The soil of Germany is not in the highest state of cultivation, and therefore in many places it is bare and sterile, though in others it is surprisngly fruitful. Agriculture, however, is daily improving. The seasons vary as much as the soil. In the south and western parts, they are more regular than in those that lie near the sea, or are in the neighbourhood of lakes and rivers. The northern and eastern winds are unfavourable to vegetation. Upon the whole, there is no great difference between the seasons of Germany and those of Great Britain.

**MOUNTAINS.]** The chief mountains of Germany are the Alps, which divide it from Italy, and those which separate Saxony, Bavaria, and Moravia from Bohemia. But many other large tracts of mountains are found in different parts of the empire.

**FORESTS.]** The vast passion which the Germans have for hunting the wild boar has preserved more woods and chaces in Germany than in most other countries. The Hercynian forest, which in Caesar's time was nine days' journey in length, and six in breadth, is now cut down in many places, or parcelled out into woods, which go by particular names. The trees are pine, fir, oak, and beech. There is a vast number of forests of less note in every part of this country; almost every count, baron, or gentleman, having a chace or park adorned with pleasure-houses, and well stocked with game, particularly deer, of which there are seven or eight sorts, as roebucks, stags, &c. of all sizes and colours, and many of a vast growth; plenty of hares, conies, foxes, and boars. They abound so much also with wild fowl, that in many places the peasants have them as well as venison, for their ordinary food.

**RIVERS AND LAKES.]** No country can boast a greater variety of noble rivers than Germany. At their head stands the Danube or Donaw, so called from the swiftness of the current. Some pretend that this is naturally the finest river in the world. From Vienna to Belgrade in Hungary, it is so broad, that, in the wars between the Turks and Christians, ships of war sometimes engaged on it. The Danube contains a vast number of cataracts and whirlpools; its stream is rapid, and its course, without reckoning turnings and windings, is computed to be 1620 miles. The other principal rivers are the Rhine, Elbe, Oder, Weser, and Moselle.

The chief lakes of Germany, not to mention many inferior ones, are those of Constance and Bregentz. Besides these, are the Chiemsee, or the lake of Bavaria; and the Ziemitzer-see in the duchy of Carniola, whose waters often run off and return again in an extraordinary manner.

Besides these lakes and rivers, in some of which are found pearls, Germany contains large masses of standing water, which are next to pestilential, and afflict the neighbouring natives with many deplorable disorders.

**MINERAL WATERS AND BATHS.]** All Europe has heard of the Spa waters, and those of Seltzer and Pymont. Those of Aix la Chapelle are not less noted. They are divided into the Emperor's Bath and the Little Bath; and the springs of both are so hot, that they let them cool ten or twelve hours before they use them. Each of these, and many other waters, have their partisans in the medical faculty; and if we are to believe all they say, they cure diseases internal and cutaneous, either by drinking or bathing. The baths and medical waters of Embs, Withaden, Schwalbach, and Wildungen, are likewise reported to perform their wonders in almost all diseases. The mineral springs at the last mentioned place are said to intoxicate as soon as wine, and therefore they are inclosed. Carlsbad and Baden baths have been described and recommended by many great physicians, and used with great success by many royal personages.

After all, many are of opinion, that great part of the salutary virtues ascribed to these waters is owing to the exercises and amusements of the patients. It is the

interest of the proprietors to provide for both ; and though at first such establishments are attended with expence, yet they more than pay themselves in a few years, by the company which crowd to them from all parts of the world.

**METALS AND MINERALS.]** Germany abounds in both. Many places in the circle of Austria, and other parts of Germany, contain mines of silver, quick-silver, copper, tin, iron, lead, sulphur, nitre, and vitriol. Salt-petre, salt-mines and pits are found in Austria, Bavaria, Silesia, and the lower Saxony ; as are carbuncles, amethysts, jasper, sapphire, agate, alabaster, several sorts of pearls, turquois stones, and the finest of rubies, which adorn the cabinets of the greatest princes and virtuosi. In Bavaria, Tirol, and Liege, are quarries of curious marble, slate, chalk, ochre, red lead, alum, and bitumen ; besides other fossils. In several places are dug up stones, which represent different animals. Many of the German circles furnish coal-pits ; and the *terra sigillata* of Mentz, with white, yellow, and red veins, is thought to be an antidote against poison.

**VEGETABLE AND ANIMAL PRODUCTIONS.]** These differ in Germany very little, if at all, from the countries already described : but naturalists are of opinion, that, had the Germans, even before the middle of this century, been acquainted with agriculture, their country would have been the most fruitful of any in Europe. Even in its present, what we may call rude state, provisions are more cheap and plentiful in Germany than in most other countries ; witness the prodigious armies which the most uncultivated part of it maintained during a late war, while many of the richest and most fertile provinces remained untouched.

The Rhenish and the Moselle wines are distinguished by their peculiar lightness and detestive qualities, more sovereign in some diseases than any medicine.

The German wild boar differs in colour from our common hogs, and is four times as large. Their flesh and the hams made of it are preferred by many, even to those of Westmoreland, for flavour and grain. The *glutton* of Germany is said to be the most voracious of all animals. Its prey is almost every thing that has life, which it can master, especially birds, hares, rabbits, goats, and fawns ; whom it surprises artfully, and devours greedily. On these the glutton feeds so ravenously, that it falls into a kind of torpid state, and not being able to move, he is killed by the huntsmen ; but though both boars and wolves will kill him in that condition, they will not eat him. His colour is a beautiful brown, with a faint tinge of red.

Germany yields abundance of excellent heavy horses ; but neither these, nor their oxen, or sheep, are comparable to those of England. Some parts of Germany are remarkable for fine larks, and great variety of singing birds, which are sent to all parts of Europe.

**POPULATION, INHABITANTS, MANNERS, } As the empire of Germany is a  
CUSTOMS, DIVERSIONS, AND DRESS. } collection of separate states, each  
having a different government and police, it hath been difficult to speak with  
precision as to the number of its inhabitants ; but lately the following estimate hath  
been formed of them.**

This calculation extends only to the principal parts of Germany; the kingdom of Bohemia will be noticed in the proper place, to which when the inferior parts are added, the number in all is now computed at twenty-one millions; and should the landholders become better acquainted with agriculture and cultivation, population must naturally increase among them.

The Germans, in their persons, are tall, fair, and strong built. The ladies here generally fine complexions; and some of them, especially in Saxony, have great delicacy of shape and features.

Both men and women affect rich dresses, which, in fashion, are nearly the same as in France and England; but the better sort of men are excessively fond of gold and silver lace, especially if they are in the army. The ladies at the principal courts differ not much in their dress from the French and English, only they are not so excessively fond of paint as the former. At some courts they appear in rich furs; and the wealthy are loaded with jewels. The female part of the burghers' families, in many of the German towns, dress in a very different manner, and some of them inconceivably fantastic, as may be seen in many prints published in books of travels: but in this respect they are gradually reforming, and many of them make quite a different appearance in their dress from what they did thirty or forty years ago. As to the peasantry, and labourers, they dress, as in other parts of Europe, according to their employments, conveniency, and circumstances. The fives made use of in Germany are the same with those already mentioned in the northern nations, and are sometimes made portable, so that the ladies carry them to church. In Westphalia, and many other parts of Germany, they sleep between two feather-

beds, with sheets stitched to them, which by use becomes a very comfortable practice. The most unhappy part of the Germans are the tenants of little needy princes, who squeeze them to keep up their own grandeur; but, in general, the circumstances of the common people are more comfortable than those of their neighbours.

This people are naturally frank, honest, hospitable, and free from artifice and disguise. The higher orders are ridiculously proud of titles, ancestry, and shew. The Germans, in general, are thought to want animation, as their persons promise more vigour and activity than they commonly exert, even in the field of battle. But when commanded by able generals, especially the Italians, such as Montecuculi and prince Eugene, they have done great things both against the Turks and the French. The imperial arms have seldom made any remarkable figure against either of those two nations, or against the Swedes or Spaniards, when commanded by German generals. This possibly might be owing to the arbitrary obstinacy of the court of Vienna; for in the two last wars, the Austrians exhibited prodigies of military valour and genius.

Industry, application, and perseverance, are the great characteristics of the German nation, especially the mechanical part of it. Their works of art would be incredible, were they not visible, especially in watch and clock-making, jewelry, turnery, sculpture, drawing, painting, and certain kinds of architecture, some of which I shall have occasion to mention. The Germans have been charged with intemperance in eating and drinking, and perhaps not unjustly. But such excesses are now less common. At the greatest tables, though the guests drink pretty freely at dinner, yet the repast is speedily finished by coffee. But no people have more feasting at marriages, funerals, and on birth-days.

The German nobility are generally men of so much honour, that a sharper in other countries, especially in England, meets with more credit if he pretends to be a German, rather than any other nation. All the sons of noblemen inherit their father's titles, which greatly perplexes the heralds and genealogists of that country. The German husbands are not quite so complaisant as those of some other countries to their ladies, who are not entitled to any pre-eminence at table; nor indeed do they seem to affect it, being far from either ambition or loquacity, though they are said to be somewhat too fond of gaming. Many of the German nobility, having no other hereditary estate than a high-sounding title, easily enter into their armies, and those of other sovereigns; while gentlemen of property think the cultivation of their lands, though it might treble their revenue, below their attention; and deeming themselves of a rank so superior to labourers, disdain being concerned in the improvement of their grounds.

The domestic diversions of the Germans are the same as in England; billiards, cards, dice, fencing, dancing, and the like. In summer, people of fashion repair to places of public resort, and drink the waters. As to their field-diversions, besides their favourite one of hunting, they have bull and bear-baiting, and the like. The inhabitants of Vienna live luxuriously, a great part of their time being spent in feasting and carousing; and in winter, when the several branches of the Danube are frozen over, and the ground covered with snow, the ladies take their recreation in sledges of different shapes, such as griffins, tigers, swans, scollop-shells, &c. Here the lady sits, dressed in velvet lined with rich furs, and adorned with laces and jewels, having on her head a velvet cap; and the sledge is drawn by one horse, stag, or other creature, set off with plumes of feathers, ribbands, and bells. As this diversion is taken chiefly in the night time, servants ride before the sledge with torches, and a gentleman standing on the sledge behind guides the horse.

**RELIGION.]** This is a copious article: but I shall confine myself to what is most necessary to be known. Before the Reformation introduced by Luther, the German bishops were possessed (as indeed many of them are at this day) of prodigious power and enormous revenues. Their ignorance was only equalled by their superstition. The Bohemians were the first who had an idea of reformation, and made so glorious a stand for many years against the errors of Rome, that they were indulged in the liberty of taking the sacrament in both kinds, and other freedoms not tolerated in the Romish church. This was in a great measure owing to the celebrated Englishman John Wickliff, who went farther in reforming the real errors of popery than Luther himself, though he lived about a century and a half before him. Wickliff was seconded by John Hus, and Jerome of Prague, who, notwithstanding the emperor's safe-conduct, were insupportably burnt at the council of Constance.

The reformation introduced afterwards by Luther \*, of which we have spoken in the Introduction, though it struck at the chief abuses of the church of Rome, was thought in some points (particularly that of consubstantiation, by which the real body of Christ, as well as the elements of bread and wine, is supposed to be taken in the sacrament) to be imperfect. Calvinism †, therefore, or the religion of Geneva (as now practised in the church of Scotland), was introduced into Germany, and is the religion professed in the territories of the king of Prussia, the landgrave of Hesse, and some other princes, who maintain a parity of orders in the church. Some go so far as to say, that the numbers of protestants and papists in the empire are now almost equal. Germany, particularly Moravia and the Palatinate, as also Bohemia, is over-run with sectaries of all kinds; and Jews abound in the empire. At present, the modes of worship and forms of church government are, by the Protestant German princes, considered in a civil rather than a religious light. The Protestant clergy are learned and exemplary in their department; but the popish too often ignorant and libertine.

**ARCHBISHOP AND BISHOP-SEES.]** These are differently represented by authors, some of whom represent Vienna, as being a suffragan to the archiepiscopal see of Saltzburg, and others as being an archbishoprick: but depending immediately upon the pope. The others are the archbishop of Mentz, who has under him twelve suffragans; but one of them, the bishop of Bamberg, is said to be exempted from his jurisdiction;—Triers has three suffragans;—Cologne has four;—Magdeburg has five;—Saltzburg has nine, besides Vienna; and Bremen three.

At different periods since the Reformation, it has been found expedient, to satisfy the claims of temporal princes, to secularise the following bishop-sees: Bremen, Verden, Magdeburg, Halberstadt, Minden, Lubec and Osnaburg, which last goes alternately to the houses of Bavaria and Hanover, and is at present held by his Britannic majesty's second son. Such of those sees as were archbishopricks are now considered as duchies, and the bishopricks as principalities.

**LANGUAGE.]** The Teutonic part of the German tongue is an original language, and has no relation to the Celtic. It is called High Dutch, and is the mother tongue of all Germany; but varies much in its dialect in different provinces. Latin and French are the most useful languages in Germany when a traveller is ignorant of High Dutch.

\* Born in Saxony, in the year 1483, began to dispute the doctrines of the Romish church 1517, and died 1546, in the 63d year of his age.

† John Calvin was born in the province of Picardy, in the north of France, anno 1506. Being obliged to fly from that kingdom, he settled at Geneva, 1539, where he established a new form

of church discipline, which was soon after embraced by several nations and states, who are now denominated Prebyterians, and from their doctrinal articles, Calvinists. He died at Geneva, in the year 1564; and his writings make nine volumes in folio.

The German Pater-Noster is as follows: *Unser Vater, der du bist im himmel, geheiligt werd dein name. Zukomme dein reich. Dein wille geschehe, wie im himmel also auch auf erden. Unser täglich brodt gib uns heute, Und vergib uns unser schuld, als wir vergeben unsern schuldigern. Und führe uns nicht in versuchung. Sondern erlöse uns von dem bösen. Den dein is das reich, und die kraft, und die herrlichkeit, en ewigkeit. Amen.*

LEARNING, LEARNED MEN, } No country has produced a greater variety of  
AND UNIVERSITIES. } authors than Germany; and there is no where a  
more general taste for reading, especially in the protestant countries. Printing is  
encouraged to a fault; almost every man of letters is an author; thousands of theses  
and disputations are annually published; for no man can be a graduate in their  
universities, who has not published one disputation at least. In this country there  
are 36 universities, of which 17 are protestant, 17 Roman catholic, and two  
mixed; besides a vast number of colleges, gymnasia, pedagogies, and Latin  
schools. There are also many academies and societies for promoting the study of  
natural philosophy, the belles lettres, antiquities, painting, sculpture, architecture,  
&c. as the Imperial Leopoldine academy of the *natura curiosi*; the academy of  
sciences at Vienna, at Berlin, at Gottingen, at Erfurth, at Leipzig, and Duisburgh, at  
Gießen, and at Hamburg. At Dresden and Nuremberg are academies for painting;  
at Berlin a royal military academy; and at Augsburg is the Imperial Franciscan  
academy of fine arts; to which we may add the Latin society at Jena. Of the public  
libraries, the most celebrated are those of Vienna, Berlin, Halle, Wolfenbuttle,  
Hanover, Gottingen, Weymar, and Leipzig.

Many of the Germans have greatly distinguished themselves in various branches  
of learning and science. They have written largely upon the Roman and canon  
laws. Stahl, Van Swieten, Storck, Hoffman, and Haller, have contributed  
greatly to the improvement of physic; Ruvinus and Dillenius, of botany; Heister,  
of anatomy and surgery; and Newman, Zimmerman, Pott, and Margraaf, of  
chemistry. In astronomy, Kepler deservedly obtained a great reputation; and  
Puffendorf is one of the first writers on the law of nature and nations, and has also  
merit as an historian. But at the end of the last century, and the beginning of the  
present, Germany, by her divines, and by her religious sects, was so much involved  
in disputes about systematical theology, that few comparatively paid any attention  
to polite literature. The language also, and the style of writing in German books,  
which at the time of the Reformation was pure and original, became ridiculous,  
by a continual intermixture of Latin and French words; and though they were  
not understood by the people in general, were thought to give an air of superiority  
to the writers. For an opinion prevailed among the learned in Germany, and  
many have not yet divested themselves of it, that compiling huge volumes, and  
larding them with numberless quotations from all sorts of authors, and from all  
languages, was the true test of great erudition. Their productions, therefore,  
became heavy and pedantical, and were in consequence disregarded by other  
nations.

It was about the year 1730, that the prospects of literature in Germany began to  
brighten. Leibnitz and Wolfius opened the way to a better philosophy than had  
hitherto prevailed there. Gottsched, an author and professor at Leipzig, who was  
greatly honoured by the late king of Prussia, introduced a better taste of writing,  
by publishing a German grammar, and by instituting a literary society, for polish-  
ing and restoring to its purity the German language, and by promoting the study  
of the *belles lettres*. We may consider this as the era from which the Germans  
began to write with elegance in their own language, upon learned subjects, and  
to free themselves, in a considerable degree, from that verbose pedantry by which  
they had been characterised. About this time several young men in the university

of Leipzig, and other parts of Lower Germany, united in publishing some periodical works, calculated for the general entertainment of persons of a literary taste. Some of these gentlemen afterwards became eminent authors; and their works are held in Germany in high estimation.

The style of preaching among the German divines also underwent a considerable change. They began to translate the best English and French sermons, particularly those of Tillotson, Sherlock, Saurin, Bourdaloue, and others. They improved by these models; and Mosheim, Spalding, Zollikofer, and others, have published sermons which would do credit to any country; though they still retain too much of that prolixity, for which German divines and commentators have been so much censured. Nor can it be denied, that great numbers of the German preachers, even in large and opulent towns, are still too much distinguished by vulgar language, absurd opinions, and an inattention to the dictates of reason and good sense.

Some of the English periodical writings, such as the *Spectator*, *Tatler*, and *Guardian*, being translated into the German language, excited great emulation among the writers of that country, and a number of periodical papers appeared, of various merit. One of the first and best was published at Hamburg, under the title of "The Patriot;" in which Dr. Thomas, the late bishop of Salisbury, was concerned; he being at that time chaplain to the British factory at Hamburg, and a considerable master of the German language. The late professor Gellert is deemed one of the most elegant of the German authors. His way of writing is particularly adapted to touch the heart, and to inspire sentiments of morality and piety. His fables and narrations, written in German verse, his letters, and his moral romances, are so much read in Germany, that even many of the ladies have them almost by heart. His comedies are also very popular; though they are rather too sentimental, and better adapted for the closet than for the stage.

Haller, the famous physician, Hagedorn, Uz, Cronenb., Lessing, Gleim, Gessner, Kleist, Klopstock, Ramler, Zacariae, Wieland, and others, have excelled in poetry. Schlegel, Cronenb., Lessing, Wieland, and Wiese, have acquired fame by their dramatic writings. Rabener has, by his satirical works, immortalized his name among the Germans: though some of his pieces are of too local a nature, and too much confined to German customs, manners, and characters, to be read with any high degree of pleasure by persons of other nations. Gessner's *Idylls* and death of Abel have been translated into the English language, and favourably received.

In chemistry, and in medicine, the merit of the Germans is conspicuous; and Reimarus, Zimmerman, Abt, Kaestner, Segner, Lambert, Mayer, Kruger, and Sulger, have acquired fame by their philosophical writings. Busching is an excellent geographical writer; and Masco, Bunau, Putter, Gatterer, and Gebaur, have excelled in historical works. But it cannot be denied that the Germans, in their romances, are a century behind us. Most of their publications of this kind are imitations of ours, or else very dry and uninteresting; which perhaps is owing to education, to false delicacy, or to a certain taste of knight-errantry, which is still predominant among some of their novel writers.

In works relating to antiquity, and the arts known among the ancients, the names of Winckelman, Klog, and Lessing, are familiar with those who are skilled in this branch. In ecclesiastical, philosophical, and literary history, the names of Albertus Fabricius, Mosheim, Semler, and Brucker, are well known among us. Raphaelius, Michaelis, and Walch, are famous in sacred literature. Cellarius, Burman, Taubman, Reiske, Ernesti, Reimarus, Havercamp, and Hicynne, have published some of the best editions of the Greek and Latin Classics.

It is an unfavourable circumstance for German literature, that the French language should be so fashionable in the German courts. The late king of Prussia ordered the Philosophical Transactions of his royal society at Berlin, from the beginning of its institution, to be published in the French tongue; by which, some of the Germans think, his majesty has cast a very unenvied reproach upon his native language.

With respect to the fine arts, the Germans have acquitted themselves tolerably well. Germany has produced some good painters, architects, sculptors, and engravers. They even pretend to have been the first inventors of engraving, etching, and mezzotinto. Printing, if first invented in Holland, was soon after greatly improved in Germany. The Germans are generally allowed to be the first inventors of great guns; as also of gunpowder in Europe, about the year 1320. Germany has likewise produced some excellent musicians; particularly Handel, Bach, and Hesse; of whom Handel stands at the head.

CITIES, TOWNS, PORTS, AND OTHER EDIFICES, } This is a copious head  
PUBLIC AND PRIVATE; WITH OCCASIONAL } in all countries, but more  
ESTIMATES OF REVENUES AND POPULATION. } particularly so in Germa-  
ny, on account of the numerous independent states it contains.

Though Berlin is accounted the capital of all his Prussian majesty's dominions, and exhibits perhaps the most illustrious example of sudden improvement that this age can boast of; yet, during the late war, it was found a place of no strength, and fell twice, almost without resistance, into the hands of the Austrians, who, had it not been for the politeness of their generals, and the love of the fine arts, which always preserves mankind from barbarity and inhumanity, would have levelled it to the ground.

Berlin lies on the river Spree, and, besides a royal palace, has many other superb edifices; it contains fourteen Lutheran, and eleven Calvinist churches, besides a popish one. Its streets and squares are spacious, and regular; but the houses, though neat without, are ill-finished within; and the town is but thinly inhabited. The king's palace here, and that of prince Henry, are very magnificent buildings. The opera-house is also a beautiful structure: and the arsenal, which is handsomely built in the form of a square, contains arms for 200,000 men. There are sundry manufactures in Berlin, and several schools, libraries, and charitable foundations. The number of its inhabitants, according to Busching, in 1755, was 126,661, including the garrison. In the same year, and according to the same author, there were no fewer than 443 silk looms, 149 of half silks, 2858 for woollen stuffs, 453 for cotton, 248 for linen, 454 for lace work, 39 frames for silk-sockings, and 310 for worsted ones. They have here manufactures of tapestry, gold and silver lace, and mirrors.

The electorate of Saxony is, by nature, the richest country in Germany, if not in Europe: it contains 210 walled towns, 61 market-towns, and about 3000 villages, according to the latest accounts of the Germans themselves (to which, however, we are not to give an implicit belief;) and the revenue, estimating each six-dollar at four shillings and six pence, amounts to 1,350,000*l.* This sum is so moderate, when compared to the richness of the soil (which, if we are to believe Dr. Busching, produces even diamonds, and almost all the precious stones to be found in the East Indies and elsewhere), and the variety of splendid manufactures, that I am apt to believe the Saxon princes to have been the most moderate and patriotic of any in Germany.

Dresden, the elector of Saxony's capital, is remarkable for its palaces, public buildings, churches, and charitable foundations: it is beautifully situated on both sides the Elbe; and is the school of Germany for statuary, painting, enamelling, and carving; not to mention its mirrors, and foundries for bells and cannon, and

its foreign commerce carried on by means of the Elbe. The inhabitants of Dresden, by the latest accounts, amount to 110,000.

The city of Leipzig in Upper Saxony, 46 miles distant from Dresden, is situated in a pleasant and fertile plain on the Pleisse, and the inhabitants are said to amount to about 40,000. There are also large and well-built suburbs, with handsome gardens. Between these suburbs and the town, is a fine walk of lime-trees, which was laid out in the year 1702, and encompasses the city. Mulberry-trees are also planted in the town-ditches; and the fortifications seem rather calculated for the use of the inhabitants to walk on, than for defence. The streets are clean, commodious, and agreeable, and are lighted in the night with seven hundred lamps. They reckon 436 merchants' houses, and 192 manufactures of different articles, as brocades, paper, cards, &c. Leipzig has long been distinguished for the liberty of conscience in religious matters. Here is an university, which is still very considerable, with six churches for the Lutherans, theirs being the established religion, one for the Calvinists, and a chapel in the castle for those of the Romish church. The university library consists of about 26,000 volumes, 6000 of which are folios. Here is also a library for the magistrates, which consists of about 36,000 volumes, and near 2000 manuscripts, and contains cabinets of urns, antiques, and medals, with many curiosities of art and nature. The exchange is an elegant building.

The city of Hanover, the capital of that electorate, stands on the river Leine, and is a neat, thriving, and agreeable city. Its present name was given from a ferry over the Leine; the name Hanover, being the same with Have-over in English. It is divided, by the river on which it stands, into two parts, called the Old and New Towns; the former but indifferently built, but the new adorned with handsome structures and continually improving. The streets are spacious, regular, and well lighted with lanthorns in the night time. It contains about twelve hundred houses, among which there is an electoral palace. It carries on some manufactures; and in its neighbourhood lie the palace and elegant gardens of Herrenhausen. The dominions of the elector of Hanover contain about seven hundred and fifty thousand people, who live in fifty-eight cities, and sixty market-towns, besides villages. The city and suburbs of Bremen, belonging by purchase to the said elector, contain about fifty thousand inhabitants, and have a considerable trade by the Weser. The other towns belonging to this electorate cultivate trade and manufactures. The electoral forces are said to be 24,000, and the revenue to be 70,000*l.* a considerable part of which arises from the silver mines. It may be proper to mention, on account of its relation to our royal family, the secularised bishoprick of Osnaburg, lying between the rivers Weser and Ems. The chief city, Osnaburg, has been long famous all over Europe for the manufacture known by the name of the duchy, and for the manufacture of the best Westphalia hams. The whole revenue of the bishoprick amounts of about 30,000*l.*

Breslaw, the capital of Silesia, which formerly belonged to the kingdom of Bohemia, lies on the river Oder, and is a fine city, where all sects of Christians and Jews are tolerated, but the magistracy is Lutheran. Since Silesia fell under the Prussian dominion, its trade is greatly improved. The manufactures of Silesia, which principally centre at Breslaw, are numerous. The revenue is now computed at a million sterling; though it never paid the house of Austria above 500,000*l.* yearly.

Frankfort on the Maine, so called to distinguish it from another of the same name on the Oder, is situated in a healthful, fertile, and delightful country, on the river just mentioned, by which it is divided into two parts, distinguished by the names of Frankfort and Sachsenhausen. The former of these, being the largest, is divided into twelve wards, and the latter into two; and both were computed to contain about three thousand houses. The fortifications, which are both regular and solid, form a decagon, or figure consisting of ten bastions, faced with hewn stone; the

ditches are deep, and filled with fresh water; and all the out-works are placed before the gates. The government here, as in Breslaw, is in the hands of the Lutherans; but there are also many Papists and Calvinists. The Papists have the great church of St. Bartholomew, with three convents for men, and one for women; but are not allowed to make any processions through the town. The Calvinists are generally merchants, and very rich; whence it is a common saying, that, at Frankfort, the Roman Catholics possess the churches; the Lutherans the dignities; and the Calvinists, the riches. The last, however, are not allowed a church in town, but are obliged to go about three miles off for their worship, to a village called *Bokenheim*. The Jews are allowed a synagogue, but, in other respects, are miserably ill treated. They are confined to a particular district of the town; obliged to wear a piece of yellow cloth as a badge of dishonourable distinction; and they subsist by selling things to strangers. Frankfort is the usual place of the election and coronation of the kings of the Romans, and is also a free and imperial city. It is of a circular form, without any suburbs; but the streets are generally narrow, and the houses are mostly built of timber and plaster, and covered with slate; though there are some handsome private structures, of a kind of red marble, that deserve the name of palaces; as the buildings called the *Compestel* and *Fronhof*, the *Trierhof*, the *Cullenhof*, the German-house, an august edifice, situated near the bridge over the *Muine*, the *Hesse-Darmstadt*hof, the palace of the prince de la *Tours*, and the houses of the counts of *Solms*, *Schauenburg*, and *Schonborn*; and there are three principal squares.

Frankfort on the *Oder* is a city on that river, in the circle of Upper Saxony. It is divided into two parts by the river, which are joined together by a wooden bridge. The houses are tolerably well built, the streets spacious, and the inhabitants have a pretty good trade in woollen and linen goods, with two fairs a year, which invite a vast number of merchants, particularly Jews, from Poland. They have a communication with the Baltic sea by the river *Oder*, as well as with the *Spree* and *Havel* by canals. Here is an university erected in 1506, by *Joachim I.* marquis of *Brandenburg*. There is likewise a handsome market-place.

*Vienna* is the capital of the circle of *Austria*, and being the residence of the emperor, is considered as the capital of Germany. It is a noble and a strong city, and the princes of the house of *Austria* have omitted nothing that could contribute to its grandeur and riches. *Vienna*, which takes its name from the little river *Wien*, which runs on the east of the city, and falls into the *Danube* a little below it, contains an excellent university, a bank, which is in the management of her own magistrates, and a court of commerce immediately subject to the aulic council. Its religious buildings, with the walks and gardens, occupy a sixth part of the town; but the suburbs are larger than the city. It would be endless to enumerate the many palaces of this capital, two of which are imperial; its squares, academies, and libraries; and, among others, the fine one of prince *Eugene*, with his and the imperial cabinets of curiosities. An academy was erected in 1706, for painting, sculpture and architecture.

In no place of the world do people live more luxuriously than at *Vienna*; and in this they are plentifully supplied by the vast produce of the neighbouring country.

Among the rich convents of this city, is one for the Scotch nation, built in honour of their countryman *St. Colman*, the patron of *Austria*; and one of the six gates of this city is called the *Scots' gate*, in remembrance of some notable exploit performed there by the troops of that nation. The inhabitants of *Vienna*, including the suburbs, are computed at about three hundred thousand; and the encouragement given them by their sovereigns has rendered this city the rendezvous of foreigners.

The streets, except those in the suburbs, are narrow and dirty. The houses of this city are generally of stone, five or six stories high, and flat roofed. They have three or four cellars under one another, with an open space in the middle of each arched roof, for the communication of air, and from the lowermost of all, there is a tube to the top, to let in air from the street. The winds often blow so hard, that it is troublesome to walk the streets. A remarkable prerogative of the sovereign here is, that the second floor of every house belongs to him, and is assigned to whomsoever he thinks proper; and hence there is no part of Germany, where lodging is so dear as at Vienna. An odd custom prevails here of putting iron bars to all their windows up to the very tops of their houses, which makes them all look like so many prisons. The houses and furniture of the citizens are greatly disproportioned to the magnificence of the palaces, squares, and other public buildings; but above all, the excessive imposts laid by the house of Austria upon every commodity in its dominions, must always keep the manufacturing part of their subjects poor.

ANTIQUITIES AND CURIOSITIES, } In describing the mineral and other  
NATURAL AND ARTIFICIAL. } springs, a great part of this article, which  
is of itself very copious, has been already anticipated. Every court of Germany produces a cabinet of curiosities, artificial and natural, ancient and modern. The tun at Heidelberg holds 800 hogheads, and is generally full of the best Rhenish wine, from which strangers are seldom suffered to retire sober. Vienna itself is a curiosity; for here you see the greatest variety of inhabitants that is to be met with any where, as Greeks, Transylvanians, Sclavonians, Turks, Tartars, Hungarians, Croats, Germans, Poles, Spaniards, French, and Italians, in their proper habits. The imperial library at Vienna is a great literary rarity, on account of its ancient manuscripts. It contains upwards of 80,000 volumes, among which are many valuable manuscripts in Hebrew, Syriac, Arabic, Turkish, Armenian, Coptic, and Chinese; but the antiquity of some of them is questionable, particularly a New Testament in Greek, said to have been written 1500 years ago, in gold letters, upon purple. Here are likewise many thousand Greek, Roman, and Gothic coins and medals; with a vast collection of other curiosities in art and nature. The vast Gothic palaces, cathedrals, castles, and, above all, townhouses, in Germany, are very curious; they strike the beholder with an idea of rude magnificence; and sometimes have an effect that is preferable even to Greek architecture. Many castles remain nearly in the same condition, as in the 14th century; their fortifications generally consisting of a brick wall, trenches filled with water, and bastions or half-moons.

Next to the lakes and waters, the caves and rocks are the chief natural curiosities of Germany. Mention is made of a cave near Blackenburg, in Hartz-forest, of which none have yet found the end, though many have advanced into it for 20 miles; but the most remarkable curiosity of that kind is near Hammelen, about 30 miles from Hanover, where at the mouth of a cave stands a monument which commemorates the loss of 130 children, who were there swallowed up in 1284. Frequent mention is made of two rocks near Blackenburg, exactly representing two monks in their proper habits; and of many stones which seem to be petrifications of fishes, frogs, trees, and leaves.

COMMERCE AND MANUFACTURES.] Germany has vast advantages in point of commerce, from its situation in the heart of Europe, and being intersected with great rivers. Its native materials for commerce, besides mines and minerals, are hemp, hops, flax, anise, cummin, tobacco, saffron, madder, truffles, variety of excellent roots and pot-herbs, and fine fruits, equal to those of France and Italy. Germany exports to other countries corn, tobacco, horses, lean cattle, butter, cheese, honey, wax, wines, linen, and woollen yarn, and cotton stuffs, toys,

turnery wares in wood, metals and ivory, goat-skins, wool, timber, both for ship-building and houses, cannon and bullets, bombs, and bomb-shells, iron plates and stoves, tinned plates, steel work, copper, brass-wire, porcelain the finest upon earth, earthen-ware, glasses, mirrors, hogs-bristles, mumi, beer, tartar, smalts, zaffer, Prussian blue, printer's ink, and many other articles.

The revocation of the edict of Nantes, by Lewis XIV. which obliged French Protestants to settle in different parts of Europe, was of infinite service to the German manufactures. They now make velvets, silks, fluffs of all kinds, fine and coarse; linen and thread, and every thing necessary for wear, to great perfection. The porcelain of Meissen, in the electorate of Saxony, and its paintings, have been long famous.

[**TRADING COMPANIES.**] The Asiatic company of Embden, established by his late Prussian majesty, was, exclusive of the Hanseatic league, the only commercial company in Germany; but no ships had been sent out since the year 1760. The heavy taxes that his majesty laid on the company, was the cause of its total annihilation. In the great cities of Germany very large and extensive partnerships in trade subsist.

[**CONSTITUTION AND GOVERNMENT.**] Almost every prince in Germany (and there are about 300 of them) is arbitrary with regard to the government of his own estates; but the whole of them form a great confederacy, governed by political laws, at the head of which is the emperor, whose power in the collective body, or the diet, is not directorial, but executive: but even that gives him vast influence. The supreme power in Germany is the diet, which is composed of the emperor, or, in his absence, of his commissary, and of the three colleges of the empire. The first of these is the electoral college; the second is the college of princes; and the third, the college of Imperial towns. The empire was hereditary under the race of Charlemagne, but after this, became elective; and, in the beginning, all the princes, nobility, and deputies of cities enjoyed the privilege of voting. In the reign of Henry V. the chief officers of the empire altered the mode of election in their own favour. In the year 1239 the number of electors was reduced to seven. One elector was added in 1649, and another in 1692.

The dignity of the empire, though elective, has for some centuries belonged to the house of Austria, as being the most powerful of the German princes; but, by French management, upon the death of Charles VI. grandfather by the mother's side, to the emperor Joseph II. the elector of Bavaria was chosen to that dignity, and died, as is supposed, heart-broken, after a short uncomfortable reign.

The election of the emperor proceeds after the following manner: The elector of Mentz, before the lapse of a month after the vacancy, summons, as great chancellor of the empire, the rest of the electors, to attend on some fixed day within the space of three months from the date of the summons. The electors generally send their ambassadors to the place of election, which is held at Frankfort on the Maine; but saving the right of the city of Frankfort, it may be held elsewhere.

When the diet of electors is assembled, they proceed to compose the capitulation, to which the emperor, when elected, is to swear. The capitulation, being adjusted, the elector of Mentz appoints a day for the election.

When this day arrives, the gates of the city are shut, and the keys delivered to the elector of Mentz. The electors or their ambassadors, protestants excepted, repair in great pomp to mass, and after its celebration they take a solemn oath to choose, unbiassed and uninfluenced, the person that appears most proper for the imperial dignity. After this, they repair to the faculty, where the elector of Mentz, first, asks if there be any impediment known against their proceeding at present to an election? And next, he obtains a promise that the person elected by the major-

ity shall be received as emperor. The declarations of the electoral ambassadors, in respect to these two points, are recorded by two notaries of the empire. Then all witnesses withdraw; and the elector of Mentz collecting the suffrages, which are *à viva voce*, and giving his own last, the witnesses are recalled, and he declares the person whom the electors have chosen. But the election is not complete, nor is the new emperor proclaimed, until the capitulation be sworn to, either by himself, or by his ambassadors, if he be absent.

From this time he is styled king of the Romans, until the coronation takes place, which ceremony confers the title of emperor. According to the golden bull\* (so called from the great golden seal of the emperor affixed to it) it should be celebrated at Aix-la-Chapelle out of respect to Charlemagne, who resided there. The coronation is performed by the archbishop of Mentz, or elector of Cologne.

For the benefit of the empire, during the reign of an emperor, his presumptive successor may be elected king of the Romans. But this election confers at first a mere title; for, by an express article in his capitulation, the king of the Romans swears not to interfere with the government during the life of the emperor; but, on his decease, the coronation confirms him emperor without a second election.

Should there not be a king of the Romans, and the throne become vacant, the government is administered by vicars of the empire, who are the electors of Saxony and of Bavaria, who have jurisdiction, the former over the northern, and the latter over the southern circles. By the golden bull it is established, that all acts of the vicars are valid; but they are all fully confirmed by the emperor; which confirmation, by an article of his capitulation, he is bound to give.

The power of the emperor is regulated by the capitulation signed at his election. He can confer titles and enfranchisements upon cities and towns; but as emperor he can levy no taxes, nor make war nor peace without the consent of the diet. When that consent is obtained, every prince must contribute his quota of men and money, as valued in the matriculation roll, though, perhaps, as an elector or prince, he may espouse a different side from that of the diet. This forms the intricacy of the German constitution; for George II. of England was obliged to furnish his quota against the house of Austria, and also against the king of Prussia, while he was fighting for them both. The emperor claims a precedence for his ambassadors in all Christian courts.

The nine electors of the empire have each a particular office in the imperial court, and they have the sole election of the emperor. They are in order,

First, The archbishop of Mentz, who is high chancellor of the empire when in Germany.

Second, The archbishop of Treves, who is high chancellor of France and Arlat, a dignity which, since the separation of France from the empire, is merely nominal.

Third, the archbishop of Cologne, who is the same in Italy, a mere title also.

The king, or rather elector of Bohemia, who is cup-bearer.

The elector of Bavaria, who is grand sewer, or officer who serves out the feasts.

The elector of Saxony, who is great marshal of the empire.

The elector of Brandenburg (now king of Prussia), who is great chamberlain.

The elector Palatine, who is great Steward; and,

The elector of Hanover (king of Great Britain), who claims the post of arch-treasurer.

\* This golden bull was published at the diet of Nuremberg, in the year 1356, and in the reign of Charles IV. It feales every thing relating to the election and coronation of the emperor, and the rights of the electors; the Latin original is preserved at Frankfort on the Maine.

It is necessary for the emperor, before he calls a diet, to have the advice of those members.

The ecclesiastical princes are as absolute as the temporal ones in their several dominions. The chief of these, besides the three ecclesiastical electors already mentioned, are the archbishop of Saltzburgh, the bishops of Liege, Munster, Spire, Worms, Wirtzburg, Straßburg, Osnaburg, Bamberg, and Paderborn. Besides these, there are many other ecclesiastical princes. Germany abounds with many abbots and abbeßes, whose jurisdictions are likewise absolute, and some of them very considerable, and all of them are chosen by their several chapters. The chief of the secular princes are the Landgrave of Hesse, the dukes of Brunswic, Wirtemberg, Mecklenburgh, Saxe-Gotha, the marquises of Baden and Culmbach, with the princes of Nassau, Anhalt, Furstenburg, and many others, who have all high titles, and are sovereigns in their own dominions. The free cities are likewise sovereign states; those which are Imperial, or compose a part of the diet, bear the Imperial eagle in their arms; those which are Hanse-towns, of which we have spoken in the Introduction, have still great privileges and immunities, but they subsist no longer as a political body.

Having spoken of the rights and privileges of the electors, princes, &c. of the empire, it may be necessary here to give some account of the ban, or proscription to which the electors and states of the empire are subject. The ban is of two sorts; the one is privatory; the other provisionary. The first consists in depriving a prince or state of the empire of all their rights, privileges, dignities, &c. &c. The second consists in taking away the actual government of the states, and committing them to the care of some other, until it be otherwise ordered.

Every state which acts directly or indirectly against the fundamental laws of the empire, or the religious peace, is subject to the punishment of the ban. But this sentence of proscription is difficult to obtain, because it is difficult to unite all the orders of the empire in the same measure. The execution of it belongs to the captain of the circle where the prince resides, and every feudal state of the empire is subject to it.

The Imperial chamber, and that of Vienna, which is better known by the name of the Aulic council, are the two supreme courts for determining the great causes of the empire, arising between its respective members. The Imperial council consists of fifty judges or assessors. The president and four of them are appointed by the emperor, and each of the electors chooses one, and the other princes and states the rest. This court is at present held at Wetzlar, but formerly it resided at Spire; and causes may be brought before it by appeal. The Aulic council was originally no better than a revenue court of the dominions of the house of Austria. As that family's power increased, the jurisdiction of the Aulic council was extended; and, at last, to the great disgust of the princes of the empire, it usurped upon the powers of the Imperial chamber, and even of the diet. It consists of a president, a vice-chancellor, a vice-president, and a certain number of Aulic-councillors, of whom six are protestants, besides other officers; but the emperor in fact is master of the court. These courts follow the ancient laws of the empire for their guides, the golden bull, the pacification of Passau, and the civil law.

Besides these courts of justice, each of the nine circles has a director to take care of the peace and order of the circle. These directors are commonly as follow: For Westphalia, the bishop of Munster, or duke of Newburg. For Lower Saxony, the elector of Hanover or Brandenburg. For Upper Saxony, the elector of Saxony. For the Lower Rhine, the archbishop of Mentz. For the Upper Rhine, the elector Palatine, or bishop of Worms. For Franconia, the bishop of Bamberg, or marquis of Culmbach. For Swabia, the duke of Wirtemberg, or bishop of Constance. For Bavaria, the elector of Bavaria, or archbishop of Saltzburg; and for Austria,

Austria, the archduke of Austria, his Imperial majesty. In case of public offences, after the votes of the diet are collected, and sentence pronounced, the emperor commits the execution of it to a particular prince, whose troops live at free quarter upon the estate of the delinquent.

The constitution of the Germanic body is a study of no small difficulty. However plausibly invented the several checks upon the imperial power may be, it is certain that the house of Austria has more than once endangered the liberties of the empire. Lately, indeed, that house has met with a powerful opposition from the house of Brandenburg, in consequence of the activity and abilities of the late king of Prussia. Before I close this head, it may be necessary to inform the reader of the meaning of a term which has of late frequently appeared in the German history, I mean that of the *Pragmatic Sanction*. This is no other than a provision made by the emperor Charles VI. for preserving the indivisibility of the Austrian dominions in the person of the next descendant of the last possessor, whether male or female. This provision has been often disputed by other branches of the house of Austria, who have been occasionally supported by France from political views, though the pragmatic sanction is strongly guaranteed by almost all the powers of Europe. The late emperor, elector of Bavaria, and the late king of Poland attempted to overthrow it, as being descended from the daughters of the emperor Joseph, elder brother to Charles VI. It has likewise been repeatedly opposed by the court of Spain.

Few of the territories of the German princes are so large as to be assigned to viceroys, to be oppressed and fleeced at pleasure; nor are they entirely without redress when they suffer any grievance: they may appeal to the general diet or great council of the empire for relief. The subjects of the petty princes in Germany are generally the most unhappy; for these princes, affecting the grandeur and splendor of the more powerful, in the number and appearance of their officers and domestics, in their palaces, gardens, pictures, curiosities, guards, bands of music, tables, dresses, and furniture, are obliged to support all this vain pomp and parade at the expence of their vassals and dependents. With respect to the burghers and peasants of Germany, the former in many places enjoy great privileges; the latter also, in Franconia, Swabia, and on the Rhine, are generally a free people, or perform only certain services to their superiors, and pay the taxes; whereas in the marquisate of Brandenburg, Pomerania, Lusatia, Moravia, Bohemia, Austria, &c. their condition is various indeed, but universally very servile.

**REVENUES.**] The only revenue falling under this head is that of the emperor, who, as such, hath an annual income of about 5 or 6000 pounds sterling, arising from some inconsiderable fiefs in the Black Forest. The Austrian revenues are immense, and are thought to amount to 7,000,000l. sterling, in Germany and Italy; a sum that goes far in those countries. The father of the late king of Prussia, whose revenues were not near so extensive as those of his son, though he maintained a large army, was so good an economist that he left 7,000,000l. sterling, in his coffers; and Silesia alone yields above half a million sterling yearly. To behold the magnificence of many of the German courts, a stranger is apt to conceive very high ideas of the incomes of their princes; which is owing to the scarcity of money in that country, and consequently the low price of necessaries and accommodations.

**MILITARY STRENGTH.**] During the two last wars, very little regard was paid in carrying them on, to the ancient German constitutions. The elector of Mentz keeps what is called a matriculation-book or register, which contains the assessments of men and money, which every prince and state, who are members of the empire, is to advance when the army of the empire takes the field. The contributions in money are called Roman months, on account of the monthly assessments paid to the emperors when they visited Rome. These assessments, however, are subject to

great

great mutability. It is sufficient here to say that, upon a moderate computation, the secular princes of the empire can bring to the field 379,000 men, and the ecclesiastical 74,500; in all 453,500; of those the emperor, as the head of the house of Austria, is supposed to furnish 90,000.

By this computation, which is far from being exaggerated, it appears that the emperor and empire form the most powerful government in Europe; and if the whole force was united, and properly directed, Germany would have nothing to fear from any of its ambitious neighbours. But the different interests pursued by the several princes of Germany, render the power of the emperor of little consequence, except with regard to his own states. The imperial army was computed, in 1775, to amount to two hundred thousand.

The time of the institution of the "*Order of the Red Eagle*" is uncertain. The margrave of Bareith is sovereign thereof, and it is generally bestowed on military officers. The badge is a golden square medal enamelled white, on which is an eagle displayed, red. It is worn pendent to a broad red watered ribband, edged with yellow, and worn scarfwise. In the year 1690, John George, elector of Saxony, and Frederic III. elector of Brandenburg, on terminating their disputes, established the "*Order of Sincerity*." The knights of this order wear a bracelet of gold: on one side are the names of the two princes with this device, "*Amitié sincere*;" on the other side are two armed hands, joined together, and placed on two swords, with two palm branches crossed, with this motto, "*Unis pour jamais*."

John George, duke of Saxe Weissenfels, instituted the "*Order of the Noble Passion*," in the year 1704, of which the duke is the sovereign. The badge is a gold medal enamelled white, on which is a star of eight points, gold, charged with a cross, red, surmounted with an oval, blue, on which are the letters J. G. in a cypher, the whole encircled with these words, "*J' aime l'honneur qui vient par la vertu*." Each knight of the order is to contribute to the maintenance of the maimed or decayed soldiers in the service of the sovereign. In the year 1709, Louise Elizabeth, widow of Philip duke of Saxe Merburg, revived the "*Order of the Death's Head*," first instituted in 1652, by her father the duke of Wirtemberg. A princeess of that house alone can be sovereign of it, and none but women of virtue and merit (birth and fortune not regarded) can be received into it. They are to avoid gaming, theatrical amusements, and luxuries of all kinds. The badge of the order is a death's head enamelled white, surmounted with a cross pattée, black; above the cross pattée, another cross composed of five jewels, by which it hangs to a black ribband edged with white, and on the ribband these words, "*Memento mori*," worn at the breast.

The great order of Wirtemberg, is that "*of the Chace*" instituted in the year 1702, by the then duke, and improved in the year 1719. The badge of the order is a golden cross of eight points enamelled, red, in the spaces between the branches of the cross is an eagle displayed, red, and between the points of each traverse a bugle horn, and in the centre the letter W. and over it a ducal coronet enamelled in proper colours. It is worn pendent to a broad scarlet watered ribband, passing scarfwise from the left shoulder to the right side. On the left side of the coat is a silver star embroidered, of the same figure as the badge, in the middle a green circle with the motto "*Amicitia, virtutisque sedes*." The festival of this order is on St. Hubert's day, he being the patron of sportsmen.

In the year 1709, the elector Palatine revived the "*Order of St. Hubert*," first instituted by a duke of Juliers and Cleves, in memory of a victory gained by him on St. Hubert's day, in 1447. The number of counts and barons of the order, who enjoyed the memorial lands annexed to it, is limited to twelve, but the number of princes and private gentlemen is not fixed. All are to prove the nobility of their descent for four generations, and on the day of reception are to pay 100 ducats to the poor. The elector Palatine is grand-master of the order. The badge is a cross of eight points, from the angles issue rays, and in the middle of a circle is enamelled the figure of St. Hubert kneeling before a crucifix, placed between the horns of a stag standing in a wood, having in the centre this device in the Runic language, "*Coylans in fidelitate*," on a red ground. All the knights have either military employments or pensions.

The archbishop of Saltburgh in 1701, instituted the "*Order of St. Rupert*," in honour of the founder and patron of the see he held, and as the apostle of his country. It is composed of twelve knights, distinguished by a chain of gold round the neck to which is pendent the badge, which is a cross of eight points enamelled blue,

and on the centre the image of St. Rupert. As the archbishop is the richest and most powerful prince of Bavaria next to the elector, his order is in good esteem. In the year 1729, Albert elector of Bavaria instituted the order of "*St. George the Defender of the Immaculate Conception*;" the knights of which are obliged to prove their nobility by father and mother for five generations: the badge they wear is a star of eight points, and on the centre is enamelled the image of St. George on horseback slaying a dragon. The cross is enamelled blue edged with white. On days of ceremony they wear the badge pendent to a collar composed of oblong plates with crowns at each end, and columns surrounded with globes, each column supported by two lions holding in their exterior paws two scymitars, the whole joined together with lozenge chains, enamelled blue with white—on the oblong plates is this motto, "*In fide, justitia, et fortitudine.*"

The "*Order of the Golden Lion*" was instituted by the present landgrave of Hesse Cassel; is equally a military and civil order, but mostly conferred on general officers. The badge is an octagonal medal enamelled red, in the centre a lion rampant, gold, ducally crowned; it is pendent to a broad watered crimson ribband, worn scarfwise. The present landgrave hath also instituted the military "*Order of Merit*," the badge of which is a gold cross of eight points enamelled white; and in the centre is this motto, "*Pro virtute et fidelitate*;" it is worn at the coat button-hole, pendent to a blue ribband edged with silver.

[HISTORY.] The manners of the ancient Germans are well described by the elegant and manly pencil of Tacitus, the Roman historian. They were a brave and independent race of men, and peculiarly distinguished by their love of liberty and arms. They opposed the force of the Roman empire, not in its origin or its decline, but after it had arrived at maturity, and still continued in its full vigour. The country was divided into a number of principalities, independent of each other, though occasionally connected by a military union for defending themselves against such enemies as threatened the liberty of them all. At length, the Roman power, directed by policy, prevailed over a great part of Germany, which was reduced to the condition of a province. When the Roman empire was invaded by the northern barbarians, Germany was over-run by the Franks, about the year 480, and a considerable part of it long remained in subjection to earls and marquises of that nation. In this situation Germany continued, notwithstanding the efforts of particular chieftains, or princes, to reduce the rest into subjection, until the beginning of the ninth century: then it was that Charlemagne, one of those enlightened and superior geniuses who sometimes start up in a barbarous age, first extended his military power, and afterwards his civil authority, over the whole of this empire. The posterity of Charlemagne inherited the empire of Germany until the death of Lewis III. in the year 911, at which time the different princes, assuming their original independence, rejected the Carolingian line, and placed Conrade, duke of Franconia, on the throne. Since this time, Germany has ever been considered as an elective monarchy. Princes of different families, according to the prevalence of their interest and arms, have mounted the throne. Of these, the most considerable, until the Austrian line acquired the imperial power, were the houses of Saxony, Franconia, and Swabia. The reigns of these emperors contain nothing more remarkable than the contests between them and the popes. From hence, in the beginning of the thirteenth century, arose the factions of the Guelphs and Gibbelines, of which the former was attached to the pope, and the latter to the emperor; and both, by their violence and inveteracy, tended to disquiet the empire for several ages. The emperors too were often at war with the Turks; and the German princes often contended among themselves for the imperial dignity. But what more deserves the attention of a judicious reader than all these noisy but uninteresting quarrels, is the progress of government in Germany, which was in some

measure opposite to that of the other kingdoms of Europe. When the empire, raised by Charlemagne, fell asunder, all the different independent princes assumed the right of election; and those, now distinguished by the name of electors, had no peculiar or legal influence in appointing a successor to the imperial throne: they were only the officers of the king's household, his secretary, his steward, chaplain, marshal, or master of his horse, &c. By degrees, as they lived near the king's person, and had, like all the other princes, independent territories belonging to them, they increased their influence and authority; and in the reign of Otho III. of the house of Saxony, in the year 984, acquired the sole right of electing the emperor. Thus while, in other kingdoms of Europe, the dignity of the great lords, who were all originally allodial or independent barons, was diminished by the power of the king, as in France, and by the influence of the people, as in Great Britain; in Germany, on the other hand, the power of the electors was raised upon the ruins of the emperor's supremacy, and of the people's rights. Otho I. having, in the year 962, united Italy to the empire of Germany, procured a decree from the clergy that he and his successors should have the power of nominating the pope and of granting investitures to bishops. Henry V. a weak and wicked prince, in the year 1122, surrendered up the right of investiture and other powers, to the disgrace of the imperial dignity: but pope Benedict XII. refusing absolution to Lewis V. of Bavaria, in 1338, it was declared in the diet of the empire, that the majority of suffrages of the electoral college should confer the empire without the consent of the pope; that he had no superiority over the emperor, nor any right to reject or to approve of elections. In 1438, Albert II. archduke of Austria, was elected emperor, and the imperial dignity continued in the male line of that family for three hundred years. One of his successors, Maximilian, married the heiress of Charles duke of Burgundy; whereby Burgundy, and the seventeen provinces of the Netherlands, were annexed to the house of Austria. Charles V. grandson of Maximilian, and heir to the kingdom of Spain, in right of his mother, was elected emperor in the year 1519. Under him Mexico and Peru were conquered by the Spaniards, and in his reign happened the reformation of religion in several parts of Germany, which, however, was not confirmed by public authority till the year 1648, by the treaty of Westphalia, and in the reign of Ferdinand III. The reign of Charles V. was continually disturbed by his wars with the German princes, and the French king, Francis I. Though successful in the beginning of his reign, his good fortune, towards the conclusion of it, began to forsake him; which, with other reasons, occasioned his abdication of the crown.

His brother, Ferdinand I. who, in 1558, succeeded to the throne, proved a moderate prince with regard to religion. He had the address to get his son Maximilian declared king of the Romans in his own life-time, and died in 1564. By his last will he ordered, that if either his own male issue, or that of his brother Charles, should fail, his Austrian estates should revert to his second daughter Anne, wife of the elector of Bavaria, and her issue. This destination is noticed, as it gave rise to the late opposition made by the house of Bavaria to the pragmatic sanction, in favour of the empress-queen of Hungary, on the death of her father Charles VI. The reign of Maximilian II. was disturbed with internal commotions, and an invasion from the Turks; but he died in peace in 1576. He was succeeded by his son Rodolph, who was involved in wars with the Hungarians, and in differences with his brother Matthias, to whom he ceded Hungary and Austria in his life-time. To him succeeded in the empire Matthias, under whom the reformers, who went

\* Wiquefort saith, that nothing was settled as to the number of electors, or the electoral dignity, till Charles IV. who was chosen emperor in 1347,

and made that famous constitution for the election of emperors, called the *Golden Bull*.

under the names of Lutherans and Calvinists, were so much divided among themselves, as to threaten the empire with a civil war. Their common fears of Matthias, at last, reconciled them; but the Bohemians revolted, and threw the imperial commissaries out of a window at Prague. This gave rise to a ruinous war, which lasted thirty years. Matthias thought to have exterminated both parties; but they formed a confederacy, called the *Evangelic League*, which was counterbalanced by a *Catholic League*.

Matthias dying in 1618, was succeeded by his cousin Ferdinand II. but the Bohemians offered their crown to Frederic the elector Palatine, the most powerful protestant prince in Germany, and son-in-law to his Britannic majesty, James I. That prince was incautious enough to accept of the crown; but he lost it, being entirely defeated by the duke of Bavaria and the imperial generals, at the battle of Prague; and he was also deprived of his own electorate, the best part of which was given to the duke of Bavaria. The protestant princes of Germany, however, had among them at this time many able commanders, who were at the head of armies, and continued the war with great firmness and intrepidity; among them were the margrave of Baden Dourlach; Christian, duke of Brunswick, and count Mansfield; the last was one of the best generals of the age. Christian IV. king of Denmark, declared for them; and Richelieu, the French minister, was not fond of seeing the house of Austria aggrandised. The emperor, on the other hand, had excellent generals; and Christian having put himself at the head of the evangelic league, was defeated by Tilly, an imperialist, of great reputation in war. Ferdinand so grossly abused the advantages obtained over the protestants, that they formed a fresh confederacy at Leiptic, of which the celebrated Gustavus Adolphus, king of Sweden, was the head. His amazing victories and progress have already been described, till he was killed at the battle of Lutzen, in 1632. But the protestant cause did not die with him. He had brought up a set of heroes, such as the duke of Saxe Weimar, Torstenson, Banier, and others, who shook the Austrian power, till, under the mediation of Sweden, a general peace was concluded at Munster, in the year 1648; which forms the basis of the present political system of Europe.

Ferdinand II. died in 1637, and was succeeded by his son Ferdinand III. who died in 1657, and was succeeded by the emperor Leopold, a severe, unamiable, and unfortunate prince. He had two great powers to contend with; France on the one side, and the Turks on the other; and was a loser in his war with both. France took from him Alsace, and many other frontier places of the empire; and the Turks would have taken Vienna, had not the siege been raised by John Sobieski, king of Poland. Prince Eugene, of Savoy, was a young adventurer in arms about the year 1697; and being one of the imperial generals, gave the Turks the first checks they received in Hungary; and by the peace of Carlowitz, in 1699, Transylvania was ceded to the emperor. The empire, however, could not have withstood the power of France, had not the prince of Orange, afterwards king William III. of England, laid the foundation of the grand confederacy against the French power, the consequences of which have been already described. The Hungarians, secretly encouraged by the French, and exasperated by the unfeeling tyranny of Leopold, were still in arms, under the protection of the Porte, when that prince died in 1705.

He was succeeded by his son Joseph, who put the electors of Cologne and Bavaria to the ban of the empire; but being very ill served by prince Lewis of Baden, the general of the empire, the French partly recovered their affairs, notwithstanding their repeated defeats. The duke of Marlborough, though he obtained very splendid victories, had not all the success he expected or deserved. Joseph himself was suspected of a design to subvert the Germanic liberties; and it was plain by his

conduct, that he expected England should take the principal part in the war, which was chiefly carried on for his benefit. The English were disgusted at his slowness and selfishness; but he died in 1711, before he had reduced the Hungarians; and leaving no male issue, he was succeeded in the empire by his brother Charles VI. whom the allies were endeavouring to place on the throne of Spain, in opposition to Philip duke of Anjou, grandson to Lewis XIV.

When the peace of Utrecht took place in 1713, Charles at first made a shew as if he would continue the war; but found himself unable, now that he was forsaken by the English. He therefore was obliged to conclude a peace with France, at Baden, in 1714, that he might attend the progress of the Turks in Hungary, where they received a total defeat from prince Eugene, at the battle of Peterwaradin. They received another of equal importance from the same general in 1717, before Belgrade, which fell into the hands of the Imperialists: and next year the peace of Passarowitz, between them and the Turks, was concluded. Charles employed every minute of his leisure in making arrangements for increasing and preserving his hereditary dominions in Italy and the Mediterranean. Happily for him, the crown of Britain devolved to the house of Hanover; an event which gave him a very decisive weight in Europe, by the connections of George I. and II. with the empire. Charles was sensible of this, and carried matters with so high a hand, that, about the years 1724 and 1725, a breach ensued between him and George I. and so uneasy was the system of affairs all over Europe at that time, that the capital powers often changed their old alliances, and concluded new ones contradictory to their interest. Without entering into particulars, it is sufficient to observe, that the safety of Hanover, and its aggrandisement, was the main object of the British court; as that of the emperor was the establishment of the pragmatic sanction, in favour of his daughter, the late empress-queen, he having no male issue. Mutual concessions upon those great points restored a good understanding between George II. and the emperor Charles; and the elector of Saxony, allured by the prospect of gaining the throne of Poland, relinquished the great claims he had upon the Austrian succession.

The emperor, after this, had very bad success in a war he entered into with the Turks, which he had undertaken chiefly to indemnify himself for the great sacrifices he had made in Italy to the princes of the house of Bourbon. Prince Eugene was then dead, and he had no general to supply his place. The system of France under cardinal Fleury happened at that time to be pacific, and she obtained for him, from the Turks, a better peace than he had reason to expect. Charles, to keep the German and other European powers easy, had, before his death, given his eldest daughter, the late empress-queen, in marriage to the duke of Lorraine, a prince who could bring no accession of power to the Austrian family. Charles died in 1740.

He was no sooner in the grave, than all he had so long laboured for must have been overthrown, had it not been for the firmness of George II. The pragmatic sanction was attacked on all hands. The young king of Prussia, with a powerful army, entered and conquered Silesia. The king of Spain and the elector of Bavaria set up claims directly incompatible with the pragmatic sanction, and in this they were joined by France; though all those powers had solemnly guaranteed it. The imperial throne, after a considerable vacancy, was filled up by the elector of Bavaria, who took the title of Charles VII. in January 1742. The French poured their armies into Bohemia, where they took Prague; and the queen of Hungary, to take off the weight of Prussia, was forced to cede to that prince the most valuable part of the duchy of Silesia by a formal treaty.

Her youth, her beauty, and sufferings, and the noble fortitude with which she bore them, touched the hearts of the Hungarians, into whose arms she threw herself

and

and her little son; and though they had been always remarkable for their disaffection to the house of Austria, they declared unanimously in her favour. Her generals drove the French out of Bohemia; and George II. at the head of an English and Hanoverian army, gained the battle of Dettingen, in 1743. Charles VII. was at this time miserable on the imperial throne, and driven out of his electoral dominions (as had been his ancestor in queen Anne's reign, for siding with France), and would have given the queen of Hungary almost her own terms; but she haughtily and impolitely rejected all accommodation, though advised to it by his Britannic majesty, her best, and indeed only friend. This obstinacy gave a colour for the king of Prussia to invade Bohemia, under pretence of supporting the imperial dignity: but though he took Prague, and subdued the greater part of the kingdom, he was not supported by the French; upon which he abandoned Bohemia, and retired to Silesia. This event confirmed the obstinacy of the queen of Hungary, who came to an accommodation with the emperor, that the might recover Silesia. Soon after, his imperial majesty, in the beginning of the year 1745, died; and the duke of Lorraine, then grand duke of Tuscany, consort to her Hungarian majesty, after surmounting some difficulties, was chosen emperor, by the title of Francis I.

The bad success of the allies against the French and Bavarians in the Low Countries, and the loss of the battle of Fontenoy, retarded the operations of the empress-queen against Frederick, king of Prussia. The latter beat the emperor's brother, prince Charles of Lorraine, who had before driven the Prussians out of Bohemia; and the conduct of the empress-queen was such, that his Britannic majesty thought proper to guarantee to him the possession of Silesia, as ceded by treaty. Soon after, Frederick pretended that he had discovered a secret convention between the empress-queen, the empress of Russia, and the king of Poland, as elector of Saxony, for stripping him of his dominions. Upon this he suddenly attacked the king of Poland in Saxony, defeated his troops, and took possession of Dresden; which he held till a treaty was made under the mediation of his Britannic majesty, by which the king of Prussia acknowledged the duke of Lorraine, now become grand- duke of Tuscany, for emperor. The war continued in the Low Countries, not only to the disadvantage, but to the discredit of the Austrians and Dutch, till it was finished by the treaty of Aix-la-Chapelle, in April 1748. By that treaty, Silesia was once more guaranteed to the king of Prussia. It was not long before that monarch's jealousies were renewed and verified; and the empress of Russia's views falling in with those of the empress-queen and the king of Poland, who were unannaturally supported by France in their new schemes, a fresh war was kindled in the empire, in the year 1750. Frederick declared against the admission of the Russians into Germany, and George against that of the French. Upon these principles, all former differences between those monarchs were forgotten; and the British parliament agreed to pay an annual subsidy of 670,000*l.* to his Prussian majesty, during the continuance of the war, the flames of which were now re-kindled with more fury than ever.

Frederick once more broke into Saxony, defeated the Imperial general Brown at the battle of Lowolitz, forced the Saxons to lay down their arms, though almost impregnablely fortified at Pirna, and the elector of Saxony again fled to his regal dominions in Poland. After this, his Prussian majesty was put to the ban of the empire; and the French poured, by one quarter, their armies, as the Russians did theirs by another, into the empire. The conduct of Frederick on this occasion is scarcely to be paralleled in history. He broke once more into Bohemia with inconceivable rapidity, and defeated an army of 100,000 Austrians, under general Browa, who was killed, as the brave mathal Schwerin was on the side of the Prussians. He then besieged Prague, and plied it with a most tremendous artillery; but just as he

was

was beginning to imagine that his troops were invincible, they were defeated at Colin, by the Austrian general Daun, obliged to raise the siege, and to fall back upon Eitenaach. The operations of the war now multiplied every day. The Imperialists, under count Daun, were formed into excellent troops; but they were beaten at the battle of Lissa, and the Prussians took Breslau, and obtained many other great advantages. The Russians, after entering Germany, gave a new turn to the war; and the cautious, yet enterprising genius of count Daun, laid his Prussian majesty under infinite difficulties, notwithstanding his amazing victories. At first he defeated the Russians at Zorndorff; but an attack made upon his army, in the night-time, by count Daun, at Hockkirchen, had almost proved fatal to his affairs, though he retrieved them with exquisite dexterity. He was obliged, however, to sacrifice Saxony, for the safety of Silesia; and it has been observed, that few periods of history afford such room for reflection as this campaign did; six sieges were raised almost at the same time; that of Colberg, by the Russians; that of Leipzig, by the duke of Deux-Ponts, who commanded the army of the empire; that of Dresden, by Daun; and those of Neiss, Cosel, and Torgau, by the Austrians.

Many capital scenes which passed at the same time in Germany, between the French, who were driven out of Hanover, and the English, or their allies, must be passed over, on account of the brevity necessary to be observed in this compendium. The operations on both sides were of little importance to history, because nothing was done that was decisive, though extremely burdensome and bloody to Great Britain. Great was the ingratitude of the empress-queen to his Britannic majesty, and his allies, who were now daily threatened with the ban of the empire. The Russians had taken possession of all the kingdom of Prussia, and laid siege to Colberg, the only port of his Prussian majesty in the Baltic. Till then, he had entertained too mean an opinion of the Russians; but he soon found them by far the most formidable enemies he had, advancing under count Solतिकoff, in a body of 100,000 men, to Silesia. In this distress he acted with a courage and resolution that bordered upon despair; but was, at last, totally defeated by the Russians, with the loss of 20,000 of his best men, in a battle near Frankfort. He became now the tennis-ball of fortune. Succeeding defeats seemed to announce his ruin, and all avenues towards peace were shut up. He had lost, since the first of October 1756, the great marshal Keith, and forty brave generals, besides those who were wounded and made prisoners. At Landshut the imperial general Laudohn defeated his army under Fouquet, on which he had great dependence, and thereby opened to the Austrians a ready gate into Silesia. None but his Prussian majesty would have thought of continuing the war under such repeated losses; but every defeat he received seemed to give him fresh spirits. It is difficult to account for the inactivity of his enemies after his defeat near Frankfort, except by the jealousy which the Imperial generals entertained of their Russian allies. They had taken Berlin, and laid the inhabitants under pecuniary contribution; but towards the end of the campaign, Frederick defeated the Imperialists in the battle of Fergau, in which count Daun was wounded. But this victory cost him 10,000 of his best troops. New reinforcements which arrived every day from Russia, the taking of Colberg by the Russians, and of Schweidnitz by the Austrians, seemed almost to have completed his ruin, when his most formidable enemy, the empress of Russia, died, January 5, 1762; George II. had died on the 25th of October, 1760.

The deaths of those illustrious personages were followed by great consequences. The British ministry of George III. were solicitous to put an end to the war, and the new emperor of Russia recalled his armies. His Prussian majesty was, notwithstanding, so very much reduced by his losses, that the empress-queen, prob-

ably, would have completed his destruction, had it not been for the backwardness of the other German princes to annihilate the house of Brandenburg. At first the empress-queen rejected all terms proposed to her, and ordered 30,000 men to be added to her armies. The visible unwillingness of her generals to execute her orders, and the successes obtained by his Prussian majesty, at last prevailed upon her to agree to an armistice, which was soon followed by the treaty of Hubertsburg, February 15, 1763, which again secured to his Prussian majesty the possession of Silesia.

Upon the death of the emperor, her husband, in 1765, her son Joseph, who had been crowned king of the Romans in 1764, succeeded him in the empire. Soon after his accession, he discovered great ambition and activity. He joined, in the dismemberment of Poland, with Russia and Prussia. He paid a visit incognito, and with moderate attendants, to Rome and the principal courts of Italy; and had a personal interview with his Prussian majesty, though this did not prevent hostilities from commencing between Austria and Prussia, on account of the succession to the electorate of Bavaria. The Austrian claims on this occasion were ill founded, and the efforts to support them unsuccessful. The Emperor next made a fruitless demand on the Dutch for the free navigation of the Scheldt, contrary to the faith of treaties. He endeavoured, however, to promote the happiness of his subjects, granted a most liberal religious toleration, suppressed most of the religious orders of both sexes, as utterly useless and even pernicious to society; and in 1783, by an edict, he abolished the remains of servitude and villanage. He also abolished the use of torture in his hereditary dominions, and removed many of the grievances under which the peasants and common people laboured. He was a prince that mixed with his subjects with an ease and affability that are very uncommon in persons of his rank. He loved the conversation of ingenious men, and appeared solicitous to cultivate knowledge.

Notwithstanding this, he was far from fortunate. He pronounced his own satire in the epitaph which he wrote for himself— "Here lies Joseph II. unhappy in all his undertakings." Unhappy, because unsuccessful, and unsuccessful because his imagination out-ran his judgment. To render religion independent, science free, laws and legislation more perfect and vigorous, were great and laudable objects—but he failed in all. And the moment before his death, which happened at Vienna, on February, 20, 1790 in the 49th year of his age, in the 26th of his reign, as emperor of the Romans, and the tenth as king of Hungary and Bohemia, he endured every aggravation of misfortune: Brabant torn from him; Hungary bearing off in noisy triumph its crown from his palace, while he lay suffering the pangs of death; his family connection with Russia cut asunder, and the views of ambition closed by the death of the princess Elizabeth; his own death, too, pronounced inevitable to him before he could view the success of his arms at Belgrade, and the single success of his life; again, that success thrown into suspense, and rendered doubtful before his expiring eyes, by the terrible news of the danger and expected defeat of Coburg. Thus did he drink the cup of bitterness to the very dregs.

Peter-Leopold, grand duke of Tuscany, succeeded his brother Joseph II. and engaged the public praise by repeated instances of moderation, and solid principles. His former management of his Italian sovereignty, which was prudent and beneficent, shewed that he aspired to truer reputation than can be acquired by the mere splendours of royalty.—One of the bishops of Hungary having refused his licence to a catholic subject to marry a protestant woman, the emperor dismissed him from his see; but pardoned him afterwards upon concession, and desired the bishop to exhort his brethren to comply with the imperial ordinances, else no favour should be shewn.

The

The conference at Pillnitz, between the emperor, the king of Prussia, and the elector of Saxony, is the most memorable event since the peace with Turkey. A proportional diminution of the forces of Austria and Prussia, the exchange of the Netherlands for Bavaria, the secularization of many German bishopricks, are some of the articles mentioned. A more probable object was to establish an alliance between the above powers for mutual defence, and for the preservation of the peace of Germany. After much irresolution, Leopold seemed at length resolved on war, when he died of a pleuritic fever on the first of March 1792, after an illness of four days.

His son Francis was raised to the imperial throne in the middle of July following. The politics of the court of Vienna continued unchanged, and Francis seems even a more violent enemy to the French revolution than his father. The imperial cities, however, whose trade will much suffer, and the elector of Saxony, a friend of peace, wished to decline the contest. The extraordinary terms upon which the emperor is obliged to borrow money, announces the difficulties he labours under in endeavouring to accomplish his plan. Whoever brings silver or gold to the mint, receives an obligation on paper for the re-payment of it in specie, at the end of six years, with an interest of four and a half, and a premium of four per cent. per annum. Twenty thousand marks of silver, and some hundred marks of gold, have been already obtained in consequence of this offer.

The new partition of Poland has induced the emperor, in an official note, to express his surprize that the courts of Peterburgh and Berlin had appropriated to themselves a much greater portion of Poland than was agreed upon at the convention at Pillnitz; the emperor, however, professes, that he does not wish that this opening should give the least umbrage to those powers; but hopes that they will literally conform to the convention which took place between them on the subject of this partition.

The consumption of men and money, which the war with France has already caused, compels the Germanic body to make the greatest efforts to procure fresh supplies for the continuance of this contest, which is as novel in its kind, as its issue will be important. In February, 1794, the Austrian envoy at the diet of Ratisbon delivered a note on the part of the emperor, to demand the sense of the Germanic states, respecting the necessity of arming all the inhabitants of the frontiers of Germany, and the furnishing of a triple contingent on the part of the said states. In this note the emperor observes, that all Europe knows the manifold and just grounds which have compelled the Germanic empire, united under its supreme chief, to declare a general war, for the maintenance of the strictest covenants, and the most sacred treaties; for the preservation of all social order, from a wild, destructive, and most anarchic tyranny, falsely called freedom; for the defence of an acknowledged religion from pestilential atheism, &c. &c. The emperor farther observes, that the general requisition of the fighting men in France has effected such a superiority, and produced such a change in the mode of making war, that it seems in some manner to call for a similar measure, viz. the rising in a mass of the inhabitants of the frontiers of the Netherlands, and other places, in order to procure safety to the loyal subjects of the empire, against the ravages of the common enemy. But the affairs of this country being entirely interwoven with those of France, they have been detailed in the transactions of that people, under which they will appear with more connection.

FRANCIS-JOSEPH-CHARLES, emperor of Germany, and grand duke of Tuscany, was born February 3, 1768; and married, January 6, 1788, Elizabeth princess of Wirtemberg, who died 1795. He married, 2dly, September 17, 1790, Maria-Theresa of Naples, his cousin. On the death of his father, Peter-Leopold,

late emperor, March 1, 1792, he succeeded to the crown of Hungary and Bohemia, and, July 14, 1792, was elected emperor of Germany.

He had no issue by his first marriage. By the latter he has a daughter,

Maria Theresia, born December 12, 1791.

The late emperor, Peter-Leopold, had fifteen children, the eldest of whom is the present emperor; the others are,

Ferdinand-Joseph, born May 5, 1769; married, September 17, 1790, Maria Amelia of Naples.

Charles-Lewis, born September 3, 1771.

Alexander-Leopold-Joseph, born August 1, 1772.

Maximilian, born December 23, 1774, died May 9, 1778.

Joseph-Anthony, born May 9, 1776.

Anthony-Victor, born August 31, 1779.

A son, born January 20, 1782.

Regnier-Jerom, born September 30, 1783.

Theresa-Josepha-Charlotta-Jane, born January 14, 1767.

Maria, born January 14, 1767; married, October 18, 1787, Anthony, brother to the elector of Saxony.

Mary-Ann-Ferdinanda-Josepha, born April 21, 1770.

Mary-Clementina-Josepha, born April 24, 1777; married, September, 1790, Francis-Januaris, prince royal of Naples.

Maria-Josepha-Theresa, born October 15, 1780.

A princess, born October 22, 1784.

Maria Antonietta, born and died in 1786.

The late emperor has living two sisters, and one brother *unmarried*. Those *married* are,

Maria-Christiana-Josepha, born May 13, 1742; married, April 8, 1766, to prince Albert of Saxony.

Mary-Amelia-Josepha, born February 26, 1746; married to the reigning duke of Parma, June 27, 1769.

Mary-Caroline-Louisa, born August 13, 1752; married, April 7, 1768, to the king of the two Sicilies.

Ferdinand-Ch.-Antoine, born June 1, 1754; married to the princess Maria-Beatrice, of Modena, and has issue.

Maria-Antonietta, born November 2, 1755; married to Lewis XVI. the late unfortunate king of the French.

**ELECTORS.**] Three ecclesiastical electors, called Electoral Highnesses; and five secular ones, Most Serene Electoral Highnesses.

**ECCLESIASTICAL ELECTORS.]**

1. Frederick-Charles-Joseph, baron of Erthal, archbishop and elector of Mentz, born July 18, 1774.

2. Prince Clement of Saxony, (son of Augustus III. king of Poland,) born September 28, 1739. Archbishop and elector of Treves, February 10, 1768; also bishop of Freisingen and Augsburgh, by dispensation from the pope.

3. Maximilian-Francis, brother to the late emperor, grand master of the Teutonic order, archbishop and elector of Cologne, and bishop of Munster, born December 8, 1756.

**SECULAR ELECTORS.]**

1. Francis-Joseph-Charles, emperor of Germany, king of Hungary, Bohemia, &c. born February 3, 1768.

2. Frederick-Augustus IV. elector and duke of Saxony, born December 23, 1750; married, January 17, 1769, to the princess Amelia-Augusta, of Deux Ponts.

3. Charles-Frederick, elector and marquis of Brandenburg.

4. The prince of Deux Ponts, elector palatine, &c.
  5. George III. king of Great Britain, elector of Hanover, &c.
- SAXE-GOTHA.] Ernest-Lewis, duke of, nephew to the late princess dowager of Wales, born January 30, 1745; married, May 21, 1769, to Maria-Charlotte of Saxe-Meningen, by whom he has,
1. Ernest, born February 27, 1770.
  2. Emilius-Leopold, born November 24, 1772.
- His brother,
- Augustus, born August 14, 1747.

MECKLENBURGH.] The house of Mecklenburgh is divided into two branches, viz.

I. Mecklenburgh Schwerin. Frederick, reigning duke, born November 9, 1717; married, in 1746, Louisa-Frederica, daughter of Frederick-Lewis, hereditary prince of Wortemburg Stutgard, born February 3, 1722; they have no issue. Issue of the late prince Lewis, by the princess Charlotte-Sophia, of Saxe-Coburgh-Saal-field.

Frederick-Francis, born December 10, 1756, sister to the reigning duke.

Princess Ulrica-Sophia, born July 1, 1723, governess of the convent of Rhune.

II. Mecklenburgh Strelitz.—Adolphus-Frederick, reigning duke, (knight of the garter,) born May 5, 1738. His brothers and sisters are,

1. Charles-Lewis-Frederick, a lieutenant-general in the Hanoverian service, born October 10, 1741; married, September 18, 1768, to Frederica-Charlotta-Louisa, of Hesse-Darmstadt, by whom he had issue,
  1. Carolina-Georgina-Louisa-Frederica, born November 17, 1769.
  2. Theresia-Matilda-Amelia, born April 5, 1778.
2. Ernest-Gotlob-Albert, major-general in the Hanoverian service, and governor of Zell, born August 7, 1742.
3. Christiana-Sophia-Albertina, born December 6, 1735.
4. Charlotte, queen consort of Great Britain, born May 19, 1744; married September 8, 1761; crowned September 22, 1761.

## THE KINGDOM OF PRUSSIA, FORMERLY DUCAL PRUSSIA.

LAT. 52°-40—to 55°-50 N.  
LONG. 16°-00—to 23°-23 E.

Containing 22,244 SQUARE MILES, with 67 INHABITANTS in each—The whole DOMINIONS 60,000 SQUARE MILES, with 104 INHABITANTS to each.

SITUATION, BOUNDARIES, } THIS country is bounded to the North by part  
AND EXTENT. } of Samogitia; to the south, by Poland  
Proper and Masovia; to the east, by part of Lithuania; and to the West, by  
Polish Prussia and the Baltic. Its greatest length is about 160 miles, and breadth  
about 112.

NAME, AIR, SOIL, PRODUCE, } The name of Prussia is probably derived from  
AND RIVERS. } the Borutli, its ancient inhabitants. The air is  
wholesome, and the soil fruitful in corn, and abounding with pit-coal and fuel.  
Its animal productions are horses, sheep, deer and game, wild boars and foxes.

Its rivers and lakes are well stored with fishes; and amber, which is thought to be formed of an oil conglutated with vitriol, is found on its coast towards the Baltic. The woods furnish the inhabitants with wax, honey, and pitch, besides quantities of pot-ashes. The rivers here sometimes do damage by inundations; the principal are the Vistula, the Pregel, the Memel or Mammel, the Passarge, and the Elbe.

POPULATION, INHABITANTS, MANNERS, } As Prussia, since the beginning  
CUSTOMS, AND DIVERSIONS. } of the present century, has become  
a most respectable power upon the continent of Europe, it may be proper to  
deviate from the usual plan, and to bring before the eye the whole of his Prussian  
majesty's territories, which lie scattered in other divisions of Germany, Poland,  
Switzerland, and the northern kingdoms, with their names; all which will be  
found in the following table.

Protestants.	Countries' Names.	Square Miles.	Pop.	Pop.	Chief Cities.
Poland.	Ducal Prussia	9,950	260	112	Königsberg

Total—		61,281			

Besides a great part of Silesia, which the late king of Prussia, under various pretences, hath wrested from Austria; availing himself also of the internal troubles in Poland, he, by virtue of no other right than that which a powerful army confers on every tyrant, seized upon Thorn, with the countries on the Vistula, the Neiter, and other territories contiguous to his own dominions, close to the walls of Dantzic. These acquisitions may be traced in the map.

I shall here confine myself to Prussia as a kingdom, because his Prussian majesty's other dominions fall under the description of the countries where they lie.

The inhabitants of this kingdom alone were, by Dr. Busching, computed to amount to 635,998 persons capable of bearing arms. Since the year 1719, it is computed that about 34,000 colonists have removed thither from France, Switzerland, and Germany; of which number 17,000 were Saltzburghers. These emigrants have built 400 small villages, 11 towns, 86 seats, and 50 new churches;

and have founded 1000 village schools, chiefly in that part of the country named Little Lithuania.

The manners of the inhabitants differ but little from those of the rest of Germany. The same may be said of their customs and diversions.

RELIGION, SCHOOLS, } The religion of Prussia is very tolerant. The estab-  
AND ACADEMIES. } lished religions are those of the Lutherans and Cal-  
vinists, but chiefly the former; but papists, antipædobaptists, and almost all other  
sects, are here tolerated. The country, as well as the towns, abounds in schools.  
An university was founded at Königsberg in 1544.

CITIES.] The kingdom of Prussia is divided into the German and Lithuanian departments; the former of which contain 280 parishes, and the latter 105.

Königsberg, the capital of the whole kingdom, seated on the river Pregel, over which it has seven bridges, is about 84 miles from Dantzic. According to Dr. Busching, this city is seven miles in circumference, and contains 3,800 houses, and about 60,000 inhabitants. This computation is perhaps a little exaggerated, because it supposes, at an average, near sixteen persons in every house. Königsberg has ever made a considerable figure in commerce and shipping, its river being navigable for ships; of which 493 foreign ones arrived here in the year 1752, besides 298 coasters; and 373 floats of timber were, in the compass of that year, brought down the Pregel. This city, besides its college or university, which contains 38 professors, boasts of magnificent palaces, a town-house, and exchange; not to mention gardens and other embellishments. It has a good harbour, and citadel, which is called Fredericburg, and is a regular square.

ANTIQUITIES AND CURIOSITIES, } See Germany.  
NATURAL AND ARTIFICIAL. }

COMMERCE AND MANUFACTURES.] The Prussian manufactures are not inconsiderable: they consist of glass, iron-work, paper, gunpowder, copper, and brass mills; manufactures of cloth, camblet, linen, silk, stockings, and other articles. The inhabitants export variety of naval stores, amber, linseed and hempsed, oatmeal, fish, mead, tallow, and caviar; and it is said that 500 ships are loaded every year with those commodities, chiefly from Königsberg.

CONSTITUTION AND GOVERNMENT.] His Prussian majesty is absolute through all his dominions, and he avails himself to the full of his power. The government of this kingdom is by a regency of four chancellors of state, viz. 1. The great master; 2. The great burgrave; 3. The great chancellor; and, 4. The great marshal. There are also some other councils, and 37 bailiwicks. The states consist, 1. Of counsellors of state; 2. Of deputies from the nobility; and, 3. From the commons. Besides these institutions, his late majesty erected a board for commerce and navigation.

REVENUES.] His Prussian majesty, by means of the happy situation of his country, its inland navigation, and the skilful regulations of his predecessor, derives an amazing revenue from this country, which, about a century and a half ago, was the seat of boors and barbarism. It is said, that amber alone brings him in 26,000 dollars annually. His other revenues arise from his demesnes, his duties of customs and tolls, and the subsidies yearly granted by the several states; but the exact sum is not known: though we may conclude that it is very considerable, from the immense charges of the late war. The revenue, which the king draws from Silesia, amounts annually to 5,854,632 rix-dollars, and after deducting the expences of the military establishment, and all others, there is a net revenue of 1,554,632 rix-dollars. The revenues were much encreased by the conquest of Polish Prussia: exclusive of its fertility, commerce, and population, its local situation is of vast importance, as it lies between his German dominions and his kingdom of Prussia.

By

By this acquisition, his dominions are compact, and his troops may march from Berlin to Koningsberg without interruption.

**MILITARY STRENGTH.]** The Prussian army, even in time of peace, consists of about 180,000 of the best disciplined troops in the world; and during the last war, that force was augmented to 300,000 men. But this great military force, however it may aggrandize the power and importance of the king, is utterly inconsistent with the interests of the people. The army is chiefly composed of provincial regiments; the whole Prussian dominions being divided into circles or cantons; in each of which, one or more regiments, in proportion to the size and populousness of the division, have been originally raised, and from it the recruits continue to be taken; and each particular regiment is always quartered, in the time of peace, near the canton from which its recruits are drawn. Whatever number of sons a peasant may have, they are all liable to be taken into the service except one, who is left to assist in the management of the farm. The rest wear badges from their childhood, to mark that they are obliged to enter into the service whenever they are called upon. But the maintaining so large an army occasioned such a drain from population, and such a withdrawing of strength from the labours of the earth, that the late king endeavoured to save his own peasantry, by raising as many recruits as he could from other countries. These foreign recruits remain continually with the regiments in which they are placed; while the native Prussians have every year some months of furlough, during which they return to labour in their native villages.

**ARMS, AND ORDERS OF KNIGHTHOOD.]** The royal arms of Prussia are argent, an eagle displayed, sable, crowned, or, for Prussia. Azure, the imperial sceptre, or, for Courland. Argent, an eagle displayed, gules, with semicircular wreaths, for the marquise of Brandenburg. To these are added the respective arms of the several provinces subject to the Prussian crown.

There are four orders of knighthood; the order of "*Concord*," instituted by Christian-Ernest, margrave of Brandenburg, in the year 1660, to distinguish his exertions for restoring peace to many of the princes of Europe. The badge is a gold cross of eight points, enamelled white; in the centre a medal bearing two olive branches passing saltier-wise through two crowns, and circumscribed with the word "*Concordans*." The cross is surmounted with an electoral crown, and is worn pendent to an orange ribband. Frederick III. elector of Brandenburg, and afterwards king of Prussia, instituted, in 1685, the order of "*Generosity*." The knights wear a cross of eight points enamelled blue, having in the centre this motto, "*La Generosité*," pendent to a blue ribband.

The same prince instituted the order of the "*Black Eagle*" on the day of his coronation at Koningsberg, in the year 1700; the sovereign is always grand-master, and the number of knights, exclusive of the royal family, is limited to thirty, who must be admitted into the order of "*Generosity*," previous to their receiving this, unless they be sovereign princes. The ensign of the order is a gold cross, of eight points, enamelled blue, having at each angle a spread eagle, enamelled black, being the arms of Prussia, and charged in the centre with a cypher of the letters *F. R.* Each knight commonly wears this pendent to a broad orange ribband (out of respect to the Orange family) worn sash-wise over the left shoulder, and a silver star embroidered on the left side of the coat, whereon is an escutcheon, containing a spread eagle, holding in one claw a chaplet of laurel, and in the other a thunder-bolt, with this motto in gold letters round, "*Suum cuique*." On days of ceremony, the knights wear the badge pendent to a collar, composed of round pieces of gold, each enamelled with four cyphers of the letters *F. R.* in the centre of the piece is set

By

set a diamond, and over each cypher a regal crown, internixed alternately with eagles displayed, enamelled black, and holding in their claws thunderbolts of gold. The knights' caps are of black velvet with white plumes.

The order of "*Merit*" was instituted by the late king in the year 1740, to reward the merit of persons either in arms or arts, without distinction of birth, religion, or country; the king is sovereign, and the number of knights unlimited. The ensign is a cross of eight points, enamelled blue, and edged with gold, having in the centre a cypher of the letters *F. R.* and in each angle an eagle displayed, black, on the two upper points the regal crown of Prussia; on the reverse, the motto, "*Pour le Merite.*" The badge is worn round the neck, pendent to a black ribbon, edged with silver.

**HISTORY.]** The ancient history of Prussia, like that of other kingdoms, is lost in the clouds of romance. The early inhabitants, a brave and warlike people descended from the Sclavonians, refused to submit to the neighbouring princes, who, on pretence of converting them to Christianity, wanted to subject them to slavery. They made a noble stand against the kings of Poland; one of whom, Boleslaus IV. was by them defeated and killed in 1163. They continued independent, and pagans, till the time of the crusades, when the German knights of the Teutonic order, about the year 1227, undertook their conversion by the edge of the sword, on condition of having, as a reward, the property of the country when conquered. A long series of wars followed, in which the ancient inhabitants of Prussia were almost extirpated by the religious knights, who, in the thirteenth century, after committing the most incredible barbarities, peopled the country with Germans. After a vast waste of blood, in 1466, a peace was concluded between the knights of the Teutonic order, and Casimir IV. king of Poland, who had undertaken the cause of the oppressed people; by which it was agreed, that the part now called Polish Prussia should continue a free province, under the king's protection; and that the knights and the grand-master should possess the other part, acknowledging themselves vassals of Poland. This gave rise to fresh wars, in which the knights endeavoured, but unsuccessfully, to throw off their vassalage. In 1525, Albert, margrave of Brandenburg, and the last grand-master of the Teutonic order, laid aside the habit of his order, embraced Lutheranism, and concluded a peace at Cracow, by which the margrave was acknowledged duke of the east part of Prussia (formerly called, for that reason, Ducal Prussia), but to be held as a fief of Poland, and to descend to his male heirs; and upon failure of his male issue, to his brothers and their male heirs. Thus ended the sovereignty of the Teutonic order, after it had subsisted near 300 years. In 1657, the elector Frederick-William of Brandenburg, deservedly called the Great, had Ducal Prussia confirmed to him; and by the conventions of Wela and Bromberg, it was freed, by John Casimir, king of Poland, from vassalage.

As the protestant religion had been introduced into this country by the margrave Albert, and the electors of Brandenburg were now of that persuasion, the protestant interest favoured them so much, that Frederick, the son of Frederick-William the Great, was raised to the dignity of king of Prussia, in a solemn assembly of the states, proclaimed, January 18, 1701, and soon after acknowledged as such by all the powers of Christendom. His grandson, the late king of Prussia, in the memoirs of his family, is silent concerning this first king's talents for government, but expatiates on those of his own father, Frederick-William, who succeeded in 1713. The latter certainly was a prince of strong natural parts, and greatly increased the revenues of his country, but too often at the expence of humanity. At his death, which happened in 1740, he is said to have left seven

millions sterling in his treasury, which enabled his son Frederick III. by his wonderful victories, and the more wonderful dexterity by which he repaired his defeats, to become the admiration of the present age. Frederick improved the arts of peace, as well as of war, and distinguished himself as a poet, philosopher, and legislator. The principal transactions of his reign have already been related in our account of the history of Germany. In the year 1783 he published a rescript, signifying his pleasure that no kneeling in future should be practised in honour of his person, assigning for his reason, that this act of humiliation was not due but to the Divinity: and vast sums were expended by him in draining marshes, establishing factories, settling colonies, relieving distress, and in other purposes of philanthropy and policy.

The celebrated Germanic union, for the preservation of the constitution, concluded in the last year of the life of Frederick III. is said to be in part the work of that great man. He conceived the first idea of it in the year 1784, and it was publicly concluded in July 1785. This patriotic union had no other end but to secure and preserve the ancient and venerable constitution of the empire.

It is self-evident that the happy state of the Prussian monarchy will depend always on the genius and activity of its sovereigns: a Frederick III. as styled by foreign writers\*, was absolutely necessary in order to give to his new kingdom a degree of power, which puts it on a level with the first monarchies of Europe; to assure it a existence, which will be so long permanent as the maxims of good government are observed; and to make it perform the brilliant, although dangerous and difficult part, which it is obliged to sustain on account of the local position of the monarchy, for its own proper preservation, and that of the balance of Germany and of Europe. Frederick III. king of Prussia, and elector of Brandenburg, after a reign of 46 years, died August 17, 1786, aged 75, and was succeeded by his nephew the present king, who has made many wise and salutary regulations for his subjects, and hath established a court of honour to prevent the diabolical practice of duelling in his dominions.

The exertions of Prussia against France have been already related in our account of that nation. If we credit the French accounts, the alliance between Prussia and Austria is condemned by all the great Prussian statesmen; has produced a political schism in the court of Berlin; and a general discontent prevails in Prussia. The war exhausts the treasures laid up by the great Frederick; and the recruiting of the army has become so difficult, that the ministers cannot, without endangering the interior tranquillity, send the king an army of 30,000 men, which he ordered. In consequence of this, together with the affairs of Poland requiring immediate attention, the Prussian monarch has been obliged to withdraw from the great cause of the allies. Jealousies certainly prevail between the courts of Berlin and Vienna.

The conduct of Prussia with regard to Poland we can hardly explain; and it would apparently have been more for the interest of the former to have erected the latter as a formidable independent barrier against Russia and Austria, than to have exposed itself to the enormous and increased power of Russia. Prussia is no longer guided by the councils of the great Frederick; and should that kingdom continue to pursue an impolitic system of conduct, the inferiority of its extent and resources will cause it to vanish as suddenly as it arose.

Frederick IV. king of Prussia, and elector of Brandenburg, born September 25, 1744; married, July 14, 1765, to the princess Elizabeth-Christiana Ulrica, of Brun-

\* His late majesty was the third elector of Brandenburg, but only the second king of Prussia of the name of Frederick, or, as he wrote it, Federick;

the first name signifying rich by war, the second rich in peace. In his own memoirs, he styles himself Federick II.

wic Wolfenbuttle. dly on July 14, 1769 to Frederica-Louisa, of Hesse Darmstadt; succeeded his uncle Frederick III. August 17, 1786.

Issue by the first marriage.

Frederica- Charlotta-Ulrica-Catharine, born May 7, 1767; married, September 29, 1791, to the duke of York, the second son of his Britannic majesty.

Issue by the latter marriage.

1. Frederick-William, born August 3, 1770.
2. Frederick-Lewis-Charles, born August 3, 1773.
3. Frederica-Sophia-Wilhelmina, born November 18, 1774; married, October 1, 1791, to the hereditary prince of Orange.
4. Frederick-Christian-Augustus, born May 1, 1780.
5. Another prince, born December 20, 1781.
6. Another prince, born July, 1783.

Queen dowager, Elizabeth-Christiana of Brunswic Wolfenbuttle, born November 8, 1715.

Brother and Sister to the king.

1. Frederick-Charles-Henry, born December 30, 1747.
2. Frederica-Sophia-Wilhelmina, born in 1751; and married in 1767, to the present prince of Orange.

**SOIL AND AIR.]** The air of Bohemia Proper is not thought so wholesome as that of the rest of Germany, though its soil and produce are pretty much the same.

**MOUNTAINS AND RIVERS.]** Bohemia, though almost surrounded with mountains, contains none of note or distinction; its woods are many, and the chief rivers are the Elbe, Muldaw, and Eger.

**METALS AND MINERALS.]** This kingdom contains rich mines of silver, quick-silver, copper, iron, lead, sulphur, and saltpetre. Its chief manufactures are linen, copper, iron, and glass.

**POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.]** About 150 years ago, Bohemia was computed to contain near 3,000,000 of inhabitants; but they are thought at present not to exceed 2,100,000. The Bohemians, in their persons, habits, and manners, resemble the Germans. There is, among them, no middle state of people; for every lord is a sovereign, and every tenant a slave. But the emperor Joseph II. generously discharged the Bohemian peasants, from the state of villanage in which they had been so long and so unjustly retained; and it will be happy if his example should be followed by the Bohemian nobility. Although the Bohemians, at present, are not remarkable either for arts or arms, yet they formerly distinguished themselves as intrepid assertors of civil and religious liberty; witness the early introduction of the reformed religion into their country, when it was scarcely known in any other; the many glorious defeats they gave to the Austrian power, and their generous struggles for independency. Their virtues may be considered as the causes of their decay; as no means were left unemployed by their despotic masters for breaking their spirit; a measure facilitated by their own intestine dissensions.

**RELIGION.]** Popery is the established religion of Bohemia: but the protestants, who are numerous, are now tolerated in the free exercise of their religion; and the Moravians have propagated their visionary tenets in several parts of the globe; some of whom a few years ago made profelytes in Great Britain; they have still a meeting-house in London, and obtained an act of parliament for a settlement in the plantations.

**ARCHBISHOPRICK AND BISHOPRICKS.]** Prague is the only Bohemian archbishoprick. The bishopricks are Koninggratz, Breslaw, and Olmutz.

**LANGUAGE.]** The proper language of the Bohemians is a dialect of the Slavonian, but they generally speak German.

**UNIVERSITY.]** The only university in Bohemia is that of Prague.

**CITIES AND TOWNS.]** Prague, the capital of Bohemia, is one of the finest cities in Europe, and famous for its noble bridge. Its circumference is so large, that the grand Prussian army, in its last siege, could never completely invest it. The inhabitants scarcely exceed 70,000 Christians, and about 13,000 Jews. It contains ninety-two churches and chapels, and forty cloisters. It is a place of little industry, and therefore the middling inhabitants are not wealthy; but the Jews carry on a large commerce in jewels. Bohemia contains many other towns, some of which are fortified, but they are neither remarkable for strength nor manufactures. Olmutz is the capital of Moravia: it is well fortified, and has manufactures

tures of woollen, iron, glass, paper, and gunpowder. Bresslaw, the capital of Silesia, hath been already described among the cities of Germany.

COMMERCE AND MANUFACTURES.] See Germany.

CONSTITUTION AND GOVERNMENT.] The forms, and only the forms, of the old Bohemian constitution still subsist; but the government, under the house of Austria, is absolute. Their states are composed of the clergy, nobility, gentry, and representatives of towns. Their sovereigns, of late, have not been fond of provoking them by ill usage, as they have a general aversion to the Austrians. This kingdom is frequently described as part of Germany, but with little reason; for it is not in any of the nine circles, nor does it contribute any thing towards the forces or revenues of the empire, nor is it subject to any of its laws. What gives some colour to this mistake is, that the king of Bohemia is the first secular elector of the empire, and their kings have been elected emperors of Germany for many years.

REVENUES.] The revenues of Bohemia are whatever the sovereign is pleased to exact from the states of the kingdom, when they are annually assembled at Prague. They may perhaps amount to 500,000*l.* a-year.

ARMS.] The arms of Bohemia are, argent, a lion gules, the tail moved, and passed in saltier, crowned, langued, and armed, or.

HISTORY.] The Bohemian nobility used to elect their own princes, though the emperors of Germany sometimes imposed a king upon them, and at length usurped that throne themselves. In the year 1438, Albert II. of Austria received three crowns, Hungary, the Empire, and Bohemia.

In 1414, John Hufs and Jerome of Prague, two of the first reformers, and Bohemians, were burnt at the council of Constance, though the emperor of Germany had promised them his protection. This occasioned an insurrection in Bohemia: the people of Prague threw the emperor's officers out of the windows of the council-chamber; and the famous Zisca, assembling an army of 40,000 Bohemians, defeated the emperor's forces in several engagements, and drove the Imperialists out of the kingdom. The divisions of the Hussites among themselves enabled the emperors to keep possession of Bohemia, though an attempt was made to throw off the Imperial yoke, by electing, in the year 1618, a protestant king in the person of the prince Palatine, son-in-law to James I. of England. The misfortunes of this prince are well known. He was driven from Bohemia by the emperor's generals, and, being stripped of his other dominions, was forced to depend on the court of England for subsistence. Since the war of thirty years, which desolated the whole empire, the Bohemians have remained subject to the house of Austria.

SITUATION AND EXTENT.

	Miles.	Degrees.	Sq. Miles.
Length	300	between { 16-35 and 26 East lon. } { 44-50 and 49-35 North lat. }	} 36,060.
Breadth	200		
Containing 87,575 SQUARE MILES, with 57 Inhabitants to each.			

**BOUNDARIES.]** THAT part of Hungary which belongs to the house of Austria (for it formerly included Transylvania, Slavonia, Croatia, Morlachia, Servia, Walachia, and other countries), is bounded by Poland, on the North; by Transylvania and Walachia, East; by Slavonia, South; and by Austria and Moravia, West.

The kingdom of Hungary is usually divided into the Upper and Lower Hungary.

UPPER HUNGARY, NORTH OF THE DANUBE. Chief Towns.	LOWER HUNGARY, SOUTH OF THE DANUBE. Chief Towns.
Prefburg, situate on the Danube, E. lon. 17-30. N. lat. 48-20. Newhaufel, N. W. Leopoldstadt, N. W. Chremnits, N. W. Schemnits, in the middle. Esperies, N. Cafchaw, N. Tokay, N. E. Zotmar, N. E. Unguar, N. E. Mongats, N. E. Waradin, Great, E. Segedin, S. E. Agria, in the middle. Pelt, on the Danube, opposite to Buda.	Buda, on the Danube, E. long. 19-20. N. lat. 47-40. Gran, on the Danube, above Buda.  Comorra, on the Danube, in the island of Schut. Raab, on the Danube, opposite to the island of Schut. Attenburg, W. opposite to the island of Schut. Weiffenburg, or Alba Regalis, situated E. of the lake called the Platten Sea. Kanifba, S. W. of the Platten Sea. Five-Churches, N. of the river Drave.

To which may be added Temeswar, which has been considered as distinct from Hungary, because it was formerly governed by an independent king; and was several times in possession of the Turks; but it was incorporated with the kingdom of Hungary in 1778. The province of Temeswar is 94 miles long, and 67 broad: it has been divided into four districts, Cfadat, Temeswar, Werschez, and Lugos. Temeswar, the principal town, is situated E. lon. 22-15. N. lat. 45-54.

**AIR, SOIL, AND PRODUCE.]** The air, and consequently the climate, of the southern parts of Hungary is found to be unhealthy, owing to its numerous lakes and marshes; but the northern parts being mountainous, the air is sweet and wholesome. No country in the world can boast a richer soil than that plain, which extends 300 miles from Prelburg to Belgrade, and produces corn, grass, excellent plants, tobacco, saffron, asparagus, melons, hops, pulse, millet, buckwheat, delicious wine, fruits of various kinds, peaches, mulberry-trees, chestnuts,

nuts, and wood: corn is in such plenty, that it sells for one-sixth part of its price in England.

**RIVERS.]** These are the Danube, Drave, Save, Teyssie, Merish, and the Temes.

**WATER.]** Hungary contains several lakes, particularly four among the Carpathian mountains of considerable extent, and abounding with fish. The Hungarian baths and mineral waters are esteemed the most sovereign of any in Europe; but their magnificent buildings, raised by the Turks when in possession of the country, particularly those of Buda, are suffered to go to decay.

**MOUNTAINS.]** The Carpathian mountains, which divide Hungary from Poland on the north, are the chief in Hungary, though many detached mountains are found in the country. Their tops are generally covered with wood, and on their sides grow the richest grapes in the world.

**METALS AND MINERALS.]** Hungary is remarkably well stocked with both. It abounds not only with gold and silver mines, but with plenty of excellent copper, vitriol, iron, orpiment, quicksilver, chrysolite, and terra sigillata. Before Hungary became the seat of destructive wars between the Turks and Christians, or fell under the power of the house of Austria, those mines were furnished with proper works and workmen, and produced vast revenues to the native princes. The Hungarian gold and silver employed mint-houses, not only in Hungary, but in Germany, and other parts of Europe; but all those mines are now greatly diminished in their value.

**VEGETABLE AND ANIMAL PRODUCTIONS.]** Hungary is remarkable for a fine breed of horses, generally mouse-coloured, and highly esteemed by military officers, so that great numbers of them are exported. There is a remarkable breed of large rams in the neighbourhood of Presburg. Its other vegetable and animal productions are in general the same with those of Germany, and the neighbouring countries. The Hungarian wines, particularly Tokay, are deemed the most precious in Europe.

**POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.]** It was late before the northern barbarians drove the Romans out of Hungary, and some of the descendants of their legionary forces are still to be distinguished in the inland parts. Before the Turks got possession of Constantinople, Hungary was one of the most flourishing kingdoms in Europe; and if the house of Austria should give proper encouragement to the inhabitants to repair their works, and clear their fens, it might become so again. Both Hungaries at present, exclusive of Transylvania and Croatia, are thought to contain about two millions and a half of inhabitants. The Hungarians have manners peculiar to themselves. They pique themselves on being descended from those heroes, who formed the bulwark of Christendom against the infidels. In their persons they are well made. Their fur caps, their close-bodied coats, girded by a sash, and their cloak or mantle, which is so contrived as to buckle under the arm, so that the right hand may be always at liberty, give them an air of military dignity. The men have their beards, but preserve their whiskers on their upper lips. Their usual arms are a broad sword, and a kind of pole-ax, besides their fire-arms. The ladies are reckoned handsomer than those of Austria, and their fable drefs with sleeves strait to their arms, and their stays fastened before with gold, pearl, or diamond little buttons, are well known to the French and English ladies. Both men and women, in what they call the mine-towns, wear fur and even sheep-skin dresses. The inns upon the roads are miserable hovels, and even those seldom to be met with. The hogs, which yield the chief animal food for their peasants, and their poultry, live in the same apartment with their owners. The gout and the fever, owing to the unwholesomeness of the air, are the predominant diseases in Hungary. The natives in general are indolent, and leave trade and manufactures to the Greeks, and

and other strangers settled in their country, the flatness of which renders travelling commodious, either by land or water. The diversions of the inhabitants are of the warlike and athletic kind. They are in general a brave and magnanimous people. Their ancestors, even since the beginning of the present century, were so jealous of their liberties, that, rather than be tyrannised over by the house of Austria, they often put themselves under the protection of the Ottoman court; but their fidelity to the late empress-queen, notwithstanding the provocation they received from her house, will be always remembered to their honour.

The inhabitants of Temeswar are computed at about 450,000. There are in this country many faraons, or gypsies, supposed to be real descendants of the ancient Egyptians, whom they are said to resemble in their features, in their propensity to melancholy, and in many of their manners and customs; and it is asserted, that the lascivious dance of Isis, the worship of onions, many famous Egyptian superstitions and specifics, and the Egyptian method of hatching eggs by means of dung, are still in use among the female gypsies in Temeswar.

**RELIGION.]** The established religion of the Hungarians is the Roman catholic, though the major part of the inhabitants are Protestants, or Greeks; and they now enjoy the full exercise of their religious liberties.

**ARCHBISHOPRICS AND BISHOPRICS.]** The archbishoprics are Presburg, Gran, and Colozza. The bishoprics are, Great Waradin, Agria, Vefprin, Raab, and Five-Churches.

**LANGUAGE.]** As the Hungarians are mixed with Germans, Slavonians, and Walachians, they have a variety of dialects, and one of them is said to approach near the Hebrew. The better and the middlemost rank speak German, and almost all, even of the common people, speak Latin, either pure or barbarous, so that the Latin may be said to be here still a living language.

**UNIVERSITIES.]** In the universities of Firman, Buda, Raab, and Caschaw, are professors of the several arts and sciences, who used generally to be Jesuits; so that the Lutherans and Calvinists, who are more numerous than the Roman Catholics in Hungary, frequently send their youth to study in the Protestant universities of Germany.

**ANTIQUITIES AND CURIOSITIES.]** The artificial curiosities of this country **NATURAL AND ARTIFICIAL.** consist of its bridges, baths, and mines. The bridge of Esseck built over the Danube and Drave is, properly speaking, a continuation of bridges, five miles in length, fortified with towers at certain distances. It was an important pass during the wars between the Turks and Hungarians. A bridge of boats runs over the Danube, half a mile long, between Buda and Pest; and about twenty Hungarian miles distant from Belgrade, are the remains of a bridge, erected by the Romans, judged to be the most magnificent of any in the world.

One of the most remarkable natural curiosities of Hungary is a cavern in a mountain near Szelitze; the aperture of this cavern, which fronts the south, is eighteen fathoms high, and eight broad; its subterraneous passages consist entirely of solid rock, stretching away farther south than has been yet discovered; as far as it is possible to go, the height is found to be fifty fathoms, and the breadth twenty-six. Many wonderful particulars are related of this cavern. Astonishing rocks are common in Hungary, and some of its churches are of admirable architecture.

**CITIES, TOWNS, FORTS, AND OTHER.]** These are greatly decayed from their **EDIFICES, PUBLIC AND PRIVATE.** ancient magnificence; but many of the fortifications are still very strong, and kept in good order. Presburg is fortified. In it the Hungarian regalia were kept, till lately removed to Vienna. The crown was sent, in the year 1000, by pope Silverster II. to Stephen king of Hungary, and was

was made after that of the Greek emperors; it is of solid gold, weighing nine marks and three ounces, ornamented with 53 sapphires, 50 rubies, one large emerald, and 338 pearls. Besides these stones, are the images of the apostles and the patriarchs. The pope added to this crown a silver patriarchal cross, which was afterwards inserted in the arms of Hungary. At the ceremony of the coronation, a bishop carries it before the king. From the cross is derived the title of apostolic king; the use of which was renewed under the reign of the empress-queen Maria-Theresa. The sceptre and the globe of the kingdom are Arabian gold; the mantle, which is of fine linen, is said to be the work of Gisele, spouse of St. Stephen, one of their early kings; the embroidered in gold the image of Jesus Christ crucified, and many other images of the patriarchs and apostles, with a number of inscriptions. The sword is two-edged, and rounded at the point. Buda, formerly the capital of Hungary, retains little of its ancient magnificence but its strength and fortifications; and the same may be said of Pest, which lies on the opposite side of the Danube. Raab is likewise a strong city, as are Gran and Comorra. Tokay has been already mentioned for the excellency of its wines.

**COMMERCE AND MANUFACTURES.]** After having mentioned the natural produce of the country, it is sufficient to say, that the chief manufactures and exports of the natives consist of metals, drugs, and salt.

**CONSTITUTION AND GOVERNMENT.]** The Hungarians dislike the term of queen, and even called their late sovereign king Theresa. Their government preserves the remains of many checks upon the regal power. They have a diet or parliament; and a Hungary-office, which resembles our chancery, and which resides at Vienna; as the stadtholder's council, which comes pretty near the British privy-council, but has a municipal jurisdiction, does at Presburg. Every royal town has its senate; and the Gespan chafis resemble our justices of the peace. Besides this, they have an exchequer and nine chambers, and other subordinate courts.

**MILITARY STRENGTH.]** The emperor can bring to the field, at any time, 50,000 Hungarians in their own country, but seldom draws out of it above 10,000; these are generally light-horse, and well known to modern times by the name of Hussars. They are not near so large as the German horse; and therefore the Hussars stand upon their short stirrups when they strike. Their expedition and alertness have been found so serviceable in war, that the greatest powers in Europe have troops that go by the same name. Their foot are called Heydukes, and wear feathers in their caps, according to the number of enemies they pretend to have killed: both horse and foot form an excellent militia, very good at a pursuit, or ravaging and plundering a country, but not equal to regular troops in a pitched battle.

**COINS.]** Hungary was formerly remarkable for its coinage, and there are still extant, in the cabinets of the curious, a complete series of coins of their former kings. More Greek and Roman medals have been discovered in this country than perhaps in any other.

**ARMS.]** The emperor, as king of Hungary, for armorial ensigns, bears quarterly, barwise argent, and rules of eight pieces.

**HISTORY.]** The Huns, after subduing this country in the middle of the third century, communicated their name to it, being then part of the ancient Pannonia. They were succeeded by the furious Goths; the Goths were expelled by the Lombards, they by the Avari, who were followed by the Sclavi, in the beginning of the ninth century. At the close of it, the Anigours emigrated from the banks of the Volga, and took possession of the country. Hungary was formerly an assemblage of different states, and the first who assumed the title of king, was Stephen, in the year 997, when he embraced Christianity. In his reign, the form of government

vernment was established, and the crown rendered elective. About the year 1310, king Charles Robert ascended the throne, and subdued Bulgaria, Servia, Croatia, Dalmatia, Sclavonia, and many other provinces; but several of those conquests were afterwards reduced by the Venetians, Turks, and other powers. In the fifteenth century, Huniades, who was guardian to the infant king Ladislaus, bravely repulsed the Turks, when they invaded Hungary; and upon the death of Ladislaus, the Hungarians, in 1438, raised Matthias Corvinus, son of Huniades, to their throne. Lewis king of Hungary, in 1526, was killed in a battle, fighting against Solymian, emperor of the Turks. This battle had almost proved fatal to Hungary; but the archduke Ferdinand, brother to the emperor Charles V. having married the sister of Lewis, he claimed the title of Hungary, in which he succeeded, with some difficulty, and that kingdom has ever since belonged to the house of Austria, though by its constitution its crown ought to be elective. For the rest of the Hungarian history, see GERMANY.

---

### TRANSYLVANIA, SCLAVONIA, CROATIA, AND HUNGARIAN DALMATIA.

THESE countries appear under one division, for several reasons, and particularly because no account sufficiently exact, of their extent and boundaries, has yet been published. The most authentic is as follows: TRANSYLVANIA belongs to the house of Austria, and is bounded on the North by the Carpathian mountains, which divide it from Poland; on the East by Moldavia and Walachia; on the South by Walachia; and on the West by Upper and Lower Hungary. It lies between 22 and 26 degrees of east longitude, and 45 and 48 of north latitude. Its length is extended about 180, and its breadth 120 miles; and contains nearly 14,400 square miles, surrounded on all sides by high mountains. Its produce, vegetables and animals, are almost the same with those of Hungary. The air is wholesome and temperate; but the wine, though good, is not equal to the Hungarian. Its chief city is Hermanstadt, and its interior government still partakes greatly of the ancient feudal system, being composed of many independent states and princes, who owe little more than a nominal subjection to the Austrians. Papists, Lutherans, Calvinists, Socinians, Arians, Greeks, Mahometans, and other sectaries, here enjoy their several religions. Transylvania is thought to add but little to the Austrian revenue, though it exports some metals and salt to Hungary. The other large places are Sageswar, Millenback, and Newmark. All sorts of provisions are very cheap, and excellent in their kinds. Hermanstadt is a large, strong, and well built city, as are Claufenburg and Weisseburgh. The seat of government is at Hermanstadt, and the governor is assisted by a council made up of Roman catholics, Calvinists, and Lutherans. The diet, or parliament, meets by summons, and receives the commands of the sovereign, to whom of late they have been more devoted than formerly. They have a liberty of making remonstrances and representations in case of grievances.

Transylvania is part of the ancient Dacia, the inhabitants of which long baffled the Roman arms. It was over-run by the Goths on the decline of the Roman empire, and then by the Huns. Their descendants retain the same military character. The population of the country is not ascertained; but if the Transylvanians can bring to the field, as has been asserted, 30,000 troops, the whole number of inhabitants must be considerable. At present its military force is reduced to six regi-

ments

ments of 1500 men each; but it is well known, that, during the last two wars in which the house of Austria was engaged, the Transylvanians did great services. Hermantadt is its only bishoprick; and the Transylvanians at present seem to trouble themselves little either about learning or religion, though the Roman catholic is the established church. Stephen I. king of Hungary, introduced Christianity there about the year 1000, and the country was afterwards governed by a Hungarian vauvod, or viceroy. The various revolutions in their government prove the impatience of the Transylvanians under slavery; and though the treaty of Carlowitz, in 1699, gave the sovereignty of Transylvania, as also of Sclavonia, to the house of Austria, yet the natives enjoy what we may call a loyal aristocracy, which their sovereigns do not think proper to invade. In October 1784, on account of the real or feigned oppressions of the nobility, near 16,000 assembled and committed great depredations on those obnoxious to them. Several had their palaces burnt, and were glad to escape with their lives. The revolters were disappointed in their attempt on Claufenburg; and afterwards offered to separate and go home in peace, on the terms of a general pardon, better treatment from the nobility, and a freedom from vassalage. The insurrection thus terminated, with the punishment of the ring-leaders.

SCLAVONIA lies between the 17th and 21st degrees of east longitude, and the 45th and 46th of north latitude. It is thought to be about 200 miles in length, and 60 in breadth, and contains about 10,000 square miles. It is bounded by the Drave on the North, by the Danube on the East, by the Save on the South, and by Stiria in Austria on the West. The reason why Hungary, Transylvania, Sclavonia, and the other nations, subject to the house of Austria in those parts, contain a surprising variety of people, differing in name, language, and manners, is because liberty here made its last stand against the Roman arms, which by degrees forced the remains of the different nations they had conquered into those quarters. The thicknes of the woods, the rapidity of the rivers, and the strength of the country, favoured their resistance; and their descendants, notwithstanding the power of the Turks, the Austrians, the Hungarians, and the Poles, still retain the same spirit of independency. Without minding the arrangements made by the sovereigns of Europe, they are quiet under the government that leaves them most at liberty. That they are generous as well as brave, appears from their attachment to the house of Austria, which, till the last two wars, never was sensible of their value and valour; insomuch that it is well known, that they preserved the pragmatic sanction, and kept the imperial crown in that family. The Sclavonians formerly gave so much work to the Roman arms, that it is thought the word *slave* took its original from them, on account of the great numbers of them who were carried into bondage. Though Sclavonia yields neither in beauty nor fertility to Hungary and Transylvania, yet the ravages of war are still visible in the face of the country, which lies in a great measure unimproved. The Sclavonians, from their ignorance, are zealous Roman catholics, though Greeks and Jews are tolerated among them. Here we meet with two bishopricks; that of Pofega, which is the capital of the country, and Zagrab, which lies on the Drave; but we know of no universities. Esbeck is a large and strong town, remarkable, as before noticed, for its great wooden bridge over the Drave, built by the Turks. Waradin and Peterwaradin are places noted in the wars between the Austrians and Turks. The inhabitants are composed of Servians, Radzians, Croats, Walachians, Germans, Hungarians, and a vast number of other nations, whose names are scarcely known even to the Austrians themselves, but from the military muster-rolls. In 1746, Sclavonia was united to Hungary, and the States now send representatives to the diet of Hungary.

CROATIA lies between the 15th and 17th degrees of east longitude, and the 45th and 47th of north latitude. It is 80 miles in length, and 70 in breadth, and

contains about 2,600 square miles. The manners, government, religion, language and customs of the Croats, are similar to those of the Slavonians and Transylvanians, who are their neighbours. They are excellent irregular troops, and as such are famed in modern history, under the name of Pandours, and various other designations. The truth is, the house of Austria finds its interest in suffering them, and the neighbouring nations, to live in their own manner. Their towns are blended with each other, there scarcely being any distinction of boundaries. Carlsbadt is a place of some note, but Zagrab (already mentioned) is the capital of Croatia. All the sovereignty exercised over them by the Austrians seems to consist in the military arrangements for bringing them occasionally into the field. A viceroy presides over Croatia, jointly with Slavonia, and

Hungarian DALMATIA. This lies in the upper part of the Adriatic sea, and consists of five districts, in which the most remarkable places are the two following: Segna, which is a royal free town, fortified both by nature and art, and is situated near the sea, in a mountainous and barren soil. The bishop of this place is a suffragan to the archbishop of Spalatro. Here are twelve churches, and two convents. The governor resides in the old palace, called the Royal Castle. 2. Ottofchatz, a frontier fortification on the river Gatzka. That part of the fortress where the governor, and the greatest part of the garrison reside, is surrounded with a wall, and some towers; but the rest of the buildings, which are mean, are erected on piles in the water; so that one neighbour cannot visit another without a boat.

Near Segna dwell the Uscocs, a people, who, being galled by oppression, escaped out of Dalmatia, from whence they obtained the name of Uscocs, from the word Senco, which signifies a *deserter*. They are also called springers, or leapers, from the agility with which they leap, rather than walk, along this rugged and mountainous country. Some of them live in scattered houses, and others in large villages. They are a rough, savage people, large-bodied, courageous, and given to rapine; but their visible employment is grazing. They use the Walachian language, and in their religious sentiments and mode of worship approach nearest to the Greek church; but some of them are Roman catholics.

A part of Walachia belongs also to the emperor, as well as to the Turks, which lies to the east of Transylvania, and its principal towns are Tregonitz, Bucharett, and Severin.

BOUNDARIES.] BEFORE the extraordinary partition of this country in the year 1772, and the second dismemberment of it in 1793, the Kingdom of Poland, with the great duchy of Lithuania annexed (part of ancient Sarmatia), was bounded on the North by Livonia, Muscovy, and the Baltic sea; on the East, by Muscovy; on the South, by Hungary, Turkey, and Little Tartary; on the West, by Germany: and, had the form of its government been as

perfect as its situation was compact, it might have been one of the most powerful kingdoms in Europe. Its grand divisions were,

Dantzic, Thorn, and Elbing, in Prussia Royal, are styled free cities, and were under the protection of Poland; the two last have been seized by the king of Prussia, and most of the privileges of the first.

**NAME.]** It is generally thought that Poland takes its name from Polu, or Pole, a Slavonian word, signifying a country fit for hunting, for which none was formerly more proper, on account of its plains, woods, and game of every kind.

**CLIMATE.]** The air of Poland is such as may be expected from so extensive but level a climate. In the northern parts it is cold, but healthy. The Carpathian mountains, which separate Poland from Hungary, are covered with everlasting snow, which has been known to fall in the midst of summer. Upon the whole, however, the climate of Poland is temperate, but the air is rather insalubrious by reason of the numerous woods and morasses.

**SOIL, PRODUCE, AND WATERS.]** Poland is in general a level country, and the soil is fertile in corn, as appears from the vast quantities that are sent from thence down the Vistula, to Dantzic, and which are bought up by the Dutch, and other nations. The pastures of Poland, especially in Podolia, are extremely rich. Here are mines of silver, copper, iron, salt, and coals; Lithuania abounds in iron ochre, black agate, several species of copper and iron pyrites, and red and grey granite, false precious stones, and marine petrifications. The interior parts of Poland contain forests which furnish timber in such great quantities, that it is employed in house-building, instead of bricks, stone, and tiles. Various kinds of fruits and herbs, and some grapes, are produced in Poland, and are excellent when they meet with culture; but their wine seldom or never comes to perfection. Poland produces various kinds of clay fit for pipes and earthen ware. The water of many springs is boiled into salt. The virtues of a spring, in the Palatinate of Cracow, which increases and decreases with the moon, are said to be wonderful for the preservation of life; and it is reported, that the neighbouring inhabitants commonly live to 100, and some of them to 150 years of age. This spring is inflammable, and by applying a torch to it, it flames like the subtilest spirit of wine. The flame, however, dances on the surface, without heating the water; and if left unattended,

guished, it communicates itself, by subterraneous conduits, to the roots of trees, in a neighbouring wood, which it consumes; and about 41 years ago, the flames are said to have lasted for three years, before they could be entirely extinguished.

RIVERS.] The chief rivers of Poland are, the Vistula or Weyssel, the Neisser, Neiper, or Boristhenes, the Bog, and Dwina.

LAKES.] The chief of the few lakes contained in Poland is Gopto, in the Palatinate of Byzetty; and Birals, or the White Lake, which is said to dye those who wash in it of a swarthy complexion.

VEGETABLE AND ANIMAL PRODUCTIONS. } The vegetable productions of Poland have been } already mentioned under the article of SOIL, though } some are peculiar to itself, particularly a kind of manna (if it can be called a vegetable) which in May and June the inhabitants sweep into sieves with the dew, and it serves for food, dressed various ways. A great quantity of yellow amber is frequently dug up in Lithuania, in pieces as large as a man's fist, supposed to be the production of a resinous pine.

The forests of Warsovia, or Masovia, contain plenty of uri, or buffaloes, whose flesh the Poles powder, and esteem it an excellent dish. Horses, wolves, bears, the glouton, lynx, elks, and deer, all of them wild, are common in the Polish forests; and there is a species of wild horses and asses, and wild oxen, that the nobility of the Ukraine, as well as natives, are fond of. A kind of wolf, resembling a hart, with spots on his belly and legs, is found here, and affords the best furs in the country. The flesh of the Polish elk forms the most delicious part of their greatest feasts. His body is of the deer-make, but much thicker and longer; the legs high, and feet broad and cloven, the horns large, rough and broad, like a wild goat's. Naturalists have observed, that upon dissecting an elk, there was found in its head some large flies with its brains almost eaten away; and it is an observation sufficiently attested, that in the large woods and wildernesses of the North, this poor animal is attacked, towards the winter chiefly, by a larger sort of flies, that, through its ears, attempt to take up their winter quarters in its head. This persecution is thought to affect the elk with the falling-sickness, when it is frequently taken, which would otherwise prove no eaty matter.

Poland produces a creature called bohac: it resembles a guinea-pig, but seems to be of the beaver kind. They are noted for digging holes in the ground, which they enter in October, and do not come out, except occasionally for food, till April: they have separate apartments for their provisions, lodgings, and their dead; they live together by 10 or 12 in a herd. We do not perceive that Poland contains any species of birds peculiar to itself; only we are told that the quails there have green legs, and that their flesh is reckoned unwholesome. Lithuania is rich in birds; among those of prey, are the eagle and vulture. The *reniz*, or little species of titmouse, is frequently found in those parts, famous for the wonderful structure of its pendent nest, formed in the shape of a long purse, with amazing art.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. } Some authors have supposed Po- } land and Lithuania to contain 14,000,000 } of inhabitants: and when we consider that the Poles have no colonies, and some- } times have enjoyed peace for many years together, and that not fewer than } 2,000,000 Jews are said to inhabit there, perhaps this calculation is not exagger- } ated. But since the partition and dismemberment of the kingdom in 1772, the } number was reduced to 9,000,000 of which 600,000 are Jews. The provinces } taken by Russia are the largest, by Austria the most populous, and by Prussia the } most commercial. The Russian contain 1,500,000; the Austrian 2,500,000, and } the Prussian about 800,000, amounting to about 5,000,000 souls separated from } their

their ancient kingdom. But from the second dismemberment of this country in 1793, the population must be much more diminished.

The Poles, in their persons, make a noble appearance; their complexion is fair, and their shapes are well proportioned. They are brave, honest, and hospitable; and their women sprightly, yet modest, and submissive to their husbands. Their mode of salute is to incline their heads, and to strike their breast with one of their hands, while they stretch the other towards the ground; but when a common person meets a superior, he bows his head near to the earth, and with his head touches the leg near to the heel of the person to whom he pays obedience. Their diversions are warlike and manly; vaulting, dancing, and riding the great horse, hunting, scating, bull and bear baiting. They usually travel on horseback: a Polish gentleman will not travel a stone-throw without his horse; and they are so hardy, that they will sleep upon the ground, without any bed or covering, in frost and snow. The Poles never lie above stairs, and their apartments are not united; the kitchen is on one side, the stable on another, the dwelling-house on the third, and the gate in the front. They content themselves with a few small beds, and if any lodge at their houses, they must carry their bedding with them. When they sit down to dinner or supper, they have their trumpets and other music playing, and a number of gentlemen to wait on them at table, all serving with the most profound respect; for the nobles, who are poor, frequently find themselves under the necessity of serving those that are rich: but their patron usually treats them with civility, and permits the eldest to eat with him at his table, with his cap off; and every one of them has his peasant boy to wait on him, maintained by the master of the family. At an entertainment, the Poles lay neither knives, forks, nor spoons; but every guest brings them with him; and they no sooner sit down to table, than all the doors are shut, and not opened till the company return home. It is usual for a nobleman to give his servant part of his meat, which he eats as he stands behind him, and to let him drink out of the same cup with himself. Bumpers are much in fashion. It would exceed the bounds of this work to describe the grandeur and equipages of the Polish nobility; and the reader may picture in his fancy all that is fastidious, ceremonious, expensive and thievish in life, to have any conception of their way of living. They carry the pomp of their attendance, when they appear abroad, even to ridicule; for it is not unusual to see the lady of a Polish grandee, besides a coach and six, with a great number of servants, attended by an old gentleman usher, an old gentlewoman for her governess, and a dwarf of each sex to hold up her train; and if it be night, her coach is surrounded by a great number of flambeaux.

The Poles are divided into nobles, clergy, citizens or burghers, and peasants; the peasants are divided into two sorts, those of the crown, and those belonging to individuals. Though Poland has its princes, counts, and barons, yet the whole body of the nobility are naturally on a level, except the difference that arises from the public posts they enjoy. Hence all who are of noble birth call one another *brothers*. They do not value titles of honour, but think a *gentleman of Poland* the highest appellation. They have many considerable privileges; and indeed the boasted Polish liberty is properly limited to them alone, partly by the indulgence of former kings, but more generally from ancient custom and prescription. They have a power of life and death over their tenants and vassals, pay no taxes, are subject to none but the king, may chuse whom they will for their king, and lay him under what restraint they please by the *pacta conventa*; and none but they, and the burghers of some particular towns, can purchase lands. In short, they are almost entirely independent, enjoying many other privileges incompatible with a well regulated state. These great privileges make the Polish gentry powerful; and possessing large territories, with a despotic power over their tenants,

whom they call their subjects, and transfer or assign over with the lands, cattle, and furniture. Until Casimir the Great, the lord could put his peasant to death with impunity, and when the latter had no children, considered himself as the heir, and seized all his effects. In 1347, Casimir prescribed a fine for the murder of a peasant, and enacted, that in case of his decease without issue, his next heir should inherit. But these and other regulations have proved ineffectual against the power and tyranny of the nobles, and have been either abrogated or eluded. Some of them have estates of prodigious extent, and can raise 8 or 10,000 men in their dependant towns and villages. The house of a great nobleman is a secure asylum for delinquents; for none must presume to take them from thence by force. The nobles make an extraordinary figure when they come to the diet, some of them having 5000 guards and attendants; and their debates in the senate are often determined by the sword. When great men have suits at law, the diet, or other tribunals, decide them; yet the execution of the sentence must be left to the longest sword, for the justice of the kingdom is commonly too weak for the grandees. Sometimes they raise 5 or 6000 men of a side, plunder and burn one another's cities, and besiege castles and forts; for they think it below them to submit to the sentence of judges, without a field-battle. As to the peasants, they are born slaves, and have no notion of liberty. If one lord kills the peasant of another, he is not capitally convicted, but only obliged to make reparation, by another peasant equal in value. A nobleman who is desirous of cultivating a piece of land builds a little wooden house, in which he settles a peasant and his family, giving him a cow, two horses, a certain number of geese, hens, &c. and as much corn as is sufficient to maintain him the first year, and to improve for his own future subsistence and the advantage of his lord.

The clergy have many immunities; they are all free men, and in some instances, have their own courts of justice, in which the canon law is practised. A bishop is entitled to all the privileges of a senator; was usually appointed by the king, and confirmed by the pope; but is now nominated by the king, out of three candidates chosen by the permanent council. The archbishop of Gnesna is primate, the first senator in rank, and viceroy during an interregnum. The burghers still enjoy some freedom and privileges; they chuse their own burgo-master and council, regulate their interior police, and have their own criminal courts of justice; and when prosecuted at the suit of a noble, they must be cited before the magistrate of their own towns, from whence an appeal lies only to the king in his assessorial tribunal. Without this exemption from the jurisdiction of the nobles, the burghers would long since have been reduced to a state of vassalage.

The peasants of the crown, if oppressed, may lodge a complaint in the royal court of justice, which is some check to injustice; but peasants belonging to individuals are at the absolute disposal of their master, and all their acquittions serve only to enrich him. They are indispensably obliged to cultivate the earth; are incapable of entering upon any condition of life that might procure them freedom, without the permission of their lords; and are exposed to the casual, and frequently fatal effects of caprice and cruelty. One blessing, however, attends the wretched situation of the Polish peasants, which is their insensibility. Born slaves, and accustomed from their infancy to hardships and severe labour, the generality of them scarcely entertain an idea of better circumstances and more liberty. They regard their masters as a superior order of beings, and hardly ever repine at their severe lot. Cheerful and contented with their condition, they are ready, upon every occasion, to sacrifice themselves and their families for their master, especially if the latter takes care to feed them well. Most of them seem to think that a man can never be very wretched while he has any thing to eat. There are some styled German peasants, whose ancestors were indulged, on settling in

Poland,

Poland, in the use of the German laws, who enjoy several privileges not possessed by the generality of Polish peasants: their villages are better built, they possess more cattle, pay their quit rents better, and are cleaner and neater in their persons. This description of the manners and present state of the Poles has been the more circumstantial, as they bear a near resemblance, in many particulars, to those of Europe in general during the feudal ages; but their tyranny over their tenants and vassals seems to be carried to a much greater height. Lately indeed, a few nobles of enlightened understandings, have ventured to give liberty to their vassals. The first who granted this freedom, was Zamoilki, formerly great chancellor, who, in 1760, enfranchised six villages in the palatinate of Masovia, and afterwards the peasants on all his estates.

Upon signing the deed of enfranchisement of the six villages, their benevolent master intimated some apprehensions to the inhabitants, lest, encouraged by their freedom, they should fall into every species of licentiousness, and commit more disorders than when they were slaves. The simplicity and good sense of their answer is remarkable. "When we had no other property," returned they, "than the sick which we hold in our hands, we were destitute of all encouragement to a right conduct; and, having nothing to lose, acted on all occasions in an inconsiderate manner; but as soon as our houses, our lands, and our cattle, are our own, the fear of forfeiting them will be a constant restraint upon our actions."

The sincerity of this answer was manifested by the event, which hath shewn the project to be no less judicious than humane; friendly to the nobles' own interests as well as the happiness of the peasants: for it appears, that in the districts where the new arrangement hath been introduced, the population of the villages is considerably increased, and the revenues of their estates augmented in a triple proportion. Prince Stanislaus, nephew to the king of Poland, hath very lately enfranchised four villages near Warsaw, and hath not only emancipated his peasants from slavery, but condescends to direct their affairs.

Torture was abolished in Poland in 1776, by an edict of the diet, under the influence of the king. Atrocious crimes, such as murder, &c. are punished by beheading, or hanging; lesser delinquencies, by whipping, imprisonment, and hard labour: the nobles are liable only to imprisonment and death.

The inns in this country are long stables built with boards and covered with straw, without furniture or windows; there is a chamber at one end: but none can lodge there because of flies and other vermin; so that strangers generally chouse rather to sleep among the horses. Travellers are obliged to carry provisions with them; and when foreigners want a supply, they apply to the lord of the village, who forthwith supplies them with necessaries.

It may be proper to observe in this place, that, in this country there are several persons with matted or clotted hair, which constitutes a disorder called *Plica Polonica*: it receives that denomination, because it is considered as peculiar to Poland; although it is not unfrequent in Hungary, Tartary, and several adjacent nations, and instances of it are occasionally to be found in other countries.

According to the observations of Dr. Vicat, an ingenious Swiss physician long resident in Poland, the *Plica Polonica* is supposed to proceed from an acrid humour penetrating into the hair, which is tubular: it then exudes either from its sides or extremities, and clogs the hair together. Its symptoms, more or less violent, according to the constitution of the patient, or malignity of the disease, are itchings, swellings, eruptions, ulcers, intermitting fevers, pains in the head, languor, soreness of joints, rheumatism, gout, and sometimes even convulsions, palsy, and madness. These symptoms gradually decrease as the hair becomes affected. If the patient is shaved in the head, he relapses into all the dreadful complaints which preceded the eruption of the *Plica*; and he continues to labour under them, until

a fresh growth of hair absorbs the acrid humour. This disorder is thought hereditary, and is proved to be contagious when in a virulent state.

Many physical causes have been supposed to concur in rendering the *Plica* more frequent in these regions than in other parts. The *first* cause is the nature of the Polish air, which is rendered insalubrious by the numerous woods and morasses; and occasionally derives an uncommon keenness, even in the midst of summer, from the position of the Carpathian mountains; for the southern and south-easterly winds, which usually convey warmth in other regions, are in this chilled in the passage over their snowy summits. The *second* is unwholesome water; for although Poland is not deficient in good springs, yet the common people usually drink that which is nearest at hand. The *third* cause is the gross inattention of the natives to cleanliness; for experience shews, that those who are not negligent in their persons and habitations, are less liable to be afflicted with the *plica*, than others who are deficient in that particular. All these causes, and particularly the last, assist its propagation, inflame its symptoms, and protract its cure.

In a word, the *Plica Polonica* appears to be a contagious distemper, which, like the leprosy, stills prevails among a people ignorant in medicine, and inattentive to check its progress; but is rarely known in those countries, where proper precautions are taken to prevent its spreading.

[Dress.] The dress of the Poles is pretty singular. They shave their heads, leaving only a circle of hair upon the crown, and men of all ranks generally wear large whiskers. They wear a vest which reaches down to the middle of the leg, and a kind of gown over it lined with fur and girded with a sash, but the sleeves sit tight on the arm. Their breeches are wide, and make but one piece with their stockings. They wear a fur cap or bonnet; their shirts are without collar or wristbands, and they wear neither stock nor neckcloth. Instead of shoes, they wear Turkey-leather boots, with thin soles, and deep iron heels bent like an half moon. They carry a pole-axe, and a sabre or cutlass, by their sides. When they appear on horseback, they wear over all a short cloak, which is commonly covered with furs both within and without. The people of the best quality wear fables, and others the skins of tygers, leopards, &c. Some of them have fifty suits of cloaths, all as rich as possible, and which descend from father to son. Were it not for our own partiality to short dresses, we must acknowledge that of the Poles to be picturesque and majestic. Charles II. of England thought of introducing the Polish dress into his court, and after his restoration wore it for two years, chiefly for the encouragement of English broad-cloth; but discontinued it through his connections with the French.

The habit of the women comes very near to that of the men, a simple Polonaise, or long robe edged with fur; but some people of fashion, of both sexes, affect the French or English modes. As to the peasants, in winter they wear a sheep-skin with the wool inwards, and in summer a thick coarse cloth; but as to linen, they wear none. Their boots are the rinds of trees wrapped about their legs, with the thicker parts to guard the soles of their feet. The women have a watchful eye over their daughters, and in the district of Samogitia particularly, make them wear little bells before and behind, to give notice where they are, and what they are doing.

[RELIGION.] The number of Protestants, consisting of Lutherans and Calvinists, in the republic of Poland, is very considerable; and when these are joined to the Greek church, the whole are called *Dissidents*. At the same time, the Polish nobility, and the bulk of the nation, are tenacious of the Roman catholic religion. The treaty of Oliva, concluded in 1660, tolerated the Dissidents, and was guaranteed by the principal powers in Europe; but was so far disregarded by the Poles, that, in the year 1724, they made a public massacre of the Protestants at Thorn.

Thorn. Numerous provisions were made for the protection of the Protestants, who were persecuted, when Jews, Turks, and infidels of every kind, have been tolerated and encouraged. The monasteries in Poland are by some writers said to be 576, and the nunneries 177, besides 246 seminaries or colleges, and 31 abbeys. The clergy are possessed of a very large proportion of the lands and revenues of the kingdom, but in general, are illiterate bigots; and the monks are some of the most profligate of mankind, are often seen drunk, and led from taverns, without apprehending any disgrace to their order, or dreading the censure of their superiors, who require equal indulgence. The popish clergy have had great influence in Poland at different periods, notwithstanding the treaties and capitulations in favour of the Protestants and the members of the Greek church. Indeed, it has been chiefly owing to the influence and the conduct of the popish clergy, that the peasants in Poland have been reduced to such a state of wretched slavery.

The principles of Socinianism made a very early and considerable progress; and even before Socinus came into Poland, it is computed that there were thirty-two congregations in that republic who denied the doctrine of the Trinity. A translation of the Bible into the Polish language was published in 1572; and two years after, under the direction of the same persons, the catechism, or confession of the Unitarians, was published at Cracow. It was lately resolved between the republic and the partitioning powers, that all Dissidents should henceforth enjoy the free exercise of their religion, but continue excluded from the diet, the senate, and the permanent council. They are to have churches, but without bells; all schools and seminaries of their own; they are capable of sitting in the inferior courts of justice, and three of their communion are admitted as assessors in the tribunal, to receive appeals in religion.

ARCHBISHOPRICS AND BISHOPRICS.] Poland contains two archbishoprics, Gnesna and Lemburg. The archbishop of Gnesna, besides being primate, and during an inter-reign, prince-regent of the kingdom, is always a cardinal. The other bishops, particularly of Cracow, enjoy great privileges and immunities.

LANGUAGE.] The Polish language is a dialect of the Slavonic, and is extremely harsh, from its deficiency in vowels. The Lithuanians and Livonians have a language full of corrupted Latin words; the Ruthian and German tongues are understood in the provinces bordering on those countries.

LEARNING AND LEARNED MEN.] Though Copernicus, the great restorer of the true astronomical system, Vortius, and some other learned men, were natives of Poland, yet many circumstances in this country are far from being favourable to learning. Latin is spoken, though incorrectly, by the common people in some provinces. But the contempt which the nobility, who place their chief importance in the privileges of their rank, have ever shown for learning, the servitude of the lower people, and the universal superstition among all ranks of men,—these circumstances have wonderfully retarded, and, notwithstanding the liberal efforts of his present majesty, still continue to retard the progress of letters in this kingdom.

UNIVERSITIES.] The universities of Poland are those of Cracow, Wilna, and Posna or Posen. The first consists of eleven colleges, and has the superintendency of fourteen grammar-schools dispersed through the city. The number of students, in 1778, amounted to 600. Wilna was under the superintendance of the Jesuits; but since their suppression, the king hath established a committee of education, who superintend the schools, and direct their salaries and studies; that of Posna, was rather a Jesuits' college than an university.

ANTIQUITIES AND CURIOSITIES.] The frequent incursions of the Tartars and other barbarous nations into Poland produced a great number of ruins. Some of the women sometimes to spare their children exposed in the woods, where

we must suppose they were nursed by bears and other wild beasts, otherwise it is difficult to account for their subsistence. It is certain that such beings have been found in the woods both of Poland and Germany, divested of almost all the properties of humanity but the form. When taken, they generally went on all fours; but it is said that some of them have, by proper management, attained to the use of speech.

The salt mines of Poland consist of wonderful caverns, several hundred yards deep, at the bottom of which are many intricate windings and labyrinths. Out of these are dug four different kinds of salts; one extremely hard, like crystal; another softer, but clearer; a third white, but brittle; these are all brackish, but the fourth is somewhat fresher. These four kinds are dug in different mines, near the city of Cracow; on one side of them is a stream of salt-water, and on the other, one of fresh. The revenue, arising from those and other salt-mines, is very considerable, and formed part of the royal revenue before seized by Austria; the annual average profit of those of Wielitzka, eight miles from Cracow, was about 98,000l. sterling. Out of some mines at Itza, about 70 miles north-east of Cracow, are dug several kinds of earth, which are excellently adapted to the potter's use, and supply all Poland with earthen ware. Under the mountains adjoining to Kiow, in the deserts of Podolia, are several grottos, where a great number of human bodies are preserved, though buried a vast number of years since, being neither so hard nor so black as the Egyptian mummies. Among them are two princes, in the habits they used to wear. It is thought that this preserving quality is owing to the nature of the soil, which is dry and sandy. The artificial rarities of Poland are but few, the chief being the gold, silver, and enamelled vessels, presented by the kings and prelates of Poland, and preserved in the cathedral of Gnesna.

**CITIES, TOWNS, FORTS, AND OTHER.** Warsaw lies on the Vistula, and almost in the centre of Poland. It is the royal residence, and contains many magnificent palaces, and other buildings, besides churches and convents. It is said to contain near 70,000 inhabitants; but a great number are foreigners. The streets are spacious, but ill paved, and the greatest part of the houses, particularly the suburbs, are mean wooden hovels. The city exhibits a strong contrast of wealth and poverty, as doth every part of this unhappy country. It has little or no commerce. The same may be said of Cracow, the ancient capital; for we are told, that notwithstanding it lies in the neighbourhood of the rich salt mines, and it is said to contain fifty churches and convents, its commerce is inconsiderable. The city stands in an extensive plain watered by the Vistula, and with the suburbs occupies a vast space of ground; but both together scarcely contain 16,000 souls. It is surrounded with high brick walls, strengthened with round square towers in the ancient style of fortification, and is garrisoned with 600 Russians. Grodno, though not the capital, is the principal town in Lithuania, containing ruined palaces, falling houses, and wretched hovels, with about 7000 inhabitants, 1000 of whom are Jews; and 3000 are employed in new manufactures of cloths, camblets, linen, cotton, silk, stuffs, &c. established there by the king in 1776. He hath also established in this place an academy of physic for Lithuania, in which ten students are instructed for physic, and twenty for surgery, all taught and maintained at his own expence.

Dantzic is the capital of Polish Prutha, and is famous in history on many accounts, particularly that of its being formerly at the head of the Hanseatic association, commonly called the Hanse-towns. It is situated on the Vistula, near five miles from the Baltic, and is a large, beautiful, populous city; its houses generally are five stories high; and many of its streets are planted with chestnut-trees. It has a fine harbour, and is still a most eminent commercial city, although it seems to be somewhat past its meridian glory, which was probably about the time that the pre-

ſident de Thou wrote his much eſteemed *Hiſtoria ſui Temporis*, wherein, under the year 1607, he ſo highly celebrates its commerce and grandeur. It is a republic, claiming a ſmall adjacent territory about forty miles round it, which was under the protection of the king and the republic of Poland. Its magiſtracy, and the majority of its inhabitants, are Lutherans; although the Romaniſts and Calviniſts are equally tolerated in it. It is rich, and has 26 pariſhes, with many convents and hoſpitals. The inhabitants have been computed to amount to 200,000; but Dr. Buſching tells us, that in the year 1752, there died but 1846 perſons. Its own ſhipping is numerous; but the foreign ſhips conſtantly reſorting to it are more ſo, whereof 1014 arrived there in the year 1752; in which year alſo 1288 Polith veſſels came down the Viſtula, chiefly laden with corn, for its matchleſs granaries, from whence that grain is diſtributed to many foreign nations; Poland being juſtly deemed the greateſt magazine of corn in Europe, and Dantzic the greateſt port for diſtributing it: beſides which, Dantzic exports great quantities of naval ſtores. Dr. Buſching affirms, that it appears from ancient records, as early as the year 997, that Dantzic was a large commercial city.

The inhabitants of Dantzic have often changed their maſters, and have ſometimes being under the protection of the Engliſh and Dutch; but generally have ſhewn a great predilection for the kingdom and republic of Poland, as being leſs likely to rival them in their trade, or abridge them of their immunities, which reach even to the privilege of coining money. Though ſtrongly fortified, and poſſeſſed of 150 large braſs cannon, the town could not ſtand a regular ſiege, being ſurrounded with eminences. It 1734, the inhabitants diſcovered a remarkable attachment and fidelity towards Stanislaus, king of Poland, not only when his enemies, the Ruſſians, were at their gates, but even in poſſeſſion of their city. The reaſon why Dantzic, Thorn, and Elbing, have enjoyed privileges, both civil and religious, very different from thoſe of the reſt of Poland, is becauſe, not being able to endure the tyranny of the Teutonic knights, they put themſelves under the protection of Poland, reſerving to themſelves large and ample privileges.

This city, as well as that of Thorn, was exempted by the late king of Pruſſia from thoſe claims which he made on the neighbouring countries; notwithstanding which, he ſoon after thought proper to ſeize on the territories belonging to Dantzic, under pretence of their having been formerly part of Polith Pruſſia. He then proceeded to poſſeſs himſelf of the port-dues belonging to that city, and erected a cuſtom-houſe in the harbour, where he laid arbitrary and inſupportable duties upon goods exported and imported. To complete the ſyſtem of oppreſſion, cuſtom-houſes were erected at the very gates of Dantzic, ſo that no perſons could go in or out of the town, without being ſearched in the ſtricteſt manner. Such is the treatment which the city of Dantzic has received, though few cities have ever exiſted, which have been comprehended in ſo many general and particular treaties, and whoſe rights and liberties have been ſo frequently ſecured, and guaranteed by ſo many great powers, and by ſuch a long and regular ſucceſſion of public acts, as that of Dantzic has been. In the year 1784, it was blockaded by his troops on various pretences: by the interpoſition of the empreſs of Ruſſia, and of the king of Poland, they were withdrawn, and a negotiation carried on by deputies at Warſaw; which was concluded on the 7th of September, by which, as now acceded to by the citizens, the place and trade of the city are to be reſtored to its former ſtability. Notwithstanding this, in the year 1793, the Pruſſian troops took poſſeſſion of Dantzic; the burgomaſters and council of the city, having on the 2d of April, aſſembled at the town-houſe, at the requeſt of the king of Pruſſia, made known to every burgher and inhabitant, by public declaration, to order every perſon to keep himſelf quiet, to follow his trade and buſineſs as uſual, and to remain peaceably in his houſe, when the Pruſſian troops ſhall

shall enter that city. The city of Thorn was also treated by the king of Prussia in the same unjust and oppressive manner, and is now added to his dominions.

COMMERCE AND MANUFACTURES.] The chief exports of Poland are all species of grain, hemp, flax, cattle, masts, planks, pitch and tar, honey, wax, potash, and tallow; its imports are foreign wines, cloths, stuffs, manufactured silks and cotton, fine linen, hardware, tin, copper, silver and gold, glass ware, furs, &c. Some linen and woollen cloths, silken stuffs, cumblets, laces, and hard-wares, are manufactured in the interior parts of Poland and Lithuania; but commerce is entirely confined to the city of Dantzic, and other towns on the Vistula and the Baltic.

CONSTITUTION AND GOVERNMENT.] Whole volumes have been written upon this subject. It differs little from an aristocracy: hence Poland has been called a kingdom and commonwealth. The king is the head of the republic, and is elected by the nobility and clergy, in the plains of Warsaw. They elect him on horseback; and in case there should be a refractory minority, the majority has no control over them, but to cut them in pieces with their sabres; but if the minority are sufficiently strong, a civil war ensues. Immediately after his election, he signs the *pacta conventa* of the kingdom, by which he engages, that the crown shall be elective, that his successor shall be appointed during his life—that the diets shall be assembled every two years—that every noble or gentleman in the realm shall have a vote in the diet of election, and that in case the king should infringe the laws and privileges of the nation, his subjects should be absolved from their allegiance. In fact the king is no more than the president of the senate, which used to be composed of the primate, the archbishop of Lemberg, 15 bishops, and 130 laymen, consisting of the great officers of state, the Palatines, and Castellans. The Palatines are the governors of the provinces, who hold their offices for life.—The Castellans' office in time of peace is mostly nominal; but when the military or feudal services are required, they are the lieutenants of the Palatines, and command the troops of their several districts.

The diets of Poland are ordinary and extraordinary; the former meet once in two, and sometimes three years; the latter is summoned by the king, upon critical emergencies; but one dissenting voice renders all their deliberations ineffectual.

The starosts properly are governors and judges, in particular starosties or districts, though some enjoy this title without any jurisdiction at all. The Palatines and Castellans, besides being senators, are lord-lieutenants, and deputy-lieutenants, in their respective Palatinates.

Previous to a general diet, either ordinary or extraordinary, which can sit but six weeks, there are dietines, or provincial diets, held in different districts. The king sends them letters containing the heads of the business that is to be treated of in the general diet. The gentry of each palatinate may sit in the dietine, and chuse nuncios or deputies, to carry their resolutions to the grand diet. The great diet consists of the king, senators, and deputies from provinces and towns, viz. 178 for Poland and Lithuania, and seventy for Prussia; and it meets twice at Warsaw, and once at Grodno, by turns, for the convenience of the Lithuanians, who made this one of the articles of their union with Poland; but since the present reign they have been always summoned to Warsaw.

The king formerly nominated the great offices of state, and to other places, but by the new constitution, for the election of senators, as bishops, palatines, castellans, and ministers, the permanent council nominates, by ballot, three candidates, one of whom the king must appoint—the same respecting the commissioners of war, and of the treasury, &c. &c. The king was also forced to renounce the right of disposing of any of the royal demesnes and starosties. When the king is absent from

Poland, or dead, his place is supplied by the archbishop of Gnesna, and if that see is vacant, by the bishop of Ploiko.

The ten great officers of state in Poland, who are senators, are the two great marshals, one of Poland, the other of Lithuania; the chancellor of the kingdom, and the chancellor of the duchy; the vice-chancellor of the kingdom, and the vice-chancellor of the duchy; the great general, the great treasurer of the kingdom, and the sub-marshal, or marshal of the court of the duchy.

Such are the outlines of this motley constitution, which was new-modelled with almost every new king, according to the *pacta conventa* which he is obliged to sign; so that nothing can be said of it with certainty, there being lately a total dissolution of all order in Poland, through the influence of some of the neighbouring powers, interested to foment anarchy and confusion in the Polish councils; and many of the first nobility do not blush to receive pensions from foreign courts. However, in this imperfect sketch, we can discern the great outlines of a noble and free government. The precautions taken to limit the king's power, and yet invest him with an ample prerogative, were worthy of a wise people. The institutions of the diet and dietines are favourable to public liberty, as are many other provisions in the republic: but it laboured, even in its best state, under incurable disorders. The exercise of the *veto*, or the tribunitial negative, that is vested in every member of a diet or dietine, must always be destructive of order and government. It is founded upon Gothic principles, and that unlimited jurisdiction which the great lords, in former ages, used to enjoy all over Europe. According to Mr. Coxe, the privilege in question is not to be found in any period of the Polish history antecedent to the reign of John Casimir. It was under his administration, in the year 1652, when the diet of Warsaw was debating upon transactions of the utmost importance which required a speedy determination, that Sicinski, nuncio of Uspita in Lithuania, cried out, "I stop the proceedings." Having uttered these words, he quitted the assembly, and, repairing immediately to the chancellor, protested, that as many acts as had been proposed and carried contrary to the constitution of the republic, if the diet continued to sit, he should consider it as an infringement of the laws. The members were thunderstruck at a protest of this nature, hitherto unknown. Warm debates took place about the propriety of continuing or dissolving the diet; at length, the venal and discontented faction, who supported the protest, obtained the majority; and the assembly broke up in great confusion. Ever since that time, the privilege of every member to stop the proceedings of the diet has continued, which is done by the single word, *veto*, "I forbid."

The want of subordination in the executive parts of the constitution, and the rendering noblemen independent and unaccountable for their conduct, is a blemish which perhaps may be impracticable to remove, as it can be done only with their own consent. After all, when we examine the best accounts of the present constitution of Poland, and compare them with the ancient history of Great Britain, and other European kingdoms, we may perceive a wonderful similarity between what these were formerly, and what Poland is at present. This naturally leads us to infer, that the government of Poland cannot be otherwise improved than by the introduction of arts, manufactures, and commerce, which would render the common people independent on the nobility, and prevent the latter from having it in their power to annoy their sovereign, and so maintain those unequal privileges which are so hurtful to the community.

Indeed the partitioning powers, besides dismembering the best provinces of Poland, proceeded to change and fix the constitution and government, under pretence of amending it; confirming all its defects, and endeavouring to perpetuate the principles of anarchy and confusion. to the king and senate, is now vested in the permanent council, composed of the king, senate, and the equestrian order—the king as president, the primate and three bishops, nine lay senators, four from the ministry of the republic, the marshal, with 17 counsellors of the equestrian order; in all 36. Of the eighteen senators, six from each province of Great Poland, Little Poland, and Lithuania. They insisted upon four cardinal laws to be ratified, which was at last obtained. *First*, "that the crown of Poland shall be for ever elective, and all order of succession proscribed;" thus the exclusion of a king's son and grandson removes the prospect of an hereditary sovereignty, and entails upon the kingdom all the evils inseparable from an elective monarchy. By the *second*, "that foreign candidates to the throne shall be excluded, and for the future, no person can be chosen king of Poland, except a native Pole of noble origin, and possessing land in the kingdom," the house of Saxony, and all foreign princes who might be likely to give weight to Poland by their hereditary dominions, and restore its provinces and liberties, are set aside. By the *third*, "the government of Poland shall be for ever free, independent, and of a republican form;" the *liberum veto*, and all the exorbitant privileges of the equestrian order, are confirmed in their utmost latitude. And by the *fourth*, "a permanent council shall be established, in which the executive power shall be vested;" and in this council the equestrian order, hitherto excluded from the administration of affairs in the interval of diets, shall be admitted, so that the prerogatives of the crown are still farther diminished. But this change of the constitution was intended by the partitioning powers to serve their own purposes, and give a large scope to influence and faction over that part of the kingdom they had not seized.

**REVENUES.]** Though the king of Poland is stinted in the political exercise of his prerogative, yet his revenue is sufficient to maintain him and his household in splendour, as he pays no troops, or officers of state, not even his body-guards. The present king had 1,000,000 and a half of florins settled upon him by the commission of state; and the income of his predecessors generally amounted to 140,000*l.* sterling. The public revenues arose chiefly from the crown-lands, the salt-mines in the palatinate of Cracow, now in Austrian Poland, which alone amounted to nearly 100,000*l.* sterling; ancient tolls and customs, particularly those of Elbing and Dantzic, the rents of Marienburg, Dirihau, and Rogenhuis, and of the government of Cracow and district of Niepolomnicz.

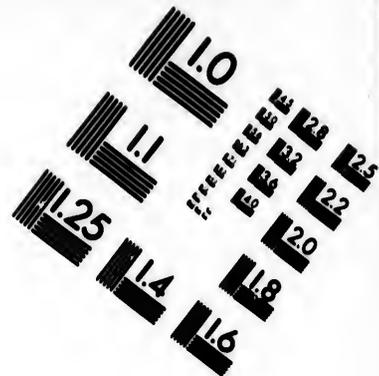

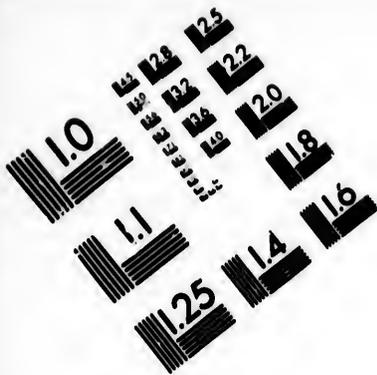

Western Prussia was the greatest loss to Poland, as by the dismemberment of that province, the navigation of the Vistula depends entirely upon the king of Prussia. Prussia has laid such heavy duties on the merchandize passing to Dantzic, as greatly to diminish the trade of that town, and to transfer a considerable part of it to Memel and Königsburgh.

By the dismemberment in 1772, Poland lost nearly half her annual income. To supply this deficiency, it became necessary to new-model and increase the taxes.

**MILITARY STRENGTH.]** The innate pride of the Polish nobility is such, that they always appear in the field on horseback; and it is said that Poland can raise with ease 100,000, and Lithuania 70,000 cavalry; but it must be understood that servants are included. As to their infantry, they are generally hired from Germany, but are soon dismissed, because they must be maintained by extraordinary taxes, of which the Polish grandees are by no means fond. As to the ordinary army of the Poles, it consisted in 1778, of 12,310 men in Poland, and 7,465 in Lithuania. The empress of Russia maintains in the country 10,000 soldiers, and every garrison is composed of Russians and natives; 1000 of the former are stationed at Warsaw. These hold the nobles in subjection; and the king himself is little more than a viceroy, while the Russian ambassador regulates the affairs of the kingdom under the direction of his court. The *pospolite* consists of all the nobility of the kingdom, and their followers, except the chancellor, and the starosts or governors of frontier places; and they may be called by the king into the field upon extraordinary occasions; but he cannot keep them above six weeks in arms, neither are they obliged to march above three leagues out of the kingdom.

The Polish hussars are the finest and most showy body of cavalry in Europe; next to them are the pancerns; and both these bodies wear coats of mail and iron caps. The rest of the cavalry are armed with muskets and heavy scymitars. The Poles may be rendered excellent troops by discipline, and on various occasions, particularly under John Sobieski, they made as great a figure in arms as any people in Europe, and proved the bulwark of Christendom against the infidels. It did not suit the Saxon princes, who succeeded that hero, to encourage a martial spirit in the Poles, whom they perpetually overawed with their electoral troops; nor indeed to introduce any reformation among them, either civil or military; the effects of which conduct have been since severely felt in that country.

**ORDERS.]** The order of the "*White Eagle*" was first instituted by Uladislavus in the year 1325, but revived by Augustus I. in the year 1705, to attach to him some of the Polish nobles who, he feared, were inclined to Stanislaus his competitor; it was conferred also on the czar Peter the Great of Russia. The collar is composed of eagles displayed, and annulets linked together, having pendent to it the badge, which is a cross of eight points enamelled, gold, bordered white and cantoned with a smaller cross, having a bead on each point charged on one side with an eagle, white, displayed, having over its head an imperial crown, and on the reverse the king's cypher with this motto, "*Pro fide, rege, et lege.*" The knights commonly wear the badge pendent to a broad blue ribband, worn fash-ways from the right shoulder and under the left arm, and a star of eight points embroidered in gold and silver alternately, on the left side of their coat. The present king instituted the order of "*St. Stanislaus*," soon after his election to the crown in 1765. The badge is a gold cross enamelled red, and on the centre of it is a medallion with the image of St. Stanislaus enamelled in proper colours. It is worn pendent to a red ribband edged with white. The star of the order is silver, and in the centre is a cypher of S. A. R. (Stanislaus Augustus Rex) encircled with the motto "*Premiando incitat.*"

**HISTORY.]** Poland of old was possessed by the Vandals, who were afterwards partly expelled by the Rus and Tartars. It was divided into many small states or principalities, each almost independent of another, though they generally had some prince who was paramount over the rest. In the year 700, the people, through the oppression of their petty chiefs, gave the supreme command, under the title of duke, to Cracus, the founder of the city of Cracow. His posterity failing, in the year 830, a peasant, one Piastus, was elected to the ducal dignity. He lived to the age of 120 years, and his reign was so long and auspicious, that every native Pole who has

has been since elected king is called a Piast. From this period, till the accession of Micislaus II. in 964, we have no very certain records of the history of Poland. The title of duke was retained till the year 999, when Boleslaus assumed the title of king, and conquered Moravia, Prussia, and Bohemia, making them tributary to Poland. Boleslaus II. added Red Russia to Poland, by marrying the heiress of that duchy, anno 1059. Jagello, who, in 1384, mounted the throne, was grand-duke of Lithuania, and a Pagan; but on his being elected king of Poland, he not only became a Christian, but was at pains to bring over his subjects to that religion. He united his hereditary dominions to those of Poland, which gave such influence to his posterity over the hearts of the Poles, that the crown was preserved in his family, until the male line became extinct in Sigismund Augustus, in 1572. This prince admitted the reformed, with the Greeks and all other sects, to a seat in the diet, and to all the honours and privileges before confined to the catholics. He gave such evident marks of favour to the protestant confession, that he was suspected of being inclined to change his religion. At this time two powerful competitors appeared for the crown of Poland. These were Henry, duke of Anjou, brother to Charles IX. king of France, and Maximilian of Austria. The French interest prevailed by private bribes to the nobles, and a stipulation to pay an annual pension to the republic from the revenues of France. But Henry had not been four months on the throne of Poland, when his brother died, and he returned privately to France, which kingdom he governed by the name of Henry III. The party who had espoused Maximilian's interest endeavoured once more to revive his pretensions; but the majority of the Poles being desirous to chuse a prince who might reside among them, made choice of Stephen Batori prince of Transylvania; who, in the beginning of his reign, meeting with some opposition from the Austrian faction, took the wisest method to establish himself on the throne, by marrying Anne, the sister of Sigismund Augustus, and of the royal house of the Jagellons. Stephen produced a great change in the military affairs of the Poles, by establishing a new militia, composed of the Cossacs, a rough and barbarous race of men, on whom he bestowed the Ukraine. Upon his death, in 1586, the Poles chose Sigismund, son of John king of Sweden, by Catharine sister of Sigismund II. for their king.

Sigismund was crowned king of Sweden after his father's death; but being expelled as we have seen in the history of Sweden, by the Swedes, a long war ensued between them and the Poles, and terminated in favour of the latter. Sigismund being secured in the throne of Poland, aspired to that of Russia as well as Sweden; but after long wars, he was defeated in both views. He was afterwards engaged in a variety of unsuccessful wars with the Turks and the Swedes. At last a truce was concluded under the mediation of France and England; but the Poles were forced to agree, that the Swedes should keep Elbing, Memel, Branenburg and Pillau, together with all they had taken in Livonia. In the year 1623, Sigismund died, and Uladisslaus his son succeeded. This prince was successful both against the Turks and the Russians, and obliged the Swedes to restore all the Polish dominions they had taken in Prussia. His reign, however, was unfortunate, by his being instigated, through the avarice of his great men, to encroach upon the privileges of the Cossacs in the Ukraine. As the war which followed was carried on against the Cossacs upon ambitious and perfidious principles, the Cossacs, naturally a brave people, became desperate; and on the succession of John II. brother to Uladisslaus, the Cossac general Schmielinski defeated the Poles in two great battles, and forced them to a dishonorable peace. It appears that, during the course of this war, the Polish nobility behaved like the worst of russians, and their conduct being highly condemned by John, they as highly condemned the peace he had concluded. As the jealousy arising from this source continued, the Russians came to a rupture with the Poles; and being joined by many of the Cossacs, they,

in 1654, took Smolensko. This was followed by the taking of Wilna, and other places; and they committed horrid ravages in Lithuania. Next year, Charles X. of Sweden, after over-running Great and Little Poland, entered into Polish Prussia, all the towns of which received him, except Dantzic. The resistance made by that city gave the Poles time to re-assemble, and their king, John Casimir, who had fled into Silesia, was joined by the Tartars, as well as Poles; so that the Swedes, who were dispersed through the country, were every where cut in pieces. The Lithuanians, at the same time, disowned the allegiance they had been forced to pay Charles, who returned to Sweden with no more than a handful of his army. It was during this expedition, that the Dutch and English protested Dantzic, and the elector of Brandenburg acquired the sovereignty of Ducal Prussia, which had submitted to Charles. Thus the latter lost Poland, of which he had made an almost complete conquest. The treaty of Oliva was begun after the Swedes had been driven out of Cracow and Thorn, by which Royal Prussia was restored to the Poles. They were, however, forced to quit all pretensions to Livonia, and to cede Smolensko, Kiow, and the duchy of Siveria, to the Russians.

During these transactions, the Polish nobility grew dissatisfied with the concessions their king had made to the Cossacs, many of whom had thrown off the Polish yoke; others taxed him with want of capacity; and some, with an intention to rule by a mercenary army of Germans. Casimir, who was fond of retirement and study, finding that cabals and factions increased every day, and that he himself might fall a sacrifice to the public discontent, abdicated his throne, and died abbot of St. Germain in France, having employed his latter days in Latin poetical compositions, which are far from being despicable.

The most remote descendants of the ancient kings ending in John Casimir, many foreign candidates presented themselves for the crown of Poland; but the Poles chose for their king a private gentleman of little interest, and less capacity, one Michael Wiesznowilki, because he was descended from a Piast. His reign was disgraceful to Poland. Large bodies of the Cossacs had put themselves under the protection of the Turks, who conquered all the provinces of Podolia, and took Kaminiack, till then thought impregnable. The greatest part of Poland was then ravaged, and the Poles were obliged to pay an annual tribute to the sultan. Notwithstanding those disgraceful events, the credit of the Polish arms was in some measure maintained by John Sobieski, the crown-general, a brave and active commander, who had given the Turks several defeats. Michael dying in 1673, Sobieski was chosen king; and, in 1676, he was so successful against the infidels, that he forced them to remit the tribute they had imposed upon Poland; but they kept possession of Kaminiack. In 1683, Sobieski, though he had not been well treated by the house of Austria, was so public-spirited as to enter into the league that was formed for the defence of Christendom against the infidels, and acquired immortal honour, by obliging the Turks to raise the siege of Vienna, and making a terrible slaughter of the enemy; for all which glorious services, and driving the Turks out of Hungary, he was ungratefully requited by the emperor Leopold.

Sobieski returning to Poland, continued the war against the Turks, but unfortunately quarrelled with the senate, who suspected that he wanted to make the crown hereditary in his family. He died, after a glorious reign, in 1696.

Poland fell into great distractions upon Sobieski's death. Many confederacies were formed; but all parties seemed inclined to exclude the Sobieski family. In the mean while, Poland was insulted by the Tartars, and her crown was in a manner put up to sale. The prince of Conti, of the blood royal of France, was the most liberal bidder; but while he thought the election almost sure, he was disappointed by the intrigues of the queen-dowager, in favour of her younger son, prince Alexander Sobieski; for which she was driven from Warsaw to Dantzic. Augustus, elector of Saxony, started up as a candidate, and after a sham election, being proclaimed by the bishop of Cujavia, he took possession of Cracow with a Saxon army, and actually was crowned in that city, in 1697. The prince of Conti made several unsuccessful efforts to re-establish his interest, and pretended that he had been actually chosen; but he was afterwards obliged to return to France, and the other powers of Europe seemed to acquiesce in the election of Augustus. The manner in which he was driven from the throne by Charles XII. of Sweden (who procured the advancement of Stanislaus), and afterwards restored by the czar, Peter the Great, has been already related in the history of Sweden. It was not till the year 1723 that Augustus was fully confirmed on the throne, which he held upon precarious and disagreeable terms. The Poles were naturally attached to Stanislaus, and were perpetually forming conspiracies and plots against Augustus, who was obliged to maintain his authority by means of his Saxon guards and regiments. In 1725, his natural son, prince Maurice, afterwards the famous count Saxe, was chosen duke of Courland; but Augustus was not able to maintain him in that dignity, against the power of Russia and the jealousy of the Poles. Augustus died, after an unquiet reign, in 1733, having done all he could to insure the succession of Poland to his son Augustus II. (or, as he is called by some, III.) This occasioned a war, in which the French king maintained the interest of his father-in-law Stanislaus, who was actually re-elected to the throne by a considerable party, of which the prince primate was the head. But Augustus, entering Poland with a powerful army of Saxons and Russians, compelled his rival to retreat into Dantzic, from whence he escaped with great difficulty into France. In the history of Germany, the war between Augustus II. as elector of Saxony, or rather as the ally of Russia and Austria, and his late Prussian majesty, has been distinctly noticed. It is sufficient to say, that though Augustus was a mild, moderate prince, and did every thing to satisfy the Poles, he never could gain their hearts: and all he obtained from them was merely shelter, when his Prussian majesty drove him from his capital and electorate. Augustus died at Dresden, in 1763; upon which, count Stanislaus Poniatowski was chosen king, by the name of Stanislaus Augustus; though it is said that the election was conducted irregularly, and that he obtained the crown chiefly through the influence of the empress of Russia. He is a man of abilities and address; but from various concurring causes, he has had the unhappiness to see Poland, during his reign, a scene of desolation and calamity. In 1766, two Polish gentlemen presented a petition to the king, in the name of all the protestant nobility, and in behalf also of the members of the Greek church, wherein they demanded to be re-instated in their ancient rights and privileges, and to be placed upon the same footing in every respect with the Roman Catholic subjects of the kingdom. "The difference of sentiments upon some points of religion among Christians," said they in their petition, "ought not to interfere with employments of the state. The different sects of Christians, although they differ in opinion among themselves with respect to some points of doctrine, agree all in one point, that of being faithful to their sovereign, and obedient to his orders: all the Christian courts are convinced of this truth; and therefore, without having any regard to the religion they profess, Christian princes ought only to seek after those whose merit and talents make them capable of serving their country properly." The king gave no answer at this time to the petition of the dissidents; but the matter was referred to the diet, which was held the following year, when the ministers of the courts of Russia, of London, of Berlin, and of Copenhagen, supported their pretensions. The diet appeared to treat the complaints of the dissidents with great moderation, as to the free exercise of their worship, which gave some flattering expectations that the affair would be happily terminated. But the intrigues of the late king of Prussia appear to have prevented this: for though he openly professed to be a zealous defender of the

cause of the dissidents, yet it was manifest from the event, that his great aim was to promote the views of his own ambition. The intervention of the Russians in the affairs of Poland also gave great disgust to all parties in the kingdom. The whole nation entered into confederacies formed in distinct provinces; the popish clergy were active in opposing the cause of the dissidents; and this unfortunate country became the theatre of the most cruel and complicated of all wars; partly civil, partly religious, and partly foreign. The confusion and devastation continued in Poland during the years 1769, 1770, and 1771, whereby the whole face of the country was desolated; many of the principal Polish families retired into foreign states with their effects; and had it not been for a body of Russian troops which acted as guards to the king at Warsaw, that city had likewise exhibited a scene of plunder and massacre. To these complicated evils, were added, in the year 1770, that most dreadful scourge, the pestilence, which spread from the frontiers of Turkey to the adjoining provinces of Podolia, Volhinia, and the Ukraine; and in these provinces it is said to have swept off 250,000 of the people. Meanwhile, some of the Polish confederates interceded with the Turks to assist them against their powerful oppressors; and a war ensued between the Russians and the Turks, on account of Poland. The conduct of the Grand Signior and of the Ottoman Porte towards the distressed Poles was just and honourable, and the very reverse of that of their Christian, Catholic, and Apostolic neighbours\*.

In the midst of those turbulent and disastrous scenes, the confederates (who ever considered the king as unlawfully elected, and who imputed to his fatal elevation and direction, or approbation, all the various ills under which the kingdom groaned from the Russian oppression) planned and executed one of the most daring enterprises of which modern history makes mention. I mean the attempt to assassinate the king, by Kozinski and two other chiefs, who chose thirty-seven other persons to accompany them. They obtained admission into Warsaw, unsuspected or undiscovered, by the following stratagem. They disguised themselves as peasants who came to sell hay, and artfully concealed their saddles, arms, and cloaths, under the loads of hay which they brought in waggons, the more effectually to escape detection.

It was on Sunday night, the 3d of September, 1771, between nine and ten o'clock, when the king was returning to the palace from a visit to his uncle prince Czartoriski, grand chancellor of Lithuania, that he was attacked by the conspirators, in the very streets of Warsaw, who ordered his coachman to stop upon pain

\* In 1764, the empress of Russia transmitted to the court of Warsaw an act of renunciation, signed with her own hand, and sealed with the seal of the empire, wherein she declares, "That she did by no means arrogate either to herself, her heirs and successors, or to her empire, any right or claim to the districts or territories, which were actually in possession, or subject to the authority of the kingdom of Poland, or great duchy of Lithuania; but that, on the contrary, her said majesty would guarantee to the said kingdom of Poland, and duchy of Lithuania, all the immunities, lands, territories, and districts, which the said kingdom and duchy ought by right to possess, or did now actually possess; and would at all times, and for ever, maintain them in the full and free enjoyment thereof, against the attempts of all and every one who should at any time, or on any pretext, endeavour to dispossess them of the same." In the same year did the king of Prussia sign, with his own hand, an act, wherein he declared, "that he had no

claims, formed no pretensions on Poland, or any part thereof; that he renounced all claims on that kingdom, either as king of Prussia, elector of Brandenburg, or duke of Pomerania." In the same instrument he guarantees, in the most solemn manner, the territories and rights of Poland against every power whatever. The empress-queen of Hungary, so late as the month of January, 1771, wrote a letter with her own hand to the king of Poland, in which she gave him the strongest assurances, "That her friendship for him and the republic was firm and unalterable; that the motion of her troops ought not to alarm him; that she had never entertained a thought of seizing a part of his dominions, nor would even suffer any other power to do it."—From which, according to the political creed of some princes, we may infer, that to guarantee the rights, liberties, and revenues of a state, means to annihilate those liberties, seize upon those rights, and appropriate those revenues to their own use.

of instant death. They fired several shot into the carriage, one of which passed through the body of a heyduc, who endeavoured to defend his master from the violence of the assassins. Though fifteen or sixteen other persons attended his majesty, they all basely abandoned him. Meanwhile, the king had opened the door of his carriage, with a design of effecting his escape under shelter of the night, which was very dark. He had even alighted, when the assassins seized him by the hair, exclaiming in Polish, with horrible execrations, "We have thee now; thy hour is come." One of them discharged a pistol at him so very near, that he felt the heat of the flash, while another cut him across the head with a sabre which penetrated to the bone. They then laid hold of his majesty by the collar, and mounting on horseback, dragged him along the ground between their horses, at full gallop, for near five hundred paces through the streets of Warsaw.

The king, after suffering incredible hardships, at last obtained from Kozinski an instant's repose. They sat down together on the ground, and his majesty employed these moments in endeavouring to soften his conductor, in which he most fortunately succeeded, after having given him the strongest assurances of his pardon and safety. Judging however, that it was prudent to gain some asylum without delay, and recollecting that there was a mill at some considerable distance, he immediately made towards it. Kozinski knocked, but in vain; no answer was given: he then broke a pane of glass in the window, and intreated for shelter to a nobleman who had been plundered by robbers. The miller refused, supposing them to be banditti, and continued for more than half an hour to persist in his denial. At length the king approached, and speaking through the broken pane, endeavoured to persuade him to admit them under his roof, adding, "If we were robbers, as you suppose, it would be very easy for us to break the whole window, instead of one pane of glass." This argument prevailed. They at length opened the door, and admitted his majesty. He immediately wrote a note to general Coccoi, colonel of the foot-guards. It was literally as follows: "Par une espèce de miracle, " Je suis sauvé des mains des assassins. Je suis ici au petit moulin de Mariemont. " Venez au plutôt me tirer d'ici. Je suis blessé, mais pas fort\*."

When the messenger arrived with the note, the astonishment and joy was incredible. Coccoi instantly rode to the mill, not above half a league from Warsaw, followed by a detachment of the guards. He met Kozinski at the door with his sabre drawn, who admitted him as soon as he knew him. The king had sunk into a sleep, caused by his fatigue; and was stretched on the ground, covered with the miller's cloak. Coccoi immediately threw himself at his majesty's feet, calling him his sovereign, and kissing his hand. It is not easy to paint or describe the astonishment of the miller and his family, who instantly imitated Coccoi's example by throwing themselves on their knees. The king returned to Warsaw in general Coccoi's carriage, and reached the palace about five in the morning. Scarcely could the nobility or people at Warsaw credit the evidence of their senses, when they saw him return. Certainly, neither the escape of the king of France from Damien, nor of the king of Portugal from the conspiracy of the duke d'Avceiro, were equally amazing or improbable.

The mill, rendered memorable by so singular an event, is a wretched Polish hovel, at a distance from any house. But the king has rewarded the miller to the extent of his wishes, in building him a mill upon the Vistula, and allowing him a small pension. From the relentings of Kozinski, and his posterior good conduct, as above related, his own life was saved, and he now resides in the papal territories, with an annual pension from the king. Pulaski, another of the conspirators, distinguished

\* "By a kind of miracle I am escaped from the hands of assassins. I am now at the mill of Mariemont. Come as soon as possible, and take me from hence. I am wounded, but not dangerously."

himself in the American service, and was killed in attacking the British lines at Savannah, in 1779.

The following year, 1772, it appeared, that the king of Prussia, the emperor and empress-queen, and the empress of Russia, had entered into an alliance to dismember Poland; though Prussia was formerly its vassal, and Russia, in the beginning of the seventeenth century, saw its capital and throne possessed by the Poles, while Austria in 1683 was indebted to a king of Poland, for the preservation of its metropolis, and almost for its very existence. The three allied powers, acting in concert, set up their formal pretensions to the respective districts which they had allotted for, and guaranteed to, each other: Polish, or Western Prussia, and some districts bordering upon Brandenburg, for the king of Prussia; almost all the south-east parts of the kingdom bordering upon Hungary, together with the rich salt-works of the crown, for the empress-queen of Hungary and Bohemia\*; and a large district of country about Mohilow, upon the banks of the Dnieper, for the empress of Russia †. But though each of these powers pretended to have a legal title to the territories which were allotted to them respectively, and published manifestos in justification of the measures which they had taken; yet as they were conscious that the fallacies by which they supported their pretensions were too gross to impose upon mankind, they forced the Poles to call a new diet; and threatened them, that, if they did not consent unanimously to sign a treaty for the ceding of those provinces to them respectively, the whole kingdom would be laid under a military execution, and treated as a conquered state. In this extremity of distress, several of the Polish nobility protested against this violent act of tyranny, and retired into foreign states, chusing rather to live in exile, and to have all their landed property confiscated, than to be the instruments of bringing their country to utter ruin; but the king was prevailed upon to sign this act, and his example was followed by many of his subjects.

As to the king of Prussia, his conduct in Poland was highly tyrannical and oppressive. In the year 1771, his troops entered into Great Poland, and carried off from that province, and its neighbourhood, at a moderate computation, 12,000 families. On the 29th of October, in the same year, he published an edict commanding every person, under the severest penalties, and even corporal punishment, to take in payment for forage, provisions, corn, horses, &c. the money offered by his troops and commissaries. This money was either silver, bearing the impression of Poland, and exactly worth one-third of its nominal value, or ducats struck in imitation of Dutch ducats, seventeen per cent. inferior to the real ducats of Holland. With this base money he bought up corn and forage enough, not only to supply his army for two whole years, but to stock magazines in the country itself, where the inhabitants were forced to come and re-purchase corn for their daily subsistence at an advanced price, and with good money, his commissaries refusing to take the same coin they had paid. At the lowest calculation, he gained, by this masterly and *honest* manœuvre, seven millions of dollars. Having stripped the country of money and provisions, his next attempt was to thin it still more of

\* The district claimed by Austria, was "all that tract of land lying on the right side of the Vistula, from Silesia above Sandomir, to the mouth of the San, and from thence by Franepole, Zamoisic, and Rubieslow, to the Bog: from the Bog, along the frontiers of Red Russia, to Zabras, on the borders of Volhinia and Podolia; and from Zabras in a strait line to the Nieper, where it receives the Sbrytz, taking in a part of Podolia, and then along the boundaries separating Podolia from Moldavia. This country is now incorporat-

ed with Austria, under the appellation of the kingdoms of Galicia and Lodomeria.

† The Russian claims comprise Polish Livonia, that part of the palatinate of Polotik to the east of the Duna—the palatinates of Vitepsk, Miedzilaw, and two portions of the palatinate of Minsk. This tract of land (Polish Livonia excepted) is situated in White Russia, and includes full one third of Lithuania. It is now divided into the two governments of Polotik and Mohilief.

its inhabitants. To people his own dominions at the expence of Poland, had been his great aim; for this purpose he hit upon a new contribution; every town and village was obliged to furnish a certain number of marriageable girls; the parents to give as a portion, a feather-bed, four pillows, a cow, two hogs, and three ducats in gold. Some were bound hand and foot, and carried off as criminals. His exactions from the abbeys, convents, cathedrals, and nobles, were so heavy, and exceeded at last their abilities so much, that the priests abandoned their churches, and the nobles their lands. These exactions continued with unabated rigour, from the year 1771, to the time the treaty of partition was declared, and possession taken of the provinces usurped. From these proceedings it would appear, that his Prussian Majesty knew no rights but his own; no pretensions but those of the house of Brandenburg; no other rule of justice but his own pride and ambition.

The violent dismemberment and partition of Poland has justly been considered as the first great breach in the modern political system of Europe. The surprize of a town, the invasion of an insignificant province, or the election of a prince, who had neither abilities to be feared, nor virtues to be loved, would, some years ago, have armed one half of Europe, and called forth all the attention of the other. But the destruction of a great kingdom, with the consequent disarrangement of power, dominion, and commerce, has been beheld by neutral nations with the most astonishing indifference and unconcern. The courts of London, Paris, Stockholm, and Copenhagen, remonstrated against these usurpations: but that was all. Poland was forced to submit, and the partition was ratified by their diet, held under the bribes and threats of the three powers. In the senate, there was a majority of six; but in the lower house, or assembly of nuncios, there was but one vote in favour of the measure, fifty-four against fifty-three. This is a very alarming circumstance, and shews that a most important, though not happy change, has taken place in that general system of policy, and arrangement of power and dominion, which had been for some ages an object of unremitting attention. Our ancestors might, perhaps, on some occasions, discover rather more anxiety about preserving the balance of power in Europe, than was necessary: but it has been well remarked, that the idea of considering Europe as a vast commonwealth, of the several parts being distinct and separate, though politically and commercially united, of keeping them independent though unequal in power, and of preventing any one from becoming too powerful for the rest, was great and liberal. It appears to be owing to this system, that this small part of the western world has acquired so astonishing a superiority over the rest of the globe. The fortune and glory of Greece proceeded from a similar system of policy, though formed upon a smaller scale. Both her fortune and glory expired with that system.

The revolution, which happened in this country on the 3d of May, 1791, deservedly engaged much of the public attention. The evils of elective monarchy were indeed the chief cause that Poland had almost ceased to be considered as a nation. The dynasty of future kings of Poland was to commence in Frederic Augustus, elector of Saxony, with the right of inheritance to his male descendants: in case the present elector should have no male issue, a husband chosen by him for his daughter, with the consent of the Polish representatives, shall begin the dynasty. But after this boasted change, Poland would only have advanced to that degree of freedom and civilization, which other European countries enjoyed in the 13th century. Her hundreds of citizens would have been free, her millions of peasants, slaves: at the utmost, not above five hundred thousand out of fifteen millions would have been free.

After a short and unequal struggle with Russia, this unhappy country has been forced to abandon the new constitution. The Polish king seems, in the consciousness

ness

ness of his own rectitude, and of the general patriotism, too much to have neglected the serpentine paths of prudence upon this occasion: the previous assent of Saxony should have been procured, and the sacrifice of Dantzic and Thorn to Prussia, though doubtless great, was yet to be preferred to the present national annihilation. The manifesto of the Russian empress, replete with sentiments disgraceful to humanity, was followed by some skirmishes; but it is said, that a letter, written with her own hand to the Polish king, in which she declared her resolution to double or triple her troops, rather than abandon her pretensions, induced that benignant monarch to prevent the further effusion of blood.

On the 6th of January, 1793, the king of Prussia issued a declaration respecting the march of his troops into Poland, in which he mentions the *friendly* interference of her imperial majesty the empress of Russia in the affairs of Poland: in the same strain his majesty adds, that he had entertained *hopes* that the troubles in that country would have subsided without his *own* interference, especially as he was so deeply occupied in another quarter. He *laments* that he has been disappointed, and that the propagation of French democracy, by means of clubs and Jacobin emissaries, especially in Great Poland, had already risen to such a height, as to require his most serious attention: his majesty, however, observes, that he has determined to anticipate their designs, by sending a sufficient body of troops into the territories of the republic, after having concerted proper measures with the friendly courts of Peterburgh and Vienna, who were equally interested with himself in the welfare of the republic.

The protest published at Grodno, in the sitting of the general confederation, the 3d of February, against this violent invasion, sufficiently evinces the detestation which the Poles themselves entertain of the measures of their pretended *friend*. They assure his majesty, that a continued correspondence between the military commanders and the civil magistrates had enabled the confederation to declare, that perfect tranquillity prevailed from one end of the kingdom to the other; that they were "astonished at the *assertions* of his majesty," in his last declaration! and conclude by intreating, that his majesty would revoke the orders which he had given for troops to enter the republic. Notwithstanding, however, these solemn assurances—notwithstanding the evidence and the facts which were alleged in support of them, the Prussian army advanced, and one of its detachments appeared under the walls of Thorn. The inhabitants, faithful to their duty, having refused entrance to the troops, experienced an open attack. Cannons were planted against it, the gates were broken open, the municipal guard were dislodged from their post; a defenceless city exhibited the spectacle of a place taken by assault, and the Prussian regiments entered, while the air resounded with their acclamations of triumph. There were no soldiers of the republic in the city to make resistance; it depended for security on public faith; and that was violated. At the same time, different Polish detachments, dispersed throughout Great Poland, were attacked and driven from their posts by superior force.

The confederation protest, that, confiding in solemn engagements, and in the faith of treaties, they could never have imagined that they had occasion to apprehend a surprise or open violence, where every thing ought to have assured them, that they were to find only friendship and assistance; and declare, that they will enter into no views which may tend to diminish any part of the Polish domains; but, on the contrary, that they are ready to sacrifice even the last drop of their blood, in defence of their liberty and independence. They conclude with *hoping*, that even the two imperial courts, and all other powers, in consequence of the reciprocity of national interests, will not behold with an eye of indifference a manifest violation of the rights of nations, and the open invasion of the domains of a neighbouring and friendly state.

The

The same general confederation at Grodno sent a note, dated the 6th of February, to count de Sievers, the Russian ambassador at that place, requesting him to make known to the empress his mistress, that the report of a new partition of Poland has spread a general alarm throughout the kingdom; that a nation, so long the sport of misfortune, is easily alarmed; that the remembrance of past miseries causes it to tremble at the approach of fresh troubles; that the confederation wait with confidence for new assurances from her majesty, of *friendship* and good will, to quiet the alarms raised among the people by these reports; and that their apprehensions are considerably augmented by the obstacles which M. Ighelstrom, the Russian general, has opposed to the troops of the republic, and his forbidding them the use of cannon; and, lastly, that they have all sworn to maintain the unity and indivisibility of the domains of the republic.

The last manifesto from the courts of Berlin and Petersburg, ordering the governors of several provinces of Poland to surrender their respective districts, to be hereafter regulated according to the *will* of these invaders, will be regarded by future historians as among those facts which serve as beacons or land-marks against arbitrary power. It will be adduced as an instance how fatally the possession of despotic authority corrupts the hearts and principles of those who are so unfortunate as to possess it.

It may be proper to mention two additional traits of despotism. On the 2d of April, the burgomasters and council of the city of Dantzic, assembled at the town-house, at the request of the king of Prussia, make known to every burgher and inhabitant, by public declaration, and order every person to keep himself quiet, to follow his trade and business as usual, and to remain peaceably in his house when the Prussian troops shall enter that city. The empress of Russia also commanded the king of Poland to travel to Grodno, under the escort of Russian troops, for the express purpose of sanctioning the alienation and partition of his kingdom.

On the 24th of June, there was an extraordinary diet at Grodno. The notes from the ministers of the courts of Petersburg and Berlin, urging the appointment of a *delegation* to discuss the proposed partition of the republic, being read, the king opposed the appointment of the delegation, contending with great warmth and perseverance, that the only proper course was to intreat the mediation of foreign courts in amity with Poland. The marshal, on the contrary, was for the appointment of a delegation; and, the question being called for, adjourned the diet. The following day the debate was renewed, and the majority in favour of the proposition was increased instead of being diminished. At last, it having been proposed, "that the delegation should be authorized to treat *only* with the court of Petersburg," the majority adopted this plan; and the question being put, it was ultimately decided, by one hundred and seven votes against twenty-four, that the delegation shall treat with the imperial court exclusively.

The means employed to effect the mock ratification of the partition of this unfortunate country, were entirely characteristic of the baseness of the cause. The diet, in the month of September, was assailed, for three successive days, with official notes from the Russian ambassador, and the Prussian minister, full of threats and menaces, pressing the signature of the treaty. The states, however, persisted in their refusal. At last M. de Sievers, the Russian ambassador, sent his ultimatum in a note, which ended with the following remarkable expressions: "The underwritten must besides inform the states of the republic assembled in the confederate diet, that he thought it of absolute necessity, in order to prevent every disorder, to order *100 battalions* of *grenadiers*, with four pieces of cannon, to surround the castle, to secure the *tranquillity* of their deliberations. The underwritten expects, that the sitting will not terminate, until the demanded signature of the treaty is decided."

decided." Conformably to this threat, the Russian soldiers so closely surrounded the castle, that no person was suffered to go out; some of the officers took their station in the senate, pretending to guard his majesty's person against conspirators. The king, on the contrary, sent a delegation to the Russian ambassador, declaring that he would not open the session in the presence of the Russian officers. In consequence, they were ordered to retire, except the general, who declared publicly, that no member should be permitted to quit the senate, before the consent to the treaty was given. The debates were long and violent; and it was not until three o'clock the next morning, after three successive divisions, that the diet came to a resolution, in which they declare, before all Europe, to whom they had frequently appealed, that, contrary to the faith of treaties most sacredly observed on their part, as well as to that of the treaty recently entered into with his majesty, the king of Prussia, and at his own desire, in the year 1790, whereby the independence and the integrity of Poland were guaranteed in the most solemn manner; that, being deprived of free will, surrounded at the moment of the present act by an armed foreign force, and threatened with a further invasion of the Prussian troops, they are forced to commission and authorize a deputation appointed to treat with the said king, to sign the treaty, such as it was, planned and amended under the mediation of the Russian ambassador.

In this ratification-treaty, extorted from the Poles at the point of the bayonet, it is further declared, in the name of the king, &c. that, in contradiction to the last article of the above-mentioned treaty at Grodno, the king does not give his ratification and consent in his own name and that of the diet, but so far, and upon condition that the commercial, and every special article shall be mutually agreed to, and definitively signed by both the high-contracting parties, under the mediation and guarantee of the court of Russia.

It is remarkable, that, at the very moment when Poland was surrendering its liberties to its despotic invaders, the generous sympathy of Great Britain was evinced by a liberal subscription, supported by all the most liberal characters in the nation, of every party, and of every sect, for the purpose of assisting the king and the republic to maintain their independence. Though the benevolent design was frustrated, the fact remains on record, as a noble testimony of the spirit of Britons in the cause of freedom, of the indignation which fills every British heart at the commission of injustice, and of the liberality with which they are disposed to assist those who suffer from the oppression of tyrants.

Thus, in one instance, the concert of princes, as it is called, has proved fatally victorious over the cause of man. Thus the growing happiness of a respectable nation has been sacrificed to the personal ambition of three despotic sovereigns. Thus the citizens of a free republic are, by one blow, reduced to be the abject slaves of tyrants. Thus the balance of Europe, so much the theme of politicians, and perhaps so necessary to the permanent welfare of Europe, has been sacrificed to private and to selfish views; while those nations, who have on former occasions devoted millions of lives, and expended countless sums in maintaining it, view with frigid tranquillity the fatal increase of despotic authority.

Whatever be the real object of this combination, it is such as no sound politician can observe with indifference. The precedent is fatal; the proceedings are ominous. If the object is ultimately the gratification of personal ambition in the parties concerned; if they have really, as some are disposed to believe, formed a secret agreement to divide among themselves, as suits their interest or their inclination, or as opportunity permits, the territory of Europe; if, as in the case of Poland, they may, without a shadow of pretence, without a cause of complaint, without any legal claim or interest, invade and subjugate a country, merely because it is too weak to oppose them; then the citizens of free states have indeed

†

cause

cause to tremble. Then the opulent part of every community have cause to fear for their possessions, since a respect for property never has been the creed of conquering despots. Then the enlightened part of mankind may weep over the fate of their fellow-creatures; and every individual, who would not wish to change the government under which he lives, for the most tyrannical and oppressive, may have cause to imprecate the interposition of Providence, to put a stop to a system which threatens the subversion of all that is dear or valuable of temporal enjoyments.

While the despots of Petersburg and Berlin had some reason to felicitate themselves upon the success of their depredations, the patriotic general Kosciuskow, excited by a detestation of the cruel oppression which his unhappy country experienced, entered and fortified the town of Cracow, at the head of a considerable number of the Poles. At Warsaw, the general hatred of tyranny produced an almost universal insurrection against the soldiers of despotism. On the 17th of April, 1794, these patriots, having rendered themselves masters of the grand arsenal at Warsaw, obliged the Russian garrison, consisting of three thousand troops, to evacuate the town. The Russian ambassador was obliged to take refuge with the Prussian army under general Wolky, encamped at a league's distance from that capital. General Igeltrohm, a few days before, had given orders to the whole of the Russian cavalry, in garrison there, to march from Warsaw, to join the troops which had been previously detached, in order to act against the army under general Kosciuskow.

When the insurrection took place, on the 17th, in the morning, general Igeltrohm ordered the only three battalions of Russian infantry, who remained in the garrison, to take up arms; at the same time he dispatched a message to the king, informing his majesty of this event. The king sent him word, that he had already been informed of what had happened; that his majesty had only to add a request to the general, to send all his troops out of the capital, in order to prevent bloodshed, until the minds of the people shall in some measure be pacified. General Igeltrohm, in the mean time, had sent general Bauer, at the head of a detachment, to protect the arsenal; but this was too late. The patriots had already rendered themselves masters of all the artillery contained in that fortress; and the latter general, with his detachment, on their arrival, were forced to lay down their arms, and to surrender as prisoners of war. The patriots afterwards, provided with arms from the arsenal, formed themselves in order of battle, and marched against a battalion of the Russian infantry, whom they drove out of the town. In this state of affairs, general Igeltrohm placed himself at the head of the remaining Russians, and took post in a street, where he was determined to defend himself; the Russian soldiers were fired upon with great violence from every window; and, after an engagement which lasted thirty-three hours, they were driven from Warsaw, with the loss of half their number killed.

Stanislaus Augustus (late count Poniatowski) was born in 1732, and crowned king of Poland in 1764. This prince, while a private nobleman, resided some time in London, and is a fellow of the Royal Society.

**AIR, CLIMATE, SOIL, AND FACE** } This being a mountainous country, lying  
**OF THE COUNTRY.** } upon the Alps (which form an amphitheatre  
of more than 100 miles) the frosts are consequently bitter in winter, the hills being covered with snow sometimes all the year long. In summer, the inequality of the soil renders the same province very unequal in its seasons; on one side of those mountains, the inhabitants are often reaping, while they are sowing on another. The vallies, however, are warm and fruitful, and well cultivated; and nothing can be more delightful than the summer months in this charming country. It is subject to rains and tempests; for which reason public granaries are every where erected, to supply the failure of their crops. The water of Switzerland is generally excellent, and often descends from the mountains in large or small cataracts which have a delightful effect.

There is, perhaps, no country in the world, wherein the advantageous effects of unwearied and persevering industry are more remarkably conspicuous than in Switzerland. In passing over the mountainous parts thereof, the traveller is struck with admiration, to observe rocks that were formerly barren, now planted with vines, or abounding with rich pasture; and to mark the traces of the plough along the sides of steep precipices. The inhabitants seem to have surmounted every obstruction which soil, situation, and climate had thrown in their way, and to have spread fertility over various spots of the country, which nature seemed to have consigned to everlasting barrenness. The feet of the mountains, and sometimes also the very summits, are covered with vineyards, cornfields, meadows, and pasture-grounds. Other parts of this country are more dreary, consisting almost entirely of barren and inaccessible rocks, some of which are continually covered with snow or ice. The vallies, between these icy and snowy mountains, appear like so many smooth frozen lakes; and from them vast fragments of ice frequently fall down into the more fruitful spots beneath. In some parts, there is a regular gradation from extreme wildness to high cultivation; in others the transitions are very abrupt, and very striking. Sometimes a continued chain of cultivated mountains, richly clothed with woods, and studded all over with hamlets, cottages above the clouds, pastures which appear suspended in the air, exhibit the most delightful landscape that can be conceived; and in other places appear rugged rocks, cataracts, and mountains of a prodigious height, covered with ice and snow.

**GLACIERS.**] No subject in natural history is more curious than the origin of these glaciers, which are immense fields of ice. If a person could be conveyed to such an elevation as to embrace at one view the Alps of Switzerland, Savoy, and Dauphiné, he would behold a vast chain of mountains, intersected by numerous vallies, and composed of many parallel chains, the highest occupying the center, and the others gradually diminishing, in proportion to their distance from that center.

The most elevated, or central chain would appear bristled with pointed rocks, and covered, even in summer, with ice and snow, in all parts that are not absolutely perpendicular. On each side of this chain, he would discover deep vallies clothed with verdure, peopled with numerous villages, and watered by many rivers. In considering these objects with greater attention, he would remark that the central chain is composed of elevated peaks and diverging ridges, whose summits are overspread with snow; that the declivities of the peaks and ridges, excepting those parts that are extremely steep, are covered with snow and ice; and that the intermediate depths and spaces between them are filled with immense fields of ice, terminating in those cultivated vallies which border the great chain.

These immense fields of ice usually rest on an inclined plain: being pushed forwards by the pressure of their own weight, and but weakly supported by the rugged rocks beneath, they are intersected by large transverse crevices; and present the

appearance of walls, pyramids, and other fantastic shapes, observed at all heights and in all situations, wherever the declivity is beyond thirty or forty degrees.

Mr. Coxe describes the method of travelling over these glaciers. "We had each of us a long pole spiked with iron; and, in order to secure us as much as possible from slipping, the guides fastened to our shoes *crampons*, or small bars of iron, provided with four small spikes of the same metal. At other times, instead of *crampons*, we had large nails in our shoes, which more effectually answered our purpose. The difficulty of crossing these valleys of ice, arises from the immense chasms. We rolled down large stones into several of them; and the great length of time before they reached the bottom, gave us some conception of their depth: our guides assured us, that in some places they are not less than five hundred feet deep. I can no otherwise convey to you an image of this body of ice, broken into irregular ridges and deep chasms, than by comparing it to a lake instantaneously frozen in the midst of a violent storm." In speaking of an unsuccessful attempt of some gentlemen to reach the summit of Mount Blanc, he presents to his readers a most horrid image of the danger of these chasms. "As they were returning in great haste, (owing to the day being far advanced) one of the party slipped in attempting to leap over a chasm of ice. He held in his hand a long pole, spiked with iron, which he struck into the ice; and upon this he hung dreadfully suspended for a few moments, until he was released by his companions."

[MOUNTAINS.] In this mountainous country, where nature is all upon a grand scale, Mont Blanc is particularly distinguished from other mountains, by having its summits and sides clothed to a considerable depth with a mantle of snow, almost without the intervention of the least rock to break the glare of the *white* appearance. According to the calculations of Mr. De Luc, the height of this mountain above the level of the sea is 2,391 $\frac{1}{2}$  French toises, or 15,304 English feet; or, according to sir George Shuckburgh, of 15,662 feet, which gives a difference of only 358 feet.—It appears, that the Peak of Teneriff and *Ætna* have been frequently supposed to be the highest points of the globe: but from the most accurate observations it will be found that Mont Blanc is of much more considerable elevation.

	Feet.
Mont Blanc is above the level of the sea, according to sir George Shuckburgh's mensuration, which agrees with M. de Sauffure's observations,	15,662
The peak of Teneriff, according to Feuille	13,248
<i>Ætna</i> , according to sir George Shuckburgh	10,954
Canigou, the highest of the Pyrenes	9,222
Ben-nevis, the highest mountain in Scotland	4,337
Vesuvius, according to M. de Sauffure	3,900
Snowden in Wales	3,555

Hence it will appear that there are no mountains (except those in America, particularly Chimboraco, the highest point of the Cordilleras, the elevation of which, according to Condamine, surpasses 3,000 toises, or 19,200 feet, but according to others, 20,608 feet) which are equal to the altitude of Mont Blanc. Some philosophers, upon considering the great superiority of the Eastern rivers over the European, both in depth and breadth, have drawn a presumptive argument, that the Asiatic mountains are much more lofty than those of Europe. But conjectures are now banished from natural philosophy: and until it shall be proved from undoubted calculations, that the highest part of the Caucasus rises more than 15,000 feet above the level of the sea, Mont Blanc may be fairly considered as more elevated.

