition of Dunkirk. France on the other hand was to restore to Great Britain the islands of Grenada, and the Grenadines, St. Christopher's, St. Vincent, Dominica, Nevis, and Montserrat; and guaranteed Fort James in the river Gambia, agreeing that the gum trade should remain in the same condition as before the war, 1755. The allies of each state in the East Indies were to be invited to accede to the pacification, but if they were averse to peace, no assistance on either side was to be given to them.

By the treaty with Spain, Great Britain gave up to that power East Florida, and ceded West Florida and Minorca, which Spain had taken during the war. To prevent all causes of complaint and misunderstanding in future, it was agreed that British subjects should have the right of cutting and carrying away logwood in the district lying between the rivers Wallis or Bellize, and Rio Hondo, taking the course of the said rivers for unalterable boundaries. Spain agreed to restore the islands of Providence, and the Bahamas, to Great Britain, but they had been retaken before the peace was signed.

In the treaty with the United States of America, the king of Great Britain acknowledges New Hampshire, Massachusetts' Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia, to be *free, sovereign, and independent states*; and for himself, his heirs and successors, relinquishes all claims to the government, propriety, and territorial rights of the same, and every part thereof. To prevent disputes in future on the subject of boundaries between these states and the British provinces, lines were very minutely drawn, which will be noticed in the proper place, as well as delineated on the map of the United States of America: and some favourable clauses were obtained for the loyalists. The navigation of the Mississippi to remain open to both parties, as also the Newfoundland fisheries.

In the treaty with the Dutch, great difficulties arose, but at length it was stipulated, that Great Britain should restore Trincomale in the island of Ceylon, but the French had already taken it, and that the Dutch should yield to us the town of Negapatnam, with its dependencies, in the East Indies.

Thus a period was put to a most calamitous war, in which Great Britain lost the best part of her American colonies, and many thousands of valuable lives, and expended or squandered nearly 150 millions of money. The terms of the peace were,

\* Preliminary articles settled January 20, 1783.

to many, a subject of great regret; but had the war continued, it would have been necessary to borrow annually 17 millions and a half, by which a million *per annum* would have been added to the taxes, and 25 millions at least to the capital of the public debt, according to the usual modes of funding. The address of thanks for the peace was carried in the house of lords by a majority of 72 to 59, but lost in the house of commons by a majority of 224 to 208.

The majority of the commons, thus enlisted under the banner of the *famous coalition leaders*, Mr. Fox and lord North, plainly indicated a ministerial revolution, unless the cabinet should call a new parliament. As they did not, the peace-makers were obliged to withdraw from power. The two gentlemen just mentioned were made secretaries of state, and the duke of Portland, first lord of the Treasury, on April 2, 1783. All plans of reformation in public offices, and for preserving the nation, which lord Shelburne proposed, seemed now to be laid aside. Mr. Pitt's motion for correcting the defects in the representation of parliament, was lost by a majority of 293 to 149; and Mr. Sawbridge's motion, that leave be given to bring in a bill for shortening the duration of parliaments, was rejected by 123 to 56. Mr. Pitt also proposed a bill for reforming the boards of the Treasury, Admiralty, Ordnance, Excise, Stamps, and other offices, which was opposed by Mr. Burke and other members of administration, who had most strenuously contended for that measure before they themselves had attained lucrative places. This bill was suffered to pass the commons to amuse the public, but was rejected by the lords, 40 to 24. Every thing went on just as the coalition administration pleased, till Mr. Fox brought into parliament his famous bill for new regulating the government of the East India company, and their commercial affairs and territories; a plan of which bill, its progress and fate, are already given in our account of that trading company. This bill being rejected in the house of lords, on December 17, by a majority of 19, occasioned a great ferment in the cabinet and in both houses of parliament. A royal message was sent between 12 and 1 of the morning of the 19th of December, to desire the two secretaries to resign the seals of their office; and Mr. Pitt succeeded the duke of Portland as first lord of the Treasury, bringing with him his friends into the respective departments, which formed the tenth administration since his majesty's accession.

Some independent gentlemen (as they styled themselves) interposed to unite the contending parties, which had filled parliament and the country with distractions; but their endeavours to form what they called a firm, efficient, extended, and united administration, proved unsuccessful.

Persons of the most distinguished and independent character in the house of commons, and in the kingdom, now wished that a dissolution had taken place weeks before, even at the first forming of the coalition.

At last, after strong and repeated contests between the two parties, on the 25th of March 1784, a proclamation was issued for dissolving the parliament and calling a new one, agreeably to the desires and addresses of a great part of the kingdom. At that juncture, the great seal was stolen from the house of the lord chancellor, which occasioned many suspicions as if done by more than ordinary felons; but nothing farther appeared, and a new seal was presently made. On the 18th of May the new parliament assembled, and the commons chose Mr. Cornwall, the speaker of the late house, for their present speaker. The next day, his majesty addressed them from the throne. A very feeble opposition was made to the address of thanks in the house of lords, and it soon appeared that the appeal to the people had turned out greatly in Mr. Pitt's favour, for on May 24th, on a division of the house for an address to the king's speech, the numbers for it, without any alteration or amendment, were 282 against 114.

Mr.

Mr. Pitt brought in his East India bill the 5th of July, the leading particulars of which we have given in our account of that company \*.

On the 25th of January 1785, the parliament assembled. Amongst a variety of matter which pressed on their attention, none seemed of more consequence than the state of parliamentary representation, the system of fortifications proposed by the duke of Richmond, the affairs of India, and the propositions for a trading intercourse with Ireland. The business of parliamentary reform having been taken up by Mr. Pitt, he accordingly introduced a specific plan for that purpose on the 18th of April, which he prefaced by a history of parliamentary representation from a very remote period. The plan was to give one hundred members to the popular interest of the kingdom, and to extend the right of election to above one hundred thousand persons, who, by the existing provisions of law, were excluded from it. This accession to the popular interest was to be principally obtained by the suppression of decayed boroughs, and the transfer of their representatives to the counties; so that the number of the house of commons would remain the same. After a debate of considerable length, it was rejected by a majority of 74; the noes being 248, and the ayes 174.

From the apprehensions of the nation, during the late war, for the safety of the dock-yards, whilst the combined fleets were in the channel, and no adequate naval force to oppose them, the duke of Richmond conceived the idea of fortifying them, as the best protection from future insult or danger. Considerable sums had been annually granted for this purpose, but the greatness of the expence at length attracted the attention of a respectable part of the house of commons, and after a full discussion of the utility of the plan, it was determined (usually in the following session) to discontinue the works as useless; and, in some respects, as dangerous.

The Irish propositions were another subject which engaged the attention of parliament. This new system of intercourse between Great Britain and Ireland was first introduced into the parliament of the latter kingdom by Mr. Orde on the 7th of February, in the form of ten propositions; these, by a small alteration, and the distribution of the subject of one of them into two heads, were increased to eleven. They received the assent of both houses in that kingdom, and on the 22d of the same month, were communicated to the parliament of Great Britain by Mr. Pitt, chancellor of the exchequer. The leading principle in this plan was the equalizing the duties on the produce and manufactures of both countries; and for the benefits communicated thereby to the sister kingdom, she was in return to give a certain portion of her hereditary revenue towards the maintenance of the navy of the empire.—The subject had received but little discussion, when the fears and prejudices of the manufacturers were roused in every part of the kingdom; innumerable petitions were presented, and evidences heard; committees were formed from assemblies of these manufacturers, who were directed to oppose the passing the propositions into a law. These circumstances, together with the strength of opposition in the house of commons, produced such an alteration in the propositions that they were extended to twenty. After having passed through both houses, when they arrived in Ireland thus multiplied and thus altered, they met with the most violent opposition, and though there appeared in their favour, in the Irish house of commons, 127 against 108, yet the majority being so small, administration thought it prudent to avoid the risk of a defeat in the progress of the bill, and therefore withdrew it in two days after.

In consequence of severe prohibitions having been laid on the importation of British manufactures into the Austrian dominions, and several restrictions on their introduction into France, the minister opened a negotiation with the latter King-

dom, for a more liberal commercial intercourse between the two countries, and appointed Mr. Eden envoy extraordinary and minister plenipotentiary for that purpose. A treaty was accordingly concluded and ratified by both houses of parliament. This was a measure of great political consequence, as it tended to break asunder the national prejudices, which had existed for many ages between the two countries.

Parliament assembled on the 24th of January 1786, and amongst the various measures agitated, the plan for establishing a sinking fund, and employing a million annually for reducing the national debt, engaged their most immediate attention. This million is produced by the yearly income of the state exceeding the permanent level of its expenditure by a sum of 900,000l. which may be increased to a million by means in nowise burthensome to the people. This measure, which had the concurrence of every man who desired the emancipation of the kingdom from the accumulated load of debt and taxes, was enacted into a law, which created commissioners for carrying the purposes of this valuable act into execution.

We come now to a very extraordinary transaction of the present times, the impeachment of Mr. Warren Hastings, late governor-general of Bengal: a transaction which derives splendour from the dignity of the party accused, a man of an indefatigable and ardent mind, of boundless spirit and enterprise, and who, in the opinion of his employers at home, and of those who witnessed his administration abroad, governed our Indian empire for upwards of a dozen years, with incomparable ability; and that in the peculiarly trying times, when England stood alone against the world in arms. On the 17th of February, Mr. Burke, who took the lead in this tedious and expensive business, explained the mode of proceeding he was desirous to adopt; and, in the course of the session, moved for a multitude of papers to ground and substantiate his charges upon. These were produced, and Mr. Hastings heard at the bar of the house of commons in his defence. The debates which arose on the subject terminated in resolutions, That certain of the charges contained matter of impeachment against the late governor general of Bengal. Mr. Hastings was therefore impeached by the commons at the bar of the house of peers. His trial has occupied a considerable portion of the seven sessions of parliament, which have since elapsed; and it is but recently that the lords have heard all the speeches and evidences deemed requisite to their passing sentence; which they will do next session.

The feeble attempt of an obscure and contemptible maniac, of the name of Margaret Nicholson, against the life of the sovereign, in the face of day, and in the sight of a multitude of spectators, on the 2d of August, was productive of no other effect than to shew how much our sovereign was beloved by his subjects. The general exultation which prevailed after that event, reflected honour on the people as well as the king.

The consolidation of the customs and excise was the most important circumstance deserving of attention in the year 1787. This was a measure of incredible labour and detail, as well as of infinite advantage to commerce, by facilitating and simplifying the intricacies attendant on mercantile transactions, and the payment of duties; a regulation which was duly and permanently effected.

The trade carried on by this country, and other European nations, upon the coast of Africa, for the purpose of purchasing negro-slaves, to be employed in the cultivation of the West-India islands, and certain parts of the continent of America, does not appear till of late years to have been considered with that general attention which such a practice might have been expected to excite; a practice so abhorrent in its nature to the mild principles of modern policy and manners. The first public attempt, we believe, that was made to put a stop to this traffic, was by the Quakers of the southern provinces of America, who, soon after the establishment

ment of their independence, not only presented for this purpose a strong and pathetic address to their several legislative assemblies, but actually proceeded, as is said, in many instances to emancipate the slaves that were in their possession. The measures taken by the American legislatures, in consequence of this application, are before the public. In Great Britain the same society appears also to have taken the lead, and, after the example of their American brethren, presented a similar petition to the parliament of this kingdom. The cause soon after became extremely popular. Many pamphlets were published upon the subject; several eminent divines recommended it from the pulpit and in printed discourses; and petitions were presented to the legislature from the two universities, and from several of the most considerable towns and corporations in the kingdom.

His majesty's ministers thought fit to institute an inquiry, before a committee of the privy council, into the facts and allegations contained in the representations of both parties upon the subject. The first public notice that was taken of this business was in an information communicated by Mr. Wilberforce, soon after the meeting of parliament, of his intention to bring forward a measure respecting the slave-trade. That gentleman being much indisposed, Mr. Pitt came forward on the 9th of May, 1783, in the name of his friend, and moved the following resolution, "That this house will early in the next session of parliament proceed to take into consideration the circumstances of the slave-trade complained of in the petitions presented to the house, and what may be fit to be done thereupon;" which was unanimously carried. After this, on the 21st of May, sir William Dolben moved the house for leave to bring in a bill to regulate the transportation of the natives of Africa to the British colonies in the West Indies\*. By the bill now proposed, the number of slaves to be transported in any ship was to be regulated according to its bulk or tonnage, allowing nearly one ton to each man. This was only intended as a temporary relief till some more permanent expedient could be devised by the legislature. Having passed through the commons, it was carried up to the lords, where it also passed, after having received several amendments; some of which being thought to interfere with the privileges of the lower-house, a new bill was brought in, which passed both houses, and received the royal assent.

The year 1788, being the hundredth anniversary of the glorious Revolution in 1688, the 4th of November being the birth-day of King William, the instrument under Providence, who completed that event, and the fifth of this month being the anniversary of his landing, were observed by many societies in London, and other parts of the kingdom, not only with festivity, but with devotion and thanksgiving. At Dublin this auspicious anniversary was observed at the castle with more than ordinary solemnity. The appearance of nobility and gentry at the levee was such as evinced their attachment to the Revolution in favour of that illustrious monarch, and its happy consequences in the establishment of the present royal family on the throne of these realms. After the levee, his excellency, attended by

\* That there was a necessity for adopting this proposition will most clearly appear from the facts which were proved in the course of the debate. It appeared that five feet six inches in length, and sixteen inches in breadth was the space allowed on an average to each slave. The lower deck of the vessels was entirely covered with bodies, and the space between the floor of that deck and the roof above, which seldom amounted to five feet eight inches, was divided by a platform also covered with bodies. Five persons in every hundred perished at the lowest computation, in a voyage of six weeks continuance, which, according to the most accurate esti-

mates of human life, was seventeen times the usual rate of mortality. It was, indeed, much more, because, in the estimate of mortality, persons of every age were included, while in an African voyage the aged were entirely excluded, and few infants were admitted. Such was the ruinous nature of the trade in the most favourable circumstances; but, in the voyage from the more distant parts of Africa, the mortality was stated to be twice as great; and consequently, thirty four persons perished, at the lowest estimation, for one that would have died in the course of nature.

a numerous train of the first personages in the kingdom, and escorted by the guard usual on such occasions, went from the castle to College-Green, and after saluting the equestrian statue of King William, proceeded from thence round Stephen's Green. The appearance on this occasion was splendid, and the number of equipages greater than had been known for many years.—At Edinburgh this day was observed as a day of solemn thanksgiving, as directed by an act of the general assembly of the church of Scotland passed on the 30th of May in this year; and by this act all the ministers of that national church were enjoined to observe the same. By the publication of this act nearly six months before the annual return of the day, that assembly had the honour to take the lead, in their resolution to celebrate this glorious event: and it ought to be mentioned, to the honour of that high-spirited and noble-minded people, that the principles of the Revolution are well understood and warmly embraced by them.—At Whittington, between Sheffield and Chesterfield, adjoining to a decent modern building, is an old thatched cottage, the upper story of which, lighted by a very small window, is shewn as the apartment called by the antirevolutionists, "the plotting parlour," in which the glorious business was planned. To this place the illustrious leaders, the earls of Devonshire and Danby, lord Delamere, and Mr. John Darcy, came disguised, and concerted the measures which happily produced so much good to this country; and, in an oak chest, still preserved in a corner of the room, the minutes of the meeting were deposited; here is also to be seen the old armed chair in which the earl of Devonshire is said to have sat. The descendants of the illustrious houses of Cavendish, Osborne, Booth, and Darcy (for the venerable duke of Leeds, whose age would not allow him to attend, had sent his two grandsons, in whom the blood of Osborne and Darcy is united); a numerous and powerful gentry; a wealthy and respectable yeomanry; a hardy, yet decent and attentive peasantry; whose intelligent countenances shewed that they understood, and would be firm to preserve that blessing, for which they were assembled to return thanks to Almighty God, presented a truly solemn spectacle, and to the eye of a philosopher, the most interesting that can be imagined. It was not the least pleasing circumstance attending this solemnity, that all party distinctions were forgotten. Persons of all ranks and denominations wore orange and blue, in memory of our glorious deliverer. And the most respectable Roman-catholic families, satisfied with the mild toleration of government in the exercise of their religion, vied in their endeavours to shew how just a sense they had of the value of civil liberty.

In the space of only four years which had elapsed since the complete triumph of the sovereign and the nation over the "Coalition," Great Britain, under the conduct of a minister, who had not yet attained his thirtieth year, had risen from a state of unexampled depression to her ancient superiority among the European kingdoms. In this state of public felicity, the nation was suddenly alarmed by the reports of his majesty being attacked with an unexpected and dangerous illness. The precise nature of it was for several days unexplained and unascertained, even by those whose residence near the court should have enabled them to obtain early and authentic information. Meanwhile fame augmented the evil, and the death of the sovereign was believed to have either already taken place, or to be imminent and inevitable.

Time, however, gradually divulged the truth, and changed the apprehensions of the nation for the situation of the king. His disorder was understood to have fallen upon the brain, and to have produced, as might be expected, a temporary privation of reason. A species of interregnum, in fact, took place; though unaccompanied by any of those circumstances which usually characterize and accompany that unfortunate state. The kingdom, anxious, and with eyes directed towards their sovereign, betrayed no symptoms of confusion, anarchy, or civil commotion.

The first minister continued to exercise, by a general submission and consent, the powers delegated to him before the king's indisposition; and the political machine, well constructed and properly organized, sustained no derangement or injury whatsoever from this shock, except those inseparably connected with delay in the transactions or negotiations pending with foreign courts.

The two houses of parliament, in consequence of the preceding prorogation, met in a few days subsequent to these extraordinary events. The general agitation and curiosity, even if they had not been aided by other emotions of hope and fear, of ambition, and of public duty, would alone have produced a numerous attendance. Mr. Pitt opened the subject of their meeting in a very concise and pathetic manner; lamented the occasion, expressed his hope that the cause would speedily be removed, and, in pursuance of that idea, advised an immediate adjournment of a fortnight. The proposition was received in deep silence by the opposite side of the house, and assented to in mute acquiescence. As soon as the adjournment was at an end, Mr. Fox laid claim to the vacant sceptre, in the name and on the behalf of the heir apparent, as belonging and devolving to him of right.

Mr. Pitt demanded the discussion and decision of so great and leading a principle, which led to conclusions unlimited and undefined, as well as subversive of the tenure on which a king of England had originally received his crown; and parliament, roused to a sense of the necessity of declaring itself solely competent to fill the vacant throne, proceeded to that great act without circumlocution or delay; and having pronounced upon this important preliminary, then decided that the prince of Wales should be invited and requested to accept the regency, under certain limitations.

The month of December elapsed in these contests, and the year 1789 commenced under the most gloomy presages. Mutual asperity and reproach embittered every debate. No appearances of convalescence or recovery, so ardently anticipated by the nation, had yet manifested themselves in the malady of the king. A second examination of the physicians who had attended his majesty during the course of his disorder, which took place before a committee of the house of commons, and which was certainly not conducted, on the part of opposition, with either delicacy or judgment, tended to throw very little light on the great object of public inquiry, the probable duration and period of this afflicting malady. Mr. Pitt constantly and warmly maintained the probability of its happy termination; and, regarding this as neither distant nor hopeless, made the resumption of the royal power by the sovereign with facility and celerity, as soon as he should be enabled to wield the sceptre, the first and leading principle of all his measures and propositions. The adherents of the prince of Wales saw the prospect of his father's recovery through a very different medium, and conceived of it not only as improbable, but as hourly augmenting in that improbability. They were sustained in this opinion by Warren, as the minister was confirmed in his opposite sentiment by Willis; the former an eminent London practitioner, the latter brought from a distant province to attend the sovereign under his severe disorder, and who being peculiarly conversant in that species of disease, boldly and early asserted, that he entertained scarcely any doubts of the king's perfect re-establishment at no remote period. The event fully justified his prediction.

A very short period, probably not exceeding three days, must have completed the bill, which was to declare the incapacity of the sovereign to conduct the national affairs, and to transfer the sceptre, though with diminished influence, to his son. The members of administration were on the point of resigning their charges, and the new ministry, already settled, prepared to enter on office; while the English people, fondly attached by every sense of loyalty and affection to their monarch, as well as from gratitude and esteem to the first minister, in dejection and silence

looked on, and saw the government transferred to others, who, whatever abilities they might collectively possess, certainly neither merited nor enjoyed the general approbation and confidence.

But the term of interregnum and misfortune was now arrived; and the impending calamity which had menaced England with all the evils of a regency, far more to be deprecated and dreaded than those from which the country had escaped in 1784, was suddenly and unexpectedly dissipated. The disorder, under which the king had suffered during three months, and whose violence had hitherto appeared to baffle all medical skill and exertion, gradually, but rapidly, subsided. Sanity of mind and reason resumed their seat, and left no trace of their temporary subversion. Time confirmed the cure, and restored to his subjects a prince, rendered supremely and peculiarly dear to them by the recent prospect and apprehension of his loss. The vision of a regency faded and disappeared, as the sovereign came forward to public view, and was totally extinguished by his resumption of all the regal functions. The demonstrations of national joy far exceeded any recorded in the English annals, and were probably more real and unfeigned than ever were offered on similar occasions. It was not only that a king, beloved and respected, was recovered from the most afflictive of all situations incident to humanity, and enabled to re-ascend the throne. Sentiments of disapprobation and of general condemnation, affixed to the measures and language of the party in opposition, heightened the emotions of pleasure, by a comparison with that state from which the kingdom had been so fortunately delivered. No efforts of despotism, or mandates of arbitrary power could have produced the illuminations which not only the capital but almost every town and village throughout the kingdom, exhibited in testimony of its loyalty; and these proofs of attachment were renewed, and even augmented, on the occasion of his majesty's first appearance in public, and his solemn procession to St. Paul's (on the 23d of April 1789), to return thanks to Heaven for his recovery.

Whilst the ancient government of France was entirely overthrown, and a revolution the most extraordinary was effected there; it is difficult to imagine a picture of more complete serenity than England presented. At peace with all the world, in the bosom of repose, she saw her commerce and manufactures extend, her credit augment, and her name excite respect among the most distant nations; while many of the great surrounding European kingdoms were either involved in foreign war, or desolated by domestic troubles. In this happy situation, a storm unexpectedly and suddenly arose from a quarter, where, it would seem, that no foresight or precautions could have anticipated the danger. Among the new and unexplored paths of commerce, which the spirit of a discerning and adventurous people had attempted to open since the peace of 1783, were particularly two, which appeared to promise the most beneficial returns. The first was a whale-fishery, similar to that which had been carried on for ages near the coasts of Greenland; but transferred to the southern hemisphere, near the extremity of Patagonia, and in the stormy seas which surround Cape Horn; as well as in the Pacific Ocean. In the course of a few years, this branch of trade had augmented rapidly, and was found on trial to afford very important advantages; nor had it received any impediments from the vague pretensions of the Spanish crown to the sovereignty of the shores washed by that ocean, which was the scene of their exertions.

The second of these enterprises, original in its own nature, able in its conception, bold in its execution, and having no precedent for its guidance, was directed to countries and to objects almost as much unknown to geographical, as to commercial knowledge or experience. The north-west coast of America, the part of the earth to which this embarkation was destined, extending northward from California and New Albion to the Frozen Sea, had been partly explored and faintly traced:

traced by capt. Cook; but much remained for future enterprize and industry to accomplish, before this discovery could be converted to any purpose of public utility. He had, however, ascertained the existence of the continent; and he had received from the barbarous natives, with whom he established a species of barter, some valuable specimens of furs, in exchange for European commodities of a far inferior nature.

The hope of procuring a considerable quantity of these rare and costly skins, for the sale of which a very advantageous market presented itself at Canton in China, was the leading inducement to the adventurers, who engaged in the expedition. Animated by these views, and having received the most affirmative marks of the protection of government previous to their departure, five ships were fitted out from London in 1785, and the two succeeding years. Four of these vessels, after doubling Cape Horn, arrived safely on the north-west coast of America. The sanguine expectations which had been entertained, of effecting a lucrative exchange of commodities with the natives, were fully and speedily realized. Cargoes of the finest furs were procured, and sold to the Chinese, even under great commercial discouragements, and pecuniary impositions, at so high a price, as amply to reimburse, and enrich the adventurers. Other attempts of a similar nature were made from Bengal; and two vessels were successively dispatched from the Gaages to the same coast in the year 1786. A factory was established at Nootka Sound, a port situated in the fiftieth degree of northern latitude, on the shore of America. Possession of it was solemnly taken in the name of the sovereign and crown of England; amicable treaties were concluded with the chiefs of the neighbouring districts; and a tract of land was purchased from one of them, on which the new proprietors proceeded to form a settlement, and to construct storehouses. Every thing bore the appearance of a rising colony, and each year opened new sources of commerce and advantage.

Although individuals, occupied in exertions of this private nature, could not be expected to extend their views or efforts to objects of public utility, yet some further information was collaterally and incidentally acquired respecting the continent of America, in the course of their voyages. It is even pretended that a sloop named the "Washington," navigated for some hundred miles along a vast number of islands, scattered in a sea, which intersects that continent in a north-east direction; and though the accounts hitherto received or transmitted, of this extraordinary and interesting fact, are not either so minute, or so accurate, as by any means to entitle them to be implicitly received, yet they appear to be not totally destitute of foundation or probability.

That, upon every principle of the law of nations, upon the established usage in all similar cases, and as being *the first settlers*, the British adventurers had an undoubted title to the place in question, is beyond dispute. Notwithstanding this, in the month of May 1789, a Spanish ship of war from St. Blas, called the *Princesa*, commanded by M. Martinez, and mounting 20 guns, anchored there. The various avocations of trade having led the greater part of the persons employed at this settlement to different parts of the coast, the only English trading ship remaining in the bays was the *Iphigenia*. The *Princesa* was soon joined by a Spanish sloop of 16 guns; and, for some time mutual civilities passed between the Spaniards and English. These, however, were at length interrupted, by an order being sent to capt. Douglas (the commander of the *Iphigenia*) to come on board of the *Princesa*; when he was informed by M. Martinez, that he had the king of Spain's orders to seize all vessels which he might find upon that coast, and that he (capt. Douglas) was his prisoner. In consequence of this, M. Martinez took possession of the *Iphigenia* in the name of his catholic majesty, and conveyed the crew prisoners on board the Spanish ships, where they were ironed. M. Martinez also took

took possession of the settlement, hoisted the Spanish flag, and proceeded to erect various buildings, on which he employed, together with his own men, some of the crew of the *Iphigenia*. He afterwards permitted captain Douglas to resume the command of his ship; and on his representing, that he had been stript of his merchandize, and other stores, M. Martinez gave him a small supply of stores and provisions (for which he took bills on the owners), by means of which, about a fortnight after he was at first detained, he was enabled to proceed to China.

Shortly afterwards, the English vessels, the *North-west America*, the *Argonaut*, and the *Princess Royal*, arriving separately at Nootka, from their trading voyages, were captured by M. Martinez, their crews were made prisoners, and their cargo seized. After some detention the crew of the *North-west America* were sent to China, the two other vessels with their crews were sent to St. Blas in Mexico, and some Chinese, who had been brought to the settlement by our people, were detained and employed as labourers.

Of the *North-west America*, sent to China, no authentic account has been received; but on the arrival of the two vessels at St. Blas, a representation of their case having been made to the Spanish governor, the ships were restored (on the officers giving security to indemnify the governor, should it be proved they were lawful prizes) and the crews were furnished with provisions, stores and money, to enable them to resume their voyage.

Of these transactions only a partial, vague, and uncircumstantial account was known by his majesty's ministers till the 30th of April 1790, when captain Meares presented his memorial to the secretary of state. This paper indeed conveyed an intelligence of a very different nature from that which had been previously received. Within one week after the affair was communicated, the most active and formidable preparations were made, a positive demand of preliminary satisfaction and restitution was sent to Madrid, and the people of England were called upon to avenge the public wrongs. The first publication of this business was by his majesty's message to parliament on the 5th of May.

An attention to the honour of their country made it necessary for our ministers, to call upon the court of Spain itself to give direct satisfaction for an injury committed by an officer acting under its immediate commission, and grounded on its pretension of an exclusive right to the whole continent of America. To do this, it was necessary for his catholic majesty to acknowledge that *such an injury* had been committed, and this was most expressly declared and signed by count de Florida Blanca, in the name and by the order of his Catholic majesty, at Madrid the 24th of July, 1790. The acknowledgment of the injury was an expression which implied a concession that the court of Spain had no right to use force in preventing British subjects from visiting the coasts in question for the purposes of trade and settlement.

The nation were waiting with painful anxiety for the determination of the objects of the depending negotiation; deprecating indeed the dreadful alternative of appealing to the sword for the vindication of our rights; yet satisfied of the justice of our cause, and confidently looking forward to an honourable and happy termination of a contest, originating in the violent proceedings, and unfounded claims of the court of Spain, when the agreeable news arrived that a convention was agreed upon between his Britannic majesty and the king of Spain, the 28th of October, 1790; which was finally ratified by both parties, on the 22d of November.

To defray the expence attending the naval and military armaments, Mr. Pitt proposed to raise, not merely the interest of the debt recently incurred; but to extinguish the principal itself, in the space of four years; though amounting to above three millions sterling. The effect of so judicious and provident a measure, which

must evince the resources of the country which adopted it, will be felt through every kingdom of Europe.

But though Great Britain was thus happily rescued from war in this quarter of the globe, accident or ambition involved our Indian possessions in contest and in blood. At so remote a distance, it is difficult to judge accurately of causes and effects; but as nearly as a diligent inquiry has enabled us to collect the truth, we shall give it in our historical narrative of that country, under which it will more naturally fall.

The cause of toleration received, in the year 1791, an accession which must be peculiarly grateful to the friends of freedom. It is remarkable, that, notwithstanding the radical freedom of our constitution, no nation in Europe has been more jealous of their religious establishment, and scarcely have the Roman Catholic states themselves loaded with a more oppressive weight of civil penalties, those who dissented in religious opinion. It has, for almost half a century, been the task of the legislature, to root out gradually and cautiously, from the code of our laws, those disgraceful statutes. They are not yet entirely removed, but in proportion as the peaceful influence of philosophy shall extend over the minds of men, we have little doubt but all parties will see the absurdity of sacrificing the cardinal virtue charity, at the shrine of vain speculation; and as the fears and jealousies of mankind shall subside, in the course of a few years, every trace of persecution will fade away. As the Romish church was the grand object of terror in the first ages of reformation, it was scarcely matter of surprise that our statute-book should be loaded with the most rigorous and sanguinary edicts, directed against the professors of that obnoxious faith; and though in the year 1780, some of these were removed, yet in 1791, in a well-known book, *Burn's Ecclesiastical Law*, not less than seventy pages were to be found, entirely occupied with the bare enumeration of the penal statutes, in force against the Roman Catholics. Among these were some of the most sanguinary nature. It was high treason and death to make a convert to the Roman Catholic faith. Severe penalties were enacted on Papists for hearing mass, by some statutes; and by others they were compelled to attend the established worship, however contrary to their consciences. That such laws should have been framed in times of difficulty and danger, in times when the church of Rome flourished in all the vigour of temporal power, and urged her authority by all the rigours of persecution, and all the artifices of bigotry, is not surprising; it is only surprising that they should have been suffered to remain in force for centuries of peace and tranquillity, when the power of the pope is annihilated even in countries professing his religion, and when all the obnoxious principles of that religion are disavowed by its professors. A reform in the penal statutes became the more necessary, since, in the course of the year 1790, a large body of Catholic dissenters had formally protested against the temporal power of the pope, against his assumed authority of releasing men from their civil obligations, or dispensing with the sacredness of oaths.

It was upon these principles, and supported by these arguments, that Mr. Mitford moved, on the 21st of February 1791, for a committee of the whole house to enable him to bring in a bill "to relieve, upon conditions and under restrictions, persons called protesting catholic dissenters, from certain penalties and disabilities, to which papists, or persons professing the popish religion, are by law subject." This bill, Mr. Mitford added, would be similar to that which had passed in Ireland some years since; and as no ill consequences had resulted in a country where the Roman Catholics were so much more numerous than in this, he should hope the house would see no impropriety in the proposition. The house entered upon the subject with a liberality which does them infinite honour, and the bill proceeded through its several stages without opposition.

The

The rights of juries had long been in an indefinite and indeterminate state, particularly in the case of libels; and disputes disgraceful in themselves, and injurious to the administration of justice, had frequently arisen between the court and the jury, between the judges and the counsel; even among the professors of the law, a difference of opinion had long existed. While the herd of mere technical practitioners earnestly supported the indefeasible authority of the bench, that oracle of constitutional jurisprudence, lord Camden, Mr. Erskine, and many others of the greatest eminence, held the rights of an English jury in too sacred a light to suffer the great constitutional principle, on which that institution was founded, to be undermined by the fallacious doctrine of precedents.

On the 25th of May in this year Mr. Fox presented his bill for removing doubts with respect to the rights of juries in criminal cases. The bill sets forth that juries in cases of libels should have a power of judging of the whole matter, and of finding a general verdict of guilty or not guilty. With a slight opposition from the legal profession, it completed its progress through the house of commons. In the house of lords, where the influence of the law is more predominant, it experienced a very different reception, and was strongly opposed. However, in the following year, this great constitutional point was at last decided by the lords and commons, that **JURIES ARE JUDGES OF BOTH THE LAW AND THE FACT.**

Early in the sessions of 1791, Mr. Wilberforce made a motion, in a committee of the house of commons, appointed for receiving and examining evidence on the slave-trade, "that the chairman be instructed to move for leave to bring in a bill to prevent the further importation of African negroes into the British colonies." Although this question was supported with great ability and eloquence by Mr. Francis, Mr. W. Smith, the chancellor of the exchequer, and Mr. Fox, yet it was negatived by a majority of 75. One immediate consequence of this was the establishment of a company for the express purpose of cultivating West India and other tropical productions at Sierra Leone, on the coast of Africa, the bill for chartering whom was introduced on the 28th of March by Mr. Thornton.

In pursuance of a message from his majesty, a bill was brought into parliament for settling the constitution of Canada, a matter of great importance, and long in agitation. By this bill the province was divided into two governments, called Upper and Lower Canada; and it is hoped that this division will put an end to the debates between the old French inhabitants, and the British settlers, as each will have a majority in their own department. A council and a house of assembly are intended for each government; the members of the council to be such for life, and power reserved to the British sovereign of annexing to certain honours an hereditary right of sitting in the council. The taxes to be levied and disposed of by the legislature of each division; and the present laws and ordinances to remain, till altered by the new legislature.

On the 28th of March 1791, a message was delivered from his majesty, importing that the endeavours which he had used in conjunction with his allies, to effect a pacification between Russia and the Porte, not having proved successful, his majesty judged it requisite, in order to add weight to his representations, to make some further augmentation of his naval force. In consequence of a majority in support of this measure, a very large naval armament was prepared. Our fleet, collected to support the cause of the Turks against Russia, amounted in April to thirty-three ships of the line; and after maintaining this large equipment for four months, at an enormous expence, it was at last dismissed. The proposed Russian war was certainly most unpopular, and the reception which the proposition of it met with in the house of commons, ought perhaps to have induced the immediate dereliction of a measure, which, however meritorious its intentions might be, was not crowned by the public favour.

Soon after the rising of the parliament, the nation was disgraced by a series of outrages and violences, which, for the space of four days, spread terror and alarm through the large, opulent town of Birmingham, and the adjacent country.

Concerning the French revolution, much difference of sentiment prevailed in this country, and much heat and ill temper the discussion of that subject appeared unnecessarily to provoke. A considerable body of the whig party in Great Britain rejoiced in the emancipation of a neighbouring nation, and flattered themselves that they saw, in the establishment of the *first* French constitution, not only the annihilation of despotism in that country, but the commencement of a new system of politics in Europe, the basis of which was peace, happiness, and mutual concord.

In most of the larger towns in Great Britain, associations were formed for the celebration of that event, by anniversary dinners on the 14th of July; but the opposite party were not indifferent spectators of these proceedings. The populace were inflamed by injurious insinuations conveyed in newspapers and pamphlets: the friends of the French revolution were (certainly falsely as to the majority) stigmatized as determined republicans; and the act of joining in a convivial meeting, on the odious 14th of July, was represented as an attempt to overturn the British constitution in church and state. The meeting in London, however, consisted of not less than 1500 persons, many of them of respectable characters and abilities, who, as the populace appeared to collect in a tumultuous manner, round the Crown and Anchor tavern, where the meeting was held, dispersed at an early hour.

At Birmingham the causes of discord were more numerous than in London. A violent animosity had subsisted for years between the high church party and the dissenters of that place, and the religious controversies, which subsisted between Dr. Priestley and some of the clergy of Birmingham, greatly contributed to increase this animosity.

In such circumstances, it is not surprising that the ignorant part of the inhabitants should confound the cause of the French revolution, with that of the dissenters, especially since the majority of that persuasion have, since the revolution in 1688, been firmly attached to the whig system, and since Dr. Priestley, whom the populace considered as at the head of the dissenters there, had distinguished himself by opposing the then fashionable pamphlet of Mr. Burke.

A festive meeting, in commemoration of the French revolution, was projected at Birmingham, on Thursday the 14th of July; and on the preceding Monday six copies of a most inflammatory and seditious hand-bill, proposing the French revolution as a model to the English, and exciting them to rebellion, were left by some person unknown, in a public-house. As the contents of this hand-bill were pretty generally circulated, they caused some ferment in the town: the magistrates thought it proper to offer a reward of 100 guineas, for discovering the author, printer, or publisher of the obnoxious paper; and the friends of the meeting, intended for the 14th, thought it necessary at the same time to publish an advertisement, explicitly denying the sentiments and doctrines of the seditious hand-bill, and disavowing all connexion with its author or publishers.

The views and intentions of the meeting having, however, been much misrepresented, the majority of the gentlemen who projected it, thought it advisable to relinquish the scheme; accordingly, notice was given to that effect; but the intention was revived, and the company met at the appointed time, to the amount of between eighty and ninety. The ingenious Mr. Keir, well known for his great attainments in chemistry, and other branches of philosophy, and a member of the established church, was placed in the chair.

The gentlemen had scarcely met, before the house was surrounded by a tumultuous crowd, who testified their disapprobation by hisses and groans, and by the

shout of "Church and King," which became the watch-word on this occasion. At five o'clock the company dispersed; and soon afterwards the windows in the front of the hotel were demolished, notwithstanding the appearance and interference of the magistrates.

Dr. Priestley did not attend the festival, but dined at home at Fairhill with a friend from London. In the evening they were alarmed with the intelligence that the mob were assembled at the new dissenting meeting-house (Dr. Priestley's), and were threatening both the doctor and his house. The rioters soon set the meeting-house on fire, and nothing remained that could be consumed. The old meeting-house shared almost a similar fate. After this they proceeded to Dr. Priestley's house, the doctor and his family having just had time to escape to a small distance, where they could distinctly hear every shout of the mob, and the blows of the instruments which were used to break down the doors. The whole of the doctor's library, his valuable philosophical apparatus, his manuscripts, and papers, were destroyed by the mob. The next day this infuriated multitude demolished the elegant mansion of Mr. Ryland, where, finding a profusion of liquor, a dreadful scene of intoxication ensued; and several of the wretched rioters perished in the cellars by suffocation, or by the falling in of the roof. The country residence of Mr. Taylor, the houses of Mr. Hutton (the ingenious historian of Birmingham), of Mr. Humphrey, of Mr. Russell, and several others, were destroyed by the resistless fury of the mob; who continued their depredations until Sunday night, when three troops of the 15th of light dragoons arrived. The town was then illuminated, and all was acclamation and joy. Of the unfortunate and infuriated wretches who were taken in the act of rioting, five were tried at Worcester, and one was found guilty, and executed. At Warwick twelve were tried, but only four received sentence of death, of whom one was reprieved. For the honour of our country, we indulge the earnest hope, that the disgraceful scenes which were acted at Birmingham, in 1791, will never be revived; but that while the continent of Europe is unhappily drenched in human blood, this island will remain as conspicuous for its harmony, order, and tranquillity, as for its constitutional freedom and national prosperity.

The marriage of the duke of York with the princess-royal of Prussia took place on the 29th of September, this year, at Berlin; and on the 25th of October they arrived in England, and were received with public joy and applause. The Prussian monarch gave to the princess a portion of 100,000 crowns. A formal renunciation is made, in favour of the male succession, of all right of inheritance arising from the house of Prussia and Brandenburg, as usually done on the marriages of the Prussian princesses. The sum of 4000l. sterling is annually alligned for pin-money, and other expences; and 8000l. annually of jointure, in case of the death of her husband. In consequence of this union, and to enable his royal highness to live in a style suitable to his exalted station, and to the high rank of the illustrious personage to whom he was allied, parliament have voted the sum of 18,000l. per annum to his royal highness. His majesty has also settled an additional 7000l. per annum upon him out of his Irish revenue, which, with 12,000l. per annum which he before enjoyed, make the sum of 37,000l. per annum. The revenues arising from the bishopric of Osnaburgh are said to amount to about 17,000l. per annum.

On the 2d of April, 1792, the house of commons, in a committee of the whole house on the African slave trade, came to a resolution, 230 against 85, for the gradual abolition. Mr. Wilberforce, Mr. Fox, and Mr. Pitt, contended for the immediate abolition. Mr. Dundas took a middle course between them and those who totally opposed new measures, and argued for the gradual relinquishment of a traffic which every good man must abhor, as degrading and debasing our fel-

low-creatures to a level with beasts. This bill, however, met with a different reception in the house of lords.

The royal proclamation, on the 21st of May, 1792, against seditious writings, which was followed by orders for the embodying the militia of the kingdom, engaged a considerable share of the public attention. It had the intended effects, and excited numerous addresses, testifying the loyalty of the people.

In the beginning of the year 1793, numerous associations were formed throughout the kingdom against republican principles and theories. To say that there was not a spirit of republicanism gone forth in this country, would be absurd; on the other hand, that the cause for alarm was as great as was asserted by some, we do not find reason to believe. The truth lies between the two extremes. The controversies revived in Messrs. Calonne and Burke's pamphlets, and particularly the writings of Mr. Paine, writings well adapted to vulgar comprehension and malignity, pregnant with pointed remarks on some existing abuses, but with nothing of sound policy or principle to recommend them, had undoubtedly contributed to render the example of the French revolution in some degree contagious. After all, the disaffected party was neither numerous nor respectable. The church, the aristocracy, and all the most opulent of the community, were averse to every change or innovation whatever. It was among the lower part of the middle class of society that democratical opinions were chiefly entertained, and among them more probably as a matter of conversation, than as a project to be reduced to practice.

We are far from wishing to insinuate that it was not laudable to check that spirit of innovation which professed to undermine the fundamental principles of a government which, though it partakes of human imperfection, yet affords its subjects a larger portion of liberty and happiness than ever was enjoyed by any other people: we would only be understood to say, that the associations in favour of the British constitution would neither have been entered into with so much unanimity nor fervour, had not the ill conduct of the French terrified the well disposed part of the nation, and disgusted them with every thing that bears the name of reform. From the period of the fatal 10th of August, the convicts from the French system were numerous, the proscription and persecution of the emigrants visibly increased the number, and the premeditated ill-treatment and unjust death of the king almost entirely annihilated the spirit of republicanism in this country. The public wanted only to be excited, to give the most forcible proofs of its attachment to a constitution which had so wisely provided against the intolerable persecutions of tyranny, and the no less deplorable mischiefs of faction.

The first disposition manifested by Great Britain to break with France, regarded the navigation of the Scheldt, which the French had determined to open for the benefit of Antwerp and the Netherlands. This impediment, however, might perhaps have been removed, from the little disposition which was evinced by Holland to assert its right to the exclusive navigation; and from the readiness of the French to refer the whole affair to a negotiation. The next exception which was taken by the English ministry, was to the decree of fraternity which was offered by the French convention, to the revolting subjects of any monarchical (or, as they said, tyrannical) government, and which was construed into a direct affront to this country, and a plot against her peace.

The alien bill, which the French complained was an infraction of the commercial treaty, was the next cause of dispute; and this offence was augmented by the prohibition to export corn to France, while it was freely allowed to the powers at war with that country. At length, towards the end of January, M. Chauvelin was officially informed by the English court, that his character and functions, so long suspended, had entirely terminated by the fatal death of the king of France; that he had no more any public character here, where his further

ther residence was forbidden. Eight days were allowed for his departure; and this notification was published in the Gazette. M. Maret had been sent by the executive council of France with enlarged powers, and, it was said, with very advantageous proposals to Great Britain; but arriving in England exactly at the period of M. Chauvelin's dismissal, he thought it prudent immediately to return home.

Mr. secretary Dundas, on the 28th of January, presented to the house of commons a message from the king, in which his majesty expressed the necessity of making a further augmentation of his forces by sea and land, for maintaining the security and rights of his own dominions, for supporting his allies, and for opposing views of aggrandizement and ambition on the part of France. The question in relation to this subject was carried by a great majority in favour of ministers.

Soon after the declaration of war, a bill was introduced into the house, to prevent traitorous correspondence with France. This bill was read a third time April 9, and, having occasioned much altercation, it passed the lower house, by 154 against 53. After innumerable amendments in the house of lords, adopted from the hints of opposition, the bill was returned to the commons, and then passed into a law.

On the 25th of March, lord Grenville and S. Comte Woronzow signed a convention at London, on behalf of his Britannic majesty and the empress of Russia, in which their majesties agree to employ their respective forces in carrying on the "just and necessary" war in which they were engaged against France; and they reciprocally promise *not to lay down their arms* but by common consent. Notwithstanding this solemn treaty, Catharine has taken no active part whatever in the war. The next treaty is between his Britannic majesty and the king of Sardinia, signed at London the 25th of April; by which Great Britain subjects herself to the payment of 200,000*l.* per annum to the king of Sardinia, and three months in advance. A treaty has also been concluded between his highness the prince of Hesse Cassel and his Britannic majesty; the former is to furnish 8000 men for the war, during *three* years, in return for which the English nation are to pay 100,000*l.* levy-money, and 56,000*l.* sterling per annum, for six years.

