## REPORT

OF THE

## COMMISSIONERS

APPOINTED TO EXPLORE THE COUNTRY

## BETWEEN THE

# ST. MAURICE AND THE OTTAWA, 

IN THE YEAR 1830.

Ordered by the ASSEMBLY to be printed.
1831.

## REPORT.

THE Legislature having, in the year 1829, voted a fum of money for exploring the Country lying between the Rivers St . Maurice and Ottawa, the underfignea had the honor to be appointed to superintend the said Exploration, and make a Report thereof to your Honorable Houfe; and a further fum having been voted during the laft Session for completing the faid Exploration in another direction further southward, the underfigned were again appointed for the faid purpofe, that is to fay, to explore that tract of country lying between the River St. Maurice and the River Ottawa, in the rear of the fettlements, and to obtain certain information whether it be practicable to open a Road, from fome point up the River St. Maurice to the Townfhip of Grenville on the River Ottawa; and to explore the and tract of country generally.

Having had reafon to be well fatisfied with the fervices of the Gentlemen who had been employed on the laft expedition, the Commiffioners, with the approbation of His Excellency the Adminiftrator of the Government, determined to place this fecond expedition under the fuperintendence of two of the gentlemen in queftion, viz : Lieutenant Ingall of the 15th Regiment, and John Adams, Efquire, Surveyor; (Lieutenant Nixon, of the 66th Regiment, who accompanied them on the former expedition, having left the country for England,) and after having procured all the neceffary documents for their guidance, the Exploring party was organized.-Inftructions were drawn up, which were delivered to the party; and of which a copy is annexed to this Report under the letter A.-The party then left Montreal on the 24th of September laft.

The Commiffioners refer to the Journal which accompanies this Report for a detailed account of the expedition from the time the party left Montreal on the 24th of September aforcfaid, to that of their arrival at Quebec on the 22nd November laft.

The faid Journal, (which is marked B.) is accompanied by an unbound beok containing remarks made by Mr. Ingall and by another containing thofe made by Mr. Adams :-
Ift. By a Plan of the lands which have been granted, and of thofe which have been furveyed in the tract of country lying on the route taken by the party.

2nd. By another Plan showing the obftacles to be furmounted on the faid route.

According to this Journal and the Plans that accompany it, is appears that the Exploring party, proceeded in purfuance of the infructions they had received, to the Townfhip and Village of Grenville on the River Ottawa, whence they started on the 26 th of September, and paffed in the raar of the most northerly settlements along a line which they traced and nearly in a north. eafterly direction (diverging from time to time towards one fide or the other according to the nature of the ground,) through the Townships of Grenville, Chatham, Abercrombie, Kilkenny, Kildare and Rawdon, the Seigniory Daillebout, and the Township of Brandon, \&rc: until they reached the Banks ofLake Maskinongé, in the Seigniory of Lanaudière.-Thence they proceeded through the Townships of Hunterstown and Caxton, whence they took a nearly fouth eafterly courfe to Three Rivers, and laftly that they arrived at Quebec on the 22nd of November.

The Commiffioners have much pleafure in remarking the facility with which a Road of communication may be opened in conformity with the views of the Legislature, from the River St. Maurice to the Townfhip of Grenville on the River Ottawa; and that the land along the whole line followed by the Exploring party, and even to the diftance of about fifteen miles towards the north west as far as the fummit of the mountains, is well adapted for cultivation, and that fettlements might therefore be formed there with advantage.

According to the information the Commiffioners have obtained, as well from the Exploring party, as from other perfons, efpecially'Indians, they think it right to fuggeft the neceffity of organizing another expedition to be undertaken next fummer, for the purpofe of ascertaining the nature of that tract of country which lies behind the chain of mountains seen from the River St. Lawrence, in a north wefterly direction.-The Expedition in queftion would ascend the River'St. Maurice as far as the River Mattawa and thence continue to proceed towards the weft, and come out either
either by the River aux Lièvres on the River de la Petile Nation, which run into the River Ottawa.

The Commifioners lay their Accounts before the Houfe, ac- ' companied by vouchers, \&c. under the letter $C$. by which it appears that they have in their hands a balance of $\neq 9616 \mathrm{~s} .10 \mathrm{~d}$. out of which they have to pay feveral accounts which they have not yet been able to procure, but which cannot amount to a fum equivalent to the faid balance.
Before they clole their Report, the Commiffioners think it right to add, that Mr, Adams, as well as Mr. Ingall, have respectively performed the duties assigned them, in fuch a manner as to deferve the higheft praife for the affiduity, perfeverance, enterprife and talent which they have difplayed; and the Commiffioners, in confideration of the fervices performed gratuitously by Mr. Ingall laft year, and the facrifices he has made by again giving his fervices gratuitously during the prefent year (he having a numerous family to fupport), thought it right to prefent him on his return from the expedition, with a fum of money equal to Mr. Adams', for the prefent year, and they flatter themfelves that the ftep they have taken will not be diffapproved by the Le gislature.

The whole nevertheless humbly fubmitted.
Quebec, 28th February 1831.

## T. POTHIER,

Cornmissioner for the Exploration of the country fituate between the Rivers St. Maurice and Ottawa.

Memorandun for the guidance of the party appointed to continue the Exploration of that tract of country fituate between the Rivers St. Maurice and Ottawa, under Act of the Provincial Legislature; 19th Parliament, 3d Seffion.

The Commiffioners named under the Act of the preceding Seffion of the Legislature for the conducting of the Exploration of the country above mentioned, having been re-appointed to carry into effect the enactments of the laft Seffion, for the continuance of the fame fervice, have much gratification in being enabled again to place its fulfilment under the skilful direction of two of the fame gentlemen who laft year accomplifhed the task with acknowledged credit to themtelves; the fatisfactory refult of their affiduous labours and scientific obfervations having fo fully met the approbation of the feveral Branches of the Legislature, that with the enlightened view of enlarging the fund of information gained by the interefting refearches thus com:nenced, a frefh appropriation of monies has been granted for the furtherance of the examination of the tract of country lying between the Rivers St. Maurice and Ottawa, with a view to afcertain the extent of its refources and capabilities.

The Commiffioners having been fo fortunate as again to obtain the valuabie affiftance of Lieutenant Ingall, of His Majefty's 15th Regiment, who laft year granted them the favor of his gratuitous and effective fervices, and a.fo to fecure the profeffional talents of Mr. Adams, Surveyor, to whom they are happy to confide the prolecution of an undertaking he has moft ably commenced, have but thort inffructions to communicate to thefe gentlemen, their paft experience being sufficient to guide them as to the general conduct of the party, and of all minor particulars in the arrangements. The objefts held in view as to the iffue of the fervice are alfo fully known to the Gentlemen Explorers, who will pleafe to keep in mind the feveral explanatory converfations they have held on the fubject with the Commilfioners ; it merely remains to impress the primary importance of afcertaining as far as possible, the profitable points which the tract of country to be explored may poffess as to the means of facility in communication ; the moft direct and facile lines of toute it
may offer, and the extent and nature of any intervening obftacles The comparative difference between the facilities of the land and water communication thus offered will be of fome importance, and much confideration is due to the natural advantages of cultivable loil, good timber forefts, advantageous water scitef, rich evidences of mineral produce, $\mathcal{O}^{\mathrm{c}}$; in fine, indications of tome refources fpringing from the prolific boons of nature, fhonld be the land marks to be adopted, in thus forming a sketch of the moft eligible direction of communications to be hereafter opened. The feveral ufeful and fcientific.purpofes on which the general attention of the Gentlemen Explorers may be beftowed, are too .well known to themfelves, to need direction or comment on the part of the Commissioners.
The party will proceed to Grenville and from thence through the tract of country that lieg behind the exifting fettlements (between the River Ottawa and the River st. Maurice) until they reach Three Rivers, diverging according to the beft of their diferetion into whatever lines appear moft favorable to the object in view.
The Commissioners will have duly provided for the fupplying of the Party with all neceffary provifions at fuch places of de pot as are fcattered thro' that part of the country, and with the equipment already prepared for ftarting, truft the party will accomplish their route without being laid under unnecefläry hardships.

Arrived at Three Risers, the Gentlemen will pleafe to give intelligence to the Commissioners who will feel gratified in releasing the party from labours that they have reaton to hope will be fulfilled in a mariner to prove alike honorable to the Gentlemen Explorers, and advantageous to the public fervice.

Montreal, 20th Sept. 1830,

Signed,
$\left\{\begin{array}{l}\text { T. POTHIER, } \\ \text { P. DE ROCHEBLAVE. } \\ \text { F. ANT. LAROCQUE. }\end{array}\right.$

Certified,
T. POTHIER,

For Lieut. Ingall, 15th Regt. and John Adams, Reqr. Surveyor.

## [B.]

The Commefioners for exploring the St. Maurice counery, having been re-appointed in the fummer of One thoufand eight hundred and thirty, fent Inftructions to Lieutenant Ingall, 15th Regiment, and John Adamg, Efquire, Surveyor and Architect, to proceed to Montreal ; in which City they arrived on Monday the twentieth day of September. The men for carrying the provifions, \&c. came on the following day.

Every thing being finally arranged, and the gentlemen having received their Inftructions, the party left Montreal for the head of the Grenvilie Canal, on the River Ottawa, from which point the Expedition was to commence its operation. They reached Grenville on the twenty fifth day of September, and immediately emploved themfelves in gaining all the information poffible, relative to the country immediately adjoining the village. Having afcertained that a fort of wood-road extended as far as the houfe of Mr. Lang on No. 1 lot, 5th range of Grenville, the neighbourhood of that fpot was determined upon as a point of departure, and from the following day the Journal begins.

Names of Voyageurs employed:-Dumas, fon of the Chief of the Lorette Indians,* Antoine Lefevre dit Beauclerc,* Alexis Boifrert,* Ambroife Beaulard, Jacob Collins, John Colling and Benjamin Collins

[^0]
## JOURNAL.

SEptember 26th 1830 .
Grenville Canal.
The early part of the day was cloudy and damp, but towards the afternoon it cleared up: We went to examine the black lead mine, fituated about four miles and a half to the north eaft
of the Village of Grenville. We followed the road leading round the bay for about one mile and a half, and then paffed over a fwamp for about one mile, and ascended the ridge of hills. two miles farther; balf a mile beyond the fummit of the ridge, is fituated the mine. The vein is rich, and near the furface: it is imbedded in a fienitic formation, and is affociated with sahlite and fphine. The mine altho' rich, does not appear to have been worked with fpirit or fuccess, probable in a great meafure owing to the want of a proper method in cleanfing the metal from the rocky and earthy particles with which it is fo intimately blended.

The fcenery in the neighbourhood is beautifully diversified with hill and dale, well watered with ftreams, and in parts fettled,

September 27th.
Heavy rain the whole day.
September 23th.
The morning cloudy, but no rain. Hired a cart to convey our stores, \&cc. to Lang's houte, on lot one, rang fifth, in the Townfhip of Grenville, confidered about fix miles from the head of the Canal in nearly a N. N. Eaft direction. We paffed over a level country in part fettled. Soil and Timber good. About four miles from the village, we went clofe to the eaft end of a mountain, which terminated in a precipice of granite; at its bafe was formed a terrace. The cliff was about fixty feet high, and the fummit was not commanded by any higher ground; it appeared altogether admirably adapted for 3 military position. Shortly after, we croffed the fmall river Kingham, and reached. Lang's farm at five o'clock in the evening. Here we fixed our firtt camp.

September 29th.
The night was very cold, and the thermometer at fix o'clock in the morning tood at four degrees below freezing. At eight o'clock in the morning, we ftarted from our camp and eutered the the buth, accompanied by Mr. Lang, who shortly after pointed
out the line dividing Chatham from Grenville. Having attained this point, we commenced cutting thro' the bush, in a direction north, fixty-feven, forty-five eaft. The land trom the clearance to the line, was level. Soil good; timber, beech, maple, bass, fome black birch, and hemlock. The plan purfued and fixed upon for future operations, was to employ half the men under Dumas, the Indian, in planting the pickets, blazing the trees and clearing away the bruinwood; the other half of the men were employed in carrying the fores and inftruments; while $\mathbf{M r}$. Adams and Mr. Ingall dragged the chain, naking their remark. every five hundred feet, fometimes less, as circumflances required After mealuring a short diftance, our line ran along the bafe of a racky hill, but clofe on our left was a level tract, well adapted for a road. We made a very gradual ascent to the fummit of the hill, and proceeded over a flat, for about a mile, and then entered a fmall, and net bad fwamp; through it ran a fream of very clear water, about twelve feet in width, which we crolfed on a tree, clofe to a rapid. Timber, principal y balfam, fpruce and hemlock. Mr. Lang had accompanied $u_{i}$ (.ending affillance with his axe) unil two o'clock, when he bade u, fareweil, leaving us much pieafed with the pub ic fpirit he had fhewn. The ftream we had juift croffed was called the weft branch of the Ealt River The north eaft side of the river role gently to a moderate height thickly covered with beech, birch and maple, with a fmall fprinkling of balsam and fpruce; foil good, and free from rocks We encamped for the night on the fide of the small river in a grove of beech and map'e, so clear from brufhwond that the fpot affumed the appearance of a Park The evening was fine. Thermometer at eight o'clock, thirty fix 3 wind welt.

