The following is a summary of the work, and the results of the various experiments conducted during the past year. The work was carried out in the laboratory of the Department of Zoology, University of Toronto, Ontario, Canada.

The first part of the work was devoted to a study of the habits and behavior of the various species of insects which were found in the laboratory. It was found that the most common species were the house fly, the fruit fly, and the common house spider. The house fly was found to be particularly troublesome, and it was found that it was very difficult to get rid of. The fruit fly was also found to be very troublesome, and it was found that it was very difficult to get rid of. The common house spider was found to be very common, and it was found that it was very difficult to get rid of.

The second part of the work was devoted to a study of the habits and behavior of the various species of insects which were found in the laboratory. It was found that the most common species were the house fly, the fruit fly, and the common house spider. The house fly was found to be particularly troublesome, and it was found that it was very difficult to get rid of. The fruit fly was also found to be very troublesome, and it was found that it was very difficult to get rid of. The common house spider was found to be very common, and it was found that it was very difficult to get rid of.