In this treaty, Great Britain engages to pay to the Landgrave a sum of money for each Hessian that is slain; so that the more of his men are killed, he will get the more money. For the military operations of the war we must refer our readers to our account of France, under which article they will more naturally fall.

The prosecutions which have taken place in England and Scotland, for seditious words, and for libellous and dangerous publications, may possibly be considered by some readers as a trait in the picture of the times; for their gratification, therefore, we shall exhibit a short out-line of the principal of these trials.

At Edinburgh, Thomas Muir *esq.* was tried before the high court of judicary, for seditious practices. In the indictment, the prisoner was charged with wickedly and feloniously exciting, by means of seditious speeches and harangues, a spirit of disloyalty and disaffection to the king and the established government—of producing and reading aloud, in a public meeting, a seditious and inflammatory writing, called, "An Address from the Society of United Irishmen in Dublin, to the Delegates for promoting a Reform in Scotland;" tending to produce in the minds of the people an insurrection and opposition to the established government. The jury being named, Mr. Muir objected to most of them; he observed, that as the gentlemen, however respectable, were all subscribers to the Goldsmiths-hall association, and had offered a reward for discovering those who had circulated what they called seditious writings, they had already prejudged him, and were therefore improper persons to pass upon his affize; but this objection was repelled by the court.

The

The most material witness against the accused was Anne Fisher, a servant to his father; she said that she carried from him to the printer a Declaration of Rights, marked with some corrections, to be printed; she added, that she had heard Mr. Muir talk to the countrymen coming to the shop of his father, very often, concerning Paine's Rights of Man, which she heard him say was a very good book; that he wished his hair-dresser to purchase them, and keep them in his shop to enlighten the people; that Mr. Muir said, when the reform took place, he would be member for Calder; that members would then be allowed thirty or forty shillings a day, and that none but honest men would be admitted, to keep the constitution clean; and that he had caused an organist in the streets of Glasgow to play *ga ira*, at Mr. Muir's desire.

After a trial of sixteen hours duration, the jury returned a verdict, finding the prisoner *guilty*; the court then proceeded to pronounce sentence, and ordained him to be transported beyond the seas, to such place as his majesty, with the advice of his privy council, shall judge proper, for the space of fourteen years.

On the 17th of September, the reverend Mr. Palmer, an Unitarian clergyman, residing at Dundee, was tried by the circuit court of judicary, before lords Esgrove and Abercrombie. The indictment charged him with being present at a meeting held at Dundee, denominating itself "A Society of the Friends of the People," that he did there put into the hands of George Mealmaker a writing of a seditious import, in the form of an address to their friends and fellow citizens, containing, among other seditious expressions, the following words: "You are plunged into a war by a wicked minister, and a compliant parliament, who seem careless and unconcerned for your interest; the end and design of which is almost too horrid to relate—the destruction of a whole people, merely because they will be free." When the court proceeded to the examination of witnesses, George Mealmaker, weaver in Dundee, acknowledged himself to be the author of the paper in question; it appeared, however, that Mr. Palmer had corrected it, ordered it to be printed, and circulated it. The verdict was returned the same day, finding the prisoner guilty, in consequence of which he was sentenced to transportation for fourteen years. This gentleman was sent to the hulks with Mr. Muir; since which they have both sailed for Botany Bay.

The next trial which we shall notice was that of Lambert, and the editors and proprietors of the Morning Chronicle. The parties were indicted for publishing in their paper, of the 25th of December last, an advertisement purporting to be the address, declaratory of the principles of a society for political information, held at the Talbot Inn in Derby, and signed S. Eyre, chairman.

The attorney-general contended, that the substance of that address was calculated to create discontent in the minds of the people with the present government of this country; and concluded that the publication of it was a criminal, and therefore a punishable act. The defendant's counsel, Mr. Erskine, in an able speech, refused the charge of criminality in his clients, and while he admitted the publication, forcibly contended that it was without any criminal intention. Lord Kenyon summed up the evidence, and at two o'clock the jury withdrew: about eight o'clock the same evening they agreed upon a special verdict, "Guilty of publishing, but with no malicious intent." Lord Kenyon informed them that he could not receive that verdict, because it was no verdict at all. The jury then consulted together in a room in his Lordship's house till nine o'clock: whence they returned to Westminster-hall, and at about five o'clock in the morning they agreed in their verdict of *not guilty*.

On the 21st of January, 1794, the two houses met. The speech from the throne enumerated, with some degree of minuteness, the advantages obtained by the allies, and exhorted to a spirited prosecution of the war, and to a reliance on the resources

of the country, and to the strength of our allies for ultimate success. The address to his majesty, in which Parliament agreed to support him in the continuance of the war, was carried in favour of ministry by an immense majority.

The disparity of numbers did not, however, discourage the opposition in both houses from embracing every opportunity of enforcing the necessity of peace. Upon all these occasions nearly the same arguments were repeated on both sides. Among these attempts one of the most remarkable was that of earl Stanhope, who made a motion for an address to his majesty, to acknowledge the republic of France. It was urged by his lordship, in favour of this measure, that the people had been deluded by ministers, who had by their emissaries held out to them that the French would soon be starved, and necessitated to come to terms honourable and advantageous to this country, because they were represented to have neither corn, arms, ammunition, nor the means of procuring them. In proof of this delusion it was said, that a year had passed since this doctrine had raised the sanguine hopes of our countrymen; yet still the Gallic nation abounded with fire-arms, corn, and, above all, with men. Since, therefore, it was generally confessed that we had no right to interfere in the regulation of their internal government, it was contended that the most advantageous mode of conduct for Englishmen would be to make a speedy peace with an armed nation, driven to a state bordering on desperation, by the combination formed against that system of liberty, which they would in all probability defend to the last extremity.

The landing of the Hessian troops, without the previous consent of parliament, was represented by the opposition-party as an infringement upon the free principles of the constitution, and in support of this assertion reference was made to the act of settlement, which expressly says, "that no office of trust, civil or military, shall on any account whatever be held by any but natural subjects of his majesty, born within the realm;" and to preserve the principles of the constitution, an act of indemnity was proposed to ministers; but the proposal was rejected.

An invasion of the French having excited serious alarm in the public mind, the steps pursued by administration to repel it were, an augmentation of the militia, and the raising volunteer companies, as well as taking measures for having a number of yeomanry and others in various parts of the kingdom, to bear arms and to be ready to take the field in case of an emergency. To aid these measures, the secretary of state addressed circular letters to the lord-lieutenants of the several counties, ordering them to take the sense of the inhabitants, upon the best mode to be pursued in order to insure the internal defence of the kingdom, either in case of invasion by a foreign enemy, or in case of riots and disturbances at home. In consequence of these letters to the lord-lieutenants, meetings have been held in most of the cities and considerable towns in the kingdom, and large sums of money have been already subscribed for raising troops to be ready at the call of ministers.

The secession of the king of Prussia from the great cause of the allies agitated the political world for several weeks, when it was announced that the whole proceeded from his inability to supply his troops from the resources of his own country, and therefore that he must be subsidized, to enable him to employ his forces for the great purpose of restoring regular government to France. The Parliament, influenced by the arguments which were advanced by the minister, voted the sum of 2,500,000*l.* to be granted to his majesty, to enable him to fulfil the stipulations of the treaty lately concluded with Prussia, for the more vigorous prosecution of the war, and for such exigencies as might arise in the year 1794. Notwithstanding this fresh treaty, it is confidently asserted that the Prussian monarch has entirely relinquished the war, having found full occupation for himself and his troops in endeavouring to suppress the insurrections in Poland, which we shall particularly notice in our narrative of the events of that unfortunate country.

On

On the 12th of May, 1794, a message from his Majesty was brought down to the house by Mr. Secretary Dundas, in which he informs them that "the seditious practices which have been for some time carried on by certain societies in London, in correspondence with societies in different parts of the country, have lately been pursued with increased activity and boldness, and have been avowedly directed to the object of assembling a pretended general convention of the people, in contempt and defiance of the authority of parliament; that the books and papers of the said societies in London have been seized, which appearing to contain matter of the greatest importance to the public interest, were now laid before the house." An address to his majesty in consequence of the message was then voted, *nem. con.* and the papers were referred to a committee of secrecy, consisting of twenty-one members.

In consequence of the first report of the committee of secrecy, with respect to the plans which had been formed by these societies for holding a general convention of the people, and intimating their suspicions that large stands of arms had been collected by these societies in order to distribute them among the lower orders of the people, the chancellor of the exchequer moved "for leave for a bill to empower his majesty to secure and detain such persons as his majesty suspects are conspiring against his person and government." By this Bill the temporary suspension of the *Habeas Corpus* act is effected, which was carried, on the minister's motion, by a majority of 162.

On the 1st of June 1794, the British fleet under the command of admiral earl Howe obtained a most signal victory over that of the French; in which two ships were sunk, one burnt, and six brought into Portsmouth harbour. To this conquest we may add the previous reduction of the principal settlements of the French in the East Indies, and the capture of their West India islands, by which the most valuable commercial advantages have been gained, the commerce of the enemy destroyed in those parts, and these blessings enhanced by the amazing rapidity and little bloodshed with which they were accomplished.

Very different has been the fortune of the allied powers in the Austrian Netherlands; most of the principal towns having surrendered to the French, viz. Ypres, Bruges, Ghent, Ostend, Charleroi, Oudenarde, Marchiennes, and Mons. Yet, whatever may be the success of French arms, or the ascendancy of French principles on the continent, this happy island will ever set both at defiance, while she beholds, with conscious security, from her sea-girt shores, that propitious element on which, without the grossest mismanagement, a combination of physical and moral advantages must always enable her to triumph over her foreign enemies. An invasion of England cannot be successful, unless the French either obtain a superiority at sea (because, without this superiority, the Gallic torrent, however impetuous, must soon be exhausted, for want of communication with its source), or unless they are abated in their hostility by the Britons themselves; a supposition as inconsistent with the feelings and principles, as it is incompatible with the manly good sense which has long distinguished this nation. A revolution in government is always a tremendous experiment; because the act of revolution itself, which often endures through many bloody years, is terrible, and its consequences at best doubtful. But a revolution effected by the assistance of an ancient and imperishable enemy, exasperated by the remembrance of past, and the smart of recent wounds, is a calamity to which no people in their senses can be inclined voluntarily to submit: and still of all, those who inherit, from the virtue of their ancestors, those substantial and inalienable benefits, whose shadows the French have hitherto pursued in vain through oceans of blood.

## GENEALOGICAL LIST OF THE ROYAL FAMILY OF GREAT BRITAIN.

George William Frederic III. born June 4, 1738; proclaimed king of Great Britain, France and Ireland, and elector of Hanover, October 26, 1760, and married, September 8, 1761, to the princess Sophia Charlotte, of Mecklenburgh Strelitz, born May 16, 1744, crowned September 22, 1761, and now have issue:

1. George Augustus Frederic, prince of Wales, born August 12, 1762.
  2. Prince Frederic, born August 16, 1763, elected bishop of Osnaburgh, February 27, 1764, created duke of York and Albany, November 7, 1784, K. G. and K. B. married, September 29, 1791, Frederica Charlotta Ulrica Catherina, princess royal of Prussia.
  3. Prince William Henry, born August 21, 1765, created duke of Clarence, K. G. and K. T.
  4. Charlotte Augusta Matilda, princess royal of England, born September 29, 1766.
  5. Prince Edward, born November 2, 1767.
  6. Princess Augusta Sophia, born November 8, 1768.
  7. Princess Elizabeth, born May 22, 1770.
  8. Prince Ernest Augustus, born June 5, 1771.
  9. Prince Frederic Augustus, born January 27, 1773.
  10. Prince Adolphus Frederic, born February 24, 1774.
  11. Princess Mary, born April 25, 1776.
  12. Princess Sophia, born November 3, 1777.
  13. Princess Amelia, born August 7, 1783.
- Issue of the late prince of Wales by the princess Augusta of Saxe Gotha, now living:

1. Her royal highness Augusta, born August 11, 1737; married the hereditary prince of Brunswick Lunenburg, January 16, 1764.
2. His present majesty.
3. Prince William Henry, duke of Gloucester, born November 25, 1743, married, September 6, 1776, Maria countess dowager of Waldegrave, by whom he has Sophia Matilda, born 1773; and William Frederic, born 1776.

## W A L E S.

THOUGH this principality is politically included in England, yet as it has distinction in language and manners, I have, in conformity with the common custom, aligned it a separate article.

## EXTENT AND SITUATION.

	Miles.		Degrees.	
Length	130	} between	{ 51 and 54	North latitude.
Breadth	96		{ 2.41 and 4.56	West longitude.

Area in square miles 7011.

NAME AND LANGUAGE.] The Welch, according to the best antiquaries, are descendants of the Belgic Gauls, who made a settlement in England about four-

score years before the first descent of Julius Cæsar, and thereby obtained the name of Galles or Wallis (the G and W being promiscuously used by the ancient Britons), that is, *Strangers*. Their language has a strong affinity with the Celtic or Phœnician, and is highly commended for its pathetic and descriptive powers.

**BOUNDARIES.]** Wales was formerly of greater extent than it is at present, being bounded only by the Severn and the Dee; but after the Saxons had made themselves masters of all the plain country, the Welch, or ancient Britons, were obliged gradually to retreat westward. It does not, however, appear, that the Saxons ever made any farther conquests in their country than Monmouthshire and Herefordshire, which formerly belonged to Wales, but now form part of England. This country is divided into four circuits, comprehending twelve counties. See ENGLAND.

**CLIMATE, SOIL, AND WATER.]** The seasons are pretty much the same as in the northern parts of England, and the air is sharp, but wholesome. The soil of Wales, especially towards the North, is mountainous, but contains rich vallies, which produce crops of wheat, rye, and other corn. Wales contains many quarries of free-stone and slate, several mines of lead, and abundance of coal-pits. This country is well supplied with wholesome springs; and its chief rivers are the Clywd, the Wheeler, the Dee, the Severn, the Elwy, and the Allen, which furnish Flintshire with great quantities of fish.

**MOUNTAINS.]** It would be endless to particularize the mountains of this country. Snowdon, in Caernarvonshire, and Plinlimmon, which lies partly in Montgomery, and partly in Cardiganhire, are the most famous; and their mountainous situation greatly assisted the natives in making so noble and long a struggle against the Roman, Anglo-Saxon, and Norman powers.

**VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.]** In these particulars Wales differs little from England. Their horses are smaller, but can endure vast fatigue, and their black cattle are small likewise, but excellent beef, and their cows are remarkable for yielding large quantities of milk. Great numbers of goats feed on the mountains. Some very promising mines of silver, copper, lead, and iron, have been discovered in Wales. The Welch silver may be known by its being stamped with the ostrich feathers, the badge of the prince of Wales.

**POPULATION, INHABITANTS, MANNERS, AND CUSTOMS.]** The inhabitants of Wales are supposed to amount to about 300,000, and though not in general wealthy, they are provided with all the necessaries, and many of the conveniences of life. The land-tax of Wales brought in, some years ago, about forty-three thousand seven hundred and fifty-two pounds a year. The Welch are, if possible, more jealous of their liberties than the English, and far more irascible, but their anger soon abates; and they are remarkable for their sincerity and fidelity. They are very fond of carrying back their pedigrees to the most remote antiquity, but we have no criterion for the authenticity of their manuscripts, some of which they pretend to be coeval with the incarnation. It is however certain, that great part of their history, especially the ecclesiastical, is more ancient, and better attested, than that of the Anglo-Saxons. Wales was formerly famous for its bards and poets, particularly Thaliessin, who lived about the year 450, and whose works were certainly extant at the time of the Reformation, and clearly evince, that Geoffrey Monmouth was not the inventor of the history which makes the present Welch the descendants of the ancient Trojans. This poetical genius seems to have inspired the ancient Welch with an enthusiasm for independency, on which account Edward I. is said to have made a general massacre of the bards. The Welch may be called an unmixed people, and are remarkable for keeping up  
the

the ancient hospitality, and their strict adherence to ancient customs and manners. This appears even among gentlemen of fortune, who in other countries commonly follow the stream of fashion. We are not, however, to imagine that many of the nobility and gentry of Wales do not comply with the modes and manner of living in England. All the better sort of the Welch speak the English language, though numbers of them understand the Welch.

[RELIGION.] I have already mentioned the massacre of the Welch clergy by Augustine the popish apostle of England, because they would not conform to the Romish ritual. Wales, after that, fell under the dominion of petty princes, who were often weak and credulous. The Romish clergy insinuated themselves into their favour, by their pretended power of absolving from crimes; and the Welch, when their ancient clergy were extinct, conformed themselves to the religion of Rome. The Welch clergy, in general, are but poorly provided for; and in many of the country congregations they preach both in Welch and English. Their poverty was formerly a great discouragement to religion and learning, but the measures taken by the society for propagating Christian knowledge has in a great degree removed the reproach of ignorance from the poorer sort of the Welch. In the year 1749, a hundred and forty-two schoolmasters were employed, to remove from place to place, for the instruction of the inhabitants; and their scholars amounted to 72,264. No people have distinguished themselves more, perhaps, in proportion to their abilities, than the Welch have done by acts of national munificence. They print, at a vast expence, Bibles, Common Prayers, and other religious books, and distribute them gratis to the poorer sort. Few of their towns are unprovided with a free-school.

The established religion in Wales is that of the church of England; but the common people in many places are so tenacious of their ancient customs, that they retain several of the Romish superstitions, and some ancient families among them are still Roman Catholics. In the principality there are also great numbers of Protestant Dissenters.

For BISHOPRICS, (see England). In former times, Wales contained more bishoprics than it does now; and about the period of the Norman invasion, the religious foundations there far exceeded the wealth of all the other parts of the principality.

[LEARNING AND LEARNED MEN.] Wales was a seat of learning at a very early period; but it suffered an eclipse by the repeated massacres of the bards and clergy. Wickliffism took shelter in Wales when it was persecuted in England. The Welch and Scotch dispute about the nativity of certain learned men, particularly four of the name of Gildas. Giraldus Cambrensis, whose history was published by Camden, was certainly a Welchman; and Leland mentions several learned men of the same country, who flourished before the Reformation. The discovery of the famous king Arthur's and his wife's burying-place was owing to some lines of Thaliessin, which were repeated before Henry II. of England, by a Welch bard. Since the Reformation, Wales has produced several excellent antiquaries and divines. Among the latter were Hugh Broughton, and Hugh Holland, who was a Roman Catholic, and is mentioned by Fuller in his Worthies. Among the former were several gentlemen of the name of Lluyd, particularly the author of that invaluable work the Archaeologia. Rowland, the learned author of the Mona Antiqua, was likewise a Welchman; as was that great statesman and prelate, the lord keeper Williams, archbishop of York in the time of king Charles I. After all, it appears, that the great merit of the Welch learning, in former times, lay in the knowledge of the antiquity, language, and history of their own country. Wales, notwithstanding all that Dr. Hicks, and other antiquaries, have said to the contrary, furnished the Anglo-Saxons with an alphabet. This is clearly de-

monstrated by Mr. Lhuyd, in his Welch preface to his *Archæologia*, and is confirmed by various monumental inscriptions of undoubted authority (See Rowland's *Mona Antiqua*). Another instance of Welch erudition we have in the excellent history of Henry VIII. written by lord Herbert of Cherbury.

With regard to the present state of literature among the Welch, it is sufficient to say, that some of them make a considerable figure in the republic of letters, and that many of their clergy are excellent scholars. The Welch Paternoster is as follows:

*Ein Tad, yr hron wyf yn y nefoedd, sansteiddier dy entw; deued dy deyrnas; bydded dy ewyllys ar y dddear, megis y mae yn y nefoed: dyro in i heddyw ein bara beunyddiol; a madden i ni ein dyledion, fel y maddewon ni i'n dyledwyr; ac nas arwain ni i brofedigaeth, eithr gwared ni rhag drwg: canys eiddot ti yw'r deyrnas, a'r gallu, a'r gogoniant, yn eos egsodd. Amen.*

CITIES, TOWNS, FORTS, AND OTHER } Wales contains no cities or towns  
EDIFICES, PUBLIC AND PRIVATE. } that are remarkable either for popu-  
lousness or magnificence. Beaumaris is the chief town of Anglesey \*, and has a good harbour. Brecknock trades in cloathing. Cardigan is a large populous town, and lies in the neighbourhood of lead and silver mines. Caerwarthen has a large bridge, and is governed by a mayor, two sheriffs, and aldermen, who wear scarlet gowns, and other ensigns of state. Pembroke is well inhabited by gentlemen and tradesmen; and part of the country is so fertile and pleasant, that it is called Little England. The other towns of Wales have nothing particular. It is proper, however, to observe, that Wales, in ancient times, was a far more populous and wealthy country than it is at present; and though it contains no regular fortifications, yet many of its old castles are so strongly built, and so well situated, that they might be turned into strong forts at a small expence: witness the vigorous defence which many of them made in the civil wars, between Charles I. and his parliament.

ANTIQUITIES AND CURIOSITIES, } Wales abounds in remains of antiquity.  
NATURAL AND ARTIFICIAL. } Several of its castles are stupendously large; and in some, the remains of Roman architecture are plainly discernible. The architecture of others is doubtful; and some appear to be partly British, and partly Roman. In Brecknockshire are some rude sculptures, upon a stone six feet high, called the Maiden-Stone; but the remains of the Druidical institutions, and places of worship, are chiefly discernible in the isle of Anglesey, the ancient Mona, mentioned by Tacitus, who describes it as being the chief seminary of the Druidical rites and religion. Many Roman altars, utensils, and other antiquities, are discovered in Wales. King Offa's dyke is said to have been a boundary between the Saxons, and the Welch or Britons. Cherphilly-castle, in Glamorganshire, is said to have been the largest in Great Britain, excepting Windsor; and the remains of it shew it to have been a most beautiful fabric. One half of a round tower has fallen quite down, but the other overhangs its basis more than nine feet, and is as great a curiosity as the leaning tower of Pisa in Italy.

Near the town of Flint are the remains of a large castle, in which Richard II. was confined, some time before his deposition; and a variety of Roman antiquities have been found in this town, which is supposed to have been a Roman station.

Some coins of Welch princes are said to be found in the cabinets of the curious;

\* The Isle of Anglesey, which is the most western county of North Wales, is surrounded on all sides by the Irish sea, except on the south-east, where it is divided from Britain by a narrow strait,

called Meneu, which in some places may be passed on foot at low water: the island is about 24 miles long, and 18 broad, and contains 74 parishes. It was the ancient seat of the British Druids.

but

but it does not seem that they have been serviceable in ascertaining the ancient history of the country.

Among the natural curiosities of this country, are the following. At a small village called Newton, in Glamorganthire, is a remarkable spring nigh the sea, which ebbs and flows contrary to the tide. Kader Idris, a mountain in Merionethshire, remarkable for its height, affords variety of Alpine plants. In Flintshire is a famous well, known by the name of St. Wenefred's well, at which, according to the legendary tales of the common people, miraculous cures have been performed. The spring boils with vast impetuosity out of a rock, and is formed into a beautiful polygonal well, covered with a rich arch supported by pillars, and the roof is exquisitely carved in stone. Over the spring is also a chapel, a neat piece of Gothic architecture, but in a very ruinous state. King James II. paid a visit to the well of St. Wenefred in 1686, and was rewarded for his piety by a present of the shift in which his great-grandmother, Mary Stuart, lost her head. The spring is supposed to be one of the finest in the British dominions; and by two different trials and calculations lately made, is found to throw out about twenty-one tons of water in a minute. It never freezes, and varies but little in its quantity of water, either in dry or rainy seasons; but in consequence of the latter, it assumes a wheyish tinge. The small town adjoining to the well is known by the name of Holywell. In Caernarvonshire is the high mountain of Penmannawr, across the edge of which the public road lies, and occasions no small terror to travellers; from one hand the impending rock seems ready every minute to crush them to pieces, and the great precipice below, which hangs over the sea, is so hideous, and, till very lately, when a wall was raised on the side of the road, so full of danger, that one false step was of dismal consequence. Snowdon hill is by triangulation measurement 1240 yards perpendicular height.

There are a great many pleasing prospects and picturesque views in Wales; and this country is highly worthy the attention of the curious traveller.

COMMERCE AND MANUFACTURES.] The Welch are on a footing, as to their commerce and manufactures, with many of the western and northern counties of England. Their trade is mostly inland, or with England, into which they send numbers of black cattle. Milford-haven, which is reckoned the finest in Europe, lies in Pembrokehire; but the Welch have hitherto reaped no great benefit from it, though of late considerable sums have been granted by parliament for its fortification. The making it the principal harbour of the kingdom would meet with strong opposition from the numerous Cornish and West-country members, whose estates would be lessened in value by the disuse of Plymouth and Portsmouth, and other harbours. The town of Pembroke employs near 200 merchant ships, and its inhabitants carry on an extensive trade. In Brecknockthire the woollen manufacture flourishes; and Wales in general carries on a great coal trade with England and Ireland.

CONSTITUTION AND GOVERNMENT.] Wales was united, and incorporated with England, in the 27th of Henry VIII. when, by act of parliament, the government of it was modelled according to the English form; all laws, customs, and tenures, contrary to those of England, being abrogated, and the inhabitants admitted to a participation of all the English liberties and privileges, particularly that of sending members to parliament, viz. a knight for every shire, and a burges for every three-town, except Merioneth. By the 34th and 35th of the same reign, there were ordained four several circuits for the administration of justice in the said shires, each of which was to include three shires; so that the chief justice of Chester has under his jurisdiction the three several shires of Flint, Denbigh, and Montgomery. The shires of Caernarvon, Merioneth, and Anglesey, are under the justices of North Wales. Those of Caermarthen, Pembrokehire, and Cardigan, have also their justices; as have likewise those of Radnor, Brecknock, and Glamorgan. By the 18th

of queen Elizabeth, one other justice-assistant was ordained to the former justices, so that now every one of the said four circuits has two justices, viz. one chief-justice, and a second justice assistant.

REVENUES.] The crown has a certain though small property, in the product of the silver and lead-mines; but it is said that the revenue accruing to the prince of Wales from his principality does not exceed 7 or 8000*l.* a year.

ARMS.] The arms of the prince of Wales differ from those of England, only by the addition of a label of three points. His cap, or badge of ostrich feathers, originated in a trophy of that kind, which Edward the Black Prince took from the king of Bohemia, when he was killed at the battle of Poitiers, and the motto is *Ich dien, I serve*. St. David, commonly called St. Tally, is the tutelar saint of the Welch, and his badge is a leek, which is worn on his day, the 1st of March.

HISTORY.] The ancient history of Wales is uncertain, on account of the number of petty princes who governed it. That they were sovereign and independent, appears from the English history. It was formerly inhabited by the three different tribes of Britons; the Silures, the Dimetæ, and the Ordovices. These people were never entirely subdued by the Romans; though part of their country, as appears from the ruins of castles, was bridled by garrisons. It hath been already observed, that the Saxons conquered the counties of Monmouth and Hereford, yet they never penetrated farther, and the Welch remained an independent people, governed by their own princes and their own laws. About the year 870, Roderic, king of Wales, divided his dominions among his three sons; and the names of these divisions were, Dimetia, or South Wales; Powesia, or Powis-land; and Venedotia, or North Wales. This division gave a mortal blow to the independency of Wales. About the year 1112, Henry I. of England planted a colony of Flemings on the frontiers of Wales, to serve as a barrier to England. The Welch made many brave attempts to maintain their liberties against the Norman kings of England. In 1237, the crown of England was first supplied with a pretext for the total subjugation of Wales; their old and infirm prince Llewelin, in order to be safe from the persecutions of his undutiful son Griflyn, having put himself under the protection of King Henry III. to whom he did homage.

But no capitulation could satisfy the ambition of Edward I. who resolved to annex Wales to the crown of England; and Llewelin, prince of Wales, disclaiming the subjection to which old Llewelin had submitted, Edward raised an army at great expence, with which he penetrated as far as Flint, and taking possession of the isle of Anglesey, he drove the Welch to the mountains of Snowdon, and obliged them to submit to pay tribute. The Welch, however, made several efforts under young Llewelin; but, at last, in 1285, that brave prince was killed in battle. He was succeeded by his brother David, the last independent prince of Wales, who, falling into Edward's hands through treachery, was by him most barbarously and unjustly hanged; and Edward, from that time, pretended that Wales was annexed to his crown of England. It was about this time probably that Edward perpetrated the inhuman massacre of the Welch bards. Perceiving that his cruelty was not sufficient to complete his conquest, he sent his queen in the year 1282, to be delivered in Caernarvon castle, that the Welch, having a prince born among themselves, might the more readily recognize his authority. This prince was the unhappy Edward II. and from him the title of prince of Wales ever since descended to the eldest sons of the English kings. The history of Wales and England became from this period the same. It is proper, however, to observe, that the kings of England long thought fit to shew particular marks of attention to the Welch. Their eldest sons not only held the titular dignity, but actually kept a court at Ludlow; and a regular council, with a president, was named by the crown, for the administration

of all the affairs of the principality. This was thought so necessary a piece of policy, that when Henry VIII. had no son, his daughter Mary was created princess of Wales.

## ISLE OF MAN.

**T**HE Mona mentioned by Tacitus was not this island but the isle of Anglesea. Some think that Man takes its name from the Saxon word *Mang* (or among), because, lying in St. George's Channel, it is almost at an equal distance from the kingdoms of England, Scotland, and Ireland; but Mona seems to have been a general name with the ancients for any detached island. Its length from north to south is rather more than thirty miles, its breadth from eight to fifteen; and the latitude of the middle of the island is fifty-four degrees sixteen minutes north. It is said, that on a clear day the three Britanic kingdoms may be seen from this island. The air here is wholesome, and the climate, only making allowance for the situation, pretty much the same as that in the north of England, from which it does not differ much in other respects. The hilly parts are barren, and the champaign fruitful in wheat, barley, oats, rye, flax, hemp, roots, and pulse. The ridge of mountains, which, as it were, divides the island, of which Snaifell is the highest, rising 1640 feet above the level of the sea, both protects and fertilizes the valleys, where there is good pasturage. The better sort of inhabitants have good sizeable horses, and a small kind, which is swift and hardy. The island is exempt from noxious animals. The coasts abound with sea-fowl; and the puffins, which breed in rabbit-holes, are almost a lump of fat, and esteemed very delicious. It is said, that this island abounds with iron, lead, and copper mines, though unwrought; as are the quarries of marble, slate, and stone.

The Isle of Man contains seventeen parishes, and four towns on the sea-coasts. Castle-town is the metropolis of the island, and the seat of its government; Peele, of late years, begins to flourish; Douglas is the largest and richest town and best market, in consequence of its excellent harbour, and its fine mole, extending into the sea; Ramsey has likewise a considerable commerce, being situate on a spacious bay, in which ships may ride safe from all winds except the north-east. The reader, by throwing his eyes on the map, may see how conveniently this island lies for being the storehouse of smugglers, which it was till within these few years, to the inexpressible prejudice of his majesty's revenue; and this necessarily leads us to touch upon the history of the island.

During the time of the Scandinavian rovers on the seas, who have been before mentioned, this island was their rendezvous, and their chief force was here collected; from whence they annoyed the Hebrides, Great Britain, and Ireland. The kings of Man are often mentioned in history; and though we have no regular account of their successions, and know but a few of their names, yet they undoubtedly were for some ages masters of those seas. About the year 1263, Alexander II. king of Scotland, a spirited prince, having defeated the Danes, laid claim to the superiority of Man, and obliged Owen, or John, its king, to acknowledge him as lord paramount. It seems to have continued tributary to the kings of Scotland, till it was reduced by Edward I. and the kings of England, from that time, exercised the superiority over the island; though we find its immediate government still held by the posterity of its Danish princes in the reign of Edward III. who dispossessed the last queen of the island, and bestowed it on his favourite, Montague, earl

earl of Salisbury. The earl's family-honours and estate being forfeited, Henry IV. bestowed Man, and the patronage of the bishoprick, first upon the Northumberland family; and that being forfeited, upon sir John Stanley, whose posterity, the earls of Derby, enjoyed it till, by failure of heirs male, it devolved upon the duke of Athol, who married the sister of the last lord Derby. Reasons of state rendered it necessary for the crown of Great Britain to purchase the customs and the island from the Athol family; and the bargain was completed by 70,000*l.* being paid to the duke in 1765. The duke, however, retains his territorial property in the island, though the form of its government is altered, and the king has now the same rights, powers, and prerogatives, as the duke formerly enjoyed. The inhabitants also retain many of their ancient constitutions and customs.

The established religion in Man is that of the church of England. The bishop of Sodor and Man enjoys all the spiritual rights and pre-eminences of other bishops, but does not sit in the British house of peers; his see never having been erected into an English barony. One of the most excellent prelates who ever adorned the episcopal character, was Dr. Thomas Wilson, bishop of Man, who presided over that diocese upwards of fifty-seven years, and died in the year 1755, aged ninety-three. He was eminently distinguished for piety, benevolence, and hospitality, and his unremitting attention to the happiness of the people entrusted to his care. He encouraged agriculture, established schools for the instruction of children, translated some of his devotional pieces into the Manks language, to render them more generally useful, and founded parochial libraries in every parish of his diocese. Cardinal Fleury had so much veneration for this good bishop, that, out of regard to him, he obtained an order from the court of France, that no privateer of that nation should ravage the Isle of Man.

The ecclesiastical government is well maintained in this island, and the livings are comfortable. The language, which is called the Manks, and is spoken by the common people, is radically Erse, or Irish, but with a mixture of other languages. The New Testament and Common Prayer Book have been translated into this dialect. The natives, who amount to above 20,000, are inoffensive, charitable, and hospitable. The better sort live in stone houses, covered with slate, and the poorer in thatched; and their ordinary bread is made of oatmeal. Their products for exportation consist of wool, hides, and tallow; which they exchange with foreign shipping for commodities they may have occasion for from other parts. Before the south promontory of Man, is a little island called the Calf of Man: it is about three miles in circuit, and separated from Man by a channel about two furlongs broad.

This island affords some curiosities, consisting chiefly of Runic sepulchral inscriptions and monuments, of ancient brass daggers, and other weapons of that metal, adorned with pure gold, which indicates the splendor of its ancient possessors.

## I S L E O F W I G H T.

**T**HIS island is opposite to the coast of Hampshire, from which it is separated by a channel, varying in breadth from two to seven miles: it is considered as part of the county of Southampton, and is within the diocese of Winchester. Its greatest length, extending from east to west, measures nearly twenty-three miles; its breadth from north to south about thirteen. The air is in general healthy, particularly the southern parts; the soil is various, but so great is its

its fertility, that more wheat grows here in one year, than can be consumed by the inhabitants in eight: and it is supposed that its present produce, under the great improvements of agriculture, and the additional quantity of land lately brought into tillage, has more than kept pace with the increase of population. A range of hills, which affords fine pasture for sheep, extends from east to west, through the middle of the island. The interior parts of the island, as well as its extremities, afford a great number of beautiful and picturesque prospects, not only in the pastoral, but also in the great and romantic style. Of these beauties, the gentlemen of the island have availed themselves, as well in the situation of their houses, as in their other improvements. Domestic fowls and poultry are bred here in great numbers; the outward-bound ships and vessels at Spithead, the Mother-bank, and Cowes, commonly furnishing themselves from this island.

Such is the purity of the air, the fertility of the soil, and the beauty and variety of the landscapes of this island, that it has been called the garden of England; it has some very fine gentlemen's seats; and it is often visited by parties of pleasure on account of its delightful scenes.

The island is divided into thirty parishes: and, according to a very accurate calculation made in the year 1777, the inhabitants then amounted to eighteen thousand and twenty-four, exclusive of the troops quartered there. Most of the farm-houses are built with stone, and even the cottages appear neat and comfortable, having each its little garden.

The town of Newport stands nearly in the centre of the island, of which it may be considered as the capital. The river Medina empties itself into the channel at Cowes harbour, distant about five miles, and, being navigable up to the quay, is very commodious for trade. The three principal streets of Newport extend from east to west, and are crossed at right angles by three others, all which are spacious, clean, and well paved.

Carilbrooke castle, in the Isle of Wight, is remarkable for the confinement of king Charles I. who, taking refuge here, was detained a prisoner from November 1647, to September 1648. After the murder of the king, this castle was converted into a place of confinement for his children; and his daughter, the princess Elizabeth, died in it. There are several other forts in this island, which were all erected about the 36th year of the reign of Henry VIII. when many other forts and block-houses were built in different parts of the coasts of England.

---

#### THE ISLANDS OF JERSEY, GUERNSEY, ALDERNEY, SARK, LUNDY, &c.

IN the English Channel four of these are situated, and are subject to England: these are Jersey, Guernsey, Alderney, and Sark; which, though much nearer to the coast of Normandy than to that of England, are within the diocese of Winchester. They lie in a cluster in Mount St. Michael's Bay, between Cape la Hague in Normandy, and Cape Frebelle in Britany. The computed distance between Jersey and Sark is four leagues: between that and Guernsey, seven leagues; and between the same and Alderney, nine leagues.

JERSEY, anciently CÆSAREA, was known to the Romans; and lies farthest within the bay, in forty-nine degrees seven minutes north latitude, and in the second degree twenty-six minutes west longitude, eighteen miles west of Normandy, and eighty-four miles south of Portland. The north side is inaccessible through

lofty cliffs, the south is almost level with the water; the higher land, in its mid-land part, is well planted, and abounds with orchards, from which is made an incredible quantity of excellent cyder. The vallies are fruitful and well cultivated, and contain plenty of cattle and sheep. The inhabitants neglect tillage too much, being intent upon the culture of cyder, the improvement of commerce, and particularly the manufacture of stockings. The honey in Jersey is remarkably fine; and the island is well supplied with fish and wild-fowl of many kinds, some of them peculiar to the island, and very delicious.

The island is not above twelve miles in length; but the air is so salubrious, that, in Camden's time, it was said there was here no business for a physician. The inhabitants in number are about 20,000, and are divided into twelve parishes. The capital town is St. Helier, or Hilary, which contains above 400 houses, has a good harbour and castle, and makes a handsome appearance. The property of this island belonged formerly to the Carterets, a Norman family, who have been always attached to the royal interest, and gave protection to Charles II. both when king and prince of Wales, at a time when no part of the British dominions dared to countenance him. The language of the inhabitants is French, with which most of them intermingle English words; yet French is most generally the language of the pulpit and the bar. Knit stockings and caps form their staple commodity; but they carry on a considerable trade in fish with Newfoundland, and dispose of their cargoes in the Mediterranean. The governor is appointed by the crown of England, but the civil administration rests with a bailiff, assisted by twelve jurats. As this island is the principal remain of the duchy of Normandy depending on the kings of England, it preserves the old feudal forms, and particularly the assembly of states, which forms a miniature of the British parliament, as settled in the time of Edward I.

GUERNSEY is thirteen miles and a half from south-west to north-east, and twelve and a half where broadest, east and west; has only ten parishes, to which there are but eight ministers: four being united parishes; and Alderney and Sark, though appendages of Guernsey, forming each a separate parish with its appropriate minister. Though this is naturally a finer island than that of Jersey, yet it is far less valuable, being poorly cultivated and thinly inhabited. It abounds in cyder; the inhabitants speak French: want of firing is the greatest inconveniency that both islands labour under. The only harbour here is at St. Peter la Port, which is guarded by two forts; one called the Old-Castle, and the other Caille Cornet. Guernsey is likewise part of the ancient Norman patrimony.

ALDERNEY is about eight miles in compass, and is by much the nearest of all these islands to Normandy, from which it is separated by a narrow strait, called the Race of Alderney, which is a dangerous passage in stormy weather, when the two currents meet; otherwise it is safe, and has depth of water for the largest ships. To the west lie a range of rocks for near three leagues together, called the Calkets; among which are several whirlpools or eddies, very dreadful to mariners. The sons of King Henry I. were cast away and drowned here, passing to Normandy; and it is fresh in memory how fatal this strait proved to the Victory man of war, commanded by admiral Blachen. This island is healthy, and the soil is remarkable for a fine breed of cows.

SARK is a small island depending upon Guernsey; the inhabitants are long-lived, and enjoy from nature all the conveniences of life; their number is about 300. The inhabitants of the three last-mentioned islands together are thought to be about 20,000. The religion of all the four islands is that of the church of England.

SCILLY ISLANDS and ROCKS, anciently called the SILURES, are a cluster of dangerous rocks, to the number of 140, lying about 30 miles from the Land's

End

THE

End in Cornwall, of which county they are reckoned a part, and to which they are supposed to have been formerly joined, but separated from it and from each other, by some violent eruption of the sea, which is here between 40 and 60 fathoms deep. *Scilly*, which gives name to all the rest, was once the chief; but *St. Mary's Island*, though only nine miles in circumference, is the largest, as well as the most fruitful, contains more inhabitants than all the rest together, and has a very good harbour, fortified with a castle, which was built by queen Elizabeth. In this, and in two or three others of the largest islands, there are various antiquities, particularly the remains of a temple of the Druids, and ancient sepulchres. But the greatest ornament of this island is the light-house, in height 51 feet. Its six lights are eleven feet three inches high, by three feet two inches broad; it stands on high land, and makes a very fine appearance. By their situation, between the English Channel and *St. George's Channel*, these rocks have been the destruction of many ships and lives, especially in the night time. This was the fate of the brave *sir Cloudesley Shovel's* Squadron, 22d October 1707, as it was returning home from *Toulon*. This, and similar disasters, have been ascribed to a mistake of reckoning, but are found by the most excellent geographer, *Mr. Rennel*, to be owing to a current which often prevails to the westward of *Scilly*, and to which seamen ought to be particularly attentive, after hard and continued gales from the western quarter. (See the Philosophical Transactions for the year 1793.)

**LUNDY ISLAND**, though fifty miles in the sea, off the north-west coast of Devonshire, has springs of fresh water. It is five miles long, and two broad, but so encompassed with inaccessible rocks, that it has but one entrance to it, so narrow that two men can scarcely go abreast: it had once a fort and chapel. On the north part is a high pyramidal rock, called the *Constable*. Here are horses, kine, hogs, and goats, with great store of sheep and rabbits; but their chief commodity is fowl, with which they abound. In the reign of *Henry VIII.* one *William Morisco*, who had conspired to murder him at *Woodstock*, fled to this island, which he fortified, turned pirate, and did much damage to this coast, till he was at length taken by surprise, with sixteen of his accomplices, and put to death.

**HOLY ISLAND** is situated ten miles south-east of *Berwick-upon-Tweed*; and called by the monks, who lived in it retired from the world, by the name of *Landisfern*, by reason of its situation over against the river *Landis*. It was anciently a bishop's see, and had twenty-two bishops successively. It has plenty of fish and fowl, but the air and soil are bad. It is three miles in compass, and has a town, a church, and castle, under which is a commodious harbour. It is encompassed with water at every flood, but sand at ebb. It lies not above a mile and a half from the land; from whence, at low water, people ride over to it.

## I R E L A N D.

## SITUATION, BOUNDARIES, AND EXTENT.

THE island of Ireland is situated on the west side of England, between 6 and 10 degrees west longitude, and between 51 and 55 degrees 20 minutes north latitude, or between the middle parallel of the eighth climate, where the longest day is 16½ hours, and the 24th parallel, or the end of the 10th climate, where the longest day is 17½ hours.

The extent or superficial content of this kingdom, is, from the nearest computation and survey, found to be in length 285 miles, from Fairhead north to Mifsenhead south; and from the East part of Down to the West part of Mayo, its greatest breadth 160 miles; containing 11,067,712 Irish plantation acres, which makes 17,927,864 acres of English statute measure, and bearing proportion to England and Wales as 18 to 30. Mr. Templeman, who makes the length 275, and the breadth 159 miles, gives it an area of 27,457 square miles, with 127 inhabitants to each. From the east part of Wexford to St. David's in Wales, it is reckoned 45 miles, but the passage between Donaghadee and Portpatrick in Scotland is little more than 20 miles, and the passage from Holyhead in North Wales about 52 miles.

NAMES AND DIVISIONS. } Many conjectures have been formed as to the Latin  
ANCIENT AND MODERN. } (Hibernia) the Irish (Eria) as well as the English name  
of this island. It probably takes its rise from a Phœnician or Gaelic term, signifying the farthest habitation westward.

It is pretty extraordinary, that even modern authors are not agreed as to the divisions of Ireland; some dividing it into five circuits, and some into four provinces, those of Leinster, Ulster, Connaught, and Munster. The last division is the most common, and likewise the most ancient. We shall therefore, in the first place, give this, and then subjoin the other distribution into Circuits.