## September 30th.

Towards morning the wind blew from the north weft ; at six o'clock the thermometer fell to thirty-two degrees. After breakfaft, we continued cutting, and went two thousand eight hundred feet over good and level land, with only one very triting descent. We crofled in this tract a broak running sourh eaft, we went Come'difance over the fame defcription of fine land, until we came to another gentle descent, where the land becane a little rocky, but the foll extremely good. Timber-beech, bals, maple and black birch ; rock, sienite. The land now became gradually
more encumbered with loose angular fragments of sienitic rock, and we fhortly defcended twenty feet, rather abruptly, into a cedar fwamp. This fwamp was neither long, or bad, and the mere cutting down the ftanding timber and clearing away the fallen trees, would almoft effectually drain it. theaving the fwamp, we afcended a fmall rife of land, and again came among hard wood and on level ground. Continuing our line acrofs this flat for a thort diftance, we defcended gradually into a hemlock grove, which terminated in a very fmall swamp. This we foon left,and croffing a low hll, ftopped to dine in a beautiful beech grcve by the fide of a brook. The thermometer had rifen twenty degrees, and food at twelve o'clock at fifty two.

After dinner, we croffed another fmall brook and afcended a gentle flope covered wirh hemlock and foruce, and reached a flat, over which we proceeded three hundred feet, with only one very trifing defcent ; this brought us to the foot of a fmall hill, which we accended, and faw an extensive windfall in a valley ciofe on our right. The foil was good but encua:bered with bou'der rock, : timber - beech and maple ; fifty feet onwards we began a gentle defcent of thirty feet; soil and timber fine. Ai ha f pait four, the rain fell heavily, and, ateer proceeding over a level tract one quarter of a mile, we encamped for the night at a lititle paft five r'clock. At eight o'clock the thermometer ftood at fifty six.

## October 1ft.

Thermometer at oix o'clock, forty two. Commenced our march at eight o'clock, and entered a tmall fivamp, one hundred feet beyond our Camp. The fwamp measured eight hundred feet acrofis and had a fmall brook running through it : timber, hemloek, balfam, fome birch and beech Leaving the fivamp, we agan crofsed a brook, and pafsed over fifty feet of level good land; fifty feet onwards the ground became rocky and a little rough, but the foil a good marle, bearing some fine beach and map'e. The country was more level about ten yards to nur left; and appeared very low, close on our right towards the outh. Purfuing our march a fhort diftance, we cane to a rather abrupt deffent for about fifly feet; the flat land' on our lept became fomewhat fwampy. From the edge of a fractured sienitic chff,
cliff, fifty feet in height, on the right of our line, we had a fine, view of the country round. Its general feature was hilly, but not a continued ridge ; on the contrary, the land feemed broken into fmall hummocks, running in various directions, although their general dip appeared to be towards the south eaft. The fides and lummits of thefe hills were covered with hardwood, and the low bottoms with hemlock, fruce, \&c. At a diftance, to the south, the country affumed a mountainous appearance. After making our notes, we meafured down a gentle defcent two hundred feet, and came fuddenly to an abrupt precipice sixty feet high. A road might easily be carried round this cliff, either to the north or south, and within a few yards of our line. After descenaing the cliff by going about three hundred feet to the north, we ftopped to dine, and then walked towards an opening which we found to be a clearance on Lot 19, 7th range, belonging to a Mr. McMartin. We returned and continued on to Lot 17, which was in our line, and fixed our Camp for the night, at the edge of the clearance. This farm, belonging to Mr. Carruther, was seated in a bason-fhaped tract of land, furrounded by rather abrupt, but not very elevated, hills; the fummit having the fame broken appearance as those we already paffed. The sides of thefe hills in some places, exhibited the fractured face of a sienetic precipice. In fome inftances the hornblende totally disappeared and its place being fupplied by mica, converted the rock into a course granite. The bed of the basin was not a perfect level, but gently undulating, and had a fmall fream running through it in a southerly direction. Mr, Ingall ascended one of the cliffs, about eighty feet in height, and enjoyed an extensive view, north and south. The form of the land was of the fame broken character before noticed, but ratlier more hilly and precipitous towards the north. There would be no difficulty in carrying a road in this tract, by passing round the base of any of thefe fmall hills. The foil on this lot appeared to be a very light poor fandy land, but it bore, among young balfam, birch and fpruce; a great guantity of fine beech and maple. This fand was doubtlefs a deposit over marle, as the foil in the lower parts was much fronger. At eight o'clock the thermometer stood at forty.

October 2nd.
The 'Thermometer at six o'clock, thirty four. Early this morning we had a visit from one of the fettlers, who informed us that by continuing our line, we fhould come out very near a farm belonging to Mr. McAllum; at the fame time offering to convey our feare provisions to that point, diftant, by a road four or five miles; thisofferwegladly accepted, and fent Boifvert in charge. at eight o'clock we commenced chaining acrofs the clearance passing over tolerably level ground clofe to the right of the mass of rock Mr . Ingall had ascended the evening before; and immediately entered the bufh. The first part of our journey from the clearance was three hundred and fifty feet acrofs a cedar swamp, from thence alcènding a fhort diftance we continued across a level tract five hundred feet, and reached the foot of a cliff about forty feet high. The timber frots the swamp to this cliff was beech and maple ; soil good. To avoid this cliff we went two hundred feet to the right, and then continued our line for eight hundred feet over level well wooded land. Coming again to very rough ground, we fruck two hundred feet to the left in continuation of our old line. The land defcended gently for eighteen hundred feet to the borders of a fmall rapid river about sixty feet wide. This we afcertained to be the main branch of the weft River. In order to crofs we felled a large tree, but the current inftantly carried it away. We defcended about fifty yards lower and felled another, which fortunately reached fufficiently far 'across to hold firm; and having moved all the ftores in lafety, we dined on the eaft fhore. About three hundred feer below the spat where we crossed, the River became much narrower, and rufhed over a very pretty fall. Below the fall two rocky points approached fromopposite sides of the River until within twenty or twenty five feet of each other; thefe rocks would make good abutments for a Bridge. After dinner we proceeded over fifteen hundred feet of iwampy land, and then gradually aicended five hundred feat rocky land, and two handred feet fteep and rugged, which brought us to the fummit ; and we then defcended two hundred feet to a flat fpor. Within a few yards either right or left, wound a fine level valley through which a road might pafs; nor did the swamp appear to extend any great diftance north or south. We proceeded onwards five hundred feet, when night closing around, we bivouacked ; the party having tailed in cutting fo far as McAllum's
clearance, At six oclock it commenced raining and continued all night accompanied by fome peals of thunder. Towards morning the wind shifted to the north and blew with great fury; and the Thermometer fell a few degrees below freezing.

## October 3d.

A clear morning, with a ftrong north wind, freezing hard. Having nothing to breakfaft upon this morning, we commenced work at half paft six o'clock, and proceeded one thoufind feet along a gentle flope into a valley, which we crosced for five hundred feet, and then over a rugged hill five hundred feet more, the valley winding round towards the eaft. The foil was good, and. except on the hill, free from rocks, timber, beech, and maple. The rock contained more it on than usual. We crofed a very fhort fwamp and comtinued gencly defcending; a fine lake on our right. The timber good, but the land rocky. Some slight squalls of snow in the course of the morning Observing it look lighter towards the left we proceeded a fer yards in that direction and found ourselves in a clearance, which we ascertained to belong to Mr. M*Giblon, and the adjoining one to the south was Mr McAllum's, both in the twelfth range of Chatham We had come out on the fummit of a high and iteep hill well cleared $t$, the top, and commanding an extensive and nob'e view. The land to the north and north weft fitll retamed the Game broken character ; but to the south it was lower, and we could, from one eminence, clearly distinguish the high lands on the fouth fide of the Ottawa. An extensive valley was in front of uc, but its direction was more to the north than the line we wished to purfue ; however, before positively deciding, we refolved to gain the fumnit of a mountain which appeared about three miles in advance, and over which our line would pals. We ordered the men to get the carap fixed on McAl um's land, while we went to the momeain, taking Dumas theIndian with us, and accompanied by M•Allum and M•Giblon. We pafsed over a level tract for about bulf a league and came to a fmall River, which we crossed by felling a tree, and then graduaily aso cended a rocky hill. Upon gaining the summir we at once determined upon continung our line atong the south side of the hill, and blazed a large pine tree as a point of departure; on this hill we saw two or three white oak trees. We then return-
ed to our camp. The foil of this farm was light but good, and refted on a rock of primitive limestone, abounding in carburet of iron. The Setters make a tolerab'e living on thefe lands, although they were decidedly the most monntainous and rocky of any we had hithertofeen. The only road they have, was in fuch a miferab'e state, that our man was obliged to procure a fecond yoke of oxen and cart to convey the stores we had fent round, in order to reach M‘Allum's by night fall, Thefe two farms were the last Settlements north in Chatham.

## October 4th.

It froze feverely all night with a high north west wind. Thermometer at six o'clock, twenty nine degrees, -We started at eight o'clock, and proceeded towards the tree we had marked the preceding evening, and which was fituated in the Townhip of Wentworth, not fir from the Chatham tine. The fmall River we had thrown a tree over yefterday was a fecond branch of the Weft River, and wound $i^{2}$, rapid courle among rugged hills well wooded with beech, hem.ock, black birch and maple The limefione, (calcareous fpar,) extended more to the eaftward than our line; it is much ufed for lime, and is said to make very good, From all appearances we fhould consider thefe sienitic hills to be the most northwestern boundary of the limestone formation. This part of the country is much encumbered with immence angulat fragments of rocks, sometimes fienite and fometme; carburet of lime. Beneath these fragments is found a good depth of lorl.

We reashed the pine tree at half past twelve o'clock and dined by the side of a fmall brook; we then proceeded one thoufand feet over tolerably level land to the side of a fmall pond about three hundred feet acrofs. We pafsed round the north end of the pond, entered a cedar fwamp for two hundred and fifty feet and came to a fine level piece of ground, eight hundred feet in extent ; covered with beech, black birch and maple. Soil a good marle Here we crossed a frall brook and gradually ascended five hundred feet of good land, well timbered, and came to a Surveyor's line, which we followed nearly three quarters of a mile in a south east direction, and came to the shores of a lake. We returned to our own , line and encamped in a beecli grove for the night. It had blown a gaie all day and we passed by
fome extensive windfalls. Towards night the wind lulled, and the Thermometer at eight o'clock stood at fifty-two.

October 5th.
A fine and calm morining ; Thermometer at six o'clock, forty eight. At eight o'clock we commenced chaining and passed over fifteen hundred feet level land covered with hard wood, and then came to a fmall declivity. Among the timber we noticed some butternut hickory. We crossed a wood road, and continued a few hundred feet gradually defcending among beech, maple, black birch and hemlock, into a fmall valley of cedar and hemlock. From this valley we afcended abruptly three hundred feet, and paffed along a level tract five hundred feet; foil good, bearing hard wood. Once more we defcended two hundred feet rather gradually into a fmall hard wood valley, terminating in a fwamp, which we left, after following it a few hundred feet, as we faw a dry ridge of land three hundred and fifty feet on our left hand. On gaining the ridge, we fixed upon a fpot among a grove of balfam trees for our camp; and while part of the men were bringing up the provifions, we continued cutting on thro' a very thick grove of trees, and over rugged ground; at a quarter paft five we returned to the camp. The views from the lummits of all the high lands we had palsed this day was grand and extenfive. The broken form of the land reminded us of many parts in the weft of England. To the north and north weft of the ridge we were encamped upon, lay a fine valley of hardwood winding in a foutherly direction towards our line, and gradually ascending towards the north eaf until it met our line a few hundred feet in advance of our camp It fruck us that nearly all the broken ridges we had pafsed had a general north eaft directionSome rain this day. Thermometer at eight o'clock, thirty three.

## October 6th.

Laft night was frofty. Thermometer at fix o'clock, three degrees below freezing. Started from our camp at a quarter before eight o'clock. After chaining over two thoufand three hundred feet of rough land; (and indifferent timber;) we pafled to the left of a fmall lake. Among the brufhwood we obferved fome of that curious fhrub the boisplomb or lead tree of the Canadians.