The

The summit of this mountain was deemed inaccessible before Dr. Pacard attempted to reach it in 1786, and succeeded in the attempt; soon after which, the same journey was undertaken by M. de Saussure, a professor in Geneva, who published a very interesting account of his journey. It was on the first of August 1787 that he began his march from the Priory of Chamouni, accompanied by a servant and eighteen guides, to carry a tent, provisions, instruments, &c. M. de Saussure passed the first night at the top of the mountain of la Côte, situated to the south of the priory; and 779 toises above the village. Hitherto there is no trouble or danger, the ascent is either on turf, or on rock, and it is easily accomplished in 5 or 6 hours.

The second day's journey is not so easy. The glacier of la Côte is to be passed, which is difficult and dangerous, being crossed by wide, deep, and irregular crevices, which frequently cannot be passed but over bridges of snow, sometimes very slight, and suspended over deep abysses. A guide narrowly escaped perishing in one of these: he went in the evening with two others to reconnoitre the passage; fortunately they had taken the precaution of fastening themselves together with cords; the snow gave way in the middle of a wide deep crevice, wherein the man was suspended between his two companions. At four o'clock in the afternoon of the second day, they again encamped, 1,455 toises above the priory, 1,995 above the sea, 90 toises higher than the pike of Teneriff. Here they soon felt the rarity of the air: the barometer was down to 17 inches 10 lines  $\frac{2}{3}$ . Those hardy fellows, who accompanied our philosopher, to whom the seven or eight hours march, which they had just made, was no sort of fatigue, had scarcely thrown up five or six spadefuls of snow, to prepare for fixing the tent, before they were utterly unable to proceed, without resting every moment. M. de Saussure himself, who is so much accustomed to the mountain air, was quite exhausted with fatigue only in observing with his meteorological instruments. They were troubled with an incessant thirst, which they had no means of allaying but by melting the snow. From the midst of this plain, enclosed by the highest summit of Mont Blanc to the south, its lofty steps to the east, and the dome of Gouté to the west, scarcely any thing is to be seen but snow, pure, and of a dazzling whiteness, forming on the highest pikes a singular contrast with the almost black sky of those exalted regions. No living creature is to be seen, no appearance of vegetation; it is the abode of cold and silence.

The guides, fearful of cold, closed the openings of the tent so carefully, that M. de Saussure suffered so much from heat, and air corrupted by respiration, as to be obliged to go out during the night, in order to breathe. He found the moon shining with most astonishing brightness, in the midst of an ebony sky, whilst Jupiter shined all radiant from behind the loftiest peak to the east of Mont Blanc.—As soon as it was light, they found the thermometer 3 degrees below the freezing point. On the third day they safely arrived at the summit at about eleven o'clock. There is no plain, but it is a long ridge nearly horizontal, in a direction from east to west. This ridge is so narrow, that two persons cannot walk a-breast on it; especially at the west end, where it resembles the roof of a house. In this state of awful elevation, as M. de Saussure was putting his instruments in order, to observe with them, he was obliged every moment to interrupt his observations, in order to take breath. If we reflect that the barometer was, on the summit, down to 16 inches 1 line, and consequently that the air was only of about half the common density, we shall easily understand, that it was necessary to supply the defect of density by more frequent inspirations. Now this accelerated the motion of the blood, and the more, because the arteries no longer sustained their ordinary pressure, inasmuch, that they were all in a fever. M. de Saussure continued upon the summit of Mont Blanc till half an hour past three in the afternoon, during which time he made some interesting experiments.

experiments. The travellers all returned safe and found, with their eyes and faces uninjured, which was owing to their having put black crape over their faces; whereas they who had gone up before them returned almost blind, and with their skin terribly burnt by the reflection from the snow.

**RIVERS AND LAKES.]** The chief rivers are the Rhine, which rises in the chain of mountains bordering on St Gothard, the Aar, the Reufs, the Tesin, the Oglio, and the Rhone. The lakes are those of Geneva, Constance, Thun, Lucerne, Zurich, Biel and Brien.

The fall of the Rhine at Schaffhausen is most astonishing. Descriptions of such scenes are always faint; something, however, may be attempted. The whole river, after rippling and foaming over several scattered breakers, runs, by different channels, against some beautiful rocks which rise several feet out of the water, covered with shrubby wood: beat back from these, it rushes round, and, by three grand openings, precipitates its fall, in accumulated masses, for fifty or sixty feet perpendicular, raging and foaming with wonderful violence, and throwing up a thick dust and shower of spray.

**METALS AND MINERALS.]** The mountains contain mines of iron, crystal, virgin sulphur, and springs of mineral waters.

**VEGETABLE AND ANIMAL PRODUCTIONS.]** Switzerland produces sheep and cattle, wine, wheat, barley, oats, rye, flax, and hemp; plenty of apples, pears, nuts, cherries, plums, and chestnuts; the parts towards Italy abound in peaches, almonds, figs, citrons, and pomegranates; and most of the cantons abound in timber. Besides game, fish, and fowl, are also found, in some of the higher and more inaccessible parts of the Alps, the bouquetin and the chamois; whose activity in scouring along the steep and craggy rocks, and in leaping over the precipices, is hardly conceivable. The blood of both these animals is of so hot a nature, that the inhabitants of some of these mountains, who are much subject to pleurisy, take a few drops of it, mixed with water, as a remedy for that disorder. The flesh of the chamois is delicious.

The chamoises are pursued by the huntsmen from rock to rock, particularly on the Freyberg mountains. They go in flocks, posting one as a sentinel, who hisses when he hears the approach of hostile foot. The people, who have sometimes seen their picturesque forms suspended as it were from the side of the mountains, describe them as hanging by the horns from the rock. The cottages, which are of a dark walnut colour, have projecting roofs which hang over to protect them from the snow: their appearance accords well with the scenery of the country; and when seen at a distant height on the mountains, has a very peculiar effect. Stones are placed on the roofs to save them from being carried away by the storms of the winter. Winter, amidst these mountains, must be awful: their lofty summits exclude the sun, except for a few hours, in the longest days of summer.

Among the Alps is likewise found a species of hares, which in summer is said to resemble other hares, but in winter become all over white, so that they are scarcely distinguishable among the snow. But this idea hath been lately exploded, nor is it certain whether the two species ever copulate together. The white hare seldom quits his rocky residence. Here are also yellow and white foxes, which in winter sometimes come down into the vallies.

**POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.]** According to the best accounts the cantons of Switzerland contain about 2,000,000 of inhabitants, who are a brave, hardy, industrious people, remarkable for their fidelity, and their zealous attachment to the liberties of their country. Like the old Romans, they are equally inured to arms and agriculture. A general simplicity of manners, an open and unaffected frankness, together with an invincible spirit of freedom, are their most distinguishing characteristics. A very striking

striking proof of the honesty of this people is mentioned by Mr. Coxe, who says, upon the authority of general Pfiffer, that, on each side of the road that runs through the valley of Muotta, in the canton of Schweitz, there are several ranges of small shops uninhabited, yet filled with various goods, of which the prices are marked: any passengers, who wish to become purchasers, enter the shops, take away the merchandize, and deposit the price, which the owners call for in the evening. They are likewise a very enlightened nation; their common people are far more intelligent than the same rank of men in most other countries; a taste for literature is very prevalent among those who are in better circumstances, and even among many of the lowest rank; and a genuine and unartful good-breeding is extremely conspicuous in the Swiss gentry. On the first entrance into this country, the traveller cannot but observe the air of content and satisfaction which appears in the countenances of the inhabitants. The cleanliness of the houses and of the people is peculiarly striking; and in all their manners, behaviour, and dress, some strong outlines may be traced, which distinguish this happy people from the neighbouring nations. Even the Swiss cottages convey the liveliest image of cleanliness, ease, and simplicity, and cannot but strongly impress upon the observer a most pleasing conviction of the peasant's happiness. In some of the cantons, each cottage has its little territory, consisting generally of a field or two of fine pasture ground, and frequently skirted with trees, and well supplied with water. Sumptuary laws are in force in most parts of Switzerland. Silk, lace, and several other articles of luxury, are totally prohibited in some of the cantons; and even the head-dresses of the ladies are regulated. Their diversions are chiefly of the active and warlike kind; and many of them employ part of their leisure hours in reading. The youth are generally trained to martial exercises, such as running, wrestling, throwing the hammer, and shooting, both with the cross-bow and the musket.

The pensive shades of the Swiss character may, in some degree, be attributed to the nature of the country in which they live. Accustomed to magnificent and solemn scenes, they acquire an elevated, and often a gloomy turn of mind, which shews itself in lofty sentiments, in deep reflection, in strong national affections, and sometimes in very deliberate suicide. Their imagination is quick and ardent, and their passions are lively; but they seldom exhibit broad traits of humour, or features of ludicrous description. Their love of their country, and the tenderness with which in other lands they cherish the remembrance of it, is well known by some striking accounts. This, however, is common to them with all people who inhabit countries of a very marked and peculiar character; where strong local impressions are made at an early age, and attachments are firmly rooted in, and grow up, as it were, with the constitution.

[**GOITERS AND IDIOTS.**] The inhabitants in one part of this country, particularly in the republic of Vallais, are very much subject to *goiters*, or large excrescences of flesh that grow from the throat, and often increase to a most enormous size: but what is more extraordinary, idiotism also remarkably abounds among them. "I saw," says Mr. Coxe, "many instances of both kinds, as I passed through Sion: some idiots were basking in the sun with their tongues out, and their heads hanging down, exhibiting an affecting spectacle of intellectual imbecility. The causes which produce a frequency of these phenomena in this country, form a very curious question."

The notion that snow-water occasions these excrescences is totally void of foundation. For on that supposition, why are the natives of those places that lie most contiguous to the glaciers, and who drink no other water than what descends immediately from those immense reservoirs of ice and snow, free from this malady? And why are the inhabitants of those countries in which there is no snow, afflicted with it? For these guttural tumours are to be found in the environs of Naples, in the

the island of Sumatra, and at Patna, and Purnea in the East Indies, where snow is unknown.

The springs, that supply drink to the natives, are impregnated with a calcareous matter, called in Switzerland *tuf*, nearly similar to the incrustations of Matlock in Derbyshire, so minutely dissolved as not in the least to affect the transparency of the water. It is not improbable, that the impalpable particles of this substance, thus dissolved, should introduce themselves into the glands of the throat, and produce goiters, for the following reasons; because *tuf*, or this calcareous deposition, abounds in all those districts, where goiters are common. There are goitrous persons and much *tuf* in Derbyshire, in various parts of the Vallais, in the Valteline, at Lucerne, Friburgh, and Berne, near Aigle and Bex, in several places of the Pays de Vaud, near Dresden, in the valleys of Savoy and Piedmont, near Turin and Milan. But the strongest proof in favour of this opinion, says our author, is derived from the following facts. A surgeon, whom I met at the baths of Leuk, informed me that he had not unfrequently extracted concretions of *tuf-stone* from several goiters; and that from one in particular, which suppurated, he had taken several flat pieces, each about half an inch long. He added, that the same substance is found in the stomachs of cows, and in the goitrous tumours, to which even the dogs of the country are subject. He had diminished and cured the goiters of many young persons by emollient liquors, and external applications; and prevented them in future by removing his patients from the places where the springs are impregnated with *tuf*; and, if that could not be contrived, by forbidding the use of water which was not purified.

Children are occasionally born with guttural swellings, but this may arise from the aliment of the mother. It is to be presumed, that a people accustomed to these excreescences will not be shocked at their deformity; but it does not appear, as some writers assert, that they consider them as beauties. To judge from the accounts of many travellers, it might be supposed that the natives, without exception, were either idiots or goitrous: whereas, in fact, the Valaisans, in general, are a robust race; and all that with truth can be affirmed, is, that goitrous persons and idiots are more abundant in some districts of the Vallais, than perhaps in any other part of the globe. It has been asserted that the people very much respect these idiots, and even consider them as *blessings from heaven*. The common people, it is certain, esteem them so, for they call them "*Souls of God, without sin*;" and many parents prefer these idiot-children to those whose understandings are perfect; because as they are incapable of intentional criminality, they consider them as certain of happiness in a future state. Nor is this opinion entirely without its good effect, as it disposes the parents to pay greater attention to such helpless beings. These idiots are suffered to marry, as well among themselves as with others\*.

[RELIGION.] Though all the Swiss cantons form but one political republic, yet they are not united in religion, as the reader, in the table prefixed, may perceive. Those differences in religion formerly created many public commotions, which seem now to have subsided; and the two sects live together in the most perfect harmony; an union the more remarkable, when we consider the fatal quarrels that have been kindled in Switzerland on account of religious tenets. In several parts of the canton of Glarus, the Protestants and Catholics successively perform service in the same church; and all the offices of state are amicably administered by the two parties. Zuinglius was the apostle of protestantism in Switzerland. He was a moderate reformer, and differed from Calvin and Luther only in a few speculative points; so that Calvinism is said to be the religion of the protestant Swisses. But this must be understood chiefly with respect to the mode of church government;

\* Cox's Travels through Switzer-land, vol. 1. p. 585, &c.

for in some doctrinal points they are far from being universally Calvinistical. There is, however, too much religious bigotry prevalent among them; and though they are ardently attached to the interest of civil liberty, their sentiments on the subject of religious toleration are in general much less liberal.

Mr. Gray gives a very interesting description of his being present at the ceremony of two girls taking the veil: one of them appeared to be about eighteen, and had a pretty face, with an expression somewhat sullen: the other was about twenty-four, her countenance meek, and expressive of gentle seriousness by a melancholy smile. The ceremony was extremely interesting: the solemnity of the scene, the presence of the parents, the grave and venerable appearance of the abbot, the prostration of the women, the tearing of the chaplets, the cutting off the hair, and the change of dress, suggested many considerations. In a voluntary resignation of the world, and in a solemn dedication to God, there is somewhat grand and awful; but who is not grieved at the sight, when he reflects that religion was not designed for seclusion, but to qualify its disciples for active life; that parental authority, or insidious persuasion; the flattery of artful caresses, the allurements of misrepresented piety, or the desire of distinction, often prompt to exertions, in which subsequent reflection will meditate with unavailing regret and helpless sorrow? Who can behold, without regret and indignation, the ministers of religion prescribing an oath, in which the ties of kindred are solemnly abjured, the parents standing by and countenancing the sacrifice with unmoved features, and not a Swiss girl present shedding a tear at the sight of two young and interesting persons throwing away all attachments and engagements, till life should terminate in eternity?

LANGUAGE.] Several languages prevail in Switzerland; but the most common is German. The Swisses who border upon France speak a bastard French, as those near Italy do a corrupted Latin or Italian.

LEARNING AND LEARNED MEN.] Calvin, whose name is so well known in all protestant countries, instituted laws for the city of Geneva, which are held in high esteem by the most learned of that country. The eloquent and popular, but often wild and dangerous writer, J. J. Rousseau, was born in the same city. M. Bonnet, and Mess. de Saussure and de Luc, deserve to be mentioned as good naturalists. Haller, a native of Berne, deserves the highest eulogy as a poet, a physiologist, and a philosopher, to whom Michaelis, the eminent orientalist, with some justice applies an observation which had been made on the genius of Aristotle; "*Neque celo, neque terra, neque mari quicquam relinquere voluit incognitum, indole præterea adeo mirabili, ut ad singula notum præcipue dicas*:" i. e. He left nothing unexplored, either in the heavens, on the earth, or in the sea, and was of such a wonderful capacity, that he seemed peculiarly born for the object of each separate pursuit.

The Swiss, who have a country of such peculiar scenery to describe, should form a school of painting of their own; but it is singular that Switzerland has as yet produced neither poets nor painters, who have much distinguished themselves. The sublime poem of Haller, on the Alps, is almost the only important description in poetry, of Swiss scenery, by a native of Switzerland; and, till lately, it has had no painters of landscape known beyond their country. The natives become familiar with the grand and noble scenes of their country, before they have attention to admire and powers to imitate them; and Switzerland has scarce yet arrived to that refinement of civilization, in which a knowledge of the polite arts leads men to the investigation of their principles. The foreigners who travel here for the first time, are astonished at the stupendous character of the objects which they behold; but these they dare not attempt to copy. The mountain, with its summit of snow, could not, perhaps, be introduced with harmony. The lake is too spacious for representation; and he who should select only the picturesque cottage, or the woody bank undermined and rugged, would not characterize his work as a description of

Switzerland. Painters, however, may study here every department of the art; and when a *Salvator Rosa* shall arise, he will find materials to employ his pencil.

UNIVERSITIES.] The university of Basle, which was founded in 1459, has a very curious physic-garden, which contains the choicest exotics; and adjoining to the library, which possesses some valuable manuscripts, is a museum well furnished with natural and artificial curiosities, and with a great number of medals and paintings. In the cabinets of *Erasinus* and *Amerbach*, which also belong to this university, there are no less than twenty original pieces of *Holbein*; for one of which, representing a dead *Christ*, a thousand ducats have been offered. The other universities, which indeed are commonly only styled colleges, are those of *Bern*, *Lausanne*, and *Zurich*.

ANTIQUITIES AND CURIOSITIES, } Every district of a canton in this mountain-  
NATURAL AND ARTIFICIAL. }ous country presents the traveller with a natural curiosity; sometimes in the shape of wild but beautiful prospects, interspersed with lofty buildings, and wonderful hermitages, especially one, two leagues from *Friburg*. This was formed by the hands of a single hermit, who laboured on it for 25 years, and was living in 1707. It is the greatest curiosity of the kind perhaps in the world, as it contains a chapel, a parlour 28 paces in length, 12 in breadth, and 20 feet in height, a cabinet, a kitchen, a cellar, and other apartments, with the altar, benches, flooring, ceiling, all cut out of the rock.

At *Shaffhausen* is a very extraordinary bridge over the *Rhine*, justly admired for the singularity of its architecture. The river is extremely rapid, and had already destroyed several stone bridges of the strongest construction, when a carpenter of *Appenzel* offered to throw a wooden bridge, of a single arch, across the river, which is near four hundred feet wide. The magistrates, however, required that it should consist of two arches, and that he should for that purpose employ the middle pier of the old bridge. Accordingly the architect was obliged to obey; but he has contrived to leave it a matter of doubt, whether the bridge is supported by the middle pier, and whether it would not have been equally as safe if formed solely of one arch. The sides and top are covered, and it is what the Germans call *hängewerk*, or hanging bridge; the road, which is almost level, is not carried, as usual, over the top of the arch; but, if the expression may be allowed, is let into the middle of it, and there suspended. A man of the slightest weight feels it almost tremble under him, yet waggons heavily laden pass over without danger. It has been compared to a tight rope, which trembles when struck, but still preserves its firm and equal tension. The architect *Ulric Grubenman* was originally a carpenter, without the least tincture of literature, and totally ignorant of mathematics. The bridge was finished in less than three years, and cost about 8000l. sterling.

At the famous pass of the *Pierre Pertuis*, the road is carried through a solid rock near 50 feet thick, the height of the arch 26, and its breadth 25. The *marcasites*, false diamonds, and other stones, found in these mountains, are justly ranked among the natural curiosities of the country. The ruins of *Cæsar's* wall, which extended 18 miles in length, from *Mount Jura* to the banks of *Lake Leman*, are discernible. Many monuments of antiquity have been discovered near the baths of *Baden*, which were known to the Romans in the time of *Tacitus*, and at *Avanche* in the canton of *Bern*. Switzerland boasts of many noble religious buildings, particularly a college of *Jesuits*; and many cabinets of valuable manuscripts, antiques, and curiosities of all kinds. At *Lucerne*, (says *Mr. Coxe*) is to be seen a topographical representation of the most mountainous part of Switzerland, by general *Philser*, a native of this town, and an officer in the French service. It is a model in relief, and well deserves the attention of the curious traveller. What was finished in 1776, comprized about 60 square leagues, in the cantons of *Lucerne*, *Zug*, *Bern*, *Uri*, *Schweitz*, and *Underwalden*. The model was twelve feet long, and

and nine and a half broad. The composition is principally a malle of charcoal lime, clay, a little pitch, with a thin coat of wax; and is so hard as to be trod upon without receiving the least damage. The whole is painted with different colours, representing the objects as they exist in nature. It is worthy of particular observation, that not only the woods of oak, beech, pine, and other trees are distinguished; but also that the strata of the several rocks are marked, each being shaped upon the spot, and formed with granite, gravel, calcareous stone, or such other natural substances as compose the original mountains. The plan is indeed so minutely exact, that it comprizes not only all the mountains, lakes, towns, villages, and forests; but every cottage, every torrent, every road, and even every path is distinctly and accurately represented. The general takes his elevations from the level of the lake of Lucerne, which, according to M. de Saussure, is about fourteen hundred and eight feet above the Mediterranean. This model, exhibiting the most mountainous parts of Switzerland, conveys a sublime picture of immense Alps piled one upon another: as if the story of the Titans were realized, and they had succeeded (at least in one spot of the globe) in heaping Ossa upon Pelion, and Olympus upon Ossa. From the account of this officer it appears, that there are continued chains of mountains of the same elevation, rising in progression to the highest range, and from thence gradually descending in the same proportion to Italy. Near Rosiniere, is a famous spring which rises in the middle of a natural basin of twelve square feet—the force that acts upon it must be prodigious; after a great shower of rain, it carries up a column of water as thick as a man's thigh, nearly a foot above its surface. Its temperature never varies, its surface is clear as crystal, and its depth unfathomable; perhaps it is the end of some subterraneous lake that hath here found an issue for its waters.

**CITIES.]** All the cities in Switzerland are excellently well provided with arsenals, bridges, and public edifices. Basil is situated in a fertile and delightful country, on the banks of the Rhine, and the confines of Alsace and the empire. It contains two hundred and twenty streets, and six market places. The town-house, which stands on the river Birsee, is supported by very large pillars, and its great hall is finely painted by the celebrated Hans Holbein, who was a native of this city. The situation of Basil is pleasing: the Rhine divides it into the upper and lower town, and it is considered as one of the keys of Switzerland. Baden is famous for its antiquity and baths. Zurich is far less considerable than Bern, but in the arsenal is shewn the bow of the famous William Tell, and in the library (says Mr. Gray) are three original manuscript letters, written in Latin, by Lady Jane Gray to Bullinger, with some elegance of style, but with much extravagance of compliment. In one hyperbolical strain, she inconsiderately enumerates St. John among other exemplary characters, to whom Bullinger, in her opinion, was not inferior in piety. One of the letters, however, was written in 1551, when she was only fourteen years of age; the others in 1552, when she was about to learn Hebrew.

To prevent a repetition, I shall here mention the city of Geneva, which is an associate of Switzerland, and is under the protection of the Helvetic body, but within itself is an independent state and republic. The city is well built and well fortified, and contains 24,000 inhabitants. It is situated upon the Rhone, where it flows from the fine lake of Geneva. The streets are not broad, and derive no embellishment from the lofty wooden arcades which shelter them from the sun. They are cheerful, however, and thronged with a busy active people. The houses which face the lake, and those which overlook the parks, are very handsome: the inns are good, the walks pleasant, and much resorted to. The environs of Geneva are very beautiful: the walks of the lake, with the view of the Salve, the mole, the glaciers, and mount Blanc, always afford pleasure. It is celebrated for the learning

of the professors of its university, and the good government of its colleges, the purity of its air, and the politeness of its inhabitants. By its situation, it is a thoroughfare from Germany, France, and Italy. It contains a number of fine manufactures and artists; so that the protestants, especially such as are of a liberal turn, esteem it a most delightful place. But the fermentation of their politics, and particularly the usurpation of the senate, hath divided the inhabitants into parties, and the late struggle of patricians and plebeians had nearly ruined all.

Geneva (from the account of Mr. Gray, who travelled into the country in 1791, is very populous. The Lutheran religion is tolerated here, and strangers may be admitted to the rights of burghers. The English are here in great numbers; many have houses. The young men travel upon a disinterested plan, of shewing the manners of their own country, while they study those of other nations. They drive, drink, and game in a gentlemanly and spirited way as in England: sometimes, indeed, they have an altercation with the magistrates of a government, which, though it respects and values the English nation, makes but little allowance for the disorderly and eccentric vivacity of our men of fashion, and has been known to punish, very sternly, slight offences against the regulations of the town. The usual plan adopted by the young Englishmen in Switzerland is, nominally, to board *en pension*, as it is called, with some professor, for which large sums are paid by the parent or guardian, while the young men themselves, spend much larger, and in a much better style, at Secheron's hotel, near Geneva; or in visiting, in expensive schemes, the different parts of the country. The professors are, certainly, many of them, men of learning; but too frequently it happens, that their understandings are narrow; and as the oeconomy of a Swiss house is not liberal, and the manners of the Swiss, in domestic life, must appear coarse and inelegant, we cannot be surprized that young men, accustomed to the politeness and luxuries of genteel families in England, should at an age which begins to reject control, rather ramble with their countrymen in expensive excursions, than confine themselves for superficial lectures on the Swiss governments, to domestic society so little refined. We must, however, except from these remarks a few enlightened men, whose judgment enables them to select, and whose liberal manners qualify them to associate with the best circles at Geneva, Lausanne, and perhaps other principal towns of Switzerland. Some such there are whose reputation are spread beyond the boundaries of their country. The advantages of these men's houses may be considerable, and furnish the occasion for an introduction to families, where some polish has been brought on, without corrupting the simplicity of the Swiss manners. It must be observed only, that it cannot be obtained without great expence, and the risk of forming attachments with women, who, whatever may be their merit, have foreign connections and different principles, and lastly, that it is still difficult for a young man to resist the attraction of a dissipated English society, always within reach. Such is the hazard of being *en pension*; and as for the general cast of houses in which the English are placed, there is considerable risk, and very little benefit to be obtained, by exporting young men here for foreign education; while every advantage of seeing Switzerland, and of studying the constitution and manners of the people, may be better gained by travelling leisurely through the country, under the direction of a tutor of known character and conduct; as a discreet tutor, or an experienced friend.

The inhabitants of Geneva have a general kind of information, which excites surprize in strangers; though, on farther acquaintance, it is often discovered to be superficial enough. They are almost all educated at a public academy, which is well regulated, and supported at the public expence. Here they imbibe a taste for literature, which every citizen is enabled to keep up, by a permission to borrow books at the public library opened to them for that purpose once a week. societies, though controlled by government, still assemble.—They estimate the population of this city at 22,000 souls.

Lausanne is an irregular town, with few buildings that deserve notice. The cathedral is a light Gothic edifice; near it there is a walk which commands a glorious view of the lake and the projecting mountains, the coast of Chablais, &c. Mr. Gibbon, the late elegant historian of the Decline and Fall of the Roman Empire, loved this country from his early youth, and chose this town for his residence, where he enjoyed, under a mild government, amidst a beautiful landscape, a life of leisure and independence, and the varied pleasures of retirement and society, among a people of easy and elegant manners. All the houses in Lausanne, that are in continuation from that in which this philosopher lived, border on the lake, and have a view that no other country can equal. The college is a large building, which contains a library of many thousand volumes, of which the English are allowed the use, in consideration of many donations by Englishmen. The baillif's castle is well situated. The land scenery near Lausanne is picturesque; the town is divided by a kind of valley; the parts of which would be better connected by a bridge, like that at Edinburgh, than by steps, as it is now. Many English reside here, (says Mr. Gray, in 1791) and something of English manners prevails.

Neuchâtel is sweetly situated on the lake of that name. It is an agreeable town, and has a neat appearance. The Prussian governor seldom resides here, though he has the disposal of the civil and military appointments, with a limitation to the burghers, or subjects of Neuchâtel. No laws can be enacted but by the council of state, the magistrates of the town, and the people of Vallengin. Their municipal immunities and independent privileges are secured by very important regulations, accepted by the house of Brandenburg before it was invested with the sovereignty of Neuchâtel. The people enjoy a considerable share of liberty, and are but slightly taxed. Trade, unfettered by partial restrictions, flourishes to a considerable extent. Many English choose Neuchâtel as an agreeable place of residence. Here is a good and well regulated society; the people are cheerful and affable; the women and girls converse with great frankness and good humour; they are not taught to be apprehensive of men, for the laws protect them from the insidious designs of seduction. If a man corrupt a girl, he must marry her, or give up his country or possessions for ever; or if he be previously married, he is compelled to make very large pecuniary reparations. The magistrates exert themselves with great activity, and prevent all public prostitutes. The people are cheerful and polite: among them resides Mr. Du Perou, the editor of the posthumous continuation of Rousseau's Confessions. The population of the district of Neuchâtel amounts to 36,000 souls; an immense number for a country not more than 36 miles in length, and 15 in its broadest extent, the greater part of which is lofty and barren mountains. If princes knew their real interest, they must be conscious, that the more free, the more flourishing would be their dominions.

Bern is a very handsome town. The streets are spacious; the piazzas, with their low-arched fronts, give it a peculiar character; the store-houses would appear to more advantage, if the arcades were more lofty; the walk, likewise, would in that case be equally sheltered from sun or rain, and there would be a freer circulation of air. The town is kept neat, but it is by felons, chained with a collar and hook over their heads. The terraces, particularly that behind the cathedral, which overlooks the Aar, afford very agreeable walks, where the Bern ladies, who are very pretty, exhibit their charms better displayed in dress than those of most of their country women. The refinements of a rich aristocracy has introduced more of the French manners here, than prevails in the other parts of Switzerland. The public

public buildings at Bern are handsome, though they do not shew any great departure from the simplicity of the country, which consults utility rather than ornament in its buildings, even when the dawns of taste most appear. The hotel de Ville, at which the council and senate assemble, is an old building; in it are some convenient rooms, and some historical pictures, not much interesting as paintings, but only as they relate to the foundation of Bern, and the origin of the charter of the town. The new room for the library shews but little advancement in skill of architecture: it is ill contrived, and fitted up with but little taste or respect to the convenience of readers: it is rich in manuscripts.

Schaffhausen, the capital of the smallest canton in Switzerland, exhibits an appearance of republican equality. The houses are plain and somewhat dirty; there is no contrast of disproportionate splendour; no palace to excite the envy of the neighbouring buildings; on the other hand, there is no edifice for the stranger to admire; no monument for national vanity or taste to point out. The free States of antiquity, long before the private citizen was well lodged, erected public edifices, with emulation of ornament; and republics, as well as monarchies, had magnificent baths, theatres, and temples. The genius of Switzerland is different; the Swifs are not rich; they are fond of simplicity, and consider with a jealous eye whatever indicates the approach of luxury and foreign taste. The fortrefs, and the curious bridge by Ulric Grubenman, of Tussen, are the only public works that engage attention.

Constance was once a very populous city. It flourished while the reformed faith was established, and began to decline as soon as the Romish religion was again set up under Charles the Fifth, in opposition to the endeavours of the league of Smalkalde. Though it is so finely situated for trade, the repeated attempts which have been made to establish manufactures have always failed. The distance from Vienna, the jealousy of the senate of Constance, the pride of the nobility, and the spirit of the Romish religion, which is unpropitious to trade, have been enumerated amidst the causes that have continued to stifle the exertions of the Swifs. The town has the appearance of decline; it contains about 6,000 inhabitants; but its deserted streets would not be too much thronged by ten times that number; they retain, however, somewhat of elegance; and the quay, the adjacent white buildings, reflected by the transparent waters of the lake; the neighbouring convents, and the view of the snowy furrowed mountains of Appenzel, give a striking and interesting character to the town. The view of its solitary streets excites reflections on its history, and lamentations on its departed grandeur. The room in which the council was held in 1414, which contributed to inculcate the subjection of the papal power to general councils, is now a repository for lumber, old armour, watermen's jackets, &c. The emperor's and the pope's chair are still there.—At the Benedictine convent are shewn some cabinets of natural history; at the cathedral a fine altar; and, from the tower, a striking view of the two lakes.

COMMERCE AND MANUFACTURES.] The commerce of Switzerland is very inconsiderable. Its exports consist of linens, muslin, hides, and the produce of their dairies, which are small huts called *Chalets*, built on the mountains, where, during the summer months, their cattle are sent to feed. The Swifs cheese is excellent, and consequently much esteemed in the neighbouring countries, particularly in France, where a great consumption is made of it. Their imports are considerable, though a frugal people, they being in want of corn, iron, and salt; the latter article they draw from France: and according to the treaties of alliance subsisting between the two countries, receive annually a certain quantity at a much more reasonable price than it is sold by the French government to their own subjects. Nevertheless, even in Switzerland it is a dear article, being retailed by the

officers

officers of state, who monopolize and draw a principal part of the public revenues from its sale. The total receipt of Bern amounts to about 75,000*l.* and of Zurich to a little more than one half. Exclusive of this tax on salt, the revenue is made up of customs and duties on merchandise, the profits of demesne lands, and the tithes of the general produce of the country (the clergy being paid by government) : to which might be added the money that the different cantons receive from foreign powers, for the hire of their troops. This is a custom which has given rise to a difference of opinion among the Swiss, relative to its advantage or ill consequence. They, who oppose it, maintain that the officers and soldiers of these regiments acquire the vices of the different countries in which they serve, and on their return to Switzerland, by spreading them, corrupt the purer morals of its inhabitants. In answer to this it is asserted, that, as the revenues of the cantons are inadequate to the expences of government and the support of a sufficient army for the national defence, it is necessary to pursue this system laid down by their ancestors, as it gives them all the advantages of a regular army, without the expence of its maintenance, it being stipulated in their treaties, that in case of attack from a foreign enemy, these troops, which amount to 30,000, should be at liberty to return home and act in concert with their countrymen. Both of these arguments are plausible ; but the question is, if they be admitted as fact, whether the morality of a nation should be sacrificed to its policy ; but it may be asserted again, that true policy is inseparable from good morals ; and still further, the Swiss cannot be apprehensive of the encroachments of any foreign state as long as they perceive that the general aim of Europe is to preserve an equilibrium of power : this balance is their best, and indeed their only safeguard ; for Switzerland, with all its force could never maintain a defensive war against either France or the emperor. The Swiss and their allies are supposed to amount to more than two millions of souls. Their manner of living is much more simple than that of their neighbours, as they are more restricted by their respective governments ; sumptuary laws being in full force among them, and no amusement, such as games of hazard, plays, operas, or even dancing, except at appointed times being permitted. As every citizen is a soldier (the clergy excepted) they on Sundays, after divine service, go through the military exercise ; they are careful of the education of their youth, as is evident from their public seminaries or universities ; the principal of which are at Basil and Bern.

**NATIONAL CHARACTER.]** In giving a sketch of the national character, notice will only be taken of the popular governments, as the people there retain the temper and manner of the ancient Swiss, more than the other cantons. Of them I think very favourably, provided I except those of the lower class, who have seen other countries, or have any communication with travellers, as such are not only in this, but I believe in every country of the world, mercenary and deceitful. With regard to the general inhabitants of these cantons, they seem to be frugal without meanness ; brave without vanity ; and hospitable without ostentation : to strangers they are courteous and polite, without being either designing or troublesome. They value but little those distinctions of rank, birth, and fortune, which in the other countries of Europe, and indeed in the other cantons of Switzerland, are so obsequiously cultivated, as they measure the dignity of the situation by the merit of the individual. Every man here knows the advantages of his own free government ; and as he also knows himself to be a component part of it, is from interest as well as principle, a real patriot. Such is their attachment to their country, that of the Swiss regiments in foreign service, many of the soldiers, after a long absence, pine and sicken for their return. Should that liberty be refused them (which never is, from experience of the ill consequence) their death is inevitable ; as neither promotion nor emolument can dissipate the melancholy that preys upon them. Home

is the only cure of this singular malady, which is called the *Swiss sickness*\*, and that cure is infallible. In domestic life their private virtues flow from their public character; to their parents they are grateful and obedient; to their families affectionate and attentive; inflexible in friendship; mild as superiors, and benevolent as men.

The productions of the loom, linen, dimity, lace, stockings, handkerchiefs, ribbands, silk and printed cottons, and gloves, are common in Switzerland, and the inhabitants are now beginning, notwithstanding their sumptuary laws, to fabricate silks, velvets, and woollen manufactures. Their great progress in those manufactures, and in agriculture, gives them a prospect of being able soon to make considerable exports.

[CONSTITUTION AND GOVERNMENT.] These are very complicated heads, though belonging to the same body, being partly aristocratical, and partly democratical. Every canton is absolute in its own jurisdiction; but those of Bern, Zurich, and Lucerne, with their dependencies, are aristocratical, with a certain mixture of democracy, Bern excepted. Those of Uri, Schwitz, Underwald, Zug, Glaris, and Appenzel, are democratical. Basil, though it has the appearance of an aristocracy, rather inclines to a democracy. But even those aristocracies and democracies differ in their particular modes of government. However, in all of them the real interests of the people appear to be much attended to, and they enjoy a degree of happiness not to be expected in despotic governments. Each canton hath prudently reconciled itself to the errors of its neighbour, and cemented on the basis of affection a system of mutual defence.

The confederacy, considered as a republic, comprehends three divisions. The first are the *Swisses*, properly so called. The second are the *Grisons*, or the *states*, confederated with the *Swisses*, for their common protection. The third are those *prefectures*, which, though subject to the other two, by purchase or otherwise, preserve each its own particular magistrates. Every canton forms within itself a little republic; but when any controversy arises that may affect the whole confederacy, it is referred to the general diet, which sits at Baden, where each canton having a vote, every question is decided by the majority. The general diet consists of two deputies from each canton, besides a deputy from the abbot of St. Gall, and the cities of St. Gall and Bien. It is observed by Mr. Coxe, to whom the public are indebted for the best account of Switzerland that has appeared, that there is no country in which happiness and content more universally prevail among the people. For whether the government be aristocratical, democratical, or mixed, a general spirit of liberty pervades and actuates the several constitutions; so that even the oligarchical states (which, of all others are usually the most tyrannical) are here peculiarly mild; and the property of the subject is securely guarded against every kind of violation. A harmony is maintained by the concurrence of their mutual felicity; and their sumptuary laws, and equal division of their fortunes among their children, seem to ensure its continuance. There is no part of Europe which contains, within the same extent of region, so many independent commonwealths, and such a variety of different governments, as are collected together in this remarkable and delightful country; and yet, with such wisdom was the Helvetic union composed, and so little have the *Swiss*, of late years, been actuated by the spirit of conquest, that since the firm and complete establishment of their general confederacy, they have scarcely ever had occasion to employ their arms against a

\* They call it in German *das heim wehe*. There is no motive that induces us to recollect the places which we love, more than the *music* we have heard in them, and from this it is that all songs and tunes

that were popular in their country, are strictly forbidden among the *Swiss* regiments in foreign service.

foreign

foreign enemy; and have had no hostile commotions among themselves, that were not very soon happily terminated.

**REVENUES AND TAXES.]** The variety of cantons that constitute the Swiss confederacy, renders it difficult to give a precise account of their revenues. Those of the canton of Berne are said to amount annually to 300,000 crowns, and those of Zurich to 150,000; the other cantons in proportion to their produce and manufactures. Whatever is saved, after defraying the necessary expences of government, is laid up as a common stock; and it has been said, that the Swisles are possessed of 300,000l. sterling in the English funds, besides money in other banks.

The revenues arise, 1. From the profits of the demesne lands; 2. The tenth of the produce of all the lands in the country; 3. Customs and duties on merchandise; 4. The revenues arising from the sale of salt, and some casual taxes.

**MILITARY STRENGTH.]** The internal strength of the Swiss cantons, independent of the militia, consists of 13,400 men, raised according to the population and abilities of each. The œconomy and wisdom with which this force is raised and employed are truly admirable, as are the arrangements which are made by the general diet, for keeping up that great body of militia, from which foreign states and princes are supplied, so as to benefit the state, without any prejudice to its population. Every burgher, peasant, and subject, is obliged to exercise himself in the use of arms; appear on the stated days for shooting at a mark; furnish himself with proper clothing, accoutrements, powder and ball; and to be always ready for the defence of his country. The Swiss engage in the service of foreign princes and states, either as guards, or as marching regiments. In the latter case, the government permits the enlisting volunteers, though only for such states as they are in alliance with, or with whom they have entered into a previous agreement on that article. But no subject is to be forced into foreign service, or even to be enlisted without the concurrence of the magistracy.

**HISTORY.]** The present Swisles and Grisons, as has been already mentioned, are the descendants of the ancient Helvetii, subdued by Julius Cæsar. Their mountainous, uninviting situation, formed a better security for their liberties, than their forts or armies; and the same is the case at present. They continued long under little better than nominal subjection to the Burgundians and Germans, till about the year 1300, when the emperor Albert I. treated them with so much rigour, that they petitioned him against the cruelty of his governors. This served only to double the hardships of the people; and one of Albert's Austrian governors, Gessler, in the wantonness of tyranny, set up a hat upon a pole, to which he ordered the natives to pay as much respect as to himself. The famous William Tell, being observed to pass frequently without taking notice of the hat, and being an excellent marksman, the tyrant condemned him to be hanged, unless he cleft an apple upon his son's head, at a certain distance, with an arrow. Tell cleft the apple; and Gessler asking him the meaning of another arrow he saw stuck in his belt, he bluntly answered, that it was intended to his [Gessler's] heart, if he had killed his son. Tell was immediately sent to prison; but making his escape, he watched his opportunity, and shot the tyrant, and thereby laid the foundations of the Helvetic liberty.

It appears, however, that before this event the revolt of the Swisles from the Austrian tyranny had been planned by some noble patriots among them. Their measures were so just, and their course so intrepid, that they soon effected a union of several cantons.

Zurich, driven by oppression, sought first an alliance with Lucerne, Uri, Suisse, and Underwald, on the principles of mutual defence; and the frequent successes of their arms against Albert, duke of Austria, insensibly formed the grand Helvetic

union.

union. They first conquered Glaris and Zug, and admitted them to an equal participation of their rights. Berne joined them in 1353; Friburg and Soleure 130 years after; Basil and Scaffhaufen in 1501; and Appenzel in 1513 completed the confederacy, which resisted the united powers of France and Germany; till by the treaty of Westphalia in 1648, their confederacy was declared to be a free and independent state.

Neuchâtel, since the year 1707, has been under the protection of Prussia, but the inhabitants are free to serve any prince whatever. The king of Prussia hath the power of recruiting among them, and of naming a governor, but the revenue he derives is not above 5000l. yearly, great part of which is laid out on the roads and other public works of the country. With regard to the military character, and great actions of the Swisses, I must refer the reader to the histories of Europe.

## S P A I N.

## SITUATION AND EXTENT.

Miles. Degrees.

Length 700 } between 10 and 3 East longitude.  
 Breadth 500 } { 36 and 44 North latitude.

Containing 150,763 SQUARE MILES, with 69 Inhabitants to each.

**BOUNDARIES.]** IT is bounded on the West by Portugal and the Atlantic Ocean; by the Mediterranean, on the East; by the Bay of Biscay and the Pyrenean Mountains, which separate it from France, on the North; and by the strait of the sea at Gibraltar, on the South.

It is now divided into fourteen districts, besides islands in the Mediterranean.

[ANCIENT NAMES AND DIVISIONS.] Spain formerly included Portugal, and was known to the ancients by the names of Iberia, and Hesperia, as well as Hispania. It was, about the time of the Punic wars, divided into Citerior and Ulterior; the Citerior contained the provinces lying north of the river Ebro; and the Ulterior, which was the largest part, comprehended all that lay beyond that river. Innumerable are the internal changes that it afterwards underwent; but they are less accurately known than those of any other European country.

[CLIMATE, SOIL, AND WATER.] Excepting in the season of the equinoctial rains, the air of Spain is dry and serene, but excessively hot in the southern provinces in June, July, and August. The vast mountains that run through Spain cheer the plains by refreshing breezes; and those towards the north and north-east are in the winter very cold.

Such is the moisture of the hills, bounded on the north by the bay of Biscay, and to the south by snowy mountains, that no care is sufficient to preserve their fruits, their grain, their instruments of iron, from mould, from rot, and from rust. Both the acetous and the putrid fermentation here make a rapid progress. Besides the relaxing humidity of the climate, the common food of the inhabitants contributes much to the prevalence of most diseases which infest the principality of Asturia. Yet, although subject to such a variety of endemical diseases, few countries can produce more instances of longevity: many live to the age of a hundred, some to a hundred and ten, and others much longer. The same observation may be extended to Galicia, where, in the parish of St. Juan de Poyo, A. D. 1724, the curate administered the sacrament to thirteen persons, whose ages together made one thousand four hundred and ninety-nine, the youngest of these being one hundred and ten, and the oldest one hundred and twenty-seven. But in Villa de Fofinaes, one Juan de Outeyro, a poor labourer, died in the year 1726, aged more than one hundred and forty-six years.

The soil of Spain was formerly very fruitful in corn, but the natives have lately suffered much through their indolence; the causes of which will be explained afterwards. It produces, in many places, almost spontaneously, the richest and most delicious fruits that are to be found in France and Italy, oranges, lemons, prunes, citrons, almonds, raisins, and figs. Her wines, especially sack and sherry, are in high request among foreigners. There are, in the district of Malaga, (according to Mr. Townsend, the latest traveller) fourteen thousand vine-presses, chiefly

Kingdom

chiefly employed in making the rich wines, which, if white, from the nature of the country, is called *mountain*; if red, from the colour, *vino tinto*, known in England by the name of *rent*. Good mountain is sold from thirteen to sixteen pounds the butt, of one hundred and thirty-five gallons, according to quality and age. It is reckoned that from eight hundred to a thousand vessels enter this port every year, of which about one-tenth are Spanish; and the exports in wine, fruit, oil and fish, are computed at about 375,000*l.* per annum.

Spain indeed offers to the traveller large tracts of unpromising, because uncultivated ground; but no country perhaps maintains such a number of inhabitants, who neither toil nor work for their food; such are the generous qualities of its soil. Even sugar-canes thrive in Spain; and it yields saffron, honey, and silk, in great abundance. A late writer, Utariz, a Spaniard, computes the number of shepherds in Spain to be 40,000; and has given us a curious detail of their œconomy, their changes of pasture at certain times of the year, and many other particulars unknown till lately to the public. Those sheep-walks afford the finest of wool, and are a treasure in themselves. Some of the mountains in Spain are clothed with rich trees, fruits, and herbage, to the tops; and Seville oranges are noted all over the world. No country produces a greater variety of aromatic herbs, which renders the taste of their kids and sheep delicious. The Kingdom of Murcia abounds so much with mulberry-trees, that the product of its silk amounts to 200,000*l.* a year. Upon the whole, few countries in the world owe more than Spain does to nature, and less to industry.

The waters of Spain, especially those that are medicinal, are little known; but many salutiferous springs are found in Granada, Seville, and Cordova. All over Spain the waters are found to have such healing qualities, as are outdone by those of no country in Europe; and the inclosing, and encouraging a resort to them, becomes daily more prevalent, especially at Alhama in Granada.

**MOUNTAINS.]** It is next to impossible to specify these, they are so numerous; the chief and the highest are the Pyrenees, near 200 miles in length, which extend from the Bay of Biscay to the Mediterranean, and divide Spain from France. Over these mountains there are only five narrow passages to France, and the road over the pass that separates Roussillon from Catalonia reflects great honour on the engineer who planned it. It formerly required the strength of 30 men to support, and nearly as many oxen to drag up, a carriage, which four horses now do with ease. The Cantabrian mountains (as they are called) are a kind of continuation of the Pyrenees, and reach to the Atlantic Ocean, south of Cape Finisterre. No Englishman ought to be unacquainted with Mount Calpé, now called the Hill of Gibraltar, and in former times, one of the Pillars of Hercules; the other, Mount Abyla, lying opposite to it in Africa.

Among the mountains in Spain, Montserrat is particularly worthy the attention of the curious traveller; one of the most singular in the world, for situation, shape, and composition. It stands in a vast plain, about thirty miles from Barcelona, and nearly in the centre of the principality of Catalonia. It is called by the Catalonians Monte Serrado, or Mount Scie, words which signify a cut, or fawed mountain; and is so called from its singular and extraordinary form: for it is so broken and divided, and so crowned with an infinite number of spiring cones, or pine heads, that it seems, at a distant view, to be the work of man; but upon a nearer approach, appears to be evidently the production of the God of nature. It is a spot so admirably adapted for retirement and contemplation, that it has, for many ages, been inhabited only by monks and hermits, whose first vow is never to forsake it. When the mountain is first seen at a distance, it has the appearance of an infinite number of rocks cut into conical forms, and built one upon another to a prodigious height, or like a pile of grotto work, or Gothic spires. Upon a nearer view, each

cone appears of itself a mountain, and the whole composes an enormous mass, about 14 miles in circumference, and the Spaniards compute it to be two leagues in height \*. As it is like no other mountain, so it stands quite unconnected with any, though not very distant from some that are very lofty. A convent is erected on the mountain, dedicated to our lady of Montserrat, to which pilgrims resort from the farthest parts of Europe. All the poor who come here are fed gratis for three days, and all the sick received into the hospital. Sometimes, on particular festivals, seven thousand persons arrive in one day; but people of condition pay a reasonable price for their entertainment. On different parts of the mountain are a number of hermitages, all of which have their little chapels, and most of them little gardens. The inhabitant of one of these hermitages, which is dedicated to St. Benito, has the privilege of annually entertaining his brethren, when they receive the sacrament from the hands of the mountain vicar; and after divine service dine together. They meet also at this hermitage, on the days of the saints to which their several hermitages are dedicated, to say mass, and commune with each other. But at other times they live in a very solitary and reclusive manner, perform various penances, and adhere to very rigid rules of abstinence, never eating flesh. Nor are they allowed to keep within their walls either dog, cat, bird, or any living thing, lest their attention should be withdrawn from heavenly to earthly objects. The number of professed monks there, is 76, of lay-brothers 28, and of singing boys 25, besides physician, surgeon, and servants. Mr. Thicknesse, who has published a very particular description of this extraordinary mountain, was informed by one of the hermits, that he often saw from his habitation the islands of Minorca, Majorca, and Yvica, and the kingdoms of Valencia and Murcia.

RIVERS, LAKES, STRAITS. } Of rivers the principal are the Duero, formerly  
AND CURRENTS. } Durus, which falls into the Atlantic Ocean below  
Oporto, in Portugal; the Tajo, or Tagus, which falls into the Atlantic Ocean below Lisbon; the Guadiana falls into the same ocean near Cape Finisterre; as does the Guadalquivir, now Turio, at St. Lucar; and the Ebro, the ancient Iberus, falls into the Mediterranean sea below Tortosa.

The river Tinto, the qualities of which are very extraordinary, rises in Sierra Morena, and empties itself into the Mediterranean near Huelva, having the name of Tinto given it, from the tinge of its waters, which are as yellow as a topaz, hardening the sand, and petrifying it in a most surprising manner. If a stone happens to fall in, and rest upon another, they both become in a year's time perfectly united and conglutinated. This river withers all the plants on its banks, as well as the roots of trees, which it dyes of the same hue as its waters. No kind of verdure will come up where it reaches, nor any fish live in its stream. It kills worms in cattle when given them to drink; but in general, no animals will drink out of this river, except goats, whose flesh nevertheless has an excellent flavour. These singular properties continue till other rivulets run into it, and alter its nature: for when it passes by Niebla, it is not different from other rivers, and falls into the Mediterranean sea six leagues lower down.

Several lakes in Spain, especially that of Beneventa, abound with fishes, particularly excellent trout. The water of a lake near Antiquera is made into salt by the heat of the sun.

The Straits of Gibraltar (formerly known by the name of the Herculean Straits) are about twelve leagues in extent, from Cape Spartel to Ceuta point, on the African coast; and from Cape Trafalgar to Europa Point, on the coast of Spain. At the western entrance, they are in breadth about eight leagues, but diminish

\* Mr. Swinburne estimates its height at only 3,300 feet, and observes that the arms of the convent are, the Virgin Mary sitting at the foot of a rock, half cut through by a saw.

considerably

considerably about the middle, opposite Tarifa (a small fishing town on the Spanish coast, originally a place of great consequence), though they widen again between Gibraltar and Ceuta, where they are about five leagues broad.

Philosophers, who have communicated their sentiments on the extraordinary phenomenon of a constant current through the Straits of Gibraltar into the Mediterranean, differ widely in accounting for the disposition of that continual influx of waters, which, it is natural to suppose, would, without some consumption or return, soon overflow the boundaries of the Mediterranean Sea. The late ingenious Dr. Halley was of opinion, that this perpetual supply of water from the vast Atlantic Ocean was intended by nature to recruit what was daily exhaled in vapour: others again think, the waters that roll in with the centre current are returned, by two counter-streams, along the African and Spanish shores. That there are two counter-streams, is without doubt; but their rapidity and breadth bear little proportion to the principal current. A third class suppose a counter-current beneath, and of equal strength with the upper stream; and this opinion appears confirmed by a circumstance related by colonel James, in his description of the Herculean Straits, of a Dutch ship being sunk in an action by a French privateer off Tarifa, which some time afterwards was cast up near Tangier, four leagues to the westward of the place where she disappeared, and directly against the upper current. This hypothesis receives also additional support from the repeated disappointments which have been experienced by many naval officers, in attempting to found the depth of the Straits with the longest lines; for the opposition between the currents might carry the line in such directions as to defeat the intention of the experiment.

These facts seem strongly to indicate a recurrency to the westward; which, though it may not be so rapid as the upper stream, yet with the assistance of the currents along the Spanish and Barbary shores, and the necessary exhalations, may account for the Mediterranean sea never increasing by the constant supply received from the Atlantic Ocean. The rapidity of the superior current renders the passage from the Mediterranean to the westward very precarious, as ships never can stem the stream without a brisk Levanter, or easterly wind. Vessels, therefore, are often detained weeks, and sometimes months, waiting for a favourable breeze; in which case they find a comfortable birth in the Bay of Gibraltar.

BAYS.] The chief bays are those of Biscay, Ferrol, Corunna (commonly called the Groyne), Vigo, Cadiz, Gibraltar, Carthagea, Alicante, Altea, Valencia, Roses, Majorca in that island, and the harbour of Port-Mahon, in the island of Minorca. The strait of Gibraltar divides Europe from Africa.

METALS AND MINERALS.] Spain abounds in both, and in as great variety as the other countries of Europe. Cornelian, agate, loadstones, jacinths, turquois stones, quicksilver, copper, lead, sulphur, alum, calamine, crystal, marbles of several kinds, porphyry, the finest jasper, and even diamonds, emeralds, and amethysts, are found here. The Spanish iron, next to that of Damascus, furnishes the best arms in the world; and in former times, brought in a vast revenue to the crown; the art of working it being here in great perfection. Even to this day, Spanish gun barrels, and swords of Toledo, are highly valued. Amongst the ancients, Spain was celebrated for gold and silver mines; and silver was in such plenty, that Strabo, who was contemporary with Augustus Caesar, informs us, that when the Carthaginians were masters of Spain, their domestic and agricultural utensils were made of that metal. These mines have now disappeared; but whether by their being exhausted, or through the indolence of the inhabitants in not working them, we cannot say; though the latter cause seems to be the most probable.

ANIMAL

**ANIMAL PRODUCTIONS.** } The Spanish horses, especially those of Andalusia, **BY SEA AND LAND.** } are thought to be the handsomest of any in Europe, and at the same time very swift and useful. The king does all he can to monopolise the finest breeds for his own stables and service. Spain furnishes likewise mules and black cattle; and their wild bulls have so much ferocity, that their bull-fights were the most magnificent spectacle the court of Spain could exhibit, nor are they now disused. Wolves are the chief beasts of prey that pester Spain, which is well stored with all game and wild fowl, that are to be found in the neighbouring countries already described. The Spanish seas afford excellent fish of all kinds, especially anchovies, which are here cured in great perfection.

This country is much infested with locusts; and Mr. Dillon observes, that in 1754, La Mancha was covered with them, and the horrors of famine assailed the fruitful provinces of Andalusia, Murcia, and Valencia. They have sometimes appeared in the air in such number as to darken the sky; the clear atmosphere of Spain has become gloomy; and the finest summer day of Estremadura been rendered more dismal than the winter of Holland. Their sense of smelling is so delicate, that they can discover a corn field or a garden, at a considerable distance; which they ravage almost in an instant. Mr. Dillon is of opinion, that the country people, by timely attention and observation, might destroy the eggs of these formidable insects, and thereby totally extirpate them.

Mr. Townsend confirms the above account, and observes, that these insects commit the greatest devastations in the south of Spain, and this proceeds not merely from the warmth of climate, but from want of cultivation, because the females never deposit their eggs in arable land, but always in the deserts. For this reason Galicia, where agriculture prevails, is little infested with the locust. Of the locust tribe Linnæus reckons twenty species. Their jaw bones are strong and dented like a saw. Their head bears a striking resemblance to that of the horse, and this similitude has been remarked in the whole genus. The sound of their wings is said to be like the noise of distant chariots. They are not always considered as a plague, being commonly seen only in the forests; but when the season has been peculiarly favorable for their propagation, these rapacious insects darken the air, their assembled hosts fall upon the rich pastures, they rob the vines and olives of their foliage, they devour the corn, they enter the houses, and lay waste every thing before them, and are then justly regarded as the scourge of heaven. As such they were considered, when, for four successive years, from 1754 to 1757, they ravaged all the southern provinces of Spain and Portugal.

The description of this gloomy scene, at least of one similar to it, which a prophet has given us, is scarcely to be equalled for beauty and poetic fire. He calls upon the people to lament because a nation, strong and without number, whose teeth are the teeth of lions, had suddenly invaded them. Then, turning to the heralds, "Blow ye the trumpet, &c." which will richly compensate the reader for the trouble of consulting it. Joel ii. 1—11.

**POPULATION, INHABITANTS, MANNERS,** } Spain, formerly the most popu-  
**CUSTOMS, DIVERSIONS, AND DRESS.** } lous kingdom in Europe, is now but thinly inhabited. This is owing partly to the great drains of people sent to America, and partly to the indolence of the natives, who are at no pains to raise food for their families. Another cause may be assigned, and that is, the vast numbers of ecclesiastics, of both sexes, who lead a life of celibacy. Some writers have given several other causes, such as their wars with the Moors, and the final expulsion of that people. The present inhabitants of this kingdom have been computed by Feyjoo, a Spanish writer, to amount to 9,250,000; so that England is three times as populous as Spain, considering its extent.

The persons of the Spaniards are generally tall, especially the Castilians; their hair and complexions swarthy, but their countenances expressive. The court of Madrid has of late been at great pains to clear their upper lips of mustachoes, and to introduce among them the French dress, instead of their black cloaks, short jerkins, strait breeches, and long Toledo swords, which dress is now chiefly confined to the lower ranks. The Spaniards, before the accession of the house of Bourbon to their throne, affected that antiquated dress, in hatred and contempt of the French; and the government, probably, will find some difficulty in abolishing it quite, as the same spirit is far from being extinguished. An old Castilian, or Spaniard, who sees none above him, thinks himself the most important being in nature; and the same pride is commonly communicated to his descendants. This is the true reason why many of them are so fond of removing to America, where they can retain all their native importance, without the danger of feeling a superior.

Throughout the whole of Spain (says Mr. Townsend) I cannot recollect to have seen a single country residence, like those which every where abound in England; the great nobility surround the sovereign, and are attracted by the court; the nobles of inferior rank or fortune are either assembled at Madrid, or establish themselves in the great cities of the distant provinces. This desertion of the country has arisen, not as in other countries, from the oppressions of the great barons, and from the franchises enjoyed by cities, but from two other causes more extensive in their operations. The first of these was the distracted condition of the empire till the reign of Ferdinand and Isabella, divided into separate kingdoms of small extent, all engaged in endless wars against each other, which drove men of property into the cities; the second was the jealousy of the court, lest the *grandees*, supported by the people, should endeavour to regain their consequence. To this fear, at the accession of the present family, succeeded one of a more alarming nature; from the attachment which many of the great families had discovered to the house of Austria. For this reason they were assembled round the throne, and kept constantly in sight. In France some inhabited castles are to be found in every province. But, in this respect, no country can be compared to England. If the causes were to be assigned for this equal dissemination of wealth, which appears in the delightful mansions of the great, and the seats of country gentlemen, scattered over the face of the whole island; of that which is to be seen in all our cities, great towns, and country villages; which meets the eye in every farm-house, and which shews itself in the high state of cultivation, in our agricultural improvements, in the flocks, the herds, and the luxuriant crops with which our fields are covered, the leading cause would probably be found in the constitution of our government, not merely as securing life, liberty, and property, but as making it necessary for the first nobility to cultivate their interest in the country, if they will extend their influence at court. By residing on their own estates, they not only spend money among their tenants, which, by its circulation, sets every thing in motion, and becomes productive of new wealth, but their amusement is to make improvements.

Ridiculous, however, as the Spanish pride certainly is, it is connected with exalted qualities. It inspires the nation with generous, humane, and virtuous sentiments; it being seldom found that a Spanish nobleman, gentleman, or even trader is guilty of a mean action. During the most embittered wars they have had with England for near 70 years past, we know no instance of their taking advantage (as they might easily have done) of confiscating the British property on board their galleons and plate fleet, which was equally secure in time of war as peace. This is the more surprising, as Philip V. was often needy, and his ministers were far from being scrupulous of breaking their good faith with Great Britain.

By

By the best and most credible accounts of the late wars, it appears that the Spaniards in America gave the most humane and noble relief to all British subjects who were in distress, and fell into their hands, not only by supplying them with necessaries, but money; and treating them in the most hospitable manner while they remained amongst them.

Having said thus much, we are carefully to distinguish the Spanish nobility, gentry, and traders, from the lower ranks of Spaniards, who are as mean and rapacious as those of any other country. The kings of Spain of the house of Bourbon, have seldom ventured to employ native Spaniards of great families, as their ministers. These are generally French or Italians, but most commonly the latter, who rise into power by the most infamous arts, and of late times from the most abject stations. Hence it is that the French kings of Spain, since their accession to that monarchy, have been but very indifferently served in the cabinet. Alberoni, who had the greatest genius among them, embroiled his master with all Europe, till he was driven into exile and disgrace; and Grimaldi, the last of their Italian ministers, hazarded a rebellion in the capital, by his oppressive and unpopular measures.

The common people who live on the coasts, partake of all the bad qualities that are to be found in other nations. They are an assemblage of Jews, French, Russians, Irish adventurers, and English smugglers; who being unable to live in their own country, mingle with the Spaniards. In time of war, they follow privateering with great success; and when peace returns, they engage in all illicit practices, and often enter into the Irish and Walloon guards in the Spanish service. There are about 40,000 gypsies, who besides their trade of fortune-telling, are inn-keepers in the small towns and villages.—The character of the Spaniards is thus drawn by Mr. Swinburne, after his late travels through the country: "The Catalans appear to be the most active stirring set of men, the best calculated for business, travelling, and manufactures. The Valencians a more sullen, sedate race, better adapted to the occupations of husbandmen, less eager to change place, and of a much more timid, suspicious cast of mind than the former. The Andalusians seem to be the greatest talkers and rhodomontadors of Spain. The Castilians have a manly frankness, and less appearance of cunning and deceit. The New Castilians are perhaps the least industrious of the whole nation: the Old Castilians are laborious, and retain more of the ancient simplicity of manners; both are of a firm determined spirit. The Arragonefe are a mixture of the Castilian and Catalan, rather inclining to the former. The Biscayners are acute and diligent, fiery, and impatient of control, more resembling a colony of republicans than the province of an absolute monarchy: and the Galicians are a plodding, pains-taking race of mortals, that roam over Spain in search of an hardly earned subsistence."

The beauty of the Spanish ladies reigns mostly in their novels and romances; for though it must be acknowledged, that Spain produces as fine women as any country in the world, yet beauty is far from forming their general character. In their persons they are commonly small and slender; but they are said to employ vast art in supplying the defects of nature. If we are to hazard a conjecture, we might reasonably suppose that those artifices rather diminish than increase their beauty, especially when they are turned of 25. Their indiscriminate use of paint, not only upon their faces, but their necks, arms, and hands, undoubtedly disfigures their complexions, and shrivels their skin. It is universally allowed, that they have great wit and vivacity.

Among the many good qualities possessed by the Spaniards, their sobriety in eating and drinking is remarkable. They frequently breakfast, as well as sup in bed; their breakfast is usually chocolate, tea being very seldom drank. Their dinner is generally beef, mutton, veal, pork, and bacon, greens, &c. all boiled together.

gether. They live much upon garlic, chives, salad, and radishes; which, according to one of their proverbs, are food for a gentleman. The men drink very little wine; and the women use water or chocolate. Both sexes usually sleep after dinner, and take the air in the cool of the evening. This is the common practice in warm countries, such as Italy, Spain, and Portugal, where, generally speaking, the weather is clear, and the inhabitants are mostly in the habit of rising much earlier than in England. The human body cannot furnish spirits sufficient to resist the effects of the violent heat through the whole day, without some refreshment; it is therefore the universal practice to go to sleep for some hours after dinner, which in those countries is over early, and this time of repose, which lasts for two or three hours, is in Spain called *the Siesta*, and in Portugal *the Sesta*. Dancing is so much their favourite entertainment, that you may see a grandmother, mother, and daughter, all in the same country-dance. Many of their theatrical exhibitions are insipid and ridiculous bombast. The prompter's head sometimes appears through a trap-door above the level of the stage, and he reads the play loud enough to be heard by the audience. Gallantry is a ruling passion in Spain. Jealousy, since the accession of the house of Bourbon, has slept in peace. The nightly musical serenades by their mistresses by their lovers are still in use. The fights of the cavaliers, or bull-fights, are almost peculiar to this country and Portugal, and make a capital figure in painting the genius and manners of the Spaniards. On these occasions, young gentlemen have an opportunity of shewing their courage and activity before their mistresses; and the valour of the cavalier is proclaimed, honoured, and rewarded, according to the number and fierceness of the bulls he has killed in these encounters. Great pains are used in settling the form and weapons of the combat, so as to give a relief to the gallantry of the cavalier. The diversion itself, which is attended with circumstances of great barbarity, is of Moorish original, and was adopted by the Spaniards when upon good terms with that nation, partly through complaisance, and partly through rivalry.

There is scarcely a town in Spain but has a large square for the purpose of exhibiting bull-fights; and it is said that even the poorest inhabitants of the smallest villages will often club together in order to procure a cow or an ox, and fight them riding upon asses, for want of horses.

RELIGION.] The Romish religion is the only one tolerated in Spain. The inquisition, a tribunal disgraceful to human nature, is not yet abrogated; but the ecclesiastics and their officers cannot now carry any sentence into execution without the royal authority. The Spaniards, embrace and practise the Roman catholic religion with all its absurdities; and in this they have been so steady, that their king is distinguished by the epithet of *Most Catholic*. It appears, however, that the burning zeal which distinguished their ancestors above the rest of the catholic world hath lost much of its activity, and seems nearly extinguished, and the power of the clergy hath been much reduced of late years. A royal edict has also been issued, to prevent the admission of novices into the different convents, without special permission, which has a great tendency to reduce the monastic orders. It is said, that there are now, in the kingdom of Spain, 54,000 friars, 34,000 nuns, and 20,000 secular clergy, but as little true moral religion as in any country under heaven.

In Catalonia, the confidence of the people on the intercession of saints has at all periods been a source of consolation to them, but upon some occasions, has betrayed them into mischief. Every company of artificers, and every ship that sails, is under the immediate protection of some patron. Besides folio volumes, which testify the innumerable miracles performed by our lady of Montserrat, every subordinate shrine is loaded with votive tablets. This has been the parent of presumption, and among the merchants has brought many families to want. The companies

companies of insurance in the last war, having each of them its favourite saint, such as San Ramon de Penaforte, la Virgin de la Merced, and others, associated in form by the articles of partnership, and named in every policy of insurance, and having with the most scrupulous exactness allotted to them their correspondent dividend, the same as to any other partner; they concluded that with such powerful associates it was not possible for them to suffer loss. Under this persuasion they ventured, about the year 1779, to insure the French West-Indiamen at fifty per cent. when the English and the Dutch had refused to do it at any premium; and, indeed, when most of the ships were already in the English ports. By this fatal stroke all the insuring companies, except two, were ruined.

[ARCHBISHOPRICKS AND BISHOPRICKS.] In Spain there are eight archbishopricks and forty-six bishopricks. The archbishop of Toledo is styled the Primate of Spain; he is great chancellor of Castile, and hath a revenue of 100,000l. sterling per annum, but the Spanish court hath now many ways of lessening the revenues of the church, as by pensions, donations to hospitals, &c. and premiums to the societies of agriculture. This archbishoprick pays annually 15,000 ducats to the monks of the Escorial, besides other pensions; and it is asserted, that there is not a bishoprick in Spain but hath somebody or other quartered upon it, and the second-rate benefices are believed to be in the same predicament. Out of the rich canonries and prebends are taken the pensions of the new order of knights of Carlos Tercero. The riches of the Spanish churches and convents are the unvarying objects of admiration to travellers as well as natives; but there is a sameness in them all, except that they differ in the degrees of treasure and jewels they contain.

The sums which are given away in charity, by the archbishops, bishops, and convents, from their ample revenues, are immense; but the effects of it are most deplorable, in promoting indolence, poverty, and every species of wretchedness. In traversing the streets of Seville (says Mr. Townsend) I was struck with the multitude of beggars clothed in rags; and was at first inclined to attribute this to the decay of trade; but upon examination, I found a more abiding cause in the distribution of alms at the archbishop's palace, and at the gates of twenty convents daily, and without distinction, to all who make application for relief. Such misplaced benevolence is a bar to industry, and multiplies the objects of distress, whose numbers bear exact proportion to the provision made for their support. This is the case not in one, but in every place, where beggars abound, for, by the mistaken benevolence of the bishop, of the canons, and of the convents, in distributing alms to all who ask, there is such ample provision made for laziness, that every street swarms with vagabonds, not merely with those who are proper objects of compassion, but with wretches, who, if compelled to work, would be found abundantly able to maintain themselves. What incitement can there be here to industry? Hence it comes to pass, that wherever these indiscriminate charities abound, few traces of it are to be seen, whilst filth and nastiness, immorality and vice, wretchedness and poverty, the inevitable consequences of undistinguishing benevolence, prevail. How evident it is from hence, that he who finds employment for the poor is their greatest friend; whilst he who indiscriminately feeds them, should be ranked amongst their enemies.

[LANGUAGE.] The ground-work of the Spanish language, like that of the Italian, is Latin; and it might be called a bastard Latin, were it not for the terminations, and the exotic words introduced into it by the Moors and Goths, especially the former. It is at present a majestic and expressive language: and it is remarkable, that foreigners who understand it the best, prize it the most. It makes but a poor figure even in the best translations; and Cervantes speaks almost as awkward English as Shakspere does French. It may, however, be considered as a standard tongue,

tongue, having retained its purity for upwards of 200 years. Their Paternoster runs thus; *Padre nuestro, que estas en el cielo, santificado se el tu nombre; venga a nos el tu reyno; hágase tu voluntad, asíen la tierra como en el cielo; el pan nuestro de cada dia das nos le ay; y perdona nos nuestras deudas así como nos otros perdonamos a nuestros deudores; no nos dexes cair en la tentacion, mas libra nos de mal, porque tao es le reyno; y la potencia; y la gloria per los siglos. Amen.*

[LEARNING AND LEARNED MEN.] Spain has not produced learned men in proportion to the excellent capacities of its natives. This defect is ascribed to their indolence and bigotry, and the despotic nature of their government. Several old fathers of the church were Spaniards; and learning owes a great deal to Isidore, bishop of Seville, and cardinal Ximenes. Spain has likewise produced some excellent physicians. Such was the gloom of the Austrian government, that took place with the emperor Charles V. that the inimitable Cervantes, the author of Don Quixote, born at Madrid, in 1549, lifted in a station little superior to that of a common soldier, and died neglected, after fighting bravely for his country at the battle of Lepanto, in which he lost his left hand. His satire upon knight-errantry, in his adventures of Don Quixote, did as much service to his country by curing them of that ridiculous spirit, as it now does honour to his own memory. He was in prison for debt when he composed the first part of this history, and is perhaps to be placed at the head of moral and humorous satirists.

The Visions of Quevedo, and some other of his humorous and satirical pieces have been translated into the English language. He was born at Madrid in the year 1570, and besides his merit as a poet, was well versed in the oriental languages, and possessed great erudition. His works are comprised in three volumes, 4to. two of which consist of poetry, and the third of pieces in prose. As a poet he excelled both in the serious and burlesque style, and was happy in a turn of humour similar to that which we admire in Butler and Swift.

Poetry was cultivated in Spain at an early period. After the Saracens had settled themselves in this kingdom, they introduced into it their own language, religion, and literature; and the oriental style of poetry very generally prevailed. Before this period, the Spaniards had addicted themselves much to Roman literature: but Alvaro of Cordova complains, that in his time, the Spaniards had so totally forgotten the Latin tongue, and given the preference to Arabic, that it was difficult, even amongst a thousand people, to find one who could write a Latin letter. The attachment of many of the inhabitants of Spain to oriental literature was then so great, that they could write Arabic with remarkable purity, and compose verses with as much fluency and elegance as the Arabians themselves. About this time the Spanish Jews made a considerable figure in literature, which was promoted by masters from Babylon, where they had academies supported by themselves. In the year 967, Rabbi Moses, and his son Rabbi Enoch, having been taken by pirates, were sold as slaves at Cordova, and redeemed by their brethren, who established a school in that city, of which Rabbi Moses was appointed the head: that learned Jew was, however, desirous of returning back to his own country; but the Moorish king of Cordova would not give his consent, rejoicing that his Hebrew subjects had matters of their own religion at home, without being under the necessity of receiving them from a foreign univerlity, and every indulgence was granted them with respect to their worship. In 1039, Rabbi Ezechias was put to death at Babylon, and the college, over which he had presided, was transferred to Cordova, from whence a number of Hebrew poets issued forth, who have been noticed by various learned writers. The Spanish Jews had also flourishing schools at Seville, Granada, and Toledo, and from hence arose the numerous Hebrew proverbs, and modes of speech, that have crept into the Castilian language, and form a conspicuous part of its phraseology. To these Jews the Spanish language is indebted for a curious

version

version of the Hebrew books of the Old Testament, which was afterwards printed at Ferrara, in 1553, in a Gothic-Spanish letter.

The Spanish writers also boast of their Troubadours as high as the twelfth or thirteenth centuries, the Provençal and Galician dialects being then very prevalent. The marquis of Villena, who died in 1434, was the author of that famous work the *Arte de la Gaya Ciencia*, which comprehends a system of poetry, rhetoric, and oratory, besides describing all the ceremonies of the Troubadours at their public exhibitions. That nobleman was also the author of a translation of the *Aeneid* of Virgil into Spanish verse. Juan de Mena, of Cordova, was also much celebrated as a poet in his own time: his poems have passed through a variety of editions, the first of which was printed at Saragossa in 1515. Juan de la Encina was also a poet of considerable merit; he translated some of the Latin poems into Spanish, and published a piece on the art of poetry, and other works, which were printed at Saragossa in 1516. Boscán, Ercilla, Villegas, and other Spanish poets, also obtained great reputation in their own country. But the most distinguished dramatic poet of this nation was Lopez de Vega, who was contemporary with our Shakspeare. He possessed an imagination astonishingly fertile, and in his dramatic works he disregarded the unities, and adapted all his compositions more to the taste of the age than to the rules of criticism. His lyric works and fugitive pieces, with his prose essays, form a collection of fifty volumes, besides his dramatic works, which make twenty-six volumes more; exclusive of four hundred scriptural dramatic pieces, called in Spain *Autos Sacramentales*. Calderon was also a dramatic writer of considerable note, but many of his plays are very licentious in their tendency.

Tostatus, a divine, the most voluminous perhaps that ever wrote, was a Spaniard. Herrera, and some other historians, particularly De Solis, have shewn great abilities in investigating the antiquities of America, and writing the history of its conquest by their countrymen. Among the writers who have lately appeared in Spain, Father Fejoo is one of the most distinguished. His performances display ingenuity, learning, and uncommon liberality of sentiment, especially when his situation and country are considered. Many of his pieces have been translated into English, and published in four volumes, 8vo. Don Francisco Peyrez Bayer, archdeacon of Valencia, and author of a dissertation on the Phœnician language, may be placed in the first line of Spanish literati. Spain has likewise produced many travellers and voyagers to both the Indies, some of whom are amusing and instructive. Should the Spaniards disengage themselves from their abstracted metaphysical turn of thinking, and from their present tyrannical form of government, without substituting a worse in its stead, they certainly would make a capital figure in literature. At present, it seems, that the common education of an English gentleman would constitute a man of learning in Spain, and should he understand Greek, he would be quite a phenomenon.

Some of the Spaniards have distinguished themselves in the polite arts, and not only the cities, but the palaces, especially the Escorial, discover many striking specimens of their abilities as sculptors and architects; Palomino, in an elaborate treatise on the art of painting, in two volumes, folio, has inserted the lives of two hundred and thirty-three painters and sculptors, who flourished in Spain from the time of Ferdinand and the Catholic, to the conclusion of the reign of Philip the Fourth. Among the most eminent Spanish painters, were Velasques, Murillo, who is commonly called the Spanish Vandyke, Ribera and Glaudio Coello, whose style of painting was very similar to that of Paul Veronese.

UNIVERSITIES.] In Spain are reckoned 24 universities, the chief of which is Salamanca, founded by Alphonfus, ninth king of Leon, in the year 1200. It contains 21 colleges, some of which are very magnificent. Many of the nobility of

Spain fend their sons to be educated here. The rest are, Seville, Granada, Compostella, Toledo, Valladolid, Alcalá, Sigüenza, Valencia, Lerida, Huefca, Saragossa, Tortosa, Offuna, Onata, Candia, Barcelona, Murcia, Taragona, Baeza, Avila, Oriuela, Oviedo, and Palencia.

ANTIQUITIES AND CURIOSITIES. } The former of these consist chiefly of  
ARTIFICIAL AND NATURAL. } Roman and Moorish antiquities. Near Segovia, a grand aqueduct, erected by Trajan, extends over a deep valley, between two hills, and is supported by a double row of 150 arches. It reaches about 140 yards, and where it crosses the valley it is something more than 94 feet high. Its solidity, which has braved upwards of sixteen centuries, seems inexplicable, on closely observing the simplicity of its construction. It is composed of square stones, placed one upon another, without any exterior appearance of cement, though we cannot now be certain whether they were really united without this aid, by being cut and placed with peculiar art, or whether the cement has been destroyed by time. Other Roman aqueducts, theatres, and circi, are to be found at Terrago, and different parts of Spain. A ruinous watch-tower near Cadiz is vulgarly, but erroneously, thought to be one of the pillars of Hercules. Near the city of Salamanca are the remains of a Roman way, paved with large flat stones; it was continued to Merida, and from thence to Seville. At Toledo are the remains of an old Roman theatre, which is now converted into a church. It is 600 feet in length, 500 in breadth, and of a proportionable height: the roof, which is bold and lofty, is supported by 350 pillars of fine marble, in ten rows, forming eleven aisles, in which are 366 altars, and 24 gates; every part being enriched and adorned with noble and costly ornaments. At Martorel, a large town, where much black lace is manufactured, is a very high bridge, built in 1768, out of the ruins of a decayed one that had existed 1985 years from its erection by Hannibal. At the north end is a triumphal arch or gateway, said to have been raised by that general in honour of his father Hamilcar. It is almost entire, well proportioned, and simple, without any kind of ornament, except a rim or two of hewn stone. Near Moviedro (once the faithful Saguntum) destroyed by Hannibal, are some Roman remains—as the ruins of the theatre, an exact semicircle about 82 yards diameter, some of the galleries are cut out of the rock, and 9000 persons might attend the exhibitions without inconvenience.

The Moorish antiquities are rich and magnificent. Among the most distinguished is the royal palace of the Alhambra at Granada, which is one of the most entire, as well as the most stately, of any of the edifices which the Moors erected in Spain. It was built in 1280, by the second Moorish king of Granada; and, in 1492, in the reign of their eighteenth king, was taken by the Spaniards. It is situated on a hill, which is ascended by a road bordered with hedges of double or imperial myrtles, and rows of elms. On this hill, within the walls of the Alhambra, the emperor Charles V. began a new palace in 1568, which was never finished, though the shell of it remains. It is built of yellow stone; the outside forms a square of one hundred and ninety feet. The inside is a grand circular court, with a portico of the Tuscan, and a gallery of the Doric order, each supported by thirty-two columns, made of as many single pieces of marble. The grand entrance is ornamented with columns of jasper, on the pedestals of which are representations of battles, in marble basso relievo. The Alhambra itself is a mass of many houses and towers, walled round, and built of large stones of different dimensions. Almost all the rooms have stucco walls and ceilings, some carved, some painted, and some gilt, and covered with various Arabic sentences. Here are several baths, the walls, floor, and ceiling of which are of white marble. The gardens abound with orange and lemon trees, pomegranates, and myrtles. At the end of the garden is another palace called Ginaraliph, situated on a more elevated station than the Alhambra.

Alhambra. From the balconies of this palace is one of the finest prospects in Europe, over the whole fertile plain of Granada, bounded by the Snowy mountains. The Moors to this day regret the loss of Granada, and still offer up prayers to God for the recovery of the city. Many other noble monuments, erected in the Moorish times, remain in Spain; some of them in tolerable preservation, and others exhibiting superb ruins.

Among the natural curiosities, the medicinal springs, and some noisy lakes, form a principal part; but we must not forget the river Guadiana, which, like the Mole in England, runs under ground, and afterwards emerges. The royal cabinet of natural history at Madrid was opened to the public by his majesty's orders in 1775. Every thing in this collection is ranged with neatness and elegance, and the apartments are opened twice a week for the public, besides being shewn privately to strangers of rank. The mineral part of the cabinet, containing precious stones, marbles, ores, &c. is very perfect; but the collection of birds and beasts at present is not large, though it may be expected to improve apace, if care be taken to get the productions of the Spanish American colonies. Here is also a curious collection of vases, basons, ewers, cups, plates, and ornamental pieces of the finest agates, amethysts, rock crystals, &c. mounted in gold, and enamel, set with cameos, intaglios, &c. in an elegant taste, and of very fine workmanship, said to have been brought from France by Philip V. The cabinet also contains specimens of Mexican and Peruvian vases and utensils.

In blowing up the rock of Gibraltar, many pieces of bones and teeth have been found incorporated with the stone, some of which have been brought to England, and deposited in the British Museum. On the west side of the mountain is the cave called St. Michael's, eleven hundred and ten feet above the horizon. Many pillars of various sizes, some of them two feet in diameter, have been formed in it by the droppings of water, which have petrified in falling. The water perpetually drips from the roof, and forms an infinite number of stalactites, of a whitish colour, composed of several coats or crusts, and which, as well as the pillars, continually increase in bulk, and may probably in time fill the whole cavern. From the summit of the rock, in clear weather, not only the town of Gibraltar may be seen, but the bay, the straits, the towns of St. Roque and Algeiras, and the Alpujara mountains, mount Abyla on the African shore, with its snowy top, the cities of Ceuta, Tangier, and great part of the Barbary coast.

CHIEF CITIES, &c.] Madrid is the capital of Spain, and contains about 300,000 inhabitants. It is surrounded with very lofty mountains, whose summits are frequently covered with snow. It is well paved and lighted, and some of the streets are spacious and handsome. The houses of Madrid are of brick, and are laid out chiefly for show, conveniency being little considered: thus you will pass through usually two or three large apartments of no use, in order to come at a small room at the end, where the family sit. The houses in general look more like prisons than the habitations of people at their liberty; the windows, besides having a balcony, being grated with iron bars, particularly the lower range, and sometimes all the rest. Separate families generally inhabit the same house, as in Paris and Edinburgh. Foreigners are very much distressed for lodgings at Madrid, as the Spaniards are not fond of taking strangers into their houses, especially if they are not catholics. Its greatest excellency is the cheapness of its provisions; but neither tavern, coffee-house, nor newspaper, except the Madrid Gazette, are to be found in the whole city. The royal palace stands on an eminence, on the west side of the city; it is a spacious magnificent structure, consisting of three courts, and commands a very fine prospect. Each of the fronts is 470 feet in length and 100 high, and there is no palace in Europe fitted up with greater magnificence; the great audience chamber especially, which is 120 feet long, and hung with

crimson velvet richly embroidered with gold; ornamented also with 12 looking-glasses made at St. Ildefonso, each 10 feet high, with 12 tables of the finest Spanish marbles. The other royal palaces round it are designed for hunting-seats, or houses of retirement for their kings. Some of them contain fine paintings and good statues. The chief of these palaces are the Buen Retiro (now stripped of all its best pictures and furniture), Casa del Campo, Aranjuez, and St. Ildefonso.

A late traveller has represented the palace of Aranjuez, and its gardens, as extremely delightful. Here is also a park many leagues round, cut across in different parts, by alleys of two, three, and even four miles extent. Each of these alleys is formed by two double rows of elm trees. The alleys are wide enough to admit of four coaches a-breast, and betwixt each double row there is a narrow channel, through which runs a stream of water. Between these alleys there are thick groves of smaller trees of various kinds, and thousands of deer and wild boars wander at large, besides numberless hares, rabbits, pheasants, partridges, and other kinds of birds. The river Tagus runs through this place, and divides it into two unequal parts. The central point of this great park is the king's palace, which is partly surrounded by the garden, and is adorned with fountains and statues; it also contains a vast variety of the most beautiful flowers, both American and European. As to the palace of Aranjuez itself, it is rather an elegant than a magnificent building.

The palace of St. Ildefonso is built of brick, plastered, and painted, but no part of the architecture is agreeable. It is two stories high, and the garden-front has thirty-one windows, and twelve rooms in a suite. The gardens are on a slope, on the top of which is a great reservoir of water, called here *El Mar*, the sea, which supplies the fountains: this reservoir is furnished from the torrents which pour down the mountains. The water-works are excellent, and far surpass those at Versailles. The great entry of the palace is somewhat similar to that of Versailles, and with a large iron palisade. In the gardens are twenty-seven fountains: the basins are of white marble, and the statues, many of which are excellent, are of lead, bronzed and gilt. These gardens are in the formal French style, but ornamented with sixty-one very fine marble statues, as large as the life, with twenty-eight marble vases, and twenty leaden vases gilt. The upper part of the palace contains many valuable paintings, and the lower part antique statues, busts, and basso-relievos. The expence laid out in this palace and gardens was immense; but when we consider, says Mr. Townsend, that the whole of the garden was a barren rock, that the very soil is brought from a great distance, and that water is conveyed to every tree; when we reflect upon the quantity of lead used for the images, and of cast iron for the pipes, with the expence of workmanship for both, together with all the other elegancies, corresponding to such an undertaking, we shall not wonder to hear that this place cost forty-five millions of piastres, or, in English money, near six millions and an half.

The pride of Spain, however, is the Escorial; and the natives say, perhaps with justice, that the building of it cost more than that of any other palace in Europe. The description of this palace forms a sizeable quarto volume, and it is said, that Philip II. who was its founder, expended upon it six millions of ducats. It contains a prodigious number of windows, 200 in the west front, and in the east 366, and the apartments are decorated with an astonishing variety of paintings, sculpture, tapestry, ornaments of gold and silver, marble, jasper, gems, and other curious stones. This building, besides its palace, contains a church, large and richly ornamented, a mausoleum, cloisters, a convent, a college, and a library, containing about thirty thousand volumes; but it is more particularly valuable for the Arabic and Greek manuscripts with which it is enriched. Above the shelves are paintings in fresco by Bartolomei Carducho, the subjects of which are taken

from sacred or profane history, or have relation to the sciences of which the shelves below present to us the elements. Thus the council of Nice is represented above the books which treat of theology; the death of Archimedes at the siege of Syracuse indicates those which relate to mathematics; and Cicero pronouncing his oration in favour of Rabirius, the works relative to eloquence and the bar. A very singular circumstance in this library may be agreeable to the curious reader to know, which is, that, on viewing the books, he will find them placed the contrary way, so that the edges of the leaves are outwards, and contain their titles written on them. The reason for this custom is, that Arias Montanus, a learned Spaniard of the sixteenth century, whose library had served as a foundation for that of the Escurial, had all his books placed and inscribed in that manner. Here are also large appointments for all kinds of arts and mechanics, noble walks with extensive parks and gardens, beautified with fountains and costly ornaments. The fathers that live in the convent are 200, and they have an annual revenue of 12,000*l*. The mausoleum, or burying-place of the kings and queens of Spain, is called the Pantheon, because it is built upon the plan of that temple at Rome, as the church to which it belongs is upon the model of St. Peter's. It is 36 feet diameter, incrusted with fine marbles.

Allowing to the Spaniards their full estimate of the incredible sums bestowed on this palace, and on its furniture, statues, paintings, columns, vases, and the like decorations, which are equally rich and beautiful, yet we hazard nothing in saying that the fabric itself discovers a bad taste. The conceit of building it in the form of a gridiron, because St. Laurence, to whom it was dedicated, was broiled on such an utensil, and multiplying the same figure through its principal ornaments, upon the doors, windows, altars, rituals, and sacerdotal habits, could have been formed only in the brain of a tasteless bigot, such as Philip II. who erected it to commemorate the victory he obtained over the French (but by the assistance of the English forces) at St. Quintin, on St. Laurence's day, in the year 1557. The apartment where the king resides forms the handle of the gridiron. The building is a long square of 640 feet by 500. The height to the roof is 60 feet. It has been enriched and adorned by his successors; but its outside has a gloomy appearance, and the inside is composed of different structures, some of which are master-pieces of architecture, but forming a disagreeable whole. It must, however, be confessed, that the pictures and statues that have found admission there, are excellent in their kind, and some of them scarcely to be equalled even in Italy itself.

Cadix is the great emporium of Spanish commerce. It stands on an island separated from the continent of Andalusia, without the straits of Gibraltar, by a very narrow arm of the sea, over which a fortified bridge is thrown, and joins it to the main land. The entrance into the bay is about 500 fathoms wide, and guarded by two forts called the Puntals. The entrance has never been of late years attempted by the English, in their wars with Spain, because of the vast interest our merchants have in the treasures there, which they could not reclaim from the captors. The streets are narrow, ill paved, and filthy, and full of rats in the night; the houses lofty, with flat roofs, and few are without a turret for a view of the sea. The population is reckoned at 140,000 inhabitants, of which 12,000 are French, and as many Italians. The cathedral hath been already 50 years building, and the roof is not half finished. The environs are exceedingly beautiful.

Cordova is now an inconsiderable place; streets crooked and dirty, and but few of the public or private buildings conspicuous for their architecture. The palaces of the inquisition and of the bishops are extensive and well situated. The cathedral was formerly a mosque, divided into seventeen aisles by rows of columns of various marbles, and is very rich in plate; four of the silver candlesticks cost 850*l*. a-piece.

The revenue of the see amounts to 3500*l.* per ann. but as the bishops cannot devise by will, all they die possessed of escheats to the king.

Seville, the Julia of the Romans, is, next to Madrid, the largest city in Spain, but is greatly decayed both in riches and population. The shape is circular, and the walls seem of Moorish construction; its circumference is five miles and a half. The suburb of Triana is as large as many towns, and remarkable for its gloomy Gothic castle, where, in 1481, the inquisition was first established in Spain. Its manufactures in wool and silk, which formerly amounted to 16,000, are now reduced to 400, and its great office of commerce to Spanish America is removed to Cadiz. The cathedral of Seville is a fine Gothic building, with a curious steeple or tower, having a moveable figure of a woman at top, called La Giralda, which turns round with the wind, and which is referred to in Don Quixote. This steeple is reckoned one of the greatest curiosities in Spain, and is higher than St. Paul's in London: but the cathedral, in Mr. Swinburne's opinion, is by no means equal to York-minster for lightness, elegance, or Gothic delicacy. The first clock made in the kingdom was set up in this cathedral in the year 1400, in the presence of king Henry III. The prospect of the country round this city, beheld from the steeple of the cathedral, is extremely delightful.

Barcelona, formerly Barcino, said to be founded by Hamilcar Barcas, is a large circular trading city, containing 15,000 houses, is situated in the Mediterranean facing Minorca, and is said to be the handsomest place in Spain; the houses are lofty and plain, and the streets well lighted and paved. The citadel is strong, and the place and inhabitants famous for the siege they sustained in 1714 against a formidable army, when deserted both by England and the emperor, for whom they had taken up arms. Their number is supposed to be nearly 150,000, and they supply Spain with most of the clothing and arms for the troops. A singular custom prevails among them on the first of November, the eve of All Souls; they run about from house to house to eat chestnuts, believing that for every chestnut they swallow, with proper faith and uncti<sup>o</sup>n, they shall deliver a soul out of purgatory.

Valencia is a large and almost circular city, with lofty walls. The streets are crooked and narrow, and not paved, the houses ill built and filthy, and most of the churches tawdry. Priests, nuns, and friars, of every dress, swarm in this city, whose inhabitants are computed at 80,000. Its archbishoprick is one of the best in Spain, to the amount of 40,000*l.* sterling a year.

Carthagena is a large city, but has very few good streets, and fewer remarkable buildings. The port is very complete, formed by nature in the figure of a heart, and the arsenal is a spacious square south-west of the town, with 40 pieces of cannon to defend it towards the sea. When Mr. Swinburne visited it, in 1775, there were 800 Spanish criminals, and 600 Barbary slaves working at the pumps to keep the docks dry, &c. and treated with great inhumanity. The crimes for which the Spaniards were sent there, deserved indeed exemplary punishments.

Granada stands on two hills, and the ancient palace of the Alhambra crowns the double summit between two rivers, the Douro and the Xenil. The former glories of this city are passed away with its old inhabitants; the streets are now filthy, and the aqueducts crumbled to dust, and its trade lost. Of 50,000 inhabitants, only 18,000 are employed in labour; the surplus is made up of clergy, lawyers, children, and beggars. The amphitheatre, for bull-fights, is built of stone, and one of the best in Spain, and the environs of the city are still pleasing and healthful.

Bilboa is situated on the banks of the river Ybaizabal, and is about two leagues from the sea. It contains about eight hundred houses, with a large square by the water side, well shaded with pleasant walks, which extend to the outlets, on the banks

banks of the river, where there are great numbers of houses and gardens, which form a most pleasing prospect, particularly in sailing up the river: for, besides the beautiful verdure, numerous objects open gradually to the eye, and the town appears as an amphitheatre, which enlivens the landscape, and completes the scenery. The houses are solid and lofty, and the streets well paved and level; and the water is so conveyed into the streets, that they may be washed at pleasure; which renders Bilboa one of the neatest towns in Europe.

Malaga is an ancient city, and not less remarkable for its opulence and extensive commerce than for the luxuriance of its soil, yielding in great abundance the most delicious fruits; whilst its rugged mountains afford those luscious grapes, which give such reputation to the Malaga wine, known in England by the name of Mountain. The city is large and populous, and of a circular form, surrounded with a double wall, strengthened by stately towers, and has nine gates. A Moorish castle on the point of a rock commands every part of it. The streets are narrow, and the most remarkable building is a stupendous cathedral, begun by Philip II. said to be as large as that of St. Paul's in London. The bishop's income is 16,000l. sterling.

The city of Salamanca is of a circular form, built on three hills and two vallies, and on every side surrounded with prospects of fine houses, noble seats, gardens, orchards, fields, and distant villages; and is ancient, large, rich, and populous. There are ten gates to this city, and it contains twenty-five churches, twenty-five convents of friars, and the same number of nunneries. The most beautiful part of this city is the great square, built about forty years ago. The houses are of three stories, and all of equal height and exact symmetry, with iron balconies, and a stone balustrade on the top of them: the lower part is arched, which forms a piazza all round the square, which extends two hundred and ninety-three feet on each side. Over some of the arches are medallions, with busts of the kings of Spain, and of several eminent men, in stone basso-relievo, among which are those of Ferdinando Cortez, Francis Pizarro, Davila, and Cid Ruy. In this square the bull-fights are exhibited for three days only, in the month of June. The river Tormes runs by this city, and has a bridge over it of twenty-five arches, built by the Romans, and yet entire.

Toledo is one of the most ancient cities in Spain, and during several centuries it held the rank of its metropolis. But the neighbourhood of Madrid has by degrees stripped it of its numerous inhabitants, and it would have been almost entirely deserted but for its cathedral, the income of which being in great part spent here, contributes chiefly to the maintenance of the few thousands that are left, and artists, in some degree, those small manufactures of sword-blades and silk-stuffs that are established in this city. It is now exceedingly ill-built, poor, and mean, and the streets very steep.

Burgos was the ancient capital of the kingdom of Castile, but now in obscurity. The cathedral is one of the most magnificent structures of the Gothic kind in Europe: its form is exactly the same as that of York-minster, and on the east end is an octagon building exactly like the chapter-house at York.

Gibraltar, once a celebrated town and fortress of Andalusia, is at present in possession of Great Britain. Till the arrival of the Saracens in Spain, which took place in the year 711, or 712, the rock of Gibraltar went by the name of *Mons Calpe*. On their arrival a fortress was built upon it, and it obtained the name of *Gibet Tarif*, from the name of their general, and thence Gibraltar. It was in the possession of the Spaniards and Moors by turns, till it was taken from the former by a combined fleet of English and Dutch ships, under the command of sir George Rooke, in 1704; and this rather through accident than any thing else. The prince of Hesse, with 1800 men, landed on the isthmus, but: n attack on that side  
was

was found to be impracticable on account of the steepness of the rock. The fleet fired 15,000 shot without making any impression on the works, so that the fortress seems to be equally impregnable both to the British and Spaniards, except by famine. At last, a party of sailors, having got merry with grog, rowed close under the New Mole in their boats, and as they saw that the garrison, who consisted only of 100 men, did not mind them, they were encouraged to attempt a landing, and having mounted the mole, hoisted a red jacket as a signal of possession. This being immediately observed from the fleet, more boats and sailors were sent out, who, in the like manner, having ascended the works, got possession of a battery, and soon obliged the town to surrender. After many fruitless attempts to recover it, it was confirmed to the English by the treaty of Utrecht, in 1713. Repeated endeavours have been since made to wrest it from England, but without success; the last war hath made it more famous than ever, when it underwent a long siege against the united forces of Spain and France by land and sea, and was gallantly defended by general Elliot and his garrison, to the great loss and disgrace of the assailants: though it must be granted, the place is by nature almost impregnable. Near 300 pieces of cannon of different bores, and chiefly brass, which were sunk before the port in the floating batteries, have been raised, and sold, to be distributed among the garrison. It is a commodious port, and formed naturally for commanding the passage of the Straits, or, in other words, the entrance into the Mediterranean and Levant seas. But the road is neither safe against an enemy, nor storms: the bay is about twenty leagues in circumference. The straits 24 miles long, and 15 broad: through which sets a current from the Atlantic ocean into the Mediterranean. The town was neither large nor beautiful, and in the last siege was totally destroyed by the enemies' bombs: but, on account of its fortifications, it is esteemed the key of Spain, and is always furnished with a garrison well provided for its defence. The harbour is formed by a mole, which is well fortified and planted with guns. Gibraltar is accessible on the land side only by a narrow passage between the rock and the sea, but that is walled and fortified both by art and nature, and so inclosed by high steep hills, as to be almost inaccessible that way. It has but two gates on that side, and as many towards the sea. Across this isthmus, the Spaniards have drawn a fortified line, chiefly with a view to hinder the garrison of Gibraltar from having any intercourse with the country behind them: notwithstanding which they carry on a clandestine trade, particularly in tobacco. The garrison is, however, confined within very narrow limits; and, as the ground produces scarcely any thing, all their provisions are brought them either from England, or from Ceuta, on the opposite coast of Barbary. Formerly Gibraltar was entirely under military government: but that system being productive of abuses, the parliament thought proper to erect it into a body corporate, and the civil power is now lodged in its magistrates.

The chief islands belonging to Spain in Europe, are those of Majorca, Minorca, and Yvica. Minorca was taken by the English, under general Stanhope, in 1708, and confirmed to Great Britain, by the treaty of Utrecht, in 1713; but it was retaken by the Spaniards in the last war, on February 15, 1782, and confirmed to them by the definitive treaty of peace, signed at Paris, September 3, 1783. Thus, it is now become a Spanish island again, containing about 27,000 inhabitants.

Notwithstanding the pride and ostentation of the Spaniards, their penury is easily discernible, but their wants are few, and their appetites easily satisfied. The inferior orders, even in the greatest cities, are miserably lodged, and those lodgings wretchedly furnished. Many of the poorer sort, both men and women, wear neither shoes nor stockings, and coarse bread steeped in oil, and occasionally seasoned with vinegar, is the common food of the country people through several provinces. A traveller in Spain must carry provisions and bedding with him, and

if perchance he meets with the appearance of an inn, he must even cook his victuals, it being beneath the dignity of a Spaniard to perform these offices to strangers; but lately some tolerable inns have been opened by Irish and Frenchmen, in cities, and upon the high roads. The pride, indolence, and laziness of the Spaniards, are powerful inducements to their more industrious neighbours the French, who are to be found in all parts of the kingdom; and here a wonderful contrast distinguishes the character of two neighbouring nations. The Spaniard seldom stirs from home, or puts his hand to work of any kind. He sleeps, goes to mass, takes his evening walk, while the industrious Frenchman becomes a thorough domestic; he is butcher, cook, and taylor, all in the same family; he powders the hair, cuts the corns, wipes the shoes, and, after making himself useful in a thousand different shapes, he returns to his native country loaded with dollars, and laughs out the remainder of his days at the expence of his proud benefactor.

COMMERCE AND MANUFACTURES.] The Spaniards, unhappily for themselves, make gold and silver the chief branches both of their exports and imports. They import it from America, from whence they export it to other countries of Europe. Cadiz is the chief emporium of this commerce. "Hither (says Mr. Anderson, in his History of Commerce) other European nations send their merchandise, to be shipped off in Spanish bottoms for America, sheltered (or, as our old English phrase has it, coloured) under the names of Spanish factors. Those foreign nations have here their agents and correspondents, and the consuls of those nations make a considerable figure. Cadiz has been said to have the finest storehouses and magazines for commerce of any city in Europe; and to it the flota and galleons regularly import the treasures of Spanish America. The proper Spanish merchandise exported from Cadiz to America are of no great value; but the duty on the foreign merchandise sent thither would yield a great revenue, (and consequently the profits of merchants and their agents would sink), were it not for the many fraudulent practices for eluding those duties."

At St. Idelfonso the glass manufacture is carried on to a degree of perfection unknown in England. The largest mirrors are made in a brass frame, 162 inches long, 93 wide, and six deep, weighing near 9 tons. These are designed wholly for the royal palaces, and for presents from the king. Yet even for such purposes it is ill placed, and proves a devouring monster in a country where provisions are dear, fuel scarce, and carriage exceedingly expensive.—Here is also a royal manufacture of linen, employing about fifteen looms; by which, as it is said, the king is a considerable loser.

In the city of Valencia there is a very respectable silk manufacture, in which five thousand looms, and three hundred stocking-frames, give employment to upwards of twenty thousand of the inhabitants, without enumerating those who exercise professions relative to the manufacture, such as persons who prepare the wood and iron work of so great a number of machines, or spin, wind, or dye the silk. At Alcora, in the neighbourhood of Valencia, a manufacture of porcelain has been successfully established; and they very much excel in painted tiles. In Valencia, their best apartments are floored with these, and are remarkable for neatness, coolness, and elegance. They are stronger and much more beautiful than those of Holland.

At Carthagená, they make great quantities of the *esparto* ropes and cables, some of them spun like hemp, and others platted. Both operations are performed with singular rapidity. These cables are excellent, because they float on the surface of the water, and are not therefore liable to be cut by the rocks on a foul coast. The *esparto* rush makes good mats for houses, *alpargates* or short trowsers and buskins for peasants, and latterly it has been spun into fine thread for the purpose of making cloth. If properly encouraged, there is no doubt that the manufacture may

be

be brought to such perfection, as to make this once uselefs rath a source of abundant wealth to the southern provinces of Spain, for it is the peculiar and natural production of all high and uncultivated mountains in the south.

As to the hempen cordage which is made in Spain for the use of the royal navy, M. de Bourgoanne observes that it is better and more durable than that of the principal dock-yards and magazines in Europe; because, in combing the hemp, all the towy part we leave in it was taken out, and made use of in caulking, whence results the double advantage of more solid cordage, and the better caulking of vessels. Another custom in our rope-yards, which the Spaniards have avoided adopting, is the tarring the cordage and keeping it a long time piled up. In this state the tar ferments, and eats the hemp, and the cordage is extremely apt to break, after being used but a short space of time.

The Spaniards formerly obtained their hemp from the north; at present they are able to do without the assistance, in this article, of any other nation. The kingdom of Granada already furnishes them with the greatest part of the hemp they use, and in case of need, they may have recourse to Arragon and Navarre. All the sail-cloth and cordage in the magazines at Cadiz are made with Spanish hemp; the texture of which is even, close, and solid.

The most important production of this country, and the most valuable article of commerce, is barilla, a species of pot-ash, procured by burning a great variety of plants almost peculiar to the kingdoms of Valencia and Murcia; such as *foza*, *algazul*, *fuзон*, *favonnes*, *salicornia*, with *barilla*. It is used for making soap, for bleaching, and for glass. All the nations in Europe, by the combustion of various vegetable substances, make some kind of pot-ash; but the superior excellence of the barilla has hitherto secured the preference. The country producing it is about sixty leagues in length and eight in breadth, on the borders of the Mediterranean. The quantity exported annually from Spain (according to the testimonies of both Mr. Townsend, and M. de Bourgoanne) is about a hundred and fifty quintals, most of which is sent to France and England, and a small quantity to Genoa, and Venice.

Spain is one of the richest countries in Europe in salt-petre. The account of this surprising manufacture we shall abridge from Mr. Townsend. "I observed," says he, "a large inclosure, with a number of mounts of about twenty feet high, at regular distances from each other. These were collected from the rubbish of the city of Madrid, and the scrapings of the highways. They had remained all the winter piled up in the manner in which I found them. At this time men were employed in wheeling them away, and spreading abroad the earth to the thickness of about one foot, whilst others were turning what had been previously exposed to the influence of the sun and air. The preceding summers these heaps had been washed, and being thus exposed, would yield the same quantity of salt again, and, as far as appears, the produce would never fail; but after having been washed, no salt-petre can be obtained without a subsequent exposure." Some of this earth they can lixiviate once a year, some they have washed twenty times in the last seven years, and some they have subjected to this operation fifteen times in one year, judging always by their eye when they may wash it to advantage, and by their taste if it has yielded a lixivium of a proper strength; from which, by evaporating the water in boiling, they obtain the salt-petre.

The other manufactures of Spain are chiefly of wool, copper, and hard-ware. Great efforts have been made by the government to prevent other European nations from reaping the chief advantage of the American commerce; but these never can be successful, till a spirit of industry is awakened among the natives, so as to enable them to supply their American possessions with their own commodities and merchandise. Meanwhile, the good faith and facility with which the English, French,

French, Dutch, and other nations carry on this contraband trade, render them greater gainers by it than the Spaniards themselves are, the clear profits seldom amounting to less than 20 per cent. This evidently makes it an important concern that those immense riches should belong to the Spaniards, rather than to any active European nation; but on this subject there will be occasion to speak in the account of America.

**CONSTITUTION AND GOVERNMENT.]** Spain, from being the most free, is now the most despotic kingdom in Europe; and the poverty which is so visible in most parts of the country is in a great degree the result of its government, in the administration of which no proper attention is paid to the interests and welfare of the people. The monarchy is hereditary, and females are capable of succession. It has even been questioned, whether his catholic majesty may not bequeath his crown at pleasure to any branch of the royal family. It is at least certain, that the house of Bourbon mounted the throne of Spain in virtue of the last will of Charles II.

The cortes of Spain, which formerly, especially in Castile, had greater power and privileges than the parliament of England, are now abolished; but some faint remains of their constitution are still discernible in the government, though all of them are ineffectual, and under the control of the king.

The privy-council, which is composed of a number of noblemen or grandes, nominated by the king, sits only to prepare matters, and to digest papers for the cabinet-council or junta, which consists of the first secretary of state, and three or four more named by the king; and in them resides the direction of all the executive part of government. The council of war takes cognizance of military affairs only. The council of Castile is the highest law tribunal of the kingdom. The several courts of the royal audiences are those of Galicia, Seville, Majorca, the Canaries, Saragossa, Valencia, and Barcelona. These judge primarily in all causes within 15 miles of their respective cities or capitals, and receive appeals from inferior jurisdictions. Besides these, there are many subordinate tribunals, for the police, the finances, and other branches of business.

The government of Spanish America forms a system apart, and is delegated to viceroys, and other magistrates, who are in their respective districts almost absolute. A council for the Indies is established in Old Spain, and consists of a governor, four secretaries, and twenty-two counsellors, besides officers. Their decision is final in matters relating to America. The members are generally chosen from the viceroys and magistrates who have served in that country. The two great viceroalties of Peru and Mexico are so considerable, that they are seldom trusted to the same person for more than three years; and their emoluments are sufficient to make his fortune in that time.

The foreign possessions of the crown of Spain, besides those in America, are the towns of Ceuta, Oran, and Malulquivir, on the coast of Barbary in Africa; and the islands of St. Lazaro, the Philippines, and Ladrones, in Asia.

**REVENUES.]** The revenues, arising to the king from Old Spain, yearly amount to 5,000,000l. sterling, some writers say eight; and they form the surest support of his government. His American income, it is true, is immense; but it is generally embezzled or anticipated before it arrives in Old Spain. The king has a fifth of all the silver mines that are worked; but little of it comes into his coffers. He falls upon means, however, in case of a war, or any public emergency, to sequester great part of the American treasures belonging to his subjects, who never complain, because they are always punctually repaid with interest. The finances of his present catholic majesty are in excellent order, and on a better footing, both for himself and his people, than those of any of his predecessors.

As to the taxes from whence the internal revenues arise, they are various, arbitrary, and so much dependent on emergencies, that they cannot be accurately ascer-

ascertained. They fall upon all kinds of goods, houses, lands, timber, and provisions; the clergy and military orders are likewise taxed.

**MILITARY AND MARINE STRENGTH.** The land forces of the crown of Spain, in time of peace, are never fewer than 70,000; but, in case of war, they amount, without prejudice to the kingdom, to 110,000. The great dependence of the king, however, is upon his Walloon or foreign guards. His present catholic majesty was at great care and expence to raise a powerful marine; and the Spanish fleet in Europe and America at present exceeds seventy ships of the line. All along the coasts of Spain are watch towers from mile to mile, with lights and guards at night, so that from Cadiz to Barcelona, and from Bilboa to Ferrol, the whole kingdom may be soon alarmed in case of an invasion.

Nature, which has so liberally bestowed on Spain all the necessaries and luxuries of life, and has scarcely refused that kingdom any of the enjoyments that peace permits to be tasted, has been equally lavish in bestowing all the materials which war employs as the means of destruction; she has given iron in abundance, copper, lead, and saltpetre, so that this country need not be indebted to any other to supply its artillery with these destructive treasures. Spain also (says M. de Bourgoanne) possesses within herself every thing necessary to her navy, and after having long neglected these benefactions of nature, she now makes successful efforts to render it independent of other nations.

**ROYAL ARMS, TITLES, NOBILITY, AND ORDERS.** Spain formerly comprehended twelve kingdoms, all which, with several others, were by name entered into the royal titles, so that they amounted in all to about thirty-two. This absurd custom is still occasionally continued, but the king is now generally contented with the title of His Catholic Majesty. The kings of Spain are inaugurated by the delivery of a sword, without being crowned. Their signature never mentions their name, but, **I THE KING.** The king's eldest son is called Prince of Asturias, and his younger children, of both sexes, are by way of distinction called infants, or infantas, that is, children.

The armorial bearings of the kings of Spain, like their title, are loaded with the arms of all their kingdoms. It is now a shield, divided into four quarters, of which the uppermost on the right hand and the lowest on the left contain a castle, or, with three towers, for Castile; and in the uppermost on the left, and the lowest on the right, are the three lions gules for Leon; with three lilies in the centre for Anjou.

The general name for those Spanish nobility and gentry, who are unmixed with the Moorish blood, is Hidalgo. They are divided into princes, dukes, marquises, counts, viscounts, and other inferior titles. Such as are created grandees, may stand covered before the king, and are treated with princely distinctions. A grandee cannot be apprehended without the king's order; and cardinals, archbishops, ambassadors, knights of the Golden Fleece, and certain other great dignitaries, both in church and state, have the privilege, as well as the grandees, to appear covered before the king.

The order of the "*Golden Fleece*," particularly described before in the orders of Germany, is generally conferred on princes and sovereign dukes; but the Spanish branch of it hath many French and Italian nobility; there are no commanderies or revenues annexed to it.

The order of "*St. James*," or *St. Jago de Compostella*, is the richest of all the orders of Spain. Some attribute its institution to Remira, king of Leon, in the year 837, and others to later princes, as an encouragement to valour in the long wars between the Christians and Moors. They were divided into two branches, each under a grand-master; but the offices of both were given by pope Alexander VI. to the kings of Spain and Portugal, as grand-masters in their respective

dominions,

dominions. The badge is a cross of gold, enamelled crimson, edged with gold, and worn round the neck, pendent to a broad ribband; it is charged on the centre with an esclop-shell white. The order is highly esteemed in Spain, and only conferred on persons of noble families. The same may be said of the order of "*Calatrava*," first instituted by Sancho, king of Toledo: it took its name from the castle of Calatrava, which was taken from the Moors; and here began the order, which became very powerful. Their number, influence, and possessions were so considerable as to excite the jealousy of the crown, to which at length their revenues and the office of grand-master were annexed by pope Innocent VIII. Their badge is a cross fleury, red, worn at the breast, pendent to a broad ribband, the whole differing only in colour from the badge of Alcantara: the ceremonial mantle is of white silk, tied with a cordon and tassels, like those of the Garter, and on the left arm a cross fleury, embroidered, gules. The celebrated order of "*Alcantara*" derived its origin from the order of St. Julian, or of the Pear-tree; but after Alcantara was taken from the Moors, and made the chief seat of the order, they assumed the name of Knights of the order of Alcantara, and laid aside the old device of a pear-tree. They were subject to the order of Calatrava, till the year 1417, when, by the sanction of the pope, they became independent. They chose their own grand-master, and acquired vast possessions; but, in 1495, pope Alexander VI. conferred the office on king Ferdinand of Arragon, and annexed it unalienably to the Spanish crown. Since that time the kings of Spain have enjoyed the revenues of the grand-master, and the commanderies belonging to the order. The badge is a gold cross, fleury, enamelled green, and worn pendent to a broad ribband on the breast. On days of ceremony, they wear a mantle of red silk, on the left side of which is embroidered, in silver, a star of five points. This order is highly esteemed, and conferred only on persons of ancient and illustrious families.

The order of the "*Lady of Mercy*" is said to have been instituted by James I. king of Arragon, about the year 1218, on account of a vow made by him to the Virgin Mary, during his captivity in France; and was designed for the redemption of captives from the Moors, in which they expended large sums of money. It was at first confined to men, but a lady of Barcelona afterwards got women included in it: the badge, which is common to both, is a shield per fess, red and gold; in chief a cross pattee, white in base four pallets red, for Arragon, and the shield crowned with a ducal coronet. This order enjoys considerable revenues in Spain. The order of "*Montesa*" was instituted at Valencia, at the close of the thirteenth century, in the place of the Templars, and held their possessions. Their chief seat being the town of Montesa, the order from thence derived its name, and chose St. George for patron. About a century afterwards, it was united to the order of St. George of Alfama, by pope Benedict XIII. and so hath continued ever since. The badge is a plain red cross enamelled on gold, worn pendent to a broad red ribband, fash-wise, and a plain red cross embroidered on the left breast of the outer garment. In the year 1771, the late king instituted, after his own name, the order of "*Charles III.*" in commemoration of the birth of the infant. The badge is a star of eight points enamelled white, and edged with gold: in the centre of the cross is the image of the Virgin Mary, vestments white and blue. On the reverse, the letters C. C. with the number III. in the centre, and this motto, *Virtuti et Merito*. The order is composed of four classes; the first class are styled *Grand Crosses*, and wear the badge pendent to a ribband, striped blue and white, over the right shoulder, and have a star of silver, with the badge embroidered on the left side of the coat. The knights of the second class wear the badge and ribband like the first, but have no star. The third and fourth classes wear the badge in the button-hole of the coat, pendent to a narrow striped ribband. The knights

of the third class have pensions on the revenues of the order. None but persons of noble descent can belong to this order.

**HISTORY OF SPAIN.]** Spain was probably first peopled by the Celts, from Gaul, to which it lies contiguous; or from Africa, from which it is only separated by the narrow strait of Gibraltar. The Phœnicians sent colonies thither, and built Cadiz and Malaga. Afterwards, upon the rise of Rome and Carthage, the possession of this kingdom became an object of contention between those powerful republics; but at length the Roman arms prevailed, and Spain remained in their possession until the fall of that empire, when it became a prey to the Goths. In the beginning of the fifth century, the Suevi, the Vandals, and the Alani, divided Spain among them; but in the year 584, the Goths again became its masters. These in their turn were invaded by the Saracens, who, about the end of the seventh century, had possessed themselves of the finest kingdoms of Asia and Africa; and not content with the immense regions that formerly composed great part of the Assyrian, Persian, Macedonian, and Roman empires, crossed the Mediterranean, ravaged Spain, and established themselves in the southerly provinces of that kingdom.

Don Pelagius is mentioned as the first Old Spanish prince who distinguished himself against these Infidels (who were afterwards known by the name of Moors, the greater part of them having come from Mauritania), and he took the title of king of Asturia about the year 720. His successes animated other Christian princes to take arms likewise, and the two kingdoms of Spain and Portugal were for many ages perpetually embroiled in bloody wars.

The Moors in Spain were superior to all their contemporaries in arts and arms, and the Abdoulrahman line kept possession of the throne near 300 years. Learning flourished in Spain, while the rest of Europe was buried in ignorance and barbarity. But the Moorish princes by degrees became weak and effeminate, and their chief ministers proud and insolent. A series of civil wars ensued, which at last overturned the throne of Cordova, and the race of Abdoulrahman. Several petty principalities were formed on the ruins of this empire, and many cities of Spain had each an independent sovereign. Now, every adventurer was entitled to the conquests he made upon the Moors, till Spain was at last divided into twelve or fourteen kingdoms; and about the year 1095, Henry of Burgundy was declared by the king of Leon, count of Portugal; but his son Alphonso threw off the dependence on Leon, and declared himself king. A series of brave princes gave the Moors repeated overthrows in Spain, till about the year 1492, when all the kingdoms of Spain, Portugal excepted, were united by the marriage of Ferdinand, king of Arragon, and Isabella the heirs, and afterwards queen of Castile, who took Granada, and expelled out of Spain the Moors and Jews, who would not be converts to the Christian faith, to the number of 170,000 families.

The expulsion of the Moors and Jews in a manner depopulated Spain of artists, labourers, and manufacturers; and the discovery of America not only added to that calamity, but rendered the remaining Spaniards most deplorably indolent. To complete their misfortunes, Ferdinand and Isabella introduced the Popish inquisition, with all its horrors, into their dominions, as a safeguard against the return of the Moors and Jews.

Charles V. of the house of Austria, and the emperor of Germany, succeeded to the throne of Spain, in right of his mother, who was the daughter of Ferdinand and Isabella, in the year 1516. The extensive possessions of the house of Austria in Europe, Africa, and, above all, America, from whence he drew immense treasures, began to alarm the jealousy of neighbouring princes, but could not satisfy the ambition of Charles; and we find him constantly engaged in foreign

wars, or with his own protestant subjects, whom he in vain attempted to bring back to the catholic church. He also reduced the power of the nobles in Spain, abridged the privileges of the commons, and greatly extended the regal prerogative. At last, after a long and turbulent reign, he came to a resolution that filled all Europe with astonishment, the withdrawing himself entirely from any concern in the affairs of this world, in order that he might spend the remainder of his days in retirement and solitude\*.

Agreeably to this resolution, he resigned Spain and the Netherlands, with great formality, in the presence of his principal nobility, to his son Philip II. but could not prevail on the princes of Germany to elect him emperor, which dignity they conferred on Ferdinand, Charles's brother, thereby dividing the dangerous power of the house of Austria into two branches; Spain, with all its possessions in Africa and the New World, also the Netherlands, and some Italian states, remained with the elder branch; whilst the Empire, Hungary, and Bohemia, fell to the lot of the younger, which they still possess.

Philip II. inherited all his father's vices, with few of his good qualities. He was austere, haughty, immoderately ambitious, and through his whole life a cruel bigot in the cause of popery. His marriage with queen Mary of England, an unfeeling bigot like himself, his unsuccessful addresses to her sister Elizabeth, his resentment and unfortunate wars with that princess, his tyranny and persecutions in the Low Countries, the revolt and loss of the United Provinces, with other particulars of his reign, have been already mentioned, in the history of those countries.

\* Charles, of all his vast possessions, reserved nothing for himself but an annual pension of 100,000 crowns; and chose for the place of his retreat, a vale in Spain, of no great extent, watered by a small brook, and surrounded by rising grounds, covered with lofty trees. He gave strict orders, that the style of the building which he erected there, should be such as suited his present situation rather than his former dignity. It consisted only of six rooms, four of them in the form of friars' cells, with naked walls; and the other two, each twenty feet square, were hung with brown cloth, and furnished in the most simple manner: they were all level with the ground, with a door on one side into a garden, of which Charles himself had given the plan, and had filled it with various plants, which he proposed to cultivate with his own hands. After spending some time in the city of Ghent in Flanders, the place of his nativity, he set out for Zealand in Holland, where he prepared to embark for Spain, accompanied by his son, and a numerous retinue of princes and nobility; and taking an affectionate and last farewell of Philip and his attendants, he set out, on the 17th of September 1566, under convoy of a large fleet of Spanish, Flemish, and English ships. As soon as he landed in Spain, he fell prostrate on the ground; and considering himself now as dead to the world, he kissed the earth, and said, "Naked came I out of my mother's womb, and naked I now return to thee, thou common mother of mankind." Some of the Spanish nobility paid their court to him as he passed along to the place of his retreat; but they were so few in number, and their attendance was so negligent, that Charles observed it, and

felt, for the first time, that he was no longer a monarch. But he was more deeply affected with his son's ingratitude; who, forgetting already how much he owed to his father's bounty, obliged him to remain some weeks on the road, before he paid him the first moiety of that small portion, which was all that he had reserved of so many kingdoms. At last the money was paid; and Charles having dismissed a great number of his domestics, whose attendance he thought would be superfluous, he entered into his humble retreat with twelve domestics only. Here he buried in solitude, and silence, his grandeur, his ambition, together with all those vast projects which, during half a century, had alarmed and agitated Europe; filling every kingdom in it, by turns, with the terror of his arms, and the dread of being subjected to his power.

New amusements and new objects now occupied his mind; sometimes he cultivated the plants in his garden with his own hands; sometimes he rode out to the neighbouring wood on a little horse, the only one that he kept, attended by a single servant on foot. He was particularly curious with regard to the construction of clocks and watches; and having found, after repeated trials, that he could not bring any two of them to go exactly alike, he reflected, it is said, with a mixture of surprise and regret, on his own folly, in having bestowed so much time and labour on the more vain attempt of bringing mankind to a precise uniformity of sentiment concerning the intricate and mysterious doctrines of religion. And here, after two years' retirement, he was seized with a fever, which carried him off, in the 59th year of his age.

In Portugal he was more successful. That kingdom, after being governed by a race of wise and brave princes, fell to Sebastian, about the year 1557. Sebastian lost his life and a fine army, in a headstrong, unjust, and ill-concerted expedition against the Moors in Africa; and in the year 1580, Philip united Portugal to his own dominions, though the Braganza family of Portugal asserted a prior right. By this acquisition, Spain became possessed of the Portuguese settlements in India, some of which she still holds.

The descendants of Philip proved to be very weak princes; but Philip and his father had so totally ruined the ancient liberties of Spain, that they reigned almost unmolested in their own dominions. Their viceroys, however, were at once so tyrannical and insolent over the Portuguese, that, in the reign of Philip IV. in the year 1640, the nobility of that nation, by a well-conducted conspiracy, expelled their tyrants, and placed the duke of Braganza, by the title of John IV. upon their throne; and ever since, Portugal has remained a separate kingdom.

The kings of Spain, of the Austrian line, failing in the person of Charles II. who left no issue, Philip duke of Anjou, second son to the dauphin of France, and grandson to Lewis XIV. mounted that throne by virtue of his predecessor's will, and by the name of Philip V. anno 1701. After a long and bloody struggle with the German branch of the house of Austria, supported by England, he was confirmed in his dignity, at the conclusion of the war, by the shameful peace of Utrecht, 1713. And thus Lewis XIV. through a masterly train of politics (for in his wars to support his grandson, as we have already observed, he was almost ruined), accomplished his favourite project of transferring the kingdom of Spain, with all its rich possessions in America and the Indies, from the house of Austria to that of his own family of Bourbon. In 1734, Philip invaded Naples, and got that kingdom for his son Don Carlos, the Sicilians readily acknowledging him for their sovereign, through the oppression of the Imperialists.

After a long and turbulent reign, which was disturbed by the ambition of his wife, Elizabeth of Parma, Philip died in 1746, and was succeeded by his son Ferdinand VI. a mild and pacific prince, who reformed many abuses, and endeavoured to promote the commerce and prosperity of his kingdom. In 1759, he died without issue, through melancholy for the loss of his wife. Ferdinand was succeeded by his brother, Charles III. then king of Naples and the Two Sicilies, late king of Spain, son to Philip V. by his wife, the princess of Parma.

He was so warmly attached to the family compact of the house of Bourbon, that two years after his accession, he even hazarded his American dominions to support it. War being declared between him and England, the latter took from him the famous port and city of Havannah, in the island of Cuba, and thereby rendered herself entirely mistress of the navigation of the Spanish plate fleets. Notwithstanding the success of the English, their ministry thought proper hastily to conclude a peace, in consequence of which the Havannah was restored to Spain. In 1775, an expedition was concerted against Algiers by the Spanish ministry, which had a most unsuccessful termination. The troops, which amounted to upwards of 24,000, and who were commanded by lieutenant-general Conde de O'Reilly, landed about a league and a half to the eastward of the city of Algiers; but were disgracefully beaten back, and obliged to take shelter on board their ships, having 27 officers killed, and 191 wounded; and 501 rank and file killed, and 2088 wounded. In the years 1783, and 1784, they renewed their attacks against Algiers by sea, but after spending much ammunition, and losing many lives, were forced to retire without doing that place much injury.

When the war between Great Britain and her American colonies had subsisted for some time, and France had taken part with the latter, the court of Spain was also prevailed upon to commence hostilities against Great Britain. In particular,  
the

the Spaniards, in 1779, began their first operations, by closely besieging Gibraltar, both by sea and land; it having been always a great mortification to them, that this fortress should be possessed by the English.

The siege was continued throughout the war with occasional fierce attacks on both sides, though what the garrison had chiefly to dread was famine; and so soon did this begin to make its appearance, that about the middle of January, 1780, not only bread, but every article necessary to the support of life, was hard to be procured, and only to be purchased at exorbitant prices. Captain Drinkwater, in his very interesting history of this siege, informs us that veal, mutton, and beef, sold from two shillings and sixpence to four shillings per pound; fresh pork from two to three shillings; salt beef and pork, one shilling and three pence per pound; fowls, eighteen shillings per couple; ducks, a guinea; and other articles in proportion. And though they were frequently relieved, yet the same difficulties frequently returned. However, the garrison still held out; and though the Spanish army and train of artillery continued daily to increase, the utmost efforts of their power seemed to be insufficient to make the least impression on this impregnable fortress. So little regard indeed was paid to the formidable preparations of the Spaniards, that even from the beginning of the siege, it had been customary with general Elliot, the governor, to allow them to bring their works to perfection and then to demolish them. The more frequently the besiegers were disappointed, the more eager they seemed to accomplish their point. The most prodigious number of cannon, mortars, and all other destructive engines of that kind, that perhaps ever were assembled in any one enterprise were now brought before a single fortress, without being able to make the least impression upon it. By the violence of their fire, indeed, the houses were reduced to ruins, and the inhabitants were obliged to remove to England; but the fortifications of the place were scarce ever damaged in the least. The soldiers were so much accustomed to shells falling and bursting near them, that they became in a manner insensible of danger; and their officers were frequently obliged to call to them to avoid them, when just ready to burst at their feet. Our historian gives many instances of their destructive power, particularly in a wounded matross, when a shell from the mortar-boats fell into the ward of the hospital, and rebounding fell upon the bed where he lay. The convalescents and sick, in the same room, instantly summoned up strength to crawl out on hands and knees, whilst the fuse was burning, but this wretched victim was kept down by the weight of the shell, which after some seconds burst, took off both his legs, and scorched him in a dreadful manner; he survived for some time, and only regretted that he had not been killed on the batteries. What was more surprising, though the shells, by reason of their fiery train, were visible in the air, and from the length of way they had to go, might have been avoided, the sight of them was attended with a kind of fascination in the beholder, so as to deprive him of motion, of which several instances are related. Amidst this dreadful scene there were two boys who proved of singular use to the garrison, the acuteness of their sight being such that they could trace the shot directly from the mouth of the cannon, and thus give warning to the soldiers of their danger.

But the grand attack was on the 13th of September 1782, under the command of the duke de Crillon, by 10 battering ships, from 600 to 1400 tons burden, carrying in all 212 brass guns entirely new, and discharging shot of 26 pounds weight. The showers of shot and shells which were directed from them, from their land-batteries, and on the other hand from the various works of the garrison, exhibited a scene, of which perhaps neither the pen nor the pencil can furnish a competent idea. It is sufficient to say, that *four hundred pieces* of the heaviest artillery were playing at the same moment; an instance which has scarcely occurred in any siege since the invention of those wonderful engines of destruction.

The

The irresistible impression of the red-hot balls, which were sent from the garrison in such numbers, and in such directions, was soon conspicuous; for in the afternoon smoke was perceived to issue from the admiral's ship and another; and by one in the morning several were in flames, and numbers of rockets were thrown up from each of their ships as signals of distress. To rescue from the flames those who were now incapable of acting as enemies, could not be done without the greatest hazard, by reason of the blowing up of the ships, and the previous discharge of the guns as the fire reached them. Yet, in defiance of every danger, brigadier Curtis distinguished himself in an eminent manner in this humane undertaking, and, with twelve gun-boats, saved nine officers, two priests, and 334 men, all Spaniards, besides one officer, and eleven Frenchmen, who had floated in the preceding evening.

Thus ended all the hopes of the Spaniards of reducing the fortrefs of Gibraltar.

In other enterprizes the Spaniards proved more successful. The island of Minorca was surrendered to them on the 6th of February 1782, after having been besieged for 171 days. The garrison consisted of no more than 2692 men, while the forces of the enemy amounted to 16,000, under the command of the duke de Crillon. The Spanish commander at first attempted to corrupt the governor (general Murray); but this being rejected with indignation, the siege was commenced in form; and the garrison would have shewed themselves equally invincible with those of Gibraltar, had it been possible to relieve them in the same manner. The scurvy soon made its appearance, and reduced them to such a deplorable situation, that they were at last obliged to surrender, in spite of every effort of human fortitude or skill; and so sensible were both parties that this was the true cause, that the Spanish general allowed them to march out with their arms shouldered, drums beating, and colours flying, while the disconsolate British soldiers protested that they surrendered their arms to God, and not to the Spaniards.

His late catholic majesty used much pains to oblige his subjects to desist from their ancient dress and manners, and carried his endeavours so far, that it occasioned an insurrection at Madrid, and obliged him to part with his minister, the marquis of Squillace; thereby affording an instance of the necessity that even despotic princes are under, of paying some attention to the inclinations of their subjects.

The government of Spain testified much uneasiness at the French revolution, and watched narrowly those who spoke in favour of its principles. The circulation of all public papers and political pamphlets from France was severely prohibited. The proclamation against tinkers and knife-grinders, introducing seditious papers into the kingdom, and the rescript concerning strangers, shew all the terror and weakness of despotism.

A short war arose between the Spaniards and the emperor of Morocco. The emperor besieged Ceuta; but peace is since restored. It was unjustly surmised, that this war was entered into, in order to divert the attention of the people, who might be impressed with the affairs of France.

The sudden dismissal of count Florida Blanca from the office of prime minister, originates in causes not disclosed. It is imagined that the court found this step necessary, to appease the public murmurs at some late measures, particularly the edict concerning strangers, which contributed to impose further fetters upon commerce, and which has since been repealed. On the 28th of February, 1792, the minister was removed, and count d'Aranda, an old statesman, a warm friend of the queen and nobility of France, succeeded to his employments till some other arrangement could be formed. It is said, he abolished the superintendant tribunal

† of

of police, a kind of civil inquisition; and in other liberal measures, appeared to see the real interest of monarchs, which is certainly to concede with grace, in order to prevent the despair of the people from recurring to force. His influence, however, was but short; and has been succeeded by that of the duke d'Alcaudia.

The irregularities committed in France, the indecent reception of the humane interference of the court of Spain in favour of the king, and the industry of the confederated sovereigns, have at length engaged his catholic majesty in open hostilities. His declaration of war is dated the 23d of March, 1793. His majesty observes, that his former moderation with respect to France proceeded from a hope, that there might be a possibility of inducing them to act on a rational system; of restraining their boundless ambition, and preventing the calamities of a general war throughout Europe; he adds, that he long flattered himself with the hope of obtaining the liberty of their king, Louis the XVth, and that of his family. Impressed with these sentiments, he had formerly ordered two notes to be delivered to the French ministry, in the one of which a neutrality was stipulated, and in the other, the withdrawing of the troops from the frontiers. That he had instructed his chargé d'affaires in Paris to employ the most efficacious interference in behalf of the king and his unhappy family, but that he did not stipulate their enlargement as an express condition, hoping that it would be so construed by implication, and the omission proceeded from delicacy, and the fear of injuring a cause in which he was so deeply interested. But to the great grief and horror of himself and his people, they had proceeded in the most cruel and outrageous of their crimes, the *assassination of their sovereign*. Finally, that the French had declared war against Spain on the 7th instant, which they were already waging against that country since the 26th of February, as appeared by letters of marque found on board one of their privateers, captured by the Spanish ship of war, the *Ligero*.

Charles IV. king of Spain, born November 11, 1748; ascended the throne December 13, 1788 (upon the death of his father, Charles III.) and was married to Louisa-Maria-Theresa, princess of Parma, September 4, 1765, by whom he has issue,

1. Charlotte, born April 25, 1775.
2. Mary-Louisa, born July 9, 1777.
3. Philip, born August 10, 1783.
4. Ferdinand, born October 14, 1784.
5. Maria-Isabella, born July 6, 1789.

Brothers to the king.

1. Ferdinand, the present king of the Two Sicilies, born in 1751, married in 1768 to the archduchess Mary-Caroline-Louisa, sister to Joseph II. late emperor of Germany.
2. Anthony-Pascal, born December 31, 1755.

P O R T U G A L.

SITUATION AND EXTENT.

	Miles.	Degrees.
Length	300	} between { 37 and 42 north latitude. 7 and 10 west longitude.
Breadth	100	

Containing 32,000 SQUARE MILES, with 72 inhabitants to each.

BOUNDARIES.] IT is bounded by Spain on the North and East, and on the South and West by the Atlantic Ocean, being the most westerly Kingdom on the continent of Europe.

**ANCIENT NAMES AND DIVISIONS.** } This kingdom was, in the time of the Romans, called Lusitania. The etymology of the modern name is uncertain. It most probably is derived from some noted harbour or port, to which the Gauls (for so strangers are called in the Celtic) resorted. By the form of the country, it is naturally divided into three parts; the northern, middle, and southern provinces.

	Provinces.	Chief Towns.	Sq. M.
The Northern Division contains	{ Entre Minho Douro and Tralos Montes Beira	{ Braga Oporto and Viana Miranda and Villa Real Coimbra	} 6814
The Middle Division contains	{ Estremadura	{ Guarda Castel Rodrigo LISBON { 38-42 N. lat. 8-55 W. lon. St. Ubes and Leira	
The Southern Division contains	{ Entre Tajo Guadiana Alentejo Algarva	{ Eborá, or Evora Portalegre, Elvas, Beja Lagos Faro, Tavora, and Silves	} 8397

**SOIL, AIR, AND PRODUCTIONS.]** The soil of Portugal is not in general equal to that of Spain for fertility, especially in corn, which is imported from other countries. The fruits are the same as in Spain, but not so highly flavoured. The Portuguese wines, when old and genuine, are esteemed to be very friendly to the constitution, and safe to drink \*. Portugal contains mines, but they are not worked; variety of gems, marbles, and mill-stones, and a fine mine of salt-petre, near Lisbon. Their cattle and poultry are not indifferent eating. The air, especially about Lisbon, is reckoned soft and beneficial to consumptive patients; it is not so searching as that of Spain, being refreshed by the sea breezes.

**MOUNTAINS.]** The face of Portugal is mountainous, or rather rocky, for their mountains are generally barren: the chief are those which divide Algarva from Alentejo; those of Tralos Montes, and the rock of Lisbon, at the mouth of the Tagus, or, according to its latest name, Tajo.

**WATER AND RIVERS.]** Though every brook in Portugal is reckoned a river, yet the chief Portuguese rivers are mentioned in Spain, all of them falling into the Atlantic Ocean. The Tagus, or Tajo, was celebrated for its golden sand. Portugal contains several roaring lakes and springs; some of them are absorbent even of the lightest substances, such as wood, cork, and feathers; some, particularly one about 45 miles from Lisbon, are medicinal and sanative; and some hot baths are found in the little kingdom, or rather province, of Algarva.

**PROMONTORIES AND BAYS.]** The promontories or capes of Portugal are Cape Mondego, near the mouth of the river Mondego; Cape Roca, at the north entrance of the river Tajo; Cape Espithel, at the south entrance of the river Tajo; and Cape St. Vincent, on the south-west point of Algarva. The bays are those of Cadooan, or St. Ubes, south of Lisbon, and Lagos Bay in Algarva.

**ANIMALS.]** The sea-fish, on the coast of Portugal, are reckoned excellent; on the land, the hogs and kids are tolerable eating. Their mules are sure, and serviceable both for draught and carriage; and their horses, though slight, are lively.

\* The Port-wines are made in the district round Oporto, which does not produce one half the quantity that is consumed under that name in the British dominions only. The merchants in that

city have very spacious wine vaults, capable of holding 6 or 7000 pipes, and it is said that 20,000 are yearly exported from Oporto.

POPULATION,

REL  
fence.

POPULATION, INHABITANTS, MANNERS, AND CUSTOMS. } According to the best calculation, Portugal contains near two millions of inhabitants.

By a survey made in the year 1732, there were in that kingdom 3344 parishes, and 1,742,230 lay persons (which is but 522 laity to each parish on a medium), besides about 300,000 ecclesiastics of both sexes.

The modern Portuguese retain nothing of that enterprising spirit that rendered their forefathers so illustrious 300 years ago. Ever since their subjugation by Spain, they have degenerated in all their virtues; though some noble exceptions are still remaining among them, and no people are so little obliged as the Portuguese are to the reports of historians and travellers. Their degeneracy is evidently owing to the weakness of their monarchy, which renders them inactive, for fear of disobliging their powerful neighbours; and that inactivity has proved the source of pride, and other unmanly vices. Treachery has been laid to their charge, as well as ingratitude, and above all, an intemperate passion for revenge. They are, if possible, more superstitious, and, both in high and common life, affect more state than the Spaniards themselves. Among the lower people, thieving is often practised; and all ranks are accused of being unfair in their dealings, especially with strangers. It is hard, however, to say, what alteration may be made in the character of the Portuguese, by the diminution of priestly influence, and by that spirit of independency, with regard to commercial affairs, which is now so much encouraged by their court and ministry.

The Portuguese are neither so tall nor so well made as the Spaniards, whose habits and customs they imitate, the nobility however affecting to be more gaily and richly dressed. The characteristic distinction between the Spaniards and Portuguese is thus described by Mr. Costigan: "In Spain the (*Hidalgo*) nobleman is what he ought to be; brave, sincere, and liberal, both in his sentiments and actions—in this country he is perfectly the reverse. As you descend among the Spaniards, the national character vitiates, and it is well known the Spanish peasant is a proud, beggarly, insolent, brutal animal—in this country (Portugal) the lower you descend in rank, the personal character rises and improves upon you; and you will hardly meet with a peasant who is not courteous and affable to a degree hardly to be found in any other country." The Portuguese ladies are thin and small of stature. Their complexion is olive, their eyes black and expressive, and their features generally regular. They are esteemed generous, modest, and witty. They dress like the Spanish ladies, with much awkwardness and affected gravity, but in general more magnificently; and they are taught by their husbands to exact from their servants an homage, that in other countries is paid only to royal personages. The furniture of the houses, especially of their grandees, is rich to excess; and they maintain an incredible number of domestics, as they seldom discharge any who survive, after serving their ancestors. The poorer sort have scarcely any furniture at all; for they, in imitation of the Moors, sit always cross-legged on the ground.

The Portuguese peasant has never reaped any advantage from the benefits of foreign trade, and of the fine and vast countries the kings of Portugal possessed in Africa and the East, or of those still remaining to them in South America. The only foreign luxury he is yet acquainted with is tobacco; and when his feeble purse can reach it, he purchases a dried Newfoundland cod-fish; but this is a regale he dares seldom aspire to. A piece of bread made of Indian corn, and a salted pilchard, or a head of garlick, to give that bread a flavour, compose his standing dish; and if he can get a bit of the hog, the ox, or the calf he himself fattens, to regale his wretched family at Christmas or Easter, he has reached the pinnacle of worldly happiness.

RELIGION.] The established religion of Portugal is popery in the strictest sense. The Portuguese have a patriarch; but formerly he depended entirely upon the

the pope, unless when a quarrel subsisted between the courts of Rome and Lisbon. The power of his holiness in Portugal has been of late so much curtailed, that it is difficult to describe the religious state of that country: what is certain is, that the royal revenues are greatly increased, at the expence of the religious institutions in the kingdom. The power of the inquisition is now taken out of the hands of the ecclesiastics, and converted to a state-trap for the benefit of the crown.

The baneful influence of their superstition is, however, too obvious; for, says a late traveller, this little country presents a striking instance how far the human mind and character may be depraved and corrupted, by the unhappy effects of a domineering and fictitious mode of worship, which has almost suppressed every sentiment of virtue. Here the practice and exercise of those dispositions of piety, gratitude, generosity, benevolence, and universal charity, which would often arise naturally in the breasts of most men, if only left to themselves, are diverted, and another and most pernicious direction is given to them. The great object of charity, all over this country and Spain, is the relieving of the souls in purgatory, by lavishing money on churches and convents, for masses to be said on that account; and such an influence has the belief of that ideal place of torment, that it will squeeze hard cash from between the fingers of many a miser, when no other consideration could have produced that effect; nay, so depraved are the understandings of the best-intentioned people, by the perverse lessons of their spiritual directors, that their charitable donations to people in distress are unaccompanied with those liberal and disinterested motives of relieving the necessitous and comforting the afflicted, which are the best stimulatives to such actions, and are divested of much of their excellency, by being bestowed from personal and selfish considerations. As the intercessions of others, especially of persons who have once address enough to be looked on by the multitude as of extraordinary sanctity, are reckoned of the greatest avail; so wherever such a person or persons appear, they are frequented by those whose consciences accuse them of any deadly sins, who load such devotees with alms and charitable gifts, charging them at the same time to intercede earnestly in their favour with the Virgin, or with their particular saint or angel, to represent the charities they have done, and to request that, in consideration of these, so much may be discounted from the degree of punishment their sins may be found to deserve; establishing by this means a sort of account current of debtor and creditor, between themselves and the Almighty, or his agents. And so universal is this notion among the people, that when they give charity to a common beggar in the streets, they charge that beggar to pray for them, that such charity may be admitted in discount of their transgressions, and which the beggar faithfully engages to do.

[ARCHBISHOPRICKS AND BISHOPRICKS.] The archbishopricks are those of Braga, Evora, and Lisbon. The first of these has ten suffragan bishops; the second, two; and the last, ten, including those of the Portuguese settlements abroad. The patriarch of Lisbon is generally a cardinal, and a person of the highest birth.

[LANGUAGE.] The Portuguese language differs but little from that of Spain, and that provincially. Their Pater-noster runs thus: *Padre nosso que estas nos Ceos, sanctificado seja o tu nome; venha a nos tua reyno, seja feita a tua vontade, assi nos Ceos, como na terra. O paonessa de cada dia, dono so oei nestro dia. E pedoa nos, senhor, as nossas devidas, assi como nos perdamos a nos nossos devedores. E nao nos dexes cahir em tentatio, mas liora nos do mal.* Amen.

[LEARNING AND LEARNED MEN.] These are so few, that they are mentioned with indignation, even by those of the Portuguese themselves, who have the smallest tincture of literature. Some efforts, though very weak, have of late been made by a few, to draw their countrymen from this deplorable state of ignorance. It is

universally

universally allowed that the defect is not owing to the want of genius, but of a proper education. The ancestors of the present Portuguese were certainly possessed of more true knowledge, with regard to astronomy, geography, and navigation, than any European nation, about the middle of the sixteenth century, and for some time after. Camoens, who himself was a great adventurer and voyager, was possessed of a true, but neglected poetical genius.

**UNIVERSITIES.]** These are, Coimbra, founded in 1291 by king Dennis; and which had fifty professors; but it has been lately put under some new regulations. Evora, founded in 1559; and the college of the nobles at Lisbon, where the young nobility have an opportunity (of which few of them profit) of being educated in every branch of polite learning, and the sciences. All the books that did belong to the banished Jesuits are kept here, which compose a very large library. The English language is likewise taught in this college. Here is also a college where young gentlemen are educated in the science of engineering, and when qualified, get commissions in that corps.

**CURIOSITIES.]** The lakes and fountains which have been already mentioned, form the chief of these. The remains of some castles in the Moorish taste are still standing. The Roman bridge and aqueduct at Coimbra are almost entire, and deservedly admired. The walls of Santarem are said to be of Roman work likewise. The church and monastery near Lisbon, where the kings of Portugal are buried, are inexpressibly magnificent; and several monasteries in Portugal are dug out of the hard rock. The chapel of St. Roch is probably one of the finest and richest in the world; the paintings are mosaic work, so curiously wrought with stones of all colours, as to astonish the beholders. To these curiosities we may add, that the king is possessed of the largest, though not the most valuable diamond, in the world. It was found in Brazil.

**CHIEF CITIES.]** Lisbon is the capital of Portugal, and is thought to contain 200,000 inhabitants. Great part of it was ruined by an earthquake, which also set the remainder on fire, upon All-Saints'-day, 1755. It still contains many magnificent palaces, churches, and public buildings. Its situation (rising from the Tagus in the form of a crescent) renders its appearance at once delightful and superb, and it is deservedly accounted the greatest port in Europe, next to London and Amsterdam. The harbour is spacious and secure, and the city itself is guarded from any sudden attack towards the sea, by forts, which could make however but a poor defence against ships of war. All that part of the city that was demolished by the earthquake, is planned out in the most regular and commodious form. Some large squares and many streets are already built. The streets form right angles, and are broad and spacious. The houses are lofty, elegant and uniform; and being built of white stone, make a beautiful appearance. The second city in this kingdom is Oporto, which is computed to contain 30,000 inhabitants. The chief article of commerce in this city is wine; and the inhabitants of half the shops in the city are coopers. The merchants assemble daily in the chief street to transact business; and are protected from the sun by sail-cloths hung across from the opposite houses. About thirty English families reside here, who are chiefly concerned in the wine trade.

**AGRICULTURE, COMMERCE, AND MANUFACTURES.]** With regard to agriculture, this country is in a most wretched state, producing grain for only three months' consumption, which renders corn the most considerable article of importation.

The Portuguese exchange their wine, salt, fruits, and most of their own materials, for foreign manufactures. They make a little linen, and some coarse silk and woollen, with a variety of straw work, and are excellent in preserving and candying fruits. The commerce of Portugal, though seemingly extensive, proves of little solid benefit to her, as the European nations, trading with her, engross all

the productions of her colonies, as well as her own native commodities, as her gold, diamonds, pearls, sugars, cocoa-nuts, fine red-wood, tobacco, hides, and the drugs of Brazil; her ivory, ebony, spices, and drugs of Africa and East India, in exchange for the almost numberless manufactures, and the vast quantities of corn and salt fish, supplied by those European nations, and by the English North American colonies.

The Portuguese foreign settlements are, however, not only of immense value, but vastly improveable: Brazil, the isles of Cape Verd, Madeira, and the Azores. They bring gold from their plantations on the east and west coast of Africa, and likewise slaves for manufacturing their sugars and tobacco in Brazil and their South American settlements.

What the value of these may be, is unknown, perhaps, to themselves; but they certainly abound in all the precious stones, and rich mines of gold and silver, and other commodities that are produced in the Spanish dominions there. It is computed that the king's fifth of gold sent from Brazil amounts annually to 300,000l. sterling, notwithstanding the vast contraband trade. The little shipping the Portuguese have is chiefly employed in carrying on the slave trade; and in a correspondence with Goa, their chief settlement in the East Indies, and their other possessions there, as Dieu, Daman, Macao, &c.

[CONSTITUTION AND GOVERNMENT.] The crown of Portugal is absolute; but the nation still preserves an appearance of its ancient free constitution, in the meeting of the cortes or states, consisting, like our parliaments, of clergy, nobility, and commons. They pretend to a right of being consulted upon the imposition of new taxes, but the only real power they have is, that their assent is necessary in every new regulation, with regard to the succession. In this they are indulged, to prevent all future disputes on that account.

The nature of this government may be fairly pronounced the most despotic of any kingdom in Europe. The established law is generally a dead letter, excepting where its decrees are carried into execution by the supplementary mandates of the sovereign, which are generally employed in defeating the purposes of safety and protection which law is calculated to extend equally over all the subjects.

Here the people have no more share in the direction of government, in enacting laws, and in the regulating of agriculture and commerce, than they have in Russia, or China. How would an Englishman, alive to all the feelings of civil liberty, tremble at reading the preamble of every new law published here! and which runs thus, "I, the king, in virtue of my own certain knowledge, of my royal will and pleasure, and of my full, supreme, and arbitrary power, which I hold only of God, and for which I am accountable to no man on earth, I do in consequence order and command, &c. &c."

All great preferments, both spiritual and temporal, are disposed of in the council of state, which is composed of an equal number of the clergy and nobility, with the secretary of state. A council of war regulates all military affairs, as the treasury courts do the finances. The council of the palace is the highest tribunal that can receive appeals; but the *Casa da Supplicação* is a tribunal from which no appeal can be brought. The laws of Portugal are contained in three duodecimo volumes, and have the civil law for their foundation.

[REVENUES AND TAXES.] The revenues of the crown amount to above 3,000,000 and a half, sterling, annually. The customs and duties on goods exported and imported are excessive, and farmed out; but if the Portuguese ministry should succeed in all their projects, and in establishing exclusive companies, to the prejudice of the British trade, the inhabitants will be able to bear these taxes without murmuring. Foreign merchandise pays 23 per cent. on importation,

importation, and fish from Newfoundland, 25 per cent. Fish taken in the neighbouring seas and rivers pay 27 per cent. and the tax upon lands and cattle that are sold is 10 per cent. The king draws a considerable revenue from the several orders of knighthood, of which he is grand master. The pope, in consideration of the large sums he draws out of Portugal, gives the king the money arising from indulgences to eat flesh at times prohibited, &c. The king's revenue is now greatly increased by the suppression of the Jesuits, and other religious orders and institutions.

**MILITARY AND MARINE STRENGTH.]** The Portuguese government used to depend chiefly for protection on England; and therefore, for many years, they greatly neglected their army and fleet; but the same friendly connection between Great Britain and Portugal does not at present subsist. In the late reign, though they received the most effectual assistance from England, when invaded by the French and Spaniards, his most faithful majesty judged it expedient to raise a considerable body of troops, who were chiefly disciplined by foreign officers. Since that period the army has been again neglected, no proper encouragement being given to foreign officers, and little attention paid to the discipline of the troops; so that the military force of Portugal is now again inconsiderable, amounting, it is said, to 25,000 men. The naval force of this kingdom is about seventeen ships of war, including six frigates.

**ROYAL TITLES AND ARMS.]** The king's titles are, king of Portugal and the Algarves, lord of Guinea, and of the navigation, conquest, and commerce of Ethiopia, Arabia, Persia, and Brasil. The last king was complimented by the pope, with the title of His Most Faithful Majesty. That of his eldest-son is Prince of Brasil.

The arms of Portugal are, argent, five escutcheons, azure, placed cross-wise, each charged with as many besants as the first, placed saltier-wise, and pointed, sable, for Portugal. The shield bordered, gules, charged with seven towers, or, three in chief, and two in each flanch. The supporters are two winged dragons, and the crest a dragon, or, under two flanches, and the base of the shield appears at the end of it; two crosses, the first flower-de-luce, vert, which is for the order of Avieze, and the second patée, gules, for the order of Christ; the motto is changeable, each king assuming a new one; but it is frequently these words, *Pro Rege et Grege*, "For the King and the People."

**NOBILITY AND ORDERS.]** The titles and distinctions of their nobility are much the same with those of Spain. Their orders of knighthood are three; 1. That of *Aviz*, or *Avieze*, first instituted by Alphonfus Henriquez, king of Portugal, in the year 1147, as a military and religious order, on account of his taking Evora from the Moors. In 1213, it was subject to the order of Calatrava in Spain; but when Don John of Portugal seized the crown, he made it again independent. The badge is a cross fleury, enamelled green, and between each angle a fleur-de-lis, gold: it is worn pendent to a green ribbon round the neck. 2. The "Order of St. James," instituted by Dennis I. king of Portugal, in the year 1370, because under that saint's protection he became victorious over the Moors; he endowed the order with great privileges. The knights profess chastity, hospitality, and obedience, and none are admitted till they prove the gentility of their blood. Their ensign is a red sword, the habit white, and their principal convent is at Dalmela. 3. The "Order of Christ" was instituted in 1317, by Dennis I. of Portugal, to engage the nobility to assist him more powerfully against the Moors. The knights obtained great possessions, and elected their grand master, till 1522, when Pope Adrian VI. conferred that office on John III. and his successors to the crown of Portugal. This order is under the same regulations, and enjoys the same privileges as that of Calatrava in Spain: the badge is a cross pattee, red, charged with a cross, white.

worn pendent to a broad scarlet ribbon round the neck, and on days of ceremony to a collar composed of three chains of gold. By the statutes, the knights should prove the nobility of their descent for four generations; but the order is now indiscriminately given to all kinds of people who profess the Roman Catholic religion, and is very little regarded. These orders have small commanderies and revenues annexed to them, but are in small esteem. The "Order of *Mato*" hath likewise 23 commanderies in Portugal.

[*HISTORY OF PORTUGAL.*] This kingdom comprehends the greatest part of the ancient Lusitania, and shared the same fate with the other Spanish provinces in the contests between the Carthaginians and Romans; and in the decline and fall of the Roman empire, was successively conquered by the Suevi, Alans, Visigoths, and Moors. In the eleventh century, Alphonfus VI, king of Castile and Leon, rewarded Henry, grandson of Robert, king of France, for his bravery and assistance against the Moors, with his daughter, and that part of Portugal then in the hands of the Christians. Henry was succeeded by his son Alphonfus Henry, in the year 1095, who gained a decisive victory over five Moorish kings, in July 1139. This victory proved the origin of the monarchy of Portugal, for Alphonfus was then proclaimed king by his soldiers. He reigned 30 years, and was esteemed for his courage and love of learning. His descendants maintained themselves on the throne for some centuries; indeed Sancho II. was expelled from his dominions for cowardice in the year 1240.

Dennis I. or Dionysius, was called the *Father of his Country*; he built and rebuilt 44 cities and towns in Portugal, founded the military order of Christ, and was a very fortunate prince. He reigned 46 years. Under his successor Alphonfus IV. happened several earthquakes at Lisbon, which threw down part of the city, and destroyed many lives. John I. was illustrious for his courage, prudence, and conquests in Africa; under him Madeira was first discovered in the year 1420, and the Canaries; he took Ceuta, and after a reign of 49 years, died in the year 1433. In the reign of Alphonso V. about 1480, the Portuguese discovered the coast of Guinea; and in the reign of his successor John II. they discovered the Cape of Good Hope, and the kingdom of Moni-Congo, and settled colonies, and built forts at Guinea in Africa, and the East Indies. Emanuel, surnamed the Great, succeeded him in 1495, and adopted the plan of his predecessors, fitting out fleets for new discoveries. Vasco de Gama, under him, cruised along the coast of Africa and Ethiopia, and landed in Indostan; and in the year 1500, Alvarez discovered Brazil.

John III. succeeded in 1521, and while he lost some of his African settlements, made new acquisitions in the Indies. He sent the famous Xavier, as a missionary to Japan, and in the height of his zeal, established that infernal tribunal, the inquisition, in Portugal, anno 1526, against the entreaties and remonstrances of his people. Sebastian, his grandson, succeeded him in 1557, and undertook a crusade against the Moors in Africa. In 1578, in a battle with the king of Fez and Morocco, on the banks of the river Lucco, he was defeated, and either slain or drowned. Henry, a cardinal, and uncle to the unfortunate Sebastian, being the son of Emanuel, succeeded, but died without issue in the year 1580; on which, Anthony, prior of Crato, was chosen king, by the states of the kingdom; but Philip II. of Spain, as has been observed in our history of that country, pretended that the crown belonged to him because his mother was the eldest daughter of the grandmother of the princes of Braganza; and sent the duke of Alva, with a powerful force, who subdued the country, and proclaimed his master king of Portugal, the 12th of September, 1580.

The viceroys under Philip and his two successors, Philip III. and Philip IV. behaved towards the Portuguese with great rapacity and violence. The Spanish ministers,

nisters treated them as vassals of Spain; and by their repeated acts of oppression and tyranny, they so kindled the hatred and courage of the Portuguese, as to produce a revolt at Lisbon, the 1st of December, 1640. The people obliged John duke of Braganza, the legitimate heir to the crown, to accept it, and he succeeded to the throne by the title of John IV. almost without bloodshed, and the foreign settlements also acknowledged him as their sovereign. A fierce war subsisted for many years between the two kingdoms, and all the efforts of the Spaniards to reunite them proved vain, so that a treaty was concluded in February, 1668, by which Portugal was declared to be free and independent.

The Portuguese could not have supported themselves under their revolt from Spain, had not the latter power been engaged in wars with England and Holland; and upon the restoration of Charles II. of England, that prince, having married a princess of Portugal, prevailed with the crown of Spain, to give up all pretensions to the kingdom. Alphonso, son to John IV. was then king of Portugal. He had the misfortune to disagree at once with his wife and his brother Peter; and they uniting their interests, not only forced Alphonso to resign his crown, but obtained a dispensation from the pope for their marriage, which was actually consummated. They had a daughter; but Peter, by a second marriage, had sons, the eldest of whom was John, his successor, and father to the late king of Portugal. John, like his father, joined the grand confederacy formed by king William; but neither of them were of much service in humbling the power of France. On the contrary, John almost ruined the allies, by occasioning the loss of the great battle of Almanza, in 1707. He died in 1750, and was succeeded by his son Joseph, whose reign was neither happy to himself, nor fortunate for his people. The fatal earthquake, in 1755, overwhelmed his capital, and shook his kingdom to the centre. His succeeding administration was not distinguished by the affection that it acquired at home, or the reputation which it sustained abroad. It was deeply stained with domestic blood, and rendered odious by excessive and horrible cruelty. In September, 1758, the king was attacked by assassins, and narrowly escaped with his life, in a solitary place near his country palace of Belem. The families of Aveira, and Tavora, were destroyed by torture, in consequence of an accusation exhibited against them, of having conspired against the king's life. But they were condemned without any proper evidence, and their innocence has been since publicly and authentically declared. From this supposed conspiracy is dated the expulsion of the Jesuits (who were conjectured to have been at the bottom of the plot) from all parts of the Portuguese dominions.

The abolition of the order of the Jesuits, being one of the most important events which have hitherto occurred in the eighteenth century, and it having originated in the court of Portugal, deserves some notice in this place. The active genius of this order, which penetrated the remotest countries of Asia, at a very early period of the preceding century, directed their attention to the extensive continent of America, as a proper object of their missions. Conducted by their distinguished leader, St. Francis Xavier, they formed a considerable settlement in the province of Paragony, and made a rapid progress in instructing the Indians in arts, religion, and the more simple manufactures, and accustoming them to the blessings of security and order. A few Jesuits presided over many thousand Indians; they soon, however, altered their views, and directed them altogether to the increase of the opulence and power of their order. Immense quantities of gold were annually transported to Europe; and in the design of securing to themselves and independent empire in these regions, they industriously cut off all communication with both the Spaniards and the Portuguese in the adjacent provinces, and inspired the Indians with the most determined opposition to those nations. Such was the state of af-

fairs, when, in the year 1750, a treaty was concluded between the courts of Lisbon and Madrid, which ascertained the limits of their respective dominions in South America. Such a treaty was death to the projects of the Jesuits, and the consequence was a violent contest between the united forces of the two European powers, and the Indians of Paraguay, incited by the Jesuits. The crafty and vindictive marquis of Pombal, who had raised himself from performing the duties of a common soldier in the character of a cadet, to be absolute minister of the kingdom of Portugal, could not easily forget this refractory conduct; and perhaps he might apprehend the downfall of his own authority, unless some decisive check was given to the growing influence of this dangerous society. Whether there was a foundation or not for the report of the conspiracy against the life of the king, or whether the discontented Jesuits were really concerned with the unfortunate noblemen who suffered on that account, or not, is difficult to determine. It was sufficient that it afforded a specious pretence for this expert, but unprincipled statesman, to rid himself of enemies, whom he could not regard in any other than a formidable light. In the beginning of the year 1759, therefore, the Jesuits of all descriptions were banished the kingdom of Portugal, on the plea that certain of their order were concerned in the attempt upon the life of the king in 1758, and their effects were confiscated. The hostilities, which commenced not long after between Portugal and Spain, served a little to protract the existence of the Jesuits in the latter kingdom; the jealousy, however, which their conduct had excited in the court of Madrid, lay dormant only for a while, and when a fit opportunity presented, no nation in Europe was more clamorous for their abolition.

In 1762, when a war broke out between Spain and England, the Spaniards, and their allies the French, pretended to force his faithful majesty into their alliance, and to garrison his sea-towns against the English with their troops. The king of Portugal rejected this proposal, and declared war against the Spaniards, who, without resistance, entered Portugal with a considerable army, while a body of French threatened it from another quarter. Some have doubted whether any of these courts were in earnest upon this occasion, and whether the whole of the pretended war was not concerted to force England into a peace with France and Spain, in consideration of Portugal's apparent danger. It is certain, that both the French and Spaniards carried on the war in a very dilatory manner, and that, had they been in earnest, they might have been masters of Lisbon long before the arrival of the English troops to the assistance of the Portuguese.

Be that as it will, a few English battalions put an effectual stop, by their courage and manœuvres, to the progress of the invasion. Portugal was saved, and a peace was concluded at Fontainebleau in 1763. Notwithstanding this eminent service, and similar favours often performed by the English to the Portuguese, the latter, ever since that period, cannot be said to have beheld their deliverers with a friendly eye. The most captious distinctions, and frivolous pretences, have been invented by the Portuguese ministers for cramping the English trade, and depriving them of their privileges.

His Portuguese majesty having no son, his eldest daughter was married, by dispensation from the pope, to Don Pedro, her own uncle, to prevent the crown from falling into a foreign family. The late king died on the 24th of February, 1777, and was succeeded by his daughter, the present queen. One of the first acts of her majesty's reign was the removal from power the marquis de Pombal, an event which excited general joy throughout the kingdom, as might naturally be expected from the arbitrary and oppressive nature of his administration, though it has been alleged in his favour, that he adopted sundry public measures, which were calculated to promote the real interests of Portugal.

On the 10th of March, 1792, the prince of Brazil, as presumptive heir to the crown, published an edict, declaring, that as his mother, from her unhappy situation, was incapable of managing the affairs of government, he would place his signature to public papers, till the return of her health; and that no other change should be made in the forms.

The queen is disordered by religious melancholy; and Dr. Willis has been called to cure her: but her insanity remaining incurable, the government of the country rests with the prince of Brazil.

Maria-Frances-Isabella, queen of Portugal, born December 17, 1734; married, June 6, 1760, to her uncle Don Pedro Clement, F. R. S. born July 5, 1717, who died May 25, 1786.—Began to reign February 24, 1777.

Their issue.

John-Maria-Joseph-Lewis, born May 13, 1767; married, March 20, 1785, Maria-Louisa of Spain, born July 9, 1777.

The issue of the late king.

1. Her present Majesty.
2. Anna-Frances-Antonietta, born October 8, 1736.
3. Maria-Francisca-Benedicta, born July 24, 1746; married, in 1776, to her nephew the prince of Brazil, who died September 11, 1788.

SITUATION AND EXTENT.

Miles.	Degrees.
Length 600 } Breadth 400 }	between { 38 and 47 north latitude. 7 and 10 east longitude.

Containing 116,967 SQUARE MILES, with 170 Inhabitants to each.

**T**HE form of Italy renders it very difficult to ascertain its extent and dimensions; for, according to some accounts, it is, from the frontiers of Switzerland to the extremity of the kingdom of Naples, about 750 miles in length; and from the frontiers of the duchy of Savoy, to those of the dominions of the states of Venice, which is its greatest breadth, about 400 miles, though in some parts it is scarcely 100.

**BOUNDARIES.]** Nature has fixed the boundaries of Italy; for towards the East it is bounded by the Gulf of Venice, or Adriatic sea; on the South and West by the Mediterranean sea; and on the North, by the lofty mountains of the Alps, which divide it from France and Switzerland.

The whole of the Italian dominions, comprehending Corsica, Sardinia, the Venetian and other islands, are divided and exhibited in the following table:

Italy		Countries' Names.	Length.	Breadth.	Chief Cities.

Island of **CORSICA**, now united to the crown of Great Britain.

Chief towns, Bastia and Bonifacio.

Island of **MALTA**, subject to the Knights. Chief town, Valetta.

**SOIL AND AIR.]** The happy soil of Italy produces the comforts and luxuries of life in great abundance; each district has its peculiar excellency and commodity; wines, the most delicious fruits, and oil, are the most general productions. As much corn grows here as serves the inhabitants; and were the ground properly cultivated, the Italians might export it to their neighbours. The Italian cheeses, particularly those called Parmesans, and their native silk, form a principal part of their commerce. There is here a great variety of air: and some parts of Italy bear melancholy proof of the alterations that accidental causes make on the face of nature; for the Campagna di Roma, where the ancient Romans enjoyed the most salubrious air of any place perhaps on the globe, is now almost pestilential, through the decrease of inhabitants, which has occasioned a stagnation of waters, and putrid exhalations. The air of the northern parts, which lie among the Alps or in their neighbourhood, is keen and piercing, the ground being in many places covered with snow in winter. The Appennines, which are a ridge of mountains that longitudinally almost divide Italy, have great effects on its climate; the countries on the South being warm, those on the North mild and temperate. The sea-breezes refresh the kingdom of Naples so much, that no remarkable inconyeniency of air is found there, notwithstanding its southern situation. In general, the air of Italy may be said to be dry and pure.

**MOUNTAINS.]** We have already mentioned the Alps and Appennines, which form the chief mountains of Italy. The famous volcano of Mount Vetusius lies in the neighbourhood of Naples.

**RIVERS AND LAKES.]** The rivers of Italy are the Po, the Var, the Adige, the Trebia, the Arno, and the Tiber which runs through the city of Rome. The famous Rubicon forms the southern boundary between Italy and the ancient Cisalpine Gaul.

The lakes of Italy are, the Maggiore, Lugano, Como, Iseo, and Garda, in the North; the Perugia or Trasimene, Bracciana, Terni, and Celano, in the middle.

SEAS,

**SEAS, GULFS OR BAYS, CAPES, } Without a knowledge of these, neither**  
**PROMONTORIES, AND STRAITS. }** the ancient Roman authors, nor the history  
 nor geography of Italy, can be understood. The seas of Italy are, the gulf of  
 Venice, or the Adriatic sea; the seas of Naples, Tuscany, and Genoa; the bays or  
 harbours of Nice, Villa Franca, Oneglia, Final, Savona, Vado, Spezzia, Lucca,  
 Pisa, Leghorn, Piombino, Civita Vecchia, Gaeta, Naples, Salerno, Policastro,  
 Rhegio, Quilace, Tarento, Manfredonia, Ravenna, Venice, Trieste, Istria, and  
 Fiume; Cape Spartavento, del Alice, Otranto, and Ancona; and the strait of  
 Messina, between Italy and Sicily.

The gulfs and bays in the Italian islands are those of Fiorenzo, Bastia, Talada,  
 Porto Novo, Cape Corso, Bonifacio, and Ferro, in Corsica; and the strait of Boni-  
 facio, between Corsica and Sardinia. The bays of Cagliari and Oristagni; Cape  
 de Sardinis, Cavello, Monte Santo, and Polo, in Sardinia. The gulfs of Messina,  
 Melazzo, Palermo, Mazara, Syracuse, and Catania; Cape Faro, Melazzo, Or-  
 lando, Gallo, Trapano, Passaro, and Alellia, in Sicily; and the bays of Porto  
 Ferro, and Porto Longone, in the island of Elba.

**METALS AND MINERALS. }** Many places of Italy abound in mineral springs;  
 some hot, some warm, and many of sulphureous, chalybeate, and medicinal qualities.  
 Many of its mountains abound in mines that produce great quantities of emeralds,  
 jasper, agate, porphyry, lapis lazuli, and other valuable stones. Iron and copper-  
 mines are found in a few places; and a mill for forging and fabricating these met-  
 als is erected near Tivoli, in Naples. Sardinia is said to contain mines of gold,  
 silver, lead, iron, sulphur, and alum, though they are now neglected; and curious  
 crystals and coral are found on the coast of Corsica. Beautiful marble of all kinds  
 is one of the chief productions of Italy.

**VEGETABLE AND ANIMAL PRO- } Besides the rich vegetable productions**  
**DUCTIONS, BY SEA AND LAND. }** mentioned under the article of soil, Italy  
 produces citrons, and such quantities of chestnuts, cherries, plums, and other fruits,  
 that they are of little value to the proprietors.

There is little difference between the animal productions of Italy, either by land  
 or sea, and those of France and Germany, already mentioned.

**POPULATION, INHABITANTS, MAN- } Authors are greatly divided on the head**  
**NEERS, CUSTOMS, AND DIVERSIONS. }** of Italian population. This may be owing  
 to the partiality which every Italian has for the honour of his own province. The  
 number of the king of Sardinia's subjects in Italy, according to the statement of  
 Mr. Watkins in 1787, when he visited this country, amount to 2,695,727 souls, of  
 which Turin contains about 77,000. The city of Milan itself, by the best accounts,  
 contains 200,000; and the duchy is proportionably populous. As to the other provinces  
 of Italy, geographers and travellers have paid very little attention to the numbers of  
 natives that live in the country, and inform us by conjecture only of those who in-  
 habit the great cities. Some doubts have arisen whether Italy is as populous now  
 as it was in the time of Pliny, when it contained 14,000,000 of inhabitants. I am  
 apt to believe that the present inhabitants exceed that number. The Campagna  
 of Roma, indeed, and some other of the most beautiful parts of Italy, are at pre-  
 sent in a manner desolate; but the modern Italians being in a great measure free  
 from the unintermitting wars, which, down to the sixteenth century, depopulated  
 their country, as some encouragement is now given to agriculture and manufac-  
 tures of all kinds, population will undoubtedly be promoted. It may not perhaps be  
 extravagant, if we assign to Italy 20,000,000 of inhabitants; but some calculations  
 greatly exceed that number\*. The Italians are generally well proportioned, and

\* M<sup>r</sup>. Swinburne saith, that, in 1779, the number of inhabitants in the kingdom of Naples amounted to 4,249,430, exclusive of the army and naval establishment.

 the ladies  
 never feou

have such meaning in their looks, that they have greatly assisted the ideas of their painters. Their women are well shaped, and sprightly. The marriage ties, especially of the higher class, are said to be of little force. Every wife has been represented to have her gullant or cicisbeo, with whom she keeps company, and sometimes cohabits, with very little ceremony, and no offence on either side. But the representations which have been made of this kind by travellers, appear to be much exaggerated. With regard to the modes of life, the best quality of the modern Italians is sobriety, and they submit very patiently to the public government. With great taciturnity they discover but little reflection. They are rather vindictive than brave, and more superstitious than devout. The middling ranks are attached to their native customs, and seem to have no ideas of improvement. Their fondness for greens, fruits, and vegetables of all kinds, contributes to their contentment and satisfaction; and an Italian gentleman, or peasant, can be luxurious at a very small expence. Though perhaps Italy does not contain many descendants of the ancient Romans, yet the present inhabitants speak of themselves as successors to the conquerors of the world, and look upon the rest of mankind as their inferiors.

The dress of the Italians is little different from that of the neighbouring countries, and they affect a medium between the French volatility and the solemnity of the Spaniards. The Neapolitans frequently dress in black, in compliment to the Spaniards. It cannot be denied that the Italians excel in the fine arts; though they make at present but a very inconsiderable figure in the sciences. They cultivate and enjoy vocal music at a very dear rate, by emasculating their males when young; to which their mercenary parents agree without remorse. Not one in fifty of these wretched martyrs to harmony and avarice succeed, but fortunately they are received as choristers by many of the religious fraternities, and are thus enabled to gain a bare subsistence.

The Italians, the Venetians especially, have very little or no notion of the impropriety of many customs that are considered as criminal in other countries. Parents, rather than their sons should throw themselves away by unsuitable marriage, or contract diseases by promiscuous amours, hire mistresses for them, for a month, or a year, or some determined time; and concubinage, in many places of Italy, is an avowed licensed trade. The Italian courtezans, or *bona robas*, as they are called, make a kind of profession in all their cities. Masquerading and gaming, horse-races without riders, and conversations or assemblies, are the chief diversions of the Italians, except religious exhibitions, in which they are pompous beyond all other nations.

A modern writer, describing his journey through Italy, gives us a very unfavourable picture of the Italians, and their manner of living. Give what scope you please to your fancy, says he, you will never imagine half the disagreeableness that Italian beds, Italian cooks, and Italian nastiness, offer to an Englishman. At Turin, Milan, Venice, Rome, and perhaps two or three other towns, you meet with good accommodations; but no words can express the wretchedness of the other inns. No other beds than those of straw, with a mattress of straw, and next to that a dirty sheet, sprinkled with water, and consequently damp: for a covering, you have another sheet as coarse as the first, like one of our kitchen jack towels, with a dirty coverlet. The bedstead consists of four wooden forms or benches: an English peer and peeress must lie in this manner, unless they carry an upholsterer's shop with them. There are, by the bye, no such things as curtains; and in all their inns the walls are bare, and the floor has never once been washed since it was first laid. One of the most indelicate customs here is, that men, and not women, make the ladies beds, and would do every office of a maid-servant, if suffered. They never scour their pewter; their knives are of the same colour. In these inns they

make you pay largely, and send up ten times as much as you can eat. The soup, like wash, with pieces of liver swimming in it; a plate full of brains, fried in the shape of fritters; a dish of livers and gizzards; a couple of fowls (always killed after your arrival) boiled to rags, without any the least kind of sauce or herbage; another fowl, just killed, stewed, as they call it; then two more fowls, or a turkey roasted to rags. All over Italy, on the roads, the chickens and fowls are so stringy you may divide the breast into as many filaments as you can a halfpenny-worth of thread. Now and then we get a little piece of mutton or veal: and, generally speaking, it is the only eatable morsel that falls in our way. The bread all the way is exceedingly bad; and the butter so rancid, that it cannot be touched, or even borne within the reach of your smell. But what is a greater evil to travellers than any of the above recited, are the infinite number of gnats, bugs, fleas, and lice, which infect us by day and night.

We beg leave to add a still more modern description of the national character of the Italians, given lately by the abbé Jagemann, member of the Florentine Academy of Agriculture; "Considering the mildness of the climate, the uncommon fertility of the soil, the situation of most towns and boroughs on hills, the excellent spring-water from the Alps and the Appennines, the number of mineral waters and baths, the spaciousness of the streets and houses, the delightful views, the frequent residence of the Italians on their villas, the fragrant and healthiness of the air, the temperate diet, the facility of getting cured of diseases in the hospitals, one is inclined to think that the corporeal frame of an Italian, if not enervated in early youth, cannot but be strong, healthy, and beautiful. The handsomest persons of either sex are found in Tuscany. The Italians, in general, are also endowed with good sense and discernment; apt to despise mere theoretical speculations, and to judge by their own feelings and experience: but education is rather neglected. The chief part of their religion consists in an external observance and practice of ecclesiastical rites, ceremonies, and injunctions. An Italian, not enlightened by reflection and experience, will sooner commit adultery than eat any flesh-meat on a Friday; but a foreigner, who wishes to pass for a Roman catholic, needs only to stick to his window an attestation, by a physician, that his state of health requires a flesh-meat diet; and he may, without any risk, eat flesh-meat in Lent. Such attestations may be purchased in coffee-houses, at Florence. The Italians are very sensual; exceedingly fond of music; impatient of delay in their passions for the fair sex; jealous of the French; but fond of the national characters of the English and the Germans. They still breathe their ancient spirit of liberty and republicanism, and are averse to monarchical government, to which they were subjected by force. Hence, a true born Italian, of an independent fortune, seldom courts public employments; hence their best geniuses too are little known; hence also their almost general inclination to satire, and the bitterness of their satires. Hence their general hatred and contempt for the military service, and for the ministers and executors of criminal jurisdiction. Their dress and their whole conduct prove their fondness of liberty and ease, and their aversion to constraint, ceremony, and compliments. As so great a variety of enjoyments and conveniences are, for an Italian, so many necessaries of life, he must be a rigid economist; but those most famous for their economical management, are the Florentines and the Genoese. Hence their habitual custom of entering into the most minute details and calculations, and of strictly adhering to rules. Hence their peculiar talents and skill for commerce, trade, political economy, finances, their avidity for gain, and their envy at the prosperity of other people. Their resentment lasts only till they have produced a satisfaction adequate to a wrong sustained; they are less irascible than many other nations; but when grossly injured in their character or fortunes, they are capable of every excess. tions, however, abbé Jagemann recollects only three instances in Tuscany, in fifteen years. From their mutual distrust, an Italian indeed seldom becomes an intimate friend to another Italian; but then their friendship proves the more cordial and lasting. No nation is more compassionate to the distressed, or more ready to serve strangers; yet letters of recommendation ought not to be neglected by travellers."

RELIGION.] The religion of the Italians is Roman-catholic. The inquisition here is little more than a sound; and persons of all religions live unmolested in Italy, provided no gross insult is offered to their worship. In the Introduction, we have given an account of the rise and establishment of popery in Italy, from whence it spread over all Europe; likewise of the causes and symptoms of its decline. The ecclesiastical government of the papacy has employed many volumes in describing it. The cardinals, who are next in dignity to his holiness, are seventy: but that number is seldom or never complete: they are appointed by the pope, who takes care to have a majority of Italian cardinals, that the chair may not be removed from Rome, as it was once to Avignon in France, the then pope being a Frenchman. In promoting foreign prelates to the cardinalship, the pope regulates himself according to the nomination of the princes who profess that religion. His chief minister is the cardinal patron, generally his nephew, or near relation, who improves the time of the pope's reign by amassing what he can. When met in a consistory, the cardinals pretend to control the pope, in matters both spiritual and temporal, and have been sometimes known to prevail. The reign of a pope is seldom of long duration, being generally old men at the time of their election. The conclave is a scene where the cardinals principally display their parts and their characters. During the election of a pope in 1721, the animosities ran so high, that they came to blows with both their hands and feet, and threw the inkstandishes at each other. We shall here give an extract from the creed of pope Pius IV. 1560, before his elevation to the chair, which contains the principal points wherein the church of Rome differs from the protestant churches. After declaring his belief in one God, and other heads wherein Christians in general are agreed, he proceeds as follows:

"I most firmly admit and embrace the apostolical and ecclesiastical traditions, and all other constitutions of the church of Rome.

"I do admit the holy scriptures in the same sense that holy mother-church doth, whose business it is to judge of the true sense and interpretation of them; and I will interpret them according to the unanimous consent of the fathers.

"I do profess and believe that there are seven sacraments of the law, truly and properly so called, instituted by Jesus Christ our Lord, and necessary to the salvation of mankind, though not all of them to every one; namely, baptism, confirmation, eucharist, penance, extreme unction, orders, and marriage, and that they do confer grace; and that of these, baptism, confirmation, and orders, may not be repeated without sacrilege. I do also receive and admit the received and approved rites of the catholic church in her solemn administration of the abovesaid sacraments.

"I do embrace and receive all and every thing that hath been defined and declared by the holy council of Trent concerning original sin and justification.

"I do also profess, that in the mass there is offered unto God a true, proper, and propitiatory sacrifice for the quick and the dead; and that in the most holy sacrament of the eucharist there is truly, really, and substantially, the body and blood,

\* A convocation of Roman-catholic cardinals, bishops, bishops, and divines, who assembled at Trent, by virtue of a bull from the pope, anno 1546, and devoted to him, to determine upon certain points of faith, and to suppress what they were pleased to term the Rising Hercules in the church.

together with the soul and divinity, of our Lord Jesus Christ; and that there is a conversion made of the whole substance of the bread into the body, and of the whole substance of the wine into the blood; which conversion the catholic church calls Transubstantiation. I confess that under one kind only, whole and entire, Christ and a true sacrament is taken and received.

"I do firmly believe that there is a purgatory; and that the souls kept prisoners there do receive help by the suffrages of the faithful.

"I do likewise believe that the saints, reigning together with Christ, are to be worshipped and prayed unto; and that they do offer prayers unto God for us, and that their relics are to be had in veneration.

"I do most firmly assert, that the images of Christ, of the blessed Virgin the mother of God, and of other saints, ought to be had and retained, and that due honour and veneration ought to be given unto them \*.

"I do likewise affirm, that the power of indulgencies was left by Christ to the church, and that the use of them is very beneficial to Christian people †.

"I do acknowledge the holy, catholic, and apostolical Roman church to be the mother and mistress of all churches; and I do promise and swear true obedience to the bishop of Rome, the successor of St. Peter, the prince of the apostles, and vicar of Jesus Christ.

"I do undoubtedly receive and profess all other things which have been delivered, defined, and declared by the sacred canons and œcumenical councils, and espe-

\* An English traveller, speaking of a religious procession some years ago at Florence, in Italy, describes it as follows: I had occasion, says he, to see a procession, where all the noblest of the city attended in their coaches. It was the anniversary of a charitable institution in favour of poor maidens, a certain number of whom are portioned every year. About two hundred of these virgins walked in procession, two and two together. They were preceded and followed by an irregular mob of penitents, in sack-cloth, with lighted tapers, and monks carrying crucifixes, bawling and bellowing the litanies; but the greatest object was the figure of the Virgin Mary, as big as the life, standing within a gilt frame, dressed in a gold stuff, with a large hoop, a great quantity of false jewel, her face painted and patched, and her hair frizzled and curled in the very extremity of the fashion. Very little regard had been paid to the image of our Saviour on the cross; but when the Lady Mother appeared on the shoulders of three or four lusty friars, the whole populace fell upon their knees in the dirt.

† A long list of indulgencies, or frees of the pope's chancery, may be seen in a book printed 150 years ago, by authority of the then pope. It has been translated into English, under the title of *Rome a great Custom-House for Sin*; from which we shall give a few extracts.

#### ABSOLUTIONS.

For him that stole holy or consecrated things out of a holy place, 10s. 6d.

For him who lies with a woman in the church, 9s.

For a layman for murdering a layman, 7s. 6d.

For him that killeth his father, mother, wife, or sister, 10s. 6d.

For laying violent hands, on a clergyman, so he be without effusion of blood, 10s. 6d.

For a priest that keeps a concubine: as also his dispensation for being irregular, 10. 6d.

For him that lyeth with his own mother, sister, or godmother, 7s. 6d.

For him that burns his neighbour's house, 12s.

For him that forgeth the pope's hand, 1l. 7s.

For him that forgeth letters apostolical, 1l. 7s.

For him that takes two holy orders in one day, 2l. 6s.

For a king for going to the holy sepulchre without licence, 7l. 10s.

#### DISPENSATIONS.

For a bastard to enter all holy orders, 18s.

For a man or woman that is found hanged, that they may have Christian burial, 1l. 7s. 6d.

#### LICENCES.

For a layman to change his vow of going to Rome to visit the apostolic churches, 18s.

To eat flesh and white meats in Lent, and other fasting days, 10s. 6d.

That a king or queen shall enjoy such indulgencies, as if they went to Rome, 15l.

For a queen to adopt a child, 300l.

To marry in times prohibited, 2l. 5s.

To eat flesh in times prohibited, 1l. 4s.

Not to be tied to fasting days, 1l. 4s.

For a town to take out of a church them (murderers) that have taken sanctuary therein, 4l. 10s.

#### FACULTIES.

To absolve all the delinquents, 3l.

To dispense with irregularities, 3l.

cially

cially by the holy synod of Trent. And all other things contrary thereto, and all heresies condemned, rejected, and anathematized by the church, I do likewise condemn, reject, and anathematize."

[ARCHBISHOPRICKS.] There are thirty-eight archbishopricks in Italy, but the suffragans annexed to them are too indefinite and arbitrary for the reader to depend upon, the pope creating or suppressing them as he pleases.

[LANGUAGE.] The Italian language is remarkable for its smoothness, and the facility with which it enters into musical compositions. The ground-work of it is Latin, and it is easily mastered by a good classical scholar. Almost every state in Italy has a different dialect; and the prodigious pains taken by the literary societies there, may at last fix the Italian into a standard language. At present the Tuscan style and writing is most in request.

The Lord's Prayer runs thus: *Padre nostro, che sei nel cielo, sia santificato il tuo nome; il tuo regno venga; la tua volontà sia fatta, siccome in cielo così anche in terra; dacci oggi il nostro pane cotidiano; e rimettici i nostri debiti, siccome noi ancora rimettiamo a' nostri debitori; e non inducici in tentazione, ma liberaci dal maligno; perciocché tuo è il regno, e la potenza, e la gloria in sempiterno. Amen.*

[LEARNING AND LEARNED MEN, PAINTERS, STATUARIES, ARCHITECTS, AND ARTISTS.] In the Introduction, we have particularized some of the great men which ancient Italy produced. In modern times, that is, since the revival of learning, some Italians have shone in controversial learning. The mathematics and natural philosophy owe much to Galileo, Toricelli, Malpighi, Borelli, and several other Italians. Strada is an excellent historian; and the history of the council of Trent, by the celebrated Father Paul, is a work of great merit. Guicciardini, Bentivoglio, and Davila, have been much commended as historians by their several admirers. Machiavel is equally famous as an historian and as a political writer. His comedies deserve some praise for the liberality of his sentiments, considering the age in which he lived. Among the prose writers in the Italian language, Boccace has been thought one of the most pure and correct in point of style: he was a very natural painter of life and manners, but his productions are too licentious. Petrarch, who wrote both in Latin and Italian, revived among the moderns the spirit and genius of ancient literature: but among the Italian poets, Dante, Ariosto, and Tasso, are the most distinguished. There are said to be upwards of a thousand comedies in the Italian language, though not many that are excellent: but Metastasio has acquired a great reputation by writing dramatic pieces set to music. Sannazarius, Fracastorius, Bembo, Vida, and other natives of Italy, have distinguished themselves by the elegance, correctness, and spirit of their Latin poetry, many of their compositions approaching in some degree to the classics themselves. Socinus, who was so much distinguished by his opposition to the doctrine of the Trinity, was a native of Italy.

The Italian painters, sculptors, architects, and musicians, are unrivalled, not only in their numbers, but their excellencies. The revival of learning, after the sack of Constantinople by the Turks, revived taste likewise, and gave mankind a relish for truth, and beauty in design and colouring. Raphael, from his own ideas, assisted by the ancients, struck out a new creation by his pencil, and still stands at the head of painting. Michael Angelo Buonarotti excelled at once in painting, sculpture, and architecture. The colouring of Titian has perhaps never yet been equalled, Buonante, Bernini, and many other Italians, carried sculpture and architecture to an amazing height. Julio Romano, Correggio, Caraccio, Veronese, and others, are, as painters, unequalled in their several manners. The same may be said of Corelli, and other Italians, in music. At present, Italy cannot justly boast of any paramount genius in the fine arts.

UNIVERSITIES.] Those of Italy are, Rome, Venice, Florence, Mantua, Padua, Parma, Verona, Milan, Pavia, Bologna, Ferrara, Pisa, Naples, Salerno, and Perugia.

ANTIQUITIES AND CURIOSITIES. } Italy is the native country of all that is  
NATURAL AND ARTIFICIAL. } stupendous, great, or beautiful, either in an-  
cient or modern times. A library might be filled by descriptions and delineations  
of all that is rare and curious in the arts; but the bounds of this work admit only  
of a very brief account of those objects that are most distinguished either for anti-  
quity or excellence.

The amphitheatres claim the first rank, as a species of the most striking magni-  
fence: there are at Rome considerable remains of that which was erected by  
Vespasian, and finished by Domitian, called the Colisseo. Twelve thousand Jewish  
captives were employed by Vespasian in this building; and it is said to have been  
capable of containing eighty-seven thousand spectators seated, and twenty thou-  
sand standing. The architecture of this amphitheatre is perfectly light, and its  
proportions are so just, that it does not appear near so large as it really is. But  
it has been stripped of all its magnificent pillars and ornaments, at various  
times, and by various enemies. The Goths, and other barbarians, began its de-  
struction, and popes and cardinals have endeavoured to complete its ruin. Car-  
dinal Farnese, in particular, robbed it of some fine remains of its marble cornices,  
friezes, &c. and, with infinite pains and labour, got away what was practicable of  
the outside casing of marble, which he employed in building the palace of Farnese.  
The amphitheatre of Verona, erected by the consul Flaminius, is thought  
to be the most entire of any in Italy. There are forty-five rows of steps carried all  
round, formed of fine blocks of marble about a foot and a half high each, and  
above two feet broad. Twenty-two thousand persons may be seated here at their  
ease, allowing one foot and a half for each person. This amphitheatre is quite per-  
fect, and has been lately repaired with the greatest care, at the expence of the inha-  
bitants. They frequently exhibited in it plays, combats of wild beasts, and other  
public spectacles. The ruins of theatres and amphitheatres are also visible in other  
places. The triumphal arches of Vespasian, Septimius Severus, and Constantine the  
Great, are still standing, though decayed. The ruins of the baths, palaces, and  
temples, are correspondent to the highest ideas we entertain of the Roman gran-  
deur. The Pantheon, which is at present converted into a modern church, and which,  
from its circular figure, is commonly called the Rotunda, is more entire than any  
other Roman temple now remaining. It was built by Agrippa, the son-in-law of  
Augustus, and called Pantheon, from the universality of its celestial dedication.  
The ascent to it was originally by seven steps, but the ground on which Rome stood  
being raised from 12 to 35 feet by its ruins, for several ages it was entered by a  
descent of 13 steps; but Alexander the Seventh caused the earth that surrounded  
it to be removed, so that the exterior surface is now upon a level with its floor.  
There are still left several of the niches which anciently contained the statues of  
the Heathen deities. The outside of the building is of Tivoli freestone, and within,  
it is encruited with marble. The roof of the Pantheon is a round dome, without  
pillars, the diameter of which is a hundred and forty-four feet; and though it has  
no windows, but only a round aperture in the centre of this dome, it is very light  
in every part. The pavement consists of large square stones and porphyry, slop-  
ing round towards the centre, where the rain-water, falling down through the  
aperture on the top of the dome, is conveyed away by a proper drain covered  
with a stone full of holes. The colonade in the front, which consists of sixteen  
columns of granite, thirty-seven feet high, exclusive of the pedestals and capitals,  
each cut out of a single block, and which are of the Corinthian order, can hardly be

viewed without astonishment. The entrance of the church is adorned with columns forty-eight feet high, and the architrave is formed of a single piece of granite. On the left hand, on entering the portico, is a large antique vase of Numidian marble; and in the area before the church is a fountain, with an antique bason of porphyry. The pillars of Trajan and Antonine, the former 175 feet high, and the latter covered with instructive sculptures, are still remaining. A traveller forgets the devastations of the northern barbarians, when he sees the rostrated column erected by Duillius, in commemoration of the first naval victory the Romans gained over the Carthaginians; the statue of the wolf giving suck to Romulus and Remus, with visible marks of the stroke of lightning, mentioned by Cicero; the very original brass plates containing the laws of the twelve tables; and a thousand other identical antiquities, transmitted unhurt to the present times; not to mention the infinite variety of medals, seals, and engraved stones which abound in the cabinets of the curious. Many palaces, all over Italy, are furnished with busts and statues fabricated in the times of the republic and the higher empire.

The Appian, Flaminian, and Æmilian roads, the first 200 miles, the second 130, and the third 50 miles in length, are in many places still entire; and magnificent ruins of villas, reservoirs, bridges, and the like, present themselves all over Italy.

The subterraneous constructions of Italy are as stupendous as those above ground; witness the cloacæ, and the catacombs, or repositories for dead bodies, in the neighbourhood of Rome and Naples. It is not above thirty years since a painter's apprentice discovered the ancient city of Pæstum or Posidonia, in the kingdom of Naples, still standing; for so indifferent are the country people of Italy about objects of antiquity, that it was a new discovery to the learned. Many curiosities are frequently dug out of the ruins of Herculaneum, a city lying between Naples and Vesuvius, which in the reign of Nero was almost destroyed by an earthquake, and afterwards, in the first year of the reign of Titus, anno 79, overwhelmed by a stream of the lava of Vesuvius. The melted lava in its course filled up the streets in some places to the height of sixty-eight feet above the tops of the latter, and in others one hundred and ten feet. The lava is now of a consistency which renders it extremely difficult to be removed or cleared away: it is composed of bituminous particles, mixed with cinders, minerals, metallics, and vitrified sandy substances, which altogether form a close and heavy mass. In the revolution of so many ages, the spot it stood upon was entirely forgotten; but in the year 1713, upon digging in these parts, somewhat of this unfortunate city was discovered, and many antiquities were dug out; but the search was afterwards discontinued, till the year 1736, when the king of Naples employed men to dig perpendicularly eighty feet deep, whereupon not only the city made its appearance, but also the bed of the river which ran through it. The temple of Jupiter was then brought to light, and the whole of the theatre. In the temple was found a statue of gold, and the inscription that decorated the great doors of entrance. In the theatre, the fragments of a gilt chariot of bronze, with horses of the same metal, likewise gilt: this had been placed over the principal door of entrance. They likewise found among the ruins of this city multitudes of statues, busts, pillars, paintings, manuscripts, furniture, and various utensils; and the search is still continued. The streets of the town appear to have been quite straight and regular, and the houses well built, and much alike; some of the rooms paved with mosaic, others with fine marbles, others again with bricks, three feet long and six inches thick. It appears that the town was not filled up so unexpectedly with the melted lava, as to prevent the greatest part of the inhabitants from escaping with many of their rich effects; for when the excavations were made, there were not more than a dozen skeletons found, and but little of gold, silver, or precious stones. The difficulty of removing the rubbish induced his majesty to fill it up again as he went on, after collecting all the moveables

moveables of any consequence. The theatre alone is left open. It is larger than any in England; and the ends of the beams burnt to coal, are still seen sticking in the walls; but all the ornaments that withstood the eruption are removed to Portici.

The town of Pompeia was destroyed by the same eruption of Mount Vesuvius, which occasioned the destruction of Herculaneum; but it was not discovered till near forty years later. One street, and a few detached buildings have been cleared; and that with more facility than at Herculaneum, no lava having ever gone over the ashes which buried Pompeia. The street is well paved with the same kind of stone of which the ancient roads are made, and narrow causeways are raised a foot and a half on each side for the conveniency of foot passengers. The street itself is not so broad as the narrowest part of the Strand, and is supposed to have been inhabited by trades-people. The traces of wheels of carriages are to be seen on the pavement. The houses are small, but give an idea of neatness and conveniency. The stucco on the walls is smooth and beautiful, and as hard as marble. Some of the rooms are ornamented with paintings, mostly single figures, representing animals. They are tolerably well executed, and on a little water being thrown on them, the colours appear surprisngly fresh. Most of the houses are built on the same plan, and have one small room from the passage, which is conjectured to have been the shop, with a window to the street, and a place which seems to have been contrived for shewing the goods to the greatest advantage. In another part of the town is a rectangular building, with a colonade towards the court, something in the style of the Royal Exchange at London, but smaller. This has every appearance of a barrack and guard-room; the pillars are of brick, covered with shining stucco, elegantly fluted; the scrawlings and drawings still visible on the walls, are such as might be naturally expected on the walls of a guard-room, where soldiers are the designers, and swords the engraving tools. They consist of gladiators fighting, some with each other, some with wild beasts; the games of the circus, as chariot races, wrestling, and the like; a few figures in caricatura, designed probably by some of the soldiers in ridicule of their companions, or perhaps of their officers; and there are many names inscribed on various parts of the wall, particularly *Cn. Balbus*, *Lu. Jun. Rufus*, &c. &c. At a considerable distance from the barrack is a temple of the goddess Isis, the pillars of which are of brick, stuccoed like those of the guard-room; but there is nothing very magnificent in the appearance of this edifice. The best paintings, hitherto found at Pompeia, are those of this temple; they have been cut out of the walls, and removed to Portici. Few skeletons were found in the streets of this town, but a considerable number in the houses. In one apartment (says Mr. Sutherland) we saw the skeletons of seventeen poor wretches, who were confined by the ancles in an iron machine. Many other bodies were found, some of them in circumstances which plainly shew that they were endeavouring to escape, when the eruption overtook them.

With regard to modern curiosities in Italy, they are as bewildered as the remains of antiquity. Rome itself contains 300 churches, filled with all that is rare in architecture, painting, and sculpture. Each city and town of Italy contains a proportionable number.

The church of St. Peter, at Rome, is the most astonishing, bold, and regular fabric, that ever perhaps existed; as neither the temple of Jerusalem, nor those of Ephesus, Eleusis, or of Olympian Jupiter at Athens, could, from what history has recorded of them, be ranked with it in this respect. The semicircular colonades that enclose its spacious court: the Egyptian obelisk in the center brought from Heliopolis to Rome by Caligula: and the fountains on each side, which generally

throw up columns of water sufficient to fill the bed of a small river, are the grandest objects of the kind which the world can produce. The front of this edifice is generally thought less noble than that of St. Paul's in London, which was built in imitation of St. Peter's; but when the whole is viewed together, crowned with its majestic dome of 617 feet in circumference, its general superiority will be manifest.

The Vatican, which is the largest palace in Christendom, is said to contain 13,000 chambers and closets. It stands close to St. Peter's, the perspective of which loses much of its effect by their junction, as the exterior of the Vatican but ill accords with the grand and regular appearance of the church; being an immense pile of building without order, raised by different architects, and at different times. The library of this palace is supposed to contain the most numerous and valuable collection of books, &c. in the world. On going into it, you look up an immense room, which had little the appearance of what it is, the volumes being shut up in armories. It is said to contain 120,000 in printed and manuscript; but this assertion is rather dubious. The house and chapel of Loretto is rich beyond imagination, notwithstanding the ridiculous romance that composes its history.

The natural curiosities of Italy, though remarkable, are not so numerous as its artificial. Mount Vesuvius, which is five Italian miles distant from the city of Naples, and Mount *Ætna*, in Sicily, are remarkable for emitting fire from their tops. The declivity of Mount Vesuvius towards the sea, is every where planted with vines and fruit-trees, and it is equally fertile towards the bottom. The circumjacent plain affords a delightful prospect, and the air is clear and wholesome. The South and West sides of the mountain form very different views, being, like the top, covered with black cinders and stones. The height of Mount Vesuvius has been computed to be 3900 feet above the surface of the sea. It hath been a volcano beyond the reach of history or tradition. An animated description of its ravages in the year 79, is given by the younger Pliny, who was a witness to what he wrote. From that time to the year 1631, its eruptions were but small and moderate: however then it broke out with accumulated fury, and desolated miles around. In 1694, was a great eruption, which continued near a month, when burning matter was thrown out with so much force, that some of it fell at thirty miles distance, and a vast quantity of melted minerals, mixed with other matter, ran down like a river for three miles, carrying every thing before it which lay in its way. In 1707, when there was another eruption, such quantities of cinders and ashes were thrown out, that it was dark at Naples at noon-day. In 1767, a violent eruption happened, which is reckoned to be the twenty-seventh from that which destroyed Herculaneum in the time of Titus. In this eruption the ashes, or rather small cinders, showered down so fast at Naples, that the people in the street were obliged to use umbrellas, or adopt some other expedient, to guard themselves against them. The tops of the houses, and the balconies, were covered with these cinders; and ships at sea, twenty leagues from Naples, were annoyed by them, to the great astonishment of the sailors. An eruption happened also in 1766, and another in 1779, which has been particularly described by sir William Hamilton, in the *Philosophical Transactions*.

This gentleman, the British envoy at the court of Naples, has been at great pains to investigate the phenomena of this volcano. From the time of his arrival at Naples, in 1764, he paid particular regard to the state of the mountain at all times, and observes that the smoke is much more considerable in bad, than in fair weather; and that the inward explosions of the mountain are often heard at Naples in bad weather, which is six miles distant. On looking into the mouth from whence the fire issues, in fair weather the smoke has sometimes been so little, that

he has seen a great way down, and observed the sides to be incrufted with fairs and minerals of various colours, white, green, deep and pale yellow. In bad weather alfo the fmoke was moist, white, and much lefs offensive than the fleams which iffued from the cracks in the fides of the mountain. The figns of an approaching eruption are an increafe of the fmoke in fair weather; and after this has continued for fome time, a puff of black fmoke is frequently feen to fhoot up in the middle of the white kind to a prodigious height; and thefe puffs are attended with confiderable explofions. While Vefuvius was in this ftate, fir William afcended to the top. It was about the beginning of November, and the upper part of the mountain was then covered with fnow. A little hillock of fulphur, about fix feet high, had been thrown up by the mountain, and burned with a blue flame at the top: but while our author was examining this phenomenon, a fudden and loud report was heard, a column of black fmoke thot up with violence, and was followed by a reddith flame. A ftower of ftones fell, which obliged him to retire; and he informs us, that it is by no means fafe to approach too near to the mountain in this ftate, as fome gentlemen, whom he mentions, were wounded by the ftones which were thrown out by an explofion of this kind. As the eruption proceeds, the fmoke becomes totally black in the day time, and at night appears like clouds tinged by the fetting fun. Afterwards it appears like flame in the night; ftowers of afhes are thrown out, earthquakes are produced, and great volleys of red-hot ftones are difcharged to an immense height in the air. The height and diftance to which thefe ftones are thrown is generally in proportion to the magnitude of the volcano which emits them, and hence the explofions of Vefuvius are commonly lefs terrible than thofe of *Ætna*; but the eruption in 1779 from Vefuvius feems to have been as violent as we have an account of in any volcano whatever. The largeft ftone thrown out by Vefuvius, whofe dimentions have been meafured, was 12 feet in length, and 45 in circumference. It was projected to the diftance of a quarter of a mile from the place where it was emitted; but much larger ones have been thrown out from volcanoes of a fuperior magnitude; and Mr. Brydone was affured by the Canon *Recupero*, that he had feen ftones of immense magnitude thrown out from *Ætna*, to the height of more than 7,000 feet above the top of the mountain, as he calculated from the time they took in falling. Along with thefe dreadful phenomena, the fmoke which iffues from the mountain is in a highly electrified ftate: the fmall afhes, which the mountain continually throws out along with the ftones and cinders, are attracted by the fmoke, and form with it one vaft, and, to appearance, dense column, from whence continual ftashes of forked, or zig-zag lightning iffue, fometimes attended with thunder, and fometimes not, but equally powerful with the ordinary lightning. This phenomenon has been taken notice of in the accounts of all volcanoes. Pliny mentions it in his account of the great eruption in 79; it has been obferved in thofe of the Icelandic volcanoes; in *Ætna*; and Sir William Hamilton has more than once feen it proceed from the fmoke of Vefuvius.