<i>Provinces.</i>	<i>Counties.</i>	<i>Chief Towns.</i>
Leinster, 12 counties.	Dublin	Dublin
	Louth	Drogheda
	Wicklow	Wicklow
	Wexford	Wexford
	Longford	Longford
	East Meath	Trim
	West Meath	Mullingar
	King's County	Phillipstown
	Queen's County	Maryborough
	Kilkenny	Kilkenny
	Kildare	Naas and Athy
	Carlow	Carlow
Ulster, 9 counties.	Down	Down Patrick
	Armagh	Armagh
	Monaghan	Monaghan
	Cavan	Cavan
	Antrim	Carrickfergus
	Londonderry	Derry
	Tyrone	Omagh
	Fermanagh	Enniskillen
	Donegall	Lifford
Connaught, 5 counties.	Leitrim	Carrick on Shannon
	Roscommon	Roscommon
	Mayo	Ballinrobe and Castlebar
	Sligo	Sligo
	Galway	Galway
Munster, 6 counties.	Clare	Ennis
	Cork	Cork
	Kerry	Tralee
	Limerick	Limerick
	Tipperary	Clonmel
Waterford	Waterford	

But

But for the convenience of administering justice, the circuits are laid out in the *five* following allotments:

Leinster Circuit, 7 Counties	{ Kildare Wicklow Wexford Carlow Kilkenny King's County Queen's County Waterford Tipperary
Munster Circuit, 6 Counties	{ Cork Kerry Limerick Clare in the province of Connaught.
Ulster North-west Circuit, 7 Counties	{ West Meath } in the province of Leinster Longford } Cavan Fermanagh Tyrone Donegal Londonderry
Ulster North-East Circuit, 6 Counties	{ Meath, or East Meath } in the province of Leinster Louth } Down } Armagh Monaghan Antrim
Connaught Circuit, 5 counties	{ Roscommon Leitrim Sligo Mayo Galway.

Dublin county, and the county of the city of Dublin, are two separate jurisdictions, and the laws in both are administered under special commissions, or at quarter sessions; the former at Kilmainham, and the latter in the court of king's bench in the said city.

CLIMATE, SEASONS, AND SOIL.] The climate of Ireland differs not much from that of England, except that it is more moist. From the reports of various registers it appears, that the number of days on which rain had fallen in Ireland, was much greater than in the same years in England. But without the evidence of registers, it is certain, that moisture (even without rain) is not only more characteristic of the climate of this island than of that of England, but is also one of its worst and most inconvenient qualities. This is accounted for by observing, that "the westerly winds, so favourable to other regions, and so benign even in this, by qualifying the rigour of the northern air, are yet hurtful in the extreme. Meeting with no lands on this side of America to break their force, and proving in the general too powerful for the counteraction of the shifting winds, from the eastern and African continents, they wait hither the vapours of an immense ocean. By this cause, the sky in Ireland is much obscured; and, from the nature of rest and condensation,

denfation, thefe vapours defcend in fuch conftant rains, as threaten deftruction to the fruits of the earth in fome feafons. This unavoidable evil from natural caufes is aggravated by the increafe of it from others, which are either moral or political. The hand of induftry hath been long feebly exerted in a country, where almoft every advantage muft be obtained from its labour, and where difcouragements to the labourer muft neceffarily produce a ftate of languor. Ever fince the neglect of agriculture in the ninth century, the rains of fo many ages, fubfiding on the lower grounds, have converted moft of the extenfive plains into mofly morafles, and near a tenth part of this beautiful ifle is become a repository for ftagnated waters, which, in the courfe of evaporation, impregnate the air with noxious exhalations.\* But, in other refpects, the climate of Ireland is more agreeable than that of England; the fummers being cooler, and the winters lefs fevere. The piercing frofts, the deep fnows, and the dreadful effects of thunder and lightning, which are fo frequently obferved in the latter kingdom, are never experienced here.

The dampnefs above alluded to, being peculiarly favourable to the growth of grafs, has been ufed as an argument why the inhabitants fhould confine their attention to the rearing of cattle, to the total defertion of tillage, and confequent injury to the growth of population; but the foil is fo infinitely various, as to be capable of almoft every fpecies of cultivation fuitable to fuch latitudes, with a fertility equal to its variety. This is fo confpicuous, that it has been obferved by an Englifh traveller, that "natural fertility, acre for acre, over the two kingdoms, " is certainly in favour of Ireland; of this I believe there can fcarcely be a doubt " entertained, when it is confidered that fome of the more beautiful, and even beft " cultivated counties in England owe almoft every thing to the capital art and induftry of its inhabitants."

We fhall conclude this article with the further sentiments of the fame author, (Mr. Young) whofe knowledge of the fubject, and candour in this refpect, are unimpeachable.

"The circumftance which ftrikes me as the greateft fingularity of Ireland, is the rockinefs of the foil, which fhould feem at firft fight againft that degree of fertility; but the contrary is the fact. Stone is fo general, that I have great reafon to believe the whole ifland is one vaft rock of different ftrata and kinds rifing out of the fea. I have rarely heard of any great depths being funk without meeting with it. In general it appears on the furface in every part of the kingdom; the flattest and moft fertile parts, as Limerick, Tipperary, and Meath, have it at no great depth, almoft as much as the more barren ones. May we not recognise in this the hand of bounteous providence, which has given, perhaps, the moft ftony foil in Europe to the moifteft climate in it? If as much rain fell upon the clays in England, (a foil very rarely met with in Ireland, and never without much ftone) as falls upon the rocks of her fifter ifland, thofe lands could not be cultivated. But the rocks here are clothed with verdure; thofe of lime-ftone, with only a thin covering of mould, have the foftest and moft beautiful turf imaginable.

"The rockinefs of the foil in Ireland is fo univerfal, that it predominates in every fort. One cannot ufe with propriety the terms, clay, loam, fand, &c. it muft be a ftony clay, a ftony loam, a gravelly fand. Clay, efpecially the yellow, is much talked of in Ireland, but it is for want of proper difcrimination. I have once or twice feen almoft a pure clay upon the furface, but it is extremely rare. The true yellow clay is ufually found in a thin ftratum, under the furface mould, and over a rock; harfh, tenacious, ftony, ftrong loams, difficult to work, are not uncommon, but they are quite different from Englifh clays.

\* O'Connot's Difertations.

" Friable

" Friable sandy loams, dry, but fertile, are very common, and they form the best soils in the kingdom for tillage and sheep. Tipperary and Roscommon abound particularly in them. The most fertile of all are the bullock-pastures of Limerick, and the banks of the Shannon in Clare, called the Corcaffes. These are a mellow, putrid, friable loam.

" Sand, which is so common in England, and yet more common through France, Germany, and Poland, quite from Gibraltar to Peterburgh, is no where met with in Ireland, except in narrow slips of hillocks, upon the sea-coast. Nor did I ever meet with, or hear of, a chalky soil.

" Besides the great fertility of the soil, there are other circumstances, which come within my sphere to mention. Few countries can be better watered by large and beautiful rivers; and it is remarkable that by much the finest parts of the kingdom are on the banks of these rivers. Witness the Suir, the Blackwater, the Liffey, the Boyne, the Nore, the Barrow, and part of the Shannon. They wash a scenery that can hardly be exceeded. From the rockiness of the country, however, there are few of them that have not obstructions, which are great impediments to inland navigation.

" The mountains of Ireland give to travelling that interesting variety, which a flat country can never abound with. And, at the same time, they are not in such number as to confer the usual character of poverty which attends them. I was either upon or very near the most considerable in the kingdom. Mangerton and the Keeks, in Kerry; the Galties in Cork; those of Mourne in Down; Crow Patrick and Nephin, in Mayo; these are the principal in Ireland, and they are of a character in height and sublimity, which should render them the object of every traveller's attention."

Pasturage, tillage, and meadow ground abound in this kingdom; but of late tillage was too much discountenanced, though the ground is excellent for the culture of all grains; and in some of the northern parts of the kingdom abundance of hemp and flax are raised, a cultivation of infinite advantage to the linen manufacture. Ireland rears vast numbers of black cattle and sheep, and the wool is excellent. Prodigious supplies of butter and salt provisions (fish excepted) are shipped at Cork, and carried to all parts of the world.

The bogs of Ireland are very extensive: that of Allen extends 80 miles, and is computed to contain 300,000 acres. There are others of nearly equal magnitude, and smaller ones scattered over the whole kingdom, the pearls of which are very useful for fuel.

RIVERS, BAYS, HARBOURS, } The numerous rivers, enchanting lakes, spacious  
AND LAKES. } bays, commodious havens, harbours, and creeks, with which Ireland abounds, greatly enrich and beautify this country. The Shannon issues from Lough Allen, in the county of Leitrim, serves as a boundary between Connaught and the three other provinces, and after a course of 150 miles, forming in its progress many beautiful lakes, it falls into the Atlantic Ocean, between Kerry-point and Loop-head, where it is nine miles broad. The navigation of this river is interrupted by a ridge of rocks spreading quite across it, south of Killaloe; but this might be remedied by a short canal, at the expence of 10 or 12,000*l.* and communications might also be made with other rivers, to the great benefit of the nation. The Ban falls into the ocean near Coleraine, the Boyne falls into St. George's Channel at Drogheda, as does the Liffey at the bay of Dublin, and is only remarkable for watering that capital, where it forms a spacious harbour. The Barrow, the Nore, and the Suir, water the south part of the kingdom, and, after uniting their streams below Ross, they fall into the channel at Waterford Haven.

But the bays, havens, harbours, and creeks, which every where indent the coast, form the chief glory of Ireland, and render that country peculiarly well fitted for foreign

foreign commerce. The most considerable are those of Carrickfergus, Strangford, Dundrum, Carlingford, Dundalk, Dublin, Waterford, Dungarvan, Cork, Kinsale, Baltimore, Glandore, Dunmanus, Bantry, Kenmare, Dingle, Shannon-mouth, Galway, Sligo, Donegall, Killebegs, Lough-Swilly, and Lough-Foyle.

Ireland contains a vast number of lakes, or, as they were formerly called, loughs, particularly in the provinces of Ulster and Connaught. Many of them produce large quantities of fine fish; and the great lake Neagh, between the counties of Antrim, Down, and Armagh, is remarkable for its petrifying quality. Some of the Irish lakes afford the most beautiful and romantic prospects, particularly that of Killarney, which takes its name from a small town in the county of Kerry. This lake, which may be divided into three, is entirely surrounded with mountains, rocks, and precipices, the immense declivities of which are covered with woods, intermixed with evergreens, from near their tops to the lakes themselves; among which are a number of rivulets tumbling over the precipices, some from heights of little less than 300 feet. On the top of one of the surrounding mountains is a round lake of about a quarter of a mile in diameter, called the Devil's Punch Bowl. From the surface of the lake to the top of the cavity, or brim of the bowl, may be about 300 yards, and when viewed from the circular top, the broad expanse of water below exhibits a very romantic appearance. The depth of it is great, but not unfashionable as the natives pretend. The discharge of the superfluous waters of this bowl, through a chasm into the middle lake, forms a fine cascade, near 150 yards in height. The echoes amongst the hills surrounding the southern part of the lake, which is mostly inclosed, are equally delightful and astonishing. The proprietor, the earl of Kenmore, has placed some cannon in the most proper places, the discharge of which is at first tremendous, but which gradually dies away among the distant mountains. Here also musical instruments, especially the French horn and trumpet, afford the most delightful entertainment, and raise a concert superior to that of a hundred performers. Among the vast and craggy heights that surround the lake, is one stupendous and frightful rock, the front of which towards the water is a most horrid precipice, called the *Eagle's nest*, from the number of those birds which have their nests in that place. Though these loughs, in the main, have but few properties that are not in common with the like bodies of water in other countries, yet they have given rise to many traditionary fables among the natives, which disfigure and disgrace their true history; and even modern geographers have been more copious on that head than the nature of their subject required. The Irish are so fond of loughs, that, like the Scots, they often give that term to inlets of the sea.

[ISLAND NAVIGATION.] The inland navigation of Ireland is very improvable, as appears from the canals that have lately been cut through different parts of the kingdom; one in particular reaching an extent of 60 miles, between the Shannon and the Liffey at Dublin, which opens a communication from the Channel to the Atlantic Ocean. In surveying the grounds for this canal, it was found necessary to carry it through a bog 24 miles over, which, from the spongy nature of that soil, became a work of incredible labour and expence, in strengthening the sides, and other works, to prevent falling in.

[MOUNTAINS.] The Irish language has been more happy in distinguishing the size of mountains than perhaps any other. A *knock* signifies a low hill, unconnected with any other eminence; *neve* marks a craggy high mountain, gradually ascending and continued in several ridges; a *bienn*, or *binn*, signifies a pinnacle, or mountain of the first magnitude, ending in a sharp or abrupt precipice. The two last are often seen and compounded together in one and the same range. Ireland however, when compared with some other countries, is far from being mountainous. The mountains of Mourne and Iveagh, in the county of Down, are reckoned among

among some of the highest in the kingdom; of which Slieu-Denard has been calculated at a perpendicular height of 1056 yards. Many other mountains are found in Ireland, some of which contain in their bowels beds of minerals, coals, stone, slate and marble, with veins of iron, lead, and copper.

**FORESTS.**) The chief forests in Ireland lie in Leinster, the King's and Queen's counties, and those of Wexford and Carlow. In Ulster there are great forests, and in the county of Donegall, and in the north part of Tyrone; also in the county of Fermanagh, along Lough Erne, and in the north part of the county of Down, wherein is some good timber.

**METALS AND MINERALS.**) The mines of Ireland are late discoveries. Several contain silver and lead, and it is said that thirty pounds of their lead-ore produce a pound of silver; but the richest silver mine is at Wicklow. A copper and lead-mine have been discovered at Tipperary; as likewise iron-ore, and excellent free-stone for building. In one part of the kingdom is a stream of water, very much impregnated with copper, which yields great quantities of that metal. The method taken to obtain it, is by putting broad plates of iron into a place where the water falls from some height, so that they may receive the whole power of the falling water. The acid, which holds the copper in solution, lets it fall in order to dissolve the iron, to which it has a stronger affinity. On the iron the other metal appears in its proper form incrusting the plate, and gradually penetrating it; so that at last a plate of copper is left instead of iron. Hence it is said by the vulgar, that this water has a power of changing iron into copper; but this is a mistake, for the iron is all dissolved and carried down the stream by the acid, which formerly held the copper in solution, while the latter, deprived of its solvent, which then rendered it invisible, only makes its appearance when the water lets it fall. Some of the Irish marble quarries contain a kind of porphyry, being red striped with white. Quarries of fine slate are found in most of the counties. The coals that are dug at Kilkenny emit very little smoke; and it contains a crystalline stream which has no sediment. Those peculiarities, with the serenity of the air in that place, have given rise to the well-known proverb, That Kilkenny contains fire without smoke, water without mud, and air without fog.

**VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.** } There is little that falls under this head that is peculiar to Ireland, her productions being much the same with those of England and Scotland. Ireland affords excellent turf and moss, which are of vast service for firing, where wood and coals are scarce. A few wolves were formerly found in Ireland; but they have been long since exterminated by their wolf-dogs, which are much larger than mastiffs, shaped like greyhounds, yet as gentle and governable as spaniels. What I have already observed about the Irish exportation of salt provisions, sufficiently evinces the prodigious number of hogs and sheep, as well as black cattle, bred in that kingdom. Rabbits are said to be more plentiful there than in England. The fishes on the Irish coast are said to be more plentiful than on the English; some of them larger and more excellent in their kind.

**POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.** ) At the commencement of the present century, the numbers in Ireland were thought to be about two millions; whereas, in 1072, there were, according to Sir William Petty, no more than 1,100,000. But from the accounts laid before the House of commons in 1786, (as returned by the hearth-money collectors) the number of houses in Ireland amounted to 474,234. Now, adding to that the increase of people, and also the numbers intentionally or unavoidably overlooked in such returns, we may reasonably conclude that the present actual amount is 500,000.

We are next to consider what average number of persons we should allow to each house. In the peasants' cottages in Ireland (perhaps the most populous in the world)

world) Mr. Young in some parts found the average 6 and  $6\frac{1}{2}$ ; others have found it in different places to be 7; and Dr. Hamilton, in his account of the island of Raghery, enumerates the houses, and discovered the average therein to be 8. In the cities and principal towns, the houses, particularly in the manufacturing parts, generally contain several families; and from different accounts, the numbers in such are from ten, up so high as seventy\*. The averages, however, of different writers on the population of cities, vary between 10 and 13.

From such data then, it will not perhaps be erroneous, if we fix the average for the whole island, at eight persons to each house; which, multiplied by the number of houses, makes the population of Ireland amount to four millions.

As to the manners of the ancient Irish, Dr. Leland observes, that if we make our inquiries on this subject from English writers, we find their representations odious and disgusting: if from writers of their own race, they frequently break out into the most animated encomiums of their great ancestors. The one can scarcely allow them any virtue: the other, in their enthusiastic ardour, can scarcely discover the least imperfection in their laws, government, or manners. The historian of England sometimes regards them as the most detestable and contemptible of the human race. The antiquary of Ireland raises them to an illustrious eminence, above all other European countries. Yet, when we examine their records, without regard to legendary tales or poetic fiction, we find them, even in their most brilliant periods, advanced only to an imperfect civilization; a state which exhibits the most striking instances both of the virtues and the vices of humanity.

With respect to the present descendants of the old Irish, or, as they are termed by the protestants, the *mere Irish*, they are generally represented as an ignorant, uncivilized, and blundering sort of people. Impatient of abuse and injury, they are implacable and violent in all their affections; but quick of apprehension, courteous to strangers, and patient of hardships. Though in these respects there is, perhaps, little difference between them and the more uninformed part of their neighbours, yet their barbarisms are more easy to be accounted for from accidental than natural causes. By far the greatest number of them are Papists, and it is the interest of their priests, who govern them with an absolute sway, to keep them in profound ignorance. They have also laboured under many discouragements, which in their own country have prevented the exertion both of their mental and bodily faculties; but when employed in the service of foreign princes, they have been distinguished for courage and fidelity. Many of their surnames have an *O*, or *Mac*, placed before them, which signify grandson and son: formerly the *O* was used by their chiefs only, or such as piqued themselves upon the antiquity of their families. Their music is the bag-pipe, but their tunes are generally of a melancholy strain; though some of the latest airs are lively, and, when sung by an Irishman, extremely diverting. The old Irish is generally spoken in the interior parts of the kingdom, where some of the ancient uncouth customs still prevail, particularly their funeral howlings; which custom may be traced in many countries of the continent. Their practice of placing a dead corpse before their doors, laid out upon tables, having a plate upon the body to excite the charity of passengers, is practised even in the parts of Dublin, though one would wish to see it abolished. Their convivial meetings on Sunday afternoon, with dancing to the bagpipe, and more often quarrelling among themselves, is offensive to every stranger. But, as we have already observed, these usages are chiefly confined to the more unpolished provinces of the kingdom, particularly Connaught; the common people there having the least sense of law and government of any in Ireland, while their tyrannical landlords or lease-

\* Dr. Tisdal enumerated the inhabitants of two parishes in Dublin in 1731, and averaged the number in each house at  $12\frac{1}{2}$ . The numbers varied from 10 to 70.

holders squeeze the poor without mercy. The common Irish, in their manner of living, seem to resemble the ancient Britons, as described by Roman authors, or the present Indian inhabitants of America. Mean huts or cabins built of clay and straw, partitioned in the middle by a wall of the same materials, serve double purposes, one part accommodating the family, who live and sleep promiscuously, having their fires of turf in the middle of the floor, with an opening through the roof for a chimney; the other being occupied by a cow, or such pieces of furniture as are not in immediate use.

Their wealth consists of a cow, sometimes a horse, some poultry, and a spot for potatoes. Coarse bread, potatoes, eggs, milk, and fish, constitute their food; for however plentifully the fields may be stocked with cattle, these poor natives seldom taste butcher's meat of any kind. Their children, plump, robust, and hardy, scarcely know the use of cloaths, and are not ashamed to appear naked on the roads, and gaze upon strangers.

In this idle and deplorable state many thousands have been lost to the community and themselves, who, if they had but an equal chance with their neighbours, of being instructed in the real principles of Christianity, and had been enured and encouraged to industry and labour, would have added considerable strength to the empire.

The Spaniards and French, particularly the latter, have not failed to avail themselves of the uncomfortable situation in which the Irish were at home, by alluring them to enter their service; but we have now the pleasing prospect of a happy reformation among these people, in consequence of the late laws passed by the parliament of Great Britain in favour of Ireland, as well as from the numerous English protestant working schools lately established over the kingdom; which institutions will undoubtedly strike deep at the root of popery, and of that laziness and ignorance by which it is attended.

The descendants of the English and Scots, since the conquest of Ireland by Henry II. though not the most numerous, form the wealthiest part of the nation. Of these are most of the nobility, gentry, and principal traders, who inhabit the eastern and northern coasts, where most of the trade of Ireland is carried on; especially Belfast, Londonderry, and other parts of the province of Ulster, which, though the poorest soil, is, next to Dublin and its neighbourhood, the best cultivated and most flourishing part of the kingdom. Here a colony of Scots, in the reign of James I. and other prebyterians, who fled from persecution in that country, in the succeeding reigns, planted themselves, and established that great staple of Irish wealth, the linen manufactory, which they have since carried on and brought to the utmost perfection. From this short review it appears, that the present inhabitants are composed of three distinct classes of people; the old Irish, poor, ignorant, and formerly depressed, who inhabit, or rather exist, upon the interior or western parts; the descendants of the English, who inhabit Dublin, Waterford, and Cork, and who gave a new appearance to the whole coast facing England, by the introduction of arts, commerce, science, and more liberal and cultivated ideas of the true God and primitive Christianity; thirdly, emigrants from Scotland in the northern provinces, who, like the others, are so zealously attached to their own religion and manner of living, that it will require some ages before the inhabitants of Ireland are so thoroughly consolidated and blended as to become one people. The gentry, and better sort of the Irish nation, in general differ little in language, dress, manners, and customs, from those of the same rank in Great Britain, whom they imitate. Their hospitality is well known, but in this they are sometimes suspected of more ostentation than real kindness.

RELIGION.] The established religion and ecclesiastical discipline of Ireland is the same with that of England. Among the bulk of the people, in the most un-

cultivated parts, popery, of the most absurd and illiberal kind, is prevalent. The Irish Papists still retain their nominal bishops and dignitaries, who subsist on the voluntary contributions of their votaries. But even the blind submission of the latter to their clergy does not prevent Protestantism from making a very rapid progress in the towns. How far it may be the interest of England, that some kind of balance between the two religions should be kept up, I shall not here inquire. Ireland contains at least as many sectaries as England, particularly Presbyterians, Baptists, Quakers, and Methodists, who are all of them connived at, or tolerated. Great efforts have been made, ever since the days of James I. in erecting free-schools, for civilising and converting the Irish Papists. The institution of the incorporated society, for promoting English Protestant working-schools, though of no older date than 1717, has been amazingly successful, as have many institutions of the same kind, in introducing industry and knowledge. Toward promoting these useful purposes, the parliament of Ireland has been uncommonly liberal; but many of its grants have been mismanaged or misapplied.

**ARCHBISHOPRICKS AND BISHOPRICKS.]** The archbishopricks are four; Armagh, Dublin, Cashel, and Tuam.

The bishopricks are eighteen, viz. Clogher, Clonfert, Cloyne, Cork, Derry, Down, Dromore, Elphin, Kildare, Killala, Killala, Leighlin, Limerick, Meath, Ossory, Raphoe, and Waterford.

**LANGUAGE.]** The language of the Irish is fundamentally the same with the British and Welch, and a dialect of the Celtic, which is made use of by the Scotch Highlanders, opposite the Irish coasts. It is, however, in a great measure defaced by provincial alterations, but not so altered as to render the Irish, Welch, and Highlanders, unintelligible to each other. The usage of the Irish language occasions among the common people, who speak both that and the English, a disagreeable tone in speaking, which diffuses itself among the vulgar in general, and even among the better sort, who do not understand Irish. It is probable, however, that a few ages hence the latter will be accounted among the dead languages.

**LEARNING AND LEARNED MEN.]** Learning seems to have been cultivated in Ireland at a very early period. Mr. O'Halloran says that the Irish "appear to have been, from the most remote antiquity, a polished people, and that with propriety they may be called, the Fathers of Letters." We are even told, that Egypt received arts and letters from Niulus the Phœnician, who is represented as the great ancestor of the Irish nation. But it has been observed that no literary monuments have yet been discovered in Ireland, earlier than the introduction of Christianity; and that the evidence of any transactions previous to this period, rests entirely on doubtful transcripts or fabulous tradition.

It is said, that when St. Patrick \* landed in Ireland, he found many holy and learned Christian preachers there, whose votaries were pious and obedient. Camden observes, that "the Irish scholars of St. Patrick profited so notably in Christianity, that, in the succeeding age, Ireland was termed *Santorum Patria*. Their monks so greatly excelled in learning and piety, that they sent whole flocks of most learned men into all parts of Europe, who were the first founders of Lieu-Dieu abbey, in Burgundy; of the abbey Bobie, in Italy; of Wirtzburg, in Franconia; St. Gall, in Switzerland; and of Malmbury, Lindisfarran, and many other monasteries in Britain." We have also the testimony of the Venerable Bede, that about the middle of the seventh century, many nobles, and other orders of the Anglo-Saxons, retired from their own country into Ireland, either for instruction,

\* It has been affirmed, that St. Patrick was a Scotchman; but Mr. O'Halloran denies this, and says that "it appears from the most authentic records, that Patrick was from Wales."

or for an opportunity of living in monasteries of stricter discipline: and that the Scots (as he styles the Irish) maintained them, taught them, and furnished them with books, without fee or reward: "a most honourable testimony," says lord Lyttleton, "not only to the learning, but likewise to the hospitality and bounty of that nation." Dr. Leland remarks, that a conflux of foreigners to a retired island, at a time when Europe was in ignorance and confusion, gave peculiar lustre to this seat of learning: nor is it improbable or surprising, that seven thousand students studied at Armagh, agreeably to the accounts of Irish writers, though the seminary of Armagh was but one of the many colleges erected in Ireland.

In modern times, the Irish have also distinguished themselves in the republic of letters. Archbishop Usher does honour to his country. Dean Swift, who was a native of Ireland, has perhaps never been excelled in the walks of wit, humour, and satire. The sprightliness of Farquhar's wit is well known to all lovers of the drama. And among the men of distinguished genius whom Ireland has lately produced, may also be particularly mentioned, sir Richard Steele, bishop Berkeley, Parnel, Sterne, and Goldsmith. Two of the ablest divines of this country were dissenters from the established church, Mr. Abernethy, and Dr. Leland. The sermons of the former upon the attributes are held to be one of the best systems of natural theology. He was deputed by the dissenters of Ulster to address the duke of Ormond, in a tour he made when lord Lieutenant, and his Grace was afterwards heard to say, that of all the young men who ever approached him on like occasions, he was most pleased with "the young man of Antrim." Dr. Leland's View of Ecclesiastical Writers, and other works, are equally known and admired.

UNIVERSITY.] Ireland contains but one university, which is denominated Trinity-college. It consists of two squares, in the whole of which are thirty-three buildings, of eight rooms each. Three sides of one of the squares are of brick, and the fourth is a very superb library, but being built of bad stone, it is unfortunately mouldering away. The inside is beautiful and commodious, and embellished with the busts of several ancient and modern worthies. A great part of the books on one side were collected by archbishop Usher, who was one of the original members of this body. The new square, three sides of which have been lately built by parliamentary bounty, and from thence called Parliament Square, is of hewn stone; and the front of it, next the city of Dublin, is ornamented with pilasters, festoons, &c. The provost's house has an elegant little front, entirely of Portland stone. The chapel is a very mean structure, as is also the old hall, wherein college exercises are performed: but the new hall, in which the members of the college dine, is a fair and large room. In their museum, is a set of figures in wax, representing females in every state of pregnancy. They are done upon real skeletons, and are the labours of almost the whole life of a French artist.

This seminary was founded and endowed by queen Elizabeth; but the original foundation consisted only of a provost, three fellows, and three scholars; which has, from time to time, been augmented to twenty-two fellows, seventy scholars, and thirty sizarars. However, the whole number of students is at present about four hundred; who are of three classes, fellow-commoners, pensioners, and sizarars, or servitors. The necessary annual expence of a fellow commoner, cloathing and books included, is about 100l; of a pensioner about 70l. A sizar receives his commons and instruction gratis; the number of these last is commonly about thirty. Of the fellows, seven are called seniors, and the annual income of each of these is about seven hundred pounds. The provostship is supposed to be worth three thousand pounds a year. Trinity-college has a power of conferring degrees of bachelors, masters, and doctors, in all the arts and faculties. The visitors are the chancellor or vice-chancellor, and the archbishop of Dublin.

**ANTIQUITIES AND CURIOSITIES, } I have already mentioned the wolf-dogs  
NATURAL AND ARTIFICIAL. } in Ireland. The Irish gos-hawks and ger-  
falcons are celebrated for their shape and beauty. The moose-deer is thought to  
have been formerly a native of this island, their horns being sometimes dug up of  
so great a size, that one pair has been found near eleven feet from the tip of the  
right horn to the tip of the left; but the greatest natural curiosity in Ireland is the  
Giants' Causeway in the county of Antrim, about eight miles from Colerain, which  
is thus described by Dr. Pococke, late bishop of Ossory, a celebrated traveller and  
antiquary. He says, "that he measured the most westerly point at high water, to  
the distance of 360 feet from the cliff; but was told, that at low water it extended  
60 feet farther upon a descent, till it was lost in the sea. Upon measuring  
the eastern point, he found it 540 feet from the cliff; and saw as much more of it  
as of the other, where it winds to the east, and is, like that, lost in the water.**

"The causeway is composed of pillars, all of angular shapes, from three sides to  
eight. The eastern point, where it joins the rock, terminates in a perpendicular  
cliff, formed by the upright sides of the pillars, some of which are thirty-three feet  
four inches high. Each pillar consists of several joints or stones, lying one upon  
another, from six inches to about one foot in thickness; and what is very surprising,  
some of these joints are so convex, that their prominences are nearly quarters of  
spheres, round each of which is a ledge, which holds them together with the great-  
est firmness, every stone being concave on the other side, fitting in the exactest  
manner the convexity of the upper part of that beneath it. The pillars are from  
one to two feet in diameter, and generally consist of about forty joints, most of which  
separate very easily, and one may walk along upon the tops of the pillars as far as  
to the edge of the water.

"But this is not the most singular part of this extraordinary curiosity, the cliffs  
themselves being still more surprising. From the bottom, which is of black stone,  
to the height of about sixty feet, they are divided at equal distances by stripes of a  
reddish stone, that resembles a cement, about four inches in thickness; upon  
this there is another stratum of the same black stone, with a stratum five inches  
thick of the red. Over this is another stratum ten feet thick, divided in the same  
manner; then a stratum of the red stone twenty feet deep, and above that a  
stratum of upright pillars; above these pillars lies another stratum of black stone,  
twenty feet high; and, above this again, another stratum of upright pillars, rising  
in some places to the tops of the cliffs, in others not so high, and in others again  
above them, where they are called the chimneys. The face of these cliffs extends  
about three English miles."

The cavities, the romantic prospects, cataraëts, and other pleasing and uncom-  
mon natural objects to be met with in Ireland, are too numerous to be called  
rarities, and several pamphlets have been employed in describing them. As to the  
artificial curiosities in Ireland, the chief are the round Pharos, or stone towers, found  
upon the coasts, and supposed to be built by the Danes and Norwegians in their  
piratical excursions, who made use of them as spy-towers or barbicans, light-houses  
or beacons.

**CITIES, TOWNS, FORTS, AND OTHER } Dublin, the capital of Ireland, is, in  
EDIFICES, PUBLIC AND PRIVATE. } magnitude and populousness, the second  
city in the British dominions, containing near 200,000 inhabitants. It is situated  
270 miles north-west of London, and near sixty miles west from Holyhead in North  
Wales, the usual station of passage vessels between Great Britain and Ireland.  
Dublin stands about seven miles from the sea, at the bottom of a large and spacious  
bay, to which it gives name, upon the river Liffey, which divides it almost into two  
equal parts, and is banked in through the whole length of the city, on both  
sides, which forms spacious and noble quays, where vessels, below the first bridge,  
load**

load and unload before the merchants' doors and ware-houses. A stranger, upon entering the bay of Dublin, which is about seven miles broad, and in stormy weather extremely dangerous, is agreeably surpris'd with the beautiful prospect on each side, and the distant view of Wicklow mountains; but Dublin, from its low situation, makes no great appearance. Dublin has greatly increased within twenty years last past, and it is generally supposed that 7000 houses have been added to the city and suburbs since the reign of queen Anne. The number of houses, in the year 1777, was 17,151, and there have been many new buildings erected since. In its appearance, this city bears a near resemblance to London. The houses are of brick; the old streets are narrow and mean, but the new streets are nearly as elegant as those of the metropolis of Great Britain. Sackville-street, which is sometimes called the Mall, is particularly noble. The houses are lofty, and uniformly built, and a gravel walk runs through the whole at an equal distance from the sides.

The river Liffey, though navigable as far as the custom-house, or centre of the city, is but small, when compared with the Thames at London. Over it are two handsome stone-bridges, lately built in imitation of that at Westminster, and there are four others that have little to recommend them. Formerly the centre of Dublin, towards the custom-house, was crowded and inconvenient for commercial purposes; but of late a new street has been opened, leading from Essex-bridge to the castle, where the lord-lieutenant resides. A new exchange has likewise been erected, an elegant structure of white stone, richly embellished with semi-column of the Corinthian order, a cupola, and other ornaments.

The barracks are pleasantly situated on an eminence near the river. They consist of four large courts, in which are generally quartered four battalions of foot, and one regiment of horse; from hence the castle and city guards are relieved daily. They are said to be the largest and completest building of the kind in Europe, being capable of containing 3000 foot and 1000 horse.

The linen hall was erected at the public expence, and opened in the year 1728, for the reception of such linen cloths as were brought to Dublin for sale, for which there are convenient apartments. It is entirely under the direction of the trustees, for the encouragement of the linen manufactory of Ireland, who are composed of the lord chancellor, the primate, the archbishop of Dublin, and the principal part of the nobility and gentry. This national institution is productive of great advantages, by preventing many frauds which otherwise would be committed in a capital branch of trade, by which many thousands are employed, and the kingdom greatly enriched.

Stephen's Green is a most extensive square, round which is a gravel walk of near a mile. Here genteel company walk in the evenings, and on Sundays after two o'clock; and in fine weather make a very gay appearance. Many of the houses round the green are very stately, but a want of uniformity is observable throughout the whole. Ample amends will be made for this defect by another spacious square near Stephen's Green, called Merrion-square, now laid out and partly built. The front of Trinity-college, extending above 300 feet, is built of Portland stone in the finest taste.

The parliament house was begun in 1729, and finished in 1739, at the expence of 40,000*l*. This superb pile was, in general, of the Ionic order, and was justly accounted one of the most celebrated architectural beauties. The portico, in particular, was perhaps without parallel; the internal parts had also many beauties; and the manner in which the building was lighted, has been much admired. This superb building, on the 27th of February 1792, was observed to be in flames, about 5 o'clock in the afternoon, when the house of Lords, as well as the Commons, was sitting, and in full debate. When the alarm was given, one of the members made

his

his way to the roof, and looking down into the house from one of the ventilators confirmed the apprehensions of those within, by saying the dome was surrounded by fire, and would tumble into the house in five minutes. The volume of fire, by which the dome was encompassed, soon made apertures on all sides, by melting the copper from the wood-work, and thus exhibiting the cavity of the dome filled with flames like a large furnace, which, at about half past six, tumbled into the house with one great crash. The valuable library, and all the papers of importance were saved.

But one of the greatest and most laudable undertakings that this age can boast of, is the building a stone wall about the breadth of a moderate street, and of a proportionate height, and three miles in length, to confine the channel of the bay, and to shelter vessels in stormy weather.

The civil government of Dublin is by a lord-mayor, &c. the same as in London. Every third year, the lord-mayor, and the twenty-four companies, by virtue of an old charter, are obliged to perambulate the city, and its liberties, which they call riding the franchises. Upon this occasion the citizens vie with each other in show and ostentation. In Dublin there are two large theatres, that are generally well filled, and which serve as a kind of nursery to those in London. In this city are 13 parish churches, 8 chapels, 3 churches for French, and 1 for Dutch protestants, 7 presbyterian meeting houses, 1 for methodists, 2 for quakers, and 16 Roman catholic chapels. A royal hospital, at some distance from the city, like that at Chelsea, for invalids; a lying-in hospital, with gardens, built and laid out in the finest taste; an hospital for lunatics, founded by the famous Dean Swift, who himself died a lunatic; and sundry other hospitals for patients of various kinds. Some of the churches have been lately rebuilt, and others are rebuilding with more taste. And, indeed, which ever way a stranger turns himself in this city, he will perceive marks of elegance; and if he extends his views over the whole kingdom, he will conclude that works of ornament and public utility are no where more encouraged than in Ireland, chiefly through the munificence of parliament.

It is, however, matter of surprize, that, with all this spirit of national improvement, few or no good inns are to be met with in Ireland. Even in the capital, there is not one inn which deserves that name. This may, in some measure, be accounted for by the long, and sometimes dangerous passage from Chester and Holyhead to Ireland, which prevents the gentry of England, with their families, from visiting that island; but as it is now proposed to make turnpike roads to Portpatrick in Scotland, from whence the passage is short and safe, the roads of Ireland may by this means become more frequented.

Cork is deservedly reckoned the second city in Ireland, in magnitude, riches, and commerce. It lies 129 miles south-west of Dublin, and contains above 8500 houses. Its haven is deep, and sheltered from all winds; but small vessels only can come up to the city, which stands about seven miles up the river Lee. This is the chief port of merchants in the kingdom; and there is, perhaps, more beef, tallow, and butter, shipped off here, than in all the other ports of Ireland together. Hence there is a great resort of ships to this port, particularly of those bound from Great Britain to Jamaica, Barbadoes, and all the Caribbee islands, which put in here to victual and complete their lading. It appears, that in the reign of Edward IV. there were eleven churches in Cork, though there are now only seven, and yet it has ever since that time been esteemed a thriving city; but it must be observed, that beside the churches, there are at this time six mass-houses, two dissenting meeting-houses, another for quakers, and a chapel for French protestants. Kinsale is a populous and strong town, with an excellent harbour, and considerable commerce and shipping; and it is, moreover, an excellent station for the royal navy; for which end this port is furnished with proper naval officers and storekeepers.

Waterford comes next to Cork for riches and shipping, and contains 2561 houses. It is commanded by Duncannon fort, and on the west-side of the town is a citadel. Limerick is a handsome, populous, commercial, strong city, it lies on both sides the Shannon, and contains 5257 houses.

Belfast is a large sea-port and trading town at the mouth of the Lagen Water, where it falls into Carrickfergus bay. Downpatrick has a flourishing linen manufacture. Carrickfergus (or Knockfergus), by some deemed the capital town of the province, has a good harbour and castle, but little commerce. Derry (or Londonderry, as it is most usually called) stands on Lough-Foyl, is a strong, but small city, having linen manufactures, with some commerce and shipping. This northern part of Ireland is situated so near to Scotland, that they are in sight of each other's coasts. Donegal, the county-town of the same name (otherwise called the county of Tyrconnel), is a place of some trade; as is likewise Enniskilling. All which last mentioned places, and others less considerable, are most industriously employed in the manufacturing of linen, and linen thread, to the great benefit of the whole kingdom; by the vast annual exportations of which into England, it is enabled to pay for the imports from thence; and likewise to render the money constantly drawn from Ireland into England, by her absentees, less grievous to her.

Though Ireland contains no strong places, according to the modern improvements in fortification, yet it has several forts and garrisons, that serve as comfortable sinecures to military officers. The chief are Londonderry and Culmore Fort, Cork, Limerick, Kinsale, Duncannon, Ross-Castle, Dublin, Charlemont, Galway, Carrickfergus, Maryborough, and Athlone. Each of these forts is furnished with deputy-governors, under various denominations, who have pecuniary provisions from the government.

It cannot be pretended, that Ireland can as yet boast of any public edifices, to compare with those to be found in countries where sovereigns and their courts reside, but it has some which do honour to the taste and public spirit of the inhabitants. The castle, Essex bridge, and several edifices about Dublin, already mentioned, are magnificent; noble Gothic churches abound; and the Irish nobility, and gentry of fortune, now begin to vie with those of England in the magnificent structure of their houses, and the elegance of their ornaments. In speaking of the public buildings of this kingdom, I must not forget the barracks where the soldiers are lodged, equally to their own convenience and that of the inhabitants.

COMMERCE AND MANUFACTURES.] The exports of Ireland are linen-cloth, yarn, lawns, and cambrics, horses, black cattle, beef, pork, green hides, tanned leather, calf skins dried, tallow, butter, candles, cheese, ox and cow-horns, ox-hair, horse-hair, lead, copper-ore, herrings, dried-fish, rabbit-skins, and fur, otter-skins, goat-skins, and salmon; but it is probable that the exports of Ireland will be greatly increased by the late laws passed in favour of the trade of that kingdom. The Irish have carried their inland manufactures, even those of luxury, to a considerable height, and their lord-lieutenants have of late greatly encouraged them.

COMMERCIAL INSTITUTIONS.] The Dublin society, for the encouragement of manufactures, and commerce, was incorporated 1750. The linen-hall, erected at Dublin, is under as just and nice regulations as any commercial house in Europe.

CONSTITUTION AND GOVERNMENT.] Ireland was formerly entituled, the dominion or lordship of Ireland, and the king's style was no other than Dominus Hibernie, lord of Ireland, till the 33d year of king Henry VIII. when he assumed the title of king, which is recognised by act of parliament in the same reign. But as England and Scotland are now one and the same kingdom, and yet differ in their municipal laws; so England and Ireland are distinct kingdoms, and yet in general agree

agree in their laws. For after the conquest of Ireland by king Henry II. the laws of England were received and sworn to by the Irish nation, assembled at the council of Lismore; and as Ireland, thus conquered, planted, and governed, continued in a state of dependence, it was thought necessary, that it should conform to, and be obliged by, such laws as the superior state thought proper to prescribe.

But this state of dependence being almost forgotten, and ready to be disputed by the Irish nation, it was thought necessary, some years ago, to declare how that matter stood: and therefore, by statute 6th of George I. it is declared, "that the kingdom of Ireland ought to be subordinate to, and dependent upon, the imperial crown of Great Britain, as being inseparably united thereto: and that the king's majesty, with the consent of the lords and commons of Great Britain, in parliament, hath power to make laws to bind the people of Ireland." This determination of the British parliament occasioned much dissatisfaction among the Irish, who at length, feeling their own strength by means of their volunteer associations, and encouraged and favoured by the several parties contending for the administration in England, obtained in the year 1782, a formal repeal of the above offensive statute, which was considered as a renunciation, on the part of the parliament of Great Britain, of every claim of legislation over Ireland.

The constitution of the Irish government, as it stands at present, with regard to distributive justice, is nearly the same with that of England. A chief governor, who generally goes by the name of lord-licutenant, is sent over from England by the king, whom he represents; but his power is in some measure restrained, and in others enlarged, according to the king's pleasure, or the exigency of the times. On his entering upon this honourable office, his letters patent are publicly read in the council-chamber; and having taken the usual oaths before the lord-chancellor, the sword, which is to be carried before him, is delivered into his hands, and he is seated in the chair of state, attended by the lord chancellor, the members of the privy-council, the peers and nobles, the king at arms, a serjeant at mace, and other officers of state; and he never appears publickly without being attended by a body of horse-guards. Hence, with respect to his authority, his train, and splendor, there is no viceroy in Christendom that comes nearer to the grandeur and majesty of a king. He has a council composed of the great officers of the crown; namely, the chancellor, treasurer, and such of the archbishops, earls, bishops, barons, judges, and gentlemen, as his majesty is pleased to appoint. The parliament here, as well as in England, is the supreme court, which is convened by the king's writ, and generally sits once every year. It consists, as in England, of a house of lords, and commons. Of the former, many are English or British peers, or commons of Great Britain; a few are papists, who cannot sit without being properly qualified; and the number of commons amounts to about three hundred. Since the accession of his present majesty, Irish parliaments have been rendered octennial. The representation of the people, in the senate of Ireland, is, in many instances, like that of England, partial, and imperfect. The acts passed by the house of lords and commons are sent to England for the approbation of his majesty and council, which having obtained, they pass the great seal of England, and are returned.

For the regular distribution of justice, there are in Ireland four terms held annually for the decision of causes; and four courts of justice, the chancery, king's-bench, common-pleas, and exchequer. The high sheriffs of the several counties were formerly chosen by the people, but are now nominated by the lord-licutenant. From this general view it appears, that the civil and ecclesiastical institutions are almost the same in Ireland as in England.

REVENUES.] In Ireland the public revenue arises from hereditary and temporary duties, of which the king is the trustee, for applying it to public purposes; but there is, besides this, a private revenue arising from the ancient demesne lands,  
from

from forfeitures for treason and felony, privilege of wines, light-house duties, and a small part of the casual revenue, not granted by parliament; and in this the crown has the same unlimited property that a subject has in his own freehold.

The revenue of Ireland amounts nearly to 1,000,000*l.* and the public expenditure exceeds that sum. The Irish complain greatly, that, of this revenue, about 70,000*l.* is granted in pensions, and a great part to absentees. Very large sums are also granted by their own parliament for more valuable purposes, the improvement of their country, and civilizing the people; such as the inland navigation, bridges, high-ways, churches, premiums, and protestant schools. In 1787 the national debt was 2,302,146*l.* chiefly contracted for national improvements.

**COINS.]** The coins of Ireland are at present of the same denominations and the like fabric with those of England, only an English shilling passes in Ireland for thirteen pence. What the ancient coins of the Irish were, is at present a matter of mere curiosity and great uncertainty.

**MILITARY STRENGTH.]** Ireland now maintains and pays an army of 15,000 men; and the military force of Ireland has been greatly increased by the many volunteer associated companies, which have been lately formed in that kingdom. Those parts of Ireland that are most cultivated, contain numbers of inhabitants that have very little sense either of divine or human laws; and regular forces are absolutely necessary for keeping them in order; witness the late insurrections of the Whiteboys, and other banditti, instigated, it is said, by their priests. Yet it does not appear that the bulk of the Irish Catholics are fond of a revolution in government, as few or none of them joined Thurot in his descent upon Carrickfergus, or took any part with the Pretender in the last rebellion.