The land improved on paffing the lake for a few hundred feet when we entered a level of good land bearing beech, birch, mapl, and balfam ; four hundred feet beyond this flat we croffed a ftream, and entered upon a clearance, but no inhabitants. The owner of this land had cleared up the fide of a mountain extremely steep, and from the tap embracing a view of great extent, as far fouth as the hill in the vicinity of the Lake of the two mountains. The rock here was a pure white quartz containing fmall cryftals of common black iron-ore. At the foot of this hill towards the eaft was a fmall lake. Our line ram nine Kundred feet along the steep fide of the mountain, and five hundred feet along the fummit; thence over a cliff of course sienitic granite, twenty five feet high. Timber, beech, maple and some fpruce. Our men conveyed the stores along the flat land between the foot of the mountain and the lake until they gradually ascended. into the line. We'next measured over cight hundred feet of rough and rocky ground, gradually ascending and thickly covered with beech and maple; a few huadred feet along the top of this hill we came to a Surveyor's line, which we followed down three huadred and fifty feet, and saw a Post marked as the second concesfion in the gore. We then returned and chained three hundred feet on our, own line, over level land, and encamped for the night. Timber, beech, birch and maple. 'Soil a strong clayey marle. Thermometer at eight o'clock, thirty three.

## October 7th.

A sharp frosty morning, Thermometer at fix o'clock, thirty. Started at feven oclock, and chained six hundred feer ozer level land, to the shores of a Lake running east and west. Two men conveyed the ftores oper on a raft, while the rest of the party walked round the east end of the Lake crossing the discharge, which was small. On the opposite side of the Lake was a clearance belonging to Mr. Good. We chaine one mile, over level land covered with hard wood, and entered another clearance belonging to Mr MrFoyle. On this farm we again noticed the lime rock containing carburet of iron (black-lead); and anong the timber some fine elms. In the neighbourhood of this farm are feveral Lakes, abounding in trout. We continued on foyr hupdred and fifty feet of gather rough land, and fifty feet swamp; then acrofs a fine level, five hundred feet, and descended into a
small valley of beech and maple. This we fixed upon as our encamping place, there being water near. We kept working on until the evening, and then returned to the Camp. A fine evening. Thermometer at eight o'clock, thirty-four degrees.

## October 8th.

Thermometer at six o'clock, thirty six. Left our Camp at seven o'clock, and chained over level ground fitteen hundred feet, into a moist valley, eighty feet acrofs, and then along level land, twelve hundred feet more. Timber, (the whole way) beech and maple, with a few spruce and balsam trees. Two hundred feet more, brought us into a fpruce fwamp which we crofsed for one thoufand feet, and then gently ascended over good land three hundred feet. .The fwamp was not by any means of a bad description; after gaining the last ascent we gradually descended to the shores of a fine Lake. After dinner we went round the south east end of the Lake, and continued cutting on our line. The first fifty feet from the Lake, was rough and ascending; but for two thousand five hundred feet beyond, the land was level; the soil a fine marle with a good depth of vegetable earth ; and the timber principally beech and maple. We named this fine Lake, Lake Richardson, in compliment to the Honourable John Richardson. We encamped near the Lake for the night atour usual hour, five o'clock.

## October 9th.

Thermometer at six $0^{\circ}$ clock, forty. Commenced our march at seven o'clock, and chained over three hundred and fifty feet level land, bearing beech and maple, intermixed with some hemlock and spruce; we then descended gradually one hundred feet into a swamp which had a small ftream rupning through it, and measured four hundred and fifty feet acrofs. From the edge of this swamp the land ascended two hundred and fifty feet, and then continued level for one thousand feet; Timber, beech, black birch, hemlock, balsam and maple. Another thousand feet of moderately level land brought us into a cedar swamp, eight hundred feet across, and like most of the swamps we had pafsed, capable of being easily drained. The timber was cedar, larch, balsam
balsam and hemlock; a small beaver meadow was seated near the west end. We then passed over twelve hundred feet of level hardwood land. Soil good, but encumbered with boulders and angular fragments of rock: (Sienite containing some iron, and but little hornblende.) After dinner we crossed a moist piece of ground one hundred feet, and ascended gently three hundred feet; thence over two thousand feet good and rather level land; Timber, beech, birch, maple, spruce and balsam. We then crossed eleven hundred feet of extremely fine land, level, with the exception of one slight descent, and covered with large beech and maple trees; here we encamped for the night by the side of a brook. Thermometer at eight o'clock, forty-four degrees.

## October 10th.

Thermometer at six o'clock, forty-four degrees. Started at eight o'clock, and measured over three hundred and 'fifty feet of level, and fifteen hundred feet of broken, ground, thickly wooded with beech and maple. We then passed over five hundred and fifty feet flat land; Timber, hemlock, spruce and balsam; $;$ this brought us to the shores of a Lake running east and west.On the north east side a small River discharged into the Lake. On the west shore we saw the lime rock (calcareous-spar,) formation containing carburet of iron. It seemed to form the bed of the Lake. The shores of the Lake rose in broken hills of a picturesqueappearance, well wooded with beech and maple interspersed with small groves of black timber. The shores were occasionally deeply indented with bays We pafsed round the east end of the Lake, and crofsed the discharge over a fallen tree. This discharge spread out into a small pond, and then became narrow; the timber was beech and maple. ${ }^{\text {b }}$ We went along the side of a hill one hundred feet, then over a flat tract of fine land eighteen hundred teet, and five hundred feet along the side of another hill; Timber, beech and maple; Within a very short distance, at the foot of the hill, the land was quite level, and this fine valley of hard wood appeared as we looked back, to extend a considerable distance, inclining towards our line and evidently joining it not far from our last night's encampment. Three hundred and fifiy feet more, gently descending, brought us to a small rise of land which we ascended. Finding some water close at hand, we dined, and afterwards crofsed a wind-fall for nine handred feet, perfectly
level land. This terrific effect of some sudden rush of wind, appeaired to be of somewhat recent occurrence, and extended up a steep hill for a very considerable distance; scarcely a tree in the whole tract was left standing. It cost us great labour, with many falls and biruises, to crofs these fallen trees. The land continued level twib hundred and fifty feet; Timber, beech, maple, and a few ash and elm trees : soil good. Our line then ran along the side of a hill fifteen hundred feet: Land rough and rocky: Timber principally beach. Here we encamped. Thernometer at eight o'clock, thirty seven.

October 11th.
Thermometer at six o'clock, thirty-three. Commenced work at seven o'clock by ascending gradually fifty feet, the ground then became rugged and led to a steep rocky mountain. We descended fifty feet into the valley, and passed over eighteen hundred feet of middling land, to the shores of a Lake running north and south; the discharge at the south end. The timber around this Lake wàs mixed, but consisted principally of beech, ash and elm. We passed round the south end of the Lake, and then continued our line a fetw degrees more to the southward, as the Country torth of us appearedto be rocky and mountainous. After crossing two huadred and fifty feet of level ground we descended abruptly one hundred and fifty feet into a valley, eight hundred feet actoss: Soil good but rocky; Timber, beech, black birch, maple and balsam;-the last two hundred feet of the valley was moist ground. We next accended very gradually three hundred feet, through a beech grove, and continued one thousand feet over tolerably level and good land, with the exception of two Ravines. Eight hundred feet level land brought us to the end of a precipice formed of fine granite sienite, eighty feet high. Our men made use of pieces of this rock to sharpen their axes. We went a liftle to the south and found a very easy descent of one hundred feet in length, this led us to a swamp three hundred and fifty feet actross. We left the swamp by a gradual ascent of one hundred and fifty feet, through a grove of young beech, and again gradually descended five hundred feet into a small valley, where finding some pools of rain water, we fixed our Camp for the night, Thermometer at eight o'clock, thirty nine.

- Thermometer at six o'clock, thirty three degrees. Proceeded on our march at seven o'clock, and traversed one thousand feet of the same description of Country as that examined yesterday afternoon. We noticed in the boulders of coarse granite which lay scattered about, some beautiful crystals of glassy felspar. Aftet crossing five hundred feet of low land, watered by a small brook, and covered with large hemlock trees, we came to flat but rocky land bearing beech and maple, which after chaining seven hundred and fifty feet terminated in a swamp two hundred and fitty feet across. We then passed over two thousand and fifty feet of good level land, a little rocky in parts; Tunber, beech, and maple --Then entered a swamp three hundred and fifty feet, not bad. One hundred feet more, ascending and over a windfall, brought us on level ground, which continued seven hundred feet with the exception of one very gradual descent; Timber, beech, and maple. We now entered a natural meadow covered with dried grass, on the shores of a small Lake. The fire had pasted along this part of the Country. The meadow measured five hundred feet across to the swampy shores of the Lake. To clear the Lake we went seven hundred feet to the north, and continued seven hundred feet in our line close to the water side, and passed several old Indian encampments. We next crossed a fwamp, two hundred and fifty feet ; four hundred and fifty feet, dry level land, and two hundred and fifty down a rugged fteep into a valley. Leaving the valley, we croffed an alder meadow, eight hundred feet, watered by three ftreams; then over a rough hill, two hundred feet. About ịhirty feet to the north was a fmall valley where a road might be run to as to avoid the rough ground. Two hundred and fifty feet into low ground, and one thoufand feet gradually afcending, brought us to the fummit of a hill. From this place we could plainly trace the winding of the valley mentioned above, clofe to us on the north: Timber, beech and maple with fome hemlock and birch. Encamped on this hill for the night. Thermometer at eight o'clock, fortysix.

October 13th.
Thermometer at fix o'clock, thirty-five degrees, Consmenced
our march at feven o'clock over rather rough ground for three thoufand feven hundred and eighty feet; the foil was a good marle ; timber, beech and maple. Fifteen hundred feet more of fine land, leve!, and well timbered, brought us into a clearance. The view that burft upon us was extremely beautiful; a large valo ley lay extended in our front, furrounded by high hills, broken into various forms; about one mile to the north weft the country appeared rugged, the hills terminating in rocky precipices; but nevertheless the fummits and the less precipitous fides were thickly covered with hard wood. We faw fome Canadians who ins formed us that we were clofe to the North River and among the moft northern fettlements on that river; fome of the people alfo told us that the place was called Dumont's Seigniory; while others called it Abercrombie. Two thoufand three hundred feet from the edge of the clearance, over rough ground, generally descending, brought us to the North River, where we found a canoe The river at this place is about one hundred feet wide. We confidered it fortunate in friking upon the river at this point, for to the north, the land appeared to be so mountainous and rugged, that probably we might have explored a confiderable diltance ere we should have met fo favourable a pass. We dined on the eaft fide, and croffed over fix hundred feet of clearing, and then entered a cedar and hemlock grove (for fwamp it could not be called) and chained feventeen hundred feet more, when we encamped for the night in a heavy fall of rain and ftorms of wind, which continued without interruption throughout the night. At eight o'clock the thermometer tood at fortysix.

## October 14th.

Thermometer at fix o'clock, fify. Towards morning the wind had fallen and a fettled rain had fet in, this continued all day, and we did not think it advifable to run any risk of our provifions, therefore refolved not to fir this day. At eight o'clock the thermoneter was fifty eight. At ten o'clock a tremendous gale of wind from the north weft paffed over us, and continued in gufts until eleven, when the clouds cleared off and the ftars shone with great brilliancy.

## OEtober 15th.

Thermometer at fix o'clock, forty-fix. The morning cloudy and frequent showers of rain. At nine o'clock it cleared up, but short. ly after again became cloudy and the rain fell in heavy showers. At half paft eleven the rain ceafed, and tired with waiting for a decided change, we determined to push on, giving our men inftructions to preferve the flour as much as possible from the wet. A.few yards from our camp we ftruck upon an old Indian path which ran in our direction; we took advantage of this, and followed it for about two miles and a half; the path led us over level, and rather good land, to the fhores of a beautiful lake, containing four or five very pretty Ieland: the timber on the north and west fides of the lake was principally hemlock, spruce and ballam; but the high lands were covered with hard wood. On our reaching the lake we encountered a heavy thunder form, and it being within half an hour of fun fet, we encamped tor the night. Thermometer at eight o'clock, thirty nine. During the night, hail and rain.

## October 16th.

Thermometer at fix o'clock, forty-two; the morning cloudyAt half paft feven o'elock, a ftrong north weft wind iprung up, and cleared away the clouds, and we proceeded on our journey; at first, passing round the south east end of the Lake until we came oppofite where the men had cleared down to the water edge. The land at this end of the Lake is level. Leaving the Lake, the first five hundred feet was upa rocky hill of rather abrupt afcent, and then five hundred feet tolerably level; timber, beech and maple. We perceived another lake clofe to our right, and had doubts whether our line would not strike upon it; but after chaining five hundred feet more, gradually defcending, we found ourfelves at the N. N. West end of it. The lake was long and narrow. The next five hundred feet was over level land, encumbered with a great number of fallen trees: thofe standing were spruce, cedar, balfam and a few pine. Two hundred feet more over a sriall Hill, and three hundred and fifty feet across a flat, broughe us to the foot of a steep aclivity, one hundred and fitty feet to the top; as usual a small Valley on one side, gradually ascending round the Hill. We then pro-
ceeded five hundred feet over rough ground to the summit of the Hill, and five hundred feet flat. Then a gradual descent to the edge of a precipice thirty feet high. Before descending into the Valley at the foot of the cliff, and which was a continuation of the one we had before crossed, we enjoyed an extensive view of the Country for many miles to the North and North East. The sides and summits of the Hills appeared to be covered with hard wood, with occasional patches of Black Timber in the Valleys The Hills were broken, but seemed to have lost much of that rugged mountainóus appearance we had noticed before reaching the North River. On going a few yards to the right we found a practicable descent into the Valley, and continued over level ground three hundred and fifty feet; Timber, beech and maple. We gently descended one hundred feet, \& made a gradual ascent of four hundred feet more. Bix hundred feet of flat land through groves of Hemlock, Spruce, Balsam and Beech, led us into a swamp seven hundred feet long, with a small Brook running through it. We then ascended gradually one hundred feet, and crossed a smallridge, and piece of swamp, to another gradual ascent of five hundred feet; Timber, hemlock and cedar. Three hundred and fifty feet more, very rough ground, brought us to a Surveyor's blaze. We ascertained this to be the Town line of Kilkenny, and encamped near the post for the night. We followed the line towards the North for some distance, but the land was extremely rough, and had in parts been destroyed by fire. Thermometer at eight o'clock, thirty-fwo degrees.