The eruption of lava in 1766 took place on the 28th of March, about feven at night. The lava began to boil over in one ftream, but foon after divided itfelf into two. It was preceded by a partial earthquake in the neighbourhood of the mountain, occafioned by a violent explofion, and a ftower of red-hot ftones and cinders were thrown up to a confiderable height. The lava had the appearance of red-hot and liquid metal, fuch as the vitrified matter of the glafs-houfes, on which were large floating cinders half lighted, and rolling one over another down the mountain with great precipitation, forming a moft beautiful and uncommon cataract. The colour of the fire was much paler and brighter the firft night than any of the fubfequent ones, when it became of a deep red, probably owing, fays Sir William,

to

to its having been more impregnated with sulphur at first than afterwards. In the day time, unless you are very near it, the lava has no appearance of fire, but its course is marked by a thick white smoke.

The heat of the lava was such, that one could not approach nearer than within ten feet of the stream, and of such consistence (though it appeared as liquid as water) as almost to resist the impression of a long stick, with which the experiment was made. Large stones thrown upon it with all his force did not sink; but, making a slight impression, floated on the surface, and were carried out of sight in a short time; for, notwithstanding the consistency of the matter, it ran with great velocity; not less, in our author's opinion, than that of the river Severn at the passage near Bristol. The stream was about ten feet wide at its source, but soon extended itself, dividing into three branches, so that these rivers of fire, communicating their heat to the cinders of former lavas, between one branch and the other, had the appearance at night of a continued sheet of fire, four miles long, and in some places near two in breadth.

Next year there was a much more violent eruption of the mountain; and the frequent emissions of red-hot-stones and cinders, which took place previous to the eruption, had at last formed a small mountain within the mouth of the great one, by their continually falling back into the place from whence they were emitted; and from the top of this little mountain the smoke issued so thick, that it seemed to have a difficulty in effecting a passage; while volleys of great stones were every minute thrown up to an immense height. At last the whole took the shape of a huge pine tree, which appearance was taken notice of by Pliny in his account of the eruption in 79. The column ascended to such an extraordinary height, as, when bent by the wind, to reach the island of Caprea, not less than 28 miles from Vesuvius. These violent symptoms ceased on the bursting forth of the lava; after which, our author, supposing the danger was over, went to the mountain to make his observations. But while he was employed in this manner, a violent noise was heard within the mountain, immediately after which the lava broke out from a new mouth only a quarter of a mile distant from where he stood, springing up to a considerable height in the air, and rolling directly towards him. He was now in extreme danger, the earth shaking with such violence as to endanger the fall of some of the rocks under which he must necessarily pass, while the showers of cinders and pumice-stone threatened to overwhelm him; and the clouds of smoke produced such an intense darkness, that he could not see which way to go. The sulphureous smell was likewise very offensive, and the explosions of the mountain were much louder than thunder. In this situation he ran three miles before he got out of danger, and afterwards perceived that the lava had actually covered the road by which he retreated, and that to the depth of no less than 60 or 70 feet. The concussions of the air were so violent upon this occasion, that windows and doors of houses, even though locked, were burst open. There was likewise a continual and rumbling subterraneous noise; which lasted for several hours, and which sir William conjectured to have been owing to rain-water lodged in the cavities of the mountain, and meeting with the lava.

The eruption of 1779 was much more violent than that already described. It commenced in the month of August, and besides the usual symptoms of volleys of stones, immense clouds of smoke, &c. a most extraordinary scene was presented by the approach of a thunder cloud. No sooner did this come over the mouth of the inflamed volcano, than the fire from its bowels spouted out in a vast column to meet that in the cloud; both together producing an appearance not to be paralleled. Next night the lava, which had not hitherto got sufficient vent, after a most astonishing explosion, spouted up to the height of at least 10,000 feet above the summit of the mountain, while the smoke around it, emitting continual flashes of zig-zag lightning,

ning, gave an appearance much more awful and tremendous, though, according to Sir William, less beautiful than that of the preceding evening. On this occasion the town of Ottaviano, upon which the volcanic shower was driven by the wind, narrowly escaped the fate of Herculaneum and Pompeii of old. The vast stream of lava indeed did not reach them, otherwise it must have been irresistible.

To the subterraneous fires which the volcanoes are produced, we must undoubtedly ascribe the frequency of earthquakes in this country. In the year 1783, the southern part of Italy was ruined by one of the most violent earthquakes mentioned in history. It affected also the island of Sicily, but less violently than the country already mentioned. Its extent, however, was much less than that of several others. Sir William Hamilton fixes the centre of its force at the town of Oppido; and from the survey which he made of the country which had suffered, computes that its violent effects were confined within a circle whose circumference is 220 Italian miles, and its centre the town of Oppido; nor did it produce any sensible effects beyond the circumference of a circle whose radius was 72 such miles, and Oppido the centre.

The most violent shock happened about noon on the 5th of February; it came on instantaneously, without any warning, and the shock seemed to be directed perpendicularly upwards. The city of Oppido is situated on a mountain, surrounded by two rivers, in a very broad and deep ravine. Into this there were vast pieces of the plain detached, in such a manner as to stop the course of both the rivers, and to form two great lakes. Part of the rock on which Oppido stood was also precipitated into the same hollow, with several houses which had been built upon it. Vast tracts of land, with large plantations of vines and olive trees, were thrown from one side of the hollow to the other, though the distance was more than half a mile; and with one of these vast pieces of earth a countryman was transported along with his field, and two oxen, who were dragging a plough, to the distance above mentioned, without receiving any hurt. The most extraordinary circumstance, however, was, that a hill about 250 feet high, and 1300 in circumference, was moved from its place near four miles down this ravine, before it settled. In several places also the soil, though there was no appearance of fire upon it, had run like the lava of a volcano, and overflowed, like it, the neighbouring grounds.

At Terra Nuova, the ground on which the town stood was split under it, and many hundred houses, with the earth on which they stood, were in a similar manner thrown about half a mile from the place where they stood; and, what is very extraordinary, some of the inhabitants were dug out of the ruins alive, and even unhurt. At Casal Nuova, the princess Gerace Grimaldi, with more than 4000 of her subjects, were destroyed in a moment. Some of the inhabitants, who had been dug alive out of the ruins, declared that they felt their houses suddenly lifted from the foundation, without having had the least previous warning. An inhabitant of the place, who happened to be on an hill which overlooks the town, at that time, turned about on feeling the shock, but, instead of the town, saw only a vast cloud of white dust in the place where it had been. The whole indeed was so effectually overthrown, that no vestige of house or street remained, all being converted into one promiscuous heap of ruins.

Near Scilla, a mountain fell into the sea, and raised such a vast wave, as swept away the prince of Scilla, with 2473 of his subjects at once. A great part of the town of Messina was overthrown. The part of Calabria which was most affected by this grievous calamity, was that which is comprehended between 38 and 39 degrees.

Such were some of the particulars of this earthquake, remarkable not only for its violence, but for the number and continuance of its shocks, which scarcely ceased

ceased for a whole year after its commencement. The number of persons who lost their lives was computed not to be less than 40,000, and the damage in other respects was prodigious.

It has been observed by a modern traveller, that though Mount Vesuvius often fills the neighbouring country with terror, yet as few things in nature are so absolutely noxious as not to produce some good; even this raging volcano, by its sulphureous and nitrous manure, and the heat of its subterraneous fires, contributes not a little to the uncommon fertility of the country around it, and to the profusion of fruits and herbage with which it is every where covered. Besides, it is supposed that the mountain, being open and active, proves less hostile to Naples, than it would be, if its eruptions were to cease, and its struggles confined to its own bowels; for then might ensue the most fatal shocks to the unstable foundation of the whole district of Terra di Lavoro\*.

The plain of Solfaterra, (so called from the vast quantities of sulphur, which are continually forced out of the cliffs by subterranean fires), which is justly considered as one of the natural curiosities of Italy, and is situated between the lakes Agnano and Puzuzoli, is no other than the crater of an ancient volcano, or the hollow from whence its eruptions formerly issued. In the plain within the hollow, we see still issues from many parts, as well as from many places in the sides. From these places they collect a kind of sal ammoniac, but in a very awkward manner, by heaping stones upon one another to collect the vapours as they rise. From the soil of the plain, sulphur and alum are extracted; and our author is of opinion, that by careful management this spot might produce a very considerable revenue, though at present it does not yield above 200l. annually. The hollow found produced by throwing a heavy stone upon the plain of Solfaterra, seems to indicate that it is supported by a kind of vault: and it is also probable, that there is underneath it a pool of water, which boils by the heat of a subterraneous fire. This supposition is confirmed by the very moist steam which issues from the cracks in the ground, and runs off in great drops from a piece of cold iron presented to it. On the outside, and towards the lake Agnano, water gushes out of the rock so hot as to raise the quicksilver in Fahrenheit's thermometer to the boiling point. After a great deal of rain, however, the heat of this fountain is much less. When you hold your ear near the rocks from whence the water issues, you hear a horrid boiling noise, which seems to proceed from the huge cauldron that may be supposed to be under the Solfaterra.

Mount Ætna is 10,954 feet in height; its ascent by roads, about 26 miles; and the circumference at the basis 160. From the very summit of Ætna, our adventurous traveller, Mr. Watkins, for a few seconds gazed into the crater: but how great was his surprise, when, instead of a shallow basin as that of Vesuvius, he saw a horrid gulf, not less than two miles in circumference, lined with immense rocks, and deeper than the eye could fathom! This crater was the grave of Empedocles, who unfortunately forgot to leave his iron sandals behind him, before he attempted to impose upon the world a belief of his immortality, by throwing himself into it. Ætna stands separate from all other mountains, its figure is circular, and it terminates in a cone. The lower parts of it are very fruitful in corn and sugar-canes; the middle

\* Sir William Hamilton, in his account of the earthquakes in Calabria Ultra, and Sicily, from February 5th, to May 1783, gives several reasons for believing that they were occasioned by the operation of a volcano, the seat of which lay deep under the bottom of the sea, between Stromboli, and the coast of Calabria, or under the parts of the plain towards Oppido and Terra Nuova. He plainly observed a gradation in the damage done to

the buildings, as also in the degree of mortality, in proportion as the countries were more or less distant from this supposed centre of the evil. One circumstance he particularly remarked: if two towns were situated at an equal distance from this centre, the one on a hill, the other on the plain, or in a bottom, the latter had always suffered greatly more by the shocks of the earthquakes than the former; a sufficient proof to him of the cause coming from beneath.

abounds with woods, olive-trees, and vines: and the upper part is almost the whole year covered with snow. Its fiery eruptions have always rendered it famous; in one of these, which happened in 1669, fourteen towns and villages were destroyed, and there have been several terrible eruptions since that time. There is generally an earthquake before any great eruption. In 1693, the port-town of Catania was overturned, and 18,000 people perished.

The grotto del Cane is remarkable for its poisonous steams, and is so called from its killing dogs that enter it, if forced to remain there; and doubtless, it would have the same effect on man, or any other animal, whose head was held near to the ground. This noxious vapour is no other than fixed air, which is produced probably from the effervescence of an acid and alkaline mixture; and this being heavier than common air, is near the earth, and fatal to those animals whose heads are so low as to breathe it. Scorpions, vipers, and serpents, are said to be common in Apulia.

Among the several curiosities of Italy, those vast bodies of snow, and ice, which are called the Glaciers of Savoy, deserve to be particularly mentioned. There are five glaciers, which include the vale of Chamouny, and are separated by wild forests, corn-fields, and rich meadows; so that immense tracts of ice are blended with the highest cultivation, and perpetually succeed to each other, in the most singular and striking situations. All these several vallies of ice, which lie chiefly in the hollows of the mountains, and are some leagues in length, unite together at the foot of Mont Blanc; the highest mountain in Europe, and probably of the ancient world; but for a fuller description of this celebrated mountain, and of the glaciers that surround it, we refer our readers to the account of Switzerland.

STATES OF ITALY, CONSTITUTION, AND CHIEF CITIES. } Thus far, of Italy in general; but as the Italian states are not, like the republics of Holland, or Switzerland, or the empire of Germany, cemented by a political confederacy, to which every member is accountable (for every Italian state has distinct forms of government, trade, and interests), I shall be obliged to take a separate view of each, to assist the reader in forming an idea of the whole.

The duke of SAVOY, or, as he is now styled, king of SARDINIA \*, taking his royal title from that island, is a powerful prince in Italy, of which he is called the Janus, or keeper, against the French. His capital is Turin. This noble city which stands on the northern bank of the river Pô, is perhaps, if taken all in all, the best built, best fortified, and the most uniform in Europe. Its form is oval, the streets are wide, and extend in straight lines from one end of it to the other. Through the middle of which the clear stream of the Doria is made to flow in little channels that keep them clean, and supply the inhabitants with good water. The fronts of the houses in every street are similar to each other, being built of hewn stone, three stories high. The late king, who was what kings should be, the

father of his country, began these improvements, and might be called the second founder; for so great is the alteration, that it would be impossible for any person, who had seen it before the new plan was executed, to know it in the present time. The venerable appearance of the royal palace makes it look like the great ancestor of the city: its heavy and ill proportioned structure stands as a memento of the rude and barbarous ages of Italy. The duchy of Savoy and principality of Piedmont are more populous than they were; by the last returns, the number is found to amount to 2,695,727 souls, of which Turin contains about 77,000. The authority of his Sardinian majesty is as absolute as his will, being neither controuled by parliaments nor conditions of government. The troops of his majesty, on the peace establishment, amount to between 25,000 and 30,000 men, besides a militia of about 15,000, who are called out during one month in the year, and receive a third of the pay of the regulars; and four Swiss regiments, one of which is a protestant corps, and has a minister, paid 100 louis per ann. partly by the king and partly by the regiment.

The MILANESE, belonging to the house of Austria, is a considerable state, and formerly predominant in Italy, when under the government of its own dukes. The fertility and beauty of the country are almost incredible. Milan, the capital, and its citadel, are very strong, and furnished with a magnificent cathedral in the Gothic taste, which contains a very rich treasury, consisting chiefly of ecclesiastical furniture, composed of gold, silver, and precious stones. Few travellers come to Milan who are not soon after their arrival taken to a place called La Casa Simonetta, an uninhabited feat, two miles from the city, remarkable for its echo, which repeats the human voice 38, and the report of a pistol 57 times. It is at a back part of the house, and seems to be produced by the projection of two wings from the body, that forms a kind of court-yard, but probably there must be some other unknown cause for so singular an effect. The military establishment of the country is from 16 to 20,000 men, the population 1,000,000, including the capital, which is said to contain 116,000. The revenue of the duchy is above 300,000l. annually. The natives are fond of literary and political assemblies. With all its natural and acquired advantages, the natives of Milan make but few exports; so that its revenue, unless the court of Vienna should pursue some other system of improvement, cannot be much bettered. The duchy of Mantua, being now incorporated with it, the province is to take the name of Austrian Lombardy.

The republic of GENOA is vastly degenerated from its ancient power and opulence, though the spirit of trade still continues among its nobility and citizens. Genoa may be called a city of marble palaces; but unfortunately it stands on such a confined slip of land, between the sea and the mountain behind it, that these noble edifices press upon one another. Add to this, the streets are so narrow, as to prevent the passenger from seeing their style of architecture to advantage. The two principal are La Strada Nuova, and La Strada Balbi. The first consists of fourteen superb palaces, that contain a profusion of marbles, and a fine collection of paintings, among which are many most admirable pieces of Titian, the Caracci, and Guido Rene. This city is seen from the sea to the greatest advantage, and forms a very magnificent scene, comprehending the city, the surrounding hills, and the numerous villas that occupy every part of them. Amongst its palaces as particularly worthy of notice, are those of Doria \*, and Durazzo. The inhabitants of

\* Andrew Doria, the head of this family, famous for his many exploits, and the deliverer of Genoa, was born in the territory of Genoa, in the year 1498: he was offered the sovereignty of the

state, but refused it, and gave to the people that republic a form of government which still subsists: he lived to the age of 93, the refuge and friend of the unfortunate.

distinction dress in black, in a plain, if not an uncouth manner, perhaps to save expences. Their chief manufactures are velvets, damasks, gold and silver tissues, and paper. The city of Genoa contains about 150,000 inhabitants (but some writers greatly diminish that number), among whom are many rich trading individuals. Its maritime power is dwindled down to six gallees. The chief safety of this republic consists in the jealousy of other European powers, because to any one of them it would be a most valuable acquisition. The common people are wretched beyond expression, as is the soil of its territory. Near the sea some parts are tolerably well cultivated. The government of Genoa is aristocratical, being vested in the nobility: the chief person is called the Doge, or Duke; to which dignity no person is promoted till he is fifty years of age. Every two years a new doge is chosen, and the former is incapable, during five years, of holding the same post again. The doge gives audience to ambassadors; all orders of government are issued in his name, and he is allowed a body-guard of two hundred Germans.

VENICE is one of the most celebrated republics in the world, on account both of its constitution and former power. It commands several fine provinces on the continent of Italy, some islands in the Adriatic, and part of Dalmatia. The city of Venice is seated on 72 islands at the bottom of the north end of the Adriatic sea, and is separated from the continent by a marshy lake of five Italian miles in breadth, too shallow for large ships to navigate, which forms its principal strength. Venice preserves many vestiges of its ancient magnificence and strictly adheres to its ancient ceremonies. As to the constitution of the republic, it was originally democratical, the magistrates being chosen by a general assembly of the people, and so continued for one hundred and fifty years; but various changes afterwards took place: doges, or dukes, were appointed, who were invested with great power, which they often grossly abused, and some of them were assassinated by the people. By degrees a body of hereditary legislative nobility was formed; and a complete aristocracy was at length established upon the ruins of the popular government. The nobility are divided into six classes, amounting in the whole to 2500, each of whom, when twenty-five years of age, has a right to be a member of the grand council. These elect a doge or chief magistrate by ballot. The doge is invested with great state, and with emblems of supreme authority, but has very little power, and is not permitted to stir from the city without the permission of the grand council. The government and laws are administered by different councils of the nobles.

The college otherwise called the seigniory, is the supreme cabinet council of the state, and also the representative of the republic. This court gives audience, and delivers answers, in the name of the republic, to foreign ambassadors, to the deputies of towns and provinces, and to the generals of the army. It also receives all requests and memorials on state affairs, summons the senate at pleasure, and arranges the business to be discussed in that assembly. The council of ten takes cognizance of state crimes, and has the power of seizing accused persons, examining them in prison, and taking their answers in writing, with the evidence against them. But the tribunal of state inquisitors, which consists only of three members, and which is in the highest degree despotic in its manner of proceeding, has the power of deciding without appeal, on the lives of every citizen belonging to the Venetian state; the highest of the nobility, even the doge himself, not being excepted. To these three inquisitors is given the right of employing spies, and issuing orders to seize all persons whose words or actions they think reprehensible, and afterwards trying them, and ordering them to be executed, when they think proper. They have keys to every apartment of the ducal palace, and can, whenever they please, penetrate

penetrate into the very bed-chamber of the doge, open his cabinet, and examine his papers. They continue in office only one year, but are not responsible afterwards for their conduct whilst they were in authority. So much distrust and jealousy are displayed by this government, that the noble Venetians decline having any intercourse with foreign ambassadors, or with foreigners who visit them.

All the orders of Venetian nobility are dressed in black gowns, large wigs, and caps which they hold in their hands. The ceremony of the doge's marrying the Adriatic once a year, from his bucentaur or state-berge, attended by those of all the nobility, is the most superb exhibition in Venice, and according to Mr. Watkins, much more splendid than that of our lord Mayor. When the bucentaur proceeds to a certain distance, on a signal given, a general silence ensues. The doge, leaning over the water from the stern of his nuptial vessel, extends his right arm, holding in his hand a ring, and pronouncing aloud, *Te, mare, desponsamus in signum veri perpetuæque dominii* \*, dropt it into the bosom of his bride. This pageant was instituted in the dogeship of Sebastian Ziani, by Pope Alexander the Third. The naval force which Venice then maintained in its gulph, the Mediterranean, and Archipelago, gave it some countenance; but time has effected such a change, that in the present age it is become quite ridiculous. The inhabitants of Venice are said to amount to 200,000. The grandeur and convenience of the city, particularly the public palaces, the treasury, and the arsenal, are beyond expression. Over the several canals of Venice, are laid near 500 bridges, the greatest part of which are stone. The Venetians still have some manufactures in scarlet cloth, gold and silver stuffs, and above all, fine looking-glasses, which bring in a considerable revenue to the owners; that of the state annually is said to amount to 8,000,000 of Italian florins, each valued at twenty-pence of our money. Out of this are defrayed the expences of the state and the pay of the army, which in time of peace consists of 16,000 regular troops (always commanded by a foreign general), and 10,000 militia. They keep up a small fleet for curbing the insolences of the piratical states of Barbary, and they have among them some orders of knighthood, the chief of which are those of the *Stola d'oro*, so called from the robe they wear, which is conferred only on the first quality, and the military order of St. Mark; of which in the proper place.

In ecclesiastical matters the Venetians have two patriarchs; the authority of one reaches over all the provinces, but neither of them have much power; and both of them are chosen by the senate; and all religious sects, even the Mahometan and Pagan, excepting Protestants, are here tolerated in the free exercise of their religion.

The Venetians are a lively, ingenious people, extravagantly fond of public amusements, with an uncommon relish for humour. They are in general tall and well made; and many fine manly countenances are met with in the streets of Venice, resembling those transmitted to us by the pencils of Paul Veronese and Titian. The women are of a fine style of countenance, with expressive features, and are of an easy address. The common people are remarkably sober, obliging to strangers, and gentle in their intercourse with each other. As it is very much the custom to go about in masks at Venice, and great liberties are taken during the time of the carnival, an idea has prevailed, that there is much more licentiousness of manners here than in other places. Great numbers of strangers visit Venice during the carnival, and eight or nine theatres are then open.

The dominions of Venice consist of a considerable part of Dalmatia, of four towns in Greece, and of the islands of Corfu, Pachfu, Antipachfu, Santa Maura,

\* *Te, O Sea, we espouse, in token of our true and perpetual dominion over thee.*

Curzolari, Val di Compare, Cephalonia, and Zante. The Venetian territories in Italy contain the duchy of Venice, the Paduanese, the peninsula of Rovigo, the Veronese, the territories of Vicenza and Brescia, the districts of Bergamo, Cremona, and the Marca Trevigiana, with part of the country of Friuli. The subjects of the Venetian republic are not oppressed: the senate has found, that mild treatment and good usage are the best policy, and more effectual than armies in preventing revolts.

The principal city of TUSCANY is Florence, which is now possessed by a younger branch of the house of Austria, after being long held by the illustrious house of Medicis, who made their capital the cabinet of all that is valuable, rich, and masterly in architecture, literature, and the arts, especially those of painting and sculpture. It is thought to contain above 70,000 inhabitants. The beauties and riches of the grand duke's palaces have been often described; but all description falls short of their excellence. The celebrated Venus of Medicis, justly deemed the standard of female beauty and proportion, stands in a room called the Tribunal. The inscription on its base mentions its being made by Cleomenes, an Athenian, the son of Apollodorus. It is of white marble, and surrounded by other master-pieces of sculpture, some of which are said to be the works of Praxiteles, and other Greek masters. Among the proofs of the genius of Michael Angelo, at Florence, may be particularly noticed the anti-chamber and stair-case to the library of St. Lorenzo, from a design of that great artist: they are uncommonly elegant. The library itself is well contrived, and contains, as appears from the catalogue made by the present librarian, a very valuable collection of books: among which are the Pandects of Justinian, in two large volumes, written very fairly on parchment, and in the same state as they were brought from Amalphi. Every corner of this beautiful city, which stands between mountains covered with olive-trees, vineyards, and delightful villas, and divided by the Arno, is full of wonders in the arts of painting, statuary, and architecture. It is a place of some strength, and contains an archbishop's see, and an university. The inhabitants boast of the improvements they have made in the Italian tongue, by means of their Academia della Crusca; and several other academies are now established at Florence. Though the Florentines affect great state, yet their nobility and gentry drive a retail trade in wine, which they sell from their cellar-windows, and sometimes they even hang out a broken flask, as a sign where it may be bought. They deal, besides wine and fruits, in gold and silver stuffs. Peter Leopold, the late emperor of Germany, when he governed this duchy, by his mild and wise regulations promoted a great reformation in the government; and improved the manufactures, to the great benefit of the finances. It is thought that the great duchy of Tuscany could bring into the field, upon occasion, 30,000 fighting men, and that its present revenues are above 500,000*l.* a year. The other principal towns of Tuscany are, Pisa, Leghorn, and Sienna; the first and last are much decayed; but Leghorn is a very handsome city, built in the modern taste, and with such regularity that both gates are seen from the market-place. It is well fortified, having two forts towards the sea, besides the citadel. The ramparts afford a very agreeable prospect of the sea, and of many villas on the land side. Here all nations, and even the Mahometans, have free access, and may settle. The number of inhabitants is computed at 40,000, among whom are said to be 20,000 Jews, who live in a particular quarter of the city, have a handsome synagogue, and, though subject to very heavy imposts, are in a thriving condition, a considerable part of the commerce of this city going through their hands.

\* In  
† Per  
June 27,

The inhabitants of **LUCCA**, a small free commonwealth, lying on the Tuscan sea, in a delightful plain, are the most industrious of all the Italians. They have improved their country into a beautiful garden, so that though they do not exceed 120,000, their annual revenue amounts to 80,000*l.* sterling. Their capital is Lucca, which contains about 40,000 inhabitants, who deal in mercery goods, wines, and fruits, especially olives. Some vestiges of the splendour of Lucca, in former ages, are still to be seen. An ossuarium and a cinerarium were discovered in 1692, by which it appeared, that the people were, formerly, buried and burnt within the walls of the town, contrary to a law of the twelve tables \*, which the independent spirit of the people disregarded, as well as to all salutary regulations. The remains of its magnificent amphitheatre, into which whole forests and oceans were occasionally introduced, and which was alternately filled with the beasts of Asia and Africa, and with the fleets and monsters of the deep, are now converted into the walls of a prison still to reverberate with the sounds of guilt and misery. The materials of this amphitheatre have been employed in the erection of churches, in honour of that religion which suppressed the barbarous spectacles therein exhibited. This republic is under the protection of the emperor. The vicinity of the grand-duchy of Tuscany keeps the people of Lucca constantly on their guard, in order to preserve their freedom; for in such a situation, an universal concord and harmony can alone enable them to transmit to posterity the blessings of their darling liberty, whose name they bear on their arms, and whose image is not only imprinted on their coin, but also on the city gates, and all their public buildings. It has been remarked that the inhabitants of this little republic, being in possession of freedom, appear with an air of cheerfulness and plenty, seldom to be found among those of the neighbouring countries.

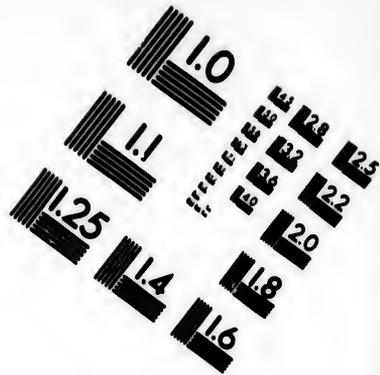

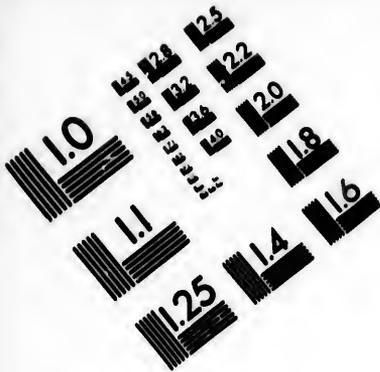

The republic of **St. MARINO** is here mentioned as a political curiosity. Its territories consist of a high craggy mountain, with a few eminences at the bottom, and the inhabitants boast of having preserved their liberties, as a republic, for 1300 years. It is under the protection of the pope; and the inoffensive manners of the inhabitants, who are not above 7000 in all, with the small value of their territory, have preserved its constitution.

The duchy and city of **PARMA**, together with the duchies of Placentia and Guastalla, now form one of the most flourishing states in Italy. The soils of Parma and Placentia are fertile, and produce the richest fruits and pasturages, and contain considerable manufactures of silk. Parma is a bishop's see, and has an university; and some of its magnificent churches are painted by the famous Correggio. The present duke † of Parma is a prince of the house of Bourbon, and son to the late Don Philip, the king of Spain's younger brother. This country was, some years past, the seat of a bloody war between the Austrians, Spaniards, and Neapolitans. The cities of Parma and Placentia are enriched with magnificent buildings, but his catholic majesty, on his accession to the throne of Naples, is said to have carried with him thither the most remarkable pictures and moveable curiosities. The duke's court is deemed one of the polite in Italy, and his revenues are computed at 100,000*l.* sterling a year. The city of Parma contains 50,000 inhabitants.

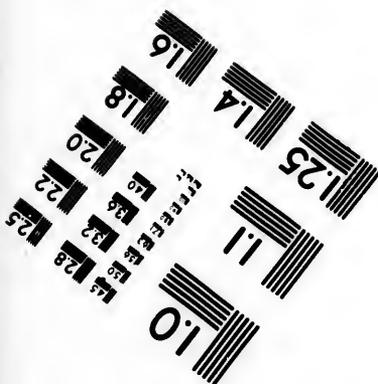

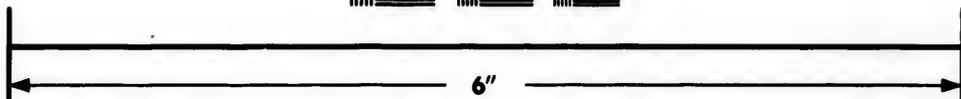

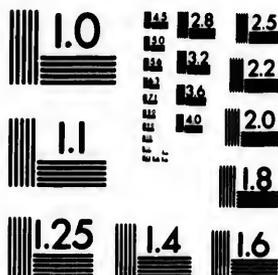

\* In Urbe ne urito neve sepelito.

† Ferdinand duke of Parma, born Jan. 20, 1751, married to the archduchess Maria-Amelia-Josepha, June 27, 1769. Their issue are a prince and two princesses.

**MANTUA**, formerly a rich duchy, bringing to its own dukes 500,000 crowns a year, is now much decayed. The government of it is annexed to that of the Milanese, in possession of the house of Austria. The capital is one of the strongest fortresses in Europe, and contains about 16,000 inhabitants, who boast that Virgil was a native of their country. By an order of the emperor in 1785, this duchy is incorporated with that of Milan into one province, and is now to be called Austrian Lombardy.

The duchy of **MODENA** (formerly Mutina) is still governed by its own duke\*, the head of the house of Este, from whom the family of Brunswic descended. Modena is a very elegant town; its streets are regular and remarkably neat: the winding arcades which are seen in some of them have a good effect. The town is not large; it may contain about 20,000 men. The duke is absolute within his own dominions, which are fruitful. The duke is under the protection of the house of Austria, and is a vassal of the empire. His dominions are not flourishing, though very improvable.

The **ECCLESIASTICAL STATE**, which contains Rome, formerly the capital of the world, lies about the middle of Italy. The bad effects of Popish tyranny, superstition, and oppression, are here too visible. Those spots which, under the masters of the world, were formed into so many terrestrial paradises, surrounding their magnificent villas, and enriched with all the luxuries that art and nature could produce, are now converted into pestilential marshes; and the Campagna di Roma, that formerly contained a million of inhabitants, affords a scanty subsistence to a thousand miserable peasants. Notwithstanding this the pope † is a considerable temporal prince, and some suppose that his annual revenue amounts to above a million sterling; other authors rate it much higher. When we speak comparatively, the sum of a million sterling is too high a revenue to raise from his territorial possessions; his accidental income, which formerly far exceeded that sum, is now diminished, by the suppression of the order of Jesuits, from whom he drew vast supplies, and the measures taken by the popish powers for preventing the great ecclesiastical issues of money to Rome. According to the latest accounts, the taxes upon the provisions and lodgings furnished to foreigners, who spend immense sums in visiting his dominions, form now the greatest part of his accidental revenues. Some late popes have aimed at the improvement of their territories, but their labours have not been attended with much success. The discouragement of industry and agriculture seems to be interwoven in the constitution of the papal government; but the poverty and sloth of the lower ranks in Italy do not proceed from their natural dispositions.

Modern Rome, which stands on the *Campus Martius*, &c. is thirteen miles in circumference, and was supposed, in 1787, to contain (according to Mr. Watkins) 160,000 inhabitants. Within its circuit there is a vast number of gardens and vineyards. It stands upon the Tiber, an inconsiderable river when compared to the Thames, and navigated by small boats, barges, and lighters. The castle of St. Angelo, though its chief fortress, would be found to be a place of small strength, were it regularly besieged. The city standing upon the ruins of ancient Rome, lies much higher, so that it is difficult to distinguish the seven hills on which it was originally

\* Hercules-Renaud, duke of Modena, born Nov. 22, 1727; married April 16, 1741, to the princess of Massa Carara. Their issue,

Mary Beatrix, born April 29, 1750; married to Ferdinand, archduke of Austria, 1771.

† His holiness, pope Pius VI. (formerly count Braschi) was born at Casena, Dec. 27, 1717; created a cardinal in 1773; and elected pope, Feb. 15, 1775.

built.

built. No city, in its general appearance, as the last mentioned traveller observes, can unite more magnificence and poverty than this; as adjoining the most superb palaces, we see the meanest habitations; and temples, the boasted ornaments of antiquity, choked up by sheds and cottages. From the drawings of this city, Mr. Watkins expected to see the streets at least as broad as in London; but was disappointed. Il Corso, the principal and most admired, is little more so than St. Martin's lane; but this mode of building their streets so narrow, is done with the view of intercepting as much as possible the sun's heat. There is nothing very particular in the pope's temporal government at Rome. Like other princes, he has his guards, and sbirri, who take care of the peace of the city, under proper magistrates, both ecclesiastical and civil. The Campagna di Roma, which contains Rome, is under the inspection of his holiness. In the other provinces he governs by legates and vice-legates. He monopolises all the corn in his territories, and has always a sufficient number of troops on foot, under proper officers, to keep the provinces in awe. Pope Clement XIV. wisely disclaimed all intention of opposing any arms to the neighbouring princes, but those of prayers and supplications.

Next to Rome, Bologna, the capital of the Bolognese, is the most considerable city in the ecclesiastical state, and an exception to the indolence of its other inhabitants. It is said to contain 55,000 people. Though in the churches and palaces we have some specimens of noble architecture, its general appearance is unpleasing, from the prevailing custom of building all the houses with piazzas or porticos before them, which, however useful against the inclemency of the seasons, close up and disfigure the streets. Bologna is, above all other cities, Rome excepted, remarkable for its collection of paintings. It was the birth-place and school of the Caracci.

The public museum, or Istituto, founded by pope Lambertini, who was a Bolognese, is a noble collection of every thing that can promote and facilitate the study of the arts and sciences; a library of 100,000 volumes, apartments for chemistry, botany, and surgery, full of anatomical preparations in wax: a cabinet of natural history; an observatory: schools for the polite arts: a collection of genuine and counterfeit medals for that study: in short, it is a complete practical encyclopaedia, with appointed professors for each respective branch. The government is under a legate *à latere*, who is always a cardinal, and changed every three years. The people here live more sociably and comfortably than the other subjects of the pope; and perhaps their distance of near two hundred miles from Rome has contributed to their ease. The rest of the ecclesiastical state contains many towns, celebrated in ancient history, and even now exhibiting the most striking vestiges of their flourishing state about the beginning of the sixteenth century.

The grandeur of FERRARA, RAVENNA, RIMINI, URBINO (the native city of the celebrated painter Raphael), ANCONA, and many other states and cities, illustrious in former times are now to be seen only in their ruins and ancient history. LORETTO, on the other hand, an obscure spot never thought or heard of in times of antiquity, is now the admiration of the world for the riches it contains, and the prodigious resort to it of pilgrims, and other devotees, from a notion industriously propagated by the Romish clergy, that the house in which the Virgin Mary is said to have dwelt at Nazareth, was carried thither through the air by angels, attended with many other miraculous circumstances, such as that all the trees, on the arrival of the sacred mansion, bowed with the profoundest reverence; and great care is taken to prevent any bits of the materials of this house from being carried to other places, and exposed as relics, to the prejudice of Loretto. The image of the Virgin Mary, and of the divine Infant, are of cedar, placed in a small apartment, separated from the others by a silver ballustrade, which has a gate of the

same:

built.

same metal. It is impossible to describe the gold chains, the rings and jewels, emeralds, pearls, and rubies, wherewith this image is or was loaded; and the angels of solid gold, who are here placed on every side, are equally enriched with the most precious diamonds. To the superstition of Roman catholic princes, Loretto is indebted for this mass of treasure. It has been matter of surprize, that no attempt has yet been made by the Turks or Barbary states upon Loretto, especially as it is badly fortified, and stands near the sea; but it is now generally supposed that the real treasure is withdrawn, and metals and stones of less value substituted in its place.

The king of NAPLES and SICILY, or, as he is more properly called, the King of the Two Sicilies (the name of Sicily being common to both), is possessed of the largest dominions of any prince in Italy, as they comprehend the ancient countries of Samnium, Campania, Apulia, Magna Græcia, and the island of Sicily, containing in all about 32,000 square miles. They are bounded on all sides by the Mediterranean and the Adriatic, except on the north-east, where Naples terminates on the ecclesiastical state. The Apennine runs through it from North to South, and its surface is estimated at 3,500 square leagues. The air is hot, and its soil fruitful of every thing produced in Italy. The wines, called *Vino Greco* and *Lachryma Christi*, are excellent. The city of Naples, its capital, which is extremely superb, and adorned with all the profusion of art and riches, and its neighbourhood, would be one of the most delightful places in Europe to live in, were it not for their vicinity to the volcano of *Vetuvius*, which sometimes threatens the city with destruction, and the soil being pestered with insects and reptiles, some of which are venomous. The houses in Naples are inadequate to the population, but in general are five or six stories in height, and flat at the top: on which are placed numbers of flower vases, or fruit-trees, in boxes of earth, producing a very gay and agreeable effect. Some of the streets are very handsome: no street in Rome equals in beauty the *Strada di Toledo* at Naples; and still less can any of them be compared with those beautiful streets that lie open to the bay. The richest and most commodious convents in Europe, both for male and female votaries, are in this city; the most fertile and beautiful hills of the environs are covered with them; and a small part of their revenue is spent in feeding the poor, the monks distributing bread and soup to a certain number every day before the doors of the convents.

Though above two-thirds of the property of the kingdom are in the hands of ecclesiastics, the protestants live here with great freedom; and though his Neapolitan majesty presents to his holiness every year a palfrey, as an acknowledgment that his kingdom is a fief of the pontificate, yet no inquisition is established in Naples. The present revenues of that king amount to above 750,000l. sterling a year; but it is more than probable that, in consequence of the new system pursued by the princes of the house of Bourbon, of abridging the influence and revenues of the clergy, his Neapolitan majesty's annual income will considerably exceed a million sterling. The exports of the kingdom are legumes, hemp, aniseeds, wool, oil, wine, cheese, fish, honey, wax, manna, saffron, gums, capers, macaroni, fait, pot-ash, flax, cotton, silk, and divers manufactures. The king has a numerous but generally poor nobility, consisting of princes, dukes, marquesses, and other high-sounding titles; and his capital, by far the most populous in Italy, contains at least 350,000 inhabitants. Among these are about 30,000 *lazaroni*, or black-guards, the greater part of whom have no dwelling-houses, but sleep every night in summer under porticos, piazzas, or any kind of shelter they can find, and in the winter or rainy time of the year, which lasts several weeks, the rain falling by pail-

fuls, they resort to the caves under Capo di Monte, where they sleep in crowds like sheep in a penfold. Those of them who have wives and children, live in the suburbs of Naples, near Paullippo, in huts, or in caverns or chambers dug out of that mountain. Some gain a livelihood by fishing, others by carrying burthens to and from the shipping; many walk about the streets ready to run on errands, or to perform any labour in their power for a very small recompence. As they do not meet with constant employment, their wages are not sufficient for their maintenance; but the deficiency is supplied by the soup and bread which are distributed at the doors of the convents.

The Neapolitan nobility are excessively fond of shew and splendour. This appears in the brilliancy of their equipages, the number of their attendants, the richness of their dress, and the grandeur of their titles. According to Mr. Swinburne, luxury of late hath advanced with gigantic strides in Naples. Expence and extravagance are here in the extreme. The great families are oppressed with a load of debt; the working part of the community always spend the price of their labour before they receive it; and the citizen is reduced to great parsimony, and almost penury, in his house-keeping, in order to answer these demands of external shew: short commons at home whet his appetite when invited out to dinner; and it is scarcely credible what quantities of victuals he will devour. The nobility in general are well served, and live comfortably; but it is not their custom to admit strangers to their table; the number of poor dependents who dine with them, and cannot properly be introduced into company, prevents the great families from inviting foreigners: another reason may be, their sleeping after dinner in so regular a manner as to undress and go to bed: no ladies or gentlemen finish their to let till the afternoon, on which account they dine at twelve or one o'clock. The great officers of state, and ministers, live in a different manner, and keep sumptuous tables, to which strangers and others have frequent invitations.

Through every spot of the kingdom of Naples, the traveller may be said to tread on classic ground, and no country presents the eye with more beautiful prospects. There are still traces of the memorable town of Cannæ; as fragments of altars, cornices, gates, walls, vaults, and under-ground granaries: and the scene of action between Hannibal and the Romans is still marked out to posterity by the name of *pezzo di sangue*, "field of blood." Taranto, a city that was once the rival of Rome, is now remarkable for little else than its fisheries. Sorrento is a city placed on the brink of steep rocks, that over-hang the bay, and, of all the places in the kingdom, hath the most delightful climate. Nola, once famous for its amphitheatres, and as the place where Augustus Cæsar died, is now hardly worth observation.

Brundisium, now Brindisi, was the great supplier of oysters for the Roman tables. It hath a fine port, but the buildings are poor and ruinous; and the fall of the Grecian empire under the Turks reduced it to a state of inactivity and poverty, from which it hath not yet emerged. Except Rome, no city can boast of so many remains of ancient sculpture as Benevento; here the arch of Trajan, one of the most magnificent remains of Roman grandeur, erected in the year 114, is still in tolerable preservation. Reggio hath nothing remarkable but a Gothic cathedral. The town was destroyed by an earthquake before the Marston war, and rebuilt by Julius Cæsar; part of the wall still remains, and was much damaged by the earthquake in 1783, but not destroyed: only 126 lost their lives out of 16,000 inhabitants. The ancient city of Oppido was entirely ruined by the earthquake of the 5th of February, and the greatest force thereof seems to have been exerted near that spot, and at Casal Nuova, and Terra Nuova. From Tropea to Squillace, most of the towns and villages were either totally or in part overthrown, and many of

the

the inhabitants buried in the ruins. To ascertain the extent of the ravages, Sir William Hamilton, who surveyed it, gives the following description: "If on a map of Italy, and with your compasses on the scale of Italian miles, you were to measure off 22, and then fixing your central point in the city of Oppido (which appeared to me to be the spot on which the earthquake had exerted its greatest force) form a circle (the radii of which will be, as I just said, 22 miles) you will then include all the towns and villages that have been utterly ruined, and the spots where the greatest mortality has happened, and where there have been the most visible alterations on the face of the earth. Then extend your compass on the same scale to 72 miles, preserving the same centre, and form another circle, you will include the whole of the country that has any mark of having been affected by the earthquake."

The island of SICILY, once the granary of the Roman world, still continues to supply Naples, and other parts, with the commodity of corn: but its cultivation, and consequently fertility, is greatly diminished. Its vegetable, mineral, and animal productions, are pretty much the same with those of Italy.

Both the ancients and moderns have maintained, that Sicily was originally joined to the continent of Italy, but gradually separated from it by the encroachments of the sea, and the shocks of earthquakes. The climate of Sicily is so hot, that even in the beginning of January the shade is refreshing; and chilling winds are only felt a few days in March, and then a small fire is sufficient to banish the cold. The only appearance of winter is found towards the summit of Mount *Ætna*, where snow falls, which the inhabitants have a contrivance for preserving. Churches, convents, and other religious foundations, are here extremely numerous: the buildings are handsome, and the revenues considerable. There are a great number of fine remains of antiquity. Some parts of this island are remarkable for female beauty. Palermo, the capital, is computed to contain 120,000 inhabitants. The two principal streets cross each other, and are exceedingly beautiful. This is said to be the only town in all Italy which is lighted at night at the public expence. It carries on a considerable trade. The dead at Palermo are never buried; but their bodies are carried to the Capuchin convent, where, after the funeral service is performed, they are dried in a stove, heated by a composition of lime, which makes the skin adhere to the bones. They are then placed erect in niches, and fastened to the wall by the back or neck. A piece of coarse drab is thrown over the shoulders and round the waist, and their hands are tied together, holding a piece of paper with their epitaph, containing their names, age, and when they died. "We of course" (says Mr. Sutherland) "visited this famous repository, and it is natural to suppose that so many corpses would impress one with reverence and awe. It was near dusk when we arrived at the convent. We passed the chapel, where one of the order had just finished saying vespers, by the gloomy glimmering of a dying lamp. We were then conducted through a garden, where the yew, the cypress, and the barren orange, obscured the remaining light, and where melancholy silence is only disturbed by the hollow murmuring of a feeble water-fall. All these circumstances tuned our minds for the dismal scene we were going to behold, but we had still to descend a flight of steps impervious to the sun; and these at last conveyed us to the dreary mansion of the dead. But notwithstanding the chilling scene we had gone through; notwithstanding our being in the midst of more than a thousand lifeless bodies, we could not help smiling. For the physiognomies of the deceased are so ludicrously mutilated, and their muscles so contracted and distorted in the drying, that no French mimick could equal their grimaces. Most of the corpses have lost the lower part of the nose—their necks are generally a little twisted—their mouths drawn awry in one direction—their noses in another

another—their eyes sunk and pointed different ways—one ear perhaps turned up—the other drawn down. The relations of the deceased are bound to send two wax tapers every year for the use of the convent; in default of which the corpse is taken down and thrown into the charnel-house. Women are dried as well as the men, but are not exposed. Nobles are shut up in chests.

Messina was formerly a place of considerable trade, and before the earthquake in 1713, was a large and well-built city, containing many churches and convents, generally elegant structures. By that earthquake a great part of the lower district of the city and of the port was destroyed, and considerable damage done to the lofty uniform buildings called the *Palazzata*, in the shape of a crescent, which extended along the water side, for above two thousand yards, adorned with pilasters and pediments, and a grand esplanade open to the sea, which at once formed a noble pier, and a delightful public walk, flanked by a fort at each end. The houses were built with great taste, all four stories high, and nearly alike. Of this beautiful and magnificent range, only the outside shell remains; the rest, with all the town, except one or two churches, was entirely destroyed; but of 30,000, the supposed population of the city, only 700 are said to have perished.

The island of **SARDINIA**, which gives a royal title to the duke of Savoy\*, lies about 150 miles south by west of Leghorn, and hath seven cities or towns. Its capital, Cagliari, is an university, an archbishoprick, and the seat of the viceroy, containing about 15,000 inhabitants. It is thought that his Sardinian majesty's revenues, from this island, do not exceed 5000l. sterling a year, though it yields plenty of corn and wine, and has a coral fishery. Its air is bad, from its marshes and high mountains on the North, and therefore was a place of exile for the Romans. It was formerly annexed to the crown of Spain, but at the peace of Utrecht it was given to the emperor, and in 1719 to the house of Savoy.

The island of **CORSICA** lies opposite to the Genoese continent, between the gulf of Genoa and the island of Sardinia, and is distinguished by the noble stand which the inhabitants made for their liberty against the Genoese tyrants, and afterwards, though unsuccessfully, against the base and ungenerous measures of the French to enslave them. Though mountainous and woody, it produces corn, wine, figs, almonds, chestnuts, olives, and other fruits. It has also some cattle and horses, and is plentifully supplied, both by sea and rivers, with fish. The inhabitants are said to amount to 120,000. Bastia, the capital, is a place of some strength; though other towns of the island appear to have been but poorly fortified. Bastia, and soon after the rest of the island, surrendered to the arms of his Britannic majesty, in the summer of 1794, to whom the states have presented the crown of Corsica.

**CAPRI**, the ancient **CAPREA**, is an island to which Augustus Cæsar often came for his health and recreation, and which Tiberius made a scene of the most infamous pleasures. It lies three Italian miles from that part of the main land which projects farthest into the sea. It extends four miles in length from East to West, and about one in breadth. The western part is, for about two miles, a continued

\* Ferdinand IV. king of the Two Sicilies, third son of his late catholic majesty, the king of Spain, born Jan. 12, 1751; ascended the throne Oct. 5, 1759; and married April 7, 1768, to the archduchess Maria-Carolina-Louisa, sister to the late emperor; by whom he has had issue 15 children, ten of whom are living; among whom are,

1. Maria-Theresa, present empress of Germany, born June 6, 1772.
2. Theresa Clementina, born Nov. 23, 1775; married Sept. 17, 1790, the archduke Ferdinand.
3. Francis Jaquatus, prince royal, born Aug. 17, 1777; married Maria-Clementina, the archduchess, Sept. 1790.

rock, high, and almost inaccessible; yet Anacapri, the largest town of the island, is situated here; and in this part are several places covered with a very fruitful soil. The eastern end of the island also rises up in precipices that are nearly as high, though not quite so long as the western. Between the rocky mountains, at each end, is a slip of lower ground running across the island, and one of the pleasantest spots conceivable; covered with myrtles, olives, almonds, oranges, figs, vineyards, and corn-fields, which afford a most delightful landscape, when viewed from the tops of the neighbouring mountains. Here is situated the town of Capri, two or three convents, and the bishop's palace. In the midst of this fertile tract rises a hill, which in the reign of Tiberius was probably covered with buildings, some remains of which are still to be seen. But the most considerable ruins are at the very extremity of the eastern promontory, from which there is a very noble prospect; on one side of it the sea extends farther than the eye can reach; just opposite is the green promontory of Sarentum, and on the other side the bay of Naples.

**ISCHIA**, and some other islands on the coast of Naples and Italy, have nothing to distinguish them but the ruins of their antiquities, and their being now beautiful summer retreats for their owners. **ELBA** hath been renowned for its mines from a period beyond the reach of history. Virgil and Aristotle mention it. It lies ten miles S. W. from Tuscany, is 80 miles in circumference, and contains near 7000 inhabitants; it is divided between the king of Naples, to whom Porto Longone belongs, and the Great Duke of Tuscany, who is master of Porto Ferrajo, and the prince of Piombino. The fruits and wine of the island are very good, and the tunnery, fishery, and salt, produce a good revenue.

I shall here mention the island of **MALTA**, though it is not properly ranked with the Italian islands. It was formerly called Melita, and is situated in 15 degrees E. lon. and 45 degrees N. lat. 60 miles south of Cape Passaro in Sicily, and is of an oval figure, 20 miles long, and 12 broad. Its air is clear, but scorching: the whole island seems to be a white rock covered with a thin surface of earth, producing excellent fruits and vegetables. This island, or rather rock, was given to the knights of St. John of Jerusalem, in 1530, by the emperor Charles V. when the Turks drove them out of Rhodes, under the tender of one falcon yearly to the viceroy of Sicily, and an acknowledgment of the kings of Spain and Sicily for their protectors: they are now known by the distinction of the Knights of Malta. They are under vows of celibacy and chastity; but they keep the former much better than the latter. They have considerable possessions in the Roman catholic countries on the continent, and are under the government of a grand-master, who is elected for life. The lord prior of the order was formerly accounted the prime baron in England. The knights are in number 1000: 500 are to reside on the island, the remainder are in their seminaries in other countries, but at any summons are to make a personal appearance. They had a seminary in England, till it was suppressed by Henry VIII. They were considered as the bulwark of Christendom against the Turks on that side. They wear the badge of the order, a gold cross of eight points enamelled white, pendant to a black watered ribband at the breast, and the badge is decorated so as to distinguish the country of the knight. They are generally of noble families, or such as can prove their gentility for six descents, and are ranked according to their nations. There are 16 called the great crosses, out of whom the officers of the order, as the marshal, admiral, chancellor, &c. are

\* The island of Malta is governed by a grand master.

chosen.

chosen. When the great-master dies, they suffer no vessel to go out of the island till another is chosen, to prevent the pope from interfering in the election. Out of the 16 great crosses, the great-master is elected, whose title is, "The most illustrious, and most reverend prince, the lord friar A. B. great master of the hospital of St. John of Jerusalem, prince of Malta, and Gaza." All the knights are sworn to defend the church, to obey their superiors, and to live on the revenues of their order only. Not only their chief town Valetta, or Malta, and its harbour, but their whole island is so well fortified, as to be deemed impregnable. On the 8th of September, there is an annual procession at Malta, in memory of the Turks raising the siege on that day, 1563, after four months assault, leaving their artillery, &c. behind.

ARMS AND ORDERS.] The chief armorial bearings in Italy are as follow: The pope, as sovereign prince over the land of the church, bears for his escutcheon, gules, consisting of a long headcape, or, surmounted with a cross, pearly and garnished with three royal crowns, together with the two keys of St. Peter, placed in saltier. The arms of Tuscany, or, five roundels, gules, two, two, and one, and one in chief, azure, charged with three fleurs-de-lis, or. Those of Venice, azure, a lion winged, sejant, or, holding under one of his paws a book covered, argent. Those of Genoa, argent, a cross, gules, with a crown closed for the island of Corsica; and for supporters, two griffins, or. The arms of Naples, are, azure, semée of fleurs-de-lis, or, with a label of five points, gules.

The order of "St. Januarius" was instituted by the present king of Spain, when king of Naples, in July 1738. The number of knights is limited to 30. They must prove the nobility of their descent for four centuries, and are to be addressed by the title of excellency. The badge of the order is a cross of eight points, enamelled white, edged with gold, and in the centre is a bishop holding in his left hand a book and crozier, and below his waist is this motto, "In sanguine foedus;" on the reverse is a book, on which are two red pillars surmounted with palms, enamelled in their proper colours. The knights wear the badge of the order pendant to a broad red ribband, worn scarfwise, and a gold star of eight points with fleurs-de-lis at the angles embroidered on their outer garment. St. Januarius, the celebrated patron of Naples, is the patron of the order. The order of "Annunciation," was instituted in the year 1355, by Amadeus V. count of Savoy, in memory of Amadeus I. who bravely defended Rhodes against the Turks, and with those arms which are now borne by the duke of Savoy, gules, a cross argent. It at first consisted of 15 knights, but afterwards the number was enlarged. At present their number is small, limited by the will of the prince, sovereign of the order. It is counted amongst the most respectable orders in Europe; the knight must not only be of a noble family, but also a papist. The colour of the order is composed of golden roses, enamelled red and white, with lovers' knots of the same. To the end of the middle rose is pendent the badge, which consists of three chains of gold, encircling an oval, and disposed in knots. On the oval is represented the salutation, as described by St. Luke, enamelled in proper colours. In the year 1572, Emanuel Philibert, duke of Savoy, instituted the order of "St. Lazarus," and revived and united the obsolete order of St. Maurice to it; which was confirmed by the pope on the condition of maintaining two galleys against the Turks. The badge of the order is a cross pomette, white, upon a cross of eight points, green, and is worn pendant to a green ribband.

In the year 828, it is pretended, that the body of St. Mark was removed from Alexandria, in Egypt, to Venice. Accordingly this saint has been taken for their tutelar saint and guardian, and his picture was formerly painted on their ensigns

and banners. When the order of "*St. Mark*" was first instituted, is uncertain; but it is an order conferred by the doge, or duke of Venice, and the senate, on persons of eminent quality, or who have done some signal service to the republic. The knights when made, if present, are dubbed with a sword on their shoulders, the duke saying, "*Esse miles fidelis*," (be a faithful soldier;) absent persons are invested by letters patent; but their title, "*Knights of St. Mark*," is merely honorary: they have no revenue, nor are they under any obligations by vows as other orders. The badge is a medal of gold, pendant to a gold chain; on one side is the emblem of St. Mark, a winged lion sejant with elevated wings, holding in his sinister paw a drawn sword erect, and in his right an open book with the words, "*Pax tibi, Marco Evangelista meus*;" on the reverse, the portrait of the reigning doge, with the image of St. Mark, delivering a standard to him.

About the year 1465, Frederic III. emperor of Germany, instituted the order of "*St. George*," and dedicated it to St. George, tutelar saint and patron of Genoa. The doge is perpetual grand master; the badge a plain cross, enamelled, gules, pendent to a gold chain, and worn about their necks. The cross is also embroidered on their cloaks. In the year 1561, Cosmo of Medici, first grand duke of Tuscany, instituted the order of "*St. Stephen*," in memory of a victory, which secured to him the sovereignty of that province. He and his successors were to be grand masters. The knights are allowed to marry, and their two principal conventional houses are at Pisa. It is a religious as well as a military order, but the knights of Justice and the Ecclesiastics are obliged to make proof of nobility of four descents. They wear a red cross with right angles, orled or, on the left side of their habit, and on their mantle.

The order of the "*Holy Ghost*" was founded with their chief seat, the hospital of that name in Rome, by pope Innocent III. about the year 1198. They have a grand master, and profess obedience, chastity, and poverty. Their revenue is estimated at 24000 ducats daily, with which they entertain strangers, relieve the poor, train up deserted children, &c. Their ensign is a white patriarchal cross with twelve points sewed on their breast on the left side of a black mantle. The order of "*Jesus Christ*," instituted by pope John XXII. was reformed and improved by pope Paul V. The reigning pope was to be always sovereign of it, and it was designed as a mark of distinction for the pope's Italian nobility, but on account of its frequent prostitution, it hath fallen into discredit. The order of the "*Golden Spur*" is said to have been instituted by pope Pius IV. 1559, and to have been connected with the order of Pius, instituted a year afterwards; but the badges were different. The knights of Pius are suppressed, and all that the knights of the Golden Spur have preserved to themselves, is the title of counts of the sacred palace of the Lateran. The badge is a star of eight points, white; and between the two bottom points, a spur, gold.

[History.] Italy was probably first peopled from Greece, as we have mentioned in the Introduction, to which we refer the reader for the ancient history of this country, which, for many ages, gave law to the then known world under the Romans.

The empire of Charlemagne, who died in 814, soon experienced the same fate with that of Alexander. Under his successors it was in a short time entirely dismembered. His son, Lewis le Debonair, succeeded to his dominions in France and Germany, while Bernard, the grandson of Charlemagne, reigned over Italy and the adjacent islands. But Bernard having lost his life by the cruelty of his uncle, against whom he had levied war, and Lewis himself dying in 840, his dominions

were

were divided among his sons, Lothario, Lewis, and Charles. Lothario, with the title of emperor, retained Italy, Provence, and the fertile countries situated between the Saone and the Rhine; Lewis had Germany; and France fell to the share of Charles, the youngest of the three brothers. Shortly after this, Italy was ravaged by many contending princes; but in 964, re-united by Otho the Great to the imperial dominions. Italy afterwards suffered much by the contest between the popes and the emperors; it was harrassed by wars and internal divisions; and at length various principalities and states were erected under different heads.

Savoy and Piedmont, in time, fell to the lot of the counts of Maurienne, the ancestors of his present Sardinian majesty, whose father became king of Sardinia, in virtue of the quadruple alliance concluded in 1718.

The great duchy of Tuscany belonged to the emperors of Germany, who governed it by deputies to the year 1240, when the famous distinctions of the Guelfs, who were the partisans of the pope, and Ghibellines, who were in the emperor's interest, took place. The popes then persuaded the imperial governors in Tuscany to put themselves under the protection of the church; but the Florentines, in a short time, formed themselves into a free commonwealth, and bravely defended their liberties against both parties by turns. Faction at last shook their freedom; and the family of Medici, long before they were declared either princes or dukes, in fact governed Florence, though the rights and privileges of the people seemed still to exist. The Medici, particularly Cosmo, who was deservedly called the father of his country, being in the secret, shared with the Venetians in the immense profits of the East India trade, before the discoveries made by the Portuguese. His revenue, in ready money, which exceeded that of any sovereign prince in Europe, enabled his successors to rise to sovereign power; and pope Plus V. gave one of his descendants, Cosmo, (the great patron of the arts), the title of Great Duke of Tuscany, in 1570, which continued in his family to the death of Gaston de Medicis in 1737, without issue. The great duchy was then claimed by the emperor Charles VI. as a fief to the empire, and given to his son-in-law the duke of Lorraine, (afterwards emperor, and father of Joseph II.) in lieu of the duchy of Lorraine, which was ceded to France by treaty. Leopold, his second son, (brother and successor to the emperor Joseph II.) upon the death of his father, became Grand Duke. When he succeeded to the imperial crown, his son Ferdinand entered upon the sovereignty of the great duchy of Tuscany, who has now succeeded his father in the empire of Germany. Leghorn, which belongs to the great duchy, carries on a great trade; and several ships of very considerable force are now stationed on the Tuscan coasts, to prevent the depredations of the Barbary rovers and pirates.

No country has undergone greater vicissitudes of government than Naples or Sicily, chiefly owing to the inconstancy of the natives. Christians and Saracens by turns conquered it. The Normans under Tancred drove out the Saracens, and by their connections with the Greeks, established there, while the rest of Europe was plunged in monkish ignorance, a most respectable monarchy flourishing in arts and arms. About the year 1166, the popes being then all-powerful in Europe, their intrigues broke the succession of Tancred's line, and Naples and Sicily at last came into the possession of the French; and the house of Anjou, with some interruptions, and tragical revolutions, held it till the Spaniards drove them out in 1504, and it was then annexed to the crown of Spain.

The government of the Spaniards under the Austrian line was so oppressive, that it gave rise to the famous revolt, headed by Massaniello, a young fisherman,

without

without shoes or stockings, in the year 1647. His success obliged the haughty Spaniards to abolish oppressive taxes, and to confirm the liberties of the people. Before these could be re-established perfectly, he turned delirious, through his continual agitations of body and mind, and he was put to death at the head of his own mob. Naples and Sicily remained to the Spaniards till the year 1700, when the extinction of the Austrian line opened a new source of litigation. In 1706, the archduke Charles, afterwards emperor, took possession of the kingdom. By virtue of various treaties, which had introduced Don Carlos, the king of Spain's son, to the possession of Parma and Placentia, a new war broke out in 1733, between the houses of Austria and Bourbon, about the possession of Naples; and Don Carlos was received into the capital, where he was proclaimed king of both Sicilies: this was followed by a very bloody campaign, which terminated in a peace between France and the emperor, to which the courts of Madrid and Naples at first demurred, but afterwards acceded in 1736, and Don Carlos remained king of Naples. Upon his accession to the crown of Spain, in 1759, it being found, by the inspection of physicians, and other trials, that his eldest son was by nature incapacitated for reigning, and his second son being heir apparent to the Spanish monarchy, he resigned the crown of Naples to his third son, Ferdinand IV. who married an archduchess of Austria.

The Milanese, the fairest portion of Italy, went through several hands; the Viscontis were succeeded by the Galezzos and the Sforzas, but fell at last into the hands of the emperor Charles V. about the year 1525, who gave it to his son Philip II. king of Spain. It remained with that crown till the French were driven out of Italy, in 1706, by the Imperialists. They were dispossessed of it in 1743; but by the emperor's cession of Naples and Sicily to the present king of Spain, it returned to the house of Austria, who governs it by a viceroy.

Mantua, with its duchy, was formerly governed by the family of Gonzaga, who adhering to France, the territory was forfeited, as a fief of the empire to the house of Austria, which now possesses it, the last duke dying without male issue; but Guastalla was separated from it in 1748, and made part of the duchy of Parma.

The first duke of Parma was natural son to pope Paul III. the duchy having been annexed to the holy see, in 1545, by pope Julius II. The descendants of the house of Farnese terminated in the late queen dowager of Spain, whose son, his present Catholic majesty, obtained that duchy; and his nephew now holds it, with the duchy of Placentia.

As a maritime power the Venetians were formerly the most formidable in Europe. In 1194, they conquered Constantinople itself, and held it for a short time, together with valuable provinces in Europe and Asia. They were more than once brought to the brink of destruction, by the confederacies formed against them among the other powers of Europe, especially by the league of Cambray, in 1509, but were as often saved by the disunion of the confederates. The discovery of a passage to India, by the Cape of Good Hope, gave the first blow to their greatness, as it lost them the Indian trade. By degrees the Turks took from them their best possessions on the continent; and so late as the year 1715, they lost the Morea.

The Genoese often disputed the empire of the Mediterranean sea with the Venetians, but were seldom or never able to maintain their own independency by land, being generally protected, and sometimes subjected, by the French and

Impe-

Imperialists. Their doge, or first magistrate, used to be crowned king of Corsica, though it does not clearly appear by what title. The successful effort they made in driving the victorious Austrians out of their capital, during the war which was terminated by the peace of Aix-la-Chapelle in 1748, has few parallels in history, and serves to shew the effects of despair under oppression. At present they are possessed of revenue barely sufficient to preserve the appearance of a sovereign state.

With the history of Christendom itself, that of the Papacy is connected. The most solid foundations for its temporal power were laid by the famous Matilda, countess of Tuscany, and heiress to the greatest part of Italy, who bequeathed a large portion of her dominions to the famous pope Gregory VII. (who, before his accession in 1073, was so well known by the name of Hildebrand.) It would be too tedious here to enter into a detail of the ignorance of the laity, and the other causes that operated to the aggrandizement of the papacy, previous to the Reformation. Even since that era the state of Europe has been such, that the popes have had more than once great weight in its public affairs, chiefly through the weakness and bigotry of temporal princes.

The papal power is evidently now upon the decline. The order of Jesus, which was not improperly called its Janizaries, has been exterminated in France, Spain, Naples, and Portugal; and is but just tolerated in other popish countries. The pope himself is treated by Roman catholic princes with very little more ceremony than is due to him as bishop of Rome, and possessed of a temporal principality. This humiliation, it is reasonable to believe, will terminate in a total separation from the holy see of all its foreign emoluments, which, even since the beginning of the present century, were immense, and in the reduction of his holiness to the exercise of his ecclesiastical functions as first bishop of Christendom.

A vehement memorial has been sent by the pope to most European courts, against the conduct of the French assembly, in refusing Avignon, and the Comtat Venaissin; but the pontiff's memorials are now as little regarded as his bulls; and the papal power is falling with increasing velocity.

The invasion of the Sardinian dominions by France, and the appearance of a French fleet in the Mediterranean, have thrown Italy into the greatest alarms. The pope held a select consistory, and reinforced the garrison at Civita Vecchia with some hundreds of men, at the same time victualling his capital. An army of ten thousand men has been raised for the defence of the papal dominions. Lombardy is also alarmed, and a dread prevails, that the French will invade it by the way of Genoa. The Milanese territory has no strong-holds, and would easily fall a prey to the stronger army. Amid the panic Tuscany alone remains tranquil.

Lord Hervey, the British ambassador, having given notice to the secretary of state of the Grand Duke of Tuscany, of the arrival of the combined British and Spanish fleets in the Mediterranean, and expressed his scruples respecting the neutrality adopted by the Grand Duke towards the belligerent powers, received for answer from the secretary of state, that the Grand Duke would not depart from the neutrality he had hitherto observed.

The measures taken to induce the small republic of Genoa to declare against France will perhaps require some detail. On the 5th of October, 1793, the English admiral Gell entered the port of Genoa, and captured the *Molyte*, a French frigate, which was followed by that of two French tartans, which had been abandoned by their crews. These, with other acts of hostility, incensed all ranks of people against the English. But although the minds of the Genoese appear to be alienated from the English, it is hoped that they will not rush into the opposite extreme, and become the partisans of the French.

John Angelo Braschi, born in 1717, was elected pope in 1775, and took upon him the name of Pius VI.

\* The republic of Ragusa, though reckoned by geographers part of Turkey in Europe, is not under the Turkish government. It is an aristocratical state, formed nearly after the model of that of Venice. The government is in the hands of the nobility; and the chief of the republic, who is styled rector, is changed every month, and elected by scrutiny or lot. During his short administration, he lives in the palace, and wears a ducal habit. As the Ragusans are unable to protect themselves, they make use of their wealth to procure them protectors, the chief of whom, for many years, was the grand signior. They endeavoured also to keep upon good terms with the Venetians, and other neighbouring states. But in the year 1783, a dispute arose between them and the king of Naples, respecting a claim of right to his appointing a commander of the Ragusan troops. It was terminated by the republic's putting itself under that

king's protection. The city of Ragusa is not above two miles in circumference, but it is well built, and contains some handsome edifices. The ancient Epidaurus was situated not far from this city. The Ragusans profess the Romish religion, but Greeks, Armenians, and Turks, are tolerated. Almost all the citizens are traders, and they keep so watchful an eye over their freedom, that the gates of the city of Ragusa are allowed to be open only a few hours in the day. The language chiefly in use among the Ragusans is the Sclavonian, but the greatest part of them speak the Italian. They have many trading vessels, and are great carriers in the Mediterranean, being constantly at peace with the piratical states of Barbary. The city of Gravosa, and Stagno, 30 miles N. E. of Ragusa, are within the territories of this republic, and there are also five small islands belonging to it, the principal of which is Melida.

**SOIL, AIR, SEASONS, AND WATER.]** Nature has lavished upon the inhabitants of Turkey all her blessings, in those four particulars. The soil, though unimproved, is luxuriant beyond description. The air is salubrious, and friendly to the imagination, unless when it is corrupted from the neighbouring countries, or through the indolence or uncleanness of the Turkish manner of living. The seasons are here regular, and the climate has been celebrated from the remotest antiquity. The Turks are invited to frequent bathings, by the purity and wholesomeness of the water all over their dominions.

**MOUNTAINS.]** These are the most celebrated in the world, and at the same time the most fruitful. Mount Athos lies on a peninsula, running into the Egean Sea; the Mounts Pindus and Olympus, celebrated in Grecian fables, separate Thessaly from Epirus. Parnassus, in Achaia, so famous for being consecrated to the Muses, is well known. Mount Haemus is likewise often mentioned by the poets; but most of the other mountains have changed their names; witness the mountains Shua, Witoka, Staras, Plamina, and many others. Even the most celebrated mountains abovementioned have modern names imposed upon them by the Turks, their new masters, and others in their neighbourhood.

**SEAS.]** The Euxine or Black Sea; the Palus Maotis, or Sea of Afoph; the Sea of Marmora, which separates Europe from Asia; the Archipelago; the Ionian Sea, and the Levant, are so many evidences that Turkey in Europe, particularly that part of it where Constantinople stands, of all other countries, had the best claim to be mistress of the world.

**STRAITS.]** Those of the Hellespont and Bosphorus are joined to the sea of Marmora, and are remarkable in modern as well as ancient history. The former, viz. the Hellespont, or Dardanelles \*, is only two miles and an half in breadth, and is famous for the passage of Xerxes over it when about to invade Greece, and of Alexander in his expedition against Asia. Xerxes, for the more easy transportation of his numerous forces, laid a bridge of boats over it. It is also celebrated by the poets in the story of two lovers, Hero and Leander, of whom the latter swam across it to his mistress; but one night was unhappily drowned. The Bosphorus is about the same breadth, but has not been so much celebrated by historians and poets.

**RIVERS.]** The Danube, the Save, the Neister, the Neiper, and the Don, are the best known rivers in this country; though many others have been celebrated by poets and historians.

**LAKES.]** These are not extremely remarkable, nor are they mentioned with any great applause, either by the ancients or moderns. The Lago di Scutari lies in

\* The Dardanelles are two ancient and strong castles of Turkey, one of which is in Romania, the other in Nætolia, on each side the canal, formerly called the Hellespont. The mouth of the canal is four miles and a half over.

Albania. It communicates with the Lago di Plave and the Lago di Holti. The Stymphalus, so famous for its harpies and ravenous birds, lies in the Morea; and Peneus, from its qualities, is thought to be the lake from which the Styx issues, conceived by the ancients to be the passage into hell.

**METALS AND MINERALS.]** Turkey in Europe contains a variety of all sorts of mines, and its marbles are esteemed the finest in the world.

**VEGETABLE PRODUCTIONS.]** These are excellent all over the European Turkey, especially when assisted by the smallest degree of industry. Besides pot and garden herbs of almost every kind, this country produces in great abundance and perfection, oranges, lemons, citrons, pomegranates, grapes, figs, almonds, olives, cotton, and many drugs, not common in other parts of Europe.

**ANIMALS.]** The Thessalian or Turkish horses are excellent both for their beauty and service. The black cattle are large, especially in Greece. The goats are highly prized for the nutrition they afford, both of milk and flesh. The large eagles which abound in the neighbourhood of Badadagi, furnish the best feathers for arrows for the Turkish archers, and they sell at an uncommon price. Partridges are very plentiful in Greece; as are all other kinds of fowls and quadrupeds all over Turkey in Europe; but the Turks and Mahometans in general are not very fond of animal food.

**ANTIQUITIES AND CURIOSITIES,}** Almost every spot of ground, every river **NATURAL AND ARTIFICIAL.** } and every fountain of Greece, presents the traveller with celebrated antiquities. On the isthmus of Corinth, the ruins of Neptune's temple, and the theatre where the Isthmian games were celebrated, are still visible. Athens, which contains at present above 10,000 inhabitants, is a fruitful source of magnificent ruins, among which are the remains of the temple of Minerva, built of white marble, and encompassed with forty-six fluted columns of the Doric order, forty-two feet high, and seven feet and a half in circumference: the architrave is adorned with basso-relievos, admirably executed, representing the wars of the Athenians. To the south-east of the Acropolis, a citadel which defends the town, are seventeen beautiful columns of the Corinthian order, thought to be the remains of the emperor Adrian's palace. They are of fine white marble, about fifty feet high, including the capitals and bases. Just without the city stands the temple of Theseus, surrounded with fluted columns of the Doric order: the portico at the west end is adorned with the battle of the Centaurs, in basso-relievo; that at the east end appears to be a continuation of the same history; and on the outside of the porticos, in the spaces between the triglyphs, are represented the exploits of Theseus. On the south-west of Athens is a beautiful structure, commonly called the Lantern of Demosthenes: this is a small round edifice of white marble, the roof of which is supported by six fluted columns of the Corinthian order, nine feet and an half high; in the space between the columns are pannels of marble; and the whole is covered with a cupola, carved with the resemblance of scales; and on the frieze are beautifully represented in relievo the labours of Hercules. Here are also to be seen the temple of the Winds: the theatre of Bacchus; the magnificent aqueduct of the emperor Adrian; and the temples of Jupiter Olympius, and Augustus. The remains of the temple of the oracle of Apollo are still visible at Castri, on the south side of mount Parnassus; and the marble steps that descend to pleasant running water, supposed to be the renowned Castalian spring, with the niches for statues in the rock, are still discernible. The famous cave of Trophonius is still a natural curiosity in Livadia, the old Bœotia.

Mount Athos, which has been already mentioned, and which is commonly called Monte Santo, lies on a peninsula which extends into the Ægean sea, and is indeed a chain of mountains, reaching the whole length of the peninsula, seven

Turkish miles in length and three in breadth: but it is only a single mountain that is properly called Athos. This is so lofty, that on the top, as the ancients relate, the sun-rising was beheld four hours sooner than by the inhabitants of the coast; and, at the solstice, its shade reached into the Agora or market-place of Myrina, a town in Lemnos, which island was distant eighty-seven miles eastward. There were twenty-two convents on mount Athos, besides a great number of cells and grottos, with the habitations of no less than six thousand monks and hermits; though the proper hermits, who live in grottos, are not above twenty; the other monks are anchorites, or such as live in cells. These Greek monks, who call themselves the inhabitants of the holy mountain, are so far from being a set of slothful people, that, besides their daily offices of religion, they cultivate the olive and vineyards, are carpenters, masons, stone-cutters, cloth-workers, taylor, &c. They also live a very austere life; their usual food, instead of flesh, being vegetables, dried olives, figs, and other fruit; onions, cheese, and on certain days, Lent excepted, fish. Their fasts are many and severe; which, with the healthfulness of the air, renders longevity so common here, that many of them live above an hundred years. It appears from *Ælian*, that anciently the mountain in general, and particularly the summit, was accounted very healthy, and conducive to long-life: whence the inhabitants were called *Macrobii*, or long-lived. We are farther informed by *Philostratus*, in the life of *Apollonius*, that numbers of philosophers used to retire to this mountain, for the better contemplation of the heavens, and of nature.

**CITIES.]** Constantinople, the capital of this great empire, is situated on the European side of the Bosphorus. It was built upon the ruins of the ancient Byzantium, by the Roman emperor Constantine the Great, as a more inviting situation than Rome for the seat of empire. It became afterwards the capital of the Greek empire, and having escaped the destructive rage of the barbarous nations, was the greatest as well as the most beautiful city in Europe, and the only one during the Gothic ages, in which there remained any image of the ancient elegance in manners and arts. While it remained in the possession of the Greek emperors, it was the only mart in Europe for the commodities of the East Indies. It derived great advantages from its being the rendezvous of the crusaders; and being then in the meridian of its glory, the European writers, in the ages of the crusades, speak of it with astonishment. "O what a vast city is Constantinople! (exclaims one when he first beheld it), and how beautiful! How many monasteries are there in it, and how many palaces built with wonderful art! How many manufacturers are there in the city amazing to behold! It would be astonishing to relate how it abounds with gold, silver, and stuffs of various kinds; every hour ships arrive in the port with all things necessary for the use of man." Constantinople is at this day one of the finest cities in the world by its situation and its port. The prospect from it is noble; but the traveller who visits Constantinople is almost as much disappointed at the internal, as delighted with the exterior appearance of it. The houses are wooden, low, and mean: the streets narrow, hollow, and dirty: in every object he beholds the little progress the Turks have made in the liberal arts, and laments that its beauty should be confined to its situation.

The capital of the Turks being, like its parent city Rome, situated upon seven hills, is divided in four parts;—Constantinople, called by the Turks Stamboul, Pera, Galata, and Scutari. The second and third divisions are separated from the first by a branch of the sea, called the Port, near half a mile across, and the last on the Asiatic coast, is divided from these by the Bosphorus, which is not less than two miles in breadth. The circumference of the whole is probably, including the water, from 17 to 20 miles, and the population in time of peace, about 750,000 souls.

souls. There is no city in Europe—perhaps in the world, that contains such a variety of inhabitants;—Turks, Greeks, Armenians, Franks, Jews, &c. &c. The three first of these nations are scattered over the whole, though the Greeks and Armenians have distinct places in which the body of them resides. The most regular part is the Befestiu, inclosed with walls and gates, where the merchants have their shops excellently ranged. In another part of the city is the Hippodrome, an oblong square of 400 paces by 200, where they exercise on horseback. The Meidan, or parade, is a large spacious square, the general resort of all ranks. On the opposite side of the port are four towns, but considered as a part of the suburbs, their distance being so small, a person may easily be heard on the other side. They are named Pera, Galata, Pacha, and Tophana. In Pera, the foreign ambassadors and all the Franks or strangers reside, not being permitted to live in the city: Galata also is mostly inhabited by Franks and Jews, and is a place of great trade. The city abounds with antiquities: the tomb of Constantine the Great is still preserved.

The mosque of Santa Sophia, once a Christian church, called by the Greeks *ἡ ἁγία σοφία*, it having been consecrated by the emperor Justinian the first, to the DIVINE WISDOM, is thought in some respects to exceed in grandeur St. Peter's at Rome. It is very advantageously situated in the finest part of Constantinople, upon an eminence, with a gradual descent to the sea. It is of a long square form, about 100 paces in length, and 80 in breadth, but in the inside it is round. A portico, or piazza, about 36 feet in breadth, supported by marble pillars, extends the whole length of the front. This communicates with the body of the church by nine folding-doors of brass, the middlemost of which has some remains of Mosaic work and paintings. This portico is joined to another which has five brazen doors. The body of the church is almost covered by a cupola of admirable structure, at the foot of which runs a colonnade supporting a gallery of nine yards broad, formerly set apart for the women. Over this run two balustrades, just broad enough for one person to pass; which, in the time of their Ramadan, or Lent, are adorned with lamps, and make a fine appearance. The dome is 34 yards from side to side, and rests upon four vast pillars, at least 15 yards in circumference. It is a perfect hemisphere, illuminated by 24 windows placed at equal distances. In the inside are upwards of 100 pillars of various kinds of marble, some of which are porphyry, and others Egyptian granite. The whole dome, and indeed all the walls, are curiously lined with marble, and the incrustations of the gallery are Mosaic, generally done with small glass cubes, which are continually loosening from their cement, but the colours are unchangeable. The Turks have added four minarets, or tall slender steeples, somewhat resembling the monument in London, and terminating in spires, with gilded crescents on the top.

The city is built in a triangular form, with the seraglio standing on a point of one of the angles, from whence there is a prospect of the delightful coast of the Lesser Asia. When we speak of the seraglio, we do not mean the apartments merely in which the grand signior's women are confined; but the whole inclosure of the Ottoman palace, which might well suffice for a moderate town. The wall which surrounds the Seraglio is thirty feet high, having battlements, embrasures, and towers, in the style of ancient fortifications. There are in it nine gates, but only two of them magnificent; and from one of these the Ottoman court takes the name of the *Porte*, or the *Sublime Porte*, in all public transactions and records. The town is surrounded by a high and thick wall with battlements after the Oriental manner, and towers, defended by a lined but shallow ditch, the works of which are double on the land-side. The best authors think that it does not contain above 800,000 inhabitants, three-fourths of whom are said to be Greeks and Armenians, and the rest are Jews and Turks. The city hath been frequently as-

failed

failed by fires, either owing to the narrowness of the streets and the structure of the houses, or the arts of the Janizaries. In August, 1784, a fire broke out in the quarter situated towards the harbour, and spread into other quarters, and about 10,000 houses (most of which had been rebuilt since the fire in 1782) were consumed.

Opposite to the seraglio, on the Asiatic side, and about a mile and a half distant across the water, is Scutari, adorned with a royal mosque, and a pleasure-house of the grand signior. On the brow of an adjacent hill is a grand prospect: in one view are the cities of Constantinople, Galata, and Pera, the small seas of the Bosphorus and Propontis, with the adjacent countries on each shore.

As to the population, manners, religion, government, revenues, learning, military strength, commerce, and manufactures of the Turks, these several heads depending on the same principles all over the empire, shall be mentioned under **TURKEY IN ASIA.**

**CRIM-TARTARY, or the CRIMEA, is the ancient Taurica Chersonesus, and is a peninsula, lying on the Euxine or Black Sea, by which it is bounded on the West and South, and on the East and North East, by that Asoph. It is between 44 and 46 degrees of north latitude, and 34 and 37 degrees of east longitude.**

This Peninsula was esteemed a part of Turkey in Europe, until it was ceded to Russia in consequence of the peace in 1784. Many cities were built on it by the Greeks, particularly those of Kherfon, Theodosia, Panticapeum, and some others, which carried on a great trade with the Scythians, as well as with the Greek cities, on the continent. It is probable, however, that the modern towns of this country are not situated exactly in the same places with those built by the Greeks. Eupatoria, now Kosleo, is but at a small distance from the seat of the ancient Eupatorium, if not exactly in the same spot; and Sebastopol stands but a very little way from the Kherfon of the Greeks; the ruins of which last are still extant. Strabo mentions a place, named Portus Symbolon, which is probably the same with that named *Symbol* by the Genese, and in more modern times *Babylava*; Janikale is the Panticapeum of the ancients; and Theodosia, lately called Kassa, has now received its ancient appellation of Theodosia again.

The most considerable rivers in the Crimea are those of Karafu and Salagir, both which, taking an easterly course, and uniting their streams, at the distance of more than 20 weills from the sea, run into the gulf of the sea of Asoph, which is interposed between the main land of Crimea, and a long narrow peninsula.

Of the towns in this part of the world we have but very slight descriptions; and indeed where the country has been so often the seat of war, and the inhabitants are still so rude, very little can be expected from their buildings. Lady Craven, now the margravine of Anspach, who, without doubt, had access to the best lodgings in the country, informs us, that "a Tartar's house is a very slight building of only one story, without any chair, table, or piece of wooden furniture. Large cushions are ranged round the room for seats; but what is extremely convenient, there is more than double the space of the room behind the wainscot, which draws back in most places; so that in a place where the room appears exceedingly small and confined, there is yet every conveniency to be met with. A Tartar house has always another building, at a small distance from it, for the convenience of strangers or travellers, whom the noble Tartar always treats with the greatest hospitality. The palace of the khan at Baczzeria is an irregular building; the greatest part of it is of one floor, raised upon pillars of wood, arched and gilt in a fanciful and lively manner; the arch, or last door-way, is finely proportioned, and is adorned with an inscription in letters of gold. The whole was entirely in ruins, but the governor caused

caused it to be repaired, and new gilt and painted for the reception of the empress. Court within court, and garden within garden, make a variety of apartments, where the khan walked from his own residence to the haram, which is spacious, and higher than the rest of the buildings. Several of the square places under his apartment were paved with marble, and have in the centre fountains which play constantly.

Among the curiosities in this country, we may reckon the source of the river Karasu, which is situated among rocks, in a very romantic manner, and rises in a considerable stream. It was visited by Lady Craven in 1786. No less wonderful are those lakes which receive the rivulets, without any visible outlet. This celebrated female traveller mentions a house, near Sebastopol, situated in a very romantic manner, at the foot of some rocks, from which issue many clear springs that amply supply the houses and baths with water. On the summit of these rocks, there are places where immense cables have certainly passed and been tied. The Tartars insist that the sea was once close to the foot of them, and ships were fastened there. Near Bacziferia there is a mine of earth, exactly like soap, which is reckoned very good for the skin, and vast quantities of it are consumed by the women at Constantinople. Our fair traveller bestows the greatest encomiums on the sheep, which in this peninsula are innumerable, and afford the most beautiful and costly fleeces. The sheep are all spotted; the lambskins very beautiful, and they kill the ewes to have them before birth, when their skins have small spots, and are smooth like the finest and lightest fattins. Coats lined with these skins are called Pelisses; and as a great number of these small animals must be killed to make the lining of one coat, this is one of the finest presents the empress can make to an ambassador. Throughout the whole of this peninsula, there are many ruins of ancient towns, particularly one at Soudak, which was rebuilt by the Genoese on the descent of steep rocks. The summit of these overlooks the sea; and here there is a chapel, with a granite pillar, situated in such a manner that on the first shake it must fall perpendicularly into it.

The peninsula of the Crimea has a considerable trade in what is called Morocco leather, of various colours, which is to be had very cheap, and like fatten. At Bacziferia there is a great trade of sword-blades, knives, and hangers, many of which are not to be distinguished from those made at Damascus.

---

#### ISLANDS BELONGING TO TURKEY IN EUROPE, BEING PART OF ANCIENT GREECE.

I shall mention these islands chiefly for the use of such readers as are conversant with ancient history, of which they make so distinguished a part.

**NEGROPONT**, the ancient Eubœa, stretches from the south-east to the north-west, and lies on the eastern coast of Achaïa or Livadia. It is 90 miles long, and 25 broad, and contains about 1300 square miles. Here the Turkish galleys lie. The tides on its coasts are irregular; and the island itself is very fertile, producing corn, wine, fruit, and cattle, in such abundance, that all kinds of provisions are extremely cheap. The chief towns are, Negropont, called by the Greeks, Egripos, situated on the south-west coast of the island, on the narrowest part of the strait; and Castell Rosso, the ancient Carysus.

**LEMNOS,**

LEMNOS, or STALIMENE, lies in the northern part of the *Ægean* sea or Archipelago, and is almost a square of 25 miles in length and breadth. Though it produces corn and wine, yet its principal riches arise from its mineral earth, much used in medicine, sometimes called *terra Lemna*, or *sigillata*, because it is sealed up by the Turks, who derive from it a considerable revenue.

TENEDOS is remarkable only for its lying opposite to Old Troy, and its being mentioned by Virgil as the place to which the Greeks retired, and left the Trojans in a fatal security; it hath a town of the same name.

SEYROS is about 60 miles in circumference, and is remarkable chiefly for the remains of antiquity which it contains: about 300 Greek families inhabit it.

LESBOS, or MYTELENE, is about 60 miles long, and is famous for the number of philosophers and poets it produced. The inhabitants were formerly noted for their prodigality. Formerly it had many cities, the ruins of which are still extant, and was so powerful by sea, as to dispute the empire of the *Ægean* with Athens. Among its illustrious characters were Pittacus, one of the seven wise men of Greece, Sappho, the poet Alcæus, and Arion, who, they tell you, was so skilled in musick, that he even won the affections of a dolphin. It was in this island that Pompey left his Cornelia when he went to dispute with Cæsar at Pharfalia the power of enslaving his country.

SCIO, or CHIOS, lies about 80 miles west of Smyrna, and is about 100 miles in circumference. This island, though rocky and mountainous, produces excellent wine, but no corn. It is inhabited by 100,000 Greeks, 10,000 Turks, and above 3,000 Latins. It hath 300 churches besides chapels and monasteries; and a Turkish garrison of 1,400 men. The inhabitants have manufactures of silk, velvet, gold and silver stuffs. The island likewise produces oil and silk, and the lentisk-tree, or mastic, from which the government draws its chief revenue. The women of this, and almost all the other Greek islands, have in all ages been celebrated for their beauty, and their persons have been the most perfect models of symmetry for painters and statuaries. A late learned traveller, Dr. Richard Chandler, says, "The beautiful Greek girls are the most striking ornaments of Scio. Many of these were sitting at the doors and windows, twirling cotton or silk, or employed in spinning and needle-work, and accosted us with familiarity, bidding us welcome, as we passed. The streets on Sundays and holidays are filled with them in groups. They wear short petticoats, reaching only to their knees, with white silk or cotton hose. Their head-dress, which is peculiar to the island, is a kind of turban, the linen so white and thin, it seemed snow. Their slippers are chiefly yellow, with a knot of red fringe at the heel. Some wore them fastened with a thong. Their garments were of silk of various colours; and their whole appearance so fantastic and lively, as to afford us much entertainment. The Turks inhabit a separate quarter, and their women are concealed." Among the poets and historians said to be born here, the inhabitants reckon Homer, and shew a little square house, which they call Homer's school.

SAMOS lies opposite to Ephesus, on the coast of the Lesser Asia, about seven miles from the continent. It is 30 miles long, and 15 broad. This island gave birth to Pythagoras, and is inhabited by Greek Christians, who are well treated by the Turks, their masters. The muscadine Samian wine is in high request; and the island also produces wool, which they sell to the French; oil, pomegranates,

nates, and silk. This island is supposed to have been the native country of Juno and some travellers think that the ruins of her temple, and of the ancient city of mos, are the finest remains of antiquity in the Levant.

To the south of Samos lies **PATMOS**, about 20 miles in circumference, but so barren and dreary, that it may be called a rock rather than an island. It has, however, a convenient haven; and the few Greek monks who are upon the island shew a cave where St. John is supposed to have written the Apocalypse.

The **CYCLADES** islands lie like a circle round Delos, the chief of them, which is south of the islands Mycone and Tirse, and almost midway between the continents of Asia and Europe. Though Delos is not above six miles in circumference, it is one of the most celebrated of all the Grecian islands, as being the birth-place of Apollo and Diana, the magnificent ruins of whose temples are still visible. This island is almost destitute of inhabitants.

**PAROS** lies between the islands of Luxia and Melos. Like all the other Greek islands, it contains the most striking and magnificent ruins of antiquity; but is chiefly renowned for the beauty and whiteness of its marble.

**CERIGO, or CYTHERA**, lies south-east of the Morea, and is about 50 miles in circumference, but rocky and mountainous. When Venus was born of the sea, she is said to have landed at this island, of which she became the presiding deity, and was from it called Cythere.

**SANTORIN** is one of the most southern islands in the Archipelago, and was formerly called Calista, and afterwards Thera. Though seemingly covered with pumice-stones, yet, through the industry of the inhabitants, who are about 10,000, it produces barley and wine, with some wheat. One third of the people are of the Latin church, and subject to a popish bishop. Near this island another arose, of the same name, from the bottom of the sea, in 1707. At the time of its birth there was an earthquake, attended with most dreadful lightnings and thunders, and boilings of the sea for several days, so that when it rose out of the sea, it was a mere volcano, but the burning soon ceased. It is about 200 feet above the sea; and at the time of its first emerging, was about a mile broad, and five miles in circumference, but it has since increased. Several other islands of the Archipelago appear to have had the like original, although the sea in their neighbourhood is so deep as not to be fathomed.

The famous island of **RHODES** is situated in the 28th degree of east longitude, and 36 degrees 30 minutes north latitude, about 20 miles south-west of the continent of Lesser Asia, being about 60 miles long, and 25 broad. This island is healthful and pleasant, abounds in wine, and many of the necessaries of life; but the inhabitants import their corn from the neighbouring country. The chief town, of the same name, stands on the side of a hill fronting the sea, and is three miles in circumference, interspersed with gardens, minarets, churches, and towers. The harbour is the Grand Signior's principal arsenal for shipping, and the place is esteemed among the strongest fortresses belonging to the Turks. The colossus of brass which anciently stood at the mouth of the harbour, was 50 fathom wide, and deservedly accounted one of the wonders of the world: one foot being placed on each side of the harbour, ships passing between its legs; and it held in one hand a light-house for the direction of mariners. The face of the colossus represented the

fun, to whom this image was dedicated; and its height was about 135 feet. The inhabitants of this island were formerly masters of the sea; and the Rhodian law was the directory of the Romans in maritime affairs. The knights of St. John of Jerusalem, after losing Palestine, took this island from the Turks in 1308, and lost it to them in 1522 after a brave defence, and afterwards retired to Malta.

**CANDIA**, the ancient Crete, is still renowned for its hundred cities, for its being the birth-place of Jupiter, and the fountain of legislation for all Greece. It lies between 35 and 36 degrees of north latitude, being 200 miles long, and 60 broad, almost equally distant from Europe, Asia, and Africa, and contains 3220 square miles. The famous Mount Ida stands in the middle of the island, and is no better than a barren rock; and Lethe, the river of oblivion, is a torpid stream. Some of the vallies of this island produce wine, fruits, and corn; all of them remarkably excellent in their kinds. The siege of Candia, the capital of the island, in modern times, was far more wonderful and bloody than that of Troy. The Turks invested it in the beginning of the year 1645, and its Venetian garrison, after bravely defending itself against 56 storms, till the latter end of September 1669, made, at last, an honourable capitulation. The siege cost the Turks 180,000 men, and the Venetians 80,000.

**CYPRUS** lies in the Levant sea, about 30 miles distant from the coast of Syria and Palestine. It is 150 miles long, and 70 broad, and lies at almost an equal distance from Europe and Africa. It was formerly famous for the worship of Venus, the Cyprian goddess; and, during the time of the Crusades, was a rich flourishing kingdom, inhabited by Christians. Its wine, especially that which grows at the bottom of the celebrated Mount Olympus, is the most palatable and the richest of any that grows in the Greek islands. Nicosia is the capital, in the midst of the country, and the see of a Greek archbishop; indeed most part of the inhabitants of the islands are Greeks. Famagusta, its ancient capital, has a good harbour; and the natural produce of the island is so rich, that many European nations find their account in keeping consuls residing upon it; but the oppressions of the Turks have depopulated and impoverished it to such a surprising degree, that the revenue they get from it does not exceed 1250*l.* a year. The island produces great quantities of grapes, from which excellent wine is made, and also cotton of a very fine quality, and oil, silk, and turpentine. Its female inhabitants do not degenerate from their ancestors as devotees to Venus; and Paphos, that ancient seat of pleasure and corruption, is one of the divisions of the island. Richard I. king of England, subdued Cyprus, on account of its king's treachery; and its royal title was transferred to Guy Lulignan, king of Jerusalem, from whence it passed to the Venetians, who still hold that empty honour.

The islands in the Ionian sea are, **SAPIENZA**, **STIVALI**, **ZANTE**, **CEPHALONIA**, **SAN LAMAURA**, **CORFU**, **FANNO**, and others of smaller note, particularly **ISOLA DEL COMPARE**, which would not deserve mention, had it not been the ancient Ithaca, the birth-place and kingdom of Ulysses. These islands in general are fruitful and belong to the Venetians.

Zante has a populous capital of the same name, and is a place of considerable trade, especially in currants\*, grapes, and wine. There are but few ships bound to the Adriatic that do not touch here; some of them take in a cargo of currants. This rich and wholesome article of consumption is the dried fruit of grapes, which

\* So called from a corruption of Corinth, from whence the vines were originally imported.

are peculiar to a few of these islands, and to part of the Morea. They are as inferior in size as superior in flavour to all other; and perhaps the most delicious ever tasted. There are two sorts, the black and the purple, both of which are ripe in July; but the inhabitants do not gather them till August, when they are exposed to the sun till dried, then put into hogheads and trodden down by naked feet to compress and preserve them the better. Zante freights six or seven ships annually, and Cephalonia four, the greater number of which are English. The citadel is erected on the top of a large hill, strong by nature, but now little better than a heap of ruins. Here is a garrison of 500 men, but their chief dependence is on their fleet and the island of Corfu. The inhabitants of Zante are about 30,000, mostly Greeks, and friendly to strangers. Corfu, which is the capital of the ancient Coreyra, and the residence of the governor-general over all the other islands, is a place of great strength, and its circumference about four miles. The Venetians are said to concern themselves very little about the welfare or government of these islands, so that the inhabitants, who are generally Greeks, bear a very indifferent character. Their number at Corfu is estimated at 50,000, and their manners more severe than at Zante.

## A S I A.

AS Asia exceeds Europe and Africa in extent of territory, it is also superior to them in serenity of air, fertility of soil, the deliciousness of its fruits, the fragrance and balsamic qualities of its plants, spices, and gums; the salubrity of its drugs; the quantity, variety, beauty, and value of its gems; the richness of its metals, and the fineness of its silks and cottons. It was in Asia, according to the sacred records, that the all-wise Creator planted the garden of Eden, in which he formed the first man and first woman, from whom the race of mankind was to spring. Asia became again the nursery of the world after the deluge, whence the descendants of Noah dispersed their various colonies into all the other parts of the globe. It was in Asia that God placed his once favourite people, the Hebrews, whom he enlightened by revelations delivered by the prophets, and to whom he gave the Oracles of Truth. It was here that the great and merciful work of our redemption was accomplished by his divine Son; and it was from hence that the light of his glorious gospel was carried with amazing rapidity into all the known nations by his disciples and followers. Here the first Christian churches were founded, and the Christian faith miraculously propagated and cherished even with the blood of innumerable martyrs. It was in Asia that the first edifices were reared, and the first empires founded, while the other parts of the globe were inhabited only by wild animals. On all these accounts, this quarter claims a superiority over the rest; but it must be owned, that a great change hath happened in that part of it called Turkey, which hath lost much of its ancient splendour. The other parts of Asia continue much in their former condition, the soil being as remarkable for its fertility, as most of the inhabitants for their indolence, effeminacy, and luxury. This effeminacy is much owing to the warmth of the climate; whence the Tartars, who live near the same latitudes with us, are as brave, hardy, strong, and vigorous, as any European nation. What is wanting in the robust frame of their bodies among the Chinese, Mogul Indians, and all the inhabitants of the more southern regions, is in a great measure compensated by the vivacity of their minds, and ingenuity in various kinds of workmanship.

This vast extent of territory was successively governed in past times by the Assyrians, the Medes, the Persians, and the Greeks; but the immense regions of India and China were scarcely known to Alexander, or the conquerors of the ancient world. Upon the decline of those empires, great part of Asia submitted to the Roman arms; and afterwards, in the middle ages, the successors of Mahomet, or as they are usually called, Saracens, founded in Asia, in Africa, and in Europe, a more extensive empire than that of Cyrus, Alexander, or even the Roman when in its height of power. The Saracen greatness ended with the death of Tamerlane; and the Turks, conquerors on every side, took possession of the middle regions of Asia, which they still enjoy. Besides the countries possessed by the Turks and Russians, Asia contains at present three large empires, the Chinese, the Mogul, and the Persian, upon which the lesser kingdoms and sovereignties depend. The prevailing form of government in this division of the globe is absolute monarchy. If any of them can be said to enjoy some share of liberty, it is the wandering tribes, as the Tartars and Arabs. Many of the Asiatic nations, when the Dutch first came among them, could not conceive how it was possible for any people to live under any other form of government than that of a despotic monarchy. Turkey, Arabia, Persia, part of Tartary, and part of India, profess Mahometanism. The Persian and Indian Mahometans are of the sect of Hali, and the Turks of that of Omar; but both acknowledge Mahomet for their law-giver, and the Koran for their rule of faith and life. In the other parts of Tartary, India, China, Japan, and the Asiatic Islands, they are generally heathens and idolaters. Jews are to be found every where in Asia. Christianity, though planted here with wonderful rapidity by the apostles and primitive fathers, suffered an almost total eclipse by the conquest of the Saracens, and afterwards of the Turks. Incredible indeed have been the hazards, perils, and sufferings of pious missionaries, to propagate their doctrines in the most distant regions, and among the grossest idolaters; but their labours have hitherto failed of success, owing in a great measure to their own nvarice, and the cruelty and injustice of the Europeans, who resort thither in search of wealth and dominion.

The principal languages spoken in Asia are, the modern Greek, the Turkish, the Russian, the Tartarian, the Persian, the Arabic, the Malayan, the Chinese, and the Japanese. The Portuguese and other European languages are also spoken upon the coasts of India and China.

The continent of Asia is situated between 25 and 180 degrees of east longitude, and between 10 degrees of southern, and 80 degrees of northern latitude. It is about 4740 miles in length, from the Dardanelles on the West, to the eastern shore of Tartary; and about 4380 miles in breadth, from the most southern part of Malacca, to the most northern cape of Nova Zembla. It is bounded by the Frozen Ocean on the north; on the west it is separated from Africa by the Red Sea, and from Europe by the Levant or Mediterranean, the Archipelago, the Hellespont, the sea of Marmora, the Bosphorus, the Black Sea, the river Don, and a line drawn from it to the river Tobol, and from thence to the river Oby, which falls into the Frozen Ocean. On the east, it is bounded by the Pacific Ocean, or South Sea, which separates it from America; and on the south, by the Indian Ocean; so that it is almost surrounded by the sea. The principal regions which divide this country are as follow:

BOUNDARIES.] **B**OUNDED by the Black Sea and Circassia, on the North; by Persia, on the East; by Arabia and the Levant Sea, on the South; and by the Archipelago, the Hellespont, and Propontis, which separate it from Europe, on the West.

Divisions.	Subdivisions.	Chief Towns.
The eastern provinces are	1. Eyraca Arabic or Chaldea	Bassora and Bagdad.
	2. Diarbec or Mesopotamia	Diarbec, Orfa, &c.
	3. Curdistan or Assyria	Mouful and Betlis.
	4. Turcomania or Armenia	Erzerum and Van.
	5. Georgia, including Mengrelia and Imaretta, and part of Circassia	Tefis, Amarchia, and Gonie.
Natolia, or the Lesser Asia, on the west.	1. Natolia proper	Bursa, Nici, Smyrna, and Ephesus.
	2. Amasia	Amasia, Trapezond, and Sinope.
	3. Aladulia	Ajazzo and Marat.
	4. Caramania	Satalia and Terasfo.
East of the Levant Sea.	Syria with Palestine, or the Holy Land	Aleppo, Antioch, Damascus, Tyre, Sidon, Tripoli, Scanderoon, and Jerusalem.

MOUNTAINS.] These are famous in sacred as well as profane writings. The most remarkable are, Olympus; Taurus, and Anti-taurus; Caucasus and Ararat; Lebanon; and Hermon.

RIVERS.] The same may be observed of the rivers, which are the Euphrates; Tigris; Orontes; Meander; Sarabat; Kara; and Jordan.

AIR AND CLIMATE.] Though both are delightful, and naturally salubrious to the human constitution, yet such is the equality with which the author of nature has dispensed his benefits, that Turkey, both in Europe and Asia, is often visited by the plague; here doubly destructive, from the native indolence of the Turks, and their superstitious belief in predestination, which prevents them from taking any precautions against this calamity.

SOIL AND PRODUCE.] As this country contains the most fertile provinces of Asia, I need scarcely inform the reader that it produces all the luxuries of life in the utmost abundance, notwithstanding the indolence of its owners. Raw silk, corn, wine, oil, honey, fruit of every species, coffee, myrrh, frankincense, and odoriferous plants and drugs, are produced here with little culture, which is practised chiefly by Greek and Armenian Christians. The olives, citrons, lemons, oranges, figs, and dates, are highly delicious, and in such plenty, that they cost the inhabitants a mere trifle. Their asparagus is uncommonly large, and their grapes far exceed in size those of other countries.

**ANIMAL PRODUCTIONS BY SEA AND LAND.** } The breed of the Turkish and Arabian horses, the latter especially, are valuable beyond any in the world, and have considerably improved that of the English. We know of no quadrupeds that are peculiar to these countries, but they contain all that are necessary for the use of mankind. Camels are here in much request, from their strength, their agility, and above all, their moderation in eating and drinking. Their manufacture, known by the name of camlets, was originally made by a mixture of camels' hair and silk, though it is now often made with wool and silk. Their kids and sheep are exquisite eating, and are said to surpass, in flavour and taste, those of Europe; but their butchers' meat in general, beef particularly, is not so fine.

As to birds, they have wild fowl in great perfection: their ostriches are well known by their tallness, swiftness in running, and stupidity. The Roman epicures prized no fish, except lampreys, mullets, and oysters, but those that were found in Asia.

**METALS AND MINERALS.]** This country contains all the metals discovered in the richest kingdoms and provinces of Europe; and its medicinal springs and baths exceed those of any in the known world.

## OF THE TURKS IN EUROPE AND ASIA.

**POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.** } THE population of this great country is by no means equal either to its extent or fertility, nor have the best geographers been able to ascertain it. It certainly is not so great as it was before the Christian era, or even under the Roman emperors; owing to various causes, and above all to the tyranny under which the natives live, and their polygamy, which is undoubtedly an enemy to population, since the Greeks and Armenians, among whom it is not practised, are incomparably more prolific than the Turks, notwithstanding the rigid subjection in which they are kept by the latter. The plague is another cause of depopulation. Yet, after all, the subjects of the Turkish empire are computed at 49,000,000.

As to the inhabitants, they are generally well made and robust: when young, their complexions are fair, and their faces handsome; their hair and eyes are black or dark brown. The women, when young, are sometimes handsome, but they generally look old at thirty. In their ordinary demeanour, the Turks are grave, sedate, and passive; but when agitated by passion, furious, raging, ungovernable; big with dissimulation, jealous, suspicious, and vindictive: in matters of religion, tenacious, superstitious, and morose. Interest is their supreme good, and when that comes in competition, all ties of religion, consanguinity, or friendship, are with the generality speedily dissolved. The morals of the Asiatic Turks are far preferable to those of the European. They are said to be charitable to one another, punctual in their dealings, and hospitable to strangers. They have no inns in Turkey, but houses called *kâns*, or Caravanferais, erected by charitable persons for the accommodation of the pilgrim or traveller. These are square buildings, not dissimilar to the smaller quadrangles at Oxford, with galleries, into which the apartments open. With the same laudable view they search out the best springs, and dig wells, which in those countries are a luxury to weary travellers. The Turks sit cross-legged upon mats, not only at their meals but in company. Their ideas, except what they acquire from opium, are simple and confined, seldom reaching without the walls of their own houses; where they sit conversing with their women, drinking coffee, smoking tobacco, or chewing opium. They have little curiosity to be informed of the state of their own or any other country. If a visitor, bahaw,

basilaw, or other officer, is turned out or strangled, they say no more on the occasion than that there will be a new visier or governor, seldom enquiring into the reason of the disgrace of the former. They are perfect strangers to wit and agreeable conversation. They have few printed books, and seldom read any other than the Koran, and the comments upon it. Nothing is negotiated in Turkey without presents; and here justice may commonly be bought and sold.

The Turks dine about eleven o'clock in the forenoon, and they sup at five in the winter, and six in the summer, and supper is their principal meal. Among the great people their dishes are served up one by one; but they have neither knife nor fork, and they are not permitted by their religion to use gold or silver spoons. Their victuals are always high-seasoned. Rice is the common food of the lower sort, and sometimes it is boiled up with gravy; but their chief dish is pilau, which is mutton and fowl boiled to rags, and the rice being boiled quite dry, the soup is highly seasoned, and poured upon it. They drink water, sherbet, and coffee; and the only debauch they know is in opium, which gives them sensations resembling those of intoxication. Guests of higher rank sometimes have their beards perfumed by a female slave of the family. They are temperate and sober from a principle of their religion, which forbids them the use of wine; though in private many of them indulge themselves in the use of strong liquors. Their common salutation is by an inclination of the head, and laying their right hand on their breast. They sleep in linen waistcoats and drawers, upon mattresses, and cover themselves with a quilt. Few or none of the considerable inhabitants of this vast empire have any notion of walking or riding either for health or diversion. The most religious among them find, however, sufficient exercise when they conform themselves to the frequent ablutions, prayers, and rites prescribed them by Mahomet.

Their active diversions consist in shooting at a mark, or tilting it with darts, at which they are very expert. Some of their great men are fond of hunting, and take the field with numerous equipages, which are joined by their inferiors; but this is often done for political purposes, that they may know the strength of their dependents. Within doors, the chess or draught-board are the usual amusements; and if they play at chance games they never bet money, that being prohibited by the Koran.

**DRESS.]** The men shave their heads, leaving a lock on the crown, and wear their beards long. They cover their heads with a turban, which they never take off but when they sleep. Their shirts are without collar or wristband, and over them they throw a long vest, which they tie with a sash, and over the vest they wear a loose gown somewhat shorter. Their breeches, or drawers, are of a piece with their stockings; and instead of shoes they wear slippers, which they put off when they enter a temple or house. They suffer no Christians, or other people, to wear white turbans. The dress of the women differs little from that of the men, only they wear stiffened caps upon their heads with horns something like a mitre, and wear their hair down. When they appear abroad, they are so muffled up as not to be known by their nearest relations. Such of the women as are virtuous make no use of paint to heighten their beauty, or to disguise their complexion; but they often tinge their hands and feet with *henna*, which gives a deep yellow. The men make use of the same expedient to colour their beards.

**MARRIAGES.]** Marriages in this country are chiefly negotiated by the ladies. When the terms are agreed upon, the bridegroom pays down a sum of money, a licence is taken out from the cadi, or magistrate, and the parties are married. The bargain is celebrated, as in other nations, with mirth and jollity, and the money is generally employed in furnishing the house of the young couple. They are not

allowed by their law more than four wives, but they may have as many concubines as they can maintain.

**FUNERALS.]** The burials of the Turks are decent. The corpse is attended by the relations, chanting passages from the Koran; and after being deposited in a mosque (for so they call their temples), they are buried in a field by the imam or priest, who pronounces a funeral sermon at the time of the interment. The male relations express their sorrow by alms and prayers; the women by decking the tomb on certain days with flowers and green leaves; and in mourning for a husband they wear a particular head-dress, and leave off all finery for twelve months.

**RELIGION.]** The established religion is the Mahomedan, so called from Mahomed, the author of it; some account of which the reader will find in the following history of Arabia, the native country of that impostor. The Turks profess to be of the sect of Omar; but are split into as many subdivisions as their neighbours the Christians. There is no ordination among their clergy; and any person may be a priest that chooses to take the habit, and perform the functions of his order, and may lay down his office when he pleases. Their chief priest, or musti, enjoys great power in the state.

**ECCLESIASTICAL INSTITUTIONS.]** These are tolerated because they are profitable; but the fines imposed on the Greek church are such as must always dispose that people to favour innovation. Constantinople, Jerusalem, Alexandria, and Antioch, are patriarchates; and their heads are indulged, according as they pay for their privilege, with a civil as well as an ecclesiastical authority over their votaries. The same may be said of the Nestorian and Armenian patriarchs; and every great city that can pay for the privilege has its archbishop or bishop. All male Christians pay also a capitation tax from seventeen years old to sixty, according to their situations.

**LANGUAGE.]** The radical languages of this empire are the Slavonian, which seems to have been the mother-tongue of the ancient Turks; the Greek modernized, but still bearing a relation to the old language; the Arabic, and the Syriac, a dialect of which is still spoken. A specimen of the modern Greek follows in their Paternoster:

*Pater hemas, opios iso ees tos ouranons: hagiasthito to onoma sou: na erti he basilia sou: to thelema sou na genetex itzon eu to ge, os is ton ouranon: to psomi hemas doze hemas semoreu: ke si chorase hemos ta crimata hemou itzone, ke hemas sichorajomen ekinous opou: mas adikouka men ternes hemais is to pirajmo, alla sison hemas apo to kaxo. Amen.*

**LEARNING AND LEARNED MEN.]** The Turks till of late professed a sovereign contempt for our learning. Greece, which was the native country of genius, arts, and sciences, produces at present, besides Turks, numerous bands of Christian bishops, priests, and monks, who in general are as ignorant as the Turks themselves, and are divided into various absurd sects of what they call Christianity. The education of the Turks seldom extends farther than reading the Turkish language and the Koran, and writing a common letter. Some few of them understand astronomy so far as to calculate the time of an eclipse, and are looked upon as extraordinary persons.

**ANTIQUITIES AND CURIOSITIES.]** These are so various, that they have furnished matter for many voluminous publications, and others are appearing every day. These countries contained all that was rich and magnificent in architecture and sculpture; and neither the neglect of the Turks, nor the depredations they have suffered from the Europeans, seem to have diminished their number. Many of the finest temples are converted into Turkish mosques, or Greek churches, and are more disfigured than those which

remain in ruins. Amidst such a plenitude of curiosities, we shall select the most striking.

Balbec is situated on a rising plain, between Tripoli in Syria and Damascus, at the foot of Mount Libanus, and is the Heliopolis of Cælo Syria. Its remains of antiquity display, according to the best judges, the boldest plan that ever was attempted in architecture. The portico of the temple of Heliopolis is inexpressibly grand, though disfigured by two Turkish towers. The hexagonal court behind it is now known only by the magnificence of its ruins. Its walls were adorned with Corinthian pilasters and statues, and it opens into a quadrangular court of the same taste and grandeur. The great temple to which this leads is now so ruined, that it is known only by an entablature, supported by nine lofty columns, each consisting of three pieces joined together, by iron pins, without cement. Some of those pins are a foot long, and a foot in diameter; and the sordid Turks are daily at work to destroy the columns, for the sake of the iron. A small temple is still standing, with a pedestal of eight columns in front, and fifteen in flank, and every where richly ornamented with figures in alto relievo, expressing the heads of gods, heroes, and emperors. To the west of this temple is another, of a circular form, of the Corinthian and Ionic order, but disfigured with mosques and houses. The other parts of this ancient city are proportionably magnificent.

Various have been the conjectures concerning the founders of these immense buildings. The inhabitants of Asia ascribe them to Solomon, but some make them so modern as the time of Antoninus Pius. Perhaps they are of different æras; and though that prince and his successors may have rebuilt some part of them, yet the boldness of their architecture, the beauty of their ornaments, and the stupendous execution of the whole; seem to fix their foundation to a period before the Christian æra, but without mounting to the ancient times of the Jews or the Phœnicians, who probably knew little of the Greek style in building and ornamenting. Balbec is at present a little city, encompassed with a wall. The inhabitants, who are about 3000 in number, chiefly Greeks, live in or near the circular temple, in houses built out of the ancient ruins. A free-stone quarry, in the neighbourhood, furnished the stones for the body of the temple; and one of the stones, not quite detached from the bottom of the quarry, is 70 feet long, 14 broad, and 14 feet five inches deep, and, reduced to our measure, is 1135 tons. A coarse white marble quarry, at a greater distance, furnished the ornamental parts.

Palmyra, or, as it was called by the ancients, Tadmor in the Desert, is situated in the wilds of Arabia Petraea, about 33 deg. N. lat. and 200 miles to the south-east of Aleppo. It is approached through a narrow plain, lined as it were with the remains of antiquity; and, opening all at once, the eye is presented with the most striking objects that are to be found in the world. The temple of the Sun lies in ruins; but the access to it is through a vast number of beautiful Corinthian columns of white marble, the grandeur and beauty of which can only be known by the plates of it, published by Mr. Wood, who, with his friends, visited it some years ago, purposely to preserve some remembrance of such a curiosity. As those drawings, or copies from them, are now common, we must refer the reader to them, especially as he can form no very adequate ideas of the ruins from a printed relation. Superb arches, amazing columns, a colonade extending 4000 feet in length, terminated by a noble mausoleum, temples, fine porticos, peristyles, intercolumniations, and entablatures, all of them in the highest style, and finished with the most beautiful materials, appear on every side, but so dispersed and disjointed, that it is impossible from them to form an idea of the whole when perfect. These striking

striking ruins are contrasted by the miserable huts of the wild Arabs, who reside in or near them.

Nothing but ocular proof could convince any man, that so superb a city, formerly 10 miles in circumference, could exist in the midst of a sandy desert. Nothing, however, is more certain than that Palmyra was formerly the capital of a great kingdom; that it was the pride as well as the emporium of the eastern world, and that its merchants dealt with the Romans, and the western nations, for the merchandises and luxuries of India and Arabia. Its present altered situation, therefore, can be accounted for only by natural causes, which have turned the more fertile tracts into barren deserts. The Asiatics think that Palmyra, as well as Balbec, owes its original to Solomon; and in this they receive some countenance from sacred history. In profane history it is not mentioned before the time of Marc Anthony; and its most superb buildings are thought to be of the lower empire, about the time of Gallienus. Odenathus, the last king of Palmyra, was highly caressed by that emperor, and even declared Augustus. His widow Zenobia reigned in great glory for some time, and Longinus, the celebrated critic, was her secretary. Not being able to brook the Roman tyranny, she declared war against the emperor Aurelian, who took her prisoner, led her in triumph to Rome, and butchered her principal nobility, and among others the excellent Longinus. That emperor also destroyed her city, and massacred its inhabitants, but expended large sums out of Zenobia's treasures in repairing the temple of the Sun, the majestic ruins of which have been mentioned. None of the Palmyrene inscriptions reach above the Christian era, though there can be no doubt that the city itself is of much higher antiquity. The emperor Justinian made some efforts to restore it to its ancient splendour, but without effect, for it dwindled by degrees to its present wretched state. It has been observed very justly, that its architecture, and the proportions of its columns, are by no means equal in purity to those of Balbec.

Nothing can be more futile than the boasted antiquities shewn by the Greek and Armenian priests in and near Jerusalem, which is well known to have been so often razed to the ground, and rebuilt anew, that no one scene of our Saviour's life and sufferings can be exactly ascertained; and yet those ecclesiastics subsist by pretending to guide travellers to every spot mentioned in the Old and New Testament. They are, it is true, under severe contributions to the Turks, but the trade still goes on, though much diminished in its profits. The church of the Holy Sepulchre, as it is called, said to be built by Helena, mother to Constantine the Great, is still standing, and of tolerable good architecture; but its different divisions, and the dispositions made round it, are chiefly calculated to support the forgeries of its keepers. Other churches, built by the same lady, are found in Palestine; but the country is so altered in its appearance and qualities, that it is one of the most despicable of any in Asia, and it is in vain for a modern traveller to attempt to trace in it any vestiges of the kingdom of David and Solomon. But let a fertile country be under the frowns of heaven, and abandoned to tyranny and wild Arabs, it will in time become a desert. Thus oppression soon thinned the delicious plains of Italy; and the noted countries of Greece, and Asia the Less, once the glory of the world, are now nearly destitute of learning, arts, and people.

Mecca and Medina are curiosities only through the superstition of the Mahomedans. Their buildings are mean, when compar'd to European houses or churches; and even the temple of Mecca, in point of architecture, makes but a sorry appearance, though erected on the spot where the great prophet is said to have been born. The same may be said of the mosque at Medina, where that impostor was buried; to that the vast sums spent yearly by Mahomedan pilgrims, in visiting those places, are undoubtedly converted to temporal uses. I shall not amuse the reader with any

accounts of the spot which is said to have formed Paradise, and to have been situated between the rivers Euphrates and Tigris, where there are some tracts which undoubtedly deserve that name. The different ruins, some of them inexpressibly magnificent, that are to be found in those immense regions, cannot be assigned with any certainty to their original founders. It is indeed easy to pronounce whether the style of their buildings be Greek, Roman, or Saracen; but all other information must come from their inscriptions.

The neighbourhood of Smyrna (now called Ismir) contains many valuable antiquities. The same may be said of Aleppo, and a number of other places celebrated in antiquity. The site of Old Troy cannot be distinguished by the smallest vestige, and is known only by its being opposite to the isle of Tenedos, and the name of a brook, which the poets magnified into a wonderful river. A temple of marble built in honour of Augustus Cæsar, at Milatio in Caria, and a few structures of the same kind, in the neighbourhood, are among the antiquities that are still entire. Three theatres of white marble, and a noble circus near Laodicea, now Latichea, have suffered very little from time or barbarism; and some travellers think that they discern the ruins of the celebrated temple of Diana, near Ephesus.

**CHIEF CITIES, MOSQUES, AND OTHER BUILDINGS.** These are very numerous, and at the same time very insignificant, because they have little or no trade, and are greatly decayed from their ancient grandeur. Scanderoon stands upon the site of Old Alexandria, but is now almost depopulated. Superb remains of antiquity are found in its neighbourhood. Aleppo, however, holds a respectable rank among the cities of the Asiatic Turkey. It is still the capital of Syria, and is superior in its buildings and conveniencies to most of the Turkish cities. Its houses, as usual in the East, consist of a large court, with a dead wall to the street, an arcade or piazza running round it, paved with marble, and an elegant fountain, of the same, in the middle. Aleppo and its suburbs are seven miles in compass, standing on eight small hills, on the highest top of which the citadel or castle is erected, but of no great strength. An old wall and a broad ditch, now in many places turned into gardens, surround the city, which contains 235,000 inhabitants, of whom 30,000 are Christians, and 5000 are Jews. It is furnished with most of the conveniencies of life, except good water, within the walls, and even that is supplied by an aqueduct distant about four miles, said to have been erected by the empress Helena. The streets are narrow, but well paved with large square stones, and are kept very clean. Their gardens are pleasant, being laid out in vineyards, olive, fig, and pistachio trees; but the country round it rough and barren. Foreign merchants are numerous here, and transact their business in caravanferas, or large square buildings, containing their warehouses, lodging-rooms, and counting-houses. The city abounds in mosques, public bagnios, and bazars, or market-places, which are formed into long, narrow, arched or covered streets, with little shops, as in other parts of the East. The coffee is excellent, and considered by the Turks as a high luxury; and their sweetmeats and fruits are delicious. European merchants live here in greater splendour and safety than in any other city of the Turkish empire, which is owing to particular capitulations with the Porte. Coaches or carriages are not used here, but persons of quality ride on horse-back with a number of servants before them, according to their rank. The English, French, and Dutch, have consuls, who are much respected, and appear abroad, the English especially, with marks of distinction.

The heat of the country makes it convenient for the inhabitants to sleep in the open air, here, over all Arabia, and many other parts of the East, for which reason their houses are flat on the top. This practice accounts for the early acquaint-

ance those nations had with astronomy, and the motions of the heavenly bodies, and explains some parts of the holy scripture. As the Turks are very uniform in their way of living, this account of Aleppo may give the reader an idea of the other Turkish cities.

Bagdad, built upon the Tigris, not far, it is supposed, from the site of ancient Babylon, is the capital of the ancient Chaldea, and was the metropolis of the caliphate, under the Saracens in the twelfth century. This city retains but few marks of its ancient grandeur. It is in the form of an irregular square, and rudely fortified: but the conveniency of its situation renders it one of the seats of the Turkish government, and it has still a considerable trade, being annually visited by the Smyrna, Aleppo, and western caravans. The houses of Bagdad are generally large, built of brick and cement, and arched over to admit the freer circulation of air: many of their windows are made of elegant Venetian glass, and the ceiling ornamented with chequered work. Most of the houses have also a courtyard before them, in the middle of which is a small plantation of orange trees. The number of houses is computed at 80,000, each of which pays an annual tribute to the Hethaw, which is calculated to produce 300,000l. sterling. Their bazars, in which the tradesmen have their shops, are handsome and extensive, filled with shops of all kinds of merchandize, to the number of 12,000. These were erected by the Persians, when they were in possession of the place, as were also their bagnios, and almost every thing here worthy of notice. In this city are five mosques, two of which are well built, and have handsome domes, covered with varnished tiles of different colours. Two chapels are permitted for those of the Romish and Greek persuasions. On the north-west corner of the city stands the castle, which is of white stone, and commands the river, consisting of curtains and bastions; on which some large cannon are mounted, with two mortars on each bastion; but in the year 1779, they had become, through neglect, altogether unserviceable. Below the castle, by the water-side, is the palace of the Turkish governor; and there are several summer-houses on the river, which make a fine appearance. The Arabians, who inhabited this city under the caliphs, were remarkable for the purity and elegance of their dialect.

Ancient Assyria is now called the Turkish Curdistan, though part of it is subject to the Persians. The capital is Curdistan; the ancient Nineveh being now a heap of ruins. Curdistan is said to be for the most part cut out of a mountain, and is the residence of a viceroy, or beglerbeg. Orta, formerly Edessa, is the capital of the fine province of Mesopotamia. It is now a mean place, and chiefly supported by a manufacture of Turkey leather. Mosul is also in the same province, a large place, situated on the western shore of the Tigris, opposite to where Nineveh formerly stood.

Georgia, or Gurgistan, now no longer subject to the Turks, is chiefly peopled by Christians, a brave, warlike race of men. Their capital, Teflis, is a handsome city, and makes a fine appearance: all the houses are of stone, neat and clean, with flat roofs, which serve as walks for the women, but the streets are dirty and narrow: its inhabitants are about 30,000. It is situated at the foot of a mountain, by the side of the river Kur, and is surrounded by strong walls, except on the side of the river. It has a large fortress on the declivity of the mountain, which is a place of refuge for criminals and debtors, and the garrison consists of native Persians. There are thirteen Greek churches in Teflis, seven Armenian, and one Roman catholic church: the Mahomedans who are here, have no mosques. In the neighbourhood of the city are many pleasant houses, and fine gardens. The Georgians are said, by some travellers, to be the handsomest people in the world; and some think that they owe their beauty to the long use of inoculation for the

small-

small-pox. They make no scruple in selling and drinking wines in their capital, and other towns; and their valour has procured them many distinguishing liberties and privileges. Lately they formed an alliance with Rulin, under the brave prince Heraclius, as hath the czar or prince Solomon, sovereign of Immeretta, a district between the Caspian and Black Seas, who is distinguished from his subjects (all of the Greek religion) by riding on an ass, and wearing boots.

The ancient cities of Damascus, Tyre, and Sidon, still retain part of their former trade. Damascus is called Sham, and the approach to it by the river is highly beautiful. It contains a fine mosque, which was formerly a Christian church. It is still famous for its steel works, such as sword-blades, knives, and the like; the excellent temper of which is said to be owing to a quality in the water. The inhabitants manufacture also those beautiful silks, called Damasks from their city, and carry on a considerable traffick in raw and worked silk, rose-water extracted from the famous damask roses, fruits, and wine.

Sidon, now Said, which lies within the ancient Phœnicia, has still some trade, and a tolerable harbour. The town is surrounded with a stone wall, a citadel on the land side, and another towards the sea. The houses are built chiefly of stone, and are two stories high. The inhabitants are about 16,000, chiefly Christians, of the Greek church, and the place is the seat of a bishop of that persuasion. There are in the town two public baths, and two mosques. It stands on a neck of land over against Tyre, and both form a bay of about 16 miles in breadth.

Tyre, now called Sur, about 20 miles distant from Sidon, so famous formerly for its rich dye, is now inhabited by scarcely any but a few fishermen, who live in the ruins of its ancient grandeur. There are strong walls on the land side, of stone, 18 feet high, and seven broad. The circumference of the place is not more than a mile and a half; and Christians and Mahomedans make the number of 500. Some of the ruins of ancient Tyre are still visible. The pavements of the old city, Mr. Bruce tells us that he saw, and observes that they were  $7\frac{1}{2}$  feet lower than the ground upon which the present city stands.

Passing by Tyre (says our author, who deserves much praise for some happy elucidations of scripture) I came to be a mournful witness of the truth of that prophecy, That Tyre, the queen of Nations, should be a rock for fishers to dry their nets on. Two wretched fishermen, with miserable nets, having just given over their occupation with very little success, I engaged them, at the expence of their nets, to drag in those places where they said shell-fish might be caught, in hopes to have brought out one of the famous purple-fish. I did not succeed, but in this I was, I believe, as lucky as the old fishers had ever been. The purple-fish at Tyre seems to have been only a concealment of their knowledge of cochineal, as had they depended upon the fish for their dye, if the whole city of Tyre applied to nothing else but fishing, they would not have coloured twenty yards of cloth in a year.

Næolia, or Asia Minor, comprehending the ancient provinces of Lydia, Pamphylia, Paphlagonia, Lycæonia, Cilicia, Cappadocia, and Pontus, or Amasia, all of them territories celebrated in the Greek and Roman history, are now, through indolence and tyranny, either forsaken, or a theatre of ruins. The sites of ancient cities are still discernible; and so luxuriant is nature in those countries, that in many places the triumphs over the folly and cruelty of man. The selfish Turks cultivate no more land than maintains themselves; and their gardens and summer-houses fill up the circuit of their most flourishing cities. The most judicious travellers, upon an attentive survey of those countries, fully vindicate all that has been said by sa-

ered and profane writers of their beauty, strength, fertility, and population. Even Palestine in Judea, the most despicable at present of them all, lies buried under the luxuries of its own soil. The Turks seem particularly fond of representing Judea in the most dreadful colours, and have formed a thousand falsehoods concerning it, which being artfully propagated by some among ourselves, have imposed upon weak Christians\*.

Under the government of Sheik Daher, the ally of the famous Ali Bey, some part of Palestine revived. He enlarged the buildings and walls of St. John de Acre, formerly Ptolemais, and shewed great indulgence to the Christians. Its inhabitants were lately computed at 40,000. Caifa, which stands on the declivity of mount Carmel, distant about 20 miles from Acre, was also new built and enlarged by Daher. The ancient Joppa, now Jussa, 50 miles west from Jerusalem, stands on a rocky hill, hath an harbour for small vessels, and its circumference is about two miles. The number of inhabitants is 7000; the western part of the town is filled with Christians. The present state of Ramah is deplorable, its walls in decay, and most of the houses empty, though the number of inhabitants is still between 3 and 4000. Not a house is standing of the once magnificent city of Cesarea, but the remains of the walls testify its former grandeur. Azotus is about two miles in circumference, the inhabitants are near 3000, and mostly Mahomedans: an old structure is shewn here, with fine marble pillars, which is said to be the house that Sampson pulled down, when insulted by the Philistines. Gaza is still respectable; it extends from east to west three miles, and is a mile in breadth, divided into the old and new town. The last is inhabited by the inferior Turks and Arabs; amounting to 26,000. It is about five miles from the sea, and without the walls is a market for the country people to dispose of their commodities to the inhabitants, for they are not permitted to enter the town. The country around is very fertile, in corn, oil, wine, honey, bees-wax, flax, and cotton.

Whether those countries of Asia could ever be restored to their ancient grandeur, trade, and population, may be a question with some; but it is most likely that it would now be impossible (let the Turkish government be ever so beneficent) to divert commerce (without which all attempts of that kind must be feeble) from its European channels. There can, however, be no question, that a government less brutal and bigoted than that of the Turks, might make the natives a powerful as well as a happy people. The misfortune is, that the Greeks, Armenians, and other sects of eastern Christians, partake but too much of the Turkish stupidity. Though they are not suffered to wear white turbans, or to ride on horseback, and are subjected to a thousand indignities and miseries, and are even, in many places, far more numerous than their oppressors, yet so abject is their spirit, that they make no efforts for their own deliverance. If they are less indolent than their oppressors, it is because they must otherwise starve; and they dare not enjoy even the property they acquire, lest it should be discovered and seized by their tyrants.

\* The late reverend Dr. Shaw, professor of Greek at Oxford, who seems to have examined that country with an uncommon degree of accuracy, and was qualified by the soundest philosophy to make just observations, says that were the Holy Land as well cultivated as in former times, it would be more fertile than the very best parts of Syria and Phœnicia, because the soil is generally much richer, and, every thing considered, yields larger crops. Therefore the barrenness, says he, at which some authors complain, does not proceed

from the natural unfruitfulness of the country, but from the want of inhabitants, the indolence which prevails among the few who possess it, and the perpetual discords and depredations of the petty princes who share this fine country. Indeed the inhabitants can have but little inclination to cultivate the earth. "In Palestine, says Mr. Wood, we have often seen the husbandman sowing, accompanied by an armed friend, to prevent his being robbed of the seed."

COMMERCE AND MANUFACTURES.] The nature of the Turkish government destroys that happy security which is the mother of arts, industry, and commerce. The advantages of Tyre, Sidon, Alexandria, and all those countries which carried on the commerce of the ancient world, are overlooked. The Turks command the navigation of the Red Sea, which opens a communication to the southern ocean, and presents them with all the riches of the Indies. Whoever looks on a map of Turkey must admire the situation of its capital, upon a narrow strait that separates Europe from Asia, and communicates on the south with the Mediterranean sea, thereby opening a passage to all the European nations as well as the coasts of Africa. The same strait, communicating northwards with the Black Sea, opens a passage, by means of the Danube and other great rivers, into the interior parts of Germany, Poland, and Russia.

In this extensive empire, where all the commodities necessary for the largest plan of industry and commerce are produced, the Turks content themselves with manufacturing cottons, carpets, leather and soap. The most valuable of their commodities, such as silk, a variety of drugs, and dying stuffs, they generally export, without giving them any additional value from their own labour. The internal commerce of the empire is extremely small, and managed entirely by Jews and Armenians. In their traffic with Europe the Turks are altogether passive. The English, French, Dutch, and other Europeans, resort thither with their commodities, and bring back those of Turkey in the same bottoms. The Turks seldom undertake distant voyages, and possess only a few coasting vessels in the Asiatic Turkey; their chief royal navy lying on the side of Europe. The intention of the Turks to objects of commerce is perhaps the best security to their government. The balance of power established among the princes of Europe, and their jealousies of each other, secure to the Infidels the possession of countries, which in the hands of the Russians, or any active state, might endanger the commerce of their neighbours, especially their trade with India.

CONSTITUTION AND GOVERNMENT.] The Turkish government is commonly exhibited as a picture of all that is shocking and unnatural in arbitrary power. But from the late accounts of sir James Porter, who resided at the Porte in quality of ambassador from his Britannic majesty, it appears that the rigours of that despotic government are considerably moderated by the influence of religion. For though in this empire there is no hereditary succession, the property of families may be fixed and perpetuated by being annexed to the church, which is done at an inconsiderable expence. Even Jews and Christians may in this manner secure the enjoyment of their lands to the latest posterity; and so sacred and inviolable has this law been held, that there is no instance of an attempt on the side of the prince to trespass or reverse it. Neither does the observance of this institution altogether depend on the superstition of the sultan; he knows that an attempt to violate it would shake the foundation of his throne, which is solely supported by the laws of religion. The laws enacted in the Koran having all the force of religious prejudices to support them, are inviolable; and by them the civil rights of the Mahomedans are regulated. Even the comments upon this book, which explain the law where it is obscure, or extend and complete what Mahomed had left imperfect, are conceived to be of equal validity with the first institutions of the prophet; and no member of the society, nor even its head, can transgress them without censure, or violate them without punishment.

The Asiatic Turks, or rather subjects of the Turkish empire, who hold their possessions by a kind of military tenure, on condition of their serving in the field with a particular number of men, think themselves, while they perform that agreement, almost independent of the emperor. The most unhappy subjects of the Turkish

govern

government, are those who attain the highest dignities of state, and whose fortunes depend on the breath of their master. There is a gradation of great officers in Turkey, of whom the grand vizir, the prime minister, the *chiaya*, second in power to the vizir; the *reis essendi*, or secretary of state; and the *aga* of the janizaries, are the most considerable. These, as well as the *mufti*, or high priest, the *bashaws*, or governors of provinces, the civil judges, and many others, are commonly raised, by their application and assiduity, from the meanest stations in life, and are often the children of Tartars, or Christian slaves taken in war. Tutored in the school of adversity, and arriving at pre-eminence through a thousand difficulties and dangers, these men are generally as distinguished for abilities, as deficient in virtue. They possess all the dissimulation, intrigue, and corruption which often accompanies ambition in a humble rank: and they have farther reason for plundering the people, because they are uncertain how long they shall enjoy the dignities to which they have attained. The administration of justice, therefore, is extremely corrupt over the whole empire; but this proceeds from the manners of the judges, and not from the laws of the kingdom, which are founded upon very equitable principles.

[REVENUES.] The riches drawn from the various provinces of this empire must be immense. According to Baron de Tot, the revenues estimated on the records amount to 25,400,000*l.* but produce effectively only 3,200,000*l.* to the public treasury. The revenues arise from the customs, and a variety of taxes which fall chiefly on the Christians and other subjects, not of the Mahometan religion; the rich pay a capitation tax of 30 shillings a year; tradesmen 15 shillings, and common labourers 6 shillings and 10 pence half-penny. Another branch of the revenue arises from the annual tribute paid by the Tartars, and other nations bordering upon Turkey, but governed by their own princes and laws. All these, however, are trifling, when compared with the vast sums extorted by the governors of provinces, and officers of state, under the name of *resents*. These harpies, to indemnify themselves, exercise every species of oppression, till, becoming wealthy from the vitals of the country, their riches frequently give rise to a pretended suspicion of disloyalty or misconduct, and the whole fortune of the offender devolves to the crown. The devoted victim is seldom acquainted with the nature of the offence, or the names of his accusers; but, without giving him the least opportunity of making a defence, an officer is dispatched, with an imperial decree, to take off his head. The unhappy *bashaw* receives it with the highest respect, and after he has read it, says, *The will of God and the emperor be done*, or some such expression, testifying his entire resignation. Then he takes the silken cord, which the officer has in his bosom, and having tied it about his neck, and said a short prayer, the officer's servants throw him on the floor, and strangle him by drawing the cord strait; after which his head is cut off, and carried to court.

[FORCES.] The militia of the Turkish empire is of two sorts: the first has certain lands appointed for its maintenance, and the other is paid out of the treasury. Those that have certain lands amount to about 268,000 effective men. Besides these, there are also certain auxiliary forces raised by the tributary nations; as the Tartars, Walachians, Moldavians, and, till of late, the Georgians, who are commanded by their respective princes. The *Kan* of the *Crim Tartars*, before his country was subjected to Russia, was obliged to furnish 100,000 men and five in prison, when the grand-signior took the field. In every war, besides the above force, there are great numbers of volunteers, who live at their own charge, in expectation of succeeding the officers. These adventurers not only promise themselves an estate if they survive, but are taught, that if they die in the war

against the Christians, they shall go immediately to paradise. The forces which receive their pay from the treasury, are called the Spahis, or horse-guards, and are in number about 12,000; and the janizaries, or foot-guards, who are esteemed the best soldiers in the Turkish armies, amounting to about 25,000 men, who are quartered in and near Constantinople. They frequently grow mutinous, and have often proceeded so far as to depose the Sultan. They are educated in the seraglio, and trained up to the exercise of arms from their infancy; and there are no less than 100,000 foot soldiers, scattered over every province of the empire, who are registered in this body, and enjoy the privileges of janizaries, who are subject to no jurisdiction but that of their aga, or chief commander.

**ARMS AND TITLES.]** The emperor's titles are swelled with all the pomp of eastern magnificence. He is styled by his subjects, *the Shadow of God, a God on Earth, Brother to the Sun and Moon, Disposer of all earthly crowns, &c.* The grand-signior's arms are, vert, a crescent argent, crested with a turban, charged with three black plumes of heron's quills, with this motto, *Donec totum impleat orbem.*

**COURT AND SERAGLIO.]** Great care is taken in the education of the youths destined to employments in the state, the army, or the navy; but they are seldom preferred till about 40 years of age, and they rise by their merit. They are generally the children of Christian parents, either taken in war, purchased, or presents from the viceroys and governors of distant provinces, the most beautiful, well made, and sprightly children that can be met with, and are always reviewed and approved by the grand-signior, before they are sent to the colleges or seminaries, where they are educated for employments according to their genius and abilities.

The ladies of the seraglio are a collection of beautiful young women, chiefly sent as presents from the provinces and the Greek islands, most of them the children of Christian parents. The brave prince Heraclius hath for some years past abolished the infamous tribute of children of both sexes, which Georgia formerly paid every year to the Porte. The number of women in the harem depends on the taste of the reigning monarch or sultan. Selim had 2000. Aehmet had but 300, and the present sultan hath nearly 1600. On their admission they are committed to the care of old ladies, taught to sew and embroider, music, dancing, and other accomplishments, and furnished with the richest cloaths and ornaments. They all sleep in separate beds, and between every fifth there is a preceptress. Their chief governess is called *Katon Kiaga*, or governess of the noble young ladies. There is not one servant among them, for they are obliged to wait on one another by rotation; the last that is entered serves her who preceded her. These ladies are scarcely ever suffered to go abroad, except when the grand-signior removes from one place to another, when a troop of black eunuchs conveys them to the boats, which are inclosed with latices and linen curtains; and when they go by land they are put in close chariots, and signals are made at certain distances, to give notice that none approach the roads through which they march. The boats of the harem, which carry the grand-signior's wives, are manned with 24 rowers, and have white covered tills, that alternately by Venetian blinds. Among the emperor's attendants, are a number of mutes, who act and converse by signs, with great quickness, and some dwarfs who are exhibited for the diversion of his majesty.

When he permits the women to walk in the garden of the seraglio, all people are ordered to retire, and on every side there is a guard of black eunuchs, with fishes in their hands. If unfortunately any one is found in the garden, even through ignorance or inadvertence, he is undoubtedly killed, and his head brought to the

feet

feet of the grand-signior, who rewards the vigilant guard. Sometimes the grand-signior passes into the gardens to amuse himself, when the women are there: and it is then that they make use of their utmost efforts, by dancing, singing, seducing gestures, and amorous blandishments, to ensnare the affections of the monarch. It is not permitted that the monarch should take a virgin to his bed except during the solemn festivals, and on occasion of some extraordinary rejoicings, or the arrival of some good news. Upon such occasions, if the sultan chooses a new companion to his bed, he enters into the apartment of the women, who are ranged in files by the governesses, to whom he speaks, and intimates to the person he likes best: the ceremony of the handkerchief which the grand-signior is said to throw to the girl that he elects, is an idle tale. As soon as the grand-signior has chosen the girl that he has destined to be the partner of his bed, all the others follow her to the bath, washing and perfuming her, and dressing her superbly, conducting her, singing, dancing, and rejoicing, to the bed-chamber of the grand-signior, who is generally, on such an occasion, already in bed. No sooner has the new-selected favourite entered the chamber, introduced by the grand eunuch who is upon guard, than she kneels down, and when the sultan calls her, she creeps into bed to him at the foot of the bed, if the sultan does not order her, by especial grace, to approach by the side: after a certain time, upon a signal given by the sultan, the governesses of the girls, with all her suite, enter the apartment, and take her back again, conducting her with the same ceremony to the women's apartments; and if by good fortune she becomes pregnant, and is delivered of a boy, she is called *afaki sultanesi*, that is to say, sultanesi-mother; for the first son, she has the honour to be crowned, and she has the liberty of forming her court, as before mentioned. Eunuchs are also assigned for her guard, and for her particular service. No other ladies, though delivered of boys, are either crowned or maintained with such costly distinction as the first: however, they have their service apart, and handsome appointments. After the death of the sultan, the mothers of the male children are shut up in the old seraglio, from whence they can never come out any more, unless any of their sons ascend the throne. Baron de Tott informs us, that the female slave who becomes the mother of a sultan, and lives long enough to see her son mount the throne, is the only woman who, at that period alone, acquires the distinction of *Sultana Mother*: she is till then in the interior of her prison, with her son. The title of *Bache Kadun*, principal woman, is the first dignity of the grand-signior's harem, and she hath a larger allowance than those who have the title of second, third, and fourth woman, which are the four free women the Koran allows.

ORIGIN AND PROGRESS OF THE TURKS.] It has been the fate of the more southern and fertile parts of Asia, at different periods, to be conquered by that warlike and hardy race of men, who inhabit the vast country, known to the ancients by the name of Scythia, and among the moderns by that of Tartary. One tribe of these people, called Turks or Turcomans, which name signifies *Wanderers*, extended its conquests under various leaders, and during several centuries, from the shore of the Caspian to the straits of the Dardanelles. Being long resident in the capacity of body guards, about the courts of the Saracens, they embraced the doctrine of Mahomet, and acted for a long time as mercenaries in the armies of contending princes. Their chief residence was in the neighbourhood of Mount Caucasus, from whence they removed to Armenia Major, and after being employed as mercenaries by the sultans of Persia, they seized that kingdom about the year 1037, and spread their ravages over all the neighbouring countries. Bound by their religion to make converts to Mahometanism, they never were without a pretence for invading and ravaging the dominions of the Greek emperors, and were sometimes

commanded by very able generals. Upon the declension of the caliphate or empire of the Saracens, they made themselves masters of Palestine; and the visiting the Holy City of Jerusalem, being then part of the Christian exercises, in which they had been tolerated by the Saracens, the Turks laid the European pilgrims under such heavy contributions, and exercised such horrible cruelties upon the Christian inhabitants of the country, as gave rise to the famous Crusades, which we have mentioned more fully in the Introduction.

It unfortunately happened, that the Greek emperors were generally more jealous of the progress of the Christians than of the Turks; and though, after oceans of blood were spilt, a Christian kingdom was erected at Jerusalem under Godfrey of Boulogne, neither he nor his successors were possessed of any sufficient power for maintaining it. The Turks, about the year 1299, had extended their dominions on every side, and possessed themselves, under Othman, of some of the finest provinces in Asia, of Nice, and Prusa in Bithynia, which Othman made his capital: from Othman they took the name of Othmans, the appellation of Turks, as it signifies in the original, wanderers, or banished men, being considered by them as a term of reproach. Othman was succeeded by a race of the most warlike princes mentioned in history. About the year 1357, the Turks passed the Hellespont, and got a footing in Europe, and Amurath settled the seat of his empire at Adrianople, which he took in the year 1360: under him the order of janizaries was established. Bajazet I. after conquering Bulgaria, and defeating the Greek emperor Sigismund, laid siege to Constantinople, in hopes of subjecting all the Greek empire. His greatness and insolence provoked Tamerlane, a Tartarian prince, who was just then returned from his eastern conquests, to declare war against him. A decisive battle was fought between those rival conquerors, in Natolia, in the plain where Pompey defeated Mithridates, when Bajazet's army was cut in pieces, and he himself taken prisoner, and shut up in an iron cage, where he ended his life.

The successors of Tamerlane, by declaring war against one another, left the Turks more powerful than ever; and though their career was checked by the valour of the Venetians, Hungarians, and the famous Scanderbeg, a prince of Epirus, they gradually reduced the dominions of the Greek emperors; and, after a long siege, Mahomet II. took Constantinople in 1453. Thus, after an existence of ten centuries, from its first commencement under Constantine the Great, ended the Greek empire; an event which had been long foreseen, and was owing to many causes; the chief was the total degeneracy of the Greek emperors themselves, their courts, and families; the dislike their subjects had to the popes, and the western church, one of their patriarchs declaring publicly to a Romish legate, "that he would rather see a turban than the pope's tiara upon the great altar of Constantinople." But as the Turks, when they extended their conquests, did not exterminate, but reduce the nations to subjection, the remains of the ancient Greeks still exist, as we have already observed, particularly in Constantinople, and the neighbouring islands; where, though under grievous oppressions, they profess Christianity under their own patriarchs of Constantinople, Alexandria, Antioch, and Jerusalem. The Armenians have only three patriarchs, who are richer than those of the Greek church, the Armenians being richer than the Greeks, and more conversant with trade.

The conquest of Constantinople was followed with the submission of all Greece; and from this time the Turks have been looked upon as an European power.

Mahomet died in 1481, and was succeeded by Bajazet II. who carried on war against the Hungarians and Venetians, as well as the Persians and Egyptians. Bajazet

jazet falling ill of the gout, became indolent, was harassed by family dissensions, and at last, by order of his second son, Selim, he was poisoned by a Jew physician. Selim afterwards ordered his eldest brother Achmet to be strangled, with many other princes of the Othman race. He defeated the Persians and the prince of Mount Taurus; but being unable to penetrate into Persia, he turned his arms against Egypt, which, after many bloody battles, he annexed to his own dominions, in the year 1517, as he did Aleppo, Antioch, Tripoli, Damascus, Gaza, and many other towns.

He was succeeded, in 1520, by his son, Soliman the Magnificent; who, taking advantage of the differences which prevailed among the Christian powers, took Rhodes, and drove the knights from that island to Malta, which was given them by the emperor Charles V. The reign of Soliman, after this, was a continual war with the Christian powers, and generally successful, both by sea and land. He took Buda, the metropolis of Hungary at that time, and Belgrade, and carried off near 200,000 captives, A. D. 1526, and, two years afterwards, advanced into Austria and besieged Vienna, but retired on the approach of Charles V. He miscarried also in an attempt to take the isle of Malta. This Soliman is looked upon as the greatest prince that ever filled the throne of Othman.

He was succeeded, in 1566, by his son, Selim II. In his reign, the Turkish marine received an irrecoverable blow from the Christians, in the battle of Lepanto. This defeat might have proved fatal to the Turkish power, had the blow been pursued by the Christians, especially the Spaniards. Selim, however, took Cyprus, from the Venetians, and Tunis in Africa, from the Moors. He was succeeded, in 1575, by his son Amurath III. who forced the Persians to cede Taurus, Teflis, and many other cities, to the Turks. He likewise took the important fortress of Raab, in Hungary, and in 1593, was succeeded by Mahomet III. The memory of this prince is distinguished by his ordering nineteen of his brothers to be strangled, and ten of his father's concubines, who were supposed to be pregnant, to be thrown into the sea. He was often unsuccessful in his wars with the Christians, and died of the plague in 1604. His successor Achmet was beaten by the Persians, but forced the Austrians to a treaty in 1606, by which he retained his conquests in Hungary. Osman, a prince of great spirit, but no more than sixteen years of age, being unsuccessful against the Poles, was put to death by the janizaries. Morad IV. succeeded in 1623, and took Bagdad from the Persians. His brother Ibrahim succeeded him in 1640; a worthless, inactive prince, and strangled by the janizaries, in 1648. His successor Mahomet IV. was excellently well served by his grand vizir Cuperli. He took Candia from the Venetians, after it had been besieged for 30 years. This conquest cost the Venetians, and their allies, 80,000 men, and the Turks, it is said, 180,000. A bloody war succeeded between the Imperialists and the Turks, in which the latter were so successful, that they laid siege to Vienna, but were forced (as has been already mentioned) to raise it with great loss, by John Sobieski, king of Poland, and other Christian generals. Mahomet was, in 1687, shut up in prison by his subjects, and succeeded by his brother Soliman II.

The Turks continued unsuccessful in their wars during this reign, and that of his brother and successor, Achmet II. but Mutapha II. who mounted the throne in 1694, headed his armies in person; after some brisk campaigns, he was defeated by prince Eugene; and the peace of Carlowitz, between the Imperialists and Turks, was concluded in 1699. Soon after, Mutapha was deposed, his musti was beheaded, and his brother Achmet III. mounted the throne. He was the prince who gave shelter, at Bender, to Charles XII. of Sweden; and ended a war with

the

the Russians, by a peace concluded at Pruth. When the Russian army was surrounded without hopes of escape, the Czarina inclined the grand vizir to peace by a present of all the money, plate, and jewels that were in the army; but the Russians delivered up to the Turks, Afoph, Kamienieck, and Taiganrog, and agreed to evacuate Poland. Aehmet afterwards made war on the Venetians, which alarmed the Christian powers. The scene of action was changed to Hungary, where the Imperial general, prince Eugene, gave so many repeated defeats to the infidels, that they were forced to conclude a disgraceful peace, at Passarowitz, in 1713. An unfortunate war with the Persians, under Kouli Khan, succeeding, the populace demanded the heads of the vizir, the chief admiral, and secretary, which were accordingly struck off; but the sultan also was deposed, and Mahomet V. advanced to the throne. He was unsuccessful in his wars with Kouli Khan, and at last obliged to recognise that usurper as king of Persia. He was, after that, engaged in a war with the Imperialists and Russians; against the former he was victorious; but the success of the latter, which threatened Constantinople itself, forced him to conclude a treaty with the emperor, and after that another with the Russians. Mahomet died in 1754.

He was succeeded by his brother Osman II. who died in 1757, and was succeeded by his brother, Miltapha III. who died on the 21st of January, 1774, whilst engaged in an unsuccessful war with the Russians. In the course of this war, a considerable Russian fleet was fitted out, which set sail from the Baltic, with a view of shaking the remote parts of the Archipelago. This fleet having arrived at Minorca, departed from thence in the beginning of February 1770, and shaped its course for the Morea. Count Orlov having debarked such land forces as he had with him at Maina, which lies a little to the westward of cape Metapan, and about 50 miles to the south-west of Mitra, the ancient Sparta; the Mainotes, descendants of the Lacedaemonians, and still possessing the country of their ancestors, under subjection to the grand-signior, immediately flew to arms, and joined the Russians by thousands, from their aversion to the tyranny of the Turks. The other Greeks immediately followed their example, and the whole Morea was in commotion. The open country was quickly over-run, and Mitra, Arcadia, and several other places, as speedily taken; while the Russian ships, that had been separated, or that put into Italy, arrived successively, and landed their men in different quarters, where every small detachment soon swelled to a little army, and the Turks were every where attacked or intercepted. In the mean time the Greeks gratified their revenge, and slaughtered the Turks without mercy; and the rage and fury with which the inhabitants on the continent were seized extended itself to the islands, where also the Turks were massacred in great numbers. They were, indeed, unable to make head against the Russians and Greeks in the field; their only protection was found within their fortresses. The malecontents had so much increased since the first debarkation of the Russians, that they invested Napoli di Romania, Corinth, and the castle of Patras, with several other places of less note. But whilst they were employed in these enterprises, an army of thirty thousand men, composed chiefly of Albanians and Epiotes, entered the Morea, commanded by Seraskier, bashaw of Bosnia. This Turkish general quickly recovered all the northern part of the peninsula; and the Greeks that were found in arms, or out of their villages, were instantly put to death. The Russians were now driven back to their ships; but about the same time another Russian squadron, commanded by admiral Elphinston, arrived from England, to reinforce count Orlov's armament. The Turkish fleet also appeared, and an obstinate engagement was fought in the channel of Seio, which divides that island from Natolia, or the Lesser Asia. The

Turkish fleet was considerably superior in force, consisting of fifteen ships of the line, from sixty to ninety guns, besides a number of chebeques and galleys, amounting in the whole to near thirty sail; the Russians had only ten ships of the line, and five frigates. Some of the ships engaged with great resolution, whilst others on both sides found various causes for not approaching sufficiently near. But Spiritoz, a Russian admiral, encountered the captain pacha, in the Sultane of ninety guns, yard-arm and yard-arm; they both fought with the greatest fury, and at length ran so close, that they locked themselves together with grappling irons and other tackling. In this situation, the Russians, by throwing hand-granades from the tops, set the Turkish ship on fire, and as they could not now be disentangled, both ships were in a little time equally in flames. Thus dreadfully circumstanced, without a possibility of succour, they both at length blew up with a terrible explosion. The commanders and principal officers on both sides were saved; but the crews were almost totally lost. The dreadful fate of these ships, as well as the danger to those that were near them, produced a kind of pause; after which the action was renewed, and continued till night, without any material advantage on either side. When it became dark, the Turkish fleet cut their cables, and ran into a bay on the coast of Natolia: the Russians surrounded them thus closely pent up, and in the night some fire-ships were successfully conveyed among the Turkish fleet, by the intrepid behaviour of lieutenant Dugdale, an Englishman in the Russian service, who, though abandoned by his crew, himself directed the operations of the fire-ships. The fire took place so effectually, that in five hours the whole fleet, except one man of war and a few galleys that were towed off by the Russians, was totally destroyed; after which they entered the harbour, and bombarded and cannonaded the town, and a castle that protected it, with such success, that a shot having blown up the powder magazine in the latter, both were reduced to a heap of rubbish. Thus was there scarcely a vestige left, at nine o'clock, of a town, a castle, and a fine fleet, which had been all in existence at one the same morning.

Some of the principal military transactions by land, in the war between Russia and Turkey, having been already noticed in our account of the former empire, we shall here only add, that, after a most unfortunate war on the side of the Turks, peace was at length concluded between them and the Russians, on the 21st of July, 1774, a few months after the accession of the late grand-signior Aehmet IV. The emperor, Mustapha III. left a son, then only in his 13th year; but as he was too young to manage the reins of government, in the then critical situation of the Turkish affairs, Mustapha appointed his brother, the late emperor, to succeed him in the throne: and to this prince, under the strongest terms of recommendation, he confided the care of his infant son.

The perseverance of the Turks, supplied by their numerous Asiatic armies, and the implicit submission to their officers, rather than any excellency in military discipline or courage in war, have been the great springs of those successes which have rendered their empire so formidable. The extension, as well as duration of their empire, may indeed be in some measure owing to the military institution of the janizaries, a corps originally composed of the children of such Christian parents as could not pay their taxes. These being collected together, were formed to the exercise of arms under the eyes of their officers in the seraglio. They were generally in number about 40,000, long deemed invincible: and are still the flower of the Turkish armies; but the Ottoman power has been long on the decline. The political state of Europe, and the jealousies that subsist among its princes, is now the forced basis of this empire, and the principal reason why the finest provinces.

vinces in the world are suffered to remain in the possession of these ignorant and haughty infidels.

Notwithstanding the peace which was established in 1774 between Russia and the Porte, various sources of discord were left open between them. For an account of these we refer our readers to our historical narrative of the former empire. Towards the latter end of the year 1786, the Turks seem to have adopted a regular system of indirect hostility against the Russians, who were continually making such encroachments as made the Turks resolve to tempt again the fortune of war. Scarcely had the empress returned from the splendid journey which she made to Cherson, before a declaration of Turkish hostilities was announced at Petersburg. What part the emperor of Germany would take in this war, was not at first known. The capriciousness of his character kept the spirit of curiosity in suspense for some little time; but he soon declared himself determined to support all the claims which Russia had upon the Porte.

Instead of being disheartened at the formidableness of the confederacy that had broken out against them, the Turks applied themselves with redoubled ardour to prepare for resistance. But an event that seems greatly to have contributed to the bad success experienced by the crescent in the year 1789, was the death of Achmet the Fourth, grand signior, on the 7th of April.

This prince, if we make suitable allowances for the disadvantages under which he laboured as a despotic monarch, and the prejudices of his country, may be allowed to possess some claim to our toleration. He filled the throne of Constantinople without reflecting disgrace upon human nature. His temper appears to have been mild and humane. He not only permitted Selim his nephew, son of the late emperor, to live, but even publicly acknowledged him for his successor. His reign was not stained with so many arbitrary murders as those of his predecessors, nor did he think it at all necessary that a disgraced minister should part at once with his office and his life. He suffered his countrymen to improve by the arts and military discipline of Europe. Ysouf, his prime minister during the three last years of his life, though by no means consistently great, must be allowed to deserve our applause; and will be better known to posterity as the patron of the Turkish translation of the Encyclopédie, than as the victorious and skilful rival of the Austrian arms in the Banat of Transylvania.

Achmet died at the unenterprising age of sixty-four, and Selim the Third succeeded at twenty-eight. In the vigour of youth he thought it necessary to distinguish himself by something extraordinary; and at first purposed to put himself at the head of his forces. He was easily, as might be expected from his effeminate education, dissuaded from this rash and ridiculous project. But he conceived that at least it became him to discomentenance the ministers of his predecessor, to confound their plans, and reverse all their proceedings. These ministers had acquired in some degree the confidence of those who acted under their command; and it appeared in the sequel, that the fantastic splendour of a new and juvenile sovereignty could not compensate for the capricious and arbitrary changes with which his accession was accompanied.

In the year 1788 Chockzin and Oczakow surrendered to the arms of Russia, as will be found in the history of that country; and on the 12th of Sept. 1786, the Austrian forces sat down before Belgrade, and with that good fortune which seemed almost constantly to attend their present commander marshal Laudohn. The place, together with its numerous garrisons, surrendered, after a vigorous resistance, on the 8th of October. The rest of the campaign was little else than a facerann of the most important success; and a circumstance that did not a little contribute

late

bute to this, was the system adopted by the Austrians and Russians, of suffering the Turkish troops to march out of the several places they garrisoned without molestation. Bucharest, the capital of Walachia, fell without opposition into the hands of prince Cobourg; while Akerman on the Black Sea was reduced by the Russians; and Bender surrendered to prince Potemkin, not without suspicion of sinister practices, on the 15th of November. One only check presented itself to the allied arms. The garrison of Orsova displayed the most inflexible constancy; and marshal Laudohn was obliged to raise the siege of this place in the middle of December, after having remained before it for a period of six weeks. In a short time after, the siege was renewed, and Orsova was reduced on the 16th of April, 1790.

After the reduction of Orsova, the war was carried on with languor on the part of Austria; and in the month of June a conference was agreed upon at Reichenbach, at which the ministers of Prussia, Austria, England, and the United Provinces assisted, and at which also an envoy from Poland was occasionally present. After a negotiation, which continued till the 17th of August, it was agreed that a peace should be concluded between the king of Hungary and the Ottoman Porte, that the basis of this treaty should be a general surrender of all the conquests made by the former, retaining only Choczim as a security till the Porte should accede to the terms of the agreement, when it was also to be restored. On the other hand, the king of Prussia gave up the Belgic provinces, and even promised his assistance in reducing them to the dominion of the house of Austria.

The king of Prussia was less successful in his mediation with Russia. Catherine had not, like Leopold, an imperial crown at stake, which, unsubstantial as it is, has always its charms with those who are educated in the habitual adoration of rank and dignities. Her conquests also on the side of Turkey were too important to be easily relinquished; and she considered her dignity attacked by the insolent style of Prussian mediation. The substance of her answer to the Prussian memorial was therefore, "That the empress of Russia would make peace and war with whom she pleased, without the interference of any foreign power."

The campaign of 1791 opened on the part of Russia with the taking of Maczin, on the 4th of April, by prince Gallitzin; and in a subsequent victory on the 12th by the same general, in the neighbourhood of Brailow, the Turks lost not less than 4000 men, and upwards of 100 officers, besides many pieces of cannon. On the 14th the Russian arms experienced a check, by which they lost about 700 men, and were obliged to relinquish the intention of besieging Brailow. After reinforcing this place, the vizir proceeded to the banks of the Danube near Silistria; and by means of a bridge which he threw across the river, his advanced posts were enabled to make incursions on the opposite side. The ability of the vizir, and the valour of the Turks, were however exerted in vain against the discipline and experience of European armies. In the month of June, 15,000 Turks were defeated by a party of cavalry under general Kutusow. On the 3d of July the fortress of Anape was taken by general Gudowitsch, and the garrison to the amount of 6,000 men made prisoners. This event was followed on the 9th of the same month by a signal victory which prince Repnin obtained near Maczin over a body of 70,000, the flower of the Turkish army. The Ottomans left upwards of 4000 dead upon the field of battle, and lost their entire camp equipage, colours, and 30 pieces of cannon. The Russians are said to have lost only 150 men killed, and between 2 and 300 wounded.

While the war was thus vigorously carried on, the mediating powers were not inactive. Great Britain and Prussia, in particular, declared themselves determined to support the balance of Europe, and to force the empress to peace upon the basis

of a *status quo*. Of the interference of Britain in this dispute, we have treated more largely in another place. To the first applications of the English minister the empress answered in nearly the same terms in which she had before replied to the memorial of Prussia—"That the British court would not be permitted to dictate the terms of peace." In the course of the negotiation, however, her demands became more moderate; and as the northern powers, and particularly Denmark, began to exert themselves for the prevention of hostilities, she confined her views to the possession of Oczakow, with the district extending from the Bog to the Niefler, and even then providing for the free navigation of the latter river. The negotiation was protracted to the 11th of August, when at length peace was concluded between the czarina and the Porte, nearly upon these terms:—terms, which, considering the ill success of the war, cannot be accounted very disadvantageous to the Porte, who has lost a fortress more useful for the purpose of annoying Russia, than for defending its own territories; but certainly of considerable importance to Russia, which, by this cession, has secured the peaceable possession of the Crimea.

It is computed that in the last war Turkey lost 200,000 soldiers, Russia 100,000; the Austrians, who fell in battle, or in the unhealthy marshes, are supposed to exceed 130,000.

The new division of Poland is not likely to prove agreeable to the Porte; the fertile province of the Ukraine, from its being in the vicinity of the Turkish emperor's dominions, and being one of the districts lately seized by Russia, must in any future war become very convenient to the latter court, for the purpose of forming establishments and magazines. The policy of the court of Constantinople probably may view these approaches as preliminary steps to a similar attack upon the disciples of Mahomet.

Intelligence was received at Constantinople in December 1793, that Giafar Khan, sovereign of the Chiras, one of the most powerful princes of Persia, had been dethroned by his brother, Mahomet Khan, who entered into the possession of his dominions. This new Persian usurper is now threatening the Turkish dominions with a powerful invasion. A far more formidable enemy has lately arisen in Arabia, who menaces the Sublime Porte with no less than a total subversion of the Mahometan religion. This enemy is a Scheich Hujabi, who is at the head of a numerous Arabian tribe, encamped between Mecca and Bassora. He professes to deny the divine mission of Mahomet, the sanctity of the Alcoran, and all the religious ceremonies of Mahometanism. He and his tribe adore the Divinity in the open field, despising the institution of mosques or temples. These new sectaries seem to menace Mecca and Medina, which contain immense treasure.

The divan is at present so far from taking any steps inimical to the new republic of France, that it seems to have more predilection for its cause than avowed amity for that of the powers combined against it.

Selim III. Grand Signior, born in 1761, succeeded to the throne of Turkey on the death of his uncle, the late sultan, April 7, 1789.

TARTARY IN ASIA.

SITUATION AND EXTENT.

	Miles.	Degrees.
Length	4000	} between { 50 and 150 east longitude. 30 and 72 north latitude.
Breadth	2400	

**BOUNDARIES.]** IT would be deceiving the reader to desire him to depend upon the accounts given us by geographers, of the extent, limits, and situations of these vast regions. Even the empress of Russia and her ministry are ignorant of her precise limits with the Chinese, the Persians, and other nations. Tartary, taken in its fullest extent, is bounded by the Frozen Ocean, on the North; by the Pacific Ocean, on the East; by China, India, Persia, and the Caspian Sea, on the South; and by Muscovy on the West.

Grand Divisions.	Subdivisions.	Chief Towns.	Sq. M.

South-west division	{ Circassian and Afracan { Tartary	{ Terki { Afracan	
Middle division	{ Siberia { Kalmuc Tartary { Usbeck Tartary	{ Tobolsk { Bocharia { Samarcand	850,000 339,840

Kamtschatka is a great peninsula, which extends from North to South about seven degrees thirty minutes. It is divided into four districts, Bolcheretk, Tigiliskaia Krepost, Verchnoi or Upper Kamtschatkoi Ostrog, and Nizhnoi or Lower Kamtschatkoi Ostrog.

**MOUNTAINS.]** The principal mountains are Caucasus in Circassia and those of Taurus and Ararat so contiguous to it, that they appear like a continuation of the same mountain, which crosses all Asia, from Mongrelia to the Indies, and the mountains of Stolp, in the North.

**SEAS.]** These are the Frozen Ocean, the Pacific Ocean, and the Caspian Sea.

**RIVERS.]** The principal rivers are, the Wolga, which runs a course of two thousand miles; the Oby, which divides Asia from Europe; the Tabol, Irtyz, Genesha or Jenka; the Burrampooter, the Lena, and the Argun, which divides the Russian and Chinese empires.

**AIR, CLIMATE, SOIL, AND PRODUCE.]** The air of this country is very different, by reason of its vast extent from north to south; the northern parts reaching beyond the arctic polar circle, and the southern being in the same latitudes with Spain, France, Italy, and part of Turkey.

Nova Zembla, and Russian Lapland, are most uncomfortable regions; the earth, which is covered with snow nine months in the year, being extremely barren, and every where incumbered with unwholesome marshes, uninhabited mountains, and impenetrable thickneses. The climate of Siberia is cold, but the air pure and wholesome; and Mr. Tooke observes, that its inhabitants in all probability would live to an extreme old age, if they were not so much addicted to spirituous liquors. Siberia produces rye, oats, and barley, almost to the 60th degree of northern latitude. Cabbages, radishes, turnips, and cucumbers, thrive here tolerably well; but scarcely any other greens. All experiments to bring fruit trees to bear, have hitherto proved vain: but there is reason to believe that industry and patience may at length overcome the rudeness of the climate. Currants and strawberries of several sorts are said to grow here in us great perfection as in the English gardens. Herbs, as well medicinal as common, together with various edible roots, are found very generally here: but there are no bees in Siberia. Astracan, and the southern parts of Tartary, are extremely fertile, owing more to nature than industry. The parts that are cultivated produce excellent fruits of almost all the kinds known in Europe, especially grapes, which are reckoned the largest and finest in the world. Their summers are very dry; and from the end of July to the beginning of October, the air is pestered, and the soil sometimes ruined, by incredible quantities of locusts. Mr Bell, who travelled with the Russian ambassador to China, represents some parts of Tartary as desirable and fertile countries, the grass growing spontaneously to an amazing height. The country of Thibet is the highest in Asia, and forms a portion of that elevated region, which gives rise to the rivers of India and China, and those of Siberia and other parts of Tartary.

[METALS AND MINERALS.] It is said that Siberia contains mines of gold, silver, copper, iron, jasper, lapis lazuli, and loadstones; a sort of large teeth found here creates dispute among the naturalists, whether they belong to elephants or fishes.

[ANIMALS.] These are camels, dromedaries, bears, wolves, and all the other land and amphibious animals that are common in the northern parts of Europe. The horses are of a good size for the saddle, and very hardy; as they run wild till they are five or six years old, they are generally headstrong. Near Astracan there is a bird called by the Russians *baba*, of a grey colour, and something larger than a swan; he has a broad bill, under which hangs a bag that may contain a quart or more; he wades near the edge of a river, and on seeing a shoal or fry of small fishes, spreads his wings and drives them to a shallow where he gobbles as many of them as he can put into his bag, and then going ashore, eats them or carries them to his young. Some travellers take this bird to be the pelican.

The forests of Siberia are well stocked with a variety of animals, some of which are not to be found in other countries. These supply the inhabitants with food and cloaths; and, at the same time, furnish them with commodities for an advantageous trade. Siberia may be considered as the native country of black foxes, fables, and ermines, the skins of which are superior to those of any part of the world. Horses and cattle are in great plenty, and sold at low prices.

The *Bos grunniens* of Linnaeus, or grunting ox, which inhabits Tartary and Thibet, hath a tail of uncommon beauty, full and nowing, of a glossy and silky texture. These tails are a considerable article of exportation from Thibet. The Indians fasten small bundles of the hair to a handle, which they use for fly-flaps; the Chinese dye tufts of it with a beautiful scarlet, to decorate their caps, and the Turks employ it as ornaments to their standards; by some erroneously called horse-tails.

POPU-

**POPULATION, INHABITANTS, MANNERS, } We can form no probable con-  
CUSTOMS, DIVERSIONS, AND DRESS. } jecture as to the number of the in-  
habitants of Tartary; but from many circumstances they are far from being pro-  
portional to its extent. They are, in general, strong made, stout men; their faces  
broad, their noses flatish, their eyes small and black, but very quick; their beards  
are scarcely visible, as they continually thin them by pulling up the hairs by  
the roots.**

The beauty of the Circassian women is a staple commodity; for parents make no scruple of selling their daughters to recruit the seraglios, or rather harems, of the great men of Turkey and Persia. They are purchased, when young, by merchants, and taught such accomplishments as suit their capacities to render them more valuable against the day of sale.

According to Mr. Bruce, the Circassian women are extremely well shaped, with exceeding fine features, smooth, clear complexions, and beautiful black eyes, which with their black hair hanging in two tresses, one on each side the face, give them a most lovely appearance: they wear a black coil on their heads, covered with a fine white cloth tied under the chin. During the summer they all wear only a thin garment of divers colours, open so low before, that one may see below their navels: this, with their beautiful faces always uncovered, (contrary to the custom of most of the other provinces in those parts), their good humour and lively freedom in conversation, contributes to render them very desirable: they have the reputation of being very chaste, although it is an established point of good manners among them, that as soon as any person comes to speak to the wife, the husband goes out of the house. Their language they have in common with the other neighbouring Tartars; although the chief people among them are also not ignorant of the Russian; the apparel of the men of Circassia is much the same with that of the Nagayans, only their caps are something larger, and their cloaks being likewise of coarse cloth or sheep-skins, are fastened only at the neck, with a string, and as they are not large enough to cover the whole body, they turn them round according to the wind and weather.

The Tartars are in general great wanderers; in their peregrinations they set out in the spring, their number in one body being frequently 10,000, preceded by their flocks and herds. When they come to an inviting spot, they live upon it till the verdure is consumed. They have little money, except what they get from their neighbours the Russians, Persians, or Turks, in exchange for cattle: with this they purchase cloth, silks, stuffs, and other apparel for their women. They have few mechanics, except those who make arms. They avoid all labour as the greatest slavery: their only employment is tending their flocks, hunting, and managing their herds. If they are angry with a person, they will he may live in one fixed place, and work like a Russian. Among themselves they are social, and extremely hospitable to strangers and travelers, who confidentially put themselves under their protection. They are naturally of an easy cheerful temper, always disposed to laughter, and seldom depressed with care or melancholy. There is a strong resemblance between the northern and independent Tartars and some nations of Canada in North America; particularly, when any of their people are infirm through great age, or seized with distempers reckoned incurable, they make a small hut for the patient near some river, in which they leave him with some provisions, and seldom or never return to visit him. On such occasions they say they do their parents a good office, in sending them to a better world. Notwithstanding this behaviour, many nations of the Tartars, especially towards the south, are tractable, humane, and susceptible of pious and virtuous sentiments. Their affection for their fathers, and their submission to their authority, cannot be exceeded; and  
this.

this noble quality of filial love has distinguished them in all ages. History tells us, that Darius, king of Persia, having invaded them with all the forces of his empire, and the Scythians retiring by little and little, Darius sent an ambassador to demand where it was they proposed to conclude their retreat, and when they intended to begin fighting. They returned for answer, "That they had no cities or cultivated fields, for the defence of which they should give him battle; but when once he came to the place of their fathers' monuments, he should then understand in what manner the Scythians used to fight."

The Tartars are inured to horsemanship from their infancy; they seldom appear on foot. They are dextrous in shooting at a mark, inasmuch that a Tartar, while at full gallop, will split a pole with an arrow, though at a considerable distance. The dress of the men is very simple, and fit for action; it generally consists of a short jacket, with narrow sleeves made of deer skin, having the fur outward; trowsers and hose of the same kind of skin, both of one piece, and tight to the hinds. The Tartars live in huts half sunk under ground; they have a fire in the middle, with a hole in the top to let out the smoke, and benches round the fire to sit or lie upon. This seems to be the common method of living among all the northern nations, from Lapland eastward to the Japanese ocean. In the extreme northern provinces, during the winter, every family burrows itself under ground; and we are told, that so sociable are they in their dispositions, that they make subterraneous communications with each other, so that they may be said to live in an invisible city. The Tartars are immoderately fond of horse-flesh, especially if it be young, and a little tainted, which makes their cabins extremely nauseous. Though horse-flesh be preferred raw by some northern tribes, the general way of eating it is after it has been smoked and dried. The Tartars purchase their wives with cattle. In their marriages they are not very delicate. Little or no difference is made between the child of a concubine or slave, and that of the wife; but among the heads of tribes the wife's son is always preferred to the succession. After a wife is turned of forty she is employed in menial duties as another servant, and as such must attend the young wife who succeeds to her place; nor is it uncommon, in some of the more barbarous tribes, for a father to marry his own daughter.

The descendants of the old inhabitants of Siberia are still most of them idolaters. They consist of many nations, entirely differing from each other in their manner of living, religion, language, and countenances. But in this they agree, that none of them follow agriculture, which is carried on by some Tartar tribes, chiefly by those converted to Christianity. A few of them breed cattle, and others follow hunting. The population of Siberia has been much increased since it became a Russian province; for the Russians have founded therein a number of towns, fortresses, and villages. Notwithstanding which it presents but a void and desert view; since, by its extent it is capable of supporting several millions more than it at present contains. For the manners and customs of the other Tartars belonging to the Russian empire, we refer to our account of that country.

**RELIGION.** The religion of the Tartars is variously modified by that of their neighbours; for it partakes of the Mahometan, the Gentoo, the Greek, and even the Popish religions. Some of them are idolaters, and worship little rude images dressed up in rags. Each has his own deity, with whom he makes very free when matters do not go according to his mind.

The Circassians are Pagans, for notwithstanding they use circumcision, they have neither priest, altar, or mosque. Every body here offers his own sacrifice at pleasure, for which, however, he has certain days, established rather by custom than any positive command; their most solemn sacrifice is offered at the death of their nearest friends, upon which occasion both men and women meet in the field

to be present at the offering, which is a he-goat; and having killed it, they flay it, and stretch the skin with the head and horns on, upon a cross at the top of a long pole, placed commonly in a quickset hedge, (to keep the cattle from it), and near the place the sacrifice is offered by boiling and roasting the flesh, which they afterwards eat. When the feast is over, the men rise, and having paid their adoration to the skin, and muttering certain prayers, the women withdraw, and the men conclude the ceremony with drinking a great quantity of aqua vite, and often with a quarrel.

But the religion and government of the kingdom of Thibet, and Lassa, a large tract of Tartary, bordering upon China, are most worthy of attention. The Thibetians are governed by the Grand Lama, or Delai Lama, who is not only submitted to, and adored by them, but is also the great object of adoration for the various tribes of Heathen Tartars, who roam through the vast tract of continent which stretches from the banks of the Wolga, to Korea on the sea of Japan. He is not only the sovereign pontiff, the vicergerent of the Deity on earth; but, as superstition is ever the strongest where it is most removed from its object, the more remote Tartars absolutely regard him as the Deity himself. They believe him to be immortal, and endowed with all knowledge and virtue. Every year they come up from different parts, to worship and make rich offerings at his shrine: even the emperor of China, who is a Manchou Tartar, does not fail in acknowledgments to him in his religious capacity, though the Lama is tributary to the emperor, and actually entertains, at a great expence, in the palace of Peking, an inferior Lama, deputed as his nuncio from Thibet. The opinion of those who are reputed the most orthodox among the Thibetians is, that when the Grand Lama seems to die, either of old age or infirmity, his soul in fact only quits a crazy habitation, to look for another younger or better, and it is discovered again in the body of some child, by certain tokens known only to the lamas or priests, in which order he always appears. In 1774, the Grand Lama was an infant, which had been discovered some time before by the Tsyothou Lama, who in authority and sanctity of character is next to the Grand Lama, and during his minority acts as chief. The lamas, who form the most numerous, as well as the most powerful body in the state, have the priesthood entirely in their hands; and, besides, till up many monastic orders, which are held in great veneration among them. The residence of the Grand Lama is at Patoh, a vast palace on a mountain near the banks of the Burrampooter, about seven miles from Lassa. The English East India Company made a treaty with the Lama in 1774\*. The religion of Thibet, though in many respects it differs from that of the Indian Bramins, yet in others has a great affinity to it. The Thibetians have a great veneration for the cow, and also highly respect the waters of the Ganges, the source of which they believe to be in heaven. The Sumiatles, or Indian pilgrims, often visit Thibet as an holy place, and the Lama always entertains a body of two or three hundred in his pay. Besides his religious influence and authority, the Grand Lama enjoys unlimited power throughout his dominions, which are very extensive, and stretch to Bengal.

Another religion, which is very prevalent among the Tartars, is that of Schamanism. The professors of this religious sect believe in one supreme God, the creator of all things. They believe that he loves his creation, and all his creatures; that he knows every thing, and is all powerful; but that he pays no attention to the particular actions of men, being too great for them to be able to offend or

\* The town of Dellamotta, which commanded the principal pass through the ridge of the Bootean mountains, was taken by Storm by captain Jenca, in 1773, and the fame of this exploit made the Thibetians sue for peace.

please

please him. But they also maintain, that the Supreme Being has divided the government of the world, and the destiny of men, among a great number of subaltern divinities, under his command and control, but who nevertheless generally act according to their own fancies; and therefore mankind cannot dispense with using all the means in their power for obtaining their favour. They likewise suppose, that, for the most part, these inferior deities abominate and punish premeditated villainy, fraud, and cruelty. They are all firmly persuaded of a future existence; but they have many superstitious notions and practices. Among all the Schamanes, women are considered as beings vastly inferior to men, and are thought to have been created only for their sensual pleasure, to people the world, and to look after household affairs: and in consequence of these principles, they are treated with severity or contempt.

[LEARNING.] The reader may be surpris'd to find this article in speaking of Tartars; yet nothing is more certain than that, under Zingis Khan and Tamerlane, and their early descendants, Astracan and the neighbouring countries were the seats of learning as well as empire. Modern luxury, be it ever so splendid, falls short of the magnificence of those princes; and some remains of their taste in architecture are still extant, but in spots so desolate that they are almost inaccessible. The encouragement of learning was the first care of the prince, and it was generally cultivated by his own relations or principal grandees. They wrote in the Persian and Arabic tongues; and their histories, many of which are still extant in manuscript, carry with them the strongest marks of authenticity.

[CURIOSITIES.] These are comprehended in the remains of the buildings left by the above mentioned great conquerors and their successors. Remains of ditches and ramparts are frequently met with, which heretofore either surrounded towns, now quite demolished, or defended camps, forts, or castles, the vestiges of which are often to be discovered. The slabode, or Tartarian suburb of Kafanof, on the Oka, seems to have been the residence of a khan. In the midst of the ruins of that city is a round and elevated tower, called in their language *Misquir*, a sort of temple. Here are also the remains of the walls of a palace; and in one of the mausoleums, or burial places, is a very considerable mausoleum, all which edifices are built of hewn stone and bricks. From an Arabic inscription we learn, that the khan Schagali was buried there in the 962d year of the hegira, or the 1520th of the Christian era. Near Mount Caucasus are still very considerable remains of Madfchar, a celebrated city of former times. Near Derbent are numerous tombs covered with cylindrical stones, exceeding the usual stature of men, with Arabic inscriptions. In the environs of Astracan the ruins of ancient Astracan are very visible; and the rubbish and ramparts of another respectable town still exist near Tzaritzin, on the left shore of the Wolga. A little below the mouth of the Kama which empties itself into the above mentioned river, are many superb monuments of the ancient city Bulgaria, consisting of towers, mosques, houses and sepulchres, all built of stone or brick. The oldest epitaphs have been there more than eleven centuries, and the most modern at least four hundred years. Not far from hence, on the Tscheremtkhan, a little river that runs into the Wolga, are found ruins somewhat more injured by the depredations of time: they are those of Boulymer, an ancient and very considerable city of the Bulgarians. The Tartars have erected upon its site the small town of Bilvaïrk.

In the fortress of Kafan is a monument of the ancient Tartarian kingdom of that name. Its lofty walls are so broad, that they serve at present for ramparts: the turrets of which, as well as the old palace of the khan, are built of hewn stone. Ascending the river Kafanlia, we meet with the strong ramparts of the old Kafan. Near the Oufa are cemetaries full of innumerable inscriptions, and several sepul-

chral vaults. The ramparts of Sibir, the ancient capital of Tartary, are still seen about Tobolsk upon the Irtysh. The lofty walls of Tontoura appear yet in the Baraba, a little gulf of the river Om; and near the mouth of the Oural are the ditches of the city Saratschik. There are other ruins in Siberia; and the desert of Kirguis abounds in relics of opulent cities. Some gold and silver coins have been found there, with several manuscripts neatly written, which were carried to Peterburgh. In 1720 there were found in Kalme Tartary a subterraneous house of stone, some urns, lamps, and ear-rings, an equestrian statue, an Oriental prince with a diadem on his head, two women seated on thrones, and a roll of manuscripts, which was sent by Peter the Great to the Academy of Inscriptions at Paris, and proved to be in the language of Thibet. About 80 miles from Lassa is the lake Palte, or Jangfo, of such extent, according to the natives, that it requires 18 days to walk round it. In the middle of it are islands, one of which is the seat of the *Lamissa Tarcopama*, or the *great regenerate*, in whom the Thibetians think a divine spirit inhabits as in the Great Lama. The quantity of gold ornaments found in the tombs of Siberia, and of elegant workmanship, as bracelets, collars in the shape of serpents, vases, crowns, rings, bucklers, fibres, figures of animals, Tartar idols, &c. is surprizing. It is supposed that these burial-places were made about the time of Zinghis Khan, and that the superstition prevailed in those parts, of departed souls following the same kind of life they did in this world, and therefore, on the death of a prince, they sacrificed his favourite wife, &c. and buried with him his arms and other valuable things.

[CITIES AND TOWNS.] Of these we know little but the names, and that they are in general no better than fixed hordes. They may be said to be places of abode rather than towns or cities, for we do not find that they are under any regular government, or that they can make a defence against an enemy. The few places, however, that are mentioned in the preceding divisions of this country, merit notice. Tobolsk and Astracan are considerable cities; the first contains 15,000, and the latter 70,000 inhabitants. Forts, villages, and towns, have also been lately erected in different parts of Siberia, for civilizing the inhabitants, and rendering them obedient to the Russian government.

Tekl, the capital of Circassian Tartary, is seated in a spacious plain on an island formed by the rivers Tekl and Butrow, and is garrisoned by 2000 regulars, and 1000 Cossacks. It is fortified with ramparts and bastions in the modern style, well stored with cannon, and has always a considerable garrison in it, under the command of a governor. The Circassian prince who resides here, is allowed five hundred Russians for his guard, but none of his own subjects are permitted to dwell within any part of the fortifications. Ever since the reduction of those parts to the obedience of Russia, they have put, in all places of strength, not only Russian garrisons and governors, but magistrates, and priests for the exercise of the Christian religion; yet the Circassian Tartars are governed by their own princes, lords, and judges; but these administer justice in the name of the empress, and in matters of importance, not without the presence of the Russian governors, being all obliged to take the oath of allegiance to her Imperial majesty.

Tarku is the capital of Dagestan, and contains 3000 houses, two stories high, platformed at top for walking. The Tartars of this province are numerous, and Mahometans, governed by a theskal, whose office is elective. The city of Derbent is situated on the Caspian shore, and called the frontier of Persia. It is said to have been first built by Alexander the Great, and that he here received the visit from the Amazonian queen Thalestris. It is now inclosed with a broad strong wall, built with large square stones, hard as marble, from the quarries in Caucasus. Lassa is a small city, but the houses are of stone, and are spacious and lofty.

**COMMERCE AND MANUFACTURES.]** This head makes no figure in the history of Tartary, their chief traffic consisting in cattle, the fine ox tails, skins, beavers, rhubarb, musk, and fish. The Astracans, notwithstanding their interruptions by the wild Tartars, carry on a considerable traffic with Persia, to which they export leather, woollen and linen cloth, and some European manufactures. The Bucharians also are a very commercial people: their caravans travel through a great part of Asia, and traffic with Thibet, China, India, Persia, and Russia. Their principal marts are Tomsk and Orenburgh. Gold dust is often found in the sand of the rivers of Bucharia.

**HISTORY.]** Though it is certain that Tartary, formerly known by the name of Scythia, peopled the northern parts of Europe, and furnished those amazing swarms of warriors that conquered the Roman empire, yet it is now but very thinly inhabited; and those fine provinces, where learning and the arts resided, are now scenes of horror and barbarity. This must have been owing to the dreadful massacres made among the natives by the two above-mentioned conquerors and their descendants; for nothing is more common in their histories than their putting to the sword three or four hundred thousand people in a few days.

The country of Ulbec Tartary was once the seat of a more powerful empire than that of Rome or Greece. It was not only the native country, but the favourite residence of Zingis Khan and Tamerlane, who enriched it with the spoils of India and the eastern world. The former, about the year 1200 made himself master of these regions, which form at this day the Asiatic part of the Russian empire; and his son Batou Sagin conquered Southern Russia, and peopled it with Tartar colonies, which are now confounded or blended with the Russians. Long and heavily did the Tartar yoke gall the neck of Russia, till alleviated by divisions among the conquerors. But not till the time of Ivan III. who ascended the Russian throne in 1462, were the Russians delivered from these warlike invaders. Ivan repeatedly defeated them, subdued the kingdom of Kafan and other provinces, and made his name respected in all that quarter.

Tamerlane's fame hath been more permanent than that of Zingis Khan. His defeat of the Turkish emperor Bajazet hath been before noticed in the history of that nation. The honour of being allied to him is claimed not only by all the Khans and petty princes of Tartary, but by the emperor of Indostan himself. The capital of this country is Bokaria, which was known to the ancients by the name of Bucharia; situated in the latitude of 39 degrees 15 minutes, and 13 miles distant from the once famous city of Samarcand, the birth-place of Tamerlane, who died in the year 1405.

The present inhabitants of this immense common compose innumerable tribes, who range at pleasure with their flocks and herds in the old patriarchal manner. Their tribes are commanded by separate Khans or leaders, who, upon particular emergencies, elect a great Khan, invested with a paramount power over strangers as well as natives, and whose forces often amount to 100,000 horsemen. His palace is a military station, which is moved and shifted according to the chance of war, and other occasions. When the vast dominions of Zenghis Khan fell to pieces under his successors in the 16th century, the Mogul and Tartar hordes, who had formed one empire, again separated, and have since continued distinct.

Besides what may be learned from their history and traditions, the standard or colours of the respective tribes form a distinctive mark, whereby each Tartar knows the tribe to which he belongs. These marks of distinction consist of a piece of Chinese linen, or other coloured stuff, suspended on a lance, twelve feet in length, among the Pagan Tartars. The Mahometan Tartars write upon their standards the name of *God*, in the Arabic language. The Kalmucs and the Mogul Tartars distinguish

distinguish theirs by the name of some animal; and as all the branches or divisions of a tribe preserve the figure drawn upon the standard of that tribe, adding only the particular denomination of each branch, those standards answer the purpose of a genealogical tree or table.

The Tartars are bounded on every side by the Russian, the Chinese, the Mogul, the Persian, and the Turkish empires; each of whom are pushing on their conquests in this extensive, and in some places, fertile country. The Khans pay a tribute, or acknowledgment of their dependency, to one or other of their powerful neighbours, who treat them with caution and lenity; as the friendship of these barbarians is often of the utmost consequence. Some tribes maintain total independency; and when united form a powerful body, and of late have been very formidable to their neighbours, particularly to the Chinese, as we shall mention in our account of that empire. The method of carrying on war by devastation is very ancient among the Tartars, and practised by all of them from the Danube eastward. This circumstance renders them a dreadful enemy to regular troops, who must thereby be deprived of subsistence; while the Tartars, having always many spare horses to kill and eat, are at no loss for provisions.

## THE EMPIRE OF CHINA.

## SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 1450 } Breadth 1260 }	between { 20 and 42 north latitude. 98 and 123 east longitude.	1,105,100
	Chinese Tartary.	644,000

**BOUNDARIES.]** IT is bounded by the Chinese Tartary, and an amazing stone wall, of five hundred leagues in length, on the North; by the Pacific Ocean, which divides it from North America, on the East; by the Chinese Sea, South; and by Tonquin, and the Tartarian countries and mountains of Thibet and Russia, on the West.

**DIVISIONS.]** The great division of this empire, according to the authors of the Universal History, and the abbé Grosier, in his general Description of China, is into fifteen provinces (exclusive of that of Lyau-Tong, which is situated without the Great Wall, though under the same dominion); each of which might, for their largeness, fertility, populousness, and opulence, pass for so many distinct kingdoms. We have the following account of the division of this kingdom from the best authority. It will be of use in consulting the map.

Provinces.	Chief Towns.	CHINESE TARTARY.	
Pe-tcheli	Pekin	<p>This is bounded on the north by Siberia; on the east by the Gulf of Kamtschatka and the eastern sea; on the south by China; and on the west by the country of the Kalmouks, who are established between the Caspian sea, and Casghar.</p> <p><b>EASTERN CHINESE TARTARY</b></p> <p>Extends north and south from the 41st to the 55th degree of north latitude, and east and west from about the 137th degree of longitude to the eastern sea. It is bounded on the north by Siberia; on the south by the Gulf of Lea-tong and Corea; on the east by the eastern sea; and on the west by the country of the Moguls. The country is divided into three grand departments.</p>

But it is necessary to acquaint the reader, that the information contained in Du Halde's voluminous account of China, is drawn from the papers of Jesuits, and other monks sent hither by the pope, but whose millions have been at an end for above half a century. Some of those fathers were men of penetration and judgment, and had great opportunities of information; but their accounts of this empire are justly to be suspected. They had powerful enemies at the court of Rome, where they endeavoured to maintain their footing by magnifying their own labours and successes, as well as the importance of the Chinese empire. If their accounts are to be received with much caution, much more are those of succeeding travellers, who have seldom penetrated farther into the empire than was necessary for the purpose of trade.

**NAME.]** It is probably owing to a Chinese word, signifying *Middle*, from a notion entertained by the natives that their country lay in the middle of the world.

**MOUNTAINS.]** China, except to the north, is a plain country, and contains no remarkable mountains.

**RIVERS AND WATER.]** The chief are the Yamour and the Argun, which are the boundary between the Russian and Chinese Tartary; the Croceus, or Whambo, or the Yellow River; the Kiam, or the Blue River; and the Tay. Common water in China is often so bad that it must be boiled to make it fit for use.

**BAYS.]** The chief are those of Nankin and Canton.

**CANALS.]** The commodiousness and length of the canals of the Chinese are wonderful. The chief of them are lined with hewn stone on the sides, and they are so deep that they carry large vessels, and sometimes extend above 1000 miles in length. That is a most celebrated canal which extends from Canton as far as Pekin, and which

forms a communication between the fourthern and northern provinces. This work, which is called *The Royal Canal*, is six hundred leagues in length; and its navigation is no where interrupted but by the mountain *Melling*, where passengers are obliged to travel ten or twelve leagues over land. In this principal canal between others end, which stretch out into the country, and form a communication between the neighbouring cities, towns, and villages. The greater part of those private canals have been made by the industry of the inhabitants of these cities and towns, who have spared neither labour nor expence to obtain an easy conveyance of their goods into all the provinces of the empire. The vessels which navigate these canals are provided with all the conveniencies of life; and it has been thought by some, that in China the water contains as many inhabitants as the land. The canals are furnished with stone quays, and sometimes with bridges of an amazing construction. The navigation is slow, and the vessels sometimes drawn by men. No precautions are wanting, that could be formed by art or perseverance, for the safety of the passengers, in case a canal is crossed by a rapid river, or exposed to torrents from the mountains. These canals, and the variety that is seen upon their borders, renders China delightful to the eye, as well as fertile, even in places naturally barren and disagreeable.

**FORESTS.]** Such is the industry of the Chinese, that they are not encumbered with forests; but no country is better fitted for producing timber of all kinds. They suffer none to grow but for ornament or use, or on the sides of mountains, from whence the trees, when cut down, can be conveyed by water.

**AIR, SOIL, AND PRODUCE.]** The air of this empire varies much, according to local situation. Towards the north it is sharp, in the middle mild, and in the south hot. All travellers agree in their accounts of the fertility of China, and of the extent and beauty of its plains. Neither inclosure, hedges, nor ditches are seen in them; scarcely is there to be found a single tree: so careful is the husbandman not to lose the smallest portion of his land. The plains of the northern provinces produce wheat, those of the south, rice, because the country is low, and even covered with water. In several provinces there are two crops in a year; and even in the interval between the harvests, the people sow several kinds of pulse, and other small grain. The culture of the cotton, and the rice fields, from which the bulk of the inhabitants are clothed and fed, is extremely ingenious. The rare trees, and aromatic productions, either ornamental or medicinal, that abound in other parts of the world, are to be found in China, and some are peculiar to itself.

The *cotton-tree*, the produce of which forms one of the most considerable branches of Chinese commerce, is cultivated with success in the southern provinces. Even on the very day that the labourers have reaped their grain, they sow cotton in the same field, after having turned up the earth slightly with a rake. When the rain or dew has moistened the ground, a shrub is seen insensibly springing up, which rises to the height of two feet. The flowers appear about the beginning, or towards the middle of August. They are generally yellow; but sometimes red. To the flower succeeds a button, which increases in the form of a pod, till it acquires the size of a walnut. The fortieth day after the flower has appeared, this pod bursts, divides itself into three parts, and discovers three or four small cotton balls: of a bright white colour, the figure of which is almost like that of those produced by silk-worms. These small downy balls, when freed from the seeds by an ingenious process, is then carded and spun; and afterwards made into cloth.

The *tallow-tree* has a short trunk, a smooth bark, crooked branches, red leaves shaped like a heart, and is about the height of a common cherry-tree. Its fruit has all the qualities of our tallow, and when manufactured with oil serves the natives as candles; but for want of purifying, as we purify tallow in Europe, it  
smells.

smells strong, nor is the light clear. Of the other trees peculiar to China, are some which yield a kind of flour; some partake of the nature of pepper. The gum of some is poisonous, but affords the finest black Japan in the world. The Chinese, notwithstanding their industry, are so wedded to their ancient customs that these trees are very little, if at all, meliorated by cultivation. The same may be said of their richest fruits, which, in general, are far from being so delicious as those of Europe, or indeed of America. This is owing to the neglect of grafting, or inoculation of trees, and other branches of experimental gardening.

It would be unpardonable here not to mention the raw-silk, which so much abounds in China, and above all, the *tea-plant*, or shrub. It is planted in rows, and pruned to prevent its luxuriance. Notwithstanding our long intercourse with China, writers are still divided about the different species and culture of this plant. It is generally thought that the green and bohea grows on the same shrub, but that the latter receives some kind of preparation, which takes away its raking qualities, and gives it a deeper colour. The other kinds, which go by the names of imperial, congo, singlo, and the like, probably owe their differences to the qualities of the soil on which they respectively grow. It is thought that the finest, which is called the flower of tea, is imported over-land to Russia; but there seems to be little difference in the effects of different teas on the human body. The greatest is between the bohea and the green.

The Portuguese had the use of tea long before the English, but it was introduced among the latter before the Restoration, since mention of it is made in the first act of parliament, that settled the excise on the king for life in 1660. Catharine of Lisbon, wife to Charles II. rendered the use of it common at court. The *ginseng*, so famous among the Chinese as the universal remedy, and monopolised even by their emperors, is now found to be but a common root, and is plentiful in North America. When brought to Europe, it is little distinguished for its healing qualities; and this instance alone ought to teach us with what caution the former accounts of China are to be read. The *ginseng*, however, is a native of the Chinese Tartary.

**METALS AND MINERALS.]** China (if we are to believe naturalists) produces all metals and minerals that are known in the world. White copper is peculiar to itself, and is so pure and fine that it approaches near to silver. Those who are desirous of preserving its splendor and beautiful colour, add to it a fifth part of silver. The gold mines are but slightly worked, for such is the policy of the Chinese, that they have always feared, that if their men should be exposed to the temptation of these artificial riches, they would be induced to forsake the more useful labours of agriculture. The currency of gold is principally supplied by the grains the people pick up in the sand of rivers and mountains. The silver specie is furnished from the mines of Honan.

Iron, lead, and tin mines must be very common, since these metals are sold at a low rate throughout the empire; and it appears from very authentic documents, that the use of iron in particular was very ancient there. Quarries, and coal-mines, abound in almost every province. Coals are found in great plenty in the mountains of the provinces of Chen-si, Chan-si, and Pe-tcheli; they are used by workmen in their furnaces, in all kitchens, and in the stoves with which the Chinese warm their apartments during winter.

**POPULATION AND INHABITANTS.]** According to some accounts, there are fifty-eight millions of inhabitants in China; and all between twenty and sixty years of age pay an annual tax. But according to father Amiot, who was at great pains to investigate this point, it would seem that China contains, at present, two hundred millions of inhabitants. This enormous population the abbe Grolier endeavoured

to prove, by a detail of the numbers in each of the fifteen provinces, to be by no means exaggerated. The extreme populousness of China often occasions dearths, and sometimes famine. Parents, who cannot support their female children, are allowed to cast them into the river; but they fasten a gourd to the child that it may float on the water, and compassionate people are often moved by its cries to save it from death. The Chinese, in their persons, are middle-sized, their faces broad, their eyes black and small, their noses rather short. They have peculiar ideas of beauty. They pluck up the hairs of the lower part of their faces by the roots with tweezers, leaving a few straggling ones by way of beard. Their Tartar princes compel them to cut off the hair of their heads, and, like Mahometans, to wear only a lock on the crown. Their complexion towards the north is fair, towards the south swarthy, and the fatter a man is, they think him the handsomer. Men of quality and learning, who are not much exposed to the sun, are delicately complexioned, and they who are bred to letters let the nails of their fingers grow to an enormous length, to shew that they are not employed in manual labour.

The women have little eyes, plump rosy lips, black hair, regular features, and a delicate, though florid complexion. The smallness of their feet is reckoned a principal part of their beauty, and no swathing is omitted, when they are young, to give them that perfection, so that when they grow up, they may be said to totter rather than walk. This fanciful piece of beauty was probably invented by the ancient Chinese, to palliate their jealousy.

To enter into all the starchy ridiculous formalities of the Chinese, especially of their men of quality when paying or receiving visits, would give little information, and less amusement. It is sufficient to observe, that the legislators of China looking upon submission and subordination as the corner-stones of all society, devised those outward marks of respect, ridiculous as they appear to us, as the test of duty and respect from inferiors to superiors; and their capital maxim was, that the man who was deficient in civility was void of good sense.

The Chinese in general have been represented as the most dishonest, low, thieving set in the world, employing their natural quickness only to improve the arts of cheating the nations they deal with, especially the Europeans, but they observe that none but a Chinese can cheat a Chinese. They are fond of law-disputes beyond any people in the world. Their hypocrisy is without bounds; and the men of property among them practise the most avowed bribery, and the lowest meanesses to obtain preferment. It should, however, be remembered, that some of the late accounts of China have been drawn up by those who were little acquainted with any parts of that empire but the sea-port towns; in which they probably met with many knavish and designing people. But it seems not just to attempt to characterise a great nation by a few instances of this kind, though well attested; and we appear not to be sufficiently acquainted with the interior parts of China to form an accurate judgment of the manners and characters of the inhabitants. By some of the Jesuit missionaries the Chinese seem to have been too much extolled, and by the later writers too much degraded.

DRESS.] This varies according to the distinction of ranks, and is entirely under the regulation of the law, which has even fixed the colours that distinguish the different conditions. The emperor, and princes of the blood, have alone a right to wear yellow; certain mandarines are intitled to wear satin of a red ground, but only upon days of ceremony; in general, they are clothed in black, blue, or violet. The colour to which the common people are confined, is blue or black; and their dress is always composed of plain cotton cloth. The men wear caps on their heads of the fashion of a bell; those of quality are ornamented with jewels. The rest of their dress is easy and loose, consisting of a vest and a fast, a coat or a gown thrown over them, silk boots quilted with cotton, and a pair of drawers. The ladies

ladies towards the south wear nothing on their head. Sometimes their hair is drawn up in a net, and sometimes it is dishevelled. Their dress differs but little from that of the men, only their gown or upper garment has very large open sleeves. The Chinese muffle themselves up closely in the morning; as the heat increases they gradually throw off their covering, and again wrap themselves up at the approach of evening.

**MARRIAGES.]** The parties never see each other in China till the bargain is concluded by the parents, and that is generally when the parties are perfect children. Next to being barren, the greatest scandal is to bring females into the world; and if a woman of a poor family happens to have three or four girls successively, it not unfrequently happens that she will expose them on the high roads, or cast them into a river.

**FUNERALS.]** People of note cause their coffins to be made, and their tombs to be built in their life-time. No persons are buried within the walls of a city, nor is a dead corpse suffered to be brought into a town, if a person died in the country. Every Chinese keeps in his house a table, upon which is written the names of his father, grandfather, and great-grandfather, before which they frequently burn incense, and prostrate themselves; and when the father of a family dies, the name of the great-grandfather is taken away, and that of the deceased is added.