**ORDER OF ST. PATRICK.]** This order was instituted February 5, and the installation of the first knights was performed on the 17th of March 1783. It consists of the sovereign and fifteen knights companions. The lord-lieutenants of Ireland for the time being officiate as grand masters of the order, and the archbishop of Armagh is the prelate, the archbishop of Dublin the chancellor, and the dean of St. Patrick, the register of the order. The knights are installed in the cathedral of St. Patrick, Dublin. Their robes are splendid, and the badge is three crowns united together on a cross, with the motto round, *Quis separabit?* 1783, fastened by an Irish harp to the crown imperial. A star of eight points encircles it on the coat.

**HISTORY.]** The history of Ireland has been carried to a very remote antiquity, and may, with greater justice than that of almost any other country, be distinguished into the legendary and authentic. In the reign of Edward II. an Ulster prince boasted to the pope of an uninterrupted succession of one hundred and ninety-seven kings of Ireland, to the year 1170. Even the more moderate Irish antiquaries carry their history up to about 500 years before the Christian era, at which time they assert, that a colony of Scythians, immediately from Spain, settled in Ireland, and introduced the Phœnician language and letters into that country: and that, however it might have been peopled still earlier from Gaul or Britain, yet Heber, Hereimon, and Ith, the sons of Milesius, gave a race of kings to the Irish, distinguished by the names of Gadelians, and Scuits, or Scots. But as our limits will not permit us to enlarge on the dark and contested part of the Irish history, we shall only observe, that it was about the middle of the fifth century that the great apostle of Ireland, St. Patrick, was employed in the propagation of Christianity in that kingdom, though Christian missionaries had been there long before. After this period, Ireland was occasionally invaded by the Saxon kings of England: but in the years 795 and 798 the Danes and Normans, or as they were called, the Easterlings, invaded its coasts, and were the first who erected stone edifices there. The common habitations of the Irish, till that time, were of hurdles covered with straw and rushes, and but very few of solid timber. The natives defended them-

selves bravely against the Easterlings, who built Dublin, Waterford, Limerick, Wexford, and Cork; but they resided chiefly at Dublin, or in its neighbourhood, which, by the old Irish, was called Fingal, or the Land of Strangers. The natives, about the year 962, seem to have called to their assistance the Anglo-Saxon king Edgar, who had then a considerable maritime power; and this might have given occasion for his clergy to call him king of Ireland. Dublin was about that time a flourishing city, and the native Irish gave the Easterlings several defeats, though supported by their countrymen from the continent, the Isle of Man, and the Hebrides.

In the twelfth century, Henry the Second of England formed a design of annexing Ireland to his dominions. He is said to have been induced to this by the provocations received from some of the Irish chieftains, who had afforded considerable assistance to his enemies. His design was patronised by the pope, and a fair pretext of attacking Ireland offered about the year 1168. Dermot Mac Murrough, king of Leinster, and an oppressive tyrant, quarrelled with all his neighbours, and carried off the wife of a petty prince, O'Roik. A confederacy being formed against him, under Roderic O'Connor (who, it seems, was the paramount king of Ireland) he was driven from his country, and took refuge at the court of Henry II. who promised to restore him, upon taking an oath of fealty to the crown of England, for himself, and all the petty kings depending on him, who were very numerous. Henry, who was then in France, recommended Mac Dermot's cause to the English barons, and particularly to Strongbow, earl of Pembroke, Robert Fitz Stephen, and Maurice Fitz Gerald. Those noblemen undertook the expedition upon much the same principles as the Norman and Breton lords did the conquest of England under William I. and Strongbow was to marry Mac Dermot's daughter Eva. In 1169, the adventurers reduced the towns of Wexford and Waterford; and the next year Strongbow arriving with a reinforcement, his marriage was celebrated.

The descendants of the Danes continued still possessed of Dublin, which, after some ineffectual opposition made by king O'Connor, was taken and plundered by the English soldiers; but Mac Turkil, the Danish king, escaped to his shipping. Upon the death of Dermot, Henry II. became jealous of earl Strongbow, seized upon his estate in England and Wales, and recalled his subjects from Ireland. The Irish, about the same time, to the amount of above 60,000, besieged Dublin, under king O'Connor; but though all Strongbow's Irish friends and allies had now left him, and the city was reduced to great extremity, he forced the Irish to raise the siege with great loss; and going over to England, he appeased Henry by swearing fealty to him and his heirs, and resigning into his hand all the Irish cities and forts he held. During Strongbow's absence, Mac Turkil, returning with a great fleet, attempted to retake the city of Dublin, but was killed at the siege; and in him ended the race of the Easterling princes in Ireland.

In 1172, Henry II. attended by 400 knights, 4000 veteran soldiers, and the flower of his nobility, landed near Waterford: and not only all the petty princes of Ireland, except the king of Ulster, but the great king Roderic O'Connor, submitted to Henry, who pretended that O'Connor's submission included that of Ulster, and that consequently he was the paramount sovereign of Ireland. Be that as it will, he affected to keep a magnificent court, and held a parliament at Dublin, where he parcelled out the estates in Ireland, as William the Conqueror had done in England, to his English nobility. He then settled a civil administration at Dublin, as similar as possible to that of England, to which he returned in 1173, having first settled an English colony from Bristol in Dublin, with all the liberties, free customs, and charters, which the citizens of Bristol enjoyed. From that time Dublin began to flourish. Thus the conquest of Ireland was effected by the English, almost with as much ease as that of Mexico was by the Spaniards; and for

much the same reasons, the rude and unarmed state of the natives, and the differences that prevailed among their princes or leaders.

Henry gave the title of lord of Ireland to his son John, who, in 1185, went over in person to Ireland; but John and his giddy Norman courtiers made a very ill use of their power, and rendered themselves odious to the Irish. Richard I. was too much taken up with the crusades to pay much regard to the affairs of Ireland; but king John, after his accession, made amends for his former misconduct. He enlarged his father's plan of introducing into Ireland English laws and officers, and he formed that part of the provinces of Leinster and Munster, which was within the English pale, into twelve counties; but the descendants of the ancient princes in other places paid him no more than a nominal subjection. They governed by their old Brehon laws, and exercised all acts of sovereignty within their own states; and indeed this was pretty much the case so late as the reign of James I. The unsettled reign of Henry III. his wars and captivity, gave the Irish a very mean opinion of the English government during his reign; but they seem to have continued quiet under his son Edward I. Gaveston, the famous favourite of Edward II. acquired great credit while he acted as lieutenant of Ireland; but the success of the Scotch king, Robert Bruce, had almost proved fatal to the English interest, and suggested to the Irish the idea of transferring their allegiance from the kings of England to Edward Bruce, king Robert's brother. That prince accordingly invaded Ireland, where he gave repeated defeats to the English governors and armies; and being supported by his brother in person, he was actually crowned king at Dundalk, and narrowly missed being master of Dublin. The younger Bruce seems to have been violent in the exercise of his sovereignty, and he was at last defeated and killed by Bermingham, the English general. After this Edward II. ruled Ireland with great moderation, and passed several excellent acts with regard to that country.

But during the minority of Edward III. the commotions were again renewed in Ireland, and were not suppressed without great loss and disgrace on the side of the English. In 1333 a rebellion broke out, in which the English inhabitants had no inconsiderable share. A succession of vigorous, brave governors, at last quieted the insurgents; and about the year 1361, prince Lionel, son to Edward III. having married the heiress of Ulster, was sent over to govern Ireland, and, if possible, to reduce its inhabitants to an entire conformity with the laws of England. In this he made a great progress, but did not entirely accomplish it. It appears, that at this time the Irish were in a very flourishing condition, and that one of the greatest grievances they complained of was, that the English sent over men of mean birth to govern them. In 1394, Richard II. finding that the execution of his despotic schemes in England must be abortive without farther support, passed over to Ireland with an army of 34,000 men, well armed and appointed. As he made no use of force, the Irish regarded his presence as a high compliment to their nation, and admired the magnificence of his court. Richard, on the other hand, courted them by all the arts he could employ, and bestowed the honour of knighthood on their chiefs. In short, he behaved so as entirely to win their affections. But in 1399, after having acted in a very despotic manner in England, he undertook a fresh expedition into Ireland, to revenge the death of his lord-lieutenant the earl of March, who had been killed by the wild Irish. His army again struck the natives with consternation, and they threw themselves upon his mercy. It was during this expedition, that the duke of Lancaster landed in England; and Richard, upon his return, finding himself deserted by his English subjects on account of his tyranny, and that he could not depend upon the Irish, surrendered his crown to his rival.

The Irish, after Richard's death, still retained a warm affection for the house of York;

York; and upon the revival of that family's claim to the crown, embraced its cause. Edward IV. made the earl of Desmond lord- lieutenant of Ireland for his services against the Ormond party, and other adherents of the house of Lancaster, and he was the *first Irish chieftain* that obtained this honour. Even the accession of Henry VII. to the crown of England did not reconcile the Irish to his title as duke of Lancaster; they therefore readily joined Lambert Simnel, who pretended to be the eldest son of Edward IV. but for this they paid dear, being defeated in their attempt to invade England. This made them somewhat cautious at first of joining Perkin Warbeck, who was, however, at last recognized as king by the Irish, of whose pretensions the event has been already related in the preceding pages under the history of England. Henry behaved with moderation towards his unfortunate partizans, and was contented with requiring the Irish nobility to take a fresh oath of allegiance to his government. This lenity had the desired effect, during the administration of the two earls of Kildare, the earl of Surry, and the earl of Ormond. Henry VIII. governed Ireland by supporting its chiefs against each other; but the emperor Charles V. endeavouring to gain them to his interest, Henry made his natural son, the duke of Richmond, his lord- lieutenant. This did not prevent the Irish from breaking out into rebellion in the year 1540, under Fitz Gerald, who had been lord deputy, and was won over by the emperor, but was at last hanged at Tyburn. After this, the house of Austria found their account, in their quarrels with England, to form a strong party among the Irish.

About the year 1542, James V. king of Scotland, formed some pretensions to the crown of Ireland, and was favoured by a strong party among the Irish themselves. It is hard to say, had he lived, what the consequence of his claim might have been. Henry understood that the Irish had a mean opinion of his dignity, as the kings of England had hitherto assumed no higher title than that of lords of Ireland. He therefore took that of king of Ireland, which had a great effect with the native Irish, who thought that allegiance was not due to a lord; and, to speak the truth, it was somewhat surprising that this expedient was not thought of before. It produced a more perfect submission of the native Irish to Henry's government, than ever had been known; and even O'Neil, who pretended to be successor to the last paramount king of Ireland, swore allegiance to Henry, who created him earl of Tyrone.

The pope, however, and the princes of the house of Austria, by remitting money and sometimes sending over troops to the Irish, still kept up their interest in that kingdom, and drew from them vast numbers of men to their armies, where they proved as good soldiers as any in Europe. This created inexplicable difficulties to the English government, even in the reign of Edward VI. but it is remarkable, that the Reformation took place in the English part of Ireland with little or no opposition. The Irish seem to have been very quiet during the reign of queen Mary; but they proved thorns in the side of queen Elizabeth. The perpetual disputes she had with the Roman catholics both at home and abroad, gave her great uneasiness; and the pope and the house of Austria always found new resources against her in Ireland. The Spaniards possessed themselves of Kinsale; and the rebellions of Tyrone, who baffled and outwitted her favourite general the earl of Essex, are related in the English history.

The lord-deputy Mountjoy, who succeeded Essex, was the first Englishman who gave a mortal blow to the practices of the Spaniards in Ireland, by defeating them and the Irish before Kinsale, and bringing Tyrone prisoner to England; where he was pardoned by queen Elizabeth in 1602. This lenity, shewn to such an offender, is a proof of the dreadful apprehensions Elizabeth had from the popish interest in Ireland. James I. confirmed the possessions of the Irish; but such was the influence of the pope and the Spaniards, that the earls of Tyrone and Tyrconnel, and their party, planned a new rebellion, and attempted to seize the castle of Dublin; but their

plot

plot being discovered, their chiefs fled beyond seas. They were not idle abroad, for in 1628 they instigated Sir Calin O'Dogharty to a fresh rebellion, by promising him speedy supplies of men and money from Spain. Sir Calin was slain, and his adherents were taken and executed. The attainders of the Irish rebels, which passed in the reigns of James and Elizabeth, vested in the crown 511,464 acres, in the several counties of Donegall, Tyrone, Fermanagh, Coleraine, Cavan, and Armagh; and enabled the king to make that protestant plantation in the North of Ireland, which now, from the most rebellious province of the kingdom, is the most quiet and most industrious.

Those prodigious attainders, however just and necessary they might be, operated fatally for the English in the reign of Charles I. The Irish Roman Catholics, in general, were influenced by their priests to hope not only to recover the lands of their forefathers, but to restore the popish religion in Ireland. They therefore entered into a deep and detestable conspiracy for massacring all the English protestants in that kingdom. In this they were encouraged by the unhappy dissensions that broke out between the king and his parliaments in England and Scotland. Their bloody plan being discovered by the English government at Dublin, prevented that city from falling into their hands. They, however, partly executed, in 1641, their horrid scheme of massacre; but authors have not agreed as to the numbers who were murdered; perhaps they have been exaggerated by warm protestant writers, some of whom make them "amount to an hundred and fifty, or two hundred thousand; but the most moderate, and probably the most reasonable account is, that they "were about forty thousand \*." What followed in consequence of this rebellion, and the reduction of Ireland by Cromwell, who retaliated the cruelties of the Irish papists, belongs to the history of England. It is certain they snarred so severely, that they were quiet during the reign of Charles II. His popish successor and brother James II. even after the Revolution took place, found an asylum in Ireland; and was encouraged to hope, that, by the assistance of the natives there, he might remount his throne; but he was deceived, and his own pusillanimity co-operated with his disappointment. He was driven out of Ireland by his son-in-law, after the battle of the Boyne, the only victory that king William ever gained in person; a victory, however, on which depended the safety of the protestant religion, and the liberties of the British empire. Had James been victorious, he probably would have been seated on the throne, and nothing else could be expected than that being irritated by opposition, victorious over his enemies, and free from every restraint, he would have trampled upon all rights, civil and religious, and pursued more arbitrary designs than before. The army of William consisted of 36,000 men, that of James of 33,000 advantageously posted. But James fought at the head of an undisciplined rabble; and his French auxiliaries were far from behaving like heroes.

The forfeitures that fell to the crown, on account of the Irish rebellions and the Revolution, are almost incredible; and had the acts of parliament which gave them away been strictly enforced, Ireland must have been peopled with British inhabitants. But many political reasons occurred for not driving the Irish to despair. The friends of the Revolution and the Protestant religion were sufficiently gratified out of the forfeited estates. Too many of the Roman Catholics might have been forced abroad; and it was proper that a due balance should be preserved between the Roman Catholic and the Protestant interest. It was therefore thought prudent to relax the reins of government, and not to put the forfeitures too rigorously into execution. The experience of half a century has confirmed the wisdom of the above considerations. The lenity of the measures pursued toward the Irish Roman Catholics, and the great pains taken for the instruction of their children, with the

\* See Hume's Hist. of England vol. vi. p. 377. 8vo. edit.

progress which knowledge and the arts made in that country, greatly diminished the popish interest. The spirit of industry enabled the Irish to know their own strength and importance; towards which effect some accidental circumstances concurred. All her ports were opened for the exportation of wool and woollen yarn to any part of Great Britain; and of late years, acts of parliament were made occasionally for permitting the importation of salt beef, pork, butter, cattle, and tallow, from Ireland to Great Britain.

But though some laws and regulations had occasionally taken place favourable to Ireland, it must be acknowledged, that the inhabitants of that country laboured under considerable grievances, in consequence of sundry injudicious restraints of the parliament of England respecting their trade. These restraints had injured Ireland without benefiting Great Britain. The Irish had been prohibited from manufacturing their own wool, in order to favour the woollen manufactory of England; the consequence of which was, that the Irish wool was smuggled over into France, and the people of that country were thereby enabled to rival us in our woollen manufacture, and to deprive us of a part of that trade. An embargo had also been laid on the exportation of provisions from Ireland, which had been extremely prejudicial to that kingdom. The distresses of the Irish manufacturers, as well as those of Great Britain, had likewise been much increased by the consequences of the American war. These circumstances occasioned great murmuring in Ireland, and some unsuccessful attempts were made for the relief of the inhabitants of that kingdom, in the British parliament. But a large body of the king's troops being withdrawn from Ireland, in order to be employed in the American war, a considerable number of Irish gentlemen, farmers, traders, and other persons, armed and formed themselves into volunteer associations, for the defence of Ireland against foreign invaders. By degrees, these volunteer associations became numerous and well-disciplined: and it was soon discovered, that they were inclined to maintain their rights at home, as well as to defend themselves against foreign enemies. When these armed associations became numerous and formidable, the Irish began to assume an higher tone than that to which they had before been accustomed; and it was soon manifest, that their remonstrances met with unusual attention, both from their own parliament and from that of Great Britain. The latter, on the 11th of May 1779, presented an address to the king, recommending to his majesty's most serious consideration the distressed and impoverished state of the loyal and well-servicing people of Ireland, and desiring him to direct that there should be prepared, and laid before parliament, such particulars relative to the trade and manufactures of Great Britain and Ireland, as should enable the national wisdom to pursue effectual measures for promoting the common strength, wealth, and commerce of his majesty's subjects in both kingdoms. To this address the king returned a favourable answer: and in October, the same year, both houses of the Irish parliament also presented addresses to his majesty, in which they declared, that nothing but granting Ireland a free trade could save it from ruin. Notwithstanding which, it being soon after suspected by many of the people of that kingdom, that the members of their parliament would not exert themselves with vigour in promoting the interests of the nation, a very daring and numerous mob assembled before the parliament-house in Dublin, crying out for a *free trade*, and a *short money-bill*. They assaulted the members, and endeavoured to compel them to swear, that they would support the interest of their country by voting for a short money-bill; and they demolished the house of the attorney general. The tumult at length subsided; and two Irish money-bills, for six months only, were sent over to England, where they passed the great seal, and were immediately returned, without any dissatisfaction being expressed by government at this limited grant.

In the mean time, the members of the opposition, in the British parliament,

very strongly represented the necessity of an immediate attention to the complaints of the people of Ireland, and of a compliance with their wishes. The arguments on this side of the question were also enforced by the accounts which came from Ireland, that the volunteer associations in that kingdom amounted to forty thousand men, unpaid, self-appointed, and independent of government, well armed and accoutred, daily improving in discipline, and which afterwards increased to eighty thousand. The British ministry appeared for some time undetermined what part they should take in this important business: but the remembrance of the fatal effects of rigorous measures respecting America, and the very critical situation of Great Britain, at length induced the first lord of the treasury to bring in such bills as were calculated to afford effectual commercial relief to the people of Ireland. Laws were accordingly passed, by which all those acts were repealed, which had prohibited the exportation of woollen manufactures from Ireland, and other acts by which the trade of that kingdom to foreign countries had been restrained; and it was likewise enacted, that a trade between Ireland and the British colonies in America, and the West Indies, and the British settlements on the coast of Africa, should be allowed to be carried on in the same manner, and subject to similar regulations and restrictions, with that carried on between Great Britain and the said colonies and settlements.

These laws in favour of Ireland were received with much joy and exultation in that kingdom: and the Irish nation, being indulged in their requisitions respecting trade, now began also to aim at important constitutional reformations. In various counties and cities of Ireland, the right of the British parliament to make laws which should bind that kingdom was denied in public resolutions. By degrees, the spirit which had been manifested by the Irish parliament seemed a little to subside; and a remarkable instance of this was, their agreeing to a perpetual mutiny bill, for the regulation of the Irish army, though that of England had always been passed, with a true constitutional caution, only from year to year. This was much exclaimed against by some of the Irish patriots; and it is indeed not easy to clear their parliament from the charge of inconsistency: but this bill was afterwards repealed, and the commercial advantages offered them by late acts in their favour, have greatly contributed to promote the prosperity of Ireland. As before observed, by the act repealing the statute of the 6th of George I. they are now fully and completely emancipated from the jurisdiction of the British parliament. The supreme jurisdiction of the British house of peers in Irish causes was also given up, and the political connection which so long subsisted between the two nations is now reduced to this one circumstance, that both being governed by the same king, Ireland is necessarily subject to the imperial crown of Great Britain. But though the Irish have obtained so great an extension of their liberties, it is very questionable whether this will terminate to their country's real advantage: their parties and dissensions increase, and the controversy with England is far from being ended; much remaining to establish such a commercial and political connection between the two kingdoms, as will promote the interest and happiness of both, and make them one great, stable, and invulnerable body.

In the year 1783, the government, the nobility, and the people of Ireland, vied with each other in countenancing, and giving an asylum to many families of the Genevese, who were banished from their city, and to others who voluntarily exiled themselves for the cause of liberty, not willing to submit to an aristocracy of their own citizens, supported by the swords of France and Sardinia. A large tract of land in the county of Waterford was allotted for their reception, a town was marked out, named *New Geneva*, and a sum of money granted for erecting the necessary buildings. These preparations for their accommodation were, however, rendered ultimately useless, by some misunderstandings (not fully comprehended), which arose between the parties; and the scheme accordingly fell to the ground.

Upon the occasion of the unhappy malady with which the king was afflicted, in

the autumn of 1788, the lords and commons of Ireland came to a resolution to address the prince of Wales, requesting him to take upon him the government of that kingdom during his Majesty's indisposition, under the style and title of *Prince Regent of Ireland*, and to exercise and administer, according to the laws and constitution of the realm, all the royal authorities, jurisdictions, and prerogatives, to the crown and government thereof belonging. The Marquis of Buckingham, being then lord lieutenant, having declined presenting the address, as contrary to his oath and the laws, the two houses resolved on appointing delegates from each: the lords appointed the duke of Leinster, and the earl of Charlemont; and the commons, four of their members. The delegates proceeded to London, and presented the address to his royal highness, by whom they were most graciously received; but his majesty having, to the infinite joy of all his subjects, recovered from his severe indisposition, the prince returned them an answer fraught with the warmest sentiments of regard for the kingdom, and of gratitude to parliament, for the generous manner in which they proposed investing him with the regency, but, that the happy recovery of his royal father had now rendered his acceptance of it unnecessary.

The parliament of Ireland has extended liberal indulgences to the Roman Catholics of that kingdom, by establishing the legality of intermarriage between them and the Protestants, by admitting them to the profession of the law, and the benefit of education, and by removing all obstructions upon their industry in trade and manufacture. A reciprocal preference in the corn-trade with Britain has been established. Further progress has been made in checking the immoderate use of spirituous liquors; and some wise institutions have been ordained for the regulation of charitable foundations.

In the year 1793, in consequence of the concessions of government, a bill passed the legislature, by which the Roman Catholics, being freeholders, are entitled to vote for members to serve in parliament. The patriots of Ireland have been less successful, in their attempt to procure a reform of parliament itself, as notwithstanding the resolution in the beginning of the session to inquire into the state of the representation, nothing effectual has been done; the times discouraging useful innovations from the just dread of ruinous or hurtful ones.

Early in the session of this year, a secret committee of the house of lords was formed to inquire into the rise and progress of that seditious spirit, which appeared in different parts of the kingdom. After some time spent in the inquiry, the secret committee made a report of their discoveries, in which they declared that seditious clubs and meetings had been held in various parts of the kingdom, and that several of these advocates for liberty had assumed the national cockade, appeared in arms, and committed various insults upon the established modes of government. The lord lieutenant and council, therefore, issued a proclamation, grounded on the above report, directing the magistrates and peace officers of the town of Belfast, and the districts adjacent, to disperse all seditious and unlawful armed assemblies, and if they shall be resisted, to apprehend the offenders, that they may be dealt with according to law.

The embodying of the militia in this kingdom has created riots and disturbances in different places. At Castlereagh in particular, on the 28th of June 1793, several persons were killed, and the mob withstood a party of the military for several hours. Subsequent to that time there have been various meetings of rioters and armed men in the other parts of the kingdom, and in attempting to quell them, the military have been obliged to kill many, and have dispersed the insurgents, at the expence of several of their own men.

The government of Ireland, apprehensive of the consequences which might attend popular meetings, have passed into a law, an act "to prevent illegal assemblies

Biscay,

blies of the people." Upon the second reading of this bill in the house of commons, July the 17th, Mr. Grattan opposed it with great freedom and boldness, asserting that the bill would disturb that tranquillity which it affected to preserve. He adduced some of the first law-authorities, Coke, Blackstone, and Hawkins—all of whom, he said, agree in declaring that no assembly can be unlawful, unless they meet to carry an illegal purpose into effect, or to effect a legal purpose in an illegal manner, or assemble in such circumstances as naturally induce terror and apprehension for the public peace, as when a number of men meet *armed* in order to redress grievances, &c. and those assemblies described by the bill were not of this class, since a meeting of peaceable men only, for the purpose of promoting a petition to parliament, was attended with none of those circumstances of terror.—In the house of lords a protest was entered against its committal, signed *Leinster, Arran, and Charlemont*, upon the ground that the law was already sufficient to prevent really riotous and illegal meetings, and that the present bill would restrain the subject in the exercise of some of his dearest rights.

The bill enacts that all persons assembling under the plea of being *elected to represent* the people of this realm, for the purpose of petitioning for an alteration of matters established by law in church and state, shall and may be apprehended by any sheriff or peace-officer. But the act provides that nothing therein contained shall tend to prevent the undoubted right of his majesty's subjects to petition his majesty, or either or both houses of parliament, for redress of any public or private grievances.

F R A N C E.

**H**AVING gone over the kingdom of Ireland, we shall now return to the continent, beginning with the extensive and mighty kingdom of France, being the nearest to England; though part of Germany and Poland lies to the northward of France.

**NAME AND CLIMATE.]** France took its name from the Franks, or *Freemex*, a German nation, restless and enterprising, who conquered the Gauls, the ancient inhabitants; and the Roman force not being able to repress them, they were permitted to settle in the country by treaty. By its situation, it is the most compact kingdom perhaps in the world, and well fitted for every purpose both of power and commerce; and since the beginning of the 15th century, the inhabitants have availed themselves of many of their natural advantages. The air, particularly that of the interior parts of the kingdom, is, in general, mild and wholesome;

\* France, nearly a square, was divided into 83 DEPARTMENTS, including Corsica. Every department is subdivided into DISTRICTS, in all 547; and each district into CANTONS. The above are the chief towns of each department, and also of the

districts. The new department of Savoy, which forms the 84th, is not added, it being at present uncertain whether it will continue its connection with France.

but

\* It is

but some late authors think it is not nearly so salubrious as is pretended; and it is well known that the French are singularly prone to exaggerate the benefits of their climate, as well as all their other advantages. It must indeed be owned, that their weather is more clear and settled than in England. In the northern provinces, however, the winters are more intensely cold, and the inhabitants not so well supplied with firing, which in France is chiefly of wood.

**SOIL AND WATER.]** France is happy in an excellent soil, which produces corn, wine, oil, and almost every luxury of life. Some of their fruits have a higher flavour than those of England, but neither the pasturage nor tillage are comparable to ours. The heats in many parts parch the ground, and destroy the verdure, and the soil barely produces as much rye and chefnuts as serve to subsist the poor inhabitants; but the chief misfortune attending the French soil is, that the inhabitants, having been uncertain of enjoying the full fruits of their labour, have not applied themselves sufficiently to agriculture\*. Notwithstanding great efforts made to produce this effect, much of the land remains uncultivated; and although some provinces, as Alsace and Languedoc, yield an exuberance of corn, yet this article is frequently imported. Indeed all Europe, one year with another, does not produce sufficient corn for its own consumption, and it is necessary to have supplies from America, whose inhabitants are almost entirely employed in agriculture.

The French lately endeavoured to supply the loss arising from their precarious title to their lands, by instituting academies of agriculture, and proposing premiums for its improvements, as in England; but those expedients, however successful they may be in particular instances, can never become of general utility in any but a free country, where the husbandman is sure of enjoying the fruit of his labour, which is far from being the case in the present distracted state of their public affairs. No nation is better supplied than France is, with wholesome springs and water; of which the inhabitants make excellent use, by the help of art and engines, for all the conveniences of life. Of their canals and mineral waters, distinct notice will be hereafter taken.

**MOUNTAINS.]** The chief mountains in France, or its borders, are the Alps, which divide France from Italy; the Pyrenees, which divide France from Spain; Vauze, which divides Lorraine from Burgundy and Alsace; Mount Jura, which divides Franche Compté from Switzerland; the Cevennes, in the province of Languedoc; and Mont D'Or, in the province of Auvergne.

**RIVERS AND LAKES.]** The principal rivers in France are the Loire, the Rhone, the Garonne, and the Seine. The Loire takes its course north and north-west, being, with all its windings, from its source to the sea, computed to run about 500 miles. The Rhone flows on the south-west to Lyons, and then runs on due south till it falls into the Mediterranean. The Garonne rises in the Pyrenean mountains, takes its course, first north-east, and has a communication with the Mediterranean by means of a canal, the work of Lewis XIV. The Seine, soon after its rise, runs to the north-west, visiting Troyes, Paris, and Rouen, in its way, and falls into the English channel at Havre. To these we may add the Saone, which falls into the Rhone at Lyons; the Charente, which rises near Havre de Grace, and discharges itself into the bay of Biscay at Rochefort; the Rhine, which rises in Switzerland, is the eastern boundary between France and Germany, and receives the Moselle and the Sarre in its passage; the Somme, which runs north-west through Picardy, and falls into the English channel below Abbeville; the Var, which rises in the Alps, and runs south, dividing France from Italy, and falling into the Mediterranean, west of Nice. The Adour runs from east to west, through Gascony, and falls into the bay of Biscay, below Bayonne.

\* It is computed that, of this extensive kingdom, only 36 millions of acres are cultivated.

The vast advantage, both in commerce and conveniency, which arises to France from these rivers, is wonderfully improved by the artificial canals which form the chief glory of the reign of Lewis XIV. That of Languedoc was begun in the year 1666, and completed in 1680: it was intended for a communication between the ocean and the Mediterranean, for the speedier passage of the French fleet; but though it was carried on at an immense expence, for 100 miles, over hills and vallies, and even through a mountain in one place, it has not answered the end in view. By the canal of Calais, travellers easily pass by water from thence to St. Omer, Graveline, Dunkirk, Ypres, and other places. The canal of Orleans is another noble work, and runs a course of eighteen leagues, to the immense benefit of commerce and the revenue. France abounds with other canals of the like kind, which render her inland navigation highly commodious and beneficial.

Few lakes are found in this country. There is one at the top of a hill near Aigre, which the vulgar report to be bottomless. There is another at Issoire, in Auvergne; and one at La Besse, in which if you throw a stone, it causes a noise like thunder.

**MINERAL WATERS AND } REMARKABLE SPRINGS. }** The waters of Bareges, which lie near the borders of Spain, under the Pyrenean mountains, have of late been preferred for salubrity to all others in France. The best judges think, however, that the cures performed by them, are more owing to their accidental success with some great persons, and the driness of the air and soil, than to the virtue of the waters. The waters of Sultzbach in Alsace are said to cure the palsy, weak nerves, and the stone. At Bagneres, not far from Bareges, are several wholesome minerals and baths, to which people resort, as to the English baths, at spring and autumn. Forges, in Normandy, is celebrated for its mineral waters; and those of St. Amand cure the gravel and obstructions. It would be endless to enumerate all the other real or pretended mineral wells in France, as well as many remarkable springs; but there is one near Aigne in Auvergne, which boils violently, and makes a noise like water thrown upon lime; it has little or no taste, yet possesses a poisonous quality, and the birds that drink of it die instantly.

**METALS AND MINERALS. }** France has many unworked *mines*, which would be very productive, if duly attended to, but at present do not yield minerals sufficient for consumption; steel alone is imported, to the annual value of 125,000*l*. Languedoc is said to contain veins of gold and silver. Alsace has mines of silver and copper, but not rich enough to bear the expence of working them. Alabaster, black marble, jasper and coal, are found in many parts of the kingdom. Bretagne abounds in mines of iron, copper, tin, and lead. Saltpetre is made in every part of the kingdom, and *sea-salt* is now procured free from oppressive duty, but not remarkable for its purity. At Laverdau, in Coninges, there is a mine of chalk. At Berry there is a mine of oker, which aids the fusion of metals, and is used for dyeing, particularly the best drab cloths; and in the province of Anjou, are several quarries of fine white stone. Some excellent turquoises (the only gem that France produces) are found in Languedoc; and great care is taken to keep the mines of marble and free-stone open all over the kingdom.

**VEGETABLE AND ANIMAL PRO- } DUCIONS BY SEA AND LAND. }** France abounds in excellent roots, in all kinds of seasoning and fallads, and in excellent fruits of all kinds, particularly grapes, figs, prunes, chestnuts, cyder in the northern provinces, and capers in the southern. It produces annually, though not enough for consumption, above twelve million pounds of tobacco, besides hemp, flax, manna, saffron, and many drugs. Alsace, Burgundy, Lorraine, and especially the Pyrenean mountains, supply it plentifully with timber and other wood.

\* In  
stant,  
his way  
emer of  
the free  
was rev

wood. Silk is so plentifully produced, besides what is imported, as to afford a considerable trade. The cattle and horses are neither very numerous, nor very good, but it has many flocks of fine *sheep*; yet so great is the consumption, that both sheep and wool are imported. The province of Gatinois produces great quantities of saffron; 1,600,000 acres are laid out in vineyards. The wines of Champagne, Burgundy, Gascony, Bourdeaux, and other provinces of France, are so well known, that they need only be mentioned. It is sufficient to observe, that though they differ very sensibly in their taste and properties, yet all of them are excellent, particularly those of Champagne, Burgundy, Bourdeaux, Hermitage, and Frontinac; and there are few constitutions, be they ever so valetudinary, to which some one or other of them is not adapted.

Wine, the staple, is made to the value of 15,000,000*l.* annually, more than an eighth part of which, besides brandy and vinegar, was exported. Olive-oil is made in large quantities, particularly in the provinces next the Mediterranean; but the consumption is so great, that much of it is imported from Italy: the inferior sort supplies the soap manufactories, of which there are thirty-six at Marseilles.

Oak, elm, ash, and other timber, common in England, is found in France; but it is said, that the internal parts of the kingdom begin to feel the want of fuel. A great deal of salt is made at Rhee, and about Rochefort, on the coast of Saintonge. Languedoc produces the herb kali, which, when burnt, makes excellent barilla, or pot-ashes. The French formerly were famous for horticulture, but they are at present far inferior to the English, both in the management and disposition of their gardens. Prunes and capers are produced at Bourdeaux and near Toulon.

France contains few animals, either wild or tame, that are not to be found in England, except wolves. Their horses, black cattle, and sheep, are far inferior to the English; nor is the wool of their sheep so fine. The hair and skins of the chamois or mountain goats are very valuable. We know of no difference between the marine productions of France and those of England, but that the former is not so well served, even on the sea-coasts, with salt-water fish. There is a considerable herring-fishery, and one for anchovies, to the annual amount of 83,000*l.* besides more important fisheries upon the coast of America and Newfoundland.

FORESTS.] The chief forests of France are those of Orleans, which contain 14,000 acres of wood of various kinds, oak, elm, ash, &c. and the forest of Fontainebleau near as large; and near Morehismoir is a forest of tall, straight timber, of 4000 trees. Besides these, large numbers of woods, some of them deserving the name of forests, lie in different provinces; but too remote from sea-carriage to be of much national utility.

POPULATION, INHABITANTS, MANNERS, } According to the latest and best  
CUSTOMS, AND DIVERSIONS. } calculations, France contains at present about 25,000,000 of inhabitants. It was lately supposed by some speculative men, that the population of France had for many years been upon the decline; but, upon an accurate investigation, the reverse appeared to be the fact; though this country certainly lost a great number of valuable inhabitants by the revocation of the edict of Nantes\*. The proportion of the people of England, to those of France, is asserted to be as 1 to 14.

The French, in their persons, are rather lower than their neighbours; but they are well proportioned and active. The ladies are celebrated more for their spright-

\* In the year 1598, Henry IV. who was a Protestant, and justly styled the Great, after fighting his way to the crown of France, passed the famous edict of Nantes, which secured to the Protestants the free exercise of their religion; but this edict was revoked by Lewis XIV. which, with the succeeding persecutions, drove that people to England, Holland, and other Protestant countries, where they established the silk manufacture, to the great prejudice of the country that persecuted them, and no less to the advantage of that which received them.

ly wit than personal beauty; the peasantry in general were remarkably ordinary, and were best described by being contrasted with those of the same rank in England. The nobility and gentry accomplished themselves in the academical exercises of dancing, fencing, and riding, in the practice of which they excelled. They were fond of hunting; and the gentry, before the Revolution, had left off their heavy jack-boots, their huge war-saddle, and monstrous curb-bridle in that exercise, and accommodated themselves to the English fashion.

The genius and manners of the French are well known, and have been the subject of many able pens. A national vanity is their predominant foible; and they are perhaps the only people who have derived great utility from this weakness. It confirms their sense of honour, supports them under misfortunes, and impels them to actions to which true courage inspires other nations. This character has been conspicuous both in the higher and middling ranks, where it produces excellent officers; and in the common soldiers of France, who, it must be confessed, in the present war against the allied powers, have discovered prodigies of valour.

This lively people display freedom and wit in their conversation. Their diversions are much the same with those of the English, but their gallantry is of a very different complexion. Their attention to the fair degenerates into gross soppery in the men, and in the ladies it is sometimes kept up by the admission of indecent freedoms; but the seeming levities of both sexes are seldom attended with that criminality which, to people not used to their manners, they seem to indicate; nor are the husbands so indifferent, as strangers are apt to imagine, about the conduct of their wives. The French are excessively credulous and litigious; but of all people in the world, they bear depression of fortune with the best grace; though in prosperity many of them are apt to be insolent, vain, arbitrary, and imperious.

The French are, or rather were, eminently distinguished for their politeness and good manners, which may be traced, though in different proportions, through every order of society. Indeed, the polished mildness of French manners, and the gay and sociable turn of the nation, have been much censured for insincerity; but this charge has been carried too far, and the imputation is generally owing to their excess of civility, which throws a suspicious light upon their candour. The French, in private life, have certainly many amiable qualities, and a great number of instances of generosity and disinterestedness may be found amongst them.

The French long possessed the lead in taste, fashion, and dress; but it seems now to be in the wane, and, before the present troubles, they thought very favourably of the English. People of fashion in France then studied the English language, and imitated them in their customs, amusements, dress, and buildings. They imitated and admired our writers; the names of Bacon, Locke, Newton, Milton, Pope, Addison, Hume, Robertson, Richardson, and many others of the last and present century, were sacred among the French of any education; and, to say the truth, the writings of such men have equally contributed, with our military reputation, to raise the name of Great Britain to that degree in which it is now held by foreign nations; and to render the knowledge of our language an ornamental and almost necessary accomplishment. But we cannot quit this article of the manners and customs of the French, without giving a more minute view of some striking peculiarities recently prevailing among this people, from the remarks of a late ingenious traveller, who was also distinguished by various other productions in polite literature.

“The natural levity of the French, says Smollett, is reinforced by the most profligate education, and the example of a giddy people, engaged in the most frivolous pursuits. A Frenchman is, by some priest or monk, taught to read his mother tongue,

tongue, and to say his prayers in a language he does not understand. He learns to dance and to fence by the masters of those sciences. He becomes a complete coiffeur in dressing hair, and in adorning his own person, under the hand and intructions of his barber and valet-de-chambre. If he learns to play upon the flute or the fiddle, he is altogether irresistible. But he piques himself upon being polished above the natives of any other country, by his conversation with the fair sex. In the course of this communication, with which he is indulged from his tender years, he learns like a parrot, by rote, the whole circle of French compliments, which are a set of phrases, ridiculous even to a proverb; and these he throws out indiscriminately to all women without distinction, in the exercise of that kind of address which is here distinguished by the name of gallantry. It is an exercise, by the repetition of which he becomes very pert, very familiar, and very impertinent. A Frenchman, in consequence of his mingling with the females from his infancy, not only becomes acquainted with all their customs and humours, but grows wonderfully alert in performing a thousand little offices, which are overlooked by other men, whose time hath been spent in making more valuable acquisitions. He enters, without ceremony, a lady's bed-chamber while she is in bed, reaches her whatever she wants, airs her shift, and helps to put it on. He attends at her toilette, regulates the distribution of her patches, and advises where to lay on the paint. If he visits her when she is dressed, and perceives the least impropriety in her coiffure, he insists upon adjusting it with his own hands. If he sees a curl, or even a single hair amiss, he produces his comb, his scissors, and pomatum, and sets it to rights with the dexterity of a professed friseur. He squires her to every place he visits, either on pleasure or business; and, by dedicating his whole time to her, renders himself necessary to her occasions. In short, of all the coxcombs on the face of the earth, a French *petit-maitre* is the most impertinent; and they are all *petits-maitres*, from the marquis who glitters in lace and embroidery, to the *garçon barbier* (barber's boy) covered with meal, who struts with his hair in a long queue, and his hat under his arm.

"A Frenchman will sooner part with his religion than his hair. Even the soldiers in France wear a long queue; and this ridiculous foppery has descended to the lowest class of people. The boy who cleans shoes at the corner of a street has a tail of this kind hanging down to his rump; and the beggar who drives an ass, wears his hair *en queue*, though, perhaps, he has neither shirt nor breeches.

"I shall only mention one custom more, which seems to carry human affectation to the very farthest verge of folly and extravagance: that is, the manner in which the faces of the ladies are primed and painted. It is generally supposed, that part of the fair sex, in some other countries, make use of *sard* and vermilion for very different purposes; namely, to help a bad or faded complexion, to heighten the graces, or conceal the defects of nature, as well as the ravages of time. I shall not inquire whether it is just and honest to impose in this manner on mankind; if it is not honest, it may be allowed to be artful and politic, and shews at least a desire of being agreeable. But to lay it on, as the fashion in France prescribes to all the ladies of condition, who indeed cannot appear without this badge of distinction, is to disguise themselves in such a manner, as to render them odious and detestable to every spectator who has the least relish left for nature and propriety. As for the *sard*, or *white*, with which their necks and shoulders are plaitered, it may be in some measure excusable, as their skins are naturally brown, or fallow; but the *rouge*, which is daubed on their faces, from the chin up to the eyes, without the least art or dexterity, not only destroys all distinction of features, but renders the aspect really frightful, or at least conveys nothing but the idea of disgust and aversion. Without this horrible mask, no married lady is admitted at court, or in any polite assembly;

assembly; and it is a mark of distinction, which none of the lower classes dare assume."

The above picture of French manners, before the revolution, is drawn with wit and spirit, and is in some respects highly characteristic; but it is certainly not a flattering portrait, and the faults and failings of this vivacious people are too much magnified. With all their defects, the French had many good qualities, paid great attention to strangers; and a general taste for literature prevailed among those in the better ranks of life.

**DRESS.]** The dress of both sexes is well known, but is, however, so variable, that it is next to impossible to describe it. They certainly have more invention in that particular than any of their neighbours, and their frequently changing their fashions was of infinite service to their manufactures.

**RELIGION.]** By the laws of the new constitution, no man is to be molested for his opinions, nor interrupted in the exercise of his religion. The territorial possessions of the Gallican church have been claimed as national property, and disposed of, through the medium of a paper money called assignats, for the creditors of the state; and the clergy made dependent upon pensionary establishments paid out of the national treasury; out of which also is paid the expences of worship, the religious, and the poor. All monastic establishments are suppressed; but the present friars and nuns are allowed to observe their vows, and the nuns optionally to remain in their convents, or retire upon pensions.

The clergy are elective by the people, and take an oath to observe the laws of the new constitution\*. They notify to the bishop of Rome their union in doctrine, but do not pay him fees, nor acknowledge any subordination to his authority. They are supplied with lodgings upon their livings, wheron they are obliged to reside, and perform the duties of their office. They vote as active citizens, and are eligible to some lay-offices in the districts, but to no principal ones.

**ARCHBISHOPRICKS, BISHOPRICKS, &c.]** France, divided into nine metropolitan circles, has a **METROPOLITAN BISHOP** with a **synod** in each, besides one for Paris. The metropolitan bishop is confirmed by the eldest bishop in his circle. Appeals are made from the bishops to these synods.

A **BISHOP** is appointed to each of the eighty-three *departments*, which form so many dioceses. They are appointed by the electoral assembly of the department, and confirmed by the metropolitan bishop, but must have held an ecclesiastical office fifteen years. The salaries are from 500l. to 840l. per annum. Each diocese has also a *seminary*, with three vicars and a vicar general, to prepare students for holy orders; and these vicars form a council for the bishop.

**VICARS** of bishops are chosen by the bishop, from among the clergy of his diocese, who have done duty ten years. The salaries are from 84l. to 250l. per annum.

**MINISTERS** of parishes or cures in the districts are confirmed by the bishop, and they must have been vicars to ministers five years. They have salaries from 50l. to 116l. per annum, and, when infirm, receive pensions.

**VICARS** of ministers are chosen by the minister, from among the priests admitted in the diocese by the bishop, and receive salaries from 30l. to 100l. sterling per annum.

France contains more than two millions of non-catholics; and the *protestants*, who are greatly increasing, are, in proportion to the catholics, as 1 to 12. There are already many regular congregations, viz. German Lutherans, French and Swiss Calvinists, Bohemian anabaptists, and Walden or Flemish dissenters, besides many chapels for the ambassadors. It also contains many Jews.

\* Many of the clergy, called *refractory priests*, from a conscientious refusal of this oath, have been ejected from their benefices, and many of the popular curates made bishops.