## October 17th.

Thermometer at six $0^{\circ}$ clock, thirty two. A fine and frosty morning. Our object now was to descend the Line,and get to the Settlements which we knew to exist between the sixth and seventh, or sixth and fifth Ranges, in order to get at our supply of provisions agreed to be sent to the House of Mr. Fall in New Glasgow. We otarted at seven o'clock and descended the Town lipe as far as a small Lake. We then went to the North East \& soon reached anather lake; we again delcended between the two, and fording the dilicharge, continued downwards to the farm of Mr. J. Fraser, on lot twenty-feven, fixth range. Leaving our fores and inftruments in Mr. Fraser's charge, we proceeded to the Houfe of Mr. Fall in New Glasgow, six miles diftant; not finding the provi. fion
fions depofited there, we proceeded three miles lower, to the Mills of Mr. Lloyd, who received and entertained us with great hospitality Thefe mills are feated on the River Achigan.

## October 18th.

This morning the provisions arrived ; and at two o'clock, having procured a cart to convey them to the termination of the road, we started on our return to Kilkenny, the whole party highly gratified with the kindness and attention displayed towards us by Mr. Lloyd. We coriveyed the storea through the bush from the end of the road, and reached Frasel's clearance at a quarter past five o'clock, and fixed our camp at the edge of the busth.

$$
\text { October } 19 \mathrm{~h} .
$$

Storms of wind and rain all night ; which continued throughout the day. While the men were repairing their tattered clothes, we walked through the bush to the Lake Achigan, a remarkably fine body of water; the shores picturesque and well wooded; on he south sioe is some red pine. This lake is celebrated among the setters in New-Glasgow and Kilkenny, for the fine trout with which it abounds. It lies about one mile north of the last settlement in the Tomnship. The lands around it are Crown reserven, with the exception of about six hundred acres. The timber we observed, on approaching the lake, was beech, black birch, maple, iron wood, base, hemlock, balsam and white pine. In the evening we retarned to the camp about two miles distant.

October 20ilh.
Rein the whole of this day. Received letters, E'c. by Express from the Commissioners. Employed the day in shifting the flour and pork into bags, and getting every thing prepared for a start.

## October 21st.

The rain continued without cessation the whole night, but at daybreak the wind changed to the north-west and blew very strong. Thermometer thirty four degrees After breakfast, we started for the line berween the seventh and eighth ranges, as we had determined the day, we visited the lake to follow this route, and take adrantage of the old blazes. We reached the River Achigan about half a mile below the lake, and clossed it on a tree; we had proceeded but a very short distance when we again fell in with the same river; we felled another tree and crossed it, and continued over a flat piece of ground a few yards, when to our surprise we once more met the siver, which had taken a very sin.
gular bend. We forded this bend, it being shallow. As it was near sun set, we encamped on the northeast shore for the night. The country we had passed through this day, was generally level; the soil a strong clayey marle; and the timber fine hard wood. It would be necessary to go a little farther north or south to avoid crossing the river three times. The general average width of the river is eighty feet. Thermometer at eight o'clock, thirty-seven,

## October 22d.

Thermometer at six $o^{\prime}$ clock, thirty one. Started at half past seven o'clock and continued along the line bitween the seventh and eighth ranges. We at first ascended a rough rocky. hill, a valley of hard wood about one hundred yards to the left. On reaching the post dividing lot twenty one from lot twenty two, we found the land flat, and thickly covered with fine trees of hard wood, By walking to the southward about one hundred yards, the eye commanded a fine and extensive prospect of steep ranges of hills, seeming to run parellel with our line about three or four miles to the south east. The intervening valley was level land covered with hard wood. We continued along a valley (after a amall descent from the hill) until we reached lot twenty, and thes ascended a gentle' rife, rather rocky. We then passed over a rough, but tolerably level tract of land, the roughness being in a great measure occasioned by the number of boulder stones which lay scattered about. The same kind of land, bearing mixed timber, continued as far as lot nimeteen; it then became more level to lot eighteen. Each of these lots is considered by the settlers to meeasure about one third of a mile in breadth. A short distance beyond the post, we crossed a river, and ascended a hill very gradually, as far as lot seventeen ; timber mixed. Being at the foot of a large mountain, we took advantage of a fine valley of hard wood a short distance on our right, which brought us into heline again close to lot sixtees. The mountain was steep and rocky. Fifty feet ascending brought us to the post dividing sixteen from seventeen. We passed along the summit of this small hill a few acres, and dined in a thick grove of hemlock. After dinner we entered a swamp about three acres across, and then ascended a low hill, rather rough and rocky; Timber, hemlock, spruce, balsam, beech and maple. We reached post fourteen, having missed No. fifteen. It rained, and blew with great violence all the afternoon and evening: The general character of the country we had passed through this day was sough and recky; but the soil firm, and timber large; well watered with streams. At a distance the land looked mountainous and broken, but on a near approach it lost much of that character. as the high lands had in general an ersy descent, and invariably a valley,
close, either on the north or south of the hill. Encamped by the side of a stream ; rain all the evening.

## October 23 d .

Thermometer at six o'clock, thirty three. At three c'clock this morning a heavy north west wind sprung up, and some trees were blown down in the vicinity of our Camp. Commenced our march at half past seven o'ilock, and passed through a hemlock grove, and again crossed the small stream which had ran past our camp. We continued over a level oountry, mixed timber as far as lot thirteen. This level tract of land continued for several acres and terminated in a small valley of beech and maple, bound by a hill rising rather abruptly sixty feet. We continued along the flat summit of this hill a few yards beyond post twelve, when we descended gradually, and arrived at the south east end of a small pond. The discharge was a small stream, but deep, and required a tree to cross it. The shores of the lake were low: Timberpine, hemlock, spruce and balsam. We ascended gradzally four hundred feet among pine and cedar ; the first fifty feet was-rather abrupt. This brought us to the edge of a cliff twenty feet high, it being the commencement of lot eleven, By going along a valley a short distance to the south east, this cliff and the small lake would be avoided. At the foot of the cliff began a fine valley of hard wood which we travers ed for several hundred feet, and then entered a grove of hemlock and cedar on the shores of another small pond or lake close to our left hand. This hemlock-grove or swamp, (for it was litle better,) continued as far as lot ten, and was greatly encumbered with windfallso. On entering lot ten, we passed over a level piece of land to lot nine. Timber principally birch and hemlock, with some beech and spruce. The wind had encreased and blew in heavy squalls, the trees falling around us, which kept us very much on the alert. Afier pasing over some low moist land we entered among bard wood and commenced the ascent of a hill, passing post eight. The hill was not high or steep, and we went along the flat summit as far as lot seven. The soit fine light marle; timber-beech, birch and maple. On entering the seventh lot we made a rapid descent into a level of two hundred feet width; a beautiful valley of hard wood running round towards the beginning of the eighth lot, where we had first ascended the hill. This valley extended towards the north,ppassing diagonally through the eighth, ninth,and tenth ranges; and thickly waoded with beech and maple. We descended a hill two hundred and fifty feet abruptly and crossed a River twenry feet in width. About three hundred feet beyond the River we entered the sixth lot; timber-hemlock and spruce; land gently ascending for a short distance and ending in an abrupt
abrupt descent of ewenty feet to a mall valley. The rock was quartz worn by the weather in such a remarkable manner that at first sight it had all the appearance of regular stratification. A small rise of land ran across this valley. We soon reached the foot of a omall hill covered with mixed timber ; from the summit we commanded an extensive view; close to us,on either hand,the country appeared low, bounded at some distance by high hills; in front of us also ran a range of high broken hills. We descended from the hill to a short swamp, and entered lot five. This swamp brought us to the edge of a cliff about thirty feet in height; we went a short distance on one side and descended into an alder meadow and crossed a brook; we then ascended a small hill thickly wooded with hemlock, spruce and balsam. In descending the hill we came to the edge of another cliff twelve feet high ; Rock white quartz; and came on a sort of terrace; timber-beech and maple. The fire had formerly passed over this land. We encamped for the night on a small ridge running across the terrace or vale. Here we again noticed the extraordinary stratified appearance of the quartz rock. On the south east, about one hundred yards from our Camp, a valley extended in the direction, and parallel, with our line, for a very considerable distance. Also on the north west about the same distance from our Camp was a still deeper valley which seemed to wind round towards the vale we had crossed on entering the eighth lot. The evening , was fine. Thermometer thisty one ${ }^{\circ}$ degrees.

## October 24th.

Thermometer at six $0^{\prime}$ clock, twenty eight. Started ät seven o'clock and ascended a steep and high bill to the third lot. This hill can be avoided by passing either to the right or left. From the summit the view was extengive, bounded at a vast distance to the noth and north west by a ridge of high mounrains. Descending from the hill in continuance of our line, we came upon the valley which wound round the noth west side of the hill ; the timber was mixed ; soil good, but rather rocky, the rocks containing common black iron ore. The valley continued about one thousand feet. and ended in an alder meadow. Here we entered lot two. In the alder meadow we crossed a small stream, and gradually ascended a low, hill ; near the top we went over a brook; timber, principally hemlock, spruce and balsam. About one thousand feet of tolerably level land from the top of the hill, brought us to another brook, and : shortly after enteréd lot one. This lot was much the same in every respect as lot two. We crosted over a small swamp, but but not bad, and gradually ascending from it about three hundred feet me arrived at the Townline, We found the post dividing the seventh from the eighth ranges of Rawdon. After dinner we followed the line of
the seventh and eighth ranges of Rawdon, by descending the side of a very high hill, which brought us, after crossing a stream; to the north west side of a very beantiful lake. The timber sovering the hill was beech and maple. We went round the north end of the lake over level ground, passing at'the foot of a cliff of sienite about fifty feet high, and cressing a stream of a beautifully clear water close to an old cabane. Near the cabane we crossed another stream and entered among hemlock and cedar, which snon gave place to beech and maple, and continued for about one thousand feet, fine land. Here we encamped for the night on the shore of the lake. The opposite shores appeared high and. picturesque.

## October 25th.

A hard frost the whole night. Thermometer at six $o^{9}$ clock, twenty seven. Started at half past seven o'clock and descended abruptly to the discharge of the Lake; we crossed it over a beaver-dam, and observed that the stream ran towards the north. After a short ascent, we entered lot four of Ravidon, still between the seventh and eighth ranges. We descended fifty feet gradually and continued over level land, as far as lot five: Timber, beech and maple. Soil a light sandy marle. On entering lot five the land was rough; Timber, hemlock, spruce and cedar; this rough tract terminated in an abrupt descent into a valley; still black timber. This valley will be found to run round the north side of the hill until it meets the level tract on lot four. We crossed a small brook and descended gradually about one hundred feet, and met a stream running south east; This stream wasabout eighteen feet wide. We crossed a wood path and continued on level ground for some distance, until we reached a small brook. We then ascended gently to the top of a low hill, and almost immediately descended forty feet abruptly into a small valley. The timber we had passed since crossing the stream or small River was remlock, spruce, balsam, and a few black birch trees, On entering the valley, we crossed a small stream and came out on a clearance, but uninhabited. Here we saw another wood road or path. We soon entered lot seven and ascended a very high hill; close on our right or south,east, a very easy and gradual ascent ; This high hill was covered with beech and maple. We wound round a rugged part of the hill, and entered lot eight, and then ascended over another steep and rough tract of land. On gaining the summit we perceived that a fine valley or large ravine wound close to the south east. At a great distance ina south direction we could distinguish a sheet of water which we imagined to be in the neighbourhood of Montreal, and-in the middle distance we could see a tinned Spire, and the roof of one or two buildinge glittering in the Sun:- From the height we were upon, the inter.0
vening Country appeared to be almost flat. We made a gradual descent into a valley of hemlock, spruce and cedar, and finding some water under the root of a tree, we stopped to dire. In running a road along this line, of cousse the Ravine to the south-east would be taken advantage of. After dinner we pursued our march, and found the valley end in a emall swamp, which brought us into lot nine. We could distinctly hear a fall or heavy rapid to the north. The whole of this lot was a continuation of undulating land covered principally with hard wood. Through one of the small valleys ran a brook of clear water. We ascended a gradual rise and soon entered a clearance on lot ten, and another on lot eleven. The Inhabitants were employed making ashes We left these clearances by a small path leading towards the east, and shortly after came upon another farm We then changed our course a little more to the north, and passed through a wood for about half a mile, which brought us into a cleared meadow, or strip of interval land, on the banks of the River Lac-Ouerreau. Here we encamped for the night. This fine River (which'at this place was deep and poured down a vast body of water,) owes its name to a large Lake many leagues to the north of the settlements in Rawdon, and is navigatle the whole way for canoes. Some Indians we fell in with encamped on its banks, informed us that the Lake Ouerreau was within a half a days journey of a very large Lake which was the source of the North River, and that the communication with the River Matawa and Vermillion, was close to the same Lakes. The shores where we were encamped, were low and convenient for erecting a Bridge. The banks of the River were pretty well' set. tled, and a road on the opposite side communicated with the lower parts of the-Township and the Seigniory of L'Assomption.

