Technical and Bibliographic Notes / Notes technique et bibliographiques

The institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming are checked below.

- [x] Coloured covers / Couverture de couleur
- [ ] Covers damaged / Couverture endommagée
- [ ] Covers restored and/or laminated / Couverture restaurée et/ou pelliculée
- [ ] Cover title missing / Le titre de couverture manque
- [x] Coloured maps / Cartes géographiques en couleur
- [x] Coloured ink (i.e. other than blue or black) / Encre de couleur (i.e. autre que bleue ou noire)
- [x] Coloured plates and/or illustrations / Planches et/ou illustrations en couleur
- [ ] Bound with other material / Relié avec d'autres documents
- [ ] Only edition available / Seule édition disponible
- [ ] Tight binding may cause shadows or distortion along interior margin / La reliure serrée peut causer de l'ombre ou de la distorsion le long de la marge intérieure.
- [ ] Blank leaves added during restorations may appear within the text. Whenever possible, these have been omitted from filming / Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.
- [ ] Additional comments / Commentaires supplémentaires:

L'institut a microfilmé le meilleur exampiaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modifications dans la méthode normale de filmage sont indiqués ci-dessous.

- [ ] Coloured pages / Pages de couleur
- [ ] Pages damaged / Pages endommagées
- [ ] Pages restored and/or laminated / Pages restaurées et/ou pelliculées
- [x] Pages discoloured, stained or foxed / Pages décolorées, tachetées ou piquées
- [x] Pages detached / Pages détachées
- [x] Showthrough / Transparence
- [ ] Quality of print varies / Qualité inégale de l'impression
- [ ] Includes supplementary material / Comprend du matériel supplémentaire
- [ ] Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image / Les pages totalement ou partiellement obscurcies par un feuillet d'errata, une pelure, etc., ont été filmées à nouveau de façon à obtenir la meilleure image possible.
- [ ] Opposing pagaa with varying colouration or discolourations are filmed twice to ensure the best possible image / Les pages s'opposant ayant des colorations variables ou des décolorations sont filmées deux fois afin d'obtenir la meilleur image possible.

This item is filmed at the reduction ratio checked below/

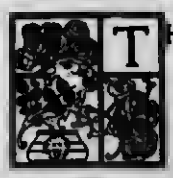
GROWTH OF LIGHT LOAD

Hydro-Electric Generating Plant at Lake Buntzen.

BRITISH COLUMBIA ELECTRIC RAILWAY COMPANY, LIMITED



HE British Columbia Electric Railway Company, Limited, owns and operates Electric Street and Interurban Railways and Light and Power systems on the lower Mainland of British Columbia, especially in and around the City of Vancouver, the commercial capital of B. C., including all the adjacent municipalities, and North Vancouver on the north side of Burrard Inlet; New Westminster, the old capital of the Mainland, and the Fraser Valley Branch, from New Westminster to Chilliwack at the eastern limits of the Fraser Valley.

The Vancouver Power Company was formed as a subsidiary concern in 1898 for the purpose of generating power by a Hydro-Electric Plant at Lake Buntzen, on the North Arm of Burrard Inlet, and the power developed by this plant is distributed and utilized by the B. C. E. Ry. Co. throughout its Mainland systems.

Io additioo there are two other branches of the Company's operations on Vancouver Island—the Victoria branch of the B. C. E. Ry. Co., which operates in and around the City of Victoria, the Capital of the Province, and the Vancouver Island Power Company, Limited, organized for the purpose of generating electricity by water power for the Company's services on Vancouver Island.

Beside the above the B. C. E. Ry. Co. owns the Vancouver Gas Company io Vancouver and the Victoria Gas Company in Victoria.

The history of the undertaking has been a marvellous record of almost unprecedented growth, unprecedeoted even in that most rapidly developing branch of Engineering—Electricity.

Like similar undertakings in other places, the history of the electrical industry in B. C. has been one of growth from small beginnings through various vicissitudes to a position of assured success, but in few places has this growth beeo so phenomenal or the success so marked as it has in B. C. The installation of electrical plant was inaugurated by the Vancouver Electric Illuminating Co., Ltd., in 1887, and in 1889 a second company, known as the Vancouver Street Railway Co., Ltd., was formed to operate by animal traction, but plans were changed and electrical operation adopted from the commencement of the service. In the following year (1890) the two companies were merged and the lines electrically operated. In 1890 there was also commenced the New Westminster interurban system and the Victoria (Vancouver Island) system. These were again merged into one Company, known as the Consolidated Railway Co., Ltd., and as such were operated until 1897, when the British Columbia Electric Railway Co., Ltd., was formed and purchased the amalgamated undertakings, which have been run continuously by this Company ever since. In 1905 the Hydro-Electric plant at Lake Buntzen was put into operation.