**LANGUAGE.]** The Chinese language contains only three hundred and thirty words, all of one syllable: but then each word is pronounced with such various modulations, and each with a different meaning, that it becomes more copious than could be easily imagined, and enables them to express themselves very well on the common occasions of life. The missionaries, who adapt the European characters, as well as they can, to the expression of Chinese words, have devised eleven different, and some of them very compounded, marks and aspirations, to signify the various modulations, elevations, and depressions of the voice, which distinguish the several meanings of the same monosyllable. The Chinese oral language being thus barren and contracted, their literature is comprised in arbitrary characters, which are amazingly complicated and numerous: according to some writers they amount to twenty-five thousand; to thirty or forty thousand, according to others; but the latest accounts say they amount to eighty thousand, though he is reckoned a very learned man, who is master of fifteen or twenty thousand. This language being wholly addressed to the eye, and having no affinity with the oral, the latter hath still continued in its original uncultivated state, while the former has received all possible improvements.

The Chinese characters, Mr. Asple observes, which are by length of time become symbolic, were originally imitative; they still partake so much of their original hieroglyphic nature, that they do not combine into words like letters or marks for sounds; but we find one mark for a man, another for a horse, a third for a dog, and in short a separate and distinct mark for each thing which has a corporeal form. The Chinese also use a great number of marks entirely of a symbolic nature, to impress on the eye the conceptions of the mind, which have no corporeal forms, though they do not combine these last marks into words, like marks for sounds or letters; but a separate mark is made to represent or stand for each idea, and they use them in the same manner as they do their abridged picture-characters, which were originally imitative or hieroglyphic.

The Chinese books begin from the right hand; their letters are placed in perpendicular columns, of which there are generally ten in a page. They are read downwards, beginning from the right hand side of the paper. Sometimes a title is placed horizontally, and this likewise read from the right hand.

**GENIUS AND LEARNING.]** The genius of the Chinese is peculiar to themselves. They have no conception of what is beautiful in writing, regular in architecture, or natural in painting; and yet in gardening, and planning their grounds, they hit upon the true sublime and beautiful. They perform all the operations of arithmetic with prodigious quickness, but differently from the Europeans. Till the latter came among them, they were ignorant of mathematical learning, and all its depending arts. They had not any good apparatus for astronomical observations; and the metaphysical learning, which existed among them, was only known to their philosophers; but even the arts introduced by the Jesuits were of short duration, and lasted little longer than the reign of Cang-hi, who was contemporary with our Charles II. nor is it very probable they will ever be revived. It has been generally said, that they understood printing before the Europeans; but that can be only applied to block-printing, for the fusile and moveable types were undoubtedly Dutch or German inventions. The Chinese, however, had almanacks, which were stamped from plates or blocks, many hundred years before printing was discovered in Europe.

The difficulty of mastering and retaining such a number of arbitrary marks and characters, as there are in what may be called the Chinese written language, greatly retards the progress of their erudition. But there is no part of the globe where learning is attended with such honours and rewards, where there are more powerful inducements to cultivate and pursue it. The literati form the only order of nobles in China. If their birth be ever so mean and low, they become mandarins of the highest rank, in proportion to the extent of their learning. On the other hand, however exalted their birth may be, they quickly sink into poverty and obscurity, if they neglect those studies which raised their fathers. It has been observed, that there is no nation in the world where the first honours of the state lie so open to the lowest of the people, and where there is less of hereditary greatness. The Chinese range all their works of literature into four classes. The first is the class of *King*, or the sacred books, which contains the principles of the Chinese religion, morality, and government, and several curious and obscure records, relative to these important subjects. History forms a class apart; yet, in this first class, there are placed some historical monuments on account of their relation to religion and government, and among others the *Tekun-ikicon*, a work of Confucius, which contains the annals of twelve kings of Low, the native country of that illustrious sage. The second class is that of the *Su*, or *Che*, that is, of history and the historians. The third class, called *Tju*, *Tje*, comprehends philosophy and the philosophers, and contains all the works of the Chinese literati, the productions also of foreign sects and religions, which the Chinese consider only in the light of philosophical opinions, and all books relative to mathematics, astronomy, physic, military science, the art of divination, agriculture, and the arts and sciences in general. The fourth class is called *Tsie*, or *Miscellanies*, and contains all the poetical books of the Chinese, their pieces of eloquence, their songs, romances, tragedies, and comedies. The Chinese literati, in all the periods of their monarchy, have applied themselves less to the study of nature, and to the researches of natural philosophy, than to moral inquiries, the practical science of life, and internal polity and manners. It is said, that it was not before the dynasty of the Song, in the 10th and 11th centuries after Christ, that the Chinese philosophers formed hypotheses concerning the system of the universe, and entered into discussions of a scholastic kind, in consequence, perhaps, of the intercourse they had long kept up with the Arabians, who studied with ardour the works of Aristotle. And since the Chinese have begun to pay some attention to natural philosophy, their progress in it has been much inferior to that of the Europeans.

The invention of gunpowder is justly claimed by the Chinese, who made use of it against Zingis Khan and Tamerlane. They seem to have known nothing of small fire-arms, and to have been acquainted only with cannon, which they call the fire-pan. Their industry in their manufactures of stuffs, porcelain, japanning, and the like sedentary trades, can be equalled only by their labours in the field, in their junks and making canals, levelling mountains, raising gardens, and navigating boats.

[ANTIQUITIES AND CURIOSITIES.] Few natural curiosities present themselves in China, that have not been comprehended under foreign articles. Some volcanoes, and rivers and lakes of particular qualities, are to be found in different parts of the empire; the volcano of Lincfung is said sometimes to make so furious a discharge of fire and ashes, as to occasion a tempest in the air; and some of their lakes are said to petrify fishes when put into them. The artificial curiosities of China are stupendous. The great wall, separating China from Tartary, to prevent the incursions of the Tartars, is supposed to extend from 1200 to 1500 miles. It is carried over mountains and valleys, and reaches, according to Mr. Grosier, from the province of Shensi to the Whang-Hay, or Yellow Sea. It is in most places built of brick and mortar, which are so well tempered, and built so closely, as not to admit the least entrance for any instrument of iron, that though it has stood for 1800 years, it has suffered but little, and in such a dry climate may remain in the same condition for many ages. The beginning of this wall is a large bulwark of stone raised in the sea, in the province of Petcheli, to the east of Peking and almost in the same latitude: it is built like the walls of the capital city of the empire, but much wider, being tarrassed and cased with bricks, and is from twenty to twenty-five feet high. It is flanked with towers, two bow-shots distant one from the other, which add to its strength, and render it much easier to be defended. One third of the able bodied men in China were employed in constructing this wall, which, it is said, was begun, and completely finished in the short space of five years; and it is farther reported, that the workmen stood so close for many miles, that they could hand the materials from one to another. P. Regis, and the other gentlemen, who took a map of these provinces, often stretched a line on the top, to measure the basis of triangles, and to take distant points with an instrument. They always found it paved wide enough for five or six horsemen to travel a-bread with ease.

The artificial mountains present on their tops, temples, monasteries, and other edifices. The Chinese bridges cannot be sufficiently admired. They are built sometimes upon barges strongly chained together, yet so as to be parted, and to let the vessels pass that sail up and down the river. Some of them run from mountain to mountain, and consist only of one arch; that over the river Saffrany is 400 cubits long, and 500 high, though a single arch, and joins two mountains; and some in the interior parts of the empire are said to be still more stupendous. The triumphal arches raised in honour of their great men, form the next species of artificial curiosities. Though they are not built in the Greek or Roman style of architecture, yet they are superb and beautiful. They are said to be eleven hundred, in number, two hundred of which are particularly magnificent. Their sepulchral monuments make likewise a great figure. The towers, the models of which are now so common in Europe under the name of pagodas, are vast embellishments to the face of their country. They seem to be constructed by a regular order, and most of them are finished with exquisite carvings and gildings, and other ornaments. That at Nanking, which is 200 feet high, and 40 in diameter, is the most admired. It is called the Porcelain Tower, because it is lined with Chinese tiles. Their temples are chiefly remarkable for the fanciful taste in which they are built, for their

capaciousness, their whimsical ornaments, and the ugliness of the idols they contain. The Chinese are remarkably fond of bells, which give name to one of their principal festivals. A bell of Peking weighs 120,000 pounds, but its sound is said to be disagreeable. The last curiosity I shall mention, is their fire-works, which in China, exceed those of all other nations. Their buildings, except their pagodas, being confined to no order, and susceptible of all kinds of ornaments, have a wild variety, and a pleasing elegance not void of magnificence, agreeable to the eye and the imagination, and present a diversity of objects not to be found in European architecture.

**CHIEF CITIES.]** The empire is said to contain 4400 walled cities; the chief of which are Peking, Nanking, and Canton. Peking, the capital of the whole empire of China, and the ordinary residence of the emperors, is situated in a very fertile plain, twenty leagues distant from the great wall. It is an oblong square, and is divided into two cities: that which contains the emperor's palace is called the Tartar city, because the houses were given to the Tartars when the present family came to the throne; and they refusing to suffer the Chinese to inhabit it, forced them to live without the walls, where they in a short time built a new city; which, by being joined to the other, renders the whole of an irregular form, six leagues in compass. The walls and gates of Peking are of the surprising height of fifty cubits, so that they hide the whole city; and are so broad, that sentinels are placed upon them on horseback; for there are slopes within the city of considerable length, by which horsemen may ascend the walls; and in several places there are houses built for the guard. The gates, which are nine in number, are neither embellished with statues, nor carvings, all their beauty consisting in their prodigious height, which at a distance gives them a noble appearance. The arches of the gates are built of marble, and the rest with large bricks, cemented with excellent mortar. Most of the streets are built in a direct line; the largest are about 120 feet broad, and a league in length. The shops where they sell silks and China-ware generally take up the whole street, and afford a very agreeable prospect. Each shop-keeper places before his shop, on a small kind of pedestal, a board about twenty feet high, painted, varnished, and often gilt, on which are written in large characters the names of the several commodities he sells. These, being placed on each side of the street at nearly an equal distance from each other, have a very pretty appearance; but the houses are poorly built in front, and very low, most of them having only a ground floor, and none exceeding one story above it. Of all the buildings in this great city, the most remarkable is the imperial palace, the grandeur of which does not consist so much in the nobleness and elegance of the architecture as in the multitude of its buildings, courts, and gardens, all regularly disposed: for within the walls are not only the emperor's house, but a little town, inhabited by the officers of the court, and a multitude of artificers employed and kept by the emperor; but the houses of the courtiers and artificers are low and ill contrived. F. Attiret, a French Jesuit, who was indulged with a sight of the palace and gardens, says, that the palace is more than three miles in circumference, and that the front of the building shines with gilding, paint, and varnish, while the inside is set off and furnished with every thing that is most beautiful and precious in China, the Indies, and Europe. The gardens of this palace are large tracts of grounds, in which are raised, at proper distances, artificial mountains, from 20 to 60 feet high, which form a number of small vallies, plentifully watered by canals, which uniting, form lakes and *mares*. Beautiful and magnificent barks sail on these pieces of water, and the banks are ornamented with ranges of buildings, not any two of which are said to have any resemblance to each other, which diversity produces a very pleasing effect. Every valley has its house of pleasure,

large enough to lodge one of our greatest lords in Europe with all his retinue; many of these houses are built with cedar, brought with a vast expence the distance of 500 leagues. Of these palaces, or houses of pleasure, there are more than 200 in this vast enclosure. In the middle of a lake, which is near half a league in diameter every way, is a rocky island, on which is built a palace, containing more than a hundred apartments. It has four fronts, and is a very elegant and magnificent structure. The mountains and hills are covered with trees, particularly such as produce beautiful and aromatic flowers; and the canals are edged with rustic pieces of rock, disposed with such art, as exactly to resemble the wildness of nature.

The city of Peking is computed to contain two millions of inhabitants; the streets are not paved; the longest are about six miles, crossing each other at right angles, as in Philadelphia, and from 90 to 130 feet in breadth. The houses are only one story high. The walls of the city are of an immense height, and the principal streets terminate at the gates, which are very magnificent. Nanking also is said to be every large both in extent and populousness. Pienin is situated at the confluence of three large rivers, and is a place of extensive commerce. Its population (from the accounts of the late embassy) is not to be reckoned by thousands but by millions, the burying-ground only, an immense plain, extends farther than the eye can reach, and appears only bounded by the horizon. Other circumstances relating to this place would appear incredible were they recorded here.

The greatest port in China, and the only one much frequented by Europeans, is Canton. The city wall is about five miles in circumference, with very pleasant walks around it. From the top of some adjacent hills, on which forts are built, you have a fine prospect of the country. It is beautifully interspersed with mountains, little hills and vallies, all green; and these again pleasantly diversified with small towns, villages, high towers, temples, the seats of mandarins and other great men, which are watered with delightful lakes, canals, and small branches from the river Ta; on which are numberless boats and junks, sailing different ways through the most fertile parts of the country. The city is entered by seven iron gates, and within side of each there is a guard-house. The streets of Canton are very straight, but generally narrow, and paved with flag-stones. There are many pretty buildings in this city, great numbers of triumphal arches, and temples replete with images. The streets of Canton are so crowded, that it is difficult to walk in them; yet women of any fashion are seldom to be seen, unless by chance, when coming out of their chairs. There are great numbers of market-places for fish, flesh, poultry, vegetables, and all kinds of provisions, which are sold very cheap. There are many private walks about the skirts of the town, where those of the better sort have their houses, which are very little frequented by Europeans, whose business lies chiefly in the trading parts of the city, where there are only shops and warehouses. Few of the Chinese traders of any substance keep their families in the house where they do business, but either in the city, in the more remote suburbs, or farther up in the country. They have all such a regard to privacy, that no windows are made towards the streets, but in shops and places of public business; nor do any of their windows look towards those of their neighbours. The shops of those that deal in silk are very neat, make a fine show, and are all in one place: for tradesmen, or dealers in one kind of goods, herd together in the same street. It is computed that there are in this city, and its suburbs, 1,200,000 people; and there are often 5000 trading vessels lying in its harbour.

TRADE AND MANUFACTURES.] China is so happily situated, and produces such a variety of materials for manufactures, that it may be said to be the native land

of industry; but it is an industry without taste or elegance, though carried on with vast art and neatness. They make paper of the bark of bamboo, and other trees, as well as of cotton, but not comparable, for records or printing, to the European. Their ink, for the use of drawing, is well known in England, and is said to be made of oil and lamp-black. The antiquity of their printing, which they perform, by cutting their characters on blocks of wood, has already been mentioned. The manufacture of that earthen ware, generally known by the name of China, was long a secret in Europe, and carried immense sums from thence. Though the Chinese affect to keep that manufacture still a secret, yet it is well known that the principal material is a prepared pulverized earth, and that several European countries far exceed the Chinese in manufacturing this commodity\*. The Chinese silks are generally plain and flowered gauzes, and they are said to have been originally fabricated in that country, where the art of rearing silk-worms was first discovered. They manufacture silks likewise of a more durable kind, and their cotton, and other cloths, are famous for furnishing a light warm wear.

Their trade, it is well known, is open to all the European nations, with whom they deal for ready money; for such is the pride and avarice of the Chinese, that they think no manufactures equal to their own. But it is certain that since the discovery of the porcelain manufactures, and the vast improvements the Europeans have made in the weaving branches, the Chinese commerce has been on the decline.

[CONSTITUTION AND GOVERNMENT.] The original plan of the Chinese government was patriarchal, almost in the strictest sense of the word. Duty and obedience to the father of each family was recommended and enforced in the most rigorous manner; but, at the same time, the emperor was considered as the father of the whole. His mandarins, or great officers of state, were looked upon as his substitutes; and the degrees of submission which were due from the inferior ranks to the superior, were settled and observed with the most scrupulous precision, and in a manner that to us seems highly ridiculous. This simple claim of obedience required great address and knowledge of human nature to render it effectual; and the Chinese legislators, Confucius particularly, appear to have been men of wonderful abilities. They enveloped their maxims in a number of mystical appearances, so as to strike the people with awe and veneration. The mandarins had modes of speaking and writing different from those of other subjects, and the people were taught to believe that their princes partook of divinity, so that they were seldom seen, and more seldom approached.

Though this system preserved the public tranquillity for a great number of years, yet it had a fundamental defect that often convulsed, and at last proved fatal to the state, because the same attention was not paid to the military as to the civil duties. The Chinese had passions like other men, and sometimes a weak or wicked administration drove them into arms, and a revolution easily succeeded, which they justified by saying, that their sovereign had ceased to be their father. During those commotions, one of the parties naturally invited their neighbours the Tartars to their assistance, who, possessing great sagacity, became acquainted with the weak side of their constitution, invaded and conquered the empire, but gradually conformed to the Chinese institutions.

Besides the great doctrine of patriarchal obedience, the Chinese had sumptuary

\* The English in particular have carried this branch to a high degree of perfection, as appears from the commissions which have been received late from several princes of Europe; and we hope that a manufacture, so generally useful, will meet with encouragement from every true patriot among ourselves.

laws and regulations for the expences of all degrees of subjects; which were very useful in preserving the public tranquillity, and preventing the effects of ambition. By their institutions likewise the mandarins might remonstrate to the emperor, but in the most submissive manner, upon the errors of his government; and when he was a virtuous prince, this freedom was often attended with the most salutary effects. No country in the world is so well provided with magistrates for the discharge of justice, both in civil and criminal matters, as China; but they are often ineffectual, through want of public virtue in the execution. The emperor is styled, "*Holy Son of Heaven, Sole Governor of the Earth, Great Father of his People.*"

**RELIGION.]** This article is nearly connected with the preceding. Though the ancient Chinese worshipped idols, yet their philosophers and legislators had juster notions of the Deity, and indulged the people in the worship of sensible objects, only to make them more submissive to government. The Jesuits made little opposition to this, when they attempted to convert the Chinese; and suffered their profelytes to worship Tien, pretending that it was no other than the name of God. The truth is, Confucius, and the Chinese legislators, introduced a most excellent system of morals among the people, and endeavoured to supply the want of just ideas of a future state, by prescribing to them the worship of inferior deities. Their morality approximates to that of Christianity; but as we know little of their religion, only through the Jesuits, we cannot adopt for truth the numerous instances which they tell us of the conformity of the Chinese to the Christian religion. Those fathers, it must be owned, were men of great abilities, and made a wonderful progress above a century ago in their conversions; but they mistook the true character of the emperor, who was their patron; for he no sooner found that they were in fact aspiring to the direction of the government, than he expelled them, levelled their churches with the ground, and prohibited the exercise of their religion; since which time Christianity has made no figure in China.

**PUBLIC ROADS.]** The security of travellers, and an easy mode of conveyance for passengers and merchandize of every kind, are objects to which particular attention seems to have been paid by the government in China. The manner in which the public roads are managed greatly contributes to the former.

These roads are in general very broad; they are paved in all the southern provinces, and some of the northern. Valleys have been filled up, and passages have been cut through rocks and mountains, in order to make commodious highways, and to preserve them as nearly as possible on a level. They are generally bordered with very lofty trees, and sometimes with walls eight or ten feet in height, to prevent travellers from entering into the fields. Openings are left in them at certain intervals, which give a passage into cross roads, that conduct to different villages. On all the great roads, covered seats are erected at proper distances, where the traveller may shelter himself from the inclemency of winter, or the excessive heats of summer.

There is no want of inns on the principal highways, and over the cross roads. The former are very spacious, but they are badly supplied with provisions. People are even obliged to carry beds with them, or to sleep on a plain mat. Government requires of those who inhabit them, to give lodging only to those who ask and pay for it.

We meet with many turrets (says Mr. Bell), called post-houses, erected at certain distances one from another, with a flag-staff, on which is hoisted the imperial pendant. These places are guarded by soldiers, who run from one post to another with great speed, carrying letters which concern the emperor. The turrets are in

fight of one another, and by signals they can convey intelligence of any remarkable event. By these means the court is informed in the speediest manner of whatever disturbance may happen in the most remote part of the empire.

**REVENUES.]** These are said by some to amount to twenty millions, or according to the abbé Grosier, to forty-one millions sterling, a year; but this cannot be meant in money, which does not generally abound in China. The taxes collected for the use of government in rice, and other commodities, are certainly very great, and may be easily imposed with equality, as an account of every man's family and substance is annually enrolled; and must amount to a great sum.

**MILITARY AND MARINE STRENGTH.]** China is, at this time, a far more powerful empire than it was before its conquest by the eastern Tartars in 1644. This is owing to the confirmate policy of Chün-tchi, the first Tartarian emperor of China, who obliged his hereditary subjects to conform themselves to the Chinese manners and policy, and the Chinese to wear the Tartar dress and arms. The two nations were thereby incorporated. The Chinese were appointed to all the civil offices of the empire. The emperor made Peking the seat of his government, and the Tartars quietly submitted to a change of their country and condition which was so much in their favour.

This security, however, of the Chinese from the Tartars, takes from them all military objects; the Tartar power alone being formidable to that empire. The only danger that threatens it at present, is the disuse of arms. The troops of this empire amount to more than seven hundred thousand. This numerous army brings to our remembrance what historians tell us concerning Ninus and Semiramis, and, to descend to later times, of the forces of Xerxes and Darius. But this multitude will appear less astonishing in China, when we consider the extent of the empire, and its enormous population. Many thousands are employed in the collection of the revenue, and the preservation of the canals, the great roads, and the public peace. The imperial guards amount to about 30,000. As to the marine force, it is composed chiefly of the junks, already mentioned, and other small ships, that trade coast-ways, or to the neighbouring countries, or which are employed to prevent sudden descents.

As to the military art, translated from the Chinese into the French language, was published at Paris in 1772, from which it appears that the Chinese are well versed in the theory of the art of war; but caution, and care, and circumspection, are much recommended to their generals; and one of their maxims is, never to fight with enemies either more numerous or better armed than themselves.

**HISTORY.]** The Chinese pretend to an antiquity beyond all measure of credibility; and their annals have been carried beyond the period to which the scripture chronology assigns the creation of the world. Poan-Kou is said by them to have been the first man; and the interval of time betwixt him and the death of the celebrated Confucius, which was in the year before Christ 479, hath been reckoned from 276,000 to 96,961,740 years. But upon an accurate investigation of this subject it appears, that all the Chinese historical relations of events, prior to the reign of the emperor Yao, who lived 2057 years before Christ, are entirely fabulous, composed in modern times, unsupported by authentic records, and full of contradictions. It appears also, that the origin of the Chinese empire cannot be placed higher than two or three generations before Yao. But even this is carrying the empire of China to a very high antiquity, and it is certain that the materials for Chinese history are extremely ample. The grand annals of the empire are comprehended in 668 volumes, and consist of the pieces that have been composed by

the

the tribunal, or department of history, established in China for transmitting to posterity the public events of the empire, and the lives, characters, and transactions of its sovereigns. It is said, that all the facts, which concern the monarchy since its foundation, have been deposited in this department, and from age to age have been arranged according to the order of time, under the inspection of government, and with all the precautions against illusion or partiality that could be suggested. These precautions have been carried so far, that the history of the reign of each imperial family has only been published after the extinction of that family, and was kept a profound secret during the dynasty, that neither fear nor flattery might adulterate the truth. It is asserted, that many of the Chinese historians exposed themselves to exile, and even to death, rather than disguise the defects and vices of the sovereign. But the emperor Chi-hoangti, at whose command the great wall was built, in the year 213 before the Christian era, ordered all the historical books and records, which contained the fundamental laws and principles of the ancient government, with the medals, inscriptions, and monuments of antiquity, to be burnt, that they might not be employed by the learned to oppose his authority, and resist the changes he proposed to introduce into the monarchy; and that there might remain no earlier record, date, or authority, relative to religion, science, or politics, than those of his own reign. Four hundred literati were burnt with their books; yet this barbarous edict had not its full effect; several books were concealed, and escaped the general ruin. After this period, strict search was made for the ancient books and records that yet remained; but though much industry was employed for this purpose, it appears that the authentic historical sources of the Chinese, for the times anterior to the year 200 before Christ, are very few, and that they are still in smaller number for more remote periods. But notwithstanding the depredations that have been made upon the Chinese history, it is still immensely voluminous, and has been judged by some writers superior to that of all other nations. Of the grand annals before mentioned, which amount to 668 volumes, a copy is preserved in the library of the French nation. A chronological abridgment of this great work, in one hundred volumes, was published in the 42d year of the reign of Kang-hi; that is, in the year 1703. This work is generally called Kammo, or the Abridgment. From these materials the abbé Grosier proposed to publish at Paris, in the French language, a General History of China, in 12 volumes, 4to. Some of which have been printed; and a smaller work in 12 volumes 8vo, by the late Father de Mailla, missionary at Peking, hath been lately published.

But the limits to which our work is confined will not permit us to enlarge upon so copious a subject as that of the Chinese history. The original form of government was probably monarchical; and a succession of excellent princes, and a duration of domestic tranquillity, united legislation with philosophy, and produced their Fo-hi, whose history is wrapped up in mysteries, their Li-Laokum, and above all, their Confucius, at once the Solon and the Socrates of China. Their long struggle with the Tartars, which lasted several centuries, and the violence of domestic factions, produced bloody wars, and many revolutions; so that though the Chinese empire is hereditary, the imperial succession has been often interrupted. Upwards of twenty dynasties, or different lines and families of succession, are enumerated in their annals.

Neither the great Zinghis Khan, nor Tamerlane, though they often defeated the Chinese, could subdue their empire; and neither of them could preserve the conquests they made. After their invasions were over, the Chinese went to war with the Manchew Tartars, while an indolent worthless emperor, Tfontching, was upon the throne. In the mean time, a bold rebel, named Li-cong-tse, in the province of Se-tchuen,

Se-tchuen, dethroned the emperor, who hanged himself, as did most of his courtiers and women. Ou-san-quey, the Chinese general, on the frontiers of Tartary, refused to recognise the usurper, and made a peace with Tsfongate, or Chun-tchi, the Manchew prince, who drove the usurper from the throne, and took possession of it himself, about the year 1644. The Tartar maintained himself in his authority, and, as has been already mentioned, wisely incorporated his hereditary subjects with the Chinese, so that in effect Tartary became an acquisition to China. He was succeeded by a prince of great natural and acquired abilities, who was the patron of the Jesuits, but knew how to check them when he found them intermeddling with the affairs of his government. About the year 1661, the Chinese, under this Tartar family, drove the Dutch out of the island of Formosa, which the latter had taken from the Portuguese.

In the year 1771, all the Tartars belonging to the nation of the Tourgouths, left the settlements which they had under the Russian government on the banks of the Wolga and the Jaick, at a small distance from the Caspian sea, and in a vast body of fifty thousand families, they passed through the country of the Haskaks. After a march of eight months, in which they surmounted innumerable difficulties and dangers, they arrived in the plains that lie on the frontier of Carapen, not far from the banks of the river Ily, and offered themselves as subjects to Kien-long, emperor of China, who was then in the thirty-sixth year of his reign. He received them graciously, furnished them with provisions, cloaths, and money, and allotted to each family a portion of land for agriculture and pasturage. The year following there was a second emigration of about thirty thousand other Tartar families, who also quitted the settlements which they enjoyed under the Russian government, and submitted to the Chinese sceptre. The emperor caused the history of these emigrations to be engraven upon stone, in four different languages.

The hopes which were lately indulged of the great and manifold advantages to be derived from the embassy of lord Macartney to the court of Peking, have ended in disappointment. Never perhaps was there a character better qualified for the management of an embassy of such delicacy and importance, than lord Macartney; but, notwithstanding his lordship's adroitness, he found it utterly impossible to carry either of the two points he was so desirous to effect. Nay, indeed, so early in the train of negociation was his lordship convinced that the idea of obtaining permission for the residence of an Englishman at the capital of China, as ambassador, consul, or in any other character, was not to be accomplished, that he abandoned all hope of its success, after the second or third interview; and, in answer to the application for an exclusive settlement for the English within the Chinese dominions, even on a temporary grant, and solely for the purposes of trade, the Imperial negative was most decidedly peremptory. According to a fundamental principle in Chinese politics, innovation, of whatever kind, is held to be inevitably pregnant with mischief and ruin. And hence, while the doctrines of reform and regeneration are so fashionable in the European world, the Chinese government would consider its political existence at an end, were they to allow any encroachment, not only on their laws, but on established prejudices, which with them are held equally venerable, and possess the same force as positive ordinances. On this principle alone it is that the emperor declined to admit a foreign resident at the court of Peking, or to expand the principles on which our commercial intercourse with this country are at present regulated and confined.

The embassy arrived in the river Tien-sin, in the bottom of the Pteheli Gulph, on the 26th July 1793. At Tacao, and Tong-Chu, about 10 miles from Peking, they continued till August 21, when the ambassador and his suite set out for Peking, which

they reached about 9 o'clock that morning. They remained here till the beginning of September, when they were conducted to Jehor, one of the emperor's country residences in Tartary, distant about 40 or 50 leagues from Peking. Thither they proceeded by easy stages, and were sumptuously accommodated on the way in the emperor's palaces, of which many intervene between Peking and Jehor.

Had the emperor assented to the proposition of a British ambassador or resident at Peking, Sir George Staunton was to have remained there in that character, with an allowance of 12,000*l.* sterling, per annum. Lord Macartney is to receive 30,000*l.* for the embassy.

The presents that have been given by the emperor are immense, both in point of quantity and value; two of which are so singular, as to claim particular notice. The one is an epic poem, addressed to his Britannic majesty, the composition of the emperor himself, and in his own hand writing: it is lodged in a black, wooden, carved box, of no great value, but as an antique—to which character it has a just claim, having been 2000 years in possession of the Imperial family of China. The other present is a mass of costly agate of unequalled size and beauty. It has always been the practice with the emperor to hold this agate in his hand, and to fix his eyes upon it whenever he spoke to a mandarin or any of his ministers; as to look upon a subject is considered as not only derogatory to the Imperial dignity, but to confer too much honour on the individual addressed.

The failure in this business cannot be easily accounted for. It is, however, supposed that the want of success is chiefly to be attributed to some evil impression made upon the Chinese court by some of the native princes of India telling them to beware how they allowed the English to obtain a footing among them; and strengthening their admonition by falsely stating, that the same people had first, as friends, obtained a small settlement in India, which they afterwards increased by repeated wars, driving many of the original owners from their dominions, and establishing upon their ruin an immense empire for themselves.

## INDIA IN GENERAL.

**SITUATION AND BOUNDARIES.** } THIS vast country is situated between the 66th and 109th degrees of East longitude, and between 1 and 40 of North latitude. It is bounded on the North, by the countries of Ubech Tartary and Thibet; on the South, by the Indian Ocean; on the East, by China and the Chinese Sea; and on the West, by Persia and the Indian Sea.

**DIVISIONS.** I shall divide, as others have done, India at large into three great parts: first, the Peninsula of India beyond the Ganges, called the Farther Peninsula; secondly, the main land, or the Mogul's empire; thirdly, the Peninsula within or on this side the Ganges; all of them vast, populous, and extended empires. But it is necessary, in order to save many repetitions, to premise an account of some particulars common of those numerous nations, which shall be extracted from the most enlightened of our modern writers who have visited the country in the service of the East India Company.

**POPULATION AND INHABITANTS.** Mr. Orme, an excellent and an authentic historian, comprehends the two latter divisions under the title of Indostan. The Mahometans (says he), who are called Moors, of Indostan, are computed at ten millions, and the Indians at an hundred millions. Above half the empire is subject to rajahs, or kings, who derive their descent from the old princes of India, and exercise all the rights of sovereignty, only paying a tribute to the Great Mogul, and

observing the treaties by which their ancestors recognized his superiority. In other respects, the government of Indostan is full of wise checks upon the overgrowing greatness of any subject; but (as all precautions of that kind depend upon the administration) the indolence and barbarity of the moguls or emperors, and their great viceroys, have rendered them fruitless.

The original inhabitants of India are called Gentoos; or, as others call them, Hindoos, and the country Hindoostan. They pretend that Brumma, who was their legislator both in politics and religion, was inferior only to God, and that he existed many thousand years before our account of the creation. This Brumma, probably, was some great and good man, whose beneficence, like that of the pagan legislators, led his people and their posterity to pay him divine honours. The Bramins (for so the Gentoos priests are called) pretend that he bequeathed to them a book called the Vedam, containing his doctrines and institutions; and that though the original is lost, they are still possessed of a sacred commentary upon it, called the Shahstah, which is written in the Shanferite, now a dead language.

The foundation of Brumma's doctrine consisted in the belief of a Supreme Being, who created a regular gradation of beings, some superior, and some inferior to man; and of the immortality of the soul and its transmigration into different bodies, according to the lives led in a pre-existent state. From this it appears more than probable, that the Pythagorean metempsychosis took its rise in India. The necessity of inculcating this sublime, but otherwise complicated doctrine, into the lower ranks, induced the Bramins, who are by no means unanimous in their doctrines, to have recourse to sensible representations of the Deity and his attributes; so that the original doctrines of Brumma have degenerated into idolatry, in the worship of different animals, and various images, and of the most hideous figures, delineated or carved. Wooden images are placed in all their temples, and on certain festivals are exhibited in the high-roads and in the streets of towns. The human figures with elephants' heads, which are the objects of their devotion, have many hands, and are enormously corpulent.

The Hindoos have, from time immemorial, been divided into four great tribes. The first and most noble tribe are the Bramins, who alone can officiate in the priesthood, like the Jewith tribe of Levi. They are not, however, excluded from government, trade, or agriculture, though they are strictly prohibited from all menial offices. The second in order is the Sitri tribe, who, according to their original institution, ought to be all military men; but they frequently follow other professions. The third is the tribe of Baise or Bhyse, who are chiefly merchants, bankers, and banias or shop-keepers. The fourth tribe is that of Sudder, who ought to be menial servants; and they are incapable of raising themselves to any superior rank. If any Gentoos should be excommunicated from any of the four tribes, he and his posterity are for ever shut out from the society of every body in the nation, except that of the Harri cast, who are held in utter detestation by all the other tribes, and are employed only in the meanest and vilest offices. This circumstance renders excommunication so dreadful, that any Gentoos will suffer torture, and even death itself, rather than deviate from one article of his faith.

Besides this division into tribes, the Gentoos are also subdivided into *casts*, or smaller classes and tribes; and it has been computed that there are eighty-four of these casts, though some have supposed there was a greater number. The order of pre-eminence of all the casts, in a particular city or province, is generally indispitably decided. The Indian of an inferior would think himself honoured by adopting the customs of a superior cast; but this last would give battle sooner than not vindicate its prerogatives: the inferior receives the victuals prepared by a superior

rior cast with respect, but the superior will not partake of a meal which has been prepared by the hands of an inferior cast. Their marriages are circumscribed by the same barriers as the rest of their intercourses: and hence, besides the national physiognomy, the members of each cast preserve an air of still greater resemblance to each other. There are some casts remarkable for their beauty, and others as remarkable for their ugliness. The most striking features in the character of the Hindoos, are their superstition, and veneration for the institutions and tenets of their ancestors.

The members of each cast, says Dr. Robertson, adhere invariably to the profession of their forefathers. From generation to generation, the same families have followed, and will always continue to follow one uniform line of life. To this may be ascribed that high degree of perfection conspicuous in many of the Indian manufactures; and though veneration for the practices of their ancestors may check the spirit of invention, yet, by adhering to these, they acquire such an expertness and delicacy of hand, that Europeans, with all the advantages of superior science, and the aid of more complete instruments, have never been able to equal the exquisite execution of their workmanship. While this high improvement of their more curious manufactures excited the admiration, and attracted the commerce of other nations, the separation of professions in India, and the early distribution of the people into classes, attached to peculiar kinds of labour, secured such abundance of the more common and useful commodities, as not only supplied their own wants, but ministered to those of the countries around them.

To this early division of the people into casts, we must likewise ascribe a striking peculiarity in the state of India, the permanence of its institutions, and the immutability in the manners of its inhabitants. What now is in India always was there, and is still likely to continue: neither the ferocious violence and illiberal fanaticism of its Mahomedan conquerors, nor the power of its European masters, have effected any considerable alteration. The same distinctions of condition take place, the same arrangements in civil and domestic society remain, the same maxims of religion are held in veneration, and the same sciences and arts are cultivated. Hence, in all ages, the trade with India has been the same; gold and silver have uniformly been carried thither, in order to purchase the same commodities with which it now supplies all nations; and from the age of Pliny to the present times, it has always been considered and execrated as a gulf which swallows up the wealth of every other country, that flows incessantly towards it, and from which it never returns\*.

[RELIGION.] The institutions of religion, publicly established in all the extensive countries stretching from the banks of the Indus to Cape Comorin, present to view an aspect nearly similar. They form a regular and complete system of superstition, strengthened and upheld by every thing which can excite the reverence and secure the attachment of the people. The temples, consecrated to their deities, are magnificent, and adorned not only with rich offerings, but with the most exquisite works in painting and sculpture, which the artists, highest in estimation among them, were capable of executing. The rites and ceremonies of their worship are pompous and splendid, and the performance of them not only mingles in all the transactions of common life, but constitutes an essential part of them. The Bramins, who, as ministers of religion, preside in all its functions, are elevated above every other order of men, by an origin deemed not only more noble, but acknowledged to be sacred. They have established among themselves a regular hierarchy and gradation of ranks, which, by securing subordination in their own order, adds weight to their authority, and gives them a more absolute dominion in the minds of the people. This dominion they support by the command of the immense

\* Dr. Robertson's Historical Dissertation concerning India. Appendix, p. 261, 262.

revenues, with which the liberality of princes, and the zeal of pilgrims and devotees, have enriched their pagodas.

We shall not enter into any minute description of this vast and complicated system of superstition. An attempt to enumerate the multitude of deities which are the objects of adoration in India; to describe the splendour of worship in their pagodas, and the immense variety of their rites and ceremonies; to recount the various attributes and functions which the craft of priests, or the credulity of the people, have ascribed to their divinities, together with the numerous and often fanciful speculations and theories of learned men on this subject, would too much extend the limits of this work.

In the various superstitions which have prevailed in different parts of the world, the invisible beings, who are the first objects of our veneration, have every where a near resemblance. The powers of man in the more early stages of his progress are very limited. He supposes that there is a distinct cause of every remarkable effect, and ascribes to a separate power every event which attracts his attention, or excites his terror. He fancies that it is the province of one deity to point the lightning, and with an awful sound to hurl the irresistible thunderbolt at the head of the guilty; that another rides in the whirlwind, and, at his pleasure, raises or stills the tempest; that a third rules over the ocean; and that a fourth is the god of battles. We may here recognise a striking uniformity of features in the system of superstition established throughout every part of the earth; more particularly, among the Greeks in Europe, and the Indians in Asia, the two people, in those great divisions of the earth, who were most early civilised. What is supposed to be performed by the power of Jupiter, of Neptune, of Æolus, of Mars, of Venus, according to the mythology of the West, is ascribed in the East to the agency of Agnéc, the god of fire; Varoon, the god of oceans; Vayoo, the god of wind; Cama, the god of love; and a variety of other divinities.

But it is well known that in Greece, although the generality of the people entertained these gross ideas, men of reflecting minds, in proportion as science advanced, thought more justly concerning the great first cause. Accordingly, some philosophers among them discerning the wisdom, the foresight, and the goodness displayed in creating, preserving, and governing the world, perceived that the characters of the divinities which were proposed as the objects of their adoration in their temples, could not entitle them to be considered as the presiding powers in nature. They, therefore, formed ideas concerning the perfections of one Supreme Being, the Creator and Ruler of the universe; as just and rational as have ever been attained by the unassisted powers of the human mind.

If from Europe we now turn to Asia, we shall find, that from the progress which the most eminent persons of the Bramin cast made in the various branches of science, they formed such a just idea of the system of nature, and of the power, wisdom, and goodness, displayed in the formation and government of it, as elevated their minds above the popular superstition, and led them to acknowledge one Supreme Being, "the Creator of all things (to use their own expression), and from whom all things proceed."

In India, the dominion of religion extends to a thousand particulars, which in other countries are governed either by the civil laws, or by taste, custom, or fashion. Dress, food, the common intercourses of life, marriages, professions, are all under the jurisdiction of religion, which prescribes rules of conduct in all circumstances and all situations. The original government of the Hindoos was in reality an hierarchy; for among that religious people, the highest authority was possessed by the priesthood, or the Bramin cast. Nor is it in this instance only, that

we find a resemblance between the natives of India and the Jews. Not only were the governments of both nations hierarchical, but in both there was a vast variety of religious observances and ceremonies extending to many particulars, which in other countries are matters of choice or of indifference; and both entertained the most profound respect and veneration for their ancestors. All the castes acknowledge the Bramins for their priests, and from them derive their belief of the transmigration; which leads many of them to afflict themselves even at the death of a fly, although occasioned by inadvertence. But the greater number of castes are less scrupulous, and eat, although very sparingly, both of fish and flesh; but, like the Jews, not of all kinds indifferently. The food of the Hindoos is simple, consisting chiefly of rice, ghee, which is a kind of imperfect butter, milk, vegetables, and oriental spices of different kinds, but chiefly what is called in the East, *chilly*, and in the West, green or Cayenne pepper. The warrior cast may eat of the flesh of goats, mutton, and poultry. Other superior castes may eat poultry and fish; but the inferior castes are prohibited from eating flesh or fish of any kind. Their greatest luxury consists in the use of the richest spices and perfumes, which grow almost spontaneously in their gardens. They esteem milk the purest of foods, because they think it partakes of some of the properties of the nectar of their gods, and because they esteem the cow itself almost like a divinity.

Their manners are gentle; their happiness consists in the solaces of domestic life; and they are taught by their religion, that matrimony is an indispensable duty in every man, who does not entirely separate himself from the world from a principle of devotion. Their religion also permits them to have several wives; but they seldom have more than one: and it has been observed, that their wives are distinguished by a decency of demeanour, a solicitude in their families, and a fidelity to their vows, which might do honour to human nature in the most civilised countries. The amusements of the Hindoos consist in going to their pagodas, in assisting at religious shews, and in fulfilling a variety of ceremonies prescribed to them by the Bramins. Their religion forbids them to quit their own shores\*, nor do they want any thing from abroad. They might, therefore, have lived in much tranquillity and happiness, if others had looked on them with the same indifference with which they regard the rest of the world.

The soldiers are commonly called Rajah-poots, or persons descended from rajahs, and reside chiefly in the northern provinces, and are generally more fair-complexioned than the people of the south. These rajah-poots are a robust and brave people, and serve faithfully those who pay them well; but when the leader falls in battle, they think that their engagements to him are finished, and they run off the field without any stain upon their reputation.

CUSTOMS AND DRESS.] The custom of women burning themselves, upon the death of their husbands, still † continues to be practised among some of high cast and

\* The Gentoos are persuaded, that the waters of the three great rivers, Ganges, Kistna, and Indus, have the sacred virtue of purifying those who bathe in them, from all pollutions and sins. This religious idea seems to be founded on a principle of policy, and intended to restrain the natives from migrating into distant countries: for it is remarkable, that the sacred rivers are so situated, that there is not any part of India where the inhabitants may not have an opportunity of washing away their sins. The Ganges, which rises in the mountains of Thibet, with its different branches, runs through the kingdoms of Bengal, Bahar, and

Orixa, and the upper provinces of Oude, Rohilcund, Agra, Delhi, and Lahore. The Kistna divides the Carnatic from Golconda, and runs through the Visapore into the interior parts of the Decan. And the Indus, bounding the Guzarat provinces, separates Indostan from the dominions of Persia.

† While I was pursuing (says Mr. Hedges) my professional labours in Benares, I received information of a ceremony which was to take place on the banks of the river, and which greatly excited my curiosity. I had often read and repeatedly heard of that most horrid custom amongst, perhaps,

and condition, though much less frequently than formerly; and it is said, that the Bramins now do not encourage it. One particular class of women are allowed to be openly prostituted: these are the famous dancing girls. Their attitudes and movements are very easy, and not ungraceful. Their persons are delicately formed, gaudily decorated, and highly perfumed. By the continuation of wanton attitudes, they

the most mild and gentle of the human race, the Hindoos; the sacrifice of the wife on the death of the husband, and that by a means from which nature seems to shrink with the utmost abhorrence, by burning. Many instances of this practice have been given by travellers; those whom I have met with, only mention it as taking place among the highest classes of society, whose vanity, united with superstitious prejudices, might have dictated the circumstance; and I confess I could not entertain any other ideas, when I observed the theatrical parade that seemed to attend it. Mr. Holwell, in his curious work, entitled *Historical Events relative to India*, thus accounts for this more than inhuman practice: "At the demise of the mortal part of the Hindoo great lawgiver and prophet, Bramah, his wives, inconsolable for his loss, resolved not to survive him, and offered themselves voluntary victims on his funeral pile. The wives of the chief rajahs, the first officers of the state, being unwilling to have it thought that they were deficient in fidelity and affection, followed the heroic example set them by the wives of Bramah. The Bramins, a tribe then newly established by their great legislator, pronounced and declared, that the spirits of those heroines immediately ceased from their transigrations, and had entered the first bosom of purification; it followed, that their wives claimed a right of making the same sacrifice of their mortal forms to God and the mans of their deceased husbands. The wives of every Hindoo caught the enthusiastic (now pious) flame. Thus the heroic acts of a few women brought about a general custom. The Bramins had given it the stamp of religion, and instituted the forms and ceremonials that were to accompany the sacrifice, subject to restrictions, which leave it a voluntary act of glory, piety, and fortitude." The author proceeds to state expressly, that he has been present at many of these sacrifices, and particularly and minutely records one that happened on the 4th of February, 1742—3, near to Cossimbuzar, of a young widow, between seventeen and eighteen years of age, leaving at so early an age three children, two boys, and a girl; the eldest he mentions as not then being four years of age. This intimated heroine was fitly urged to live, for the future care of her infants; but notwithstanding this, though the agonies of death were painted to her in the strongest and most lively terms, she, with a calm and resolved countenance, put her finger into the fire, and held it there a considerable time; she then with one hand put fire in the palm of the other, sprinkled it on it, and fumigated the Bramins. She was then given to understand, by some of her friends, that she would not be permitted to burn herself; and this intimation ap-

peared to give her deep affliction for a few moments; after which she resolutely replied, that death was in her own power, and that if she was not allowed to burn according to the principles of her cast, she would starve herself. Her friends finding her thus peremptory were obliged at last to consent to the dreadful sacrifice of this lady, who was of high rank.

The person whom I saw (observes Mr. Hodges) was of the Bhye (merchant) tribe or cast; a class of people we should naturally suppose exempt from the high and impetuous pride of rank, and in whom the natural desire to preserve life should in general predominate, undiverted from its proper course by a prospect of posthumous fame. I may add, that those motives are greatly strengthened by the exemption of this class from that infamy with which the refusal is inevitably branded in their superiors. Upon my repairing to the spot, on the banks of the river, where the ceremony was to take place, I found the body of the man on a bier, and covered with linen, already brought down and laid at the edge of the river. At this time, about ten in the morning, only a few people were assembled, who appeared destitute of feeling at the catastrophe that was to take place; I may even say that they displayed the most perfect apathy and indifference. After waiting a considerable time, the wife appeared, attended by the Bramins, and music, with some few relations. The procession was slow and solemn; the victim moved with a steady and firm step; and, apparently with a perfect composure of countenance, approached close to the body of her husband, where for some time they halted. She then addressed those who were near her, with composure, and without the least trepidation of voice or change of countenance. She held in her left hand a cocoa nut, in which was a red colour mixed up, and dipping in it the fore-finger of her right hand, she marked those near her, to whom she wished to shew the last act of attention. As at this time I stood close to her, she observed me attentively, and with the colour marked me on the forehead. She might be about twenty-four or five years of age, a time of life when the bloom of beauty has generally fled the cheek in India; but still she preserved a sufficient share to prove that she must have been handsome; her figure was small, but elegantly turned; and the form of her hands and arms was particularly beautiful. Her dress was a loose robe of white flowing drapery, that extended from her head to the feet. The place of sacrifice was higher upon the bank of the river, a hundred yards or more from the spot where we now stood. The pile was composed of dried branches, leaves and rushes, with a door on one side, and arched and covered on the top; by the side of the door stood a man with a lighted

brand.

they acquire, as they grow warm in the dance, a frantic lasciviousness, and communicate, by a natural contagion, the most voluptuous desires to the beholders.

The Gentoos are as careful of the cultivation of their lands, and their public works and conveniences, as the Chinese; and remarkably honest and humane: there scarcely is an instance of a robbery in all Indostan, though the diamond-merchants travel without defensive weapons. According to a late writer, the Hindoos, as well as the Persians, Tartars, and adjoining nations, who have inhabited Indostan since it was invaded by Tamerlane, though of different nations, religions, laws, and customs, possess nevertheless, in equal degrees, hospitality, politeness, and address. In refinement and ease of manners they are superior to any people to the westward of them. In politeness and address, in gracefulness of deportment, and speech, an Indian is as much superior to a Frenchman of fashion, as he is to a Dutch burgomaster of Dort. A Frenchman's ease is mixed with forward familiarity, with confidence, and self-conceit; but the good breeding of the Hindoos, especially those of the higher casts, is reserved, modest, and respectful.

The complexion of the Gentoos is black, their hair is long, their persons are straight and elegant, their limbs finely proportioned, their fingers long and tapering, their countenances open and pleasant, and their features exhibit the most delicate lines of beauty in the females, and in the males a kind of manly softness.

Their walk and gait, as well as their whole deportment, is in the highest degree graceful. The dress of the men is a kind of close-bodied gown, like our women's gowns, and wide trowsers, resembling petticoats, reaching down to their slippers. Such of the women as appear in public, have shawls over their heads and shoulders, short close jackets, and tight drawers which come down to their ankles. Hence the dress of the men gives them, in the eyes of Europeans, an appearance of effeminacy; whereas that of the women appears rather masculine.

Their houses cover much ground, and have spacious galleries and accommodations of various kinds. The apartments are small, and the furniture not very elegant, if we except the rich Persian carpets. The grandeur of their palaces consists in baths, perfumes, temples, gods, and harems. The harems or zezanns, that is, the residences of the women, are removed from the front of the house, and lighted only from a square space in the centre of the whole building. The apparel of the women is inconceivably rich; they have jewels on their fingers and about

brand. From the time the woman appeared, to the taking up of the body to convey it into the pile, there elapsed the space of half an hour, which was employed in prayer with the Bramins, in attention to those who stood near her, and conversation with her relations. When the body was taken up, she followed close to it, attended by the chief Bramin; and when it was deposited in the pile, she bowed to all around her, and entered without speaking. The moment she entered, the door was closed; the fire was put to the combustibles, which instantly flamed, and immense quantities of dried wood and other matters were thrown upon it. This last part of the ceremony was accompanied with the shouts of the multitude, who now became numerous, and the whole seemed a mass of confused rejoicing. For my part, I felt myself actuated by very different sentiments: the event that I had been witness to was such, that the minutest circumstance attending it could not be erased from my memory; and when the melancholy which had overwhelmed me was somewhat abated, I made a drawing of the subject.

In other parts of India, as the Carnatic, this dreadful custom is accompanied in the execution

of it with still greater horror. It is asserted that they dig a pit, in which is deposited a large quantity of combustible matter, which is set on fire, and the body being let down, the victim throws herself into the flaming mass. In other places a pile is raised extremely high, and the body with the wife is placed upon it, and the whole is set on fire. Whatever be the means, reason and nature so revolt at the idea, that, were it not a well known and well authenticated circumstance, it would hardly obtain credit. In truth, I cannot but confess, that some degree of incredulity was mingled with curiosity on this occasion; and the desire of ascertaining so extraordinary a fact was my greatest inducement to be a spectator. See Hodges' Travels in India, during the years 1780, 1781, 1782 and 1783, p. 79—84, where the reader will find this affecting scene represented, from a painting by Mr. Hodges, in a very elegant print. —Lieut. Moor, in his Narrative of the Operations of Capt. Little's Detachment, p. 133, relates an account of another victim to this horrid superstition, in October 1791, in the camp of Purram Bhow.

their necks, and also in their ears and nostrils, with bracelets on their wrists and arms, and around their ankles.

**PAGODAS.]** The temples or pagodas of the Gentooes are stupendous but disgusting stone buildings, erected in every capital, and under the direction of the Bramins.

To this, however, there are some exceptions; for in proportion to the progress of the different countries of India in opulence and refinement, the structure of their temples gradually improved. From plain buildings they became highly ornamented fabrics, and, both by their extent and magnificence, are monuments of the power and taste of the people by whom they were erected. In this highly finished style there are pagodas of great antiquity in different parts of Indostan, particularly in the southern provinces, which were not exposed to the destructive violence of Mahomedan zeal. In order to assist my readers in forming a proper idea of these buildings, I shall briefly describe two, of which we have the most accurate accounts. The entry to the pagoda of Chillambrum, near Porto Novo, on the Coromandel coast, held in high veneration on account of its antiquity, leads through a stately gate under a pyramid an hundred and twenty-two feet in height, built with large stones above forty feet long, and more than five feet square, and all covered with plates of copper, adorned with an immense variety of figures neatly executed. The whole structure extends one thousand three hundred and thirty-two feet in one direction, and nine hundred and thirty-six in another. Some of the ornamental parts are finished with an elegance entitled to admiration.

The pagoda of Seringham is superior in sanctity to that of Chillambrum, and surpasses it as much in grandeur. This pagoda is situated about a mile from the western extremity of the island of Seringham, formed by the division of the great river Caveri into two channels. It is composed of seven square enclosures, one within the other, the walls of which are twenty-five feet high, and four thick. These enclosures are three hundred and fifty feet distant from each other, and each has four large gates with a square tower, which are placed, one in the middle of each side of the enclosure, and opposite to the four cardinal points. The outward wall is near four miles in circumference, and its gateway to the south is ornamented with pillars, several of which are single stones thirty-three feet long, and nearly five in diameter; and those which form the roof are still larger; in the inmost enclosures are the chapels. Here, as in all the other great pagodas of India, the Bramins live in a subordination which knows no resistance, and slumber in a voluptuousness which knows no wants.

There is a beautiful structure, at Triple Cane, two miles south of Madagascar. It is of considerable magnitude; and as the top of the building rises considerably above the trees, it is seen all over the country. Adjoining to the temple is a large tank, with steps descending to the bottom, filled with water. The whole is of stone, and the masonry excellent. On the surface of the temple are many basso-relievos, which probably relate to the religion of the Hindoos; but whether they are connected with the rites and worship of Bramah, or not, it is not easy to say: some of them are of the most indecent kind\*. Mr. Hodges has given a very elegant print of the great pagoda at Tanjore.

If the Bramins are masters of any uncommon art or science, they frequently turn it to the purposes of profit from their ignorant votaries. Mr. Scriver says, that they know how to calculate eclipses; and that judicial astrology is to prevail among them, that half the year is taken up with unlucky days; the head astrologer being always consulted in their councils. The Mahometans likewise encourage

\* Hodges' Travels in India, from 1782 to 1783. p. 100.

those superstitions, and look upon all the fruits of the Gentoo industry as belonging to themselves. The Gentoos are entirely passive under all their oppressions, having little of that resentment in their nature that animates the rest of mankind; yet they are susceptible of avarice, and sometimes bury their money, and rather than discover it, put themselves to death by poison or otherwise. This practice, which it seems is not uncommon, accounts for the great scarcity of silver that till of late prevailed in Indostan.

[INFLUENCE OF FOOD AND EARLY MARRIAGES.] The reasons above mentioned account likewise for their being less under the influence of their passions than the inhabitants of other countries. The perpetual use of rice, their chief food, gives them but little nourishment; and their marrying early, the male before fourteen and their women at ten or eleven years of age, keeps them low and feeble in their persons. A man is in the decline of life at thirty, and the beauty of the women begins to decay at eighteen: at twenty-five they have all the marks of old age. We are not therefore to wonder at their being soon strangers to all personal exertion and vigour of mind; and whatever may be the cause, a recent traveller among them observes, it is certain, that death is regarded with less horror in India than in any other country in the world. The origin and the end of all things, say the philosophers of India of the present times, is a *vacuum*. A state of repose is the state of greatest perfection; and this is the state after which a wise man aspires. "It is better", say the Hindoos, "from a favourite book, to sit than to walk, to lie down than to sit, and to sleep than to wake; but death is the best of all †". According to the Gentoo laws, criminals sentenced to death are not to be strangled, suffocated, or poisoned, but to be cut off by the sword; because, without an effusion of blood, malefactors are supposed to die with all their sins about them; but the shedding of their blood, it is thought, expiates their crimes.

The Mahometans, who, in Indostan, are called Moors, are chiefly of Persian, Turkish, and Arabic extraction. They early began, in the reigns of the caliphs of Bagdad, to invade Indostan. They penetrated as far as Delhi, which they made their capital. They settled colonies in several places, whose descendants are called Pytans; but their empire was overthrown by Tamerlane, who founded the Mogul government, which still subsists. Those princes being strict Mahometans, received under their protection all that professed the same religion, and who being a brave, active people, counterbalanced the numbers of the natives. They are said to have introduced the division of provinces, over which they appointed soubahs; and those provinces, each of which might be styled an empire, were subdivided into nabobships; each nabob being immediately accountable to his soubah, who in process of time became almost independent of the Great Mogul, except in paying him an annual tribute. The vast resort of Persian and Tartar tribes has likewise strengthened the Mahometan government: but it is observable, that in two or three generations, the progeny of all those adventurers, who brought nothing with them but their horses and their swords, degenerated into eastern indolence and sensuality.

Of all those tribes, the Mahrattas at present make the greatest figure. They are a kind of mercenaries, who live on the mountains between Indostan and Persia. They commonly serve on horseback, and, when well commanded, they have been known to give law even to the court of Delhi. Though they are originally Gentoos, yet they are of bold active spirits, and pay no great respect to the principles of their religion. Mr. Scrafton says, that the Mahometans or Moors are void of every principle even of their own religion; and if they have a virtue, it is an appearance of hospitality, but it is an appearance only; for while they are drinking

with, and embracing a friend, they will stab him to the heart. But it is probable that these representations of their moral depravity are exaggerated.

The manner of drinking among the Gentoos is remarkable. They religiously avoid touching the vessel that contains the liquor with their lips, and pour it into their mouths, holding the bottle, or other vessel, at a foot's distance. Their idea is, that they would be polluted by stagnating water: They will drink from a pump, or of any running stream, but not out of a pool.

POLITICAL CONSTITUTION AND FORM } These will afford a very striking proof  
OF GOVERNMENT. } of the early and high civilization of the people of India. "The Indians trace back the history of their own country through an immense succession of ages, and assert that all Asia, from the mouth of the Indus on the west, to the confines of China on the east, and from the mountains of Thibet on the north, to Cape Comorin on the south, formed a vast empire, subject to one mighty sovereign, under whom ruled several hereditary princes and rajahs. But their chronology, which measures the life of man in ancient times by thousands of years, and computes the length of the several periods, during which it supposes the world to have existed, by millions, is so wildly extravagant, as not to merit any serious disquisition. We must rest satisfied then, until some more certain information is obtained with respect to the ancient history of India, with taking the first accounts of that country, which can be deemed authentic, from the Greeks, who served under Alexander the Great. They found kingdoms of considerable magnitude established in that country. The territories of Porus, and of Taxiles, comprehended a great part of the Panjab\*, one of the most fertile, and best cultivated countries in India. The kingdom of the Prasi, or Gangaridae, stretched to a great extent on both sides of the Ganges. All the three, as appears from the ancient Greek writers, were powerful and populous,

"This description of the partition of India into states of such magnitude, is alone a convincing proof of its having advanced far in civilization. In whatever region of the earth there has been an opportunity of observing the progress of men in social life, they appear at first in small independent tribes or communities. Their common wants prompt them to unite; and their mutual jealousies, as well as the necessity of securing subsistence, compel them to drive to a distance every rival who might encroach on those domains which they consider as their own. Many ages elapse before they coalesce, or acquire sufficient foresight to provide for the wants, or sufficient wisdom to conduct the affairs of a numerous society. Even under the genial climate, and in the rich soil of India, more favourable perhaps to the union and increase of the human species than any other part of the globe, the formation of such extensive states, as were established in that country when first visited by Europeans, must have been a work of long time; and the members of them must have been long accustomed to exertions of useful industry.

"Though monarchical government was established in all the countries of India, to which the knowledge of the ancients extended, the sovereigns were far from possessing uncontrouled or despotic power. The monarchs of India, who are all taken from the second of the four classes formerly described, which is intrusted with the functions of government and exercise of war, behold among their subjects an order of men far superior to themselves in dignity, and so conscious of their own pre-eminence, both in rank and in sanctity, that they would deem it degradation and pollution, if they were to eat of the same food with their sovereign.

"While the sacred rites of the Bramins opposed a barrier against the encroachments of regal power on one hand, it was circumscribed on the other by the

\* This term means the country watered by the five eastern branches of the Indus.

ideas which those who occupied the highest stations in society entertained of their own dignity and privileges.—Nor were the benefits of these restraints upon the power of the sovereign confined wholly to the two superior orders in the state; they extended, in some degree, to the third class employed in agriculture \*.

**LAW AND JUDICIAL PROCEEDINGS.]** In the early and rude ages of society, the few disputes with respect to property which arise, are terminated by the interposition of the old men, or by the authority of the chiefs in every small tribe or community; their decisions are dictated by their own discretion, or founded on plain and obvious maxims of equity. But as controversies multiply, cases similar to such as have been formerly determined must recur, and the awards upon these grow gradually into precedents, which serve to regulate future judgments. Thus, long before the nature of property is defined by positive statutes, there is gradually formed, in every state, a body of customary or common law by which judicial proceedings are directed.

In this state the administration of justice seems to have been in India, when first visited by Europeans. Though the Indians, according to their account, had no written laws, but determined every controverted point, by recollecting what had been formerly decided; they assert that justice was dispensed among them with great accuracy, and that crimes were severely punished. Towards the middle of the sixteenth century, Akber the Sixth, in descent from Tamerlane, mounted the throne of Indostan. As in every province of his extensive empire the Hindoos formed the great body of his subjects, he laboured to acquire a perfect knowledge of their religion and institutions; in order to arrange every part of his government, particularly the administration of justice, in a manner the best accommodated to their own ideas. In this generous undertaking he was seconded with zeal by his vizier Abul Fazel, a minister whose understanding was not less enlightened than that of his master. By their assiduous researches, and consultation of learned men, such information was obtained as enabled Abul Fazel to publish a brief compendium of Hindoo jurisprudence, in the Ayeen Akberry, which may be considered as the first genuine communication of its principles to persons of a different religion. About two centuries afterwards, the illustrious example of Akber was imitated and surpassed by Mr. Hastings, the governor-general of the British settlements in India. By his authority, and under his inspection, the most eminent Pundits, or Bramins learned in the laws of the provinces over which he presided, were assembled at Calcutta; and, in the course of two years compiled, from their most ancient and approved authors, a full code of Hindoo laws; which is, undoubtedly, the most valuable and authentic elucidation of Indian policy and manners that has been hitherto communicated to Europe.

According to the Pundits, some of the writers upon whose authority they found the decrees which they have inserted in the code, lived several millions of years before their time. Without entering into any examination of what is so extravagant, we may conclude, that the Hindoos have in their possession treatises concerning the laws and jurisprudence of their country, of more remote antiquity than are to be found in any other nation. The truth of this depends not upon their own testimony alone, but it is put beyond doubt by one circumstance, that all these treatises are written in the Shankreet language, which has not been spoken for many ages in any part of Indostan, and is now understood by none but the most learned Bramins. That the Hindoos were a people highly civilized, at the time when their laws were composed, is most clearly established by internal evidence contained in the Code itself. Among nations beginning to emerge from barbarism, the regula-

\* Dr. Robertson's Disquisition concerning India, Appendix, p. 262—266.

tions of law are extremely simple, and applicable only to a few obvious cases of daily occurrence. Men must have been long united in a social state, their transactions must have been numerous and complex, and judges must have determined an immense variety of controversies to which these gave rise, before the system of law becomes voluminous and comprehensive. In that early age of the Roman republic, when the laws of the twelve tables were promulgated, nothing more was required than the laconic injunctions which they contain for regulating the decisions of courts of justice; but, in a later period, the body of civil law, ample as its contents are, was found hardly sufficient for that purpose. To the jejune brevity of the twelve tables, the Hindoo code has no resemblance; but with respect to the number and variety of points it considers, it will bear a comparison with the celebrated digest of Justinian; or with the systems of jurisprudence in nations most highly civilised. The articles of which the Hindoo code is composed, are arranged in natural and luminous order. They are numerous and comprehensive, and investigated with all that minute attention and discernment which are natural to a people distinguished for acuteness and subtilty of understanding, who have been long accustomed to the accuracy of judicial proceedings, and acquainted with all the refinements of legal practice. The decisions concerning every point, with a few exceptions occasioned by local prejudices and peculiar customs, are founded upon the great and immutable principles of justice which the human mind acknowledges and respects, in every age, and in all parts of the earth\*.

The Mahometan institutes prevail only in their great towns and their neighbourhood. The empire is hereditary, and the emperor is heir only to his own officers. All lands go in the hereditary line, and continue in that state even down to the subtenants, while the lord can pay his taxes, and the latter their rent; both which are immutably fixed in the public books of each district. The imperial demesne lands are those of the great rajah families, which fell to Tamerlane and his successors. Certain portions of them are called jaghire lands, and are bestowed by the crown on the great lords or *omraks*, and upon their death revert to the emperor; but the rights even of the subtenants of those lands are indefeasible.

According to the Gentoo constitution, land (houses and gardens excepted) is not private property, but belongs to the community, in the several villages; which are supplied with their respective public officers, as the headman, to execute justice; the conicopoly, to keep the accounts of the village; the corn-meter, smith, barber, doctor, astrologer, &c. The grounds are cultivated by the community, and the produce shared out in certain proportions to all. One is allotted to the pagodas and Bramins, one to the government, another to the public officers, one to the repair of tanks, or reservoirs of water, and the rest distributed among the community; but we understand that the Mahometan government, and the intrusion of Europeans, have introduced some innovations in this ancient constitution, particularly, by farming the circar, or government shares.

[LITERATURE.] The evidence which we have of the literature of the Indians is rendered more interesting by being derived from a source of knowledge which the laudable curiosity of our countrymen has opened to the people of Europe within these few years. That all the science and literature possessed by the Bramins, were contained in books written in a language understood by a few only of the most learned among them, is a fact which has long been known; and all the Europeans settled in India during three centuries, have complained that the Bramins obstinately refused to instruct any person in this language. But at length, by address, mild treatment, and a persuasion that the earnestness with which

\* Dr. Robertson's Disquisition, Appendix, p. 270—275.

instruction was solicited, proceeded not from any intention of turning their religion into derision, but from a desire of acquiring a perfect knowledge of their sciences and literature, their scruples have been overcome. Several British gentlemen are now completely masters of the Shanskrete language; and in the course of five years, the curiosity of the public has been gratified by two publications, as singular as they were unexpected. The one is a translation, by Mr. Wilkins, of an Episode from the *Mahabarat*, an epic poem, in high estimation among the Hindoos, composed, according to their account, by Kreefna Dwypayen Veias, the most eminent of their Bramins, above three thousand years before the Christian era. The other is *Sacontala*, a dramatic poem, written about a century before the birth of Christ, translated by sir William Jones.

The *Mahabarat* is a voluminous poem, consisting of upwards of four hundred thousand lines. Mr. Wilkins has translated more than a third of it; but only a short episode, entitled *Baghvat-Geeta*, is hitherto published, and from this specimen we must form an opinion with respect to the whole. The subject of the poem is a famous civil war between two branches of the royal house of Bhaurat. When the forces on each side were formed in the field, and ready to decide the contest by the sword, Arjoon, the favourite and pupil of the god Kreefna, who accompanied him in this hour of danger, requested of him to cause his chariot to advance between the two hostile armies. He looked at both armies, and beheld, on either side, none but grandfathers, uncles, cousins, tutors, sons and brothers, near relations or bosom friends: and when he had gazed for a while, and saw these prepared for the fight, he was seized with extreme pity and compunction, and uttered his sorrows in the following words:—"Having beheld, O *Kreefna*! my kindred thus waiting anxious for the fight, my members fail me, my countenance withereth, the hair standeth an end upon my body, and all my frame trembleth with horror! Even *Gandeev*, my bow, escapeth from my hand, and my skin is parched and dried up.—When I have destroyed my kindred, shall I longer look for happiness? I wish not for victory, *Kreefna*; I want not dominion; I want not pleasure; for what is dominion, and the enjoyments of life, or even life itself, when those to whom dominion, pleasure and enjoyment were to be coveted, have abandoned life and fortune, and stand here in the field ready for the battle. Tutors, sons and fathers, grandfathers and grandsons, uncles, nephews, cousins, kindred, and friends! although they would kill me, I wish not to fight them; no not even for the dominion of the three regions of the universe, much less for this little earth\*."

The drama of *Sacontala* must be deemed a great literary curiosity; but from this the nature of our present work will not permit us to give any extract. We shall therefore refer our curious readers either to the translation above mentioned, or to several quotations from it, which he will find in Dr. Robertson's elegant Appendix on the manners and institutions of the people of India; to which we shall add one remark, namely, that it is only to nations considerably advanced in refinement, that the drama is a favourite entertainment. The Greeks had been for a good time a polished people; *Alcæus* and *Sappho* had composed their odes, and *Thales* and *Anaximander* had opened their schools, before tragedy made its first rude effort in the cart of *Thespis*; and a good time elapsed before it attained to any considerable degree of excellence. From the drama of *Sacontala*, then, we must form an advantageous idea of the state of improvement in that society to whose taste it was suited.

Besides the two works that have been already mentioned, we shall enumerate some other pieces which have been translated from the Shanskrete language.—1. To

\* *Baghvat Geeta*, p. 30, 31.

Mr. Wilkins we are indebted for *Hæto-pades*, or *Amicable Instruction*, in a series of connected fables, interspersed with moral, prudential, and political maxims.—2. In the first Number of the *New Asiatic Miscellany*, we have a translation of a celebrated composition in the East, known by the title of the *Five Gems*. It consists of stanzas by five poets, who attended the court of Abisfura, king of Bengal. Some of these stanzas are simple and elegant.—3. An Ode translated from Wulli; in which that extravagance of fancy, and those far-fetched and unnatural conceits, which so often disgust Europeans with the poetical compositions of the East, abound too much.—4. Some original grants of land, of very ancient dates, translated by Mr. Wilkins. It may seem odd, that a charter of legal conveyance of property should be ranked among the literary compositions of any people. But so widely do the manners of the Hindoos differ from those of Europe, that as our lawyers multiply words and clauses, in order to render a grant complete, and to guard against every thing that may invalidate it, the *Pundits* seem to dispatch the legal part of the deed with brevity, but, in a long preamble and conclusion, make an extraordinary display of their own learning, eloquence, and powers of composition, both in prose and in verse. The preamble to one of these deeds is an encomium of the monarch who grants the land, in a bold strain of eastern exaggeration: "When his innumerable army marched, the heavens were so filled with the dust of their feet, that the birds of the air could rest upon it. His elephants moved like walking mountains, and the earth, oppressed by their weight, mouldered into dust."—5. The translation of part of the *Shaster*, published by colonel Dow, in the year 1768: taken from the mouth of a Bramin, who explained the *Shaster* in Persian, and the vulgar language of Bengal.

COMMERCE.] In every age, it has been a commerce of luxury rather than of necessity, which has been carried on between Europe and India. Its elegant manufactures, spices, and precious stones, are neither objects of desire to nations of simple manners, nor are such nations possessed of wealth sufficient to purchase them. The three great articles of general importation from India were spices and aromatics, precious stones and pearls, and silk.—1. Spices and aromatics. From the mode of religious worship in the heathen world; from the incredible number of the deities, and of the temples consecrated to them; the consumption of frankincense and other aromatics, which were used in every sacred function, must have been very great: but the vanity of men occasioned a greater consumption of these fragrant substances than their piety. It was the custom of the Romans to burn the bodies of their dead; and they deemed it a display of magnificence to cover, not only the body, but the funeral pile on which it was laid, with the most costly spices.—2. Precious stones, together with which pearls may be classed, seem to be the article next in value imported from the East.—3. Another production of India in great demand at Rome, was silk.

In two particulars, however, our importations from India differ greatly from those of the ancients. The dress, both of the Greeks and Romans, was almost entirely woollen, which, by their frequent use of the warm bath, was rendered abundantly comfortable. Their consumption of linen and cotton cloths was much inferior to that of modern times, when these are worn by persons in every rank of life. Accordingly a great branch of modern importation from that part of India with which the ancients were acquainted, consists in *piece-goods*; comprehending under that mercantile term, the immense variety of fabrics which Indian ingenuity has formed of cotton. Besides these, we import, to a considerable extent, various commodities, which are to be considered merely as the materials of our domestic manufactures. Such are the cotton-wool of Indostan, the silk of China, and the salt-petre of Bengal.

We have already given the outlines of the government by which this great empire long subsisted, without almost the semblance of virtue among its great officers, either civil or military. It was shaken, however, after the overthrow of Mahomet Shah, by Kouli Khan, which was attended by so great a diminution of the imperial authority, that the soubahs and nabobs became absolute in their own governments. Though they could not alter the fundamental laws of property, yet they invented new taxes, which beggared the people, to pay their armies and support their power; so that many of the people, a few years ago, after being unmercifully plundered by collectors and tax-masters, were left to perish through want. To sum up the misery of the inhabitants, those soubahs and nabobs, and other Mahometan governors, employ the Gentoos themselves, and some even of the Bramins, as the ministers of their rapaciousness and cruelties. Upon the whole, ever since the invasion of Kouli Khan, Indostan, from being a well regulated government, became a scene of mere anarchy or stratoeracy; every great man protecting himself in his tyranny by his soldiers, whose pay far exceeded the natural riches of his government. As private assassinations and other murders were here committed with impunity, the people, who knew they could not be in a worse state, concerned themselves very little in the revolutions of government. To the above causes are owing the late successes of the English in Indostan. The reader, from this representation, may perceive, that all the English have acquired in point of territory, has been gained from usurpers and robbers; and their possession of it being guaranteed by the present lawful emperor, is thus founded upon the laws and constitutions of that country.

The PENINSULA of INDIA beyond the GANGES, called the

**NAME.]** The name of India is taken from the river Indus, which of all others was best known to the Persians. The whole of this peninsula was unknown to the ancients, and is partly so to the moderns.

**AIR AND CLIMATE.]** The air of the southern parts is hot and dry, but in some places moist and consequently unhealthy. The climate is subject to hurricanes, lightnings, and inundations, so that the people build their houses upon high pillars to defend them from floods; and they have no other idea of seasons, but wet and dry. Easterly and Westerly *monsoons*, or trade-winds, prevail in this country.

**MOUNTAINS.]** These run from North to South almost the whole length of the country; but the lands near the sea are low, and annually overflowed in the rainy season.

**RIVERS.]** The chief are Sanpoo \* or Burrampooter † Domea, Mecon, Menan and Ava, or the great river Nau Kian.

Of these the Burrampooter, called Sanpoo, in the upper part of its course, is by far the most considerable. This rival sister of the Ganges issues from the same mountains; but taking a contrary, i. e. an easterly direction through Thibet, winds to the south-west through Assam, and entering Indostan, flows to the south, assumes the name of Megna, and joins the western branch of the Ganges with an immense body of water, equal if not superior to the Ganges itself.

These two noble rivers, when they approach the sea, divide into such a multitude of channels; and receive such a number of navigable streams, that a tract of country, nearly equal to Great Britain in extent, enjoys by their means an inland navigation which gives constant employment to 30,000 boat-men. These channels are so numerous that very few places in that tract are even in the dry season 25 miles from a navigable stream; and in the season of the periodical rains, they overflow their banks to the depth of 30 feet, and form an inundation that fertilizes the soil to the extent of more than 100 miles †.

**BAYS AND STRAITS.]** The bays of Bengal, Siam, and Cochin China. The straits of Malacca and Sineapore. The promontories of Siam and Banca.

**SOIL AND PRODUCT OF THE } DIFFERENT NATIONS. }** The soil of this peninsula is fertile, producing all the delicious fruits that are found in the countries contiguous to the Ganges. Ava affords salt-petre, and the best teek-timber, or Indian-oak, which for ship-building in warm climates is of much longer duration than any European oak. Teek ships of 40 years old are not uncommon in the Indian seas. This peninsula abounds likewise in silks, elephants, and quadrupeds, both domestic and wild, that are common in the southern kingdoms of Asia. The natives carry on a great trade in gold, diamonds, rubies, topazes, amethysts, and other precious stones. Tonquin produces little or no corn or wine, but is the most healthful country of all the peninsula. In some places, especially towards the north, the inhabitants have swellings in their throats, said to be owing to the badness of the water.

**INHABITANTS, CUSTOMS, } AND DIVERSIONS. }** The Tonquinese are excellent mechanics and fair traders; but greatly oppressed by their king and great lords. His majesty engrosses the trade, and his factors sell by retail to the Dutch and other nations. The Tonquinese are fond of lacker houses, which are unwholesome and poisonous. The people in the south are a savage race, and go almost naked; they wear large silver and gold ear-rings, and coral, amber, or shell bracelets. In Tonquin and Cochin China, the two sexes are scarcely distinguish-

\* Sanpoo, in the language of Thibet, means *The River*; but it is said to be written in the Shanferit language, *Brahma-pooter*, which signifies *the son of Brahma*. Major Renael's Memoir, 255.

† The orthography of this word, as given here, is according to the common pronunciation in Ben-

gal; but it is said to be written in the Shanferit language, *Brahma-pooter*, which signifies *the son of Brahma*. Major Renael's Memoir, 255.

NAME.]

able by their dress, which resembles that of the Persians. The people of quality are fond of English broad-cloth, red or green; and others wear a dark-coloured cotton cloth. In Azem, which is thought one of the best countries in Asia, the inhabitants prefer dogs-flesh to all other animal food. The people of that kingdom pay no taxes, because the king is sole proprietor of all the gold and silver, and other metals, found in his kingdom. They live, however, very comfortably. Almost every house-keeper has an elephant for the conveniency of his wives and women, polygamy being practised all over India.

It is unquestionable that those Indians, as well as the Chinese, had the use of gunpowder before it was known in Europe; and the invention is generally ascribed to the Azemese. The inhabitants of the southern division of this peninsula go under the name of Malayans, from the neighbouring country of Malacca.

Though the superstitions that prevail in this peninsula are extremely gross, yet the people believe in a future state; and when their kings are interred, a number of animals are buried with them, and such vessels of gold and silver as they think can be of use to them in their future life. The people in this peninsula are commonly very fond of show, and often make an appearance beyond their circumstances. They are delicate in no part of their dress but in their hair, which they buckle up in a very agreeable manner. In their food they are loathsome; for beside dogs, they eat rats, mice, serpents, and stinking fish. The people of Arracan are indelicate in their amours, and value their women most when in a state of pregnancy. Their treatment of the sick is so inhuman that when a patient is judged to be incurable, he is often exposed on the bank of some river, where he is either drowned, or devoured by birds or beasts of prey. Notwithstanding the great antiquity of most Indian nations, it is confidently asserted, that on the confines of Arracan and Pegu, there is a people (if solitary savages, roaming through woods in quest of prey, deserve the name of people) that appear to be in the very first stage of society. They go absolutely naked, without the smallest covering on any part of their bodies. They live on fruit, which grows spontaneously, in the uncultivated desert they inhabit, in great abundance; and on the flesh of animals, which they tear alive and devour raw. They sit on their hams, with their legs and arms disposed in the manner of monkeys. At the approach of men, they fly into their woods. They take care of their offspring, and live in families, but have no ideas of civil government.

The diversions common in this country are fishing and hunting, celebrating festivals, and acting comedies, by torch-light, from evening to morning.

[LANGUAGE.] The language of the court of Delhi is Persian, but in this peninsula it is chiefly Malayan, interspersed with other dialects.

[LEARNING AND LEARNED MEN.] The Bramins, who are the tribe of the priesthood, descend from those Brachmans mentioned with so much reverence by antiquity; and although much inferior, either as philosophers, or men of learning, to the reputation of their ancestors, their religious doctrines are still implicitly followed by the whole nation; and as preceptors, they are the source of all the knowledge which exists in Indostan. But the utmost stretch of their mathematical knowledge seems to be the calculation of eclipses. They have a good idea of logic; but it does not appear that they have any treatises on rhetoric: their ideas of music, if we may judge from their practice, are barbarous; and in medicine they derive no assistance from the knowledge of anatomy, since dissections are repugnant to their religion.

The poetry of the Asiatics is too turgid, and full of conceits, and the diction of their historians verbose: but though the manner of eastern compositions differs from the correct taste of Europe, there are many things in the writings of Asiatic authors

authors worthy the attention of literary men. Mr. Dow observes, that in the Shanferit, or learned language of the Bramins, which is the grand repository of the religion, philosophy, and history of the Hindoos, there are many hundred volumes in prose which treat of the ancient Indians and their history. The same writer also remarks, that the Shanferit records contain accounts of the affairs of Western Asia, probably more authentic than those given by the Arabians.

No princes in the world ever patronized men of letters with more generosity and respect than the Mahometan emperors of Indostan. A literary genius was not only the certain means to acquire a degree of wealth which must astonish Europeans, but an infallible road for rising to the first offices of the state. The character of the learned was at the same time so sacred, that tyrants, who made a pastime of embracing their hands in the blood of their other subjects, not only abstained from ordering violence to men of genius, but stood in fear of their pens.

MANUFACTURES AND COMMERCE.] These vary in the different countries of this peninsula; but the chief branches have been already mentioned. The inhabitants, in some parts, are obliged to manufacture their salt out of ashes. In all handicraft trades that they understand, the people are more industrious, and better workmen than most of the Europeans; and in weaving, sewing, embroidering, and some similar employments, it is said that the Indians do as much work with their feet as their hands. Their painting, though they are unskilful in drawing, is amazingly vivid in its colours. The fineness of their linen, and the silligree work in gold and silver, are unrivalled. The commerce of India, in short, is courted by all trading nations, and probably has been so from the earliest ages: it was not unknown even in Solomon's time; and the Greeks and Romans drew from thence their highest materials of luxury. The greatest share of it is now centered in England, though that of the Dutch is still very considerable; that of the French has for some time declined, nor is that of the Swedes and Danes of much importance.

CONSTITUTION, GOVERNMENT, } This article is so extensive, that it requires  
RARIETIES, AND CITIES. } a slight review of the kingdoms that form

this peninsula. In Azen, it hath been already observed, the king is proprietor of all the gold and silver; he pays little or nothing to the Great Mogul; his capital is Ghergong or Kirganu. We know little or nothing of the kingdom of Tipra, but that it was anciently subject to the kings of Arracan; and that they send to the Chinese gold and silk, for which they receive silver in return. Arracan lies to the south of Tipra, and is governed by twelve princes, subject to the chief king, who resides in his capital. His palace is very large, and contains, as we are told, seven idols each in gold of two inches thick, each of a man's height, and covered over with diamonds and other precious stones. Pegu is about 350 English miles in length, and nearly as much in breadth. The riches of the kingdom, when an independent state, were almost incredible; some idols, as big as life, being of massy gold and silver. The king's revenues arose from the rents of lands, of which he was sole proprietor, and from duties on merchandise; so that some thought him the richest monarch in the world, except the Chinese emperor. He was said to be able to bring a million, and on occasion a million and a half, of soldiers to the field, well clothed and armed; and to be master of 800 trained elephants, each with a castle on his back holding four soldiers. The constitution of this empire is of the feudal kind, for the prince assigns lands and towns to his nobles upon military tenures. In the year 1754, Pegu was reduced to the state of a dependent province by the king of Ava. Macao is the great mart of trade in that province.

We know little of the kingdom of Ava. Monchaboo was the residence of the king, and not Ava, in 1755. It is said, the honours the king assumes are next to China. His subjects trade chiefly in musk and jewels, rubies, and sapphires. In other particulars, the inhabitants resemble those of Pegu. In those kingdoms, and indeed

in the greatest part of this peninsula, the doctrines of the Grand Lama of Thibet prevail, as well as those of the Bramins.

The kingdom of Laos or Lahos, formerly included that of Jangoma or Jangomay, but that is now subject to Ava; we know few particulars of it that can be depended upon. It is said to be immensely populous, to abound in all the rich commodities as well as the gross superstitions of the east, and to be divided into a number of petty kingdoms, all of them holding of one sovereign, who, like his oriental brethren, is absolutely despotic, and lives in inexpressible pomp and magnificence; but is of the Lama religion, and often the slave of his priests and ministers.

The kingdom of Siam is rich and flourishing, and approaches, in its government, policy, and the acuteness of its inhabitants, very nearly to the fame of China. The kingdom of Siam is surrounded by high mountains, which on the east side separate it from the kingdoms of Camboja and Laos; on the west, from Pegu; and on the north, from Ava, or, more properly, from Jangoma; on the south it is washed by the river Siam, and joins the peninsula of Malacca, the north-west part whereof is under its dominion. The extent of the country, however, is very uncertain, and it is but indifferently peopled. The inhabitants of both sexes are distinguished by their modesty. Great care is taken of the education of children. Marriages are simple, and performed by talapoins, or priests, sprinkling holy water upon the couple, and repeating some prayers. The government is despotic; servants must appear before their masters in a kneeling posture; and the mandarins are prostrate before the king. Siam, the capital, is represented as a large city, but scarcely a sixth part of it inhabited; and the palace is about a mile and a half in circuit. Bangkok, which stands about 18 leagues to the south of Siam, and 12 miles from the sea, is the only place towards the coast that is fortified with walls, batteries, and brass cannon; and the Dutch have a factory at Ligor, which stands on the east side of the peninsula of Malacca, but belonging to Siam.

The peninsula of Malacca is a large country, and contains several kingdoms or provinces. The Dutch, however, are said to be real masters and sovereigns of the whole peninsula, being in possession of the capital (Malacca). The inhabitants are simple, or rather gross, in their manner of living; and yet the Malayan language is reckoned the purest of any spoken in all the Indies. We are told by the latest travellers, that its chief produce is tin, pepper, elephants' teeth, canes, and gums. The excellent situation of this country admits of a trade with India; so when it was first discovered by the Portuguese, who were afterwards expelled by the Dutch, Malacca was the richest city in the east, next to Goa and Ormus being the key of the China, the Japan, the Moluccas, and the Sunda trade; of which the most valuable is that with the Chinese. This degeneracy of the Malaysians, who were formerly an industrious and ingenious people, is easily accounted for by the tyranny of the Dutch, whose interest it is that they should never recover from their present state of ignorance and slavery.

The English carry on a smuggling trade in their country ships, from the coast of Coromandel and the Bay of Bengal, to Malacca. This commerce is connived at by the Dutch governor and council, who little regard the orders of their superiors, provided they can enrich themselves.

Cambodia, or Camboja, is a country little known to the Europeans; but, according to the best information, its greatest length, from north to south, is about 520 English miles; and its greatest breadth, from west to east, about 398. This kingdom has a spacious river running through it, the banks of which are the only habitable parts of the country, on account of its saltry air, and the pestiferous gnats, serpents, and other animals bred in the woods. Its soil, commodities, trade, animals, and products by sea and land, are much the same with those of the other kingdoms

kingdoms of this vast peninsula. The betel, a creeping plant of a particular flavour, and, as they say, an excellent remedy for all those diseases that are common to the inhabitants of the East Indies, is the highest luxury of the Cambodians, from the king to the peasant; but is very unpalatable and disagreeable to the Europeans. Between Cambodia and Cochin China lies the little kingdom of Chiampa, the inhabitants of which are said to have gained in civility by their commercial intercourse with the Chinese.

Cochin-China, or the western China, is situated under the torrid zone, and extends, according to some authors, about 500 miles in length; but it is much less extensive in its breadth from east to west. Laos, Cambodia, and Chiampa, as well as some other smaller kingdoms, are tributary to Cochin-China, whose king is said to be immensely rich, his kingdom enjoying all the advantages of commerce that are found in the other parts of the East Indies; but this mighty prince, as well as the king of Tonquin, are subject to the Chinese emperor.

The government of Tonquin is particular. The Tonquinese had revolted from the Chinese, which occasioned a civil war. A compromise at last took place between the chief of the revolt, and the representative of the ancient kings, by which it was agreed that the former should have all the executive powers of the government, under the name of the Chouah; but that the Bua, or king by birth, should retain the royal titles, and enjoy customary honours within his palace, from which neither he nor any of his family can stir without the permission of the chouah.

The chouah resides generally in the capital, Cachao, which is situated near the centre of the kingdom. The Bua's palace is a vast structure, and has a fine arsenal. The English have a very flourishing factory on the north-side of the city.

The British nation possesses in full sovereignty the whole soubah of Bengal, and the greatest part of Bahar. In Orissa, or Orisa, only the districts of Midnapour. The whole of the British possessions, before the termination of the late war in India, were, according to Major Rennel †, computed to be 182,122 square miles ‡, containing nearly eleven millions of people; the total net revenue, including Benares, was about 287 lacks of Sicca rupees, which may be reckoned equal to 3,050,000l. But a considerable addition, both to the territory and revenue of the East India company, was obtained by the cession in the late treaty of peace with Tippoo Sultan, to the amount of 15,374 square miles, affording a revenue of 13,16,765 Koontary pagodas §: equal to 411,450l. ¶ With their allies and tributaries, they now occupy the whole navigable course of the Ganges, from its entry on the plains to the sea, which, by its winding course, is more than 1350 miles.

**AIR AND SEASONS.]** The winds in this climate generally blow for six months from the south, and six from the north. April, May, and the beginning of June, are excessively hot, but refreshed by sea breezes; and in some dry seasons, the hurricanes, which tear up the sands, and let them fall in dry showers, are excessively disagreeable. The English, and Europeans in general, who arrive at Indostan, are commonly seized with some illness, such as flux or fever in their different appearances; but when properly treated, especially if the patients are abstemious, they recover, and afterwards prove healthy.

**MOUNTAINS.]** The most remarkable mountains are those of Caucasus and Naugraut, which divide India from Persia, Ulbec Tartary, and Thibet, and are inhabited by Mahrattas, Afghans, or Patans, and other people more warlike than the Gentoos.

\* The eastern part Agra, between the Ganges and Jumna, is called the Dakh, or country between the two rivers.

been appl

The mountains named the Ghauts, Gattes, or INDIAN APENNINE, and which extend from Cape Comorin to the Tapti, or Surat river, are also called *Balla-Ghaut*, throughout their whole extent: meaning, literally, the *higher or upper Ghauts* \*. In the peninsula within the Ganges, this term is applied in contradistinction to Paven-Ghaut, or the *lower-Ghauts*: but in the Deccan, it appears to be used only as a proper name, and not as a correlative; we having never heard of the Deccan, Puyen-Ghaut.

That vast chain of mountains is frequently in sight from the western sea at the distance of, from twenty, and less, to sixty miles: the country in general between the sea and the Ghauts is hilly: above the Ghauts it is called the table land, but must not be understood as a level flat country; on the contrary, many parts of it are very mountainous. If the table land, or upper country, is supposed to be level, it is evident there must be an abrupt descent to the eastward, proportionate to the elevation of the western range: this, however, is not the case, as the surface of the land declines to the eastward, which is proved by the rivers, with partial exceptions, all taking that direction.

Major Rennell, with happy boldness, calls the upper country an inclined plane; the inclination of the plane is, however, very trifling, and is interrupted by ranges of hills of abrupt descent, running parallel with the western range:—how many there may be, cannot, perhaps, from their irregularity, be ascertained. As the Ghauts themselves are not interrupted, major Rennell informs us (*Memoirs*, p. 276.) there is a break in their continuity opposite Paniany; so these inferior Ghauts, in some places, admit rivers to wind through them; in others they are precipitated from the upper country to the lower.

A traveller journeying, let us suppose, from Masulipatam to Goa, would have to ascend the whole way from the eastern sea to the western Ghauts; sometimes by gentle acclivities, sometimes by abrupt ranges; then to descend the Ghauts abruptly, and by a gentle declivity reach the western shore: this will be farther explained by an account of the cataract to the westward of Coceuk †.

The famous Appennine, which marks, with more precision perhaps than any other boundary whatever, the line of summer and winter, or rather of dry and wet, extends 13 degrees of latitude: that is, from Cape Comorin to Surat (with the exception of a valley or break in the continuity of the ridge of these mountains, opposite to Paniany) at unequal distances from the coast; seldom more than seventy miles, and commonly about forty; and within one short space only, it approaches within six miles. Although the altitude of these mountains is unknown, yet it is sufficiently great to prevent the great body of clouds from passing over them; and accordingly the alternate N. E. and S. W. winds (called the monsoons) occasion a rainy season on one side of the mountains only; that is, on the windward side. It would appear, however, that clouds enough do pass over, to occasion a rainy season, at a considerable distance to leeward, where those clouds descend; as we may suppose them to do, although at the time they passed over at the Ghauts, they must necessarily have been too high, and of course too light, to condense and fall in rain there. This appears from Lieut. Bwari's account of the weather at Nagpour, in the very centre of India: where the seasons differ but little from their usual course in Bengal, and on the western side of India: that is, the S. W. monsoon occasions a

\* *Gaut*, or *Ghaut*, signifies either a pass through mountains, or landing-place on the bank of a river. In the former sense, the term has been applied to the Carnatic, which is divided

by ridges of mountains abounding with passes and defiles.

† Lieut. Moor's Narrative of the Operations of Capt. Little's Detachment, p. 261.

rainy

rainy season: but the rains are not so violent, nor of such long continuance as in those places. At the mouth of the Godaverry river and its neighbourhood, the S. W. monsoon occasions a rainy season also; and the Godaverry is then swollen and overflows: and this part is about as far to leeward of the Ghauts, as Nagpouree. We may conclude then, that the ridge of the Ghauts shelters a particular tract only; beyond which the light and elevated clouds that pass over it descend in rain. Madras is within the limits of the sheltered tract, though at least three hundred miles to leeward of the Ghauts: Rajamundry (near the mouth of the Godaverry) may be about five hundred. It would be curious to know the exact limit of wet and dry.

Until lately it was a general opinion, that the Ghauts extended from the northern (or Bootan) mountains to Cape Comorin, and occasioned a diversity of seasons, at one and the same time, throughout all India. But the truth is, that different seasons exist at the same moment, only in a part of the peninsula: for the cause ceases in the parallel of Surat; where the S. W. wind, no longer opposed by a wall of mountains, carries its supplies of moisture uninterruptedly both far and near, over the whole face of the country.

RIVERS.] These are the Indus and the Ganges, both of them known to the ancients, and held in the highest esteem, and even veneration, by the modern inhabitants. The Indus is by the natives called Sinde † or Sindoh, and is formed of about ten principal streams which descend from the Persian and Tartarian mountains on the north-east and north-west. From the city of Attock down to Moultan, it is commonly styled the River Attock; below Moultan it is often named the Soor, until it divides itself into many channels near Tatta, where the principal branch takes the name of Mehran. These channels form and intersect a large triangular island, which they fertilize by their periodical inundations. The principal rivers it receives are the Behat, or Hydaspes, and the Hyphasis, which formed the eastern boundary of the conquests of Alexander.

The Ganges ‡, one of the finest rivers of the world, issues from Kentsaile, one of the vast mountains of Thibet, and after a course of about 750 miles, through mountainous regions little known, enters Indostan at the defile of Kupele, supposed by the natives to be its source. From hence this fine river (which is revered by the Hindoos as a deity that is to wash away all their sins) flows through delightful plains, with a smooth navigable stream, from one to three miles wide, during the remainder of its course, which is about 1350 miles, to the bay of Bengal, into which it falls by two larger, and a multitude of lesser channels, that form and intersect a large triangular island, whose base at the sea is near 200 miles in extent. The entire course of the Ganges is 2100 miles, and is to that of the Thames as 9½ to 1. § The navigation of the eastern branch being dangerous, is little frequented. The western branch, called the Little Ganges, or River of Hoogly, is navigable by large ships, and

\* Major Rennell's Memoirs, p. 213, 214.

† The name of Sinde was not unknown to the Romans: *Indus in India Sindus appellatus.* Pliny, Book vi.

‡ The proper name of this river, in the language

of Hindostan (or Indostan), is *Padis*, or *Pakis*. It is also named *Batta Gange*, or the Great River; and *Ganga* the river, by way of eminence; and from this, doubtless, the European names of the River are derived. Rennell's Memoirs, 255.

§ The proportionable lengths of course, of some of the most noted rivers in the world, are shewn nearly by the following numbers:

most generally resorted to. The Ganges receives 11 rivers, some of which are equal to the Rhine, and none inferior to the Thames.

Besides these rivers, many others water this country, as the Belut, or Thylum, (the Hydaspes of Alexander) the Jenau or the ancient Acesines, the Beyah, Setlege, Jamma, and the Rauvee, formerly the Hydraotes, on the south bank of which stands the city of Labor.

SEAS, BAYS, AND CAPES.] These are the Indian Ocean; the Bay of Bengal, the gulf of Cambaya; the straits of Ramanakool; Capes Comorin and Diu.

INHABITANTS.] To what was said of their religion and sects, in the general review of this great empire, we may add, that the fakirs are a kind of Mahometan mendicants or beggars, who travel about, practising the greatest austerities; but many of them are impostors. Their number is said to be 800,000. Another set of mendicants are the jughis, who are idolaters, and much more numerous, but most of them are vagabonds and impostors, who live by amusing the credulous Gentoo with foolish fictions. The Banians, who are so called from their innocence of life, serve as brokers, and profess the Gentoo religion.

The Parsees are the principal native inhabitants of the island of Bombay, in regard to wealth and numbers; not only the most valuable estates, but a very considerable part of the shipping of the port, belong to them; and no merchants transport their goods in finer ships than the Bombay merchants, not excepting even the honourable East India Company. The reader will have an idea of the commercial opulence of this little island, when he learns, that besides the great number of ships from Europe and America, that yearly clear from the custom house, there are, in carpenters' measurement, belonging to the port and island, 27,500 \* tons of shipping constantly employed trading to every part of Asia, navigated by English officers. Besides this, there are country ships, vessels and boats, to an immense amount in tonnage, going to and fro, between Bombay and the Red Sea, Persian Gulf, &c. &c.

To return to the Parsees—we have observed them as the favourites of fortune; let us add, they are deservedly so, for we find them doing very extensive acts of charity and benevolence. In the Bombay Herald of the 4th October 1790, we read the following paragraph: "We are happy in the opportunity of pointing out the liberality of Soorahjee Muncherjee, whose conduct does honour to humanity: during the present scarcity of provisions, he daily feeds upwards of two thousand people of different casts, at his own expence." Other public instances might be given.

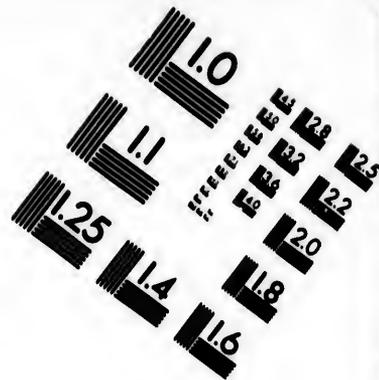

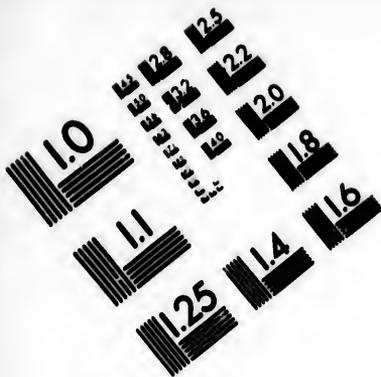

Some of them also have poor Europeans on their pension list, to whom are given a weekly allowance, and food and cloathing. To their private charity and benevolence, they add all the public show and expence necessary to give dignity to their riches. Some of them have two or three country houses furnished in all the ex-

travagance of European taste; with elegant and extensive gardens, where European gentlemen are frequently invited; and where they are always welcome to entertain their own private parties, and retire to enjoy the rural pleasures of the country, free from the noise and bustle of a busy dirty town. Parsee merchants give balls, suppers, and entertainments to whole settlements; and some of them ride in English chariots, such as a nobleman in England need not be ashamed to own, drawn by beautiful animals, that every nobleman cannot equal in his stud. The Parsees have been often known to behave to English gentlemen, respecting pecuniary concerns, in a manner highly liberal; and although instances might be given to the contrary, and instances might also be given, where individuals, elated by their riches, have forgotten the respect due to the English, still they are but instances, and are not more reprobated by any than themselves.

A Parsee beggar was never known; and their women, who are as fair as Europeans, are proverbially chaste; so that a harlot is as rare as a beggar. Upon the whole, they are a very handsome race of people.

An inquiry into the history and customs of the Parsees would we think be curious. Their history commences at the period of the troubles caused by the Saracen conquerors of Persia; when, persecuted for their religious opinions, a few Persians took refuge in the isle of Ormus, whence, some time after, they sailed for India, and landed in Gudjraat, where they found an asylum, on condition, that they should reveal the mysteries of their creed, should renounce their own language and dress, that their women should go abroad unveiled, and their nuptials be celebrated in the evening. These restrictions were all complied with, and the Parsees' dress is nearly the same with that of the Hindoos, and they use the nagri character. So far is their own language forgotten, that perhaps there are not ten Parsees, we know not of one on the Island of Bombay, that can speak it.

Tavernier in his *Persian Travels*, p. 163, gives a long account of the Guars, by whom he evidently means this people; but he is so unfortunate as to err notoriously in a number of particulars\*.

**WORSHIP AND FUNERALS OF THE PARSEES.]** They never intermarry, nor have they any public places of prayer; like their progenitors, the puritans of the east, they do not think temples, as places of worship, at all necessary, merely as such: they pray in the open air, and make their protestations to the sun, as the grandest emblem in nature of the Deity, whose temple is the universe, and the all-pervading element of fire, his only symbol.

Most of their original customs are, however, somewhat altered. No one, perhaps, is so singularly curious as their method of sepulture.

The defunct, after lying a proper time in his own house, for the purposes of mourning, is carried, followed by his relations and friends, the females chaunting a requiem, and deposited in a tomb of the following construction. It is a circular building, open at top, about fifty-five feet diameter, and twenty-five in height, filled to within five feet of the top, excepting a well of fifteen feet diameter in the centre. The part so filled, is terraced with a slight declivity toward the well. Two circular grooves, three inches deep, are raised round the well, the first at the distance of four, the second at ten feet from the well. Grooves of the like depth, or height, and four feet distant from each other, at the outer part of the outer circle, are carried straight from the wall to the well, communicating with the circular ones, for the purpose of carrying off the water, &c. The tomb, by this means, is divided into three circles of partitions: the outer about seven feet by four; the middle, six by three; the inner, four by two: the outer for the men, the middle for the women, the inner for the children; in which the bodies are respectively placed, wrapped

\* Lieut. Moor's Narrative of the Operations of Capt. Little's Detachment, p. 383.

loosely in a piece of cloth, and left to be devoured by the vultures; which is very soon done, as numbers of those animals are always seen hovering and watching about these charnel-houses, in expectation of their prey. The friends of the deceased, or the persons who have charge of the tomb, come at the proper time, and throw the bones into their receptacle, the well in the centre; for which purpose iron rakes and tongs are deposited in the tomb. The entrance is closed by an iron door, four feet square, on the eastern side, as high up as the terrace, to which a road is raised. Upon the wall, above the door, an additional wall is raised, to prevent people from looking into the tomb, which the Parsees are particularly careful to prevent. A Persian inscription is on a stone inserted over the door, which we once copied, but have forgotten its tenor. From the bottom of the wall, subterranean passages lead, to receive the bones, &c. and to prevent the well from filling.

Men of great property sometimes do not chuse to be deposited in these indiscriminate receptacles, and cause a small one to be built for their own families. Soorabjee, a rich merchant formerly of Bombay, is laid in a private one in the garden to his house on Malabar Hill; and we understand his tomb is grated over; if so, it is the only one on the island so covered. The public tombs are, we think, five in number, but not now all in use, situated about three miles north-westerly from Bombay fort: the largest (for they are of different sizes) is that here described. We have seen accounts of this custom of the Parsees, and descriptions of their tombs, but never any correct\*.

The nobility and people of rank delight in hunting with the bow as well as the gun, and often train the leopards to the sports of the field. They love shady walks and cool fountains, like other people in hot countries. They are fond of tumblers, mountebanks, and jugglers; of barbarous music, both on wind and stringed instruments, and play at cards in their private parties. Their houses are mean, and generally thatched, which renders them subject to fire; but the inside of houses belonging to the principal persons are commonly neat, commodious, and some magnificent.

COMMERCE OF INDOSTAN.] To what has been already given on this article, and the manufactures of India, it may be added, that the Mahometan merchants carry on, in a particular species of vessels called junks, a trade with Mecca, in Arabia, from the western parts of this empire, up the Red Sea. The largest of these junks, besides the cargoes, will carry 1700 Mahometan pilgrims to visit the tomb of their prophet. At Mecca they meet with Abyssinian, Egyptian, and other traders, to whom they dispose of their cargoes for gold and silver; so that a Mahometan junk returning from this voyage is often worth 200,000.

PROVINCES, CITIES, AND OTHER } The province of Agra is the largest in all } BUILDINGS, PUBLIC AND PRIVATE. } Indostan, containing 40 large towns and 340 villages. Agra is the greatest city, and its castle the largest fortification in all the Indies. The Dutch have a factory there, but the English have none.

The city of Delhi, which is the capital of that province, is likewise the capital of Indostan. It is described as a fine city, and contains the imperial palace, which is adorned with the usual magnificence of the East. Its stables formerly contained 12,000 horses, brought from Arabia, Persia, and Tartary; and 500 elephants. When the forage is burnt up by the heats of the season, these horses are said to be fed in the morning with bread, butter, and sugar, and in the evening with rice-milk properly prepared.

Latta, the capital of Sindy, is a large city, in which a plague in 1699 carried off above 80,000 of its manufacturers in silk and cotton. It is still famous for the manufacture of palanquins, a kind of canopied couches, on which the great men

\* Lieut. Moor's Narrative, p. 384.

all over India, Europeans as well as natives, repose when they appear abroad. They are carried by four men, who will trot along, morning and evening, 40 miles a day; 10 being usually hired, who carry the palanquin by turns, four at a time. Though a palanquin is dear at first cost, yet the porters may be hired for nine or ten shillings a month each, out of which they maintain themselves. The Indus, at Tatta, is about a mile broad, and famous for its fine carp.

Though the province of Moultan is not very fruitful, yet it yields excellent iron and canes; and the inhabitants, by their situation, are enabled to deal with the Persians and Tartars yearly for above 60,000 horses. The capital is Moultan, about 800 miles, by the course of the river, from the sea.

The province of Cashimere, being surrounded with mountains, is difficult of access, but when entered, it appears to be the paradise of the Indies. It is said to contain 100,000 villages, to be stored with cattle and game, without any beasts of prey. The capital (Cashimere) stands by a large lake; and both sexes, the women especially, are almost as fair as the Europeans; and are said to be witty, dexterous, and ingenious.

The province and city of Lahor formerly made a great figure in the Indian history, and is still one of the largest and finest in the Indies, producing the best sugars of any in Indostan. Its capital was once about nine miles long, but is now much decayed. We know little of the provinces of Ayud, Varad, Bekar, and Hallabas, excepting that they are inhabited by a hardy race of men, who seem never to have been conquered; and though they submit to the Moguls, live in an easy, independent state. In some of those provinces many of the European fruits, plants, and flowers, thrive, as in their native soil.

**BRITISH POWER IN INDIA.]** The relation subsisting between Great Britain and its Asiatic dominions, has been explained under the article of the East India Company of England.

In ancient times, the commerce between Europe and Asia was carried on, partly by land, partly by the course of great rivers and a clogged coasting navigation. The Eastern silks, spices, aromatics, and precious stones, were in the highest estimation among all the nations of antiquity; but the conquests even of Alexander, in India, were limited to the Panjab, while those of the Romans never led their legions beyond the banks of the Euphrates.

At the time when the modern Europeans began to assume a civilized character, they also imbibed a taste for the luxuries of Asia. The ships of the Italian free states, for this end, took up the Indian goods, which by means of caravans and the navigation of rivers had reached the shores of the Mediterranean, and diffused them over the northern kingdoms of Europe.

Towards the close of the sixteenth century, the minds of the Europeans, in general, began to take an adventurous turn. This bias was strengthened by the discoveries which had been made in those natural sciences that are subservient to the useful arts, and it terminated in exciting a general desire to make discoveries and to encourage trade.

In this new and bold career, Spain and Portugal unexpectedly took the lead: both courts patronized schemes for exploring, not only those parts of the world which hitherto had been concealed from the Europeans, but for finding out tracts, which should be better suited to the purposes of trade, than those which had hitherto been pursued.

Under this impression, Columbus sought a new route to the East-Indies; but, by an accident, was driven to the continent of America, there to rear a new pillar of the world, on which the crown of Spain was to lean.

Vasco de Gama, soon afterwards, on the original plan of Columbus, of finding a passage

a passage to the countries in the East which had been described by Marco Polo, doubled the Cape of Good-Hope; sailed along the coast of Africa, and reached the great peninsula of Asia. Gama, by this discovery, gave to Portugal a trade, more valuable than that which Columbus had conferred on Spain, though he could not annex to his country, either territories so extensive, or a trade so immediately productive.

The Dutch had already thrown off their dependence on the crown of Spain, and were struggling to establish their civil and religious freedom. These new republicans had motives to industry of every kind; they possessed a country which did not afford provisions for a third part of its inhabitants, and they had no other resource, but in their industry and maritime skill. Patient in their tempers and persevering in their purposes, trained too in a country, where navigation, if not the only, was certainly the principal pursuit; they caught, at once, the spirit of enterprize, because it promised them, at the same time, power and ample gain. For these purposes they sent their armed ships to the east, established factories, became the rivals and supplanters of the power and influence of the Portuguese, and, at last, erected their several, but connected, East India companies.

The English nation had, during these events, neither been insensible to the value of this commercial object, nor slow in its efforts to extend its trade and navigation; possessed of more national ardour, and yet equally persevering with the Dutch; emerging too from civil and religious thralldom, it determined to participate with the Portuguese and Dutch commercial adventurers, in the profits of the trade to the East Indies. In consequence of the wise measures adopted by those who governed the affairs of India, the administration of our possessions and trade there has become regular and efficient; the credit of our East India Company has increased; the price of India stock risen higher than the most sanguine of the proprietors could have expected; the trade of the Company has been almost doubled; tranquillity for a course of years maintained; and a war, not less necessary than politic, supported with dignity, and happily terminated with success and honour.

As Mr. Dundas's late bill is to be henceforth the great regulator of our Indian concerns (see page 248), the reader will be pleased to find the following abridgement of that most beneficial act:

[THE CONTROUL AT HOME.] The act provides for the continuation of the board of controul for the affairs of India in all its parts, except that, instead of the secretary of state being the president, the person first named in the king's commission is to be the president; and, instead of the commission being limited to six privy counsellors, the number is indefinite, resting on the king's pleasure; of which, however, the two principal secretaries of state and the chancellor of the exchequer are to be three: and his majesty may, if he pleases, add to the list two commissioners, who are not of his privy council.

By the former act, no salaries were given to the commissioners for India; and those of their secretary and other officers were to be paid out of the civil list. By the new act, the king may give 5,000*l.* a year amongst such of the commissioners as he pleases; which, together with the salaries of the secretary and officers, and other expences of the board, are to be paid by the India company, and not by the civil list. The whole is not to exceed 16,000*l.* a year, the commissioners' salaries included.

[THE GOVERNMENTS ABROAD.] The present forms of government over the presidencies of Bengal, Fort St. George, and Madras, are continued in all their essential parts. For Bengal, by a governor general and three members of council. For each of the others, a governor and three members. These latter, in respect to treaties with the native powers of India, levying war, making peace, collecting

and

and applying revenues, levying and employing forces, or other matters of civil or military government, are to be under the controul of the *government general* of Bengal; and are, in all cases whatever, to obey its orders, unless the directors shall have sent to those settlements any orders repugnant thereto, not known to the *government general*; of which, in that case, they are to give the *government general* immediate advice.

The court of directors are to appoint to these several governments; namely, the *governor general*, the two other *governors*, and the members of all the councils, and likewise the *commander in chief* of all the forces, and the three provincial *commanders in chief*. None of the *commanders in chief* are, *ex officio*, to be of the council; but they are not disqualified from being so if the directors shall think fit to appoint them, and, when they are members of the council, they are to have precedence of the other counsellors. The civil members of council are to be appointed from the list of civil servants, who have resided twelve years in the service in India.

[PATRONAGE AND RULE OF PROMOTION.] The directors are to appoint to many cadets and writers only, as to supply vacancies according to returns from abroad. Their ages shall not be under fifteen, nor exceed twenty-two, unless any cadet shall have been one year in the king's service, and then his age is not to exceed twenty-five years. All shall have promotion by seniority of service only. Three years service qualifies a civil servant for a place of 500l. a year; six years for one of 1,500l. nine years, 3000l. twelve years, 4000l. a year or upwards. None to take two offices, where the joint emoluments shall exceed this rule. All collectors of the revenue are to take the oath prescribed in the act against the acceptance of presents, and for faithfully rendering to the company all they shall receive.

[THE TRADE.] The company's term is extended for 20 years, from the 1st of March 1794; subject to be determined at, or after that period, on three years previous notice by parliament, signified by the speaker of the house of commons; subject, however, as to the trade to and from *India*, to the following limitations in favour of such private merchants as may choose to trade thither. In other respects, and to and from *China* and other places beyond the Cape of Good Hope, the former restrictions against private traders are continued in force; and if the exclusive trade thus limited, shall be hereafter discontinued, the company are still to retain their corporate capacity, with power to trade with a joint stock in common with other people. If, however, any new settlement shall be obtained from the Chinese government separate from the continent of Asia, an export trade thither is reserved to private merchants, under certain conditions and regulations; and there is also a clause to preserve the southern whalers in the benefit of their carrying trade into the Pacific Ocean, by the way of Cape Horn, to the northward of the equator, limited to 180 degrees west longitude from London; and ships from Nootka Sound are to be licensed to trade from thence with Japan and China, but are not to bring any goods of the produce or manufacture of those countries to Great Britain.

[LIMITATIONS ON THE EXCLUSIVE TRADE TO AND FROM INDIA.] All persons may export and import goods to and from India in the company's ships, except that they shall not export military stores ammunition, masts, spars, cordage, anchors, pitch, tar, or copper; nor import India calicoes dimities, mullins, or other piece goods, made or manufactured with silk or cotton, or with silk or cotton mixed, or with other mixed materials, unless it be done by leave of the company. If the market shall not be sufficiently supplied with the excepted articles of import or export, with an exception of military stores and copper, the board of controul may

open that trade also to individuals. If the company should not export 1500 tons of copper annually, private traders may export copper in the company's ships, to the amount of the deficiency.

The company are to furnish private traders, till 1796, with 3000 tons of shipping yearly, computed on the same principle as the company's own tonnage is computed. The quantity may be increased by order of the board of controul, to meet the demands of the private traders; and if the board order more than the company approve, they may appeal from the order to the king in council. And the company are restricted from charging any higher freight than 5l. per ton outwards, and 15l. per ton inwards, except in time of war, or in circumstances incidental to war, or preparations for war, when they may charge an increased rate of freight, in a due proportion to the rates at which they shall take up their own shipping, but the proposed increase can only be made by the consent of the India board, before whom the directors are also required, in 1794, and in every third year afterwards, to lay a statement of the affairs of shipping, and to abide by their order, touching any continuance, increase, or abatement of the rate of freight on private trade.

Private traders are required to notify to the company's secretary at home, and to the proper officers in India, at a time limited, the quantity of tonnage wanted by them for the ensuing season, with the place of destination, and the time when the goods will be ready for shipping. At home, this notice is to be given before the 31st August for the ships of the ensuing season; and before the 15th September, they are to deposit the sum for the tonnage, or give security to the directors for payment of it. Before the 30th of October, they are to deliver a list of the sorts and quantities of the goods intended to be sent. In failure of having them ready by the day specified in the notice, they are to forfeit their deposit, or the security, and also their tonnage for that turn. Similar rules are prescribed for shipping, &c. goods in India; but it is left to the governments there to fix the times, and to name the officers, to whom notices are to be given. The company is to have the benefit of all forfeited and vacant tonnage, and if more is demanded for private trade than the quantity limited, every person is to have his due proportion; and notice is to be given him thereof, seven days before the day for making the deposits. All private trade is to be registered in the company's books, and in default of being registered, it is to be considered as illicit trade, and punishable accordingly.

APPROPRIATIONS.] First, *in India*. The territorial revenues are to be applied, in the first place, in defraying all charges of a military nature. Secondly; in payment of the interest of the debts there already, or hereafter to be incurred. Thirdly; in payment of the civil and commercial establishments. Fourthly; in payments of not less than one million per annum for the company's investments of goods to Europe, and remittances and investments to China; and the surplus, if any shall remain, is to be applied in the discharge of debts, or such other purposes as shall be directed from home.

Secondly, *at Home*. The net produce of the company's funds at home, after payment of current charges, are thus appropriated: First; in payment of a ten per cent. annual dividend, on the present or any increased amount of the capital stock of the company. Secondly; of 500,000l. per annum to be set apart on the first March and the first September, half yearly; and applied in the discharge of the before-mentioned bills of exchange, for the aforesaid reduction of the India debt. Thirdly; of a like annual sum of 500,000l to the exchequer, to be applied by parliament for the use of the public, and to be paid on the 1st of January

ary

ary and first of July, half yearly, by equal instalments. And, lastly, the surplus may be applied in the more speedy reduction of the India debt, till reduced to two millions; or in discharging debts at home, so as not to diminish the bond debt below 1,500,000l.

Bengal of all the Indian provinces, is perhaps the most interesting to an English reader. Its natural situation, (as described by Major Rennel, late surveyor general in Bengal) is singularly happy with respect to security from the attack of foreign enemies. On the north and east it hath no warlike neighbours, and hath moreover a formidable barrier of mountains, rivers, or extensive wastes towards those quarters, should an enemy start up. On the south is a sea-coast guarded by shallows and impenetrable woods, and with only one port, which is of difficult access, in an extent of 300 miles. Only on the west can an enemy be apprehended: but there the natural barrier is strong; and with its population and resources, and the usual proportion of British troops, Bengal might bid defiance to any power of Indostan. It is the store-house of the East Indies, and, in fertility, exceeds Egypt. The produce of its soil consists of rice, sugar-canes, corn, sesamum, small mulberry and other trees; besides callicoes, silk, salt-petre, lakka, opium, wax, and civet, are sent to the most distant countries. Provisions are incredibly cheap, especially pullets, ducks, and geese. The country is intersected by canals cut out of the Ganges for the benefit of commerce; and extends near 100 leagues on both sides that noble river, full of cities, towns, villages, and castles.

In Bengal, the worship of the Gentoos is practised in its greatest purity; and their sacred river (Ganges) is in a manner lined with magnificent pagodas or temples.

Generally speaking, the description of one Indian city is a description of all; being all built on one plan, with exceeding narrow, confined, and crooked streets; with an incredible number of reservoirs, ponds, and gardens. A few of the streets are paved with brick. The houses are variously built: some of brick, others with mud, and a still greater proportion with bamboos, and mats: which standing intermixed with each other, form a motley appearance. The bamboo houses are invariably of one story, and covered with thatch. Those of brick seldom exceed two floors, and have flat, terraced roofs, but are often so thinly scattered, that fires, which often happen, do not sometimes meet with the obstruction of a brick house through a whole street.

Calcutta is in part an exception to this rule of building, the quarter inhabited by the English being composed entirely of brick-buildings, many of which have more the appearance of palaces than of private houses; but the remainder of the city, and by much the greatest part, is built according to the general description of Indian cities. Within 20 or 25 years, Calcutta has been wonderfully improved, both in appearance and in the salubrity of its air; for the streets have been properly drained, and the ponds filled up; thereby removing a vast surface of stagnant water, the exhalations from which were particularly hurtful. Calcutta is well known to be the emporium of Bengal, and the seat of the governor-general of India. It is supposed at present to contain, at least, 500,000 inhabitants. Its local situation is not fortunate; for it has some extensive muddy lakes, and a vast forest, close to it. It is a modern city, having risen on the site of the village of Govind-pour, about 90 years ago\*.

It is about 100 miles from the sea, situate on the western branch of the Ganges, which is navigable up to the town, for the largest ships that visit India.

The city of CALCUTTA extends from the western point of Fort William, along

\* Rennel's Memoir of his Map of Indostan, p. 58, 59.

the banks of the river, almost to the village of Cossipoor: that is about four and a half English miles. The breadth in many parts is inconsiderable. The streets are broad; the line of buildings, surrounding two sides of the esplanade of the fort, is magnificent; and it adds greatly to the superb appearance, that the houses are detached from each other, and insulated in a great space. The buildings are all on a large scale, from the necessity of having a free circulation of air, in a climate, the heat of which is extreme. The general approach to the houses is by a flight of steps, with great projecting porticoes, or surrounded by colonnades or arcades, which give them the appearance of Grecian temples; and indeed every house may be considered as a temple dedicated to hospitality.

CALCUTTA, from a small and inconsiderable fort, which yet remains (and in which is the famous black-hole, so fatal to many of our countrymen in 1756), and a few warehouses, was soon raised to a great and opulent city, when the government of the kingdom of Bengal fell into the hands of the English. For its magnificence, however, it is indebted solely to the liberal spirit and excellent taste of the late governor general; and it must be confessed, that the first house was raised by Mr. Hastings which deserves the name of a piece of architecture: in fact it is even in a purer style than any that has been built since, although it is on a smaller scale than many others.

The mixture of European and Asiatic manners, which may be observed in Calcutta, is curious—conches, phaetons, single-horse chaises, with the pallankeens and hackeries of the natives—the passing ceremonies of the Hindoos—the different appearances of the fakirs—form a sight perhaps more novel and extraordinary than any city in the world can present to a stranger\*.

In 1756, an unhappy event took place at Calcutta. The nabob or soubah quarrelled with the company, and invested Calcutta with a large body of black troops. The governor, and some of the principal persons of the place, threw themselves, with their chief effects, on board the ships in the river: they who remained, for some hours, bravely defended the place; but their ammunition being expended, they surrendered upon terms. The soubah, a capricious tyrant, instead of observing the capitulation, forced Mr. Holwell, the governor's chief servant, and 145 British subjects, into a little but secure prison, called the Black-hole, a place about eighteen feet square, and shut up from almost all communication of free air. Their miseries during the night were inexpressible, and before morning no more than twenty-three were found alive, the rest dying of suffocation, which was generally attended with a horrible phrensy. Among those saved, was Mr. Holwell himself, who has written a most affecting account of the catastrophe. The insensible nabob returned to his capital, after plundering the place, imagining he had rooted the English out of his dominions; but the seasonable arrival of admiral Watson, and colonel (afterwards lord) Clive, put them once more, with some difficulty, in possession of the place; and the war was soon concluded by the battle of Plassy, gained by the colonel, and the death of the nabob Suraja Dowla, in whose place Mht. Jasseir, one of his generals, was advanced to the soubahship.

The capital of Bengal, where the nabob keeps his court, is Muxadabad, or Moorhedabad. Benares, lying in the same province, is the Gentoo university, and celebrated for its sanctity. This zemindary, which includes also the circars of Gazy-pour and Chunar, constituted a part of the dominions of Oude till 1774, when its tribute or quit-rent of 24 lacs was transferred to the English.

Dacca is situated in the eastern quarter of Bengal, and beyond one principal stream of the Ganges, while another runs to the east of it. Few situations are

\* Hodges' Travels in India, from 1780 to 1783, p. 15.

better calculated for an inland emporium of trade, than this, as the Dacca river communicates with all the other inland navigations; and that not by a circuitous, but by a direct communication. It is the third city of Bengal in point of extent and population, and has a vast trade in mullins, and in those manufactures of the most delicate kinds, which are so much sought after in Europe. The cotton is produced within the province. Dacca has in its turn been the capital of Bengal, and that within the present century. There are the remains of a very strong fortress in it; and, within these few years, there was near it a cannon of extraordinary weight and dimensions\*; but it has since fallen into the river, together with the bank on which it rested.

The city of Agra is situated on the south side of the river Jumna, which at this place is not fordable. It is supposed to be a place of high antiquity. The present city, however, was raised by the emperor Achar, about 1566, and named from him Acharabad, and was the principal seat of his government.

To the south-east of the city of Agra is a beautiful monument, raised by the emperor Shah Jehan, for his beloved wife Taje Mahel, whose name it bears, and is called, by way of eminence, the Taje Mahel. When this building is viewed from the opposite side of the river, it possesses a degree of beauty from the perfection of the materials and from the excellence of the workmanship, which is only surpassed by its grandeur, extent, and general magnificence. The basest material that enters into the central part of it is white marble, and the ornaments are of various coloured marbles, in which there is no glitter: the whole together appears like a most perfect pearl on an azure ground. The effect is such, as I confess (says Mr. Hodges) I never experienced from any work of art. The fine materials, the beautiful form, and the symmetry of the whole, with the judicious choice of situation, far surpasses any thing I ever beheld †.

The city of Lucknow is extensive but meanly built: the houses are chiefly mud walls, covered with thatch, and many consist entirely of mats and bamboos, and are thatched with leaves of the cocoa nut, palm tree, and sometimes with straw. Very few, indeed, of the houses of the natives are built with brick: the streets are crooked, narrow, and the worst our traveller, Mr. Hodges, saw in India. In the dry season, the dust and heat are intolerable; in the rainy season, the mire is so deep, as to be scarcely passable; and there are a great number of elephants, belonging to the nabob and the great men of his court, which are continually passing the streets, either to the palace, or to the river, to the great danger and annoyance of the foot passenger, as well as the inferior class of shopkeepers.

The palace of the nabob is on a high bank, near to the river, and commanding an extensive view both of the Goomty and the country on the eastern side. A small part of it was raised by the late Nabob Sujah ul Dowlah, the father of Asoph ul Dowlah. It has however been greatly extended by the present prince, who has erected large courts within the walls, and a darbar, where he receives publicly all persons that are presented. This darbar is a range of three arcades, parallel to

\* Major Rennell gives the dimensions of this gun. The measures were taken by himself very carefully throughout. It was made of hammered iron; it being an immense tube formed of 14 bars, with rings of 2 or 3 inches wide driven over them, and hammered down into a smooth surface; so that its appearance was equal to the best executed piece of brass ordnance, although its proportions were faulty.

Whole length . . . 22 feet 10 $\frac{1}{2}$  inches.  
Diameter of the breech . . . 3 . . . 3

Diameter 4 feet from the muzzle 2 feet 10 . . . inches.  
— of the muzzle . . . 2 . . . 2 $\frac{1}{2}$   
— of the bore . . . 1 . . . 3 $\frac{1}{2}$

The gun contained 234,413 cubic inches of wrought iron; and consequently weighed 64,814 pounds avoirdupois, or about the weight of eleven 32 pounders. Weight of an iron shot for the gun, 46 $\frac{1}{2}$  pounds.

each other, and supported by columns in the Moorish style; the ceiling, and the whole of this, is beautifully gilt, and painted with ornaments and flowers. It is ascended by steps from a flower garden laid out in the same manner as we see in Indian paintings, which are all in square plats, in which are planted flowers of the strongest scent; so strong, indeed, as to be offensive at first to the nerves of an European. The exterior of the building is not to be commended; being similar to what might be the style of a baron's castle in Europe, about the twelfth century\*.

The city of Fyzabad is of considerable extent, and appears to contain a great number of people, chiefly of the lowest class; for the court being removed to Lucknow, drew after it the great men, and the most eminent of the merchants, bankers, and shroffs, or money changers. These last are persons in all the towns, and even villages, who make large sums by their knowledge of the exchange, which in India is in a state of constant fluctuation, to the great injury of the poor and the industrious.

The remains of the palace built by the late nabob Sujah ul Dowlah is a vast building, covering a great extent of ground, having several areas or courts, and many separate buildings in them. In the inner court are the remains of the durbar, or hall of public audience; an elegant building on the same plan as that already mentioned in the palace at Lucknow, but much richer; the painting and gilding greatly gone to decay. There are many other buildings designed for offices, or other accommodations. Within an interior court is a large extent of building, the principal front of which is on the banks of the river; and, when it was first raised, must have been very handsome. This was the part designed for the domestic habitation of the nabob. Adjoining are other buildings, designed for the Zenanah, or seraglio, and in which are the remnants of the gardens. The grand entrance to the palace is through a large and handsome gate, the superstructure of which was a place of arms, and there is still a guard kept in it. On the top of the gate was the situation of the nobut (a great drum), which is an appendage of royalty in India, and, when beaten, is heard over a great city. The nobut is usually beaten at sun-rise and sun-set. Nearly adjoining Fyzabad are the remains of the very ancient city of Oud, which is said to have been the first imperial city of Hindoostan, and to have been built by their hero Krishen. In colonel Dowe's translation of Ferishta's history, it is mentioned as the capital of a great kingdom, one thousand two hundred and nine years previous to the christian era; and it is frequently mentioned in the famous Hindoo work in Shanferite (the learned language of the Bramins) the Mahabheret, under the name of Adjudea. Whatever may have been said of its former elegance and magnificence, no traces of them are now left †.

Chandenagore is the principal place possessed by the French in Bengal: it lies higher up the river than Calcutta. But, though strongly fortified, furnished with a garrison of 500 Europeans, and 1200 Indians, and defended by 123 pieces of cannon and three mortars, it was taken by the English admirals Watson and Pococke, and colonel Clive, and also was obliged to surrender in the last war, but restored by the peace. Hoogley, which lies fifty miles to the north of Calcutta, upon the Ganges, is a place of prodigious trade for the richest Indian commodities. The Dutch have here a well-fortified factory. The search for diamonds is carried on by about 10,000 people from Saumelpour, which lies thirty leagues to the north of Hoogley, for about fifty miles farther. The other chief towns are Cassimbazar, Chinchura, Barnagua, and Maldo; besides a number of other places of less note, but all of them rich in the Indian manufactures.

\* Hodges' Travels in India, p. 100.

† Ibid. p. 105.

We know little concerning the province or foubah of Malva, which lies to the west of Bengal, of which Sindia and Holkar divide the largest part; but that it is as fertile as the other provinces, and that its chief cities are Ratipor, Ougein, and Indoor. The province of Candeish includes that of Berar and part of Orissa, whose capital is Brampur, or Burhampoor, a flourishing city, which carries on a vast trade in chintzes, callicoes, and embroidered stuffs. Cattaek is the capital of Orissa, and lies in the only road between Bengal and the Northern circars, and belongs to the Berar Rajah Moodajee Boolla, whose dominions are very extensive. Of the five Northern circars \*, Ciencole, Rajamundry, Ellore, and Condapilly are in possession of the English, and Guntor is in the hands of the Nizam. The four first occupy the sea-coast from the Chilka lake on the confines of Cattaek, to the northern bank of the Kistna river; forming, comparatively, a long, narrow slip of country, 350 miles long, and from 20 to 75 wide †.

The above are the provinces belonging to the Mogul's empire to the north of what is properly called the Peninsula within the Ganges. Those that lie to the southward fall into the description of the peninsula itself.

**HISTORY.]** The first invader of India whose expedition is authentically recorded was the famous Alexander of Macedon; and where the fortrefs of Rotas now stands on the banks of the Behar, he is supposed to have put in execution his stratagem for crossing the river, whilst the opposite shore was possessed by Porus. Zinghis Khan also directed his force there in the year 1221, and made the emperor forsake his capital. The seat of government was, indeed, often changed, as from Gazna to Delhi, to Lahore, to Agra, and to Canage. This last place was, in the reign of Porus, and long afterwards, the capital of Indostan, but is now reduced to a middling town, though the ruins are of great extent ‡.

Tamerlane crossed the Indus nearly at the same place with Alexander: but, long before Tamerlane, Mahomedan princes had entered, made conquests, and planted colonies. Valid, the sixth of the caliphs, named Ommiades, who ascended the throne in the 708th year of the Christian era, and in the 90th of the Hegira, made conquests in India: so that the Koran was introduced very early into this country. Mahmoud, son of Sebegtechin, prince of Gazna, the capital of a province separated by mountains from the north-west parts of India, and situated near Kandahar, carried the Koran with the sword into Indostan in the year 1000 or 1002 of the Christian era. He treated the Indians with all the rigour of a conqueror, and all the fury of a zealot, plundering treasures, demolishing temples, and murdering idolaters. The wealth found by him in Indostan is represented as immense. The successors of this Mahmud are called the dynasty of the Gaznavides, and maintained themselves in a great part of the countries which he had conquered in India until the year 1155, or 1157, when Kofrou Schah, the 13th and last prince of the Gaznavide race, was deposed by Kustain Gauri, who founded the dynasty of the Gaurides, which furnished five princes, who possessed nearly the same dominions as their predecessors the Gaznavides. Scheabbedin, the fourth of the Gauride emperors, during the life of his brother and predecessor Gaiatheddin, conquered the kingdoms of Moul-tan and Delhi, and drew from thence prodigious treasures. But an Indian, who had been rendered desperate by the pollutions and insults to which he saw his gods

\* These circars, or provinces, were originally denominated from their position in respect to Madras, on which they depend; and the term *circars* has at length been adopted by the English in general. Major Rennell's Introduction to his Memoir, p. 134.

and temples exposed, made a vow to assassinate Scheabbedin, and executed it. The race of Gaurides ended in the year 1213, in the person of Mahmood, successor and nephew to Scheabbedin, who was also cut off by assassins. Several revolutions followed till the time of Tamerlane, whose troops entered India at the end of the year 1398, descending, more terrible than all its former inundations, from the centre of the Indian Caucasus. This invincible barbarian met with no resistance sufficient to justify, even by the military maxims of Tartars, the cruelties with which he marked his way. But, after an immense slaughter, he at length rendered himself lord of an empire which extended from Smyrna to the banks of the Ganges.

The successors of Tamerlane, who reigned over Indostan with little interruption more than 350 years, were magnificent and despotic princes, and committed their provinces, as has been already observed, to rapacious governors, or to their own sons, by which their empire was often miserably torn to pieces. The provinces of Indostan have seldom continued under one head during a period of twenty years, from the earliest history down to the reign of Achar in the 16th century. Bengal, Guzerat, and other provinces, were in turn independent, and sometimes the empire of Indostan was confined within the proper limits of the province itself; the history of which furnishes an excellent lesson to princes not to grasp at too extensive dominion\*. At length, the famous Aurengzebe, in the year 1657, though the youngest among many sons of the reigning emperor, after defeating or murdering all his brethren, mounted the throne of Indostan, and may be considered as the real founder and legislator of the empire. He was a great and politic prince, and the first who extended his dominion over the Peninsula within the Ganges. He lived so late as the year 1707; and it is said that some of his great officers of state were alive in the year 1750.

In 1713, four of his grandsons disputed the empire, which, after a bloody struggle, fell to the eldest, Mauzoldin, who took the name of Jehander Shah. This prince was a slave to his pleasures, and was governed by his mistress, so absolutely, that his great Omrahs conspired against him, and raised to the throne one of his nephews who struck off his uncle's head. The new emperor, whose name was Furrukhsir, was governed, and at last enslaved by two brothers of the name of Seyd, who usurped his power so absolutely, that, being afraid to punish them publicly, he ordered them both to be privately assassinated. Discovering his intention, they dethroned the emperor, in whose place they raised a grandson of Aurengzebe, by his daughter, a youth of seventeen years of age, after imprisoning and strangling Furrukhsir. The young emperor proved disagreeable to the brothers, and being soon poisoned, they raised to the throne his elder brother, who took the title of Shah Jehan. The rajahs of Indostan, whose ancestors had entered into stipulations, or what may be called *passa conventa*, when they admitted the Mogul family, took the field against the two brothers; but the latter were victorious, and Shah Jehan was put in tranquil possession of the empire, and died in 1719. He was succeeded by another prince of the Mogul race, who took the name of Mahomed Shah, and entered into private measures with his great rajahs for destroying the Seyds, who were declared enemies by Nizam al Muluck, one of Aurengzebe's favourite generals. Nizam, it is said, was privately encouraged by the emperor to declare himself against the brothers, and to proclaim himself soubah of Deccan, which belonged to one of the Seyds, who was assassinated by the emperor's order. The

\* Some parts of the empire were 1000 miles distant from the seat of government. The English conquests in India met those of Tamerlane in a point equidistant from the mouths of the Ganges

and Indus, in the year 1774; for they closed their campaign that year at Loldong, 1100 miles from Calcutta.

younger Seyd no sooner understood what had happened, than he proclaimed the sultan Ibrahim, another of the Mogul princes, emperor. A battle ensued in 1720, in which the emperor was victorious, and is said to have used his conquest with great moderation, for he remitted Ibrahim to the prison from whence he had been taken; and Seyd being likewise a prisoner, was condemned to perpetual confinement; but the emperor took possession of his vast riches. Seyd did not long survive his confinement; and upon his death the emperor abandoned himself to the same course of pleasures that had been so fatal to his predecessors. As to Nizam, he became now the great imperial general, and was often employed against the Mahrattas, whom he defeated, when they had almost made themselves masters of Agra and Delhi. He was confirmed in his soubahship, and was considered as the first subject in the empire. Authors are divided as to his motives for inviting Nadir Shah, otherwise Kouli Khan, the Persian monarch, to invade Indostan. It is thought that he had intelligence of a strong party formed against him at court; but the truth perhaps is, that Nizam did not think that Nadir Shah could have success, and at first wanted to make himself useful by opposing him. The success of Nadir Shah is well known, and the immense treasures which he carried from Indostan in 1739. Besides those treasures, he obliged the Mogul to surrender to him all the lands to the west of the rivers Attock and Sind, comprehending the provinces of Peyshor, Cabul, and Gagna, with many other rich and populous principalities.

This invasion cost the Gentoos 200,000 lives. As to the plunder made by Nadir Shah, some accounts, and those strongly authenticated, make it amount to the incredible sum of two hundred and thirty-one millions sterling. The most moderate say that Nadir's own share amounted to considerably above seventy millions. Be that as it will, the invasion of Nadir Shah may be considered as putting a period to the greatness of the Mogul empire. Nadir, however, having raised all the money he could in Delhi, reinstated the Mogul, Mahommed Shah, in the sovereignty, and returned into his own country. A general defection of the provinces soon after ensued; none being willing to yield obedience to a prince deprived of the power to enforce it. The provinces to the north-west of the Indus had been ceded to Nadir Shah, who being assassinated in 1747, Achmet Abdalla, his treasurer, an unprincipled man, but possessed of great intrepidity, found means, in the general confusion occasioned by the tyrant's death, to carry off three hundred camels loaded with wealth, whereby he was enabled to put himself at the head of an army, and march against Delhi with fifty thousand horse. Thus was the wealth drawn from Delhi, made the means of continuing those miseries of war which it had at first occasioned. In this extremity, prince Ahmed Shah, the Mogul's eldest son, and the vizier, with other leading men, took the field, with eighty thousand horse, to oppose the invader. The war was carried on with various success, and Mahommed Shah died before its termination. His son, Ahmed Shah, then mounted the imperial throne at Delhi; but the empire fell every day more into decay. Abdallah erected an independent kingdom, of which Candahar is the capital.

The Mahrattas, a warlike nation, possessing the north-western peninsula of India\*, had, before the invasion of Nadir Shah, exacted a chout, or tribute from the em-

\* Malwa, Berar, Orissa, Candeish, and Vissapur, the principal part of Amednagar or Dowlatabad, half of Guzerat, and a small part of Aginere, Agra, and Allahabad, are comprized within their empire, which extends from sea to sea across the widest part of the peninsula, and from the confines of Agra northward, to

the Kistna southward, forming a tract of about 1000 miles long, and 700 wide. This extensive country is divided among a number of chiefs, whose obedience to the Paithwah, or Head, is merely nominal, and they are often at war among themselves, and also with their head. Their power hath been on the decline for the last twenty years.

pire, arising out of the revenues of the province of Bengal, which being withheld in consequence of the enfeebled state of the empire, the Mahrattas became clamorous. The empire began to totter to its foundation; every petty chief, by counterfeiting grants from Delhi, laying claim to Jaghires \* and to districts. The country was torn to pieces by civil wars, and groaned under every species of domestic confusion. Ahmed Shah reigned only seven years, after which much more disorder and confusion prevailed in this country, and the people suffered great calamities. At present, the imperial dignity of Indostan is vested in Shah Allum or Zadah, who is universally acknowledged to be the true heir of the Tamerlane race; but the city of Delhi, and a small territory round it, is all that is left remaining to the house and heir of Tamerlane, who depends upon the protection of the English, whose interest it is to support him, as his grant to the company is the best legal guarantee of their possessions.

We shall now conclude the history of Indostan with some account of the British transactions in that part of the world, since 1765, when they were quietly settled in the possession of the provinces of Bengal, Bahar, and Orissa; not indeed as absolute sovereigns, but as tributaries to the emperor. This state of tranquillity, however, did not long continue; for in 1767 they found themselves engaged in a very dangerous war with Hyder Ally, the sovereign of Mysore. This man had originally been a military adventurer, who learned the rudiments of war in the French camp; and, in the year 1753, had distinguished himself in their service. In 1763, having been advanced to the command of the army of Mysore, he deposed his sovereign, and usurped the supreme authority under the title of regent. In a short time he extended his dominions on all sides, except the Carnatic, until at last his dominions equalled the island of Great Britain in extent, with a revenue of not less than four millions sterling annually. The discords which took place in various parts of Indostan, particularly among the Mahrattas, enabled him to aggrandise his power, but rendered him an object of jealousy to his neighbours; and in 1767, he found himself in danger of being attacked on one side by the Mahrattas, and on the other by the British. The former were bought off with a sum of money, and the latter were in consequence obliged to retire. Having soon, however, assembled all their forces, several obstinate engagements took place; and the British now, for the first time, found a steady opposition from an Indian prince. The war continued with various success during the years 1767, 1768, and part of 1769, when Hyder, with a strong detachment of his army, passing by that of the British, advanced within a little distance of Madras, where he intimidated the government into a peace upon his own terms. The advantages gained by this peace, however, were quickly lost by an unfortunate war with the Mahrattas, from whom, in the year 1771, he received a most dreadful defeat, almost his whole army being killed or taken. Hyder was now reduced to the necessity of allowing his enemies to desolate the country, till they retired of their own accord; after which he retrieved his affairs with incredible perseverance and diligence, so that in a few years he became more formidable than ever. In 1772, the Mahrattas made various attempts to get possession of the provinces of Corah and some others, but were opposed by the British, who, next year, defeated and drove them across the river Ganges, when they had invaded the country of the Rohillas. On this occasion the latter had acted only as the allies of Sujah Dowlah, to whom the Rohilla chiefs had promised to pay 40 lacks of rupees for the protection afforded them; but when the money came to be paid, it was under various pretences refused; the consequence of which

\* Jaghire means a grant of land from a sovereign to a subject, revocable indeed at pleasure, but generally held for life.

was, that the Rohilla country was next year (1774) invaded and conquered by the British, as well as several other large tracts of territory; by which means the boundary of Oude was advanced to the westward, within 25 miles of Agra; north-westward to the upper part of the navigable course of the Ganges; and south-westward to the Jumna river.

In 1778, a new war commenced with the Mahrattas; on which occasion a brigade, consisting of 7000 Indian troops, commanded by British officers, traversed the whole empire of the Mahrattas, from the river Jumna to the western ocean. About this time the war with France broke out, and Hyder Ally, probably expecting assistance from the French, made a dreadful irruption into the Carnatic, at the head of 100,000 men. For some time he carried every thing before him, and, having the good fortune to defeat, or rather destroy a detachment of the British army under colonel Baillie, it was generally imagined that the power of Britain in that part of the world would soon be annihilated. By the happy exertions of sir Eyre Cooté, however, to whom the management of affairs was now committed, the progress of this formidable adversary was stopped, and he soon became weary of a war, which was attended with incredible expence to himself, without any reasonable prospect of success. By the year 1782, therefore, Hyder Ally was sincerely desirous of peace, but died before it could be brought to a conclusion; and his rival, sir Eyre Cooté, did not survive him above five months; a very remarkable circumstance, that the commanders in chief of two armies, opposed to each other, should both die natural deaths, within so short a space of time.

To Hyder Ally succeeded his son Tippoo Sultan, whose military prowess is well known. Of all the native princes of India, Tippoo was the most formidable to the British government, and the most hostile to its authority. The peace of Mangalore in 1784 had, it was supposed, secured his fidelity by very feeble ties; and the splendid embassy which, not long after that event, he dispatched to France, afforded much reason to apprehend that some plan was concerted between the old government of that country and the tyrant of Mysore, for the annoyance of Great Britain in its Indian possessions; but this plan was happily defeated by the French revolution.

The increasing power of Tippoo was not less formidable to the Dutch; and the vicinity of Cochin, their most flourishing settlement on the continent of India, to the territories of that aspiring monarch, made them tremble for its safety. That sagacious people, however, have seldom been without their resources. Besides Cochin, the Dutch were possessed of two other forts, which were situated between Mysore and their favourite settlement; and one of them, Cranganore, had been taken by Hyder Ally in 1779, or 1780. When the war broke out in 1780 between Hyder and the English, he was obliged to evacuate his garrisons on the Malabar coast to employ his force in the Carnatic; and Holland and France being soon after united with Hyder against the English, the Dutch embraced the opportunity of clandestinely taking possession, and regarrisoning the fort; a measure which greatly offended Hyder, and of which he loudly complained. By the mediation, however, of France, a compromise took place, but upon what terms, is uncertain.

From the vicinity of Cranganore and Acottah to his boundary, and their situation within the territory of an acknowledged tributary to Mysore (the rajah of Cochin), the possession of them was a most desirable object with Tippoo. In the month of June 1789, he marched a formidable force towards Cranganore, with a professed intention of making himself master of it, upon a claim chiefly founded upon the transactions we have just related. Unable therefore to retain the possession of the forts themselves, and fearing for a settlement of much superior value, the Dutch readily entered into a negociation with the rajah of Travancore for the

purchase of them. That politic people easily saw, that, by placing them in his hands, they erected a most powerful barrier, no less than the whole force of Great Britain (who was bound by treaty to assist him) against the encroachments of their ambitious neighbour upon their settlement at Cochin. The imprudence of the rajah, in entering upon such a purchase while the title was disputed, drew down upon him the heaviest censures from the government at Madras; and he was repeatedly cautioned, both by sir Archibald Campbell, and Mr. Holland his successor in the government, not to proceed in the negotiation. Such however was the ardour and temerity of the rajah in making this acquisition, that he not only concluded the purchase with the Dutch, but even treated with the rajah of Cochin, without the privity of Tippoo, though he was the acknowledged tributary of that prince, for some adjacent territory. The bargain was concluded in July 1789, though it was not till the 4th of August that the rajah informed the Madras government through their resident Mr. Powney, that he was on the point of making the purchase.

It was not probable that Tippoo would remain an indifferent spectator of these transactions. He insisted on the claim which he retained over these forts, in consequence of their being conquered by his father, and in consequence of the subsequent compromise. He asserted, that, according to the feudal laws, no transfer of them could take place without his consent, as sovereign of Mysore; and on the 29th of December, he made with a considerable force a direct attack upon the lines of Travancore. On receiving a remonstrance from the British government of Fort St. George, he desisted and even apologized. From the 29th of December to the 1st of March, Tippoo sultan remained perfectly quiet, still asserting his claims to the feudal sovereignty of the forts, but (it is confidently affirmed) offering to submit the dispute to any impartial arbitration.

On the 1st of March 1790, the rajah's troops made an offensive attack upon Tippoo, who had continued quiet within his lines from the 29th of December. An engagement took place; and the British government conceived themselves bound to take an active part. No period appeared more favourable to humble Tippoo, if that was the object of the British administration. With all the other powers of India we were not only at peace, but treaties of alliance existed between Great Britain, and the two most powerful states of India, the Nizam and the Mahrattas; and both declared themselves in perfect readiness to exert their utmost force to crush the rising power of Mysore.

Events of such magnitude as the close of this war in India, by which the British power is more than ever established on the continent of Asia, naturally excite an eager curiosity in all the subjects of the crown of Great Britain. We wish to be minutely informed by what steps so great advantages were secured, what obstacles were surmounted, and by what means; how far the glory of our country is increased by the manner, as well as her interest promoted by the nature, of the conquest. We are happy, therefore, from a narrative drawn up by major Dillon from journals and authentic documents, to lay before our readers the most satisfactory information upon these subjects.

It should be remembered, that the campaign here recorded was the third of our war with Tippoo sultan. The *first* commenced in June 1790, and concluded with that year. It was carried on below the Ghauts. The *second campaign* contained the capture of Bangalore, which fixed the seat of war in the enemy's country, and concluded with the retreat of lord Cornwallis from Seringapatam, towards the end of May 1791. The third commences almost from that point, and terminates in March 1792. Observing, however, as the author very properly states, that, in

the fine climate of Myfore, campaigns are regulated rather by plans of operations, than by seasons.

The narrative commences with unfavourable circumstances; the retreat of the two armies under general Abercromby and lord Cornwallis; the loss of cannon in both; an epidemic disorder among the cattle; and a dreadful scarcity of grain. These evils, however, vanish by degrees; the junction of the Mahrattas affords a supply of necessaries, arrangements are made for obtaining in future the most ample and regular provision of bullocks and grain, and for replacing the battering guns. On the return of the army to the vicinity of Bangalore, the operations began, which were to secure the communication with the Carnatic, and reduce the power of the enemy in those parts. The British force was immediately and successfully employed to reduce Ousoor, Rayacotta, and the other hill-forts commanding the Policode Pass. The next object was the forts to the north-east of Bangalore, which interrupted the communication with the Nizam's army and with the Carnatic, by that route. These being soon reduced, Nundydroog, built on the summit of a mountain about one thousand seven hundred feet in height, a place of greater magnitude and strength, was attacked, and, after being besieged from Sept. 22d, was carried by assault, on the 18th of October, in spite of obstacles which might reasonably have been deemed insurmountable.

By means of dispositions made for that purpose, supplies of all kinds now came in from the Carnatic. Penagra was taken at the end of October; and Kistnageri attacked on the 7th of November: this was almost the only enterprise that was not completely successful: the lower fort and pettah were taken; but the upper fort maintained its defence, and the attack was relinquished. It seems that it could only have been carried by a *coup de main*, which unluckily failed. On the 2d of the same month another instance of ill success happened to us: the relief of Coimbatore having been prevented, that garrison was obliged to capitulate to Cummer-ud-Deen Cawn, on terms which Tippoo did not afterwards fulfil.

Savendroog, or the rock of death, bore witness, in the month of December, to the ardour and perseverance of the British troops. This fortress, standing in the way between Bangalore and Seringapatam, is thus described: It is "a vast mountain of rock, and is reckoned to rise above half a mile in perpendicular height, from a base of eight or ten miles in circumference. Embraced by walls on every side, and defended by cross walls and barriers, wherever it was deemed accessible, this huge mountain had the farther advantage of being divided above by a chafin which separates the upper part into two hills, which, having each their defences, form two citadels capable of being maintained independent of the lower works; and, affording a secure retreat, should encourage the garrison to hold out to the last extremity;" p. 67. It is no less famed for its noxious atmosphere, occasioned by the surrounding hills and woods, than for its wonderful size and strength. Hence it derives its formidable name.

The sultan is said to have flattered himself, that before this place "half the Europeans would die of sickness, the other half be killed in the attack." He was, however, mistaken. The garrison, fortunately for us, trusted more to the strength of the place than to their own exertions, and on the 21st of December, only the 11th day of the siege, this fortress, hitherto deemed impregnable, was taken by assault in less than an hour, in open day, without the loss of a man, only one private soldier having been wounded.

Outredroog and other forts fell successively after this brilliant success. The forces of the allies were not equally fortunate during the same interval. The army of the Nizam, after a long siege of Gurraccondah, drew off to join our forces, and only left the place blockaded. To make amends for this failure, the Mahratta

army under Purferam Bhow, assisted by our engineers, took Hooly Onore, Bankapur, Simoga, and other places. By the latter end of January 1792, the whole allied force, excepting the Bombay army, was assembled in the vicinity of Hooleadrog.

We come now to the operations against Seringapatam. On the 1st of February 1792, the allies began their march, and by two o'clock on the 5th, were encamped across the valley of Milgotah, only six miles from the position of Tippoo before Seringapatam. It could not well be expected by the sultan, that he should receive so early an attack as lord Cornwallis destined for him. His camp was strongly situated and fortified by a bound hedge\* and several redoubts. Nevertheless, after causing his position to be reconnoitred in the morning of the 6th, the commander in chief issued orders for the attack that very evening. The army was to march at night in three divisions, and without cannon. "The plan of attack, says major Dirom, was indeed bold beyond the expectation of our army; but, like a discovery in science, which excites admiration when disclosed, it had only to be known, to meet with general applause." The outlines of this great enterprize are generally known; the particulars cannot be detailed in this place, but are related with great clearness by the historian, and so illustrated by the attendant plans, that the circumstances cannot be mistaken.

The result of this operation was, that Tippoo was driven from his camp into Seringapatam, all his redoubts taken, and a lodgement established in the island, in a strong position, where lieut. Stuart remained posted. All possible preparations were made, from this time, for taking the capital by assault: and they were such as probably would have been crowned with full success. On the 16th of February, the Bombay army, under general Abercromby, after overcoming various obstacles, joined the main army, and remained posted to the north-west of the city. On the 19th it was stationed on the south side of the Cavery, in a situation that seemed to give the sultan much uneasiness. However, after attacking the advanced post of this army on the night of the 21st, Tippoo made no farther effort; and on the 24th, when the preparations for the general assault were in great forwardness, it was announced that preliminaries of peace were settled. The conferences for this purpose had begun on the 15th; but the operations on both sides continued till the 24th. After the cessation of arms which then took place, the conduct of Tippoo Sultan was so equivocal and suspicious, as to make it necessary, on our part, to renew the preparations for the siege. Overawed, at length, by the firmness and decision of lord Cornwallis, and probably alarmed by the discontent of his own people, the reluctant sultan submitted to all the terms proposed; and on the 19th of March, the copies of the definitive treaty were delivered in form, by his sons, to lord Cornwallis, and the agents of the allied princes. The Nizam's son, prince Secunder Jah, and the Mahratta plenipotentiary Hurry Punt, thought it beneath their dignity to be present on this occasion in person, and were represented by their vakeels.

The substance of the treaty was, 1st, That Tippoo was to cede one half of his dominions to the allied powers: 2d, That he was to pay three crores and thirty lacks of rupees: 3d, That all prisoners were to be restored: 4th, That two of the sultan's three eldest sons were to become hostages for the due performance of the treaty.

\* A bound hedge is a broad strong belt of planting, chiefly the bamboo tree, the prickly pear, and such other trees and shrubs as form the closest fence. Most of the forts and villages are surrounded with such a hedge; and the large forts

have a bound hedge that incloses a circuit of several miles, as a place of refuge to the inhabitants of the adjoining country against the incursions of horse.

Major Dirom's and Lieut. Moor's Glossaries.

Tippoo is said to have been prevailed upon with infinite difficulty to subscribe to the terms of peace; and now that all was settled, the uneasiness in the seraglio became extreme in parting with the boys, who were to be sent out as hostages. The sultan was again intreated to request they might be allowed to stay another day, in order to make suitable preparations for their departure, and lord Cornwallis, who had dispensed with their coming at the time the treaty was sent, had again the goodness to grant his request.

When the princes left the fort, which appeared to be manned as they went out, and every where crowded with people, who, from curiosity or affection, had come to see them depart, the sultan himself was on the rampart above the gateway. They were saluted by the fort on leaving it, and with twenty-one guns from the park as they approached our camp, where the part of the line they passed was turned out to meet them. The vakeels conducted them to the tents, which had been sent from the fort for their accommodation, where they were met by sir John Kennaway, the Mahratta and Nizam's vakeels, and from thence accompanied by them to head quarters.

The princes were each mounted on an elephant richly caparisoned, and seated in a silver howder, [a canopied seat] and were attended by their father's vakeels, and the persons already mentioned, also on elephants. The procession was led by several camel harraccars, [messengers] and seven standard-bearers, carrying small green flags suspended from rockets \*, followed by one hundred pikemen, with spears inlaid with silver. Their guard of two hundred sepoy, and a party of horse, brought up the rear. In this order they approached head quarters, where the battalion of Bengal sepoy, commanded by captain Welch, appointed for their guard, formed a street to receive them.

Lord Cornwallis, attended by his staff, and some of the principal officers of the army, met the princes at the door of his large tent, as they dismounted from the elephants; and, after embracing them, led them in, one in each hand, to the tent. The eldest, Abdul Kalick, was about ten, the youngest, Mooza-ud-Deen, about eight years of age. When they were seated on each side of lord Cornwallis, Gulam Ally, the head vakeel, addressed his lordship as follows: "These children were this morning the sons of the sultan my master; their situation is now changed, and they must look up to your lordship as their father."

Lord Cornwallis, who had received the boys as if they had been his own sons, anxiously assured the vakeel and the young princes themselves, that every attention possible would be shewn to them, and the greatest care taken of their persons. Their little faces brightened up; the scene became highly interesting; and not only their attendants, but all the spectators were delighted to see that any fears they might have harboured were removed, and that they would soon be reconciled to their change of situation, and to their new friends.

The princes were dressed in long white muslin gowns, and red turbans. They had several rows of large pearls round their necks, from which was suspended an ornament consisting of a ruby and an emerald of considerable size, surrounded by large brilliants; and in their turbans, each had a sprig of rich pearls. Bred up from their infancy with infinite care, and instructed in their manners to imitate the reserve and politeness of age, it astonished all present to see the correctness and propriety of their conduct.

The operations of the Mahratta army commanded by Purseram Bhow, and the Bombay brigade of three native battalions, which acted with it, commanded by

\* *Rockets* is a missile weapon, consisting of an iron tube of about a foot long, and an inch in diameter, fixed to a bamboo rod of ten or twelve feet long.

capt. Little, are related in a very judicious narrative by lieut. Moore; which is not to be estimated from the inferior importance of the facts it contains, when brought into comparison with the operations of the grand army, under lord Cornwallis, so ably detailed by major Dirom; but it is a recital at once curious and instructive, containing a variety of matter well digested, and geographical information of high importance, if ever the arms of Britain should again be summoned to act above the Ghauts.

The Mahratta chief, Purseram Bhow, in consequence of a treaty formed with lord Cornwallis, for the purpose of humbling Tippoo sultan, moved from Poonah at the head of 20,000 horse and 10,000 foot, with the design of invading Tippoo's dominions on the North, while lord Cornwallis advanced from the East: both armies were to meet at Seringapatam. A detachment from Bombay was to join the Bhow on his march. This detachment consisted of 1600 Sepoys, commanded by British officers, one company of native artillery, and one of British. It joined the Mahratta army at Durwar, and was afterwards increased by the 2d regiment on the Bombay establishment, and a battalion of the 9th; the whole under the command of col. Frederick. Upon the death of col. Frederick the command devolved upon capt. Little, who at the head of this small force contributed essentially to the reduction of Darwar, a fortress of importance, bravely defended for six months; and in December 1791, defeated one of the largest armies Tippoo had in the field at Gadjnoor, inducing a loss which the sultan never recovered.

The army of Purseram Bhow, it is well known, did not reach lord Cornwallis till after his retreat from Seringapatam in 1791; but it saved his army, by the supplies it afforded. During the Monsoon, while lord Cornwallis continued at Bangalore, the Mahrattas returned to the North, and never joined him again, till the negociation with Tippoo was approaching to its conclusion.

Thus ended a war, which, as the author sums it up in his conclusion, "vindicated the honour of the nation, has given the additional possessions and security to the settlements in India, which they required; has effected the wished for balance amongst the native powers on the peninsula; has, beyond all former example, raised the character of the British arms in India; and has afforded an instance of good faith in alliance, and moderation in conquest, so eminent, as ought to constitute the English arbiters of power worthy of holding the sword and scales of justice in the East."

The general view of advantages gained by us in this war, may be briefly stated thus:—1. Our most formidable enemy is so reduced by it, as to render our possessions in India both profitable and secure.—2. Madras is secured from invasion by possession of the passes, and covered by a territory defended by strong forts.—3. The value of Bombay is greatly enhanced by possessions gained on the Malabar coast, protected by Poligautcherry and the frontier of the Coorga Rajah. These advantages, it may be presumed, will far overbalance the expences of the war. By a statement of major Dirom, it appears that Tippoo lost in this war 67 forts, 601 cannons, and 49,340 men.

It is utterly impossible, says major Rennell, in the present imperfect state of our knowledge of the geography of the northern part of the peninsula (notwithstanding the present improvements), to describe, with any degree of accuracy, the boundaries of the new cessions to the Mahrattas and Nizam; or even the positions of all the principal places situated within them. A very good *general idea* may, however, be collected from the map, on which the countries ceded will be particularly marked.

It would however be unjust to withhold our approbation from lord Cornwallis, in every thing that respects the conduct of the concluding campaign. Nothing that sound judgment could devise, or activity effect, appears to have been omitted. The

humanity

humanity and goodness of his lordship were conspicuous during the whole of the enterprize; and his moderation and sound policy in the concluding scenes cannot be too highly extolled.

By a letter from lord Cornwallis, the British ministry were informed that Mr. Baldwin, his majesty's consul at Alexandria, sent intelligence to Fort St. George of the war with France, which reached that place on the second of June 1793, and declared himself responsible in his public character for the truth of the information. His lordship adds, that upon the receipt of this intelligence all the small factories belonging to the French on the continent of India, as well as their ships in the ports belonging to the English, were taken possession of for his majesty of Great Britain. Soon afterwards, the government of Fort St. George proceeded to make preparations for the attack of the important fortrefs of Pondicherry. Lord Cornwallis being desirous of giving his personal assistance in carrying on the last piece of service that was likely to occur during his stay in India, set sail for the scene of action; but a few days before his arrival, the mutinous and dastardly conduct of the French garrison in Pondicherry had obliged the governor to surrender the forts to the British colonel Braithwaite, with all the troops and stores in the garrison of Pondicherry.

This intelligence reached England in the month of February 1794, soon after which his lordship arrived in person to receive the congratulations of the nation for the eminent services he had rendered his country.

The emperor of Indostan, or Great Mogul (so called from being descended from Tamerlane the Mongul, or Mogul Tartar), on his advancement, to the throne, assumes some grand title; as, "*The Conqueror of the World, the Ornament of the Throne, &c.*" but he is never crowned.

62,100  
CATARACT OF THE GUTPURBA RIVER.] A mile westward of Gocauk, the Heron Casley river, from a south-westerly direction, falls into the Gutpurba: a mile farther westward (the road ascending) commences a steep winding pass up a hill, and although assisted by pretty good steps, it is a very laborious walk. Soon after gaining the summit, a most striking scene presents itself of the whole Gutpurba river, perpendicularly rolling from the upper to the lower country. From the extent of the rocky bed, and pieces of weeds and the like, left on its bushy sides, this river, in the rains, we found to be one hundred and sixty nine yards broad, which volume of water is precipitated perpendicularly one hundred and seventy four feet two inches\*.

CLIMATE, SEASONS, AND PRODUCE.] The chain of mountains already men-

\* Niagara, the famous cataract in Canada, between the lakes Erie and Ontario, on the river Saint Laurence, falls one hundred and sixty two feet; it is affected that the mill arising from it forms a beautiful appearance like a rainbow, and may be seen at the distance of sixteen miles. Lieut. Moor's Narrative of the Operations of Capt Little's Detachment, p. 262.

† Other accounts make the falls of Niagara to be 150 feet perpendicular.

tioned,

Grand

tioned, running from north to south, renders it winter on one side of this peninsula, while it is summer on the other. About the end of June, a south-west wind begins to blow from the sea, on the coast of Malabar, which, with continual rains, lasts four months, during which time all is serene upon the coast of Coromandel (the western and eastern coasts being so denominated). Towards the end of October, the rainy season, and the change of the monsoon, begins on the Coromandel coast, which being destitute of good harbours, renders it extremely dangerous for ships to remain there, during that time; and necessarily occasions the periodical returns of the English shipping to Bombay, upon the Malabar coast. The air is naturally hot in this peninsula, but is refreshed by breezes, the wind altering every twelve hours; that is, from midnight to noon it blows off the land, when it is intolerably hot, and during the other twelve hours from the sea, which last proves a great refreshment to the inhabitants of the coast. The produce of the soil is the same with that of the other parts of the East Indies. The like may be said of their quadrupeds, fish, fowl, and noxious creatures and insects.

The Teek forests, (observes major Rennell, in his Memoir, p. 180, 181.) from whence the marine yard at Bombay is furnished with that excellent species of ship-timber, lie along the western side of the Ghaut mountains, and other contiguous ridges of hills, on the north and north-east of Bassen: the numerous rivulets that descend from them, affording water-carriage for the timber. We cannot help remarking the unpardonable negligence we are guilty of, in delaying to build teek ships of war for the use of the Indian seas. They might be freighted home, without the ceremony of regular equipment, as to masts, sails, and furniture; which might be calculated just to answer the purpose of the home passage, at the best seasons; and crews could be provided in India. The letter subjoined in a note, and which was written with the best intentions nine or ten years ago, will explain the circumstances of the case. Teek ships of forty years old and upwards, are no uncommon objects in the Indian seas, while an European built ship is ruined there in five years. The ships built at Bombay are the best, both in point of workmanship and materials, of any that are constructed in India: and although 4th rates only are mentioned in the letter, there is no doubt but that 3d rates may be constructed, as there is a choice of timber. The Spaniards build capital ships in their foreign settlements. The East India company have a Teek ship on her fourth voyage at present; which ship has wintered in England: therefore any objection founded on the effects of frost, on the Teek timber, is done away †."

Bilfish, which is almost in the heart of India, affords tobacco of the most delicate kind, throughout the whole region ‡.

\* "Frequent have been the opportunities I have had, of observing how very rapid the decay of ships built of European timber is, in the East Indies: and, on the contrary, how durable the ships are that are built of the wood of that country, namely, the TEER, which may not improperly be styled INDIAN-OAK. The number of ships of war that were ruined in those seas, during the late war (1757 to 1762) may be admitted as a proof of the former remark; and the great age of the ships built in India, may serve to prove the latter. What I mean to infer from this, for your lordship's use, is, that ships of war, under third rates, may be constructed in India; and, with moderate repairs, last for ages; whereas, a ship of European construction can remain there but a very few years; to which disadvantage may be added, that of losing, in the mean time, the services of the ships that are sent to relieve the worn-out ones.

† Bengal produces iron and hemp; and the neighbouring forests, pine masts: nothing is wanted to bring all these into use, but a fit opportunity, and proper encouragement.

"August 20, 1788."

‡ The major, in a note, adds, that the ship was then (when the second edition of the Memoir was printed in 1791) on her sixth voyage. Memoir, p. 260.

§ A difference of opinion seems to have arisen among the learned, whether tobacco came originally from Asia or America. It was possibly indigenous to both continents. It is universally disseminated over Indostan, and China; and appears to have been in use so long, in the former, that it is not regarded as a new plant. It is there named *Tamba pusa*; that is, the copper, or copper-coloured leaf.

In times of peace this country abounds in oxen and sheep, the latter for food, the former for the purpose of labour, for the Canareese eat no beef or swine flesh. Grain and fowls are also in abundance; but no geese, turkeys, or tame ducks. The jungles and hills are inhabited by tigers, bears, and other carnivorous animals: of the cat kind as well as the tiger, here are leopards, cheetas, and we believe, the lynx is sometimes seen, but no lions. Of the canine species, wolves, hyænas, jackals, and foxes are on every hill, and afford good sport in chase; the antelope and several other kinds of deer, in an open country, are seen every day in herds; some of them are very large and beautiful, having long branching antlers, and black skins spotted white: they are so fleet it is in vain giving chase; and withal so shy, and keeping mostly in a clear country, it is difficult to shoot them. Elks are said to be in this country, but we never saw any; and a species of deer not unlike the elk, called in India the sambá.

For the gun here are peacocks, partridges, quails, snipes, doves, plover, and other delicate birds: the pheasant is not eatable, and has not the beautiful plumage of the English or Chinese pheasant; but the jungle cock is, in every respect, but little inferior. The kurmoa, or korakin, is highly esteemed; and here is another bird, whose name we cannot recollect, larger than the turkey, and for the spit equally good: it flies slowly and heavily, and being shy, and lighting only in clear open places, is difficult to shoot. Hares are in plenty, but no rabbits. The tanks abound in ducks, teal, and widgeon, of the first variety, and some very large. Fishing affords but indifferent sport; for although the rivers and tanks seem to have plenty of fish, they will not take bait.

In times of plenty, the ordinary price of provisions is in this proportion: a bullock load of jowary (guinea corn) for a rupee, or four sheep, or twenty fowls: sheep are frequently at half a rupee each. A bullock load is eighty pukka seer, which, at a liberal allowance, will serve a family of six persons a month.

Fruit and vegetables are neither in such variety or quality as might be expected, where they form so considerable an article in the diet of the people: plantains should, from their utility, and perhaps flavour, rank first on the list of fruits; mangoes are in abundance, but very inferior to many kinds of that exquisite fruit in Bombay, Goa, and other places on the Malabar coast. Mangoes when green give a relish to the simple food of the natives; they are also salted and used as an acid, the only one indeed the Canareese have, excepting tamarinds; for they make no vinegar, although it might be so easily procured, as it is in most parts of India, by suffering the juice that exudes from the cocoa-nut, or date-tree, to ferment a few days in the sun, with a little coarse sugar mixed in it. This liquor, called by natives in different parts of India, tarree, neera, or sindee; by the English toddy, is procured by hanging an earthen pot on a stem whence the embryo fruit has been cut: when drank before sun-rise it is sweet, of delicious flavour, and of medicinal properties; keeping the body cool and soluble. In a few hours, by violent fermentation, it becomes intoxicating, and is drank to excess by the lower classes of people in most parts of Hindoostan: a spirit is also extracted from it by distillation. The liquor is gathered twice a day, in the quantity of half a pint, about the time of sun-rising or setting.

The other fruits are musk and water-melons, pomegranates, grapes, pine-apples, pines, cuttard-apples, jacks, guavas, and a few other inferior kinds common throughout India: grapes and pines seldom come to market. Cocoa-nuts and dates are in great abundance, and are sent to the coast as an article of merchandise. Heretofore it has been a received opinion, that the cocoa-nut tree would not

\* Lieut. Moor's Narrative, &c. p. 278.

fourth but near the sea; there are however very extensive groves, or rather forests, of them, about the centre of the peninsula a hundred and fifty miles from the seas, in as fine order as any on the coast.

The vegetables are bendys, brinjals, purslain, cucumbers, radishes, carrots, yams, sweet potatoes, &c. &c.

There is not perhaps on record an instance of any tree, or natural production of any kind, that can be, and is applied to so many useful purposes, as the cocoa-nut tree. Not having particularly considered the subject, we are not likely to enumerate half the purposes for which it is rendered serviceable.

The trunk of the tree is used in building, being, after some years seasoning, a solid timber, very hard and durable, although in a green state not very fit for that purpose from being principally composed of pith and brittle fibres. With the leaves the greater part of the houses in India are covered: they grow to six or seven feet long, and are formed proper for use, by plaiting the narrow slips that compose the leaf, which project a foot or two on each side the centre stem. Not only the houses of the poorer people are thus covered, but also the country houses of gentlemen, who prefer a kadjan roof, as being cooler than any other. It requires being renewed every year before the periodical rains, which, although so severe, do not penetrate a roof composed solely of these leaves. Two leaves plaited together frequently serve to sleep upon, and are very cooling and refreshing in hot weather: they are also formed to serve as a defence against rain. The variety of uses to which the fruit is applied, is indeed great: the outside husk is a considerable time soaked in water, when fibrous shreds are drawn from it, of which rope of every kind is made, from the size of a packthread, to a sheet cable for a seventy-four. The standing and running-rigging of the country ships is chiefly of koiar, which is its general name, but in what language we know not. The best koiar cables are made on the Malabar coast, at Anjenga and Cochin, of the Laekadevy nut, from which islands they are an article of extensive trade. The shell of the cocoa-nut is well known in England: in India it is, as may be supposed, made subservient to numberless uses. Two thirds of a shell makes a cup, the remaining third, with a piece of stick, a ladle, &c. &c. The kernel of the fruit is an article of subsistence among the natives, and the water it contains gives the finishing zest to the repast. While the nut is green, nearly a pint of milk, then clear as water, is contained in the young sweet pulp, and is, in a hot day, a most delicious and luxurious draught. A dish well known in the East and West Indies, called the curry, a favourite among Europeans, and in universal esteem with the natives, cannot be prepared without the cocoa-nut, which is also dried and used for various culinary purposes. The oil universally burned, the best and clearest in India, is extracted from the kernel of the cocoa-nut by exprellion: nor is the remaining *caput mortuum*, if it may be so called, useless; for it is fine food for fattening poultry, or beasts, and is sometimes, in scarcities, eaten by the poorer people. Cocoa-nut oil, as well as for the lamp, is medicinally esteemed, and to that it is that the females of Asia owe their celebrity for hair, unequalled in blackness and beauty. In its natural state however the oil is ill scented, which causes the more delicate to mix grateful and stimulating perfumes with it, before applying it to their persons. Among the inferior classes, this is not much attended to, and is doubtless a just cause of complaint against their sweetness, especially by those who have nice nasal nerves.

The embryo fruit being cut from its stem, a sweet pleasant liquor exudes, which is noticed by the name of tarree, or toddy: this when gathered and drank, before

\* Lieut. Moor's Narrative, &c. p. 279.

sun-riſe, is highly ſalutary and grateful; and a perſon of ordinary habit, who would live moderately regular, and drink half a pint of it twice a week, would in this climate have but little cauſe for a phyſician. Trees, whence tarree is drawn, produce no fruit, the juices being of courſe exhauſted that ſhould nourish the kernel. The only leaven uſed by the bakers in India is the tarree.

Indeed to ſuch a variety of purpoſes is every part of this tree applied, that it would be worth the pains of an intelligent perſon to make particular enquiries into its hiſtory. It is very long-lived, and does not come to perfection (by which criterion every thing animal or vegetable may be ſafely judged as to its longevity) for a conſiderable number of years, ten or twelve at leaſt. A cocoa-nut being put two feet in the ground, will in a year or two put forth the leaves to their full length, before any of the trunk makes its appearance, which comes up at its uſual diameter, and continues increaſing in height only, until the time of its maturity, when the tree is fifty or ſixty feet high; and, if uninterrupted, is perfectly ſtraight, without any excreeſence, except at the top, where the leaves are fifteen or twenty in number, and the fruit, which grows on a ſtem, as thick and long as a man's arm\*.

Amongſt the trees in India, the moſt famous is that called kuhlbeer-burr, by the Engliſh the *banyan-tree*. That deſcribed by Mr. Wales's print, is on an iſland in the river Nurbudda, ten miles from the city of Baroach, in the province of Gujraat, ceded to Madajie Scindia by the government of Bengal, at a treaty of peace concluded with the Mahrattas in 1783. The tree is ſuppoſed to be the largeſt, and moſt extraordinary in exiſtence; and is aſſuredly a moſt ſtupendous production.

From Mr. Maurice's third volume of Indian Antiquities, page 493, the following account of the banyan tree is taken. "The banyan, or Indian fig-tree, is perhaps the moſt beautiful and ſurpriſing production of nature in the vegetable kingdom. Some of theſe trees are of an amazing ſize, and as they are always increaſing, they may in ſome meaſure be ſaid to be exempt from decay. Every branch proceeding from the trunk throws out its own roots; firſt in ſmall fibres, at the diſtance of ſeveral yards from the ground; theſe continually becoming thicker when they approach the earth, take root, and ſhoot out new branches, which in time bend downwards, take root in the like manner, and produce other branches, which continue in this ſtate of progreſſion as long as they find ſoil to nourish them.

"This tree, called in India *Cabeer Burr*, in honour of a famous ſaint, was much larger than it is at preſent; for high floods have at different times carried away the banks of the iſland where it grows, and along with them ſuch parts of the tree as had extended their roots thus far; yet what ſtill remains is about two thouſand feet in circumference, meaſuring round the principal ſtems; but the hanging branches, the roots of which have not reached the ground, cover a much larger extent. The chief trunks of this ſingle tree amount to three hundred and ſixty, all ſuperior in ſize to the generality of our Engliſh oaks and elms; the ſmalleſt ſtems, forming into ſtronger ſupporters, are more than three thouſand; and from each of theſe new branches, hanging roots are proceeding, which in time will form trunks, and become parents to a future progeny.

"*Cabeer Burr* is famed throughout Hindooſtan for its prodigious extent, antiquity, and great beauty. The Indian armies often encamp round it; and at certain ſeaſons, ſolemn Jattras, or Hindoo feſtivals, are held here, to which thouſands of votaries repair from various parts of the Mogul empire. Seven thouſand perſons, it is ſaid, may eaſily reſt under its ſhade. There is a tradition among the natives, that this tree is three thouſand years old; and that this is the amazing tree

\* Lieut. Moor's Narrative, &c. p. 402.

ers; but these measures tended to create desertion, and increase distress. In short no man will carry his family to camp who does not find his convenience and advantage in doing so; no person will pay for servants he does not want, nor will followers attend on an army without pay who do not earn a living, which they can do only by contributing to its support. There are no towns to be depended on for supplies, and an army in India not only carries with it most of the means of subsistence for several months, but also a variety of necessaries, which are exposed daily in the bazars, like merchandize in a fair; a scene altogether resembling more the emigration of a nation guarded by its troops, than the march of an army fitted out merely with the intention to subdue an enemy."—The major's idea of likening a country army to the emigration of a nation, guarded by its troops, is very happy.

Speaking of the Bhow's army (in page 10) the major says, "The Mahratta camp was at the distance of about six miles from ours, and, on approaching it, had the appearance of a large irregular town; for the chiefs pitch their standards and take up their ground around their general without order; and their tents being of all sizes, and of many different colours, at a distance resemble houses more than canvass.—The streets too of their camp crossing and winding in every direction, display a variety of merchandize as in a great fair. There are shoofs, (bankers) jewellers, smiths, mechanics, and people of every trade and description, as busily employed in their occupations, and attending as minutely to their interests, as if they were at Poonah and at peace."

Orme, in his "History of the Military Transactions of the British Nations in Hindostan," a work which we sincerely wish may be continued, notices the number of women and followers to an eastern army: he says every "common soldier in an Indian army is accompanied either by a wife or a concubine; the officers have several, and the generals whole seraglios: besides these, the army is encumbered by a number of attendants and servants, exceeding that of the fighting men; and to supply the various wants of the enervated multitude, dealers, pedlars, and retailers of all sorts, follow the army, to whom a separate quarter is allotted, in which they daily expose their different commodities in greater quantities, and with more regularity, than in any fair in Europe\*."

[SINGULAR CUSTOMS.] The beetel is in universal use throughout all India, perhaps throughout Asia, from the pauper to the prince. The proper name of this compounded quid is, from the ingredients of which it is compounded, called paan-sooparee, or a beeree. It is an article at all entertainments and visits: at the latter, a beeree being presented, is equivalent to a licence, or what in England we should call a hint for taking leave. The beeree is composed of the sooparee, commonly called beetel, cut by an instrument for the purpose into thin slices, two or three of which, with a cardanom, and a very small quantity of chuna, is inclosed in a paan, or leaf, and fastened by a clove in a triangular form.

Although the beeree is at first unpleasent to Europeans, a little intercourse with country people will soon familiarise it so as not only to be tolerated, but desirable and grateful. On ceremonious visits the beeree, as before noticed, are distributed, ready made, previously to the guest's departure; but on familiar occasions, the paardan, leaf-holder is early brought into company, and each person helps himself; or should ladies be introduced, the luxury is enhanced by their preparing the beeree.

There are, perhaps, few practices in any part of the world more extensive than this of chewing beetel in India, and in many parts it is done to a degree bordering

\* Lieut. Moor's Narrative of the Operations of Capt. Little's Detachment, p. 84.

on disgust. Many of the inhabitants of the peninsula are guilty of this excess, particularly on the Malabar coast. The Malays, and inhabitants of the eastern side of the Bay of Bengal, the Sumatrans, and all the people in the Streights of Malacca, the island of Borneo, Madagascar, and others in Africa, it is said, abuse it to a shameful degree; and mixing too much chuna, or some other corroding ingredient, their teeth decay, and their mouths are extremely filthy. What few people our traveller saw on the island of Sumatra were so without exception\*.

Tobacco is not so much used by the Canareese as by most eastern nations; in those parts, however, where it is used to excess, so much attention is paid to cleanliness, that it is less disagreeable than the smaller quantity more grossly used by the Canareese. The women seldom smoke, but the inferior people chew a small quantity of tobacco with their betel. It must be observed, that the ladies, or females above the common classes, of India, although accustomed to both smoking tobacco, and chewing betel, do them with so much attention to cleanliness, as not to offend the most punctilious nicety. The extreme elegance of the smoking apparatus not leaving the smallest indelicacy in the breath, and the beeri or betel, in moderation, is highly esteemed as a sweetener of it. Nothing indeed can be a greater proof of their utility, and agreeable effects, than being grateful to the ladies of Indostan; for no females on earth can be more attentive to their personal attractions, nor readier to reject anything that might have the most minute tendency to lessen them. To an Englishman, it may possibly be a stronger argument, informing him that his own countrywomen, so famed for delicacy and sweetness, do not scruple to partake of the refined luxury of inhaling tobacco in the eastern stile; nor do they despise the beeri, although, perhaps, it is not in so much, nor so deserved, estimation as the hoykah †.

[ADHERENCE TO ANCIENT USAGE.] The bigotry with which all sects of Hindoos adhere to their own customs is well known; still when these customs are strikingly injudicious, and totally abstracted from religious prejudices, perseverance degenerates into obstinacy, and simplicity into ignorance.

The farriers travel about the camp, and, wherever they are wanted, do the business on the spot; as they carry a dozen ready made shoes, with nails, and all their implements in a bag. The anvil weighs five or six pounds, and is driven into the ground; a hammer or two, a pair of pincers, and a clumsy knife to pare the hoof are all their tools ‡. They use no rasp, but pare the hoof to fit the shoe.

[LANGUAGES SPOKEN IN THE PENINSULA.] On considering the advantages that a traveller conversant in the languages of the countries in which he

\* Lieut. Moor's Narrative, &c. p. 375.

† Ibid. p. 207.

‡ The same small number of tools used by all the mechanics in India is remarkable. A carpenter carries his whole stock about with him, and it is indifferent to him where he works: he has no work-shop or bench, but squats on the ground wherever his job calls him. A couple of hammers, as many chisels, a plane, a saw, a drill, used as a gimblet, and a tool with a short handle, otherwise not unlike an adze, its head serving as a hammer, are his whole store. With these the carpenters work very well, and neatly.

A goldsmith is in the same stile: his furnace is a broken earthen pot, containing two or three pounds of charcoal; his bellows are his own cheeks, and a piece of musquet barrel, or a bamboo tube, which he holds in one hand, while he

stirs the metal in the crucible with a pair of pincers in the other: his crucible is of earth baked in the sun, and resists the heat these simple furnaces are capable of affording; his anvil is knocked in the ground, and a little water, in a cocoa nut shell, serves to cool his metal. His tools are not more numerous than the carpenter's, a hammer or two, as many files and polishing instruments, and a plate for drawing wire, are all with which these people work so neatly. The goldsmith too is indifferent where he works; he is ready to work in his employer's house, where, by knocking his anvil into the ground, his apparatus is prepared. At home they generally work in open verandas, and remove their tools into the house at night. We are not now speaking of camp particularly; it is thus in Bombay, Poona, Tellicherry, and every where in India. Lieut. Moor's Narrative, p. 93.

travels, has over his uninformed companion, we are induced to give our opinion on the subject of the languages spoken in the peninsula, and which of them will be of most utility to a person in his peregrinations there. That which is commonly, but incorrectly called Moors, is the first that a person visiting India will, in most parts, observe to be in practice; but if he has occasion to go about the centre of the peninsula, he will frequently be in situations where that language will avail him but little. Northward of the Krishna, and between the 74th and 79th degrees of longitude, the Mahratta tongue is generally spoken. From the Krishna southward, to perhaps Cape Comorin, the Canarese prevails, with the exceptions of the Malabars between the Ghauts and the western shore, and the Tamulic, generally also called Malabars, spoken by the inhabitants of the eastern coast of the peninsula: both these languages, however, as we have noticed in another place, bear strong internal evidence of having originally been the same with the Canarese. In the low country north of the Krishna's latitude, on the western side, a corrupt jargon is in use called Koonknee, or Kooknee, composed of Moors and Mahrattas. The situation in which a resident may be placed, will of course, in a great measure, regulate his application to languages; but in almost every place where Europeans are likely to be called, the Hindoi, the tongue just called Moors, is first to be recommended, and farther his situation and inclination must determine. In the European settlements on the Malabar coasts, particularly in Tellicherry, Cochin Anjenga, &c. the Portuguese is a good deal spoken, sadly corrupted.

On the subject of Persian, we speak with the diffidence which but a confined knowledge in that beautiful dialect renders becoming; and from that knowledge in the practical part being so confined, we draw the conclusion that it is very little known in the peninsula; for in journeys of several thousand miles, I rarely, says Mr. Moor, although they were sought, met with opportunities of conversing in it. Its study is, nevertheless, strongly to be recommended; and should the student have no other inducements but gratifying his curiosity and taste for polite literature, that gratification he will find very satisfactory: if his avocations or amusements call him to courts, he will, if ignorant, be unpleasantly situated, there being no other language used where we have connections, at any court in India, Poona excepted: (we do not mean to include the petty sovereignties on the Malabar coast, &c.) indeed among the Mahometans, Persian is reckoned necessary to a genteel education, bearing precisely the same analogy to their other languages, as French does in Europe\*.

CHARACTERS AND MATERIALS } The characters used in writing by the Canarese and Malabars, appear, as well as their dialect, to be derived from the same source: they write from the left, as we do; the Malabars, with an iron skewer, on leaves of a species of the palmyra, commonly called the brab-tree: the leaf is about two inches broad, has many folds, strung loosely by a loop at the end, and is held in the left hand, the thumb-nail of which, in those who profess writing, has a nick in it to receive and direct the skewer: the writing is performed with inconceivable quickness, and not only trifling occurrences, but public records of disbursements and events are thus written and preserved.

On public or important matters, the Canarese, we believe, write on common paper; but their ordinary accounts and writings are done with a white pencil on black paper, or rather a cloth, which is prepared something like our slate paper, and the pencil is a fossil very similar to French chalk. A large book has but one piece of this paper, which is folded backward and forward, and will open out to

\* Lieut. Moor's Narrative, p. 426.

ten or twelve yards in length. We are not certain, says Mr. Moor, if their records are written on common paper, for in a pagoda at Dooridroog, and in other places, we saw a quantity, perhaps a waggon load, of the manuscript books; two or three small ones we brought away, but they contained little else than accounts of sums expended for the services of the pagoda; the whole, however, could hardly be on the same subject\*.

[THE METHOD OF RECKONING TIME.] This is the same as in other parts of India, by p'hours and gurries; but the manner of measuring it in Chittledroog and other sorts, is somewhat curious. It may be called a hydrostatic measure, being a small cup with a hole in its bottom, floated in a vessel of water, and when a certain quantity of water is received into the cup, from its gravity it sinks, and points out the expiration of a particular portion of time. The water being kept quite unruffled, this may perhaps be a very accurate method of measuring time, as it is evident no other nicety is required but exactness in the hole of the cup, which may be easily determined. At each gurry, or half hour, the cup sinks, and the centinel who has charge of the time measurer, strikes the number upon a gong, and emptying the cup, immediately sets it afloat. After the p'hours, that is to say, at three, six, nine, and twelve o'clock, he makes a clattering on the gong, and begins gurries again, similar to the bells on shipboard. A gong is a circular piece of brass, or sonorous metal, plane on both sides, three or four feet in diameter, and a quarter of an inch thick; it is hung up by a thong, and being struck with a piece of hard wood, is heard to a great distance †.

[MAUSOLEUM.] Besides many other elegant buildings in the city of Bejapoor, Mr. Moor gives a very curious description of the mausoleum of Ibrahim Padshah, in the following terms: "fronting the mosque, at the distance of forty yards, having a piece of water and a fountain between, stands the stately mausoleum of the king (Ibrahim Padshah) and his family. It is a room of 57 feet square, inclosed by two virandas; the inner 13 feet broad, and 22 feet high, the outer 20 feet broad by 30, supported by seven arches in each face: the interstices of the stones at top are filled with lead, and clamped together by ponderous bars of iron, some of which have been wrenched from their holds by the destructive Mahrattas, supposing, perhaps, that they were of a metal more precious. The stones are so neatly joined as to appear all of one piece in the inside, where the tops of the virandas are ornamented with beautiful sculptures, chiefly passages from the Koran; but the sides of the room are in the most elaborate style: it is indeed wonderfully so. A black stone, but not we believe marble, is the chief material, on which chapters of the Koran are raised in manner of basso relievo, and polished equal to a mirror. The part cut out to give a due degree of prominence to the letters, has on the northern side been beautifully gilt, and adorned with flowers on a blue ground, in imitation of enamel. The doors, which are the only pieces of wood in the building, are handsome, and studded with gilt knobs; around the door-ways in each face, are a variety of ornaments exquisitely executed. There is a window on each side of the four doors, and over them arches of open work, so contrived, that what is not cut out expresses passages from the Koran. Around the southern door is a tetraëch, containing an account of the expenses of this building; by

\* Orme, in the xxvth note to his fragments, on the authority of M. Anquetil da Perron, says, the Mahrattas and Canarese "Morattos and Canarins," use the same character, and regulate their chronology by the same cycle. As to their chronological regulations we cannot speak; but their cha-

raacters, to us, appear to differ materially; that used by the Mahrattas seems very similar to the Nagri, the ordinary character common to Hindoos. Lieut Moor's Narrative. &c. p. 277.

† Ibid. p. 136.

which

which it appears to have cost fourteen lacs, and thirty-one thousand pagodas: it is not thus expressed, but in a mytic manner, to bring in as often as possible the number NINE, which is of virtue in astrological calculations; the lines concluded thus:—one hundred and fifty-nine thousand pagodas nine times told. Estimating the pagoda at its highest value, the amount is nearly seven hundred thousand pounds sterling, which sum we were informed was expended on the tomb alone; but we apprehend it includes the mosque and adjacent buildings, and even then is an enormous sum in a country where labour is so cheap. Six thousand five hundred and thirty-three workmen were employed on this elegant structure, thirty-six years, eleven months, and eleven days." Page 312.

PROVINCES, CITIES, AND OTHER BUILDINGS, PUBLIC AND PRIVATE. } From what has been said above, this peninsula is rather to be divided into great governments, or soubahships, than into provinces. One soubah often engrosses several provinces, and fixes the seat of his government according to his own conveniency. I shall speak of those provinces as belonging to the Malabar, or Coromandel coast, the two great objects of English commerce in that country; and first, of the eastern, or Coromandel coast.

Madura begins at Cape Comorin, the southernmost point of the peninsula. It is about the bigness of the kingdom of Portugal, and is said to have been governed by a sovereign king, who had under him seventy tributary princes, each of them independent in his own dominions, but paying him a tax; now, the case is much altered, the prince of the country being scarcely able to protect himself and his people from the depredations of his neighbours, but by a tribute to buy them off: the capital is Tritchinopoli. The chief value of this kingdom seems to consist in a pearl fishery upon its coast. Tanjore is a little kingdom, lying to the east of Madura. The soil is fertile, and its prince rich, till plundered by the nabob of Arcot, and some British subjects connected with him. Within it, lies the Danish East India settlement of Tranquebar, and the fortress of Negapatam, which was taken from the Dutch the war before the last, and confirmed to the English by the succeeding treaty of peace. The capital city is Tanjore, governed by a rajah under the English protection.

The Carnatic is bounded on the east by the bay of Bengal, on the north by the river Kistna, which divides it from Golconda; on the west by Visapur, or Vissipour; and on the south by the kingdoms of Messaur and Tanjore; being in length, from south to north, about 345 miles. If Tanjore, Marrawar, Tritchinopoli, Madura, and Tinivelly be included, and they are all appendages of the Carnatic, the length thereof, from north to south, is 570 miles, but no where more than 110 wide, and chiefly no more than 80. The capital of the Carnatic is Bisnagar, belonging to the nabob of Arcot, whose dominions commence on the south of the Guntoo circar, and extend along the whole coast of Coromandel to Cape Comorin. The country in general is esteemed healthful, fertile, and populous. Within this country, upon the Coromandel coast, lies Fort St. David's, or Cuddalore, belonging to the English, with a district round it. The fort is strong, and of great importance to our trade. Five leagues to the north lies Pondicherry, the emporium of the French in the East Indies, which hath been repeatedly taken by the English, and as often restored by the treaties of peace; but has again lately surrendered to the British arms.

Fort St. George, better known by the name of Madras, is the capital of the English East India Company's dominions in that part of the East Indies, and is distant eastward from London about 4800 miles.

The English town, rising from within Fort St. George, has from the sea a rich and beautiful appearance; the houses being covered with a stucco called chunam,

which in itself is nearly as compact as the finest marble, and, as it bears as high a polish, is equally splendid with that elegant material. The style of the buildings is in general handsome. They consist of long colonnades, with open porticoes, and flat roofs, and offer to the eye an appearance similar to what we may conceive of a Grecian city in the age of Alexander. The clear, blue, cloudless sky, the polished white buildings, the bright sandy beach, and the dark green sea, present a combination totally new to the eye of an Englishman, just arrived from London, who, accustomed to the sight of rolling masses of clouds floating in a damp atmosphere, cannot but contemplate the difference with delight: and the eye being thus gratified, the mind soon assumes a gay and tranquil habit, analogous to the pleasing objects with which it is surrounded.

Some time before the ship arrives at her anchoring ground, she is hailed by the boats of the country filled with people of business, who come in crowds on board. This is the moment in which an European feels the greatest distinction between Asia and his own country. The rustling of fine linen, and the general hum of unusual conversation, presents to his mind for a moment the idea of an assembly of females. When he ascends upon the deck, he is struck with the long muslin dresses, and black faces adorned with very large gold ear-rings and white turbans. The first salutation he receives from these strangers is by bending their bodies very low, touching the deck with the back of the hand and the forehead three times.

The settlement of Madras was formed by the English at or about the middle of the last century, and was a place of no real consequence but for its trade, until the war so ably carried on by general Stringer Laurence, from the year 1748 to 1752; and which originated from the claims of Chunda Saib, in opposition to our ally, Mahomed Ally Cawn, the present nabob of Arcot; from which period the English may be considered as sovereigns. In the school of this able officer the late lord Clive received his military education.

In Fort St. George are many handsome and spacious streets. The houses may be considered as elegant, and particularly so from the beautiful material with which they are finished, the chunan. The inner apartments are not highly decorated, presenting to the eye only white walls; which however, from the marble-like appearance of the stucco, give a freshness grateful in so hot a country. Ceilings are very uncommon in the rooms. Indeed it is impossible to find any which will resist the ravages of that destructive insect, the white ant. These animals are chiefly formidable from the immensity of their numbers, which are such as to destroy, in one night's time, a ceiling of any dimensions. I saw, observes Mr. Hodges, an instance in the ceiling to the portico of the admiralty, or governor's house, which fell in flakes of twenty feet square. It is the wood-work which serves for the bases of ceilings, such as the laths, beams, &c. that these insects attack; and this will serve to explain the circumstance just mentioned.

The houses on Choultry Plain are many of them beautiful pieces of architecture, the apartments spacious and magnificent. I know not, says Mr. Hodges, that I ever felt more delight, than in going on a visit to a family on Choultry Plain, soon after my arrival at Madras, in the cool of the evening after a very hot day. The moon shone in its fullest lustre, not a cloud overcast the sky, and every house on the plain was illuminated. Each family, with their friends, were in the open porticoes, enjoying the breeze. Such a scene appears more like a tale of enchantment than a reality to the imagination of a stranger just arrived\*.

The fort protects two towns, called, from the complexions of their several inhabitants, the White and the Black. The White Town is fortified, and contains an English

\* Hodges' Travels in India, in the years 1780, 1781, 1782, and 1783, pages 1, 8, and 9.

corporation of a mayor and aldermen. Nothing has been omitted to mend the natural badness of its situation, which seems originally to be owing to the neighbourhood of the diamond mines, that are but a week's journey distant. These mines are under the direction of a mogul officer, who lets them out by admeasurement, enclosing the contents by pallisadoes; all diamonds above a certain weight originally belonged to the emperor. The district belonging to Madras doth not extend much more than forty miles round, and is of little value for its product. Eighty thousand inhabitants of various nations are said to be dependent upon Madras; but its safety consists in the superiority of the English by sea. It carries on a considerable trade with China, Persia, and Mocha.

Immense fortunes have been gained by the English upon this coast within thirty years; and the English East India Company, through the distractions of the Mogul empire, the enterprising spirit of their military officers, and the assistance of the English navy, acquired an income in this peninsula, and in Indostan, that is superior to the revenues of many crowned heads. The right hon. Henry Dundas, in his speech before the house of commons, Feb. 23, 1793, has proved from an average of three years, 1787-8 to 1789-90, that the net revenue of the company is 1,614,013 l to which is to be added the income arising from the countries ceded by Tippoo at the termination of the war, of about 400,000 l. from which the expences attending it must be deducted. But he estimates the future revenues at 1,971,050 l.\*

The kingdom of Golconda, besides its diamonds, is famous for the cheapness of its provisions, and for making white wine of grapes that are ripe in January. It is subject to a prince, called the Nizam or soubah of the Deccan, who is rich, and can raise 100,000 men. The famous diamond mine, Raolconda, is in this province. The capital of his dominions is called Bagnagar, or Hydrabad; but the kingdom takes its name from the city of Golconda, and comprizes the eastern part of Dowletabad. East-south-east of Golconda lies Masulipatam, where the English and Dutch have factories. The English have also factories at Ganjam and Visagapatam, on this coast; and the Dutch at Narisnore. The province of Orissa, from whence the English company draw some part of their revenues, lies to the north of Golconda, extending in length from east to west about 550 miles, and in breadth about 240. It is governed chiefly by Moodajee Booslah, and his brother Bembajee, allies to the Mahrattas. In this province stands the idolatrous temple of Jagernaut, which they say is attended by 500 priests. The idol is an irregular pyramidal black stone, of about 4 or 500 lb. weight, with two rich diamonds near the top, to represent eyes, and the nose and mouth painted with vermilion.

Major Rennell observes, that there is a void space between the known parts of Berar, Golconda, Orissa, and the northern circars, of near 300 miles in length, and 250 in breadth, and that it is not likely to be filled up unless a great change takes place in European politics in India. Our possessions in the northern circars extend only 70 miles inland, and in some places not more than 30, which forms a slip of 350 miles in length, bounded towards the continent by a ridge of mountains. Within these, and towards Berar, is an extensive tract of woody and mountainous country, with which the adjacent provinces appear to have scarcely any communication. Though surrounded by people highly civilized, and who abound in useful manufactures, it is said that the few specimens of the miserable inhabitants of this tract who have appeared in the circars, use no covering but a wisp of straw. This wild country extends about 160 miles, and the first civilized people beyond them are the Berar Mahrattas.

\* See the Heads of Mr. Dundas's Speech.

The origin and signification of the word **MARRATTA** (or **MORATTOE**) has of late, observes major Rennell \*, been very much the subject of inquiry and discussion in India; and various fanciful conjectures have been made concerning it. We learn however, from Ferishta †, that **MARHAT** was the name of a province in the Deccan; and that it comprehended Baglana or (Bogilana) and other districts, which at present form the most central part of the **Mahratta** dominions. The original meaning of the term **Marhat**, like that of most other proper names, is unknown; but that the name of the nation in question is a derivative from it, cannot be doubted: for the testimony of Ferishta may be received without the smallest suspicion of error, or of design to establish a favourite opinion, when it is considered that he wrote at a period, when the inhabitants of the province of **MARHAT** did not exist as an independent nation; but were blended with the other subjected **Hindoos** of the Deccan. Besides the testimony of Ferishta, there is that also of **Nizam-ul-Deen** ‡, an author who wrote at an earlier period; and who relates in his general history of **Hindoostan**, that one of the kings of **Delhi** made an excursion from **Deegur** (**Dowlatabad**) into the neighbouring province of **MARHAT** §.

The country of the Deccan ¶ comprehends several large provinces, and some kingdoms; particularly those of **Baglana**, **Balagate**, **Telenga**, and the kingdom of **Viliapour**. Modern geographers are not agreed upon the exact situation and extent of those countries: but by the assistance of major Rennell's late Memoirs of a map of **Indoostan**, and his new drawings, we have gratified our readers with a new map, which we hope will be found clear and accurate. The principal towns are **Aurangabad**, and **Doltabad** or **Dowlatabad**. The latter is the strongest place in all **Indoostan**. Near it stands the famous pagod of **Elorá**, in a plain of about two leagues square. The tombs, chapels, temples, pillars, and many thousand figures that surround it, are said to be cut out of the natural rock, and to surpass all the other efforts of human art. **Telenga** lies on the east of **Golconda**, and its capital, **Beder**, contains a garrison of 3000 men. The inhabitants of this province speak a language peculiar to themselves.

**Guzerat** is a maritime province on the gulf of **Cambaya**, and one of the finest in **India**, but inhabited by a fierce rapacious people. It is said to contain 35 cities. **Amedabab** is the capital of the province, where there is an English factory, and is

\* Introduction of his Memoirs, p. lxxix.

† Ferishta's History of the Deccan, &c. opens to our view the knowledge of an empire that has scarcely been heard of in Europe. Its emperors of the **BADISHAH** dynasty (which commenced with **Hassan** CAIC, A. D. 1347) appear to have exceeded in power and splendour, those of **Delhi**, even at the most flourishing periods of their history. The seat of government was at **Calberga** (See **Orme's Historical Fragments**, p. cxxvii.) which was central to the great body of the empire; and is at this day a considerable city. Like other overgrown empires, it fell to pieces with its own weight: and out of it were formed four potent kingdoms, under the names of **Viliapour** (properly **Belapour**), **Golconda**, **Berar**, and **Amednagur**; whose particular limits and interior members we are not well informed of. Each of these subsisted with a considerable degree of power, until the **Mogul** conquest; and the two first preserved their independency until the time of **Aurengzebe**. It is worthy of remark, that the four monarchs of these kingdoms, like the **Cæsars** and **Ptolemies**, had each

of them a name or title, common to the dynasty to which he belonged; and which were derived from the respective founders. Thus the kings of **Viliapour**, were styled **Audil** (or **Adil**) **Shah**; those of **Golconda**, **Cuttub** **Shah**; and those of **Berar** and **Amednagur**, **Nizam** **Shah**, and **Emud** **Shah**.

‡ **Nizam-ul-Deen** was an officer in the court of **Arbar**; and wrote a general history of **Hindoostan**, which he brought down to the 40th year of that emperor.

§ This also occurs in **Ferishta's History of Hindoostan**. It was in the reign of **Alla I. A. D. 1312**. See also p. lii. of the introduction.

¶ The name **DECCAN** signifies the SOUTH, and in its most extensive signification, includes the whole peninsula south of **Indoostan** Proper. However, in its ordinary acceptation, it means only the countries situated between **Indoostan** Proper, the **Carnatic**, and **Orissa**; that is, the provinces of **Candish**, **Amednagur**, **Viliapour**, **Golconda**, and the western part of **Berar**. **Rennell's Introduction** to his **Memoir of his Map of Indoostan**, p. cxii.

said, in wealth, to vie with the richest towns in Europe. About 43 French leagues distant lies Surut, where the English have a flourishing factory.

Vissapour is a large province: the western part is called Konkan, which is intermingled with the Portuguese possessions. The rajah of Vissapour is said to have had a yearly revenue of six millions sterling, and to have brought into the field 150,000 soldiers. The capital is of the same name, and the country very fruitful. The principal places on this coast are Damau, Bassaim, Trapour, or Tarapor, Chawl, Dandi-Rajahpur, Dabul-Rajahpur, Gheriah, and Vingorla. The Portuguese have lost several valuable possessions on this coast; and those which remain are on the decline.

Among the islands lying upon the same coast is that of Bombay, belonging to the English East India Company. Its harbour can conveniently contain 1000 ships at anchor. The island itself is about seven miles in length, and twenty in circumference; but its situation and harbour are its chief recommendations, being destitute of almost all the conveniences of life. The town is about a mile long, and poorly built; and the climate was fatal to English constitutions, till experience, caution, and temperance, taught them preservatives against its unwholesomeness. The best water there is preserved in tanks, which receive it in the rainy seasons.