LANGUAGE.] One of the wisest measures of Lewis XIV. was his encouragement of every proposal that tended to the purity and perfection of the French language. His munificence, with other concurring causes, rendered it the most universal of all the living tongues. The French is chiefly composed of words radically Latin, with many German derivatives introduced by the Franks. It is now rather on the decay; its corner stones, fixed under Lewis XIV. are as it were loosened; and in the present mode of writing, and expressing themselves, the modern French too often abandon that grammatical standard, which alone can render a language classical and permanent.

As to the properties of the language, it wants the dignity and energy of the English, but is well adapted to subjects void of elevation or passion, and well accommodated to dalliance, compliments, and common conversation.

The Lord's prayer in French is as follows: *Notre père qui es aux cieux, ton nom soit sanctifié. Ton regne vienne. Ta volonté soit faite en la terre comme au ciel. Donne nous aujourd'hui notre pain quotidien. Pardonne nous nos offenses, comme nous pardonnons à ceux qui nous ont offensés. Et ne nous induis point en tentation, mais nous délivre du mal; car à toi est le regne, la puissance, et la gloire, aux siècles des siècles. Amen.*

LEARNING AND LEARNED MEN.] The French, like the other nations of Europe, were for many centuries immersed in barbarity. The first learning they began to acquire was not of that kind which improves the understanding, corrects the taste, or regulates the affections. It consisted in a subtle and quibbling logic, which was more adapted to pervert than to improve the faculties. But the study of the Greek and Roman writers, which first arose in Italy, diffused itself among the French, and gave a new turn to their literary pursuits. This, together with the encouragement which the polite and learned Francis I. gave to all men of merit, was extremely beneficial to French literature. During this reign, many learned men appeared in France, who greatly distinguished themselves by their writings; among whom were Budæus, Clement Marot, Peter du Chatel, Rabelais, and Peter Ramus. The names of Henry and Robert Stephens are mentioned by every real scholar with reverence. It was not, however, till the seventeenth century, that the French began to write with elegance in their own language. The *Académie Française* was formed for promoting this purpose: and though their labours, considered as a body, were not so successful as might have been expected, some particular academicians did great service to letters. In fact, literary copartnerships are seldom very successful. Of this we have a remarkable instance in the present case. The academy published a dictionary for improving the French language: it was generally condemned. Furetières, a single academician, publishes another: it meets with universal approbation.

Lewis XIV. was the Augustus of France. The protection he gave to letters, and the pensions he bestowed on learned men, both at home and abroad, which, by calculation, little exceeded 12,000*l.* per annum, gained him more glory than all the military enterprises upon which he expended so many millions. The learned men who appeared in France during this reign are too numerous to be particularised. The tragic poets, Racine and Corneille, have deservedly obtained a very high reputation: the first was distinguished for his skill in moving the passions; the second for majesty; and both, for the strength and justness of their painting, the elegance of their taste, and their strict adherence to the rules of the drama. Moliere would have exhausted the subjects of comedy, were they not every where inexhaustible, and particularly in France. In works of satire, and in criticism, Boileau, who was a closer imitator of the ancients, occupies the first place. But France has not yet produced an epic poem that can be compared with Milton's; nor a genius of the same extensive and universal kind with Shakespeare, equally fitted for the gay and the serious, the humorous and the sublime.

In the eloquence of the pulpit and of the bar, the French are greatly our superiors: Bossuet, Bourdaloue, Flechier, and Massillon, carried pulpit eloquence to a degree of perfection unexampled and unrivalled. The French have not so many good didactic writers on moral, religious, or political subjects, as have appeared in Great Britain. But France has produced some great men, who do honour to humanity; whose career no obstacle could stop, whose freedom no government, however despotic, no religion, however superstitious, could curb or restrain. As an historian, De Thou is entitled to the highest praise: and who is ignorant of Pascal, or of the archbishop of Cambray? Few men have done more service to religion, either by their writings or their lives. As for Montesquieu, he has been, with some justice, extolled as the legislator of nations; his works are read in every country and language, and wherever they go, they enlighten and liberalise the mind. And, indeed, the distinguished literary productions of Lewis XV.'s reign universally breath sentiments incompatible with superstition or despotism; but too many of them incur the opposite reproach of irreligion and licence.

In the Belles Lettres, poetical and miscellaneous way, no nation ever produced a greater number of amusing authors; but unfortunately amusement is too often, not only their chief, but their sole end and aim, which many of them (particularly Voltaire and his imitators) have pursued at the expence of virtue and good morals.

Before the immortal Newton appeared in England, Descartes was held the greatest philosopher in modern times. He was the first who applied algebra to the solution of geometrical problems, which naturally paved the way to the analytical discoveries of Newton. Many eminent mathematicians have flourished in the present age, particularly Clairaut, Bezout, and D'Alembert; but none whose inventive genius entitles them to rank in the first class.

Since the beginning of the present century, the French have almost vied with the English in natural philosophy. Buffon would deserve to be reckoned among men of science, were he not more remarkable for his eloquence than his philosophy. He is to be regarded as a philosophical painter of nature; and, under this view, his Natural History is the first work of its kind.

Their painters, Poussin, Le Brun, and, above all, Le Sueur, did honour to the age of Lewis XIV. And in our own times, Mr. Greufe, for portraits and conversation-pieces, never perhaps was excelled.

Sculpture is in general better understood in France than in most other countries of Europe. Their engravings on copper plates have been universally and justly celebrated; but such a liberal patronage has been afforded to English artists, that they are now thought to excel their ingenious neighbours, and have rivalled them also in the manufacture of the paper proper for such impressions. Their treatises on ship-building and engineering stand unrivalled; but in the practice of both they are outdone by the English. No genius has hitherto equalled Vauban in the theory or practice of fortification. The French were our superiors in civil architecture; though we now surpass them in this art.

We shall conclude this head with observing, that, in consequence of many recent discoveries in chemistry, natural history, geography, &c. the French literati had made great progress in new-modelling and enlarging the Encyclopædia, or General Dictionary of Arts and Sciences, originally drawn up by the most able masters in each branch of literature, in 28 volumes in folio (six of which are copper-plates), under the direction of Messieurs D'Alembert and Diderot.

UNIVERSITIES AND PUBLIC COLLEGES.] These literary institutions sustained a considerable loss by the expulsion of the Jesuits, who made the languages, arts, and sciences, their particular study, and taught them all over France. The universities or public colleges, are in number twenty-eight, as follow; Aix, Angiers, Arles, Avignon, Befançon, Bourdeaux, Bourges, Caen,

Review for

Cahors, Dol, Douay, La Fleche, Montauban, Montpellier, Nantes, Orange, Orleans, Paris, Perpignan, Poitiers, Point Moufon, Richlieu, Rheims, Soissons, Strasbourg, Toulouse, Tournoise, and Valence. Among these the Sorbonne at Paris was the most celebrated.

ACADEMIES.] The following literary establishments were supported out of the national treasury: the French Academy, Academy of Belles Lettres, Academy of Sciences, Royal Society of Medicine, King's Library, Observatory, and the Free-school of design.

ANTIQUITIES AND CURIOSITIES.} Few countries, if we except Italy, can  
NATURAL AND ARTIFICIAL. } boast of more valuable remains of antiquity than France. Some of the French antiquities belong to the time of the Celts, and consequently, compared with them, those of Rome are modern. Father Mabillon has given us a most curious account of the sepulchres of their kings, which have been discovered so far back as Pharamond; and some of them, when broke open, were found to contain ornaments and jewels of value. At Rheims, and other parts of France, are to be seen triumphal arches: the most entire is at Orange, erected on account of the victory obtained over the Cimbri and Teutones, by Caius Marius and Lucatius Catulus. After Gaul was reduced to a Roman province, the Romans took delight in adorning it with magnificent edifices, both civil and sacred; some of which are more entire than any to be met with in Italy itself. The ruins of an amphitheatre are to be found in Chalons, and likewise at Vienne. Nismes, however, exhibits the most valuable remains of ancient architecture of any place in France. The famous Pont du Garde was raised in the Augustan age by the Roman colony of Nismes, to convey a stream of water between two mountains for the use of that city; and the building is fresh to this day; it consists of three bridges, or tiers of arches, one above another; the height is 174 feet, and the length extends to 723. Many other ruins of antiquity are found at Nismes; but the chief are the temple of Diana; the amphitheatre, which is thought to be the finest and most entire of the kind, of any in Europe; but above all, the house erected by the emperor Adrian, called the Maison Carrée. The architecture and sculpture of this building are so exquisitely beautiful, that it enchants even the most ignorant; and it is still entire, being very little affected either by the ravages of time, or the havoc of war. At Paris, in La Rue de la Harpe, may be seen the remains of a palace, or thermæ, supposed to have been built by the emperor Julian, surnamed the Apostate, about the year 356, after the same model as the baths of Dioclesian. The remains of this ancient edifice consist of many arches, and within them a large saloon. It is fabricated of a kind of mastic, the composition of which is now known, intermixed with small square pieces of free-stone and bricks. But the most extraordinary of all artificial curiosities are the subterraneous caverns at Paris: for the first building of that city, it was necessary to get the stone in the environs: as Paris was enlarged, the streets and suburbs extended to, and were built on the ancient quarries from which the stone had been taken; and hence proceed the caverns or frightful cavities, which are found under the houses in several quarters of the city. Eight persons lately perished in one of them, a gulf of 150 feet deep; which excited the police and government, to cause the buildings of several quarters to be privately propped up. All the suburbs of St. James's, Harp-street, and even the street of Tournon stand upon the ancient quarries, and pillars have been erected to support the weight of the houses.—But as the lofty buildings, towers and steeples, now tell the eye, that what is seen in the air, is wanting under the feet, so it would not require a very violent thock, to throw back the stones to the places from whence they have been raised\*.

\* See Memoirs of the Literary and Philosophical Society of Manchester, vol. 2.—See also Monthly Review for 1786, vol. 75, p. 414.

At Arles in Provence is an obelisk of oriental granite, 52 feet high, and seven feet diameter at the base, and all but one stone. Roman temples and aqueducts are frequent in France. The most remarkable are in Burgundy and Guienne. The passage, cut through the middle of a rock near Briancon in Dauphiny, is thought to be a Roman work, if not of greater antiquity. The round buckler of massy silver, taken out of the Rhone in 1665, being twenty inches in diameter, and weighing twenty-one pounds, containing the story of Scipio's continence, is thought to be coeval with that great general. Innumerable antiquities, found in France, have been collected in the cabinets of the curious.

CITIES AND TOWNS.] These are numerous; of which we shall mention only Paris, Lille, and their principal sea-ports, Brest and Toulon.

Lille, in French Flanders, is thought to be the most regular and strongest fortification in Europe, and was the master-piece of the famous Vauban. It is generally garrisoned with above 10,000 regulars; and for its magnificence and elegance, it is called Little Paris. Its manufactures of silk, cambric, and camblets, were very considerable; and its inhabitants amount to about 100,000. Every reader is acquainted with the history of Dunkirk, which the French were obliged by the treaty of Utrecht to demolish; but it is still a thorn in the side of the English, by being a harbour for their smugglers. The rest of French Flanders, and its Netherlands, abound with fortified towns, which carried on very gainful manufactures.

Moving southward, we come to the Isle of France; the capital of which, and of the whole kingdom, is Paris. This city has been so often described, that it may appear superfluous to mention it more particularly, were it not that the vanity of the French has given it a preference, which it by no means deserves, to all the capitals in the world, in every respect, not excepting even population. Many of the English have been imposed upon in this point; particularly by calculating from the births and burials within the bills of mortality, which exclude the most populous parishes about London. Another mistake arises from this source, viz. the number of dissenters of all kinds in and about London, who do not register the births of their children; and from many of the poorer sort, who will not afford the small expence of such a registration. Another peculiarity existing in London is, that most of the citizens in affluent circumstances, when they find themselves consumptive, or otherwise indisposed, retire into the country, where they are buried, and thereby excluded from the bills of mortality. The population of Paris, therefore, where the registers are more exact, and accessible to the poor, and where the religion and the police were, before the troubles, more uniform and strict, is far more easily ascertained than that of London; and by the best accounts, it does not exceed 7 or 800,000, which is far short of the inhabitants of London and the contiguous parishes.

Paris is dividet into three parts; the city, the university, and that which was formerly called the town. The city is old Paris; the university and the town are the new. Paris contains more works of magnificence than utility. Its palaces were showy, and some of its streets, squares, hotels, hospitals, and churches, superbly decorated with a profusion of paintings, tapettry, images, and statues; but Paris, notwithstanding its boasted police, was always greatly inferior to London, in the conveniencies of life, and the solid enjoyments of society. Without entering into more minute disquisitions, Paris, it must be owned, was the paradise of splendor and dissipation. The tapettry of the Gobelines\* is unequalled for beauty and richness. The Louvre is a building that does honour to architecture itself; it was

\* One *Gobelin*, a noted dyer at Rheims, was the first who settled in this place, in the reign of Francis I. and the house has retained his name ever since; and here the great Colbert, about the year 1667, established that valuable manufactory.

adorned

adorned by many excellent institutions for the arts and sciences, particularly the three academies, and ennobled by the residence of the learned. The Tuilleries, the palace of Orleans, or, as it is called, Luxembourg, where a valuable collection of paintings were shewn, the palace and library (which belonged to the late unfortunate king), the guild-hall, and the hospital for the invalids, were superb to the highest degree. The city of Paris is said to be fifteen miles in circumference. The hotels, formerly occupied by the French noblesse at Paris, take up a great deal of room with their court-yards and gardens; and so do their convents and churches. The streets are very narrow, and the houses very high; many of them seven stories. The houses are built of stone, and generally mean, even to wretchedness, owing partly to their containing a different family on every floor. The river Seine, which runs through the centre of the city, is not half so large as the Thames at London: it is too far distant from the sea for the purposes of navigation, and furnished with boats only for the purpose of passing from one side of the river to the other, in places distant from the bridges, which are built of stone or wood, with little to recommend them. The streets of Paris were generally crowded, particularly with coaches, which gave that capital the appearance of wealth and grandeur, though in reality there was more show than substance. The glittering carriages that dazzled the eyes of strangers, were mostly common hacks, hired by the day or week to the numerous foreigners who visit that city; and in truth, the greatest part of the trade of Paris arose from the constant succession of strangers arriving daily from every nation and quarter of the globe. This ascendancy was undoubtedly owing to the reputation of their language, their politeness and magnificence, their libraries, and collections of paintings, all open to the public; the cheapness of provisions, excellency of the French wines, and above all, the purity of the air and climate in France. With all these advantages, Paris, in general, will not bear a comparison with London, in the more essential circumstances of a thriving foreign and domestic trade, the cleanliness of their streets, elegance of their houses, especially within; the plenty of water, and that of a better quality than the Seine, which generally disagrees with strangers, as do likewise their small wines. In the houses of Paris, most of the floors are of brick, and have no other kind of cleaning than that of being sprinkled with water, and swept once a day. These brick floors, the stone stairs, the want of wainscoting in the rooms, and the thick party-walls of stone, are, however, good preservatives against fire, which seldom does any damage in this city. Instead of wainscoting, the walls are covered with tapestry or damask. The beds in general are very good, and well ornamented with tester and curtains; but bugs are here a most intolerable nuisance, which frequently oblige strangers to sleep on the floor, during the heat of the summer. Their shops are but poorly stored with goods; and the shop-keepers and tradesmen, an indolent, loitering people, seldom make their appearance before dinner in any other than a morning dress, of velvet cap, silk night-gown, and morocco slippers; but when they intend a visit, or going abroad, all the punctilios of a courtier are attended to, and hardly the resemblance of a man remains. There is a remarkable contrast between this class of people, and those of the same rank in London. In Paris, the women pack up parcels, enter the orders, and do most of the drudgery business of the shop, while the husband loiters about, talks of the great, of fashions and diversions, and the invincible force of their armies. The splendour of the grand monarch used also to be with them a favourite topic of conversation, previous to the change in their political system. The Parisians, however, as well as the natives of France in general, are temperate in their living; and to be drunken is considered as infamous. Eread, and all manner of butchers' meat and poultry, were tolerably good in Paris; the beef is excellent; the wine they generally drink, is a very thin kind of Burgundy. The common

common people, in the summer season, live chiefly on bread, butter, grapes, and small wine. The Parisians scarcely know the use of tea, but they have coffee in plenty. The police of Paris was so well attended to, that quarrels, accidents, or felonies, seldom happened; and strangers, from all quarters of the globe, let their appearance be ever so uncommon, met with the most polite treatment. The streets were patrolled at night by horse and foot, so judiciously stationed, that no offender could escape their vigilance. They likewise visited the publicans precisely at the hour of twelve at night, to see that the company were gone; for in Paris no liquor could be had after that time. The public roads in France were under the same excellent regulation, which, with the torture of the rack, which was used till of late, prevented robberies in that kingdom; but for the same reason, when robberies did happen, they were always attended with the death of the unfortunate traveller; and indeed this is the general practice in every country of Europe, Great Britain excepted.

The environs of Paris are very pleasant, and contain a number of fine seats, small towns and villages; some of them, being scattered on the edges of lofty mountains rising from the Seine, are remarkably delightful.

The palace of Versailles, which stands twelve miles from Paris, though magnificent and expensive beyond conception, and adorned with all that art can furnish, is properly a collection of buildings, each of exquisite architecture, but not forming a whole, agreeable to the grand and sublime of that art. The gardens, and water-works (which are supplied by means of prodigious engines across the Seine at Marli, about three miles distance), are astonishing proofs of the fertile genius of man, and highly worthy of a stranger's attention. Trianon, Marli, St. Germain en Laye, Moudon, and other royal palaces, are laid out with taste and judgment; each has its peculiar beauties for the entertainment and amusement of that luxurious court which lately occupied them; but some of them were, even then, in a shameful condition, both as to repairs and cleanliness.

Brest is a small, but very strong town, upon the English Channel, with a most spacious and well fortified road and harbour, the best and safest in the kingdom; yet its entrance is difficult, occasioned by many rocks lying under water. Here there is an academy for sea-affairs; and also docks, and magazines for all kinds of naval stores, rope-yards, store-houses, &c. inasmuch that it may now be termed the capital receptacle for the navy of France, and it is admirably well adapted for that end.

Lewis XIV. rendered Toulon (now called Port de la Montagne), from a pitiful village, a sea-port of great importance. He fortified both the town and harbour, for the reception and protection of the navy. Its old and its new harbour lie contiguous; and by means of a canal, ships pass from one to the other, both of them having an outlet into the spacious outer harbour. Its arsenal, established also by that king, has a particular storehouse for each ship of war; its guns, cordage, &c. being separately laid up. Here are spacious workshops for blacksmiths, joiners, carpenters, locksmiths, carvers, &c. Its rope-work, of stone, is 320 toises or fathoms in length, with three arched walks. Its general magazine supplies whatever may be wanting in the particular storehouses, and contains an immense quantity of all kinds of stores, disposed in the greatest order.

COMMERCE AND MANUFACTURES.] Next to Henry IV. justly styled the Great, the famous Colbert, minister to Lewis XIV. may be called the father of the French commerce and manufactures. Under him there was a great appearance that France would make as illustrious a figure as a trading, as she did then as a warlike people; but the truth is, the French do not naturally possess that persevering industry which is necessary for commerce and colonization, though no people, in theory, understand them better. It is to be considered at the same time, that

France, by her situation, by the turn of her inhabitants for certain manufactures, and the happiness of her soil, must be always possessed of great inland and neighbouring trade.

The silk manufacture was introduced into France so late as the reign of Henry IV. and in the age of his grandson Lewis XIV, the city of Tours alone employed 8000 looms, and 800 mills. The city of Lyons then employed 18,000 looms; but after the impolitic and unjust revocation of the edict of Nantes, the expulsion of the Protestants, and the ruinous war maintained by France, they decreased to 4000; and their silk manufacture is now rivalled by that of England, where the French Protestants took refuge, and were happily encouraged. Next to Tours France contained 1,500 silk-mills, 21,000 looms for stuffs, 12,000 for ribbons and lace, 20,000 for silk stockings, all of which employed two millions of people. They also manufacture gloves and stockings from spider-silk. The French woollen cloths and stuffs, more especially at Abbeville, Amiens, and Paris, were said to be little inferior to those of England, and had greatly injured them, particularly in the Turkish market, assisted by the clandestine importation of English and Irish wool, and workmen from this country.

In *manufactures*, the French were long distinguished for their invention, and the English for their superior improvement. Abbeville was famous for cloth, linen, sail-cloth, and soap; Auvergne for fine thread, lace, stuffs, and paper; Nismes for fine serges; Cambrai for cambrics; St. Quentin for lawns; and Picardy for plate-glass. But the peaceful labours of France are now suspended, and all hands are employed either in bearing arms, or in providing for those who do.

The districts adjoining the British Channel contain many sheep of the English breed, which are said to degenerate by removal from their native soil.

Besides the infinite advantage arising from her inland commerce, from her rivers, navigable canals, and a connexion with two seas, her foreign trade, before the late troubles, might be said to extend itself all over the globe. It is a doubtful point, whether France was a loser by its cession of Canada and part of Louisiana at the peace in 1763. The most valuable part of Hispaniola in the West Indies, which she possessed by the partiality and indolence of Spain, is a most improvable acquisition, and was the most considerable of all her foreign colonies; but part of it has lately surrendered to the British arms, as well as the important sugar islands of Martinico, Guadeloupe, St. Lucia, Tobago, St. Bartholomew, Descada, and Marigalante. Her possessions in North America are only a small tract upon the Mississippi.

The French possessions in the East Indies were never very considerable; but such as they are, they are now in the hands of the English.

Mr. Anderson gives the following description of her trade before the late revolution: Her land trade to Switzerland and Italy is by way of Lyons—To Germany, through Metz and Strassburgh—To the Netherlands, through Lille—To Spain (a most profitable one), through Bayonne and Perpignan. As for her naval commerce, her ports in the channel, and on the western ocean, are frequented by all the trading nations in Europe, to the great advantage of France, more especially respecting what is carried on with England, Holland, and Italy. The trade from her Mediterranean ports (more particularly from Marseilles), with Turkey and Africa, has long been very considerable. The negro trade from Guinea supplies her sugar colonies, besides the gold, ivory, and drugs got from thence.

The *exports* are wine, vinegar, brandy, oil, silks, satins, linens, cambrics, woollen cloth, tapestries, laces, gold and silver embroideries, toys, trinkets, perfumery, paper, prints, books, dyes, &c. The *imports* are hardware, earthenware, cottons, metals, hemp, flax, silk, wool, horses, East and West India goods, &c. France employs one million tons of shipping, with near 50,000 seamen; and before the revolution, the imports were valued at 9,583,333l. the exports at 12,500,000l. and it

had a *balance of trade* of more than two millions in its favour; but its trade and manufactures have since declined.

In the year 1739, France may be said to have been in the zenith of her commerce. Favoured by Spain, and dreaded by most of the other powers of Europe, her fleets covered the ocean; but she was too confident in her superiority; Cardinal de Fleury, who then directed her affairs, took little care to protect her trade by proper naval armaments; so that the greater it was, it became the more valuable prey to the English, and some other countries.

[**PUBLIC TRADING COMPANIES.**] It has no trading companies (having abolished all monopoly) but a bank or *caisse d'escompte*, and a bank of extraordinaries.

[**CONSTITUTION AND GOVERNMENT.**] France, by the revolution in 1789, founded a *new constitution*, upon the principles that all men are free and equal in their rights, and that sovereignty resides in the nation. It would be trifling with our readers to give them any detail of this constitution, as it has been virtually overthrown, by the abolition of the monarchical part of it, and by the subsequent condemnation and execution of the king; a deed of most singular atrocity, by which the national convention have stamped eternal infamy upon their characters.—A committee was appointed by the convention to draw up a new constitution, which has made its appearance; but how long it will continue, is a question extremely problematical, as to render it improper, in the present stage of it, to give it a place in this work.

After the reader has been told of the excellency of the climate, and the fertility of the soil in France; her numerous manufactures, and extensive commerce; her great cities, numerous towns, sea-ports, rivers, and canals; the cheapness of provisions, wines, and liquors; the formidable armies and fleets she has sent forth, to the annoyance of Europe; and the natural character of her inhabitants, their sprightliness and gaiety; he will undoubtedly conclude, that France is the most powerful nation, and her people the most opulent and happy in Europe. But this is not the case; for the French resources, by a wrong application, have often proved ruinous to the people. The most obvious causes of this have been the ambition and vanity of their kings and leading men, which led them into schemes of universal dominion, to promote the aggrandisement of their name, and the enslaving of Christendom. Their wars, which they sometimes carried on against one half of Europe, and in which they were generally unfortunate, led them into difficulties to which the ordinary revenues were inadequate; and hence proceeded the arbitrary demands upon the subject, under various pretences, in the name of loans, free-gifts, &c. When these failed, other methods, more despotic and unwarrantable, such as raising and reducing the value of money as it suited their own purposes, national bankruptcies, and other grievous oppressions, were adopted, which gave the finishing blow to public credit, and shook the foundations of trade, commerce, and industry, the fruits of which no man could call his own.

When we consider the motives of these wars, a desire to enslave and render miserable the nations around them; that man must be devoid of humanity, whose breast is not raised with indignation at the bare mention of the blood that has been spilt, the miseries and desolations that have happened, and the numerous places that have fallen sacrifices to their ambition. It appears too plain, that, while they thus grasped after foreign conquest, their own country exhibited a picture of misery and beggary. Their towns, a very few excepted, make a most dismal and solitary appearance; for the truth of which we may appeal to the observation of any one who has been in that kingdom. Were it possible to mention a people more indigent than these citizens, we might describe the farmers and peasantry. We have in another place mentioned the natural advantages of France, where the hills are covered with grapes, and most extensive plains produce excellent crops of corn, rye, and barley. Amidst this profusion of plenty, the farmer and his family barely exist-

ed upon the gleanings; and his cattle, which were seldom numerous, picked a subsistence, in the summer months, from the skirts of his fields. Here the farmer, meagre, dispirited, and distressed, exhibited a spectacle of indigence hardly credible; and to see him ploughing the ground with a lean cow, ass, and a goat yoked together, excited in an English traveller that pity to which human nature is entitled — he forgot the country, while he felt for the man.

REVENUES.] Mr. Lafond presented to the assembly, Dec. 30, 1791, the following general estimate, from the particular estimate of the ministers for the year 1792:

	Livres.		Livres.
Appanage of princes	5,000,000	Bridges and roads	4,000,000
Foreign affairs	6,000,000	High national court and court of appeal	450,000
Marine and colonies	43,000,000	Schools and academies	1,000,000
General administration	5,000,000	Interests of debt	10,000,000
Public worship	81,000,000	Life annuities	100,000,000
Pensions to ecclesiastics	68,000,000	Perpetual annuities	300,000,000
National assembly	5,000,000	besides the expences of the army.	
Civil list	25,000,000		

The WAYS and MEANS.

By land-tax, a tax on personal property, patents, stamps, &c. valued at 530,000,000 livres; the remaining sum to be provided for from the fund of extraordinary.

The extraordinary expences of the army, colonies, and public worship, would soon cease, and bring the expenditure on a level with the revenue.

Some authors make the amount of the assessed taxes, for the year 1792, only 300,000,000 livres, equal to 12,500,000*l.* sterling, and with the incidental taxes, in all, 15,500,000*l.* sterling; near nine million less than before the revolution, when the noblesse and clergy were exempted.

All excises and excisemen, tythes, and game-laws, are now abolished, and the roads maintained at the public expence.

The REVENUE, in the year 1788, before the Revolution, was twenty millions and a half sterling; and its ordinary expenditure exceeded the revenue five millions and a half.

The public DEBT, in the year 1784, was 141,666,000*l.*

MILITARY AND MARINE STRENGTH.] There is no nation in Europe where the art of war, particularly that part of it relating to gunnery and fortification, is better understood than in France. Besides other methods for cultivating it, there is a royal military academy established, for training up 500 young gentlemen, in the several branches of this great art.

ARMY.] The peace establishment of the army, for the year 1791, was,

Infantry	111,000
Cavalry	30,000
Artillery	11,000
<hr/>	
Total	152,000

These are called *troops of the line*, and, along with the volunteer national guards, form an army of 224,000 men.

The *municipal army* or national guards are a kind of embodied militia for the interior defence of the kingdom, and amount to between three and four millions.

The *gens-d'armes* are an auxiliary body of troops, for the protection of the laws and police.

NAVY.] The report of the minister, towards the close of the year 1791, states the ships in good condition to be 86 of the line, and; including those building, as follows:

Large first rates	8
100 Guns	5
80 Guns	10
74 Guns	67
64 Guns	1
	<hr/>
	Total 91
Frigates	78
Besides fireships, corvettes, galleys, and cutters.	

But this account will now (1794) admit of considerable deductions, from the number of ships which were destroyed by the British upon the evacuation of Toulon, and from those captured and sunk by earl Howe, in the naval victory he obtained over the French fleet, on the 1st of June this year.

There are 80,000 seamen, with officers registered, to man the fleet; but the French navy is at present without proper subordination.

ROYAL TITLES, ARMS, NOBILITY, } The NATIONAL ASSEMBLY, desirous  
AND ORDERS. } of establishing the French constitution on the principles it has declared, abolished, irrevocably, those institutions which are injurious to liberty and equality of rights.

There is no longer any nobility, nor peerage, nor hereditary distinctions, nor difference of orders, nor feudal government, nor patrimonial jurisdiction, nor any of the titles, denominations and prerogatives, which are derived from them; nor any of the orders of chivalry, corporations, or decorations, for which proofs of nobility were required; nor any kind of superiority, but that of public functionaries in the exercise of their functions.

Royalty, which was one branch of the first constitution, is now abolished; and the unfortunate monarch decapitated.

HISTORY.] The history of no country is better authenticated than that of France, and it is particularly interesting to a British reader. This kingdom, which was by the Romans called Transalpine Gaul, or Gaul beyond the Alps, to distinguish it from Cisalpine Gaul, on the Italian side of the Alps, was probably peopled from Italy, to which it lies contiguous. Like other European nations, it soon became a desirable object to the ambitious Romans; and, after a brave resistance, was annexed to their empire by the invincible arms of Julius Cæsar, about forty-eight years before Christ. Gaul continued in the possession of the Romans till the downfall of that empire in the fifth century, when it became a prey to the Goths, the Burgundians, and the Franks, who subdued, but did not extirpate the ancient natives. The Franks themselves, who gave it the name of France, or Frankland, were a collection of several people inhabiting Germany, and particularly the Salii, who lived on the banks of the river Sale, and who cultivated the principles of jurisprudence better than their neighbours. These Salii had a rule, which the rest of the Franks are said to have adopted, and which has been, by the modern Franks, applied to the succession of the throne, to exclude all females from the inheritance of sovereignty, and is well known by the name of the *Salic Law*.

The Franks and Burgundians, after establishing their power, and reducing the original natives to a state of slavery, parcelled out the lands among their principal leaders; and succeeding kings found it necessary to confirm their privileges, allowing them to exercise sovereign authority in their respective governments, until they at length assumed independency, only acknowledging the king as their head.

This

This gave rise to those numerous principalities that were formerly in France, and to the several parliaments; for every province became, in its policy and government, an epitome of the whole kingdom; and no laws were made, or taxes raised, without the concurrence of the grand council, consisting of the clergy and nobility.

Thus, as in other European nations, immediately after the dissolution of the Roman empire, the first government in France seems to have been a kind of mixed monarchy, and the power of their kings extremely limited by the feudal barons.

The first Christian monarch of the Franks (according to Daniel, one of the best French historians) was Clovis, who began his reign anno 481; and being baptized, introduced Christianity in the year 496. The mind of Clovis had been affected by the pathetic tale of the Passion and the Death of Christ; and insensible of the beneficial consequences of the mysterious sacrifice, he exclaimed, with religious fervour, "Had I been present with my valiant Franks, I would have revenged his injuries." But though he publicly professed to acknowledge the truth of the gospel, the divine precepts which it inculcated were but little respected by the aspiring barbarian; he calmly assassinated all the princes of the Merovingian race; and, though the only monarch in the christian world free from the stain or imputation of heresy, was perpetually employed in the aggrandisement of his dominions by the violation of moral and religious duties. From this period, the history of the French exhibits them generally engaged in domestic broils or in foreign wars. The first race of their kings, prior to Charlemagne, found a cruel enemy in the Saracens, who then over-ran Europe. In the year 800, Charlemagne, king of France, whom we have often mentioned as the glory of those dark ages, became master of Germany, Spain, and part of Italy, and was crowned king of the Romans by the pope; he divided his empire by will among his sons, which proved fatal to his family. Soon after this, the Normans, a fierce warlike people from Norway, Denmark, and other parts of Scandinavia, ravaged the kingdom of France, and, about the year 900, obliged the French to yield up Normandy and Bretagne to Rollo, their leader, who married the king's daughter, and was persuaded to profess himself a Christian. This laid the foundation of the Norman power in France; which afterwards gave a king to England, in the person of William duke of Normandy, who subdued Harold, the last Saxon king, in the year 1066. This event proved unfortunate and ruinous to France, as it engaged that country in almost perpetual wars with England, for whom it was not an equal match, notwithstanding its numbers, and the assistance it received from Scotland.

The rage of crusading, which broke out at this time, was of infinite service to the French crown in two respects: in the first place, it carried off thousands of its turbulent subjects, and their leaders, who were almost independent of the king: in the next, the king succeeded to the estates of many of the nobility, who died abroad without heirs.

But passing over the dark ages of the crusades, and the ancient wars with England, which have already been described, we shall proceed to that period when the French began to extend their influence over Europe in the reign of Francis I. contemporary with Henry VIII. of England. This prince, though he was brave to excess in his own person, and had defeated the Swiss, who till then were deemed invincible, was an unfortunate warrior. He had great abilities, and great defects. He was a candidate for the empire of Germany, but lost the imperial crown; Charles V. of the house of Austria, and king of Spain, being chosen. In the year 1520, Francis having invited Henry VIII. of England to an interview, the two kings met in an open plain near Calais, where they and their attendants displayed such magnificence as procured it the name of the *Field of the Cloth of Gold*. Feats of chivalry, parties of gallantry, together with such exercises and pastimes as were in that age reckoned manly or elegant, rather than serious business, occupied both

both courts during eighteen days that they continued together \*. Francis made some dazzling expeditions against Spain, but suffered his mother, of whom he was very fond, to abuse his power; by which he disobliterated the constable of Bourbon, the greatest of his subjects, who joined in a confederacy against him, with the emperor and Henry VIII. of England. In his adventurous expedition into Italy, he was taken prisoner at the battle of Pavia, in the year 1524, and obliged to agree to dishonourable terms, which he never meant to perform, to regain his liberty. His non-performance of those conditions was afterwards the source of many wars between him and the emperor: he died in 1547.

France, at the time of his death, notwithstanding the variety of disagreeable events during the late reign, was in a flourishing condition. Francis I. was succeeded by his son, Henry II. who, upon the whole, was an excellent and fortunate prince. He continued the war with the emperor of Germany, to the great advantage of his own dominions; and was so well served by the duke of Guise, that though he lost the battle of St. Quintin, against the Spaniards and the English, he retook Calais from the latter, who never since had any footing in France. He married his son, the Dauphin, to Mary queen of Scots, in hopes of uniting that kingdom to his crown; but in this scheme he, or rather his country, was unfortunate, as may be seen in the history of Scotland. He was killed in the year 1559, at an unhappy tilting-match, by the count of Montgomeri.

He was succeeded by his son Francis II. a weak, sickly, inactive prince, and only thirteen years of age, whose power was entirely engrossed by a prince of the house of Guise, uncle to his wife, the beautiful queen of Scotland. This engrossment of power encouraged the Bourbon, the Montmorenci, and other great families, to form a strong opposition against the government. Anthony, king of Navarre, was at the head of the Bourbon family; but the queen-mother, the famous Catharine of Medicis, being obliged to take part with the Guises, the confederacy, who had adopted the cause of Hugonotism, was broken in pieces, when the sudden death of Francis happened, in the year 1560.

This event took place while the prince of Condé, brother to the king of Navarre, was under sentence of death for a conspiracy against the court; but the queen-mother saved him, to balance the interest of the Guises; so that the sole direction of affairs fell into her hands, during the minority of her second son, Charles IX. Her regency was a continued series of dissimulation, treachery, and murder. The duke of Guise, who was the scourge of the Protestants, was assassinated by one Poltrot, at the siege of Orleans; and the murderer was unjustly thought to have been instigated by the famous Coligni, admiral of France, who was then at the head of the Protestant party. Three civil wars succeeded. At last the court pretended to grant the Hugonots a very advantageous peace, and a match was concluded between Henry, the young king of Navarre, a Protestant, and the French king's sister. The heads of the Protestants were invited to celebrate the nuptials at Paris, with the infernal view of butchering them all, if possible, in one night. This project

\* The French and English historians describe the pomp of this interview, and the various spectacles, with great minuteness. One circumstance mentioned by the marshal de Fleuranges, who was present, and which appears singular in the present age, is commonly omitted. "After the tournament," says he, "the French and English writers made their appearance, and wrestled in presence of the kings and the ladies; and as there were many stout wrestlers there, it afforded excellent pastime; but as the king of France had neglected to bring any  
wrestlers out of Bretagne, the English gained the

prize.—After this, the kings of France and England retired to a tent, where they drank together: and the king of England, seizing the king of France by the collar, said, *My brother, I must wrestle with you*, and endeavoured once or twice to trip up his heels; but the king of France, who was a dexterous wrestler, twisted him round, and threw him on the earth with prodigious violence. The king of England wanted to renew the combat, but was prevented." *Memoirs de Fleuranges*, 12mo. Paris, 1753. p. 329.

proved

proved but too successful, though it was not completely executed, on St. Bartholomew's day, 1572. The king himself assisted in the massacre, in which the admiral Coligni fell. The sign, for the inhuman slaughter of so many thousands, was to be made by striking the great bell of the palace. At that dreadful knell, the work of death was begun, and humanity recoils from the horrors of the fatal night of St. Bartholomew; yet the reader may expect, amidst the general carnage, some few moments should be devoted to the fate of Coligni. He had long retired to rest, when he was aroused by the noise of the assassins who had surrounded his house. A German, named Besme, entered his chamber, and the admiral, apprehending his intentions, prepared to meet death with that fortitude which had ever distinguished him. Incapable of resistance, from the wounds he had received by two balls in a late attempt to assassinate him, with an undismayed countenance, he had scarce uttered the words, "Young man, respect these grey hairs, nor stain them with blood," when Besme plunged his sword into his bosom, and with his barbarous associates threw the body into the court. The young duke of Guise contemplated it in silence; but Henry, count d'Angouleme, natural brother to Charles, spurned it with his foot, exclaiming, "Courage, my friend! we have begun well: let us finish in the same manner." It is said that about 30,000 Protestants were murdered at Paris, and in other parts of France; and this brought on a fourth civil war. Though a fresh peace was concluded in 1573 with the Protestants, yet a fifth civil war broke out the next year, when the bloody Charles IX. died without heirs.

His third brother, the duke of Anjou, had some time before been chosen king of Poland; and hearing of his brother's death, he, with some difficulty, escaped to France, where he took quiet possession of that crown, by the name of Henry III.

Religion at that time supplied to the reformed nobility of France the feudal powers they had lost. The heads of the Protestants could raise armies of Hugonots. The governors of provinces behaved in them as if they had been independent of the crown; and the parties were so equally balanced, that the name of the king alone turned the scale. A *holy league* was formed for the defence of the Catholic religion, at the head of which was the duke of Guise. The Protestants, under the prince of Condé, and the duke of Alençon, the king's brother, called in the German princes to their assistance; and a sixth civil war broke out in 1577, in which the king of Spain took the part of the League, in revenge of the duke of Alençon declaring himself lord of the Netherlands. This civil war was finished within the year, by another sham peace. The king, ever since his accession to the crown, had plunged himself into a course of infamous debauchery and religious-extravagance. He was entirely governed by his profligate favourites, but he possessed natural good sense. He began to suspect that the proscriptions of the Protestants, and the setting aside from the succession the king of Navarre, on account of his religion, which was aimed at by the Holy League, was with a view to place the duke of Guise, the idol of the Roman Catholics, on the throne, to which that duke had some distant pretensions. To secure himself on the throne; a seventh civil war broke out in 1579, and another in the year 1585, both of them to the disadvantage of the Protestants, through the abilities of the duke of Guise. The king thought him now so dangerous, that after inviting him in a friendly manner to court, both he, and his brother the cardinal, were, by his majesty's orders, and in a manner under his eye, basely assassinated in 1588. The Leaguers, upon this, declared that Henry had forfeited his crown, and was an enemy to religion. This obliged him to throw himself into the arms of the Protestants; but while he was besieging Paris, where the Leaguers had their greatest force, he was in his turn assassinated by one Clement, a young enthusiastic monk, in 1589. In Henry III. ended the line of Valois.

The readers of history are well acquainted with the difficulties, on account of his religion, which Henry IV. king of Navarre \*, head of the house of Bourbon, and the next heir by the Salic law, had to encounter before he mounted the throne: the Leaguers were headed by the duke of Maín, brother to the late duke of Guise; and they drew from his cell the decrepit popish cardinal of Bourbon, uncle to the king of Navarre, to proclaim him king of France. Their party being supported by the power of Spain and Rome, all the glorious actions performed by Henry, his courage and magnanimity, seemed only to make him more illustriously unfortunate; for he and his little court were sometimes without common necessaries. He was, however, personally beloved; and no objection lay against him but that of his religion. The Leaguers, on the other hand, split among themselves; and the French nation in general were jealous of the Spaniards. Henry, after experiencing a variety of good and bad fortune, came secretly to a resolution of declaring himself a Roman Catholic. This was called a measure of prudence, if not of necessity, as the king of Spain had offered his daughter Isabella Clara Eugenia to be queen of France, and would have married her to the young duke of Guise.

In 1593 Henry went publicly to mass, as a mark of his conversion. This complaisance wrought wonders in his favour; and having with great difficulty obtained absolution from the pope, all France submitted to his authority, and he had only the crown of Spain to contend with, which he did for several years with various fortune. In 1598 he published the famous edict of Nantes, which secured to his old friends the Protestants the free exercise of their religion; and next year the treaty of Vervins was concluded with Spain. Henry next chastised the duke of Savoy, who had taken advantage of the late troubles in his kingdom; and applied himself with wonderful attention and success (assisted in all his undertakings by his minister, the great Sully) to promote the happiness of his people, by encouraging manufactures, particularly that of silk, the benefit of which France feels at this day. Having re-established the tranquillity, and, in a great measure, secured the happiness of his people, he formed connexions with the neighbouring powers, for reducing the ambition of the house of Austria; for which purpose, it is said, he had formed great schemes, and collected a formidable army; others say (for his intention does not clearly appear) that he designed to have formed Christendom into a great republic, of which France was to be the head, and to drive the Turks out of Europe; while others attribute his preparations to more ignoble motives, that of a criminal passion for a favourite princess, whose husband had carried her for protection into the Austrian dominions. Whatever may be in these conjectures, it is certain, that, while he was making preparations for the coronation of his queen, Mary of Medicis, and was ready to enter upon his grand expedition, he was assassinated in his coach in the streets of Paris, by one Ravillac, a young enthusiast, in 1610.

Lewis XIII. son to Henry IV. was but nine years of age at the time of his father's death. As he grew up, he discarded his mother and her favourites, and chose for his minister the famous cardinal Richieu, who put a period, by his resolute and bloody measures, to the remaining liberties of France, and to the religious establishment of the Protestants there, by taking from them Rochelle, though Charles I. of England, who had married the French king's sister, made some weak efforts by his fleet and arms to prevent it. This put an end to the civil wars, on account of religion, in France. Historians say, that in these wars above a million of men lost their lives; that 150,000,000 livres were spent in carrying them on; and that nine cities, four hundred villages, two thousand churches, two thousand

\* A small kingdom lying upon the Pyrenean mountains, of the greater part of which, Upper Navarre, Henry's predecessors had been unjustly

dispossessed, by Ferdinand, king of Spain, about the year 1512.

monasteries, and ten thousand houses, were burnt, or otherwise destroyed, during their continuance.

Richelieu, by a masterly train of politics, though himself bigoted to popery, supported the Protestants of Germany, and Gustavus Adolphus, against the house of Austria; and after quelling all the rebellions and conspiracies which had been formed against him in France, he died some months before Lewis XIII. who, in 1643, left his son, afterwards the famous Lewis XIV. to inherit his kingdom.

During that prince's non-age, the kingdom was torn in pieces, under the administration of his mother Anne of Austria, by the factions of the great, and the divisions between the court and parliament, for the most trifling causes, and upon the most despicable principles. The prince of Condé flamed like a blazing star; sometimes a patriot, sometimes a courtier, and sometimes a rebel. He was opposed by the celebrated Turenne, who from a Protestant had turned Papist. The nation of France was involved at once in civil and domestic wars; but the queen-mother having made choice of cardinal Mazarine for her first minister, he found means to turn the arms even of Cromwell against the Spaniards, and to divide the domestic enemies of the court so effectually among themselves, that when Lewis assumed the reins of government in his own hands, he found himself the most absolute monarch that had ever sat upon the throne of France. He had the good fortune, on the death of Mazarine, to put the domestic administration of his affairs into the hands of Colbert, who formed new systems for the glory, commerce, and manufactures of France, all which he carried to a surprising height.