In 1904 the street railway work of Vancouver City was handled by one 500 k.w. Rotary Converter, whilst to-day in the Vancouver substation alone there are two 2,000 k.w. and one 500 k.w. Rotary Converters, a total of 4,500 k.w., and the Company have Rotary substations in operatioo on the Mainland at the following poiots also: New Westminster, North Vancouver, Chilliwack, Burnaby, Point Grey, Cloverdale, Matsqui, Langley, and Sumas. The total capacity of its substations at present is 10,500 k.w., and another substation is now in course of construction at Collingwood East, which will have installed a Rotary Converter of 500 k.w. capacity. Such is the phenomenal development in street railway work alone. In the other branches, Light and Power, the story is the same—one of great and rapidly increasing growth. When it is considered that every part of the plant has beeo installed to take the place of out-of-date machinery in a short space of six years, it will be seen how great has been the development which has taken place in this "last outpost" of the Empire.

An auxiliary steam plant of three turbine units has recently beeo added for a stand-by and for emergency cases, giving a total steam capacity of 6000 k.w.

Io the lighting branch the Company had in 1904 about 4,600 meters installed on the Lower Mainland, whilst now it has 25,000 meters. In the power load it had in 1904, 1,200 h.p. of connected load, whilst at the end of 1910 it has reached 17,000 h.p.

Close to the shore of the North Arm of Burrard Iolet and four hundred feet above high tide is Lake Buntzen. It was named in honor of J. Buntzen, Esq., Director of the Company, and for several years its General Manager. This lake of 500 acres is fed by the waters of the Eternal Snows, but would be inadequate to supply a plant of this magnitude. It has,

End view of one 10,500 h. p. unit, showing "Doble" wheel and governors.
Lake Buntzen Generating Station.

One of the 10,500 h. p. Generators (Lake Buntzen Generating Station).

Proposed New General Offices and Interurban Station at Vancouver

¶Total Office Staff of the Company in Vancouver in 1896. The number of office employees in the new building shown on the opposite page will be over three hundred. ¶This is typical of the phenomenal growth of the City of Vancouver and District.

therefore, been connected, by means of a tunnel, to Lake Coquitlam, altitude 432 ft., area 2300 acres, drainage area 100 sq. miles, whilst the rainfall amounts to 150 inches per year. This tunnel, 12,775 ft. in length, is the longest purely Hydro-Electric Tunnel in the world, and of itself constitutes a work of no mean engineering character.

A concrete dam, 54 ft. high, across the canyon (the outlet of Lake Buntzen) at once raises the water level of this lake, increases its storage capacity and contains the pipe intakes.

The site for the Generating Station has been blasted out of the solid rocks and cliffs, and the buildings were erected from the granite so quarried. The within pictures of this plant and surroundings show the transformer houses, step-up stations and operators' dwellings. Immediately behind and above the Power House an electric elevator in a concrete shaft serves as a means of quick conveyance from one to the other. To the right of the Power House is a concrete warehouse and wharf built on concrete piers. Cars loaded with the heaviest machinery and freight are landed on this wharf over a drop apron, at any stage of the tide.

The installation in the Power House at present consists of six units, totalling 33,000 h.p. Four of the units are 3000 h.p. each, the other two 10,500 h.p. each.

To provide an ample water supply for the future growth of the business the tunnel between Lake Buntzen and Lake Coquitlam is being enlarged to double its original capacity, and the storage capacity of Lake Coquitlam is being increased by the erection of a 60-foot dam at the outlet of the lake to replace the existing 12-foot dam. It is expected that the enlargement of the tunnel will be completed early in February of this year, and the raising of the dam will be pushed with all possible expedition.

In addition to this the Company has other water power under development.

Two pole lines, 80 feet apart, carry four distinct sets of high-tension transmission wires over a private right-of-way to the north shore of Burrard Inlet, opposite Barnet. Between two wooden towers on this north shore and two steel towers at Barnet on the south shore, a span of over 3000 feet, these four sets of high-tension lines cross the salt water, giving a headway of 132 feet for clearance of the masts of sailing vessels. From Barnet almost straight west one pole line, with two sets of transmission wires, continues to Vancouver City substation; the other almost straight south to Burnaby substation. The Vancouver substation and the Burnaby substation are interconnected along the Company's private right-of-way, the Westminster-Vancouver Interurban Railway, by two independent sets of transmission wires, so that in case of trouble on any one line an uninterrupted service may still be maintained. From Burnaby substation two sets of transmission wires run out to New Westminster City substation, and five new substations, about 12 miles apart, on the Fraser Valley Branch to the City of Chilliwack, 64 miles from New Westminster.

From Barnet a further high-tension transmission line leads directly east, dividing into two branches, one supplying Lake Coquitlam and the other the Asylum Farm substation, a Government institution, and New Westminster Junction, and Port Moody.