The fort is a regular quadrangle, and well built of stone. Many black merchants reside here. This island was part of the portion paid with the infants of Portugal to Charles II. who gave it to the East India Company; and the island is still divided into three Roman-catholic parishes, inhabited by Portuguese, and what are called popish Mestizos and Canarins; the former being a mixed breed of the natives and Portuguese; and the other, aborigines of the country. The English have fallen upon methods to render this island and town, under all their disadvantages, a safe, if not an agreeable residence. The governor and council of Bombay have lucrative posts, as well as the officers under them. The native troops or sepoys on the island are commanded by English officers. The inhabitants of the island amount to near 60,000 of different nations; each of whom enjoys the practice of his religion unmolested. Here, besides Europeans of all countries, you meet with Turks, Persians, Arabians, Armenians, a mixed race, the vilest of their species, descended from the Portuguese, and the outcasts from the Gentoo religion, &c. and also captives that are slaves to every other tribe. The Turks that resort to this place on account of trade, are, like the rest of their countrymen, stately, grave, and reserved. The Persians are more gay, lively, and conversible, but less honest in matters of trade, than the saturnine Turks. The Arabians are all life and fire, and when they treat with you on any subject, will make you a fine oration in flowing numbers, and a musical cadence; but they are the most dishonest of all. The Armenians are generally handsome in their features, mild in their tempers, kind and beneficent, and profess the Christian religion.

Near Bombay are several other islands, one of which, called Elephanta, contains the most inexplicable antiquity perhaps in the world. A figure of an elephant, of the natural size, cut coarsely in stone, presents itself on the landing-place, near the bottom of a mountain. An easy slope then leads to a stupendous temple, hewn out of the solid rock, eighty or ninety feet long, and forty broad. The roof, which is cut flat, is supported by regular rows of pillars, about ten feet high, with capitals, resembling round cushions, as if pressed by the weight of the incumbent mountain. At the farther end are three gigantic figures, which have been mutilated by the blind zeal of the Portuguese. Besides the temple, are various images, and groups on each hand, cut in the stone: one of the latter bearing a rude resemblance of the judgment of Solomon; also a colonnade, with a door

of regular architecture; but the whole bears no manner of resemblance to any of the Gentoo works.

The island and city of Goa, the capital of the Portuguese settlements in the East Indies, lies about thirty miles south of Vingorla. The island is about twenty-seven miles in compass. It has one of the finest and best fortified ports in the Indies. This was formerly a most superb settlement, surpassed in bulk or beauty by few of the European cities. It is the residence of a captain general sent from Portugal, who lives in great splendour. The city stands upon the banks of a river of the same name, about twelve miles distant from the entrance of the harbour: the view up this river is truly delightful, the banks on either side being adorned with churches and country seats of the Portuguese, interspersed with groves and vallies. The hills behind rise to an amazing height, and add grandeur to the prospect. The city of Goa itself is adorned with many fine churches, magnificently decorated; and has several handsome convents; the church of St. Augustine is a noble structure, and is adorned in the inside by many fine pictures. It stands on the top of a hill, which commands an extensive view of the city and adjacent country: it is a circumstance that has always been observed, and very justly, that the Portuguese have ever chosen the spots for their convents and churches in the most delightful situations. The church has a convent adjoining to it, in which live a set of religious monks, of the order of St. Augustine: some of the brothers of this convent have given popes and cardinals to the Roman see, as appears by their portraits which are hung up in a neat chapel.

Goa, as well as the rest of the Portuguese possessions on this coast, is under a viceroy, who will not suffer any Mussulman or Gentoo to live within the precincts of the city. The Portuguese dominions have dwindled almost to nothing through this bigotry and oppression; yet the court cannot be prevailed upon to alter its measures, although the flourishing situation of the English and other European settlements (and of which one cause is certainly the mild and tolerant principles exercised in points of religion, provided it interferes not with government) is continually before their eyes. Tippoo Sultan lately shewed an inclination to attack them, but was suddenly called off by the Mahrattas. There was formerly an acquisition at this place, but it is now abolished; the building still remains, and, by its black outside, appears a fit emblem of the cruel and bloody transactions that passed within its walls! The rich peninsula of Salvett is dependent on Goa. Sunda lies south of the Portuguese territories, and is governed by a rajah, tributary to the Mogul.

Canara lies about forty miles to the south of Goa, and reaches to Calicut. Its soil is famous for rice, that supplies many parts of Europe, and some of the Indies. The Canarese are said generally to be governed by a lady, whose son has the title of rajah; and her subjects are accounted the bravest and most civilized of any in that peninsula, and remarkably given to commerce.

The celebrated Hyder Ally is said to have been a native of Mysore, which lies to the south-west of the Carnatic. He was a very active and powerful prince; but upon his death in 1783, his dominions descended to his son Tippoo Sultan. They have been diminished nearly one half in consequence of the late war; at the termination of which, and as the price of peace, Tippoo was obliged to cede some very extensive and profitable districts to the British, to the Mahrattas, and to the Nizam. The territories that still remain in his possession will be fully stated at the end of this account of India.

Though Malabar gives name to the whole south-west coast of the peninsula, yet it is confined at present to the country so called, lying on the west of Cape Comorin, and called the dominions of the Samorin. The Malabar language, however,

is common in the Carnatic; and the country itself is rich and fertile; but pestered with green adders, whose poison is incurable. The most remarkable places in Malabar are Cranganore, containing a Dutch factory and fort; and Tellicherry, where the English have a small settlement, keeping a constant garrison of one battalion of sepoy, a company of artillery, and sometimes a company of European infantry; they are also able to raise about three thousand native militia. The view of the country round Tellicherry is very pleasant, consisting of irregular hills and vallies. The boundaries of the English are terminated by the opposite side of the river, and at a very little distance is a strong fortress of Tippoo. Tellicherry is esteemed by all who reside there one of the healthiest places in India. It is much resorted to by convalescents. I observed, (says Mr. Franklin) in the company's garden, the pepper-vine, which grows in a curious manner, and something similar to the grape. The pepper on it, when fit to gather, appears in small bunches; it is in size something larger than the head of a small pea; the pepper, however, for the company's ships' cargoes, is brought from some distance in the country. Tellicherry produces the coffee-tree. Calicut also deserves to be mentioned, where the French and Portuguese have small factories, besides various other distinct territories and cities. Cape Comorin, which is the southernmost part of this peninsula, though not above three leagues in extent, is famous for uniting in the same garden the two seasons of the year; the trees being loaded with blossoms and fruit on the one side, while on the other side they are stripped of all their leaves. This surprising phenomenon is owing to the ridge of mountains so often mentioned, which traverse the peninsula from south to north. On the opposite sides of the Cape, the winds are constantly at variance, blowing from the west on the west side, and from the east on the eastern side.

In the district of Cochin, within Malabar, are to be found some thousands of Jews, who pretend to be of the tribe of Manasseh, and to have records engraven on copper plates in Hebrew characters. They are said to be so poor, that many of them embrace the Gentoo religion. Discoveries of Jews and their records have likewise been made in China, and other places of Asia, which have occasioned various speculations among the learned.

CURIOUS INSTANCE OF ORIENTAL ALLEGORY.] Few courts in India, perhaps, afford so many instances of folly and ostentatious adulation as that of Hyderabad. During the war, the nizam, it seems, was determined to take the field in person, as it was clearly proved at court that nothing decisive could be effected against Tippoo, without the influence of his highness's presence and wisdom; and he actually moved with his court to Paungul on his way to the armies. One of his courtiers, setting forth the inadequacy of the object to the inconvenience it must necessarily subject his highness to, concluded his oration by saying, "that, so far from his presence being necessary, were one of his highness's royal slippers hurled against the gates of Seringapatam, it would wrench them from their holds." What can more fully shew the hyperbolical adulation of courtiers than this harangue addressed to one whose impotency in the field and imbecility in the cabinet are equally notorious? Tippoo would with as much contempt see the united force of the Nizamites really at his gates, as he would the romantic experiment of "his highness's royal slipper." The full force of this courtier-like rhapsody does not appear in a translation; in the East, being struck with a shoe or slipper, conveys an idea of the most degrading kind.

## FENERAL

\* The East is certainly the seat of allegory and figurative epithets, which being peculiarly suited to the genius of the languages, are sometimes happily conceived and elegantly applied. For the tender

**FUNERAL CEREMONIES IN CANARA.]** We had an opportunity (says lieutenant Moor) of attending the funeral of a Canarise, which was performed much in the same manner as we had before observed north of the Kishna, where we saw an old woman buried, whom they brought in a sort of litter to a hole dug about four feet square and deep, in which, with great care, she was preserved in a sitting posture, with her face to the east. Being supported in this position with clods of clay, and some plantains and beetel put in her lap, she was covered with dirt, all but her head, when a mangoe leaf was put in her mouth, and a little water poured upon it; one of the attendants bawling and striking his mouth during this part of the ceremony. The grave was then immediately filled, and each of the attendants taking a handful of mangoe leaves, continued attentive while one pronounced a short oration, when they flung them on the grave, cried *hara!* thrice, and departed. There were not more than eight attendants, and in none of them could be observed any signs of grief, rather of unconcern and indifference:—perhaps they were not relations.

At Tarrakeera, the deceased was a young man, who was attended to his grave by his father, mother, widow, and half a dozen other relations, most of them making hideous noises; all which appeared to be mechanical, and not the genuine effusions of sorrow: the father placed the deceased in his grave, and appeared much affected—he was silent; the mother was most vociferous, and felt the least; the widow, a very handsome young girl, came unadorned, with dishevelled hair, and all the external signs of woe; but she performed her part of the ceremony, of presenting plantains, beetel, &c. to her husband's remains, with so much studied and attentive grace, and her lamentations were so elegantly modulated, that she seemed winning a lover to her arms, rather than bewailing the loss she had so recently sustained.—This funeral was attended by music\*.

Before we close our account of Indostan, it may be proper to describe its present division according to the different powers among whom it is shared; and this is the more necessary, as it may serve to give the reader a clearer idea of these extensive regions, and at the same time shew him how very considerable a portion belongs to the British and their allies.

tender effusions of an enamoured heart, the Persian is perhaps unrivalled; and for the bolder flights of fancy, in energy is inferior to few. The following *jeu d'esprit* was communicated by a Bramin, and is added as an instance of the fanciful turn sometimes given by flowery Orientals. The names of the courts were perhaps applied by the Bramin, and the anecdote is not, we apprehend, a new one: it will lose much by the translation, more by the translator. A vakeel from Tippoo to the court of Hyderabad, after stating the magnificence and power of his master, admitted in answer to one of the courtiers, that Tippoo comparatively was but the new moon, whereas his highness was the full-orbed planet, in the plenitude of its splendour. Such a flattering confession, conveyed in so elegant a compliment to the Nizam's country, gained the ambassador the entire confidence of the court; and the success of the embassy gained his superior address. Jealous of their sovereign's favour, envious persons at Serinaganstam procured the recal and impeachment of the vakeel, who honourably acquitted himself of every article preferred against him; when his ene-

mies, as their last resource, charged him with the speech that had been so grateful to the Nizamites, declaring that a confidential servant, who could so far forget his diplomatic character, as to evilt the vanity of a foreign prince by so humiliating and debasing his own, merited the most exemplary punishment.

The ambassador, by acknowledging the expression he was charged with having uttered, said it was an exposition of the impotence and ignorance of his enemies. "The full moon," said he, "to which I likened the Nizam, admits no increase in size, or augmentation of splendour: the new moon, the symbol of my royal master, is daily adding to its lustre, and beams on the admiring world in continual accumulation, evidently emblematic of his extending government."

The envious courtiers were confounded, the wavering monarch confirmed in his servant's integrity, who, in the favour of his sovereign, was amply rewarded for his address and ingenuity. *Lieut. Moor's Narrative of the Operations of Capt. Little's Detachment*, p. 119.

The celebrated Persian usurper, Thomas Kouli Khan, having in the year 1738 defeated the emperor Mahomed Shaw, plundered Delhi, and pillaged the empire of treasure to the amount of more than 70 millions sterling, restored to the unhappy prince his eastern dominions, but annexed to Persia all the countries westward of the Indus.

This dreadful incursion so weakened the authority of the emperor, that the viceroys of the different provinces either threw off their allegiance, or acknowledged a very precarious dependence; and engaging in wars with each other, called in as allies the East-India companies of France and England, who had been originally permitted, as traders, to form establishments on the coasts. These companies, owing to the great superiority of European discipline, from allies became in a short time principals in an obstinate contest, that at length terminated in the expulsion of the French from Indostan; and thus a company of British merchants have acquired, partly by cessions from the country powers, and partly by conquest, territories equal in extent, and superior in wealth and population, to most of the kingdoms of Europe.

The Mahrattas originally possessed several provinces of Indostan, from whence they were driven by the arms of the Mogul conquerors; they were never wholly subdued, but retiring to the northern part of the Ghauts, made frequent incursions from these inaccessible mountains; taking advantage of the anarchy of the empire, they have extended their frontiers, and are at present possessed of a tract of country 1000 British miles long, by 700 wide, besides the territories they acquired by the late partition treaty signed by Tippoo Sultan, in March 1792.

Hyder Ally, a soldier of fortune, who had learned the art of war from the Europeans, having possessed himself of that part of the ancient Carnatic, called the kingdom of Mysore, within a few years gained, by continual conquests, a considerable portion of the southern part of the peninsula. This able and active prince, the most formidable enemy that the English ever experienced in Indostan, dying in 1783, left to his son Tippoo Saib the peaceful possession of his dominions, superior in extent to the kingdom of England.

These extraordinary revolutions, with others of less importance, render the following account of the present division of property in these immense regions absolutely necessary, in order to understand their modern history.

#### PRESENT DIVISION OF INDOSTAN.

Such is the instability of human greatness, that the present Mogul, Shaw Allum, the descendant of the great Famerlane, is merely a nominal prince, of no importance in the politics of Indostan: he is permitted, as we before observed, to reside

• The character of the late Hyder Ally appearing to me (says major Kennell) to be but little understood in this part of the world, I have ventured to attempt an outline of it. His military success, founded on the improvement of discipline; attention to merit of every kind; conciliation of the different tribes that served under his banners; contempt of state and ceremony, except what naturally arise from the dignity of his character; and the consequent economy in personal expences the different habits of which form the great distinction of what is called character among oriental princes) together with his minute attention to

matters of finance, and the regular payment of his army; all these together raised Hyder as far above the princes of Indostan, as the great qualities of the late Prussian monarch raised him above the generality of European princes; hence I have ever considered Hyder as the Famerlane of the East. Cruelty was the vice of Hyder; but we are to consider that Hyder's ideas of mercy were regulated by an Asiatic standard; and it is not improbable that he might rate his own character for moderation and clemency, as far above those of Famerlane, Nadir Shah, and Abdallah, as he rated his discipline above theirs.

at Delhi, which, with a small adjacent territory, is all that remains to him of that vast empire which his ancestors governed for more than 350 years.

The principal divisions of this country, according to the treaty signed at Seringapatam, are as follow, viz. The British possessions; states in alliance with Britain; Mahratta states and their tributaries; the territories of the foubah of the Deccan; and the dominions of Tippoo Sultan.

## BRITISH POSSESSIONS.

The British possessions contain about 197,496 square British miles, (which is 90,327 more than is contained in Great Britain and Ireland) and about 10 millions of inhabitants. They consist of three distinct governments, viz.

Government of Calcutta or Bengal,	{ Bengal Soubah * Bahar Soubah Benares Soubah Northern Circars	{ On the Ganges. On the coast of Orissa.
Government of Madras	{ The Jaghire Territory of Cuddalore ——— of Devicotta ——— of Nagapatam	{ On the coast of Coromandel.
Government of Bombay		On the Gulf of Cambay.

DISTRICTS CEDED BY TIPPOO SULTAN in his late treaty, signed at Seringapatam, on the 18th of March 1792, viz.

	Koontearly pagodas
Calicut and Palicaudcherry, yielding a revenue of	936,765

Ahtoor, Purmutty, Shadmungul and Valoor	68,000
Barra-Mahal, Raycotta, Darampoory, &c.	134,000
	1,316,765

At the rate of three rupees to each pagoda, and the rupees reckoned at 2s. 1d. each, the annual value of the late British acquisitions will be 411,450l. according to major Rennell in his Memoir of a Map of the Peninsula of India, p. 33. For the revenue of the other British possessions, see before p. 734.

GOVERNMENT OF BENGAL.] This government is rich, flourishing, and populous. It is finely watered by the Ganges and Burrampooter with their numerous navigable channels, and the several navigable rivers they receive; it is fertilized by their periodical inundations; and by its natural situation is well secured against

\* As the terms SOUBAH, CIRCAR, and PURGUNNAH frequently occur in writings and speeches upon India concerns, it may be useful to explain them. During the long reign of Acbar in the 16th century, the internal regulation of the empire of India was much attended to. Acbar began by dividing HINDOOSTAN PROPER into eleven *foubahs* or provinces, some of which were in extent equal

to large European kingdoms. The *foubahs* were again divided into *circars*, and these subdivided into *purgunnahs*. If English names were to be applied to these divisions, they might be styled kingdoms, (or viceroalties), counties §, and hundreds. Rennell's Introduction to his Memoir of a Map of Hindostan, p. cx.

§ Few circars are of less extent than the largest English counties.

foreign enemies. But for a more particular description of this province, we refer our readers to the account we have already given of it.

GOVERNMENT OF MADRAS.] The great defect of this government is not only the want of connection between its parts, which are scattered along an extensive coast, and separated from each other by states frequently hostile, but that it is totally devoid of good harbours: hopes however have been entertained of supplying this last defect, by removing the bar as the mouth of that branch of the Caveri called Coleroon, which falls into the sea at Devicotta. The capital and seat of government is MADRAS in the Jnghire, called also Fort St. George. It is ill-situated, without a harbour, and badly fortified, yet contains upwards of 200,000 inhabitants.—Fort St. DAVID in the territory of Cuddalore is rich, flourishing, and contains 60,000 inhabitants.—MASULIPATAM, in the northern Circars, at one of the mouths of the Kistna, was formerly the most flourishing and commercial city on this coast, and, though much declined, is still considerable.

The northern Circars, which are denominated from the towns of Cicacole, Rajamundry, Elore, and Condapil, are defended inland by a strong barrier of mountains and extensive forests, beyond which the country is totally unknown for a considerable space.

GOVERNMENT OF BOMBAY.] This government is watered by the Tapee and Nerbudda. Its capital and seat of government is BOMBAY, in a small island and an unhealthy situation; but it is well-fortified, and has a fine harbour.—SURAT on the Tapee, which forms an indifferent port, is one of the most rich and commercial cities in Indostan. TELLICHERY, on the Malabar coast, is dependent on Bombay.

ALLIES OF THE BRITISH.

Dominions of the Nabob of Oude,

Fyzabad.  
Lucknow.  
Arcot on the Paliar is the capital, though the nabob usually resides at Madras.  
Gingee, the strongest Indian fortrefs in the Carnatic.  
Trichinopoly near the Caveri, well fortified in the Indian manner, was rich and populous, containing near 400,000 inhabitants, now almost ruined by the numerous sieges it has sustained.

Dominions of the Nabob of Arcot, comprehending the eastern part only of the Ancient Carnatic,

Seringham Pagoda, in an island of the Caveri, is famous throughout Indostan for its sanctity, and has no less than 40,000 priests, who constantly reside here in voluptuous indolence.  
Chandegeri, the ancient capital of the empire of Narsinga, formerly rich, powerful, and populous; near it is the famous pagoda of Tripetti, the Loretto of Indian: the offerings of the numerous pilgrims who resort hither, bring in an immense revenue.  
Tanjore, Madura, and Tinivelly, are the capitals of small states of the same name, which, with Marawar, are dependent on the nabob of Arcot.

Territory of Futty Sing Guicker, in the Soubah of Guzerat,

Amedabat.  
Cambay.

Territory of the Rajah of Ghod,

Gwalior, a celebrated fortrefs.

## MAHRATTA STATES AND THEIR TRIBUTARIES.

This extensive country is divided among a number of chiefs or princes, who have one common head called the Parishwa, or Nana, to whom however their obedience is merely nominal, as they often go to war against each other, and are seldom confederated except for mutual defence.

Southern Poonah Mahrattas, or the territories of Paithwa, are naturally strong, being intersected by the various branches of the Ghauts. { Satara, the nominal capital of the Mahratta states; the Parishwa at present resides at Poonah. Aurangabad, Amednagur, and Viliapour, are in his territories.

The Concan, or tract between the Ghauts and the sea, is sometimes called the Pirate Coast, as it was subject to the celebrated pirate Angria, and his successors, whose capital was the strong fortress of Gheria, taken by the English and Mahrattas in 1755. By the acquisition of this coast the Mahrattas have become a maritime power, and dangerous enemies to the government of Bombay.

By the treaty of peace, Tippoo sultan ceded to the Mahrattas

## TERRITORIES of the NIZAM, or SOUBAH of the DECCAN, an Ally to the BRITISH.

The possessions of the Nizam or Soubah of the Deccan (a younger son of the famous Nizam-al-Muluck), comprize the province of Golconda, that is, the ancient province of Tellingana, or Tilling, situated between the lower parts of the Kistna and Godavery rivers, and the principal part of Dowlatabad; together with the western part of Berar, subject to a tribute of a chout, or fourth part of its net revenue, to the Berar Mahratta. The Nizam has the Paithwa, or Poonah Mahratta, on the west and north-west; the Berar Mahratta on the north; the northern circars on the east; and the Carnatic and Tippoo sultan on the south. I am not perfectly clear, says major Rennell, in my idea of his western boundary, which, during his wars with the Mahrattas, was subject to continual fluctuation; but I understand generally that it extends more than 40 miles beyond the city of Aurungabad, westwards; and comes within 80 miles of the city of Poonah.— His capital is Hyderabad, or Bagnagur, situated on the Mouli river, near the famous fortresses of Golconda.

The districts of Adoni and Rachore, which were in the hands of Bazalet Jung (brother to the Nizam) during his life time, are now in the hands of the Nizam. The Sourapour, or Sollapoor rajah, on the west of the Beenah river, together with some other rajahs, are his tributaries. The Guntoor circar also belongs to him. Probably, says the major, these dominions, including his tributaries and feudataries, are no less than 430 miles in length, from N W to S E, by 300 wide.

To the above we have now to add those which Tippo sultan ceded to him in the treaty of peace, signed March 18, 1792, viz.

**BOUNDARIES.]** MODERN Persia is bounded by the mountains of Ararat, or Daghistan, which divide it from Circassian Tartary, on the North-West; by the Caspian Sea, which divides it from Russia, on the North; by the river Oxus, which divides it from Ubec Tartary, on the North-east; by India, on the East; by the Indian ocean, and the gulfs of Persia and Ormus, on the South; and by Arabia and Turkey, on the West.

This kingdom is divided into the following provinces: on the frontiers of India, are Chorasan, part of the ancient Hyrcania, including Herat and Eslerabad; Sablufan, including the ancient Bactriana and Candahor; and Sigistan, the ancient Drangiana. The southern division contains Mazeran, Kerman, the ancient Gedrosia, and Partisan, the ancient Persia. The south-west division, on the frontiers of Turkey, contains the provinces of Chusistan, the ancient Susiana, and Irac-Ageni, the ancient Parthia. The north-west division, lying between the Caspian Sea and the frontiers of Turkey in Asia, contains the provinces of Aderbeitzen, the ancient Media; Gangea, Daghistan, part of the ancient Iberia and Colchis; Ghilan, part of the ancient Hyrcania; Shirvan, and Mazanderan.

**NAME.]** Persia, according to the poets, derived its name from Perseus, the son of Jupiter and Danaë. Less fabulous authors suppose it derived from Paras, which signifies a horseman, the Persians being always celebrated for their skill in horsemanship.

**AIR.]** Those parts which border upon Caucasus and Daghistan, and the mountains near the Caspian sea, are cold, as lying in the neighbourhood of those mountains which are commonly covered with snow. The air, in the midland provinces of Persia, is serene, pure, and exhilarating; but in the southern it is hot, and sometimes communicates noxious blasts to the midland parts, which are so often mortal, that the inhabitants fortify their heads with very thick turbans.

**SOIL, VEGETABLE AND ANIMAL PRODUCTIONS.]** The soil is far from being luxuriant towards Tartary and the Caspian Sea, but with cultivation it might produce abundance of corn and fruits. South of mount Taurus, the country abounds in corn, fruits, wine, and other luxuries of life; with oil, fena, rhubarb, and the finest drugs. The fruits are delicious, especially dates, oranges, pistachio nuts, melons, cucumbers, and garden-vegetables. Silk is also the production of this country; and the gulf of Bassora formerly furnished great part of Europe and Asia with very fine pearls. Some parts near Isfahan produce almost all the flowers that are valued in Europe; and from some of them, the roses especially, they extract waters of a salubrious and odorous kind, which form a valuable article in trade. In short, the fruits, vegetables, and flowers of Persia, are

of a most exalted flavour; and, had the natives the art of horticulture to as great perfection as some nations in Europe, by transplanting, engrafting, and other improvements, they would add greatly to the natural riches of the country. The Persian assa-fœtida flows from a plant called hiltot, and turns into a gum. It is either white or black; and the white is so much valued, that the natives make very rich sauce of it, and sometimes eat it as a rarity.

No place in the world produces the necessaries of life in greater abundance and perfection than Shirauz; nor is there a more delightful spot in nature than the vale in which it is situated, either for the salubrity of the air, or for the profusion of every thing necessary to render life comfortable. The fields yield plenty of rice, wheat, and barley, which are reaped in the month of May, and by the middle of July the harvest is completed. Most of the European fruits are produced here, and many of them of peculiar size and flavour, particularly the apricot and grape. Of the grape of Shirauz there are several sorts; the large white grape, which is extremely agreeable to the taste; the small white grape, as sweet as sugar; and the black grape, of which the celebrated wine of Shirauz is made. This grape is pressed by the Armenians and Jews in the months of October and November, and a vast deal is exported annually to Abu Shehr, and other parts in the Persian gulph, for the supply of the Indian market. The pomegranate is good to a proverb; the Persians call it the fruit of Paradise.

The breed of horses in the province of Fars is at present very indifferent, owing to the ruinous state of the country; but in the province of Dushtistaan, lying to the south-west, it is remarkably good. The sheep are of a superior flavour, owing to the excellence of the pasturage in the neighbourhood of Shirauz, and are also celebrated for the fineness of their fleeces: they have tails of an extraordinary size, some of which I have seen weigh (says Mr. Franklin) upwards of thirty pounds; but those which are sold in the markets do not weigh above six or seven. Their oxen are large and strong, but their flesh is seldom eaten by the natives, who confine themselves chiefly to sheep and fowls.

Provisions of all kinds are very cheap; and the neighbouring mountains affording an ample supply of snow throughout the year, the meanest artificer of Shirauz may have his water and fruits cooled with little expence. This snow being gathered on the tops of the mountains, and brought in carts to the city, is sold in the markets. The price of provisions is regulated in Shirauz by the daroga, or judge of the police, who sets a fixed price upon every article, and no shop-keeper dares to demand more, under the severe penalty of losing his nose and ears.

**MOUNTAINS.]** These are Caucasus and Ararat, which are called the mountains of Daghistan; and the vast chain of mountains called Taurus, with its ramifications, which run through the middle of the country from Natolia to India.

**RIVERS.]** It has been observed, that no country, of so great an extent, has so few navigable rivers as Persia. The most considerable are the Kur, anciently Cyrus; and Aras, anciently Araxes, which rises in or near the mountains of Ararat, and joining the Cyrus, falls into the Caspian Sea. Some small rivulets falling from the mountains, water the country; but are so inconsiderable, that few or none of them can be navigated even with boats. The Oxus can scarcely be called a Persian river, though it divides Persia from Ubec Tartary. Persia has the river Indus on the east, and the Euphrates and Tigris on the west.

**WATER.]** The scarcity of rivers in Persia occasions a scarcity of water: but the defect, where it prevails, is admirably well supplied by means of reservoirs, aqueducts, canals, and other ingenious methods.

**METALS AND MINERALS.]** Persia contains mines of iron, copper, lead, and above all, turquoise stones, which are found in Chorasan. Sulphur, salt-petre, and antimony,

antimony, are found in the mountains. Quarries of red, white, and black marble, have also been discovered near Thuris.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. } It is impossible to speak with any certainty concerning the population of a country so little known as Persia. If we are to judge by the vast armies, in modern as well as ancient times, raised there, the numbers it contains must be very great. The Persians of both sexes are generally handsome; the men being fond of marrying Georgian and Circassian women. Their complexions towards the south are somewhat swarthy. The men shave their heads, but the young men suffer a lock of hair to grow on each side, and the beard of their chin to reach up to their temples; but religious people wear long beards. They have a maxim to keep their heads very warm, so that they never pull off their caps or turbans out of respect even to the king. Their dress is very simple. Next to their skin they wear callico shirts, over them a veil, which reaches below the knee, girt with a sash, and over that a loose garment somewhat shorter. The materials of their cloaths, however, are commonly very expensive; consisting of the richest furs, silks, mullin, cottons, and the like valuable stuffs, richly embroidered with gold and silver. They wear a kind of loose boots on their legs, and slippers on their feet. They are fond of riding, and very expensive in their equipages. They wear at all times a dagger in their sash, and linen trowsers. The collars of their shirts and cloaths are open; so that their dress upon the whole is far better adapted for the purposes both of heat and activity than the long flowing robes of the Turks. The dress of the women, as well as that of the men, is very costly; and they are at great pains to heighten their beauty by art, colours, and washes; particularly by rubbing their eye-brows and eye-lids with the black powder of antimony called *urma*.

The Persians accustom themselves to frequent ablutions, which are the more necessary, as they seldom change their linen. In the morning early they drink coffee, about eleven go to dinner upon fruits, sweatmeats, and milk. Their chief meal is at night. They eat at their repasts cakes of rice, and others of wheat flour; and as they esteem it an abomination to cut either bread, or any kind of meat after it is dressed, these cakes are made thin, that they may be easily broken with the hand; and their meat, which is generally mutton, or fowls, is so prepared, that they divide it with their fingers. When every thing is set in order before them, they eat quickly and without ceremony. But it is observed by a late traveller, that when the oldest man in the company speaks, though he be poor and sit at the lower end of the room, they all give a strict attention to his words. They are temperate, but use opium, though not in such abundance as the Turks. They are great masters of ceremony towards their superiors, and so polite, that they accommodate Europeans who visit them, with stools, that they may not be forced to sit cross-legged. They are so immoderately fond of tobacco, which they smoke through a tube fixed in water, so as to be cool in the mouth, that when it has been prohibited by their princes, they have been known to leave their country rather than be debarred from that enjoyment. The Persians are naturally fond of poetry, moral sentences, and hyperbole. Their long wars, and their national revolutions, have mingled the native Persians with barbarous nations, and are said to have taught them dissimulation; but they are still pleasing and plausible in their behaviour, and in all ages have been remarkable for hospitality.

The Persians write, like the Hebrews, from the right to the left, are neat in their seals and materials for writing, and wonderfully expeditious in the art. The number of people employed on their manuscripts (for no printing is allowed there) is incredible. Their great foible seems to be ostentation in their equipages and dresses; nor are they less jealous of their women than the Turks and other eastern nations. They are fond of music, and take a pleasure in conversing in large companies; but

but their chief diversions are those of the field, hunting, hawking, horsemanship, and the exercise of arms, in all which they are very dexterous. They excel, as their ancestors the Parthians did, in archery. They are fond of rope-dancers, jugglers, and fighting of wild beasts; and privately play at games of chance.

There are places in Shirauz (Mr. Francklin observes) distinguished by the name of Zoor Khana, the house of strength or exercise, to which the Persians resort for the sake of exercising themselves. These houses consist of one room, with the floor sunk about two feet below the surface of the earth, and the light and air are admitted to the apartment by means of several small apertures made in the dome. In the centre is a large square terrace of smooth earth; and on each side are small alcoves raised about two feet above the terrace, where the musicians and spectators are seated. When all the competitors are assembled, which is on every Friday morning by day-break, they immediately strip themselves to the waist; after which each man puts on a pair of thick woollen drawers, and takes in his hands two wooden clubs of about a foot and a half in length, and cut in the shape of a pear; these they rest upon each shoulder, and the music striking up they move them backwards and forwards with great agility, stamping with their feet at the same time, and straining every nerve till they produce a very profuse perspiration. After continuing this exercise about half an hour, upon a signal given they all leave off, quit their clubs, and joining hands in a circle, begin to move their feet very briskly in unison with the music, which is all the while playing a lively tune. Having continued this for some time, they commence wrestling, in which the master of the house is always the challenger; and, being accustomed to the exercise, generally proves conqueror. The spectators pay each a shahce in money, equal to three-pence English, for which they are refreshed with a caléan to smoke, and coffee. This mode of exercise must contribute to health, as well as add strength, vigour, and a manly appearance to the frame. The Persians, with respect to outward behaviour, are certainly the most polished people of the East. Whilst a rude and insolent demeanour peculiarly marks the character of the Turks towards foreigners and Christians, the behaviour of the Persians would, on the contrary, do honour to the most civilised nations: they are kind, courteous, civil and obliging to all strangers, without being guided by those religious prejudices so very prevalent in every other Mahomedan nation; they are fond of enquiring after the manners and customs of Europe; and in return very readily afford any information in respect to their own country. The practice of hospitality is with them so grand a point, that a man thinks himself highly honoured if you will enter his house and partake of what the family affords; whereas going out of a house, without smoking a caléan, or taking any other refreshment, is deemed, in Persia, a high affront; they say that every meal a stranger partakes with them brings a blessing upon the house.

The Persians, in their conversation, use extravagant and hyperbolical compliments on the most trilling occasions: this mode of address (which in fact means nothing) is observed not only by those of a higher rank, but even amongst the meanest artificers, the lowest of whom will make no scruple, on your arrival, of offering you the city of Shirauz, and all its appurtenances, as a peishkush or present. Freedom of conversation is a thing totally unknown in Persia, and that *walls have ears* is proverbially in the mouth of every one. The fear of chains, which bind their bodies, has also enslaved their minds; and their conversation, to men of superior rank to themselves, is marked with signs of the most abject and slavish submission; while, on the contrary, they are as haughty and overbearing to their inferiors.

In their conversation, the Persians aim much at elegance, and are perpetually repeating verses and passages from the works of their most favourite poets, Hafez,

Sadi, and Jami; a practice universally prevalent from the highest to the lowest; because those who have not the advantages of reading and writing, or the other benefits arising from education, yet by the help of their memories, which are very retentive of whatever they have heard, are always ready to bear their part in conversation. They also delight much in jokes and quaint expressions, and are fond of playing upon each other, which they sometimes do with great elegance and irony. There is one thing much to be admired in their conversations, which is the strict attention they always pay to the person speaking, whom they never interrupt on any account.

**MARRIAGES.]** When the parents of a young man have determined upon marrying him, they go to the house where the female they intend to demand, lives. If the father of the woman approves, he immediately orders sweetmeats to be brought in, which is taken as a direct sign of compliance. After this, the usual presents on the part of the bridegroom are made, which, if the person be in middling circumstances, generally consist of two complete suits of apparel of the best sort, a ring, a looking-glass, and a small sum in ready money, of about ten or twelve to-mounds\*, which is to provide for the wife in case of divorce. There is also provided a quantity of household stuff of all sorts, such as carpets, mats, bedding, utensils for dressing viands, &c. The contract is witnessed by the cadi, or magistrate. The wedding-night being come, the bride is brought forth covered from head to foot in a veil of red silk, or painted muslin; a horse is then presented for her to mount, which is sent thither expressly by the bridegroom; and when she is mounted, a large looking-glass is held before her by one of the bride-maids, all the way to the house of her husband, as an admonition to her, that it is the last time she will look into the glass as a virgin, being now about to enter into the cares of the married state. The procession then sets forward in the following order:—first, the music and dancing-girls, after which the presents in trays borne upon men's shoulders; next come the relations and friends of the bridegroom, all shouting, and making a great noise, who are followed by the bride herself, surrounded by all her female friends and relations, one of whom leads the horse by the bridle, and several others on horseback close the procession. Rejoicings upon this occasion generally continue eight or ten days. Men may marry for life, or for any determined time, in Persia, as well as through all Tartary; and travellers or merchants, who intend to reside a time in any city, commonly apply to the cadi, or judge, for a wife during that short period. The cadi, for a stated gratuity, produces a number of girls, whom he declares to be honest, and free from diseases; and he becomes a surety for them. A gentleman who lately attended the Russian embassy to Persia declares, that, among thousands, there has not been one instance of their dishonesty during the time agreed upon.

**FUNERALS.]** The funerals of the Persians resemble those of other Mahomedans. On the death of a Mussulman, the relations and friends of the deceased being assembled, make loud lamentations over the corpse; after which it is washed and laid out on a bier, and carried to the place of interment without the city-walls, attended by a mullah, or priest, who chants passages from the Koran all the way to the grave. If any Mussulman should chance to meet the corpse during the procession, he is obliged by the precepts of his religion, to run up to the bier, and offer his assistance in carrying it to the grave, crying out at the same time, *Lâ ilâh illâ Allah!* There is no God but God. After interment, the relations

\* A tomond is an imaginary money, which cannot be represented but by several other pieces (as a pound sterling, &c.) and is in value worth

of the deceased return home, and the women of the family make a mixture of wheat, honey, and spices, which they eat in memory of the deceased, sending a part of it to their friends and acquaintance, that they also may pay him a like honour. This custom seems to be derived from very great antiquity, as we read in Homer of sacrifices and libations being frequently made to the memory of departed souls.

[RELIGION.] The Persians are Mahomedans of the sect of Ali; for which reason the Turks, who follow the succession of Omar and Abu-Bekr, call them heretics. Their religion is, if possible, in some things more fantastical and sensual than that of the Turks; but in many points it is mingled with bramini superstitions. When they are taxed by the Christians with drinking strong liquors, as many of them do, they retort, "You Christians whore and get drunk, though you know you are committing sins, which is the very case with us." Having mentioned the bramins, the comparison between them and the Persian *guebres* or *gauris*, who pretend to be the disciples and successors of the ancient magi, the followers of Zoroaster, might be highly worth a learned disquisition: that both of them held originally pure and simple ideas of a Supreme Being, may be easily proved; but the Indian bramins and parsecs accuse the *gauris*, who still worship the fire, of having sensualised those ideas, and introduced an evil principle into the government of the world. A considerable ground, about ten miles distant from Baku, a city in the north of Persia, is the scene of the *guebres* devotions. This ground is impregnated with inflammatory substances, and contains several old little temples, in one of which the *guebres* pretend to preserve the sacred flame of the universal fire, which rises from the end of a large hollow cone stuck in the ground, resembling a lamp burning with very pure spirits. The Mahomedans are the declared enemies of the *gauris*, who were banished out of Persia by Shuh Abbas. Their sect is said to be numerous, though tolerated in very few places.

Many sects are found in Persia that evidently have Christianity for the groundwork of their religion. Some of them, called Soudtees, who are a kind of quietists, sacrifice their passions to God, and profess the moral duties. The Sabean Christians have, in their religion, a mixture of Judaism and Mahometanism; and are numerous towards the Persian gulf. The Armenian and Georgian Christians are very numerous in Persia, as well as in Indostan.

The Persians observe the fast during the month of Ramazan (the 9th month of the Mahomedan year) with great strictness. About an hour before-day light, they eat a meal which is called Sehre, and from that time until the next evening at sunset, they neither eat nor drink. In the course of the day, should the smoke of a calum, or the smallest drop of water, reach their lips, the fast is deemed of no avail. From sunset until the next morning they are allowed to refresh themselves. This fast, when the month Ramazan falls in the middle of summer, as it sometimes must do (the Mahomedan year being lunar), is extremely severe, especially to those who are obliged by their occupations to go about during the day-time, and is rendered still more so, as there are also several nights during its continuance which they are enjoined to spend in prayer. The Persians particularly observe two; the one being that in which their prophet Ali died from a wound which he received from the hands of an assassin three days before; which night is the 21st of Ramazan, the day of which is called by the natives the day of murder.—The other is the night of the 23d, in which they affirm that the Koran was brought down from Heaven by the hands of the angel Gabriel, and delivered to their prophet Mahomed; wherefore it is denominated the night of power.

[LANGUAGE.] The common people, especially towards the southern coasts of the Caspian sea, speak Turkish; and the Arabic probably was introduced into Persia under the caliphate, when learning flourished in those countries. Many

of the learned Persians have written in the Arabic, and people of quality have adopted it as the modish language, as we do the French. The pure Persian is said to be spoken in the southern parts, on the coast of the Persian gulf, and in Isfahan; but many of the provinces speak a barbarous mixture of the Turkish, Russian, and other languages. Their Pater-noster is of the following tenour: *Ei Padere ma kih der ofroni; pac bafked mam tu; buyayed padfchahi tu; fchwad chwad-afle tu kenzjuntankih der ofron niz derzemih; beh mara jmrouz ndu kefdf rouz mara; wadargawafar mara konahan ma zjunankihma niz mig farim ormdn mara; wador ozma-fjih mimeldzmaro; likin chalas kun mara ez efcherir.* Amen.

[LEARNING AND LEARNED MEN.] The Persians, in ancient times, were famous for learning; and their poets renowned all over the East. There is a manuscript at Oxford, containing the lives of a hundred and thirty-five of the finest Persian poets. Ferdusi and Sadi were among the most celebrated. The former comprised the history of Persia in a series of epic poems which employed him for near thirty years, and which are said by Sir William Jones, to be "a glorious monument of Eastern genius and learning." Sadi was a native of Shirauz, and flourished in the thirteenth century, and wrote many fine pieces, both in prose and verse. Shemfeddin was one of the most eminent lyric poets that Asia has produced; and Nakhsheb wrote in Persian a book called the "Tales of a Parrot," not unlike the Decameron of Boccace. Jami was an elegant poet, who flourished in the middle of the fifteenth century, and whose beautiful compositions, on a great variety of subjects, are preserved at Oxford, in twenty-two volumes. Hariri composed, in a rich, elegant, and flowery style, a moral work, in fifty dissertations, on the changes of fortune, and the various conditions of human life.

Of Hafez, the sprightly and voluptuous bard of Shirauz, the name and character are sufficiently known to Orientalists. It may, however, excite the curiosity of the English reader, that the poet here introduced to his notice, conciliated the favour of an offended emperor, by the delicacy of his wit, and the elegance of his verses; that the most powerful monarchs of the East sought in vain to draw him from the enjoyment of literary retirement, and to purchase the praises of his Muse by all the honours and splendour of a court; and that his works were not only the admiration of the jovial and the gay, but the manual of mystic piety to the superstitious Mahomedan, the oracle which, like the *Sortes Virgilianæ*, determined the councils of the wife, and prognosticated the fate of armies and of states. Seventeen odes have already been translated into English by Mr. Nott, with which he has published the originals, for the purpose of promoting the study of the Persian language.

The tomb of this celebrated and deservedly admired poet stands about two miles distant from the walls of the city of Shirauz, on the north-east side. It is placed in a large garden, and under the shade of some cypress trees of extraordinary size and beauty; it is composed of fine white marble from Tauris, eight feet in length and four in breadth: this was built by Kerim Khan, and covers the original one: on the top and sides of the tomb are select pieces from the poet's own works, most beautifully cut in the Persian Nushleek character. During the spring and summer seasons, the inhabitants visit here, and amuse themselves with smoking, playing at chess and other games, reading also the works of Hafez, who is in greater esteem with them than any other of their poets.

At present, learning is in a low state among the Persians. Their boasted skill in astronomy is now reduced to a mere snattering in that science, and terminates in judicial astrology; so that no people in the world are more superstitious. The learned profession in greatest esteem among them is that of medicine; which is at perpetual variance with astrology, because every dose must be in the lucky hour

fixed by the astrologer, which often defeats the ends of the prescription. Their drugs are excellent, and some of their physicians are no strangers to the works of Galen and Avicenna. The plague is but little known in this country. They are very ignorant in surgery, which is exercised by barbers, whose chief occupation is in letting blood; for they trust the healing of green wounds to the excellency of the air, and the good habit of the patient's body.

ANTIQUITIES AND CURIOSITIES. } The monuments of antiquity in Persia  
NATURAL AND ARTIFICIAL. } more celebrated for their magnificence, and  
expence, than their beauty or taste. No more than nineteen columns, which formerly belonged to the famous palace of Persepolis, are now remaining. Each is about fifteen feet high, and composed of excellent Parian marble. The ruins of other ancient buildings are found in many parts of Persia, but void of that elegance and beauty which is displayed in the Greek architecture. The tombs of the kings of Persia are stupendous works; being cut out of a rock, and highly ornamented with sculptures. The chief of the modern edifices is a pillar, to be seen at Ispahan, sixty feet high, consisting of the skulls of beasts, erected by Shah Abbas, after the suppression of a rebellion. Abbas had vowed to erect such a column of human skulls; but upon the submission of the rebels, he performed his vow by substituting those of brutes, each of the rebels furnishing one.

The baths near Gombroon are medicinal, and esteemed among the natural curiosities of Persia. The springs of the famous Naphtha near Baku, are often mentioned in natural history for their surprising qualities; but the chief of the natural curiosities in this country is the burning phenomenon, and its inflammatory neighbourhood, already mentioned under the article of Religion.

HOUSES, CITIES, AND PUBLIC EDIFICES.] The houses of men of quality in Persia, are in the same taste with those of the Asiatic Turks already described. They are seldom above one story high, built of bricks, with flat roofs for walking on, and thick walls. The hall is arched, the doors are clumsy and narrow, and the rooms have no communication but with the hall; the kitchens and office-houses being built apart. Few of them have chimneys, but a round hole in the middle of the room. Their furniture chiefly consists of carpets, and their beds are two thick cotton quilts, which serve them likewise as coverlids, with carpets under them.

Ispahan, or Spahawn, the capital of Persia, is seated on a fine plain, within a mile of the river Zenderhend, which supplies it with water. It is said to be twelve miles in circumference. The streets are narrow and crooked, and the chief amusement of the inhabitants is on the flat roofs of their houses, where they spend their summer evenings; different families associating together. The royal square is the third of a mile in length, and about half as much in breadth; and we are told, that the royal palace, with the buildings and gardens belonging to it, is three miles in circumference. There are in Ispahan 160 mosques, 1800 caravan-series, 260 public baths, a prodigious number of fine squares, streets, and palaces, in which are canals, and trees planted to shade and better accommodate the people. This capital is said formerly to have contained 650,000 inhabitants; but was often depopulated by Kouli Khan during his wars, so that we may easily suppose, that it has lost great part of its magnificence. In 1744, when Mr. Hanway was there, it was thought that not above 5000 of its houses were inhabited.

Shirauz lies about 225 miles to the south east of Ispahan. It is an open town, but its neighbourhood is inexpressibly rich and beautiful, being laid out for many miles in gardens, the flowers and fruits of which are incomparable. This town is the capital of Faristan, or Persia Proper, and hath a college for the study of eastern learning, where the arts and sciences were taught; and is the same as that mentioned.

tioned by *fr* John Chardin, who visited this city in the last century. It is now, however, decaying very fast, but there are still mullahs and religious men residing in it; at present it goes by the name of *Madrussa Khan*, or the Khan's college; but literature and the sciences have long since been neglected at Shirauz, and the present situation of the country does not seem to promise a speedy revival. This city contains an uncommon number of mosques, and is adorned by many noble buildings, but its streets are narrow and inconvenient, and not above 4000 of its houses are inhabited. Shirauz has many good bazars and caravanferas; that distinguished by the appellation of the *Vakeel's bazar* (so called from its being built by *Kerim Khan*) is by far the handsomest. It is a long street, extending about a quarter of a mile, built entirely of brick, and roofed something in the style of the *Piazzas* in *Covent Garden*; it is lofty and well made; on each side are the shops of the tradesmen, merchants, and others, in which are expofed for sale a variety of goods of all kinds: these shops are the property of the *Khan*, and are rented to the merchants at a very easy monthly rate. Leading out of this bazar is a spacious caravanferay, of an octagon form, built of brick; the entrance through a handsome arched gate-way: in the centre is a place for the baggage and merchandise, and on the sides above and below commodious apartments for the merchants and travellers; these are also rented at a moderate monthly sum. About the centre of the above mentioned bazar, is another spacious caravanferay of a square form, the front of which is ornamented with a blue and white enamelled work, representing *China ware*, and has a pleasing effect to the eye.

The cities of *Ormus* and *Gombroon*, on the narrow part of the *Persian Gulf*, were formerly places of great commerce and importance. The *English* and other *Europeans* have factories at *Gombroon*, where they trade with the *Persians*, *Arabians*, *Banyans*, *Armenians*, *Turks*, and *Tartars*, who come hither with the caravans which set out from various inland cities of *Asia*, under the convoy of guards.

**MOSQUES AND BAGNOS.]** I thought proper to place them here under a general head, as their architecture is pretty much the same all over the *Mahomedan* countries.

Mosques are religious buildings, square, and generally of stone: before the chief gate there is a square court, paved with white marble, and low galleries round it, whose roof is supported by marble pillars. Those galleries serve for places of ablution before the *Mahomedans* go into the mosque. About every mosque there are six high towers, called *minarets*, each of which has three little open galleries, one above another. These towers, as well as the mosques, are covered with lead, and adorned with gilding and other ornaments; and from thence, instead of a bell, the people are called to prayer by certain officers appointed for that purpose. No woman is allowed to enter the mosques: nor can a man with his shoes or stockings on. Near most mosques is a place of entertainment for strangers during three days; and the tomb of the founder, with conveniences for reading the *Koran*, and praying.

The city of *Shirauz* is adorned (according to *Mr. Francklin*) with many fine mosques, particularly that built by the late *Kherim Khan*, which is a noble one. Being very well disguised, says our traveller, in my *Persian* dress, I had an opportunity of entering the building unobserved: it is of a square form; in the centre is a stone reservoir of water, made for performing the necessary ablutions: previous to prayer; on the four sides of the building are arched apartments allotted for devotion, some of the fronts of which are covered with *China tiles*; but *Kherim Khan* dying before the work was completed, the remainder has been made up with a blue and white enamelled work. Within the apartments, on the walls, on each side, are engraved various sentences from the *Koran*, in the *Nuthki* character; and at the upper end of the square is a large dome with a cupola at top, which is the particular

particular place appropriated for the devotion of the Vakeel, or for the sovereign himself: this is lined throughout with white marble, ornamented with the curious blue and gold artificial lapis lazuli, and has three large silver lamps suspended from the roof of the dome. In the centre of the city is another mosque, which the Persians call the Musjid Noo, or the New Mosque; but its date is nearly coeval with the city itself, at least since it has been inhabited by Mahomedans: it is a square building of a noble size, and has apartments for prayer on each side; in them are many inscriptions in the old Cufick character, which of themselves denote the antiquity of the place.

The bagnios in the Mahomedan countries are wonderfully well constructed. Sometimes they are square, but oftener circular, built of white well-polished stone or marble. Each bagnio contains three rooms; the first for dressing and undressing; the second contains the water, and the third the bath; all of them paved with black and white marble. The operation of the bath is very curious, but wholesome; though to those not accustomed to it, it is painful. The waiter rubs the patient with great vigour, then handles and stretches his limbs as if he was dislocating every bone in the body; all which exercises are, in those inert warm countries, very conducive to health. In public bagnios, the men bathe from morning to four in the afternoon; when all male attendants being removed, the ladies succeed, and upon coming out of the bath display their finest cloaths.

I might here attempt to describe the eastern seraglios or harems, the women's apartments; which, from the most credible accounts, are contrived according to the taste and conveniency of the owner, and divided into a certain number of apartments, which are seldom or never entered by strangers; and there is no country where women are so strictly guarded as among the great men in Persia.

[POLICE.] The police in Shirauz, as well as all over Persia, is very good. At sun-set the gates of the city are shut; no person whatever is permitted either to come in or go out during the night, the keys of the different gates being always sent to the Hakim or Governor, and remaining with him until morning. During the night, three tiblas or drums are beaten at three different times; the first at eight o'clock, the second at nine, and the third at half past ten. After the third tibia has sounded, all persons whatsoever found in the streets by the Daroga, or judge of the police, or by any of his people, are instantly taken up, and conveyed to a place of confinement, where they are detained until next morning, when they are carried before the Hakim; and if they cannot give a very good account of themselves, are punished, either by the bastinado, or a fine.

Civil matters are all determined by the Cazi, and ecclesiastical ones (particularly divorces) by the Sheik at Sellaum, or head of the faith, an office answering to that of Mufti in Turkey. Justice is carried on in Persia in a very summary manner; the sentence, whatever it may be, being always put into execution on the spot. Theft is generally punished with the loss of nose and ears; robbing on the road, by ripping up the belly of the criminal, in which situation he is exposed upon a gibbet in one of the most public parts of the city, and there left until he expires in torment; a dreadful punishment, but it renders robberies in Persia very uncommon.

[MANUFACTURES AND COMMERCE.] The Persians equal, if not exceed, all the manufacturers in the world in silk, woollen, mohair, carpets, and leather. Their works in these join fancy, taste, and elegance, to richness, neatness, and show. Their dying excels that of Europe. Their silver and gold laces, and threads, are admirable for preserving their lustre. Their embroideries and horse furniture are univalled; nor are they ignorant of the pottery and window-glass manufactures. On the other hand, their carpenters are unskillful, which is said to be owing to the scarcity of timber all over Persia. Their jewellers and goldsmiths are clumsy workmen;

workmen; and they are ignorant of lock-making, and the manufacture of looking-glasses.

The trade of the Persians, who have little or no shipping of their own, is carried on in foreign bottoms. That with the English and other nations, by the gulf of Ormus at Gombroon, was the most gainful they had; but perpetual wars have ruined their commerce. The great scheme of the English, in trading with the Persians through Russia, promised vast advantages to both nations, but it has hitherto answered the expectations of neither. Perhaps the court of Peterburgh is not fond of suffering the English to establish themselves upon the Caspian sea, the navigation of which is now possessed by the Russians.

[CONSTITUTION AND GOVERNMENT.] Both these are extremely precarious, as resting in the breast of a despot. The Persians, however, had some fundamental rules of government. They excluded from their throne females, but not their male progeny. Blindness likewise was a disqualification for the royal succession. In other respects the king's will was a law for the people. The instances that have been given of the cruelties and inhumanities practised by the Mahomedan kings of Persia, are almost incredible, especially during the two last centuries. The reason given to the Christian ambassadors, by Shah Abbas, one of their most celebrated princes, was, that the Persians were such brutes, and so insensible by nature, that they could not be governed without the exercise of exemplary cruelties. But this was only a wretched and ill-grounded apology for his own barbarity. The favourites of the prince, female as well as male, are his only counsellors, and the smallest disobedience to their will is attended with immediate death. The Persians have no degrees of nobility. The king has been known to prefer a younger son to his throne, by putting out the eyes of the elder brother.

[REVENUES.] The king claims one-third of the cattle, corn, and fruits of his subjects, and likewise a third of silk and cotton. No rank or condition of Persians is exempted from severe taxations and services. The governors of provinces have particular lands assigned to them for maintaining their retinues and troops; and the crown-lands defray the expences of the court, king's household, and great officers of state. The water that is let into fields and gardens is subject to a tax, and foreigners, who are not Mahomedans, pay each a ducat a head. The revenues of Persia are therefore very great, but have never been ascertained with any tolerable accuracy.

[MILITARY STRENGTH.] This consisted formerly of cavalry, which, in its present state, is thought to exceed that of the Turks. Since the beginning of this century, however, their kings have raised bodies of infantry. The regular troops of both brought to the field, even under Kouli Khan, did not exceed 60,000; but, according to the modern histories of Persia, they are easily recruited in case of a defeat. The Persians have few fortified towns; nor had they any ships of war until Kouli Khan built a royal navy; but since his death we hear no more of their fleet.

[ARMS AND TITLES.] The arms of the Persian monarch are a lion couchant looking at the rising sun. His title is Shah, or the *Disposer of Kingdoms*. Shah or Khan, and Sultan, which he assumes likewise, are Tartar titles. To acts of state the Persian monarch does not subscribe his name, but the grant runs in this manner, *This act is given by him whom the universe obeys*.

[HISTORY.] The Persian empire succeeded the Assyrian or Babylonian; Cyrus laid its foundation about 556 years before Christ; and restored the Israelites, who had been captives at Babylon, to liberty. The first dynasty ended in the person of Darius, who was conquered by Alexander 329 years before Christ. Alexander's empire was divided among his generals, whose descendants in less than three centuries

tries were conquered by the Romans. These last, however, never fully subdued Persia, and the natives had princes of their own, from Arfaces, called Arfacide, who more than once defeated the Roman legions. The successors of those princes survived the Roman empire itself; but were subdued by the famous Tamerlano, whose posterity were supplanted by a doctor of law, Cheki Adir, the ancestor of the Sefi or Sophi family, and who pretended to be descended from Mahomet himself. His successors, named Sophis, though some of them were valiant and politic, and enlarged the empire, rendered themselves odious by their cruelty, ignorance and indolence, which brought them into such disrepute with their subjects, barbarous as they were, that Hussein, a prince of the Sefi race, who succeeded in 1694, was murdered by Mahmud, son and successor to the famous Miriweis; as Mahmud himself was by Esref, one of his general officers, who usurped the throne. Prince Tahmas, the representative of the Sefi family, had escaped from the rebels, and assembling an army, took into his service Nadir Shah, who defeated and killed Esref, and re-annexed to the Persian monarchy all the places dismembered from it by the Turks and Tartars during their late rebellions. At last the secret ambition of Nadir broke out, and after assuming the name of Tahmas Kouli Khan, and pretending that his services were not sufficiently rewarded, he rebelled against his sovereign, made him a prisoner, and, it is supposed, put him to death.

This usurper afterwards mounted the throne, under the title of Shah Nadir. His expedition into Indostan, and the amazing booty he made there, have been mentioned in the description of that country. He next conquered Ubec Tartary; but was not so successful against the Daghestan Tartars, whose country is almost inaccessible. He beat the Turks in several engagements, but was unable to take Bagdad. The great principle of his government was to strike terror into all his subjects by the most cruel executions. His conduct became so intolerable, that it was thought his brain was touched; and he was assassinated in his own tent by his chief officers and his relations, in the year 1747. Many pretenders, upon his death, started up; and the confusion which prevailed through the whole country, from the death of Nadir, until the settlement of Kerim Khan, prevented all attempts of literature, arts, and sciences. During this interval, the whole empire of Persia was in arms; different parties in different provinces of the kingdom struggling for power, and each endeavouring to render himself independent, torrents of blood were shed, and the most shocking crimes were committed. The whole face of the country, from Gombroon to Kullia, presents to the view thousands of instances of the misery and desolation which were occasioned by these commotions.

From the accounts we have been able to collect, the series of pretenders to the throne of Persia, from the death of Nadir Shah until the final establishment of Kerim Khan's government was no less than nine, including himself. Kerim Khan Zand was a favourite officer of Nadir Shah, and at the time of his death was in

\* The instances of wanton cruelty, and the most savage barbarity, recorded of some of the kings of Persia, are shocking to humanity, and a striking evidence of the calamities occasioned by despotic power. Shah Abbas, surnamed the Great, having three sons, caused the eyes of the two youngest to be put out, and afterwards put the eldest to death. He was succeeded by his grandson, who began his reign by depriving his only brother of his eyes. He also cut from a rack his two uncles, who had before been blinded by order of Shah

Abbas. The instances of his cruelty were innumerable; he buried alive forty-four women of his harem, though when he was not hunting, or over his cups, he used to pass his time with them. Sella, or Solenne, who ascended the throne of Persia in 1662, and was a brutal tyrant, when he was intoxicated either with wine or anger, often ordered the hands, feet, ears, and nose of those near him to be cut off, their eyes to be plucked out, or their lives to be sacrificed, as if it were his pleasure.

the southern provinces. Shirauz and other places had declared for him. He found means, at last, after various encounters with doubtful success, completely to subdue his rivals, and finally to establish himself as ruler of all Persia. He continued in power about thirty years, the latter part of which he governed Persia under the appellation of Vakeel, or regent; for he never would receive the title of Shah. He made Shirauz the chief city of his residence, in gratitude for the assistance he had received from its inhabitants. He died in the year 1779, in the eightieth year of his age, regretted by all his subjects. His character is most deservedly celebrated for the public buildings which he erected, and the excellent police which he maintained, so that during his whole reign there was not in Shirauz a single riot productive of bloodshed; besides these merits, his aversion to severe punishments, his liberality and kindness to the poor, his partiality for Europeans, and his encouragement of trade, together with his great military abilities and personal courage, rendered him not only beloved by his own subjects, but greatly respected by foreign powers.

From the death of Kerim Khan to the present time, a variety of competitors have been desirous of filling the throne of Persia. Of these we shall only mention the two principal. Akau Mahomet Khan keeps possession of the provinces of Mazanderan and Ghilan, as well as the cities of Ispahan, Hamadan, and Tauris, where he is acknowledged as sovereign. Jaafar Khan has possession of the city of Shirauz, and the provinces of Beaboon and Shuster: he also receives an annual present from the province of Carmania, and another from the city of Yezd; Abu Shehr and Lar also send him tribute.

Jaafar Khan is a middle-aged man, very corpulent, and has a cast in his right eye: he is very mild in his disposition, and just in his government. In Shirauz he keeps up a most excellent police. He is very kind and obliging to strangers in general, and to the English in particular. Of the two competitors who at present contend for the government of Persia, he is the most likely, in case of success against his opponent, to restore the country to a peaceful and happy state; but it will require a long space of time to recover it from the calamities into which the different revolutions have brought it:—a country, if an Oriental metaphor may be allowed, once blooming as the garden of Eden, fair and flourishing to the eye;—now, sad reverse! despoiled and leafless by the cruel ravages of war, and desolating contention.

Intelligence was received at Constantinople in December 1793, that Jaaffar Khan had been dethroned by his brother, Mahomed Khan, who entered into the possession of his dominions. This new Persian usurper is now threatening the Turkish dominions with a powerful invasion.

NAME.] It is remarkable that this country has always preserved its ancient name. The word *Arab* signifies a robber. The word *Saracen*, by which one tribe is called, is said to signify both a thief and an inhabitant of the desert. These names justly belong to the Arabians, for they seldom let any merchandise pass undiminished through their country.

MOUNTAINS.] The mountains of Sinai and Horeb, lying in Arabia Petraea, east of the Red-sea, and those called Gabel el Ared, in Arabia Felix, are the most noted.

RIVERS, SEAS, GULFS, AND CAPES.] There are few fountains, springs, or rivers in this country, except the Euphrates, which washes the north-east limits of it. It is almost surrounded with seas; as the Indian-Ocean, the Red-Sea, the gulfs of Persia and Ormus. The chief capes or promontories are those of Rosalgate and Mussledon.

CLIMATE, AIR, SOIL, AND PRODUCE.] As a considerable part of this country lies under the Torrid Zone, and the Tropic of Cancer passes over Arabia Felix, the air is excessively dry and sultry, and the country is subject to hot, noxious, and deadly winds, like those on the opposite shores of Persia. The soil, in some parts, is nothing more than immense sands, which, when agitated by the winds, roll like the troubled ocean, and sometimes form mountains by which whole caravans have been buried or lost. In these deserts, the caravans, having no tracks, are guided, as at sea, by a compass, or by the stars, for they travel chiefly in the night. Here, says Dr. Shaw, are no pastures clothed with flocks, nor vallies standing thick with corn: here are no vineyards or olive-yards: but the whole is a lonesome desolate wilderness, no otherways diversified than by plains covered with sand, and mountains that are made up of naked rocks and precipices. Neither is this country ever, unless sometimes at the equinoxes, refreshed with rain; and the intenseness of the cold in the night is almost equal to that of the heat in the day-time. But the southern part of Arabia, deservedly called the Happy, is blessed with an excellent soil, and, in general, is very fertile. There the cultivated lands, which are chiefly about the towns near the sea-coast, produce balm of Gilead, manna, myrrh, cassia, aloes, frankincense, spikenard, and other valuable gums; cinnamon, pepper, cardamom, oranges, lemons, pomegranates, figs, and other fruits; honey and wax

in plenty, with a small quantity of corn and wine. This country is famous for its coffee and its dates. There are few trees fit for timber in Arabia, and little wood of any kind.

**ANIMALS.]** The most useful animals in Arabia are camels and dromedaries; animals so formed, that they can throw up the liquor from their stomach into their throat, by which means they can travel the parched deserts six or eight days without water. The camels usually carry 800lb. weight upon their backs, which is not taken off during the whole journey; for they naturally kneel down to rest, and in due time rise with their load. The dromedary is a small camel with two bunches on its back, and remarkably swift. It is an observation among the Arabs, that wherever there are trees, the water is not far off; and when they draw near a pool, their camels will smell it at a distance, and set up their great trot till they come to it. The Arabian horses are well known in Europe, and have contributed to improve the breed of the English. They are only fit for the saddle, and are admired for their make as much as for their swiftness, and high mettle. The finest breed is in the kingdom of Sennar, in which Mocha is situated.

**INHABITANTS, MANNERS, } The Arabians, like most nations of Asia, are of a  
CUSTOMS, AND DRESS. }** middle stature, thin, of a swarthy complexion, with black hair and black eyes. They are swift of foot, excellent horsemen, expert at the bow and lance, and, since they became acquainted with fire-arms, good marksmen. The inhabitants of the inland country have in all ages lived in tents, and removed from place to place with their flocks and herds.

The Arabians in general are such thieves, that travellers and pilgrims are struck with terror on approaching the desert. Those robbers, headed by a captain, traverse the country in considerable troops on horseback, to assault and plunder the caravans; and we are told, that so late as the year 1750, a body of 50,000 Arabians attacked a caravan of merchants and pilgrims returning from Mecca, killed about 60,000 persons, and plundered it of every thing valuable, though escorted by a Turkish army. On the sea-coast their piracies are well known, for they make prize of every vessel they can master, of whatever nation, unless they receive a subsidy either in money or commodities.

The habit of the roving Arabs is a kind of blue shirt, tied about them with a white sash or girdle; and some of them have a vest of furs or sheep-skins over it; they also wear drawers, and sometimes slippers, but no stockings; and have a cap or turban on their head. Many of them go almost naked; but the women, as in eastern countries, are so wrapped up, that nothing can be discerned but their eyes. Like other Mahometans, the Arabs eat all manner of flesh, except that of hogs; and prefer the flesh of camels, as we prefer venison, to other meat. They take care to drain the blood from the flesh, as the Jews do, and, like them, refuse such fish as have no scales. Coffee and tea, water, and sherbet made of oranges, water, and sugar, is their usual drink: they have no strong liquors.

**RELIGION.]** Many of the wild Arabs are still Pagans, but the people in general profess Mahometanism; of which the reader will find an account in the following history.

**LEARNING AND LANGUAGE.]** Though the Arabians in former ages were famous for their learning and skill in the liberal arts, there is scarcely a country at present where the people are so universally ignorant. The vulgar language used in the three Arabias is the Arabic, or corrupt Arabian, which is likewise spoken, with some variation of dialect, over great part of the East, from Egypt to the court of the Great Mogul. The pure old grammatical Arabic, which is said to be a dialect of the Hebrew, and by the people of the East accounted the richest, most energetic and

copious language in the world, is taught in their schools, as Greek and Latin is among Europeans, and used by Mahometans in their worship; for as the Koran was written in this language, they will not suffer it to be read in any other: they look upon it to have been the language of Paradise, and think no man can be master of it without a miracle, as consisting of several millions of words. The books which treat of it, say they have no fewer than a thousand terms to express the word *camel*, and five hundred for that of *lion*.

In the temple of Mecca, or suspended on its walls and gates, are seven Arabian poems, called the *Maalakat*, a fine specimen of Oriental poetry, as to the dramatic pastoral, which has been lately translated into English by Sir William Jones. The following stanzas of one of the poems are transcribed, as they serve to gratify literary curiosity, and also display a lively and entertaining view of the Arabian customs and modes of living:

1. "Desolate are the mansions of the fair, the stations in Minia, where they rested, and those where they fixed their abodes! Wild are the hills of Gouf, and deserted is the summit of Rijaam.
2. The cunabs of Rayaan are destroyed: the remains of them are laid bare, and smoothed by the floods, like characters engraved on the solid rocks.
3. Dear ruins! many a year has been closed, many a month, holy and unhallowed, has elapsed since I exchanged tender vows with the fair inhabitants.
4. The rainy constellations of spring have made their hills green and luxuriant: The drops from the thunder-clouds have drenched them with profuse as well as with gentle showers:
5. Showers from every nightly cloud, from every cloud veiling the horizon at day-break, and from every evening cloud, responsive with hoarse murmurs.
6. Here the wild eringo plants raise their head: here the antelopes bring forth their young by the sides of the valley; and here the ostriches drop their eggs.
7. The large-eyed wild cows lie suckling their young a few days old: their young, who will soon become a herd on the plain.
8. The torrents have cleared the rubbish, and disclosed the traces of habitations, as the reeds of a writer restore effaced letters in a book:
9. Or as the black dust, sprinkled over the varied marks on a fair hand, brings to view, with a brighter tint, the blue stains of woad.
10. I stood asking news of the ruins concerning their lovely habitants; but what avail my questions to dreary rocks, who answer them only by their echo?
11. In the plains, which now are naked, a populous city once dwelled: but they decamped at early dawn, and nothing of them remains but the camels which encircled their tents, and the Thumaam-plants, with which they were repaired.
12. How were thy tender affections raised, when the damsels of the tribe departed: when they hid themselves in carriages of cotton, like antelopes in their lair: and the tents, as they were struck, gave a piercing sound!
13. They were concealed in vehicles, whose sides were well covered with awnings and carpets, with fine-spun curtains, and pictured veils.
14. A company of maidens were seated in them, with black-eyes, and graceful motions, like the wild heifers of Tuda, or the roes of Wegera, tenderly gazing on their young.
15. They hastened their camels, till the sultry vapour gradually stole them from thy sight: and they seemed to pass through a vale wild with tamarisks, and rough with large stone, like the valley of *Bejsha*."

The Pater-noster in the Arabic is as follows: *Abuna elladhi fi-samawat; jekaddas efmdc; tati malacutac; taouri mafchiatc, cama fi-sfama; kedhalec ala lardh aoting chobzena kefatna iaum beiaum; waagfor leua donubena, wachataina, cama nogfor nachna lemea aca doina; wald tadulchulna fihajarib; lakeu mejjina me nefcheriv. Amen.*

**CHIEF CITIES, CURIOSITIES, }** What is called the Desert of Sinai, is a beautiful plain near nine miles long, and above three in breadth: it lies open to the north-east, but to the southward is closed by some of the lower eminences of Mount Sinai; and other parts of that mountain make such encroachments upon the plain as to divide it into two parts, each sufficiently capacious to receive the whole camp of the Israelites.

From Mount Sinai may be seen Mount Horeb, where Moses kept the flocks of Jethro, his father-in-law, when he saw the burning bush. On those mountains, are many chapels and cells, possessed by the Greek and Latin monks, who, like the religious of Jerusalem, pretend to shew the very spot where every miracle or transaction recorded in scripture happened. The chief cities in Arabia are Mocha, Aden, Muschat, Suez, and Jiddah or Gedda.

Mocha is well built, the houses lofty, and forts covered with a chinam or stucco that give a dazzling whiteness to them. The harbour is semicircular, the circuit of the wall is two miles, and there are several handsome mosques in the city. Suez, the Artimee of the ancients, is surrounded by the desert, and but a mean ill-built place. The ships are forced to anchor a league from the town, to which the leading channel has only about nine feet water. Jiddah is the place of the greatest trade in the Red Sea, for there the commerce between Arabia and Europe meets and is interchanged, the former sending her gums, drugs, coffee, &c. and from Europe come cloths, iron, furs, and other articles, by the way of Cairo. The revenues of these, with the profits of the port, are shared by the grand-signior and the xeriff of Mecca, to whom jointly this place belongs.

Mecca, the capital of all Arabia, and Medina, deserve particular notice. At Mecca, the birth-place of Mahomed, is the most magnificent mosque or temple in the Turkish dominions: its lofty roof, raised in fashion of a dome, and covered with gold, with two beautiful towers at the end, are conspicuous at a great distance. The mosque hath a hundred gates, with a window over each; and the whole building within is decorated with gildings and tapestry. The number of pilgrims who yearly visit this place is prodigious, because every good mussulman ought to come hither once in his life-time, or send a deputy. At Medina, about fifty miles from the Red Sea, the city to which Mahomed fled when he was driven out of Mecca, and the place where he was buried, is a stately mosque, supported by 400 pillars, and furnished with 300 silver lamps, which are continually burning. It is called the *Mosk Holy* by the Turks, because in it is placed the coffin of their prophet Mahomed, covered with cloth of gold, under a canopy of silver tissue, which the bathaw of Egypt, by order of the grand-signior, renews every year. The camel which carries it, derives a sort of sanctity from this office, and is never to be used in any drudgery afterwards. Over the foot of the coffin is a rich golden crescent, curiously wrought, and adorned with precious stones. Thither the pilgrims resort, as to Mecca, but not in such numbers.

**GOVERNMENT.]** The inland country of Arabia is under the government of many petty princes, who are styled xeriffs or imans, including the offices of king and priest, in the same manner as the califs of the Saracens, the successors of Mahomed. These monarchs are absolute, both in spirituals and temporal; the succession is hereditary, and they have no other laws than those found in the Koran, and the comments upon it. The northern Arabs owe subjection to the Turks, and

are

are governed by the grand signior. The Arabians perform all their duties.

His royal highness, all others their history, that they man's hands, most ages, vincible, pre-conits of Arabia, wandering, jets of no come into of their history to enjoy. forms a very famous Mahomed, the luxurious, termed the epithet of Mahomed.

Mahomed Constantino, endowed with a degree of enterprize. He had as a factor, in Egypt. He was death he married wealth and of East, he had each other was particulars, by riches, and plenty of religion, this design he would him forsake his whom he remained monk was perfect his master, for wife have proved they purposed to homed turned a often subject to furious to conceal which he was instructed in his wild and austere life, acquaintance and n

are governed by bashaws residing among them; yet receive large gratuities from the grand-signior for protecting the pilgrims that pass through their country. The Arabians have no standing regular militia, but their kings command both the persons and the purses of their subjects, as the necessity of affairs require.

**HISTORY.]** The history of this country in some measure differs from that of all others; for as the slavery and subjection of other nations make a great part of their history, that of the Arabs is entirely composed of their conquests or independence. The Arabs are descended from Ishmael, of whose posterity it was foretold, that they should be invincible, "have their hand against every man, and every man's hand against theirs." They are at present, and have remained from the remotest ages, during the various conquests of the Greeks, Romans, and Tartars, a convincing proof of the divinity of this prediction. Toward the north, and the sea-coasts of Arabia, the inhabitants are, indeed, kept in awe by the Turks; but the wandering tribes in the southern and inland parts acknowledge themselves subjects of no foreign power, and do not fail to harass and annoy all strangers who come into their country. The conquests of the Arabs make as wonderful a part of their history, as the independence and freedom which they have ever continued to enjoy. These, as well as their religion, began with one man, whose character forms a very singular phenomenon in the history of mankind. This was the famous Mahomed, a native of Mecca, a city of that division of Arabia, which, for the luxury of its soil, and mild temperature of its climate, has ever been esteemed the loveliest and sweetest region of the world, and is distinguished by the epithet of Happy.

Mahomed was born in the year 569, in the reign of Justinian II. emperor of Constantinople. Though descended of mean parentage, illiterate and poor, he was endowed with a subtle genius, like those of the same country, and possessed a degree of enterprize and ambition peculiar to himself, and much beyond his condition. He had been employed, in the early part of his life, by an uncle, Abuteleb, as a factor, and had occasion, in this capacity, to travel into Syria, Palestine, and Egypt. He was afterwards taken into the service of a rich merchant, upon whose death he married his widow, Cadiga, and by her means came to be possessed of great wealth and of a numerous family. During his peregrinations into Egypt and the East, he had observed the vast variety of sects in religion, whose hatred against each other was strong and inveterate, while at the same time there were many particulars in which the greater part of them agreed. He carefully laid hold of these particulars, by means of which, and by addressing himself to the love of power, riches, and pleasure, passions universal among men, he expected to raise a new system of religion, more general than any which had hitherto been established. In this design he was assisted by a Surgian monk, whose libertine disposition had made him forsake his cloister and profession, and engage in the service of Cadiga, with whom he remained as a domestic when Mahomed was taken to her bed. This monk was perfectly qualified, by his great learning, for supplying the defects which his master, for want of a liberal education, laboured under, and which might otherwise have proved fatal to his design. It was necessary, however, that the religion they purposed to establish should have a divine sanction, and for this purpose Mahomed turned a calamity, with which he was afflicted, to his advantage. He was often subject to fits of the epilepsy, a disease which those whom it afflicts are desirous to conceal; Mahomed gave out, therefore, that these fits were trances, into which he was miraculously thrown by God Almighty, during which he was instructed in his will. By this strange story, and by leading a retired, abtemious, and austere life, he easily acquired a character for superior sanctity among his acquaintance and neighbours. When he thought himself sufficiently fortified by the

numbers and the enthusiasm of his followers, he boldly declared himself a prophet, sent by God into the world, not only to teach his will, but to compel mankind to obey it.

As we have already mentioned, he did not lay the foundation of his system so narrow as only to comprehend the natives of his own country. His mind, though rude and enthusiastic, was enlarged by travelling into distant lands, whose genius and manners he had made a peculiar study. He proposed that his religion should extend over all the neighbouring nations, to whose doctrines and prejudices he had taken care to adapt it. Many of the inhabitants of the Eastern countries were at this time much adducted to the opinions of Arius, who denied that Jesus Christ was co-equal with God the Father, as is declared in the Athanasian creed. Egypt and Arabia were filled with Jews, who had fled into these corners of the world from the persecution of the emperor Adrian, who threatened the total extinction of that people. The other inhabitants of those countries were pagans. These, however, had little attachment to their decayed and derided idolatry: and, like men whose religious principle is weak, had given themselves over to pleasure and sensuality, or to the acquisition of riches, the doctrine of predestination composing the sole principle of their philosophy. Mahomed's system exactly suited these three kinds of men. To gratify the two former, he declared that there was one God, who created the world, and governed all things in it; that he had sent various prophets to teach his will to mankind, among whom Moses and Jesus Christ were the most eminent; but the endeavours of these having proved ineffectual, God had therefore now sent his last and greatest prophet with a commission more ample than either Moses or Christ had been entrusted with. He had commanded him not only to publish his laws, but to subdue those who were unwilling to believe or obey them; and for this end to establish a kingdom upon earth which should propagate the divine law throughout the world; that God had designed utter ruin and destruction to those who should refuse to submit to him; but to his faithful followers, he had given the spoils and possessions of all the earth, as a reward in this life; and had provided for them hereafter a paradise of all sensual enjoyments. These, together with the prohibition of drinking strong liquors (a restraint not very severe in warm climates), and the doctrine of predestination, were the capital articles of Mahomed's creed. They were no sooner published than a vast many of his countrymen embraced them with implicit faith. They were written by the priest we formerly mentioned, and compose a book called the *Koran*, or Alcoran, by way of eminence, as we say the bible, which means the Book. The person of Mahomed, however, was familiar to the inhabitants of Mecca, so that the greater part of them were sufficiently convinced of the deceit. The more enlightened and leading men entered into a design to cut him off; but Mahomed, getting notice of their intention, fled from his native city to Medina Tahmachi, or the city of the Prophet. The fame of his miracles and doctrine was, according to custom, greatest at a distance, and the inhabitants of Medina received him with open arms. From this flight, which happened in the 622 year of Christ, the fifty-fourth year of Mahomed's age, and the tenth of his ministry, his followers, the Mahomedans, compute their time, and the era is called in Arabic, Hegira, "the Flight."

Mahomed, by the assistance of the inhabitants of Medina, and of others whom his intimation and address daily attached to him, brought over all his countrymen to a belief, or at least to an acquiescence in his doctrines. The speedy propagation of his system among the Arabians was a new argument in its behalf among the inhabitants of Egypt and the East, who were previously disposed to it. Arians, Jews, and Gentiles, all forsook their ancient faith, and became Mahomedans. In a word, the contagion spread over Arabia, Syria, Egypt, and Persia; and Mahomed,

med, from a deceitful hypocrite, became a powerful monarch. He was proclaimed king at Medina in the year 627, and, after subduing part of Arabia and Syria, he died in 632, leaving two branches of his race, both esteemed divine by their subjects. These were the caliphs of Persia and of Egypt, under the last of which Arabia was included. The former of these turned their arms to the East, and made conquests of many countries. The caliphs of Egypt and Arabia directed their ravages towards Europe, and, under the name of Saracens or Moors (which they obtained because they entered Europe from Mauritania in Africa, the country of the Moors) reduced most of Spain, France, Italy, and the islands in the Mediterranean.

In this manner did the successors of that impostor spread their religion and conquests over the greatest part of Asia, Africa, and Europe; and they still give law to a very considerable portion of mankind.

## THE INDIAN AND ORIENTAL ISLANDS.

**T**HE JAPAN ISLANDS, Japan or Nipham, Bongo, Tonfo, and Dezima, form together what has been called the empire of JAPAN, and are governed by a most despotic prince, who is sometimes called emperor and sometimes king. They are situated about 150 miles east of China, and extend from the 30th to the 41st degree of north latitude, and from the 130th to the 147th of east longitude. The chief town is Jeddo, in the 141st degree of east longitude, and the 36th of north latitude.

The soil and productions of the country are pretty much the same with those of China: and the inhabitants are famous for their lacquer ware, known by the name of Japan. The islands themselves are very inaccessible, through their high rocks and tempestuous seas; they are subjected to earthquakes, and have some volcanos. The Japanese are the grossest of all idolaters, and so irreconcilable to Christianity, that it is commonly said the Dutch, who are the only European people with whom they now trade, pretend themselves to be no Christians, and humour the Japanese in the most absurd superstitions. Notwithstanding all this compliance, the natives are very shy and rigorous in their dealings with the Dutch; and Nagasacki, in the island of Dezima, is the only place where they are suffered to trade. The complexions of the Japanese are in general yellowish, although some few, chiefly women, are almost white. Their narrow eyes, and high eye-brows, are like those of the Chinese and Tartars; and their noses are short and thick. Their hair is universally black; and such a sameness of fashion reigns throughout this whole empire, that the head-dress is the same from the emperor to the peasant. The fashion of their cloaths has also remained the same from very high antiquity. They consist of one or more loose gowns, tied about the middle with a sash. People of rank have them made of silk, but the lower class of cotton stuffs. Women generally wear a greater number of them than men, and much longer, and have them more ornamented, often with gold or silver flowers woven into the stuff.

Their houses are built with upright posts, crossed and wattled with bamboo, plastered both without and within, and white-washed. They generally have two stories; but the uppermost is low and seldom inhabited. The roofs are covered with pantiles, large and heavy, but neatly made. The floors are elevated two feet from the ground, and covered with planks, on which mats are laid. They have no furniture in their rooms; neither tables, chairs, stools, benches, cupboards, or

even beds. Their custom is to sit down on their heels upon the mats, which are always soft and clean. Their victuals are served up to them on a low board raised but a few inches from the floor, and one dish only at a time. Mirrors they have, but never fix them up in their houses as ornamental furniture; they are made of a compound metal, and used only at their toilets. Notwithstanding the severity of their winters, which obliges them to warm their houses from November to March, they have neither fire-places nor stoves; instead of these, they use large copper pots standing upon legs. These are lined in the inside with loam, on which ashes are laid to some depth, and charcoal lighted upon them, which is prepared in such a manner that the fumes of it are not dangerous. The first compliment offered to a stranger, in their houses, is a dish of tea, and a pipe of tobacco. Fans are used by both sexes equally; and are, within or without doors, their inseparable companions. Every house, whether public or private, has a bath, of which constant and daily use is made. Obedience to parents, and respect to superiors, are the characteristics of this nation. Their salutations and conversations between equals abound also with politeness; to which children are early accustomed by the example of their parents. Their penal laws are very severe; but punishments are seldom inflicted. Perhaps there is no country where fewer crimes against society are committed. Commerce and manufactures flourish here, though, as these people have few wants, they are not carried to the extent which we see in Europe. Agriculture is so well understood, that the whole country, even to the tops of the hills, is cultivated. They trade with no foreigners but the Dutch and Chinese, and in both cases with companies of privileged merchants. Besides the sugars, spices, and manufactured goods, which the Dutch send to Japan, they carry thither annually upwards of 200,000 deer skins, and more than 100,000 hides, the greatest part of which they get from Siam, where they pay for them in money. The merchandise they export from these islands, both for Bengal and Europe, consists in 9000 chests of copper, each weighing 120 pounds, and from 25 to 30,000 weight of camphor. Their profits on imports and exports are valued at 40 or 45 per cent. As the Dutch company do not pay duty in Japan, either on their exports or imports, they send an annual present to the emperor, consisting of cloth, chintz, succotas, cottons, stuffs, and trinkets.

The **LADRONE ISLANDS**, of which the chief town is said to be Guam, east longitude 140, north latitude 14: they are about twelve in number. The people took their name from their pilfering qualities. We know nothing of them worth a particular mention, except that lord Anson landed upon one of them (Tinian), where he found great refreshment for himself and his crew.

**FORMOSA** is likewise an Oriental island. It is situated to the east of China, near the province of Fo-kien, and is divided into two parts by a chain of mountains, which runs through the middle, beginning at the south-coast, and ending at the north. This is a very fine island, and abounds with all the necessaries of life. That part of the island which lies to the west of the mountains belongs to the Chinese, who consider the inhabitants of the eastern parts as savages, though they are said to be a very inoffensive people. The inhabitants of the cultivated parts are the same with the Chinese, already described. The Chinese have likewise made themselves masters of several other islands in those seas, of which we scarcely know the names; that of Anan is between sixty and seventy leagues long, and between fifty and sixty in breadth, and but twelve miles from the province of Canton. The original inhabitants are a shy, cowardly people, and live in the most unwholesome part of the island; the coast and cultivated parts, which are very valuable, being possessed by the Chinese.

The PHILIPPINES are said to be 1100 in number, lying in the Chinese sea (part of the Pacific Ocean), 200 miles south-east of China, of which Manila, or Luconia, the chief, is 400 miles long and 200 broad. The inhabitants consist of Chinese, Ethiopians, Malays, Spaniards, Portuguese, Pintados or painted people, and Melles, a mixture of all these. The property of these islands belongs to the king of Spain, they having been discovered by Magellan, and afterwards conquered by the Spaniards in the reign of Philip II. from whom they take their name. Their situation is such, between the eastern and western continents, that the inhabitants trade with Mexico and Peru, as well as with all the islands and places of the East Indies. Two ships from Acapulco, in Mexico, carry on the commerce for the Spaniards, who make 400 per cent. profit. The country is fruitful in all the necessaries of life, and beautiful to the eye. Venison of all kinds, buffaloes, hogs, sheep, goats, and a particular large species of monkeys, are found here in great plenty. The nest of the bird fuligan affords that dissolving jelly, which is so voluptuous a rarity at European tables. Many European fruits and flowers thrive surprisngly in those islands. If a sprig of an orange or lemon tree is planted there, it becomes within the year a fruit-bearing tree; proof of the verdure and luxuriance of the soil. The tree amct supplies the natives with water; and there is also a kind of cane, which, if cut, yields fair water enough for a draught: this abounds in the mountains, where the water is most wanted.

The city of Manila contains about 3000 inhabitants; its port is Cavite, lying at the distance of three leagues, and defended by the castle of St. Philip. In the year 1762, Manila was reduced by the English under general Draper and admiral Cornish, who took it by storm, and humanely suffered the archbishop, who was the Spanish viceroy at the same time, to ransom the place for about a million sterling. The bargain, however, was ungenerously disowned by him and the court of Spain, so that great part of the ransom is still unpaid. The Spanish government is settled there, and the Indian inhabitants pay a capitation tax. The other islands, particularly Mindanao, the largest next to Mauilla, are governed by petty princes of their own, whom they call sultan. The sultan of Mindanao is a Mahomedan.

Upon the whole, though these islands are enriched with all the profusion of nature, yet they are subject to most dreadful earthquakes, thunder, rains, and lightning; and the soil is pestered with many noxious and venomous creatures, and even herbs and flowers, whose poisons kill almost instantaneously. Some of their mountains are volcanos.

The MOLUCCAS, commonly called the SPICE or CLOVE ISLANDS. These are not out of sight of each other, and lie all within the compass of twenty-five leagues, to the south of the Philippines, in 125 degrees of east longitude, and between one degree south, and two north latitude. They are in number five, viz. Bachian, Machiam, Motyr, Ternate, and Tydore. These islands produce neither corn nor rice, so that the inhabitants live upon a bread made of sago. Their chief produce consists of cloves, mace, and nutmegs, in vast quantities; which are monopolized by the Dutch with so much jealousy, that they destroy the plants lest the natives should sell the supernumerary spices to other nations. These islands, after being subject to various powers, are now governed by three kings, subordinate to the Dutch. Ternate is the largest of these islands, though no more than thirty miles in circumference. The Dutch have here a fort called Victoria; and another called Fort Orange, in Machiam.

AMBOYNA. This island, taken in a large sense, is one of the most considerable of the Moluccas, which, in fact, it commands. It is situated in the Archi-

pelago of St. Lazarus, between the third and fourth degrees of south latitude, and 120 leagues to the eastward of Batavia. Amboyna is about seventy miles in circumference, and defended by a Dutch garrison of 7 or 800 men, besides small forts, which protect the clove plantations. It is well known, that when the Portuguese were driven off this island, the trade of it was carried on by the English and Dutch; and the barbarities of the latter, in first torturing and then murdering the English, and thereby engrossing the whole trade, and that of Banda, can never be forgotten; but must be transmitted as a memorial of Dutch cruelty, at that period, to all posterity. This tragical event happened in 1622.

The **BANDA, or NUTMEG ISLANDS**, are situated between 127 and 128 degrees east longitude, and between four and five south latitude, comprehending the islands of Lantor (the chief town of which is Lam or), Poleron, Rolinging, Pooloway, and Gonapi. The chief forts belonging to the Dutch on these islands, are those of Revenge and Nassau. The nutmeg, covered with mace, grows on these islands only, and they are intirely subject to the Dutch. The great nutmeg harvest is in June and August.

The island of **CKEREES, or MACASSAR**, is situated under the equator, between the island of Borneo and the Spice islands, at the distance of 160 leagues from Batavia, and is 500 miles long, and 200 broad. This island, notwithstanding its heat, is rendered habitable by breezes from the north, and periodical rains. Its chief product is pepper and opium; and the natives are expert in the study of poisons, with a variety of which nature has furnished them. The Dutch have a fortification on this island; but the internal part of it is governed by three kings, the chief of whom resides in the town of Macassar. In this, and indeed in almost all the Oriental islands, the inhabitants live in houses built on large posts, which are accessible only by ladders, which they pull up in the night-time, for their security against venomous animals. They are said to be hospitable and faithful, if not provoked. They carry on a large trade with the Chinese; and if their chiefs were not perpetually at war with each other, they might easily drive the Dutch from their island. Their port of Jampoden is the most capacious of any in that part of the world.

The Dutch have likewise fortified **GILOLO** and **CERAM**, two other spice islands, lying under the equator, and will sink any ships that attempt to traffic in those seas.

The **SUNDA ISLANDS**. These are situated in the Indian Ocean, between 93 and 120 degrees of east longitude, and between eight degrees north, and eight degrees south latitude, comprehending the islands of Borneo, Sumatra, Java, Bally, Lambee, Banca, &c. The three first, from their great extent and importance, require to be separately described.

**BORNEO** is said to be 800 miles long, and 700 broad, and, till recent discoveries, was thought to be the largest island in the world. The inland part of the country is marthy and unhealthy; and the inhabitants live in towns built upon floats in the middle of rivers. The soil produces rice, cotton, canes, pepper, camphor, the tropical fruits, gold, and excellent diamonds. The famous ouran-outang is a native of this country; it is now found by Dr. Camper to have the intermaxillary bone, in common with other quadrupeds, besides a bone in its penis; and in many other particulars to differ from the human form, which it was long supposed to nearly resemble. The sea-coast of Borneo is governed by Mahomedan prin-

ees; the chief port of this island is *Benjar-Masseen*, which carries on an extensive commerce.

*SUMATRA* has *Malacca* on the north, *Borneo* on the east, and *Java* on the south-east, from which it is divided by the *Straits of Sunda*; it is divided into two equal parts by the equator, extending five degrees, and upwards, north-west of it, and five on the south-east; and is 1000 miles long, and 100 broad. This island produces so much gold, that it is thought by some to be the *Ophir* mentioned in the scriptures; but *Mr. Martden*, in his late history of the island, thinks it was unknown to the ancients. The highest mountain in *Sumatra* is called *Ophir* by the Europeans, whose summit above the level of the sea is 13,842 feet, exceeding the height the *Peak of Teneriffe* by 577 feet. The Portuguese were the first discoverers and settlers, but met with disgrace in their attempts against *Acheen*. The first English fleet that made its appearance in this part of the world, and laid the foundation of a commerce that was to eclipse that of every other European state, visited *Acheen*, in the year 1602, under captain *Lancaster*, who carried a letter from queen *Elizabeth* to the king of that place. The English East India company have two settlements here, *Beneoolen*, and *Fort-Marlborough*; from whence they bring their chief cargoes of pepper. The king of *Acheen* is the chief of the Mahomedan princes who possess the sea-coasts. The interior parts are governed by Pagan princes, whose governments are independent, and their languages and manners various. The natural products of *Sumatra* are much the same with those of the adjacent islands; but this island is surpassed by few in rice, pepper, and camphor, and the bountiful indulgence of nature. From the most of the castia sent to Europe is produced. The castia tree grows to fifty or sixty feet, with a stem of about two feet diameter, and a beautiful and regular spreading head. The quantity of pepper produced in the East India company's districts on *Sumatra* is annually 1200 tons; of which the greatest part comes to Europe, and the rest is sent to *China*.

Rain is very frequent here: sometimes very heavy, and almost always attended with thunder and lightning. Earthquakes are not uncommon, and there are several volcanoes on the island. The people who inhabit the coast are *Malays*, who came hither from the peninsula of *Malacca*, but the interior parts are inhabited by very different people, and who have hitherto had no connection with the Europeans. Their language and character differ much from those of the *Malays*; the latter using the Arabic character, as do the *Acheenese*. The principal internal languages of the island are the *Rejang* and *Batha*, each containing characters essentially different from the other. The people between the districts of the English company, and those of the Dutch at *Palembang*, on the other side the island, write on long narrow slips of the bark of a tree, with a piece of bamboo. They begin at the bottom, and from the left hand to the right, contrary to the custom of the other eastern nations. These inhabitants of the interior parts of *Sumatra* are a free people, and live in small villages, called *doofons*, governed each by its own chief. All of them have laws, some written ones, by which they punish offenders, and terminate disputes. Most of them, particularly the women, have large swellings in their necks, like the *Goitres* of the Alps. That part of this island, which is called the *Castia* country, is well inhabited by a people called *Battas*, who differ from all the other inhabitants of *Sumatra* in language and customs. They have no king, but live in villages, independent of each other, and generally at variance. They fortify their villages very strongly with double fences of camphor plank pointed, and placed with their points projecting outwards; and between these fences they place pieces of bamboo, hardened by fire, and likewise pointed, which

are concealed by the grass, but which will run quite through a man's foot. Such of their enemies whom they take prisoners, they put to death and eat, and their skulls they hang up as trophies, in the houses where the unmarried men and boys eat and sleep. They allow of polygamy. A man may purchase as many wives as he pleases; but Mr. Marsden observes, it is extremely rare that an instance occurs of their having more than one, and that only among a few of their chiefs: but this continence is attributed to their poverty. The original clothing of the Sumatrans is the same with that of the inhabitants of the South-Sea islands, generally styled Otaheitean cloth. The buffalo (*carbow*) constitutes a principal part of their food, and is the only animal employed in their domestic labours. The Sumatran pheasant is a bird of uncommon beauty.

Within about ninety miles of Sumatra is the island of ENGANHO, which is very little known, on account of the terrible rocks and breakers that entirely surround it. It is inhabited by naked savages, who are tall and well made, and who generally appear armed with lances and clubs, and speak a different language from the inhabitants of any of the neighbouring islands.

The greatest part of JAVA belongs to the Dutch, who have here erected a kind of commercial monarchy, the capital of which is Batavia, a noble and populous city, lying in the latitude of six degrees south, at the mouth of the river Jucata, and furnished with one of the finest harbours in the world. The town itself is built in the manner of those in Holland, and is about a league and a half in circumference, with five gates, and surrounded by regular fortifications; but its suburbs are said to be ten times more populous than itself. The government here is a mixture of Eastern magnificence and European police, and held by the Dutch governor-general of the Indies. When he appears abroad, he is attended by his guards and officers. The city is as beautiful as it is strong, and its fine canals, bridges, and avenues, render it a most agreeable residence. The description of it, its government and public edifices, have employed whole volumes. The citadel, where the governor has his palace, commands the town and the suburbs, which are inhabited by natives of almost every nation in the world. The Chinese residing in this island are computed at 100,000; but about 30,000 of that nation were barbarously massacred, without the smallest offence proved upon them, in 1740. This massacre was too unprovoked and detestable to be defended even by the Dutch, who, when the governor arrived in Europe, sent him back to be tried at Batavia; but he never has been heard of since. A Dutch garrison of 3000 men constantly resides at Batavia; and about 15,000 troops are quartered in the island and the neighbourhood of the city. Their government is admirably well calculated to prevent the independency either of the civil or military power.

The ANDAMAN and NICOBAR islands. These islands lie at the entrance of the bay of Bengal, and furnish provision, consisting of tropical fruits and other necessaries, for the ships that touch there. They are otherwise too inconsiderable to be mentioned. They are inhabited by an harmless, inoffensive, but idolatrous people.

CEYLON. This island, though not the largest, possesses great natural advantages. It is situated in the Indian Ocean, near Cape Comorin, the southern extremity of the Hindler Peninsula of India, being separated from the coast of Coromandel by a narrow strait, and is 250 miles long and 200 broad. It produces, besides excellent fruits of all kinds, long pepper, fine cotton, ivory, silk, tobacco, ebony, crystal, salt-petre, sulphur, lead, iron, steel, copper: besides cinnamon, gold, and Silver, and all kinds of precious stones except diamonds. Fowls and fishes abound

here. Every part of the island is well wooded and watered; and besides some curious animals peculiar to itself, it has plenty of cows, buffaloes, goats, hogs, deer, hares, dogs, and other quadrupeds. The Ceylon elephant is preferred to all others, especially if spotted; but several noxious animals, such as serpents and ants, are likewise found here. The chief commodity of the island is cinnamon, which is by far the best in all Asia. Though its trees grow in great profusion, yet the best is found in the neighbourhood of Columbo, the chief settlement of the Dutch, and Nangambo. The middle of the country is mountainous and woody, so that the rich and beautiful vallies are left in the possession of the Dutch, who have in a manner shut up the king in his capital city, Candy, which stands on a mountain in the middle of the island, so that he has scarcely any communication with other nations, or any property in his own dominions. The descendants of the ancient inhabitants are called Cinglases, idolaters, who value themselves upon maintaining their ancient laws and customs. They are, in general, a sober inoffensive people, and are mingled with Moors, Malabars, Portuguese, and Dutch.

It may be here proper to observe, that the cinnamon tree, which is a native of this island, has two, if not three barks, which form the true cinnamon; the trees of a middling growth and age afford the best; and the body of the tree, which when stripped is white, serves for building and other uses. In 1656, the Dutch were invited, by the natives of this delicious island, to defend them against the Portuguese, whom they expelled, and have monopolised it ever since to themselves. Indeed, in January 1782, Trincomale, the chief sea-port of the island, was taken by the English, but soon afterwards retaken by the French, and restored to the Dutch by the last treaty of peace.

The MALDIVES. These are a vast cluster of small islands, or little rocks, just above the water, lying between the equator and eight degrees north latitude, near Cape Comorin. They are chiefly resorted to by the Dutch, who drive a profitable trade with the natives for couries, a kind of small shells, which go, or rather formerly went, for money upon the coasts of Guinea and other parts of Africa. The cocoa of the Maldives is an excellent commodity and medicine. "Of this tree (says a well-informed author) they build vessels of twenty or thirty tons; their hulls, masts, sails, rigging, anchors, cables, provisions, and firing, are all from this useful tree."

We have already mentioned BOMBAY on the Malabar coast, in speaking of India. With regard to the language of all the Oriental islands, nothing certain can be said. Each island has a particular tongue; but the Malayan, Chinese, Portuguese, Dutch, and Indian words, are so frequent among them, that it is difficult for an European, who is not very expert in those matters, to know the radical languages. The same may be almost said of their religion; for though its original is certainly Pagan, yet it is intermixed with many Mahometan, Jewish, Christian, and other foreign superstitions.

The sea which separates the southern point of the peninsula of Kamtschatka from Japan contains upwards of twenty islands, in a position from north-north-east to south-south-west, which are called the KERILE ISLANDS. They are mountainous, and in several of them are volcanoes and hot springs. The principal are inhabited; but some of the little ones are entirely desert. The forests in the more northern ones are composed of laryx and pines; those to the southward produce canes, bamboos, vines, &c. In some of them are bears and foxes. The sea-otter appears on the coasts of all these islands, as well as whales, sea-horses, seals, and other

other amphibious animals. Some of the inhabitants have a great likeness to the Japanese in their manners, language, and personal appearance; others very much resemble the Kamtschadales. The northern islands acknowledge the sovereignty of the empire of Russia; but those to the south pay homage to Japan. The Kurilians discover much humanity and probity in their conduct, and are cautious and hospitable; but adversity renders them timid, and prompts them to suicide. They reverence an old man whoever he be, but have an especial affection for those of their respective families. Their language is agreeable to the ear, and they speak and pronounce it slowly. The men are employed in hunting, fishing for whales, &c. and catching fowls. Their canoes are made of wood that their forests produce, or that the sea casts upon their shores. The women have charge of the kitchen, and make cloaths. In the northern islands they sew, and make different cloaths of the thread nettles. The southern islanders are more refined and polished than the northern, and carry on a sort of commerce with Japan, whither they export whale-oil, furs, and eagles' feathers to sledge arrows with. In return, they bring Japanese utensils of metal and varnished wood, skillets, sabres, different stuffs, ornaments of luxury and parade, tobacco, all sorts of trinkets, and small wares.

## A F R I C A.

**A**FRICA, the third grand division of the globe, is generally represented as bearing some resemblance to the form of a pyramid, the base being the northern part of it, which runs along the shores of the Mediterranean, and the point or the top of the pyramid, the Cape of Good Hope. Africa is a peninsula of a prodigious extent, joined to Asia only by a neck of land, about sixty miles over, between the Red Sea and the Mediterranean, usually called the Isthmus of Suez, and its utmost length from north to south, from Cape Bona in the Mediterranean, in 37 degrees north, to the Cape of Good Hope in 34-7 south latitude, is 4300 miles; and the broadest part from Cape Verd, in 17-20 degrees, to Cape Guardafui, near the straits of Babel-Mandel, in 51-20 east longitude, is 3500 miles from east to west. It is bounded on the north by the Mediterranean Sea, which separates it from Europe; on the east by the Isthmus of Suez, the Red Sea, and the Indian Ocean, which divide it from Asia; on the south by the Southern Ocean; and on the west by the great Atlantic Ocean, which separates it from America. As the equator divides this extensive country almost in the middle, and the far greater part of it is within the tropics, the heat is in many places almost insupportable to an European; it being there increased by the reflection of the sun's rays from vast deserts of burning sands. The coasts, however, and banks of rivers, such as the Nile, are generally fertile, and most parts of this region are inhabited, though it is far from being so populous as Europe or Asia. From what has been said, the reader cannot expect to find here a variety of climates. In many parts of Africa, snow never falls in the plains; and it seldom lies but on the tops of the high mountains. The natives, in these scorching regions, would as soon expect that marble should melt and flow in liquid streams, as that water, by freezing, should lose its fluidity, be arrested by the cold, and, ceasing to flow, become like the solid rock.

That the geography of Africa has made a slower progress towards improvement than that of every other part of the world, during the last and the present century, is to be attributed to natural causes. Formed by the Creator with a contour and surface totally unlike the other continents, its interior parts elude all nautic research; whilst the wars and commerce in which Europeans have taken part, have been confined to very circumscribed parts of its borders. To the lovers of adventure and novelty, Africa displays a most ample field; but the qualification of local manners, and in some degree of habits, must in this case be superadded to that of language; and this unquestionably renders the undertaking peculiarly arduous.

As both EUROPE, and its adjacent continent, ASIA, are spread over with inland seas, lakes, or rivers, of the most extended navigations, so as collectively to aid the transport of bulky articles of merchandise from one extreme of them to the other; and to form (like stepping-stones over a brook) a more commodious communication: so likewise the northern part of America appears to have an almost continuous inland navigation; which must prove of infinite advantage to its inhabitants, when fully peopled, and contribute meanwhile to their speedier civilization. But AFRICA stands alone in a geographical view. Penetrated by no inland seas, like the Mediterranean, Baltic, or Hudson's Bay; nor overspread with extensive lakes, like those of North America; nor having, in common with the other continents, rivers

running from the centre to the extremities; but on the contrary, its regions separated from each other by the least practicable of all boundaries, and deserts of such formidable extent, as to threaten those who traverse them, with the most horrible of all deaths, that arising from thirst! Placed in such circumstances, can we be surprised either at our ignorance of its interior part, or of the tardy progress of its civilization? Possibly the difficulty of conveying merchandise to the coasts, under the above circumstances, may have given rise to the traffic in men, a commodity that can transport itself!

Nothing can evince the low state of the African geography, more than M. D'Anville's having had recourse to the works of Ptolemy and Edrifi, to compose the interior part of his map of Africa (1749). It is well known that those authors wrote in the second and in the twelfth centuries of our æra. Most of the positions in the inland part of the great body of Africa are derived from Edrifi; and it is wonderful how nearly some of them agree with those furnished by the latest observations.

But the public are not to expect, even under an improved system of African geography, that the interior part of that continent will exhibit an aspect similar to the others; rich in variety; each region assuming a distinct character. On the contrary, it will be meagre and vacant in the extreme. The dreary expanses of desert which often surround the habitable spots, forbid the appearance of the usual proportions of towns; and the paucity of rivers, added to their being either absorbed or evaporated, instead of being conducted in flowing lines to the ocean, will give a singular cast to its hydrography; the direction of their courses, being moreover equivocal, through the want of that information which a communication with the sea usually affords at a glance.

The society for promoting the discovery of the interior parts of Africa has been fortunate in collecting much geographical information in so early a stage of the African researches; and there is little doubt that, in a few years, all the great features of this continent (within the reach of their enquiries) may be known and described. But to accomplish this, it will be necessary that intelligent Europeans should trace some of the principal routes; as well to apportion the distances, as to establish some kind of criterion for the parole information derived from the natives. As yet, in the wide extent of near thirty degrees on a meridian, between Benin and Tripoli, not one celestial observation has been taken to determine the latitude.\*

The most considerable rivers in Africa, are the Niger, which falls into the Atlantic or western ocean at Senegal, after a course of about 2800 miles †. It increases

\* Major Rennell's Memoir of his Map of the Northern Parts of Africa, printed by the African Association, at the end of their Proceedings.

† This is extremely difficult, if not impossible, to ascertain. For (according to Mr. Lucas's communications to the African Association) both the rise and termination of the Niger are unknown, but the course is from east to west. So great is its rapidity, that no vessel can ascend its stream; and such is the want of skill, or such the absence of commercial inducements among the nations who inhabit its borders, that even with the current neither vessels nor boats are seen to navigate. In one place, indeed, the traveller finds accommodations for the passage of himself and of his goods; but even there, though the ferrymen, by the indulgence of the Sultan of Calina, are exempted from all taxes, the boat which conveys the merchandize is nothing more than an ill-constructed raft, for the

planks are fastened to the timbers with ropes, and the seams are closed, both within and without, by a plaster of tough clay, of which a large provision is always carried on the raft, for the purpose of excluding the stream wherever its entrance is observed.

The depth of the river at the place of passage, which is more than a hundred miles to the south of the city of Calina, the capital of the empire of that name, is estimated at twenty-three or twenty-four feet English.

Its width is such, that even at the island of Gongo, where the ferrymen reside, the sound of the loudest voice from the northern shore is scarcely heard; and at Tombuctou, where the name of Guewa, or black, is given to the stream, the width is described as being that of the Thames at Westminster. In the rainy season it swells above its banks, and not only floods the adjacent lands, but

creases and decreases as the Nile, fertilises the country, and contains grains of gold intermixed with its sand. The Gambia and Senegal are only branches of this river. The Nile divides Egypt into two parts, and discharges itself into the Mediterranean, after a prodigious course from its source in Abyssinia.

The most considerable mountains in Africa are the Atlas, a ridge extending from the western ocean, to which it gives the name of Atlantic Ocean, as far as Egypt. It had its name from the king of Mauritania, a great lover of astronomy, who used to observe the stars from its summit; on which account the poets represent him as bearing the heavens on his shoulders. The mountains of the Moon, extending themselves between Abyssinia and Monomotapa, are still higher than those of Atlas. Those of Sierra Leona, or the mountains of the Lions, dividing Nigritia from Guinea, and extending as far as Ethiopia, were styled by the ancients the mountains of God, on account of their being subject to thunder and lightning. The Peak of Teneriffe, which the Dutch make their first meridian, rises about two miles high in the form of a sugar-loaf, and is situated on an island of the same name near the coast. The most noted capes or promontories in this country are, Cape Verd; so called, because the land is always covered with green trees and mossy ground; it is the most westerly point of the continent of Africa. The Cape of Good Hope, so denominated by the Portuguese, when they first went round it in 1498, and discovered the passage to Asia. It is the southern extremity of Africa, in the country of the Hottentots; at present in the possession of the Dutch, and the general rendezvous of ships of every nation who trade to India, being about half way from Europe. There is but one strait in Africa, which is called Babel-Mandel, and joins the Red Sea with the Indian Ocean.

The situation of Africa for commerce is extremely favourable, standing as it were in the centre of the globe, and having thereby a much nearer communication with Europe, Asia, and America, than any of the other quarters has with the rest. That it abounds with gold, we have not only the testimony of the Portuguese, the Dutch, the English, and the French, who have settlements on its coasts, but that of the most authentic historians. It is, however, the misfortune of Africa, that, though it has 10,000 miles of sea-coast, with noble, large, deep rivers, it should be inhabited by barbarous or savage nations. At the mouths of many of its rivers are the most excellent harbours, deep, safe, calm, and sheltered from the wind, and capable of being made perfectly secure by fortifications; but quite destitute of shipping, trade, and merchants, even where there is plenty of merchandise. In short, Africa, though a full quarter of the globe, stored with an inexhaustible treasure, and capable, under proper improvements, of producing so many things delightful, as well as convenient, within itself, has been neglected strangely both by the natives and the Europeans settled in it, particularly the Portuguese.

Africa once contained several kingdoms and states, eminent for the liberal arts, for wealth and power, and the most extensive commerce. The kingdoms of Egypt and Ethiopia, in particular, were much celebrated; and the rich and powerful state of Carthage, that once formidable rival to Rome itself, extended her commerce to every part of the ancient world; even the British shores were visited by her fleets, till Juba, who was king of Mauritania, but tributary to the republic of Carthage,

often sweeps before it the cattle and cottages of the most sited, or too confident inhabitants. That the people who live in the neighbourhood of the Niger should refuse to profit by its navigation, may justly surprize the traveller; but much greater is his astonishment, when he finds that even the food which the bounty of the stream would give, is use-

lessly offered to their acceptance; for such is the want of skill, or such the settled dislike of the people to this sort of provision, that the fish, which the river abounds, are left in undisturbed possession of its waters. — Proceedings of the African Association, p. 183—186.

unhappily called in the Romans, who, with the assistance of the Mauritanians, subdued Carthage, and by degrees all the neighbouring kingdoms and states. After this, the natives, constantly plundered, and consequently impoverished, by the governors sent from Rome, neglected their trade, and cultivated no more of their lands than might serve for their subsistence. Upon the decline of the Roman empire, in the fifth century, the north of Africa was over-run by the Vandals, who contributed still more to the destruction of arts and sciences; and, to add to this country's calamity, the Saracens made a sudden conquest of all the coasts of Egypt and Barbary, in the seventh century. These were succeeded by the Turks; and both being of the Mahomedan religion, whose professors carried desolation with them wherever they came, the ruin of that once flourishing part of the world was thereby completed.

The inhabitants of this continent, with respect to religion, may be divided into three sorts; namely, Pagans, Mahomedans, and Christians. The first are the most numerous, possessing the greatest part of the country, from the tropic of Cancer to the Cape of Good Hope, and they are generally black. The Mahomedans, who are of a tawny complexion, possess Egypt, and almost all the northern shores of Africa, or what is called the Barbary coast. The people of Abyssinia, or the Upper Ethiopia, are denominated Christians, but retain many Pagan and Jewish rites. There are also some Jews, on the north of Africa, who manage all the little trade that part of the country enjoys.

There are scarcely any two nations, or indeed any two of the learned, that agree in the modern divisions of Africa; and for this very reason, that scarcely any traveller has penetrated into the heart of the country; and consequently we must acknowledge our ignorance of the bounds, and even the names of several of the inland nations, which may be still reckoned among the unknown and undiscovered parts of the world; but, according to the best accounts and conjectures, Africa may be divided according to the following Table:

Having

Nations

Having given the reader some idea of Africa in general, with its principal kingdoms, we shall now consider it under four grand divisions: first, Egypt; secondly the states of Barbary, stretching along the coast of the Mediterranean, from Egypt in the east, to the Atlantic Ocean, west; thirdly, the kingdoms of Abyssinia, Fezzan, Bornou, and Cassina; and, lastly, the country of the Hottentots, Caffraria, and that part of Africa, between the tropic of Cancer and the Cape of Good Hope: the last of these divisions, indeed, is vastly greater than the other three; but the nations which it contains are so little known, and so barbarous, and, like all barbarous nations, so similar in most respects to each other, that they may, without impropriety, be thrown under one general head.

E G Y P T.

SITUATION AND EXTENT.

**AIR.]** It is observed by M. Volney, that during eight months of the year (from March to November) the heat is almost insupportable to an European. "During the whole of this season, the air is inflamed, and the sky sparkling."—The other months are more temperate. The southerly winds which sometimes blow in Egypt, are by the natives called *poisonous winds*, or the *hot winds of the desert*. They are of such extreme heat and aridity, that no animated body exposed to them can withstand their fatal influence. During the three days which this wind generally lasts, the streets are deserted; and woe to the traveller whom it surprises remote from shelter; when it exceeds three days it is insupportable. Very frequently the inhabitants are almost blinded with drifts of sand. These evils are remedied by the rising and overflowing of the Nile.

**SOIL AND PRODUCE.]** The vast fertility of Egypt is owing to the annual inundation of the Nile, occasioned by the rains which fall during May, June, and July, in Abyssinia and the neighbouring countries of Africa. According to M. Volney,

the commencement of the inundation is not entirely ascertained, though the Coptes fix it at the 19th of June. At the height of its flood in the Lower Egypt, nothing is to be seen in the plains, but the tops of forests and fruit-trees, the towns and villages being built upon eminences either natural or artificial. When the river is at its proper height, the inhabitants celebrate a kind of jubilee, with various festivities. The banks or mounds which confine it are cut by the Turkish basha, attended by his grandees; but, according to captain Norden, who was present on the occasion, the spectacle is not very magnificent. When the banks are cut, the water is let into what they call the *Chalis*, or grand canal, which runs through Cairo, from whence it is distributed into cuts, for supplying their fields and gardens. This being done, and the waters beginning to retire, such is the fertility of the soil, that the labour of the husbandman is next to nothing. He throws his wheat and barley into the ground in October and May. He turns his cattle out to graze in November, and in about six weeks, nothing can be more charming than the prospect which the face of the country presents, in rising corn, vegetables, and verdure of every sort. Oranges, lemons, and fruits, perfume the air. The culture of pulse, lemons, sugar-canes, and other plants, which require moisture, is supplied by small but regular cuts from cisterns and reservoirs. Dates, plantanes, grapes, figs, and palm-trees, from which wine is made, are here plentiful. March and April are the harvest months, and produce three crops; one of lettucees and cucumbers (the latter being the chief food of the inhabitants), one of corn, and one of melons. The Egyptian pasturage is equally prolific, most of the quadrupeds producing two at a time, and the sheep four lambs a year.

[ANIMALS.] Egypt abounds in black cattle; and it is said, that the inhabitants employ every day 20,000 oxen in raising water for their grounds. They have a fine large breed of asses, upon which the Christians ride, being insolently debarred by the Turks from riding on horseback. The Egyptian horses are very fine; they never trot, but walk well, and gallop with great speed, turn short, stop in a moment, and are extremely tractable. The hippopotamus, or river-horse, an amphibious animal, resembling an ox in its hinder parts, with the head of a horse, is common in Upper Egypt. Tygers, hyenas, camels, antelopes, apes with the head like a dog, and the rat, called *ichneumon*, are natives of Egypt. The camelion, a little animal something resembling a lizard, that changes colour as you stand to look upon him, is found here as well as in neighbouring countries. The crocodile was formerly thought peculiar to Egypt, but there does not seem to be any material difference between it and the alligators of India and America. They are both amphibious animals, in the form of a lizard, and grow till they are about twenty feet in length, and have four short legs, with large feet armed with claws, and their backs are covered with a kind of impenetrable scales, like armour. The crocodile waits for his prey in the sedge, and other cover, on the sides of the rivers; and, pretty much resembling the trunk of an old tree, sometimes surprises the unwary traveller with his fore paws, or beats him down with his tail.

This country produces likewise great numbers of eagles, hawks, pelicans, and water-fowls of all kinds. The ibis, a creature (according to Mr. Norden) somewhat resembling a duck, was deified by the ancient Egyptians for its destroying serpents and pestiferous insects. They were thought to be peculiar to Egypt, but a species of them is said to have been lately discovered in other parts of Africa. Ostriches are common here, and are so strong that the Arabs sometimes ride upon their backs.

The Cerastes, or horned viper, inhabits the greatest part of the eastern continent, especially the desert sandy parts of it. It abounds in Syria, in the three Arabias, and

and in Africa. It is thought to have been this species of viper which Cleopatra employed to procure her death. Alexandria, plentifully supplied by water, must then have had fruit of all kinds in its gardens. The baskets of figs must have come from thence, and the aspic, or cerastes, that was hid in them, from the adjoining desert, where there are plenty to this day. Mr. Bruce, in his Travels in Abyssinia, has given a very curious account of the power which the natives have over these reptiles, by which they become quite harmless to them; but he could learn no other reason for this exemption, than their saying that they were born so. Whatever be the cause, the fact seems plain both from sacred \* and profane † writers.

POPULATION, MANNERS, CUSTOMS, AND DIVERSIONS. } As the population of Egypt is almost confined to the banks of the Nile, and the rest of the country inhabited by Arabs, and other nations, we can say little upon this head with precision. It seems to be certain that Egypt is at present not near so populous as formerly, and its depopulation is owing to anarchy and despotism. According to M. Volney, the number of inhabitants may amount to 2,300,000, of which Cairo contains about 250,000. This country is inhabited by four different races of people; the Turks who pretend to be masters of the country; the Arabs who were conquered by the Turks; the Coptes, who are descended from the ancient Egyptians, mixed with the Persians, Greeks, and Romans, who successively conquered Egypt; and the Mamelouks, who were originally Circassian and Mingrelian slaves, and being the only military force, are the real masters of the country.

The Turks, who reside in Egypt, retain all their Ottoman pride and insolence, and wear the Turkish habit, to distinguish themselves from the Arabs and Coptes, who dress very plain, their chief finery being an upper garment of white linen, and linen drawers; but their ordinary dress is of blue linen, with a long cloth coat, either over or under it. The Christians and Arabs of the meaner kind content themselves with a linen or woollen wrapper, which they fold, blanket-like, round their body. The Jews wear blue leather slippers, the other natives of the country wear red, and the foreign Christians yellow. The dress of the women is very ungraceful, which in the higher ranks, is of silk. Those females who are not exposed to the sun, have delicate complexions and features. The women are not admitted to the society of men even at table. When a rich Egyptian is desirous of dining with one of his wives, he gives her previous notice; who accordingly prepares the most delicate dishes, and receives her lord with the greatest attention and respect. The women of the lower class remain standing, or seated in a corner of the room, while their husband is at dinner, and present him with water to wash, and help him at the table. The Coptes are generally excellent accompaniments, and many of them live by teaching the other natives to read and write. Their exercises and diversions are much the same as those made use of in Persia, and other Asiatic countries. Egypt abounds with jugglers, fortune-tellers, and mountebanks.

RELIGION.] To what has been already said concerning the religion of Egypt, it is proper to add that the bulk of the Mahomedans are enthusiasts, and have among them their *fiates*, or fellows who pretend to a superior degree of holiness, and without any ceremony intrude into the best houses, whence it would be dangerous to turn them out. The Egyptian Turks pay little attention to religion;

\* Jerem. viii. 17. Psal. lviii. 5.

† Ad quoniam cantus mites jacuere cerastæ. Sil. Ital. lib. iii.

nor would it be easy to say what species of Christianity is believed by the Christian Coptes who are here numerous; they however profess themselves to be of the Greek church, and enemies to that of Rome. In religious, and indeed many civil matters, they are under the jurisdiction of the patriarch of Alexandria, who by easy pecuniary influence generally obtains a protection at the Ottoman court.

[LANGUAGE.] The Coptic is the most ancient language of Egypt. This was succeeded by the Greek, about the time of Alexander the Great; and that by the Arabic, upon the commencement of the califate, when the Arabs dispossessed the Greeks of Egypt. The Arabic, or Arabesque, as it is called, is still the current language, but the Coptic and modern Greek continue to be spoken.

[LEARNING AND LEARNED MEN.] Though it is supposed that the Greeks derived all their knowledge from the ancient Egyptians, yet scarcely a vestige of it remains among their descendants. This is owing to the bigotry and ignorance of their Mahomedan masters; but here it is proper to make one observation which is of general use. The Califs or Saracens who subdued Egypt were of three kinds. The first, who were the immediate successors of Mahomed, made war, from confidence and principle, upon all kinds of literature, except the Koran; and hence it was, that when they took possession of Alexandria, which contained the most magnificent library the world ever beheld, its valuable manuscripts were applied for some months to cooking their victuals, and warming their baths. The same fate attended upon the other magnificent Egyptian libraries. The Califs of the second race were men of taste and learning, but of a peculiar strain. They bought up all the manuscripts, that survived the general conflagration, relating to astronomy, medicine, and some useless parts of philosophy; but they had no taste for the Grecian arts, sciences, history, or poetry, and learning was confined to their own courts and colleges, without ever finding its way back to Egypt. The lower race of Califs, especially those who called themselves Califs of Egypt, disgraced human nature; and the Turks have riveted the chains of barbarous ignorance which they imposed.

All the learning therefore possessed by the modern Egyptians consists in arithmetical calculations for the dispatch of business, the jargon of astrology, a few nostrums in medicine, some knowledge of Arabesque, and of the Mahomedan religion.

[CURIOSITIES AND ANTIQUITIES.] Egypt abounds more with these than perhaps any other part of the world. Its pyramids have been often described. Their antiquity is beyond the researches of history itself, and their original uses are still unknown. They are eleven in number, and distant four leagues from Cairo. The basis of the largest covers eleven acres of ground, and its perpendicular height is 500 feet, but, if measured obliquely to the terminating point, 700 feet\*. It contains a room thirty-four feet long, and seventeen broad, in which is a marble chest, but without either cover or contents, supposed to have been designed for the tomb of the founder, who, according to Herodotus, was Cheops, the Egyptian king, who immediately succeeded Proteus, in the ninth century before Christ. In short, the pyramids of Egypt are the most stupendous, and to appearance, the most useless, structures that ever were raised by the hands of men.

The mummy pits, so called for their containing the mummies, or embalmed bodies of the ancient Egyptians, are subterraneous vaults of a prodigious extent; but the art of preparing the mummies is now lost. It is said that some of the bodies, thus embalmed, are perfect and distinct at this day, though buried 3000 years

\* Mr. Volney says that a late mensuration assigns and its perpendicular height four hundred and to each face of the great pyramid, six hundred feet; eighty-feet.

ago. The labyrinth in Upper Egypt is a curiosity thought to be more wonderful than the pyramids themselves. It is partly under ground, and cut out of marble rock consisting of twelve palaces, and 1000 houses, the intricacies of which occasion its name. The lake Mariis was dug by order of an Egyptian king, to correct the irregularities of the Nile, and to communicate with that river, by canals and ditches which still subsist, and are evidences of the utility as well as grandeur of the work. Wonderful grottos and excavations, mostly artificial, abound in Egypt. The whole country towards Grand Cairo is a continued scene of antiquities, of which the oldest are the most stupendous, but the more modern the most beautiful. Cleopatra's needle, and its sculptures, are admirable.

Pompey's pillar, which is situated on a rock, about a mile without the gates of the city of Alexandria, is a fine regular column of the Corinthian order, the shaft of which is one stone, being eighty-eight feet nine inches in height, or ten diameters of the column; the whole height is 114 feet, including the capital and pedestal. The whole of the pillar is granite, but the capital is of another stone. This magnificent monument appears, in taste, (says Mr. Bruce) to be the work of that period between Hadrian and Severus; but, though the former erected several large buildings in the east, it is observed of him that he never put inscriptions upon them. This pillar has had a Greek inscription, and I think, may very probably be attributed to the time of the latter, as a monument of the gratitude of the city of Alexandria for the benefits he conferred on them, especially since no ancient history mentions its existence at an earlier period. He conjectures that it was brought in a block from the Thebais in Upper Egypt, by the Nile; though some have imagined it was an old obelisk, hewn to the round form of a pillar. The Sphinx, as it is called, is no more than the head and part of the shoulders of a woman hewn out of the rock, and about thirty feet high, near one of the pyramids.—The manner of hatching chickens in ovens is common in Egypt, and now practised in some parts of Europe.

The papyrus (which is one of the natural curiosities of Egypt, and served the ancients to write upon) is a cyperus, called by the Greeks *Biblus*. Pliny says that Varro writes that the papyrus came not into general use till after the conquest of Egypt by Alexander; yet it is plain from Anacreon \*, *Alexus*, *Æschylus*, and the comic poets, that it was known in their time. Plato and Aristotle speak of it also, so do Herodotus, and Theophrastus †. We also know it was of old in use among the Ionians, who probably brought it in very early days directly from Egypt. Numa, too, who lived 300 years before Alexander, is said to have left a number of books written on the papyrus, which a long time after his death were found at Rome.

With Aristotle began the first arrangement of a library. Alexander's conquest, and the building of Alexandria, laid open Egypt, its trade, and learning, to the world. Papyrus then, or the paper made from it, was the only material made use of for writing upon. A violent desire of amassing books, and a library, immediately followed.

The Ptolemies, and the kings of Pergamus, contended who should make the largest collection. The Ptolemies, masters of Egypt, and of the papyrus, availed themselves of this monopoly to hinder the multiplication of books in Greece. The other princes probably smuggled this plant, and propagated it wherever it would grow out of Egypt. And Eumenes king of Pergamus set about bringing to perfection the manufacture of parchment, which, long before, the Ionians had used on account of the scarcity of paper; for whatever resemblance there might be in names, or whatever may be inferred from them, writing upon skins or parchment was much

\* *Anac. Ode 17.*

† *Theoph. Hist. Plant. lib. 17. 9.*

more ancient than any city or state in Greece, and in use probably before Greece was inhabited. The Jews we know made use of it in the earliest ages. At this very time which we are now speaking of, we learn from Josephus \*, that the elders, by order of the high priests, carried a copy of the law to Ptolemy Philadelphus in letters of gold upon skins, the pieces of which were so artfully put together that the joinings did not appear.

" In a large and very perfect manuscript in my possession (says Mr. Bruce), which was dug up at Thebes, the boards are of papyrus root, covered first with the coarser pieces of the paper, and then with leather in the same manner as it would be done now. It is a book one would call a small folio, rather than by any other name, and I apprehend that the shape of the book where papyrus is employed was always of the same form with those of the moderns. The letters are strong, deep, black, and apparently written with a reed, as is practised by the Egyptians and Abyssinians still. It is written on both sides, so never could be rolled up as parchment was, nor would the brittleness of the materials when dry, support any such frequent unrolling †."

CITIES, TOWNS, AND } Even a slight review of these would amount to a large  
PUBLIC EDIFICES. } volume. In many places, not only temples, but the  
walls of cities, built before the time of Alexander the Great, are still entire, and  
many of their ornaments, particularly the colours of their paintings, are as fresh  
and vivid as when first laid on.

Alexandria, which lies on the Levant coast, was once the emporium of the world, and by the means of the Red Sea furnished Europe, and great part of Asia, with the riches of India. It owes its name to its founder Alexander the Great. It stands forty miles west from the Nile, and is a hundred and twenty north-west of Cairo. It rose upon the ruins of Tyre and Carthage, and is famous for the light-house erected on the opposite island of Pharos, for the direction of mariners, deservedly esteemed one of the wonders of the world. The mole which was built to form a communication with the island of Pharos is 1000 yards in length, and though near 2000 years old, the excellence of its materials has resisted, in a great measure, the violence of winds and waves ever since. All the parts of the city were magnificent in proportion, as appears from their ruins, particularly the cisterns and aqueducts. Many of the materials of the old city, however, have been employed in building New Alexandria, which at present is a very ordinary sea-port, known by the name of Scanderoon. Notwithstanding the poverty, ignorance, and indolence of the inhabitants, their mosques, bagnios, and the like buildings, erected within these ruins, preserve an inexpressible air of majesty. " It is thinly inhabited, and there is a tradition among the natives that, more than once, it has been in agitation to abandon it altogether, and retire to Rosetta, or Cairo, but that they have been withheld by the opinion of divers saints from Arabia, who have assured them, that Mecca being destroyed, (as it must be they think by the Russians) Alexandria is then to become *the holy place*, and that Mahomed's body is to be transported thither: when that city is destroyed, the sanctified relics are to be transported to Carouan, in the kingdom of Tunis: lastly, from Carouan they are to come to Rosetta, and there to remain till the consummation of all things †."

Rosetta, or Rafchid, stands twenty-five miles to the north-west of Alexandria, and is recommended by its beautiful situation, and the delightful prospects which command the fine country, or island of Delta, formed by the Nile, near its mouth. It is likewise a place of great trade. The length of the city is two miles, but it is only

\* Joseph, lib. xii. p. 405. † Bruce's Travels, 4to. vol. v. p. 1, 2, 3, 5, &c. ‡ Ibid. vol. i. p. 15, 5 M 2  
half

half a mile broad. In the environs are many country houses belonging to Christian merchants, with fine gardens, producing the choicest fruits of the East. The Mahomedan inhabitants are here also particularly civil and polite.

Cairo, now Maſr, the preſent capital of Egypt, is a large and populous, but a diſagreeable reſidence, on account of its peſtilential air, and narrow ſtreets. It is divided into two towns, the Old and the New, and defended by an old caſtle, the works of which are ſaid to be three miles in circumference. This caſtle is ſaid to have been built by Saladin: at the weſt end are the remains of very noble apartments, ſome of which are covered with domes, and adorned with pictures in Moſaic work; but theſe apartments are now only uſed for weaving embroidery, and preparing the hangings and coverings annually ſent to Mecca. The well, called Joſeph's well, is a curious piece of mechanism, about 300 feet deep. The memory of that patriarch is ſtill revered in Egypt, where they ſtrew granaries, and many other works of public utility, that go under his name. They are certainly of vaſt antiquity; but it is very queſtionable whether they were erected by him. One of his granaries is ſhewn in Old Cairo, but captain Norden ſuſpects it is a Saracenic work, nor does he give us any high idea of the buildings of the city itſelf. On the bank of the Nile, facing Cairo, lies the village of Gize, which is thought to be the ancient Memphis. Two miles weſt, is Bulac, called the port of Cairo. The Chriſtians of Cairo praſtiſe a holy cheat, during the Eaſter holidays, by pretending that the limbs and bodies of the dead ariſe from their graves, to which they return peaceably. The ſtreets of Cairo are peſtered with the jugglers and fortune-tellers already mentioned. One of their favourite exhibitions is their dancing camels, which, when young, they place upon a large heated floor: the intenſe heat makes the poor creatures caper, and being plied all the time with the ſound of a drum, the noiſe of that inſtrument ſets them a dancing all their lives after.

The other towns of note in Egypt are Damietta, ſuppoſed to be the ancient Peluſium; Seyd, on the weſt banks of the Nile, 200 miles ſouth of Cairo, ſaid to be the ancient Egyptian Thebes; and Colſiar, on the weſt coaſt of the Red Sea. The general praſtice of ſtrangers, who viſit thoſe places, is to hire a Janizary, whoſe authority commonly protects them from the inſults of the other natives. Suez, formerly a place of great trade, is now a ſmall city, and gives name to the Iſthmus, that joins Africa with Aſia. The children of Iſrael are ſuppoſed to have marched near this city, when they left Egypt, in their way towards the Red Sea. This ſea appears to have certainly derived its name from Edom, long and early its powerful maſter, that word ſignifying Red in Hebrew. It formerly went by the name of the ſea of Edom, or Idumæa. Almoſt every object and village in this country preſents ſome amazing piece of antiquity.

MARBLE QUARRIES.] "It has been a wonder (ſays Mr. Bruce in his journey acroſs the deſert of the Thebaid from Kenné to Colſeir) with all travellers, and with myſelf among the reſt, where the ancients procured that prodigious quantity of fine marble, with which all their buildings abound. That wonder, however, among many others, now ceases after having paſſed, in four days, more granite, porphyry, marble, and jaſper, than would build Rome, Athens, Corinth, Syracuſe, Memphis, Alexandria, and half a dozen ſuch cities. It ſeemed to be very viſible that thoſe openings in the hills, which I call deſiles, were not natural, but artificial, and that whole mountains had been cut out at theſe places.

"The porphyry ſhews itſelf by a fine purple ſand, without any gloſs, or glitter on it, and is exceedingly agreeable to the eye. It is mixed with the native white ſand, and fixed gravel of the plains. Green unvariegated marble is generally ſeen in the ſame mountain with the porphyry. Where the two veins meet, the marble

marble is for some inches brittle, but the porphyry of the same hardness as in other places.

"The granite is covered with sands, and looks like stone of a dirty, brown colour. But this is only the change and impression the sun and weather have made upon it; for upon breaking it, you see it is grey granite, with black spots, with a reddish cast, or bluish over it. This red seems to fade, or suffer from the outward air, but, upon working or polishing the surface, this colour again appears. It is in greater quantity than the porphyry, and nearer the Red Sea. Pompey's pillar seems to have been from this quarry.

"Next to the granite, but never, as I observed, joined with it in the same mountain, is the red marble. It is covered with sand of the same colour, and looks as if the whole mountain were spread over with brick dust. There is also a red marble with white veins, which I have often seen at Rome, but not in principal subjects. I have also seen it in Britain. The common green (called serpentine) looks as if covered over with Brazil snuff. Joined with this green, I saw two samples of that beautiful marble, they call Isabella; one of them with a yellowish cast, which we call Quaker-colour, the other with a bluish, which is commonly termed dove-colour. In this green, likewise, it was, we saw the vein of jasper; but whether it was absolutely the same with this, which is the bloody jasper, or blood-stone, is what we had not time to settle.

"I should first have made mention of the verde antico, the dark green with white irregular spots, because it is of the greatest value, and nearest the Nile. This is produced in the mountains of the plain green, or serpentine, as is the jasper, and is not discoverable by the dust, or any particular colour upon it. First, there is a blue sleeky stone. After lifting this, we come to the beds of the verde antico; and here the quarrying is very obvious, for it has been uncovered in patches, not above twenty-feet square. Then, in another part, the green stone has been removed, and another pit of it wrought.

"I saw, in several places in the plain, small pieces of African marble scattered about, but no rocks or mountains of it. This prodigious store of marble is placed upon a ridge, whence there is a descent to the east, or west, either to the Nile or Red Sea. The level ground, and hard-fixed gravel are proper for the heaviest carriages, and will easily and smoothly convey any weight whatever to its place of embarkation on the Nile; so that another wonder ceased, how the ancients transported those vast blocks of marble to Thebes, Memphis, and Alexandria \*."

MANUFACTURES AND COMMERCE.] The Egyptians export prodigious quantities of unmanufactured as well as prepared flax, thread, cotton, and leather of all sorts, callicoes, yellow, wax, sal ammoniac, saffron, sugar, senna, and cassia. They trade with the Arabs for coffee, drugs, spices, callicoes, and other merchandises, which are landed at Suez, from whence they send them to Europe. Several European states have consuls resident in Egypt, but the customs of the Turkish government are managed by Jews. A number of English vessels arrive yearly at Alexandria; some of which are laden on account of the owners, but most of them are hired and employed as carriers to the Jews, Armenians, and Mahomedan traders.

CONSTITUTION AND GOVERNMENT.] A viceroy is sent to Egypt from the Porte under the title of the pasha or b. Law of Cairo, and is one of the greatest officers of the Ottoman empire. But since the revolution of Ali Bey, the power of the Turks in Egypt is more precarious than in any other province. The government of Egypt is both monarchical and republican. The monarchical is executed

\* Bruce's Travels, 4to. vol. i. p. 156, 187, 188.

by the pasha. The republican, or rather the aristocratical part of the government, consists of a divan, composed of twenty-four sangaicks, beys or lords. The head of them is called the sheik bellet, who is chosen by the divan, and confirmed by the pasha. Every one of the sangaicks is arbitrary in his own territory, and exerts sovereign power; the major part of them reside at Cairo. If the grand signior's pasha acts in opposition to the sense of the divan, or attempts to violate their privileges, they will not suffer him to continue in his post, and the Porte is obliged to send another. They have an authentic grant of privileges, dated in the year 1517, in which year Sultan Selim conquered Egypt from the Mamalukes.

**REVENUES.]** These are very inconsiderable, when compared with the natural riches of the country, and the despotism of its government. Some say they amount to a million sterling, and that two thirds of the whole is spent in the country.

**MILITARY STRENGTH.]** This consists in the Mamalukes, some bodies of whom are cantoned in the villages to exact tribute, and support authority. The greater part are assembled at Cairo. They amount to about eight thousand men, attached to the different beys, whom they enable to contend with each other, and to set the Turks at defiance.

**HISTORY.]** It is generally agreed that the princes of the line of the Pharaohs sat on the throne of Egypt, in an uninterrupted succession, till Cambyses, the second king of Persia, conquered the Egyptians 520 years before the birth of Christ; and that in the reign of those princes, the pyramids were raised; structures, which cannot now be viewed without astonishment. Egypt continued a part of the Persian empire, till Alexander the Great vanquished Darius, when it fell under the dominion of that prince, who soon after built the celebrated city of Alexandria. The conquests of Alexander, who died in the prime of life, being seized upon by his generals, the province of Egypt fell to the share of Ptolemy, by some supposed to have been a half-brother of Alexander, when it again became an independent kingdom, about 300 years before Christ. His successors, who sometimes extended their dominions over great part of Syria, ever after retained the name of Ptolemies, and in that line Egypt continued between two and three hundred years, till the famous Cleopatra, the wife and sister of Ptolemy Dionysius, the last king, ascended the throne. After the death of Cleopatra, who had been mistress successively to Julius Cæsar and Mark Anthony, Egypt became a Roman province, and thus remained till the reign of Omar, the second Calif of the successors of Mahomed, who expelled the Romans, after it had been in their hands 700 years. The famous library of Alexandria, said to consist of 700,000 volumes, was collected by Ptolemy Philadelphus, son of the first Ptolemy; and the same prince caused the Old Testament to be translated into Greek, but whether by seventy-two interpreters, and in the manner commonly related, is justly questioned: this translation is known by the name of the Septuagint. Omar subjected Egypt to the Mahomedan power, about the year 643, and the Califs of Babylon were sovereigns of the country till 870, when the Egyptians set up a governor of their own called the Calif of Cairo.

About the time of the crusades, between the year 1150 and 1190, Egypt was governed by Norededdin, the Saracen sultan of Damascus, whose son, the famous Saladin, proved to formidable to those Christian adventurers, and retok from them Jerusalem. He instituted the military corps of Mamalukes, like the Janizaries of Constantinople, who, about the year 1242, advanced one of their own officers to the throne, and ever after chose their prince out of their own body. Egypt, for some time, made a figure under those illustrious usurpers, and made a noble stand against the prevailing power of the Turks, till under Selim, who, about the year

1517, after giving the Mamalukes several bloody defeats, reduced Egypt to its present state of subjection.

While Selim was settling the government of Egypt, great numbers of the ancient inhabitants withdrew into the deserts and plains, under Zinganeus, from whence they attacked the cities and villages of the Nile, and plundered whatever fell in their way. Selim and his officers perceiving that it would be a matter of great difficulty to extirpate those marauders, left them at liberty to quit the country, which they did in great numbers, and their posterity were known over Europe and Asia, by the name of Gipsies.

An attempt was made a few years since to deprive the Ottoman Porte of its authority over Egypt by Ali Bey, whose father was a priest of the Greek church. Ali turned Mahomedan, and being a man of abilities and address, rendered himself extremely popular in Egypt. A false accusation having been made against him to the grand signior, his head was ordered to be sent to Constantinople, but being apprized of the design, he seized and put to death the messenger who brought the order, put himself at the head of an army and taking advantage of the distressed and dangerous situation to which the Turkish empire was reduced, in consequence of the war with Russia, boldly mounted the throne. But not content with the kingdom of Egypt, he also laid claim to Syria, Palestine, and that part of Arabia which had belonged to the ancient Sultans. He marched at the head of his troops to support these pretensions, and actually subdued some of the neighbouring provinces both of Arabia and Syria. At the same time that he was engaged in these great enterprizes, he was not less attentive to the establishing of a regular government in a country that had been long the seat of anarchy and confusion. His views were equally extended as to commerce; for which purpose he gave great encouragement to the Christian traders, and took off some shameful restraints and indignities, to which they were subjected in that barbarous country. He also wrote a letter to the republic of Venice, with the greatest assurances of his friendship, and that their merchants should meet with every degree of protection and safety. His great design was said to be, to make himself master of the Red Sea; to open the port of Suez to all nations, but particularly to the Europeans, and to render Egypt once more the great centre of commerce. The conduct and views of Ali Bey shewed an extent of thought and ability that indicated nothing of the barbarian, and bespoke a mind equal to the founding of an empire. He assumed the titles and state of the ancient Sultans of Egypt, and was ably supported by Sheik Daher, and some other Arabian princes, who warmly espoused his interests. He also succeeded in almost all his enterprizes against the neighbouring Asiatic governors and pashas, whom he repeatedly defeated; but he was afterwards ruined at once by the base and ungrateful conduct of his brother-in-law, Mahomed Bey Aboudaab, his troops being totally defeated on the 7th of March 1773, and himself wounded and taken prisoner: he died of his wounds, and was buried at Grand Cairo. Aboudaab afterwards governed Egypt as Sheik Bellet, and marched into Palestine to subdue Sheik Daher. After behaving with great cruelty to the inhabitants of the places he took, he was found dead in his bed one morning at Acre, supposed to be strangled. Sheik Daher accepted the Porte's full amnesty, and trusting to their assurances, embraced the captain pasha's invitation to dine on board his ship, when the captain produced his orders, and the brave Daher, Ali Bey's ally, had his head cut off in the 85th year of his age.

From that time Egypt has been torn by a civil war, between the adherents of Ali, and other beys or princes, who rose on his ruins. Of these the principal are Morad and Ybrahim, who having driven their enemies into banishment, began to quarrel

quarrel among themselves. Alternately expelled from Cairo, they finally agreed to a compromise, March, 1785.

The Porte still retains a pasha in Egypt; but this pasha, confined and watched in the castle of Cairo, is rather the prisoner of the Mamalukes, than the representative of the Sultan.

THE STATES OF BARBARY\*.

**U**NDER this head are included the countries of, 1. Morocco and Fez; 2. Algiers; 3. Tunis; 4. Tripoli and Barca.

The empire of Morocco, including Fez, is bounded on the North by the Mediterranean sea; on the South, by Taflet; and on the East, by Segelmessa and the kingdom of Algiers, being 500 miles in length, and 480 in breadth.

Fez, which is now united to Morocco, is about 125 miles in length, and much the same in breadth. It lies between the kingdom of Algiers to the East, and Morocco on the South, and is surrounded in other parts by the sea.

Algiers, formerly a kingdom, is bounded on the East by the kingdom of Tunis, on the North by the Mediterranean, on the South by Mount Atlas, and on the West by the kingdoms of Morocco and Taflet. According to Dr. Shaw, who resided 12 years at Algiers in quality of chaplain to the British factory, and has corrected many errors of ancient and modern geographers respecting the states of Barbary, this country extends in length 480 miles along the coast of the Mediterranean, and is between 40 and 100 miles in breadth.

Tunis is bounded by the Mediterranean on the North and East; by the kingdom of Algiers on the West; and by Tripoli, with part of Biledulgerid, on the South; being 220 miles in length from North to South, and 170 in breadth from East to West.

Tripoli, including Barca, is bounded on the North by the Mediterranean sea; on the South by the country of the Beriberics; on the West by the kingdom of Tunis, Biledulgerid, and the territory of the Gadamis; and on the East by Egypt; extending about 1100 miles along the sea-coast; and the breadth is from 100 to 300 miles.

Each capital bears the name of the state or kingdom to which it belongs, but the capital of Biledulgerid (the ancient Numidia) is Dara.

The Barbary states form a great political confederacy, however independent each may be as to the exercise of its internal policy; nor is there a greater difference than happens in different provinces of the same kingdom, in the customs and manners of the inhabitants.

**AIR AND SEASONS.]** The air of Morocco is mild, as is that of Algiers, and indeed of all the other states, except in the months of July and August.

**SOIL, VEGETABLE AND ANIMAL PRODUCTIONS, BY SEA AND LAND.]** This country, under the Roman empire, was justly denominated the garden of the world; and to have a residence there, was considered as the highest state of luxury. The produce of the soil formed those magazines, which furnished all Italy, and great part of the Roman empire, with corn, wine, and oil. Though the lands are now uncultivated, through the oppression and barbarity of their constitution,

\* This territory was called *Barbaria* by the Greeks and Romans, from *Berber*, in the original signifying *Aethiops*, which was the original or caption of the inhabitants. Bruce's Travels, vol. I. p. 397.

yet they are still fertile, not only in the above mentioned commodities, but in dates, figs, raisins, almonds, apples, pears, cherries, plums, citrons, lemons, oranges, pomegranates, with plenty of roots and herbs in their kitchen gardens. Excellent hemp and flax grow on their plains; and, by the report of Europeans who have lived there for some time, the country abounds with all that can add to the pleasures of life; for the great people find means to evade the sobriety prescribed by the Mahomedan law, and make free with excellent wines and spirits, of their own growth and manufacture. Algiers produces salt-petre, and great quantities of excellent salt; and lead and iron have been found in several places of Barbary.

Neither the elephant nor the rhinoceros are to be found in the states of Barbary; but their deserts abound with lions, tigers, leopards, hyænas, and monstrous serpents. The Barbary horses were formerly very valuable, and thought equal to the Arabian. Though their breed is now said to be decayed, yet some very fine ones are occasionally imported into England. Dromedaries, asses, mules, and kumrahs, a most serviceable creature, begot by an ass upon a cow, are their beasts of burden.

But from the services of the camel they derive their greatest advantages. This useful quadruped enables the African to perform his long and toilsome journeys across that continent. The camel is, therefore, (says Mr. Bruce) emphatically called the *ship of the desert*. He seems to have been created for this very trade, endued with parts and qualities adapted to the office he is employed to discharge. The driest thistle, and the barest thorn, is all the food this useful animal requires; and even these, to save time, he eats while advancing on his journey. As it is his lot to cross immense deserts, where no water is found, and countries not even moistened by the dew of heaven, he is endued with the power, at one watering-place to lay in a store with which he supplies himself for thirty days to come. To contain this enormous quantity of fluid, nature has formed large cisterns within him, from which, once filled, he draws at pleasure the quantity he wants, and pours it into his stomach with the same effect as if he then drew from a spring; and with this he travels, patiently and vigorously, all day long, carrying a prodigious load upon him, through countries infected with poisonous winds, and glowing with parching and never-cooling sands.

Their cows are but small, and barren of milk; their sheep yield but indifferent fleeces, but are very large, as are their goats. Bears, porcupines, foxes, apes, hares, rabbits, ferrets, weasels, moles, camelions, and all kinds of reptiles are found here. Besides vermin, says Dr. Shaw (speaking of his travels through Barbary), the apprehensions we were under, in some parts at least of this country, of being bitten or stung by the scorpion, the viper, or the venomous spider, rarely failed to interrupt our repose; a refreshment so very grateful and so highly necessary to a weary traveller. Partridges and quails, eagles, hawks, and all kinds of wild-fowl, are found on this coast; and of the smaller birds, the capsa-sparrow is remarkable for its beauty, and the sweetness of its note, which is thought to exceed that of any other bird; but it cannot live out of its own climate. The seas and bays of Barbary abound with a variety of the finest fish which were preferred by the ancients to those of Europe.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. Morocco was formerly far more populous than it is now, if, as travellers say, its capital contained 100,000 houses, whereas at present it is thought not to contain above 25,000 inhabitants: nor can we think that the other parts of the country are more populous, if it is true that their king or emperor has 80,000 horse and foot, of foreign negroes, in his armies.

The city of Algiers is said to contain 100,000 Mahomedans, 15,000 Jews, and 2000 Christian

5000 Christian slaves; but no estimate can be formed as to the populousness of its territory. Some travellers report, that it is inhabited by a friendly, hospitable people, who are very different in their manners and character from those of the metropolis.

Tunis is the most polished republic of all the Barbary states. The capital, which also bears the name of Tunis, is a large and flourishing city. The people are more civilized than in Algiers, and the government milder, but the climate is very far from being so good. Tunis is low, hot, and damp; and destitute of good water, with which (according to Mr. Bruce) Algiers is supplied from a thousand springs. It contains 10,000 families, and above 3000 tradesmen's shops, and its suburbs consist of 1000 houses. The Tunisines are indeed exceptions to the other states of Barbary; for even the most civilized of the European governments might improve from their manners. Their distinctions are well kept up, and proper respect is paid to the military, mercantile, and learned professions. They cultivate friendship with the European states; arts and manufactures have been lately introduced among them; and the inhabitants are said at present to be well acquainted with the various labours of the loom. The Tunisine women are exceedingly handsome in their persons; and though the men are sun-burnt, the complexion of the ladies is very delicate, nor are they less neat and elegant in their dress; but they improve the beauty of their eyes by art, particularly the powder of lead-ore, the same pigment, according to the opinion of the learned Dr. Shaw, that Jezebel made use of when she is said (2 Kings, chap. ix. verse 30.) to have painted her face; the words of the original being, that she set off her eyes with the powder of lead-ore. The gentlemen, in general, are sober, orderly, and clean in their persons, their behaviour genteel and complaisant, and a wonderful regularity reigns through all the streets and city.

Tripoli was once the richest, most populous, and opulent of all the states on the coast; but is now much reduced; and the inhabitants, who are said to amount to between 4 and 500,000, have all the vices of the Algerines.

Their manners are much of a piece with those of the Egyptians already described. The subjects of the Barbary states, in general subsisting by piracy, are allowed to be bold intrepid mariners, and will fight desperately when they meet with a prize at sea. They are notwithstanding far inferior to the English, and other European states, both in the construction and management of their vessels. They are, if we except the Tunisines, void of all arts and literature. The misery and poverty of the inhabitants of Morocco, who are not immediately in the emperor's service, are beyond description; but those who inhabit the inland parts of the country are an hospitable inoffensive people; and indeed it is a general observation, that the more distant the inhabitants of those states are from the seats of their government, their manners are the more pure. Notwithstanding their poverty, they have a liveliness about them, especially those who are of the Arabic descent, that gives them an air of contentment; and having nothing to lose, they are peaceable among themselves. The Moors are supposed to be the original inhabitants, but are now blended with the Arabs, and both are cruelly oppressed by a handful of insolent domineering Turks, the refuse of the streets of Constantinople.

**DRESS.** The dress of these people is a linen shirt, over which they tie a silk or cloth vestment with a sash, and over that a loose coat. Their drawers are made of linen. The arms and legs of the wearer are bare, but they have slippers on their feet; and persons of condition sometimes wear buskins. They never move their turban, but pull off their slippers when they attend religious duties, or the person of their sovereign. They are fond of striped and fancied silks. The dress of the women is not very different from that of the men, but their drawers are longer,

longer, and they wear a sort of cawls on their heads instead of a turban. The chief furniture of their houses consists of carpets and mattresses, on which they sit and lie. In eating, their slovenliness is shocking. They are prohibited gold and silver vessels; and their meat, which they swallow by handfuls, is boiled or roasted to rags.

[RELIGION.] All foreigners are here allowed the open profession of their religion, but the inhabitants of these states are Mahomedans; and many subjects of Morocco follow the tenets of Hamed, a modern sectary, and an enemy to the ancient doctrine of the Califs. All of them have much respect for idiots; whose protection in some cases screens offenders from punishment. The Moors of Barbary, so called from Mauritania, the ancient name of their country, have adopted the very worst parts of the Mahomedan religion, and seem to have retained only as much of it as countenances their vices. Adultery in the women is punished with death; but though the men are indulged with a plurality of wives and concubines, they commit the most unnatural crimes with impunity.

[LANGUAGE.] As the states of Barbary possess those countries that formerly went by the name of Mauritania and Numidia, the ancient African language is still spoken in some of the inland countries, and even by some inhabitants of the city of Morocco. In the sea-port towns, and maritime countries, a corrupt kind of Arabic is spoken; and sea-faring people are no strangers to that medley of living and dead languages, Italian, French, Latin, &c. that is so well known in all the parts of the Mediterranean, by the name of *Lingua Franca*.

[ANTIQUEITIES AND CURIOSITIES.] This article is well worth the study of an antiquary, but the subjects of it are difficult of access, being scattered over a wide extent of country, inhabited by ignorant and inhospitable barbarians. The reader can scarcely doubt that the countries which contained Carthage, and the pride of the Phœnician, Greek, and Roman works, are replete with the most curious remains of antiquity. Some memorials of the Mauritania and Numidian greatness are still to be met with, and many ruins of cities which bear evidences of their ancient grandeur and populousness. Julia Casarea of the Romans was little inferior in magnificence to Carthage itself. A few of the aqueducts of Carthage are said to be still remaining, but no vestige of its walls\*. The same is the fate of Utica, famous for the retreat and death of Cato, and many other renowned cities of antiquity; and so over-run is the country with barbarism, that their very sites are not known, even by their ruins, amphitheatres, and other public buildings, which remain still in tolerable preservation. Besides those of classical antiquity, many Saracen monuments, of the most stupendous magnificence, are likewise found in this vast tract; these were erected under the Califs of Bagdad, and the ancient kings of the country, before it was subdued by the Turks, or reduced to its present form of government. Their walls form the principal fortifications in the country, both inland and maritime. We know of few or no natural curiosities belonging to this country, except its salt-pits, which in some places take up an area of six miles. Dr. Shaw mentions springs found here that are so hot as to boil a large piece of mutton very tender in a quarter of an hour.

\* Mr. Stanley, having had frequent opportunities of going over the remains, is of opinion that this celebrated city was about fifteen miles in circumference. There are three eminences, which are to many leaps of fine marble pounded together, and were in all probability, the sites of temples, and other distinguished buildings. He observes, that

the present buildings are not the remains of the ancient city destroyed by the Romans, who entirely raised it, and ploughed up the very foundations. They are the ruins of the city which was built on the site of the former, and which was destroyed by the Saracens in the beginning of the seventh century.

**CITIES AND PUBLIC BUILDINGS.]** Mention has already been made of Morocco, the capital of that kingdom, but now almost in ruins, the court having removed to Mequinez, a city of Fez, 30 miles distant, and very populous. Incredible things are recorded of the magnificent palaces in both cities; but the common people live in a dirty slovenly manner.

The city of Algiers is not above a mile and a half in circuit, though it is computed to contain near 120,000 inhabitants, 15,000 houses, and 107 mosques. Their public baths are large and handsomely paved with marble. The prospect of the country and sea from Algiers is very beautiful, being built on the declivity of a mountain; but the city, though for several ages it has braved some of the greatest powers in Christendom, could make but a faint defence against a regular siege. The Spaniards however attacked it in the year 1775, by land and by sea, but were repulsed with great loss, though they had near 20,000 foot and 2000 horse, and 47 king's ships of different rates, and 346 transports. In the year 1783 and 84, they renewed their attacks by sea to destroy the city and galleys, but after spending a quantity of ammunition, bombs, &c. were forced to retire without either its capture or extinction. The mole of the harbour is 500 paces in length, extending from the continent to a small island where there is a castle and large battery.

The kingdom of Tunis, which is naturally the finest of all these states, contains the remains of many noble cities, some of them still in good condition. The capital, about 30 miles south of old Carthage, has fortifications, and is about three miles in circumference. The streets (says Mr. Stanley) are narrow, as in most hot countries; and, not being paved, they are dirty in winter, and dusty in summer. The houses are not magnificent, but neat and commodious; most of them have a porch, or gateway, with benches on each side, covered with mats, where the master of the house transacts his business, and receives his friends; no persons, except on some extraordinary occasions, having any further admittance. Beyond this is an open court paved with marble stone, or glazed tiles, according to the ability of the owner, covered over, and sheltered from the sun and weather, by a cloth which by means of pulleys may be folded or unfolded at pleasure. When entertainments are given, the company meets in the court, which is always kept very clean. The public exchange for merchants and their goods is commodious.

Most of the water used in this city is rain-water, preserved in cisterns, into which it is conveyed by pipes from the roofs of the houses, which are all flat. These cisterns are so large, that they hold enough to serve the families five or six months. Almost every cistern has the base of a marble column hollowed out to cover the mouth; thousands of them being put to this use all over the country.

Meisa, two short miles from Carthage, and eleven from Tunis, is a very pleasant situation. Here the bey has two country-houses, one of which has been a costly work, built by Hassan Bey, surnamed the Good. From these houses are orange gardens, reaching almost to the sea-shore; on the edge of which is a famous well of sweet water, esteemed the best and lightest in the kingdom; and close to this a coffee-house. Numbers of people from the neighbouring places, resort here to drink coffee, and a glass of this natural luxury, so peculiarly enjoyed in the eastern countries; few persons, except those who have lived in hot climates, knowing the blessing of a good spring.

In the middle of the court is a large mulberry-tree, under the shade of which they sit and smoke, and play at chess, inhaling the comfortable sea-breeze, that refreshes this charming spot. Nothing can be more picturesque, than to see the Moors gallantly mounted, with their attendants, complimenting each other.

The water is drawn up by a camel, with the Persian wheel, and distributed to the neighbouring countries.

The city of Tripoli consists of an old and new town, the latter being the most flourishing; but never can make any considerable figure, on account of the inconveniencies attending its situation, particularly the want of sweet water. The city of Oran, lying upon this coast, is about a mile in circumference, and is fortified both by art and nature. It was a place of considerable trade, and the object of many bloody disputes between the Spaniards and the Moors. Constantina was the ancient Cirta, and one of the strongest cities in Numidia, being inaccessible on all sides, except the south-west.

Besides the above towns and cities, many others, formerly of great renown, lie scattered up and down this immense tract of country. The city of Fez, at present the capital of the kingdom so called, is said to contain near 300,000 inhabitants, besides merchants and foreigners. Its mosques amount to 500; one of them magnificent beyond description, and about a mile and a half in circumference. Mequinez is esteemed the great emporium of all Barbary. Salée was formerly famous for the piracy of its inhabitants. Tangier, situated about two miles within the straits of Gibraltar, was given by the crown of Portugal as part of the dowry of queen Catharine, consort of Charles II. of England. But the misunderstandings between that king and his parliament occasioned the demolition of its fortifications and harbour; so that from being one of the finest cities in Africa, it is now little better than a fishing town. Ceuta, upon the same strait, almost opposite to Gibraltar, is still in the hands of the Spaniards, but often, if not always, besieged or blocked up by the Moors. Tetuan, which lies within twenty miles of Ceuta, is now but an ordinary town, containing about 800 houses; but the inhabitants are said to be rich, and tolerably civilized in their manners.

The provinces of Suz, Taflet, and Gefula, form no part of the states of Barbary, though the king of Morocco pretends to be their sovereign: nor do they contain any thing that is particularly curious.

Zaara is a desert country, thinly peopled, and nearly destitute of both water and provisions.

**MANUFACTURES AND COMMERCE.]** The lower subjects of these states know very few imaginary wants, and depend partly upon their piracies to be supplied with necessary utensils and manufactures; so that their exports consist chiefly of leather, fine mats, embroidered handkerchiefs, sword-knots, and carpets, which are cheaper, and softer than those in Turkey, though not so good in other respects. As they leave almost all their commercial affairs to the Jews and Christians settled among them, the latter have established silk and linen works, which supply the higher ranks of their own subjects. They have no ships that, properly speaking, are employed in commerce; so that the French and English carry on the greatest part of their trade. Their exports, besides those already mentioned, consist of elephant's teeth, ostrich feathers, copper, tin, wool, hides, honey, wax, dates, raisins, olives, almonds, gum-arabic, and sandrac. The inhabitants of Morocco are likewise said to carry on a considerable trade by caravans to Mecca, Medina, and some inland parts of Africa, from whence they bring back vast numbers of negroes, who serve in their armies, and are slaves in their houses and fields.

In return for their exports, the Europeans furnish them with timber, artillery of all kinds, gunpowder, and whatever they want, either in their public or private capacities; the particulars of which are too many to specify. The duties paid by the English in the ports of Morocco, are but half those paid by other Europeans. It is a general observation, that no nation is fond of trading with these states, not only on account of their capricious despotism, but the villainy of their individuals, both natives and Jews, many of whom take all opportunities of cheating, and when detected are seldom punished.

It has often been thought surprising, that the Christian powers should suffer their marine to be insulted by those barbarians, who take the ships of all nations with whom they are not at peace, or rather, who do not pay them a subsidy either in money or commodities. We cannot account for this forbearance otherwise than by supposing, first, that no Christian power would be fond of seeing Algiers, and the rest of that coast, in possession of another; and, secondly, that nothing could be got by a bombardment of any of their towns, as the inhabitants would instantly carry their effects to their deserts and mountains, so that the benefit, resulting from the conquest, must be tedious and precarious.

**CONSTITUTION AND GOVERNMENT.]** In Morocco, government cannot be said to exist. The emperors have for some ages been parties, judges, and even executioners with their own hands, in all criminal matters; nor is their brutality more incredible than the submission with which their subjects bear it. In the absence of the emperor, every military officer has the power of life and death in his hand. Some vestiges, however, of the califate government still continue; for in places where no military officer resides, the mufti or high-priest is the fountain of all justice, and under him the cadis, or civil officers, act as our justices of the peace. Though the emperor of Morocco is not immediately subject to the Porte, yet he pays distant allegiance to the Grand Signor as the chief representative of Mahomed. What I have said of Morocco is applicable to Fez, both kingdoms being now under one emperor.

Though Algiers, Tunis, and Tripoli, have each of them a Turkish pasha or dey, who governs in the name of the Grand Signor, yet very little regard is paid to his authority. When a vacancy of the government happens, which it commonly does by murder, every soldier in the army has a vote in choosing the succeeding dey; and though the election is often attended with bloodshed, yet it is no sooner fixed than the new dey is cheerfully recognized and obeyed. It is true, he must be confirmed by the Porte; but this confirmation is a matter of mere form. The power of the dey is despotic; and the income of the dey of Algiers amounts to about 150,000*l.* a year, without greatly oppressing his subjects, who are very tenacious of their property. A detachment of the army of their states is annually sent into each province to collect the tribute from the Moors and Arabs; and the prizes taken at sea, sometimes equal the taxes laid upon the natives. These deys pay slight annual tributes to the Porte. When the Grand Signor is at war with a Christian power, he requires their assistance, as he does that of the king of Morocco; but he is obeyed only as they think proper. Subordinate to the deys are officers, both military and civil; and in all matters of importance, the dey is expected to take the advice of a common council, which consists of thirty pashas. These pashas seldom fail of forming parties among the soldiers, against the reigning dey, whom they make no scruple of assassinating, even in council; and the strongest candidate then fills his place. Sometimes he is deposed; sometimes, though but very seldom, he resigns his authority to save his life.

**REVENUES.]** Those of Algiers, already mentioned, are now said to be exceeded by Tunis. They consist of a certain proportion of the prizes taken from Christians, a small capitation tax, and the customs paid by the English, French, and other nations, who are suffered to trade with those states. As to the king of Morocco, we can form no ideas of his revenues, because none of his subjects can be said to possess any property. From the manner of his living, his attendance and appearance, we may conclude he does not abound in riches. The ransoms of Christian slaves are his perquisites. He sometimes shares in the vessels of the other states, which entitles him to a part of their prizes. He claims a tenth of the goods of his Mahomedan subjects, and six crowns a year from every Jew merchant. He has

likewise considerable profits in the Negroland and other caravans, especially the slave-trade towards the south. It is thought that the whole of his ordinary revenue, in money, does not exceed 165,000*l.* a year.

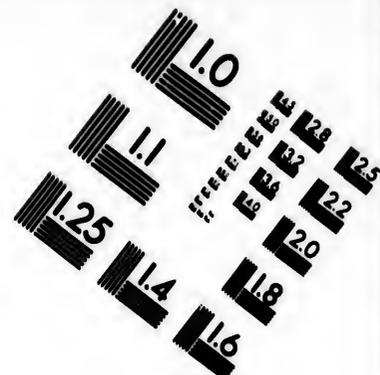

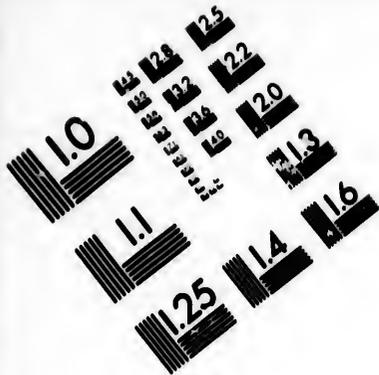

**MILITARY STRENGTH.]** The king of Morocco can bring to the field 100,000 men at sea and land. The strength of this army consists of cavalry mounted by his negro slaves. These wretches are brought young to Morocco, know no other state but servitude, and no other master but their king, and prove the firmest support of his tyranny. About the year 1727, all the naval force of Morocco consisted only of three small ships, which lay at Sallee, and, being full of men, sometimes brought in prizes. The Algerines maintain about 6500 foot, consisting of Turks, and cogolies, or the sons of soldiers. Part of them serve as marines on board their vessels. About 1000 of them do garrison duty, and part are employed in fomenting differences among the neighbouring Arab princes. Besides these, the dey can bring 2000 well disciplined Moorish horse into the field, and the deys of all the other Barbary states keeping up a proportional force, they have ventured jointly to refuse sending any tribute to the Turkish emperor, who seems to be satisfied with the shadow of obedience which they pay him.

It is very remarkable, that though the Carthaginians, who inhabited this very country of Barbary, had greater fleets and a more extensive commerce than any other nation, or than all the people upon the face of the earth, when that state flourished, the present inhabitants have scarcely any merchant-ships belonging to them, or indeed any other than what Sallee, Algiers, Tunis, and Tripoli fit out for piracy; which, though increased since the last attack of the Spaniards, are now but few and small, and some years ago did not exceed six ships from thirty-six to fifty guns. The admiral's ship belongs to the government; the other captains are appointed by private owners, but subject to military law. With such a contemptible fleet, these infidels not only harrass the nations of Europe, but oblige them to pay a kind of tribute by way of presents.

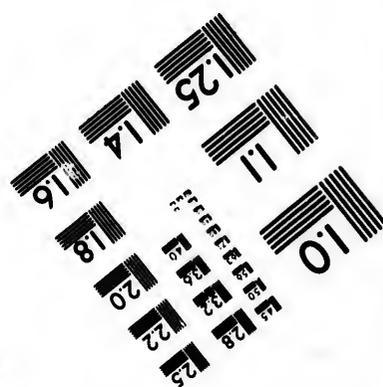

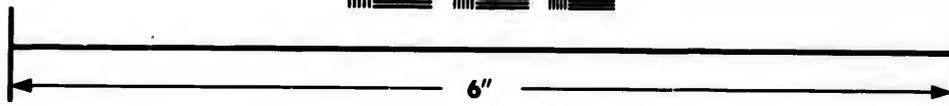

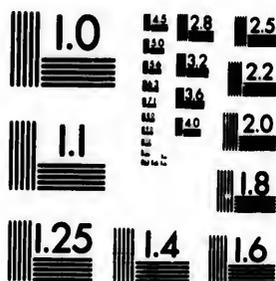

**HISTORY.]** Under the Roman emperors, the states formed the fairest jewel in the imperial diadem. It was not till the seventh century that, after these states had been by turns in possession of the Vandals and the Greek emperors, the Saracenic subjects of Bagdad conquered them, and from thence became masters of almost all Spain, from whence their posterity was totally driven about the 1492, when the exiles settled among their friends and countrymen on the Barbary coast. This naturally begot a perpetual war between them and the Spaniards, who pressed them so hard, that they called to their assistance the two famous brothers Barbarossa, who were admirals of the Turkish fleet, and who, after breaking the Spanish yoke, imposed upon the inhabitants of all those states (excepting Morocco) their own. Some attempts were made by the emperor Charles V. to reduce Algiers and Tunis, but they were unsuccessful; and, as already observed, the inhabitants have in fact shaken off the Turkish yoke likewise.

The emperors or kings of Morocco are the successors of those sovereigns of that country who were all called xeriffs, and whose powers resembled that of the califate of the Saracens. They have been in general a set of bloody tyrants; though they have had among them some able princes, particularly Muley Moluc, who defeated and killed Don Sebastian, king of Portugal. They have lived in almost a continual state of warfare with the kings of Spain and other Christian princes ever since: nor does the crown of Great Britain sometimes disdain, as in the year 1769, to purchase their friendship with presents.

## SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 903 } Breadth 900 }	between { 6 and 20 north latitude. } 26 and 44 east longitude. }	378,000

**BOUNDARIES.]** It is bounded on the north by the kingdom of Sennaar, or Nubia; on the east, partly by the Red Sea, and partly by Dancala; on the west by Gorham; and on the south by the kingdom of Gingiro, and Alaba.

It contains (according to Mr. Bruce, from whom the subsequent account is taken) the following provinces; viz. 1. Mafuah; 2. Tigre; 3. Samen; 4. Begemder; 5. Amhara; 6. Walakz; 7. Gojam; 8. Damot; 9. Maitshia; 10. Dembea; 11. Kuara; 12. Nara.

**AIR AND SEASONS.]** The rainy season continues for six months of the year, from April to September, which is succeeded, without interval, by a cloudless sky, and vertical sun; and cold nights, which as immediately follow these scorching days. The earth, notwithstanding the heat of these days, is yet perpetually cold, so as to feel disagreeably to the soles of the feet; partly owing to the six months rains, when no sun appears, and partly to the perpetual equality of nights and days.

**QUADRUPEDS.]** There is no country in the world which produces a greater number or variety of quadrupeds, whether tame or wild, than Abyssinia. Of the tame or cow-kind, great abundance present themselves every where, differing in size, some having horns of various dimensions, some without horns at all. The female buffalo is the only animal kept for giving milk in Egypt. And though apparently these are of the same species, and came originally from Ethiopia, their manners are so entirely changed by their migration, difference of climate or of food, that without the exertion of any art to tame them, they are milked, conducted to and fro, and governed by children of ten years old without apprehension, or any unlucky accident having ever happened.—Of horses also there is a sufficient quantity in this part of the continent of Africa.

Among the wild animals are prodigious numbers of the gazel or antelope kind; the bohur, fassa, fcelho, and madequa, and many others. Hyenas are still more numerous. There are few varieties of the dog or fox kind. Of these the most numerous is the deep, or, as he is called, the jackal; this is precisely the same in all respects as the deep of Barbary and Syria, who are heard hunting in great numbers, and howling in the evening and morning. The wild boar, smaller and smoother in the hair than that of Barbary or Europe, but differing in nothing else, is met frequently in swamps or banks of rivers covered with wood.

The elephant, rhinoceros, giraffa, or camelopardalis, are inhabitants of the low hot country; nor is the lion, leopard, or faadh, which is the panther, seen in the high and cultivated country. The hippopotamus and crocodile abound in all the rivers, not only of Abyssinia, but as low down as Nubia and Egypt. There are many of the ass kind in the low country towards the frontiers of Atbara, but no zebras; these are the inhabitants of Fazucllo, and Narea.

But of all the other quadrupeds, there is none exceeds the hyana, for its merciless

cilefs ferocity. They were a plague, says our author, speaking of these animals, in Abyssinia, in every situation, both in the city and in the field, and, I think, surpassed the sheep in number. Gondar was full of them from the time it turned dark till the dawn of day, seeking the different pieces of slaughtered carcases which this cruel and unclean people expose in the streets without burial.

It is a constant observation in Numidia, that the lion avoids and flies from the face of man, till by some accident they have been brought to engage, and the beast has prevailed against him; then that feeling of superiority, imprinted by the Creator in the heart of all animals for man's preservation, seems to forsake him. The lion, having once tasted human blood, relinquishes the pursuit after the flock. He repairs to some highway or frequented path, and has been known, in the kingdom of Tunis, to interrupt the road to market for several weeks; and in this he persists till hunters or soldiers are sent out to destroy him.

The hunting of the elephant, rhinoceros, &c. being one of the amusements of the natives, we shall give the reader a brief account of this dangerous sport. Two men, absolutely naked, get on horseback; this precaution is from fear of being laid hold of by the trees or bushes, in making their escape from a very watchful enemy. One of these riders sits upon the back of the horse, sometimes with a saddle, and sometimes without one, with only a switch or short stick in one hand, carefully managing the bridle with the other; behind him sits his companion, who has no other arms but a broad-sword, such as is used by the Sclavonians, and which is brought from Trieste.

As soon as the elephant is found feeding, the horseman rides before him as near his face as possible; who, chafed and angry, seeks to seize him with his proboscis, and follows the horse every where. After having made him turn once or twice, the horseman drops his companion; and, while he engages the elephant's attention upon the horse, the footman behind gives him a drawn stroke just above the heel, or what in man is called the tendon of Achilles. If the sword is good, and the man not afraid, the tendon is commonly entirely separated; and if it is not cut through, it is generally so far divided, that the animal, with the stress he puts upon it, breaks the remaining part asunder. In either case he remains incapable of advancing a step, till the horseman returning, or his companions coming up, pierce him through with javelins and lances; he then falls to the ground, and expires with the loss of blood.

Though the rhinoceros runs with surprising speed, considering his bulk, he is, in a very little time, transfixt with thirty or forty javelins, which so confound him that he sometimes runs into a ditch, without outlet, breaking about a dozen of the javelins as he enters. Here he is caught as in a trap, having scarce room to turn; when a servant, with a gun, standing directly over him, fires at his head, and the animal is thus killed.

**BIRDS.]** The number of birds in Abyssinia exceeds that of other animals beyond proportion. The high and low countries are equally stored with them: the first kind are the carnivorous birds. Many species of the eagle and hawk, many more still of the vulture kind, as it were overstock all parts of the country. That species of glede, called Haddaya, so frequent in Egypt, comes very punctually into Ethiopia, at the return of the sun, after the tropical rains.

The Nisser, or golden eagle, is not only the largest of the eagle-kind, but one of the largest birds that flies. From wing to wing he is eight feet four inches. The black eagle, Rachamah, Erkoom, Moroc, Sheregrig, and Waalia, are particularly described by the historian of Abyssinia, to whose celebrated work we refer the reader who is desirous of information concerning them.

There is no great plenty of water-fowl in Abyssinia, especially of the web-footed kind. Vast variety of storks cover the plains in May, when the rains become constant. All the deep and grassy bogs have snipes in them; and swallows there are of many kinds unknown in Europe; those that are common in Europe appear in passage at the very season when they take their flight from thence. There are few owls; but these are of an immense size and beauty. There are no geese, wild or tame, excepting what is called the golden goose, goose of the Nile, or goose of the cape, common in all the south of Africa: these build their nest upon trees, and when not in water, generally sit upon them.

**INSECTS.]** From the class of insects, we shall select the most remarkable, viz. the Tsaltfalya or fly, which is an insect that furnishes a striking proof how fallacious it is to judge by appearances. If we consider its small size, its weakness, want of variety or beauty, nothing in the creation is more contemptible or insignificant. Yet passing from these to his history, and to the account of his powers, we must confess the very great injustice we do him from want of consideration. We are obliged with the greatest surprize to acknowledge, that those huge animals, the elephant, the rhinoceros, the lion, and the tiger, inhabiting the same wood, are still vastly his inferiors, and that the appearance of this small insect, nay, his very sound, though he is not seen, occasions more trepidation, movement and disorder, both in the human and brute creation, than would whole herds of these monstrous animals collected together, though their number was in a tenfold proportion greater than it really is.

This insect has not been described by any naturalist. It is in size very little larger than a bee, of a thicker proportion. As soon as this plague appears, and their buzzing is heard, all the cattle forsake their food, and run wildly about the plain, till they die, worn out with fatigue, fright and hunger. No remedy remains but to leave the black earth, and hasten down to the sands of Atbara; and there they remain while the rains last; this cruel enemy never daring to pursue them farther. Though the size of the camel is immense, his strength vast, and his body covered with a thick skin, defended with strong hair, yet still he is not capable to sustain the violent punctures the fly makes with his pointed proboscis. He must lose no time in removing to the sands of Atbara; for when once attacked by this fly, his body, head, and legs break out into large bosses, which swell, break, and putrefy, to the certain destruction of the creature.

**VEGETABLE PRODUCTIONS.]** The *Papyrus*, which is a plant well known in Egypt, appears to have been early brought thither from Ethiopia. It is also found in Abylinia. *Balestan*, *Balm*, or *Balsam* is also a native of this country. The great value, set upon this drug in the east, remounts to very early ages. We know from scripture, the oldest history extant, as well as the most infallible, that the Ishmaelites, or Arabian carriers and merchants, trafficking with the India commodities into Egypt, brought with them balm as part of the cargo; for we are told that "a company of Ishmaelites came from Gilead, with their camels, bearing spicery, and balm, and myrrh, going to carry it down into Egypt\*." At this time it probably acquired its name of Balm of Gilead.—The *Eufete* is an herbaceous plant, which grows and comes to great perfection at Gondar, but it most abounds in that part of Mattha and Goutto west of the Nile, where there are large plantations of it, and is there, almost exclusive of every thing else, the food of the Galla inhabiting that province. The *Teff* is a grain commonly sown; and it seems to thrive equally on all sorts of ground; from it is made the bread which is commonly used

\* Gen. xxxvii. 25.

through-

throughout this country. The Abyssinians indeed have plenty of wheat, and some of it of an excellent quality. They likewise make as fine wheat-bread as any in the world, both for colour and taste; but the use of wheat-bread is chiefly confined to people of the first rank. The acacia tree is very common in Abyssinia, as are several other curious productions of the vegetable world, many of which are described in the Appendix of our author, and illustrated by many elegant engravings, which will afford a very great entertainment to the curious botanist.

**LAKES.]** The lake of Tzana (not to mention those of Gooderoo, and Court Ohha) is by much the largest expanse of water known in this country. Its extent, however, has been greatly exaggerated. Its greatest breadth is thirty-five miles, and its length is forty-nine. The Nile, by a current always visible, crosses the end of it. In the dry months from October to March, the lake shrinks greatly in size: but after that all those rivers are full which are on every side of it, and fall into the lake, like radii drawn to a centre, then it swells, and extends itself into the plain country, and has of course a much larger surface.

There are about eleven inhabited islands in the lake. All these islands were formerly used as prisons for the great people, or for a voluntary retreat, on account of some disgust or great misfortune, or as places of security to deposit their valuable effects during troublesome times.

**CATARACTS OF THE NILE.]** Omitting those of inferior note, we shall here give the reader some account of the great cataract of Alata, which was the most magnificent sight that Mr. Bruce ever beheld. The height has been rather exaggerated. The missionaries say the fall is about fifty feet. The measuring is, indeed very difficult; but, by the position of long sticks, and poles of different lengths, at different heights of the rock, from the water's edge, Mr. Bruce thinks he may venture to say that it is nearer forty feet than any other measure. The river had been considerably increased by rains, and fell in one sheet of water, without any interval, above half an English mile in breadth, with a force and noise that was truly terrible, and which stunned, and made him, for a time, perfectly dizzy. A thick fume, or haze, covered the fall all round, and hung over the course of the stream both above and below, marking its tract, though the water was not seen. The river, though swelled with rain, preserved its natural clearness, and fell, as far as he could discern, into a deep pool, or basin, in the solid rock, which was full, and in twenty different eddies to the very foot of the precipice, the stream, when it fell, seeming part of it to run back with great fury upon the rock, as well as forward in the line of its course, raising a violent ebullition, by chaffing against each other.

**SOURCES OF THE NILE.]** The Agows of Damot pay divine honour to the Nile; they worship the river, and thousands of cattle have been offered, and still are offered, to the spirit supposed to reside at its source. The village of Geeth, though not farther distant than 600 yards, is not in sight of the sources of the Nile. In the middle of a marsh, near the bottom of the mountain of Geeth, arises a hillock of a circular form, about three feet from the surface of the marsh itself, though apparently founded much deeper in it. The diameter of this is something short of twelve feet: it is surrounded by a shallow trench, which collects the water, and voids it eastward; it is firmly built with sod or earthen turf, brought from the sides, and constantly kept in repair; and this is the altar upon which all their religious ceremonies are performed. The mouth, or opening of the source, is some parts of an inch less than three feet diameter, and the water stood about two inches from the lip or brim. This spring is about six feet six inches deep.

Ten feet distant from the first, a little to the west or south, is the second fountain, about eleven inches in diameter; but eight feet three inches in depth. And about twenty feet distant from the first is the third source, its mouth being something

more than two feet large, and it is five feet eight inches deep. With a brass quadrant of three feet radius, he found the latitude to be  $10^{\circ} 59' 25''$  in round numbers, for the exact latitude of the principal fountain of the Nile, though the Jesuits have supposed it  $12^{\circ}$  N. by a random guess. The longitude he ascertained to be  $36^{\circ} 55' 30''$  east of the meridian of Greenwich.

**CAUSES OF THE INUNDATION** } The sun being nearly stationary for some days  
OF THE NILE. } in the tropic of Capricorn, the air there becomes so much rarefied, that the heavier winds, charged with watery particles, rush in upon it from the Atlantic on the west, and from the Indian Ocean on the east. Having thus gathered such a quantity of vapours as it were to a focus, the sun now puts them in motion, and drawing them after it in its rapid progress northward, on the 7th of January, for two years together, seemed to have extended its power to the atmosphere of Gondar, when, for the first time, there appeared in the sky white, dappled, thin clouds, the sun being then distant  $34^{\circ}$  from the zenith, without any one cloudy or dark speck having been seen for several months before. Advancing to the line with increased velocity, and describing larger spirals, the sun brings on a few drops of rain at Gondar the first of March, being then distant  $5^{\circ}$  from the zenith; these are greedily absorbed by the thirsty soil, and this seems to be the farthest extent of the sun's influence, capable of causing rain, which then only falls in large drops, but lasts but a few minutes: the rainy season, however, begins most seriously upon his arrival at the zenith of every place, and these rains continue constant and increasing after he has passed it, in his progress northward.

In April, all the rivers in Amhara, Begemder, and Lasta, first discoloured, and then beginning to swell, join the Nile in the several parts of its course nearest them; the river then, from the height of its angle of inclination, forces itself through the stagnant lake without mixing with it. In the beginning of May, hundreds of streams pour themselves from Gojam, Damot, Maittha, and Dembea, into the lake Tzana, which had become low by intense evaporation, but now begins to fill insensibly, and contributes a large quantity of water to the Nile, before it falls down the cataract of Alata. In the beginning of June, the sun, having now passed all Abyssinia, the rivers there are all full; and then is the time of the greatest rains in Abyssinia, while he is for some days, as it were, stationary in the tropic of Cancer.

Immediately after the sun has passed the line, he begins the rainy season to the southward, still as he approaches the zenith of each place; but the situation and necessities of this country being varied, the manner of promoting the inundation is changed. A high chain of mountains runs from about  $6^{\circ}$  south all along the middle of the continent towards the Cape of Good Hope, and intersects the southern part of the peninsula, nearly in the same manner that the river Nile does the northern. A strong wind from the south, stopping the progress of the condensed vapours, dashes them against the cold summits of this ridge of mountains, and forms many rivers which escape in the direction either east or west, as the level presents itself. If this is towards the west, they fall down the sides of the mountains into the Atlantic, and if on the east, into the Indian Ocean.

**CITIES AND TOWNS.**] **GONDAR**, the metropolis of Abyssinia, is situated upon a hill of considerable height, the top of it nearly plain, on which the town is placed. It consists of about ten thousand families in time of peace; the houses are chiefly of clay, the roofs thatched in the form of cones, which is always the construction within the tropical rains. On the west end of the town is the king's house, formerly a structure of considerable consequence. It was a square building, flanked with square towers. It was formerly four stories high, and, from the top of it, had a magnificent view of all the country southward to the lake Tzana. Great part of this house is now in ruins, having been burnt at different times; but there is still

ample lodging in the two lowest floors of it, the audience chamber being above one hundred and twenty feet long.

The palace and all its contiguous buildings are surrounded by a substantial stone wall thirty feet high, with battlements upon the outer wall, and a parapet roof between the outer and inner, by which you can go along the whole, and look into the street. There appears not ever to have been any embrasures for cannon, and the four sides of the wall are above an English mile and a half in length. Gondar, by a number of observations of the sun and stars, made by day and night, in the course of three years, with an astronomical quadrant of three feet radius, and two excellent telescopes, and by a mean of all their small differences, is in N. lat.  $12^{\circ} 34' 30''$ ; and by many observations of the satellites of Jupiter, especially the first, both in their immersions and emersions during that period, its longitude is  $37^{\circ} 33' 0''$  east from the meridian of Greenwich.

DIXAN is the first town in Abyssinia, on the side of Taranta; it is built on the top of a hill, perfectly in form of a sugar loaf; a deep valley surrounds it every where like a trench, and the road winds spirally up the hill till it ends among the houses. It is true of Dixan, as of most frontier towns, that the bad people of both contiguous countries resort thither. The town consists of Moors and Christians, and is very well peopled; yet the only trade of these sects is a very extraordinary one, that of selling children. The Christians bring such as they have stolen in Abyssinia, to Dixan as to a sure deposit; and the Moors receive them there, and carry them to a certain market at Masuah, whence they are sent over to Arabia, or India. The priests of the province of Tigre, especially those near the rock Damo, are openly concerned in this infamous practice. Dixan is in lat.  $14^{\circ} 57' 55''$  north, and long.  $40^{\circ} 7' 30''$  east of the meridian of Greenwich.

AXUM is supposed to have been once the capital of Abyssinia, and its ruins are now very extensive; but, like the cities of ancient times, consist altogether of public buildings. In one square, which seems to have been the centre of the town, there are forty obelisks, none of which have any hieroglyphics upon them. They are all of one piece of granite, and, on the top of that which is standing, there is a *patena* exceedingly well carved in the Greek taste. Axum is watered by a small stream, which flows all the year from a fountain in the narrow valley, where stand the rows of obelisks. The spring is received into a magnificent basin of 150 feet square, and thence it is carried at pleasure, to water the neighbouring gardens, where there is little fruit excepting pomegranates; neither are these very excellent. The latitude of this town is  $14^{\circ} 6' 36''$  north.

MASUAH. The houses of this town, which is situated upon an island bearing the same name, on the Abyssinian shore of the Red Sea, are, in general, built of poles and bent grass, as in the towns of Arabia; but besides these, there are about twenty of stone, six or eight of which are two stories each. N. lat.  $15^{\circ} 35' 5''$  E. lon.  $39^{\circ} 36' 30''$ .

[TRADE AND COMMERCE.] There is a considerable deal of trade carried on at Masuah, narrow and confined as the island is, and violent and unjust as is the government. But it is all done in a slovenly manner, and for articles where a small capital is invested. Property here is too precarious to risk a venture in valuable commodities, where the hand of power enters into every transaction.

Gondar, and all the neighbouring country, depend for the necessaries of life, cattle, honey, butter, wheat, hides, wax, and a number of such articles, upon the Agows, who inhabit a province in which the sources of the Nile are found, and which province is no where sixty miles in length, nor half that in breadth. These Agows come constantly in succession, a thousand or fifteen hundred at a time, loaded with these commodities, to the capital.

It may naturally occur, that, in a long carriage, such as that of a hundred miles, in such a climate, butter must melt, and be in a state of fusion, consequently very near putrefaction: this is prevented by the root of an herb, called Moc-moco, yellow in colour, and in shape nearly resembling a carrot; this they bruise and mix with their butter, and a very small quantity preserves it fresh for a considerable time.

RELIGION.] Mr. Bruce informs us from the annals of Abyssinia, that, in the time of Solomon, all this country was converted to Judaism, and the government of the church and state modelled according to what was then in use at Jerusalem.

Some ecclesiastical writers, rather from attachment to particular systems, than from any conviction that the opinion they espouse is truth, would persuade us that the conversion of Abyssinia to Christianity happened in the days of the Apostles; but it appears that this was effected by the labours of Frumentius (the apostle of the Abyssinians) in the year of Christ 333, according to our account.

Their first bishop, Frumentius, being ordained about the year 333, and instructed in the religion of the Greeks of the church of Alexandria, by St. Athanasius, then sitting in the chair of St. Mark, it follows that the true religion of the Abyssinians, which they received on their conversion to Christianity, is that of the Greek church. They receive the holy sacrament in both kinds, in unleavened bread, and in the grape bruised with the husk together as it grows, so that it is a kind of marmalade, and is given in a flat spoon. They observe also circumcision.

HISTORY.] As the accounts of kings and princes of remote ages are much involved in fable, and as the history of so barbarous and uncivilized a people will, we presume, afford but small amusement, we shall therefore make no apology for omitting the annals of Abyssinia, but refer our readers to the second volume of Bruce's Travels.

### FEZZAN, BORNOU, AND CASHNA.

IT having been long a subject of lamentation that Europeans know very little, if any thing, of the interior districts of Africa, we are happy to find that a number of learned and opulent individuals have formed themselves into a society for the purpose of exploring them. The association was formed on the ninth of June, in the year 1788; and on the same day a committee of its members, viz. *lord Rawdon, the bishop of Landaff, sir Joseph Banks, Mr. Beaufoy, and Mr. Stuart*, were invested with the direction of its funds, the management of its correspondence, and the choice of the persons to whom the geographical mission was to be assigned. Persuaded of the importance of the object which the association had in view, their committee lost no time in executing the plan which it had formed. Two gentlemen were recommended to them; and appearing to be eminently qualified for making the projected researches, they were chosen. One was *Mr. Ledyard*; the other *Mr. Lucas*. Mr. Ledyard's history, which pointed him out to the society as a proper person for undertaking the African adventure, is too curious to be omitted.

Mr. Ledyard was an American by birth, and seemed from his youth to have felt an invincible desire to explore the unknown or imperfectly discovered regions of the globe. For several years he had lived with the Indians of America, had studied their manners, and had practised in their school the means of obtaining the protection, and of recommending himself to the favour of savages. In the humble situation of a corporal of marines, to which he submitted, rather than relinquish his pursuit, he had made, with captain Cook, the voyage of the world; and feeling on

his

his return an anxious desire of penetrating from the north-western coast of America, which Cook had partly explored, to the eastern coast, with which he himself was perfectly familiar, he determined to traverse the vast continent from the Pacific to the Atlantic Ocean.

His first plan for the purpose was that of embarking in a vessel, which was then preparing to sail on a voyage of commercial adventure to Nootka Sound, on the western coast of America; and with this view he expended in sea-stores the greatest part of the money which his chief benefactor, sir Joseph Banks (whose generous conduct he often acknowledged), had liberally supplied. But the scheme being frustrated by the rapacity of a custom-house officer, who had seized and detained the vessel, for reasons, which, on legal inquiry, proved to be frivolous, he determined to travel over land to Kamtschatka, from whence, to the western coast of America, the passage is extremely short. With no more than ten guineas in his purse, which was all that he had left, he crossed the British Channel to Ostend, and, by the way of Denmark and the Sound, proceeded to the capital of Sweden, from which, as it was winter, he attempted to traverse the gulph of Bothnia on the ice, in order to reach Kamtschatka by the shortest way; but finding, when he came to the middle of the sea, that the water was not frozen, he returned to Stockholm, and taking his course northward, walked into the arctic circle; and passing round the head of the gulph, descended on its eastern side to Peterburgh.

There he was noticed as an extraordinary man. Without stockings, or shoes, and in too much poverty to provide himself with either, he received and accepted an invitation to dine with the Portuguese ambassador. To this invitation it was probably owing that he was able to obtain the sum of twenty guineas for a bill on sir Joseph Banks, which he confessed he had no authority to draw, but which, in consideration of the business that he had undertaken, and of the progress that he had made, sir Joseph, he believed, would not be unwilling to pay. To the ambassador's interest it might also be owing that he obtained permission to accompany a detachment of stores which the empress had ordered to be sent to Yakutz, for the use of Mr. Billings, an Englishman, at that time in her service.

Thus accommodated, he travelled eastward through Siberia six thousand miles, to Yakutz, where he was kindly received by Mr. Billings, whom he remembered on board captain Cook's ship, in the situation of the astronomer's servant, but to whom the empress had now entrusted her schemes of northern discovery.

From Yakutz he proceeded to Oczakow, on the coast of the Kamtschatka sea, from whence he meant to have passed over to that peninsula, and to have embarked on the eastern side in one of the Russian vessels that trade to the western shores of America; but finding that the navigation was completely obstructed by the ice, he returned again to Yakutz, in order to wait for the conclusion of the winter.

Such was his situation, when, in consequence of suspicions not hitherto explained, or resentments for which no reason is assigned, he was seized, in the empress's name, by two Russian soldiers, who placed him in a sledge, and conveying him, in the depth of winter, through the deserts of the Northern Tartary, left him at last on the frontiers of the Polish dominions.

As they parted, they told him, that if he returned to Russia, he would certainly be hanged; but that, if he chose to go back to England, they wished him a pleasant journey.

In the midst of poverty, covered with rags, infested with the usual accompaniments of such cloathing, worn with continued hardship, exhausted by disease, without friends, without credit, unknown and full of misery, he found his way to Koenigsberg.—There, in the hour of his utmost distress, he resolved once more to have recourse

recourse to his old benefactor, and luckily he found a person who was willing to take his draft for five guineas, on the president of the Royal Society.

With this assistance he arrived in England, and immediately waited on sir Joseph Banks, who told him, knowing his temper, that he believed he could recommend him to an adventure almost as perilous as the one from which he had returned; and communicated to him the wishes of the Association for discovering the inland countries of Africa.

Ledyard replied, that he had always determined to traverse the continent of Africa, as soon as he had explored the interior of North America; and as sir Joseph had offered him a letter of introduction, he came directly to the writer of these memoirs\*. Before I had learnt from the note, the name and business of my visitor, I was struck with the manliness of his person, the breadth of his chest, the openness of his countenance, and the inquietude of his eye. I spread the map of Africa before him, and tracing a line from Cairo to Senaar, and from thence westward, in the latitude and supposed direction of the Niger, I told him that was the route by which I was anxious that Africa might, if possible, be explored. He said, he should think himself singularly fortunate to be entrusted with the adventure. I asked him, when he would set out? "To-morrow morning," was his answer. I told him I was afraid that we should not be able, in so short a time, to prepare his instructions, and procure for him the letters that were requisite; but that, if the committee should approve of his proposal, all expedition should be used.

Mr. Lucas's history, being less singular than that of Mr. Ledyard, is told with more brevity: but enough is said to satisfy every reader respecting his qualifications. He had been sent, when a boy, to Cadiz, in Spain, for education as a merchant, and having the misfortune on his return to be captured by a Saltee rover, was brought as a slave to the imperial court of Morocco. Three years of captivity preceded his restoration to freedom and his consequent departure from Gibraltar, where, at the request of general Cornwallis, he accepted the offices of vice-consul and chargé d'affaires in the empire of Morocco, and had the satisfaction to return, as the delegate of his sovereign, to the very kingdom, in which, for a long period, he had lived as a slave. At the end of sixteen years, he once more revisited England, and was soon appointed Oriental interpreter to the British court; in which situation he was, when he became known to the committee, and expressed his willingness, with his majesty's permission, to undertake, in the service of the Association, whatever journey his knowledge of the manners, customs, and language, of the Arabs might enable him to perform.

From two such geographical missionaries (observes a very respectable literary journalist †) much information was no doubt expected; and, though the views of the society are not yet fully answered, the communications which it has received, are of a nature which will excite, though not fully gratify, the curiosity of geographers.

Mr. Ledyard undertook, at his own desire, the difficult and perilous task of traversing from east to west, in the latitude attributed to the Niger, the widest part of the continent of Africa. On this bold adventure, he left London, June 30, 1788, and arrived at Cairo on the 19th of August.

Such was the information which he collected here from the travelling slave-merchants, and from others, respecting the interior districts of Africa, that he was impatient to explore them. He wrote to the committee, that his next communication would be from Senaar, (600 miles to the south of Cairo): but death,

\* Mr. Beaufoy.

attributed to various causes, arrested him at the commencement of his researches, and disappointed the hopes which were entertained of his projected journey.

Endowed with a soul for discovery, and formed, by nature, for achievements of hardihood and peril, the death of Ledyard must be considered as a public misfortune. Ladies, as well as philosophers, will lament him; especially, when they read his character of the sex, which, conceiving it to be just, we shall here insert.

"I have always remarked that women, in all countries, are civil, obliging, tender and humane; that they are ever inclined to be gay and cheerful, timorous and modest; and that they do not hesitate like men to perform a generous action. Not haughty, not arrogant, not supercilious, they are full of courtesy, and fond of society; more liable, in general, to err than man, but, in general, also, more virtuous, and performing more good actions than he. To a woman, whether civilised or savage, I never addressed myself in the language of decency and friendship, without receiving a decent and friendly answer. With men it has been otherwise.

"In wandering over the barren plains of inhospitable Denmark, through honest Sweden, and frozen Lapland, rude and churlish Finland, unprincipled Russia, and the wide-spread regions of the wandering Tartar; if hungry, dry, cold, wet, or sick, the women have ever been friendly to me, and uniformly so; and to add to this virtue, (so worthy the appellation of benevolence) these actions have been performed in so free, and so kind a manner, that if I was dry, I drank the sweetest draught, and if hungry, I eat the coarse morsel with a double relish."

"With a mixture of regret and disappointment, we turn from poor Ledyard, to notice Mr. Lucas's communications, which occupy the greatest part of the volume published by the Association. He embarked for Tripoli, October 18, 1788, with instructions to proceed over the desert of Zahara to Fezzan, to collect and to transmit by way of Tripoli whatever intelligence the people of Fezzan, or the traders thither, might be able to afford respecting the interior of the continent; and to return by the way of Gambia, or the coast of Guinea.

"Instructions to undertake great enterprizes are more easily given than executed. So Mr. Lucas found; and so the reader, to his disappointment, will find likewise. Only a part of the plan was this geographic missionary able to carry into execution. He sets out, indeed, mounted on a handsome mule presented to him by the Bey, the bathaw's eldest son, in company with three, for the kingdom of Fezzan; resolved, we will suppose, to penetrate from Tripoli even unto Gambia; but his peregrinations, which began Feb. 1, 1789, terminated at Mefurata, on Feb. 7.

"Deprived of visiting Fezzan, and the other inland districts of Africa, Mr. Lucas solicits the information of his fellow travellers, and transmits to the society the result of his conferences. A memoir compiled in this way, from the reports of a Sherreef Inhammed, will not be deemed very satisfactory, and yet it certainly merits consideration, as it is, in part, corroborated by other testimonies †.

"The Sherreef might not mean to deceive; and yet, in consequence of his education, and particular prejudices, on account of the language which he used, and of not properly distinguishing between vague report and attested facts, we may be allowed to question whether things exactly accord with this relation before us. The Aga Mohammed told Mr. Ledyard, "That he would see in his travels, a people who had the power of transmuting themselves into the forms of different animals," p. 28; and hence it is fair to infer, that no absolute dependence is to be placed on

\* Proceedings of the African Association, p. 44.

† The governor of Mefurata, and Ben Alli, a native of Morocco. This, however, is the same sort of evidence. No European has yet confirmed it; and as for the governor of Mefurata, he was not separately interrogated, but only had the me-

morandums, which were taken from the Sherreef, read to him; the truth of which, however, he confirms. As for Ben Alli's testimony, it is given from recollection, impaired by the lapse of twenty years.

the accuracy of the Mohammedan narrative of the interior districts of this quarter of the globe\*."

Having no other sources of information, however, we must, for the present, content ourselves with these communications. From the various conferences of Mr. Lucas with the Shereef Imhammed, the following narrative is composed:

"It describes the kingdom of Fezzan to be a small circular domain, placed in a vast wilderness, as an island in the midst of the ocean, containing near an hundred towns and villages, of which Mourzouk is the capital; distant, south, from Mesurata, about 390 miles. In this kingdom are to be seen some venerable remains of ancient magnificence, some districts of remarkable fertility, and numerous smoking lakes, producing a species of fossil alkali called *trona*. Agriculture and pasturage are the principal occupations of the Fezzaners: they do not appear to have any coin; their medium of commerce is gold-dust; their houses, or rather huts, are built of clay, and are covered with branches of trees, on which earth is laid. As rain never falls at Fezzan, this covering is a sufficient protection. Their dress resembles that of the Moors of Barbary; but, during the heats of summer, which are intense, they only wear drawers, and a cap to protect their heads from the immediate action of the sun. To these, many particulars are added of their persons, diseases, and mode of cure; of their religion, government, taxes, animal and vegetable productions. Their sovereign, who is a tributary of the bashaw of Tripoli, administers impartial justice.

"The narrative proceeds to state, that south-east of Morzouk, at the distance of 150 miles, is a sandy desert, 200 miles wide; beyond which, are the mountains of Tibesti, inhabited by ferocious savages tributary to Fezzan. The vallies between the mountains are said to be fertilized by innumerable springs, to abound with corn, and to be celebrated for their breed of camels. The tribute of the Tibestins to the king of Fezzan, is twenty camel loads of fenna.

"This kingdom is inconsiderable, when compared with the two great empires of Bornou, and Cashna, which lie south of Fezzan, occupying that vast region which spreads itself from the river of the Antelopes, for 1200 miles westward, and includes a great part of the Niger's course. Cashna, we are informed, contains a thousand towns and villages; and in Bornou, which is still more considerable, thirty languages are said to be spoken. The latter is represented as a fertile and beautiful country; its capital being situated within a day's journey of the river *Wad-el-Gazel*, which is lost in the sandy wastes of the vast desert of Bilma, and is inhabited by herdsmen, dwelling, like the old patriarchs, in tents, and whose wealth consists in their cattle †. (Bornou, or Bernoa, is a word signifying the land of Noah: for the Arabs conceive, that, on the retiring of the deluge, its mountains received the ark.) Though they cultivate various sorts of grain, the use of the plough is unknown; and the hoe is the only instrument of husbandry. Here, grapes, apricots, and pomegranates, together with limes and lemons, and two species of melons, the water and the milk, are produced in large abundance; but one of the most valuable of its vegetables is a tree called *kedeyna*, which, in form and height, resembles the olive, is like the lemon in its leaf, and bears a nut, of which the kernel and the shell are both in great estimation, the first as a fruit, the last on account of the oil which it furnishes, when bruised, and which supplies the lamps of the people of Bornou with a substitute for the oil of olives, p. 139. Bees,

\* When the person in whom Mr. Lucas confides, p. 138, contounds the skin of the hippopotamus with that of the cameloparadis, may we not suspect that he confounds many other things?

† Horses and horned cattle, goats, sheep, and camels, are the common animals of the country.

it is added, are so numerous, that the wax is often thrown away as an article of no value in the market. Many other particulars are added, for which we must refer to the work. The population is described by the expression, a *countless multitude*. We shall pass over the nature of their religion, which is Mohammedan; of their government, which is an elective monarchy; and the singular mode of their electing a new king from among the children of the deceased sovereign; but the account of the present sultan, his wives, and his children (p. 227.) is too curious not to be exhibited.