To write the history of this reign, would be to write that of all Europe. Ignorance and ambition were the only enemies of Lewis: through the former, he was blind to every patriotic duty of a king, and promoted the interests of his subjects only that they might the better answer the purposes of his greatness: by the latter he embroiled himself with all his neighbours, and wantonly rendered Germany a dismal scene of devastation. By his impolitic and unjust revocation of the edict of Nantes, in the year 1685, and his persecutions of the Protestants, he obliged them to take shelter in England, Holland, and different parts of Germany, where they established the silk manufactures, to the great prejudice of their own country. He was so blinded by flattery, that he arrogated to himself the divine honours paid to the pagan emperors of Rome. He made and broke treaties for his conveniency, and at last raised against himself a confederacy of almost all the other princes of Europe; at the head of which was king William III. of England. Lewis was so well served, that he made head for some years against this alliance; but having provoked the English by his repeated infidelities, their arms under the duke of Marlborough, and their allies the Austrians under prince Eugene, rendered the latter part of his life as miserable as the beginning of it was splendid. His reign, from the year 1702 to 1711, was one continued series of defeats and calamities; and he had the mortification of seeing those places taken from him, which, in the former part of his reign, were acquired at the expence of many thousand lives. Just as he was reduced, old as he was, to the desperate resolution of collecting his people, and dying at their head, he was saved by the English tory ministry deserting the cause, withdrawing from their allies, and concluding the peace of Utrecht, in 1713. He survived his deliverance but two years; and in his last hours he displayed a greatness of mind worthy of his elevated situation. "Why do you weep?" said he to his domestics: "did you think me immortal?" He died on the first of September, 1715, and was succeeded by his great-grandson, Lewis XV.

The partiality of Lewis XIV. to his natural children might have involved France in a civil war, had not the regency been seized upon by the duke of Orleans, a man of sense and spirit, and the next legitimate prince of the blood. We have already seen in what manner he discharged the national debt of France; but having

embroiled himself with Spain, the king was declared of age in 1721; and the regent, on the fifth of December, 1723, was carried off by an apoplexy.

Among the first acts of Lewis XV. was the nominating his preceptor, afterwards cardinal Fleury, to be his first minister. Though his system was entirely pacific, yet the situation of affairs in Europe, upon the death of the king of Poland in 1734, more than once embroiled him with the house of Austria. The intention of the French king was to replace his father-in-law, Stanislaus, on the throne of Poland. In this he failed through the interposition of the Russians and Austrians; but Stanislaus enjoyed the title of king, and the revenues of Lorraine, during the remainder of his life. The connection between France and Spain forced the former to become principals in the war with Great Britain, which terminated in the peace of Aix la Chapelle in 1748.

In the year 1757, Francis Damien, an unhappy wretch, whose sullen mind, naturally frantic and savage, was inflamed by the disputes between the king and his parliament relative to religion, embraced the desperate resolution of attempting the life of his sovereign. In the dusk of the evening, as the king prepared to enter his coach, he was suddenly wounded, though slightly, with a penknife, between the fourth and fifth ribs, in the presence of his son, and in the midst of his guards. The daring assassin had mingled with the crowd of courtiers, and was instantly betrayed by his distracted countenance. He declared it never was his intention to kill the king, but that he only meant to wound him, that God might touch his heart, and incline him to restore the tranquillity of his dominions by re-establishing the parliament, and banishing the archbishop of Paris, whom he regarded as the source of the present commotions. In these frantic and incoherent declarations he persisted amidst the most exquisite tortures; and after human ingenuity had been exhausted in devising new modes of torment, his judges, tired out with his obstinacy, consigned him to a death, the barbarity of which was increased by the evident madness that stimulated him to the abominable and desperate attempt. He was conducted to the common place of execution, amidst a vast concourse of the populace; stripped naked, and fastened to the scaffold by iron gyves. One of his hands was then burnt in liquid flaming sulphur. His thighs, legs, and arms, were torn with red hot pincers; boiling oil, melted lead, rosin and sulphur, were poured into the wounds; and to complete the horrid catastrophe, he was torn to pieces by horses.

The Jesuits, having rendered themselves odious by their real or supposed share in the conspiracy against the king of Portugal, fell in France under the lash of the civil power, for certain fraudulent mercantile transactions. They refused to discharge the debts of one of their body, who had become bankrupt for a large sum, and who was supposed to act for the benefit of the whole society. As a monk, indeed, he must necessarily do so. The parliaments eagerly seized an opportunity of humbling their political enemies. The Jesuits were every where cited before these high tribunals in 1761, and ordered to do justice to their creditors. They seemed to acquiesce in the decision, but delayed payment under various pretences. New suits were commenced against them, in 1762, on account of the pernicious tendency of their writings. In the course of these proceedings which the king endeavoured in vain to prevent, they were compelled to produce their *Institute*, or the rules of their order, hitherto studiously concealed. That mysterious volume, which was found to contain maxims subversive of civil government and morality, completed their ruin. All their colleges were seized, all their effects confiscated; and the king, ashamed or afraid to protect them, not only resigned them to their fate, but finally expelled them the kingdom, by a solemn edict, and utterly abolished the order of Jesus in France.

Elated

Elated with this victory over ecclesiastical tyranny, the French parliament attempted to set bounds to the absolute power of the crown, and seemed determined to confine it within the limits of law. Not satisfied with refusing, as usual, to register certain oppressive edicts, or with remonstrating against them, they ordered criminal prosecutions to be commenced against the governors of several provinces, acting in the king's name, who had enforced the registration of those edicts. The magnanimity of these assemblies awakened a new ardour in the bosoms of the French; and this flame, in the succeeding reign, burst forth with accumulated force.

As to the war with Great Britain, which was ended by the peace of Fontainebleau, in 1763, the chief events attending it, so humiliating to France, have been already mentioned in the history of England, and therefore need not be recapitulated here.

Corsica, a small island in the Mediterranean, had long resisted with manly firmness the oppressive councils of the Genoese, who claimed the sovereignty over it, by right of conquest. But, unable to support those pretensions, Genoa transferred them to France, on condition that Lewis should put her in full possession of the adjacent island of Capraia, which the Corsicans had lately invaded and reduced. To execute his engagements, powerful armaments were fitted out by Lewis, at Antibes and Toulon; twenty battalions of French were landed in Corsica; and the natives, whose free suffrages had summoned Paoli, one of their principal chiefs, to the supreme government of the island, determined to defend their liberties to the utmost. A sharp and bloody war, such as suited the inferior numbers of the inhabitants and the nature of the country, was carried on in all the fastnesses and mountainous parts of the island. And it was not till after the French had fatally experienced, in two successive campaigns, the enthusiastic courage which animates the champions of freedom, that they overwhelmed by their superior numbers this unfortunate people; nor had Lewis much reason to triumph in an acquisition, to attain which, he had sacrificed several thousands of his bravest troops, and only extended his dominion over a rugged and unproductive island.

The late unfortunate monarch, Lewis XVI. succeeded his grandfather, Lewis XV. on the 10th of May, 1774. Several regulations were made, after his accession, highly favourable to the general interests of the nation, particularly the suppression of the mousquetaires, and some other corps, which being adapted more to the parade of guarding the royal person, than any real military service, were supported at a great expence, without an adequate return of benefit to the state. But one of the most remarkable circumstances which attended this reign, was the placing of Mr. Neckar, a Protestant, and a native of Switzerland, at the head of the French finances, in 1776; a measure contrary to the constant policy of France, which had carefully excluded the aliens of her country and faith from the controul of the revenue. Under the direction of Neckar, a general reform took place in France throughout every department of the revenue. When hostilities commenced in 1777, between France and Great Britain, in consequence of the assistance afforded by the former to the revolted British colonies in America, the people of France were less burthened with new taxes for carrying on the war, than usual; and the public revenue was augmented by the economy, improvements, and reformation, that were introduced into the management of the finances. In consequence of this national economy, the navy of France was raised to so great a height as to become truly formidable to Great Britain.

With a most laudable zeal to extend the dominion of science, Lewis fitted out several vessels on astronomical discoveries. The chevalier de Borda was instructed to ascertain the exact position of the Canary islands and Cape de Verd; and the different degrees of the coast of Africa from Cape Spartal to the island of Goree: the

chevalier Grenier, who had traversed the Indian seas to improve the charts and correct the errors of former navigators, was liberally rewarded by a monarch who aspired to immortalize the æra of his power, by expeditions beneficial to mankind.

The visit of the emperor to the court of Paris was another occurrence that excited the attention of Europe. Averse to pomp, he chose to travel under the humble title of count Falkenstein; he was received by Lewis with that respect which was due to the imperial dignity, and he regarded that he was impatient to testify to the brother of his royal consort. During six weeks that the emperor remained at Paris, his hours were much employed in examining the arts and manufactures of that capital. With the same spirit of inquiry he made a tour through different provinces of the kingdom, and in his journey endeavoured to glean whatever might be advantageous to his own dominions.

Amidst the fury of war, Lewis displayed that regard for science, which had early formed a striking characteristic of his reign. Previous to the commencement of hostilities, the English had sent two vessels into the South Seas, commanded by captains Cook and Clerke, to explore the coasts and islands of Japan and California; the return of those vessels was hourly expected in Europe; and Lewis, with a considerate humanity which reflects the highest lustre on his character, by a circular letter to all his naval officers, commanded them to abstain from all hostilities against these ships, and to treat them as neutral vessels. The letters mentioned also in terms of the highest respect captain Cook, who had long distinguished himself in successive voyages of discovery. But death allowed not that celebrated navigator to enjoy this grateful testimony to his merit; having, in one of the newly-discovered islands, already fallen a victim to the blind fury of the savage inhabitants.

At the beginning of the year 1780, in consequence of the representations of Mr. Neckar, a variety of unnecessary offices in the household of the king and queen were abolished; and sundry other important regulations adopted, for the ease of the subject, and the general benefit of the kingdom. Could we implicitly credit his memorial, he changed the excess of disbursements, at least one million sterling, of the year 1776, into an excess of revenue in the year 1780, to the amount of 445,000*l.* But Neckar's œconomy was not calculated to please the court. He was therefore displaced, and is said to have been particularly obnoxious to the queen's party.

The freedom of America had been the grand object of France; and that having been acknowledged in the fullest and most express terms by Great Britain, the preliminary articles of peace were signed at Paris on the 20th of January 1783; but the immense expences incurred were found at last to be much more than the revenues of the kingdom could by any means support; and the miserable exigencies to which government was reduced, produced or hastened the present revolution.

In the various wars of France with England, particularly in the last and present centuries, the former often experienced the disadvantage of not having a good port in the channel. The government of France took up this important object with the greatest zeal and vigour; and having employed the ablest engineers in that kingdom, proceeded, by the most astonishing and stupendous works, to render the port of Cherbourg capable of receiving and protecting a royal navy. Since the last peace, they prosecuted this work at an annual expence of upwards of 200,000*l.*

In the year 1786, a treaty of navigation and commerce was concluded between the two courts of London and Versailles, of which notice has been previously taken in our account of England.

The ambition of the French government, which made it acquainted with liberty in assisting the insurgents in America and Holland, excited a spirit amongst the people, which could not well admit the continuance of arbitrary power at home. When the edict for registering the loan at the conclusion of 1785, amounting to the sum of three millions, three hundred and thirty thousand pounds, was presented

ed to the parliament of Paris, the murmurs of the people, and the remonstrances of that assembly, assumed a more legal and obstinate form. The king, however, signified to the select deputation commissioned to convey to him their remonstrances, that he expected to be obeyed without farther delay. The ceremony of registration took place on the next day, but was accompanied with a resolution, importing, that public œconomy was the only genuine source of abundant revenue, the only means of providing for the necessities of the state, and restoring that credit, which borrowing had reduced to the brink of ruin.

This proceeding was no sooner known, than the king required the attendance of the grand deputation of parliament; he erased from their records the resolution that had been adopted; and observed, though it was his pleasure that the parliament should communicate, by its respectful representations, whatever might interest the good of the public, yet he never would consent that they should so far abuse his confidence and mercy, as to erect themselves into the censors of his administration; he expected in future they should confine their expressions within the limits of wisdom and loyalty; he declared himself satisfied with the conduct of monsieur. Calonne, his comptroller-general; and, more strongly to mark his resentment against them, he directed the dismissal from farther service of one of their officers who had appeared most active in forwarding the late resolution.

However gratified by the support of his sovereign, monsieur de Calonne could not fail of finding himself deeply mortified by the opposition of the parliament. His address to conciliate that assembly had proved ineffectual, and he experienced their inflexible averfion at the critical juncture, when their acquiescence might have proved of the most essential service. An anxious inquiry into the state of the public finances had convinced him that the expenditure had far exceeded the revenues; in the present situation, to impose new taxes was impossible; to continue the method of borrowing was ruinous; and to have recourse only to œconomical reforms, would be found wholly inadequate; and he hesitated not to declare that it would be impossible to place the finances on a solid basis, but by the reformation of whatever was vicious in the constitution of the state.

To give weight to this reform, the minister was sensible that something more was necessary than royal authority; he perceived that the parliament was neither a fit instrument for introducing a new order into public affairs, nor would submit to be a passive machine for sanctioning the plans of a minister, even if those plans were the emanations of perfect wisdom. Though originally a body of lawyers, indebted for their appointments to the king, there was not an attribute of a genuine legislative assembly that they did not seem desirous to engross to themselves; and they had been supported in their pretensions by the plaudits of the people, who were sensible that there was no other body in the nation who could plead their cause against ministerial oppression.

Under these circumstances, the only alternative that seemed to remain, was to have recourse to some other assembly, more dignified and solemn in its character, and composed of members from the various orders of the state, and the different provinces of the kingdom. This promised to be a popular measure; it implied a deference for the people at large, and might be expected to prove greatly acceptable; but the true and legitimate assembly of the nation, the states-general, had not met since the year 1614. Another assembly had occasionally been substituted in the room of the states-general; this was distinguished by the title of the *Novab'ys*, or men of note, and consisted of a number of persons from all parts of the kingdom, chiefly selected from the higher orders of the state, and nominated by the king himself. This assembly had been convened by Henry the Fourth, and again by Lewis the Thirteenth; and was now once more summoned by the authority of the late monarch.

The

The writs for calling together the assembly of the notables were dated on the 20th of December, 1786; they were addressed to seven princes of the blood, nine dukes and peers of France, eight field marshals, twenty-two nobles, eight counsellors of state, four masters of requests, eleven archbishops and bishops, thirty-seven of the heads of the law, twelve deputies of the pays d'états, the lieutenant civil, and twenty-five magistrates of the different towns of the kingdom. The number of members was one hundred and four; and the 29th of January, 1787, was the period appointed for their opening.

It was at the moment when the members of the notables had arrived at Paris, and when the attention of all classes in the kingdom was fixed upon their meeting as an important era in the national history, that the minister found himself yet unprepared to submit his system to their inspection, and postponed the opening of the council to the 7th of February. This delay was injudicious in the highest degree; and to this the subsequent revolution is said immediately to have been owing. Politics had occupied the minds of men, particularly in the metropolis, to the exclusion of every other subject; and, during this interval, an opportunity was given to the members of conversing with each other, communicating their complaints, and forming schemes for redress. A second delay, to the 14th of the same month, was occasioned by the indisposition of monsieur de Calonne himself, and that of the count de Vergennes, president of the council of finance, and first secretary of state; and a third procrastination, owing to the death of the count, postponed the meeting to the 22d of February.

It was under these difficulties that monsieur Calonne first met the assembly of the notables, and opened his long-expected plan. He began by stating that the public expenditure had for centuries past exceeded the revenue, that a very considerable deficiency had of course existed, and that at his own accession to office it was three millions, three hundred and thirty thousand pounds.

To remedy this evil, the comptroller-general recommended a territorial impost, in the nature of the English land-tax, from which no rank or order of men was to be exempted; an inquiry into the possessions of the clergy, which hitherto had been exempted from bearing public burthens; the various branches of internal taxation were also to undergo a strict examination; and a considerable resource was presented in mortgaging the demefne lands of the crown.

Before monsieur Neckar retired from the management of the finances, he had published his *Compte rendu au Roi*, in which France was represented as possessing a clear surplus of four hundred and twenty-five thousand pounds sterling. This performance had been read with avidity, and had been considered as forming a new era in the history of France. The credit of this statement was ably vindicated by monsieur de Brienne, archbishop of Toulouse, and by the count de Mirabeau, a still more formidable enemy to Calonne. His eloquence, however, might have successfully vindicated his system and reputation against the calculations of Brienne, and the invectives of Mirabeau; but the genius of the comptroller-general sunk under the influence of the three great bodies of the nation. The grand and essential object of reform was to equalize the public burthens, and by rendering the taxes general, to diminish the load of the lower and most oppressed classes of the people. The ancient nobility and the clergy had ever been free from all public assessments; the crowds of new noblesse, who had purchased their patents, were by that shameful custom exempted, both themselves and their posterity, from contributing proportionally to the expences of the state; the magistracies likewise throughout the kingdom enjoyed their share of these exemptions; so that the whole weight of the taxes fell on those who were least able to bear them. Thus the nobility, the clergy, and the magistracy, were united against the minister, and the event was such as might be expected. The intrigues of those three bodies raised against him so loud a clamour, that

finding it impossible to stem the torrent, monsieur de Calonne not only resigned his place on the 12th of April, but soon after retired to England from the storm of prosecution.

The notables proceeded in their inquiries, and it was now suggested that an assembly of the states should be called, as the notables were not competent to impose a new tax. As the deliberations of the notables were not carried on in secret, this proposal was instantly circulated through the capital, and supposed to be a new discovery. The notables were soon after dissolved.

The stamp-act, however, was established, and a bed of justice was held by the king on the fifth of August, 1787, at which the parliament of Paris was obliged to attend; and the edict was registered, notwithstanding their protest to the contrary; but the parliament, though defeated, were far from being subdued. On the day after the king had held his bed of justice, they entered a formal protest against the concession that had been extorted from them. They declared that the edict had been registered against their approbation and consent, by the king's express command; that it neither ought, nor should have any force; and the first person who should presume to attempt to carry it into execution, should be adjudged a traitor, and condemned to the gallies.

This declaration left to the crown no other alternative, than either proceeding to extremities in support of its authority, or giving up, for ever after, the power of raising money upon any occasion without the consent of parliament. Painful as every appearance of violence must have proved to the mild disposition of Lewis, he could not consent to surrender, without a struggle, that authority which had been so long exercised by his predecessors. Since the commencement of the present discontents, the capital had been gradually filled with considerable bodies of troops; and about a week after the parliament had entered the protest, an officer of the French guards, with a party of soldiers, went at break of day to the house of each individual member, to signify to him the king's command, that he should immediately get into his carriage, proceed to Troyes, a city of Champagne, about seventy miles from Paris, without writing or speaking to any person out of his own house before his departure. These orders were served at the same instant; and before the citizens of Paris were acquainted with the transaction, the parliament were already on the road to the place of their banishment.

But previous to their removal, they had presented a remonstrance on the late measures of government, and the alarming state of public affairs. In stating their opinions on taxes, they declared that neither the parliaments, nor any other authority, save that of the three states of the kingdom collectively assembled, could warrant the laying of any permanent tax upon the people; and they strongly enforced the renewal of those national assemblies, which had rendered the reign of Charlemagne so illustrious.

So great was the resentment of the whole nation against the banishment of the parliament, that after a month's exile it was recalled. This was scarcely done, when they were desired to register a loan; at which they hesitated. At last the king came to the house, and held what is called a royal session. The edicts were now registered; but the duke of Orleans protested, in the presence of the king, against the legality of the proceeding. The parliament protested against the legality of the session itself, but to no purpose. The duke of Orleans, and four others, were banished; the king called for the journals of the house, destroyed the protest, and forbade it to be inserted again. Great clamours were raised for the release of the duke of Orleans, and the other members of parliament; remonstrances were presented by the parliaments of Paris, Bourdeaux, and Rennes; but the exiles were not recalled till the spring of 1788.

The parliament of Paris had not confined their demands to the liberation of those gentlemen, but had called the remonstrances of the parliament of Grenoble,

and

and had loudly inveighed against the execution of *lettres de cachet*. So free, and pointed were the speeches of two of the members, that Lewis was once more prevailed upon to recur to severity; and Messrs. d'Espromenil and Monfambert were committed to separate state-prisons.

The remonstrance of the parliament on this new exertion of despotism, exceeded in boldness all the former representations of that assembly: they declared they were now more strongly confirmed, by every proceeding, of the entire innovation, which was aimed at in the constitution. "But, Sire," added they, "the French nation will never adopt the despotic measures to which you are advised, and whose effects alarm the most faithful of your magistrates; we shall not repeat all the unfortunate circumstances which afflict us; we shall only represent to you with respectful firmness, that the fundamental laws of the kingdom *must not* be trampled upon; and that *your authority can only be esteemed, so long as it is tempered with justice.*"

Language so bold and decisive, and which asserted the controlling power of the laws above the regal authority, could not fail of seriously alarming the royal bosom. No alternative remained now to Lewis; but to plunge his country into all the calamities of civil war, or to comply with the wishes of his people, and re-establish the states-general. In the first case, he must have expected to encounter the majority of the people, animated by the exhortations and examples of their magistrates; the peers of the realm had expressed the strongest disapprobation of his measures, nor could he even depend any longer on the princes of the blood; but what afforded most serious matter of alarm, was the spirit lately displayed among the military, who, during the disturbances in the provinces, had reluctantly been brought to draw their swords against their countrymen; and many of whose officers, having imbibed principles of resistance in America, publicly proclaimed their abhorrence of despotism.

Yet it was not till after many a painful struggle, that Lewis could resolve to restore an assembly, whose influence must naturally overshadow that of the crown, and whose jurisdiction would confine, within narrow limits, the boundless power he had inherited from his predecessor. During the two preceding reigns, the states-general had been wholly discontinued; and though the queen-regent, amidst the troubles which attended the minority of Lewis the Fourteenth, frequently expressed her intention of calling them together, she was constantly dissuaded by the representations of the crafty Mazarine. It is probable that the present monarch still flattered himself with the hope of being able to allure the members of that assembly to the side of the court; and thought, that having employed them to establish some degree of regularity in the finances, he would again dismiss them to obscurity.

In the beginning of August, an arret was published, which fixed the meeting of the states-general to the first of May in the ensuing year, viz. 1789; at the same time every step was taken to secure the favourable opinion of the public. New arrangements took place in the administration; and monsieur Neckar, whom the confidence of the people had long followed, was again introduced into the management of the finances; the torture, which by a former edict had been restricted in part, was now entirely abolished; every person accused was allowed the assistance of counsel, and permitted to avail himself of any point of law; and it was decreed that, in future, sentence of death should not be passed on any person, unless the party accused should be pronounced guilty by a majority at least of three judges.

But the most important consideration that occupied the attention of the sovereign and his ministers, was the means of assembling the states-general. The last meeting, in the year 1614, had been convened by application to the bailiwicks; but this

this mode was liable to several strong objections; the bailiwicks had been increased in number and jurisdiction; and since that period several provinces had been united to France; nor were the numbers and quality of the members less an object of serious deliberation; and it was not till the close of the year that the proposal of monsieur Neckar was adopted, and publicly registered, which fixed the number of deputies at one thousand and upwards; and ordained that the representatives of the third estate, or commons, should equal in number those of the nobility and clergy united.

The eyes of all Europe were now turned on the states-general, or national assembly, whose re-establishment, in the month of May, 1789, presented a new era in the government of France. But the moment of their meeting was far from auspicious to the court. The minds of the French had long been agitated by various humours; the unanimity, that had been expected from the different orders of the states, was extinguished by the jarring pretensions of each; and their mutual jealousies were attributed by the suspicions of the people to the intrigues of ministers. A dearth that pervaded the kingdom increased the general discontent; and the people, pressed by hunger, and inflamed by resentment, were ripe for revolt. The sovereign also, equally impatient of the obstacles he incessantly encountered, could not conceal his chagrin; the influence of the queen in the cabinet was again established, and was attended by the immediate removal of Neckar. This step, which evinced a total change of resolutions, was followed by others equally injudicious. The states-general were driven into the "Salle des Etats," where they held their meetings, by detachments of the guards, who surrounded them, and who waited only the orders of the court, to proceed to greater extremities against the obnoxious representatives of the nation.

Had these manifestations of vigour been sustained by instantly attacking and entering Paris, it is probable that the capital would have been without difficulty reduced to obedience. But the delay which succeeded, gave the inhabitants time to recover from their first emotions of surprise and apprehension. They saw the timidity and imbecillity of the government, which, having founded the charge, dared not advance to the attack. They profited by this want of exertion; and passing from one extreme rapidly to another, they almost unanimously took up arms against their rulers. Joined by the French guards, who, from a long residence in the capital, had been peculiarly exposed to seduction, and who at this decisive moment abandoned their sovereign, the Parisians broke through every obstacle by which they had hitherto been restrained. The supplies of arms and ammunition, which had been provided for their subjugation, were turned against the crown; and the "Hotel des Invalides," the great repository of military stores, after a faint resistance, surrendered.

The prince de Lambese, who alone, of all the officers commanding the royal troops in the vicinity of Paris, attempted to carry into execution the plan for disarming the capital, was repulsed in a premature and injudicious attack, which he made at the head of his dragoons, near the entrance of the garden of the Tuilleries. Already the "Prevot des Marchands," monsieur de Flessels, convicted of entertaining a correspondence with the court, and detected in sending private intelligence to monsieur de Launay, governor of the Bastille, had been seized by the people, and fallen the first victim to their resentment. His head, borne on a lance, exhibited an alarming spectacle of the danger with which adherence to the sovereign was likely to be attended.

The Bastille alone remained; and while it continued in the power of the crown, Paris could not be regarded as secure from the severest chastisement. It was instantly invested on the 14th of July, 1789, by a mixed multitude, composed of citizens, and soldiers who had joined the popular banner. De Launay, who com-

manded in the castle, by an act of perfidy, unjustifiable under any circumstances, and which rendered his fate less regretted, accelerated the capture of this important fortress. He displayed a flag of truce, and demanded a parley; but abusing the confidence which these signals inspired, he discharged a heavy fire from the cannon and musquetry of the place upon the besiegers, and made a considerable carnage. Far from intimidating, he only augmented, by his treacherous cruelty, the rage of an incensed populace. They renewed their exertions with irresistible energy. The Bastille, that awful engine of despotism, whose name alone diffused terror, and which for many ages had been sacred to silence and despair, was entered by the victorious assailants. De Launay, seized and dragged to the "Place de Greve," was instantly decapitated, and his head carried in triumph through the streets of Paris.

In this prison were found the most horrible engines for putting to the severest tortures those unhappy persons, whom the cruelty or jealousy of despotism had determined to destroy. An iron cage, about twelve tons in weight, was found with the skeleton of a man in it, who had probably lingered out a great part of his days in that horrible mansion. Among the prisoners released by its destruction, were major White, a Scotman, lord Massarene, an Irish nobleman, and the count de Lorges. The first appeared to have his intellectual faculties totally impaired, and had forgotten the use of speech. The second, on his arrival at the British shore, eagerly jumped out of the boat, fell down on his knees, and kissing the ground thrice, exclaimed, "God bless this land of liberty." The count de Lorges, at a very advanced period of life, was also liberated, and exhibited to the public curiosity in the "Palais Royal." His squalid appearance, his white beard which descended to his waist, and above all, his imbecility, resulting from an imprisonment of thirty-two years, were objects highly calculated to operate upon the senses and passions of every beholder. It is indeed impossible, not to participate in the exultation, which a capital and a country, so long oppressed, must have experienced, at the extinction of this detestable and justly dreaded prison of state.

With the Bastille expired, the despotism of the French princes, which long prescription, submission, and military strength, seemed to render equally sacred and unassailable; which neither the calamities of the close of Lewis the Fourteenth's reign, the profligacy and enormities of the succeeding regency, nor the state of degradation into which the monarchy sunk under Lewis the Fifteenth, had ever shaken: that power, which appeared to derive its support almost as much from the loyalty and veneration, as from the dread and terrors of the subject, fell prostrate in the dust, and never betrayed a symptom of returning life.

So many great events have arisen in consequence of this revolution, that the limits of our present work will not permit us to give any more than the most prominent features, and important consequences of it. The next morning after the capture of the Bastille, the monarch appeared in the national assembly, but without the pomp and parade of despotism. His address was affectionate and consolatory. "He lamented the disturbances at Paris; disavowed all consciousness of any meditated attack on the persons of the deputies; and added, that he had issued orders for the immediate removal of the troops from the vicinity of the metropolis." The tear of sympathy started into every eye. An expressive silence first pervaded the assembly, which presently was succeeded by a burst of applause and acclamation. On the 16th, the king having intimated to the national assembly his intention of visiting Paris the following day, he accordingly, on the morning of the 17th, left Versailles in a plain dress, and with no other equipage than two carriages, with eight horses each; in the first of which he rode himself; a part of the national assembly in their robes accompanied him on foot; and the militia of Versailles composed his only guard, till the procession arrived at the

Seve, where they were relieved by the Paris militia, with the marquis de la Fayette at their head; and from this place, the suite of the monarch amounted to about 20,000 men. The progress was remarkably slow; and no shout was to be heard but *Vive la nation!* Mr. Bailly, on presenting the keys of the city, addressed his majesty in a short speech, the exordium of which was: "These, sir, are the keys which were presented to Henry IV. He came to reconquer his people; it is our happiness to have reconquered our king." On receiving the complimentary addresses of the mayor, &c. the king exclaimed with an air of pathetic emotion, which scarcely allowed him utterance—"My people may always rely upon my affection." He received from the hands of the mayor the national cockade; and when he shewed himself at the window with this badge of patriotism, the joy of the people could no longer be restrained; the shout of *Vive le Roi!* which had scarcely been heard in the former part of the day, filled the whole atmosphere, and resounded from one extremity of the city to the other. The return of the king to Versailles was a real triumph. The citizens, intoxicated with joy, surrounded his carriage; his countenance, which in the morning bore the aspect of melancholy, was now cheerful and smiling; and appeared sincerely to partake in the general satisfaction.

The events which followed, are by the candid of all parties allowed to be enveloped in an almost impenetrable veil of obscurity. An incident which occurred at Versailles contributed to excite a most unhappy commotion. On the 1st of October, an entertainment was given by the gardes-du-corps, or king's body guards, to the officers of a regiment of Flanders, who had just joined them in the service of guarding the monarch. Several of the officers of the national guard, with others of the military, were invited. At the second course four toasts were given: "the king, the queen, the dauphin, and the royal family." "The nation" was proposed, but, according to a number of witnesses, expressly rejected by the gardes-du-corps. After this, the queen, having been informed of the gaiety of the scene, persuaded his majesty, who was just returned from hunting, to accompany her with the heir apparent to the saloon. She appeared with the dauphin in her arms, affectionate as she was lovely, and carried the royal infant through the saloon, amidst the acclamations and murmurs of the spectators. Fired with enthusiasm, the soldiers drank the health of the king, the queen, and the dauphin, with their swords drawn; and the royal guests bowed respectfully, and retired.

The entertainment, which had hitherto been conducted with some degree of order, now became a scene of entire confusion. Nothing was omitted to inflame the passions of the military. The music played the favourite air—"O Richard, O my king, the world abandons thee!" the ladies of the court distributed *white cockades*, the anti-patriot ensign; and even some of the national guard, it is said, had the weakness to accept them.

During these transactions, the city of Paris was afflicted with all the evils of famine. At this juncture the news arrived of the fatal banquet at Versailles, with every circumstance greatly magnified. Early on the morning of the memorable 5th of October, a woman sallied out from the quarter of St. Eustache, and entering the corps-de-garde, and seizing a drum, paraded the adjacent streets beating an alarm, and exciting the people by clamours respecting the scarcity of bread. She was soon joined by a very numerous mob, chiefly of women, to the amount of 800, who proceeded to Versailles, where the king, upon hearing their complaints, signed an order for bringing corn from Senlis and Lagny, and for removing every obstacle which impeded the supply of Paris. This order was reported to the women, and they retired with gratitude and joy.

This band of Amazons were no sooner dispersed, than it was succeeded by another. The national assembly continued sitting, but their deliberations were tumultuous, and interrupted by the shouts and harangues of the Parisian sithwomen, who filled the galleries; and whose applause was mingled with affecting murmurs and complaints, the multitude crying out that they were actually starving, and that the majority of them had eaten nothing for upwards of twenty-four hours. The president therefore humanely ordered that provisions should be sought for in every part of the town, and the hall of the assembly was the scene of a scanty and scrambling meal. Indeed, such was the dreadful famine, that the horse of one of the gardes-du-corps being killed in a tumult, he was immediately roasted, and greedily devoured by the mob.

Darkness and a deluge of rain added to the horrors of the night. The wretched multitudes who had travelled from Paris, were exposed, almost famished, to the inclemencies of the weather, in the open streets: within the castle all was tepidation: nothing was to be heard from without but imprecations, and the voices of enraged multitudes, demanding the life of the queen and the gardes-du-corps. Towards midnight, however, all appeared tolerably still and peaceable, when the beating of the drums, and the light of innumerable torches, announced the approach of the Parisian army.

The day began to break at about half past five; and at this period, crowds of desperate persons, breathing vengeance, and thirsting for blood, advanced to the castle, which, in an hour of fatal security, was left unguarded in several places. An immense crowd found its way into every part. The queen had been awaked a quarter of an hour before, by the clamours of the women who assembled upon the terrace; but her waiting-woman had satisfied her by saying, "that they were only the women of Paris, who, she supposed, not being able to find a lodging, were walking about." But the tumult approaching, and becoming apparently more serious, she rose, dressed herself in haste, and ran to the king's apartment by a private passage. In her way she heard the noise of a pistol, and a musquet, which redoubled her terror. "My friends," said she to every person she met, "save me and my children." In the king's chamber she found the dauphin, who had been brought there by one of her women; but the king was gone. Awaked by the tumult, he had seen from a window the multitude pressing towards the great stair-case; and alarmed for the queen, he hastened to her apartment, and entered it at one door in the moment she had quitted it by the other. He returned without loss of time; and having with the queen brought the prince's royal into the chamber, they prepared to face the multitude.

In the mean time the noise and tumult increased, and appeared at the very door of the chamber. Nothing was to be heard but the most dreadful exclamations, with violent and repeated blows against the outer door, a pannel of which was broken, and instant death was expected by the royal company. Suddenly, however, the tumult seemed to cease—every thing was quiet; and a moment after, a gentle rap was heard at the door. The door was opened, and in an instant the apartments were filled with the Parisian guard. The officer who conducted them, ordered them to ground their arms. "We come," said he, "to save the king;" and turning to such of the gardes-du-corps as were in the apartments, "We will save you also, gentlemen; let us from this moment be united."

The royal family now ventured to shew themselves at a balcony, and received the most lively acclamations of respect from the soldiers and the people. A single voice, or a few voices, exclaimed—"The king to Paris!" and this was instantly followed by an universal acclamation enforcing the same demand. The king addressed them; "You wish me to go to Paris—I will go, on the condition that I am to be accompanied by my wife and children." He was answered by reiterated acclamations

\* The p  
" wife, and

acclamations of *Vive le roi!* It was two in the afternoon before the procession set out. During the progress, all was gaiety and joy among the soldiers and spectators; and such was the respect in which the French nation still held the name and person of their king, that the multitude were superstitiously persuaded that the royal presence would actually put an end to the famine\*. On his arrival, the king was congratulated by the municipality, and declared his approbation of the loyalty which the city of Paris manifested.

The spirit of the nation was so entirely averse from the principles of the high aristocratic party, that the king's two brothers, and many persons of rank and fortune, took refuge in foreign countries, where they applied themselves indefatigably to the purpose of exciting war against their country.

Great preparations were made for the celebration of a grand confederation, in which the representatives of the nation, the king, the soldiery, and all who were in ostensible situations, should solemnly, and in the face of the whole nation, renew their oaths of fidelity to the new constitution; and this confederation was decreed to take place on the 14th of July 1790, in honour of the taking of the Bastille, and of the full re-establishment of Gallic liberty. The *Champ de Mars*, so famous for having been the rendezvous of the troops, which in the preceding year were intended to overawe the capital, was chosen for this solemnity. This piece of ground, which is about 400 toises, or 800 yards in diameter, is bounded on the right and left by lofty trees, and commands at the further extremity a view of the military academy. In the middle of this vast plain an altar was erected for the purpose of administering the civic oath; and round it an immense amphitheatre was thrown up, of a league in circumference, and capable of containing 400,000 spectators. The entrance was through triumphal arches. The king's throne was placed under an elegant pavilion in the middle, and on each side of it were seats for the members of the national assembly.

The important 14th of July at length arrived. The national guards of the departments, distinguished by their respective standards, the battalions of infantry, and the different troops of cavalry, the marine of France, and the foreigners who served under its banners, being arranged in military order, the king and the national assembly took a solemn oath to maintain the constitution; the armed citizens repeated it amongst the applauses of innumerable spectators. They swore to live free, or die; and this oath was taken on the same day through the whole extent of the kingdom.

The escape of the king and queen with their infant children, and monsieur and madame, which happened on the 20th of June 1791, menaced France with the convulsions of anarchy, and the horrors of civil war. The route of the royal fugitives, which had been expected to have been towards the Austrian Netherlands, the nearest frontier of the kingdom, was in fact directed toward Metz, from the presence of so gallant and accomplished a royalist as monsieur de Bouillé in that quarter, from its vicinity to the prince of Condé's army in Germany, and from the probable reluctance of Leopold to hazard the tranquillity of his Netherlands, by permitting any incursion from them into France. They reached St. Menesbould, a small town, about 150 miles from Paris. The king was there recognised by the postilion, who said to him, "*Mon roi, je vous connois, mais je ne vous trahirai pas.*" "I know you, my king, but I will not betray you." But the postmaster, monsieur Drouet, a man of very different principles, adopted a different conduct. He avoided, with great dexterity and presence of mind, betraying his

\* The popular exclamation was, as they proceeded along, "We are bringing the baker, the baker's wife, and the little journeyman."

knowledge

knowledge of the rank of the royal travellers, being much struck with the resemblance which his majesty's countenance bore to his effigy on an assignat of 50 livres. The carriages taking the road to Varennes, he went a cross-road to rejoin them; and arriving before them at Varennes, he alarmed the town, and assembled the national guards, who, notwithstanding the detachment of hussars to protect their route, dispersed them, and the King was then *made a prisoner*; and at six o'clock in the afternoon of the 25th of June, their majesties, with the dauphin and madame royale, arrived at the Tuilleries.

The new constitution was presented to the king on the 3d of September, 1791, who, on the 13th, signified his acceptance of it in writing; and the following day he appeared in the assembly, introduced by a deputation of sixty members, and solemnly consecrated the assent which he had already given; and concluded with an oath, "To be faithful to the nation and to the law, and to employ the powers vested in him, for the maintenance of the constitution, and the due execution of the law." On the 30th of this month, the constituent national assembly terminated an uninterrupted session of two years and four months, and spontaneously dissolved itself.

Before the constituent assembly dissolved itself, measures ought to have been taken for assembling the new legislature in some place where its deliberations would have been more free and independent than they could be in the factious metropolis; and they should have corrected the error into which their own vanity betrayed them, of admitting a numerous and insolent audience to seat themselves in the galleries, as judges of the debate, which they frequently disturbed, by their insolent testimonies of applause or disapprobation.

Another serious misfortune to France was the influence acquired by the popular societies. The Jacobin club originated from a small and secret association of about forty gentlemen, and men of letters, who united themselves, long previous to the meeting of the states-general, for the purpose of disseminating political knowledge among the mass of the people. It was afterwards melted into the Breton club, at Versailles, during the first sessions of the national assembly; and the society becoming numerous on the removal of the king and assembly to Paris, it obtained possession of the chapel of the Jacobins, on the dissolution of the monastic orders. The popularity which it acquired soon rendered it exceedingly numerous, and this circumstance pointed it out as a proper engine to work upon the passions of the multitude. From a very early period of its institution, one principal object was, to discuss such political questions as were likely to be agitated in the national assembly, in order that the members might act in concert, according to the decisions of the majority. This plan was reduced to a system, when the club became numerous; and a regular president and secretaries were chosen, and it became a national assembly in miniature. Besides the members, an immense multitude of auditors were admitted into the galleries, who applauded or condemned the speakers, as passion or caprice dictated. Here the most inflammatory declamations were heard with the most clamorous testimonies of approbation, and every proposition in the least inclining to moderation of sentiment, or wisdom in political conduct, was reprobated and condemned. In few words, it became ultimately the mere vehicle of faction, where, as always happens in such cases, the worst men, and the worst measures were usually triumphant. *Fraternal* societies (according to the barbarous jargon, which was adopted as the language of anarchy) were instituted in all the considerable towns in the kingdom; and the only object of emulation in these nests of political hornets seemed to be, which should act most unwisely, and least for the public benefit.

In imitation of the Jacobins, several other societies were instituted for the purpose of political discussion; and thus, independent of the perversion of sentiment,

an intolerable waste of time was occasioned to the lower classes of society. It should have been one of the great objects of the national assembly, to dissolve or restrain these factious assemblages, and to restore the nation, from that political delirium in which so great a revolution must necessarily involve them, to the sober paths of industry, œconomy, and proper subordination.

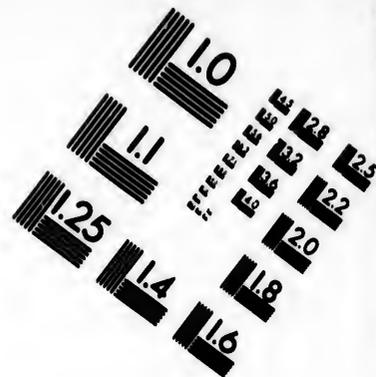

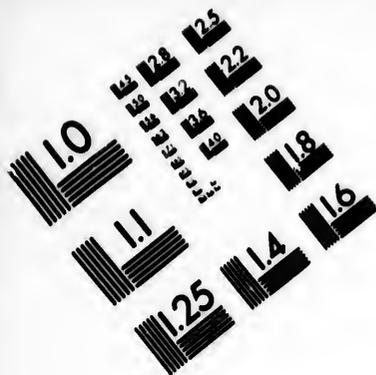

With the constituent assembly, the sun of French liberty set. With it, the wisdom, the moderation, the dignity of the nation was dissolved. That fatal decree, which deprived the country of all the assistance which might be derived from the exertion of the most brilliant talents matured by experience, placed in their seats men incapable, either from want of principle or of ability, to exercise the sacred and important function of legislators.

The doubtful conduct of the emperor, and the refuge and protection found on the German frontiers by the emigrant princes, excited France to vigorous resolutions, and a celebrated manifesto, addressed to all states and nations, made its appearance. The energetic measures pursued had the effect of intimidating the German princes; and the emigrants were constrained to an ignominious dispersion from the frontiers. But the protection of the emperor, and the Prussian king, afforded them asylums more remote and less obtrusive. Irresolution seemed to preside in the councils of the emperor; a monarch more eminent for the mild virtues of peace, than for the exertions of war. He had acknowledged the national flag, he had declared that he regarded the king of the French as absolutely free, while the league of Pilnitz, (which seemed intended not only to secure Germany from such a revolution as France had experienced, but even to extinguish the dreaded source) and the protection afforded to the emigrants, were deemed infallible proofs that the emperor could not be regarded as a friend. His sudden death, on the first of March, 1792, excited great consternation among the aristocrats, and afforded joy and exultation to the supporters of the new constitution. Another event, no less unexpected, happened in the assassination of the Swedish monarch, on the 29th of the same month; and the superstitious vulgar imagined that they beheld the peculiar protection of heaven, in the removal of the two chief foes of France in so short a time.

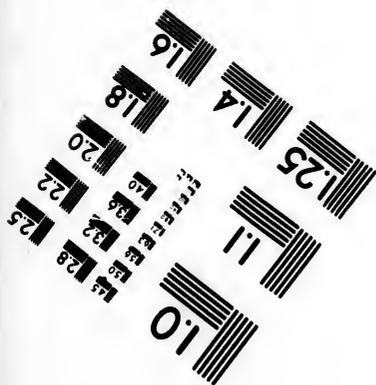

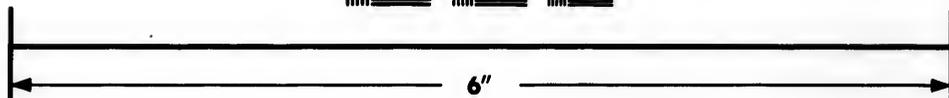

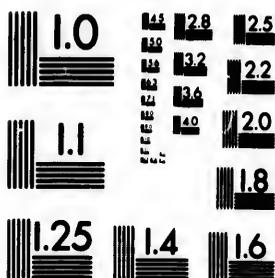

In the progress of the negotiations between the national assembly and the court of Vienna, the young Hungarian king, excited by the influence of Prussia, began to exhibit more enmity, and to use severer language. At length, on the 5th of April, M. de Noailles, in his dispatches to the French minister for foreign affairs, explained the propositions of the imperial court, that satisfaction should be given to the German princes, proprietors of Alsace; that Avignon, which had been appropriated by France, should be restored to the pope; and that the internal government of France should be invested with sufficient efficiency, that the other powers may have no apprehensions of being troubled by France. Those terms produced a declaration of war against Francis I. king of Hungary and Bohemia, decreed by the assembly and ratified by the French king, on the 24th of April.