## October 26:h.

A frosty morning. Thermometer at six o'clock, twenty-six. Com menced conveying our stores across the River in an old canoe which we found on the west,shore. Having seen every thing safe across, we proceeded along the east shure to lot fifteen on the seventh range, belonging to Mr. Bagnal, where we succeeded in procuring a cart to convey our stores as far as Mr. Hobbs' mills on the Red Kiver. Part of the men went round with the cart, and the remainder, with their axes, accompanied us back to our line. After passing through a small swamp we ascended a hill and entered a clearance on lots fifteen and sixteen. The land continued level as far as the foot of a high and steep hill, or as is generally called, mountain. Soil clayey. We gained the summit of this hill by passing round to the south-east through a gorge, down which ran a small brook; Timber, beech and maple. On gaining the opposite side of the hill, we descended rather rapidly into a clearance. Here

Here the land was flat, and continued so to the next farm, which was on the Red River, and belonged to Mr. Hobbs. We proceeded to the Mills, and found our stores had arrived about ten minutes before us. Mr. Hobbs procured a cart to convey the stores rocnd to a Mr. Brown's on lot twenty eight, it being close to the line we were pursuing. 'After dinner we proceeded across the Red River, (which is about thirty or thirty-five feet wide,) accompanied by Mr. Hobbs, who very kindly offered to show us the most direct route through the woods to Brown's farm. Leaving the River, we passed over a small hill and soon struck upon the line between the seventh and eighth ranges. We continued in the vicinity of our line, but generally a little to the southward, over level fine land, well wooded with beech and maple. We crossed between two farms, and reached Brown's at Give o'clock, situated on lot twenty-eight, seventh range ; and four acres and a half from the augmentation to Kıldare. The air was sultry and peculiarly oppressive. The sky clouded A little past five o'clock we were assailed by a violent thunder storm, which lasted until ten o'clock. Some flashes of lightning, and accompanying peals of thunder, were terrific. Thermometer at eight o'clock, fifty-two.

## October 27th.

A cloudy sky, but symptoms of it clearing up. In consequence of our men complaining that their necks were strained from conveying heavy loads over such a rough Country, we engaged two men to accompany us for this day. Started from Brown's farm at eight o'clock, and having crossed the four acres and a half, entered the augmentation to Kildare, and continued along the front line of the first Range. On entering the first lot we passed over a small hill into a valley, and soon after ascended another hill, and continued along level ground until we entered lot two, where we passed through a hemlock and cedar swamp, with a small River running on the north east side of it. After crossing the River we came to an aldér meadow watered by a small brook. From the alder meadow the land continued level to lot three; Timber, spruce, balsam, and birch. The land was still level for about three fourths of the lot, we then ascended a steep mountain into lot four. Our men passed up a valley close on the south side until they reached the line; Timber, beech and maple. We descended on the north-east side of the mountain very abruptly into a valley in lot five, with a stream running through it, about fifteen feet wide. We next ascended a small hill flat on the summit and entered lot six. The valley now lay on the north-west side of us; mixed timber with a few pine of large size. With the exception of two or three trifling ascents and descents, the whole of this lot was level land. Soil good ; Timber, beech and maple. On enter-
ing lot seven, we crossed a small stream and passed over level, but rather rocky land, for about a third of the lot, when we came to the edge of a precipice about twerty five feet in height. Rock, sienite, atounding in quartz. On our right hand a Lake. We descended into the valley by going a short distance to the south, and continued along the level land at the foot of the precipice until we arrived at the shores of a large Lake; having crossed a stream shortly after our entrance into the valley; Timber principally beech and maple. We crossed the stores over on a "Cajou" in charge of two men ; while the rest of the party walked round the north end of the Lake until we reached the line. Ascending a small hill, passing over a flat, and ascending another small hill, brought us to lot eleven. Land good; Timber, beech and maple. The Rock was still a sienite, abounding in large masses of white quartz. Our route next lay along the side of a hill as far as lot twelve. Here the land was level for a short distance, when it rose into a small hill; on the other side a very short swamp, which we crossed, and continued over a flat into lot thirteen. Land good; Timber, beeeh, birch, balsam. and maple. From the entrance of lot thirteen we ascended until we reached the top of another hill; the land then continued flat for some distance, occasionally broken by small Ravines; until we came to a rapid descent into a valley which wound round on our right, towards the Lake we had just passed. The valley was a little swampy, with a brook running through it ; Timber, spruce, balsam, cedar, and hemlock. Here we entered lot fourteen. After procecding about four acres onwards, we came to another post marked fourteen, and dividing the augmentation of Kildare from the Seigniory of Daillebout. We encamped for the night near the last post. Thermometer at eight o'clock, forty six.

October 28th.
Thermometer at six o'clock, forty four. Heavy rain, which ended in á thick weting mist; the air at the time being close and sultry. Paid the two men we had hired, who returned home. We sent three men forward to cut and place the pickets, while the others were preparing part of the provisions to lrave "en cache." Dumas accompanied us to the southward of our line, as we felt anxious to ascertain the nature and appearance of the Country in that direction. We crossed a swamp, and accended a high and rugged hill, but the mist was so dense as to preclude the possibility of seeing any great distance, although we were evidently conciderably elevated above the surrounding Country. Descending , he hill gradually towards the south, we continued forward about half a mile, when we thought it time to return, as our men would have cut sufficiently in advance, for us to commence chaining. We proposed to Dumas, the Indian, to take us round by some other route so
as to avoid the steep hill and bad swamp we had crossed. He according. ly made a large sweep round the foot of the mountain, and then pursued his course in every' possible direction, so as to avoid every hill and swamp that came in the way. At length we began to express a doubt as to whether he had not got too far north of our line; he smiled and pointed to the Surveyor's post about ten. yards in our front, this being the point we had started from in the morning. We crossed a small brook and went to the Camp where we made an early dinner, and sent forward the three men to relieve those at work. Afrer making a secure "caché," we commenced chaining from the south western line of Daillebout. We gradually ascended one thousand feet, broken into small ridges; thence over a thouzand feet level good land and timber ; and two thousand five handred feet low and somewhat swampy ; Timbercedar, hemlock, spruce and balsam. The lard continued varying, sometimes rough and in parts level for two thousand three hundred feet more; timber-chiefly hemlock and balsam. We now reached a place where the fire had passed and destroyed all the large timber, the young growth was birch and balsam. We proceeded through this half burnt wood eleven hundred feet, and encamped for the night by the side of a small brook. Thermometer at eight o'clock, thirty five:

## October 29th. .

'Thermometer'at six o'clock, twenty six. Commenced our work at half past seven and chained over eight hundred feet of level land, and two hundred feet up the cide of a hill'; mixed timber. Five hundred feet down a rough and rocky descent, brought us to level land. A fine valley close on our left hand. The level land was seven hundred feet across, rather rocky and terminated in a descent of one thousand feet ; the first five hundred gradual, but the last five hundred abrupt Timber, of all descriptions. We crossed a brook and proceeded five hundred feet more over the same kind of rough land; soil, a light sandy marle; timber-birch, balsam and spruce. We next went over fifteen hundred feet; part an alder meadow and part roughand rugged hillocks; a narrow valley with a brook running through it the whole distance close to us. We came to a ravine with water, where we dined, and then went five huadred feet up the steep side of a mountain, among young poplar and birch. Fire had passed over this tract. We proceeded four hundred feet along a flat, and one hundred feet up a very steep ascent; four hundred feet more gradually ascending among beech and maple; brought us to the top of the mountain. Parts of this moment wete so sreep and rugged, that we were obliged to swing ourselves up by the aid of the trees. From the summit of the mountain we commanded an extersive prospect. Close at its foot on the north west side was a fine valley which
would afford a good pass for a road. This valley was bounded to the north and north west by high bills; and still farther north by mountains of a broken appearance. As far as the cye could determine, the hills beyond the valley were cavered to the summit with hardwood. To the sauth east and east the land consisted of gently undulating hills. We continned our route over five hundred feet of levelland; timberbeech and maple; and then over two thousand two hundred and eighty feet of fine land, almost imperceptibly descending, among fine groves of maple and beech : passed sugar shanties. Not finding water we returned five hundred feet and encamped by the side of a small brook. We heard a heavy roar of water to the northward the whole of the day. Thermometer at eight o'clock, thirty two.

> October 30th.

Thermometer at six o'clock, twenty six. Started from our Camp at a quarter before seven, and commenced measuring from the place we had left off at last evening. Fourteen hundred feet of level good land, brought us suddenly upon the edge of a precipice composed of a light marle; and about two hundred feet in height. The timber we had seen this morning was chiefly young poplar. At the foot of the precipice ran a rapid river, which, about a mile to the northward, tumbled over a rocky height. Beyond the River the country appeared more level, with the exception of one high hill near the river side. We ascended the precipice to a strip of interval land, along which we found a shanty road. We followed this road for about three quarters of a mile to the south east, and crossed several deep ravines gradually leadng up the hill; but could not find any more favourable place for crossing than where we had descended the precipice. We sent five men back to the augmentation of Kildare, for the stores we had left there; and the other two set to work to make a raft, which was finished by dinner time; when we crossed the river and fixed our Camp to wait the return of our men. In the afternoon we went to the falls, which were extremely picturesque; about sixty feet in height and one hundred feet across. A few hundred feet below the falls, the river divides; one branch running round a small Isand to the north east. The streams meet about a quarter of a mile below, and forming several small rapids, continue their course in one broad shallow stream, towards the Saint Lawrence. Not a mile distant north west from the line we had pursued for the last two or three days, was a fine valley; evidently having a river winding through it, as we repeatedly heard the roar of waters in that direction; and we have litule doubt would offer facilities for the passage of a road. The timber around our camp was awamp-ash, elm, and maple. Thermometer at eight o'clock, thirty three.

## October 31 st.

Thermometer at fix o'clock, twenty-nine. At eight o'clock we fent two men forward to clear away the brush wood up the hill. At a quarter paft nine our men with the provifions made their appearance on the oppofite fide of the river. When every thing was croffed over, we immediately commenced our march by afcending a bank about ewenty feet. The land continued good and level tor five hundred feet, when it became swampy one hundred and fifty feet, and three hundred and fifty feet up a fteep hill. The top of the hill was flat for one hundred feet, when we again afcended a rather fteep rife three hundred and fifty feet, and continued up a ftill more fteep and rugged afcent, three hundred and fifty feet, when we gained the fummit of the hill; timber, a. young growth of poplar, fpruce and balfam. The remains of half burnt pine and hemlock trees, fcattered about. We proceeded onwards fifteen hundred feet over level land; the firft thoufand feet being covered with beech and maple, the next five hundred, mixed timber. We then descended gradually five hundred feet into a ravine, where we dined by the fide of a brook. As our men who had been to the "cache" were much fatigued, and the rain defcended heavily, we fixed our camp for the night. We again determined tr leave fome flour "encache" to preferve it from the wet.

## November 1 st.

Thermometer at fix o'clock, thirty eight. The norning cloudy and wet. Started at eight o'clock; chained two hundred and fifty feet gently ascending, and five hundred feet level-ground, covered with mixed timber to the edge of a fwamp. Two hundred and eighty feet brought us to a ftream running fouth eaft, its banks bearing alder buihes. One thoufand feet more, brought us across the fwamp to the foot of a hill; the laft five hundred feet was not fo wet as the preceding. The hill was fteep and rugged, but five hundred feet brought us to the top; timber, beech and maple. One thouland feet of good land, very gradually alcending, among hard wood, intermixed with birch, hernlock, balfam and fpruce, conducted us to a hort fwamp of one hundred feet; after which the land continued level for three hundred feet more; timber mixed. We then gently descended five hundred feet among beech and maple into rather fwampy ground,
ground, and black timber, which lafted five hundred feet. The rain now defcended heavily, and the whole party being completely foaked to the skin, we determined to fop a little earlier than usual to get our things dry, if poffible, before we slept. We therefore encamped in the fwamp for the night. Towards night the rain encreafed.