"The present sultan, whose name is Alli, is a man of an unobtrusive, plain appearance; for he seldom wears any other dress than the common blue shirt of cotton or silk, and the silk or muslin turban, which form the usual dress of the country. Such, however, is the magnificence of his seraglio, that the ladies who inhabit it are said to be 500 in number, and he himself is described as the reputed father of 350 children, of whom 300 are males; a disproportion which naturally suggests the idea that the mother, preferring to the gratification of natural affection, the joy of seeing herself the supposed parent of a future candidate for the empire, sometimes exchanges her female child for the male offspring of a stranger."

"We are told that fire-arms, though not unknown to the people of Bornou, are not possessed by them.

"South-east from Bornou, lies the extensive kingdom of Begarmee; and beyond this kingdom, are said to be several tribes of Negroes, idolaters, and feeders on human flesh. These, we are told, are annually invaded by the Begarmee; and, when they have taken as many prisoners as their purpose may require, they drive the captives, like cattle, to Begarmee. It is further said, that if any of them, exhausted by fatigue, happen to linger in their pace, one of the horsemen seizes on the oldest, and, cutting off his arm, uses it as a club to drive on the rest.

"We are not much disposed to give credit to this relation. That the Negroes, who are sold for slaves, are different from the other Africans, is not probable; and that they should be driven along with the mangled limbs of their associates, utterly exceeds belief.

"The empire of Cashna bears a great resemblance to that of Bornou.

"After perusing what is here related of the extent, population, fertility, manufactures, and commerce of these regions, we may be permitted to wonder at their having remained altogether unknown to Europeans. We cannot but suspect considerable exaggerations. That the interior parts of Africa are peopled, the caravans which go from Cairo and Tripoli, and which are often absent three years, sufficiently evince: that they are divided into regular and civilized states, may be a question. *A thousand towns and villages* in one empire, and *thirty different languages* spoken in the other, manifest a disposition in the Shereef Imbammed to enlarge, or, at least to retail loose reports. That they should be acquainted with, yet not possess fire-arms, nor make any attempt to navigate the Niger, nor even to catch the fishes that abound in its waters, but little accords with the history of their commerce, and of their progress in manufactures.

"Let us, however, make all possible deductions, and be ever so incredulous as to some particulars, the prospect which this narrative opens to us, of the interior of Africa (the greater part of which we have been accustomed to consider as consigned by nature to perpetual sterility and desolation) must afford great pleasure; and though, as we have already remarked, it is far from being satisfactory, or from having answered the object of the mission, it may be regarded by the society as that sort of evidence which should encourage them to persevere, and ought to induce them, without delay, actually to explore the central provinces of the African continent."

## SIERRA LEONE AND BULAM.

**A** SETTLEMENT, from the purest motives of humanity, was formed at Sierra Leone, upon the coast of Africa, (in 8° 12' N. lat. and about 12° W. lon.) under the patronage of a very respectable society of gentlemen in London, in the year 1791. The benevolent purposes for which it was intended, are to introduce the light of knowledge, and the comforts of civilization into Africa; and to cement and perpetuate the most confidential union between the European colony, and the natives of that country.

The company has ordered experiments to be made, concerning the growth of sugars in their settlements, which have met with such success, as to encourage a hope that the present high price of this commodity may be soon reduced, by a rivalry with the West India merchants. This benevolent colony proceeds with diligence in clearing of land and building of houses. Some delay was occasioned in obtaining the united consent of the surrounding chiefs, which was at length procured, and the dispositions of king Naimbanna appear to be very friendly. The climate is found to be more salubrious than was expected. We with success to this settlement, established upon principles that do honour to humanity.

A settlement of a similar nature was formed upon the island of Bulam, on the same coast, to the eastward of the island of Bilagos. But this is now entirely relinquished. A great part of the colonists were massacred by the natives of the shore, at the mouth of the river Gambia, who were accustomed to make annual plantations of rice in Bulam. The governor being obliged by bad health to return soon to England, the colony was preserved for two years, and the company's property saved by the manly exertions of lieutenant Beaver of the royal navy, who thereby merited the thanks of all concerned.

In January 1793, advices were received at the Sierra Leone house, from that settlement, dated October the 20th, giving a favourable account of the farther progress of the colony. An amicable meeting or palaver had been held with the chiefs on the subject of the distribution of the lots of land, of which a regular survey was begun. The rains had ceased, and the health of the Nova Scotia blacks was much improved. It appears also by the returns, that the mortality among them had not been so very great as was apprehended, only ninety-eight American blacks having died, the chief of whom were of the lower order of those who lived on shore. The company's accountant, who returned for the recovery of his health, died on his arrival in England.

The company's brig Catharine, of one hundred and forty tons, which was dispatched home with some of the adventurers to Bulam, and brought the dispatches of the 20th of October, had been lost off Bideford in a storm, and one boy perished. The settlers had been afflicted with an intermittent fever. Out of the one thousand one hundred and ninety free blacks embarked at Halifax in January 1792, the return of those who died before the 2d of September 1792, amounted to one hundred and sixty-four in men, women, and children, including those who died on their passage. In September 1794 a French 50 gun ship, with some smaller armed vessels, assisted and piloted by two American slave traders, landed at Sierra Leone, plundered the town, and destroyed the public buildings as well as the company's ships lying in the river. They also captured and pillaged the factory at Banee island. In little more than fifteen days, the French squadron left those parts; and the colony, assisted by the seasonable arrival of a ship from England, began to recover from this disaster. At the time when it was most distressed, no want of order had prevailed. The Nova Scotia settlers had suffered but little.

Their

Their farms are well stocked; there is a sufficient quantity of rice in the colony; and as the company will doubtless send out proper supplies, there is reason to hope that the settlement will again flourish; especially as the principles on which it is founded, entitles it to the protection of every nation that venerates the names of humanity and liberty.

## COUNTRY OF THE HOTTENTOTS.

**D**URING the thirty-six hours which I spent (says monsieur Vaillant) with the Gonaqua Hottentots, I had time to make several observations concerning them. I remarked that they make a clapping noise with their tongue, like the rest of the Hottentots. When they accost any one, they stretch forth the hand, saying *Tabé*, I salute you. This word and ceremony, which are employed by the Caffrees, are not used by the Hottentots, properly so called.

This affinity of customs, manners, and even conformation, their being so near Great Caffraria, and the accounts I afterwards received, convinced me these *hordes* or Gonaquas, who equally resemble the Caffrees and the Hottentots, must be a mixed breed produced by these two nations. The dress of the men, arranged with more symmetry, has the same shape as that of the Hottentots; but as the Gonaquas are a little taller, they make their mantles of calves instead of sheeps skins; they are both called *krofs*. Several of them wear hanging from their necks a bit of ivory, or very white sheeps' bone, and this contrast of the two colours produces a good effect, and is very becoming.

When the weather is excessively hot, the men lay aside every part of their dress that is superfluous, and retain only what they name their *jackals*. This is a piece of the skin of the animal so called, with which they cover what nature bids them conceal, and which is fastened to their girdle. This veil, however, negligently arranged, may be considered as an useless appendage, and is of very little service to their modesty. The women employ more care in adorning their persons. They wear a *krofs* like the men, but the apron which conceals their sex is larger than those of the Hottentots. During the great heats, they retain only this apron, with a skin which descends, behind, from their girdle to the calf of the leg. Young girls, below the age of nine years, go perfectly naked; when they attain to that age, they wear nothing but a small apron.

Whatever may be the extent of the deserts of Africa, we must not form any calculations respecting its population from those innumerable swarms of blacks which are found on the west, and which border all the coasts of the ocean, from the Canary Isles to the environs of the Cape of Good Hope. There is certainly no proportion to enable us to hazard even a conjecture; since by a trade approved by a few, and held in detestation by the greater number, the barbarous navigators of Europe have induced these negroes, by the most villainous attractions, to give up their prisoners, or those who are inferior to them in strength. As their wants increased, they have become equally inhuman and perfidious; the prince has sold his subjects; the mother has sold her son; and nature, as an accomplice, has rendered her prolific.

This disgusting and execrable traffic is, however, still unknown in the interior parts of the continent. The desert is really a desert; and it is only at certain distances that one meets with a few *hordes*, that are not numerous, and who live on the fruits of the earth, and the produce of their cattle. After finding one horde, one must

must travel a great way to find another. The heat of the climate, the dryness of the sands, the barrenness of the earth, a scarcity of water, rugged and rocky mountains, ferocious animals, and, besides these, the humour of the Hottentots, a little phlegmatic, and their cold temperament, are all obstacles to propagation. When a father has six children, it is accounted a phenomenon.

The country of the Gonaquas, into which I penetrated, did not therefore contain three thousand people, in an extent of thirty or forty leagues. These people did not resemble those degenerated and miserable Hottentots, who pine in the heart of the Dutch colonies, contemptible and despised inhabitants, who bear no marks of their ancient origin but an empty name; and who enjoy, at the expence of their liberty, only a little peace, purchased at a dear rate, by the excessive labour to which they are subjected on the plantations; and by the despotism of their chiefs, who are always sold to government. I had here (continues M. Vaillant) an opportunity of admiring a free and brave people, valuing nothing but independence; never obeying any impulse foreign to nature.

The huts, constructed like those of the Hottentots in the colonies, were eight or nine feet in diameter, and were covered with ox or sheep's skins, but more commonly with mats. They had only one opening, very narrow and low; and it was in the middle of their hut that the family kindled their fire. The thick smoke with which these kennels were filled, and which had no other vent but the door, added to the stench which they always retain, would have stifled any European who might have had the courage to remain in them two minutes.

The two colours for which these savages shew the greatest fondness are red and black. The first is composed of a kind of ochry earth, which is found in several places of the country, and which they mix and dilute with grease: this earth has a great resemblance to brick-dust, or tiles reduced to powder. Their black is nothing else than soot, or the charcoal of tender wood. Some women, indeed, are contented with painting only the prominence of the cheeks; but in general they daub over their whole body, in compartments varied with a certain degree of symmetry: and this part of their dress requires much time. These two colours, so much admired by the Hottentots, are always perfumed with the powder of the *boughou*, which is offensive to the smell of an European. But the *boughou* has over our rouge and puffs the advantage of not being pernicious to the skin or the lungs. The men never paint their faces, but they use a preparation made of both colours mixed, to paint the upper-lip as far as the nostrils; by which they enjoy the advantage of continually inhaling the odour of the substance employed for this purpose. Young girls sometimes favour their lovers so far as to apply this paint for them under the nose; and on this point they shew a kind of coquetry which has a very powerful influence over the heart of a Hottentot novice. The reader, however, must not infer, that the Hottentot women pay so much attention to dress as to neglect those daily and useful occupations to which nature and their usages call them.

They are remarkably fond of hunting, and in this exercise they display great dexterity. Besides gins and snares, which they place at convenient spots to catch large animals, they lie in wait for them also, attack them as soon as they appear, and kill them with their poisoned arrows, or their assegays, which are a kind of lances. On the first view of their arrows, one would not suspect how destructive weapons they are; their smallness renders them so much the more dangerous, as it is impossible to perceive and follow them with the eye, and consequently to avoid them. The slightest wound which they make always proves mortal, if the poison reaches the blood, and if the flesh be torn. The surest remedy is to amputate the wounded part, if it be a limb, but if the wound be in the body, death is unavoidable. The assegay is generally

generally a very feeble weapon in the hands of a Hottentot; and its great length making it visible while it cleaves the air, it may easily be avoided.

The Hottentots have not the least notion of the elements of agriculture; they neither sow nor plant, nor do they ever reap any crop.—When they choose to give themselves the trouble, they make an intoxicating liquor, composed of honey and a certain root, which they suffer to ferment in a certain quantity of water. This liquor, which is a kind of hydromel, is not their usual beverage, nor do they ever keep a stock of it by them. Whatever they have, they drink all at once, and frequently regale themselves in this manner at certain periods. They smoke the leaves of a plant which they name *dagha*, and not *daka*, as some authors have written. This plant is not indigenous; it is the hemp of Europe. There are some of the savages who prefer these leaves to tobacco; but the greater part of them are fond of mixing both together. They set less value on the pipes brought from Europe than on those which they fabricate themselves; the former appear to them to be too small.

Though they rear abundance of sheep and oxen they seldom kill the latter, unless some accident happens to them, or old age has rendered them unfit for service: their principal nourishment, therefore, is the milk of their ewes and cows, besides which, they have the produce of their hunting excursions, and from time to time they kill a sheep. To fatten their animals they employ a process as efficacious as it is barbarous. They bruise, between two flat stones, those parts which we cut off by the knife; and when thus compressed they acquire in time a prodigious bulk, and become a most delicate morsel, when they have resolved to sacrifice the animal.

Those oxen which they intend for carrying burdens must be broke and trained very early to the service; otherwise they would become absolutely untractable. On this account, when the animal is still young, they pierce the cartilage which separates the nostrils, and thrust through the hole a piece of stick about eight or ten inches in length, and almost an inch in diameter.—The task of milking the cows and the ewes belongs to the women: and, as they never beat or torment them, they are surprisingly tractable.

Of their sheep and kine each village hath one common herd; every inhabitant taking it in his turn to be herdsman. This charge requires many precautions, beasts of prey being very numerous and fierce in the southern parts of Africa. Lions, indeed, are not very common; but there are elephants, rhinoceroses, leopards, tygers, hyenas, and several kinds of wolves, more destructive than ours, together with many other furious animals that abound in the forests, and occasionally make excursions towards the Cape, and destroy the tame cattle. To prevent these misfortunes, it is the business of the herdsman to go, or send, every day round his district, in order to discover if any beast of prey be lurking in that quarter. In which case, he assembles the whole village together, and makes his report; when a party of the stoutest among them arm themselves with javelins and pointed arrows, and follow the person who may have discovered the beast, to the cave or covert where he is lodged. Here they arrange themselves in two lines; the herdsman entering the cave, and endeavouring to provoke the beast to follow him out, where he is inevitably destroyed.

These savages measure the year by the epochs of drought and rainy weather. This division is common to all the inhabitants of the tropical regions, and it is subdivided into moons; but they never count the days, if they exceed ten, that is to say, the number of their fingers. Beyond that, they mark the day or the time by some memorable epoch; for example, an extraordinary storm, an elephant killed, an infectious disorder among the cattle, an emigration, &c. The different parts of the  
day

day they distinguish by the course of the sun; and they will tell you, pointing with their finger, he was *there* when I departed, and *here* when I arrived.

A sense of delicacy makes the Hottentots keep themselves separate from others when they are sick. They are then seldom seen; and it would appear that they are ashamed of having lost their health.

When a Hottentot dies, he is buried in his worst kross, and the limbs are disposed in such a manner that the whole body is covered. The relations then transport it to a certain distance from the horde, and disposing it in a pit dug for this purpose, and which is never deep, cover it with earth, and then with stones, if any are to be found in the neighbourhood. Such a mausoleum proves but a very weak defence against the attacks of the jackal and the hyæna: the body indeed is soon dug up and devoured. However badly this last duty may be discharged, the Hottentots are not much to be blamed, when we call to mind the funeral ceremonies of the ancient and celebrated Parthians, (or Persians) still attached to the custom of exposing their dead on the tops of high towers, or in open cemeteries, in order that the crows and the vultures may feed upon them, and carry them away in morsels. The children, and failing them, the nearest relations of the deceased, take possession of whatever is left; but the quality of a chief is not hereditary. He is always appointed by the horde, and his power is limited. In their councils his advice prevails, if it be judged good; if not, no regard is paid to it. When they are about to go to war, they know neither rank nor divisions; each attacks or defends after his own manner; the most intrepid march in the van; and, when victory declares itself, the whole nation triumphs.

Of all the people whom I ever saw (observes our author) the Gonaquas are the only nation that can be considered as free; but they will perhaps be soon obliged to remove to a greater distance, or receive laws from the Dutch government. All the land to the east being in general good, the planters endeavour to extend their possessions in that quarter as much as they can, and their avarice doubtless will some day succeed. Misery must then be the portion of these happy and peaceful people; and every trace of their liberty will be destroyed by massacres and invasions. Thus have all those hordes mentioned by old authors been treated; and, by being often dismembered and weakened, they are now reduced to a state of absolute dependence on the Dutch. The existence of the Hottentots, their names, and their history, will therefore in time be accounted fabulous; unless some traveller, who may possess curiosity enough to induce him to discover their remains, should have the courage to penetrate into the remote deserts inhabited by the great Nimiquas, where rocks more and more hardened by time, and old and barren mountains, do not produce a single plant worthy to engage the attention of the speculative botanist.

It is necessary in this narration to take notice of that disgusting apron of the Hottentot women, which has long made a figure in history. It is still fashionable among a certain horde. I say, it is fashionable (observes M. Vaillant), for, instead of being the gift of nature, it ought to be considered as one of the most monstrous refinements ever invented by I know not what coquetry, altogether peculiar to a certain small corner of the world. This singularity is nothing else but a prolongation of the nymphæ, occasioned by weights suspended from them. They may hang down about nine inches more or less, according to the age of the person, or the assiduous care which is bestowed on this singular decoration.

There is something peculiar in the features of the Hottentot, which in a certain degree separates him from the generality of mankind; his cheek-bones are exceedingly prominent; so that his face being very broad in that part, and the jaw bones on the contrary extremely narrow, his visage continues still decreasing even to the point of the chin. This configuration gives him an air of lankness, which makes

his head appear very much disproportioned, and too small for his full and plump body. His flat nose rises scarcely half an inch at its greatest elevation; and his nostrils, which are extremely wide, often exceed in height the ridge of his nose. His mouth is large, and furnished with small teeth, well enamelled and perfectly white: his eyes, very beautiful and open, incline a little towards the nose, like those of the Chinese; and, to the sight and touch, his hair has the resemblance of wool; it is very short, curls naturally, and in colour is as black as ebony. He has very little hair, yet he employs no small care to pull out by the roots part of what he has; but the natural thinness of his eyebrows saves him from this trouble in that part. Though he has no beard but upon the upper lip, below the nose, and at the extremity of the chin, he never fails to pluck it out as soon as it appears. This gives him an effeminate look, which, joined to the natural mildness of his character, destroys that commanding fierceness usual among savages.—The women, with more delicacy of features, exhibit the same characteristic marks in their figure: they are equally well made. Their breasts, admirably placed, have a most beautiful form while in the bloom of youth; their hands are small, and their feet exceedingly well shaped, though they never wear sandals. The sound of their voice is soft; and their idiom, passing through the throat, is not destitute of harmony. When they speak, they employ a great many gestures, which give power and gracefulness to their arms.

The Hottentots are naturally timid. Their phlegmatic coolness, and their serious looks, give them an air of reserve, which they never lay aside, even at the most joyful moments; while, on the contrary, all other black or tawny nations give themselves up to pleasures with the liveliest joy, and without any restraint.

A profound indifference to the affairs of life inclines them very much to indolence: the keeping of their flocks, and the care of procuring a subsistence, are the only objects that occupy their thoughts. They never follow hunting as sportsmen, but like people oppressed and tormented by hunger. In short, forgetting the past, and careless of the future, the present alone engages their attention.

They are however (according to our traveller) the best, the kindest, and the most hospitable of men. Whoever travels among them may be assured of finding food and lodging: and though they will receive presents, yet they never ask for any. If the traveller has a long journey to accomplish, and if they learn from the information he requires, that there are no hopes of his soon meeting with other herds, that which he is going to quit, supply him with provisions as far as their circumstances will allow, and with every thing else necessary for his continuing his journey, and reaching the place of his destination. Such are these people, or at least such did they appear to our author, in all the innocence of manners, and of a pastoral life.

## C A F F R A R I A.

**T**HE country known by the general denomination of Caffraria, is a very extensive region, bounded on the north by Negroland and Abyssinia; on the west by part of Guinea, Congo, and the sea; on the south by the Cape of Good Hope; and on the east by the sea. It is divided into several territories and kingdoms, of which little is known, and is computed to be 700 miles long, and 660 broad.

We shall give a more particular description of the people from two modern writers;

writers; the first celebrated for his botanical knowledge, the other for his very interesting travels into the interior parts of Africa, which, it is hoped, will not prove unacceptable to the reader.

The men among the Caffrees, says lieutenant Paterfon, are from five feet ten inches to six feet high, well proportioned, and in general evince great courage in attacking lions or any beasts of prey.

The colour of the Caffrees is a jet black, their teeth white as ivory, and their eyes large. The cloathing of both sexes is nearly the same, consisting entirely of the hides of oxen, which are as pliant as cloth. The men wear tails of different animals tied round their thighs; pieces of brass in their hair, and large ivory rings on their arms: they are also adorned with the hair of lions, and feathers fastened in their heads, with many other fantastical ornaments.

They are extremely fond of dogs, which they exchange for cattle: and to such a height do they carry this passion, that if one particularly pleases them, they will give two bullocks in exchange for it.—Their whole exercise through the day is hunting, fighting, or dancing. They are expert in throwing their lances, and, in time of war, use shields made of the hides of oxen.

The women are employed in the cultivation of their gardens and corn. They cultivate several vegetables, which are not indigenous to their country, such as tobacco, water melons, a sort of kidney-beans, and hemp. The women also make baskets, and the mats which they sleep on.—The men have great pride in their cattle; they cut their horns in such a way as to be able to turn them into any shape they please, and they teach them to answer a whistle. When they with their cattle to return home, they go a little way from the house, and blow this small instrument, which is made of ivory or bone, and so constructed as to be heard at a great distance.

The soil of this country is a blackish loomy ground, and so extremely fertile that every vegetable substance, whether sown or planted, grows here with great luxuriance.—There are great variations in the climate; but, having no thermometer, our traveller could not observe the degrees of heat. It seldom rains, except in the summer season, when it is accompanied with thunder and lightning. The country, however, is extremely well supplied with water, not only from the high land towards the north, which furnishes abundance throughout the year, but from many fountains of excellent water, which are found in the woods. Mr. Paterfon thinks, from his own observations, this country to be greatly superior to any other known part of Africa. The woods produce variety of arboreous plants, and some of a great size; they are inhabited by elephants, buffaloes, &c. There were also variety of beautiful birds and butterflies; but they were so shy, that he could only preserve two birds of that country.

To judge of the Caffrees by those I had seen, says Monsieur Vaillant, they are taller than the Hottentots of the colonies, or even than the Gonaquais, though they greatly resemble the latter, but are more robust, and possess a greater degree of pride and courage. The features of the Caffrees are likewise more agreeable, none of their faces contracting towards the bottom, nor do the cheek bones of these people project in the uncouth manner of the Hottentots; neither have they large flat faces and thick lips like their neighbours the negroes of Mosambique, but a well formed contour, and agreeable nose, with eyes sparkling and expressive; so that, setting aside our prejudice with regard to colour, there are many women among them who might be thought handsome by the side of an European lady. They do not disfigure themselves by daubing their eye-brows like the Hottentots; but are very much tattooed, particularly about the face.

The hair of the Caffrees, which is strong and curling, is never greased; but they

anoint the rest of their bodies, with a view of making themselves active and strong. The men are very fond of beads and brass rings. They are seldom seen without bracelets on their legs and arms, made of the tusks of an elephant, which they saw to a convenient thickness, and then polish and round. As these rings cannot be opened, it is necessary to make them big enough to pass the hand through, so that they fall or rise according to the motion of the arm. Sometimes they place small rings on the arms of their children, whose growth soon fills up the space, and fixes the ornament, a circumstance which is particularly pleasing to them.

They likewise make necklaces of the bones of animals, which they polish and whiten in the most perfect manner. Some content themselves with the leg bone of a sheep hanging on the breast, which is thought a pleasing decoration. In the warm season, the Caffres only wear their ornaments; when the weather is cold, they make use of kroses made of the skins of calves or oxen, which reach to the feet. One particularity which deserves attention, and does not exist elsewhere, is, that the Caffree women care little for ornaments. Indeed they are well made, and pretty, when compared to other savages; and never use the uncouth profusion of Hottentot coquetry, not even wearing copper bracelets. Their aprons, like those of the Gonnquais, are bordered with small rows of beads, which is the only vanity they exhibit.

The skin, that the female Hottentot ties about the loins, the Caffree woman wears as high as her shoulders, tying it over the bosom which it covers. They have, like the men, a kros or cloak of calf or ox skin divested of the hair; but it is only in the cold and rainy season that either sex wear it. These skins are as soft and pliant as the finest stuffs. Let the weather or the season prove ever so bad, neither men nor women cover their heads. Sometimes, indeed, I have seen the head of a Caffree adorned with a feather stuck in the hair; but this sight is by no means common.

One part of the daily occupation of the women is making earthen ware, which they fashion as dexterously as their husbands: they likewise make a curious kind of baskets, of a texture so compact as to contain milk; and they also prepare the fields for seed, scratching the earth, rather than digging it, with wooden pick-axes.

The huts of the Caffrees are higher and more commodious than those of the Hottentots; they form perfect hemispheres; and are composed of wooden work very strong and compact, covered, both within and without, with a mixture of earth, clay, and cow-dung. The opening or door-way is so low, that, to enter the dwelling, you must crawl on your hands and knees, which makes it easier of defence against animals, or the sudden attacks of an enemy. The hearth or fire-place is in the centre, surrounded by a circular rim which rises two or three inches.

The lands of Caffraria, either from their situation or the number of small rivers that refresh them, are more fertile than those of the Hottentots. The Caffrees practise agriculture.

I have remarked, continues monsieur Vaillant, that, notwithstanding the beautiful forests that adorn Caffraria, and delightful pastures which spring up and almost cover the animals which feed on them; notwithstanding those rivers and streams which cross each other in a thousand different directions to render them rich and fertile; their oxen, their cows, and almost all their animals, are much smaller than those of the Hottentots—a difference which undoubtedly arises from the nature of the soil, and a certain flavour predominant in every kind of grass. I have made the observation both on domestic and wild animals, which never acquire the size of those bred in the dry barren countries I have passed through.

Industry is the leading trait in the character of the Caffrees. Some arts, taught indeed by necessity, a love of agriculture, with a few religious dogmas, distinguish them as a more civilised people than those towards the south.

Circumcision is generally practised among them. They acknowledge the supreme being, believe in a future state, where the good will be rewarded, and the wicked punished; but have no idea of the creation, thinking the world had no beginning, and will ever continue in the present state. They have no sacred ceremonies. They instruct their own children, having no priests; but instead of them a kind of forcerers or conjurers, whom they greatly distinguish and revere.

The Caffrees are governed by a chief or king, whose power is very limited, receiving no tax, having no troops at his command, but being the father of a free people; neither attended nor feared, but respected and beloved, and frequently poorer than many of his subjects. Being permitted to take as many wives as he pleases, who think it an honour to belong to him, it is necessary that he should have a larger portion of land to cultivate, and a greater number of cattle to tend and feed; these being his only resources for the maintenance of his numerous family, he is frequently in danger of being ruined. His cabin is neither higher nor better decorated than the rest; his whole family and seraglio live round him, composing a group of a dozen or fifteen huts; the adjoining land is generally of his own cultivation.

It is a custom among the Caffrees for each to gather his own grain, which is their favourite nourishment, and which they grind, or rather crush, between two stones; for which reason, the families living separately, each surrounded by his own plantation of corn, occasions a small *horde* sometimes to occupy a league square of ground, a circumstance never seen among the Hottentots.

The distance of the different *hordes* makes it necessary that they should have chiefs, who are appointed by the king. When there is any thing to communicate, he sends for and gives them orders, or rather information, which the chiefs bear to their several *hordes*.

The principal weapon of the Caffree is the lance or assaygay, which shews his disposition to be at once intrepid and noble, despising, as below his courage, the venomous dart, so much in use among his neighbours; seeking his enemy face to face, and never throwing his lance but openly. In war he carries a shield of about three feet in height, made of the thickest part of the hide of a buffalo; this defends him from the arrow or assaygay, but is not proof against a musket ball. The Caffree also manages with great skill a club of about two feet and a half long, made of a solid piece of wood, three or four inches thick in the largest part, and gradually diminishing towards one of the ends. When in a close engagement, they strike with this weapon, or frequently throw it to the distance of fifteen or twenty paces, in which case it seldom fails of the intended effect.

The sovereignty here is hereditary, the eldest son ever succeeding. In default of male heirs, it is not the king's brother succeeds, but the eldest nephew; and in case the king should have neither children nor nephews, the chiefs of the different hordes elect a king. Upon these occasions a spirit of party sometimes prevails, which gives rise to factions and intrigues that generally end in bloodshed.

Polygamy is customary among the Caffrees: their marriages are even more simple than those of the Hottentots, the parents of the bridegroom being always content with his choice; the friends of the bride are rather more difficult, but seldom refuse their consent; after which they rejoice, drink and dance, for weeks together according to the wealth of the families; but these feasts are never held but on the first espousals. They have no musical instruments but such as are used by the Hottentots. As for their dances, the step is not unlike the English.

At the death of the father, the sons and the mother divide the property he has left between them. The daughters claiming nothing, remain at home with their mother or brother, unless it pleases some man to take them; and if this happens during the life of the parents, they receive cattle in proportion to the wealth of their father. The dead are seldom buried, but carried away from the Kraal by their family, and deposited in a deep trench used by the whole horde on such occasions, where the wild beasts repair at leisure, which preserves the air from those noxious vapours which otherwise the putrefaction would occasion. The honours of burial are only due to the king or chief of a horde. They cover these bodies with piles of stones in the form of a dome.

I am unacquainted with the disposition of the Caffrees, respecting love and jealousy, but believe that they only feel the latter sensation in regard to their countrymen; voluntarily giving up their women for a small consideration to the first white man that expresses an inclination for them.

---

OF AFRICA, FROM THE TROPIC OF CANCER TO THE CAPE OF GOOD-HOPE.

*See the Table and Map.*

**T**HIS immense territory is, comparatively speaking, very little known, no modern traveller having penetrated into the interior parts; so that we are ignorant not only of the bounds, but even of the names of several inland countries. In many material circumstances, the inhabitants of this extensive continent agree with each other. If we except the people of Abyssinia, who are tawny, and profess a mixture of Christianity, Judaism, and Paganism, they are all of a black complexion: in their religion, except on the sea-coasts which have been visited and settled by strangers, they are pagans: and the form of government is every where monarchical. Few princes, however, possess a very extensive jurisdiction; the natives of this part of Africa being generally united in small communities, enjoying little intercourse with each other. In Abyssinia indeed, as well as in Congo, Loango, and Angola, we are told of powerful monarchs; but on examination, it is found that the authority of these princes stands on a precarious footing, each tribe or separate body of their subjects being under the influence of a petty chieftain of their own, styled Negus, to whose commands, however contrary to those of the *Negafcha Negafcht*, or king of kings, they are always ready to submit. This indeed must always be the case among rude nations, where the art of governing, like all others, is in a very simple and imperfect state. In the succession to the throne, force generally prevails over right; and an uncle, a brother, or other collateral relation, is on this account commonly preferred to the descendants, whether male or female.

The fertility of a country so prodigiously extensive might be supposed more various than we find it is; in fact, there is no medium in this part of Africa with regard to the advantages of soil; it is either perfectly barren, or extremely fertile; this arises from the intense heat of the sun, which, where it meets with sufficient moisture, produces the utmost luxuriance, and, in those countries where there are few rivers, reduces the surface of the earth to a barren sand. Of this sort are the countries of Amian and Zaara, which, for want of water, and consequently of all other necessaries, are reduced to perfect deserts, as the name of the latter denotes. In those countries, on the other hand, where there is plenty of water, and particularly

cularly where the rivers overflow the land, part of the year, as in Abyssinia, the productions of nature, both of the animal and vegetable kinds, are found in the highest perfection and greatest abundance. The countries of Mandingo, Ethiopia, Congo, Angola, Batavia, Truticul, Monomotapa, Cafati, and Mehene-mugi, are extremely rich in gold and silver. The baser metals likewise are found in these and many other parts of Africa. But the persons of the natives make the most considerable article in the produce and traffic of this miserable quarter of the globe.

On the Guinea or western coasts, the English trade to James Fort, and other settlements near and up the river Gambia, where they exchange their woollen and linen manufactures, their hardware and spirituous liquors, for the persons of the natives. By the treaty of peace in 1783, the river of Senegal with its dependencies were given up to France. Among the negroes, a man's wealth consists in the number of his family, whom he sells like so many cattle, and often at an inferior price. Gold and ivory, next to the slave trade, form the principal branches of African commerce. These are carried on from the same coast, where the Dutch and French, as well as English, have their settlements for this purpose.

According to Mr. Ramsay, the annual British exports to Africa are estimated at 500,000*l.* part of which is annually exchanged with American and other foreign traders on the coast. About 50,000*l.* is returned in Ivory, gold dust, gum, &c. The greatest part of the profits of the slave trade is raised on the sugar plantations. If, by establishing factories, and encouraging civilization on the coast of Africa, and returning some of our West Indian slaves to their original country, we tried to make up for our past treachery to the natives, and instructed them in the culture of those articles, our demand for which has been so advantageous to America, viz. tobacco, indigo, cotton, rice, &c. to barter with us for our manufactures, great would be our profits. Were Africa civilized, and could we pre-occupy the affections of the natives, and introduce gradually our religion, manners, and language among them, we should open a market that would fully employ our manufacturers and seamen, morally speaking, till the end of time; and, while we enriched ourselves, we should contribute to their happiness.

The Portuguese are in possession of the east and west coast of Africa, from the Tropic of Capricorn to the Equator; which immense tract they became masters of, by their successive attempts, and happy discovery and navigation of the Cape of Good Hope. From the coast of Zanguebar, on the eastern side, they trade not only for the articles above mentioned, but likewise for several others, as sena, aloes, civet, ambergrise, and frankincense. The Dutch have settlements towards the southern part of the continent in the country called Caffraria, or the land of the Hottentots, particularly Cape Town\*, which is well settled, and fortified;

\* Monsieur de Pagés gives a singular instance of magnanimity, which happened at the Cape the evening before his arrival, which excited in every individual the strongest emotions of sympathy, blended with admiration.

A violent gale of wind setting in from the north north west, the barometer, which had stood at 28° and a fraction during the preceding fine weather, suddenly dropped to 27°, and three Dutch vessels in the road dragged their anchors. One loaded with grain for Holland was forced upon the rocks and bulged; and while the greater part of the crew fell an immediate sacrifice to the

waves, the remainder were seen from the shore struggling for their lives by clinging to different pieces of the wreck. The sea ran dreadfully high, and broke over the sailors with such amazing fury, that no boat whatever would venture off to their assistance. Meanwhile a planter, considerably advanced in life, and long a member of the colony, had come from his farm on horseback, to be a spectator of the shipwreck. His heart was melted at the sight of the unhappy seamen; and knowing the bold and enterprising spirit of his horse, and his particular excellence as a swimmer, he instantly determined to make a desperate effort,

sied; where their ships bound for India usually put in, and trade with the natives for their cattle, in exchange for which they give them spirituous liquors.

**HISTORY.]** The history of the continent of Africa is little known. We learn from the ancients, who sailed a considerable way round the coasts, that the inhabitants were in the same rude situation near 2000 years ago in which they actually remain. The attempts of the Europeans, particularly of the Dutch at the Cape of Good Hope, have been hitherto ineffectual for making the least impression on these savage mortals, or giving them the least inclination or even idea of the European manner of life.

The Portuguese are sovereigns of the greatest part of the coast, and have a number of black princes their tributaries. There are some independent princes who have extensive dominions, particularly the kings of Dahome and Widah, the most noted of any for the infamous slave-trade. Upwards of 200 years have the European nations traded with Africa in human flesh, and encouraged in the Negro countries, wars, rapine, desolation, and murder, that the West India islands might be supplied with labourers. The annual exportation of poor creatures from Africa hath exceeded 100,000, many of whom are driven a thousand miles to the sea coast, their villages having been surrounded in the night by an armed force, and the inhabitants dragged into perpetual captivity.

A sea officer lately visited all the chiefs of the Negroes in our settlements, from Santa Apollonia to Athera, an extent of more than 250 miles, and found the police and punishment of all crimes regulated by the slave-trade. Those who commit crimes or trespasses against their laws, are, at the decision of twelve elders, sold for slaves for the use of their government, and the support of their chiefs. Theft, adultery, and murder, are the highest crimes, and whenever they are detected, subject the whole family to slavery. But any individual, condemned to slavery for the crime of his relation, may redeem his own person, by furnishing two slaves in his room. Or when a man commits one of the above cardinal crimes, all the male part of his family are forfeited to slavery; if a woman, the female part is sold. "This traffic in crimes makes the chiefs vigilant. Nor do our planters, who purchase them, use any pains to instruct them in religion, to make them amends for the oppression thus exercised on them. They are unnaturally averse to every thing that tends to it; yet the Portuguese, French, and Spaniards, in their settlements, succeeded in their attempts to instruct them, as much to the advantage of commerce, as of religion. It is for the sake of Christianity, and the advantages accompanying it, that English slaves embrace every occasion of deserting to the settlements of those nations."

It is high time for the legislature to interfere, and put an end to this most infamous of all trades, so disgraceful to the Christian name, and so repugnant to the principles of our constitution. Let the negroes already in our islands be properly treated, made free, and encouragement given to their population; measures that would be attended with no less profit than honour.

effort for their deliverance. He alighted, and blew a little brandy into his horse's nostrils, when again seating himself firm in the saddle, he instantly rushed into the midst of the breakers. At first both disappeared; but it was not long before they floated on the surface, and swam to the wreck; when taking with him two men, each of whom held by one of his boots, he brought them safe on shore. This perilous experiment he repeated not less than seven times, and saved four-

teen lives to the public; but on his return the eighth time, being much fatigued, and meeting a most formidable wave, he lost his balance, and was overwhelmed in a moment. The horse swam safe to land, but his gallant rider, alas! was no more. I am doubtful if in the history of mankind we have a more brilliant example of heroism exerted in the cause of humanity. *Pagés' Travels round the World, from 1767 to 1771. vol. iii. p. 32.*

AFRICAN

## A F R I C A N I S L A N D S .

**O**F the African islands, some lie in the Eastern or Indian Ocean, and some in the Western or Atlantic. We shall begin with those in the Indian Ocean; the chief of which are Zocotra, Babelmandel, Madagascar, the Comora Islands, Bourbon, and Mauritius. *See the Map.*

**ZOCOTRA.** This island is situated in east lon. 53, north lat. 12, thirty leagues east of Cape Gardesol, on the continent of Africa: it is eighty miles long, and fifty-four broad, and has two good harbours, where the European ships used formerly to put in when they took their passage to India. It is a populous, plentiful country, yielding most of the fruits and plants that are usually found within the tropics, together with frankincense, gum-tragacanth, and aloes. The inhabitants are Mahomedans, of Arab extraction, and are under the government of a prince or Sheik who is probably tributary to the Porte.

**BABELMANDEL.** The island of Babelmandel gives name to the strait at the entrance of the Red Sea, where it is situated, in east lon. 44-30, north lat. 12, about four miles both from the Arabian and Abyssinian shores. The Abyssinians or Ethiopians, and the Arabians, formerly contended with great fury for the possession of this island, as it commands the entrance into the South Sea, and preserves a communication with the ocean. This strait was formerly the only passage through which the commodities of India found their way to Europe; but since the discovery of the Cape of Good Hope, the trade by the Red Sea is of little importance. The island is of small value, being a barren, sandy spot of earth, not five miles round.

**COMORA.** These islands are, Joanna, Mayotta, Mohilla, Angezia, and Comora; situated between 41 and 46 east lon. and between 10 and 14 south lat. at an equal distance from Madagascar and the continent of Africa. Joanna, the chief, and which claims sovereignty over, and exacts tribute from the others, is about 30 miles long and 15 broad, and affords plenty of provisions, and such fruits as are produced between the tropics. East-India ships, bound to Bombay, usually touch here for refreshments. The inhabitants are negroes of the Mahomedan persuasion, and entertain our seamen with great humanity.

**MADAGASCAR.** This is the largest of the African islands, and is situated between 43 and 51 deg. east lon. and between 10 and 26 south lat. 300 miles south-east of the continent of Africa; it being near 1000 miles in length from north to south; and generally between 200 and 300 miles broad. The sea rolls with great rapidity, and is exceeding rough between this island and the continent of the Cape of Good Hope, forming a channel, or passage, through which all European ships, in their voyage to and from India, generally pass, unless prevented by storms.

Madagascar is a pleasant and fertile country, abounding in sugar, honey, vines, fruit-trees, vegetables, valuable gums, corn, cattle, fowls, precious stones, iron, some silver, copper, steel, and tin. It affords an agreeable variety of hills, vallies, woods, and champaign, watered with numerous rivers, and well stored with fish. The air is generally temperate, and said to be very healthy, though in a hot climate. The inhabitants are of different complexions and religions: some white, some

some negroes, some Mahomedans, some pagans. The whites, and those of a tawny complexion who inhabit the coasts, are descended from the Arabs, as is evident from their language, and their religious rites; but here are no mosques, temples, nor any stated worship, except that they offer sacrifices of beasts on particular occasions; as when sick, when they plant yams, or rice, when they hold their assemblies, circumcise their children, declare war, enter into new-built houses, or bury their dead. Many of them observe the Jewish sabbath, and give some account of the sacred history, the creation and fall of man, as also of Noah, Abraham, Moses, and David; from whence it is conjectured that they are descended of Jews who formerly settled here; though none knows how or when. This island was discovered by the Portuguese, and the French took possession of it in 1643; but the people disliking their government, they were driven out in 1651; since which time the natives have had the sole possession of the island, under a number of petty princes, who make war upon each other for slaves and plunder.

**MAURITIUS, or Maurice,** was so called by the Dutch, who first touched here in 1598, in honour of prince Maurice their stadtholder; but the French, its present masters, have given it the name of **THE ISLE OF FRANCE.** It is situated in east lon. 56, south lat. 20, about 400 miles east of Madagascar. It is of an oval form, about 150 miles in circumference, with a fine harbour, capable of holding fifty large ships, secure against any wind that blows, and 100 fathoms deep at the entrance. The climate is extremely healthy and pleasant. The mountains, of which there are many, and some so high that their tops are covered with snow, produce the best ebony in the world, besides various other kinds of valuable wood, two of which greatly resemble ebony in quality; one red, the other yellow as wax. The island is watered with several pleasant rivers well stocked with fish; and though the soil is not the most fruitful, it yields plenty of tobacco, rice, fruit, and feeds a great number of cattle, deer, goats, and sheep.

**BOURBON.** The Isle of Bourbon is situated in east lon. 54, south lat. 21, about 300 miles east of Madagascar, and is about 90 miles round. There are many good roads for shipping round Bourbon, particularly on the north and south sides; but hardly a single harbour where ships can ride secure against those hurricanes which blow during the monsoons. Indeed the coast is so surrounded with blind rocks, a few feet below the water, that coasting along shore is at all times dangerous. On the southern extremity is a volcano, which continually throws out flames, smoke, and sulphur, with a hideous roaring noise, terrible in the night to mariners. The climate here, though extremely hot, is healthy, being refreshed with cooling gales, that blow morning and evening from the sea and land: sometimes, however, terrible hurricanes shake the whole island almost to its foundation, but generally without any other bad consequence than frightening the inhabitants. The island abounds in brooks and springs, and in fruits, grass, and cattle, with excellent tobacco (which the French have planted there), aloes, white pepper, ebony, palm, and other kinds of wood, and fruit-trees. Many of the trees yield odoriferous gums and resins, particularly benzoin of an excellent sort in great plenty. The rivers are well stocked with fish, the coast with land and sea tortoises, and every part of the country with horned cattle, as well as hogs and goats. Ambergris, coral, and the most beautiful shells, are found upon the shore. The woods are full of turtle doves, paroquets, pigeons, and a great variety of other birds, beautiful to the eye and pleasant to the palate. The French first settled here in the year 1672, after they were driven from the island of Madagascar. They have now some considerable towns in the island, with a governor; and here their East-India ships touch and take in refreshments.

There are a great many more small islands about Madagascar, and on the eastern coast of Africa, laid down in maps but no where described.

Leaving therefore the eastern world and the Indies, we now turn round the Cape of Good Hope, which opens to our view the Atlantic, an immense ocean, lying between the two grand divisions of the globe, having Europe, Asia, and Africa, or the Old World, on the east; and America, or the New World, on the west; towards which division we now steer our course, touching in our way at the following islands upon the African coast, that have not yet been described, viz. St. Helena, Ascension, St. Matthew, St. Thomas's, &c. Goree, Cape Verd, the Canary and Madeira islands. *See the Map.*

**ST. HELENA.** The first island on this side the Cape is St. Helena, situated in west lon. 6-4, south lat. 16, being 1200 miles west of the continent of Africa, and 1800 east of South America. The island is a rock about 21 miles in circumference, very high, and very steep, and only accessible at the landing-place, in a small valley at the east side of it, which is defended by batteries of guns planted level with the water; and as the waves are perpetually dashing on the shore, it is generally difficult landing even here. There is no other anchorage about the island but at Chapel Valley Bay; and as the wind always blows from the south-east, if a ship over-shoots the Island ever so little, she cannot recover it again. The English plantations here afford potatoes and yams, with figs, plantains, bananas, grapes, kidney-beans, and Indian corn; of the last, however, most part is devoured by the rats, which harbour in the rocks, and cannot be destroyed; so that the flour they use is almost wholly imported from England; and in times of scarcity they generally eat yams and potatoes instead of bread. Though the island appears on every side a hard barren rock, yet it is agreeably diversified with hills and plains, adorned with plantations of fruit-trees and garden-stuff. They have great plenty of hogs, bullocks, poultry, ducks, geese, and turkeys, with which they supply the sailors, taking in exchange shirts, drawers, or any light cloaths, pieces of callico, silks, muslins, arrack, sugar, &c.

St. Helena is said to have been first discovered by the Portuguese on the festival of the empress Helena, mother of the emperor Constantine the Great, whose name it still bears. It does not appear that the Portuguese ever planted a colony here; and the English East India company took possession of it in 1600, and held it without interruption till the year 1673, when the Dutch took it by surprise. However, the English, under the command of captain Munden, recovered it again within the space of a year, and at the same time took three Dutch East India ships that lay in the road. There are about 200 families in the island, most of them descended from English parents. The East India ships take in water and fresh provisions here, in their way home; but the island is so small, and the wind so much against them outward bound, that they then very seldom see it.

The company's affairs are here managed by a governor, deputy-governor, and store-keeper, who have standing salaries allowed by the company, besides a public table well furnished, to which all commanders, masters of ships, and principal passengers are welcome.

**ASCENSION.** This island is situated in 7 deg. 40 min. south lat. 600 miles north-west of St. Helena: it received its name from its being discovered by the Portuguese on Ascension-day; and is a mountainous, barren island, about 20 miles round, and uninhabited; but is a safe, convenient harbour, where the East India ships generally touch to furnish themselves with turtles or tortoises, which are very plentiful here, and vastly large, some of them weighing above a hundred pounds.

The sailors going ashore in the night-time, frequently turn two or three hundred of them on their backs before morning; and are sometimes so cruel, as to turn many more than they use, leaving them to die on the shore.

**ST. MATTHEW.** This is a small island lying in 6-1 west lon. and 1-30 south lat. 300 miles to the north-east of Ascension, and was also discovered by the Portuguese, who planted and kept possession of it for some time; but afterwards deserting it this island now remains uninhabited, having little to invite other nations to settle there, except a small lake of fresh water.

The four following islands, viz. **ST. THOMAS, PRINCE'S ISLAND, ANNABOA,** and **FERNANDOPO,** are situated in the gulf of Guinea, between Congo and Benin; all of them were first discovered by the Portuguese, and belong still to them; they furnish vessels with fresh water and provisions as they pass by. And, to the honour of the Portuguese government, and disgrace of our West India legislatures, there are 15,000 Negro Christians in St. Thomas, instructed to read and write, who daily attend divine worship, clean and well clothed.

**CAPE VERD ISLANDS.** These islands are so called from a cape of that name on the African coast, near the river Gambia, over against which they lie, at the distance of 300 miles, between 23 and 26 degrees west lon. and 14 and 18 deg. north lat. They were discovered in the year 1460, by the Portuguese, and are about 20 in number; but some of them, being only barren, uninhabited rocks, are not worth notice. St. Jago, Bravo, Fogo, Mayo, Bonavista, Sal, St. Nicholas, St. Vincent, Santa Cruz, and St. Antonio, are the most considerable, and are subject to the Portuguese. The air, generally speaking, is very hot, and in some of them very unwholesome. They are inhabited by Europeans, or the descendants of Europeans, and negroes.

**ST. JAGO,** where the Portuguese viceroy resides, is the most fruitful, best inhabited, and largest of them all, being 150 miles in circumference, yet it is mountainous, and has much barren land in it. Its produce is sugar, cotton, some wine, India corn, cocoa-nuts, oranges, and other tropical fruits; but the plant of most consequence is madder, which grows in abundance among the cliffs. Here is plenty of roots, garden-stuffs, hogs, and poultry, and some of the prettiest green monkeys, with black faces, that are to be met with any where. Baya, or Praya (famous for an action between an English and French squadron), situated on the east side, has a good port, and is seldom without ships, those outward-bound to Guinea or the East Indies, from England, Holland, and France, often touching here for water and refreshments.

In the island of **MAYO** or **MAY**, immense quantities of salt are made by the heat of the sun from the sea-water, which at spring tides, is received into a sort of pan, formed by a sand-bank, which runs along the coast for two or three miles. Here the English drive a considerable trade for salt, and have commonly a man of war to guard the vessels that come to load with it, which in some years amount to a hundred or more. The salt costs nothing, except for raking it together, wheeling it out of the pond, and carrying it on asses to the boats, which is done at a very cheap rate. Several of our ships come hither for a freight of asses, which they carry to Barbadoes and other British plantations. The inhabitants of this island, even the governor and priests, are all negroes, and speak the Portuguese language. The negro governor expects a small present from every commander that loads salt,

and is pleased to be invited aboard their ships. The sea water is so clear on this coast, that an English sailor, who dropped his watch, perceived it at the bottom, though many fathoms deep, and had it brought up by one of the natives, who are generally expert at diving.

The island of **Fogo** is remarkable for being a volcano, continually sending up sulphureous exhalations; and sometimes the flame breaks forth like *Ætna*, in a terrible manner, throwing out punice stones that annoy all the parts adjacent.

**GORRE** is situated within cannon-shot of Cape Verd, N. lat. 14-43, W. lon. 17-20 and was so called by the Dutch, from an island and town of the same name in Holland. It is a small spot not exceeding two miles in circumference, but its importance rises from its situation for trade so near Cape Verd, and it has been therefore a bone of contention between European nations. It was first possessed by the Dutch, from whom, in 1663, it was taken by the English; but in 1665 it was re-taken by the Dutch, and in 1677 subdued by the French, in whose possession it remained till the year 1759, when the British arms were every where triumphant. It was restored to the French at the treaty of peace in 1763. It was re-taken by the English in the last war, but again restored at the peace of 1783.

**CANARIES.** The Canaries, anciently called the Fortunate Islands, are seven in number, and situated between 12 and 19 degrees west lon. and between 27 and 29 degrees north lat. about 150 miles south-west of Morocco. Their particular names are, Palma, Hiero, Gomera, Teneriffe, Grand Canaria, Fuerteventura, and Langorote. These islands enjoy a pure, temperate air, and abound in the most delicious fruits, especially grapes, which produce those rich wines that obtain the name of the Canary, whereof the greatest part is exported to England, which in time of peace is computed at ten thousand hogsheads annually. The Canaries abound with those little beautiful birds that bear their name, and are now so common and so much admired in Europe; but their wild notes in their native land far excel those in a cage or foreign clime.

Grand Canary, which communicates its name to the whole, is about 150 miles in circumference, and so extremely fertile, as to produce two harvests in the year. Teneriffe, the largest of these islands next to that of the Grand Canary, is about 120 miles round; a fertile country, abounding in corn, wine, and oil; though it is pretty much encumbered with mountains, particularly the Peak. Captain Glas observes, that in coming in with this island, in clear weather, the Peak may be easily discerned at 120 miles distance, and in sailing from it at 150. The Peak is an ascent in the form of a sugar-loaf, about fifteen miles in circumference, and according to the account of Sprat bishop of Rochester, published in the Philosophical Transactions, near three miles perpendicular; but lately ascertained to be only 13,265 feet. This mountain is a volcano, and sometimes throws out such quantities of sulphur and melted ore, as to convert the richest land into barren deserts. These islands were first discovered and planted by the Carthaginians; but the Romans destroying that state, put a stop to the navigation on the west coast of Africa, and the Canaries lay concealed from the rest of the world, until they were again discovered in the year 1405, by the Spaniards, to whom they still belong. It is remarkable, that though the natives resembled the Africans in their stature and complexion when the Spaniards first came among them, their language was different from that spoken on the continent; they retained none of their customs, were masters of no science, and did not know there was any country in the world besides their own.

**MADEIRAS.** The three islands called the Madeiras, are situated, according to the author of Anson's voyage, in a fine climate in 32-27 north lat. and from 18-30 to 19-50 west lon. about 100 miles north of the Canaries, and as many west of Sallee in Morocco. The largest, from which the rest derive the general name of Madeiras, or rather Mattered, on account of its being formerly almost covered with wood, is about 75 miles long, 60 broad, and 180 in circumference. It is composed of one continued hill, of a considerable height, extending from east to west; the declivity of which, on the south side, is cultivated and interspersed with vineyards; and in the midst of this slope the merchants have fixed their country seats, which form a very agreeable prospect. There is but one considerable town in the whole island, which is named Funchial, seated on the south part of the island, at the bottom of a large bay; towards the sea it is defended by a high wall, with a battery of cannon, and is the only place where it is possible for a boat to land; and even here the beach is covered with large stones, and a violent surf continually beats upon it.

Though this island seems to have been known to the ancients, yet it lay concealed for many generations, and was at length discovered by the Portuguese in 1519; but others assert that it was first discovered by an Englishman, in the year 1344. Be that as it may, the Portuguese took possession of it, and are still almost the only people who inhabit it. The Portuguese, at their first landing, finding it little better than a thick forest, rendered the ground capable of cultivation by setting fire to this wood; and it is now very fertile, producing in great abundance the richest wine, sugar, the most delicate fruits, especially oranges, lemons, and pomegranates; together with corn, honey, and wax: it abounds also with boars and other wild beasts, and with all sorts of fowls, besides numerous groves of cedar trees, and those that yield a juice called dragon's blood, mastic, and other gums. The inhabitants of this isle make the best sweet-meats in the world, and succeeded wonderfully in preserving citrons and oranges, and in making marmalade and perfumed pastes, which exceed those of Genoa. The sugar they make is extremely beautiful, and smells naturally of violets. This indeed is said to be the first place in the West where that manufacture was set on foot, and from thence it was carried to the Brasils in America. The Portuguese not finding it so profitable as at first, have pulled up the greatest part of their sugar canes, and planted vineyards in their stead, which produce several sorts of excellent wine, particularly that which bears the name of the island, malmsey, and tent; of all which the inhabitants make and sell prodigious quantities. No less than 20,000 hogheads of Madeira, it is said, are yearly exported, the greatest part to the West Indies, especially to Barbadoes, the Madeira wine not only enduring a hot climate better than any other, but even being improved, when exposed to the sun in barrels, after the bung is taken out. It is said no venomous animal can live here. Of the two other islands, one is called Port Santo, which lies at a small distance from Madeira, is about eight miles in compass, and extremely fertile. It has very good harbours, where ships may ride with safety against all winds, except the south-west; and is frequented by Indiamen outward and homeward bound. The other island is an inconsiderable barren rock.

**AZORES.** Leaving the Madeiras, with which we close the account of Africa, we continue our course westward through this immense ocean, which brings us to the Azores, or, as they are called, the Western Islands, that are situated between 25 and 32 degrees west lon. and between 37 and 40 north latitude, 900 miles west of Portugal, and as many east of Newfoundland, lying almost mid-way between Europe and America. They are nine in number, and are named Santa Maria, St.

Miguel

Miguel or St. Michael, Tercera, St. George, Graciosa, Fayal, Pico, Flores, and Corvo. They were discovered in the middle of the fifteenth century by Joshua Vander Berg, a merchant of Bruges in Flanders, who, in a voyage to Lisbon, was, by stress of weather, driven to these islands, which he found destitute of inhabitants, and called the them Flemish Islands. On his arrival at Lisbon he boasted of this discovery, on which the Portuguese set sail immediately, and took possession of them, which they still retain. They were called in general the Azores, from the great number of hawks and falcons found in them. All these islands enjoy a very clear and serene sky, with a salubrious air; but are exposed to violent earthquakes and inundations, from both which they have frequently suffered much damage. They are, however, extremely fertile in corn, wine, and a variety of fruits; also in cattle, fowl, and fish. It is said that no poisonous or noxious animals breed on the Azores, and that if carried thither they will expire in a few hours.

St. Michael, which is the largest, being near 100 miles in circumference, and containing 50,000 inhabitants, was twice invaded and plundered by the English in the reign of queen Elizabeth. Tercera is the most important of these islands, on account of its harbour, which is spacious, and has good anchorage, but is exposed to the south-east winds. It is generally visited by homeward bound fleets from Brazil, Africa, and the East Indies. Its capital town, Angra, contains a cathedral and five churches, and is the residence of the Governor of these islands, as well as of the bishop.

## ITS DISCOVERY AND CONQUEST.

WE are now to treat of a country of vast extent and fertility, and which, though little cultivated by the hand of Art, owes in many respects more to that of Nature than any other division of the globe. The particular circumstances of this country require that we should in some measure vary our plan, and, before describing its present state, afford such information with regard to its discovery, as is most necessary for satisfying our readers.

Towards the close of the 15th century, Venice and Genoa were the only powers in Europe who owed their support to commerce. An interference of interests inspired a mutual rivalship; but in traffic Venice was much superior. She engrossed the whole commerce of India, then, and indeed always, the most valuable in the world; but hitherto entirely carried on through the inland parts of Asia, or by the way of Egypt and the Red Sea. In this state of affairs, Columbus, a native of Genoa, whose knowledge of the true figure of the earth, however attained, was much superior to the general notions of the age in which he lived, formed a project of sailing to the Indies by a bold and unknown route, and of opening to his country a new source of opulence and power. But this proposal of sailing westward to the Indies was rejected by the Genoese as chimerical, and the principles on which it was founded were condemned as absurd. Stung with disappointment and indignation, Columbus retired from his country, laid his scheme before the court of France, where his reception was still more mortifying, and where, according to the practice of that people, he was laughed at and ridiculed. Henry VII. of England was his next resort; but the cautious politics of that prince were the most opposite imaginable to a great but uncertain design. In Portugal, where the spirit of adventure and discovery about this time began to operate, he had reason to expect better success. But the Portuguese contented themselves with creeping along the coast of Africa, and discovering one cape after another: they had no notion of venturing boldly into the open sea, and of risking the whole at once. Such repeated disappointments would have broken the spirit of any man but Columbus. The expedition required expence, and he had nothing to defray it. His mind, however, still remained firm; he became the more enamoured of his design, the more difficulty he found in accomplishing it, and he was inspired with that noble enthusiasm which always animates an adventurous and original genius. Spain was now his only resource; and there, after eight years attendance, he at length succeeded, and chiefly through the interest of queen Isabella. Columbus set sail in the year 1492, with a fleet of three ships, upon the most adventurous attempt ever undertaken by man, and in the fate of which the inhabitants of two worlds were interested\*. In this voyage he had a thousand difficulties to contend

\* Dr. Robertson observes, that the armament of Columbus was not suitable either to the dignity of the nation by which it was equipped, or to the importance of the service for which it was destined.

It consisted of three vessels. The largest, a ship of no considerable burden, was commanded by Columbus, as admiral, who gave it the name of Santa Maria, out of respect for the Blessed Virgin, whom

tend with ; the most striking was the variation of the compass, then first observed, and which seemed to threaten that the laws of Nature were altered on an unknown ocean, and the only guide he had left was ready to forsake him. His sailors, always discontented, now broke out into open mutiny, threatening to throw him overboard, and insisted on their return. But the firmness and address of the commander, and much more the discovery of land, after a voyage of 33 days, put an end to the sedition. It was on the morning of the 12th of October, that Columbus descried an island, whose flat and verdant fields, well stored with wood, and watered with many rivulets, presented the aspect of a delightful country. The crew of the *Pinta* instantly began the *Te Deum*, as a hymn of thanksgiving to God, and were joined by those of the other ships, with tears of joy, and transports of congratulation. This office of gratitude to Heaven was followed by an act of justice to their commander. They threw themselves at the feet of Columbus with feelings of self-condemnation mingled with reverence, and implored him to pardon their ignorance, incredulity, and insolence. After this the boats were all manned and armed, and they rowed towards the island with their colours displayed, with warlike music and other martial pomp. As they approached the coast, they saw it covered with a multitude of people, whom the novelty of the spectacle had drawn together, and whose attitudes and gestures expressed wonder and astonishment at the strange objects which presented themselves to their view. Columbus was the first European who set foot in the new world which he had discovered. He landed in a rich dress, and with a naked sword in his hand. His men followed, and kneeling down, they all kissed the ground which they had so long desired to see ; and took solemn possession of the country for the crown of Castile and Leon. The natives of the country were at first shy through fear, but soon became familiar with the Spaniards, and trafficked with them. It was one of the Bahama islands on which Columbus had landed, and which he called *San Salvador* ; but he soon discovered, from the poverty of the inhabitants, that these could not be the Indies he was in quest of. In steering southward, however, he found the island called *Hispaniola*, abounding in all the necessaries of life, inhabited by a humane and hospitable people, and what was of still greater consequence, as it insured his favourable reception at home, promising, from some samples he received, considerable quantities of gold. This island therefore he proposed to make the centre of his discoveries : and having left upon it a few of his companions as the ground-work of a colony, returned to Spain to procure necessary reinforcements.

The court was then at Barcelona ; Columbus travelled thither from Seville, amidst the acclamations of the people, attended by some of the natives, and conveying the gold, the arms, utensils, and ornaments of the country he had discovered. This entry into Barcelona was a species of triumph more glorious than that of conquerors, more striking, and more innocent. In this voyage, he had acquired a general knowledge of all the islands in that great sea which divides North and South America ; but he had no idea that there was an ocean between him and China. The countries which he had discovered were considered as a part of India. Even after the error which gave rise to this opinion was detected, and the true position of the new

whom he honoured with singular devotion. Of the second, called the *Pinta*, Martin Pinzon was captain, and his brother Francis pilot. The third, named the *Niña*, was under the command of Vincent Yanez Pinzon. These two were light vessels, hardly superior in burden or force to large boats. This Squadron, if it merits that name, was victualled for twelve months, and had on board ninety men, mostly sailors, together with a few

adventurers who followed the fortune of Columbus, and some gentlemen of Isabella's court, whom she appointed to accompany him. Though the expence of the undertaking was one of the circumstances which chiefly alarmed the court of Spain, and retarded so long the negotiation with Columbus, the sum employed in fitting out this Squadron did not exceed four thousand pounds.

world was ascertained, the name has remained, and the appellation of *West Indies* is given by all the people of Europe to the country, and that of *Indians* to its inhabitants. Thus were the West Indies discovered by seeking a passage to the East; and even after the discovery, still conceived to be a part of the eastern hemisphere. The present success of Columbus, his former disappointments, and the glory attending to unexpected a discovery, rendered the court of Spain as eager to forward his designs now, as it had been dilatory before. A fleet of seventeen sail was immediately prepared; all the necessaries for conquest or discovery were embarked, and 1500 men, among whom were several of high rank and fortune, prepared to accompany Columbus, now appointed governor with the most ample authority. It is impossible to determine, whether the genius of this great man, in first conceiving the design of these discoveries, or his sagacity in executing the plan he had conceived, most deserves our admiration. Instead of hurrying from sea to sea, and from one island to another, which, agreeably to the vulgar ambition of navigators, was naturally to be expected, Columbus with such a field before him, unable to turn on either hand without finding new objects of his curiosity and his pride, determined rather to turn to the advantage of the court of Spain the discoveries he had already made, than to acquire for himself the unavailing applause of visiting a number of unknown countries, from which he reaped no other benefit but the pleasure of seeing them. With this view he made for Hispaniola, where he established a colony, and erected forts in the most advantageous grounds for securing the dependence of the natives. Having spent a considerable time in this employment, and laboured for the establishment of this colony with as much zeal and alacrity as if his views had extended no farther, he next proceeded to ascertain the importance of his other discoveries, and to examine what advantages were most likely to be derived from them. He had already touched at Cuba, which, from some specimens, seemed a rich country; but whether it was an island, or a part of some great continent, he was altogether uncertain. To ascertain this point, was the present object of his attention. In coasting along the southern shore of Cuba, Columbus was entangled among a multitude of islands, of which he reckoned 160 in one day. These islands, which were well inhabited, and abounded in all the necessaries of life, gave him an opportunity of reflecting on this fertility of nature, where his countrymen expected nothing but the barren ocean; he called them *Jardin de la Reina*, or the Queen's Garden, in gratitude to his royal benefactress, who was always uppermost in his memory. In the same voyage Jamaica was discovered. But to so many difficulties was Columbus exposed, on an unknown sea, among rocks, shelves, and sands, that he returned to Hispaniola, without learning any thing more certain with regard to Cuba, the main object of this enterprise.

By the first success of this great man, the public diffidence was turned into admiration; but by a continuance of the same success, their admiration degenerated into envy. His enemies in Spain set every spring in motion against him; and there is seldom difficulty in finding specious grounds of accusation against such as are employed in the execution of extensive and complicated plans. An officer was dispatched from Spain, fitted by his character to act the part of a spy and informer, and whose presence plainly demonstrated to Columbus the necessity of returning to Europe, for obviating the objections or calumny of his enemies.

It was not without great difficulty that he was enabled to set out on a third expedition, still more famous than any he had hitherto undertaken. He designed to sail to the southward from the Canaries until he came under the equinoctial line, and then to proceed directly westward, that he might discover what opening that might afford to India, or what new islands, or what continent might reward his labour.

bour. In this navigation, after being long buried in a thick fog, and suffering numberless inconveniencies from the excessive heats and rains between the tropics, the adventurers were at length favoured by a smart gale, and went before it seventeen days to the westward. At the end of this time, a seaman saw land, which was an island on the coast of Guiana, now called Trinidad. Having passed this island, and two others which lie in the mouth of the great river Oronoque, the admiral was surpris'd with an appearance he had never seen before: this was the frightful tumult of the waves, occasioned by a conflict betwixt the tide of the sea, and the rapid current of that immense river. But sailing forward, he plainly perceived that they were in fresh water; and judging rightly that it was improbable any island should supply so vast a river, he began to suspect he had discovered the continent; but when he left the river, and found that the land continued on to the westward for a great way, he was convinced of it. Satisfied with this discovery, he yielded to the uneasiness and distresses of his crew, and bore away for Hispaniola. In the course of this discovery, Columbus landed at several places, where, in a friendly manner, he traded with the inhabitants, and found gold and pearl in considerable plenty.

About this time the spirit of discovery spread itself widely, and many adventurers all over Europe wished to acquire the reputation of Columbus, without possessing his abilities. The Portuguese discovered Brasil, which makes at present the most valuable part of their possessions: Cabot, a native of Bristol, discovered the north-east coasts, which form the United States of America; and Americus Vesputius, a merchant of Florence, sailed to the southern continent; and being a man of address, had the honour of giving his name to half the globe. But no one is now imposed on by the name; it is universally known that Columbus was the first discoverer. The being deprived of the honour of giving name to the new world, was one of the smallest mortifications to which this great man was exposed. For such were the clamours of his enemies, and the ingratitude of the court of Spain, that, after discovering the continent, and making settlements in the islands of America, he was treated like a criminal, and carried over to Europe in irons. When he arrived in Spain, the court began to be ashamed of their ungenerous treatment of this great man, and orders were instantly issued to set him at liberty. He vindicated his conduct, in the presence of the king and queen, in the most satisfactory manner, and gave ample evidence of the wickedness of his enemies. Ferdinand and Isabella expressed their sorrow for what had happened, disavowed their knowledge of it, and joined in promising him protection and future favour. Columbus, however, retained a deep sense of the indignity with which he had been treated. The fetters that he had been loaded with were constantly hung up in his chamber, and he gave orders that when he died they should be buried in his grave. But, notwithstanding the ill treatment which he had received, he undertook another voyage in order to make farther discoveries. He underwent in the course of it great fatigues; and returning to Spain, ended his life at Valladolid on the 20th of May, 1506, in the 59th year of his age. He had the glory of making the one half of the world known to the other; a glory so much the more precious, as it was untaunted by cruelty or rapacity, which disfigured all the exploits of those who came after him, and accomplished the execution of his plan. The succeeding governors of Cuba and Hispaniola endeavoured to purchase the same advantages by the blood of the natives, which Columbus had obtained by his good sense and humanity. These islands contained mines of gold. The Indians only knew where they were situated; and the extreme avarice of the Spaniards, too furious to work by the gentle means of persuasion, hurried them to acts of the most shocking enormity and cruelty against those unhappy men, who, they believed, concealed

part of their treasure. The slaughter once begun, they set no bounds to their fury; in a few years they depopulated Hispaniola, which contained three millions of inhabitants; and Cuba, that had about 600,000. Bartholomew de las Casas, a witness of those barbarous depopulations, says, that the Spaniards went out with their dogs to hunt men. The unhappy savages, almost naked and unarmed, were pursued like deer in the forests, devoured by dogs, killed by gun-shot, or surpris'd and burnt in their habitations.

The Spaniards had hitherto only visited the continent: from what they saw with their eyes, or learned by report, they conjectured that this part of the new world would afford a still more valuable conquest. Fernando Cortez was dispatched from Cuba with 600 men, 18 horses, and a small number of field-pieces. With this inconsiderable force, he propos'd to subdue the most powerful state on the continent of America; this was the empire of Mexico; rich, extensive, and inhabited by millions of Indians passionately fond of war, and then headed by Montezuma, whose fame in arms struck terror into the neighbouring nations. No true history was ever more improbable and romantic than that of this war. The empire of Mexico, it is said, had subsisted for ages: its inhabitants were not rude and barbarous; every thing announced a polished and intelligent people. They knew, like the Egyptians of old, that the year consisted nearly of 365 days. Their superiority in military affairs was the object of admiration and terror over all the continent; and their government, founded on the sure basis of laws combined with religion, seem'd to bid defiance to time itself. Mexico, the capital of the empire, situated in the middle of a spacious lake, was the noblest monument of American industry: it communicated with the continent by immense causeways, which were carried through the lake. The city was admir'd for its buildings, all of stone, its squares and market-places, the shops which glittered with gold and silver, and the sumptuous palaces of Montezuma, some erected on columns of jasper, and containing whatever was most rare, curious, or useful. But all the grandeur of this empire could not defend it against the Spaniards. Cortez, in his march, met with feeble opposition from the nations along the coast of Mexico, who were terrified at their first appearance: the warlike animals on which the Spanish officers were mounted, the artificial thunder which issued from their hands, the wooden castles which had waded them over the ocean, struck a panic into the natives, from which they did not recover till it was too late. Wherever the Spaniards march'd, they spared no age or sex, nothing sacred or profane. At last, the inhabitants of Tlascala, and some other states on the coast, despairing of being able to oppose them, enter'd into their alliance, and join'd armies with those terrible, and, as they believ'd, invincible conquerors. Cortez, thus reinforced, march'd onward to Mexico; and in his progress discover'd a volcano of sulphur and saltpetre, whence he could supply himself with powder. Montezuma heard of his progress, without daring to oppose it. This sovereign is report'd by the boasting Spaniards, to have commanded 30 vassals, of whom each could appear at the head of 100,000 combatants, arm'd with bows and arrows; and yet he dur'd not resist a handful of Spaniards, aided by a few Americans, whose allegiance would be shaken by the first reverse of fortune. Such was the difference between the inhabitants of the two worlds, and such the effect of the Spanish victories, the fame of which always march'd before them.

By sending a rich present of gold, which only whett'd the Spanish avarice, Montezuma hasten'd the approach of the enemy. No opposition is made to their entry into his capital. A palace is set apart for Cortez and his companions, who are already treat'd as the masters of the new world. He had good reason, however, to distrust the affected politeness of this emperor, under which he suspected some plot for his destruction was conceal'd; but he had no pretence for violence;

Montezuma loaded him with kindness, and with gold in greater quantities than he demanded, and his palace was surrounded with artillery, the most frightful of all engines to the Americans. At last a circumstance fell out, which afforded Cortez a pretext for beginning hostilities. In order to secure a communication by sea, to receive the necessary reinforcements, he had erected a fort, and left a small garrison behind him at Vera Cruz, which has since become an emporium of commerce between Europe and America. He understood that the Americans in the neighbourhood had attacked this garrison in his absence, and that a Spaniard was killed in the action; that Montezuma himself was privy to this violence, and had issued orders that the head of the slain Spaniard should be carried through his provinces, to destroy a belief, which then prevailed among them, that the Europeans were immortal. Upon receiving this intelligence, Cortez went in person to the emperor, attended by a few of his most experienced officers. Montezuma pleaded innocence, and Cortez seemed extremely ready to believe him; though at the same time he alleged that the Spaniards in general would never be persuaded of it, unless he returned along with them to their residence, which would remove all jealousy between the two nations. The success of this interview shewed the superiority of European address. A powerful monarch, in the midst of his own palace, and surrounded by his guards, gave himself up a prisoner, to be disposed of according to the will of a few strangers who came to demand him. Cortez had now got into his hands an engine, by which every thing might be accomplished. The Americans had the highest respect, or rather a superstitious veneration for their emperor. Cortez, therefore, by keeping him in his power, allowing him to enjoy every mark of royalty but his freedom, and at the same time, from a thorough knowledge of his character, being able to flatter all his tastes and passions, maintained the easy sovereignty of Mexico, by governing its prince. Did the Mexicans, grown familiar with the Spaniards, begin to abate of their respect? Montezuma was the first to teach them more deference. Was there a tumult excited through the cruelty or avarice of the Spaniards? Montezuma attended the battlements of his prison, and harangued his Mexicans into order and submission. This farce continued a long while: but on one occasion, when Montezuma was shamefully disgracing his character by justifying the enemies of his country, a stone, from an unknown hand, struck him on the temple, which in a few days occasioned his death. The Mexicans, now delivered from this emperor, who co-operated so strongly with the Spaniards, elected a new prince, the famous Guatimozin, who from the beginning discovered an implacable animosity against the Spanish name. Under his conduct the unhappy Mexicans rushed against those very men, whom a little before they had offered to worship. The Spaniards, however, by the dexterous management of Cortez, were too firmly established to be expelled from Mexico. The immense tribute which the grandees of this country had agreed to pay to the crown of Spain, amounted to 600,000 marks of pure gold, besides an amazing quantity of precious stones, a fifth part of which being distributed among the soldiers, stimulated their avarice and their courage, and made them willing to perish, rather than part with so precious a booty. The Mexicans, however, made no small efforts for independence; but all their valour, and despair itself, gave way before what they called the Spanish thunder. Guatimozin and the empress were taken prisoners. This was the prince who, (when he lay stretched on burning coals, by order of one of the receivers of the king of Spain's exchequer, who inflicted the torture to make him discover in what part of the lake he had thrown his riches) said to his high-priest, condemned to the same punishment, and who loudly expressed his sense of the pains that he endured, "Do you take me to lie on a bed of roses?" The high-priest remained silent, and died in an act of obedience to his sovereign. Cortez, by getting a second emperor into his hand, made a complete conquest of Mexico;

Mexico; together with which, the Castille D'Or, Darien, and other provinces, fell into the hands of the Spaniards.

While Cortez and his soldiers were employed in reducing Mexico, they got intelligence of another great empire, situated towards the equinoctial line and the tropic of Capricorn, which was said to abound in gold and silver and precious stones, and to be governed by a prince more magnificent than Montezuma. This was the empire of Peru, which extended in length near thirty degrees, and was the only other country in America which deserved the name of a civilized kingdom. Whether it happened that the Spanish government had not received certain intelligence concerning Peru, or that, being engaged in a multiplicity of other concerns, they did not chuse to adventure on new enterprises; certain it is, that this extensive country, more important than Mexico itself, was reduced by the endeavours, and at the expence of three private persons. The names of these were, Francis Pizarro, Almagro, and Lucques, a wealthy and artful priest. The two former were natives of Panama, men of doubtful birth, and of low education. Pizarro, the soul of the enterprise, could neither read nor write. They sailed over into Spain, and without difficulty obtained a grant of what they should conquer. Pizarro then set out for the conquest of Peru, with 250 foot, 60 horse, and 12 small pieces of cannon, drawn by slaves from the conquered countries. If we reflect that the Peruvians naturally entertained the same prejudices with the Mexicans, in favour of the Spanish nation, and were beside of a character still more soft and unwarlike, it need not surprise us, after what has been said of the conquest of Mexico, that, with this inconsiderable force, Pizarro should make a deep impression on the Peruvian empire. There were particular circumstances likewise, which conspired to assist him, and which, as they discover somewhat of the history, religion, and state of the human mind in this immense continent, it may not be improper to relate.

Mango Capac was the founder of the Peruvian empire. He was one of those uncommon men, who, calm and dispassionate themselves, can observe the passions of their fellow-creatures, and turn them to their own profit or glory. He observed that the people of Peru were naturally superstitious, and had a particular veneration for the sun. He pretended therefore to be descended from that luminary, whose worship he was sent to establish, and whose authority he was entitled to bear. By this story, romantic as it appears, he easily deceived a credulous people, and brought a large extent of territory under his jurisdiction; a larger still he subdued by his arms; but both the force and the deceit he employed for the most laudable purposes. He united and civilised the dispersed and barbarous people; he bent them to laws and arts; he softened them by the institution of a benevolent religion; in short, there was no part of America where agriculture and the arts were so assiduously cultivated, and where the people were of such mild and ingenuous manners. A race of princes succeeded Mango, distinguished by the title of Yncas, and revered by the people as descendants of their great God, the Sun. The twelfth of these was now on the throne, and named Atabalipa. His father, Guaiana Capac, had conquered the province of Quito, which now makes a part of Spanish Peru. To secure himself in the possession, he had married the daughter of the natural prince of that country; and of this marriage was sprung Atabalipa. His elder brother, named Huascar, of a different mother, had claimed the succession to the whole of his father's dominions, not excepting Quito, which devolved on the younger by a double title. A civil war had been kindled on this account, which, after various turns of fortune, and greatly weakening the kingdom, ended in favour of Atabalipa, who detained Huascar, as a prisoner, in the tower of Cusco, the capital of the Peruvian empire. In this feeble and disjointed state

 conquest of  
 Mexico;

was the kingdom of Peru when Pizarro advanced to it. The ominous predictions of religion, too, as in most other cases, joined their force to human calamities. Prophecies were recorded, dreams were recollected, which foretold the subjection of the empire by unknown persons, whose description was supposed to correspond to the appearance of the Spaniards. In these circumstances, Atabalipa, instead of opposing the Spaniards, set himself to procure their favour. Pizarro, however, whose temper partook of the meanness of his education, had no conception of dealing gently with those he called Barbarians; but who, however, though less acquainted with the cruel art of destroying their fellow-creatures, were more civilised than himself. While he was engaged in conference, therefore, with Atabalipa, his men, as they had been previously instructed, furiously attacked the guards of that prince, and having butchered 3000 of them, as they were pressing forward, without regard to their particular safety, to defend the sacred person of their monarch, seized Atabalipa himself, whom they carried off to the Spanish quarters. Pizarro, with the sovereign in his hands, might already be deemed the master of Peru: for the inhabitants of this country were as strongly attached to their emperor, as the Mexicans themselves. Atabalipa was not long in their hands before he began to treat of his ransom. On this occasion the ancient ornaments, amassed by a long line of magnificent kings, the hallowed treasures of the most magnificent temples, were brought out to save him, who was the support of the kingdom and of the religion. While Pizarro was engaged in this negotiation, by which he proposed, without releasing the emperor, to get into his possession an immense quantity of his beloved gold, the arrival of Almagro caused some embarrassment in his affairs. The friendship, or rather the external show of friendship, between these men, was solely founded on the principle of avarice, and a bold enterprising spirit, to which nothing appeared too dangerous that might gratify their ruling passion. When their interests, therefore, happened to interfere, it was not to be thought that any measures could be kept between them. Pizarro expected to enjoy the most considerable share of the treasure arising from the emperor's ransom, because he had the chief merit in acquiring it. Almagro insisted on being upon an equal footing: and at length, lest the common cause might suffer by any rupture between them, this disposition was agreed to. The ransom was paid without delay, a sum exceeding their conception, but not sufficient to gratify their avarice. It amounted to 1,500,000*l.* sterling, and, considering the value of money at that time, was prodigious: on the dividend, after deducting a fifth for the king of Spain, and the shares of the chief commanders and officers, each private soldier had above 2000*l.* English money. With such fortunes, it was not to be expected that a mercenary army would patiently submit to the rigours of military discipline. They insisted on being disbanded, that they might enjoy the fruits of their labour in quiet. Pizarro complied with this demand; sensible that avarice would still detain many in his family, and that those who returned with such magnificent fortunes, would induce new adventurers to pursue the same road to wealth. These wise reflections were abundantly verified; it was impossible to send out better recruiting-officers than those who had themselves so much profited by the field; new soldiers constantly arrived, and the American armies never wanted reinforcement.

This immense ransom was only a farther reason for detaining Atabalipa in confinement, until they discovered whether he had another treasure to gratify their avarice. But whether they believed he had no more to give, and were unwilling to employ their troops in guarding a prince from whom they expected no farther advantage, or that Pizarro had conceived an aversion against the Peruvian emperor, on account of some instances of craft and duplicity which he observed in his character,

character, and which he conceived might prove dangerous to his affairs, it is certain, that by his command Atabalipa was put to death. To justify this cruel proceeding, a pretended charge was exhibited against the unhappy prince, in which he was accused of idolatry, or having many concubines, and other circumstances equally impertinent. The only just ground of accusation against him was, that his brother Huefcar had been put to death by his command; and even this was considerably palliated, because Huefcar had been plotting his destruction, that he might establish himself on the throne. Upon the death of the Ynca, a number of candidates appeared for the throne. The principal nobility set up the full brother of Huefcar; Pizarro set up a son of Atabalipa; and two generals of the Peruvians endeavoured to establish themselves by the assistance of the army. These distractions, which in another empire would have been extremely hurtful, and even here at another time, were at present rather advantageous to the Peruvian affairs. The candidates fought against each other; their battles accustomed these harmless people to blood; and such is the preference of a spirit of any kind raised in a nation to a total lethargy, that in the course of those quarrels among themselves, the inhabitants of Peru assumed some courage against the Spaniards, whom they regarded as the ultimate cause of all their calamities. The losses which the Spaniards met with in these quarrels, though inconsiderable in themselves, were rendered dangerous, by lessening the opinion of their invincibility, which they were careful to preserve among the inhabitants of the new world. This consideration engaged Pizarro to conclude a truce; and this interval he employed in laying the foundations of the famous city Lima, and in settling the Spaniards in the country. But as soon as a favourable opportunity offered, he renewed the war against the Indians, and after many difficulties made himself master of Cusco, the capital of the empire. While he was engaged in these conquests, new grants and supplies arrived from Spain. Pizarro obtained 200 leagues along the sea-coast, to the southward of what had been before granted, and Almagro 200 leagues to the southward of Pizarro's government. This division occasioned a warm dispute between them, each reckoning Cusco within his own district. But the dexterity of Pizarro brought about a reconciliation. He persuaded his rival, that though the country which really belonged to him, lay to the southward of Cusco, it was equally rich and fertile, and might be as easily conquered as Peru. He offered him his assistance in the expedition, the success of which he did not even call in question.

Almagro, that he might have the honour of subduing a kingdom for himself, listened to his advice; and joining as many of Pizarro's troops to his own as he judged necessary, penetrated, with great danger and difficulty, into Chili; losing many of his men as he passed over mountains of an immense height, and always covered with snow. He reduced, however, a very considerable part of this country. But the Peruvians were now become too much acquainted with war, not to take advantage of the division of the Spanish troops. They made an effort, for regaining their capital, in which, Pizarro being indisposed, and Almagro removed at a great distance, they were well nigh successful. The latter, however, no sooner got notice of the siege of Cusco, than, relinquishing all views of distant conquests, he returned, to secure the grand object of his former labours. He raised the siege, with vast carnage; but having obtained possession of this city, he would not resign it to Pizarro, who now approached with an army, being ignorant of any other enemy but the Peruvians. This dispute occasioned a long and bloody struggle between them, in which the turns of fortune were various, and the resentment fierce on both sides. At last, Almagro, in an advanced age, fell a victim to the security of a rival, in whose dangers and triumphs he had long shared, and with whom, from the beginning of the enterprise, he had been intimately connected.

needed. During the course of this civil war, many Peruvians served in the Spanish armies, and learned, from the practice of Christians, to commit cruelties which are a disgrace to humanity. That unhappy nation, however, at length took a very remarkable resolution. They saw the ferocity of the Europeans, their unextinguishable resentment and avarice, and they conjectured that these passions would never permit their contests to subside. "Let us retire," said they, "from among them; let us fly to our mountains; they will speedily destroy each other, and then we may return in peace to our former habitations." The resolution was instantly put in practice; the Peruvians dispersed, and left the Spaniards in their capital. Had the force on each side been exactly equal, this singular policy of the natives of Peru might have been attended with success. But the victory of Pizarro put an end to Almagro's life, and to the hopes of the Peruvians, who have never since ventured to make head against the Spaniards.

Pizarro, now sole master of the field, and of the most extensive empire in the world, was still urged on, by his ambition, to undertake new enterprises. The southern countries of America, into which he had some time before dispatched Almagro, offered the richest conquest. Towards this quarter, the mountains of Potosi, composed almost of entire silver, had been discovered, the shell of which only remains at present. He therefore followed the track of Almagro into Chili, and reduced another part of that country. Orellana, one of his commanders, passed the Andes, and sailed down to the mouth of the river of Amazons; an immense navigation, which discovered a rich and delightful country; but as it is mostly flat, and therefore not abounding in minerals, the Spaniards then, and ever since, neglected it. Pizarro, meeting with repeated success, and having no superior to control, nor rival to keep him within bounds, now gave loose reins to the natural ferocity of his temper, and behaved with the basest tyranny and cruelty against all who had not concurred in his designs. This conduct raised a conspiracy against him, to which he fell a sacrifice in his own palace, and in the city of Lima, which he himself had founded. The partisans of old Almagro declared his son, of the same name, their viceroy. But the greater part of the nation, though extremely well satisfied with the fate of Pizarro, did not concur with this declaration. They waited the orders of the emperor Charles V. then king of Spain, who sent over Vaca di Castro to be their governor. This man, by his integrity and wisdom, was admirably well fitted to heal the wounds of the colony, and to place every thing on the most advantageous footing, both for it and for the mother country. By his prudent management, the mines of La Plata and Potosi, which were formerly a matter of private plunder, became an object of public utility to the court of Spain. The parties were silenced or crushed; young Almagro, who would hearken to no terms of accommodation, was put to death; and a tranquillity, since the arrival of the Spaniards unknown, was restored to Peru. It seems, however, that Di Castro had not discovered sufficient address in gaining the favour of the Spanish ministry, by proper bribes or promises, which in that age were expected from the governor of so rich a country. By their advice, a council was sent over to control Di Castro, and the colony was again unsettled. The party spirit, but just extinguished, began to blaze anew; and Gonzalo, the brother of the famous Pizarro, set himself at the head of his brother's partisans, with whom many new malcontents had united. It was now no longer a dispute between governors about the bounds of their jurisdiction. Gonzalo Pizarro only paid a nominal submission to the king. He gained strength daily; and even went so far as to behead a governor who was sent over to curb him. He won the confidence of the admiral of the Spanish fleet in the South Seas, by whose means he proposed to hinder the landing of any troops from Spain; and he had a view of uniting the inhabitants of Mexico in his revolt.

Such was the situation of affairs, when the court of Spain, sensible of their mistake in not sending into America men whose character and virtue only, and not impatience and cabal, pleaded in their behalf, dispatched with unlimited powers Peter de la Gasca, a man differing only from Castro by being of a more mild and insinuating behaviour, but with the same love of justice, the same greatness of soul, and the same disinterested spirit. All those who had not joined in Pizarro's revolt, flocked to his standard; many of his friends, charmed with the behaviour of Gasca, forsook their old connections; the admiral was gained over by insinuation, to return to his duty; and Pizarro himself was offered a full indemnity, provided he should return to the allegiance of the Spanish crown. But so intoxicating are the ideas of royalty, that Pizarro was inclined to run every hazard rather than submit to an officer of Spain. With those of his partisans, therefore, who still continued to adhere to his interest, he determined to venture a battle, in which he was conquered and taken prisoner. His execution followed soon after; and thus the brother of him, who conquered Peru for the crown of Spain, fell a sacrifice to the security of the Spanish dominion over that country.

The conquest of the great empires of Mexico and Peru is the only part of the American history which deserves to be treated under the present head. What relates to the reduction of the other parts of the continent, or of the islands, if it contains either instruction or entertainment, shall be recorded under those particular countries. We now proceed to examine the manners, government, religion, and whatever composes the character of the natives of America: and as these are extremely similar all over this part of the globe, we shall speak of them in general, in order to save continual repetitions; and whatever is peculiar or remarkable in the respective states, shall be particularly delineated, as they pass in revision before us.

---

#### Of the ORIGINAL INHABITANTS of A M E R I C A.

THE discovery of America has not only opened a new source of wealth to the busy and commercial part of Europe, but an extensive field of speculation to the philosopher, who would trace the character of man under various forms of society, and observe the movements of the human heart, or the operation of the human understanding, when untutored by science, and untainted with corruption. So striking seemed the disparity between the inhabitants of Europe and the natives of America, that some speculative men ventured to affirm, that it was impossible they should be of the same species, or derived from one common source. This conclusion, however, is precipitate and erroneous. The complexion, form, and characters of mankind may be infinitely varied, according to the different degrees of improvement at which they are arrived, the nature of their climate\*, the manner in which they acquire the necessaries of life, the force of custom and habit, and a multiplicity of other circumstances too particular to be mentioned, and too various to be reduced under any general head. But the great outlines of humanity are to be discovered among them all, notwithstanding the various shades which characterise nations, and distinguish them from each other.

When the thirst of gold carried the inhabitants of Europe beyond the Atlantic,

\* See an ingenious Essay on the Causes of the Variety of Complexion and Figure in the Human Species, by Dr. Smith, of New Jersey.

they found the inhabitants of the New World immerfed in what they reckoned barbarity, but which, however, was a ftate of honeft independence and noble fim- plicity. Except the inhabitants of the great empires of Peru and Mexico, who, comparatively fpeaking, were refined nations, the natives of America were unac- quainted with almoft every European art; even agriculture itfelf, the moft ufe- ful of them all, was hardly known, or cultivated very fparingly. The only kind of labour on which they depended for acquiring the neceffaries of life, was that of hunting the wild animals, which their mountains and forefts fupplied in great abundance. This exercife, which among them is a moft ferious occupation, gives a ftrength and agility to their limbs, unknown among other nations. The fame caufe perhaps renders their bodies in general, where the rays of the fun are not too violent, un- commonly ftaight and well proportioned. Their mufcles are firm and ftrong; their bodies and heads flattifh, which is the effect of art; their features are regular, but their countenances fierce; their hair long, black, lank, and as ftrong as that of a horfe. The colour of their fkin is a reddifh brown, admired among them, and heightened by the conftant ufe of bear's fat and paint. The character of the Indians is altogether founded upon their circumftances and way of life. A people who are conftantly employed in procuring the means of a precarious fubfiftence, who live by hunting the wild animals, and who are generally engaged in war with their neighbours, cannot be fupposed to enjoy much gaiety of temper, or a high flow of fpirits. The Indians, therefore, are in general grave even to fadnefs; they have nothing of that giddy vivacity peculiar to fome nations of Europe; and they defpife it. Their behaviour to thofe about them is regular, modeft, and refpect- ful. Ignorant of the arts of amufement, of which that of faying trifles agreeably is one of the moft confiderable, they never fpeak but when they have fomething important to obferve; and all their actions, words, and even looks, are attended with fome meaning. This is extremely natural to men who are almoft continually engaged in purfuits, which to them are of the higheft importance. Their fubfiftence depends intirely on what they procure with their hands; and their lives, their honour, and every thing dear to them, may be loft by the fmalleft inattention to the defigns of their enemies. As they have no particular object to attach them to one place rather than to another, they fly wherever they expect to find the neceffaries of life in greateft abundance. Cities, which are the effects of agriculture and arts, they have none. The different tribes or nations are for the fame reafon extremely fmall, when compared with civilifed focieties, in which, induftry, arts, agriculture, and commerce, have united a vaft number of individuals, whom a complicated lux- ury renders ufe- ful to each other. Thefe fmall tribes live at an immense diftance; they are feparated by a defert frontier, and hid in the bofom of impenetrable and almoft boundlefs forefts.

There is eftablifhed in each fociety a certain fpecies of government, which pre- vails, with little variation, over the whole of this continent; and it may alfo be ob- ferved that their manners and way of life are nearly fimilar and uniform. Without arts, riches, or luxury, the great inftruments of fubjection in polished focieties, an American can render himfelf confiderable among his companions, only by a fuperiority in perfonal qualities of body or mind. Where all enjoy the fame education, all are pretty much equal, and will defire to remain fo. Liberty, therefore, is the prevailing paffion of the Americans; and their government, un- der the influence of this fentiment, is better fecured than by the wifeft poli- tical regulations. Though free in the full- eft fenfe of the word, they do not de- fpife all fort of authority; they are attentive to the voice of wifdom, which expe- rience has conferred on the aged, and they inlift under the banners of the chief, in whofe valour and military addrefs they have learned to re- pofe their confidence. every society, therefore, there is to be considered the power of the chief and of the elders; and according as the government inclines more to the one or to the other, it may be regarded as monarchical, or as a species of aristocracy. Among those tribes which are most engaged in war, the power of the chief is naturally predominant; because the idea of having a military leader was the first source of his superiority, and the continual exigencies of the state requiring such a leader, will continue to support, and even to enhance it. His power, however, is rather persuasive than coercive; he is revered as a father, rather than feared as a monarch. He has no guards, no prisons, no officers of justice; and a single act of ill-judged violence would drive him from the throne. The elders, in the other form of government, which may be considered as an aristocracy, have no more power. In some tribes, indeed, there is a kind of hereditary nobility, whose influence being constantly augmented by time, is more considerable. But this source of power, which depends chiefly on the imagination, by which we annex to the merit of our contemporaries that of their forefathers, is too refined to be very common among the natives of America. In most countries, therefore, age alone is sufficient for acquiring respect, influence, and authority. It is age which teaches experience, and experience is the only source of knowledge among a barbarous people. Among the Indians, business is conducted with such simplicity as recalls, to those acquainted with antiquity, a picture of the most early ages. The heads of families meet together in a house or cabin appointed for the purpose. Here the business is discussed; and here those of the nation, distinguished for their eloquence or wisdom, have an opportunity of displaying their talents. The orators\*, like those of Homer, express themselves in a bold figurative style, stronger and more expreive than nations softened by refinement can well bear, and with gestures equally violent, but often extremely natural and affecting. When the business is over, and they happen to be well provided with food, they appoint a feast upon the occasion,

\* I may challenge (says Mr. Jefferson, in his Notes on Virginia) the whole orations of Demosthenes and Cicero, and of any more eminent orator, if Europe has furnished more eminent, to produce a single passage superior to the speech of Logan, a Mingo chief, to lord Dunmore, when governor of this state; and, as a testimony of their talents in this line, I beg leave to introduce it, first stating the incidents necessary for understanding it.

In the spring of the year 1774, a robbery and murder were committed on the inhabitants of the frontiers of Virginia, by two Indians of the Shawnee tribe. The neighbouring whites, according to their custom, undertook to punish this outrage in a summary way. Col. Cresap, a man infamous for the many murders he had committed on those much-injured people, collected a party, and proceeded down the Kanaway in quest of vengeance. Unfortunately a canoe of women and children, with one man only, was seen coming from the opposite shore, unarmed, and unsuspecting an hostile attack from the whites. Cresap and his party concealed themselves on the bank of the river, and the moment the canoe reached the shore, singled out their objects, and, at one fire, killed every person in it. This happened to be the family of Logan, who had long been distinguished as a friend to the whites. This unworthy return provoked his vengeance; he accordingly signalled himself in the war which ensued. In the autumn of the same year, a decisive

battle was fought at the mouth of the great Kanaway, between the collected forces of the Shawnees, Mingo's, and Delawars, and a detachment of the Virginia militia. The Indians were defeated, and sued for peace. Logan, however, disdained to be seen among the suppliant. But lest the sincerity of a treaty should be mistrusted, from which so distinguished a chief absented himself, he sent by a messenger the following speech to be delivered to lord Dunmore:

"I appeal to any white man to say if ever he entered Logan's cabin hungry, and he gave him not meat; if ever he came cold and naked, and he clothed him not. During the course of the last long and bloody war, Logan remained idle in his cabin, an advocate for peace. Such was my love for the whites, that my countrymen pointed, as they passed, and said, 'Logan is the friend of white men.' I had even thought to have lived with you, but for the injuries of one man. Col. Cresap, the last spring, in cold blood, murdered all the relations of Logan, not sparing even my women and children. There runs not a drop of my blood in the veins of any living creature. This called on me for revenge. I have sought it: I have killed many; I have glutted my vengeance. For my country, I rejoice at the beams of peace. But do not labour a thought that mine is the joy of fear. Logan never felt fear. He will not turn on his heel to save his life. Who is there to mourn for Logan?—Not one."

of which almost the whole nation partakes. The feast is accompanied with a song, in which the real or fabulous exploits of their forefathers are celebrated. Their dances (though, like those of the Greeks and Romans, chiefly of the military kind) and music accompany every feast.

It often happens, that those different tribes or nations, scattered as they are at great intervals, meet in their excursions after prey. If there subsists no animosity between them, which seldom is the case, they behave in the most friendly and courteous manner; but if they happen to be in a state of war, or if there has been no previous intercourse between them, all who are not friends are deemed enemies, and they fight with the most unrelenting fury.

War, if we except hunting, is the only employment of the men; as to every other concern, and even their little agriculture; it is left to the women. War, when it does not arise from an accidental rencounter or interference, is entered upon either to revenge themselves for the death of some lost friends, or to acquire prisoners, who may assist them in their hunting, and whom they adopt into their society. These hostilities are either undertaken by some private adventurers, or at the instance of the whole community. In the latter case, all the young men, who are disposed to go out to battle (for no one is compelled contrary to his inclination), give a piece of wood to the chief, as a token of their design to accompany him; for every thing among these people is transacted with a great deal of ceremony and many forms. The chief, who is to conduct them, fasts several days, during which he converses with no one, and is particularly careful to observe his dreams, which the presumption natural to savages generally renders as favourable as he could desire. A variety of other superstitions and ceremonies are observed. One of the most hideous is setting their war-kettle on the fire, as an emblem that they are going out to devour their enemies; which among some nations must formerly have been the case, since they still continue to express it in clear terms, and use an emblem significant of the ancient usage. Then they dispatch a porcelane, or large shell, to their allies, inviting them to come along, and drink the blood of their enemies. For with the Americans, as with the Greeks of old,

“ A generous friendship no cold medium knows,  
“ Burns with one love, with one resentment glows, &c.”

They think that those in their alliance must not only adopt their enmities, but have their resentment wound up to the same pitch with themselves. And, indeed, no people carry their friendships, or their resentment, so far as they do; and this is what should be expected from their peculiar circumstances; for the Americans who live in small societies, who see few objects and few persons, become wonderfully attached to these objects and persons, and cannot be deprived of them without feeling themselves miserable. Their ideas are too confined to enable them to entertain just sentiments of humanity, or universal benevolence. But this very circumstance, while it makes them cruel to an incredible degree, towards those with whom they are at war, adds a new force to their particular friendships, and to the common tie which unites the members of the same tribe, or of those different tribes which are in a state of alliance. Without attending to this reflection, some facts we are going to relate, would excite our wonder without informing our reason, and we should be bewildered in a number of particulars, seemingly opposite to each other, without being sensible of the general cause from which they proceed.

Having finished all the ceremonies previous to the war, they issue forth with their faces blackened with charcoal, intermixed with streaks of vermilion, which

give them a most horrid appearance. Then they exchange their cloaths with their friends, and dispose of all their finery to the women, who accompany them to a considerable distance, to receive those last tokens of eternal friendship.

The great qualities in an Indian war are vigilance and attention, to give and to avoid a surprize; and indeed in these they are superior to all other nations. Accustomed to continual wandering in the forests, having their perceptions sharpened by keen necessity, and living in every respect according to nature, their external senses have a degree of acuteness almost incredible. They can trace out their enemies, at an immense distance, by the smoke of their fires, which they smell, and by the tracks of their feet on the ground, imperceptible to an European eye, but which they count and distinguish with the utmost facility. They can even distinguish the different nations with whom they are acquainted, and can determine the precise time when they passed, where an European could not, with all his glasses, distinguish footsteps at all. These circumstances, however, give them no superiority, because their enemies are equally skilful. When they go out, therefore, they take care to avoid making use of any thing by which they might run the risque of a discovery. They light no fire to warm themselves, or to prepare their victuals: they lie close to the ground all day, and travel only in the night; and marching along in files, he that closes the rear diligently covers with leaves the tracks of his own feet, and of theirs who preceded him. When they halt to refresh themselves, scouts are sent out to reconnoitre the country, and beat up every place where they suspect an enemy to lie concealed. In this manner they enter unawares the villages of their foes; and, while the flower of the nation are engaged in hunting, massacre all the children, women, and helpless old men, or make prisoners of as many as they can manage, or have strength enough to be useful to their nation. But when the enemy is apprised of their design, and coming on in arms against them, they throw themselves flat on the ground among the withered herbs and leaves, which their faces are painted to resemble. Then they allow a part to pass unmolested, when all at once, with a tremendous shout, rising up from their ambush, they pour a storm of musket-bullets on their foes. The party attacked returns the same cry. Every one shelters himself with a tree, and returns the fire. Thus does the battle continue until one party is so much weakened as to be incapable of farther resistance. But if the force on each side continues nearly equal, the fierce spirit of the savages, inflamed by the loss of their friends, can no longer be restrained. They abandon their distant war, they rush upon one another with clubs and hatchets in their hands, magnifying their own courage, and insulting their enemies with the bitterest reproaches. A cruel combat ensues, death appears in a thousand hideous forms, which would congeal the blood of civilized nations to behold, but which rouse the fury of savages. They trample, they insult over the dead bodies, tearing the scalp from the head, wallowing in their blood like wild beasts, and sometimes devouring their flesh. The flame rages on till it meets with no resistance; then the prisoners are secured, those unhappy men, whose fate is a thousand times more dreadful than theirs who have died in the field. The conquerors set up a hideous howling to lament the friends they have lost. They approach in a melancholy and severe gloom to their own village; a messenger is sent to announce their arrival; and the women, with frightful shrieks, come out to mourn their dead brothers or their husbands. When they are arrived, the chief relates in a low voice to the elders a circumstantial account of every particular of the expedition. The orator proclaims aloud this account to the people, and as he mentions the names of those who have fallen, the shrieks of the women are redoubled. The men too join in these cries, according as each is most connected with the deceased by blood or friendship. The last ceremony is the proclamation of

of the victory; every individual then forgets his private misfortunes, and joins in the triumph of his nation; all tears are wiped from their eyes, and by an unaccountable transition, they pass in a moment from the bitterness of sorrow to an extravagance of joy. But the treatment of the prisoners, whose fate all this time remains undecided, is what chiefly characterises the savages.

We have already mentioned the strength of their affections or resentments. United as they are in small societies, connected within themselves by the firmest ties, their friendly affections, which glow with the most intense warmth within the walls of their own village, seldom extend beyond them. They feel nothing for the enemies of their nation; and their resentment is easily extended from the individual who has injured them, to all others of the same tribe. The prisoners, who have themselves the same feelings, know the intentions of their conquerors, and are prepared for them. The person who has taken the captive attends him to the cottage, where, according to the distribution made by the elders, he is to be delivered to supply the loss of a citizen. If those who receive him have their house weakened by war or other accidents, they adopt the captive into their family, of which he becomes a member. But if they have no occasion for him, or their resentment for the loss of their friends be too high to endure the sight of any connected with those who were concerned in it, they sentence him to death. All those who have met with the same severe sentence being collected, the whole nation is assembled at the execution, as for some great solemnity. A scaffold is erected, and the prisoners are tied to the stake, where they commence their death-song, and prepare for the ensuing scene of cruelty with the most undaunted courage. Their enemies, on the other side, are determined to put it to the proof, by the most refined and exquisite tortures. They begin at the extremity of the captive's body, and gradually approach the vital parts. One plucks out his nails by the roots; another takes a finger into his mouth, and tears off the flesh with his teeth; a third thrusts the finger, mangled as it is into the bowl of a pipe made red hot, which he smoaks like tobacco; then they pound his toes and fingers to pieces between two stones; they pull off the flesh from the teeth, and cut circles about his joints, and gashes in the fleshy parts of his limbs, which they fear immediately with red-hot irons, cutting, burning, and pinching them successively; they tear this flesh, thus mangled and roasted, bit by bit, devouring it with greediness, and smearing their faces with the blood in an enthusiasm of fury. When they have thus torn off the flesh, they twist the bare nerves and tendons about an iron, tearing and snapping them, whilst others are employed in pulling and extending their limbs in every way that can increase the torment. This continues often five or six hours; and sometimes, such is the strength of the savages, days together. Then they frequently unbind him, to give a breathing to their fury, to think what new torments they shall inflict, and to refresh the strength of the sufferer, who, wearied out with a variety of torture, often falls into so profound a lethargy, that they are obliged to apply the fire to awake him, and renew his sufferings. He is again fastened to the stake, and again they renew their cruelty: they stick him all over with small matches of wood, that easily take fire, but burn slowly; they continually run sharp reeds into every part of his body; they drag out his teeth with pincers, and thrust out his eyes; and lastly, after having burned his flesh from the bones with slow fires; after having so mangled the body that it is all one wound; after having mutilated his face in such a manner that it carries nothing human in it; after having peeled the skin from the head, and poured a heap of red-hot coals or boiling water on the naked skull, they once more unbind the wretch, who, blind and staggering with pain and weakness, assaulted and pelted upon every side with clubs and stones, now up, now down, falling into their fires at every step, reels hither and thither, until one of the chiefs, whether out of compassion, or weary of cruelty, puts an end to his life with

a club or dagger. The body is then put into a kettle, and this atrocious employment is succeeded by a feast as atrocious.

The women, forgetting the human as well as the female nature, and transformed into something worse than furies, even outdo the men in this scene of horror; while the principal persons of the country sit round the stake, smoking and looking on without the least emotion. What is most extraordinary, the sufferer himself, in the little intervals of his torments, smokes too, appears unconcerned, and converses with his torturers about indifferent matters. Indeed, during the whole time of his execution, there seems a contest which shall exceed, they in inflicting the most horrid pains, or he in enduring them, with a firmness and constancy almost incredible: not a groan, not a sigh, not a distortion of countenance is perceivable; he possesses his mind entirely in the midst of his torments; he recounts his own exploits; he informs them what cruelties he has inflicted upon their countrymen, and threatens them with the revenge that will attend his death; and, though his reproaches exasperate them to a perfect madness of rage and fury, he continues his insults even of their ignorance in the art of tormenting, pointing out more exquisite methods, and more sensible parts of the body to be afflicted. The women have this part of courage as well as the men; and it is as rare for an Indian not to display it, as it would be for any European to suffer as an Indian. Such is the wonderful power of an early institution, and a ferocious thirst of glory. *I am brave and intrepid, exclaims the savage in the face of his tormentors; I fear not death, nor any kind of tortures; those who fear them are cowards; they are less than women; life is nothing to those that have courage: may my enemies be confounded with despair and rage! Oh! that I could devour them, and drink their blood to the last drop!*

These circumstances of cruelty, which so exceedingly degrade human nature, ought not, however, to be omitted, because they serve to throw, in the strongest light, to what an inconceivable degree of barbarity the passions of men may be carried, when let loose from the government of reason, and uninfluenced by the dictates of Christianity, the only religion that teaches compassion ever to our enemies.

Nothing in the history of mankind, as I have already observed, forms a stronger contrast than this cruelty of the savages towards those with whom they are at war, and the warmth of their affection towards their friends, who consist of all those who live in the same village, or are in alliance with it: among these all things are common; and this, though it may in part arise from their not possessing very distinct notions of separate property, is chiefly to be attributed to the strength of their attachment; because, in every thing else, with their lives as well as their fortunes, they are ready to serve their friends. Their houses, their provision, even their young women, are not enough to oblige a guest. Has any one of their neighbours succeeded ill in his hunting? Has his harvest failed? or is his house burned? These misfortunes are speedily compensated by the benevolence and regard of his fellow-citizens; but to the enemies of his country, or to those who have privately offended, the American is implacable. He conceals his resentment; he appears reconciled, until by some treachery or surprise he has an opportunity of executing an horrible revenge. No length of time is sufficient to allay his fury; no distance of place great enough to protect its object; he crosses the steepest mountains, he pierces the most impracticable forests, and traverses the most hideous bogs and deserts for several hundreds of miles; bearing the inclemency of the seasons, the fatigue of the expedition, the extremes of hunger and thirst, with patience and cheerfulness, in hopes of surprising his enemy, on whom he exercises the most shocking barbarities, even to the eating of his flesh. To such extremes do the Indi-

ans push their friendship or their enmity; and such it deed, in general, is the character of all strong and uncultivated minds.

But what we have said respecting the Indians would be a faint picture, did we omit observing the force of their friendship, which principally appears by the treatment of their dead. When any one of the society is cut off, he is lamented by the whole; on this occasion a thousand ceremonies are practised, denoting the most lively sorrow. Of these, the most remarkable, as it discovers both the height and continuance of their grief, is what they call the feast of the dead, or the feast of souls. The day of this ceremony is appointed by public order; and nothing is omitted, that it may be celebrated with the utmost formality. The neighbouring tribes are invited to be present. At this time, all who have died since the last solemn occasion (which is renewed every ten years among some tribes, and every eight among others), are taken out of their graves; those who have been interred at the greatest distance from the villages are diligently sought for, and brought to this great rendezvous of carcases.

It is not difficult to conceive the horror of this general disinterment. I cannot describe it in a more lively manner than it is done by Lafitau, to whom we are indebted for the most authentic account of those nations.

Without question, says he, the opening of these tombs displays one of the most striking scenes that can be conceived: this humbling portrait of human misery, in which death is painted in a thousand various shapes of horror, in the several carcases, according to the degree in which corruption has prevailed over them, or the manner in which it has attacked them. Some appear dry and withered; others have a sort of parchment upon their bones; some look as if they were baked and smoked, without any appearance of rottenness: some are just turning towards the point of putrefaction; whilst others are all swarming with worms, and drowned in corruption. I know not which ought to strike us most, the horror of so shocking a sight, or the tender piety and affection of these poor people towards their departed friends; for nothing deserves our admiration more than that eager diligence and attention with which they discharge this melancholy duty of their tenderities; gathering up carefully even the smallest bones, handling the carcases, disgusting as they are with every thing loathsome, cleansing them from the worms, and carrying them upon their shoulders through tiresome journeys of several days, without suffering any other emotions to arise than those of regret for having lost persons who were so dear to them in their lives, and so lamented in their death.

They bring them into their cottages, where they prepare a feast in honour of the dead; during which their great actions are celebrated, and all the tender intercourses which took place between them and their friends are piously called to mind. The strangers, who have come sometimes many hundred miles to be present on the occasion, join in tender condolence; and the women, by frightful shrieks, demonstrate that they are pierced with the sharpest sorrow. Then the dead bodies are carried from their respective cabins for general reinterment. A great pit is dug in the ground, and thither, at a certain time, each person, attended by his family and friends, marches in solemn silence, bearing the remains of a son, a father, or a brother. When they are all convened, the dead bodies, or the dust of those which were quite corrupted, are deposited in the pit: then the torrent of grief breaks out anew. Whatever they possess most valuable is interred with the dead. The strangers are not wanting in their generosity, and confer those presents which they have brought along with them for the purpose. Then all present go down into the pit, and every one takes a little of the earth, which they afterwards preserve with the most religious care. The bodies, ranged in order, are covered with entire new furs, and

over these with bark, on which they throw stones, wood and earth. Then taking their last farewell, they return each to his own cabin.

We have mentioned, that in this ceremony the savages offer, as presents to the dead, whatever they value most highly. This custom, which is universal, arises from a rude notion of the immortality of the soul. They believe this doctrine most firmly, and it is the principal tenet of their religion. When the soul is separated from the body of their friends, they conceive that it still continues to hover around it, and to require and take delight in the same things with which it formerly was pleased. After a certain time, however, it forsakes this dreary mansion, and departs far westward into the land of spirits. They have even gone so far as to make a distinction between the inhabitants of the other world; some, they imagine, particularly those who in their life-time have been fortunate in war, possess a high degree of happiness, have a place for hunting and fishing, which never fails, and enjoy all sensual delights, without labouring hard in order to procure them. The souls of those, on the contrary, who happen to be conquered or slain in war, are extremely miserable after death.

Their taste for war, which forms the chief ingredient in their character, gives a strong bias to their religion. Areskou, or the god of battle, is revered as the great deity of the Indians. Him they invoke before they go into the field; and according as his disposition is more or less favourable to them, they conclude that they shall be more or less successful. Some nations worship the sun and moon; among others there are a number of traditions, relative to the creation of the world, and the history of the gods: traditions which resemble the Grecian fables, but which are more inconsistent and infinitely less agreeable. But religion is not the prevailing character of the Indians; and except when they have some immediate occasion for the assistance of their gods, they pay them no sort of worship. Like all rude nations, however, they are strongly addicted to superstition. They believe in the existence of a number of good and bad genii or spirits, who interfere in the affairs of mortals, and produce all our happiness or misery. It is from the evil genii, in particular, that our diseases proceed; and it is to the good genii we are indebted for a cure. The ministers of the genii are the jugglers, who are also the only physicians among the savages. These jugglers are supposed to be inspired by the good genii, most commonly in their dreams, with the knowledge of future events; they are called in, and are supposed to be informed by the genii whether the patients will recover, and in what manner they must be treated. But these spirits are extremely simple in their system of physic, and in almost every disease, direct the juggler to the same remedy. The patient is inclosed in a narrow cabin, in the midst of which is a stone red hot; on this they throw water, until he is well soaked with the warm vapour and his own sweat. Then they hurry him from the baguio, and plunge him suddenly into the next river. This coarse method, which destroys many lives, often performs very extraordinary cures. The jugglers have likewise the use of some specifics of wonderful efficacy; and all the savages are dexterous in curing wounds by the application of herbs. But the power of these remedies is always attributed to the magical ceremonies with which they are administered.

It should be observed by the reader, that the particulars which have just been mentioned concerning the manner of the Americans, chiefly relate to the inhabitants of North America. The manners and general characteristics of great part of the original inhabitants of South America were very different. On the first appearance of the inhabitants of the New World, their discoveries found them to be in many particulars very unlike the generality of the people of the ancient hemisphere. They were different in their features and complexions; they were not

only averſe to toil, but ſeemed incapable of it; and when rouſed by force from their native indolence, and compelled to work, they ſunk under taſks which the inhabitants of the other continent would have performed with eaſe. This feebleneſs of conſtitution ſeemed almoſt univerſal among the inhabitants of South America. The Spaniards were alſo ſtruck with the ſmalneſs of their appetite for food. The conſtitutional temperance of the natives far exceeded, in their opinion, the abſtinance of the moſt mortified hermits; while, on the other hand, the appetite of the Spaniards appeared to the Americans infinitely voracious; and they affirmed, that one Spaniard devoured more food in a day than was ſufficient for ten Americans. But though the demands of the native Americans for food were very ſparing, ſo limited was their agriculture, that they hardly raiſed what was ſufficient for their own conſumption. Many of the inhabitants of South America confined their induſtry to rearing a few plants, which, in a rich and warm climate, were eaſily trained to maturity; but if a few Spaniards ſettled in any diſtrict, ſuch a ſmall addition of ſupernumerary mouths ſoon exhausted their ſcanty ſtores, and brought on a famine. The inhabitants of South, compared with thoſe of North America, are generally more feeble in their frame, leſs vigorous in the efforts of their minds, of a gentle but daſtardly ſpirit, more enſlaved by pleaſure, and deeper ſunk in indolence.

#### A GENERAL DESCRIPTION OF A M E R I C A.

**T**HIS great weſtern continent, frequently denominated the **NEW WORLD**, extends from the 80th degree North, to the 56th degree South latitude; and, where its breadth is known, from the 35th to the 136th degree of Weſt longitude from London; ſtretching between 8 and 9000 miles in length, and in its greateſt breadth, 3690. It poſſeſſes part of both hemiſpheres, has two ſummers, and a double winter, and enjoys all the variety of climates which the earth affords, and is waſhed by the two great oceans. To the eaſtward it has the Atlantic, which divides it from Europe and Africa. To the weſt it has the Pacific, or great South-Sea, by which it is ſeparated from Aſia. By theſe ſeas it may, and does, carry on a direct commerce with the other three parts of the world. It is compoſed of two great continents, one on the North, the other on the South, which are joined by the kingdom of Mexico, which forms a fort of iſthmus 1500 miles long, and in one part, at Darien, ſo extremely narrow, as to make the communication between the two oceans by no means difficult, being only 60 miles over. In the great gulf, which is formed between the iſthmus and the northern and ſouthern continents, lie a multitude of iſlands, many of them large, moſt of them fertile, and denominated the Weſt Indies, in contradiſtinction to the countries and iſlands of Aſia, beyond the Cape of Good Hope, which are called the Eaſt Indies.

Before we begin to treat of ſeparate countries in their order, we muſt, according to juſt method, take notice of thoſe mountains and rivers, which diſtain, as it were, to be confined within the limits of particular provinces, and extend over a great part of the continent. For though America in general be not a mountainous country, it has the greateſt mountains in the world\*. In South America, the Andes,

\* Dr. Robertson obſerves, that “the mountains of America are much ſuperior in height to thoſe in the other diviſions of the globe. Even the plain of Quito, which may be conſidered as the

Andes, or Cordilleras, run from north to south along the coast of the Pacific ocean. They exceed in length any chain of mountains in the other parts of the globe; extending from the isthmus of Darien to the straits of Magellan, they divide the whole southern part of America, and run a length of 4300 miles. Their height is as remarkable as their length; for, though in part within the torrid zone, they are constantly covered with snow\*. In North America, which is chiefly composed of gentle ascents, or level plains, we know of no considerable mountains, except those towards the pole, and that long ridge which lies on the back of the American States, separating them from Canada and Louisiana, which we call the Apalachian, or Allegany mountains; if that may be considered as a mountain, which upon one side is extremely lofty, but upon the other is nearly on a level with the rest of the country.

America is, without question, that part of the globe which is best watered; and that not only for the support of life, and all the purposes of fertility, but for the convenience of trade and the intercourse of each part with the others. In North America, such is the wisdom and goodness of the Creator of the universe, those vast tracts of country, situated beyond the Apalachian mountains, at an immense and unknown distance from the ocean, are watered by inland seas, called the Lakes of Canada, which not only communicate with each other, but give rise to several great rivers, particularly the Mississippi, running from north to south till it falls into the gulf of Mexico, after a course, including its turnings, of 4500 miles, and receiving in its progress the vast tribute of the Illinois, the Missouri, the Ohio, and other great rivers, not inferior to the Rhine or the Danube; and on the north, the river St. Laurence, running a contrary course from the Mississippi, till it empties itself into the ocean near Newfoundland; all of them being almost navigable to their heads, lay open the immense recesses of this great continent, and afford such an inlet for commerce, as must produce the greatest advantage, whenever the country adjacent shall come to be fully inhabited, and by an industrious and civilised people. The eastern side of North America, besides the noble rivers Hudson, Delaware, Susquehanna, and Potowmack, supplies several others of great depth, length, and commodious navigation; hence many parts of the settlements are so advantageously intersected with navigable rivers and creeks, that the planters, without exaggeration, may be said to have each a harbour at his door.

South America is, if possible, in this respect even more fortunate. It supplies the two largest rivers in the world, the river of Amazons, and the Rio de la Plata, or Plate river. The first rising in Peru, not far from the South Sea, passes from West to East, and falls into the ocean between Brazil and Guiana, after a course of more than 3000 miles, in which it receives a prodigious number of great and navigable rivers. The Rio de la Plata rises in the heart of the country, and having its strength gradually augmented by an accession of many powerful streams, discharges itself with such vehemence into the sea, as to make its taste fresh for many leagues from land. Besides these, there are other rivers in South America, of which the Oronoque is the most considerable.

the base of the Andes, is elevated farther above the sea than the top of the Pyrenees. This stupendous ridge of the Andes, no less remarkable for extent than elevation, rises in different places more than one third above the Pike of Teneriffe, once thought to be the highest land in the ancient hemisphere. The Andes may literally be said to hide their heads in the clouds; the storms often roll, and the thunder bursts below their summits,

which, though exposed to the rays of the sun in the centre of the torrid zone, are covered with everlasting snows."

\* Chimborazo, the highest of the Andes, is 20,608 feet; at this about 2400 feet from the summit are always covered with snow. Carazon was ascended by the French astronomers, and is said to be 15,800 feet high.

globe. Even  
considered as  
the

A country, of such vast extent on each side of the equator, must necessarily have a variety of soils as well as climates. It is a treasury of Nature, producing most of the metals, minerals, plants, fruits, trees, and wood, to be met with in the other parts of the world, and many of them in greater quantities and higher perfection. The gold and silver of America have supplied Europe with such immense quantities of those precious metals, that they are become much more common, so that the gold and silver of Europe now bear little proportion to the high price set upon them before the discovery of America.

This country also produces diamonds, pearls, emeralds, amethysts, and other rare stones, which, by being brought in great quantities into Europe, have also fallen in value. To these, which are chiefly the production of Spanish America, may be added a great number of other commodities, which, though of less price, are of much greater use; and many of them make the ornament and wealth of the British empire in this part of the world. Of these are the plentiful supplies of cochineal, indigo, matto, logwood, brazil, fustic, pimento, lignum vitæ, rice, ginger, cocoa, or the chocolate nut, sugar, cotton, tobacco, banillas, red-wood, the balsams of Tolu, Peru, and Chili, that valuable article in medicine the Jesuit's bark, mechoacan, sassafras, sarsaparilla, cassia, tamarinds, hides, furs, ambergrise, and a great variety of woods, roots, and plants, to which, before the discovery of America, we were either entire strangers, or forced to buy at an extravagant rate from Asia and Africa, through the hands of the Venetians and Genoese, who then engrossed the trade of the eastern world.

This continent has also a variety of excellent fruits, which here grow wild to great perfection; as pine-apples, pomegranates, citrons, lemons, oranges, malicorns, cherries, pears, apples, figs, grapes, great numbers of culinary, medicinal, and other herbs, roots, and plants; and so fertile is the soil, that many exotic productions are nourished in as great perfection as in their native ground.

Though the Indians still live in the quiet possession of many large tracts, America, so far as generally known, is chiefly claimed, and divided into colonies, by three European nations, the Spaniards, English, and Portuguese. The Spaniards, as they first discovered it, have the largest and richest portion, extending from New Mexico and Louisiana in North America, to the straits of Magellan in the South Sea, except the large province of Brasil, which belongs to Portugal; for though the French and Dutch have some forts upon Surinam and Guiana, they scarcely deserve to be considered as proprietors of any part of the southern continent.

Next to Spain, the most considerable proprietor of America was Great Britain, who derived her claim to North America from the first discovery of that continent by Sebastian Cabot, in the name of Henry VII. anno 1497, about six years after the discovery of South America by Columbus, in the name of the king of Spain. This country was in general called Newfoundland, a name which is now appropriated solely to an island upon its coast. It was a long time before we made an attempt to settle this country. Sir Walter Raleigh, an uncommon genius, and a brave commander, first shewed the way by planting a colony in the southern part, which he called Virginia, in honour of his mistress, queen Elizabeth.

The French, indeed, from this period until the conclusion of the war in 1763, laid a claim to, and actually possessed Canada and Louisiana, comprehending all that extensive inland country, reaching from Hudson's Bay on the north, to Mexico and the gulf of the same name on the south; regions which all Europe could not people in the course of many ages. But no territory, however extensive, no

empire, however boundless, could gratify the ambition of that aspiring nation; hence, under the most solemn treaties, they continued in a state of hostility, making gradual advances upon the back of our settlements, and rendering their acquisitions more secure and permanent by a chain of forts, well supplied with all the implements of war. At the same time they laboured incessantly to gain the friendship of the Indians, by various arts, even by intermarriages, and not only trained them to the use of arms, but infused into these savages the most unfavourable notions of the English. The British colonies thus hemmed in, and confined to a slip of land along the sea-coast, by an ambitious and powerful nation, the rivals of Great Britain, begun in 1755 to take the alarm. The British empire in America, yet in its infancy, was threatened with a total dissolution. The colonies, in their distress, called aloud on the mother-country. The bulwarks and the thunder of England were sent to their relief, accompanied with powerful armies, well appointed, and ably commanded. A long war succeeded, which ended gloriously for Great Britain: for after much blood was spilt, and every inch of ground bravely disputed, the French were not only driven from Canada and its dependencies, but obliged to relinquish all that part of Louisiana, lying on the east side of the Mississippi.

Thus, at an immense expence, and with the loss of many brave men, our colonies were preserved, secured, and extended so far, as to render it difficult to ascertain the precise bounds of our empire in North America, to the northern and western sides; for to the northward, it should seem that we might have extended our claims quite to the pole itself; nor did any nation seem inclined to dispute the property of this northernmost country with us. If we had chosen to take our stand upon the northern extremity, and look towards the south, we had a territory extending in that aspect, from the pole to Cape Florida in the gulf of Mexico, North lat. 25, and consequently near 4000 miles long, in a direct line; which was the more valuable, as it included the most temperate climates of this new world, and such as are best suited to British constitutions. To the westward, our boundaries reached to the nations unknown even to the native Indians of Canada. But our American dominions have been greatly abridged by the contest between the mother-country and the colonies, which, after eight years' continuance, with a great expence of treasure and blood, ended in the establishment of a new republic, styled "The Thirteen United States of America." This country is washed by the Atlantic ocean on the east, and on the south by the gulf of Mexico. We have already taken notice of the river St. Laurence, the Mississippi, the lakes of Canada, and other great bodies of water, which fertilise and enrich its northern and western boundaries, as well as the interior parts.

The multitude of islands, which lie between the two continents of North and South America, are divided among the Spaniards, English, and French. The Dutch indeed possess three or four small islands, which, in any other hands, would be of no consequence; and the Danes have one or two: but they hardly deserve to be named among the proprietors of America. France has ceded the small island of St. Bartholomew to Sweden. We shall now proceed to the particular provinces, beginning, according to our method, with the north: but as Labrador, or New Britain, and the country round Hudson's Bay, with those vast regions towards the pole, are little known, we can only include within the following Table the colonies that have been formed into regular governments, which bring us to the 50th degree of north latitude.

A SUMMARY VIEW of the FIRST SETTLEMENTS of  
N O R T H A M E R I C A.

Names of Places.	When settled.	By whom.
Quebec	- - - 1608	By the French.
Virginia	- June 10, - 1609	By Lord de la War.
Newfoundland	- June - 1610	By governor John Guy.
New York } New Jersey }	- about - 1614	By the Dutch.
Plymouth	- - - 1620	{ By part of Mr. Robinson's congregation.
New Hampshire	- - - 1623	{ By a small English colony near the mouth of Piscataqua river.
Delaware } Pennsylvania }	- - - 1627	By the Swedes and Finns.
Massachusetts Bay	- - - 1628	By capt. John Endicott and company.
Maryland	- - - 1633	{ By lord Baltimore, with a colony of Roman catholics.
Connecticut	- - - 1635	{ By Mr. Fenwick at Saybrook, near the mouth of Connecticut river.
Rhode Island	- - - 1635	{ By Mr. Roger Williams and his persecuted brethren.
New Jersey	- - - 1664	{ Granted to the duke of York by Charles II. and made a distinct government, and settled some time before this by the English.
South Carolina	- - - 1669	By governor Sale.
Pennsylvania	- - - 1682	{ By William Penn, with a colony of Quakers.
North Carolina	- about - 1728	{ Erected into a separate government, settled before by the English.
Georgia	- - - 1732	By general Oglethorpe.
Kentucky	- - - 1773	By col. Daniel Boone.
Vermont	- - - 1777	{ By emigrants from Connecticut and other parts of New-England.
Territory N. W. of } Ohio river }	- - - 1787	By the Ohio and other companies.

SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 850	} between { 50 and 70 north latitude.	} 318,750.
Breadth 750		

**N**EW BRITAIN, or the country lying round Hudſon's Bay, and commonly called the country of the Eſquimaux, comprehending Labrador, now North and South Wales, is bounded by unknown lands, and frozen ſeas, about the pole, on the North; by the Atlantic ocean, on the Eaſt; by the Bay and river of St. Laurence, and Canada, on the South; and by unknown lands on the Weſt.

**MOUNTAINS.]** The tremendous high mountains in this country towards the north, their being covered with eternal ſnow, and the winds blowing from thence three quarters of the year, occaſion a degree of cold in the winter, over all this country, which is not experienced in any other part of the world in the ſame latitude.

**RIVERS, BAYS, STRAITS, AND CAIES }** Theſe are numerous, and take their names generally from the Engliſh navigators and commanders by whom they were diſcovered; the principal bay is that of Hudſon, which includes ſeveral others; the principal ſtraits are thoſe of Hudſon, Davis, and Belleſle; and the chief rivers are the Mooſe, Severn, Rupert, Nelſon, and Black River.

**SOIL AND PRODUCE.]** This country is extremely barren; to the northward of Hudſon's Bay, even the hardy pine-tree is ſeen no longer, and the cold womb of the earth is incapable of any better production than ſome miſerable ſhrubs. Every kind of European ſeed, committed to the earth in this inhospitable climate, has hitherto periſhed; but perhaps the ſeed of corn from the northern parts of Sweden and Norway might be more congenial to the climate. All this ſeverity, and long continuance of winter, and the conſequent barrenneſs of the earth, is experienced in the latitude of fifty-two; in the temperate latitude of Cambridge.

**ANIMALS.]** Theſe are the mooſe deer, ſtags, rein deer, bears, tygers, buffaloes, wolves, foxes, beavers, otters, lynxes, martins, ſquirrels, ermins, wild cats, and hares. Of the feathered kind they have geese, buſtards, ducks, partridges, and all manner of wild fowls. Of fiſh, there are whales, morſes, ſeals, cod-fiſh, and a white fiſh preferable to herrings; and in their rivers and freſh waters, pike, perch, carp, and trout. There have been taken at Port Nelſon, in one ſeaſon, ninety thouſand partridges, which are here as large as hens, and twenty-five thouſand hares.

All the animals of theſe countries are clothed with a cloſe, ſoft, warm fur. In ſummer there is here, as in other places, a variety in the colours of the ſeveral animals: when that ſeaſon is over, which holds only for three months, they all aſſume the livery of winter, and every ſort of beaſts, and moſt of their fowls, are of the colour of the ſnow; every thing animate and inanimate is white. This is a ſurpriſing phenomenon. But what is yet more ſurpriſing, and what ought to draw the moſt inattentive to an admiration of the wiſdom and goodneſs of Providence, is, that the dogs and cats from England that have been carried into Hudſon's Bay, on the approach of winter, have entirely changed their appearance, and acquired a much longer, ſofter, and thicker coat of hair, than they had originally.

Before we advance farther in the description of America, it may be proper to observe in general, that all the quadrupeds of this new world are less than those of the old; even such as are carried from hence to breed there, are often found to degenerate, but are never seen to improve. If, with respect to size, we should compare the animals of the new and the old world, we shall find the former greatly inferior to the latter. The Asiatic elephant, for instance, often grows to above fifteen feet high, while the tapurette, one of the largest natives of America, is not bigger than a calf of a year old. The lama, which some also call the American camel, is still less. Their beasts of prey are quite divested of that courage, which is so often fatal to man in Africa or Asia. They have no lions, nor, properly speaking, either leopard, or tyger. Travellers, however, have affixed those names to such ravenous animals as are there found most to resemble those of the ancient continent. The conjar, the taquar, and the taquaretti among them, are despicable in comparison of the tyger, the leopard, and the panther of Asia. The tyger of Bengal has been known to measure six feet in length, without including the tail; while the congar, or American tyger, as some affect to call it, seldom exceeds three. All the animals therefore in the southern parts of America, are different from those in the southern part of the ancient continent; nor does there appear to be any common to both, but those which, being able to bear the colds of the North, have travelled from one continent to the other. Thus the bear, the wolf, the rein-deer, the stag, and the beaver, are known as well in New Britain and Canada as in Russia; while the lion, the leopard, and the tyger, which are natives of the south with us, are utterly unknown in South America. But if the quadrupeds of America be smaller than those of the ancient continent, they are much more numerous; for it is a rule that obtains through nature, and evidently points out the wisdom of the author of it, that the smallest animals multiply in the greatest proportion. The goat, exported from Europe to Southern America, in a few generations, becomes much less; but then it also becomes more prolific, and instead of one kid at a time, or two at the most, generally produces five, six, and sometimes more. The wisdom of Providence in making formidable animals unprolific is obvious: had the elephant, the rhinoceros, and the lion, the same degree of fecundity with the rabbit or the rat, all the arts of man would soon be unequal to the contest, and we should soon perceive them to become the tyrants of those who call themselves the masters of the creation.

**PERSONS AND HABITS.]** The men of this country shew great ingenuity in their manner of kindling a fire, in clothing themselves, and in preserving their eyes from the ill effects of that glaring white which every where surrounds them for the greatest part of the year; in other respects they are very savage. They are of a tawny complexion, and lead a vagrant life, moving from place to place, spending their time in hunting and fishing. In their shapes and faces they do not resemble the Americans who live to the southward; they are much more like the Laplanders and the Samocids of Europe already described, from whom they are probably descended. These on the coast appear to be peaceable and inoffensive, and are dexterous in managing their kials or boats. The other Americans seem to be of a Tartar original.

**DISCOVERY AND COMMERCE.]** The knowledge of these northern seas and countries was owing to a project started in England for the discovery of a north-west passage to China and the East Indies, as early as the year 1576. Since then it has been frequently dropped, and as often revived, but never yet completed; and from the late voyages of discovery, it seems manifest that no practicable passage ever can be found. Frobisher only discovered the main of New Britain, or Terra de Labrador, and those straits to which he has given his name. In 1585, John Davis sailed from Portsmouth, and viewed that and the more northerly coasts; but he

seems never to have entered the bay. Hudson made three voyages on the same adventure, the first in 1607, the second in 1608, and his third and last in 1610. This bold and judicious navigator entered the straits that lead into this new Mediterranean, the bay known by his name, coasted a great part of it, and penetrated to eighty degrees and a half, into the heart of the frozen zone. His ardour for the discovery not being abated by the difficulties he struggled with in this empire of winter, he staid here until the ensuing spring, and prepared, in the beginning of 1611, to pursue his discoveries; but his crew, who suffered equal hardships without the same spirit to support them, mutinied, seized upon him and seven of those who were most faithful to him, and committed them to the fury of the icy seas, in an open boat. Hudson and his companions were either swallowed up by the waves, or, gaining the inhospitable coast, were destroyed by the savages; but the ship and the rest of the men returned home.

Other attempts towards a discovery were made in 1612 and 1667; and a patent for planting the country, with a charter for a company, was obtained in the year 1670. In 1746 captain Ellis wintered as far north as 57 degrees and a half, and captain Christopher attempted farther discoveries in 1761. But besides these voyages, which satisfy us that we must not look for a passage on this side of the latitude 67 degrees North, we are indebted to the Hudson's Bay Company for a journey by land; which throws much additional light on this matter, by affording what may be called demonstration, how much farther North, at least in some parts of their voyage, ships must go, before they can pass from one side of America to the other. The northern Indians, who come down to the Company's factories to trade, had brought to the knowledge of our people a river, which, on account of much copper being found near it, had obtained the name of the Copper-mine river. The Company, being desirous of examining into this matter with precision, directed Mr. Hearne, a young gentleman in their service, and who having been brought up for the navy, and served in it the war before last, was extremely well qualified for the purpose, to proceed over land, under the convoy of those Indians, for that river, which he had orders to survey, if possible, quite down to its exit into the sea; to make observations for fixing the latitudes and longitudes; and to bring home maps and drawings, both of it and the countries through which he should pass.

Accordingly Mr. Hearne set out from Prince of Wales's Fort, on Churchill river, latitude  $53^{\circ} 47'$  North, and longitude  $94^{\circ} 7'$  West from Greenwich, on the 7th of December, 1770. Mr. Hearne on the 13th of June reached the Copper-mine river, and found it all the way, even to its exit into the sea, incumbered with shoals and falls, and emptying itself into it over a dry flat of the shore, the tide being then out, which seemed, by the edges of the ice, to rise about 12 or 14 feet. This rise, on account of the falls, carries the sea but a very small way within the river's mouth, so that the water in it had not the least brackish taste. Mr. Hearne is, nevertheless, sure that it empties itself into the sea, or a branch of it, by the quantity of whale-bone and seal skins which the Esquimaux had at their tents; and also by the number of seals which he saw upon the ice. The sea, at the river's mouth, was full of islands and shoals, as far as he could see, by the assistance of a pocket telescope; and the ice was not yet (July 17th) broken up, but thawed away only for about three quarters of a mile from the shore, and for a little way round the islands and shoals. But he had the most extensive view of the sea when he was about eight miles up the river, from which station the extreme parts of it bore N. W. by W. and N. E.

By the time Mr. Hearne had finished his survey of the river, which was about one o'clock in the morning on the 18th, there came on a very thick fog and drizzling rain; and as he had found the river and sea, in every respect, unlikely to be of

any utility, he thought it unnecessary to wait for fair weather, to determine the latitude more exactly by observation; but by the extraordinary care he took in observing the courses and distances, he walked from *Congecathawachaga*, where he had two very good observations, and thinks the latitude may be depended on within 20' at the utmost. It appears from the map which Mr. Hearne constructed of this singular journey, that the mouth of the Copper-mine river lies in latitude 72° N. and longitude 25° W. from Churchill river; that is, about 119° W. of Greenwich. Mr. Hearne's journey back from the Copper-mine river to Churchill lasted till June 30th, 1772; so that he was absent almost a year and seven months.

The consequences resulting from this extensive discovery are obvious. We now see that the continent of North America stretches from Hudson's Bay, so far to the North-West, that Mr. Hearne travelled near 1300 miles before he arrived at the sea; and that the whole of his track to the northward of 61° of North latitude, lay near 600 miles due West of the western coast of Hudson's Bay, at the same time that his Indian guides were well aware of a vast tract of land, stretching farther in the same direction. Futile, therefore, are the arguments of those, who, about 40 years ago, pleaded for a North-west passage through Hudson's Bay.

Though the adventurers failed in the original purpose for which they navigated this bay, their project, even in its failure, has been of great advantage to this country. The vast territories which surround Hudson's Bay, as we have already observed, abound with animals, whose fur and skins are excellent. In 1670, a charter was granted to a company, which does not consist of above nine or ten persons, for the exclusive trade to this bay, and they have acted under it ever since with great benefit to themselves. The fur and peltry trade might be carried on to a much greater extent, were it not entirely in the hands of this exclusive company, whose interested, not to say iniquitous spirit has been the subject of long and just complaint. The company employ four ships, and 130 seamen. They have several forts, viz. Prince of Wales's fort, Churchill river, Nelson, New Severn, and Albany, which stand on the west side of the bay, and are garrisoned by 186 men. The French, in May 1782, took and destroyed these forts, and the settlements, &c. valued at 500,000*l.* They export commodities to the value of 16,000*l.* and bring home returns to the value of 29,340*l.* which yield to the revenue 3,734*l.* This includes the fishery in Hudson's Bay. This commerce, small as it is, affords great profits to the company, and is advantageous to Great Britain in general; for the commodities we exchange with the Indians for their skins and furs, are all manufactured in Britain; and as the Indians are not very nice in their choice, those things are sent, of which we have the greatest plenty, and which, in the mercantile phrase, are drugs with us. Though the workmanship too happens to be in many respects so deficient, that no civilised people would take it off our hands, it may be admired among the Indians. On the other hand, the skins and furs we bring from Hudson's Bay, enter largely into our manufactures, and afford us materials for a lucrative trade with many nations of Europe. These circumstances tend to prove incontestably the immense benefit that would redound to Great Britain, by throwing open the trade to Hudson's Bay, since even in its present restrained state it is so advantageous. The exclusive company, it is probable, do not find their commerce so advantageous now, as it was before we got possession of Canada. The only attempt made to trade with Labrador, has been directed towards the fishery. Great Britain has no settlement here, though the annual produce of the fishery, amounting to upwards of 49,000*l.* and the natural advantages of the country, strongly encourage such a design.

## CANADA, or the PROVINCE OF QUEBEC.

## SITUATION AND EXTENT.

Miles.		Degrees.		Sq. Miles.
Length	600	between	{ 61 and 81 west longitude. 45 and 52 north latitude. }	100,000.
Breadth	200			

**BOUNDARIES.]** THE French comprehended, under the name of Canada, a very large territory, taking into their claim part of Nova Scotia, New England, and New York, on the East; and, to the West, extending it as far as the Pacific Ocean. That part, however, which they had been able to cultivate, and which bore the face of a colony, lay chiefly upon the banks of the river St. Laurence, and the numerous small rivers falling into that stream. This being reduced by the British arms in the war of 1756, was formed into a British colony, called the Province of Quebec, which is now bounded by New Britain and Hudson's Bay on the North and East; by Nova Scotia, New England, and New York, on the South, and by unknown lands on the West.

**AIR AND CLIMATE.]** The climate of this extensive province is not very different from the colonies mentioned above; but as it is much farther from the sea and more northerly than a great part of these provinces, it has a much severer winter, though the air is generally clear; yet, like most of the American tracts that do not lie too far to the northward, the summers are exceedingly pleasant.

**SOIL AND PRODUCE.]** Though the climate be cold, and the winter long and tedious, the soil is in general very good, producing wheat, barley, rye, with many other sorts of grains, fruits, and vegetables; tobacco, in particular, thrives well and is much cultivated. The Isle of Orleans near Quebec, and the lands upon the river St. Laurence and other rivers, are highly fertile. The meadow-grounds in Canada, which are well watered, yield excellent grass, and breed vast numbers of great and small cattle. As we are now entering upon the cultivated provinces of British America, and as Canada is upon the back of the United States, and contains almost all the different species of wood and animals that are found in these colonies, we shall, to avoid repetition, speak of them here at some length.

**TIMBER AND PLANTS.]** The uncultivated parts of North America contain the greatest forests in the world. They are a continued wood, not planted by the hands of men, and spreading in all the wild luxuriance of nature. The trees lose themselves in the clouds; and there is such a prodigious variety of species, that even among those persons who have taken most pains to describe them, there is not one perhaps that knows half the number. The province we are describing produces, amongst others, two sorts of pines, the white and the red; four sorts of firs; two sorts of cedar, and oak, the white and the red; the male and female maple; three sorts of ash-trees, the free, the mongrel, and the ballard; three sorts of walnut-trees, the hard, the soft, and the smooth; vast numbers of beech trees, and white wood; white and red elms, and poplars. The Indians hollow the red elms into canoes, some of which, made out of one piece, will contain twenty persons; others are made of the bark, the different pieces of which they sew together with the inner rind, and daub over the seams with pitch, or rather a bituminous matter resembling pitch, to prevent their leaking; and the ribs of these canoes are made of boughs of trees. About November the bears and wild cats take up their habitations in the hollow elms, and remain there till

till April. Here are also found cherry-trees, plum-trees, the vinegar-tree, the fruit of which, infused in water, produces vinegar; an aquatic plant, called *alaco*, the fruit of which may be made into a confection; the white thorn; the cotton tree, on the top of which grow several tufts of flowers, which, when shaken in the morning, before the dew falls off, produce honey, that may be boiled up into sugar, the seed being a pod, containing a very fine kind of cotton; the sun-plant, which resembles a marigold, and grows to the height of seven or eight feet; Turkey corn; French beans; gourds, melons, capillaire, and the hop-plant.

[METALS AND MINERALS.] Near Quebec is a fine lead mine; and in some of the mountains, we are told, silver has been found, though we have not heard any great advantage made of it as yet. This country also abounds with coals.

[RIVERS.] The rivers branching through this country are very numerous, and many of them large, bold, and deep. The principal are the Outtauais, St. John's, Seguinay, Desprairies, and Trois Rivieres; but they are all swallowed up by the river St. Laurence. This river issues from the lake Ontario, and, taking its course north-east, washes Montreal, where it receives the Outtauais, and forms many fertile islands. It continues the same course, and meets the tide upwards of 400 miles from the sea, where it is navigable for large vessels; and below Quebec, 320 miles from the sea, it becomes broad, and so deep, that ships of the line contributed, in the last war, to reduce that capital. After receiving in its progress innumerable streams, this great river falls into the ocean at Cape Rosieres, where it is 90 miles broad, and where the cold is intense, and the sea boisterous. In its progress it forms a variety of bays, harbours, and islands, many of them fruitful, and extremely pleasant.

[LAKES.] The great river St. Laurence is that only upon which the French (now subjects of Great Britain) have considerable settlements; but if we look forward into futurity, it is not improbable that Canada, and those vast regions to the west, will be enabled of themselves to carry on a considerable trade upon the great lakes of fresh water, which these countries environ. Here are five lakes, the smallest of which is a piece of sweet water, greater than any in the other parts of the world; this is the lake Ontario, which is not less than 200 leagues in circumference; Erie, or Oswego, longer, but not so broad, is about the same extent. That of the Huron spreads greatly in width, and is in circumference not less than 300, as is that of Michigan, though, like the lake Erie, it is rather long and comparatively narrow. But the lake Superior, which contains several large islands, is 500 leagues in circuit. All of these are navigable by any vessels, and they all communicate with one another, except that the passage between Erie and Ontario is interrupted by a stupendous fall or cataract, which is called the Falls of Niagara. The water here is about half a mile wide, where the rock crosses it, not in a direct line, but in the form of a half moon. When it comes, to the perpendicular fall, which is 120 feet, no words can express the contemplation of travellers at seeing so great a body of water falling, or rather violently thrown, from so great a height, upon the rocks below; from which it again rebounds to a very great height, appearing as white as snow, being *not* converted into foam, through those violent agitations. The noise of this fall is often heard at the distance of 15 miles, and sometimes much farther. The vapour arising from the fall may sometimes be seen at a great distance, appearing like a cloud, or pillar of smoke, and in the appearance of a rainbow, whenever the sun and the position of the traveller favours. Many boats and bows here lose their lives, by attempting to swim, or cross the stream in the rapids above the fall, and are found dashed in pieces below; and sometimes the Indians, through carelessness or drunkenness, have met with the same fate; and per-

haps

haps no place in the world is frequented by such a number of eagles as are invited hither by the carnage of deer, elks, bears, &c. on which they feed. The river St. Lawrence, as we have already observed, is the outlet of these lakes; by this they discharge themselves into the ocean. The French, when in possession of the province, built forts at the several straits, by which these lakes communicate with each other, as well as where the last of them communicates with the river. By these they effectually secured to themselves the trade of the lakes, and an influence over all the nations of America which lay near them.

ANIMALS.] These make the most curious, and hitherto the most interesting part of the natural history of Canada. It is to the spoils of these that we owe the materials of many of our manufactures, and most of the commerce as yet carried on between us and that province. The animals that find shelter and nourishment in the immense forests of Canada, and which indeed traverse the uncultivated parts of all this continent, are stags, elks, deer, bears, foxes, martins, wild cats, ferrets, weasels, squirrels of a large size and greyish hue, hares, and rabbits. The southern parts in particular breed great numbers of wild bulls, deer of a small size, divers sorts of roebucks, goats, wolves, &c. The marshes, lakes, and pools, which in this country are very numerous, swarm with otters, beavers or castors, of which the white are highly valued, being scarce, as well as the right black kind. The American beaver, though resembling the creature known in Europe by that name, has many particulars which render it the most curious animal we are acquainted with. It is near four feet in length, and weighs sixty or seventy pounds; they live from fifteen to twenty years, and the females generally bring forth four young ones at a time. It is an amphibious quadruped, that continues not long at a time in the water, but yet cannot live without frequently bathing in it. The savages, who waged continual war with this animal, believed it to be a rational creature, that it lived in society, and was governed by a leader, resembling their own sachem or prince. It must indeed be allowed, that the accounts given of this animal by travellers, the manner in which it contrives its habitation, provides food to serve during the winter, and always in proportion to the continuance and severity of it, are sufficient to shew the near approaches of instinct to reason, and even in some instances the superiority of the former. They are of different colours; black, brown, white, yellow, and straw-colour; but it is observed, that those of lighter colour are clothed with a less quantity of fur, and live in warmer climates. The furs of the beaver are of two kinds, the dry and the green; the dry fur is the skin before it is applied to any use; the green are the furs, that are worn, after being sewed to one another, by the Indians, who besmear them with unctuous substances, which not only render them more pliable, but give to the fine down, that is manufactured into hats, that oily quality which renders it proper to be worked up with the dry fur. Both the Dutch and English have of late found the secret of making excellent cloths, gloves, and stockings, as well as hats, from the beaver fur. Besides the fur, this useful animal produces the true castoreum, which is contained in bags in the lower part of the belly, different from the testicles: the value of this drug is well known. The flesh of the beaver is a most delicious food, except when boiled. It has then a disagreeable flavour.

The musk rat is a diminutive kind of a beaver (weighing about five or six pounds), which it resembles in every thing but its tail; and it affords a very strong musk.

The elk is of the size of a horse or mule. Its flesh is very agreeable and nourishing, and its colour a mixture of light-grey and dark-red. They love the cold countries; and when the winter affords them no grass, they gnaw the bark of trees. It is dangerous to approach very near this animal when he is hunted, as he sometimes springs

springs furiously on his pursuers, and tramples them to pieces. To prevent this, the hunter throws his cloaths to him, and while the deluded animal spends his fury on these, he takes proper measures to dispatch him.

There is a carnivorous animal here, called the carcajou, of the feline or cat kind, with a tail so long, that Charlevoix says he twisted it several times round his body. Its body is about two feet in length, from the end of the snout to the tail. It is said, that this animal, winding himself about a tree, will dart from thence upon the elk, twisting his strong tail round his body, and cut his throat in a moment.

The buffalo, a kind of wild ox, has much the same appearance with those of Europe: his body is covered with a black wool, which is highly esteemed. The flesh of the female is very good; and the buffalo hides are soft and pliable as chamois leather, but so very strong, that the bucklers which the Indians make use of are hardly penetrable by a musket ball. The Canadian roebuck is a domestic animal. Wolves are scarce in Canada, but they afford the finest furs in all the country: their flesh is white, and good to eat; and they pursue their prey to the tops of the tallest trees. The black foxes are greatly esteemed, and very scarce; but those of other colours are more common; and some on the upper Mississippi are of a silver colour, and very beautiful. They live upon water-fowls, which they decoy by a thousand antic tricks, and then spring upon, and devour them. The Canadian pole-cat has a most beautiful white fur, except the tip of his tail, which is as black as jet. Nature has given this animal no defence but its urine, the smell of which is intolerably nauseous; this, when attacked, it sprinkles plentifully on its tail, and throws it on the assailant. The Canadian wood-rat is of a beautiful silver colour, with a bushy tail, and twice as big as the European: the female carries under her belly a bag, which she opens and shuts at pleasure; and in that she places her young when pursued. Here are three sorts of squirrels; that called the flying-squirrel will leap forty paces and more, from one tree to another. This little animal is easily tamed, and is very lively; he puts up wherever he can find a place, in one's sleeve, pocket, or muff; he first pitches on his master, whom he will distinguish among twenty persons. The Canadian porcupine roasted tastes full as well as a sucking pig. The hares and rabbits differ little from those in Europe, only they turn grey in winter. There are two sorts of bears here, one of a reddish, and the other of a black colour; but the former is the most dangerous. The bear is not naturally fierce, unless when wounded, or oppressed with hunger. They run themselves very poor in the month of July, when it is somewhat dangerous to meet them; and they are said to support themselves during the winter, when the snow lies from four to six feet deep, by sucking their paws. Scarcely any thing among the Indians is undertaken with greater solemnity than hunting the bear; and an alliance with a noted bear-hunter, who has killed several in one day, is more eagerly sought after than that of one who has rendered himself famous in war. The reason is, because this chase supplies the family with both food and raiment.

Of the feathered creation, they have eagles, falcons, goshawks, tercols, partridges, grey, red, and black, with long tails, which they spread out as a fan, and make a very beautiful appearance: woodcocks are scarce in Canada, but snipes, and other water-game, are plentiful. A Canadian raven is said by some writers to rattle as well as a pullet, and an owl better. Here are black-birds, swallows, and larks; no less than twenty-two different species of ducks, and a great number of geans, turkeys, geese, bustards, teal, water-hens, cranes, and other large water-fowl; but always at a distance from habitations. The Canadian wood-pecker is a beautiful bird. Thrushes and goldfinches are found here; but the chief Canadian bird

of melody is the white-bird, which is a kind of ortolan, very showy, and remarkable for announcing the return of spring. The fly-bird, called also the humming-bird, is thought to be the most beautiful of any in nature; with all his plumage, he is no bigger than a cock-chaffer, and he makes a noise with his wings like the humming of a large fly.

Among the reptiles of this country, the rattle-snake only deserves attention. Some of these are as big as a man's leg, and they are long in proportion. What is most remarkable in this animal is the tail, which is scaly like a coat of mail, and on which it is said there grows every year one ring, or row of scales; so that they know its age by its tail, as we do that of a horse by its teeth. In moving, it makes a rattling noise, from which it has its name. The bite of this serpent is mortal, if a remedy is not applied immediately. In all places where this dangerous reptile is bred, there grows a plant, which is called rattle-snake herb, the root of which (such is the goodness of Providence) is a certain antidote against the venom of this serpent, and that with the most simple preparation, for it requires only to be pounded or chewed, and applied like a plaster to the wound. The rattle-snake seldom bites passengers, unless it is provoked; and never darts itself at any person without first rattling three times with its tail. When pursued, if it has but little time to recover, it folds itself round, with the head in the middle, and then darts itself with great fury and violence against its pursuers: nevertheless, the savages chase it, and find its flesh very good; it also possesses medicinal qualities.

Some writers are of opinion that the fisheries in Canada, if properly improved, would be more likely to enrich that country than even the fur trade. The river St. Laurence contains the greatest variety of fish of any in the world, and these in the greatest plenty and of the best sorts.

Among innumerable others, in the rivers and lakes, are sea-wolves, sea-cows, porpoises, the lencorner, the goberque, the sea-plaife, salmon, trout, turtle, lobsters, the chaourou, sturgeon, the achigan; the gilthead, tunny, trout, turtle, prey, snells, conger-eels, mackrel, soals, herrings, anchovies, and pilchards. The sea-wolf, so called from its howling, is an amphibious creature; the largest are said to weigh two thousand pounds; their flesh is good eating; but the profit of it lies in the oil, which is proper for burning, and currying of leather; their skins make excellent coverings for trunks; and, though not so fine as Morocco leather, they preserve their freshness better, and are less liable to cracks. The shoes and boots made of those skins let in no water, and when properly tanned, make excellent and lasting covers for seats. The Canadian sea-cow is larger than the sea-wolf, but resembles it in figure: it has two teeth of the thickness and length of a man's arm, which, when grown, look like horns, and are very fine ivory, as well as its other teeth. Some of the porpoises of the river St. Laurence are said to yield a hoghead of oil; and of their skins waistcoats are made, which are musket proof. The lencorner is a kind of cuttle-fish, quite round, or rather oval; there are three sorts of them, which differ only in size; some being as large as a hoghead, and others but a foot long; they catch only the last, and that with a torch; they are excellent eating. The goberque has the taste and smell of a small cod. The sea-plaife is good eating; they are taken with long poles armed with iron hooks. The chaourou is an armed fish, about five feet long, and as thick as a man's thigh, resembling a pike; but is covered with scales that are proof against a dagger. its colour is a silver grey; and there grows under his mouth a long bony substance, ragged at the edges. One may readily conceive, that an animal so well fortified is a ravager among the inhabitants of the water; but we have few instances of fish making prey of the feathered creation, which this fish does, however, with much art. He conceals himself among the canes and reeds, and in such a manner that nothing is to

he seen besides his weapon, which he holds raised perpendicularly above the surface of the water: the fowls, which come to take rest, imagining the weapon to be only a withered reed, perch upon it; but they are no sooner alighted, than the fish opens his throat, and makes such a sudden motion to seize his prey, that it seldom escapes him. This fish is an inhabitant of the lakes. The sturgeon is both a fresh and salt water fish, taken on the coasts of Canada and the lakes, from eight to twelve feet long, and proportionably thick. There is a small kind of sturgeon, the flesh of which is very tender and delicate. The achigau, and the gilthead, are fish peculiar to the river St. Laurence. Some of the rivers breed a kind of crocodile, that differs but little from those of the Nile.

[INHABITANTS AND PRINCIPAL TOWNS.] Before the late war, the banks of the river St. Laurence, above Quebec, were vastly populous; but we cannot precisely determine the number of French and English settled in this province, who are undoubtedly upon the increase. In the year 1783, Canada and Labrador were supposed to contain about 130,000 inhabitants\*. The different tribes of Indians in Canada are almost innumerable; but these people are observed to decrease in population where the Europeans are most numerous, owing chiefly to the immoderate use of spirituous liquors, of which they are excessively fond. But as liberty is the ruling passion of the Indians, we may naturally suppose, that, as the Europeans advance, the former will retreat to more distant regions.

Quebec, the capital, not only of this province, but of all Canada, is situated at the confluence of the rivers St. Laurence and St. Charles, or the Little River, about 320 miles from the sea. It is built on a rock, partly of marble and partly of slate. The town is divided into an upper and a lower; the houses in both are of stone, and built in a tolerable manner. The fortifications are strong, though not regular. The town is covered with a regular and beautiful citadel, in which the governor resides. The number of inhabitants are computed at about 15,000. The river, which from the sea hither is four or five leagues broad, narrows all of a sudden to about a mile wide. The haven, which lies opposite to the town, is safe and commodious, and about five fathom deep. The harbour is flanked by two bastions, that are raised 25 feet from the ground, which is about the height of the tides at the time of the equinox.

From Quebec to Montreal, which is about 170 miles, in sailing up the river St. Laurence, the eye is entertained with beautiful landscapes, the banks being in many places very bold and steep, and shaded with lofty trees. The farms lie pretty close all the way; several gentlemen's houses, neatly built, shew themselves at intervals, and there is all the appearance of a flourishing colony; but there are few towns or villages. It is pretty much like the well-settled parts of Virginia and Maryland, where the planters live wholly within themselves. Many beautiful islands are interspersed in the channel of the river, which have an agreeable effect upon the eye. After passing the Richieu islands, the air becomes so mild and temperate, that the traveller thinks himself transported to another climate; but this is to be understood in the summer months.

The town, called Trois Rivières, or the Three Rivers, is about half way between Quebec and Montreal, and has its name from three rivers which join their currents here, and fall into the river St. Laurence. It is much resorted to by several nations of Indians, who, by means of these rivers, come hither and trade with the inhabitants in various kinds of furs and skins. The country is pleasant, and

\* In 1784, general Haldimand ordered a census of the inhabitants to be taken, when they amounted to 113,012 English and French, exclusive of 10,000 loyalists settled in the upper parts of the province.

fertile in corn, fruit, &c. and great numbers of handsome houses stand on both sides the rivers.

Montreal stands on an island in the river St. Laurence, which is ten leagues in length and four in breadth, at the foot of a mountain which gives name to it, about half a league from the south shore. While the French had possession of Canada, both the city and island of Montreal belonged to private proprietors, who had improved them so well, that the whole island was become a most delightful spot, and produced every thing that could administer to the conveniences of life. The city forms an oblong square, divided by regular and well-formed streets; and when taken by the English, the houses were built in a very handsome manner; and every house might be seen at one view from the harbour, or from the southernmost side of the river, as the hill, on the side of which the town stands, falls gradually to the water. This place is surrounded by a wall and a dry ditch; and its fortifications have been much improved by the English. Montreal is nearly as large as Quebec; but since it fell into the hands of the English, it hath suffered much by fires.

GOVERNMENT.] Before the late war, the French lived in idleness, being free from all taxes, and having full liberty to hunt, fish, fell timber, and to sow and plant as much land as they could cultivate: and by the capitulation granted to them when their country was reduced, both individuals and communities were entitled to their ancient privileges.

It was enacted by parliament in the year 1774, that it should be lawful for his majesty, with the advice of his privy-council, to constitute and appoint a council for the affairs of the province of Quebec, to consist of such persons resident there, not exceeding twenty-three, nor less than seventeen, as his majesty might be pleased to name; and upon the death, removal, or absence of any of the members of the said council, in like manner to appoint others to succeed them. And this council, so nominated, or the majority of them, are vested with authority to make ordinances for the peace, welfare, and good government of the province, with the consent of the governor, or, in his absence, of the lieutenant-governor, or commander in chief for the time being. The council, however, are not impowered to lay taxes, except for the purpose of making roads, reparation of public buildings, or such local conveniences. By this act, all matters of controversy relative to property and civil rights are to be determined by the French laws of Canada; but the criminal law of England is to have force in the province. The inhabitants of Canada are also allowed by this act not only to profess the Romish religion, but the Popish clergy are invested with a right to claim their accustomed dues from those of the same religion.

TRADE AND COMMERCE.] By expelling the French from the back of our then settlements, we secured them from the danger of being molested or attacked by an active and formidable enemy, and enabled our people to attend, with proper spirit and industry, to agriculture, and the improvements of that country. While the important conquest of Canada removed a rival power from that part of North America, it put us in the sole possession of the fur and peltry trade, the use and importance of which are well known to the manufacturers of Great Britain.

The nature of the climate, severely cold in winter, and the people manufacturing nothing, shews what Canada principally wants from Europe; wine, or rather rum, cloths, chiefly coarse linen, and wrought iron. The Indian trade requires rum, tobacco, a sort of duffel blankets, guns, powder, balls and flints, kettles, hatchets, toys, and trinkets of all kinds.

While this country was possessed by the French, the Indians supplied them with peltry; and the French had traders, who, in the manner of the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience.

carrying their goods into the remotest parts of America, and among nations entirely unknown to us. These again brought the market home to them, as the Indians were thereby habituated to trade with them. For this purpose, people from all parts, even from the distance of 1000 miles, came to the French fair at Montreal, which began in June, and sometimes lasted three months. On this occasion, many solemnities were observed, guards were placed, and the governor attended to preserve order, in such a concourse, and with so great a variety of savage nations. But sometimes great disorder and tumults happened; and the Indians, being fond of brandy, frequently gave for a dram all they were possessed of. It is remarkable, that many of these nations actually passed by our settlement of Albany in New York, and travelled 250 miles farther to Montreal, though they might have purchased the goods cheaper at the former. So much did the French excel us in the arts of winning the affections of these savages!

Since we became possessed of Canada, our trade with that country is computed to employ about 60 ships and 1000 seamen. Their exports, in skins, furs, ginseng, snake-root, capillaire, and wheat, in the year 1786, were 343,263l. The amount of imports the same year was 325,116l. It is unnecessary to make any remarks on the value and importance of this trade, which not only supplies us with unmanufactured materials, indispensably necessary in many articles of our commerce, but also takes in exchange the manufactures of our own country, or the productions of our other settlements in the East and West Indies.

But whatever attention be paid to the trade and peopling of Canada, it will be impossible to overcome certain inconveniences, proceeding from natural causes, viz. the severity of the winter, which is so excessive from December to April, that the greatest rivers are frozen over, and the snow lies commonly from four to six feet deep on the ground, even in those parts of the country which are three degrees south of London, and in the temperate latitude of Paris. Another inconvenience arises from the falls in the river St. Laurence, below Montreal, which render it difficult for very large ships to penetrate to that emporium of inland commerce; but vessels from 300 to 400 tons arrive there annually. Our communication therefore with Canada, and the immense regions beyond it, will always be interrupted during the winter season, until roads are formed, that can be travelled with safety. For it may be here observed, that the Indians often commence hostilities against us, without any provocation, and commit the most horrid ravages. But when at last their barbarities have roused the strength of our people, they are not ashamed to beg a peace: they know we always grant it readily; they promise it shall endure as long as the sun and moon; and then all is quiet till some incident, too often co-operating with ill usage received from our traders, gives them a fresh opportunity of renewing their cruelties.

## N O V A S C O T I A .

## SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 350 } Breadth 250 }	between { 43 and 49 north latitude. 60 and 67 west longitude. }	57,000.

**BOUNDARIES.]** BOUNDED by the river St. Laurence on the North; by the Gulf of St. Laurence, and the Atlantic ocean, East; by the same ocean, South; and by Canada and New England, West. In the year 1784, this province was divided into *two governments*.

The province and government, now styled **NEW BRUNSWICK**, is bounded on the westward of the mouth of the river St. Croix, by that river to its source, and by a line drawn due north from thence to the southern boundary of the province of Quebec; to the northward by that boundary as far as the western extremity of the Bay de Chaleurs; to the eastward by the said bay to the gulf of St. Laurence to the bay called Bay Verte; to the south by a line in the centre of the Bay of Fundy, from the river St. Croix to the mouth of the Musquat River, by the said river to its source, and from thence by a due east line across the isthmus into the Bay Verte, to join the eastern lot above described, including all islands within six leagues of the coast.

**RIVERS.]** The river of St. Laurence forms the northern boundary. The rivers, Rigouche and Nipisiguit run from west to east, and fall into the bay of St. Laurence. The rivers of St. John, Passamagnadi, Penobscot, and St. Croix, which run from north to south, fall into Fundy Bay, or the sea a little to the eastward of it.

**SEAS, BAYS, AND CAPES.]** The seas adjoining to it are, the Atlantic ocean, Fundy Bay, and the gulf of St. Laurence. The lesser bays are, Chanigto and Green Bay upon the isthmus, which joins the north part of Nova Scotia to the south; and the Bay of Chaleurs on the north-east; the bay of Chedibucto on the south-east; the Bay of the Islands, the ports of Bart, Chebucto, Prosper, St. Margaret, La Heve, port Maltois, port Rossignol, port Vert, and port Joly, on the south; port La Tour, on the south-east; port St. Mary, Annapolis, and Minas, on the south side of Fundy Bay, and port Roseway, now the most populous of all.

The chief capes are, Cape Portage, Ecoumenac, Tourmentin, Cape Port and Epis, on the east. Cape Fogeri, and Cape Cancau, on the south-east. Cape Blanco, Cape Vert, Cape Theodore, Cape Dore, Cape La Heve, and Cape Negro, on the south. Cape Sable, and Cape Fourche, on the south-west.

**LAKES.]** The lakes are very numerous, but have not yet received particular names.

**CLIMATE.]** The climate of this country, though within the temperate zone, has been found rather unfavourable to European constitutions. They are wrapt up in the gloom of a fog during great part of the year: and for four or five months it is intensely cold. But though the cold in winter and the heat in summer are great, they come on gradually, so as to prepare the body for enduring both.

**SOIL AND PRODUCE.]** From such an unfavourable climate, little can be expected. Nova Scotia, or New Scotland, was, till lately, almost a continued forest; and agriculture, though attempted by the English settlers, has hitherto made little progress.

grafs. In most parts the soil is thin and barren, the corn it produces, of a shrivelled kind like rye, and the grafs intermixed with a cold spongy moss. However, it is not uniformly bad; there are tracts in the peninsula to the southward, which do not yield to the best land in New England; and, in general, the soil is adapted to the produce of hemp and flax. The timber is extremely proper for ship-building, and produces pitch and tar. Flattering accounts have been given of the improvements making in the new settlements on the Bay of Fundy. A great quantity of land hath been cleared which abounds in timber, and ship-loads of excellent masts and spars have been shipped for England.

ANIMALS.] This country is not deficient in the animal productions of the neighbouring provinces, particularly deer, beavers, and otters. Wild fowl, and all manner of game, and many kinds of European fowls and quadrupeds, have, from time to time, been brought into it, and thrive well. At the close of March, the fish begin to spawn, when they enter the rivers in such shoals as are incredible. Herrings come up in April, and the surgeon and salmon in May. But the most valuable appendage of New Scotland is the Cape Sable coast, along which is one continued range of cod-fishing banks, and excellent harbours.

HISTORY, SETTLEMENT, CHIEF TOWNS, AND COMMERCE. } Notwithstanding the forbidding appearance of this country, it was here that some of the first European settlements were made. The first grant of lands in it was given by James I. to his secretary sir William Alexander, from whom it had the name of Nova Scotia, or New Scotland. Since then, it has frequently changed hands, from one private proprietor to another, and from the French to the English nation backward and forward. It was not confirmed to the English till the peace of Utrecht; and their design in acquiring it does not seem to have so much arisen from any prospect of direct profit to be obtained by it, as from an apprehension that the French, by possessing this province, might have had it in their power to annoy our other settlements. Upon this principle, 3000 families were transported in 1749, at the charge of the government, into this country. The town they erected is called Halifax, from the earl of that name, to whose wisdom and care we owe this settlement. The town of Halifax stands upon Chebucto Bay, very commodiously situated for the fishery, and has a communication with most parts of the province, either by land carriage, the sea, or navigable rivers, with a fine harbour, where a small squadron of ships of war lies during the winter, and in summer puts to sea, under the command of a commodore, for the protection of the fishery. The town has an entrenchment, and is strengthened with forts of timber. Three regiments of men are stationed in it to protect the inhabitants from the Indians, whose resentment, however excited or fomented, has been found implacable against the English. The number of inhabitants is said to be 15 or 16,000, who live very comfortably by the trade they carry on in furs and naval stores, by their fisheries, and by supplying the wants of the governor and the garrison already mentioned.

The other towns of less note are Annapolis Royal, which stands on the east side of the bay of Fundy, and though but a small wretched place, was formerly the capital of the province. It has one of the finest harbours in America, capable of containing a thousand vessels at anchor, in the utmost security. This place is also protected by a fort and garrison. St. John's is a new settlement at the mouth of the river of that name, that falls into the bay of Fundy on the west side. Since the conclusion of the American war, the emigration of loyalists to this province, from the United States, hath been very great. By them new towns have been raised, but particularly at Port Roseway, where is now a city named Shelburne, which extends two miles on the water side, and one mile back, with wide streets crossing each other

other at right angles. It is said to have above 9000 inhabitants, exclusive of what is styled the Black Town (containing 1200 free blacks\*, who served on the royal side during the war), which stands about a mile from Shelburne, and separated from it by a small fresh-water river. The harbour here is deep, capacious, and secure, and the tide hath a great rise and fall.

Of the old settlements, the most flourishing and populous are Halifax, and the townships of Windsor, Norton, and Cornwallis, between Halifax and Annapolis. Of the new settlements, the most important are Shelburne, Parr-town, Digby and new Edinburgh. But recent accounts of these settlements represent them in a declining state, great numbers of the houses in the new towns being uninhabited, and considerably reduced in value.

The exports from Great Britain to this country consist chiefly of woollen and linen cloth, and other necessaries for wear, of fishing tackle, and rigging for ships. The amount of our exports, at an average of three years, before the new settlements, was about 26,500*l*. The only articles we can get in exchange are timber, and the produce of the fishery, which, at a like average, amounts to 38,000*l*. But from the late increase of inhabitants, it is supposed that they will now erect saw-mills, and endeavour to supply the West India islands with lumber of every kind, as well as with the produce of the fishery, which will be a profitable article to both countries. The whole population of Nova Scotia and the islands adjoining is estimated at 50,000; but this is thought to be considerably too large.

---

## UNITED STATES OF AMERICA.

**O**F the rise, progress, and most remarkable events of the war between Great Britain and her American colonies, abetted by France, which at length terminated in the establishment of the "United States of America," we have already given an account, in our view of the principal transactions in the history of Great Britain. It was on the 4th of July, 1776, that the congress published a solemn declaration, in which they assigned their reasons for withdrawing their allegiance from the king of Great Britain. In the name, and by the authority, of the inhabitants of the united colonies of New-Hampshire, Massachusetts-Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North-Carolina, South-Carolina, and Georgia, they declared, that they then were, and of right ought to be, Free and Independent States; and that, as such, they had full power to levy war, conclude peace, contract alliances, establish commerce, and do all other acts which independent states

\* When the act of parliament had passed for incorporating the Sierra Leone company, and a considerable capital in 1791 appeared likely to be raised for carrying on the undertaking, a delegate from a body of Nova Scotia blacks was then in England, who represented that the persons who sent him thither had migrated to Nova Scotia at the end of the American war, having received from government certain promises of lots of land, which had never been strictly fulfilled; that both the soil and the climate of Nova Scotia, as well as many other circumstances in their situation, were

complained of by them, and that many of them were desirous of becoming colonists at the settlement which they understood was likely to be made at Sierra Leone. In consequence of the directors approving of this petition, and obtaining the approbation of the British government, the number of Nova-Scotians who were willing to embark for Sierra Leone proved to be no less than 1196; of which number 1131 arrived in 16 vessels, in March, 1792; the remaining 65 died during the passage.—Report of the Sierra Leone Company, by Henry Thornton, Esquire.

may.

may of right do. They also published Articles of Confederation, and perpetual Union, between the colonies, in which they assumed the title of "The United States of America;" and by which each of the colonies contracted a reciprocal treaty of alliance and friendship for their common defence, for the maintenance of their liberties, and for their general and mutual advantage; obliging themselves to assist each other against all violence that might threaten all or any one of them, and to repel, in common, all the attacks that might be levelled against all or any one of them, on account of religion, sovereignty, commerce, or under any other pretext whatsoever. Each of the colonies reserved to themselves alone the exclusive right of regulating their internal government, and of framing laws on all matters not included in the articles of confederation.

But for the more convenient management of the general interests of the United States, it was determined, that delegates should be annually appointed in such manner as the legislature of each state should direct, to meet in congress on the first Monday of November of every year, with a power reserved to each state to recall its delegates at any time within the year, and to send others in their stead. No state was to be represented in congress by less than two, nor more than seven members; and no person was capable of being a delegate for more than three years, in any term of six years; nor was any person, being a delegate, capable of holding any office under the United States, for which he, or any other for his benefit, should receive any salary, fees, or emolument of any kind. In determining questions in the United States in congress assembled, each state was to have one vote, and to abide by the determinations of the United States in congress assembled, on all questions submitted to them by the confederation. The articles of confederation were to be inviolably observed, and the union to be perpetual; nor was any alteration thenceforth to be made in any state, unless previously agreed to in congress, and afterwards confirmed by the legislature of that state.

It was on the 30th of January, 1778, that the French king concluded a treaty of amity and commerce with the Thirteen United Colonies of America. Holland acknowledged their independence, April 19th, 1782; and on the 30th of November, 1782, provisional articles were signed at Paris, by the British and American commissioners, in which the thirteen colonies are acknowledged as Free, Sovereign, and Independent States; and these articles were afterwards ratified by a definitive treaty. Sweden acknowledged them, February 5th, 1783; Denmark, the 25th February; Spain, in March, and Russia, in July, 1783.

According to the report of the committee appointed for that purpose, the *Foreign Debt* of the United States, incurred by the late war for obtaining their independence, amounted to 7,885,085 dollars, and the *Domestic Debt* to 34,115,290; total, at 4s. 6d. each, equal to 9,450,084l. sterling, the interest of which at 6 per cent. is 567,005l. But the cost of the war to Great Britain is moderately computed at 115,654,914l. and the additional annual burden by it, 4,557,575l. since January 1775. As to the loss of men during the unhappy war, the states of America, according to authentic estimates, lost by the sword and in prison near 80,000 men; and by the British returns at New York, the number of soldiers killed in the service amounted to 43,633.

*The following Calculations were made from actual Measurement of the best Maps, by THOMAS HUTCHINS, Esq. Geographer to the United States.*

The territory of the United States contains, by computation, a million of square miles, in which are	-	-	-	-	640,000,000	of acres.
Deduct for water	-	-	-	-	51,000,000

That part of the United States, comprehended between the west temporary line of Pennsylvania on the east, the boundary line between Britain and the United States, extending from the river St. Croix to the north-west extremity of the Lake of the Woods on the North, the river Mississippi to the mouth of the Ohio on the west, and the river Ohio on the south, to the aforementioned bounds of Pennsylvania, contains by computation about four hundred and eleven thousand square miles, in which are

Deduct, for water	263,040,000 of acres.
	43,040,000
To be disposed of by order of Congress	220,000,000

The whole of this immense extent of unappropriated western territory, containing, as above stated, 220,000,000 of acres, has been, by the cession of some of the original Thirteen States, and by the treaty of peace, transferred to the federal government, and is pledged as a fund for sinking the continental debt. It is in contemplation to divide it into new states, with republican constitutions similar to the old states near the Atlantic ocean.

That

POPULATION OF THE } According to the census, taken by order of congress,  
 UNITED STATES. } in 1790, the number of inhabitants in the United States  
 of America was 3,930,000 nearly. In this number none of the inhabitants of the  
 territory N. W. of the river Ohio, and but a part of the inhabitants of the territory  
 south of the river Ohio, are included. These added would undoubtedly have  
 increased the number to 3,950,000 \*, at the period the census was taken. The in-  
 crease since, on supposition that the inhabitants of the United States double once  
 in twenty years, has been about 600,000; so that now (1795) there are probably  
 4,550,000 souls in the American United States.

The western division	— } Connecticut	— } { New London Hartford.

FACE OF THE COUNTRY, } New England is a high, hilly, and, in some parts,  
 MOUNTAINS, &c. } a mountainous country. The mountains are com-  
 paratively small, running nearly north and south, in ridges, parallel to each other.  
 Between these ridges, flow the great rivers in majestic meanders, receiving the in-  
 numerable streams which proceed from the mountains on each side. To a specta-  
 tor on the top of a neighbouring mountain, the vales between the ridges, while in  
 a state of nature, exhibit a romantic appearance. They seem an ocean of woods,  
 swelled and depressed in its surface, like that of the great ocean itself.

There are four principal ranges of mountains, passing, nearly from north-east to  
 south-west, through New-England. They consist of a multitude of parallel ridges,  
 each having many spurs, deviating from the course of the general range; which  
 spurs are again broken into irregular hilly land. The main ridges terminate,  
 sometimes in high bluff heads, near the sea coast, and sometimes by a gradual de-  
 scent in the interior part of the country.—These ranges of mountains are full of

\* Morse's American Geography, vol. 1. p. 207.

† Morse's American Geography.

lakes, ponds and springs of water, that give rise to numberless streams of various sizes. No country on the globe is better watered than New England\*.

RIVERS.] Their rivers are, 1. Connecticut; 2. Thames; 3. Patuxent; 4. Merrimac; 5. Piscataway; 6. Saco; 7. Casco; 8. Kinebeque; and 9. Penobscot, or Pentagonet.

BAYS AND CAPES.] The most remarkable bays and harbours are those formed by Plymouth, Rhode Island, and Providence Plantations; Monument-Bay; West-Harbour, formed by the bending of Cape-Cod, Boston-harbour; Piscataway; and Casco-Bay.

The chief capes are, Cape-Cod, Marble-head, Cape-Anne, Cape-Netic, Cape-Porpus, Cape-Elizabeth, and Cape-Small-Point.

AIR AND CLIMATE.] New England, though situated almost ten degrees nearer the sun than England, has an earlier winter, which continues longer, and is more severe than with us. The summer is extremely hot, and much beyond any thing known in Europe, in the same latitude. The clear and serene temperature of the sky, however, makes amends for the extremity of heat and cold, and renders the climate of this country so healthy, that it is reported to agree better with British constitutions, than any other of the American provinces. The winds are very boisterous in the winter season; and naturalists ascribe the early approach, the length, and severity of the winter, to the large fresh-water lakes lying on the north-west of New England, which, being frozen over several months, occasion those piercing winds, which prove so fatal to mariners on this coast.

The sun rises at Boston, on the longest day, at 26 minutes after four in the morning, and sets at 34 minutes after seven in the evening; and on the shortest day, it rises at 35 minutes after seven in the morning, and sets at 27 minutes after four in the afternoon: thus their longest day is about fifteen hours, and the shortest about nine.

SOIL AND PRODUCE.] We have already observed, that the lands lying on the eastern shore of America are low, and in some parts swampy, but farther back they rise into hills. In New England, towards the north-east, the lands become rocky and mountainous. The soil here is various, but best towards the south. Round Massachusetts bay the soil is black, and said to be as rich as in any part of England; and here the first planters found the grass above a yard high. The uplands are less fruitful, being for the most part a mixture of sand and gravel, inclining to clay. The low grounds abound in meadows and pasture land. The European grains have not been cultivated here with much success; the wheat is subject to be blasted; the barley is a hungry grain, and the oats are lean and chaffy. But the Indian corn flourishes in high perfection, and makes the general food of the lower sort of people. They malt and brew it into a beer, which is not contemptible. However, the common table-drink is cider and spruce beer: the latter is made of the tops of the spruce fir, with the addition of a small quantity of mellisks. They raise a large quantity of hemp and flax. The fruits of Old England come to great perfection here, particularly peaches and apples: of the former, seven or eight hundred may be found on one tree; and seven barrels of cider have been produced in one season, from a single apple-tree.

But New England is chiefly distinguished for the variety and value of its timber, as oak, ash, pine, fir, cedar, elm, cypress, beech, walnut, chestnut, hazel, salisfras, sumach, and other woods used in dying or tanning leather, carpenters' work, and ship-building. The oaks here are said to be inferior to those of England; but the firs are of an amazing bulk, and formerly furnished the royal navy of England

\* Morfe's American Geography.

with masts and yards. They draw from their trees considerable quantities of pitch, tar, resin, turpentine, gums, and balm; and the soil produces hemp and flax. A ship may here be built and rigged out with the produce of their forests; and indeed ship-building forms a considerable branch of their trade.

**METALS.]** Rich iron mines, of a most excellent kind and temper, have been discovered in New England, which, if improved, may become very beneficial to the inhabitants.

**ANIMALS.]** The animals of this country furnish many articles of New England commerce. All kinds of European cattle thrive here, and multiply exceedingly. The horses of New England are hardy, mettlesome, and serviceable, but smaller than ours, though larger than the Welch. They have few sheep; and the wool, though of a staple sufficiently long, is not near so fine as that of England. Here are also elks, deer, hares, rabbits, squirrels, beavers, otters, monkeys, minks, martens, racoons, babbs, bears, wolves, which are only a kind of wild dogs, foxes, ounces, and a variety of other tame and wild quadrupeds. But one of the most singular animals, of this and the neighbouring countries, is the moose or moose deer, of which there are two sorts; the common light grey moose, which resembles the ordinary deer; these herd sometimes thirty together; and the large black moose, whose body is about the size of a bull; his neck resembles a stag's, and his flesh is extremely grateful. The horns, when full grown, are about four or five feet from the head to the tip, and have shoots or branches to each horn, which generally spread about six feet. When this animal goes through a thicket, or under the boughs of a tree, he lays his horns back on his neck, to place them out of his way; and these prodigious horns are shed every year. This animal does not spring or rise in going, like a deer; but a large one, in his common walk, has been seen to step over a gate five feet high. When unharboured, he will run a course of twenty or thirty miles before he takes to bay; but, when chased, he generally takes to the water.

There is hardly any where greater plenty of fowls, as turkeys, geese, partridges, ducks, widgeons, dappers, swans, heathcocks, herons, storks, blackbirds, all sorts of barn-door fowl, vast flights of pigeons, which come and go at certain seasons of the year, cormorants, ravens, crows, &c. The reptiles are rattlesnakes, frogs, and toads, which swarm in the uncleared parts of these countries, where, with the owls, in the summer evenings, they make an unpleasant noise.

The seas round New England, as well as its rivers, abound with fish, and even whales of several kinds, such as the whalebone whale, the spermaceti whale, which yields ambergris, the fin-backed whale, the serag whale, and the bunch whale, of which they take great numbers, and send besides some ships every year to fish for whales in Greenland, and as far as Falkland islands. A terrible creature, called the whale-killer, from 20 to 30 feet long, with strong teeth and jaws, persecutes the whale in these seas; but, afraid of his monstrous strength, they seldom attack a full-grown whale, or indeed a young one, but in companies of ten or twelve. At the mouth of the river Penobscot, there is a mackarel fishery: they likewise fish for cod in winter, which they dry in the frost.

**POPULATION, INHABITANTS, AND**  
**FACE OF THE COUNTRY.]** There is not one of the colonies which can be compared, in the abundance of people, the number of considerable and trading towns, and the manufactures that are carried on in them, to New England. The most populous and flourishing parts of the mother-country hardly make a better appearance than the cultivated parts of this province, which reach above sixty miles back. There are here many gentlemen of considerable landed estates; but the great body of the people are landholders, and cultivators of the soil. The former attaches them to their country;

|| Ibid. p. 38

the latter, by making them strong and healthy, enables them to defend it. These freeholds generally pass to their children in the way of gavelkind; which keeps them from being hardly ever able to emerge out of their original happy mediocrity. In no part of the world are the ordinary ranks so independent, or possess more of the conveniences of life: they are used from their infancy to the exercise of arms; and, before the contest with the mother-country, they had a militia, which was by no means contemptible; but their military strength is now much more considerable.

The inhabitants of New England are almost universally of English descent; and it is owing to this, and to the great and general attention that has been paid to education, that the English language has been preserved among them so free from corruption. It is true that, from laziness, inattention, and want of acquaintance with mankind, many of the people in the country have accustomed themselves to use some peculiar phrases, and to pronounce certain words in a flat drawing manner. Hence foreigners pretend they know a New England man from his manner of speaking. But the same may be said with regard to a Pennsylvanian, a Virginian, or a Carolinian; for all have some phrases and modes of pronunciation peculiar to themselves, which distinguish them from their neighbours.

The New-Englanders are generally tall, stout, and well built. They glory, and perhaps with justice, in possessing that spirit of freedom, which induced their ancestors to leave their native country, and to brave the dangers of the ocean, and the hardships of settling a wilderness. Their education, laws and situation, serve to inspire them with high notions of liberty.—In New England, learning is more generally diffused among all ranks of people, than in any other part of the globe; arising from the excellent establishment of schools in every township. A person of mature age, who cannot both read and write, is rarely to be found. By means of this general establishment of schools, the extensive circulation of newspapers (of which not less than 30,000 are printed every week in New England, and sent to almost every town and village in the country), and the consequent spread of learning, every township, throughout the country, is furnished with men capable of conducting the affairs of their town with judgment and discretion.

New England contains, according to the census\* of 1790, 1,000,522 souls, and, should any great and sudden emergency require it, could furnish an army of 164,600 men. The inhabitants of Massachusetts bay are estimated at 378,787 †.

Connecticut is said, in proportion to its extent, to exceed every state of America in populousness and plenty. In 1790, the population amounted to 237,946 ‡, of whom 2,764 were slaves. The men, in general, throughout the province, are robust, stout, and tall. The greatest care is taken of the limbs and bodies of infants, which are kept straight by means of a board; a practice learnt of the Indian women, who abhor all crooked people; so that deformity is here a rarity. The women are fair, handsome, and genteel, and modest and reserved in their manners and behaviour. They are not permitted to read plays, nor can they converse about whist, quadrille, or operas; but it is said that they will talk freely upon history, geography, and other literary subjects. The inhabitants of Connecticut are extremely hospitable to strangers.

New Hampshire, of late years, hath greatly increased in population, so that in 1783 the number of inhabitants was reckoned to amount to 82,200; but in 1790 to 141,885 §. The population of Rhode Island province in 1783 was 50,400; but in 1790, amounted to 67,877 ||, of which 948 were slaves.

RELIGION.] The church of England, in this part of America, is far from being

\* Morfe's American Geography, vol. i. p. 314. † Ibid. p. 353. ‡ Ibid. p. 393. § Ibid. p. 329. || Ibid. p. 381.

in a flourishing condition; in several places, the number of auditors do not amount to twelve persons. Calvinism, from the principles of the first settlers, hath been very prevalent in New England; many of the inhabitants also formerly observed the sabbath with a kind of Jewish rigor; but their bigotry of late hath been much diminished. Since their independence, there is no one established religion in the province, but every sect is allowed the free exercise of its own, and is equally under the protection of the laws\*. They annually celebrate fasts and thanksgivings. In the spring, the several governors issue their proclamations, appointing a day to be religiously observed in fasting, humiliation and prayer, throughout their respective states, in which the predominant vices, that particularly call for humiliation, are enumerated. In autumn, after harvest, that gladfome era of the husbandman's life, a day of public thanksgiving is appointed, enumerating the public blessings received in the course of the year. This pious custom originated with their venerable ancestors, the first settlers. A custom so rational, and so well calculated to cherish in the minds of the people a sense of their dependence on the GREAT BENEFACITOR of the world for all their blessings, it is hoped will ever be sacredly preserved †. The Connecticut province hath also provided a bishop for the Episcopalians among them, by sending one of their number to Scotland to be ordained by the nonjur-ing bishops of the episcopal church in that kingdom, which ceremony was performed at Aberdeen.

**CHIEF TOWNS.]** Boston, the capital of Massachusetts, stands on a peninsula at the bottom of Massachusetts bay, about nine miles from its mouth. At the entrance of this bay, are several rocks which appear above water, and upwards of a dozen small islands, some of which are inhabited. There is but one safe channel to approach the harbour, and that so narrow, that two ships can scarcely sail through abreast; but within the harbour there is room for 500 sail to lie at anchor, in a good depth of water. On one of the islands of the bay, stands Fort William, the most regular fortrefs in all the plantations. This castle is defended by 100 guns, twenty of which lie on a platform level with the water, so that it is scarcely possible for an enemy to pass the castle. To prevent surprize, they have a guard placed on one of the rocks, at two leagues distance, from whence they make signals to the castle, when any ships come near it. There is also a battery of guns at each end of the town. At the bottom of the bay is a noble pier, near 2000 feet in length; along which, on the north side, extends a row of warehouses for the merchants; and to this pier, ships of the greatest burden may come and unload, without the help of boats. The greatest part of the town lies round the harbour, in the shape of a half moon; the country beyond it rising gradually, and affording a delightful prospect from the sea. The head of the pier joins the principal street of the town, which is, like most of the others, spacious and well built. Boston contains at present about 20,000 inhabitants. The surprizing increase of Newbury port, Salem, Marblehead, Cape Anne, Plymouth, Dartmouth, and the island of Nantucket, hath checked the growth and trade of the capital; the latter of which was, however, so very considerable, that, in the year 1768, 1200 sail entered or cleared at the Custom-house there. Both the town and trade of Boston greatly suffered during the war with Great Britain; but since, the trade has again considerably increased.

Cambridge, in the same province, four miles from Boston, has an university, containing two spacious colleges, called by the names of Harvard College, and Stoughton Hall, with a well-furnished library. It consists of a president, five

\* By a late account there are 400 Independent and Presbyterian churches in this province, 84 of Baptists, and 31 of other dominations.

fellows, a treasurer, three professors, four tutors, and a librarian. The college charter was first granted in 1650, and renewed in 1692, and is held under the colony seal.

The other towns in New England, the chief of which have already been mentioned, are generally neat, well built, and commodiously situated upon fine rivers, with capacious harbours.

**COMMERCE AND MANUFACTURES.]** The trade of New England is great, as it supplies a large quantity of goods from within itself; but it is yet greater, as the people of this country are the principal carriers for the other colonies of North America, and even for some parts of Europe. The commodities which the country yields are principally pig and bar iron, which were imported to Great Britain duty-free; also masts and yards, pitch, tar, and turpentine, for which they contracted largely with the royal navy; pot and pearl ashes, staves, lumber, boards; all sorts of provisions, which they sent to the French and Dutch sugar islands, and formerly to Barbadoes, and the other British isles, as grain, biscuit, meal, beef, pork, butter, cheese, apples, cider, onions, mackarel and cod-fish dried. They likewise send thither cattle, horses, planks, hoops, shingles, pipe-staves, oil, tallow, turpentine, bark, calf-skins, and tobacco. Their peltry trade is not very considerable. They have a most valuable fishery upon their coasts in mackarel and cod, which employs vast numbers of their people; with the produce of which they trade to Spain, Italy, the Mediterranean, and West Indies, to a considerable amount. Their whale-fishery has been already mentioned. The arts most necessary to subsistence are those which the inhabitants of New England have been at the greatest pains to cultivate. They manufacture coarse linen and woollen cloth for their own use; hats are made here, which find a good vent in all the other colonies. Sugar-baking, distilling, paper-making, and salt-works, are upon the improving hand. The business of ship-building is one of the most considerable, which Boston, Newbury, and the other sea-port towns in New England carry on. Ships are sometimes built here upon commission; but frequently the merchants of New England have them constructed upon their own account; and loading them with the produce of the colony, naval stores, fish, and fish oil principally, they send them out upon a trading voyage to Spain, Portugal, or the Mediterranean; where, having disposed of their cargo, they make what advantage they can by freight, until such time as they can sell the vessel herself to advantage, which they seldom fail to do in a reasonable time.

It was computed, that, before the late revolution, the value of English manufactures, and India goods, sent into this colony from Great Britain, amounted, at an average of three years, to 395,000*l*. Our imports from the same were calculated at 370,500*l*.

**HISTORY AND GOVERNMENT.]** New England comprehends the four provinces of New Hampshire, Massachusetts, Rhode Island, and Connecticut. As early as 1606, king James I. had by letters patent erected two companies, with a power to send colonies into those parts, then included under the name of Virginia. No settlements, however, were made in New England by virtue of this authority. The companies contented themselves with sending out some ships to trade with the Indians for their furs, and to fish upon their coast. This continued to be the only sort of correspondence between Great Britain and this part of America, till the year 1620. By this time the religious dissensions which agitated England had become warm and furious. Archbishop Laud persecuted all sorts of nonconformists with an unrelenting severity. Those men, on the other hand, were ready to submit to all the rigour of persecution rather than conform to the ceremonies of the church of England, which they considered as abuses of a most dangerous tendency. America opened to them an extensive field. There they might transport themselves, and

establish

establish whatever sort of religious polity they were inclined to. With this view, having purchased the territory, which was within the jurisdiction of the Plymouth Company, and having obtained from the king the privilege of settling it in whatever way they had a mind, 150 persons embarked for New England, and built a city, which, because they had sailed from Plymouth, they called by that name. Notwithstanding the severity of the climate, the unwholesomeness of the air, and the diseases to which, after a long sea voyage, and in a country which was new to them, they were exposed, notwithstanding the want of all sort of conveniences, and even of many of the necessaries of life, those who had constitutions fit to endure such hardships, not dispirited or broken by the death of their companions, set themselves to cultivate this country, and to take the best steps for the advancement of their infant colony. New adventurers, encouraged by their example, passed over into this land of religious and civil liberty. By the close of the year 1630, they had built four towns, Salem, Dorchester, Charles Town, and Boston, which last has since become the capital of New England. But as necessity is the natural source of that active and frugal industry which produces every thing great among mankind, so an uninterrupted flow of prosperity and success occasions those dissensions, which are the bane of human affairs, and often subvert the best founded establishments.

The inhabitants of New England, who had fled from persecution, became in a short time strongly tainted with this illiberal vice, and were eager to introduce an uniformity in religion among all who entered their territories. Many of them were bigoted Calvinists; and though they had felt the weight of persecution themselves, they had no charity for those who professed sentiments different from their own. It was not the general opinion of the age, that men might live comfortably together in the same society, without maintaining the same religious tenets; and wherever these were at variance, the members of different sects kept at a distance from each other, and established separate governments. Hence several slips, torn from the original government of New England by religious violence, planted themselves in a new soil, and spread over the country. Such was that of New Hampshire, which continues to this day a separate jurisdiction; such too was that of Rhode Island, whose inhabitants were driven out from the Massachusetts colony (for that is the name by which the government first erected in New England was distinguished), for maintaining that the civil magistrate had no right over the speculative opinions of mankind. These liberal men founded a city, called Providence, which they governed by their own principles; and such is the connection between justice of sentiment and external prosperity, that the government of Rhode Island, though small, became extremely populous and flourishing. Another colony, driven out by the same persecuting spirit, settled on the river Connecticut, and received frequent reinforcements from England, of such as were dissatisfied either with the religious or civil government of that country.

America indeed was now become the main resource of all discontented and enterprising spirits; and such were the numbers which embarked for it from England, that, in 1637, a proclamation was published, prohibiting any person from sailing thither, without an express licence from the government. For want of this licence, it is said that Oliver Cromwell, Mr. Hamplen, and others of that party, were detained from going into New England, after being on shipboard for that purpose.

These four provinces, though always confederated for their mutual defence, were at first, and still continue, under separate jurisdictions. They were all of them by their charters originally free colonies, having the choice of their own magistrates, the governor, the council, the assembly, and the power of making laws not contradictory

dictory to those of Great Britain. Towards the latter end of the reign of Charles II. when he and his ministers wanted to destroy all charters and liberties, the Massachusetts colony was accused of violating their charter, in like manner as was the city of London, and, by a judgment in the King's Bench of England, was deprived of it. From that time to the Revolution, they remained without any charter. Soon after that period, they received a new one, which, though very favourable, was much inferior to the extensive privileges of the former. The appointment of a governor, lieutenant-governor, secretary, and all the officers of the admiralty, was vested in the crown; the power of the militia was wholly in the hands of the governor, as captain-general; all judges, justices, and sheriffs, to whom the execution of the law was entrusted, were nominated by the governor, with the advice of the council; the governor had a negative on the choice of counsellors, peremptory and unlimited; authentic copies of the several acts passed by this colony, as well as others, were to be transmitted to England, for the royal approbation; but if the laws of this colony were not repealed within three years after they were presented, they were not repealable by the crown after that time; no laws, ordinances, election of magistrates, or acts of government whatsoever, were valid without the governor's consent in writing; and appeals for sums above 300*l.* were admitted to the king and council.

There were originally three sorts of governments established by the English on the continent of America, viz. royal governments, charter-governments, and proprietary governments.

A royal government was properly so called, because the colony was immediately dependent on the crown, and the king remained sovereign of the colony; he appointed the governor, council, and officers of state; and the people only elected the representatives, as in England. Such were the governments of Canada, Nova Scotia, Virginia, New Hampshire, New York, New Jersey, Georgia, East and West Florida, the West Indies, and the island of St. John's.

A charter-government was so called, because the company, incorporated by the king's charter, were in a manner vested with sovereign authority, to establish what sort of government they thought fit; and these charter-governments have generally transferred their authority to the people; for in such governments, or rather corporations, the freemen did not only choose their representatives, but annually chose their governor, council, and magistrates, and made laws without the concurrence, and even without the knowledge, of the king; and were under no other restraint than this, that they enacted no laws contrary to the laws of England; if they did, their charters were liable to be forfeited. Such were the governments of Rhode Island and Connecticut, in New England; and such was that of the Massachusetts formerly, though some alterations were afterwards made in it. Such likewise were those of the two Carolinas.

The third kind of government was the proprietary, properly so called, because the proprietor was invested with sovereign authority: he appointed the governor, council, and magistrates, and the representatives were summoned in his name; and by their advice he enacted laws, without the concurrence of the crown; but, by a subsequent statute, the proprietor was to have the king's consent in the appointing a governor, when he did not reside in the plantation in person, and of a deputy-governor, when he did. And all the governors of the plantations were liable to be called to an account for their administration, by the court of King's Bench. The last proprietary governors were those of Pennsylvania and Maryland.

But the government of New England was entirely changed, in consequence of the revolt of the colonies from the authority of Great Britain; of the origin and progress of which an account hath been given in another place. It was on the 25th

of July, 1776, that, by an order from the council at Boston, the Declaration of the American Congress, absolving the United Colonies from their allegiance to the British crown, and declaring them free and independent, was publicly proclaimed from the balcony of the state-house in that town.

A constitution, or form of government, for the commonwealth of Massachusetts, including a declaration of rights, was established by the inhabitants of that province, in October 1780. In the preamble to this it was declared, that the end of government is to secure the existence of the body politic; to protect it, and to furnish the individuals who compose it, with the power of enjoying, in safety and tranquillity, their natural rights, and the blessings of life; and that whenever these great objects are not obtained, the people are entitled to take measures necessary for their own happiness. They expressed their gratitude to the great Legislator of the universe, for having afforded them an opportunity of forming a new constitution of civil government for themselves and their posterity. They declared that it was the right, as well as the duty of all men in society, publicly, and at stated seasons, to worship the Supreme Being; and that no subject should be hurt, molested or restrained, in his person, liberty, or estate, for worshipping God in the manner and season most agreeable to the dictates of his own conscience; provided he did not disturb the public peace, or obstruct others in their religious worship.

It was also enacted, that the several towns, parishes, precincts, and other bodies politic, or religious societies, should, at all times, have the exclusive right of electing their public teachers, and of contracting with them for their salaries. That all monies paid by the subject towards the support of public worship, and of the public teachers, should, if he require it, be uniformly applied to the teachers of his own religious sect or denomination, provided there were any on whose instructions he attended; otherwise it might be paid to those of the parish or precinct in which the said monies should be raised. That every denomination of Christians, demeaning themselves peaceably, and as good subjects of the commonwealth, should be equally protected by the law: and that no subordination of any sect or denomination, to another, should ever be established.

It was likewise declared, that, as all power originated in the people, the several magistrates, whether legislative, executive, or judicial, are their substitutes and agents, and at all times accountable to them. That no subject should be arrested, or deprived of his property, or privileges, but by the judgment of his peers, or the law of the land. That the legislature should not make any law, subjecting any person to a capital or infamous punishment, except for the government of the army or navy, without trial by jury. That the liberty of the press is essential to the security of freedom in a state. That the people have a right to keep, and to bear arms, for the common defence; but that, as in times of peace armies are dangerous to liberty, they ought not to be maintained without the consent of the legislature; and that the military power should always be held in an exact subordination to the civil authority.

The legislature of Massachusetts consists of a senate and a house of representatives; which, together with the governor and lieutenant governor, are elected annually by the people. Electors must be 21 years of age, have freeholds of the annual value of 31. or personal estate to the value of 601. To be eligible to the office of governor or lieutenant governor, the candidate must have resided in the state seven years, and during that time have been seized of a freehold of 10001. Senators must have resided five years in the state, and have possessed a freehold to the value of 3001. or personal property to the value of 6001. A representative must have resided one year in the town which he is chosen to represent, and have been seized therein of freehold estate to the value of 1001. or been possessed of personal property to the value of 2001. fellors, being forty in all, nine are annually elected by joint ballot of both houses for the purpose of advising the governor in the execution of his office. All judicial officers, the attorney and solicitor general, sheriffs, &c. are, with the advice of his council, appointed by the governor. The judges (except justices of the peace, whose commissions expire in seven years, but may be renewed) hold their offices during good behaviour. The constitution of New-Hampshire is not materially different from that of Massachusetts. The supreme executive authority is also vested in a governor and council of five members; and the legislative, in a senate and house of representatives, which together are here styled the "General court." The legislatures of Rhode Island and Connecticut are constituted with an upper and lower house. In Rhode Island, the upper house is composed of the governor, deputy governor, and ten assistants; who, together with the secretary and treasurer, are chosen by the freemen annually. The lower house is composed of deputies from the several towns. All judicial and executive magistrates are appointed by the two houses annually; and all military officers appointed in like manner, but without any precise limitation of time. What has been just said of the constitution of Rhode Island is applicable to Connecticut. One or two variations in point of name and number constitute the only difference; except that in Rhode Island a freeman elector must have freehold estate of the value of 2l. or personal, of 40l. In all these states, the government is arranged on the most frugal scale; the salaries of governors and chief justices amounting to no more than 3 or 400l. per annum; and those of other officers proportionally moderate.

It is worthy of notice, that, during the war with Great Britain, an act was passed, on the 4th of May 1780, by the council and house of representatives of Massachusetts Bay, for incorporating and establishing a society for the cultivation and promotion of the arts and sciences. It is entitled "The American Academy of Arts and Sciences;" the first members were named in the act; and they were never to be more than two hundred, nor less than forty. It was declared in the act, that the end and design of the institution of the said academy was to promote and encourage the knowledge of the antiquities of America, and of the natural history of the country; and to determine the uses to which its various natural productions might be applied; to promote and encourage medicinal discoveries; mathematical disquisitions; philosophical inquiries and experiments; astronomical, meteorological, and geographical observations; and improvements in agriculture, arts, manufactures, and commerce; and, in short, to cultivate every art and science, which might tend to advance the interest, honour, dignity, and happiness, of a free, independent, and virtuous people.