The first movement of the French was stained with defeat, and with the unpropitious murder of Theobald Dillon, the leader, who fell a prey to the suspicious and savage ferocity of some of the soldiers, who fled from the enemy, but attacked their general. The court of Vienna had, in the beginning of July, published a declaration explaining the cause of their hostilities, and retorting on the French nation some of the heavy charges contained in its declaration of war against the king of Hungary and Bohemia, now emperor of Germany. On the 26th day of the same month, the Prussian monarch issued a concise exposition of the reasons which determined him to take up arms against France. He pleads his alliance with the emperor, and that, as sovereign of a German state, he was bound to interfere, to prevent the violation of the rights of the German princes of Alsace and Lorraine,

Lorraine, and the invasion of the territories of others: and he honestly concludes by avowing that it is his intention to repress the too great liberty of France, which might afford a dangerous example to neighbouring countries. At the same time the duke of Brunswick, general of the combined armies of Austria and Prussia, published at Coblenz a declaration to the inhabitants of France, conceived in the most haughty and presumptuous terms; he declared his intention of putting a stop to the anarchy which prevailed in France, and of restoring the king to his power; and yet he afterwards expresses his design not to interfere in the internal government! It is unnecessary to dwell on the other ill-advised parts of this memorial, in which France is already regarded as a conquered country, and directions are given to the magistrates, national guards, and inhabitants at large: but the threat that the city of Paris should be given up to military execution, in case the least outrage should be offered to the king, queen, or royal family, is worthy of a Hun.

The excesses of the night between the 9th and 10th of August, we relate with pain. At midnight, the alarm-bell sounded in every quarter of Paris, the *generale* was beat, and the citizens flew to arms. The palace of the Tuilleries was attacked by the multitude; and the king, queen, and royal family, were forced to take refuge in the national assembly. At first, the Swiss guards (who were obnoxious to the people, and had been ineffectually proscribed by repeated decrees of the assembly, the king not being allowed to have a foreign guard) repelled the populace; but these being reinforced by the Marseillois, and federates from Brest, bodies which the Jacobins seem to have brought to Paris to balance the Swiss, and by national guards, the gates of the palace were burst open. The artillery joined the assailants. The consequences were, that, after a slaughter of about four hundred on each side, the Swiss guards were exterminated, and the palace ransacked. M. de la Fayette, finding that the constitution was overthrown, and apprehensive that his life would be attempted by some assassin, or that he would certainly be delivered up into the hands of his adversaries, left the camp on the 19th of August, accompanied only by his staff and a few servants. They took the route of Rochefort, in the bishopric of Liege, which, being a neutral country, they hoped to pass unmolested; but an Austrian general of the name of Harancourt, being stationed there with an advanced party, arrested the fugitives, and sent them prisoners to Namur. It is said, that these unfortunate exiles have ever since been confined in a noisome dungeon, for no other crime, or rather under no other pretext, than that of having been members of the national assembly of France. The approvers of Fayette's political conduct regret his being abandoned by the people, for whom he had made so many sacrifices; and oppressed by a combination of kings, while his attachment to the cause of monarchy is the source of his calamity. Faithful to his oath, to his king, to his engagements, he was among the first, they observe, to oppose the seditious designs of the Jacobin club, and among the most distinguished of those who contended for the maintenance of order and civil obedience. To have received with cordiality the illustrious confessor of regulated liberty, would have been noble and magnanimous. To imprison and persecute virtue and valour in distress, was mean and dastardly; but from Tiberius to the present times, cowardice has been the uniform characteristic of tyranny.

The month of September seemed pregnant with the total ruin of French freedom, while the three following months reversed the scene, and exhibited a tide of success, on the part of France, perhaps unexampled in modern history. It is with infinite concern that we direct the attention of our readers to the prison scene, which occurred on the 2d and 3d of September. The horrid massacre of the defenceless prisoners, and other aristocrats, which took place at that period, is an eternal disgrace to the Parisian populace, who, in their fury, spared not even that gentle

gentle sex, which all civilised nations hold in the highest respect. The number of the slain has doubtless been exaggerated, as usual; yet supposing that, by the most moderate account, only two thousand perished, the enormity of the deed remains the same. Could any extenuation be admitted for the affair of the 10th of August, in which a people, who supposed themselves betrayed to slavery, and all its evils, so recently experienced and shaken off, assumed their revenge and their cause into their own hands; yet surely no defence can be offered for this latter unnecessary crime. Had the combined armies besieged Paris, it is difficult to conceive what aid they could have found from two or three thousand aristocrats, and many of these secured in chains.

A national convention had been called, to determine on the charges brought against the king. They met on the 21st of September; and on the first day of the meeting, the abolition of royalty in France was decreed by acclamation; and the following day it was ordered that all public acts should be dated the first year, &c. of the French republic. But hardly was this convention constituted, when a violent faction appeared, headed by Marat, Robespierre, and others, who have repeatedly degraded its transactions by their fanaticism; and being supported by the Jacobins and Parisian populace, have proved too powerful for the convention to punish, or to restrain as it wished. Repeated instances have proved that the convention is not free, but must vote as the mob of Paris dictates; the moderation of the members being often obliged to yield to the indecent applauses and hisses of the galleries.

So rapid was the progress of the French arms, and so great were the distresses in the combined armies, arising from a scarcity of provisions, from a long rainy season, and from a considerable mortality among the Prussians, by the French accounts, estimated at one half, that the Prussians retreated from the dominions of France, whose example the Austrians soon followed.

Even at the very time that Paris was in the greatest danger, the invasion of Savoy was ordered. On the 21st of September, general Montesquiou entered the Savoyard territories, seized on the frontier posts and castles; and two days after, took Montmelian. Chamberry and all Savoy soon followed; but the conquest not being resisted, was productive of no military glory. The imprudence of the national convention, in permitting Savoy to incorporate itself with France, has excited wonder. After frequent declarations, that the French would enter into no war with any view to conquest, their conduct in this respect was absurd and impolitic. It subjected them to the merited reproach, that, under the pretence of liberty, they maintained the destructive maxims of their ancient government; and that their wishes to increase their territory, perhaps to subjugate Europe, remained the same. Admiral Truguet, commanding a squadron in the Mediterranean, captured Nice, Villa-Franca, and the fortresses of Montalban, belonging to the Sardinian king.

The subjection of Savoy was regarded as a trifle; but when Custine began his acquisitions in Germany, every eye was turned to the rapidity and importance of his progress, till diverted by the wonders of Dumourier. Spire yielded to the French arms on the 30th of September, and Worms soon after followed; ample supplies of provisions and ammunition were found in these cities. Custine pursuing his course along the left shore of the Rhine, captured Mentz, and afterwards Frankfort. He was eager to proceed to Coblenz, that noted seat of the counter-revolutionists; but the Prussians and Austrians at length indicated a renewal of hostilities by garrisoning that town, and encamping in the adjacent country.

The conquest of the Austrian Netherlands forms the next grand object. Dumourier had promised to pass his Christmas at Brussels; and what was regarded as an idle vaunt, proved very modest; for that city was in his hands by the

14th of November. That able general, having entered the Netherlands on the first or the second of that month, with an army of forty thousand men, since much increased, and with a most formidable train of artillery, repeated engagements with the Austrian army, commanded by the duke of Saxe-Teschen, governor of the Austrian Netherlands, and by general Beaulieu, which however exceeded not twenty thousand, occupied the five first days. At length, on the 6th of November, a great battle was fought at Gemappe, which decided the fate of the Netherlands. The contest was very general; all the points of the enemy's flanks and lines were attacked at once; all the bodies of the French were in action, and almost every individual fought personally. The cannonade began at seven in the morning; Dumourier ordered the village of Carignon to be attacked, because he could not attempt the heights of Gemappe, till he had taken that village; at noon the French infantry formed in columns, and rapidly advanced to decide the affair by the bayonet. After an obstinate defence, the Austrians at two o'clock retired in the utmost disorder.

Dumourier immediately advanced, and took possession of the neighbouring town of Mons, where the French were received as brethren. The tidings arriving at Brussels, the court was struck with an indescribable panic; and instantly fled to Ruremond, whence it was again to be driven by the arms of Miranda. Tournay surrendered to a detachment on the 8th of November. Dumourier, having refreshed his troops at Mons, advanced to Brussels, where, after an indecisive engagement between his van and the Austrian rear, he was received with acclamations on the 14th of that month. Ghent, Charleroi, Antwerp, Malines, or Mechlin, Louvain, Oitend, Namur; in short all the Austrian Netherlands, except Luxembourg, successively followed the example of the capital; and the boasted conquests of Louis XIV. were not more rapid.

Many of the priests, who were banished, came to England, and were treated with compassion and bounty; this was followed by the decree of the national convention against the emigrants, by which they are declared dead in law, their effects confiscated, and themselves adjudged to immediate death, should they appear in France.

Another decree of the 19th of November attracted the attention of every nation in Europe. It is in the following terms: "The national convention declare, in the name of the French nation, that they will grant fraternity and assistance to all those people who wish to procure liberty; and they charge the executive power to send orders to the generals, to give assistance to such people, and to defend citizens who have suffered, or are now suffering, in the cause of liberty." This decree, and others of a similar tendency, seem to institute a political crusade against all the powers of Europe.

No sooner had Antwerp yielded to the French arms, than, in order to conciliate the Belgians, the opening of the navigation of the Scheldt, shut up by the treaty of Munster, 1648, was projected and ordered; notwithstanding this treaty, so far as respects the shutting up of the navigation of this river, has been confirmed to the Dutch in succeeding treaties, guaranteed both by the courts of Versailles and London. The Dutch regard this measure as injurious to their trade, for Antwerp might prove a dangerous rival to Amsterdam. The infraction of this treaty is one of the reasons which has induced the parliament of Great Britain to oppose the unwarrantable pretensions of the French.

The memorable trial of the king commenced on the 11th of December. The question which most embarrassed his accusers was, whether the king was not invested by the constitution, with perfect and legal inviolability, and whether, consistently with justice, he, whom the law had solemnly pronounced to be above the reach of any legal process, could be brought to trial. This objection was

strangely

strangely and most iniquitously overruled by the convention, who in this instance established the precedent, always so fatal to liberty, of an *ex-post-facto* law, and evinced to the eyes of Europe their inattention to those "rights of man" which the nation had solemnly proclaimed. The issue is too well known; impartial history will record it to the eternal infamy of the French nation. The firmness of this unfortunate monarch during his trial, and at the place of execution", on the 21st of

\* The following account of the last moments of this unfortunate monarch is truly interesting. It is extracted from the letters of an English lady at that time at Paris.

"The French king received the intelligence of his approaching fate without dismay. He displayed far more firmness upon the scaffold than he had done upon the throne; and atoned for the weakness and inconsistency of his conduct in life, by the calmness and fortitude of his behaviour in death. The evening before his execution, his family, from whom he had been separated since the commencement of his trial, were conducted to the tower of the Temple, and allowed the sad indulgence of a last interview, unmolested by the presence of his guards. Alas! when imagination pictured the anguish of such an interview, it was not necessary to look back upon the former elevation of the sufferer, in order to pity the gloomy transition in his fate! It was not necessary to recollect, that he, who was the following morning to suffer death upon the scaffold, was once the first monarch of Europe, and would be led to execution through the streets of his own capital! It was enough to consider this unfortunate person as a man, a husband, a father! Ah! surely amidst the agonies of final separation from those to whom we are bound by the strongest ties of nature and affection—surely, when we cling to those we love, in the unutterable pang of a last embrace—in such moments, the monarch must forget his crown; and the regrets of disappointed ambition must be unfeigned amidst the anguish which overwhelms the broken heart. That anguish was not confined to the bosom of the king, the queen, and his sister. The princess, his daughter, had attained that age when perhaps the soul is most susceptible of strong impressions, and its sensibility most exquisite. Even the young prince, only in his ninth year, caught the infectious sorrow; and, while his eyes were bathed in tears, cried, sobbing, to Santerre, "Ah, laissez-moi courir les rues!—j'irai aux districts—j'irai à toutes les sections, demander grace pour mon papa!"

"The king had sufficient firmness to avoid seeing his family on the morning of his execution. He desired the queen might be told that he was unable to bear the sight of her and his children in these last moments. He took a ring off his finger, which contained some of his own hair, of the queen's, and of his two children, and desired that it might be given to the queen. He called the municipal officers round him, and told them, it was his dying request, that Clery, his valet-de-

chambre, might remain with his son. He then said to Santerre, "Marchons!" and after crossing, with a hurried pace, the inner court of the Temple, he got into the mayor's carriage, which was in waiting, and was attended by his confessor.—

"The calmness which Louis the Sixteenth displayed in this great trial of human fortitude, is attributed not only to the support his mind received from religious faith, but also to the hope which it is said he cherished, even till his last moment, that the people, whom he meant to address from the scaffold, would demand that his life might be spared. His confessor, from motives of compassion, had encouraged him in this hope. After ascending the scaffold with a firm step, twice the unhappy monarch attempted to speak, and twice Santerre prevented him from being heard, by ordering the drums to beat immediately.

"Two persons, who were on the scaffold, assert, that the unhappy monarch, finding the hope he had cherished, of awakening the compassion of the people, frustrated by the impossibility of his being heard, as a last resource, declared that he had secrets to reveal, of importance to the safety of the state, and desired he might be led to the national convention. Some of the guards, who heard this declaration, cried, "Yes, let him go to the convention!"—others said "No."—Had the king been conducted to the convention, it is easy to imagine the effect which would have been produced on the minds of the people, by the sight of their former monarch led through the streets of Paris, with his hands bound, his neck bare, his hair already cut off at the foot of the scaffold in preparation for the fatal stroke—with no other covering than his shirt. At that sight, the enraged populace would have melted into tenderness; and the Parisian women, among whom were numbers who passed the day in tears of unavailing regret, would have rushed between the monarch and his guards, and have attempted his rescue, even with the risque of life. Santerre, who foresaw these consequences, who perceived the danger of this rising dispute among the guards, called to the executioner to do his office. Then it was, that despair seized on the mind of the unfortunate monarch—his countenance assumed a look of horror—twice with agony he repeated, "Je suis perdu! je suis perdu!" His confessor meantime called to him from the foot of the scaffold, "Louis, fils de St. Louis, montez au ciel!" and in one moment he was delivered from the evils of mortality.

\* "Oh! let me run through the streets—I will go the districts—I will go to all the sections, and beg pardon for my papa."

† "Let us go."

‡ "I am undone! I am undone!"

§ "Louis, son of St. Louis, ascend to heaven!"

January, 1793, increased the commiseration of every indifferent spectator; and callous indeed must be the person, who does not partake of the sympathy which was felt through all Europe upon this transaction.

"The condemnation and execution of the king," said a great statesman in the British house of commons, "is an act as disgraceful as any that history records; and I never can view, but with the greatest detestation, the injustice and inhumanity that has been committed towards that unhappy monarch. Not only were the rules of criminal justice, rules that more than any other ought to be strictly observed, overturned; not only was he tried and condemned without any existing law to which he was personally answerable, and even contrary to laws that did actually exist; but the degrading circumstances of his imprisonment, the unnecessary and insulting asperity with which he had been treated, the total want of republican magnanimity in the whole transaction, added every aggravation to the inhumanity and injustice."

It would be a tedious, and therefore an unwelcome undertaking, to trace minutely and gradually the progress of the dispute between France and England. Without affixing any degree of credit to the reports which have been circulated, that the court of Great Britain had early but secretly acceded to the concert of princes, and the treaty of Pilnitz, it is natural to believe that the British ministry had long viewed with a jealous eye the progress of the French revolution towards a turbulent democracy. On the contrary, we must do the French nation the justice to confess, that the unanimous voice of that people was clamorous from the first for peace and alliance with England. A series of events changed this inclination. A bill, for forcibly transporting aliens out of the kingdom, was introduced into parliament. The ports of Great Britain were shut against the exportation of corn to France, while it was permitted to her enemies. In the end, the ambassador of the republic, M. Chauvelin, was ordered, under the authority of the alien-bill, at a short notice, out of the kingdom; immediately after which dissolution, the convention declared, that the French republic is at war with the king of England, and the stadtholder of the United Provinces.

In consequence of these measures, general Dumourier proceeded with a large body of troops, to invade Holland, exhorting the Batavians in a violent manifesto, to reject the tyrannic aristocracy of the stadtholder and his party, and to become a free republic. The Dutch every where made the most vigorous preparations for defending themselves; and the English cabinet seconded their efforts, by an immediate embarkation of troops, to the command of which the duke of York was appointed.

The subjugation of Holland was the first project of general Dumourier; and when the ease with which he effected the conquest of the Netherlands, and the courage and ability displayed by him and his army at the famous battle of Gemappe, were considered, there was reason to apprehend that he would soon make an impression upon these provinces; and the easy surrender of Breda and Gertruydenberg encouraged him to boast that he would terminate the contest by a speedy approach to Amsterdam. A train of circumstances, however, soon interrupted the victorious career of Dumourier, and evinced to mankind the uncertainty of military successes.

General Miranda, who had besieged the city of Maestricht, and summoned the governor to surrender, was attacked by prince Frederic of Brunswick, and defeated with considerable loss. The Austrians, after this, divided themselves into three columns, two of which marched towards Maestricht, and the siege of that place was immediately raised. The third pursued the advanced guard of the republic; and the absence of several commanding officers was supposed to have greatly facilitated the success of the Prussians in these rencounters, which may be justly

considered as the commencement of a new series of misfortunes to France. Such was the consternation which the successes of the enemy occasioned, that general Valence himself informed the commissioners, that if Dumourier did not arrive immediately, he could not answer for the consequences; but notwithstanding all the past successes of that general, and all his acknowledged military skill, the allies soon beheld his hasty retreat from the Netherlands, and final defection from the cause of his employers. Soon after that general quitted Holland, and assumed in person the command of the disconcerted armies of Valence and Miranda, the forces of the prince of Cobourg and general Clairfuit attacked him with a force which astonished him, who had but a few months before driven the same troops out of France, and through the Netherlands into Germany. He saw with mortification and dismay the laurels of Gemappe wither on the plains of Tirlemont.

On the 14th of March, 1793, the imperialists advanced from Tongres towards Tirlemont, by St. Tron, and were attacked by general Dumourier successively on the 15th and following days. The first attempts were attended with success. The Austrian advanced posts were obliged to retire to St. Tron, through Tirlemont, which they had already passed. On the 18th a general engagement took place, the French army being covered on the left by Dormael, and on the right by Landen. The action continued with great obstinacy on both sides, from seven o'clock in the morning till five in the evening, when the French were obliged to fall back, and the Austrian cavalry coming up, put them entirely to flight. The loss in each army was great. The French displayed considerable courage and address, but were overpowered by the superior numbers, and, perhaps by the more regular discipline of their enemies. Dumourier himself, in a letter to general Duval, says of this battle, that he attacked the enemy in the famous plain of Newinghen, and fought the whole day with his right wing and centre. The left wing not only fought ill, but abandoned him, and fled beyond Tirlemont. He fortunately withdrew the right wing and the centre, skirmishing from the 19th to the 20th; and in the night he took a position on the heights of Cumpitch.

Dumourier addressed a letter to Bournonville the minister at war, dated the 25th of March, in which he gave an account of the retreat of a part of the army under generals Neuilly and Ferrand, who, by the defection of a great number of volunteers, were obliged to evacuate the city of Mons during the night. He added that colonels St. Clair and Theuvenot were attacked without means of defence; that if order and discipline were not restored,—that if fifty authorities, each more absurd than the other, continued to direct all political and military operations, France would be lost. “I have always affirmed,” says he “and I repeat it, that a republic can only be founded on virtue, and that freedom can be maintained only by order and wisdom.” Such is the outline of the proceedings which preceded the final defection of that celebrated general from the republicans of France, whose conduct he seems rather to have disapproved than their principles. His ambitious mind was affected even to desperation, when he had lost the alluring epithet of *deliverer of nations*, by the raimess of the convention and the irregularity of mobs; and it will perhaps long remain a doubt with speculative men, whether Dumourier would not have continued faithful and victorious, if France had seconded his efforts with liberality and wisdom, immediately after the retreat of the duke of Brunwick, which happened in the preceding October.

The latter end of June and the beginning of July were chiefly distinguished in the north, by some petty skirmishes between the two grand armies. The latter part of July was marked by some successes of more importance to the Austrians. The garrison of Condé, after sustaining a blockade of three months, surrendered on the 10th by capitulation to the prince of Cobourg; and Valenciennes, on the 20th

of the same month, to the duke of York, not without suspicions of treachery in both cases.

Encouraged by these successes, a large detachment from the combined army, under the command of the duke of York, proceeded without loss of time to a vigorous attack upon the port and town of Dunkirk. On the 22d of August the duke of York marched from Furnes to attack the French camp at Ghivelde, which was abandoned at his approach, and he was almost immediately enabled to take the ground which it was his intention to occupy during the siege. On the 24th he attacked the outposts of the French, who with some loss were driven into the town. In this action the famous Austrian general Dalton and some other officers of note were killed. The succeeding day the siege might be said regularly to commence. A considerable naval armament from Great Britain was to have co-operated in the siege; but by some neglect, admiral Macbride was not able to sail so early as was expected. In the mean time the hostile army was extremely harassed by the gun-boats of the French; a successful sortie was effected by the garrison on the 6th of September; and the French collecting in superior force, the duke of York, on the 7th, after several severe actions in which the allied forces suffered very considerably, was compelled to raise the siege, and leave behind him his numerous train of artillery. General Houchard was afterwards impeached by the convention for not having improved his success to the best advantage, as it is asserted that he had it in his power to capture almost the whole of the duke of York's army.

The disaffection of the southern provinces of France was productive of serious dangers to the new republic. It is well known that the deputies and people of these provinces were among the foremost in the iniquitous business of dethroning their king, on the execrable 10th of August, 1792. It is therefore somewhat extraordinary that the same men should be among the first to rebel against the authority of the convention. The formidable union which took place under the name of *federate republicanism*, between the cities of Marseilles, Lyons, and Toulon, in the course of the months of June and July, seemed to threaten almost the dissolution of the existing authorities. A considerable army was, however, dispatched against Lyons, and that city closely besieged. The Marseillois in the mean time opened their gates on the approach of the republican army, and submitted; but the people of Toulon entered into a negotiation with the English admiral, lord Hood, who was then cruising in the Mediterranean, and he took possession both of the town and of the shipping in the name of Louis XVII. and under the express and positive stipulation that he is to assist in restoring the constitution of 1789.

We have been led a little to transgress the chronological order of our narrative, to exhibit a connected detail of the external wars, and the internal disturbances of this unhappy country. We should otherwise have remarked, that the incendiary Marat did not long survive to enjoy his triumph in the convention. On the 13th of July, 1793, he was assassinated in his own house, by the hand of an enthusiastic female, of the name of Charlotte Cordé, a native of Caen, and who appeared to have some connexion with the deputies of the Gironde party.

The remains of this notorious anarchist were interred with great funeral pomp, attended by a part of the national convention, and a vast multitude of citizens. There are, however, but few who will probably lament his death, except those who instigated, or at least profited by his crimes.

The death of this execrable incendiary did not restore the convention and the mob of Paris to humanity. On the night of the 1st of August, the unfortunate queen was forcibly separated from her family, conveyed from the Temple to the

Conciergerie, one of the prisons destined for common malefactors; where her treatment was such as would disgrace a civilised people. She was confined in a narrow room, or rather vault, of eight feet square; and the couch, on which degraded royalty was destined to repose, was a hard bed of straw. The Graces had all deserted her countenance, and the marks of premature old age seemed to proclaim that repeated sorrows would soon have terminated a life, which was unnecessarily devoted to the hand of the executioner.

If any act of phrensy could exceed the ill treatment of the queen (who, though her sufferings may have expiated her crimes, certainly cannot be considered as the friend of France) it is the shocking ingratitude and cruelty, which the ruling party immediately afterwards exercised to one of the most meritorious generals that ever the French republic could boast. The unfortunate Custine, after being committed a prisoner to the Abbey, was accused before the revolutionary tribunal, of having maintained an improper correspondence with the Prussians while he commanded on the Rhine, and of having neglected various opportunities of throwing reinforcements into Valenciennes. The French have no distinct notions of the administration of justice; they have no idea of the nature of evidence. To be suspected is to be condemned. The unfortunate general, in the crisis of his adversity, lamented that he appeared forsaken by every friend; and the remorseless populace of Paris, accustomed to sights of horror, beheld the murder of their former defender, with calm indifference, or with blind exultation.

The trial and condemnation of the queen immediately followed that of general Custine. The act of accusation consisted of several charges, many of which were singular, frivolous, and incredible; and we must observe that, although on the trial a number of witnesses were examined, few of the charges appeared to be substantiated. The unfortunate victim was prejudged; and had the evidence been even more frivolous, it is probable she could not have escaped; after an hour's consultation, therefore, the jury brought in their verdict—"guilty of all the charges."

The queen heard the sanguinary sentence with dignity and resignation; perhaps indeed it might be considered by her, less as a punishment than as a release. On the 16th of October, at about eleven o'clock in the forenoon, she was conducted in a coach from the prison of the Conciergerie, to a scaffold prepared in the Place de la Revolution, where her unfortunate husband had previously suffered. The people who crowded the streets as she passed, exhibited no marks of pity or compassion; and her behaviour, as her last sufferings approached, was decent and composed. She met her fate in the thirty-eighth year of her age.

Soon after the convention had brought the queen to the scaffold, they entered upon the trial of Brissot and his supposed accomplices; Brissot was charged with having said and written, at the commencement of the revolution, that Fayette's retiring from the public service was a national misfortune; that he distinguished himself three times in the Jacobin club, by speeches, of which one provoked the ruin of the colonies, another the massacre of the patriots in the Champ de Mars, and the third the war against Austria.

Upon these and other vague accusations, Brissot and twenty-one more of the convention were brought to trial before the Revolutionary tribunal, on the 24th of October; a few days afterwards, the jury declared all the accused members to be accomplices in a conspiracy which had existed against the unity and indivisibility of the French republic; and the tribunal immediately condemned them all to the punishment of death. Valazé, after he had heard his sentence, stabbed himself; and the remaining twenty-one were executed on the 30th of October.

The wretched and profligate Egalité (ci-devant duc d'Orleans) who had voted for the death of the king, was soon after brought to the block, with the highest

highest marks of insult from the surrounding multitude, and with the most unequivocal signs of contempt from the nations of Europe.

The catalogue would be disgusting and even tedious, were we to specify all the judicial murders that have since succeeded. Surely those who contend for freedom and the rights of man, ought to include among them the most sacred of duties, humanity, and ought ever to hold sacred the golden maxim, "that it is better ten guilty persons should escape, than one innocent man perish." But, alas! the French convention and the revolutionary tribunal are not CHRISTIANS.

In the south of France, neither the exertions of the allies, nor the surrender of the Toulonese, have produced the expected consequences in establishing a monarchial government. On the 30th of November, the garrison of Toulon made a vigorous sortie in order to destroy some batteries which the French were erecting upon certain heights, within cannon shot of the city. The detachments sent for this purpose accomplished it with silence and success; and the French troops were surprised, and fled. Elated unfortunately with the facility of the conquest, the allied troops rushed forward in pursuit of their flying foes, when they unexpectedly encountered a considerable force, which was proceeding to cover the retreat of the fugitives. At this moment general O'Hara, the commander in chief at Toulon, arrived upon the spot; and while he was exerting himself to bring off his troops with regularity, he received a wound in his arm, and was made prisoner by the republicans. It is said that near a thousand of the British and allied forces were killed, wounded, or taken prisoners on this occasion.

Soon after the capture of the British general O'Hara, the city of Toulon was evacuated by the allies. On the morning of the 19th of December, the attack began before all the republican forces had time to come up. It was chiefly directed against an English redoubt (Fort Mulgrave) defended by more than three thousand men, twenty pieces of cannon and several mortars. This formidable post was not able to resist the ardour of the republican army. It was attacked about five o'clock in the morning, and at six the republican flag was flying upon it. This success cost the French about 200 men killed, and more than 500 wounded. The allies lost the whole garrison, of which 500 were made prisoners, including eight officers and a Neapolitan prince. The representatives of the people rushed among the several columns, and rallied those who were panic-struck for an instant.

The town was bombarded from noon till 10 o'clock the same evening, when the allies and part of the inhabitants, having first set fire to the town and shipping, precipitated their flight; two chaloups, filled with the fugitives, were sunk to the bottom by the batteries. The precipitation with which the evacuation was effected, caused a great part of the ships and property to fall into the hands of the French, and was attended with the most melancholy consequences to the wretched inhabitants. As soon as they observed the preparation for flight, they crowded to the shores; they demanded the protection which had been promised them on the faith of the British crown. A scene of confusion, riot and plunder ensued; and though great efforts were made to transport thousands of the people to the ships, thousands of the people were left to all the horrors of falling into the hands of their enraged countrymen. Many of them plunged into the sea, and made a vain effort to swim on board the ships; others were seen on the beach to shoot themselves, that they might not endure the greater tortures they might expect from the republicans. During all this, the flames were spreading in every direction; and the ships that had been set on fire, were threatening every instant to explode, and blow all around them into the air. This is but a faint description of the scene on shore, and it was scarcely less dreadful on board the ships. Loaded with the heterogeneous mixture of nations, with aged men and infants, as well as women; with the sick from all the hospitals, and with the mangled soldiers from the posts just deserted,

deserted, their wounds still undrest; nothing could equal the horrors of the fight, except the still more appalling cries of distraction and agony that filled the ear, for husbands, fathers, children, left on shore.

In the latter end of March, 1794, the party called the Hebertists, consisting of Hebert, Momoro, Vincent, and some others, was arrested, and brought to trial before the revolutionary tribunal. It was asserted, in a long act of accusation exhibited against them, "that they had conspired to restore despotism, and to murder the representatives of the people, &c." The prisoners denied what the witnesses alleged against them; but a verdict of guilty was pronounced, with little ceremony; and on the 25th of March 1794, twenty of the supposed conspirators suffered under the axe of the guillotine. A few days after violence and jealousy had sent these reputed traitors to the block, a still more extraordinary scene was exhibited. The celebrated Danton, Fabre d'Eglantine, Bazire, Chabot, Philippeaux, Lacroix, and others, were arrested as conspirators against the public. In a very summary way they were sentenced to death; and on the 5th of April they were brought to the usual place of execution, when most of them, and particularly Danton, manifested the utmost contempt of death.

The successes of the republican arms in Austrian Flanders have been very great, and the campaign of 1794 has witnessed their victories through all that country. The towns of Bruges, Courtray, Ypres, Charleroi, Brussels, Nieuport, and Antwerp, surrendered to the forces of the French: and what will be the future fate of Holland, upon the very frontiers of which the armies of the republic are now (July 1794) placed, time only can unfold.

**T**HE seventeen provinces, which are known by the name of the Netherlands, were formerly part of Gallia Belgica, and afterwards of the circle of Belgium or Burgundy, in the German empire. They obtained the general name of Netherlands, Pais-Bas, or Low-Countries, from their situation in respect to Germany.

EXTENT, SITUATION, AND BOUNDARIES OF THE SEVENTEEN PROVINCES.

	Miles.	Degrees.
Length	360	} between { 49 and 54 North lat. { 2 and 7 East lon.
Breadth	260	

They are bounded by the German sea on the North; by Germany, East; by Lorraine and France, South; and by the British Channel, West.  
 I shall, for the sake of perspicuity, and to avoid repetition, treat of the seventeen provinces under two great divisions: first, the *Northern*, which contains the Seven United Provinces, usually known by the name of **HOLLAND**; secondly, the *Southern*, containing the Austrian and French Netherlands. The United Provinces are, properly speaking, eight, viz. Holland, Overijssel, Zealand, Friesland, Utrecht, Groningen, Gelderland, and Zutphen; but the two latter forming

ing only one sovereignty, they generally go by the name of the Seven United Provinces.

## SITUATION AND EXTENT OF THE UNITED PROVINCES.

Miles. Degrees.

Subdivisions.	Chief Towns.
On the old channel of the Rhine	Utrecht
North of the Old Rhine	Amerfort
South of the Old Rhine	Duelfardwyck

**AIR, SEASONS, SOIL, AND FACE OF THE COUNTRY.** These provinces lie opposite to England, at the distance of 90 miles, upon the east side of the English Channel, and are only a narrow slip of low swampy land, near the mouths of several great rivers, and gained from the sea by means of dykes, raised and still supported with incredible labour. The air of the United Provinces is therefore foggy and gross, until purified by the frost in winter, when the east wind usually lets in for about four months, freezing up their harbours. The moisture of the air causes metals to rust, and wood to mould, more than in any other country; which is the reason of their perpetually rubbing and scouring, and of the brightness and cleanliness observable in their houses. The soil is unfavourable to vegetation; but, by the industry of the inhabitants in making canals, it is rendered fit for pasture, and in many places for tillage. Holland, with all its commercial advantages, is not a desirable country to live in. Here are no mountains nor rising grounds, no plantations, purling streams, or cataracts. The whole face of the country, when viewed from a tower or steeple, has the appearance of a continued marsh or bog, drained at certain distances by innumerable ditches; and many of the canals, which in that country serve as high-roads, are in the summer months highly offensive to the smell.

**RIVERS AND HARBOURS.** The rivers are an important consideration to the United Provinces; the chief of which are the Rhine, one of the largest and finest rivers in Europe; the Maese, the Scheld, and the Vecht. There are many small rivers that join these, and a prodigious number of canals; but there are few good harbours in the United Provinces; the best are those of Rotterdam, Helvoetsluis, and Flushing; that of Amsterdam, though one of the largest and safest in Europe,

has a bar at the entrance of it, over which large vessels cannot pass without being lightened.

**VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.** } The quantity of grain produced here is not sufficient for home consumption; but by draining their bogs and marshes they have many excellent meadows, which fatten lean German and Danish cattle to a vast size; and they make prodigious quantities of butter and cheese. Their country produces turf, madder, tobacco, some fruit, and iron; but all the pit-coal and timber used there, and indeed many of the comforts, and even the necessaries of life, are imported. They have a good breed of sheep, whose wool is highly valued; and their horses and horned cattle are of a large size. It is said, there are some wild boars and wolves here. Storks build and hatch on their chimnies; but, being birds of passage, they leave the country about the middle of August, with their young, and return the February following. Their river-fish is much the same as ours, but their sea-fish is generally larger, owing perhaps to their fishing in deeper water. No herrings visit their coasts; but they have many excellent oysterbeds about the islands of the Texel, producing very large and well-tasted oysters; and the industry of the Hollanders furnishes as great a plenty of the necessaries and commodities of life, and upon as easy terms (except to travellers and strangers), as most neighbouring countries.

**POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.** } The Seven United Provinces are perhaps the best peopled of any spot of the same extent in the world. They contain, according to the best accounts, 113 cities and towns, 1400 villages, and 2,758,632 inhabitants, according to a public account given in 1785; besides the twenty-five towns, and the people in what is called the Lands of the Generality, or conquered countries and towns of other parts of the Netherlands. The manners, habits, and even the minds of the Dutch (for so the inhabitants of the United Provinces are called in general) seem to be formed by their situation, and to arise from their natural wants. Their country, which is preserved by mounds and dykes, is a perpetual incentive to labour; since the artificial drains, with which it is every where intersected, must be kept in perpetual repair. Their principal food they earn out of the sea by their herring-fisheries; for they dispose of most of their valuable fishes to the English, and other nations, for the sake of gain. The air and temperature of their climate give to them phlegmatic, slow dispositions, both of body and mind; and yet they are irascible, especially if heated with liquor. Even their virtues are owing to their coldness, with regard to every object that does not immediately concern their own interests; for in all other respects they are quiet neighbours and peaceable subjects. Their attention to the constitution and independency of their country is owing to the same principle; for they were never known to risk innovations in government, except when absolutely necessary.

The valour of the Dutch becomes warm and active when they find their interest at stake; witness their sea wars with England and France. Their boors, though slow of understanding, are manageable by fair means. Their seamen are a plain, blunt, but rough, surly, and ill-mannered people. Their tradesmen in general are reckoned honest in their dealings, and very sparing of their words. Smoking tobacco is practised by old and young of both sexes; and as they are generally plodding upon ways and means of getting money, no people are so unsociable. A Dutchman of low rank, when drunk, is guilty of every species of brutality. The Dutch have also been known to exercise the most dreadful inhumanities for interest abroad, where they thought themselves free from discovery; but their own country exhibits but few instances of murder, rapine, or violence. As to the habitual tipping and drinking charged upon both sexes, it is owing in a great

measure to the nature of their soil and climate. In general, all appetites and passions seem to run lower and cooler here than in most other countries, that of avarice excepted. Their tempers are not airy enough for joy, or any unusual strains of pleasant humour, nor warm enough for love, which is little better than a mechanical affection, arising from interest, conveniency, or habit; talked of sometimes among the young men, but as a thing they have heard of rather than felt, and as a discourse that becomes them rather than affects them.

In whatever relates to the management of pecuniary affairs, the Dutch are certainly the most expert of any people; to the knowledge of acquiring wealth, uniting the no less necessary science of preserving it. It is a kind of general rule for every man to spend less than his income, be that what it will; and when this does not happen, they think at least they have lived that year to no purpose; and the report of it used to discredit a man among them, as much as any vicious or prodigal extravagance does in other countries. But this rigid frugality is not so universal among the Dutch as it was formerly; for a greater degree of luxury and extravagance has been introduced among them, as well as the other nations of Europe. Gaming is likewise practised by many of their fashionable ladies, some of whom discover more propensity to gallantry than was formerly known. No country can vie with Holland in the number of those inhabitants, whose lot, if not riches, is at least a comfortable sufficiency; and among whom fewer failures or bankruptcies occur. Hence, in the midst of a world of taxes and contributions such as no other country experiences, they flourish and grow rich. From this systematic spirit of regularity and moderation, joined to the most obstinate perseverance, they succeeded in the stupendous works of draining their country of those immense deluges of water that had overflowed so large a part of it during many ages, while at the same time they brought under their subjection and command the rivers and seas that surround them, by dykes of incredible thickness and strength, and made them the principal bulwarks on which they rely for the protection and safety of their territories against the danger of an enemy. This they have done by covering their frontiers and cities with innumerable sluices, by means of which, at the shortest notice, the most rapid inundations are let in, and they become in a few hours inaccessible. From that frugality and perseverance by which they have been so much characterised, they were enabled, though labouring under the greatest difficulties, not only to throw off the Spanish yoke, but to attack that powerful nation in the most tender parts, by seizing her rich galleons, and forming new establishments in Africa, and the East and West Indies, at the expense of Spain, and thereby becoming, from a despicable province, a most powerful and formidable enemy. Equally wonderful was the growth of their military and marine establishments, maintaining, during their celebrated contention with Lewis XIV. and Charles II. of England, not less than 150,000 men, and upwards of 80 ships of the line. But a spirit of frugality being now less universal among them, the rich traders and mechanics begin to imitate the luxuries of the English and French; and their nobility and high magistrates, who have retired from trade, affect splendour in their tables, buildings, furniture, and equipages.

The diversions of the Dutch differ not much from those of the English, who seemed to have borrowed from them the neatness of their drinking-booths, skittle and other grounds, and small pieces of water, which form the amusements of the middling ranks, not to mention their hand-organs, and other musical inventions. They are the best skaters upon the ice in the world. It is amazing to see the crowds in a hard frost upon the ice, and the great dexterity both of men and women, darting along, or rather flying, with inconceivable velocity.

Dress.] Their dress formerly was noted for the large breeches of the men; and the jenkins, plain mobs, short petticoats, and other oddities of the women; all which,

which, added to the natural thickness and clumsiness of their persons, gave them a very grotesque appearance. These dresses now prevail only among the lower ranks, and more particularly amongst the sea-faring people.

**RELIGION.]** The established religion here is the Presbyterian and Calvinism: none but Presbyterians are admitted into any office or post in the government, except the army; yet all religious sects are tolerated, and have their respective meetings or assemblies for public worship; among which the Papists and Jews are very numerous. And, indeed, this country may be considered as a striking instance of the benefits arising to a nation from universal toleration. As every man is allowed to worship God according to the dictates of his own conscience, persons of the most opposite opinions live together in harmony and peace. No man in this republic has any reason to complain of being oppressed on account of his religious principles, nor any hopes, by advancing his religion, to form a party, or to disturb the government; and therefore in Holland men live together as citizens of the world, associated by the common ties of humanity and bonds of peace; with equal encouragement to arts and industry, and equal freedom of speculation and enquiry.

**LANGUAGE.]** The natural language of the United Provinces is Low Dutch, which is a corrupted dialect of the German; but the people of fashion speak English and French. Their Lord's Prayer runs thus: *Onse Vader, die in de hemelin zyn wven naam worde geheylight: wy'koningryk kome: wze wille geschiede gelyck in den kemel zoo ook op den arden, ons dageliks broot geef ons heeden, ende vergeest onse schulden gelyk ook wy vergeeven onse schuldenaaren: ende laats ons neit in wsoer kingemaer vertoef on van der hoosen. Amen.*

**LEARNING AND LEARNED MEN.]** Erasmus and Grotius, who were both natives of this country, stand almost at the head of modern learning. Haerlem disputes the invention of printing with the Germans; and the magistrates keep two copies of a book intitled *Speculum Salvationis*, printed by Koster in 1440. The most elegant editions of the classics came from the Dutch presses of Amsterdam, Rotterdam, Utrecht, Leyden, and other towns. The Dutch have excelled in controversial divinity, which insinuated itself so much into the state, that, before principles of universal toleration prevailed, it had almost proved fatal to the government; witness the violent disputes about Arminianism, free-will, predestination, and the like. Besides Boerhaave, they have produced excellent writers in all branches of medicine. Grævius, Gronovius, father and son, and Burmann are ranked among their numerous commentators upon the classics. Nothing is more common than their Latin poems and epigrams; and later times have produced a Van Haaren, who is possessed of some poetical abilities, and about the year 1747 published poems in favour of liberty, which were admired as rarities, chiefly because their author was a Dutchman. In the other departments of literature, the Dutch publications are mechanical, and arise chiefly from their employments in universities, church, or state.

**UNIVERSITIES.]** These are Leyden, Utrecht, Groningen, Harderwicke, and Francker

The university of Leyden, which was founded in 1575, is the largest and most ancient in all the United Netherlands. Its library, besides a number of printed books, contains two thousand oriental manuscripts, many of which are in Arabic; and a large sphere adapted to the Copernican system, moving by clock-work. Here is also a phytic-garden, and an anatomical theatre.

The university of Utrecht, in the province of the same name, was changed from a school into a university, in 1636; but it has not all the privileges of the other universities, being entirely subject to the magistrates of the city. The Phytic garden here is very curious; and for the recreation of the students, on the east side of

the city, just without the gate, is a beautiful mall, consisting of seven straight walks; two thousand paces in length, regularly planted with limes: but that in the middle is properly the mall.

The number of students, one year with another, is seven or eight hundred in each of the universities of Leyden and Utrecht: in the other three, they are not so numerous. These seminaries of learning have each three or four divinity professors, as many of physic, and two or three of law; besides others of history, languages, and eloquence, or the *belles lettres*, and others of philosophy, mathematics, the Greek and Roman antiquities, and the Hebrew and Oriental languages. The professors in the universities of Holland are often men of literary eminence; as there is an emulation among the states of the different provinces, which shall have the greatest men to adorn their universities, and attract numbers of students from all parts of Europe to enrich their towns: and therefore they are ready to afford very liberal encouragement to able professors, who are often invited from the universities of Germany.

The buildings of these universities are old, and rather mean; the schools of Leyden are better, and more contiguous than the rest. The professors wear gowns when they read lectures, or preside in public disputations. The students wear no distinct habits, but are almost always in their morning gowns, in which they attend the colleges; and it is common for them, at Leyden, to walk in this dress in the streets and mall without the city. There are abundance of youth, of the principal nobility and gentry, from most countries in Europe, at these seminaries of literature: and as every one may live as he pleases, without being obliged to be profuse in his expences, or so much as quitting his night gown for weeks or months together, foreigners of all ranks and conditions are to be seen here. The force of example is strikingly exhibited at these universities: for frugality in expence, order, a composed behaviour, attention to study, and assiduity in all things, being the characteristics of the natives, strangers, who continue among them, soon adopt their manners and forms of living. And though the students live as they please, and study as much or as little as they think fit, yet they are in general remarkable for their sobriety and good manners, and the assiduity and success with which they apply themselves to their studies. No oaths are imposed, nor religious tests; so that Roman Catholic parents, and even Jews, send their children here, with as little scruple as Protestants.

ANTIQUITIES AND CURIOSITIES, } The prodigious dykes, some of which are  
NATURAL AND ARTIFICIAL. } said to be 17 ells in thickness; mounds, and  
canals, constructed by the Dutch, to preserve their country from inundations, are  
works as stupendous as singular. A stone quarry near Maestricht, under a hill, is  
worked into a kind of subterranean palace supported by pillars twenty feet high.  
The stadthouse of Amsterdam is one of the best buildings of that kind: it stands  
upon 13,659 large piles, driven into the ground; and the inside is equally convenient  
and magnificent. Several museums, containing antiquities and curiosities,  
artificial and natural, are to be found in Holland and the other provinces, particularly  
in the university of Leyden; such as the effigies of a peasant of Rullia, who  
swallowed a knife ten inches in length, and is said to have lived eight years after  
it was cut out of his stomach. A shirt made of the entrails of a man. Two  
Egyptian mummies, being the bodies of two princes of great antiquity. All the  
muscles and tendons of the human body, curiously set up by professor Stalpert Van-  
der-Weil.