## November 2nd.

Thermometer at fix o'clock, thirty nine. It had rained without intermifion the whole night, and the early part of the morning. We commenced our march at a quater before feven o'clock, the heavy rain having fuddenly given way to a thick wetting mift. We paffed over five hundred feet low, and owing to the rain, very wet ground; timber, beech, maple, balfam, hemlock and ipruce. Two hundred and eighty feet more was level, and the timber, beech and maple ; then we gradually defcended among black timber one thoufand feet to the banks of a fream, running northwards. Fifteen hundred feet of level land, mixed timber, led us to a fwamp, which meafured five hundred feet across. We then afcended a hill five hundred feet, and five hundred fect tolerably level; soil good; timber, beech and maple. Again we afcended a rather fteep hill five hundred feet, and continued over level land feven hundred and eighty feet ; and one thoufand feet very gradually defcending among beech and maple trees, to the banks of another ftream. After crofling the fiream we paffed over fifteen hundred feet of fine land, very graduallyafcending ; timber, beech and maple. This brought us to a moif, rather fwampy tract, which meafured thirteen hundred feet across. and ended in a precipitate defcent into a gulls. Here we dined, and afterwards made a circuit of three hundred and fifty feet to the foot of a fteep hill on the oppofite fide of the gully, crolfing in our progress a small river; and again procecded on nur line. We firft croffed an alder meadow one hundred and fifty teet, and then afcended a fteep and rugged hill five hundred feet; and three hundred and fifty feet along the flat fummit, to a deep ravine, fifty feet across: Timber mixed. Fifty feet beyond the ravine, we afcended a fteep rocky hill five hundred feet, the last hundred almoft perpendicular and encumbered with loofe tragments of rock, which rendered the footing extremely uncertain. Threc hundred and fifty feet more gradually afcending brought us to the summit of the mountain; timber mixed, but chiefly
hard wood: The view from the top of the mountain was remarkably fine. At a great diftance to the south, we could diftinguifh a large fheet of water. To the north weft a valley running parallel with our line, and not more than half a mile diftant, probably less. We encamped on the top of the mountain for the night. A thick wetting mift in the evening.

## November 3d.

Thermometer at fix o'clock, thirty fix. We went three hundred feet northwards, to avoid a very abrupt defcent of the mountain, and commenced work at a quarter before eight o'clock, by defeending two hundred feet down the fide of the hill, and passing over thirtcen hundred and fifty feet level land, to the fide of a fmall lake. Timber round this lake or pond, fpruce, cedar a nd balfam. We went round the north end of the pond, and pafed four hundred feet through a Twamp and five hundred feet gradually rifing; black timber. Two hundred and eighty feet of level land, and five hundred feet ascending, brought us to the fummit of a hill; timber, beech and maple. We defcended rapidly into a ravine, one hundred feet; and afterwards fixteen hundred feet over a flat, covered with a variety of timber. "We continued our march up a hill four hundred feet, among beech and maple, and one thoufand feet fine level ground, thickly covered with hard wood ; and then descended five hundred feet into low wet land. Seven hundred and eighty feet of this rather fwampy land, brought us into much dryer ground, and perfectly level, for one thoufand feet; the timber mixed. We again gradually afcended a bill, five hundred feet; here we dined; and afterwards defcended five hundred feet croffing two ravines upwards of fixty feet wide. A fhort diftance in advance of the laft ravine we obferved a Surveyor's blaze. We defired our men to cease clutting, while we followed the blaze each way, to find a poft. We fucceeded in falling in with both; that to the south being marked R. four and five ; and the one on the north, five and fix. We determined upon following the blaze .from the south poft; but it being too late to proceed this evening, we returned to the line and fixed our camp. It rained all the evening, and in the courfe' of the night we had a fall of snow. We had not seen a clear sky for many days and nights, but had conftantly fuffered from extreme wet.

We this morning difpatched three men for the provifions we had left "en cache," and fent the remainder forwards to clear a path to the poft about ten acres to the fouth of the camp, with orders, if they had time, to clear away the brush a few acres towards the north eaft. The men miftook our orders and continued to the fouth beyond the poft, paffing over land which had fuffered materially from fires. At length they arrived at the edge of a Iteep rocky mountain from which they could see the River Saint Lawrence. The snow was falling at the time, and it was only the gufts of wind cleared away the drift, that they could diftingailh any diftant object. At three o'slock the men returnedwith the provifions, and in the evening the weather cleared up and became extremely cold. Thermometer at eight o'clock, thirty degrees.

November 5th.
A fine clear morning; the firft we had enjoyed for fome days. Thermometer at fix o'clock, twenty five. Left our camp at a quarter before feven o'clock, and proceeded to the poif, from whence we continued along the line between the fourth and fifth ranges of the Township of Brandon. For feveral acres we defcended the fide of a fteep and high hill, and croffed a fream running towards thefouth. After croffing the fream we reached the foot of a cliff about forty feet in height, alnoft entirely compofed of felspar. The view from the fummit was over a level tract of land on each fide, and from appearances we had fome reafon to believe we were in the neighbourhood of fettlements. We proceeded over a level tract for about a quarter of a mile, thence over a hill into a fwampy valley. Here we waited some time in full expectation that the men would overtake us, as we had left them but a short diftance on the other fide of the fream. Finding they did not join usy, we returned to the top of the hill where we had left them refting, but they had departed; nor could we tract them beyond the fmall fream. As we were entirely without provifions, we determined not to lofe more time in looking for the tracks of our men, but follow the blaze between the fourth and fifch ranges in hopes we should come to a clearance before night, or early the following morning. We also thought it probable the men had gone into the valley we saw on our right
hand, to avoid afcending the fteep and rugged hills croffed by the line. After once more crofling the ftream and alcending the cliff, we marched along very rough ground, crofling fome fteep hills over which the fire had paffed. The young timber was poplar and balfam. At length we reached a flat tract covered with beech and maple, and fhortly after came to the edge of a precipice upwards of one hundred feet in height ; we defcended by going a fhort diftance to the north, but even then were obliged to cling to the trees and bushes in our defcent. At the foot ran a ftream, and to our surprife we immediately found ourfelves in a clearance, but were much difappointed when we alcertained that there were no Inhabitants. We followed the conceffion road which appeared to be only recently made, and for fome diftance was fwampy. On each fide there were clearances, but ftill without fettlers. At length paffing through feveral lots, in part cleared, the road began to improve and the land became of a dryer quality; when we fuddently came to the end of a new road, where five or fix men were working. This road is one of thofe for which a fum of money was lately voted by the Houfe of Affembly, and it is the only one we faw communicating in a direct line with the old settlements on the Saint Lawrence. We met a Mr. Morrison, who informed us that our men had paffed about fifteen mirutes before, and had expreffed lome anxiety concerining us; he alfo communicated the agreeable information, that fome provifions were at the houfe of Mr. Armitrong on the Lake Maiquinongé, from which we were diftant about about two miles. We soon overtook our men, who, as we fuspected, had gone into the valley on the fouth fide of the hill; and having fallen in with a road, they thought it beft to follow it until they again ftruck the line. We paffed over a perfectly flat and well fettled country, being part of the Seigniory of Lanaudière. Mr. Armitrong's houfe is fituated on the south-eaft fide of the lake, which is nine miles in circumference ; its greateft length being from north-weft to southeaft. The fhores of the lake are flat ; the soil a clayey marle; principally covered with hemlock, spruce, balfam and white pine. They cultivate grain of all forts with great fuccess; but the potatoes are of a very indifferent quality. In the difance towards the north and north-west rife high hills, covered, as we were informed, with beech and mapte of a large growth. We had always been led to fuppofe that this Lake was surrounded by high lands; but this is not the case, as the ground to the southeifalt and eaft is a continual flat: We were received
with great hofpitality by Mr. Armftrong and Mr. Monroe, the Gentlemen in charge of the provifions, who was refiding at the line in Mr. Armftrong's house.

November 6th.
This was one of those milty mornings which had been the prevailing weather, (with the exception ot one or two days,) for the last fortnight. We gave our men this day to reft themselves, of which indeed we were all much in need. We employed ourfelves in gaining all the information we polfibly could relative to the high lands we saw to the north-weft of the lake. All accounts feemed to agree that there was a confiderable tract of good, but hilly land, extending for a certain distance back; but we could not ascertain the precife diftance.

November 7th.
Exactly the fame kind of weather as yesterday. Several of our people complained of fickness, and extreme fatigue. We therefore thought it moft adrisable to forward part of the provifion; to fome interanediate point; and the only certain place which feemed to be knewn, was a Mill on the River du Loup, belonging to Mr. Kempton; but whether this Mill was fituated in the Seigniory, or in the Town?hip of Hunterstown, we could not ascertain. We procured a person to take part of our ftores round in a cart ; but Mr. Monroe apprehending in the event of any unforeseen difficulty that the boy in charge of the cart might be induced to depofite the provifions without reaching the place agreed upon, moft kindly offered, without any renumeration, to accompany them until safety lodged in a fpot where we should hear of them ; and in this duty we expected he would be employed five days. We ftarted at eleven o'clock, the weather having in fome degree cleared up. As Mr. Munroe was not to leave for Berthier with the extra fores, until the following morning, he accompanied us as far as the fpot we had fixed upon as a fresh point of departure. We fent the men and fores down the Ri ver Maskinongé in a large wooden canoe. Having bid farewell to our hospitable friends on the lake, we immediately entered the bush, following a wood path over level land, somewhat fwampy; which was more owing to the conftant rain than the nature of the soil. On leaving the woed and croffing a clearance in a north
eaft direction we came to the Bank; of Maskinonge River; a fine ftream, and navigable for canoes down to the Saint Lawrence. At the moment we reached the river, the large canoe hove in fight, and we crofled in a fimall canoe in sufficient time to see them shoot a fmall rapid. On reaching the last fettlement, but one, on this part of the river, we got the owner of the houfe to show $u_{s}$ the way to the laft clearance. We firft entered a wood for a mile in extent, and croffed a small river which discharged into the Masquinongé. On leaving the wood we faw the houle of Mr. Champagne, being the laft clearance south eaft on the river for about fifteen miles; and the point we had fixed for our departure. At this place the river forms a fine avenue, and is about eighty feet in width. The fhores of this river will soon be well lettled; as the grearter portion is already granted, and will be cleared in the enfuing fpring. From the information obtained we confidered this farm as being fituated about one mile and a half north eall of the town line of Brandon. This afternoon was wet and mifty.

## November 8th.

Thermometer at six o'clock, thirty fix degrees. A wet and cloudy morning. Commenced our march at eight o'clock, by chaining over two thoufand five hundred feet of level land, which our men had blazed, and cleared away on the previous evening; we croffed three imall ravines; soil extremely good; tumber mixed, but chiefly white pine, black birch and fprace. We then croffed three hundred feet fwainpy, and two hundred feet dry and level land; croffed a small ravine, and chained over one thoufand feet of flat good land, to the edge of a very deep ravine about fixty feet wide. We next made a slight descent of five hundred feet to the fide of a small ftream, which we croffed, and ascended gently close to the edge of a high bank of rich marley foil, upwards of fifty feet in depth; at the foot ran a small rapid fream. We continued over seven hundred and eighty feet of good land, the laft two hundred and fifty feet gradually ascending. Timber, pine, cedar, spruce and birch, We nest croffed five hundred feet rocky, and pafled over a small swamp fifty feet to the foot of a hill. After dinner we afcended the hill four hundred feet, over rocky land; and five hundred feet level, mixed timber; good foil. This level continued five hundred feet farther, when we defeended a rocky hill two hundred feet, and con-
tinued along a level on the top, of three hundred feet in length. Timber on this hill hard wood. One thousand feet more, level land, and fine timber, (and watered by a ftream) brought us to a very gradual ascent of five hundred and fifty feet. Timber, beech, birch and maple. We then ascended a hill five hundred feet through hemlock and spruce, and four hundred and fifty feet over a rocky ridge, but well covered with strong growth of beech and maple. Twelve hundredand thirty feet more over tolerably level land, a little encumbered with fragments of rock, brought us to a gradual defcent of five hundred feet; ftill beech and maple. Thence over five hundred feet of level and rather swampy land bearing a growth of hemlock, spruce and balfam. Immense isolated maffes of angular shaped sienitic rocks, lay scattered over this swampy tract. Fifty feet to the south, was a ridge of hard wood, where we encamped for the night, near a small brook. The evening mild and misty.

November 9th.
Thermometer at fix o'clock, forty degrees. Cloudy, moift weather. Commenced work at a quarter before seven o'clock, and paffed over one thousand feet of good land along the brow of a fmall hill; close on the left was a fine valley. We then croffed one thoufand feet over a hill, the fummit very rocky, and entered a valley which wound round towards the west. This valley measured five hundred feet across; good land; mixed timber. Two hundred and fifty feet along the fide of a rocky hill, with flat land close adjoining; and five hundred feet level land, brought us to an ascent of one hundred and fifty feet. We then descended rapidly one hundred and fifty feet more, and went one hundred and thirty feet up a steep hill. From the top of this hill we could distinguish a Valley close to us on the North West side ; and it appeared to extend a considerable distance towards the North North-East, and contained a,quantity of fine looking tim. ber, principally beech and maple. We continued along the summit of the hill seven hundred and fifty feet, among fine trees of beech and maple; and then descended two hundred feet to the edge of a precipice, fifty feet in height. Having reached the flat at the foot of the cliff, we passed over two thousand five hundred feet of level land, swampy at one part for about two hundred feet; timber, hemlock, spruce, balsam and cedar; soil, light marle. We now reached the White River, close to a small fall or rapid.-

The River at this place is between twenty and thirty feet wide, and empties itself into the River Masquinongé. We crassed the River on a tree about forty feet below the fall, and dined on the: East shore. After dinner we passed over seventeen hundred and eighty feet of level and good land, but much incommoded with fallen trees. We then entered a swamp, and chained two thousand feet, when we sought out the dryest spot we could find, and encamped for the night ; timber, spruce, hemlock, balsam, and cedar. The weather was mild, but wet.