BOUNDARIES.] **N**EW YORK is bounded on the South and South-west, by Hudson's and Delaware rivers, which divide it from New Jersey and Pennsylvania; on the East and North-east, by New England and the Atlantic Ocean; and on the North-west, by Canada.

This province, including the Island of New York, Long Island, and Staten Island, is divided into the following sixteen counties:

Counties.	Chief Towns.
New York - - - - -	NEW YORK { 40°40' N. lat. 74°00' W. lon.
Ulster - - - - -	Kingston
Duchefs - - - - -	Poughkeepsie, Fishkill
Orange - - - - -	Orange, Goshen
West Chester - - - - -	Bedford, White-plains
King's - - - - -	Flatbush, Brooklyn
Queen's - - - - -	Jamaica
Suffolk - - - - -	East Hampton, Huntington
Richmond - - - - -	Westfield
Washington - - - - -	Salem
Montgomery * - - - - -	Johnstown
Columbia - - - - -	Hudson, Kinderhook
Cinton - - - - -	Plattsburgh
Ranfelaer - - - - -	Lansburgh
Ontario - - - - -	Canadaque

**RIVERS.]** The principal of these are Hudson's and the Mohawk; the former abounds with excellent harbours, and is well stored with great variety of fish: on this the cities of New York and Albany are situated. The tide flows a few miles above Albany, which is 160 miles from New York. It is navigable for floops of 80 tons to Albany, and for ships to Hudson. About 60 miles above New York the water becomes fresh. The river is stored with a variety of fish, which renders a summer passage to Albany delightful and amusing to those who are fond of angling †. On the Mohawk is a large cataract, called the Cohoes, the water of which is said to fall 30 feet perpendicular, but including the descent above, the fall is as much as 60 or 70 feet ‡, where the river is a quarter of a mile in breadth.

**CAPES.]** These are Sandy-Hook, near the entrance of Raritan river; and Montock Point, at the east end of Long Island.

**CLIMATE, SOIL, AND PRODUCE.]** This province, lying to the South of New England, enjoys a more happy temperature of climate. The air is very healthy, and agrees well with all constitutions. The face of the country, resembling that of the other American colonies, is low, flat, and marshy towards the sea. As you recede from the coast, the eye is entertained with the gradual swelling of hills, which become large in proportion as you advance into the country. The soil is extremely fertile, producing, wheat, rye, Indian corn, oats, barley, flax, and fruits, in great abundance and perfection. The timber is much the same with that of New England. A great deal of iron is found here.

**CITIES, POPULATION, AND COMMERCE.]** The city of New York stands on the

South-west end of York-Island, which is twelve miles long, and near three in breadth, extremely well situated for trade, at the mouth of Hudson's river, where it is three miles broad, and proves a noble conveyance from Albany, and many other inland towns towards Canada, and the lakes. New York is situated at the confluence of the Hudson and east rivers. The length of the city on east river is about two miles, but falls much short of that distance on the banks of the Hudson, and its mean breadth a quarter of a mile. The city and harbour are defended by a fort and battery; in the fort is a spacious mansion-house for the use of the governor. Many of the houses are very elegant; and the city, though irregularly built, affords a fine prospect. In the year 1776, when the king's troops took it, some incendiaries attempted to destroy it, and one fourth part of it was burnt down. A great part of the inhabitants, reckoned, in 1790, at 33,131, are descended from the Dutch families, who remained here after the surrender of the New Netherlands to the English; and the whole province, in 1790, was numbered at 340,120.

The city of Albany contains about 4000 inhabitants, collected from almost all parts of the northern world. As great a variety of languages are spoken in Albany, as in any town in the United States. Adventurers in pursuit of wealth are led here by the advantages for trade which this place affords. Situated on one of the finest rivers in the world, at the head of sloop-navigation, surrounded with a rich and extensive back country, and the store house of the trade to and from Canada and the lakes, it must flourish, and the inhabitants cannot but grow rich.

The city of Hudson, however, is their great rival, and has had the most rapid growth of any place in America, if we except Baltimore in Maryland. It is 130 miles north of New York. It was not begun till the autumn of 1783\*.

The situation of New York, with respect to foreign markets, has decidedly the preference to any of the states. It has at all seasons of the year a short and easy access to the ocean. It commands the trade of a great proportion of the best settled and best cultivated parts of the United States. It has been supposed by gentlemen well informed, that more wealth is conveyed down Connecticut river, and through the Sound to New York, than down the Hudson. This is not improbable, as the banks of the Connecticut are more fertile, and much thicker and more extensively settled than the banks of the Hudson †.

The commodities in which they trade are wheat, flour, barley, oats, beef, and other kinds of animal food. Their markets are the same with those which the New-Englanders use; and they have a share in the log-wood trade, and that which is carried on with the Spanish and French plantations. They used to take almost the same commodities from England with the inhabitants of Boston. At an average of three years, their exports were said to amount to 526,000*l.* and their imports from Great Britain to 531,000*l.*

[AGRICULTURE AND MANUFACTURES.] New York is at least half a century behind her neighbours in New England, New Jersey and Pennsylvania, in point of improvement in agriculture and manufactures. Among other reasons for this inferiority, that of want of enterprise in the inhabitants is not the least. Indeed their local advantages are such that they have grown rich without enterprise. Besides lands have hitherto been cheap, and farms of course large, and it requires much less ingenuity to raise 1000 bushels of wheat upon 60 acres of land, than to raise the same quantity upon 30 acres. So long, therefore, as the farmer in New York can have 60 acres of land to raise 1000 bushels of wheat, he will never trouble himself to find out how he can raise the same quantity upon half the land.

\* Morfe's American Geography, vol. 1. p. 421.

† Ibid.

It is population alone that stamps a value upon lands, and lays a foundation for high improvements in agriculture. When a man is obliged to maintain a family upon a small farm, his invention is exercised to find out every improvement that may render it more productive. This appears to be the great reason why the lands on Delaware and Connecticut rivers produce to the farmer twice as much clear profit as lands in equal quantity, and of the same quality, upon the Hudson. If the preceding observations be just, improvements will keep pace with population and the increasing value of lands.

Improvements in manufactures never precede, but invariably follow improvements in agriculture. This observation applies more particularly to the country. The city of New York contains a great number of people who are employed in the various branches of manufactures, viz. wheel carriages of all kinds, loaf-sugar, bread, beer, shoes and boots, saddlery, cabinet work, cutlery, hats, clocks, watches, mathematical and musical instruments, ships, and every thing necessary for their equipment. A glass work and several iron works have been established\*.

[RELIGION AND LEARNING.] All religious denominations, without discrimination or preference, enjoy equal privileges here, provided that the liberty of conscience hereby granted shall not be so construed as to excuse acts of licentiousness, or justify practices inconsistent with the peace and safety of the state. The inhabitants of the province consist chiefly of Dutch, English, and Scotch presbyterians, German Calvinists, Lutherans, quakers, baptists, &c. who have their respective houses of worship. The Dutch presbyterians being in subordination to the Classis of Amsterdam, used to send all their youth, who are intended for the ministry, to Holland for ordination, as the episcopalians did theirs to England †.

A college was erected in New York, called king's college, by act of parliament, about the year 1755; but as the assembly was at that time divided into parties, it was formed on a contracted plan, and has for that reason never met with the encouragement which might naturally be expected for a public seminary in so populous a city. It is now called COLUMBIA COLLEGE. It has about 100 students in the four classes, besides medical students.

[HISTORY AND GOVERNMENT.] The Swedes and Dutch were the first Europeans who formed settlements on this part of the American coast. The tract, claimed by these two nations, extended from the 38th to the 41st degree of latitude, and was called the New Netherlands. It continued in their hands till the time of Charles II. who gained it by right of conquest in 1664, and it was confirmed to the English by the treaty of Breda, 1667. The New Netherlands were not long in our possession, before they were divided into different provinces. New York took that name from the king's brother, James, duke of York, to whom the king granted

\* Morfe.

† In the year 1740, the number of places for public worship in the city of New York stood as follows:

Dutch Presbyterians	-	3	Baptists	-	1
English ditto	-	2	Moravians	-	1
Scotch ditto	-	1	German Calvinists	-	2
Episcopalians	-	3	----- Lutherans	-	1
French refugees	-	1	Methodists	-	1
Quakers	-	1	Jews	-	1

The various religious denominations in the state of New York, with the number of their respective congregations, were as follows:

English Presbyterian	-	87	German Lutherans	-	12
Dutch Reformed, including six of the } German language	-	66	Moravians	-	2
Baptists	-	30	Methodists	-	1
Episcopalians	-	26	Roman Catholic	-	1
Quakers	-	20	Jews	-	1

it, with full powers of government, by letters patent, dated March 20, 1664. On James's accession to the throne, the right to New York became vested in the crown, since which time it became a royal government.

According to the constitution ratified in 1777, the legislature of New York consists of a senate and assembly. The number of senators is equal to one third of the assembly, the whole number of which is at present 70, and may never exceed 300. Members of the assembly are elected annually; but senators are chosen for four years, and classed in such manner that the seats of a fourth part are vacated every year. The qualifications of voters for an assembly-man or senator, as well as for the governor and lieutenant-governor (who are elected for the term of 3 years), are a maturity of age, an oath of allegiance to the state, six months' residence, and being a freeholder worth 100l. clear of incumbrance. The governor, chancellor, and judges of the supreme court, form a council for the revision of all bills about to be passed into laws. All officers, whose appointments are not specially provided for in the constitution, are chosen by a council of appointment selected from the senate annually by the assembly. The chancellor, judges of the supreme, and first judges of the county courts, hold their offices during good behaviour, or till 60 years of age: but military officers hold their appointments during pleasure.

RIVERS.]

**RIVERS.]** These are the Delaware, Raritan, and Passaic, on the latter of which is a remarkable cataract; the height of the rock from which the water falls is said to be about 70 feet perpendicular, and the river there 80 yards broad.

**CLIMATE, SOIL, AND PRODUCE.]** The climate is much the same with that of New-York; the soil is various; at least one-fourth part of the province is barren sandy land, producing pines and cedars; the other parts in general are good, and produce wheat, burley, rye, Indian corn, &c. in great perfection.

**RELIGION AND LEARNING.]** The former state of religion here may be seen by the subjoined list of the houses for public worship throughout the province, which was made in 1765 by a member of the council of the province\*. According to the present constitution of this province, all persons are allowed to worship God in that manner that is most agreeable to their own consciences; nor is any person obliged to pay tithes, taxes, or any other rates, for the purpose of building or repairing any other church or churches, or for the maintenance of any minister or ministry, contrary to what he believes to be right, or has deliberately engaged himself to perform. There is not any establishment of any one religious sect in this province, in preference to another; and no protestant inhabitants are denied the enjoyment of any civil right, merely on account of their religious principles.

A college, called Nassau Hall, was established at the town of Princeton, by governor Belcher, in 1746, which has a power of conferring the same degrees as Oxford or Cambridge. There are generally between 70 and 100 students here, who come from all parts of the continent, some even from the extremities of it. The damages it sustained during the late war are computed at 5000l. There is another college at Brunswick, called Queen's college, founded a little before the last war, and in great repute.

**HISTORY, GOVERNMENT, POPULATION, &c.]** New Jersey is part of that vast tract of land, which we have observed was given by king Charles II. to his brother, James duke of York: he sold it to lord Berkeley and sir George Carteret (from whom it received its present name, because sir George had estates in the island of Jersey), and they again sold it to others, who in the year 1702 made a surrender of the powers of government to queen Anne, which she accepted; after which it became a royal government. By an account published in 1790, the number of inhabitants appears to have been about 184,139, of whom 11,423 were blacks†. Perth-Amboy and Burlington were the seats of government; most frequently the latter, which is pleasantly situated on the fine river Delaware, within twenty miles of Philadelphia. The former is among the best ports on the continent; and the harbour is safe and capacious enough to contain many large ships. This province has no foreign trade worth mentioning, owing to its vicinity to the large trading cities of New York and Philadelphia, by which it is supplied with merchandises of all kinds, and makes returns for them in lumber, wheat, flour, &c. In Bergen county, is a very valuable copper mine.

By the new charter of rights established by the provincial congress, July 2, 1776, the government of New Jersey is now vested in a governor, legislative council, and general assembly. The members of the legislative council are to be freeholders,

and worth at least one thousand pounds real and personal estate; and the members of the general assembly to be worth five hundred pounds. All inhabitants worth fifty pounds are entitled to vote for representatives in council and assembly, and for all other public officers. The governor, legislative council, and general assembly are chosen annually: judges of the supreme court are chosen for seven years; and judges of the common pleas, justices of peace, and the attorney general, for five years.

which form a distinct state and government, having a governor, senate, and house of representatives. The senators are nine, three from each county, and the representatives 27. The former must be 27 years old, and the latter 24; and senators must have a freehold of 200 acres; or real and personal estate to the value of 1000*l*. The governor is not eligible more than three years in six. In other particulars, the constitution of Delaware almost exactly agrees with that of Pennsylvania which will be immediately described.

**RIVERS.** The rivers are Delaware, which is navigable more than 200 miles above Philadelphia. Susquehanna and Schuylkill are also navigable a considerable way up the country. These rivers, with the numerous bays and creeks in Delaware bay, capable of containing the largest fleets, render this province admirably suited to carry on an inland and foreign trade.

**CLIMATE, AIR, SOIL, AND** } The face of the country, air, soil, and produce, **FACE OF THE COUNTRY.** Do not materially differ from those of New York. If there be any difference, it is in favour of this province. The air is sweet and clear. The winters continue from December till March, and are so extremely cold and severe, that the river Delaware, though very broad, is often frozen over. The months of July, August, and September, are most intolerably hot; but the country is refreshed by frequent cold breezes\*. It may be remarked in general,

\* The climate of the middle states of America, viz. New York, New Jersey, Pennsylvania, Delaware, and Territory N. W. of the Ohio, lying almost in the same latitudes, varies but little from that of New England. There are no two successive years alike. Even the same successive seasons and months differ from each other every year. And there is perhaps but one steady trait in the character of this climate, and that is, it is uniformly variable. The changes of weather are great and frequently sudden. The range of the quicksilver in Fahrenheit's thermometer, according to Dr. Mitchell, is between the 24th degree below, and the 10th degree above cypher; and it has been known to vary 30 degrees in the course of 26 hours. Such alterations are much more considerable along the coast, than in the interior and inland parts of the country; and, wherever they prevail, are accompanied with proportionate changes in the air, from calms to winds, and from moisture to drench. Storms and hurricanes sometimes happen, which are so violent as to overturn vessels, demolish fences, uproot trees and unroof buildings. Droughts of six weeks' or two months' continuance occur now and then. Rain has been known to fall in such abundance that the earth by measurement has received 6,5 inches on a level in the short space of four hours\*. The quantity of water which falls in rain and snow, one year with another, amounts to from 24 to 30 inches †. In the northern parts of this district the snow falls in larger quantities, lies longer, and the cold is more steady and intense, by many degrees, than in the southern; hence the climate of the former is more agreeable in winter, and that of the latter in summer. The warmest weather is generally in the month of July; but intensely warm days are often felt in May, June, August, and September. Dr. Rittenhouse says, that, during his residence in the country, in the state of Pennsyl-

vania, he never had passed a summer without discovering frost in every month in the year except July. The greatest degree of heat upon record in Philadelphia, in 1789, was 90°. The standard temperature of air in Philadelphia is 52½° which is the temperature of their deepest wells, and the mean heat of their common spring water. There are seldom more than four months in the year in which the weather is agreeable without a fire. In winter, the winds generally come from the N. W. in fair, and from the N. E. in wet weather. The N. W. winds are uncommonly dry as well as cold.

The climate, on the west side of the Allegany mountains, differs materially from that on the east side, in the temperature of the air, and the effects of the wind upon the weather, and in the quantity of rain and snow which fall every year. The S. W. winds, on the west side of the mountain, are accompanied by cold and rain. The temperature of the air is seldom so cold or so hot by several degrees, as on the east side of the mountain.

On the whole it appears that the climate of this division of the United States is a compound of most of the climates in the world. It has the moisture of Ireland in the spring, the heat of Africa in summer, the temperature of Italy in June, the icy of Egypt in autumn, the snow and cold of Norway and the ice of Holland in winter, the tempests (in a certain degree) of the West Indies in every season, and the variable winds and weather of Great Britain in every month in the year.

From this account of the climate of this district, it is easy to ascertain what degrees of health, and what diseases prevail. As the inhabitants have the climates, so they have the acute diseases, of all the countries that have been mentioned. Although it might be supposed, that, with such changes and varieties in the weather, there would be connected epidemical diseases, and an unwholesome climate, yet on the whole this district is found to be as healthy as any part of the United States.

that, in America, from New York to the southern extremity of the United States, the woods are full of wild vines of three or four species, all different from those we have in Europe. But, whether from some fault in their nature, or in the climate, or the soil where they grow, or, what is much more probable, from a fault in the planters, they have not yet produced any wine that deserves to be mentioned, though the Indians from them make a sort of wine, with which they regale themselves. It may also be observed of the timber of these colonies, that towards the south it is not so good for shipping, as that of the more northern provinces. The farther southward you go, the timber becomes less compact, and rives easily; which property, as it renders it less serviceable for ships, makes it more useful for staves.

**HISTORY, GOVERNMENT, SETTLEMENT, POPULATION, CHIEF TOWNS, LITERARY SOCIETIES, AND COMMERCE.** } This country, under the name of the New Netherlands, was originally possessed by the Dutch and Swedes. When these nations, however, were expelled from New York by the English, admiral Penn, who, in conjunction with Venables, had conquered the island of Jamaica (under the auspices of Cromwell), being in favour with Charles II. obtained the promise of a grant of this country from that monarch. Upon the admiral's death, his son, the celebrated quaker, availed himself of this promise, and, after much court solicitation, obtained the performance of it. Though, as an author and a divine, Mr. Penn by little known but to those of his own persuasion, his reputation in a character no less respectable is universal among all civilised nations. The circumstances of the times engaged vast numbers to follow him into his new settlement, to avoid the persecutions to which the quakers, like other sectaries, were then exposed; but it was to his own wisdom and ability they are indebted for that charter of privileges, which placed this colony on so respectable a footing. Civil and religious liberty, in the utmost latitude, was laid down by that great man, as the foundation of all his institutions. Christians of all denominations might not only live unmolested, but have a share in the government of the colony; and by the provisions of the new code, a Protestant, a Roman Catholic, and a Hebrew, may elect or be elected to any office in the state, and pursue any lawful calling or profession\*. No laws can be made but by the consent of the inhabitants. Even matters of benevolence, to which the laws of few nations have extended, were by Penn subjected to regulations. The affairs of widows and orphans were to be inquired into by a court constituted for that purpose. The causes between man and man were not to be subjected to the delay and chicanery of the law, but decided by wise and honest arbitrators. His benevolence and generosity extended also to the Indian nations: instead of taking immediate advantage of his patent, he purchased of these people the lands he had obtained by his grant, judging that the original property, and eldest right, was vested in them. William Penn, had he been a native of Greece, would have had his statue placed next to those of Solon and Lycurgus. His laws, founded on the solid basis of equity, still maintain their force; and, as a proof of their effects, it is only necessary to mention that land was lately granted at twelve pounds an hundred acres, with a quit-rent of four shillings reserved; whereas the terms on which it was formerly granted, were at twenty pounds the thousand acres, with one shilling quit-rent for every hundred. Near Philadelphia, before the commencement of the war with the mother-country, land rented at twenty shillings the acre, and, even at several miles distance from that city, sold at twenty years' purchase.

In some years, more people transported themselves into Pennsylvania than into

\* Morfe, vol. 1. p. 481.  
6 B 2

all the other settlements together. In short, this province has increased greatly from the time of its first establishment. Upon the principal rivers, settlements are made, and the country has been cultivated 150 miles above Philadelphia. The inhabitants amounted, in 1790, to 434,373; about 10 for every square mile; and in the state of DELAWARE, to 59,094, of whom 8,887 were slaves\*. The people are hardy, industrious, and most of them substantial, though but few of the landed people can be considered as rich; but before the commencement of the civil war, they were all well lodged, well fed, and, for their condition, well clad; and this at the more easy rate, as the inferior people manufactured most of their own wear, both linens and woollens.

This province contains many very considerable towns, such as German-Town, Chester, Oxford, Radnor, all which, in any other colony, would deserve being taken notice of more particularly. But here the city of Philadelphia, containing upwards of 30,000 inhabitants, beautiful beyond any city in America, and in regularity scarcely equalled by any in Europe, totally eclipses the rest. It was built after the plan of the famous Penn, the founder and legislator of this colony. It is situated 100 miles from the sea, between two navigable rivers, the Delaware, above a mile in breadth, on the east, and the Schuylkill, on the west, and extends in a line of two miles between them. It is intended that every quarter of the city, should form a square of eight acres, and that in the middle a square of ten acres, surrounded by the town-house, and other public buildings. The principal street is 100 feet wide, and runs the whole breadth of the town: parallel to it run nine other streets, which are crossed by twenty more at right angles, all of them 30 feet wide, and communicating with the two rivers, which contribute not only to the beauty, but to the wholesomeness of the city. According to the original plan, every man in possession of 1000 acres in the province, might have his house either in one of the fronts facing the rivers, or in the principal street, running from the middle of one front to the middle of the other. Every owner of 5000 acres, besides the above mentioned privilege, was entitled to have an acre of ground in the front of his house, and all others might have half an acre for gardens and court yards. The proprietor's seat, which is the usual place of the governor's residence, and is about a mile above the town, is the first private building, both for magnificence and situation, in the United States. The market, and other public buildings, are proportionably grand. The quays are spacious and fine; and the principal quay is 200 feet wide.

There were in this city a great number of very wealthy merchants; which is no way surprising, when we consider the great trade which it carried on with the English, Spanish, French, and Dutch colonies in America; with the Azores, the Canaries, and the Madeira islands; with Great Britain and Ireland; with Spain, Portugal, and Holland. Besides the Indian trade, and the quantity of grain, provisions, and all kinds of the produce of this province, which is brought down the rivers upon which this city is so commodiously situated, the Germans, who are settled in the interior parts of this province, employ several hundred waggons, drawn each by four horses, in bringing the product of their farms to this market. In the year 1749, 303 vessels entered inwards at this port, and 291 cleared outwards.

The commodities formerly exported into Pennsylvania, at an average of three years, amounted to the value of 611,000l. Those exported to Great Britain and other markets, besides timber, ships built for sale, copper ore, and iron in

pligs, and bars, consisted of grain, flour, and many sorts of animal food; and, at an average of three years, were calculated at 705,500*l*. But such was the spirit of adventuring in trade, after the conclusion of the late war, the duty in Philadelphia upon imported goods, of 2½ per cent. *ad valorem*, produced, from the first of March 1784, to the first of December, 132,000*l*. which, supposing that their value was not under-rated, nor any smuggled to save the duty, makes their value amount to 3,168,000*l*.

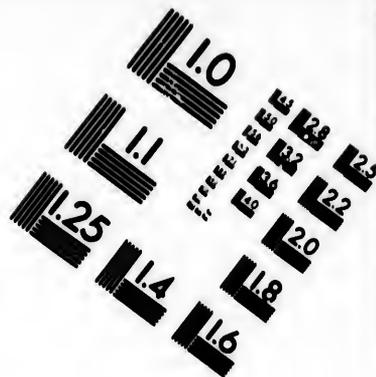

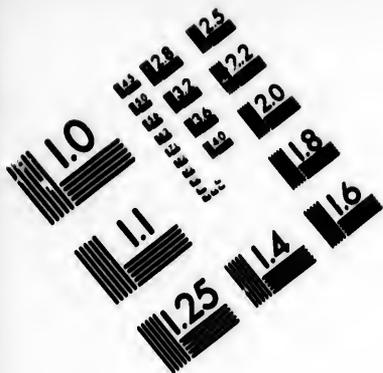

There was an academy established at Philadelphia, greatly encouraged by contributions from England and Scotland, and which, before the civil war broke out, bid fair to become a might seminary of learning. It is now styled an *UNIVERSITY*: its funds were partly given by the state and partly taken from the old college. And in 1787 a college was founded at Lancaster, and, in honour to Dr. Franklin, called Franklin-College.

Besides several other very improving institutions in this city, there is one which deserves a particular notice, which is *THE AMERICAN PHILOSOPHICAL SOCIETY, HELD AT PHILADELPHIA, FOR PROMOTING USEFUL KNOWLEDGE*. This society was formed January 2, 1769, by the union of two other literary societies that had subsisted for some time in Philadelphia; and were created one body corporate and politic, with such powers, privileges, and immunities, as are necessary for answering the valuable purposes which the society had originally in view, by a charter, granted by the commonwealth of Pennsylvania, on the 15th of March, 1780. This society has already published several very valuable volumes of their Transactions, particularly one in 1771, the other in 1786. In 1771, this society consisted of nearly 300 members; and upwards of 120 have since been added; a large proportion of whom are foreigners.

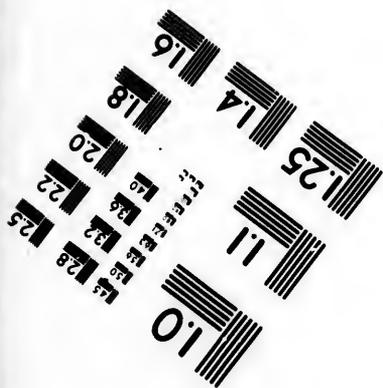

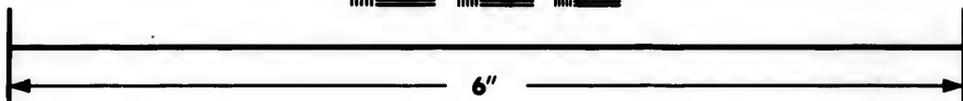

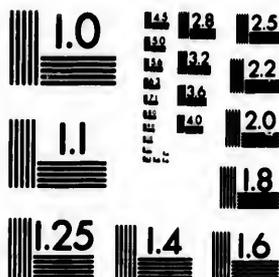

It was in Philadelphia that the general congress of America met in September 1774; and their meetings continued to be chiefly held there, till the king's troops made themselves masters of that city, on the 26th of September, 1777. But in June 1778, the British troops retreated to New York, and Philadelphia again became the residence of the congress.

In 1776, the representatives of the freemen of Pennsylvania met in a general convention at Philadelphia, and agreed upon the plan of a new constitution of government for that colony. According to the actual constitution, the legislative power is administered by a senate and house of representatives; the executive by a governor; and the judiciary by a supreme court, a court of common pleas, and a court of quarter sessions of the peace. The legislature and governor are elected by the freemen; the governor for three years; the representatives and a fourth part of the senate, annually. The number of representatives must not be less than fifty, nor exceed one hundred; nor that of senators less than a fourth, nor greater than a third part of the number of representatives. The electors of the magistrates must have attained the age of 21, have resided in the state two years, and paid taxes. The representatives must have been inhabitants of the state three years, and, the last year previous to their election, have resided in the county which chooses them. The qualifications of 25 years' of age, and of four years' residence, are required in senators; and the governor must have attained the age of thirty, and have resided in the state seven years: and he is not eligible more than nine years in twelve. The senators are divided by lot into four classes, and the seats of one class vacated, and refilled, yearly.

**RIVERS.]** This country is indented with a vast number of valuable creeks and rivers. The chief are Potowmac, Pocomoac, Patuxent, Cheptonk, Severn, and Sassafras.

**FACE OF THE COUNTRY, AIR, SOIL, AND PRODUCE.** In these particulars, this province is not to be distinguished from those already described. The hills in the inland country are of so easy ascent, that they rather seem an artificial than a natural production. The climate is generally mild and agreeable, suited to agricultural productions, and a great variety of fruit trees. In the interior hilly country, the inhabitants are healthy; but in the flat country, in the neighbourhood of the marshes and stagnant waters, they are, as in the other southern states, subject to intermittents. The vast number of rivers diffuses fertility through

through the soil, that is admirably adapted to the rearing of tobacco and wheat, which are the staple commodities of that country; hemp, Indian corn and grain.

**POPULATION AND COMMERCE.]** The number of inhabitants have of late years greatly increased, amounting at present to 419,728; of whom 103,036 are slaves; which is nearly 34 for every square mile. The commerce of Maryland depends on the same principles with that of Virginia, and is so closely connected with it, that any separation of them would rather confuse than instruct. It will be considered therefore under that head.

**HISTORY AND GOVERNMENT.]** Maryland, like the provinces we have formerly described, owes its settlement to religious considerations. As the neighbouring districts, however, were peopled by protestants, and even sectaries, Maryland was originally planted by Roman-catholics. This sect, towards the close of Charles the First's reign, was the object of great hatred to the bulk of the English nation; and the laws in force against the Roman-catholics were executed with great severity. This in part arose from an opinion, that the court was too favourably disposed towards them. It is certain that many marks of favour were conferred on the Roman-catholics. Lord Baltimore, was one of the most eminent, one in greatest favour with the court, and on that account most odious to the generality of Englishmen. This nobleman, in 1632, obtained a grant from Charles, of that country, which formerly was considered as a part of Virginia, but was now called Maryland, in honour of queen Henrietta Mary, daughter to Henry IV. of France, and spouse to king Charles. The year following, about 200 popish families, some of considerable distinction, embarked with lord Baltimore, to enter into possession of this new territory. These settlers, who had that liberality and good breeding which distinguishes gentlemen of every religion, bought their land at an easy price from the native Indians; they even lived with them for some time in the same city; and the greatest harmony continued to subsist between the two nations until the Indians were imposed on by the malicious insinuations of some planters in Virginia, who envied the prosperity of this popish colony, and inflamed the Indians against them by ill-grounded reports, but such as were sufficient to excite the resentment of men naturally jealous, and who from experience had reason to be so.

The colony, however, was not wanting to its own safety on this occasion. Though they continued their friendly intercourse with the natives, they took care to erect a fort, and to use every other precaution for their defence against sudden hostilities. The defeat of this attempt gave a new spring to the activity of this plantation, which was likewise receiving frequent reinforcements from England, of those who found themselves in danger by the approaching revolution. But during the protectorship of Cromwell, every thing was overturned in Maryland. Baltimore was deprived of his rights; and a new governor, appointed by the Protector, substituted in his room. At the Restoration, however, the property of this province reverted to its natural possessor. Baltimore was reinstated in his rights, and fully discovered how well he deserved that favour. He established a perfect toleration in all religious matters; the colony increased and flourished, and dissenters of all denominations, allured by the prospect of gain, flocked into Maryland. But the tyrannical government of James II. again deprived this noble family of its possession, acquired by royal bounty, and improved by much care and expence.

At the Revolution, lord Baltimore was again restored to all the profits of the government, though not to the right of governing, which could not consistently be conferred on a Roman-catholic. But, after the family changed their religion, they obtained the power as well as the interest. The government of this country, exactly resembled that of Virginia, except that the governor was appointed, by the proprietor,

proprietor, and only confirmed by the crown. The customs too were reserved to the crown, and the officers belonging to them were independent of the government of the province. At length, as the protestants became far more numerous, they excluded the papists from all offices of trust and power, and even adopted the penal laws of England against them. The church of England was by law established here, and the clergy were paid in tobacco: a tax for this purpose was annually levied, and every male white person above the age of sixteen was obliged to pay 40 lb. of tobacco, (or if he raised no tobacco, he must take an oath that he did not, and pay the value in cash); dissenting clergy were not exempted. By the declaration of rights and the constitution agreed to in the convention of delegates at Annapolis, August 14, 1776, the legislature is now to consist of two distinct branches, the senate and the house of delegates; the latter to be annually chosen, *viva voce*, by the freeholders in the counties, each of which appoints four; and the towns of Annapolis and Baltimore, each, two. The senate is not elected immediately by the people, but by electors chosen by the people, each county choosing two, and Annapolis and Baltimore, each, one. The governor, and council consisting of five members, are annually elected by the legislature. Voters for delegates, &c. must be above 21 years of age, and possessed of 50 acres of freehold in their respective counties, or property in the state to the amount of 30l. and have resided in the country one year. Proportional qualifications of age property and residence are required in the magistrates.

In 1782, a college was founded at Chester-town in this province, under the name of WASHINGTON COLLEGE, in honour of General Washington.

The city of Washington, now building at the junction of the rivers Potowmac and the Eastern Branch, is fixed on by the United States for the seat of their government after the year 1800. When the plan is carried into execution, this city will eminently possess the advantages of regularity, convenience, healthiness, and elegance of prospect.

[CAPES, BAYS, AND RIVERS.] In sailing to Virginia or Maryland, you pass a strait between two points of land, called the Capes of Virginia, which opens a passage into the bay of Chesapeake, one of the largest and safest in the world; for it enters the country near 300 miles from the south to the north, is about 18 miles

\* Morfe, vol. i. p. 532, 533, 534.

broad for a considerable way, and seven where it is narrowest, the water in most places being nine fathoms deep. This bay, through its whole extent, receives a vast number of navigable rivers from the sides of both Maryland and Virginia. From the latter, besides others of less note, it receives James River, York River, the Rappahannock, and the Potomac: these are not only navigable for large ships into the heart of the country, but have so many creeks, and receive such a number of smaller navigable rivers, that Virginia is unquestionably the country in the world of the most convenient navigation. It has been observed, and the observation is not exaggerated, that every planter has a river at his door. To the westward of the province, is the Ohio, a large river, which after a long course falls into the Mississippi.

**FACE OF THE COUNTRY.]** The whole face of this country is so extremely low towards the sea, that you are very near the shore, before you can discover land from the mast-head. The lofty trees, which cover the soil, gradually rise as it were from the ocean, and afford an enchanting prospect. You travel 100 miles into the country, without meeting with a hill; which is nothing uncommon on this extensive coast of America.

**AIR AND CLIMATE.]** In an extensive country it will be expected that the climate is not the same in all its parts. It is remarkable that, proceeding on the same parallel of latitude westwardly, the climate becomes colder in like manner as when you proceed northwardly. This continues to be the case till you attain the summit of the Allegany, which is the highest land between the ocean and the Mississippi. From thence, descending in the same latitude to the Mississippi, the change reverses; and, if we may believe travellers, it becomes warmer there than it is in the same latitude on the sea side. Their testimony is strengthened by the vegetables and animals which subsist and multiply there naturally, and do not on the sea coast. Thus catalpas grow spontaneously on the Mississippi, as far as the latitude of 37°, and reeds as far as 38°. Parroquets even winter on the Scioto, in the 39th degree of latitude.

Mr. Jefferson reckons the extremes of heat and cold to be 98° above, and 6° below 0, in Fahrenheit's thermometer.

That fluctuation between heat and cold, so destructive to fruit, prevails less in Virginia than in Pennsylvania in the spring season: nor is the overflowing of the rivers in Virginia then so extensive or so frequent as that of the rivers in the New England states; because the snows in the former do not lie accumulating all winter, to be dissolved all at once in the spring, as they do sometimes in the latter. In Virginia, below the mountains, snow seldom lies more than a day or two, and seldom a week; and the large rivers seldom freeze over. This fluctuation of weather, however, is sufficient to render the winters and springs very unwholesome, as the inhabitants have to walk in almost perpetual slop.

**SOIL AND PRODUCE.]** Towards the sea shore, and the banks of the rivers, the soil of Virginia consists of a dark rich mould, which, without manure, returns plentifully whatever is committed to it. At a distance from the water there is a lightness and sandiness in the soil, which, however, is of a generous nature, and which, helped by a kindly sun, yields corn and tobacco in abundance.

From what has been said of the soil and climate, it is easy to infer the variety and perfection of the vegetable productions of this country. The forests are covered with all sorts of lofty trees; and no underwood or brushies grow beneath; so that the people travel with ease through the forests on horseback, under a fine shade to defend them from the sun: the plains are enamelled with flowers and flowering shrubs of the richest colours and most fragrant scent. Silk grows spontaneous in many places, the fibres of which are strong as hemp. Medicinal herbs and roots, particularly snake-root, and ginseng, are here in great plenty; and

there is no sort of grain but might be cultivated to advantage. The inhabitants, however, are so engrossed with the culture of the tobacco plant, which is here of a superior quality to what any other country affords, that they think, if corn sufficient for their support can be reared, they do enough in this way. But flax and hemp are produced, not only for their own consumption but for exportation.

**ANIMALS.]** We shall here observe, that there were neither horses, cows, sheep, nor hogs in America, before they were carried thither by the Europeans; but now they are multiplied so extremely, that many of them, particularly in Virginia, and the southern colonies, run wild. Before the war between Great Britain and the colonies, beef and pork were sold here from one penny to two pence a pound; their fattest pullets, at six pence a-piece; chickens, at three or four shillings a dozen; geese, at ten pence; and turkeys, at eighteen pence a-piece. But fish and wild fowl were still cheaper in the season, and deer were sold from five to ten shillings a-piece. In the other American colonies, provisions were equally cheap. Besides the animals transported from Europe, those natural to the country are deer, of which there are great numbers, a sort of panther or tiger, bears, wolves, foxes, and racoons. Here is likewise that singular animal, called the opoffum, which seems to be the wood-rat, mentioned by Charlevoix, in his History of Canada. It is about the size of a cat; and, besides the belly common to it with other animals, it has another peculiar to itself, and which hangs beneath the former. This belly has a large aperture, towards the hinder legs, which discovers a large number of teats on the usual parts of the common belly. Upon these, when the female of this creature conceives, the young are formed, and there they hang like fruit upon the stalk, until they attain a certain weight and size, when they drop off, and are received into the false belly, from which they go out at pleasure, and in which they take refuge when any danger threatens them. In Virginia there are all sorts of tame and wild fowl. They have the nightingale, called from the country, whose plumage is crimson and blue; the mocking bird, thought to excell all others in its own notes, and including that of every one; the humming bird, the smallest of all the winged creation, and by far the most beautiful, all arrayed in scarlet, green, and gold. It sips the dew from the flowers, which is all its nourishment; and is too delicate to be brought alive into England.

**CHARACTER, MANNERS, CUSTOMS.]** Virginia has produced some of the most distinguished actors in effecting the revolution in America. Her political and military character has been rendered conspicuous by a few eminent men who take the lead in all her public transactions, and who, in short, govern Virginia; for the great body of the people do not concern themselves with politics, so that their government, though nominally republican, is in fact aristocratical.

Several travellers give but a very indifferent account of the generality of the people of this province. The young men, observes one, generally speaking, are gamblers, cock-fighters, and horse jockies. The ingenuity of a Locke, or the discoveries of a Newton, are considered as infinitely inferior to the accomplishments of him who is expert in the management of a cock-fight, or dexterous in manœuvring at a horse-race. A spirit for literary inquiries, if not altogether confined to a few, is, among the body of the people, evidently subordinate to a spirit of gaming and barbarous sports. At almost every inn or ordinary on the public road, there is a billiard-table, a back-gammon table, cards and other implements for various games. To these public houses the gambling gentry in the neighbourhood resort to *kill* time, which hangs heavily upon them; and at this business they are very expert, having been accustomed to it from their earliest youth. The passion for cock-fighting, a diversion not only extremely barbarous, but infinitely beneath the dignity of a man of sense, is so predominant that they

even advertise their matches in the public papers\*. This dissipation of manners is the consequence of indolence and luxury, which are the fruit of African slavery †.

**NATURAL CURIOSITIES.]** The natural bridge is the most sublime of nature's works. It is on the ascent of a hill, which seems to have been cloven through its length by some great convulsion. The fissure just at the bridge is, by some measurements, 270 feet deep, by others only 205; it is about 45 feet wide at the bottom, and 90 feet at the top; this of course determines the length of the bridge, and its height from the water. Its breadth in the middle is about 60 feet, but more at the ends; and the thickness of the mass at the summit of the arch, about 40 feet. A part of this thickness is constituted by a coat of earth, which gives growth to many large trees. The residue, with the hill on both sides, is a solid rock of lime-stone. The arch approaches the semi-elliptical form; but the larger axis of the ellipsis, which would be the chord of the arch, is many times longer than the transverse. Though the sides of this bridge are provided in some parts with a parapet of fixed rocks, yet few men have resolution to walk along them and look over into the abyss. You involuntarily fall on your hands, and feet, creep to the parapet and peep over it. If the view from the top be painful and intolerable, that from below is delightful in an equal extreme. It is impossible for the emotions arising from the sublime to be felt beyond what they are here; so beautiful an arch, so elevated, so light, and springing as it were up to heaven! the rapture of the spectator is really indescribable. The fissure continuing narrow, deep and straight for a considerable distance above and below the bridge, opens a short but very pleasing view of the North Mountain on one side, and Blue Ridge on the other, at the distance, each of them, of about five miles. This bridge is in the county of Rockbridge, to which it has given name, and affords a public and commodious passage over a valley which cannot be crossed elsewhere for a considerable distance. The stream passing under it is called Cedar creek. It is a water of James river, and sufficient in the driest seasons to turn a grist mill, though its fountain is not more than two miles above ‡. There is a natural bridge similar to the above over Stock creek, a branch of Pelebon river, in Washington county.

**MANUFACTURES AND COMMERCE.]** Before the war, the inhabitants of this state paid but little attention to the manufacture of their own cloathing. It has been thought they used to import as much as *seven eighths* of their cloathing, and that they now manufacture *three quarters* of it. Considerable quantities of iron are manufactured in this state.—To these we may add the manufacture of lead; besides which they have few others of consequence. The people are much attached to agriculture, and prefer foreign manufactures.

In the year 1758, this state exported seventy thousand hogheads of tobacco, which was the greatest quantity ever produced in this country in one year. But its culture has fast declined since the commencement of the war, and that of wheat taken its place. The price which it commands at market will not enable the planter to cultivate it. Were the supply still to depend on Virginia and Maryland alone, as its culture becomes more difficult, this price would rise, so as to enable the planter to surmount those difficulties and to live. But the western country on the Mississippi, and the midlands of Georgia, having fresh and fertile

\* A Traveller through Virginia observes, "Three or four matches were advertised in the public prints at Williamsburg; and I was witness of five in the course of my travels from that place to Port Royal."

† Morse's Geography, the edition of 1789.

‡ Don Ulloa mentions a break, similar to this, in the province of Angaracé, in South America. It is from 16 to 22 feet wide, 11 feet deep, and of 15 miles continuance, English measure. Its breadth at top is not sensibly greater than at bottom.

lands in abundance, and a hotter sun, are able to underfell these two states, and will oblige them in time to abandon the raising tobacco altogether. And a happy obligation for them it will be. It is a culture productive of infinite wretchedness. Those employed in it are in a continued state of exertion beyond the powers of nature to support. Little food of any kind is raised by them; so that the men and animals on these farms are badly fed, and the earth is rapidly impoverished. The cultivation of wheat is the reverse in every circumstance. Besides cloathing the earth with herbage, and preserving its fertility, it feeds the labourers plentifully, requires from them only a moderate toil, except in the season of harvest, raises great numbers of animals for food and service, and diffuses plenty and happiness among the whole. It is easier to produce an hundred bushels of wheat than a thousand weight of tobacco; and the former produce is more valuable.

**HISTORY, GOVERNMENT, &c.** This is the first country which the English planted in America. We derived our right, not only to this but to all our other settlements, as has been already observed, from the discovery of Sebastian Cabot, who, in 1497, first made the northern continent of America, in the service of Henry VII. of England. No attempts, however, were made to settle it till the reign of queen Elizabeth. It was then that sir Walter Raleigh, a man of the most enterprising genius of any in that age, applied to court, and got together a company, which was composed of several persons of distinction, and several eminent merchants, who agreed to open a trade, and settle a colony, in that part of the world, which, in honour of queen Elizabeth, he called Virginia. Towards the close of the sixteenth century, several attempts were made for settling this colony, before any proved successful. The three first companies who failed into Virginia perished through hunger and disease, or were cut off by the Indians. The fourth was reduced to almost the same situation; and being dwindled to a feeble remainder, had set sail for England, in despair of living in such an uncultivated country, inhabited by hostile and warlike savages. But in the mouth of Chesapeak bay, in the year 1610, they were met by lord Delaware, with a squadron loaded with provisions, and with every thing necessary for their relief and defence. At his persuasion they returned: by his advice, his prudence, and winning behaviour, the internal government of the colony was settled, and its defence provided for. This nobleman, who had accepted the government from the noblest motives, was compelled, by the decayed state of his health, to return into England. He left behind him, however, his son, as deputy; with sir Thomas Gates, sir George Summers, the honourable George Percy, and Mr. Newport, for his council. By them, James-Town, the first town built by the English in the New World, was erected.

In April 1613, Mr. John Rolfe, a worthy young gentleman, was married to *Pocahontas*, the daughter of *Powhatan*, the famous Indian chief. This connection, which was very agreeable both to the English and Indians, was the foundation of a friendly and advantageous commerce between them.

In 1616, Mr. Rolfe, with his wife Pocahontas, visited England, where she was treated with that attention and respect which she had merited by her important services to the colony in Virginia. She died the year following at Gravesend, in the twenty-second year of her age, just as she was about to embark for America. She had embraced the christian religion; and in her life and death evidenced the sincerity of her profession. She left a little son, who, having received his education in England, went over to Virginia, where he lived and died in affluence and honour, leaving behind him an only daughter. Her descendants are among the most respectable families in Virginia.

Tonococomo, a sensible Indian, brother in law to Pocahontas, accompanied her

to

to England; and was directed by Powhatan to bring him an exact account of the numbers and strength of the English. For this purpose, when he arrived at Plymouth, he took a long stick, intending to cut a notch in it for every person he should see. This he soon found impracticable, and threw away his stick. On his return, being asked by Powhatan, how many people there were, he is said to have replied, "Count the stars in the sky, the leaves on the trees, and the sands on the sea shore; for such is the number of the people in England."

The colony continued to flourish, and the true sources of its wealth began to be discovered and improved. The first settlers, like those of Maryland, were generally persons of consideration and distinction. It remained a steady ally to the royal party during the troubles of Great Britain. Many of the cavaliers, in danger at home, took refuge here; and, under the government of sir William Berkeley, held out for the crown, until the parliament, rather by stratagem than force, reduced them. After the restoration, there is nothing very interesting in the history of this province. Soon after this time, a young gentleman, named Bacon, a lawyer, availing himself of some discontents in the colony on account of restraints in trade, became very popular, and set every thing in confusion. But this pest of society being removed by a natural death, tranquillity returned to the province.

The government of Virginia was not at first adapted to the principles of the English constitution. It was subject to a governor and council, appointed by the king. As the inhabitants increased, the inconveniency of this form became more grievous; and a new branch was added to the constitution, by which the people, who had formerly no consideration, were allowed to elect their representatives from each county, with privileges resembling those of the representatives of the commons of England. Thus two houses, the upper and lower house of assembly, were formed. The upper house, which was before called the council, remained on its former footing; its members were appointed, during pleasure, by the crown; they were styled honourable, and answered in some measure to the house of peers in the British constitution. The lower house was the guardian of the people's liberties. And thus, with a governor representing the king, an upper and lower house of assembly, this government bore a striking resemblance to our own. According to the constitution confirmed on the 5th of July 1776, the legislature of Virginia consists of a senate, and house of delegates; the senate, of 24 members, who are divided into four classes, and the seats of one class vacated every year. The delegates are composed of two members from each county, and one from the cities of Richmond and Williamsburg and the borough of Norfolk respectively. They are elected annually, as well as one class of the senate, by freeholders seized of 100 acres of uninhabited land, or of 25 acres with a house, or of a house or lot in town. The legislature appoints the governor, who is the supreme executive magistrate, and also the privy council, consisting of eight members, together with the judges of the superior courts and other principal officers of the law and army. The governor is annually elected; two members of the privy council are changed every three years; the judges of the superior courts hold their offices during good behaviour.

The inhabitants of Virginia amounted, according to the census of 1790, to 747,610; of whom 292,627 were negroes. Kentucky, which till lately belonged to this state, contains 73,677 inhabitants, which, added to 747,610, makes 821,287. In the year 1781, a very inaccurate census was taken: several counties made no return; but supplying by conjecture the deficiencies, the population of Virginia was then computed at 567,614.—The inhabitants therefore have increased in the proportion of 13 to 9 in the course of ten years. In the very first session after their independence, the assembly passed a law for the perpetual prohibition of the importation of slaves. Williamsburg, till the year 1780, was the

seat of government, and contained 1800 inhabitants; Norfolk, the most populous town in Virginia, about 6000; and Richmond, the present seat of government, 4000; the towns in general not being large, owing to the interfection of the country by navigable rivers, which bring the trade to the doors of the inhabitants. The bishop of London used to send over a superintendent to inspect the characters of clergymen, who lived comfortably here (a priest to each parish) with about 100*l.* per annum, paid in tobacco.

The college, called William and Mary college, was founded by king William, who gave 2000*l.* towards it, and 20,000 acres of land, with power to purchase and hold lands to the value of 2000*l.* a year, and a duty of one penny per pound on all tobacco exported to the other plantations. There is a president, six professors, and other officers, who are named by the governors or visitors. The honourable Mr. Boyle made a very large donation to the college for the education of Indian children. The presbyterian denomination of christians is the most numerous in Virginia; for, though the first settlers were episcopalians, yet, through the indolence of the clergy, two thirds of the people had become dissenters at the commencement of the late revolution.

**RIVERS.]** These are the Roanoke, or Albemarle river; Pamlico; Neus; Cape Fear, or Clarendon river; Pedee; Santee; Savannah; Alatamaha, or George river, and St. Mary's, which divide Georgia from Florida: all which rivers rise in the Apalachian mountains, and running east, fall into the Atlantic ocean. The back parts are watered by the Cherokees, Yafous, Mobile, Apalachicola, the Pearl river, and many other noble streams which fall into the Mississippi or the gulf of Mexico.

**SEAS, BAYS, AND CAPES.]** This country is washed by the Atlantic ocean, which is so shallow near the coast, that a ship of any great burden cannot approach it, except in some few places. There has not yet been found one good harbour in North Carolina; the best are those of Roanoke, at the mouth of the Albemarle river, Pamlico and Cape Fear. In South Carolina, there are the harbours of Winyaw or George-Town, Charleston, and Port-Royal. In Georgia, the mouths of the rivers Savannah and Alatamaha form good harbours.

The most remarkable promontories, are, Cape Hatteras, in 35 degrees odd minutes north latitude, Cape Fear to the south of it, and Cape Carteret still farther south.

**CLIMATE, DISEASES, &c.]** In the flat country near the sea-coast, the inhabitants, during the summer and autumn, are subject to intermitting fevers, which often prove fatal, as bilious or nervous symptoms prevail. These fevers are seldom immediately dangerous to the natives who are temperate, or to strangers who are prudent. They however, if suffered to continue for any length of time, bring on other disorders, which greatly impair the natural vigor of the mind, debilitate the constitution, and terminate in death. The countenances of the inhabitants, during these seasons, have generally a pale yellowish cast, occasioned by the prevalence of bilious symptoms. They have very little of the bloom and freshness of the people in the northern states.

It has been observed that more of the inhabitants, of the men especially, die

during the winter, by pleurisies and peripneumonies, than during the warm months by bilious complaints. These pleurisies are brought on by intemperance, and by an imprudent exposure to the weather. Were the inhabitants cautious and prudent in these respects, it is alleged by their physicians, that they might in general escape the danger of these fatal diseases. The use of flannel next to the skin during the winter is reckoned an excellent preventative of the diseases incident to this climate. The western hilly parts of the country are as healthy as any of the United States. That district is fertile, full of springs and rivulets of pure water. The air there is serene a great part of the year, and the inhabitants live to old age, which cannot so generally be said of the inhabitants of the flat country. Though the days in summer are extremely hot, the nights are cool and refreshing. Autumn is very pleasant, both in regard to the temperature and serenity of the weather, and the richness and variety of the vegetable productions which the season affords. The winters are so mild in some years, that autumn may be said to continue till spring. Wheat harvest is in the beginning of June, and that of Indian corn early in September.\*

SOIL, PRODUCE, AND FACE } In this respect, too, there is a considerable  
OF THE COUNTRY. } coincidence between these countries and Virginia: the Carolinas, however, in the fertility of nature, have the advantage; but Georgia hath not so good a soil as the other states. The whole country is covered with trees, except where cleared by the planters. The trees are almost the same in every respect with those produced in Virginia; and by the different species of these, the quality of the soil is easily known. The land in Carolina is easily cleared, as there is little or no underwood. Those grounds which bear the oak, the walnut, and the hickory, are extremely fertile; they are of a dark sand intermixed with loam; and as all their land abounds with nitre, it is a long time before it is exhausted; for here they never use any manure. The pine-barren is the worst of all; this is an almost perfect white sand; yet it bears the pine and some other useful trees, yielding good profit in pitch, tar, and turpentine. When this species of land is cleared, for two or three years together it produces very good crops of Indian corn and pease; and, when it lies low, and is flooded, it answers well for rice. But what is most fortunate for this province is, that this worst part of its land is favourable to a species of the most valuable of all its products, to one of the kinds of indigo. The low, rich, swampy grounds bear their great staple, rice. The country near the sea is much the worst, in many parts little better than an unhealthy salt marsh; for Carolina is all an even plain for 30 miles from the sea, not a hill nor a rock, nor scarcely even a pebble to be met with. But the country, as you advance in it improves continually; and at 100 miles distance from Charleston, where it begins to grow hilly, the soil is of a prodigious fertility, fitted for every purpose of human life: nor can any thing be imagined more pleasant to the eye than the variegated disposition of this back-country. Here the air is pure and wholesome, and the summer heat much more temperate than on the flat sandy coast.

In Carolina, vegetation is incredibly quick. The climate and soil have something in them so kindly, that the latter, when left to itself, naturally throws out an immense quantity of flowers and flowering shrubs. All the European plants arrive at perfection here beyond that in which their native country affords them. With proper culture and encouragement, silk, wine, and oil, might be produced in these colonies: of the first we have seen excellent samples. Wheat yields a prodigious increase in the back parts.

From what we have observed of these colonies, their productions appear to be vines, wheat, rice, Indian corn, barley, oats, pease, beans, hemp, flax, cotton, tobacco, indigo, olives, oranges, citron, cypress, sassafras, oak, walnut, cassia, and pine trees; white mulberry-trees for feeding silk worms, sarsaparilla, and pines which yield turpentine, rosin, tar, and pitch. There is a kind of tree from which runs an oil of extraordinary virtue for curing wounds; and another, which yields a balm, thought to be little inferior to that of Mecca. There are other trees beside these, that yield gums. The Carolinas produce prodigious quantities of honey, of which they make excellent spirits, and mead as good as Malaga sack. Of all these, the three great staple commodities at present are, indigo, rice, and the produce of the pine. Nothing surprises an European more at first sight, than the size of the trees here, as well as in Virginia and other American countries. Their trunks are often from 50 to 70 feet high, without a branch or limb; and frequently above 36 feet in circumference. Of these trunks when hollowed, the people of Charleston as well as the Indians make canoes, which serve to transport provisions and other goods from place to place; and some of them are so large, that they will carry 30 or 40 barrels of pitch, though formed of one entire piece of timber. Of these are likewise made curious pleasure-boats.

**MODE OF CULTIVATING RICE.]** Rice-ground is prepared only by effectually securing it from the water, except some higher parts of it, which are sometimes dug up with a hoe, or mellowed by a plough or harrow. When the rice is young the overflowing of the water does not prevent its growth. Those who have water in reserve, commonly let it in upon their rice, after first going through with the hoe, while it is young, though it is deemed best to keep out the grass without this aid by the hoe only. The water is commonly kept on the rice eight or ten days after hoeing. When the ear is formed, the water is continued on till it is ripe. It is hoed three or four times. When the grass is very thick, a negro cannot hoe more than one sixteenth of an acre in a day. From 50 to 80 bushels of rough rice have been produced per acre, but sometimes 120 bushels, 20 of which weigh about 500 pounds, and yield eight and a quarter bushels of clean rice for market. After it is threshed, it is winnowed, and then ground in a mill, constructed of two blocks in a simple manner.—After which it is winnowed in a van constructed for that purpose; then beat in a mortar by hand, or now generally by horse or water machines—then sifted, to separate the whole rice from that which is broken and the flour. The whole rice is then barrelled in casks which contain about 500 pounds, or eight and a quarter bushels. The small rice serves for provisions, and the flour for provender, the chaff for manure, and the straw for fodder. The blade is green and fresh while the ear is ripe. The price is from 9s. and 4d. to 10s. and 6d. a hundred—dollars 4s. 8d. \*.

**ANIMALS.]** The original animals of this country do not differ much from those of Virginia; but in Carolina they have still a greater variety of beautiful fowls. All the animals of Europe are here in plenty; black cattle are multiplied prodigiously: to have 2 or 300 cows is very common, but some have 1000 or upwards. These ramble all day at pleasure in the forests; but their calves being separated and kept in fenced pastures, the cows return every evening to them. The hogs range in the same manner, and return like the cows: these are very numerous, and many run quite wild, as well as horned cattle and horses, in the woods. It is surprising that the cattle should have increased so quickly since their being first imported from Europe, while there are such numbers of wolves, tigers, and panthers, constantly ranging the woods and forests. We have already observed that these ani-

\* Morfe, vol. i. p. 600.

mals are less ravenous than the beasts of Africa and Asia; they very seldom attempt to kill either calves or foals in America, and when attacked, their dams make a vigorous defence.

HISTORY, GOVERNMENT, POPULATION, } The first English expeditions into  
CHIEF TOWNS, AND COMMERCE. } Carolina were unfortunate. Nothing successful was performed till the year 1663, in the reign of Charles II. At that time several English noblemen, and others of great distinction, obtained a charter from the crown, which invested them with the property and jurisdiction of this country. They parcelled out the lands to such as were willing to go over into the new settlement, and to submit to a system of laws, which they employed the famous Locke to compose for them.

They began their first settlement at a point of land towards the southward of their district, between two navigable rivers. Here they laid the foundation of a city called Charleston which was designed to be, what it now is, the capital.

In time, however, the disputes between the church-of-England men and dissenters caused great confusion in the colony. This was rendered still greater by the incursions of the Indians, whom they had irritated by injustice. In order to prevent the fatal consequences of these intestine divisions and foreign wars, an act of parliament was passed, which put this colony under the immediate protection of the crown. The lords proprietors, except earl Granville who had a seventh share, accepted a recompense of about 24,000*l.* for both the property and jurisdiction; and the constitution of this colony, in those respects in which it differed from the royal colonies, was altered. For the more convenient administration of affairs, Carolina was divided into the northern and southern districts and governments. This happened in 1728, and from that time, peace being restored at home, as well as with the Cherokees and other Indian tribes, these provinces began to breathe; and their trade advanced with wonderful rapidity.

The settlement of Georgia was projected in 1732, when several public-spirited noblemen and others, from compassion to the poor of these kingdoms, subscribed a considerable sum, which, with 10,000*l.* from government, was given to provide necessaries for such poor persons as were willing to transport themselves into this province. In process of time, new sums were raised, and new inhabitants sent over. Before the year 1752, upwards of 1000 persons were settled in this province. It was not however to be expected that the inhabitants of Georgia, removed as they were at a great distance from their benefactors, and from the check and control of those who had a natural influence over them, would submit to the magistrates appointed to govern them. Many of the regulations, too, by which they were bound, were very improper in themselves, and deprived the Georgians of privileges which their neighbours enjoyed, and which, as they increased in numbers and opulence, they thought it hard they should be deprived of. From these corrupt sources arose all the bad humours which tore to pieces this constitution of government. Dissensions of all kinds sprang up, and the colony was on the brink of destruction, when, in 1752, the government took it under their immediate care, removed their particular grievances, and placed Georgia on the same footing with the Carolinas.

The method of settling in Carolina, and indeed in other provinces of British America, was to pitch upon a void space of ground, and either to purchase it at the rate of 20*l.* for a 1000 acres, and one shilling quit rent for every 100 acres; or otherwise, to pay a penny an acre quit-rent yearly to the proprietors, without purchase-money: the former method was the most common, and the tenure a freehold.

The people of Carolina live in the same easy, plentiful, and luxurious manner with the Virginians already described. Poverty is here almost an entire stranger

and the planters are the most hospitable people that are to be met with to all strangers, and especially to such as by accidents or misfortunes are rendered incapable to provide for themselves. The general topics of conversation among the men, when cards, the bottle, and occurrences of the day do not intervene, are negroes, the prices of indigo, rice and tobacco, &c. Less attention and respect are paid to the women here, than in those parts of the United States, where the inhabitants have made greater progress in the arts of civilised life. Indeed, it is a truth, confirmed by observation, that in proportion to the advancement of civilisation, in the same proportion will respect for the women be increased; so that the progress of civilisation in countries, in states, in towns and in families, may be remarked by the degree of attention which is paid by husbands to their wives, and by the young men to the young women.

Temperance and industry are not to be reckoned among the virtues of the North Carolinians. The time which they waste in drinking, idling and gambling, leaves them very little opportunity to improve their plantations or their minds. The improvement of the former is left to their overseers and negroes; the improvement of the latter is too often neglected.

We are told that a strange and very barbarous practice prevailed among the lower class of people before the revolution in the back parts of Virginia, North and South Carolina and Georgia, it was called *gouging* \*. We have lately been told that in a particular county, where at the quarterly court 20 years ago, a day seldom passed without 10 or 15 boxing matches, it is now a rare thing to hear of a fight.

The only place in either of the Carolinas worthy of notice is Charleston, the metropolis, in South Carolina. It is admirably situated at the confluence of two navigable rivers, one of which is navigable for ships 20 miles above the town, and for boats and large canoes near 40. The harbour is good in every respect, but that of a bar, which hinders vessels of more than 200 tons burden, loaded, from entering. The fortifications are now demolished; the streets are well cut; the houses are large and well built: some of them are of brick, and others of wood, but all of them handsome and elegant, and rent is extremely high. The streets are wide and straight, intersecting each other at right angles; those running east and west extend about a mile from one river to the other: It contains about 1000 houses, and was the seat of the governor, and the place of meeting of the assembly. Its neighbourhood is beautiful beyond description. Several handsome equipages are kept here. The planters and merchants are rich and well bred; and, before the war between Great Britain and the colonies, the people were shewy and expensive in their dress and way of living; so that every thing conspired to make this by much the liveliest, and politest place, as well as the richest, in all America. It ought also to be observed, for the honour of the people of Carolina, that when, in common with the other colonies, they resolved against the use of certain luxuries, and even necessaries of life, those articles which improve the mind, enlarge the understanding, and correct the taste, were excepted: the importation of books was permitted as formerly.

North and South Carolina joined with the other colonies in their revolt against

\* *Gouging* is thus described. When two hands are worried with fighting and bruising each other, they come, as it is called, to *close quarters*, and each endeavours to twist his forefingers in the ear-locks of his antagonist. When

these are fast clinched, the thumbs are extended each way to the nose, and the eyes *gently* turned out of their sockets. It is incredible that such a savage practice should ever have been a common pastime. Morfe, vol. i. p. 581.

Great Britain; and in 1780, Charleston being besieged by the king's troops, surrendered on capitulation, with 6000 men in arms, prisoners, on the 11th of May in that year, after the siege had continued seven weeks.

As South-Carolina has met with infinitely more attention than the neighbouring provinces, the commerce of this country alone employed 140 ships, while that of the other two did not employ 60. Its exports to Great Britain, of native commodities, on an average of three years, amounted to more than 395,000*l.* annual value; and its imports 365,000*l.* The exports of North-Carolina were computed at about 70,000*l.* and its imports 18,000*l.* The exports of Georgia amounted to little more than 74,000*l.* and the imports to 49,000*l.*

The trade between Carolina and the West-Indies was the same in all respects with that of the rest of the colonies, and was very large; their trade with the Indians was in a very flourishing condition; and they formerly carried English goods on pack-horses 5 or 600 miles into the country west of Charleston.

The mouths of the rivers in North-Carolina form but ordinary harbours, and do not admit, except one at Cape Fear, vessels of above 70 or 80 tons. This lays a weight upon their trade, by the expence of lightering.

Georgia has two towns already known in trade. Savannah, the capital, is commodiously situated for an inland and foreign trade, about ten miles from the sea, upon a noble river of the same name, which is navigable for 200 miles farther for large boats, to the second town, called Augusta, which stands in a country of the greatest fertility, and carries on a considerable trade with the Indians. From the town of Savannah you see the whole course of the river towards the sea; and on the other hand, you see the river for about 60 miles up into the country. Here the rev. Mr. George Whitefield (who used to cross the Atlantic every second year) founded an orphan house, which is now converted into a college for the education of young men, designed chiefly for the ministry.

In October 1779, the town of Savannah, being in possession of the king's troops, was besieged by 8000 of the American and French troops, in conjunction; but they were bravely repulsed by the king's troops, with a great slaughter of the French and Americans. But Savannah and Charleston, with the rest of the provinces, were afterwards evacuated and restored to the Americans.

By an estimate of their population, taken in 1791, the number of inhabitants in North Carolina was 393,751\*, of whom 293,179 were freemen; in South Carolina, 249,073, of whom 107,094 were slaves; and in Georgia, 82,548, of whom 29,264 are slaves.

In North Carolina the most numerous branch of the legislature is styled the house of commons; the other branch, the senate. Both are elected annually; each county choosing one senator and two commoners: and the five towns Edenton, Newbern, Wilmington, Hillsborough, and Halifax, one commoner each. The qualifications, as to residence, fortune, &c. both of the electors and candidates, are here extremely moderate. The governor, styled captain-general, is chosen by the legislature annually, as is also the council of state composed of seven members.

\* Perhaps there are few instances of such a rapid increase of inhabitants as we find in this state. In the year 1710, we are well assured that the number of inhabitants in North Carolina did not exceed six thousand. This extraordinary increase must arise in a great measure from the migration of inhabitants from other states, or from distant countries. Besides this, in North Carolina land continues to be plenty and cheap; grain is raised

with so much ease, and the trouble of providing for cattle in winter is so trifling, that a man supports his family with half the labour that is required in the cold climates. Under these advantages, we are not to wonder that people in all ranks of life should marry young. We have heard of grandmothers in that state, who were not more than 27 years old. *Morse, vol. i. p. 580.*

DIVISION  
runs from s  
visions are a

The legislature appoints the judges and attorney-general, and recommends the justices of the peace, who are respectively commissioned by the governor, and continue in office during good behaviour. General and field officers of the militia are appointed in the same manner, but hold their commissions only during pleasure. In South Carolina the house of representatives is chosen for two years; the senate for four. The senators are classed, and the seats of one half their number vacated and refilled at every election of representatives. The number of representatives is 124; of senators, 37. Most of the executive as well as judiciary officers are appointed by the legislature; the governor and his lieutenant for two years; the judges during good pleasure; and the commissioners of the treasury, secretary of state, surveyor-general and sheriffs, for four years. To be eligible to the office of governor or senator, candidates must be thirty years old; and have freeholds, the governor 1,500l. and senators 1000l. sterling, unless they be resident in the election district, when 300l. clear of debt is sufficient. The representatives must have resided in the state three years, and have 500 acres of land freehold and ten negroes, or some real estate to the value of 150l. if non resident in the district, to the amount of 500l. and voters for either branch of the legislature must be free white men of the age of 21, have resided in the state two years, and possess freeholds of 50 acres of land, or a town lot; or have resided in the election district six months, and paid a tax to the amount of three shillings sterling. In Georgia the election of senators is triennial; that of representatives in general assembly is annual. The legislature appoints the governor and all executive and other state officers; those of the militia are named by the governor. In all legislative appointments three persons are first balloted for the house of representatives, one of whom is afterwards elected by the senate. The qualifications of electors and candidates are the same as in South Carolina in point of age and residence; but in point of fortune, considerably lower. The actual number of representatives is 34, but may be increased as new counties are laid off in vacant parts of the state. There is a senator for each county.

---

NEW STATES FORMED IN NORTH AMERICA.

V E R M O N T.

SITUATION AND EXTENT.

	Miles.	Degrees.
Length	150	} between { 42 and 44 North latitude. 72 and 73 30' West longitude.
Breadth	70	

**BOUNDARIES.]** BOUNDED north by Lower Canada; east by Connecticut river, which divides it from New Hampshire; south by Massachusetts; west by New York.

**DIVISIONS.]** Vermont is naturally divided by the Green Mountain, which runs from south to north, and divides the state nearly in the middle. Its civil divisions are as follows:

Counties,

The

	Counties.	Towns.
West of the Mountain.	Bennington - - -	Bennington
	Rutland - - -	Rutland
	Addison - - -	Addison
	Chittendon - - -	Colchester
East of the Mountain.	Orange - - -	Newbury
	Windfor - - -	Windfor
	Windham - - -	Newfane and Putney.

RIVERS.] The principal rivers in this state are Michiscoui, Lamoille, Onion and Otter Creek rivers which run from east to west into lake Champlain; West, Sexton's Black, Waterquechee, White, Ompompanoosuck, Weld's, Wait's, Pafsumtick, and several smaller rivers which run from west to east into Connecticut river. Over the river Lamoille is a natural stone bridge 7 or 8 rods in length. Otter Creek is Navigable for boats 50 miles. Its banks are excellent land, being annually overflowed and enriched.

LAKES AND SPRINGS.] Memphremagog is the largest lake in this state. It is the reservoir of three considerable streams, Black, Barton and Clyde rivers. One of these rises in Willoughby Lake, and forms a communication between it and lake St. Peter's in the river St. Laurence.

CLIMATE.] During the winter season, which commonly lasts from the beginning of November, to the middle of April, the inhabitants enjoy a serene sky and a keen cold air. Snow begins to fall, commonly by the first of November; but the permanent snows do not fall till about the tenth of December, which prevent the ground from freezing to any considerable depth. In April the snow is gradually dissolved by the warm influences of the sun, which moistens and enriches the earth, and vegetation advances with surprising rapidity.

FACE OF THE COUNTRY, SOIL, } This state, generally speaking, is hilly but  
 PRODUCTIONS, &c. } not rocky. West of the mountain, from the county of Rutland, northward to the Canada line, is a flat country well adapted for tillage. The state at large is well watered, and affords the best of pasturage for cattle. Some of the finest beef cattle in the world are driven from this state. Horses also are raised for exportation. The natural growth upon the rivers is white pines of several kinds, intermingled with low intervals of beech, elm, and white oak. Back from the rivers, the land is thickly timbered with birch, sugar-maple, ash, butter nut and white oak of an excellent quality. The soil is well fitted for wheat, rye, barley, oats, flax, hemp, &c. Indian corn, back from the river, is frequently injured by the frost; but on the river it is raised in as great perfection as in any part of New England, owing in a great measure to the fogs, arising from the river, which either prevent or extract the frost. These fogs begin as soon as the corn is in danger from frosts, and last till cold weather commences. Fruit trees, in the northern counties, do not prosper.

TRADE AND MANUFACTURES.] The inhabitants of this state trade principally with Boston, New York and Hartford. The articles of export are pot and pearl ashes, chiefly beef, horses, grain, some butter and cheese, lumber, &c. The inhabitants generally manufacture their own cloathing, in the family way. Grain has been raised in such plenty within a few years past, that the inhabitants have been induced to attempt the manufacture of corn spirits. For this purpose six or seven stills have already been erected, which yield a sufficient supply for the people, and a profit for the owners. Vast quantities of pot and pearl ashes are made in every part of the state. But one of the most important manufactures, in this state

towns to ch

state is that of maple sugar. It has been estimated by a competent judge, that the average quantity made for every family back of Connecticut river is 200 lbs. a year. One man, with but ordinary advantages, in one month, made 550 lbs. of a quality equal to imported brown sugar. In two towns in Orange county, containing no more than forty families, 13,000 lbs. of sugar were made in the year 1791. The probability is, that in a few years maple sugar will become an article of export. In some parts of the state, the inhabitants are beginning to line the roads with maple trees, and it would certainly be a wise measure if this practice should become general throughout the states. Orchards of these trees planted on sloping hills, so as to render it easy to collect the juice, might be attended with peculiar advantages to the owners.

**POPULATION, RELIGION, AND CHARACTER.]** In 1790, according to the census then taken, this state contained 85,539 inhabitants, consisting chiefly of emigrants from Connecticut and Massachusetts, and their descendants. Two townships in Orange county are settled principally by Scotch. The body of the people are Congregationalists. The other denominations are Presbyterians, Baptists, and Episcopalians. This state is rapidly peopling. Five years ago the township of Danville, in the county of Orange, was a wilderness, without so much as a single family. Now they have two considerable companies of militia, besides a company of light infantry dressed in uniform.

The inhabitants of this state are an assemblage of people from various places, of different sentiments, manners, and habits. They have not lived together long enough to assimilate and form a general character. Assemble together in imagination a number of individuals of different nations—consider them as living together amicably, and assisting each other through the toils and difficulties of life; and yet rigorously opposed in particular religious and political tenets; jealous of their rulers and tenacious of their liberties;—dispositions which originate naturally from the dread of experienced oppression, and the habit of living under a free government—and you have a pretty just idea of the character of the people of Vermont.

**CHIEF TOWNS.]** In a new and interior country, large populous towns are not to be expected. Bennington, situated near the south-west corner of the state, is one of the largest. It contains about 2400 inhabitants, a number of handsome houses, a Congregational church, a court-house, and gaol.

Windsor and Rutland, by a late act of the legislature, are alternately to be the seat of government for eight years. The former is situated on Connecticut river, and contains about 1600 inhabitants; the latter lies upon Otter Creek, and contains upwards of 1400 inhabitants. Both are flourishing towns.

**HISTORY.]** The tract of country called Vermont, before the late war, was claimed both by New York and New Hampshire; and these interfering claims have been the occasion of much warm altercation, the particulars of which it would be neither entertaining nor useful to detail. They were not finally adjusted till since the peace. When hostilities commenced between Great Britain and her colonies, the inhabitants of this district, considering themselves as in a state of nature, and not within the jurisdiction either of New York or New Hampshire, associated and formed for themselves the constitution of which we have given an abstract. Under this constitution they have continued to exercise all the powers of an independent state, and have prospered. On the 4th of March 1791, agreeably to act of congress of December 6th, 1790, this state became one of the United States, and constitutes the fourteenth, and not the least respectable pillar of the American Union.

**CONSTITUTION.]** The legislature consists of a house of representatives and a council of twelve, besides the governor, who is president, and the lieutenant-governor, who is officially a member. The freemen meet annually in their several towns to choose the governor, counsellors, and other magistrates; and to the privilege

ilege of voting all males twenty-one years old and of peaceable dispositions are entitled, after taking the oath of fidelity to the state. The judges of the supreme and county courts, sheriffs, and justices of the peace, are appointed annually by joint ballot of the council and house. The council may originate bills, other than money bills, and suspend till the next session such bills as they disapprove; but have not a final negative.

### TERRITORY NORTH-WEST OF THE OHIO.

#### SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 900 } Breadth 700 }	between { 37 and 50 north latitude. 81 and 98 west longitude.	} 411,000.

**BOUNDARIES.]** THIS extensive tract of country is bounded, north, by part of the northern boundary line of the United States; east, by the lakes and Pennsylvania; south, by the Ohio river; West, by the Mississippi. Mr. Hutchins, the late geographer of the United States, estimates that this tract contains 263,040,000 acres, of which 43,040,000 are water.

**CIVIL DIVISIONS.]** That part of this territory in which the Indian title is extinguished by being purchased from them, and which is settling under the government of the United States, is divided into four counties as follows:

Counties.	When erected.	Counties.	When erected.
Washington,	1788, July 26.	St. Clair,	1790, April 27.
Hamilton,	1790, Jan. 2.	Knox,	1790, June 20.

**RIVERS.]** The Muskingum is a gentle river, confined by banks so high as to prevent its overflowing. It is 250 yards wide at its confluence with the Ohio, and navigable by large batteaux and barges to the Three Legs, and by small ones to the lake at its head. The Hockhocking resembles the Muskingum, though somewhat inferior in size. The Scioto is a larger river than either of the preceding, and opens a more extensive navigation. One hundred and seventy-six miles above the Ohio, and eighteen miles above the Missouri, the Illinois empties itself into the Mississippi from the north-east, by a mouth about 400 yards wide.

**POPULATION.]** The number of souls in this large tract of country has not been ascertained. From the best data as yet received, the population may be estimated at 72,820.

**FACE OF THE COUNTRY, SOIL, AND PRODUCTIONS.]** The lands on the various streams abovementioned, which fall into the Ohio, are now more accurately known, and may be described with confidence and precision. They are interspersed with all the variety of soil which conduces to pleasantness of situation, and lays the foundation for the wealth of an agricultural and manufacturing people. Large level bottoms or natural meadows, from 20 to 50 miles in circuit, are every where found bordering the rivers and variegating the country in the interior parts. These afford as rich a soil as can be imagined, and may be reduced to proper cultivation with very little labour. It is said that in many of these bottoms a man may clear an acre a day fit for planting with Indian corn; there being no underwood, and the trees growing very high and large, but not thick together, need nothing but girdling.

The sugar maple is a most valuable tree for an inland country. Any number of inhabitants

BOUNDA  
and a li  
of North

coln and  
Coun  
Jeterke  
Fayette  
Bourbo  
Mercer  
Nelson

inhabitants may be forever supplied with a sufficiency of sugar, by preserving a few trees for the use of each family. A tree will yield about ten pounds of sugar a year, and the labour is very trifling. The sap is extracted in the months of February and March, and granulated, by the simple operation of boiling, to a sugar equal in flavour and whiteness to the best Muscovado.

Springs of excellent water abound in every part of this territory; and small and large streams for mills and other purposes are actually interspersed, as if by art, that there be no deficiency in any of the conveniences of life.

**ANIMALS, &c.]** No country is better stocked with wild game of every kind. Innumerable herds of deer and wild cattle are sheltered in the groves, and fed in the extensive bottoms that every where abound; an unquestionable proof of the great fertility of the soil. Turkeys, geese, ducks, swans, teal, pheasants, partridges, &c. are, from observation, believed to be in greater plenty here, than the tame poultry are in any part of the old settlements in America.

The rivers are well stored with fish of various kinds, and many of them of an excellent quality. They are generally large, though of different sizes: the cat-fish, which is the largest, and of a delicious flavour, weighs from six to eighty pounds.

**GOVERNMENT, &c.]** By an ordinance of congress, passed on the 13th of July 1787, this country, for the purposes of temporary government, was erected into one district, subject however to a division when circumstances shall make it expedient.

In the same ordinance it is provided, that congress shall appoint a governor, whose commission shall continue in force three years, unless sooner revoked.

The governor must reside in the district, and have a freehold estate therein of 1000 acres of land, while in the exercise of his office.

Congress from time to time are to appoint a secretary, to continue in office four years, unless sooner removed, who must reside in the district, and have an estate of 500 acres of land while in office.

Whenever population shall be sufficiently increased, this territory, as well as that to the south of the Ohio (which will afterwards be described), is to be divided into separate states, which, by an act of congress, May 1790, are to be admitted into the confederacy of the United States on an equal footing with its original members.

K E N T U C K Y.

SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 250 } between { 83 and 90 west longitude.		} 5,000.
Breadth 200 }	{ 36-30' and 39-30' north latitude.	

**BOUNDARIES.]** BOUNDED, north-west, by the river Ohio; west, by Cumberland river; south, by North Carolina; east, by Sandy river, and a line drawn due south from its source, till it strikes the northern boundary of North Carolina.

**CIVIL DIVISIONS.]** Kentucky was originally divided into two counties, Lincoln and Jefferson. It has since been subdivided into nine which follow:

Counties.	Chief Towns.	Counties.	Chief Towns.
Jefferson - -	LOUISVILLE.	Madison	
Fayette - -	LEXINGTON.	Lincoln	
Bourbon		Woodford	
Mercer - -	Danville	Mason - -	Washington.
Nelson - -	Beardstown		

As most of these counties are very large, it is probable that subdivisions will continue to be made as population increases.

**RIVERS.]** The river Ohio washes the north-western side of Kentucky, in its whole extent. Its principal branches, which water this fertile tract of country, are Sandy, Licking, Kentucky, Salt, Green and Cumberland rivers.

**FACE OF THE COUNTRY, SOIL, AND PRODUCE.]** This whole country, as far as has yet been discovered, lies upon a bed of limestone, which in general is about six feet below the surface, except in the valleys, where the soil is much thinner. A tract of about twenty miles wide, along the banks of the Ohio, is hilly broken land interspersed with many fertile spots. The rest of the country is agreeably uneven, gently ascending and descending at no great distances.

This country in general is well timbered. Of the natural growth which is peculiar to this country, we may reckon the sugar, the coffee, the papaw, and the cucumber tree. The two last are soft wood, and bear a fruit of the shape and size of a cucumber. The coffee tree resembles the black oak, and bears a pod which incloses a seed, of which a drink is made not unlike coffee. Besides these, there is the honey locust, black mulberry, wild cherry of a large size. The buckeye, an exceedingly soft wood, is the horse-chestnut of Europe. The magnolia bears a beautiful blossom of a rich and exquisite fragrance. Such is the variety and beauty of the flowering shrubs and plants which grow spontaneously, that in the proper season the wilderness appears in blossom.

The accounts of the fertility of the soil in this country have probably been exaggerated. That some parts of Kentucky, particularly the high grounds, are remarkably good, all accounts agree. The lands of the first rate are too rich for wheat, and will produce 50 and 60, and in some instances, it is affirmed, 100 bushels of good corn an acre. In common the land will produce 30 bushels of wheat or rye an acre. Barley, oats, cotton, flax, hemp, and vegetables of all kinds common in this climate, yield abundantly.

**CLIMATE.]** Healthy and delightful, some few places in the neighbourhood of ponds and low grounds excepted. The inhabitants do not experience the extremes of heat and cold. Snow seldom falls deep or lies long. The winter, which begins about Christmas, is never longer than three months, and is commonly but two, and is so mild that cattle can subsist without fodder.

**POPULATION AND CHARACTER.]** The population of this state in 1790 was 73,677. In 1783, in the county of Lincoln\* only, there were on the militia rolls 3,570 men, chiefly emigrants from the lower parts of Virginia. In 1784, the number of inhabitants were reckoned at upwards of 30,000. It is asserted that at least 20,000 migrated here in the year 1787. These people, collected from different states, of different manners, customs, religions, and political sentiments, have not been long enough together to form an uniform national character. Among the settlers there are many gentlemen of abilities, and many genteel families from several of the states, who give dignity and respectability to the settlement. They are in general more regular than people who settle new countries.

**RELIGION.]** The Baptists are the most numerous religious sect in Kentucky. There are several large congregations of Presbyterians, and some few of other denominations.

**CONSTITUTION.]** By the constitution of this state, formed and adopted in 1792, the legislative power is vested in a general assembly, consisting of a senate and house of representatives; the supreme executive, in a governor; the judiciary, in the supreme court of appeals and such inferior courts as the legislature may establish. The representatives are chosen annually by the people; the senators and

governor are chosen for four years, by electors appointed for that purpose; the judges are appointed during good behaviour, by the governor, with advice of the senate. The number of representatives cannot exceed 100 nor be less than 40; and the senate, at first consisting of 11, is to increase with the house of representatives in the ratio of one to four. The qualifications of candidates for offices, and of voters, are such only as appear requisite for insuring their maturity of judgment and attachment to the state.

TERRITORY SOUTH OF OHIO,  
OR, THE TENNESSEE GOVERNMENT.

SITUATION AND EXTENT.

	Miles.	Degrees.
Length	360	between { 81-20' and 91-30' West longitude. { 35 and 36-30' North latitude.
Breadth	105	

**BOUNDARIES.]** BOUNDED, north, by Kentucky and part of Virginia; east, by the Stone, Yellow, Iron and Bald mountains, which divide it from North Carolina; south, by South Carolina and Georgia; west, by the Mississippi\*.

**CIVIL DIVISIONS AND POPULATION.]** This extensive district is divided into the following counties:

	Counties.	Counties South of French Broad.
WASHINGTON district.	{ Washington	MERO district { Davidfon { Sumner { Tennessee
	{ Sullivan	
	{ Green	
	{ Hawkins	

The population is 35,691 according to the returns made by the governor of this territory, in 1791.

**CLIMATE.]** Moderate and healthy. In the tract lying between the great island, as it is called, and the Kanhaway, the summers are remarkably cool, and the air rather moist. South-west of this as far as the Indian towns, the climate is much warmer, and the soil better adapted to the productions of the southern states.

The diseases to which the adult inhabitants are most liable are pleuritis and rheumatism. It is to the inhabitants a real advantage that they are almost beyond the reach of those luxuries which are enjoyed, and those epidemical diseases which are consequently frequent, in populous towns on the sea coast. An inhabitant of this district writes, "Our physicians are a fine climate, healthy robust mothers and fathers, plain and plentiful diet, and enough of exercise. There is not a regular bred physician residing in the whole district."

**RIVERS AND MOUNTAINS.]** The Tennessee, called also the Cherokee, and absurdly the Hogohege river, is the largest branch of the Ohio. It rises in the mountains of Virginia, latitude 37°; and pursues a course of about 1000 miles south and south-west, nearly to latitude 34°, receiving from both sides a number of

\* About seven and a half millions of acres of this tract only has been yet purchased from the Indians.

large

governor

large tributary streams. It then wheels about to the north, in a circuitous course, and mingles with the Ohio nearly 60 miles from its mouth.

The Cumberland mountain, in its whole extent from the great Kanaway to the Tennessee, consists of the most stupendous piles of craggy rocks, of any mountain in the western country. In several parts of it, for miles, it is inaccessible even to the Indians on foot. In one place particularly, near the summit of the mountain, there is a most remarkable ledge of rocks of about 30 miles in length and 100 feet thick, shewing a perpendicular face to the south-east more noble and grand than any artificial fortification in the known world, and apparently equal in point of regularity. Through this stupendous pile, according to a modern hypothesis, had the waters of all the upper branches of the Tennessee to force their way.

The Shawnee, now called Cumberland river, one of the southern branches of the Ohio, is next in size to the Tennessee, and extends eastward nearly as far, but runs a much more direct course. It is navigable for small craft as far as Nashville. From the south it receives Harper's, Coney, Obeys and Clear Fork rivers; and from the north, Red and Rock Cattle rivers, besides many smaller streams.

**ANIMALS.]** A few years since, this country abounded with large herds of wild cattle, improperly called buffaloes; but the improvident or ill disposed among the first settlers have destroyed multitudes of them out of mere wantonness. They are still to be found on some of the south branches of Cumberland river. Elk or moose are seen in many places, chiefly among the mountains. The deer are become comparatively scarce, so that no person makes a business of hunting them for their skins only. Enough of bears and wolves yet remain. Beavers and otters are caught in plenty in the upper branches of Cumberland and Kentucky rivers.

**COMMERCE.]** This country furnishes many valuable articles of export, such as fine waggon and saddle horses, beef, cattle, ginseng, deer skins and furs, cotton, hemp and flax, which may be transported by land; also iron, lumber, pork, and flour, which might be exported in great quantities, if the navigation of the Mississippi were opened; but there are few of the inhabitants who understand commerce, or are possessed of proper capitals; of course it is badly managed.

**RELIGION.]** The Presbyterians are the prevailing denomination of Christians in this district. They have a presbytery called the Abingdon presbytery, established by act of synod, which, in 1788, consisted of 23 large congregations, who were then supplied by only six ministers. There are also some of the Baptist and Methodist denominations.

**GOVERNMENT.]** Similar to that established by congress in the territory of the United States north-west of the Ohio. The governor is the executive (and in his absence the secretary), and the governor and three judges, the legislative power, in the district.

**CHARACTER, MANNERS, AND DRESS.]** Among the bulk of the inhabitants a great simplicity of manners prevails. Duplicity, or the etiquette of cities and populous places, is unknown among them. If a man deceives another, he is deemed and called a liar, and it frequently happens that a *bloody nose* is the consequence. Wrestling, jumping, running foot-races, and playing at ball, are the common diversions. Dancing is coming into fashion. Card-playing is a rare amusement. The hunting shirt is still worn by the militia on duty, and by hunters in pursuit of game. At home and at public assemblies they dress like the Virginians.

**INDIANS.]** The Indian tribes within and in the vicinity of this district are the Cherokees and Chickasaws. The Cherokees have been a warlike and numerous nation; but by continual wars, in which it has been their destiny to be engaged with the northern Indian tribes, they were reduced at the commencement of the last war to about 2000 fighting men; since which they have been reduced more than one half, and have become weak and pusillanimous.

The Chickasaws, of all the Indian tribes within the limits of the United States merit the most from the Americans, having at all times maintained a brotherly attachment to them. They glory in saying that they never shed the blood of an Anglo-American. There is so great an affinity between the Chickasaw and Choctaw languages, that the common people can converse together, each speaking in his own dialect. They are a personable people, and have an openness in their countenances and behaviour, uncommon among savages.

**HISTORY.]** The eastern parts of this district were explored by colonels Wood, Patton, Buchanan, captain Charles Campbell, and Dr. T. Walker (each of whom were concerned in large grants of land from the government), as early as between the years 1740 and 1750. In 1754, at the commencement of the French war, not more than 50 families had settled here, who were either destroyed or driven off by the Indians before the close of the following year. It remained uninhabited till 1765, when the settlement of it recommenced; and in 1773 the country as far west as the long island of Holftein, an extent of more than 120 miles in length from east to west, had become tolerably well peopled.

In 1785, in conformity to the resolves of congress of April 23, 1784, the inhabitants of this district essayed to form themselves into a body politic, by the name of the state of FRANKLAND; but differing among themselves as to the form of government, and about other matters, in the issue of which some blood was shed—and being opposed by some leading characters in the eastern parts, the scheme was given up, and the inhabitants remained in general peaceable until 1790, when congress established their present government. Since this period, some late incursions of the Indians excepted, the inhabitants have been peaceable and prosperous.

**PRESENT AND FUTURE CONSTITUTION.]** Such are the extensive dominions OF CONGRESS } dependent on congress; which, together with a president chosen for four years, consists, since 1789, of a senate and house of representatives. The senate is composed of two senators from each state, elected for six years; and the house of representatives, of one representative, chosen every second year, for every thirty-three thousand inhabitants in each state, until the number has exceeded one hundred; since which there is not to be less than one representative for every forty thousand, until the number of representatives amounts to two hundred. When this takes place, the proportion between the people and their representatives is to be so regulated by congress, that there shall not be less than two hundred representatives, nor more than one representative for every fifty thousand persons. This is the ultimate limit to which the Americans as yet look forward, in the constitution of the general government of their Union.

## WEST INDIES.

**WE** have already observed, that, between the two continents of America, lie a multitude of islands, which we call the West Indies, and which, such as are worth cultivation, now belong to five European powers, Great Britain, Spain, France, Holland, and Denmark. As the climate and seasons of these islands differ widely from those of Europe, we shall, to avoid repetition, speak of them in general, as well as mention some other particulars peculiar to the West Indies.

**SEASONS.]** A TROPICAL year seems properly to comprehend but two distinct seasons, the wet and the dry; but as the rains in these climates continue two great periods, it may be described, like the European year, under four divisions.

\* For these we acknowledge great obligations to the very elegant History, which Mr. Edwards of Jamaica has published of the British

Colonies in the West Indies, in 2 vols. 4to. second edition, 1795.

The spring may be said to commence with the month of May, when the foliage of the trees evidently becomes more vivid, and the parched favannas begin to change their rufflet hue, even previous to the first periodical rains, which are now daily expected, and generally set in about the middle of the month. These, compared with the autumnal rains, may be said to be gentle showers. They come from the south, and commonly fall every day about noon, and break up with thunderstorms; creating a bright and beautiful verdure, and a rapid and luxuriant vegetation. The thermometer at this season varies considerably; commonly falling six or eight degrees immediately after the diurnal rains: its medium height may be stated at 75°.

After these rains have continued about a fortnight, the weather becomes dry, settled, and salutary; and the tropical summer reigns in full glory. Not a cloud is to be perceived; and the sky blazes with irresistible fierceness. For some hours, commonly between seven and ten in the morning, before the setting in of the sea-breeze or trade-wind, (which at this season blows from the south-east with great force and regularity until late in the evening) the heat is scarcely supportable; but no sooner is the influence felt of this refreshing wind, than all nature revives, and the climate, in the shade, becomes not only very tolerable, but pleasant. The thermometer now varies but little in the whole twenty-four hours: its medium, near the coast, may be stated at about 80°. it has been seldom observed higher than 85° at noon, nor much below 75° at sun-rise.

The nights at this season are transcendently beautiful. The clearness and brilliancy of the heavens, the serenity of the air, and the soft tranquillity in which all nature reposes, contribute to harmonize the mind, and produce the most calm and delightful sensations. The moon too in these climates displays far greater radiance than in Europe: the smallest print is legible by her light; and in the moon's absence her function is not ill supplied by the brightness of the milky-way, and by that glorious planet Venus, which appears here like a little moon, and glitters with so resplendent a beam as to cast a shade from trees, buildings, and other objects, making full amends for the short stay and abrupt departure of the crepusculum or twilight\*.

This state of the weather commonly continues, with little variation, from the beginning of June until the middle of August, when the diurnal breeze begins to intermit, and the atmosphere becomes sultry, incommodious, and suffocating. In the latter end of this month, and most part of September, we look about in vain for coolness and comfort. The thermometer occasionally exceeds 90°; and, instead of a steady and refreshing wind from the sea, there are usually faint breezes and calms alternately. These are preludes to the second periodical or autumnal season. Large towering clouds, fleecy, and of a reddish hue, are now seen in the morning, in the quarters of the south, and south-east; the tops of the mountains at the same time appear clear of clouds, and the objects upon them wear a bluish cast, and seem much nearer to the spectator than usual. When these vast accumulations of vapour have risen to a considerable height in the atmosphere, they commonly move horizontally towards the mountains, proclaiming their progress in deep and rolling thunder, which, reverberated from peak to peak, and answered by the distant roaring of the sea, heightens the majesty of the scene, and irresistibly lifts up the mind of the spectator to the great author of all sublimity.

\* In the mountainous and interior parts of the larger islands, innumerable *fire-flies* abound at night, which have a surprising appearance to a stranger. They consist of different species, some of which cast a light, resembling a spark of fire, from a globular prominence near each eye; and others from

their sides in the act of respiration. They are far more luminous than the glow-worm, and fill the air on all sides, like so many living stars, to the great astonishment and admiration of a traveller unaccustomed to the country.—In the day time they disappear.

The

\* In Barbadoe windward, the by day. This is months of June

The waters, however, with which these congregated vapours load the atmosphere, seldom fall with great and general force until the beginning of October. It is then that the heavens pour down cataracts. An European who has not visited these climates can form no just conception of the quantity of water which deluges the earth at this season: by an exact account which was kept of the perpendicular height of the water which fell in one year in Barbadoes (and that no-wise remarkable) it appeared to have been equal to sixty seven cubic inches.

It is now, in the interval between the beginning of August and the latter end of October, that hurricanes, those dreadful visitations of the Almighty, are apprehended. The prognostics of these elementary conflicts have been minutely described by various writers, and their effects are known by late mournful experience to every inhabitant of every island within the tropics; but their immediate cause seems to lie far beyond the limits of our circumscribed knowledge.

Towards the end of November, or sometimes not till the middle of December, a considerable change in the temperature of the air is perceivable. The coasts to the northward are now beaten by a rough and heavy sea, roaring with incessant noise; the wind varies from the east to the north-east and north, sometimes driving before it, across the highest mountains, not only heavy rains but hail; till at length the north wind having acquired sufficient force, the atmosphere is cleared; and now comes on a succession of serene and pleasant weather, the north-east and northerly winds spreading coolness and delight throughout the whole of this burning region.

If this interval, therefore, from the beginning of December to the end of April, be called winter, it is certainly the finest winter on the globe. To valetudinarians and persons advanced in life, it is the climate of Paradise.

The account thus given is however to be received not as uniformly exact and minutely particular; but as a general representation only, subject to many variations and exceptions. In the large islands of Cuba, Hispaniola, and Jamaica, whose lofty mountains are clothed with forests perhaps as old as the deluge, the rains are much more frequent and violent than in the small islands to windward; some of which are without mountains, and others without wood; both powerful agents on the atmosphere. In the interior and elevated districts of the three former islands, it is believed there are showers in every month of the year; and on the northern coasts of those islands, considerable rains are expected in December, or January, soon after the setting in of the north winds.

**SEA-BREEZE AND LAND WIND.]** Concerning the trade-wind, or diurnal sea-breeze, which blows in these climates from the east and its collateral points, with little intermission or variation nine months in the year, the causes of it having been traced and displayed by numerous writers, it is unnecessary to treat: but the peculiarity of the land wind by night (than which nothing can be more grateful and refreshing) has been less generally noticed. This is an advantage, among others, which the larger islands of the West Indies derive from the great inequality of their surface; for as soon as the sea-breeze dies away, the hot air of the plains being rarefied, ascends towards the tops of the mountains, and is there condensed by the cold; which making it specifically heavier than it was before, it descends back to the plains on both sides of the ridge. Hence a night wind is felt in all the mountainous countries under the torrid zone, blowing on all sides from the land towards the shore, so that on a north shore the wind shall come from the south, and on the south shore from the north. The islands to windward, having no mountains, have of course no land breeze.

\* In Barbadoes, and most of the small islands to windward, the sea breeze blows as well by night as by day. This is sometimes the case in Jamaica in the months of June and July, the land at that time be-

ing heated to such a degree, that the cold air of the mountains is not sufficiently dense to check the current which flows from the sea.

BEAUTY OF THE COUNTRY.] To the first discoverers, the prospect of these islands must have been interesting beyond all that imagination can at present conceive of it. Even at this day when the mind is prepared by anticipation, they are beheld by the voyager for the first time, with strong emotions of admiration, arising not only from the novelty of the scene, but also from the beauty of the smaller islands, and the sublimity of the larger, whose lofty mountains form a stupendous and awful picture.

Nor did these promising territories disappoint expectation on a nearer search and more accurate inspection. Columbus, whose veracity has never been suspected, speaks with raptures of their beauty and fertility. "There is a river" (he observes in one of his letters to king Ferdinand written from Cuba) "which discharges itself into the harbour that I have named Porto Santo, of sufficient depth to be navigable. I had the curiosity to sound it, and found eight fathom. Yet the water is so limpid, that I can easily discern the sand at the bottom. The banks of this river are embellished with lofty palm-trees, whose shade gives a delicious freshness to the air; and the birds and the flowers are uncommon and beautiful. I was so delighted with the scene, that I had almost come to the resolution of staying here the remainder of my days; for, believe me, sire, these countries far surpass all the rest of the world in pleasure and conveniency; and I have frequently observed to my people, that, with all my endeavours to convey to your majesty an adequate idea of the charming objects which continually present themselves to our view, the description will fall greatly short of the reality."

MAGNIFICENCE AND SUBLIMITY OF THE MOUNTAINS.] Relinquishing the naturalist's task of minutely describing the splendid aerial tribe of these regions whose variety is not less remarkable than their beauty, we now proceed to the largest and most awful objects of inanimate nature. It is in the magnitude, extent, and elevation of the mountains of the New World, that the Almighty has most strikingly manifested the wonders of his omnipotence. Those of South America are supposed to be nearly twice the height of the highest in the ancient hemisphere, and, even under the equator, have their tops involved in everlasting snow. To those massive piles, the loftiest summits of the most elevated of the West Indian islands cannot indeed be compared; but some of these rise, nevertheless, in amazing grandeur, and are among the first objects that fix the attention of the voyager. The mountains of Hispaniola in particular, whose wavy ridges are descended from sea to the distance of thirty leagues, towering far above the clouds in stupendous magnificence, and the blue mountains of Jamaica, have never yet, perhaps, been fully explored. Neither curiosity nor avarice has hitherto ventured to invade the topmost of those lofty regions. In such of them as are accessible, nature is found to have put on the appearance of a new creation. As the climate changes, the trees, the birds, and the insects are seen also to differ from those which are met with below. To an unaccustomed spectator, looking down from those heights, the whole scene appears like enchantment. The first object which catches the eye at the dawn of day is a vast expanse of vapour, covering the whole face of the vallies. Its boundaries being perfectly distinct, and visibly circumscribed, it has the exact resemblance of an immense body of water, while the mountains appear like so many islands in the midst of a beautiful lake. As the sun increases in force, the prospect varies: the incumbent vapours fly upward, and melt into air; disclosing all the beauties of nature, and the triumphs of industry, heightened and embellished by the full blaze of a tropical sun. In the equatorial season, scenes of still greater magnificence frequently present themselves; for, while all is calm and serene in the higher regions, the clouds are seen below sweeping along the sides of the mountains in vast bodies, till, growing more ponderous by accumulation, they fall at length in torrents of water on the plains. The sound of the tempest is distinctly

stinctly heard by the spectator above; the distant lightning is seen to irradiate the bloom; while the thunder, reverberated in a thousand echoes, rolls far beneath his feet.

**SUGAR-CANE, COTTON, IN-} In treating of the agriculture of the West IN-  
DIGO, COFFEE, &c. &c.} dian islands, the first object that naturally excites attention is the cane which produces their great staple commodity, sugar;—a plant which, from its commercial importance and general utility, we may venture to pronounce one of the most valuable in the creation. The ancient name of the cane was *Saccharum*. This word was corrupted, in monkish Latin, into *Zucharum*, and afterwards into *Zucra*. By the Spaniards, it was converted into *Açucar*, from whence *Sugar*. The plant is a native of the east, and was probably cultivated in India and Arabia, time immemorial.**

The botanical name of the sugar-cane is *Arundo Saccharifera*. It is a jointed reed, terminating in leaves or blades whose edges are finely and sharply serrated. The body of the cane is strong but brittle, and, when ripe, of a fine straw-colour, inclining to yellow; and it contains a soft pithy substance, which affords a copious supply of juice, of a sweetness the least cloying in nature.

The time of crop in the sugar islands is the season of gladness and festivity to man and beast. So palatable, salutary, and nourishing is the juice of the cane, that every individual of the animal creation, drinking freely of it, derives health and vigour from its use. The meagre and sickly among the negroes exhibit a surprising alteration in a few weeks after the mill is set in action. The labouring horses, oxen, and mules, though almost constantly at work during this season, yet, being indulged with plenty of the green tops of this noble plant, and some of the scummings from the boiling-house, improve more than at any other period of the year.

Even the pigs and poultry fatten on the refuse. In short, on a well-regulated plantation, under a humane and benevolent director, there is such an appearance during crop-time, of health, plenty, and busy cheerfulness, as to soften in a great measure the hardships of slavery, and induce a spectator to hope, when the miseries of life are represented as insupportable, that they are sometimes exaggerated through the medium of fancy\*.

The juice from the mill ordinarily contains eight parts of pure water, one part of sugar, and one part composed of gross oil and mucilaginous gum, with a portion of essential oil. The proportions are taken at a medium; for some juice has been so rich as to make a hog'shead of sugar from thirteen hundred gallons, and some so watery as to require more than double that quantity.—By a hog'shead is meant sixteen hundred weight. The richer the juice is, the more free it is found from redundant oil and gum: so that an exact analysis of any one quantity of juice would convey very little knowledge of the contents of any other quantity †.

That beautiful vegetable wool, or substance called **COTTON**, is the spontaneous production of three parts of the earth. It is found growing naturally in all the tropical regions of Asia, Africa, and America; and may justly be comprehended

\* "He (says honest old Slare the physician) that undertakes to argue against *Sweets* in general, takes upon him a very difficult task, for nature seems to have recommended this taste to all sorts of creatures; the birds of the air, the beasts of the field, many reptiles and flies seem to be pleased and delighted with the specific relish of all sweets, and to dislike the contrary. Now the sugar-cane, or sugar, I hold for the top and highest standard of vegetable sweets." Sugar is ob-

tainable in some degree from most vegetables, and Dr. Cullen is of opinion, that sugar is directly nutritious. There is also good reason to suppose, that the general use of sugar in Europe has had the effect of extinguishing the scurvy, the plague, and many other diseases formerly epidemical.

† A pound of sugar from a gallon of raw liquor is reckoned in Jamaica very good yielding. Sugar, chemically analysed, yields phlegm, acid, oil, and spongy glossy charcoal.

among the most valuable gifts of a bountiful Creator, superintending and providing for the necessities of man.

The cotton wool which is manufactured into cloth (for there is a species in the West Indies, called silk or wild cotton, unfit for the loom) consists of two distinct kinds, known to the planters by the names of *green-seed cotton* and *shrub cotton*; and these again have subordinate marks of difference, with which the cultivator ought to be well acquainted if he means to apply his labours to the greatest advantage.

**GREEN-SEED COTTON** is of two species; of one of which the wool is so firmly attached to the seed, that no method has hitherto been found of separating them, except by the hand; an operation so tedious and troublesome, that the value of the commodity is not equal to the pains that are requisite in preparing it for market. This sort therefore is at present cultivated principally for supplying wicks for the lamps that are used in sugar-boiling, and for domestic purposes; but the staple being exceedingly good, and its colour perfectly white, it would doubtless be a valuable acquisition to the muslin manufactory, could means be found of detaching it easily from the seed.

The other sort has larger seeds, of a duller green than the former, and the wool is not of equal fineness; though much finer than the cotton wool in general cultivation.

**SHRUB COTTON**, properly so called. The shrub itself very nearly resembles an European corinth bush, and may be subdivided into several varieties, all of which however very nearly resemble each other. These varieties (such of them at least as have come to my knowledge), are, 1st, the *common Jamaica*; 2d, *brown-bearded*; 3d, *nanken*; 4th, *French or small seed*, with a whitish beard; 5th, *kidney cotton*.

The plant is raised from the seed, the land requiring no other preparation than to be cleared of its native incumbances; and the season for putting the seed into the ground is from May to September, both months inclusive. At the end of five months, the plant begins to blossom and put forth its beautiful yellow flowers, and, in two months more, the pod is formed. From the seventh to the tenth month the pods ripen in succession; when they burst open in three partitions, displaying their white and glossy down to the sight. The wool is now gathered, the seeds being enveloped in it; from which it is afterwards extricated by a machine resembling a turner's lathe.

It is computed that not less than six hundred thousand people in Great Britain find full employment in the cotton manufactory. In point of importance therefore, even the produce and manufacture of the great staple commodities of this kingdom, *wool*, does not exceed it in a twofold proportion. According to the information of a very able and diligent inquirer, there are from ten to twelve millions of sheep in England. The value of their wool may, one year with another, amount to 3,000,000*l.* the expence of manufacturing this is probably 9,000,000*l.* and the total value 12,000,000*l.* In reference to the number of persons who are maintained by this manufactory, there are probably about a million.

The plant which yields the valuable commodity called **INDIGO** (probably so named from India, where it was first known to be cultivated) grows spontaneously in all the West Indies. In the British sugar islands, they reckon three distinct species; the wild, Guatimala, and French. The first is said to be the hardest, and the dye extracted from it is supposed to be of the best quality both in colour and closeness of grain; but one of the other two species is commonly preferred by the planter, as yielding a greater return; and of those, the French surpasses the Guatimala in quantity; but yields to it in fineness of grain and beauty of colour.

**COFFEE** will thrive in every soil in the West Indies; a cold stiff clay soil, and a shallow mould on a hot marl, excepted; in both which, the leaves turn yellow, and the trees perish, or produce nothing: but the best and highest flavoured fruit is unquestionably the growth of either a warm gravelly mould, a sandy loam, or the dry red hills which are found in almost every island of the West Indies, Jamaica especially. Frequent showers of rain, however, are friendly to its growth; but if water remains long about the roots, the tree will decay and perish.

The **CACAO**, or chocolate nut, a production equally delicate, wholesome and nutritive, is a native of South America, and is said to have been originally conveyed to Hispaniola from some of the provinces of New Spain, where, besides affording to the natives an article of nourishment, it served the purpose of money, and was used by them as a medium in barter; one hundred and fifty of the nuts being considered of much the same value as a real by the Spaniards.\*

**GINGER** is distinguished into two sorts, the black and the white; but the difference arises wholly from the mode of curing; the former being rendered fit for preservation by means of boiling water, the latter by insolation; and as it is found necessary to select the fairest and soundest roots for exposure to the sun, white ginger is commonly one third dearer than black in the market.

In the cultivation of this root no greater skill or care is required than in the propagation of potatoes in Great Britain, and it is planted much in the same manner; but is fit for digging only once a year, unless for the purpose of preserving it in syrup. In that case, it must be taken up at the end of three or four months, while its fibres are tender, and full of sap. Ginger thus prepared makes an admirable sweetmeat.

It seems as if this commodity was growing greatly out of use in Europe, and its cultivation in the West Indies decreases in consequence. The average quantity exported annually from the British islands may be stated at ten thousand bags of one cwt. of which 6,000 are the produce of Barbadoes, and the remainder (except a very small part from Dominica) is raised in Jamaica. Its medium price at the London market is forty shillings the hundred weight.

**ARNATTO**. This production is indigenous, and was called by one class of Indians roucou, and by another achiotte. Its botanical name is bixa. Arnatto is mixed up by the Spanish Americans with their chocolate, to which it gives, in their opinion, an elegant tincture and great medicinal virtue. They suppose that it strengthens the stomach, stops fluxes, and abates febrile symptoms; but its principal consumption is among painters and dyers. It is sometimes used by the Dutch farmers to give a richness of colour to their butter: and very small quantities of it are said to be applied in the same manner in the English dairies. On the whole, however, it

\* The cacao tree, both in size and shape, somewhat resembles a young *black-heart cherry*. The flower is of a saffron colour, extremely beautiful, and the pods, which in a green state are much like a cucumber, proceed immediately from all parts of the body and larger branches. As they ripen they change their colour, and turn to a fine bluish red, almost purple, with pink-coloured veins. This is the common sort; but there is a larger species, which produces pods of a delicate yellow or lemon colour. Each pod may contain from twenty to thirty nuts or kernels, not unlike almonds, which are again inclosed in a white pulpy substance soft and sweet, and immediately enveloped in a parchment shell. These nuts, being first simply dried in the sun, are packed for market, and require very

little preparation, after removing the shell, to be made into good chocolate. The cakes which are generally used under this name in England appear to be composed of not more than one half genuine cacao; the remainder is perhaps *sour* and *Cassia soap*. Considered medicinally, chocolate is said to be too heavy for weak and relaxed stomachs; but in the West Indies, experience abundantly demonstrates that it is in the highest degree balsamic and restorative.—Colonel Montague James, of Jamaica, who was the first white person born after the conquest of the island by the English, lived to the great age of one hundred and four, and for the last thirty years of his life used scarce any other food than chocolate.

is an object of no great commercial importance, and the demand for it is not sufficient to encourage much attention to its cultivation.

The **PIZMENTO** trees or allspice grow spontaneously, and in great abundance, in many parts of Jamaica, but more particularly on hilly situations, near the sea, on the northern side of that island; where they form the most delicious groves that can possibly be imagined; filling the air with fragrance, and giving reality, though in a very distant part of the globe, to our great poet's description of those balmy gales which convey to the delighted voyager

"Sabean odours from the spicy shore  
Of Araby the blest.—  
Chear'd with the grateful smell, old ocean smiles."

There cannot be, in all the vegetable creation, a tree of greater beauty than a young piemento. The trunk, which is of a grey colour, smooth and thinning, and altogether free of bark, rises to the height of fifteen or twenty feet. It then branches out on all sides, richly clothed with leaves of a deep green, somewhat like those of the bay-tree; and these, in the months of July and August, are beautifully contrasted and relieved by an exuberance of white flowers. It is remarkable, that the leaves are equally fragrant with the fruit, and yield in distillation a delicate odiferous oil, which is very commonly used, in the medicinal dispensaries of Europe, for oil of cloves.

[**CRUELITIES EXERCISED ON THE ORIGINAL INHABITANTS.**] It may be safely affirmed, that the whole story of mankind affords no scene of barbarity equal to that of the cruelties exercised on these innocent and inoffensive people\*. All the murders and desolations of the most pitiless tyrants that ever diverted themselves with the pangs and convulsions of their fellow creatures, fall infinitely short of the bloody enormities committed by the Spanish nation in the conquest of the new world; a conquest, on a low estimate, effected by the murder of ten millions of the species! But although the accounts which are transmitted down to us of this dreadful carnage are authenticated beyond the possibility of dispute, the mind, shrinking from the contemplation, wishes to resist conviction, and to relieve itself by incredulity.—Such at least is the apology one would wish to frame for the author of the American History, when he attempts, in contradiction to the voice and feelings of all mankind, to palliate such horrible wickedness†. Yet the same author admits, that, in the short interval of fifteen years subsequent to the discovery of the West Indies, the Spaniards had reduced the natives of Hispaniola from a million to sixty thousand‡. It is in vain that he remarks on the bodily feebleness of these poor Indians,

\* Historians have preserved a remarkable speech of a venerable old man, a native of Cuba, who, approaching Christopher Columbus who exercised some of the barbarities which disgraced his successions, with great reverence, and presenting a basket of fruit, addressed him as follows: "Whether you are divinities" (he observed), "or mortal men, we know not; you are come into these countries with a force against which were we inclined to resist it, resistance would be folly. We are all therefore at your mercy; but if you are men, subject to mortality like ourselves, you cannot be unappriized, that after this life there is another, wherein a very different portion is allotted to good and bad men. If therefore you expect to die, and believe, with us, that every one is to be rewarded in a future state according to

"his conduct in the present, you will do no hurt to those who do none to you."

† Introduction to the History of America, by Dr. Robertson, vol. i. p. 10. "It is to be hoped" (says the author) "that the Spaniards will at last discover this system of concealment to be no less impolitic than illiberal. From what I have experienced in the course of my inquiries, I am satisfied that upon a more minute scrutiny into their early operations in the New World, however reprehensible" (a tender expression) "the actions of individuals may appear, the conduct of the nation will be placed in a more favourable light." This opinion however needs no other reutation than that which is to be found in the subsequent pages of the learned author's history.

‡ History of America, vol. i. book iii. p. 185.

and their natural incapacity for labour. Such a constitutional defect, if it existed, entitled them to greater lenity; but the Spaniards distributed them into lots, and compelled them to dig in the mines, without rest or intermission, until death, their only refuge, put a period to their sufferings. Such as attempted resistance or escape, their merciless tyrants hunted down with dogs, which were fed on their flesh. They disregarded sex and age, and with impious and frantic bigotry even called in religion to sanctify their cruelties! Some, more zealous than the rest, forced their miserable captives into the water, and after administering to them the rite of baptism, cut their throats the next moment, to prevent their apostacy! Others made a vow to hang or burn thirteen every morning in honour of our saviour and the twelve apostles! Nor were these the excesses only of a blind and remorseless fanaticism, which exciting our abhorrence, excites also our pity: The Spaniards were actuated in many instances by such wantonness of malice, as is wholly unexampled in the wide history of human depravity.—Martyr relates that it was a frequent practice among them to murder the Indians of Hispaniola in sport, or merely, he observes, *to keep their hands in use*. They had an emulation which of them could most dexterously strike off the head of a man at a blow; and wagers frequently depended on this hellish exercise\*.

“I once beheld” (says Las Casas) “four or five principal Indians roasted alive at a slow fire; and as the miserable victims poured forth dreadful screams which disturbed the commanding officer in his afternoon slumbers, he sent word that they should be strangled; but the officer on guard (*I know his name and I know his relations in Seville*) would not suffer it; but causing their mouths to be gagged, that their cries might not be heard, he stirred up the fire with his own hands, and roasted them deliberately till they all expired.—*I saw it myself!!!*”

STRIKING PECULIARITIES OF } There are some peculiarities in the habits of the  
THE WHITE INHABITANTS. } white inhabitants, which cannot fail to catch the eye of an European newly arrived; one of which is the contrast between the general plenty and magnificence of their tables (at least in Jamaica) and the meanness of their houses and apartments; it being no uncommon thing to find at the country habitations of the planters a splendid side-board loaded with plate, and the choicest wines, a table covered with the finest damask linen, and a dinner of perhaps sixteen or twenty covers; and all this in a hovel not superior to an English barn. A stranger cannot fail also to observe a strange incongruity between the great number of negro domestics, and their appearance and apparel. The butler (and he but seldom) is the only attendant that is allowed the luxury of shoes and stockings. All the others, and there is commonly one to each guest, wait at table in *bare-footed majesty*; some of them perhaps half naked. Another peculiarity in the manners of the English in the West Indies (in Jamaica especially) is the number of nautical expressions in their conversation. Thus they say, *hand such a thing*, instead of bring or give it; a plantation well stocked with negroes is said to be *well handed*: an office or employment is called a *birth*; the kitchen is denominated the *cook-room*; a warehouse is called a *store* or *store-room*; a sofa is called a *cot*; a waistcoat is termed a *jacket*; and in speaking of the East and West, they say *to windward* and *leeward*. This language has probably prevailed since the days of the bucaniers.

CHARACTER, AND DISPOSITIONS OF } The negroes in general in our islands  
NEGROES IN A STATE OF SLAVERY. } (such of them at least as have been any length of time in a state of servitude) are of a distrustful and cowardly disposition. So degrading is the nature of slavery, that fortitude of mind is lost as free agency is re-

\* Edwards's Hist. of the West Indies, vol. i. p. 27.

† Ibid, vol. i. p. 90.

strained.

strained. To the same cause probably must be imputed their propensity to conceal or violate the truth; which is so general, that the vice of falsehood appears to be one of the most prominent features in their character.

The negroes are strongly attached to their countrymen, but above all, to such of their companions as came in the same ship with them from Africa. This is a striking circumstance: the term *shipmate* is understood among them as signifying a relationship of the most endearing nature; perhaps as recalling the time when the sufferers were cut off together from their common country and kindred, and awakening reciprocal sympathy from the remembrance of mutual affliction.

But their benevolence, with a very few exceptions, extends no further. The softer virtues are seldom found in the bosom of the enslaved African. Give him sufficient authority, and he becomes the most remorseless of tyrants. Of all the degrees of wretchedness endured by the sons of men, the greatest, assuredly, is the misery which is felt by those who are unhappily doomed to be the slaves of slaves; a most unnatural relation, which sometimes takes place in the sugar plantations; as for instance, when it is found necessary to instruct young negroes in certain trades or handicraft employments. In those cases it is usual to place them in a sort of apprenticeship to such of the old negroes as are competent to give them instruction; but the harshness with which these people enforce their authority, is extreme; and it serves in some degree to lessen the indignation which a good mind necessarily feels at the abuses of power by the whites, to observe that the negroes themselves, when invested with command, give full play to their revengful passions, and exercise all the wantonness of cruelty without restraint or remorse.

The same observation may be made concerning their conduct towards the inferior animal creation. Their treatment of cattle under their direction is brutal beyond belief. Even the useful and social qualities of the dog secure to him no kind usage from an African master. Although there is scarce a negro that is not attended by one, they seem to maintain these poor animals solely for the purpose of having an object whereon to exercise their caprice and cruelty. And, by the way, it is a singular circumstance, and not the less true for being somewhat ludicrous, that the animal itself, when the property of a negro, betrays at first sight to whom he belongs; for, losing his playful propensities, he seems to feel the inferiority of his condition, and actually crouches before such of his own species as are used to better company. With the manners he acquires also the cowardly, thievish, and sullen disposition of his African tyrant.

If, by love, is meant that tender attachment to one individual object, which, in civilised life, is desire heightened by sentiment and refined by delicacy, it is questionable if it ever found a place in an African bosom. That passion therefore, to which (dignified by the name of love) is ascribed the power of softening all the miseries of slavery, is mere animal desire, implanted by the great author of all things for the preservation of the species. This the negroes, without doubt, possess in common with the rest of the animal creation, and they indulge it, as inclination prompts, in an almost promiscuous intercourse with the other sex; or at least in temporary connections, which they form without ceremony, and dissolve without reluctance. When age indeed begins to mitigate the ardour, and lessen the fickleness of youth, many of them form attachments, which, strengthened by habit and endeared by the consciousness of mutual imbecility, produce a union for life. It is not uncommon to behold a venerable couple of this stamp, who, tottering under the load of years, contribute to each other's comfort, with a cheerful assiduity, which is at once amiable and affecting.

The situation of the aged among the negroes is indeed commonly such as to make them some amends for the hardships and sufferings of their youth. The labour

bour required of the men is seldom any thing more than to guard the provision grounds; and the women are chiefly employed in attending the children, in nursing the sick, or in other easy avocations; but their happiness chiefly arises from the high veneration in which old age is held by the negroes in general; and this may be considered as one of the few pleasing traits in their character.

Among other propensities and qualities of the negroes, must not be omitted their loquaciousness. They are as fond of exhibiting set speeches, as orators by profession; but it requires a considerable share of patience to hear them throughout; for they commonly make a long preface before they come to the point; beginning with a tedious enumeration of their past services and hardships. Yet I have (says Mr. Edwards) sometimes heard them convey much strong meaning in a narrow compass: I have been surpris'd by such figurative expressions, (and notwithstanding their ignorance of abstract terms) such pointed sentences, as would have reflected no disgrace on poets and philosophers. One instance recurs to my memory, of so significant a turn of expression in a common labouring negro who could have had no opportunity of improvement from the conversation of white people, as is alone, I think, sufficient to demonstrate that negroes have minds very capable of observation. It was a servant who had brought me a letter, and, while I was preparing an answer, had, through weariness and fatigue, fallen asleep on the floor. As soon as the papers were ready, I directed him to be awakened; but this was no easy matter. When the negro who attempted to awake him, exclaimed in the usual jargon, *You no hear massa call you?* that is *Don't you hear master call you?* *Sleep,* replied the poor fellow, looking up, and returning composedly to his slumbers, *sleep hab no massa.* (Sleep has no matter.)

Of those imitative arts in which perfection can be attained only in an improved state of society, it is natural to suppose that the negroes have but little knowledge. An opinion prevails in Europe that they possess organs peculiarly adapted to the science of music; but this is an ill-founded idea. In vocal harmony they display neither variety nor compass. Nature seems in this respect to have dealt more penuriously by them than towards the rest of the human race. As practical musicians, some of them by great labour and careful instruction become sufficiently expert to bear an under part in a public concert; but an instance perhaps cannot be produced of a negro who could truly be called a fine performer on any capital instrument.

Their songs are commonly impromptu, and there are among them individuals who resemble the *improvisatori*, or extempore bards of Italy; but much cannot be said for their poetry.

At their merry meetings and midnight festivals, they are not without ballads of another kind adapted to such occasions; and here they give full scope to a talent for ridicule and derision, which is exercised not only against each other, but also, not unfrequently, at the expence of their owner or employer: but most part of their songs at these places are fraught with obscene ribaldry, and accompanied with dances in the highest degree licentious and wanton. At other times, more especially at the burial of such among them as were respected in life or venerable through age, they exhibit a sort of Pyrrhick or warlike dance, in which their bodies are strongly agitated by running, leaping, and jumping, with many violent and frantic gestures and contortions. Their funeral songs too are all of the heroic or martial cast, affording some colour to the prevalent notion that the negroes consider death not only as a welcome and happy release from the calamities of their condition, but also as a passport to the place of their nativity; a deliverance, which, while it frees them from bondage, restores them to the society of their dearest, long-lost and lamented relatives in Africa. But perhaps this, like other European notions con-

cerning the negroes, is the dream of poetry, the sympathetic effusion of a fanciful or too credulous an imagination\*. The negroes in general are so far from courting death, that, among such of them as have resided any length of time in the West Indies, suicide is much less frequent than among the free-born, happy, and civilised inhabitants of Great Britain. With them, equally as with the whites, nature shrinks back at approaching dissolution; and when at any time, sudden or untimely death overtakes any of their companions, instead of rejoicing at such an event, they never fail to impute it to the malicious contrivances and diabolical arts of some practitioners in *Obeah*,—a term of African origin, signifying forcery or witchcraft, the prevalence of which among many of their countrymen, all the negroes most firmly and implicitly believe. We may conclude, therefore, that their funeral songs and ceremonies are commonly nothing more than the dissonance of savage barbarity and riot, as remote from the fond superstition to which they are ascribed, as from the sober dictates of a rational forerow.

The courage or unconcern, which the negroes manifest at the approach of death, arises, doubtless, in a great measure, from their national manners, wars, and superstitions, which are all in the highest degree savage and sanguinary.

DISPROPORTION OF SEXES IN THE NUMBER OF } The disproportion in  
SLAVES ANNUALLY EXPORTED FROM AFRICA. } the number of male and female slaves exported from Africa (says Mr. Barnes †) appears to me to be imputable to the three following causes: first, to the practice of polygamy, which prevails throughout Africa. Secondly, to some of the very causes of slavery itself:—men are more apt to commit civil offences than women; and in all such cases, where males and females are involved in the same calamity, the first cause still has its operation: the young females are kept for wives, and the males are sold for slaves. Thirdly, to the circumstance that females become unfit for the slave-market at a much earlier period than the males. A woman, through child-bearing,

\* Perhaps it was some such imagination that gave rise to the following little poem, published for the first time in Mr. Edwards's history,—the production of early youth; but surely if the fond idea of returning to their native country could afford the poor negroes comfort and consolation in death, it were to be wished that it really prevailed among them.

ODE ON SEEING A NEGRO FUNERAL.

Mahali dies! O'er yonder plain  
His bier is borne; the sable train  
By youthful virgins led.  
Daughters of injur'd Africa, say,  
Why raise ye thus th' heroic lay?  
Why triumph o'er the dead?

No tear bedews their fixed eye:  
'Tis now the hero lives (they cry)  
Releas'd from Slav'y's chain:  
Beyond the billowy surge he flies,  
And joyful views his native skies,  
And long-lost bow'rs again

On Koromantyn's palmy soil,  
Heroic deeds and martial toil  
Shall fill each glorious day;  
Love, fond and faithful, crown thy nights,  
And bliss unbought, unmix'd delights,  
Fall cruel wrongs repay.

Nor lordly pride's stern av'rice there,  
Alone, shall nature's bounties share,—  
To all her children free.  
For thee the dulcet reed shall spring,  
His balmy bowl the coco bring,  
Th' anana bloom for thee.

The thunder!—hark! 'Tis Afric's God!  
He wakes,—he lifts th' avenging rod,  
And speeds th' impatient hours.  
From Niger's golden stream he calls;—  
Fair freedom comes! oppression falls;  
And vengeance yet is ours!

Now, Christian, now, in wild dismay,  
Of Afric's proud revenge the prey,  
Go roam th' affrighted wood.  
Transform'd to tigers, fierce and fell,  
Thy race shall prowl with savage yell,  
And glut their rage for blood!

But soft, beneath yon tantrind shade  
Now let the hero's limbs be laid;—  
Sweet slumbers bless the brave!  
There shall the breezes shed perfume;  
Nor livid lightnings blast the bloom  
That decks Mahali's grave.

may appear a very exceptionable slave at twenty-two or twenty-three years of age, whereas a healthy well-made man will not be objected to at four or five-and-thirty; consequently, if an equal number of males and females of like ages were offered for sale, a much greater proportion of the females would be rejected on that account only. With regard to the question, whether the European traders prefer purchasing males rather than females? I have to observe, that though it is impossible to conduct the business either of a house or of a plantation without a number of females, yet as the nature of the slave-service in the West Indies (being chiefly field-labour) requires, for the immediate interest of the planter, a greater number of males, the European trader would of course wish to purchase his assortment according to the proportion wanted: but the fact is, *he has not an option in the case for the reasons already mentioned*; so that, in most parts of Africa, it is with great difficulty he can get as many saleable females as will form any tolerable assortment."

**ARRIVAL AND SALE IN THE WEST INDIES.]** The arrival of a Guinea ship in the West Indies is announced by public advertisement, specifying the number of negroes imported, the country from whence, and day of sale.

The circumstance of being exposed naked is perhaps of little account to these who were never sensible of the necessity or propriety of being clothed. The climate requires it not, nor are the negroes, though naked, destitute of decorations, on which, at their first arrival, they seem to set a much higher estimation than on raiment; most of the nations of Africa having their skin, particularly on the forehead, the breast, and round the waist, punctured or impressed with figures and representations of different kinds (squares, circles, triangles, and crescents) similar to the practice which prevails in *Otaheite* and the other islands of the South Sea, called *tatooving*, as described in the voyages of captain Cook. Like those islanders too, some of the newly-imported negroes display these marks with a mixture of ostentation and pleasure, either considering them as highly ornamental, or appealing to them as testimonies of distinction in Africa, where, in some cases, they are said to indicate free birth and honourable parentage. The negroes are apprised also, before their arrival, that they are to be employed in tillage; and, knowing that they were bought with money, expect to be sold in the same manner. They display therefore, on being brought to market, very few signs of lamentation for their past, or of apprehension for their future condition.

**PEOPLE OF COLOUR.]** Of persons of mixed blood (usually termed people of colour) all the different classes or varieties are not easily discriminated. In the British West Indies, they are commonly known by the names of *Samboes*, *Mulattoes*, *Quadroons*, and *Mestizos* \*.

**POPULATION.]** The present state of the population in the British West Indies appears to be as follows:

	Whites.	Blacks.
Jamaica	30,000	250,000
Barbadoes	16,167	62,115
Grenada	1,000	23,926
St. Vincent	1,450	11,853
Dominica	1,236	14,967
Antigua	2,590	37,808

\* A *Sambo* is the offspring of a black woman by a mulatto man, or *vice versa*.

*Mulatto*, of a black woman by a white man.  
*Quadroon*, of a mulatto woman by a white man.

*Mestizo* or *mustee*, of a quadroon woman by a white man.

The offspring of a mestizo by a white man are white by law. A Mestizo therefore in our islands is perhaps the quinteron of the Spaniards.

	Whites.	Blacks.
Montserrat . . .	1,300	10,000
Nevis . . .	1,000	8,420
St. Christopher's . . .	1,900	20,435
Virgin Isles . . .	1,200	9,000
Bahamas . . .	2,000	2,241
Bermudas . . .	5,462	4,919
Total . . .	65,305	455,684

There is likewise, in each of the islands, a considerable number of persons of mixed blood, and native blacks of free condition. In Jamaica they are reckoned a ten thousand; and they do not fall short of the same number in all the other islands collectively taken. The whole inhabitants therefore may properly be divided into four great classes; 1. European whites; 2. Creole or native whites; 3. Creoles of mixed blood, and free native blacks; 4. Negroes in a state of slavery.

LAND ANIMALS USED AS FOOD.] The enumeration of them follows; the agouti, the peccary, the armadillo, the opossum, the racoon, the musk rat, the alca, the smaller monkey of several varieties; but besides the animals now mentioned, and those that are furnished by the rivers and the sea, the woods were peopled with two very extraordinary creatures, both of which anciently were, and still are, not only used as food, but accounted superior delicacies. These are the iguana and the mountain crab. The iguana (or, as it is commonly written, the *guana*) is a species of lizard; a class of animals, about which naturalists are not agreed whether to rank them with quadrupeds, or to degrade them to serpents. The English did not often serve them at elegant tables; but their French and Spanish neighbours, less squeamish, still devour them with exquisite relish, and say that the iguana is equal in flavour and wholesomeness to the finest green turtle.—Concerning the mountain crab, we shall subjoin the following description.

“These animals (says Du Tertre) live not only in a kind of orderly society in their retreats in the mountains, but regularly once a year march down to the sea-side in a body of some millions at a time. As they multiply in great number, they chuse the months of April or May to begin their expedition; and then fall out from the stumps of hollow trees, from the clefts of rocks, and from the holes which they dig for themselves under the surface of the earth. At that time the whole ground is covered with this band of adventurers: there is no setting down one's foot without treading upon them. The sea is their place of destination, and to that they direct their march with right-lined precision. No geometrician could send them to their destined station by a shorter course; they neither turn to the right nor to the left, whatever obstacles intervene; and even if they meet with a house, they will attempt to scale the walls to preserve the unbroken tenor of their way. But though this be the general order of their route, they, upon other occasions, are compelled to conform to the face of the country; and if it be intersected by rivers, they are seen to wind along the course of the stream. The procession sets forward from the mountains with the regularity of an army under the guidance of an experienced commander. They are commonly divided into battalions, of which the first consists of the strongest and boldest males, that, like pioneers, march forward to clear the route and face the greatest dangers. The night is their chief time of proceeding; but if it rains by day, they do not fail to profit by the occasion, and they continue to move forward in their slow uniform manner. When the sun shines and is hot upon the surface of the ground, they make an universal halt, and wait till the cool of the evening. When they are terrified, they march back in a confused disorder.”

"derly manner, holding up their nippers, with which they sometimes tear off a piece of skin, and leave the weapon where they inflicted the wound.

"When, after a fatiguing march, and escaping a thousand dangers (for they are sometimes three months in getting to the shore), they have arrived at their destined port, they prepare to cast their spawn. The eggs are hatched under the sand; and soon after millions at a time of the new-born crabs are seen quitting the shore, and slowly travelling up to the mountains."

So far Du Tertre, as copied by Goldsmith. What follows is from Brown's history of Jamaica. "The old crabs, having disburthened themselves (as above), generally regain their habitations in the mountains by the latter end of June.— In August they begin to fatten, and prepare for moulting: filling up their burrows with dry grass, leaves, and abundance of other materials. When the proper period comes, each retires to his hole, shuts up the passage, and remains quite unactive until he gets rid of his old shell, and is fully provided with a new one. How long they continue in this state is uncertain: but the shell is first observed to burst at the back and sides to give a passage to the body, and the animal extracts its limbs from all the other parts gradually afterwards. At this time the flesh is in the richest state, and covered only with a tender membranous skin, variegated with a multitude of reddish veins; but this hardens gradually, and soon becomes a perfect shell like the former. It is however remarkable that, during this change, there are some stony concretions always formed in the bag, which waste and dissolve as the creature forms and perfects its new crust."

To these full and particular accounts, I will add of my own knowledge, (says Mr. Edwards) that many people, in order to eat of this singular animal in the highest perfection, cause them to be dug out of the earth in the moulting state; but they are usually taken from the time they begin to move of themselves, till they reach the sea as already related. During all this time they are in spawn, and if my testimony can add weight to that of all who have written, and all who have feasted, on the subject, I pronounce them, without doubt, one of the choicest morsels in nature. The observation therefore of Du Tertre is neither hyperbolic nor extravagant. Speaking of the various spices of this animal, he terms them "a living and perpetual supply of manna in the wilderness, equalled only by the miraculous bounty of providence to the children of Israel when wandering in the desert. They are a resource," continues he, "to which the Indians have at times resort; for when all other provisions are scarce, this never fails them."

MANAGEMENT OF PLANTATIONS, } Large plantations of the sugar-cane are  
AND TRADE. } generally under the care of a manager, or chief overseer, who has commonly a salary of 150*l.* a year, with overseers under him in proportion to the greatness of the plantation, one to about 30 negroes, with a salary of about 40*l.* Such plantations too have a surgeon at a fixed salary, employed to take care of the negroes which belong to it. But the course which is least troublesome to the owner of the estate is, to let the land, with all the works, and the stock of cattle and slaves, to a tenant, who gives security for the payment of the rent and the keeping up repairs and stock. The estate is generally estimated to such a tenant at half the neat produce of the best years; such tenants, if industrious and frugal men, soon make good estates for themselves.

The negroes in the plantations are subsisted at a very easy rate. This is generally by allotting to each family a small portion of land, and allowing them two days in the week, Saturday and Sunday, to cultivate it. Some are subsisted in this manner; but others find their negroes a certain portion of Guinea or Indian corn,

and to some a salt herring, or a small portion of bacon or salt pork, a day. All the rest of the charge consists in a cap, a shirt, a pair of breeches, and a blanket; and the profits of their labour yield 10 or 12l. annually. The price of men negroes upon their first arrival is, for an able man in his prime, 50l. sterling; an able woman, 49l. sterling; a youth approaching to manhood, 47l. sterling; a young girl, 46l. sterling; boys and girls, from 40 to 45l. sterling; exclusive of the colonial tax, or duty on importation, about 20s. more.

To particularise the commodities proper for the West India market, would be to enumerate all the necessaries, conveniences, and luxuries of life; for they have nothing of their own but cotton, coffee, tropical fruits, spices, and the commodities already mentioned.

Traders there make a very large profit upon all they sell; but from the numerous shipping constantly arriving from Europe, and a continual succession of new adventurers, each of whom carries out more or less as a venture, the West India market is frequently overstocked; money must be raised, and goods are sometimes sold at prime cost or under. But those who can afford to store their goods and wait for a better market, acquire fortunes equal to any of the planters. All kinds of handicraftsmen, especially carpenters, bricklayers, braziers, and coopers, get very great encouragement. But it is the misfortune of the West Indies, that physicians and surgeons even outdo the planter and merchant, in accumulating riches.

**SITUATION AND FORM.]** The islands of the West Indies lie in the form of a bow or semicircle, stretching from north to south, from the coast of Florida to the river Oronoque in the main continent of South America. Some call them the Caribbees, from the first inhabitants; though this is a term that most geographers confine to the Leeward islands. Sailors distinguish them into the Windward and Leeward islands, with regard to the usual courses of ships from Old Spain, or the Canaries, to Carthagená or New Spain and Portobello. The geographical tables and maps distinguish them into the Great and Little Antilles.

The first that we come to belonging to Great Britain, and also the most important, is

## J A M A I C A.

**T**HIS island was originally a part of the Spanish empire in America. Several descents had been made upon it by the English, prior to 1656; but it was not till that year that Jamaica was reduced under our dominion. Cromwell had fitted out a squadron under Penn and Venables, to reduce the Spanish island of Hispaniola, but there this squadron was unsuccessful. The commanders, of their own accord, to atone for this misfortune, made a descent on Jamaica, and, having carried the capital, St. Jago, soon compelled the whole island to surrender. Ever since it has been subject to the English, and the government of it is one of the richest offices in the disposal of the crown, the standing salary being 2,500l. per annum, and the assembly commonly voting the governor as much more; which, with other perquisites, make it on the whole little inferior to 10,000l. per annum.

**SITUATION.]** Jamaica\* is situated in the Atlantic ocean, about 4,000 miles south-west of England. It has the island of Hispaniola at the distance of 30 leagues

\* The following particulars concerning this interesting island are selected from the instructive History of the British Colonies in the West Indies, by Bryan Edwards, esq.

to the east; the island of Cuba about the same distance to the north; the gulph of Honduras to the west; and Carthagea on the great continent of South America, to the south, distant 145 leagues.

CLIMATE.] The centre of Jamaica lies in about  $18^{\circ} 12'$  north latitude, and in longitude about  $76^{\circ} 45'$  west from London. From these data the geographical reader will perceive that the climate, although tempered and greatly mitigated by various causes, some of which will be presently explained, is extremely hot, with little variation from January to December; that the days and nights are nearly of equal duration, there being little more than two hours difference between the longest day and the shortest; that there is very little twilight; and finally, that when it is twelve o'clock at noon in London, it is about seven in the morning in Jamaica.

FACE OF THE COUNTRY.] The general appearance of the country differs greatly from most parts of Europe; yet the north and south sides of the island, which are separated by a vast chain of mountains extending from east to west, differ at the same time widely from each other. When Columbus first discovered Jamaica, he approached it on the northern side; and beholding that part of the country which now constitutes the parish of St. Anne, was filled with delight and admiration at the novelty, variety, and beauty of the prospect. The whole of the scenery is indeed superlatively fine, nor can words alone convey a just idea of it. A few leading particulars may perhaps be pointed out; but their combinations are infinitely various, and, to be understood, must be seen.

The country at a small distance from the shore rises into hills, which are more remarkable for beauty than boldness, being all of gentle declivity, and commonly separated from each other by spacious vales and romantic inequalities; but they are seldom craggy, nor is the transition from the hills to the vallies oftentimes abrupt. In general the hand of nature has rounded every hill towards the top with singular felicity. The most striking circumstances however attending these beautiful swells are the happy disposition of the groves of pimento with which most of them are spontaneously clothed, and the consummate verdure of the turf underneath, which is discoverable in a thousand openings, presenting a charming contrast to the deeper tints of the pimento. As this tree, which is no less remarkable for fragrancy than beauty, suffers no rival plant to flourish within its shade, these groves are not only clear of underwood, but even the grass beneath is seldom luxuriant; the soil in general being a chalky marl, which produces a close and clean turf, as smooth and even as the finest English lawn, and in colour infinitely brighter. Over this beautiful surface the pimento spreads itself in various compartments. In one place we behold extensive groves; in another a number of beautiful groupes, some of which crown the hills, while others are scattered down the declivities. To enliven the scene and add perfection to beauty, the bounty of nature has copiously watered the whole district. No part of the West Indies abounds with so many delicious streams. Every valley has its rivulet, and every hill its cascade. In one point of view, where the rocks overhang the ocean, no less than eight transparent waterfalls are beheld in the same moment. Those only who have been long at sea can judge of the emotion which is felt by the thirsty voyager at so enchanting a prospect.

Such is the foreground of the picture. As the land rises towards the centre of the island, the eye, passing over the beauties that have been recounted, is attracted by a boundless amphitheatre of wood,

Insufferable height of loftiest shade,  
Cedar and branching palm:

an immensity of forest, the outline of which melts into the distant blue hills; and these, again are lost in the clouds.

On the southern side of the island, the scenery, as before observed, is of a different nature. In the landscape just sketched, the prevailing characteristics are variety and beauty: in that which remains, the predominant features are grandeur and sublimity. When one first approaches this side of the island by sea, and beholds from afar such of the stupendous and soaring ridges of the blue mountains as the clouds here and there disclosed, the imagination (forming an indistinct but awful idea of what was concealed, by what was thus partially displayed) was filled with admiration and wonder; yet the sensation was allied rather to terror than delight. Though the prospect before me, says Mr. Edwards\*, was in the highest degree magnificent, it seemed a scene of magnificent desolation. The abrupt precipice and inaccessible cliff had more the aspect of a chaos than a creation; or rather seemed to exhibit the effects of some dreadful convulsion which had laid nature in ruins. Appearances however improved as we approached; for amidst ten thousand bold features too hard to be softened by culture, many a spot was soon discovered, where the hand of industry had awakened life and fertility. With these pleasing intermixtures, the flowing line of the lower range of mountains (which now began to be visible, crowned with woods of majestic growth) combined to soften and relieve the rude solemnity of the loftier eminences; till at length the savannas at the bottom met the sight. These are vast plains, clothed chiefly with extensive cane fields, displaying, in all the pride of cultivation, the verdure of spring blended with the exuberance of autumn, and bounded only by the ocean, on whose bosom a new and ever-moving picture strikes the eye; for innumerable vessels are discovered in various directions, some crowding into, and others bearing away from the bays and harbours with which the coast is everywhere indented. Such a prospect of human ingenuity and industry, employed in exchanging the superfluities of the old world for the productions of the new, opens another, and I might add, an almost untrodden field for contemplation and reflection.

**MOUNTAINS AND THEIR ADVANTAGES.]** The mountains of the West Indies, if not in themselves objects of perfect beauty, contribute greatly towards the beauty of general nature; and surely the inhabitants cannot reflect, but with the deepest sense of gratitude to Divine Providence, on the variety of climate, so conducive to health, serenity and pleasure, which these elevated regions afford them. On this subject, observes our author †, I speak from actual experience. In a maritime situation, on the sultry plains of the south side, near the town of Kingston, where I chiefly resided during the space of fourteen years, the general medium of heat during the hottest months (from June to November, both inclusive) was eighty degrees of Fahrenheit's thermometer ‡. At a villa eight miles distant, in the high lands of Liguanea, the thermometer seldom rose, in the hottest part of the day, above seventy. Here then was a difference of ten degrees in eight miles; and in the morning and evening the difference was much greater. At Cold Spring, the seat of Mr. Wallen, a very high situation six miles further in the country, possessed by a gentleman who has taste to relish its beauties and improve its productions, the general state of the thermometer is from 55° to 65°: it has been observed so low as 44°, so that a fire there even at noon day is not only comfortable but neces-

† Ibid. p. 189.

‡ In the other months, viz. from December to May, the thermometer ranges from 70 to 80°. The night air in the months of December and

January is sometimes surprisngly cool. I have known the thermometer so low at sun-rise as 69°, even in the town of Kingston; but in the hottest months, the difference between the temperature of noon day and midnight is not more than 5 or 6°.

sary a great part of the year \*. It may be supposed that a sudden transition from the hot atmosphere of the plains to the chill air of the higher regions is commonly productive of mischievous effects on the human frame; but this is seldom the case, if the traveller, as prudence dictates, sets off at the dawn of the morning (when the pores of the skin are in some measure shut) and is clothed somewhat warmer than usual. With these precautions, excursions into the uplands are always found safe, salubrious, and delightful.

SOIL, LANDS CULTIVATED AND UNCULTIVATED.] Jamaica is one hundred and fifty miles in length, and, on a medium of three measurements at different places, about forty miles in breadth. These data, supposing the island to have been a level country, would give 3,840,000 acres.

But a great part consisting of high mountains, the superficies of which comprise far more land than the base alone, I conceive it is a moderate estimate to allow on that account  $\frac{1}{8}$  more, which is

240,000

The total is

4,080,000 acres.

Of these, it is found by a return of the clerk of the patents, that no more than 1,007,589 were, in November 1789, located, or taken up, by grants from the crown. Thus it appears that upwards of one half of the lands are considered as of no kind of value, the expence of taking out a patent being of no great account; and even of the located lands, I conceive that little more than 1,000,000 of acres are at present in cultivation.

WOODS AND TIMBERS.] The mountains are in general covered with extensive woods, containing excellent timbers, some of which are of prodigious growth and solidity: such as the lignum vite, dog-wood, iron-wood, pigeon-wood, green-heart, brazil-wood, and bully-trees; most of which sink in water, and are of a compactness and impenetrability inconceivable by European workmen. Some of these are necessary in mill-works, and would be highly valuable in the Windward Islands. They are even so in such parts of Jamaica, as, having been long cultivated, are nearly cleared of contiguous woods; but it frequently happens in the interior parts, that the new settler finds the abundance of them an incumbrance instead of a benefit; and, having provided himself with a sufficiency for immediate use, sets fire to the rest in order to clear his lands; it not answering the expence of conveying

\* Cold Spring is 4,200 feet above the level of the sea. The soil is a black mould on a brown marl; but few or none of the tropical fruits will flourish in so cold a climate. Neither the netberry, the avocado pear, the star-apple, nor the orange, will bear within a considerable height of Mr. Wallen's garden; but many of the English fruits, as the apple, the peach, and the straw-berry, flourish there in great perfection, with several other valuable exotics; among which are a great number of very fine plants of the tea-tree and other oriental productions. The ground, in its native state, is almost entirely covered with different sorts of the fern, of which Mr. Wallen has reckoned about 400 distinct species. A person visiting Cold Spring for the first time, almost conceives himself transported to a distant part of the world, the air and

face of the country so widely differing from that of the regions he has left. Even the birds are all strangers to him. Among others peculiar to these lofty regions, is a species of the swallow, the plumage of which varies in colour like the neck of a drake; and there is a very fine song bird, called the fish-eye, of a blackish brown, with a white ring round the neck. I visited † this place in December, 1788: the thermometer stood at 57° at sunrise, and never exceeded 65° in the hottest part of the day. I thought the climate the most delightful that I had ever experienced. On the Blue Mountain peak, which is 7,531 feet from the level of the sea, the thermometer was found to range from 47° at sunrise to 58° at noon, even in the month of August. See Med. Comment. Edin. 1785.

† Edwards's History of the West Indies, vol. i. p. 150.

them to the sea-coast, for the purpose of sending them to a distant market. Of different kinds for boards and shingles, the species are innumerable; and there are many beautiful varieties adapted for cabinet work,—among others, the bread-nut, the wild-lemon, and the well-known mahogany.

**RIVERS AND MEDICINAL SPRINGS.]** There are reckoned throughout the extent of this island above one hundred rivers, which take their rise in the mountains, and run, commonly with great rapidity, to the sea, on both sides of the island. None of them are deep enough to be navigated by marine vessels. Black River, in St. Elizabeth, flowing chiefly through a level country, is the deepest and gentlest, and admits flat-bottomed boats and canoes for about thirty miles.

Of the springs, which very generally abound even in the highest mountains, some are medicinal, and are said to be highly efficacious in disorders peculiar to the climate. The most remarkable of these is found in the eastern parish of St. Thomas, and the fame of it has created a village in its neighbourhood, which is called the Bath. The water flows out of a rocky mountain about a mile distant, and is too hot to admit a hand being held underneath: a thermometer on Fahrenheit's scale, being immersed in a glass of this water, immediately rose to 123°. It is sulphureous, and has been used with great advantage in that dreadful disease of the climate, called the dry belly-ach. There are other springs, both sulphureous and chalybeate, in different parts of the country,—of which however the properties are but little known to the inhabitants in general.

**ORES.]** In many parts of Jamaica there is a great appearance of metals; and it is asserted by Blome and other early writers, that the Spanish inhabitants had mines both of silver and copper: but, admitting the fact, the industry of the present possessors is perhaps more profitably exerted on the surface of the earth, than by digging into its bowels. A lead mine was indeed opened some years ago, near to the Hope estate in the parish of St. Andrew; and it is said, there was no want of ore: but the high price of labour, or other causes, compelled the proprietors to relinquish their project.

**VEGETABLE PRODUCTIONS.]** Of the most important of the present natural productions, as sugar, indigo, coffee, cotton, &c. we have already treated, in the general account of the West Indies, and shall only subjoin a few observations on the vegetable classes of inferior order, which, though not of equal commercial importance with the preceding ones, are equally necessary to the comfort and subsistence of the inhabitants. If the reader is inclined to botanical researches, he is referred to the voluminous collections of Sloane and Browne.

The several species of grain cultivated in this island are—1st, maize, or Indian corn, which commonly produces two crops in the year, and sometimes three: it may be planted at any time when there is rain, and it yields, according to the soil, from fifteen to forty bushels the acre. 2dly, Guinea corn, which produces but one crop in the year: it is planted in the month of September, and gathered in January following, yielding from thirty to sixty bushels an acre. 3dly, Various kinds of calavances (a species of pea); and lastly, rice, but in no great quantity, the situation for its growth being deemed unhealthy, and the labour of negroes commonly employed in the cultivation of articles that yield greater profit.

This island abounds likewise with different kinds of grass, both native and extraneous, of excellent quality; of the first is made exceeding good hay, but not in great abundance, this method of husbandry being practised only in a few parts of the country; and it is the less necessary, as the inhabitants are happily accommodated with two different kinds of artificial grass, both extremely valuable, and yielding great profusion of food for cattle. The first is an aquatic plant, called *Scot's grass*,

CHIEF TO

*grafs*, which, though generally supposed to be an exotic, there is reason to think, grows spontaneously in most of the swamps and morasses of the West Indies. It rises to five or six feet in height, with long succulent joints, and is of very quick vegetation. From a single acre of this plant, five horses may be maintained a whole year, allowing fifty-six pounds of *grafs* a day to each.

The other kind, called *Guinea-grafs*, may be considered as next to the sugar-cane in point of importance, as most of the grazing and breeding farms, or pens, throughout the island, were originally created, and are still supported chiefly by means of this invaluable herbage. Hence the plenty of horned cattle both for the butcher and planter, which is such, that few markets in Europe furnish beef at a cheaper rate, or of better quality, than those of Jamaica. Perhaps the settlement of most of the north-side parishes is wholly owing to the introduction of this excellent *grafs*, which happened by accident about fifty years ago,—the seeds having been brought from the Coast of Guinea, as food for some birds which were presented to Mr. Ellis, chief justice of the island. Fortunately the birds did not live to consume the whole stock; and the remainder being carelessly thrown into a fence, grew and flourished; and it was not long before the eagerness displayed by the cattle to reach the *grafs* attracted Mr. Ellis's notice, and induced him to collect and propagate the seeds, which now thrive in some of the most rocky parts of the island, bestowing verdure and fertility on lands which otherwise would not be worth cultivation.

The several kinds of kitchen-garden produce, as edible roots and pulse, which are known in Europe, thrive also in the mountains of this island; and the markets of Kingston and Spanish-town are supplied with cabbages, lettuce, carrots, turnips, parsnips, artichokes, kidney-beans, green-peas, asparagus, and various sorts of European herbs, in the utmost abundance. Some of them, as the first three, are of superior flavour to the same kinds produced in England. However, several of the native growths, especially the chocho, ochra, lima-bean, and Indian-kale, are more agreeable than any of the esculent vegetables of Europe. The other indigenous productions of this class are plantains, bananas, yams of several varieties, calaloe (a species of spinach), eddoes, cassavi, and sweet potatoes. A mixture of these, stewed with salted fish or salted meat of any kind, and highly seasoned with Cayenne-pepper, is a favourite olio among the negroes. For bread, an unripe roasted plantain is an excellent substitute, and universally preferred to it by the negroes and most of the native whites. It may in truth be called the staff of life to the former; many thousand acres being cultivated in different parts of the country for their daily support.

Of the more elegant fruits, the variety is equalled only by their excellence. Perhaps no country on earth affords so magnificent a desert; and perhaps the following were spontaneously bestowed on the island by the power of nature:—the anana or pine-apple, tamarind, papaw, guava, sweet-sop of two species, cashew-apple, custard-apple (a species of *chirimoya*), cocoa-nut, star-apple, grenadilla, avocado-pear, hog-plum and its varieties, pindal-nut, netberry, mamee, mamee sapota, Spanish-goosberry, prickly pear, and perhaps a few others. For the orange, Seville and China, the lemon, lime, shaddock and its numerous species, the vine, melon, fig, and pomegranate, the West Indian Islands were probably indebted to their Spanish invaders. Excepting the peach, the strawberry, and a few of the growths of European orchards, which, however, attain to no great perfection unless in the highest mountains, the rose-apple, genipe, and some others of no great value, English industry had not added much to the catalogue until within the last twenty years.

CHIEF TOWNS, &c.] The island of Jamaica is divided into three counties, which.

which are named Middlesex, Surrey, and Cornwall. The county of Middlesex is composed of eight parishes, one town, and thirteen villages. The town is that of *St. Jago-de-la-Vega*, or SPANISH-TOWN, the capital of the island. Most of the villages of this and the other counties are hamlets of no great account, situated at the different harbours and shipping-places, and supported by the traffic carried on there. *St. Jago-de-la-Vega* is situated on the banks of the river *Cobre*, about six miles from the sea, and contains between five and six hundred houses, and about five thousand inhabitants, including free people of colour. It is the residence of the governor, or commander in chief, who is accommodated with a superb palace; and it is here that the legislature is convened, and the court of chancery, and the supreme court of judicature are held.

KINGSRON, in the county of Surry, is situated on the north side of a beautiful harbour, and was founded in the year 1693, when repeated desolations by earthquake and fire had driven the inhabitants from Port-Royal. It contains one thousand six hundred and sixty-five houses, besides negro-huts and warehouses. The number of white inhabitants, in the year 1733, was six thousand five hundred and thirty-nine; of free people of colour, three thousand two hundred and eighty; of slaves, sixteen thousand six hundred and fifty-nine; total number of inhabitants, of all complexions and conditions, twenty-six thousand four hundred and seventy-eight. It is a place of great trade and opulence. Many of the houses in the upper part of the town are extremely magnificent; and the markets for butchers' meat, turtle, fish, poultry, fruits and vegetables, &c. are inferior to none. I can add too, says Mr. Edwards, from the information of a learned and ingenious friend who kept comparative registers of mortality, that since the furrounding country has been cleared of wood, this town is found to be as healthful as any in Europe.

PORT-ROYAL, once a place of the greatest wealth and importance in the West Indies, is now reduced, by repeated calamities, to three streets, a few lanes, and about two hundred houses. It contains however the royal navy-yard, for heaving down and refitting the king's ships; the navy-hospital, and barracks for a regiment of soldiers. The fortifications are kept in excellent order, and vie in strength with any fortrefs in the king's dominions. Cornwall contains five parishes, three towns, and six villages.

CHURCH LIVINGS.] The twenty parishes into which the island is divided contain eighteen churches and chapels, and each parish is provided with a rector, and other church officers: the rectors' livings, the presentation to which rests with the governor or commander in chief, are severally as follows, viz. *St. Catherine*, 300*l.* per annum; *Kington, St. Thomas in the East, Clarendon, and Westmoreland*, 250*l.* per annum; *St. David, St. George, and Portland*, 100*l.* per annum; all the rest 200*l.* per annum. These sums are paid in lieu of tithes, by the church-wardens of the several parishes respectively, from the amount of taxes, levied by the vestries, on the inhabitants. Each parish builds and repairs a parsonage-house, or allows the rector 50*l.* per annum in lieu of one; besides which, many of the livings have glebelands of very considerable value annexed to them, as the parish of *St. Andrew*, which altogether is valued at one thousand pounds sterling per annum.

JUDICATURE.] The supreme court of judicature for the whole island (commonly called the Grand Court, as possessing similar jurisdiction in this country to that of the several courts of king's bench, common pleas, and exchequer, in Great Britain) is held in the town of *St. Jago-de-la-Vega*, the capital of the county of Middlesex, on the last Tuesday of each of the months of February, May, August, and November, in every year. In this court, the chief justice of the island presides, whose salary is only 120*l.* but the perquisites arising from the office make it worth

about 3000*l.* per annum. The assistant judges are gentlemen of the island, commonly planters, who receive neither salary nor reward of any kind for their attendance. Three judges must be present to constitute a court; and each term is limited in duration to three weeks. From this court, if the matter in dispute in a civil action be for a sum of 300*l.* sterling or upwards, an appeal lies to the governor and council, as a court of error; if sentence of death be passed for felony, the appeal is to the governor alone.

Assize courts are also held every three months, in Kingston, for the county of Surry, and in Savanna-la-Mar, for the county of Cornwall.

**GOVERNOR, AND OTHER GREAT OFFICERS.]** The governor, or commander in chief, is chancellor by his office, and presides solely in that high department, which is administered with great form and solemnity. He is also the sole ordinary for the probate of wills, and granting letters of administration. From the first of these offices, he derives extensive authority, and from the latter, considerable emolument.

As appendages of the supreme court, the several great offices, viz. the office of enrolments, or secretary of the island, provost marshal-general, clerk of the court (or prothonotary, *custos brevium*, &c.) are held and situated in Spanish-town.

**LEGISLATURE.]** The legislature of Jamaica is composed of the captain-general, or commander in chief, of a council nominated by the crown, consisting of twelve gentlemen, and a house of assembly, containing forty-three members, who are elected by the free-holders, viz. three for the several towns and parishes of St. Jago-de-la-Vega, Kingston, and Port-royal, and two for each of the other parishes. The qualification required in the elector is, a freehold of ten pounds per annum in the parish where the election is made; and, in the representative, a landed freehold of three hundred pounds per annum in any part of the island, or a personal estate of three thousand pounds. In the proceedings of the general assembly, they copy, as near as local circumstances will admit, the legislature of Great Britain; and all their bills (those of a private nature excepted) have the force of laws as soon as the governor's assent is obtained. The power of rejection however is still reserved to the crown; but until the royal disapprobation is signified, the laws are valid.

**POPULATION.]** The whole number of inhabitants of all complexions and conditions may be stated as follows:

Whites	-	-	-	30,000
Freed negroes and people of colour				10,000
Maroons	-	-	-	1,400
Negro slaves	-	-	-	250,000
Total	-	-	-	<u>291,400</u>

**TRADE.]** The trade of this island will best appear by the quantity of shipping and the number of seamen to which it gives employment, and the nature and quantity of its exports. The following is an account, from the books of the inspector-general of Great Britain, of the number of vessels of all kinds, their registered tonnage, and number of men, which cleared from the several ports of entry in Jamaica, in the year 1787, exclusive of coasting sloops, wherries, &c. viz.

For

## BRITISH AMERICAN ISLANDS.

	Number of vessels.	Tonnage.	Men.
For Great Britain	242	63,471	7,748
Ireland	10	1,231	98
American States	133	13,041	893
British American Colonies	66	6,133	449
Foreign West Indies	22	1,903	155
Africa	1	109	8
Total	474	85,888	9,344

It must however be observed, that, as many of the vessels clearing for America and the foreign West Indies make two or more voyages in the year, it is usual, in computing the real number of those vessels, their tonnage, and men, to deduct one third from the official number. With this correction, the total to all parts is 400 vessels, containing 78,862 tons, navigated by 8,845 men. To this we may add the inspector-general's account of the Jamaica exports, between the 5th of January, 1787, and the 5th of January, 1788; the total of which, in sugar, rum, melasses, pimento, coffee, cotton-wool, indigo, ginger, cacao, tobacco, mahogany, logwood, and miscellaneous articles, amounted to 2,136,442 l. 17s. 3d.

The general account of imports into Jamaica, from Great Britain, Ireland, Africa, the British Colonies in America, the United States, Madeira and Teneriffe, and the Foreign West Indies, as nearly as could be estimated, amounted to 1,496,232 l. 5s. 4d.

**BARBADOES.]** This island is situated in 13° 10' north latitude, and in longitude 59° west from London. It is about twenty-one miles in length, and fourteen in breadth, and contains 106,470 acres of land, most of which is under cultivation. The soil in the low lands is black, somewhat reddish in the shallow parts; on the hills, of a chalky marl, and near the sea generally sandy. Of this variety of soil, the black mould is best suited for the cultivation of the cane, and, with the aid of manure, has given as great returns of sugar, in favourable seasons, as any in the West Indies, the prime lands of St. Kitt's excepted.

That the soil of this island is to a great degree naturally fertile, we must necessarily admit, if we give credit to the accounts which are transmitted down to us of its ancient population and opulence. We are assured, that about the year 1670, Barbadoes could boast of fifty thousand white, and upwards of one hundred thousand black inhabitants, whose labours, it is said, gave employment to sixty thousand tons of shipping\*. I suppose that this account is much exaggerated.

In

\* The earliest planters in Barbadoes were sometimes reproached with the guilt of forcing or decoying into slavery the Indians of the neighbouring continent. The history of *Inkle* and *Yarico*, which the Spectator has recorded for the detestation of mankind, took its rise in this island; but happily this species of slavery has been long since abolished; and perhaps such of my readers as have sympathized with the unfortunate Yarico, may not be sorry to hear that she bore her misfortunes with greater philosophy than they have hitherto fancied. The story was first related by *Ligon*, who (after praising

poor Yarico's excellent complexion, which, he says, was a "bright bay;" and her "small breasts, with "nipples of porphyrie,") observes, that "she "chance afterwards to be with child by a Christian "servant, and being very great, walked down to a "woode, in which was a pond of water, and there, "by the side of the pond, brought herself a-bed, "and in three hours came home with the child in "her arms, a lully boy, frolicke and lively." The crime of *Inkle*, the merchant, however, admits of no palliation; but it is ridiculous enough to hear *Abbe Raynal* (willing to improve upon Addison)

Barbadoes.  
at Inkle's  
cord, the c  
plot was di

In 1786, the numbers were sixteen thousand one hundred and sixty-seven whites, eight hundred and thirty-eight free people of colour, and sixty-two thousand one hundred and fifteen negroes.

Their commerce consists in the same articles as formerly, viz. cotton, indigo, and tobacco, though they deal in them to less extent. Their capital is Bridgetown, where the governor resides, whose employment is said to be worth 5000*l.* per annum. They have a college, founded and well endowed by colonel Codrington, who was a native of this island. Barbadoes, as well as Jamaica, has suffered much by hurricanes, fires, and the plague. On the 10th of October, 1780, a dreadful hurricane occasioned vast devastation in Barbadoes: great numbers of the houses were destroyed; not one house on the island was wholly free from damage; many persons were buried in the ruins of the buildings, and great numbers were driven into the sea and there perished.

**ST. CHRISTOPHER'S.**] This island, commonly called by the sailors St. Kitt's, is situated in 63°-17' west longitude, and 17°-15' north latitude, about 14 leagues from Antigua; and is twenty miles long, and seven broad. It has its name from the famous Christopher Columbus, who discovered it for the Spaniards. That nation, however, abandoned it as unworthy of their attention; and in 1626, it was settled by the French and English conjunctly; but entirely ceded to us by the peace of Utrecht. It contains 43,726 acres of land, of which about 17,000 acres are appropriated to the growth of sugar, and 4000 to pasturage. As sugar is the only commodity of any account that is raised, except provisions and a little cotton, it is probable that nearly one half the whole island is unfit for cultivation. The interior part of the country consists indeed of many rugged precipices and barren mountains. Of these, the loftiest is Mount Misery (evidently a decayed volcano), which rises 3,711 feet in perpendicular height from the sea. Nature, however, has made abundant amends for the sterility of the mountains, by the fertility she has bestowed upon the plains. No part of the West Indies possesses even the same species of soil that is found in St. Christopher's. It is in general a dark grey loam, so light and porous as to be penetrable by the slightest application of the hoe; and it may perhaps be the production of subterraneous fires, the black ferruginous pumice of naturalists, finely incorporated with a pure loam, or virgin mould. The under stratum is gravel, from eight to twelve inches deep. Clay is no where found, except at a considerable height in the mountains.

By what process of nature the soil now mentioned becomes more especially suited to the production of sugar than any other in the West Indies, it is not within our province to explain; the circumstance however is unquestionable. Canes, planted in particular spots, have been known to yield 8000 lbs. of Muscovado sugar from a single acre. One gentleman, in a favourable season, made 6,400 lbs. or four hog-heads of 16 cwt. each, per acre, on an average return of his whole crop. It is not however pretended that the greatest part, or even a very large proportion, of the cane land throughout the island is equally productive.

In this island, as in Jamaica, the jurisdiction of both the king's bench and common pleas centres in one superior court, wherein justice is administered by a chief justice and four puisne judges. The chief is appointed by the crown; the others by the governor, in the king's name; and they all hold their commissions during

afcribe to it an intended revolt of all the negroes in Barbadoes, who, as he asserts, moved by indignation at Inkle's monstrous cruelty, vowed, with one accord, the destruction of all the whites; but their plot was discovered the night before it was to have

been carried into effect. The *Histoire Philosophique* has a thousand beauties; but, in point of historical accuracy, it is nearly on a level with the History of Robinson Crusoe.

pleasure. The office of chief judge is worth about 600 l. per annum. The emoluments of the assitant judges are trifling.

The present number of white inhabitants is computed at 4000, and taxes are levied on 26,000 negroes; and there are about 300 blacks and mulattoes of free condition.

In February, 1782, St. Christopher's was taken by the French, but restored to England by the treaty of peace.

ANTIGUA.] Situated in 61° west longitude, and 17° north latitude, is of a circular form, near 20 miles over every way. It is about 20 leagues to the eastward of St. Christopher's, and was discovered at the same time with that island, by Columbus himself who named it, from a church in Seville, *Santa Maria la Antigua*. Antigua is upwards of 50 miles in circumference, and contains 59,838 acres of land, of which about 34,000 are appropriated to the growth of sugar, and pasture annexed: its other principal staples are cotton-wool and tobacco; and they raise, in favourable years, great quantities of provisions.

In 1774, the white inhabitants of all ages and sexes were 2,590; and the enslaved negroes 37,808. The legislature of Antigua is composed of the commander in chief, a council of twelve members, and an assembly of twenty-five; and it is very much to its honour, that it presented the first example to the sister islands, of a melioration of the criminal law respecting negro slaves, by giving the accused party the benefit of a trial by jury, and allowing, in the case of capital convictions, four days between the time of sentence and execution: and it is still more to the honour of Antigua, that its inhabitants have encouraged, in a particular manner, the laudable endeavours of certain pious men, who have undertaken, from the purest and best motives, to enlighten the minds of the negroes, and lead them into the knowledge of religious truth. In the report of the lords of the committee of council on the slave-trade, is an account of the labours of the society known by the name of the *Unitas Fratrum* (commonly called Moravians), in this truly glorious pursuit: from which it appears that their conduct in this business displays such sound judgment, breathes such a spirit of genuine christianity, and has been attended with such eminent success, as to entitle its brethren and missionaries to the most favourable reception from every man whom the accidents of fortune have invested with power over the poor Africans, and who believes (as it is hoped every planter believes) that they are his fellow-creatures, and of equal importance with himself in the eyes of an all-seeing and impartial governor of the universe.

The number of converted negro slaves under the care of the brethren, at the end of the year 1787, was,

In Antigua, exactly	- - - - -	5,465

**NEVIS.]** This beautiful little spot is nothing more than a single mountain, rising like a cone in an easy ascent from the sea; the circumference of its base not exceeding eight English leagues. It is believed that Columbus bestowed on it the appellation of *Nieves*, or *The Snows*, from its resemblance to a mountain of the same name in Spain; but it is not an improbable conjecture, that on those days a white smoke was seen to issue from the summit which, at a distance, had a snow-like appearance, and that it derived its name from thence. That the island was produced by some volcanic explosion there can be no doubt; for there is a hollow, or crater, near the summit still visible, which contains a hot spring, strongly impregnated with sulphur; and sulphur is frequently found in substance in the neighbouring gullies and cavities of the earth.

The government, in the absence of the governor-general, is administered by the president of the council. This board is composed of the president and six other members. The house of assembly consists of fifteen representatives; three for each parish.

The administration of common law is under the guidance of a chief justice and two assistant judges, and there is an office for the registry of deeds. The present number of white inhabitants is stated not to exceed six hundred, while the negroes amount to about ten thousand; a disproportion which necessarily converts all such white men as are not exempted by age and decrepitude, into a well regulated militia, among which there is a troop consisting of fifty horse, well mounted and accoutred. English forces, on the British establishment, they have none.

**MONTERRAT.]** Of this little island, neither the extent nor the importance demands a very copious discussion. It was discovered at the same time with St. Christopher's, and derived its name from a supposed resemblance which Columbus perceived in the face of the country, to a mountain of the same name near Barcelona.

**BARRUDA.]** Situated in 17°-49' north latitude, 61°-50' west longitude, 35 miles north of Antigua, is 20 miles in length, and 12 in breadth. It is fertile, and has a good road for shipping, but no direct trade with England. The inhabitants are chiefly employed in husbandry, and raising fresh provisions for the use of the neighbouring isles. It belongs to the Codrington family, and the inhabitants amount to about 1500.

**ANGUILLA.]** Situated in 18° north latitude, 60 miles north-west of St. Christopher's, is about 30 miles long, and 10 broad. This island is perfectly level, and the climate nearly the same with that of Jamaica. The inhabitants, who are not numerous, apply themselves to husbandry, and feeding of cattle.

**DOMINICA.]** Situated in 16° north latitude, and 62° west longitude, lies about half way between Guadaloupe and Martinico. It is 29 miles in length, and 16 in breadth: it received its name from being discovered by Columbus on a Sunday. The soil of this island is thin, and better adapted to the rearing of cotton than sugar; but the sides of the hills bear the finest trees in the West Indies, and the island is well supplied with rivulets of fine water. The French have always opposed our settling here, because it must cut off their communication, in the time of war, between Martinico and Guadaloupe. However, by the peace of Paris, in 1763, it was ceded in express terms to the English; but we have derived little advantage from this conquest, the island being, till lately, no better than a harbour for the natives of the other Caribbees, who, being expelled their own settlements, took

refuge here. But, on account of its situation between the principal French islands, and Prince Rupert's Bay, being one of the most capacious in the West Indies, it has been judged expedient to form Dominica into a government of itself, and to declare it a free port. It was taken by the French in 1778, but was restored again to Great Britain by the late peace.

The legislative authority of this island is vested in the commander in chief, a council of twelve gentlemen, and an assembly of nineteen members\*. Dominica contains 186,436 acres of land, and is divided into ten parishes. The town of Roseau is at present the capital of the island, and is situated in the parish of St. George, being about seven leagues from Prince Rupert's Bay; it is on a point of land on the south-west side of the island, which forms two bays, viz. Woodbridge's Bay to the north, and Charlotteville Bay to the southward.

This island contains many high and rugged mountains, interspersed with fine valleys; and in general they appear to be fertile. Several of the mountains contain unextinguished volcanos, which frequently discharge vast quantities of burning sulphur. From these mountains also issue springs of hot water, some of which are supposed to possess great virtue in the case of tropical disorders. In some places the water is said to be hot enough to coagulate an egg.

Dominica is well watered, there being upwards of thirty-five fine rivers in the island, besides a great number of rivulets. The soil in most of the interior country is a light brown colour, mould, and appears to have been washed from the mountains. Towards the sea-coast, and in many of the vallies, it is a deep black and rich native earth, and seems well adapted to the cultivation of all the articles of West Indian produce. The under stratum is in some parts a yellow or brick clay, in most places very strong.

**ST. VINCENT.]** Situated in 13° north latitude, and 61° west longitude, 50 miles north-west of Barbadoes, 30 miles south of St. Lucia, is about 24 miles in length, and 18 in breadth.

St. Vincent's contains about 84,000 acres, which are every where well watered, but the country is very generally mountainous and rugged; the intermediate vallies, however, are fertile in a high degree, the soil consisting chiefly of a fine mould, composed of sand and clay, well adapted for sugar. The extent of country at present possessed by British subjects is 23,605 acres, and about as much more is supposed to be held by the Charaibes or Caribbeans. All the remainder is thought to be incapable of cultivation or improvement.

The island, or rather the British territory within it, is divided into five parishes, of which only one was provided with a church, and that was blown down in the hurricane of 1780; whether it is rebuilt we are not informed. There is one town called Kingston, the capital of the island and the seat of its government, and three villages that bear the name of towns, but they are inconsiderable hamlets, consisting each of a few houses only.

But the public establishment that reflects the greatest honour on St. Vincent's, is its celebrated botanic garden, under the provident and well-directed care of Mr. Anderson. It consists of thirty acres, of which no less than sixteen are in high cultivation, abounding not only with almost every species of the vegetable world, which the hand of nature has bestowed on these islands for use and beauty, for food and luxury, but also with many valuable exotics from the East Indies and South America. If it be surpassed in this latter respect by the magnificent garden of Mr.

\* The governor's salary is 1200l. sterling per annum, exclusive of his fees of office.

East, in Jamaica, it claims at least the honour of seniority, and does infinite credit both to its original founders and present directors.

In the frame of its government and the administration of executive justice, St. Vincent seems to differ in no respect from Grenada. The council consists of twelve members, the assembly of seventeen. The governor's salary is two thousand pounds sterling, one half of which is raised within the island, the other half is paid him out of the exchequer of Great Britain.

The military force consists at present of a regiment of infantry, and a company of artillery, sent from England, and a black corps raised in the country, but provided for, with the former, on the British establishment, and receiving no additional pay from the island. The militia consists of two regiments of foot, serving without pay of any kind.

The number of inhabitants appear, by the last returns to government, to be one thousand four hundred and fifty whites, and eleven thousand eight hundred and fifty-three negroes.

The Charaibes, or Caribbeans are said to have been treated with so much injustice and barbarity, after this island came into possession of the English, to whom it was ceded by the peace, in 1763, that they greatly contributed towards enabling the French to get possession of it again in 1779; but it was restored to Great Britain by the late treaty of peace.

**BREAD-FRUIT-TREE EXPEDITION.]** The ship Providence, captain Bligh, and the Assistance brig, lieutenant Portlock, arrived in the West Indies in January, 1793, from Otaheite, with many hundreds of the bread-fruit-trees, and other valuable plants. These vessels left England the 2d of August, 1791, and arrived at Otaheite the 10th of April, 1792, where they remained till the 19th of July. They encountered various dangers in passing through the before unexplored strait between New Guinea and New Holland, which they found full of rocks, shoals, and small islands, instead of being clear and open as supposed, and laid down in charts. It took twenty-one days to get through it, which, if it were clear, might be passed in two. In this strait the Pandora was lost, and it is conjectured that M. de la Peyrouse there perished. Three hundred bread-fruit plants, were landed at St. Vincent in the latter end of January, 1793, in excellent order, for the purpose of being distributed among the neighbouring islands. The remainder of the plants, amounting to an equal number, arrived at Jamaica in a few days after, of which an allotment was made to the three counties in the islands; to the county of Surry 83, to the county of Middlesex 83, to the county of Cornwall 83.

The cultivation of these valuable exotics will, without doubt, in a course of years, lessen the dependence of the sugar islands on North America, for food and necessaries; and not only supply subsistence for future generations, but probably furnish fresh incitements of industry, new improvements in the arts, and new subjects of commerce. That our readers may be satisfied that this benevolent design is likely to answer the most sanguine wishes that have been formed of it, we shall close this account with an extract of a letter to SIR JOSEPH BANKS, from the botanic gardener in Jamaica, dated December, 1793. "All the trees under my charge are thriving with the greatest luxuriance. Some of the bread-fruit are upwards of eleven feet high, with leaves thirty-six inches long; and my success in cultivating them has exceeded my most sanguine expectations."

**GRENADA AND THE GRENADINES.]** Grenada is situate 12° north latitude, and 62° west longitude, about thirty leagues south west of Barbadoes, and almost the same distance north of New Andalusia, or the Spanish Main. This island is said to be 30 miles in length, and 15 in breadth. Experience has proved, that the soil is

extremely proper for producing sugar, coffee, tobacco, and indigo; and upon the whole it carries with it the appearance of becoming as flourishing a colony as any in the West Indies, of its dimensions. A lake on the top of a hill, in the middle of the island, supplies it plentifully with fine rivers, which adorn and fertilize it. Several bays and harbours lie round the island, some of which may be fortified with great advantage, which renders it very convenient for shipping; and it is not subject to hurricanes. St. George's Bay has a sandy bottom, and is extremely capacious, but open. In its harbour, or careening place, 100 large vessels may be moored with perfect safety. This island was long the theatre of bloody wars between the native Indians and the French, during which this handful of Caribbees defended themselves with the most resolute bravery. In the last war but one, when Grenada was attacked by the English, the French inhabitants, who were not numerous, were so amazed at the reduction of Guadaloupe and Martinico, that they lost all spirit, and surrendered without making the least opposition; and the full property of this island together with the small islands on the north, called the Grenadines, which yield the same produce, were confirmed to the crown of Great Britain by the treaty of Paris in 1763. In July 1779, the French made themselves masters of this island, which was restored to Great Britain by the late treaty of peace.

Grenada appears to be fertile in a high degree, and by the variety as well as excellence of its returns, seems adapted to every tropical production. The exports of the year 1776, from Grenada and its dependencies, were 14,012,157 lbs. of Muscavado, and 9,273,607 lbs. of clayed sugar, 818,700 gallons of rum, 1,827,166 lbs. of coffee, 457,719 lbs. of cacao, 91,943 lbs. of cotton, 27,638 lbs. of indigo, and some smaller articles; the whole of which, on a moderate computation, could not be worth less at the ports of shipping than 600,000 l. sterling, excluding freight, duties, insurance, and other charges. It deserves to be remembered too, that the sugar was the produce of one hundred and six plantations only, and that they were worked by eighteen thousand two hundred and ninety-three negroes, which was therefore rather more than one hoghead of muscavado sugar of sixteen hundred weight, from the labour of each negro, old and young, employed in the cultivation of that commodity; a prodigious return, equalled perhaps by no other British island in the West Indies, St. Christopher's excepted.

The governor, by virtue of his office, is chancellor, ordinary, and vice-admiral, and presides solely in the courts of chancery and ordinary as in Jamaica. His salary is 3,200 l. currency per annum\*.

The council of Grenada consists of twelve members, and the assembly of twenty-six. The powers, privileges, and functions of both these branches of the legislature, are the same, and exercised precisely in the same manner as those of the council and assembly in Jamaica.

The law courts in Grenada, besides those of chancery and ordinary, are 1st, The court of grand sessions of the peace, held twice a year, viz. in March and September. 2dly, The court of common pleas. 3dly, The court of exchequer. 4thly, The court of admiralty, for trial of all prize causes of capture from enemies in war, and of revenue seizures in peace or war. There is one judge of admiralty and one surrogate. Lastly, The governor and council compose a court of error, as in Jamaica, for trying all appeals of error from the court of common pleas.

NEWFOUNDLAND.] Exclusive of the West India sugar islands lying between the two continents of America, Great Britain claims some others, that are seated at

THE  
D.A.]  
Madame  
compreh

the distance of some thousand miles from each other, upon the coast of this quarter of the globe, of which we shall speak according to our method, beginning with those of the most northern situation.

Newfoundland is situated to the east of the gulf of St. Laurence, between 46° and 52° north latitude, and between 53° and 59° west longitude, separated from Labrador, or New Britain, by the straits of Belleisle; and from Canada, by the Bay of St. Laurence, being 350 miles long, and 200 broad. The coasts are extremely subject to fogs, attended with almost continual storms of snow and sleet, the sky being usually overcast. From the soil of the island, which is rocky and barren, we are far from reaping any sudden or great advantage, for the cold is long-continued and severe; and the summer heat, though violent, warms it not enough to produce any thing valuable. However, it is watered by several good rivers, and hath many large and good harbours. This island, whenever the continent shall come to fail of timber, convenient to navigation, (which on the sea-coast is perhaps no very remote prospect), will afford a large supply for masts, yards, and all sorts of lumber for the West India trade. But what at present it is chiefly valuable for, is the great fishery of cod, carried on upon those shoals which are called the Banks of Newfoundland. Great Britain and North America, at the lowest computation, annually employed 3000 sail of small craft in this fishery; on board of which, and on shore to cure and pack the fish, are upwards of 10,000 hands; so that this fishery is not only a very valuable branch of trade to the merchant, but a source of livelihood to many thousands of poor people, and a most excellent nursery for the royal navy. This fishery is computed to increase the national stock 300,000*l.* a year in gold and silver, remitted to us for the cod we sell in the North, in Spain, Portugal, Italy, and the Levant. The plenty of cod, both on the great bank and the lesser ones, which lie to the east and south of this island, is inconceivable; and not only cod, but several other species of fish, are caught there in abundance; all of which are nearly in equal plenty along the shores of Newfoundland, Nova Scotia, New England, and the isle of Cape Breton; so that where our colonies are thinly peopled, or so barren as not to produce any thing from their soil, their coasts make us ample amends, and pour in upon us a wealth of another kind, and no way inferior to that arising from the most fertile soil.

This island, after various disputes about property, was entirely ceded to England by the treaty of Utrecht, in 1713; but the French were left at liberty to dry their nets on its northern shores; and by the treaty of 1763, they were permitted to fish in the gulf of St. Laurence, but with this limitation, that they should not approach within three leagues of any of the coasts belonging to England. The small islands of St. Pierre and Miquelon, situated to the southward of Newfoundland, were also ceded to the French, who stipulated to erect no fortifications on them, nor to keep more than fifty soldiers to enforce the police. By the last treaty of peace, the French are to enjoy the fisheries on the north and the west coasts of the island; and the Americans are allowed the same privileges in fishing as before their independence. The chief towns in Newfoundland are Placentia, Bonavista, and St. John: but not above 1000 families remain here in the winter. A small squadron of men of war are sent out every spring to protect the fisheries and inhabitants, the commander of which is governor of the island; besides whom, there are two lieutenant-governors, one at Placentia, the other at St. John's.

**THE ISLAND OF CAPE BRETON.** Annexed to the province of LOWER CANADA.] The island, or rather collection of islands, called by the French *Les Isles de Madame*, which lie so contiguous that they are commonly called but one, and comprehended under the name of the island of Cape Breton, lies between 45° and 47° north

47° north latitude, and between 59° and 60° west longitude from London. It is about 100 miles in length, and 50 in breadth; and is separated from Nova Scotia by a narrow strait, called the *Gut of Canso*, which is the communication between the Atlantic Ocean and the Gulf of St. Laurence.

It is surrounded with little sharp pointed rocks, separated from each other by the waves, above which some of their tops are visible. All its harbours are open towards the east, turning towards the south. On the other parts of the coast there are but a few anchoring places for small vessels in creeks, or between inlets. The harbour of St. Peter's, at the west end of the island, is a very commodious place for carrying on the fishery.

FACE OF THE COUNTRY, CLIMATE, } Except in the hilly parts, the surface of  
SOIL, AND PRODUCTION. } the country has but little solidity, being  
every where covered with a light moss and with water. The dampness of the soil is exhales in fogs. In other respects the climate is very cold, owing either to the prodigious quantity of lakes, which cover above half the island, and remain frozen for a long time; or to the number of forests that totally intercept the rays of the sun; the effect of which is besides decreased by perpetual clouds.

The inhabitants never applied themselves to agriculture, the soil being unfit for it. They often sowed corn, but it seldom came to maturity; and when it did thrive so much as to be worth reaping, it had degenerated so considerably, that it was not fit for seed for the next harvest. They have only continued to plant a few pot herbs, tolerably well tasted; but they must be renewed every year with seed from abroad. The poorness and scarcity of pastures has likewise prevented the increase of cattle. In a word the soil of Cape Breton seems calculated to invite none but fishermen and soldiers.

Though the island was entirely covered with forests before it was inhabited, its wood has scarce ever been an object of trade. A great quantity, however, of soft wood was found there fit for firing, and some that might be used for timber; but the oak has always been scarce, and the fir never yielding much resin.

POPULATION, CHIEF TOWNS, &c.] On this island there are about 1000 inhabitants, who have a lieutenant-governor resident among them, appointed by the king. The principal towns are Sidney, the capital, and Louisbourg, which has the best harbour in the island.

This island may be considered as the key to Canada, and the very valuable fishery in its neighbourhood, depends for its protection on the possession of this island; as no nation can carry it on without some convenient harbour of strength to supply and protect it, and Louisbourg is the principal one for these purposes.

TRADE.] The paltry trade is a very inconsiderable object. It consisted only in the skins of a few lynxes, elks, musk-rats, wild-cats, bears, otters, and foxes, both of a red, silver, and grey colour. Some of these were procured from a colony of Micmac Indians, who had settled on the island with the French, and never could raise more than 60 men to bear arms. The rest came from St. John's, or the neighbouring continent. Greater advantages might possibly have been derived from the coal mines which abound in this island. They lie in a horizontal direction, and being no more than six or eight feet below the surface, may be worked without digging deep or draining off the waters. Notwithstanding the prodigious demand for this coal from New England, from the year 1745 to 1749, these mines would probably have been forsaken, had not the ships which were sent out to the French islands wanted ballast. In one of these mines a fire has been kindled, which could never yet be extinguished.

The people of Cape Breton did not send all their fish to Europe. They sent part of it to the French southern islands, on board twenty or twenty-five ships, from 70

to 140 tons exported to mackarel, but chiefly edities. Can the people and cattle.

to it, carried In 1743, 3,116½ tons of dry fish, according to this trade less than 560,000 livres, in his "wealth and

to 140 tons burden. Besides the cod, which made at least half their cargo, they exported to the other colonies timber, planks, thin oak boards, salted salmon and mackerel, train oil and sea-coal. These were paid for, some in sugar and coffee, but chiefly in rum and molasses. The island could not consume all these commodities. Canada took off but a small part of the overplus; it was chiefly bought by the people of New England, who gave in exchange fruits, vegetables, wood, bricks, and cattle. This trade of exchange was allowed, but a smuggling trade was added to it, carried on in flour and salt fish.

In 1743, while this island belonged to the French, they caught 1,149,000 quintals of dry fish, and 3,500,000 of mud-fish, the value of both which, including 3,116½ tons of train oil, drawn from the blubber, amounted to 926,577l. 10s. sterling, according to the prime cost of the fish at Newfoundland. The whole value of this trade annually, at that period, amounted to a million sterling, in which no less than 564 ships, besides shallops, and 27,000 seamen were employed. Charlevoix, in his history of France, says, "This fishery is a more valuable source of wealth and power to France, than even the mines of Peru and Mexico would be.

**HISTORY.]** Though some fishermen had long resorted to this island every summer, not more than 20 or 30 had ever fixed there. The French, who took possession of it in August 1713, were properly the first inhabitants. They changed its name into that of *Isle Royale*, and fixed upon Fort Dauphin for their principal settlement. This harbour was two leagues in circumference. The ships came to the very shore, and were sheltered from the winds. Forests, affording oak sufficient to fortify and build a large city were near at hand; the ground appeared less barren than in other parts, and the fishery was more plentiful. This harbour might have been rendered impregnable at a trifling expence; but the difficulty of approaching it (a circumstance that had at first made a stronger impression than the advantages resulting from it) occasioned it to be abandoned, after great labour had been bestowed upon the undertaking. They then turned their views to Louisbourg, the access to which was easier; and convenience was thus preferred to security: the fortification of Louisbourg, however, was not begun till 1720.

In the year 1714, some fishermen, who till then had lived in Newfoundland, settled in this island. It was expected that their number would soon have been increased by the Acadians, who were at liberty from the treaties that had been granted them, to remove with all their effects, and even to dispose of their estates; but these hopes were disappointed. The Acadians chose rather to retain their possessions under the dominion of Britain, than to give them up for any precarious advantage they might derive from their attachment to France. Their place was supplied by some distressed adventurers from Europe, who came over from time to time to Cape Breton, and the number of inhabitants gradually increased to 4000. They were settled at Louisbourg, Fort Dauphin, Port Toulouze, Neruka, and on all the coasts where they found a proper beach for drying the cod.

This island remained in possession of the French till 1745, when it was captured for the crown of Great Britain, by a body of troops from New England, under the command of lieutenant general William Pepperell; but it was again, by the treaty of Aix-la-Chapelle, ceded to the French, who spared no expence to fortify and strengthen it. Notwithstanding which, it was again reduced, in 1758, by the British troops under general Amherst and admiral Boscawen, together with a large body of New England men, who found in that place two hundred and twenty-one pieces of cannon, and eighteen mortars, together with a large quantity of ammunition and stores; and it was ceded to the crown of Great Britain by the peace of 1763, since which the fortifications have been blown up, and the town of Louisbourg dismantled.

**St. John's.]** Situated in the gulf of St. Laurence, is about 60 miles in length, and 30 or 40 broad, has many fine rivers, and though lying near Cape Breton and Nova Scotia, has greatly the advantage of both in pleasantness and fertility of soil. Upon the reduction of Cape Breton, the inhabitants of this island amounting to 4000, submitted quietly to the British arms; and to the disgrace of the French governor, there were found in his house several English scalps, which were brought there to market by the savages of Nova Scotia; this being the place where they were encouraged to carry on that barbarous and inhuman trade. This island was so well improved by the French, that it was styled the granary of Canada, which it furnished with great plenty of corn, as well as beef and pork. It has several fine rivers, and a rich soil. Charlotte-town is its capital, and is the residence of the lieutenant-governor, who is the chief officer in the island. The inhabitants are estimated at about 5000. Upon the reduction of Cape Breton, in 1745, the inhabitants of this island, amounting to about 4000, submitted quietly to the British arms. It is attached to the province of Nova Scotia.

**BERMUDAS, or SOMMERS' ISLANDS.]** These received their first name from their being first discovered by John Bermudas a Spaniard; and were called the Summer Islands, from sir George Sommers, who was shipwrecked on their rocks in 1609, in his passage to Virginia. They are situated at a vast distance from any continent, in 32° north latitude, and in 65° west longitude. Their distance from the Land's End is computed to be near 1500 leagues, from the Madeiras about 1200, and from Carolina 300. The Bermudas are but small, not containing in all above 20,000 acres; and very difficult of access, being, as Waller the poet, who resided some time there, expresses it, "walled with rocks." The air of these islands, which Waller celebrates in one of his poems, has been always esteemed extremely healthful; a continual spring prevails, so that the beauty and richness of the vegetable productions are delightful. The pasture ground is ever verdant; the gardens ever in bloom. Most of the productions of the West Indies might here be cultivated. Though the soil of these islands is admirably adapted to the cultivation of the vine, the chief and only business of the inhabitants, who consist of about 10,000, is the building and navigating of the light sloops and brigantines, which they employ chiefly in the trade between North America and the West Indies. These vessels are remarkable for their swiftness; as the cedar, of which they are built, is for its hard and durable quality.

The town of St. George, which is the capital, is seated at the bottom of a haven in the island of the same name, and is defended with seven or eight forts and seventy pieces of cannon. It contains above five hundred houses, and some elegant public buildings.

"The houses are built of a soft stone, which is fawn like timber; when exposed to the weather, and washed like lime, it becomes hard. The houses are white as snow; which beheld from an eminence, contrasted with the greenness of the cedars and pasture-ground, and the multitude of islands full in view, realize what the poets have feigned concerning the Elysian fields. The inhabitants are numerous, perhaps not less than 15 or 20,000, who live so contiguous, that it looks like a continued village.

"The common food of the Bermudians is coffee, fish of different kinds, a sweet potatoe, Indian corn, and American flour. The water is rain preserved in cisterns: the general drink is grog. The government is conducted under a governor named by the crown of England, a council, and general assembly. The established religion is episcopacy. There are nine churches, of which three clergymen have the charge. There is one Presbyterian church. A regard for religion is

**LUCAY'S, OR BAHAMA ISLANDS.]** The Bahamas are situated to the south of Carolina, between 22° and 27° north latitude, and 73° and 81° west longitude. They extend along the coast of Florida quite down to the ile of Cuba, and are said to be 500 in number,—some of them only mere rocks; but twelve of them are large, fertile, and in nothing different from the soil of Carolina: all are, however, uninhabited, except Providence, which is 200 miles east of the Floridas; though some others are larger and more fertile, on which the English have plantations. Between them and the continent of Florida is the gulf of Bahama, or Florida, through which the Spanish galleons sail in their passage to Europe.

These little islands have deservedly a claim to particular notice; for it was one of them † that had the honour of first receiving Columbus, after a voyage the most bold and magnificent in design, and the most important in its consequences, of any that the mind of man has conceived, or national adventure undertaken, from the beginning of the world to the present time. They were not known to the English till 1667, when captain Seyle, being driven among them in his passage to Carolina, gave his name to one of them; and being a second time driven upon it, gave it the name of Providence. The English, observing the advantageous situation of these islands as a check on the French and Spaniards, attempted to settle them in the reign of Charles II. Some unlucky accidents prevented this settlement from being of any advantage; and the Isle of Providence became an harbour for the buccaneers or pirates, who for a long time infested the American navigation. This obliged the government, in 1718, to send out captain Woodes Rogers, with a fleet, to dislodge the pirates, and to make a settlement. This the captain effected; a fort was erected, and an independent company was stationed in the island. Ever since this last settlement, these islands have been improving, though but slowly. In time of war, people gain considerably by the prizes condemned there; and at all times by the wrecks, which are frequent in this labyrinth of rocks and shelves. The Spaniards and Americans captured these islands during the last war; but they were retaken by a detachment from St. Augustine, April 7, 1783.

**FALKLAND ISLANDS.]** Leaving the Bahama and West India islands, we shall now proceed along the south-east coast of America, as far as the 52d degree of south latitude, where the reader, by looking into the map, will perceive the Falkland islands, situated near the Straits of Magellan, at the utmost extremity of South America. King Charles II. of England thought the discovery of this coast of such consequence, that sir John Narborough was purposely fitted out to survey the Straits of Magellan, the neighbouring coast of Patagonia, and the Spanish ports in that neighbourhood,—with directions, if possible, to procure some intercourse with the Chilian Indians, who are generally at war, or at least on ill terms, with the Spaniards; and to establish a commerce and a lasting correspondence with them. Though sir John, through accidental causes, failed in this attempt, which, in appearance, promised many advantages to this nation, his transactions upon that coast, besides the many valuable improvements he furnished to geography and navigation, are rather an encouragement for farther trials of this kind, than any ob.

\* This account is from a letter lately written by an intelligent gentleman, who had resided a number of years in Bermuda.

† St. Salvador, known to English seamen by the name of Cat Island.

jection against them. It appeared by the precautions and fears of the Spaniards, that they were fully convinced of the practicability of the scheme he was sent to execute, and extremely alarmed with the apprehension of its consequences. It is said that his majesty Charles II. was so far prepossessed with the belief of the emoluments which might redound to the public from this expedition, and was so eager to be informed of the event of it, that, having intelligence of sir John Narborough's passing through the Downs on his return, he had not patience to attend his arrival at court, but went himself in his barge to Gravesend to meet him.

"As therefore it appears (says the author of Anson's Voyage) that all our future expeditions to the South Seas must run a considerable risk of proving abortive, whilst in our passage thither we are under the necessity of touching at the Portuguese settlement of Brazil (where we may certainly depend on having our strength, condition, and designs betrayed to the Spaniards), the discovery of some place more to the southward, where ships might refresh, and supply themselves with the necessary sea-stock for their voyage round Cape Horn, would be an expedient that would relieve us from these embarrassments, and would surely be a matter worthy the attention of the public. Nor does this seem difficult to be effected; for we have already the imperfect knowledge of two places, which might perhaps, on examination, prove extremely convenient for this purpose: one of them is Pepys' Island, in the latitude of 47, south, and laid down by Dr. Halley about 80 leagues to the eastward of Cape Blanco, on the coast of Patagonia; the other is Falkland's Isles, in the latitude of 51 and a half, lying nearly south of Pepys' Island. The last of these have been seen by many ships, both French and English. Woodes Rogers, who ran along the north-east coast of these isles in the year 1708, tells us that they extended about two degrees in length, and appeared with gentle descents from hill to hill, and seemed to be good ground, interspersed with woods, and not destitute of harbours. Either of these places, as they are islands at a considerable distance from the continent, may be supposed, from their latitude, to lie in a climate sufficiently temperate. This, even in time of peace, might be of great consequence to this nation,—and, in time of war, would make us masters of those seas."

Falkland islands were first discovered by sir Richard Hawkins in 1594; the principal of which he named Hawkins' Maidenland, in honour of queen Elizabeth. The present English name Falkland was probably given them by captain Strong, in 1689; and being adopted by Halley, it has from that time been received into our maps.

In the year 1764, the late lord Egmont, then first lord of the admiralty, revived the scheme of a settlement in the South-Seas; and commodore Byron was sent to take possession of Falkland Islands in the name of his Britannic majesty, and in his journal represents them as a valuable acquisition. On the other hand, they are represented by captain M'Bride who in 1766 succeeded that gentleman, as the outcasts of nature. "We found, says he, a mass of islands and broken lands, of which the soil was nothing but a bog, with no better prospect than that of barren mountains, beaten by storms almost perpetual. Yet this is summer; and if the winds of winter hold their natural proportion, those who lie but two cables' length from the shore, must pass weeks without any communication with it." The plants and vegetables which were planted by Mr. Byron's people, and the fir-trees, a native of rugged and cold climates, had withered away; but goats, sheep, and hogs, that were carried thither, were found to thrive and increase as in other places. Geese, of a sily taste, snipes, foxes, sea-lions, penguins, plenty of good water, and, in the summer months, wild celery and sorrel, are the natural luxuries of these islands.

But though the soil be barren, and the sea tempestuous, an English settlement was made here, of which we were dispossessed by the Spaniards in 1770. That measure was, however, disfavoured by the Spanish ambassador, and some concessions were made to the court of Great Britain; but the settlement was finally abandoned in 1774, in order to avoid giving umbrage to the court of Spain.

## SPANISH DOMINIONS IN NORTH AMERICA.

## EAST AND WEST FLORIDA.

## SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 600 } Breadth 130 }	between { 80 and 92 west longitude. 25 and 31 north latitude.	} 100,000.

**BOUNDARIES.]** THIS country, which was ceded by Great Britain to Spain by the late treaty of peace, and includes a part of Louisiana, is bounded by Georgia on the north; by the Mississippi on the west; by the gulf of Mexico on the south; and by the Bahama straits on the east.

**RIVERS.]** These are the Mississippi, which forms the western boundary of Florida, and is one of the finest in the world, as well as the largest; for, including its turnings and windings, it is supposed to run a course of 4,500 miles: but its mouths are in a manner choked up with sands and shoals, which deny access to vessels of any considerable burthen,—there being, according to Mitchel's map, only twelve feet water over the bar (captain Pitman says seventeen) at the principal entrance. Within the bar there is 100 fathom water, and the channel is every where deep, and the current gentle, except at a certain season, when, like the Nile, it overflows and becomes extremely rapid. It is, except the entrance already mentioned, every where free from shoals and cataracts, and navigable for craft of one kind or other almost to its source. The Mobile, the Apalachicola, and St. John's rivers, are also large and noble streams.

**BAYS AND CAPES.]** The principal bays are—St. Bernard's, Ascension, Mobile, Pensacola, Dauphin, Joseph, Apalaxy, Spiritu Santo, and Charles Bay.

The chief capes are—Cape Blanco, Sambles, Anclote, St. Augustine, and Cape Florida, at the extremity of the peninsula.

**AIR AND CLIMATE.]** Different accounts have been given of these particulars. It may be observed, that, though the air is very warm, the heats are much allayed by cool breezes from the seas which environ and wash a considerable part of this country. The inland countries towards the north feel a little of the roughness of the north-west wind, which, more or less, diffuses its chilling breath over the whole continent of North America, carrying frost and snow many degrees more to the southward in these regions, than the north-east wind does in Europe. That the air of Florida is pure and wholesome, appears from the size, vigour, and longevity of the Floridian Indians, who in these respects far exceed their more southern neighbours, the Mexicans; and when the Spaniards quitted St. Augustine, many of them were of great age,—some above ninety.

**SOIL, PRODUCTIONS, AND** } Many of the disadvantages indiscriminately  
FACE OF THE COUNTRY. } imputed to the soil of the whole country should  
be confined to East-Florida, which, indeed, near the sea, and 40 miles back, is flat  
and sandy. But even the country round St. Augustine, in all appearance the worst  
in the province, is far from being unfruitful: it produces two crops of Indian corn  
a year; the garden vegetables are in great perfection; the orange and lemon trees  
grow here, without cultivation, to a larger size, and produce better fruit than in  
Spain or Portugal.

The live-oaks, though not tall, contain a prodigious quantity of timber. The  
trunk is generally from twelve to twenty feet in circumference, and rises ten or  
twelve feet from the earth, and then branches into four or five great limbs, which  
grow in nearly a horizontal direction, forming a gentle curve. "I have stepped,"  
says Bartram \*, "above fifty paces in a straight line, from the trunk of one of these  
trees to the extremity of the limbs." They are ever green and the wood almost  
incorruptible. They bear a great quantity of small acorns, which are good to  
eat, when roasted, and from which the Indians extract a sweet oil, which they use  
in cooking hominy and rice.

The laurel magnolia is the most beautiful among the trees of the forest, and is  
usually an hundred feet high, though some are much higher. The trunk is per-  
fectly erect, rising in the form of a beautiful column, and supporting a head like an  
obtuse cone. The flowers are on the extremities of the branches, are large, white,  
and expanded like a rose, and are the largest and most complete of any yet known;  
when fully expanded, they are from six to nine inches diameter, and have a most  
delicious fragrance. The cypress is the largest of the American trees. "I have  
seen trunks of these trees," says Bartram, "that would measure eight, ten, and  
twelve feet in diameter, for forty or fifty feet straight shaft." The trunks make ex-  
cellent shingles, boards, and other timber; and, when hollowed, make durable and  
convenient canoes. "When the planters fell these mighty trees, they raise a stage  
round them, as high as to reach above the buttresses: on this stage eight or ten  
negroes ascend with their axes, and fall to work round its trunk."

The inland country towards the hills is extremely rich and fertile, producing  
spontaneously the fruits, vegetables, and gums, that are common to Georgia and  
the Carolinas; and is likewise favourable to the rearing of European productions.  
There is not, on the whole continent of America, any place better qualified by  
nature to afford not only all the necessaries of life, but also all the pleasures of ha-  
bitation, than that part of this country which lies upon the banks of the Missis-  
sippi.

From the climate of Florida, and some specimens sent to England, there is reason  
to expect that cotton, sugar, wine, and silk, will grow here as well as in Persia,  
India, and China, which are in the same latitudes. This country also produces  
rice, indigo, ambergris, cochineal, amethysts, turquoises, lapis lazuli, and other  
precious stones; copper, quick-silver, pit-coal, and iron ore: pears are found in  
great abundance on the coast of Florida: mahogany grows in the southern parts of  
the peninsula, but inferior in size and quality to that of Jamaica. The animal cre-  
ation are here so numerous, that you may purchase a good saddle-horse in exchange  
for goods of five shillings value prime cost; and there are instances of horses being  
exchanged for a batchet per head. Naval stores might be raised in these provinces  
in great abundance; and West Florida has already supplied Spain with considerable  
quantities. It is said, that no province can so profitably furnish Madeira with corn  
and pipe-slaves as West Florida, and in return supply itself and other provinces with

**POPULATION, COMMERCE, & CHIEF TOWNS.** } of war, and frequently changed masters, belonging alternately to the French and Spaniards. West Florida, as far as east Perdido river, was owned and occupied by the French,—the remainder, and all East Florida, by the Spaniards,—previous to their being ceded to the English, at the peace of 1763. The English divided this country into East and West Florida. But notwithstanding the luxuriance of the soil, the salubrity of the air, the cheapness and plenty of provisions, and the encouragement of the British government, the number of English inhabitants here was never very considerable. Indeed the affairs of the colony appear to have been injudiciously managed; and the reduction of Pensacola by the arms of the king of Spain in 1781, and its being guaranteed to that crown by the definitive treaty of 1783, deprived us of our flattering prospects from the possession of Florida.