From the Vancouver substation two sets of transmission lines lead out towards the city of North Vancouver and its surrounding district, crossing the harbor at the Second Narrows on a set of high masts 190 feet above tide water. The receiving substation for this line is located in the east end of the City of North Vancouver; the other line follows the right-of-way of the Lulu Island Railway to the substation on Lulu Island.

The Vancouver City substation naturally is the largest and most interesting. It supplies the business, residence and street lighting of the city, the suburbs of South Vancouver and Point Grey, the power for numerous industrial motors in these districts, in addition to the city's extensive street railway system. Two six-phase 60-cycle Rotaries, recently added to its equipment, are particularly interesting to the electrical

One of the large Valves being placed in position for 10,500 h. p. Unit at Lake Buntzen.

engineer as being the largest of their kind in the world.

Next to the Vancouver substation the most important substation on the system is located at Burnaby, about nine miles from Vancouver, on the Vancouver-Westminster interurban line. It is the switching point for Westminster City, Vancouver-Westminster Interurban and Fraser Valley branches. Two 10,000-volt transmission lines distribute power over considerable distances to large sawmills on Burnaby Lake to the north and the Carbolineum Works on the Fraser River to the south, a third to a Granite Quarry on Deep Cove, near the proposed Dry Dock, and a fourth south from the Fraser Valley Branch into the municipality of Ladner, the principal use of this being for the operation of the Municipal Water Works.

The Lulu Island and Point Grey substations apparatus, operates the Vancouver and Lulu Island Railway and the Eburne-Westminster line, and also lights the

Seven Feet Wooden Stave Pipe at Commencement of Penstock.

(Highest in Canada.)

residences of the farmers along and near these railways, the town of Steveston at the mouth of the Fraser, the towns of Ladner and Port Guichon on the south side of the Fraser River, the motors in the salmon canneries along the river bank, and the stables, barns and dairy houses of the farmers in this district.

A portable Rotary substation of 300 k.w. capacity, mounted on trucks for hauling from place to place, is found very useful and convenient to assist in the moving of large crowds to the various parks, both in Vancouver and Westminster, and to the exhibition grounds in both cities.

The electric railway system of the Company, consisting of the Mainland and the Vancouver Island (Victoria) systems, is fully shown on the accompanying maps. It comprises 200 miles of track on the Mainland and 25 miles in Victoria and its suburbs.

All along the various Interurban Lines the Company has extended its lighting and power circuits. These are greatly appreciated, and exceedingly well patronized by the residents and settlers of the districts traversed, giving them practically all city conveniences in their suburban homes, and even on the farm. Small electric motors for water pumping and other household duties are used quite extensively from these lines. For the improvement of the suburban roads, rock crusher motors are operated for various municipalities.

Along the banks of the Fraser River from Point Grey (Eburne), through South Vancouver to Burnaby, a number of industries and factories have by this means been able to obtain a cheap and reliable power, available at all hours of the day, as well as a good and frequent railway service, with siding facilities for the handling of freight in carload lots.

Into the timbered sections branch power lines have been built for the operation of sawmills and shingle mills, obviating the hauling of the unwieldy and ponderous logs, at the same time clearing up these districts for the settler and his plow. A number of the illustrations show plants of this kind in the timber

Interior View of Auxiliary Steam Plant; Three Steam Turbo Generator Units 2,000 Kilowatt Each.

between Vancouver and Westminster and near North Vancouver. All of these, when first connected and started up, were closely surrounded by timber, which may now be noticed receding in the distance before the onslaught of electrically-driven saws and planers. The lumber from these mills is again worked up in the numerous electrically-operated woodworking establishments, box factories, shipbuilding yards, etc., in the three cities. The car-building shops of the B. C. E. R. Co., Ltd., in New Westminster, is a good example of the use of the electric power.

Since the extension of the Company's power circuit to New Westminster and through its manufacturing and wholesale section, a number of very important industries have adopted the electric drive, among others a large can factory, an ice and cold storage plant, several machine and iron works, butcher shops and their cooling plants, bakeries, plumbing shops, printers, etc. The swings of the two bridges spanning the Fraser at New Westminster City are also operated by the current from this Company's lines. All along the river front of this city, power lines are now available for any industries intending to locate there. These same power lines now extend along the Fraser Valley line to the city of Chilliwack, 64 miles in length, serving towns and villages, farmers and sawmills en route. On this line particularly the mill is taken to the timber instead of the timber to the mill.

Many and varied are the uses to which the electric current supplied by the Company is put. Its flexibility lends itself to almost any undertaking. An attempt, in a small way, is made to illustrate this with the assistance of the camera, and the photographic reproductions herein may be sufficiently interesting to be kept as a memento of the "Farthest West" and one of the institutions which has done its full share towards bringing about the highly prosperous conditions which exist in British Columbia to-day.