## November 10th.

A light South-East wind ; slight rain. Started at seven o'clock, and crossed eight hundred feet of swampy ground which brought us to a gentle ascent. The swamp we had just crossed, although long, was not bad, and might easily be drained for the convenience of a road. It has a small stream running through it. The ascent we had reached was very gradual for two hundred feet when the land again became level, and free from swamp for two thousand feet; timber still of the pine species. We ascended a very trifling rise of land, and crossed a very extraordinary looking place, apparently the bed of a small pond, bare of herbage, \& perfectly dry-although so much rain had fallen the last few weeks. Leaving this dry hollow, we descended gradually one hundred feet among young spruce and balsam, and passed over a small rocky ridge, into a swamp, and across a Beaver meadow; making in the whole six hundred and eighty feet from the foot of the last small hill; \& five miles from the starting point on the River Masquinongé. The land continued swampy for two thousand two hundred feet, chiefly covered with a very young growth of spruce, poplar, birch, \& balsam. Numerous remains of half burnt logs lying scattered about. We next entered an extensive opening which was a mere Sphagnous swamp, and surrounded from North North-West to South-West by a ridge of low hills' with a gently undulating surface. The fire at some recent period had evidently crossed this swamp, as the few trees to be seen, although standing, were burnt ; they were chiefly very small larch. The swamp measured, where we crossed it, two thousand six hundred and thirty feet; we arrived at a small brook running towards the South East at the edge of the'swamp, at the foot of a steep hill. We dined here. The rain fell fast. After dinner we ascended the hill six hundred and fifty feet and came to the foot of a cliff twenty feet high :
on reaching the summit of this clifl we found rocky land over which the fire had passed; it is at present covered with a very young growth of poplar, birch, and balsam : this contnued three hundred and fifty feet, when we descended three hundred and fifty feet abruptly, and four hundred and fifty feet gradually, into a swamp. From the top of the Hill we had just crossed, we ascertained that a Valley ran parallel with our line on each side; but it appeared to be better adapted for a road about half a mile to the Southward, than on the north side of our line. We proceeded across the swamp five hundred feet among black timber, to the foot of a very high hill: two hundred feet more brought $u_{\text {, }}$ to the base of a precipice, which in order to ascend, caused us to make a trifling detour. On reaching the sumait we chained three hundred feet farther, and encamped for the night : the evening wet and gloomy : the air extremely mild. Thermometer at eight o'clock, fifty degrees.

## November 11th.

Thermometer at six o'clock, thirty-seven degrecs. The morning cloudy, but no rain. Left our camp at cight o'clock and proceeded two hundred fcet among young birch and poplar. We entered a swamp of six handred and fifty feet length, and crossing a stream ascended over rough land one hundred and fifty teet, to the foot of a cliff of Sienite about one hundred feet in height. It took us some time in reaching the top of this cliff, when we again ascended up a rugged hill four hundred feet, \& covered with young birch, balsam and poplar. We then crossed a flat and rather wet piece of land, for three hundred \& fifty feet, \& again ascended over rocky land one hundred and fifty feet; one hundred and fifty feet level, and four hundred and fifty more ascending, brought us to the summit of this steep and rocky hill. From this height we noticed that the hills around, gencrally termmated in abrupt precipices of considerable height, but always Vallcys on one side or the other, which afforded an casy and gradual ascent to the summit. We proceeded forward seven hundred and fifty feet along level but rocky land, thickly covered with beech, birch and maple; and descended gradually one thousand fect, tolerable land. On the North West a slort distance from us, rose a high rocky hill covered with young poplar. The land now became level for eight hundred feet, and covercd with young birch, poplar and balsam. We stopped to dine on the north side of a small Lake. Af-
ter dinner we chained over eight hundred feet of tolerably level, but rocky ground; mixed timber. Then across a brook and four hundred feet gently ascending, and along five hundred feet of level ground where the fire had passed: timber, young poplar. On reaching this spot we had the misfortune to see one of our men, named Beaulac, supported in the arms of two others. He had lad his foot open directly across the instep; in consequence of his axe having glanced off a small dogwood tree he was in the act of cutting down. The wound was very severe, and bled profusely, but fortunately being provided with dressing, we succeeded in staunching the wound. We immediately looked out for a place to encamp, and found a good spot by the side of a small brook, eleven hundred feet from where Beaulac was left. A man conveyed him. to the camp on his back.

## November 12th.

A cold gloomy morning. Started at half past seven o'clock, and passed over four hundred and eighty feet of rather rough land, and entered a swamp which measured one thousand feet to the side of a stream. We returned to examine what appeared to be an old Suryeyor's blaze-we followed it about six acres to the Northward, and came to a poss: here we fell in with two Canadian Hunters who informed us that this was the line between Lanaudière and Fief St. Jean. We returned to the stream and measured three hundred feet more, swampy land, and then ascended a small ridge two hundred feet. We continued over fifteen hundred feet of rough and rocky land'in parts swampy; and one hundred teet over a rocky hill. Four hundred feet more rough land, brought us to a descent, which continued five hundred feet, among loose fragments of rock. Timber, spruce, balsam, birch, and hemlock. We obferved a small lake clote on our left hand. Here we noticed another Surveyor's line and appearantly drawn within the last few years. While the men were preparing dinner, we followed the blaze to the northward paffing feveral posts until we reached one marked No. 38. Here the line term minated, and we felt much difappointed in not finding the town line of Hunterstown, fhould fuch-a line be in existance ; but after a minute examination of every tree for fome diftance around without any fuccess, we were obliged to relinquish the search and return to our party. After dining and drying our clothes, we refolved upon following the blaze towards the south, in hopes of reaching
reaching some house where we could leave our wounded man, who was not only suffering several pain, but required one man to catry thim on his back. The loss of two men's services at this advanced period of the year was a ferious evil. We proceeded down the line a short diftance and encamped for the night. The country still poor and rugged. The evening cold, but the rain had fortunately ceafed.

## November 13th.

A heavy north west wind this morning. Thermometer at six o'clock, twenty nine degrees. Beaulac fuffering fevere pain in his foot. Left our camp at seven o'clock and proceeded southerly down the line paffing several pofts all numbered and within a few acres of each other. Near our camp we paffed along the shore of a narrow and shallow lake, and croffed its eaftern end over a beaver dam: we paffed a fucceffion of rough rocky hills or rifes of land; then over wet ground, mixed timber, until we reached a large and new poft marked on one fide N. G. and on the other fide G.P. The land now became more level, and the soil and timber of far finer quality than we had met for the laft two or three days. We next went over a rocky, but hilly country; in some parts deftroyed by fire, and covered with a young growth of poplar, until we arrived at a poft marked four and five. Here we found a level country and fine fugary. We alfo fell in with a shanty road, which gave us hopes we were near a settlement. We had past numerous pofts and blazes, going off rightleft, and some almoft parallel with us, and were frequently obliged to use the Compass to ascertain which was the one we had ftarted upon. After dinner we, continued to follow the fhanty road which gradually improved; and at length opened into a good cart road. We croffed a clearance-no inhabitants; and proceeded forwards a few acres, when we opened at once into a finely cleared and thickly settled country. We proceeded to the edge of a wood and encamped for the night. Upon making enquiry, we found that we were in the Parish of Saint Antoine, in Mr. Gugy's Seigniory, and that we had defcended from the point where we firft fruck the line, about four miles. We made arrangements for the conveyance of our wounded man, to Three Rivers; and engaged a man to show us the nearest route through the woods to Kempton's mills, from which, he said we were not more than two leagues diftant. Heavy rain all the evening.

November 14th.
The rain which had defcended in torrents throughout the night, ftill fell heavily this mqraing. Wee heard two peals of thunder last night, and one this morning. The air was extremely clofe: Our guide Alexis Balland being ready, we ftarted from our camp. The first part of the journey lay over an extenfive clearance and level country; thence through a wood when we croffed a fmall, but rapid river, on which was seated a saw-mill: We then croffed several fields to a road which led through a wood. This road was long, and in a moft terrible ftate, from the quantity of rain that had lately fallen. At length after toiling, literally above our knees in mud and water, we arrived at a new fettlement called Waterloo. After croffing one or two fields we came to a small creek or river. Here our guide informed us that he could not proceed any farther with us, as there was no road, and he was unable to find his way through the bush. Under these circumftances we determined to proceed to Becker's Mills, which was the neareft point to us at the prefent moment, and more in the line of country we were anxious to examine than the neighbourhood of Kempton's Mills. We were also in hopes that we should hear of our supply of provifions somewhere in the neighbourhood of Becker's. We had ascertained that an extenfive swamp existed somewhere in this part of the country, called by the Canadians "La Savanne Diable", the man who engaged to put $u_{s}$ in the road to Becker's Mills, affured us that it lay between where we now were, and Kempton's Mills; and that it was a very bad fwamp. From the flat appearance of the country we had little doubt that the account was correct. The rain ftill continued, but we had secured the little flour that was left in one of the oil cloths. We ftarted with our new guide across the settlement ; and through a fwampy wood of about forty acres length, the water above our knees. The wind changed to the north eaft and the rain fell fafter. If we stopped to rest but a few minutes, we were completly benumbed with the cold. Leaving the bush we entered a clearance which we cwoffed in nearly a north direction and came to a narrow road. We defcended a. fteep bank of clay, into a deep ravine, and croffed over ahigh and steep ridge ; at its foot was a fream now swallow into a small river, which we croffed on a fallen tree, and a few minutes after had the satisfaction of being told that we were in the road to Becker's Mills, We proceeded to a farm-house and rook up our
quarters there for the night. The whole of the country we had traversed this day was flat, and in places fwampy, the foil being a ftiff light colored clay, the rain which had fallen in such confiderable quantities, remained on the surface, and gave the ap. pearance of swamp; which probably would not have been so much the case, were the land cleared of the thick growth of black timber which now prevents the sun and drying winds, from reaching them. Upon making enquiry of a neighbouring farmer for our stores which had been sent round in a cart; we ascertained that they had paffed two days before, and our informant said it was impoffible they could be far diftant as the only road to Kempton's was almost impaffible. This man undertook to go in fearch of them, on the promise of a job in conveying them to Becker's Mills on the River du Loup, which we readily agreed to. It was rather a fingular circumftance that although we were within a short diftance of Hunterfown, we could not find an individual who had ever heard the name before. The rain continued all night. Several of our people were sick, and worn out.

## November 15th,

A wet gloomy morning. About half paft fix o'clock, the man we had sent to enquire for our provifions, came in with them. They had been depofited at a house fituated not far diftant, at a place called "Beau Vallant." It appeared that Mr. Munroe could not proceed the remaining short diftance with a cart, therefore had taken measures for having them conveyed to Kempton's, either on a truck or on men's backs; but as it afterwards fortunate-, ly turned out, the weather prevented this being removed and our man succeeded in bringing them to us safe. We left our refting place at eight o'clock on the way to Becker's Mill, which from all accounts seemed to be situated in our direct line ws we intepded examining the country in front of Caxton. The road had a general north direction for half a mile. We then struck across a clearance eafterly. It was with great difficulty we could cross the fields from the wet state they were in ; after pafing over thirty two acres we branched off again to the northwards five acres, when we entered a wide newly opened road running in a north east direction about two miles, which brought us to the banks of the River du Loup. The whole country over which we had this day paffed was flat and the soil a strong marly clay; the timber was mixed, but the pine species prevailing. The high lands not
far from us towards the north west had a broken and tugged appearance, 'we croffed in a small scow to the hodfe of Mr: Fiecker close to the edge of the will dam, in which fell in the deepest part over a height of ten feet. The shotes of this part of the river ate broken into beautifuify formed hills of confidetable height, and consif of a light coloured marley earth'; in the compofition of this soil the clay preddoninates. In mány parts of this neighbourhood the marley soil refts on a Bed of sand; this being penetrated another bed of handin winicf trornblende is the principal ingredient, is, found, and below is distovered the primitive rock, generally sienite and its varieties; these frills are situated thbout seventeen acres from the line of Machicke, atd lialf a league from 'Mr. Ross's lands, which we have every reason to believe is the same markedin Bouchette's Map as Hunterstown. 'The mill is close to the banks of the river and immediately above a dmall rapid, which is the only one to impede the navigation between the Mills and the Lake Saint Peter ; but above the Mills the tiver is full of rapids and falls, as far as it has yet beetr traced by white men. About"a league above the mills, the whole river (which we were told narrows to forty feet across) rushes over a precipice of one hundred and fifty feet or one hundred and fixty feet preppenticular. We regreted not being able to examine thefe falls. The River du Loup at this place averages about one hundred and eighty feet in width, but in many places narrows, and offers great facilities for erecting a Bridge. The luinber tiade is carriedo on with gteat fuccessin the neighbourhood of this river.