The chief town in West Florida is Pensacola, N. lat. 30-22. W. lon. 87-20, which is seated within the bay of the same name, on a sandy shore that can only be approached by small vessels. The road is, however, one of the best in all the gulf of Mexico, in which vessels may lie in safety against every wind, being surrounded by land on all sides. This place sent skins, logwood, dying stuff, and silver in dollars, to the annual value of 63,000*l.* and received of our manufactures, at an average of three years, to the value of 97,000*l.*

St. Augustine, the capital of East Florida, N. lat. 29-45. W. lon. 81-12, runs along the shore, and is of an oblong form, divided by four regular streets, crossing each other at right angles. The town is fortified with bastions, and inclosed with a ditch. It is likewise defended by a castle, which is called Fort St. John; and the whole is furnished with cannon. At the entrance into the harbour are the north and south breakers, forming two channels, whose bars, at low tides, have eight feet water.

## LOUISIANA.

**BOUNDARIES.]** BOUNDED by the Mississippi east; by the Gulf of Mexico south; by New Mexico west; and runs indefinitely north. Under the French government, Louisiana included both sides of the Mississippi, from its mouth to the Illinois, and back from the river, east and west indefinitely.

**RIVERS.]** It is intersected by a number of fine rivers, among which are St. Francis, which empties into the Mississippi at Kappas Old Fort, navigable about 250 or three hundred miles; its course is nearly parallel with the Mississippi, and from 20 to 30 miles distant from it;—the Natchitoches, which empties into the Mississippi above Point Coupée, and the Adayes or Mexicano river, emptying into the Gulf of Mexico;—and the river Rouge, on which it is well known, are as rich silver mines as any in Mexico. This is supposed to be one principal reason why the exclusive navigation of the Mississippi has been so much insisted on by Spain.

**CAPITAL.]** New Orleans. It stands on the east side of the Mississippi, 105 miles from its mouth, in latitude 30° 2' north. It contained about 1100 houses, seven eighths of which were consumed by fire, in the space of five hours, on the 19th of March 1788. It is now fast rebuilding. Its advantages for trade are very great,—situated on a noble river, in a fertile and healthy country, within a week's

fall of Mexico by sea, and as near to the British, French, and Spanish West India islands, with a moral certainty of its becoming the general receptacle for the produce of that extensive and valuable country on the Mississippi and Ohio: these circumstances are sufficient to ensure its future growth and commercial importance.

[RELIGION, GOVERNMENT, &c.] The greater part of the white inhabitants are Roman Catholics. They are governed by a viceroy from Spain, and the number of inhabitants is unknown.

[CLIMATE, SOIL, AND PRODUCE.] Louisiana is agreeably situated between the extremes of heat and cold. Its climate varies, as it extends towards the north. The Southern parts, lying within the reach of the refreshing breezes from the sea, are not scorched like those under the same latitudes in Africa; and its northern regions are colder than those of Europe under the same parallels, with a wholesome serene air. To judge of the produce to be expected from the soil of Louisiana, let us turn our eyes to Egypt, Arabia Felix, Persia, India, China, and Japan, all lying in corresponding latitudes. Of these, China alone has a tolerable government; and yet it must be acknowledged they all are or have been famous for their riches and fertility. From the favourableness of the climate, two annual crops of Indian corn may be produced; and the soil, with little cultivation, would furnish grain of every kind in the greatest abundance. Their timber is as fine as any in the world, and the quantities of live-oak, ash, mulberry, walnut, cherry, cypress, and cedar, are astonishing. The neighbourhood of the Mississippi, besides, furnishes the richest fruits in great variety; the soil is particularly adapted for hemp, flax, and tobacco; and indigo is at this time a staple commodity which commonly yields the planter three or four cuttings a year. In a word, whatever is rich and rare in the most desirable climates in Europe seems to be the spontaneous production of this delightful country. The Mississippi and the neighbouring lakes furnish in great plenty several sorts of fish, particularly perch, pike, sturgeon, and eels.

In the northern part of Louisiana, a few miles below the mouth of the Ohio river, on the west bank of the Mississippi, a settlement is commencing, conducted by colonel Morgan of New Jersey, under the patronage of the Spanish king. The spot on which the city is proposed to be built is called New Madrid, after the capital of Spain, and is in north latitude  $36^{\circ} 30'$ .

[HISTORY.] The Mississippi, on which the fine country of Louisiana is situated, was first discovered by Ferdinand de Soto, in 1541. Monsieur de la Salle was the first who traversed it. He, in the year 1682, having passed down to the mouth of the Mississippi, and surveyed the adjacent country, returned to Canada, from whence he took passage to France.

From the flattering accounts which he gave of the country, and the consequential advantages that would accrue from settling a colony in those parts, Louis XIV. was induced to establish a company for the purpose. Accordingly a squadron of four vessels, amply provided with men and provisions, under the command of Monsieur de la Salle, embarked with an intention to settle near the mouth of the Mississippi. But he unintentionally sailed a hundred leagues to the westward of it, where he attempted to establish a colony; but through the unfavourableness of the climate, most of his men miserably perished; and he himself was vainly murdered not long after by two of his own men. Monsieur Iberville succeeded him in his headable attempts. He, after two successful voyages, died while preparing for a third. Crozat succeeded him; and, in 1712, the king gave him Louisiana. This grant continued but a short time after the death of Louis XIV. In 1763, Louisiana was ceded to the king of Spain, to whom it now belongs.\*

South-east division		
South division	Sonora - - -	Tuampe
West division	California, a peninsula.	St. Juan.

**SOIL AND CLIMATE.]** These countries, lying for the most part within the temperate zone, have a climate in many places extremely agreeable, and a soil productive of every thing, either for profit or delight. In California, however, the heat is great in summer, particularly towards the sea-coast; but in the inland country, the climate is more temperate, and in winter even cold.

**FACE AND PRODUCE OF THE COUNTRY.]** The natural history of these countries is yet in its infancy. The Spaniards themselves know little of the matter, and the little they know they are unwilling to communicate. It is certain, however, that in general the provinces of New Mexico and California are extremely beautiful and pleasant; the face of the country is agreeably varied with plains, intersected by rivers, and adorned with gentle eminences covered with various kinds of trees, some producing excellent fruit. With respect to the value of the gold mines, nothing positive can be asserted. They have undoubtedly enough of natural productions to render them advantageous colonies to any but the Spaniards. In California there falls in the morning a great quantity of dew, which, settling on the rose leaves, candies, and becomes hard like manna, having all the sweetness of refined sugar, without its whiteness. There is also another very singular natural production; in the heart of the country there are plains of salt, quite firm and clear as crystal, which, considering the vast quantities of fish found on its coasts, well render it an invaluable acquisition to an industrious nation.

**INHABITANTS, HISTORY, GOVERNMENT, RELIGION AND COMMERCE.]** The Spanish settlements here are comparatively weak, though they are increasing every day in proportion as new mines are discovered. The inhabitants are chiefly Indians, whom the Spanish missionaries have in many places brought over to Christianity, to a civilised life, and to raise corn and wine, which they now export pretty largely to Old Mexico. California was discovered by Cortez, the great conqueror of Mexico, in 1536, after enduring incredible hardships, and encountering dangers of almost every species. During a long period, it was so little frequented, that even its form was unknown, and, in most maps, it was represented as an island. Our famous navigator, sir Francis Drake, took possession of it in 1578, and his right was confirmed by the principal king or chief in the whole country.

country. This title, however, the government of Great Britain have not hitherto attempted to vindicate, though California is admirably situated for trade, and on its coast has a pearl fishery of great value. The inhabitants and government do not materially differ from those of Old Mexico.

**BAYS.]** On the north sea are the gulfs or bays of Mexico, Campechy, Vera Cruz, and Honduras; in the Pacific Ocean, or South-Sea, are the bays Micoya and Amapalla, Acapulco and Salinas.

**CAVES.]** These are cape Sardo, cape St. Martin, cape Condecedo, cape Ca-toche, cape Honduras, cape Cameron, and cape Gracias Dios, in the North Sea.

Cape Marques, cape Spirito Santo, cape Corientes, cape Gallero, cape Blanco, cape Burica, cape Prucroca, and cape Mala, in the South-Sea.

**WINDS.]** In the gulf of Mexico, and the adjacent seas, there are strong north winds from October to March, about the full and change of the moon. Trade-winds prevail every where at a distance from land, within the tropics. Near the coast, in the South-Sea, they have periodical winds, viz. monsoons, and sea and land breezes, as in Asia.

**SOIL AND CLIMATE.]** Mexico, lying for the most part within the torrid zone, is excellently hot; and, on the eastern coast, the land is low, marshy, and constantly flooded in the rainy seasons. The inland country, however, assumes a better aspect, and the air is of a milder temperature; on the western side, the land is not so low as on the eastern, much better in quality, and full of plantations.

**PRODUCES.]** Mexico, like all the tropical countries, is rather more abundant in fruits than in grain. Pine-apples, pomegranates, oranges, lemons, citrons, figs, and cocoa-nuts are here in the greatest plenty and perfection. Mexico produces also a prodigious quantity of sugar, especially towards the gulf of Mexico, and the province of Guaxaca and Guatimala, so that here are more sugar-mills than in any other parts of Spanish America. Cedar-trees and logwood abound near the bays of Campechy and Honduras; the Mahoe-tree also which hath a bark with strong fibres, which they twist and make ropes of. They have also a tree, which is called light-wood, being as light as a cork, of which they make floats to carry their merchandise on the sea-coasts.

But what is considered as the chief glory of the country, and what first induced the Spaniards to form settlements upon it, are the mines of gold and silver. The chief mines of gold are in Veragua and New Granada, bordering upon Darien and Terra Firma. Those of silver, which are much more rich, as well as numerous, are found in several parts, but in none so much as in the province of Mexico. The mines of both kinds are always found in the most barren and mountainous part of the country; nature making amends in one respect for her defects in another. The working of the gold and silver mines depends on the same principles. When the ore is dug out, compounded of several heterogeneous substances mixed with the precious metals, it is broken into small pieces by a mill, and afterwards washed, by which means it is disengaged from the earth, and other soft bodies which cling to it. Then it is mixed with mercury, which, of all substances, has the strongest attraction for gold, and likewise a stronger attraction for silver than the other substances which are united with it in the ore. By means of the mercury, therefore, the gold and silver are first separated from the heterogeneous matter, and then by straining and evaporation, they are disunited from the mercury itself.

The other articles next in importance to gold and silver, are the cochineal and cocoa. The former is of the animal kind, and of the species of the gall insects. It adheres to the plant called opuntia, and sucks the juice of the fruit, which is of a crimson colour. It is from this juice that the cochineal derives its value, which consists in dyeing all sorts of the finest scarlet, crimson, and purple. It is also used in medicine as a sudorific, and as a cordial; and it is computed that the Spaniards annually export no less than nine hundred thousand pounds weight of this commodity to answer the purposes of medicine and dyeing. The cocoa, of which chocolate is made, grows on a tree of a middling size, which bears a pod about the

size and shape of a cucumber, containing the cocoa. The Spanish commerce in this article is immense; and such is the internal consumption, as well as the external demand for it, that a small garden of cocoas is said to produce to the owner twenty thousand crowns a year. At home it makes a principal part of their diet, and is found wholesome, nutritious, and suitable to the climate. This country likewise produces silk, but not in such plenty as to make any remarkable part of its export. Cotton is here in great abundance, and on account of its lightness is the common wear of the inhabitants.

POPULATION, INHABITANTS, } We have already described the original inhabitants of Mexico, and the conquest of that country by the Spaniards. The present inhabitants may be divided into Whites, Indians, and Negroes. The whites are either born in Old Spain, or they are creoles, i. e. natives of Spanish America. The former are chiefly employed in government or trade, and have nearly the same character with the Spaniards in Europe; only a still more considerable portion of pride; for they consider themselves entitled to great distinctions as natives of Europe, and look upon the other inhabitants as many degrees beneath them. The creoles have all the bad qualities of the Spaniards, from whom they are descended, without that courage, firmness, and patience, which make the praise-worthy part of the Spanish character. Luxurious without variety or elegance, and expensive with great parade and little convenience, their general character is no more than a grave and specious insignificance. From idleness and constitution, their whole business is amour and intrigue; and their ladies of consequence are not greatly distinguished by their chastity or domestic virtues. The Indians, who notwithstanding the devastations of the first invaders, remain in great numbers, are become, by continual oppression and indignity, dejected and timorous. The blacks here, like all those in other parts of the world, are stubborn, hardy, and as well adapted for the gross slavery they endure as any human creatures can be.

Such is the general character of the inhabitants, not only in Mexico, but the greatest part of Spanish America. The civil government is administered by tribunals, called Audiences, which bear a resemblance to the parliaments formerly in France. In these courts the viceroy of the king of Spain presides. His employment is the greatest trust and power which his Catholic majesty has in his disposal, and is perhaps the richest government entrusted to any subject in the world. The greatness of the viceroy's office is diminished by the shortness of its duration, which lasts only three years. The clergy are extremely numerous in Mexico; and it has been computed, that priests, monks, and nuns of all orders, make upwards of a fifth of all the white inhabitants, both here and in the other parts of Spanish America. The people are superstitious, ignorant, rich, lazy, and licentious: with such materials to work upon, it is not remarkable that the church should enjoy one fourth of the revenues of the whole kingdom.

COMMERCE, CITIES, AND SHIPPING.] The trade of Mexico consists of three great branches, which extend over the world. It carries on a traffic with Europe, by La Vera Cruz, situated on the gulf of Mexico; with the East Indies, by Acapulco on the South-Sea; and with South America by the same port. These two sea-ports, Vera Cruz and Acapulco, are wonderfully well situated for commercial purposes. By means of the former, Mexico pours her wealth over the whole world; and receives in return the numberless luxuries and necessaries, which Europe affords to her, and which the indolence of her inhabitants will never permit them to acquire for themselves. To this port, the fleet from Cadiz, called the Flota, consisting of three men of war, as a convoy, and 14 large merchant ships, annually arrive about the beginning of November. Its cargo consists of every

commodity and manufacture of Europe; and there are few maritime nations but have more concern in it than the Spaniards, who send out little more than wine and oil. The profit of these, with the freight and commission to the merchants, and duty to the king, are almost the only advantages which Spain derives from her American commerce. When all the goods are landed and disposed of at La Vera Cruz, the fleet takes in the plate, precious stones, and other commodities for Europe. Some time in May they are ready to depart. From La Vera Cruz they sail to the Havannah, in the isle of Cuba, which is the rendezvous where they meet the galleons, another fleet which carries on the trade of Terra Firma, by Carthagena, and of Peru by Panama and Porto Bello. When all are collected and provided with a convoy necessary for their safety, they steer for Old Spain.

Acapulco is the sea-port, by which the communication is kept up between the different parts of the Spanish empire in America, and the East Indies. About the month of December, the great galeon, attended by a large ship as a convoy, annually arrives here. The cargoes of these ships (for the convoy, though clandestinely, likewise carries goods) consist of all the rich commodities and manufactures of the East. At the same time, the annual ship from Lima, the capital of Peru, comes in, and is computed to bring not less than two millions of pieces of eight in silver, besides quicksilver and other valuable commodities to be laid out in the purchase of the galleons' cargoes. Several other ships, from different parts of Chili and Peru, meet upon the same occasion. A great fair, in which the commodities of all parts of the world are bartered for one another, lasts thirty days. The galeon then prepares for her voyage, loaded with silver, and such European goods as have been thought necessary. As the Spaniards allow the Dutch, Great Britain, and other commercial states, to furnish the greater part of the cargo of the flota; so the Spanish settlers in the Philippines, tainted with the same indolence, permit the Chinese merchants to furnish the greater part of the cargo of the galeon. Notwithstanding what has been said of Vera Cruz, and Acapulco, the city of Mexico, the capital of the empire, ought to be considered as the centre of commerce in this part of the world; for here the principal merchants reside, and the greatest part of the business is negotiated. The East India goods from Acapulco, and the European from Vera Cruz also pass through this city. Hither all the gold and silver come to be coined, here the king's fifth is deposited, and here are wrought all those utensils and ornaments in plate which are every year sent to Europe. The city itself breathes the air of the highest magnificence, and according to the best accounts contains about 80,000 inhabitants.

	1. New Granada - - -	Santa Fè de Bagota
	2. Popayan - - - - -	Popayan.

**RIVERS, BAYS, CAPES, &c.]** The Isthmus of Darien, or Terra Firma Proper, joins North and South America. A line drawn from Porto Bello in the North, to Panama on the South Sea, or rather a little west of these two towns, is the proper limit between North and South America; and here the Isthmus, or neck of land, is only 60 miles over. The principal rivers are the Rio Grande, Darien, Chagre, and the Oronoque. The peculiarities of this last mentioned river require a particular description.

It was Columbus, who, in 1498, first discovered the Oronoque, the borders of which have since been named Spanish Guiana. This great river takes its rise among the Cordelera mountains; and is said to discharge itself into the ocean by forty openings, after it hath been increased, throughout an immense tract, by the afflux of a prodigious number of rivers more or less considerable. Such is its impetuosity, that it stems the strongest tides, and preserves the freshness of its waters to the distance of twelve leagues from the mouth of that vast and deep channel within which it was confined. Its rapidity, however, is not always the same, which is owing to a circumstance perhaps entirely peculiar. The Oronoque, which begins to swell in April, continues rising for five months; and during the sixth, remains at its greatest height. From October, it begins gradually to subside, till the month of March, throughout the whole of which it remains in the fixed state of its greatest diminution. These alternate changes are regular, and even invariable. Perhaps the rising of the waters of the Oronoque may depend entirely on the rainy season.

This river is not so easily navigated as it might be presumed from its magnitude; its bed being in many places filled up with rock, which obliges the navigator, at times, to carry both his boats and the merchandize they are laden with, by land round the obstruction.

The principal bays in Terra Firma are, the bay of Panama, and the bay of St. Michael's, in the South-Sea; the bay of Porto Bello, the gulf of Darien; Sino bay, Carthagena bay and harbour, the gulf of Venezuela, the bay of Maracaibo, the gulf of Triesto, the bay of Guaria, the bay of Curiaco, and the gulf of Paria, or Andalusia, in the North-Sea.

The chief capes are, Sambblas point, Point Canoa, Cape del Agua, Swart point, Cape de Vela, Cape Conquibacoa. Cape Cabelo, Cape Blanco, Cape Galera, Cape Three Points, and Cape Nassau; all on the north shore of Terra Firma.

**CLIMATE.]** The climate here, particularly in the northern divisions, is extremely hot; and it was found by Ulloa, that the heat of the warmest day in Paris is continual at Carthagena; the excessive heats raise the vapour of the sea, which is precipitated in such rains as seem to threaten a general deluge. Great part of the country, therefore, is almost continually flooded; and this, together with the excessive

cessive heat, so impregnates the air with vapours, that in many provinces particularly about P. payan and Porto Bello, it is extremely unwholesome.

**SOIL AND PRODUCE.]** The soil of this country, like that of the greater part of South America, is wonderfully rich and fruitful. It is impossible to view, without admiration, the perpetual verdure of the woods, the luxuriancy of the plains, and the towering height of the mountains. This, however, only applies to the inland country, for the coasts are generally barren sand, and incapable of bearing any species of grain. The trees, most remarkable for their dimensions, are the caobo, the cedar, the maria, and balsam tree. The manchineel tree is particularly remarkable. It bears a fruit resembling an apple, but which, under this specious appearance, contains the most subtle poison. The Habella de Carthagena is the fruit of a species of willow, and contains a kernel resembling an almond, but less white, and extremely bitter. This kernel is found to be an excellent and never failing remedy for the bite of the most venomous vipers and serpents, which are very frequent all over this country. There were formerly in Terra Firma rich mines of gold, which are now in a great measure exhausted. The silver, iron, and copper mines have been since opened; and the inhabitants find emeralds, sapphires, and other precious stones.

**ANIMALS.]** In treating of North America, we have taken notice of many of the animals that are found in the southern parts. Among those peculiar to the South, the most remarkable is the sloth, or as it is called by way of derision, the swift Peter. It bears a resemblance to an ordinary monkey in shape and size, but is of a most wretched appearance, with its bare hams and feet, and its skin all over cougated. He stands in no need of either chain or hutch, never stirring unless compelled by hunger; and he is said to be several minutes in moving one of his legs, nor will blows make him mend his pace. When he moves, every effort is attended with such a plaintive, and at the same time, so disagreeable a cry, as at once produces pity and disgust. In this cry consists the whole defence of this wretched animal. For on the first hostile approach it is natural for him to be in motion, which is always attended with disgusting howling, so that his pursuer flies much more speedily in his turn, to be beyond the reach of this horrid noise. When this animal finds no wild fruits on the ground, he looks out with a great deal of pains for a tree well loaded, which he ascends with a world of uneasiness, moving and crying, and stopping by turns. At length having mounted, he plucks off all the fruit, and throws it on the ground, to save himself such another troublesome journey, and rather than be fatigued with coming down the tree he gathers himself in a bunch, and with a shriek drops to the ground.

The monkeys in these countries are very numerous; they keep together 20 or 30 in company, rambling over the woods, leaping from tree to tree, and if they meet with a single person, he is in danger of being torn to pieces by them; at least they chatter, and make a frightful noise, throwing things at him; they hang themselves by the tail, on the boughs, and seem to threaten him all the way he passes, but where two or three people are together, they usually scamper away.

**NATIVES.]** Besides the Indians of this country, who fall under our general description of the Americans, there is another species of a fair complexion, delicate habit, and of a smaller stature than the ordinary Indians. Their dispositions too are more soft and effeminate; but what principally distinguishes them is their large weak blue eyes, which, unable to bear the light of the sun, see best by moon-light, and from which they are called Moon-eyed Indians.

**INHABITANTS, AND COMMERCE.]** We have already mentioned how this country fell into the hands of the Spaniards. The inhabitants therefore do not materially differ from those of Mexico. To what we have already observed, therefore,

it

it is only necessary to add, that the original inhabitants of Spain are variously intermixed with the negroes and Indians. These intermixtures form different gradations, which are carefully distinguished from each other, because every person expects to be regarded, in proportion as a greater share of the Spanish blood runs in his veins. The first distinction, arising from the intermarriage of the whites with the negroes, is that of the mulattoes, which is well known. Next to these are the Tercerones, produced from a white and mulatto. From the intermarriage with these and the whites arise the Quarterones, who, though still nearer the former, are disgraced with a tint of the negro blood. But the produce of these and the whites are the Quinterones, who, it is said, are not to be distinguished from the real Spaniards, but by being of a still fairer complexion. The same gradations are formed in a contrary order, by the intermixture of the mulattoes and the negroes; and besides these, there are a thousand others, hardly distinguishable by the natives themselves. The commerce of this country is chiefly carried on from the ports of Panama, Carthagena, and Porto Bello; which are three of the most considerable cities in Spanish America. In them are held the annual fairs for American, Indian, and European commodities. Among the natural merchandize of Terra Firma, the pearls found on the coast, particularly in the bay of Panama, are not the least considerable. The fishing for these, employs a great number of negro slaves, who have arrived at wonderful dexterity in this occupation. They are sometimes, however, devoured by fish, particularly the sharks, while they dive to the bottom, or are crushed against the shelves of the rocks. The government of Terra Firma is on the same footing with that of Mexico.

**CHIEF TOWNS.]** CARTHAGENA is the principal seaport town in Terra Firma. It is situated on the Atlantic ocean in N. lat.  $10^{\circ} 26'$ . and about  $78^{\circ}$  W. lon. The bay on which it stands, is seven miles wide from north to south,—abounds with a variety of good fish,—and has a sufficient depth of water, with good anchorage; and so smooth that ships are no more agitated than on a river. The many shallows at its entrance, however, make the help of a good pilot necessary. The town and its suburbs are fortified in modern style,—the streets are straight, broad, and well paved. The houses are principally brick, and one story high. All houses have balconies, and lattices of wood. This city is the residence of the governor of the province of Carthagena, and of a bishop whose spiritual jurisdiction extends over the whole province. There is here also a court of inquisition,—several convents, and nunneries,—a church, a chapel of ease, and a college of Jesuits. The city is well peopled with Indians, Europeans, negroes, and creoles. The Europeans, who are not numerous, and the creoles, manage the whole trade of the place; the other inhabitants are poor, and work hard for subsistence. The inhabitants are universally fond of chocolate and tobacco; and the most sober seldom fail of drinking a glass of brandy in the morning.

PANAMA is the capital of Terra Firma Proper, and is situated upon a capacious bay, to which it gives its name. It is the great receptacle of the vast quantities of gold and silver, with other rich merchandize, from all parts of Peru and Chili: here they are lodged in store houses, till the proper season arrives to transport them to Europe.

PORTO BELLO is situated close to the sea, on the declivity of a mountain, which surrounds the whole harbour. The convenience and safety of this harbour is such, that Columbus, who first discovered it, gave it the name of Porto Bello, or the fine Harbour.

**HISTORY.]** This part of South America was discovered by Columbus, in his third voyage to this continent. It was subdued and settled by the Spaniards about the year 1514, after they had inhumanly destroyed several millions of the natives.

This country was called Terra Firma, on account of its being the first part of the continent which was discovered; all the lands discovered, previous to this, being islands.

P E R U.

SITUATION AND EXTENT.

Miles.	Degrees.	Sq. Miles.
Length 1800 } Breadth 600 }	between { the equator and 25 south latitude. } { 60 and 81 west longitude. }	970,000

**BOUNDARIES.]** BOUNDED by Terra Firma, on the North; by the mountains of Cordeleirias des Andes, East; by Chili, South; and by the Pacific Ocean, West.

Divisions.	Provinces.	Chief Towns.
The Northern division,	{ Quito - -	{ Quito { Payta
The Middle division,	{ Lima, or Los Reyes	{ LIMA, 76-49 W. lon. 12-11 S. lat. { Cusco, and Callao
The Southern division,	{ Los Charcos -	{ Potofi { Porco.

**SEAS, BAYS, AND HARBOURS.]** The only sea which borders on Peru is the Pacific Ocean, or South Sea. The principal bays and harbours are Payta, Malabrigo, Cuanchaco, Cofina, Vermeio, Cuara, Callao the port town to Lima, Ylo, and Arica.

**RIVERS.]** There is a number of rivers, which rise in the Andes, but most of them run to the eastward. Among these are the Granada, or Cagdalená, Oro-noque, Amazon, and Plate. The Amazon rises in Peru, but directs its course eastward, and after running between 3 and 4000 miles, falls into the Atlantic ocean, under the Equator. This river, like others between the tropics, annually overflows its banks; at which time it is 150 miles wide at its mouth. It is supposed to be the largest river in the world, either with regard to the length of its course, the depth of its waters or its astonishing breadth. There is one river in Peru, the waters of which, are said to be as red as blood; but this is doubted by some. It is probable, however, that there may be qualities in the earth through which this river runs, which may tinge the waters and give them some resemblance to blood. Many other rivers rise also in the Andes, and fall into the Pacific Ocean, between the equator and eight degrees S. lat.

**PETRIFYING WATERS.]** There are some waters, which, in their course, cover whatever they touch or pass over, with stone; and here are fountains of liquid matter called coppey, resembling pitch and tar, and used by the seamen for the same purposes.

**SOIL AND CLIMATE.]** Though Peru lies within the torrid zone, yet having on one

one side the South-Sea, and on the other the great ridge of the Andes, it is not so stifled with heat as the other tropical countries. The sky too, which is generally cloudy, shields them from the direct rays of the sun: but what is extremely singular, in some places, it never rains; which defect, however, is sufficiently supplied by a soft kindly dew, which falls gradually every night on the ground, and so refreshes the plants and grass, as to produce in many places the greatest fertility; but in Quito, they have excessive rains, attended by dreadful storms of thunder and lightning. Along the sea-coast, Peru is generally a dry barren sand, except near the banks of rivers, where it is extremely fertile, as are all the low lands in the inland country.

**VEGETABLE, AND ANIMAL PRODUCTIONS.** The northern part of Peru produces wine in great plenty. But one of the most important vegetable productions of this country is that valuable article in the materia medica, the Peruvian bark, better known by the name of Jesuits' bark. The tree which produces this invaluable drug, grows principally in the mountainous parts of Peru, and particularly in the province of Quito. The best bark is always produced in the high and rocky grounds: The tree which bears it, is about the size of a cherry-tree, and produces a kind of fruit resembling the almond. But it is only the bark which has those excellent qualities that render it so useful in intermitting fevers, and other disorders, to which daily experience extends the application of it. It is distinguished into three kinds: the red, the yellow, and the white; but the red is found to be the best and most efficacious. The Jesuits carried this bark to Rome, as early as 1639; but the natives are supposed to have been acquainted with its medicinal qualities, many ages before. Guinea pepper, or Cayenne pepper as we call it, is produced in the greatest abundance in the vale of Africa, a district in the southern parts of Peru, from whence it is annually exported, to the value of 600,000 crowns.

Wool is another article of the produce of this country, and is no less remarkable for its fineness than for the animals on which it grows; these are the Lamas and Vicuñas. The lama has a small head, resembling that of a horse and a sheep at the same time. It is about the size of a stag, its upper lip is cleft like that of a hare, through which, when enraged, it spits a kind of venomous juice, which inflames the part it falls on. The flesh of the lama is agreeable and salutary, and the animal is not only useful in affording wool and food, but also as a beast of burden. It can endure amazing fatigue, and will travel over the steepest mountains with a burden of sixty or seventy pounds. It feeds very sparingly, and never drinks. The vicunna is smaller and swifter than the lama, and produces wool still finer in quality. In the vicunna is found the bezoar stone, regarded as a specific against poisons.

**MINES.** In the northern parts of Peru are several gold mines; but those of silver are found all over the country, particularly in the neighbourhood of Potosi. Nature never offered to the avidity of mankind, in any country on the globe, such rich mines as those of Potosi. They were accidentally discovered in the year 1545, in this manner; an Indian named Hualpa, one day following some deer, they made directly up the hill of Potosi; he came to a steep craggy part of the hill, and the better to enable him to climb up, laid hold of a shrub, which came up by the roots, and laid open a mass of silver ore. He for some time kept it a secret, but afterwards revealed it to his friend Guanca, who, because he would not discover to him the method of refining it, acquainted the Spaniard's master, named Valarocel, with the discovery. Valarocel registered the mine in 1545; and from that time till 1633 there came out of Potosi had yielded 395,619,000 pieces of eight, which is about 100,000,000 pieces a year. Potosi is about 20 or 25 leagues from the city of La Plata.

**Plata.** The hill, and also the country for a considerable distance round, is quite barren and desert, and produces neither tree, plant, nor herb, so that the inhabitants of Potosi, which is situated at the foot of the hill, on the south side, are obliged to procure all the necessaries of life from Peru. These mines begin to decrease, and others rise in reputation.

Under this head it may not be improper to make some observations upon that new substance called *Platina*, and which may be considered as an *eighth* metal. In its native state it is mixed with gold and iron; and this at first gave rise to a suspicion that it was nothing more than a combination of these two metals; but late experiments of chemists fully prove that it is a pure and simple metal, with properties peculiar to itself. It cannot be affected by any simple acid, or by any known solvent except the *aqua regia*; it will not tarnish in the air, neither will it rust; it unites to the fixedness of gold, and to the property it has of not being susceptible of destruction, a hardness almost equal to that of iron, and a much greater difficulty of fusion. It is of an intermediate colour between that of iron and silver; it can be forged and extended into thin plates; and when dissolved in *aqua regia*, it may be made to assume, by precipitation, an infinite diversity of colours; and Count Milhey has succeeded in varying these precipitates so much, that he has had a picture painted, in the colouring of which there is scarce any thing but *platina* made use of. Upon the whole, from considering the advantages of *platina*, we cannot but conclude that this metal deserves, at least, from its superiority to all others, to share the title of king of the metals, of which gold has so long been in possession.

Peru is likewise the only part of South America which produces quicksilver, an article of immense value, considering the various purposes to which it is applied, and especially the purification of gold and silver. The principal mine is at a place called Guancavelica, discovered in 1567, where it is found in a whitish mass, resembling brick ill burned. This substance is volatilized by fire, and received in steam by a combination of glass vessels, where it condenses by means of a little water at the bottom of each vessel, and forms a pure heavy liquid.

**MANUFACTURES, TRADE, AND CITIES.]** We join those articles, because of their intimate connection; for, except in the cities we shall describe, there is no commerce worth mentioning. Lima is the capital of Peru; its situation, in the middle of a spacious and delightful valley, was fixed upon by the famous Pizarro, as the most proper for a city, which he expected would preserve his memory. It is so well watered by the river Rimac, that the inhabitants, like those of London, command a stream, each for his own use. There are many very magnificent structures, particularly churches, in this city; though the houses in general are built of slight materials, the equality of the climate, and want of rain, rendering stone houses unnecessary; and besides, it is found that these are more apt to suffer by shocks of the earth, which are frequent and dreadful all over this province. Lima is about two leagues from the sea, extends in length two miles, and in breadth one and a quarter. It contains about 60,000 inhabitants, of whom the whites amount to a sixth part. One remarkable fact is sufficient to demonstrate the wealth of the city. When the viceroy, the duke de la Palada, made his entry into Lima in 1682, the inhabitants, to do him honour, caused the streets to be paved with ingots of silver, amounting, it is said, to seventeen millions sterling. All travellers speak with amazement of the decorations of the churches with gold, silver, and precious stones, which load and ornament even the walls. The merchants of Lima may be said to deal with all the quarters of the world, and that both on their own accounts, and as factors for others. Here all the products of the southern provinces are conveyed, in order to be exchanged at the harbour of Lima, for such articles as the

inhabitants of Peru stand in need of: the fleets from Europe and the East Indies land at the same harbour, and the commodities of Asia, Europe, and America, are bartered for each other. What there is no immediate vent for, the merchants of Lima purchase on their own accounts, and lay up in warehouses, knowing that they must soon find an outlet for them, since by one channel or other they have a communication with almost every commercial nation. But all the wealth of the inhabitants, all the beauty of the situation, and fertility of the climate of Lima, are not sufficient to compensate for one disaster which always threatens and has sometimes actually befallen them. In the year 1747, a most tremendous earthquake laid three-fourths of this city level with the ground, and entirely demolished Callao, the port-town belonging to it. Never was any destruction more terrible or complete,—not more than one of three thousand inhabitants being left to record this dreadful calamity, and he by an accident the most extraordinary.—This man, who happened to be on a fort which overlooked the harbour, perceived in one minute the inhabitants running from their houses in the utmost terror and confusion; the sea, as is usual on such occasions, receding to a considerable distance, returned in mountainous waves, and buried the inhabitants for ever in its bosom; but the same wave which destroyed the town, drove a little boat to the place where the man stood, into which he threw himself, and was saved.

Cusco, the ancient capital of the Peruvian empire, has already been taken notice of. As it lies in the mountainous country, and at a distance from the sea, it has been long on the decline. But it is still a very considerable place, and contains above 40,000 people. The inhabitants, of whom three parts are Indians, are very industrious in manufacturing baize, cotton, and leather. They have also, both here and at Quito, a particular taste for painting; and their productions in this way, some of which have been admired in Italy, are dispersed all over South America. Quito is next to Lima in populousness, if not superior to it. It is, like Cusco, an inland city, and having no mines in its neighbourhood, is chiefly famous for its manufactures of cotton, wool, and flax, which supply the consumption over all the kingdom of Peru.

**INHABITANTS, MANNERS, AND GOVERNMENT.** It has been guessed by some writers, that in all Spanish America there are about three millions of Spaniards and Creoles of different colours; and undoubtedly the number of Indians is much greater;—though neither is in any respect proportionable to the wealth, fertility, and extent of the country. The manners of the inhabitants do not remarkably differ over the whole Spanish dominions. Pride and laziness are the two predominant passions. It is said, by the most authentic travellers, that the manners of Old Spain have degenerated in its colonies. The Creoles, and all the other descendants of the Spaniards, according to the above distinctions, are guilty of many mean and pilfering vices which a true born Castilian regards with detestation. This, no doubt, in part arises from the contempt in which all but the real natives of Spain are held in the Indies,—mankind generally behaving according to the treatment they meet with from others. In Lima the Spanish pride has made the greatest descents; and many of the first nobility are employed in commerce. It is in this city that the viceroy resides, whose authority extends over all Peru, except Quito, which has lately been detached from it. The viceroy is as absolute as the king of Spain; but as his territories are so extensive, it is necessary that he should part with a share of his authority to the several audiences or courts established over the kingdom. There is a treasury court established at Lima, for receiving the fifth of the produce of the mines, and certain taxes paid by the Indians, which belong to the king of Spain.

Length 1200	between { 25 and 45 south latitude. 65 and 85 west longitude. }	206,000.
Breadth 500		

**BOUNDARIES.]** THIS extensive country is bounded by Peru, on the North; by La Plata, or Paraguay, on the East; by Patagonia, on the South; and by the Pacific Ocean, on the West.

Divisions.	Provinces.	Chief Towns.
On the western side of the Andes	} Chili Proper - -	} { St. Jago, W. lon. 77. S. lat. 34. Baldivia. Imperial.
On the eastern side of the Andes		

**LAKES.]** The principal lakes are those of Tagatagua near St. Jago, and that of Paren. Besides which, they have several salt-water lakes, that have a communication with the sea, part of the year. In stormy weather the sea forces a way through them, and leaves them full of fish; but in the hot season the water evaporates, leaving a crust of fine white salt a foot thick.

**SEAS, RIVERS, BAYS, AND HARBOURS.]** The only sea that borders upon Chili is that of the Pacific Ocean on the west. The principal rivers are—the Salado, or Salt River, Guasco, Caquimbo, Bohio, and the Baldivia, scarcely navigable but at their mouths; they fall into the Pacific Ocean.

The principal bays or harbours are—Copiapo, Coquimbo, Govanadore, Valparaiso, Iata, Conception, Santa Maria, La Moucha, Baldivia, Brewer's-haven, and Castro.

**CLIMATE, SOIL, AND PRODUCE.]** These are not remarkably different from the same in Peru; and if there be any difference, it is in favour of Chili. There is indeed no part of the world more favoured than this is, with respect to the gifts of nature. For here, not only the tropical fruits, but all species of grain, of which a considerable part is exported, come to great perfection. Their animal productions are the same with those of Peru; and they have gold almost in every river, supposed to be washed down from the hills.

**INHABITANTS.]** This country is very thinly inhabited. The original natives are still in a great measure unconquered and uncivilised; and leading a wandering life, attentive to no object but their preservation from the Spanish yoke, are in a very unfavourable condition with respect to population. The Spaniards do not amount to above 20,000; and the Indians, negroes, and mulattoes, are not supposed to be thrice that number. However, there have lately been some formidable insurrections against the Spaniards, by the natives of Chili, which greatly alarmed the Spanish court.

**COMMERCE.]** The foreign commerce of Chili is entirely confined to Peru, Panama, and some parts of Mexico. To the former they annually export corn sufficient

C H I L I.

cient for 60,000 men. Their other exports are hemp, which is raised in no other part of the South-Seas; hides, tallow, and salted provisions: they receive in return the commodities of Europe and the East Indies, which are brought to the port of Callao.

GOVERNMENT.] St. Jago is the capital of the state, and the seat of the empire. The commandant there is subordinate to the viceroy of Peru in all matters relating to the government, to the finances, and to war; but he is independent of him as chief administrator of justice, and president of the royal audience. Eleven inferior officers, distributed in the province, are charged, under his orders, with the details of administration.

BAYS AND LAKES.] The principal bay is that at the mouth of the river La Plata, on which stands the capital city of Buenos Ayres; and Cape St. Antonio, at the entrance of that bay, is the only promontory. This country abounds with lakes, one of which, Carócores, is 100 miles long.

RIVERS.] Besides a vast number of smaller rivers which water this country, there is the grand river La Plata, which deserves a particular description. A Modenese Jesuit, by the name of *P. Cottaneo*, who sailed up this river, speaks in the following language concerning it: "While I resided in Europe, and read in books of history or geography, that the river La Plata was 150 miles in breadth, I considered it as an exaggeration, because in this hemisphere we have no example of such vast rivers. When I approached its mouth, I had the most vehement desire to ascertain the breadth with my own eyes; and I have found the matter to be exactly as it was represented. This I deduce particularly from one circumstance: when we took our departure from Monte Viedo, a fort situated more than 100 miles from the mouth of the river, and where its breadth is considerably diminished, we sailed a complete day before we discovered the land on the opposite bank of the river; and when we were in the middle of the channel, we could not discover land on either side, and saw nothing but the sky and water, as if we had been in

**ATR. SOIL, AND PRODUCE.]** This vast tract is far from being wholly subdued or planted by the Spaniards. There are many parts in a great degree unknown to them, or to any other people of Europe. The principal province of which we have any knowledge is that which is called Rio de la Plata, towards the mouth of the above-mentioned river. This province, with all the adjacent parts, is one continued plain for several hundred miles, extremely fertile, and produces cotton in great quantities, tobacco, and the valuable herb called Paraguay, with a variety of fruits, and the prodigious rich pastures, in which are bred such herds of cattle, that it is said the hides of the beasts are all that is properly bought, the carcase being in a manner given into the bargain. A horse some time ago might be bought for a dollar; and the usual price of a bullock, chosen out of a herd of two or three hundred, was only four rials. But, contrary to the general nature of America, this country is destitute of woods. The air is remarkably sweet and serene, and the waters of La Plata are equally pure and wholesome.

**FIRST SETTLEMENT, CHIEF CITY, } The Spaniards first discovered this coun-**  
**COMMERCE, AND POPULATION. } try, by sailing up the river La Plata in**  
1515, and founded the town of Buenos Ayres, so called on account of the excellence of the air, on the south side of the river, fifty leagues within its mouth, where it is seven leagues broad. This is one of the most considerable towns in South America, and the only place of traffic to the southward of Brazil. Its streets are wide, the houses extremely low, and each of them is accommodated with a garden. The public and private buildings, which, 60 years ago, were all made of earth, are of more solid and commodious construction, since the natives have learned the art of making brick and lime. The number of inhabitants is about 30,000. One side of the town is defended by a fortress, with a garrison of 6 or 700 men. The ships approach by sailing up a river that wants depth, is full of islands, shoals and rocks, and where storms are more dreadful and more frequent than on the ocean. It is necessary to anchor every night on the spot where they come to; and on the most moderate days, a pilot must go to sound the way for the ship. After having surmounted these difficulties, the ships are obliged, at the distance of three leagues from the town, to put their goods on board some light vessel, and to go to rest, and to wait for their cargoes at Incunado de Barragon, situated seven or eight leagues below. Here we meet with the merchants of Europe and Peru; but no regular fleet comes hither as to the other parts of South America; two, or at most three register ships make the whole of their regular intercourse with Europe. Their returns are very valuable, consisting chiefly of the gold and silver of Chili and Peru, sugar and hides. Those who have carried on a contraband trade to this city, have found it more advantageous than any other. The benefit of this contraband is now wholly in the hands of the Portuguese, who keep magazines for that purpose in such parts of Brazil, as lie near this country. The trade of Paraguay, and the manners of the people, are much the same with those of the rest of the Spanish colonies in South America, so that nothing farther need be said on those articles. The inhabitants, from the best information that can be obtained, do not exceed 100,000, including Spaniards, Indians, Negroes, and Creoles. The Spaniards exhibit much the same character here as in the other countries already described.

But we cannot quit this country without mentioning that extraordinary species of commonwealth, which the Jesuits erected in the interior parts, and concerning which these crafty priests have endeavoured to keep all strangers in the dark.

About the middle of the last century, those fathers represented to the court of Spain, that the want of success in their missions was owing to the scandal which

the

the immorality of the Spaniards never failed to give, and to the hatred which their insolent behaviour caused in the Indians. They insinuated, that, were it not for those obstacles, the empire of the gospel might, by their labours, have been extended into the most unknown parts of America; and that all those countries might be subdued to his Catholic majesty's obedience, without expence, and without force. This remonstrance met with success; the sphere of their labours was marked out, and the governors of the adjacent provinces had orders not to interfere, nor to suffer any Spaniards to enter into this pale, without licences from the fathers. They on their part agreed to pay a certain capitation tax, in proportion to their flock; and to send a certain number to the king's works whenever they should be demanded, and the missions should become populous enough to supply them.

On these terms the Jesuits gladly entered upon the scene of action, and opened their spiritual campaign. They began by gathering together about 50 wandering families, whom they persuaded to settle; and they united them into a little township. This was the slight foundation upon which they built a superstructure which has amazed the world, and added much power, at the same time that it occasioned much envy against their society. For when they had made this beginning, they laboured with such indefatigable pains and such masterly policy, that by degrees they mollified the minds of the most savage nations; fixed the most rambling, and subdued those to their government who had long disdained to submit to the arms of the Spaniards and Portuguese.

Our limits do not permit us to trace with precision all the steps which were taken in the accomplishment of so extraordinary a conquest over the bodies and minds of men. The Jesuits left nothing undone that could confirm their subjection, or that could increase their number; and it is said that above 340,000 families lived in obedience, and expressed an awe, bordering upon adoration, yet obtained without any violence or constraint: that the Indians were instructed in the military art, and could raise 60,000 men well armed: that they lived in towns; were regularly clad; laboured in agriculture, exercised manufactures; some even aspired to the elegant arts; and that nothing could equal their submission to authority, except their contentment under it. Some writers have treated the character of these Jesuits with great severity; accusing them of ambition, pride, and of carrying their authority to such an excess, as to cause not only persons of both sexes, but even the magistrates, who were always chosen from among the Indians, to be corrected before them with stripes, and by suffering persons of the highest distinction within their jurisdictions to kiss the hem of their garments, as the greatest honour. The priests themselves possessed large property; all manufactures were theirs; the natural produce of the country was brought to them, and the treasures annually remitted to the superior of the order seemed to evince that zeal for religion was not the only motive for forming these millions. The fathers would not permit any of the inhabitants of Peru, whether Spaniards, Meztizos, or even Indians, to come within their missions in Paraguay. In the year 1757, when part of this territory was ceded by Spain to the crown of Portugal in exchange for Saint Sacramento, to make the Urugua the boundary of their possessions, the Jesuits refused to comply with this division, or to suffer themselves to be transferred from one hand to another, like cattle, without their own consent. It was declared in the Spanish Gazette that the Indians actually took up arms; but notwithstanding the exactness of their discipline, they were easily, and with considerable slaughter, defeated by the European troops who were sent to quell them; and in 1767, the Jesuits were removed from America, by royal authority, and their late subjects were put upon the same footing with the rest of the inhabitants of the country.

## SPANISH ISLANDS IN AMERICA.

**CUBA.]** The island of Cuba is situated between  $20^{\circ}$  and  $25^{\circ}.30'$  north latitude, and between  $74^{\circ}$  and  $85^{\circ}.30'$  west longitude; 100 miles to the south of Cape Florida, and 75 north of Jamaica, and is near 700 miles in length, and generally about 70 miles in breadth. A chain of hills runs through the middle of the island from east to west: but the land near the sea is in general level, and flooded in the rainy season, when the sun is vertical. This noble island is supposed to have the best soil, for so large a country, of any in America. It produces all the commodities known in the West Indies, particularly ginger, long-pepper, and other spices, cassia, fistula, mastic, and aloes. It also produces tobacco and sugar,—but, from the want of hands, and the laziness of the Spaniards, not in such quantities as might be expected. It is said that its exports do not equal in quantity those of our small island of Antigua.

The course of the rivers is too short to be of any consequence; but there are several good harbours, which belong to the principal towns, as that of St. Jago, facing Jamaica, strongly situated and well fortified, but neither populous nor rich. That of the Havannah faces Florida, and is the capital of Cuba; and a place of great strength and importance, containing about 2000 houses, with a great number of convents and churches. It was taken, however, by the courage and perseverance of the English troops in the year 1762, but restored in the subsequent treaty of peace. Besides these, there is likewise Cumberland harbour, and that of Santa Cruz, a considerable town thirty miles east of the Havannah.

**HISPANIOLA, or ST. DOMINGO.]** This island was first possessed by the Spaniards alone; but by far the most considerable part is now in the hands of the French. However, as the Spaniards were the original possessors, and still continue to have a share in it, Hispaniola is commonly regarded as a Spanish island.

It is situated between  $17^{\circ}.40'$  and  $20^{\circ}$  north latitude, and  $69^{\circ}$  and  $74^{\circ}$  west longitude, lying in the middle between Cuba and Porto-Rico, and is 450 miles long, and 150 broad. When Hispaniola was first discovered by Columbus, the number of its inhabitants was computed to be at least one million. But such was the cruelty of the Spaniards, and to so infamous a height did they carry their oppression of the poor natives, that they were reduced to sixty thousand in the space of fifteen years. The face of the island presents an agreeable variety of hills, vallies, woods, and rivers; and the soil is allowed to be extremely fertile, producing sugar, cotton, indigo, tobacco, maize, and cassava root. The European cattle have so much multiplied here, that they run wild in the woods, and, as in South America, are hunted for the hides and tallow only. In the most barren part of the rocks they discovered formerly silver and gold. The mines, however, are not now worked. The north-west parts, which are in possession of the French, consist of large fruitful plains, which produce the articles already mentioned in vast abundance. This indeed is the best and most fruitful part of the best and most fertile island in the West Indies, and perhaps in the world.

The most ancient town in this island, and in all the New World, built by Europeans, is St. Domingo. It was founded by Bartholomew Columbus, brother to the admiral, in 1504, who gave it that name in honour of his father Dominic, which is extended sometimes to the whole island by the French. It is situated on a spacious harbour, and is a large, well-built city, inhabited, like the other Spanish towns, by a mixture of Europeans, creoles, mulattoes, mestizoes, and negroes.

The French towns are, Cape François, the capital, which is neither walled nor palled in, and is said to have only two batteries, one at the entrance of the harbour, and the other before the town. It contains about 8000 whites and blacks. Leogane, though inferior in point of size, is a good port, a place of considerable trade, and the seat of the French government. They have two other towns considerable for their trade, Petit Goaves, and Port Louis.

The following is said to be an exact statement of the product, population, and commerce of the French colony of Hispaniola, in the year 1788, and may serve to shew the immense losses sustained by the late insurrection of the negroes.

POPULATION.] White people 27,717, viz. 9699 men, 2401 males above twelve years old, 2296 under twelve years, 1296 husbandmen of plantations, 1832 plantation managers, 325 sugar refiners, 308 physicians, 510 mechanics, 614 clerks, two white servants, 8511 women and girls.

Free people of colour 21,808, of whom 3493 were men, 2892 males above twelve years old, 2892 under twelve, 2700 servants, 9833 women or girls.

Slaves 405,528.

PLANTATIONS AND MANUFACTORIES.] Sugar 792, indigo 3097, cotton 705, coffee 2810, distilleries 173, brick and potters' ware 63, cocoa 69, tanners 3.

PRODUCTIONS EXPORTED TO FRANCE.

70,227,709 pounds of white sugar,	930,016 pounds of indigo,
93,177,518 ditto raw ditto,	6,286,126 ditto cotton,
68,151,371 ditto coffee,	12,995 dressed skins.

STOLEN TO AMERICAN, ENGLISH, AND DUTCH SMUGGLERS.

25,000,000 pounds of raw sugars,	3,000,000 pounds of cotton,
12,000,000 ditto coffee,	

The molasses exported in American bottoms, valued at 1,000,000 dollars; precious wood, exported in French ships, 200,000 dollars.

TRADE.] Five hundred and eighty large ships, carrying 189,679 tons, in which the imports amounted to 12,000,000 dollars of which more than 8,000,000 dollars were in manufactured goods of France, and the other 4,000,000 in French produce.

The Spanish ships exported in French goods or money 1,400,000 dollars, for mules imported by them into the colony.

Ninety-eight French ships, carrying 40,130 tons, imported 26,506 negroes, who sold for 8,000,000 dollars.

The negroes in the French division of this island have for several years past been in a state of insurrection. In the progress of these disturbances, which have not yet subsided, the planters and others have sustained immense losses. As this unhappy affair has engaged much of the attention of the public, we are happy in being able to give a summary statement of the causes of this insurrection\*.

The situation of the French colonies early attracted the attention of the constituent assembly. At this time all was as tranquil as such a state of oppression would permit. The first interference of the national assembly in the affairs of the colonies was by a decree of the 8th March, 1790, which declared, "That all free persons, who were proprietors and residents of two years' standing, and who contributed to the exigencies of the state, should exercise the rights of voting, which constitute the quality of French citizens."

\* From a pamphlet published in 1792, entitled, "An Inquiry into the Causes of the Insurrection of the Negroes in the Island of St. Domingo."

This regards general interests, appealed to the repelled mutually.

These were as a consequence of the interest of the colony.

Peace true, had occurred, were patriots.

This decree, though in fact it gave no new rights to the people of colour, was regarded with a jealous eye by the white planters; who evidently saw that the generality of the qualification included all descriptions of proprietors. They affected, however, to impose a different construction upon it. The people of colour appealed to common justice and common sense: it was to no purpose. The whites repelled them from their assemblies. Some commotions ensued, in which they mutually fell a sacrifice to their pride and resentment.

These disturbances again excited the vigilance of the national assembly. A decree was passed on the 12th day of October 1790, by which the assembly declared, as a constitutional article, "That they would establish no regulations respecting the internal government of the colonies, without the precise and formal request of the colonial assemblies."

Peace however was not the consequence of this decree. The proprietors, it is true, had obtained a legal right of tyrannising; but the unfortunate question still recurred, who should be permitted to exercise that right? On this head the decree was silent. New dissensions arose: each of the parties covered under a factious patriotism the most atrocious designs: assassinations and revolt became frequent. Maudit, a French officer of rank, lost his life by the hands of his own countrymen. The unfortunate Ogé, a planter of colour, who had exerted himself in France in the cause of his brethren, resolved to support by force their just pretensions. He landed in the Spanish territory of St. Domingo, where he assembled about 600 mulattoes. Before he proceeded to hostilities, he wrote to the French general, that his desire was for peace, provided the laws were enforced. His letter was absurdly considered as a declaration of war. Being attacked and vanquished, he took refuge amongst the Spaniards, who delivered him up to his adversaries. The horrors of his death were the harbingers of future crimes. These disturbances still increasing, the national assembly found it necessary at length to decide between the contending parties.

On the 15th of May, 1791, a decree was made consisting of two articles, by the first of which the assembly confirmed that of the 12th of October, so far as respected the slaves in their islands. It is true that the word slave was cautiously omitted in this document, and they are only characterised by the negative description of 'men not free,' as if right and wrong depended on a play of words, or a mode of expression.

This part of the decree met with but little opposition, though it passed not without severe reprehension from a few enlightened members. The second article, respecting the people of colour, was strongly contested. Those who were before known by the appellation of patriots, divided upon it. It was, however, determined in the result, that the people of colour, born of free parents, should be considered as active citizens, and be eligible to the offices of government in the islands.

This second article, which decided upon a right that the people of colour had been entitled to for upwards of a century, instead of restoring peace, may be considered as the cause, or rather the pretext, of all the subsequent evils that the colony of St. Domingo has sustained. They arose not indeed from its execution, but from its counteraction by the white colonists. Had they, after the awful warnings they had already experienced, obeyed the ordinances of an assembly they pretended to revere,—had they imbibed one drop of the true spirit of that constitution to which they had vowed an inviolable attachment,—had they even suppressed the dictates of pride in the suggestions of prudence,—the storm that threatened them had been averted; and in their obedience to the parent state they had displayed an act of patriotism, and preserved themselves from all possibility of danger.

But the equalisation of the people of colour stung the irritable nerves of the white

white colonists. The descendants of slaves might have lost the resentments of their fathers; but the hatred of a despot is hereditary. The European maxim allows, 'That they never pardon who have done the wrong'; but in the colonies, this perversity attains a more monstrous growth, and the aversion to African blood descends from generation to generation. No sooner had the decree passed, than the deputies from the islands to the national assembly withdrew their attendance. The colonial committee, always under the influence of the planters, suspended their labours. Its arrival in the island struck the whites with consternation. They vowed to sacrifice their lives rather than suffer the execution of the decree. Their rage bordered upon phrenzy. They proposed to imprison the French merchants then in the island, to tear down the national flag, and hoist the British standard in its place. Whilst the joy of the mulattoes was mingled with apprehensions and with fears, St. Domingo re-echoed with the cries of the whites, with their menaces, with their blasphemies against the constitution. A motion was made in the streets to fire upon the people of colour, who fled from the city, and took refuge in the plantations of their friends, and in the woods. They were at length recalled by a proclamation; but it was only to swear subordination to the whites, and to be witnesses of fresh enormities. Amidst these agitations, the slaves had remained in their accustomed subordination. Nor was it till the month of August 1791, that the symptoms of this insurrection appeared amongst them.

A considerable number, both of whites and people of colour, had lost their lives in these commotions before the slaves had given indications of disaffection;—they were not, however, insensible of the opportunities of revolt afforded by the dissensions of their masters. They had learnt that no alleviation of their miseries was ever to be expected from Europe; that in the struggle for colonial dominion, their humble interests had been equally sacrificed or forgotten by all parties. They felt their curb relaxed by the disarming and dispersion of their mulatto masters, who had been accustomed to keep them under rigorous discipline. Hopeless of relief from any quarter, they rose in different parts, and spread desolation over the island. If the cold cruelties of despotism have no bounds, what shall be expected from the paroxysms of despair?

On the 11th of September, 1791, a convention took place, which produced the agreement called the *Concordat*, by which the white planters stipulated that they would no longer oppose the law of the 15th of May, which gave political rights to the people of colour. The colonial assembly even proposed to meliorate the situation of the people of colour, born of parents not free, and to whom the decree of the 15th of May did not extend. An union was formed between the planters, which, if it had sooner taken place, had prevented the insurrection. The insurgents were every where dispirited, repulsed, and dispersed, and the colony itself preserved from total destruction.

By a decree of the national assembly, the 24th of September, the people of colour were virtually excluded from all right of colonial legislation, and expressly placed in the power of the white colonists.

If the decree of the 15th of May could infligate the white colonists to the frantic act of violence before described, what shall we suppose were the feelings of the people of colour on that of the 24th of September, which again blasted those hopes they had justly founded on the constitutional law of the parent state, and the solemn ratification of the white colonists? No sooner was it known in the islands, than those dissensions which the revolt of the negroes had for a while appeased, broke out with fresh violence. The apprehensions entertained from the slaves had been allayed by the effects of the *Concordat*: but the whites no sooner found themselves relieved from the terrors of immediate destruction, than they availed themselves of the

the decree of the 24th of September; they formally revoked the *Concordat*, and treacherously refused to comply with an engagement to which they owed their very excellence. The people of colour were in arms; they attacked the whites in the southern provinces; they possessed themselves of Fort St. Louis, and defeated their opponents in several engagements. A powerful body surrounded Port-au-Prince, the capital of the island, and claimed the execution of the *Concordat*. At three different times did the whites assent to the requisition, and as often broke their engagement. Gratified with the predilection for aristocracy which the constituent assembly had in its dotage avowed, they affected the appellation of patriots, and had the address to transfer the popular odium to the people of colour who were contending for their indisputable rights, and to the few white colonists who had virtue enough to espouse their cause. Under this pretext, the municipality of Port-au-Prince required M. Grimoard, the captain of the *Boreas*, a French line of battle ship, to bring his guns to bear upon, and to cannonade the people of colour assembled near the town. He at first refused; but the crew, deluded by the cry of patriotism, enforced his compliance. No sooner was this measure adopted, than the people of colour gave a loose to their indignation; they spread over the country, and set fire indiscriminately to all the plantations: the greatest part of the town of Port-au-Prince soon after shared the same fate. Nothing seemed to remain for the white inhabitants but to seek their safety in quitting the colony.

In the northern parts, the people of colour adopted a more magnanimous and perhaps a more prudent conduct. "They began," says Mr. *Vernaud*, "by offering their blood to the whites. We shall wait," said they, "till we have saved you, before we assert our own claims." They accordingly opposed themselves to the revolted negroes with unexampled courage. They endeavoured to soothe them by attending to their reasonable requisitions; and, if the colony of St. Domingo be preserved to the French nation, it will be by the exertions of the people of colour.

**PORTO RICO.]** Situated between  $65^{\circ} 30'$  and  $67^{\circ} 40'$  west lon. and in 18 degrees north lat. lying between Hispaniola and St. Christopher's, is 100 miles long, and 40 broad. The soil is beautifully diversified with woods, vallies, and plains; and extremely fertile, producing the same fruits as the other islands. It is well watered with springs and rivers; but the island is unhealthy in the rainy season. It was for the sake of the gold that the Spaniards settled here; but there is no longer any considerable quantity of this metal found in it.

**PORTO-RICO**, the capital town, stands in a little island on the northern side, forming a capacious harbour, and joined to the chief island by a causey, and defended by forts and batteries, which render the town almost inaccessible. It was, however, taken by sir Francis Drake, and afterwards by the earl of Cumberland. It is better inhabited than most of the Spanish towns, because it is the centre of the contraband trade carried on by the English and French with the king of Spain's subjects.

**VIRGIN ISLANDS.]** Situated at the east end of Porto Rico, are extremely small.

**TRINIDAD.]** Situated between  $60^{\circ}$  and  $61^{\circ} 30'$  west lon. and in 10 degrees north lat. lies between the island of Tobago and the Spanish Main, from which it is separated by the straits of Paria. It is about 90 miles long, and 60 broad; and is an unhealthy but fruitful soil, producing sugar, fine tobacco, indigo, ginger, variety of fruit, some cotton trees, and Indian corn. It was taken by sir Walter Raleigh,

leigh, in 1595, and by the French in 1676, who plundered the island, and extorted money from the inhabitants.

MARGARETTA.] Situated in 63 degrees west lon. and 11° 15' north lat. separated from the northern coast of New Andalusia in Terra Firma, by a strait of 24 miles, is about 40 miles in length, and 24 in breadth; and being always verdant, affords a most agreeable prospect. The island abounds in pasture, in maize, and fruit; but there is a scarcity of wood and water. There was once a pearl fishery on its coast.

There are many other small islands in these seas, which the Spaniards have neglected. We shall therefore proceed round Cape Horn into the South Seas, where the first Spanish island of any importance is CHILOBE, on the coast of Chili, which has a governor, and some harbours well fortified.

JUAN FERNANDES.] Lying in 83 degrees west lon. and 33 south lat. 300 miles west of Chili. This island is uninhabited; but having some good harbours, it is found extremely convenient for the English cruisers to touch at and water. This island is famous for having given rise to the celebrated romance of Robinson Crusoe. It seems one Alexander Selkirk, a Scotsman, was left ashore in this solitary place by his captain, where he lived some years, until he was discovered by captain Woodes Rogers, in 1709. When taken up, he had forgotten his native language, and could scarcely be understood, seeming to speak his words by halves. He was dressed in goats' skins, would drink nothing but water, and was some time before he could relish the ship's victuals. During his abode in this island, he had killed 500 goats, which he caught by running them down; and he marked as many more on the ear, which he let go. Some of these were caught, 30 years after, by lord Anson's people; their venerable aspect and majestic beards discovered strong symptoms of antiquity.

Selkirk, upon his return to England, was advised to publish an account of his life and adventures in his little kingdom. He is said to have put his papers into the hands of Daniel Defoe, to prepare them for publication. But that writer, by the help of those papers, and a lively fancy, transformed Alexander Selkirk into Robinson Crusoe, and returned Selkirk his papers again; so that the latter derived no advantage from them. They were probably too indigested for publication, and Defoe perhaps derived little from them but those hints which gave rise to his own celebrated performance.

The other islands that are worth mentioning are the Gallipago isles, situated 400 miles west of Peru, under the equator; and those in the bay of Panama, called the King's or Pearl Islands.

SEAS, BAYS, HARBOURS, } The Atlantic Ocean washes the coast of Brasil on  
RIVERS, AND CAPES. } the north-east and east, upwards of 3000 miles, forming several fine bays and harbours,—as the harbours of Pernambuco, All-Saints, Porto Seguro, the port and harbour of Rio Janeiro, the port of St. Vincent, the harbour of St. Gabriel, and the port of St. Salvador, on the north shore of the river La Plata. On the west, far within land, are mountains from which issue many noble streams, that fall into the great rivers Amazon and La Plata, others running across the country from east to west till they fall into the Atlantic Ocean, after meandering the lands which they annually overflow, and turning the sugar mills belonging to the Portuguese.

The principal capes are—Cape Roque, Cape St. Augustine, Cape Trio, and Cape St. Mary, the most southerly promontory of Brasil.

CLIMATE,

CLIMATE, SOIL, AND PRODUCTIONS.] The climate of Brasil has been described by two eminent naturalists, Piso and Margrave, who observed it with a philosophical accuracy, to be temperate and mild, when compared with that of Africa. They ascribe this chiefly to the refreshing wind, which blows continually from the sea. The air is not only cool but chilly through the night, so that the natives kindle a fire every evening in their huts. As the rivers in this country annually overflow their banks, and leave a sort of slime upon the lands, the soil here must be in many places amazingly rich; and this corresponds with the best information upon the subject. The vegetable productions are Indian corn, sugar-canes, tobacco, indigo, hides, ipecacuana, balsam, Brasil wood, which is of a red colour, hard and dry; and is chiefly used in dying, but not the red of the best kind. Here is also the yellow fustic, of use in dying yellow; and a beautiful speckled wood made use of in cabinet work. Here are five different sorts of palm trees, some curious ebony, and a great variety of cotton trees. This country abounds in horned cattle, which are hunted for their hides only,—20,000 being sent annually into Europe. There is also a plenty of deer, hares, and other game. Amongst the wild beasts found here, are tigers, peccary vines, janouveras, and a fierce animal, somewhat like a greyhound; monkeys, *orangs*; and the topirassou, a creature between a bull and an ass, but without horns, and entirely harmless; the flesh is very good, and has the flavour of beef. There is a numberless variety of fowl, wild and tame, in this country. Among these are turkeys, fine white hens, and ducks. The remarkable birds are—the humming bird,—the lankima, sometimes called the unicorn bird, from its having a horn two or three inches long growing out of its forehead,—the guira, famous for often changing its colour, being first black, then ash coloured, next white, afterwards scarlet, and last of all crimson; which colours grow richer and deeper the longer the bird lives. Among the abundance of fish with which the seas, lakes and rivers of this country are stored, is the globe fish, so called from its form, which is so beset with spines, like a hedgehog, that it bids defiance to all fish of prey. But the most remarkable creature is the sea-bladder, so called because it greatly resembles one, and swims on the surface of the waves; the inside is filled with air, except a small quantity of water that serves to poise it. The skin is very thin and transparent, and, like a bubble raised in the water, reflects all the colours of the sky. Brasil breeds a great variety of serpents and venomous creatures, among which are the Indian salamander, a four-legged insect, the sting of which is mortal,—the ibivaboca, a species of serpent, about seven yards long, and half a yard in circumference, whose poison is instantaneously fatal,—the rattlesnake, which there attains an enormous size.

INHABITANTS, MANNERS, AND CUSTOMS.] The Portuguese in America are described as a people, who, while sunk in the most effeminate luxury, practise the most desperate crimes:—of a temper hypocritical and dissembling,—without sincerity in conversation, or honesty in dealing;—lazy, proud, and cruel;—in their diet penurious; for, like the inhabitants of most southern climates, they are much more fond of stew, stote, and attendance, than of the pleasures of free society, and of a good table; yet their feasts, which are rare, are sumptuous to extravagance. When they appear abroad, they cause themselves to be carried in a kind of cotton hammocks, called serpentines, which are borne on the negroes' shoulders, by the help of a bamboo, about twelve or fourteen feet long. Most of these hammocks are blue, and adorned with fringes of the same colour; they have a velvet pillow, and above the head a kind of tetter with curtains; so that the person carried cannot be seen unless he pleases; but may lie down, or sit up, leaning on his pillow. When he has a mind to be seen, he pulls the curtains aside, and salutes his acquaintance

quaintance whom he meets in the streets; for they take a pride in complimenting each other in their hammocks, and will even hold long conferences in them in the streets; but then the two slaves who carry them, make use of strong rods, forked above, and pointed below with iron; these they stick fast in the ground, and on them rests the bamboo, to which the hammock is fixed, till their master's business or compliment is over. Scarcely any man of fashion, or any lady, will pass the streets without being carried in this manner.

**TRADE AND CHIEF TOWNS.]** The trade of Portugal is carried on upon the same exclusive plan on which the several nations of Europe trade with their colonies of America; and it more particularly resembles the ancient Spanish method, in not sending out single ships, as the convenience of the several places, and the judgment of the European merchants, may direct,—but annual fleets, which sail at stated times from Portugal, and compose three flotas, bound to as many ports in Brazil; namely, to Pernambuco in the northern part, to Rio Janeiro at the southern extremity, and to the Bay of All-Saints in the middle.

In this last is the capital, which is called St. Salvador, and sometimes the city of Bahia, where all the fleets rendezvous on their return to Portugal. This city commands a noble, spacious, and commodious harbour. It is built upon a high and steep rock, having the sea upon one side, and a lake forming a crescent, investing it almost wholly, so as nearly to join the sea, on the other. The situation makes it in a manner impregnable by nature; and they have besides added to it very strong fortifications. It is populous, magnificent, and beyond comparison the most gay and opulent city in all Brazil.

The trade of Brazil is very great, and increases every year; which is the less surprising, as the Portuguese have opportunities of supplying themselves with slaves for their several works, at a much cheaper rate than any other European power that has settlements in America,—they being the only Europeans who have established colonies in Africa, and from hence they import between 40 and 50,000 negroes annually, all of whom go into the amount of the cargo of the Brazil fleets for Europe. Of the diamonds there is supposed to be returned to Europe to the value of 135,000*l*. This, with the sugar, the tobacco, the hides, the valuable drugs for medicine and manufactures, may give some idea of the importance of this trade, not only to Portugal, but to all the trading powers of Europe.

The chief commodities the European ships carry thither in return, are not the fiftieth part the produce of Portugal: they consist of woollen goods of all kinds, from England, France, and Holland; the linens and laces of Holland, France, and Germany; the silks of France and Italy; silk and thread stockings, hats, lead, tin, pewter, iron, copper, and all sorts of utensils wrought in these metals, from England; as well as salt fish, beef, flour and cheese. Oil they have from Spain; wine, with some fruit, is nearly all they are supplied with from Portugal. England is at present most interested in the trade of Portugal, both for home consumption and the use of the Brasils.

Brazil is a very wealthy and flourishing settlement. Their export of sugar, within 40 years, is grown much greater than it was, though anciently it made almost the whole of their exportable produce, and they were without rivals in the trade. Their tobacco is remarkably good, though not raised in such large quantities as in the United States.

The Portuguese had been long in possession of Brazil before they discovered the treasures of gold and diamonds which have since made it so valuable. Their fleets rendezvous in the bay of All-Saints, to the amount of 100 sail of large ships, in May or June, and carry to Europe a cargo little inferior in value to the treasures of the Spanish flota and galleons. The gold alone, great part of which is coined in America,

rica, amounts to near four millions sterling; but part of this is brought from their colonies in Africa, together with ebony, and ivory.

[RELIGION.] Though the king of Portugal, as grand master of the order of Christ, be solely in possession of the titles,—and though the produce of the crusade belongs entirely to him; yet in this extensive country, six bishoprics have been successively founded, which acknowledge for their superior the archbishopric of Bohia, established in the year 1552. The fortunate prelates, most of them Europeans, who fill these honourable sees, live in a very commodious manner, upon the emoluments attached to the functions of their ministry, and a salary from government. Among the inferior clergy, none but the missionaries, who are settled in the Indian villages, are paid; but the others find sufficient resources among the superstitious people, whom they are to edify, to instruct, and to comfort. Besides an annual tribute paid by every family to the clergyman, he is entitled to two shillings for every birth, for every wedding, and every burial. Though there be not absolutely an inquisition in Brasil, yet the people of that country are not protected from the outrages of that barbarous institution.

[HISTORY AND GOVERNMENT.] This country was first discovered by Americus Vesputius, in 1498; but the Portuguese did not plant it till 1549, when they fixed themselves at the Bay of All-Saints, and founded the city of St. Salvador. They met with some interruption at first from the court of Spain, who considered the whole continent of South America as belonging to them. However, the affair was at length made up by treaty; and it was agreed that the Portuguese should possess all the country lying between the two great rivers Amazon and La Plata, which they still enjoy. The French also made some attempts to plant colonies on this coast, but were driven from thence by the Portuguese, who remained without a rival till the year 1580, when, in the very meridian of their prosperity, they were struck by one of those blows, which instantly decide the fate of kingdoms:—Don Sebastian, the king of Portugal, lost his life and army in an expedition against the Moors in Africa; and by that event the Portuguese lost their independence, being absorbed into the Spanish dominions.

The Dutch, soon after this, having thrown off the Spanish yoke, were not satisfied with maintaining their independence; but, flushed with the juvenile ardor of a growing commonwealth, pursued the Spaniards into the remotest recesses of their extensive territories, and grew rich, powerful, and terrible, by the spoils of their former masters. They particularly attacked the possessions of the Portuguese; they took almost all their fortresses in the East Indies, and then turned their arms, in the year 1623, upon Brasil, where they took seven of the captainships or provinces, and would have subdued the whole colony, had not their career been stopped by the archbishop, at the head of his monks, and a few feathered forces. The Dutch were, however, about the year 1654, entirely driven out of Brasil; but their West-India company still continuing their pretensions to this country, and harrassing the Portuguese at sea, the latter agreed, in 1661, to pay the Dutch eight tons of gold to relinquish their interest in that country; which was accepted; and the Portuguese have remained in peaceable possession of all Brasil from that time, till about the end of 1762, when the Spanish governor of Buenos Ayres, hearing of a war between Portugal and Spain, took, after a month's siege, the Portuguese frontier fortress called St. Sacramento; but, by the treaty of peace, it was restored.

The government of Brasil is in the viceroi, who has two councils, one for criminal, the other for civil affairs, in both of which he presides.

## FRENCH AMERICA.

**T**HE possessions and claims of the French before the war of 1756, as appears by their maps, consisted of almost the whole continent of North America; which vast country they divided into two great provinces, the northern of which they called Canada, comprehending a much greater extent than the British province of that name, since it included a great part of the provinces of New York, New England, and Nova Scotia. The southern province they called Louisiana, in which they included a part of Carolina. This distribution, and the military dispositions which the French made to support it, formed the principal cause of the war between them and Great Britain in the year 1756, the issue of which is well known. While the French were rearing their infant colonies, and with the most sanguine hopes forming vast designs of an extensive empire, one wrong step in their politics lost them the whole: for by commencing hostilities many years too soon, they were driven from Canada, and forced to yield to Great Britain all that fine country of Louisiana eastward of the Mississippi. At the treaty of peace, however, they were allowed to keep possession of the western bank of that river, and the small town of New Orleans, near the mouth of it; which territories, in 1769, they ceded to Spain, for reasons unknown to the public.

The French, therefore, from being one of the greatest European powers in that quarter, have now lost all their possessions in North America; but on the southern continent they have still a settlement which is called

## CAYENNE, OR EQUINOCTIAL FRANCE.

**I**T is situated between the equator and fifth degree of north latitude, and between the 50th and 55th of west longitude. It extends 240 miles along the coast of Guiana, and near 300 miles within land; bounded by Surinam, on the North; by the Atlantic Ocean, East; by Amazonia, South; and by Guiana, West. The chief town is Caen.

All the coast is very low; but within land there are fine hills very proper for settlements: the French have, however, not yet extended them so far as they might; but they raise the same commodities which they have from the West India islands, and in no inconsiderable quantity. They have also taken possession of the island of Cayenne, on this coast, at the mouth of the river of that name, which is about 45 miles in circumference. The island is very unhealthy; but having some good harbours, the French have here some settlements, which raise sugar, coffee, tobacco, Indian corn, fruits, and other necessaries of life.

## FRENCH ISLANDS IN AMERICA.

**T**HE French were among the last nations who made settlements in the West Indies; but they made ample amends by the vigour with which they pursued them, and by that chain of judicious and admirable measures which they used in drawing from them every advantage that the nature of the climate affords; and in contending against the difficulties which it threw in their way.

We have already mentioned the French colony upon the Spanish island of Hispaniola or St. Domingo, as the most important and valuable of all their foreign settlements,

settlements, and which they possess through the indolence of the Spaniards on that island, or the partiality of their court to the French nation. We shall next proceed to the islands of which the French have the sole possession, beginning with the large and important one of

**MARTINICO.**] Which is situated between 14 and 15 degrees of north lat. and in 61 degrees west lon. lying about 40 leagues north-west of Barbadoes, is about 60 miles in length, and half as much in breadth. The inland part of it is hilly, and pours out on every side a number of agreeable and useful rivers, which adorn and enrich this island in a high degree. The produce of the soil is sugar, cotton, indigo, ginger, and such fruits as are found in the neighbouring islands. But sugar is here, as in all the West India Islands, the principal commodity,—of which they export a considerable quantity annually. Martinico is the residence of the governor of the French islands in these seas. Its bays and harbours are numerous, safe, and commodious; and so well fortified that they often bade defiance to the English, till the war of 1756, when the British arms being triumphant in every quarter of the globe, this island was added to the British empire; but it was given back at the treaty of peace.

**GUADALOUPE.**] So called by Columbus, from the resemblance of its mountains to those of that name in Spain, is situated in 16 degrees north lat. and 62 west lon. about 30 leagues north of Martinico, and almost as much south of Antigua; being 43 miles long, and 38 broad. It is divided into two parts by a small arm of the sea, or rather a narrow channel, through which no ships can venture; but the inhabitants pass it in a ferry-boat. Its soil is equally fertile with that of Martinico, producing sugar, cotton, indigo, ginger, &c. This island is in a flourishing condition, and its exports of sugar almost incredible. Like Martinico, it was formerly attacked by the English, who gave up the attempt; but in 1759, it was reduced by the British arms, and was given back at the peace of 1763.

**ST. LUCIA.**] Situated in 14 deg. north lat. and in 61 deg. west lon. 80 miles north-west of Barbadoes, is 23 miles in length, and 12 in breadth. It received its name from being discovered on the day dedicated to the virgin martyr St. Lucia. The English first settled here in 1637. From that time they met with various misfortunes from the natives and French: at length it was agreed on between the latter and the English, that St. Lucia, with Dominica and St. Vincent, should remain neutral. But the French, before the war of 1756 broke out, began to settle these islands; which by the treaty of peace were yielded up to Great Britain, and this island to France. The soil of St. Lucia, in the vallies, is extremely rich. It produces excellent timber, and abounds with pleasant rivers and well situated harbours; and is now declared a free port under certain restrictions. The English made themselves masters of it in 1778; but it was restored again to the French in 1783.

**TOBAGO.**] This island is situated in 11 degrees odd minutes, north lat. 120 miles south of Barbadoes, and about the same distance from the Spanish Main. It is about 32 miles in length, and nine in breadth. The climate here is not so hot as might be expected so near the equator; and it is said that it lies out of the course of those hurricanes that have sometimes proved so fatal to the other West India islands. It has a fruitful soil, capable of producing sugar, and indeed every thing else that is raised in the West Indies, with the addition (if we may believe the Dutch) of the cinnamon, nutmeg, and gum copal. It is well watered with numerous

merous springs; and its bays and creeks are so disposed as to be very commodious for all kind of shipping. The value and importance of this island appears from the expensive and formidable armaments sent thither by European powers in support of their different claims. It seems to have been chiefly possessed by the Dutch, who defended their pretensions against both England and France with the most obstinate perseverance. By the treaty of Aix-la-Chapelle, in 1748, it was declared neutral; though, by the treaty of peace in 1763, it was yielded up to Great Britain; but in June 1781, it was taken by the French, and confirmed to them by the treaty of 1783.

**ST. BARTHOLOMEW, DESRADA, } Are three small islands lying in the neigh-  
AND MARIEGALANTE. } bourhood of Antigua and St. Christopher's;**  
and of no great consequence to the French, except in time of war, when they give shelter to an incredible number of privateers, which greatly annoy our West India trade. It would therefore be good policy in Great Britain, upon the breaking out of a war with France, immediately to take possession of these islands; which would seem to be a matter of no great difficulty, as they have been frequently reduced by the English, and as frequently given back to the French, who have often experienced the generosity of the British court. St. Bartholomew is now to be considered as belonging to the crown of Sweden, being ceded to it by France, 1785.

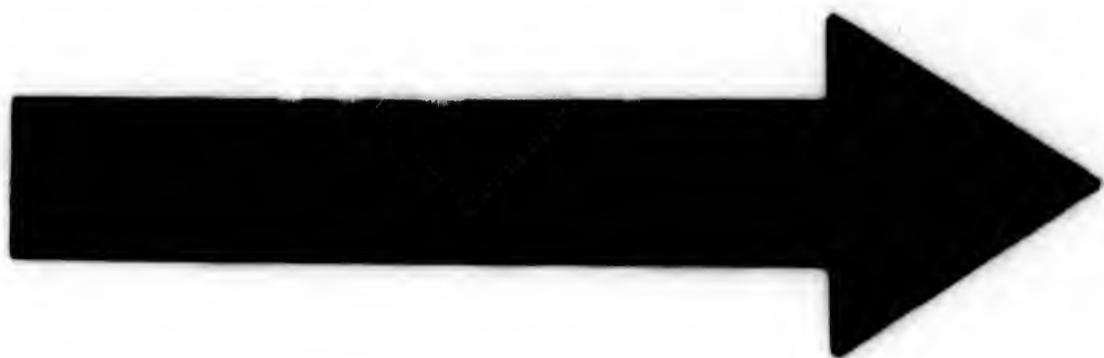

The small islands of St. PIERRE and MIQUELON, situated near Newfoundland, belonging to France, have been already mentioned with that island.

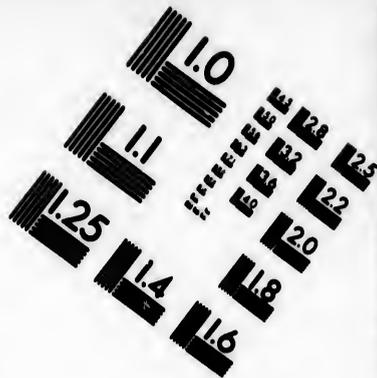

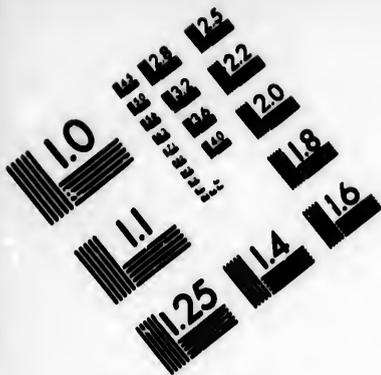

## DUTCH AMERICA,

Containing SURINAM, on the Continent of SOUTH AMERICA.

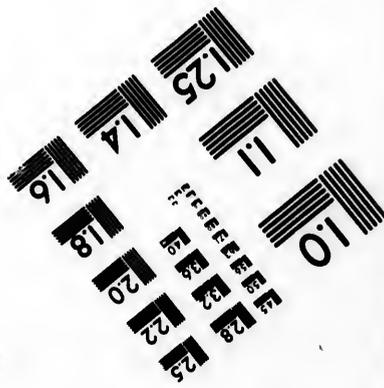

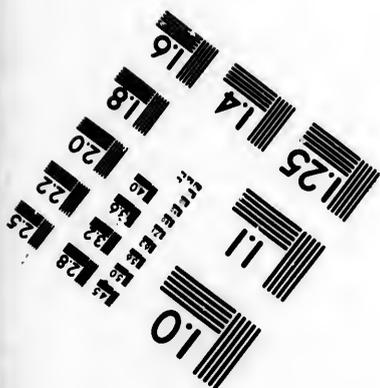

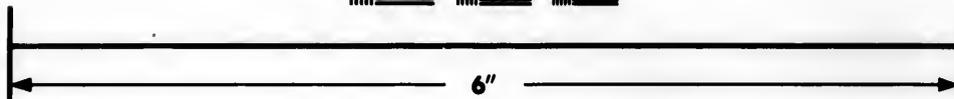

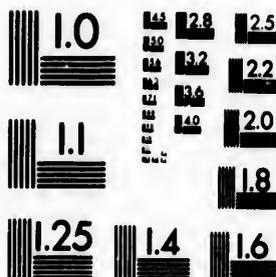

**A**FTER the Portuguese had dispossessed the Dutch of Brasil in the manner we have seen,—and after they had been entirely removed out of North America,—they were obliged to console themselves with their rich possessions in the East Indies, and to sit down content in the West with Surinam,—a country once possessed by the English, but of no great value whilst we had it, and which we ceded to them in exchange for New York, with two or three small and barren islands in the north sea, not far from the Spanish Main.

Dutch Guiana is situated between five and seven degrees north lat. extending above an 100 miles from the mouth of the river Oronoque, north, to the river Marowyne, or French Guiana, south. This is one of the richest and most valuable colonies belonging to the United Provinces; but it is in a less prosperous situation than it was some years since, owing, among other causes, to the wars with the fugitive negroes, whom the Dutch treated with great barbarity, and who are become so numerous, having increased from year to year, that they have formed a kind of colony in woods almost inaccessible, along the rivers of Surinam, Saramara, and Copename, and are become very formidable enemies to their former masters. Under the command of chiefs whom they have elected among themselves, they have cultivated lands for their subsistence, and make frequent incursions into the neighbouring plantations. The Dutch claim the whole coast from the mouth of the Oronoque to the river Marowyne, on which are situated

their colonies of Essequibo, Demerara, Berbice, and Surinam. The last begins with the river Saramacha, and ends with the Marowynne, extending 120 miles along the winding coast.

**RIVERS.]** A number of fine rivers pass through this country, the principal of which are Essequibo, Surinam, Demerara, Berbice and Conya. Essequibo is nine miles wide at its mouth, and is more than 300 miles in length. Surinam is a beautiful river, three quarters of a mile wide, navigable for the largest vessels four leagues, and for smaller vessels 60 or 70 miles further. Its banks, quite to the water's edge, are covered with evergreen mangrove trees, which render the passage up this river very delightful. The Demerara is about three quarters of a mile wide where it empties into the Surinam, is navigable for large vessels 100 miles; a hundred miles further, are several falls, of easy ascent, above which it divides into the south-west and south-east branches.

**CLIMATE.]** In the months of September, October, and November, the climate is unhealthy, particularly to strangers. The common diseases are putrid and other fevers, the dry belly-ach, and the dropsy: 100 miles back from the sea, you come to quite a different soil, a hilly country, a pure dry wholesome air, where a fire sometimes would not be disagreeable. The thermometer ranges from 75° to 90° through the year. A north-east breeze never fails to blow from about nine o'clock in the morning, through the day, in the hottest seasons. As the days and nights, throughout the year, are very nearly of equal length, the air can never become extremely heated, nor the inhabitants so greatly incommoded by the heat, as those who live at a greater distance from the equator. The seasons were formerly divided regularly into rainy and dry; but, of late years, so much dependence cannot be placed upon them, owing probably to the country's being more cleared, by which means a free passage is opened for the air and vapours.

**WATER.]** The water of the lower parts of the rivers is brackish, and unfit for use; and the inhabitants are obliged to make use of rain water, which is here uncommonly sweet and good. It is received in cisterns placed under ground; and before drinking, it is set in large earthen pots to settle, by which means it becomes very clear and wholesome. These cisterns are so large and numerous, that water is seldom scarce.

**CHIEF TOWNS, AND POPULATION.]** Paramaribo, situated on Surinam river, four leagues from the sea, N. lat. 6°. W. lon. 55° from London, is the principal town in Surinam. It contains about 2,000 whites, one half of whom are Jews, and 8,000 slaves. The houses are principally of wood; some few have glass windows, but generally they have wooden shutters. The streets are spacious and straight, and planted on each side with orange or tamarind trees.

About seventy miles from the sea, on the same river, is a village of about 40 or 50 houses, inhabited by Jews. This village, and the town above mentioned, with the intervening plantations, contain all the inhabitants in this colony, which amount to 3,200 whites, and 43,000 slaves. The buildings on the plantations are, many of them, costly, convenient, and airy. The country around is thinly inhabited with the native Indians, a harmless, friendly set of beings. They are in general short of stature, but remarkably well made, of a light copper colour, straight black hair, without beards, high cheek bones, and broad shoulders. In their ears, noses, and hair, the women wear ornaments of silver, &c. Both men and women go naked. One nation or tribe of them tie the lower part of the leg of the female children, when young, with a cord bound very tight for the breadth of six inches about the ankle, which cord is never afterwards taken off but to put on a new one; by which means, the flesh, which should otherwise grow on that part of the leg, increases the calf to a great size, and leaves the bone below nearly bare. This, though it must render

render them very weak, is reckoned a great beauty by them. The language of the Indians appears to be very soft. They are enemies to every kind of labour; but nevertheless manufacture a few articles, such as very fine cotton hammocks, earthen water-pots, baskets, a red or yellow dye called roucau, and some other trifles, all of which they bring to town and exchange for such articles as they stand in need of.

**SOIL, PRODUCTIONS, TRADE, &c.]** Through the whole country runs a ridge of oyster-shells, nearly parallel to the coast, but three or four leagues from it, of a considerable breadth, and from four to eight feet deep, composed of shells exactly of the same nature of those which form the present coast. From this and other circumstances, there is great reason to believe, that the land, from that distance from the sea, is all *new land*, rescued from the sea, either by some revolution in nature, or other unknown cause.

On each side of the rivers and creeks, are situated the plantations, containing from 500 to 2000 acres each, in number about 550 in the whole colony, producing at present annually about 16,000 hogsheads of sugar, 12,000,000 pounds coffee, 700,000 pounds cocoa, 850,000 pounds cotton: all which articles (cotton excepted) have fallen off within 15 years, at least one-third, owing to bad management, both here and in Holland, and to other causes. Of the proprietors of these plantations, not above 80 reside here. The sugar plantations have, many of them, water mills, which being much more profitable than others,—and the situation of the colony admitting of them,—will probably become general: of the rest, some are worked by mules, others by cattle; but from the lowness of the country, none by the wind.

Connected with Surinam, we shall mention the two Dutch colonies of Demerara and Essequibo on the Spanish Main, which surrendered to the English in the year 1781, and were represented as a very valuable acquisition, which would produce more revenue to the crown than all the British West India islands united. But the report was either not believed or slighted; for these places were left defenceless, and soon retaken by a French frigate.

Dr. Bancroft observes, that the inhabitants of Dutch Guiana are either whites, blacks, or the reddish brown aboriginal natives of America. The promiscuous intercourse of these different people has likewise generated several intermediate casts, whose colours immutably depend on their degree of consanguinity to either whites, Indians, or Negroes. These are divided into mulattoes, tercerones, quarterones, and quinterones, with several intermediate subdivisions, proceeding from their retrograde intercourse.

**ANIMALS, FISH, SERPENTS, &c.]** The rivers abound with fish, some of which are good; at certain seasons of the year there is plenty of turtle. The woods abound with deer, hares, and rabbits, a kind of buffalo, and two species of wild hogs, one of which (the peccary) is remarkable for having its navel on the back. There are so great a number of birds of various species, and remarkable for the beauty of their plumage, in Guiana, that several persons in this colony have employed themselves advantageously, with their slaves and dependents, in killing and preserving birds for the cabinets of naturalists in different parts of Europe. The torporific eel is found in the rivers of Guiana, which, when touched either by the hand, or by a rod of iron, gold, silver, copper, or by a stick of some particular kinds of heavy American wood, communicates a shock resembling that of electricity. There are an immense number and variety of snakes in this country, which form one of its principal inconveniences. A snake was killed some years since on a plantation which had belonged to Peter Amyatt, esq. which was upwards of thirty-three feet in length, and in the largest place, near the middle, was three feet in circumference.

It

It had a broad head, large prominent eyes, and a very wide mouth, in which was a double row of teeth. Among the animals of Dutch Guiana, is the *laubba*, which is peculiar to this country. It is a small amphibious creature, about the size of a pig four months old, covered with fine short hair; and its flesh, by the Europeans who reside here, is preferred to all other kinds of meat.

### DUTCH ISLANDS IN AMERICA.

**ST. EUSTATIUS,** } Situated in 17° 29' N. lat. 63° 10' W. lon. and three leagues  
OR EUSTATIA. } north-west of St. Christopher's, is only a mountain, about  
29 miles in compass, rising out of the sea, like a pyramid, and almost round. But, though so small, and inconveniently laid out by nature, the industry of the Dutch has made it turn to very good account; it is said to contain 5000 whites, and 15,000 negroes. The sides of the mountain are disposed in very pretty settlements; but they have neither springs nor rivers. They raise here sugar and tobacco; and this island, as well as Curassou, is engaged in the Spanish contraband trade; and both places generally profited by their neutrality. But when hostilities were commenced by Great Britain against Holland, admiral Rodney and general Vaughan were sent with a considerable land and sea force against St. Eustatius, which being incapable of defence, surrendered at discretion, on the 3d of February 1781. The private property of the inhabitants was confiscated with a degree of rigour very uncommon among civilised nations, and very inconsistent with the humanity and generosity by which the English nation used to be characterised. The reason assigned was, that the inhabitants of St. Eustatius had assisted the revolted colonies with naval and other stores. But on the 27th of November, the same year, St. Eustatius was retaken by the French, under the command of the marquis de Bouillé, though their force consisted of only three frigates and some small craft, and about 300 men.

**CURASSOU.]** Situated in 12 degrees north lat. 9 or 10 leagues from the continent of Terra Firma, is 30 miles long, and 10 broad. The island is not only barren, and dependent upon the rains for its water, but the harbour is naturally one of the worst in America: yet the Dutch have entirely remedied that defect; they have upon this harbour one of the largest, and at the same time the most elegant and cleanly towns in the West Indies. The public buildings are numerous and handsome; the private houses commodious; and the magazines large, convenient, and well filled. All kind of labour is performed by engines,—some of them so well contrived, that ships are at once lifted into the dock.

Though this island is naturally barren, the industry of the Dutch has brought it to produce a considerable quantity both of tobacco and sugar: it has, besides, good salt-works, for the produce of which there is a brisk demand from the English islands and the colonies on the continent. But what renders this island of most advantage to the Dutch, is the contraband trade which is carried on between the inhabitants and the Spaniards, and their harbour being the rendezvous to all nations in time of war.

The Dutch ships from Europe touch here for intelligence or pilots, and then proceed to the Spanish coasts for trade, which they force with a strong hand,—it being very difficult for the Spanish guarda-costas to take these vessels; for they are

not only stout ships, with a number of guns, but are manned with large crews of chosen seamen, deeply interested in the safety of the vessel and the success of the voyage. They have each a share in the cargo, proportioned to their respective ranks, and supplied by the merchants upon credit, and at prime cost. This animates them with uncommon courage; and they fight bravely, because every man fights in defence of his own property. Besides this, there is a constant intercourse between this island and the Spanish continent.

Curassou has numerous warehouses, always full of the commodities of Europe and the East Indies. Here are all sorts of woollen and linen cloth, laces, silks, ribbands, iron utensils, naval and military stores, brandy, the spices of the Moluccas, and the callicoos of India, white and painted. Hither the Dutch West India, which is also their African company, annually bring three or four cargoes of slaves; and to this mart the Spaniards themselves come in small vessels, and carry off not only the best of the negroes, at a very high price, but great quantities of all the above sorts of goods; and the seller has this advantage, that the refuse of warehouses and mercers' shops, and every thing that is grown unfashionable and unsaleable in Europe, go off here extremely well; every thing being sufficiently recommended by its being European. The Spaniards pay in gold and silver, coined or in bars, cocoa, vanilla, Jesuits' bark, cochineal, and other valuable commodities.

The trade of Curassou, even in times of peace, is said to be annually worth to the Dutch no less than 500,000*l.* but in time of war, the profit is still greater; for then it becomes the common emporium of the West Indies; it affords a retreat to ships of all nations, and at the same time refuses none of them arms and ammunition. The intercourse with Spain being then interrupted, the Spanish colonies have scarcely any other market from whence they can be well supplied either with slaves or goods. The French come hither to buy the beef, pork, corn, flour, and lumber, which are brought from the continent of North America, or exported from Ireland; so that, whether in peace or in war, the trade of this island flourishes extremely.

The trade of all the Dutch American settlements was originally carried on by the West India company alone: at present, such of the ships as go upon that trade pay two and a half per cent. for their licences; the company however reserve to themselves the whole of what is carried on between Africa and the American islands.

The other islands, Bonaire and Aruba are inconsiderable in themselves, and should be regarded as appendages to Curassou, for which they are chiefly employed in raising cattle and other provisions.

The small islands of Saba and St. Martin's, situated at no great distance from St. Eustatius, were both captured by admiral Rodney and general Vaughan, at the time when Eustatius surrendered to the arms of Great Britain; but were afterwards retaken by the French.

## DANISH ISLANDS IN AMERICA.

ST. THOMAS.] **A**N inconsiderable member of the Caribbees, situated in 64 degrees west lon. and 18 north lat. about 15 miles in circumference, and has a safe and commodious harbour.

STE. CROIX, OR SANTA CRUZ.] Another small and unhealthy island, lying about

five leagues east of St. Thomas, ten or twelve leagues in length, and three or four where it is broadest. These islands, so long as they remained in the hands of the Danish West India company, were ill managed, and of little consequence; but that wise and benevolent prince, the late king of Denmark, bought up the company's stock, and laid the trade open; and since that time the island of St. Thomas, as well as this, has been so greatly improved, that it is said to produce upwards of 3000 hogheads of sugar of 1000 weight each, and other of the West India commodities in tolerable plenty. In time of war, privateers bring in their prizes here for sale; and a great many vessels trade from hence along the Spanish Main, and return with money in specie or bars, and valuable merchandize. As to Santa Cruz, from a perfect desert a few years since, it is beginning to settle very fast. Several persons from the English islands, some of them of considerable property, have gone to settle there, and have received very great encouragement.

---

### N E W D I S C O V E R I E S.

**O**UR knowledge of the globe has been considerably enlarged by the late discoveries of the Russians, and still more by those that have been made by British navigators in the present reign, which have been numerous and important: and of these discoveries we shall therefore here give a compendious account.

---

### NORTHERN ARCHIPELAGO.

**T**HIS consists of several groups of islands, lying between the eastern coast of Kamtschatka and the western coast of the continent of America\*. Mr. Muller divides these islands into four principal groups, the two first of which are styled the Aleutian islands. The first group, which is called by some of the islanders Saglian, comprehends,—1. Beering's Island; 2. Copper Island; 3. Otma; 4. Samyra, or Shemiya; 5. Anakta. The second group is called Khao, and comprises eight islands, viz. 1. Immak; 2. Kiska; 3. Tchetchia; 4. Ava; 5. Kavia; 6. Tichangulak; 7. Ulagama; 8. Amtchidga. The third general name is Negho, and comprehends the islands known to the Russians under the name of Andreanofski Ostrava: sixteen of which are mentioned under the following names; 1. Amatkinak; 2. Ulak; 3. Unalga; 4. Navottha; 5. Uliga; 6. Anagin; 7. Kagulak; 8. Illask, or Illak; 9. Takavanga, upon which is a volcano; 10. Kanaga, which has also a volcano; 11. Leg; 12. Skeshuna; 13. Tagaloon; 14. Goreloi; 15. Otehu; 16. Amla. The fourth group is called Kavalang, and comprehends sixteen islands;

\* Mr. Cove observes that, "the first project for making discoveries in that tempestuous sea which lies between Kamtschatka and America was conceived and planned by Peter I." Voyages with that view were accordingly undertaken at the expense of the crown: but when it was discovered, that the islands in that sea abounded with valuable furs, private merchants immediately engaged with ardour in similar expeditions: and, within a period of ten years, more important discoveries

were made by these individuals, at their own private cost, than had hitherto been effected by all the efforts of the crown. The investigation of useful knowledge has also been greatly encouraged by the present empress of Russia; and the most distant parts of her vast dominions, and other countries and islands, have been explored, at her expense, by persons of abilities and learning; in consequence of which, considerable discoveries have been made.

which are called by the Russians *Lyffe Ostrova* or the *Fox Islands*; and which are named, 1. Anuchta; 2. Tschigama; 3. Tschegula; 4. Uniftra; 5. Ulaga; Taingulana; 7. Kagamin; 8. Kigalga; 9. Skelinaga; 10. Umnak; 11. Agun-Alathka; 12. Uninga; 13. Uligun; 14. Anturo-Leilume; 15. Semidit; 16. Senegak.

Some of these islands are only inhabited occasionally and for some months in the year, and others are very thinly peopled; but others have a great number of inhabitants, who constantly reside in them. Copper Island receives its name from the copper which the sea throws upon its coasts. The inhabitants of these islands are, in general, of a short stature, with strong and robust limbs, but free and supple. They have lank black hair, and little beard, flattish faces, and fair skins. They are for the most part well made, and of strong constitutions, suitable to the boisterous climate of their isles. The inhabitants of the Aleutian isles live upon roots which grow wild, and sea-animals. They do not employ themselves in catching fish, though the rivers abound with all kinds of salmon, and the sea with turbot. Their cloaths are made of the skins of birds and of sea-otters.

The Fox Islands are so called from the great number of black, grey, and red foxes with which they abound. The dress of the inhabitants consists of a cap, and a fur coat which reaches down to the knee. Some of them wear common caps, made of the skin of a party-coloured bird, upon which they leave part of the wings and tail. On the forepart of their hunting and fishing caps, they place a small board like a screen, adorned with the jaw-bones of sea bears, and ornamented with glass beads, which they receive in barter from the Russians. At their festivals and dancing-parties they use a much more shewy sort of caps. They feed upon the flesh of all sorts of sea animals, and generally eat it raw. But if at any time they choose to dress their victuals, they make use of a hollow stone: having placed the fish or flesh therein, they cover it with another, and close the interstices with lime or clay. They then lay it horizontally upon two stones, and light a fire under it. The provisions intended for keeping are dried without salt in the open air. Their weapons consist of bows, arrows, and darts; and for defence they use wooden shields.

The most perfect equality reigns among these islanders. They have neither chiefs nor superiors, neither laws nor punishments. They live together in families, and societies of several families united, which form what they call a race, who, in case of attack or defence, mutually help and support each other. The inhabitants of the same island always pretend to be of the same race; and every person looks upon this island as a possession, the property of which is common to all the individuals of the same society. Feasts are very common among them, and more particularly when the inhabitants of one island are visited by those of the others. The men of the village meet their guests, beating drums, and preceded by the women, who sing and dance. At the conclusion of the dance, the hosts serve up their best provisions, and invite their guests to partake of the feast. They feed their children when very young with the coarsest flesh, and for the most part raw. If an infant cries, the mother immediately carries it to the sea-side, and, whether it be summer or winter, holds it naked in the water until it is quiet. This custom is so far from doing the children any harm, that it hardens them against the cold, and they accordingly go barefooted through the winter without the least inconvenience. They seldom heat their dwellings; but, when they are desirous of warming themselves, they light a bundle of hay, and stand over it; or else they set fire to train oil, which they pour into a hollow stone. They seem cold and indifferent in most of their actions; but let an injury, or even a suspicion only, rouse them from this phlegmatic state,—and they become inflexible and furious, taking the most violent revenge, without regard to consequences. The least affliction prompts them

to suicide: the apprehension of even an uncertain evil often leads them to despair, and they put an end to their days with apparent insensibility.

The Discovery of an INLAND SEA, containing a great Number of ISLANDS, in NORTH AMERICA.

FROM the observations made by captain Cook on the inhabitants of the western part of America about the latitude of  $64^{\circ}$  north, it appeared that there was a strong similarity between them and the Esquimaux on the eastern coast. Hence it was even then conjectured, that a communication by sea existed between the eastern and western sides of that continent.

In this part of America, however, a most surprising discovery has lately been made, which, when properly authenticated, cannot fail to be of the utmost benefit to the commercial and political interests of mankind. This, though not made by captain Cook himself, took place in consequence of his discoveries on the north-west coast of America. In these parts he found that such quantities of valuable furs might be purchased from the inhabitants, as promised to be a very profitable article of commerce, provided any regular connection could be established between that part of the world and the British settlements in the East Indies. This task was quickly undertaken by some spirited adventurers, who unluckily have found themselves opposed both by *friends* and *foes*, viz. the East India company, and the Spaniards,—the former pretending that they had no right to dispose of furs in the East Indies, and the latter, that they had none to bring them from the western coast of America. By one Mr. Etches who fitted out ships for this purpose, it was discovered that all the western coast of America, from the latitude of  $48^{\circ}$  to  $57^{\circ}$  north, was no continued tract of land, but a chain of islands which had never been explored, and that these concealed the entrance to a vast inland sea like the Baltic or Mediterranean in Europe, and which seems likewise to be full of islands\*. Among these, Mr. Etches' ship, the *Princess Royal*, penetrated several hundred leagues in a north-east direction, till they came within 200 leagues of Hudson's Bay; but as the intention of their voyage was merely commercial, they had not time fully to explore the Archipelago just mentioned, nor did they arrive at the termination of this new mediterranean sea. From what they really did discover, however, it is probable, that there may this way be a communication with Hudson's-bay, in which case the north-west passage to the East Indies will be found through seas much more navigable than those in which it has hitherto been sought. The islands which they explored were all inhabited by tribes of Indians, who appeared very friendly, and well disposed to carry on a commerce. Of these islands upwards of fifty were visited: but of them little can be said till future discoveries render the existence, extent, and direction of this sea, and these islands, more certain.

\* In our map of North America, an island is laid down at the entrance of the River of the West, north latitude  $48^{\circ}$  and west longitude  $127^{\circ}$ , the

place where this discovery is said to have been made.

## THE PELEW ISLANDS.

THE existence and situation of these islands were probably known to the Spaniards at a distant period; but from a report among the neighbouring islands of their being inhabited by a savage race of cannibals, it appears that there had never been the least communication between them and any of the Europeans, till the Antelope packet (belonging to the East India company) was wrecked on one of them, in August, 1783. From the accounts given of these islands by captain Wilfon who commanded the packet, it appears that they are situated between the 5th and 9th degrees north latitude, and between 130 and 136 degrees of east longitude from Greenwich, and lie in a N. E. and S. W. direction; they are long but narrow, of a moderate height, and well covered with wood; the climate is temperate and agreeable; the lands produce sugar-cane, yams, cocoa-nuts, plantains, bananas, oranges and lemons; and the surrounding seas abound with fish.

The natives of these islands are a stout, well-made people, above the middle stature; their complexions are of a far deeper colour than what is understood by the Indian copper, but not black. The men go entirely naked, and the women wear only two small aprons, one behind, and one before, made of the husks of the cocoa nut, dyed with different shades of yellow.

The government is monarchical, and the king is absolute; but his power is exercised more with the mildness of a father than the authority of a sovereign. In the language of Europeans, he is the fountain of honour; he occasionally creates his nobles, called Rupacks or Chiefs, and confers a singular honour of knighthood, called the *Order of the Bone*, the members of which are distinguished by wearing a bone on their arm.

The idea which the account published by captain Wilfon gives us of these islanders, is that of a people, who, though unacquainted with the arts and sciences, and living in the simplest state of nature, yet possess all that genuine politeness, that delicacy and chastity of intercourse between the sexes, that respect for personal property, that subordination to government, and those habits of industry, which are so rarely united in the more civilised societies of modern times.

It appears that when the English were thrown on one of these islands, they were received by the natives with the greatest humanity and hospitality; and, till their departure, experienced the utmost courtesy and attention. "They felt our people were distressed; and in consequence wished they should share whatever they had to give. It was not that worldly munificence that bestows and spends its favours with a distant eye to retribution. It was the pure emotion of native benevolence. It was the love of man to man. It was a scene that pictures human nature in triumphant colouring; and whilst their liberality gratified the sense, their virtue struck the heart."

## THE MARQUESAS ISLANDS

ARE five in number, first discovered by Quiros, in 1595; and their situation better ascertained by captain Cook in 1774. St. Dominica is the largest, about 16 leagues in circuit. The inhabitants, their language, manners, and cloathing, with the vegetable productions, are nearly the same as at the Society Isles.

## INGRAHAM'S ISLANDS.

THESE islands were discovered by captain Joseph Ingraham, of Boston, commander of the brigantine Hope, on the 19th of April, 1791. They lie N. N. W. from the Marquesas Islands, from 35 to 50 leagues distant, and are seven in number, which captain Ingraham named as follows, viz.

Names.	Lat. S.	Lon. from Lond.	Circuit.
Washington,	8° 52'	140° 19'	These five, except Federal Island which is smaller, are about 10 leagues in circuit.
Adams,	9° 20'	140° 54'	
Lincoln,	9° 24'	140° 54'	
Federal,	8° 55'	140° 50'	
Franklin,	8° 45'	140° 49'	
Hancock,	8° 3'	141° 14'	6 or 7 leagues.
Knox,	8° 5'	141° 18'	5 ditto.

Most if not all these islands are inhabited, and appear generally to be diversified with hills and vallies, and to be well wooded, and very pleasant. The people resemble those of the Marquesas islands, as do their canoes, which are carved at each end. They appeared friendly.

## OTAHEITE, or KING GEORGE'S ISLAND.

THIS island was discovered by captain Wallis, in the Dolphin \*, on the 19th of June, 1767. It is situated between 17° 28', and 17° 53', south latitude; and between 149° 11', and 149° 39', west longitude. It consists of two peninsulas, of

\* The Dolphin was sent out, under the command of captain Wallis, with the Swallow, commanded by captain Carteret, at the expense of the British government, in August 1766, in order to make discoveries in the southern hemisphere. These vessels proceeded together, till they came within sight of the South Sea at the western entrance of the Strait of Magellan, and from thence returned by different routes to England. On the 6th of June 1767, captain Wallis discovered an island about four miles long, and three wide, to which he gave the name of *Whitfun Island*, it being discovered on Whitfun-eve. Its latitude is 19° 26' S. and its longitude, 137° 56' W. The next day he discovered another island, to which he gave the name of *Queen Charlotte's Island*. The inhabitants of this island, captain Wallis says, were of a middle stature, and dark complexion, with long black hair, which hung loose over their shoulders. The men were well made, and the women handsome. Their clothing was a kind of coarse cloth or matting, which was fastened about their middle, and seemed capable of being brought up round their shoulders. This island is about six miles long, and one mile wide, and lies in latitude 19° 18' S. longitude 138° 4' W. In the space of a

few days after, he also discovered several other small islands, to which he gave the names of *Edmont Island*, *Gloucester Island*, *Cumberland Island*, *Prince William Henry's Island*, and *Ofenburgh Island*.

On the 19th of the same month he discovered the island of Otahete; and after he had quitted that island, he discovered, on the 28th of July 1767, another island, about six miles long, which he called *Sir Charles Saunders's Island*; and, on the 30th of the same month, another about ten miles long, and four broad, which he called *Lord Howe's Island*. After having discovered some other small islands, one of which was named *Wallis's Island*, he arrived at Batavia on the 30th of November, — at the Cape of Good Hope on the 4th of February 1768; and his ship anchored safely in the Downs on the 20th of May following.

Captain Carteret, in the Swallow, after he had parted with captain Wallis, in the Dolphin, having passed through the Strait of Magellan, and made some stay at the island of Mafaturo, discovered, on the 21 of July 1767, an island about five miles in circumference, to which he gave the name of *Pitcairn's Island*. It lies in latitude 25° 2' S. longitude 133° 21' W. and about a thousand leagues

of a somewhat circular form, joined by an isthmus, and is surrounded by a reef of coral rocks, which form several excellent bays and harbours, where there is room and depth of water for almost any number of the largest ships. The face of the country is very extraordinary; for a border of low land almost entirely surrounds each peninsula, and behind this border the land rises in ridges that run up into the middle of these divisions, and these form mountains that may be seen at sixty leagues distance. The soil, except upon the very tops of the ridges, is remarkably rich and fertile, watered by a great number of rivulets, and covered with fruit-trees of various kinds, forming the most delightful groves. The border of low land that lies between the ridges and the sea, is in few places more than a mile and a half broad; and this, together with some of the valleys, are the only parts that are inhabited. Captain Wallis made some stay at this island; and it was afterwards visited again by captain Cook, in the Endeavour, in April, 1769. That commander was accompanied by Mr. (now sir Joseph) Banks, and Dr. Solander; and those gentlemen, together with the captain, made a very accurate survey of the island.

Some parts of the island of Otaheite are very populous; and captain Cook was of opinion, that the number of inhabitants on the whole island amounted to 204,000, including women and children. They are of a clear olive complexion; the men are tall, strong, well-limbed, and finely shaped; the women are of an inferior size, but handsome, and very amorous. Their cloathing consists of cloth or matting of different kinds; and the greatest part of the food eaten here is vegetable, as coconuts, banannas, bread-fruit, plantains, and a great variety of other fruit. Their houses—those which are of a middling size—are of an oblong square, about 24 feet long, and eleven wide, with a shelving roof supported on three rows of posts, parallel to each other, one row on each side, and one in the middle. The height within is about nine feet, and the eaves on each side reach to three feet and a half from the ground. All the rest is open. The roof is thatched with palm-leaves, and the floor covered some inches deep with soft hay, over which they lay mats; and upon these they sit in the day, and sleep in the night. Their tools are made of stone, or some kind of bones. The inhabitants of Otaheite are remarkable for their cleanliness; for both men and women constantly wash their whole bodies in running water three times every day. Their language is soft and melodious, and abounds with vowels.

There were no tame animals on the island but hogs, dogs, and poultry; and the only wild animals are tropical birds, parroquets, pigeons, ducks, a few other birds, rats, and a very few serpents. The sea, however, supplies the inhabitants with a great variety of the most excellent fish; and by the kindness of the English and the Spaniards, they have now bulls and cows, sheep, goats, a horse and mare, geese, ducks, peacocks, and turkeys, and also cats.

In other countries, the men cut their hair short, and the women pride themselves on its length; but here the women always cut it short round their ears, and the men (except the fishers, who are almost continually in the water) suffer it to spread over their shoulders, or tie it up in a bunch on the top. They have the custom of

leagues to the eastward of the continent of America. The 13th of the same month he discovered another small island, to which he gave the name of the *Bishop of Osnaburg's Island*. The next day, he discovered two other small islands, which he called the *Duke of Gloucester's Islands*. The following month he discovered a cluster of small islands, to which he gave the name of *Queen Charlotte's Land*, and also three others, which he named

*Gower's Island*, *Simpfon's Island*, *Carteret's Island*. On the 24th of the same month, he discovered *Sir Charles Hardy's Island*, which lies in lat. 45° S. and the next day *Winklesha's Island*, which is distant about ten leagues, in the direction of S. by E. He afterwards discovered several other islands, and then proceeded round the Cape of Good Hope to England, where he arrived in March 1769.

discolouring

discolouring the skin, by pricking it with a small instrument, the teeth of which are dipped into a mixture of a kind of lamp-black, and this is called tattooing. This is performed upon the youth of both sexes, when they are about twelve or fourteen years of age, on several parts of the body, and in various figures. Their principal manufacture is their cloth, of which there are three kinds, made of the bark of three different trees. The finest and whitest is made of the Chinese paper mulberry tree; and this is chiefly worn by the principal people. Another considerable manufacture is matting, some of which is finer, and in every respect better than any we have in Europe. The coarser sort serves them to sleep upon, and the finer to wear in wet weather. They are likewise very dexterous in making wicker-work: their baskets are of a thousand different patterns, and many of them exceedingly neat. The inhabitants of Otaheite believe in one supreme Deity, but at the same time acknowledge a variety of subordinate gods: they offer up their prayers without the use of idols, and believe the existence of the soul in a separate state, where there are two situations, of different degrees of happiness. Among these people a subordination is established, which somewhat resembles the early state of the European nations under the feudal system. If a general attack happens to be made upon the island, every district is obliged to furnish its proportion of soldiers for the common defence. Their weapons are slings, which they use with great dexterity, and clubs of about six or seven feet long, and made of a hard heavy wood. They have a great number of boats, many of which are constructed for warlike operations. Otaheite is said to be able to send out 1720 war canoes, and 68,000 fighting men.

Bimco, Mataia, or Osnaburgh Island, and Tethuroa, are considered as islands dependent on Otaheite: the customs of the inhabitants of the two former nearly agreeing with the Otaheitans.

#### THE SOCIETY ISLANDS.

OF the several islands so called in honour of the Royal Society, which were discovered by captain Cook\* in the year 1769, the principal are HUANEINE, LISIUA, OTARA, and SOLAROLA. HUANEINE is about 31 leagues to the north-west

\* At the close of the year 1767, it was resolved by the Royal Society, that it would be proper to send a vessel into that part of the South Sea, to observe a transit of the planet Venus over the sun's disk, which, according to astronomical calculation, would happen in the year 1769; and that the places called Marquesa de Mendoza, or those of Rotterdam, or Amsterdam, were the proper places then known for making such observation. In consequence of these resolutions, it was recommended to his majesty, in a memorial from the Society, dated February, 1768, that he would be pleased to order such an observation to be made; upon which his majesty signified to the lords commissioners of the admiralty his pleasure, that a ship should be provided to carry such observers as the Society should think fit to the South Seas: and accordingly a bark of three hundred and seventy tons was prepared for that purpose. It was named the Endeavour, and commanded by captain James Cook, who was soon after, by the Royal Society,

appointed, with Mr. Charles Green, a gentleman who had been long assistant to Dr. Bradley at the royal observatory at Greenwich, to observe the transit. But while this vessel was getting ready for her expedition, captain Wallis returned; and it having been recommended to him by lord Morton, when he went out, to fix on a proper place for his astronomical observation, he, by letter dated on board the Dolphin, the 18th of May 1768, the day before he landed at Hattings, mentioned Port Royal harbour, in the island of Otaheite: the Royal Society, therefore, by letter dated the beginning of June, in answer to an application from the Admiralty to be informed whether they would have their observers sent, made choice of that place. Captain Cook set sail from Plymouth, in the Endeavour, on the 26th of August 1768. He was accompanied in his voyage by Joseph Banks, esq. and Dr. Solander. They made no discovery till they got within the tropic, where they fell in with Lagoon Island, Two Groups, Bird Island, and

well of Otaheite, and its productions are exactly the same, but it appears to be a month forwarder. The inhabitants seem to be larger made, and more stout, than those of Otaheite. Mr. (now Sir Joseph) Banks measured one of the men, and found him to be six feet three inches and a half high; yet they are so indolent, that he could not persuade one of them to go up the hills with him; for they said, if they

Chain Island; and they arrived at Otaheite on the 13th of April, 1769. During their stay there, they had an opportunity of making very accurate enquiries relative to its produce and inhabitants; and on the 4th of June, the whole passage of the planet Venus over the sun's disk was observed by them with great advantage. The result of their observations may be found in the Philosophical Transactions. After his departure from Otaheite, captain Cook discovered and visited the Society Islands and Oheetera, and thence proceeded to the south till he arrived in the latitude of 40 degrees 22 minutes, longitude 137 degrees 29 minutes W. and afterwards made an accurate survey of the coast of New Zealand. In November, he discovered a chain of islands, which he called *Bottle Islands*. He afterwards proceeded to New Holland, and from thence to New Guinea; and, in September 1770, arrived at the island of Savu, from whence he proceeded to Batavia, and from thence round the Cape of Good Hope to England, where he arrived on the 12th of June, 1771.

Soon after captain Cook's return home in the Endeavour, it was resolved to equip two ships in order to make some further discoveries in the southern hemisphere. Accordingly the Resolution and the Adventure were appointed for that purpose: the first was commanded by captain Cook, and the latter by captain Tobias Furneaux. They sailed from Plymouth Sound, on the 13th of July, 1772, and on the 20th of the same month arrived at the island of Madeira. From thence they proceeded to the Cape of Good Hope; and in February, 1773, arrived at New Zealand, having sought in vain for a southern continent. In that month the Resolution and the Adventure separated in consequence of a thick fog; but they joined company again in Queen Charlotte's Sound, on the 18th of May following. In August, they arrived at Otaheite; and in September they discovered Hervey's island. On the 2d of October, they came to Muffelburgh, one of the Friendly Islands; and about the close of the month, the Resolution and the Adventure were separated, and did not join company any more. Captain Cook, however, proceeded in the Resolution, in order to make discoveries in the southern polar regions, but was stopped in his progress by the ice, in the latitude of 71 degrees 10 minutes south, longitude 126 degrees 54 minutes west. He then proceeded to Easter Island, where he arrived in March, 1774, as he did also in the same month at the Marquesa Islands. He afterwards discovered four islands, which he named Palliser's islands; and again steering for Otaheite, he arrived there on the 23d of April, and after a short stay in it also visited the neighbouring isles. In August, he came to the New Hebrides, some of which were first dis-

covered by him. After leaving these islands, he steered to the southward a few days, and discovered New Caledonia. Having surveyed the south-west coast of this island, captain Cook steered again for New Zealand, in order to refresh his crew, and put his ship into a condition to encounter the dangers attending the navigation in the high southern latitudes. Directing his course to the south and east after leaving New Zealand, till he arrived in the latitude of 53 degrees 6 minutes south, longitude 139 degrees 56 minutes west, without meeting with any continent, captain Cook gave up all hopes of discovering any in this ocean; and therefore came to a resolution to steer directly for the west entrance of the straits of Magellan, with a view of crossing and surveying the uttermost or south side of Terra del Fuego. Keeping accordingly in latitude from 54 to 56, and steering nearly east, he arrived off the western mouth of the straits of Magellan, without meeting with any thing remarkable in this new route. In January 1775, he discovered a large and dreary island, to which he gave the name of *South Georgia*. He afterwards discovered various capes and elevated snow-clad coasts, to the most southern part of which he gave the name of the *Southern Tule*, as being the nearest land to that pole, which has yet been discovered. In February, he discovered *Sandwich Land*, and several islands covered with snow. He then proceeded round the Cape of Good Hope to England, where he arrived on the 30th of July, 1775. Captain Furneaux had returned to England, in the Adventure, a year before, having peered about home round the Cape of good hope, without making any remarkable discovery. Ten of his men, a boat's crew, had been murdered and eaten by some of the savages of New Zealand; so that this voyage afforded a melancholy proof that cannibal really exist; and, indeed, in the course of these voyages of discovery, other evidence appeared of this fact. As to captain Cook, in the course of his voyage in the Resolution, he had made the circuit of the southern ocean in a high latitude, and had traversed it in such a manner, as to leave not the least room for believing the existence of a southern continent, unless it were near the pole, and out of the reach of navigation. It deserves also to be remembered, in honour of that able commander, that, with a company of an hundred and eighteen men, he performed this voyage of three years and eighteen days, throughout all the climates, from fifty two degrees north, to seventy-one degrees south, with the loss of only one man by sickness; and this appears in a considerable degree to have arisen from the great humanity of the commander, and his uncommon care and attention to adopt every method for preserving the health of his men.

were to attempt it, the fatigue would kill them. The women are fairer than those of Otaheite; and both sexes appear less timid and less curious; though in their dress, language, and almost every other circumstance, they are the same. Their houses are neat, and they have boat-houses that are remarkably large. *Ulitea* is about seven or eight leagues to the south-west of *Huaheine*, and is a much larger island, but appears neither so fertile nor so populous. The principal refreshments to be procured here are plantains, cocoa-nuts, yams, and fowls; but the two last are rather scarce. *Otaha* is divided from *Ulitea* by a strait, that, in the narrowest part, is not above two miles broad. This island affords two good harbours, and its produce is of the same kind as that of the other islands. About four leagues to the north-west of *Otaha* lies *Bolabola*, which is surrounded by a reef of rocks, and several small islands, all of which are no more than eight leagues in compass. To these islands, and the two called by the natives *Marua*, which lie about fourteen miles westward of *Bolabola*, captain Cook gave the name of Society Islands. *Ta-booyamoo*, or *Saunders's Island*, may be here mentioned also, being subject to *Huaheine*.

#### O H E T E R O A.

**T**HIS island is situated in latitude  $22^{\circ} 27'$  south, and in longitude  $150^{\circ} 47'$  west from Greenwich. It is thirteen miles in circuit, and rather high than low, but neither so populous nor fertile as some of the other islands in these seas. The inhabitants are lusty and well made, but are rather browner than those of Otaheite. Their principal weapons are long lances made of coa-wood, which is very hard; and some of them are near twenty feet long.

#### T H E F R I E N D L Y I S L A N D S.

**T**HESSE islands were so named by captain Cook in the year 1773, on account of the friendship which appeared to subsist among the inhabitants, and from their courteous behaviour to strangers. Abel Jansen Tasman, an eminent Dutch navigator, first touched here in 1643, and gave names to the principal islands. Captain Cook laboriously explored the whole cluster, which he found to consist of more than sixty. The three islands which Tasman saw, he named *New Amsterdam*, *Rotterdam*, and *Middleburg*. The first is the largest, and extends about 21 miles from east to west, and about 13 from north to south. These islands are inhabited by a race of Indians who cultivate the earth with great industry. The island of *Amsterdam* is intersected by straight and pleasant roads, with fruit-trees on each side, which provide shade from the scorching heat of the sun.

The chief islands are *Annamooka*, *Tangataboo* (the residence of the sovereign and the chiefs), *Lefooga*, and *Eooa*. *Lefooga* is about seven miles long, and in some places not above two or three broad. It is in many respects superior to *Annamooka*.

The plantations are both more numerous and more extensive; and inclosed by fences, which, running parallel to each other, form fine spacious public roads, which would appear beautiful in countries where rural conveniences have been carried to the greatest perfection. They are, in general, highly cultivated, and well-stocked with the several roots and fruits which these islands produce: and captain Cook endeavoured to add to their number, by planting Indian corn, and the seeds of melons, pumpkins, and the like.

Tooa, when viewed from the ship at anchor, formed one of the most beautiful prospects in nature, and very different from the others of the Friendly Isles, which being low and perfectly level, exhibit nothing to the eye but the trees which cover them: whereas here, the land rising gently to a considerable height, presents us with an extensive prospect, with groves of trees interspersed at irregular distances, in beautiful disorder; the rest is covered with grass, except near the shores, where it is entirely covered with fruit and forest trees, amongst which are the habitations of the natives. In order to have a view of as great a part of the island as possible, captain Cook and some of his officers walked up to the highest point of the island. From this place they saw almost the whole, which consisted of beautiful meadows of prodigious extent, adorned with tufts of trees, and intermixed with plantations. "While I was surveying this delightful prospect," says captain Cook, "I could not help flattering myself with the pleasing idea that some future navigator may, from the same station, behold these meadows stocked with cattle brought to these islands by the ships of England; and that the completion of this single benevolent purpose, independent of all other considerations, would sufficiently mark to posterity, that our voyages had not been useless to the general interests of humanity." "The next morning," says our benevolent commander, "I planted a pine-apple, and sowed the seeds of melons and other vegetables in Taooa's plantation. I had indeed some encouragement to flatter myself that my endeavours of this kind also would not be fruitless; as I had this day a dish of turnips served up at my dinner, which was the produce of seeds I left here in my former voyage."

We are informed that the bulk of the people of these islands are satisfied with one wife; but the chiefs have commonly several women, though it appeared as if one only was regarded as mistress of the family. Though female chastity was frail enough in some, it is highly probable that conjugal fidelity is seldom violated, as it does not appear that more than one instance of it was known to our voyagers,—and, in that, the man's life, who was the cause of it, paid the forfeit of his crime. Nor were unmarried persons of the better sort liberal of their favours; those who despised chastity, being obviously prostitutes by profession. When they are afflicted with any disorder which they deem dangerous, they cut off a joint of one of their little fingers, fondly believing that the Deity will accept of that as a sort of sacrifice, efficacious enough to procure the recovery of their health. It was supposed from some circumstances, that, though they believe in a future state, they have no notion of future rewards or punishments for the things done here. They believe in one Supreme Being; but every island has its peculiar god, as every European nation has its peculiar saint. Captain Cook thinks he can pronounce that they do not worship any thing which is the work of their own hands, or any visible part of the creation. They make no offering of hogs, dogs, or fruit, to the *Orooa*, as at Otaheite; but it is absolutely certain that even this mild, humane, and beneficent people use *human sacrifices*. The government, as far as our people could learn, appears to approach nearly to the feudal system formerly established all over Europe. When any person of consequence dies, his body is washed and decorated by some woman, or women, who are appointed on the occasion; and these women are not, according to their customs, to touch any food with their hands for many months afterwards; and it is remarkable, that the length of the time they are thus proscribed is the greater in proportion to the rank of the chief whom they have washed. Their great men are fond of a singular piece of luxury, which is to have women sit beside them all night, and beat on different parts of their body until they go to sleep; after which they relax a little of their labour, unless they appear likely to awake; in which case they redouble their drumming until they are again fast asleep.

## NEW ZEALAND.

**T**HIS country was first discovered by Tasman, the Dutch navigator, in the year 1642, who gave it the name of Staten Land, though it has been generally distinguished, in our maps and charts, by the name of New Zealand, and was supposed to be part of a southern continent: but it is now known, from the late discoveries of captain Cook who sailed round it, to consist of two large islands, divided from each other by a strait four or five leagues broad. They are situated between the latitudes of 34 and 48 degrees south, and between the longitudes of 166 and 180 degrees east from Greenwich. One of these islands is for the most part mountainous, rather barren, and but thinly inhabited: but the other is much more fertile, and of a better appearance. In the opinion of sir Joseph Banks and of Dr. Solander, every kind of European fruits, grain, and plants, would flourish here in the utmost luxuriance. From the vegetables found here, it is supposed that the winters are milder than those of England, and the summers not hotter, though more equably warm; so that it is imagined, that if this country was settled by people from Europe, they might be abundantly supplied, not only with the necessaries, but the luxuries of life. Here are forests of vast extent, filled with very large timber-trees; and near four hundred plants were found, that had not been described by naturalists. The inhabitants of New Zealand are stout and robust, and equal in stature to the largest Europeans. Their colour in general is brown, but in few deeper than that of a Spaniard who has been exposed to the sun, and in many not so deep; and both sexes have good features. Their dress is very uncouth, and they mark their bodies in a manner similar to the inhabitants of Otaheite, which is called tattooing. Their principal weapons are lances, darts, and a kind of battle-axes; and they have generally shewn themselves very hostile to the Europeans who have visited them. As to their religious principles, they believe that the souls of such as are killed in battle, and their flesh afterwards eaten by the enemy, are doomed to perpetual fire; while the souls of those who die a natural death, or whose bodies are preserved from such ignominious treatment, ascend to the habitations of the gods. The common method of disposing of their dead is by interment in the earth; but if they have more of their slaughtered enemies than they can eat, they throw them into the sea. They have no such things as *morais*, or other places of public worship; nor do they ever assemble together with this view: but they have priests who alone address the Deity in prayer for the prosperity of their temporal affairs, such as an enterprise against a hostile tribe, a fishing party, or the like. Polygamy is allowed; and it is not uncommon for a man to have two or three wives.

## THE NEW HEBRIDES.

**T**HIS name was given by capt. Cook to a cluster of islands, the most northerly of which was seen by Quiros, the Spanish navigator, in 1606, and by him named Tierra del Espiritu Santo. From that time, till Bougainville's voyage in 1768, and capt. Cook's voyage in the Endeavour, in 1769, this land was supposed to be part of a great southern continent, called *Terra Australis Incognita*. But when capt. Cook had sailed round New Zealand and along the eastern coast of New Holland, this opinion was fully confuted. On his next voyage, in the Resolution,

he resolved to explore those parts accurately; and accordingly, in 1774, besides ascertaining the extent and situation of these islands, he discovered several in the group, which were before unknown. The New Hebrides are situated between the latitudes of  $14^{\circ} 29'$  and  $20^{\circ} 4'$  south; and between  $166^{\circ} 41'$  and  $170^{\circ} 21'$  east longitude. They consist of the following islands, some of which have received names from the different European navigators, and others retain the names which they bear among the natives, viz. Tierra del Espritu Santo, Mallicollo, St. Bartholomew, Isle of Lepers, Aurora, Whitsuntide, Anbrym, Immer, Apee, Three Hills, Sandwich, Montagu, Hinchinbrook, Shepherd, Eorromanga, Ironan, Annatom, and Tanna.

Not far distant from the New Hebrides, and south-westward of them, lies NEW CALEDONIA, a very large island, first discovered by capt. Cook, in 1774. It is about eighty-seven leagues long, but its breadth does not any where exceed ten leagues. It is inhabited by a race of stout, tall, well-proportioned Indians, of a swarthy or dark chestnut brown. A few leagues distant are two small islands called the Island of Pines and Botany Island.

## NEW HOLLAND,

THE largest island in the world, and formerly supposed to be a part of that imaginary continent called Terra Australis Incognita, lies between  $10^{\circ} 30'$  and  $43^{\circ}$  south latitude, and between  $110^{\circ}$  and  $153^{\circ} 30'$  east longitude; extending in all as much as the whole continent of Europe,—the eastern coast running no less than 2000 miles in length from north-east to south-west. Its dimensions from east to west have not been exactly ascertained, since we are obliged to take our information concerning them from the accounts of navigators of different nations, who visited this part of the world at a time when the method of ascertaining the latitudes and longitudes of places was less accurate than it is now. Different parts of the country have been called by the names of these discoverers, as Van Dieman's Land, Carpentaria, &c. and though the general appellation of the whole was New Holland, it is now applied by geographers to the north and west parts of the country. The eastern part, called New South Wales, was taken possession of in his majesty's name by captain Cook, and now forms a part of the British dominions,—a colony being very lately formed there, chiefly of the convicts sentenced to transportation.

The accounts of the climate and soil of this extensive country, now become an object of importance to Great Britain, are very various,—different parts having been explored at different times, and at different seasons of the year. In general, however, the relations are by no means favourable; the sea-coast, the only place on which any inhabitants have been discovered, appearing sandy and barren: and as for the inland parts which might reasonably be supposed more fertile, they are now thought to be wholly uninhabited; but whether this proceeds from the natural sterility of the soil, or the barbarity of the inhabitants who know not how to cultivate it, is not yet discovered.

One thing we are assured of by all who have ever visited this country, that its coast is surrounded by very dangerous shoals and rocks, so that it is by no means easy to effect a landing upon it. A shoal, called Houtman's Abrolhos, or shoal, from Frederic Houtman, commander of a fleet of Dutch Indiamen in 1618, lies on the western coast, on which commodore Pelsart, a Dutch navigator, was wrecked in 1629. When his ship, the Batavia, having on board 330 men, struck on this shoal, there was no land in sight, except some small rocky islands, and one considerably

derably bigger, about three leagues distant. All these were explored in search of fresh water; but none being found, part of the crew were obliged to sail in their skiff to the continent, which they soon after discovered. But, on their approach, they found the coast so excessive rocky, that it was impossible to land. Continuing their course northward for two days, they found themselves in 27 degrees of south latitude; but still the shore was so extremely steep, that there was no possibility of approaching it. It presented the same appearance as far north as 24 degrees; but the men being now resolved to get on shore at any rate, six of them who were expert swimmers, threw themselves into the sea, and with much ado got to land. Here they employed themselves in searching for fresh water; but finding none, they were obliged to swim back again to their skiff. Next day they discovered a cape, from the extreme point of which ran a ridge of rocks for about a mile into the sea, with another behind it; but still no passage was found to the continent. Another opening appeared about noon the same day, into which they ventured, though the passage was extremely dangerous, even for a skiff,—having only two feet water, with a rugged stony bottom. Here, however, they effected a landing; but though they made the most diligent search for fresh water, they could find neither rivulets, springs, nor even water that could be drunk by digging of wells. The shoal on which commodore Pelsart was wrecked is placed by Dampier in 27 degrees south latitude.

This navigator explored the coast of New Holland in 1688 and 1699. In the last of these voyages he fell in with the land in 26° south latitude, but could not land on account of the steepness of the shore. In 22° 22', he found another shoal, which was the first he had met with since leaving the Abrolhos in 27°. In 20° 21', he fell in with some rocky islands, which, from the nature of the tides, he supposed to extend in a range as far south as Shark's bay, in 25°, and nine or ten leagues in breadth from east to west. In 18° 21' he effected a landing; but the shore here, as in all other places visited by this navigator, is excessively rocky at low water, so that it is then impossible to land. At high water, however, the tides rise so high, that boats may get over the rocks to a sandy beach which runs all along the coast.

The southern part of this island, visited by captain Tasman in 1642, was found less difficult of access. He pursued the coast as far south as 44 degrees, where it begins to run to the eastward; and from his time the country appears not to have been visited by any Europeans, till the year 1770, when captain Furneaux, of the *Adventure*, reached the point we speak of, lying in 43° 17' south, 145° 36', and by account 143° 10' east from Greenwich. Several islands appeared to the north-west, one of which was named by captain Cook, Eddystone, from its resemblance to the light-house of that name; and he observes that nature seems to have left these two rocks for the same purpose that the Eddystone light-house was built by man, viz. to give navigators warning of their danger; for they are the conspicuous summits of a ledge of rocks under water, on which the sea in many places breaks very high. Their surface is white with the dung of sea-fowls, which makes them conspicuous at a considerable distance.

This celebrated navigator, capt. Cook, spent upwards of four months in surveying the eastern coast, the extent of which, as has already been mentioned, is nearly 2000 miles. The bay in which he anchored, from the great quantity of herbs found on shore, was called *Botany Bay*, and is the place for which the convicts were originally destined; though now they are settled in another part of the island about 15 miles to the northward, named by capt. Cook, *Port Jackson*,—the principal settlement being called *Sydney Cove*.

This was not visited or explored by captain Cook; it was seen at the distance of between two and three miles from the coast: but bad fortune conducted him into

the harbour, he would have found it much more worthy of his attention as a sea-man than Botany-Bay, where he passed a week. From an entrance not more than two miles broad, Port Jackson gradually extends into a noble and capacious basin, having foundations sufficient for the largest vessels, and space to accommodate in perfect security any number that could be assembled. It runs chiefly in a western direction about 13 miles into the country, and contains no less than 100 small coves formed by narrow necks of land, whose projections afford shelter from the winds.

Sydney Cove lies on the south side of the harbour, between five and six miles from the entrance. The neck of land that forms this cove is mostly covered with wood, yet so rocky, that it is not easy to comprehend how the trees could have found sufficient nourishment to bring them to so considerable a magnitude. The soil, in other parts of the coast immediately about Port Jackson, is of various qualities. This neck of land, which divides the south end of the harbour from the sea, is chiefly sand. Between Sydney Cove and Botany-Bay, the first space is occupied by a wood, in some parts a mile and a half, in others three miles broad. Beyond that, is a kind of heath, poor, sandy, and full of swamps; but, as far as the eye can reach to the westward, the country is one continued wood.

There are several parts of the harbour in which the trees stand at a greater distance from each other than in Sydney Cove; some of these, which have small runs of water, and a promising soil, the governor proposed to cultivate, as soon as hands could be spared; but the advantage of being able to land the stores and provisions with so much ease, immediately determined the choice of a place for the principal settlement; for, if they had but one mile to remove the stores from the spot where they were landed, the undertaking would probably have been fruitless; so many were the obstacles to land-carriage at the head of Sydney Cove, where captain Philip fixed the seat of his government. The 7th of February, 1788, was the memorable day on which a regular form of government was established on the coast of New South Wales. For obvious reasons, all possible solemnity was given to the proceedings necessary on this occasion.

On a space previously cleared, the whole colony was assembled, the military drawn up under arms, the convicts stationed apart,—and near the person of the governor those who were to hold the principal offices under him. The royal commission was then read by Mr. David Collins the judge-advocate. By this instrument, Arthur Philip was constituted and appointed captain-general and governor in chief, in and over the territory called New South Wales, extending from the extremity of the north coast, called Cape York, south latitude  $10^{\circ} 30'$ , to the southern extremity of the South Cape, south latitude  $43^{\circ} 30'$ , and all the inland country to the westward, as far as east longitude  $135^{\circ}$ , including all the islands adjacent in the Pacific Ocean within the latitudes aforesaid; and of all the towns, garrisons, castles, forts, and fortifications, which may be hereafter erected in the said territory. The act of parliament, establishing the courts of judicature, was next read; and lastly, the patents under the great seal, empowering the proper persons to convene and hold their courts whenever the exigency should require. A triple discharge of musquetry concluded this part of the ceremony.

The 4th of June was not suffered to pass without due celebration. It was a day of remission from labour, and a general festivity took place through the whole settlement. At sun-rise, the Sirius and Supply transports fired each a salute of 21 guns; and again, at one o'clock, the marines on shore saluted with three volleys; at sun-set, the same honours were a third time repeated from the ships; large bonfires were lighted, and the whole camp afforded a scene of joy. That there might not be any exception to the happiness of this day, four convicts, who had been  
reprieved

retrieved from death, and banished to an island in the middle of the harbour, received a full pardon, and were sent to bear their part in the general exultation. The governor said, he hoped there was not a single heavy heart in this part of his majesty's dominions. His house was the centre of conviviality to all who could be admitted to that society; it was at this time that the name of Cumberland county was given by the government to this part of the territory. It is above 50 miles in length, and 30 broad. The boundaries fixed for Cumberland county were—on the west, Carmarthen and Lanfdown hills; on the north, the northern part of Broken-Bay; and to the southward, the southern parts of Botany-Bay,—thus including completely these three principal bays, and leaving the chief place of settlement at Sydney-Cove nearly in the centre.

At the very first landing of governor Philip on the shore of Botany-Bay, an interview took place with the natives. They were all armed; but on seeing the governor approach with signs of friendship, alone and unarmed, they readily returned his confidence by laying down their arms.

They were perfectly devoid of clothing, yet seemed fond of ornaments, putting the beads and red baize that were given them on their heads or necks, and appearing pleased to wear them.

There was no kind of disagreement between the natives and the British while the ships remained at Botany-Bay. The governor, immediately after landing, examined the bay itself; when it appeared, that, though extensive, it afforded no shelter from the easterly winds; and that, in consequence of its shallowness, ships of a moderate draught would always be obliged to anchor at the entrance of the bay, where they must be exposed to a heavy sea that rolls in whenever it blows from the eastward. Several runs of fresh water were found in different parts of the bay; but there did not appear to be any situation to which there was not some very strong objection. In the northern part of it is a small creek, which runs a considerable way into the country; but it has water only for a boat; the sides of it are frequently overflowed, and the low lands near it are a perfect swamp.

The western branch of the bay is continued to a great extent; but the officers sent to examine it could not find any supply of fresh water, except in small quantities. Point Sutherland afforded the most eligible situation, having a run of good water, though not in very great abundance. But to this part of the harbour the ships could not approach; and the ground near it, even in the highest parts, was in general damp and spongy. Smaller numbers might indeed, in several spots, have found a comfortable residence; but no place was found in the whole of Botany-Bay which seemed at all calculated for the reception of so large a settlement. These circumstances, viz. the shallowness of the harbour, the scarcity of fresh water, the openness of the bay, and the dampness of the soil by which the people would probably be rendered unhealthy, made the governor determine to seek another situation.

The different coves of Port Jackson were examined, and the preference was given to one which had the finest spring of water, and in which ships can anchor so close to the shore, that at a very small expence quays may be constructed at which the largest vessels may unload.

After they had all landed at Sydney Cove, a plan was laid down for building a town, according to which were traced out the principal streets, the governor's house, main-guard, hospital, church, store-houses, and barracks. In some parts of this space, temporary barracks are erected, but no permanent building will be allowed, except in conformity to the plan laid down. The forms of other streets are also marked out, in such a manner as to ensure a free circulation of air. The principal streets, according to this design, will be 200 feet wide; the ground assigned for

for them is nearly level; not more than one house is to be built on one allotment, which is to consist of 60 feet in front, and 150 in depth. It has been also an object of the governor's attention to place the public buildings in the most eligible situations, and particularly to give the storehouses and hospital sufficient space for future enlargement.

The first huts that were erected here were composed of very perishable materials,—the soft wood of the cabbage-palm being only designed for immediate shelter. The necessity of using the wood quite green made it also the less likely to prove durable. The huts of the convicts were still more slight, being composed only of upright posts, wattled with slight twigs, and plastered up with clay. Barracks and huts were afterwards formed of materials rather more lasting. Buildings of stone might easily have been raised, had there been any means of procuring lime for mortar. The stone which has been found is of three sorts,—a fine free-stone, reckoned equal in goodness to that of Portland, an indifferent kind of sand-stone, or fire-stone, and a sort which appears to contain a mixture of iron. But neither chalk nor any species of lime-stone has yet been discovered. In building a small house for the governor on the eastern side of the cove, lime was made of oyster-shells collected in the neighbouring coves; but, until the discovery of chalk or lime-stone, the public buildings must go on very slowly, unless care be taken to send out those articles as ballast in all the ships destined for Port Jackson. The clay is very good, and some bricks have been made of it; but in using it for building, the walls must be made very thick.

In a country exposed to frequent storms of thunder and lightning, it was rather an uneasy situation to have all the provisions and other necessaries lodged in wooden buildings, covered with thatch of the most combustible kind. Instead of thatch, however, they now use shingles, made from a tree in appearance like fir, but producing a wood not unlike the English oak; but this, though more secure than thatching, is not enough for store-houses. For these, if slate-stone should not be found, tiles must be made of the clay which has been used for bricks.

The principal farm is situated in the next cove to the east of the town, and less than half a mile from it. When the plan was drawn, it contained about nine acres laid down in corn of different kinds. Later accounts speak of six acres of wheat, eight of barley, and six of other grain, as raised on the public account, and in a very promising way.

It is supposed that metals of various kinds abound in the soil on which the town is placed. A convict, who had formerly been used to work in the Staffordshire lead-mines, declared very positively, that the ground which they were now clearing contains a large quantity of that ore; and copper is supposed to lie under some rocks which were blown up in sinking a cellar for the public stock of spirituous liquors. It is the opinion of the governor himself that mines may hereafter be worked to great advantage; but at present he strongly discourages any search of this kind, very judiciously discerning, that in the present situation of his people which requires so many exertions of a very different nature, the discovery of a mine would be the greatest evil that could befall the settlement. In some places where they dug in making wells, they found a substance which they concluded to be black lead. The kind of pigment, called by the painters Spanish brown, is found in great abundance; and the white clay, with which the natives paint themselves, is still in greater plenty. The Abbé le Receveur was of opinion, that this clay, if cleaned from the sand, which might easily be done, would make excellent porcelain.

The climate at Sydney-Cove is considered, on the whole, as equal to the finest in Europe. The rains are never of long duration, and there are seldom any fogs.

The

The soil, though in general light, and rather sandy in this part, is full as good as usually is found so near the sea-side. All the plants and fruit-trees brought from Brazil and the Cape, which were not damaged in their passage, thrive exceedingly; and vegetables have now become plentiful,—both the European sorts, and such as are peculiar to New South Wales. In the governor's garden are excellent cauliflowers, and melons very fine of their kinds. The orange-trees flourish, and the fig-trees and vines are improving still more rapidly. In a climate so favourable, the cultivation of the vine may doubtless be carried to any degree of perfection; and should not other articles of commerce divert the attention of the settlers from this point, the wines of New South Wales may perhaps hereafter be sought with avidity, and become an indispensable part of the luxury of European tables.

The rank grass under the trees unfortunately proved fatal to all the sheep purchased by governor Philip on his own and on the public account. Those kept by individuals close to their own tents were preserved. Hogs and poultry increased very fast; and black cattle will doubtless succeed as well. It was very unfortunate, that two bulls and four cows, having been left for a time by the man who was appointed to attend them, strayed into the woods, and, though they were traced to some distance, never could be recovered. This was a loss which must be for some time irreparable.

The natives of New Holland, in general, seem to have no great aversion to the new settlers,—the only acts of hostility having arisen on the subject of the fishing-grounds, which the New Hollanders justly supposed to belong to themselves. They appear, however, to be in too savage a state to be capable as yet of deriving much instruction from their new neighbours. They are so ignorant of agriculture, that it seems most probable they do not even know the use of corn, and, therefore, perhaps more from ignorance than malice, set fire to that which the colonists had raised for their own use. To avoid such disagreeable incidents, a new settlement was begun on a small uninhabited island, named *Norfolk Island*, lying in south latitude 29°, and east longitude 168° 10', at the distance of 1200 miles from New Holland. The party sent out to form this settlement consisted only of 26 persons, who took possession on the 14th of February, 1788. This settlement was found so eligible, that, in October, 1788, another party was sent thither, so that the new colony, at the time the last advices were received, consisted of 44 men and 16 women, who being supplied with 18 months' provisions, will probably be able to cultivate the soil in such a manner as to enable them to form a granary, which will put those who are settled on New Holland entirely out of danger from their barbarous neighbours.

For a more particular account of this new settlement, we refer our readers to "Governor Philip's Voyage to Botany-Bay."

## NEW GUINEA,

**UNTIL** the late discoveries, was thought to be the north coast of an extensive continent, and to be joined to New Holland; but captain Cook discovered a strait between them, which runs north-east, through which he sailed. Thus it was found to be a long narrow island, extending north-east, from the second degree of south latitude to the twelfth, and from one hundred and thirty-one to one hundred and fifty degrees east longitude; but in one part it does not appear to be above fifty miles broad. The country consists of a mixture of very high hills and vallies, interspersed with groves of cocoa-nut trees, plantains, bread-fruit, and most of the trees, shrubs, and plants, that are found in the other South-Sea islands. It affords from

## NEW DISCOVERIES.

1041

from the sea a variety of delightful prospects. The inhabitants make nearly the same appearance as the New Hollanders on the other side the straits.

To the north of New Guinea is *NEW BRITAIN*, which is situated in the 4th degree of south latitude, and 152 degrees 19 minutes east longitude from Greenwich. It was supposed to be part of an imaginary continent till captain Dampier found it to be an island, and sailed through a strait which divides it from New Guinea. Captain Carteret, in his voyage round the world, in 1767, found that it was far less extensive than formerly supposed, by sailing through another strait to the north, which separates it from a long island, to which he gave the name of *New Ireland*. There are many high hills in *New Britain*, and it abounds with large and stately trees. To the eastward of *New Britain*, and in both the above straits, are many islands, most of which are said to be extremely fertile, and to abound with plantains and cocoa-nut trees.

*NEW IRELAND* extends in length, from the north-east to the south-east, about two hundred and seventy miles, but is in general very narrow. It abounds with a variety of trees and plants, and with many pigeons, parrots, rooks, and other birds. The inhabitants are black, and woolly-headed, like the negroes of Guinea, but have not their flat noses and thick lips. North-westward of *New Ireland*, a cluster of islands was seen by captain Carteret, lying very near each other, and supposed to consist of twenty or thirty in number. One of these, which is of very considerable extent, was named *NEW HANOVER*; and the rest of the cluster received the name of the *ADMIRALTY ISLANDS*.

## SANDWICH ISLANDS.

**B**ESIDES the voyages of discovery already mentioned, another voyage was performed by captain Cook and captain Clerke, in the *Resolution* and *Discovery*, during the years 1776, 1777, 1778, and 1779, in search of a north-west passage between the continents of Asia and America. After they had arrived at the *Cape of Good Hope*, they proceeded from thence to *New Holland*: in this course, they discovered two islands, which captain Cook called *Prince Edward's Isles*. The largest, about 15 leagues in circuit, is in latitude 46-53 south, longitude 37-46; the other, about nine leagues in circuit, latitude 46-40 and longitude 38-3, E. both barren and almost covered with snow. From *New Holland* they sailed to *New Zealand*, and afterwards visited the *Friendly* and *Society Isles*. In January, 1777, they arrived at the *Sandwich Isles*, which are twelve in number, and are situated between 22° 15' and 18° 53' N. latitude. The air of these islands is in general salubrious, and many of the vegetable productions are the same with those of the *Society* and *Friendly Isles*. The inhabitants are of a middle size, stout and well-made, and their complexion in general a brown olive. *O'why'hee* is in circumference about 300 English miles, and the number of inhabitants is computed at 150,000. The others are large and well peopled: for their names, we refer to our map. The natives are described as of a mild and friendly temper and carriage, and, in hospitality to strangers, not exceeded by the inhabitants of the *Friendly Isles*. On the 7th of February, being nearly in latitude 44° 33' north, and longitude 235° 36' east, the sailors saw part of the American continent, bearing north-east. Captain Cook afterwards discovered *King George's Sound*, which is situated on the north-west coast of America, and is extensive: that part of it where the ships under his command anchored, is in latitude 49° 36' north, and longitude 233° 28' east. The whole sound is surrounded by high land, which in some places appears very broken and rugged, and is in general covered with wood to the very top.

They found the inhabitants here rather below the middle size, and their complexions approaching to a copper colour. On the 12th of May, they discovered Sandwich Sound, in latitude  $59^{\circ} 54'$  north. The harbour in which the ships anchored appeared to be almost surrounded with high land, which was covered with snow; and here they were visited by some of the Americans in their canoes. They afterwards proceeded to the island of Unalafelka, and, after their departure from thence, still continued to trace the coast. They arrived, on the 20th of August 1778, in latitude  $70^{\circ} 54'$ , longitude  $194^{\circ} 55'$ , where they found themselves almost surrounded with ice; and the farther they proceeded to the eastward, the closer the ice became compacted. They continued labouring among the ice till the 25th, when a storm came on, which made it dangerous for them to proceed; and a consultation was therefore held on board the Resolution, as soon as the violence of the gale abated, when it was resolved, that as this passage was impracticable for any useful purpose of navigation, which was the great object of the voyage, it should be prosecuted no farther; and especially on account of the condition the ships were in, the approach of winter, and their great distance from any known place of refreshment. The voyage, indeed, afforded sufficient evidence that no practicable passage exists between the Atlantic and Pacific oceans towards the North; and this voyage also ascertained the western boundaries of the great continent of America. On their return, it unfortunately happened that the celebrated and able navigator, captain Cook, was killed in an affray with the natives, by an act of sudden resentment and fear, rather than from a bad disposition, on the island of Owhyhee, the largest of the Sandwich isles, on the 14th of February, 1779. In his last voyage he had explored the coast of America, from  $42^{\circ} 27'$  to  $70^{\circ} 40' 57''$  north. After the death of captain Cook, the command devolved on captain Clerke, who died at sea, on his return to the southward, on the 22d day of August 1779. The two ships returned home by the Cape of Good Hope; and on the 5th of October, 1780 anchored at the Nore.

We cannot conclude this article, without inserting the following character of capt. Cook, to perpetuate the memory and services of so excellent a navigator and commander.

Perhaps no science ever received greater additions from the labours of a single man, than geography did from those of capt. Cook. In his first voyage to the South Seas, he discovered the Society Islands; determined the insularity of New Zealand; discovered the straits which separate the two islands, and are called after his name; and made a complete survey of both. He afterwards explored the Eastern coast of New Holland, hitherto unknown,—an extent of twenty-seven degrees of latitude, or upwards of two thousand miles.

In his second expedition, he dispelled the illusion of a southern continent,—having traversed that hemisphere between the latitude of  $40^{\circ}$  and  $70^{\circ}$ , in so many directions that land could not exist, except so near the pole as to be out of the reach of navigation. During this voyage he discovered New Caledonia, the largest island in the Southern Pacific, except New Zealand; the island of Georgia; and an unknown coast, which he named Sandwich Land, the *Thule* of the Southern hemisphere; and having twice visited the tropical seas, he settled the situations of the old, and made several new discoveries.

But the last voyage is distinguished above the rest by its importance. Besides several smaller islands in the Southern Pacific, he discovered, to the North of the Equinoctial Line, the group called the Sandwich Islands, which, from their situation and productions, bid fairer for becoming an object of consequence in the system of European navigation, than any other discovery in the South-Sea. He afterwards explored what had hitherto remained unknown of the Western coast of Ame-

rica, from the latitude of  $43^{\circ}$  to  $70^{\circ}$  North, containing an extent of 3,500 miles,—ascertained the proximity of the two great continents of Asia and America,—passed the straits between them, and surveyed the coast on each side, to such a height of northern latitude, as to demonstrate the impracticability of a passage, in that hemisphere, from the Atlantic into the Pacific ocean, either by an Eastern or a Western course. In short, if we except the Sea of Amur, and the Japanese Archipelago, which still remain imperfectly known to Europeans, he completed the hydrography of the habitable globe.

The method which he discovered, and so successfully pursued, of preserving the health of seamen, forms a new era in navigation, and will transmit his name to future ages, among the friends and benefactors of mankind.

Those who are conversant with naval history need not be told at how dear a rate the advantages which are sought through the medium of long voyages at sea, had hitherto been purchased. That dreadful disorder which is peculiar to their service, and whose ravages have marked the tracks of discoverers with circumstances almost too shocking to relate, must, without exercising an unwarrantable tyranny over the lives of our seamen, have proved an insuperable obstacle to the prosecution of such enterprises. It was reserved for capt. Cook to shew the world, by repeated trials, that voyages might be protracted to the unusual length of three or even four years, in unknown regions, and under every change and rigour of the climate, not only without affecting the health, but even without diminishing the probability of life in the smallest degree.

Having pointed out the numerous and important advantages which have arisen and may arise from these voyages, both to the discoverers and discovered, the learned editor of the last voyage enquires into the origin of the inhabitants who people this myriad of islands that are scattered over the great Pacific Ocean, and proves, by incontrovertible arguments, founded on the affinity of their language, manners, and customs, that they have all originally sprung from one common stock, and that stock is the Asiatic nation called *Malayans*. He also traces another of the large families of the earth, but whose lot has fallen in far less hospitable climes,—we mean the Esquimaux, known hitherto only on the coasts of Greenland, Labrador, and Hudson's Bay; and who differ in several characteristic marks from the inland inhabitants of North America. They are the same race which peoples the bays and islands on the West coast of North America, and are extended over a space of at least 1500 leagues from east to west, and from the latitude of  $60^{\circ}$ , to the latitude of  $72^{\circ}$  north.

#### TERRA-INCOGNITA, or unknown Countries.

**N**OTWITHSTANDING the amazing discoveries of navigators, and the progress made in geography, since the first voyage of Columbus, anno 1492, there still remain some countries, either absolutely unknown, or very superficially surveyed.

## IN AFRICA.

**O**F this quarter of the globe the moderns are acquainted with little more than the sea-coasts, and these very imperfectly; the internal parts being unexplored; nor have we any satisfactory accounts of their inhabitants, their productions, or their trade. It is well known, however, that the rivers of Africa bring down large quantities of gold; and it is equally certain that the ancients drew prodigious riches from a country blessed with a variety of climates, some of them the finest in the world.

## IN AMERICA.

**I**N North America, towards the pole, are Labrador or New Britain, New North and South Wales, New Denmark, &c. very little known. The inhabitants, like those of Nova Zembla, Greenland, Groenland, and the northern parts of Siberia, are few, and these savage, low in stature, and of an ugly appearance. They live upon the raw flesh of whales, bears, foxes, &c. and go muffled up in skins, the hairy side next their bodies. In these inhospitable regions, their nights (as may be seen in the table of climates in the Introduction) are from one to six months; and the earth is bound up in impenetrable snow; so that the miserable inhabitants live underground great part of the year. Again, when the sun makes his appearance, they have a day of equal length.

All that vast tract on the back of the British settlements, from Canada and the lakes, to the Pacific Ocean which washes America on the west, is altogether unknown to us, no European having ever travelled thither. From the climate and situation of the country, it is supposed to be fruitful; it is inhabited by innumerable tribes of Indians, many of whom used to resort to the great fair of Montréal, even from the distance of 1000 miles.

In South America, the country of Guiana, extending from the equator to the eighth degree of north latitude, and bounded by the river Oronoque on the north, and the Amazons on the south, is unknown, except a slip along the coast, where the French at Cayenne, and the Dutch at Surinam, have made some settlements, which, from the unhealthfulness of the climate almost under the equator, and other causes, can hardly be extended any considerable way back.

The country of Amazonia is so called from the great river of that name, which rises in Quito, in 76 degrees W. lon. and discharges itself into the Atlantic Ocean: it is computed, that with all its turnings and windings it runs near 5000 miles; and it is generally two or three leagues broad: 500 leagues from the mouth it is 30 fathoms deep; and near 100 rivers fall into it on the North and the South. The country has never been thoroughly explored, though it is situated between the European colonies of Peru and Brasil, and every where accessible by means of that great river and its branches. Some attempts have been made by the Spaniards and Portuguese, but always attended with vast difficulties, so that few of the adventurers ever returned back.

Patagonia, at the southern extremity of America, is sometimes described as part of Chili: but as neither the Spaniards nor any other European nation have any colonies there, it is almost unknown, and is generally represented as a barren, inhospitable

hospitable country. Some of the inhabitants are certainly very tall, to 6½ and 7 feet high; but others, and the greater part, are of a moderate and common stature. Here, in 54½ degrees south lat. we fall in with the Straits of Magellan, having Patagonia on the north, and the island of Terra del Fuego on the south. These Straits extend from east to west 110 leagues, but the breadth in some places falls short of one. They were first discovered by Magellan, or Magelhaens, a Portuguese, in the service of Spain, who sailed through them in the year 1520, and thereby discovered a passage from the Atlantic to the Pacific or Southern Ocean. He has been since considered as the first navigator that sailed round the world; but having lost his life in a skirmish with some Indians before the ships returned to Europe, the honour of being the first circumnavigator has been disputed in favour of the brave sir Francis Drake, who, in 1574, passed the same Strait in his way to India, from which he returned to Europe by the Cape of Good Hope. In 1616, Le Maire, a Dutchman, keeping to the southward of these Straits, discovered in lat. 54½ another passage, since known by the name of the Straits Le Maire; and this passage, which has been generally preferred by succeeding navigators, is called doubling Cape Horn. The author of Anson's voyage, however, from fatal experience, advises mariners to keep clear of these Straits and islands, by running down to 61 or 62 deg. south lat. before they attempt to set their face westward towards the South Sea; but the extreme long nights, and the intense cold in those latitudes, render that passage practicable only in the months of January and February, which is there the middle of summer.

A

# MODERN UNIVERSAL TABLE;

The most **COPIOUS** and **AUTHENTIC** that ever was published, of the present State of the **REAL** and **IMAGINARY MONIES** of the **WORLD**.

Divided into Four Parts, viz.

## EUROPE, ASIA, AFRICA, AND AMERICA;

Which are subdivided into fifty-five Parts, containing the Names of the most Capital Places, the Species whereof are inserted, shewing how the Monies are reckoned by the respective Nations; and the Figures standing against the Denomination of each foreign Piece give the English intrinsic Value thereof, according to the best Assays made at the Mint of the **TOWER of LONDON**.

### E X P L A N A T I O N.

By real Money, is understood an effective Specie, representing in itself the Value denominated thereby, as a **GUINEA**, &c.

\* This Mark is prefixed to the imaginary Money, which is generally made Use of in keeping Accounts, signifying a fictitious Piece which is not in being, or which cannot be represented but by several other Pieces, as a **POUND STERLING**, &c.

All Fractions in the Value English are Parts of a **PENNY**.

= This Mark signifies, *is, make, or equal to*.

Note, for all the Spanish, Portuguese, Dutch, and Danish Dominions, either on the Continent, or in the West Indies, see the Monies of the respective Nations.

### ENGLAND AND SCOTLAND.

A

# NEW CHRONOLOGICAL TABLE

OF

REMARKABLE EVENTS, DISCOVERIES, AND INVENTIONS,

ALSO,

The **ÆRA**, the **COUNTRY**, and **WRITINGS** of **LEARNED MEN**:

The whole comprehending, in one View, the Analysis or Outlines of  
General History, from the Creation to the present Time.

*Ref. Christ.*

- 4004** **T**HE creation of the world, and Adam and Eve.  
**4003** The birth of Cain, the first who was born of a woman.  
**3017** Enoch, for his piety, is translated to Heaven.  
**2348** The old world is destroyed by a deluge, which continued 377 days.  
**2247** The Tower of Babel is built about this time by Noah's posterity; upon which, God miraculously confounds their language, and thus disperses them into different nations.  
About the same time, Noah is, with great probability, supposed to have parted from his rebellious offspring, and to have led a colony of some of the more tractable into the East, and there either he or one of his successors to have founded the ancient Chinese monarchy.  
**2234** Celestial observations are begun at Babylon, the city which first gave birth to learning and the sciences.  
**2188** Misraim, the son of Ham, founds the kingdom of Egypt, which lasted 1663 years, down to its conquest by Cambyfes, in 525 before Christ.  
**2059** Ninus, the son of Belus, founds the kingdom of Assyria, which lasted above 1000 years; and out of its ruins were formed the Assyrians of Babylon, those of Nineveh, and the kingdom of the Medes.  
**1921** The covenant of God made with Abram, when he leaves Haran to go into Canaan, which begins the 430 years of sojourning.  
**1897** The cities of Sodom and Gomorrah are destroyed for their wickedness, by fire from Heaven.  
**1856** The kingdom of Argos, in Greece, begins under Inachus.  
**1822** Memnon, the Egyptian, invents letters.  
**1715** Prometheus first struck fire from flint.  
**1635** Joseph dies in Egypt; which concludes the book of Genesis, containing a period of 2369 years.  
**1574** Aaron born in Egypt; 1490, appointed by God first high-priest of the Israelites.  
**1571** Moses, brother to Aaron, born in Egypt, and adopted by Pharaoh's daughter, who educates him in all the learning of the Egyptians.  
**1556** Ccerops brings a colony of Saïtes from Egypt into Attica, and begins the kingdom of Athens, in Greece.

1546 Scamander

- 1546 Scamander comes from Crete into Phrygia, and begins the kingdom of Troy.  
 1493 Cadmus carried the Phœnician letters into Greece, and built the citadel of Thebes.  
 1491 Moses performs a number of miracles in Egypt, and departs from that kingdom, together with 600,000 Israelites, besides children; which completed the 430 years of sojourning. They miraculously pass through the Red Sea, and come to the desert of Sinai, where Moses receives from God, and delivers to the people, the Ten Commandments, and the other laws, and sets up the tabernacle, and in it the ark of the covenant.  
 1485 The first ship that appeared in Greece was brought from Egypt by Danaus, who arrived at Rhodes, and brought with him his fifty daughters.  
 1453 The first Olympic games celebrated at Olympia, in Greece.  
 1452 The Pentateuch, or five first books of Moses, are written in the land of Moab, where he died the year following, aged 120.  
 1451 The Israelites, after sojourning in the wilderness forty years, are led under Joshua into the land of Canaan, where they fix themselves, after having subdued the natives; and the period of the sabbatical year commences.  
 1406 Iron is found in Greece, from the accidental burning of the woods.  
 1372 The Milesians arrived from Spain into Ireland.  
 1263 Argonautic expedition.  
 1198 The rape of Helen by Paris, which, in 1293, gave rise to the Trojan war, and siege of Troy by the Greeks, which continued ten years, when that city was taken and burnt.  
 1048 David is sole king of Israel.  
 1004 The Temple is solemnly dedicated by Solomon.  
 896 Elijah, the prophet, is translated to Heaven.  
 894 Money first made of gold and silver at Argos.  
 869 The city of Carthage, in Africa, founded by queen Dido.  
 814 The kingdom of Macedon begins.  
 786 Trireme galleys invented by the Corinthians.  
 776 The first Olympiad begins.  
 753 Æra of the building of Rome in Italy by Romulus, first king of the Romans.  
 720 Samaria taken, after three years siege, and the kingdom of Israel finished, by Salmanassar, king of Assyria, who carries the ten tribes into captivity.  
 The first eclipse of the moon on record.  
 658 Byzantium (now Constantinople) built by a colony of Athenians.  
 604 By order of Necho, king of Egypt, some Phœnicians sailed from the Red Sea round Africa, and returned by the Mediterranean.  
 600 Thales, of Miletus, travels into Egypt, consults the priests of Memphis, acquires the knowledge of geometry, astronomy, and philosophy; returns to Greece, calculates eclipses, gives general notions of the universe, and maintains that one supreme intelligence regulates all its motions.  
 Maps, globes, and the signs of the Zodiac, invented by Anaximander, the scholar of Thales.  
 597 Jehoiakin, king of Judah, is carried away captive, by Nebuchadnezzar, to Babylon.  
 587 The city of Jerusalem taken, after a siege of 18 months.  
 502 The first comedy at Athens acted upon a moveable scaffold.  
 559 Cyrus, the first king of Persia.  
 538 The kingdom of Babylon finished; that city being taken by Cyrus, who, in 536, issues an edict for the return of the Jews.  
 534 The first tragedy was acted at Athens, on a waggon, by Theſpis.  
 526 Learning is greatly encouraged at Athens, and a public library first founded.  
 515 The second temple at Jerusalem is finished under Darius.  
 509 Tarquin, the seventh and last king of the Romans, is expelled, and Rome is governed by two consuls, and other republican magistrates, till the battle of Pharsalia,—being a space of 461 years.  
 504 Sardis taken and burnt by the Athenians, which gave occasion to the Persian invasion of Greece.  
 486 Æschylus, the Greek poet, first gains the prize of tragedy.  
 481 Xerxes the Great, king of Persia, begins his expedition against Greece.  
 458 Ezra is sent from Babylon to Jerusalem, with the captive Jews and the vessels of gold and silver, &c. being seventy weeks of years, or 490 years before the crucifixion of our Saviour.  
 454 The Romans send to Athens for Solon's laws.

## A NEW CHRONOLOGICAL TABLE.

1079

- 451 The Decemvirs created at Rome, and the laws of the Twelve Tables compiled and ratified.
- 430 The history of the Old Testament finishes about this time.
- 401 Retreat of 10,000 Greeks under Xenophon.
- 400 Socrates, the founder of moral philosophy among the Greeks, believes the immortality of the soul, and a state of rewards, and punishments; for which, and other sublime doctrines, he is put to death by the Athenians, who soon after repent, and erect to his memory a statue of brass.
- 398 Catapults invented by Dionysius.
- 379 The Boeotian war commences in Greece, and finishes in 366, after the death of Epaminondas, the last of the Grecian heroes. After his death, Philip, brother to the king of Macedonia, who had been educated under him, privately set out for that country, seized the liberty of the Greeks by the battle of Cheronæa.
- 336 Philip, king of Macedon, murdered, and succeeded by his son Alexander the Great.
- 332 Alexandria in Egypt built.
- 331 Alexander the Great, king of Macedon, conquers Darius, king of Persia, and other nations of Asia.
- 323 Dies at Babylon, and his empire is divided by his generals into four kingdoms, after destroying his wives, children, brother, and sisters.
- 291 Darkness at Rome at noon-day.
- 290 Solar quadrants introduced at Rome.
- 285 Dionysius of Alexandria began his astronomical work on Monday June 26, being the first who found the exact solar year to consist of 365 days, 5 hours, and 49 minutes.
- 284 Ptolemy Philadelphus, king of Egypt, employs seventy-two interpreters to translate the Old Testament into the Greek language; which translation is called the Septuagint.
- 269 The first coinage of silver at Rome.
- 264 The first Punic war begins, and continues 23 years. The chronology of the Arundelian marbles composed.
- 260 The Romans first concern themselves in naval affairs, and defeat the Carthaginians at sea.
- 237 Hamilcar, the Carthaginian, causes his son Hannibal, at nine years old, to swear eternal enmity to the Romans.
- 218 The second Punic war begins, and continues 17 years. Hannibal passes the Alps, and defeats the Romans in several battles; but, being amused by his women, does not improve his victories by the storming of Rome.
- 190 The first Roman army enters Asia, and from the spoils of Antioch, brings the Asiatic luxury first to Rome.
- 170 Eighty thousand Jews massacred by Antiochus Epiphanes.
- 168 Perseus defeated by the Romans; which ends the Macedonian kingdom.
- 167 The first library erected at Rome, of books brought from Macedonia.
- 163 The government of Judea under the Maccabees begins, and continues 126 years.
- 146 Carthage, the rival of Rome, is razed to the ground by the Romans.
- 145 An hundred thousand inhabitants of Antioch massacred in one day by the Jews.
- 135 The history of the Apocrypha ends.
- 25 Colchester built.
- 65 Catiline's conspiracy against the liberties of his country detected.
- 52 Julius Cæsar makes his first expedition into Britain.
- 47 The battle of Pharsalia between Cæsar and Pompey, in which the latter is defeated.
- The Alexandrine library, consisting of 400,000 valuable books, burnt by accident.
- 45 The war of Africa, in which Cato kills himself.
- The solar year introduced by Cæsar.
- 44 Cæsar, the greatest of the Roman conquerors, after having fought fifty pitched battles, and slain 1,192,000 men, and overturned the liberties of his country, is killed in the senate-house.
- 43 Brutus, one of the conspirators against Cæsar, and chief of the republicans, being vanquished in the battle of Philippi, kills himself.
- 41 The battle of Actium fought, in which Mark Antony and Cleopatra are totally defeated by Octavius, nephew to Julius Cæsar.
- 30 Alexandria, in Egypt, is taken by Octavius; upon which Antony and Cleopatra put themselves to death; and Egypt is reduced to a Roman province.

27 Octavius,

- 27 Octavius, by a decree of the senate, obtains the title of Augustus Cæsar, and an absolute exemption from the laws, and is properly the first Roman emperor.
- 28 Coin first used in Britain.
- 8 Rome at this time is fifty miles in circumference, and contains 463,000 men fit to bear arms.
- The temple of Janus is shut by Augustus, as an emblem of universal peace; and JESUS CHRIST is supposed to have been born on Monday December 25, but, according to many, in September, during the Jewish feast of Tabernacles.

## A. C.

- 12 Christ hearing the Doctors in the Temple, and asking them questions\*.
- 17 ----- is baptised in the wilderness.
- 33 JESUS CHRIST is crucified on Friday, April 3, at 3 o'clock P. M.
- His Resurrection on Sunday, April 5; his Ascension, Thursday, May 14.
- 36 St. Paul converted.
- 39 St. Matthew writes his Gospel.
- Pontius Pilate kills himself.
- 40 The name of Christians first given at Antioch to the followers of Christ.
- 43 Claudius Cæsar's expedition into Britain.
- 44 St. Mark writes his Gospel.
- 49 London is founded by the Romans; 368, surrounded by them with a wall, some parts of which are still observable.
- 51 Caractacus, the British king, is carried in chains to Rome.
- 52 The council of the apostles at Jerusalem.
- 55 St. Luke writes his Gospel.
- 59 The emperor Nero puts his mother and brothers to death.
- persecutes the Druids in Britain.
- 61 Boadicea, the British queen, defeats the Romans; but is conquered soon after by Suetonius, governor of Britain.
- 62 St. Paul is sent in bonds to Rome; writes his Epistles between 51 and 66.
- 63 The Acts of the Apostles written.
- Christianity is supposed to be introduced into Britain by St. Paul, or some of his disciples, about this time.
- 64 Rome set on fire, and burned for six days; upon which began (under Nero) the first persecution against the Christians.
- 67 St. Peter and St. Paul put to death.
- 70 Whilst the factious Jews are destroying one another with mutual fury, Titus, the Roman general, takes Jerusalem, which is razed to the ground, and the plough made to pass over it.
- 79 Herculaneum overwhelmed by an eruption of Mount Vesuvius.
- 83 The philosophers expelled Rome by Domitian.
- 85 Julius Agricola, governor of South-Britain, to protect the civilised Britons from the incursions of the Caledonians, builds a line of forts between the rivers Forth and Clyde; defeats the Caledonians under Galgacus on the Grampian hills; and first sails round Britain, which he discovers to be an island.
- 96 St. John the Evangelist wrote his Revelation,—his Gospel in 97.
- 121 The Caledonians reconquer from the Romans all the southern parts of Scotland; upon which the emperor Adrian builds a wall between Newcastle and Carlisle; but this also proving ineffectual, Pollius Urbicus, the Roman general, about the year 144, repairs Agricola's forts, which he joins by a wall four yards thick, since called Antoninus's wall.
- 135 The second Jewish war ends, when they were all banished Judea.
- 139 Justin writes his first Apology for the Christians.
- 140 Dublin built.
- 141 A number of heresies appear about this time.
- 152 The emperor Antoninus Pius stops the persecution against the Christians.

\* "I have often thought (says a judicious commentator) that it is a great injury to the character of our blessed Redeemer, to represent his story, whether in pictures or words, as if Christ, at his tender age, went up into the seats of the doctors and there disputed with them. Not one word is said

of his disputing by the evangelist, but only of his hearing them and asking them questions, which was a very useful thing in these assemblies, and indeed the very end of them. All was conducted with the utmost modesty and decorum."

- 211 Gold and silver coin first used in Scotland.  
The emperor Severus, after having conquered the Scots, and pent them up by a new wall between the Forth of Clyde (since called Graham's Dyke), having also conquered the Parthians in the East, and extended the Roman empire to its utmost bounds, dies at York.
- 217 The Septuagint said to be found in a cask.
- 222 About this time the Roman empire begins to sink under its own weight. The barbarians begin their inroads, and the Goths receive tribute not to molest the empire.
- 260 Valerian is taken prisoner by Sapor, king of Persia, and slayed alive.
- 274 Silk first brought from India; the manufacture of it introduced into Europe by some monks, 551; first worn by the clergy of England, 1534.
- 291 Two emperors and two Cæsars march to defend the four quarters of the empire.
- 306 Constantine the Great begins his reign.
- 308 Cardinals first created.
- 313 The tenth persecution ends by an edict of Constantine, who favours the Christians, and gives full liberty to their religion.
- 314 Three bishops, or fathers, are sent from Britain to assist at the council of Arles.
- 325 The first general council at Nice, when 318 fathers attended, against Arius, where was composed the famous Nicene Creed.
- 338 Constantine removes the seat of empire from Rome to Byzantium, which is from that time called Constantinople.
- 331 Constantine orders all the heathen temples to be destroyed.
- 363 The Roman Emperor Julian, surnamed the Apostate, endeavours in vain to rebuild the temple of Jerusalem.
- 364 The Roman empire is divided into the eastern (Constantinople the capital) and western (of which Rome continued to be the capital), each being now under the government of different emperors.
- 400 Bells introduced by bishop Paulinus.
- 404 The kingdom of Caledonia or Scotland revives under Fergus.
- 406 The Vandals, Alans, and Suevi, spread into France and Spain, by a concession of Honorius, emperor of the West.
- 410 Rome taken and plundered by Alaric, king of the Visigoths.
- 412 The Vandals begin their kingdom in Spain.
- 420 The kingdom of France begins upon the Lower Rhine under Pharamond.
- 426 The Romans, reduced to extremities at home, withdraw their troops from Britain, and never return; advising the Britons to arm in their own defence, and trust to their own valour.
- 446 The Britons, now left to themselves, are greatly harrassed by the Scots and Picts; upon which they once more make their complaint to the Romans, but receive no assistance from that quarter.
- 447 Attila (surnamed the Scourge of God), with his Huns, ravages the Roman empire.
- 449 Vortigern, king of the Britons, invites the Saxons into Britain, against the Scots and Picts.
- 455 The Saxons, having repulsed the Scots and Picts, invite over more of their countrymen, and begin to establish themselves in Kent, under Hengist.
- 476 The western empire is entirely destroyed, 523 years after the battle of Pharsalia; upon the ruins of which several new states arise in Italy and other parts, consisting of Goths, Vandals, Huns, and other barbarians, under whom literature is extinguished, and the works of the learned are destroyed.
- 496 Clovis, king of France, baptised, and Christianity begins in that kingdom.
- 508 Prince Arthur begins his reign over the Britons.
- 513 Constantinople besieged by Vitalianus, whose fleet is burned by a speculum of brass.
- 516 The computing of time by the Christian æra is introduced by Dionysius the monk.
- 529 The code of Justinian, the eastern emperor, is published.
- 557 A terrible plague all over Europe, Asia, and Africa, which continues near 50 years.
- 581 Latin ceased to be spoken about this time in Italy.
- 596 Augustine the monk comes into England with forty monks.
- 606 Here begins the power of the popes, by the concessions of Phocas, emperor of the East.
- 622 Mahomet, a false prophet, flies from Mecca to Medina, in Arabia, in the 54th year of his age, and roth of his minority, when he laid the foundation of the Saracene empire, and from whom the Mahometan princes to this day claim their descent. His followers compute

- pute their time from this era, which in Arabic is called Hegira, i. e. the Flight.
- 637 Jerusalem is taken by the Saracens, or followers of Mahomet.
- 640 Alexandria in Egypt is taken by them, and the grand library there burnt by order of Omar, their caliph or prince.
- 653 The Saracens now extend their conquests on every side, and retaliate the barbarities of the Goths and Vandals upon their posterity.
- 664 Gifts introduced into England by Benalt, a monk.
- 685 The Britons, after a brave struggle of near 150 years, are totally expelled by the Saxons, and driven into Wales and Cornwall.
- 713 The Saracens conquer Spain.
- 720 The controversy about images begins, and occasions many insurrections in the eastern empire.
- 748 The computing of years from the birth of Christ began to be used in history.
- 749 The race of Abbas become caliphs of the Saracens, and encourage learning.
- 762 The city of Bagdad, upon the Tigris, is made the capital for the caliphs of the house of Abbas.
- 800 Charlemagne, king of France, begins the empire of Germany, afterwards called the Western empire; and endeavours to restore learning in Europe; but mankind are not yet disposed for it, being solely engrossed by military enterprises.
- 826 Harold, king of Denmark, dethroned by his subjects, for being a Christian.
- 828 Egbert, king of Wessex, unites the Heptarchy by the name of England.
- 836 The Flemings trade to Scotland for fish.
- 838 The Scots and Picts have a decisive battle, in which the former prevail, and both kingdoms are united by Kenneth; which begins the second period of the Scottish history.
- 867 The Danes begin their ravages in England.
- 871 The springs at Bath first discovered.
- 886 Juries first instituted.
- 896 Alfred the Great, after subduing the Danish invaders (against whom he fought 56 battles by sea and land), composes his body of laws; divides England into counties, hundreds, and tythings; erects county courts, and founds the university of Oxford about this time.
- 915 The university of Cambridge founded.
- 936 The Saracen empire is divided by usurpation into seven kingdoms.
- 975 Pope Boniface VII. is deposed and banished for his crimes.
- 979 Coronation oaths said to be first used in England.
- 991 The figures in arithmetic are brought into Europe by the Saracens from Arabia. Letters of the alphabet were hitherto used.
- 996 Otto III. makes the empire of Germany elective.
- 999 Boleslaus, the first king of Poland.
- 1000 Paper made of cotton rags was in use; that of linen rags in 1170: the manufactory introduced into England at Dartford, 1588.
- 1005 All the old churches are rebuilt about this time in a new manner of architecture.
- 1015 Children forbidden by law to be sold by their parents in England.
- 1017 Canute, king of Denmark, gets possession of England.
- 1040 The Danes, after several engagements with various success, are about this time driven out of Scotland, and never again return in a hostile manner.
- 1041 The Saxon line restored under Edward the Confessor.
- 1043 The Turks (a nation of adventurers from Tartary, serving hitherto in the armies of contending princes) become formidable, and take possession of Persia.
- 1054 Leo IX. the first pope that kept up an army.
- 1057 Malcolm III. king of Scotland, kills the tyrant Macbeth at Duninane, and marries the princess Margaret, sister to Edgar Atheling.
- 1065 The Turks take Jerusalem from the Saracens.
- 1066 The battle of Hastings fought, between Harold and William (surnamed the Bastard), duke of Normandy, in which Harold is conquered and slain; after which William becomes king of England.
- 1070 William introduces the feudal law.
- Musical notes invented.
- 1075 Henry IV. emperor of Germany, and the pope, quarrel about the nomination of the German

Episcopacy restored in England and Scotland.  
The people of Denmark, being oppressed by the nobles, surrender their privileges to Frederic III. who becomes absolute.
- 1662 The Royal Society established in London by Charles II.  
Pendulum clocks invented by John Fromentel, a Dutchman.  
Fire-engines invented.
- 1663 Carolina planted, in 1728, divided into two separate governments.
- 1664 The New Netherlands, in North America, conquered from the Swedes and Dutch, by the English.
- 1665 The plague rages in London, and carries off 68,000 persons.
- 1666 The great fire of London began Sept. 2, and continued three days, in which were destroyed 13,000 houses, and 400 streets.  
Tea first used in England.
- 1667 The peace of Breda, which confirms to the English the New Netherlands, now known by the name of Pennsylvania, New York, and New Jersey.
- 1668 Peace of Aix la Chapelle.  
St. James's Park planted, and made a thorough-fare for public use, by Charles II.
- 1670 The English Hudson's Bay Company incorporated.
- 1672 Lewis XIV. over runs great part of Holland, when the Dutch open their sluices, being determined to drown their country, and retire to their settlements in the East Indies.  
African company established.
- 1678 The peace of Nimeguen.  
The *habeas corpus* act passed.
- 1680 A great comet appeared, and, from its nearness to our earth, alarmed the inhabitants. It continued visible from Nov. 3, to March 9.  
William Penn, a Quaker, receives a charter for planting Pennsylvania.
- 1683 India stock sold from 360 to 500 per cent.
- 1685 Charles II. dies, aged 55, and is succeeded by his brother, James II.  
The duke of Monmouth, natural son to Charles II. raises a rebellion, but is defeated at the battle of Sedgemoor, and beheaded.  
The edict of Nantes infamously revoked by Lewis XIV. and the Protestants cruelly persecuted.
- 1687 The palace of Versailles, near Paris, finished by Lewis XIV.
- 1688 The revolution of Great Britain begins, Nov. 5. King James abdicates, and retires to France, Dec. 3.
- 1689 King William and queen Mary, daughter and son-in-law to James, are proclaimed February 16.  
Viscount Dundee stands out for James in Scotland, but is killed by general Mackey, at the battle of Killcrankie; upon which the Highlanders, wearied with repeated misfortunes, disperse.
- 1689 The land-tax passed in England.  
The toleration act passed there.  
Several bishops are deprived for not taking the oath to king William.
- 1690 The battle of the Boyne, gained by William against James, in Ireland.
- 1691 The war in Ireland finished, by the surrender of Limerick to William.
- 1692 The English and Dutch fleets, commanded by admiral Russel, defeat the French fleet off La Hogue.
- 1693 Bayonets at the end of loaded muskets first used by the French against the confederates in the battle of Turin.  
The duchy of Hanover made the ninth electorate.  
Bank of England established by king William.  
The first public lottery was drawn this year.  
Massacre of Highlanders at Glencoe, by king William's troops

- 1739 Letters of marque issued out in Britain against Spain, July 21, and war declared, October 23.  
Violent frost for nine weeks after Christmas.
- 1743 The battle of Dettingen won by the English and allies, in favour of the Queen of Hungary.
- 1744 War declared against France. Commodore Anson returns from his voyage round the world.
- 1745 The allies lose the battle of Fontenoy.  
The rebellion breaks out in Scotland, and the Pretender's army defeated by the duke of Cumberland, at Culloden, April 16, 1746.
- 1746 British Linen Company erected.  
Electric shock discovered.  
Lima and Callao swallowed up by an earthquake.
- 1748 The peace of Aix-la-Chapelle, by which a restitution of all places taken during the war was to be made on all sides.
- 1749 The interest of the British funds reduced to three per cent.  
British herring fishery incorporated.
- 1751 Frederic, prince of Wales, father to his present majesty, died.  
Antiquarian society at London incorporated.
- 1752 The new style introduced into Great Britain; the third of September being counted the fourteenth.
- 1753 The British Museum erected at Montague House.  
Society of Arts, Manufactures, and Commerce, instituted in London.
- 1755 Lisbon destroyed by an earthquake.
- 1756 146 Englishmen are confined in the black hole at Calcutta, in the East Indies, by order of the Nabob, and 123 found dead next morning.  
Marine society established at London.
- 1757 Damien attempted to assassinate the French king.  
Identity of electric fire and lightning discovered by Dr. Franklin, who thereupon invented a method of securing buildings from thunder-storms by metallic conductors.
- 1759 General Wolfe is killed in the battle of Quebec, which is gained by the English.
- 1760 King George II. dies, October 25, in the 77th year of his age, and is succeeded by his present majesty, who, on the 22d of September, 1761, married the princess Charlotte, of Mecklenburgh Streliz.  
Black-Friars Bridge, consisting of nine arches, begun; finished 1770, at the expence of 152,840*l.* to be discharged by a toll.
- 1762 War declared against Spain.  
Peter III. emperor of Russia, is deposed, imprisoned, and murdered.  
American Philosophical Society established in Philadelphia.  
George Augustus Frederic, prince of Wales, born, August 12.
- 1763 The definitive treaty of peace between Great Britain, France, Spain, and Portugal, concluded at Paris, February 10, which confirmed to Great Britain the extensive provinces of Canada, East and West Florida, and part of Louisiana, in North America; also the islands of Granada, St. Vincent, Dominica, and Tobago, in the West Indies.
- 1764 The parliament granted 10,000*l.* to Mr. Harrison, for his discovery of the longitude by his time-piece.
- 1765 His majesty's royal charter passed for incorporating the society of artists.  
An act passed annexing the sovereignty of the island of Man to the crown of Great Britain.
- 1766 April 21, a spot or macula of the sun, more than thrice the bigness of our earth, passed the sun's centre.
- 1768 Academy of painting established in London.  
The Turks imprison the Russian ambassador, and declare war against that empire.  
Electricity of the aurora borealis discovered by Wideburg at Jena
- 1771 Dr. Solander and Mr. Banks, in his majesty's ship the Endeavour, lieut. Cook, return from a voyage round the world, having made several important discoveries in the South Seas.
- 1772 The king of Sweden changes the constitution of the kingdom.  
The Pretender marries a princess of Germany, grand daughter of Thomas, late earl of Aylebury.

- 1772 A dreadful fire at Antigua.  
Twelve hundred and forty people killed in the island of Java by an electrified cloud.  
A revolution in Denmark.  
The emperor of Germany, empress of Russia, and the king of Prussia, strip the king of Poland of great part of his dominions, which they divide among themselves, in violation of the most solemn treaties.
- 1773 Captain Phipps is sent to explore the North Pole; but having made 81 degrees, is in danger of being locked up by the ice, and his attempt to discover a passage in that quarter proves fruitless.  
The Jesuits expelled from the Pope's dominions, and suppressed by his bull, Aug. 25.  
The English East India company, having, by conquest or treaty, acquired the extensive provinces of Bengal, Orissa, and Bahar, containing fifteen millions of inhabitants, great irregularities are committed by their servants abroad, upon which government interferences, and sends out judges, &c. for the better administration of justice.  
The war between the Russians and Turks proves disgraceful to the latter, who lose the islands in the Archipelago, and by sea are every where unsuccessful.
- 1774 Peace is proclaimed between the Russians and Turks.  
The British parliament having passed an act, laying a duty of three pence per pound upon all teas imported into America,—the colonists, considering this as a grievance, deny the right of the British parliament to tax them.  
Deputies from the several American colonies meet at Philadelphia, as the first general congress, Sept. 5.  
First petition of Congress to the king, Octob.
- 1775 April 19, The first action happens in America between the king's troops and the provincials, at Lexington.  
May 20, Articles of confederation and perpetual union between the American provinces.  
June 16, A bloody action at Bunker's Hill, between the royal troops and the Americans.
- 1776 March 17, The town of Boston evacuated by the king's troops.  
An unsuccessful attempt, in July, made by commodore sir Peter Parker, and lieutenant-general-Clinton, upon Charleston, in South Carolina.  
The Congress declare the American colonies free and independent states, July 4.  
The Americans are driven from Long Island, New York, in August, with great loss, and great numbers of them taken prisoners; and the city of New York is afterwards taken possession of by the king's troops.  
December 25, General Washington takes 900 of the Hessians prisoners at Trenton.  
Torture abolished in Poland.
- 1777 General Howe takes possession of Philadelphia.  
Lieutenant-general Burgoyne is obliged to surrender his army, at Saratoga, by convention, to the American army under the command of the generals Gates and Arnold, October 17.
- 1778 A treaty of alliance concluded at Paris between the French king and the Thirteen United American Colonies, in which their independence is acknowledged by the court of France, February 6.
- 1778 The remains of the earl of Chatham interred at the public expence in Westminster Abbey, June 9, in consequence of a vote of parliament.  
The earl of Carlisle, William Eden, esq. and George Johnstone, esq. arrive at Philadelphia, the beginning of June, as commissioners for restoring peace between Great Britain and America.  
Philadelphia evacuated by the king's troops, June 18.  
The congress refuse to treat with the British commissioners, unless the independence of the American colonies were first acknowledged, or the king's fleets and armies withdrawn from America.  
An engagement fought off Brest between the English fleet under the command of admiral Keppel, and the French fleet, under the command of the count d'Orvilliers, July 27.  
Dominica taken by the French, Sept. 7.  
Pondicherry surrenders to the arms of Great Britain, Oct. 17.  
St. Lucia taken from the French, December 28.

- 1779 St. Vincent taken by the French, June 17.  
 Granada taken by the French, July 3.
- 1780 Torture in courts of justice abolished in France.  
 The inquisition abolished in the duke of Modena's dominions.  
 Admiral Rodney takes twenty-two sail of Spanish ships, Jan. 8.  
 The same admiral also engages a Spanish fleet under the command of Don Juan de Lan-  
 gara, near Cape St. Vincent, and takes five ships of the line: one more driven on shore,  
 and another blown up, Jan. 16.  
 Three actions between admiral Rodney and the count de Guichen, in the West Indies, in  
 the months of April and May; but none of them decisive.  
 Charleston, South Carolina, surrenders to sir Henry Clinton, May 4.  
 Pensacola, and the whole province of West Florida, surrender to the arms of the king of  
 Spain, May 9.  
 The pretended Protestant Association, to the number of 50,000, go up to the house of com-  
 mons, with their petition for the repeal of an act passed in favour of Papists, June 2.  
 That event followed by the most daring riots in the city of London and in Southwark,  
 for several successive days, in which some Popish chapels are destroyed, together with  
 the prisons of Newgate, the King's bench, the Fleet, several private houses, &c. These  
 alarming riots are at length suppressed by the interposition of the military, and many of  
 the rioters tried and executed for felony.  
 Five English East Indiamen, and fifty English merchant ships bound for the West Indies,  
 taken by the combined fleets of France and Spain, August 2.  
 Earl Cornwallis obtains a signal victory over general Gates, near Camden, in South Caro-  
 lina, in which above 1000 American prisoners are taken, Aug. 16.  
 Mr. Laurens, late president of the congress, taken in an American packet, near Newfound-  
 land, Sept. 3.  
 General Arnold deserts the service of the congress, escapes to New York, and is made a  
 brigadier-general in the royal service, Sept. 24.  
 Major André, adjutant-general to the British army, hanged as a spy at Tappan, in the  
 province of New York, Oct. 2.  
 Mr. Laurens is committed prisoner to the Tower, on a charge of high treason, October 4.  
 Dreadful hurricanes in the West Indies, by which great devastation is made in Jamaica,  
 Barbadoes, St. Lucia, Dominica, and other islands, Oct. 3. and 10.  
 A declaration of hostilities published against Holland, December 10.
- 1781 The Dutch island of St. Eustatia taken by admiral Rodney, and general Vaughan, Feb. 3.  
 Retaken by the French, Nov. 27.  
 Earl Cornwallis obtains a victory, but with considerable loss, over the Americans under ge-  
 neral Green, at Guildford, in North Carolina, March 15.  
 The island of Tobago taken by the French, June 2.  
 A bloody engagement fought between an English squadron under the command of admiral  
 Parker, and a Dutch squadron under the command of admiral Zoutman, off the Dogger-  
 Bank, August 5.  
 Earl Cornwallis, with a considerable British army, surrendered prisoners of war to the  
 American and French troops, under the command of general Washington and count  
 Rochambeau, at York town, in Virginia, Oct. 19.
- 1782 Trincomale, on the island of Ceylon, taken by admiral Hughes, Jan. 11.  
 Minorca surrendered to the arms of the king of Spain, Feb. 5.  
 The island of St. Christopher taken by the French, Feb. 12.  
 The island of Nevis, in the West Indies, taken by the French, Feb. 14.  
 Montserrat taken by the French, Feb. 22.  
 The house of commons address the king against any farther prosecution of offensive war  
 on the continent of North America, March 4, and resolve, that the house would consider  
 all those as enemies to his majesty and this country, who should advise, or by any means  
 attempt, the farther prosecution of offensive war on the continent of North America, for  
 the purpose of reducing the revolted colonies to obedience by force.  
 Admiral Rodney obtains a signal victory over the French fleet, under the command of count  
 de Grasse, near Dominica, in the West Indies, April 12.  
 Admiral Hughes, with eleven ships, beats off, near the island of Ceylon, the French admiral  
 Suffrein, with twelve ships of the line, after a severe engagement, in which both fleets lost  
 a great number of men, April 13.

- 1782 The resolution of the House of Commons relating to John Wilkes, esq. and the Middlesex election, passed Feb. 17, 1769, rescinded May 3.  
The bill to repeal the declaratory act of George I. relative to the legislation of Ireland, received the royal assent, June 20.  
The French took and destroyed the forts and settlements in Hudson's Bay, Aug. 24.  
The Spaniards defeated in their grand attack on Gibraltar, Sept. 13.  
Treaty concluded betwixt the republic of Holland and the United States of America, Oct. 8.  
Provisional articles of peace signed at Paris between the British and American commissioners, by which the Thirteen United American colonies are acknowledged by his Britannic majesty to be free, sovereign, and independent states, Nov. 30.
- 1783 Preliminary articles of peace between his Britannic majesty and the kings of France and Spain, signed at Versailles, Jan. 20.  
The order of St. Patrick instituted, Feb. 5.  
Three earthquakes in Calabria Ulterior and Sicily, destroying a great number of towns and inhabitants, Feb. 5, 7, and 28th.  
Armistice between Great Britain and Holland, Feb. 10.  
The first air-balloon let off in Paris, by M. Mongolfier, Aug. 27.  
Ratification of the definitive treaty of peace between Great Britain, France, Spain, and the United States of America, Sept. 3.
- 1784 The city of London wait on the king with an address of thanks for dismissing the coalition ministry, Jan. 16.  
The great seal stolen from the lord chancellor's house in Great Ormond-street, March 24th.  
The ratification of the peace with America arrived, April 7.  
The definitive treaty of peace between Great Britain and Holland, May 24.  
The memory of Handel commemorated by a grand jubilee, at Westminster Abbey, May 26.  
Proclamation for a public thanksgiving, July 2.  
Mr. Lunardi ascended in a balloon from the Artillery-ground, Moorfields, the first attempt of the kind in England, Sept. 15.  
Ascended at Edinburgh.
- 1785 Dr. Seabury, an American missionary, was constituted bishop of Connecticut, by five non-juring Scotch prelates, Nov.
- 1786 The king of Sweden prohibited the use of torture in his dominions. Cardinal Turlone, high inquisitor at Rome, was publicly dragged out of his carriage by an incensed multitude, for cruelty, and hung on a gibbet 50 feet high.  
Commercial treaty signed between England and France, Sept. 26.  
471,000l. 3 per cent. stock transferred to the landgrave of Hesse, for Hessian soldiers lost in the American war, at 30l. a man, Nov. 21.
- 1786 Mr. Adams, the American ambassador, presented Dr. White, of Pennsylvania, and Dr. Provost of New York, to the archbishop of Canterbury, to be consecrated bishops for the United States. They were consecrated Feb. 4. 1787.
- 1787 Mr. Burke, at the bar of the house of lords, in the name of all the commons of Great Britain, impeached Warren Hastings, late governor-general of Bengal, of high crimes and misdemeanours, May 21.  
The king, by letters-patent, erected the province of Nova Scotia into a bishop's see, and appointed Dr. Charles Inglis to be the bishop, Aug. 11.
- 1788 In the early part of October, the first symptoms appeared of a severe disorder, which afflicted our gracious sovereign. On the 6th of November they were very alarming, and on the 13th a form of prayer for his recovery was ordered by the privy council.
- 1789 His majesty was pronounced to be in a state of convalescence, Feb. 17, and to be free from complaint, Feb. 26.  
A general thanksgiving for the king's recovery, who attended the service at St. Paul's, with a great procession, April 23.  
Revolution in France, capture of the Bastille, execution of the governor, &c. July 14.
- 1790 Grand confederation in the Champ de Mars, July 14.
- 1791 On the 14th of July, in consequence of some gentlemen meeting to commemorate the French revolution, in Birmingham, the mob arose and committed the most daring outrages for some days on the persons and properties of many of the inhabitants of the town and

- and neighbourhood; burning and destroying meeting-houses, private dwellings, &c. Peace and security were at length restored, by the interposition of the military power.
- 1792 On the 10th of March, the definitive treaty of peace was signed between the British, and their allies, the Nizam, and Malirattas on the one part, and Tippoo Sultan on the other, by which he ceded on half of his territorial possessions, and delivered up two of his sons to lord Cornwallis, as hostages for the fulfilment of the treaty.
- Gustavus III. king of Sweden, died on the 29th of March, in consequence of being assassinated by Ankerström.
- 1793 January 21st. Lewis XVI. after having received innumerable indignities from his people, was brought to the scaffold, and had his head severed by the guillotine, contrary to the express laws of the new constitution, which had declared the person of the king inviolable.
- On the 25th of March, lord Grenville, and S. Comte Woronzow, signed a convention at London on behalf of his Britannic majesty and the empress of Russia, in which their majesties agreed to employ their respective forces in carrying on the "just and necessary war" against France. Treaties also were entered upon with the king of Sardinia, and the prince of Hesse Cassel.
- The unfortunate queen of France, on the 16th of October, was conducted to the spot, where Louis had previously met his fate; and conducted herself during her last moments with fortitude and composure, in the thirty-eighth year of her age.
- Messrs. Muir and Palmer, having been accused of seditious practices, were tried in the high court of Justiciary in Scotland, and pronounced guilty. Their sentence was transportation for the space of 14 years to such place as his majesty might judge proper.—They have since failed for Botany Bay.
- 1794 On the 1st of June, the British fleet, under the command of admiral earl Howe, obtained a most signal victory over that of the French, in which two ships were sunk, one burnt, and six brought into Portsmouth harbour.
- 1795 In consequence of the rapid progress of the French arms in Holland, the princess of Orange, the hereditary princess and her infant son, arrived at Yarmouth, on the 19th of January: the hereditary prince himself, with his father the stadtholder, landed at Harwich on the 20th. On the 8th of April, his royal highness, George Augustus Frederic, prince of Wales, was married to her serene highness, princess Caroline of Brunswick.
- The trial of Warren Hastings, esq. at length came to a close on the 23rd of April, when the lord chancellor, having put the question to each of the peers, upon the sixteen articles of the impeachment, and finding that a very great majority voted for his acquittal, informed the prisoner that he was acquitted of the charges brought against him by the house of commons, and of all matters contained therein.

## MEN OF LEARNING AND GENIUS.

N. B. *By the Dates is implied the time when the above Writers died; but when that Period happens not to be known, the Age in which they flourished is signified by ft. The names in Italics are those who have given the best English Translations, exclusive of School-books.*

- Ref. Chr.
- 907 **H**OMER, the first profane writer, and Greek poet, flourished. *Popl. Cowper.*
- Hesiod, the Greek poet, supposed to live near the time of Homer. *Cooke.*
- 884 Lycurgus, the Spartan lawgiver.

 428 Eutropius, the Roman historian.  
 524 Boetius, the Roman poet and Platonic philosopher. *Bellamy. Preston.*  
 529 Procopius of Caesarea, the historian. *Holcroft.*
- Here ends the illustrious list of ancient, or, as they are styled, classic authors, for whom mankind are indebted to Greece and Rome, those two great theatres of human glory: but it will ever be regretted, that a small part only of their writings have come to our hands. This was owing to the barbarous policy of those fierce illiterate pagans, who, in the fifth century, subverted the Roman empire, and in which practices they were joined soon after by the Saracens, or followers of Mahomet. Constantinople alone had escaped the ravages of the barbarians; and to the few literati who sheltered themselves within its walls, is chiefly owing the preservation of those valuable remains of antiquity. To learning, civility, and refinement, succeeded worse than Gothic ignorance—the superstition and buffoonery of the church of Rome. Europe therefore produces few names worthy of record during the space of a thousand years; a period, which the invention of printing contributed to the revival of learning in the sixteenth century, from which time letters continued to flourish in France, Italy, Germany and England; with the celebrated men of which last country, before and after that period, we shall conclude this table.
- A. C.
- 735 Bede, a priest of Northumberland; history of the Saxons, Scots, &c.  
 921 King Alfred; history, philosophy, and poetry.  
 1259 Matthew Paris, monk of St. Albans; history of England.