CITIES, TOWNS, AND OTHER EDI- } Amsterdam, which is built upon piles of  
FICES, PUBLIC AND PRIVATE. } wood, is thought to contain 241,000 people,  
and to be, next to London, the most commercial city in the world. Its conveniences  
for commerce, and the grandeur of its public works, astonish every beholder. In  
this,

this, and all other cities of the United Provinces, the beauty of the canals, and walks under trees planted on their borders, are admirable; but above all, we are struck with the neatness and cleanliness that is every where observed within doors. This city, however, labours under two great disadvantages; bad air, and the want of fresh wholesome water, which obliges the inhabitants to preserve the rain water in reservoirs. Rotterdam is next to Amsterdam for commerce and wealth: its inhabitants are computed at 56,000. The Hague, though but a village, is the seat of government in the United Provinces, and is celebrated for the magnificence and beauty of its buildings, the resort of foreign ambassadors and strangers of all distinctions who live in it, the abundance and cheapness of its provisions, and the politeness of its inhabitants, who are computed at 40,000. Leyden and Utrecht are fine cities, as well as famous for their universities. Saardam, a village in North Holland, contains about 900 wind-mills, partly corn-mills, partly saw and paper-mills, and mills for the making of white lead, &c. It is a wealthy trading place, and was the workshop where Peter the Great of Muscovy served his apprenticeship to ship-building, and laboured as a common artisan. The upper part of Gelderland is subject to Prussia, and the capital city Gelder.

**INLAND NAVIGATION, CANALS, AND } MANNER OF TRAVELLING.** } The usual way of passing from town to town is by covered boats, called trecksuits, which are dragged along the canal by horses, on a slow uniform trot, so that passengers reach the different towns where they are to stop, precisely at the appointed instant of time. This method of travelling, though to strangers rather dull, is convenient and cheap. By means of these canals, an extensive land commerce is carried on through the whole country; and as they communicate with the Rhine and other large rivers, the productions of the whole earth are conveyed at a small expence into various parts of Germany, and the Austrian and French Netherlands. A trecksuit is divided into two different apartments, called the roof and the ruin; the first for gentlemen, and the other for common people. Near Amsterdam and other large cities, a traveller is delighted with beholding the effects of an extensive and flourishing commerce. Here the canals are lined, for miles together, with elegant, neat country houses, seated in the midst of gardens and pleasure grounds, intermixed with figures, busts, statues, temples, &c. to the very water's edge. Having no objects for amusement beyond the limits of their own gardens, the families in fine weather spend much of their time there, smoking, reading, or viewing the passengers, to whom they appear complaisant and polite.

**COMMERCE AND MANUFACTURES.]** An account of the Dutch commerce would comprehend that of the world. There is scarcely a manufacture that they do not carry on, or a state to which they do not trade. In this, they are assisted by the populousness of their country, their industry and frugality, and, above all, by the water-carriage, which, by means of their canals, gives them advantages beyond other nations. The United Provinces are the grand magazine of Europe; and goods may be purchased here sometimes cheaper than in the countries where they grow. Their East India company has had the monopoly of the fine spices for more than a hundred years, and, till the late war with England, was extremely opulent and powerful. Their capital city in India is Batavia, which excels in magnificence, opulence, and commerce. Here the viceroys appear in greater splendor than the stadtholder; and some of the Dutch subjects in Batavia scarcely acknowledge any dependence on the mother-country. Among the monopolies of the East-India company, the spice-trade, comprehending the articles of cloves, mace, nutmeg, cinnamon, &c. is the most valuable, and forms a very great branch of the Asiatic as well as European commerce of Holland: 150,000lbs. of cloves are annually sold in India, and 360,000 carried to Europe. The company pays on the spot only eight stivers per pound; but the freight and other charges raise this price to 43 stivers, and the company sells it at no less than 75 stivers. Of nutmeg, the produce

produce of the island of Banda, 250,000lbs. are sold in Europe, and 100,000 in India: the prime cost is somewhat more than one stiver per pound; including charges, the pound costs the company about 25 stivers, and is sold by them at upwards of 50 stivers, west of the Cape of Good Hope; and at about 40 stivers, east of it. In India, 200,000lbs. of cinnamon are sold, and 400,000 in Europe. The Java coffee is the best we know of, after that of Mecca in Arabia. Other great branches of this trade are rice, cotton, pepper, &c. articles of great importance, but not in the exclusive possession of the Dutch. They have other settlements in India, but none more pleasant, healthful, or useful, than that on the Cape of Good Hope, the grand rendezvous for the ships of all nations, outward or homeward bound. When Lewis XIV. invaded Holland with an army of 80,000 men, the Dutch made some dispositions to ship themselves off to their settlements in India; so great was their aversion to the French government. Not to mention their herring and whale fisheries, which they have carried off from the native proprietors, they are distinguished for their pottery, tobacco-pipes, delft-ware, finely refined salt; their oil-mills, and starch-manufactures; their improvements of the raw linen-thread of Germany; their hemp, and fine paper manufactures; and fine linen, and table damasks; their saw-mills for timber, either for shipping or houses, in immense quantities; their great sugar-baking; their vast woollen, cotton, and silk manufactures; wax-bleaching; leather dressing; the great quantity of their coin and specie, assisted by their banks, especially by that of Amsterdam; their East-India trade; and their general industry and frugality.

This country affords a striking proof, that unwearied and persevering industry is capable of conquering every disadvantage of climate and situation. The possession of the very soil is disputed by the ocean, which rising considerably above the level of the land, can only be prevented by strong and expensive dykes, from overflowing a spot which seems to be stolen from its natural domains. Notwithstanding these difficulties, which might seem unsurmountable to a less laborious people, the strenuous exertions of the patient Dutchmen have rendered this small and seemingly insignificant territory, in fact, one of the richest spots in Europe, both with respect to population and property. In other countries, which are possessed of a variety of natural productions, we are not surprised to find manufactures employed in multiplying the riches which the bounty of the soil bestows. But to see, in a country like Holland, large woollen manufactures, where there are but scanty flocks; numberless artists employed in metals, where there is no mine; thousands of saw-mills, where there is scarce any forest; an immense quantity of corn exported from a country where there is not agriculture enough to support one-half of its inhabitants, is what must strike every attentive observer with admiration.

The natural and political situation of the Dutch nation may be compared with the colonies of Canadian beavers, who, by unwearied labour and mutual assistance, are enabled to build secure habitations on the banks of rapid rivers, and to form societies rendered durable and invincible by the tie of firm union: yet their wonderful fabric would, by dissension and separation, soon sink into insignificance or annihilation. When we consider what Holland was before the union of Utrecht, and when we afterwards see the inhabitants of that swampy spot become respectable in Europe and predominant in India, it is not without regret we witness the decay of their power, that most admirable monument of human industry. An impartial observer, however, who cannot wish to see the benefits of activity confined to one spot, and extorted from the weakness and ignorance of other nations, will be comforted by the consideration, that Holland's exclusive advantages are lessened by the general increase of industry and happiness throughout all the states of Europe, and not by any of those great calamities or revolutions, which have put a period to the power of other commercial states.

**PUBLIC TRADING COMPANIES.]** Of these, the capital is the East India, incorporated in 1602, by which formerly the Dutch acquired immense wealth, having divided forty per cent, and sometimes sixty, about the year 1660; at present the dividends are much reduced; but in a hundred and twenty-four years, the proprietors, on an average, one year with another, divided somewhat above twenty-four per cent. So late as the year 1760, they divided fifteen per cent. but the Dutch West India company, the same year, divided no more than two and a half per cent. This company was incorporated in 1621. The bank of Amsterdam is thought to be inexhaustibly rich, and is under an excellent direction: it is said, by sir William Temple, to contain the greatest treasure, either real or imaginary, known in the world. What may seem a paradox, is, that this bank is so far from paying any interest, that the money in it is worth something more than current cash is, in common payments. Mr. Anderson supposes that the cash, bullion, and pawned jewels, forming the treasure of the bank, which are kept in the vaults of the stadthouse, amounts to thirty-six millions sterling; but more probable conjectures reduce it to about one tenth of that sum.

**CONSTITUTION AND GOVERNMENT.]** This is a very intricate article; for though the United Provinces subsist in a common confederacy, yet each province has an internal government or constitution of its own: this government is called the *States* of that province; and the delegates from them form the *States General*, in whom the sovereignty of the whole confederacy is vested; but though a province should send two, or more delegates, yet such province has no more than one voice in every resolution; and before that resolution can have the force of a law, it must be approved of by every province, and by every city and republic in that province. This formality, in times of great danger and emergency, has been set aside. Every resolution of the states of a particular province must be carried unanimously.

The *council of state* consists likewise of deputies from the several provinces: but its constitution is different from that of the states-general: it is composed of twelve persons, whereof Guelderland sends two; Holland, three; Zealand, two; Utrecht, two; Friesland, one; Overysse, one; and Groningen, one. These deputies, however, do not vote provincially, but personally. Their business is to prepare estimates, and ways and means for raising the revenue, as well as other matters that are to be laid before the states-general. The states of the provinces are styled "Noble and Mighty Lords," but those of Holland, "Noble and Most Mighty Lords," and the states-general, "High and Mighty Lords," or, "the Lords the States-General of the United Netherlands," or, "their High Mightinesses." Subordinate to these two bodies, is the chamber of accounts, which is likewise composed of provincial deputies, who audit all public accounts. The admiralty forms a separate board; and the executive part of it is committed to five colleges in the three maritime provinces of Holland, Zealand, and Friesland. In Holland, the people have nothing to do in chusing their magistrates. In Amsterdam, which takes the lead in all public deliberations, the magistracy is lodged in thirty-six senators, who are chosen for life; and every vacancy among them is filled up by the survivors. The same senate also elects the deputies to represent the cities in the province of Holland.

I have mentioned the above particulars, because, without a knowledge of them, it is impossible to understand the history of the United Provinces, from the death of king William to the year 1747, when the stadholderhip was made hereditary in the male and female representatives of the family of Orange. This office in a manner superseded the constitution already described. The stadholder is president of the state of every province; and such is his power and influence, that he can change the deputies, magistrates, and officers, in every province and city. By this he has the moulding of the assembly of the states-general, though he has no voice

in it; in short, though he has not the title, he has more real power and authority than some kings; for, besides the influence and revenue he derives from the stadtholdership, he has several principalities and large estates of his own. At different periods, the United Provinces have been without a stadtholder: but these periods were usually very turbulent; and whenever a war broke out, the republic felt the necessity of re-establishing this magistrate. Notwithstanding the complaints of the party styling themselves patriots, it would seem that the office of stadtholder is essential to the constitution of the United Provinces. The present stadtholder is William V. prince of Orange and Nassau, son of the late stadtholder, William Charles, who married Anne, princess royal of Great Britain, and died in 1751.

With respect to the administration of justice in this country, every province has its tribunal, to which, except in criminal causes, appeal lies from the petty and county courts; and it is said that justice is no where distributed with more impartiality.

[REVENUES.] The government of the United Provinces proportion their taxes according to the abilities of each province or city. These taxes consist of an almost general excise, a land-tax, poll-tax, and hearth-money; so that the public revenue amounts annually to about four millions and a half sterling. The province of Holland pays nearly half of this revenue. The following is the rate at which each of the Seven United Provinces is said to contribute toward the public expence:

Of every million of ducats the Province of Holland contributes	420,000
Zealand	130,000
Friesland	170,000
Utrecht	85,000
Groningen	75,000
Guelderland	70,000
Overyssel	50,000

Of the 420,000 ducats paid by the province of Holland, the city of Amsterdam furnishes upwards of 320,000. The taxes in these provinces are so heavy, and so many, that it is not without reason a certain author asserts, that the only thing which has escaped taxation there, is the air they breathe. But, for the encouragement of trade, the duties on goods and merchandize are exceedingly low. The immense sums in the British funds have made some people imagine that Holland labours under heavy debts; but the chief reason is, the states only pay two and a half per cent. interest for money.

[MILITARY AND MARINE STRENGTH.] The number of land forces in the United Provinces in time of peace commonly amount to about 40,000; 25,000 of whom serve in garrisons; and in time of war, they hire Germans. The chief command of the army is vested in the stadtholder, under whom is the field-marshal general. The marine force of the United Provinces used to be very great, and they formerly fitted out very considerable fleets: but their navy has of late been much neglected. Their late war with Great Britain obliged them to increase it; and they have great resources for that purpose. According to the last accounts, their navy consists of one ship of 76 guns, three of 70, four of 68, five of 60, eight of 56, four of 50, five of 44, nine of 40, and ten of 36, besides vessels of inferior force. But they have many ships upon the stocks; and their fleet will probably be much augmented, and in future be kept in better order.

[ORDER OF TEUTONIC KNIGHTS.] This was one of the most powerful as well as ancient orders in Europe, now divided into two branches; the first for Papists, and the second branch for Protestants. This branch has a house at Utrecht, where

they transact their business. The nobles of Holland, if they propose a son to be a knight, enter his name in the register, and pay a large sum of money to the use of the poor maintained by the order; and the candidate succeeds in rotation, if he brings with him proof of his nobility for four generations on the father's and mother's side. The ensign is a cross patee, enamelled white, surmounted with another, black; above the cross, is a ball twisted, white and black. It is worn pendent to a broad black watered ribband, which is worn about the neck. The same cross is embroidered on the left breast of the upper garment of each knight.

**ARMS.]** The ensigns armorial of the Seven United Provinces, or the States of Holland, are, *Or*, a lion, gules, holding with one paw a cutlass, and with the other a bundle of seven arrows close bound together, in allusion to the seven confederate provinces, with the following motto, *Concordia res parva crescunt*.

**HISTORY.]** See the Austrian Netherlands.

William V. prince of Orange and Nassau, Hereditary Stadtholder, Captain-General and Admiral of the Seven United Provinces, was born in 1748, married in 1767 the princess Frederica of Prussia, born 1751; by whom he has issue,

1. Frederica-Louisa-Wilhelmina, born November 28, 1770; married to the hereditary Prince of Brunswick.

2. William-Frederic, hereditary Prince, born August 2, 1772; married October 1, 1791, to Princess Frederica-Sophia-Wilhelmina of Prussia.

3. William-George-Frederic, born February 15, 1774.

The Stadtholder hath one sister, Wilhelmina-Carolina, born 1743, and married to the Prince of Nassau Weilburgh.

**AIR, SOIL, AND PRODUCE.]** The air of Brabant, and upon the coast of Flanders, is bad; that in the interior parts is more healthful, and the seasons more settled, both in winter and summer, than they are in England. The soil and its produce are rich, especially in corn and fruits. They have abundance of pasture; and Flanders itself has been reckoned the granary of France and Germany, and sometimes of England. The most barren parts for corn rear far more profitable crops of flax, which is here cultivated to great perfection. Upon the whole, the Austrian Netherlands, by the culture, commerce, and industry of the inhabitants, was formerly the richest and most beautiful spot in Europe, whether we regard the variety of its manufactures, the magnificence and riches of its cities, the pleasantness of its roads and villages, or the fertility of its land. If it has declined in later times, it is owing partly to the neglect of its government, but chiefly to its vicinity to England and Holland; but it is still a most desirable and agreeable country. There are few or no mountains in the Netherlands. Flanders is a flat country, scarcely a single hill in it. Brabant, and the rest of the provinces, consist of little hills and valleys, woods, inclosed grounds, and champaign fields.

**RIVERS AND CANALS.]** The chief rivers are the Maese, Sambre, Demer, Dyle, Nethe, Geet, Sanne, Ruppel, Scheld, Lis, Scarpe, Deule, and Dender. The principal canals are those of Brussels, Ghent, and Ostend.

**METALS AND MINERALS.]** Mines of iron, copper, lead, and brimstone, are found in Luxemburgh, and Limburgh, as are some marble quarries; and in the province of Namur there are coal-pits, and a species of bituminous fat earth proper for fuel, with great plenty of fossile nitre.

**INHABITANTS, POPULATION, MANNERS, CUSTOMS, AND DIVERSIONS.]** The Flemings (for so the inhabitants of the provinces are generally called) are thought to be a heavy, blunt, honest people; but their manners are somewhat indelicate. Formerly they were known to fight desperately

separately in defence of their country; at present they make no great figure. The Austrian Netherlands are extremely populous; but authors differ as to their numbers. Perhaps we may fix them, at a medium, at a million and a half. They are ignorant, and fond of religious exhibitions and pageants. Their other diversions are the same with those of the peasants of the neighbouring countries.

**DRESS AND LANGUAGE.]** The inhabitants of French Flanders imitate the French in both these particulars. The Flemings on the frontiers of Holland dress like the Dutch boors, and their language is the same; but the better sort of people speak French, and dress in the French style.

**RELIGION.]** The established religion here is the Roman Catholic; but Protestants, and other sects, are not molested.

**ARCHBISHOPRICS AND BISHOPRICS.]** The archbishoprics are Cambrai, Malines or Mecklin; the bishoprics, Ghent, Bruges, Antwerp, Arras, Ypres, Tournay, St. Omer, Namur, and Ruremond.

**LEARNING, LEARNED MEN, AND ARTISTS.]** The society of Jesuits formerly produced the most learned men in the Austrian Low Countries, in which they had many comfortable settlements. Works of theology, and the civil and canon law, Latin poems and plays, were their chief productions. Strada is an elegant historian and poet. The Flemish painters and sculptors have great merit, and formed an illustrious school. The works of Rubens and Vandyke cannot be sufficiently admired. Flamingo, or the Fleming's models for heads, particularly those of children, have never yet been equalled; and the Flemings formerly engrossed tapestry-weaving to themselves.

**UNIVERSITIES.]** Louvain, Douay, Tournay, and St. Omer. The first was founded in 1426, by John IV. duke of Brabant. By a grant of pope Sixtus IV. this university has the privilege of presenting to all the livings in the Netherlands, which right they enjoy, except in Holland.

**ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICIAL.]** Some Roman monuments of temples and other buildings are to be found in these provinces. Many curious bells, churches, and the like, ancient and modern, are also found here; and the magnificent old edifices of every kind, seen through all their cities, give evidence of their former grandeur. In 1607, some labourers found 1600 gold coins, and ancient medals of Antoninus Pius, Aurelius, and Lucius Verus.

**CITIES.]** This article has employed several large volumes, published by different authors, but in times when the Austrian Netherlands were far more flourishing than now. The walls of Ghent, formerly the capital of Flanders, and celebrated for its linen and woollen manufactures, contain the circuit of ten miles; but the town is now thinly inhabited. Bruges, formerly so noted for its trade and manufactures, but above all for its fine canals, is now dwindled to an inconsiderable place. Ostend is a tolerably convenient harbour for traders; and, soon after the rupture between Great Britain and Holland, became more opulent and populous. In 1781, it was visited by the emperor, who granted to it many privileges and franchises, and the free exercise of the protestant religion. As to Ypres, it is only a strong garrison town. The same may be said of Charleroy and Namur, which lie in the Austrian Hainault.

Louvain, the capital of the Austrian Brabant, instead of its flourishing manufactories and places of trade, now contains pretty gardens, walks, and arbours. Brussels retains somewhat of its ancient lace manufacture; and being the residence of the governor or viceroy of the Austrian Netherlands, it is a populous, lively place. Antwerp, once the emporium of the European continent, is now reduced to be a tapestry and thread-lace thop, with the houses of some bankers, jewelers, and painters, adjoining. One of the first exploits of the Dutch, soon after they

they threw off the Spanish yoke, was to ruin at once the commerce of Antwerp, by sinking vessels, loaded with stones, in the mouth of the Scheld; thus shutting up the entrance of that river to ships of large burden. This was the more cruel, as the people of Antwerp had been their friends and fellow-sufferers in the cause of liberty: but they foresaw that the prosperity of their own commerce was at stake.

It may be observed here, that every gentleman's house is a castle or *chateau*; and that there are more strong towns in the Netherlands than in all the rest of Europe; but since the decline of the Flemish trade, by the rise of the English and Dutch, these towns are considerably diminished in size; and whole streets, particularly in Antwerp, are in appearance uninhabited. In the Netherlands, provisions are extremely good and cheap. Travelling is safe, reasonable, and delightful in this luxurious country. The roads are generally a broad causeway, and run for some miles in a straight line, till they terminate with the view of some noble buildings. From Cassel, in the French Netherlands, may be seen thirty-two towns, itself being on a hill.

**COMMERCE AND MANUFACTURES.]** The chief manufactures of the French and Austrian Netherlands are their beautiful linens and laces; in which, notwithstanding the boasted improvements of their neighbours, they are yet unrivalled; particularly in that species called cambrics, from Cambrai, the chief place of its manufacture. These manufactures form the principal article of their commerce.

**CONSTITUTION AND GOVERNMENT.]** The Austrian Netherlands are still considered as a circle of the empire\*, of which the archducal house, as being sovereign of the whole, is the sole director and summoning prince. This circle contributes its share to the imposts of the empire, and sends an envoy to the diet, but is not subject to the judicatories of the empire. It is under a governor-general, or regent, appointed by the court of Vienna. The face of an assembly, or parliament, for each province, is still kept up, and consists of the clergy, nobility, and deputies of towns, who meet at Brussels. Each province claims particular privileges, but they are of very little effect: and the governor, till of late, seldom found any resistance to the will of his court. Every province has a particular governor, subject to the regent: and causes are here decided according to the civil and canon law.

**REVENUES.]** These rise from the demesne lands and customs; but so much is the trade of the Austrian Flanders now reduced, that they are said not to defray the expence of their government; but by the late reduction of the garrisons, this is now altered. The French Netherlands bring in a considerable revenue to the crown.

**MILITARY STRENGTH.]** The troops maintained here by the emperor are chiefly employed in the frontier garrisons. Though, by the barrier treaty, the Austrians were obliged to maintain three-fifths of those garrisons, and the Dutch two; yet both of them were miserably deficient in their quotas, the whole requiring at least 30,000 men, and, in the time of war, above 10,000 more. But the emperor Joseph demolished the fortifications, most of which were mouldering to decay.

**ARMS.]** The arms of Flanders are, or, a lion sable, and langued gules.

**HISTORY.]** The seventeen provinces, and that part of Germany which lies west of the Rhine, was called Gallia Belgica, by the Romans. About a century before

\* Although a great part of the Austrian Netherlands have, at this present writing (August 1794), surrendered to the arms of the French; yet as the events of war are so uncertain, and as the

troops of the new republic were compelled to evacuate this country in the beginning of 1793, it is impossible to say how long they may retain the possession of their new conquests.

the Christian era, the Batavæ removed from Hesse to the marshy district bounded by the Rhine and the Maese. They gave the name of Batavia to their new country. Generous and brave, the Batavians were treated by the Romans with great respect, being exempted from tribute, governed by their own laws, and obliged only to perform military services. Upon the decline of the Roman empire, the Goths, and other Northern people, possessed themselves of these provinces first, as they passed through them in their way to France, and other parts of the empire. Batavia and Holland became independent on Germany, to which they had been united under one of the grandsons of Charlemagne, in the beginning of the 10th century, when the supreme authority was lodged in the three united powers of a Count, the Nobles, and the Towns. At last they were swallowed up by the house of Burgundy, anno 1433.

The emperor Charles V. the heir of that family, transferred them, in the year 1477, to the house of Austria, and ranked them as part of the empire, under the title of the Circle of Burgundy. The tyranny of his son Philip II. who succeeded to the throne of Spain, made the inhabitants attempt to throw off his yoke, which occasioned a general insurrection. The counts Hoon and Egmont, and the prince of Orange, appearing at the head of it, and Luther's reformation gaining ground about the same time in the Netherlands, his disciples were forced by persecution to join the mal-contented. Whereupon king Philip introduced a kind of inquisition, which, from the inhumanity of its proceedings, was called the *Council of Blood*, in order to suppress them; and many thousands were put to death by that court, besides those that perished by the sword. Count Hoon and count Egmont were taken and beheaded; but the prince of Orange, whom they elected to be their stadtholder, retiring into Holland, that and the adjacent provinces entered into a treaty for their mutual defence, at Utrecht, in the year 1579. And though these revolted at first were thought so despicable as to be termed *Beggars* by their tyrants, their perseverance and courage were such, under the prince of Orange, and the assistance afforded them by queen Elizabeth, both in troops and money, that they forced the crown of Spain to declare them a free people in the year 1609; and afterwards they were acknowledged by all Europe to be an independent state, under the title of **THE UNITED PROVINCES**. By their sea wars with England, under the commonwealth, Cromwell, and Charles II. they justly acquired the reputation of a formidable naval power. When the house of Austria, which for some ages ruled over Germany, Spain, and part of Italy, with which they afterwards continued to carry on bloody wars, was become no longer formidable; and when the public jealousy was directed against that of Bourbon, which was favoured by the government of Holland, who had dispossessed the prince of Orange of the stadtholdership; the spirit of the people was such, that they revived it in the person of the prince, who was afterwards William III. king of Great Britain; and during his reign, and that of queen Anne, they were principals in the grand confederacy against Lewis XIV. king of France.

Their conduct towards England in the wars of 1742, and 1756, hath been discussed in the history of that country, as also the occurrences which led to a rupture between them and the English in the year 1780. As it was urged, that they refused to fulfil the treaties which subsisted between them and Great Britain, so all the treaties which bound Great Britain to them were declared null and void, as if none had ever existed. By the war, their trade suffered considerably, but Negapatnam, in the East Indies, is the only place not restored to them at the late peace.

Probably, to their separation from Great Britain, may be attributed the recent differences between the States General and the emperor of Germany, who, from the exhausted state of several of the European powers, seemed to have a favour-

able opportunity of accomplishing his ambitious designs. In the year 1781, he had been allowed to demolish the Dutch barrier in his dominions, for which they had contended so desperately in the time of queen Anne, and now he seemed willing to encroach upon their territories. A conference concerning the boundaries of their respective nations was proposed to the states; but before this could take place, he began to commit some acts of hostility, and extend his dominions a little way by way of preliminary. Two small forts, St. Donat, and St. Paul, were seized upon, as well as some part of the marshes in the neighbourhood of Sluys. As a prelude to the negotiations, he also demanded that the Dutch guardship should be removed from before fort Lillo, in acknowledgment that one of the prerogatives of his Imperial majesty was the free navigation of the Scheldt. This being complied with, the negotiations were opened at Brussels on the 24th of April 1784, when several other demands of small portions of territory and little sums of money were made; the most material requisition being the town of Maeftricht, and its territory. For some time the conferences were carried on in that dry and tedious manner which generally marks the proceedings of the Dutch; but the emperor urged on his demands with great vigour, and matters seemed fast tending towards an open rupture. On the 23d of August, he delivered in his *ultimatum* to the commissioners at Brussels, in which he offered to give up his demand on Maeftricht, in consideration of having the free and unlimited navigation of the Scheldt in both its branches to the sea; and in token of his confidence in the good intentions of the states, he determined to consider the river as open from the date of that paper. Any insult on his flag in the execution of these purposes, he would conclude to be a direct act of hostility, and a formal declaration of war on the part of the republic. To prevent the injuries which the States General had in view to commit, contrary to the incontestable rights of his Imperial majesty, and to leave no doubt of his unalterable resolution to adhere to the propositions contained in the ultimatum, his majesty could not forbear determining to send to sea, from Antwerp, a ship under his flag, after having declared long enough before in what manner he should consider all violent opposition that might be made to the free passage of the said ship.

The ship was stopped in its passage, as was another ordered to sail from Ostend up the Scheldt to Antwerp. But the Dutch offered to dismiss the vessels if the captains would engage to return to their respective places, and not continue their voyage on the river, which they refused to do. This the emperor called insulting his flag, and declared to all foreign courts, that he could not look on this fact but as "an effective declaration of war on the part of the republic." In answer to their conduct in stopping the Imperial ships, by which the emperor declares them to have begun hostilities, the Dutch ministers at Brussels, in a paper delivered to that court, protest, "That as their sole aim was to support their uncontrovertible right, they cannot be suspected of any hostile aggression, which is the less to be laid to their charge, as they positively declared not to stand any ways answerable for the consequences that may ensue from the particular construction which his Imperial majesty may be pleased to put upon the affair. The provinces, far from deserving to be considered in the light of a power having acted offensively, still persist in their peaceable dispositions; but if, unfortunately, such dispositions can have no influence on the mind of his Imperial majesty, though the States still preserve some hopes to the contrary, the republic will find itself in the disagreeable necessity of having recourse to such means as the rights of nature and nations entitle them to; hoping that Divine Providence, and the applauding voice of the neutral powers, will assist in maintaining the republic in the just defence of its dearest rights."

Great preparations were made for immediate hostilities against the Dutch, and several hundred of the Imperialists, with some field pieces, advancing towards the counterscarpe of Lillo, the commanding officer of that place ordered sluices to be opened November 7, 1784, which effected an inundation that laid under water many miles of flat country round the forts on the Scheldt, to preserve them from an attack. Both parties exerted themselves, in case they should be called forth to open a campaign in the next spring; but France and Prussia interposed as negotiators and mediators; and succeeded in bringing about a reconciliation. However, from the conduct of the emperor in the partition of Poland, and in demolishing the fortifications of the barrier places in the Netherlands, and demanding a free navigation of the Scheldt, and to the East-Indies, advancing from one pretension to another, it is apparent, that the most solemn treaties will be no longer observed by some courts and statesmen, than till they have an opportunity with ability to break them.

During the progress of their contentions with the emperor, this country was greatly distressed by the most unhappy intestine animosities, which it may be proper in this place briefly to state. The continued series of losses which they had sustained in the late war with Great Britain, was particularly disgraceful to the states. All their settlements in the West-Indies fell into the hands of the British without resistance; their ships were captured, and their trade ruined; while the disasters of the war excited the animosity of the two factions against each other to the highest degree. The patriots, or aristocratic party attributed these defects to the stadtholder, who openly expressed his predilection for the English at the beginning of the American quarrel. To this conduct the patriots now very artfully reverted. They accused him of having advised the aggression of the English, and of contributing to their success by treachery. The evident inequality of the struggle, the notorious deficiency of all warlike articles in the dock-yards, and arsenals of the republic, the frequent and public reclamations made by the prince and by the council of state on the subject of that deficiency were forgotten; and the wilful misconduct of the stadtholder was boldly alledged by the patriots as the sole cause of that miserable succession of defeat and disgrace, which immediately followed the commencement of hostilities. Whilst these were the recriminations of the patriots, the monarchical, or Orange party accused their antagonists of having involved the country in a dangerous war, at a time when it was entirely unprepared for it.

The alterations in the Dutch constitution projected by the patriots, were as follows: "That the *forms* of the present government should continue to subsist, but that the states should become in every respect completely independent of the stadtholder; and that for this purpose he should no longer enjoy a seat in any of the colleges in the republic. That the stadtholder's right of recommending candidates for the vacant magistracies in the towns of Holland should cease. That the charges of stadtholder and captain-general should, if possible, be separated, and conferred on different persons; or that, at least, the titles only should be reserved to the prince of Orange, and the offices be executed, as in the time of the De Witts, by deputies chosen for the purpose. In general, that the stadtholder should possess such powers only as might enable him to execute the orders of the states. That the hereditary stadtholderate should continue in the prince of Orange on his acceptance of these terms; but that in case of his refusal, the different states should be at liberty to elect another stadtholder."

In the assembly of the states, it was found that the states themselves were proper sovereigns of the country, that the stadtholder was no more than their servant, and that whatever powers they might communicate to him were revokeable at pleasure; but with regard to the garrison of the Hague in particular, they affirmed

ed that the provincial states had never given it into his hands. In pursuance of this idea, it was next directed, that on the commencement of the year 1786, the arms of the house of Orange should be taken out of the ensigns of the troops of Holland, and those of the province substituted in their room; that the president of the provincial states should on all occasions receive the military honours, and salute the garrison of the Hague, as the president of the states already did; and that no other officer of the province should be entitled to that distinction. The next steps were to dismiss the body-guards of the prince, though this was afterwards qualified by allowing them to extinguish themselves, and to enlist no more in the room of them who died.

These proceedings were by no means agreeable to the inhabitants of the Hague, who had all along shewn the greatest attachment to the stadtholder, and they soon prepared a petition to the states of Holland, requesting them to interpose their good offices with the prince of Orange to induce him to return from Breda, to which he had retired on the 14th of September, 1785, to the place of his usual residence. The states, however, suppressed this petition as soon as they knew that it existed; and the affairs of the stadtholder appeared to be in the most desperate situation.

The new king of Prussia offered his mediation, but that being refused, he applied to the court of France, to know whether they would co-operate with him in his pacific intention. On receiving a favourable answer to this, both monarchs united their efforts to reconcile the contending parties, but all in vain.

This unfortunate event produced various accusations and vindications between the two parties, with a long train of negociations, resolutions, and animosities, until at last, in the month of May, 1786, the stadtholder gave orders to seize on Vreeswick, a post of importance to the city of Utrecht, on account of its situation on the canal between that city and the territories of South Holland; containing also the sluices by which both the provinces might be overflowed. This brought on a skirmish between the troops of the stadtholder and the burghers of Utrecht, in which the latter proved victorious. Some other important hostilities took place; but while the military operations were carried on in such a languid manner, a violent tumult took place at Amsterdam, in which several persons were killed. This was followed by a revolt of most of the regular troops of Holland, who went over to the stadtholder; but notwithstanding this apparent advantage, and some others which afterwards took place, the dispute still continued with extreme violence, insomuch that the prince of Orange herself was seized, and detained for one night a prisoner by the patriots.

These most turbulent commotions were, however, at last happily settled by the king of Prussia, who, for this purpose, marched an army into the territories of the United States, and took possession of the city of Rotterdam, and some other places, without resistance. This overawed both parties to such a degree, that they quickly came to an accommodation, and a treaty was concluded between that monarch and the states of Holland. By this the two contending parties were formally reconciled, and the courts of London and Berlin guaranteed the stadtholdership, as well as the hereditary government of each province, in the house of Orange, with all the rights and prerogatives settled in the years 1747 and 1748; by which all attempts to disturb the domestic tranquillity of the republic, by means of any foreign interference, appear to be effectually guarded by the close union that subsists between these two important powers.

The French republic, finding that the stadtholder of the United Provinces had entered into a league with the crown of Great Britain, against the republican principles adopted by the Gallic nation, declared war against Holland. In consequence of this declaration, general Dumourier proceeded, with a large body of troops,

troops, to the invasion of that country, exhorting the Batavians, in a violent manifesto, to reject the tyrannic aristocracy of the stadtholder and his party, and to become a free republic. The states-general of Holland issued a counter-declaration, in which they combated that of the French commander, and pointed out the fallacy of his assertions, and the danger of his designs. The Dutch every where made the most vigorous preparations for defending themselves, and lord Auckland, the British ambassador at the Hague, was directed to assure their high mightinesses, that as the theatre of war was brought so near to the confines of their republic, his majesty, the king of Great Britain, was both ready and determined to execute, with the utmost good faith, the treaty of 1788.

Dumourier, having failed in all his efforts to negotiate with lord Auckland for peace, entered Holland, in the beginning of 1793, with his victorious troops, and soon reduced Breda to a capitulation: Klundert, Williamstadt, and Maestricht were besieged: and Bergen-op-Zoom, Tholen and Steenberg were blockaded at the same time. Two thousand British guards were sent over to Holland under the command of the duke of York: and a body of twelve thousand Hanoverians were ordered to march immediately towards Holland, to be under his royal highness's command. These, having been powerfully supported by the arms of Austria and Prussia, checked the progress of the French troops. The allied forces raised the siege of Maestricht, and obliged the French to abandon the bombardment of Venlo, to evacuate Ruremond and its entrenchments, Aix-la-Chapelle and Liege. Thus, in the course of March, 1793, Dumourier was forced to abandon his conquests in Holland, in order to rally his forces in Brabant. It was the last effort which he had to make, to retain the possession of the Netherlands. Three very bloody and obstinate engagements took place between Dumourier and the prince of Saxe-Cobourg. The French were forced to retreat to Brussels, and on the 24th they evacuated that city, and the rest of the Austrian territories. About the same time also they retired from Breda and Gertrudenberg, and wholly evacuated the republic of Holland.

Here we shall conclude the history of the Seven United Provinces, whose inhabitants so gloriously exerted themselves against the tyranny and ferocious bigotry of Philip II. and their brave, vigorous, and successful struggles in this noble contest will be always remembered with pleasure, whilst men preserve a just sense of true liberty, which will be, it is hoped, so long as human nature exists. They are now called to a struggle against a tyranny and bigotry of a different kind indeed, but equally oppressive, and in which it is hoped they will be equally successful.

---

After the independency of the Seven United Provinces was acknowledged, the Spaniards remained possessed of the other ten provinces, or, as they are termed, the Low Countries, until the duke of Marlborough, general of the allies, gained the memorable victory of Ramillies, in the year 1706. After which, Brussels, the capital, and great part of these provinces, acknowledged Charles VI. afterwards emperor of Germany, for their sovereign; and his daughter, the late empress-queen, remained possessed of them until the war of 1741, when the French reduced them, except part of the province of Luxemburgh; and would have still possessed them, but for the exertions of the Dutch, and chiefly of the English in favour of the house of Austria. The places retained by the French, by the peace of Aix-la-Chapelle, in the year 1748, may be seen in the preceding general table of divisions.

It was not long after the settlement of the disturbances in Holland, between the party of the stadtholder, and that of the patriots, that the provinces of the Netherlands,

Netherlands, belonging to the emperor, determined to assert their liberty. As no great friendship had subsisted between the states and his Imperial majesty, it was natural to suppose that the discontented subjects of the latter would find a ready asylum in the territories of the Dutch. The quarrel originated, like those in other countries, about the prerogatives assumed by the emperor, and which were more extensive than his subjects wished to allow. A letter concerning this had been published as early as the 13th of December, 1787, by count Trautmansdorff, the Imperial minister to the council of Brabant; in which province the disputes had originally commenced. In this performance, the count took notice of the little confidence they put in his majesty, and commanded them in the most express terms, "to hold no connection, relation, correspondence, or keep up any understanding whatever on public affairs, either in a body or by commissioners, with the states or their deputies, without the previous knowledge, or express command of his majesty, or his representative." This not proving effectual, and the emperor making use of force to assert his usual prerogatives, the territories of the United States became a refuge for the discontented Brabanters. They first began to assemble in Dutch Brabant, in the close of the summer of 1789, and being well received, took up their head-quarters at Tilbourg. To this place they invited their discontented countrymen to join them, and promised them the pay of 14 sols per day for their support. From whatever source these patriots derived their finances, it soon became evident that they were well supplied; for this sum was punctually paid, and they had great plenty of provisions; so that, being protected by the states-general, they soon became very strong, and in a very short time manifested a design to assert their liberty by force of arms. Their first exploits were the taking of two forts belonging to the emperor, situated between Antwerp and Bergen-op-Zoom. They seized also M. Crumpepin, chancellor of Brabant, threatening to hang him up by way of retaliation, for the first person of their party to whom the emperor should offer any violence.

On the part of his Imperial majesty, the insurgents were not treated with lenity. A proclamation was issued by count Trautmansdorff, governor of Brussels, intimating that no quarter should be given them, and that the villages, in which they concealed themselves, should be set on fire. General Dalton marched with 7000 men to retake the forts, proclaiming that he meant to become master of them by assault, and would put every one he found in them to the sword. A resolution was taken by the government of Brussels, to disarm the inhabitants of the Low Countries, excepting such as were in the actual service of the emperor. A proclamation accordingly issued forth, commanding all persons to deliver up their arms within twenty-four hours, under pain of being accounted favourers of sedition. All who should be taken with arms in their hands, in any case of riot or insurrection, to be immediately put to death on the spot. All the nobility and abbots who had left the country (which they had done in great numbers) were commanded to return under pain of perpetual banishment, and confiscation of estate.

In opposition to this sanguinary proclamation, the patriots issued a manifesto, in which they declared the emperor to have forfeited his authority by reason of his various oppressions and cruelties, his annulling his oath, and infringing the constitution. Banishment was threatened to such as took part with him; and all were exhorted to take up arms in defence of their country, though strict orders were given that no crowds or mobs should be allowed to pillage; and whoever was found doing so, should be treated as an enemy to his country.

This was dated at Hoogstraten, in Brabant, October the 24th, 1789. The king of Prussia was at that time assembling an army, with which it was thought he designed to take some active part in the present affair; but he published a manifesto, declaring

declaring that he did not mean to interfere in the troubles of the Low Countries; but as a director of the circle of the empire, to take notice of those which had happened in the bishopric of Liege, and Wutzlar. Thus the emperor and the patriots were left to decide their quarrel by themselves; and in this contest the latter displayed a resolution, as well as power to accomplish their purposes, which was by no means generally expected. Almost every town in Austrian Flanders shewed its determination to oppose the emperor, and the most enthusiastic attachment to military affairs displayed itself in all ranks of men. Even the ecclesiastics manifested their valour on the occasion; which perhaps was naturally to be expected, as the emperor had been very active in depriving them of their revenues. A formidable army was soon raised, which, after some successful skirmishes, made themselves masters of Ghent, Bruges, Tournay, Malines, and Ostend; so that general Dalton was obliged to retire to Brussels. A battle was fought before the city of Ghent, in which the patriots were victorious, though with the loss of one thousand men, besides women and children: for the merciless savages not only destroyed the men, but killed women and sucking infants. Some of them plunged their bayonets into the bodies of children in the cradle, or pinned them against the walls of the houses. By these monstrous cruelties, which reflected indelible disgrace on their authors, the emperor ensured success to his adversaries; for the whole countries of Brabant, Flanders, and Maes, almost instantly declared against him. They published a memorial for their justification, in which they gave, as reasons for their conduct, the many oppressive edicts with which they had been harassed since the death of the empress-queen; the unwarrantable extension of the emperor's prerogative, contrary to his coronation-oath, and the violence committed on his subjects, by forcibly entering their houses at midnight, and sending them prisoners to Vienna, to perish in a dungeon, or on the banks of the Danube. Not content with this, he had openly massacred his subjects; he had consigned towns and villages to the flames, and entered into a design of exterminating people who contended only for their rights. These things, they owned, might be terrible at the time, and easily impose upon weak minds, but "the natural courage of a nation roused by repeated injuries, and animated by despair, would rise superior to those last efforts of vindictive tyranny, and render them as impotent and abortive, as they were wicked and unexampled." For all which reasons they declared themselves *INDEPENDENT, and for ever released from the house of AUSTRIA.*

The emperor now, perceiving the bad effects of his cruelty, published proclamations of indemnity, &c. but they were treated with the utmost contempt. The patriots made the most rapid conquests, inasmuch, that before the end of the year, they were masters of every place in the Netherlands, except Antwerp and Luxemburg. The emperor next declared himself willing to treat with those whom he seemed not to be able to subdue; but the states published a paper by way of preliminary, which seemed to give very little hope of success to the negotiation. In this they insisted, 1. That the plenipotentiary, attended by two deputies from the states, should repair to those places in the town of Ghent, "where that sanguinary executioner Dalton ordered, saw, and executed robbery, rape, profanation, murder, massacre, and conflagration." 2. The corpses of those "immolated to the fury of the ferocious servants of the Nero their master, to be digged up and exposed to his excellency's view; that he might make a terrific report to the court of Vienna; and not only the banks of the Danube, but the whole world might be struck with horror." Lastly, When his mind was supposed to be sufficiently impressed with this dreadful spectacle, it was to be notified to him in the assembly of the states, to which he was to be conducted, that "it was impossible to treat or make any conventions with a sovereign perjured and perfidious, who had repeatedly violated

violated the most sacred of all human ties, though secured by the most solemn treaties with foreign powers."

A new act of union was established between the Belgic provinces, to which all those formerly subject to Austria unanimously acceded. It originated between those of Flanders and Brabant, and was to the following purpose: That neither party ever enter into any compromise with their former sovereign, but by common agreement. They agree to change this union into one common sovereignty between the two states; so that the whole power should be centered in a congress composed of deputies named by both parties. The power of this sovereign assembly to be confined to the sole object of common defence, to the power of making peace and war, the support of a national militia, the fortifications necessary for the defence of the country, the contracting alliance with foreign powers, &c. On the fourth of January 1790, the states of Brabant were opened with great ceremony at Ghent; they were declared independent, and the emperor to have forfeited all right to the sovereignty of that country. On the 11th, a solemn and general treaty of union was signed by the deputies from Brabant, Guelders, Flanders, West Flanders, Hainault, Namur, Tournay, with the territory depending on it, called Tournesis, and Malines.

But this hasty and complete revolution was hastily and completely subverted. The emperor Joseph was succeeded in 1790 by the mild and pacific Leopold, whose conciliatory measures with his revolted subjects were enforced by the mediation of Great Britain, Prussia, and Holland; and a convention was signed at Reichenbach on the 27th of July 1790, by the abovementioned high contracting powers, for the re-establishment of peace and good order in the Belgic provinces of his Imperial Majesty, by a general amnesty, and total forgiveness of whatever had passed during the troubles.

Their majesties of Great Britain and Prussia, and the states general of Holland, became, in the most solemn manner, guarantees to the emperor and his successors for the sovereignty of the Belgic Provinces, now re-united under his dominion. The ratification of this convention was exchanged between the contracting parties within two months from the date of signing, which was executed at the Hague on the 10th of December, 1790.

In our history of the late transactions of the new republic of France, we have narrated the incursions which their forces made into these provinces, which will render any repetition of these circumstances unnecessary in this place.

GERMANY and BOHEMIA contain 191,573 SQUARE MILES, with 135 inhabitants to each.

BOUNDARIES.] **T**HE empire of Germany, properly so called, is bounded by the German ocean, Denmark, and the Baltic, on the North; by Poland and Hungary, including Bohemia, on the East; by Switzerland and the Alps,

Alps, which divide it from Italy, on the South; and by the dominions of France and the Low Countries, on the West, from which it is separated by the Rhine, Moselle, and the Maese.

**GRAND DIVISIONS.]** The divisions of Germany are variously laid down even by modern writers. I shall therefore adhere to those most generally received. Germany was formerly divided into the Upper, or Southern, and the Lower, or Northern. The emperor Maximilian, predecessor and grandfather to the emperor Charles V. divided it into ten great circles; and the division was confirmed in the diet of Nuremberg, in 1552; but the circle of Burgundy, or the seventeen provinces of the Low Countries, being now detached from the empire, we are to confine ourselves to nine of those divisions, as they now subsist;

Whereof three are in the north, three in the middle, and three in the south.