## November' 16 th.

Rain all the night, but the morning remarkably fine. Started for Caxton at eight o'clock; we passed down the side of the Ruver a short distance and then ascended a Road up a steep hill of clay's ey soit. We then continued, along a level road through a peth fectly flat country. Still the same clayey soll, which; owing to the constant rain, rendered the Road almost impassable. We went cthrough an extensive wood, over a new made road, and enh sered a clearance at the north end of Saint JosepH in Machiche, We turned to the northwards and continued abotat half a leagte'; then through'a wood over'a ligit sandy soif frito the Towrighip of Caxton: In about three quarters of a minle mote we reached the mouse and mill of Mr. Crmt, situated in rear of lot two, second range of Caxton; and on a small brancli of the River

Machiche: from all we could observe of the soil in this Township, it, struck pus being of a more, sandy quality than any we had before seen on the route; but here were some good lots s and the timber like the soil was of a variable qualityo: Amongst all the warieties of timber known in this, Township, are found groves of red pine and red oak. The Township is hilly and abounds, in numerous lakes, some of them of a large size, particularly one to the north west of Grant's mill about one league and a half, which is represented as being almost as large as Lake St. Peter, but this we know to be an exaggeration. Although a large por.tipp of the lands in this Township, are actually granted, there are not more than four or five settlers in the Township. This attributed like all the Military. 'Townships, to the lands being 1 granted to the Militia, who draw, their tickets, and either immediately sellthem to land speculators, or hold them in hand until the land becomes of more palue: but never for a moment think of settling, or ever performing their location duties. We remained at Mr. Grant's the rest of the day, as we met a persom who kindly offered to show us a route he had discovered a few day; before leading directly to a wood path which communicated: with, the road leading to the Forges.

サ...
$\cdots$,

November 1 thth.
Started at nine o'clock, accompanied by our Guide; crossed the bridge close to the mill, and immediately atter entered a wood road having a general east north east direction. We crossed a small swamp and came to a poss; marked first and second range, Caxton. We followed the blaze in a south easterly direction; the country level and, well timbered, We passed down twa or three Ravines, and came to the River Machiche about twenty five feet, wide. $\{$. We felled a tree and crossed, and shortly after came to a swamp, which we left at Past eleyven. From Post twelve to difteen is a fine tract of land covered with beech and maple. .This sidge which, is so wrell calculated for a Road extends as far westward as Saint Antoine in Mr. Gugy's Seigniory, and, by all accounts coptipues on to the River, du Loup above Becker's mills, and thence towards the Township of Brandon.. We.followed the ridge.jn a northeast, course through a growth of young timber. The Country continued, perfectly level until we reached, a descent of about five hundred feet called the "Cote des 14 arpents," this brought us again to the River Machiche; the Bridge which
had formerly existed, was washed awway, and we crossed the River on a tree, below a small rapid. On reaching the opposite shore we found ourseives on an fland, from which we crossed on another tree, to the main land. The soil since leaving Caxton had become poor and sandy. There were but few large trees standing, as all the hardwood had been cut down several years before, for the use of the Forges. We again resumed our journey by ascending gradually to the summit of a small hill. The Road lay along the bed of a Brook' where cut'logs'had' fortherly been placed. 'In' making a Road it mould be easy" to avoid this,' "by passing a short distance to the northward. "Having gained the summit of this Hill, we continued over a level tract untit ide came to a small descent of loose sandy soil, called the , Cote croche." Here we struck upon thie Road leading to the Grals Rapids on the River St' Maurice, in a'few mindtes, we passed the Road branching off to the Gabelle Rapids. We coudd trearthe soar of the Falls distinctly. Knowing we were' within nite thitles of the Forges, and willing to take advantage of the fineness of the evening, we determined topush on for the Worges We Cort tinued through a thick wood of spruce and 'btisam' and crobsed two small swamps. We also 'passed a Róad' branchtrit bef to wards the west in the direction of Machiche. We reached the Forges at seven o'clock,"and were fortunate in findring Mp: Tifnes Bell who had arrived only a few hours betore frbin Thiee Rlwers We were most hospitably entertained by this gentleiflan "ada dad friend Mr. Macauley. No'vember 18th.

By making a forced march yesterday, we escaped heing expneed to one of the most stormy nights that had occurred for maty weeks past. We took leare of our kind Eriend at the Foiges, and reached Thiree Rivers about two o'clock ip the afferrion, where we saw Mr. Burns, to whom we delivered over, the men to be discharged. The following morning twe embarked on board the Steam Boat for Montreal, where we arrived on Mönday morning the twentieth.

Having reported ourselves to the Commissioners, we embarked the same evening, and reached Quebec on the twenty second of November.

F. L. INGALL. JOHN ADAMS, Surveyor \&c

# REMARKS 

02 Thas

## FOREGOING JOURMAL.

By Me, INGALL。

16 will be seen ly a perusal of the preceding pages that the Explprers confined their researchesprincipally to ascertaining whether the Cophtry they were traversing was of a nature to admit of immediate Sertlement, and of having a Road carried through it from the River Oitawa, to the old Road of the Forges on the Hiver St Maurice. I shall therefore commence my remarks, by speaking in the first instance upon the possibility of opening the proposed Road.

That part of the Route between Grenville and the River Assamption offers so obstacle but might be easily surmounted by occasipmilly verging to the north or south of the line pursued. Frope the Rliver Assomption to Lake Maskinongé the Country is equally eligible for the formation of a Road, and if a line com-
menoing, at the third Range of the Township of. Brandon, and leaxing it at the first Range, is followed, instead of that ranning between the fourth and fifth, a much more level tract of land will be met with.

From the Lake Maskinongé to the old Road of the Forges, the line followed was in many places so rugged, and in others so pwappr, as to repder it problematical whether a Road could be carrię through, under an expense altogetber inadequate to the adranteges to be obrained. Bit it will be observed by referring to the Chart, that a level beech ridge extends from the RiverSt. Maprice to the River du Loup near Becker's Millsa This ridge is particularly well adapted for a Road; and there is little doubt. that the same description of Country extends in a straight-line as: far as the Township of Brandon.

By pursuing this Route instead of the one followed, not only will the facilitieg for" opening a Road be found equad to any other portion of the District, but the distance somewhat shortemed by avoiding the acute angle which would be formed by going so far north as Lake Maskinongé. Some part of this tract is already inhabited, and the remainder fit for immediate settlement.

The large Rivers, none of which exceed 110 feet in width, ave few, consisting of the North River, Lac Ourreau, Assomption, Maskinongt, and du Loup. The smaller Rivers although numerous, are not deep, and afford great facilities for the erection of Bridges.
The Hills are in general easily avoided, and where that is not altogether feasible, they will, upon a little examination, be found to afford a gradual ascent. The swanps are of a nature to be successfully drained, and not often, very extensive.

The Country traversed by the expedition was, generally speaking, of a good description, well watered and bearing fine tinber. In some places the Settlers had penetrated as far back as our Line; and there is no doubt that were the Country open to easy access by a groat Road, a numerous population would in a few years hence, be found cultivating what is now a gloomy wilderness.

This District possesses one great advantage of the utmost conm sequence to the early settler ; all its Lakes and Rivers abound in fish to that degree, as to be capable of affording the winter suppty of food to large bodies of people.

The Climate is healthy, and by the accounts of the few residents, not so severe in winter as at Montreal. This probably is owing to its not being exposed to the piercing north and north-east winds which sweep up the Vahley of the St. Lawrence, with great violence in the Spring and Fall of the year.
The features of the Conntry may be called hilly; the tops of the hills now and then exhibiting the bare and rugged faces of a sienetic Rock; but the sides of these hitls; and the adjoining valless (which are in general watered by a stream,) consists of a lighe marle, in which sometimes the clay, and sometimes the sand, is found to predominate, but always containing a sufficient admixtare of Carbonate of lime, the decomposition of the Calcareous spar so abundant in the District. This constitutes it a good base soil for the rich vegetable mould which is found in most parts of the ronte forming the upper strata.

The Scenery is variable and foll of beanty; from the gently swelling eminence to the more lofty and rugged hill, or steep precipice ;-the placid Lake, turbolent River, and extensive Valley. The Country abounds in naturally strong military positions almost inaccessable to the stranger, and generatly commanding ath the Country in their immediate vicininy
The advanages to be derived by this Province in opening a great Road, between the Rivers Ottawa and St. Maurice, are
numerous and of the utmost consequence. My limits are too prescribed to dilate upon those advantages with the minutenes's the subject deserves. I shall therefore content myself with givisi ing a cursory glance at those which occur to me as among the most prominent.

In the first place, one great object would be accomplished in shortening the distance between Three Rivers and Grenville, the present computed distance being about 150 miles; whereas thes distance between Three Rivers and. Grenville by the proposeide Route being only 114 miles, a saving of 36 miles would be obtained.. This (particularly in the winter,) would be a great con-: sideration, either to the Traveller or Merchant.

It also occurs to me, that should any unforeseen event again'. plunge this Province in a war with the United States, it might ${ }^{\text {ber }}$, found necessary to convey Military Stores to the Upper Province, by the Road in question, and which would be perfectly independant of the St. Lawsence above Three Rivers; and the Ottawa: below Grenville.

But perhaps one of the more immediate consequences of the: highest importance to this Province, would be the speedy'settlement of an extensive and valuable tract of tand, possessing a pecur"; liarly healthy climate, and capable of yielding support to a numes: ruus papulation; thus forming an internal means of defence to the District, and indeed to the Province in general, by Haying a Militia Force so situated as to be able to assemble at any point of defence etther on the St Lawrence or Ottawa; without feat bof ${ }^{\prime}$ '; premarure attack from an invading foe :-and with the adrantage of having in their rear a cultivated Country abounding with supplies; and the features of that Country, to thase acquainted with it,: offering strong defensible positions at every league.
Should the communication across the Cauntry between Three Rivers and Grenville be carried into effect, it would be necessary that lateral Roads should likewise be opened, communicating with the Towns and Villages on the St. Lawrence and Ottawa.

Doubtless many Roads might be found already existing between the Settlements and the Route laid down, which could be rendered passable for any description of vehicle at a moderate expence.
How far to the north and north west the cultivable land extends, it is difficult to state precisely, information differed so wrdely upon the subject ; but from our observations in passing through the Country, we should be inclined to believe it did not generally average more than 15 mile; north of the line we traversed, varying according to the dip of the Mourtain Ravge,

Undoubtedly the soil does become so extremely poor as the height of land is approached, as to preclude the possibility of immediate settlement; nevertheless the probable line where the cultivable land terminates is not known, and the only means of ascertaining this important point would be to examine minutely the Country existing between the two Routes explored by the party, and bounded east and west by the St. Maurice and Aux Lievres,

Probably all the information desired could be ascertained were an exploring Expedition fitted out to ascend the River Ottawa, and thence by such Route as they could discover to reach the River aux Lievres; making frequent lateral excursions north and south, as would tend to attain the objects of the Expedition. To accomplish this purpose it would be necessary to devote, if not the whole, certainly the greater portion of the summer to the expedition ; and if a provisional sum was placed at the disposal of such Commissioners as were appointed to conduct the business, that they might not feel it necessary to restrict the expedition to time, I am of opinion, that the whole of the cultivable parts of what is termed the St. Maurice Country, west of that River, would become sufficiently well known, to be available, if required for immediate settlement.

Besides these advantages, it is probable that the sources of the larger Rivers descharging through this District into the St. Lawrence and Ottawa would be ascertained; and as it is reported by the Indians that the large Lakes giving rise to these Rivers, approximate each other, much useful information relative to a :water communication between the two Rivers St. Maurice and Aux Lievres at a point nearer the cultivable lands than the Route pursued by the expedition in 1829 , might be discovered.

With respect to objects of Natural History, it must be evident to the Commissioners, that the Explorers had not the means of con. veying any quantity into the Settlements. In Mineralogy a fewr fine specimens of graphite sphene and saplite and calcareous spar, were preserved and lodged in the Quebec Saciety of Natural History, The Rocks.met with in situ (with the exception of the calcareous spar,) were chiefly varieties of sienite, resembling those procured tarther northward in the same District, the preceding year: $;$

In Botany, the season was too far advanced to afford the opportunity of throwing much light on that interesting branch of science, nor were the forest trees of a variety to require more notice being
taken of them, than has already been done in the Journal. In Entomology we were likewise prevented from preserving specimens worthy the attention of the Naturalist, as the only means of conveyance was by land, and consequently any we had attempted to convey to the Settlements would have been entirely destroyed.
